III. The fifth, or Blew Mouse Ear with a turning top. It has a small and thready Root, from whence rises up, usually but one Stalk, (scilicet any more) which is round, hairy, and about half a Yard high or better; at the bottom of which grow somewhat long and broad hairy Leaves, very like as well for roughness, as for shape and color unto the Wild Borage Leaves. The Stalk is sometimes Branched, and sometimes not, with several such like Leaves, but growing lesser and lesser thereon, as they grow up to the tops of the Flowers, which turn or wind themselves inward like unto a Scorpions Tail, or the Herb Heliotropium: The Flowers consist of five small Leaves apiece, which are round, and of a pale blew color, very much resembling the Flowers of Buglois, or Wild Borage, with a yellow spot or Eye in the middle, and stand all on one side of the Stalk and Branches, after they are past, there come in their places, small rough flat heads, in which the Seed is contained.

IX. The sixth, or Small creeping blew Mouse Ear. This is very like the last Kind, but that it is smaller; and most commonly has smaller Leaves and Flowers on the Branches, which do not stand so upright, but trail or creep more on the Ground. The Flowers also stand not on one side only, but on both, and open by degrees. The turning tops, which are like the last do grow up, and dilate themselves; and the Flowers are of a blew color, but some of them are more purple, with a yellow Eye in the middle.

X. The seventh, or Sweet Indian or American Mouse Ear. This Plant has a fleshy Root creeping under Ground, not growing deep, with many Fibres adjoining thereto; from whence shoot forth several somewhat long Leaves, set with very long Hairs. The Hairy Stalk which rises from them, grows to be about half a Foot high, at the top of which stands seven or eight fair Flowers, like these of our common Mouse Ear, but of a deeper yellow or orange color, smelling very sweet like Musk.

XI. The eighth, or Lesser Mouse Ear, or Mountain Mouse Ear with white and purple Flowers, or Cats-Foot. This Mouse Ear may be accounted for certain Kind of Mountain Cudweed, or Cottonweed. Its Root is composed of several small blackish Fibres, Threads or Strings. From which spring forth many small, white, woolly Leaves, lying upon the Ground, somewhat like unto the Leaves of the small Mouse Ear, but smaller than them. From among which rises up a small Stalk of about half a Foot high, beset here and there with some few Leaves; at the top of which comes forth a Tuft of small Flowers, set close together, in some of a pure white, in others of a purple or reddish color; in some of a pale red or bluish, and in others of a white and purple mix together. This Plant for its beauty is much commended, but will scarcely abide all Winter with us in our Gardens, unless the Season is mild.

XII. The ninth, or Rose Mouse Ear, Rose Cudweed, or Cotton Rose. Its Root is small, long and thready. And from the same spring up such like woolly Leaves as in the former, growing upon small short Branches, scarcely an Hand breadth high, in shape something like unto Daisy Leaves, but lesser and round pointed. At the top of every Stalk or Branch, stands one Flower, composed of two rows of small white Leaves, laid open like a Star or Rose, whence came the Name, having a round Head in the middle, made of many yellow Threads or Thrums, which falling away, a small round Head rises up, full of small Seeds.

XIII. The Places. The first and second grow promiscuously on Ditch Banks, and sometimes in or near to Ditches, if they be dry, as also on Sandy Grounds, and untill'd places, which ly open to the Air. The third is more rare, and but now and then to be met with in England; but is more plentiful in Germany. The fourth is found growing upon dry barren Hearths, especially upon Hampstead Heath, where it grows in such plenty, that one can hardly set a Foot but upon the Heads of it. The fifth and sixth grow in dry and barren Grounds in many places of our Land; the fifth Parkinson found in the back Close of formerly Sir John Tunstall his House near Croydon. The seventh, its Title or Name shews where it naturally grows, and whence it came to us; I have found much of it growing in the Continent of Florida. The eighth and ninth grow in France and other Southern Countries; but grow also as well in the colder Countries of Germany, and with us are only Nurst up in Gardens.

XIV. The Times. The first and third are said by Gerard, to Flower in May and June: but the first seven, generally speaking, Flower in June and July, and abide green all the Winter. The eighth and ninth Flower very late, towards the latter end of September; sometimes they shew not their beauty at all with us, it is so late.

XV. The Qualities. The first seven are hot and dry in the first Degree; Absterfiv, Astringent, Consolidative, Diuretic, Traumatick or Vulnerary, Pectoral, Nephritick, and Hyfterick. The two last are said to be cold and dry in the first Degree.

XVI. The Specification. It is powerful against the yellow Jaundice, Stone and Gravel, Tortors and gripings of the Bowels, the Dropsy, obstructions of the Spleen, stops the overflowing of the Terms, or any Flux of Blood: is good against Coughs, a Pthiftis, or Ulceration of the Lungs, and Consumptions, prevails against Quartan Agues; cures Green Wounds, as also Ulcers in any part of the Body. The first is what we intend here, and next to that the second Kind, and then the third.

XVII. The Preparations. You may have herefrom, 1. *A Liquid Juice of the Herb.* 2. *An Essence of the same.* 3. *A Decoction in Wine.* 4. *A Powder of the Herb.* 5. *A Syrup of the Juice.* 6. *A Balsam or Ointment.* 7. *A Cataplasin of the Green Herb.* 8. *A Distilled Water of the same.* 9. *A Spirituous Tincture.* 10. *An Acid Tincture.* 11. *An Oily Tincture.*

The Virtues.

XVIII. The Liquid Juice of the Herb. It may be taken from an Ounce to 2 or 3 Ounces, Morning and Night, in a Glass of such Wine as is most proper against the Disease it is given for. It is good against the yellow Jaundice, and cures the Disease tho' of long continuance, but it is more powerful in this case, if a quarter part of the *Black Tincture of Mars* be mixed with it. Add it a few Grains of *Salt of Tartar* is dissolved in it, it is a special remedy against the Stone and Gravel and other Tartarous Matter bred in the Reins, Ureters, and Bladder. And so also given in the *Decoction of Centory and Succory*, it is said to be effectual against the Dropsy: and to ease all Tortors and Griping pains of the Bowels.

XIX. The Essence. It has all the Virtues of the *Liquid Juice*, and may be taken from 1 Ounce to 2 in the same manner. It contributes to the curing of Green Wounds and Ulcers, inwardly taken, and outwardly applied, by way of *Lotion*. It gives ease in the Colick and Griping of the Guts, and is of singular use in curing a Diarrhea, Dysentery, Lienteria, and Hepatick Flux. It stops Fluxes of Blood either at Mouth or Nose, as also pissing Blood, and the overflowing of the Terms in Women. Taken to 4 Ounces or more, before the Fit of a Quartan Ague, it keeps the Fit Back, and lessens it, and by the constant use of it for some time, it takes it quite away and cures it.

XX. The Decoction in Wine. It has all the Virtues of the *Juice and Essence*, and may be given from 4 to 8 Ounces, sweetened with the *Syrup* of the same Plant: outwardly applied, it is an incomparable thing to cleanse, incarnate, dry, and heal up old Ulcers: The *Powder of the dry Herb* being strewed upon the same, after washing with it.

XXI. The Powder of the Herb. It has the Virtues of the *Juice and Essence*, and may be given from half a Dram to a Dram and a half in *Syrup* of the same, and that Morning and Night. It is said to cure the Pain of the Stomach, tho' never fo inveterate, to stop Vomiting, and to strengthen it.

XXII. The Syrup of the Juice. Being made with double refined Sugar, or Clarified Honey, it is an excellent thing against Coughs, Colds, Hoarseness, Wheezing, Asthma's, Pthifticks or Ulcerations of the Lungs; and indeed is prevalent against a *Tuber*, Pining, or Consumption of the whole Body, and most other Distempers of the Lungs,

and Thorax or Breast; it is also said to be good against Ruptures or Burstennells: Dose two or three Spoonfuls Morning and Night, in a Glass of *Styptick red Wine*, or other proper Vehicle.

XXIII. The Balsam or Ointment. They cure simple Green Wounds at the first Intention; digest, cleanse, incarnate, dry and heal old running Sores, and putrid, or eating Ulcers. It gives ease in the Gout, and other Pains, being duly applied to the parts affected.

XXIV. The Cataplasin of the green Herb. Being laid to any simple Green Wound, it quickly conglutinates the Lips thereof: it also is prevalent against simple Contusions, and either prevents or dissolves the Tumor, if any arises, and reduces it to its natural color.

XXV. The Distilled Water. It is available against all the Diseases afore named, in the *Juice, Essence, Powder, Decoction, or Syrup*, but must be given in much greater Dose, as to 8 Ounces or more, sweetened with the *Syrup*: and if a little of the *Spirituous Tincture* is added to it, it will heal Sores and Wounds which are outward, being washed therewith, and Tents, or Cloths wet therein being applied.

XXVI. The Spirituous Tincture. It takes away the pain of the Stomach, eases the Belly ach, and strengthens all the Viscera: If mixed with the *Powder* to the thickness of a *Cataplasin*, and applied, it is singular good to stay the Malignity of spreading, fretting, or eating Cankers, Sores, and Ulcers wheresoever, as well in the Mouth, as in the secret parts of Men or Women.

XXVII. The Acid Tincture. It is good against the Plague, and all sorts of Burning and Malign Fevers: It quenches Thirst, stops Vomiting, strengthens the Stomach, causes a good Appetite, and a strong Digestion, and kills Worms in the Bowels whether in old or young. Dose 40 Drops or more in any thing the Patient drinks.

XXVIII. The Oily Tincture. It is prevalent against the yellow Jaundice, the Cholick, Gripings of the Guts, the Stone, Sand, Gravel, and Tartarous Humors in the Reins Ureters and Bladder, and prevails against Convulsions, and the Palsie, and is a potent thing to give present ease in the Strangury. Dose from 20 to 60 Drops, Morning and Night in a Glass of *White Port Wine*.

XXIX. Note. The *Juice of Mouse Ear*, is said to be so powerful to harden Iron or Steel, that if any edged or pointed Tool, shall be often quenched therein, that it will cut all other Iron, Steel or Stone very easily, without turning the edge of point.

CHAP. DIV.

Of MOUSTAIL.

THE Names. It is called in *Greek*, *Moustail*, *χρυσόχορδος*; in *Latine*, *Cauda Muris*, *Holosteam Loniceri*, *Holosteo affinis Cauda Muris*, *Baubini*: *Coronopus Sylvestris Tragi*; *Myosuros quorundam*: in *English*, *Mouse Tail*.

II. The Kinds. It is a singular Plant of its Kind, but enumerated both by *Baubinus*, *Lonicerus*, and *Parkinson*, among the *Holostea*, because it is, as they say, in Taste and Property like them.

The Descriptions.

III. It has a small, bushy, Fibrous Root, from whence spring up many small grassy Leaves (for which reason it might have been placed as well among the Grasses) which Leaves are very short, rough and hard: from among which spring up several small, slender Stalks, with small, long, blackish green, Spiked Heads, like unto a small Plantain

Mouse Tail.

Head, but smaller, having white Flowers on them, which quickly fade and fall away, after which there is found very small blackish Seed in the long Heads, which then in some are a little crooked, and in others straight, resembling a Mouse Tail, from whence it took its Denomination or Name.

IV. Gerard thus describes it. It has a small and thready Root, from whence spring up many small grassy Leaves spread on the Ground, an Inch long, or somewhat more: among which does rise up small tender naked Stalks, about two Inches long, bearing at their tops, a little blackish Torch, or Spiked Knob, in shape like that of the Plantains, resembling very notably the Tail of a Mouse.

V. The Places. It grows in many fertile Pastures and Meadows, as also on dry Banks, and by the Path sides in many places of England. It has been found growing upon a barren Ditch Bank, near unto a Gate leading into a Pasture, on the right Hand of the Way, going from London to Hamstead: and in a Field as you go from Edmonton in Hartford-shire, unto a House near to it, called Pims, by the Foot Path sides. Also in Woodford Row in Waltham Forrest, and in several places in Essex, and other parts of the Kingdom.

VI. The Times. Its Flowers often in April, and is almost gone in May, but if the Weather is not

too hot and unseasonable, it is sometimes found in June.

VII. The Qualities. It is cold and dry in the first Degree: and of an Altringent or Binding quality: much of the nature of Plantain.

VIII. The Specification. Country People apply it for the stopping of Hemorrhages, whether of the Nose or Wounds, and find it a very excellent thing.

IX. The Preparations. You may make therefrom, 1. A Juice or Essence. 2. A Decoction in Wine. 3. A Powder of the Herb and its Heads.

The Virtues.

X. The Juice or Essence. Syringed up the Nostils it stops an Hemorrhage, or Bleeding at the Nose: and given inwardly from a Spoonful to two Spoonfuls, it stops any inward Bleeding, Spitting or Vomiting, Pissing Blood or the Bloody Flux: it may be given in Alicant, or some strong Bodied Styptick Wine.

XI. The Decoction in Wine. It has the same Virtues, but much weaker, and may be given Morning, Noon, and Night, from 4 to 8 Ounces, sweetned with Syrup of Consfrey.

XII. The Powder. Blown up the Nostils thro' a Quill, it is said to stop the Bleeding of the Nose: given inwardly in Styptick Red Wine from a Dram to two Drams, it performs all that the Juice and Essence will do: Applied outwardly upon Bleeding Wounds it stops the Hemorrhage, and being made into a stiff Cataplasme with the Juice or Essence, it secures them against their future bleeding.

CHAP. DV.

OF MUGWORT.

THE Names. It is called in Greek, *Ἀρtemisia*: in Latine, *Artemisia* (from *Artemisia* the Wife of Mausolus King of Caria:) formerly it was called *Parthenis*, quasi, *Virginalis*, i. e. *Maidenwort*: and as *Apuleius* says, was also called *Parthenium*, which is indeed the proper Name of another Plant, viz. *Fetherfew*. But some think the Name came from *Artemis* (one of the Names of *Diana*) because it is chiefly applied to Womens Diseases: and in English, it is called only, *Mugwort*.

II. The Kinds. There are four Species of this Plant, usual with us, viz. 1. *Artemisia vulgaris*, called by some *Mater Herbarum*, Our common Mugwort: and this is common almost in all Countries. 2. *Artemisia minor*, The lesser or small Mugwort. 3. *Artemisia Montana*, *Artemisia tenuifolia Montana*, Fine Mountain Mugwort. 4. *Artemisia Virginiana*, Virginian Mugwort.

The Descriptions.

III. The first, or Our Common Mugwort, has a Root which is long and hard, with many small Fibres growing from it, whereby it takes firm hold

in the Ground, but both Leaf and Stalk dye and perish every Year, the Root remaining all Winter, and shooting out anew the next Spring. From this Root spring forth divers Leaves, lying upon the Ground, very much divided or cut in deeply about the edges, something like unto Wormwood, but

MUGWORT.

much larger, of a sad or dark green color on the upper side, and of a very hoary white underneath. The Stalks, (which grow in some to be purplish, and in some to be deeper colored) rise to be sometimes three, four, or five Feet high, on which grow such like Leaves as those below, but something smaller. Branching forth very much towards the top, on which grow very small, pale, yellowish Florets like Buttons, which fall away, after which comes small Seed, inclosed in small round Heads. The whole Plant has a reasonable good smell, and is more easily propagated by slips, than by the Seed.

IV. The second, or Lesser, or small Mugwort. It has a Root much like the former, but lesser, from whence spring forth Leaves like unto the former also, (the whole Plant being like it) which Leaves are divided or cut in on both sides, as that, green on the upper side, and whitish underneath, but much smaller than they. The Stalk likewise, (for many times it has but one) rises up, not so high, nor is so great, but bears like Flowers, yet paler; the smell of the whole Plant is like the other.

V. The third, or Fine Mountain Mugwort. It has a Root which is long and black, spreading it self in the Ground, from whence springs up a Plant, not much unlike the former, having several square brownish Stalks, or Branches, about a Foot and half high, on which do grow such like Leaves almost for form, but longer, narrower, and much more crumpled or jagged on the edges. The Flowers are small and pale, like the foregoing, and the smell of the whole Plant differs very little.

VI. The fourth, or Virginian Mugwort. It has a Root much like the Common English Kind,

and the whole Plant very much resembles it, in its divided Leaves: but it rises up something higher, and spreads it self larger out, and its jagged or deeply cut Leaves are somewhat bigger.

VII. The Places. The first grows plentifully throughout all England, as well as in other Countries by the Way sides, by Ditch sides, on Banks also, and by Brook sides, or Water courses, almost in an infinite number of places, as also in the borders of Fields. The second is also found in some of those places but not so frequently. The other two are only Nurst up with us in Gardens. The last according to its Title or Name grows very plentifully in Virginia, and other parts of Florida.

VIII. The Times. They all Flower and Seed in July and August, or in the end of Summer.

IX. The Qualities. Mugwort is hot and dry in the second Degree. Aperitive, Absterive, Afrinquent, Anodyn, Diuretick, Discussive, Nephritick, Hysterick, and Emmenagogick.

X. The Specification. It is prevalent against Vapors and Fits of the Mother: it powerfully provokes the Terms, brings away both Birth and After-Birth, and expels the Dead Child; it is good against the Palsie, as also Cramps and Convulsions; it cures the Strangury, as also the Poyson of the Black Poppy, or the over-much taking of Opium.

XI. The Preparations. You may have herefrom, 1. A Liquid Juice of the Herb. 2. An Essence of the same. 3. An Infusion or Decoction. 4. A Pouder. 5. A Balsam or Ointment. 6. A Cataplasm. 7. A Pessary, made of the Root, or of the Juice. 8. A Distilled Water. 9. A Spirituous Tincture. 10. An Acid Tincture. 11. An Oily Tincture.

The Virtues.

XII. The Liquid Juice of the Herb. Being taken every Morning Fast, and every Night at Bed time, from two Spoonfuls to four, in a Glass of White Port, or Lisbon Wine, or in Madera Wine, it provokes the Terms powerfully, and facilitates the Birth of Women in Labor, bringing away the After-Birth, and causing a due cleansing. It is good to expel a Mola, when the Woman has gone beyond her Time, as also the Child when it is Dead. It suppresses Vapours, being duly taken; and I have cured Hysterick Fits with it to admiration; but then in these two last cases, it ought to be given in its own Distilled Water, or in fair Spring Water.

XIII. The Essence. It has all the Virtues of the Liquid Juice, but more Powerful, and more Stomack: it opens all obstructions not only of the Womb, but also of the Reins, Ureters and Bladder, provokes Urine admirably, gives ease in the Strangury, and expels small Stones, Sand, Gravel, and other Mucilaginous or Tartarous Matter from those Parts: if any one is poysoned with the Juice of the Black Poppy, or has taken too large a Dose of Opium, this is said to be a present remedy. Dose from one Spoonful to four, in a Glass of Generous Wine.

XIV. The Infusion or Decoction in Wine. They have all the Virtues of the Juice or Essence, but must be given in larger proportion, as from 4 to 6 or 8 Ounces Morning and Night: and it may be sweetened or made pleasant with double refined Sugar. If the Decoction is made in Water,

it may serve as a Bath for Women to sit in, or to sit over its fumes, it loosens the Womb, opens the obstruction thereof, and causes the Courtes to come down, and also facilitates the Birth: and if sat in, as a Bath, it not only opens the obstructions of the Womb, but also takes away the Inflammation thereof, if any be. If the *Decoction* is made with the addition of *Agrimony* and *Camomil*, whether in Wine or Water, it has an Anodyn power and quality, for if any part which is pained, if the Nerves are hurt, or are troubled with the Cramp, and they be bathed and fomented herewith, as hot as it can well be endured, it gives present ease and relief.

XV. *The Powder of the Herb.* It has the Virtues of the *Juice*, *Essence* and *Decoction*, and may be given from 2 Scruples to 2 Drams in Generous Wine, or other proper Vehicle. If it is given to three Drams in Wine, Authors say, it is the best, and a certain help for the *Sciatica*. But I suppose it ought to be given Morning and Evening, with a *Continuando* for fifteen or twenty days; taking now and then, a proper Purge between whiles. When it is to be given in so large a quantity, it ought to be given in a Mefs of hot Water Gruel, or Mutton Broth, or in three or four Spoonfuls or more, of Syrup of Clove Gillflowers, or of Violets.

XVI. *The Balsam or Ointment.* They cure Green Wounds excellently well: they being applied to Wens, or Gums, or hard Knots, or Kernels which happen about the Neck and Throat, it eases their pains and takes them away; and they are said to be more effectual, if some *Field Daishes* be added to the Composition: I am sure, they will be then the better for the curing of Wounds and Ulcers.

XVII. *The Cataplasim.* It is made of the Green Herb, and is of good use to dissipate the Fluxion, and cure a simple Contusion. And if it is applied to the Joints and Limbs of such as are very much wearied with Travelling, it eases and gives them much relief, as *Pliny* says: and that they shall feel no weariness, in their Journeying.

XVIII. *The Pessary.* It is made either of the Raw Root, either whole, or beaten into a Mafs in a Mortar: or of the *Juice*, mixed with fine Powder of Myrrh, enough to bring it into a Body, of such a consistence as may be formed into a Pessary. Being put up the Womb, it induces the Terms which have been stop't; and if a Woman is at the time of her Labour, it facilitates the Birth, and afterwards brings away the After-Birth.

XIX. *The Distilled Water.* Tho' possibly it has the Virtues of the *Juice*, *Essence*, *Decoction*, and *Powder*, yet it is weak in its Operation, and may be given (sweetned with Syrup of Violets) to half a Pint or more: but it is chiefly used as a Vehicle, to convey the other Preparations in.

XX. *The Spirituous Tincture.* It is of excellent use to be given to Women in Labor to facilitate the Birth, as also after Delivery, to prevent After Pains, and to cause a full and compleat cleansing, for the want of which thing a great many Women suffer much, incur many Weaknesses and Distempers, and are many times ruined by it. It is good also, against the Colick, as also Tortions and Gripings of the Bowels. Dose 2 or 3 Drams at a time in a Glass of Wine.

XXI. *The Acid Tincture.* It prevails powerfully against the Poyson and Malignity of Poppies and Opium: rectifies the Stomach, stops Vomiting, and causes a good digestion. It allays Vapors, opens all sorts of Obstructions of the Bowels, and

cures the Rickets in Children: It likewise cleanses the Reins and Bladder of Tartarous Mucilage. Dose from twenty to sixty Drops or more, according to the quantity of the Vehicle it is taken in: it may be given in Canary, or other Generous sort of Wine, two, three, or four times a day.

XXII. *The Oily Tincture.* If it is inwardly given from half a Dram to two Drams, it gives present ease in the Colick, and Gripings of the Guts, as also in the Strangury, powerfully provokes Urine, and cleanses the Urinary parts of all kinds of Heterogeneous Matter: is good against Fits of the Mother, and many times cures the Palsie (if not in old People) as also inward Convulsions of the Stomach and Bowels. In the Palsie, it ought to be Anointed also outwardly Morning and Night on the Back Bone from the *Vertebre* of the Neck, to the *Anus* almost: Anointed likewise upon the part afflicted with the *Sciatica*, it has been found to give ease, and many times a cure.

C H A P. DVI.

of MUGWORT Sea.

I. **T**HE Names. It is called in Greek, *Ἀρtemīsia Marina*: in Latine, *Artemisia Marina*: and in English, *Sea Magwort*.

II. *The Kinds.* It is a singular Plant of its own Kind: but is thought by some good Authors to be a Species of the *Magworts*, and therefore being a Sea Plant they called it *Artemisia Marina*, as Gerard: and *Artemisia folio Lavendule*, as *Clasius*, because it has a kind of Lavender like Leaf: *Lobel* and *Tabernaemontanus* call'd it also *Artemisia Marina*: Others taking it to be a Species of *Wormwood*, of the Sea Kinds, have call'd it, *Absinthium Marinum latifolium*, as *Camerarius*, and he thinks it to be so: *Dodonus* calls it *Absinthium Angustifolium*, viz. Narrow Leaved Wormwood, and narrow Leav'd it may well be thought, in respect to the Common Wormwood. But *Parkinson* calls it, *Absinthium Maritimum Lavendule folio*, Lavender Leav'd Sea Wormwood.

The Descriptions.

III. Gerard thus Describes it. It has a woody Root, from whence rise up many Branches, standing upright in distances one from another, of an ashie color, beset with Leaves not much unlike to those of Sea Parslane: these Leaves are of two sorts, for some of them are long and narrow, like those of Lavender, whence *Clasius* called it *Artemisia folio Lavendule*, others some are cut in or divided, almost to the middle Rib; about the lower parts of the Stalks, and towards the Tops of the Branches, they are narrower and lesser, and cut with great and deep jaggs, thick in Substance, and of a whitish color, as all the rest of the Plant is. The flowers are many and yellow, which fading away, there follows Mollie Seed like unto that of Our Common Wormwood. It yields a pleasant Smell like unto *Abrotanum Marinum*, and in Taste is somewhat Saltyish or Brackish. [As to the Taste I fear that Gerard is a little out; I have some-

W O R T S e a .

Sometimes tasted of it, but could observe no such Saltiness; yet for all that I know of it, the Taste may vary, according to the differing places in which it may grow.]

IV. Parkinson Describes it thus. It shoots forth many slender, weak, woody, and brittle Stalks, bending a little downwards, whereon do grow divers hoary, white, long Leaves, somewhat broader than Lavender Leaves, having sometimes some cuts or divisions at the Bottoms of them, which are but seldom seen, and in a very few of the lowest next the Ground. Those which are set on the Stalks are smaller, and sometimes are cut or divided at the ends, of a reasonable weak scent, between Lavender and Southernwood, and of an unpleasing taste. The Flowers grow after the same manner of those of the Common Wormwood, and of a yellow color; and the Seed is not unlike thereto also.

V. The Places. It grows about the Sea Coasts, as on those of the Venetian Gulph, and likewise in the Island of Chio. It has been found growing also about Rye in Sussex, and Winchelsea Castle, and at Portsmouth, in the Isle of White, as Gerard says.

VI. The Times. It Flowers in July and August, or towards the latter end of Summer, in which time it perfects its Seed.

VII. The Qualities, Specifications, Preparations and Vertues, are said to be the same with those of the Common Mugwort, in the former Chapter, and thither we refer you. Some will have it to be of the nature of the Common Wormwood, but that it can scarcely be, because it wants much of that bitterness, Astringent, and Stomack property.

CHAP. DVII.

Of MULLEIN Common.

OR,

H I G T A P E R .

I. **T**HE Names. It is called in Greek, *φλῆγος*; from *φλέω*, Uro, to Burn; and *φλῆξ*, *φλῆγος*, Flamma a Flame, for that it served as a Wick to put into Lamps to burn, from whence some of the Latines called it *Candela regia*, and *Candelaria*, because in the Ancient times, they used to dip the Stalks hereof in Suet, Tallow, or Wax, to make Candles, Tapers, or Torches of. It is called also in Latine, *Thapsus*, *Thlapsus*, *Tapsus barbatus*, *Verbascum*, and *Lanaria*: and in English *Mullein*, *Higtaper* or *High Taper*, because it was used sometimes as a Taper or Torch at Funerals.

II. The Kinds. There are three Principal Kinds of this Plant, viz. I. *Verbascum vulgare*, see *Tapsus barbatus communis*, our Common Mullein, of which in this Chapter. II. *Verbascum Nothum*, *Tapsus Nothus*, Bastard Mullein, or Base Mullein, of which in Chap. 508. III. *Blattaria*, Moth Mullein, of which in Chap. 509. following.

III. The Kinds of the Common Mullein. There are, 1. *Verbascum Mas*, *Verbascum Mas Latifolium*, *Verbascum album vulgare*; *Tapsus barbatus communis*, our Common white Mullein, which is the Male white Mullein. 2. *Verbascum Fæmina Lobelij*, *Verbascum album Fæmina*, *Verbascum foliis longioribus Mas quorundam*; *Phlomos alter Lobelij*; *Verbascum Lychmæ Matthioli*, *Verbascum Candidum Mas Fuchsj*, *Verbascum album Fæmina Gesneri*, *Verbascum augustius Dodonæi*, our white Mullein with long Leaves, Female white Mullein. 3. *Verbascum Fæmina flore albo vel pallido*; *Tapsus barbatus maximus odoratus meridionalium flore albo*, Sweet white Mullein.

The Descriptions.

IV. The first, of Our Common white Mullein, which is the Male white Mullein. Its Root is long, white, and woody, perishing every Year after it has born its Seed: from whence spring up many fair, large, white, woolly Leaves, lying next the Ground, something longer than broad, pointed at the ends, and as it were dented about the edges: the Stalk rises up to be four or five Feet high, covered over with such woolly Leaves as the lowest, but lesser, so that no Stalk can be seen, for the multitude of Leaves thereon, up to the Flowers, which come forth on all sides of the Stalk, without any Branches for the most part, and are many set together in a long Spike; in some of a gold yellow color, in others

more

MULLEIN Common Male.

more paler, consisting of five pointed Leaves, which afterwards give small round Heads, which contain within them small brownish Seed.

V. The second, or Our white Mullein with long Leaves, which is the Female white Mullein. Its Root is somewhat long, thick and hard, but not woody, with several long Fibres adjoining thereto. From whence rise up many thick, white, woolly

MULLEIN Female.

Leaves, lying upon the Ground, like unto the Common Male white Mullein in the former Section, but that they are somewhat narrower, and thereby seeming longer: from among which, springs up, a round, hard, woolly Stalk, about three feet high, set with the like Leaves, as those which grow below, but smaller unto the middle thereof, where it begins to give Flowers, and in some Plants and Places, to divide it self into Branches, whereon grow many Flowers, Standing round about the Stalks or Branches, thick set together, consisting every one of five round pointed Leaves, of a whitish color, and in some Plants and Places more yellow, with a few yellow Threads in the middle, which being past away, round, hard, Seed Vessels come in their places, very like unto the Seed Vessels of Fox-Gloves, or Finger Flowers, but not so long, in which is contained very small and brownish Seed.

VI. The third, or Sweet white Mullein. It has a Root like the former, from which spring up white, hoary, and woolly Leaves, like the other, but longer, narrower, and more indented about the edges, and not so many growing below on the Ground. The Stalk is woolly, and rises higher than the former, having greater Flowers growing at the top, much sweeter also than it, and of a white color, wherein sometimes some reddish lines are to be seen: in other particulars, it differs not from the former.

VII. The Places. The first grows plentifully in Florida in the West-Indies, and I saw it grow in great plenty in the Southern Carolina. It grows by Way sides and in Lanes, as also in the borders of Fields and Pastures, Ploughed Fields, Cawties, and in dry sandy Ditch Banks, and other untilld places in most parts of England. The two last grow also in many places in England, but not so universally and plentifully as the first.

VIII. The Times. They all Flower about July, and from July to September, and bring forth Seed, the second year after their Sowing.

IX. The Qualities. Mullein is Temperate in respect to heat or cold, and dry in the first Degree: Aperitive, Aststringent, Pectoral, Hysterick, and Nephritick.

X. The Specification. It prevails against Coughs, Colds, Obstructions of the Lungs, Asthma's, Fluxes of the Bowels, the Strangury, cures Agues and the Piles, and gives ease in pains of the Gout.

XI. The Preparations. They are manifold, as, 1. A Liquid Juice or Essence of the Herb. 2. A Decoction in Wine or Water of the same. 3. A compound Decoction. 4. A Powder of the Roots. 5. A Powder of the Flowers. 6. A Fume. 7. Tap-simel. 8. Taffivaletia. 9. An Insolated or Decoiled Oil. 10. An Ointment of the flowers. 11. A Cataplasm. 12. A Distilled Water. 13. A Spirituous Tincture. 14. An Oily Tincture.

The Virtues.

XII. The Juice or Essence. Taken from a Spoonful to three Spoonfuls in a strong-Bodied or Styp-tick red Wine, it cures Diarrhea's, Dysenteria's, Lienteria's, and the Hepatick Flux; and is good against a Rupture or Bristenness: they cure Catarrhs, and Defluxions of Rheum upon the Lungs, and used as a Gargle, heal a sore Mouth and Throat. And being drunk Morning and Night for 20 Days together, it cures the Gout. The Juice or Essence of the Roots, made before it bears a Stalk, and taken in a draught of Muscadine, for three or four times

times or oftner, an hour before the coming of the Fit of a Quartan Ague, will certainly cure it. The Juice of the Leaves and Flowers being put upon rough Warts, and rubbed on, quickly takes them away, as Matthiolus says, but does no good to those which are smooth.

XIII. *The Decoction in Wine or Water.* It is profitable for those which are Butten, and for such as have Cramps and Convulsions, and likewise for such as are troubled with an old Cough. Being used as a Gargle, it eases the Tooth-ach. The Decoction of the Root in Red Wine or Water, is good against an Ague, as also the Bloody Flux, more especially, if Gads of red hot Steel or Iron has been often quenched therein. The same opens obstructions of the Reins and Bladder, and is good against the Strangury. It is of great force to dissolve Tumors or Swellings, and Inflammations of the Throat. The Decoction of the Herb in Water, Country People give to their Cattel, when troubled with a Cough, or by reason of a Looseness of the Bowels have a falling out of the *Intestinum rectum* or Fundament.

XIV. *The Compound Decoction.* Take Leaves of Mullein two parts, Camomil Flowers, Marjoram, Sage, of each one part, make of all these a Decoction in Wine. With this bathe Morning and Night where the Veins are Swollen, or the Nerves are contracted, or where the Cramp commonly afflicts, it gives relief, ease and comfort.

XV. *The Powder of the Roots.* Given to a Dram in a strong or Stiptick red Wine, Morning and Night, it stops all sorts of Fluxes of the Belly. If it is rubbed often on rough Warts, it will take them away in a short time, but it does no good to such as are smooth, as was said before of the Juice.

XVI. *The Powder of the Flowers.* It is an especial remedy, for such as are afflicted with Belly-aches, and such as are troubled with the Colick, rho? periodical. It may be given from a Dram to a Dram and half, Morning and Night, in any proper Vehicle.

XVII. *The Fume.* Take Seeds and Flowers dried of Mullein, of each three parts; white Rosin two parts, Camomil Flowers, and Caraway Seeds of each one part; mix them, and put them upon live Coals in a Chafin Dish, or some Earthen Pan, and set it in a Close-Stool, and let the person who is troubled with the Hemorrhoids or Piles, or falling down of the Fundament, sit over it, to receive the Fumes up the Body; it gives much ease and relief, and is also very profitable for such as are troubled with a Tenasmus, which is a desire to go often to Stool, and can do nothing.

XVIII. *Tapsimel, Hony of Mullein.* Take Juice of Male Mullein, Juice of Celandine, of each one part; Clarified Hony, two parts; boil them by Degrees, till the Juices are consumed, adding (if the Physician shall so prescribe) Vitriol and Alum burnt, a sufficient quantity; Ink enough to make a thin Body that they mix well; boil again to a consistence of an Ointment according to Art. The simple Tapsimel (without the Vitriol, Alum, and Ink) being taken three times a Day, an Ounce or Ounce and half at a time stops Catarrhs powerfully, and is good against the Falling-Sickness. That with the Vitriol, Alum, and Ink, is good to cleanse old Sores, Ulcers, Fistula's, take away a Calous; and consume proud and dead Flesh.

XIX. *Tapsivalentia*, an Ointment containing the Powers, Force, or Strength of Mullein. Take Juice of Mullein, Hogs Lard, of each equal quantities; mix and beat or grind them together in a

Stone Mortar; keep it in a convenient Vessel nine or ten days, then beat it well twice, once more with fresh Juice, until it be green, and another time without Juice, first casting away what is thin and discolored, then keep it close covered for use. It softens hard Tumors, and eases their pain; anointed on the Belly, it stops a Looseness and a Bloody Flux; so also given in a Clyster. Anointed on the Crown of the Head and Sutures, as also on the Nape of the Neck and Stomack, it Stops Catarrhs, and is an excellent thing against Coughs of the Lungs. And it has been found by experience to cure the Hemorrhoids or Piles.

XX. *The Infused or Decoiled Oil.* It is made by an Infusion or Decoction of the Flowers in pure Oil Olive, often repeated. It is very powerful against the Hemorrhoids or Piles, being often anointed on the part affected.

XXI. *The Ointment.* It is made of the bruised Flowers, the Yolk of an Egg, Juice of Leeks, and Crumbs of white Bread, beaten together into the form of an Ointment. Applied to the Piles when they swell, and their pains are most vehement, it gives wonderful ease upon the spot, and in a short time cures them.

XXII. *The Cataplasim.* 1. Made of the Leaves and Seed boiled in Wine, and laid upon any Dislocation, after it is set, it eases all the Pains and dissolves the Swelling. 2. Made of the Leaves and Tops of the Lesser white Mullein boiled in Water, and applied to the Gout, it gives wonderful ease, and dissolves the Tumor. 3. Made of the green Leaves beaten in a Mortar, and applied or bound to a Horse Foot, which is very much pricked with a Nail, or Thorn, or Splinter, it eases the Pain, and heals it in a short time.

XXIII. *The Distilled Water of the Flowers.* Taken to 3 Ounces at a time or more, Morning and Night for some days together, it is said that there is not a better remedy found out for the hot Gout. Dropped into the Eyes, it takes away the watering of them, and also cures the redness of the Face, called in Latin, *Gutta Rosacea*, or the Rose, if it be washed therewith often; more especially if a little Camphorated Spirit of Wine be added to it. This Water is also used against creeping and running Sores or Ulcers, or any other deformity of the Skin.

XXIV. *The Spirituous Tincture.* It cures a vehement pain of the Stomack, and is profitable against Convulsions, Fainting and Swooning Fits, Palpitation of the Heart, Sickness at Heart, and Vomiting, a vehement Diarrhea, and the Bloody Flux. Dose from 1 Dram to 3 in a Glass of Madera, Sherry, or Canary.

XXV. *The Oily Tincture.* Outwardly applied to the Piles, it eases the pain, heals and cures them. Applied to the Gout, it eases the pain and cures it: Anointed on the Back Bone and other parts affected, it prevails against the Palsie, Numbness of the Limbs, and a Trembling. Inwardly taken from a Scruple to a Dram, Dram and half, or more, according to the Exigency, it gives ease in the most vehement Colick, prevails against inward Convulsions of the Bowels, induces the Terms in Women if stopt, facilitates the Birth, gives ease in the Strangury, and provokes Urine powerfully, expelling all Heterogeneous things, as Stone, Gravel, Sand; or Tartarous Mucilage from the Reins, Ureters and Bladder.

C H A P. DVIII.

Of MULLEIN Bastard or Base.

I. **T**HE Names. It is called in Greek, *ῥαβδος*: in Latine, *Verbascum nothum*, *Verbascum vile*, *Tapsus nothus*, *Tapsus vilis*: and in English, *Base Mullein*, *Bastard Mullein*.

II. The Kinds. There are three Kinds of this Plant, viz. 1. *Verbascum nigrum vulgare*, *Verbascum nigrum*, *Verbascum nothum vulgare*, Our Common Base or Bastard Mullein, or Common Black Mullein. 2. *Verbascum nigrum odoratum*, *Tapsus nothus odoratus*, Sweet Base Mullein, or Sweet Black Mullein. 3. *Verbascum nothum Laciniatum*, *Verbascum aliud Matthioli*, *Verbascum Erucafolium Lobelij*, *Verbascum Laciniatum Matthioli*, *Verbascum folio Papaveris cornuti Camerarij*, Jagged Mullein, or Jagged Base or Bastard Mullein. To these we may add, 4. *Aethiops*, *Aethiops*, *Verbascum Aethiopicum*, *Verbascum Laciniatum*, & non Laciniatum, *Sclarea Aethiopica*, Ethiopian Mullen Jagged and not Jagged, which Parkinson will have to be a Kind of Clary: but we thought it very proper to be enumerated among the Bastard or Base Kinds of Mulleins, it being none of the true Kinds in the former Chapter, nor yet of the Moth Mulleins in the following Chapter, and withall seeming to be much more a Mullein than a Clary.

The Descriptions.

III. The first, or Our Common Base or Bastard Mullein, or Common Black Mullein. Its Root is pretty large, long, and Branched and Fibrous, which

MULLEIN Base or Bastard Common;

O R,

MULLEIN Black Common.

perishes after Seed time. Its Leaves are nothing woolly or Hairy, but of a dark green color, somewhat large, longer pointed, and a little dented about the edges. The Stalk or Stalks rise up almost as high as the Common Mullein, and sometimes parted at the tops into a few Branches, bearing long Spiky Heads of Gold yellow Flowers, and in some tending to purple, like the other, with some Threads in the middle, which are reddish in some and purplish in others, with Seed following them like to the true Kinds in the former Chapter. The whole Plant has a stronger smell than that in the White Kinds.

IV. The second, or Sweet Base Mullein, or Sweet Black Mullein. Its root is something great and long, with several Fibres adjoining to it, which perishes not, but abides many Tears. It has four or five Leaves lying upon the Ground somewhat long and broad, ending in a long point, somewhat hard, and

MULLEIN Base or Bastard Sweet;

O R,

MULLEIN Black Sweet.

as it were crumpled, of a dark green color, without any manifest dents or notchings on the edges, but only unevenly waved; from among which rises up a round, hard, green Stalk, and sometimes two, about three Feet high, oftentimes without any Branches, and sometimes again divided into two or three, on which grow many yellow Flowers, smaller and thicker set together, viz. two or three at a place, than in any other, and smelling pretty sweet, which for the most part fall away without giving any Seed; and when it does bear Seed, it is very small, and contained in small round Heads.

V. The third, or Jagged Base or Bastard Mullein. Its Root is much like the former, and it has large and long Leaves unevenly cut in on the edges, somewhat like the Leaves of Horned Poppy, of a dark green color, and a little hairy withall. The Stalk is small and green, but high, and variously Branched, bearing smaller yellow Flowers, and more sparsely set than in the two former Black sorts, and having after them Seed much alike. Lobel says,

the

the Flowers are set under the Stalks, as Sage or Wild Clary are, and of the same form and color.

VI. The fourth, or Ethiopian Mullein, Jagged and not Jagged. Their Roots are Woody, and perish as soon as they have born their Seed, which is usually the second Year after their Sowing and Springing up, for the first Year they seldom run up to Flower. Each of these have divers very large Leaves spread upon the Ground, every one near a Foot long, and almost half a Foot broad, ending in a point; in the one, very much torn in on the edges on all sides, and dented thereabouts, and in the other smooth and not dented or jagged: both of them are of a whitish, hoary, green color, with much white hoariness or wooliness upon them, far surpassing any of the White Mulleins, which grow wild abroad in Our Country, or beyond Sea; for they are of a yellowish white hoariness, and are nothing so pleasant to look on as this. In the middle of these Leaves rises up a hoary, square, strong Stalk four or five Feet high, set full of such like Leaves as grow below, but much lesser, and lesser still up to the top, all hoary and woolly as the rest. This Stalk towards the top, is spread out into several Branches, on which also grow divers smaller Leaves like the former up to their tops, which Branches spread far, and take up a great compass or room. On each of the Stalks and Branches, at set distances are set two small Leaves, and with them round the Stalks several large white hooded or gaping Flowers, and some say they are of a pale, black, blew, color: after which comes the Seed, two Seeds always joined to gether in one Seed Vessel, which are brownish, and those of the jagged like those of the not jagged.

VII. Gerard Describes the smooth and not jagged Kind thus. It has a Root which is black and hard, and of a Woody substance. From which spring forth many very broad hoary Leaves, spread upon the Ground, very soft and downy, or rather woolly like those of our Common white Male Mullein, but far whiter, softer, thicker, and fuller of wooliness; which Wooll is so long, that one may with his fingers pull the same from the Leaves, even as Wooll is pulled from a Sheeps Skin: from among which Leaves, rises up a four square downy Stalk, set with like Leaves but smaller: which Stalk is divided at the top into several Branches, set about and orderly placed at certain distances, with many Flowers like those of Arch-Angel, of a white color, tending to blueness: which being past, there follows a three cornered brown Seed.

VIII. The Place. The first grows in many places of Essex, Kent, and Surry: The second is sometimes also found growing Wild in our Country, but not commonly to be met with, unless carefully lookt after. The third *Lobel* says he found near the Ruines of an old Church, by the Baths at Bath in England. The fourth *Dioscorides* says, grew upon Mount Ida in Phrygia near Troy, and in Messenia a Province of the *Morea*; and has of late been gathered upon some Hills in Greece and Illyria which are near the Sea: but it also grows naturally in Ethiopia, from whence it took its Name: it also grows in *Meroe*, an Island in the River Nilus: from some of these places it has been brought to us, and grows here in our Gardens; Gerard says, he had it growing in his Garden: I have also seen it grow Wild, upon some of the Southern Parts of the Continent in Florida, where it is in abundance.

IX. The Times. They all Flower in July and August, or latter end of Summer, as the other Mulleins do; and their Seed is ripe in some little time after.

X. The Qualities, Specification, Preparations, and Vertues, of these Mulleins, are the same with those of the Common Mullein in the former Chapter so that no more need be said of them here.

XI. Observations. A Decoction of the Golden Flowers of the Black Mullein in Lye, is said to dye the Hair of the Head yellow, and to make it fair and smooth. And a Decoction of the Leaves in Wine with a little Honey, is good to wash and cleanse old and putrid Ulcers, and foul, rotten, and running Sores, and to induce their healing. A Decoction in Vinegar also, is very profitable to stop the bleeding of Green Wounds, and to heal them; and it is made with Rue, it is a Remedy against the Stinging of Scorpions. The Decoction of the Leaves and Flowers in Wine or Water, is good against Diseases of the Breast and Lungs, and for such as Spit corrupt and rotten Matter. An Ointment made of the Leaves, is used with good Success against Scaldings and Burnings with Fire or Water. A Cataplasm of the Leaves made by boiling in Water and stamping them in a Mortar, &c. being applied, is profitable against an Oedema, and other cold Tumors: it cleanses and cures Ulcers also, and is of excellent use against an Ophthalmia, or Inflammation of the Eyes.

XII. The Virtues of the Ethiopian Mullein. The Decoction of the Root in Wine or Water, is good against corrupt and rotten matter of the Lungs: helps the asperity or roughness in the Throat, and is said to be profitable against the Sciatica. An Electuary or Loboc, made of the Root with Honey has also the same Vertues, and causes an Expectoration of the purulent or rotten Matter in a Pleurisie.

CHAP. DIX.

Of MULLEIN Moth.

I. THE Names. It was unknown to the Greeks, and therefore has no Greek Name: but it is called in Latine, *Blattaria* from *Blatta*, a Moth: *hæc abiecta Blattæ in se contrahit unde nomen accepit*, as Pliny says, lib. 25. cap. 9. And in English, Moth Mullein.

II. The Kinds. Authors have made twelve or thirteen Species of them, or more; but as many of them are perfectly Foreign to us, and not at all to be come by, we shall here omit them, and give you only the Description of such, as either grow Wild in our Country, or are commonly Nurst up in our Gardens; and they are the following seven, viz. 1. *Blattaria lutea odorata*, Sweet yellow Moth Mullein. 2. *Blattaria lutea minor sive vulgaris*, Our Common yellow Moth Mullein. 3. *Blattaria Flore albo*, White Moth Mullein. 4. *Blattaria lutea major, sive Hispanica*, The greater yellow Moth Mullein. 5. *Blattaria Flore luteo purpurascens*, Cloth of Gold Moth Mullein, or yellowish purple Flowered Moth Mullein. 6. *Blattaria Flore purpureo*, Purple Flowered Moth Mullein. 7. *Blattaria Flore Caruleo*, Blew Flowered Moth Mullein.

The Descriptions.

III. The first, or Sweet yellow Moth Mullein. It has a long Branched Root, pretty thick with some Fibres adjoining to it, which abides all the Winter, and lives many Years, which few or none of the others do. It has many hard, grayish, green Leaves lying on the Ground, somewhat long and broad, little or

Moth Mullein.

nothing snipt about the edges, but pointed at the ends. The Stalks are two or three Feet high, with some smaller Leaves on them; branching forth from the middle upwards into many long Branches, furnished with many small, pale, yellow Flowers, having a pretty sweet smell, stronger than in the others, which pass away, very rarely giving any Seed.

IV. The second, or Our Common yellow Moth Mullein. It has a Root pretty thick and long, with several Fibres coming from its sides, which perishes every Year after Seed time. It has such like long Leaves as our fourth Species at Sect. VI. following, but narrower, and roundly dented about the edges: The Stalk is usually single, and without Branches: on which towards the top, grow such like Gold yellow Flowers as those are, but lesser, with the like purple Threads in the middle. The Seed Vessels are single, and the Seed small, both so like to that fourth Species following, that they cannot be distinguished.

V. The third, or White Moth Mullein. The Root of this is like the last or Common yellow Moth Mullein: but the Leaves of this are of a little fresher green color, and sharper dented about the edges. The Stalk rises as high as the former, and has now and then some Branches about it. The Flowers hereof are pure white, as large and great as those last Described, or somewhat larger, with the like

purple threads like Flies creeping up in the middle, as are in the Common yellow: and the Seed is like the same: in all other respects, it differs nothing from the former.

VI. The fourth, or Greater yellow Moth Mullein. This is a Spanish Kind, whose Root is not great or full of Fibres, but perishes almost every Year, after it has given Seed, except the Winter is very mild: It has longer and greener Leaves than the first Kind, and rounder also at the ends than the second Kind. The Stalk is stronger and higher than it also; on which besides the Leaves, grow towards the top, many Gold yellow flowers, consisting of five Leaves apiece, as all the rest do; not so thick set as the first Species, but a pretty deal larger, with some purplish threads in the middle, formed somewhat like unto a Fly: after which come in their places, round Heads, two or three, or more sometimes together, but most usually one, in which ly small dusky Seed.

VII. The fifth, or Cloth of Gold Moth Mullein; or yellowish purple Flowered Moth Mullein. This abides longer in its Root than some others, tho' in a hard Winter it will perish like the last. The greatest difference between this and the second Species, consists, first in the Flower, which is of a yellowish purple, or the ground yellow, over-shadowed with a bright crimson color, which is very pleasant and delightful. Secondly, The threads in the middle are not so purple, as in that second Species, but near unto the color of the flower. Thirdly, It seldom bears Seed, which that Kind for the most part does.

VIII. The sixth, or Purple Flowered Moth Mullein. Its Root is long, thick, and blackish on the out side, abiding many years, and much encreases by the Sowing of its own Seed. Its Leaves are broader, shorter, and of a grayer green color, than the third Species or white Moth Mullein, and without any denting on their edges for the most part, yet pointed at the ends: The Stalk rises not so high as that, but is sometimes Branched, bearing such like Flowers; of a fair deep blew, or purple color, tending to redness, the threads in the middle of the Flower being yellow. The Seed Vessels hereof are smaller also, than those of that third kind.

IX. The seventh, or Blew Flowered Moth Mullein. This blew Kind is in all respects like unto the former purple Kind, saving only in the color of the flower, which is of a blewish Violet color, and is not much inferior either in the greatness of the Plant, or in the largeness of its flower, unto the said purple Kind, and endures many Years in like manner.

X. The Places. The three first have been found growing Wild in several places of England, as on Black-Heath in Kent, and near Deptford, and in other places: the four last grow only in Gardens with us; and so does sometimes the third sort also.

XI. The Times. They all Flower in the Summer time, as in July and August, and yield their ripe Seed not long after.

XII. As to their Qualities, Specifications, Preparations, and Virtues, Authors have said nothing, save what Pliny ascribes to them, especially to the Common sort, which is, to gather Moths to it wheresoever it is laid. And what Camerarius also says of the said first Species, That the Decolion of its Flowers or Leaves opens Obstructions of the Bowels and Meserick Veins.

CHAP. DX.

OF MUSHROOMS.

OR,

TOAD-STOOLS.

I. **THE Names.** This Plant is called by the *Arabians*, *Fater*, and *Hatar*: in *Greek*, *Múkus*. Pl. *μύκητες*: in *Latine*, *Fungus*. Pl. *Fungi*: in *English*, *Mushrome*, Pl. *Mushrooms*; *Toad-Stools*.

II. **The Kinds.** There are several Species of *Mushrooms*, some of which we have already Treated, or shall hereafter Treat of, in their particular and proper Chapters, viz. I. *Such as grow upon or in the Earth*, as, 1. *Tubera Terra*, Earth Balls, which see in Chap. 238. foregoing. 2. *Capita Terra*, *Lupi Crepitus*, *Fuſs Balls*, which see in Chap. 306. foregoing. II. *Such as grow upon Trees*, as, 3. *Auricule Jude*, *Fungus Sambucinus*, *Jews Ears*, which see in Chap. 404. foregoing. 4. *Lichen Arborum*, *Pulmonaria Fungosa*, *Mufcus Pulmonarius*, Tree Lungwort, which see in Chap. 458. foregoing. 5. *Fungus Arboreus ignarius*, *Fungus ignarius*, *Fungus incendiarius*, *Touch-Wood*, or *Match-Wood*, of which in Chap. following. 6. *Agaricus*, *Agarick*, or *Mushrom* of the *Larch Tree*, which see in the *Third Book* of this our *Botanologia*, or *Hiftory of Plants*. Of all or any of theſe, we have nothing to ſay in this place. Thoſe which we ſhall Treat of in this Chapter are the *Fungi Terrei*, or *Mushrooms* of the *Earth*, which we divide into two Claſſes, viz. I. *Fungi Eſculenti*, The *Edible Mushrooms*. II. *Fungi non Eſculenti*, The *non Edible Mushrooms*; which are ſaid to be *Perniciſi vel Deleterij*, *Dangerous* or *Deadly*. Now becauſe there is a great number of both theſe Kinds; to avoid as much as may be being tedious, we ſhall forbear the enumerating of them here in particular, and give you their Names, as we ſhall Treat of them, or Deſcribe them, in the order following.

The Descriptions.

I. Of the Edible, or Wholſome Mushrooms.

III. **The General Deſcription.** Our common ſorts of *Mushrooms* have ſmall, ſmooth, round Heads, ſtanding upon thick ſhort Stalks, and are for the moſt part white; yet in ſome the upper Skin is browniſh or yellowiſh; but generally more yellow, after they have ſtood long and are decaying; moſt of them are ſomewhat flat, and hollow underneath, with many Lines, or thin Feather-like Subſtances, running directly from the Center or middle of the Head, to the Edges round about. Their Subſtance is generally looſe and ſpongy, eaſily yielding to be broken between the Fingers, if but preſſed a little hard. The Taſte and Reliſh is according to the Soil and place where they grow. *Cuſius* ſays, The *Hungarians*, *Germans* and others, do eſteem thoſe moſt, which grow in the Woods, and chiefly thoſe under *Firr Trees*; and next to them, thoſe which grow under *Oaks*: But doubtleſs, thoſe which grow

in the open Air, in *Champion Fields* and *Meadows*, are not only ſafer from danger, but of better reliſh than thoſe which grow in Woods and under Trees, eſpecially with us in *England*: and herewith agrees *Horace* in his *Satyrs*, lib. 2. ſatyr 4. ver. 20. and 21.

— pratenſibus optima fungis
Natura eſt: aliis male creditur.

Mushrooms Wholſom

IV. 1. *Favogioſi*, *Spongioſus Dalechampij*, The *Honey Comb Muſhrom*. Some of this Kind grow bigger than others, and ſome more Topped or Spiring, and ſome are parted as it were all over into ſundry diviſions, making it ſeem like an *Honey Comb*, and its Head many times reſembles a *Mulberry*. Theſe are not dangerous as *Gerard* ſays; and *Cuſius* accounts them as one of the firſt or principal Kinds of *Edible Muſhrooms*, and *Camerarius* ſays, that the *Germans* are much delighted with them.

V. 2. *Fungi aliusculi & parvi*. Theſe are higher than any of the reſt, and ſmall withall, But good of the Kind.

VI. 3. *Fungus Pyramidalis*, *Spear* or *Pyramidal* fashioned Muſhrom. Its out-ſide is of a whitish brown color, is more Sceptle fashioned and larger, than ſome others, and as good as any of the former; being the greateſt of the fourth ſort of *Cuſius* his *Edible Muſhrooms*.

VII. 4. *Fungus Georgij*, *St. George's Muſhrom*. It is round, ſomewhat ſoft and whitish, having a ſlit moſt uſually on the Edges: They are called by this Name, becauſe they Spring up much about that time of the Year.

VIII. 5. *Fungus Populæus*, growing under *Poplar Trees* and *Elme Trees*. It is cornered either more or leſs, and ſome jagged about the Edges, having longer and ſhorter Stalks, and ſome of them fuller, and ſanker than others.

§ C 2

IX. 6.

IX. 6. *Heuol*, *Peziza* Plinij, Cup Mushrooms. They grow out of the solid Ground, unto which they adhere so strongly, that they can scarcely be got up without breaking; sticking to the Earth by certain small Fibres, scarcely to be discerned, and spreading low upon the Ground without any Stalk, into broad, deep, and hollow Cup-like Pieces, the Brims or Edges whereof are either plain or crumpled, or Cornered; and containing many times within the hollowest, three or four ounces of Rain Water, especially the greater of them, which by reason of the thick skinny, or fleshy Substance thereof, corrupts not, nor yet the Water contained therein, for a long time, being white on the out-side, and reddish within.

X. 7. *Fungus Muliebris*, The Womans Mushroom: It is somewhat flat on the Head, a little turn'd in like a Navel. They are of an unequal size, being brownish, greenish, or yellowish Coated.

XI. 8. *Fungus Tuberosus*, The Tuberous Mushroom. It is not flat throughout, but round in the Body, and sometimes torn on the edges, of a pale brown color, spotted with white.

XII. 9. *Fungus vel Fungi nemorum*; *Boletus vel Boleti* Cordi: Mushroom of the Woods. It is almost round and white, Spotted with yellow brown spots, some of them bigger than others: those growing under Beech-Trees, are redder than others: some chuse for eating, the pale sort, rather than the redder.

XIII. 10. *Fungi Capreolini*, The Goats Mushroom. They differ not much from some of the last, but in being yellower above, and browner underneath.

XIV. 11. *Fungi rubei*, Red Mushrooms, They grow in Woods about the beginning of Summer, and for their redness above, are called Red Mushrooms; altho' both the Stalk and the under part be not so full of Stripes.

XV. 12. *Amanita*, *Amanita vulgares* Tragi; *Boleti* Tragi: These are the Fungi Species, or kind of Mushroom, which are said to be the most Common both by Lobel and others.

XVI. 13. *Fungi Villosi*, *Fungi hirsuti cervini*, The Hairy Mushrooms. These are round, and a little flat above, are all hairy, and of a bluish color: some of them will also be blackish, and some will likewise grow two together.

XVII. 14. *Fungi abietini*, Fir Mushrooms, because they grow in the Fir Tree Woods. These are less hairy, but otherwise much like the last; of which some are mixed with white, pale, and brown; and some smooty with all, or many blackish with purple Lines underneath.

XVIII. 15. *Fungi ungulati*, *Caprei ungulati*, Goats Hoof Mushroom. They are cut in on the edges into such parts, that they very well resemble a Goats Hoof; being brown above, and white beneath, and is more torn on the edges, when it grows old, than when it is new sprung up, or is but young.

XIX. 16. *Amanita Pauli Aginetæ*. These have their Stalks sometimes bigger in the lower part, than the upper Bole is: and are much discolored with blew, green, and brown, or yellowish, as in some, the upper part of the Bole being brown; and without any Lines underneath.

XX. 17. *Fungi Lactici*, Milky Mushroom. These are of so delicate a Taste, that they are eaten raw: it is flat at the Head, and of a reddish color, yielding a sweet Milk when it is broken.

XXI. 18. *Fungi Regales*, Kingly Mushrooms. These are great, white, and round, smelling very sweet, and of as pleasant a Taste as the former, and may be given to such as are Sick, without any danger.

XXII. 19. *Fungi lingulati*, *Lingua Cæsalpini*. It grows on the Bolls of Chestnut Trees, or near them: its head is something red: and its Stalk is red, but not so red, as that of the true *Boletus*.

XXIII. 20. *Boletus Verus*, The true *Boletus*. This is white as an Egg, and of the same form when they first spring up: but after two or three days, the white Skin or Coat breaks above, and shews yellow like the Yolk of an Egg, which then grows greater, and into the form of a Mushroom (the white Skin falling away by little and little) being raised somewhat higher in the middle, and so much of a gold yellow color, that it seems deeper colored, than Saffron it self, but less yellow underneath, with as many Feather-like Lines or Divisions, or Septa as in other Mushrooms. The Stalk likewise is yellow, and an inch thick: when it grows old, it breaks into three or four parts, and looses the fresh color above, becoming more pale, and underneath almost white. These are of so delicate a Taste, that those who are accustomed to feed on Mushrooms, desire them more than any other Kind, nor can they easily be satisfied with them. They are accounted by all Hands to be very wholesome, and yet it is said that Claudius Cæsar, was kill'd with eating them. This might chance indeed after the eating of this Kind: but the question is, whether the Mushrooms were the cause of his Death, or that there might be some other cause thereof going before, or unknown, which might effect it: It is good to lay the Saddle on the right Horse. *Clausius* says, That some of these being dress'd, and Served up, as a Dish at Table, that they seem'd unto him, as if they had been colored with Saffron.

XXIV. 21. *Fungi Porcini*, *Fungi Suilli*, Swines Mushrooms. They are somewhat pointed, of a smoaky color, spotted with white spots, and underneath with blackish spots, or Feather-like lines or divisions and the upper part in some will be red. But *Cæsalpinus* says, that with them, some were of a brownish yellow above; and of an Ash color underneath.

XXV. 22. *Scarogia Cæsalpini*: These grow in Meadows, the Head being broad, and the Stalk very long, and of divers colors.

XXVI. 23. *Fungus Quercinus dissacoides*, The Bason or Teasel Mushroom growing among Oaks. Its Head is white, and like unto the common sort in form, but that the top is brown and grows to be spotted: but the chiefest matter of difference is in the Stalk, which has about the middle of it, or higher, a certain hollow Dish, like as the Teasel has, being rough and brown about the brims. The lower part of the Stalk is as it were knobbed, and blackish next to the Ground, with some hairy Fibres thereat.

XXVII. 24. *Fungus acris vel Piperitis*, *Fungus Piperitis Sapore*, The Pepper tasted Mushroom, as *Cordus* on *Dioscorides* calls it. It is white in color, and tastes sharp and hot like Pepper.

XXVIII. 25. *Fungi Prunuli Cæsalpini*. It is a very small Mushroom, of an Ash color and very sweet in smell.

XXIX. 26. *Fungi ramifici vel ramosi*, *Barba Hirci*, The Branched Mushroom. It is spread out large into many Branches, being in some yellow, in others reddish, and in others of a pale white, which they call the Goats Beard. The most conspicuous is that that which is yellow, and has white spots upon it.

XXX. 27. *Fungus Digitatus major & minor*: *Fungi Digitelli*, as the Italians call them. The Finger Mushroom. It is of a large Size, and parted as it were into long whitish Fingers, one of which will suffice a Man for a Meal.

XXXI. 28. *Fungus dentatus*, pl. *Fungi dentati*, The Toothed Mushroom. This is a small Mushroom, and a little long, being formed like unto a Tooth.

XXXII. 29. *Fungi artificiales producti*, Mushrooms produced by Art. They are made to grow at the Foot of the white Poplar Tree, within four days, by sprinkling warm Water in which some Leaves have been Decocted, and Powder of the same Leaves mixt therewith, or rather the green Leaves beaten into a soft Pulp, and so mixt with the warm Water: I say if the Water thus ordered shall be poured in upon the Root, which must be slit before hand, especially upon those parts of the Root which ly above Ground, or even with the surface of the Earth, Mushrooms will be produced in a very short time.

XXXIII. The Preparations. The order of Dressing them is various. 1. Some Boil them, and drain or press the Water out of them, and then slice them, and put Oil and Vinegar to them with a little Salt, or Sugar, as some will, and a little Spice, and so eat them. 2. Others Boil them soft in Water mixt with Vinegar and Salt, then Butter, Sugar, and Spice them, and so eat them. 3. Others Boil them in Milk, or Cream, or Fat Broth, till they are tender, then dress them up with sweet Butter, Vinegar, Salt, Pepper, or other Spice. 4. Others having cleared them, and Skin'd them, slice them, and strew fine Flower on them, and then Fry them with Oil, or Suet, or Butter, and so eat them. 5. Some Pickle them by first Boiling them soft in fair Water, mixt with some Vinegar and Salt, then taking them out they let them cool, and make a Pickle of the Liquor they were Boil'd in, by adding more Vinegar and Salt, some Spices, and a fifth part of choice Brandy, into this Pickle when cold, they put the former Boil'd Mushrooms, which will preserve them good for a Year or more, being kept close stopp'd up. 6. Some string them and dry them, and so keep them, as *Chusius* says, and some Salt them, and so keep them until Winter, and then Boil, Dress and Eat them. 7. Some Boil them with Wild, Choaky, Sower Pears, and then Dress them as aforesaid, and so Eat them; for thus (as Authors say) they may be Eaten without any danger: and if Wild Pears cannot be gotten, the Sowerer and Harsher sorts of other Pears may be used: *Garlick*, *Onions*, and Vinegar are also conducing to the same purpose.

II. The Non-Edible or Poisonous Mushrooms.

XXXIV. 1. *Pruneoli*, *Fungi Pruneoli*, The Plum-Tree Mushrooms. Some grow under the Trees in the beginning of the Year, of differing forms and largeness: and some grow many together, from one and the same Root, as it were, with little or no Stalk at all: some are round fashioned; some are Cornered; some are larger, and some smaller than others, all of them being mixt with white, pale, yellowish, and brown together.

XXXV. 2. *Fungus Fimetarius*, *Fimetarii*, The Dung Mushroom, because found growing among Dung. It is of a round flatness, somewhat thin, white, and covered as it were with Meal all over, having brown Septs underneath.

XXXVI. 3. *Fungus Coryleti*, *Fungi Avellanei*, The Mushroom growing under Haste Trees. It is sometimes of a whitish red, and as it were smok'd over; it is round, and somewhat broad.

XXXVII. 4. *Fungus Corneolus*, Flesh colored or Coral-like colored Mushroom. It is full of round yellowish Spots above, and pale yellow underneath

full of blackish Septs, or Divisions, found much in Wales.

XXXVIII. 5. *Bufonei*, *Fungi Bufonei*, The Toads Mushroom. It is of a wan color, and round like an Helmet, or more yellowish, but smoaky; or else more flat and reddish with some Spots.

XXXIX. 6. *Fungus Ruber parvus*. The small red Mushroom. It is very small and round, not exceeding the Nail of ones Finger: reddish above, and very hollow underneath. It is called also *Fungus Hircinus*.

XL. 7. *Boletus nothus*, *Fungus Boleti similis*, The Mushroom which is like to the true *Boletus*. It is about half an Inch broad, spiring a little at the top; of a whitish color, with a long Stalk, and of the bigness of ones little Finger. This is also called, the *Fool's Mushroom*.

XLI. 8. *Fungus Muscarius*, The Fly-bane Mushroom. Of this there are two or three sorts, some of them being greater and broader than others; some much redder and spotted with white Spots, all which grow in Woods which have been fell'd. They are said to kill as many Flies as sit and feed on them, as well when they are dry, as when they are fresh.

XLII. 9. *Fungi Letbales albi*. These are found in fell'd Woods about August: One whose Stalk is larger below than above, and the Head or Top round and of a pale whitish color, but no bigger than the bottom of the Stalk.

XLIII. 10. *Fungus Letbalis niger*, The black Deadly Mushroom. This Kind is much frequent with us, and is of a blackish color, much rent or torn on the edges, and hanging lank about a small long Stalk.

XLIV. 11. *Fungi Letbales Varij*, *Fungi Letbales edulis similes*. These are of divers sorts, which because they are so like to some of the Edible Kinds, have deceived many which have gathered them, and are often a sudden Death to such as eat them. Of which some are reasonably small, others very large; and most of them are of a beautiful Aspect, either whitish or reddish, or more red, and as it were smok'd over.

XLV. 12. *Fungi abietales hirsuti*, Mushrooms growing under Fir-Trees. These are like to the Edible ones which grow in the same places, and have no other difference, but that these are hairy underneath, for which reason they are refused to be eaten.

XLVI. 13. *Phallus Hollandicus* (as *Adrianus Junius* calls it) The Hollanders Tool, or Working Tool. At its first rising up, it is somewhat round; but the Skin breaking, there rises up a Stalk of the thickness of ones Thumb, and of a fingers length, something like to the Penis of a Dog, having a Nut, or Cap on the top, an Inch thick, of a blackish green color at first, and after blacker, with certain Cells or hollow places in it. The lower part or Purse from whence the Stalk rises, is of an Ash color, and sometimes brownish: the Stalk at first is white, but afterwards of divers colors and spotted. This Kind sinks at the best, but withering, it is turned into a moist blackness, coloring the very Ground on which it falls: and Flies are kill'd which feed thereon. *Junius* says, It is plentifully found on the Dutch Sea Shores.

XLVII. 14. *Fungus imbricatus dispositus versicolor*. The folded changeable Mushroom. This grows on Cherry Trees which begin to putrify: It is a Kind which rises up many together laid flat one upon another, about an Inch or more broad below, and spreading to be 3 or 4 Inches above, and about half a Foot high, being of divers colors on their tops, the edges being of a deep red color, with a mealy white List

or Border about. The lower part for an Inches breadth upwards, is a pale whitish color, up higher it is yellow and red mixt together, crossing it a-thwart, then yellowish, and above it red and yellow mixt again; and then yellow to the very edge, but marked with several smoky Spots, pale or yellowish underneath. This is deleterious being given to Men; but dryed and made into Powder, it is said to be safe to be given to Cattel.

XLVIII. 15. *Fungi rotundi & albi magni*. They are large, round, and whitish, full of black Septa or Lines from the Center to the Circumference, both above and below; but those which are above are greater, and not straight as those below, and a little waved; the edge also is finely dented about.

XLIX. 16. *Fungus Hacknienfis*; The Hackney Mushrom. It is small, dented in like manner about the edges, and of a black Chestnut color, but not striped above, and has been found about Hackney.

L. 17. *Fungi Ligni*. These grow on rotten Boards and Timber, which ly, or are set into the Earth, and are small like a green Fig, having small Seed within them.

LI. 18. *Fungus Capiribus Terræ similis*, The Mushrom much like to a Fuf's Ball. It is round like a Fuf's Ball, of a brownish color above, and of a dark red underneath, which when they are broken are of a blewish green color.

LII. 19. *Fungus Clypeo vel Scutulo similis*. These are some of them like Brimble's Hats, many growing together: and some of them broad like Shields, with their Brims turned up.

LIII. 20. *Fungus cancellatus*, *Lupi crepitus* efflorescens Columnæ. It has a small stringy Root, differing from all others, and is a round white Fungus at first; which afterwards breaking open, divers reddish Branches do arise from it, which do all join together; making round Arches of hollow netted Bars, or Lattices as it were, separated one from another. It has a very stinking smell, from whence came the Name. It is much eaten by Flys.

LIV. 21. *Fungi Auriculis Jude similes*, Mushrooms like to Jews Ears. These grow upon the Arms, Bodies, or Stocks of Trees, which are rotting or dead, or at their Roots, or upon dry Boards. They are very much differing, yet none of them are of the hardness of Touch-wood: Some of them are like unto Jews Ears, either whitish or yellowish, crumpled, and of a skinny substance like them.

LV. 22. *Fungus multicaulis*, *Fungus multiplex*. This Grotes like the Common Mushrooms very many together, on several Stalks, differing in brounness, whiteness and redness one from another, and all rising from one and the same Root: They grow either on the rotten Arms of Trees, or dead rotten Bodies of Trees, lying upon the Ground.

LVI. 23. *Fungus Fruticosus argenteus*, The Silver colored Shrub-like or Branched Mushrom. It grows like a Shrub with many Branches, which are of so pure a whiteness that they seem as if they were made of pure Silver, if they were shining withall. This has oftentimes no Stalk, or of it has one, 'tis not above half an Inch long, and grows on the rotten Bodies of Trees, which ly rotting upon the Ground.

LVII. 24. *Fungus Cineræ forme*, Artichoke-like Mushrom. Its Stalk is like unto other Mushrooms, but the Head is made of Scales, like unto an Artichoke, of a faint yellowish color. It is found growing in Kent, near Ashford, also on Bromly-Green, and at Warehorn in Rumney-Marsh.

Clusius, *Bauhinus*, and other Authors, have given us a great many more than we have Described, they are too numerous for our design, and serve for no purpose, and therefore it would be in vain for us to exhibit all their Varieties here. For as much, as they have no peculiar properties yet known, for the benefit of Man-kind, and withall, are most of them perfect Strangers in our Climate.

CHAP. DXI.

of MUSTARD Garden.

I. **T**HE Names. It is called in *Arabic*, *Curdal*: in *Greek*, *Σινάμι*, *Σινάμι*, *Νάρι* *Aristophanis* & *Athenai*: in *Latine*, *Sinapi*, and *Sinapis*: and in *English*, *Mustard*.

II. The Kinds. There are three Generick Kinds of Mustard, viz. 1. *Sinapi Sativum vel Commune*, Our Common or Garden Mustard, of which in this Chapter. 2. *Erysimum*, *sive Irio*, Hedge Mustard, of which in Chap. 512. 3. *Thlaspi*, & *Thlaspe*, Treackle Mustard, of which in Chap. 513. following.

III. The Kinds of our Common Mustard. There is, 1. *Sinapi sativum*, *Sinapi primum Matthioli*, Garden Mustard. 2. *Sinapi Sativum Rapisfolio*, *Sinapi Burse Pastoris folio Lobelij*, *Sinapi tertium Matthioli*, *Sinapi Sylvestre Dodonæi & Lugdunensis*, *Eruca sativa Fuchsi*, *Eruca hortensis Turneri*, Common broad Leav'd Mustard. 3. *Sinapi album*, *Sinapi sativum alterum Lobelij*, *Sinapi album*, *Officinarium*, White Mustard. 4. *Sinapi agreste*, *Sinape agreste Burse pastoris folio*, *Sinapi Sylvestre Dodonæi*, *Sinapi Eruca folio Bauhini*, Wild Mustard: of all which in order.

The Descriptions.

IV. The first, or Garden Mustard. It has a Root which is tough and white, running deep into the Ground, with many small Fibres adjoining to it. From whence rises up great rough, long, divided, Leaves, of an over-worn green color, like to those of the Turnep (as Gerard says) but rougher and lesser. The Stalk is round, rough and hairy, three, four, or five Feet high, divided into many Branches, on which grow many small, pale, yellow Flowers, in a great length, which turn into small, slender, long, rough Pods, in which is contained small blackish Seed inclining to redness, of a fiery, sharp, biting Taste.

V. The second, or Common broad Leav'd Mustard. Its Root is small, long, and Woody when it bears Stalks, and perishes every Year. Its Leaves are long, large, and broad, and very much jagged, with uneven and unorderly gashes, much like to Turnep Leaves, but lesser, and not so rough: The Stalks are round and smooth, and grow sometimes to be four, five, or six Feet high (according to the goodness of the Soil) spreading themselves out into many Branches from the middle up to the top, having such like Leaves as the former, but smaller, and towards the tops, growing long and narrow, growing on short foot Stalks. Upon these Branches grow small,

MUSTARD Common.

Small yellow Flowers one above another, to the tops; after which come small Pods standing upon short foot Stalks, in which are contained round reddish or yellowish Seed, which is sharp, hot, and biting upon the Tongue.

VI. The third, or White Mustard. This in its Root, Leaves, and Stalks is much like to the first

MUSTARD White.

described, but only it is lesser, and grows not so high; the Stalks are more whitish; its Flowers are yellowish like the former, and its Pods are rough and crooked, in which are contained whitish Seed, which is also very sharp and biting. These three Kinds of Mustard, just now described, have been so briefly treated of by all Authors, that it is hard to give the true differences of them; and a matter of more difficulty than could have been expected in a thing so commonly known and used as Mustard is.

VII. The fourth, or Wild Mustard. It has a Root which is long, not very large, but Fibrous, from whence rise up Leaves like those of Shepherds-Purse, but larger, and more deeply gash. The Stalk is round, rising up to be about two Feet high, (but the whole Plant is lesser than any of the former:) It is spread out into Branches towards the Top, and its Spikes are furnished with small yellow Flowers, made of four Leaves apiece; after which follow the Pods, which are small and slender, wherein is contained brownish or reddish Seed, lesser than any of the former, and not full out so sharp or biting.

VIII. The Places. The first is not found Wild with us, but grows only in Gardens. The second and third, grow also in Gardens, but are oftentimes found growing Wild in the Borders of Fields, and in low Rills and Furrows: the last only grows Wild. *Johnson* upon *Gerard* says, that our Common Mustard, and the other two sorts, viz. the three first Kinds, grow Wild in many places of this Kingdom, and might all three be found on the Banks of Ditches, about the back of Old Street near London, and in the way to Islington; in which last I have for several years together found them growing.

IX. The Times. They are all Annual Plants, and may be Sown in the beginning of the Spring: they come to perfection in the same Year they are Sown, they Flower in July; and their Seed is ripe in July and August.

X. The Qualities. Mustard Seed (which is part of the Plant which is chiefly used) is according to *Galen* hot and dry in the fourth Degree: it is Aperitive, Absterfive, Attractive, Anodyne, Carni-native, Cosmetick, Digestive, Discaussive, Diure-tick, Incisive, and Suppurative: Cephalick, Neu-rotick, Stomatick, Pectoral, Nephritick, Hyfterick, Arthritick: Parmick, Alexipharmick, and Sper-matogenetick.

XI. The Specification. It is found by Experi-ence to be of especial use, to provoke the Terms in Women, provoke Urine, and give ease in the Strangury, Stone and Gravel: it Cures Hyfterick fits, pains of the sides and Spleen, Tooth-Ach, Kings Evil, Gout, Cramp, and Convulsions of the Bowels; and prevails also against Agues, Epilepsy, Lethargy, Carus, Vertigo, expels Poyson of all sorts, is good against Impotency in Men, and re-moves Scabbiness, and other Defædations of the Skin.

XII. The Preparations. These are all of them taken from the Seed; and considering the exceeding usefulness of it, they are not many neither, being these few following, viz. 1. A Powder. 2. A Condiment. 3. An Infusion. 4. A Cataplasim. 5. A Spirituous Tincture. 6. An Acid Tincture. 7. An Oily Tincture. 8. A Saline Tincture. 9. A Spirit. 10. A Distilled Water both from the Seed alone, and from the Leaves alone: also from Seed and Leaves together. 11. An Oil of the Seed by Expression. 12. An Errhine.

The Virtues.

XIII. *The Powder of the Seed.* Given from a Scruple to 2 Scruples or a Dram, mixt with some proper Syrup, or in Wine, or other fit Vehicle, it provokes Urine, and the Terms in Women, is good against Epileptic, Lethargick and Hysterick Fits, the Nostrials, Temples, and Forehead being rubbed with the *Condiment*, for so it allays the Vapours, and quickens those dull Spirits, which were asleep as it were, or almost dead; for by its Volatile and Sharp Particles, it pierces to the Brain, and purges it of the Recrements which offend, by Sneezing, and drawing down the Rheum, and other Viscous and Clammy Humors which hurt the Nerves, and cause a perturbation of the Spirits, and may otherwise fall upon the Lungs and Thorax, and so cause Coughing, Wheezing, Hoarseness and shortness of breath. It comforts and Warms the Stomach, helps Digestion, and cleanses the Head, Brain, Thorax, and Lungs, of cold, viscid, pituitous Humors. Taken to the quantity of a Dram, made up into a *Bolus* with Syrup of Citron Peels, resists and expels Poyson, and does wonderfully provoke Lust, and being continued for some time, cures Impotency in Men: warms and comforts the Womb in Women, and causes Fruitfulness. It also eases the Pains of the Spleen and Hypochonders, the Gnawings and Tortions of the Bowels, and resists and expels Poyson of all Kinds.

XIV. *The Condiment or Sauce.* It is made of the Seed by Grinding it with White Wine Vinegar, or with warm Water, adding a little Brandy to either of them; and it is Ground either in a small Quern, or Mill, or in a large Bowle, with a Cannon Iron Bullet by rouling it up and down upon the Seed. It is used as a general Sawce both for Flesh and Fish, and is indeed a very wholesome and excellent thing; and has all the Vertues of the Powder aforegoing: being given as a Medicine, it may be taken from a Dram to two or three Drams in a Glas of Wine; and so it is profitable against Convulsions, the Palsie, Megrim, and all sorts of Poyson, it resists the Malignity of *Multhroms*, the Venom of the Scorpion, the bitings of Vipers, Mad Dogs, and other Poisonous Creatures.

XV. *The Infusion or Decoction.* It is commonly made in Wine, and has all the Virtues of the Powder, being given from 2 Ounces to 4. It provokes Urine powerfully, gives ease in the Strangury, expels watery Humors from the whole Body, and evacuates them by the Reins and Bladder, and so has been found of admirable Use in curing the Dropfie. It powerfully resists Poyson, not suffering the Virulency thereof to smight the Spirits or Vital parts, to the overthrow of Life; but immediately Masters or overcomes it, if taken in time. Taken an Hour or two, before the Fits of Agues, it so warms the Blood and Spirits, that it keeps back, and lessens the cold Fit, and so thereby alters the course thereof, and at length cures it. Made into a Gargle with some of the *Condiment*, it helps the weakness or hanging down of the Uvula, commonly called the Palate of the Mouth, and as an Apoplegmaticum draws Humors from the Head, Brain, Jaws, Teeth, Almonds, and parts adjacent to the Neck, whereby it prevails against Lethargy, Carus, Palsie, Convulsions, and Stumous Swellings about the Neck and Throat, commonly called the Kings Evil. The *Infusion* prevails against Impotency in Men, and stirs up bodily Lust in Wo-

men, and is admirable against Wind in the Bowels, and Pains and Stitches in the Sides.

XVI. *The Cataplasme.* It dissolves, rarifies, and draws out Thorns, Splinters of Bones, or other things out of the Flesh. Applied to the warm Forehead, and Temples, it warms and quickens the Animal Spirits, and is good against all cold and sleepy Diseases of Head, Brain, and Nerves. Applied to Scrophulous Tumors or Kernels in the Neck, and about the Throat, it is said to Dissolve or Dissolve them. Applied upon the pained place in a Sciatica, as also in the Gout, and other Joint Diseases, it eases or lessens the Pain, and dissolves the Humors abounding in the part. It eases Pains in the Side, as Stitches, Spleen, &c. pains in the Back and Loins, Shoulders, and other parts of the Body; it many times raises Blisters (if mixt with Leaven) and by drawing the Pains to the place from the inward or more remote parts, it many times cures the Disease, or divers it to those outward places where Topicks being applied may do the Cure. Being immediately applyed upon the Biting of a Mad-Dog, or of a Viper, Rattle Snake, or other poisonous Creature, it attracts and draws forth the Poison, and so prevents the danger which might ensue. Applied also (mixed with a little Honey) it takes away black and blew spots or marks of Beatings and Bruisings or the like, it dissolves simple Contusions, and removes the roughness of the Skin, also Scabbiness, Scurf, Morpew, Leprosie and the Loufie Evil: it gives ease also to the Crick in the Neck, or when it is so pained, that the Head cannot be turned, without turning the whole Body.

XVII. *The Spirituous Tincture.* It is an excellent thing against the Palsie and Gout, and has all the Virtues of the Powder, and Infusion aforegoing, and may be given inwardly from a Dram to two Drams, in a Glas of Canary or other Generous Wine, two or three times a Day; and outwardly it may be Bathed upon the parts affected. It is an incomparable Stomack, warming and comforting the same, and gives present ease in all extrem pains and griefs of the Stomach and Bowels, proceeding from an Acid Humor.

XVIII. *The Acid Tincture.* It prevails against all internal Poisons, is good against loathing, Vomiting, and other weaknesses of the Stomach; it causes a good Appetite, and a strong Digestion, and puts a good color into the Face. It opens obstructions of the Viscera, allays Vapors powerfully, and by a continuall use of it for some time, it cures Fits of the Mother: It may be given in a Glas of Ale, Beet, or Wine, so many Drops at a time as to make it Pleasantly Acid, and to be taken, two or three times a Day, or in all that the Patient drinks. It is much better in Wine than in any other Vehicle: and I am apt to believe (from my own great Experience of it) that it is one of the best Remedies against the Scurvy in the World, and for which it ought to be esteemed as a Jewel.

XIX. *The Oily Tincture.* It is good against the Colick tho' never so extreme, as also against the Stone, Gravel, Sand or Tartarous Mucilage whether in Reins or Bladder. It provokes Urine powerfully, eases the Strangury, induces the Terms in Women, and facilitates the Birth of a Woman in Labour, and forces away the After-birth: and being prudently used, it not only causes a due cleansing, but also prevents After-pains: It has all the Virtues of the Powder and Infusion, and may be given from 12, to 20, 30, or more Drops, according as the exigency and occasion may require. Outwardly anointed upon any part, it eases all pains proceeding from a cold cause, and is of singular

ingular use against the Palfie, Trembling, Numbness, Convulsions, Cramps, and other like Diseases of the Nerves and external parts.

XX. *The Saline Tincture.* It is a good discutient and absterfiv, is profitable against Spots, Freckles, Sunburnings, Tanning, and other discolorings of the *Cuticula*: It is excellent against Scurff, Morpew, *Leuca*, Leprosie, as also good against Scabs, Itch, Pimples and other Breakings out, and cleanses the Face and Skin from all other Deformities thereof.

XXI. *The Spirit.* It comforts the Head, Brain, Nerves and Heart, revives the Spirits Animal, Vital, and Natural; Dissolves all congelations of the Blood and Humors, makes them thin and fluid, and to run freely in their Vessels; and is profitable against Asthmās, and most Diseases of the Stomach and Lungs, causing a free and easy respiration; and is a powerful thing against all sorts of Convulsions in young or old, as also the Palfie, or other like Distempers of the Nerves. Dose from one to two Drams in a Glas of Wine, Morning, Noon, and Night.

XXII. *The Distilled Water.* It has the Virtues of the *Powder*, *Infusion*, *Tincture* and *Spirit*, but nothing near so powerful, and may be given from two to four Ounces, in a Glas of Wine. It provokes Urine, and gives ease in the Strangury: It is good to make a Gargle for a sore Mouth and *Uvula*; and used outwardly in a Wash, it is a Cosmetick, and is good against all Defecations of the Face and Skin, cleansing and clearing them from their Deformities. If it is Distilled also from the *Herb when in Flower*, it is good, and may be used to all the purposes aforesaid; but it is not full out so prevalent, as that which is distilled from the Seed.

XXIII. *The Oil of the Seed by Expression.* Schroder says, it is good in cold Diseases of the Nerves: it certainly eases pains arising from a cold and moist cause, is good against Palfies and Convulsions, and strengthens parts which are weak.

XXIV. *The Errhine.* It purges the Head admirably, of cold, moist, viscous, and pituitous Humors, is good against Catarrhs and distillations of Rheum upon the Lungs, clears the Eye sight, and draws off Humors which settle upon the *Amigdalæ* and parts adjacent belonging to the Throat; and being often used is of singular use against the Kings Evil, because it attracts and draws away much of the Morbifick Matter causing the same.

plien Dioscoridis: in *Latine*, *Erysimum*, & *Irio* *Plinij*, lib. 28, chap. 10. *quod ab acrimonia sua irritu in guttum*: in *English*, *Hedge Mustard* and *Bank-Cress*.

II. *The Kinds.* Authors have made many Species of this Plant: there are but three which we shall take notice of in this Work, viz. 1. *Irio*, sive *Erysimum Vulgare*, *Hierabotane* *Femina* *Brumfelfij*, *Sinapi septimum* *Tragij*, *Sinapi alterum* *Sylvestre* *Luclij*, *Erysimum* *Sinapi Sylvestris* *Species Gesneri*, *Irio Matthioli*, *Cordi*, *Loniceri*, *Lugdunensis*, *Cesalpini* & *Lobelij*, *Cleone* *Olavij* *Heratij* *Anguiluræ*, *Erysimum vulgare* *Baubini*, Our Common *Hedge Mustard*. 2. *Erysimum Verum*, sive *Montanum*, *Irio alter* *Matthioli*, *Lugdunensis*, & *Camerarij*, *Erysimum verum* *Anguiluræ*, *Irionis* *tertia Species Cesalpini*; *Saxifraga Romanorum* *Lugdunensis*, *Erysimum Polyceraton vel corniculatum* *Baubini*, The True *Hedge Mustard*. 3. *Erysimum alterum* *siliquis Erucæ* *Baubini*, *Erysimum secundum* *Tabernemontani*, *Erysimum Latifolium* *Parkinsoni*, Our broad *Leav'd Hedge Mustard*.

The Descriptions.

III. *The first, or Our Common Hedge Mustard.* Its Root is slender and Woody, running down deep into the Earth, abiding all Winter, and Springing up again every Year. From this Root, it usually Springs up, with but one blackish green Stalk, tough or limber, easy to bend, but not to break, spread out

Hedge Mustard Common.

into several Branches; and sometimes with divers Stalks, set full of Branches, on which grow long, rough or hard rugged Leaves, very much cut in or torn on the edges into many parts, some bigger and some

CHAP. DXII.

OF MUSTARD Hedge;

O R,

BANK -- CRESS.

I. **T**HE Name. It is called in *Greek*, *Ἐρύσιμον*, and is given quod ob suam caliditatem attrahendi facultate præditum est: also *Χαμαίριον* *Chame-*

some lesser, of a dirty or dull green color. The Flowers are small, and of a yellow color, consisting for the most part of four small Leaves, which grow at the tops of the several Branches in long Spikes, Flowering by degrees: so that continuing long in Flower, the said Stalks, or Branches will have small round Cods at the bottom, growing upright, and close to the Stalk, whilst the top Flowers yet show themselves: in which Cods or Pods, are contained small yellow Seed, which is sharp and strong, as the Herb it self also is.

IV. The second, or True Hedge Mustard. Its Root is small, and perishes after Seed time, but by sowing it self, it never misses to be in the Ground where it once has Seeded. From this Root spring up divers large winged Leaves, of a fresher green color than the former, and something smaller than the following third Kind, which are cut in on both sides into several parts, but smaller, resembling the divisions of some of the Leaves of

True Hedge Mustard.

Dandelion, or rather, like to Rocket Leaves, each part or corner looking downwards, the end division of the Leaf being largest, almost oval, but sharp pointed, and unevenly dented upon the edges. From among those Leaves rise up sometimes two, sometimes three Stalks, and sometimes but one, as is most usual, which is round and about half a Yard high, having on them a pretty many of those like Leaves, but smaller; the Stalk or Stalks, spread themselves out into Branches towards the top, from all which come forth very small yellow Flowers, consisting of four Leaves apiece, after which follow robitish, yellow small Cods or Pods, growing like the former close to the Stalk, making a pretty long Spike, which has also Flowers continuing at the top, till the Flowering time is over. These Pods contain within them small yellow Seed; not full out so sharp or strong as the former, yet something quick and biting upon the Tongue.

V. The third, or Broad Leav'd Hedge Mustard. Its Root is not so long, nor Woody as the first is; but it is more fibrous, an Annual, not abiding above a Year. From this Root spring up two, three, or more dark green Leaves, which are winged, pretty large, bigger than either of the former, and divided into several unequal parts down to the very middle Rib, viz. into three or four several divisions, with almost equal gashes on each side, each of which divisions are small towards the bottom or foot Stalk of the

Mustard Hedge broad Leav'd.

Leaf; growing larger as they are higher, but the end division or Leaf is the largest of all, which is also gasht somewhat deeply on each side, and sharp pointed at the very ends; each several part of these winged Leaves, are unevenly dented about their edges, the lesser in like manner dented as the greater. The Flowers are small and yellow, consisting of four small Leaves apiece: which being past away, leave long round Pods standing upright and close to the Stalk like the former, making a Spiked Head like the two first, not altogether so long, but a little bending withall, the Pods themselves being a little shorter, almost like those of Rocket.

VI. The Places. The first is very frequent thro' all England by High-ways, and Hedge and Ditch sides, and sometimes on the tops of open Fields: It grows in Gravelly and Stoney Places among Rubbish, as also upon Earth or Mud-Walls, and in other Untilled places. The second grows in like Places as the first as Matthioli says, and is very frequently found wild in Italy; with us it many times grows in Gardens: Gerard says, he found it growing at a place by Chelmsford in Essex, called little Badden, and in sundry other places. The third, is not altogether so common as the first, but is more rare to be met withall; yet it is sometimes found,

but

but still in the better Grounds, for which reason it grows so large.

VII. *The Times.* It Flowers in *June* and *July*, but most usually in the latter Month: and the Seed is ripe in *August*, or not long after.

VIII. *The Qualities.* The Seed is chiefly in use, and is said to be hot and dry in the second Degree: it is like in Taste to *Garden Cress*, and is as *Galen* says, of a heating Quality, consisting of a thin Substance, does exceedingly attenuate, and is of a cutting, cleansing nature. It is *Aperitive*, *Absterfive*, *Vulnerary*, *Pectoral* and *Alexipharmick*.

IX. *The Specification.* It is a singular thing against *Asthma's*, for it not only helps *Wheezings*, *Hoarseness*, and difficulty of breathing, but also is said to restore such as have lost their Voice, and therewith their Spirits almost also. It is prevalent against the *Jaundice*, *Griping* of the Guts and *Poison*; gives ease in the *Gout* and *Sciatica*, and induces the healing of hollow *Ulcers*, *Fistula's*, running and eating *Sores*, *Cankers* in the Mouth and Throat, &c.

X. *The Preparations.* You may have herefrom, 1. A *Liquid Juice* or *Essence*. 2. A *Decoction* in *Water* or *Wine*. 3. A *simple Syrup* or *Loboc*. 4. A *Compound Syrup*. 5. A *Powder* of the Seed. 6. A *Cataplasim* of the Seed.

The Virtues.

XI. *The Liquid Juice* or *Essence.* They are made of the whole Plant when in Flower. They are very good for such as have the yellow *Jaundice*, the *Plurisie*, pains in the Back and Loins, as also for *Tortions* and *Gripings* in the Belly, and the *Colick*, or for such as have taken *Poison*; being given inwardly from two Spoonfuls to four, in any proper Vehicle; or given by *Clyster* in double that quantity, in a sufficient quantity of Mutton Broth.

XII. *The Decoction of the whole Plant in Wine or Water.* It has the Virtues of the Juice or *Essence*, comforts and warms the Stomach and Bowels, and is good to heal *Excoriations* of the Guts: especially being used *Clyster*-wise. Old running *Sores* and *Ulcers*, *Fistula's* and eating *Cankers* in the Mouth or other parts, being washed therewith it induces their healing.

XIII. *The simple Syrup* or *Loboc* of the Juice of the Plant. It is made with *Hony* or *Sugar*, by gently boiling them together, and despumating the mixture. It is inciding and cleansing, and causes an Expectoration of *Viscid*, or tough, or Salt *Flegm* from the Stomach and Lungs, making it easy to be spit forth: and indeed it is a very good thing in most Diseases of the Lungs, as *Hoarseness*, *Wheezing*, *Vehement Coughs*, *Asthma's*, or difficulty of Breathing, and shortness of Breath: as also for such as have utterly lost their Voice, with a kind of sinking of the Spirits, it being taken every day, four or five times a day or oftener, for some reasonable time.

XIV. *Syrupus de Eryfino Compositus.* The Compound Syrup of Hedge Mustard. Take Hedge Mustard (the whole Plant) fresh gathered when in Flower 6 Handfuls; Leaves of Borage, Cichory, Maiden-Hair, of each 2 Handfuls, of the Cordial Flowers, Rosemary, Betony, of each half a Handful; Raifons stoned, Roots of Elecampane, Colts-foot,

Liquorice, of each 2 Ounces; Aniseeds half an Ounce; Water, Hydromel, of each 2 Pound and half; Juice of Hedge Hyssop depurated 8 Ounces: Digest a whole Day; afterwards Boil in Balneo, pressing out the Liquor strongly: to 4 Pounds of which Clarified Liquor, add Sugar Candy 4 Pounds and a half, and make them into a Syrup in Balneo according to Art. It is a very good Pectoral, and causes easy Expectoration of *Viscid Flegm*, or other putrid Matter out of the Lungs, curing most Diseases of that Viscus; as *Asthma's*, *Hoarseness*, *Wheezing*, shortness of Breath, spitting Blood, *Ulcers* in the Lungs, *Vehement Coughs*, &c. Dose an Ounce and half or more at a time, twice a Day, either alone, or mixt with some proper Vehicle.

XV. *The Powder of the Seed.* It is held to be a special remedy against *Poison*, being inwardly taken from half a Dram to a Dram or more, mixt with *Hony*, or in *Syrup of Green Ginger*, or of *Citron Peels*; it is also prevalent against the *Colick*, and all other inward Pains, and Tortions of the Stomach and Bowels: it provokes Urine and the Terms, gives ease in the *Strangury*, facilitates the Birth, and forces away the After-Birth, given in a Glas of White Port or Lisbon Wine: made into a Loboc with *Hony*, it causes easy expectoration of cold pituitous or corrupt Matter, out of the Breast and Lungs, is prevalent against *Coughs*, *Catarrhs*, *Asthma's*, and other like Distempers of those parts, and has all the Virtues of the Juice, *Essence*, *Decoction* and *Syrup*, aforegoing.

XVI. *The Cataplasim.* It is made of the Seed bruised and mixed with *Honey*. Applied, it is singular good for pains, in the Hips, or Huckle Bones, called the *Sciatica*, the Gout, and all other pains of the Joints; as also for *Fistula's*, hollow *Ulcers*, running *Sores*, and eating *Cankers*, in Mouth or Throat, or behind the Ears, as also for the hardness or swellings of Women's Breasts, or in the Testicles or Stones.

CHAP. DXIII.

Of MUSTARD Treacle;

OR,

Mithridate MUSTARD.

I. **THE Names.** It is called in Greek, *Ἐνδομύς*, *ἡ ἑνδομύς*, *Thlaspi*, & *Thlaspe*, quod fructus quasi infractus: & *ἑνδομύς*, *Thlaspidion*, quasi fructum Clypeatum: also *Σύννη ἀγρον*, *Sinape agreste*: in Latine, *Thlaspi* also: yet some do call it *Capfella*, *Scandulaceum*, *Nasturtium Testorum*, & *Sinapi rusticum*: In English, *Treacle Mustard*, and *Mithridate Mustard*, because the Seed hereof is used to be put in Treacle or Mithridate.

II. *The Kinds.* There are at least Nine Generick or Principal Kinds of this Plant, as, *Thlaspi arvense*, the Field Kind: *Umbellatum*, the Umbelliferous: *Creticum*, the Candy Tufts: *Montanum*, the Mountain: *Clypeatum*, the Buckler-like: *Fruticosum*, the Shrubby: *Exoticum*, the Strange: *Dra-*

ba, vel Arabis, the Arabian: And *Turritis vel Turrita*, the Towering. Each of these diversifie themselves again, into several other Species; so that of them all, or in the whole, there are about three-score several Kinds. But whereas the greatest part of them are unknown to us, and neither grow in the compass of our British Islands, nor yet in our Plantations abroad in the West-Indies, We shall permit the greater part of them, and only Describe such as grow either Wild in our Fields and by Ways: or in the Gardens of our Country and Plantations, and are daily used in Physick, which are these following, viz. 1. *Thlaspi Drabe folio Lobelij*, *Scorodo-Thlaspi Dodonæi* & *Dalechampij*; *Thlaspi secundum Matthioli*, *Platycarpon Camerarij*; *Thlaspi arvense siliquis latis Bauhini*, Treacle Mustard with broad flat Pouches. 2. *Thlaspi Majus Tabernamontani*; *Thlaspi arvense Acetosæ lato levigato folio Gerardi* & *Bauhini*, The greater Treacle Mustard. 3. *Thlaspi Vaccariæ folio Vulgatifimum*, *Thlaspi Mithridaticum*, *Thlaspi primum Matthioli*, *Thlaspi Vulgatum Bauhini*; *Thlaspi verum cujus semine utimur in Theriaca Camerarij*; *Thlaspi Cardaminoides Cordi*; *Thlaspi Vulgatum* & *Thlaspidion Vulgare Trogi*; *Thlaspi arvense incano folio majus Bauhini*, The greater Mithridate Mustard. 4. *Thlaspi minus*, & *Thlaspi minus Vaccariæ folio*, *Thlaspi Theriacum vel Mithridaticum minus*, the lesser Mithridate or Treacle Mustard, French Treacle Mustard. 5. *Thlaspi arvense perfoliatum majus Bauhini*, *Thlaspi primum Dalechampij*, *Thlaspi oleraceum Tabernamontani* (because it is almost without Taste) *Thlaspi alterum burse pastoris fructu Columnæ*, the greater Treacle Mustard with Throughwax Leaves. 6. *Thlaspi Americanum*, *Thlaspi Spanospermon Americanum Cortusi* (as he calls it in his History of Canada) American *Thlaspi* bearing little Seed, or rarely bearing Seed. 7. *Thlaspi Creticum flore albo* & *Purpureo*, Candy Tufts with white and purple Flowers. 8. *Thlaspi Beticum Morinum*, Spanish Tufts. 9. *Thlaspi Creticum album umbellatum majus*, the great white Candy Treacle Mustard. 10. *Thlaspi Hederaceum*, Ivy Leav'd Treacle Mustard. 11. *Turritis sive Turrita Lobelij*, *Turritis Vulgatiore Clusij*, Common Towers Mustard, or Towering Mustard. 12. *Draba*, & *Æsculis*, *Draba*, & *Arabis*, *Nasturtium Orientale*, *Draba vulgaris*, *Draba Umbellata Bauhini*, Arabian Mustard, or Turkey Cress.

The Descriptions.

III. The first, or Treacle Mustard with broad flat Pouches. It has a small and Fibrous Root, which perishes every Year, from which rises up a hard round Stalk, about a foot more or less high, which then is parted or spread out in some Branches, which are long and brittle, having several soft green Leaves, somewhat long and narrow, set thereon, coaved but not cut in on the edges, broadest towards the ends, and somewhat round pointed. The Flowers grow at the tops of the Branches one above another Spike fashion, after which come large round Pouches, parted in the middle with a Furrow, having one blackish brown Seed on either side, somewhat thicker and larger than in any of the other *Thlaspies*, sharp in Taste, and smelling something like Garlick, especially that which grows in the Fields, where it is natural, but that which is nursed up in Gardens is

Treacle Mustard Common.

less acute in its Taste, and not of so Garlick like scent.

IV. The second, or Greater Treacle Mustard. It has a Root long and Fibrous like the former, from whence rise up several pretty large Leaves,

Greater Treacle Mustard.

pointed

pointed at the ends, and unevenly waved, and sometimes dented unequally about the edges, which are larger, smoother, and broader than the first. Those which grow upon the Stalks, or Branches, are longer, narrower, sharper pointed, and come from the Stalks at the Joints without any foot Stalk, having at their lower end two sharp points, and divided into two parts, not much unlike to the Narrow Leav'd Arrow-Head. It rises up with one or more Stalks about 3 Feet high, on which grow the said smaller Leaves, with the Flowers on the tops of the said Stalks or Branches, in long Spiked Heads, growing one above another, small, and of a whitish color. The Seed Vessels are round, containing brownish Seed: the whole Plant is of a strong unpleasant Taste and Smell.

V. The third, or the Greater Mithridate Mustard. Its Root perishes after Seed time, but abides the first Winter after Springing. This grows higher than the first, spreading more, and having longer Branches: its Leaves are also smaller and narrower, and sometimes unevenly dented about the edges. The Flowers are small and white, and growing on long Branches, with much smaller and rounder Seed Vessels after them, and parted in the middle,

Mithridate Mustard Greater.

in the same manner, with the said first Kind, and containing within them smaller brown Seeds, which are much sharper in Taste, than the Seed of the said first described.

VI. The fourth, or Lesser Mithridate or Treacle Mustard. Its Root is a little long, and Fibrous towards its lower part, from whence spring up several sharp pointed Leaves, which are long and not very broad, very like to the Leaves of the third Kind, being smooth, and of a dark green color. From among which springs up one Stalk, (seldom any more) about half a Yard high, which is covered up almost to the top with such like Leaves, but that they are lesser, as they grow higher up, unevenly

dented upon the edges, and in some places almost like a Saw. Towards the top, the Stalk spreads it self out into many Branches, as four, five, six, seven, or more, each of which are filled and almost covered with such like Leaves, some of them dented in

Mithridate Mustard Smaller.

on the edges, and some not, they growing still shorter and shorter, also very narrow, and very sharp pointed. The Flowers are small and white, and grow one above another, at the tops of the several Branches, making each of them a long Spike: these being past away, the Seed Vessels appear, which are broad at the Head, and not much unlike to those of Shepherds Purse, but a little larger.

VII. The fifth, or the Greater Treacle Mustard with Throughwax Leaves. Its Root is long, white, Woody, and Fibrous: From which spring forth Leaves which ly upon the Ground, and are small and somewhat round, like to those of Basil, but yet a little cut or notched on the edges at the bottoms, where they are smallest, and a little dented about the other part, of a grayish green color, every one upon a small foot Stalk, among which rise up a round Stalk or Stalks a Foot high, more or less, purplish at the bottom, and sometimes spotted, on which grow single Leaves at the Joints one above another, at certain distances, which encompass it at the bottom, in the manner of Thorough-wax Leaves; and whereat likewise come forth, other smaller Leaves upon short Branches, on which at the tops of the Stalks, stand several small white Flowers, which break forth out of reddish Husks; after which small flat Pouches appear, like unto those of Shepherds Purse parted in the middle, as is usual in most of the Thlaspies, on each side whereof lie small flat yellowish Seed. The whole Plant is more milde, or less sharp than any of the former. There is another of this sort something lesser, which has a few Leaves lying upon the Ground, of a grayish green color, not much unlike to the Smaller Mouse Ear, or to Godded

Through-

Throughwax, but much lesser: those which grow up higher upon the Stalk, which is scarcely a Foot high, and but few set thereon, are still smaller, pointed at the ends, and broad at the bottoms, encompassing it like the last: the Flowers are small and white, and the Seed Vessels flat, and somewhat sharp pointed.

VIII. The sixth, or American Thlaspi rarely bearing Seed. Its Root is hard, with many Fibres adjoining thereto, which tastes sharp like Cressies. This Plant Branches from the Root divers ways somewhat thick, set with fat green Leaves, something long, not very broad, and sharp pointed, not notched, dented, or waved on the edges: The tops of the Branches or Stalks are without Leaves, but stored vassly with small yellowish Flowers, consisting of four Leaves, which endure only one day, falling away for the most part, without bearing any Seed, or if any yet very sparingly: so that on the whole Plant, there will scarcely be four or five husks of Seed gathered any Year, which are flat and a little long, like those of the Manured Wood, in which is contained a sharp tasted Seed.

IX. The seventh, or Candy Tufts, with white and purple Flowers. Its Root is small and hard, and Perishes every Year, after giving its Seed. It is but a small Plant, and seldom rises above a Foot and half high, having small, narrow, long, and whitish green Leaves, notched or dented with three or four notches on each side, from the middle to the point-wards: from among which, rise up the Stalks, Branched from the Bottom almost, into divers small Branches, at the tops whereof stand many small Flowers, put thick together in an Umbel or Tuft, making them seem to be small, round, double Flowers, of many Leaves, when as every Flower is single, and stands apart by it self, of a fair white color, in some Plants, without any spot: and in others, with a purplish spot in the Center or middle, as if some of the middle Leaves were purple. In others again, the whole Flower is purplish all over, which appears beautiful in a Garden. The Seed is contained in many small and flat Seed Vessels, which stand together in an Umbel, as the Flower did: in which are contained, somewhat reddish Seed, like unto some of the other sorts of Thlaspies, or Treacle Mustard.

X. The eighth, or Spanish Tufts. The Root of this is much like the former: from whence come Leaves (before any Stalk springs up) which are a little toothed or finely dented about the edges: the Stalk is about the height of the former, but spreads not it self out so much into Branches, but carries an Umbel of purplish Flowers like unto the former; after which comes the Seed, which is of something a paler yellow color.

XI. The ninth, or Great white Candy Treacle Mustard. Its Root is small and Fibrous, and abides many Years, not dying Annually as the others do. From whence spring up several hard and small Stalks, bearing a few long and narrow sharp pointed smooch Leaves, set one above another up to the tops, where grow Umbels of white Flowers, in broad round Tufts, somewhat larger than in those of the former Kind at Sect. IX. foregoing. The Seed Vessels are greater also, with a Pointel in the middle of them.

XII. The tenth, or Ivy Leaved Treacle Mustard. Its Root is small, long, and Fibrous, perishing every Year: which sends up many weak, slender Stalks, leaning downwards, or rather creeping upon the Ground, scarcely raising it self above a Span high, or not much higher; these Stalks are dispersedly set,

with small broad Leaves, thick and short, broad at the bottom, cornered about the middle, and pointed at the end, somewhat resembling Ivy Leaves. The Flowers are small and white, growing Spike fashion at the tops of the Stalks or Branches: which being past away, small Seed Vessels come in their places, which are parted at the ends, and contain small Seed, sharp and hot like the other Thlaspies.

XIII. The eleventh, or Common Towers or Towering Mustard. Its Root is composed of many white Fibres or Strings, abiding after it has given its Seed: but being shed, there springs up several Plants before Winter, which so abide, and Flower and Seed the next Summer. This Common Kind has many rough hairy Leaves, full of Sap or Juice, of a deep green color, about two Inches long, and more than one broad, pointed sharp at the ends, broadest in the middle, nothing dented about the edges, lying round about the Head of the Root upon the Ground. From among which rise up, several rough and hairy Stalks almost two Feet high, set orderly with such like Leaves, one above another on all sides, but encompassing them at the bottom, which are narrower than the afore described Ground Leaves, longer, or sharper pointed, broader at their joining to the Stalk, with two round corners. At the tops of the Stalks, which are seldom Branched, come forth very many small white Flowers, as it were in a Tuft, together; but Flowering by degrees, the lowermost first, and so gradually upwards, they bring forth long slender Pods presently after, which standing upright, round about the Stalks, before the highest Flowers are blown, each whole Stalk seems like a Pyramid, or Spire Steeple or Tower, from whence came its Name. In which Pods, or Pods are contained, small, brown, and sharp biting Seed.

XIV. The twelfth, or Arabian Mustard, or Turkey Cress. The more common or known Arabian Mustard (for there are 8 or 9 Kinds more, all

Arabian Mustard, or Turkey Cress.

Strangers to us) has a long, white, creeping Root, with many Fibres adjoining to it, which abides all Winter, and perishes not: but creeping along under Ground, it sends up in several places many strait Stalks, which are streaked, and set about with grayish green Leaves, somewhat broad, and not very long, a little pointed at the end, and broad at the bottom compassing them; but those which grow at the foot of them have each of them a short foot Stalk, and are all of them unevenly denuded about the edges: the tops of the Stalks are spread into some Branches, all of them rising to an equal height, with many small white Flowers set thereon, consisting of four Leaves apiece, and forming a large Umbel or Tuft, where after they are past, come forth small round Seed Vessels, divided into two parts, like some of the former Thlaspies, with a small Point at the end, in each part of which is contained one Seed, which is hot and sharp, as are also the Leaves.

XV. *The Places.* The first and third have been found growing Wild in several parts of England, as half a Mile from Hatfield by the Rivers side under an Hedge, as you Travel to Hatfield, and in the Street of Peckham on Surry side. The second and fourth are also Natives of our Land, and have been found growing Wild in several places; these four first Kinds grow Wild in Corn-Fields, upon Ditch Banks, and in Sandy, dry, and Barren Grounds, and in Stony and Unrilled places. The first of them Gerard says, he found in Corn-Fields between Croydon and Godstone in Surry; at Southfleet in Kent; and by the Path which leads from Hornsey (near London) to Waltham-Cross, and in many other places. The others he says were also found growing Wild in England in several places, which he gathered, and placed in his Garden. The fifth, sixth, seventh, eighth, ninth, and Twelfth, grow with us only in Gardens, as do also the first four. The tenth, Lobel says grows in Portland, and about Plymouth, and upon other Rocky places, on the Sea Coasts of England. This says Johnson, is a little creeping Herb, having small, red, crested Stalks, about a Span high; its Leaves are thick, and fashioned like Ivy, and the white Flowers and small Seeds do in shape and taste resemble the Thlaspies. The eleventh, delights to grow more in the open Sun upon Hilly Grounds: it has been found growing in the West of England, upon Dunghills and such like places: Gerard says, he found it by the City Walls of West-Chester: also in a Flax Ground near Cambridge: and at Pym's near Edmondston, not far from London.

XVI. *The Times.* They most of them Flower from May, through June and July to August, and their Seed is ripe about a Month after. The seventh, eighth, ninth, and tenth, Flower about the end of June or beginning of July; and their Seed is ripe not long after. The eleventh Flowers for the most part early, sometimes in April, but usually in May, and the Seed is ripe in June. The twelfth Flowers about the end of May, through June and July, its Seed ripening in the mean Season.

XVII. *The Qualities.* Treacle Mustard (the four first Kinds are chiefly used, and of them the third Species is principal, and that which is always used in Venice Treacle and Mithridate) is hot and dry in the end of the third Degree, or beginning of the fourth: Parkinson determines it to be absolutely hot in the fourth Degree, and near unto Cresses. It is Attenuating, Attractive, Aperitive, Absterfivè, Inciding, Colmetick, Carminative, Digestive, Diuretick, Stomackick, Neurotick, Nephritick, Hysterick, and Alexipharmick; for that its Seed is an Ingredient in Mithridate, and Treacle as afore-

said, being of it self an Antidote resisting Poison, Venom, and putrification, where, by its sharpness it acuates those Compositions.

XVIII. *The Specification.* It provokes the Terms powerfully, and facilitates the Birth of Women in Labor, and expells the After-Birth. And has all the other Specifick properties of Common Mustard Seed, which see in Chap. 511.

XIX. *The Preparations and Virtues,* are the same also with those of the Common Mustard Seed, in the aforecited Chap. 511. to which you are referred, but it is thought that the Treacle Mustard is the weaker (if any difference is) of the two.

XX. *Nota.* 1. *The Powder of the Seed,* given to a Drain or more, forcibly brings down the Terms in Women, and causes Miscarriage, for which cause Women with Child ought to forbear it. 2. *A Clyster made of it with Mutton Broth,* and Exhibited, gives ease in the Sciatica. So also, 3. *A Cataplasim of it* applied to the Hip or Huckle Bone, draws out the Humor, and eases the Pain. 4. *The Arabian Mustard* is as hot and sharp as any of the Thlaspies, and is effectual to the same purposes; and according to Dioscorides, is used instead of Pepper to be put among Broths and Meats. 5. *The Prison made of its Seed* is available to cut tough Flegm, which stuffs up the Breth and Lungs, and cause an easie Expectoration thereof.

CHAP. DXIV.

Of the MYRTILL.

I. *THE Names.* It is called by the Arabians, *As, Aes, & Alus*: in Greek, *Myrtinus, & μύρτινος*: Pena says, sic vocatur volunt, propter amulam Myrrhe odoris gratiam, in ejus baccis recentibus: others à Myrsine Arbenienfi puella amica Paladis. Also *Μύρτε* in *μύρτινος*, ab odore Myrrhe, vel *ἐμύρτινος*, redolens: in Latine, *Myrtillus, Myrsine, & Myrtus*: in English, the Myrtle.

II. *The Kinds.* There is the Myrtle Tree or Shrub, of a considerable Magnitude, of which we shall not treat in this Chapter, but refer you to the proper place, in the second Book of this Work. What we shall discourse of here, is a small bushy Plant, scarcely removed from the degree of an Herb, and is called *Myrtus Nobilis*, also *Myrtillus*, from the smallness of the Plant being compared with the *Myrtus Arbor*: This also is an Inhabitant of our Gardens, for which reason we give it a Place here. There are two Kinds of it, viz. 1. *Myrtus minor Tarentina. Myrtus minor vulgaris Lobelij, Myrtus Nobilis prima, Myrtillus Nobilis primus, Myrtus minor acuto folio, Myrtillus Nobilis acuto folio.* The prime Noble Myrtle, or small sharp pointed Myrtle. 2. *Myrtus minor folio rotundiore, Myrtillus Nobilis alter, The other Noble Myrtle, or small roundish or BoxLeav'd Myrtle.*

The Descriptions.

III. *The first, or Prime Noble Myrtle, or sharp pointed Myrtle.* It has a Branched Woody Root. spread

spread out into many Arms, with several Fibres adjoining to them. It is a little low bushy Plant rising up to be two or three feet high, which spreads it self out into many Branches from the main Stalk, whereby it looks like a small Bush; every Arm or Branch, and Twig of which, are thick set with small, fine and green, narrow, joining Leaves, with smooth edges, and a little sharp pointed at the ends,

Myrtle Noble Common.

very much in shape resembling the Leaves of Marum or Herb Mastic, but of a little deeper, or fresher green color, which abide green Summer and Winter, even through the whole Year, as all the sorts of Myrtles do, which is of a very sweet and odoriferous Smell, very much gratifying that Sense, for which reason it is called *Myrtillus Nobilis*, The Noble or Excellent Myrtle. The Flowers are white, and very sweet also, not differing in form, from the Flowers of other Myrtles, but grow not plentifully on the Branches, in our Country, by reason of the coldness of our Climate: The Flowers being past away small Berries succeed, which when ripe, are in warmer Climates of a black color, but seldom come to perfection in our Country, by reason of the coldness thereof, how well sooner Housed or defended.

IV. The second, or other Noble Myrtle, or Box Leav'd Myrtle. This grows in its Roots, Stalks, Branches, and in all other points like the former; in respect to its magnitude, placing of its Leaves, deep greenness of their color, thick growing of the Branches, and thick setting of the Leaves thereon, that it might be thought, by the looker on, to be the same with the former, without good heed to, and observation thereof, by comparing the one with the other; but the Leaves of this are a little broader, and somewhat rounder at the ends, not very much

Myrtle Noble Box-Leav'd.

unlike to the smallest Leaves, of the smallest sort of Box, now called Dutch Box; by which alone, it appears to be a differing Kind from the former, and in nothing else. The Flowers are like the first, and grow as sparingly, and the sweet Smell, and beautiful Aspect of the Plant, are full as much and pleasant, and altogether the same with that just before described.

V. The Places. These Myrtles grow naturally in Spain, Portugal, Italy, and other hot Countries in great abundance. These here with us are Nurst up in Gardens; or put into Pots, which may be removed into Houses, and so taken care of, that as soon as cold Weather begins to come, they may be sheltered from the same. They are a pleasant delightful Plant, and great Ornaments to a Garden, as being among the Number of the most desirable Ever-Greens.

VI. The Times. In their native places, they Flower in May and June; and their Fruit or Berries are ripe in September; but with us, they Flower not untill August at soonest; which is the reason that they seldom or never bear Fruit in England.

VII. The Qualities. The Noble Myrtle is hot and dry in the beginning of the second Degree; and of fine, thin, and Volatile parts, as well as Earthy. It is Absterfive, Astringent, Diuretick and Vulnerary: Pectoral, Nephritick, Hysterick and Alexipharmick.

VIII. The Specification. It resists Poison, stops the Terms and Whites in Women, provokes Urine, gives ease in the Stungury, Stops all sorts of Fluxes of the Bowels, and heals Wounds and Ulcers.

IX. The Preparations. You may have from the Leaves or Fruit, or both, 1. A Liquid Juice. 2. An Infusate Juice. 3. A Decoction in Wine. 4. A Decoction in Water. 5. A Syrup. 6. A

6. *A Powder of the Leaves or Fruit.* 7. *A Lotion.*
8. *Myrtidanum.* 9. *A Decolled Oil.* 10. *A Balsam.* 11. *A Syrup Compound.* 12. *A Compound Oil.*

The Virtues.

X. *The Liquid Juice or Essence.* They stop all effusions of Blood in what part soever, whether inward or outward both in Men and Women. They stop Catarrhs, and the most vehement Coughs, and are good to heal Exulcerations in the Lungs. They stop spitting or pissing of Blood, the Bloody Flux, and all other Fluxes of the Bowels, and are incomparable Medicaments against the Whites, as also the overflowing of the Terms in Women. Drank in Wine they resist Poison, the Bittings of Venomous creatures, and the malignity of *Mushrooms*, and cause a sweet Breath, where it is ferid or stinking. Dose 1, 2, or 3 Spoonfuls Morning and Night in a Glaſs of Red Port Wine.

XI. *The Inſpiffate Juice.* It has all the Virtues of the former, and may be given Morning and Night, from 1 Dram to 3 Drams in a Glaſs of Generous Red Wine, Mull'd and sweeten'd with white Sugar. It is a most excellent thing for the Cure of a *Gonorrhæa*, whether simple or virulent, Universals being first premised: for it not only stops the *Gonorrhæa*, but also strengthens the parts, tho' they have been much weakened through the long continuance of the Disease.

XII. *The Decolion in Wine.* It has all the Virtues of the *Essence* and *Juice*, whether *Liquid* or *Inſpiffate*. It cures a stinking Breath, resists and expels Poison, is good against the Palpitation and Passions of the Heart, the Bittings of Serpents, Mad-Dogs, and other Venomous Creatures, and heals Ulcers of the Reins, Ureters, and Bladder, bathed very hot upon the Nerves, Tendons, and Joints, it takes away their weaknesſes, and admirably strengthens them. And so it helps to consolidate broken Bones, and restore Strength to Joints that have been dislocated. A *Decolion* of the *Berries* cures a Scald or Scabby Head, and cleanses it from Scuff and Morpew, being often washed therewith: it also keeps the Hair from falling, and makes it of a black color: and being daily drank, it is said to cure Ruptures or burstnesses.

XIII. *The Decolion in Water.* It is good for any one to fit in, who are troubled with the falling down of the Fundament, as also for Women to sit in, who are afflicted with the falling down of the Womb. It makes also an excellent Injection to cast up the Womb with a Womb Spring, 2, 3, or 4 times a Day, to stop and cure the overflowing of the Whites, it cleanses and very much strengthens the parts.

XIV. *The Syrup made of the green Leaves, or Juice, or of the Fruit.* It is a most excellent thing against spitting or pissing of Blood, exulcerations of the Lungs, and other Bowels, Ulcers of the Reins, and Neck of the Bladder: stops the most vehement Coughs and Catarrhs, and after Universals, prevails against the most obdurate Asthma's, causing an easie expectoration of the Morbid Matter: and being constantly taken for some considerable time, it is said to consolidate Ruptures in Children. Dose is 2 or 3 Spoonfuls Morning, Noon and Night, in a Glaſs of Red Port or *Barcelona* Wine; or alone, drinking a Glaſs of the same Wine after it, but in a Vehement Cough, the Patient must be often taking of it, or licking it, even as

often as the Cough is violent upon them, or troubles them.

XV. *The Powder of the Leaves or Fruit.* It may be given in a Glaſs of Red Port or *Barcelona* Wine, or in the former Syrup, either with the Syrup alone, or mixt with any of those Wines, Morning and Night from 2 Scruples to a Dram and half, or more, for all the purposes and Intentions for which the *Essence*, *Juices Liquid* or *Inſpiffate*, *Decolion* or Syrup are given for; tho' I do not think it to be of equal power with the *Juices* or *Essence*. Strewed upon bleeding Wounds it stops their bleeding: and put upon old rotten or putrid Sores and Ulcers, it destroys the putridity; cleanses them, incarnates, dries and induces their healing. Put upon a Whitlow, or Fellon, which is laid open, it cures them. And applied to the Groyns, Privy parts, and Arm-pits which stink, or are affected with a stinking Sweat, it dries them, and takes away the ill Smell.

XVI. *The Lotion.* Take of Red Port Wine a Quart; of the *Inſpiffate Juice* 2 Ounces, or for want of it, of the *Liquid Juice* 6 Ounces; of the Syrup 8 Ounces; Powder of Roch Alum, half an Ounce; mix and dissolve. It is good against moist, running, and fretting Sores and Ulcers in any part of the Body; and indeed it has been found by experience to cure all Ulcers which are hard and difficult to be healed; it is profitable against Blains, and Wheals and other breakings out in the Skin: as also to Foment hot withall in the falling down of the Fundament; it heals Whitlows and Fellons on the Fingers ends, and Ulcerated Kibes in Childrens Feet: it heals all sorts of Ulcers in the Mouth, Throat, and Private parts: and put into the Eyes takes away their Inflammation, Watring and Soreness, and clears the Eye Sight, taking away any Cloud or Film, which is beginning to grow over them.

XVII. *Myrtidanum.* This *Pliny lib. 14. cap. 18. lib. 15. cap. 29. & lib. 23. cap. 9.* makes to be a *Myrtle Wine*, or *Wine of Myrtle Berries*, which according to him has almost all the Virtues ascribed to all the former Preparations: It may be made of the Leaves as well as of the Fruit, by beating the green Leaves in a Wooden Mortar, then adding Red Wine in a sufficient quantity, and therewith they press out the *Juice*, and so make a Wine thereof by a gentle Fermentation: But new Wine ought to be chosen, viz. that which is new pressed from the Grape called *Musc*, and is yet unfermented. If it is made of the Berries only, they ought to be thorough ripe: and so they ought to be if the Leaves be joyned with them.

XVIII. *Myrtidanum Apophyas.* The Excrescence growing upon the *Myrtle*. It is often found upon old *Myrtles*. It has all the Virtues of the *Myrtle* and *Myrtle Berries*; and is said to be of greater force to dry, bind, stop Coughs, Bleeding, Fluxes, &c. than either the *Leaf*, *Juice*, *Essence*, *Powder*, or *Berries* of the *Myrtle*: And you may make thereof all the foregoing Preparations, and give them in like manner, for all the same intentions and purposes.

XIX. *The Decolled Oil.* It is good to discuss and give ease to the Hemorrhoids or Piles, being anointed thereon; it discusses also Swelling in the Testicles, as also Tumors in other parts of the Body, and is good to heal Wheals, Boils, Pimples, and other breakings out in the Skin, and gives ease to the Gout, and other pains of the Nerves and Joints.

XX. *The Balsam.* It heals simple Green Wounds at a few times dressing; cleanses old putrid Ulcers, incarnates, dries and induces their healing. Applied

plied to the Gout, it gives ease in a short time, and in some reasonable time after cures it: It is also good to cure Punctures or Wounds of the Nerves and Tendons, being applied very hot to them according to Art.

XXI. *The Compound Syrup.* Take Myrtle Berries 2 Ounces and half; Sanders white and red, Sumach, Bilvaustium, Barberries, of each an Ounce and half: Medlers cut half a Pound: bruise and boil all in fair Water 8 Pounds, till half is consumed; then strain out, and add Juice of Quinces, Juice of four Pomgranets, of each 6 Ounces: and with white Sugar 4 Pounds, boil them into a Syrup, adding the Juices towards the end. It is good against all sorts of Fluxes of the Bowels and Hemorrhages, chiefly Spitting of Blood: it is cooling, binding and strengthening, resists Vomiting and Nauseousness, comforts and strengthens the Stomach, and is profitable against a Catarrh and an old Cough; it is said to cure Ruptures and stop the Whites in Women. Dose 2 Spoonfuls.

XXII. *The Compound Oil.* Take Myrtle Berries well bruised a Pound: Sharp Wine a Pint: Juice of Quinces, and Juice of Mint, of each a quarter of a Pound: Oil Ompbacine 4 Pounds: mix them well and set all in the hot Sun, or in an equivalent Sand heat for a Week, then boil and press out the Berries, and repeat this Operation twice more with fresh Berries, insulating, boiling and pressing out as before, and then keep it for use. It admirably strengthens weak Limbs and Joints, fastens loose Gums and Teeth; and anointed on the Temples, Cheeks, Jaws, and Gums, gives ease in the Tooth-ach: The Hair of the Head being Shaved off, and this Oil being anointed thereon, it fastens the Roots of the Hair, and hinders the shedding thereof: it strengthens the Nerves, Brain, Stomach and Joints, stays Vomiting, and stops Fluxes, being anointed on the Stomach and Belly, and used Clysterwise.

NAILE-WORT, see Whitlow-Grafs. Chap.

CHAP. DXV.

of NAVEL--WORT;

OR,

PENNY--WORT.

I. *THE Names.* It is called in Greek, *Korv-andon*, *Cotyledon*, ab *Acetabuli* sive *Umbilici* figura: in Latine, *Umbilicus Veneris*, *Acetabulum*, *Cotyledon*, *Scutum Celi*, *Scutellum*, *Terra Umbilicus*, *Hortus Veneris*, *Herba Coxendicum*; in English, *Navel-wort*, *Penny-wort*, *Kidney-wort*, *Hip-wort*, and *Venus Navel*.

II. *The Kinds.* This Plant seems to be a Species or sort of *Sedum*, or *Howseek*: and thereof Authors have given us many Kinds, some of which, because they are total strangers in our Country, we shall pretermitt, and describe to you only these fol-

lowing, which are found to grow either Wild, or else Nurst up in our Gardens. 1. *Umbilicus Veneris vulgaris*, *Cotyledon, Terra Umbilicus, Scutellum, Hortus Veneris*, our Common Navel-wort, Wall Penny-wort, or Kidney-wort. 2. *Cotyledon altera Matthioli*, *Umbilicus Veneris alter*, Spotted Navel-wort. 3. *Cotyledon altera minor folio subrotundo*, *Cotyledon minor Montana altera*, small Navel-wort, with roundish Leaves. 4. *Cotyledon altera Floribus versicoloribus*, small Navel-wort with party color'd Flowers. 5. *Cotyledon seu Sedum latifolium serratum guttato flore*, *Sedum Montanum*, vel *Sedum serratum Flore rubente Maculato*, spotted Navel-wort with Saw-like broad Leaves, The Princes Feather. To these may be added, 6. *Cotyledon palustris*, Water Navel-Wort or Penny-wort. *Columna* and *Baubine* refer this to the *Ranunculi* or Crowfeet, for it has no affinity with the *Cotyledons*, but only in the roundness of the Leaf, the former of them call it *Ranunculus aquaticus Umbilicato folio*: and the latter *Ranunculus aquaticus Cotyledonis folio*, in the North of England they call it *White Ror*: and in Norfolk, *Flock-wort*. 7. *Umbilicus Veneris Officinarium Loniceri*, *Cotyledon bederaceo folio*, *Cymbalaria bederacea Lobelij*, *Cymbalaris*, *Cymbalaria*, *Linaria bederacea folio Columna*, Ivy Leav'd Navel-wort, or Ivy-wort, this is likewise no more a *Cotyledon* than the former, but Gerard has placed it among the Species. 8. *Umbilicus marinus*, *Cotyledon Marina Lobelij*, *Fungus Marinus minimus Cesalpini*, Sea Navel-wort. Neither is this a Species of the *Cotyledon*, but for the Name sake it has a place in this Chapter, but that of *Cesalpinus* is the more proper Name. Some will have it to be the *Androsace Dioscoridis*, but what plant that was, is scarcely now known.

The Descriptions.

III. *The first, at Our Common Navel-wort, Wall Penny-wort, or Kidney-wort. It has a Root*

Navel-wort Common.

enbich

which is round, something like unto the full Root of an Orchis or Dog Stone, most usually smooth, but sometimes rugged or knobbed, grayish without, and white within, having a great many small Fibres, (not at the bottom of the Root, but) at the top of the Root, or foot of the Stalk, more resembling the Root of an Orchis than the Root of an Houleek. This Our great Navel-wort, has many thick, flat, and round Leaves growing from the Root, every one having a long foot Stalk, fastned underneath, about the middle thereof, sometimes a little unevenly waved about the edges, of a pale green color, and sometimes hollow on the upper side like a Spoon or Sawcer; from among which rise up, one or more tender, smooth, hollow Stalks, half a Foot high, with two or three small Leaves thereon, not usually round, as those below, but something long, and divided at the edges: the tops are sometimes divided into long Branches, bearing a great number of Pendulous Flowers, set round about a long Spike, one above another, which are hollow and like a little Bell, of a whitish green color. After which come small Heads, containing very small brownish Seed, which falling on the Ground, will plentifully Spring up before Winter, if the Season is moist.

IV. The second, or Spotted Navel-wort. Its Root is small, long, and thready, shooting out such Heads of Leaves as are under described, which abide all the Winter, those bearing Flowers perishing. This Spotted Navel-wort (as many call it) has many thick small Leaves, not so broad as long, of a whitish green color, lying on the Ground in Circles, after the manner of the Heads of Houleek, and finely dented about the edges. From the middle whereof sometimes (for it does not Flower every Year in many places) rises up a Stalk nearly a Foot high, beset with such like Leaves as are below, but somewhat longer. From the middle of the Stalk up to the top, it Branches forth variously, with a Leaf at every Joint, bearing three or four Flowers at every Branch, consisting of five white Leaves, spotted with small red Spots, like unto the Spotted Sannicle, but with fewer and greater Spots, having a yellowish Circle or Eye in the bottom of every Flower, and many whitish Threads, with yellowish tips in it. The Seed is small and black, contained in round Heads.

V. The third, or small Navel-wort, with roundish Leaves. Its Root is small and Fibrous like the former, sending forth Heads of the like Leaves, as those of the other Head round about it. This small Navel-wort has much rounder and smaller Leaves in the Heads than the former, not so big as the Nail of ones Thumb, and of as pale a green color, or more white, and finely dented about the edges, in the same manner; of an astringent Taste like the other Houleeks. From the middle of some of the Heads, Tearly rise up, slender, hard, rough Stalks, about an hand length high, set with a few smaller, and longer Leaves thereon: at the tops whereof appear small Flowers upon long foot Stalks, consisting of five and sometimes six Leaves apiece, sometimes wholly white, and sometimes spotted with red Spots; and sometimes having three purple Lines, running down the back of every Leaf, so that it makes the whole Leaf seem of a purplish color, which being past away, small Heads follow, containing within them small Seed.

VI. The fourth, or Small Navel-wort with particolored Flowers. This has a Root like the last, and grows in like manner with many Heads of small Leaves circlewise as that does, of which this is a peculiar sort, greater than the smaller Cotyledons,

or smaller than the greatest: each of which Leaves is something long and narrow, of a whitish green color, dented as it were about the edges; or rather set with Silver white Spots about their Brims, making them seem like unto white Teeth, (or as Gesner compares them, to the Silver like Finns of Fishes) very pleasant to behold: for in the Winter when no Flowers appear, this and the last, as also the second Species being all of one Genus, give as much delight, as when they are in Flower, which are many standing on several foot Stalks, each Leaf whereof is part white, and part Purple, variously diversified in every one of them.

VII. The fifth, or Spotted Navel-wort, with Saw like broad Leaves, called by some the Princes Feather. Its Roots are small threads, which spread under the Ground, and shoot up again, with several Heads round about the Mother Head. This kind of Navel-Wort, or Houleek, is composed of Heads of larger, broader, and thinner Leaves, than any of the former, of a sadder green color, somewhat unevenly indented about the edges, and not so close set together, but spreading forth into several Heads, like as the former sorts do, altho not so plentifully. From the middle of divers of which Heads, rise up brownish or reddish Stalks, set with smaller Leaves thereon, to the middle thereof, and then Branch forth into several Sprigs, set with several small reddish Flowers, consisting of five Leaves apiece: the inner sides of which, are of a pale red, somewhat whitish, spotted with many small Blood red Spots, as small almost as Pins points, with some small Threads in the middle, standing about a small green Head, which turns into the Seed Vessel, parted four ways at the Head, in which is contained small blackish Seed.

VIII. The sixth, or Water Navel-wort, or Penny-wort. This is called by the Husband Men in some places Sheep-Bane, because it kills Sheep which eat thereof. The form of the Leaf is not much unlike to the third Species foregoing, but it is not of a fleshy thicknes like it, nor are the round edges of the Leaves so even as that. It has a small Fibrous Root, and is a creeping Plant, lying and creeping upon the Ground, and taking Root almost at every Joint: From every Joint of which also springs forth a Leaf, round, and as it were Scollop'd, having about seven Scollops, round the edge of it, it stands upon a pretty long foot Stalk, which is fastned to the lower side of the Leaf, about the middle thereof. And from most of the Joyns with the Leaves, comes forth a Flower, standing also upon a long foot Stalk.

IX. The seventh, or Ivy Leav'd Navel-wort, or Ivy-wort. Its Root is small and Fibrous, which sends forth a small Herb creeping upon the Ground, with slender stringy Branches, all about, taking hold of Walls, or any thing it meets, shooting out again at every Joint small Fibrous Roots into the Earth, all along as it runs. At the several Joyns grow small broad Leaves, cut in on the edges into corners, somewhat like unto a corner'd Ivy Leaf, each standing upon a small and stringy foot Stalk: at the Joyns likewise come forth several small Flowers upon slender foot Stalks, fashioned like unto a Snap Dragon, or Fluellen Flower, with a Tail or Spur behind it; mixed with yellow, whitish, and purple colors; and the Spurs as it were, washed over with a purplish color also, which being past away, in their places succeed small round Heads, containing within them small blackish Seed.

Navel-wort Ivy Leav'd.

X. Johnson upon Gerard, Describes the last Plant thus. It has a Root which is small, creeping and thready. The Branches of this Plant are many, long, slender, and creeping, upon which grow without any certain order, many little, smooth, thick Leaves, fashioned like those of Ivy, and fastened to foot Stalks of about an Inch long: and together with these Stalks, come forth other Stalks of the same length, that bear Spur-fashioned Flowers, of the shape, and bigness of those of the Female Fluellen: their outside is purple, their inside blew, with a Spot of yellow in the opening.

XI. The eighth, or Sea Navel-wort. This is generally called by divers Authors *Androsace*

Navel-wort Sea.

Matthioli, because he first set it forth, being sent to him from *Pisa* in *Italy*; but it no ways agrees with the *Androsace* *Dioscoridis*. This is a Sea Excrecence, formed like small round Savocers, hollowish in the middle, like unto a Navel, and born up by small, smooth Foot Stalks, about two Inches long, every one by its self, springing from some Stone, Rock, or Shell in the Sea, or Salt Laker, being of a pale greenish Ash color, whilst growing under Water, but afterwards grow as white almost as Coral, or the like, and of a Stony Substance.

XII. Gerard Describes it thus. Sea Navel-wort has many round thick Leaves, like unto little Savocers, set upon small and tender Stalks, bright, shining, and smooth, of two Inches long; for the most part upon the furrowed Shells of Cockles, or the like: every small Stem, bearing upon its end or point, one little Buckler and no more, resembling a Navel. The Stalk and Leaf are set together in the middle of the Leaf, upon which it was called, *Umbilicus Marinus*, or Sea Navel-wort. The Leaves and Stalks of this Plant, whilst yet in the Water, are of a pale Ash color; but taken forth, they presently grow white and hard, as Sea Moss called *Corallina*, and are of a Salty Taste.

XIII. The Places. The first grows very plentifully in many parts of *England*, but especially in all the West of this Land, upon Stone and Mud Walls, upon Rocks also, and in Stony places upon the Ground, at the bottoms of old Trees, and sometimes on the Bodies of them which are decayed and rotten. It has been found to grow plentifully in *Northampton*, almost upon every Stone Wall about the Town, as also at *Bristol*, *Bath*, *Wells*, and other Places, upon Stone Walls. The second, third, fourth, and fifth, upon the *Pyrenean Hills* and *Alps* of *Switzerland*, on Rocks, Mountains and Stony places in *Germany*, *Hungaria*, *Austria*, and other Countries, where they grow upon the Rocks, and among the very Stones, where there is scarcely any Earth for the Roots to fix in, or to nourish them: but with us they all grow in Gardens very well, if they be Planted in shadowy places, and not in the Sun. The sixth or Water Navel-wort grows and creeps upon the surface of the Earth in Swamps and other moist places; it grows on the Boggs upon *Hamsted-Heath*, and on many such moist and rotten Grounds in other places. The seventh, or Ivy Leav'd Navel-wort, grows naturally in divers places of *England* Wild, as at *Hatfield* in *Hartfordshire*, and in other places which are shady, in which it delights to grow; as also upon Thatcht Houses in the North parts, as it is said, and most abundantly in *Lancashire*; it also grows in many Gardens throughout the Kingdom, and if it is planted near any Wall, it will run up the same to a considerable height. The last will not grow but in the Sea, as the name thereof imports.

XIV. The Times. The first Flowers sooner than any of the others, as at the beginning of *May*; and the Seed ripening quickly after, sheds it self, so that about the end of *May* usually, the Leaves and Stalks are withered and gone, untill *September*, that the Leaves Spring up again, and so abide all *Winter*. The second, third, fourth, and fifth Flower about the beginning of *June*, and through the whole Month, and sometimes in *July*, according as the Seasons fall out; and their Seed is ripe in *August*. Those Heads which bear Stalks, usually perishing together, and the others which bear not, abiding all the extremity of *Winter*. The sixth Flowers in the beginning of *Summer*, and its Seed ripens not long after, the Plant it self being green all *Winter*. The seventh seldom Flowers till the

the end of *July*, and in *August*, and continues many times Flowering, till a Frosty Season comes and nips it; and the Seed is soon ripe after the Flowers are withered and gone.

XV. The Qualities. The five first are cold and moist in the second Degree; Absterfive, Discussive, and Repercussive, Anodyn, and Diuretick. The sixth, is hot and dry in the fourth Degree, and has all the other Qualities of *Water Crowfoot*. The seventh is cold and moist in the second Degree, and has all the other Qualities of the first five.

XVI. The Specification. The first five cool Inflammations, repel fluxes of Humors, provoke Urine and cleanse the Urinary parts, yet heal Ulcerated Kidneys: They give ease in the Gout and Sciatica; and are profitable against Scrophulous Tumors, as also to cure Green Wounds. The seventh has the like Specifick Vertues; besides which, it is said to cure the Whites in Women.

XVII. The Preparations. You may have from the first five and the seventh, 1. *A Liquid Juice*. 2. *A Decolion in Water or Wine*. 3. *A Syrup of the Green Herb, or Juice*. 4. *An Oil by Insolation or Decolion*. 5. *An Ointment*. 6. *A Cataplasim of the Green Herb*. 7. *A Distilled Water*.

The Virtues.

XVIII. The Liquid Juice. It cools, repels, cleanses, and eases pain. It is effectual against all Inflammations and unnatural Heats, whether inward or outward. Inwardly taken to a Spoonful or more in a Glass of *Barley Water* or Broth in which a little of the *Juice* of an *Orange* or *Limon* is squeezed, it abates the heat of Fevers, quenches Thirst, refreshes a fainting Stomach, cools the heat of the Liver and Bowels, opens obstructions and cleanses the Reins, Ureters, and Bladder, and takes away the heat and scalding of the Urine. The *Juice* of the *Ivy-woort*, taken to 2 Spoonfuls Morning and Night in Red Wine cures the Whites in Women.

XIX. The Decolion in Water or Wine. In Water it has all the former *Virtues*, and may be given Morning and Night from 4 to 8 Ounces. In Wine, it more effectually cures inward Ulcers in Reins or Bladder: made with Water, and mixed with white *Port Wine* when drank, it provokes Urine, and is available against the Dropsie: and in the Hemorrhoids or Piles, it gives present ease, the parts being fomented hot therewith. The *Decolion in Water* is good against heat, redness, and Pimples in the Face, as also *Anthony's Fire*, the parts being well Bathed therewith, Morning, Noon, and Night: and being drank, it admirably cools the heat of the Stomach and Liver.

XX. The Syrup of the Green Herb, or Juice. It has all the *Virtues* of the *Decolion* and *Liquid Juice*, but not near so powerful as it: mixt with *Syrup* or *Juice* of *Lemons*, it is good against Fevers, quenches Thirst, and comforts a weak and fainting Stomach. It heals also exulcerations of the Lungs, excoriations of the Bowels, and other inward parts. Mixt with the *Decolion* made in White Wine, it powerfully provokes Urine, and is profitable against the Dropsy.

XXI. The Oil by Insolation or Decolion. It is made with *Oil Omphacine*, or of *Unripe Olives*. It cools Inflammations admirably, eases the pain of the Piles, and cures Chilblains: and being applied, it gives ease in the Gout and Sciatica.

Anointed upon Scrophulous Tumors in the Neck and Throat, it eases the pain, waistes, and consumes them; anointed upon Chilblains, it takes them away.

XXII. The Ointment. It has all the *Virtues* of the *Juice* and *Oil*, outwardly used. If to every Ounce of it two Drams of *Scammony* in fine *Powder* is added, it will be a most effectual thing for the cure of all old running Sores and Ulcers, and will heal ulcerated Kibes almost to a Miracle. And above all things, it will digest, draw, cleanse, and induce the healing of strumous Ulcers, beyond most other Topick Medicaments, being skillfully applied. It also quickly cures ulcerated Hemorrhoids or Piles; and is an excellent thing against redness, Scurf, Morpew, Pimples, Scabs, and other like Detecations of the Skin.

XXIII. The Cataplasim of the green Herb. Being immediately applied upon a simple Contusion, it discusses it, or repels the present afflux of Humors. It eases pains of the Gout and Sciatica, abates the Inflammation and Tumor in the Testicles and *Penis*, giving in a little time ease and relief.

XXIV. The Distilled Water. It is Cosmetick, and good against most Detecations of the Face and Skin, taking away, Heat, Redness, and Inflammation. Inwardly taken being sweetned with the *Syrup*, it abates the heat of Fevers, cools the Stomach, Liver and Reins, gives ease in the Strangury, cleanses the Reins and Bladder, and takes away the heat and scalding of the Urine. Dose from 2 to 4 Ounces, or more, Morning and Night. It is said also to heal Ulcers of the Reins and Bladder, being duly taken for some considerable time.

O R,

Long T U R N E P.

I. THE Names. It is called in *Greek*, Βένιας *Bounias*; in *Latine*, *Napus* and *Bunias*; in *English*, *Navew*, or *Long Turnep*.

II. The Kinds. We may very well take *Navew* to be a Species of the *Turnep*, for the *Sweet Garden Kind*, eats like it, and full as well or rather better and sweeter, being drest like the *Common Turnep*. This Plant is either 1. Βένιας ἁγία, *Bunias five Napus Hortensis, Napus dulcis*, *Garden Navew*, or *Sweet Navew*, or *Navew Gentle*. 2. Βένιας ἄγρια, *Bunias agrestis, Napus Sylvestris Dodonæi & Lugdunensis, Rapum Sylvestris Tragi, Napus agrestis Turneri*, *Wild Navew*.

The Descriptions.

III. The Garden Navew, or Navew Gentle, is like unto the Turnep, in its Stalks, Leaves, Flowers, and Seed, as also in its shape and manner of growing; but the Leaves of the Navew are much smoother: it also differs in the Root, for the Turnep is round, almost like a Ball, but the Root of the Navew

Navew is long, and much stretched out in length, whereby it seems to be degenerated from the form of the Common Turnep. This Garden Navew, or Navew Gentle is also of two Kinds, viz. The greater and the lesser. The greater is long and great, almost as large as the short Carrot, but for

Navew Gentle, or Garden smaller.

Navew Gentle Garden greater.

the most part of an uneven length and roundness, to the very end, where it sends from its sides several small long Fibres. The smaller in its growth and appearance above Ground, is in all things like the former, differing only in its Root, which is very much lesser, for it is somewhat round with its length, and is about twice as big as a Mans Thumb, some bigger, some lesser, both these are so like to the Common Garden Turnep, in Stalks, Leaves, Flowers, and Seed, that they are hardly to be known asunder.

IV. The Wild Navew. Its Root is likewise somewhat Tuberos, round and long withall, of the bigness of a Mans Thumb, or somewhat larger, with several Fibres springing from it towards the bottom. Its Leaves are long, smooth, and not Hairy, and more deeply jagged than the Garden Kind. The

Navew Wild.

Flowers are also yellow, and the Seed in small Pods like the former, but more hot, sharp, and biting, Whosoever says Lobel has seen or known the Garden Navew, or Navew Gentle, will even upon the sight of this, judge it to be the Wild sort, it is so like thereto.

V. Nota. There is a difference between *Bunias*, and *Bunium*, (tho' Pliny by a mistake makes them but one Plant) for *Bunias* is truly the Navew, of which we treat in this Chapter; whereas *Bunium*, is a kind of *Daucus Petroselinæ vel Coriandri folio*, of which opinion are *Baubin* & *Dalechampsius*. *Galen* likewise puts no difference between *Τρυβάν*, *Gongule*, *Rapum*, a Turnep: and *Βύνια*, *Bunias*, *Napus*, Navew, (i.e. the Garden Kind) because there is but little difference in their form, manner of growing, greatness of the Root, and sweetness also: but there is really a difference between the Plants, which is chiefly determined by the Root, which is much longer than any Turnep, and scarcely ever so thick

some of the smaller *Turneps*; besides, some Authors do assert, that the Root of the *Naveo Gentle*, is yet sweeter than the sweetest *Turnep* that grows.

VI. *The Places.* The first is only planted, and to be found in *Gardens*, in many places of the Kingdom: it requies a gentle, soft, loose and yellow Mould, like as the *Turnep* does, and prospers in a fruitful Soil; it is Sown in *France* and some parts of *Germany*, in the Fields, for the Seed sake, as is likewise that of the *Wild Cole-wort*, or *Cole-Rape*; for the plentiful encrease of the Seed, is very profitable to the Husbandmen of those Countries, because that being pressed forth in their *Oil-Mills*, a great quantity of *Oil* is produced, which they use not only in Lamps, but also for the making of Soap; and amongst some of the poorer sort of People, it is there eaten, and used instead of *Sallet Oil*. In *Holland* and *Flanders* and other places it is boiled into Soap, by mixing it with a strong Lye, made of Pot Ashes. It is said, that it is also Sown in several places of *England* for the same purposes. The second or *Wild Naveo* grows Wild by Hedge sides, High-ways, Ditch Banks; as also in Clay Grounds, and the Banks sides of Fresh Marshes, near to Towns and Villages, in many parts of the Kingdom.

VII. *The Times.* They are Sown in the end of *August*, and beginning of *September*, as also in the *Spring*; and Flower and Seed about the same time as *Turneps* and *Charlock* do.

VIII. *The Qualities.* *Naveo Gentle* is temperate in respect of heat or cold, and moist in the first Degree; but this is understood of the Root; for the Seed is hot and dry in the second Degree. The *Wild Naveo* is hot and dry in the first Degree, but the Seed (which is only used) in the third Degree. The *Garden Kind* is Aperitive, Absterfitive, and Restorative in Consumptions. The *Wild Kind* has the same Virtues, as to its Seed, which is also Alexipharmick, or a Resister of Poison.

IX. *The Specification.* The Roots of the *Garden Kind* encrease Seed, provoke Lust and restore in Consumptions. The Seeds of both Kinds expel Wind, give ease in the Strangury and Colick, and are good against the Poison of Vipers, Rattle-Snakes, Mad-Dogs, and other Venomous Creatures: They provoke the Terms, facilitate the Delivery of Women in Labor, and remove Obstructions of the Lungs.

X. *The Preparations.* You may have 1. A Liquid Juice of the Root of the *Garden Kind*. 2. An Essence of the same. 3. A Syrup of the Juice. 4. A Decoction of the Roots. 5. A boiled Sallet of the Roots. 6. A Cataplasm of the Roots. 7. A Sallet of the first Sprouts. 8. An Oil by expression from the Seeds of both Kinds. 9. An Infusion in Wine of the Seeds of both Kinds. 10. A Powder of the Seeds of both Kinds. 11. An Oil of the Root of the *Garden* sort by Decoction. 12. A Wine of the Root of the same Kind.

The Virtues.

XI. *The Liquid Juice of the Root of the Garden Kind.* It nourishes, restores in Consumptions, is good against Coughs, Colds, Hoarseness, Wheezings, Asthma's, and Ulcers of the Lungs, encreases Seed, Provokes Lust, and provokes Urine, giving ease in the Strangury, Stone, Gravel, &c. Dose 2 or 3 Spoonfuls at Morning, Noon, and Night, or 3 or 4 times a Day, in a good Draught of warm new Milk.

XII. *The Essence of the same Root.* It has all the Virtues of the Juice, and may be given two Spoonfuls at a time in the same manner, or in a Dish of strong Meat Broth, or Gelly Broth: This does moreover strengthen all the Viscera, and heal excoriations of the Bowels, Reins, Bladder, &c. and is good for healing of a *Gonorrhoea*.

XIII. *The Syrup of the Juice.* It is singular good against Rickets in Children, and prevails wonderfully against a Cough, and stuffing of the Lungs, causing an easy Expectoration. It has all the Virtues of the Juice; besides which, being long used, it restores the Voice to such as had lost it.

XIV. *The Decoction of the Roots in Water.* It has the Virtues of the Juice, Essence, and Syrup, but may be taken from 4 to 8 Ounces, several times a Day: it powerfully provokes Urine, and gives ease in the Strangury, expelling Tartarous Mucilage from the Reins, Ureters and Bladder. Being taken for some time, sweetened with fine white Sugar or Clarified Honey, it cures an habitual Costiveness of Body, and withal, it heals Excoriations of the Bowels.

XV. *The Sallet of the Roots.* It is made either by boiling, baking or roasting; and then being chopt small with a Knife, it is seasoned with Pepper, Salt, and Butter, adding if you so please a little Juice of *Oranges* or *Lemons*. Being thus eaten for about five or six Weeks together, with only a little white Bread, and forbearing all other Food whatsoever, whether Flesh, Fish, Eggs, Cheese, &c. and only drinking either the Decoction of the Root, or new Milk, for the whole time; I have known it cure several times, the most inveterate Rheumatism, beyond all hope or expectation: and all this it does purely by sweetning all the Juices of the Body, destroying their acerbities.

XVI. *The Cataplasm of the Roots.* Being made of the green Root by beating it in a Mortar, and applied to Kibed Heels, it cures them. Being made of the Roots Baked or Roasted, and applied to the Tumors of the Testicles or Penis, or Swellings in any other part of the Body, it allays the Inflammation if any, eases the Pain, and in a short time dissolves the Tumor.

XVII. *The Sallet of the first Sprouts out of the Ground.* It is eaten raw, as other green Salleting: it purifies and cleanses the Blood, strengthens the Stomach, Liver, Spleen, and Lungs; opens Obstructions of the Reins, and frees them from Tartarous Matter powerfully, with all provoking Urine.

XVIII. *The Expressed Oil from the Seed, of both Kinds.* It facilitates the Birth, prevents or gives ease and takes away the After-Pains of Women in Childbed: and given to young Children against the Worms, it kills and drives them forth. If the Oil is washed well with fair warm Water, it becomes sweeter and softer, and is then good to anoint the Skin withal; it allays Inflammations, and takes away roughness of the Skin, and other Deformities thereof.

XIX. *The Infusion in Wine, of the Seeds of both Sorts.* It gives present ease in the Colick, and Gripings of the Guts; opens Obstructions of the Reins, cleanses them of Tartarous Matter, gives ease in the Strangury, provokes Urine, and powerfully resists and expels Poison, whether the Poison is taken inwardly by the Mouth, or by the Bittings of Serpents, Mad-Dogs, or other Venomous Creatures: for which reason sake the Seed is always put into the Compositions of Treacle, and other Counter-Poisons.

XX. *The Powder of the Seed, of both Kinds.* It strengthens the Stomach, causes a good Appetite and

and Digestion, eases the Colick, provokes Urine, gives relief in the Strangury, and induces the Courses in Women. It is good against all sorts of Poison, and is ever an Ingredient in *Venice Treacle*, viz. the Seed of the *Bunias dulcis*, and both *Dioscorides*, and *Pliny* say, that the Seed of the *Garden Bunias* is put into Antidotes, not the Seed of the *Wild*: and yet that of the *Wild* is certainly the stronger and the more effectual: it kills also Worms in Children. Dose from half a Dram to a Dram or more in any fit Vehicle, Morning and Night.

XXI. *The Oil of the Garden Root, by Infolation or Decoction.* It allays Inflammations, dissolves hot Tumors, and is profitable against Chilblains and Kibes, they being anointed therewith.

XXII. *The Wine made of the Juice of the Root of Navew Gentle.* The Root is to be Ground in an Engine or Mill, and the Juice to be pressed forth, which is to be put into Wooden Fats or Vessels, and left to Ferment, as Wine or Cyder, are: The Fermentation being over, and the Liquor grown Fine, you will have a noble delicate Liquor for drinking, very Pleasant beyond Cyder, and much stronger, and not much Inferior to Wine. This Wine if well made, by reason of the strength of its Body will keep some Years.

CHAP. DXVII.

Of NEP; or, CAT--MINT.

I. **T**HE Names. It was unknown to the Greeks, so far as we can Learn; the Latins called it *Nepeta*, *Mentha felina*, *Mentha Cattaria*, and by some is simply called *Cattaria*, and *Cattaria*, also *Herba Gattaria*: we in English call it, *Nep*, *Neppe* and *Cat-Mint*.

II. *The Kinds.* Authors make many Kinds hereof, but the following fix are Principal, viz. 1. *Nepeta major Vulgaris*, *Herba Gattaria Matthioli*; *Nepeta Cordi & Tragi*; *Cattaria*, & *Mentha Cattaria Lobelij*; Common Garden Nep, or Cat-Mint. 2. *Nepeta Media*, *Cattaria Media*; The middle Kind of Nep, or Cat-Mint. 3. *Nepeta minor Camerarij*, *Mentha Cattaria minor Bauhini*, *Cattaria tenuifolia Hispanica Clusij*; Our small Nep or Cat-Mint. 4. *Nepeta Peregrina latifolia*, *Mentha Cattaria Peregrina latifolia Lobelij*, *Mentha felina sativa latifolia Tabernemontani*, *Nepeta Perigrini Besseri*, *Cattaria altera Gerardi*; Strange Nep, or Cat-Mint with broad Leaves. 5. *Nepeta Peregrina angustifolia*, *Mentha Cattaria angustifolia minor Bauhini*, *Mentha Cattaria Peregrina angustifolia Lobelij*, *Cattaria folio longiore Dodonaei*, *Sativa Romana Gerardi*; Strange Nep or Cat-Mint with narrow Leaves. 6. *Mentha Cattaria minor Alpina*, *Nepeta minor Alpina*, Small Mountain Nep, or Cat-Mint.

The Descriptions.

III. *The first, or Common Garden Nep or Cat-Mint.* Its Roots are composed of many long Strings and Fibres, fastning themselves strongly in the Ground, and abide with green Leaves thereon all the Winter. From this Root shoot forth a hard four square Stalk, or Stalks, with an hoariness on

them, a yard high, or more, full of Branches, bearing at every Joint, two broad Leaves, for form and largeness somewhat like unto Bawm, but longer pointed, softer, whiter, and more hoary, and notched also about the edges, which have a strong sweet smell, not offensive to any, but very pleasing to Cats,

Nep: or, Cat-Mint Common.

who will rub themselves thereon all over, and also eat the Leaves thereof, they are so much delighted with it, whence came the Name. The Flowers grow in large Tufts at the tops of the Branches, and underneath them likewise on the Stalks, many together, of a whitish purple color. In this particular of the Flowers, our Figure here inserted is defective.

IV. *The second, or Middle Kind of Nep, or Cat-Mint.* Its Roots are greater, longer, and more Woody than the former, abiding many Years in the Ground, but retaining no green Leaves thereon in the Winter Season. It has likewise hard square Stalks, not so great as the former, but rather more in number, and sometimes as high: the Leaves are smaller almost by half, harder, greener, and nothing so strong scented, and are set by couples on the Stalks, which spread not themselves out in Branches, in that manner which the first does. The Flowers are fewer, smaller, and growing only by spaces, along them, up to the tops, of a faint purplish color, gaping like the other, and after them such like small round Seed in the Husks.

V. *The third, or Our small Nep, or Cat-Mint.* It has a long, small, Fibrous, Woody Root, which sends forth several four-square, hard and hoary Stalks, which die not away after Seed bearing, but shoot forth again fresh Branches, not above a foot high, with two small and long narrow Leaves, snipt or dented about the edges, and hoary also, of a stronger Smell than the first or Common Kind, and of a better Taste. The Stalks shoot forth into many

Nep; or, Cat-Mint small.

many Branches, at the tops whereof stand small white gaping Flowers, in Spike fashion like those of the first, or Common Kind, after which come small black Seed like as in the other.

Nep broad Leav'd.

VI. *The fourth, or Strange Nep, or Cat-Mint* with broad Leaves. It has a long small slender Root, spread out into many Branches with several Fibres adjoining to them. From which Root springs up a square hoary Stalk, spreading into Branches on all sides, from the bottom almost to the top; set with two Leaves at every Space, which are broader than those of the next Kind following, tho' not much, but longer than our first or Common Nep, dented about the edges, and of a hoary green color. The Flowers stand in the spaces about the tops of the Stalks, almost of a pure white color, like in form to those of our first Common Nep, but larger; after which comes the Seed, which is also black like it: The smell of the whole Plant, is likewise stronger and sharper, and more pleasing than that of our said Common sort.

VII. *The fifth, or Strange Nep or Cat-Mint* with narrow Leaves. This is a Species of the same Kind with the former, and is like it in its Root, Stalks, Branching out, Flowers, Seed, color, smell, and manner of growing, and differs from it in nothing but in the Leaves, which are smaller and narrower than those are.

VIII. *The sixth, or Small Mountain Nep, or Cat-Mint.* This has a small Fibrous Woody Root, which sends forth a Plant smaller than our third Kind or small Nep aforegoing. It has square brownish Stalks of about a Foot high, spreading themselves forth into Branches, on which grow smaller Leaves, than those of the former small sort, but they are somewhat broad, almost three square, and hoary withall. The Flowers are small and whitish, set or placed Spike-fashion at the Tops of the Stalks and Branches, like unto those of the Common Kind.

IX. *The Places.* The first grows about the Borders of Gardens and Fields (as Gerard says) near to rough Banks, Ditches and Common Ways, and is delighted in moist and watery places, from whence it was brought into Gardens. Parkinson says, that the first and second grow Wild in other Countries, but are Nurst up with us only in Gardens, as all the rest are. The third, fourth, and fifth grow naturally in Spain, from whence they were brought to us in their Seeds; and notwithstanding the coldness of our Climate, grow here to be goodly sort of Plants. The sixth grows in Italy, about Naples, from whence the Seed was brought hither.

X. *The Times.* They all come forth in the Spring Season, Flower in July and August, and their Seed is ripe soon after.

XI. *The Qualities.* Nep or Cat-Mint is hot and dry in the third Degree; Aperitive, Absterive, Astringent, Anodyn, Carminative, Digestive, and Traumatick; also Cephalick, Neurotick, Stomack, Hepatick, Cordial, Ptarmick, Emmenagogick, Sudorick, Alexipharmick, and Analeptick.

XII. *The Specification.* It provokes the Terms in Women, hastens and facilitates the Labor, stops Catarrhs and cold thin Rheums, expels Wind, gives ease in the Colick, cures Asthma's or difficulty of Breathing, as also Cramps, Convulsions, and all cold and moist disaffections of the Nerves.

XIII. *The Preparations.* You may have therefrom, 1. A Liquid Juice. 2. An Essence. 3. An Infusion. 4. A Powder of the Leaves and Heads of Flowers. 5. A Syrup. 6. A Lotion. 7. An Ointment or Balsam. 8. Pessary. 9. A Cataplasm. 10. A Distilled Water. 11. A Spirit. 12. A Distilled Oil. 13. A Spirituous Tincture. 14. An Acid Tincture. 15. An Oily Tincture.

The Virtues.

XIV. *The Liquid Juice.* Taken one or two Spoonfuls at a time in a Glass of choice *Canary*, or other proper Wine, it cures such as are inwardly Bruised by any Blow, Fall, or other Accident. It expells Wind out of Stomach and Bowels, gives ease in the Colick; and being constantly taken for some time, it provokes the Courtes in such Virgins as never had them, and brings them down in such Women as have had them stop for some time, it also takes away Sterility or Barrenness in such Women, in whom it is caused through a coldness, over-moisture or slipperiness of the Womb, and other weaknesses of those parts: Given also to Women in Travel in a Glass of White *Lisbon* Wine, it hastens and facilitates the Birth, brings away the After-Birth, and prevents, or eases After-Pains.

XV. *The Essence.* It has all the Virtues of the *Liquid Juice*, besides which, it prevails against all cold and moist Diseases of the Head, Brain and Nerves; is profitable against Apoplexies, Vertigo's, Megrims, Epilepsies, Lethargies, Carus, Palsies, Convulsions, and other like Diseases of those parts. Dose a Spoonful or two every Morning fasting, and every Night going to Bed, in a Glass of Generous Wine. It also expels Poison, whether inwardly received, or externally by the Stinging or Biting of any Venomous Creatures, Vipers, Rattle-Snakes, Mad-Dogs, &c. if it is presently given in a proper Vehicle, and a Cataplasim of raw *Garlick*, be also applied forthwith to the Wound.

XVI. *The Infusion in Wine.* It has the Virtues of the *Juice and Essence*, but nothing near so powerful: yet it is a singular Cordial, defends and cheers the Heart, enlivens the Spirits, and is profitable against deliquiums of the Viral Spirits, as Faintings, Swoonings, Vapors, Hysterick-Fits, &c. Dose 4 Ounces, at time of the Paroxysm.

XVII. *The Powder of the Leaves and Heads of Flowers.* It has all the Virtues of the *Juice and Essence*, but acts not with that speed which they do: yet it seems to comfort the Stomach and Bowels after a wonderful manner: it provokes Appetite, and causes a good Digestion: is a singular expeller of Wind, and stops Fluxes of the Belly. It is also good against Coughs, Colds and Catarrhs, or thin distillations of Rheum, which disaffect the Lungs. It also warms, dries and strengthens the Womb, and is said strongly to provoke Lust, and induce Conception. Dose one Dram at a time in *Syrup of Citron Peels*, Morning and Night, drinking a Glass of strong Wine after it.

XVIII. *The Syrup of the Juice or Green Herb.* It is a most admirable Pectoral, and is said to alleviate the most vehement Cough, being taken often in the day time with a *Liquorice Stick*; it profligates a Cold, and causes an easy expectoration of the viscid pituitous matter lodg'd in the Stomach and Lungs. It is good to cure an Asthma or difficulty of Breathing, stuffing of the Stomach, Hoarseness, Wheezing, shortness of Breath, and a continual distillation of Rheum, which is very obnoxious to most of the *Viscera*. It may be taken particularly Morning and Night, and as often in the day time as need requires.

XIX. *The Lotion.* Take of the *Essence* 3 parts of *Madera* or other Generous Wine 2 parts, Spirit of Wine 1 part, mix them. Being used as an Injection up the Womb, with a proper Womb Syringe

it cleanses, warms, comforts, dries, and strengthens it, takes away its slipperiness, and makes it apt for Conception; and if this *Lotion* be set in a Copper or Earthen Pan over live Charcole in a Close-Stool, so that the Fumes thereof may be received up the Womb, it does also the same things, takes away the overflowing moisture of the Mother, disaffects the Wind, and eases the Pains of those parts, and by the frequent use thereof takes away those causes of Sterility or Barrenness. It is also good to wash the Head, to dry up running Humors, and cure the Scabs thereof, and is effectual for the like affects in other parts of the Body. Bathed or Fomented on the Piles, it eases their Pain, and in a short time disaffects them.

XX. *The Ointment or Balsam.* They are good Vulneraries being applied to moist and running Sores and Ulcers; they strengthen the Nerves, or any Limb or Member weakened through Cold, or moisture, or blows, or any over-straining; and applied to Ulcerated Piles, they disaffect the remaining Tumor, ease the Pain, and in a short time heal them: the same thing they do, being also applied to Ulcerated Kibes.

XXI. *The Pessary.* It is made of the Green Herb, with its Tops or Heads of Flowers, and a little Wool. Being put up the Vagina Uteri, it eases the Pains of the Womb, draws down the Vapors, prevents Fits of the Mother, provokes the Terms; and in a Woman with Child, if it is near the Moments of Delivery, it hastens the Birth.

XXII. *The Cataplasim.* Applied to the Fundament in the Hemorrhoids or Piles, it gives present ease tho' the pain be never so Vehement: applied to the Joints it also eases the pains of the Gout, proceeding from a cold cause, or an accidental weakness of the part.

XXIII. *The Distilled Water.* It has the Virtues of the *Juice*, but very much weaker in its effects, and may be given to 6 Ounces, sweetned with the *Syrup* aforegoing; otherwise, it is used for the most part as a Vehicle to convey the other Preparations in. It is a very good Stomachick.

XXIV. *The Spirit.* It is a great Neurotick and Cordial, good against Palsies, Convulsions, Tremblings, Numbness, Vertigo, Lethargy, Carus, Fainting and Swooning Fits, Vapors, Fits of the Mother, and the like Nervous, Cardiac, and Hysterick Distempers. Dose one, two, or three Drams dulcified with the *Syrup* at *Sect* 18. aforegoing.

XXV. *The Distilled Oil.* It has all the Virtues of the *Juice, Essence, Infusion, and Spirit* aforegoing: it provokes the Terms powerfully, brings away the Birth (when ripe) momentarily, and prevents and cures After-pains upon the spot: It has nor many equals for the Diseases of the Head, Brain, Heart, Nerves and Womb. Dose from 6 Drops to 12, 20, 30, or more, according to Age, Strength, and Necessity; drop them first into fine powder Sugar, mixing both very well together; then give the mixture in a Glass of Wine.

XXVI. *The Spirituous Tincture.* It has all the Virtues of the *Juice, Essence, Spirit and Oil*; It is stronger and more powerful than the three first, but weaker much than the *Oil*. It may be given in the Colick, Fainting and Swooning Fits, Lethargy, &c. from one Dram to two Drams, in a Glass of Generous Wine; but if it is given against Vapors, or Hysterick Fits, it will be best to give it in a Glass of the *Distilled Water*, which may be repeated Morning and Night.

XXVII. *The Acid Tincture.* This has all the Virtues of the *Spirituous Tincture*, and more powerful

powerful than it, in suppressing Vapors and Hyfterick Fits, also Vomiting, Sicknefs at Heart, and other Difcaies of the Stomach,; and exceeds all the other Preparations, in curing Calentures, burning Fevers, the Plague, and all forts of Malign and Peftilential Fevers, for which it is a kind of Specifick. Dofe fo many Drops as to make the Vehicle it is given in gratefully Acid, and to be repeated as often as need fhall require.

XXVIII. *The Oily Tinfure.* It is a powerful Antiparalytick, Neurorick, Hyfterick, and Nephritick; outwardly it is good againft the Palfie, Lameness, Numbness, and Trembling, being anointed very well all along the Back Bone Morning and Night, taking some few Drops of it also inwardly, and anointing withall the parts affected. It facilitates the Birth, and powerfully provokes the Terms in Women. And is a fingular Medicament againft the Stone, Gravel, Sand, Tartarous Mucilage in the Reins and Bladder, Strangury, scalding and heat of Urine, in all which Cafes it gives present relief. Dofe from one Dram to three Drams in any proper Vehicle.

XXIX. *Nota.* The first Kind is most used, but *Lobel* fays, the fourth and fifth forts are more effectual to all the Purposes and Intentions, than the first Kind: And if my Observation may fignifie any thing, I am of Opinion, that the third Kind is not inferior in goodness to any of them all.

NENUPHAR, see Water Lilly, Chap. 442.
NESPITE, see Calamint, Chap. 104.

CHAP. DXVIII.

Of the NETTLE.

I. **T**HE Name. It is called in Arabick, *Hu-niure*, & *Angiara*: *Serapio* calls it *Hammure Uraith*: in Greek, *Ἀγρίον* (quia talia aspera & injucunda est:) also *Ῥιζόν*, (quod vellicet & punget:) in Latine, *Urtica*, ab *Urendo*, quod prurium pustulasque igni similes excitet: and in English, Nettle, and Stinging Nettle.

II. *The Kinds.* There are said to be four Kinds of Nettles, viz. 1. *Urtica Hortensis*, *Urtica Romana*, *Urtica Italica*, *Urtica prima Dioscoridii*, *Urtica Legitima Chusij*, *Urtica Mas*, vel *Mascula*, The Garden or Roman Nettle. 2. *Urtica Sylvestris major*, *Urtica major*, *Urtica Urens*, *Urtica Femina*, our great common stinging Wild Nettle. 3. *Urtica media Sylvestris*, *Urtica urens vulgaris altera Tragi*, *Urtica Olygophyllus* (a paucitate foliorum) our middle sort of stinging Wild Nettle. 4. *Urtica minor Sylvestris*, *Urtica minor*, *Urtica Exigua Casalpini*, *Urtica urens minima*, *Urtica tertia Lugdunensis*, *Matthioli* & *Tragi*, *Urtica Canina*, vel *Canina Plinij*, our lesser or small stinging Nettle.

The Descriptions.

* III. *The first, or Garden or Roman Nettle.* Its Root is yellowish, and spreads under Ground with many long Fibres or strings, whereby it takes fast hold, yet perishes every Year, requiring to be new Sow'd every Spring. It springs up with one or more great Stalks, which spread themselves out in

Nettle Garden.

to many round hairy Branches, rather leaning down, than standing perfectly upright, sometimes rising to be four or five Feet long, spreading out into several Ramifications: whereon at the Joints, are two Leaves set together, very rough: and tho' it has no sharp Prickles, yet it has a hairy Down thereon, which will sting the Skin egregiously, if but touch'd therewith, and raise it full of Blisters, as if it was burnt with Fire: and dented round the edges somewhat deeply. At several places of the Branches come forth small Stalks of reddish and yellowish Flowers, made of threads which fall away, without bearing any thing else: but at the Joints with the Leaves in other Places, from the middle of the Branches upward, come forth small, round, rough, green, prickly pellets bigger than Pease, in which are contained several flat, smooth, slippery, glittering or shining Seed, much like to Line or Flax-Seed, but rounder and smaller.

IV. *The second, or Great common stinging Wild Nettle.* The Root of this perishes not like the former, but continues all the Winter, with some green Leaves upon it, if the Season be not too extreme: It is pale and yellow, and spreads it self, running very deep into the Earth, with long strings and small Fibres. From this Root shoots forth one,

and sometimes more Stalks, which spread themselves out into many Bran-ches, any of which if they lye upon the Ground, will take Root again, and spread abroad, and take up a great deal of room. The

others. The Seed is small and white like to the others.

Nettle Stinging Great.

Leaves are of a darker color than the former, and sometimes brownish, or red, as large, rough, and stinging as the former, but not so deeply dented on the edges. At the tops of the Branches and likewise, from the Joints with the Leaves underneath, come forth small, long, Branches of Flowers, and Seeds after them, in fashion very like to the Branches of the Female Mercury, in which is contained, small, flat, whitish Seed.

V. The third, or Our middle sort of Stinging Wild Nettle. This in its Creeping, stringy and Fibrous Root, Stalk, Branches, Flowers, Seed, and manner of growing seems not to differ from the former last described, excepting that this is lower, and smaller, and thinner set with Branches: for this reason, it is thought by many, that it is one and the same Kind with the Greater last described, and differs nothing from it, saving that it grows not full out so great, which may be with respect to the Soil, being poorer, and not so fat and good.

VI. The fourth, or Our Lesser, or small stinging Nettle. Its Roots are smaller than any of the former, and perish every Year, yea twice or thrice sometimes in a Year, for it has been observed to shed its Seed twice in a hot Year, and spring up again the third time of the shed Seed, which being near Winter, perishes with the first Frosts, but springs up again the next Year. This Nettle is in most things like to the two last, but rises seldom above half a Yard high, and is nothing so much Branched as the great Kind. Its Leaves also are much smaller, rounder, much sharper notched on the edges, and of a fresher or lighter green color, and more sharply stinging than any of the

Nettle stinging small.

VII. The Places. The first is usually Sown in Gardens with us, as it is also in Upper and Lower Germany, and in most places of France: but in Italy Wild in the Woods. It has also been found naturally growing Wild, time out of mind, both at the Town of Liddle by Romney, and in the Streets of the Town of Romney in Kent, where it is said that Julius Caesar with his Soldiers Landed and staid for a time, whence it is thought the place took its Name, being by them called *Romania*, and we for shortness *Romney*, and also obtained the first produce of the Plant; ever since which time, it is thought that it has continued there, growing, and rising Yeatly of its own Sowing. But it has been found growing Wild also in other parts of this Kingdom, as in the Street of *Bardney* in *Lincolnshire*. The other three sorts grow in waste Grounds, by Hedges, and on Ditch Banks, by High-ways and Walls sides, and in many other places both till'd and untill'd, and in Pastures, and in Gardens, and in all sorts of Grounds both rich and poor, good and bad, where if they be suffered to grow a while, it will be difficult to clear the place of them.

VIII. The Times. They come up plentifully early in the Spring, and through all the Summer Months, and they Flower and Seed in July, August, and September; but the smaller Kind more early, because it many times Flowers and Seeds twice a Year, as was before observed.

IX. The Qualities. Nettle is hot and dry in the first Degree, and is of thin and subtil parts: now it does not burn and sting, because of its extreme heat; but because its downy or small prickles are hard and stiff, piercing like a Sting or the fine Points of Needles; for if it is once withered, it stings not at all, because its fine hard Prickles grow

grow soft and flabby. It is Aperitive, Absterfive, and Diuretick, Pectoral, Nephritick, Hyfterick, and Alexipharmick.

X. *The Preparations.* You may make herefrom, 1. *A Liquid Juice* 2. *An Essence of the whole Plant.* 3. *A Decoction of the Plant.* 4. *A Wine of the Plant.* 5. *A Lohoch of the Juice of the Plant.* 6. *An Electuary.* 7. *A Powder of the Leaves and of the Seed.* 8. *A Lotion.* 9. *An Ointment.* 10. *An Oil by Decoction.* 11. *A Cataplasm.* 12. *A Distilled Water.*

The Virtues.

XI. *The Liquid Juice.* Taken inwardly to 2 or 4 Ounces or more, according to Age, it will make the Belly Soluble, it opens obstructions of the Stomach and Lungs, helps Wheezing and shortness of Breath; It provokes the Terms, allays Vapors, and prevents Hyfterick-fits: it provokes Urine, and expels Sand, Gravel and Tartarous Matter out of the Reins and Bladder. It kills Worms in Children, eases and takes away Stitches in the side, removes the oppilation of the Spleen expelling the windiness thereof, and is said also to provoke to Venery: being taken for two or three Days together it stops Spitting or Vomiting Blood, coming from the Lungs or Stomach, being put into Green Wounds or old Sores, it cleanses them and induces their healing. The common Dose is 2, 3, or 4 Spoonfuls at a time in a Glass of Wine, or other fit Vehicle.

XII. *The Essence.* It has all the Virtues of the *Liquid Juice*, and more powerful than it, for which reason it may be given in a less Dose, as from 1 Spoonful to 3 in Water, Broth or Wine. It warms the Stomach, heals Sores and Ulcers in the Mouth or Throat, and given with 10, 15, or 20 Grains of *Myrrh in fine Powder*, it helps moist cold and moist Diseases of the Womb. It eases Pleuritic Pains, helps the Cholick, expels Wind from the Viscera, resists Poison, and is good against the Stinging or Biting of any Venomous Creature as of Serpents, Mad Dogs, Scorpions, Hornets, &c. and resists the Poisonous qualities of *Hemlock, Henbane, Mandrake, Musbroome, Nightshade*, &c. Bathed upon overwearied Members it refreshes them, eases Pains, and Dissolves simple Contusions.

XIII. *The Decoction in Water or Wine.* It has all the Virtues of the *Juice and Essence*, but nothing near so powerful, and therefore may be given Morning, Noon, and Night from 2, to 6, or 8 Ounces, made pleasant with a little double refined Sugar.

XIV. *The Wine.* It is made by a cold Infusion of the *Green Herb or Plant in Wine* for 3 or 4 Days, and then pressing out the Wine; and repeating this Infusion in the same Wine, 3 or 4 times or more, till the Wine is very strong thereof, and at last pressing it out again; after which, letting it stand till its fine, the clear is to be decanted and kept for use. It may be done with *Madera Wine, White Port, White Lisbon, Sherry, or Canary*, as every one likes best. It has the Virtues of the former Preparations, is very Stomackick, and a safe and sure Medicine to open obstructions of the Viscera, but chiefly of the Womb, which it warms and strengthens very much.

XV. *The Lohoch of the Juice.* To every Pint of the *Juice*, half a Pound of Honey is to be put; and they are to be melted together in a Sand heat, or in Balneo, and the humidity is to be evaporated till it comes to the consistency of a Lohoch: It opens the obstructions of the Bronchia of the Lungs, and

cures Coughs, Wheezings, Hoarseness, shortness of Breath, Asthma's, and helps to expectorate cold, tough and impacted Flegm in the Lungs or Stomach, and to spit forth the purulency of a Pleurisie, and to spend it that way: it is also good to discuss the Tumors or Swellings of the Almonds and Throat, to strengthen the Uvula, and reduce it to its place. Drank also mixt with *White Port Wine*, from an Ounce to 2 Ounces, it provokes Urine and cleanses the Reins and Bladder from Sand, Gravel, Stone, and Tartarous Slime.

XVI. *The Electuary.* Take of the *Powder of the Seed* 2 Ounces; of the *Leaves in Powder, Myrrh in fine Powder*, of each 1 Ounce; *Clarified Honey* 10 Ounces; mix and make an *Electuary*. It has all the Virtues of the *Juice, Essence, Wine and Lohoch*, and may be given from 1 Dram to 2 or 3, in any proper Vehicle: It is an excellent Hyfterick, provokes the Terms, stirs up Venery, facilitates the Birth, and brings away the After-birth.

XVII. *The Powder of the Leaves and Seed.* That of the Seed is the strongest, or more effectual: It provokes Urine, Stone and Gravel, from the Reins and Bladder, kills Worms in Stomach and Belly, eases Pleuritic pains, opens obstructions of the Liver and Spleen, and provokes Lult; it is also a Remedy against the Stinging of Venomous Creatures, the Bittings of Mad-Dogs, the Venom of *Hemlock*, and other cold Poisons which stupify and dull the Senses. It is good against the Lethargy, being taken with a little Salt, the Forehead and Temples being rubbed also therewith. Dose a Dram or Dram and half in a Glass of Generous Wine. If it is blown up the Nostrils, it is said to stop their Bleeding; and takes away the *Polypus* or fleshy Excrecence growing therein. Given to Hens in their Meat in Winter time, it is said to make them to lay Eggs all Winter more plentifully.

XVIII. *The Lotion.* Take of the *Juice or Essence* a Pint; of the *Decoction, and Wine*, of each half a Pint; *Clarified Honey* 6 Ounces; mix and dissolve. It is good against Coughs, Colds, Wheezings, Asthma's, causes expectoration from the Stomach and Lungs, and has all the Virtues of *Juice, Essence and Lohoch*. It is good to gargle with when the Almonds and Throat are Swelled, asswages the Tumor of the Uvula, and restores it to its place, heals Inflammations, Sores and Ulcers of the Mouth and Throat, and stops spitting of Blood arising from the Stomach. It is good also for outward Wounds and Sores, they being washed therewith. And if it is made without the Honey, it is good to cleanse the Skin from Scurf, Morpew, Leprosie, and other Defecations; and is profitable to wash old, rotten and stinking Sores, or Fittula's, and Gangrenes, and such as are fretting and corroding: It heals Green Wounds by washing them therewith, and injecting it with a Syringe into them, if they be deep.

XIX. *The Ointment.* It is made of the *Juice* by adding Oil and a little Wax, boiling gently to the consumption of the humidity. It eases the Gout, and other Pains, and is good to Anoint cold and benumbed Members therewith, to bring them to their proper Activity again.

XX. *The Oil by Decoction.* It is made of the *Juice*, or *Green Herb bruised and boiled to Crispness in Sallet Oil*, and then press forth, reiterating the Operation three times. Being Anointed upon a place stung with Nettles; it is said to be a present Remedy, to take away the pain and stinging.

XXI. *The Cataplasm.* It is made of the *Green Herb being bruised in a Mortar*. Being put up the Nostrils, it stops their Bleeding. Applied to places affected with Scurf, Morpew, Leprosie, Scab-

Scabbiness, it cures them; and is said to cure old rotten Sores and Ulcers, tho' the Flesh was separated from the Bones; Applied to Dislocations after the Setting of the Joint, it strengthens the part, dries up Humors, hinders defluxions, and gives ease in the Gout, and other like Pains. If it is made with equal parts of the green Leaves of Nettles, and Dwarf Elder Leaves, and applied to the Gout, Sciatica, or Joint aches in any part, it quickly gives admirable ease, and in a little time Cure.

XXII. *The Distilled Water from the whole Plant.* It is said to be good for all the purposes to which the Juice and Essence are applied, but nothing near so powerful. But outwardly it is Cosmetick, and an excellent thing to wash Wounds and Sores with, and to cleanse the Skin from Scurff, Morpew, Leprosy, Scabs, and other Defecations thereof.

XXIII. *Nota.* The Garden or Roman Nettle is said to be the most effectual of them all: yet where that cannot be had, the others may very well be used in its place; and are thought by some to be no less powerful: and some likewise think the least of the three, to be no less effectual than the greater, and it may be to exceed them in efficacy too.

CHAP. DXIX.

Of NIGELLA;

OR,

FENNEL -- FLOWER.

I. **THE Names.** It is called in Arabick, *Xamin*; *Suntis*; *Sunici*, or *Sunizi*: in Greek, *Melanthion*, *ἡ μελανθιον*: in Latine, *Melanthium*, *Nigella*, *Salusandra*, *papaver Nigrum*: in English *Gibb*, *Fennel Flower* and *Nigella*: *Fuchsius* and *Cordus* took this Plant to be *Cuminum Sytvestre* alterum *Dioscoridis*.

II. *The Kinds.* There are two principal Species of this Plant, viz. I. *The Garden Kind*, which are, 1. *Melanthium Hortense* *Nigella hortensis* *Flore simplicis*, Our Garden Nigella with a single Flower. 2. *Nigella Cretica latifolia odorata*, broad Leav'd sweet Scented Nigella. 3. *Nigella Cretica tenuifolia odorata*, narrow Leav'd sweet Scented Nigella. 4. *Nigella Citrina* *Flore albo simplicis*, single Flower'd white Nigella with yellow Seed. All the former are single Flowered; these following are double Flowered. 5. *Nigella Damascena* *Flore multiplici*, Blew Nigella with a Double Flower. 6. *Nigella Citrina* *Flore albo multiplici*, white Nigella double Flowered. II. *The Wild Kind*. 7. *Melanthium Sytvestre*, *Nigella Sytvestris*. Wild Nigella.

The Descriptions.

III. *The first, or Garden Nigella with a single Flower.* It has a long slender Root, with some fibres adjoining to it, from whence springs forth a weak and brittle Stalk, and some times Stalks, about

a foot high, full of Branches; beset with Leaves, very much cut or jagged, much resembling the Leaves of Fumitory, but much greater. The Flowers grow at the top of the Branches, of a whitish blew color, each Flower being divided into five small Leaves Star fashion. The Flowers being past away,

Nigella Garden.

there come up small Knobs or Heads, having at the ends thereof, 5 or 6 little sharp Horns or Pointels, and every Knob or Head is divided into several small Cells or partitions, in which the Seed is contained, which is of a blackish color, very like unto Onion Seed, sharp in taste, and of an excellent sweet smell.

IV. *The second, or broad Leav'd sweet scented Nigella.* Its Root is yellowish, thready and Annual; from whence springs up a slender weak Stalk, divided into some Branches, having long and divided Leaves set thereon, but not of the form of some of the other Nigella, which are Fennel like, or Lark Spur-like, but much broader, and parted into several Divisions, somewhat like to those of Groundsel, but cut into lesser and finer parts. At the tops of each of the Branches, grows a single white Flower, like unto the other Nigella's, and Heads somewhat like them succeeding, containing black Seed also, and having a sweet smell.

V. *The third, or narrow Leav'd sweet Nigella.* The Roots of this Candy Nigella, are said to be harder than the rest, yet Annual like them: the Stalks which rise from thence are many, upright and slender, parted into several Branches, with but few Leaves set thereon, those below not being so finely cut or divided, as are those which are higher. The Flowers are small, yellowish, and white, growing at the Tops of the Branches, after which come cornered black Seed, sharp, and something sweet, contained in small bisformed Seed Vessels or Heads, which are much like to two small Berries.

VI. *The fourth, or single Flowered white Nigella, with yellow Seed.* This sort of single Nigella

gella we have also in our Gardens, proceeding first from Seed sent from other more Southern Countries: but it differs so little from the other Annual sorts, that it can scarcely be discerned, except it be in the fresher greenness of the Leaves, before it comes to Flower, which then is small like the *Nigella Romana arvensis*, or Wild Katherin Flower in Chap. 410. Sect. 6. *foregoing* of this Book, but of a white color. The Heads also are small, but formed alike, having smaller Seed within them, not black as others are, but yellowish, and without smell, and herein it is something like the double white Kind described in Sect. 8. following.

VII. The fifth, or blew *Nigella* with a double Flower. Its Root is small and yellow, perishing every Year, as the others do: from which spring forth several Green Leaves, finely cut, and into so many parts, that they are finer than Fennel, and divided somewhat like to the Leaves of Larks-heel, from among which rise up Stalks with many such like Leaves upon them, Branched forth into several parts, at the tops of which, upon each grows one fair large Flower, which consists of three or four rows of Leaves, laid one upon another, of a pale blew color, with a green round Head, compassed with several short threads in the midst, and having five or six such small green Fennel like Leaves, under the Flower, to bear it up (as it were) below, adding thereby a greater grace to the Flowers, which at the first shew sometimes white, but quickly after change. The horned Heads hereof are like to the Heads of the Wild Kind, which are somewhat rounder and greater, having within them black uneven Seeds, without the least Smell.

Nigella Blew double Flower'd.

VIII. The sixth, or white *Nigella* double Flowered. Its Root is yellow, and perishes every Year, as the other does. This double white *Ni-*

gella, has such like Leaves as the last has, but of a yellower green color, and much larger and broader, and very much jagged, being nothing like the fine cut of the former, as you may perceive in the single Leaf of this Plant placed near the bottom of the Cut, belonging to that last described in Sect. 7. *foregoing*. The Flowers are somewhat less, and lesser double than the former, and in color white, having no green Leaves under the Flower, as the former has: the Head whereof in the middle, is very like also to that of the last described, but not so great, in which is contained for the most part black Seed, and smelling sweet like the Roman *Nigella* in Chap. 410. Sect. 4. *foregoing*; which is the only sweet Scented besides this: but the Seed of this is sometimes not so black, but rather a little more white, or yellowish.

IX. The seventh, or Wild *Nigella*. It has a long slender Root, with many long strings and Fibers adjoining to it, which perish every Winter. The Stalk or Stalks, are a Foot or more high, beset full of grayish Leaves, very finely jagged, almost like the Leaves of Dill; the flowers are like to

Nigella Wild.

those of the first or Garden Kind described at Sect. 3. *foregoing* in this Chapter, excepting that these are blewer. The Cods or Pods are like the Heads or Husks of Columbines, in which is contained a sweet and pleasing Seed, tho' not so sweet smelling as the last.

X. The Places. The first is the Garden Kind, and grows with us in Gardens, and so do all the other six Kinds: which in *Candia*, *Italy*, and other hot Countries grow Wild in the Fields.

XI. The Times. They are all Annually to be Sown in the Spring, if they do not Sow themselves; they Flower in June or July, and the Seed is ripe in August.

XII. The

XII. The Qualities, Specification, Preparations, and Virtues of these, are the same with those of *Katharine Flower*, or *Roman Nigella* in Chap. 410. foregoing, so that we shall say no more thereof in this place; saying that the *Garden sweet smelling Roman Nigella*, is rather to be chosen than any of the others, as being very much the strongest, but if that is wanting, then the first Kind in this Chapter is to be first admitted, and after that the sixth Species foregoing or *robite double Flower'd Nigella*,

This Cut should have come in, in Chap. 140. *Self.* 3. But was there over-look't: We have thought good to put it in this place, that it might not be lost.

Nigella Bastard; or Cockle.

NICOTIAN, see Tobacco, Chap. (122.
NIGHT-SHADE Red, see Cherries Winter, Chap.
NIGHT-SHADE Woody, see Bitter-sweet. Chap. (77.

CHAP. DXX.

OF NIGHT--SHADE.

OR,

MORELLE.

I. **T**HE Names. It is called in Arabick, *Hamebathaneleb*, *Hamebalebaich*, & *Hamebalthaleb*: in Greek, *Σελύγος*, also *πύργος*, and *πύργος*; but the first is more usual and is accounted the true Writing: in Latine, *Solanum*, & *Solatrium*, *Uva Lupina*, & *Uva Vulpis*: and in English, *Nightshade* and *Morelle*.

II. The Kinds. There are 1. *Σελύγος κοινά*, *Solanum Hortense vel commune*, The Common or Garden Night-shade: of which in this Chapter. 2. *Solanum Lethale*, or *Solanum Majus*, The Deadly Night-shade. 3. *Solanum Halicacabum*, or Winter Cherries, of which we have discoursed in Chap. 122. 4. *Solanum Lignosum*, *Dulcamara*, or *Amaradulcis*, Woody Nightshade or Bitter-Sweet, of which we have already spoken in Chap. 77. foregoing.

III. The Garden or Common Kinds ate, *Σελύγος κοινά* & *πύργος*, *Solanum Hortense vel Sativum*, *Solanum commune*, *Solanum Vulgare*, Our Common Night-shade; it is also called *Garden Night-shade*, because formerly it was Planted in Gardens, tho' not now; but it is yet found plentifully in almost all Gardens tho' not Planted there, it generally coming up of its own accord. 2. *Solanum Vulgare baccis rubris*, *Solanum puniceum Cordi*, *Solanum rubrum* & *luteum Gesneri*, Common Night-shade red Berried. 3. *Solanum somniferum Dioscoridis*, *Matthioli*, *Gesneri*, *Lacuna*, *Clusii*, *Dodonæi*, *Lobelii*, *Casalpini*, *Camerarii*, *Lugdunensis*, *aliorumque*, Sleepy Night-shade. 4. *Solanum somniferum antiquorum verum*, The true Sleepy Night-shade of Theophrastus and Pliny. 5. *Solanum Magnum rubrum Virginianum*, Red Night-shade, or Red Weed of Virginia; this referred to the Kinds of *Solanum* for the likeness of the Leaves, altho' much larger; and it is called *Rubrum*, both from the color of the Stalks, and the color which it gives, with which the Indians color both their Skins, and the Barks of Trees, with which they make their Baskets, and such like things. 6. *Solanum Circæum majus* *Circæa major* (because in its outward form it is like the *Circæa Dioscoridis*:) *Circæa Lutetiana major Lobelii* & *Pene*; *Lappa Sylvæstris Tragi* (from its rough Heads and Seed like Burrs:) *Helxine Sylvæstris*, *fluvialis major Thalij*, (for that the Leaves are like to *Helxine* or *Paritaria*:) *Ocimumstrum Verrucarium Gesneri*; *Herba Divi Stephani Tabernemontani*, *Solanifolia Circæa dicta major Bauhini*, The greater Inchanters Night-shade. 7. *Solanum Circæum minus*, *Circæa minor*; *Circæa Lutetianum minor*; *Helxine Sylvæstris minor*; *Solanifolia Circæa minor*, & *Alpina*, The lesser Inchanters Night-shade. 8. *Solanum fruticosum Americanum*; *Amonum Plinij*; *Pseudocapsicum Dodonæi*; *Strichmodendron*, i. e. *Solanum arborescens*; *Solanum Americum Dalechampi*; *Solanum Indicum*; *Cerasa Indiana*, Tree Night-shade, or Tree Winter Cherry. *Dioscorides* his *Σελύγος ανωτά*; is, *Solanum somniferum*; but what his *Σελύγος ανωτά*, *Solanum furi-*
osum

ajum vel manicum, is very doubtful; some will have it to be the *Solanum Lethale*, but others deny it, and will have it to be another Plant, of which we shall speak more in the next Chapter.

The Descriptions.

IV. The first, or Cur Commoh or Garden Nightshade. Its Root is white and a little Woody (after it has perfected its Flowers and Fruit) with many small Fibres adjoining to it: and it sends up an upright, round, green hollow Stalk, about a Foot, half a Yard, or two Feet high, spreading itself forth into many Branches, on which grow many dark green Leaves, something broad, and pointed at the ends, soft and full of Juice, larger than the Leaves

Night-shade Garden.

of Basil, else something like, and a little unevenly waved about the edges. At the Tops of the Stalks and Branches, come forth three or four, or more white Flowers, made of five small pointed Leaves apiece, standing on a Stalk together, one by, or above another, with yellow Pointels in the middle, composed of four or five yellow Threads set together, which afterwards turn into so many pendulous Berries, hanging like those of Ivy, which are green at first, and black afterwards when they are ripe, and are of the bigness of a small Pea, full of Juice, and containing within each Berry small whitish round flat Seed. The whole Plant is of a waterish insipid Taste, but the Juice within the Berries is somewhat Viscous, like unto a thin Mucilage, and is of a cooling and binding quality.

V. The second, or Common Night-shade Red Berried. This is in all respects like the former Common Night-shade, in its Roots, Stalks, Branches, Leaves, Flowers, and manner of growing, ex-

cepting that its Leaves are somewhat harder and rougher, and the Berries when they are ripe are of a yellowish red color; the whole Plant growing also a little bigger than the former. In hot Countries its Root abides many Years, but scarcely so with us: it seems that this Plant is but a degenerate Species from the former, by reason of our Climate, as it happens in Sweet Fennel Seed, which being Sown with us, in a short time becomes (by transplantation into our Country) changed into our Common Fennel.

VI. The third, or Sleepy Nightshade. Its Root is thick, long, and hard, and of a brownish color on the out side. It rises up with several thick, round, soft, Woody Stalks, divided into other Branches, on which grow many soft, woolly, but green, broad, round Leaves, very like unto Quince Leaves; two always set at a Joint, one against another, of a something hot Taste, as Clusius says. The Flowers come forth at the Joints with the Leaves, all along the Stalks and Branches, 3 or 4 together, round about them, which are long and hollow, ending in 4 somewhat long and pointed Leaves, of a pale white color, which being past, green Berries come forth in their places set in woolly Husks, which being ripe are of a yellowish red color, and larger than those of the former.

VII. The fourth, or True Sleepy Nightshade of Theophrastus and Pliny. Its Root is somewhat great and Woody, covered with a whitish Bark, not very thick, of an ill Smell, and insipid Taste. It springs up with 3, or 4, or more thick, round, straight, whitish Stalks, about a Yard or more high, spread out into some other Branches, hard to break; set with somewhat broad Leaves very like unto Quince Leaves, standing on small foot Stalks, not always 2 at a Joint, but many standing singly at the Joints: from the middle of the Stalks upwards, come forth several reddish Flowers together, consisting of 4 Leaves a piece; after which follow small striped and pointed greenish Husks, but red when they are ripe, very like unto Bladders of Winter Cherries, but much less, with a red Berry within it in like manner, containing within it several small Seeds.

VIII. The fifth, or Red Nightshade, or Red Weed of Virginia. Its Root is white, and grows very great with us, but perishes if it is not defended from the Frost in Winter, which usually rot it: but in its Native places, it grows as big as a Man's Leg, (and such I have seen of it in Carolina, and other Southern parts of Florida) and above a Foot long, which being cut cross has like a Bryony Root, many circles to be seen in the middle. It is a large Plant, and takes its Name of *Solanum* from the likeness of its Leaves. It rises up with a great thick, round, reddish Stalk, of the thickness of ones Thumb at least; and four or five Feet high, or more; set with many very large, fresh, green Leaves full of Veins (but without any order,) some greater, and some smaller, and sometimes many of them turning reddish; from the Joints where the Leaves stand, from the middle of the Stalk upwards, come forth many small foot Stalks with Flowers, which are very small, consisting of four Leaves apiece, of a pale red, or bluish color, divers standing together as it were in a small long cluster, which afterwards bring forth small blackish round Seed, 4 usually set in one Husk, which seldom come to ripeness with us in England.

IX. The sixth, or Great Inchanters Nightshade. Its Root is small, very white, and full of Joints and Branches, by which it shoots forth and creeps every way under Ground, quickly taking up a great compass. It rises up with one or more

s G. round

round and jointed Stalks, most commonly standing upright, yet sometimes leaning down to the Ground, and taking Root again at the Joints: it grows about a Foot or half a Yard high, especially if it grows in a moist shady place, with two Leaves set at every Joint, each of them growing upon a pretty long foot Stalk, which are broad, and round almost at the bottom, but very long pointed at the end, something curved about the edges, much like to the Leaves of Nightshade as some think, or rather like to those of Pellitory of the Wall, being of a shining green color on the upper side; and tender, soft and gentle in handling; but a little hairy, and of a dark grayish color underneath. From the middle of the Stalk almost upwards, the flowers grow in Spike fashion, many set together, one above another, which shew to be of a dark brown color, whilst they continue Budds, not blown open, but being blown are small Star like flowers, consisting of five Leaves apiece, dust over, especially at the brims or edges, with a light shew of bluish, with many brownish yellow Threads in the middle; where, after they are past, small, rough, round Heads come forth, like unto small Burs, sticking to Garments in like manner, in which are contained small shining black Seed, something like unto the Seed of Parietaria, but lesser.

Inchanters Nightshade.

X. The seventh, or Lesser Inchanters Nightshade. This in its Root, Stalks, Leaves, Flowers, Seed, form, and manner of growing, and indeed in all respects is like to the former, and differs from it only in that it grows much lesser in every part, and this, altho' it grows in the same Ground or place. These two Plants obtained the Name of Inchanters, from Circe the Inchantress, they being something like the Circea Diofcoridis, and not from any Inchanting Power or Virtue that is in them.

XI. The eighth, or Tree Nightshade, which is a beautiful Plant in respect to its green Leaves and

red Berries. It has a small long woody yellow stringy Root, with many Fibres adjoining to it: from whence springs up a Woody Stem or Stalk as thick as ones Finger or Thumb, and about 3 or 4 Feet high, covered with a whitish green Bark, spread out into many green Branches, having on them many fair green Leaves;

Tree Nightshade.

Sometimes unevenly waved on the edges, narrower than any Nightshade Leaves, and very near resembling the Leaves of Capsicum or Guinny Pepper, (whence the Name Pseudo Capsicum, for it has nothing of the nature of that Plant in it) but smaller, and narrower, falling away in the Winter, and shooting fresh again in the Spring. The flowers grow often 2 or 3 together at the Joints of the Branches with the Leaves, they are white and Star fashioned, but sometimes turning themselves back, with a yellow Pointel in the middle, very like to Nightshade flowers; when they are past, small green Buttons come in their places, which afterwards come to be pleasant round red Berries, of the bigness of small Cherries when they are ripe, which with us ripen not till about Christmas, in which are contained many flat, small, whitish Seed. All the whole Plant, as well Leaves and Flowers as Seed, are without either Smell or Taste.

XII. The Places. The first grows Wild with us under old Walls, and among Rubbish, by common Path Ways, by Hedge sides, and banks of Ditches, both in hot and cold Countries; and in all Climates it grows naturally or spontaneously in most Gardens, without any Sowing it, or Planting it. The second and third grows Wild only in hot Countries, as Spain, Italy, &c. The fourth Alpinius says, grows in Cantina. The fifth in Virginia, Carolina, New-England, and other Provinces of Florida. But these last four grow with us only

in Gardens. The sixth and seventh grow in moist and shady places, and some times at the Roots of old rotten Trees in Woods, and sometimes by Hedge-sides, and borders of Fields. The last is thought to come from the *West-Indies*, but it has been an Inhabitant a long time in our *English Gardens*, where it Lives and continues reasonably well, so that some care be taken of it in Extricity of Winter.

XIII. *The Times.* They all except the last dye away in Winter, and come up fresh again in the Spring. The third or *Sleepy Nightshade*, by reason it comes out of a warmer Country, will scarcely endure, but perish by the extremity of our Winters, unless it be well fenced or defended. The two first which dye every Year, and rise of their own Sowing, spring not out of the Ground, till late in the Year, as about the latter end of April or beginning of May. The first five, Flower in the Summer Months, and continue Flowering till Autumn is well spent, after which their Berries come to ripeness. The sixth and seventh spring up in April, are in Flower in June, and give their ripe Seed in August, then dye away to the Ground, the Roots abiding safe all Winter. The eighth Flowers sometimes in June, but generally in July and August; and the Fruit, is ripe about the latter end of December or beginning of January.

XIV. *The Qualities.* Of all these Plants before described, the first is only, or chiefly used in Physick. It is cold in the third Degree, and dry in the second: Anodyne, Altering, Costivick Diuretick, Repersussive, Hystrick, Nephritick and Arthritick.

XV. *The Specification.* It is prevalent against Inflammations of the Throat and Tonills, eases the Head-ach and Gout, provokes Urine, and gives ease in the Strangury.

XVI. *The Preparations.* You may have herefrom, 1. A Liquid Juice. 2. A Decoction in Water. 3. An Insolated Oil. 4. An Ointment. 5. A Pessary. 6. A Cataplasim. 7. A Powder of the Bark of the Root. 8. A Powder of the Seed. 9. A Decoction of the Root in Wine. 10. A Distilled Water of the whole Herb. 11. A Collyrium. 12. A Lotion.

The Virtues.

XVII. *The Liquid Juice of the Herb or Berries.* It is of use to cool vehement Inflammations, whether inwardly given or outwardly applied, being no ways dangerous as that of the *Solanum Lethale* is, or as the *Solanum Somniferum*, which is scarcely safe for internal uses. But however the Juice of this Common Kind by reason of its great coldness, must be given in due proportions, being first clarified, it may be given (mixed with a little Honey) to a Spoonful or something more: It cures an Erysipelas by Bathing therewith, and dipping double Linnen Cloths in it, and laying it over the Sore, and is good against creeping and corroding Ulcers. Bathed upon the Temples, it takes away the heat and Inflammation of the Eyes. The Juice of the *Somniferous*, comes nearly to the Quality of Opium, to procure Sleep, but it is something weaker: dropt into the Ears, it presently eases their pain.

XVIII. *The Decoction in Water.* It has all the Virtues of the Juice, but not full out so powerful, and may be given inwardly against Fevers to three or four Spoonfuls. The Eyes washed therewith,

it takes away their heat, inflammation, and eases their pain.

XIX. *The Insolated, or Decoiled Oil.* It is made of the Juice or bruised Herb, with Oil Olive or Oil of Roses. Anointed upon Inflammations, Shingles, and Fiery breakings out, it cools, eases, and heals them.

XX. *The Ointment.* It is made of the Juice mixed with Wine Vinegar, Oil of Roses and Ceruse, ground together for a considerable time in a Leadem Mortar, till it comes to the consistence of an Ointment. It is good to Anoint with in all Heats and Inflammations, Anthonies Fire, Shingles, Fiery Pustules, and other like eruptions, in whatsoever part vehemently afflicted with heat: it eases the Head-ach, gives relief in Frenzies, the Temples and Fore-head being Anointed therewith, and cools Inflammations of the Eyes. And is profitable also against Ringworms, Tettars, Shingles, Herpes and all sorts of running, fretting, eating Sores or Ulcers, weeping and moist Fistula's, &c.

XXI. *The Pessary.* It is made of the Green Herb and Root beaten together, and formed with Wool or Cotton, and then dipt into the Juice. Being put up the Womb, it stops the overflowing of the Terms, and the Flux of the Whites in Women.

XXII. *The Cataplasim.* It is made of the Green Herb, beaten in a Mortar, and brought to a moderate Consistency with Barley Flower. Applied to the Testicles or Cods, it eases the pain and diffuses the Swelling. Applied to the place in a Megrim, or other Head-ach, it presently eases the Pain: and diffuses hot Tumors in the Throat: It gives present ease also in the Gout.

XXIII. *The Powder of the Bark of the Root.* Taken to a Dram in Wine, it eases pain like Opium, and procures Rest and Sleep, but this Dose is not to be exceeded for fear of danger.

XXIV. *The Powder of the Seed.* It may be taken in White Port or Lisbon Wine, from half a Dram to a Dram, so taken, it powerfully provokes Urine, and is profitable against the Dropsy, and takes away heat and scalding in Pissing: but it ought not to be taken too often, nor in too great a quantity, because it is apt to induce a Frenzy: The remedy of which is (as Authors say) to Drink liberally of Warm Honied Water.

XXV. *The Decoction of the Root in Wine.* Being held in the Mouth, it gives ease in the Tooth-ach: and Pliny says, it is good to fasten loose Teeth.

XXVI. *The Distilled Water of the whole Herb.* It has all the the Virtues of the Liquid Juice, and may be used in the same manner, but in a greater quantity or Dose: And Authors say, that the Water is fittest and safest to be taken inwardly, and in that respect prefer it before the Juice.

XXVII. *The Collyrium.* Take of the Juice of the Root 3 Ounces; Clarified Hony 2 Ounces; Vinegar half an Ounce; mix them. Put into the Eyes, it eases their pain and smarting, cools their heat or Inflammations; it strengthens weak Eyes, and clears the sight.

XXVIII. *The Lotion.* Take of the Clarified Juice 8 Ounces; Red Port Wine 4 Ounces; Clarified Hony 3 Ounces; mix them for a Lotion. It eases the pains of the Teeth, cleanses old, running and putrid Sores and Ulcers, and heals Cankers, and other like Sores in the Mouth and Throat, they being often wash'd and gargled therewith.

C H A P. DXXI.

OF NIGHT-SHADE DEADLY.

O R,

D W A L E.

I. **T**HE Names. It is called in Greek, *Στεφύλιον θανάσιον*; & *Στεφύλιον θανάσιον*; in Latine, *Solanum Lethale*; *Solanum Letiferum*, vel *Letificum*; *Solanum Deleterium*; in English, *Deadly Nightshade*, and *Dwale*.

II. The Kinds. There is, 1. *Solanum Lethale* (properly so called) *Solanum majus Matthioli*, *Calpini* & *Camerarii*; *Solanum hortense nigrum Tragi*; *Solanum somniferum*, *Lobelii* & *Lugdunensis*; *Solanum Lethale Clusii*, *Dodonæi*, & *Thalii*; *Solanum Sylvaticum Gesneri*, *Anguillareæ*, *Guillandini*, & *Dodonæi*; *Deadly Nightshade*, or *Dwale*. 2. *Solanum Lethale minus*, The lesser *Deadly Nightshade*. 3. *Solanum Somniferum alterum Matthioli*, *Camerarii*, *Gesneri* & *Lugdunensis*; *Solanum Lethale aliud genus Dodonæi*, The other *Sleepy Nightshade*, which *Dodonæus* calls, an other Kind of the *Deadly Nightshade*.

The Descriptions.

III. The first, or *Deadly Nightshade*, or *Dwale*. Its Root is great, growing down deep into the Ground, and spreading great Branches therein,

Deadly Nightshade

and besides creeping under Ground, rising up in several places distant, quickly spreading over a Ground. It grows sometimes to the height of a Man, but usually it rises up not above 3 or 4 Feet high or something more, having round green Stalks, set with divers large Leaves much greater than any of these before, smooth and of a dark green color, set upon very short foot Stalks; among which at the Joints with the Leaves, come forth several long hollow Flowers, dented at the brims, of a faint deadish purple color, in a green Husk, growing upon a short foot Stalk, which being fallen away, round Berries succeed, which are at first green, but afterwards when ripe, come to be of a shining black color, like shining or polished Jet, full of a purplish Juice, many whitish Seeds being contained within it; the whole Plant has no good Taste nor Smell, but unsavory, bitter, and very pernicious; the Berries are a little sweetish and luscious, but not pleasant to an acute Palate.

IV. The second, or Lesser *Deadly Nightshade*. This in its Roots, Stalks, Leaves, Flowers, Berries, Seed, Smell, Taste, form and manner of growing, is much like the last, saving that in this the Leaves are lesser,

Nightshade Deadly lesser.

and of a darker green color, and stand upon longer foot Stalks, and the Flowers which are Bell fashioned as the other, are not so great and large as they are.

V. The third, or other *Sleepy Nightshade*, called by *Dodonæus*, the other Kind of *Deadly Nightshade*. Its Root is great, and spreads it self out into many Branches under Ground, with many Fibres adjoining to them. It has an upright crested or cornered Stalk, with many Leaves thereon, being longer and narrower, than those of the *True Sleepy Nightshade*, and more inclining downwards to the Ground, full of Veins running longwise and Traversed therein. At the Joints of the Stalk, from the middle part upwards, come forth several penda-

Other Sleepy Nightshade.

ious Flowers, hanging by very long Stalks, being long and hollow like unto a Bell-Flower, of a purplish color, each of them set in a large green Husk, dented or cut into five parts at the edges, but not very deep: in which after the Flower is past, comes forth a round Berry, of a deep blackish purple color, enclosed therein to the middle, and having a Crown like form at the Head of the Berry, which has a Wine like Juice, and many small white Seeds within it.

VI. The Places. The first and second grow Wild, not only in several Woods in Germany, but also in a great number of places in England, as in the Castle Yard of Framingham in Suffolk; under the Wall of Jesus Colledge in Cambridge, and in many other places of that Country: at Ifford in Essex: at Croydon among the Elms, at the end of the Town: in More Park: in the Park of formerly Sir Percival Hart, at Lellinstone in Kent, on the Conny Borrows; in Barling Park likewise: also in the Way going from S. Mary Cray, to Foots Cray, over against a great Field called Wenael. In former Years it was found growing in an Orchard in Lyn-Regis in Norfolk, near the South Gate; where it bore noble and great Berries as large, as large Black Cherries; of which I remember a little Boy of about 7 Years old, (Job Taylor by Name, a Gardiners Son there by) eat several of them, by which he was Poisoned, and died in a violent Fever, swelled in the Stomach and Belly, the whole Body being as red as Fire, and all in about 2 Hours time; the number of the Berries, according to the best of my remembrance, did not exceed a dozen; for this Accident sake, the Owner of the Orchard, rooted it out of his Ground. The last grows in the East Countries in Syria, as also in Italy near Trent; but with us only in Gardens, where it is Nurst up by the more Curious. The first is also found plentifully in Holland in Lincolnshire, and in the Isle of Ely, at a place called Wal-

foken in Norfolk near Wisbich: it was also found growing near High-Gate, not far from the Pond on the left Hand, as Gerard says: It grows generally in untill'd places, near High-ways, near Hedges and in the corners of Wood-land Grounds, and sometimes in Marshy places.

VII. The Times. These Plants flourish all the Spring and Summer: They Flower in July and August: and their Fruit is ripe in August and September, after which they fade and dye away.

VIII. The Qualities. Deadly Nightshade is said to be cold in the fourth Degree, and dry in the third: Anodyn, Narcotick, Repercussive, Arthritic, and Deleterious.

IX. The Specification. It is prevalent against Inflammations, Shingles, Anthones Fire, Ophthalmies, and so cause rest; but by reason of its Morriferous quality, is scarcely ever given inwardly.

X. The Preparations. You may have herefrom,
1. A Liquid Juice of the Leaves. 2. An Ointment.
3. A Cataplasm. 4. A Distilled Water.

The Virtues.

XI. The Juice of the Leaves. Used either alone, or mixed with a little Vinegar, and Bathed upon the Fore-head and Temples, upon any great Distemperature, or in a Frenzy, long watchings, or in a long Sickness and Weakness, it causes Rest and Sleep. It takes away the Violent pains of the Head from a hot cause, allays Inflammation, and is good against the Shingles and an Erysipelas or Anthones Fire, and all other Fiery and running Cankers, it cools them, and stops their spreading: applied also in the Gout, it eases the pain, and repels the Humors, if in the beginning, but is not proper to be Applied if the Disease has been of any continuance, lest it sends it up into the Stomach, to the Patients farther detriment.

XII. The Ointment. It has all the Virtues of the Juice, it cools, allays Inflammations, eases pain, causes Rest and Sleep, being anointed upon the proper parts; and is found to be a very good thing against the Distemper of the Spleen, being anointed upon the Region thereof.

XIII. The Cataplasm. It has all the Virtues of the Liquid Juice; besides which, being applied to simple Contusions, it repercusses the flowing Humor, and cures them. It eases the pains of the Gout upon the spot; and in the beginning prevents the afflux of the Humor.

XIV. The Distilled Water. It has all the Virtues of the Juice, but much weaker. It may be given inwardly from 1 Ounce to 2 (as Authors say) and that without any danger: it is good against Heart burning, and Inflammations of the Viscera, and being bathed upon the Eye Lids, or put into the Eyes, it is good against Ophthalmies, or Inflammations there: but it is much more powerful for this purpose, if it is mixed with equal parts of the clarified, or filtrated Juice. It cools and removes the Fluxion, to admiration.

XV. Nota. This Plant is of so Malign and Destructive Qualities, that neither its Juice, Roots, Leaves, or Berries, ought to be given inwardly; but the Berries are a certain Poison even upon the spot, as appears by the sad Example of the Boy, before related, who was our next Neighbors Son, and my Play Fellow, my self being much about the same Years: I eat one or two of the Berries at the same time, but by reason of their Lushious

or Mauckish Taste, eat no more of them, and for that reason escaped the danger.

This Cut should have been placed in Chap. 77. foregoing; but that it might not be lost, we have put it at the end of this Chapter.

Wood-Night-shade

C H A P. DXXII.

OF NIPPLE--WORT;

I. THE Names. It is called in Greek, Λαμ-
ψάνη; in Latine, *Lampsana*, also, and is
thought to be the true *Lampsane* Dioscoridis: in
English Nipple-wort.

II. The Kinds. Some will have this Plant to
be a Species of *Sonchus* or Sowthistle; others
of *Hieracium*, or Hawkweed; if it is a Species
of either, it seems rather to be of the latter;
I rather think it to be a peculiar Plant *sui*
generis, or of its own kind. The three follow-
ing Species we shall describe to you, viz. 1. *Lampsana* *Vulgaris*, *Lampsana* *Dioscoridis*; *Lamp-*
sana *Lobelij*, *Dodonaei*, *Lugdunensis*, *Thalij* & *Ca-*
merarij, *Papillaris* *Camerarij*, *Sonchis* *Cognatum*
Gesneri, & *Sonchi* *genus*; Our Common Nipple-
wort. 2. *Soncho* *affinis* *Lampsana* *Sylvatica*; *Bau-*
bini; *Sonchus* *Sylvaticus* *secundus* *Tabernamonta-*
ni, Wild or Wood Nipple-wort, Bastard Nipple-
wort. 3. *Lampsana* *Austriaca* *Parkinsoni*, *Sonchus*
Major *Pannonicus* *quartus* *Flore* *purpureo* *Clusij*;

Ladluca *Montana* *Flore* *purpureo* *Bauhini*, *Clusius*
his Austrian Nipple-wort.

The Descriptions.

III. The first, or Our Common Nipple-wort.
Its Root is small and bready, and being broken or cut,
yields a white bitter Milk or Juice. From whence
spring up one or more upright hard Stalks, on which
grow dark green Leaves, from the bottom to the
tops, but lesser still as they grow higher: in some
places whole without dents on the edges, and in
others with a few uneven cuts therein, something
after the manner of Hawkweed. The tops of the
Stalks have small long Branches, which bear many
small Star-like yellowish Flowers on them, which con-
vert into small Seed.

Nipple-wort Common.

IV. In Gerard, the former is thus Described.
Its Root is small Fibrous and white; its Leaves are
roughish and hairy, of an over-worn green color,
deeply cut or indented, on both sides like the Leaves
of small Turneps. The Stalks grow to the height
of two or three Cubits, and sometimes higher, di-
viding themselves towards the top, into sundry
little Branches, whereon grow many small Flowers,
like those of *Hieracium* or Hawkweed: which de-
caying are succeeded by little Crested Heads, con-
taining a longish small Seed, somewhat like to Let-
tice Seed, but of a yellowish color. The Plant is
also Milky, and the Stalk Woody.

**V. The second, or Wild, or Wood, or Bastard
Nipple wort.** This Wild or Wood Kind differs
not much either in Root, Stalks, Leaves, Flowers,
Seed, or manner of growing, from the former,
being

being very like unto it; but its Leaves are somewhat broader; and it has a greater store of Branches, but in its Flowers and other particulars, it differs not much.

VI. The third, or *Clusius* his Austrian Nipplewort. Its Root is small, Fibrous, and enduring many Tears. And it has several slender smooth and solid Stalks, not easy to break, a Cubit high or more, on which are set without any order, somewhat long and narrow Leaves, broadest in the middle, and sharp at the ends, reaved a little about the edges, and compassing them at the bottom, yielding a little Milk. From the upper joints with the Leaves, spread forth small firm Branches, yet a little bending, bearing each of them four or five long green Husks, and in them small purplish Flowers, of five Leaves apiece, nicked in at the broad ends, with some small Threads in the middle, which turn into Downe, which is carried away with the Wind.

VII. The Places. The first grows almost every where by High-ways, upon Walls made of Mud or Earth, in Stony places, upon the Banks of Ditches, and Borders of Fields, in most Counties of England. The second near Wood-sides and Hedge-rows. The third *Clusius* found in Hungaria, and in Saxones *Harcynia Sylva*, and other places; but with us it is only found Nurst up in Gardens.

VIII. The Times. The first Flowers from May to the end of August, and the Seed is ripe in July, August, and September. The second and third Flower in the Summer Months, and their Seed is ripe soon after.

IX. The Qualities. The first which is that which is only used, is temperate in respect to heat or cold, dryness or moisture. Digestive, Absterfise, of thin parts, and able to absorb the Virulency of sharp and corroding Humors.

X. The Specification. It is peculiar against Shingles, breakings out of the Lips after Fevers, sharp and running Sores, and the exulcerated Nipples of Womens Breasts, whence it came to be called *Papillaris* or *Nipple-wort*.

XI. The Preparations. You may have therefrom, 1. A Liquid Juice. 2. An Ointment. 3. A Cataplasim.

The Virtues.

XII. The Liquid Juice. It cools Inflammations, discusses Tumors, and is good against sore Eyes, Shingles, Pimples, and breakings out of the Face and other parts; applied to the Sore Nipples of Womens Breasts, it heals them.

XIII. The Ointment made with Hogs Lard, and a little Bees Wax. It is one of the best things in the World to heal Womens sore Breasts and sore Nipples being applied: it also heals superficial running Sores in other parts.

XIV. The Cataplasim. It has all the same Virtues of the Liquid Juice and Ointment: Absorbs the acid and corroding Humor, and cures simple Contusions.

C H A P. DXXIII.

OF OAK of CAPPADOCIA.

I. THE Names. It is called in Greek, *Αμφοβία*: (*quasi τὸ τῶν Θεῶν ἔσθιον*, *Deorum Cibus*, the Food of the Gods, from its excellent fragrantcy, and for that it seems to give long Life to such as eat thereof, that they might be held to be in a manner Immortal.) In Latine, *Ambrosia Hortensis*; *Ambrosiavera*; *Ambrosia Maritima Bauhini*; *Ambrosia Sativa Camerarij*; *Dodonei*; *Lobelij*; & *Ubernemontani*; *Artemisia secunda Plinij*; *Artemisia genus Gesneri*, who with *Anguillara* and *Camerarius* suppose it also to be *Conyza Hippocratis*; *Artemisia monoclonos Lugdunensis*: in English, *Oak of Cappadocia*.

II. The Kinds. It is a singular Plant, *sui generis*, I know other Authors make two or three sorts of *Ambrosia*, but two of them are other Herbs, which have no relation to this, as the *Ceanopis relictus*, & *Coronopus repens* *Ruellij*, *Bucks-Horn*, or *Warr-Cresse*, of which we have already discoursed in Chap. 91. foregoing: but what we treat of here is the first Kind, both of *Lobel* and *Gerard*, which is the True Garden *Ambrosia*, those other being *Ambrosia agrie*, and Plants of another Species.

The Descriptions.

III. This Plant, or Oak of Cappadocia has a long slender Root, spreading itself forth into many Branches and Fibres, from which comes forth one hoary, white, striped, or streaked Stalk, rising to be two Feet high at least, in any good sort of Ground, which divides or spreads it self out into many Branches, from the very bottom, on which grow without any certain order, Leaves something large, upon pretty long foot Stalks, very much cut in on the edges, somewhat resembling the divisions of Mugwort Leaves, especially the ends of them, but much smaller than they, being all whitish or hoary upon the green, and of a very pleasing Smell, not so hot or streng as *Bourys* or Oak of Jerusalem. At the tops of all the Branches both great and small, grow the Flowers, which are small, round, yellow, Mossie Buttons, never opening abroad, nor bringing any Seed, but fall away like Chaff. But under these Flowers from among the Leaves, come forth small short Stalks, bearing two or three or four small rough and pointed Heads, without any Flowers before them, in which is contained small, round, blackish Seed, almost like the Kernels or Stones of Raisons or Grapes.

IV. Gerard gives us another description, which being compared with the former, will more excellently declare and fit out the Plant; and it is as follows. The Root and whole Plant perishes with us in England at the first approach of Winter. Dioscorides says, that it grows about three Handfuls high, but in Gerards Garden, it grew to be about three Feet high, yielding many weak, crooked, and streaked

NONE-SUCH, see Flower of Constantinople, (Chap. 280.

NOON-TIDE, see Goats-Beard, Chap. 319.

NOON-FLOWER, see Goats-Beard, Ibid.

NOSE-BLEED, see Yarrow, Chap.

NUTMEG, see the Tree, Lib. II.

streaked Branches, dividing themselves into several other smaller Branches, having from the midst to the top thereof, many Mossie, yellowish Flowers, not much unlike to those of Our Common Wormwood, standing one before and above another in good order. And the whole Plant is as it were covered over with Bran or a Mealy dust. The Flowers do change into small, prickly, cornered Buttons, much like unto Tribulus Terrestris (in Chap. 106. foregoing) in which is contained black, round Seed, not unpleasant in either Taste or Smell. The Leaves are in shape like unto the Leaves of Mugwort, but thinner and more tender: all the whole Plant is hoary, and yields a pleasant scent.

V. *The Places.* It grows Naturally in Cappadocia; and it is a Native also (as Bellonius says) in many Places of Asia Minor: but with us, and so likewise thro' all Europe, it is only Nurst up, and found growing in Gardens.

VI. *The Times.* It seldom Flowers in our Country till August, and very rarely gives us any ripe Seed; for the least cold Night coming before it Seeds, makes it presently dye away and perish, so that for the most part (without very great care) we are to seek out for Seed, from Spain, Italy, and other like places.

VII. *The Qualities.* It is hot and dry in the second Degree, and of thin and subtle parts. It Incides, is Absterfivè, Astringent and Pectoral.

VIII. *The Specification.* It stops a Fluxion of Rheum or Humors into the Stomach and Lungs, cures Fluxes of the Bowels: and (as Gerard says) cuts tough Flegm, and is good for such as are short Winded, and cannot easily draw their Breath.

IX. *The Preparations.* You may make herefrom, 1. A Liquid Juice. 2. A Decolion in Water or Wine. 3. A Conserve of the Green Herb. 4. A Powder of the dried Herb. 5. An Ointment or Balsam. 6. A Cataplasim.

The Virtues.

X. *The Liquid Juice.* It is Absterfivè and cleansing, and stops the Flux of Humors into any part, and therefore is of excellent use to strengthen the Stomach and other Bowels, and cure Fluxes of all kinds in those parts. Externally applied to any part, it repels the flowing Humor, cleanses old running Sores and Ulcers, and induces their healing. Dose 1, 2 or 3 Ounces morning and Night in any proper Vehicle.

XI. *The Decolion in Water or Wine.* It has all the Virtues of the Liquid Juice but not so powerful: it may be given from 4 to 6 Ounces, sweetned with white Sugar, or Sugar Candy; and so exhibited, it is profitable against Coughs, Colds, Wheezings, shortness of Breath, difficulty of Breathing, and causes an easy Expectoration of the pituitous matter lodged in the Brest and Lungs.

XII. *The Conserve of the green Herb.* It has the Virtues of the Juice and Decolion, and is used as an excellent thing by such as are in Consumptions, and have lain under the tedious languishment of an inveterate Cough. Dose as much as a Chestnut.

XIII. *The Powder of the dried Herb.* It is given to a Dram or more in any proper Vehicle against the Bloody Flux, and all other Fluxes of the Bowels: outwardly being plentifully strewed upon old, putrid, running Sores and Ulcers, it cleanses and dries them, represses the farther Flux of the Humor, and disposes them to a speedy healing.

XIV. *The Ointment or Balsam.* They are Vulnerary and of great use in healing not only of Green Wounds, but also of old Sores and running Ulcers, of difficult cure, for they digest, cleanse, incarnate, dry, and induce the healing to a wonder.

XV. *The Cataplasim of the Green Herb.* It repels the Humor and cures simple recent Contusions. According to Dioscorides, it has a property to stop, repel and bind those Humors, which fall into any part of the Body, being outwardly applied; and of the same opinion also is Galen himself.

CHAP. DXXIV.

Of OAK of JERUSALEM.

I. *THE Names.* It is called in Greek, *Βοτρύς* in Latine, *Botrys* also: and in English, *Oak of Jerusalem.* All Authors call it *Botrys*; but Dioscorides says, that in his time, The Cappadocians called it *Ambrosia*, and some others called it *Artemesia*. Cordus upon Dioscorides calls it *Ambrosia altera Species*; and he says that in some Apothecaries Shops in Germany, the Seed was taken for *Amomum*. In the *Hortus Eysletensis* it is called *Artemesia Turcica*: and Camerarius says, the Italians call it *Patientia*.

II. *The Kinds.* Formerly there was but one sort of *Botrys* known, but now we have found out another, growing in Virginia, 1. The first is called simply *Botrys* (*à Floribus & Seminibus in Botrys formam ramulis insidentibus*, from the Flowers and Seed growing like unto a Bunch of Grapes.) Also *Botrys vulgaris*, but Bauhinus calls it *Botrys Ambrosioides vulgaris*, Our Common Oak of Jerusalem. 2. *Botrys Americana*, which Bauhinus also calls *Botrys Ambrosioides Mexicana*; it is likewise called *Botrys Virginiana*, & *Botrys Fruticosa Americana*, American, or Virginian Oak of Jerusalem, or Shrubby Oak of Jerusalem.

The Descriptions.

III. *The first, or Our Common Oak of Jerusalem.* Its Root is long and hard after giving Seed, perishing Yearly. It is a small Bushy Plant full of Branches, about a Foot and half high, with some few, and not many Leaves thereon, which at the first springing up, are reddish on the underside, and afterwards grow to be of a yellowish green color, more especially when they grow old, and in the time of flowering and Seeding, which are much cut in on the edges, like unto Groundsel, but larger. Gerard says, that the upper side of the Leaf is of a deep green, and somewhat rough or hairy; and that the Branches are beset with small Leaves deeply cut in or jagged on the edges, very much resembling the Leaf of an Oak, which caused our English Women to call it Oak of Jerusalem. From the middle of the Branches upwards to to the very tops, grow small, pale, yellow, Flowers like the Blossoms, or young Blowings or Clusters of the Vine, which turn into small brownish Seed. The whole Plant is of a very pleasant Smell and of a kind of Aro-

Aromatick Scent; and whilst it is green is something clammy in handling.

IV. *The second, or American, or Virginian Oak of Jerusalem. Its Root is small, Fibrous and Woody. It rises up also higher than the former, and its Branches are more Lignous and durable. The Leaves are something like unto Wild Arach, but larger, and much cut in on the edges, like unto the former. The whole Plant both Flowers and Seed, is most like to the first or our Common Kind; and where it is a Native, as in Virginia, Florida, Mexico, &c. it will abide the Winter Season, because it is nothing so violent as ours; but it will not endure the Winters cold with us, without much care in Housing and preserving it: but it will spring up again of the Seed soon the next Year, as some other Plants do. The Smell hereof is something strong, but very pleasant, and comes very near to that of the former.*

V. *The Places.* The first grows plentifully in Italy, as also in the Southern parts of France, both by Water sides, and in dry Sandy Grounds, but with us it is Nurst up only in Gardens. The Second is a Native of Mexico, Florida, Carolina, Virginia, from some of which places, it has been brought home to us, and planted in our Gardens, or in Pots, that it may be Houfed, and so be preserved against the coldness of the Winter.

VI. *The Times.* They both Flower and Seed in August and September, and do often times raise themselves of their own sowing, more especially the former.

VII. *The Qualities.* They are hot and dry in the second Degree: they are both Aperitive, Attenuating, Inciding, Pectoral, Arrhretick, Hystrick, and a little Cathartick as some Authors hold.

VIII. *The Specification.* They are of extraordinary use in the curing of Asthma's, Coughs, Wheezings, and other obstructions of the Brest, Lungs, Reins and Womb.

IX. *The Preparations.* You may make, 1. A Liquid Juice. 2. An Essence. 3. A Decoction, or Infusion in Wine. 4. A Powder of the Herb. 5. An Ointment or Balsam. 6. A Fumigation. 7. A Cataplasme. 8. A Spirituous Tincture. 9. An Acid Tincture. 10. An Oily Tincture. 11. A Syrup.

The Virtues.

X. *The Liquid Juice.* It is a very good thing against an Asthma, Wheezing, and shortness of Breath, being taken with an equal quantity of Honey Morning and Evening: It opens obstructions of the Brest and Lungs, and causes an easie expectoration of the rough Flegm, and other crude Humors which oppres them: It cleanses also filthy and corrupted Lungs, causing the putrid Matter to be spit forth, and if they be exulcerated, it very much conduces to the healing. Dose from two to three Spoonfuls Morning and Night.

XI. *The Essence.* It has all the Virtues of the Juice, and may be given from 1 Spoonful to 2; mixt with an equal quantity of Clarified Honey, or with as much Syrup of Violets, and so to be taken twice a day as the former. It is an excellent thing against a Cough or Catarrh, or continual defluxion of thin, salt, and sharp Rheum.

XII. *The Decoction or Infusion in Wine.* If a little of Liquorice Root bruised, be added to it, it will be so much the better; and then taken from 3 to 6 Ounces mixed with a Spoonful or 2 of Clarified Honey, or Syrup of Violets, it will have all the effects of the Juice or Essence.

Outwardly used as a Gargle for sore Mouths and Throats, or for old running Sores, or putrid Ulcers in any other parts, it cleanses them, dries, and admirably induces their healing.

XIII. *The Powder of the Herb.* Taken to a Dram (in any fit Vehicle) it strengthens the Stomach, expels Wind, gives ease in the Cholick, and stops all sorts of Fluxes of the Bowels, and strewed very thick upon external moist and running Ulcers, it cleanses them, corrects the acrimony, dries and heals them.

XIV. *The Ointment or Balsam.* They are good Anodyns and Vulneraries, digest and heal simple Green Wounds, and thar in a little time, discurt flatulent Tumors, digest, cleanse, and incamate (where need is) old Ulcers, dry, and dispose them to a speedy cure, if in places easily admitting the Operation.

XV. *The Fumigation.* It is made of the Decoction or Infusion in Water or Wine, which being put into a Chafin Pan is to be set upon a Chafin Dish of thoroughly kindled Charcole, in a Close-stool: Then a Woman sitting over it, so as the Fumes may be received up the Womb, it is said to bring down the Courses, and to expel the Dead Child.

XVI. *The Cataplasme.* It is made of the Green Herb, being heated in a Frying-pan, or otherwise, and moistned with a little Canary, Muscadine, or other Wine, and applyed hot to the Region of the Womb, it gives ease in pains of the Mother. Or, you may make it of the Green Herb, with the addition of Featherfew and Camomil flowers, and Fryed together with the Oil of Lillies, or of Roses, or Camomil. This being applyed hot to the Belly, of a Woman in Child-Bed, presently gives ease in, and takes away the After-Pains.

XVII. *The Spirituous Tincture.* It warms and comforts the Stomach, expels Wind in the Bowels, is good against Convulsions of the Viscera, and gives ease in the Cholick.

XVIII. *The Acid Tincture.* It powerfully opens obstructions of the Thorax, cuts tough Flegm, and makes it fit for expectoration, strengthens the Stomach, causes a good Appetite and Digestion, and kills Worms in Children. Dose 20 or 30 Drops in any fit Vehicle.

XIX. *The Oily Tincture.* It is good against Convulsions of the Stomach and Bowels, prevails against Paralytick Distempers, opens obstructions of the Reins, Ureters and Bladder, gives relief in the Strangury, powerfully provokes Urine, and gives present ease in After-pains, to Women in Child-Bed. Dose 20 or 30 Drops.

XX. *Syrupus Botrys.* Syrup of Oak of Jerusalem. Take Oak of Jerusalem, Hedge Mustard, Nettles, of each 2 Handfuls, Coltsfoot a Handful and half: Boil them in a sufficient quantity of Spring Water till half be consumed, strain out, and to 2 Pounds of the Decoction add 2 Pounds, (some say 1 Pound) of the Juice of Turneps baked in an Oven in a close Pot: and with 3 Pounds of white Sugar, boil it to the Consistency of a Syrup. It is a good Pectoral, designed against Asthma's, Coughs, Colds, Shortness of Breath, Ulcers of the Lungs, Spitting of Blood, Consumptions, and other like Infirmities of the Brest and Lungs, proceeding from cold, salt, sharp Rheums, and rough Flegm, obstructing those Parts. Dose from an Ounce to 2 Ounces, to be suckt in leisurely with a Liquorice Stick.

XXI. *Nota.* This Plant or Herb, (as also Oak of Cappadocia) are much used to be laid in Ward-robes, or Presses and Chests, both to kill and drive away Moths, and by their sweet Smell to Perfume the Garments.

CHAP. DXXV.

of OATS Manured and Wild.

I. **THE Names.** This Plant is called by the Arabians, *Chartal*, in Greek, *Βέη*, and *Βέη*, *quod Cibus significat*: in Latine, *Avena*: and in English, *Oats*.

II. **The Kinds.** It is two fold, I. *Manured*, viz. 1. *Avena Vesca*, *Manured Oats*. 2. *Avena nuda*, *Naked Manured Oats*. II. *Wild Oats*, viz. 3. *Βέη*, *Avena Sylvestris*, *Avena Sterilis*, *Bromos Herba Dodonæi*, *Bromos Sterilis longissimus aristis Lobelij*, *Festucago Gaza*, *Festuca* & *Avena fatua*, *Avena Græca*, *aliorum*: *Lolij primum genus Tragi*, *Ægilops Matthioli*, *Common Wild Oats*, or *Wild Bearded Oats*. 4. *Avena Sterilis minor*, *Bromos Sterilis altera Lobelij*, *Festuca altera Dodonæi*, *Syphonium* & *Bromos herba Tabernaemontani*, *Small Wild Oats*.

The Descriptions.

III. **The first, or Manured Oats.** The Root is small and Fibrous or Thready, which sends up several tall jointed Stalks, with large Grassy Leaves, somewhat resembling Wheat, bearing at the Tops a large spread Tuft, of many pointed Agets, hanging down like small winged Birds, from small

Oats Manured.

Threadlike foot Stalks; within every one of which Husks lies a small and long round Grain, somewhat like unto Rye, but longer, and more pointed, cover-

ed with a hard, horny, shining Husk, sticking close to it.

IV. **The second, or Naked Manured Oats.** This Plant grows in all respects like the former; saving that the Grain being somewhat smaller and whiter, lies not so fast enclosed in the Husk, but is very easily rubbed out with ones Hand.

V. **The third, or Common Wild Oats, or Wild Bearded Oats.** Its Root is small and Fibrous or Thready like the first: and this Common Wild Oat, grows both in Stalk and Leaves, something like unto the first Manured Oat, but that it seldom rises so high, being lower, slenderer, smaller, and

Common Wild Bearded Oats.

lesser. The tufted Head is spread in the like manner, having such like winged Husks, with longer Awns at the ends of them, but gentle, and not prickly, growing upon small tender threadlike foot Stalks. In these Husks is contained the Grain, which is small and lank, as if it had no Substance in it.

VI. **The fourth, or Small Wild Oats.** This Wild Oat is very like the former, but lesser in Stalk and Leaf. The spured Top, consists of many slender long Chaffy Ears, Bearded only at the ends, growing upon long slender foot Stalks, and hanging down their Heads, with small Grains in them, like as that in the former. Of this Species there is another sort, called *Avena sterilis minor Serotina*, which bears its Oats late, or not till the other be past.

VII. **The Places.** The Manured Kinds of both sorts, are Sown in Fields, for both Mans and Horses Food, but the Naked Oats are nothing so frequent as the first Kind, and they delight in a cold and moist Ground, rather than in a hot and dry: They are usually the first Seed which are Sown upon Woodland Grounds after their Stocking up.

up. The *Wild Kinds* are found in many places with us among *Rye* and *Barly*; and the fourth Kind many times plentifully by Hedge-fides.

VIII. *The Times.* The *Manured Kinds* are *Summer Grains*, Sown in the *Spring*, and Reaped or Cut down in *Autumn*. The *Wild Sorts* are ripe in *July* and *August*.

IX. *Nota.* The *Avena Vesca*, are so called à *Vesendo*, because in many Countries they are eaten, being made into *Oat-Meal*, of which they make Bread, Cakes, Puddings, &c. and being Malted, are also by some People made into Ale or Drink, very good, and exceeding in pleasantness that made of *Barly*. The *Avena nuda*, is like unto the former *Oat*, but differs in that these *Naked Oats*, as soon as they are Thrashed or Rubbed out, without help of a Mill, become *Oat-Meal*, and fit for use; for which reason, in *Norfolk* and *Suffolk* they are called *Unhulled* or *Naked Oats*.

X. *The Qualities.* *Oats* (according to *Galen*) are cold and dry, and according to our Opinion in the beginning of the first Degree, Absterfive, Astringent and Nutritive.

XI. *The Specification.* Authors say, they stop Fluxes of the Bowels: and yet made into Water Gruel, or Milk Porridge, they certainly open, and loosen the Belly.

XII. *The Preparations.* You may have therefrom, 1. *Oat-Meal*. 2. *Bread*, *Cakes*, *Pudding*. 3. *Gruel* or *Broth*. 4. *A Cream*. 5. *A Cataplasim*. 6. *Malt*. 7. *Ale* or *Beer*. 8. *A Decolion*.

The Virtues.

XIII. *The Oat-Meal.* It is hulled in a Mill: Eaten in any quantity raw by Young Virgins, it gives them the Disease *Chlorosis*, or that called the Green Sickness, causing a fresh and well colored Maid to look white, or of a Tallow Complexion, and almost as pale as Death. Made very hot in a Frying-Pan, and put into a Linnen Bag, and applied to the Stomach or Side pained, it gives ease in the Colick, and takes away Pains and Stitches in the Side: but this ought to be done with whole *Oat-Meal*, or with *Oats* unhulled.

XIV. *The Bread, Cakes, or Pudding.* They are made of the Flower of the *Oat-Meal*, according to the usual Method. They stop Fluxes of the Bowels, nourish much, and restore in Consumptions. But Puddings made of the *Oat-Meal*, whether whole or Ground, and filled very full with Beef Suet shred small, and blew Currants, or Raisons of the Sun, always loosen the Belly.

XV. *The Gruel or Broth.* If made savory with Salt, and eaten with a good quantity of fresh Butter, it loosens the Belly, and by continuing thereof makes it soluble; it sweetens the Juices and Lympha, and takes away the Acrimony of the Humors: the thicker it is made the more it nourishes, but if made to take with Purging Physick, it ought to be the thinner. If Milk is added to it, tho' it loosens the Belly, yet it nourishes much more than the simple *Gruel* alone.

XVI. *The Cream of Oat-Meal.* It is made by boiling with Water, the Head being continually scum'd off: or it is made with the very finest of the Flower, first boiled with a little Water, then adding Milk to it, it is boiled to a Consistency. It has all the Virtues and goodness of the *Gruel* or *Broth*, but much more delicious or pleasant: Mixt with fine Sugar or Sugar Candy, and so given, it is profitable for such as have gotten a Cold or Cough.

XVII. *The Cataplasim.* It is made by boiling in Milk, and till it comes to a Consistency. It moderately discusses, and that without biting or any sharpness: it allays Inflammations, and strengthens the part it is applied to. If mixt with Oil of *Bays* and applied, its good against the Itch and Leprosie: it dissolves or discusses hard Apostems; and is profitable against a *Fistula in Ano*, or in the Fundament. If the *Cataplasim* is made of *Wine Vinegar*, it discusses hard Tumors, Strengthens weak parts, and takes away Spots, Freckles and Morpew in the Face, or other places of the Skin.

XVIII. *The Malt.* A strong Decolion of it made into a Syrup with Honey, is good against an *Asthma*, as also for Coughs, Colds, Wheezings, shortness of Breath, &c. Mixt with Turpentine and Talk of an Egg, it Digests old, running and eating Ulcers, and facilitates their Cure.

XIX. *The Ale or Beer.* It has all the Virutes of those made with *Barly Malt*, but this is much pleasanter, and is not so Heady: it quenches Thirst more, and inflames less, by which means, those who drink it, Live in good Health and Strength of Body: and passes much better off by Urine, carrying away with it the Recrements of the Reins, Ureters and Bladder.

XX. *The Decolion of the Oat-Meal.* If such as have a *Serpigo*, or *Impetigo*, in their Hands or Feet, shall daily twice or thrice a day for some considerable time, Bathe them here in, for half an Hour at a time or more, it will at length heal those Chops, Clifts, or Rifts: but it ought to be done as hot, as the Patient can well endure it. So also if such Hands or Feet be held over the Fumes hereof, it is very profitable for the same Purpose; more especially if the Decolion is made with *White Wine Vinegar*.

OLLY-SEED, see Gold of Pleasure, Chap. 324.
OCULUS-CHRISTI, see Clary Wild, Chap. 138.

CHAP. DXXVI.

OF OISTER-GREEN,

OR,

SEA-LUNGWORT,

OR,

SEA-LETTICE.

I. **T**HE Names. It is called in *Greek*, *Θαλάσσιος ἄνθος* & *θαλάσσιος ὀλίσκος*; in *Latine*, *Lactuca Marina*, *Fucus Marinus* *Lactuarius*: in *English*, *Oister-Green*, *Sea-Lettice*, and *Sea-Lungwort*.

II. *The Kinds.* There are two several Species of this Plant, viz. 1. *Lactuca Marina*, *Fucus Marinus* *Dioscoridis*; *Muscus Marinus* altera *Mattbioli*, *Fucus Marinus* prior *Dodonzi*, *Muscus Marinus* *Theophrasti*; *Fucus Marinus* primus *Dioscoridis* & *Theophrasti*; *Bryon Lactuce* *Jolii* *Plinii* & *Lo-belii*; *Lichen Marinus* *Gerardi*; Our Common

Oyster-Green, Sea-Lettice, or Sea-Lungwort. 2. *Lichen Marinus rotundifolius* Gerardi, *Opuntia Marina* Cortusi, *Corallina Latifolia*, *Sertularia Imperati*, *Lichen Marinus Clusij*, *Fucus Maritimus*, & *Fucus folio rotundo Bauhini*; Oyster-Green, or Oyster-Weed round Leav'd; Sea-Lung-wort round Leav'd; Sea-Garland.

The Descriptions.

III. The first, or Our Common Oyster-Green, or Sea-Lungwort, is a Kind of Sea Fucus, or Herby Substance, like unto Liverwort, or Lungwort, altogether without Stalk or Stem, bearing many green Leaves, very uneven or crumpled, and full of Wrinkles, something broad, not much differing from the

Oyster-Green, or Sea Lung-wort.

Leaves of curled Lettice. It grows upon Rocks within the Sea, but more especially among Oysters, and in great plenty among those called Wall-Fleet Oysters. It is very well known even to Oyster Women, who make use of the said Moss for setting off their Oysters, that they may Sell the better. It is a tender Herb, with dark green Leaves, thin and crumpled, growing upon Rocks or Stones, and is a kind of Food for Oysters.

IV. The second, or Oyster-Green, or Oyster-Weed round Leav'd. It is a delicate Plant growing up from some Rocks or Stones, in or near the Sea, spreading several flat, thick, short and round Leaves, one set on the top of another, and some also growing from the sides, forming Branches of Leaves leaning downwards, each being as it were strung on a Thread, which yet is scarce to be discerned, like as a Country Garland of Field and Corn Flowers, made for the Ornament of Country Houses; so as the whole Plant seems to be made of nothing but strung Leaves, bearing a large yellow Flower at the top, as Bauhinus says. The lower Leaves are somewhat brown, the rest are of a whitish green, and these

which are new sprung forth are green, and all of them smooth and shining, which may be kept between Papers for a long time: yet by long keeping, they will grow rougher, and full of Wrinkles, but still tough, and not brittle like Coralline, which by sleeping in Water will become soft and smooth again, and retain their first Taste, which is very Salt.

V. Gerard says, That the Branches of this Elegant Plant, are about a Handfull or better high, spread abroad on every side, and only consisting of sundry single roundish Leaves, whereto are fastned sometimes one, sometimes two, or more such Leaves, so that the whole Plant consists of Branches made up of small round Leaves, fastned together by droers little and very small Threads, the lower Leaves which stick to the Rock, are of a brownish color; the other of a whitish or light green, smooth and shining.

VI. The Places. They are generally found on our English and Scotch Rocky-Shores, chiefly where Oysters are Bred, and indeed in other Seas wherever Oysters grow. But the second grows upon Rocks in divers parts of the Mediterranean, upon the Coast of Corsica, and in many other Seas.

VII. The Times. They are in the prime of their Beauty in the end of Summer, and all the time Oysters are in Season.

VIII. The Qualities. They are cold and dry in the first Degree, Aperitive, Absterfiv, Anodyn, Diuretick, and Arthritick.

IX. The Specification. They are both good to expell Sand, Gravel, and small Stones out of the Reins, Ureters and Bladder: and the second is said to kill Worms in Children.

X. The Preparations. You may make from these Plants, 1. A Decoction. 2. A Pickle. 3. A Powder. 4. A Fricase. 5. A Cataplasm.

The Virtues.

XI. The Decoction in Water or Wine. Being given to 3 or 4 Ounces or more, well sweetned with Hony 2 or 3 times a Day, it is good against Coughs and Wheezing, shortness of Breath, and difficulty of Breathing; and cleanses the Urinous parts of any kind of Tartarous Matter lodged in them.

XII. The Pickle. Either of them are an excellent Sallet, being Pickled in a mixture made of white Port Wine, Brandy, Vinegar and Water, in an equal proportion: They strengthen the Stomach much, and cause a good Digestion.

XIII. The Powder. That which is made of the first sort is much Commended by Learned Physicians against Diseases of the Lungs, especially against Inflammations and Ulcers of the same, being taken to about a Dram in fair Water or some proper Vehicle. Being given in Red Barcelona Wine, or other Red Styptick Wine, it stops the Terms, and prevails against the Bloody Flux, and other Fluxes of the Bowels, as also it stops Vomiting, and all these things more especially if they proceed of Choler. Given also in Parsly or Hydropiper Water, it cures the Strangury, provokes Urine, gives ease in the Stone, and expels Sand, Gravel, and small Stones out of the Reins and Bladder. Outwardly applied, it heals Bloody and Green Wounds, and cures Ulcers in the Secret parts. The Powder made of the second sort, or round Leav'd Kind. Given from half a Dram, to a Dram, mixed with Hony, or in any other proper liquid Vehicle, kills Worms in Children.

XIV. The

XIV. *The Fricasie.* The first Kind, or both the sorts, being Fried with Eggs, as you Fry *Clary Leaves*, and so eaten, it is said to be a singular Medicine to cure the Weakness of the Back.

XV. *The Cataplasin.* Being made of either of the Green Herbs, and applied to places affected with the Gout, it cools, eases the Pain, stops the afflux of Humors to the Part; and in some reasonable time cures the Patient.

es and Fibres spreads it self under the upper Crust of the Ground, something like a Couch-Grass Root, but not so white, and not much lesser than the Root of the White Wild Anemony, or Wind-Flower, and almost of as dark a color, being much like there-to in its creeping. This Root shoots forth Stalks with

One Berry: or, Herb True Love.

CHAP. DXXVII.

of ONE BERRY;

OR,

HERB TRUE LOVE.

I. *THE Names.* It knows no Greek Name: But the Latines call it *Herba Paris*, and so it is generally called by all Herbarists; and in English, *One Berry*, *Herb True Love*, and *Herb Paris*. Some have thought it to be a kind of *Aconitum*, but were deceived, and therefore *Fuchsius* called it *Aconitum Pardalianches*, and *Cordus* seems to be of the same Opinion, and therefore calls it *Aconitum Pardalianches monococon*, they accounting it to be dangerous and deadly: but *Matthioli* contradicts all this, for that it has been found by Experience, not to be hurtful but Salutiferous, for which reason *Tabernaemontanus* called it *Aconitum Salutiferum*, which yet I think to be an improper Name also, for that it is no Species of the *Aconites*. Some have thought it to be a kind of *Aster*, or *Starwort*, and therefore *Tragus* called it *Aster sed non Atticus*, but it is no Species of the *Starworts*: he also called it *Uva Lupina*, and *Uva Canina*. Others have thought it to be a Kind of *Solanum* or *Night-shade*, but it is no more a Species of that Plant than it is of the two former; but upon this supposition *Pena* and *Lobel*, in their *Adverjaria* call it *Solanum Tetraphyllum* (from the form of the Leaves and Berry:) and *Baibinus*, as leaning to the same Opinion, *Solanum quadrifolium Bacciferum*; both of which to call it very improperly: and I think the first Name *Herba Paris*, is the fittest we can bestow upon it.

II. *The Kinds.* There are three Species of this Plant very well known, viz. 1. *Herba Paris vulgaris*, *Herba Paris Tetraphyllos*; Our Common Herb True Love or One Berry. 2. *Herba Paris Floridensis*, *Herba Paris Floridiana*, vel *Brasiliana*, *Herba Paris Triphyllus Brasiliana*, *Solanum Triphyllum Brasilianum Baubini*, Herb True Love, or One Berry of Florida, or of Brasil. 3. *Herba Paris Canadensis radice rotunda*, *Herba Paris Floridensis radice tuberosa*; *Solanum Triphyllum Canadense Curtisi*; Herb True Love of Canada.

The Descriptions.

III. *The first, or Our Common Herb True Love, or One Berry.* Has a Root which is long and tender, small and creeping under the Earth, dispersing it self hither and thither; its Taste is Styptick or Astringent, and very unpleasant, and by its Branch-

Leaves, some of which bear no Berries, and some do, every Stalk being smooth, without joints, and of a blackish green color, rising to about six Inches high, if it bears its Berry; but seldom so high, if it bears none. This Stalk bears at the Top four Leaves, set directly one against another, in manner of a Cross, or a Cross-Knot, commonly called a True Loves Knot: which are each of them a-part, something like to a Night-shade Leave, but a little broader, and in some places, twice as broad as in others, for they oftentimes vary much. and tho' the stunted number of the Leaves is generally four: yet sometimes there are but three, and sometimes five, and sometimes six, which are sometimes smaller, and sometimes larger, and that by a quarter or half part, and sometimes they are (as is before said) twice as large. This Plant has been seen sometime to alter or degenerate, and that the four Leaves have not only been twice as large, as the ordinary, but they have also been dented in, both on the edges, and at the points, which have been parted, or forked, and have born larger Berries, than commonly this Plant is used to bear: all which are of a fresh green color, not dented about the edges. In the middle of these four Leaves, there rises up a small slender Stalk, about an Inch high, bearing at the top thereof, one Flower, spread open like a Star, consisting of four small and narrow long pointed Leaves, of a yellowish green color; and four other lying between them, lesser than they. In the middle where-
of

grows a round dark purplish Button or Head, encompassed with eight small yellow mealy Chives, or Threads, which three colors make it the more Conspicuous and Beautiful to behold. This Button, or Head, or rather Berry in the middle, when the other Leaves are withered, becomes a blackish purple Berry full of Juice, of no hot nor evil Flavor, nor yet of any sweetish or fulsome Taste, of the bigness of a reasonable Grape, having within it, many white Seeds. The whole Plant is almost insipid, without any manifest Taste, and by its effects, in repressing hot Inflammations and Humors, it is accounted as cold as Nightshade, tho' no Species of that Plant.

IV. The second, or Herb True Love, or One Berry of Florida, or of Brasil. The Root hereof is small and creeping like the former under the upper Crust of the Earth, from which Springs forth a Stalk of four or five Inches high, having three such like Leaves as the other, but broader and longer growing thereon. The Stalk rises up about 3 Inches above them, bearing at the top, 3 much narrower Leaves, which are as it were the Husk of the flower standing in the middle, consisting of three white Leaves, having some Veins in them, and are about three Inches long, and one broad.

V. The third, or Herb True Love of Canada. The Root of this Plant creeps not as the former do, but grows into a small round Tuberous Substance, having several small Fibres issuing out from its sides almost round about. From this Tuberosity Root Springs up one Stalk, with three large Leaves like to the last, from the middle of which, the Stalk rises up, yet some few Inches further, at the top of which is one Flower, consisting of six Leaves, three whereof are green and small, which are as it were the Husk to the other three Leaves, growing in the middle, which are larger and longer, of a dark purple color, and in some white: in the middle whereof grows a small round blackish Berry, full of small Seed, like Nightshade Seed.

VI. The Places. The first grows in our Woods and Copse, as also sometimes in the corners and borders of Fields, and waste Grounds, in many places throughout England. Gerard says, it grows plentifully in Chalkney Wood, near to Wakes Colne, seven Miles from Colchester in Essex: in the Wood by Robin Hood's Well, near to Nottingham: in the Parsonage Orchard, at Rodwintar in Essex, near to Saffron Walden: in Blackburn at a place called Merton in Lancashire: in the Moore by Canterbury called the Clapper: in Dingley Wood, six Miles from Preston in Alderneys: in Bocking Park by Braintree in Essex: at Heston in Lincolnshire: and in Cotting Wood, in the North of England. It has also been found growing (as Parkinson says) in Hinbury Wood, three miles from Maidstone in Kent: in a Wood by Chiffelhurst in Kent, called Longwood: in the next Wood thereto, called Sfeets-Wood, especially about the skirts of a Hop Garden bordering thereon: in the Wood called Harwarth, near to Pinnendon Heath, about a mile distant from Maidstone: and in a Wood also overgrown with Boxley Abby, a mile from Maidstone aforementioned, where it grows in great abundance, not far from the Hedge side of that Meadow, thro' which a small River or Rivulet runs. The second *Bauhinia* was found growing in the Woods in Brasilia: but both the second and the third have been found growing in Canada, as Cortusus and others affirm, and I myself have also found them growing, in the Southern Provinces of Florida, as in the South Carolina, in some of the Woods adjacent to Wadmalata and Stonow Rivers, &c.

VII. The Times. They spring up about the lat-

ter end of March, Flower in April and May, and the Berry is ripe not long after, viz. in the end of May, or before the middle of June.

VIII. The Qualities. One Berry is cold and dry in the first Degree, Anodyn, Vulnerary, and Alexipharmick, or Resisting Poison.

IX. The Specification. It causes Rest and Sleep, gives ease in the Colick, expels Poison, and cures the Plague or Pestilence.

X. The Preparations. You may have herefrom, 1. An Essence. 2. A Powder of the Leaves. 3. A Powder of the Roots. 4. A Powder of the Berries. 5. An Infusion or Decoction of them in Wine. 6. An Ointment or Balm of the Leaves and whole Plant. 7. A Cataplasm of the Leaves. 8. A Distilled Water of the Leaves and Roots. 9. A Spirituous Tincture of Leaves, Roots, and Berries. 10. An Acid Tincture of the same.

The Virtues.

XI. The Essence of Herb, Root, or Berry. It is Anodyn, gives ease in the pains of the Colick, expels Poison, and powerfully resists the Plague or Pestilence, and all sorts of Pestilential and Malign Fevers. Particularly it is said to be an Antidote against the Poison of the *Aconites* and all other like sorts of Poisons. It is profitable for such as have lain long in a lingering Sickness, and for such who have been thought to have lain under the Power of Witchcraft, so as to become half Foolish or wanting their Senses. Dose 1 Spoonful in Wine, or other fit Vehicle, Morning fasting, and at Night going to Bed, for a Month together.

XII. The Powder of the Leaves. It has all the former Virtues, but not so effectual as the Powder of the Berries or Seed, and may be given to a Dram Morning and Night, in a Spoonful of Syrup of Citron Peels, or other like Vehicle.

XIII. The Powder of the Berries or Seed. It is a Potent thing and performs all that the Essence does. Given to a Dram at a time Morning and Night in a Glass of Tent, or old Malaga Wine, every Day for 20 Days or more together, it restores such to their Healths, who have lain under long, languishing Sicknesses, and restore them to their pristine health. Both this Powder, and the Powder of the Leaves are good for the Cure of Green Wounds, and to cleanse and heal old running Sores and Filthy Ulcers.

XIV. The Powder of the Roots. Being given from half a Dram to a Dram in a Glass of Wine it gives immediate ease in the most extrem, Colick, and other vehement pains of the Viscera.

XV. The Infusion or Decoction of the Leaves, Roots, and Berries in Wine. They have all the Virtues of the Essence and Powders, resist all sorts of hot Poisons and malign Diseases. Being given at Bed-time, they procure Rest and Sleep: Outwardly used as a Lotion, (with a third part of the Essence being added) they are very effectual for the cure of simple Green Wounds: They also cleanse, dry, and heal old filthy running Sores and putrid Ulcers: and are very powerful to disperse all Tumors and Swellings, and speedily to allay all Inflammations, and to abate those Tumors which happen in the Groin, Testicles and Privy parts.

XVI. The Ointment or Balm of the Leaves and whole Plant. They are exceeding good Vulneraries, Absterfive, Dedicative and Healing: abate Inflammations.

Inflammations in Wounds, repress the flux of Humors, and ease their pain and anguish: and are excellent good against Felons, Whidows, and the like happening to the Fingers ends and Nails of those parts. They Suppurate or Ripen Apostems and make them break, or fit to be opened in a little time.

XVII. *The Cataplasm of the green Leaves.* It is effectual to cure simple Contusions, and to heal Green Wounds, cleanse and dry old running Sores, and putrid Ulcers, abate Inflammations, discuss Tumors, and to ease the Gout, and any other kind of pain in any part of the Body, being duly applied: It also is good against an Ophthalmy, and heals all Inflammations and Soreness of the Eyes, easing their Pain almost upon the spot.

XVIII. *The Distilled Water.* Being put into the Eyes it cools Inflammations therein, eases their Pains, and takes away their Soreness and redness, more especially if also Cloaths two or three times double, be dipt therein and applied. But the Juice or Essence of the Herb, performs this yet inore effectually.

XIX. *The Spirituous Tincture of Leaves, Roots and Berries.* Being taken from one Dram to two Drams in any proper Vehicle, it alleviates the pains of the Cebick, gives ease in the griping of the Guts, comforts the Stomach, and obtunds sharp Humors, causing Heaviness and Melancholy.

XX. *The Acid Tincture.* It may be given to a pleasing Acidity 3, 4, 5, or 6 times a Day in Water Gruel, or in the white Decoction, or other like Vehicle against the Purples, Spotted Fever, all sorts of Malign and Pestilential Fevers, and the Plague it self: it destroys the malignity and Poison of the Disease, and in a short time secures the Life of the Patient against all dangers accrewing from the same.

The Descriptions.

III. This small Plant, has a very small Root of the bigness of a Rush, lying and creeping under the upper Crust of the Earth, having several Fibres or small Threads adjoining to it, which shoot forth out of the Earth again in several places. From this

One-Blade.

Root springs forth one Stalk, which never bears more than one Leaf, but only when it rises up with its Stalk, above that Leaf, in order to the bearing a Head of Flowers, and then it bears another Leaf, seldom any more, which are of a blewish green color, and therein very like unto the Leaf of the Lilly Convally, but something broader at the bottom, having many Ribs or Veins in it, and pointed at the end, not much unlike to a Plantain Leaf. At the top of the Stalk, grow many small white Flowers, Star fashion, smelling somewhat sweet, after which come small reddish Berries when they are ripe.

IV. Gerard describes it after this manner. Its Root is small, tender, and creeping far abroad under the upper face of the Earth. Its Leaf is not much unlike the greatest Leaf of Ivy, with many Nerves or Ribs, like those of the Plantain Leaf, which single Leaf does always spring forth of the Earth alone, but when the Stalk rises up, it brings upon its sides two Leaves, the latter in fashion like the former. At the top of which slender Stalk, come forth fine small Flowers like Pyrola, which being faded away, small red Berries succeed.

V. The Places. It grows in moist, shadowy and Grassie places of Woods and Groves or Coptes, in many parts of England. Gerard says it grows in Lancashire in Dinglywood, six miles from Preston in Alderneys; and in Harwood near to Blackburn likewise.

VI. The Times. It Flowers about May, and the Berries are ripe in June, and then it quickly perishes untill the next Year, it springing afresh, from the same Root again.

VII. The

CHAP. DXXXVIII.
of ONE BLADE.
OR,
MONOPHYLL.

I. *THE Names.* It scarcely appears that this Plant was known to the Ancient Greeks. But it may be called in Greek *Μονοφυλλον*, Monophylon, after the Latin Name *Unifolium*, from whence it is called in English, One Blade.

II. *The Kinds.* This is *Planta singularis sui generis*, unless you would have *Ophioglossum* or *Adders Tongue*, to be a Species of it, which no Author that I know of has ever yet admitted. Dalechampius upon *Dioscorides*, supposes it may be the *Cyclaminus* Plinij. in lib. 25. chap. 19. but doubtless this is a mistake. Tragus calls this Plant (besides *Unifolium*) *Cotyledon Sylvestre*: but most of our latter Writers call it *Monophyllon*, or *Unifolium*; but *Baubin* referring it to the *Lilium Convallium*, calls it, *Lilium Convallium minus*, or lesser Lilly of Vally, I will not dispute the point with him, but rather give him his way.

VII. *The Qualities.* It is hot and dry in the first Degree, Absterfive, Vulnerary, Sudorifick, and Alexipharmick.

VIII. *The Specification.* It is a peculiar thing for resisting Poison, profligating the Plague or Pestilence, and all manner of Malign and Pestilential Fevers, and for the curing of simple Green Wounds, old running Sores and Malign putrid Ulcers.

IX. *The Preparations.* You may have herefrom, 1. *A Liquid Juice, or an Essence.* 2. *A Powder of the Root.* 3. *A Balsam from the whole Plant.* 4. *An Acid Tincture of the Root, and whole Plant.*

The Virtues.

X. *The Liquid Juice or Essence of the Root and whole Plant.* It is a potent thing to expel all sorts of Vegetable Poisons taken into the Stomach, and to defend the Heart from their Malignity: it is also a cure for all sorts of Malign and Pestilential Fevers, being given a Spoonful at a time in Canary, made pretty sharp with Juice of Limons, and repeated as need requires: and so used it cures also the Plague it self.

XI. *The Powder of the Root.* Being given from half a Dram to a Dram at a time, in a mixture of Wine and Vinegar, of each equal parts, and the Patient (being in Bed) laid presently to Sweat thereupon, it is said to be a Sovereign Remedy for those that are infected with the Plague, and have a Sore upon them, by defending the Heart and Vital Powers from the danger of the Malignity and Infection, and expelling the Poison of the Disease: it has also all the Virtues of the Juice or Essence.

XII. *The Balsam from the whole Plant.* It is a singular good Vulnerary, admirable for the curing of Wounds whether recent, or old; as also for the curing of malign, putrid and Inveterate running Sores and Ulcers, more especially those of the Nerves and Tendons.

XIII. *The Acid Tincture of the Root and whole Plant.* It may be given to a grateful acidity in any proper Vehicle 3, 4, 5, or 6, times a Day against the Purples, Spotted Fever, Calenrure and Plague it self, as also in all other Malign Fevers, it relists the Poison and Malignity, and performs the Cure to a Wonder.

II. *The Kinds.* Onions are either Red or White: and of both these Kinds, 1. *The flat Red Onion.* 2. *The long Red Onion.* 3. *The round Red Onion, or Sweet Spanish Onion.* 4. *The flat White Onion.* 5. *The long White Onion.* 6. *The round white Onion;* all which White Onions are almost like to Chalk-stones, lying upon the Ground when they are ripe and fit to be gathered. 7. *Ascalonica, or Ascalonitis,* The Scallion, which is thought to be the Gethyan, or Gethyllis of Theophrastus; these Ascalonitides, are said to be our Set Onions, the lesser sort of which are called Chibols: all the other Kinds are produced from Seed. The Flat Red Onion is the strongest of all, some of them are Red throughout, very large and pleasant to Eat. The Long Red Onion is the St. Omers Onion, commonly called St. Thomas Onion. The Round Red Onion, called the Strashburgh Onion, is red only on the out side, and is very sharp and strong. All these variety of Onions, have gone and the same manner of growing above Ground, and the same Form, and therefore One Description may serve for them all, which take as follows.

The Description.

III. Onions have a Root which is in some very great, in some very small, and are either, flat, round, or long, bulbous, or made of many Coats, Peels or Coverings growing one upon another, of which the outermost is thinnest, and those more inward, growing thicker and thicker, according

Onion Red Great and Round.

CHAP. DXXIX.

of ONIONS.

I. **T**HE Names. This Plant is called in Arabic, *Basil*, and *Bassal*: in Greek, *Κεπύρον*: in Latine, *Cepa*, *Cepe*, & *Cepe*: and in English, *Onion*, which seems to be derived from the Latine word *Unio*, because the Root is single or but One.

to their remoteness from the first outward Coat: at the lower part or bottom of which Bulb, is a Beard of Fibres or Strings like a Tassel. Some are red on the outside only, others are red quite thro' out: some are white, and these are either small or great, flat, long, or round. Some are very sharp and strong, others milder and more pleasant: and some of those growing in Spain, are so pleasant that they may be eaten as an Apple. All these Kinds of Onions, contrary to the Nature of all other Bulbous Roots, have no off-sets, or other Roots growing to them, but are every one alone single by themselves, and therefore it seems the Latines, as Columella, did give to the Plant the Name of Unio, from whence as I conceive came our English Name Onion: This Root if it remains on the Ground after Seed

Onion White flat or round.

time, dies, rots, and perishes every Year. From this Root spring up several green, long, hollow Leaves, seeming half flat: among which rises up a great, round, hollow Stalk, thicker and bigger in the middle than any where else: at top whereof stands a close round Head, covered at the first with a thin skin which breaks of its own accord, as the Head grows larger and larger, and shews forth it self as a very large Globular Umbel of white Flowers, which being past away turn into black Seed. This Head is many times so heavy, that the Stalk cannot bear it, but must be up held by some convenient prop from falling to the Ground, that it may not rot or perish.

IV. Some will have it that there is no Wild Onion. Others that there is, which they make to be an Onion which is long, and has a very long Neck: and this they will have to be the Ceper

Scallion not Headed.

Scallion Headed.

Ascalonitides, which is also called by some Gethyllides, and this is that of which they say Theophrastus makes mention under the Title of Gethyum, as is aforementioned.

V. *The Places.* All sorts of Onions are Sown, Planted, and Nurst up in Gardens not only in England, but in almost all Countries throughout the World; and they grow and prosper best in a Fat and Rich Soil, which has been well Dunged and Digg'd, or turn'd up and made mellow and loose. The *Scallion* takes its Name from *Ascalon* a City in *Palestine*, where they grew plentifully, and from whence they are said to be brought into all parts of Europe, and from thence Transplanted into America, where all the other Kinds of Onions grow also very plentifully, and come to great perfection.

VI. *The Times.* Those which are Sown for Store should be Sown in February, or before the latter end of March at farthest, and in the increase of the Moon; and are to be gathered when the Blades begin to flag towards the Root. Those that are for Seed, are to be Set at the same time, when the former are Sown: This Seed tho' it is perfected in England, and will grow again with us, and produce good Onions, yet it is apt to degenerate, for which reason we commonly make use of Seed brought to us from beyond Sea.

VII. *The Qualities.* Onions are hot and dry in the fourth Degree, yet not thought to be full out so hot as *Garlick*. They are Attenuating, Aperitive, Absterfve, vehemently Attractive, Digestive, Discussive, Diuretick, Incisive, Emollient and Suppurative: Stomatick, Pectoral, Nephritick, Hystrick, Arthritick, Ptarmick, Emmenagogick, Alexipharmick and Spermatogenetick.

VIII. *The Specification.* They strengthen the Stomach, create Appetite, cause good Digestion, give ease in the Strangury, provoke Urine and Womens Courses, and prevail against Sand, Gravel Stones, or any Tartarous Matter in the Reins, Ureters or Bladder: Cure the Bitings of Mad-Dogs, Serpents, or other Venomous Creatures, as also Coughs, Colds, Hoarseness, Wheezing, Asthma, and shortness of Breath. They ripen Apostemes, give ease in the Gout, prevail against the Lethargy, Carus and all cold and moist Diseases of the Head, being used as an Errhine, and take out the Fire in Scaldings, or Burnings by Water, Oil, Fire, or Gun-Powder, &c.

IX. *The Preparations.* 1. Raw Onions eaten as a Sallet. 2. A Liquid Juice. 3. An Infusion in Water. 4. An Infusion in Wine. 5. A Decolion. 6. An Errhine. 7. A Lohoch. 8. An Electuary. 9. A Lotion. 10. Roasted or Baked Onions. 11. A Powder of the Seed. 12. A Cataplasm of Raw Onions. 13. A Cataplasm of Roasted or Baked Onions. 14. A Distilled Water from Onions. 15. A Spirit from Onions.

The Virtues.

X. *Raw Onions eaten as a Sallet.* They are of Heating, Volatile and Subtil parts, strengthen the Stomach, cause Appetite, and a good Digestion, ease pains in the Stomach and Bowels, increase Seed, provoke Lust, gives ease in the Strangury, and force away the Urine; and are good against Sand, Gravel, Stones, or any Tartarous Matter lodged in the Reins, Ureters and Bladder. They make thin, and scatter gross and clammy Humors, open Obstructions of the Viscera, and make the Body soluble.

XI. *The Liquid Juice.* The Juice mixt with the Sap of an Apple, and applied, provokes the

Hemorrhoids. The Juice dropt into the Eyes, takes away the Dimness of Sight; and if used at the beginning, takes away Mists, Clouds, Spots, Haws, &c. in them. Dropt into the Ears, it is good against Deafness, Noise and Ringing in them, and cleanses them from filthiness and corrupt Matter. A Pessary imbibed in the Juice, and put up into the Womb, it provokes the Terms, and brings away the After-Birth. The Head and other parts of the Body troubled with Scabs, Itch, Scalds, Scurff, Morpew, Leprosie, &c. being often washed or bathed therewith, it cures them. It stops the falling of the Hair, and cures Baldness, &c. being often applied. The Juice mixed with Juice of Penny-Royal, and applied to the Gout, gives ease in the pain, Cloth dipt therein, being also put upon the same. Beaten up with Oil, and applied, it is good against Burnings with Fire or Gun-Powder, and heals Wounds made by Gun-Shot.

XII. *The Infusion in Water.* The Onions being thin sliced and steeped in Water all Night, and the Infusion given to Children which are troubled with Worms, it kills them.

XIII. *The Infusion in Wine.* It may be made in White Port Wine, or White Lisbon. It provokes Urine powerfully, gives present ease in the Strangury, and forces away Sand, Gravel, Stones and Tartarous Matter from the Urinary parts: I gave this Infusion to a miserable Patient, who had not made Water in eight Days, and in an Hours time after it, they pilt above a Gallon, and were cured of their Strangury.

XIV. *The Decolion.* If it is made strong of the Onions, and in Veal Broth: it eases pains and gripings in the Stomach and other Bowels, Strengthens the Stomach, causes a good Appetite, and makes the Belly Soluble.

XV. *The Errhine.* It is made of the Juice mixed with Powder of Scammony, a Dram of the Scammony to an Ounce of the Juice. Snuff up the Nostrils it cures the Lethargy, Carus, dulness and heaviness of Head and Brain, Megrim, and other cruel and inveterate Head-achs, and prevails against an Apoplexy, because it draws away the Morbick Matter through the Os Ethmoides, by the Nostrils.

XVI. *The Lohoch.* It is made of the Juice mixed with Honey and Oil. It cuts tough Flegm and loosens; it is good against Coughs, Colds, Wheezing, Hoarseness, Shortness of Breath, Asthma's, &c. and being often taken, it causes ease Expectoration.

XVII. *The Electuary.* Take Pulp of Baked Onions (Baked in their Skins) a Pound, Honey 3 quarters of a Pound, Powder of Elecampane, and of Onion Seed, of each 3 Ounces; Rue cut small and bruised, or Powder of Rue 2 Ounces: mix and make an Electuary. It has all the Virtues of the Lohoch, and much more Powerful to all the Intentions: besides which, it expels Poison inwardly taken, and outwardly applied, it is good against the Bitings of Mad Dogs, Serpents, and other Venomous Creatures. Dose as much as a Chest-Nut Morning and Night.

XVIII. *The Lotion.* Take Juice of Onions 2 parts; Wine Vinegar 1 part: mix them. It takes away Spots, Marks, Scurff, Morpew, Leprosie, and other blemishes of the Skin, being often bathed therewith. Applied in the Gout, with Cloths dipt in the same, it gives present ease.

XIX. *Roasted or Baked Onions.* They ought to be Baked dry in their Skins, once or twice, or oftner, till they are perfectly soft. Their Pulp being then taken from the Skins, and dress't up with choise

choise Butter, Sugar, and a little Salt, and so eaten with Bread, Morning Fastings, and at Night going to Bed, so much at a time, as to make a Meal thereof, for 2, 3, or 4 Days running, it never fails of curing the most extream Cold, eases the Cough, causes easy Expectoration, takes away Asthmas's, Hoarseness, Wheezings, and shortness of Breath, and restores the Voice to such who had almost lost it, or could scarcely speak for as to be understood.

XX. *The Powder of the Seed.* It strongly provokes Urine, gives ease in the Strangury, cleanses the Reins, Ureters and Bladder, of Sand, Gravel, or Tartarous Matter, provokes the Terms in Women, facilitates the Birth, and brings away the After-Birth. And being constantly taken for some time, it very much increases Seed, provokes Lust, and heightens the pleasure of Coition. Dose from half a Dram to a Dram, at Bed time in a Glass of Wine, or other fit Vehicle.

XXI. *The Cataplasim of raw Onions.* It is made by beating the Onions with Green Rue, and a little Salt, and brought to a consistency with Orobis Meal, or Powder of Elecampare Roots. Applied upon the Bitings of a Mad Dog, Viper, Rattle-Snake, or other Serpent, or stinging of any Venomous Creature, whilst the Wound is recent, it powerfully draws forth the Venom or Poison, and secures the Life of the Patient from danger. It gives also present ease in the most extream pains of the Gout, draws it out of the Stomach, if it is flown upwards, and in a short time after cures the Disease.

XXII. *The Cataplasim of Roasted or Baked Onions.* It is thus made. Take of the Pulp 5 parts, Rue 3 parts, Pulp of Figs and Mithridate 2 parts, Salt 1 part, beat all well together for a Cataplasim. Applied very hot, and repeated every six Hours, as long as need requires, it will ripen and break any Apostem, and suppurate Pestilential Bubo's, and other Tumors of the like nature; it is also good for the Biting of a Mad-Dog, being presently laid thereto; it is profitable against Kibes and other putrid Sores of the Legs and Feet, which are hard to heal: and being applied to the Piles or Hemorrhoids, it eases the Pain, dissolves the Tumor, if not broken, and cleanses and heals them if Ulcerated. Take a great Onion, make it hollow in the middle, and fill it with Mithridate or Treacle of Andromachus; close up the hole, and Roast it thoroughly in the Embers: then taking away the outwardmost Skins, let them be beaten together to a Cataplasim. This Applied to any Plague Sores, or putrid Apostems, it brings them to suppuration, draws forth the Poison or Malignity, cleanses them, and induces their healing.

XXIII. *The Distilled Water of Onions.* It is one of the noblest Nephriticks and Diureticks in the World, superior to Parsly Water, Hidropiper Water, or any other Vegetable Water of that kind, nor does it seem inferior to the Decoction of Hops, or Infusion of Lignum Nephriticum. It provokes Urine powerfully, gives ease in the Strangury, and cleanses the Reins and Bladder of Sand, Gravel and Tartarous Mucilage. Dose from 4 to 8 Ounces, either alone, or mixt with a little white Port Wine. If it is given with the Powder of the Seed, it will be yet much more effectual.

XXIV. *The Spirit.* It is exceeding Volatile, sharp and piercing, and a noble Anticorbutick, Nephritick, and Arthritick, in a cold habit of Body; it ought not to be given to hot Constitutions, for in those, it may put all into a Flame, and kindle such a Fire, as may not easily be extinguished. It is a good Stomatick, creates an Appetite, and causes a good Digestion: expels Wind

out of the Stomach and Bowels, and gives ease in the Colick: and is a very profitable thing for such as are inclinable to a Dropfie, or are newly cured of one, because it warms and comforts the Blood, and strengthens its Tone or Crasis. Dose from 1 Dram to 2, in any proper Vehicle.

XXV. *Nota.* Authors say, that if an Onion be sliced, and dipped in the Juice of Sorrel, and given to be eaten by one that is sick of a Tertian Ague, that it will take away the Fit, at once or twice so taking it.

OF ORCHIS FLIES;

OR,

FLIE - FLOWER;

OR,

FLIES - STONES.

I. **T**HE Names. It is called in Greek, *Orchis muscaria*: in Latine, *Orchis Muscaria*, *Testiculus Muscarius*: in English, *Flies-Orchis*, or *Flies-Stones*.

II. *The Kinds.* These are Species of Fox-Stones, in Chap. 298. foregoing, of which we gave you nine several Kinds: The rest which are wanting there, we shall supply you withall here in this Chapter, which are the following nine Varieties. 1. *Orchis Serapias bifolia, vel trifolia minor Clusii & Thalij*, The lesser Twa Blade, or three Leav'd white Butter-Fly Orchis. 2. *Orchis Sphegodes altera, vel secunda Lobelij*, The Wasp Orchis. 3. *Orchis minor culicem exprimens; Calices minores Triphyllae Lobelij*, The lesser Gnat Flower. 4. *Orchis Sphegodes, sive Testiculus Vulpinus primus Lobelij*, The greater Gnat Flower. 5. *Orchis Melittias, sive apifera Lobelij*, The Honey Bee Flower. 6. *Orchis Myodes minor, vel Myodes prima Lobelij*, The lesser Fly Flower. 7. *Orchis Myodes minima, Orchis Serapias tertius Dodonaei*, The least Fly-Flower. 8. *Orchis Myodes lutea Narbonensis Lobelij*, The great Fly Flower of Narbone. 9. *Orchis Myodes angustifolia Bauhim, & minor Tabernemontani*, The narrow leav'd Fly Flower.

The Descriptions.

III. The first, or lesser Twa-Blade or Three Leav'd white Butter Fly Orchis. From two long Testicles or Stones, with a long Tail at the bottom of its Root, spring up two or three large Leaves less than those of the Hungarian or greatest Twa-Blade Fox Stones in Chap. 298. Sect. 4. The Stalk is more than half a Foot high, with 2 or 3 small, long, narrow Leaves thereon, and a small Tuft or Spike of white Flowers at the top thereof, thinly set thereon, somewhat resembling white Butter-Flies, with their Wings spread, each Flower having a crooked Tail behind it, full of a sweet or Honey Liquor.

IV. The second, or Wasp Orchis. The Roots or Stones are pretty large and more roundly Tuberos. The Leaves are a little narrower than the former. The Flowers stand in the same manner and almost of the same fashion, but something greater, and of a brown yellow color, the Wings being a little inclinable to purple. This Gerard makes the Bumble Bee Orchis.

V. The third, or Lesser Gnat Flower. It has two longish Testicles of a mean magnitude, having three Leaves usually standing below the Stalk, with some few short ones up higher. The Flowers are but small, but much resembling a small Gnat or Fly, of a yellowish brown color, whose lower part is smaller than the Greater Gnat Flower following.

VI. The fourth, or Greater Gnat Flower. The Testiculous Root or Stones are a little larger than in the last, and pointed at the Bottom. The Stalk bereof is greater and higher; the Leaves also are larger and longer than in the two last, but much smaller upon the stalk. The Flowers are fewer at top, but larger by much; and their color differs not much, but is rather sadder.

VII. The fifth, or Honey-Bee Flower. Its Testiculous Root consists of two small round Tubers. The Stalk is seldom a Span high. The Leaves thereon are few, narrow and small, but pretty long, turning sometimes inward, some growing upon the Stalk. At top stands usually two or three Flowers, seldom more, each whereof is in shape much like to the Honey or Hive Bee; that many who have not seen it before, would verily believe, that it were either a living or the Carcase of a dead Bee; but that the upper Leaves, which are like Wings, are of a pale blewish purple color, and the Head yet paler; the Body being full and round and of a dark brown color, with some Spots of yellow thereon.

VIII. The sixth, or the Lesser Fly-Flower, or Flesh Fly-Flower. Its Testiculous Root is a round Tuber and sometimes longish, with Fibres springing from its top. It has lesser Leaves and more ribbed than the Greater Flesh Fly-Flower, in Chap. 298. Sect. 6. The Stalk rises not fully so high; the Flowers in form, are like to those, but lesser, and of a little darker color, both at the bottom and about the middle part; but paler between the Wings, being of a pale color, inclining to blew.

IX. The seventh, or Least Fly Orchis, or Fly-Flower. Its Testiculous Root consists of two round Tubers and small. It has three narrow Leaves and Ribbed, growing closer to the Stalk than in the last. Its Stalk is smaller and lower than it, having two or three small Flowers at top like the other, but smaller, and of a brownish purple color, somewhat spotted.

X. The eighth, or Great Fly-Flower of Narbone. Its Testiculous Root consists of two small, round Tubers, or a little longish towards the upper

parts; it has three or four Leaves, which are larger than the last and full of Ribs. The Stalk is higher. And the Flowers much larger or greater, and of a yellow color, like some Flies with us.

XI. The ninth, or Narrow Leav'd Fly-Flower. Its Root consists of two small, round, longish, tuberos Testicles, a little pointed at the bottom, with many small Fibres at the tops. It has several Leaves upon the Stalk, as six, eight, or ten, which are very narrow and very long, and grow upon the Stalk, even to the very top, where grow the Flowers which very much resemble a small short Fly.

XII. The Places. They grow in open Grounds and in Wood-land Grounds, in Clay Grounds, as also in a moist fertile Earth; in Marsh Grounds and in dry sandy Soils, and barren Fields, in many parts of England; and all of them are found Nurst up in the Gardens of some of our Florists.

XIII. The Times. They Flower from the middle or latter end of April to the end of May.

XIV. The Qualities, Specification and Preparations of these Fly-Flowers, or Fly-Stones, are the same with those of Dog-Stones in Chap. 226. foregoing, to which we refer you, and therefore shall say no more thereof in this place.

CHAP. DXXXI.

of ORCHIS Handed;

OR,

PALMA CHRISTI.

I. THE Names. It is called in Greek, *Ὀρχίς*, *Orchis*; in Latine, *Orchis Palmata*, *Orchis Digitata*, *Palma Christi*: and in English Handed Orchis, Finger Orchis, and Palma Christi.

II. The Kinds. Of these which are common to us the following nine are chief, viz. 1. *Orchis Palmata major*, vel *Mas*; *Palma Christi Mas Lobelij*. The great Male Handed Orchis. 2. *Orchis Palmata major pratensis angustifolia Bauhini*. The great Male Handed Orchis with narrow Leaves. 3. *Orchis Palmata Fœmina*, *Palma Christi Fœmina folio maculato Lobelij*. The Female Handed Orchis. 4. *Orchis Palmata pratensis maxima, Conopsea dista Lobelij*. The greatest Handed and Hooded Orchis. 5. *Orchis Palmata minor Flore rubra, Serapias minor Lobelij*. Small Handed Orchis with red Flowers. 6. *Orchis Palmata angustifolia minor, Orchis Fœmina Tragii*. The lesser Handed Orchis with narrow Leaves. 7. *Orchis Palmata angustifolia minor odoratissima Bauhini*. The sweet small Handed Orchis. 8. *Orchis Palmata Caryophyllata Lobelij*. The Clove scented Handed Orchis. 9. *Orchis Palmata Botrachiter, vel Myodes Lobelij*. Handed Orchis resembling Frogs or Flies. There are others of the *Orchides Palmate*, which grow in Marsh and Fenny places. These are the *Orchides palustres*, Fenny Orchides, or Marsh Palms, of which we have already treated: but the Cuts or Figures of the first and second Kinds, there treated of, were over lookt, and so not inserted in their proper places; we have thought

thought good, that they might not be lost, to place them here next following.

1. *Serapias, vel Orchis Palmata palustris latifolia*
Fenny Orchis, or Marsh Handed Palms with
broad Leaves, Chap. 251. Sect. 2. N^o. 1.

2. *Serapias vel Orchis Palmata palustris Lepio-
phylla*, Fenny Orchis Handed, or Marsh Palms
thin Leav'd, Chap. 251. Sect. 2. N^o. 2.

The Descriptions.

III. The first, or Great Male Handed Orchis
The Root is Handed, Palm'd, or Fingred, as in the
Cut or Figure, flat and broad, two, and two, joined
together at the Head, like unto Hands, parted at
the bottom into short pieces, as if the Fingers were
cut short off by the Knuckles, with some Fibres at
the Head thereof also, one of them being firm,

Orchis Handed Male Great :
or, Palma Christi.

the other loose or Spongy, as in the round Tuberous
Orchides, which rise and decay in like manner. It
has divers large, broad, and long, smooth, green
Leaves, lying on the Ground, among which rises up
a round Stalk, with some such Leaves on it, but
lesser up to the top, where grows a large Head of
red purple Flowers, spotted with a deep purple
color, each Flower having a Heel of the same color
behind it.

IV. The second, or Great Male Handed Or-
chis with narrow Leaves. The Roots of this are
double Handed like the former, parted into three
parts below : the Leaves are long, and narrower
than the former, thro' which the Stalk rises up, as
thro' a Pipe, to be a Foot and half high, on which is
set a spiked Head of Flowers of a pale purple color,
with a Spur behind, and a small Leaf set with every
Flower at the bottom.

V. The third, or Female Handed Orchis. Its
Root is Handed or Fingred like the others. The
Leaves hereof are long and narrow, spotted diversly
with black Spots. The Stalk has likewise some
narrow

narrower Leaves thereon, and a spiked Head of hooded Flowers, some reddish, either deeper or paler, or bluish, or else white, the lowest of them being spotted, but several of them have sometimes none.

VI. The fourth, or Greatest Handed and Hooded Orchis. The Root is like the former, but larger Palmed and Fingered, from the Head of which rises up a Stalk 3 feet high, having several long and narrow Leaves set thereon, almost encompassing it at the bottom, the Flowers whereof are Hooded like the last, but of a delicate pale purple color and sweet toothall, but flowering late.

VII. The fifth, or Small Handed Orchis with red Flowers. Its Root is small and Handed like the others. It is but a small Plant, and has a slender Stalk, with a few long and narrow Leaves set thereon, smaller above than those below, having a spiked Head, of shining red Flowers.

VIII. The sixth, or Lesser Handed Orchis with narrow Leaves. Its Root is Handed and Fingered much like to those foregoing, but lesser, and the lower divisions of them are longer. The Leaves are very long and narrow, and the Stalk grows to be about a Foot high, the Flowers at top whereof, are of a pale purple color, and the whole Spike shorter than the others.

IX. The seventh, or Sweet small Handed Orchis. This Kind has small Root Palmed like the rest. The Leaves are narrower, and long almost as Grass, the Stalk is a Hand high, with very small Leaves up to the top, bearing thereon a small Spike of pale purple Flowers, very sweet, each having a Hood and a Lip hanging down, divided at the bottom into four parts, with a Hook behind.

X. The eighth, or the Clove Scented Handed Orchis. Its Root is Palmed or Finger'd, much like the others, but has its lower divisions much longer, running down deep into the Earth. The Leaves of this Kind are long and narrow. The Stalk is slender, with several short Leaves thereon. The spiked Head of Flowers is Purple, each resembling small Flies, and smelling as sweet as a Clove, or Clove Gilliflower: after which come great Heads of small Seed.

XI. The ninth, or Handed Orchis resembling Frogs, or Flies. Its Palmed or Finger'd Root has shorter divisions in one part, and longer in another. Its Leaves which grow on its Stalk, are somewhat short and broad, encompassing it at the bottom. Its Flowers which grow at top of the Stalk, are small, with Wings as it were above, and a long small Body hanging down, and does in some sort resemble a Frog, as well as a Fly.

XII. The Places. These Palmed or Finger'd Orchides, grow for the most part in Fields and Meadows in many parts of England, and are also Nurst up in Gardens, by the more curious sort of Herbarists. The Marsh or Fenny Palmed or Finger'd Orchides grow in Marsh, Moorish, or Fenny Grounds, as their Name does inculcate, and of which we have already spoken in Chap. 251. Sect. 10. foregoing.

XIII. The Times. They Flower in April, May, and June, but seldom after, except they degenerate; or that it has had some hinderance at the time when it ought to have Naturally Flowered, which does indeed sometimes happen.

XIV. The Qualities, Specification, Preparations, and Vertues of these, are the same with those of Cynosorchis, or Dogs-Stones in Chap. 226. Sect. 14. ad 18. foregoing, to which we refer you.

ORGANIE, see Origanum, Chap. 522.

OROBANCH, see Broom Rape, Chap. 86.

CHAP. DXXXII.

OF ORIGANUM;

OR,

Bastard MARJORAM.

I. THE Names. It is called in Arabic, *Faudenigi*, or *Faudenigi*; in Greek, *Ὠρίανον* & *Ὠρίανον*; in Latine, *Origanum*; and in English, *Origanum*, *Organy*, and *Bastard Marjoram*.

II. The Kinds. Late Authors make many Kinds hereof, but the most used in Physick are these five Species following, viz. 1. *Origanum Heracleoticum* verius *Lobelij*, *Matthioli*, *Gesneri*, *Camerarij*, *Lugdunensis*, *Tabernamontani*, & *Dodonaei*; some call it by the Name of *Creticum*, and some of *Hispanicum*: it is also called, *Cunila Gallinacea* *Plinij* *Bauhino*, and is the *Cunila Dioscoridis*, Greek *Origanum*. 2. *Origanum Onitis* *Matthioli*, *Gesneri* *Bauhini* & *Lugdunensis*, and called by some by the Name of *Italicum*; white Greek *Origanum*. 3. *Origanum Onitis aliud majus* *Camerarij* & *Bauhini*; *Origanum Creticum* *Gerardi*; The greater white *Origanum*. This third has so great a resemblance with the former second Species, that they are very much suspected both of them to be but one and the same Kind, and that they differ but in the largeness of the Leaves, which may be occasioned by reason of the difference of the Soil, or fertility of the Ground in which they may grow. 4. *Origanum Vulgare*, *Origanum officinarum*, *Origanum Sylvestre*; *Cunila Bubula* *Plinij* *Ruellio* & *Bauhino*: Our Common *Origanum*. This *Dioscorides* says (if it is his Wild Kind) was called in his time *Cunila*. This is the strongest in Smell, and quickest in Taste, and is in *Galens* Opinion, the best. 5. *Origanum Anglicum* *Gerardi*, Our English *Origanum*.

The Descriptions.

III. The first, or Greek *Origanum*. It has a long slender Root, with some small Fibres adjoining to it; from whence rises up several hard, round, reddish green Stalks, a Foot and sometimes more in height, spreading forth into many other smaller Branches; on which grow many Leaves by couples at the joints. These Leaves are of a whitish green color, more long than round, and sharp pointed, very like unto those of *Marjoram*, but larger, whiter, and harder, or rougher in handling. At the tops of the Branches stand small, long, scaled Spikes or Ears, such like as in *Marjoram*, but longer, out of which shoot forth small whitish purple Flowers, like the Flowering of Wheat, after which comes small brownish Seed. The whole Plant rises up with us not much higher than *Marjoram*.

Origanum Greek.

Marjoram, but of a hotter and quicker Smell, yet very sweet, and has a sharper biting Taste.

IV. The second, or White Greek Origanum. This Plant is more tender to keep than the former.

Origanum Greek white.

scarcely abiding the sharpness of our Winters, tho' it be as well defended: it differs something from the former tho' not much; but in the color of the Flowers, which in this is white: in its Leaves which are whiter and larger; and in its Magnitude or Stature, this being much higher. The Heads are also more divided, and separated into smaller Spikes or Ears.

V. The third, or Greater white Origanum. This is more hardy than the last, and will better abide the cold of a Winter, if there be care used to preserve it. It has larger and whiter Leaves than the former; the spikey Heads are larger also, and more spread abroad than those; and bear white Flowers in like manner.

VI. Gerard describes this third Species thus. It has many thready Roots: from which rise up divers weak and feeble Branches, trailing upon the Ground, set with fair green Leaves, not unlike those of Penny-royal, but broader and shorter; at the tops of those Branches stand Scaly or Chaffy Ears of a purple color; and the whole Plant is of a most pleasant sweet Smell. The Root of this, Gerard says, endured in his Garden, and the Leaves also green all the Winter long, tho' some have said that it perishes at the first Frost, as Sweet Marjoram does.

VII. The fourth, or Our Common Origanum. Its Root, says Parkinson, perishes when it has given Seed; It rises up with divers round hard Stalks, on which are set somewhat broader, lesser, and rougher Leaves than the former. The Flowers

Origanum Common, or Wild.

grow at the tops of the Branches, in smaller Spiked Heads, and more dispersed than the former, of a reddish purple color; after which comes small brownish Seed.

VIII. The

VIII. *The fifth, or Our English Origanum.* Its Root creeps under Ground, and encreases much, abiding from Year to Year, from whence come forth several brownish, hard, square Stalks, with small, dark, green Leaves, set by couples on them, very like to those of Sweet Marjoram, but harder, and somewhat broader. At the tops of the Stalks stand

Origanum English.

Tufts of dark or deep purplish red Flowers, which turn into small Seed, like that of the Garden Marjoram, but blacker. The whole Plant smells pleasantly strong.

IX. Gerard says, That this fifth Species or English Kind, has a Root which creeps in the Ground, is long lasting, and sends forth long, stiff and hard Stalks of two Cubits high, set with Leaves like those of Sweet Marjoram, but broader and greater, of a russet green color. On the tops of the Branches stand Tufts of purple Flowers, composed of many small ones set together very closely, Umbel fashion. This Plant is called by Lobel, Origanum Onitis majus, and Agtioriganum, and is the Origanum Italicum Catalpini.

X. *The Places.* All these Kinds of Origanum's grow Wild in hot Countries, as Greece, Italy, Spain, Crete, Florida in America, and other hot Climates: But with us they are Nuisit up in Gardens. The fifth or last grows (as well as in Gardens) Wild in the borders of Fields, and low Copfes, in most places of England. I found it to grow Wild in many Plantations in the South of Carolina, whete it grew spontaneously, and flourished after an admirable manner.

XI. *The Times.* They bear their spiked Heads or Flower about the middle or end of August, or

middle of September with us; so that their Seed (except that of the last) does not often come to Maturity in our Country.

XII. *The Qualities.* Origanum is hot and dry in the end of the third Degree: it attenuates or makes thin, incisives, is something Appetitive, Attractive, Catminative, Digestive, Anodyn; Cephalick, Neurotick, Stomackick, Hysterick; Parmick, Emmenagogick, and Alexipharmick.

XIII. *The Specification.* It prevails against Poison, the Bitings of Serpents, or other Venomous Creatures; Convulsions, the Dropfy, Obstructions of the Terms, Coughs, Swellings of the Throat, Ulcers of the Mouth, Jaundice, Colick, &c.

XIV. *The Preparations.* 1. A Liquid Juice. 2. An Essence. 3. A Decoction or Infusion in Wine. 4. A Powder. 5. An Errhine. 6. A Distilled Water. 7. A Spirit. 8. A Distilled Oil. 9. A Spirituous Tincture. 10. An Acid Tincture. 11. An Oily Tincture. 12. An Electuary. 13. An Emetick.

The Virtues.

XV. *The Liquid Juice.* Given with Wine, and Oxymel, it is good against Poffon, and the malignity of Hemlock, Henbane, and Opium, or the Root of Colchicum Ephemerum, which is Meadows Saffron, that kills in about a Days time. It may be given from 1 Spoonful to 4: given with Pulp of Figs it is good against Ruptures, Convulsions, and Cramps: and mixt with an equal quantity of Honey, it Purges downwards black and melancholy Humors. Taken in a Glas of White Port or Lisbon Wine, it provokes the Terms in Women, and prevails against the Dropfie. Mixt with Honey as aforesaid, it is good against Coughs, Colds, Wheezing, Hoarseness, and Shortness of Breath.

XVI. *The Essence.* It is given from 1 Spoonful to 2 or 3, against all the Diseases afore named, in Wine or some other proper Vehicle. Being dropt into the Ears, it eases their pain. It is profitable for such as are luchy, Mangy, or are Scabby: and being taken for some considerable time, is an excellent thing for the cure of the Jaundice.

XVII. *The Decoction or Infusion in Wine.* These have the Virtues of the Juice and Essence, but nothing near so powerful, and therefore may be given Morning and Night from 4 to 6 Ounces or more, according to the Age of the Patient. They are potent Remedies against all sorts of cold Poisons whatsoever: as also against the bitings or stings of Serpents, mad Dogs, Scorpions, Spiders, &c. securing the Life of the Patient upon the spot.

XVIII. *The Powder of the Herb and Heads of Flowers.* It has all the Virtues of the former Preparations; but operates not with that speed which they do, because it requires some time to be digested in the Stomach: but being given in Mead or Honeyed Water from a Dram to 2 Drams, it Purges downwards, black and melancholy Humors, is good against the Jaundice, provokes the Terms, and facilitates the Birth of a Woman in Labor.

XIX. *The Errhine.* Take of the liquid Juice an Ounce: of the Essence 2 Drams: of the Powder half a Dram, mix them, to be snufft up the Nostrils. It purges the Head and Brain that way, draws forth

forth Pituitous Humors, and other kinds of Matter out of the Cavities of the Brain, and therefore is profitable against the Head-ach, Megrim, Vertigo, Lethargy, Apoplexie, Epilepsie, and other like cold diseases of the Head: in which being often used, Morning, Noon, and Night, it is found to be a thing of great efficacy.

XX. *The Distilled Water.* It has the former Virtues, but is much weaker than either Juice or Essence, and may be taken from 4, to 6 or 8 Ounces, dulcified with double refined Sugar: it will be much more effectual if half a Spoonful or Spoonful of the Spirit is added to it; however it may be used as a Vehiculum to convey the other Preparations in.

XXI. *The Spirit Distilled from the whole Plant.* It is Cephalick, Neurotick, Cordial and Hysterick: good against Lethargies, *Curus*, and all other cold and moist Diseases of the Head and Brain; is prevalent against Palsies, Tremblings, and Numbness of any part, Sickness at Heart, Fainting, Swooning, Palpitation, and all cold and moist Diseases of the Stomach and Womb. Dose from 2 Drams to 6 in a Glass of Wine.

XXII. *The Distilled Oil from the Spiked Heads of Flowers.* It has all the Virtues of the former Preparations; and is one of the most powerful Vegetables in the World against the Palsie, rho' universal, being taken inwardly from 3 to 10 or 12 drops in any Antipatalytick Vehicle: and outwardly anointed upon the *Spina Dorsæ* and parts affected, Morning and Evening: but by reason of its extraordinary heat, it ought to be mixed with *Chymical Oil of Limons* in equal parts, and then used: and so it is a most excellent thing against Cramps, and Convulsions of the Nerves in what part of the Body soever.

XXIII. *The Spirituous Tincture.* It has all the Virtues of the Juice, Essence, Spirit and Oil, but is milder, and more fit to be taken than the last of them, unless in an inveterate Palsie, in which I think, scarcely any Medicine can be too strong. It is a great Stomackick, and this as well as the Oil are potent things against the Colick, whether in the Stomach or Guts: it strengthens the *Viscera*, expels Wind, and makes a cheerful Countenance. Dose from 1 to 2 or 3 Drams, or more, in a Glass of Wine Morning and Evening.

XXIV. *The Acid Tincture.* It is a great corrector of all sorts of Poisons of Vegetables or Animals, but more especially against the Poison or Malignity of the Plague or Pestilence, and resists the utmost force of all sorts of Malign or Pestilential Fevers: it very much strengthens the Stomach, causes a good Appetite, and a strong Digestion, and being used for some time, very admirably restores languishing Nature. Dose so many drops at a time, as to make a Glass of Ale, Wine, or Dith of Broth, pleasantly and gratefully Acid.

XXV. *The Oily Tincture.* It has all the Virtues of the Oil and Spirituous Tincture; besides which it is prevalent against Diseases of the Reins, Ureters and Bladder, cleansing them from Sand, Gravel, Stones, and other Tartarous Mucilage obstructing them. It strengthens the Back, eases the vehement pain thereof, being inwardly taken and outwardly anointed upon the same, provokes Urine powerfully, and gives present relief in the Strangury. Dose from 20 to 40 or 60 drops, in any fit Vehicle.

XXVI. *The Eleluary.* Take of the Powder an Ounce, of Sal ntre in fine Powder 4 Drams, Honey 2 Ounces and half, mix them. Held in the Mouth,

between the Gums and Lips, or Cheeks, it eases the Tooth-ach: and being rubbed upon the Teeth, it makes them white, and fastens them: given inwardly, to 2 Drams or more, in a Glass of Wine, it potently provokes Urine, gives ease in the Strangury, and heat and scalding of the Water; and evacuates the Watery Humor in Dropsies.

XXVII. *The Emetick.* It is made of the Juice, with Onions sliced, and Sumach infused in it, in a Copper Vessel for the space of 40 Days. Dose a Dram or 2, more or less, according to Age and Strength, in a Glass of Wine in the Morning Fasting.

XXVIII. *Nota.* Galen says, all the sorts of *Origanum*, are of a cutting, rarifying, and attenuating Faculty, and heat in the third Degree; and that the *Heracleoticum* is of more power or force than the *Omitis*, and that the Wild is stronger than either. It is also said that the Decoction of *Origanum*, with Cloves, sweetened with Sugar, helps such as are troubled with the Hiccough.

CHAP. DXXXIII.

of ORRICE Florentine.

I. **THE Names.** It called in Greek, *ἱεὶς ἄσπερ ὀνυκίδης*; in Latine, *Iris Tuberosa alba*, *Iris Tuberosa Florentina*, *Iris alba Florentina*: in English, *White Orrice*, *Florentine Orrice*, and *White Tuberos Flower de Luce*.

II. *The Kinds.* We have treated of this Plant already in Chap. 287. foregoing, where we have described three several Species thereof, viz. *Iris alba Florentina*, the Sweet Florentine Orrice: of whose Root Sweet Pouders and Waters are made, and of which they make their *Rasp-Berry Ale*, by putting a little bit of it into each Bottle. 2. *Iris Flore pallido Florentina*, The Straw colored Florentine Orrice: 3. *Iris alba major versicolor*, The white parti-colored Orrice. To these we shall add in this Chapter, 4. *Iris Cærulea odorifera*, vel *odorosa*, *Iris Camerarij Germanica*, *Camerarius* his Sweet German Orrice; or Sweet blew Flowered Orrice: 5. *Iris Pannonica*, Hungarian or Austrian Flower de Luce, or Orrice. And with these, we here give you the Cut, or Figure, of the Sweet white or Florentine Orrice, which was over-past in Chap. 287. *Secl.* 3. above mentioned, which is now here placed.

The Descriptions

III. *The first of these, or Sweet Florentine Orrice,* has a tuberous Root of a considerable thickness, which is admirable sweet, and being put into Ale, or Wine, does give them an absolute Rasp-Berry Flavour or Taste; also being reduced into Powder, makes a yellowish or Cream white Powder, of a very pleasant sweet Smell, of which many Sweet Pouders and Bags are composed; and which is generally now Sold

3. Orrice Florentine Sweet: or Sweet white Orrice, or Sweet tuberous Flower de luce.

Orrice Florentine.

in Perfumers Shops: This Orrice in its form and way of growing, is altogether like to the Common Flower de luce, saving that the Flowers of this are of a white color, and the Root of an exceeding sweet Smell. The larger description hereof see in the afore cited Chapter and Section.

IV. The fourth, or Camerarius his Sweet German Orrice, or Sweet blew Flowered Orrice. Camerarius in his *Hortus Medicus* says, That it has a great thick and knobby Root, which smells as Sweet as the Florentine Orrice. The Stalk is single and smooth, thick and full of Juice. The Leaves are very large and broad, and twice as broad as any of the other Flower de luces. The Flower grows at the top of the Stalk, consisting of six great Leaves, of a most bright shining blew color, welted down the middle, with a middle Rib, of a yellowish white color, the three upper Leaves being somewhat yellowish. At the bottom next the Stalk, it is of a white color, with some yellowness fringed about the said white, as also about the brims or edges, which very much expresses the Beauty thereof.

V. The fifth, or Hungarian, or Austrian Flower de luce or Orrice. Its Root is tuberous, and very sweet when it is dry, out-lying, or contending in sweetness, with the first or Common Sweet Florentine Orrice it self. It has great broad Leaves, thick and flat, of a purple color near unto the Ground, like to the Dalmatian Flower de luce, which it very much resembles. The Flower is of all the others, the most confusedly mixed with various colors, being very Beautiful, inasmuch as it is very difficult to describe every Line or Stroke, according to the truth thereof. The three Leaves which stand upright, do clasp or embrace one another, and are of a yellow color. The Leaves which look downwards, are

about the edges, of a pale color, the middle part of white, mixed with a Line of Purple, and has many small purple Lines, striped over the said white Flower, even to the brim of the pale colored edge. This being lightly smelt to has a Smell almost like to those of the Hawthorn Flowers.

VI. The Places. The Titles or Names of these Orrice's shew in what Places or Countries they are Natives: with us they are only Nurst up in Gardens, where they flourish very well.

VII. The Times. They Flower in July and August; and their Seed is ripe in September, or not long after.

VIII. The Qualities, Specifications, Preparations, and Vertues of these, are the same with the Florentine Orrice, declared in Chap. 287. Sect. 8. ad 17. aforegoing, to which you are referred.

CHAP. DXXXIV.

Of ORPINE;

OR,

LIVE -- LONG.

I. THE Names. It is called in Greek, Τηλέφου; in Latine, *Telephium* also (so called from *Telephus Rex Misie*, whose Wounds received from *Achilles*, and grown almost past Cure, were healed herewith:) by some Authors, *Fabaria*, and by most *Crassula*: in English, *Orpine* and *Live-long*; (because a Branch or Branches of the Plant will live and grow a long time, after they are taken out of the Ground and hung up in any place, more especially if put into a shallow Basin of Water, in which it will spring up regularly, and grow beautifully, even to admiration).

II. The Kinds. These following six Sorts, are the chief, viz. 1. *Telephium*, sive *Crassula major vulgaris* (à foliorum Crassite: *Scrophularia media*, vel *Tertia Brunfelsij*: *Fabaria*, *Faba crassa*, *Faba inversa* *Quorundam* & *Lobelij*; à foliorum *Fabe* similitudine & crassitudine, *Acetabulum alterum Cordi*; *Cotyledon alterum Dioscoridis Columnæ*, *Anacampteros Gesneri in hortis*, *Telephium*, *Telephium vulgare*, *Clusij*, *Dodonei*, *Matthioli*; Our Common *Orpine*. 2. *Telephium* seu *Crassula minor*, *Cepæa Matthioli*, *Cepæa marina aliorum*; Small *Orpine*. 3. *Telephium*, sive *Crassula major Hispanica*, *Clusij*; & *Lobelij* *Telephium Hispanicum* *Clusij*; The Great Spanish *Orpine*. 4. *Telephium Floribus purpureis* *Lobelij*; *Scrophularia* seu *Portulaca major Tragi*; *Acetabulum alterum purpureum Euchsij*; *Telephium quintum* *Clusij*; *Crassula Montana* *Cesalpini*; *Rapuntium Umbellatum Columnæ* (for he did not think it to be a Species of *Telephium*.) *Orpine* purple Flowered. 5. *Telephium minus repens*, *Dodonei* & *Lobelij*; *Cepæa Fancij* *Clusio* & *Camerario*; *Telephium sextum* *Clusij* (who thinks it more nearly to resemble the True *Telephium* or *Orpine*, than any other.) *Telephium semper Virens*, *Dodonei* & *Lobelij*; Small creeping *Orpine*, or French *Orpine*. 6. *Telephium Legitimum Imperati*, *Clusio*; *Telephium Imperati Camerario*; The True *Orpine* of *Imperatus*.

The

The Descriptions.

III. The first, or Our Common Orpine. The Roots are manifold, thick, round, and white, with glandulous or tuberous Clogs, not much unlike to those of the Spanish Kind following, but lesser. It rises up with several round brittle Stalks, thick set with thick, fat, and fleshy

Orpine Common.

Leaves, without any order, and little or nothing dented about the edges, lesser than those of the Spanish sort, and of a paler green color. The Flowers grow in lesser Tufts, and are white, or of a whitish color, which after wards bear chaffy Husks, containing within them small dust like Seed. This when it is found growing Wild in Fields and Woods sides, does generally grow smaller than when it grows in Gardens.

IV. The second, or Small Orpine. Its Root is long and Fibrous, smelling something sweet, like Rose-wort Root as Camerarius says, and perishes every Year, so that if it rises not of the shed Seed (which it usually does, if it is suffered to shed it) it must be new Sown every Year. It has a small weak Stalk, scarcely a Foot long, lying almost upon the Ground, spread out into several Branches, and they again into other smaller ones, set with small thick long Leaves, without any order; and sometimes like unto Purslane. At the tops of the Branches grow many small white Flowers, in Tufts, but more thiny, or sparsely set, than in some of the other Kinds, consisting

Orpine Small.

of five Leaves apiece, after which come small Heads, like to the other Orpines, in which is contained small dusty Seed.

V. The third, or Great Spanish Orpine. Its Roots are thick, white, and tuberous, bigger and longer than those of the first, or Our Common Orpine, which abide all the Winter, with the green Leaves on their Stalks, which have not yet flowered. From this Root rises up several weak, round sappy Stalks, about two Feet high, on which are set, at distances, two large and thick broad Leaves, very like unto the Common Orpine, but much larger and sometimes browner of color, and a little unevenly dented about the edges. At the tops of the Stalks grow Tufts of Flowers, larger and more spread, than those in our first or Common Kind which consist of five small whitish Leaves apiece, which being past away, small chaffy Husks succeed, with small dust like Seed within them.

VI. The fourth, or Orpine purple Flowered. It has a tuberous Root like the first Kind, but much smaller, and very much fuller of Fibres or Strings. Nor does it much differ from our Common Kind, but that the Stalks are more flexible and weak, and the Leaves (which grow without any order) are more finely dented about the edges. The Tuft of Flowers at the tops of the Stalks are of a reddish purple color, consisting of five small Leaves apiece, like the former. This has been found also smaller in all its parts, but not otherwise differing, than in that the Stalks with all the Leaves, utterly perish every Year to the Root, which every Spring sends forth new Stalks.

VII. The fifth, or Small creeping Orpine, called by some French Orpine. Its Roots are not tuberous but fibrous or stringy; yet do endure with the green Leaves on them, the greatest extremity of Winter, losing only some set of the lower Leaves of the Branches. This Root sends forth several weak round Stalks, lying on the Ground, and easily

ly taking Root again as they lie, thick set with thick fat Leaves, like unto Purslane, but smaller and smaller upwards, of a dark or rusty green color; from among which rise bare or naked weak Stalks, without any, or with but few Leaves thereon; at the tops whereof stand small Tufts of purplish Flowers like the other.

VIII. The sixth, or True Orpine of Imperatus. Its Root is small and long, of 4, 6, or 8 Inches in length, with drovers Branches and small Fibres adjoining to it; at the Head whereof some Branches of green Leaves, which have not seeded, will remain, tho' those that have flowered and seeded dye away and perish. It is a small Plant and spreads its self upon the Ground, with many small and long trailing Branches, a Foot or more long: whereof those which will not flower the same Year have smaller, and somewhat longer Leaves on them, and thicker set together: but those which will bear Flowers, are set sparsely with out any order to the tops, and are lesser in form, and less thick and sappy than any of the others before, and of a sad blewish green color. At the tops of the Stalks, stand thick clusters of white Flowers of five Leaves apiece, after which come small corner'd Heads containing small brownish Seed.

IX. The Places. The first of both sorts, both greater and lesser, are frequently found almost in every County of England, the greater being generally Nurst up in Gardens; the lesser sort is found to grow in the shady sides of Fields and Woods. The second was first brought to us from Padoua, and is now planted in many places in our Gardens. The third *Clusus* found in Spain, as also in Hungary, and upon the Alps. The fourth has been found often in several places of Germany, as *Tragus*, *Camerarius*, *Clusus* and others affirm. The fifth was a Native of Italy, and was sent thence by *Alphonfus Pancius* an excellent Herbarist of Ferrara. The sixth came from Imperatus of Naples, from *Cortusius* and *Josephus de Casa bona*, of whom *Clusus* says, that he received the Seed. These are the Native places of these five last, but with us in England, they are all Nurst up in Gardens.

X. The Times. They do all of them Flower thro' the whole Month of July, and their Seed is ripe in August.

XI. The Qualities. They are cold and moist in the second Degree, as some say; and Vulnerary, as being good to heal Wounds and Ulcers, whether inward or outward.

XII. The Specification. They are peculiar for cooling Inflammations in Wounds and Tumors, and easing their Pain: They absorb the acidity of Humors in the Bloody Flux, stop fluxes of Blood in Wounds, allay Vapors, and cure Excoriations or Ulcers in the Stomach, Bowels, Liver, Lungs, Reins, Womb, or other inward parts.

XIII. The Preparations. You may have therefrom, 1. A Liquid Juice. 2. An Essence. 3. A Decoiled or Insolated Oil. 4. A Cataplasin of the Leaves. 5. A Distilled Water.

The Virtues.

XIV. The Liquid Juice. Used with Vinegar as a Bath or Wash, it takes away Scurf, Morpew, Leprosy, and all other Deformities of the Skin, and is good to wash old filthy Sores, and putrid Ulcers, to cleanse and heal them. It prevails against a Quinsy, the Throat being gargled therewith several times a Day, and outwardly it being

bathed therewith double Cloths wet therein, being also bound thereto.

XV. The Essence. Taken inwardly 1, 2, or 3 Spoonfuls at a time, it is good to heal any gnawing, Excoriation, or Ulcer in the Stomach, Intestines, Lungs, Liver, Spleen, Reins, Ureters, Bladder, or Womb, or other inward parts, being taken for several Days together. It also absorbs the acrimony and acidity of the Humors, heals other Bowels in the Bloody Flux, and stops all the Fluxes of Blood in the Body, as also the bleeding of Wounds outwardly. The Root of these Plants, is said also to perform the same things, viz. The Essence made of the Root: Inwardly taken for some considerable time, it wafts and consumes Scrophulous Tumors, or Swellings of the Throat, from the Evil.

XVI. The Decoiled or Insolated Oil. It may be made of the green Herb, or Root. Or it may be made by heating the Juice and Oil Olive together. It cools Inflammations, gives ease in hot Apoplems, as also in inflamed Wounds, and is excellent to heal Scaldings or burnings with Water, Oil, Lead, or Fire, &c. Anointed upon Strumous Swellings in the Neck and Throat, it is said to abate them, prevent the afflux of Humors, and in a short time to cure the same.

XVII. The Cataplasin of the green Leaves or Roots. Applied to any simple Green Wound in Hands, Arms, Legs, or Feet, or other parts of the Body, it quickly heals them. Being bound to the Throat of One that has a Quinsy, it repels the Humor, suddenly puts the Patient out of Peril, and in a short time cures it; the Throat being gargled also with the Juice or Essence, five or six times a Day. Applied to Ruptures, it is said to consolidate them, especially if the Patient is young.

XVIII. The Distilled Water. It has all the Virtues of the Liquid Juice and Essence, and may be given to six Ounces or more, a little dulcified with double refined Sugar. Mixt with an equal part of Vinegar, it is said to be a singular Cosmetick.

CHAP. DXXXV.

of OX EYE.

I. THE Names. It is called in Arabick, *Bihar*: in Greek, *Βίχθαρος*: in Latine, *Buphtalmum*, & *Oculus Bovis*: and in English, Ox Eye.

II. The Kinds. Authors give us several Kinds of this Plant, but those which grow with us in England, are chiefly these following, viz. 1. *Buphtalmum vulgare*, *Buphtalmum Matthioli millefolij folijs*, *Oculus Bovis vulgaris*, *Cacbe Dioscoridis*, *Chrysanthemum Cordi*, *Fuchsj*, *Gesneri* & *Turneri*, The Common or Vulgar Ox Eye. 2. *Buphtalmum alterum Cotule folio Camerarij*, & *Baubini* *Buphtalmum Narbonense*, Camomil-like Ox Eye. 3. *Buphtalmum flore purpurascete*, Ox Eye purple Flowered. 4. *Buphtalmum Africanum tenuifolium Boelji*, Ox Eye Fennel Leav'd.

The Descriptions.

III. The first, or Common or Vulgar Ox Eye. It has a small and slender Root, and fibrous withall, which perishes yearly, or otherwise abides the second Year after the first Sowing, which Yarrow does not. This is the most common Ox Eye with us; its Leaves are fair and green, divided very much

Ox-Eye.

into several other Leaves, somewhat resembling Common Yarrow, and so taken to be by many who look but superficially upon it, but being carefully observed, it is found plainly to differ from it, the divisions not being so thick nor small. The Stalks tho' they grow upright, yet are not so stiff or strong as those of Yarrow; and at their tops they bear but single Flowers, lesser than those of the Corn-Marigold, but wholly of a deep yellow, and not shining, after which follows the Seed in the middle yellow Thrum. The Figure we here exhibit to you is that which is in Matbiolus his Epitome, but the more Elegant Cut of this Plant, is that which is in Baubinus his Edition of Matbiolus his Dioscorides.

IV. The second, or Camomil-like Ox Eye. Its root is tough, long and slender, with some Fibres adjoining to it. The Stalks are weak, sappy, flexible or apt to bend, and green withall, which grow sometimes to be about 2 Feet high, with fine Camomil or May-weed-like Leaves, but a little larger, dispersedly growing thereon, as also on its Branches; every one of which bear a Flower like unto the former Ox-Eye, or Corn-Marigold, but its Leaves are fewer, yet somewhat larger than those of Camomil, and yellow; the yellow Thrum in the middle being of a deeper yellow color, and somewhat hollow withal.

V. The third, or Ox-Eye purple Flower'd. Its Root is much like the former. The Stalk also (which in the other is green) is more reddish in this. In the main, the Plant differs not much from the last in the manner of its growing, or in the form of its Leaves and Flowers; saving, that in this, the Flowers are either wholly purplish, or else purplish in the middle.

VI. The fourth, or Ox-Eye Fennel Leav'd. It has a long slender Root, which is full of Fibres or Strings, and perishes every Year after Seed time. It rises up with one slender Stalk, with several long thin Leaves, variously divided, and cut into small fine parts, coming nearer to the form of Fennel, than any other, bearing a large yellow Flower at top of each Branch, Leaves and Flowers growing together.

VII. The Places. They generally grow in moist Grounds, by Water Courses, and the like in other Countries; but with us they grow only in Gardens.

VIII. The Times. They Flower in June and July, and sometimes in August; the Seed being ripe not long after.

IX. The Qualities. Authors are very short in this part, all that they say of Ox-Eye, is, that it is Discussive.

X. The Specification. It is said to discuss Tumors, and to be helpful against the Jaundice.

XI. The Preparations. You may have herefrom, 1. A Powder of the Heads of the Flowers. 2. A Cerot made of the same.

The Virtues.

XII. The Powder of the Flowers. It may be given in White Wine, from a Dram to two Drams Morning and Evening, and so it is helpful against the Jaundice: Or it may be so given immediately after Bathing, as Dioscorides says, and so it gives a good color to the Skin.

XIII. The Cerote of the Flowers. Applied to cold and hard Tumors or Swellings, it softens and discusses them: and therefore may probably be good against Scrophulous Kernels.

CHAP. DXXXVI.

of OX -- LIPS.

I. THE Names. They have no proper Greek Name: but are called in Latine, *Paralysis absque calicibus*: and in English, *Ox-Lips*.

II. The Kinds. It is a Species of the Cowslip, and of that sort, whose Flower is without any Hofs, or green Husk to contain it, or if it has any, it is a very short one. It is threefold, viz.

1. *Paralysis absque calicibus simpliciter*, Ox-Lips single. 2. *Paralysis sine calicibus dupliciter*, Ox-Lip double. 3. *Paralysis calicibus dissectis*, Ox-Lips with jagged Husks. 4. *Paralysis Flore Viridante, sive, Calamistrato*, Ox-Lip green Rose, or Fether Flowered. All these we have treated on already in the Chapter of Cowslips, viz. Chap. 157. Sect. 9,

10, 11, 15. foregoing; so that no more need be said of them now, saving that we shall here give you Gerard's general Description of them; and then add a fifth Kind, viz. 5. *Paralytica Flore Geminata pallidioris inodora*, Ox-Lips double of a paler yellow color without Smell.

The Descriptions:

III. Gerard's general Description. This well known Flower by the Name of Ox-Lip, differs not from the Cowslip, saving that the Flowers are not so thick thrust together, and they are fairer, are

Ox-Lip.

not so many in number, and smell not so pleasant as the other: (to which we add) and standing naked, or without any green Huse or Husk, to contain them, or if they have any, it is a very short one, see the Figure.

IV. The fifth, or Ox-Lips double of a paler yellow color without Smell. Its Root is long, stringy, and very Fibrous, from whence spring forth many green Leaves, very like to those of the Common Field Cowslip, very much of the same shape and make, rough, stiff, and a little Crumpled about the edges, each Leaf standing upon a short foot Stalk. It has Stalks of Flowers, much like the Cowslip, growing in bunches at the tops of the said Stalks. The Flowers themselves are double, like those of the Double Cowslip, one within another, saving that this has no Husk or Huse to contain them, no more than the Single Ox-Lip has, but stand bare or naked, and of the very same largeness each of them, having very little or no Smell; but with this

difference; 1. That the Leaves of this Plant are something larger. 2. That the Flowers are also a little larger. 3. And that they are of a paler yellow color.

V. The Places. They are all found growing Wild in Meadows and other Pasture Fields almost throughout all England: from whence they have been Transplanted into Gardens, for delight sake, with such as are Lovers of Flowers, where they abide, flourish, and grow faster than in their natural places.

VI. The Times. They Flower in the Spring of the Year, at the same time when Cowslips are in Flower, some earlier, and some later, but generally later, or after Primroses; so that their Season may be said to be from the beginning of April to the end of May: But I have seen some of them in Flower almost to the middle of June, tho' not often.

VII. The Qualities, Specification, Preparations, and Virtues of these are the same with those of Cowslips, which we have enumerated at large in Chap. 157. Sect. 18. ad 32. foregoing. They are singular Cephalicks, and Neuroticks, and therefore must be of extraordinary use in Diseases of the Head, Brain, and Nerves: and for easing pains in the Head, are accounted next to Betony. Experience has shew'd that they are profitable for the Cure of the Palsie, for which reason the whole Tribe of Cowslips (of which these are Species) are called by many People Palsie-woorts. They are also profitable against pains of the Joints, or Gout, (as are the Bears Ears also, which are another Species of Cowslips) for which reason they have obtained the Name *Arthritica*, as well as *Paralytica* or *Paralyssis*.

VIII. The Juice of the Flowers. It is commended by some Authors, to cleanse, soften, and whiten the Skin, and to take away the spots, discolorings, and defecations of the Face or Skin. The said Juice drank Morning, Noon, and Night, from 3, to 5, or 6 Ounces, for some Days in a Glass of Madera, Sherry, or White Lisbon Wine, is said to prevail wonderfully against both Palsie and Gout.

IX. The Juice of the Leaves. Snuff up the Nostrils as an Errhine, it purges the Head, Brain, and original of the Nerves, of cold and moist Humors, which fall upon other parts, and cause Palsies, Gouts, Convulsions, Evil, and many other dangerous Diseases.

Of PANICK:

OR,

GUINNY CORN.

I. **T**HE Names. It is called in *Arabick*, *Do-chon*; in *Greek*, *Ἑλμυς*; *Elymos*: in *Latine*, *Panicum*: and in *English*, *Panick*, *Guinny Corn*, and *Indian Corn*.

II. *The Kinds*. There are several sorts of this Plant, as, 1. *Panicum Indicum*, *Panicum Americanum*, *Panicum Carolinianum*, *Maïson Dioscorides & Galeni*, *μαϊσον* as *Diocles* has it: *Mel frugum Plinij*, *Pliny* says *Panicum à Paniculis dictum* fruit; *Indian Panick* or *Guiny Corn*. 2. *Panicum Ceruleum Indicum*, *Blew Indian Panick*. 3. *Panicum Indicum Panicula Villosa*, *Indian Panick* with a more hairy Spiked Head. 4. *Panicum Germanicum Panicula minore*, *Panicum album vulgare*, *Ordinary* or *Common Panick*, *German Panick*. 5. *Panicum Sylvæsticæ Gerardii*, *Wild Panick*. Of the *Manured Panick* growing with us in *Europe*, there is but one sort. But the *Indian* or *Guinny Panick* is manifold, coming from *East India*, *Guinny*, *Ethiopia*, or *Africa*, and from *America* also: One sort has white Heads as big as ones Fift, thick and short, with round white Grains, having an hole or dent in every one of them. Another, has a Head or Spike a Foot long, with a bowing top, as hairy as the third sort afore named. Another has a slender Spike a Foot and half long, larger at the lower part thereof, and smaller at the upper part, much like to the first Kind. Another has a half spiked Head, larger than both ones Fifts, and 9 or 10 Inches or more long, whose Stalk is a full Inch in Diameter, of a fine whitish yellow color: besides all these, there are several other sorts growing in their Native places, too many to be enumerated here, and which to mention would be to little other purpose than to fill up Room. We shall give you in this Chapter the Descriptions only of the five Kinds we have first Named, which take as follows.

The Descriptions.

III. *The first, or Indian Panick, or Guinny Corn*. Its Root is *Fibrous*, consisting of many Threads or Strings: Its Stalk is very tall, as tall as the highest *Indian Maiz*; Its Leaves or Blades are like to those of *Millet* or *Maiz*, very long and broad, and of a considerable thickness, with a Rib running all along the length to the middle. Its Ear is thick, close, and compact, made Taper fashion, broader or thicker at the lower end, and small at the top, a Foot, or almost a Foot and half in length. Its Grain is much like that in Sect. 4. following, saving that many of them are contained together in one Hairy Husk, which is fastned to a very short foot Stalk.

IV. *The second, or Blew Indian Panick*. It has a fibrous or stringy Root like the former, which sends forth Stalks, growing up to the

height of a Man, or more, with strong and great Joints, full of a white spungy Pith like to the former, or that of *Maiz*, which near the Ground are of a shining purplish color: it spreads it self out into sundry Branches, with large and long Leaves on them, like to those of the first, which encompass the Stalk at the bottom, having each a thick Rib running its whole length through the middle. From the Joints towards the top, as also at the tops, come forth short round Panick like Heads, closer set together, than in the next following, and of a blewish shining purple color, as the Stalk below, or rather much more Orient and fresh, full of hairy Husks, and small, long, blewish, round Seed, or Grains in them, like unto *Naked Oats*.

V. *The third, or Indian Panick*, with a more hairy spiked Head. Its Root is a bush of Fibres or Strings, which sends up a thick, strong, jointed Stalk, four, five, or six Feet high, an Inch and quarter or more in thickness, whose Cavity is filled with white spungy Pith, at the Joints of the Stalks, and their Branches, come forth long, broad, thick Leaves like to the former,

Panick Indian; or Guinny Corn.

with a thick Rib running through their middle from the one end to the other, which when dry is white like Straw. At the top of the Stalks, comes forth a large spiked Head, almost Corn fashion, round, thick below, and small at top, a Foot or more long, sometimes fifteen or sixteen Inches in length, a little inclining or bending downward, by reason of its weight, for it is very full of Grain close set together, the which is white or yellowish, and fashion almost like to *Gromel Seed*, or not much unlike to that of *Millet*: but the whole Spike is much more hairy than either of the former.

VI. The fourth, or Ordinary, or Common Panick, or German Panick. Its Root is bushy like to those of the former Kinds, but smaller, and dying every Year as they do. It grows up with a reasonable strong jointed Stalk, full of a spongy Pith, but not Downy as Millet is, having thereon, somewhat large Leaves, greater by much than those of Wheat, and very near to the largeness of those of Millet, so that they can hardly be distinguished. At the top of the Stalk comes forth a whitish, long, round, close Spike, round at the end, soft, and as it were hairy, with small short Branches, all the length of it; when it is full ripe and opened, it is full of hairy soft Husks, which include a small white Grain, something less than that of Millet, and not so shining. The Ear grows at top, single, not unlike to the Spike or Ear of that last described, but much less.

VII. The fifth, or Wild Panick. Its Root is small and fibrous or thready. It grows up with long, slender, jointed, Reedy Stalks, set at the Joints with long Leaves, like to those of Sorghum,

Panick Wild.

or Indian Panick at Sect. V. foregoing. The Tuft or Feather like top, is like to the Common Reed, or Ear of the Grass called Ischamon, or Manna Grass.

VIII. The Places. The first three grow in Guinny, as also in the East and West Indies, and flourish admirably well in our Plantations in America; but of them the third Species is Principal, and that which is chiefly planted, not only in Guinny, but also with us in the West Indies, and is Sown in many Places throughout all Europe, where it thrives very well. The fourth grows in Germany, and with us in many places in Gardens. The fifth grows Wild in the hotter

Climates, but in England, it is preferred only in manured Grounds.

IX. The Times. They are not to be Sown till April, unless the Year be hot: The second Kind does not often come to Maturity here, but the first many times will, if the Summer is seasonable and warm, and it be Sown in a strong and fat Ground. But they prosper best in hot and dry Climates, and are apt to wither with much watering. The Grain is ripe about the beginning of August, and being full ripe when gathered, may be kept good a long time, if it is carefully preserved from the Weevil, or other Vermin which may eat it.

X. The Qualities, Specification, Preparation, and Virtues of the Grain are the same with those of Millet, in Chap. 491. Sect. 8. ad 17. foregoing, to which I refer you. But Galen says, That Millet is better to all purposes than Panick, sweeter also in Taste, and easier of Digestion; but he says, that Country people feed thereon, as we do of Wheat, being boiled in Milk, and so eaten. He also says, That that which grows in Italy, exceeds in goodness, that which grows in Asia.

XI. Nota. Johannes Leo, Historiâ Africae, says, That in some places in those Countries, they make very fine Bread of Panick. It is eaten too, in our West Indies, where also we Feed our Dunghil Fowls, Ducks, Geese, Turkeys, Pidgeons, &c. therewith. The Bread made of the Meal or Flower of Panick stops Fluxes, by reason of its very drying Quality or Property. A Cataplasim of the Meal or Flower, is said also to be cooling, and drying; Strengthens the parts affected, and presses a Flux of Humors.

XII. Panick boiled (as Pliny says) in Goats Milk, or in Cows Milk, which for all that I know may do as well, being Eaten twice a Day, stops Lasks or Fluxes of the Belly; but this I suppose is to be understood, whilst the Disease is recent.

C H A P. DXXXVIII.

of PARNASSUS--GRASS.

O R,

LIVER-WORT White.

I. **T**HE Names. It has no Greek Name: but is called in *Latine*, *Gramen Parnassi*: and in *English*, *Parnassus Grass*.

II. The Kinds. There are two Kinds of this Plant, viz. 1. The single Flowered, which may be called in *Greek*, *Ἀγρὸς ἡ ἐν ποταμῷ* which is the Name *Camerarius*, in his Epitome of *Matthioli* gives to our *Unifolium* or *One Blade*, but very unjustly: *Matthioli* himself in his said Epitome calls it in *Greek*, *Ἀγρὸς ποταμῶν*, which he ascribes to the true Plant, but with out any Flower, which we here give you in the first place: so that upon the whole it is much to be questioned whether our *Parnassus Grass* here intended, was ever known to the *Greeks*; however these *Greek* Names will very well suit with what we here offer you: in *Latin*, it may be called *Gramen Parnassi*, and probably may be the right *Gramen Parnassi Dioscoridis*, (tho' I think we cannot be positive of it:) for *Gesner* in *hortis Germanie*, says, that the right is not known to any in our Days:) *Cordus* in his History of Plants calls it *Hepatica alba*; *Lobel*, *Gramen Parnassi bederaceum recentiorum*: and *Tabernaemontanus*, *Gramen bederaceum*, & *Flos Hepaticum*: Common *Parnassus Grass*. 2. *Gramen Parnassi flore duplicato Lobelij*: *Parnassus Grass* double Flowered.

Parnassus Grass of *Matthioli*, without Flowers.

The Descriptions.

III. The first, or Common *Parnassus Grass* which is single Flowered. It has a Root consisting of a small blackish fibrous Bush of Threads, enduring all the Winter. From the Head of this Root rise up many Leaves, not altogether round, but shaped below like the upper part of a Heart, broad in the middle, and ending in a point, sometimes sharp, and sometimes blunter like the lower part of a Heart, smaller and thicker than Violet Leaves, not much unlike to some Ivy Leaves, or Leaves of *Asarabacca*, but smaller, and not of so dark a color, yet of a fresh sort of green, every

Parnassus Grass Common single Flowered.

one standing on a long foot Stalk, among which there rises up several slender weak Stalks about a Foot high, so weak as that they are scarcely able to stand upright, on which grow at the several Joins, such like Leaves as the former, but smaller, and without any foot Stalk, but joining themselves so close to the Flower Stalk, that the said Stalk seems almost to run thro' it. The tops of the Stalk are naked and bare of Leaves, unto the Flowers, for a good way. The Flowers are at the tops of the Stalks, and are white, consisting of five Leaves a piece, round at their ends and not pointed: in the middle of which is a small round green Head or Burton, which the Flower being fallen, grows something larger, and contains within it, small reddish Seed.

5 L

IV. The

IV. *The second, or Parnassus Grass double Flower'd.* This second Kind does answer the former almost in all respects, its Root, Leaves, and Stalks being much alike, saving that in this, the Leaves of the Plant are something larger, and the Flower has a double row of Leaves one with-

Parnassus Grass double Flowered.

in another, which makes the Flower show double; the Leaves of which Flowers both the inward and outward are long and sharp pointed, otherwise in its form and manner of growing this Plant is like to the first; but it seldom gives any Seed as the former does.

V. *The Places.* It is very probable that Parnassus Grass grew formerly very plentifully upon Mount Parnassus, from whence it seems to take its Name, where Cattle feeding became fat and in good liking, as they do when they feed upon Clover Grass, or St. Foine with us. The first grows in moist, marshy Ground, in England. It grows very plentifully in Lansdall, and Craven in the North parts of England: at Doncaster, and in Thornton Fields in the same County: in the Moore near to Limon by Cambridge: at Hessel and Drinkstone also in Suffolk, in the Butchers Close thereby: in a Meadow close on the back side of the Parsonage-House at Burton: and at the bottom of Barton Hills in Bedfordshire: in the Boggy Ground below the Red Well of Wellingborough in Northamptonshire: and in the Castle-Fields of Barwick upon Tweed, where it is found plentifully: in the middle of the great Town Field of Haddington, about a Mile from Oxford: in a Pasture next unto Botley, in the High-way, on the other side of Oxford; and in several other places. The second was found growing in Brabant in Flanders: but with us only in Gardens.

VI. *The Times.* They Flower about the middle and latter end of July, and the Seed is ripe about the middle or end of August.

VII. *The Qualities.* It is cold and dry in the beginning of the first Degree, Absterfive, Aperitive, of thin parts, Diuretick, Nephritick, Vulnerary, and Alexipharmick.

VIII. *The Specification.* It is prevalent against the Stone, Sand, Gravel, and Tartarous Matter in the Urinary parts, provokes Urine, gives ease in the Strangury, strengthens the Stomach, stops Vomiting and Fluxes of the Bowels: abates Inflammations, stops Bleeding, and cures simple Green Wounds.

IX. *The Preparations.* You may have therefrom, 1. A Liquid Juice of the Herb and Roots. 2. A Decoction of the same. 3. An Ophthalmick. 4. A Powder of the Seed. 5. A Cataplasm.

The Virtues.

X. *The Liquid Juice of the Leaves or Root.* Paulus Aegineta says, that Parnassus Grass is moderately cold, of thin parts, and somewhat fowre. The Juice thereof does dissolve and expel Stones and Gravel from the Reins and Bladder, and provokes Urine abundantly. It eases the Torments and Gripping pains of the Bowels, and heals Ulcers of the Bladder, it helps also against the Biting of any Venomous Beast. It is good to cool Inflammations of the Eyes, and to dry up the running or watering of them. It is also said to be effectual to ease the Tooth-ach, being held in the Mouth against the Tooth. It is also applied to stop the Bleeding of Green Wounds, hinder or abate their Inflammation, and suddenly to consolidate and heal them being outwardly applied. Dose inwardly from 2, to 6, or 8 Spoonfulls in any proper Vehicle.

XI. *The Decoction of the Herb and Roots.* It has all the Virtues of the Juice, but much weaker, and therefore may be given from a quarter of a Pint to half a Pint or more, sweetened with white Sugar Morning and Night.

XII. *The Ophthalmick.* Take of the Liquid Juice 8 Ounces: Spirit of Wine 4 Ounces: Clarified Honey two Ounces: mix and Dissolve. It has all the Virtues of the Liquid Juice, as respecting the Eyes: It abates their Inflammation and watering, clears them from Mistiness, Clouds, and Films, and heals Sores or Ulcers of the Eyes. Used as a Gargle it heals a Sore Mouth and Throat, and gives ease in the Tooth-ach.

XIII. *The Powder of the Seed.* It has all the Virtues of the Juice in respect to the Stone and Gravel in the Urinary parts, Strangury, &c. and operates more forcibly than it. It strengthens the Stomach, stops Vomiting, and cures any Flux of the Bowels, being given in a convenient Vehicle from 2 Scruples to a Dram, or Dram and half, in the Morning fasting, and last going to Bed.

XIV. *The Cataplasm of the Herb and Roots.* It effectually stops the Bleeding of Simple Green Wounds: and in a short time conglutinates their Lips, and heals them.

C H A P. DXXXIX.

of PARSLY GARDEN.

I. **T**HE Names. It is called In Arabick, *Chars*, *Chares*, and *Charfi*: in Greek, *Ξίλον*: in Latine, *Apium*, & *Petrofelinum*: and in English, *Parsly*. Here is to be observed, that tho' formerly *Apium*, was the proper and true Name of *Parsly*, even when used singly and alone, yet of late Days, it seems to be rejected, without some other Epithite be joined with it, as *Apium Hortense*, which is our Common *Parsly*, whose vulgar Name now is *Petrofelinum*; and *Apium*, simply so called is with us only *Smallage*; tho' it is also called *Apium Palustre*, & *Paludapium*, or *Water Parsly*.

II. The Kinds. Authors have given us many Species of *Parsly*, as, 1. *Ξίλον κηπάριον*, *Apium Hortense*, Garden *Parsly*, of which in this Chapter. 2. *Πιτροσελίον*, *Apium Macedonicum*, *Petrofelinum Macedonicum*, Stone *Parsly*, or Macedonian *Parsly*, or Stone *Parsly*, of which in Chap. 540. 3. *Ξίλον ἀγριον*, *Σισυμ* Dioscoridis, *Apium Agreste* vel *Sylvestre*, Wild *Parsly*, of which in Chap. 541. 4. *Ξίλον βοτον*, *Καυκαλις*, *Apium notium*, *caucalis*, Bastard *Parsly*, of which in Chap. 542. following. To these we may add, 5. *Ἱπποσελίον*, & *ἐμπριον*, *Hippofelinum*, *Equapium*, Horse *Parsly* or *Alexander*, of which in Chap. 7. aforegoing. 6. *Ξίλον ἀγριον*, *Selinum Segetale*, *Sium Terrestre*, *Sium Segetum*, Corn *Parsly*, of which in Chap. 371. aforegoing. 7. *Ξίλον γάλατον*, *Apium Rissus*, *Pulsatilla*, Sardonian *Parsly*, or *Parsly* causing Laughter; *Palque Flower*; of which in Chap. 543. 8. *Ξίλον ῥυδιον*: *ἑλασσελίον*, *Apium palustre*, *Paludapium*, *Smallage*, of which in Chap. following.

III. The Kinds of the Garden *Parsly*. There are four sorts of Garden *Parsly* common with us, viz.

1. *Petrofelinum vulgare*, *Apium hortense*, *Selinum hortense* Dioscoridis, *Apium Veterum*, *Apium Domesticum*, Our common Garden *Parsly*.
2. *Petrofelinum Crispum*, *Apium multifidum*, *Apium Crispum*, & *Apium hortense Crispum*, Curled *Parsly*.
3. *Petrofelinum majus*, *Petrofelinum Virginianum*, *Apium majus Virginianum*, Virginia *Parsly*.
4. *Petrofelinum Creticum*, *Apium Creticum*, *Parsly* of Crete or Candy.

The Descriptions.

IV. The first, or Our common Garden *Parsly*. It has a Root which is white and long, with somewhat a rugged Bark, which is as Aromatical as the Herb is, very pleasant to the Taste, and agreeable to the Stomach, and perishes after Seed time: From this Root spring forth many Stalks of fresh, green winged Leaves, divided into several parts, first into three parts or Leaves from the middle Stalk, and then each of them, into three parts or Leaves again, somewhat roundish, and finely snipt about the edges. The Stalk rises much higher in some places than in others, according to the goodness of the Soil in which it grows, with divers smaller Leaves at the Joins, and still finer cut, and at the top long, almost like Fennel, so unlike to the former,

Parsly Garden Common.

that one would not think them to be *Parsly* Leaves. The Flowers are white and small, growing in Umbles, and the Seed is small, longish, a little furrowed, of a whitish brown color, and hot and sharp in Taste.

V. The second, or Curled *Parsly*. This is also a Garden *Parsly*, and is in Taste and Virtue, like and equal to the former. This sort differs not in anything from the former (for that it grows after the same manner) but only in the Leaves, which are very finely crisped or curled, or folded in, on the edges, seeming like a Ruff, or Fann's of curled Feathers, whence came the Name.

VI. The third, or Virginian *Parsly*. The Root of this is greater and shorter than that of the Common Kind, and perishes like it. The Plant grows also after the very same manner that the Garden *Parsly* does, but larger, having greater Stalks of Leaves, set by three and three, as in the former, but much larger, even as large as *Smallage*, and of a paler, or yellower green color. The Stalks, Flowers, and Seed, are also like the first, but still larger, the Seed being twice if not thrice as big or large as it. The Root tho' it perishes after Seed time, yet endures usually the first Year of its Sowing: the Leaves as they are much larger, so they are also something rounder: and the Stalk grows to be sometimes three Feet high, which spread themselves out into sundry Branches, on which grow Umbles of whitish Flowers. The Seed when ripe, falls and commonly sows it self, and springing up, bears Seed the second Year after its Sowing. This Virginia *Parsly* is now become natural to our English Climate, and being of as good use as the first, is grown almost as common as it.

VII. The fourth, or Cretick or Candy *Parsly*. Its Root is always single, or but one, of the thickness of a Man's Thumb, long and covered with a thin Kind or Bark, of a blackish color, which may be

be rubbed off with ones Fingers, being white underneath, and of a sweetish Taste, like unto our Earth Nuts, and is often eaten by the Natives: it lives and continues after Seedtime, shooting forth a fresh every year. In its manner of growing, it is very like to our Common Garden Parsly, but lesser in every part, having Leaves made and cut into such like Divisions, but lesser, and something thicker. The Stalk is like, but shorter than in our Common Parsly, bearing such like Taste or Umbles of white Flowers, after which follows smaller Seed than that of Parsly, but blacker.

VIII. *Nota.* There is another Species of this Candy Parsly, but it differs nothing from that last described, but in the color of its Root, which is reddish on the outside, and not black as the former; This Flowers and Seeds also earlier than the others, and its Root is as fit to be eaten. The Country People in Candy call it *Agriopastica*, i. e. *Pastinaca Sylvestris*, but it has no likeness to, or resemblance of a Parsnap.

IX. *The Places.* The Names of some of these show whence they first came; but they all of them grow in our Gardens in England, where they thrive admirably well. They delight to grow in moist and watery Grounds, near Fountains and Springs and other moist places: and *Lucbsius* says, that Parsly is found growing of it self in many Fenny Grounds in Germany.

X. *The Times.* It may be Sown in the Spring, but it comes slowly up; and in its growing may be often cut and crop'd: if it Sows it self, yet it brings forth its Stalk but in its second Year, after which, it Flowers in June or July, and the Seed is ripe in July and August, after which the Root (except in the Candy Kind) dies away and perishes.

XI. *The Qualities.* The Leaves and Roots of Parsly are hot and dry in the second Degree, but the Seed in the third Degree. It is Aperitive, Absterfitive, Attractive, Carminative, Digestive, Disculfitive, Diuretick, Cephalick, Neurotick, Stomatick, Nephritick, Hysterick, Emmenagogick, Alexipharmick, Analeptick, and Spermatogenerick.

XII. *The Specification.* It is peculiar against the Cholick in the Stomach and Bowels, expells Wind, opens obstructions of the Liver, Spleen, Reins and Womb, gives ease in the Strangury; provokes Urine, is said to break and expel the Stone, Gravel, Sand and Tartarous Slime; is profitable against the Jaundice, Dropsy, and Falling Sicknefs, provokes the Terms in Women, facilitates the Birth, and resists and expels Poison.

XIII. *The Preparations.* Of this Plant the Leaves, Roots, and Seed are all used: the Leaves are weakest: the Roots are next in strength: and then the Seed which is the strongest of all. These following forms may be made of the whole, viz. 1. A Liquid Juice of Leaves or Roots. 2. An Essence of the same. 3. A Decoction of the Roots. 4. An Infusion of the Seed. 5. A Powder of the Seed. 6. A Compound Decoction from Tragus. 7. An Oil of the Leaves, Roots or Seed by Decoction. 8. A Cataplasm of all the three. 9. A Distilled Water of the whole Plant. 10. A Spirituous Tincture of the Seed. 11. An Acid Tincture of the same. 12. An Oily Tincture thereof. 13. A Chymical Oil of the Seed. 14. Potestates or Powers of the Seed. 15. An Elixir of the same.

The Virtues.

XIV. *The Liquid Juice of the Leaves or Roots.* It is comfortable to the Stomach, eases the Stran-

gury, and powerfully provokes Urine and Womens Courses: expels Wind whether in the Stomach or Bowels, and does a little open the Body, making the Belly Soluble. It is a singular Aperitive, and opens Obstructions of Lungs, Liver, Spleen, Reins and Womb; and therefore is mixt with Solurives, or things which move the Belly downwards. The Root is one of the five opening Roots; and therefore the Juice thereof must be profitable against all Diseases proceeding from Obstruction. Dose 4 or 6 Spoonfuls Morning, Noon, and Night, either alone, or mixt with a Glass of White Port, or Lisbon Wine.

XV. *The Essence of the same.* It has all the Virtues of the Liquid Juice, and more powerful to the Intentions: besides which, it is said to break the Stone whether in Reins or Bladder, as also to expel Stones, Gravel, Sand or Tartarous Matter from the Reins and Bladder. It eases the pain of the Stomach, resists and expels Poison, and is good against the Bitings of Mad Dogs, Serpents, or other Venemous Creatures: It helps such as have been hurt by taking of *Litbarg*; suppresses Vapors in Women, which offend the Head and Eyes, and is profitable against the Dropsy and Yellow Jaundice. Dose 2 or 3 Spoonfuls or more, Morning and Evening in a Glass of Wine.

XVI. *The Decoction of the Root.* It is a powerful Aperitive, and opens all Obstructions of the Viscera, having all the Virtues of the Juice and Essence: but as it is a much weaker Preparation, so it must be given in a much larger Dose, with a *continuando*, as from 4 to 8 or 10 Ounces Morning and Night.

XVII. *The Powder of the Seed.* It may be given from a Dram to 2 Drams Morning and Night, against the Stone, Gravel, Sand, and Glutinous Slime in the Urinary parts, and is very effectual to expel the same; and also to provoke Urine and the Terms in Women: to give ease in the Cholick, Gripings of the Guts, and After-pains of Women in Child-Bed: It eases pains in the Stomach and Bowels, proceeding from Wind, and has all the Virtues of the Juice, Essence and Decoction.

XVIII. *The Infusion of the Seed.* It eases the Gripings of Infants, and may be given against all the Diseases for which the Decoction is given: Dose Morning, and Evening, from 6 Ounces to 8, a little dulcified with double Refined Sugar.

XIX. *The Compound Decoction of Tragus.* Take Seeds of Parsly, Anise, Carrawaies, Fenel, of each an Ounce: of the Roots of Parsly, of Saxifrage, of Carrawaies, of Burnet, of each an Ounce and half: let the Roots be washed and chopt small, and the Seeds bruised: let them infuse a Night or two in 2 Quarts of White Port Wine: after which, gently boil altogether in an Earthen Vessel close cover'd with an Alembick Head, till about a third part is wasted: then strain out, and let it stand to settle. This opens Obstructions of the Liver, Spleen, Reins and Womb, prevails against the Falling-Sicknefs, and forces away the Morbifick Matter of the Jaundice and Dropsy by Urine, curing those Diseases in a short time. Dose 4 Ounces at a time, first and last Morning and Night.

XX. *The Decoiled Oil of Leaves, Roots, or Seed.* It is Anodyn, or an easer of Pain, dissolves recent Tumors, alleviates pains of the Gout, and takes away black and blew Marks, coming by means of Bruises, Falls, and the like. Anointed upon Womens Breasts, which are Swelled, Painful and hard with their Milk, it abates the Tumor, Dissolves the Humor, and eases the pain thereof.

XXI.

XXI. *The Cataplasm of the Leaves, Roots, or Seed, or all of them.* Applied it gives ease in the Gout, disuffles and cures simple recent Contusions: laid to Womens swoln and hard Breasts, it softens the Tumor and Disuffles it: and applied to the Eyes, which are inflamed with heat, or swoln, it quickly gives ease and relief, more especially if Barly Flower be mixed therewith.

XXII. *The Distilled Water of the whole Plant.* It is a familiar Medicine with Nurses to give their Children, when they are griped in their Stomach or Belly with Wind, or sharp Humors, which they call the Frets, and is no less available than *Saxifrage Water* for that purpose, as also for those which are of elder Years. *Riverius* (as I remember) commends it as an admirable thing, (a few grains of Salt of Tartar being dissolved in it) against the Stone, Sand, Gravel, Strangury, and other like Distempers of the Urinary passages.

XXIII. *The Spirituous Tincture of the Seed.* It is admirably Somarick, causes a good Appetite and Digestion, expels Wind, and eases the gnawing pains of that Bowel; and is very profitable against Fainting, Swooning, Convulsions, Colick, and the like: Dose almost half a Spoonful in a Glass of Wine, Morning and Night.

XXIV. *The Acid Tincture of the Seed.* It is profitable against Vapors, and Fits of the Mother, weakness and sickness of the Stomach, want of Appetite and Digestion: It is singular against all Sorts of Poisons; cures all sorts of Burning and Malign Fevers, and resists the Poison and Malignity of the Plague or Pestilence it self, and all sorts of Peftilential Fevers. Dose so many drops at a time (in all that the Sick drinks) as may give it a grateful or pleasing Acidity.

XXV. *The Oily Tincture of the same.* It powerfully provokes Urine and the Terms: gives present ease in the Strangury, Stone, Gravel, Tartar, &c. obstructing the Urinary passages. It facilitates the Birth of a Woman in Labor, forces away the After-Birth, and prevents or eases After-Pains: Dose from 15 to 30, or 40, or more Drops, dropt into Sugar, and then mixt with *Penny Royal Water*, or other Vehicle proper for the Patient.

XXVI. *The Chymical Oil of the Seed.* It potently cures the Cholick, all inward pains of the Stomach and Bowels, Convulsions, Palsys, Carus, Lethargy, and other Diseases of the Head, Brain, and Nerves, proceeding from obstructions, cold and moisture, or other remote and hidden Causes. It forces away the Birth, and After-birth, and gives present relief in the Strangury, Stone, Gravel, or any obstruction or heat of Urine. Dose from 8 drops to 16 drops or more, to be taken in the same manner, and in the like Vehicle, as is directed in the giving of the *Oily Tincture* foregoing.

XXVII. *The Powers.* They may be given from a Dram to 3 Drams or half an Ounce in any proper Vehicle Morning and Night against the Cholick, Convulsions, Palsy, Stone, Strangury, and all the Diseases for which the *Juice, Essence, Decoctions, Tinctures, or Chymical Oil* are given: This Medicament is more pleasant than any of them, and operates with much more speed.

XXVII. *The Elixir.* This has all the Virtues of the Powers, and more potent in its operation, and therefore may be given from 1 Dram to 2 Drams in a Glass of Wine, Morning, Noon and Night, or when extremity or occasion may require it, either in a Glass of Wine, or in any other fit Vehicle. 'Tis indeed an admirable Preparation.

C H A P. DXL.

Of PARSLY Macedonian.

O R,

Mountain PARSLY.

I. **T**HE Names. It is called in Greek, *Παραλίανον*, & *Σέλιον Μακεδονικόν*, *Maxidvli*: in Latine, *Apium Macedonicum* *Petrapium*, & *Selinum*, vel *Petroselinum Macedonicum*: and in English, *Macedonian Parsly*, *Mountain Parsly*, and *Stone Parsly*.

II. *The Kinds.* What the *Macedonian Parsly*, or *Stone Parsly* of *Dioscorides* was, is hard now to determine, by reason he is so deficient in his Description thereof: what our Modern Authors account for the same, we shall here give you, two kinds of which they have Described to us, viz. 1. *Petroselinum Macedonicum quibusdam*. The first supposed *Stone Parsly* of *Macedonia*, and that it was thought to be, by *Martialis*, *Lobel*, *Dodonæus*, *Lugdunensis*, *Tabernaemontanus*, and *Castor Durantes*, in their times, and still continues to be thought so in our Days, and that deservedly; for that the forms of the Roots, Stalks, Leaves, Flowers and Seed, so nearly resembles our *Common Parsly*, and the qualities of the Seed are answerable to the properties which *Galen* does appropriate to it. 2. *Petroselinum Macedonicum forte Dalechampi*. The second supposed *Stone Parsly* of *Macedonia*; this seems to be the *Petroselinum Plinii*, and differs from the former, in the form of the Leaves, as being finer cut than any of them, for which reason as I suppose it is that *Bauhinus* calls it *Apium Montanum folio tenuiore*, but agrees much with it, in the qualities, sharpness and bitterness of the Seed. Now because these *Stone Parslies* grow upon Hills and Mountains, they may properly enough be called also *Oreoselina*, or *Apia Montana* *Mountain Parslies*. III. But of the *Mountain Parsly*, properly so called, there are several Kinds, which by reason they are altogether of the same Nature and Qualities with the former, we shall take the Liberty to Treat of them in this place, the chief of which are the three following, viz. 3. *Oreoselinum simpliciter*, *Oreoselinum vulgatum*, *Montapium*, *Apium Montanum vulgatum*, *Oreoselinum Dodonæi*, *Oreoselinum majus Lobelij*, *Clusij* & *Lugdunensis*, *Apium Montanum Dalechampi*. The more Common *Mountain Parsly*. 4. *Oreoselinum albidum*, *Apium Montanum verius Selinum Peregrinum Clusij*, *Bauhini*, *Apium Peregrinum Cicute folio Bauhini*. The truer *Mountain Parsly*, or the *Oreoselinum verum Dioscoridis*. 5. *Oreoselinum Parisiense*, *Lugdunensis*, *Apium Montanum Parisiense*: *Apium Montanum Nigrum*, The *Paris*, or *Black Mountain Parsly*.

The Descriptions.

III. *The first, or First* supposed *Stone Parsly* of *Macedonia*. Its Root is somewhat thick, short, and white, perishing in our Country, after it has yielded its Seed, tho' not so as it is said, in the warmer

warmer Climates where it is a Native. From this Root spring up several Stalks of Leaves, next to, or lying upon the Ground, winged and divided into parts, much like to the Common Garden Parsly, but with greater, broader, and rounder Leaves, dented round about, and in some places more deeply cut in

Parsly Macedonian.

or gash, of a bright pale green color: among which rises up, a short, thick, and somewhat hairy Stalk, about half a Yard high or higher, full of Joints and Leaves; and so spread out into Branches, that it seems a small thick bush: on the tops of all which are small Umbels of whitish Flowers, and after them, small, rough, dark, grayish Seed, something like unto our Common Garden Parsly Seed, especially after the roughness is rubbed from them, yet somewhat longer and darker, of an aromatick or sharp Taste, with an unsavory bitterness last of all, not much unlike to Cumin Seed.

IV. The second, or second supposed Stone Parsly of Macedonia. Its Root is long (as Columna says) like that of our Garden Parsly, and black on the out side, with a tuft of hairs at the Head thereof, neither sharp, nor sweet, (but Columna says it is more sharp and bitter, than the Root of the Garden Parsly :) From this Root rise up several slender Stalks of winged Leaves, having several very thin cut Leaves thereon, all of them like the uppermost, and not the undermost Leaves of the Common Garden Parsly, or like unto Dill, of a blew green color, having three of the winged Stalk, as Parsly has, and smelling so like unto Parsly, as both Columna and Lugdunensis do say, that if it is smelt to, when a little bruised, tho' the Person was blinded and did not see it, yet they would judge it to be Parsly, such as we commonly use. At the tops of the Stalks grow small Umbels of pale reddish or bluish colored Flowers, after which follow small Seed, like to that of

Parsly, something blackish, and furrowed or scattered like unto Cumin Seed, of a very sharp Taste, almost burning the Mouth, and of a sweet Smell. But so bitter withall, that it may well be accounted the most bitter Seed of all the kinds of Parsly. This kind is taken by Dalechampius, to be the True Parsly of Macedonia, to which Columna seems to consent.

V. The third, or the more common Mountain Parsly. The Root of this Plant is long, great and thick, with a bush of Hairs at the top thereof, being sweet of Taste, sharp and Aromatick: from whence spring up several reddish Stalks of large spread Leaves, winged and divided into several parts, lying like a bush upon the Ground next the Root, very like unto Garden Parsly, but something larger, and smelling well. From among which rises up a short stalk of about half a Yard high, with drovers the like Leaves upon it, branching or spreading it self out towards the top, and bearing thick Tufts or Umbels of white Flowers; after which comes small Seed, like that of Smallage, smelling a little sweet, sharp in Taste, and bitter withall.

VI. The fourth, or Truer Mountain Parsly of Dioscorides. The Root of this is small, long, and white, not much differing from that of Common Garden Parsly: from whence shoot forth next the Ground several Stalks of winged Leaves, and among them a hollow Kexie Stalk, in some places, growing tall and high, in others more short and low, according to the Soil in which it grows; having thereon several large spread Leaves, cut and divided something like to those of Hemlock, or Garden Parsly, bearing at the top, Umbels of white Flowers; after which comes the Seed, which is long and blackish, not much unlike to Cumin Seed, being sweet in Smell, and sharp in Taste.

VII. The fifth, or Paris, or Black Mountain Parsly. Its Root is large, white, and thick, tasting and smelling much like to the Root of Herb Terrible, which is hot, bitter, and unpleasant. The whole Plant does resemble our Common Garden Parsly, lying thick, and bushing on the Ground: the Flowers grow at the Tops of the Stalks and Branches in Umbels, of a white color: after which comes the Seed, which is sharp in Taste, but smelling very sweet.

VIII. The Places. The first grows in Candia and Venice, and the Seed has been brought from thence to us. The second grows (as Lugdunensis says) on the Rocky Hills of Gratianopolis; and (as Columna says) on the Hills of Campoclarenis and Aquicolis: with us they both grow in Gardens, where they flourish very well. The third, or first Mountain Parsly grows near unto Vienna in Austria (as Clusius says) and on the Mountains on the Rocks in Germany, and other Places. Dodonaeus says, it grows upon the Hills which divide Silesia from Moravia: also it is said to be found on other Hills and Mountains in the North parts of England. The fourth, or second Mountain Parsly, is found on the borders of Fields on the Mountains of Burgundy. The fifth, or third Mountain Parsly, is found on the sandy top of the Surene Hill near Paris: but these two last grow with us only in Gardens.

IX. The Times. The two first Flower in the Summer Months, but Seed late with us. The other three Flower also in the Summer time, and yield their ripe Seed soon after.

X. The Qualities, Specification, Preparations and Virtues of these Species, are the same with those of Our common Garden Parsly, declared in Chap. 539. just foregoing, so that we need say no more of them here.

XI. *Nota.* 1. But it is here to be observed, that the two first Kinds of *Macedonian Stone Parsly* are much stronger, and much exceed our *Garden Parsly*, in their properties and effects. And some have thought that the *Mountain Kind*, exceed also the *Macedonian* in their Virtues and Operations: however this is certain, that they all of them exceed the *Common Garden Kind* by many Degrees, and are therefore to be chosen before it, if they can be had.

XII. *Nota.* 2. *Galen* says, that the Seed of the *Macedonian Stone Parsly* is most in use: The Herb and Root are also used alike, but are of a weaker property than the Seed, which is very sharp in Taste and bitter also, hot in quality, and of an attenuating and inciding property withall, for which reason it mightily provokes Urine, and Womens Courses: warms and comforts the inward parts, being hot and dry in the third Degree, and therefore expels Wind. It is profitable against Wind and Belchings in the Stomach, as also the Wind Colick, and gives ease in the griping pains and torments of the Bowells; as also in Stitches and pains of the Sides and Spleen, and the excruciating torments of Stone and Gravel, whether in the Reins or Bladder, being put into those Medicaments which provoke Urine.

XIII. *Nota.* 3. *Dioscorides* says, That *Mountain Parsly* provokes Urine, if the Root and Seed be taken in Wine. It brings down also Womens Courses, and is put among those Medicines which expel Sand, Gravel and Stone; and by its heat, warms and comforts such parts as are weakened by cold and moisture. *Galen* says, It operates like to *Smallage*, but it is more effectual. *Dodonæus* says, That the first *Mountain Parsly* is hot and dry in the end of the second Degree, or beginning rather of the third, and is good for many things. That it does incide, and attenuate, or make thin, thick and gross Humors; that it cuts tough and clammy Flegm, opens obstructions of the Liver and Spleen, provokes Urine, and Womens Courses; breaks and expels the Stone; and is profitable against the Yellow Jaundice: And being chewed in the Mouth, that it draws away much watery Humor and eases the Tooth-ach.

vestre, Jagged Parsly, Wild Parsly with small jagged Leaves, Wild Parsly, Wild Milky Parsly *Gesner* in *Hortis* calls it *Daucus Palastris*; it is the *Olsenichium Cordi*, (so called from the German Name, *Osenick*;) *Apium Sylvestre Dodonæi*, & *Lugdunensis*, (but both *Dodonæus* and *Lobel* say, that in former times it was used in the Shops for *Meum* or *Spignel*;) *Baubinus* calls it, *Apium Sylvestre Succo lacteo turgens*, which we render in *English*, *Wild Milky Parsly*, to distinguish it from the other sorts of Wild Parsly.

The Description.

III. *The first, or Small Wild Parsly, Common Wild Parsly.* Its Root grows down deep, and spreads every way, by which means it takes fast hold of the Ground, and abides long. It rises up with a tall slender Stalk, scarcely able to stand upright without help, thinly set with winged Leaves on its Branches, the lower Leaves being largest, and several being set on a Stalk on both sides, each of which is as small almost, as the Leaves of our Common Ammi, or Bishops-Weed; some whereof will be cut in on the edges more or less, and some not cut in at all, but all of them dented about the edges. At the tops of the Stalks and Branches, grow small Umbels of white Flowers, which turn into small blackish Seed, something lesser than Parsly Seed, but of a strong Scent, and of a quicker, and hotter Taste.

IV. *The second, or Sweet Wild Parsly.* Its Root is long, white and slender; from whence springs forth a single Stalk, about three Feet high, with long Fennel like Leaves at the Joints, which have a sweet Smell, between that of Dill and Fennel. At the top of the Stalk and Branches, are small Umbels of white Flowers, which are thin set. After which follows the Seed, which is small, black, of a good smell, and bitterish in Taste, somewhat like to *Smallage* Seed. This Plant is called *Odortum*, or sweet Scented, to distinguish it from the former *Sison* vulgare, tho' I am apt to believe, that this is not the *Sison verum* *Dioscoridis*. Some have thought also that this Herb was the *Seseli* *Maffientie*, or Hart-wort of *Marcellis*, but were mistaken.

V. *The third, or Jagged Parsly, Wild Parsly with jagged Leaves, or Wild Milky Parsly.* Its Root spreads its self out into many long Strings and Fibres, blackish without, but white within, and running deep into the Ground, somewhat like unto *Meum*, or *Spignel*, abiding or living many Years. This Kind of Wild Parsly, has several large, well spread winged Leaves, something resembling those of *Garden Parsly*; but are divided into more parts, and each division hath smaller Leaves, which look as if they were cut or jagged into small parts: from among which, rises up an hollow straked Stalk a Yard high, reddish towards the bottom, sometimes with the like Leaves at the Joints, where it Branches out diversely, bearing at the tops of the Stalks and Branches, thick Umbels of white Flowers, reddish on the one side, and pale on the other, and after them flat Seed, somewhat like unto *Parthenp* Seed, but a little less, hot in Taste, and somewhat Aromaticall. The whole Plant, and every part thereof, if broken in any part, yields a Milky Juice.

VI. *The Places.* The first was formerly thought to be a Foreign Plant, the Seed being to be had in

CHAP. DXLI.

OF PARSLY Wild.

I. **T**HE Names. It is called in Greek, *Σίλιον ἀγρὸν* in Latine, *Selinum* vel *Petroselinum Sylvestre*; *Apium Agreste* vel *Sylvestre*; and in *English*, *Wild Parsly*.

II. *The Kinds.* There are several Kinds of this Plant, as, 1. *Σίλιον ἄγρον*, *Sison vulgare*; *Sison Galeni*, *Sison Hippocratis*, (so that *Sison* and *Sison*, be but one Plant, as *Cordus* does also acknowledge;) small Wild Parsly. The Ignorance of many German Apothecaries took the Seed of this to be *Amonum*, as *Tragus*, *Gesner*, and others affirm, but very Erroniously; and so they called it *Amonum Germanicum*: *Euchsius* and *Dodonæus* called it, *Petroselinum Macedonicum*, which is yet as great a Mistake as the former. 2. *Sison Odoratum Alpini*, Sweet Wild Parsly. 3. *Θυσσέλιον*, *Thysellium Plinij*, *Apium Syl-*

in the Apothecaries Shops in Germany, under the Title of *Anomum*, or as some have had it, *Anomum Germanicum*, tho' it was no more than Seed than it was *Anise Seed*: but afterwards, as *Gesner in Hortis* shews, it was found growing Wild in sundry places in Germany, as it has been found in like manner growing with us, near Hedges, by moist Ditches, almost every where. The second grows with us only in Gardens. The third is found by Ponds sides, in Ditches also having in them standing Water, in moist and marshy or moorish Grounds, and in Water-Courses; also in moist Woods, near the old Stocks of Alder Trees.

VII. *The Times*. They all Flower in June and July, and the Seed is ripe in some short time after.

VIII. *The Qualities, Specification, Preparations and Vertues* of these several Wild Parslies, are the same with those of our Common Garden Parsly, saving that in the effects, these are, or have been found to be the more potent and operative.

IX. *Nota*. The Root of the third or Milky Kind; as it is found to be hot and dry in the third Degree; so being chewed in the Mouth, it draws away much Rheum or pituitous Humour from the Head Throat, Tonfils and parts adjacent, and in an especial manner eases the Tooth-ach. And this Quality, *Pliny* says, the Root of his *Thyssetinum* is endued withall. The other properties of the other Wild Kinds, are, no doubt to be found in this, and that to no less effect, as well to incide, as to attenuate, be aperitive, and diuretick, forcibly to provoke Urine, and the Terms in Women when stop'd.

7. *Caucalis arvensis latifolia purpurea*, *Echinophora major platyphyllis purpurea* *Columnæ*, *Bastard Parsly* broad Leav'd, or the Greater with prickly Seeds. 8. *Caucalis tenuifolia purpurea*, *Echinophora leptophyllon* *Columnæ*, *Bastard Parsly* the Lesser, *Bastard Parsly* fine or small Leav'd. 9. *Caucalis magno fructu echinato*, *Echinophora altera asperior platy carpos* *Columnæ*, *Caucalis Montpellica echinato fructu magno Bauhini*, *Lappa boaria Plinij Lugdunense*, *Caucalis secundo Tabernemontani*, *Bastard Parsly* with great prickly Seed. 10. *Caucalis major flore saturo rubente Clusij*, *Bastard Parsly* the greater deep red Flowered. 11. *Caucalis tenuifolia Montana*, *Bastard Mountain Parsly*, with small fine Leaves. 12. *Caucalis Hispanica Camerarii & Clusij*, *Gingidio congener Ceraspini*, *Caucalis Peregrina semine rugoso* Spanish *Bastard Parsly*.

The Descriptions.

III. *The first, or Our Common Bastard Parsly*. It has a Root which is straight and single, running deep into the Ground, of a white color, and having the taste of a Parsnep. It rises up with a short Stalk, about half a Yard high, and set at the Joints, with whitish rough Leaves diversly cut. It is a

Parsly Bastard; or *Caucalis*.

rough bairy Herb, not much unlike to Carrots. The Leaves are parted into many small jaggs, smaller than Parsly, and much like to those of Coriander. At the top of the Branches grow sweet shaded Umbles, or spoky Rundles, consisting of many small

C H A P. DXLII.

Of PARSLY Bastard;

OR,

Hedge PARSLY.

I. *THE Names*. It is called in Greek, *Σίκον* *von rôdon*, *Καυκάλις*; in Latine, *Selinum nothum*, *Apium nothum*, & *Caucalis*; in English, *Bastard Parsly*, and *Hedge Parsly*.

II. *The Kinds*. There are many Species of this Plant, as, 1. *Caucalis vulgaris floribus albis Lobelij*; *Lappa agrestis Tragi*, *Lappula Canaria Plinij Angularâ*; *Caucalis alba vulgaris & Myrrhis Lappa Dalechampij Lugdunense*; *Caucalis Dodonei, Gesneri, aliorumque*; *αυωαγέτος*, *Echinophora Columnæ*; our Common Bastard Parsly. 2. *Caucalis Anghica flore rubente*; *Caucalis Apij foliis flore rubro Gerardis*; our English Bastard Parsly with reddish Flowers. 3. *Caucalis Maxima Bauhini*; *Caucalis major Clusij*; *Caucalis maxima semine aculeata*, the Greatest Bastard Parsly, or Great rough Parsly. 4. *Caucalis minor flore rubente*; *Caucalis minor siccis rubentibus*, Small Bastard Parsly with reddish Flowers, Hedge Parsly, as Gerard has it. 5. *Caucalis nodoso semine echinato Dauoides minor Cordi in Historia*, & *Thalij*, Knotted Parsly, small Bastard Parsly with knotted Joints. 6. *Caucalis folio Feniculi*; *Caucalis Angularæ Lobelio*; *Caucalis Pene Lugdunense*; *Caucalis folio Peucedani Bauhini*; Bastard Parsly Fennel Leav'd, Hogs Parsly.

small white Flowers, the outermost being the greatest; which being past away, there follows rough, prickly, round Seed, like Carrot Seed, but greater, two always being joined together, which makes them but half round when they are parted.

IV. The second, or Our English Bastard Parsly with reddish Flowers. Its Root is small and long, white and hard, perishing every Year after Seed time. This English Kind grows to be about two Feet high, of an Olive green color, with a strong, round, crested, rough and hairy Stalk; set at the Joints (which are two or three Inches asunder)

Bastard Parsly English, red Flowered.

with Leaves three or four Inches long, consisting of seven or nine narrow hairy Leaves, set by couples, upon one middle Rib or Stalk, and one single Leaf at end, somewhat deeply dented about the edges; the foot of the Stalk being a broad thin Skin or Film: and from between it, and the Stalk, come forth lesser Stalks of Leaves, towards the top, parted into three or four Branches, which at three Inches distance, do each of them, from one Center, shoot forth four, five, or six equal Stems, about an Inch and half long apiece, having a thin Skin, running all the length of them, and the two innermost Strings, being of a dark red color, composing a Spoky Umbel of Flowers. At the tops of each of them, grow five or six long, rough, hairy, small knobs or bottoms, crowded with Flowers, of a Pink red color, consisting of five leaves a piece; the outermost whereof shew like two, by the folding of it inwards, and the inner four with five Chives, and a double pointed shew not half so big as it is when they are full blown. In the Center of

the Flower lye six or seven such like small Flowers. The Leaves being broken, give little or no Taste. After the Flowers are past, come the Seed, which are rough Burrs, sticking to any thing they touch, like the Seed of Hounds-Tongue, within which are contained two brown Seeds, like unto hulled Oats, but larger.

V. The third, or the greatest Bastard Parsly, or Great rough Parsly. Its Root is white, hard and woody. From whence spring up many upright tall crested Stalks, three or four Feet or more high, being hollow within, and with divers Joints on them. These Stalks are spread out into several Branches; and at each Joint they send forth long and large winged Leaves, encompassing their Stalks at the bottom, which Leaves are large, and something like those of Angelica but rougher, and of a darker green, set by couples on the middle Rib, and an odd one at the end, all of them finely cut or dented about the edges. At the tops of the Stalks and Branches, grow long Umbels of whitish Flowers; somewhat of a purplish, or bluish, or flesh color underneath, after which come very large and flat rough Seed, almost like that of Cow-Parsnep, but rougher, which is forked at the Head or Top, with a double point, and prickly round about.

VI. The fourth, or small Bastard Parsly with reddish Flowers, or Hedge Parsly as Gerard has it. Its Root is small and white; from whence spring up small and rough Stalks, crested and hollow, grow-

Parsly Bastard small;
OR,
Hedge Parsly. } Red Flower'd.

ing up to the height of two Feet or more: on which at the Joints grow winged Leaves, made of several little

little longish ones, set one against another, snipt or dented in about the edges, and ending in a long and sharp pointed Leaf, not much unlike to the winged Leaves of Hemlock, but each of them broader, and the end Leaf longest: These Leaves, as also the Stalks, are rough and harsh, and of a dark green color. At the upper Joins of the Stalks come forth slender Branches, bearing sparfed small Umbles of reddish Flowers, and sometimes more white, which being past away, there follows small, round, rough Seed, of somewhat a strong and aromatick Taste and Smell. It is an Annual Plant, and springs up every Year from its Seed, being Sown.

VII. The fifth, or Knotted Parsly, small Bastard Parsly with Knotted Joins. It has a white long and small Root, which perishes every Year, it springing up again by the falling of the Seed, whether in the Field or Garden. From this Root spring up several crested, long, small, rough and trailing

Parsly Hedge Knotted.

Branches, which commonly lye along upon the Ground, some longer, some shorter, some a Foot long, some a Foot and half or more in length, which are set at several distances with long winged Leaves, which are small, rough and deeply jagged, pretty deeply cut or dented about the edges, having 3, 4, 5, and sometimes 6 couples or pairs of Leaves upon a Wing, growing upon a middle Rib, with one single Leaf something larger than the rest at the end thereof. These Leaves are rough, or a little crumpled, but not hairy, and of an overworn, or decayed green color. At the setting on of each Leaf at the Joins, close to the Stalks, at every Joint round about it, almost close unto it, usually upon very short foot-Stalks, come forth small whitish or reddish Flowers, out of rough Husks, consisting of five Leaves apiece, after which follows the Seed, which is small, round and rough, hard and prickly, growing close to the Stalk.

VIII. The sixth, or Bastard Parsly Fennel Leaf'd, Hogs Parsly. Its Root is single, long and white, running deep into the Earth, thumbed about the upper end, with many Fibres or Threads of a brown color, which Root has the Taste of a Parsnep. From which rises up divers Stalks full of Joins, covered with a sheath or skinny Film, like unto that of Meum, rising up to be about half a Yard high. Gerard says, The Leaves are finely cut or jagged, resembling the Leaves of Our English Saxifrage: But Parkinson says, That both in Stalk and Leaf it is very like unto Fennel. At the tops of the Stalks it bears spiky Rundles, or Umbles of white sweet smelling Flowers, set close together, like those of Fennel also, which being past away, the Seed is produced, not rough like the former, but small like that of Parsly.

IX. The seventh, or Bastard Parsly broad Leaf'd, or the Greater, with prickly Seeds. Its Root is white, hard, and Aromatick, which sends forth several Stalks of hard rough Leaves, divided into five parts, each leaf being three Inches long, and an Inch broad, deeply dented in on the edges, somewhat like unto Oaken Leaves. The Stalk is rough and hoary, two Feet long, so crested that it seems square, bearing at the tops, Umbles of Flowers, standing three together, upon pretty short and thick Stems. The Flowers are red like the next following, but greater, having small Leaves like Beards under them: after which follows the Seed Vessels, being smaller than the next Species, and not so rough, containing such like Seed within them, but smaller and Aromatick.

X. The eighth, or Bastard Parsly the Lesser, or Bastard Parsly fine or small Leaf'd. The Root is like the former but lesser. The Leaves are most finely cut into several parts like unto Wild Carrots. The Umbles of Flowers grow at the tops of the Stalks and Branches, and stand three and three at a place, and so the Seed after them. The Kernel or Seed within the Husk, is something like to Hull'd Barly.

XI. The ninth, or Bastard Parsly with great prickly Seeds. Its Root is small and white, and something Sweet both in Taste and Smell. The Leaves hereof are divided something like to those of the Greater Parsly Leaf'd Daucus, and hairy underneath: The Stalk is about two Feet high, and somewhat rough, having the like Leaves at the Joins upward, but smaller, bearing small Umbles of whitish Flowers, standing three together, and perishing usually but two Seeds on them, which are twice as big as others, and more rough and prickly, having a large flat Kernel within it.

XII. The tenth, or Bastard Parsly the Greater, deep red Flower'd. - This Great red Flowered Kind has larger winged Leaves than the twelfth Species, or Spanish Kind following, being divided and cut in, after the manner of our Burnet Saxifrage Leaves. The Flowers hereof, are larger than those of the first sort, or our Common Bastard Parsly but each of an equal bigness, and of a deep red color.

XIII. The eleventh, or Bastard Mountain Parsly with small fine Leaves. The Root is somewhat long and thick, from which rises a Stalk of a Foot in height, spread out from the bottom into small round smooth Branches, and they again into lesser, whose smallest Branches, even near the Root as well as the others, bear small Umbles of very small or white Flowers, and afterwards small long striped Seeds. The Leaves next unto the Root are divided into very fine and small Leaves, but those above on the Stalk are much more small, even like Hairs.

XIV. The

XIV. *The twelfth, or Spanith Bastard Parsly.* The Root perishes after Seed time, and tho' this is a Milky Plant yet being cut or broken, it gives no Milk. From this Root rise up several crested rough Stalks, and Leaves very like to the first Common Bastard Parsly, but the Umbels of white Flowers are smaller, and grow more round together, as it were into the form of a round Head: and the Seed which follows is greater, very much striped, and rough, but not prickly. The Herb being broken in any part, it yields a sweet Milk.

XV. *The Places.* These several Bastard Parslies grow Wild in several Countries of Austria, England, France, Germany, Italy, Spain, &c. The first is common almost every where in our Country. The second was found in Lincoln-shire, on the North Descent of the North Field of Witham nigh to Bourne: it was also found growing in the Corn Fields about Bath. The third and fourth grows about Hedges, and in Plow'd Fields, almost every where. The fifth grows Wild with us in several places: Gerard says it grew upon the Banks in the Fields about St. James's and Pickadilly, which was before these places were Built upon, and made into Streets, &c. The rest Naturally grow upon Rocks and Stoney Grounds, and those which grow not Wild with us, are many times to be found in the Gardens of the more Curious.

XVI. *The Times.* They all Flower and Seed very well in England, from the beginning of June to the end of August. The second and third Flower in June, or July, and the Seed is ripe in July or August. If the Seed is Sown in September, it will come up and continue green all the Winter.

XVII. *The Qualities, Specification, Preparations and Vertues* of these Bastard Parslies, are the same with those of our Common Garden Parsly in Chap. 539. foregoing, to which you are refer'd.

XVIII. *Nota. 1. The Juice of Bastard Parsly,* not only provokes Urine and the Terms, but as Matthiolus says, is comfortable to the Heart, opens obstructions of the Liver and Spleen, cleanses the Reins of Stones, Gravel, and Tartarous Mucilage, and therefore must be profitable against all Diseases of those parts, excites Lust, and strengthens the Instruments of Generation.

XIX. *Nota. 2. The green Herb.* According to Dioscorides, it was a familiar Sallet Herb, and therefore used in his time more for Meat than Medicine: but later Physicians have found it to be good for many other Diseases, even for all that the Common Garden Parsly is good for, as is before expressed: if the whole Herb is eaten with Vinegar, after a Vomit, it cleanses the Belly, and causes a good Appetite, taking away loathing of Meat, and Indigestion.

XX. *Nota. 3. The Essence.* It has the Vertues of the Juice, besides which it prevails against Hypochondriack Melancholy, is good against Quartan Agues, Scabs, Itch, and French Disease, being given 2 Ounces at a time Morning and Evening either in a Glass of Wine, or other fit Vehicle.

XXI. *Nota. 4. The Powder of the Seed.* Given to a Dram, more or less in a Glass of White Port, or Lisbon Wine, it is said to clear and sharpen the Eye Sight, and provoke Lust exceedingly in both Sexes, as also the Terms in Women. It is likewise given with Ceterach or Spleen-wort, and Seeds of Agnus Castus, against the Running of the Reins. The Powder being drank also in Wine,

causes Fruitfulness in Barren Women, and is good against the Bittings of Venomous Beasts, more especially if a Cataplasm of the green Herb be also applied to the Wound.

C H A P. DXLIII.

Of PARSLY Laughing;

OR,

PASQUE-FLOWER.

I. *THE Names.* I know no Greek Name that this Plant has, but it is called in Latine, *Pulsatilla*, also *Apium Rifulum*, *Apium Sardonium*, *Herba Sardonia*, & *Herba Ventii*: in English, *Laughing Parsly*, by some, and *Pasque-Flower*, or *Passe-Flower*, by others, because of their Flowering about Easter, or time of the Paschal Solemnity.

II. *The Kinds.* This Plant is no Species of the Parsly's, tho' (through Custom) it has obtained the Name of *Apium rifulum*. Nor do I think it any Species of the *Anemonies*, tho' some Learned Men are of that Opinion, nor yet a Kind of *Crowfoot*, which some would have it to be, but rather a Genus of its own, not related to any other. Of this Pasque-Flower there are several Kinds, as, 1. *Pulsatilla Anglica purpureo*, *Pulsatilla Vulgaris*, *Anemone Limonia Dalechampi*, *Samolus Plinii*; Our English purple Pasque Flower. 2. *Pulsatilla Flore rubro*, *Pulsatilla rubra Gerardi*, The red Pasque Flower. 3. *Pulsatilla Flore luteo*, The yellow Pasque Flower. 4. *Pulsatilla Flore albo*, The white Pasque Flower. 5. *Pulsatilla Danica*, The Danish Pasque Flower. 6. *Pulsatilla Danica Flore duplici*, The double Danish Pasque Flower.

The Descriptions.

III. *The first, or Our English purple Pasque Flower.* The Root is pretty thick and long, running downwards, or deep into the Ground, and not lying or running under the upper Crust thereof, as the Wild *Anemonies* do, having at the top of the said Root, a Tuft of Hair, or kind of bary Beard adjoined thereto. From this Root rises up many winged Leaves, lying upon the Ground, somewhat rough or hairy, hard in feeling, and finely cut into many small Leaves, of a dark green color, in form almost like to those of Carrots, but finer and smaller. From among these Leaves, rise up naked Stalks, rough and hairy, set about the middle thereof, with some small divided Leaves, compassing them, the said Stalks rise above those Leaves, about a Span high, bearing at the top of every one of them one pendulous Flower, Bell fashioned as Gerard says, and very beautiful, of a bright delayed purple color; or consisting of six Leaves of a fine Violet purple color, and sometimes deep whitish. In the middle thereof is a tuft of many yellow Threads or Thrums, set about a middle purple Pointel. When the whole Flower is past, there succeeds a bushy Knob, or

Parsly Laughing Common.

^{OR,}
Pasque-Flower purple Flowered.

Head compact of many gray hairy Locks, and in the solid part of the Knob, or Head, ly long Seeds, which are small, flat, and hoary, every Seed having at the end thereof a small Hair springing from it, which is gray likewise.

Parsly Laughing; }
^{OR,} } red Flowered.
Pasque Flower }

IV. The second, or Red Pasque Flower. This Plant in its Roots, Leaves, Stalks, and Seeds, as also in its manner of growing, differs not from that before described, saving, 1. That in this the Leaves are longer and much more finely cut. 2. That the Flower is something smaller but with longer Leaves, which are of a bright red color, whereas the former was of a purple color.

V. The third, or Yellow Pasque Flower. Its Root runs deep into the Earth, of about the thickness of a Mans Finger. Its Leaves are cut and divided, very like unto the Leaves of the first Kind, but somewhat more hairy, green on the upper side, and hairy underneath. The Stalk is round and hoary, the middle whereof is beset with some small Leaves, as in the others, from among which rises up the Stalk of the Flower, consisting of six Leaves, of a very fair yellow color on the inside, and of a hoary pale yellow on the outside: after which follows such a Knob or Head of hairy Thrums as in the former.

VI. The fourth, or White Pasque Flower. Its Root is black, and long, running deep into the Earth, having at its top a Head or Tuft of Hair, such as grow at the top of the Root of the first Kind. From among which spring up many Leaves which are winged, and standing upon long foot Stalks: they are divided as it were into three Wings or Parts: and each part finely cut and divided, like unto the Danish Pasque Flower following, but something harder in bandling, greenish on the upper side, and something gray underneath, and very hairy all over. From among these Leaves rise up the Stalks, beset at the middle of them with three Leaves, as finely cut and divided as these below: from above which grows the Flower, being smaller, and not so pendulous as the former, but in like manner consisting of six Leaves apiece, of a Snow white color on the inside, and a little browner on the outside, with many yellow Thrums in the middle. After the Flower is past, there comes forth such a like hoary Head, composed as it were of many Hairs, each whereof has a small Seed, to which it is fastened, like as the former Pasque Flowers have.

VII. The fifth, or Danish Pasque Flower. This in respect to its Root, Leaves, Stalks, Flowers, Seed, and form of growing, is very like to the first, or English Kind, before described, and differs from it only in these respects, 1. That in its Root, Leaf and Flower, it is larger. 2. That the Flower is of a fairer purple color, and not so deep. 3. That sometimes, and in some Plants the Flower is found white. 4. That it will better abide with us, and be more easily manured than our English Kind, tho' ours is a Native of our Country, and grows Wild therein, in many places.

VIII. The sixth, or double Danish Pasque Flower. This in its Roots, Leaves, Stalks, Flowers, Heads, Seeds, and manner of growing, differs nothing from that last described, saving in the duplicity of the Flowers: for whereas the former Flower was single, this is double Flowered, having two rows of Leaves, the one within the other.

IX. The Places. The first is found in many places of England, upon dry Banks which ly open to the Sun. It did grow very plentifully in a Pasture or Close belonging to the Parsonage House of Hildersham, a small Village, about six miles distant from Cambridge: The first four grow Wild in France, Germany, and other Countries, in untill'd, rough, Stoney and Rocky places. The fifth and sixth grow in Denmark, and were brought from thence into England, where they Flourish rather better than in their own Country. The

second

second Red Kind, *Lobel* says, was brought from Syria. The third or Yellow Kind, *Clusius* makes to be his third Wild *Anemone*, and says, it was found growing plentifully at the foot of St. Bernards Hill near to the Cantons of Switzerland. The fourth or White Kind is growing on the Alps near Austria: in France likewise, and in other places. Now all these are planted and grow with us in our Gardens, where they flourish as well as in their Native places.

X. *The Times.* They all Flower for the most part about Easter, from whence came the Name of Pasque Flower. They do indeed Flower early in the Year, at the farthest in the beginning or middle of April, accordingly as the Spring proves seasonable.

XI. *The Qualities.* These are all of them hot and dry in the fourth Degree: vehemently attractive and exulcerating; and therefore not fit to be taken inwardly.

XII. *The Specification.* By external application they are good against the Bittings of Mad-Dogs, Vipers, Rattle-Snakes, and all other sorts of Serpents and Venomous Beasts, drawing forth the Poyson by means of their strong attractive force: and for the same reason they prevail against an inveterate Sciatica.

XIII. *The Preparations.* You may make of the Pasque Flower, all the Preparations which you make of Crowfoot, which you may see in Chap. 176. *Self.* 26. ad 23. These having all the same Virtues with those there mentioned. But generally we only make, 1. A Cataplasm of the fresh Herb or Root. 2. A distilled Water of the whole Plant.

The Virtues.

XIV. *The Cataplasm of Herb or Root.* It is applied against the Bittings of Mad-Dogs, Vipers, Rattle-Snakes, and other Poisonous Creatures, and to places affected with the Gout, Sciatica, &c. with admirable success.

XV. *The Distilled Water of the whole Plant.* *Camerarius* in his *Hortus Medicus* says, that in *Borussia* it is used with good Success, to be given to those who are troubled with a Tertian Ague, for he saith that it is an *expurgativum*, or *Medicamentum expiraticum, vel deobstruivum*, a Remedy to open Obstructions.

XVI. *The Danger.* The Herb, Flower or Root, being taken inwardly in substance, are without doubt deleterious, or deadly: It kills by making the Patient look Laughing all the while, whence it obtained the Name of *Apium Risus*. And yet notwithstanding the Standers by, or lookers on, may think, that the Patient is really a Laughing, or in a Laughing Humor, there is indeed no such thing. It only by its Poisonous qualities, hurts the Senses and Understanding, thereby causing Foolishness; and Convulsing the Nerves, especially of the Mouth, Jaws, and Eyes, draws them this way, and that way, and sometimes in a manner all ways, making the Sick seem to the by-standers as if he continually Laughed, whereas, it is only a Convulsive Motion, wringing, or drawing of the Mouth and Jaws awry; and so the poor Patient dying in this Condition, the lookers on, think he dyes Laughing, and so report it; when at the same time there is no such matter, but he goes out of the World under the Sense of violent Convul-

sions, vehement Pain, and the most extream Torment imaginable.

XVII. *But the chief use that is now made of these Flowers* is for Ornament sake, more than any thing else; and to set off and Adorn a Garden; among such as are curious and delight in things of this Nature; they being very beautiful in their Kind.

CHAP. DXLIV.

Of PARSNEP

Garden and Wild.

I. *THE Names.* It is called in Arabic, *Jezar*, *Gezar*, and *Giezar*: in Greek, *Σταφυλίον*: in Latine, *Pastinaca latifolia*, *Staphylinus latifolius*: and in English, *Parsnep*.

II. *The Kinds.* There are several Species of this Plant, as, 1. *Σταφυλίον ονυμίας*, *Pastinaca latifolia Hortensis vel Domestica*, The Garden Parsnep. 2. *Σταφυλίον άγριον*, *Pastinaca latifolia Sylvestris*, The Wild Parsnep; of both which we shall Treat in this Chapter. 3. *Σπονδύλιον*, *Sphondylium*, Cow Parsnep, of which in Chap. 545. 4. *Σίον*, *Sium*, *Pastinaca Aquatica*, The Water Parsnep, of which in Chap. 546. following.

III. *The Garden and Wild Kinds.* Of the Garden sort there are two Species, viz. 1. *Pastinaca latifolia sativa communis*, *Pastinaca latifolia Domestica*; *Pastinaca alba sativa*; *Sisfarum sativum* *Magnum Fuchsj*, *Sifer Dioscoridis Columne*; *Elaphoboscum sativum Tabernamontani*, Our Common Garden Parsnep. 2. *Pastinaca alba sativa altera*; *Pastinaca Pineae*, The Pine Parsnep. 3. *Pastinaca latifolia Sylvestris*, *Pastinaca Sylvestris*; *Pastinaca Sylvestris Gallica Cordi*; *Sifer Sylvestre Fuchsj*; *Ἐλαφοβόσκον Dioscoridis*, Lib. 3. Chap. 80. *Elaphoboscum*, *Plinij*, Lib. 22. Chap. 22. and so *Dodonæus*, *Matthiolus*, and *Tabernamontanus*, call it: Our Wild Parsnep. 4. *Pastinaca infans*: Mad-Neps.

The Descriptions.

IV. *The first, or Our Common Garden Parsnep.* The Root is white, great, long and large, thick at its top or upper part, and sharp or spear pointed at bottom, and as it is white without, so it is also within, of a very sweet and pleasant Taste, being boiled, baked, or roasted, which then are dressed up with Butter and Vinegar, as every one likes best. From this Root spring up large winged Leaves, a great many lesser being set on both sides of a long-ribbed Stalk, each of them standing for the most part directly one against another, with a single one at the end, being much larger than those of the Skirret, and closer set together, and rougher, being also dented about the edges. The Stalk grows four, five, or six Feet high, with divers the like Leaves and

Parsnep Garden.

Parsnep Wild.

and Branches thereon, but lesser. The Flowers which grow in Umbels at the tops of the Stalk, and Branches, are yellow, which passing away, brownish, thin, roundish, flat Seed comes in their places, having a good, and a kind of Aromatick Smell.

V. The second, or Pine Parsnep. This is not so common in every Garden as the former, but yet is found in many. The Root is white both within and without, which is not so long as the former, but it is thicker at the Head and smaller below. The Stalk is neither so big, nor so high, but Branched forth in like manner. The Umbels of Flowers at the tops of the Stalk and Branches are lesser than the former, and the Seed smaller. The Root hereof is not altogether so sweet in eating, but more fleshy and inspid, but its Taste is more pleasant, if it grow in a fat and Sandy Soil.

VI. The third, or Our Wild Parsnep. The Root (as most Writers of every Country affirm,) is shorter and more woody, and therefore not so fit to be eaten as the former Garden Kinds are, but is thought to be more Medicinable. This Wild sort differs very little from the first Garden Kind, but only as a Wild Plant, and so grows not so fair and large, nor has it so many Leaves, nor such large Umbels of Flowers; it is thought to be the Garden Kind found Wild, (as the Garden Kind is thought by others to be the Wild Kind Transplanted into Gardens.) And it is to be met with in many places of England, as sweet and tender, after the Sowing as those of the Garden sort be. This Wild Species grows in some Fields and places so plentifully, that a Sack full of its Seed might be gotten from it, which being Sown in Gardens (having a Sandy but

yet rich and fat Soil,) and there well ordered will prove as good as the former Garden Parsneps.

VII. *Pastinaca Infusa*, or *Mad-Nep*, we describe not, for that it is the same Plant with our Common Garden Parsnep, or *Pine Garden Parsnep*, before Described, the only difference between them and the *Mad-Neps* is the time of Flowering, as Parkinson says; for if (says he) the Common Garden Parsneps do Flower in the first Year after Sowing, the Country People do call them *Mad-Neps*. These are only to be known by the report of the Gardner, or such as Gather or Sell them; for they are so like to the Choice Landable ones, that there is no distinguishing them by the outward appearance. They are found by long experience to have an evil and pernicious quality; for they not only cause a Vertigo or Swimming of the Head, but Frenzy also, and in some even Madnes it self; out of which the Patient is not presently restored, some having continued in that Condition for the space of twenty four Hours, and others not having come perfectly to themselves for the space of 2 whole Days and Nights. Gerard says, that these *Mad-Neps*, are the Produce of our Common Garden Turneps, arising from the Seed of the Garden Kind; which if they Flower the same Year they are Sown, they are said to degenerate, and become what the Country People in *Cheshire*, about *Nantwich*, &c. call *Mad-Neps*. But I suppose this is a mistake, that being the most probable, which Parkinson has declared of our Common Garden Parsnep, as is aforesaid.

VIII. The Places. The first and second grow only in Gardens, where they are Nurst up for Food, but especially the first sort. The third grows Wild in several places of England; as in the Marshes by *Rocheester*, in the Grounds of formerly

merly Sir John Levison: It grows in Salt Marshes, and upon the Banks and Borders of the same. Gerard says, That the Seed thereof being gathered and Sown in Gardens which have a fertile and fat Soil, does bring forth better Roots, sweeter and larger, than those which come from Seeds of the Garden Kind.

IX. *The Times.* They Flower and Seed generally the second Year after they be Sown: and then it is in the Month of July, the Seed being ripe in August, or not long after.

X. *The Qualities.* They are hot and moist in the first Degree, are Diuretick, Attenuating, Cleansing and Opening: Stomackick, Nephritick, Chylifick, Analeptick and Spermatogenetick. The Seed is Alexipharmick.

XI. *The Specification.* Parsneps restore in Consumptions, make the Body Fat, plentifully encrease Seed, and provoke Lust exceedingly.

XII. *The Preparations.* 1. *The Boiled, Baked or Roasted Roots.* 2. *Bread made of Parsneps.* 3. *A Decoction of the Roots.* 4. *A Pudding made of the Roots.* 5. *Sanguis or Blood of Parsneps.* 6. *A Powder of the Seed.*

The Virtues.

XIII. *Boiled, Baked, or Roasted Parsneps.* Eaten as common Food they sweeten the Blood and Juices above all other Roots in the World, restore in Consumptions, make the Eater of them grow Fat and Flethy, nourish much, and indeed much more than either Carrots, or Turneps; Breed Seed after an admirable manner, and potently provoke Lust. They strengthen the Stomach, Reins and Bladder, and provoke Urine. But the *Wild Kind* are more Physical, being Aperitive, Attenuating, Inciding and more Diuretick than those of the Garden. They are dressed up with Salt, Butter, Pepper, and Vinegar, or Juice of Lemons.

XIV. *Bread made of Parsneps.* It has all the former Virtues; it is sweet, and eats pleasantly enough, but ought to be eaten whilst it is new, for then it is best. It is made of Baked or Boiled Parsneps, with the addition of some fine pure Wheat Flower or Meal, as they usually make Bread of Eddo Roots in Carolina.

XV. *The Decoction of the Roots.* It is commonly made in Water, to which at the end of the Boiling, a little, as a quarter part, of White or Red Port Wine may be added. It comforts or cleanses the Stomach, Reins, Bladder, and Womb, opens, incides, provokes Urine, and gives ease in the Strangury. Some make the Decoction by a long boiling them in Milk. This restores in Consumptions to admiration, and in short time makes a thin, lean, extenuated Body, plump, fleshy, and in good liking.

XVI. *The Pudding.* It is made of the Garden Parsnep half Boiled, then chopt small, and mixt with Eggs, Rice, Beef-Suet shred, Salt, and the other proper Ingredients. It is excellent Food, nourishes extremely, and has all the Virtues of the Boiled Roots, Bread, and Decoction, made with Milk, foregoing.

XVII. *Sanguis Pastinacæ latifolia.* The Blood of Parsneps. It is made as the Blood of Potatoes, Satyrion, Eddo, &c. after this following manner, viz. Take of the best Garden Parsneps (if they be first Boiled or Baked in their Skins, or half Baked it may be so much the better, tho' whilst

raw, they will also do) cleanse them well from their Skins, beat them well in a Marble Mortar with a Wooden Pestle, till they become a Pulp: Take of this Pulp six Pounds: Crumbs of White Bread three Pounds: mix them well together: Sprinkle them with White Port Wine, and put all into a Bolt Head, stopping it well with Cork and Wax, so that nothing may transpire: place this Matrafs in warm Horsedung, or in Balneo, or in a warm Sand heat, till the Matter is changed into a Rubickend or Bloody Chyle: then force it strongly out with a Press, and put the expressed Blood into Balneo Vaporosa, or such a like heat again, that by this second Digestion it may acquire a greater redness, and some faces may settle, which separate: this Digestion and Separation continue, till the Blood becomes absolutely clear, and of a most perfect red. From this you may (if you so please) with an Alembick, separate a thin and clear Liquor: so have you remaining in the bottom, the Blood of Parsneps of a very glorious color. It has all the Virtues of the Roots Boiled, Baked, Roasted, or made into Bread, Puddings, Broth, &c. afore enumerated. I do not believe that there is any greater Vegetable restorative in Consumptions in the World besides, it invigorates to a strange Degree. Dose from a Dram to two, three, or four Drams, Morning, Noon, and Night, in a Glas of choice Malaga or Barcelona Wine: or if the Patient likes not Wine, in Milk.

XVIII. *The Powder of the Seed.* It is strongly Aperitive, Absterfivè, Carminative, Digestive, Diuretick, Stomackick, Nephritick, Hysterick, and Alexipharmick: being given from two Scruples to a Dram, or Dram and half in White Port Wine, or other proper Vehicle, it strengthens the Stomach singularly, expels Wind, gives ease in the Colick and Strangury, provokes Urine, cleanses the Reins and Bladder from Stones, Sand, Gravel, Slime, or any Tartarous Matter obstructing them: It potently provokes the Terms in Women, and resists Poison, and cures the Bitings of Serpents, and other Venomous Creatures. It is an admirable thing also against Striches and other Pleuritick Pains, apt to afflickt such as are Hypochondriacal.

XIX. *Nota.* You may also from Parsnep Seed prepare, 1. *A Distilled Water.* 2. *A Spirit.* 3. *An Oil by Distillation.* 4. *A Spirituous Tincture.* 5. *An Acid Tincture.* 6. *An Oily Tincture.* 7. *Potestates or Powers.* 8. *An Elixir.* Every one of which are possessed with all the Virtues of the Seed, before enumerated in the Section immediately foregoing.

CHAP. DXLV.

OF PARSNEP Cow.

I. **THE Names.** It is called in Greek, Σπονδύλιον, or Σπονδυλίον: (for both are extant in good Authors) in Latine, by Dodonæus, Gesner, Lobel, Matthioli, and others, Spondilium, & Spondilium: in English, Cow Parsnep, and Meadow Parsnep: Gerard says that it is called also Mad-Nep.

II. *The*

II. The Kinds. Authors make five or six Kinds or more of Cow Parsnep, but three only of them being known to us in our Land, we shall only describe them, which are the following, viz. 1. *Spondilium vulgare*; *Brancà ursina Cordi* & *Tragi*; *Acanthus vulgaris* sive *Germanica Fuchsij*; Our Vulgar or Common Cow Parsnep. 2. *Spondilium majus*, sive *Acanthus Germanica major*; *Spondilium alterum Dodonæi*, The Great German Cow Parsnep. 3. *Spondilium majus aliud foliis laciniatis* (*Spondilium hirsutum foliis angustioribus Baubini*, as *Parkinson* supposes:) Jagged Cow Parsnep of our own Land.

The Descriptions.

III. The first, or Our Vulgar or Common Cow Parsnep. It has a Root which is long and white, with two or three long Strings growing or running down deep into the Ground, of a strong and unpleasant Smell. It springs up with three or four large spread, rough, winged Leaves, lying often upon

Parsnep Cow.

the Ground, or else raised a little from it, with long, round, hairy foot Stalks under them, parted usually into five divisions, the two couples standing each against other, and one at the end, and each division or Leaf being almost round, yet cut in somewhat deeply on the edges, in some Leaves and places, and not so deep in others, of a whitish green color, having a strong Smell. From among which rises up a round, crested, hairy Stalk, two or three Feet or more high, with a few Joins and Leaves thereon, and spread out into Branches on the Top: on the tips of which stand pretty large Umbels of white Flowers, something in-

clining to be a little reddish: which being past away, there follows after them, flat, thin, whitish, winged Seed, two always joined together, as is usual in most of these Umbelliferous Plants.

IV. The second, or Great German Cow Parsnep. Its Root is white, and like the other, but greater. The whole Plant it self, differs very little from the former, but in the largeness of its Leaves and Stalks, being nearly twice as great; that is to say every single Leaf or division, which are seldom above three, on a great long foot Stalk, which is about 6 Inches long to the Leaf, which is hairy and rough, and of a dull faded sort of green color, a little folded in or crumpled, and dented besides on the edges. The Stalk grows like the former, and comes to be sometimes 4 or 5 Feet high, spread out towards the top into several Branches. At the tops of all which are like Umbels of Flowers, (for the most part white) the Flowers and Seed being in form much like the first, but larger, of a hot unpleasant Taste, but not so unpleasant as those of the Common Kind.

V. The third, or Jagged Cow Parsnep of our own Land. Its Root is great, thick, and white, living after Seed time, or all the Winter, and springing up again anew every Year. It grows as high, or rather higher than the second or last described, and with greater Stalks, having a white hairyness on them. The lower Leaves grow very large, and much spread, winged, and divided into five parts: two couple standing each against another, but of another form; for each of these Leaves or divisions, are parted into distinct parts, yet closely joined at the bottom, the two side Leaves or divisions, being not of half that length that the middlemost is, which is in some above six Inches long, in others above five, and not above half an Inch broad, each of them having a deeper Cut or Notch at the bottom, than is on the rest of the Leaf, which yet is dented with greater Notches than in most usual Herbs, the upper or end Leaf being usually parted into five divisions or Leaves, dented in the like manner, little or nothing hairy, but of a deeper green color on the upper side, and grayish underneath. The Umbels of white Flowers, are as large as in the last, and the flat thin white Seed, is so like that (setting aside their being a little whiter) they are scarcely to be discerned one from another, but only by the Taste and Smell, which in this are little or nothing.

VI. The Places. The first grows in moist Meadows, and the Borders and Corners of Fields, and near Ditches generally, throughout England. The second is a Native of Germany, but I have found it growing in the Borders of Fields or Meadows in several places in *Cambridgeshire*. The third was found growing Wild also by one Mr. George Bowles, in some places in *Shropshire*.

VII. The Times. They all Flower in June and July, and the Seed is ripe not long after, or in August.

VIII. The Qualities. The Root is hot and dry in the beginning of the second Degree: The Seed is hot and dry in the third Degree, and is incisive, Aperitive, Cephalick, Arthritic and Hysterick.

IX. The Specification. The Seed is prevalent against the Asthma, Epilepsy, Lethargy, Jaundice, and Hysterick Fits. The Root is profitable against Fistulas and Callous Ulcers.

X. The Preparations. You may make, 1. A Drink, or Beer of the Leaves and Seed. 2. A Powder of the Seed. 3. A Decoction of the Seed. 4. A Spirituous Tincture of the Seed. 5. The

Fumes

Fumes of the Seed. 6. *A Juice of the Umbles or Flowers.* 7. *The raw Root.* 8. *A Powder of the Root.* 9. *A Decoction of the Root.* 10. *An Oil of the Root.* 11. *A Cataplasm of the Root.*

The Virtues.

XI. *The Drink or Beer made of the Leaves or Seed.* You must first make a strong Decoction of them with Water, and then, being Blood-warm, you are to Ferment or Work it up with Yest or Leaven, as Brewers do their Ale or Beer. It is used in all respects to be drank as Beer or Ale, for the quenching of Thirst; and is a common Drink at Meals in Poland and Lithuania.

XII. *The Powder of the Seed.* Given to a Dram mixt with Honey, it is good against Asthma's, Coughs, shortness of Breath, Hoarseness, Wheezing, Epilepsy, Jaundice, Lethargy, and cleanses the Bowels, from tough, slimy, pituitous humors, sticking in the Passages of the Guts. For according to Galen, it is of a sharp and incisive Quality. It prevails also against the Rickets, or such as are Liver-grown, as the Vulgar call it. It provokes the Terms in Women, and prevails against Vapors and Hysterick Fits.

XIII. *The Decoction of the Seed.* It may be made either in Water or Wine: and being sweetened with Honey or Sugar, it has all the Virtues of the Powder of the Seed afore enumerated, being drank inwardly, and bathed with outwardly upon the part affected, it gives ease in a Cephalaea, or that which is called an inveterate or old Head-Ach.

XIV. *The Spirituous Tincture of the Seed.* It expels Wind, gives ease in the Colick, provokes Urine and the Terms, and has all the Virtues of the Powder aforegoing, being given from a Dram to two or three Drams in any proper Vehicle: outwardly applied, it is good against Scabs, Pimples, Shingles, running Sores, and other breakings out.

XV. *The Fumes of the Seed, from the Seed being burnt.* Received up the Mouth or Nostrils, it is good against Carus, Lethargy, Epilepsy, and other cold and moist Diseases of the Head and Brain: received up the Womb by a Funnel, it prevails against Vapors, Faintings, Swoonings, and Fits of the Mother.

XVI. *The Juice of the Umbels or Flowers.* If it is dropt into Ears which are ulcerated or sore, and which run and are full of Matter, it cleanses and heals them. It also cleanses, dries and heals Ulcers and running Sores in any other part of the Body; they being daily washt therewith warm.

XVII. *The raw Root.* Being scraped as you scrape Horse Radish Roots, and the scrapings applied to the Callous of a Fistula, it softens it, and takes it away, disposing the same to a speedy healing.

XVIII. *The Powder of the Root.* Being strewed upon a Callosity in a Fistula it consumes it: and being taken inwardly to 1 Dram or more, in Honey or any other proper Vehicle, it is said to have all the Virtues of the Powder of the Seed before enumerated. It is said to cleanse and strengthen the Stomach and Bowels, and to give ease in the Colick.

XIX. *The Decoction of the Root in Water or Wine.* It is of like quality to that of the Seed,

and available to all the same purposes: and either alone, or mixt with Honey, makes a singular good Lotion to cleanse Fistulas, Ulcers, and old running Sores with, to dry them and induce their healing, as also to wash Pimples, mattery Pustles, Scabs, and Shingles withall.

XX. *The Oil of the Root.* It is made by Decolling it in Oil Olive, as is usual. The Head being anointed and rubbed therewith, it helps not only such as are fallen into a Frensy, but is profitable for the Cure of such as are sick of a Carus or Lethargy, and who have for a long time been afflicted and grieved with a Cephalaea, or old Head-Ach.

XXI. *The Cataplasm of the Roots.* Applied to the Gout, or any part pained, it gives ease and relief in a very short time; and applied very hot to the Sides and Hypochonders, it gives present ease in Stitches, and other like Pleuritic pains.

CHAP. DXLVI.

Of PARSNEP Water.

I. **T**HE Names. It is called in Arabic, *Rochabhalmo*, and *Inhamabanella*, or *Hamebanella*: in Greek, *Σιον*, so called *σιν θιονιον*, ab *Urnis calculisque ciendis*; in Latin, *Sium*: in English, *Water Parsnep*.

II. *The Kinds.* The chief of these we shall treat of in this Chapter are, 1. *Sium*, *Sium majus*, *Sium majus latifolium Bauhini*, *Gerardi*, & *Tabernemontani*: *Pastinaca Aquatica major*, & *Aquatica latifolia*, The Greater, or broad Leav'd Water Parsnep. 2. *Sium verum Dioscoridis*, *Matthiolo*, *Thalio* & *Lugdunense*, *Sium majus angustifolium Junsoni*, *Sium odoratum Thalij* & *Gesneri*, *Sij primum genus quod* & *Laver Fuchsj*, *Silva Plinij Angularda*, *Sium* & *Laver Cordi*, *Dodonei* & *Lobelij*, *Sium Olusatris folio Lobelij*, *sive Pastinaca Aquatica*, *Sium verum Camerarij* in his Epitome, *Sium eruce folio Tabernemontani*, *Bauhini* & *Lugdunensis*, *Sium alterum Olusatris facie*, *Pastinaca Aquatica minor*, The Lesser Water Parsnep. 3. *Sium majus angustifolium*, *Sium minimum Alpini*, *Pastinaca Aquatica angustifolia*, *Sium alterum Dodonei*, Water Parsnep narrow Leav'd. 4. *Sium Umbellatum repens*, Creeping Water Parsnep.

The Descriptions.

III. *The first, or Greater broad Leav'd Water Parsnep.* Its Root is black with many Fibres at the Joins thereof, and at the Joins of the Stalk under the Water, near the Ground. It rises up with great hollow and crested Stalks, three, four, or more Feet high, spread out into several Branches, on which stand long winged Leaves, made of many long and somewhat broad Leaves, pointed at the ends, and dented about the edges, smooth, thick, and Sappy or juicy, every one of which is as large as those of a Parsnep. The Flowers grow at the tops of the Stalks in Tufts or Umbels, and are of a white color, after which comes the Seed, which smells well, and

Parsnep Water Greater.

is larger and rounder than Aniseed. The whole Herb is of a strong but sweet and pleasant Smell.

IV. The second, or Lesser Water Parsnep. Its Root is very Fibrous, and consists of many small

Parsnep Water Lesser.

Strings or Threads, which are fastened to the Stalk or Root within the Water or Muddy Ground: both it and the Leaves (says Parkinson) smell strong like Petroleum. This Plant is very like the former, but lower and lesser, growing two Feet, or two and a half high. The Leaves smell well, are fat and full of Juice, being long, but narrower than those of the first Kind. They grow winged, upon a long foot Stalk, having sometimes four, five, six, seven, and eight pair of Leaves set one opposite to another upon a middle Rib, and one single one at the end, finely snipt or dented about the edges, and growing as it were bolt upright. The Stalk is smooth, round and hollow like a Kex, which towards the top spreads it self into several Branches. At the tops of the Stalks and Branches grew the Flowers, which are white and stand in round Umbles, not much unlike to those of Fennel. The Flowers being past away, the Seed follows, which is small, and much like the former.

V. The third, or Water Parsnep narrow Leav'd. Its Root consists of a great number of small, slender, toristed brown Fibres or Strings, wrapped up as it were, among themselves, and strongly fixed or fastened in the Mud. The Stalks of this Plant are hollow like those of Hemlock, and a Cubit, or two

Parsnep Water narrow Leav'd.

Feet high, (Gerard says they are about three Cubits high:) on which grow several winged Leaves something like the last, but are divided into smaller Leaves, which are long, much narrower, and snipt about the edges, growing commonly two or three together. The Flowers grow at the tops of the Stalk and Branches: they stand in round Tufts or Umbles, and are of a pale, yellowish, green color: which being past away, turn into small Seed, very much like to that of Parsly; but in its Taste, something resembling that of Cupmin, or of Daucus Cre-

ticus,

ticus, and of a Citron Peel, but somewhat better than any of them.

VI. *The fourth, or Creeping Water Parsnep.* It has a bushy Fibrous Root, not much unlike to the second, but in these things it differs from it, 1. The Stalks in this never grow upright, but always lean and creep, and are also less than those. 2. The Leaves of this are also less than those of the second Kind, and grow not so many upon one Rib. 3. The creeping Stalks put forth an Umbel of Flowers almost at every Joint, whereas the other, bear them only at the tops of the Stalks and Branches.

VII. *The Places.* The first grows Wild in Germany, with us for the most part in Gardens, in places apt to have standing Water, or where it is Planted by Ditch sides. The second grows in Kent in several standing Waters, and watery Ditches. It has been found between Redriff and Deptford, in a rotten Boggy place on the right hand of the Way. The third grows (as Lobel says) near Antwerp, but has been found growing Wild in several parts of this Kingdom: it has been found in the Ponds about Moor Park; and in the Ditches about Epsom, and in divers Ponds in Flintshire. The first I have sometimes found growing in Cambridgehire, in watery places on the Borders of the Fens, adjoining to the Land Ground, commonly called Medlands. The fourth grows almost every where in watery places, thro' the Kingdom.

VIII. *The Times.* They all Spring about the middle and latter end of March; spread and grow green in April; Flower in July; and Seed before the end of August.

IX. *The Qualities.* Water Parsnep is hot and dry in the third Degree, Aperitive, Absterfiv, Carminative, Digestive, Diuretick, Incisive, Neurotick, Stomatick, Hepatick, Nephritick, Hyfterick, Alexipharmick, and Spermatogenetick.

X. *The Specification.* It powerfully provokes the Terms in Women, and Urine, breaks and expels the Stone in the Reins and Bladder, gives ease in the Strangury, facilitates the Birth, and expels the dead Child and After-birth.

XI. *The Preparations.* You may make thereof, 1. A Liquid Juice. 2. An Essence. 3. A Decoction. 4. A Syrup. 5. A Powder of the Seed. 6. A Cataplasm of Herb and Root. 7. A Distilled Water. 8. A Spirituous Tincture. 9. An Acid Tincture. 10. An Oily Tincture. 11. A Spirit. 12. A Fixt Salt.

The Virtues.

XII. *The Juice of the Herb and Root.* It powerfully opens obstructions of the Viscera, especially of the Stomach, Lungs, Liver, Mesentery and Reins: it is good against the Scurvy in a cold habit of Body, provokes Urine and the Courses very powerfully, gives ease in the Strangury, breaks gritty Stones whether in the Reins or Bladder, and expels Sand, Gravel, and other Tartarous Matters from those parts. It facilitates the Birth in a Woman in Labor, and brings away the After-birth. Dose 3, 4, 5, or 6 Spoonfuls in a Glass of warm White Port Wine, or other proper Vehicle.

XIII. *The Essence of Herb or Root.* It has all the Virtues of the Liquid Juice, and is more powerful to all the Intentions. It resists Poison, and the Bittings of Serpents, and other Venomous Creatures being inwardly given. It is a singular good thing against the Dropsie Scirrhus, carrying off

the Morbifick Matter by Urine: It prevails also against the jaundice, and carries off the recrements of the Juices and Blood which breed the Gout. Dose 2 or 3 Spoonfuls Morning and Night, in a Glass of Wine, or Wine and Water, or in the Distilled Water of the Plant, or in Parsly Water.

XIV. *The Decoction of Herb or Root, or Umbels of Flowers.* It may be made in Water or Wine, and given from 3 to 6 Ounces, Morning and Night. It has all the Virtues of the Juice and Essence, but operates not so strongly as they, for which reason it is given in larger quantities: it warms, comforts, and rectifies the Stomach, causes a good Appetite and Digestion, and prevails against Vapors and Fits of the Mother.

XV. *The Syrup.* It is Pectoral, good against Coughs, Colds, Wheezings, Hoarseness, obstructions of the Lungs, Asthma's, and other like Distempers, proceeding from a Viscid Mucilage: It is Diuretick, and gives ease in the Strangury.

XVI. *The Powder of the Seed.* It is Diuretick, Nephritick, Lithontriptick, and an excellent thing against most disaffections of the Reins and Bladder, proceeding from Obstructions, or Tartarous Concretions: it carries off the Jaundice and Dropsie by its Diuretick property: it expels Wind powerfully, and gives present ease in the Colick: and has all the Virtues of the Juice and Essence foregoing. Dose from half a Dram to a Dram, or Dram and half, in the Syrup foregoing, or in Wine dulcified with the Syrup.

XVII. *The Cataplasm of Herb and Root.* If it is immediately applied to the Biting of a Mad Dog, Vipet, Rattle-Snake, or other Serpent or Venomous Creature, it attracts or Draws forth the Poison, and secures the Patient against the danger thereof. It dissolves simple Contusions: and being applied gives ease in the Gout.

XVIII. *The Distilled Water from the whole Plant.* It has all the Virtues of the Juice, Essence, and Seed: but as it is much weaker in its effects and operation, so it is given in much greater quantities, as to 6 or 8 Ounces, mixed with a little White Port Wine. It is used also as a Vehicle to convey, several of the other Preparations in.

XIX. *The Spirituous Tincture.* It warms and comforts a cold and weak Stomach, expels Wind, is good against sickness at Heart, Fainting and Swooning away: prevails against the Colick, weakness of the Intestines, and Flux of the Bowels; and given in a proper Vehicle powerfully provokes Urine. Dose from two to four Drams.

XX. *The Acid Tincture.* It is an Antidote against the Plague, Spotted Fever, and all sorts of Pestilential and Malign Fevers. It takes off the Febrilitick heat momentarily, destroys the putrid and corruptive Ferment: and if timely taken, secures the Life of the Patient against future danger. It strengthens and fortifies the Stomach, strengthens the Digestion, and causes a good Appetite. Dose so many Drops at a time, as to make the Vehicle gratefully Acid.

XXI. *The Oily Tincture.* It is a present remedy against the Strangury, Stone, Gravel, and all manner of Tartarous Matters obstructing the Reins, Ureters, and Bladder. It gives present ease in the Colick, eases pains in the Vertebrae of the Back, and strengthens it, being inwardly taken in any proper Vehicle, from 15 to 20, 40, 50, or 60 Drops, and also outwardly anointed upon the part. It is profitable also against the Palsie being outwardly and inwardly used. It provokes

the Terms, and hastens and facilitates the Birth, and forces away the After-Birth.

XXII. *The Spirit.* It is Cordial, good against sickness at Heart, Fainting and Swooning Fits, and other Distempers of the Heart and Stomach. It expels Wind, cheers the Spirits, represses Melancholy, and causes a kind of Elevation of Soul. Dose a Dram, two, or three, now and then in a Glass of Wine.

XXIII. *The Fixed Salt.* It is highly Diuretick, Nephritick and Hysterick: and is a Specifick against the Stone, Sand, Gravel and Viscous Slime in the Reins, Ureters and Bladder. It gives present ease in the Strangury, prevails against Vapors and Hysterick Fits, and cleanses the Womb of cold, vici, and putrid Humors which may offend it. Dose from 8 Grains to a Scruple, in *Parly* or *Hydropiper Water*, *Onion Water*, *White Port Wine*, or any other fit Vehicle.

CHAP. DXLVII.

of PATIENCE Garden.

OR,

Monks RHUBARB.

I. **THE Names.** It is called in Greek, *Ἱπποδάμειον*; *ῥαβδαριον* *καλλιόν*; in Latine, *Hippolapathum*, *Lapathum Hortense*, *Patientia Hortensis*, *Rhabarbarum Hortensium*, *Rhabarbarum Monachorum*; and in English, *Garden Patience*; *Garden Dock*, *Horse Dock*, and *Monks Rhubarb*.

II. *The Kinds.* Of the *Hippolapathum* or *Horse Dock*, there are two special Sorts, viz. 1. *Hippolapathum* *ῥαβδαριον* *Ἱππεον*, *Patientia Hortensis*; *Lapathum Sativum*, *Rhabarbarum Monachorum*; *Garden Patience*, or *Monks Rhubarb*. 2. *Hippolapathum notum*, *Hippolapathum rotundifolium*, *Lapathum Rotundifolium*; *Lapathum Sativum rotundifolium* *Clusij* & *Camerarii*; *Pseudo Rha recentiorum* *Lobelii*; *Rhabarbaricum Cordi* in *Historia Plantarum*, Lib. 4. Fol. 201. *Bastard Rubarb*, *Garden round Leav'd Horse Dock*, or *Great round Leav'd Garden Dock*.

The Descriptions.

III. *The first, or Garden Patience, or Monks Rhubarb.* It has a very long great Root, brown without and yellow within, much like to those of the Common Wild or Water Docks, but a little redder; but when Dry, in color and taste like to the true Rhubarb; having also a less store of discolored Veins, than the next following when that is dry. It grows up with very large strong tall Stalks, chambered or furrowed (and rises up to be about 8 or 9 Feet high, as Gerard says, when it grows in good and fertile ground;) set about with great, large or broad and long Leaves (not much unlike to those of the Great Water Dock,) of a fair green color, and not dotted at all about the edges. The Stalks towards their tops, spread themselves out into several small Branches, which towards their tops bear reddish or

Patience Garden, or Monks-Rhubarb.

purplish Flowers, or Flowers of a light purple color, declining to brownness. Which being past away, the Seed follows, contained in thin chaffy Husks, and of a triangular Form, like to the Seed of our Common Docks. This Patience or Garden Horse Dock, has obtained the Name of Rhubarb, for some small purging faculty which it has, much like to that of the True Rhubarb.

IV. *The second, or Bastard Rhubarb, or Garden round Leav'd Horse Dock.* Its Root is exceeding great and thick, very like unto the Rhubarbaricum, as well in color and taste as proportion, and Purges after the same manner, if given in a greater Dose or quantity: it grows much greater than that of the Patience before described, with many great Branches and Fibres adjoining to it: it is indeed yellow on the out-side, and somewhat of a paleish yellow within, with some Store of discolored Veins therein, like to the True Rhubarb, but much less, especially when it is dry, which then looses its fresh color, which the True Rhubarb constantly retains. This Bastard Rhubarb rises up with several large, great, broad, round, thin, and yellowish green Leaves, in shape like to those of the Garden Bur-Dock, a little waved about the edges; they rise up from the Root, every one standing on a reasonable thick and long brownish foot Stalk. From among these Leaves, rises up a pretty large Stalk, much like the former, about two Feet or more high, having some such like Leaves as before described thereon, but smaller. Towards the top, the Stalk spreads it self out into several Branches, some greater and some lesser, towards the tops of which grow long spiked Heads full of small brownish Flowers; after which follows in thin chaffy Husks the seed, which is shining and triangular like to the Common Docks, or of the Garden Patience before described.

V. The

V. *The Places.* The first grows naturally about *Laufanna* in *Sveoy*, as *Trogus* says. The second grows naturally upon the Hills not far from *Ciria* in *Germany*, as also near *Eriburg* in *Switzerland*, and on the Mountains in *Austria*: But with us they both grow only in *Gardens*, where they thrive and flourish very well.

VI. *The Times.* These Plants when Nurst up in our *Gardens*, Flower about the beginning or middle of *June*, (much about the time when our *Common Docks* Flower) and their Seed is ripe in *July*. The Roots are not to be taken up, till the Leaves and Stalks are quite withered and gone, which is about the middle or end of *October*: for if they be taken up, either a little before the Leaves do spring, or a while after they are sprung up, the Roots will not retain half so good a color in them: It is also to be noted, that when they are taken up, they are to be scraped very clean, and carefully dried, so as they may not touch one another till they are perfectly dry.

VII. *The Qualities.* Both these in respect to heat or cold, are said to be Temperate: Authors will have them to be moist, with a kind of clamminess: this possibly the Leaves may be, whilest they are young: but the dried Roots are doubtless dry in the first Degree. They are Aperitive, Absterfve and Afringent, tho' they have a Cathartic or Laxative force in loosening the Belly, for they certainly Bind after Purgings.

VIII. *The Specification.* The Roots and Seeds of both Kinds are prevalent against a Bloody Flux, as also against all other Fluxes of the Bowels; Vomiting and Sicknes of the Stomach, bitings of Serpents or other Venomous Creatures; the Dropsy, Jaundice, and all manner of Scabs, Leprosy, and breakings out. The Roots of both Purge as the *True Rhubarb* does; saving (that they may have the same effects,) the Dose must be augmented to treble the quantity. They are also said to be absolute in the Cure of Agues.

IX. *The Preparations.* 1. A Sallet of the young and tender Leaves. 2. A Liquid Juice of the Leaves. 3. A Decolion or Infusion of the Roots. 4. A Diet Drink. 5. A Powder of the Roots. 6. A Powder of the Roots compound. 7. A Powder of the Seed. 8. A Distilled Water.

The Virtues.

X. *The Sallet of the young and tender Leaves.* Being boiled, and eaten with Butter, Vinegar, Salt and Pepper, as you eat Beets or Spinach, (tho' it is not altogether so pleasant) they nourish but little, but make a thin Blood; loosen the Belly, and Purge away slimy Humors.

XI. *The Liquid Juice of the Leaves.* Given to 2, 3, or 4 Spoonfuls, more or less (according to Age and Strength) it is a certain Cure for an Ague, being given in Glafs of warm Ale, clarified Whey, or the like. One *John Benet* a Chirurgion of *Middstone* in *Kent*, cured a Lad of an Ague therewith, which did grievously vex him: He took 3 or 4 Leaves (as *Gerard* says) of this Plant of *Rhubarb*, beat it, and strained out the Juice with a draught of Ale, and gave it the Lad in the Morning to Drink: it wrought extremely both upwards and downwards, within one Hour after, and never ceased until Night: in the end, the Purgings faculty of the Medicine abated and gave over working, and the Youth lost his Ague. Since which time (says he) he has cured with the

same Medicine, many others of the like Disease, having always a regard to the quantity, which was the cause of the violent working in the first Cure. I have sometimes also seen that the Liquid Juice of the green or fresh Roots being given in like manner, has also cured Agues, as well as the Juice of the Leaves. The Juice of the Leaves or Roots, mixed with a little Vinegar, is used as a most effectual Remedy for the Cure of Scabs and running Sores.

XII. *The Decolion or Infusion of the Roots.* The Roots sliced and boiled in Water of *Cardus Benedictus* to the consumption of a third part, and then sweetned with a little Honey: Being given to the quantity of 8 or 9 Spoonfuls at a time, before the coming of the Fit of an Ague, generally cures it at 2 or 3 times so taking it; such as are of a robust or strong Body, may take 12 Spoonfuls of it at a time. The truth of this has been proved by many Experiments, (as *Gerard* says.) The simple Decolion of the Roots of *Patience* or *Monks Rhubarb* loosens the Belly, Purges gently, helps against the Jaundice and Dropsie, and other like Diseases proceeding from a cold cause; is good against the Stinging of Serpents, helps the Sicknes of the Stomach arising from Cholera, and cures the Bloody Flux, as also other Fluxes of the Bowels: and being taken with *Acacia*, or Juice of *Sloes*, it is said to cure the spitting of Blood. The Decolion of the Roots in Vinegar, is effectual to heal inveterate Scabs, and old running Sores. The Decolion of the Roots of *Bastard Rhubarb* in Vinegar has the same Virtues; and being dropt into the Ears it eases their pain: gargled in the Mouth it cures Sores and Ulcers therein, and eases the Tooth-ach: and being Drank, or taken inwardly it prevails against the Jaundice, Dropsie, Gout, Rhumatism, Kings-Evil, Stone, Gravel, Sand, Strangury, &c. it opens and purges the Liver, Spleen, Reins and Belly, and cleanses and cools the Blood. But for the general use in curing all these Distempers the Decolion or Infusion may be made in Water, or Clarified Whey; and if the Patient like of it, it may be a little sweetned with Syrup of Violets, or Syrup of Roses Solutive.

XIII. *The Diet Drink.* Take Roots of *Monks Rhubarb* sliced, and Roots of red Madder, of each 8 Ounces: Sena 4 Ounces: Aniseed bruised, Liquorice bruised, of each 2 Ounces: Agrimony, Scabions, of each one Handful, which cut a little with a Knife, put them into an Earthen Stew, or a small Wooden Cask, which may hold 4 Gallons or better: affuse thereon 4 Gallons of Strong new Ale; which let stand for 3 Days. At the end of that time the Patient may drink of it, as ordinary Drink for 3 Weeks or a Month together, (and the longer it is continued the better) providing another like Cask of the same, to have in readiness, one under another. It is said to Cure the Dropsy, Jaundice, Gout, Rhumatism, Spleen, Rickets in Children, Kings-Evil, and all manner of Itch, Manginess, Scabs, Pustules, and other Breakings out in the whole Body: it purifies or cleanses the Blood from all Corruption, prevails against the Green-Sicknes, and admirably opens all manner of obstructions of the Stomach, Lungs, Liver, Spleen, Mesentery, Reins and Womb, provoking the Terms when stopt, after a singular manner.

XIV. *The Powder of the Roots.* A Dram and half or 2 Drams of the Powder of *Monks Rhubarb* mixt with Ginger in Powder a Scruple, and taken fasting in a Dish of warm Broth or Posset Drink, Purges Cholera and Flegm very gently and safely without any the least danger. The Powder of the Root of the *Bastard Rhubarb* does the same thing, but is

more

more effectual, both for inward and outward Diseases. It is good against a Quinsy, Bastard Quinsy, scrophulous or Humorous Tumors in the Neck and other parts, commonly called the Kings-Evil, as also Swellings and Kernels behind the Ears: It gives ease in the Strangury, helps such as are troubled with the Stone, Sand and Gravel, provokes Urine, and is good for such as are troubled with dimness of Sight.

XV. *The Pouder of the Roots Compound.* Take Roots of Monks or Bastard Rhubarb in fine Powder 2 Drams: Resinous Fallap in fine Powder 2 Scruples: best Scammony in subtil Powder a Scruple: Cloves in Powder 1 Dram: mix them for 4. Doses for a Man or Woman. It cures the Scurvy, Dropsy, Gout, Rheumatism, Jaundice, Kings-Evil, Pally, Scabs, Itch, and all sorts of Pustules and other breakings out whatsoever; It prevails against Agues, Purges off Choler, Flegm, and watery Humors, cleanses thoroughly the Stomach, and Bowels, and opens all obstructions of the Liver, Spleen, Menterery, Reins and Womb.

XVI. *The Pouder of the Seed.* That made of the Seed of *Patience*, cools, asfringes or binds, and is of extraordinary use in stopping Fluxes of the Bowels, and in spitting of Blood. The Seed of the *Bastard Rhubarb*, is also manifestly asfringent, and is said to cure the Bloody Flux, given in a Glafs of Red Styptick Wine. It eases the gnawing griping pains of the Stomach, and takes away Nauseousness, and loathing of Food: The Pouder of either of them may be given every Morning Fasting, and at Night at Bed time, from a Dram to two Drams, in a Glafs of Red Port, or *Barcelonina* Wine.

XVII. *The Distilled Water.* Drawn from either of the Plants, it is good to cool and allay Inflammations, cleanses the Face and Skin from external Defecations or Defilements, and is very profitable to heal running Sores, foul Ulcers, and Scabbiness in what part of the Body soever.

XVIII. *Nota.* Tho' Monks Rhubarb is of the Nature of the True Rhubarb, yet the Bastard Rhubarb approaches the nearest thereto; and is much the strongest and best of these two; it has not only the shape and proportion of the True Rhubarb, but the same color both within and without, with very little difference: they agree also as well in Taste and Smell; and it colors the Spittle of a yellow color, when it is chewed in the Mouth, as Rhubarb does; and it Purges the Belly after the same gentle manner as the right Rhubarb does; only herein it differs, that this must be given in at least the double quantity to that.

CHAP. DXLVIII.

OF PEASE Manured.

I. **THE Names.** It is called in Greek; *Πίσιον*, & *Πίσιον τὸ μαγειρῆον*: in Latine, *Pisum*, & *Pisum Cultatum*: in English Pease, and Manured Pease.

II. *The Kinds.* Of Pease there are several sorts, as, 1. *Pisum Cultatum*, *Pisum Hortense*, Manured Pease, of which in this Chapter. 2. *Pisum*, vel *Cicer*, vel *Lathyrus Annuus*, Annual Chich-Pease, or Chichings, of which we have spoken in Chap. 126, aforegoing. 3. *Πίσιον ἀγρῆν*, *Pisum agreste*, *Pisum Sylvestre*, Wild Pease of which in Chap. 549. 4. *Cicer Sativum* & *Sylvestre*, Chich Pease Garden and Wild, of which in Chap. 550. 5. *Cicerula*, *Lathyrus*, *Pisum Perenne*, Pease Everlasting, of which in Chap. 551. following.

III. *The Kinds of the Manured Pease.* There are many sorts of the Manured Pease, as, 1. *The Early Pease*, or *Fulham Pease*. 2. *The Green Hasting*. 3. *The White Hasting*. 4. *The Sugar Pease*. 5. *The Rouncival*. 6. *The Gray Pease*. 7. *The Spotted Pease*. 8. *Pease without Skins*. 9. *Tufted*, or *Scotch Pease*. 10. *Pisum rubrum*, *Pisum quadratum*, *Lotus Siliquosus flore rubella*, *Lotus tetragonolobus*, Square Codded Pease. 11. *Pisum cordatum*, Heart Pease. Of these Species, because of their great likeness one to another in their Stalks, Leaves, Flowers, and manner of growing, we shall give you but one Description, saving the tenth and eleventh Kinds, which shall be particularly spoken to.

The General Description.

IV. *The Roots of all the sorts of Manured Pease are small and Fibrous, and quickly perish after Seed-time.* Garden Pease are for the most part the greatest, and the sweetest Kinds, and are sustained with Stakes or Bushes. The Field Pease, are not so managed, because of the almost infinite Labor, besides Charge, and therefore grow as they naturally please, without any such trouble. They (all of them) spring up with long weak, hollow, and brittle (while they are young and green) whitish green Stalks, branched out into many parts, and at every Joint where it spreads out a Branch, there is one round broad Leaf, encompassing the Stalk about, so that they come as it were through it. The Leaves are Winged, made of several small Leaves, growing from a middle Rib, of a whitish green color, with Tendrels or Claspers at the end of the Leaves, by which it takes hold of whatsoever stands next to it. Between the Leaves and the Stalks, come forth the Flowers, standing two or three together, every one by it self, on its own several foot Stalk, which are either wholly white or purple, or mixt white and purple, or purple and blew: The Cods are long, and somewhat round or full and bunching out, of which some are greater, some lesser, some thick and short, some plain and smooth, others a little crooked at the ends, in which are contained several forms of Pease in

Number

Pease Garden Early.

Pease Field.

Pease Rouncivals.

Number from one to nine inclusive (I never saw ten:) of which some are round, others almost cubical; some small, some great: some white, some green, some gray, others spotted, &c.

V. The tenth, or Square Coddled Pease. Its Root is small and Fibrous like the former, and perishes every Year. It is a pretty Kind of Pulse, and might for the form of the Leaves be very well referred to the Kinds of Lotus or Trefoils. It has three or four small weak Stalks, which spread themselves out into many Branches, having two Stalks of Leaves at every Joint, and three small soft Leaves standing on a very small Foot Stalk, coming from the Joints. The Flowers grow for the most part two together, of a perfect red or crimson color; like in form almost, to the Common Garden Pease Blossom: after which come long, thick, and round Cods, with two Skins or Films, running all along the Cod, at the Back or upper side; and two other such like Films, all along the Belly or underside of the Cod; which makes it seem to be four square: in which is contained, round discolored Pease, something smaller, and harder than the ordinary Pease.

VI. The eleventh, or Heart Pease, which some call also, *Pisum Vesicarium*, Bladder Pease. *Cor Indum*, and *Cor Indicum* (because they first came from the Indies.) It has a Root which is very small, Bushy and Stringy, with many Fibres adjoining to it, and perishing every Year at the first approach of Winter. It rises up and spreads much, if it has a good Soil to grow in, having several slender weak Stalks, which will lye down upon the Ground, and entangle it self with the Claspers which it has, unless it be sustained with Stakes, Bushes, or some such like thing. These Stalks send forth large,

Pease Heart.

large, long, thin, and very green Leaves on all sides, upon long foot Stalks, being divided either into three or five parts, each of which is much rent or cut in on the edges. At the Joints with the Leaves from the middle of the Stalks almost upwards, and at their tops also, come forth several small whitish Flowers, set together upon a foot Stalk, each consisting of five small Leaves apiece, which being past away, small Bladders succeed in their places, in which are contained the Grains or Pease: these Bladders grow whitish as they ripen, having Six Ridges, of which three are the more eminent, and open into three parts, in each whereof lies one round, hard, blackish Seed, of the bigness of a great Pea, spotted on the out side with a mark, much of the form of a Heart, as it is painted on Cards, whence came the Name.

VII. *The Places.* All these several sorts of Pease grow with us only in Gardens, and the worst sort of them in Manured Fields, for the profit of the Husband-Man. The tenth is only Sown in Gardens: and so also the eleventh, being first brought to us out of Italy and other places, being originally (as is supposed) a Plant of Indian growth.

VIII. *The Times.* They are all Sown in the Spring: The first ten Kinds Flower in June, July, and August, and the Grain, or Pease ripen in the mean Season. The eleventh Flowers in August or September and the Grain or Pease is ripe in September or October.

IX. *The Qualities.* We speak now of the first nine or ten Kinds of Pease: they are hot and moist in the first Degree, Aperitive, Absterfiv, and Diuretick; Stomatick, Nephritick, and Arthritick, Chylifick, Analeptick and Spermatogentick.

X. *The Specification.* They are peculiar against the Strangury, or stoppage of Urine, Sand, Gra-

vel, Stones and Tartarous Mucilage or Slime in the Reins, Ureters, and Bladder: Breed good Chyle, nourish much, and restore in Consumptions.

XI. *Hippocrates* says, That Pease are less windy than Beans, and pass sooner thro' the Belly: And *Galen* says, That Pease in their whole substance are like unto Beans, and are eaten after the same manner, but that they differ in two things, viz. That they are not so windy as Beans, nor altogether of so cleansing a faculty; and that they are in a mean between those things which nourish much, and nourish little, and which are windy, and not windy.

XII. *The Preparations.* 1. An Essence of the Leaves and green Cods. 2. A Meal or Flower of the dried Pease. 3. A Decolion of Pease. 4. A strong Broth or Pottage. 5. A Cataplasm of Pease Meal. 6. The Ashes of Pease Straw and Cods. 7. A Distilled Water from Pease Blossoms, or from the whole Plant. 8. A Volatile Spirit, Oil and Salt, Distilled by Retort from dried Pease.

The Virtues.

XIII. *The Essence of the Leaves and green Cods.* It is highly Aperitive, Absterfiv and Diuretick, opens Obstructions of the Reins, Ureters and Bladder, breaks Gritty Stones, and expels from the Reins and Bladder, Stones, Gravel, Sand, and Slimy Humors in great quantities. Dose 2, 3, or 4 Spoonfuls or more in a Glass of White Port or Lisbon Wine.

XIV. *The Meal or Flower of Pease.* Made into a Pudding with Milk and Eggs, tho' it is Absterfiv and Diuretick, yet it nourishes very much, and being much or long eaten, it restores in Consumptions, the Patients Drink being every Day new Milk. Bread made thereof, or Cakes, and eaten while they are new, are also restorative; they very much strengthen the whole Body, provoke Lust and encrease Seed.

XV. *The Decolion of the Pease either green alone, or with the Cods, or dried.* It is a famous thing against the Strangury and all stoppages of Urine, Stone Gravel, Sand, Slimy Matter, &c. It opens all obstructions of the Urinary parts, expels the obstructing matter, and eases the Pain. Dose 6 or 8 Ounces; sweetened with Honey.

XVI. *The strong Broth or Pottage.* It is of great nourishment, and if it is made good and strong with Knuckles of Veal, and Legs of Pork, and strained from the Hulls of the Pease, and then he eaten as daily Food, it wonderfully restores in Consumptions, cherishes Languishing Nature, increases Seed, and provokes Lust extremely. It strengthens the Bowels, and stops all sorts of Lasks or Fluxes: and has such a Power in it as to cure Impotency in the Male Kind, whether it be from a weakness in the Instruments of Generation, or from a defect of Seed. It may be made pleasant and savory with a little Pepper and Salt, Juice of an Orange or Limon, and a little Sweet Butter.

XVII. *The Cataplasm of the Meal.* If it is made with Vinegar, with a little Oil, it repels and Dissolves Tumors in Womens Breasts, proceeding from too great a quantity of Milk, or from its Curdling therein: applied to the Testicles which are Swollen, it dissolves the Tumor, and eases the pain. If it is made with Wine and Yolks of Eggs, and applied to weak Joints it strengthens them: applied

applied also to swollen and watering Eyes it helps them. If it is made with Wine, Yolks and Whites of Eggs, Double refined Sugar, and Beef Suet: and then Fried in a Frying-Pan, and so eaten with a little White Sugar and Juice of Oranges, It good to restore [such as are Impotent, encrease Seed, and provoke Lust.

XVIII. *The Ashes of the Straw and Cods.* Being Infused in Ale, Beer, or Wine, the Infusion is very Aperitive, and Diuretick; it opens all Obstructions of the Reins and Bladder, is good against Sand, Gravel, Stone and Strangury, and prevails against the Scurvy, Dropsy, Jaundice and Gout. *The Ashes made into a Cataplasim with Hogs Lard,* and applied, is good against old Aches or Pains, Sciatica and Gout, whether in the Hands, Arms, Knees, or Feet.

XIX. *The Distilled Water from the Blossoms or whole Plant.* It is a Cosmetick, or a beautifier of the Face and Skin: it cools, softens, whitens, and makes smooth the Skin, the Face or Skin being often washed with it, and suffered to dry on. It is also good against Stone, Gravel, Sand and Slime in the Reins and Bladder, and gives ease in the Strangury. Dose 4, 6, or 8 Ounces, sweetened with the Syrup of Violets, Honey, or the like.

XX. *The Volatile Spirit, Oil, and Salt.* They are made exactly in all respects as those of Beans, in Chap. 55. *Sell.* 16. foregoing of this Book. *The Volatile Salt of Pease,* is one of the most Subtil and Volatile Salts, being of the same use with all other Volatile Salts. It prevails against all Diseases of the Head, Brain, Nerves, Spleen, Reins, Womb, and Joints: as Apoplexies, Epilepsies, Vertigo's, Megrims, Head-Aches, Lethargy, Carus, Colds, Vapors, Hysterick Fits, Colicks, Gouts, Rheumatism, &c. and kills Worms in the Stomach and Belly. Dose is from 7 Grains, to 14, in Wine, or any other proper Vehicle, Morning and Night. *The Spirit* has all the same Virtues and may be given from 10 Drops to 20 in Wine, Water, &c. *The Oil* is stronger: It ought to be rectified after the usual manner, and is chiefly for outward Applications: you may mix it with Oil of Ben, or of Bitter Almonds, and anoint the Stomach and Navel for Vapors and Fits of the Mother.

The Virtues of the Heart Pease.

XXI. *Cordus* on *Dioscorides* says, These Pease are a great provoker to Sleep, even to the Danger of Life, if the quantity given be too large: he says, That he tried this upon himself, and found it to be dangerous in provoking Sleep, if taken in too great a Dose; but he also says, it causes a pleasanter and sweeter Sleep than *Opium* does. *Dodonæus* says, that this Plant is the *Abrong*, or *Abrugi* of *Serapio*, in his Chap. 153. where he has these Words, *Abrong* is a small Grain, spotted with black and white, like unto the Grain Maize. It has the form of a Heart upon it in white, and therefore *Tabernemontanus* calls it *Cardispermon*. It is also said to be available against Faintings, and other Diseases of the Heart, and this is probable enough to be true, for if it has the proper

ties of *Opium* in it, to cause pleasant and sweet Sleep, as *Cordus* says, it may well have those effects also, as to comfort and cheer the Heart, and resist Fainting and Swooning Fits, and other like disaffections of that noble Part. I find not what Dose is given of it, That the industrious Artift is to find out by many Tryals, beginning with a small quantity first, and so increasing it gradually, till he finds how much will sufficiently do, and may be safely exhibited.

CHAP. DXLIX.

Of P E A S E Wild.

I. **T**HE Names. It is called in *Greek*, Πικρον λευκον, & Πικρον αλευρον: in *Latine*; *Pisum agreste* & *Pisum Sylvestre*: in *English* Wild Pease.

II. *The Kinds.* Authors have given us several sorts hereof, those which we shall take notice of in this Work, are only these following, viz. 1. *Pisum Sylvestre commune*, *Pisum Sylvestre primum*, The first, or Common Wild Pease. 2. *Pisum Sylvestre alterum*, The second, or other Wild Pease. 3. *Σικκος*, *Oculus Theophrasti* in his *de causis Plantarum*, Lib. 4. Chap. 2. *Ervilia Plinij*, in Lib. 18. Chap. 7. which is now its usual Name: *Aracis niger Matthioli* (which is erroneous) *Ervilia Sylvestris Dodonæi*, *Oculus Sylvestris*, five *Ervilia Lobelij*, *Cicer ervinum Lugdunensis*, *Orchus Parkinsoni*, *Ervilia Flore* & *Fruitu albo*, *Lobelij*, White winged Wild Pease. 4. *Ervilia altera*, Blackish winged Wild Pease. 5. *Pisum Spontanum Maritimum Anglicum*, English Wild Sea Pease. 6. *Pisum aliud Maritimum Britannicum*, The other English Sea Pease, or Suffolk Pease. 7. *Pisum Sylvestre nigrum maculatum Baticum*, Spanish black spotted Wild Pease.

The Descriptions.

III. *The first, or Common Wild Pease.* It has a Root which is as thick as ones Finger, and long, with many Fibres adjoining. This Plant does little differ from the Manured, either in its rambling corner'd Stalks, or in its broad, stiff, green Leaves, two always being set at a Joint, and six or more lesser ones, on the Branches, which end in a Clasper. The Flowers are white, many standing on a foot Stalk together, which turn into so many Cods, each of them much smaller than the Manured, and the Seed, Grain, or Pulse within, much less also, and of no Pleasant Taste.

IV. *The second, or other Wild Pease.* Its Root abides many Years, and is much like the first, but the Branches of this are scarcely half a Foot long, with broader, and shorter Leaves on them, yet like the former but more pale. The Cods and Pease likewise differ not much in form, but are much less.

V. *The third, or White winged Wild Pease.* Its Root is small and long, with some Fibres adjoining, which wholly perishes every Year. This

kind of Pease has two or three Stalks at the root, which are broad and flat, veined or winged at the sides, with somewhat long Leaves shooting from them, small at the setting on to the Stalk, and broader towards the end, as it were growing from the middle Rib of the other, at the top of which comes forth two or three twining Claspers. This Plant never shoots forth any Branches, but the Leaves from almost the bottom of the Stalks upwards

Pease Wild Winged.

are parted as it were at their tops into one or two smaller Leaves; or rather one or two smaller Leaves grow at the top of them with the Claspers between them. At the foot of these Leaves, come forth single flowers, like to the Cicer or Garden Chick Pease in the following Chapter, which are wholly white, and turn into small, round, long Cods, with small crooked points at the end, and Films at the Backs, in which are contained small, round, whitish Pease, a little bitterish.

VI. The fourth, or Blackish winged white Pease. This in its Roots, Stalks, Leaves, Flowers, and manner of growing, differs nothing from the last Described, saving in the color of the Flowers, which in this are tending to a reddish purple: the Pease in the Cods also are more dusky, tending to black.

VII. The fifth, or English Wild Sea Pease. The Root of this perishes not every Year, and in its Roots, Stalks, Leaves, Flowers, and Cods, and manner of growing, differs not much from the second sort before described: but herein this differs from that, viz. That it grows somewhat greater, and bears many Flowers together in a Tuft, mixt of purple and Ash color: and the succeeding Husks or Cods are small and long.

Pease Sea Wild English.

VIII. The sixth, or other English Sea Pease or Suffolk Pease. Its Root runs down incredibly deep into the Ground, even two Fathom, or twelve Feet deep at least, and spreading infinitely (as it were) therein, among the very Stones and Beech of the Sea. From the Head of this Root springs up a triangular Stalk full of Joints, bending to the Ground, with two Leaves at every Joint, branched forth in divers Places with winged Leaves at them, consisting of ten or twelve dark green Leaves, set by couples or pairs on a middle Rib, with a small Clasper at the end, each Leaf not being much unlike to Sea Parslane. The flowers grow towards the Tops of the Branches, 8 or 10 set together in a Cluster, upon a small long Stalk, which both for form and color, are very like to the first Kind of Wild Pease, but with a whiteness in the middle, when it is full blown. The Fruit or Cods which follow, are lesser than those of the Common Field Pease, and contain (many times) 8 or 10 Pease in a Cod, each of which has the whiteness called the Eye of the Pea, which encompasses half the Pea, like a Semicircle, the which being Ripe and dry are of a darkish color. About a Yard deep or more under the Stones, there is found some Sand, or sandy Earth, in which the Roots of this Plant spread, which are not great, but slender pliant and flexible, not sweet but bitter, as the whole Plant is, and the Pease also. The old Stalks dye away every Year, but from the old Head of the Root, will shoot many long, white Tendrils, like the Root of the small Bind-weed, by which it wonderfully encreases, and not by the Seed, as has been found by Experience. For that the Seed falling upon, or among the Stones of the Beach, it is scarcely possible it should grow there, there being no Fæculum or Earth to nourish the same; till you dig two or three

three Feet deep; the Birds also for the most part devour it all. All this Parkinson supposes to be true, for that he Sowed some of the Seed or Pease in his Garden, but they would never Spring up. However, tho' this matter of Fowl may be true, yet 'tis probable, that if the Seed or Grain had been Sown in a Ground or Soil proper thereto, it might have grown, notwithstanding what Parkinson has said.

IX. The seventh, or Spanish black spotted Wild Pease. This Kind differs not much neither in its Root, (which Perishes every Year) Stalks, Branches, Leaves, Flowers nor Cods, from our first sort of Wild Pease described in this Chapter, but in many things it is like. Yet it is lesser, and the Flowers are of a pale yellowish green color: and the Pease are of a dark color spotted with very black Spots like Velvet.

X. The Places. The first has been found in many places of England. The second, on the Chalky Hills, at Kings-Hay in Kent, not far from the Thames: there is a larger sort of this second Species, which has been found in some Barten Fields in Essex. The third and fourth grow with us only in our Gardens, but Lobel says, they grow naturally in Lombardy. The fifth has been found growing near Romney in Kent. The sixth was found growing Anno 1555, being the third Year of Queen Mary I. between Orford and Alborough, where it grew upon the Beech of the Sea, in places where never Grass or Herbage was ever seen to grow, but the neighbouring People thereabouts said, that they had observed, and known them to grow there of a long time before. In that Year there was a great Dearth, so that many were forced to make Bread of Acorns, and the People gathered many Quarters of these Pease (being in great necessity) to eat them for Food, and keep them from Starving, which at that time might be accounted a great blessing from Heaven. Stow in his Chronicle; and Camden in his Britannia, make mention of these Pease: but vainly thought that they might first come thither by some Shipwrack. But this is false, for it is a singular Plant sui Generis, specially differing from all the other Kinds: and this is true, from its form and taste: but besides it has been found growing in other places about the Sea Shore (which seems to be natural to it) as at Rye in Kent, at Pemse in Sussex; at Gifford in Surry, over against the Comber, and at Ingolne Mills in Lincoln-shire. The seventh grows in Spain, from whence it has been brought into our Gardens.

XI. The Times. These all Flower, and bear their ripe Fruit with the latter Kind of Field Pease: The sixth Kind Flowers about the end of July, and the Cods are ripe about the end of August.

XII. The Qualities, Specification, Preparations, and Virtues of these are the same with those of the Manured Kinds. The third and fourth Kinds (according to Galen) are in a mean or middle property between those which nourish much, and little, and which are easie and hard of Digestion, but they are hot and moist, and have a drawing, digesting, cutting, and cleansing Faculty; that they also purge the Liver, Spleen and Reins; cleanse the Skin from Scurf, Morpew, Leprosie, Tettars and Ringworms, dissolve hard Tumors in the Cods, and heal Apoplems, running Sores and putrid Ulcers, the Meal being mixt with Honey: and this is spoken in General, of all the Kinds.

C H A P. DL.

Of P E A S E -- C H I C H ;

O R,

C I C E R, Garden and Wild.

I. THE Names. It is called in Arabick, Chemps, Hamos, Achamos, or Halhamos: in Greek, *Ἐπίκυρος*, & *Ἐπίκυρος κείος*: in Latin, *Cicer*: and in English, Chich Pease, and Cicers.

II. The Kinds. Of this Plant there are two Principal Kinds, viz. 1. *Ἐπίκυρος ἑσπερος*, Cicer sativum, vel bortenfis, Garden Chich Pease, or Cicer. 2. *Ἐπίκυρος ἀγρος*, Cicer Sylvestre, Wild Chich Pease, or Cicer.

III. The Garden Kinds of Cicers. There are several of this Species, as, 1. *Ἐπίκυρος κείος* Cicer Arietinum, White Garden Chich Pease, Rams Chiches, Rams Pease, and Rams Cicers. 2. *Cicer rubrum*, Red Cicer, or Chich Pease. 3. *Cicer nigrum*, Black Cicer, or Chich Pease. This is Matthioli's his red and black Cicer, but the red in time changes into black; these three differing only in their colors, will merit but one general Description, which we shall give you in Sect. V. following.

IV. The Wild Kinds of Cicers. There are eight sorts of the Wild Kind, viz. 1. *Cicer Sylvestre Matthioli*, Dodonai, Lugdunensis & Dalechampi; Cicer Sylvestre majus Thalij, Cicer Sylvestre Herbariorum Lobelij, The greater Wild Cicer. 2. *Cicer Sylvestre minus*, Cicer Sylvestre minimum Thalij, The lesser Wild Cicer. 3. *Cicer Montanum Languinosum*, Bauhini; The Woolly Mountain Cicer. 4. *Cicer Montanum ægros* Bauhini, Mountain Cicer without any Stalk. 5. *Cicer Sylvestre Triphyllum*, Cicer Sylvestre verius Lobelij, Cicer Sylvestre alterum aliorum, Trefoil Wild Cicer. 6. *Cicer Sylvestre alterum triphyllum*, Cicer Sylvestre secundum Dalechampi Lugdunense; The second three Leav'd Wild Cicer. 7. *Cicera ægros*, five *Aracus major Beticus*; The greater Spanish Wild Chichling Pease. 8. *Aracus minor Lusitanicus*, The lesser Wild Chichling Pease.

The General Description of the Garden Kinds.

V. They have a small Root which perishes every Year: The Ram or white Chich Pease, (and so of the others) has Stalks of a Yard long, on which do grow winged Leaves; that is, many small and almost round Leaves dented about the edges, set on both sides of a middle Rib. At the Joints come forth one or two Flowers, upon short foot Stalks, Pease fashion, either white or whitish, or else purplish red, lighter or deeper, according as the Pease which follow will be; which are contained in small, thick, and short Pods or Cods, (in which be one, or two Pease, more usually) a little pointed at the lower end, and almost round at the Head, yet a little cornered or sharp. This White Chich Pease is much used in Spain, so that it is usually one of their Chief Dishes at all their Feasts.

Pease Chick Garden.

The Descriptions of the Wild Kinds.

VI. The first, or Greater Wild Cicer. It has a hard and woody Root, which lives long, and

Pease Chick Wild.

spreads far about. It has very long winged Leaves set on the Stalks, composed of many, every one of them being small, and longer than those of the Garden Kind before Described, not dented at all about the edges, and of a sad green color. At the tops of the Stalks, come forth many Tufts of Flowers, thick set together, of a pale, yellowish color, almost white, after which follow rough skinny Cods, in Tufts also, each of them small pointed at the end, within which are contained other small smooth Husks, which have many small, flat, yellow, round Seed, (as Thallius says,) but Lugdunensis, makes the first of Dalechampsius, to have blackish Flat Seed or Grains, and not like to the Matured Cicers, (which some take to be both one, as also that of Matthiolus.)

VII. The second, or Lesser Wild Cicer. This in its Roots, Stalks, Branches, Leaves, Flowers, Cods, Grains, and manner of growing, is altogether like the former, but in this it only differs, that it is not altogether lesser in the whole, but lesser in every part.

VIII. The third, or Woolly Mountain Cicer. It has upright round Stalks about a Foot high, and soft or woolly, spreading themselves forth into small Branches, on which grow winged Leaves, ten or twelve on a side, of a middle Rib, with an odd one at the end, each of which is soft or woolly, and long like unto the Vetches, some broader and some narrower than others. At the tops of the Branches, grow a Spike of rough pale colored Flowers, and the Cods which follow, are somewhat long and woolly, with a crooked Thread at the end, containing within them small black Seed.

IX. The fourth, or Mountain Cicer without Stalks. Its Root runs deep into the Earth, if the Rocky Ground on which it grows does not hinder it: from whence spring several hairy foot Stalks of Leaves, which contain about twelve or more of a side, something round yet longer than those of the Garden Cicer, their edges being hairy, and some of them equally, others unequally set one against another, with an odd one at the end. The Flowers grow near about the Root, being somewhat long and pale, and after them come Swoln Cods having two partitions, full of small yellow Seed, like unto those of the Medicas, which are of a Kidney fashion.

X. The fifth, or Trefoil Wild Cicer. It has a long slender Root with some Branches and Fibres adjoining, from which rise up Stalks about two Feet high, divided into some Branches spreading abroad, on which are set upon long foot Stalks one above another, Leaves divided into three parts, like the Wild Trefoil, and each of them larger, thicker and rounder than those of the Garden Cicer, a little dented about the edges. The Flowers grow two or three together upon a long foot Stalk, at the Joints with the Leaves, which are like the Garden Cicer Flowers, but larger. The Cods that follow are small like unto the Garden Kind, but something flatter, having some small Leaves at their bottoms, within which ly much smaller Seed, and more flat, and rather like to those of the Cicercula, in Chap. 126. foregoing.

XI. The sixth, or The second three Leav'd Wild Cicer. This has a thick, long, Branched Root, which is blackish without, and whitish within. The Stalks are full of Branches, with Leaves like unto Cicers, but three always set together, and no more. The Flowers are red: and the Cods are like unto the other Wild Cicers, but hairy, and spotted with red Spots.

XII. The seventh, or Greater Spanish Wild Chichling Pease. It has a Root which is small and Fibrous.

Fibrous, and perishing yearly. It spreads on the Ground, with several square, hairy, and crested Stalks; sometimes a yard long or more; at the several Joints of which, grow many dark green hairy pointed Leaves set on each side of a middle Rib, which end in a Clopper, like Lentils, or Vetches. At the foot of the Leaves, come forth single Flowers on very short foot Stalks, of a dasky, whitish purple color, with deeper purple Veins therein; and of a deeper purple at the bottom of the upper Leaves, next to the Stalks: which when they are past, there come in their places, short, thick, and almost roundish Cods, covered with a short hairiness thereon; within which lyes 3 or 4 round blackish Pease, almost like unto blackish Velvet, as big as those of the Cicercula, but not cornered.

XIII. The eighth, or Lesser Wild Chichling Pease. The Root of this perishes likewise every Year, as the former does. In its Stalks, Leaves, Flowers, Cods, and Grain, it is much like the former, but lesser in all its parts, and nothing hairy. The Flowers are of a pale white (with us in England) or of a whitish yellow Color. The Cods are smooth, smaller, and not hairy, with smaller, and blackish colored Pease within them.

XIV. The Pease. All the Manured or Garden Cicers, or Chich Pease, are Sown with us in Gardens, or in Fields, as other Pease are, not only in England, but in other Foreign Countries, where they are Sown for Food, as in Spain, &c. The first six sorts of the Wild Kinds, grow upon Hills and in Woods, and sometimes by Hedge sides in Fields. The seventh grows in Spain, and the eighth in Portugal, from whence they are brought to us in Seed, and are Nurt up with us in Gardens.

XV. The Times. The Garden Chich Pease, tho' they are Sown sooner than Pease, yet they are gathered at the same time with them, or a little after. The first six Wild Cicers, or Chich Pease, Flower in July and August; and the Cods or Seed are ripe in August or September. The seventh and eighth Flower with us in the end of July, and the Cods or Pease are ripe in August or September. But Boel who first brought them out of those places, viz. Spain and Portugal, their natural places, says that he gathered their ripe Cods or Pease in April and May.

XVI. The Qualities. Garden Cicers or Chich Pease are hot and dry in the first Degree; Incitive, Absterfiv, Diuretick, Nephritick, Hyfterick, Emmenagogick, Chylifick, Analeptick, Galectogenetick, and Spermatogenetick. The Wild Cicers or Chich Pease are so much more powerful than those of the Garden, by how much they exceed them in heat and dryness, perceived by their sharper and more bitter Taste; whereby, it is manifest that they much more open obstructions, provoke Urine, break the Stone, and have all those other properties of Inciding, Opening, Digesting and Dissolving, which are attributed to the Garden Kinds, and that both more speedily and more certainly. And Pliny says, that if they be taken too largely, they breed Wind, and loosen the Belly, but not without some Pain.

XVII. The Specification. They are peculiar in easing the Strangury, breaking the Stone in the Reins, expelling Sand, Gravel and Tartarous Matter from the Urinary parts, and provoke the Courses in Women. They prevail against Pleuritick Pains and Stitches in the Sides, carry off the Dropsy, and Yellow Jaundice by Urine, are Emollient, and cleanse the Belly by Stool. The white Ram Cicers, or Chich Pease, are those which are only used as Meat or Food, they are a little windy, but are said to Nourish more than either

Pease or Beans, for which reason they are of extraordinary use in curing Consumptions; They increase Milk in Nurfes, and Seed mightily, both in Men and Women, incite Lust powerfully, and cure Barrenness in both Sexes; which things all the Kinds of Cicers do; and for which reasons they are commonly given to Stallion Horses. The White are accounted a Delicacy among the Spaniards, and commonly one of their choice Dishes in all their Feasts, as we have before hinted. The other Garden Cicers, but chiefly the Wild Kinds, are most used as Physick or Medicine.

XVIII. The Preparations. You may make therefrom, 1. A Boiled Mese, of the White Cicers or Chich Pease. 2. An Essence of the Leaves and green Cods. 3. A Decoction of the green Cods. 4. A Meal or Flower of the Grain. 5. Bread and Puddings thereof, if of the white Rams Chich Pease. 6. A Cataplasm of the Meal or Flower. 7. Ashes of the Straw and Cods: From which a Fixt Salt may be extracted by Elxiviation. 8. A Distilled Water from the Flowers, or from the green Cods, or from the whole Plant. 9. A Volatile Spirit, Oil, and Salt of the dried Cicers, as you make those of Beans in Chap. 55. Sect. 16. foregoing. 10. A Strong Broth of the White Cicers, made by Boiling till they break, with Knuckles of Veal, Mutton, Pork, and Beef, &c. and then strained out from the Hulls.

The Virtues.

XIX. The Virtues and Uses of all the aforegoing Preparations are the same with those of Beans, in Chap. 55. Sect. 10. ad 18. Chap. 56. Sect. 12. ad 17. Chap. 57. Sect. 11. ad 17. And Chap. 548. Sect. 13 ad 20 to all which you are referred for full satisfaction, these Cicers or Chich Pease being altogether of the same Qualities and Nature.

XX. Nota. 1. Galen says that Cicers are windy Food, yet that they Nourish more than Beans, provoke Urine more, as also encrease Seed. They are more cleansing than Pease or Beans, and thereby are said to break the Stone in the Reins.

XXI. Nota. 2. There is a Cream to be made of them, by boiling them in Water, which being freely eaten plentifully encreases Seed in both Sexes, as also Milk in Nurfes, it provokes Urine, and gently keeps the Belly soluable.

XXII. Nota. 3. The Decoction of any of the Cicers in Water, chiefly of the Wild, made with Rosemary, Dioscorides says is good for the Dropsy and Yellow Jaundice. But tho' the Wild Cicers are said to be the most powerful for Medicine, yet the white Ram Cicers or Chich Pease, are said more powerfully to encrease Milk and Seed, and provoke Lust.

XXIII. Nota. 4. The Broth Compounded. Take Cicers 3 Ounces; French or Hull'd Barly 2 Ounces, Marsh Mallow Roots 2 Ounces and half, boil them sufficiently in Chicken Broth. Of this five or six Ounces may be taken in the Morning fasting, against Pains and Stitches in the Sides, Dropsy, Jaundice, Gout, Rheumatism, &c. and thereby the Belly will be gently Purged.

XXIV. Nota. 5. Dioscorides says that Cicers are hurtful to such as have Ulcers in their Reins or Bladder; but I know no reason for his so reporting, unless it be from their great absterfiv or cleansing Qualities; however from the Experience I have had of the use of them I am of the clear contrary Opinion.

XXV. Nota.

XXV. Nota. 6. Plutarch has also this Note. That no Worms breed in Cicers, whereas all other Pulces are subject to them; by which he seems to intimate, that they resist Putridity or Corruption, but he relates this thing upon another account.

CHAP. DLI.

OF PEASE Everlasting.

I. **THE Names.** It is called in Greek, *Λαβύρος* & *αἰδιός*; in Latine, *Lathyrus perennis*; *Cucircula*, & *Cicercula perennis*: in English, *Pease Everlasting*.

II. **The Kinds.** There are but three Species observed of this Plant, viz. 1. *Λαβύρος αἰδιός* *μαζών*, *Lathyrus perennis major*; *Cicercula perennis major* *Baubini*; *Clymenum Matthioli*; *Eruum Sylvestre* *Fuchsi*; *Ervillium Celsini*; *Pisum Grecorum* *Tragi*; *Lathyrus Latifolius*; *Pisum perenne*, *Pease Everlasting the greater*. 2. *Lathyrus perennis angustifolius*; *Orobis Venetus Clusi*, (but very improperly, for tho' it came from Venice, yet it is no *Orobis*;) *Blew upright Pease Everlasting*, *Pease Everlasting narrow Leav'd*. 3. *Lathyrus perennis Sylvestris Dodonæi*. *Wild Pease Everlasting*.

The Descriptions.

III. **The first, or Pease Everlasting the greater.** Its Root is great, black and rugged on the outside, running down deep into the Ground; it is of the

Pease Everlasting.

thickness sometimes of a Mans Arm, and whitish within, spreading it self out into some Branches, with a few Fibres annexed to them. This Plant abides long, and grows every Year greater and greater. It first springs up with many long, flat, or broad, trailing Branches, or Stalks, winged as it were on both the sides, which must be sustained; and are diversly divided into several other smaller Branches, at the several Joints of which, stand two hard and not very broad Leaves, but somewhat long and green, with divers Claspers or Tendrels in several places with the Leaves, from between the Branches and the Leaves, and at the ends of the Branches. At the Joints towards the top, and at the ends of the Branches, come forth pretty long Stalks, with five or six or more Pease like Blossoms, of a fine pale, purplish red color, very beautiful to behold, and of a very pleasant Smell. After which succeed small, long, hard Skin'd, roundish, and whitish Cods, with small round blackish Pease in them. This is that which Lobel calls *Lathyrus folio Latiore*, and has been found growing Wild, in several places of our Land.

IV. **The second, or Blew upright Pease Everlasting, or Pease Everlasting narrow Leav'd.** Its Root is black, hard or woody, abiding after Seed time, as the former does, and shooting afresh every Year. It has divers slender, but upright green Branches, somewhat corner'd, two Feet high, or more, having at several distances on both sides of them, certain winged Leaves, set together upon long foot Stalks, one against another, consisting of eight Leaves, a little broadish in the middle, and pointed, without any odd one at the end. At the Joints towards the tops, between the Leaves and the Stalks, come forth many Flower's set together, upon pretty long foot Stalks, of the fashion of the former Pease Blossom, but somewhat smaller, and of a purplish blew, or Violet color: After which come slender or long pointed Pods or Cods, rounder than the foregoing, in which are contained, small, round, grayish Pease. This in its durability, form, and manner of growing, differs not much, but in having somewhat paler Flowers, and in the Leaves thereof, which are narrower than they.

V. **The third, or Wild Pease Everlasting.** The Root of this is long, and endures for many Years. It has longer winged Stalks, and something larger Leaves, but shorter Claspers or Tendrels than the last: The Flowers are of a deep purple: And the Cods are long and slender, with small, hard, round Pease within them.

VI. **The Places.** It is said that they have all of them been found growing Wild with us, in several parts of the Kingdom; but are usually Cherished and Nurst up in Gardens for the beauty of the Flowers.

VII. **The Times.** They all Flower about the Months of June and July, to the end of August; and the Grain, or Pease are ripe in some short time afterwards.

VIII. **The Qualities, Specification, Preparations and Virtues** of these, are the same with those of Pease, in Chap. 548. foregoing, to which you are referred. Galen says, That *Lathyrus* is in substance much like to *Ervilia*, and *Phaselus*, or Beans; and that the Country People in his Country of Asia, did use them as they used *Phaselis*, and made them into Pottage, as they did *Lentils*: but says he, They are of a thicker Consistence than they, and that they Nourish more

C H A P. DLII.

Of PELLITORY of the Wall;

OR,

P A R I T A R Y.

I. **T**HE Names. It is called in Greek, *Ἑλκίνη*, & *Παρύτιον* (the first *quod foliorum* & *seminum hirsutie vestibus adherat*: the latter, *quod Perdices ea libenter vescantur*:) in Latin, *Helxine*, & *Perdicium*. It is also called *Parietaria*, or *Parietaria*, also *Muralium*, & *Herba Muralis* (because it naturally grows upon Walls.) And by some Authors, *Urceolaris*, *Vitrage*, & *Vitriolaris Herba*. *Galen* and *Paulus Aegineta* said, That in their days (also *Cornelius Celsus*, and *Pliny* out of him) that several did call it *Parthenium*, but this erroneous Name is so Foreign to the Plant, that it needs no refutation: in English it is called *Pellitory* and *Paritary* of the Wall.

II. The Kinds. There are but two peculiar Kinds used in Physick, viz. 1. *Parietaria vulgaris*, *Perdicium commune*, *Helxine vulgaris*, *Helxine major*, *Parietaria major*; Our common or greater *Pellitory* of the Wall, or *Greater Parietary*. 2. *Parietaria minor*, *Helxine minor*, *Parietaria exigua* *Tragi*; The lesser *Parietary*, or *Pellitory* of the Wall.

The Descriptions.

Pellitory, }
OR, } of the Wall common.
Paritary }

III. The first, or Our Common, or Greater *Pellitory* of the Wall. Its Root is somewhat long, with many small Fibres adjoined thereto, of a dark reddish color, and abides all the Winter (altho' the Stalks with their Leaves perish) and springs up again afresh every Year. It rises up with many brownish, red, tender and weak, clear, and almost transparent Stalks, about two Feet high. Upon which grow at the several Joints, two Leaves, something broad and long, like unto those of French Mercury, or *Amaranthus*, called *Flower Gentle*, of a dark green color, which afterwards turn brownish, and smooth, or not at all dented about the edges, which are a little rough and hairy as the Stalks also are. At the Joints with the Leaves, from the middle of the Stalks upwards, where it spreads it self out into several branches; come forth many small pale purplish Flowers, in hairy, or somewhat rough Heads or Husks; after which comes small black and rough Seed, which will stick to any Garment or Cloth it shall touch.

IV. The second, or Lesser *Parietary*, or *Pellitory* of the Wall. Its Root is much like the former, and the Plant grows in like manner as that does, but

Pellitory, }
OR, } of the Wall small.
Paritary }

not so great or high; having tender, reddish, rough Stalks, smaller and shorter than the other, but with something greener Leaves thereon, yet rougher, (not much unlike to those of Basil) so that they will stick to any Cloth, or other thing they touch. The Flowers and Seed differ not much from those of the greater, but are smaller, and the Seed is more like unto *Pavillane Seed* (when rubbed out of the Husks,) than the former.

V. The Places. The first grows Wild generally throughout all England, about the Borders of Fields, and among Rubbish, and by or on the sides of old Walls, chiefly Stone Walls; on the moist Corners

Corners of old Church-Walls, and Stone Buildings, and other like Places. I have seen it grow plentifully upon the Stone Walls of the Cathedral or Minster of Ely, from which I have sometimes formerly gathered it. It will thrive also well enough, when Planted in Gardens on the shady side, and where it is moist withall; and if a great deal of Stone or Brick Rubbish, and old Mortar of Walls be mixed with the Earth, it will thrive admirably well; and if it is suffered to Seed and Sow it self, and then to spring up of its own Sowing, it will not easily be eradicated thence afterwards. The second or lesser Kind is rare in England as also in Germany, and is not to be found growing naturally with us, but as it is Planted in Gardens: these two seldom grow together in one place: and the latter keeps its green Leaves sometimes all the Winter.

VI. *The Times.* They both Spring up in the middle or end of April and in May; they Flower in June and July, and the Seed is ripe in July or August, or not long after.

VII. *The Qualities.* Pellitory of the Wall, is said to be cold and moist in the first Degree. It is highly Aperitive, Absterfive, Anodyn, Diuretick, Traumatick, Hepatick, Nephritic, Hysterick, and Arthritic.

VIII. *The Specification.* It cures the Strangury and Dropsy; and is highly profitable against the Stone, Sand, Gravel or Tartarous Slime in the Reins and Bladder; is good against Coughs, and pains of the Liver, Spleen and Womb.

IX. *The Preparations.* From the whole Plant of Pellitory of the Wall you may have, 1. A Liquid Juice. 2. An Essence. 3. A Syrup. 4. A Decoction. 5. A Clyster. 6. An Ointment. 7. A Cataplasm. 8. A Distilled Water. 9. An Electuary. 10. A Saline Tincture.

The Virtues.

X. *The Liquid Juice.* Given to the quantity of 6 or 7 Spoonfuls at a time, it gives wonderful ease to such as are troubled with the Strangury or suppression of Urine, causing them very speedily to make Water, and to expel Sand, Gravel, and Stones or Tartarous Slime from the Reins and Bladder, and carries off the Water in Dropsies, to admiration, giving thereby a speedy cure to that Disease. The Juice held a while in the Mouth, gives ease in the Tooth-ach; and dropt into the Ears it eases their Noise and Ringing, and takes away pricking and shooting Pains in them. The said Juice cools Inflammations, and is good against Burnings by Fire, or Scaldings with Water: it prevails against Antonies Fire, or any other eruptions of heat, being bathed often therewith, and wet Cloths dipped therein being also laid on. It is very effectual to cleanse Fistula's, and to heal them, more especially if a little Honey be mixed therewith.

XI. *The Essence.* It has all the Virtues of the Liquid Juice, and may be given in the same Dose; It eases the pains of the Liver, Spleen, Reins, and Womb: and opens all their obstructions. Used as a Gargarism, it cures Inflamed, Swollen, Sore, and Ulcerated Throats: and is profitable being inwardly taken, and outwardly applied, for the curing of old running Sores, and putrid Ulcers in any part of the Body, beyond many other things.

XII. *The Syrup.* It is made of the Juice and Honey: It has all the Virtues of the Juice and Essence, and may be given Morning and Night, 2,

3, or 4 Spoonfuls either alone, or mixt with a Glas of White Port Wine. It is a peculiar thing for the cure of the Dropsy. Therewith my Father cured me of the Dropsy Anasarca, when the hopes of Life were almost past. I took 3 or 4 Spoonfuls of this Syrup Morning and Night for a Month together: It carried off the Water after an admirable manner, and I became perfectly well, without so much as taking one formal Purge.

XIII. *The Decoction in Wine or Water.* It has the Virtues of the Juice, Essence and Syrup, but nothing near so powerful, and may be given Morning and Night, to 6 or 8 Ounces mixt with Honey, it becomes an excellent Gargle for an Inflamed, Sore, or Ulcerated Mouth and Throat.

XIV. *The Clyster.* It is made of the Juice or Essence mixt with Honey. It eases Pains in the Sides, Back and Bowels, proceeding from Wind, or the Stone and Gravel in the Reins. It heals also a Bloody Flux, and Excoriations or Ulcers in the Bowels.

XV. *The Ointment or Liniment.* It is made of the Juice with Oil of Roses and Ceruse, or White Lead. It is good against Ignis Sacri, hot Eruptions in the Skin, cleanses foul, rotten filthy Ulcers, and such as spread or creep; cures running Sores and Scabs in Childrens Heads, and stays the falling of the Hair: applied to the Fundament, it eases the Hemorrhoids or Piles and quickly cures them. Mixed with Goats Suet, or a little Cyprus Turpentine, it cures the Gout.

XVI. *The Cataplasm.* The Green Herb beaten up with a little Wine, and applied as hot as it can be well endured to the Belly; it eases the Colick, and pains of the Bowels proceeding from Wind. The Cataplasm of the simple green Herb, with a little Salt, cures simple green Wounds, cleanses old running Sores, and putrid Ulcers, and causes them to heal, and it is so effectual to heal any simple green Wound, that being bound thereto for three days, it will heal it without any other Salve, Balm, Ointment or Medicine. If the Cataplasm is made with Mallows, with Wheat Bran and Bean Flower, adding also a sufficient quantity of Wine in the boiling them together, with a little Oil Olive, and applied warm to any bruised Nerve, Tendon, or Muscle, it does in a short time restore them to their pristine state of Health and Soundness, easing the Pain, dissolving the Contusion, and dissolving the coagulated Blood.

XVII. *The Distilled Water.* It has the Virtues of the Juice, Essence and Decoction, but in a much inferior or meaner degree. Mixt with Sugar and Drank, it works the same effects. Applied to the Face or Skin, it is said to clear it from Spots, Freckles, Pimples, Wheals, Tanning, Sun-burn, Morpew, Scurf, &c. leaving the Skin clear, smooth and delicate.

XVIII. *The Electuary.* It is made of the Powder of the Herb, and a Rob of its Juice, mixt with Honey. It is a singular remedy for any old, continual or dry Cough, Asthma's, shortness of Breath, Hoarseness, Wheezing, and other Distempers of the Brest and Lungs.

XIX. *The Saline Tincture.* It is excellent to cleanse the Reins, Ureters, Bladder, and Womb, helps against the Strangury, provokes Urine, and brings away Tartar, Sand, Gravel and Stones, from the Reins, Ureters and Bladder.

C H A P. DLIII.

PELLITORY of Spain :

O R,

S N E E S E W O R T .

I. **T**HE Names. It is called by the *Arabians*, *Macarcaraba*, or *Haebarcharba*; in *Greek*, *Παρακρη*, & *Πιπέλερ*; in *Latine*, *Parmica*, & *Pyrethrum*; in *English*, *Pellitory of Spain*, and *Sneefewort*.

II. **The Kinds.** There are several sorts of this Plant, as, 1. *Parmica vulgaris* *Parkin-soni*, *Parmica Fuchsij*, *Gesneri*, & *Matthioli*; *Parmica Sylvestris* *Germanica* *Thalij*; *Parmica Pratenfis* *Clusij*, *Parmica folio Taraconis* vel *Sternutamentoria* *Lobelij*, *Pyrethrum Brumfelsij*; *Pyrethrum Sylvestre* *Cordi*; *Parmica fœe Draco Sylvestris* *Dodonai*; *Tanacetum album* vel *acutum* vel *Millefolium Primum* *Tragi*, *Tarachon Sylvestre* vel *Aquaticum*, & *Draco Aquaticus* *Gesneri*, *Dracunculus Pratenfis serrato folio* *Bauhini*, Common Field Pellitory or Sneefewort. 2. *Parmica Sylvestris Flore pleno*, *Sternutamentoria Flore pleno*, *Pyrethrum Flore pleno Sylvestre*, Common Field Pellitory with a double Flower. 3. *Παρακρη*, *Parmica vulgaris* *Officinarum*, *Pyrethrum vulgaris* *Officinarum*, *Pyrethrum aliorum*, & *Salvoaris*, *Pyrethrum alterum Lugdunensis*, *Matthioli aliorumque*, *Pyrethrum Officinarum* *Lobelij*, & *Flore Bellidis*, *Bauhini*, The Common Shop Pellitory of Spain. 4. *Πιπέλερ*, (*ob radicis igneum fervorem*, & *ἵδιον*, *Ignis Fire*) *Pyrethrum*, & *Pyrethrum verum Dioscoridis* *Matthioli*, *Pyrethrum alterum* *Lobelij*, *Salvoaris*, (from its quality of attracting Spittle in the Mouth) *Pyrethrum Dioscoridis* *Camerario*, *Pyrethrum Umbelliferum*, & *Umbelliferum primum*; The true Pellitory of Spain. 5. *Pyrethrum Umbelliferum alterum*, *Pyrethrum Gesneri*, & *Dalechampij*, The other true Pellitory of Spain.

The Descriptions.

III. **The first, or Common Field Pellitory or Sneefewort.** Its Root is long and whitish, jointed at several distances, creeping far about under Ground. It shoots forth divers little Stalks a Yard high and more, spread out into several Branches, on which are set narrow long Leaves pointed at the ends, and finely dented about the edges, standing one above another up to the tops, where grow many white Flowers, in a round Tuft together, something like to those of Yarrow or Millfoil, with a very small yellowish Thrum in the middle, bordered about with very short whitish Leaves, dented in at the broad ends, which passing away, leave behind them small Heads, with Chaffy Seed therein. Both Leaf and Root are of an hot sharp biting Taste, like unto the True Pellitory of Spain in Sect. 6. following, and of which it took its Name.

Pellitory of Spain Field.

IV. **The second, or Common Field Pellitory with a double Flower.** Its Roots are many long Strings, running here and there in the Ground. It has straight and slender Stalks, beset with long and narrow Leaves, snipt round about the edges, not much unlike the former, and as it were in all points like the first described Wild Kind, which grows with us almost every where. On the Tops of the Stalks stand four or five, or more white Flowers, one above another, with a green Leaf at the bottom of the foot Stalk of every one of them, being small, thick, and very double, with a little yellowness in the middle of every Flower, like, both for form and color unto the Flower of the double Featherfew, but smaller. This Plant has no Smell at all, but is very pleasant to behold, for its double white Flowers sake.

V. **The third, or Common Shop Pellitory of Spain.** Its Root is long, and growing down right, of the bigness of a Mans Finger or Thumb, growing in our Country, but not half so great where it grows naturally, with some Fibres and Branches from the sides thereof, of a very hot, sharp, and biting Taste, drawing much Water into the Mouth, after it has been chewed a while. It is a small and low Plant, bearing many fine green Leaves, upon its slender Branches, which lean, or lye down upon the Ground, divided into many parts, yet somewhat larger and broader, than Camomil, the Stalks whercof are bigger, and more full of Juice than they. The flowers grow at the Tops of the Stalks, and are single, but much larger than any Camomil Flowers, having a Pale, or Border of many Leaves, white on the upper side, and reddish underneath, set about a middle yellow Head or Thrum, but not standing so close together joining at the

P

bottom

*Pellitory of Spain, Shop
Common.*

bottom, as Camomil Flowers do, but more severed one from another. It bears also white Seed, which is with difficulty found and discerned from the Chaff. This Plant which is very tender, and will scarcely,

*Pellitory of Spain, Shop
Lefser.*

or not at all, endure the hardness and extremities of our Winters, unless it be preserved with much Care. Of this there is another Species, not differing at all from it but in the Magnitude, this being in its Stalks, Leaves and Flowers much less.

VI. The fourth, or True Pellitory of Spain. The Root grows sometimes as thick as two Thumbs together, but often of a Thumb's thickness, and a Foot or more deep in the Earth; of a brownish yellow color on the out side, and whitish within, of a very hot, burning, sharp and

True Pellitory of Spain

biting Taste, drawing forth much Saliva or Water into the Mouth, more plentifully and quickly than the Common Pellitory of Spain, which has a Daisy like Flower: This Root endures after Seed time, and with us all Winter, if it be carefully defended in the Winter Season. From the Head of this Root spring up several Stalks of fine cut Leaves, the form and divisions whereof do something resemble that of May-weed, being short, and not long like Fennel, or like Wild Carrots, as Dioscorides compares them; from among which rises up some Stalks, with few or no Leaves on them, Branched out into two or three parts, bearing a round Umbel of white Flowers, after which follows somewhat round dark colored Seed, larger than that of Aniseed.

VII. The fifth, or the Other true Pellitory of Spain. Its Root is slenderer and single, in which consists the chief difference: it grows also somewhat lower than the former: and the Leaves are also something longer and finer, more resembling Dill. The Stalks are slenderer and full of Leaves. And the Umbels of Flowers are white, but not so large.

VIII. The Places. The first grows in Fields and Meadows by Hedges and Pathways, almost every where. It was formerly found growing in the three great Fields next adjoining to Kentish Town near London; and in several Fields in Kent about

about *South-fleet*: and is also Nurst up in sundry *Gardens*. The second grows only in *Gardens* with us. The third is only Planted with us in *Gardens* and Manured places. The fourth is Native to the hotter Countries, as, *Spain, Italy, &c.* The fifth grows in some Mountains in *Germany*, and often among Rocks on which there is but a Crust of Earth, so that the Roots grow in the Chinks and Gutters of the same: and in *England* these two last grow in *Gardens*.

IX. *The Times.* The two first Flower in the end of *June*, or in *July*, and give ripe Seed, not long after. The third Flowers not till *August*, and sometimes so late, that it gives no ripe Seed before it perishes, unless it is carefully preserved in *Winter*. The fourth and fifth, Flower and Seed in *August* also, or towards the end of *Summer*.

X. *The Qualities.* They are all of them hot and dry in the fourth Degree, Aperitive, and Vehemently Attractive, as also by accident Anodyne; Cephalick, Neurotick, Hystrick, Arthritick, and Antifebricitick.

XI. *The Specification.* The Roots of these Plants, chiefly of the first, third and fourth, more especially of the third and fourth, are peculiar against the Tooth-ach, Agues, Catarrhs, Diffusions upon the Eyes, Apoplexies, Epilepsies, Vertigoes, Lethargy, Carus, Megrim, Head-ach, Gout, Sciatica, Numb and Dead Palsie, Colicks, obstruction of the Terms in Women, &c.

XII. *The Preparations.* 1. A Liquid Juice of the Leaves or Roots of the first and third. 2. An Essence of the same. 3. The dried Leaves or Roots of the same. 4. A Decolion or rather Infusion of the same. 5. A Powder of the dried Leaves or rather Roots. 6. A Cataplasm of the Green Herb or Roots. 7. An Ointment or Balsam of Leaves or Roots. 8. An Oil of the Roots. 9. A Spirituous Tincture of the Roots. 10. An Acid Tincture of the same. 11. An Oily Tincture of the same. 12. The dried Roots of the fourth and fifth. 13. A Powder of the same. 14. An Infusion of the same. 15. An Oil or Ointment of the same. 16. A Cataplasm. 17. A Spirit from the Roots. 18. A Spirituous Tincture from the same. 19. An Acid Tincture of them. 20. An Oily Tincture.

The Virtues.

XIII. *The Juice of the Leaves or Roots of the first and third.* An Ounce thereof taken in a Draught of *Muscadine*, or other strong Wine, an Hour or two before the Fit of an Ague, and the Sick presently laid to Sweat upon it, is said certainly to cure the Patient, at second or third time taking it at farthest.

XIV. *The Essence of the same.* It has the same Virtues with the Juice aforesaid, being given in the same manner: besides it warms and comforts the Stomach and other Bowels, gives ease in the Colick, and obstructions from Wind, and powerfully provokes the Terms in Women; It also facilitates the Birth of a Woman in Labour: is profitable against Catarrhs, Apoplexies, Epilepsies, Vertigo's; Lethargy, Carus, Megrim, Head-ach, Gout, Sciatica, Colick and Palsie, being inwardly taken, and outwardly applied to the parts affected.

XV. *The dried Leaves or Roots.* Being chewed in the Mouth, they draw down from the Head, Brain, and parts adjacent, much cold Rheum and pituitous matter, give ease in the Tooth-ach tho' never so extrem, help against Catarrhs, and

Rheums in the Eyes, and are profitable against all cold and moist Diseases of the Head and Brain; as Lethargy, Carus, Vertigo, Head-ach, Apoplexy, Falling-sickness, Palsy, Convulsions, &c. Being thus chewed they wonderfully purge the Head and Brain from those cold Humors, causing the aforesaid Diseases, and help to consume those superfluous Humours falling upon other parts of the Body, which are the causes of many other Diseases.

XVI. *The Powder of the dried Leaves or Roots.* Being taken inwardly, from a Scruple to a Dram, mixt with a little Syrup or any other fit Vehicle, it warms a cold and moist Stomach, strengthens it, as also the other Bowels, causes a good Appetite and Digestion, and gives present ease in the Colick. It provokes the Terms, and causes easy Delivery to Women in Travel. Snuff up the Nostrils, it causes Sneezing, by which means it many times eases the Megrim, Head-ach, and Tooth-ach, and gives relief in Apoplexies, Epilepsies, Lethargy, Carus, Palsy, &c.

XVII. *The Decolion or Infusion of the same.* They have all the Virtues of the Juice and Essence, but in a much inferior Degree, and therefore may be given Morning and Night, to 3 or four Ounces at a time. They are excellent for Women in Labor. And by Bathing with them outwardly gives ease in the Gout, and all other pains proceeding from cold and moisture.

XVIII. *The Cataplasm of the Green Leaves or Roots.* Applied to the Gout or Sciatica, they give present ease of the pain, and being continued (as the Physician shall advise) will in some little time cure the same. It is also good against any ach or pain in any other part of the Body, caused by cold and moisture.

XIX. *The Balsam or Ointment.* They have the Virtues of the Cataplasm, but not altogether so powerful against the Gout; but being rubbed on they take away black and blew Spots, which come by Blows, Falls, or Bruises, as also all other Defecations or Blemishes of the Skin.

XX. *The Oile of the Roots, made by Coltion or Infolation.* Galen says, That being rubbed on the parts of the Body (I suppose he means on the Breast or Stomach and Belly, as also on the Back and Spina Dorso) it helps such as have the shaking Fits of Agues. It is without doubt, a very warming and comfortable Oil; and therefore of singular use against both Numb, and Dead Palsies, Convulsions, Cramps, and other like Pains and Aches.

XXI. *The Spirituous Tincture.* It is a most singular thing against the Colick, Pains of the Stomach, Sickness at Heart, Vomiting and Fainting. It has all the Virtues of the Juice and Essence, and may be given in Posset Drink, Broth, or Wine, Morning, Noon and Night, from 50 to 100 Drops, or more.

XXII. *The Acid Tincture of the Roots.* It radically cures the Plague or Pestilence, and is a most excellent thing against all Pestilential, Malign and Burning Fevers, of what kind soever. It strengthens and fortifies the Stomach, causes a good Appetite and Digestion, resists Poison; is good against Coughs, Colds, Asthma's, and all obstructions of the Lungs, or the other Viscera, provokes the Terms in Women, as also Urine, and is profitable against the Strangury, Sand, Gravel, Stone, &c. in the Reins, Ureters and Bladder. Dose so much as to give the Vehicle a pleasant acidity, and may be taken as often as the Patient Drinks.

XXIII. *The Oily Tincture of the same.* It is prevalent against the Strangury, Sand, Gravel, Stone or Tartarous Matter in the Reins and Bladder, opens Obstructions of the Womb, provokes the Terms, and facilitates the Birth of Women in Labor. It cleanses, eases After-pains, and is profitable against the Gout, Colick and Palfie, being inwardly taken, and anointed on the *Spina Dorſi* and other parts affected. Dose from 12 to 20, 30, or 40 Drops, or more, in a Vehicle proper against the Disease afflicting.

The Virtues of the fourth and fifth Kinds.

XXIV. *The Liquid Juice, and Essence of the Leaves or Roots of the True Pellitory of Spain.* Have all the same Qualities and Virtues of the Common, and that of the *Shops*, before declared; only with this difference, that as the *True Pellitory of Spain* is more potent and excellent than the Common, or that of the *Shops*; so also are these Preparations of this Plant, very much transcending them in their Effects.

XXV. *The Dried Roots.* Chewed in the Mouth often, it eases the Vehement pain of the Teeth proceeding from an afflux of Cold Rheum upon them; and so used, it also draws away Rheum from fore Eyes.

XXVI. *The Powder of the Root.* Made into a *Bolus* by mixing it with a little *Mithridate*, or made into an *Electuary* with *Honey*, it is effectual against all cold and moist Diseases of the Head, Brain, Lungs, Stomach, and other Bowels; It prevails against the Apoplexy, Falling Sickness, Vertigo, Megrim, Lethargy, Carus, Obstructions of the Lungs, Coughs, Colds, Wheezings, Asthma's, Colick, &c. Dose from a Scruple to a Dram, Morning fasting, and at Night at Bed time.

XXVII. *The Infusion of the Root in Wine.* It has all the Virtues of the former *Infusion* at *Self*. 17. foregoing, but this is much more powerful for all those purposes and intentions: If the *Green* or *Dried Root* is well bruised and Infused in *Vinegar*, and the Mouth Gargled therewith, it presently gives ease in the most Violent Tooth-ach: and resists the affluxes of Rheum from the Head to the Teeth, Eyes, Ears, Tonſils, Jaws, and other parts.

XXVIII. *The Oil or Ointment of the Root.* They are effectual to warm, or heat, comfort and strengthen any part of the Body, Nerves, Tendons, or Muscles, afflicted with cold and moist Humors, or which are affected with Cramps, Convulsions, Palfy, Gout, Sciatica, or the like. They may be made of the *green Roots*, by many repeated *Insolations* or *Boilings*; and will be found very profitable against the Shaking and Dead Palfies, or any pain or ach proceeding from Cold, as aforesaid. Being timely used, they are said to prevent a Gangrene when approaching.

XXIX. *The Cataplasm of the green Roots.* It effectually cures the Gout and Sciatica, if prudently applied; and has all the Virtues of the *Cataplasm of the Roots of the former Kinds*, specified in *Self*. 18. foregoing.

XXX. *The Spirit of the Root.* It is Cordial, Anticolick, and Antipeſtilential; good against Fainting and Swooning Fits, Sickness at Heart, Belly-ach, or Gripping of the Guts: It expels Wind out of the Stomach and Bowels, and admirably strengthens the Stomach, causing a good Appetite and Digestion. Dose a Spoonful or more in a Glass of Wine now and than upon occasion.

XXXI. *The Spirituous Tincture.* It has all the Virtues of the *Spirit*, but Superior to it in efficacy, and may be given from half a Spoonful to a Spoonful in some proper Vehicle. It provokes the Terms in Women, facilitates the Birth, brings away the After-birth, and eases After-pains. Held for some little time in the Mouth, it eases the Tooth-ach. And Bathed upon parts affected with the Cramp or Convulsions, it warms and comforts the Nerves and Muscles, and quickly cures the Disease.

XXXII. *The Acid Tincture of the Root.* It has all the Virtues of the former *Acid Tincture*, at *Self*. 22. foregoing; but with a more exalted efficacy and power. Held in the Mouth it gives present ease in the Tooth-ach. It stops Vomiting, and helps a nauſeouſneſs of the Stomach, or Loathing of Food; and is a singular Diuretick, breaking and dissolving (so much as is in the Power of a Medicine to do, the Stone, and Gravel in the Reins, Ureters and Bladder. Being given to Children for some time in Broth or Water-Gruel, it cures the Rickets, and opens the Lungs, Liver, Spleen, and Reins, by which means the Morbifick Matter of that Disease is gradually carried off. Dose from 20, to 30, 40, or 60 Drops, or so many as may make the Vehicle pleasantly Sharp.

XXXIII. *The Oily Tincture of the same.* It has all the Virtues of the former *Oily Tincture*, at *Self*. 23. foregoing, but in a more prevalent manner, as being much more strong and potent in its Operation. It gives admirable and present ease in the Colick and Strangury, and being very well bathed in upon the Hip in the Sciatica, it eases the Pain, and in a short time Cures it: given to 30, 40, or 60 Drops (according to Age and other Accidents), 2, or 3 Hours before the coming of the Fit of the Ague, it in a great measure prevents it; and by continuing it in the same manner, for some few times, it perfectly cures it. Held in the Mouth also, it gives present ease in the Tooth-ach.

CHAP. DLIV.

OF PENNYROYAL;

OR,

PUDDING--GRASS.

I. **T**HE Names. It is called by the *Arabians*, *Alnam*, and *Alnegan*; in *Greek*, Πάικων, & Πάικων; in *Latine*, *Pulegium*, & *Pulejum*; in *Engliſh*, *Pennyroyal*, also *Pudding-Grass*; and in the West Parts, about *Exeter*, *Organs*.

II. *The Kinds.* The Six following we shall chiefly consider, viz. 1. *Pulegium Vulgare* (quod

ſtos

flos recentis Herbe incanfus Pulices necat odore :) Because it kills Fleas being Burned :) Our Common Pennyroyal. 2. *Pulegium regium vulgare majus*, Great Pennyroyal. 3. *Pulegium furculis densis*, Thick or double Pennyroyal. 4. *Pulegium mas Flore albo Plinij*, White Flowered Pennyroyal. 5. *Pulegium angustifolium Baubini & Lobelij*, *Pulegium Cervinum Gefneri*, *Pulegium alterum foliis oblongis Dodonæi*, Narrow Leav'd, or Hearts Pennyroyal. 6. *Pulegium foliis Nummulariæ Baubini*, Round Leav'd Pennyroyal.

The Descriptions.

III. The first, or Our Common Pennyroyal. Its Root is Bushy, long and Fibrous, creeping under the upper surface of the Earth. From whence spring forth many weak round Stalks, divided into several Branches, rather leaning or lying upon the Ground, than standing upright. On which are set

Pennyroyal.

at several Joints, small, roundish, dark green Leaves. The Flowers of that which grows in Gardens, are purplish for the most part, yet some on that which grows Wild, are white, or more white than purple, set in rundles about the tops of the Branches. The Stalks shoot forth small Fibres or Roots, at the Joints, as it lies upon the Ground, fastning it self therein quickly, and over spreading any Ground, more especially if it grows in the Shade, or in moist places: and it is encreased by breaking off the sprouted Stalks, and putting or thrusting them into the Earth.

IV. The second, or Great Pennyroyal. Its Root is like to the former. Its Stalks and Branches rise higher, and creep not upon the Ground so much as that does. It is greater than that, and abides so being brought into our Gardens, from abroad, where

it grows Wild in our Fields and Commons, it differs indeed but little from the first, but in the largeness of its Leaves and Stalks, and in its growing up higher. The Flowers hereof are purple, and grow in rundles about the Stalks, as the others do.

V. The third, or Thick or double Pennyroyal. This differs very little from the former, either in Roots, Stalks, Leaves, Flowers, or manner of growing; saving that the Leaves are something smaller, and also thicker set on the Stalks, and the Branches grow closer together.

VI. The fourth, or White Flowered Pennyroyal. The Roots creep under the Ground, with a multitude of Fibres: and this Kind grows more upright with its Stalks than the former, and sometimes a foot higher also, having Leaves thereon, set by couples like it: and in some places, other smaller Leaves likewise growing with them: The Flowers (as the former) grow in rundles, or whorls, round about the Stalks, at the several Joints, but are wholly white, and so abide, being transplanted out of the Field, and Planted in Gardens. The Smell and Taste of this Plant, as also its Medicinal use, are altogether the same with the first, and other Kinds, and every way as acceptable.

VII. The fifth, or Narrow Leav'd, or Hearts Pennyroyal. This fine and delicate Plant, has creeping Fibrous Roots under Ground, but shoot forth longer Sprouts than the former Kinds, from whence spring forth many tall, hard, upright Stalks, on which are set at equal distances, many small long and narrow Leaves, all along the Branches up to the Tops. The Flowers grow round about the Stalks, at the Joints with the Leaves, at many of the spaces up towards the height, of a pale purplish color: and the Smell and Taste hereof is stronger and much more pleasing also.

VIII. The sixth, or round Leav'd Pennyroyal. It has a small Fibrous creeping Root, which sends up slender Stalks, almost as upright as the last: having the Leaves set by couples at each Joint, which are small, and round like unto those of Money-wort, or Herb Two-Pence, but much less. The Flowers grow in rundles or rows as the others do, encompassing the Stalks, which are of a pale blewish color. The Smell of this Plant is much more pleasant than that of the Common sort.

IX. The Places. Tho' all and every one of these Species or Kinds of Pennyroyal grow with us, in our Gardens, yet several of them grow also Wild in our Fields. The first is Common in many watery or moist places of our Land, which yet for its most excellent use is almost every where Nurst up in Gardens. The second is found Wild in Essex, in divers Places of the High way, between London and Colchester, and thereabouts, and yet more abundantly in other Countries, from whence it is Transplanted also into Gardens. The third has also been found growing Wild, in many places of England, and like the others Transplanted, and made a Garden Plant. The fourth is a Native of Italy, and found growing in several places of Piedmont, from whence it has been brought to us. The fifth grows in moist and moorish Grounds about Mompelier in France, where the Inhabitants scarcely use any of the other Kinds, tho' they have them in great Plenty. The sixth grows in the Gardens at Padua, from whence it has been Transplanted to us.

X. The Times. They all Flower from the beginning of June to the end of August, and sometimes later.

XI. The Qualities. Pennyroyal is of Subtil parts as Galen says: It is hot and dry in the third Degree:

gree, Aperitive, Absterfve, Carminative, Digestive, Difcuffive, Diuretick, Incifive, Vulnerary, Cephalick, Neurotick, Stomatick, Splenetick, Nephretick, Hyfterick, Emmenagogick, Sudorifick, Alexipharmick, Analeptick and Spermatogenetick.

XII. *The Specification.* It prevails againft Convulfions, Spafms, Poifon, the Bittings of Serpents, or other Venomous Creatures, Coughs, Colds, Swellings in the Throat, Jaundice, Colick, Obftructions of the Terms, Rickets in Children, Pallie, &c.

XIII. *The Preparations.* You may have therefrom. 1. *A Liquid Juice.* 2. *An Effence.* 3. *A Decoction or Infufion in Wine.* 4. *A Powder.* 5. *An Errhine.* 6. *A Balfam, Ointment, or Oil.* 7. *An Eleluary.* 8. *A Diftilled Water.* 9. *A Spirituous Tincture.* 10. *An Acid Tincture.* 11. *An Oily Tincture.* 12. *A Spirit.* 13. *A Diftilled Oil.* 14. *Poteflates or Powers.* 15. *A Cataplafm.*

The Virtues.

XIV. *The Liquid Juice.* It powerfully digefts, opens, and provokes the Terms in Women, expels the Birth, Dead Child and After-Birth; it ftops Vomiting, eafes the pain and gnawing of the Stomach; is profitable againft Convulfions, refifts Poifon, and cures fuch as are bitten or ftung by Serpents, Mad-Dogs, Scorpions, or other Venomous Creatures. Dofe 2, 3 or 4, Spoonfuls at a time, Morning, Noon, and Night, in a Glafs of Wine, or other fit Vehicle.

XV. *The Effence.* It has all the Virtues of the *Liquid Juice* exalted: is good againft Althma's, Coughs, Colds, Wheezing, Hoarfenefs, and moft other Difcafes of the Lungs, caufing an eafy expectoration (if taken with Honey) it refifts Melancholy and caufes Cheerfulnefs: and drunk with the *Juice of Sivile Oranges, Limons,* or choife *Vinegar,* It is good againft Fainting, and Swooning Fits, Vapors, and fuch like. It helps the Rickets in Children, is good againft the Leprofy, opens the obftructions of the Liver, Pancreas and Mefentery, and eafes the pain of the Spleen. Being drank in choife ftrong Wine, it gives eafe in the Colick, and eafes After-pains of Women lying in. Conftantly taken for fome time, it leffens the Fatnefs and Corpulency of the Body, making the Patient Leaner: yet at the fame time, it much encreafes Seed in both Sexes, and ftrongly provokes Luft. Dofe 2 or 3 Spoonfuls at a time in a Glafs of Wine, Morning and Night.

XVI. *The Decoction, or Infufion in Wine.* It has all the Virtues of the *Juice and Effence,* but nothing near fo powerful. It warms the coldnefs of the Stomach and Womb, and other Vifcera, helps againft the Swelling and Hardnefs of the Womb; cleanfes foul Sores and Ulcers, and mixt with Honey caufes them to Digelt. It is good againft black and blew Eyes, and difcolorings of the Skin, being outwardly applied. If a little *Sal Prunelle* be diffolved in it, and it be held in the Mouth, it eafes the Tooth-ach. It is good againft Faintings, Swoonings, and Hyfterick-Fits, and provokes Urine ftrongly. Ufed as a Gargarifm with Honey, it cures Sores, Cankers, and Ulcers of the Mouth and Throat. Drank pretty plentifully it is good againft the Strangury, Dropfy, and Jaundice, helps to quicken and clear the Eye-fight, is profitable againft the Falling-Sicknefs, and eafes all forts of pains of the Head. Dofe 6, or 8 Ounces, Morning, Noon, and Night.

XVII. *The Powder.* It is made of the dried Herb when in Flower. It has all the Virtues of the *Juice, Effence and Decoction,* but acts not with that Celerity. Dofe Morning and Night, from half a Dram to a Dram in Wine. Mixed with a little Honey and Turpentine, and applied to Sores and Ulcers, it digelts and cleanfes them.

XVIII. *The Errhine.* It is thus made *Take Powder of Tops of Pennyroyal when in Flower, an Ounce, Afarabacca Leaves in fine Powder, Refinous Scammony in fine Powder, of each half an Ounce: mix them.* Snufft up the Noftils Medicinally, it attracts Humors both thick and thin out of the Head, and clears it effectually, by which means it is profitable againft the Megrim, Head-ach, Lethargy, Carus, Sleepinefs, Dullnefs, Drowfinefs, Apoplexy, Epilepfy, Verrigo, Convulfions, Palfies, and other Difcafes of the Head, Brain and Nerves, proceeding from cold and moifture. And if it is taken inwardly twice a Week in the Morning Fafting, from a Scuple to a Dram, or more, according to Age and Strength, it carries off the Morbifick caufe of all the afore-named Difcafes, and fo the more effectually contributes to their Cure.

XIX. *The Eleluary.* It is made of the Errhine, with three times its weight of Honey: adding withall Powder of Birth-wort Roots, an equal quantity to the Scammony. It is given inwardly from one Dram to three; and has all the Virtues of the *Juice, Effence,* and Errhine before enumerated: Applied to old running Sores, Fiftula's, and putrid Ulcers, it caufes Digeltion, eafes the pain, prevents their eating and fpreeding farther, and very much induces their healing. There is no better Remedy againft Kibed Heels, than to apply the Dry Powder of the Errhine firft, and then over it a Plafter of this Eleluary.

XX. *The Balfam, Ointment, or Oil, made by Infolation or Boiling.* Applied to fuch as are troubled with the Gout, they quickly eafe the pain: warm the parts, and take away cold griefs of the Joints; They gently draw, digelt alfo, cleanfe, and heal old running Sores, and putrid Ulcers.

XXI. *The Diftilled Water.* It has the Virtues of the *Juice, Effence,* and *Decoction,* but in a much Inferior Degree. Mixed with Honey, it is a good Ophthalmick, for Blood-shot, Watering and Sore Eyes: and fo ufed as a Gargle, it heals Sores and Ulcers in the Mouth and Throat: otherwife it may ferve as a Vehicle for conveying the *Juice, or Effence,* or other Preparations of the Plant down into the Stomach.

XXII. *The Spirituous Tincture.* It has all the Virtues of the *Juice and Effence,* being given Morning and Evening, from 1 Dram to 2, or 3, in a Glafs of Wine, or fome other convenient Liquid. It eafes the Gnawing of the Stomach, and cures inward Convulfions of the Bowels. Outwardly bathed upon the Head, it eafes the Head-ach: and bathed upon other parts, it prefently eafes their pain, and alfo reftores the parts troubled with the Cramp. Taken for forty Days or more together, in *Juice or Water of Black Cherries,* it cures the Falling-ficknefs, and is alfo profitable againft the Vertigo, Lethargy, Carus, and other like dull Difcafes of the Head and Brain.

XXIII. *The Acid Tincture.* It admirably reftores the Tone of the Stomach being hurt; ftops Vomiting; deftroys Putridity, and allays the heat of Fevers. It cuts thick and tough Flegm, and caufes it to be eafily expectorated. It is a fingular Diuretick, and therefore profitable againft the Strangury, Sand, Gravel, Stone, or Tartarous Muclage in the Reins, Ureters and Bladder. It

take_s

takes away stoppages of the Stomach and Lungs, and causes easy Breathing; it creates a good Appetite, and a strong Digestion, expelling Wind and Vapors, out of the Stomach and Bowels. It is also profitable against all putrid, non-putrid, malign, and peffilential Fevers, and profligates even the Plague, or Peffilence it self. It may be given in all that the Patient Driuks, whether Ale, Beer, Wine, or Barly-Broth, to a grateful acidity.

XXIV. *The Oily Tincture.* It is good against the Gout, Sciatica, Rheumatick Pains, Cramps, Convulsions, and Palfie, being very well anointed Morning and Evening upon the parts affected, as also (in the case of the Palfie) all along the Back Bone. Taken inwardly it Potently provokes Urine and the Terms in Women, and is good against the Strangury, or any stoppage of Urine from Tartarous, Gravelly or Lapidifcent Concretions. It hastens the Birth of Women in Labor, brings away the Dead Child and After-Birth: and causes a plentiful cleansing afterwards. In the cure of Palfies, as well as to be used outwardly, it is to be taken also inwardly, because it not only warms and comforts the Nerves and their Original, but carries off the Morbifick Cause by Urine. Dose from a Scruple to a Dram or two Drams in any proper Vehicle, Morning and Night.

XXV. *The Spirit.* It is a most admirable Cordial, and an excellent reviver of the Spirits Natural, Vital and Animal. It cheers the Heart, comforts Nature, strengthens the Brain and Nerves, is good against Fainting, Swooning and Hyfterick Fits; and restores the whole Humane Frame, tho' put into the greatest disorder. It is a singular thing against Convulsions of all Kinds, and absolutely cures them in Children, even when Death seems to stand at the Door. Dose from a Dram to 2, 3, or 4 Drams, in some of the *Distilled Water*, or rather in a Glafs of Wine, 2, 3, or four times a Day, or as often as is needful.

XXVI. *The Distilled Oil.* Inwardly given, and outwardly applied, it cures Convulsions, the Falling-Sickness, Palfy, pains of the Head, Megrim, Vertigo, Lethargy, Carus, Gout, Sciatica, and has, in a word, all the Virtues of the *Juice, Essence, Tincture and Spirit*, but in a much more exalted manner. Dose from 10 Drops to 20, dropt first into Sugar, and well mixt with it, and then taken in a Glafs of Wine, Morning and Evening: as it powerfully provokes Urine and the Terms, so, when the Birth is near, it causes the Child to be brought forth into the World in a Moment, expels the dead Child and After-birth, and prevents and cures After-pains.

XXVII. *The Potestates or Powers.* They consist of most subtil parts, cut, attenuate, open, dissolve, provoke Urine, break the Concretions of Gravel and Slime, and expel them, provoke the Terms, facilitate the Birth, whether living or dead, force away the After-Birth, and miraculously ease and take away After-pains. They are Stomatick, Cordial, Pectoral, give present ease in the Colick, open obstructions of the Lungs, being very good against Coughs, Colds, Asthma's, Hoarseness, Wheezing and shortness of Breath. They are good in an Inveterate Head-ach, Megrim, Vertigo, Falling-Sickness, Apoplexy, Convulsions, Palfy, Cramp, Numbness, Lameness, and weakness of the Nerves, Muscles and Joints, being inwardly taken, and outwardly bathed therewith. They are powerful against all manner of Aches, Pains, Strains, or weakness of any part, as also against an inveterate Gout, Sciatica or Rheumatism, proceeding from a cold and moist cause. They are an Antidote against Poison, the bitings of Mad Dogs, Ser-

pents and other Venomous Creatures. They prevail against the Malignity of the Plague, and all other Malign and Peffilential Fevers, as also against Scorbutick Boils, Botches, Scabs, Scurff, Morpew, Spots, Pimples, and other like Symptoms, inwardly taking them every Day for some time, and outwardly bathing therewith Morning and Night. They provoke Sweat powerfully, and are a great Alexipharmick in the French Pox, being daily taken in Ale, Wine, Whey or thin Broth, after the manner of Diet; and have performed as much as any *Guajacum* Diet could do, they being a kind of Specifick against that Disease and its Inveterate and Malign Symptoms. They are said to cure Barrenness in Man or Woman, (if there is not a defect of parts) cleanse, strengthen and fortifie the Womb, and are a Specifick for the Diseases of the Genitals. They are prevalent against Catarrhs, and cold Rheums, help defects of the Eye-Sight, cure a Stinking Breath, ease Pains, and soften hard Tumors of the Liver, Spleen, or Mesentery, by bathing those Regions therewith, for they warm, strengthen, and comfort even all the parts of Mans Body. Dose from 20 to 60 or 100 Drops, or more, as the Prudence of the Physician shall Prescribe, and that 2 or 3 times a Day at least (And in case of the French Pox, 5 or 6 times a Day) in Ale, or Wine, or Wine and Water mixt, or in some *Syrup* or *Cordial Julep*, and so to be continued for 2 or 3 Weeks, or 2, or 3 Months, as the exigency of the Disease may require, outwardly bathe the parts affected with them twice or thrice a day as long as you shall see need for their use.

XXVIII. *The Cataplasim.* Made of the Green Herb, and applied, it is good against the Gout and Sciatica, Blows, Strains, and other pains of the Joints. It also takes away spots or marks in the Skin; and applied to the Regions of Liver or Spleen, it eases the pains in those parts; and to the Region of the Womb, it helps the swelling and hardness of the Mother. Applied with Vinegar, it causes eating Ulcers to digest, and cleanses such as are filthy or putrid: and it is said to be profitable also against the Leprosy, Morpew, and other like Defecations. Applied with *Barly Flower*, it heals Burning by Fire, and Scalding with Water. Applied with Vinegar to the Fore-head and Nostrils, it is profitable against Carus, Lethargy, and Epilepsy, giving present relief in the same.

PENNY-WORT WALL, see Navel-wort, Chap. (515).

CHAP. DLV.

OF PEONY.

I. **THE Names.** It is called in *Arabic*, *Feonia*: in *Greek*, *Παωνία*: (from *Paon*, a famous Physician in his time) and *Παυωνία*: in *Latine*, *Paonia*, and *Glycyfide* or *Dulcisfide* (from the red Grains in the *Pomgranate* called *Sida*.) It has obtained also many other *Greek* and *Latine* Names, as, *Pentorobos* or *Pentoboros*, *Orbelion*, *Hemogogon*, *Paonion*, *Panthiceraton*, *Theodonion*, *Selenion*, *Selenogonon*, *Agalophotis*, *Idaus* *Dadylum*,

Rosa Fatuina, *Herba Casta*, *Hafta Regia*, *Rosa Af-niarum*, with some others; but *Peonia*, is the general Name, which bears away the Bell: in English *Peony*, and *Piony*.

II. *The Kinds*. Tho' there are many Species of this Plant, yet there are but two Principal Kinds, viz. *Peonia Mas*, the Male Peony; and *Peonia Femina*, the Female Peony. Of the *Peonia Mas*, or Male Peony, we know but of one only Species, which is thus distinguished from the Female. The Leaf of the Male is whole with out any particular division, notch, or dent, on the edge, like to thof of the *Wall-Nut-Tree*, its Roots are long and round, divided into many Branches, something like to the Roots of *Gentian* or *Elecampane*, and not Tuberous at all. The Female (of which there are a great many sorts) has its Leaves cut in or divided into parts, more or less, and has Tuberous Roots or Clogs, like those of the *Asphodil*, with many great, thick, round pieces, hanging or growing at the end of smaller Strings, and all joined to the top of the main Root. From what has been said, these following Kinds are eminent, viz. 1. *Peonia Mas*, the Male Peony, which is a singular Species, as aforesaid. 2. *Peonia Femina vulgaris flore simplici*, the Common Female Peony single Flowered. 3. *Peonia Femina Vulgaris flore pleno rubro*, the Common double red Peony. 4. *Peonia Femina flore carneo simplici*, the Single bluish Peony. 5. *Peonia Femina flore pleno albicante*, the Double bluish Peony. 6. *Peonia Femina Byzantina flore simplici*, the Single red Peony of *Constantinople*, or Turkish Peony. 7. *Peonia Femina flore simplici & pleno Clusij*, *Clusius* his Female single and double red Peonies. Authors have some more Species of Peonies, but they seem to me, to be some of the former Kinds over again, or being absolute Strangers to us, are totally unknown in our Country.

The Descriptions.

Peony Male.

III. The first, or Male Peony. Its Roots are great, Thick, and long, spreading in the Ground, and running down pretty deep. It rises up with many brown Stalks, on which do grow winged Leaves, viz. many fair green, and sometimes reddish Leaves, one set upon another on a Stalk, without a particular Division of the Leaf at all. The Flowers grow at the tops of the Stalks, consisting of five or six broad Leaves, of a fair, purplish, red color, with many yellow Threads in the middle standing about the Head, which after rises up to be the Seed Vessels, divided into two, three, or four rough crooked Pods, like Horns; which when they are full ripe, open, and turn themselves down one edge to another backwards, shewing within them divers round black shining Seed, which are the true Seed, being full and good, and having also many red or crimson Grains, which are lank and idle, intermixed among the black, as if they were good Seed, which makes them show Beautifully.

IV. The second, or Common Female Peony single Flowered. The Root consists, as we said before, of many thick and short tuberous Clogs, fastened at the ends of long Strings, and all from the Head

Peony Female.

of the Root, which is thick and short, and Tuberous also, of the same or like smell with the Male. This Common Female Peony, has many Stalks, with more store of Leaves on them, than those of the Male have: The Leaves also are not so large, but divided on the edges or deeply cut in, some with great and deep, others with smaller Cuts or Divisions, and of a dark or dead green color: The Flowers are of a Strong Heady Smell, and usually smaller than those of the Male, and something more purple, tending to a merry color, with yellow Threads about the Head in the middle, as the Male Kind has. The Heads or Horns with Seed in them, are like also but smaller. The Seed is black, but less shining.

V. The

V. *The third, or Common double red Peony.* The Roots are Tuberous, like unto the former Female. This double Peony, as well as the former single, is so frequent in every Garden of Note, thro' every Country, that it is almost labor in vain to describe it. It is very like unto the former single Female Peony, both in its Stalks and Leaves, but that it grows something higher, and the Leaves are of a fresher green color. The Flowers grow at the tops of the Stalks, and are very large, thick, and double, so fair, beautiful, great, and double, that no other Flower comes near them; but abide not blown above 8 or 10 Days. They are of a more reddish purple color, than the former Female Kind, and of a sweeter Smell. After the Flowers are past, the Cods of Seed or Grains follow, which sometimes prove abortive Seed, and sometimes good Seed, which being Sown, bring forth Plants, some of them bearing single Flowers, and some of them double Flowers, as Nature is pleased to dispose them.

VI. *The fourth, or Single blush Peony.* Its Roots are like the other Female Peonys. Its Stalks are higher, and its Leaves of a paler, or whiter green color than the double Blush next following, and more white underneath; so that it is manifest, that it is of another Kind, and not sprung from the Seed of the double Blush, as some have thought; its Leaves also have many Veins, which are somewhat discolored, or differing from the color of the Leaf thro' which they run. The Flowers are very large and single, consisting of five Leaves for the most part, of a pale flesh, or bluish color, with an Eye of yellow dispersed or mixed therewith, having many whitish Threads, ript with yellow Pendants, standing about the middle Head.

VII. *The fifth, or Double blush Peony.* Its Roots are like unto the former Female Kinds, but something longer, and of a brighter color on the out side. This double blush Peony has not its Stalks so high as the double Red, but something lower and stiffer, bearing such like winged Leaves, cut in, or divided here and there in the edges, as all these Female Kinds are, but not so large as the last. The Flowers are smaller, and less double by much, than the former double Red, of a faint, shining, crimson color at the first opening, but decaying, or growing paler every Day; so that after it has stood long, (for this Flower sheds not its Leaves in a great while) it will change something whitish; for which reason some have ignorantly called it, the double white Peony. The Seed or Grain, which in some times bears, is like to the Seed of the former Female Kinds.

VIII. *The sixth, or Single red Peony of Constantinople, or red Turkish Peony.* The Roots of this Kind, have longer Clogs, and not so short, as those of the ordinary Female Kind, and of a paler color on the out side. This Plant is very like in all things unto the double red Peony, but that the Flowers hereof are single, and as large as the last, and that is larger than either the single Female, or the Male Kind. It consists of eight Leaves, of a deeper red color, than either the single or double Peonys, and not purplish at all, but rather of the color of an ordinary red Tulip, standing close and round together.

IX. *The seventh, or Clusius his Female single and double red Peonys, ex semine Floris pleni rubri vulgaris Natæ.* Clusius says, That having in some Years Seed from the common double Red Peony, (which is not very usual) he Sowed them, and within 3 Years he had Plants which bore Flowers, some single, and some double. Of the single Sorts,

one bore Flowers, for color most like unto the Mother, but was single, consisting only of six Leaves, as the Ordinary or Common Female does. Another bore a larger Flower, of eight Leaves, whose color was of a deeper red, drawing somewhat to blackness. A third bore a double Flower, as great as the Mother Plant, or greater, and of the same color. A fourth was like the Mother Plant in Leaves, and its Flower was double, but lesser, and not so thick Leaves, the color of which was of a deep red, being near the largeness of the double Blush, having some black Veins in those Leaves which grew in the middle.

X. *The Places.* All these several sorts of Peonies are originally Natives of Foreign Countries, and have been brought home to us by Travellets, and made Denizons in our Gardens, where they have grown and flourished so long, that they are now become Natives of our Land also: and we nourish them, as well for the Beauty and Ornament of their Flowers, as for their most excellent and famed Medical Virtues.

XI. *The Times.* They all Flower in May, some of which Flowers abide but some few Days, whilst others abide many Weeks.

XII. *The Qualities.* Peony is temperate in respect to heat or cold, and dry in the first Degree, gently Styptick, or Astringent, Absterfive, Anodyn and Strengthening; Cephalick, Neurotick, Hyfterick and Emmenagogick.

XIII. *The Specification.* The Male Peony has been oftentimes (even for many Ages) found a certain Cure for the Epilepsie or Falling-Sickness: it also provokes the Terms in Women, and is profitable against the Epialtes or Night-Mare.

XIV. *The Preparations.* You may have, 1. The fresh or Male green Root. 2. A Juice or Essence of the same. 3. A Powder of the same Male Root. 4. An Infusion of the said green Male Root. 5. A Powder of the black Grains or Seeds. 6. A Syrup of the Flowers. 7. A Distilled Water from the Flowers or fresh and green Root. Where Note, That all these Preparations are spoken of the Male Kind, that being the only and truly effectual Plant for all the purposes intended, which yet is much more scarce or rare than the Plants of the Female Kind: But for want of the Male Species, Physicians and Apothecaries often use the Female; which tho' probably it may be good for the same purposes, yet doubtless is much weaker in its effects, and therefore cannot be attended with equal Success.

The Virtues.

XV. *The fresh or green Root of the Male Kind.* It is affirmed by Galen and others, that a good or large piece of it hung or worn about the Neck of a Child troubled with the Falling-Sickness, will cure it: That a Child was freed from that Disease, that for eight whole Months had worn it about its Neck; and then being taken away for trial of the Matter, the Child fell into the Disease again, but having a fresh Root hung about its Neck again, he became afterwards perfectly cured.

XVI. *The Juice, or Essence of the Male Root.* Either of these are much more available for the cure of the Epilepsie than the Amulet hung about the Neck: it may be given to Children from one Spoonful to two; and to elder Persons from two to four Spoonfuls, in a Glass of Red Barcelona, or Red Port Wine, Morning and Evening, some few days before and after the Full Moon; and if it

is given some few Days before and after the Change likewise, it may be so much the better; either of these Preparations, have been found profitable, and more available in elder Persons, than some others, because they have more strength and efficacy with them. They provoke the Terms also in Women, where they have been stopt, and are effectual for such as have not been sufficiently cleansed after their Labor, and are also troubled with Vapors, or Fits of the Mother. They are profitable also to be given to such as are troubled with the *Incubus* or Night-Mare, called by *Pliny*, *Suppressio Nocturna*, being a Disease which affects People in their Sleep, or between Sleeping and Waking, suppressing both Voice and Motion, and in a measure the Breath likewise. It is truly good for such as are troubled with Melancholy, yea, with a deep Melancholy, and affected with Melancholy Dreams.

XVII. *The Powder of the Male Root.* It may be given from a Dram, to a Dram and half, or two Drams, in a Glass of Red Wine as aforesaid, against the Epilepsy, *Incubus*, Melancholy, and other Diseases of the Head and Brain, and that Morning and Evening, at the times before directed: but if it is given for cleansing of Women in Child Bed, provoking the Terms, facilitating the Birth, &c. it ought to be given in White Port, or White Lisbon Wine, and that in the largest Dose.

XVIII. *The Infusion or Decoction of the green Male Root.* The Root is to be taken and washed clean, and then stamped well, and put to Infuse in choice Canary for three or four Days, and then strained out, and so given first and last, a good draught at a time for several Days together, before and after the Full Moon, it is said to cure the Falling-Sickness, especially if there is a due and orderly Preparation of the Body beforehand, with Posset-Drink made with Betony, as the Learned Physician shall direct. These have all the other Virtues of the Juice and Essence, and are likewise available in older Persons, if the Disease (*i. e.* the Epilepsy) be not grown too old and past Cure.

XIX. *The Powder of the black Grains or Seeds of the Male Kind.* Given from half a Dram to a Dram and half in Styptic Red Wine, it prevails against the Epilepsy, as the Root aforesaid does, besides it effectually stops Fluxes of the Belly, as Diarrheas, Dysenterias, Lienterias, and the Hepatick Flux, very much strengthen the Head, Brain and Bowels: it also cures the *Ephialtes* or *Incubus*, and other Distempers of the Brain: *Marthiolus* saith, It is available to restore Speech to such as have lost it.

XX. *The Syrup of the Flowers.* It has the Virtues of the Juice, Essence, and Infusion, but in a much weaker Degree, and therefore ought to be given from 2 to 4 Spoonfuls, Morning and Night, in a Wine proper for the purpose.

XXI. *The Distilled Water of the Flowers or green Roots.* It has all the former Virtues, but very much weaker, and therefore may be given from 4 to 8 ounces or more, Sweetned with the Syrup of the Flowers, and is used also as a Vehicle to convey some of the former Preparations in.

XXII. *Nota.* The skilful Botanist and Apothecary is to take care, in seeking after, and choosing the Male Kind, that he be not cheated with that of *Tragus*, which certainly is no *Peony*, but a kind of *Fraxinella*, or Bastard *Dittany*.

C H A P. DLVI.

Of PEPPER, Guinny or Indian.

I. **T**HE Names. It is called in the Indian Language, *Axi*: in Greek, *Kakody* (*a* 1237-74, *Mordeo*): in Latine, *Capsicum*, *Capsicum Americanum*, *Capsicum* & *Piper Indicum*, & *Americanum*: in English, *Guinny Pepper*, and *Indian Pepper*. It is generally thought to be the *Siliquastrum Plinii*, (*a Siliquis quas producit*) and *Piperitis* of him also (*quia fructus Piperis sapore & Acrimonia fit*): *Capsicum Alluarij*, *Zingiber Caninum Avicennae*, *Piper Indicum* & *Brasilicum*, or *Brasilianum*, *Piper Calecutium* & *Hispanicum*, and by many *Piper Guinea*, as tho' it came originally from thence, tho' in truth, it came to us in these Northern Climates, from the West Indies: but I deny not, that it grows in Guinea also, for that I have had the report thereof, from Eye Witnesses.

II. *The Kinds.* There are many Species of this Plant, several of which grow with us in England, and most, if not all of them, in some of our Plantations in the West Indies; for which reason we shall take notice of, and Describe these following, *viz.* 1. *Capsicum majus vulgatius oblongis siliquis*, *Capsicum longum*, *Capsicum rubrum*, & *Siliquastrum majus Fuchsij*, *Piper Indicum majus Marthioli*. Our most Common Guinny Pepper with long red Cods. 2. *Capsicum Pyramidale erectum majus*, The great upright Spire fashioned Guinny Pepper. 3. *Capsicum Pyramidale erectum minus*, The lesser upright Spire fashioned Guinny Pepper. 4. *Capsicum Pyramidale erectum exiguum*, The very small or smallest Pyramidal Guinny Pepper. 5. *Capsicum Cordatum erectum majus*, The greater upright Heart fashioned Guinny Pepper. 6. *Capsicum Cordatum erectum minus*, The lesser upright Heart fashioned Guinny Pepper. 7. *Capsicum Cordatum propendens*, The pendulous, or hanging Heart fashioned Guinny Pepper. 8. *Capsicum Siliqua Olivaria propendens*, The hanging Olive fashioned Guinny Pepper. 9. *Capsicum Siliqua Olivaria erecta*, The upright Olive fashioned Guinny Pepper. 10. *Capsicum longum erectum majus*, The greater long and upright Guinny Pepper. 11. *Capsicum oblongum majus Siliquis recurvis*, The greater crooked or Horned Guinny Pepper. 12. *Capsicum oblongum minus Siliquis recurvis*, The lesser crooked or Horned Guinny Pepper. 13. *Capsicum bifurcata Siliqua*, Forked, or double pointed Guinny Pepper. 14. *Capsicum rotundum minus Brasilianum*, Small round Guinny Pepper. 15. *Capsicum rotundum majus surrectum*, The greater round upright Guinny Pepper. 16. *Capsicum Siliqua rotunda Cerasorum*, The round Cherry fashioned Guinny Pepper. 17. *Capsicum Siliqua lata & rugosa*, Broad wrinkled coddled Guinny Pepper. 18. *Capsicum Siliqua flava brevior*, The shorter Gold yellow Guinny Pepper. 19. *Capsicum Siliqua flava longior*, The longer Gold yellow Guinny Pepper. 20. *Capsicum Caule piloso*, Hairy Stalk'd Guinny Pepper.

The Descriptions.

III. *The first, or Our most Common Guinny Pepper with long red Cods. It has a Root which*

is composed of a great Tuft or Bush of Fibres or Threads, spreading plentifully in the Ground, and perishing in the Winter Season, even in hot, or its Native Countries, after its Fruit or Cods are ripened; and with us, upon the first sharp Frost it meets with. The Plant it self rises up, with an upright

Pepper, Guinny or Indian.

firm round Stalk, having a certain Pith within it, and in our Country about two Feet high, and not above three in its Native places of Growth; spreading it self out into many Branches on all sides, even from the very bottom, which divide themselves again, into other smaller Branches: at each joint of which come forth two long Leaves upon short foot Stalks, somewhat bigger than those of Nightshade; else very like, with divers Veins in them, not at all dented about the edges, and of a very sad green color. The Flowers stand severally at the joints, with the Leaves; very like unto the Flowers of Nightshade, consisting most usually of five, yet sometimes of six white small pointed Leaves, standing open like a Star, with a few yellow Threads in the middle: After which comes the Fruit, (either great or small, long or short, round or square, as the Kind is; and standing either upright or hanging down, as their Flowers shew themselves, either of this or that form, as shall be shewed in the following Descriptions.) In this it is somewhat great and long, about three Inches in length, thick and round at the Stalk, but smaller towards the end, which is not very sharp, but roundish pointed; green at the first, but being full ripe, of a very deep crimson shining red color on the out side, which is like a thick Skin, and white on the inside, smelling tolerably well and sweet; having many flat yellowish white Seeds therein, cleaving to certain thin Skins within it, which are broader at the upper end, and smaller at the lower; leaving the end or point empty, as not reaching so far; the whole Husk or Cod, but especially the Seed, being

of so hot and fiery a Taste, that it enflames and burns the Mouth and Throat vehemently, and for a long time after it has been chewed, with such an extremity, almost to hazard Choking. The Description of this first Kind, is proposed as a pattern for all the rest following, and by which you may frame at large all their Descriptions, the chief difference consisting in the form of the Fruit, whether Husks or Cods, as shall be more demonstrated in every one of them in their before named order.

IV. The second, or Great upright Spire fashioned Guinny Pepper. This is much alike, or very little differing from the former. The difference of the Fruit is, that this stands upright; is great below, and smaller and smaller to the point, which is sharper than in the first, else it might seem the same inverted, that is, either that turned upwards, or this turned downwards, of as brave and orient a shining Coral color, as that other is.

V. The third, or Lesser upright Spire fashioned Guinny Pepper. The Fruit of this Kind is lesser by half than the last, and not so sharp or small at the end, but somewhat round: and the green Leaves also are smaller and narrower. The Stalk likewise is smaller, and not so high. The Flowers of this as of all the rest, which bear their Fruit upright, stand upright likewise; which is a certain rule to know, what Fruit will be pendulous, and what upright.

VI. The fourth, or the very small or smallest Pyramidal Guinny Pepper. The Fruit of this is small and grows upright; the Cods being short and round, an Inch long at least, and of a blackish red, before they be thro ripe, but when perfectly ripe, are as red as the rest. This Plant grows taller, fuller of Branches, and more stored, both with Flowers and Fruit, which make the goodlier prospect. The Leaves are no smaller than those of the last foregoing; and of the same dark green color with the rest.

VII. The fifth, or Greater upright Heart fashioned Guinny Pepper. This Plant grows to be but of a mean height, not so high as any of the former: its Leaves are large, but not so small at the ends. The Fruit is not hanging downwards, but standing upright, being something great, flatish, and as it were bunched out at the upper end, next unto the Stalk, and smaller below, short and round pointed, something resembling the form of a Man's Heart.

VIII. The sixth, or Lesser upright Heart fashioned Guinny Pepper. This differs not from the last, but in the smallness of the fruit, standing also upright, and being smaller by a third part, or near a half, and shorter also.

IX. The seventh, or Pendulous or hanging Heart fashioned Guinny Pepper. The form of this is something like to the fifth, or greater upright Heart fashioned Pepper, being near of the same bigness, but a little more uneven, and not so round, and full as red being ripe: it is pendulous, or hanging down, not standing upright as the other. There is another sort of these Pendulous Peppers, (alterum minus) differing in nothing from the greater, but in being smaller.

X. The eighth, or Hanging Olive fashioned Guinny Pepper. This has small, long, and round Cods, smaller below than above, being very like unto an Olive Plum, of full as red a color being ripe, as any of the rest, and hanging from its foot Stalk downwards.

XI. The ninth, or Upright Olive fashioned Guinny Pepper. This differs from the last, but in being greater than it, and in its Fruit standing upright, and not in any thing else.

XII. *The tenth, or Greater long and upright Guinny Pepper.* This is long and round, yet not like that which carries the form of an Olive Berry, but much longer, and of an equal bigness all its length, growing also upright.

XIII. *The eleventh, or Greater crooked or Horned Guinny Pepper.* This has great large Cods, about five Inches long, sometimes little or nothing crooked at the lower end, which is long and small: and sometimes a little crooked or bended upwards, and sometimes very much.

XIV. *The twelfth, or Lesser crooked or Horned Guinny Pepper.* This differs from the last in not being half so thick or long, and keeping its end bowed or crooked constantly, not varying as that does. Both this and the last hang down their Cods towards the Earth. And the whole Plant is likewise less than the former.

XV. *The thirteenth, or Forked or double pointed Guinny Pepper.* This is very like the Long upright Pepper, and much about the same form and bigness, being of an equal size almost all the length thereof: but differs from it in this, that the lower end is parted as it were into two short round Points, and is also a little smaller there than upwards; neither in color, nor any thing else differing from any of the rest.

XVI. *The fourteenth, or Small round Guinny Pepper.* This grows in the same manner and form that the first Kind does, not differing therefrom in any thing, but in the Leaves, which being in the same form, are not so great and large: and in the Fruit, which in this is small and round, (standing some forth right, and some upright, but none pendulous or hanging down, each of them upon a long foot Stalk) about the bigness of a Barberrry, but round and nothing so red, of dark or blackish red color, inclining to red: and in another sort, almost black, having such like Seed within them, but smaller. This seldom bears ripe Fruit in our Climate. Those Plants or Fruit which we have had from the Bermudas where they are Natives, are of a yellowish red.

XVII. *The fifteenth, or Greater round upright Guinny Pepper.* The chief difference in this, consists in the form of the Fruit, which grows upright as the Flowers do, being great and round like an Apple, and is the greatest of all the sorts which bear round Fruit; of an excellent red color when it is ripe, like unto polished Coral.

XVIII. *The sixteenth, or Round Cherry fashioned Guinny Pepper.* There are two Species of this Plant, one which bears fully round Fruit, like unto an English or Flemish Cherry: the other which has a little point at the end; this being a little bigger than the other, and both of them hanging down.

XIX. *The seventeenth, or Broad crumpled Codded Guinny Pepper.* The Cods of this Kind are somewhat large, greater above, and smaller below; something flat also, and not round, but crumpled as it were, or shrunk half together, smelling withall pretty Sweet.

XX. *The eighteenth, or Shorter Gold yellow Guinny Pepper.* It might be thought by some, which see only the Cods of this Pepper, that it differs from all the rest, in the manner of growing, as well as in the color of the Fruit, but it is not so. For it has like Leaves, Stalks and Flowers in every part, and only differs in that it bears Cods, very like unto the first sort here described at Sect. 3. which is the Common Kind, but that they are shorter, and ending in a smaller or sharper point, and of a fair Gold yellow color, not red as all the others before are.

XXI. *The nineteenth, or longer Gold yellow Guinny Pepper.* This differs in nothing from

the last, but in the Cods, which are not so thick as they, but a little smaller, from the middle thereof; and a little longer, lessening very finely unto the pointed end, of as fair a Gold yellow color as the former.

XXII. *The twentieth, or Hairy Stalk'd Guinny Pepper.* Its Roots are like to the others: and it grows up with round green Stalks, set full of white Hairs, in that differing from all the former. At the Joints with the Branches come forth two such Leaves, as the first Kind here described has, but larger than they. The Flowers are white, consisting of five Leaves like the rest, but larger also than any of them. After which come the Cods, which are green at first, as all the others are: but of as beautiful and glorious a red as the rest, when they are full ripe. They are pretty great and long, ending in a very long point.

XXIII. *The Places.* All these Kinds of Pepper are Natives of the West-Indies or America, as Brazil, New-Spain, Mexico, Peru, Florida, Carolina, Virginia, Barbadoes, Bermudas, Jamaica, &c. and also they have been found growing in Guinny, and many other parts of the African Continent. From the West-Indies they were first brought to Spain, Portugal, Italy, England, Holland, &c. and are Nurt up in our Gardens, where they thrive and prosper very well, and are now found in almost all the Provinces of Europe. *Clasius* says, That this kind of Cod Pepper, is not only Planted in Spain and Portugal in several places, but also in Moravia, for the profit sake they make of the Fruit, which serves them in all those parts, instead of our Common East-India Pepper.

XXIV. *The Times.* They are commonly Sown about the end of March, or beginning of April, in their Native Countys: They usually Flower about the beginning of August; and the Fruit or Cods ripen not thoroughly, that is, they come not to the beauty and perfection of their Coralline redness, until the beginning of Winter; and so do abide both with Flowers and Fruit, most of the Winter in those hotter Climates: but with us, as soon as the Frost comes they perish, and therefore must be Houfed if you will preserve them.

XXV. *The Qualities.* Guinny Pepper is hot and dry in the fourth Degree, Altringent, Carminative, Anodyne, Diuretick, Neurotick, Stomatick, Hyfterick, Emmenagogick and Alexipharmick.

XXVI. *The Specification.* It cures Vomiting, want of Appetite, weakness and Indigestion, the Cholick, expels Wind, and powerfully provokes the Terms in Women: it facilitates the Birth, expels the After-Birth, and is profitable against Sand, Gravel, Stone, and Tartarous Slime in the Reins, Ureters and Bladder.

XXVII. *The Preparations.* You may have from the Cods or Fruit, 1. A Pickle. 2. A Simple Powder. 3. A Compound or Artificial Powder. 4. An Infusion, or Vinegar. 5. A Pessary. 6. A Loboc, or Electuary. 7. A Balsam. 8. A Cosmetick. 9. An Emplaster. 10. A Decotion in Wine. 11. The Ashes. 12. A Spirituous Tincture. 13. An Acid Tincture. 14. An Oily Tincture.

The Virtues.

XXVIII. *The Pickle.* The Cods are Pickled as Cucumbers, French Beans, and other things of like Nature: being so preserved, they are of extraordinary use to strengthen and fortifie the Stomach, stop Vomiting, remove Nauseousness, cause Appetite, and a good Digestion: they expell Wind in the

the Stomack and Bowels, and are good against pains in the Intrails, and the Colick. They are commonly eaten with Meat, as a *Pickled Sallet*.

XXIX. *The Compound or Artificial Powder.* The Receipt is from *Georgio de Reggio*, who is the chief Author that has wrote amply of these *Guinny* or *Indian Peppers*. Take of the ripe Cods of any of the sorts of *Guinny Pepper*, (being all in Properties or qualities alike) dry them well, first by themselves, and then in an Oven, after the Bread is taken out, put into a Pot or Pipkin, with a sufficient quantity of Flower, that they may be sufficiently dried: after which cleanse them from the Flower, (and from their Stalks if they have any) cut or clip them very small, both Husks or Cods, and Seeds within them: and to every Ounce of them put a Pound of fine Wheat Flower, or the same with which they were dried in the Oven: make them up into Cakes or small Loaves, with so much Leaven, as may be convenient for the quantity: Bake these again as you may do Bread of that size, and being well Baked, cut it again into smaller parts, and Bake it again, that it may be as dry and hard as Bisket: which then beat into fine Powder, and sift it through a fine Searse or Sieve, to be kept for use, or to be used instead of ordinary Pepper, for Broth, Meat or Sauce, or any other purpose our Common East-India Pepper is used for. In my opinion, half the quantity of Flower here prescribed may be enough: and it may be a quarter of a Pound to an Ounce may be fully enough. It gives a good Savor, and it may be a better Taste and Relish to Meat or Sauce, than the Common Pepper: and is singular good to be used with such Meats as are Flatulent or Windy, to break and disperse the Wind both in the Stomach and Bowels, and for such whose Bodies abound with Crudities and Moisture. One Scruple of the said Powder may be taken in a little Chicken, Mutton, or Veal Broth, for comforting and strengthening a cold and moist Stomach, to help Digestion and provoke Appetite.

XXX. *The simple Powder of the Cods and Seed.* It is made by drying them thoroughly, (not scorching or burning them) which may be done in a Bakers Oven, after the Bread is out, and repeating the drying so long, till they will beat to Powder in a Mortar. It has all the Virtues of our Common black East-India Pepper, and may be used as Spice, in Sauce or otherwise, as that is: It dissolves and expels Wind, comforts and warms the Stomach, is good against the Colick, and griping of the Guts, provokes the Terms in Women, facilitates the Birth, and forces away the Dead Child, and After-birth; being also prevalent against Obstructions of the Reins and Bladder thro' Sand, Gravel, Stones, and Tartarous or Slimy Matter lodged in those parts. Dose 1 Scruple to a Man or Woman, mixt with some proper Syrup, or with Honey, or other fit Vehicle, Morning and Night, or at time of any Paroxysm.

XXXI. *The Vinegar or Infusion.* It is made by Infusing it in the best Dutch Wine Vinegar, 2 Ounces of the Powder to a Quart of Vinegar. If it is made of the fresh ripe Cods, you may put 5 or 6 Ounces or more, (first cut small) to a Quart of the said Vinegar. It is an admirable Stomackick, strengthens and fortifies it, provokes Appetite, and causes a good Digestion: it may be used at Meals, as Sauce with Meats, and such other things as require Pepper and Vinegar: and upon occasion for the purposes aforesaid may be used or taken in a Glass of Wine, at Meals or otherwise. Bathed upon the Region of the Spleen very hot, it dissolves the hardness, and eases the pain of, that Viscus. Held in the Mouth against the place

troubled with the Tooth-Ach, it eases the pain, and preserves them from Rotteneffs. Mixt with Red Port Wine, and used as a Gargle, helps a sore Throat, and in a little time heals it.

XXXII. *The Decoction in Wine.* It has the Virtues of the Vinegar, eases the Tooth-Ach upon the Spot, and makes an Excellent Gargle for a Sore Mouth and Throat. It immediately gives ease in the Colick, stops Vomiting, and is profitable for such as are troubled with a Quinsey. It is said to be good for such as have a Watery Rupture, outwardly applied: provokes Urine powerfully, helps against the Strangury, Sand, Gravel, Stone, &c. Induces the Terms in Women, and causes speedy delivery to Women in Labor.

XXXIII. *The Cosmetick.* The Powder mixt with an equal quantity of Levigated Niter, and dissolved in White Wine, or mixed into a Liniment with Oil of Ben; and applied, it takes away Scurf, Morpew, Spots, Freckles, red and fiery Pimples and other hot and sharp eruptions of the Skin. The Liniment mixed with a little sharp Wine Vinegar, and applied, eases the pains of the Spleen, and dissolves the hardness thereof, it also dissolves other cold Tumors, and Oedematous Swellings in the Joints.

XXXIV. *The Lohoch or Elelluary.* It is made by mixing the simple Powder with three times its weight of Clarified Honey, or rather with the Syrup of green Ginger. It is good against Asthma's, Coughs, Colds, Wheezings, Hoarseness, shortness of Breath, and other like Distempers of the Breast, and Lungs: it is profitable against an inveterate or old Cough, helps the falling down of the Palate, and applied to the Throat inwardly and outwardly, is good against a Quinsey. Taken for 3 or 4 Days together to the quantity of a Dram or Dram and half, Morning, Noon, and Night, it is said to expel the Dead Child.

XXXV. *The Balsam.* It is made by mixing the Powder with Gum Armoniacum, or Galbanum, or Balsam de Capivi, or Balsam de Peru. This laid upon any hard Knots or Kernels, in the Neck, Throat, or any other parts of the Body, it will hinder their growing, and dissolves or resolves them, not suffering them to grow any more.

XXXVI. *The Pessary.* Take of the Powder 3 parts; of Powder of Gentian 2 parts; Gambogia in Powder 1 part; mix, and make them into a Pessary with Wooll, dipping the same into Decoction of Colocynthis before using it. Being put up the Womb, it induces the Courses or Terms, eases the pains of those parts; and if the time of a Womans Labour is at hand, it hastens it, and even brings away (as it is said) the Dead Child, and the After-Birth.

XXXVII. *The Emplaster.* Take of the former Powder 2 Ounces; Powder of Tobacco 1 Ounce; Frankincense 4 Ounces; Balsam of Peru 3 Ounces; Chymical Oils of Sassafras, and of Juniper Berries, of each one Ounce: Mix and make an Emplaster according to Art, adding Bees Wax so much as to give it a due consistence. It is good (being presently applied) against the bitings of Mad Dogs, or the biting or stinging of any other Venomous Creature. It prevails against Cramp, Convulsions, or Palsies, or any Trembling, weakness, or pain of the Nerves and Tendons, whether in the Joints, Muscles, Spina Dorsi, or in any other parts whatsoever. Applied to the Wrists, Stomach, and along the Spina Dorsi, it cures Agues after an admirable manner, so as that they return no more.

XXXVIII. *The Ashes of the Cods, and of the whole Plant.* Being rubbed on the Teeth, they cleanse them, and make them grow white, if they

were

were black. Infused in White Port Wine, the Infusion provokes Urine powerfully, is good against the Strangury, and prevails against the Dropsy, Jaundice, Scurvy, Gout, as also against Sand, Gravel, and Tartarous Mucilage in the Reins and Bladder.

XXXIX. *The Spirituous Tincture.* Taken 60 or 80 Drops at a time in a Glass of Wine, it gives immediate ease in the Colick: it powerfully provokes the Terms in Women, facilitates the Birth, and expels the After-birth, as also the Dead Child. It prevails against inward Convulsions; and outwardly Barhed along the Back-Bone, as also upon the parts affected, it is very beneficial against the Palsy, restoring the feeling, easing the pains if any be, and adding strength to the Nerves, Muscles, Tendons, and parts affected. Drank in Wine, sometimes 30 or 40 Drops at a time, especially fasting, it is said to be good against a sinking Breath, although of long continuance: and mixed with a little Wine, and held in the Mouth, it gives present ease in the Tooth-Ach.

XL. *The Acid Tincture.* It has all the Virtues of the Spirituous Tincture, but much more Stomack; it cleanses the Ventricle, powerfully opens all obstructions of the Viscera, stops Vomiting, rakes away Nauſeouſness, causes a good Appetite, and a strong Digestion, and therefore is very good for such as are falling into, or are indeed in a deep Consumption, because it not only opens all sorts of Obstructions as aforesaid, but it causes a good Chylous Juice to be generated for the nourishing of all the wasted and consumed parts of the fleshy Substance.

XLI. *The Oily Tincture.* It is a most excellent Diuretick, Lithontriptick, and Antiparalytick. In the Strangury, Gravel, Stone, Palsie, inward Convulsions, Cramps, stoppage of the Terms in Women, &c. It may be given from 15 to 30 Drops in Decoction of Penny-royal, or of Parsly, or in White Port, or Lisbon Wine, or any other fit Vehicle. It brings away both Birth and After-Birth, and admirably eases After-Pains, bathed upon the Back-Bone and parts affected in a Palsie, as also in Cramps, it gives singular relief.

XLII. *Nota.* Gunny Pepper is so fiery hot, and of so sharp and biting Taste, that it will burn and inflame the Mouth and Throat so extremely, that it is scarcely to be endured: if any one should chance to eat a Cod of it raw, it would hazard their choaking: yea, being outwardly applied (fresh bruised) to the Skin, in any place of the Body, it would raise Blisters and exulcerate it, in the same manner as if it had been Burnt with Fire, or Scalded with Water. The reducing the Cods (when dry) into Powder, ought to be done with care, the Eyes being cloathed, and the Nostrils being stopp'd: for the Atoms of the Powder by flying up to those Parts, (if they can come at them) will so pierce and attract, that they will induce a great Flux of Rheum or Humors by those parts, and cause such Vehement Sneezings as may do the party concerned much Mischief: and if they should press into the Throat, they will cause such fierce Sneezings, Coughings, and Vomittings with all, and with that Vehemency as to cause Convulsions, not only of the Stomach and Bowels, but Universally of the whole Body.

C H A P. DLVII.

Of PEPPER - - WALL.

I. *THE Names.* It is called in Arabick, *Halschram*, *Handrachabara*, and *Tilsan*; in Greek, *Ἀλκυωνίδος ῥίζον*; in Latine, *Alcebra minor Lobelij*; *Aizoon acre Cordi*; *Aizoon minus fervidi gustus Thalij*; *Sedum minus causticum*, *Clusij*; *Gramen Tertium*, *Plinij Angularia*; *Dactylon secundum vel tertium Columne*; *Sempervivum minimum Lobelij*; but *Columne* thinks it not fit to be called an *Aizoon*, or *Sedum*, because they are all extremely Cold; whereas this is very hot, even in the fourth Degree, and to this Opinion I adhere, knowing it to be no Species of the *Sedum's*, but a Plant of another Kind. In English it is called, *Wall-Pepper*, also *Little Stone-Crop*, *Pricket*, and *Wall Mouse-Tail*.

II. *The Kinds.* Authors make two Species of this Plant, viz. 1. *Alcebra minor*, sive *Sedum Tertium Dioſcoridis*, to which all the Names in the former Section belong, Our Common Wall Pepper. 2. *Alcebra insipida*, *Aizoon minus Thalij* & *Vermicularis insipida*, *Aizoon minimum Cordi*, *Insipid*, or *Tasteless Wall-Pepper*.

The Descriptions.

III. *The first, or Our Common Wall-Pepper.* It has a Root which is Creeping and Fibrous, much like to those of the Stone Crops. This Root sends forth many Stalks, which as they lye upon the Earth, take Root again, and spread far. It is a small Plant, and grows much like to some of the Stone Crops, with very many and slender Stalks, beset round with small round Leaves growing very thick or close together. At the tops thereof grow small pale yellow Flowers, in small Tufts. The Taste of the Plant is very hot and Sharp upon the Tongue, which chiefly distinguishes it from the *Sedum's*, or Stone Crops; tho' it is also distinguished by its form, being small and thick set with round Leaves.

IV. *Gerard describes it thus.* Its Root is nothing but Strings. It is a low and little Herb, whose Stalks are slender and short. The Leaves about the Stalks stand very thick, being small in growth, full Bodied, sharp pointed, and full of Juice. The Flowers stand at the top, and are very small, of color yellow, and of a sharp biting Taste.

V. *The second, or Insipid, or Tasteless Wall Pepper.* This has a Root only made of Fibres, and is as small a Plant as the last, growing altogether like it in Leaf, Stalk, and Flowers, which are yellowish likewise: but it is chiefly distinguished from the former by the Taste, which in this is nothing biting, but utterly insipid or without Taste.

VI. *The Places.* The first grows almost every where in dry and stony places, and in Chinks and Crannies of old Walls, and on the tops of Houses. It is always green, and therefore was ranked by former Authors among the *Sempervives*, or *Houſe-Leeks*. The second grows also in the like Places, on Mud or Stone Walls, or among Rubbish, or in sandy or gravelly Places, and oftentimes on the sides of old Tiled Houses, and Pent-Houses, &c.

Pepper-Wall Inspid.

VII. *The Times.* They both Flower in the Summer Months, in June and July, and sometimes sooner; and the Leaves (if the Season is not very extreme) continue green all the Winter.

VIII. *The Qualities.* The first of these is only used in Physick, and is hot and dry in the fourth Degree, very attractive, sharp and biting: outwardly applied it raises Blisters, and at length exulcerates the part it is applied to.

IX. *The Specification.* It cures the Sciatica and Gout; prevails against the Kings Evil, is Alexipharmick or good against Poyson, and cures Quartans and other Agues of long continuance.

X. *The Preparations.* You may have therefrom, 1. A Liquid Juice. 2. An Essence. 3. An Insolated or Decolled Oil. 4. A Balsam. 5. A Cataplasim.

The Virtues.

XI. *The Liquid Juice.* By reason of its hot and attractive qualities, it is (being taken inwardly) Emetick. Being taken with Vinegar, or some other proper Vehicle, it educes thick and tough Flegm, and other tenacious and viscous Humors in the Ventricle, by Vomit: it evacuates also Choleric Humors, and thereby cures Quartan Agues, and other Agues inveterate, or of long continuance. And taken in the same manner, it expels any sort of Poison, whether Vegetable, as of the *Aconites*, or Animal, from the swallowing of any Poisonous Creature; but, *Caveat qui sumpsit*, says Parkinson, I suppose because of its heat.

XII. *The Essence.* It has all the Virtues of the Liquid Juice, being taken in the same manner, or in the same Vehicle: and may either of them be given, from a Spoonful to two Spoonfuls, more or less, according to the Prudence of the Physician.

If the Dose is given in a large quantity of the Vehicle, it will certainly be less dangerous; so also if a good quantity of Posset Drink, or Mutton Broth be Drank after it, if it is found to burn much: it much expels wind, and being given in a small quantity warms and comforts the Stomach, and gives ease in the Colick.

XIII. *The Insolated or Decolled Oil.* It eases pains and dissolves Tumors proceeding from cold and moist Humors, and is a very beneficial thing, in alleviating pains of the Gout. Anointed upon the *Spina Dorsi*, and parts affected with the Palsy, it dissolves the Flatulent Humor, and cures that disease, if it is recent: Anointed on the Neck and Throat, it is good against the Quinsy, swellings of the Almonds, and other Distempers of those parts: Anointed on the Piles it cures them.

XIV. *The Balsam.* It is made with Beef Suet, Strasburg Turpentine, with a little Frankincense. It is a potent thing against the Gout, and all manner of Aches and Pains of the Joints being applied, (universals also being at the same time exhibited:) it is profitable against the Kings Evil, taking away or dissolving Knots and Kernels in the Neck and Throat, before they are broken; or if Ulcerated, digesting, cleansing, and healing them in a short time.

XV. *The Cataplasim.* It is made by beating the Herb up with a little Hogs Lard. Applied to the Hips, it cures the Sciatica; and to Joints affected with the Gout, it eases the Pain and educes the Morbifick Matter, and this it does by drawing Blisters upon the parts affected. And applied to Kernels or Scrophulous Tumors in the Neck and Throat, commonly called the Kings-Evil, it removes or takes them away after a singular manner.

XVI. *Nota.* The second of these, is cold and moist in the second Degree, and yet it is thought to be astringent withal. And to stop Fluxes and distillations of Rheum, inward Bleeding, and outward hot eruptions of the Skin, and to heal cancerous and fretting Sores and Ulcers, and is safely to be used, and effectual for all the purposes for which our Common House-Leek is used, its Qualities, Preparations, Virtues and Uses, being much the same, which see Chap. 484. Sect. 10, ad 19. and Chap. 485. Sect. 6. foregoing of this Book.

CHAP. DLVIII.

OF PERWINCLE.

OR,

The CLIMBER.

I. *THE Names.* It is called in Greek, *Κλαμαρίς δαφνοειδής*; (*Clematis*, because it brings forth its Stalks which creep or climb like those of the Vine: *Daphnoeides*, because its Leaves are like those of the Bay-Tree:) in Latine, *Clematis*, & *Vinca*

Vinca Perwinca, *Chamedaphne* Plinij; *Centunculus* Plinij: in English, Periwinkle, or Climer, also Periwinkle.

II. The Kinds. There are three several sorts which are common amongst us, viz. 1. *Clematis Daphnoides major*, *Vinca Perwinca major*, *Chamedaphne major*, The greater Periwinkle. 2. *Clematis Daphnoides minor*, *Vinca Perwinca minor* (*diversorum colorum*) *Chamedaphne* Plinij; *Centunculus* Plinij, The lesser Periwinkle, or single Periwinkle of divers colors. 3. *Clematis Daphnoides*, sive *Vinca Perwinca Flore duplici purpureo*, Periwinkle with double purple Flowers.

The Descriptions.

III. The first, or Greater Periwinkle. Its Root consists of a great Bush of Fibres, which run and spread themselves much, fastning themselves strongly in the Ground. This greater Periwinkle is something like to the next, or smaller Kind, but much larger, yet its Branches creep not in that manner,

Periwinkle Great.

but stand more upright, or less creeping at the least. The Leaves also hereof stand by couples at the Joins, but they are broader and larger by the half than the next following. The Flowers likewise are larger, consisting of five Leaves, of a blew color, a little deeper than the blew in the lesser Kind. This Plant is far tenderer to keep than the smaller Species, and therefore ought to be Planted in a warmer place, yet a place which is moist and shady.

IV. The second, or Lesser Periwinkle, which is a single Periwinkle of divers colors. Its Root is in its Body, little bigger than a Ruth, bushing it set

Periwinkle purple small.

Periwinkle Wild small.

out, in the Ground and creeping with its Branches and Fibres far about, whereby it quickly takes up a large compass, and is therefore most usually planted under Hedges, where it may have room enough to run in. From this Root spring forth many Branches, trail-

ing upon the Ground, running far about, and shooting out small Fibres at the Joints as it runs, taking thereby fresh hold in the Earth, and rooting it self again in many Places. At the Joints of these Branches grow two small dark green shining Leaves, something like Bay Leaves but smaller, and with them come forth also the Flowers, one at a Joint, standing upon a tender foot Stalk, being something long and hollow, parted at the brims or edges, sometimes into four, and sometimes into five Leaves. The Common sort are of a pale blew color, and some are of a pure white; but some again are of a dark reddish purple color, and these are those which are only planted in Gardens.

V. The third, or Perwinkle with double purple Flowers. Its Root is very Bushy and Fibrous like the former: and this Plant is very much like to the second lesser Kind just now described, in all things, except in the Flower, which is of that dark reddish purple color, which is in the former single lesser Kind, but herein it differs, that this has another row of Leaves within the Flower, so that from the two rows of Leaves, it came to be called double Perwinkle, but the Leaves of the Flowers of this are lesser than the Leaves of this single Flowered.

VI. The Places. The first or Great Perwinkle, grows in Spain, Italy, France, and other hot Countries, from some of which places it has been Transplanted to us, and grows only in our Gardens. The second or Blew smaller Perwinkle, grows in many Woods and Orchards, by Hedge sides in many parts of England, so also does the white Kind here and there: but the Single purple, and Double purple, or third Species, grow only in our Gardens with us. The second Species whether Wild or Garden, is said to be the Common or Vulgar Kind, and that which is only, or chiefly in Use.

VII. The Times. They are said to Flower all in March and April, and the Branches remain or abide always green, more especially if they grow in moist and shady places, in which they chiefly delight.

VIII. The Qualities. Perwinkle is hot and dry in the second Degree, Astringent, Emphractive, Styptick and Vulnerary.

IX. The Specification. It stops all sorts of Fluxes of the Belly, chiefly the Dysentery or Bloody Flux; as also all other Fluxes of Blood, as Spitting or Vomiting Blood, Pissing of Blood, and the overflowing of the Terms in Women, and the too abundant Flux of the Loches of Women in Child-bed.

X. The Preparations. You may have therefrom, 1. A Liquid Juice. 2. An Essence. 3. A Decoction or Infusion in Red Wine. 4. A Powder of the Plant. 5. A Cataplasm of the green Herb.

The Virtues.

XI. The Liquid Juice. Two or three Spoonfuls of it taken alone, or in a Glass of Red Styptick Wine, it stops all Fluxes of the Belly, and Bloody Fluxes of what kind soever, and in what Part of the Body soever. It is said never to fail in the Cure of a Bloody Flux, Spitting of Blood, or Pissing of Blood, or the Terms; but it ought to be taken Morning and Night, till such time as the Cure is performed: Injected up the Nostrils, it stops the Hemorrhage there; so also Injected up the Womb with a proper Womb Syringe (as well as taken inwardly by the Mouth) it contributes more immediately to stop the overflow-

ing of the Courfes, or Loches in Women as aforesaid.

XII. The Essence. It has all the Virtues of the Juice, being used in the same Dose, and in the same manner, but is more effectual to the purposes intended, applied outwardly it stops the bleeding of Green Wounds, and contributes very much to the speedy healing of simple Wounds or Ulcers, more especially, if the Powder of the Herb, be strewed pretty thick upon the same.

XIII. The Decoction, or Infusion in Red Wine. It has the Virtues of the Juice and Essence, and may be given Morning and Night to five or six Ounces. Outwardly, it is Vulnerary and contributes to the speedy healing of Wounds and Ulcers. Used as a Gargle to a Sore Mouth or Throat, it cleanses the same and quickly heals it.

XIV. The Powder of the Herb. It has all the Virtues of the Juice, Essence, and Decoction or Infusion, but operates not altogether with that speed they do. Dose from two Scruples to a Dram or Dram and half, in Styptick Red Wine: outwardly applied to Wounds it stops their Bleeding: and strewed upon Ulcers, it cleanses, dries and heals them.

XV. The Cataplasm. Applied to Bleeding Wounds, it presently stops the Hemorrhage: and to inveterate running Ulcers, it in a short time stops the Fluxion.

CHAP. DLIX.

Of the PERU -- FLOWER.

O R,

MARVEL of PERU.

I. THE Names. This Plant is called by the Indians of Peru, *Hachal*; and for that reason some Authors call it *Hachal Indi*: It has no Greek Name: but our Modern Authors call it *Admirabilis*, *Mirabilia Peruviana* & *Peruviana*; *Planta Admirabilis*, *Gelsinum vel Jasminum Mexicanum*, *Jasminum rubrum* & *Indicum*; *Solanum Mexicanum Baubini*, *Solanum Odoriferum*, *Admirabilia Peruviana Clusii*: in English it is called, *Marvel of Peru*, *Marvel of Mexico*, and *Marvel of the World*.

II. The Kinds. Authors have described two varieties of this Plant, viz. 1. *Mirabilia Peruviana major*, The greater Marvel. 2. *Mirabilia vel Mirabilis Peruviana minor*, *Solanum Mexicanum Flore parvo*, The lesser Marvel, whose Descriptions follow.

The Descriptions.

III. The first, or Greater Marvel. It has a Root which is long and round, greater at the Head, and smaller downwards to the end, like unto a Radish, spreading out into two or three or more Branches, blackish on the out side, and whitish within. These Roots have often been preserved by Art thro' the Winter Season, yea for two or three Winters together (for they will perish if they be left abroad

in the Garden in those Months, unless it be under a House-side, or where they may be sheltered from the Winters cold:) because many times the Year not falling out to be moderate or kindly, the Plants give nor ripe Seed; and so we should be to seek both for Seed to Sow, and Roots to Set or Plant again. The Stalk of this Marvelous Plant is great and thick, thicker than any Mans Thumb, bunched out, or swelling with a Kind of Kne at every Joint; in some Plants the Stalks will be of a fair green color, and those will bring white, or white and red Flowers; and in some a dark green color, which will give yellow Flowers. The Stalks and Joints of those, which will give red and yellow Flowers Spotted, are somewhat brownish, but not so red as those which give wholly red Flowers. Upon these Stalks which spread into many Branches, there grow at their Joints upon several foot Stalks, fair green Leaves, broad at the Stalk, and pointed at the end. At the Joints likewise, towards the upper part of the Branches, at the foot of the Leaves, come forth several small Flowers, upon short foot Stalks, every one being small, long and hollow, from the bottom to the brim, which is broad, spread open, and round, and consists but of one Leaf without division, like unto a Bell-flower, but not cornered at all. These Flowers are of divers colors, and diversly marked and spotted, some being wholly white, without any spot in them for the most part, thro' all the Flowers of the Plant. So likewise some being yellow, and some wholly red. Some Plants again are mixed and spotted so variably, either white and red, or purple (except here and there, some may chance to be wholly white, or red, or purple, among the rest,) or red and yellow thro' the whole Plant (except as before, some may chance in this kind, to be either wholly red, or wholly yellow) that you shall scarcely finde 2 or 2 Flowers in a Hundred, which will be alike spotted and marked, without some diversity, and so likewise every Day, as long as they blow, which will be until the Winters or rather Autumns Cold puts a stop to their proneness of Flowering. It has also been often observed, that one side of a Plant will give fairer varieties of Flowers than another, which is most commonly the Eastern, as the more temperate and shadowy side. All those Flowers do open for the most part, in the Evening or in the Night time, and so stand blown open, untill the next Mornings Sun begins to grow warm upon them, which then close themselves together, all the brims of the Flowers shrinking into the middle of the long Neck, much like unto the Blew Bind-weed, which in a manner does so close up at the Suns warm heat. Or else, if the Day is temperate and mild, without any Sunshine upon them, the Flowers will not then close up for the most part of that Day, or until it is towards Night. After the Flowers are past, come several Heads of Seed, that is, but one at a Place, as the Flowers stood before, of the bigness sometimes of a small Pea, but not so round, standing within the green Husks, in which the Flowers grew before, which Seed is a little flat at top, like a Crown or Head, and round below where it is fastened in the Cup, of a black color when it is ripe, but esse green all the while it grows on the Stalk: and being ripe, is soon shaken down with the Wind, or any other light blow.

IV. Gerard has another Description, which being compared with the former, will more lively set forth this admirable Plant: and it is in these following Words. Its Root is thick, and like unto a great Radish, outwardly black, and within white, and sharp in Taste, wherewith is mingled a Superficial Sweetness: it brings forth new Flowers from July to October in Infinite Number, yea even until the Frost does cause the whole Plant to perish, not

withstanding it may be preserved in Pots, and set in Chambers or Cellars that are warm, and so defended from the injury of our cold Climate, provided always that there be no Water cast upon it, or put forth into the Air, to take any moisture in there, untill the March following: at which time it must be taken forth out of the Pot, and planted again in the Garden: by this means many Plants have been preserved, as well as by Sowing of Seeds, which Sown Plats will bear Flowers in as ample manner, and in as good time, as those reserved Plants. This admirable flower, called the Marvel of Peru, or the Marvel of the World, springs forth of the Ground, like unto Basil in Leaves: among which it sends out a Stalk two Cubits and a half high (viz. about four Feet and half) of the thickness of a Finger, full of Juice, very firm, and of a yellowish green color, knotted or kneed with Joints, somewhat bunching forth, of a purplish color, as in the Female Ballamina: which Stalk divides it self into sundry Branches or Boughs, and those also knotted, like the Stalk. Its Branches are decked with Leaves growing by couples at the Joints, like the Leaves of Wild Peasecocks, green, fleshy, and full of Joints, which being rubbed do yield the like unpleasant Smell as Wild Peasecocks do, and are in Taste also very unsavory, yet in the latter end they leave a Taste, and sharp smack of Tobacco. The Stalks towards the Top, are garnished with long hollow single Flowers, folded as it were into five parts, before they be opened, but being fully blown, do resemble the Flowers of Tobacco, glittering oftentimes with a fine purple or crimson color, many times of an Horse Flesh color, sometimes yellow, sometimes pale, and sometimes resembling an old red or yellow color; sometimes whitish, and most commonly of two colors, which occupy half the Flower, or intercouring the whole Flower with streaks, or orderly streams, now yellow, now purple, divided thro' the whole; having sometimes great, and sometimes little spots of a purple color, sprinkled and scattered, in a most variable order, and admirable mixture. The Ground or Field of the whole Flower, is either pale, red, yellow, or white, containing in the middle of the hollowness a Prick or Pointal set round about with six small Springs or Chives. The Flowers are very sweet and pleasant, resembling the Narcissus or White Daffodil, and are very suddenly fading. For at Night the Flowers are wide open, and so continue till 8 of the Clock the next Morning, at which time they begin to close (after the manner of Bind-weed) especially if the Weather is very hot: but the Air being temperate, they will sometimes remain open the whole Day, and close themselves only at Night, and so perish, one Flower lasting but only one Day, like the True Ephemerum or Hemerocallis. This wonderful variety does (not without cause) bring admiration to all who observe it. For if the Flowers be gathered, and reserved in several Papers, and compared with those Flowers, which will Spring and Flourish the next Day, you shall easily perceive, that not one Flower is like another in color, tho' you should compare an hundred which Flower one Day, with another hundred which you may gather the next Day, and so from Day to Day, during the time of their Flowering. The Cups and Husks which contain and embrace the Flowers, are divided into five pointed Sellsions, which are green, and as it were consisting of Skins, wherein is contained one Seed and no more, covered with a blackish Skin, having a blunt point on which the Flower grows, but on the other end next the Cup or Husk, it is adorned with a little fine cornered Crown. The Seed is as large as a Pepper Corn, which of it self fades with any light motion. With-

in this Seed is contained a white Kernel, which being bruised, resolves into a very white Pulp like Starch. Thus Gerard.

V. The second, or Lesser Marvel. The Root of this is like to the former, and answerable to it, in proportion to the rest of the Plant. This Small Marvel of the World, or of Peru, as it is called, grows in the same manner that the former greater does, but nothing so large, or so high; having such like Leaves set on the Stalks, but much lesser and rounder: the Flowers likewise being of a red color for the most part, and made of one Leaf, opening into five parts on the Brims, like the other. They are so small, that the whole Flower of this is scarcely so big, as the one part or division of the greater Flower; and the Seed which follows, is in proportion to the Flower going before it.

VI. An Observation. This larger Plant yields in our Gardens, five or six several Varieties of beautiful Flowers, as, 1. Pure White. 2. Pure Yellow. 3. Pure Red. 4. White and Red Spotted. 5. Red and Yellow Spotted. 6. Purple Spotted. But besides these there are some other sorts, among which was, 7. One of a Pale Purple or Peach color. 8. And a Purple or Peach color Spotted, &c. all which differences in the color of their Flowers, may be discerned by the Leaves of the Plant, and manner of growing, which are all different one from another: and many of them in their Native Countries different from those which we have growing with us in our Gardens; but concerning them all, the chief difference almost consists in the Flowers.

VII. Observation 2. Within a while after the first Frosts have taken the Plants, so that the Leaves wither and fall, dig up the Roots whole, and lay them in a dry Place for three or four Days, that the superfluous moisture on the outside may be exhausted or spent and dried away, which done, wrap them up severally, in two or three brown Papers, and lay them by in a Box, Chest, Tub, or in some other convenient thing or place in the House, all the Winter time, where no Wind or moist Air may come to them. And thus you shall have these Roots preserved, and fit to Plant again the next Spring, which will spring again afresh the next Year, if you plant them in the beginning of March, as has been often times proved.

VIII. Observation 3. Some have put them up into a Barrel or Firkin of Sand or dry Ashes, which is also good, if the Sand or Ashes be thro' dry; but if they be any thing moist, or if they give again in Winter, as is usual, that moisture of Sand or Ashes, will putrify the Roots, so that they will be nothing worth, when the time shall come that they should be planted:

IX. Observation 4. This is also to be Noted, as to the sowing of the Seed, that if you would have variable Flowers, and nor all of one color, you must chuse it out of such Plants as be variable while they grow, and out of such you must always reserve your Seed: for if the Flowers be of one entire color, you will have for the most part from those Seeds, Plants which will bring forth Flowers all of a color, whether they be white, red, or yellow.

X. The Places. These Plants grow naturally in Peru, Mexico, and other Provinces of the West-Indies, where there is a perpetual Summer, or at the least no cold Frosty Winters; and from some of those parts the Seed was first brought to Spain, from whence it has been conveyed to most other Countries in Europe, and particularly into our Gardens in England, having now had it with us, for near this Hundred Years, or more, so that now they are almost in every Garden of Note.

XI. The Times. The Roots ought to be planted in the middle of March if the Season is temperate and warm; otherwise in the beginning of April, at which time they are to be taken out of the Papers, or from the Sand, in which they lay Buried, and then placed in that part of the Garden which is warmest, and withall shady and a little moist. If you raise them from the Seed, it is to be sown or planted about the middle of April. They bring forth their Flowers from the end of July, and Flower thro' all August and September, to October, or till cold Air and Frosts come, which pull them down; the Seed ripening in the mean Season.

The Virtues.

XII. This Plant is esteemed more for its Rarity and Beauty, than for any Virtues it is known to have; nor have we learnt any thing concerning the same from the Indians, among whom it is a Native: Its exceeding and admirable Beauty, and Sweetness of its Flowers, being the only reasons for which it is Nurst up in our Gardens; in which it is indeed a pleasant Ornament. However, Jacobus Antonius Cortusius of Padua says, That he had found out by experience, that the Powder of the Root, taken to two Drams inwardly, in any fit Vehicle, does exceedingly well purge Watery Humors.

Of PETERS -- WORT.

O R,

Square JOHNS -- WORT.

I. THE Names. It is called in Greek, *Ἀσφύριον*, & *Ἀσφύριον*, *Ascyron* & *Ascyroides*: Dioscorides saith, it was called also, *Ἰσχυρίον* & *Ἀνδροσάμων*, *Hypericon*, i. e. *Johns-Wort*, and *Androsamon*, i. e. *Tutsan*, or *Park Leaves*: and Galen therefore, accounted it a kind of *Androsamon*; but it is truly neither of these Plants: in Latine, it has no other Name than *Ascyrum*, from the Greeks: and in English, it is called *Peters-wort*, or *Johns-wort Square Stalked*, *Johns-wort the greatest*.

II. The Kinds. Authors have many Kinds of this Plant, the three following are eminent, viz. *Ascyrum vulgare*, *Matthioli*; it is, *Androsamon primum* Fuchsij; *Hypericon Dodonaei*, in his French Edition; *Androsamon alterum* *Hirsutum Columne* (and yet he doubted whether he should call it *Hypericum*, or *Androsamon*, and said that it came nearest unto *Ascyrum*, tho' something differing

from it, but this mistake of his might be from the differing Soils and Clime, wherein he saw it grow:) *Androsæmum Hirsutum Bauhini*; *Hypericon in dumetis nascens Tragi*, Our common Peters-wort, or Square Johns-wort. 2. *Ascyrum Supinum villosum palustre, Bauhini*; *Ascyrum Supinum* *advers Clusij*, Marsh Peters-wort, or Creeping Marsh Peters-wort. 2. *Ascyrum magna Flore Bauhini*, Great Flowered Peters-wort.

The Descriptions.

III. The first, or Our Common Peters-wort, or Square Johns-wort. It has a hard and woody-Root, not very thick, running under the upper surface of the Earth, with a great number of Fibres springing from the same, and running strait down into the Earth; it sends forth new shoots every Year, and abides a long time, or for many Years. This is that Peters-wort which is most common with us in England, and rises up with square upright Stalks for the most part, something greater and higher than Hypericon, or Johns-wort, but brown in the same manner. At every Joint, it has two Leaves, something like those of Hypericon, but larger, a little rounder pointed, and with very few or no holes to be seen therein, and having sometimes some smaller Leaves, rising from the Bosom of the greater, and sometimes a little hairy withall, as the Stalks will be. At the tops of the Stalks grow many yellow Star like Flowers, with yellow Threads in the middle very like unto those of Hypericon, so that but for the largeness and height, it is not readily discerned from Hypericon. The Leaves and Flowers give a bloody Juice, being bruised between the fingers as that does; and it has such like Seed, and of a Strong and Resinous Smell.

Johns-wort.

Note, That by a mistake of the Printer, the true Figure of Peters-wort is placed in the Chapter of Johns-wort, Chap. 405. Pag. 572. b. which ought to be placed here; and this Figure of Johns-wort, which is put here, ought to be placed there, of which we desire the Reader to take notice, to avoid being mistaken.

IV. The second, or Marsh Peters-wort, or Creeping Marsh Peters-wort. It springs up with Stalks round, woolly, and soft, which stand not upright, but lean downwards, taking Root at the Joints, having somewhat rounder pointed Leaves, set at the Joints, two for the most part together. The Flowers are as yellow, and of the same bigness as the former, but give not full out so red a Juice as they do; and in these particulars consists the whole difference from the first, setting aside also the Natural place of its growth.

V. Johnson upon Gerard, thus describes this second Species. It sends forth divers round hairy creeping Stalks, which here and there put forth new Fibres or Roots, and these are set at certain spaces, with very round and hairy Leaves of a whitish color, and two at a Joint. And on the tops of these Stalks, grow a few small yellow Flowers, which consist of five Leaves apiece. These Stalks seldom send forth Branches, unless it be one or two at the tops. This (says he) may well be called in English, Round S. Peters-wort.

VI. The third, or Great Flowered Peters-wort. This Plant is very much like the first described, saving that it has a round brown upright Stalk, two feet high at the least, with such like, but larger Leaves, and round pointed, of a paler green color on the upper side, and whiter underneath. The Flowers which put forth at the end of the Stalk, are of a pale yellow color like the first, but much larger, with yellow Threads therein also. There is a larger Peters-wort than this, which is said to grow in Candia, which they call *Ascyroides Cretica major*; but it differs in nothing from this, but in the largeness of its Leaves and Flowers, which are three or four times greater: the which difference may arise (for all that I know) from the different goodness of the Soils.

VII. The Places. The first grows in many Groves and small low Woods in several places of England, as in Kent, Huntington, Northampton, and Cambridgeshires, as also near Water Courses in other places. Gerard found it in many places in Kent, as in a Cops by the then Mr. Sidleys House near South-Fleet. It grows also plentifully in the North parts of England, especially in Lancashire and Craven. The second grows in the Marshes in the Low Countries, and in divers Boggy Grounds of this Kingdom, as Johnson says, and is truly that Plant which Clusius describes in *Austriam*. The third is a Native of the Pyrenean Mountains, and has been Transplanted from thence into our Clime, and is nourisht up in some of our Gardens. Yet I have heard some excellent Botanists say, that they have sometimes met with it upon several of the Mountains in Wales.

VIII. The Times. They all Flower in June and July, and the Seed is ripe in July and August.

IX. The Qualities, Specification, Preparations and Virtues of Peters-wort, are the same with those of Johns-wort, in Chap. 405. Sect. 5. ad 22. of this Book foregoing, to which I refer you. But Johns-wort is said to be the more potent and efficacious to the purposes intended, and so to be preferred before Peters-wort.

X. The

X. The Powder of the Seed of Peters-wort. Dioscorides, Pliny, and Galen say, That if it is taken to the quantity of two Drams at a time in Mead, or Honied Water, that it purges Cholerick Humors, and thereby helps such as are troubled with the Sciatica or Hip Gout.

PILD-CORN, see Oats Wild, Chap. 525.

CHAP. DLXI.

OF PILE--WORT.

OR,

FIG--WORT.

I. **T**HE Names. It is called by the Arabians, *Memiton*: in Greek, *Χελιδών*: in Latine *Chelidonium minus*, (and yet in truth is no *Chelidonium*, or *Celandine*, nor any Species thereof:) but the most common Latine Names are, *Ficaria*, & *Scrophularia* (because it cures the Kings-Evil,) also *Amellus Virgillij Guilandino*, *Tesculus Sacerdotis Sylvarici*, *Ranunculus latifolius Lugdunensis*, (and yet it has no biting Taste as the *Ranunculi* have:) *Chelidonia Rotundifolia Bauhini*, and it is thought to be the *Strumea* Plinij: in English, *Pile-wort*, *Fig-wort*, and by some, the *Lesser Celandine*, (tho' improperly.)

II. The Kinds. There are two Species of this Plant, viz. 1. *Ficaria seu Scrophularia major*, *Hirundinaria major*, The Greater *Pile-wort*, or *Fig-wort*. 2. *Ficaria seu Scrophularia minor*, The Lesser *Pile-wort*, or *Fig-wort*.

The Descriptions.

III. The first, or Greater *Pile-wort*, or *Fig-wort*. Its Root is Fibrous, full of many small Kernels or Knots, some smaller, some greater, growing without any order, almost like Grains of Wheat, but larger, and of a white color. The Leaves are round, thick and smooth, growing almost as large as *Asarum* or *Asarabacca*, sometimes a little waved about the edges, and sometimes not, each Leaf standing upon a longer foot Stalk than those of the following or Lesser Kind, yet lying upon the Ground. The Flowers which grow severally, as the next or lesser do, stand upon longer foot Stalks, are of a pale yellow color, and larger than they, consisting but of five or six Leaves, cut in at the ends unto their middle, and having some reddish Threads in the middle of the Flowers.

Pile-wort Great.

Pile-wort Great double Flower'd.

IV. The second, or Smaller *Pile-wort*, or *Fig-wort*. It has a Root which is made up of many small Kernels, or Knots, like Grains of Corn, some of them being twice or thrice as big and as long as others, of a whitish color, with some Fibres at the ends of them. This Plant does spread out with many

Pile-wort small.

many round pale green Leaves, set on weak and trailing Branches, which lie upon the Ground, and are flat, smooth, and somewhat shining, and in some Places (tho' seldom) marked with black Spots, each standing on a long foot Stalk: among which rise up small yellow Flowers, (consisting of nine or ten small narrow Leaves) growing upon slender foot Stalks, very like unto a Crowfoot Flower, to which the Seed also is not very unlike, being many small ones set together upon one Head.

V. There is another sort hereof, which has as it were double Flowers, consisting of two rows of Leaves, in all other things not differing from the former, which Camerarius in Horto, only mentions.

VI. The Places. They grow in moist Meadows, by common Ways, and Ditch-sides which are wet, and sometimes overflowed with Water, and almost every where throughout the Kingdom, in Plashy, and watery Grounds, in the moist corners of Fields, and places which are near the Water side: and yet they will also grow in something dryer Grounds provided it be in the shade withal.

VII. The Times. They spring forth out of the Ground about the middle or latter end of February, and Flower and Seed in March and April, and are quite gone in May, so that they cannot be found, till they spring up again the next Year.

VIII. The Qualities. They are hot and dry in the first Degree, and not in the fourth Degree, as Dioscorides and Galen, make theirs to be. They are Attractive, moderately Maturative, otherwise Discurfive, Absterfive, and Vulnerary.

IX. The Specification. Pile-wort is a singular Cure for the Hemorrhoids or Piles, and the Disease called the Struma or Scrophula, vulgarly the Kings-Evil; it softens and discurfies Wens, and other hard Tumors.

X. The Preparations. You may make therefrom, 1. A Liquid Juice or Essence of the Leaves and Roots. 2. A Decoction of the same. 3. An Oil, or Ointment. 4. A Balsam. 5. A Cataplasm of the same.

The Virtues.

XI. The Liquid Juice, or Essence. They are Specificks against the Scurvy, Jaundice, Gout, Stone, Gravel, Kings-Evil; and productions of the Hemorrhoids or Piles, being inwardly taken from 2 to 3, or 4 Spoonfuls, Morning and Night; in a Glass of White Port, or Lisbon Wine; and withall bathing and fomenting the parts affected therewith hot, twice or thrice a Day, for half an Hour together.

XII. The Decoction. It has the Virtues of the Juice or Essence, but much weaker in its effects and operation, and may be given for the same purposes, from 4 to 8 Ounces, sweetened with Syrup of Violets, or of Roses Solutive, Morning and Night. If the Decoction 1 part, is mixed with the Juice or Essence 3 parts, and used as an Errhine up the Nostrils, it purges and cleanses the Head and Brain, from cold and moist Humors which offend it, and many times prevents an Apoplexy, and Cures the Epilepsy, Vertigo, Lethargy, and other Diseases of like Kind.

XIII. The Oil or Ointment. Anointed 2 or 4 times a Day upon the Hemorrhoids or Piles it cures them; and is wonderfully beneficial in the Cure of the Kings-Evil, and hard Tumors in many parts of the Body, being anointed upon the parts affected, and Cloths dipt in the same applied over them.

XIV. The Balsam. If the Piles or Scrophula are disposed to break, it will ripen and break them, and afterwards more fully digest the indigested Matter, cleanse and heal them after an admirable manner, beyond most other Medicaments appropriated to the Cure of those Diseases.

XV. The Cataplasm of the Green Herb and Roots. It discurfies and heals simple Contusions, being applied whilst they are Recent; is profitable against an Oedema in the Knee, and either discurfies (being applied warm) or maturates, breaks, cleanses and heals the Hemorrhoids in a short time, and withal gives present ease and relief in the pain tho' never so extreme. In a recent Scrophula, it discurfies the Kernels and Knots, tho' never so hard, so also if they be inveterate, if long applied; but if they tend to suppuration, it hastens it and breaks them, after which they may be washed with the Juice or Essence, and then cleansed and healed with the Ointment and Balsam.

CHAP. DLXII.

of PIMPERNEL.

I. THE Names. Some take this Plant to be the Melochia of Serapio, but the Mas or Male Kind Fibre Phaniceo, he calls it in the Arabian Tongue Xantala, and the Femina Fibre Caruleo, he calls, Cardabelli. It is called in Greek, Αναγallis (ex ἀνά & γάλλω idque ex Gallo Phrygiae fluviō ubi oritur:) in Latine, Anagallis: in English, Pimpernel. Some Authors call it, Morfus Galline & Morgeina, but these are rather the proper Names of a Species of Alsine or Chickweed. Marcellus an old Writer calls it Macia, which is extant also in Dioscorides, among the Barba-

Barbarous Names. Some call it *Corchorus*, or *Corchorus*, supposing it to be the *Corchorus* Theophrasti, Lib. 2. Chap. 7. which he accounts. *Inter Olera*, among the *Pot Herbs*: and for its bitterness became a Proverb, *καρχορος ἐς ἀνθρώπους*, *Corchorus inter Olera*, when we speak of vile or ill Men, who would be accounted of, as among the Good, or deserving of Mankind. But this is not the *Corchorus* Plinij, in Lib. 15. Chap. 22. which is the *Melochia*, or *Olivus Judiacum*, the *Jewes Mallow*.

II. The Kinds. There are several Species of this Plant, as, 1. *Anagallis Mas*, *Anagallis Floribus Pheniceis*, vel *Flore Pheniceo*, the Male Pimpernel, or Pimpernel red Flowered. 2. *Anagallis Fœmina*, *Anagallis Flœre Ceruleo*, vel *Floribus Cœruleis*, the Female Pimpernel, or Pimpernel blew Flowered. 3. *Anagallis Flœre purpureo obsolete Clusij*, the dull red, or purple colored Pimpernel. 4. *Anagallis Flœre carneo Parkinsoni*, Pimpernel with bluish colored Flowers. 5. *Anagallis Flœre luteo*, *Anagallis lutea*, *Nunularia Syriatica* & *Mas Gesneri*, *Alfine lutea Lugdunensis*, Pimpernel yellow Flower'd. 6. *Anagallis tenuifolia Gerardi*, *Anagallis tenuifolia Flœre Cœruleo*, *Anagallis tenuifolia Monelli Clusij*, Pimpernel narrow Leaf'd of Monellus.

The Descriptions.

III. The first, or Male Pimpernel, or Pimpernel red Flowered. Its Root is small and Fibrous, perishing every Year. This Common Pimpernel springs up with several weak square Stalks, lying on the Ground, beset all along with two small and almost round Leaves at every Joint, one against another very like unto Chickweed, but without foot Stalks, for they do as it were encompass the Stalk, in which particular it differs from it. The Flowers stand singly, each by themselves, at the Joints, between them and the Stalks, consisting of five small round pointed Leaves, of a fine pale red color,

Pimpernel Male, or red Flower'd.

tending to an Orange color, with so many Threads in the middle: in whose places after they are gone, smooth round Heads succeed, like those of Chickweed, in which is contained a small sort of Seed.

IV. Gerard thus describes it. The Male, or red Flowered Pimpernel, (which is like unto Chickweed,) has a Root which consists of slender strings. The Stalks are four square, trailing here and there upon the Ground, on which do grow broad Leaves and sharp pointed, set together by Couples: from the Bosoms whereof do come forth slender tendrils, on which grow small purple Flowers tending to redness, which being past, there comes in their places fine round Bullets, like unto Coriander Seed, in which is contained small dusty Seed.

V. The second, or Female, or blew Flowered Pimpernel. This differs not in any particular from the first or Male Kind, but is in all things like unto it, saving only in the color of the Flowers,

Pimpernel Female, or blew Flower'd.

the former or Male being of a red color, but these or the Female, being of a fair blew color, in which only the difference consists.

VI. The third, or Dull red, or purple colored Pimpernel. This does likewise in all things resemble the former, saving that the Flowers of this are of a dull or dark red color, having an Eye or glimpse of purple therein.

VII. The fourth, or Pimpernel with bluish colored Flowers. This in its Roots, Stalks, Leaves, Flowers, Seed, and manner of growing, is altogether like to those before described, and only differs from them, in the color of the Flower, which is of a fair bluish or incarnate color.

VIII. The fifth, or Pimpernel yellow Flower'd. It has a Root which is small and Fibrous, and perishes not every Year as the others do, for with the Plant when in Flower, there has been gathered dry Stalks with

the Heads of Seeds upon them, which have remain'd all the Winter, from the former Years growing. This Plant grows in like manner as the others do, with many spreading Branches upon the Ground, but they are something greater, and so are the Leaves also, larger than any of the former sorts, but set by couples at the Joints, where the Flowers come forth upon long foot Stalks, like unto the others, but larger, and of a fair yellow color, with pointed Leaves some what like unto *Nummularia*, with round Heads also, containing the Seed.

Pimpernel yellow.

IX. Gerard says, Its Root is small and thready, that it has many weak and feeble Branches trailing upon the Ground, beset with Leaves one against another like the great Chick-weed, and not unlike to *Nummularia*, or Money-wort: between which and the Stalks come forth single small tender foot Stalks, each bearing at their top, one single yellow Flower, and no more.

X. The sixth, or Pimpernel narrow Leav'd of Monellus of Tournay. Its Root is small and Thready like the others, perishing in the same manner every Year. It grows also in the same manner which the others do, with spreading Branches upon the Ground, and Leaves set at the several Joints, which are longer and narrower, and with sharp pointed, something resembling the Leaves of *Gratiola* or *Hedg-Hyflo*, not always two at a Joint, but oftentimes three, and sometimes more, tho' not often. At the Joints likewise with the Leaves, stand several Flowers, as in the other sorts, upon small long foot Stalks, made of five small round pointed Leaves, yet something greater than those of the former blew sort, having a circle of a purple color in the middle or bottom, which afterwards yield such like round Heads and Seeds.

XI. The Places. The first grows in Plowed Fields, near Path-ways, in Gardens, and Vine-yards, in Meadows and Corn-Fields, almost every where. The second is not so common, yet found in many places, as near *Battle* by Oxford, and plentifully in *Rumney Marsh*, at *Higbam-Ferries*, *Artillboreo*, and *Raunds* in *Northamptonshire*, and at *Beconsfield* in *Buckinghamshire*, Gerard found it also growing in a Chalky Corn-field in the way from

one Swanie's House of *South-Fleet* to *Long-feld Downs*. The third only grows in Gardens at *Frankford*, at *Leyden* in *Holland*, and with us. The fourth, *Parkinson* says, grew of it self, in his own Garden, here in *London*, and came up every Year of its own sowing. The fifth grows in shady places, as in *Hampsted Wood*, about *Ashford*, at a place called the *Park*, and in many places in *Kent*, especially in *Wood-Lands*. The sixth is a Native of *Spain*, about *Cadiz*, and *John Monellus*, had of it growing in his Garden at *Tournay* in *France*, *Johnson* says also, that he found it growing in *Essex*, among the Corn at *Wrightsbridg*, being the then Seat of one Mr. *John Wright*.

XII. The Times. They are said to Flower from May to August, and the Seed to ripen and fall in the mean time. They Flower chiefly in the Month of August and in Harvest time, and the Husband-Man has an observation of the Weather from the Flowers, and will preface what shall follow the next Day after: if the Flowers be close shut up, they say that it betokens Rain, and foul Weather: but if they be open and spread abroad, it shews the contrary, viz. that the Weather will be fair.

XIII. The Qualities. Pimpernel (Male and Female) is hot and dry in the first Degree, Absterfive, Anodyne, Aperitive, Attractive, (so that *Galen De fac. Simp. Med. Lib. 6.* says, They are of a cleansing faculty, and have an attractive heat, whereby they draw forth Thorns, Splinters, or other like things, which are gotten into the Flesh.) Cosmetick, Digestive, Disculfive, Diuretick, Incarnative and Traumatick or Vulnerary; they are Cardiack, Hepatick, Nephritic, Parnick, Emmenagogick, Sudorifick, and Alexipharmick.

XIV. The Specification. Pimpernel is a peculiar remedy against the Plague, and all Malign and Pestilential Fevers, and other Contagious Diseases: it cures the bitings of Serpents, as Vipers, Rattle Snakes, Mad-Dogs, and other Venomous Creatures: is good against the Strangury, Stone, and Gravel, and heals all Wounds and Ulcers, whether inward or outward; stops the Flux of Humors into any part, eases pains in the Ears, and the Piles, and prevails against an Ophthalmy, and other Diseases of the Eyes.

XV. The Preparations. You may have therefrom, 1. A Liquid Juice. 2. An Essence 3. A Decoction 4. An Errhine. 5. An Ointment or Balsam. 6. A Cataplasm. 7. A Distilled Water. 8. A Spirituous Tincture. 9. An Acid Tincture. 10. An Oily Tincture. 11. An Ophthalmick.

The Virtues.

XVI. The Liquid Juice. Applied to Green Wounds, it conglutinates their Lips and heals them: to Ulcers, it cleanses them and incarnates. The Face or Skin being washed therewith, it is good to cleanse it from its roughness, ill color, and other deformities thereof, and to make it soft, smooth and clear.

XVII. The Essence. It has all the Virtues of the Liquid Juice, besides which it is of great force against the Plague or Pestilence, and all sorts of Malign and Pestilential Fevers, being a few times used, and Sweating well upon it. It is also prevalent against the bitings of Mad-Dogs, Serpents, or other Venomous Creatures, the stinging of Scorpions, Hornets, and other like Insects. It gives ease in the Strangury, and removes the Pain, heat, and stoppage of Urine, and is profitable against

againſt inward Wounds and Ulcers, as Ulcers of the Lungs, Reins, and Neck of the Bladder. And applied outwardly to all Green Wounds, which are ſimple without Fracture or laceration, it quickly conſolidates and heals them: it alſo cleanses and heals old, filthy, fretting, and running Ulcers, and ſuch as are made by Poiſonous Beaſts; it cleanses them from their Corruption, reſtrains their malignant corroding, invalidates their venomous qualities, and dries up their Flux of Humors, and ſo quickly brings them to healing. Fomented on the Piles it eaſes the Pain, and diſcuſſes them, and dropt into the Ear on the contrary ſide, it eaſes the Tooth-ach. Doſe 2, 3, or 4 Ounces Morning and Night.

XVIII. *The Decoction in Wine.* Given from 4 to 8 Ounces, it is a good remedy againſt the Plague and other peſtilential Fevers, and Contagious Diſeaſes, ſo as after the taking thereof, as hot as the Patient can well drink it, they ly in their Beds, and Sweat for two Hours after, whereby the Poiſon of the Diſeaſe will be expelled, this being thus uſed for 2 or 3 times. It has all the other Virtues of the *Liquid Juice* and *Eſſence* afore ſpecified, but ought to be given in a larger Doſe, as is before Directed.

XIX. *The Errhine.* Take of the *Juice* 4 Ounces, *Scammony in Subtil Powder* 2 Drams, mix them. Snufft up the Noſtrils it Purges the Head and Brain of cold, moiſt and pituitous Humors; gives eaſe in the Head-ach, Megrim, and a *Cephalica*, or inveterate periodical Head-ach, and in a little time cures the Vertigo, Lethargy, Carus, Apoplexy, Epilepſy, Night-Mare, and other like Diſtempers of thoſe parts; as alſo deſluxions of Rheum into the Eyes, Ears, Noſe, Jaws, Teeth, &c.

XX. *The Ointment or Balm.* It cures ſimple Green Wounds, at a few times dressing; and applied to a peſtilential Bubo, it ripens and breaks it. Applied to the Gout it eaſes the pain; and digeſts, cleanses, incarnates, and heals old filthy and running Ulcers; and Kings-evil Sores, more eſpecially if to every 4 Ounces of the *Ointment or Balm*, half an Ounce of *Powder of Tobacco*, and 1 Ounce of *Levigated Mercurius dulcis* be added, the Ulcer being cleaned at every dressing with the *Liquid Juice*, *Eſſence*, or *Decoction*, aforegoing.

XXI. *The Cataplaſm.* It is attractive, and being applied to any part where there is any Prick, Splinter, Thorn, or the like, it draws it forth: and applied to a ſimple Contuſion, it diſcuſſes the Tumor and cures it.

XXII. *The Diſtilled Water.* It is a Coſmetick, and has all the Virtues of the *Liquid Juice*, being applied according to Art to the Face and Skin: but I am of opinion that it is not full out ſo effectual as the *Juice* or *Eſſence*: yet it will be more powerful if a quarter part of the *Juice of Limons* be added to it; and then it will make an excellent *Gargarism* for a Sore Mouth and Throat, and a good cleaner of the Teeth.

XXIII. *The Spirituous Tincture.* It has all the Virtues of the *Eſſence* and *Decoction*, and may be given Morning and Night from 2 Drams to 4, in a Glaſs of Wine, or other fit Vehicle, againſt Poiſon, Plague, and Peſtilence, bitings of Mad Dogs, &c. as in *ſect. XVII.* is before hinted. It prevails againſt Convulſions, Fainting and Swooning Fits, Vapors, and other Diſtempers of the Heart, Liver, Spleen, and Womb.

XXIV. *The Acid Tincture.* It is a potent thing againſt the Plague, and all malign and peſtilential Fevers, deſtroying the Malignity, and extinguiſhing almoſt in a moment the preternatural Heat.

It quenches thirſt, reſtores a loſt Appetite, cauſes good Digeffion, opens all manner of obſtructions of the *Viſcera*, but chiefly of the Lungs, Spleen, and Reins, and is good againſt the bitings of Mad Dogs, and other Venomous Creatures. Doſe ſo many Drops as will make the Vehicle pleaſantly ſharp, and ro be often repeated in the Day time.

XXV. *The Oily Tincture.* It opens all Obſtructions of the Reins and Bladder, powerfully provokes Urine, gives eaſe in the Strangury, and expels Sand, Gravel, Stones, and Tarrarous Matter from the Reins and Bladder. It gives eaſe in the Colick, expels Wind powerfully, gives relief in Convulſions, provokes the Terms, and is profitable againſt the Palfy, being taken inwardly from 20 Drops to 60, in any fit Vehicle, according as Age, Strength and other Accidents will admit: It may be given twice a Day inwardly, and applied outwardly to the parts affected. It alſo cures Wounds and Punctures of the Nerves and Tendons, being applied by a Skillful Hand.

XXVI. *The Ophthalmick.* Take of the *Clarified Juice of Pimpernel*, *Clarified Honey*, of each equal parts, mix them in the Heat of a Bath. Being put into the Eyes Morning and Night, or 3 or 4 times a Day, as the neceſſity may require, it is good to clear them from Clouds, Miſts, and Films, which obſcure or hinder the Sight, is profitable againſt an Ophthalmie, helps weeping Eyes, and cures Ulcers therein, being duly applied.

C H A P. DLXIII.

Of PIMPERNEL Water and Sea.

I. *THE Names.* It is called in Greek, *Ἀναγallis ὕδωρ*: in Latine, *Anagallis Aquatica*: and in English, *Water Pimpernel*: The Sea Kind is called in Greek, *Ἀναγallis θαλάσσιος*: in Latine, *Anagallis Maritima*, vel *Marina*: and in English, *Sea Pimpernel*.

II. *The Kinds.* There are many ſorts of *Water Pimpernel*, as, 1. *Anagallis Aquatica folio subrotundo non crenato*, *Anagallis aquatica Lobelij tertia* (this *Guilandinus* thought it ſometimes to be *Alisma Dioſcoridis*, and at another time to be *Cochlearia*, but in both was miſtaken): *Anagallis Aquatica folio rotundo non crenato Bauhini*, *Water Pimpernel*, *Lobel's third Water Pimpernel*. 2. *Anagallis Aquatica anguſtifolia*, *Anagallis Aquatica Lobelij quarta*, (*Samolus Plinij*, Lib. 25. Chap. 11. as ſome think:) *Long Chickweed* *Leav'd Water Pimpernel*, or *Lobel's fourth Water Pimpernel*. 3. *Anagallis Aquatica anguſtifolia Scutellata Bauhini*, *Narrow Leav'd Water Pimpernel*. 4. *Anagallis Aquatica foliis Pulegij Bauhini*, *Stium alterum Tragi*, *Anagallis Aquatica Tragi*, *Small round Leav'd Water Pimpernel*. To theſe might be added the ſeveral ſorts of *Brooklimes*, which the Latines call *Anagallides Aquaticæ*, but theſe becauſe they are better known by the Name of *Brooklime*, we have treated of before, apart, in a Chapter by themſelves, viz. Chap. 83. aforegoing of this Book. 5. *Anthyllis lentifolia*, *Alfine Cruciata Marina*, *Alfine genus Pelagicum Cheſſij*, *Sea Pimpernel*.

The Descriptions.

III. The first, or Water Pimpernel, which is Lobel's third Water Pimpernel. The Root of this Plant runs or spreads not it self abroad, but is a small Bush of white Fibres, from whence spring many smooth, pale green Leaves, small at the bottoms and broad

Pimpernel Water of Lobel.

and round at the ends. The Stalk is round, about a Foot more or less high, with several smaller Leaves thereon, set one by one up to the top, where it spreads it self forth into many branched Spikes of white Flowers.

IV. The second, or Long Chickweed Leav'd Water Pimpernel, which is Lobel's fourth Water Pimpernel. This is a Fibrous Root consisting of a bunch of white Strings much like the former. It is a small Plant, and rises up not above half a Foot high, with several Branches spreading from a weak square Stalk, having two small Leaves at a Joint, something like unto the Greater Chickweed, but somewhat longer. The Flowers are white, consisting of four Leaves apiece, standing on long foot Stalks, after which follow round Heads with small Seed in them.

V. The third, or Narrow Leav'd Water Pimpernel. Its Root is reddish, Fibrous and Creeping. The Stalks are smooth, streaked, jointed, and about a Foot and half high, having two very narrow and long Leaves at every Joint, pointed at the ends, without any foot Stalk to them. At every Joint almost, with the Leaves, come forth small upright Branches, winding themselves one within another, as if they had Claspers, from whence spring smaller foot Stalks, on both sides, which sustain small whitish

purple Flowers, like unto those of Chickweed, consisting of three Leaves apiece. After which come small flat double Pods much like to a Shield (whence the Latine Name *Scutellata*) being two set together with a Thread between them; on both sides whereof the Seed lyes.

VI. The fourth, or small round Leav'd Water Pimpernel. Its Root is white, fibrous and creeping in the Ground, much like to Brooklime. The Leaves are small and round, like almost unto Pennyroyal, two always at a Joint upon the Stalks, which are four square, and bear blew Flowers, like to those of the Land Pimpernel.

VII. The fifth, or Sea Pimpernel. Its Root is somewhat long, slender, jointed, and deep thrust into the Ground, like to Soldanella. It has many small branches full of Joints, not above an Hand-full high, creeping several ways, beset with small thick Leaves, of a pale color resembling Lenticula,

Pimpernel Sea.

or rather *Alfine minor*, the Lesser Chickweed. The Flowers grow at the top of the Stalk, Star fashion, of an herby color like Box, or *Sedum minus*. It incloses its Seed, which is small, in a three cornered Husk. All the whole Plant is Saltsy, bitter in Taste, and somewhat heating. The Epithite *Cruciata* is here added to the Name, because the Leaves which grow thick together by couples, cross each other, as it happens in most Plants which have square Stalks, with two Leaves at each Joint. And it is Englished, Sea Pimpernel rather than Sea Chickweed, because the Leaves in shape, are liker those of Pimpernel, than of any other Plant. And also for that the Author Lobel, has called another Herb by the Name of Sea Chickweed.

VIII. The Places. The four first grow by River sides, small running Brooks, and watery Ditches. The first has been found growing in the Marshes of Dartford in Kent, also between Sandwich and Sandown-Castle, and in the Ditches on this side Sandwich. The second grows in many standing Waters, and watery Ditches, in several parts of the Kingdom. The third and fourth grow in like places, tho' they are not so common; but are Natives of Germany. The fifth grows in the South Island belonging to England, especially in Portland, and in the Gravel and Sandy Fords, which lye low, and against the Sea: It has also been found in the Isle of Shippy near the Water side, and in Westgate-Bay by Margate in the Isle of Tenet.

IX. The Times. They all Flower in June and July, and sometimes in August, and give their ripe Seed the Month after the time of their Flowering as the Brooklimes do.

X. The

X. *The Qualities, Specification, Preparations, and Virtues of the first four, are the same with those of Brooklime, in Chap. 88. Sect. 9. ad 21. to which I refer you. These are something weaker than Water Cresses, but are much used in Diet Drinks with other things, to purge and cleanse the Blood, and Lympha, as also the whole Body from those Peccant and Scorbutick Humors which overturn the Health thereof; they are Specificks against the Scurvy, Scrophula, Dropsy, Gout, and Jaundice: and are said to be Libenteripricks or Stone Breakers, and cause Sand, Gravel, and Tartarous Mucilage to be expell'd by Urine, easing and helping the Strangury: they also provoke Womens Courses, and expel the Dead Child. A Cataplasm made of them, being Fried with Butter and Vinegar, and applied warm, helps all manner of Tumors or Swellings, and Anthony's Fire also, if it be often renewed.*

XI. *The Virtues of the Sea Pimpernel. It is temperate in respect of heat or cold, dryness or moisture. The Powder of the Dried Leaves, being given from two Drams to half an Ounce, either in its own Distilled Water, or in Parsly or Hydropiper Water, or in Onion Water, it prevails greatly against the heat and Scalding of the Urine, the Strangury, or difficulty of making Water, and purges the Reins. The same Powder taken with Oxymel or Honied Water, is good against the Epilepsy or Falling-sickness, being given first in the Morning fasting, and last at Night going to Bed, and so continued for some considerable time.*

Pinks Garden red single.

also, which consists usually of five Leaves apiece (seldom six) round pointed, and a little snipt for the most part about the edges, with some Threads in the middle, either crooked or straight.

Pinks Garden small single.

PINKNEEDLE, see Cranes-Bill Muskcd, Chap. 160.

CHAP. DLXIV.

Of PINKS Great and Small.

I. **T**HE Names. I know no Greek Names belonging to these Plants; the Latines call them *Caryophylli Sylvestres*, or *Cariophylli Notbi*: and in English, *Pinks*, or *Bastard Gilliflowers*.

II. *The Kinds.* There are several sorts of Pinks, as, I. *Caryophyllus Hortensis Flore simplici, vel minor Flore simplici*, The Garden single Pink. II. *Caryophyllus Hortensis minor Flore multiplex*, The Garden double Pink. III. *Caryophyllus Sylvestris minor*, The Wild Pink. Now each of these three principal Kinds, have several other Species under them, hereafter in this Chapter to be declared.

The Descriptions.

I. *Caryophylli Hortenses minores Flore simplici*, Single Garden Pinks.

III. *Caryophyllus Hortensis minor simplex*, The Common single various colored Pink. This in its manner and form of growing in all its parts, is like to the Gilliflower in Chap. 318. foregoing, saving only that its Leaves are smaller and shorter, in some more or less than in others, and so are the flowers

IV. *Caryophyllus minor albus*, The single white Pink. It is the Common white Pink, with a single white Flower of five Leaves, finely jagged about edges.

V. *Caryophyllus Plumarius albus orbe rubro five Stellatus*, The single white Star Pink. It bears Flowers almost as deeply jagged in as the following Plumarius, of a fair white color, having a Ring or Circle of red, about the bottom or lower part of the Leaves, and are as sweet as the Plumarius. This being sown of Seed, does not give the Star of so bright a red color but becomes more dum.

VI. *Caryophyllus Plumarius*, Feathered or jagged single Pinks. These have small woody Roots, and such like Stalks and Leaves as the first described, at Sect. III. above, but somewhat shorter and smaller, or Grals like, and of a whitish or grayish green color. The Flowers stand in like manner at the tops of the Stalks, in long, round, slender, green Husks, consisting of five Leaves, very much cut in on the edges, and jagged almost like a Feather, of a light red or bright purple color, with two white Threads standing in the middle, crooked like a Horn at the end, and are of a very sweet Smell. But there are some of this sort, which have not these two crooked Threads or Horns in the middle, but have in their stead many small Threads, not crooked at all. The Seeds of them are all like to the Seeds of Gilliflowers, or the other Pinks, viz. small, black, long, and flat.

VII. *Caryophyllus Hortensis minor rubrus*, The single red Garden Pink. This is like the White foregoing, but that the Leaves are not so much jagged, and the Flower is of a pale purplish color.

VIII. *Caryophyllus minor purpureus*, The single purple Pink. This is of a fair purple color, beautiful in its Kind, and almost like to the purple Gilliflower.

IX. *Caryophyllus minor Carneus*, The Blush colored Pink. This has broader and larger Leaves in the Flower, than any other Pink, and of a fair blush or flesh color.

X. *Caryophyllus Plumarius albus*, The white Feathered Pink. This has the edges of the Flower more finely and deeply cut in than the former, without the Ring or Circle of red at bottom.

XI. *Caryophyllus minor purpureus Dilutus*, The light red, or purple colored Pink. This is like the former Feathered Pink, and differs only from it in its color.

XII. *Caryophyllus minor Stellatus*, The Star Pink. This is a beautiful Flower, finely jagged on the edges, but not so deep as the former Star Pink, and has a fair red Circle at the lower end of the Leaves on the inside.

XIII. *Caryophyllus Plumarius albus Austriacus*, five *superba Austriaca*, The white Feathered Pink of Austria. Its Roots are small and woody like the others. Its first or lower Leaves are somewhat broader and greener, than any of the former Pinks, being both for breadth and greenness more like unto Sweet Johns. The Leaves on the Stalks are smaller, standing by couples at every Joint, at the tops of which stand such like jagged Flowers, as the last described, and as large, but more deeply cut in or jagged round about, of a pure white color, and of a most fragrant sweet Smell, comforting the Spirits and Senses afar off.

XIV. *Caryophyllus Plumarius purpureus Austriacus*, The purple Feathered Pink of Austria. This in its form and manner of growing is altogether like the former, and differs nothing from it but in the color of the Flowers, which in this are of a purplish color, and having the same sweet Smell. Some have mistaken a Kind of Wild Campion, growing

in our Woods, as by the Path sides in Hornsie Park, and other Places, to be this white or purple Austrian Feathered Pink: But by comparing the Flowers, the mistake will be sufficiently manifest.

XV. *Caryophyllus minor repens simplex*, The single creeping or matted Pink. This is the smallest Pink both for Leaf and Flower of all the other Kinds which are nourished in our Gardens, having many short and small Grassly green Leaves upon the Stalks, which as they grow and lye upon the Ground (not standing so upright as the former) do take Root again, whereby it quickly spreads, and covers a great deal of Ground in a little time. The Flowers are small and round, a little snipt about the edges, whereof some are white, some red, some white spotted with red, and some of them red spotted with white, all of them single Flowers.

XVI. *Caryophyllus minor maculosus*, The speckled Pink. It is a small Flower, having small spots of red here and there, dispersed over the white Flower.

XVII. *Nota*. Now here is to be Observed, That those single Flowers which are like unto Pinks, but do rise from the sowing of the Orange Tawny, or any other colored Gilliflower or Carnation, are not to be accounted of as in this Classis of Pinks, but of the Kinds of *Caryophylli majores*, or Gilliflowers.

XVIII. *Caryophyllus Maritimus*, Sea Thrift or Cushion. This our Common Thrift, is well known unto most which have Gardens, because of its general use to Empane or Border Knots and Beds in Gardens, for that it abides green Winter and Summer, and that by cutting it will grow thick, and be kept in what form you please. It has many short and hard green Leaves, smaller than many of the Grasses, growing thick together, and spreading upon the Ground. The Stalks are naked of Leaves, a Span high, bearing a small Tuft of light purple, or bluish colored Flowers, standing round, and close thrust together.

XIX. *Caryophyllus Maritimus major*, five, *Mediterreaneus*, Great Thrift, or Great Sea Gilliflower. This is a larger or greater Kind than the former, and of as great beauty and excellency almost, as any of the former Pinks, whether single or double, as well for that the Leaves are like unto Gilliflowers, being longer and larger than any Pinks, and of a whitish green color, like unto them, not growing long or by couples upon the Stalks, as Pinks and Gilliflowers do, but Tufting close upon the Ground, like unto the former Common Thrift. As also that the Stalks, rising from among the Leaves, (being sometimes two feet high) are yet so slender and weak, that they are scarcely able to bear the Heads of Flowers, naked or bare, both of Leaves and Joints, saving only in one place, where at the Joint each Stalk has two small and very short Leaves, not rising upwards, as in all other Gilliflowers and Pinks, but growing downwards, and do bear each of them a Tuft or Umbel of small purplish, or bluish colored Flowers at their tops, standing something like to Sweet Williams, but more roundly together, each Flower consisting of five small, round, stiff, or hardish Leaves, as if they were made of Paper, the bottom or middle being hollow: They blow not all at once as the Common Thrift foregoing, but for the most part one after another, not shewing usually above four or five Flowers open at one time: so that it is long before the whole Tuft of Flowers is blown or past: but yet the hotter and dryer the time is, the sooner their time of Flowering is over. Its Root is somewhat great, long and hard, and not so much spreading in the Earth, as the Roots of Gilliflowers or Pinks do.

II. *Caryo-*

II. *Caryophylli Hortenses minores Flore multipli.*
Double Garden Pinks.

XX. *Caryophyllus Hortensis minor Flore multipli variegata*, The Common double various colored Pink. The form of the whole Plant and manner of

Pinks double.

its growing is exactly like that at Sect. 3. foregoing, saving that this double Kind is lesser, and less double than the double Gilliflowers, having its Leaves a little snipt or indented about the edges, with some Threads in the middle, of divers and various colors, and of a fragrant sweet Smell.

XXI. *Caryophyllus Plumarius albus multiplex*, The double white Pink. This is only with more Leaves in it, than is in the single white Pink, which makes the only difference.

XXII. *Caryophyllus Plumarius multiplex*, The double Feathered or jagged Pink. This in its Roots, Leaves, Stalks, Flowers, color of the Flower, and Seed, is exactly like that at Sect. VI. foregoing, without any difference therefrom, saving that the Flowers of this are double.

XXIII. *Caryophyllus Hortensis minor rubens multiplex*, The double red Pink. This is in the same manner double as the former, differing in that only, viz. in its duplicity, from the single of the same color.

XXIV. *Caryophyllus Hortensis minor purpureus multiplex*, The double purple Pink. It differs not from the single purple, for color and form of growing, but only in the doubleness of the Flowers.

XXV. *Caryophyllus Hortensis minor Granadensis*, The Granado Pink. It differs not from the Gilliflower of the same Name, but in the smallness of the Leaves and Flowers.

XXVI. *Caryophyllus Hortensis minor carneus multiplex*, The double bluish Pink. This is almost as great as the Ordinary bluish Gilliflower; and

some have taken it for a Gilliflower; but the green Leaves are almost as small as Pinks, for which Reason, I rather refer it to the Pink Kind.

XXVII. *Caryophyllus Hortensis minor repens multiplex*, The double matted Pink. This is like the single matted Pink, in its form and manner of growing, at Sect. 15. foregoing, not differing in its Leaf, but in its Flower. The first Flowers are but once double, or of two rows of Leaves, of a fine reddish color, spotted with Silver Spots; but those which follow are so thick and double, that they oftentimes do break the Pod or Husk, and are not altogether of so deep a red color, but more pale.

XXVIII. *Caryophyllus Plumarius Austriacus*, albus & purpureus multiplex, The double white and purple Austrian Feathered Pinks. These differ not from the single at Sect. 13. and 14. foregoing, neither in its Leaves, Stalks, nor manner of growing, but only in the Flowers, these being double, and the best of the double Kinds.

XXIX. *Caryophyllus Plumarius multiplex macula purpurea in fundo*, The double Feathered Pink with a purple spot in its bottom. This differs not also from that at Sect. 5. foregoing, but only in the duplicity of its Flower.

III. *Caryophylli Sylvestres minores*, Wild or Field Pinks.

XXX. *Caryophyllus arvensis proliifer*, Childing Pinks. Its Root is small, white and hard, perishing every Year after Seed time, and raising itself again by its own sowing, or else, it must be sown in the Spring. It has a few pale green, short, blunt, grassy Leaves, lying on the Ground for the first Year, and are the next Year carried up with the Stalks, divided into some Branches, and set by couples at the Joints, having a short, thick, grayish green Husk at their tops, out of which shoot forth by degrees, one after another, seven or eight small faint Flowers, smaller than the smallest Garden Pink by much, which scarcely shew themselves above the brim of the Husk: more Flowers than one, seldom appear at a time out of the Husk, very rarely two, by reason of which, they are long in Flowering. After they have done blowing, there is found in the outward Husk, so many several small long Husks, as there were Flowers, each containing within them small blackish Seed. Of this Kind, there is One which has but one Flower rising out of the Husk, and of a paler reddish color than the former.

XXXI. *Caryophyllus pratensis noster major*, Our greater Wild Field Pink. This grows near Deptford and Redriff, and in many places of England Wild, being a small Kind of Pink, as it may be called. It spreads much oftentimes, and roots again by the Branches as it grows, with small short green Leaves next the Ground, and by couples on the Stalks, with small reddish Pink like Flowers on the Tops.

XXXII. *Caryophyllus pratensis noster minor*, Our lesser Wild Field Pink. This is lesser than the former, and grows among the thick Grass in our Meadows near London, as towards Totnam Court, and other places adjacent to the same. Its Root is so small and Thready, that it will not bear Transplanting. Its Stalks are very slender, on which are set smaller, shorter, and greener Leaves, than on the former. The Flowers also are smaller, and of a clear shining red color, sometimes but One of a Stalk, and sometimes more, especially if it grows under Hedges and bushes which may defend it by their Shadow.

XXXIII.

Pinks Wild, or Field.

XXXIII. *Caryophyllus arvensis Umbellatus*, Wild Pink in Tufts. It much resembles a Wild Campion, having short broad Leaves, something like to Lobel his Catch-Fly, but of an hoary green color; The Stalks have the like Leaves set by couples on them, and at the top several small Flowers, rising altogether from one Joint, and each standing on a short foot Stalk, composing thereby a kind of Umbel, some of a reddish, others of a whitish color.

XXXIV. *Caryophyllus arvensis hirsutus*, Wild hairy Sea Pink. This grows very like to a Garden Pink, but of a grayish or hoary green color, and somewhat hairy withall. The Flowers grow not like Pinks in long Husks, but more like to a small Wild Campion, of a reddish color tending to a murrey, and gives smaller Seed, unlike to that of Pinks.

XXXV. *Caryophyllus hirsutus tomentosus*, Hoary Sea Pinks. Its Root is small and creeping, and sends forth several slender round Jointed Stalks lying on the Ground, and dividing themselves into many Branches, a Foot or two, or more long, on which are set Leaves by couples, some of them broad and long, others more round, yet all of them hoary white, like unto the Leaves of *Gnaphalium Americanum*, called white Live Long, or Life Everlasting. The Flowers are white, consisting of five Leaves, and round pointed. This abides long, and spreads much upon the Ground.

XXXVI. *Caryophyllus angustifolius tomentosus*, Hoary narrow Leav'd Pink. This small low Pink scarcely rises with the Stalks an Hand breadth high, which are woolly, and Branching into two or three parts. It has very narrow long and woolly green Leaves thereon, one being longer than another. Each of the Stalks has a white Flower consisting of five Leaves, standing in a Green Husk.

XXXVII. *Caryophyllus pumilus latifolius*, The

low broad Leav'd Pink. It rises up with a short low Stalk, which presently divides it self into two Branches, about half a Foot high. Its lower Leaves next the Ground, are something broad and short, but a little longer on the Branches, being set, and a pale green color, set by couples at the Joints; each of the Branches bear but one small, pale, purplish, white Flower, rising out of a small short Husk.

XXXVIII. *Caryophyllus Montanus albus*, The white Mountain Pink. Its Root is great thick and woody, which sends up very many small and narrow Leaves, finer and lesser than Grass, not unlike to the smallest Rush; among which rise up tender Stalks, Jointed or Kneed by certain distances, set with the like Leaves by couples even to the top, one opposite against another, at the tops of which grow sweet smelling Flowers composed of five small white Leaves. The Seed is small and blackish.

XXXIX. *Caryophyllus pumilus Alpinus*, The Dwarf Mountain Pink. Its Root is long, black, and much spreading, by which means this little

Pinks Mountain Dwarf.

Plant covers the Ground for a good space together, like as a Moss, making when the Flowers are blown a beautiful shew, which is commonly in June, the beauty of its verdure and bluish, being thick intermixt, makes it look like a wrought Carpet, by which it very much pleases the Sight. The Stalk is about an Inch, or something more high, set with little sharp pointed green Grassie Leaves. The Flowers which grow upon these Stalks, are composed of five little flesh colored Leaves, a little divided in their upper parts. The Seed is contained in black shining Heads, which is small, reddish, and Kidney fashioned.

XL. The Places. The first sixteen single Garden Pinks, and the next ten double Garden Pinks, are in our Country, only Inhabitants of Gardens; tho' in some Foreign Southern Countries and warmer Climes, they do often grow Wild in the Fields. The last ten grow Wild abroad in Pastures and Borders of Fields, in many Regions, as in England, France, Germany, Italy, Spain, &c. The Common Sea Thrift grows in the Salt Marshes

Chattam by Rochester, and in many other places in England. But the great Kind was gathered in Spain by Boel, and the Seed thereof sent to us, from whence we have had divers Plants. However, the Common small Thrift has been brought into our Gardens for its exceeding usefulness, being of great Service for the Bordering of Knots, Beds, Banks, &c. as we have before hinted.

XLII. *The Times.* The Garden single and double Pinks, as also, the Wild or Field Kinds, and the Gramen Polyanthemum or Sea Thrifts, do all Flower before any of the Gilliflowers, even from May through the whole Summer, till the end of August, and sometimes to the middle of September, or later, if the Weather is warm, or milde and gentle.

XLII. *The Qualities, Specification, Preparations and Virtues of the Garden Pinks*, are much the same with those of the Gilliflower and Clovegilliflower, but not thought to be so effectual as they. Gerard says, They are not used in Physick, but in making Garlands and Nosegayes. And that they are good to be put into Vinegar (I suppose those which are the deepest colored) to give it a delightful color, and a pleasant taste, as Ruellius Writes. Euchsus says, That their Roots are commended against the Infection of the Plague, and that the Juice thereof is profitable to wattle or dissolve the Stone and to expel it; as also to cure such as have the Falling-sickness.

XLIII. As to the *Qualities and Virtues of the Wild or Field Kinds*, Authors have said nothing, so that we have no farther Observations concerning them.

XLIV. Rea in his *Flora Lib.* 1. Chap. 38. says, That Pinks are of many sorts and little esteem, and serve only to set on the sides of Bordets in Spacious Gardens, and the better sort of them to make Posies of, mixed with Buds of Damask Roses. Most of them are single, but there are some which bear double Flowers (as are before described) and of those, they which are called the Feathered Pinks are the best both for form, color, and fragrancy of Smell, having broad Leaves, deeply cut in and jagged on the edges, of which Kind there is white, light red, bright purple, light and deep speckled, and some with a deeper or paler purple spot in the middle: and of these the best are the Feathered Pinks of Austria, and that with the large deep purple Spot in the bottom.

XLV. Pinks Flower with Roses in June, and every ordinary Gardner knows how to Plant and dispose them, as also that vulgar Plant called Thrift, the greater Kind of which bears many Flowers on a Head, like the smaller or common Sort, but by reason of its Flowering by degrees, it is of no very great beauty, besides it is a tender Plant, affects the Vicinity of the Sea, and abides not long in our Gardens.

CHAP. DLXV.

Of PLANTAIN Common.

OR,

WAY-BREED.

I. **THE Names.** It is called in Arabick, *Lisen*, and *Losan alhamel*: in Greek, *Ἀγνίνη*, *ἡ Ἀγνίνη λεῖσος*, (à forma, viz. *Agnina* Lingua: It is also called *Πολύνευς* (*multinervia*) and *ἑπτάνευς* (*septinervia*) from the seven Nerves or Ribs, which are in every Leaf: in Latine it is called, *Plantago* (à *Planta* Vocabulo:) in English, *Plantain*, and *Plantane*, also *Way-breed*.

II. *The Kinds.* There are several Generick Species of this Plant, as, 1. *Plantago communis latifolia*, The broad Leav'd Plantain, of which in this Chapter. 2. *Plantago angustifolia*, vel *quinenervia*, Long Leav'd Plantain, or Ribwort; of which in Chap. 566. 3. *Plantago Cervina*, *Cornu Cervinum*, Bucks-horn Plantain; of which in Chap. 567. 4. *Plantago Aquatica*, Water Plantain; of which in Chap. 568. 5. *Plantago Marina*, *Holostium*, Sea Plantain; of which in Chap. 569, following; of all which in their order.

III. *The Kinds of the broad Leav'd Plantain.* 1. *Plantago latifolia vulgaris*, *Plantago major*, *Plantago rubra* Brunfelsij & Tragi (because the Seed thereof is redder than the Seed of any of the other Kinds) Our common broad Leav'd Plantain. 2. *Plantago latifolia maxima*, *Plantago maxima tota glabra* Bauhini, The largest or greatest broad Leav'd Plantain. 3. *Plantago major incana* Lobelij & Clusij, & *Plantago Salmaticensis*, *Plantago media* Dodonei, Euchsij & Gesneri, hut *Tabernaemontanus* and *Turner* call it *Plantago minor*, Great hoary Plantain. 4. *Plantago latifolia rosea multiformis*, *Plantago latifolia exotica* Clusij, *Plantago latifolia incana spiciis variis* Bauhini, *Plantago spiralis*, *Plantago panicula sparsa* Lobelij, Rose Plantain, Planrain broad Leav'd variously formed. 5. *Plantago sinuosa exotica* Parkinsoni, *Plantago Umbilicata latifolia* Lobelij, & *convoluta unifolia*, Crumpled Plantain, or Exotick Plantain.

The Descriptions.

IV. *The first, or Our Common broad Leav'd Plantain.* Its Root is made of many white Strings, growing somewhat deep, and taking so fast hold in the Ground, that it is not easie to pull it up. It springs up with many fair, broad, and almost round pointed Leaves, with seven Nerves, or Ribs in every one of them for the most part, running all the length of the Leaf, of a sad green color on the upper side, and of a more yellowish green underneath. Among these Leaves rise up several small slender Stalks, about a Foot more or less high, not easie to break, naked or bare of Leaves unto their tops, where each Stalk bears a small long round blackish green Spike or scaly Head, whose Blomings or Flowers are small whitish Heads, with

Plantain Common.

Plantain Hoary.

with Aglets hanging at their ends, almost like to the bloomings of Corn, or Wheat; after which come small brown Seed, enclosed in the small Husks, Scales, or Skins.

V. The second, or Largest or greatest Leav'd Plantain. Its Root is Fibrous and Blackish; and the whole Plant seems in all things to be like the former, saving, that it exceeds it in largeness, or greatness, and Height. For the Leaves which ly on the Ground, are six Inches and sometimes more in length, and four Inches broad; and the foot Stalks of every Leaf, are near a Hand breadth long. The naked Stalks which bear the spiked Heads, are like the former, and are some times two or three Feet high; and the Head or Spike, sometimes a Foot long. This sort has been sometimes found to have Leaves a Foot long, and half a Foot broad, which are somewhat torn on the edges, for which reason it is called *Plantago latifolia maxima foliis lacinatis*, and this sort has some small Leaves under the spiked Heads.

VI. The third, or Great Hoary Plantain. Its Root is like the first, blackish and stringy, so also its Leaves and Spikes; but the Leaves are very hoary, or whitish, especially in the hotter Countries, of Italy, Sicily, Candia, Spain, Portugal, Florida, Carolina, &c. much more than in these our colder Climates, and somewhat smaller. Clusius says, That in Spain, it seldom bears its Spiked Heads, but when it does, they are smaller than those of Our first common Kind: But in Carolina, &c. it bears its Spiked Heads as frequently as in England, and much about the same magnitude.

VII. The fourth, or Rose Plantain, Plantain broad Leav'd variously formed. Its Root is like unto the former: and tho' there are many sorts of this Plant, yet all of them have large, and sometimes hoary green Leaves spread on the Ground, either whole, like the former greater Plantain, or a little jagged towards the lower parts of the Leaves. From among which rise up, short naked Stalks, bearing every one at the top, either a broad round Head, made of many small, short, green Leaves in fashion of a Rose: or a spiked, thick, long Head, made of many shorter green Leaves, bushing thick below, and smaller upwards, sometimes a Plant will have both these forms at once together; and some again cut of the middle of the Rose, will have another short Spike of green Leaves rising up. Others at the bottom of the Rose or Spike, will have one or two other small Tufts, either round or long. One sort there is likewise, whose long Spiked Heads are parted into many and sundry several sparsed Spikes, and therefore called *Spiralis*. There are also many other varieties of this Species, as Nature is pleased to play with them in their production.

VIII. The fifth, or Crumpled Plantain, or Exotick Plantain. Its Root is composed of a thick round Head at its top, having at its bottom running downwards, many long Fibres or Strings, whereby it takes good Rooting in the Ground. This upon the first Years sowing of its Seed, rises up, but with one great and large Leaf, almost a Foot long, foulded as it were together, and wound about Spire fashion into two parts at the upper end thereof, which opening it self, and remaining somewhat hollow, becomes much crump-

crumpled or waved on the edges; the farther end of it shewing something like a Plantain Leaf. The bottom of the Leaf has on each side thereof, a large piece as it were torn from it, but yet growing to it, which are likewise crumpled and waved, and each of them shewing themselves in the form of a Plantain Leaf, its Taste also being not unlike to Plantain; so that the whole Leaf seems as if divers great large Leaves were joined together to make one. This Leaf perishing the first Year, there rises up the next Spring, several Leaves close together, not formed into one, as the former, but as if divers Leaves were joined together, each having a Plantain form, but something a little rounder, and a little crumpled or waved as the former was. The Stalk rises up in the middle of these Leaves, about half a Yard high, bearing thick and short spiked flatish Heads, with Seed therein, much like to the others.

IX. *The Places.* The first grows almost every where in Fields, and in waste and uncultivated places, and in Path ways generally. The second grows in France, Italy, Carolina, &c. and with us in some Gardens. The third *Clusius* says, grows in Spain, I found it growing plentifully in many places of the South Carolina: and it has been found growing in several other colder Climates, as also in some places in England. The fourth, tho' it is called a Strange or Exotick Plantain, in *Clusius* his Country, yet it is found growing Naturally in England, and is thought to rise from the third sort, and is now brought out of the Fields, and in many places Planted in Gardens. The fifth and last was sent in Seed from *Pelliterius* of *Mompelieri* to *Lobel*, who sowing the Seed, it grew with him in his Garden many Years. *Johnson* in *Gerard* says that he found the fourth Kind growing in some places in the Isle of *Tenet*.

X. *The Times.* They spring up from the beginning of April to the end of September. They are in their Beauty and flourishing State, from the end of May to the end of August, their Seed ripening in the intermediate times, and not long after their Flowering.

XI. *The Qualities.* Plantain is cold and dry in the end of the first Degree, *Gerard* says in the second Degree. It is dry without biting, and cold without benumbing: the Root is said to be dry in the same Degree, but not so cold as the Leaves. The Seed is of Subtil parts, and less cold yet than the Roots. It is Aperitive, Absterive, Astringent, Anodyn, and Traumatick or Vulnerary.

XII. *The Specification.* It cures the Scurvy in a hot habit of Body, Heals the excoriations of the Stomach and other Bowels; stops Cararrhs, and all sorts of Fluxes in Man or Woman. It stops also all sorts of Hemorrhages whether Internal or External, the overflowing of the Courses in Women, Spitting and Pissing of Blood, and therefore is of excellent use in the Curing of a Phthisis, or Ulceration of the Lungs. *Dioscorides* says, It cures Agues, stops Vomiting, and is good against the Epilepsy and yellow Jaundice. It allays Inflammations of the Eyes, cleanses and heals old Ulcers, whether in the Mouth, Throat, or other parts, gives ease in the Piles, Kills Worms in the Belly, and gives ease in the Gout, and cures all sorts of simple Green Wounds, as also old Sores, whether inward or outward.

XIII. *The Preparations.* You may have from these Plants, 1. A Liquid Juice. 2. An Essence. 3. A Decoction. 4. A Powder of the Leaves. 5. A Powder of the Root. 6. A Powder of the Seed. 7. A Cosmetick. 8. A Lotion. 9. A Liniment. 10. A Cataplasim. 11. A Distilled Water. 12. A Diet Drink.

The Virtues.

XIV. *The Liquid Juice.* Being Depurated or Clarified, and drank for several Days together, prevails Wonderfully against all Torments and Excoriations of the Guts or Bowels, helps distillations of Rheum upon the Throat, Glands, Lungs, &c. and stops all manner of Fluxes in Man or Woman, and the overflowing of the Terms in Women: Dose from 3 to 8 Spoonfuls or more, either alone or mixt with some Styptic red Wine.

XV. *The Essence.* It has all the Virtues of the Liquid Juice, besides which it is good to cure Spitting of Blood, and all other Bleedings by the Mouth, also Pissing Blood, and is profitable to help a bloody or foul Water, occasioned by any Ulcer in the Reins or Bladder, as also to stop the free bleeding of Wounds; it is likewise an especial Remedy against a Phthisis or Ulceration of the Lungs, and a Vehement Cough arising from the same. It is said to be good against the Falling-sickness, Dropsie and Jaundice, and opens Obstructions of the Liver, Spleen, and Reins. It cools Inflammations of the Eyes, and takes away the Pin and Web (so called) in them. Dropt into the Ears, it eases their Pains, and restores Hearing much decayed. Dose from 3 to 6 Spoonfuls more or less, either alone or with some fir Vehicle, Morning and Night, or oftener.

XVI. *The Decoction.* It has all the Virtues of the Juice and Essence, but ought to be given in a much larger Dose, as to half or three quarters of a Pint. The Decoction of the Roots in Wine, (according to *Dioscorides*) is good to cure Quotidian, Tertian and Quartan Agues: and this is probable enough, for I am apt to believe it performs that Cure, by Vertue of its Natural Stypticity. It may be given an hour or two before the Fire.

XVII. *The Powder of the Leaves.* It has the Virtues of the Juice and Essence, yet is not altogether so effectual as they, in the Dropsy, Epilepsy and Jaundice: put upon old putrid and running Sores, it cleanses and dries up the moisture, and in some measure incarnates. Taken in Drink to a Dram or Dram and half, it is said to kill Worms in the Belly: and strewed upon old Ulcers which have Worms in them, it kills them, more especially if white Wine Vinegar be sprinkled upon the same.

XVIII. *The Powder of the Root.* Given from 1 to 2 Drams, it is said to Cure Agues, to stop Vomiting and Fluxes, and to strengthen the Stomach. Mixed with equal parts of Powder of *Pellitory* of Spain, and put into a hollow Tooth, it is said to ease the pain thereof: put into Wounds and Ulcers, it dries and heals them.

XIX. *The Powder of the Seed.* Taken every day Morning and Night, from 1 to 2 Drams in any fit Vehicle, as in the Yolk of an Egg, Pulp of a Roasted Apple, or in *Mithridate*, or some proper Syrup, it is said to heal Ulcers of the Lungs, stop Coughs, and all sorts of Fluxes of the Bowels, Catarrhs, and helps weakness of the Stomach,

mach, Indigestion, and stops Vomiting, is good against the Epilepsy, Lethargy, Convulsions, Dropsy, Jaundice, Strangury, and Obstructions of Liver, Spleen and Reins.

XX. *The Cosmetick.* Take Essence of Plantain, Essence of Houseleek, of each 2 Ounces; Juice of Limons 1 Ounce, mix them. It is good against Burnings and Scaldings, as also Inflammations, and all hot pimples and eruptions of the Skin, being bathed therewith twice or thrice a Day.

XXI. *The Lotion.* Take Decoction of Plantain 8 Ounces; Essence of Plantain 4 Ounces; Alum Water, Tincture of Madder Roots, of each 2 Ounces; Honey enough to Sweeten them: mix all well together for a Lotion. It is of great use, and has a good effect, for the curing of old or hollow Ulcers, which are difficult to be healed, as also for Sores, Cankers, and Ulcers in the Gums, Mouth, Throat, or Nose; or in the privy Parts of Man or Woman; it cleanses, dries, and heals them in a short time. Fomented also upon Tumified Hemorrhoids or Piles, it eases their Pain, and quickly dissolves them.

XXII. *The Liniment.* It is made with the Juice and Oil of Roses. Anointed on the Temples and Forehead, it gives ease in the Head-ach proceeding from heat, and is very profitable for Frantick or Lunatick Persons, also against the bitings of Serpents, or Mad Dogs; it gives great ease (being applyed) in all hot Gouts, whether in Hands or Feet, especially in the beginning, to cool the heat and repels the Humors.

XXIII. *The Cataplasm of the Green Herb and Root.* It allays the heat of Inflammations, is profitable against a hot Gout, cleanses old and putrid Ulcers, and prevents pains, Tumor, and Inflammations, which are apt to happen in Dislocations, and over-straining of the Nerves and Tendons.

XXIV. *The Distilled Water.* Dropt into the Eyes, It eases their pain and smarting, and cools them very much being Inflamed; and is said to clear the Eyes from Clouds, Films, and other things which obfuscate the Sight. A little Alum and Honey being dissolved in it, it is of good use for washing, cleansing and healing a sore and ulcerated Mouth or Throat. If Plantain Water 1 part is mix'd with Beef Brine 2 parts, it will be good to heal all spreading Scabs, Scald Heads, Tettars, Ringworms, Scurff, Morpew, Shingles, or other running and fretting Sores.

XXV. *The Diet Drink.* Take Juice of Plantain 3 Quarts; Juice of Oranges a Pint; Roots of Burdock 8 Ounces; of Angelica, sharp pointed Dock, and Parsly, of each 4 Ounces; Corriander and sweet Fennel Seed, of each 2 Ounces; Nutmegs thin sliced an Ounce; Alexandrian Sena 4 Ounces: New Ale 10 Quarts; put the Juices into the Ale, then put all the other Ingredients, (as the Roots first thin sliced or bruised, the Seeds bruised, the Nutmegs and Sena) into a long, close Knit Net bag, with a Stone in it, which put also into the Ale. Let them work together, and after two or three Days, let the Patient drink of it a Pint at a time Morning and Evening, renewing the Recipe with fresh Ingredients, as oft as need shall require. This is a perfect cure for the Scurvy, and all Scorbatick Taints, and Rheumatick Pains in a hot Constitution; it cleanses and purifies

the Blood, makes subtil and fine the Lympha, and cause a due and easy circulation of all the Natural Juices of the Body.

C H A P. DLXVI.

Of PLANTAIN narrow Leav'd.

OR,

R I B - W O R T.

I. *THE Names.* It is called in Greek, *Πεντανευρος* *ungiv*, & *πεντανευρος*; *Penta-neuros*: in Latin, *Quinquenervia* (from its having five Ribs) and *Plantago angustifolia*: in English, *Narrow Leav'd*, or *Long Leav'd Plantain*, and *Ribwort*, also *Ribwort Plantain*.

II. *The Kinds.* There are nine or ten several sorts of this Plant, accounted of in some Authors, but the most of them not being to be found in our Climate, nor yet in our West India, or American Plantations, we shall only Describe to you such as are Natives of our own, which are the four following, viz. 1. *Plantago quinquenervia major*, *Plantago angustifolia major*, *Plantago minor Dodonai*, *Fuchsi*, *Gesneri*, *Plantago longa Matthioli* & *Lugdunensis*; Our common or greater Rib-wort, or Rib-wort Plantain. 2. *Plantago angustifolia minor*, *Plantago quinquenervia minor*, & *longa minor*; The lesser Ribwort, or Ribwort Plantain. 3. *Plantago angustifolia Rosea*, & *multiformis*, *Plantago torosa prolifera*, *Plantago angustifolia Rosea*, *Plantago quinquenervia Rosea Gerardi*, *Rose Rib-wort*, or *Rose Rib-wort Plantain*. 4. *Plantago angustifolia serrata Clusii*, *Rib-wort* or *Ribwort Plantain* with dented Leaves.

The Descriptions.

III. *The first, or Out common or greater Rib-wort, or Ribwort Plantain.* Its Roots are long, fibrous, or stringy, like the Roots of the Common broad Leav'd Plantain. From which Spring up divers narrow, long, and hairy, dark green Leaves, lying on the Ground, with five Nerves or Ribs for the most part, in every one of them, running from one end of the Leaf to the other, and pointed at the ends. And from among which rise up many naked and striped Stalks, somewhat hairy, at the tops of which grow such like long and Spiked dark green Heads, as in the first Common Plantain, and Flowering in the same manner, but greater and shorter, wherein ly such Seeds as in the former, but larger, and of a darker color. This is found sometimes varying in the Heads, for some will have two Heads upon a Stalk, or one Head parted into two parts, or with two or more spiked Heads, growing at the bottom of the principal Head.

IV. *The*

*Plantain long Leav'd,
or Ribwort.*

IV. The second, or Lesser Ribwort, or Ribwort Plantain. This in its Roots, Leaves, Stalks, Heads, Flowers and Seed, and in every of its parts, as also in its form of growing, is like unto the first before described, and differs only in its magnitude, this growing always much smaller than that.

V. The third, or Rose Ribwort, or Rose Ribwort Plantain. It has a pretty thick long Root, with many Fibres adjoining to it. Its Leaves are like the two former Kinds, so that by its single Leaves it is scarcely to be known from them, before the Stalks with the Heads begin to appear, which when they are full ripe, shew themselves in a variable manner; some having large or long narrow Leaves set together, somewhat sparsely, imitating a loose or dispersed Rose: others having shorter green Leaves, more compact and closed, making a more comely form of a Rose, sometimes fully laid open, and sometimes more close, and as it were half closed; and sometimes out of the middle of the Rose will arise two or three or more short Stalks, bearing each a small green Rose, and therefore called Prolifera made of many small Leaves set together in the same manner, and sometimes many short Spikes set close together in one Head, or separate each by its self. This Kind has scarcely ever been seen to bear Seed, but is increased by slipping or parting the Root, and planting or setting it again.

VI. Johnson in Gerard says, That this Rose Ribwort has many broad and long Leaves sharp pointed, and of a dark green color, Ribbed with five Nerves or Sinews like the Common Ribwort, among which rise up naked Stalks, furrowed, chan-

fered, or crested, with certain sharp edges. At the tops whereof grows a great and large Tuft of such like Leaves, as grow next the Ground, making one entire Tuft or Umbel, in shape resembling a Rose; (whereof I thought good to give it the Surname) which is from its Flower.

VII. The fourth, or Ribwort, or Ribwort Plantain with dented Leaves. Its Root is small, long and fibrous like the first Kind. In its Leaves and manner of growing, it is very much like the Second or Lesser Ribwort, but smaller, narrower, and harder in handling, being dented about the edges, and so sharp withall, that they may seem to be Prickles, which has caused some to call it, *Peregrina Spinosa*, tho' I think improperly. The spiked Heads grow upon slender Stalks, about half a Foot high, being somewhat open, or dispersed.

VIII. The Places. The first grows almost every where by Hedge sides, Path way sides, Borders of Fields, and Fertile Meadows. The Second grows likewise in divers Meadows and Fields, and by Path-ways, and is also found growing in Gardens as a Weed. The third is found Wild in several places of this Kingdom, in some places in the North of England, and formerly in a Field near London by Hogsdon, and in many other parts of the Kingdom, from whence for the rarity thereof, it has been Transplanted by some Lovers of Plants, and nourished up in Gardens. The fourth grows with us only in Gardens, being brought hither in Seed from Spain: but I have sometimes found it growing Wild in some parts of Florida.

IX. The Times. They all Flower and Seed at the same times (*viz.* in May, June, and July) with the former Broad Leav'd Plantain.

X. The Qualities, Specification, Preparations, and Vertues, of Ribwort Plantain are exactly the same with the former Broad Leav'd Plantain; saying that some Authors are of Opinion, that the Ribwort exceeds in Virtue and Efficacy, to all the Intentions for which the Broad Leav'd is applied.

C H A P. DLXVII.

Of PLANTAIN Bucks-horn.

I. THE Names. It is called in Greek *Κορνόπυς* (*A Corvino pede quem effigiant folia*, as Pena says:) in Latine, *Coronopus* also; but they likewise call it *Cornu Cervi*, and *Cornu Cervinum*, *Herba Stella*, *Harenaria*, & *Sanguinaria*, or *Sanguinalis*, (the one from the place of its growing, the other from its Qualities, Properties or Effects;) I think it might be more properly called, *Plantago Cervina*, *Plantago Cornigera*, *Plantago Cornuata* vel *Corniculata*, a Horned Plantain: in English, *Bucks-horn Plantain*, and by some, *Crow-foot Plantain*.

II. The Kinds. We scarcely know any more than two Species of this Plant, *viz.* 1. *Coronopus vulgaris*, *Cornu Cervinum vulgare*, *Coronopus fativus Cordi*, *Gesneri*, & *Camerarij*, (because in Italy, France, Spain, and other places it was Nurst up in Gardens for a Sallet Herb:) *Cornu Cervi*, & *Herba Stella Dodonæi* & *Lobelij*; It is also

called, *Coronopus Sylvestris*, because it is also found Wild in several Countries: Our common Bucks-horn Plantain. 2. *Coronopus Insula Prochytae Columne*; *Coronopus Sylvestris hirsutus Bauhini*, Prickly Bucks-horn Plantain.

The Descriptions.

III. The first, or Our Common Bucks-horn Plantain. Its Root is single, long, and small, with several Fibres adjoining thereto. If it is Sown or Planted from Seed, it rises up at first with small, long, narrow, hairy, dark, green Leaves, almost like Grass, without any division or gash in them; but those which succeed are gash in, on both sides of the Leaves, into three or four gashes, and pointed at the ends, resembling the Snaggs of a Bucks Horn, from whence it took its Name. And being well grown, these Leaves lie round about the Root upon the

Bucksborn Plantain.

Ground, in order, one by another, thereby resembling the form of a Star, and therefore called *Herba Stella*. From among which rise up several Hairy Stalks, about an Hand breadth high, bearing every one of them a small, long, spiky Head, very like unto those of the Common Plantain, having such like Bloomings and Seed after them. The Smell and Taste thereof is very much, or altogether, the same with that of the Common and Ribwort Kind.

IV. The second, or Prickly Bucks-horn Plantain. This differs but little from the former, but

that its Leaves are something larger, broader and thicker, and more hairy or rough. And the dents or jaggs of the Leaves are more sharp and prickly. The Stalks and Heads are likewise more rough and hairy. These are the chief differences, in all other things, it is like to the former.

V. The Places. The first usually grows in dry sandy Grounds, in Barren Plains and Untill'd places, in many parts of England; as in Tuttle Fields, near Westminster; at Waltham Abby, not far from London, as also upon Black-Heath near Southwark, and many other like places. In Italy, &c. they are wont to Plant it in their Gardens, as a Sallet Herb, because they commonly eat it in Sallets. The second Grows on Rocks in the Island Prochyta as *Columna* says: I have had it from Eye Witnesses, who told me, that they had seen it grow upon some of the Mountains in Wales, and some other like Places in England.

VI. The Times. They both Flower in May, June, and July, their Seed ripening in the mean Season: and their Leaves abide fresh and green in a manner all the Winter.

VII. The Qualities, Specification, Preparations, and Virtues of Bucks-horn Plantain, are the very same with those of the Common broad Leav'd Plantain, (in Chap. 565. Sect. 11. ad 25.) to which I refer you.

VIII. Observ. 1. The Juice or Essence of this Plant, is said to be a peculiar remedy against the Bitings of Vipers, or other Venomous Beasts, by drinking of it either alone, or in a Glass of Generous Wine, a Cataplasm of the Green Herb being also laid upon the Wound or place bitten. It stops also all bleedings and eruptions of Blood, whether at Mouth or Nose, whether by Urine or Stool, cures the Dysentery or Bloody Flux, and other Fluxes of the Bowels, and is profitable as *Paulus Aegineta*, Lib. 7. says, against the Colick. Given inwardly from 4. to 8 Spoonfuls at a time in Symplick Red Wine, 3 Hours before the coming of an Ague, it cures it, more especially if the Leaves of the Plant be laid to the sides, and so the Fit will suddenly vanish, as if it had been done by Witchcraft.

IX. Observ. 2. The Decoction in Wine. It has the Virtues of the Juice or Essence; besides which, if it is long drank, it cures the Strangury, and is profitable for such as are troubled with Sand, Gravel, Stones, or Tartarous Matter in the Reins, abating the heat and Inflammation of the Reins, Ureters or other adjacent parts, and strengthening them. And given Morning and Evening for some Days together, it helps all sorts of Sore Eyes, caused from a Defluxion of hot, sharp, and Salt Rheums, by cooling the parts, abating the acrimony of the humor, and stopping the Fluxion.

X. Observ. 3. The Root, whether in Powder, (which may be given from 2 Scruples to 2 Drams, in any fit Vehicle Morning and Night) or the Decoction in Wine, or Infusion in Spirit of Wine, have all the Virtues of the Juice, Essence and Decoction, asforespecified, saving that the Root is thought to be more potent than the Herb or Leaves, and to be a more specifick Remedy for the Colick.

XI. Observ. 4. The Cataplasm of Leaves and Roots with Bay Salt. Applied to both Wrists, and Bound on pretty hard (yet not too hard neither) cures Agues admirably; it presently stops the Course of the Fits, and soon after so profligates the Ague, as to complet a Cure.

C H A P.

C H A P. DLXVIII.

of PLANTAIN Water.

I. **T**HE Names. What Greek Name this was called by in Dioscorides or Theophrastus, is uncertain, but in respect to the Latine Name it may be *Ἀργυράσσω ἕρπυς*; in Latine, *Plantago Aquatica*, *Arnoglossum Aquaticum*: and in English, *Water Plantain*.

II. The Kinds. 1. *Plantago Aquatica major*, *Fistula Pastoris*, *Barba Sylvana*, Our common greater Water Plantain. 2. *Plantago minor Aquatica* *Cesalpini*; *Plantago Aquatica humilis angustifolia* *Lobelij*, The lesser Water Plantain. 3. *Plantago Aquatica minor muricata*, *Damasonium Stellarum Lugdunensis*, The lesser Water Plantain, with Calthrope like Seed, Star Water Plantain. 4. *Plantago Aquatica minima Clusij*, *Plantaginella palustris* *Baubini*, The least Water Plantain.

The Descriptions:

III. The first, or Our common greater Water Plantain. Its Root consists of a great Bush of many long Fibres or Strings set together: which

Plantain Water Star.

sends forth several long thick green hollow Stalks, with large long green Leaves on them, having some shew of Ribs in them, like unto Plantain: but they are much greater, stiffer, and longer, and with sharper ends. From among these rise up several tall three cornered spongy Stalks, divided in several Branches at the Tops, on which stand a great number of white Flowers, composed of three leaves apiece. After which follow small three cornered green Heads, in which is contained the Seed.

IV. The second, or The lesser Water Plantain. Its Root consists of many small white Fibres like the former, which sends forth several long Leaves, six times smaller and narrower than the former, from among which rise up divers bare Stalks a Foot high, bearing a Tuft of many bluish, colored Flowers, consisting of three Leaves apiece like the former, each standing on a long foot Stalk, and all rising from one Head, like an Umbel, after which follow rough Heads of Seed like to those of the Crowfoot.

V. The third, or Lesser Water Plantain with Calthrope like Seed, Star Water Plantain. Its Root is a bush of long white Fibres or Strings: which sends up several small and long Leaves like to those of the Ribwort Plantain, but much smaller, and turning themselves backwards. The Stalks are slender and naked, and about half a Foot high or more, which bear at their tops sparsed small Tufts of white three Leaved Flowers; which being past away, come after them, prickly Heads standing out with ends like to a Star, in which lyes the Seed.

VI. Johnson in Gerard says, That this Plant in its Roots and Leaves is like to our first described, as also in the Stalk, but much less in each of them, the Stalk being about a Foot high; at the top of which stands many pretty Star like skinny Seed Vessels, containing a yellowish Seed.

VII. The fourth, or The least Water Plantain. Its Roots consists of nothing but a Bush of very fine Fibres or Threads. This Least Water Plantain spreads it self wholly upon the Ground, bringing forth several small, long and narrow Leaves, standing on very slender foot Stalks, from among which come many slender Stalks lying down on the Ground, being not much above an Inch long, and ending in a small Head, which sending forth small Fibres, comprehends a great space of place, and take Root again, shooting forth other smaller Leaves, from among which spring forth five or six small round Buttons (no Flowers having yet been observed on the Plant) standing on very fine Stalks, opening into two parts, shewing very small Seed within them. From among these round Buttons grow also other rows or courses of small Heads, bringing forth other smaller Leaves and Buttons than the former.

VIII. The Places. These all grow on the brinks of Rivers, in Watery Ditches, Plashes, wet Ponds, and other standing Waters. The first grows almost every where in moist places throughout the whole Kingdom. The second and third are more rare, but in the like places, as in a Ditch on this side Margate, in the Isle of Tener. The third has been found growing in the Ditches on the left Hand of the Highway from Holloway to Highgate; and a little beyond Ilford, in the Way to Ransford: Mr. Goodyer found it also growing upon Hounslow-Heath.

IX. The

IX. *The Times.* They Flower all *June*, and *July*, unto *August*, and the *Seed* is ripe in some little time after.

X. *The Qualities, Specification, Preparations, and Virtues,* of *Water Plantain*, are the same with those of the *Common Plantain*, described in *Chap. 565. Sect. 11. ad Sect. 25.* foregoing, to which I refer you: but it is very rarely used in *Physick*, the others being more common and more easy to be had.

CHAP. DLXIX.

Of PLANTAIN Sea.

I. **THE Names.** It is called in *Greek*, *Ὠκίσκος* & *Ὠκίσκος*; in *Latine*, *Holostium*, & *Holostium*, (for it is Written both ways) also *Plantago Marina*: and in *English*, *Sea Plantain*.

II. *The Kinds.* There are many Species of this Plant, but these five sorts are chief, viz. 1. *Plantago Marina vulgaris Lobelij, Lugdunensis & Gerardi*, Our common *Sea Plantain*. 2. *Holostium Salamanticum, Holostium Hispanicum, Plantago angustifolia albida Dodonæi, Plantago Hispaniensis major, Holostium quorundam Camerarij, Holostium hirsutum albicans majus Bauhini*; The greater *Spanish Sea Plantain*. 3. *Holostium minus, Holostium hirsutum albicans minus Clusij, Bauhino, Plantago Hispaniensis minor, Holostium Salamanticum minor*; The lesser *Spanish Sea Plantain*. 4. *Holostium angustifolium majus, sive Serpentaria major; Coronopus Sylvestris Mattioli; Serpentina marina, Plantago marina Camerarij in horto, Plantago angustifolia Dodonæi*, The greater *Grass Leav'd Sea Plantain*. 5. *Holostium angustifolium minus, Serpentina Omnium minima Lobelij, Holostium quorundam Lugdunensis*, The lesser *Grass Leav'd Sea Plantain*. To these may be added, 6. *Holostium Loniceri, Cauda muris Vocatum, Alyscurus, Holosteo affinis Cauda muris Bauhini, Coronopus Sylvestris Tragi, Mouffe Tail*. This, tho' *Camerarius, Lonicerus, Lugdunensis, Thalius*, and *Bauhinus* himself, accounts among the Kindred of the *Holostea*, yet others have been of another Opinion, for which Reason we have treated of it alone, in a particular Chapter by it self, viz. in *Chap. 504.* foregoing, and therefore shall say no more of it in this place.

The Descriptions.

III. *The first, or Our Common Sea Plantain.* Its Root is somewhat white, thick, and long, with long Fibres adjoining thereto, and abides many Years, from this Root spring up many narrow, long, and thick green Leaves, having here and there a dent or two on the one edge, and pointed at the end. From among these Leaves rise up several bare Stalks, with a small spiked Head thereon, smaller than *Common Plantain*, otherwise alike, both in its Blooming and Seed.

Plantain Sea Common.

IV. *The second, or Greater Spanish Sea Plantain.* Its Root is something long and hard, with several Fibres adjoining to it. It differs not much from the former Greater Kind, having many narrow hoary Leaves lying on the Ground, but shorter and broader than they. From among which rise up divers naked short Stalks, little more than an Hand breadth high, furnished from the middle almost to the tops, with many whitish green Flowers, standing more sparsely in the spiked Heads than the former, which contain in their Husks a certain kind of small Seed.

V. *The third, or Lesser Spanish Sea Plantain.* This in its Root and Fibres, Leaves, Stalks, Heads, Flowers and Seed, as also in its manner of growing, is very like the last, saving that this is much smaller, and not so gray or hoary, and the Flowers are like to those of the Ribwort, or Bucks-horn Plantain, but the Heads are smaller, and the Leaves greener and narrower.

VI. *The fourth, or Greater Grass Leav'd Sea Plantain.* Its Root is somewhat thick, long and woody, with some Fibres thereto adjoining. This Greater Grassy Leav'd Plant has a great number of small long Leaves, almost like Grass, but that they are stiff and hard, sometimes lying upon the Ground, and sometimes raised a little higher, from a Stem under them. They are of a grayish or hoary green color, and having on some of them, some small gashes on the edges. From among which rise up naked Stalks, about half a Foot high, with small spiked Heads, like unto *Plantain Heads*, set on their tops, in which is contained also such like Seed.

VII. *The*

Plantain Sea Grass Leav'd great.

VII. The fifth, or Lesser Grass Leav'd Sea Plantain. This in its Roots, Leaves, Stalks, Heads, Flowers and Seed differs not much from the former, or Greater Kind, but that it is smaller, and scarcely having any dent on the edges; it grows also much lower, not exceeding three or four Inches in height, and the Leaves not above two or three Inches at most in length.

VIII. The Places. The first grows near the Sea, and upon the Sea Coast, in most places of England, as also upon the Sea Shores of many other Countries. The second and third are Natives of Spain, the greater of which *Clusius* says, he saw by the High-way sides near to *Valencia*; but since his time they have been found to be Natives also of our Country, growing at *Bustable* in the Isle of *Wight*, and in the Isles of *Ferisy* and *Gernsey*. The fourth and fifth Kinds are Natives of Italy, as *Matthiolus* says; and of Germany as *Camerarius* says, growing by a Lake of Salt Water near *Islebia*: since those times, we find them to be Natives also of our Country, and several Eye Witnesses have affirmed, that both the greater and lesser Sorts grow near the Sea side in the West parts of England; in all the Tracts of the Marishes near *Ast-ferry* in *Glocestershire*; and that they grow upon the Rocks in *Silly*, *Garnsey*, and the Isle of *Man*. The first Species has been found growing by the Forts on both sides the Water at *Gravesend*; at *Erith* near *London*; at *Lee* in *Essex*; at *Rye* in *Kent*; at *West-Chester* also; and at, or near *Bristol*.

IX. The Times. They Flower towards the end May, and thro' all June and July, and their Seed ripens in a short time after.

X. The Qualities, Specification, Preparations, and Virtues of Sea Plantain, are fully

the same with those of the Common Plantain in Chap. 565. *Self.* 11. ad 25. to which I refer you.

XI. Observation, 1. *Gerard* says, That these Herbs have the same Faculties and Virtues which the other Plantains have; and that they are thought to be the best or most efficacious of all the Kinds. And *Parkinson* says, that what has been said of the other Plantains may in some sort be justly referred to these; for in their coldness and dryness, and other Properties, wherein the Plantains are excellent, these do but little differ, and therefore, That it needs not to repeat the same things here again, which in other places have already been spoken.

XII. Observ. 2. Only says *Matthiolus*, That the fourth Kind here mentioned called *Serpentina*, the People of *Goritia* in Italy where it grows, use it to especial good purpose, against the Bittings of Serpents especially, and of other Venomous Beasts (which *Matthiolus* himself also says, That he had found true by good Experience:) as also to help those that are troubled with the Dropsy, that chiefly which has possest the whole Body properly called a *Sarcitis* or *Anasarca*.

XIII. Observ. 3. *Galen*, *Dioscorides*, and *Pliny*, have proved Sea Plantain, to be such an excellent Wound Herb, that it presently closes or shuts up a Wound, tho' it be very great and large. And by the same Authority I speak it (says *Gerard*) That if it be put into a Pot wherein pieces of Flesh are Boiling, it will Soder them together.

POCKWOOD, see Guajacum, Lib. 2. Chap.

CHAP. DLXX.

OF POLEY;

OR,

POLEY Mountain.

I. THE Names. It is called in Greek, Πόλεον (sic dictum propter Canitiam, πολίς enim Canitiam vel Canum significat, because it is like to the hoary Hairs of a Mans Head:) in Latine, *Polium*, & *Polium Montanum*: in English, *Poley*, and *Poley Mountain*. Some will have *Polium* to be *Leucas*, and that *Dioscorides* has twice treated of that Herb under divers Names, for that the Kinds, the reason of their Names, and the Qualities or Faculties do agree. There are two, viz. *Λευκὸν βουνόν*, which they will have to be *Polium Montanum*; and *Λευκὸς ἡμετέρος* which is *Polium Hortense*. The Name *Leucas* is from the whitish color; and *Polium* from its Hoariness, as is aforesaid, being like to the white Hoariness of a Mans Head.

II. The Kinds. Authors have made ten or more Kinds of this Plant, but they being most of them Strangers

Strangers in our Climate, nor yet found to be growing in our Transmarine Plantations, we shall only take notice of, and Describe the three Species following, viz. 1. *Polium Montanum vulgare*, *Polium Montanum Luteum Lobelij*, *Polium Montanum primum Dodonzi*, Our ordinary or common Poley. 2. *Polium Montanum minus*, *Polium Montanum primum Matthioli*, *Polium Montanum album*, White Poley, or upright Spanish Poley Mountain. 3. *Polium Montanum Lavendule folio Bauhini*, *Polium Montanum secundum Matthioli*, *Polium Montanum septimum Clusij*, *Polium recentiorum Famine Lavendule folio Lobelij*, Spike or Lavender Leav'd Poley.

The Descriptions.

III. The first, or Our ordinary or common Poley. Its Root is somewhat long and hard, with a few Fibres hanging thereto. It is a small low Plant, not above a foot high, having several white or hoary round and hard Branches, on which are set divers long and small hoary Leaves, overlaid as it were with a yellowish white Down, a little dented about the edges, and something broader or greater than any of those which follow; two always set together on the Stalks as they grow up: at the tops whereof grow whitish or hoary yellowish Heads, thrusting out many small pale colored Flowers, and in some places more yellow, standing in hoary Husks. The Seed is small and blackish. The whole Plant smells sweet; strong and quick withall. The Branches being Slipt, and set in the Ground, will grow very well, and by that means be sufficiently increased, for in our Climate

Poley Mountain Common, or Yellow.

it seldom gives perfect Seed to be Sown. Yet Clusius says, That he had some Plants raised from the Seed of this Species; but they brought forth Flowers more pale than the Mother Plant, and some more white, especially on the outside, being pale on the inside.

IV. The second, or White Poley, or Upright Spanish Poley Mountain. Its Root is hard and woody like the former. The whole Plant is smaller than it, and rises up with many small slender Branches, standing more upright than the first or common Kind, and not leaning downwards to the Ground, tho' it grows upright, yet it grows not much higher. On its Stalks and Branches are set

Poley Mountain white.

many hoary Leaves, smaller than those of the first sort, and some small ones together with them, a little dented about the edges towards the ends, and as hoary, or rather more hoary than it. At their tops grow longer and smaller Heads, having white Flowers, coming forth out of hoary Cups, larger and more spread than the following. The Seed is blackish and small, yet greater than that of the just before described, tho' the Plant it self is smaller. And the Smell of this is more sweet and acute than that.

V. The third, or Spike or Lavender Leav'd Poley. It has a hard woody Root, spreading it self out with many small Fibres. From this Root spring forth several weak Branches, on which are set many small long Leaves, two together, one against another, as in both the former, which are something green on the upper side, and hoary underneath, something like the Leaves of Rosemary, or Lavender, and not at all snipt about the edges. At the tops of the Branches, come forth many Flowers not bushing, but loosely spread, which are of a white color, not differing in form from the other, but coming forth of a grayish Husk, yet not so very hoary as the others. The Seed is black like the rest; and the whole Plant

Poley Mountain Lavender
Leav'd

has a small sweet Smell, not so pleasant as the former, as some Authors say: but Matthioli says it smells well, tho' not so pleasant or strong as the last, being of less virtue and efficacy than it.

VI. *The Places.* All these are Natives of more Southern and warmer Climates, as *Italy, Spain, Candia, &c.* but here they are Nurst up only in Gardens, the first of them being the most common with us.

VII. *The Times.* They Flower all June and July to the beginning of August, and the Seed ripens in the mean Season.

VIII. *The Qualities.* Poley is hot and dry in the third Degree: Aperitive, Absterfive, Diuretick, Vulnerary, Cardiack, and Alexipharmick. The first or greater Kind is most in use.

IX. *The Specification.* It is profitable against the Jaundice, Dropfy, Spleen, Bitings of Venomous Creatures, Poison, Strangury, obstructions of the Courfes; cures Green Wounds, as also old Sores and putrid Ulcers, cleansing, drying and healing them.

X. *The Preparations.* You may have therefrom, 1. *A Juice or Essence.* 2. *A Decoction.* 3. *A Powder.* 4. *A Cataplasm.* 5. *A Spirituous Tincture.* 6. *An Acid Tincture.* 7. *An Oily Tincture.*

The Virtues.

XI. *The Juice or Essence.* They are good for such as are bitten or stung with any Venomous Creature, and is profitable against the Dropfy, Jaundice, Hypochondriack Melancholy, and Pain,

Tumor or Swelling of the Spleen. They provoke the Terms in Women, give ease in the Strangury, provoke Urine, and force away Sand, Gravel, Stones or Tartarous Matter from the Reins and Bladder. Dose from 3 Spoonfuls to 6 or more, Morning and Night, in a Glaſs of white Lisbon Wine. If they are given in too great a Dose they are apt to trouble the Stomach a little, and sometimes (if the Stomach is very foul) to cause Vomiting. If the Lips of Cuts or Wounds be washed with them, they cause Consolidation, and a sudden healing.

XII. *The Decoction in Wine.* It has all the Virtues of the Juice and Essence, but not altogether so efficacious, and therefore ought to be given in greater Quantity. It opens all obstructions of the Viscera, as of the Stomach, Lungs, Liver, Spleen, Mesentery, Reins and Womb, thereby carrying off the recrements of those parts by Urine, and curing the Scurvy, Rheumatism, Cachexy, and other like Diseases. Used as a Lotion, it is profitable for the cure of Green Wounds; and it cleanses, dries and heals also old running Sores, and filthy putrid Ulcers.

XIII. *The Powder of the Leaves and Heads.* It has the Virtues of the Juice, Essence and Decoction; and may be given Morning and Evening, from half a Dram to two Drams, in a Glaſs of white Port, or Lisbon Wine, or a Spoonful or two of Syrup of Violets, or Clovegilliflowers. Strewed upon old putrid Sores and Ulcers, it stops the flux of Humors, cleanses, dries, and heals them. Tho' the first or greater Kind is most used with us, yet it is the Powder of the lesser Kind, (which is the more bitter in Taste, and the more sharp or quick upon the Tongue) which is put into Mithridate and Venice Treacle, and other Antidotes or Counter Poisons, and is indeed of greatest Virtue.

XIV. *The Cataplasm made of the green Herb.* Applied to great Cuts or Wounds, it quickly Conglutinates and heals them, and this the greater Kind does best perform.

XV. *The Spirituous Tincture.* It very much comforts and strengthens the Stomach, Bowels, and Womb, give present ease in the Colick, and is profitable against Convulsions whether in old or young: It resists Poison and is good against the birings of Mad Dogs, Vipers, and other Venomous Creatures. Dose from 1 Dram to 2, Morning and Evening in a Glaſs of Wine.

XVI. *The Acid Tincture.* It opens all manner of Obstructions of the Bowels, of what kind soever, strengthens and fortifies the Stomach, creates an Appetite, and causes a good Digestion. It is a potent Remedy against the Scurvy, and resists the malignity of the Plague or Pestilence, as also the Spotted Fever, Purples, and all other Malign Fevers, more usually happening to younger People, where there is a high and exalted Temperament of the Blood. Dose 30 or 40 Drops at a time, in all that the Patient drinks.

XVII. *The Oily Tincture.* It is an Anti-colick, and a potent Diuretick, giving present ease in the Stone and Strangury: It expels Sand, Gravel, Stones if they be small, and Tartarous Mucilage from the Reins, Ureters and Bladder. It provokes the Terms Women, facilitates the Birth, and gives ease Labor: it also causes a due cleansing afterwards, and either prevents or cures After-pains, which are so very troublesome to some Women, that they exceed the Vehemency of the Labor it self.

Taken also daily Morning and Night inwardly in Wine, and the Back Bone being also anointed therewith twice a Day, as also the other parts affected in a Palsy, it has been found by good Experience to Cure that Disease, as also Numbness, Trembling of the Limbs, and other Paralytick Disaffections of the Nerves. It helps Lameness, gives ease in the Gout tho' never so extreme, prevails against the Sciatica, and is a powerful Remedy against Rheumatisms. Dose from 15 to 30, 40, or 60 Drops at a time, Morning and Night in any fit Vehicle.

CHAP. DLXXI.

of POLYPODY.

I. **THE Names.** It is called by the *Ara-
bians*, *Bisbera*, as *Serapio* has it: by *Avicen*, *Derbers*, and *Budeig*: by others *Aibeig*, and *Bessaigi*: in *Greek*, *Πολυπόδιον*, (à *Poly-
porum cirrhis*, says *Dioscorides*: or a cavernous acetabulis, seu cirrhis *Polyporum*, says *Pliny*:.) in *Latine*, *Polypodium*, & *Filicula* (quasi *purva filix*;) & *Filicularis Herba*: in *English*, *Polypody*: some call it *Wall Fern*, and *Oak Fern*, (according to their places of growth) but then they ought to add another Epithite to it, and make it *Great*, as, *Great Oak Fern*, because there are smaller which are properly so called, as you may see in Chap. 260. foregoing, of which the *Polypody* is no Species.

II. **The Kinds.** We make three particular Species hereof, tho' the two first differ not much, one from another, but in their place of growth, and these are, 1. *Polypodium*, (and so it is called by all Authors,) *Polypodium Murinum*, *Wall Polypody*, or *Polypody of the Wall*. 2. *Polypodium quercinum*, vel *quernium*, *Polypody of the Oak*. 3. *Polypodium alterum*, *Polypodium minus*, The smaller *Polypody*.

The Descriptions.

III. **The first or Polypody of the Wall.** Its Root is long, not a Finger thick, creeping a slope; on which are seen certain little Buttons, like those Pits and Dents which appear in the Tails of Cuttle Fishes; which has a certain sweetness, with a Taste somewhat harsh. The Leaves of this *Polypody* might be thought to be like those of the *Male Fern*, but that these are far lesser, and not nickt at all on the edges. These do presently spring up from the Root, being cut in on both the edges, with many deep gashes, even to the middle Rib. On the upper side they are smooth: on the under side they are lightly Powdered, as it were with dusty Marks. This kind of Fern (for it is a Species of the Fern's) wants not only Seeds and Flowers, but Stalks also.

Polypody of the Wall.

IV. **The second, or Polypody of the Oak.** Its Root is smaller than one's little Finger, lying a slope, or creeping under the upper crust of the Earth, or matter it grows on, brownish on the outside, and greenish within, of a certain sweetish harshness in the Taste; fat

Polypody of the Oak.

with certain rough Knags or Excrefcencies on each fide thereof, having alfo much moffinefs, or yellow hairinefs upon it, and fome Fibres underneath it, by which it is nourifhed. It is a fmall Herb, and confifts of nothing but Roots and Leaves, having neither Stalk, nor Flowers, nor Seed, as it is thought. It has three or four Leaves rifing from the Root, every one fingly by it felf, of about an Hand length, which are winged, confifting of many fmall narrow Leaves, cut in, to the very middle Rib, ftanding on each fide the Stalk, each being larger below, and fmallier up to the top, very like unto the Olfmand Fern, not having any dents or notches on the edges, as the Male Fern has, of a fad green color on the upper fide, and fmoother, but fomewhat rough on the under fide, by reafon of certain yellowifh fpoats, which are thereon.

V. This Polypody of the Oak, Gerard thus defcribes. The Root has many Strings faftned to it, one folded within another, of a mean bignefs, and fweet in Tafte, which fends forth here and there new Sprouts or Springs, whereby it increafes. This Polypody is much like that of the Wall (before defcribed) yet the Leaves of it are more finely cut, fmoother on the upper fide, of a pale green color, together with their Stalks and middle Ribs: but on the nether fide, it is rough like thofe of Fern. This Fern grows alfo without Stalks, and continues always without Seed.

VI. The third, or Smaller Polypody. This differs not from either of the former before defcribed, neither in its Root, or Leaf, or Marks on the underfide of the Leaves, but only that the Root is fmallier, and flenderer, and the Leaves alfo not fo long and large. This fmallnefs, as I fuppose, may rife more from the place where it grows, than from the diverfity of Kind: for altho, in fome places, the Leaves may feem to be a little waved on the edges, yet in refpect to the general growth of the Plant, it is but accidental.

VII. The Places. The firft grows upon old Mud Walls, as alfo in Mofly, Stony, and Gravelly places, near unto Woods, and where it has moft mellow and moift Earth to fpring and live in: alfo upon old Stone Walls, and the tops of Houfes: it is likewife found in the borders of Fields, efpecially under Trees and Thorns, and now and then in Woods: in fome places it grows rank, and with a broader Leaf; in others not fo rank, and with a narrower Leaf. The fecond grows upon old rotten Trunks or Stumps of Trees, as of Oak, Beech, Haffe, Willow, and feveral other forts of Wood, and in the Woods under them; that which grows upon the Bodies of old Oaks, is preferred before the reft, but inftead of this, moft do ufe that which grows under the Oak, and for all that I know, it may do nearly as well. The third or Smaller Polypody grows where the place is hard and dry, or in barren places, where fcarcely any other thing will grow or thrive.

VIII. The Times. By reafon it is green all the Year, and bearing neither Flower, nor Seed as it is thought, it may be gathered for ufe at any time; yet it fends forth young green Leaves only in the Spring.

IX. The Qualities. It is hot and dry in the firft Degree, and as Galen fays, without any biting property: Aperitive, Abfterfive, Anodyn, Splenetic, Arthritic, and Cathartic.

X. The Specification. It purges Melancholy, Choler, and tough Flegm: is good againft Agues; Gout in Hands or Feet; hardnefs, pain and tumor of the Spleen, Colick, Stitches in the Sides, Wind, Coughs, fhortnefs of Breath, Wheezing, Hoarfenefs, &c.

XI. The Preparations. The Root is only, or chiefly in Ufe; and you may make thereof, 1. A Simple Decoction in Wine or Water. 2. A Compound Decoction in Wine or Water. 3. A Powder thereof. 4. A Cataplafm. 5. A Diftilled Water, not only from the Roots but from the Leaver alfo.

The Virtues.

XII. The Simple Decoction in Wine or Water, or in Barly Broth, or Chicken Broth, or in Whey, or Mead, or Honyed Water. If it is made with other opening and mollifying things, it is of good ufe to purge the Belly, to Digest tough and thick Humors, and purge Phlegm, whether thick or thin, even from the joints: and by ufing this Decoction for a confiderable time, fome who have been troubled with Pains and Tumors in their Hands, Knees, Feet and Joints, have been wholly cured of the fame. It purges off alfo, Colerick and Melancholy Humors, is good againft Pains and Tumors of the Spleen, and profitable for fuch as have been long troubled with Quartan Agues, efpecially if the Decoction is made in Whey, Mead or Chicken Broth, with Epithimum, Beets, Mallows, and Parfly Roots. It is profitable alfo againft Prickings and Stitches in the Side, as alfo againft the Colick, tho' inveterate, but then it ought to be taken for a pretty long time, and Seed of Anife, Coriander, Carawaies, and Fennel, with Ginger ought to be added. It is a fafe and gentle Medicine, free from danger, and that brings no trouble to the Stomach, fit for all Seafons and Perfons, which daily Experience has confirmed. It may be given from an Ounce to an Ounce and half, or two Ounces in a Decoction, for one Dofe; which may be given in the Morning Fafting, with due Obfervation; as in other gentle Purges.

XIII. The Compound Decoction in Wine, Water, Barly Broth, Chicken Broth, Whey, Mead, or Honyed Water. Take Polypody cleaned and Bruifed, from half an Ounce to an Ounce or fomething more: Alexandrian Sena from a Dram to 2 Drams: Anifeeds, Carawaies, Coriander Seed, Sweet Fennel Seed, Ginger, all bruifed, of each a Dram: Cloves fit a Scruple: Wine, Water, or Broth, &c. a fufficient quantity, Boil gently with a fimmering Heat, for almoft half an Hour, then ftrain out thro' a Flannel Bag, which Dulcife with Syrup of Violets, or of Citron Peels, for one Dofe. It admirably Purges Melancholy, opens the Spleen and expels the malign Hypochondriack Humor: it prevails againft Franfies, and radically cures the moft profound Madnefs, whether it be raging or otherwife, provided it be ufed alternately with Opiates, as with my Laudanum Volatile, Laudanum Specificum, or my Gutta Vitæ, &c. But the purging with this Decoction ought to be repeated 6, 8, or 10 times, or more, as the exigency, or neceffity of the Difcfe may require. It carries off the Caufe of the Colick, as alfo of the Gour, gives relief in Obftructions of the Spleen, Athmas, Coughs, Colds, Hoarfenefs, fhortnefs of Breath, Wheezing, &c. And being continued for fome time, is an excellent thing for the speedy profligating of Agues: and has all the Virtues of the Simple Decoction, with great advantage, becaufe it more powerfully carries off the Morbifick Matter, or offending Humor.

XIV. The Powder of the Root. Being taken in the Morning Fafting, from a Dram to 2 Drams, in a Glafs of Mead, or Honyed Water, it moves the Belly, and Works gently, and is profitable againft all the Difcfe, for which the Simple or

Compound Decoctions are given; tho' I think the latter of them to be the better Medicine, because Polypody of its self is a very weak Purge, and so weak, that in some Constitutions it will not work at all.

XV. The Cataplasme. It is made of the fresh Roots beat small and mixt with Honey, or of the Powder thereof mixed with Honey. Being applyed to Dislocations, it Strengthens and Confirms the Joints, Tendons, &c. Applyed to the Polypus of the Nose, (which sometimes grows so big as to stop the Nostril up) it is said to cure it. It cures also those Cliffs or Chaps, which sometimes happen between the Fingers of the Hands, or Toes of the Feet, as also those coming in the very Fundament.

XVI. The Distilled Water, from both Roots and Leaves. It is much commended for the Cure of the Quartan Ague, being taken many Days together, as also against Melancholy, or fearful or troublesome Dreams. If it be dulcified with Sugar Candy, it is good against all the distaffs of the Lungs, as Asthma's, Coughs, Colds, shortness of Breath, Hoarseness, Wheezing, and Catarrhs, or thin Distillations of Rheum upon the Lungs, which oftentimes causes a Consumption, as an Atrophia, and Consumption of the Lungs. If a Fixt Salt be made of the Herb or Root by Incineration, and it be added to the Distilled Water, it makes it more efficacious or powerful to all the purposes and intentions aforementioned.

XVII. Nota. It is creditably reported, that if the Decoction of the Roots made with Wine, or the Roots themselves, be given to Hogs, that it will preserve them from the Murrain, by purging away the poisonous, deleterious or malign Humor, which causes it.

POMGRANATE TREE, see it in Lib. 2.
POMPION, see Melon, Chap. 482.
POMPION WILD, see Melon Wild, Chap.

CHAP. DLXXII.

Of POND -- WEED.

OR,

RIVER -- WORT.

OR,

WATER -- SPIKE.

THE Names. It is called in Greek, Ποντομαργαρις (quasi Fluminibus vicina:) and Ποντομαργαρις (quasi Spicata Fontalis.) In Latine, Potamogeton, Fontalis, & Spicata. In English, Pond-weed, River-wort, and Water Spike.

II. The Kinds. Authors give us many Kinds of this Plant, but we shall describe only the four following, as being those which are found growing in our Country, viz. 1. Potamogeton latifolium majus vulgare, Fontalis latifolia major vulgaris; Our common greater broad Leav'd Pond-weed. 2. Potamogeton latifolium minus vulgare, Fontalis latifolia minor vulgaris, Spicata-latifolia

minor Lobelij, The lesser broad Leav'd Pond-weed. 3. Potamogeton angustifolium majus, Fontalis longifolia major; The greater long or narrow Leav'd Pond-weed. 4. Potamogeton longifolium minus, Potamogeton foliis longis acutis; Fontalis longifolia minor, Potamogeton alterum Dodonæi; The lesser long Leav'd Pond-weed, or Long sharp Leav'd Pondweed.

The Descriptions.

III. The first, or Our common greater broad Leav'd Pond-weed. Its Root creeps too and fro in the Mud, with several Joints and Tufts of Fibres at them, by which they are fastned to their place of growing. It rises up with several slender round Stalks, full of Joints and Branches, and fair

Pond-weed broad Leav'd great.

broad round pointed dark green Leaves, with long Ribs in them like Plantain, set singly at the Joints, and lying flat on the top of the Water. At the tops of the Stalks and Branches, usually (more seldom at the lower Joints) come forth long Spiked Heads, of bluish colored Flowers upon long foot Stalks, like unto those of Arismet or Bistort: on which, after they are past, come Chaffe Husks, containing within them blackish hard Seed.

IV. The second, or Lesser broad Leav'd Pond-weed. This differs not much from the former, but that it is lesser, being the third Species of Dodonæus his Potamogeton. Its Root is fibrous and thoroughly fastned, as the other is. It shoots forth into many slender and round Stems, which are divided or spread out into several Branches. The Leaves are pretty broad, long and sharp pointed, with Ribs running along the length of the Leaf, but they are much less than the first, or former Kind. Out of the Bosoms of the Branches and Leaves,

Pond-weed broad Leav'd small.

Leaves, certain little Stalks spring forth, which bear several small white Mossy Flowers, which turn into plain and round Seeds not much unlike to the Common Tare or Vetch.

V. The third, or Greater long or narrow Leav'd Pondweed. Its Root is long, jointed, and Fibrous. It has also longer, narrower, and sharper pointed Leaves, than those last described, having the Veins running from the middle Rib, to the sides of the Leaves, as in a Willow Leaf, which they something resemble. At the Tops of the Stalks, grow reddish Spikes or Ears, like those in the first described, in some more whitish, in others of fair bluish color.

VI. The fourth, or Lesser long Leav'd Pond-weed; or Long sharp Leav'd Pond-weed. It has a pretty thick Root (considering the magnitude of the Plant) which is long and full of Joints, with many small Fibres at each Joint, which Root runs along under the surface of the Mud, and creeping in the bottom of the Water. From the Joints of this Root spring up slender, jointed, and long, Stalks, smaller below, and larger above, having upon them, and springing from their various joints, and ends of their Stalks or Branches, long, narrow, and very stiff, sharp pointed Leaves. The Flowers grow in a reddish Spike, like those in the first Described.

VII. The Places. These Plants grow in Standing Waters, Pools, Ponds, and Watery Ditches, almost every where in our Land: The two first are the most frequent to be met with; the two latter are more rare, and to be seen but in few places with us.

VIII. The Times. Gerard says, They Flower in June and July: But Parkinson says, That they shew their Flowers in the end of August, seldom sooner.

IX. The Qualities. Pond-weed is cold and dry in the first Degree, and Galen says, it cools and binds as Knot-Grass does, but is of a thicker Effence. It is Astringent, Anodyn, Colicretick, Vulnerary, and Arthritic.

X. The Specification. It stops Fluxes, eases the Belly-ach, is good against Anthoines Fire, alliwages Inflammations, gives present ease in the Gout, and heals old running Sores and Ulcers.

XI. The Preparations. You may make therefrom, 1. A Liquid Juice or Effence. 2. A Decoction. 3. A Powder of the Leaves and Heads. 4. An Ointment. 5. A Cataplasim.

The Virtues.

XII. The Liquid Juice or Effence. Given to two Spoonfuls, Morning and Evening in a Sytyctick Red Wine, it eases gripings, and stops all sorts of Fluxes of the Bowels: and being Bathed therewith, it is good to help Itches, Ulcers, old running Sores, and corroding Cankers. It allays Inflammations, Anthoines Fire, and is good against Freckles, Tanning, Sunburning, Pimples and heat of the Face.

XIII. The Decoction in Wine. It has all the former Virtues, but may be taken inwardly, to 6 or 8 Ounces; it is a very good Gargarism for a sore Mouth or Throat, cleanses, dries and heals Ulcers, &c. But Made with Water, It is better for to cool Inflammations, allay the heat in Anthoines Fire, &c.

XIV. The Powder of the Leaves and Heads. It has all the Virtues of the Juice and Effence, a Dram at a time being given inwardly Morning and Night in some Sytyctick Red Wine. Outwardly being strewed upon old running Sores and Ulcers, it is said to stop the Fluxion, cleanse, dry, and heal them, and this it more effectually does, if it is mixed with an equal weight of the Powder of common black Resin.

XV. The Ointment. It is cooling and Anodyn; is good against Inflammations of all sorts, running Sores and old Ulcers in the Legs, disfigures Pimples and other breakings out in the Face and Skin.

XVI. The Cataplasim made of the Leaves or Heads and Roots. Being made by boiling them with Oil and Vinegar, and applied to places pained with the Gout, it gives present ease: and made with Honey and Vinegar, and applied, it heals old running Sores and foul Ulcers in the Legs or other parts: made of the Root alone, it is said to dissolve Knots and Kernels in the Neck, and other places of the Body.

C H A P. DLXXIII.

Of POPPY Garden.

I. THE Names. It is called in Greek; *Μήλον*; in Latine, *Papaver*; and in English, *Poppy*.

II. The Kinds. There are four principal Species of this Plant, viz. 1. *Μήλον Πάρεα*, *ή ανινον*, *μήλον ημεσ*, *ή ουλακιν* Dioscoridis; in Arabick, *Thaythay*, & *Caschas*, *Papaver Hortense*, vel *sativum*, Garden Poppy, of which in this Chapter. 2. *Μήλον ποικίλ*, *Papaver Rheas* vel *erraticum*, vel *Sylvestre*, vel *Rubrum*,

Rubrum, The Wild Poppy, of which in Chap. 574. 3. *Makav kashtas*, *Almachuram* Arabicæ; *Papaver Corniculatum*, vel *Cornutum*, The Horned Poppy, of which in Chap. 575. 4. *Makav azghadit*, *Papaver Spineum*, Spattling Poppy, of which in Chap. 576. following.

III. The Kinds of the Garden Species. There are many sorts of this Species, but the following are chief; viz. 1. *Makav kashtas*, *Papaver album sativum simplex*, The single white Garden Poppy. 2. *Papaver nigrum sativum simplex*, The single black Garden Poppy. 3. *Papaver rubrum sativum simplex*, *Papaver flore rubro*, vel *rubente sativum simplex*, The single red Garden Poppy. 4. *Papaver album multiplex*, The double white Garden Poppy. 5. *Papaver rubescens multiplex*, The double red or bluish Poppy. 6. *Papaver nigrum multiplex*, five *purpureum multiplex*, The double murky or purple Poppy. 7. *Papaver Rheas flore multiplici*, The double red or Corn Poppy. 8. *Papaver Spinosum*, The Thorny Poppy:

The Descriptions.

IV. The first; or Single white Garden Poppy. It has a Root which is white and woody, which perishes as soon as it has given ripe Seed. This springs up first with four or five whitish green Leaves, lying upon the Ground, which rise with the Stalk, encompassing it at their bottoms, and are very large, as well broad as long, much rent or torn in on the edges, and dented also besides. The Stalk, which for the most part is but one, and some-

Poppy Garden single white.

times three, or four Feet, or more high, has sometimes no Branches at the top, but usually but two or three, which are the most; each of which bears one Head, wrapped or folded in a thin Filme or Skin, which bows down before it is ready to blow,

and then rising and being broken, the Flower which was folded within it, spreads it self open, and consists of four very large white round Leaves, with many whitish round Threads in the middle, set about a small round green Chaplet or Heal, having a Crown, or Star-like Cover on its top, which Head growing ripe, becomes as great as a large Apple. Bellonius says, That in Natolia, (where they make Opium) the Heads are so large, that they will hold half a Pim. In these Heads are contained great numbers of white small round Seed, in several Partitions or Divisions, next unto the Shell, the middle thereof remaining hollow and empty. This Head keeps close, and opens not at top under the Croton, as all the black Kinds for the most part do. All the whole Plant, Stalks Leaves and Heads, whilst they are fresh, young, and green, yield a Milk, or milky Juice when they are broken, which is of an unpleasant bitter Taste, which nauseates the Stomach, almost to Vomiting, and of a strong heady Smell, which being condensate is called either Opium or Meconium. Of this white Kind, there is another in all things like unto it, but that the Flowers, and especially the Heads of Seed, are not so great by the half, and for the most part has more Branches upon the Stalks; its Seed is as white as the other, and full as large or great.

V. The second, or Single black Garden Poppy. Its Root is like to the former, and there is but little difference to be seen between this and that, until it

Poppy Garden single black.

comes to Flowering; for that the Flowers of this are somewhat less, and of a blackish purple color, without any purple Spots in the bottom of the Leaf, as in the next. The Heads of Seed are commonly not so large, as the second sort of white Ones before mentioned, and opens it self a little, round about the top, under the Crown, so that the Seed which is

very

very black, will fall out, if the Head thereof be turned downwards.

VI. The third, or Single red Garden Poppy. This Poppy has various Species, with respect to the Variable colors of the Flowers, yet they differ not from the former, but only something in the Leaves, these being lesser, and in some crumpled, and cut in or jagged on the edges, but in the jagged edges also of some of the Flowers, and especially in the colors of the Flower and Seed: for the Flowers of some of them will be very red, of others paler; some of a Rose color; others of a murrey color,

Poppy Garden single Red.

either deeper, or paler; yet all of them have a deeper Spot, somewhat large, in the bottom of every Leaf. And as the Flower varies, so does the Seed also; for the Rose and pale colored Flower brings gray or Ash colored Seed; the reddish and deep murrey, not so pale Seed, but more inclining to black. The Seeds of all these Kinds, the white as well as the black or gray, if they be suffered to shed, will spring up again the next Year, and bear every Kind, its own color of Flower and Seed, without the least degeneration or varying of their forms or appearances, unless by meer accident.

VII. The fourth, or Double white Garden Poppy. Its Root is hard, woody, long; and perishing every Year, and must be new Sown every Spring, if they do not spring up of their own Sowing, which if they do, the Flowers are seldom so fair and double, as they which are Sown in the Spring. It has drivers broad and long whitish green Leaves, giving Milk, (as all the rest of the Plant above Ground does, whereforever it is broken or cut.) These Leaves are very much rent or torn on the edges or sides, and notched or indented besides, encompassing at their bottoms, a hard, round, brittle, whitish green Stalk, Branched towards the top, each Branch bearing one fair, large, great Flower, which before it breaks out, is contained within a thin Skin, and being blown open, is very thick of Leaves,

and very double, something jagged at the ends, and of a whitish color. In the middle of which stands a round Head or Bowl, with a striped Croton or Cover on its Head, very like a Star, compassed about with some Threads; in which, when it is ripe is contained, in several Cells or Partitions, small, round, white Seed. The whole Plant is of a strong heady smell.

VIII. The fifth, or Double red or blush Poppy. This Kind of double Poppy, differs not in any other thing from the former, but only in the color of the Flowers, which are of a bright red, tending to a blush color, parted, and striped in many places with white, and exceedingly more jagged than the former, almost like a Feather at the ends, the bottoms of all the Leaves being white. The Seed hereof is white as the former, which is not so in any other Poppy, which bears not a full white Flower.

IX. The sixth, Double murrey or purple Poppy. This Kind varies both in Flowers and Seed; altho' neither in Leaves, or any other thing from the first. The Flowers are thick and double, and jagged at the ends, in some more, in some less,

Poppy Garden double white,
Sect. VII.

Poppy Garden double black.
Sect. IX.

either red, or blush, or purplish red, more or less; or of a sad murrey, or tawney color; with brown, or black, or tawney Buttons. The Seed is either of a grayish blew color, or (as in some Plants) more blackish.

X. The seventh, Double red, or double Corn Poppy. This double Poppy is like to the Wild or Field Poppy, which is well known to all. It has longer, narrower, and more jagged green Leaves than the former

former Kinds, the Stalks are more hairy, and the Flower of a deep yellowish red color. Now this differs nothing from the Corn Poppy, but in the duplicity of the Flower, which is very thick and double, but not full out so large as the former. This rises from Seed in the like manner as they do, and is so to be preserved.

XI. The eighth, or Thorny Poppy. Its Root is small and spreading, dying every Year. It rises up at first with three or more whitish green Leaves lying on the Ground, streaked with white Veins, which growing greater, are long, smooth, and not hairy, something long and broad, and diversly rent or torn on the edges, but not to the middle Rib, having many Corners or Dents as it were about them, at which stand many sharp Prickles or Thorns, not having any white Streaks or Veins on the under side, but in the white milky Veins, are like to that which we call Our Ladys Thistle, and on the under side are more whitish, with some small Prickles, along the middle Rib and Veins, encompassing the Stalk at their bottoms, which Stalk rises sometimes two or three Feet high, spreading it self forth into several Branches, with the like but lesser Leaves on them, and bearing at every of the Tops one small Head, enclosed in a rough Skin or Film, like as the Poppies have, which opening, shews forth a small yellow Flower, consisting usually of five Leaves, yet sometimes having but four, and sometimes again six, with a small, long, green, prickly Head in the middle, tipped at the top with a red Spot, which quickly tears away, and with many yellow Threads standing about it. After the Flower is past, (for it continues but a while) the Head grows ripe, having five or six Ribs from the top to the bottom, and so likewise between the Ribs, armed with very small, but cruel sharp short Prickles, in which is enclosed, rough round black Seed, twice as large as any Poppy Seed. Every part of the Plant yields a yellow Juice.

XII. The Places. The first three, or four single flowered Kinds grow not Wild in any place, that I know of, but are Planted and Nurst up in Enclosures, for the general good they do to Mankind. The Native place of the four double Kinds are unknown, but we have had them for a long time in our Gardens, and it is said that they came first from Constantinople, or out of Turkey. The eighth or Thorny Poppy, has been found growing in Florida, and other parts of the West Indies, from whence the Seed was first brought to us.

XIII. The Times. The first 7 or 8 Garden Kinds, do all Flower from the beginning of June, until the middle or end of July, according as the Season may be, but if they spring up of their own Sowing, they may Flower somewhat earlier, viz. in May, or end thereof, and their Heads of Seed are commonly ripe in July or August. The Thorny Kind seldom Flowers before Midsummer, and the Seed is ripe in August; it is to be Sown in Autumn, else it scarcely springs up.

XIV. The Qualities. Poppy is hot and dry in the second Degree, or rather in the third: Astringent, Anodyn, Narcotick, Cephalick, Splenetick, Arthritick, Antiemmenagogick, Sudorifick, and Anticathartick.

XV. The Specification. Poppy (in its several Preparations) is effectual for the Cure of Asthma's, Coughs, Colds, Consumptions, Pleurifies, Pains and Stitches in the Sides, Spleen, Womb, Reins, and Bladder, Vapors, Hysterick Fits, Colick, Gripings of the Guts, Stone and Gravel in the Urinary parts; all Fluxes of the Bowels, as, Diarrhæa, Dysenteria, Lyenteria, and Hepatick Flux: all

Fluxes of Blood, by the Nose, Mouth, (as Spitting and Vomiting Blood) Secret parts (as Pissing Blood, overflowing of the Terms, &c.) of Fundament, (as the Hemorrhoids, Bloody Flux, &c.) bleeding of Green Wounds, Fluxes of Humors to Wounds, old Sores, Ulcers, Fistula's, Joints, or any other parts, &c. Gouts in Arms, Hands, Fingers, Hips, Knees, Ankles, Feet, Toes, Rheumatisms, &c.

XVI. The Preparations. They are almost innumerable, these following, as most Material, we shall Entreat of in their Order, viz. 1. A Liquid Juice of the Leaves, Flowers, and Heads. 2. An Essence of the same. 3. A Decoction of Leaves and green Heads. 4. A Decoction of the black Seed. 5. A Decoction of the Shells of the Heads. 6. A Powder of the Seed. 7. An Emulsion of the Seed. 8. An Oil of the Seed by Expression. 9. Syrupus de Papavere nigris compositus. 10. Syrupus Papaveris albi & nigri minus compositus. 11. Syrupus Narcoticus. 12. Syrupus de Meconio, Syrup of Juice of Poppies. 13. Diacodium Liquidum aliud. 14. Diacodium Crocatum Mynsiebrii. 15. Diacodium Montani. 16. Diacodium Solidum. 17. Discoodium. 18. Philonium Persicum. 19. Philonium Romanum. 20. Philonium Magistrale. 21. Philonium Taracense Galei. 22. Oil by Infusion. 23. An Ointment. 24. A Cataplasm. 25. White Poppy Water. 26. Black Poppy Water. 27. Spirit of White Poppies. 28. Meconium, The Insipiate Juice. 29. Opium, The Tears of the Poppy Heads. 30. Extractum Opij. 31. Pulvis Opij. 32. Tinctura Opij simplex, Simple Tincture of Opium. 33. Tinctura Opij composita. 34. Tinctura Opij Paracelsi. 35. Tinctura Opij Scheseri. 36. Spiritus Opij. 37. Laudanum of Helmont. 38. Laudanum Helmontij aliud. 39. Laudanum Specificum Paracelsi & aliud ejusdem. 40. Laudanum Londinense. 41. Nephentes Opium. 42. Requies Nicolai. 43. Theriaca Londinensis Salmoniana. 44. Our Specifick Laudanum. 45. Our Volatile Laudanum. 46. Our Cathartick Laudanum. 47. Our Gutte Vine. 48. Laudanum Opium Hartmanni. 49. Pilule de Cynoglossa, Opiate Pills of Hounds Tongue. 50. Pilule de Styrace, Opiate Pills of Storax. 51. Extractum Florum & Caput Papaveris. German Opium.

The Virtues.

XVII. The Liquid Juice. It is Medicamentum Anodynum, giving present ease in any pains in what part of the Body soever, by bathing the parts afflicted therewith warm, two or three times a Day; and bathing the Head, Forehead, and Temples therewith, it eases the Head-ach, and causes Sleep and Rest: the same it does, if a Rose Cake be dipped therein, and so bound on upon the Forehead and Temples, and so it stops Catarrhs, and Fluxes of Rheum falling upon the Eyes, Nose, Palate, Tonfils, Jaws, Teeth, &c. Applied upon Ignis sacer or Antonies Fire, it allays the Inflammation, eases the pain, diffuses the Tumor, and quickly cures the Disease, more especially if it be mixt with a little White Wine Vinegar.

XVIII. The Essence. It has all the Virtues of the Liquid Juice above named, besides which being dropt into the Eyes, or bathed upon the Forehead, Temples, and Eye Lids, it cools the Inflammation, Stops the Flux of Humors, eases the Pain, and strengthens the weakened part. The parts

parts afflicted with the Gout being well bathed therewith, and Linnen Cloth fix or eight times double being dipt therein and applyed, it eases the pain, cools the Inflammation; if any be, it stops the Flux of Humors to the part, and in a short time Cures it. Held in the Mouth, it Cures the Tooth-ach upon the Spot. Bathed upon fore, hard, inflamed and pained Breasts, it softens, cools, and eases their pain almost in a Moment.

XIX. The Decoction of the Leaves and green Heads. It has all the Virtues of the Juice and Essence, but nothing near so powerful. Given inwardly 3 or 4 Spoonfulls at a time, more or less, it is found to stop Catarrhs, and Vehement Coughs, give rest and ease, and cause Sleep, and prevail against pains of the Stone and Gravel, to stop Fluxes of the Belly, and overflowing of the Terms.

XX. The Decoction of the black Seed in Wine. Being drank, it eases inward pains of the Bowels, stops all Fluxes of the Belly, as Diarrhea, Dysenteria, Lienteria, and Hepatick Flux, as also the overflowing of the Courses in Women: and outwardly bathed upon any place pained with the Gout, or Defluxion of Humors, it eases the pain and repercusses the Humor: held in the Mouth, and repeated for some time, it has been found to give ease and relief in the Tooth-ach.

XXI. The Decoction of the Shells of the Heads in Water. The Empty Shells of the Poppy-Heads, are usually Boiled in Water, the Decoction of which is given to 2, 3 or 4 Ounces to procure Rest and Sleep; so also if the Head and Temples be bathed therewith warm, for some considerable time.

XXII. The Powder of the Seed. Dioscorides, Galen, and others write that the Seed is familiarly eaten in Bread, and made into Cakes, and eaten with pleasure. And Matthiolus with several others have observed, that in our Days the White Poppy Seed is Sown in Italy and other places, and much used; yea, and the Black Poppy Seed also, which they all agree, is stronger in Operation, and only Medicinable, or only to be used in Physick for the Cure of Diseases: This Black Poppy Seed Matthiolus says, that the Inhabitants about Trent, do Sow in their Fields, and Grounds, among Beans and other Pulse, which they familiarly Eat, being made up with Wheat Flower into Cakes, the Seed being cast into the same and so kneaded together; and yet he says, they are not at all the more Sleepy or Drowsy, than those who Eat none of them. As also, That in Stiria, and the Upper Austria, the Inhabitants do Eat the Expressed Oil out of the Black Seed, familiarly in their Meats instead of Sallet Oil, and find no inconveniency or drowsiness to come upon them thereby. And hereby he says, That he shook off the Fears of the danger of Poppy, which his Wife Masters had, by their grave Admonitions seasoned him withall in former times. The Powder of the Seed, whether of the White or Black Poppy, being given from 10 Grains to a Scruple, or half a Dram, according to the Age, and Strength of the Patient, in any proper Syrup, is good to stop Fluxes of the Belly, and ease the pains of the Spleen; as also to procure Rest and Sleep, being given at Bed-time, tho' it had no such operation being eaten made up into Bread or Cakes, because (as I suppose) it might be taken, want of its due Dose.

XXIII. The Emulsion of the Seed. Matthiolus says, That the Emulsion, or Milk of the Seed, (I suppose of either White or Black Poppy) made with Early Water, he had oftentimes given, and in great quantity, in the hot Fits of Agues, and in

Burning Fevers, both to assuage Thirst and procure Rest: and no doubt, it has a good Property in it, to procure Rest and Sleep.

XXIV. The Oil of the Seed by Expression. This Oil we have shewn before, in *Sell. 22.* The People of Austria and Stiria, Eat, as others Eat Sallet Oil, and therefore without doubt, it can have no dangerous effects. It is good against Hoarseness, Wheezing, and loss of Voice, being taken inwardly; and so taken mixt with Syrup of Clove-gilliflowers, of Citron Peels, or of Violets, it prevails against vehement Coughing, and Shortness of Breath, Asthma's, &c. outwardly anointed upon any part, it cools Inflammations, eases pain, and takes away redness and Pimples in the Face and Skin.

XXV. Syrupus de Papavere magis compositus: Syrup of Poppies the greater Composition. Take the Heads of White and Black Poppies, with their Seed, whilst green, of each 6 Ounces; Maiden-hair 15 Ounces; Jujubes N^o 30; Lettice Seeds 5 Ounces; Seeds of Mallows and Quinces (tyed up in a Rag) of each a Dram and half; fair Water a Gallon; Boil all according to Art, and strain out, to three Pounds of which, put Clarified, or double Refined Sugar 2 Pounds, and make a Syrup according to Art. It is good against Coughs, Catarrhs, Phthisicks, Consumptions, all sorts of Fluxes, Pleurifies, eases all manner of pains, giving Rest and Sleep. Dose from 1 Ounce to 2.

XXVI. Syrupus Papaveris albi & nigri minus compositus, Syrup of Poppies the lesser Composition. Take Heads of White and Black Poppies, whilst both are green, of each 6 Ounces; Seeds of Lettice and Violets, of each 1 Ounce; fair Water a Gallon; Boil them till the Virtue is out of the Heads, then strain out, and with double Refined Sugar 4 Pounds, make a Syrup. The Virtues of this are the same with the former, and it may be given in the same Dose: It is an excellent thing against pains and stitches, of the Sides, pains of the Spleen, and Gripings of the Guts.

XXVII. Syrupus Narcoticus Gregorij Horstij, Horstius his Syrup easing Pain. Take Syrup of Corn Poppies 16 Ounces; Laudanum Opiatum a Dram; Dissolve the Laudanum in White Poppy Water 8 Ounces; and mix them well together. It has all the Virtues of the former Syrups of Poppies, and gives present ease in the Colick, Gout, and Stone: but it is most commonly used in Vehement and strong Pains of the Head, for which purpose, it was often used by the Author thereof, being powerful for that intention: Dose from half an Ounce, to one Ounce or Ounce and half.

XXVIII. Syrupus de Meconio sive Diacodium Liquidum, Syrup of Meconium, or of Condensed Juice of Poppies. Take Heads of White Poppies, gathered just after the Flowers are fallen off, and kept three Days apart, 8 Ounces; Heads of Black Poppies with the Seeds gathered in like manner, 6 Ounces; Spring Water a Gallon: digest 24 Hours, then boil a little with a simmering Heat, and gently press out the Juice, which afterwards boil to 3 Pints; and with 2 Pounds of double Refined Sugar, make a Syrup according to Art. It is Hypnotick, Narcotick and Pectoral, good against Diseases of the Breast, Lungs, and Bowels, Coughs, Colds, Hoarseness, Asthma, Colick, Pleurify, Consumptions, and stops all sorts of Fluxes of the Bowels, and the overflowing of the Terms in Women. Dose 1 Ounce more or less, according to Age and other accidents.

XXIX. Diacodium Liquidum aliud, seu Syrupus Hemoptoeicus, Another Liquid Diacodium, or Syrup of Poppies. Take Heads and Seeds of White and black

Black Poppies, whilst green, of each 8 Ounces; Spanish Juice of Liquorice bruised 2 Ounces and half; fair Spring Water a Gallon; extract the Tincture out of the Juice, in a warm Balneo, in 48 Hours, let it cool and settle well; then decant the clear, and put it to the Poppy Heads, boil with a simmering Heat, then press out the Juice, evaporate again till it comes to about 2 quarts, and with 2 Pounds of double Refined Sugar, boil it to the Consistency of a Syrup. It gives ease in pains, and causes Rest and Sleep; it stops Vomiting, and all manner of Fluxes of the Belly, or Fluxes of Humors, Catarrhs, Coughs, Spitting and Pissing Blood, &c. It gives ease in the Colick, Gout and Stone, and prevails against Asthma's; Pleurifies, pains and Stitches in the Sides, &c. Dose 1 Ounce in any proper Vehicle.

XXX. *Diacodium Crocatum Myrsiceti*, *Diacodium* with Saffron. Take white Poppy Heads, with the Seeds, whilst green, N° 21; Fat Figs, Dates, Sebestens, of each N° 12; Pulp of Sweet Carobs, Liquorice rasped of each 3 Ounces; Seeds of Cotton, of Althea, of Quinces, of each half an Ounce; Flowers of Mullets 2 of Napweed, of Violets, of each 4; Saffron 3 Drams; mix and make an Electuary according to Art. Take a sufficient quantity of Spring Water, and strain it to the strained Liquor, add white Sugar of each half part, and make by boiling a Syrup of the Juice of Orange Poppy Flowers, or of Tuberose, of each 2 Ounces; Extract of English Saffron a Scruple; mix and boil all to the thickness of Honey, aromatizing it with *Gallia Moschata*. It is an excellent thing in all hot Catarrhs, where the Humor is thin, sharp, and Salt, in a Vehement and continual Cough, it is a Secret. It thickens Rheum, causes Expectoration, quenches Thirst, mitigates the extremity of heat and burning, cools and moistens, and gives Rest and Sleep. It is prevalent against the most acute pains, chiefly those of the Reins and Bowels, as Stone, Gravel, Colick, and Gripings of the Guts; It gives ease in the Pleurisy, and Ballard Pleurisy; and is profitable against all Cholerick Fluxes and other Fluxes of the Belly. Dose from a Spoonful to two Spoonfuls or more.

XXXI. *Diacodium Montani*, *Montanushis* Syrup of Poppies. Take green Heads of White Poppies with the Seed, N° 20; Pulp of ripe Carobs 3 Ounces; Althea Roots, or rather Myrtle Berries, Liquorice rasped, of each 2 Ounces, Fountain Water 6 Quarts; mix and boil the Water away till it comes to 3 Pints, then strain out by Expression, and strain again, and with Sugar of Roses 1 Pound, boil it to the thickness of a Syrup, or of New Honey. It has all the Virtues of the former, yet by some not thought so powerful: however it is very profitable in all thin, and sharp Rheums, and other Diseases of the Lungs, and *aspera Arterias*; it takes away the vehemency of Coughing, and causes Rest; for which effects it was highly celebrated by *Montanus*. I have here Substituted Myrtle Berries, instead of Althea Roots, because the former make the Preparation more fragrant and grateful, and I judge the Myrtle Berries to be full as efficacious.

XXXII. *Diacodium Solidum Tabulatum*, *Diacodium* Solid or made into Lozenges. Take white Poppy Heads, meanly ripe, and newly gathered, N° 20, steep them in Spring Water warmed 3 Pints, the next Day boil till the Virtue is out, then strain out the Liquor, and with a sufficient quantity of fine Sugar boil again according to Art, to such a Consistency as it may be made up into Lozenges. This *Diacodium* thickens and stops Catarrhs, helps Coughs, roughness and foreness of the Wind-

Pipe, causes Rest and Sleep, and eases all sorts of Pains; you may carry these Lozenges in a Box in your Pocket, and Eat them as you see occasion.

XXXIII. *Diaefordium*, Confection of Scordium. Take Scordium an Ounce; Cinnamon, Cassia lignea, Dittany of Crete, Tormenfil, Bistort, Gentian, Galbanum, Gum Arabick, Earib of Lemnos, Storax Calamita, of each half an Ounce; fine Bole an Ounce and half; Long Pepper, Ginger, of each 2 Drams; Opium, Sorrel Seeds, of each a Dram and half; Clarified Honey 2 Pounds and a half; Sugar of Roses a Pound; Canary 8 Ounces; mix and make an Electuary according to Art. It is an excellent thing against Plague, Poison, Bittings of Serpents, and of Mad Dogs, and all malign Fevers: it stops Loosness, and all sorts of Fluxes of the Belly, Vomiting, Catarrhs, delusions of Rheum and Coughs, is good against Watchings, all manner of Pains in any part of the Body, and the Whites in Women. It strengthens the Heart, revives the Spirits, recreates the natural Powers, gives relief in Pleurifies, and restores in Consumptions. To Infants and Children you may safely give from 10 Grains to a Scruple; to elder Persons from half a Dram to 2 Drams, or more as the necessity may require.

XXXIV. *Philonium Persicum*, a Persian Confect causing Rest and Sleep. Take white Pepper, white Henbane Seed, of each 4 Ounces; Opium, Terry Lemnia, of each 2 Ounces; Blood Stone prepared, Saffron, of each 1 Ounce; Castoreum, Indian Spicknard, Pyrethrum, Pearls, Amber, Zedoary, Eleagnant, Patches Kamich, of each 1 Dram and 12 Grains; Camphir 24 Grains; best Honey of Roses the triple weight of all, viz. 45 Ounces; mix and make an Electuary according to Art. Of this Composition the one thirtieth part is Opium. It stops the Flux of the Terms, the Whites, Hemorrhoids, Catarrhs, Bloody Flux, and all other Fluxes of the Bowels, Coughs, and Fluxes of Rheum upon any part; it prevents Miscarriage, and eases all manner of Pains in what part of the Body soever, as Colick, Pains and Stitches of the Sides, Pleurifies, Spleen, &c. In the *Angustan Dispensatory*, there is added, Euphorbium and Dromicum of each in fine Powder, 1 Ounce and 48 Grains, which are here left out. Mesue was the Author of it.

XXXV. *Philonium Romanum*, a Roman Confect causing Rest and Sleep. Take white Pepper, white Henbane Seeds, of each 4 Ounces; Opium 2 Ounces; Cassia, Lignea, Cinnamon, of each 1 Ounce and half and 8 Grains; Parsly Seed 6 Drams and 20 Grains; Seeds of Macedonian Parsly, of Fennel, and of Daucus half an Ounce and 30 Grains; Saffron 3 Drams 12 Grains; Indian Spicknard, Pyrethrum, Zedoary, of each 1 Dram and 36 Grains; Myrrh, Costor, of each 6 Drams and 1 Scruple; Clarified Honey the triple weight of all, viz. 40 Ounces and a half almost; mix and make an Electuary according to Art. Of this Composition, $\frac{1}{3}$ part is purely Opium. In this is left out also, the Prepared Euphorbium 6 Drams and 1 Scruple. It is given in the Stone, Strangury, Colick, Pleurisy, Spleen, griping of the Guts, all sorts of Fluxes, Gouts, Rheumatisms, Coughs, Asthma's, &c. and has all the Virtues of the former.

XXXVI. *Philonium Magistrale*, the Magistral Confect causing Rest. Take Opium prepared, or Aqueous Extract of Opium 4 Ounces; Benjamin, Myrrh, Marumy, of each half an Ounce; with Spirit of Wine a sufficient quantity, dissolve and make an Opiate. The Opium in this will be about $\frac{1}{3}$ one third part of the Prescript. It has all the Virtues of the two former, or of any prepared Landanum, whether Solid or Liquid. The two former, viz. the

Philo-

Philonium Persicum, and *Romanum*, may be given from a Scruple to a Dram: this *Philonium Magistrale*, may be given from a Grain, to 3, 4, or 6, according to Age, and other Accidents.

XXXVII. *Philonium Taracense Galeni*. *Galens* Confess easing Pain. Take Extract of *Opium* a Pound; white Pepper, Henbane Seeds, of each 2 Pounds; Saffron half a Pound; Euphorbium, Pyretbrum, Indian Spicknard, of each in fine Powder an ounce and half; Honey the triple weight of all, viz. almost 18 Pounds: mix, and make an Electuary according to Art. It has all the Virtues of the *Philonium Persicum & Romanum*, foregoing; and may be given from a Scruple to a Dram; the *Opium* being $\frac{1}{4}$ a twenty fourth part of the Composition. It is indeed a most Excellent thing, to ease all manner of intolerable Pains in any part of the Body, chiefly of Stomach, Pleura, Spleen, Guts, Reins, Womb, Joints, &c. It helps in Suffocations, Fits, Stone, Gravel, Heat and Scalding of the Urine, Coughs, Colds, &c.

XXXVIII. The Oil by Infusion or Infolation, or Boiling. It is made either of the Flowers, or of the green Heads and Seed, or of the Leaves and Stalks: But that made with the Green Heads is the most efficacious. It cools Inflammations, repelcusses a Flux of Humors, it abates the Milk and Pains in Womens Breasts; gives ease in Rheumatism, Gout and Sciatica; prevails against Leprosy, Morpew and Scurf, and eases the pain of the Head, being well anointed upon the grieved parts twice a Day.

XXXIX. The Ointment of the green Poppy Heads and Seed. It has all the Virtues of the Oil in the last Section, and may be applied to Cancers which are breeding in Womens Breasts, or in any other parts; it qualifies the Humor, eases the Pain, and if proper Internals be given in the mean time, may be of extraordinary Service for that purpose: what we should propose to be taken inwardly in this case is our *Laudanum Catharticum*, the Description of which you have in *Self*. LXII. following.

XL. The Cataplasm. It is made of the green Heads and Seed, and for want of them of the green Leaves. Applied to the Fore-head and Temples, it gives present ease in the Megrim or Head-ach; and is profitably applied to the Crown of the Head, (being first Shaved) in a Delirium Frenzy, or Madness. And it gives present ease being applied to the Spleen or Region of the Womb, or to places pained with the Gout, Rheumatism, &c. It cools Inflammations, and hinders the Flux of Humors to any part.

XLI. Distilled Water of white Poppies. It is cooling, and very profitable against violent Burning Fevers, to be drank ad libitum, being first acuated with Spirit of Sulphur, and then a little dulcified with double Refined Sugar: It makes also a good Vehicle, for conveying other Preparations of Poppies in, whether *Diacodiates*, *Electuaries*, or *Laudana*. It is profitable also against Deliriums and Frenzies, also Inflammations in any part of the Body, whether inward or outward. And gives Rest to weary Bodies, and pleasant Sleep.

XLII. Distilled Water of black Poppies. It is Drawn from either the Flowers, green Leaves, or green Heads and Seed. It has the Virtues and Uses of the former: mixed with White Wine Vinegar, and the Forehead and Temples bathed therewith, it eases the Megrim and Head-ach, and causes Rest and Sleep; and is a peculiar thing to bath with for the curing of *Ignis Sacer*, or *Antheones Fire*.

XLIII. Spirit of white Poppies. It is made either of the Flowers, or of the green Heads and Seed, or of the whole Plant, as the Spirit of Corn Poppies is made. The Virtues is also to give ease in the Colick, and to alleviate pains in any part of the Body. It gives ease in the Stone and Gravel; and is profitable against Aiter-pains of Women in Child-Bed, and with a great deal of pleasure induces Sleep. But these things it does more powerfully, if you make a Tincture of the Flowers with the same. Dose from half a Dram to 3 Drams *plus-minus*.

XLIV. Meconium, or the Impiffate Juice of Poppies. It is made of the Expressed Juice of the green Heads and Seed of the white, or black Poppy, or both of them; or of the Expressed Juice of the whole Plant. This is put into a proper Glass Body, and the Poppy Waters afore named are drawn off from it in Balneo, or a gentle Sand heat, till the Magma comes to the consistency of Honey, or of an Extract for making Pills, according as it is to be used. This Magma is Meconium. If it is of the consistency of Honey, it is then fit to be made into an Ointment or soft Emplaster, which being Anointed all over the top of the Head, (it being first Shaved) cures Frenzies and Madness it self, tho' never so extrem: if applied to the Sciatica or places pained with Gout or Rheumatism, it eases the pain, and Cures them. That which is brought to the thickness of an Extract, must be prepared as *Opium* is (declared in *Self*. 46 and 47 following,) before it can be used inwardly; and then it will have the Virtues and Effects of *Opium*, tho not altogether so powerful.

XLV. *Opium*, The Tears of Poppy Heads. It is made only in hot Climates, in China, India, Asia major, Turkey, and other Eastern Countries: The Thebean *Opium* is accounted the best of all, and after that the Indian. Parkinson says, that he has gathered some of it from the green Poppy Heads standing in the Garden, and but half grown ripe, here in England. The several Heads are slit, cut, or Wounded with a Knife, in two or three places obliquely, towards the lower parts of the Head, which then yield a Milky bitter Juice, at first coming forth, which is gathered gradually every Day, with some convenient Instrument in a proper Vessel; this being dried in the Sun, (but not at the Fire) becomes that *Opium*, which is brought to us, and which we use, and by its gradual drying, turns to the color we see it of. The Question now is, out of which Kind of Poppy, *Opium* is extracted, whether out of the Heads of the black Poppy, or out of the Heads of the white Poppy? Gerard says, that it flows from the Heads of the black Poppy; and this he seems to have from *Dioscorides*, for *Matthiolus* in his Epitome, has these Words, *Opium autem, quod à Papaverum nigrorum Capitis paratur, magis refrigerat, inspissat, siccataque*. And *Matthiolus* in his Comment, appears to be of the same opinion, for speaking of the black Poppy, he says, *Caterum ex incisis Papaverum Capitis opor, sive Succus manat, qui in Opium vocatum addensatur, ut scite docuit Dioscorides*. But Parkinson will have it to be the Tears flowing only from the white Poppy. The Milky Juice (says he) gathered from the Heads only of the great white Poppy, growing in the East Countries of Asia Major towards India, &c. is the true and best *Opium*, that is, or should be used in Medicines. And our Learned Willis was of this opinion, for speaking of *Opium*, and *Diacodium*, &c. he says, *I shall not need in this place to describe the white Poppy, out of which these are made, nor the Extration of the Opiate Juice*. Now by reason of this divers-

ty of Opinions among these Learned and Great Men, how shall we certainly determin, and by what means shall we find out the Truth? *Angelus Sala*, a Wife and Learned Man seems to determin it for us, *Anatom. Essentiarum Vegetabilium*. Sect. 6. Cap. 2. *Opium (dixit ille) nihil aliud est, quam lacteus, & aeris ille succus, ex Papaveris albi & nigri capitibus, expressus, & inspissatus; ijque apud Turcas latissimis Natolia & aliorum Provinciarum campis, studio excultus, frequenti in usu, Mastich dictus, ad nos deferitur.* From these Words I am apt to believe, that it is indifferently extracted from both the Species.

XLVI. Extractum Opii, the Extract of Opium. It is done several ways. 1. *The Extraction with fair Water.* Take Turkey Opium what quantity you please, suppoſe a Pound, dissolve it in Spring Water 2 Quarts over a gentle Fire, then let it settle 24 Hours, and decant the clear Tincture; add more Water and over a gentle heat extract again and let it settle as before, and decant the Tincture again which put to the former: Repeat this Work of extracting, so long as the Forces will yield any Tincture: these Tinctures being all put together, evaporate either in Balneo, or a Sand heat, to the consistency of a thick Extract fit for Pills, or almost to dryness, which Magma, keep for use. If to the Tinctures before evaporation you add Spirit of Wine Vinegar, 3 or 4 Ounces; or Oils of Salt, Sulphur, or Vitriol 2 or 3 Ounces; mixing them well together, and then evaporate, the Extract will be so much the better, and be also corrected into the bargain. 2. *Angelus Sala*, makes an Extract of Opium thus. Moisten Opium in slices with Vinegar, and dry it, till it will powder with your Fingers, which Powder dissolve in Vinegar of Roses in a Sand heat: Strain out and abstract; dissolve it again in Rectified Essence of Elder, Clarify it with Whites of Eggs, and inspissate to a consistency fit for Pills. This Sweats powerfully. 3. *Extractum Opii Quercetani.* Cut the Opium into slices, and dry them with a moderate heat in Sand (avoiding the Fumes) till it will rub into Powder with your Fingers; so will the stinking Sulphur (in which is the Narcotick and Poisonous force) be gone: dissolve this Powder in Juice of Limons, or Lime Juice, or in Spirit of Vinegar, and abstract to a consistency fit for Pills. 4. *Extractum Opii Crollianum.* Dissolve the Opium in Hyssop Water and extract the Tincture, as in the first way; which abstract to the thickness of Hony: dissolve this in Spirit of Wine, and extract a Tincture again, which abstract to a consistency fit for Pills. 5. *Extractum Opii Hartmanni.* Take Powder of Opium made by drying at the Fire, from which extract a Tincture with Juice of Limons, or pure Wine Vinegar, so long till they will be no longer Tinged; digest these Tinged Liquors 10 Days, decant the clear, and abstract to a due thickness. By these ways of Extraction the Opium is purified or cleansed, prepared and made fit for other Compositions, and sufficiently corrected for general Use.

XLVII. Pulvis Opij, the Powder of Opium. Take either of the former Extracts, dry them by the Fire (being cut into thin slices) and gradually increase the fire till the Mass will reduce into subtil Powder, which searſe and keep for use: so is the Opium prepared and made fit for any Preparation of Compound Powders, Electuaries, Pills, Laudana, or Tinctures, which the Artist shall think fit, or have occasion for. Out of this Simple Powder of Opium thus prepared, you may make *Pulvis Opij Compositus*, vel *Pulvis Optimis*, after this manner: Take of this simple Powder 5 Ounces; Salt of Tar-

tar Vitriolate, or Sulphurate 15 Ounces; mix them, then add, Chymical Oils of Angelica, Cloves, Limons, Oranges, and Savin, of each 2 Drams; mix the Oils first together by themselves, and then mix them with the Powder, which keep in a Flint Glass Bottle (having a pretty wide Mouth, with a ground Glass Stopper) close stop for use. It is a most admirable thing to ease all manner of Pains whatever, in any part of the Body, whether internal or external, stop Fluxes of Humors, ease Coughs, helps Asthma's, and resolve Pleurifies. And for this reason it is peculiarly good against the Stone, Gravel, pain and heat in making Water, the Colick, Megrim, Head-ach, Gout, Rheumatism, Venereal Nocturnal Pains, and other Diseases akin to them. Dose from 1 Grain to 3, 4, 6, or 8, according to Age and other Accidents, beginning with a small Dose, and so encreasing the Dose gradually, as need requires.

XLVIII. Tinctura Opij simplex, simple Tincture of Opium. Take Extract of Opium (at Sect. 46.) 12 Ounces; Spirit of Wine acuated with Spirit or Oil of Sulphur a Gallon: mix, dissolve, digest in a Bath-head well stop for 8 or 10 Days, then decant the clear Tincture for Use. Or thus, Take Extract of Opium 12 Ounces; Powers of Cloves Sulphurated a Gallon; mix, dissolve, digest, for 10 Days, and decant the clear Tincture for Use. Or thus from *Margrave*, Take Extract of Opium 12 Ounces; Spirit of Wine Vinegar a Gallon, or a sufficient quantity: mix, dissolve, and digest, for 10 Days, or till the Tincture becomes clear, which decant, and keep it close stop for Use. Being thus prepared, it is fit to make other Compositions of, and an Acid Menstruum is rather to be chosen than one that is not, because it not only corrects the Opium, but also prevents its making the Stomach Sick, whereby the Tincture becomes not only the more Friendly to the Stomach and other Bowels, but also to the Universal Body in general. Dose is from 10 to 20 or 30 Drops or more every Night at Bed time in a Glass of Canary, or other fit Vehicle. It admirably induces Sleep, and gives ease in all manner of tormenting and excoriating Pains in what part of the Body soever. It stops the Flux and motion of all sorts of Humors in any part of the Body, partly by thickening the Matter, and partly by constringing or shutting up the Mouths of the Vessels. It induces a gentle Sweating, after a very excellent and easy manner, gives ease in a Pleurisy, and the most exquisite Colick, and is profitable against Catarrhs, Coughs, Colds, Hoarseness, Wheezing, Asthma's and other Distempers of those parts, proceeding from thin, flowing, acrid, sharp, and Salt Humors. It gives ease in the Sciatica, Gout, and Rheumatism, and is an approved thing against all sorts of Fevers or Agues, and in a short time puts a stop to the Current of the Disease. Outwardly also applied, it is a singular Anodyn, and eases all sorts of pains, the part being bathed therewith, and double Cloths dipt thereto being applied or laid over.

XLIX. Tinctura Opij composita, Compound Tincture of Opium. Take Thebium Opium a Pound, cut it into bits, and dissolve it in fair Water, in a boiling Balneo, digest afterwards in a gentle heat for 7 Days to extract the aqueous Tincture, and till all the Forces have perfectly subsided, decant the clear Tincture, and to the Residue put more Water, repeating the same Work, till they will no more color the Water, which then cast away. These Tinctures evaporate in a gentle Balneo or Sand heat, or draw off the aqueous parts in a Glass Alembick (which Water keep for an Opiatick Vehicle) till the Magma at bottom becomes as thick as New Hony,

or an *Extrakt*. Then add thereto choice *Lime Juice*, choice *Canary*, pure *Spirit of Wine*, of each a *Pint* and half: *Powder of Cloves* 2 *Ounces*: *Cochinele*, *Saffron*, *Winters Cinnamon*, of each 1 *Ounce*: *Campbir* half an *Ounce* dissolved in *Oil of Oranges* 2 *Drams*; or so reduced to a *Pap*: mix all and digest for a *Month*, in a very gentle *Sand heat*, shaking the *Glass* once or twice a *Day*: then let it stand in a cool place, till it is perfectly settled, and decant the clear *Tincture*, keeping it a *Glass* close stopp'd for Use. The Power and Virtue of this Medicine, flies like *Lightning* thro' the whole *Body*; for it is no sooner received into the *Stomach*, but it presently refreshes the *Spirits*, cheers the *Heart*, and gives ease and relief in any pain, in what part of the *Body* forever. Nor is this Preparation subject to those ill effects, which some other *Opiates* retain, because it is freed from the *Malign Sulphur* of the *Concreets*, which the *Water*, in its first dissolution will never resolve, for which reason it is much pleasanter than many other Preparations of *Opium*. It silently and softly as it were, appeases pain in any part of the *Body* from *Head* to *Foot*, allays *Grief*, procures a quietness of *Mind*, and causes pleasant Rest and Sleep, restoring Nature to its *Pristine State*, and repairing the decayed *Strength*. It is of such an amicable, and Kind Nature, that scarce any *Cordial* should be given without some few Drops of it for thereby, the *Cordial* it self is exalted and made more *Cordial*. It gives ease after an admirable manner, both in *Stone* and *Gout*, cures *Rheumatism*, and alleviates *After-pains* of *Women* in *Child-Bed*, giving them rest and ease. It is a *Specifick* in the *Gout*, and all raging pains in the *Joints*, *Nerves*, *Sides*, and *Bowels*, being inwardly taken, and outwardly bathed upon the parts affected. It gives ease in an *Exquisite Pleurisy* in half an *Hour* time: stops *Catarrhs* and *Coughs* to a miracle, as also all sorts of *Bleeding*, as *spitting Blood*, *vomiting Blood*, *pissing Blood*, *Bloody-flux* and *Hepatick Flux*, *Flux of the Courfes*, and the *extream bleeding* of *Wounds*: It is an excellent thing against *Wind*, *Indigestion*, *Colick*, and other *Distempers* of the *Bowels*, proceeding from cold and sharp *Humors*. It gives relief in *Asthma's*, *shortness of Breath*, *Hoarseness*, *Wheezing*, and the *Phthisick*, or *Ulceration* of the *Lungs*; and dissolves the *Tartar* or *Viscous Flegm*, which sticks to the *Lungs*, *Stomach* and *Guts*, and is the cause of *Tortions*, *pricking* or sharp *Pains*: It does indeed extinguish in all *Ages* and *Sexes*, the *acrimony*, *sharpness*, and *anguish* of *Diseases*, giving relief after a miraculous manner, and this sometimes after all hopes are past. You may give of it from 10, to 20, 30, or 40 Drops, or more, according to *Age* and other *Circumstances*, in *Wine*, as *Canary*, or in *Beer*, *Ale*, or other *Liquors*, every *Night* going to *Bed*.

L. *Tinctura Opii Paracelsi Diaphoretica*, *Paracelsus* his *Sweating Tincture* of *Opium*. Take of one of the former *Extrakt*s of *Opium* 12 *Ounces*; *Tartaris'd Spirit of Wine* a *Gallon*; *Saffron*, *Cochinele*, of each 2 *Ounces*; digest and make a very strong *Tincture*, which decant from the *Feces*; to this *Tincture* add of the *Tinctura Diaphoretica Paracelsi* in our *Pharmacopœia Londinensis*, *Lib. 4. Chap. 7. Sect. 25.* 2 *Gallons*: mix, digest, circulate for a *Month*, and keep the *Tincture* for Use. It is a most admirable thing to cause *Sweating*, and you will find it as good a *Sudorifick*, as is ordinarily to be met with, expelling *Tartarous Diseases*, as the *Scurvy*, *Droopy*, *Jaundice*, *Gout*, *Rheumatism*, and *Pox*. It melts *Icy* and *Resinous Humors*, expelling *Wind* in any part. And by its *Balsamick Virtus*, it resists *putrefaction*, expelling the malig-

nity of the *Meatles*, *Small Pox*, *Poison*, and *Plague* it self. It may be given from 20 Drops, to 40, 60, or more, without any danger, in any Vehicle the *Physitian* shall see fit.

LI. *Tinctura Opii Scheferi*. *Schefer* his *Tincture* of *Opium*. Take *Thebian Opium*, (dried as *Quercetan* advises) or, some of the former *Extrakt*s of *Opium* 12 *Ounces*; rectified *Spirit of Wine* 1 *Gallon*, acuated with *Oil of Vitriol* 12 *Ounces*; *English Saffron*, *Species Diambre*, *Aromaticum Rosatum*, of each 2 *Ounces*; *Ambergrise* 6 *Drams*: Infuse all in a *Glass Matrafs* close stopp'd for 20 *Days*, then decant the clear, filter and it keeps for Use. It is a most admirable *Soporifick*, eases all pains in a Moment, performing the same in a most admirable manner, and all that the most excellent *Laudanum* can do. Dose from 10, or 12 Drops, to 20, 30, or more, according to *Age* and other *Circumstances*.

LII. *Spiritus Opii*, *Spirit of Opium*. Take choice *Thebian Opium* a *Pound* cut into bits, and dissolve it in a sufficient quantity of fair *Water*, so much as may extrakt all the *Tincture* of it, and till it will yield no more color; what remains, which will not dissolve in the *Water* cast away, and let the *Tincture* settle till it is perfectly clear, which decant, and cast those *Feces* also away: to this *Tincture* add an equal quantity of *Spirit of Wine*; digest 24 *Hours*, and then in a *Glass Alembick* draw off all the *Spirit*, and continue the distillation till what comes over tastes *Sowerish*: draw off the remaining part of the *Water* (which is a thing of no Use) till the *Magma* becomes as thick as new *Honey*; Cohobate the *Spirit* upon the *Magma*, and distill as before; which *Work* of *Cohobation* repeat four times, drawing it off at last till an *Extrakt* is left at bottom, of a consistence fit for *Pills*; this *Spirit* thus drawn off, is *Spirit of Opium*: The *Extrakt* at bottom may serve to make *Laudanum* of. There is also another way to make *Spiritus Opii*, which is done by *Fermentation*, after this manner. Take *Thebian Opium* a *Pound*, dissolve it by gentle *Boiling* in a *Gallon* of *Rain Water*; then decant or strain, and cast the *Feces* away: To this add another *Gallon* of fair *Rain Water*, in which dissolve *Brown Sugar* 6 *Pounds*, and a good large *Leaven*, and with a gentle heat, being about *Blood warm*, cause them to ferment for some *Days*, till all the *Liquor* becomes of a *Vinous Smell*: Then put all into a *Copper Vessel*, with its *Head*, *Serpentine* and *Receiver*, and distill or draw off 8 or 9 *Pounds* of *Spirit*, which keep for *Spirit of Opium*. Then changing the *Receiver*, draw off the *Water* till it begins to Taste *sower*, this keep for *Poppy Water*. Afterwards putting more *Water* to the *Magma*, wash it all out of the *Still*, and evaporate it away, till an *Extrakt* remains of a consistency for *Pills*, which may be reserved, to be put into some *Opiate Preparation*. There are several other ways also of making *Spirit of Opium*, which you may see at large in the *Second Edition*, of our *Pharmacopœia Batæana*, *Lib. 1. Chap. 2. Sect. 58.* which see at your leisure. These *Spirits* are much pleasanter than either *Tincture* or *Extrakt* of *Opium*, which contain the *Body* of the *Concreet*. *Spirit of Opium* never makes the *Stomach* sick as some other Preparations do, nor yet disturbs the *Head*, otherwise than it is possible as much *Spirit of Wine* may do, which is a considerable advantage in its Operation. And altho' it is not altogether so strong and forcible as are *Tinctures*, *Extrakt*s, or *Laudana*, yet it operates with much more speed and safety than they possibly can. For they fly like *Lightning* through the whole *Body*, and give ease and relief, not only to the *Spirits*, but to the *Universal Body* almost

in a Moment. This *Spirit* suppresses not the Excretion of Excrements, nor stops the Passages of Urine, it benumbs not, nor enervates the Limbs, nor changes the natural complexion of the Skin to paleness, nor crushes cold Sweats, shortness of Breath, nor stupification of the Animal or Vital Faculties; but it has all the good effects which are attributed to the most excellent *Laudanum*, tho' not with the self same strength and force: it appeases all perturbations of the Mind, and intestine and violent Commotions of the Body, as Disquietings, and the Rage, Fury and Madness of the *Archæus* (the principal director of the Spirit of Life) restoring again Peace and Concord, Rest, and Ease to the whole Man, and all the faculties of the Body. So that after it has softly and silently (as it were) appeased the Pain, and allayed the Grief, it procures a quiet and pleasant Rest and Sleep, restoring Nature to its pristine State, and repairing its decayed Strength: whereby, unthought of Health comes on, with a violent Career, and takes possession of its ancient Habitation, exterminating in all Ages and Sexes, the Roots of bitterness, and the Seminalities of Pain and Diseases. This *Spirit* is of such a kind and amicable Nature, that scarcely any Cordial should be given without it; and it may be given from half a Dram, to 1, 2, or 3 Drams, yet to half an Ounce, according as the Age, Strength, Condition, and Necessity of the Sick, and other Accidents will admit of.

LIII. *Laudanum Liquidum Helmontij*. Helmont his Liquid Laudanum, according to Joel Langelot. Take Thebaian Opium cut small, a Pound; Juice of ripe Quinces newly drawn 3 Pints; Salt of Tartar 1 Ounce; digest all 2 Days in a very gentle Sand heat, or till you see Bubbles appear above the Liquor, which is a sign that Fermentation is at Hand; then add thereto fine Sugar in Powder 4 Ounces; and use a moderate heat to advance the Fermentation; so will the Opium rise, and totally dissolve. At the top of the Liquor, will be a filthy, impure and Scummy part which swims. At bottom will be an impure and Earthy part. And in the middle will be, a pure and transparent Liquor, as red as a Rubie, which separate, filterate, and keep for Use. This is the True Laudanum of Helmont from Langelot, and may be given a gut. 6 ad 15, 20, or 30, in any proper Vehicle, as Canary, &c. But if you please you may inspissate the Tincture to the consistency of an Extract fit for Pills, and either keep it in that Form, or dissolve it again in pure Rectified Spirit of Wine, which being Filter'd, is to be digested for a Month, to ripen it and bring it to perfection; then inspissate again, to the consistency of an Extract. From this, the said Langelot promises wonderful things, in all cases where Laudanum is to be used, giving at a time not above a quarter, or half a Grain, or at most a Grain. This small Dose is imputed to the union and close binding up of the Particles of the Opium, first dilated by Fermentation, and then reduced or consolidated again by bringing the Matter to the Form of an Extract. This Laudanum induces Rest, allays the sharpness of Humors, and stops their motion. It fortifies Nature, and parts of the Body afflicted, corroborates all the Bowels, cherishes the Natural Heat, restores the Retentive faculty debilitated, stops all Fluxes of Blood in Man or Woman, as the overflowing of the Terms, and all sorts of Fluxes of the Belly, Catarrhs, and other thin and corroding Defluxions, either upon the Eyes, Ears, Teeth, Throat, Lungs, Stomach, Joints, or any other part external or internal. It eases all pains of the Head, arising from attenuated Humors, taken inwardly, or applied to

the Fore-head and Temples. It discusses and expels Wind, and takes away noises in the Ears. It eases the Tooth-ach, stops Vomiting, and all other violent Purgations and Fermentations of the Humors. It gives ease in the Disease Cholera, and the Wind Colick, and in all griping pains of the Bowels in Man or Woman, given as well as by the Mouth, by Clyster. It is a powerful Remedy against the Stone, Gravel and Tartarous Matter in the Urinary parts. It not only allays the Fermentation of the Humors, but abates their Acrimony after due Purgation. It cures a Gonorrhæa (Universals being premised) and strengthens the Spasmodick Vessels. It cures all sorts of Gouts and Rheumatisms, and is prevalent against all pains in any Age or Sex, arising from what cause soever, especially after general Remedies, or previous Evacuations.

LIV. Another Prescription of Helmonts Liquid Laudanum. Take Juice of Quinces a Gallon, which put into a Fermentation with Ale Yeast, with this extract a deep red Tincture from Thebaian Opium 1 Pound, which strain and Aromatize; then draw off one half of the Liquor in Balneo, and keep the remaining part for Use. It has the Virtues of all other Laudanums, and is given with a happy Success in Dysenterick affections, and is esteemed by many Physicians, the most safe of any Laudanum. Dose a gut. 8, ad 20, 30, or more (according to Age and other Accidents) in Canary or other fit Vehicle at Bed times. There is yet another Preparation of Helmonts Liquid Laudanum, the which you may see in *Our Præces Medica*, or *Comment upon Sydenham's Praxis Integri*. Lib. 2. Chap. 12. Sect. 24. lately emitted into the World; to which we refer you.

LV. *Laudanum Specificum Paracelsi*, Paracelsus his Specifick Anodyn. Take Thebaian Opium extracted a Pound; Powders or Extracts of Cinnamon, Cloves, Saffron, of each half a Pound; Juices of Sewer Oranges and Quinces, of each 3 quarters of a Pound; mix, and digest with a gentle heat for a Month, or till the mixture is dissolved, strain out by pressing, and abstract to the consistency of a soft Extract for Pills; then add Ambergrise in fine Powder an Ounce and half; Musk in fine Powder 3 Drams; Magisteries of Coral and Pearl, of each 1 Ounce; mix and digest a while, then add of the Quintessence of Gold 1 Ounce; mix, and complete the Great Specifick Anodyn of Paracelsus. In this Hartman leaves out the Quintessence of Gold, and substitutes some proper Salt; we rather advise to add in place thereof, an Ounce of pure Oil of Cinnamon, as it is extracted in the East-Indies. There is another Recipe of the Laudanum Paracelsi given us by some Aurohops, which is the following. Take Extract of Thebaian Opium a Pound, inspissate Juice of Henbane, Species Diambra & Diamoschi, of each 10 Ounces; Mummy 2 Ounces; Salts of Pearl and Coral, of each an Ounce and half; Liquor of white Amber extracted with Alcohol of Wine, Bone of a Stags Heart, Bezoar Stone, Unicorns Horn, Aurum Potabile, of each an Ounce; Musk 3 Drams; Ambergrise 2 Ounces and half; or for want of Aurum Potabile, you may add of the Chymical Oil of Cinnamon and Cloves, of each half an Ounce; mix them well, and digest again for a Month, and so keep it for Use. It eases all manner of Pains in a Moment, stops all sorts of Fluxes of the Bowels, Catarrhs, Coughs, overflowing of the Terms and Whites in Women, stops Bleeding, &c. And is a Specifick in the Pleurisy, Colick, Hyfterick-fits, Gripings of the Guts, Gout, Rheumatism, Restlessness, &c. and has all the Virtues of the Tinctura Opij Simplex and Composita, and that of Paracelsus, as also of the Laudanum Helmontij at Sect.

Self. 48, 49, 50, and 52, foregoing. Dose *à gr.* 1, *ad 6*, either in a Pill, or dissolved in any proper Vehicle.

LVI. *Laudanum Londinense*, The London Laudanum. Take Thebanian Opium extracted, a Pound; Extract of English Saffron a Pound and half; Extract of Castoreum 2 Ounces; strong Tincture of Species Diambra, made with Spirit of Wine, half a Pound; Ambergrise, Musk, of each 5 Scruples; Oil of Nutmegs 160 Drops, or 2 Drains: mix them perfectly together, and evaporate in Balneo, or a Sand heat, to a due Consistency. It is a most excellent Composition, and has all the Virtues of the Laudanum Paracelsi in the former Section, and may be given in the same manner and Dose, every Night at Bed-time.

LVII. *Nepenthes Opiatum*, A Confect against Sorrow and Sadness. Take Tincture of Opium (first prepared with Spirit of Vinegar, then with Spirit of Wine,) Extract of Saffron made with Spirit of Wine, of each a Pound; Salts of Coral and Pearl, of each half a Pound; Tincture of Species Diambra a Pound; Ambergrise, 2 Ounces; mix, and by the gentle heat of a Bath, evaporate to a consistency fit for Pills. The Virtues are the same with the two former, save that this more cheers the Heart and Spiritus, causes Gladness, and drives away Melancholy. Dose *à gr.* 2, *ad 6*, or 8.

LVIII. *Requies Nicolai*, Nicholas his Confect causing Rest and Sleep. Take red Roses Engulged, blew Violets, of each 4 Ounces; Thebanian Opium (dissolved in Wine) Seeds of white Henbane, of white and black Poppies, of Endive, of Furslane, of Lettice, of Pysilium, Roots of Mandrake, Spodium, Gum Tragacanth, of each an Ounce; Nutmegs, Cinnamon, Ginger, red, white, and yellow Sanders, of each 2 Ounces; fine Sugar three times the weight of them all, viz. 92 Ounces, which dissolve in Rose Water, into a Syrup of the thickness of Honey: mix and make an Electuary according to Art. In this Composition the Opium is about $\frac{1}{10}$, or an Hundred fifty sixth part of the whole. It has all the Virtues of the Philonium Persicum, and Romanum; and may be given from 2 Scruples to 2 or 3 Drains in any proper Vehicle, as occasion and the reason of the thing may require.

LIX. *Theriaca Londinensis nova, vel Salmoniana*, Our new London Treacle. Take Extract of Opium a Pound; Solid Extracts of Juice of Liquorice, of Elecampane Root, of Gentian, of Zedoary and of Bay Berries, Juice of Alkermes of each 4 Ounces; which dissolve in so much Spirit of Wine, as to make them of the Thickness of a soft Extract. Take Saffron, Contrayerva, Indian Spicknard, Virginian Snake Root, Ginger, Myrrh, Cochinele, Bezoar Stone, each of them made a part into subtil Powder, Salts of Coral and Pearl made with Oil of Salt, Volatile Sal Armoniack in fine Powder, being ground with a little Spirit of Wine, of each 4 Ounces; Angelus Mineralis, Panacea aurea, of each 2 Drains; Bezoar Animal, Bezoar Minerale, Bezoar Sulare, of each 4 Ounces; Camphir half a Pound; Chymical Oils of Carraways, Cloves, Juniper, Rosemary, Sassafras, Wormwood, of each 2 Ounces; Clarified Honey 14 Pounds: mix and make an Electuary according to Art. It has all the Virtues of the most exalted Laudanum, whether of those at *Self.* 48, 49, 50, and 52, foregoing, or those at *Self.* 60, 61, and 62, following. The proportion of the Opium to the rest of the Ingredients is $\frac{1}{10}$, or one of twenty one parts. So that the Dose may be from half a Scruple to a Scruple, half a Dram, 2 Scruples or more, according to Age, Strength, and other Accidents. It stops the most Vehement Coughs, Catarrhs,

and Fluxes of all kinds; is excellent against Gouts, Rheumatisms, Colicks, Agues, Phtisicks, Asthma's, all Fluxes of Blood upwards or downwards, Bittings of Serpents, Vipers, Mad-Dogs, or other Venomous Beasts; takes away all manner of Pains (almost in a Moment) in what part of the Body soever, and gives pleasant Rest and Sleep.

LX. *Laudanum Volatile Nostrum*, Our Cordial Pills, or Volatile Laudanum. Take Extract of the best Thebanian Opium a Pound; of the best Mithridate or Venice Treacle 6 Ounces; Camphir 10 Ounces, made into fine Powder with a little Spirit of Wine; Extracts of Contrayerva, Indian Spicknard, Virginian Snake Root, Zedoary, Winters Cinnamon, Cloves, Saffron, Castoreum, of each an Ounce; Volatile Salts of Mans Skull, of Haris Horn, of Sal Armoniack, of Vipers, of Amber, and of Tartar, of each 6 Drains: Chymical Oils of Cloves, Cinnamon, Limons, Sweet Marjoram, Nutmegs, Oranges, Rosemary, Sassafras, Savin, Wormwood, of each 2 Drains; being all well mixt together, digest in a very gentle, or rather only warm Sand heat for a Month; then add Oriental Bezoar Levigated, Bezoar Mineral, Cochinele, Salts of Coral and Pearls, of each a like quantity, so much, as may bring it to a consistency for Pills, which keep close in Wooden, or Silver Boxes with Screws for Use. It is one of the best Anodyns in the World, easing all manner of Pains in a Moment, in any part of the Body inward or outward. It is prevalent against all sorts of Fits and Passions of the Heart, as Palpitation, Trembling, Swooning, oppression of Wind, Fits of the Mother, Convulsions, Vertigo, Frensie, Delirium, Madnes, Megrim, Head-ach, &c. It causes pleasant Rest and Sleep; stops all sorts of Catarrhs, Coughs, and distillations of Rheum, upon any Member or part; is good against Colics, Wheezing, Hoarseness, Asthma, soreness of the Throat, Ulcers of the Lungs. It eases Pains of the Teeth presently, and is admirable against the Gout, Rheumatism, Sciatica, and French Disease, being an effectual Alexipharmick and Sudorifick. It is good against spitting of Blood, pissing of Blood, and the Bloody Flux, and all other Fluxes of the Bowels, as also all other Sorenesses and Bruises, Pleuritis, Pains and Stitches of the Sides; it stops the Whites, and the overflowing of the Terms in Women; and infallibly cures Agues of all sorts, being given in a Glass of Canary, about 3 Hours before the coming of the Fit. Dose from 1 Grain to 4, according to the Age and other Accidents of the Patient. The proportion of the Opium to the rest of the Ingredients is $\frac{1}{10}$ or as one to Six.

LXI. *Laudanum Specificum nostrum*, Our Specifick Laudanum. Take Extract of Thebanian Opium a Pound; Oil of Sulphur 3 Ounces; mix them well together; to which add, Oil of Nutmegs by Expression 1 Pound; Anodyn Sulphur of Mars 6 Ounces; Bezoar Mineral, Pouders of Camphir, Cloves, Catechu, Winters Cinnamon, Indian Spicknard, Jesuits Bark, Saffron, Virginian Snake Root, Cochinele, of each 3 Ounces; Salts of Coral and Pearl, of each 2 Ounces; Chymical Oils of Amber, Aniseeds, Cloves, Rosemary, Wormwood, of each 5 Drains: Mithridate a sufficient quantity, to make it into a Mass for Pills. The Proportion of Opium here is more than $\frac{1}{10}$ and less than one sixth part, so that it may well be given from 2 Grains, to 4, 6, or 8 Grains according to the Age and Condition of the Patient, and that every Night at Bed-time. It comforts the Stomach and Bowels, and is found by Experience, to be admirable against all Fluxes of the Belly, Vomiting, and Sickness at Stomach, Bleeding at Nose, overflowing of the Terms in Women,

Women, spitting and piling of Blood, vehement Coughs, Colds, Catarrhs, and other deluxions of Humors. It comforts the Viscera, and all the Internal Members. It is of Wonderful power against the Scurvy, Dropsy, Jaundice, Gout, Rheumatism, Vapors, Fits of the Mother, and other like Diseases of the Womb; and prevails also against all kinds of Agues and Fevers, intermitting, remitting, continual, continent, putrid, or Malign; and is given even in the Plague itself, and in all sorts of Epidemick Diseases, as Measles, Small Pox, &c. It gives ease in all vehement Pains, of what kind, and in what part of the Body soever; It prevails against the Stone, Gravel, &c. in the Urinary parts; is a singular thing against Asthma, Pleuritis, and a Phthisis or Consumption of the Lungs. It cheers the Heart, revives the Vital and Animal Spirits, restores the Faculties, strengthens Nature, and causes pleasant Rest and Sleep. And it is a Secret in curing a *Gonorrhoea* in Men; and a Running in Women, Universals having been premised.

LXII. Laudanum Catharticum nostrum. Our Purging Laudanum. Take Extract of *Thebais* Opium 1 Pound; Extract of Aloes, made with simple Fennel or Angelica Water 7 Pounds; Native Cinnamon Levigated 2 Pounds; Resinous Scammony in fine Powder, 1 Pound; Camphir, Ginger, of each in fine Powder half a Pound; Oils of Angelica, Cloves, and Wormwood, of each 2 Ounces: mix and make a Mass for Pills. It Purges very well, more than treble the quantity of Aloes would do, without the Opium, and Purging without Pain, eases all manner of Pains in any part of the Body: the Belly being bound, it will Purge or gently loosen it, according to the largeness or smallness of the Dose given. The Virtues of this Medicine are to be admired, never enough to be praised. It strengthens the whole Man admirably, and is commended for corroborating the more Noble Bowels; but above all for correcting of corrupt and evil Humors, and its very sweetly purging the Body, which it does by a very safe and pleasant Operation. I have cured by this Medicine alone indurated Cancers tho' of some Years standing, where they have not been broken or ulcerated; for since nothing can stand at a stay, but what does not encrease, must necessarily decrease; so, since this Medicine hinders the *Pabulum* of the Cancer, it must in time decrease, and as it were pine away, and this it does by stopping the Fluxion of the Humor to the part, and carrying it off another way. It eases the Cough, is good against Asthma's, and stops thin Catarrhs: It induces Rest and Sleep, and prevails against Quotidian, Tertian, and Quartan Agues, being given some Hours before the Fit. Dose from half a Scruple to a Scruple, or half a Dram at Bed-time, according to Age and other Circumstances. The Proportion of the Opium here is $\frac{1}{16}$ or as one to twelve.

LXIII. Gutte Vitæ Nostræ. Our Cordial Drops. Take Extract of Opium, made as before directed, 16 Ounces; which dissolve in Tincture of Salt of Tartar 8 Quarts, or in Powers of Anniseeds, Angelica, Carrawaies, Cloves, Rosemary, of each 2 Quarts; the Menstruum being first impregnated with the strong Tinctures of Saffron, Cochinele, Cloves, Winters Cinnamon, Nutmegs, Virginian Snake Root, Zedoary, of each 2 Ounces; all of them (the Saffron excepted) reduced into fine Powder; Castoreum (freed from Skins and Fat) in fine Powder 4 Ounces; The Opium being dissolved in the said Tincture, digest for a Month, shaking the Bottle well once a Day; let it then settle till it is perfectly fine, and decant off the clear Tincture into ano-

ther Glass Bottle, to which add Narcotick Sulphur of Vitriol 3 Ounces; Camphir half a Pound: mix and dissolve, and digest 10 Days; and so keep it close stop for Use. It has all the Virtues of any of the former Tinctures of Opium, or of any of the Philonium's or of any the most exalted Laudanum, which we have discoursed of before at large: and is much better to be given to such, who cannot swallow Bolus's, or Pills, This being to be given only in Drops at Bed-time in a Glass of Canary, or fair Water, or other Vehicle, the Patient best likes, as White Wine and Sugar, Mace Ale, Broth, Posset Drink, or a little Syrup. If it is taken for a Cough, which is troublesome in the Day time, or for a deep Consumption, or for prevention of any Illness, it may be taken in the Morning Fasting, in the design'd Vehicle. The Dose is to be regulated according to the Age of the Sick, and other Circumstances. To a Child of a Month, Quarter, half Year, or Year old, you may give from 4 Drops to 10. From a Year to 2, 3, 4, or 5 Years old, you may give from 10 to 16 Drops. And to elder Persons from 6 Years of Age to 12, or 14, you may give from 16 to 24 Drops. From 14 Years of Age, to 20, 30, 40, 60, or 80 Years old and upwards, you may give from 24 Drops to 40, 50, or 60 Drops at a time, which in ordinary cases may be the highest Dose. But in all Persons, Ages, and Sexes, it will be better to begin with a smaller Dose first, and so to encrease it every Day gradually till it comes to the highest. It may safely be given to Women with Child, being a most excellent thing to prevent Miscarriage.

LXIV. Laudanum Opium Hartmanni. Hartman his Laudanum. Take of any of the former Extracts of Opium a Pound; Salts of Coral and Pearls, of each half a Pound; Extract of Saffron, made with the Spirit of Wine a quarter of a Pound; mix them well together, and then add to them Oil of Cloves, 1 Ounce; mix them well again, and keep it in a Silver Box very close, for Use. It has all the Virtues of any of the other Laudana. The Opium here is $\frac{1}{4}$ or as four to five, to the rest of the Ingredients, and therefore it may be given from half a Grain, to 1, 2, or 3 Grains, as the Physician shall advise, beginning with a small Dose first, and so gradually increasing it.

LXV. Pillule de Gyneglesio. Opiate Pills of Hounds-Tongue. Take Roots of Hounds-Tongue dried, white Henbane Seed, Opium prepared of each a Pound; Myrrh in fine Powder a Pound and half; Olibanum in fine Powder, a Pound and quarter; Saffron, Castoreum, Storax Calamita, of each a quarter of a Pound and half a quarter: let the Roots of Hounds Tongue and Henbane Seeds be Powdered together, but the Myrrh, Saffron, and Olibanum, each by themselves; the Opium being cut small, dissolve to the thickness of an Extract with Rose Water; then add the Powders, and with Syrup of Stachas make a Mass for Pills. They were invented to stop Catarrhs, Coughs, Asthma's, all sorts of Fluxes of the Bowels, the overflowing of the Terms, and the Whites in Women. They are good against a Phthisis or ulceration of the Lungs, restore in Consumptions, and are profitable against Pleuritis, Pains and Stitches in the Sides, Colick and Gripping of the Guts, and all other internal Pains whatsoever, as of the Spleen, Stomach, Reins, Bladder, from the Stone, &c. and cause pleasant Rest and Sleep. The Proportion of the Opium in this Composition is $\frac{1}{10}$ as one to ten, or a tenth part of the whole. So that the Dose may be from 5 Grains to 10, 20, or 30.

LXVI. Pillule de Syrace. Opiate Pills of Storax. Take Storax Calamita, Olibanum, Myrrh, Insipissate

Inspissate Juice of Liquorice, Extract of Opium, or Opium prepared, of each a Pound; Saffron a quarter of a Pound; with Syrup of white Poppies make a Mass for Pills according to Art. The Virtues of these *Pills* are the same with the last, and have the same force and effects, with any of the *Laudana* before described and declared, and may be given for those purposes in the same manner. The Proportion of the *Opium* in this Composition is $\frac{1}{4}$ as one to six, or a sixth part of the whole, and therefore the Dose may be *gr. 3. ad 12. or 18.* and the larger Dose may be exhibited in vehement Catarrhs, violent Coughs, and inveterate Fluxes of the Belly, Gout, Rheumatisms, &c.

LXVII. *Extractum Florum & Capitum Papaveris*, or German *Opium*. Take the Heads of Poppies when they begin to flower, bruise them, and digest in *Balneo*, with *Hydromel*, *Artheglin*, or *Canary*, for 15 or 20 Days, till the *Liquor* is very red: then strain forth the *Juice* or *Liquor* by strong Pressing: abstract in *Balneo* till a Gummy *Magma* or Substance remains, which being put into cold Water will be forthwith congealed. This is German *Opium* no ways Sophisticated, which may be made use of instead of the True *Opium*.

An APPENDIX to, Sect. XLVI, and XLVII.

LXVIII. Some confound *Opium* with *Meconium*, but erroneously: for *Meconium*, as *Dioscorides*, lib. 4. chap. 65. Testifies, is an Expressed *Juice* from the Poppy, which is *Inspissated*: which according to *Fred. Hoffman*, is thus Prepared. *Papaverum Vascula cum foliis tudentes torculari expriment, mox in Mortario teretes pastillos formant, vocaturque illud Meconium.* *Casper Hoffman de Medicamentis Officialibus*, lib. 2. chap. 169. sect. 9. has it thus, *Hoc autem, (μυκάνιον, ή δέσις μήκωνος) tota Planta contusa & expressa.* But *Quercetanus* in his *Pharmacopœia Restituta*, chap. 25. makes it after this manner: *Recipe Capitum Papaverum* (which bears the red Flowers, I suppose he means our Black Poppy Heads) *q. v. contunde in Mortario marmoreo, affunde Vinum generosum ad duorum digitorum eminentiam: digere in Balneo per aliquot dies, ut incipiat rubescere, exime & inspissa.* *Lemery* says, That *Opium* is a Tear, which distills of it self, or by Incision from the Heads of Poppies, and this in Greece, as also in the Kingdom of Cambaia, and the Territories of Grand Cairo in Egypt, and that there are three sorts of it, the Black, the White, and the yellow; which the Inhabitants of those Countries do keep for their own Use, and only send us *Meconium*, which is nothing else but the *Juice* of the Poppy Heads, drawn by Expression, and then thickned, and wrapt up in Leaves to Export it the better: but I hope *Monfieur Lemery* will give me leave to believe as much as I think fit of the latter part of his Discourse, and no more.

LXIX. *Opium*, says *Schroder*, is, *Lachryma*, a Tear, which Distills from the Heads of the Poppies, being gently cut, when they begin to grow ripe. And of this *Opium*, there are three sorts. 1. *White*, which comes from *Cairo* in *Egypt*, and this is said to be the *Thebaian Opium*, which we call *Turkey Opium*, and is accounted the best. *Schroder* says, the *Cabaian Opium* is the choicest, and that it is heavy, and thick, and burns with a Flame not black, of a Poppy like Smell, but stronger, of the color of *Aloes* when broken, and easie to be dissolved. That which the *Turks* daily take from half a Dram to a Dram, which they

call *Mastac*, is of a Lyon tawny color, but we have scarcely any of that. *Lemery* says, that the *Opium* which comes from *Thebes*, or else from *Grand Cairo*, is accounted the best, which is blackish, inflammable, bitter to the Taste, a little acrimonious, of a stupifactive and something disagreeable Smell. 2. *Black and hard*, which comes from *Aden*, a Country of *Arabia*, not far from the Red Sea, and is brought from *Alexandria* and *Syria*. 3. Of a reddish yellow color and softer, which comes from *Cambaja* and *Decan*, and this is the *East India Opium*, and comes from thence, and other parts adjacent thereto, and is in much use with us at this Day. But the *Turkey* or *Thebaian Opium* is the most valuable, and that only which is to be chosen.

LXX. How *Opium* is made, *Dioscorides* in the place before cited, has told us, as also, *Pliny* lib. 20. chap. 24. *Bellonius* lib. 3. chap. 15. and *Jacobus Bonjuss* in *Notis ad Garciam*, with many other Modern Authors. *Fred. Hoffman*, in his Notes upon *Schroder* has it thus, *Capita Papaveris recentia grandia immatura tamen, & succo turgida, mane post Rorem solis dispersum Culiello in Asterisci forma leviter incident, unde liquor lacteus, continuo emanans & identidem concreescens digito in Conchulam subiectum abstergitur: idque tandem continuatur dum Vultus liquorum plorat, & ex noviter incisus recentes Lachryme coalescunt.* It is called in *India*, and also in *Asia*, by a corrupt Name, viz. *Opum*, also *Aphon*, *Omfium* and *Anfian*; but in many Compositions, as in *Theriaca Andromachi*, we find *ὀπὸν μήκωνος* and *Casp. Hoffman* says, *Ὀπὸν μήκωνος indifferenter est vel ὀπὸν, vel μυκάνιον: illudque quidem fieri Capitibus Papaveris incisus, & succo inde Stillante excepto.* *Opium* is said to be adulterated with the *Juice* of *Glaucium*, which is of a yellow color (and is thought to be the *Juice* of the Thorney Poppy before described:) but this Cheat is easily to be discovered; for if the *Opium* is dissolved in fair Water, it will color it yellow, by reason of the yellow mixture.

LXXI. But yet the Grand Question returns to be resolved, *Ex quo Papavere fit Opium?* We have already said something to it, in what has gone before; to which we add, that according to *Pliny*, and *Avicenna*, it is gathered from the Heads of the Black Poppy, being Cut or Wounded. But says *Casper Hoffman*, loco citato, *ex albo fieri tam in Asia, quam in India ex Bellonio & Garzia Constat: atque apud Dioscoridem fit ex Nigro & Sylvestri: Sed in Asia (Author est Pena) hodieque ex utroque fieri.* Yet *Fred. Hoffman* in his Annotations upon *Schroders Dispensatory* says, *Hoc (Mastac, vel Opium) nihil aliud est quam Succus exsudans ex Capitibus Papaveris albi incisus in Vigore Constituti suo Balsamico & Crescente Luna Collectus; formantur inde Pilule a Drachma semis, ad Drachmam unam; effectus hujus est pro Constitutionum vel Temperamentorum diversitate, &c.* From what has been said before, and what here, it is manifest that *Opium* is made from the Black Poppy Heads, and sometimes from the White, and sometimes promiscuously from both.

C H A P. DLXXIV.

O F P O P P Y Wild.

I. **T**HE Names. It is called in Greek, *Ῥόδον ῥαῖς*: in Latine, *Papaver Rhæas* vel *erraticum*, vel *Sylvestre*; and in English, *Wild Poppy*.

II. The Kinds. It is of two principal Species, viz. 1. *Papaver Sylvestre verum*, which is also called *Papaver Rhæas*, & *Papaver erraticum*, Red Poppy, Corn Poppy, and Corn Rose. 2. *Argemone*, *Quia argemas vel oculorum nubes tollit*; and of this there are several Kinds, the chief of which are, 1. *Argemone Capitula rotundiora*, *Argemone*, & *Argemonia*, as *Pliny lib. 25. cap. 9.* has it, Our Common round Headed Bastard Poppy; and all Modern Writers agree, that this is the *Argemone* of *Dioscorides*: it is also called *Argemone Capitula torulis canulato* *Lobelij*; *Argemone Capitula breviora*. 2. *Argemone Capitula longiora* *Lobelij* & *Bauhini*, *Argemone Cordi*, Long Headed Bastard Poppy. 3. *Argemone lutea*, *Argemone Cambro-Britannica lutea* *Lobelij*, because found out by *Lobel* growing in *Wales*: Yellow Wild Bastard Poppy of *Wales*.

The Descriptions.

III. Our common red Poppy, Corn Poppy, or Corn Rose. Its Root is something long and slender, and perishes every Year, the Plant rising every Year of its own Sowing. Its Leaves are long and narrow, very much cut in on the edges into many Di-

Poppy Corn or red, or Corn-Rose.

visions, of a light green color, but not whitish, and something hairy with all. The Stalk is blackish, or blackish green, and hairy also, but rises not up so high as the Garden Kinds, having some such like Leaves thereon as grow below; it spreads it self out sometimes into three or four Branches, on which grow small hairy Heads, bowing down before the Skin breaks, in which the Flower is enclosed: which when it is full blown open, is of a fair red, or crimson color, but in some much paler, without any Spot in the bottom of the Leaves, having many black, soft Threads in the middle, compassing a small green Head; which when it is ripe, is scarcely so big as ones Thumbs end; in which is contained much black Seed, smaller by half than that of the Garden. Of this Kind, there is one which is lesser in all the parts thereof, and differs in nothing else.

IV. The first of the Bastard Kinds, which is Our common round Headed Bastard Poppy. Its Root is small and long with many Fibres adjoining, and perishes every Year after Seed time. This Kind of Wild Poppy has several hairy green Leaves lying on the Ground, somewhat longer, and more divided into parts, than those of the Corn Poppy, somewhat like to the Leaves of the thin Leav'd Anemone, or

Poppy Wild Bastard.

Wind Flower, as *Lobel* says, tho it is seldom so found with us. From among which rise up several rough hairy Stalks, more than two Feet high sometimes, which bear also such like Leaves here and there on them, but lesser than those below, all yielding when broken, a yellow Milk or Juice. On the top of each Branch, grows one Flower, lesser than that of the Corn Poppy, but consisting of 4 round pointed Leaves, of a more faint or diluted red color, each of them having sometimes a blackish Spot in the bottom, but sometimes without it, with several blackish Threads standing about a small green Head,

Head, which when it is ripe, is something short, round, and rough, with some Crests thereon, and a little round Head or Cover, but not a Crown or Star, at its top, like the other Poppies; in which is contained such like small blackish Seed as in the Corn Poppy Heads, but larger.

V. The second of the Bastard Kinds, or Long Headed Bastard Poppy. This is in its Root, Leaves, Stalks, Branches, Flowers, Seed, and manner of growing, and indeed in all things, like the

Poppy Wild long Codded.

first Bastard Kind, saving that the Heads of this are longer than those of the last, smaller below, than above, and having a little round Head or Cover at the top, but no Crown, and is rough and hard like it, and in this consists all the difference.

VI. The third of the Bastard Kinds, which is, the Yellow Wild Bastard Poppy of Wales. Its Root is long and brownish on the out side, spreading it self out into some Branches, with many small Fibres adjoining to them, which perish not every Year as the other sorts do. This Yellow Poppy has many winged large spread Leaves lying upon the Ground; that is, many Leaves set together on each side of a middle Rib, each divided Leaf being somewhat deeply cut in, in some places of the edges, more than others, and of a deep, but fair green color. From among these Leaves, rise up several branched Stalks, about 2 Feet high, having some such Leaves thereon, but smaller, and set at several distances. At the tops of the Stalks and Branches grow fair, yellow, and pretty large Flowers, consisting each of four round Leaves a piece, with many yellow Threads in the middle, standing about a long green Head, which when the Flower is fallen, and the Head ripe, is then larger than the former long headed Bastard Kind, and in like manner smaller at the bottom, and larger at the

top, with a small Head or Topping thereon, containing within, much small black Seed, lying within several Cells, in the same manner as in other Poppies.

VII. The Places. The Corn Poppy is plentifully enough to be found in almost all Corn-fields throughout all England, as also on Banks and Ditch-sides, and under Hedges thro' most parts of the Kingdom. The first and second of the Bastard Kinds are often found, as well in Corn fields, as by the Way-sides, in Somersetshire and Kent, and other Counties of this Land, and in the Corners and Borders of Fields, and by the Hedges and Highway sides, going from London to Bath. Gerard says, that he and Lobel, found them growing in the next Field to Southfleet in Kent: and Johnson in Gerard says, that he found them both growing in Chelsey Fields, as also in those belonging to Hammer-smith, in all which places I my self have also often found them. The short or round Headed one has a Flower of a more Elegant color, but is not found so plentifully as the other long Headed one. The third grows in many Places in Wales, in Vallies and Fields, at the Feet of Hills, and by Water sides, about a Mile from a small Village called Abbar; and in the midway from Denbigh to Guider; as also nere a Wooden Bridge, which gives passage over the River Dee, to a small Village called Balam, which is in North-Wales; and in going up the Hill which leads to Bangor, as also near Anglesey in the way leading to the House formerly Sir John Gwin's.

VIII. The Times. The first Flowers from May all the Summer Months, and the three last about the end of June and in July, and the Seed is ripe in August, or not long after Flowering; in some places earlier, and in some Places later.

IX. The Qualities. They are all of them of the Nature of the Garden Poppy, to which I refer you.

X. The Specification. The Corn Poppy has the same Specifick Virtues with the Garden Poppies. The Bastard Kinds cool, are profitable against Inflammations of the Eyes, the Bloody Flux, obstructions of the Spleen, and the bitings or stings of Venomous Creatures. They heal Green Wounds, also old Sores, Cankers and Running Fistula's, help against the Quinsie, give ease in Gout and Rheumatisms, consume Warts, and take away black and blew Spots, or discolorings of the Skin; They are profitable against Sore Eyes, and are good to take away Clouds, Mists, Films, or Skins, which grow over them, and hinder the Sight.

XI. The Preparations. From the Corn Poppy. You may make 1. A Juice, and Essence. 2. A Decoction. 3. An Oil or Ointment. 4. A Cataplasn. 5. A Distilled Water from the whole Plant. 6. A Distilled Water from the Flowers. 7. Spiritus Papaveris erratici, Spirit of Corn Poppies. 8. Spiritus Rhaadus Crapularius, The Surfeit Spirit of Poppies. 9. Tincture of Corn Poppy Flowers. 10. Another Tincture of the same. 11. Syrup of Corn Poppy Flowers, 12. Another Syrup of the same.

The Virtues.

XII. The Juice or Essence. They are Anodyns, and being bathed warm upon any part of the Body give present ease; bathed on the Head Fore-head, and Temples, they ease the Megrim and Head-ach, and cause Rest and Sleep. They allay Inflammations, and prevail against Antonies Fire, and
 5 Y 2 allevi-

alleviate the sharp and fiery Heat of Burnings and Scaldings.

XIII. *The Decoction of the Green Heads and Seed.* It has all the Virtues of the Juice and Essence, besides which, given inwardly it cools the heat of Fevers, is profitable against Deliriums and Frenzies, eases pains and stitches of the Sides, and prevails against the Colick; dropt into the Eyes, it is good against Inflammations therein, Blood-shot, vehement Pains, and defluxions of hot and sharp Humors. Dose from 2 to six Spoonfuls, sweetned with Syrup of Violets, or White Sugar.

XIV. *The Oil or Ointment.* It is singular against the Gout in Hands, Arms, Legs and Feet. The Head and Temples anointed therewith, it eases the Megrin and Head-ach, and procures Rest and Sleep. It is good against Delirium or Frenzy; and is profitable to cool and allay Inflammations in what part of the Body soever.

XV. *The Cataplasim.* It is made of the Green Heads and Seed, and for want of them of the Seed. It has in outward Application all the Virtues of the Juice, Essence, Oil and Ointment: Applied to the Fore-head and Temples it gives ease in the Megrin and Head-ach. Applied to the Crown of the Head (being first Shaved) it is profitable against Dotage, and perturbation of the Senses. Applied to any part, it represses, and repercusses the Flux of Humors, especially to the Joints, easing all manner of pains whatsoever.

XVI. *The Distilled Water out of the Green Heads and Seed, and indeed from the whole Plant.* It is refreshing and cooling, and very profitable being taken inwardly against burning Fevers, more especially if it is acuated with a few Drops of Spirit of Salt, or Sulphur, and then dulcified with Double refined Sugar: and makes a good Vehicle for conveying other Medicines, (especially Opiates) down into the Body: it gives Rest and Ease to weary Bodies, and causes pleasant Sleep. It quenches the heat, and allays the fury of *Antho-nies* Fire, by cooling and suppressing the Humor. Dropt into the Eyes, it prevails also against an *Ophthalmia* or Inflammation in them, and stops the Flux of the Humor.

XVII. *The Distilled Water from the Flowers.* It is a singular good thing for the cure of the Pleurisie, and all sorts of pains and stitches in the Side. It is an excellent thing to give Rest and Ease to Women in Child-Bed, after due cleansing; and to give pleasant Sleep. It is held also to be of good use against Surteits, to drink it Evening and Morning, more especially if it is sweetned with the Syrup of the Flowers. *Porkinson* says, It is more cooling in quality than any other Poppy, (*vix credo*) and therefore cannot but be as effectual in hot Agues, Frenzies, and other Inflammations either inward or outward.

XVIII. *Spiritus Papaveris erratici*, The Spirit of Corn Poppies. Take Wild or Corn Poppy Flowers 8 Pounds, rectified Spirit of Wine 16 Pounds, mix, digest a Week, and then distill in a Glass Alembick in Balneo to driness. Affuse this distilled Liquor upon as many more of the same Flowers, digest again 3 Days and distil as before: this distilled Spirit affuse again a third time upon fresh Flowers, and if you so please a fourth time, distilling each time to driness; Lastly, in a gentle Balneo, draw off three parts of the Liquor, which keep as Spirit of Poppies simple. 2. Or thus. Take French Corn Poppy Flowers 20 Pounds; White Port Wine 16 Pounds; mix, and with Sugar 3 or 4 Pound, and a large Leaven dissolved in the Wine, cause a fermentation, till the whole becomes somewhat Acid, then distil in Balneo to driness. Affuse the Liquor upon 10 Pounds more of

fresh Flowers, digest 3 Days, and distil in like manner to driness. Then in a gentle Balneo, draw off the one half of the Liquor, which keep for Spirit of Corn Poppy Flowers. If you continue the distillation to driness in the same Balneo, you may keep the Liquor for *Aqua Papaveris*, or reserve it for making more Spirit with. If you would have a Spirit from the whole Plant, you may proceed with it in the same manner, as with the Flowers, by either of the former ways, or otherwise you may make it after this manner. Take Corn Poppies, the whole Plant when in flowering, as much as you please, bruise it well in a Marble Mortar, add warm Rain Water 4 times the quantity in weight, disolving in every Gallon of Water a Pound of brown Sugar, mix well, and cause them to ferment to a fit Acidity. Then distil in a Copper Vesica Tin'd within, in a proper heat, drawing off the first quarter part of the humidity for Spirit of Poppies: and half the remaining part for Poppy Water: which keep for use, or reserve for making new Spirit of Poppies. Any of these Spirits are excellent against the Colick; and to alleviate pains in any part of the Body. They give ease in the Stone, and are profitable against After-pains of Women in Child-Bed, and with a great deal of pleasure induce Sleep. But these things they will do more powerfully, if you make a Tincture of the Flowers with the same. They have in a Word, the Virtues of *Spiritus Opii*, in Sect. LII, of the former Chapter, but not altogether so powerful. Dose from half a Dram, to 3 Drams, plus-minus.

XIX. *Spiritus Rhodod Crapularius*, The Surfeit Spirit of Poppies. Take Corn Poppy Flowers new gathered a Pound; Caraway Seeds 2 Ounces; Nutmegs 1 Ounce; Ambergrise 4 Grains; Spirit of Wine 4 Pounds, digest according to Art, strain out, and keep it for Use. Dose from 4 Drams, to 4 Ounces, at the Hours of Sleep, or in the Morning after Surfeiting. It is a Specieck also in a Pleurisie. The Spirit of Wine here intended is only common Spirit of Wine or Brandy, for otherwise the Dose could not be so large as we have here given it. It is not only excellent against Surfeiting and Drunkenness, as also the Pleurisie, but against all manner of pains and stitches in the Sides, Breast and Stomach, the Colick and gripings of the Guts, pains in the Back, Reins and Bladder, but indeed against all manner of Pains in what part of the Body soever. It gently provokes Sweat, dissolves coagulated Blood, and gives relief against the strongest Agonies. It may be given either alone sweetned with White Sugar, or in Wine, or *Aqua Ladis alexiteria* chiefly at Night going to Bed.

XX. *Tincture of Corn Poppy Flowers.* Take Corn Poppy Flowers fresh gathered a Pound: Spirit of Corn Poppy Flowers, choice Canary or Sherry Wine, of each 2 Pounds; Winters Cinnamon in fine Powder 2 Ounces; Cochinele in fine Powder, choice English Saffron, of each half an Ounce: mix, digest, and make a Tincture according to Art. It has all the Virtues and Excellencies of all the Spirits of the Flowers, at Sect. XIX and XX, foregoing: besides which it is an excellent Cordial and a potent expeller of Wind, and therefore good against Fainting and Swooning Fits, Sickneis at Heart, &c. Dose from half an Ounce to an Ounce, or more in a Glass of Angelica Water, well dulcified with white Sugar.

XXI. *Tinctura Papaveris erratici Mynsichti*, another Tincture of the same from *Mynsichti*. Take Corn Poppy Flowers 2 Ounces; sprinkle them with Spirit of Vitriol a Dram: then with the Distilled Water from 30 Ounces of the Juice of fresh Flowers, extract a Rubicund Tincture, which filter,

filter, and add thereto, Syrup of the Juice of Corn Poppy Flowers Vitriolated 8 Ounces: mix and keep them for Use. It is excellent in all thin and sharp defluxions of Rheum upon the Lungs and *Aspera Arteria*: It causes Rest and Sleep, cures Coughs, Hoarseness, and Wheezings, eases the Phthisick; is good against Pleurifies, pains and stitches in the Sides; eases all sorts of Dolours and Grievs, abates Inflammations, provokes Sweating, and stops the Bloody Flux, as also the Terms and Whites in Women. Dose 2 Ounces alone, or with some other proper Vehicle.

XXII. *Syrupus de Papavere erratico, sive Rubro*, Syrup of Corn Poppies. Take Corn Poppy Flowers 2 Pounds; warm Spring Water 4 Pounds: steep or infuse, and the next Day strain it; repeat the Infusion with new Flowers; strain again, and with its equal weight of Sugar, boil it into a Syrup in Balneo. It is excellent to cool and abate the heat of Fevers, eases all sorts of Pains, causes Rest and Sleep, abates the violence of Pleurifies, Colicks, violent pains of the Stone, and stops all sorts of Fluxes of the Belly, as Diarrhea, Dysenteria, Lienteria, Hepatick Fluxes, as also the Terms and Whites in Women. Dose from one Spoonful to 2 or 3, either alone, or in some proper Vehicle.

XXIII. *Syrupus Hemoptoicus, seu Diacodium Liquidum Papaveris erratici*, another Syrup of Corn Poppies. Take Heads and Seeds of the Wild or Corn Poppy Number 20. Juice of Spanish Liquorice an Ounce, bruise the Heads and Seed, and steep them in Rain Water 8 Pints, for 4 Hours; and then dissolve in it the Spanish Juice, boil gently in Balneo to 6 Pints: strain leisurely thro' a Flannel Bag, and with white Sugar 12 Pound make a Syrup. It gives ease in Pains, and causes Rest and Sleep; it stops Vomiting, helps in the Colick; is good against a Looseness and all other Fluxes of the Belly, as also Fluxes of Humors to any part; prevails against Asthma's, Coughs, Colds, Phthisicks, spitting and pissing Blood, gives ease in the Stone, Gravel and Strangury, as also in the Gout, and all other Pains whereforever. Dose from half an Ounce to an Ounce, Ounce and half or more, as occasion requires.

The Bastard Wild POPPY.

XXIV. *The Qualities.* It is hot and dry in the third Degree, Absterfivè, Anodyn, Vulnerary, Anthritick and Alexipharmick.

XXV. *The Specification.* It prevails against dimness of Sight, Bloody Flux, the Poyson of Venomous Beasts, obstructions of the Spleen, Quinsy, Belly-ach, Gout, Cramps, Convulsions and the like: It is said to cure Warts also, Green Wounds, old Sores, running Ulcers and Fistula's.

XXVI. *The Preparations.* You have therefrom, 1. The Green Leaves. 2. A Juice. 3. An Essence. 4. An Infusion in Water. 5. A Decoction in Wine. 6. An Ointment. 7. A Cataplasm.

The Virtues.

XXVII. *The Green Leaves.* Being oftentimes in a Day, and for several Days together, rubbed upon Warts, they consume them, and take them away: the same they do to Corns, more especially, if they being fresh gathered, are also bound thereto, Morning and Night.

XXVIII. *The Liquid Juice.* Dropt into the Eyes, it takes away Mists, Clouds, and Films, which hinder the Sight, also Inflammations and Heat, and cures the Disease of the Eye called *Argema* (from which the Herb took its Name) which is the *Haro* in the Eye: the Malady, when it happens on the black of the Eye, it appears white; and contrariwise, when it falls on the white of the Eye, it appears blackish, or of another color. Bathed also on Warts it consumes them.

XXIX. *The Essence of the Leaves and Roots.* Given to 2 Drams or more in Ale, Beer, or Wine, it is good against the Gripping of the Guts. Taken in Sherry, Canary, or other strong Wine, it powerfully expels Poison: it opens obstructions of the Spleen, and eases the pains thereof: and is good against the bitings or stinging of Serpents, Mad-Dogs Horners, Scorpions, or other Venomous Creatures. The Essence inwardly taken, and a Cataplasm of the Leaves being outwardly applied: and taken in Red Port Wine, is good against the Bloody Flux.

XXX. *The Infusion in Water or Wine.* It prevails powerfully against the Gripping of the Guts, a Diarrhea, or Looseness, and other Fluxes of the Bowels: and is said to give ease in the pains of the Hypochonders.

XXXI. *The Decoction in Wine.* Bathed upon places black and blew, or otherwise discolored by Blows, Falls, &c. whether on the Face, Eyes, or other parts, it quickly restores them to their rectitude. It is good against the Bloody Flux: and is a present Remedy against the stinging or biting of any Creature.

XXXII. *The Ointment, made with Oil, Wax and Turpentine.* It heals any simple Green Wound, running Sore, or old Ulcer; and being applied to Joints pained with the Gout, it eases the pain, and in a little time cures the Disease. It is good also against Cramps, Convulsions, and other like Diseases of the Nerves.

XXXIII. *The Cataplasm of Leaves and Heads.* It heals Cankers, old Ulcers, running Fistula's: consumes and takes away Warts; cures recent Contusions, as also discolorings of the Skin. And being made with Wine Vinegar, it cures the Quinsy being applied to the Throat; and eases the Gout, and takes it away being applied to the place agrieved.

CHAP. DLXXX.

Of POPPY Horned.

I. *THE Names.* It is called in the Arabick, *Almacharam*: in Greek, *Μήλον κέρατος*: in Latine, *Papaver Corniculatum* & *Cornutum* (à *siliquarum effigie Corniculorum modo inflexa*, because the Pods are crooked like a Corner or Horn.) Pliny, and others say, it was also called *Paralison*, i. e. *Marinum*; and of some *Papaver Sylvestre*; in English it is called the Horned Poppy.

II. *The Kinds.* Of the Horned Poppy we make two Principal Kinds, viz. I. *Μήλον κέρατος*, *Papaver Corniculatum verum*, The true Horned Poppy. II. *Μήλον κέρατος ρεβόλον*, *Papaver Corniculatum notum*, The Bastard Horned Poppy.

III. *The particular Kinds.* Of the I. Species there are these three following, viz. 1. *Papaver Cornicu-*

Corniculatum luteum, The yellow Horned Poppy, and Sea Poppy. Many Authors have thought that *Glacium* was made hereof, as *Dioscorides* himself says, and as *Pliny* likewise thought: But *Dioscorides* in describing *Glacium*, does not say it is the Juice of Horned Poppy, but it is the Juice of an Herb, that has Leaves something like unto those of the Horned Poppy, but fatter or thicker, and yielding a yellow Juice: so that being but like to it, it cannot be the same thing. 2. *Papaver Corniculatum rubrum*, The Red Horned Poppy. 3. *Papaver Corniculatum flore violaceo*, The blew or Violet colored Horned Poppy. This the Spaniards call *Rosetta*, and some *Amapoles Morados*, because the Flowers give a juice like Mulberries. Of the II. Species, there are the two following sorts, viz. 4. *Hypecoum*, in Latine, *Hypecoum*, and *Hypopheum*, *Hypecoum legitimum* Clusii & Bauhini, The Bastard Horned Poppy or *Hypecoum Dioscoridis*. 5. *Hypecoum alterum*, *Hypecoum altera* Species Bauhini, The second Kind of Bastard Horned Poppy. Some Authors will have these Bastard Species to be a sort of *Cuminum Syriacum*, and call each of them, *Cuminum filiquosum*, & *Cuminum Syriacum filiquosum*, but I think very improperly, for they are not in the least akin, to any of the Species of *Cumin*, but rather a sort of Wild Poppies, as is very manifest both from their Poppy like Smell and Qualities.

The Descriptions.

IV. The first, or Yellow Horned Poppy, or Sea Poppy. Its Root is white, long, and tough, spreading it self out several ways, and enduring many Years, the Plant keeping its Leaves also all the Winter.

Poppy Horned Yellow.

it has many long, and somewhat large, whitish, or hoary Leaves, lying upon the Ground, very much cut in or torn on the edges, and something rough or hairy; from among which rise up several weak round Stalks leaning down, rather than standing upright, somewhat hairy also, spreading forth into several Branches, and bearing a large Flower, at the top of every one of them, consisting of four Leaves, of a delicate pale yellow color, with a few Threads in the middle, standing about a small crooked Pointel, which in time grows to be a long, naked, round Pod, six Inches or more long, with a small Head or Button, as it were, at the end thereof, in which is contained, small blackish round Seed; every part of this Plant, being cut or broken, sends forth a yellow Juice, and of a bitter Taste.

V. The second, or Red Horned Poppy. Its Root is long and slender, perishing every Year, raising it self again from its own Sowing, or else must be sown every Year in the Spring. This has fewer, lesser, and more jagged Leaves than the former, nothing so whitish, but of a dull green color, something hairy also. The Stalks are slenderer, and lower, bearing flowers at the tops of them,

Poppy Horned Red.

like the other, and consisting of four Leaves a piece, but much smaller, and of a pale reddish color for the most part; tho' sometimes they are found saddler. After which come such like crooked or horned Pods, but smaller than the former, containing such like small blackish Seed within them. This Plant when cut or broken yields no such yellow Juice, as the other does.

VI. Johnson in Gerard, gives us another Horned Poppy, which he calls, *Papaver Corniculatum Phoeniceum glabrum*, or Red horned Poppy with smooth Leaves. This he says is much like the last described, and according to Clusius is rather a variety of that second Kind than any differing Species. Its Leaves are with many deep jugs in them, much like as Rocket has, but are smooth, and without hair.

hair: and the color of the Flowers are of a pale yellowish red: both which accidents Clusius says happen to the former, towards the latter end of Summer.

VII. The third, or Blew, or Violet colored Horned Poppy. Its Root is long and small with a few Fibres adjoining to it, and perishes every Year. This grows much lower, and with smaller Leaves, very much, and finely cut in, or rather divided into many parts, of a sad green color. The Stalks are low and slender, something hairy, rising not much above a Foot, or Foot and half high at most, with small Flowers at their tops, like unto the second Kind for form, viz. consisting of four Leaves, but of a fair deep purple color, almost like unto a Violet: after which come small, slender and shorter Pods, not above a Fingers length, in which lies such like blackish Seed but smaller.

VIII. The fourth, or Bastard Horned Poppy, or true Hypecoum Diofcorides. Its Root is small and a little Stringy, perishing every Year, at the first approach of Winter, and is very hardly made to spring again, but by sowing its Seed in Autumn. This small Plant has divers long Leaves lying on the Ground, very much divided, and cut into many parts, of a pale or whitish green color, so like unto Furniture in the color of the Leaves, as also somewhat near it, in the many divisions and parts thereof, that it will soon deceive one that does but slightly view it, but is smaller and thinner, and more gentle in Handling, yet is larger in Spain, as Clusius says, than that which grows with us. In the middle of these Leaves rises up a Stalk, sometime two, with some Leaves thereon, which divide or spread out towards the top into several Branches: at the tops of which stand small yellow Flowers, consisting of six Leaves, two whereof are larger than the rest, and stand opposite to one another, the others being very small and scarcely discerned, till the Flower is fully blown open. After which spring out long, crooked, flat, husky Horns, or Cods, full of Joins, somewhat like unto the Husks or Horns of the Scorpioides Matthioli, but greater and longer, in the several Joins of which by several square yellowish Seed, very difficult to be taken forth or separated from the Husks or Skins. The Plant has a Poppy like Smell, and of an unpleasant Taste.

IX. The fifth, or Second Kind of Bastard Horned Poppy. This Plant is very like unto the former, but that the Leaves thereof are not so Broad, nor long, but more finely divided, something like unto the Sefeli, or Hartwort of Marcellus, or Wild Chervil: The Stalks are smooth, full of Leaves and Branches, which send forth yellow Flowers, made of five pointed Leaves, which being past away, long Cods come in their places, which stand not upright, but hang down; nor are crooked like the former, but straight, and jointed, containing greater yellow Seed, not much unlike to those of Galega or Goats Rue.

X. The Places. The first or Sea Poppy, grows upon the Sands and Banks of the Sea; and Naturally by the Sea side as well beyond Seas, as on the Coasts of our own Country in many Places. Gerard says he found it growing near unto Rye in Kent, in the Isles of Sheppy and Thanet, at Lee in Essex, and Harwich, and at White-Stable, and in many other places on the English Shore. It is a pleasant Plant, and is now planted in Gardens, for its beautiful Aspect, as well as for its Virtues. The second and third are Natives of Spain, Austria, and Bohemia; Angelus Palea, and Bartholomeus ab Urbe Veterum, say, that the second grows in the Kingdoms of Arragon and Castile in Spain, in the fields and near Common High-ways; but with us

they both Flourish only in Gardens. The fourth and fifth grow in Provence in France, in the way to Arles and Mompelien, and other places in that Kingdom: as also in divers places in Spain, as Clusius says: but with us they are only found growing in Gardens.

XI. The Times. The first Flowers from May all the Summer long to the beginning of September, and its Seed ripens in the mean time. The second Flowers seldom before July, and gives ripe Seed every Year, if the Season proves temperate and kindly, otherwise not. The third, as it late before it springs up, so it comes late in the Year to Flowering, for which reason it rarely gives ripe Seed with us. The fourth and fifth Flower about the end of June, and in July, and the Seed is ripe in August; in some places earlier, and in others later.

XII. The Qualities, Specification, Preparations, and Virtues of the two last, viz. the Hypecoua, are much the same with those of the Corn Poppy in the last Chapter, so that nothing more need be said of them here.

Of the True Horned Poppy.

XIII. The Qualities of the Horned Poppy. It is said to be hot and dry in the third Degree. And is Absterive, Aperitive, Diuretick and Vulnerary: Hepatick, Nephritick, and Cathartick.

XIV. The Specification. It prevails against the Strangury, Obstruction of the Spleen, heals Green Wounds, and old rotten Sores and Ulcers, and by its Cathartick Quality eases the Pains of the Sciatica.

XV. The Preparations. You may make, 1. A Liquid Juice or Essence. 2. A Decoction of the Root. 3. A Powder of the Seed. 4. An Oil of the Leaves and Flowers. 5. A Liniment of the same. 6. An Ointment. 7. A Cataplasim.

The Virtues.

XVI. The Liquid Juice or Essence. Given to 2 or 3 Spoonfuls (if the Juice, being first clarified) in a Glass of Port Wine, it provokes Urine, cleanses the Reins and Bladder, and carries off the Morbifick matter of the Gout, Rheumatism, Stone, &c.

XVII. The Decoction of the Root in Water. Being boiled to the consumption of the one half, and then strained out and Drank, it opens the Obstructions of the Liver and Reins, and gives ease in the pains of the Sciatica, and admirably provokes Urine, giving ease in the Strangury.

XVIII. The Powder of the Seed. Being given from the quantity of 2 Scruples to 2 Drams, viz. about a Spoonful at a time in Mead or Honied Water, it is said gently to purge the Belly.

XIX. The Oil of the Leaves and Flowers made by Infusion, or Collion. It is good to clear the Eyelight, and to take away Spots and Films upon them; for which purpose it is also used to the Eyes of Cattel.

XX. The Liniment of the Leaves and Flowers. It is made of their Juice mixed with Honey and Orobolus Meal, with an addition of Oil of Hypericon: cleanses foul and virulent Ulcers, and that so powerfully, that Galen advises, that it should not be applied unto those Sores or Ulcers, which are already cleansed, lest it should consume the quick Flesh also. It takes away also by the strength and force

force of its Absterfve quality, even those Crufts which grow upon Ulcers, by neglect or ill looking after.

XXI. *The Ointment.* It is made of the Leaves and Flowers, by boiling or Infusing in Oil of Hypericon, adding after Expression, Turpentine a quarter part; Wax, Frankincense, of each an eighth part; Powder of Tobacco a tenth part. It has all the Virtues of the Liniment, cleanses putrid Sores, old Ulcers, and running Fistula's powerfully, and heals simple Green Wounds, after an admirable manner.

XXII. *The Cataplasim of the Leaves and Flowers.* Being applied to filthy putrid Sores, rotten Ulcers and running Fistula's, it Absterges them wonderfully, and disposes them to incanation or healing.

CHAP. DLXXVI.

Of POPPY Spatling.

I. *THE Names.* It has no Greek Name that we know of: but is called in Latine, *Papaver Spuncum*: in English, *Spatling Poppy*, or *Frothy Poppy*, because oftentimes about the Joints a certain frothy kind of Substance is seen.

II. *The Kinds.* Whether it is of the Kinds of Poppies or no, I will not determin. It is a singular Plant of the Kind, and ought rather to be accounted a Kind of *Lychnis*, (as most Herbarists think it to be:) It is called by some *Ben*, or *Beben album* (differencing it from the *Valeriana rubra Dodonæi*, & *muscipula Lobelij*, each of which is called *Ben*, or *Beben rubrum*;) tho' neither of them is the true *Beben album*, or *rubrum* of the Arabians: *Baubinus* calls it, *Lychnis Sylvestris quæ Ben vel Beben album vulgo*, which is all that can be said of it as relating to its Species.

The Description.

III. Its Roots is white, and spreads it self abroad in the Earth abiding many Years. It is a small low Herb, having divers weak tender Stalks, full of Joints, about half a Yard or two Feet in height or length, they usually lying upon the ground; on which grow many pale whitish green Leaves, two always set together one against another at the Joints: having many times upon the Leaves, but more often about the Joints of the Stalks, a certain white frothy Substance, like unto that which is called *Cuckow Spittle*. At the tops of the Stalks grow many Flowers together, every one on a pretty long Foot Stalk, hanging down their Heads, which are white, composed of five small white Leaves a piece with a deep notch in the middle of each one of them, making the Flower to seem to consist of more than five Leaves; they all standing in a large Hose or Holster striped, the flower scarcely appearing above it; wherein afterwards is contained Black Seed.

Poppy Spatling

IV. *The Places.* It grows generally throughout England in many places and pastures, and Hedgides; by some it is much valued, and therefore planted also in Gardens.

V. *The Times.* It Flowers almost from the beginning of June till the end of July and sometimes later; and the seed ripens in the mean season. And as the Root abides all the Winter, so also do some of the Leaves keep green all that Season.

VI. *The Qualities.* It is hot and dry in the second degree. Aperitive Absterfve, Cephalick, Cathartick and Emericick.

VII. *The Specification.* It is peculiar for the cure of the Epilepsy or Falling sickness, and other cold and moist diseases of the Brain.

VIII. *The Preparations.* The Powder of the Seed is only in use.

The Virtues.

IX. It may be given from a dram to two drams, in Mead or Honied water: it causes vomiting, and purges downwards Pituitous or stegmy humors, and is especially good for the Cure of the Falling Sickness, and other Cold and moist diseases of Head and Brain.

POTATO-Canada, see Hartichoke Jerusalem, Chap. 340.

CHAP. DLXXVII.

Of POTATO,
Spanish, Virginian, and English.

I. **T**HE Names. It has no Greek Name that we know of: but it is called by our Modern Authors *Battata*, *Battatas*, *Amotes*, *Camotes*, *Ignanes*, & *Inbames*; and by the Indians, *Papas*, *Papus*, and *Poppus*; we in English call it, *Potato*, and *Potatus*.

II. **The Kinds.** There are three several Species of this Plant, which are almost as different one from another, as they are every one of them different from the *Jerusalem Hartichoke*. 1. The first is *Battata*, sive *Pappas Hispaniarum*, The Spanish Potato, because it grows not only in Spain, but in all the Spanish West-Indies; as also every where almost in our West-India Plantations. 2. *Pappas vel Battata Virginiana*, The Virginian Potato, which grows wild not only in Virginia, but almost every where thro' the whole Continent of Florida. 3. *Pappa seu Battata Anglicana seu Hiberniana*, The English or Irish Potato, which grows in vast plenty in many of our English Gardens, so that now the Roots are sold by Bushels in our London Markets.

The Descriptions.

III. **The first, or Spanish Potato.** It has many firm and sweet Roots, which being boiled, baked, or Roasted, are of a pleasant sweet Taste, exceeding in deliciousness any other Root whatsoever: it is in shape and form somewhat like to Asphodil Root, tuberos, knobby, and from two to eight or ten Inches in length, more or less, with an answerable thickness; much greater than Asphodil Roots, and larger at one end than at another: some sorts of them are longer, others rounder and thicker; some of them of a white color, some of a yellow color, others of a pale brown, and some of a kind of reddish color; and of a white, or yellowish white within, the whole Root being of one solid, compact, or uniform Substance, without any Heart or Pith in the middle, as Carrots and Parsneps have; many of them springing and growing as it were from one Head. From the Head of these Roots spring up many long Branches, which by reason of their weight and weakness cannot stand of themselves, but trail on the Ground, a Yard or half in length, or more, on which are set at several distances, broad, and in a manner triangular, or three cornered Leaves, not very much unlike to those of Ivy, soft in feeling to, and of a dark green color, the two sides whereof are broad and round as to the middle part thereof, but pointed at the end, and growing pretty close together.

Spanish Potatoes

Spanish Potatoes.

IV. **The second, or Virginian Potato.** The Root of this is nothing like the former neither in form, magnitude, color, nor taste, nor resembles it in any thing but the solid, compact, uniform Substance thereof. The Roots are small, some about the bigness of Wall-Nuts, green and all, some lesser by much, and others greater; some of them almost round, some oval, some of a long round, and almost pointed at each end, some smooth, others knobby, all of them being tuberos, of a dirty brown whitish color on the out side, and white within; not of a pleasant sweet Taste, as the Spanish are, but rather of a flatulent, or insipid Taste, which yet being boiled, baked, or roasted, and eaten with Butter, Salt, Vinegar, and a little Sugar, are most admirable Food, and not much inferior to those of the Spanish Kind, (both sorts of them, as also the English following, being very mealy when they are dress'd, for which reason they require a great deal of Butter.) It has many weak and somewhat flexible Branches, leaning a little downwards, or easily born down with the Wind or other things, beset with many Winged Leaves, of a dark grayish green color, whereof divers are smaller, and some

greater than others. The flowers grow many together upon a long Stalk, coming forth from between the Leaves and the great Stalks, every one severally, upon a short foot Stalk, somewhat like to the flowers of Tobacco for the form, being one whole Leaf, six cornered at the brims, but something larger, and of a pale blewish purple color, or pale Dove color, and in some almost white, with some red Threads in the middle, standing about a thick Gold-yellow Pointel, tipped with green at the end. After the flowers are past, there comes up in their places small round Berries or Fruit, as large as a Damson, or Bully, green at the first, and some thing whitish afterwards, with many white Seeds therein like to Nightshade; from the likeness of which Bauhinus upon Matthiolus calls it *Solanum tuberosum esculentum*.

V. The third, or English, or Irish Potato. This is a roundish tuberous Root sometimes smooth, some times knobby, of various magnitudes from the smallness of a Filbert, to bigger than a large Fijl doubled; it is solid, compact, and of one uniform Substance, white within, and reddish without, having a Cuticula or Scarf Skin, over the principal Skin, not sweet in Taste, like those of the Spanish Kind, but of a more flatulent or insipid Taste, when being thoroughly boiled, baked or roasted, are meaty like the others. They are dispersed under the Ground by many small Threads or Strings, from the Head of the Root, and one from another, each encircling in its tuberous bulk, in its station or place where it lies, without running deeper into the Ground, as long Roots usually do.

VI. The Places. The first grow in Spain and Portugal and in the West-Indies, as well among the English and Dutch in our Plantations, as among the Spaniards, who plant them universally for Food. The second grow plentifully in Virginia and through all Florida. The third are only Nurst up in Gardens in England and Ireland, where they flourish and come to perfection, prodigiously encreasing to a vast plenty.

VII. The Times. The first bear their green Leaves all the Summer, which perish with the Stalks at the first approach of Winter, or any great Frost. The second thrust forth their Leaves in the beginning of May, the flowers bud forth in August, and the Roots are fit for Food in September. The last their Roots come to perfection towards the latter end of Autumn, and encrease in largeness and goodness, being a good provision for Food, through the whole Winter.

VIII. The Qualities. The Leaves of Potato are manifestly hot and dry in the beginning of the second Degree, as manifestly appear by the Taste. But the Roots are temperate in respect to heat or cold, dryness and moisture: They Astringe, are moderately Diuretick, Stomatick, Chylifick, Analeptick, and Spermatogenetick.

IX. The Specification. They nourish the whole Body, restore in Consumptions, and provoke Lust.

X. The Preparations. You may have therefrom, 1. The boiled, baked, or roasted Roots. 2. The Broth. 3. Sanguis, The Blood.

The Virtues.

XI. The Prepared Roots. They stop Fluxes of the Bowels, nourish much, and restore in a pining Consumption: Being boiled, baked, or roasted, they are eaten with good Butter, Salt, Juice of Oranges or Limons, and double refined Sugar, as

common Food: they encrease Seed and provoke Lust, causing Fruitfulness in both Sexes: and stop all sorts of Fluxes of the Belly.

XII. The Broth of the Roots. They are first boiled soft in fair Water, then taken out and peeled, afterwards put into the same Water again, and boiled till the broth becomes as thick, as very thick Cream, or thin Hasty Pudding: some mix an equal quantity of Milk with it, and so make Broth: others after they are peeled, instead of putting them into the Waters they were boiled in, boil them only in Milk, till they are dissolved as aforesaid, and the broth is made pleasant with sweet Butter, a little Salt and double refined Sugar, and so eaten. It has all the Virtues of the Roots eaten in Substance, nourishes more, and restores not only in an *Atrophia*, or pining Consumption, but also in a *Pthipsis* or Ulceration of the Lungs.

XIII. Sanguis, or The Blood of Potatoes. It is made as the Blood of Strymon, Parsneps, Eddo's, Comfrey, and other like Roots. It may be taken on a Spoonful or two, Morning, Noon, and Night, in a Glass of choice Canary, Tent, Alicante, old Malaga, or other good Wines. It restores in deep Consumptions of all Kinds, nourishes to admiration, is good against Impotency in Men and Barrenness in Women, and has all the other Virtues of both the Prepared Roots and Broth.

PRICKET, see Stone Crop, Chap.

CHAP. DLXXVIII.

OF PRICK -- MADAM.

I. THE Names. It is called in Greek, *Ἀνίσων σκωληκώδης*: in Latine, *Vermicularis*, *Sedum Vermiculare*, *illecebra vermiculata*: and in English, *Prick Madam*, (being a certain Kind of small Houseleek, or Stone Crop.)

II. The Kinds. There are several Species of it as, 1. *Ἀνίσων σκωληκώδης ἡ βαρύφυλλος*, *Vermicularis Arborescens*, Tree Prick-Madam. 2. *Ἀνίσων σκωληκώδης βαρυφύλλος*, *Vermicularis frutescens altera*, Shrubby Prick-Madam, or the lesser Tree Prick-Madam. 3. *Sedum minus Hemarodes*, *sempervivum minus primum Dodonæi*, *Sedum minus mas Eucharis*, *Vermicularis sive illecebra major vulgaris*, The Common greater Prick-Madam. 4. *Sempervivum minus æstivum Lobelij*, *Sedum minus sextus Clusij*, *Vermicularis sive illecebra minor*, *Aizoon medium Thalij*, The lesser Prick-Madam, or small Stone Crop.

The Descriptions:

III. The first, or Tree Prick-Madam. Its Roots are long, woody, and spreading in the Ground; this Plant rises up to be five or six Feet high, as I have sometimes observed it, when it is planted in Gardens in a good Soil, and is plentifully stored with Branches, from the bottom to the top, and thick set with small, long, and round green Leaves, without any Taste, very like to those of the small Houseleek, called Stone Crop, (but Lobel says, it has a kind of Salty Taste) yet lesser and greener.

The

The Flowers grow at the tops of the Branches, smaller than the next which follows, and of a pale yellow color. The Branches hereof slipped and put into the Ground, will quickly take Root and grow.

IV. The second, or Shrubby Prick-Madam, or lesser Tree Prick-Madam. Its Root is hard and woody; nor does this Plant grow so high as the former, not being much above a Foot high. It is full of Branches, and covered with an Ash colored Bark, as limber and as pliant as the former. The Leaves hereof are somewhat greater and larger than the other, of a more Salty Taste, and of a darker green. The Flowers grow at the tops of the Branches, and are larger than those of the first, but fewer, and of a yellowish color.

V. The third, or Common greater Prick-Madam. Its Roots are very small and creeping in the Ground, and send forth Stalks with Leaves here and there all about. This Common greater Prick-Madam, (which some call also Common greater Stone Crop) grows upon the Ground with divers trailing Branches, set with many thick, fat, and somewhat round, whitish or yellowish green Leaves, a little pointed at the edges. The Flowers grow at the tops of the Branches, many set together, yet somewhat loosely, and not in a thick Tuft or Cluster as the Orpines, and are of a yellowish color.

Prick-Madam small.

VI. The fourth, or Lesser Prick-Madam, or small Stone Crop. Its Root is creeping, in like manner as the former, or Common greater Prick-Madam, and shoots it self forth in divers places also. It has small and long Leaves like the last going before, which are set upon short foot Stalks, not much above an Hand breadth long, which are not so thick, but more flat, and of a more Styptick Taste. The Flowers are of a paler yellow color, and greater than the former, but standing in sparsed Tufts in the same manner. It looses both Leaf and Stalk in Winter.

VII. The Places. The first and second grow by the Sea side, and farther off likewise, where the second will have a brackish Taste, as well as when

it grows near the Sea. The third grows many times in Gardens, and in other Places upon Stone Walls, and tops of Houses, almost every where. The fourth grows among Rubbish, and in the Borders of Fields open to the Sun, also on Mud, or on Stone Walls, and on other Sandy and Gravelly places, and often times upon the sides of old Tiled Houses and Penthouses in many parts of the Kingdom.

VIII. The Times. The first and second Flower in August, or very late with us: The third and fourth Flower in June and July, and sometimes sooner.

IX. The Qualities. They are cold in the third Degree, and dry in the first. Absterfive, Anodyn, Repercussive, and Vulnerary.

X. The Specification. It is good against the Gout, Pains, Aches, Strangury, scalding and heat of Urine, Stone, Gravel, burning Fevers, Head-ach, Bleeding at Nose, Inflammations, Erysipelas, Pimples, Shingles, Tettars, Ringworms, and other breakings out: as also stops Fluxes of Humors to any part, and is good to heal fretting Sores, old Ulcers, Cankers, Burnings and Scaldings, with Fire, Water, or other things. It is said to waste away Warts and Corns, and to free the Skin from Scurff, Morpew, and other defilements and deformities thereof.

XI. The Preparations. You may have therefrom, 1. The green Leaves. 2. A Liquid Juice. 3. A Syrup. 4. A Posset. 5. An Oil or Ointment. 6. A Cataplasme. 7. A Distilled Water.

The Virtues.

XII. The green Leaves. Rubbed upon the Teeth and Gums, is good against the Scurvy in them, so also being laid between the Lips and Gums all Night for a Week or Fortnight or more. Rubbed also upon Warts or Corns it causes them to waste away.

XIII. The Liquid Juice. It cools Inflammations in the Eyes, being dropt into them, as also in other parts of the Body: it stops Bleeding and all hot Defluxions of Rheum into the Eyes, or Ears, and eases the pains of the Ears being dropt into them. Taken inwardly to a Spoonful or more in Mead, Spring Water, or in Barly Water, or in Red Wine, it stops the overflowing of the Terms in Women, and all sorts of Fluxes of the Bowels, proceeding from heat and sharp Humors. It Kills Worms in the Stomach and Guts, and being bathed upon the places, is good against the bitings of Venomous Beasts. It is profitable also against Anthonyes Fire, Shingles, Tettars, Ringworms, Scurff, Morpew, Tannedness, Sun-burning, Yellowness, and other defilements and deformities of the Skin, being bathed upon the Places, and double Cloths dipt in the same, being also applyed over.

XIV. The Syrup. It is good against Inflammations of Stomach and Lungs, Burning Fevers, and the hot Fits of Agues, being given a Spoonful or two, or more at a time, in a Glass of the Distilled Water.

XV. The Posset Drink made of the Juice. It has the Virtues of the Syrup, being taken in the same manner: and is good to cool and heal raw and galled places in Children, the parts being bathed therewith, and then afterwards anointed with the Oil or Ointment.

XVI. The Oil or Ointment. They cool Inflammations in any part, heal Shingles, Burnings and Scaldings

Scaldings with Fire, Water, Oil, or other things, as also Cankers, running Sores, fretting Ulcers, Pimples, Leprosy, and other like Breakings out of the Skin. They give ease in the Gout, and all other pains proceeding from heat, and hot scalding or sharp Humors, in what part of the Body soever: and have all the Virtues of the *Liquid Juice*, as to outward applications. Anointed on the Fore-Head, Temples, and Crown of the Head, it eases the Head-ach, Megrim, and allays the disordered heat of the Brain.

XVII. *The Cataplasim.* Applied to Inflammations, simple Contusions or Bruises, *Anthony's Fire*, or other hot and fiery eruptions in the Skin, it alleviates the heat, and cures them; so also applied in the Gout it gives ease to the part; and applied to the Crown of the Head and Temples, it is good against Frenzies, Deliriums, and Madness, eases the pains of those parts, and cools and allays the preternatural heat of the fame; and has indeed all the Virtues of the *Juice*, *Oil* and *Ointment*, as to external Applications.

XVIII. *The Distilled Water.* Drank Inwardly, it has all the Virtues of the *Juice* and *Syrup*, tho' not altogether so powerful; it quenches Thirst; allays inward Heats and Inflammations, and abates the sharpness of Humors in the Stomach. Outwardly, it has all the Virtues of the *Juice*, *Oil* and *Ointment*, and in especial is an incomparable thing against an *Erysipelas*, and all External Heats, Pimples, eruptions of the Skin, and other detestations and deformities thereof. The *Distilled Water*, or the *Juice*, being bathed on any place stung with Nettles, Bees, or Wasps, or bitten with any Venomous Creature, it presently gives ease, and takes away the pain thereof.

CHAP. DLXXIX.

OF PRIMROSE.

I. **THE Names.** It is called in *Latine*, *Primula veris* (for I know no *Greek* Name it has) which Name I suppose it has obtained, because it is one of the first of those Plants which Flower in the Spring; also, *Alysia Sylvarum Columne*: and in *English*, *Primrose*.

II. *The Kinds.* The *Primrose* is said to be a Species of *Herba Paralytis*, or *Cowslip*: and of this Species, there are two principal Kinds, viz. I. *Primula Veris*, or *Primrose*, specially so called, of which we shall treat in this Chapter. II. *Primula Veris pachyphyllis Lugdunensis*, *Auricula Ursi*, The Bears Ear *Primrose*, of which we shall treat, God willing, in the next Chapter following.

III. *The Kinds of the Primrose specially so called.* Of this there are these following Species, viz. 1. *Primula veris flore albo*, The single white *Primrose*. 2. *Primula veris flore viride simpliciter*, The single green *Primrose*. 3. *Primula veris flore viridante & albo simpliciter*, The single green and white *Primrose*. 4. *Primula veris flore viridi dupliciter*, The double green *Primrose*. 5. *Primula veris hesketti flore multiplici separatim diviso*, *Hesketti* double *Primrose*. 6. *Primula hortensis flore pleno vulgaris*, The common double Garden *Primrose*. 7. *Primula veris minor flore dupliciter*, The small double *Primrose*. 8. *Primula veris turcica flore purpureo tradescanti*, The *Turky purple Primrose*. 9. *Primula veris flore chermesino turcica*, The

Turky crumion Primrose. 10. *Primula veris rubra*, The red *Primrose*. 11. *Primula veris rubra*, The fair red *Primrose*. 12. *Primula veris phenicea*, The scarlet *Primrose*. 13. *Primula veris flore geminato rubro*, The red *Primrose* *Hofe* in *Hofe*. 14. *Primula veris rubra flore dupliciter*, The double red *Primrose*.

The Descriptions.

IV. *The first, or Single white Primrose.* It has a long, stringy, fibrous and bushy Root, from the Head of which rise up many Leaves, almost all in a cluster, which are sometimes 2, 3, or 4 Inches long, and sometimes 1 or 2 broad, rough, full of Veins, and unevenly waved about the edges, narrow

Primrose.

at the bottom, and from thence gradually increasing in breadth till they come to their full breadth near the top, after which, they presently grow narrow, and end in a something obtuse point. From among these Leaves spring up several small whitish yellow stalks, about 3, 4, or 5 Inches in height, at the tops of which the flowers grow in a small rough whitish Husk, and of a pale or whitish yellow color, having five roundish Leaves dented about the middle of their edges, and of a pleasant sweet color. There is another Kind hereof, which is somewhat smaller, and bears Milk white Flowers, without any show of yellowness in them, which are usually brought into Gardens for their rarity, and differ not from these just now described, either in Root, or Leaf, or any thing else, but having those yellow Spots smaller, and not so deep, as in the other Wild Kinds.

V. *The second, or single green Primrose.* This has its Leaves very like unto the Greater double *Primrose*, but smaller, and of a sadder green color.

and

The Flowers stand severally upon long foot Stalks, as the first Single Kind does, but larger than they, and more laid open, of the same, or very near the same yellowish green color that the Husk is of, so that at first opening, the Husk and the Flower, seem to make but one double green Flower, which afterwards separating themselves, the single Flower grows out of the Husk and spreads it self open, much more than any other Single Primrose does, growing in the end to be of a paler green color.

VI. The third, or Single green and white Primrose. The Leaves of this differ in a manner, nothing from the former, neither does the Flower, but only in this, that out of the larger yellowish green Husks, which contain the Flowers of the former, there comes forth, out of the middle of each of them, either a small piece of a whitish flower, or else a larger, sometimes making up a whole Flower, like an ordinary Primrose.

VII. The fourth, or Double green Primrose. This Plant is in its Leaves, so like the former Green Kinds, That the one cannot be known from the other, untill it come to Flower, and then it bears upon every Stalk a double green Flower, of a little deeper green color than the Flower of the former Single Kind, consisting but of two rows of short Leaves most usually, and both of them of an equal height above the Husk, abiding a pretty time in Flower, more especially if it stands in a shady place, or where the Sun can come but a little to it.

VIII. The fifth, or Heskett's double Primrose. It is very like unto the Double small Primrose, as well in Root, as in Leaf, and Magnitude, the Stalk not rising much higher than it, but bearing Flowers in a far different manner. For this bears not only single Flowers upon several Stalks, but sometimes two or three single Flowers upon one Stalk, and also at the same time a bigger Stalk, and something higher, having one green Husk at top thereof, sometimes broken on the one side, and sometimes whole, in the middle whereof stands sometimes, divers single Flowers thrust together, every Flower to be seen in its proper form. And sometimes there appears with some whole Flowers, others which are but parts of Flowers, as if the Flowers, were broken in pieces, and thrust into one Husk. The Leaves of the Flowers (being of a white or pale Primrose color, but a little deeper) seldom rising above the height of the very Husk it self, and sometimes, as I have observed in this Plant, it will have upon the same Stalk, which bears such Flowers as are here described, a small Flower or two, making the Stalk seem Branched into many Flowers, by which it is manifest, that it will diversify it self into many forms, not abiding constant in any Year, as the other Kinds do.

IX. The sixth, or Common double Garden Primrose. The Leaves of this are very large, and like unto the Single Kind, but something larger, because of its cultivation in Gardens. The Flowers do stand every one severally, upon long slender foot Stalks, as the Single Kinds do; in greenish Husks, of a pale greenish color, like unto the Field Primrose; but very thick and double, and having the same sweet Smell with them.

X. The seventh, or Small double Primrose. This is in Root, Leaf, and Flower, altogether like unto the last Double Primrose, but that it is smaller in every respect, for the Flower rises not above 2 or 3 Fingers high, and but twice double, that is, with two rows of Leaves, yet of the very same Primrose color which the former is of.

XI. The eighth, or Turkey purple Primrose. The Leaves of this are so like the other Primroses, that they can very hardly be distinguished until the

Flowers appear: but the chief difference in the Leaves is, that they are something longer, rounder pointed, and a littlereddish at the very bottom of the Leaves. The Flowers are as large as any other Primrose, or rather larger, made of five Leaves like unto them; but of a delicate Violet purple color; the bottoms of them yellow, circled as it were with a deep Saffron like yellow, which adds a greater grace thereto: in other things it is like to the Common or Ordinary Primroses.

XII. The ninth, or Turkey crimson Primrose. This differs but little from the last, neither in its Leaves, Stalks, Flowers, magnitude, and form of growing, nor indeed in any thing, except in the color of the Flowers, which in this is crimson, as in the other it is purple.

XIII. The tenth, or Red Primrose. This is of a newer date than any of the former; has more beauty, and greater variety than the former. In Roots, Leaves and fashion, it differs not from the Common single Field Primrose, only the tops of the Roots, and bottoms of the Stalks are of a reddish color; but the greatest difference is in the colors of the Flowers, there being of them, almost twenty diversity of reds, some deeper, and others lighter, from Blood red, to a pale Pink color, some are of a bluish Rose color, paler and paler, some of a Brick color, some of a Dove color, others of the color of an old Buff Coat, and some Hair color, all which Kinds have been raised from Seeds, as also, these more excellent Kinds following.

XIV. The eleventh, or Fair red Primrose. It is a pleasant Flower, of a most beautiful, rich, shining, Velvet, red color, with a yellow Star in the bottom, as in all the rest.

XV. The twelfth, or Scarlet Primrose. It is a Flower of very great esteem, and of a bright scarlet color, and more rare than any of the former Kinds.

XVI. The thirteenth, or Red Primrose Hose in Hose. It has many Stalks rising from one Root, each of which bears a Flower, and has Hose in Hose upon every Stalk; that is two Flowers ingeminated, one standing within the other, in some bigger, and of a deeper red color, in others lesser and paler. Of this Kind Mr. Rea says, he had raised six several diversities, differing from each other, either in size, fashion, or color.

XVII. The fourteenth, or Double red Primrose. This is the rarest of all the Kinds. The Flower is said to be almost as large, thick and double, as the Common pale yellow Kind, and of a fair red color. For the sake of this Flower, much Seed has been sown, in hopes to have obtained it.

XVIII. The Places. The first three Kinds have been found growing Wild in most places of this Kingdom. The eighth and ninth came to us out of Turkey: but now all the various Kinds here Treated of, are found to grow in Gardens, and are Nurst up by the diligent lovers of Flowers. The English Kinds are hardy and prosper in any place, which is not too hot, or too much in the Sun. The Red Kinds are planted, sowed, and ordered in the same manner as we do Bears Ears. Yet if sowed in a Bed of good Earth, towards the end of September, they will come up in the Spring, and soon come to bear Flowers. Heskett's Primrose grows in Clapdale Wood, 3 Miles from Settle, in Yorkshire.

XIX. The Times. Primroses Flower generally very early in the Spring, and sometimes again in Autumn. Some Flower earlier, some later, and some in the midst of Winter, as they are detended from Cold and Frost, and the mildness of the Winter will admit. The Common double Primrose Flowers,

Flowers in April: the Common single and red Kinds in March: and many of them will begin in September, and continue bearing Flowers all Winter unless checked by hard Weather.

XX. The Qualities, Specification, Preparations, and Virtues of Primroses, are the same with those of Cowslips, in Chap. 157. Sect. 18. ad 32, foregoing, to which we refer you.

XXI. An Observation. The Juice of Primrose Roots. Being Snuff'd up the Nose, or gently Syringed up with a small Syringe, it purges the Head and Brain of cold, moist, and pituitous Humors, which afflict the Original of the Nerves, and cause Apoplexies, Epilepsies, Vertigo's, Megrim, Head-ach, Carus, Lethargy, Convulsions, Palsies, Rheumatisms, and other Diseases of like Kind. I cured a Man who had four Fits of an Apoplexy, by the use of this Errhine; and a little Youth of an Epilepsy, by the use of it seven or eight times, and taking the Powder of the Root also inwardly: I cured an Ancient Gentlewoman of a Lethargy therewith; and two other Young Gentlewomen, one of a Megrim, the other of an inveterate Head-ach.

XXII. Another Observation. The Powder of the Roots. Given to a Dram and half, or more, it purges the Head, Brain, and Stomach, of cold, moist and putrid Humors; and is prevalent against all the Diseases for which the Errhine or Juice is exhibited. It purges Choler and Flegm very well. With 10 Doses of this Powder I cured a middle Aged Woman of the Palsy: and with much the like number of Doses, I cured a Man of 50 Years old, of the Gout; proper Topicks being also in the mean season applied.

XXIII. A third Observation. The Decoction of the Roots in Wine. It is good against the Stone in the Reins and Bladder, and heals inward Wounds and Bruises; and bathed upon weak Joints it strengthens them. The Decoction of the Leaves and Flowers in Wine, being drank, it is good against Asthma's, Coughs, Colds, Hoarseness, Wheezings, shortness of Breath, and all other Diseases of the Breast and Lungs; and is said to draw any Thorn or Splinter out of the Flesh.

C H A P. DLXXX.

of PRIMROSE Bears Ear.

Vulgarly called

AURICULA.

THE Names. This Plant knows no Ancient Greek Name; but it is, called by *Lugdunensis*, *Primula veris* *primula* (from the thickness of the Leaves) *The thick Leav'd Primrose*. It is also called *Sanicula Alpina Baudini & Gesneri*, for they will have it to be a Species of the *Sanicles*; however it is a very good Wound Herb: by others, *Sanicula altera*, *Paralytica Alpina*, *The Alpine or Mountain Cowslip*, because it is certainly of the Family of the *Cowslips*: but now in our time it is mostly called *Auricula Urfi*; and we in English call it, *the Bears Ear Primrose*, also *Bears Ear*, and *Auricula* (without any other addition,) which is the most Common and usual Name.

II. The Kinds. We have already treated of these *Auricula's* under the Title of *Bears Ear*, in Chap. 59. foregoing, where we have given you a compleat Description of the three principal Kinds, which may serve for all the several individual Species of *Auricula*. But they being properly *Primroses*, and this being the place, in which they ought to be methodically treated of, we shall for the sake of *Florists*, and all Lovers of the Flower Garden, expatiate our Discourse, and more largely shew you a great many of the Individuals, which for brevity sake we before omitted. We shall treat of them, with respect to their colors, which are chiefly, 1. *Purple and Blew*. 2. *Red or Scarlet*. 3. *Yellow or Buff*. 4. *White*. In each of which we shall shew you so many fine and delicate Species or Individuals, as may be sufficient to Stock a *Florist's Garden*, who from their Seeds, being managed according to the following directions, may raise many new Varieties. The number of the various sorts being many, we shall not give you their Names here, but put them to each Plant, in its order, as it is treated of.

The Descriptions.

I. Purples and Blews.

III. 1. *Auricula Urfi Flore purpureo*, Purple Bears Ear. Its Root is composed of many whitish Strings springing from the main long Root, which is very like to a Cowslip, or Primrose Root, as it is in all the other parts besides. From the Head of this Root spring up many green Leaves, something long and smooth, narrow from the bottom of the Leaf to the middle, and broad from thence to the end, being round pointed and a little snipt,

Auricula.

or indented about the edges. In the middle of these Leaves, and sometimes at the sides also, do spring round green Stalks four or five fingers high, bearing at their tops, many Flowers, the Buds whereof, before they be blown, are of a deep purple color, and being open, are of a bright, but deep purple, usually called a Murrey color; consisting of five Leaves a piece, cut in, or indented at the end, as it were into two, with a whitish ring or circle at the bottom of each Flower, which stand in small green Caps: in which after the Flowers are fallen, are contained very small Heads, not rising to the height of the Caps, bearing a small Prick or Point at the top of them, in which is small blackish Seed.

IV. 2. *Auricula Urst purpurea absque orbe*, The Murrey Auricula without Eyes. This is another of the former Kind, whose Leaf is somewhat less, as is also the Flower, but of the same color, and sometimes something redder, tending to a scarlet, without any circle at the bottom of the Flower: but in nothing else, differing from it.

V. 3. *Auricula Urst flore purpureo ceruleo*, The Violet purple colored Bears Ears. The Leaves of this are something mealy and large; and the Flowers hereof, are of a paler or blower purple than the first, something tending to a blew.

VI. 4. *Auricula Urst flore purpureo eximio*, The beautiful purple Auricula. It is a strong Plant with large Leaves, having a big tall Stalk, bearing a great Truss of many fair, fine, rich, purple Flowers, with Snow white Eyes, which will not wither yellow with Rain, as some do, but abide white to the last.

VII. 5. *Auricula purpurea pulcherrima*, A fine purple Bears Ear. This is like the former in all the parts, but that the great Head of Flowers stands more erect, and is of a deeper purple color, with broader white Eyes.

VIII. 6. *Auricula purpurea alia*, Another purple Bears Ear. It is a very good Flower, fair and large, many on one Stalk, of a lighter purple than any of the former, with fair white Eyes. There is another of this kind, something like this in color, but brighter, and bearing more Flowers, with large round white Eyes.

IX. 7. *Auricula purpurea bona*, The good purple Bears Ear. It is an excellent good Flower, and bears a great Truss of rich shining purple Flowers, with very large white Eyes.

X. 8. *Auricula purpurea colore albo radiata*, The purple striped Auricula. It is small in all its parts, has a weak low Stalk, bearing 4 or 5 purple Flowers, striped with white. And of this sort and color there is one which bears double Flowers.

XI. 9. *Auricula flore ceruleo folio Boraginis*, The Borage Leaved blew Auricula. It is brought into the Kindred of the Auricula only for the form of the Flowers sake. It has a Root which is long and brownish, with many small Fibres annexed to it. It has several rough, broad, hairy Leaves, spread on the Ground, like to those of Borage for the roughness, but much lesser, the Leaves hereof being something rent in some places on the edges. From among these Leaves rises up one Stalk, but sometimes two or more Stalks, which are brown and hairy, five or six Inches high or thereabouts; each bearing at the top three or four Flowers apiece, consisting of five Leaves, which are large and sharp pointed, of a fair rich blew, or bright azure color, with some small yellow threads in the middle, standing in small green Caps. This Plant as it is rare, so it is tender, and impatient of our cold Winters, and therefore requires to be planted in a Pot, that it may be housed in Winter.

XII. 10. *Auricula Urst flore purpureo duplici vario*, The various double purple Flower'd Auricula. This purple Flowered, has its Flowers but once more double than the single, but is various in its purple color.

XIII. 11. *Auricula Urst flore caelestino*, The azure or Sky blew Bears Ears. This has its Leaves broader, and of a dusky yellowish green color, the Flowers being of a bluish color, tending to a purple.

XIV. 12. *Auricula Urst flore ceruleo diluto*, The pale blew Auricula. It is something like unto the last in its green Leaves: but the Flowers are of a paler blew color.

XV. 13. *Auricula Urst flore purpureo rubro vario*, The fair Collier, or Violet purple colored Auricula. It has a pale greenish Leaf, without dents, and somewhat a large Flower of a delicate Violet purple color, something sad, but very lively.

XVI. 14. *Auricula Urst flore purpureo ceruleo folio incano*, The purple blew Auricula, with a mealy Leaf. The Flower is of a purplish blew color, with a white bottom, and a mealy Leaf.

II. Reds, Crimfon and Scarlet.

XVII. 15. *Auricula Urst flore rubro saturo orbe luteo*, Deep, or blood red Auricula, with a yellow Eye. It has small and long green Leaves, nothing mealy, but snipt about the edges, from the middle of the Leaves forwards to the ends. The Flowers hereof are of a deep red color, tending to a blood red, with a deep yellow circle, or rather bottom in the middle.

XXVIII. 16. *Auricula Urst flore rubro saturo absque orbe*, The deep, or Blood red Auricula without an Eye. This is another Kind, having small and long green mealy Leaves, smaller than any that have mealy Leaves. The Flowers are of the same deep red color with the last described, but without any Eye or circle at bottom, of any other color whatsoever.

XIX. 17. *Auricula Urst flore obsoleto magno*, The Spanish bluish Auricula. This Great Auricula, has as large Leaves as any other of this Kindred whatsoever, and whitish or mealy withall, something snipt about the edges, as many others of them are. The Flowers stand at the top of a strong and tall Stalk, larger than any of the others, being of a dusky bluish color, resembling the bluish of a Spaniard, whose tawny Skin cannot manifest so pure a bluish, as the English can, for which reason it is called the Spanish bluish.

XX. 18. *Auricula Urst flore rubello*, Scarlet or light red Auricula, or Bears Ear. The Leaves of this Kind are very like the Leaves of the first purple Kind, but that they are not so thick, of a little paler green color, and little or nothing snipt about the edges. The Flowers are of a bright, but pale reddish color, not half so deep as the two, with white Eyes or circles in their bottoms; in other things it differs not from others.

XXI. 19. *Auricula Urst colore roseo*, The Rose colored Auricula or Bears Ear. The Leaf of this is almost as large as any of the former, and a little mealy. The Flowers are of a light red, or Damask, or Province Rose color very near, with a white Eye at bottom.

XXII. 20. *Auricula Urst imperialis*, The Imperial Auricula or Bears Ear. It might be reckoned with the Purples, but is rather a dark or dead Red,

Red, it has small Leaves and a short Stalk, but bears many fair Flowers close set together, of so dark a red or purple color, that with out much error it may be called black, with fair Snow white Eyes.

XXIII. 21. *Auricula Urſi Imperator vocata*, The Emperor. It is like the last, only a little bigger in all its parts, but of as dead or black a red color, with fair white Eyes. This has been lately raised from Seed.

XXIV. 22. *Auricula Urſi Flore rubro ſive Coccineo*, The red or Scarlet Auricula. This is of divers sorts, it has large Leaves, a strong upright Stalk, bearing a great Truss of fine scarlet Flowers, with Snow white Eyes.

XXV. 23. *Auricula Urſi Flore Sanguineo*, The Blood red colored Auricula. It is of two sorts, 1. *Flore Sanguineo saturo*, which is of a deep crimson Velvet color. 2. *Flore Sanguineo diluto*, or fair bright Crimson. It has Leaves of a middle size more green than mealy, and Flowers of a bright crimson color, larger than the deep Blood red following.

XXVI. 24. *Auricula Urſi Flore Sanguineo saturato*, The Crimson, or deep Blood red Auricula. It has a yellowish green Leaf, something small and long, with a few dents on the edges. The Flowers are of a deep Blood red color with a yellow Eye, and but a few upon a Stalk.

XXVII. 25. *Auricula Urſi Flore Carne color Variegata*, The various Flesh colored Auricula. Of this Flesh and bluth colored Auricula, there are various sorts, some paler, some deeper, more or less beautiful by much than others, and with such wonderful variety of colors, not easily to be expressed, which arise almost every Year from the Seed. There are divers other sorts of Reds inclining to Scarlet, Crimson, Carnation, Rose colors, and Bluishes, some redder, some yellower than others, some with large Flowers, and many on a Stalk, with white or pale yellow Eyes, for many of which new invented Names have been imposed, not worth our Remembering here.

XXVIII. 26. *Auricula Urſi versicolor prima*, *fve Flore rubescence*, The Prime or Chief variegated bluth Auricula or Bears Ear. Its Leaves are as large, and as hoary and mealy as the third or Greater yellow or Straw colored Auricula, at Sect. 21. following; from among which rises up a Stalk about 4. or 5 Inches high, bearing from 6 to 12 or more fair Flowers, something larger than the Smaller yellow Auricula, having the ground of the Flower of a dark or dun yellow color, shadowed over a little, with a shew of light purple, which makes a kind of bluth color, the edges of the Flower being tipped with a little deeper shew of that purple color, the bottoms of the Flowers being wholly yellow, without any Eye or Circle, and is of very great beauty, making an admirable variable colored Auricula.

III. Yellows, Buff, and Tawney.

XXIX. 27. *Auricula Urſi maxima lutea Flore Eleganti*, The greatest fair yellow Auricula or Bears Ear with Eyes. It has many fair and large thick Leaves, something mealy or hoary upon the greenness, being larger than any other Kind, except the Spanish Bluth, at Sect. 19. foregoing, and the next Yellow following, smooth about the edges, and without any indenting at all. The Stalk is large, round, and not higher than in some others of the former, but bearing many more Flowers thereon than in any other Kind, many times to the number

of thirty, standing so round and close together, that they seem to make a Nofegay alone, and of the same fashion with others, but that the Leaves are shorter and rounder, yet with a notch in the middle the rest, of a fair yellow color, neither very pale nor deep, with a white Eye or Circle in the bottom, about the middle of every Flower, which gives it the greater grace. The Seed is of a blackish brown color like unto others, but contained in greater round Heads than any other, with a small pointed sticking in the middle. Its Root is greater and thicker than any other, with long Strid Fibres but greater than any of the former.

XXX. 28. *Auricula Urſi major lutea folio incavo*, The greater yellow Auricula, or Bears Ear. Its Leaves are larger, and more hoary or mealy than the last or any other of these Kinds. The Flowers are not so many, but longer and not so thick set together, but of a deeper yellow color, without any Eye, or Circle in them.

XXXI. 29. *Auricula Urſi major Flore Pallida*, The great Straw colored Auricula, or Bears Ear. This has almost as mealy Leaves as the last, nothing so large. The Flowers are of a pale yellow color, with an Eye or white Circle at their bottoms. These three last have no shew or shadow of any other color in any part of the edge, as some others which follow have.

XXXII. 30. *Auricula Urſi minor Flore pallente*, The lesser Straw colored Auricula. The Leaves of this are less mealy, or rather of a pale greenish little mealy withal. The Flowers are of a yellow, than the last, and it bears almost as many upon a Stalk, as the first Great yellow.

XXXIII. 31. *Auricula Urſi minor lutea*, The lesser yellow Auricula, or Bears Ear. Its Leaves are nothing so large, as either of the three former yellow Kinds, but rather of the bigness of the first White Kind, at Sect. 43. following, but yet a little larger, thicker and longer than it, having under the greenness a small shew of meanness, and something snipt about the edges. The Flowers are of a pale yellow color, with a small white Eye or bottom in them. The Seed and Roots are like the other Kinds.

XXXIV. 32. *Auricula Urſi Flore flavo*, The deep yellow Auricula, or Bears Ear. This has something larger Leaves than the last, of a yellowish green color, without any meanness on them, or indenting about the edges, but smooth and whole. The Flowers are not larger but longer, and not laid open so fully as the former, but of as deep a yellow color, or deep Cowslip color, without any Circle in the bottom. Neither of these two last have any shew of other colors than yellow in them, saving the white in the Eye.

XXXV. 33. *Auricula Urſi minor Flore fuvio*, The tawny Auricula, or Bears Ear. It has a greater shew of meanness in its Leaves, than is to be seen in the Second Kind, at Sect. 4. foregoing, and snipt or indented at the ends like that, the Flowers are many, of the same fashion with these, but smaller, each of which is of a deep Marrey, or rather Tawney color when it is blown, as the Buds of the above named are before they are blown, having an Eye or white Circle at bottom, which is yellowish in the middle below the Circle.

XXXVI. 34. *Auricula Urſi Crinis coloris*, The Hair colored Auricula. Its Leaves are more mealy than those at Sect. 28. foregoing, and somewhat longer and larger, snipt also about the edges in the same manner, from the middle of the Leaf forwards. The Flower is usually of a fine light brown yellow color, by some called Hair color, and sometimes browner. The edges of the Flower have a shew or shadow

shadow of a light purple or blush about them, but more on the outside than on the inside. Of this Species there are divers sorts.

XXXVII. 35. *Auricula Urfsi versicolor lutea*, The yellow variable Bears Ear, or Auricula. Its Leaves are green and something like to the Deep yellow, at Sect. 34. foregoing, but something of a fresher green, more shining and smaller, snipt also about the edges towards the ends, as many of those before are. The Flowers are of a fair yellow color, much laid open, when they are full blown, that they seem almost flat, dash about the edges only, with purple, being more yellow in the bottom, than in any other part.

XXXVIII. 36. *Auricula Urfsi versicolor lutescente viride Flore*, The Variable yellow green Auricula, or Bears Ear. Its Leaves are green, much like to those last described, and snipt in like manner about the edges: but in this it differs, that its Leaves do not turn or fold themselves a little backwards. The Flowers are of a yellowish green color, more closed than the former, having purplish edges, especially after they have stood blown some time, and have little or none at the first opening, nor yet any Eyes or circles at all in them.

XXXIX. 37. *Auricula Urfsi Flore luteo eximio*, The Noble yellow Flowered Auricula. It bears the largest Flower and biggest Truss, of the deepest yellow color having white Eyes. Of this Species there are some whose Flowers are of a Buff color, some yellower and some dunner than others, which are in good Esteem. There is also one, which on a short Stalk bears four or five double Flowers, with three rows of Leaves in each Flower.

XL. 38. *Auricula Urfsi versicolore luteo*, The variable yellow Auricula. Its Ground is yellow, but it is so diversified or varied with other colors, impossible to be expressed in Words, and they are so many that some Authors have said, they are numberless.

XLI. 39. *Auricula Urfsi Flore luteo Fusco*, The Leather Coat Auricula, or Bears Ear. It is of two Kinds, the greater and lesser, and deeper and paler, one than other. They have all large mealy Leaves, yet not so much as in the Greatest yellow, but yet it seems that they are produced from thence, they come so near to it. Of this sort is the Shammy colored.

XLII. 40. *Auricula Urfsi Flore Limoniaco*, The Limon colored Auricula, or Bears Ear. It is of a delicate pale yellow color, and of a middle size, both for Leaf and Flower. Of this other sort of plain yellows, there are a very great number, impossible to be distinguished.

IV. Whites.

XLIII. 41. *Auricula Urfsi major Flore albo*, The great white Auricula, or Bears Ear. Its Root is like the Purple Kind, as all or most of the rest are, or not much differing. It has many fair whitish green Leaves some what paler than the Leaves of any of the Kinds of Auricula, and a little snipt about the ends, as many others are. From among these Leaves rise up Stalks four or five Inches high, bearing at the top many Flowers, like unto the Small yellow Auricula, at Sect. 33. foregoing, of a pale whitish color, tending to yellow at the first opening of the Flower, which after 2 or 3 days, change into a fair white color, and so continue all the while it Flowers.

XLIV. 42. *Auricula Urfsi minor Flore albo*, The lesser white Auricula, or Bears Ear. It has smaller

Leaves, of a little darker green color. The Stalk and Flowers are likewise lesser than the former, and have no show of yellowness at all, in either Bud, or Flower, but is pure white, not differing in other things from the rest.

XLV. 43. *Auricula Urfsi Flore Niveo*, The Snow white Auricula, or Bears Ear. The Flowers are of a pure Snow white color, but smaller than those in Sect. 44. above; otherwise in all other things they are much alike.

XLVI. 44. *Auricula Urfsi Flore albedo vel Palido*, The whitish Auricula, or White mixt with a pale blush. Of these there are various Kinds according to the differing mixture of the red with the white, the white most predominating.

XLVII. 45. *Auricula Urfsi Flore albo Lacteo*, Lac Virgineum, & Lac Virginis dista, The Milk white Auricula; called also, Virgins Milk, which is accounted the best among the Whites. It has large mealy Leaves, a tall strong Stalk, with a great Truss of Milk white Flowers, with Snow white Eyes, which placed among the Purples sets off, and adds to their glory. There are many perfectly white, and many Milk whites, but not many of better esteem than the Yellows.

XLVIII. 46. *Auricula Urfsi Flore multiplici albo Lacteo*, The double Milk white Auricula, or Bears Ear. The Leaves are like the former, The Stalk bears but one Flower on its top, but it is very double, and like the Common double Primrose.

XLIX. The Places. These goodly Plants grow Naturally on Mountains, especially on the Alps in divers places, for which reason some call them *Primula veris Alpina*: some of them have been found also on the Pyrenean Mountains: but that Kind with the Borage Leaf, has been found on the Mountains in Spain, and on the Pyreneans next to Spain. From which places they have been transferr'd to us, into our Gardens, and into almost all the Gardens of Europe, where they thrive admirably well.

L. The Times. They all Flower from the beginning of April to the beginning of May, and the Seed is ripe in the end of June or beginning of July. And sometimes they will Flower again in the end of August, or beginning of September; if the Season prove temperate, moist and rainy: but those Flowers which come then, are neither so fair, nor so many on one Stalk, as those which come in the Spring.

Directions for Planting them.

LI. The best sort of *Auriculae* are set in Pots, which they well deserve; the Pots are to be filled almost half full with sifted Neats Dung, the rest with good Sandy Earth, well mixed with sifted Dung. About the end of August set the Plants therein, and not too deep, for the Roots will be apt enough to run downwards. Place these Pots in the Sun all the Winter, and with Glasses defend them from over much wet, but House them not, they will do better in the open Air. In the Spring, when they rise to Flower, remove them into a place more shady; and after the Flowers are past (except those you leave for Seed) you may dispose them in some shady place out of the way, to make room for Pots with *Gilliflowers*.

LII. But if you Plant them in the Earth at large, and not in Pots, let it be in some place a little shaded from the scorching heat of the Sun; the Soil being first made very Rich, it stiff with Sand and store of well rotted Neats or Cows Dung;

and in this let the Roots be Set, a Foot asunder (for they spread wide, and will not thrive if they want room.) The best way of Planting them, is, open a wide Hole, leaving or raising a little Hill in the middle thereof, then to set the Root thereon, and spread the Fibres round about it, lightly, to cover them with Earth, and so to Water them. After the middle of *August*, every other Year, take them up, and then mend or enrich the Soil where they grow, with sifted Neats or Cows Dung, and having slipped or parted the Roots, and cut off the Fibres which are too long, set them in the same place again. By this means you will not fail to have them thrive, and bear store of Flowers. But if you let them stand too long unremoved, or in poor or stiff Ground, you must expect a crop of Flowers accordingly.

LIII. *The raising variety of them from Seed, is a Secret, with which few are well acquainted, and it is to be performed with something more than common diligence, by the following method.* When the Flowers are past and the Stalks begin to grow yellow, you may observe in the top of the little round Seed Vessel, a small hole, and then you may be sure, that the Seed is almost ripe, and which if you do not carefully look to, will all of it fall before you are aware. So soon therefore, as you perceive it to be ready, cut down the Stalks, and keep the tops upright, for if you turn them downwards all the best Seeds will fall out. Then bind them up in Bundles or Handfuls, and place them upright, to the Glass of some South Window, where (by the warmth of the Sun) they will harden, and be much the better.

LIV. About the end of *August*, or beginning of *September*, prepare some square Box or Boxes, according to your store of Seeds, let them be 9 or 10 Inches deep, and of what breadth you please, with some holes in the bottom to let out the Water, which fill three parts full with fine Sandy sifted Earth, one half whereof let be well rotted Neats Dung, which well mingled together, and laid smooth with your Trowel, lay thereon a Fingers thickness of fine sifted *Willow* Earth, or for want thereof, of dried Cow Dung beaten small, mixed with a little good Earth and sifted, and sow your Seeds thereon, mixt with Wood Ashes, which by their color will direct you to sow them the more suitably: sow them not too thin, for all will not come up; and if they do, they may easily be removed to another place.

LV. The Seeds being thus sow'd, cover them half a Finger thick with the same Earth, you put next under them, which press down lightly, and let them remain in the Sun and Air, till they begin to come up, which will be about *April* next, and then they must be removed into the Shade, and often gently Watered. As soon as they are grown to any considerable bigness, take some of them up where they are too thick, and set them presently in some Bed prepared for that purpose, eight Inches asunder, where they may remain, till they come to bear Flowers. And those you leave in the Box, may be Transplanted in the end of *August*, after the same manner, and so the Box will be ready again to sow more Seeds in. Some of them will bear the *Spring* following, others about *August* the Year after they were sowed; and the rest, the *Spring* then next following, provided the Earth you set them in be rich and good, otherwise you will fail of your expectation.

LVI. Some think that the best time to sow the Seed in, is, in the beginning of *October*, others at the end of *February*: but having tried all those Seasons, it has been found that the end of *August* or beginning of *September*, are the best times for

that purpose; for the Seeds are so small, that if they be kept any time out of Ground, they will dye and become unprofitable. You are also to observe, that you save the Seed of the choicest and best Flowers, for from thence must come all your Expectations. Such Flowers as you dislike, cast their Seed away, it is not worth saving; by this means having the best Seed, sowing it in due time, and that also in prepared Earth, and then seasonably removing them, into their destined places, you may reasonably expect not only a great Variety of admirable Plants, but even all that you can desire to result from the same.

LVII. *The Qualities, Specification, Preparations, and Virtues of Bears Ears*, are the same, in all respects with those of *Primroses* and *Cowslips*, which if you please, you may see at large, in *Chap. 59. Sect. 8. ad 18.* and *Chap. 157. Sect. 18. ad 32.* as also, in *Chap. 579. Sect. 21. ad 22.* foregoing, to all which places we refer you, it being needless to repeat the same things over and over again.

CHAP. DLXXXI.

OF PURPLE -- WORT.

OR,

PURPLE -- GRASS.

I. **THE Names.** This Plant has no Greek Name that I know of: but it is called in *Latine*, *Quadrifolium fuscum*; *Gramen purpureum*; *Lotus Quadrifolia*; and in *English*, *Purple-wort*, or *Purple-Grass*.

II. **The Kinds.** Authors make it a Species of the *Trefoils*, as *Casper Bauhine* in his *Pinax*, who calls it *Quadrifolium hortense album*, as *Lobel* and *Penn* call it *Quadrifolium phaeum fuscum hortense*, vel *hortorum*; which is *Four Leav'd Grass*, or our *Purple-Grass*, and is a singular Plant, sui Generis.

The Descriptions.

III. It has a long stringy Root, furnished with many fibres and knobs, bolls or protuberances, as it were springing from them: from this Root rises several creeping Branches, which spread themselves on the Ground, having at their ends several Leaves like those of *Trefoil*, it has for the most part four Leaves (whence the Name *Quadrifolium*) yet sometimes but three, and sometimes five, and sometimes seven, (foliis quaternis, quinis, et quando Septenis donatur, dixit Bauhinus.) these Leaves are of a sad green color, with a shadow of dark purple cast

Purple-Wort.

cast over them, (whence came also our English Name Purple-Grafs.) The Flowers are in form like the other Meadow Trefoils, and of a white or whitish color.

IV. Gerard describes it thus. This Kind of Three Leav'd Grafs, or rather Four Leav'd, has Leaves like unto the Common Trefoil, saving that they are lesser, and of a brown purplish color, known by the Name of Purple-Wort, or Purple-Grafs, whose Flowers are in shape like unto the Meadow Trefoil, but of a dusky overgrown color, tending to whiteness, the which does oftentimes degenerate, sometimes into three Leaves, sometimes into five, and also into seven, and yet the Plant of its own Nature has but four Leaves and no more, but Johnson in Gerard, seems not to admit it to have white Flowers: for that the Plant with white Flowers, he could never find had more than three Leaves upon a Stalk.

V. To this we may add, *Trifolium pratense minus purpureum*, Small Meadow Purple-Grafs, or Purple Trefoil. Its Root is slender, white, and woody, which sends up small hard Stalks about a Foot high, full of Branches, bearing on some three Leaves, and on some other Branches and joints, four small Leaves, like a Lotus. The Flowers grow many together, at the tops of the Sprigs, being very small, and in a loose Head, of a purplish red color.

VI. The Places. The first grows only in Gardens, and is scarcely ever seen any where else: for the Wild which is thought by some to be the true Purple-Grafs, is not it. The second grows with us only in Fields and Meadows, in most places of this Kingdom.

VII. The Times. They both Flower in the Summer Months, viz. in July and August, and their Seed is ripe not long after.

VIII. The Qualities. Purple-Grafs is temperate in respect to heat or cold, and dry in the first Degree; Astringent, Stomackick, Cardiack, Antisebricitick and Alexipharmick.

IX. The Specification. It is generally given (through the Kingdom) for the cure of the Purple Fever, or the Purples (as it is commonly called) in Children, as also in elder People.

X. The Preparations. You may have therefrom, 1. A Liquid Juice. 2. An Essence. 3. A Decoction in Wine or Water.

The Virtues.

XI. The Liquid Juice. Given to 4 Spoonfuls more or less, it prevails against all sorts of Burning Fevers, more especially against that called the Purple Fever. Dropt into the Eyes it represses or stops a Flux of Rheum into them, and cures Redness or Inflammations, and Blood-shot.

XII. The Essence. Drank inwardly to 3, or 4, or more Spoonfuls, it is good against the bitings of Vipers, or of any other poisonous serpent, washing the place bitten with the same. It Speedily also cures Green Wounds, they being daily once or twice a day wash'd therewith, used Clysterwise, it is good against Fluxes of the Bowels, strengthens the Guts, and prevails against a Tenasmus, or continual provocation or desire to go to Stool: and is profitable to stop the Whites in Women.

XIII. The Decoction in Wine or Water. It has been given with good success against the Purple Fever, commonly called the Purples in Children, and also in elder People; and has indeed all the Virtues of the Liquid Juice and Essence, but much weaker, and therefore ought to be given in a larger Dose, as from a quarter of a Pint to half a Pint.

C H A P. DLXXXII.

Of PURSLANE Garden and Wild.

I. THE Names. It is called in Arabicke, *Bakle ancha*, and *Bachele albanica*: in Greeke, by Dioscorides, Ἀνδράχνη, *Andrachne*: and by Theophrastus, Ἀδράχνη, *Adrachne*: in Latine, *Portulaca*: and in English, *Purslane*.

II. The Kinds. There are two Principal Species of this Plant, viz. 1. *Portulaca terrena*, vel *terrigena*, The Land Purslane, of which in this Chapter. 2. *Portulaca Hydratica*, Sea or Water Purslane, of which in the next Chapter.

III. The Varieties of the Land Kinds. These are, 1. *Portulaca Hortensis*, The Garden Purslane, which is, 1. *Portulaca Hortensis viridis communis*, Our common Green Purslane. 2. *Portulaca Hortensis aurea*, Golden Leav'd Purslane. 3. *Portulaca Sylvestris*, Wild Purslane, which is, 3. *Portulaca agrestis major*; *Portulaca Sylvestris major*; *Portulaca minor*, *Camerarij* & *Gesneri*, *Portulaca Angustifolia Bauhini* & *Cesalpini*, *Cepaea Cordi*, for Cordus upon Dioscorides says that *Cepaea* is no other than *Portulaca Sylvestris*, The greater Wild Purslane. 4. *Portulaca agrestis minor*, *Portulaca Sylvestris minor*, *Portulaca exigua Camerarij*, *Portulaca arvensis Bauhini*, The smaller or least Wild Purslane.

The Descriptions.

IV. The first, or Our common green Garden Kind. Its Root is small and perishes every Year: from which Root spring up many thick round shining red Stalks, full of Juice, lying upon the Ground for the most part, on which are set several long, thick, pale green Leaves, sometimes alone by themselves, and sometimes many small ones together with them, among which grow small yellow Flowers, which stand in little green Husks, containing black Seed.

Purslane Garden.

V. Gerard describes it thus. Its Root has many Strings; and the Stalks of this Great Purslane are round, thick, somewhat red, full of Juice, smooth, glittering, and parted into certain Branches trailing upon the Ground. The Leaves are on each long, something broad, thick, flat, glab, somewhat green, and whitish underneath. The Flowers are small, of a faint yellow, and grow out at the bottoms of the Leaves. After they are past, there Springs up in each Flowers place, a Husk of a green color, of the bigness of almost half a Barly Corn, in which is contained small black Seed.

VI. The second, or Golden Leav'd Purslane. This in its Roots, Stalks, Leaves, Flowers, and Seed, as also in its manner and form of growing, is exactly like the former, saving, that the Leaves are of a shining yellowish, or yellowish red Golden color, and possibly larger than the Green Kind before described, that the whole Plant seems to be the larger, and the Stalks to grow something the more upright.

VII. The third, or Greater Wild Purslane. The Root is small and thready, perishing at the first approach of Winter, from which rise up sappy reddish

Stalks, spreading much upon the Ground, lying almost flat thereon, and covering it a great way about. These Stalks are set with thick, fat, shining green Leaves, like in form or shape, and in all other things, unto the Garden Kind, the magnitude only excepted, these being generally smaller, and lesser at the Joints; with the Leaves towards the ends of the Branches come forth very small Star-like yellowish green flowers, scarcely to be discerned, and as quickly falling away as the Garden Kind, having also such like hard Husks, wherein the like small black Seed is contained. This is used for a Sallet Herb, as well as the two former, and differs not from them in Taste, yet some think the Taste is more astringent, than the Garden Kinds, as it is for the most part in all Wild Herbs.

Purslane Wild.

VIII. The fourth, or Lesser, or Smallest Wild Purslane. It has a Root of a considerable thickness, running under the upper Surface of the Earth, from which a greater number of greater and lesser Strings, and other smaller Fibres proceed, running not only down deep into the Earth, but almost every other way. This Small Purslane is like also to the other, but much smaller than it, having always 2 Leaves set together, of a paler yellowish green color, on the thick round Stalks and Branches, which stand a little more upright, and bend down to the Ground again. The Flowers are like the former, and so is the black Seed, but the Husks open themselves before the Seed is ripe, and stand upon smaller and longer foot Stalks. This has little or no Taste, but what is flatulent and watery.

IX. The Places. The first and second grow only in Gardens in most places of England; by reason the Root perishes every Year, it must be sown every Spring in April: The Gardeners sow it many times in Allies between the Beds, or in rich Beds of fat Earth, and moist, where it may have plenty of Nourishment, or in those Beds of Dung, which Gardeners have first used for Nurfing up their Cucumbers,

cumbers, Melons and Pumpions; whereon, after those have been taken away, they many times sow their *Purslane* Seed; where if it is much watered, the warmth of the Dung, and the Water together, makes it grow great and large, and continues it in that State, if it be sometimes cut, till *Winter*. The third grows many times in our *Gardens*, without any previous help of ours. And in most of our Plantations, in *New England*, *New York*, *New Jersey*, *Mary-Land*, *Pennsylvania*, *Virginia*, *North and South Carolina*, when they ly void. It will spontaneously come up, and over spread many Acres of Ground, even in one *Spring*, and in those places where never any has grown from the beginning of the World to that time, and this it does in almost all our Fallow Plantations, thro' the whole Continent of *Florida*, which considering it does so universally do it, and that in such vast quantities, as sometimes almost to cover a Plantation, it is a Remark worthy the taking notice of. The fourth, *Camerarius* in *Horto Medico*, says, that he found it growing about *Lipswick*; and I have been informed by some, that they found it growing Wild, in some of the Northern Counties of *England*.

X. *The Times*. They may be all Sown in *March* or *April*, and they spring up in *May*, and are fresh and green in *May* and *June*, they are fit for Salleting in *July*, and so continue all *August*, and sometimes to the end of *September*, if the Season is favourable and warm, even till the colds nips them, and causes them to perish.

XI. *The Qualities*. All these sorts of *Purslane* are cold in the third degree; and the two *Garden Kinds* moist in the second Degree; but the *Wild Kind* moist only in the first Degree. They are Astringent, Cosmetick, Diuretick, Emollient, Relaxive, Repercussive, Nephritick, Hystrick, and Galactogenetick.

XII. *The Specification*. *Purslane* is good against Burning Fevers, hot and choleric Fluxes of the Bowels, Catarrhs, want of Sleep, *Gonorrhoea* in Men, and Whites in Women, as also the overflowing of the Courfes. It cools the Blood, gives ease in the Strangury, and takes away the heat and scalding of the Urine. Abates Lust, extinguishes the Seed, stops Vomiting, as also defluxions of hot, salt, and scalding Humors into the Eyes.

XIII. *The Preparations*. You may have these from, 1. A Sallet. 2. A Liquid Juice. 3. An Infusate Juice. 4. An Essence. 5. A Syrup. 6. An Oil or Ointment. 7. A Cataplasim. 8. A Distilled Water. 9. A Powder of the Seed. 10. A Collyrium.

The Virtues.

XIV. *The Sallet*. It is made of the green Leaves and very young Stalks, with Salt, Sugar, Vinegar and Oil. It is good to cool and temperate the Blood and *Lympha*, is grateful to hot and fainting Stomachs and is profitable for such as have the Falling-Sickness. The *Wild Purslane* is used beyond Seas, and in our Plantations in *Florida*, as familiarly in Sallets and Meats, as the first *Garden Kinds*, and with all the same good effects, saving that it is not altogether so moist, and therefore the more fit to stop some sorts of Fluxes.

XV. *The Liquid Juice*. It is good against the burning Fits of Agues and Choleric Fluxes of the Belly, and is profitable against the Whites and Reds in Women, as also a *Gonorrhoea* in Men: it stops Catarrhs, eases pains of the Head proceed-

ing from Heat, and causes Sleep and Rest, and is of good use for such as are in a *Delirium* or Frenzy. It is prevalent against outrageous Lust, extinguishes, at least diminishes the Seed, and being over much used abolishes the Natural power of Procreation. It is good to stay Vomiting, and sweetened with a little white Sugar, is good against an old and dry Cough, Asthma, and shortness of Breath. It quenches vehement Thirst, and heals Ulcers of the Lungs. It is good also against Inflammations and Ulcers of the Secret parts in Man or Woman, and gallings of those parts: and used with Honey, it heals excoriations, and even Ulcers of the Bowels, and *Anus*, and obliterates a *Tenasmus*, tho' of some Weeks standing. Dose from 2 to 4 Spoonfuls or more, Morning and Night.

XVI. *The Infusate Juice*. *Camerarius* says, That the thickned Juice, Made up into Pills with Powders of Gum *Tragacanth*, and Gum *Arabic*, and taken (from a Dram to two Drams, Morning and Evening) prevails much, in helping such as make a bloody Urine, or piss Blood.

XVII. *The Essence*. It has all the Virtues of the Liquid and Infusate Juices, excepting, that it does not so powerfully suppress Lust, or Exanimate the Seed. But it more powerfully heals excoriations of the Bowels, *Anus*, Lungs, and other inward parts. Outwardly applied it gives ease in the Gout, and softens the hardness of the Nerves. It is good for Womens faoln and pained Breasts, and other Tumors caused by heat and Inflammation. It is good against the bitings of Serpents or other poisonous Creatures, and to draw forth the Poison, being bathed upon the part. Applied to the Navels of Children which stick forth, it helps them; it is good also for sore Mouths and sore Gums, which are much swollen, and to fasten loose Teeth, and take away their pain, when they seem to be on edge as it were, after the eating of fower things. Dose from 2 to 4 Spoonfuls.

XVIII. *The Syrup*. If made with Honey of the Juice, it not only prevails against Coughs, Colds, Asthma's, but is also prevalent against a Phthisis, or Ulceration of the Lungs, and has all the other Virtues of the Juice and Essence, being given from 2 to 4 Spoonfuls, Morning and Night.

XIX. *The Oil or Ointment*. They cool Inflammations, heal galling in the Groin and Secret parts, give ease in the Head-ach, Gout, and other pains proceeding from heat, and discaus Pustles; Wheals, Pimples, and other like hot and fiery Eruptions in the Skin. They are also good against Burnings and Scaldings, and Womens hard, tumified and inflamed Breasts; as also the stings and bitings of Hornets, Wasps, Bees, Serpents, and other venomous Creatures.

XX. *The Cataplasim of the Green Herb*. It is prevalent against *Anthony's Fire*, Gout Sciatica, strained Nerves if Inflamed, Pimples, Tettars, Ringworms, Shingles, and other hot breakings out of the Skin. Made with Vinegar, a little Linseed Oil, and Powder of Nut Galls, and applied, it takes away pains and creeks in the Neck, and other parts; and discusses and heals simple Contusions in the Muscular parts.

XXI. *The Distilled Water from the whole Plant*. It has all the Virtues of the Juice, Essence, and Syrup, but nothing near so effectual, and therefore may be given in a double or treble Dose, or used as a Vehicle to Convey other Preparations in, being sweetned with double Refined Sugar. It prevails against *Anthony's Fire*, beautifies the Face and Skin, and allays the Inflammations of the Eyes.

XXII. *The*

XXII. *The Powder of the Seed, or Seed bruised.* It is said to be more effectual than the Herb, even for all the purposes afore named; it is of singular good use to cool the heat and sharpness of Urine, to suppress Lust, and Nocturnal Pollutions, and even to extinguish the Seed, and abolish the inclination to Venery. Given to Children which have Worms, it is said to kill and expel them. *The Decoction of the Seed being bruised, in Wine,* performs likewise the same things. And the Seed of the *Wild Purslane*, is more commended for killing of Worms, than the Seed of the other. Dose from a Dram to 2 Drams in any proper Vehicle.

XXIII. *The Collyrium.* Take Clarified Juice of Purslane 2 Ounces; of the Distilled Water 2 Ounces; of common Spirit of Wine or Brandy 4 Ounces; Honey 1 Ounce; mix, distill, strain out, and let it settle for 12 Days, then decant the purest part, and keep it for Use. It cools Inflammations of the Eyes, dries up hot and salt Rheums, heals Sores and Ulcers in them, and cures most Diseases happening to them; removing Mists, Clouds, and Films, and very much clearing the Sight.

CHAP. DLXXXIII.

Of PURSLANE Sea and Water.

I. **T**HE Names. It is called by the *Arabs*, *Molochia*; in *Greek*, *Ἀλυσ*; and in *Latine*, *Halimus*, and *Portulaca Marina*. The *Water Purslane* is called in *Greek*, *Ἀνδράγγιον ὕδρεα*; and in *Latine*, *Portulaca Aquatica*.

II. *The Kinds.* There are several Species of the *Sea Purslane* to be found in Authors, but omitting those which grow not in *England*, or some of our Foreign Plantations, we shall only treat of these two following, viz. 1. *Ἀλυσ*, *Halimus*, *Portulaca marina nostras*, Our *Sea Purslane*. It is called *Halimus*, because of its saltish Taste, which is as much as if you should call it *Salt-wort*. But *Solinus* calls it, *Ἀλυσ*, *Alimos* without the Aspirate, and says that its Name is derived from its effects, or operation, which is to prevent Hunger; for says *Solinus*, the People in *Candia* tell us, that that Day they eat thereof, they shall not be Hungry, but be free from desiring Food. 2. *Halimus tenuifolius*, *Halimus angustifolius procumbens*, *Halimus minor*, *Portulaca Marina incana minor*. The lesser *Sea Purslane*, or *Sea Purslane* less white than the former. 3. *Ἀνδράγγιον ὕδρεα*, *Portulaca Aquatica*, *Alfine palustris minor folio oblongo Bauhini*; *Portulaca vel Andrachne palustris*, *Water Purslane*.

The Descriptions.

III. *The first, or Our Sea Purslane.* It has a Root which is something woody, with several long Strings joined thereto, and abides with the Leaves on the Branches all the Winter. It has several hoary and grayish Stalks, somewhat Woody, about a Foot or more long, lying for the most part upon the Earth, bearing thereon many small, thick, fat and long Leaves, of a whitish green color, set without order, at some Joins more, at some less, Branching forth here and there, and bearing at the tops many long Sprigs, or spiked Stalks. set round about

Purslane Sea Common.

with greenish purple flowers, which turn into whitish, flat, thin Seeds, like unto those of Sea Arach.

IV. *The second, or Lesser Sea Purslane.* Its Root is woody and perennial, or enduring all Winter like

Purslane Sea.

the former. This Sea Purslane has very slender, weak and somewhat hoary white Stalks, about 2 Feet long, scarce able to stand upright, but for the most part do fall down, and ly upon the Ground; the Leaves which grow on them, being set much in the same manner, viz. without order, something narrower and sometimes longer, but not altogether so hoary white. The Flowers are much like the first Kind before described, but of a more greenish color, growing at the tops of the Stalks, and afterwards yield such like Seed as they, but somewhat less.

V. Gerard describes the second Kind after this manner. Its Leaves are like the former, but not altogether so white, yet they are somewhat longer and narrower, not much unlike to the Leaves of the Olive Tree. The slender Branches are not above a Cubit or Cubit and half long, and commonly ly spread upon the Ground. And the Flowers are of a deep overworn Herby color, after which follow Seed, like those of the first but smaller. Ramos plures à radice fundit (dixit Matthiolus in Dioscoridem) lentos & obsequiosos, foliis Olivæ pinguioribus, albicantibusque, salsò sapore, Semen proferit racemosum in Caulium summitatibus.

VI. The third, or Water Purslane. Its Root consists of nothing but a parcel of fine Fibres or Threads. Its manner of growing is something like the Chickweeds, especially the Water Chickweeds; It is but a small Plant, but has many trailing square Branches, which take Root almost every where, as they spread; but not so thick set with Leaves

Purslane Water.

as the Chickweeds are. Its Leaves are something long, narrow, and round pointed, of a pale yellowish green color, two always growing at a joint, the Flowers are small and white, set together in long Clusters, on small foot Stalks, with very small round Seed following them, in little round Seed Vessels.

VII. The Places. The two first grow in Salt Marshes, and by the Sea side, in many parts of the World. The first grows in the Salt Marshes and by the Sea Coast in many parts of England, as in Kent; In the Marshes by the Sea side going over the Kings-Ferry unto the Isle of Sheppy, going to Shoreland House, and by the Ditch sides of the same Marsh: it grows also plentifully in the Isle of Thanet, as you go from Margate to Sandwich, and in many other places along the Coast. The second grows upon the Sea Coasts of Spain, and other hot Countries: Clusius says it grows about Lisbon in Portugal. With us it only grows in Gardens. Dodonæus says, it grows in the Maritime places of Flanders, Holland, and Zeland, and other

like Sandy places. The Water Purslane grows in or near Water, and Watery Ditches and Grounds in many parts of England.

VIII. The Times. They Flower in July and August, and the Seed is ripe in August or September; or not long after the time of Flowering.

IX. The Qualities. These Plants are temperate, in respect to heat or cold, and moist in the first Degree: Absterfive, Astringent, Anodyn, Galactogenetick and Spermatogenetick.

X. The Specification. Sea Purslane expels or diffuses Wind, gives ease in the Colick, strengthens the Bowels, and is profitable against Cramps and Convulsions.

XI. The Preparations. You may have from the Sea Purslane, 1. A Sallet. 2. The Leaves Pickled. 3. The Juice or Essence. 4. A Decoction in Wine. 5. A Powder of the Root.

The Virtues.

XII. The Sallet. Parkinson says, it is used to be eaten as other Sallet Herbs, for that it much pleases the Palate, having a little astringent relish withal. The Leaves Dioscorides says, are boiled, and then eaten as a boiled Sallet: *Folia, Dioscorides ait, decoquantur ciborum gratia.*

XIII. The Pickle. *Folia autem in Belgio veluti Cappares Sale aut Muria condiuntur, &c.* The Leaves are preserved with Salt or Pickle, in Holland and other parts of the Low Countries, as Capers are, to be served up at Mens Tables, and Eaten in their stead, having a pleasant and grateful taste.

XIV. The Juice or Essence. They expel Wind in the Stomach and Belly, give ease in the Colick, almost upon the Spot, loosen the Belly first, and then afterwards Bind, stop Fluxes and strengthen the Bowels. They are good against Ruptures, prevail against Cramps and inward Convulsions; cause plenty of Milk in Nurses Breasts: and very much encrease Seed, and Vigor. Dose 1, 2, 3, or 4 Spoonfuls, Morning and Night, in a Glass of Generous Wine.

XV. The Decoction in Wine. It has all the Virtues of the Juice and Essence, but as it is weaker so it ought to be given in a double or treble Dose.

XVI. The Powder of the Root. Given to a Dram in Mead or Honied Water, it is good against Ruptures, Convulsions, and torments of the Guts, as Dioscorides says: but we find the Leaves to have the same effects.

C H A P. DLXXXIV.

of RADISH Garden.

I. **T H E** Names. It is called in Greek, *Ῥάβδης*: in Latine, *Raphanus*, & *Raphanus Hortensis*: and in English, *Radish* and *Garden Radish*, or *Reddish*. *Celius* says, that *Marcellus Empericus* calls the Seed of *Radish*, *Bacanon*; which is also found in *N. Myrepsus*, lib. 1. comp. 255. but *Cornarius* reads it, *Cacanon*.

II. The Kinds. Of *Radishes* there are three Generick Species, viz. 1. *Ῥάβδης κομίνη*, *Raphanus Hortensis*, *Garden Radish*. 2. *Ῥάβδης ἄγριος*, *Raphanus Sylvestris*, *Wild Radish*. 3. *Raphanus Rusticanus*, *Horse Radish*: of all which in order.

III. The Garden Kinds. They are various, as, 1. *Raphanus sativus communis*, Our common *Garden Radish*. 2. *Raphanus sativus minor*, The lesser *Garden Radish*. 3. *Raphanus Orbiculatus*, The round *Radish*. 4. *Raphanus niger*, *Raphanus Pyriformis*, The *Pear* fashioned, or *Black Radish*.

The Description.

IV. The first, or Our common *Garden Radish*. Its Root is long, white within, and of a reddish purple color on the out side towards the top of it, and of a sharp biting Taste; yet some are less sharp and biting and of a more pleasant Taste. It has long Leaves unevenly cusp'd on both sides: the Stalks

Radish Garden Great.

rise up to the height of three or four Feet, bearing many purplish Flowers at top, made of four Leaves apiece, which turn into thick short Pods, in which are contained round Seed, larger than Turnep or Cole-wort Seed, and of a pale reddish color.

V. Gerard describes it thus. Its Root is gross, long and white, both within and without, and of a sharp Taste. It sends forth great and large Leaves, green, rough, cut in on both sides with deep gashes, not unlike to the *Garden Turnep*, but greater. The Stalk is round and parted into many Branches, out of which spring many Flowers of a light purple color, made of four little Leaves; and when they be past, there come in their places, sharp pointed Cods, past or blown up towards the Stalk, full of a spongy Substance, wherein is contained the Seed, of a light brown color, somewhat greater than the Seeds of Turneps or Cole-worts.

VI. The second, or Small *Garden Radish*. Its Root is small, long, white both within and without, except a small part of it, towards its top, which is of a reddish color. Its Leaves are exactly like the former, saving that they are smaller and more brittle in Handling. The Stalk is about a Yard high,

Radish Garden small.

having some Branches from the middle upwards like the other, on the tops of which grow the Flowers, very like them also. The Seed is smaller and not so sharp in Taste.

VII. The third, or Round *Radish*. Its Root is almost Orbicular, and firm, nothing waterish like the Common *Radish*, but more pleasant in Taste, and wholesomer, not so apt to rise in the Stomach, as the others are, or as the *Garden Radishes* do. Its Leaves are like the *Garden Turnep*; from among which spring up a round and smooth Stalk, dividing it self towards the top into two or three Branches, on which grow small purplish Flowers consisting

consisting of four Leaves apiece: which being past, there comes in place small Cods, put up, or bunched out, in two, and sometimes in three places, full of a soft spongy Substance like to the Common Garden Radish; in which is contained the Seed, something smaller than Cole-wort Seed, but of an hotter Taste.

VIII. The fourth, or Pear-fashioned, or Black Radish. Its Root is formed like a Pear, or Long Turnep, black without and white within, of a firm and solid Substance; its Taste is quick and sharp, biting the Tongue like the other Kinds of Radish, but more strongly. It grows to be four, five, or six

Radish Pear-fashion'd.

Feet high, of a bright reddish color. The Leaves are deeply cut in or jagged on the edges, like those of the Turnep, and something rough withall. The Flowers consist of four Leaves apiece, of a light Carnation, or Flesh color. And the Seed is contained in small bunched Cods like the former.

IX. Parkinson says, That this Pear-fashion'd Radish, has a Root which is blackish on the outside, and white within, great and round at the Head, but ending shorter than a Radish, and longer than a Turnep, so that it is almost Pear-fashion'd, of a firmer and harder Substance than our Common Radish, but no less sharp and biting, and somewhat strong withal. The Leaves are somewhat smaller and with deeper gashes. The Flowers and Seed are also like the others but smaller. It has been observed also, that some of this Seed, being sown again, has produced Roots, whereof some have been black, but the most part white on the outside. This has been brought to us from Flanders and Holland, in which places it is accounted a rare Winter Root or Sallet, and is there sometimes sold by the Pound.

X. There is *Raphanus pyriformis minor*, a lesser sort of black Radish, (like in Leaf and Seed to the former, but its Flower is of a lighter purple color:) whose Root is longer and smaller, and

sometimes changes also to be white as the other does. It is thought that both these Species have risen from one Kind.

XI. The Places. All these Kinds of Radishes are generally sown in Gardens, where they require a loose Ground, which has been long Manured, and is somewhat Fat. They prosper well in Sandy Ground also, where they are not so Subject to Worms as in other Grounds.

XII. The Times. These Kinds of Radishes are best to be sown after the middle of June, viz. in June or July; for being sown betimes in the Spring, they yield not their Roots so kindly nor profitably, for that they then quickly run up to Stalk and Seed; whereas otherwise they do not run up to Flower and Seed, till the next Spring. They may be sown 10 Months running in the Year; yet of all those times, in June and July are the best Seasons.

XIII. Black Radishes are most used in Winter, (yet some, in their natural and not forc'd Grounds, have their Roots good, the most part of the Summer,) and therefore they ought to be sown after Midsummer, for if they should be sown earlier, there would be no Root, but they would like the others, presently run up to Stalk and Seed. They are very profitable against Stone and Gravel.

XIV. The Qualities. Radish is hot and dry in the third Degree, Aperitive, Absterfiv, Carminative, Cosmetick, Digestive, Diuretick, Incisive, Cephalick, Pectoral, Nephritick, Emmenagogick, and Lithontriptick.

XV. The Specification. The Root is mostly used, after that the Seed, and in the last place the Leaves. They are peculiar for the Cure of Strangury, or pain, heat and stoppage of Urine, by reason of Tartarous Slime, or any other Matter impacted in the Reins, Ureters and Bladder; are peculiar for provoking of Urine, as also of the Courses in Women, and to expel Sand, Gravel, and the Stone from the Urinary parts. To cure the Cough, Asthma, Phthisis, and other Diseases of the Lungs. As also the Scurvy, Dropsy, Gout, obstructions of Liver and Spleen, and Quartan Agues, tho' of long standing.

XVI. The Preparations. You may have therefrom. 1. A Sallet of the Root, and tender Tops. 2. A Liquid Juice of Root, or Leaves. 3. An Essence of the same. 4. A Decoction or Infusion. 5. A Syrup of the Juice. 6. The Seed. 7. A Cataplasm of the Root. 8. A Distilled Water of the Herb and Root. 9. A Spirit from Root, Herb and Seed.

The Virtues.

XVII. The Sallet of the Roots and tender Tops. They are Eaten raw, either with Salt and Bread and Butter, or with Meat: They strengthen the Stomach and cause Digestion, and are very Diuretick: but are apt with some to rise in the Stomach, yet are great Enemies to Scurvy, Dropsy, Jaundice, and Gout in cold Constitutions.

XVIII. The Liquid Juice of the Roots or Leaves, (but that of the Roots is best.) It powerfully opens obstructions of the Stomach, Lungs, Liver, Spleen, Reins, and Womb: resists the Scurvy, Dropsy, and Gout, is good against Asthma's, Coughs, Colds, Hoarseness, Wheezing, and shortness of Breath: resists the putridity of the Blood, and Hypochondriack Melancholy: gives ease in the Strangury and Stone; and expels Sand, Gravel, Stones and Tartarous Slime out of the Urinary parts,

parts, and provokes the Terms in Women where they are stop. Dose from 1, to 2, or 4 Spoonfuls in White Port Wine, or the Distilled Water hereof, Morning and Night: and so taken it kills Worms.

XIX. *The Essence of the same.* It has all the Virtues of the *Liquid Juice*, and may be given in the same manner, from 1 Spoonful to 2, according to Age, &c. It comforts a cold and raw Stomach, causes Appetite and a good Digestion; expels Wind, and is good against the Colick, &c. Given to 4 or 5 Spoonfuls, 2 or 3 Hours before the coming of the Fit of a Quartan Ague, it causes in some Vomiting, in others Sweating, and so thereby alters the course of the Ague and cures it.

XX. *The Decolion or Infusion.* They provoke Urine powerfully, expelling Sand, Gravel, and Tartarous Matter out of the Reins and Bladder. The Root may be sliced thin, and laid to Infuse all Night in Rhenish Wine, or in White Port, or Lisbon Wines, and drank in the Morning Fasting, and so to be continued for some Days.

XXI. *The Syrup of the Juice.* It is made by dissolving double Refined Sugar, or Clarified Honey in the Juice, in Balneo; and some add to it Vinegar. It is good against Asthma's, Coughs, Colds, Phibis, and all other Diseases of the Lungs. It is good against an old Cough, and makes thin, thick and gross Flegm, causing it to be easily expectorated: it is of good use in pains of the Reins, Bladder and Stone, provokes Urine much, and so carries off the Jaundice, and has all the Virtues of the Juice, Essence, Decolion and Infusion foregoing.

XXII. *The Seed.* It may be given to a Dram, or two, bruised or made up into an *Eleduary* with Clarified Honey or Oxymel. It Kills Worms in Children being drank, and provokes Urine. It is said to cause Vomiting sometimes, especially in weak Stomacks.

XXIII. *The Cataplasim of the Root.* Being bruised and laid to the place grieved with the Gout, Sciatica, or other like pains, or to the hard and painful Swellings, it wonderfully gives ease to them and helps them. If the Cataplasim is made with a mixture of Orobis Meal and Wine Vinegar, and applied to the Belly, it kills Worms therein. And so made, if it is applied to other places, it takes away all black and blew spots, and other blemishes of the Skin.

XXIV. *The Distilled Water from Root and Herb.* It has all the Virtues of Juice, Essence, Decolion, Infusion, and Syrup, but in a much lower Degree, and therefore ought to be given in a much larger Dose. Used as a Cosmetick, it is a great beautifier of the Skin, more especially if Pulp of *Coloquintida* be Infused therein.

XXV. *The Spirit from Root, Seed, &c.* It is made altogether as you make Spirit of Scurvy-Grass, Cresset, &c. It is a potent Remedy against the Scurvy, Colick, weakness of the Stomach, and Indigestion in a cold habit of Body: and has indeed all the Virtues of Juice, Essence, Infusion, and Syrup; and may be given from 15 to 30, or 40 Drops, in Ale, Beer, Wine, or other proper Vehicle, Morning, Noon and Night, and in some cases, four or five times a Day.

C H A P. DLXXXV.

of RADISH Wild.

I. *THE Names.* It is called in Greek, *ῥαβδαν*; in Latin, *Armoracia*, *Raphanus Sylvestris*: and in English, Wild Radish.

II. *The Kinds.* Of the Wild Kinds there are two Sorts, viz. I. *ῥαβδαν ἀγρην*, *Raphanis agrestis*, which is called also, *Armoracia Fuchsi*, *Rapistrum album Tabernemontani*, *Rapistrum Flore albo Eruca folijs Lobelij*, The Field Wild Radish. II. *ῥαβδαν ὑδροβη*, *Raphanus Aquaticus vel Palustris*, Water Radish: and this twofold, viz. 2. *Raphanus Aquaticus vel Palustris primus*, *Radicula Sylvestris Dodonai*, *Raphanus Aquaticus in profundis Laciniis divisis Bauhini*, *Raphanus Sylvestris Officinarum Aquaticus Lobelij*, *Raphanus Eruca folijs Theophrasti*, *Bauhino*, *Sisymbrium Sylvestre Cesalpini*, Our common Water Radish. 3. *Raphanus Aquaticus alter Bauhini*, *Rapistrum Aquaticum Tabernemontani* & *Gerardi*, The other or second Water Radish of *Basbinus*.

The Descriptions:

III. *The first, or Field Wild Radish.* It has a Root which is about a Fingers thickness, white both without and within, and of a sharp and biting Taste. It has a shorter narrower Leaf than the Common Radish, and more deeply cut or jagged, almost like

Radish Wild.

like the Leaves of Rocket, but much greater. The Stalks are slender and rough, about 3 Feet high, divided towards the top into many Branches. The Flowers are small and white. And the Cod (in which is contained the Seed) is long, slender, and jointed.

IV. The second, or Water Radish. Its Root is very long, and of near a Fingers thickness, which runs far up and down, here and there through the Mud, shooting forth a great many Fibres, and in many places, as also several Leaves under Water. It rises up in the Water with slender weak and bending Stalks, yielding to and fro, on which grow at every Joint, a long and somewhat broad Leaf, very deeply indented, or cut in on the edges unto the middle Rib. At the top of the Stalk, comes forth a small Tuft of yellowish Flowers, consisting of four Leaves apiece. After which follows small and almost round Pods, with round Seed in them.

V. Gerard describes this Water Radish thus. Its Root is long, set at sundry spaces, with small Fibres or Threads like the Rowel of a Spur, hot and burning in Taste, more than any of the Garden Radishes. It has long and broad Leaves deeply indented, or cut in even to the middle Rib. The Stalk is long and weak, and leans this way and that way, being not able to stand upright, without a prop, inasmuch, that you shall never find it, no not when it is very young, but leaning down upon the Mud or Mire where it grows. The Flowers grow at the top, made of four small yellow Leaves.

VI. The third, or Second Water Radish, (which is the *Rapistrum Aquaticum Tabernæmontani & Gerardi*.) It has a long tough white Root, a Fingers thickness or more, running and spreading it self much, not deep into the Ground, but under the upper Crust thereof, having at certain distances almost every where, small bunches of Fibres or Springs proceeding from it, which have long Leaves springing from them. This grows more upright than the last, for that it seldom grows in Ponds or Ditches of Water, as the other does, but on the edge, or near Watery Ditches, or other standing Waters. Its main Stalk or Stalks grow to be sometimes three Feet or more high, on which grow many long Leaves, much torn, or cut in, on both edges. At the tops of the Stalks grow large Tufts of whitish or purplish Flowers, which being past away, leave in their places, short Pods containing the Seed, which is small, and not round as the former.

VII. The Places. The first grows upon the Borders of Banks, and Ditches cast up, and in the Borders of Fields. The second never grows but in Water, or Brooks, or by Ditches and standing Waters, and by Rivers sides, or where store of Water is continually. The third grows near the Water side, and sometimes in small watery Ditches, where there may be some little Water, and almost dry.

VIII. The Times. They all Flower in June and July, and the Seed is ripe in August, in or about a Month after the time of Flowering.

IX. The Qualities, Specification, Preparations, and Virtues, are the same with those of the Garden Radish foregoing, (except being used as they are for a Sallet,) and therefore I refer you to the former Chapter. Parkinson says, that the Water Radishes are somewhat hot in the Mouth, but the first of them more than the other, and therefore thinks that they may be used instead of Horse Radish, to warm a cold Stomach, and to help both to provoke Urine, and to expel Wind: For which purpose the Seed is more effectual than the Herb, and the Root of more force than the Seed.

CHAP. DLXXXVI.

Of RADISH Horfe.

I. THE Names. It was unknown unto the Greeks, and therefore has no proper Greek Name: but it may well enough be called *ῥαβδαν*: in Latine, *Hipporaphanus*; *Raphanus rusticanus* Lobelij; *Raphanus magnus*; in English, Horse Radish.

II. The Kinds. It is the third Generick Species of Radishes, and *Planta singularis sui Generis*, a singular Herb of its own Kind. This cannot be the *Raphanus Sylvestris Dioscoridis*, because the Root of that is small, and the Leaves tender and fit to be eaten for a Sallet, which the Leaves of this are not. But *Tragus* will have it to be the *Armoracia* Plinij: it is the *Raphanus major*, & *Radicula magna Dodonæi*, *Armoracia*, aut *Raphanus major Brunfelsij*, *Tragi*, & *Gesneri*; *Thlaspi magnum* & *magus Cordi* & *Loniceri*; *Raphanus rusticanus Thlaspi alterum Dioscoridis* (Lib. 2. Chap. 13.) *Bauhino*: and the very thing which we in England call Horse Radish, and by some is called Mountain Radish, and in the North of England, Green Radish, and Red Cole.

The Description.

III. Its Root is great and long, white and rugged, shooting up divers Heads of Leaves, which may be parted or divided for Increase, but it does not creep within the Ground, nor run above Ground, but for the most part runs deep into the Earth. The first Leaves which rise up before Winter, are about a Foot and half long, narrower, and very much cut in or torn about the edges into many parts, of a dark green color, with a great Rib in the middle: but after these have been up a while, others follow, which are greater, rougher, broader and longer, whole, and not divided as the first, but only something roundly dented about the edges. The Stalk when it bears Flowers (which it does but seldom) is great, rising up with some few lesser Leaves thereon, till it is 3 or 4 Feet high; spreading at the top into many small Branches of whitish Flowers, made of 4 Leaves apiece: after which come small Pods like those of the Lesser Shepherds Purse, but seldom with any Seed in them.

IV. Gerard describes it thus. The Root is long and thick, white of color, in Taste sharp, and very much biting the Tongue like to Mustard. It brings forth great Leaves, long, broad, sharp pointed, and snipt about the edges, of a deep green color, like those of the Great Garden Dock, called of some Patience, or Monks Rhubarb, but longer and rougher. The Stalk is slender and brittle, bearing at the top small white Flowers: which being past, there follow small Cods, in which is contained the Seed.

V. The Places. Gerard says, he has found it growing Wild in several places, as at *Namprwich* in *Cheshire*, in the place called the *Miln-Eye*: as also at *Hogsden* near *London*, in the Field next to a Farm House leading to *Kings-land*, where it flourished for a long time afterwards. But for the most part it is planted and grows in Gardens, and delights in moist and shadowy Places.

VI. *The Times.* Gerard says that it Flowers for the most part in April or May, and the Seed is ripe in August, but that it is rare or seldom to be seen, and that Petrus Placentius has wrote, that it brings forth no Seed at all. Parkinson says, that it Flowers but seldom, but when it does, it is in July.

VII. *The Qualities.* It is, (*viz.* the Root) hot and dry in the third Degree. Aperitive, Digestive, Absterfitive, Attractive, Carm:native, Cosmetick, Diuretick, Cephalick, Neurotick, Stomatick, Pectoral, Hepatick, Splenetick, Nephritick, Hyfterick, Ptarmick, and Alexipharmick.

VIII. *The Specification.* It is prevalent against the Strangury, and stoppage of Urine by Stone, Gravel, Sand, or Tartarous Humors lodged in the Urinary parts: it is good against Asthma's, Coughs, Phthisis and other Diseases of the Lungs, open Obstructions of Liver, Spleen and Womb, and provokes the Terms in Women. It cures the Scurvy, Dropsy, Gout, and Quartan Agues, kills Worms in Children: and outwardly applyed eases pains of the Gout, Sciatica, Liver, Spleen, and Reins, being applied upon the parts affected.

IX. *The Preparations.* You may have therefrom, 1. A Sauce. 2. A Liquid Juice. 3. An Essence. 4. An Infusion 5. A Lobeoh. 6. A Cataplasm. 7. A Distilled Water. 8. A Spirit.

The Virtues.

X. *The Sauce.* It is made of the Root scraped very thin, and eaten with Salt and Vinegar, either alone with Meat, or mixt with other Saluting. Tho some Persons cannot away with it, yet it is grateful to many Stomachs, and by strengthening the Viscera, it causes a good Appetite and Digestion, prevents breeding of Wind, and eases Gripings in the Bowels, being a peculiar Enemy to the Scurvy.

XI. *The Liquid Juice of the Root.* Being given in Drink, it is held to be very effectual for the cure of the Scurvy; and so given, it kills also Worms in Children; A Cataplasm of the Root being also laid upon the Belly.

XII. *The Essence of the Root.* It has all the Virtues of the Juice, besides which, it gives ease in the Strangury, and eases pains in the Reins, Ureters and Bladder; is profitable against the Stone, provokes Urine, and expels Sand, Gravel, and Tartarous Matter from the Urinary parts. It is a good Remedy in strong Bodies against Asthma's, Coughs, Colds, Phthisis, and other like Diseases. It provokes the Terms in Women; and being given some Hours before the coming of the fit of a Quartan Ague, it alters its Course, and many times cures it. Given also to a Woman in Childbed, it brings away the After-Birth, and causes due Cleansing. Dose from one Spoonful to two, or more in Wine, or some other proper Vehicle.

XIII. *The Infusion in Wine.* It has all the Virtues of the Juice and Essence, but must be given in a larger quantity, as from 2 to 4 or 6 Spoonfuls, Morning, Noon, and Night. It is good against the Colick, Strangury, pain, heat, and difficulty of making Water.

XIV. *The Lobeoh.* It is made of the Juice with the addition of Vinegar and Honey, and then boiling them to a due Consistency. It has all the Virtues of Juice, Essence, and Infusion, but is peculiarly good against Asthmas, Coughs, Colds,

Phthisis, Hoarsness, Wheezing, Shortness of Breath, want of Appetite, &c.

XV. *The Cataplasm.* It is made with the Root scraped fine and thin, &c. Applied to any place pained, or grieved with the Gout, Sciatica, swellings and pains of the Pleura, Liver, or Spleen, it gives wonderful ease and Relief. The Leaves boiled soft in Wine and a little Oil Olive added to them, and so made into a Cataplasm, and applied to the Regions of the Liver and Spleen, it mollifies the hard Swellings thereof, and takes away the pain: and applied to the bottom of the Belly, it gives help and relief in the Strangury.

XVI. *The Distilled Water from the Roots, as also from the Herb.* It is profitable for all the purposes aforesaid, being dulcified with fine white Sugar, and taken inwardly from a quarter of a Pint to half a Pint, Morning and Night. The Water Dropt into the Eyes, is said to clear the Sight: and if two parts of it be mixt with one part of the Juice or Essence, and the Face or Skin be washt therewith, and suffered to dry on, it will (if used for some considerable time) clear the same from Spots, Tannings, Sunburnings, Pimples, Scurff, Morpew, and other Defilements thereof.

XVII. *The Spirit of Horse Radish Roots.* It is made altogether as the Spirits of Cresses, Scurvy-Grafs, &c. And taken in the same manner as they are taken, it cures the Scurvy absolutely in a cold habit of Body: causes a good Appetite and Digestion, warms, comforts, and strengthens the Stomach; invigorates and depurates the Blood and Limpha, and causes a due Circulation of the same through all the Vessels, and every part of the Body. It is profitable against Rheumatisms, the Gout, Dropsy, Jaundice, and all obstructions of the Viscera. Dose 20 or 30 Drops or more in Ale, Beer, or Wine, 2, 3, or 4 times a Day.

CHAP. DLXXXVII.

OF RAG-WORT.

OR,

JAMES--WORT.

I. *THE Names.* It was unknown to the Greeks: the Latines call it *Jacobaea*, and *Herba Jacobi*, *Flos Jacobi* & *Jacobaea*: in English, Rag-wort, and James-wort: thought by some to be a Species of Groundsel.

II. *The Kinds.* Authors make near a dozen Kinds of this Plant; but the five following are the most usual with us, *viz.* 1. *Jacobaea vulgaris major*; *Jacobaea Senetio Lobelij*; *Flos vel Herba Jacobi Majoris*, vel *Jacobaea communis*; Our Common Rag-wort. 2. *Jacobaea vulgaris minor*; *Flos Jacobi minor*; Our Lesser Rag-wort. 3. *Jacobaea Marina*, *Cineraria vulgaris*, *Cineraria Dodonaei*, *Arthemisia Marina Alpini*, Our common Sea Rag-wort. 4. *Jacobaea marina altera*, seu *minor*; *Cineraria Lobelij*; *Cineraria altera*, The lesser Sea Rag-wort. 5. *Jacobaea Maritima latifolia Bauhini*, *Cineraria latifolia Bauhini*, Broad Leav'd Sea Rag-wort.

The Descriptions.

III. The first, or Our common Rag-wort. Its Root is made of many Fibres, some greater, others lesser, by which it is firmly fastened into the Ground, and abides many Years. This Greater common Rag-wort, has many large and long dark green winged Leaves lying on the Ground, very much rent and

Rag-wort Common.

torn on the sides into many pieces even to the middle Rib. From among which rises up sometimes but one, and sometimes two or three Square or crested blackish or brownish Stalks, three or four Feet high, sometimes Branched, bearing divers such like Leaves upon them up to the tops, at several distances, where it branches it self forth, each Branch bearing yellow Flowers, consisting of divers Leaves, set as a Pale or Border, with a dark yellow Thrum in the middle, which do abide a great while: but in the end growing full ripe, are turned into Down, and with a small blackish gray Seed, carried away with the Wind.

IV. The second, or Our lesser Rag-wort. This in its Roots, Stalks, Leaves, Flowers, form and manner of growing is very like the precedent, so that many who do not well view it, do over-pass it, as judging it the same with the former, but the chiefest differences are these, it usually rises in Stalks not so high, nor is the Plant in the whole so great, the Leaves are not so finely jagged, nor of so sad a green color, but rather somewhat whitish, soft and woolly, and the Flowers are commonly paler, yet in many of them are much alike.

V. The third, or Our common Sea Rag-wort. Its Root is long and more woody than the others, with several small Fibres adjoining to it, it has hard crested Stalks about two Feet high, all hoary or white, on which grow hoary white Leaves, much

Rag-wort Sea.

much jagged, or cut into many parts, yet each part of them broader than any of our Wild Rag-worts, and somewhat stiff, but yet soft in handling. The tops of the Stalks are furnished with divers Flowers, whose Cups or Husks are hoary as the rest of the Plant is; but the Flower it self is of a pale yellow color, with a brownish Thrum in the middle, which turn into Down, and with the Seed is carried away with the Wind.

VI. The fourth, or Lesser Sea Rag-wort. Its Root is some thing great and Woody like the other. It grows lesser and lower than the former, yet the Leaves are longer, and much divided, or cut into many other jagged Leaves, each jag being rounder pointed than in the former, of a grayish or Ash green color above, and very white underneath. The Flowers are many which grow at the tops of the hard woody hoary white Stalks, which are sometimes three or four Feet high, and Branched. These Flowers are smaller, and of a dun or darker yellow than the other, and the middle Thrum also browner, which abide in Flower two whole Months at least, before they fall away, and then at last, they turn into Down, as the others do.

VII. The fifth, or Broad Leav'd Sea Rag-wort. Its Root is long, and thicker than any of the former, with some few Fibres retaining to it, from whence spring up round Stalks, about a Foot and half high, very hoary and woolly, spread out into divers Branches, the lower Leaves whereof are somewhat round and jagged as a Cole-wort, each part being as it were waved about the edges, and each Leaf being about four Inches broad, and (together with its foot Stalk) about a Foot long, of a dark green color on the upper side, and of a hoary white underneath, and soft in handling. The Flowers grow at the tops of the Branches upon longer and slenderer foot Stalks, whose Cups or Husks are hoary, and the Flowers themselves greater, and paler, than in the former sorts, the middle Thrum being of a Gold yellow color, which after they are ripe, are turned into Down, and with the Seed blown away with the Wind.

VIII. The Places. The two first grow Wild in Pastures and untill'd Grounds in many places of this Kingdom, and oftentimes both together in one Field, more especially in Fields or Grounds which are something moist, and chiefly near the Borders of Fields. The third grows on our own Coasts, not far from the Sea, in the Isles of Shep-

py and Tenet, and along the *Kentish* shore in many places. The fourth grows, as *Dodoneus* says, by the Sea side in *Zealand*; also on the *Mediterranean* Sea shore of *Italy*. And I have heard some diligent Herbarists here, say, that they had found it growing on the Southern shores of this *Island* towards the West of *England*. The last grows by the Sea side as *Bauhinus* says, but where is not declared.

IX. *The Times*. They all Flower in *June*, *July* and *August*; and the Seed is ripe not long after, at which time it is carried away by the Wind, with the Down.

X. *The Qualities*. Rag-wort is hot and dry in the second Degree, Absterfve, Astringent, Anodyn, and Vulnerary.

XI. *The Specification*. It cures Green Wounds, old Sores, running Ulcers, Fistula's, Catarrhs, Defluxions into the Eyes, Nose, &c. Quinsy, Sciatica, Gout, Kings-Evil.

XII. *The Preparations*. You may have therefrom, 1. A Liquid Juice or Essence. 2. A Decoction. 3. An Ointment. 4. A Balsam. 5. A Cataplasim.

The Virtues.

XIII. *The Liquid Juice or Essence*. By gargling and washing the Throat and Mouth therewith, they cleanse and heal Sores and Ulcers therein. And are good against Swellings, hardness, and Apostematation in those parts; and therefore are said to be profitable against the Quinsy and Struma, or Kings Evil. Drank in a Glass of Wine about 3 or 4 Spoonfulls at a time, they are profitable against Catarrhs, and Defluxions of Rheum into the Eyes, Nose, Mouth, Throat, and other parts. They are singular good to heal Green Wounds, and cleanse old Ulcers, and filthy running Sores, as well in the Privy parts, as in other parts of the Body: and inwardly taken they cure inward Wounds and Ulcers in the Stomach, Lungs, Reins, Bladder and Womb. And outwardly injected into hollow Ulcers and Fistula's, they cleanse, and induce their healing.

XIV. *The Decoction in Wine or Water*. It has all the Virtues of the Juice and Essence, and may be used in the same manner to all those intentions; but when given Inwardly, it ought to be given in a much larger Dose, as to 4 or 6 Ounces, adding to every Dose about half an Ounce of Common Spirit of Wine.

XV. *The Ointment*. After it is made of the Juice, or Green Herb, according to the usual manner, you ought to add to every pound thereof 3 Ounces or something more, of pure fine Powder of Tobacco Leaves. It heals Green Wounds, and cleanses and heals filthy running Sores, old Ulcers and Fistula's, not suffering them to spread farther. It gives ease also in pains which happen both in the Muscular and Nervous parts.

XVI. *The Balsam*. It has all the Virtues of the Ointment, and being mixed with an eighth part of White Precipitate, it more admirably cleanses old putrid running Sores and Ulcers, more especially those of the Kings Evil, which Disease it potently resists, and cures the Ulcers thereof after an admirable manner. It is good against pains of the Nervous parts, and gives ease in the Gout and Sciatica, being applied thereto.

XVII. *The Cataplasim*. It is made of the bruised Herb boiled with Hogs Lard and Beef Suet mixt in

equal quantities, adding thereto a little *Frankincense* and *Mithridate*. It eases pains in any part, chiefly those of the Gout, is good against Simple Contusions; and cleanses old putrid running Sores.

CHAP. DLXXXVIII.

Of RAMPION.

I. *THE Names*. We know no *Greek* Name for this Plant: but it is called in *Latine*, *Rapuntium*, and *Rapunculus*: It is called by *Gesner*, *Dodoneus* and others, *Rapum Sylvestre*, tho' it is not at all like *Rapum* or the *Turnep*, but in the edibleness of the Root: in *English*, *Rampion*.

II. *The Kinds*. Authors give us many Species of this, these following are most usual with us, viz. 1. *Rapunculus esculentus vulgaris*, *Rapuntium parvum*, *Rapunculus minor Matthioli*, *Camerarii*, *Dodonei*, *aliorumque*, *Rapunculus vulgare Tragi*; *Pes Locustæ Avicennæ*; Our common Garden Rampions. 2. *Rapunculus Spicatus Alopecuroides*, *Rapunculum Sylvestre Tragi*, *Rapum Sylvestre majus*, & *Rapunculum Alopecuron Dodonei*. *Rapuntium majus Alopecuroides Comoso Flore Lobelij*; *Rapunculus Alopecuroides spica longa Clusij*; *Rapunculus Sylvestris spicatus Thali*; *Rapunculus Nemorosus primus Tabernemontani*; *Rapuntium majus Gerardi*, Great Rampion, or Long Foxtail Rampion. 3. *Rapunculus Nemorosus Tabernemontani*, *Gerardi*, & *Parkinsoni*; *Rapunculus Campanulatus Nerij foliis terius Thali*, Our Wood Rampion. 4. *Rapunculus Nemorosus Flore magno minor*; *Rapuntium sive Erinus Flore magno Columne*, Wood Rampions with great Flowers. 5. *Rapunculus Corniculatus Montanus Gerardi*, Our Mountain horned Rampions. 6. *Rapunculus Sylvestris Flore ex purpureo Candicante Tabernemontani*, *Campanula minor alba & purpurea Gerardi*, Our Wild Heath Rampion. 7. *Rapunculus Creticus Bauhini*, *Pyramidalis altera*, *Petro-marula*, Candy Rampions.

The Descriptions.

III. *The first*, or Our common Garden Rampion. Its Root is small and white, and gives Milk being broken, as all the rest of the Plant does, shooting out two or three Branches, almost of an equal bigness, which is sweet in Taste, and therefore much used to be eaten. It is usually Nurst up in Gardens, and is accounted a lesser Kind than many of the others which grow Wild; and lying upon the Ground with several small and long round pointed pale green Leaves, before it sends up its Stalks, which spread out with divers such Leaves thereon, but smaller to the top, where break forth several small pale purplish Flowers, ending in five points, like unto the Throat-worts, but much smaller, having also such like Heads, with small brownish Seed therein.

IV. *The second*, or Great Rampion, or Long Foxtail Rampion. Its Root is white, greater than
the

former, but as full of Milk, and as sweet, and fit to be eaten as it, especially when it is boiled, and after stewed with Butter. The lower Leaves of this Rampion are somewhat broad and round, yet ending in a sharp point, a little dented or waved about the edges, of a dark green color, in some places spotted with black Spots, and standing upon long small Root Stalks; but those which grow upon the Stalks are something longer and narrower, sparingly set here and there, leaving the top bare, where grows a small spiked Head or Bush of Flowers, almost in fashion of a Foxtail (whence came the Name) at the first of a darkish green color, for so are the Husks of the Flowers which break out of them, being long and small, like unto Horns, bigger below, and smaller above, ending in four, and sometimes in five points, of a blewish purple color, in some paler, in others deeper, and in some of a white color: which being past there appear in their places small round Heads, a little corner'd, with brownish Seed therein.

V. The third, or Our Wood Rampion. Its Root is white and long, but not so tender as the former. Its lowest Leaves are something long and dented about the edges, yet not so long as the next, which are very long also, standing upon short Stalks, with some smaller ones at the joints with them. The Flowers are like the other Rampions, of a pale swatchet color.

VI. The fourth, or Wood Rampions with greater Flowers. Its Root is somewhat thick, and of a whitish color inclining to red, full of Milk and sweet, being as fit to be eaten, and more desired than any other. Its Leaves are small, somewhat long, and round at the ends; the others which follow, and grow after them upon the Stalks are narrower and longer, and pointed also, the Flowers are longer than others, and of a dusky purplish color, with purple Veins in them, many standing together, like unto the ordinary Rampions, and of the same fashion with five points, but of a deeper color.

Rampion Mountain Horned.

VII. The fifth, or Our Mountain Horned Rampions. Its Root grows after an unusual manner; for first or lowermost is a Root like to that of a Rampion, but slenderer; and from the top of that, comes forth as it were another Root or two, (as it were Root upon Root) being much smaller than the lower Root, especially where they are joined to the under Root; and all these have small Fibres or Strings proceeding from them. The Leaves which first grow up are smooth, and almost like those of a Rampion, yet rounder, and made somewhat after the form of a Violet Leaf, but nothing so big. At the bottom of the Stalk come forth seven or eight long narrow Leaves, dented about the edges and sharp pointed: and upon the rest of the Stalk grow also three or four narrow sharp pointed Leaves, not much unlike those at bottom of the Stalk, but narrower and lesser. The Flowers are of a purple color, and grow at the top in an Umbel or Tuft, and shaped almost like a Chymical Vessel, which we call a Retort, being big, large, or swollen out of their bottoms, and so becoming smaller towards their tops. But afterwards they part themselves into five parts or slender Strings, with Threats in the middle: which decaying, they are succeeded by little Cups, ending in five little pointels, in which is contained a small little Seed.

VIII. The sixth, or Our Wild Heath Rampion. Its Root is small with some Fibres adjoining to it. Its Ground Leaves are small and roundish, almost like unto a Violet, but rounder and dented about the edges; from among which rise up weak slender Stalks, about two Feet high, which have very few Leaves thereon, or none at all; each Stalk or Branch having at its top one Flower only, of a perfect blew or white color as any of the former, and almost as large.

IX. The seventh, or Candy Rampion. Its Root is great and white, parted into many Branches, yielding Milk even as the Leaves and Stalks also do, and abides many Years, altho the Leaves and Stalks perish every Year, fresh springing up before Winter again, but with us it requires to be a little defended in Winter time as aforesaid. The first Leaves which spring up from the Seed of this Cretick or Candy Rampion, are round, like unto Violet Leaves, little or nothing dented about the edges, which so abide the first Year; but those which rise afterwards with the Stalks, are much different from them, being much cut in, and deeper into several parts, set on both sides of the middle Rib, the end being longest, all of them dented, of a dark green color on the upper side, and oftentimes reddish underneath. From among which rise up several Crested Stalks two or three Feet high, bearing such like Leaves on them as below, but smaller from the middle to the tops, furnished abundantly with many small reddish purple Flowers, and sometimes with white Flowers, growing one above another in a long Spike, very like unto the Spiked Rampion, but somewhat longer, and more divided or dented in at the corners, and each part turning it self a little back again. After which come very small brownish Seed in Heads, both of them like unto the other Rampions. This Pena in his Mons Baldus, and Honorius Bellus in his first Epistle to Clusius, calls Petromarula seu Lactuca petraea Cretica.

X. The Places. The first is always Nurst up in Gardens, and sometimes the second, both of which are also found growing Wild in England, the Roots being eaten in Sallets, and also eaten boiled. The seventh grows with us only in Gardens, but requires to be a little defended in the Winter with us. The third grows in Woods in many places of England. The fourth grows also Wild in Fields sides and

and in Woods. The fifth Gerard says, that he received Seeds and Roots thereof from Mr. Goodyer, who found it growing plentifully Wild in the enclosed Chalky Hill Grounds by Mapal Durban near Petersfield in Hampshire, and that being Planted in Gardens, its Flowers become much longer and fairer. The sixth grows Wild also in many places in this Kingdom.

XI. *The Times.* They Flower in May, Jun and July, yea even all the Summer long, and lasting even to the cold of Autumn, which causes them to decay.

XII. *The Qualities.* The Roots of these *Ramsons* are only used, and are temperate in respect to heat or cold, dryness or moisture, are Absterfive, Cosmetick, Stomackick, Analeptick, and Galactogenetic, or encreasers of Milk in Nurfs Breasts.

XIII. *The Specification.* The Roots encrease appetite, cause good digestion, are Absterfive, and Cosmetick, clearing the Skin from deformities, and restore in Consumptions.

XIV. *The Preparations.* You may have therefrom. 1. A Sallet. 2. A Decoction. 3. A Cataplasm. 4. A Distilled Water from the Roots and whole Plant.

The Virtues.

XV. *The Sallet.* The Roots of all the *Ramsons*, if they be of any greatness, are used for Sallets, either Cold, with Salt, Vinegar, Oil, and Pepper; being cut and sliced thin. Or being boiled, or stewed in Butter, or Oil, and so eaten with Salt, Vinegar and Pepper; either way, or any way, they are familiar to the Stomach, stir up the Appetite, and cause Digestion; and so cause Milk in Nurfs Breasts; And by reason of their Temperate and Analeptick, or Nutritive Qualities, they encrease Blood and Flesh, and so restore in Consumptions.

XVI. *The Decoction.* It may be made in Wine, Milk, or Water. It is said to be good against Inflammations of the Mouth, Throat and Almonds, and other diseases happening to those parts, in like manner, as the *Throat-Worts* are.

XVII. *The Cataplasm.* The Roots beaten small and mixed with Meal or Flower of *Lupines* or rather of *Orobis*, cleanses the Skin, from Scurff, Morpew, Pimples, Spots, Marks, and other like Defecations or Discolorings.

XVIII. *The Distilled Water of Roots and the whole Plant.* It has all the Virtues of the Cataplasm, and makes the Face and Skin, very fine, beautiful and clear. Drank constantly by Nurfs, either alone, or mixt with Milk or Whey, and a little sweetned with double Refined Sugar, it encreases Milk in their Breasts, and is good against a Pining Consumption, as also for Ulcers of the Lungs.

CHAP. DLXXXIX.

OF RAMSON:

OR,

BEARS -- GARLICK.

I. *THE Names.* It has no proper Greek Name, but as being a Species of Wild Garlick, it may be called *ῥάβδα ἀγρία*: in Latine, *Allium Ursinum*; *Allium Latifolium*; and *Moly Hippocraticum*; in English, *Ramson*, or *Ramsons*.

II. *The Kinds.* This *Ramson* is certainly a Species of Garlick, as appears by the Smell and Taste, Parkinson joins it with the *Garden Garlick*. Gerard with the Wild: for that it has been found growing Wild in Woods: This is *Bears-Garlick*, or *Garden Ramsons*. There is another *Ramson* called *Allium Montanum*, *Allium Alpinum latifolium* Gerard; *Allium anguinum* Matthioli, & Parkinson; *Victorialis longa* Chusij; (because *Gladiolus* is called *Victorialis rotunda*) *Ophioscoridon* Lobelij; Snake Ramson.

The Descriptions.

III. *The first*, or *Bears-Garlick* of *Garden Ramson*. It has a Root which is divided into many cloves or parts, by which it much

Ramsons; Bears Garlick: *Allium Ursinum.*

encreases;

increases, and is much milder than the Common Garlick both in Taste and Smell. It has two or three fair broad Leaves of a fresh or light green color, and pointed at the end. The Stalk grows to be about an Hand length high, bearing many small and pure white Star-like Flowers at the top, and afterwards small, black and smooth round Seed.

IV. Gerard thus describes it. Instead of a Root, it has a long slender Bulb, which sends down a bundle of Strings, and is covered with Skins or thick Coats. From whence Spring two or three broad longish Leaves, sharp pointed, smooth, and of a light green color. The Stalk is a span high, smooth and slender, bearing at the Top a cluster of whiter star fashioned flowers.

V. The second, or Snake Ramson, Its root is bulbous but longer than the other, covered with a brownish outward Skin or Coat, somewhat netted as it were like Gladiolus, with a Tuft of fibers adjoining to it. Parkinson says, it has somewhat broader Leaves than the other Ramson, something like to Lilly Convally Leaves, but spotted oftentimes with black Spots, as the slender Stalks are, which bear many small white Flowers on their Heads.

VI. Gerard describes this second sort thus. Its Root is great and long, covered with many scaly Coats, and hairy Strings. This Mountain Ramson rises up with a Stalk half a Yard high, and of about a fingers thickness, yet very weak, and full of a Spongy Substance: near to the bottom, it is of a purplish color, and green above, bearing at the top a multitude of small whitish Flowers, Star-furnished and something Gaping. The Leaves are three or four broad, and Ribbed like the Leaves of Great Gentian, but more resembling the Leaves of Garden Ramson, or Bears-Garlick (before described) saving that they are larger.

VII. The Places. The first, or Bears-Garlick or Ramson, besides its being Planted in Gardens, is found to grow Wild in many parts of England, in Woods and Borders of Fields under Hedges, among the Bushes. Gerard says, he found it growing in the next Field to Booby's Barn near London, under that Hedge which borders upon the Lane: also upon the left Hand under an Hedge adjoining to a Lane leading to Hampstead near London. The second grows Wild on the Mountains of Germany as Clusius says; but with us only in the Gardens of the Curious.

VIII. The Times. They spring up in April and May, and they Flower in June and July; and their Seed is ripe in August.

IX. The Qualities. They both of them have all the Qualities of Garden Garlick, but are not full out so strong and efficacious as it, being hot and dry but in the third Degree.

X. The Specification, Preparations, and Vertues are the same with those of Garden Garlick, in Chap. 307. Sect. 9. ad Sect. 22. to which I refer you: yet the following particular Observations Authors have made concerning them.

XI. Observat. 1. The Leaves of Ramsons; In the Low Countries: They are stamped and eaten by several People with Fith for a Sawce; just as we eat Green Sauce made with Sorrel. And the same Leaves may very well be eaten in April and May with Bread and Butter, for they very much expel Wind, and strengthen the Stomach.

XII. Observat. 2. The Distilled Water of the Roots and whole Plant. It is of singular good

use against Stone, Gravel, Sand and Tartar in the Reins and Bladder: it opens obstructions of those parts, and cleanses them very well: it provokes Urine; and is said even to break the Stone and drive it forth. But if it breaks it, I conclude that its substance or consistence, must be made of a Friable matter.

XIII. Observat. 3. The Root of the Snake Ramson. It is like Garlick in its Operation. Camerarius says, that Country People hang it about the Necks of their Cattle, when they are fallen Blind, and persuade themselves, that by this means they will recover their Sight again. Those who work in the Mines in Germany, say (as Clusius reports,) that they find this Root powerful in defending them from the injuries of Evil Spirits and Devils, which are oftentimes troublesome in those places. I rather think that hereby is meant, that it is good against the Malignity of Poisonous and Pestilential Vapors, and Mortiferous Damps, which are very frequent in the Mines.

RAKET, see Rocket, Chap. 598.

RAMPE, see Wake Robin, Chap.

RAPE, see Turnep, Chap.

CHAP. DXC.

OF RAPE -- SEED.

AND

'COLE -- RAPE.

I. **THE Names.** We know no Greek Name it has: but it is called in Latine, *Rapo-Caulis*, & *Caulo-Rapum*: in English, Rape and Cole-Rape.

II. **The Kinds.** The Species we treat of here are, 1. *Rapo-Caulis*, The Garden Rape-Cole. 2. *Caulo-Rapum*, The Garden Cole-Rape. 3. *Brassica Sylvestris*, vel *arvensis*, The Wild Rape, or Cole-wort, which yields the Rape Seed, and is only sown for Profit sake.

The Description.

III. **The first, or Garden Rape Cole.** It has one single long Root, garnished with many Thready Strings. From which rises up a great thick Stalk, bigger than a Great Cucumber, or Great Turnep, at the top whereof shoots forth, great broad Leaves like to those of Cabbage-Cole. The Flowers grow at the Top on slender Stalks, compast of four small yellow Leaves, which being past, the Seed follows, inclosed in small long Cods, like the Seed of Mustard.

Rape-Cole.

IV. Parkinson describes this Rape Cole thus. It has a Root which is somewhat long, and very bushy with Threads. From the Head of this Root, proceeds another white Head, or Headed Stalk above the Ground, as large as a reasonable Turnep, but a little longer: and from the top thereof proceeds or springs out divers great Leaves like unto Coleworts) for which reason it is accounted one of the Kinds of Coleworts;) from among these Leaves, rise divers Stalks, which bear yellow Flowers, consisting of four Leaves apiece; and Seed in small long pods, almost as small as Mustard Seed.

V. The second, or Garden Cole Rape. It has a long fibrous Root like unto the former. The Tuberous Stalk is very great and long, thrusting forth in some places here and there some foot Stalks, on which do grow smooth Leaves, slightly indented about the edges; on the top of the long Turnep Stalk grow Leaves, Stalks, and Flowers like the former. This differs from the first chiefly in the length of the swollen Stalk, for which reason it is called by some Caulo Rapum longum, or Long Cole Rape.

VI. The third, or Wild Rape, -or Wild Cole wort, (which yields the Rape Seed, of which they make Rape Oil.) Its Root is white, hard, and somewhat Woody. From this Root spring up many long grayish round Leaves, much gashed in, or torn on the edges. From among these Leaves rise up the Stalks, bearing such like Leaves, but smaller; and at their tops yellowish Flowers, each consisting of four Leaves, which are succeeded

Rape Seed Plant.

by small rough Pods, with small round Seed in them.

VII. Gerard thus describes this Kind. This Wild Rape, or Cole-wort has long broad Leaves,

Rape Seed Plant.

not unlike to the Tame or Garden Cole-wort, but lesser, as is all the rest of the Plant. This is of its own Nature Wild, and therefore not Nurst up for Food: but it is Sown and Husbanded in whole Fields for the Seed sake, by which the Owners oftentimes get great Gain.

VIII. *The Places.* The two first are Natives of Italy, Spain, and some places of Germany: from some of which places Seed has been sent to us, and they are become Natives in many of our Gardens. The third grows Wild on many Ditch bank sides, both in the Up-lands and near the Sea side: but now for the profit sake which is made of the Seed, (by extraction of its Oil, by the help of Oil Mills, built on purpose for that use) whole Fields are sometimes sown therewith, as we but even now hinted.

IX. *The Times.* They all Flower when other Coleworts do, viz. about the middle or end of July; and the Seed is ripe in the middle or end of August.

X. *The Qualities, Specification, Preparations, Virtues and Uses* of these Plants, are the same with those of the Garden Cole-wort in Chap. 143. Sect. 7. ad 22. so that no more need be said of them in this place: saving that the Wild Rape, or Rape Seed Plant, is seldom or never used either as Food or Sallet but is chiefly produced for the Oil of its Seed.

XI. *Observation 1.* The Seed of the Rape-Cole, or Cole Rape. If it is grossly bruised and boiled a little in Meat or Flesh Broth, it is a present Remedy for the Colick: The Seed and Broth being taken together, easing them who are troubled therewith, of all Gripping Pains, and gives ease also to those who are troubled with the Stone in the Reins.

XII. *Observ. 2.* An Elestuary of the Pulp of the boiled Stalks. If the Turnep part of the Stalk, is boiled or baked till it is soft, you are to take the Pulp thereof, and with a little Honey and Almond-Milk, to make a Lohoch, or soft Elestuary. This taken now and then upon a Knives point, is very profitable for shortness of Breath, and such as are entering into a consumption of the Lungs.

XIII. *Observ. 3.* Gerard says, that there is nothing Wrote of the Faculties of these Rape-Coles, or Cole-Rapes; but he says they are accounted for dainty Food, contending with the Cabbage in goodness, and pleasant Taste.

XIV. *Observ. 4.* Not taking notice of the Mechanick Uses for which Rape Seed Oil is had in Estimation: its Medical Use is for easing of Pains in any part of the Body; by anointing the parts affected well therewith, and applying Cloths dipt in it over the same. It is Anodyn, Relaxative, and gives ease in the Gout, Cramp, and helps shrunk Sinews, if not of too long continuance. It eases Pains of the Spleen, Reins and Womb, being outwardly apply'd, and inwardly taken to the quantity of a Spoonful or two at a time.

CHAP. DXCI.

Of RASP-BERRY Plant:

OR,

HINDE-BERRY.

I. *THE Names.* It is called in Greek, *Bérō-idea*: in Latine, *Rubus Idae*: in English, *Rasp-Berry*, and *Hinde-Berry*.

II. *The Kinds.* We shall describe five several Varieties, viz. 1. *Rubus Idae vulgaris vel Hortensis*, Our common Garden Rasp-Berry. 2. *Rubus Montanus Odoratus*, The sweet Mountain Raspis. 3. *Rubus Tricocco*, Our common Field Dew-Berry. 4. *Rubus Saxatilis Alpinus*, The Stony, Rock Rasp-Berry. 5. *Chamaemorus Anglica*, Our Knot-Berry.

The Descriptions.

III. *The first, or Our common Rasp-Berry.* Its Root creeps under Ground very far, and shoots up again in many places, much increasing thereby. It is of two sorts, viz. one bearing red Berries, the other white; but otherwise they differ not in their form or manner of growing, either as to the

Rasp-Berry Bush.

whole Bush, or as to the Leaf, Flower or Berry, but only in the color of the Fruit, and a little in the Taste thereof, the white Rasp-Berry being a little more pleasant than the red. The Rasp-Berry Bush has tender whitish Stems, with reddish small Pricks like

like hairs set round them, especially at the first when they are young; but when they grow old they become more woody and firm, without any show of Thorns or Prickles upon them, and have only a little hairiness covering them. The Leaves are somewhat rough or rugged, and wrinkled,

Rasp-Berry Garden.

standing three or five upon a Stalk, something like unto Roses, but greater, and of a grayer green color. The Flowers are small, made of five whitish round Leaves, with a dash as it were of bluish cast over them, many standing together, yet every one upon its own Stalk, at the tops of the Branches. After which come up small Berries, something bigger than the Common finall red Straw-Berry, with a kind of downiness cast over them, of a pleasant acid Taste, having a kind of peculiar flavor of their own.

IV. The second, or Sweet Mountain Rasp-Berry. Its Root creeps and spreads much under Ground, as the other does. It has several long Stalks rising up from the Root, without any Thorns on them, but set thick with soft Hairs, having on them broad and large Leaves without order, growing upon long hairy foot Stalks, divided into five parts, almost to the middle Rib, and sometimes but into three, each part a little dented about the edges, of a very sweet Smell, but falling in Winter. The Flowers are something large like the Eglantine, of a diluted purplish Violet color, with several yellow Threads in the middle, standing at the tops of the Branches: after which come the Fruit, very like to the former, and reddish, having much the Rasp-Berry Taste.

V. The third, or Our common Field Dew-Berry. Its Root creeps under Ground more than the last, and has slender weak Branches like that, but more often lying down, than rising up, with a few Thorns or Prickles thereon. The Leaves are usually but three set together, more separate on the

Branches, yet almost as large, and standing on long foot Stalks. The Flowers are white and small. The Berries usually consist but of three parts or bunchings out, each having but one Grain or Seed in it, and all making but one Berry, yet sometimes they may have 4 or 5 of those Grape like bunchings out, being of a sweet and pleasant Taste.

VI. The fourth, or The Stony, or Rock Rasp-Berry. Its Root creeps all about, and shoots forth several Branches from the Joints as they creep. It is but a low Plant, and is more of the Rasp-Berry Kind, than of the Bramble. It has several slender, reddish, twiggy hairy Branches, little more than a foot, scarcely half a Yard high, without any Thorns or Prickles at all on them; the Leaves are set here and there, on the Stalks, and stand on long foot Stalks, being rough, and three always joined together, dented about the edges, and of a very styptick, or harsh binding Taste. The Flowers stand at the tops of the Branches, three or four together, consisting some of four, and some of five Leaves a-piece, of a pale, or whitish Rose color, which afterwards turn into small Fruit, composed of three, four, five, or more small Grape like bunchings out, larger than either in the Bramble, or Garden Rasp-Berry. The whole Berry is of a reddish color when it is ripe, and almost transparent, full of a most pleasant acid sweet Juice, very grateful to the Palate, having in each of its bunchings out, a small white rough Grain, or Seed.

VII. The fifth, or Our Knot-Berry. Its Root creeps much and far, shooting forth small Fibres at the knotty Joints, by which it is fastned in the Ground, and from whence spring up divers new Shoots or Stalks. It rises up with slender brownish Stalks, scarcely exceeding a Foot in height, unless the Soil be very good, set with four or five large Leaves, one above another, at several Joints, each of them divided into five parts, and each of them somewhat deeply jagged, and dented also round the edges, rough and as it were crumpled, each upon a long foot Stalk, which at the Joints have 2 small pieces like Ears growing thereto. Each Stalk being furnished at top, with one Flower, consisting of five round pointed Leaves, of a dark purple color. Being past away, there follows a large Berry, like to a Mulberry, consisting of many Grains, set together, of a reddish color when it is ripe, and of a sweet acid Taste.

VIII. The Places. The first grows generally with us in Gardens throughout the Kingdom. Gerard says, that it grew not Wild that he knew of, except in a Field by a Village in Lancashire called Harwood, not far from Blackburne, also among the Bushes of a Cawley near to Wishterton, two Miles from Nantwich in Cheshire; I have formerly found it to grow Wild also, in some parts of the Fens in Cambridgeshire, not far from a Town called Chartres. The second grows on Hills and higher Grounds in divers places. The third grows in many places in the North of England, as, Cheshire, Lancashire, and Yorkshire, also in Cambridgeshire, in many of the Plowed Fields, and Arable Land in several places. The fourth, in Stoney and Rocky places in the Isle of Tene, and other places in Kent, it grows also in Huntingdonshire and Northamptonshire. The fifth grows on the high Hills in Lancashire, it loves open and Snowy Hills, and Mountains, and grows plentifully upon Ingleborough Hills in Lancashire aforementioned, which is thought to be the highest Hill in England; as also upon Pendle Hills in Yorkshire, which is another Hill, nearly as high as the former, and other like places.

IX. The

IX. *The Times.* They all Flower about the latter end of May, thro' all June and July; and the Berries are ripe in August and September.

X. *The Qualities.* The Roots, Stalks, Leaves, Flowers, and unripe Fruit are cold and drying in the first Degree, Astringent, and Styptick, Vulnerary, and Alexipharmick.

XI. *The Specification.* They stop Fluxes of the Belly, and bleeding in the inward parts, are good against the overflowing of the Courses in Women: they cure Sores and Ulcers of the Throat, Mouth and other parts, are profitable against the bitings of Serpents, and cure the *Stomacace*, or Scurvy, being used according to Art, for some considerable time.

XII. *The Preparations.* You may have herefrom, 1. A *Liquid Juice* of the Roots, Stalks and Leaves. 2. A *Liquid and Inspissate Juice* of the green or unripe Berries. 3. A *Decoction* of the Roots, Leaves, Flowers and unripe Berries. 4. A *Decoction* of the dried unripe Berries. 5. The ripe Berries. 6. A *Conserve* of the Flowers. 7. A *Conserve* of the unripe Berries. 8. A *Conserve* of the ripe Berries. 9. A *Syrup* of the Juice of the ripe Berries. 10. A *Wine* of the ripe Berries. 11. A *Powder* of the Roots and Leaves. 12. A *Distilled Water* from the whole Plant and unripe Berries. 13. A *Vinous Spirit* from the Berries.

The Virtues.

XIII. *The Liquid Juice of Roots, Leaves and Stalks.* Taken to 3 or 4 Spoonfuls at a time in any convenient Vehicle, as Red Wine, &c. it stops all sorts of Fluxes of the Bowels, Fluxes of the Womb, and defluxions of Humors to any Sore, Ulcer, or other part of the Body; it is excellent against Catarrhs, and mixed with Honey, or Syrup of the Berries ripe or unripe, it is good against Sores and Ulcers of the Throat, Mouth, and Secret parts; and is also very profitable to the speedy healing of Green Wounds.

XIV. *The Liquid and Inspissate Juice of the green or unripe Berries.* They have both of them all the Virtues of the former Juice, but much more effectual to all those Intentions. The *Liquid Juice* may be given Morning and Evening from 1 Spoonful to 2, in a Glass of Red Port Wine, or other proper Vehicle. The *Inspissate Juice* may be given from a Dram to two Drams or more, dissolved in the *Decoction* of the Leaves, or in Red Styptick Wine, and then Sweetened with the Syrup of the ripe Berries. They are both good against the heat and Inflammation of the Throat, Almonds, and Mouth, stop Spitting of Blood, and all sorts of Fluxes of Blood wheresoever. And mixt with Honey are good to heal Sore Eyes.

XV. *The Decoction of the Roots, Stalks, Leaves, Flowers and unripe Berries, in Wine or Water.* It has all the Virtues of the former *Liquid and Inspissate Juices*, but must be given in greater quantity, as to 4 or 6 Ounces or more Morning and Night, mixed with Syrup of Mulberries, or Syrup of ripe or unripe Raspberries, it makes an extraordinary Gargle for a sore Throat and Mouth, takes off the force of the hot Inflammation, and in a little time causes a healing: and being also swallowed down, it cools and represses inward Fevers.

XVI. *The Decoction of the dried unripe Berries.* It has the Virtues of the former *Decoction* and of the *Juices*, and may be taken in the same Dose of the *Decoction*, either alone sweetened with the Syrup

of the Berries, or mixt with some proper Wine. It is good against the Poison of Scorpions, Serpents and other Venomous Beasts, being both inwardly taken in Wine, and outwardly fomented upon the part scalding hot, or as hot as it can be endured, for some considerable time.

XVII. *The ripe Berries.* They are eaten raw, and so they cool, abate the heat of the most violent Fevers, even of the Pestilential, attenuate the Stomach, and refresh, and cheer the Spirits, and are of extraordinary benefit, to be plentifully eaten by such as are troubled with the *Stomacace* or Scurvy, viz. the Stomach Disease, for they cool, cleanse, and strengthen the Stomach, and restore its healthful Tone, and withall rectify the Discreasy of the Blood and Juices.

XVIII. *The Conserve of the Flowers.* It is Styptick or Binding, and of singular good use against all sorts of Fluxes of the Bowels in Man or Woman, taken to the quantity of a Chest-Nut Morning and Night.

XIX. *The Conserve of the unripe Berries.* It has all the Virtues of both the *Liquid Juices* and *Inspissate Juice* aforegoing, and may be taken Morning and Evening, upon a Knives point, to the quantity of a Chest-Nut. It is very cooling and grateful to the Stomach, and stops Vomiting.

XX. *The Conserve of the ripe Berries.* It is not so great an Astringent as the former, but is of good use to cool and strengthen the Stomach, resist the Scurvy, and to take off the preternatural heat of Fevers, and cause a good Appetite.

XXI. *The Syrup of the Juice of the ripe Berries.* It is pleasant and grateful, effectual to cool a hot Stomach, and to quicken and refresh such as are overcome with Sickness at Heart and Faintings. It refits the Scurvy in a hot Constitution, and is very Cordial.

XXII. *The Wine of the ripe Berries.* It is made of the Juice by a Natural Fermentation, as the Wine of Grapes are made. And when by Age and keeping it becomes fine, it is a noble Cordial, and as much comforts the Spirits as other Wine does. Parkinson says, that it is generally held at least by many, that the Red Wine which is usually Sold by the Vintners is made of Raspberries. As to the truth of this I can say nothing: but this I can say, that the Vintners need not beholden to the Rasp-Berry for Red Wine, for that there is a Red Grape which yields a Blood red Juice, of as deep a Red, as any thing can be imagined to be.

XXIII. *The Powder of the Roots and Leaves.* It is Styptick, but of a thin Substance, for which reason, (experience having also confirmed the same) it is said to waste away the Stone in the Reins; and also to break the Stone and drive forth Gravel and Sand out of the Reins and Bladder: and strewed on old Sores and running Ulcers, yet tho' Cancertous, it is said wonderfully to help and heal them.

XXIV. *The Distilled Water from the whole Plant and unripe Berries.* It is of extraordinary use in cooling the Body, and abating preternatural heat. If it is taken (being impregnated with a few drops of Spirit of Sulphur,) it takes away the heat, and extinguishes the malignity of all Burning and Malign Fevers, yea of the Pestilence itself. And so used it admirably quenches Thirst, and supports the Spirits against Fainting, Swooning, and other like accidents of the Vitals.

XXV. *The Spirit.* It is Distilled off from the the Wine made of the Berries in an Alembick, exact-

exactly in the same manner as you make Spirit of Wine. If it is well done, it is full as strong and as good as Spirit of Wine, and as pure: and when it has Age upon it is scarcely to be known from true Spirit of Wine. It serves to all the same uses which Spirit of Wine does, both in Chymistry and Physick, and is full as good and as Cordial, being taken as a Dram.

CHAP. DXCII.

Of RATTLE-GRASS' Red:

OR,

Red LOUSE-WORT.

I. **THE Names.** It is called in Greek, *Παλιου*: in Latine, *Pedicularis*, and *Fistularia*, also *Crista Galli*, or *Gallinacea rubra*: in English, *Rattle-Grass*, *Red Rattle Grass*, *Red Cocks-Comb*, and *Red Louse-wort*.

II. **The Kinds.** There are three Species hereof, viz. 1. *Pedicularis Pratensis rubra vulgaris*, *Crista Galli altera*, sive *Phibirion*; Our Common red Rattle. 2. *Pedicularis major montana*; *Pedicularis Alpina filicis folio major Baubini*; *Alectorolophus major Clusij*, The greater Mountain Rattle-Grass, or greater Red Cocks-Comb. 3. *Pedicularis montana minor*; *Pedicularis Alpina filicis folio minor Baubini*; *Alectorolophus minor Clusij*; The lesser Mountain red Rattle-Grass. There is also *Yellow Rattle-Grass*, or *Rattle-Grass* with yellow Flowers, called generally *Cocks-Comb*, and under that Title we have already treated of it in Chap. 142 foregoing, to which you are referred.

The Descriptions.

III. **The first, or Our Common red Rattle.** Its Root consists of two or three small whitish Strings

Rattle-Grass red; or, Louse-wort.

with some Fibres adjoining to them. It has several reddish hollow Stalks, which are sometimes green also, rising up from the Root, lying for the most part on the Ground, yet some growing more upright, with many small reddish greenish Leaves set on both sides of a middle Rib, finely dented about the edges. The Flowers stand at the tops of the Stalks and Branches, of a fine purplish red color, like small gaping Hoods, after which come flat blackish Seeds in small Husks, which lying loose therein, will Rattle by shaking, whence came the Name.

IV. **The second, or Greater Mountain Rattle-Grass, or Greater Red Cocks-Comb.** Its Root is long, thick, and black. It rises up near half a Yard high, with a thick crested hollow Stalk, set something thick, with long Stalks of Winged Leaves, made after the manner of Ferns, notched about the edges, one above another. The Flowers are like the former, but of a whitish color, growing in a long Spike, after which follow broader Husks, containing therein flat Seed much like to Madwort.

V. **The third, or Lesser Mountain red Rattle-Grass.** Its Root is long and white, of the thickness of ones Finger, with some great Fibres adjoining to it. This smaller kind grows much lower than the last, and with fewer Leaves on the Stalks, which are slender, but hollow also like unto them. The Flowers likewise are smaller and grow on a shorter Spike, but of a delicate shining red Color. The Husks which follow, are greater than the first, with long beaks at their ends, having corner'd Seed within them.

VI. **The Places.** They grow the first in our Meadows, the second and third in our Woods and Mountainous and Hilly Grounds, in many parts of this Land; and are rather a Plague and Annoyance to the Land, than of any good use for the Cattle. The first delights in moist and moorish Meadows, where it encreases and becomes hurtful to the Grass.

VII. **The Times.** Gerard says the first Flowers in May and June. Parkinson says, they flower in June, and sometimes till August is past.

VIII. **The Qualities.** They are cold and dry in the first degree; Astringent, and Vulnerary.

IX. **The Specification.** It heals the Bloody Flux, stops the overflowing of the Courses in Women, or any other Flux of Blood; stops all other Fluxes of the Bowels, as also any Flux of Humors to any old running Sore, Ulcer or Fistula, and is profitable for the speedy healing them up.

X. **The Preparations.** You may have herefrom, 1. A Liquid Juice of the Plant. 2. A Decotion of the same in rough or Styptick Red Wine. 3. A Powder of the Seed, and Leaves.

The Virtues.

XI. **The Liquid Juice.** Taken from a Spoonful to two in Red Styptick Wine, Morning and Night, it stops the overflowing of the Courses in Women, and all other Fluxes of the Bowels, as also Catarrhs or Fluxes of Rheum into the Mouth and Throat, and all sorts of Fluxes of Humors upon the Joints and other parts, and thin Distillations upon old running Sores, Ulcers, Fistula's, &c. causing them speedily to heal, more especially if they be daily washed with the same Juice, mixed with an eighth part of Common Spirit of Wine or Brandy, lawardly taken also as aforesaid, it

cure.

cures Spitting of Blood, Vomiting of Blood, Piffing of Blood, and other inward Bleedings, and after due cleansing, heals Ulcers of the Bowels.

XII. *The Decoction in Red Styptic Wine.* It has all the Virtues of the *Juice* aforegoing, but much weaker, and therefore ought to be used in larger quantities, as from a quarter to half a Pint Morning Noon and Night, a little sweetned with double Refined Sugar. Sweetned with Honey, and used as a *Gargarism*, it is an excellent thing to cure Inflammations, Sores, and Ulcers in the Almonds, Throat, Mouth, Tongue and Gums, &c. being used 3, 4, or 6 times a Day. And so used also as a Wash for running Sores, or as an Injection for hollow Ulcers and Filtula's, it cleanses, incarnates, and causes a speedy healing. It is an excellent thing also for an Injection in a Virulent Gonorrhoea, Universals being premised, and cure the Virulent running in Women.

XIII. *The Powder of the Leaves and Seed.* Being taken inwardly to a Dram in Red Wine, it stops all Fluxes of the Bowels, even the Bloody Flux, and all other inward Fluxes of Blood: and outwardly applied to any old running Sore or Ulcer, it very much dries up the Humor, stops the Fluxion, and induces a speedy healing.

CHAP. DXCH.

OF REED -- BURR:

OR,

SE DGE.

Burr-Reed, or Sedge.

I. **T**HE Names. It is called in *Arabic*, *Sufarberamon*: in *Greek*, *Συμφύτον*: (*Fasciola*: quod ex eo fascie fierent.) Also *Ἐπίθιον*, *Xiphidion*, *Gladiolus*, *ensculus*, (because it is Sword like, and double edged:) some think it to be *Birchos*, *Butomos* *Theophrasti*, *que est Herba palustris, acutam habens aciem secansque*: in *Latine*, *Sparganium*, and *Xiphidion*; which is the *Platanaria* *Dodonai* & *Thalij*, because the Burrs of it are like to those of the *Plane Tree*: But *Lonicerus* calls it *Carex*, which to me seems the more proper Name: in *English*, *Burr-Reed*, *Sheer-Grass*, *Sword-Grass*, *Burr-weed*, *Sedge*, which last, is the proper *English* Name.

II. *The Kinds.* There are several sorts of it, the three following are chief, viz. 1. *Carex* *Ramosa*, *Sparganium* *Ramosum*, *Platanaria* *Dodonai* & *Thalij*, *Butomos* *Theophrasti* *Ruellio* & *Angulata*, *Xiphidion* *Dioscoridis*, Our *Sedge*, or *Burr-Reed* *Branched*. 2. *Carex* *non Ramosum*, *Sparganium* *majus non Ramosum*, *Sparganium* *alterum* *Lobelij*, *Platanaria* *altera* *Dodonai*, *Sedge* or *Burr-Reed* not *Branched*. 3. *Sparganium* *majus* *Ramosum* *Virginianum*, The great *Branched* *Burr-Reed* of *Virginia*.

The Descriptions.

III. *The first, or Our Sedge, or Burr-Reed* *Branched.* Its Root is *Bushy*, consisting of a great number of *Strings* and *small* *Fibres*. It has larger, broader and rougher *Leaves* than those of the *Cats-*

Tail, or Reed-Mace, yet a little or in some small measure three square as it were, like them, and sharp both on the edges and at the points. From among which rises up a rough round *Stalk*, 2 or 3 Feet high, with the like, but lesser *Leaves* on them, dividing or branching it self towards the top into several parts, bearing on them several small green *Burrs*, which are not rough at the first, but growing ripe, are hard and prickly, somewhat resembling the rough *Burrs* of the *Platanus*, or *Plane-Tree*, with a *Leaf* at each joint up to the top.

IV. *The second, or Sedge, or Burr Reed* not *Branched.* The Root of this is in all respects like to that of the former. It grows up also in like manner, but with *Leaves* somewhat broader than those, and a single lower *Stalk* not *Branched* at all, but bearing the like *Balls* or *Burrs*, yet something softer, and not so prickly, with a *Leaf* at every one of them likewise.

V. *The third, or Great Branched Sedge, or Burr Reed* of *Virginia.* Its Root is somewhat knobby at the Head, with several *Fibres* or *Strings* thereat. It has only 2 or 3 very long and somewhat broad, pale green *Leaves* rising from the Root, and in the midst of them a strong round *Stalk*, without any *Leaves* thereon; but Branching it self forth near the top into many round and somewhat prickly *Burrs*, of the bigness of a *Wall-Nut*, without any shew of *Flowers* appearing thereon.

VI. *The Places.* They usually grow in *Marshes*, *Watery Ditches*, *Ponds*, and in *Rivers* *Salt* and *Fresh Waters*, or by their sides: the two first in several parts of this Land: The third in *Virginia*, *Maryland*, *New-England*, *New-York*, *Carolina*, and other parts of *Florida*. The two first grow plentifully

tifully in the Fenny Grounds of *Lincolnshire*, and such like places.

VII. *The Times*. They are green all the *Spring* and *Summer*, and bring forth their Burrs or Seedy Knots in *August*.

VIII. *The Qualities*. They are cold dry in the first Degree, and Alexipharmick, or resisters of Poison.

IX. *The Specification*. Authors have said no more of the Virtues of these Plants, but that they are good against the Poison of Serpents.

X. *The Preparations*. There is only *A Decolli-* on of the Root, or of the Burrs in Wine.

The Virtues.

XI. *The Decolli-*. The Root being made into a Decolli in Wine (for so I suppose *Dioscorides* is to be understood, *Datur radix ex vino, contra Serpenti Venena*;) is good against the Poison of Serpents. But *Gerard* says, that the Knots or rough Burrs of these Plants boiled in Wine, are good against the Bittings of Venomous Beasts, if the Decolli is either drank, or the Wound washed therewith.

CHAP. DXCIV.

of REED Common.

I. **T**HE Names. It is called in *Arabic*, *Casab*; in *Greek*, *Κάλαμος*; in *Latine*, *Calamus*, *Horundo*, & *Arundo*: in *English*, *Reed*.

II. *The Kinds*. We shall not here enumerate the vast numbers or Species of Reeds, which grow in most parts of the World, but those only which grow in *England*, and our Plantations beyond Sea, in the *West Indies*, and these are the three following, viz. 1. *Phragmatis Dodonei* & *Ruellij*; *Arundo Vallaris Lobelij*, *Horundo vel Arundo Vallatoria*, *Arundo Palustris Matthioli*, *Arundo vel Calamus Vulgaris*, Our common Pool Reed. 2. *Horundo vel Arundo multifida Anglica*; Our English Finger Reed. 3. *Arundo Donax*, Cane Reed; *Calamus vel Arundo Cypria Dodonei*, *Calamus Italicus major*; *Arundo Italica major Camerarij*, *Arundo major Hispanica*; *Calamus vel Arundo major Caroliniana, vel Floridiana*, The Carolina, or West-Indian Cane Reed. This without doubt may be the same Cane Reed which grows in the *East-Indies*, which by reason of the Climate, grows both taller and greater; so that they serve instead of Wood or Timber to make their little Houses, Hovils, or Huts of, and to cover them.

The Descriptions.

III. *The first*, or Our common Pool Reed. Its Root is white, hard, round, long, and with many knobbed joints, running a slope, but not deep, and shooting up Stalks from divers of the joints. These Stalks are manifold, great, round, and hollow, and full of joints, not distant very far one from another, and run up to a considerable height, as to 4, 5, or 6 Feet high, or more, but higher in

Reed Pool Common.

some places than in others, with long and somewhat broad hard green Leaves at each of the joints, sharp on both edges, and somewhat encompassing the Stalk, at their bottoms; bearing a long, and broad spread, soft, brownish Pannicle at top, whose Chaffy, or Downy Seed flies away with the Wind. The whole Stalk dies, and perishes every Year, but is usually cut down before Winter, when as it is grown white, to serve for several Mechanick uses.

IV. *The second*, or Our English Finger Reed. Its Root, form, magnitude and manner of growing, is much like the former; its difference from that is only in the Leaves, which are each of them half a Yard long, and two or three Inches broad, with several great Ribs or Veins running along them, and parted at the ends into three or four parts, something like unto our Finger Harts-Tongue.

V. *The third*, or Carolina or West-India Cane-Reed, called also Spanish Cane or Reed. This in its Root, Stalk, Leaf, and manner of growing, differs not from the first described, but only in its greatness, the Canes or Stalks being harder, thicker, and rising much higher, sometimes to eight, ten or twelve Feet high, (according to the goodness or richness of the Soil) more or less; whose joints are further distant asunder than in our Common Pool Reed; the Leaves are likewise much larger, broader, and longer, having also a very much larger Pannicle at top. These Reeds or Canes are of several thickneses, some of them half an Inch thick or lesser, and some three quarters of an Inch thick. These are without doubt the same with those Reeds or Canes which grow in the *East-Indies*; called Cane-Reed, where they grow much greater, thicker, and taller, and are of such a Substance as to serve them to make their

Cane-Reed.

their little Houses or Huts of, which greatness of their growth, I am persuaded, comes only from the Heat, Soil, and Nature of the Clime where they grow.

VI. *The Places.* All these *Reeds* delight to grow in moist and Watery places, and Grounds apt to be overflowed with Water, as in Watery Ponds and Ditches, by soft or slow running Rivers sides, and almost every where, through all the Fen Country. The first two grow in England, the *Pool Reed* almost every where. The second is more rare, but has been found growing only in England. The third is the *Arundo Domestica* Matthioli, the *Arundo Donax*, vel *Cypria Dodonæi*, Lobelij, and the *Italica major Camerarij*, so that it is one and the same sort which grows in Carolina, Florida, Virginia, Italy, Spain, Cyprus, Turkey, in all which Countries it is to be found growing plentifully, altho' in one Country it may grow much greater, and larger, thicker, stronger and higher than it does in another, which is according to the Soil and Clime, as I have before intimated.

VII. *The Times.* These all Head and Seed, and the Stalks or Reeds come to their perfection of growth and hardness about the end of September, or in October, but are more Seasoned if cut down in October, or November.

VIII. *The Qualities.* They are as *Galen* says, hot and dry in the second Degree: Absterfitive, Attractifve, and Cosmetick.

IX. *The Specification.* They are good against Inflammations, to heal Scald or Scabby Heads, take away Scurff, Morpew, and Dandriff, and to help against the falling of the Hair.

X. *The Preparations.* You may have therefrom, 1. A Decoction of Roots and Leaves

in Water or Wine. 2. A Cataplasm of Roots and Leaves. 3 The Ashes of the Roots, and whole Plant.

The Vintnes.

XI. *The Decoction of Roots and green Leaves in Wine or Water.* That made with Wine is best, but for the Poorer sort of People it may be made with Water: barbed as hot as it can be endured upon Inflammations, it cools and abates them. Mixed with Honey and used as a Gargarism, it heals Sores and Ulcers in the Throat, Mouth and Gums: applied as a Lotion to old running Sores and putrid Ulcers in the Secret parts, or other places, it cleanses them, in some measure stops the Fluxion, and induces the healing. Used as a Clyster, mixt with a quarter part of Spirit of Wine, it is good against a Diarrhea, or Looseness, and a Dysenteria or Bloody Flux, especially if it is often repeated.

XII. *The Cataplasm of Roots and green Leaves.* It is made by beating them in a Mortar, adding thereto a little strong Wine Vinegar. Applied it cools and eases hot and sharp Inflammations in any part. It eases the pain, comforts and strengthens Joints which have been Luxated, eases pains in the Loins, and cures Anthomes Fire.

XIII. *The Ashes of Roots and the whole Plant.* Mixed with strong White Wine Vinegar and applied, it is profitable against Scald or Scabby Heads, Scurff, Morpew, Dandriff, Pimples, Breakings out, and Discolorings of the Skin: And prevents the Alopecia, or falling of the Hair.

C H A P. D X C V.

Of RHEUBARB True and Bastard.

I. *THE Names.* It is called in Greek, Ρῆζ and almost by all Nations *Rha*, and *Rhabarbarum*, and so it is called in Latine: and in English, *Rheubarb*.

II. *The Kinds.* There are several Sorts of *Rheubarb*, as, 1. *Rhabarbarum Verum*, The True *Rheubarb*, or True Indian or China *Rheubarb*. 2. *Rhaponticum verum*, The true Turkey *Rheubarb*, or *Rheubarb of Pontus*. 3. *Rha nothum Rhabarbarum spurium*; *Pseudo Rha*; *Hippolapathum rotundifolium vulgare*, Our Bastard *Rheubarb*. To these you may add, 4. *Rhaponticum folia Enule lutiore*, *Rha capitatum Lobelij*, The broad *Elecampane* Leav'd Turkey *Rheubarb*. 5. *Rhaponticum angustifolium*, *Rha capitatum angustifolium*, The narrow *Elecampane* Leav'd *Rheubarb*. 6. There is

6 D

another

another Rheubarb, called *Rhabarbarum Monachorum*, *Patientia*, and *Patientia bortenfis*, *Lapathum fatium*, Garden Patience, or Monks-Rheubarb: of which we have already Discourfed at large in Chap. 547. foregoing.

III. Whence the Name might come, or be derived. The Original Name is *Rha*, which Name it took as is fuppofed from the River *Rha*, now faid to be called *Volga* in *Pontus*, where the true Root did grow. But whence came the Name *Rhabarbarum*? Why, fome will tell us it came from *Barbary*, as the Name expreffes, and they argue thus, becaufe that which comes from other places is denominated by the place from whence it comes, as *Rhaponiticum*, *Rhaturcicum*, *Rhatbracicum*, *Rhafcenicum*, vel *Rhafceniticum*, which is *Rhaindicum*, for *Mefues* fays, that *Scenicum*, or *Sceniticum*, is all one with *Indicum*. But thefe Difcourfes are far from Truth, becaufe that neither in *Barbary* it felf, nor in the Country of the *Troglodites*, from whence it has been faid to be brought into *Barbary*, did ever any Rheubarb yet grow. And that the Merchants of our Times Trading into thofe parts, can hear of no Rheubarb growing in thofe Countries now: moreover the *Scenita* are not a People of *India*, but of *Arabia Deferta*, where no Spices or Drugs ever grew. Some again will have it come from *Barbarum* a City of *India*, above the River *Indus*, and that *Rha-Indicum*, and *Rha Barbarum* are all one. But this may be doubtful, and as far from the Truth as the former Opinion: The moft probable Judgement can be made is this, that the *Greeks* and *Romans* accounted, and called all other Nations but themfelves, who were not Civiliz'd with their Breeding and Difcipline, *Barbarous*, or *Barbarians*: (alluding to thofe untractable People, Inhabiting the Coaft and Country of *Barbary*) and this Root or Drug, being brought from far, and from an uncultivated People, fcarcely known to them, they might join to the Name *Rha*, the Epithet *barbarum*, and fo make up the Word *Rhabarbarum*, which in procefs of time became the moft ufual and known Name, through all the Habitable World.

The Descriptions.

IV. The first, or True Rheubarb, or True Indian or China Rheubarb. The Root of this Plant, which is *Tuberos*, and in time grows to be very great, has feveral great fpredding Branches, of a dark brownish or reddish color on the outside, with a pale yellow thin Skin under it, which covers the inner Substance of the Root: This Rind and under Skin, being pared away, the Root appears of a fresh and lively color, with Flesh colored Veins running through it. This Root is carefully dried, either in the Sun, or before a gentle Fire, or in the heat of a Stove, and with this Caution or Observation, that every piece be kept from touching one another, as it is done in *India* or *China*, where they put them upon Strings, that they may not touch, and fo dry them apart in the Sun; and this is that True Indian Rheubarb which is brought to us by the Merchants, and Sold in our Druggifts Shops. This Root when not very old, holds its color, almoft as well as when it is fresh, and gives a yellow Tincture to the Spittle, when it is chewed in the Mouth. When the Winter is past, this Root (in the place where it grows) fends forth young Sprouts, which at their first appearance out of the Ground, have green, round, brownish Heads,

rising up from the middle or fides of the Root, which open into fundry Leaves, one after another, very much crumpled or felded together at the first, and brownish; but afterwards fspread themselves abroad and become smooth, very large, waved on the edges, and almoft round, each Leaf ftanding on a brownish

Rheubarb China and English.

Stalk, of the thicknefs of a Mans Thumb, when they are grown to their full bignefs: moft of the Stalks are two Foot or more in length, (efpecially if the Plant grows in any good and moist Ground) I mean the length of the foot Stalk upon which the Leaf grows, from the bottom of the Leaf to the Root from whence it fprings. The Leaf it felf is alfo about two Feet or more in length, and the breadth thereof is two Feet likewise being meafured from edge to edge in the broadest place, being of a fad or dark green color, and thicker in Substance than the Bastard Rheubarb in Sect. VII. following; it is of a fine tart fowerish Taste, much more pleafant, than either our Garden or Wood Sorrel. From among thefe Leaves riles up fometimes, (but not every Year) a ftrong thick Stalk, not growing fo high as *Patientia*, or Monks Rheubarb, with fuch waved round Leaves as grow below, but fmall at every joint up to the top; and among the Flowers (which are white) fpreads forth it felf into feveral Branches, contrary to the manner of the Bastard Rheubarb following, or of any other of the Docks. The Flowers confift of five or fix fmall white Leaves apiece, hardly to be difcerned from the white Threads which are in the middle, and feeming to be all Threads: After the Flowers are paff away there comes in fmall brownish Husks the Seed, which is of a brownish color, and triangular, or tetrabedrical, like unto other Docks, but larger, by which it may appear plainly, that the True Indian or China Rheubarb is only a Species of the Dock.

V. Query. It may well be demanded of me, why I fhould place Rheubarb, among our English Plants, fince

since it is so apparently an Indian Drug? To this I Answer. The reason why I have plac'd it in the *Classis* of English Herbs, is, because it has already grown in England, where it has been known to prosper and flourish: And therefore I placed it here, to encourage our Country Men to continue the propagation thereof: and if possible it should not arrive to the height of its perfections in our Climate, and therefore may be thought not to be altogether so strong and effectual, yet it has been found by Experience to answer all the same ends, being used only in somewhat a greater quantity: besides it may be Planted and propagated in all or most of our Plantations in the *West-Indies*, where, the Climates being more agreeable to its Native place, it may in some short time be brought forth in perfection, and so be of a publick Service to our Nation. Our Parkinson was the Man in whose Garden this *Rheubarb* once grew, and therefore what he has said of it, we will give you in his own Words. I have (says he) a kind of round *Leard Dock* growing in my Garden, which was sent me from beyond Sea, by a worthy Gentleman, Dr. Lister, one of the Kings Physicians, with the Title *Rhaponticum verum*, which first grew with me, before it was ever seen or known elsewhere in England, which by proof I have found to be so like to the True *Rheubarb*, or *Rhaponticum*, both for form and color, that I dare say it is the very True *Rheubarb*, our Climate making it only less strong in Workings, less heavy, and less bitter in Taste. For this has great and thick Roots, and as diversly discolored with Flesh colored Veins, as the True Indian *Rheubarb*, which I have to shew to any who are desirous to see and know it: and also other smaller Branches of Roots spreading from the main great Root, which smaller Branches may well be compared to the *Rhaponticum* which Merchants bring us, and which appear to be longer and slenderer, than (the Great Tuberous) *Rheubarb*, but of the same color. This our English *Rheubarb* being trim'd, by taking away its Rind and Skin under it, as you do the China or Indian, appears with as lively and as fresh a color, with Flesh colored Veins running thro' it, that the choicest China *Rheubarb* cannot excel it: and if it is dried carefully as it ought, by the gentle heat of a Fire, or in a warm Oven (because we want the heat of the Sun to do it) and each piece kept one from another, it will hold its color almost as well when dried, as when it is fresh, and give a yellow Tincture to the Spittle when chewed, tho' not so very yellow, nor with so much bitterness and astringion, as the True Indian Root does. I have divers Years taken up these Roots, and dried them carefully, and they have been shewed to the Best and most Skillful, who have approved of them, and divers of our Physicians have oftentimes used them, with many other Persons, to very good purpose. Thus Parkinson.

VI. The second, or True Turkey *Rheubarb*, or *Rheubarb* of Pontus. The form of the Root is somewhat great, round, and long withal, for the most part, (yet there are smaller and shorter pieces, as well as greater which come together:) whose color on the out side is not all alike, no more than the Substance within: for still some is better colored, and sounder than others. The best is firm, and somewhat heavy, not spongy and light, and somewhat brown, but fresh on the out side, without many blackish spots (which are suspicious places, where, often times being broken, it is found rotten, or corrupted and naught; I say many, because the best pieces have sometimes this fault in them,) but they do not run far inwards, yet if they should, the rest of the piece might be excellent good, and not to be

refused, the bad being to be cut away, as not fit to be used, the sound parts being repleat with Flesh colored Veins running through it, bitterish in Taste, and a little Aromatick in its Smell (if it be not old) and causing the Spittle to be yellow, being a little chewed in the Mouth. Now these are the very Properties which belong to the True Chinese

Rheubarb Pontick; or, Rhaponticum.

or Indian *Rheubarb*, as may appear by the former Description, so that we need not seek for a new Plant to take this *Pontick Rheubarb* from, nor describe any other Species, than what we have done before at *Self. 4.* above, for any Person of common Reason and Ingenuity may easily see, that as the former (before described in *Self. 4.*) is the True Indian or China sort, so also they may as easily perceive that this *Pontick Rheubarb* (the true sort, not the false Kind, which is Counterfeited with the Great Centory Roots) is but only the greater Ramifications of the true China or Indian, cut off from the same, and so Dried and Sold alone, as another Species of *Rheubarb*. These Reasons thus offered ought to excite our People, to make the Trial, by Planting it in other hotter Climates, as in our Plantations in the *West-Indies*, where I doubt not, but it would turn to a very good Account.

VII. The third, or Our Bastard *Rheubarb*. Its Root grows greater than that of *Patience Rheubarb*, with many Branches, or great Strings adjoining; yellow on the out side, and somewhat of a pale yellow within, with some discolored Veins therein, like to those of the True Indian *Rheubarb*, first described but much less than it, especially when it is dry, which then has quite lost its fresh color, which the said True Indian constantly holds in its perfection. From this Root spring up divers large, round, thin, yellowish green Leaves, a little waved about the edges, each one standing on a reasonable thick and long brownish foot Stalk, from among which rises up a pretty big Stalk about two Feet high, with some such Leaves thereon as grow below, but smaller; at the top whereof stand in a long Spike, many small brownish flowers, which turn into hard triangular

Rheubarb Bastard.

or tetrahedral Seed, of a shining brown color, like unto that of the Garden Dock, Patience, or Monks Rheubarb.

VIII. The fourth, or Broad Elecampane Leav'd Turkey Rheubarb. Its Root is something long and thick, blackish on the outside, and of a deadish color on the inside, more loose and spongy than either any Dock or Great Centory, which Centory Root has in former times been used by the Apothecaries for Rhaponticum. From this Root rises up several Leaves, something large and long (yet nothing so large as the Leaves of Elecampane) greenish on the upper side, and grayish or white and woolly underneath, like therein to the Leaves of Elecampane, every one standing upon its own Stalk, broadest at the bottom, and pointed at the end, and dented, or rather waved about the edges. From among which rises up a reasonable large round Stalk about half a Yard or two Feet high, bearing at the top thereof, one great Scaly Head, consisting of very broad and loose or open brown Scales, at the first shew representing a small Hartichoke Head, but that the Scales do not stand close together, but are much more open and loose, especially after the Flower is past, which stands in the middle, composed of many bluish red, or purple Threads or Thrums, very beautiful to behold. After which comes blackish Seed, long and round, very like unto the Seed of a Jacea, or that of the Great Centory, but a little longer, and not altogether so thick.

IX. The fifth, or Narrow Elecampane Leav'd Rheubarb. The Root of this is almost exactly like to the last described, there being but small difference between this Plant and that, but only in the Leaves, which are a little narrower and longer than those,

being as green above, and as hoary white underneath as they are, and a little unevenly waved on the edges. The Head and Flowers are alike also, but only a little larger; so that it is very likely, that the chiefest cause of the difference between them arises from the Soil, or places of their growth. These two last Plants cannot properly be accounted Rheubarbs, because their form admits them not, but are rather to be refer'd to the Jacea's, Knap-weeds, or Centaurium majus, the Great Centory, for the likeness both to their Flowers and Seed, the Scales of their Heads being somewhat different: Yet by reason of the Names which they have obtained, and of the Custom or Use, which for the Names sake has placed them with the Rheubarbs; we thought good to comply also, that we might not be singular from all other Authors.

X. The Places. The first and second, which are Natives of India, as China, Indostan, as also of Pontus, have grown and flourish in Our English Gardens, and without doubt are possible to be promoted in all our West-India Plantations. The third grows with us in our Gardens also, as likewise the fourth and fifth, which are Natives of Turkey: it is probable that the two last, which the Turks call Rhaponticum, is used by them for the True Kind, altho' in truth they are not in the least akin to Rheubarb, for which reason some Authors have called them by the Name Centaurium Heleni folio, and by that Name Parkinson says he received the Seeds from beyond Sea.

XI. The Times. They all Flower about the beginning or middle of June, and the Seed is ripe in July. The Roots are to be dried, and then may be kept all the Year, but they are not to be taken up before the Stalk and Leaves are quite withered and gone; and that is not until about the middle or end of October; for if they be taken up a little before the Leaves do spring, or when they are sprung up, the Roots will not have half so good a color, but look as if they were dead or decay'd things.

XII. The Qualities. They are hot and dry in the second Degree, Aperitive, Absterfive, Astringent, Digestive, Traumatick, Stomatick, Hepatick, Splenetick, Hysterick, and Cathartick.

XIII. The Specification. Indian Pontick and Bastard Rheubarb, are peculiar against the Colick, Gripings of the Guts, and all sorts of Fluxes of the Bowels, more especially the Bloody and Hepatick Flux: they purge Choler and Hægm, and are profitable against the Kings-evil, Jaundice, Scurvy, Gout, Dropsies, and Agues. They cure Spitting and Pissing of Blood, the Running of the Reins in Men, and the Whites, and overflowing of the Terms in Women; and are of singular use in the cure of old running Sores, hollow and putrid Ulcers, Fistula's, Scabs, and other breakings out in the Flesh and Skin, from Salt and Acrimonious Humors: they open all obstructions of the Liver and Spleen, and ease the pains and gnawings of the Stomach.

XIV. The Preparations. You may make therefrom, 1. A Liquid Juice of the Green Leaves and Roots. 2. A Decoction of the Green Leaves or Roots. 3. A Powder of the Seed. 4. An Infusion or Decoction of the Dried Roots. 5. A Tincture of Rheubarb. 6. An Extract. 7. A Powder. 8. A Syrup Compound. 9. A Diet Drink. 10. A Gargarism with Vinegar and Honey. 11. A Distilled Water from the Green Leaves and Root. 12. Pills of Rheubarb. 13. An Oil by Insolation or Decoction.

The Virtues.

XV. *The Liquid Juice of the green Leaves and Roots.* It opens the obstructions of the Liver, Spleen, and Reins; carries off the sharp, salt, and acrimonious Humors which cause Scabs, Pustles, Itch, running Sores, Scurf, Morphea, Pimples, and other like detestations of the Flesh and Skin; being inwardly taken from one Spoonful to two, three, or four, every Morning and Night, and outwardly applied to the parts affected, during all the Spring and Fall of the Leaf.

XVI. *The Decoction of the Green Leaves or Roots made in White Wine, or in Whey.* It has all the Virtues of the Liquid Juice, but must be given in double or trebble quantity, you may correct it by adding towards the end of the Decoction a little *Indian Spicknard*, or some choice *Ginger* very thinly sliced. If it is done for External uses, the Decoction or Infusion may be made in White Wine Vinegar, and sweetened with Honey. And so it becomes an effectual Remedy to cleanse and heal of running Sores, and other breakings out in the Skin. Dropt into the Ears it takes away the Pains. Gargled in the Mouth, it is said to ease the Tooth-ach, and being drank it cures the Jaundice.

XVII. *The Powder of the Seed.* Given to a Dram in rough Red Wine, Morning and Night, it stops all sorts of Fluxes of the Bowels, chiefly the Bloody Flux: it eases also the Grawings and Gripings of the Stomach, strengthens it, and takes away the loathing of Meat.

XVIII. *The Decoction or Infusion of the Dried Roots, in Whey, or White Port Wine.* Take *Rheubarb* which thinly slice 2 Ounces; Clarified Whey, or rather White Lisbon Wine 3 Pints: Infuse in a simmering heat, or a Sand heat for 8 Hours close covered: then decant the Infusion and dulcify it with honey for 3 Doses. If it is made in Clarified Whey, it ought to be boiled half an Hour, then strained out and sweetened with Honey as aforesaid. If a little Cream of Tartar be added in the Infusion or Boiling, it will make the Medicament Work the better. It is an Excellent thing to purge Cholera and Flegm, and cleanse the Stomach and Bowels; and is profitable against Asthma's, Coughs, Colds, Wheezings, obstructions of the Lungs, Liver, Spleen, and Reins: and is profitable against the Dropsie, Jaundice, Gout, Scurvy, Kings Evil, and other Distempers of those Parts; it cleanses the Stomach, Bowels and Reins, is good against Agues, provokes Urine, and clears the Eye Sight. There is a Compound Infusion, which is thus made, Take *Rheubarb* very thin sliced 2 Ounces; which Infuse in Rose Water; Extracts of *Senae* and *Carthamus* Seeds of each half an Ounce; Syrup of *Roses* Salutivæ 8 Ounces; Cinnamon Water 2 Ounces; mix them for 7 or 8 Doses. It has all the Virtues of the Simple Infusion, but Works something brisker.

XIX. *The Tincture of Rheubarb.* Take the best *Rheubarb* thin sliced. Liquorice well bruised, of each 2 Ounces; Raisins stoned N^o 60; Anniseeds bruised 1 Ounce; Sugar Candy 6 Ounces; Spirit of Wine 2 Pounds; mix, digest according to Art, and strain out for Use. Dose 2, 3, or 4 Spoonfuls in a Morning against the Cholick, and Griping of the Guts, which it wonderfully Cures. If it be digested 8 or 10 Days in a gentle Sand heat, shaking the Glass 2 or 3 times a Day, and then letting it settle, the clear is to be decanted, and kept in a

Bottle close stopp'd for Use. It Purges gently, and collects and expels Acid and Tartarous Humors adhering to the Tunicles of the *Viscera*, which causes violent Pains and Gripings; for which it is indeed a Specifick; and one of the Choicest things in Nature against all the Weaknesses and Distempers of the Bowels, especially it accompanied with painful defections. It is of singular use to Purge such as are troubled with any simple *Gonorrhæa*, Weeping or Gleet, as also the Whites in Women, Universals being premised. For tho' it Purges yet it is but gently, and so strengthens admirably, and stops all sorts of Fluxes as *Diarrhæa*, *Dysenteria*, *Lienteria*, to a wonder.

XX. *Tinctura Rhabarbari Absinthiata*, Wormwood Tincture of Rheubarb. Take *Rheubarb* very thin sliced, or grossly bruised 4 Ounces, Wormwood Water Compound a Quart; mix in a Bolt Head, digest in a gentle Sand heat for 14 Days, shaking the Bottle once a Day, then being settled an Hour, decant the clear Tincture and keep it for use. You may also or want of the Wormwood Water, make it with hoarse Cinnamon Water, or any other Cordial Water, which may answer the Intention of the Medicine. It has both a Purging and an Astringent Property, for it Purges gently Cholera, Flegm, and clammy tartarous Humors, which cause the Cholick and Gripings of the Guts, from the Stomach and Bowels. Besides which it has a Cordial and strengthening Virtue, and is especially good for the Stomach, Heart, Liver and Spleen, and is good against Fainting and Swooning Fits, and Sickness at heart. It opens obstructions of Liver and Spleen, cures the Jaundice, and all sorts of Fluxes of the Bowels, as also the Hepatick Flux, from its Astringent Property. And indeed I know it to be a Specifick in the most Vehement Fluxes of the Bowels, and will do that (in those cases) which a Thousand other Medicines will not do. I have cured Cholicks and Vehement Gripings of the Bowels with it, of several Months standing, and that after all other Medicines I had used, had failed. You may use it thus. Take of this Tincture an Ounce; White Lisbon Wine in which a few Leaves of *Seana* have been Infused 4 Ounces; Syrup of *Pamusk* *Roses* half an Ounce; mix for a Dose. The Body being sufficiently cleansed, if you would stop a Flux therewith, and strengthen the parts, give it thus. Take of this Tincture, of Tincture of *Catechu*, Syrup of Red Poppies, of each half an Ounce; Cinnamon Water, Black Cherry Water, of each an Ounce and half, mix for a Dose. And let the Sick take the Tincture in Drops all the Day long, in any thing they Drink, about 40 or 50 Drops at a time. In a little time it will so alter and corroborate the Bowels, and the whole habit of the Body, that the Patient will think himself to be almost a new Man.

XXI. *Extractum Rhabarbari*, Extract of Rheubarb. Take *Rheubarb* thin sliced, or rather in gross Powder 8 Ounces; Cinnamon, in gross Powder 1 Ounce; Rhenish Wine 2 Quarts; Spirit of Wine a Pint; Juice of Lemons a quarter of a Pint; mix, digest 30 days in a gentle Sand heat, shaking the Bottle 2 or 3 times a day; let it settle and decant the clear, which Abstract in Balneo to the consistency of an Extract (reserving the Spirit drawn off for other uses,) to every Ounce of the Extract add Cynical Oil of Orange Peels, a Scruple; and keep it close covered for use. Dose from a Scruple to half a Dram, or a Dram, in the Morning fasting. It expels Cholera, Flegm, and Melancholy from Stomach and Bowels, opens obstructions of Liver, Spleen, and Reins, is good against the Rickets in Children, Scabs, running Sores, Jaundice,

dice, Green-sickness, and all kinds of Fluxes of the Bowels, having all the *Virtues* of the *Tincture* aforesaid.

XXII. *The Powder.* It is made of the dried Root beaten and searfed, adding to every Ounce thereof, a quarter of an Ounce of Anniseeds in fine Powder. Dose from half a Dram to a Dram, or more, according to Age and Strength, in any convenient Vehicle, as in a Glass of White Wine. It is an excellent thing against the Kings-Evil, Belly-ach, and to Purge Cholera and Flegm, cleanse the Stomach and Bowels, and to open obstructions of the Inwards. It is profitable against Scurvy, Gout, Dropsy, Agues, and Jaundice, and pricking pains of the Pleura or Sides.

XXIII. *The Compound Powder.* Take fine Powder of Rheubarb 2 Ounces; White Resin in fine Powder an Ounce and half; Cremor Tartari in fine Powder half an Ounce, mix them. It dissolves clotted Blood in the Stomach, Bowels, Reins or Bladder, or in any other parts caused by any Fall or Bruise, potently stops Fluxes of the Bowels, cleanses the Reins and strengthens them, and is very effectual to stop a Gonorrhoea, or running of the Reins, as also the Whites in Women. Dose from a Dram to 2 Drams in the Morning fasting in any fit Vehicle.

XXIV. *Syrupus de Rhubarbaro compositus.* Syrup of Rheubarb Compound. Take Rheubarb very thin sliced, Sena, of each 3 Ounces; Violet Flowers 2 Handfuls; Cinnamon half an Ounce; Ginger 2 Drams; Waters of Betony, Bugloss, Cichory (or rather Angelica) of each 3 Pints; mix and digest in Balneo or a Sand heat all Night, the next Morning strain out, and with double refined Sugar 4 Pounds, make a Syrup by boiling, adding when all is done Syrup of Roses Solutive, 8 or 12 Ounces, mixing them well together. It gently cleanses the Stomach and Bowels of Cholera, Flegm, and Melancholy, allays the heat of Inflammations, stops hot Rheums, and sharp Fluxes of the Bowels, by leaving a binding quality behind it. Dose 2 or 3 Ounces in Clarified Whey, or a weak Infusion of Sena in White Wine.

XXV. *The Diet Drink.* Take of Choise Rheubarb very thin sliced, 8 Ounces; Alexandrian Sena 4 Ounces; Tellow of Orange Peels, Horse Radish Roots scraped thin, of each 6 Ounces; Coriander Seeds, Mustard Seed bruised, of each 3 Ounces; Juices of Scurvy Grass, Garden Cresses and Angelica, of each a Pint; New Ale 3 Gallons; put the Juices into the Ale, and after them, the other Ingredients, in a Net-bag with a stone in it; after 3 days the Patient may drink of it. It carries off sharp Humors which cause the Colick, Gout, Jaundice, Scurvy and Rheumatick pains, provokes Urine, and evacuates Hydropick Humors. Dose a Pint Morning and Evening.

XXVI. *The Gargarisma.* Take Decolition or Infusion of Rheubarb made with White Port Wine a Quart, White Wine Vinegar, Spirit of Wine of each half a Pint; Rheubarb very thin sliced 4 Ounces; Madler Roots in gross Powder 3 Ounces; Roch Alum 1 Ounce; mix and digest in a gentle Sand heat for 24 Hours; then add Honey 6 Ounces; digest again 24 Hours; press out the Juice and keep it for Use. It cures all sorts of Sores, Cankers, and putrid Ulcers in the Throat, Almonds, Mouth, Tongue and Gums, they being wash'd or gargled therewith 2 or 3 times a day. It cleanses also and heals Ulcers in the Secrets or other parts, being rightly applied.

XXVII. *The Distilled Water from the Green Leaves and Root.* It is used to allay or cool

Inflammations, and to heal or dry up Scabs, and foul Ulcerous Sores in any part of the Body.

XXVIII. *Pills of Rheubarb.* Take fine Powder of Rheubarb 8 Ounces; Scammony in fine Powder 3 Ounces; Cremor Tartari in fine Powder 2 Ounces; Chio Turpentine, enough to make all up into Pills. Dose from half a Dram to a Dram or Dram and half. They cleanse the Reins and Bowels, carry off sharp Humors, cure the Scurvy, Gout, Dropsy, Jaundice, Strangury, Rheumatism and Kings-Evil, and are prevalent against a Recent Gonorrhoea in Men, and Whites in Women.

XXIX. *The Infused or Decolled Oil of Rheubarb.* It heals Ulcers which happen in the Eyes and Eye-lids, dissolves Inflammations and Strumous swellings in the Neck, Throat and other Parts; and takes away black and blew Marks, or other discolorings of the Skin.

XXX. *Nota.* The Bastard Rheubarb has the same Virtues with the China Rheubarb, but not full out so strong and effectual, and is used in all these several ways or forms. The English Rheubarb (which is the China growing in England) has likewise all the same Virtues, but must be used in double Dose, in the mean season it is the China, or Indian which we chiefly use. The two last are no Rheubarbs, but of the nature and qualities of the Great Centory, to which we refer you.

CHAP. DXCVI.

of RICE.

I. *THE Names.* It is called in *Arabic*; *Arz* and *Arzi*; in *Greek*, *Ὠζα*; in *Latine*, *Oryza*; and in *English*, *Rice*.

II. *The Kinds.* Galen accounts Rice, *inter legumina potius quam inter Cerealia*, as he did Oats and Panick, but I can see no Reason for it, nor any force in his Argument for the same, for that their forms, manner of growing, and Qualities are every way so different. It is a singular Plant of its own Kind, but may be denominated, or receive, an Epithite from the Country in which it is produced.

The Descriptions.

III. Its Root is Bushy, composed of many Strings and Fibres, which perishes every Year, as the Roots of other Grains do. It rises up with a stronger Stalk than Wheat, about a Yard high, with several Joints, and a large thick Leaf at each of them, like unto the Reed. At the top it bears a sparsed Juba, Tuft or Head, spread out into very many Branches, which has Blooms of a purplish color, with the Seed or Grain growing singly on them, enclosed in a hard straked and yellowish brown Husk, with an Awone at the end of every one of them, which Grain being Hull'd, is very white, blunt at both ends, and nearly as large as those of Wheat.

IV. Gerard

Rice.

IV. *Gerard* describes it thus, from its growing in his Garden. The Rice which (says he) did grow in my Garden, had Leaves soft and Grassy like Barly. The Flower did not shew it self with me, by reason of the Injury and Unseasonableness of the Year. *Theophrastus* says, it has a Flower of a purple color. But says my Author, Rice has Leaves like unto those of Quitch-Grass, or Barly. And a small Straw or Stem full of Joints, like to other Corn: at the top thereof grows a Bush or Tuft, garnished with round Knobs like small long round Goose-Berries, in which the Seed or Grain is contained, every one of which has at its end one small, long, rough Awne or Beard adjoined to it, like that of Barly.

V. *The Places.* *Strabo* reports that Rice grew in Water in the Territories of *Babylonia*, and near *Babylon*; in *Susum*, and in the lower parts of *Syria*, where it grew to be near six Foot high, and bore plenty of Seed or Grain. It grows now, not only in those Countries, but also in the *Fortunate Islands*, or *Azores*, and in *Italy* and *Spain*, from whence great quantities have been brought to us, hulled, and prepared, as we now buy it; it prospers best in Fenny, Wet, Moist and Watery places, which are often overflowed with Water: But it is thought that the Original thereof came first to these parts of the World, out of the *East-Indies*, where it is their chiefest, if not only Corn they Live upon; but it has not been found there only, but through all *Aethiopia* and *Africa*, from whence it was brought into *Syria*, *Aegypt*, *Italy*, *Spain*, &c. wherever it has been yet Sown. It Loves only to grow in moist Grounds as aforesaid, and such as may be overflowed with Water in the Summer time, and let out again. It is now Sown in *Carolina*, and become one of the great products of the Country: I have seen it grow, and flourish there, with a vast increase, it being absolutely the best

Rice which grows upon the whole Earth, as being the weightiest, largest, cleancst and whitest, which has been yet seen in the Habitable World.

VI. *The Times.* It is Sown in the Spring in the *East-Indies*, as *Eratosthenes* says, and that in a showery and wet time. It is a Summer Corn, and is Yearly Sown, and is Reaped or Mowed down, in the middle or end of Autumn with us. In several places in the *East-Indies* it is Sown twice a Year; and probably it may admit of the same in *Carolina*, or the *West-Indies*, in which last place its goodness is manifest by its weight, largeness, and whiteness, as I said before, where it is Hulled, as French-Barly and Out-Meal are Hulled, &c.

VII. *Nota.* In Germany, there is a smaller Kind grows, which they call *Oryza Germanica*, and which *Cordus* on *Dioscorides* says, is called *Schwoaden*; being indeed a kind of Rice, but lesser, having the same Taste and Use, and the same form of growing and proportion, in its Stalks, Leaves, and Tuft, or Tuft, growing in Marshy, or Plashy and Watery places, as the former larger Kind does. This *Hermolaus*, *Ruellius*, and some others would have to be the *Hordeum Galaticum Columelle*, which is a mistake, for that is neither more nor less than our Common Barly.

VIII. *The Qualities.* It is temperate in respect to heat or cold, and dry in the first Degree: Astringent, Repercussive, and Spermatogenetic.

IX. *The Specification.* It stops Fluxes of the Bowels, and restores in Consumptions.

X. *The Preparations.* You may have therefrom, 1. A Broth. 2. A Milk. 3. A Pudding. 4. Sanguis, or the Blood thereof. 5. A Cataplasma.

The Virtues.

XI. *The Broth.* It is made either with simple Water, or with Mutton Broth. It nourishes much, restores a weakned and decayed Body, but binds not the Body as that made with Milk.

XII. *The Milk.* It is an excellent thing for stopping all sorts of Fluxes of the Belly, and restoring such as are labouring under a Consumption, especially where there is an Ulcer of the Lungs. The best way of making it is to boil it soft first in Milk, till it is in a manner perfectly dissolved and becomes a thick Pap; and then to mix it and make it thinner with Milk warm from the Cow, and so to Drink or Eat, a Quart or Pint of it Morning and Evening.

XIII. *The Pudding.* It is made with Rice, soaked all Night in Milk, and then boiled till dissolved, after which, with Eggs, Sugar, Raisins and Nutmeg grated, it is made into a Pudding, either by baking or boiling. This as also the Broth and Milk, nourish much, strengthen such as are weak, restore such as are Consumptive, encrease Seed, and makes the feeble Vigorous.

XIV. *The Blood of Rice.* It has all the Virtues of the Broth, Milk, and Pudding, and is made as you make the Blood of Saffron, Potatoes, Parsneps, Comfrey, &c. Dose 2 Spoonfuls, or more, Morning, Noon, and Night, in a Glass of Generous Wine.

XV. *The Cataplasma.* It is made of the Meal or Flower of Rice boiled with Milk to the Consistency of a Pulver: or it may be made of the whole Rice, boiled to softness in the Milk, and then to a consistency, adding to it a little Barly Flower. It is used to be applied to Tumors to repel Humors flowing

flowing to them; also to Womens Breasts, to re-
percuss the Milk, and allay the Inflammation; and
this it will best do, if it is made of Water only.

RIVER-WORT, see Pondweed, Chap. 572.

C H A P. DXCVII.

of R I E.

I. **T**HE Names. It knows no Greek Name. But it is called in Latine, *Secale* and *Farrago*, Plinij Lib. 18. Chap. 15. But Modern Authors understand by *Farrago*, only Barly. Some have taken it to be *Typha cerealis* Theophrasti: Cordus on Dioscorides to be *Oliva*: and Tragus with some other took it to be *Siligo*. But *Siligo*, is truly Wheat. In English, we call it only by the Name of Rie.

II. The Kinds. There are three several sorts thereof, viz. 1. *Secale vulgatus*, *Secale Hyemale*, Our Common or Winter Rie. 2. *Secale aestivum*, *Dodonæi*, *Secale minus*, vel *Vernum Bauhini*, *Secale Alterum Luglanensis*, *Siligo aestiva Tragi*, Small or Summer Rie. 3. *Secale Latifolium Bauhini*, Great or broad Leav'd Rie.

The Descriptions.

III. The first, or Our common Rie. Its Root consists of a Bush of Strings and Fibres, yet

Secale Rie.

not so thick bushing as Wheat, nor sucking out, or consuming the Fertility of the Soil, so soon as Wheat does. It first springs up some what reddish, which afterwards grows green, and brings forth several jointed Stalks, something higher than Wheat, but bearing at their tops smaller Ears than those of Wheat, set in short Rows, with shorter and sharper, rougher and more prickly Awns. The Grain within is also smaller, lankier, or slenderer, and blacker than Wheat, not wrapped in Husks like it, but easily falling out of it self, when the Ear is ripe. Whilst it Flowers, the Ear stands upright, but when it is nearly ripe, it hangs downwards.

IV. The second, or Small Summer Rie. The Root of this is very like the former, as also in its Stalks, Leaves, Ears, Flowers, Grain and manner of growing; saving that this grows lower, and with fewer Stalks, and has a shorter and lesser Ear, but armed with Awns as the other, but lesser, as is the Grain, or Corn also. This is Sown in the Spring only, and therefore called Summer Rie, whereas the former is Sown in Autumn, as Wheat is.

V. The third, or Great or Broad Leav'd Rie. The Root of this bushes out with Strings and Fibres, like that of Wheat. This Rie has whiter Stalks than the two former, round also and striated. The Leaves grow at the joints, and are much larger than the Common sort, being about a Foot and half long, and an Inch broad, much broader than the other, as you may see by the Figure: they are somewhat sharp or rough about the edges, like those of the Common Rie. The Ear at top, is large and great, set with sharp, long Awns, a full Hand breadth in length; the Grain within is like to the first Kind, blackish brown in color, but greater than it, and almost like to Wheat.

VI. The Places. The first grows plentifully enough with us in England, and very plentifully in most places of Germany and Poland, as appears by the great quantities of it brought into England, in times of Scarcity from Dantzick, when we have a general want of Wheat and other Grain, as in very wet Years. It is sown also in all the Northern Regions, more especially in Denmark, and those more Northerly Countries, than else where, their Climates not so well serving to produce Wheat. The second grows also with us in England. The third is brought out of the East Country, and in times of Scarcity is many times Transported from Dantzick hither. Bauhinus had the Ear with some of the Leaves, out of Signior Contarino his Garden.

VII. The Times. The first is usually sown in Autumn, in October, and November, when Wheat is sown: the second in the Spring in April, which is not so enduring, but more apt to corrupt than the former, because the Winter comes upon it before it can attain its full perfection or ripeness. The first and third are generally ripe in August. The second comes not to its full growth till September.

VIII. The Qualities. It is hotter than Wheat, being hot in the first Degree, and temperate in respect to dryness and moisture. It is Discurfive, or absorbing and wasting away of Tumors or Humors, to which it is applied. It is also Emphractive, or of a more obstruative or clammy Nature than Wheat, and harder to Digest in the Stomach; but to Rustick Bodies, which have a brisk Appetite, and a strong and good Digestion, it affords good Nutrient, being next in goodness unto Wheat, especially if the Corn be sweet and good, and the Bread well made.

IX. The

IX. *The Specification.* It maturates Apostems, eases the Head-ach, and heals Chaps of the Hands and Feet.

X. *The Preparations.* You may make therefrom 1. *A Meal or Flower.* 2. *Bread.* 3. *Bran.* 4. *Leaven.* 5. *A Cataplasim.* 6. *A Powder.* 7. *Emplastrum à Crusta panis.* 8. *A Distilled Water from Green Rie.* 9. *A Distilled Water from the Bread.* 10. *An Acid Spirit made from the Bread.* 11. *The Ashes of the Straw.*

The Virtues.

XI. *The Meal or Flower.* It heats moderately, and is more forcible than *Wheat*, in waisting and consuming Tumors, and clammy Humors; yet made in *Broth*, or *Puddings*, and *Cakes*, it gives good Nourishment. Made with Vinegar into a *Cataplasim*, it strengthens the Nerves and Joints, over-trained, or lately put out of place: it diffuses Tumors, and eases Pains, and prevails against an *Oedema*, an *Erysipelas*, and the Gout. And bound unto the Head in a Linnen Cloth, it eases a *Cephalea*, or long continued Head-ach, and the Megrim.

XII. *The Bread.* It is generally made with *Leaven*. It nourishes much, and is Stomack, yet apt to Gripe some People. Applied hot as it can be endured out of the Oven, to the most Vehement Head-ach, and left on till it is cold, it presently eases the pain, as if it was by Inchantment; and if repeated some few times it perfectly cures it. And so applied to the Stomach it helps the weakness thereof, and the Palpitation of the Heart.

XIII. *The Bran.* It cleanses, mollifies, and diffuses Tumors, being laid hot thereon in form of a *Cataplasim*, made with Vinegar, a little Salt, and Brandy.

XIV. *The Leaven.* It is made of the Paste of *Rie Flower* mixt with Salt, or laid in the midst of a *Box of Salt*. It does more forcibly digest, draw, ripen, and break Apostems, Boils and Bubo's than *Wheat Leaven*. Applied to the Head, it eases the continual pains thereof, cools, humects, softens, is suppurating and absterfiv, yet is said to stanch Bleeding, and to diffuse such Tumors as will not suppurate.

XV. *The Cataplasim.* It is made of the Crums of the Bread with Wine, or Wine Vinegar. It diffuses Tumors, eases Pains, and is profitable against an *Oedema*, and the Gout, being filly applied.

XVI. *The Powder.* It is made of the Crust of the Bread almost half burnt, and then reduced to a Powder by beating in a Mortar. The Powder it self is used as a *Dentifrice* to cleanse the Teeth, they being often rubbed with the same dry, laid upon a Cloth. The Decoction of it in Water, made as *Coffee* is, is very Stomachical, and causes a good Appetite to Food.

XVII. *Emplastrum à Crusta Panis.* Take *Rie Bread* toasted very brown and hard, 4 Ounces, which boil in *Rose Vinegar* to the thickness of a *Pulvis*: clear Turpentine of *Chio*, 2 Ounces: Powder of Red *Roses* one Ounce: *Mint*, *Mastic*, *Myrrh*, *Nutmeg*, *Storax Calamita*, New yellow Wax, *Labdanum*, Oil of *Mastic*, Powder of *Cloves*, of each half an Ounce: mix and make an Emplaster according to Art. It is hot, dry and strengthening, good against Aches and Pains from a cold cause, and all cold Diseases of the Head, Brain, Nerves, Stomach, Womb and Joints; Applied to the Stro-

mach, it causes Concoction, and stops Vomiting.

XVIII. *The Distilled Water from Green Rie.* It is made by Distillation in *Balneo*, of the Green Plant, whilst the Ear is Green. It is Absterfiv, and Aperitive, and of good use to clear the Eye-sight, and to remove Heats and Inflammations of the Eyes, especially where a hot sharp Rheum follows them.

XIX. *The Distilled Water from the Bread.* It is drawn in *Balneo* from the Bread Crums whilst New. It is a good *Ophthalmick*, being often dropt into the Eyes, but is more powerful if it is mixed with an equal quantity of *Common Spirit of Wine*. It is commended against a *Diarrhea* or Looseness, and a *Dysentery* or Bloody-Flux.

XX. *The Acid Spirit drawn from the Bread.* It dissolves Minerals, extracts their Tinctures, and does many other great things: and therewith an excellent Eye Water is made, only by letting it stand for some few Days in a Copper Vessel, close covered. This dropt into the Eyes is good against Pearls, Films, Clouds and other things which obfuscate the Sight: it clears the Eyes and very much strengthens them.

XXI. *The Ashes of the Straw and empty Ears.* A *Lixivium* being made of them with fair Water, either by Infusing or Boiling, heals Chaps of the Hands and Feet, as *Matthiolus* says: and by often using it, it clears the Skin, and makes it smooth and soft.

CHAP. DXCVIII.

Of ROCKET Garden and Wild.

I. **T**HE Names. It is called by the *Arabians*, *Fergir*, and *Firgir*: by the *Greeks*, *Ἐρῦκαον*, *ob suavitatem in condiciendis chysionis*: by the *Latines*, *Eruca*, *quod vellicando Linguam quasi erodat*: and by the *English*, *Rocket*.

II. *The Kinds.* There are several Species of this Plant, as, I. *Eruca sativa*, Garden Rocket. II. *Eruca Sylvestris*, Wild Rocket. III. *Eruca Sylvestris notha*, Bastard Wild Rocket: of which in this Chapter. IV. *Eruca Aquatica*, Water Rocket. V. *Eruca Marina*, Sea Rocket: of both which in Chap. 599. next following.

III. *The Kinds of the Land Species.* 1. *Eruca sativa*, *Eruca Hortensis*: our Garden Rocket. 2. *Eruca sativa alba*, *Eruca*, sive *Eruca marina major Tragi*, *Eruca major Cordi*, *Sinapi Hortense sive album Lugdunensis*, *Sinapi sativum semine albo duplo quam Thlaspi vulgaris majore Lobelij*, *Eruca flore & semine albo*, Roman Garden Rocket with white Flowers and Seed. 3. *Eruca latifolia*, Great Garden Rocket. 4. *Eruca maxima Americana vel Floridiana*, Great Rocket of Florida. 5. *Eruca Sylvestris vulgarior Dodonai*, *Lobelij*, *Matthioli*, *aliorumque*, Our more common Wild Rocket. 6. *Eruca Sylvestris minor flore parvo*, *Eruca Sylvestris fatida Gesneri*, *Eruca palustris minor Tabernaemontani*: *Eruca Sylvestris*, & *Erysimum verum Lugdunensis*, *Sinapi palustre Gerardi*, The lesser Wild Rocket with a small Flower. 7. *Eruca Cerulea*, *Eruca palustris Cerulea*, & *Eruca Cerulea in arenosis cresecens Bauhini*, Blew Flowered Wild Rocket. 8. *Eruca Sylvestris angustifolia Lobelij*, *Eruca angustifolia Austriaca*, Narrow Leav'd Wild Rocket. 9. *Reseda major Plinij*, *Reseda*

Reseda maxima Lobelij (à sedandis doloribus collecti-
ones & inflammationes discutere nomen traxit. *Reseda*
lutea Lugdunensis; *Reseda recta Camerarij*; *Sesamoides*
magnum Lacune; *Sesamoides alterum Casal-*
pini; *Pycnocomon Angulare*. Our greater Bastard
Wild Rocket. 10. *Reseda minor*; *Eruca vulgaris*;
Reseda Plinij Neotericorum Lobelio; *Eruca Peregrina*
Italica & Cantabrica; *Reseda supina Camerarij*;
Reseda latifolia Tabernamontani; *Sesamoides pri-*
mium; *Casalpini*; *Eruca vulgaris Columnæ*; Our
common Bastard Wild Rocket. 11. *Reseda alba*
minor; *Reseda Linariae foliis Bauhin*; *Reseda*
Candida Lugdunensis; *Sesamoides parvum Sali-*
manticum Clusij, Small white Bastard Wild
Rocket.

The Descriptions.

IV. The first, or Our Garden Rocket, is but a
Wild Kind brought into Gardens, for the
True Roman Rocket in the next Section has
larger Leaves. Its Root is small and long, with
some few Fibres adjoining to it, and perishes
as soon as it has given Seed. It has long
Leaves much torn or rent on the edges, smaller
and narrower than the Roman Kind. The
Flowers hereof are of a pale yellowish color,
whereas the Roman are whitish, consisting of
four Leaves. Its Seed is reddish, contained in

Rocket Garden.

smaller and longer Pods, than the Roman which
are shorter and thicker, whose Seeds are of a
whitish yellow color.

V. The second, or Roman Garden Rocket with
white Flowers and Seed. Its Root is like the for-
mer, and perishes Annually in like manner. It is
a smaller Plant than the former, but larger or
broader Leaves, which are cut in on the edges, but

not so much nor so deep, each part being rounder,
and round at the end, and nothing so hot or sharp
in Taste. The Stalk has some Leaves thereon,
lesser, and less jagged, which bears white Flowers
at the tops, made of four somewhat long and round
pointed Leaves, after which come little long round
Pods in which is contained yellowish white round Seed.

VI. *Eruca Hortensis Romana altera femine nigres-*
cente. We have another Roman Kind also, whose
Root perishes in like manner presently after the Seed
is ripe. Its Stalk rises to be 3 or 4 feet high,
Branched into many parts. Its Leaves are very like
to the former, and at the tops of the Stalks and
Branches are less whitish Flowers made with four
Leaves apiece, round pointed, with a black Line in
the middle of each Leaf. After which come long
slender Pods, containing blackish brown Seed within
them.

VII. The third, or Great Garden Rocket. Its
Root is much like to the former Garden Kind, with
Stalks and Leaves like it, but that the Leaves are
broader, and the divisions at the Leaves larger,
and smaller at the ends than those of our Garden
Kind, and each part more unevenly dented about
the edges. The Flowers hereof are more yellow;
and enclining to a Gold color, and the Seed smaller,
and darker, in smaller and longer Pods.

VIII. The fourth, or Great Rocket of Florida.
It has a considerable thick long Root Branching it
self forth every way, from the Head whereof rises
up one or more great Stalks, even to a Mans height,
with a number of rough hairy Stalks, spreading
themselves out on all sides, and set with divers long
and pointed Leaves unevenly dented about the edges,
and somewhat like unto those of *Lyfimachia* or
Loofeftrife, but having a small downy hairiness upon
them; tasting something sweet at the first, but sharp
afterwards. The Flowers are many, which stand at
the ends of the Stalks and Branches, consisting of
four yellow Leaves apiece, which turn into slender
long Pods, containing within them small Seed, which
is sweetish, for which reason of its sweetness, we
have Clus'd it with the Garden Kinds.

II. Of Wild Rocket.

IX. The fifth, or Our more common Wild Rocket,
It has a very long and pretty thick Root, with many
Strings and Fibres adjoining to it. It has longer
and narrower Leaves, much more divided, and into
slenderer cuts and jaggs on both sides the middle Rib,
than any of the former, and of a sad overwoorn green
color, from among which rises several stiff Stalks, two
or three Feet high sometimes, set with the like Leaves
but smaller, and smaller upwards; Branched from
the middle into several stiff Stalks, bearing divers
yellow Flowers, consisting of four Leaves apiece, like
the others, which afterwards give small long Pods,
containing small reddish Seed, of a more bitter hot
biting Taste than the others, as the Leaves also are.

X. The sixth, or Lesser Wild Rocket with a
small Flower. This in its Root, Stalks, &c. differs
not much from the last, but only in the smallness of
the Leaves, Branches, Flowers and Pods, for in all
parts it is lesser, and the Leaves are as much divided,
but into smaller parts, not smelling well.

XI. The seventh, or Blaw Flowered Wild Rocket.
Its Root is long, slender and reddish, with some Fibres
adjoining to it. Its lowest Leaves are cut in on both
sides, something like to Rocket, but in my opinion, more
like Groundsel. From among which rise up several
hairy straked Stalks, scarcely a Foot high, bearing
rough hairy Leaves on them, less jagged, and some of
them

them not at all, shorter also and narrower. At the tops stands the Flowers one above another in a kind of spiked Head, of an excellent purplish blew color, consisting of four Leaves, after which come small long smooth Pods, containing within them small sharp reddish Seed.

XII. *The eighth, or Narrow Leav'd Wild Rocket.* Its Root is long and slender. Its Leaves are long and narrow, not much unlike to those of Tarragon, but of the color of Rocket. Its Flowers are yellow and like those of the former Wild Rockets, growing on long spiked Heads or Stalks a Foot and half high. After which come in their places long slender Pods, like those of Cressies or Mustard, containing within them, not sharp Seed, having the appearance of Erysimum or Bank Cressies, but the Taste of Rocket.

III. Bastard Wild Rocket.

XIII. *The ninth, or Our greater Bastard Wild Rocket.* Its Root is long and woody, with several Fibres thereat, abiding many Years. It rises up with divers crested bending Stalks, about 2 Feet high, set with many and much divided Leaves thereon, something like unto the lowest Leaves of Rocket, of a piercing sharp Smell and Taste, like unto Cressies, and many such like Leaves bustling together at the Foot of them. At the tops of the Stalks grow yellow Flowers in long Spikes standing thick together, which gradually opening at the bottom, spread themselves farther asunder, and afterwards upon short foot Stalks come small skinny, swollen, cornered Pods, turning downwards, in which are contained very small Seed.

XIV. *The tenth, or Our common Bastard Wild Rocket.* The Root is long and woody like the former. It grows more upright, and not altogether so high as it, but with whiter green Leaves, deeply cut in, or torn on the edges, yet each division is broader than the former. The Flowers are small and yellow, growing on such Spikes, but shorter.

XV. *The eleventh, or Small white Bastard Wild Rocket.* Its Root is small, long and white with Fibres adjoining to it. It shoots forth divers whitish green Stalks, much about a Foot high, bearing several long and narrow green Leaves (not much unlike to those of Linaria or Toad Flax) yet hoary withall, and lesser than those which grow near the Ground, or at the foot of the Stalk, which are somewhat broader, but not less hoary. The Flowers are white, growing on the like Spikes, many clustering together, with small green Heads in the middle of each, in which (afterwards) is contained small blackish Seed.

XVI. *The Places.* The first four are generally Sown and Nurst up in Gardens, but many will have it, that the first of them is a Wild Kind, and brought into the Garden for its usefulness: it grows in most Gardens of its self, and you may see most Brick and Stone Walls near London, and in many other places abounding with it. The fourth of them was brought to us from America. The Wild Rockets are found growing Wild in many places in England, tho' without doubt they may grow Wild in several other Countries. The eighth, or Narrow Leav'd (tho' said to grow in Austria) grows with us in several places, near unto Water sides, in the Chinks and Crevices of Stone Walls among Mortar: Gerard says he found it as you go from Lambeth-Bridge to Lambeth, and under a small Bridge that you must pass over near the Thames side. The three last, or Bastard Kinds, are also Wild

Plants; the two first of them, viz. the ninth and tenth, grow frequently in our Nation in many waste Grounds, both near London, and up and down in the Country, in Sandy, Stony, Gravelly, and Chalky Barren Grounds, as in several places in Kent, at Southfleet, upon Longfield Downs, which is a very Barren, Chalky, Hilly Ground: and at Greenwich upon the Hills; and at other places in Kent. The ninth has also been found growing upon the Woads in York-shire: The eleventh being a Foreign or Italian Plant, is found with us only in Gardens.

XVII. *The Times.* The first four Flower in June and July, and their Seed is ripe in August. The Wild Rockets, viz. the fifth, sixth, seventh, and eighth, Flower till August, and their Seed is ripe in July, August and September. The Bastard Kinds, viz. the ninth, tenth, and eleventh, Flower about June, and all July and August, the Seed being ripe in the next Month following their Flowering.

XVIII. *The Qualities.* They are all hot and dry in the third Degree, Aperitive, Abstersive, Attractive, Carminative, Cosmetick, Digestive, Diuretick, Suppurative, Cephalick, Neurotick, Stomackick, Nephritick, Hystrick, Emmenagogick, Alexipharmick and Spermatogenetick.

XIX. *The Specification.* Rocket is good against the Scurvy, Strangury, Stone, Gravel, stoppage of Urine, bitings of Serpents and other venomous Creatures, itting of Scorpions, resists Poison, is profitable against the Jaundice, Cough, obstructions of the Spleen, Stoppage of the Terms in Women: is excellent against Asthma's, and all obstructions of the Lungs, and gives ease in the Gout, Sciatica, and other like pains of the Joints. Where Note, The Wild Rockets, are strongest and most used in Physick: The Garden Rockets are of the same Nature, but weaker, and most used in Sallets. The Bastard Rockets, tho' they are of the same Nature, are yet weaker, and but very little used any way, where the others can be had.

XX. *The Preparations.* You may have therefrom, 1. A Sallet of the Herb, especially of the Garden Kinds, tho' the Wild Kinds are sometimes used for that purpose also. 2. A Liquid Juice. 3. An Essence. 4. An Infusion or Decoction of the Herb. 5. An Infusion or Decoction of the Seed. 6. A Powder of the Seed. 7. A Syrup. 8. An Oil or Ointment. 9. A Cataplasm. 10. A Cosmetick. 11. A Distilled Water of the whole Plant. 12. A Spirit from the Herb, or Seed.

The Virtues.

XXI. *The Sallet of Garden Rocket.* It is seldom eaten alone, but with other Herbs of a cooling Nature, as with Lettice, Common Cabbage, and Roman, or with Purslane, either Garden or Wild, but it is in a manner wholly spent as a Condiment, or Sauce for Meat, to please the Palate, sharpen the Appetite, and cause a good Digestion: It admirably encreases Seed, removes Impotency and Frigidity, and provokes to Venerial Aets; but the Wild is more potent to this purpose than the Garden, and therefore in the last case is most used.

XXII. *The Liquid Juice.* Being taken from a Spoonful to 2 or 3, mixed with Honey, or double Refined Sugar, and half a Pint of Generous Wine, and Drank Morning and Evening, it powerfully provokes Urine and the Terms, cures the Strangury, and is profitable against the Stone, Gravel, Sand, or Tartarous Matter, or Slime, obstructing the Reins,

Ureters and Bladder. It is a wonderful thing for the Cure of the Scurvy and Rheumatism in a cold habit of Body: and to reſtit the Poiſon by reaſon of the bitings of Serpents, Vipers, Rattle-Snakes, Stinging of Scorpions, &c. (*A Cataplaſm of the Green Herb being alſo applied to the place.*) It is good againſt the Jaundice and obſtructions of the Spleen, Vapors and Hyſterick fits; and is an excellent thing for the Colick, tho' never ſo extream, and that upon the Spot; being alſo repeated as oft as need requires.

XXIII. *The Eſſence.* It has all the Virtues of the *Liquid Juice*, beſides which it is ſingular againſt Coughs, Colds, and all Obſtructions of the Womb, Belly-achs, Gripings of the Guts; and alſo kills Worms in Children. Doſe from half a Spoonful to two Spoonfuls, in Wine, or other fit Vehicle, ſweetned with the following *Syrup of the ſame*.

XXIV. *The Infuſion or Decoction of the Herb in Wine.* It has all the Virtues of the *Juice and Eſſence*, but muſt be given in larger quantities, as from half a quarter of a Pint, to almoſt half a Pint, Morning and Night, ſweetned with the *Syrup of the ſame Plant*. It increaſes Seed (as do alſo in a more eſpecial manner the *Juice and Eſſence*) is good againſt Impotency and Frigidity, and ſtrongly provokes Luſt, exciting to Venereal Actions.

XXV. *The Powder of the Seed.* Mixed a Dram at a time with Honey or ſome proper *Syrup*, it increaſes Seed, provokes Luſt, and cures Impotency. It kills Worms in Children, and has all the other Virtues of the *Juice, Eſſence, and Infuſion*. Made into a *Cataplaſm* with Ox Gall, and applied to the Face or other parts, it clears the Skin from Spots, Freckles, Tanning, Sun-burning, Yellowneſs and other diſcolorings thereof, and clears it from Scurff, Morpew and the like. Mixed or made up with Vinegar, it takes away Freckles and other Redneſs, happening in the Face or other parts, as alſo black and blew Spots, and the diſcolorings of the Small-Pox, reſtoring the Skin to its color again.

XXVI. *The Infuſion or Decoction of the Seed.* It has all the Virtues of the *Powder of the Seed*, and of the *Infuſion or Decoction in Wine*. It is a ſingular good thing for the Cure of the Scurvy and Rheumatism in a cold Conſtitution, with all their appendent Symptoms; and is very profitable againſt the Colick, Gripings of the Guts, and inveterate pains of the Stomach. Doſe from a quarter of a Pint to half a Pint Morning and Night.

XXVII. *The Syrup.* It is made with the *Juice of the Herb*, or with its *Eſſence*, by mixing an equal quantity of Clarified Honey therewith, in a Gentle Balneo or Sand beat. It cures Aſthma's, Coughs, Colds, Wheezing, Hoarſneſs, ſhortneſs of Breath, and other Diſtempers of the Breſt and Lungs, and is profitable againſt the Rickets in Children: and taken mixed with the *Juice or Eſſence*, and an equal part of the *Diſtilled Water*, it increaſes Seed, as alſo Milk in Nurſes Breſts, is good againſt Impotency and Frigidity, and provokes Luſt in both Sexes. Being taken with half a Dram of the *Powder of the Seed* at a time, it kills Worms in Children, opens obſtructions of the Spleen and Reins and Womb, provokes Urine and the Terms, and takes away the ſtinking or evil Smell of the Arm-Pits, and the ſtrong Smell of the reſt of the Body.

XXVIII. *The Oil or Ointment.* They are Anodyn and Diſcuſſive, good to diſcuſs Tumors, and eaſe Pains ariſing from cold and moiſture, or a Flux of Cold Humors to any part. They give eaſe in the Gout and Sciatica, and are profitable to be uſed in the Cure of the Palfy, Cramps, Convulſions, and the like.

XXIX. *The Cataplaſm.* It may be made of the Green Herb, or of the Herb mixed with the *Powder of the Seed*. Applied to Wounds made by the bitings of Mad Dogs, or of Serpents, as the Viper, Rattle-Snake, &c. or ſtinging of Scorpions, it preſently draws out the Poiſon or Venom, and preſerves the Patient from danger. Applied to the Skin, it clears it of any deformity, and takes away Scurff, Morpew, and other diſcolorings thereof.

XXX. *The Coſmetick.* Take of the *Liquid Juice or Eſſence* 8 Ounces; of Bulls Gall made pure and fine, 6 Ounces; the beſt White Wine Vinegar 4 Ounces, mix them. It is good againſt Pimples, Puſtules, and other breakings out, as alſo Freckles, Lentils, Scurff, Morpew, Tanning, Sun-burning, Yellowneſs, Tetters, Ringworms, and other deformities of the Skin, it being laid on Morning, Noon, and Night, after the Face has been waſht clean with warm Water.

XXXI. *The Diſtilled Water from the whole Plant.* It has the Virtues of the *Juice, Eſſence, and Infuſion*, but in a much lower or meaner degree: and therefore may be uſed as a Vehicle to convey the other Medicines down into the Body in. It is Cordial and Stomackick; and withall Coſmetick, and therefore may be uſed againſt moſt of the Vices and deformities of the Skin.

XXXII. *The Spirit drawn from the Herb or Seed.* It is made in all reſpects as you make *Spirit of Scurvy-Grass*, or *Spirit of Crefles*. It is a potent Medicine againſt the Scurvy in a Cold habit of Body, Dropſy, Jaundice, Rheumatism, Colick, Gripings of the Guts, Pleuriſy, Stone, Gravel, Obſtruction of the Reins and Womb, and other internal parts. It rectifies and ſtrengthens the Stomach, Stops Vomiting, and cauſes a good Appetite and Digefſion. Doſe 50 Drops or more in a Glaſs of Ale, Beer, or Wine.

CHAP. DXCIX.

Of ROCKET Water and Sea.

I. **THE Names.** It is called in Greek, *Ἐρουκα* *ἰακύνθου*; in Latine, *Eruca Paluſtris*: and in Engliſh, Water or Muſh Rocket.

II. *The Kinds.* I. Of the Water Rocket, called in Greek, *Ἐρουκα ὕδατος*; in Latine, *Eruca Aquatica*: there is but one Species, which is here declared. II. Of the Sea Rocket there is, 2. *Ἐρουκα θαλάσσιος*: *Eruca Marina* Anglica *Lobelij*, *Angulæ*, *Camararii*, *Columnæ*, & *Lugdunenſis*; and is called by *Scrapio*, *Kakile*; in Engliſh, Sea Rocket. 3. *Eruca Maritima Floridiana* & *Italica*, American, and Italian Sea Rocket.

The Descriptions.

III. *The firſt, or Water Rocket.* It has a long ſlender Root, full of Fibres, ſet as it were at Joints. Its Leaves and Stalks ly as it were upon the Ground, creeping on the ſame, with long Branches, of long Winged Leaves, almoſt like to *Sium* Impatiens, but not ſo much dented upon the edges, having but two or three dents for the moſt part, and yellowiſh Flowers at the tops, with ſlender Pods following them.

IV. *The ſecond, or Engliſh Sea Rocket.* It has a long ſlender Root with ſome few Fibres adjoining

Rocket Water.

to it: from which spring up divers Stalks, some trailing on the Ground, others Standing more upright, (but being Nurst up in Gardens, it something varies its form and manner of growing in its Stalks and Leaves:) these Stalks are Scatteringly set with small long Leaves, cut in or dented on the edges like to Groundsel or Rocket but longer and lesser, when growing in a Garden:) at the tops of the Stalks grow the Flowers of a pale purplish color, of the fashion of Radish Flowers composed of four Leaves apiece: after which comes the Seed, in form like to a Wheat Corn, but greater: which Grains are something Spongy and not solid, nor two joined together, (when growing in a Garden) but every Seed single by it self, whereas that which grows by the Sea-side, has always two growing together.

V. The third, or American and Italian Sea Rocket. Its Root creeps under Ground, with some Strings or Fibres, and perishes every Year after it has born its Seed. From this Root spring up some long and narrow Leaves, lying next the Ground, very much and finely cut into several parts, not very much unlike to a Deers Horns: the Stalk also is variously spread out into many Branches, which are also set with the like Leaves, but lesser, and less divided still up to the tops of each Arm. The Flowers are of a purplish color, consisting of four Leaves apiece, and stand one above another in small Husks each with two points, upon their several Stalks or Branches. When they are faded and gone, small pointed Heads in form like to a Spears point succeed, in every one of which is contained a white Grain or Kernel.

VI. The Places. The first grows oftentimes near Ditches and Water Courses, and sometimes also in dryer places. The second grows on our own Sea Coasts, in many places of Kent and Sussex especially, yet is not proper to our Climate only, but is also found on the Sea Coasts of seve-

ral other Foreign Countries. The third has been found about the Sea Coast of Italy, near Venice, and other places of that Shore: and in Travelling I have sometimes found it upon the Sea Shores of Florida, in and near our English Plantations.

VII. The Times. They all Flower in June, July, and August, and their Seed is ripe within a Month after the time of Flowering.

VIII. As to the Qualities, Specification, Preparations, and Virtues of these Plants, Authors have said nothing: but if we may presume to judge of them by their Taste, which is very much like to that of Rocket, we may predicate the same of them. However they are said to be Anodyn, and Discussive, and that by a kind of Diaphoretick faculty, they will disperse Swellings and Inflammations. Angulara says, that Our English Sea Rocket Purges exceedingly. Miconius says, it wonderfully eases the Cholick: and that the Distilled Water, drank 4 Ounces at a time, gives admirable ease in the Stone and Gravel, whether in the Reins or Bladder.

C H A P. DC.

of ROSE -- WORT:

O R,

ROSE -- ROOT.

I. **T**HE Names. It is called in Greek, *Ρόδια* *ῥα*: in Latine, *Rhodia Radix*, and *Rosea Radix* (because of its Rose like Smell:) and in English, *Rose-Wort*, and *Rose-Root*.

II. The Kinds. Some have thought it to be a Species of Orpine, but that is doubtful. There is according to Authors, two sorts thereof, viz. 1. *Rhodia serrata*, *Rhodia Radix foliis serratis vel dentatis*, *Rose-Wort* or *Rose-Root* with dented Leaves. 2. *Rhodia non dentata, vel serrata*, *Rhodia Radix foliis non serratis vel dentatis*, *Rose-Wort*, or *Rose-Root* with smooth edged Leaves, or Leaves not dented.

The Descriptions.

III. The first, or *Rose-Wort*, or *Rose-Root* with dented Leaves. Its Root is thick and Tuberous or Knobby at the Head, and Branched out, rising oftentimes above the Ground, whereas it grows somewhat reddish, and is long downwards, with divers Fibres annexed to it, which being a little broken or bruised whilst it is fresh, smells much like to a Damask Rose, much more than when it is dry, tho' then it retains a great deal of the Scent, and from thence it was that it took its Name. From the Heads

Rose-wort with dented Leaves.

Heads of this Root spring forth divers Stalks, which grow upright, thick, round, or green, about a Foot thick, set with Leaves up to the top, which are somewhat long and narrow, like unto those of Orpine, but smaller, yet as fat and thick, and of the like pale green color, whereby it much resembles Orpine in its Leaf, Flower, and manner of growing. The Leaves are dented about the edges. And the Flowers are many, small and yellow, set in a Tuft, or Cluster, but something smaller than Orpine, with Seed in Heads like unto it also.

IV. Gerard thus describes it. The upper end of the Root is thick and knobby, and grows for the most part out of the Ground, and is there of a purplish color, bunched and knobbed like the Root of Orpine, with many hairy Strings hanging there-to, of a pleasant Smell when it is broken, like to that of the Damask-Rose, from whence it took its Name. From this Root spring forth many small, thick, and fat Stems, about which the Leaves are set round, even from the bottom to the top, like to those of the Field Orpine, but narrower, and more snipt about the edges. The Flowers grow at the tops of the Stalks of a faint yellow color.

V. The Second, or Rose-Wort, or Rose-Root, with Leaves not dented. This in its Root, Stalks, Leaves, Flowers, magnitude, and manner of growing, is much like the former, and scarcely at first sight to be discerned from it, the only difference being in the Leaves, these being smooth, or even, and not dented on the edges, as the former are. And this it is which answers to the Cut which Matthiolus has given us in his Epitome of Dioscorides.

Rose-wort without dented Leaves.

VI. The Places. It grows very plentifully in the North parts of England, and scarcely any where else, as far as we can understand; as upon the Mountains of Pendle and Ingelborough, (the very highest Mountains as is supposed in all England,) oftentimes on the very raggedst places, scarcely accessible, and very dangerous by reason of their height and steepness, so that one may be in great danger of tumbling down, who does not look wearily to their footing. Gerard says, it grows in a place called Ingelborough Fels, near unto the Brook sides. From these places, both Gerard and Parkinson say, that they have had some Roots or Plants sent them for their Gardens.

VII. The Times. They Flower about June and July, and the Seed is ripe in August. The Leaves and Stalks perish about the beginning of Winter, and spring again every Year anew from the Root; which abides and Lives thro' all extremities of Cold.

VIII. The Qualities. It is cold and moist in the first Degree, Anodyn, Cephalick, and Neurotick.

IX. The Specification. It has been found by Experience to cool Inflammations, to give ease in the Megrim, and other pains of the Head.

X. The Preparations. You may have therefrom;

1. A Liquid Juice from Leaves, Stalks, and Root.
2. A Cataplasm of the green Root, Leaves, or Stalks.
3. An Oil or Ointment from the same.
4. A Distilled Water from the green or fresh Root.

The Virtues.

XI. The Liquid Juice. It cools and allays the heat and fermentation of a troubled Stomach, and stops

It stops Vomiting by reason of the boiling of Choler, taken in Mead or other fit Vehicle, it pleasantly cools, abates Febricit heat, and very much recreates the Spirits. Dose from 1 Spoonful to 2 or more, upon any pressing occasion.

XII. *The Cataplasm of the Green Roots, Leaves, and Stalks.* If it is beaten up with Oil of Roses, and applied to the Forehead and Temples, it gives ease in the Megrims, and other accidental pains of the Head, especially if it proceeds from a Fever, or hot cause.

XIII. *The Oil or Ointment made of the Juice, or green Root and Herb.* If it is beaten up with Rose Water, and the Head and other parts pained be anointed therewith, it gives present ease of any pain proceeding from a hot cause: and this it will do so much the better, if Stuphs dipt in the same be also applied over after the anointing.

XIV. *The Distilled Water.* It cools Inflammations, eases pains of the Head and other parts, is a good Cosmetick, taking away Pimples, Pustles, Scurffs, Morpew, Tannings, Sunburning, yellowness, roughness, or any other deformity of the Skin. And this it does more effectual if it is mixed with an equal part of the *Liquil Juice*, and a quarter part of the *Juice of Limons*, or for want of it, of the strongest *White Wine Vinegar*.

CHAP. DCI.

Of the ROSE--BUSH.

I. **T**HE Names. It is called in *Arabick*, *Nard*, *Naron*, *Jen Vard*: in *Greek*, *Ῥόδον*: in *Latine*, *Rosa*: and in *English*, the *Rose*.

II. *The Kinds.* There are two Generick Species of *Roses*, viz. 1. *Rosa sativa*, *Rosa Hortensis*, the *Garden Rose-Bush*, of which in this Chapter. 2. *Ῥόδον ἀγριον*, *κνυφίδιον*: *Rosa Sylvestris*, *Rosa Canina*, the *Wild Rose-Bush*, or *Briar-Bush*, of which in Chap. 602. next following.

III. *The Kinds of the Garden Roses.* There is a great variety of *Garden Roses*, the whole Stock of them not being easy to be described, Those most common in our *English Gardens* are these following, viz. 1. *Rosa Anglica alba major & minor*, The *English White Rose* Greater and Lesser. 2. *Rosa incarnata*, The *Carnation Rose*. 3. *Rosa Belgica*, five *Vitrea*, The *Dutch Rose*. 4. *Rosa Anglica rubra*, The *English Red Rose*. 5. *Rosa Damascena*, The *Damask Rose*. 6. *Rosa Provincialis*, *Rosa Centifolia Batavica incarnata*, *Rosa Damascena Holandica*, The great double *Damask Province*, or *Holland Rose*. 7. *Rosa Provincialis rubra*, *Rosa Centifolia Batavica rubra*, The *Red Province Rose*. 8. *Rosa Provincialis alba*, The *White Province Rose*. 9. *Rosa versicolor*, The *Party colored Rose*; The *York and Lancaster*. 10. *Rosa Crystalina*, The *Crystal Rose*. 11. *Rosa rubra humilis*, The *Dwarf Red Rose*, or *Gilliflower Rose*. 12. *Rosa Francofurtensis*, The *Franckford Rose*. 13. *Rosa Hungarica*, The *Hungarian Rose*. 14. *Rosa Holoferica simplex*, The *single Velvet Rose*. 15. *Rosa Holoferica Multiplex*, The *double Velvet Rose*. 16. *Rosa sine Spinis simplex*, The *Rose without Thorns* single. 17. *Rosa sine Spinis multiplex*, The *double Rose without Thorns*. 18. *Rosa Cinamomea simplex*, The *single Cinamon Rose*. 19. *Rosa Cinamomea multiplex*, The *double Cinamon Rose*. 20. *Rosa Lutea simplex*, The *single*

Yellow Rose. 21. *Rosa Lutea Multiplex*, five *stere pleno*, The *Double Yellow Rose*. 22. *Rosa Moschata simplex*, The *single Musk Rose*. 23. *Rosa Moschata multiplex*, The *Double Musk Rose*. 24. *Rosa Moschata multiplex altera*, alijs, *Rosa Damascena alba*; *Rosa Cinamomea verisimilior stere pleno albo*, The *Double White Damask Musk Rose*. 25. *Rosa Moschata simplex Hispanica*, The *Spanish single Musk Rose*. 26. *Rosa Eglentaria odora simplex*, The *Single sweet Eglantine*, or *sweet Briar Rose*. 27. *Rosa Eglentaria odora multiplex*, The *Double Sweet Eglantine*, or *Double sweet Briar Rose*. 28. *Rosa Mensalis*, The *Monthly Rose*. 29. *Rosa Belgica rubicante*, The *blush Belgick Rose*. 30. *Rosa Damascena variegata Eligantior*, The *beautiful variegated Damask Rose*. 31. *Rosa Canina Flore pleno*, The *double Wild Bryar Rose*. 32. *Rosa mundi*, *Rosa variegata admirabilis*, The *Rose of the World*, or *admirable variegated Rose*, of all which in order.

The Descriptions.

IV. *The first, or English White Rose.* This is of two Kinds, the one the *Greater* more thick and double than the other. The one rises up in some shadowie places to be about 8 Feet high, with a Stock of a great thickness for a *Rose*: it has some what smaller and whiter green *Leaves* than many of the other Kinds of *Roses*, five most usually set on a *Stalk*, and more white underneath, as also a whiter

Rose Bush.

green Bark, armed with sharp *Thorns* or *Prickles*, by which it is easily known from other *Roses*. The *Flowers* are whitish, with an *Eye* or *stew* of a *blush*, especially towards the *ground* or *bottom* of the *flower*, which is very thick, double and close set together, and for the most part, not opening it self so largely and fully as either the *Red* or *Damask Rose*.

V. The

V. The second Kind of the English White Rose. *Rosa Anglica alba minor*, being the lesser sort. This seldom grows higher than a Damask Rose; its Leaves in magnitude, number and color are like the former, and the Bush in like manner armed with Prickles. The Flower is whiter, less thick and double, and opening it self more; some of the Flowers are so little double, as not to have above two or three rows of Leaves, that they seem in some manner almost to be single, and having but little Smell. Some judge both these to be but one Kind, and make the diversity to be occasioned from the Air, or Soil, or both: but I confess I am not of that Opinion.

VI. Gerard gives us this general Description of our White Rose thus. Its Root is long, tough, and of a woody Substance. From which spring up very long Stalks, of a woody Substance also, set or armed with divers sharp Prickles; the Branches whereof are likewise full of Prickles, on which grow Winged Leaves, five in number for the most part set upon a middle Rib, by couples, the odd Leaf standing at the point, or end of the same, every one of those Leaves being snipt about the edges, somewhat rough, and of an over worn green color. * From the Bosom whereof shoot forth long Foot Stalks, on which grow very fair double Flowers, of a white color, and very sweet Smell, having in the middle a few yellow Threads or Chives, which being past, the Fruit succeeds (as large as a Horse Bean, or larger) which is of a longish round form (almost oval) green at the first, afterwards of a shining Coral red color, with a red Pulp within, which when the Berry is ripe, is soft, and of a pleasant acid Taste: and within this Pulp is contained a good quantity of downy choaking Matter, almost like Hair, but short, within which the Seed or Grains ly hid, which are very hard almost, as Stones.

VII. The second, or Carnation Rose. It is in most things like unto the Lesser White Rose, both for the growing of the Stock, and bigness of the Flower, but that it is more spread abroad when it is blown than the White is, and is of a pale bluish color all the Flower thro' out, and almost of as small a Smell, as the small White One.

VIII. The third, or Dutch Rose. This sort is not very great, but very thick and double, and is very variable in its Flowers, in that they will be so different one from another. And tho' they may all if them be called Carnation Roses, yet some are paler than others, and some are as it were blasted, which comes not Casually, but Naturally to this Rose. But the best Flowers (of which there will always be some) will be of a bright pale murrey color, near unto the Velvet Rose, but nothing near of so dark a color.

IX. The fourth, or English Red Rose. We call this English, because it is more frequent in England than in other Countries. It never grows so high as the Damask Rose Bush, but more commonly grows low, and shoots forth many Branches from its Root (seldom growing up as the Damask Rose into Standards) which Branches have a green Bark, thinner set with Prickles, and having larger Leaves, and greener on the upper side than the White, yet with an Eye of white upon them, five likewise for the most part set upon a Stalk, and grayish or whitish underneath. The Roses or Flowers do very much vary, according to their Sight and abiding; for some are of an orient red, or of a deep crimson color, and very double, (altho' never so double as the White) which when it is full blown, has the largest Leaves of any other Rose. Some of them again are paler, tending something to a Damask; and some are of so pale a red, as to re-

semble almost that of a Canker Rose; yet all for the most part having larger Leaves than the Damask Rose, and with many more yellow Threads in the middle. The Smell of this Red Rose is much better or richer than that of the White, but not comparable to that of the Damask: but this Rose being well dried, and well kept, it will keep both its Color and Smell longer than the Damask, with the best looking after.

X. The fifth, or Damask Rose. The Damask Rose Bush is more usually Nurst up to a competent height to stand alone (which they call Standards) than any other Rose. The Bark both of the Stock and Branches, is not fully so green, as the Red or White Rose. The Leaves are green with an Eye of white upon them, so like unto the Red Rose, that there is no great difference between them, but that the Leaves of the Red Rose seem to be of a darker green. The Flowers are of a fine deep bluish color, with some pale yellow Threads in the middle, but are not full out so thick and double as the White, nor being blown, have they so great or large leaves as the Red: but are of a most excellent sweet pleasant Smell, far surpassing all other Roses or Flowers, not being heady or too strong, nor stuffing, or unpleasantly sweet as many other things are.

XI. The sixth, or Great Double Damask Province, or Holland Rose. This Bush has its Bark of a brown reddish color, by which it is easy to be discerned from other Roses. The Leaves are also more reddish than in others, and something larger; but it usually grows much like to the Damask Rose, and much of the same height. The Flowers or Roses are of the same deep bluish color, but the Damask Roses are, or rather somewhat deeper; but much thicker, broader, and more double, or fuller of Leaves by three parts almost, the outwards Leaves turning themselves back, when the Flower has stood long blown: the middle part it self (which almost in all other Roses has some yellow threads to be seen) being folded hard with small Leaves, has scarcely any yellow at all visible. The Smell of this Rose comes nearest unto the Damask Rose, but yet is by much short of it, tho' many do indeed think it as good as the Damask. And some have therefore caused their Damask Rose Stocks to be Grafted with Province Roses, hoping to have as good Rose Water, and more store from them, than from Damask Roses; but truly (let such think what they will) the Smell of it is not half so strong or so good.

XII. The seventh, or Red Province Rose. The difference between this and the last is not very great. The Stock, and the Branches also, in this, seeming not to be so great, but greener, and the Bark not so red. The Leaves are of the same largeness with the former Damask Province. The Flowers are not altogether so large, thick, and double, but of a little deeper Damask or bluish color, turning to a Red Rose, yet not coming up near to the full color of the deepest Red Rose: nor is the Smell altogether so strong or sweet as the Damask Province, but coming something near to the scent of the Common red Rose, yet exceeding it: nor is it so plentiful in bearing as the last or Damask Province.

XIII. The eighth, or White Province Rose. It is very white and double, and very large like to the Red Province Rose, or rather like to the double Damask, or Greater white English Rose, in the form and magnitude of the Rose, and manner of its growing, but not in the largeness of its Stock, or Body, this being much the lesser.

XIV. The ninth, or The Party colored Rose, called the York and Lancaster. This in its form and

and order of its growing is nearest unto the Common Damask Rose, as well for its Body or Stem, as for its Branches, Leaves and Flowers. The difference consisting chiefly in this; that the Flower (being of the same magnitude and multiplicity or doubleness with that of the Damask Rose) has the one half of it, sometimes of a pale whitish color; and the other half of it, of a paler Damask color than the ordinary. This happens thus, many times; and sometimes also the Flower has several stripes and marks in it, as one Leaf white, or striped with white; and the other half bluish, or striped with bluish; sometimes also, the whole Flower is striped, or spotted over; and at other times, it has few or no stripes or marks at all, as Nature is pleased to varie it. But this is observable, that the longer it abides blown open in the Sun, the paler, and the fewer Stripes, Marks, or Spots, it will have; it has the Smell of a Damask Rose, but weaker.

XV. The tenth, or the Crystal Rose. This is very like to the last described, both for Stalk, Branch, and Leaf. The Flower hereof is not much different from it, being no great, large or double Rose; but of a mean size, striped and marked with a deeper bluish or red, upon the pale colored Leaf; so that it seems in the marking and beauty thereof, to be as pleasant and beautiful as the Crystal Gilliflower. This even as the former does, soon fades and passes away, not yielding any great number of Flowers any Year.

XVI. The eleventh, or Dwarf Red Rose, or Gilliflower Rose. This always grows low and small; otherwise in most respects it is like unto the Common red Rose, and with few or no Prickles upon it: The Flowers or Roses are double, thick, small, and close, and not so much spread open as the Ordinary Red, but somewhat like unto the first Double white Rose, before described. Yet in some Gardens they blow more open, and are as even at the tops of the Leaves as if they had been clipped off with a pair of Scissars, and are not of so full a red color as the Red Province Rose, but of as weak and poor a Smell as the Common red Rose, or rather weaker.

XVII. The twelfth, or Frankford Rose. The young Shoots of this Rose are covered with a pale purplish Bark, set with a good number of small Prickles like Hairs, and the elder have but very few Thorns. The Rose has a very great Bud or Button under it, greater than in any other Rose, and is thick and double as a Red Rose, but so very much swelling in the Bud, that many of them break before they can be fully blown, and then they are of a pale Red Rose color, viz. between a Red and a Damask; with a very thick, broad, and hard Umbone or Pointel, and short yellow Threads or Thrums in the middle; the Husk of the Flower has long ends, which are called the Beards of the Rose, which in all others, are jagged in some of them, but in this has no Juggs at all. The Smell thereof is nearest to that of the Red Rose.

XVIII. The thirteenth, or Hungarian Rose. This has green Shoots which are set with many Prickles; and seldom grows higher than the Common red Rose; the Stem or Stock being much about that bigness. The Rose is as thick, great, and double, as the Common red Rose, and of the same fashion, of a paler red color, and being nearly look'd upon, is finely spotted with faint Spots, as it were spread over the red; the Smell of which is something stronger than the Smell of the Red Rose of the best Kind.

XIX. The fourteenth, or Single Velvet Rose. The old Stock or Stem of the Velvet Rose is covered with a dark colored Bark, and the young

Shoots with a sad green, with very few or almost no Prickles upon them. The Leaves are of a sadder green color, than in most sorts of Roses, and very often seven on a Stalk, many of the rest having but five. The Rose is single, and when blown, is a broad spread Flower, consisting of five or six broad Leaves, with many yellow Threads in the middle.

XX. The fifteenth, or Double Velvet Rose. The Stock, Bark and Leaves of this are like those of the Single Kind. The Flower or Rose is double, and has two rows of Leaves; the one large, which are outermost, the other smaller within, of a very deep red crimson color, like unto Crimson Velvet, with many yellow Threads also in the middle; and yet for all the double row of Leaves, these Roses seem but like single Flowers.

XXI. There is another Double Velvet Rose, much more double than the last, consisting oftentimes of 16 Leaves or more in a Rose, and most of them of an equal bigness, of the color of the first Single Velvet Rose, at Sect. 19. above, or something brisker; but all of them a weaker Smell than the Common red Rose.

XXII. The sixteenth, or Rose without Thorns or Prickles single. This has several green smooth Shoots rising up from its Root, without any Thorns or Prickles at all upon them, neither whilst they are young, nor whilst they are old. The Leaves are not fully so large as those of the Red Rose. The Roses are not much bigger than those of the Double common Rose; they are not fully single, but short, and of a pale red rose color, with divers pale colored Veins, thro' every Leaf of the Flower, which has caused it to be called also, The Marbled Rose. It has but little Smell, not full out so strong as that of the Red Rose.

Rose Bush without Prickles.

XXIII. The seventeenth, or Double Rose without Thorns. This in its Shoots, Stocks, Branches, Leaves and Buds, as also in its form and manner of growing, is altogether like the former; and differs from it only in its Flower. For in this, the Rose (which is a little larger also than the Double Cinamon Rose) has its Leaves thick set together, and is very full of them, short also, and of the same pale red Rose color, with pale colored Veins running through every Leaf thereof; the duplicity of the Rose making the chief difference from the former.

XXIV. The eighteenth, or Single Cinamon Rose. This has its Shoots something red, yet not so red as the Double Kind, armed with great Prickles, almost like to those of the Eglantine Bush, thereby showing, as well by the multiplicity of its Shoots, as the quickness of its growing, and the height of its Stem, its original Nature, which seems to be of a Wild Kind originally. On the Stem and Branches grow winged Leaves, sometimes seven or more together, which are small and green, yet like unto unto other Roses, which are single, consisting of five Leaves apiece, something large and of a pale red color.

XXV. The nineteenth, or Double Cinamon Rose. This in its Stems, Branches, Leaves, Buds, color, and form of growing is altogether like the Single Cinamon Rose, and differs chiefly in the doubleness of its Flowers; but in this the Shoots are redder, and it bears small, short, thick and double Roses, something like unto the Rose without Thorns or Prickles, but a little lesser, of a paler red color at the ends of the Leaves, and something redder and brighter towards their middle, with many short Thorns about the Center of the Flower. The Smell both of this and of the Single Kind, is that of Cinamon, from whence came the Name.

XXVI. The twentieth, or Single yellow Rose. This is Planted rather for variety than any thing else. It often grows to a good height, its Stem being great and Woolly, with few or no Prickles upon the old Wood; but with a great number of small Prickles like Hairs, and thick set upon the younger Branches, of a dark color, sometimes reddish; and the Bark of the young Shoots being of a sad green reddish color. The Leaves of this Rose Bush are smaller, rounder pointed, of a paler green color, finely snipt about the edges, and more in number upon each middle Rib, viz. seven or nine, as it happens. It bears a small single Rose, consisting of five Leaves, not so large as the Single Spanish Musk Rose, but larger than the Eglantine, or Sweet Briar Rose, and of a fine pale yellow color, without any great Smell whilst fresh; but a little more (tho' very weak) when it is dry.

XXVII. The twenty first, or Double yellow Rose. This Rose, by reason of its Rarity, and exceeding doubleness of its Flower, had it but an answerable Smell also, would have been one of those which might have obtained the highest Esteem. In the Stem or Stock, the young Shoots or Branches, the small hairy Prickles, and the small winged Leaves, it is altogether like unto the former Single Kind. The chiefest difference consists in the duplicity, or rather multiplicity of the Leaves of the Flower or Rose, which is so thick and double, that very often it breaks out on one side or another, so that but few of them abide fair and whole with us in our Gardens. The cause of which is supposed to be the too great wet, or moisture of our Air or Weather, in the time of their Flowering, too much Rain hurting them, besides it is so plentiful in young Shoots or Branches, as also in Flowers at the top of every Branch, which for the most part, are small and weak, that it is not able to bring all its Flowers to perfection, and therefore most of them fall or wither away without coming to ripeness. The Remedy which many use for this inconveniency is, to nip away most of the Buds, leaving but some few upon a Branch, that so the vigor of the Plant, may be collected into a few Flowers, and so the more easily come to their perfect beauty, which yet even by this means is with difficulty affected. The Roses are of a yellowish green color in the Bud, and before they are blown open; but afterwards when fully blown, are of a fair yellow color, very full of

Leaves, with many short Hairs rather than Leaves in the middle, and having short, round, green, smooth Buttons or Heps, almost flat under them. The Flower being fully blown open, does scarcely give place for largeness, thickness, and doubleness, unto the Great double Damask Province, or Holland Rose. This Rose Bush or Plant is very tender with us here about London, and requires more care than the Single Kind does, which is hardy enough. But it thrives very well in a warm, dry and free Air, and that in all or most parts of the Kingdom, more especially if it is planted against a Wall, or be other ways defended from Rain and Wet by covering it.

XXVIII. The twenty second, or Single Musk Rose. It rises up oftentimes to a very great height, so as to over grow any Arbor in a Garden, or being set by an House side, will rise up to ten or twelve Feet or more, with many green far spread Branches, armed with a few sharp and great Prickles, such as the wilder sorts of Roses have. The Leaves are small and of a dark green color, not much bigger than the Leaves of Eglantine. The Flowers come forth at the tops of the Branches, many together, as it were in a Tuft, which for the most part do Flower all at a time, or not long one after another, every one standing on a pretty long foot Stalk, of a pale whitish or Cream color. The Roses are small, consisting of five Leaves apiece, with many yellow Threads in the middle.

XXIX. The twenty third, or Double Musk Rose. This in its Stocks, or Stems, Branches, Leaves, height, and manner of growing, is exactly like the former Single Kind, the chief difference between them is in the Flowers, which in this are double, and of the same pale white, or Cream color, as the Single Sort. The Roses are furnished with two or three rows of Leaves, with yellow Thorns also in the middle. Both the Single and Double Kinds have a very sweet and pleasing Smell, very much resembling Musk.

XXX. The twenty fourth, or Double white Damask Musk Rose. This more truly may be called the Double white Cinamon Rose, from its Smell. It has its Stem and Branches shorter than the former, but as green. The Leaves are somewhat larger, and of a whiter green color: The Flowers or Roses are also something larger than the former Double Kind at Sect. 29. above, but stand in Tufts after the same manner, or something thicker, and of the same whitish color or a little whiter, and something, altho but little, near the Smell of the last described, but nothing so strong. This Flowers at the times of other Roses, or rather later, yet much before the two former sorts of Musk Roses, which Flower not till the end of Summer, or in Autumn; both which things as to time of Flowering and Smell, shew that it cannot be of the Species of the Musk Roses.

XXXI. The Twenty fifth, or Single Spanish Musk Rose. This rises up to the height of the Eglantine, and sometimes higher, with several great green Branches, the Leaves of which are larger and greener than any of the former Kinds of Musk Roses. The Flowers are Single Roses, consisting of five whiter Leaves, than any of the former Musk Roses, and much larger, having sometimes an Eye of bluish in the white, of a very sweet Smell, coming nearest unto the last sort, at Sect. 30. as also for its time of Flowering.

XXXII. The twenty sixth, or The single sweet Eglantine, or Sweet Briar Rose. This is well known for the sweetness of its Leaves, and is Planted almost in all Gardens, yet found growing Wild in many Woods and Hedges. It has exceed-

ing

ing long green Shoots, armed with cruel sharp, and strong Prickles, and thicker set upon the Branches and Stems, than on any other Rose Bush, whether Wild or Garden. The Leaves are smaller than most of those which grow in Gardens, seven or nine most usually set together upon one middle Rib or winged Leaf, which are very green, and Smell sweet, above the Leaves of any other kind of Rose. The Flowers are small Singleblush Roses, having little or no Smell, which being past away leave behind them Hips, which when ripe, are of a shining Coral color, and contain within them a downy substance in which the white hard Seed does lye.

XXXIII. The twenty seventh, or Double sweet Eglantine, or Double sweet Briar Rose. This is generally where ever it is planted, a Grafted Rose, tho' I doubt not but its Original was Natural, and may be made to grow so, naturally again. It grows and spreads very well, and with a great head of Branches, on which grow such like Leaves as in the Single Kind, but a little larger, and not smelling so sweet. The Flowers are something bigger than the single, but not much, having but only two rows of Leaves, the inner of which are smaller and the outward larger, of the same pale reddish purple color, but smelling something sweeter than the Single.

XXXIV. The twenty eighth, or Rosa mensalis, the Monthly Rose. It is in all its parts like unto the Damask Rose, and in Italy is said to bear seven Months in the Year, tho' with us, we rarely find it to bear above three or four, viz. in June, July, August, even to the end of September. The Roses are very like to the Damask, but something more double, and not altogether so sweet.

XXXV. The twenty ninth, or Blush Belgick Rose, Rosa Belgica Rubicante. It has bigger Branches and fuller of Thorns or Prickles than most other Roses. The Leaves are thicker, stiffer, and of a whitish green color. The Flowers grow many together on the ends of the Branches, which are about the bigness of the ordinary Damask Roses, but very thick and Double, of a fine pleasant pale bluish color, and sweet Smell. This is the greatest Bearer of all the Roses, and the Distilled Water thereof, is almost or good as that of the Damask.

XXXVI. The thirtieth, or Rosa Damascena variegata Elegantior, the Beautiful variegated Damask Rose. It is something like the Rosa Crystallina, but only the Shoots are shorter and redder, and the Leaves smaller. The Flowers are something more double, and often better marked than either the Varicolor'd, or Crystalline, at Sect. 14 and 15.

XXXVII. The thirty first, or Rosa Canina flore pleno, or Double Wild Briar Rose. This in its Stems, Branches and Leaves is like to the Lesser White Rose at Sect. 5. foregoing, or to those of the Single Wild Briar, but the Flowers are double, for which it is esteemed, and are of a faint whitish bluish color, having but a weak Smell.

XXXVIII. The thirty second, or Rosa Mundi, The Rose of the World. This differs not in any of its parts from the Common red Rose, but only in the color of the Flowers, which in this are for the most part red, of a pale bluish color, diversly spotted, marked and striped thro'out every Leaf of the double Flower, with the same red color which is in the Ordinary red Rose, so that it is the most beautiful to behold of all the Striped or Variegated Roses, yet known. The form of the Rose and its Smell, is like to that of the Common red Rose.

XXXIX. The Places. Where many of these were Originally Natives is hard to determin, now they are all Natives with us in England, and grow only in our Gardens. The first and

fourth are Originally English, for the Dried Red Roses which come over to us from beyond Sea, are not of the same Kind with our English, nor any wise to be compared to them, neither for goodness nor color. The Double Yellow came to us first from Turkey; others from Holland and other Countries.

XL. The Times. The Cinamon Rose is for the most part the earliest: The Common Musk Roses both Single and Double, Flower latest: all the others Flower much about one time, viz. from the beginning of June, and all July till August, and the Red, many times through the whole Month of August, even till September.

XLI. The most Esteemed of all these are, I. Of the Red Roses; the Rosa Mundi, Red Belgick Rose, the Variegated, the Red Province Rose, and the Rose without Thorns. II. Of the Damask Roses; the Crystall Rose, the Beautiful Variegated Damask Rose, the Blush Belgick Rose, the Monthly Rose, and the Damask Province Rose. III. Of the Yellow Roses; the Scarlet Austrian Rose, and the Double yellow Rose. IV. Of the White Roses; the Blush Rose, and the Damask Musk Rose. These are all excellent Roses, and none of them ought to be wanting in any good Flower Garden.

Of the Planting and Nurseing up of Roses.

XLII. Note. 1. All sorts of Roses are hardy, and will endure the Frost in Winter; and the better the Soil is you set them in, the better they will thrive, and the faster will be the Flowers. They are generally disposed in Rows and Hedges, and supported and kept in on both sides. And the several colored Roses, intermixt and well placed will make an excellent and beautiful Prospect.

XLIII. Note. 2. All Stocks of Budded Roses are to be carefully kept from Suckers: and if the Buds be placed near the Ground, after one Years growth, they may be laid in the Earth to Root, by which means it will become a Natural Bush; one of which is more worth than three that are Budded, for that every Sucker which comes from them will be of the same Kind, by which they will be increased. But as all Rose Bushes are not apt to yield Suckers, it will therefore be the speediest and most certain way to lay down the Branches, or make Layers of them, and to put old well rotted Duag about the places where they are Lay'd, which will make them take Root the sooner.

XLIV. Note. 3. There are some Roses which are not fit to be Planted in Hedges, as the Musk Roses, which will not Bear at all, unless they grow by some high Wall, or House side, where they may have liberty to grow to their full height, which is commonly eight or nine Feet high. Also the Double Yellow, which is the most unapt of all others to bear kindly, and fair Flowers, except it be ordered and taken care of in an especial manner; for whereas all other Roses are best Natural, this proves best being Inoculated upon another Stock. And whilest others thrive and bear best in the Sun, this thrives best in the Shade.

XLV. Note. 4. The best way then that is known to cause this Double yellow Rose, to bring forth fair and kindly Flowers, is done thus; first in the Stock of a Franckford Rose, near the Ground, put in the Bud of the Single yellow Rose, which will quickly shoot to a good length; then halt a Yard higher than the place where the same was Budded,

put into it a Bud of the *Double yellow Rose*, which growing, the Sackers must be kept from the Root, and all the Buds rubbed off, except those of the Kind desired, which being grown big enough to beat (which will be in two Years) it must in *Winter* be Prun'd very near, cutting off all the small Shoots, and only leaving the biggest, cutting off the tops of them also, as far as they are small.

XLVI. *Note.* 5. Then the next *Spring*, when the Buds for Leaves come forth, rub off the smallest of them, leaving only some few of the largest, which by reason of the Strength of the Stock, affords more nourishment than any other: and by the agreeable Nature of the *Single yellow Rose*, from whence it is immediately nourished, the Shoots will be strong and able to bear out the Flowers, (if they be not too many, which may be prevented by nipping off the smallest Buds for Flowers, leaving only such a number of the fairest, as the Bush may be able to bring to perfection,) which Bush should stand something shaded, and not too much in the heat of the Sun, and in a Standart by it self, rather than under a Wall.

XLVII. *Note.* 6. *Roses* are also increased either by Inoculating the Buds of them into other Stocks, or by laying down the Branches in the Earth, as we before hinted. The best Stocks to be Inoculated upon, are, 1. The *Damask*. 2. The *White*. 3. The *Frankford*. 4. And the *Wild Eglantine*. The Best time to do it in, is about *Midsummer*, or as soon as good Buds can be gotten.

XLVIII. *Note.* 7. After your *Rose Bushes* have done Bearing, they ought to be cut with the Garden Sheers, something near, and towards the *Spring*, each Branch is to be cut again with a knife, close to, a Leaf Bud; and what is dead or Superfluous is to be taken away. These Rules being observed you may expect to reap a plentiful Crop, and to obtain every Year, a good Store of very fair *Roses*; when many times those which are Natural, may notwithstanding all the helps of Industry, prove poor and mean or blasted.

XLIX. *Note.* 8. The parts of the *Rose* it self, have also several particular Names, as, 1. *Viburna*, which are the Shoots of the *Rose* Plants, as *Strabo Gallus*, in his *Little Garden* is pleas'd to call them. 2. *Alabaster*, are those parts of the Cup which are deeply cut, and which encompass the Flower close about, till it is opened, which be in number five, two of which have Beards, and two have none, and the fifth has but half one. 3. *Calix*, or the Cup it self, which contains and holds in together the yellow part, and the Leaves of the Flower. 4. *Ungues*, or the Nails, which are the lower white parts, of the Leaves of the Flowers, by which they are joined to the Cups. 5. *Anthos*, in Shops *Anthera*, *Flos Rosa*, The Flower of the *Rose*, &c. the middle part thereof, which they call the Chives, and some (tho' falsely) the Seeds of the *Rose*. 6. *Fructus*, *Corallatum*, the Hep or Fruit, which comes after the *Rose*, and which being ripe is of a bright shining Coral like color.

L. *The Qualities.* *Mesues* says, that the *Rose* is cold in the first Degree, and dry in the second. Both the *White* and *Red* are cooling and drying, but the *White* is taken to exceed the *Red* in both these Properties. *Galen* says, the *Red* has a bitter and astringent Quality with it, and that the *Anthera* or yellow Threads in the middle of the *Rose*, do bind more than the *Rose* it self, and are more drying also. *Mesues* will have the *Rose* to be compounded of divers parts or substances, viz. of a Watery temperate Substance; of Earthy drying Parts; and of a Volatile Aromatick Substance, which is hot, whence comes its Redness, Perfection and

Form. The Bitterness in the *Roses*, viz. *Damask*, and *Musk*, whilst they are fresh, causes their Cathartick Quality, and makes them to purge both Cholerick and Watery Humors, which it does not appear that the *Greeks* knew any thing of; but being dry, that bitterness vanishes, and therewith their purging property, and then they have only an astringent, binding or stopping Power. Those which are not full blown, do both cool and bind, more than those which are full blown, and the *White* more than the *Red*, and the *Red* more than the *Damask* or *Musk* Kinds. Also the *Musk Roses* both *Single* and *Double*, do Purge more powerfully than the *Damask*, and the *Single* are held to be stronger than the *Double*, tho' none of the *Greeks* have taken notice hereof; but *Mesues* the *Arabian* only. And *Camerarius* says, that 20 Leaves of the *Single Musk Rose*, will open the Belly, and Purge the Body, but more are to be taken of the *Double Kind*, to do the same.

LI. *The Specification.* The *White* and *Red*, stop Fluxes of the Bowels, and Catarrhs, are Vulnerary, drying and healing, good against Consumptions and Ulcers of the Lungs, as also internal Ulcers of the other Viscera, as of the Stomach, Guts, Reins, Bladder, and Womb, comfort the Head, Brain, and Nerves, and are good against Diseases afflicting those parts, proceeding from cold and moisture.

LII. *The Preparations.* Out of *Roses* the following Medicaments are made, viz. 1. Juice of *Red Roses*. 2. Liquid Juice of *Damask* and *Musk Roses*. 3. Essence of *Damask* and *Musk Roses*. 4. Decoction of *Red Roses* in Wine. 5. Infusion of *Damask* and *Musk Roses* in Wine. 6. A Decoction of the Heps. 7. A Simple Syrup of *Red Roses*. 8. A Syrup of dried *Red Roses*. 9. A Syrup of the Juice of *Damask Roses*. 10. Syrupus Rosarum Odoratus. 11. Syrup of *Damask* and *Musk Roses*. 12. Syrup of *Roses* solutive simple. 13. Syrup of *Roses* solutive with *Agarick*. 14. Syrup of *Roses* solutive with *Hellebor*. 15. Syrup of *Roses* solutive with *Sena*. 16. Julapium Alexandrinum, vel Syrupus Regius. 17. Julapium Rosatum, Julep of *Roses*. 18. Mel Rosatum Commune, Honey of *Roses*. 19. Mel Rosatum Colatum. 20. Mel Rosatum solutivum. 21. Acetum Rosatum, Vinegar of *Roses*. 22. Tincture of fresh *Red Roses*. 23. Tinctura Rosarum siccatum, Tincture of dried *Red Roses*. 24. Lohoch Rosatum. 25. Conserve of *Damask Roses*. 26. Preserved *Damask Roses*. 27. Sugar of *Roses*. 28. Electuarium Rosarum Mynsichti. 29. Electuary of *Roses*. 30. Aloe Rosata. 31. Powder of *Red Roses*. 32. Aromaticum Rosatum. 33. Diarrhodon Abbatis. 34. Powder of the *Anthera*. 35. Powder of *Damask* and *Musk Roses*. 36. Dried Leaves of *Damask* and *Red Roses*. 37. *Rose Cake*. 38. An Epithem. 39. Oil of *Roses* Ompacine. 40. Oil of *Roses* complet. 41. Ointment of *Roses*. 42. A Cataplasim. 43. *White Rose Water*. 44. *Red Rose Water*. 45. *Damask Rose Water*. 46. Spirit of *Damask* or *Musk Roses*. 47. Oil or Fat of *Roses*. 48. Potestates Rosarum. 49. Elixir of *Roses*. 50. Fixed Salt. Of all which in order.

The Virtues.

LIII. *The Liquid Juice of Red Roses.* It strengthens the Stomach, Heart, Liver, and Retentive Faculty, stops the overflowing of the Whites and Courtes in Women, Defluxions of Rheum into the Eyes, and all sorts of Fluxes of

LIV. The

the Bowels, as also Ulcers of the Lungs, Guts, Reins, Bladder, and Womb. Dose 2 or 3 Spoonfuls Morning and Night, in a Glass of Red Sytyck Wine.

LIV. *The Liquid Juice of Damask and Musk Roses.* It has in a great measure the Virtues of the Red, besides which, it purges and cleanses the Body of cholerick and hegmatick Humors; eases pains arising from heat, allwages Inflammations, and causes Rest and Sleep. It also gives ease in the Colick, by purging off those acrimonious and sharp Humors which cause it.

LV. *The Essence of Damask and Musk Roses.* It has all the Virtues of the Liquid Juice, Works lively and easily, and may be given Morning and Night, from 2 Spoonfuls to 4, in a Glass of warm White Port Wine, or in Posset Drink, or Water-Gruel, or Mutton Broth.

LVI. *The Decoction of Red Roses in Wine.* It is very good against the Head-ach, and pains in the Eyes, Ears, Throat and Gums; as also the *Intestinum Terminus*, and Womb, being Injected into them: and the other parts bathed therewith. Taken inwardly, it is said to give ease in the most excruciating Pains of the Colick. In this last Case, I am of Opinion the Infusion would be better to be made in Aniseed Water than in Wine.

LVII. *The Infusion of Damask or Musk Roses in Wine.* It purges and cleanses the Bowels, and whole Body, from Choler, Flegm, and Viscous, Tartarous and Slimy Humors, and therefore is profitable against the Gripping of the Guts, Colick, or dry Belly-ach, Stone, Gout, and other like Distempers, proceeding from those Humors.

LVIII. *The Decoction of the Heps.* It may be made in White Port Wine, or in Water, or in an equal mixture of those two. It is of good use against Spitting or Vomiting of Blood, Pissing Blood, or the Bloody Flux, and all other Fluxes of the Bowels.

LIX. *The Simple Syrup of Red Roses.* It is made altogether as you make Syrup of Clovegilliflowers, in a boiling Balneo. Also if you please, in stead of Water, you may use a strong Sytyck sort of Red Wine, as Alicante, Barcelona, or Barabar Wine, &c. It stops all manner of Fluxes of Blood by Mouth, Urinary parts, Womb, and Fundament; stops Fluxes of the Bowels, a *Gonorrhoea* in Men; and the Whites in Women, is good against nauouseous and Vomiting, and profitable against Coughs, Colds, and Catarrhs. Dose a quarter of a Pint at a time, more or less, 2, 3, or 4 times a day.

LX. *The Syrup of dried Red Roses.* Take Spring Water 4 Pints, let it boil, and then infuse in it, some at a time, of dried Red Roses 8 Ounces: the next day press them out; and with 2 Pounds of Sugar, make a Syrup by boiling according to Art. It comforts and strengthens the Heart and Spirits, binds, stops Fluxes, stops Vomiting, and has all the Virtues of the former made of the fresh gathered Roses.

LXI. *Syrupus à succo Rosarum Damascenarum.* Syrup of the Juice of Damask Roses. It is prepared without Maceration, only with the Juice of Damask, or of Musk Roses pressed out and Clarified, with an equal proportion of Sugar. It purges Choler, Flegm, and watery Humors, which it does without any Violence, cools, and also strengthens the Bowels. It is a *solutive Syrup*, familiar, safe, and gentle, good against the Cholick or dry Belly-ach, being given from 1 Ounce to 2, 3, or 4 Ounces at a time, in Clarified Whey, or some other proper Vehicle.

LXII. *Syrupus Rosarum Odoratus.* Sweet or perfumed Syrup of Roses. It is made of the Distilled Water of Red Rose Leaves one part, with treble refined Sugar 2 parts; melting them into a

Syrup in B. M. to which is added some few Grains of prepared Musk and Ambergrise. It is refrigerating, cordial and strengthening, and used as a Vehicle to convey other Medicines in. Drop into the Eyes 4 or 5 times a day, it clears the Sight, and takes off Clouds, Mists, Blood-shot, &c. It is many times used with Gargarisms, Washes, and Injections, instead of Honey of Roses, to palliate, cleanse, and heal old Sores, running Ulcers, Fistula's, &c. The best way to perfume it, will be, by adding to every Pint of the Syrup, 50 Drops more or less of the Tincture of the Perfumes, and not the Perfumes in Substance. It will be best to be given without being Perfumed, especially if they be apt to have Vapors, Hysterick Fits, &c.

LXIII. *Syrup of Damask and Musk Roses.* It is made of the Leaves of Damask and Musk Roses in equal quantities, exactly, as you make the Syrup of Roses *solutive* simple in the next Section. It purges admirably well, and yet with gentleness or easiness, and is peculiar against the Colick or dry Belly-ach, and the vehemency of the cholerick Fermentations. Dose from 1 Ounce to 2, in any proper Vehicle.

LXIV. *Syrupus Rosaceus solutivus simplex.* Syrup of Roses *solutive* simple. Take Spring Water boiling hot 2 Quarts; Damask Rose Leaves fresh, as many as the Water will contain, digest in a Vessel close stoppt 12 Hours: then press them out, and put in fresh Rose Leaves as many as before, the Water being warmed anew: repeat this again, 3 or 4 times, encreasing the quantity of the Roses, as the Liquor encreases, which will be by almost a third part, every time. Take of this Liquor three parts: double refined Sugar two parts: mix and make a Syrup in Balneo. It purges Choler, Flegm and watery Humors, gently and easily, cools and softens the Belly, expels Flegm out of the Stomach, and has all the Virtues of the Syrupus à succo at Sect. 60. foregoing, you may give from 1 to 4 Ounces of it at a time, according to age and strength, in Clarified Whey, Sack Whey, Posset Drink, Mutton Broth, &c.

LXV. *Syrupus Rosaceus solutivus cum Agarico.* Syrup of Roses *solutive* with Agarick. Take Agarick very thin sliced 2 Ounces; Ginger very thin sliced half an Ounce; Sal Gem 2 Drams; Polypody grossly bruised 4 Ounces; sprinkle them with White Wine: Digest them 2 days over warm Ashes, or Sand heat, in an Infusion of Damask Roses 3 Pounds: express out the Liquor, and with white Sugar 1 Pound, boil into a Syrup according to Art. It is stronger and more effectual in Working than the Simple Syrup; for one Ounce thereof by it self, will open the Body more than 2 Ounces of the other, and Works as much on Flegm and Water, as on Choler. It cleanses the Stomach and Liver of Choler, provokes Urine, strengthens the Stomach, and stops Vomiting. Dose from an Ounce to 3 Ounces. If you would have the Syrup more effectual, it will be best to take Agarick 2 Ounces, and to make into a Syrup with Sugar first, least you loose the force of the Agarick by boiling.

LXVI. *Syrupus Rosaceus solutivus cum Helleboro.* Syrup of Roses *solutive* with Hellebor. Take the Rinds of all the Myrobalans, of each 4 Ounces; Epithymum, Polypody, of each 6 Ounces; Liquorice 4 Ounces; Seeds of Citrons 2 Ounces; Cloves 1 Ounce, cut and grossly bruise them; put them into a Glass Cucurbit, upon which affuse the afore-mentioned Infusion of Damask Roses 6 Quarts; digest 24 Hours, and then Distill off till about 3 Pints remain. The remainder with the Ingredients express strongly, and clarify it with robies of Eggs. Afterwards take Sena 6 Ounces; Roots of black Hellebor

Hellebor 6 Drams; *Rheubarb*, 2 Ounces being prepared; *Extrakt* with the before *Distilled Water*, by a double or trebble *Infusion* or *Cottion*, and *expressing*; which with the afore *clarified Liquor*, and *fine Sugar Candy* 5 Pounds, make a *Syrup* in *Balneo*, according to *Art*. It opens obstructions of both *Liver* and *Spleen*, and prevails against *Melancholy*, *Frenzy* and *Madnels*. Dose from 1 Ounce, to 2 or more, at a time in *Clarified Whey*, or *Borage* or *Pionitory Water*. It is best to be taken in a smaller Dose, and often.

LXVII. *Syrupus Rosaceus solutivus cum Sena*, *Syrup* of *Roses* solutive with *Sena*. Take *Sena* 6 Ounces; *Caraway* and *Sweet Fennel Seed*, of each half an Ounce; sprinkle them with *White Wine*, and digest them two days, in the aforementioned *Infusion* of *Damask Roses* 2 Quarts; then strain out, and with *white Sugar* two Pounds, boil it into a *Syrup*. It is an excellent thing to purge *Melancholy*, open obstructions and ease pains of the *Spleen*, *Wind*, &c. and all Diseases proceeding from those Causes: it eases the *Head* and *Heart*, comforts the *Stomach*, revives the *Spirits*, and prevails against the *Green-sickness* in *Virgins*. Dose from 1 Ounce to 3, in a weak *Infusion* of *Sena* in *Clarified Whey*, or *White Port Wine*.

LXVIII. *Julapium Alexandrinum*, vel *Syrupus Rosus*, The *Cordial Julep*. Take *Red Rose Water* 2 Quarts; double refined *Sugar* a Pound, mix and make a *Julep*. It is a delicate cooling *Cordial*, refreshing *Nature*, cheating the *Heart* and reviving the *Spirits*, good against *Fevers*, *Faintings* and *Swoonings*. If a few Drops of *Oil of Sulphur* be added to it, it will make it to much the gratefuller, and so much the more cooling.

LXIX. *Julapium Rosatum*, *Julep* of *Roses*. It is prepared of *Damask Rose Water*, in the same manner as the former *Cordial Julep*. It has all the *Virtues* of the former, comforts the *Head*, *Brain* and *Animal Spirits*, besides which it is said, to be binding, and to stop all sorts of *Fluxes* of the *Bowels*. And if it is impregnated with some few Drops of *Oil of Sulphur*, it effectually stops *Vomiting*, and represses all *Burning* and *Malign Fevers*.

LXX. *Mel Rosatum Commune*, The common *Honey* of *Roses*. Take *Red Roses* not quite opened, 2 Pounds; *Honey* 6 Pounds: set them in the *Sun* according to *Art*. Or thus. Take of the manifold *Infusion* of *red Roses* 5 Pints: *Clarified Honey* 4 Pints: mix and boil to the thickness of *Honey*. It strengthens the *Stomach*; heals *Sores* and *Ulcers* of the *Eyes*; cleanses and heals *Ulcers* of the *Mouth* and *Throat*; as also *Ulcers* in the *Secret parts* of *Man* or *Woman*; and is used in *Clysters* to heal *Ulcers* of the *Guts*, being dissolved in *Milk* or *Fat* Both.

LXXI. *Mel Rosatum colatum*, *Honey* of *Roses* strained. Take *Honey* despumated in *Balneo* 10 Pounds; *Juice* of *Red Roses* 1 Pound; set them conveniently over the *Fire*, and when they begin to boil, put in *fresh Red Roses* (the *Whites* being cut off) 4 Pounds; consume the *Juice* by boiling and stirring, then strain out, and keep it for use. The *Virtues* and *Use* of this, are altogether the same with the former. It is sometimes mixed with *Injections* for the cure of a *Gonorrhæa*, and other *Veneral Ulcers*.

LXXII. *Mel Rosatum solutivum*: *Honey* of *Roses* solutive. Take of the manifold *Infusions* of *Damask Roses* 5 Pints: *Honey* well *Clarified* 4 Pounds: mix and boil them to the thickness of *Honey*. This has all the *Virtues* of the former *Honies*. But besides being taken inwardly, from 1 Ounce to 3 (according to *Age*, *Accidents*, &c.)

It Works gently and easily, makes the *Belly* soluble, and purges off *Choler*, *Flegm*, and *Watery Humors*, and gives special ease in the *Colick*.

LXXIII. *Actum Rosatum*, *Vinegar* of *Roses*. Take *Red Rose Buds* gathered in a dry time, the whites cut off, and dried in the *Sun* a Pound; *Wine Vinegar* 6 Quarts; set them in the *Sun* 40 days: then strain out the *Vinegar*, and repeat the *Infusion* with *fresh Roses*. It comforts the *Head* and *Stomach*, stops *Vomiting*, causes a good *Appetite*, represses *Inflammations*, and cools the heat of *Fevers*, whether outwardly or inwardly used.

LXXIV. *Tinctura Rosarum Bateana*, *Tincture* of *fresh Red Roses*. Take *Red Roses* exungulated an Ounce; *Fountain Water* boiling hot 5 Pints; *Oil of Vitriol*, 60 Drops; Digest 2 Hours, and to the clear *Tincture*, add *white Sugar Candy* in *Powder* 6 Drams. It refrigerates in *Fevers*, and comforts the *Liver*, helps *Concoction*, stops *Fluxes*, as also the overflowing of the *Terms*. Dose 2 Ounces to 4. It is a pleasing *Julep* to the ally heat in *Fevers* and quench *Thirst*, and is of good use to be given in the *Measles* and *Small Pox*, if any *Flux* be present, or feared. It is also of approved success in the *Plague*, and all *malign* or *Pestilential Fevers*, destroying the *Root* of the *Morbific Cause*. It may be given as a *Cordial* after this manner. Take of this *Tincture* or *Julep* 3 Ounces; *Spirit of Saffron* an Ounce; *Tincture* of *Antimony* 20 Drops; mix for a draught against *Faintings*, *Swoonings*, sickness at *Stomach*, *Palpitation* of the *Heart*. In all continent, continual, and vehemently burning *Fevers*, it may be thus given. Take *Spring Water* a Pint; of this *Tincture* half a Pint; *Syrup of Violets* 4 Ounces; mix them: and let the Sick drink thereof at *Pleasure*.

LXXV. *Tinctura Rosarum Siccaram*, *Tincture* of *Dried Roses*. Take exungulated *Red Roses* dried an Ounce; *Spring Water* 2 Quarts; redified *Oil of Sulphur* a Dram; Infuse in a warm *Balneo* for 4 Hours; strain, and dissolve in it *fine white Sugar* 6 Ounces: and then filter through *Brown Paper*. It cools, comforts and digests, is excellent in all *Burning Fevers*, and has all the *Virtues* of the former.

LXXVI. *Tinctura Rosarum Composita*, *Tincture* of *Roses* Compound. Take new made *Whey* Clarified, 3 Quarts: and whilst it boils, put into it *Red Roses* 6 Drams (but double the quantity would do better) *Tamarinds* an Ounce and half; *Spirit* or *Oil of Vitriol* a Scruple; let the boiling cease, but whilst it is hot, cast in *fresh Red Roses* bruised 2 Ounces; *Corn Peppies*, and *Violets*, of each half an Ounce; Digest in a warm Place for some Hours: and being cold, strain and filter; and to the filtered *Liquor* add *Damask Rose Water* 3 Ounces. It is intended against *Melancholy*, inward *Inflammations*, heat of the *Liver*, *Pleurisy*, &c. Where note, that instead of *Whey*, you may use *Lettice*, *Purslane*, or *Poppy Water*. Dose from 1 Ounce to 2 or more.

LXXVII. *Loboch Rosatum Myrsibria*, *Loboch* of *Roses*. Take *Conserve* of *Red Roses* ting'd with *Spirit of Sulphur* 4 Ounces; *Loboch* of *Colts foot* prepared with *Sugar* 2 Ounces; *Species Diarrhodori abbatis* 1 Ounce; *fine Bole*, *Juice of Liguierice*, of each 2 Drams; *Saffron* 1 Dram; *Flowers of Benjamin*, *lesser Cardamoms*, *Mace*, of each, half a Dram; *Anisated Bism* of *Sulphur* a Scruple; *Chymical Oil* or *Spirit of Roses* 6 Grains; mix, and with some *Pectoral Syrup* make a *Loboch*. It is good against violent *Coughs*, *Colds*, *Catarrhs*, difficulty of *Breathing*, *Exulcerations* of the *Breast* and *Lungs*, *Spitting of Blood*, *Consumptions*, &c. Dose the quantity of a *Chest-Nut*.

LXXVIII. Con-

LXXXVIII. Conserve of Damask Roses. Take fresh Damask Roses the robies being cut off a Pound, beat them in a Mortar to a Pulp, adding a double proportion of white Sugar, as they are a beating, but the Apothecaries have now a much better way of doing it, which is by passing them through a Mill, which makes the Mass or Conserve smooth and uniform. It gently opens the Belly and Purges, and has the Virtues of the Syrup of Damask Roses, but is clogg'd with more earthy parts, and therefore Binds after it has done purging.

LXXXIX. Damask Roses Preserved. It is done either by laying the Flowers, *Stratum super stratum*, with double refined Sugar, and a double quantity of Sugar: Or by making the double quantity of Sugar into a Syrup with Damask Rose Water, and then pouring it on them: but in this last way, the Syrup must be made very high or thick, and be somewhat thicker, than new Honey. It has the Virtues of the Conserve foregoing, and operates exactly after the same manner.

LXXX. *Electuarium Rosatum Myrsiciti*, Electuary of Roses, called also *Zinzibar Rosatum*, or Ginger Rosate. Take Conserve of Red Roses Vitriolated 12 Ounces; Green Ginger Preserved 4 Ounces; Oil of Cinnamon, a Scruple; Oil of Cloves, half a Scruple: mix, and with Syrup of Violets Vitriolated, make an Electuary. It comforts the Heart and Stomach, strengthens the Digestion, excites Appetite, takes away Loathing, and stops Vomiting. It recreates the Spirits, cheers the Vitals, relists putridition, expels Wind, gives ease in the Cholick, and is a famous and present Remedy against all cold Diseases of the Head, Stomach, or Womb. Dose 2 or 3 Drams.

LXXXI. *Saccharum Rosatum Tabulatum*, Sugar of Roses Tabulated. Take Red Roses exanguinated, and dried carefully in the Sun an Ounce; double refined Sugar a Pound; melt the Sugar in Red Rose Water, and Juice of the same, of each 2 Ounces; in a gentle Balneo, consume the humidity by degrees, and put in the Rose Leaves in Powder, mix them well, then put it upon a Marble, that it may be made into Lozenges according to Art. These Lozenges comfort the Head, Breast, Lungs, and Liver; stay Vomiting, stop Fluxes, and are good for such as are in Consumptions. Dose from a Dram to 2 Drams, or more Morning, Noon, and Night.

LXXXII. *Electuarium Rosarum Myrsiciti*, Electuary of Roses. Take Conserve of Red Roses Vitriolated a Pound and half; Rob of Barberries, Rob of English Currants, of each a Pound; Syrup of the Juice of Citrons, and of the Juice of unripe Grapes, *Oxyfacccharum*, of each half a Pound; Citron Peels Conditioned, Pulp of Citrons Candied, *Species Diarrhodon abbatiss* sprinkled with Spirit of Vitriol, of each 5 Ounces; Nitre prepared, an Ounce and half: mix and make an Electuary, adding a little strong Cinnamon Water. It cools and moistens the heat of Fevers, allays Thirst, and takes away all preternatural heats whatsoever to a Wonder. It strengthens the Stomach, stops Vomiting, prevails in the Choleric passion, heals a Dysentery, and cures Contagious Diseases. It comforts the more noble Members, as the Heart, Stomach, Liver, Spleen, Reins, and other Viscera, it opens their obstructions, and preserves them from Putrefaction. It stops bleeding at Nose, represses the Vomiting of Cholera, and is profitable against Calentures. Dose from a Dram to half an Ounce, two or three times a Day, or oftener.

LXXXIII. *Aloe Rosata*, Rosed Aloes. Take Aloes Succotrina and clear, which reduce into

Powder, 4 Ounces; Juice of Damask Roses depurated a Pound; mix and digest in the Sun, or in Balneo, till the superfluous moisture is evaporated: repeat this digestion and evaporation four times, and make a Mass for Pills according to Art. It purges Choler and Flegm excellently, cleanses and strengthens both Head and Stomach, frees the Bowels from evil Humors: causes Digestion, excites Appetite, stops Fluxes, and is good against the Yellow Jaundice. Dose from half a Dram to a Dram in the Morning fasting.

LXXXIV. *Powder of Red Roses*. It strengthens the Heart, Stomach, and Liver, fortifies the retentive Faculty, eases pain from a hot Cause, allays Inflammations, induces Rest and Sleep, stops the Whites and Terms in Women, all Fluxes of the Belly, and heals a Gonorrhoea in Men. Dose a Dram, or more, in Syrup of Red Roses, or made up into Pills with Chio Turpentine, to be taken at Night going to Bed. It is (so used) profitable also against Ulcers of the Reins, Ureters, and Bladder.

LXXXV. *Aromaticum Rosatum*, The Rose Aromatick. Take Red Roses exanguinated 15 Drams; Liquorice 7 Drams; Xylolaoes, Yellow Sanders, of each 3 Drams; Cinnamon 5 Drams; Cloves, Mace, of each 2 Drams and half; Gum Arabick, Tragacanth, of each 8 Scruples; Nutmegs, Greater Cardamoms, Galangal, of each 1 Dram; Indian Spicknard, Ambergrise, of each 2 Scruples; Musk 1 Scruple; make a Powder according to Art; which keep in a Glass close stopp'd for use. It is a great Cordial, strengthens the Head, Brain, Nerves, Heart, Stomach, and Womb; makes a good Appetite and strong Digestion, expels Wind powerfully, and prevails against the Cholick, Gripping of the Guts, Epilepsy, Apoplexy and Palsie: it dries up Catarrhs, and restores in Consumptions. Dose from a Scruple to a Dram, Morning and Night.

LXXXVI. *Diarrhodon Abbatiss*, The Abbats Confect of Roses. Take Red Roses exanguinated 12 Drams; of Red and White Sanders, each 2 Drams and half; Ivory, Gum Arabick, Tragacanth, of each 2 Scruples; Asarabacca Roots, Indian Spicknard, Mastick, Cardamoms, Cinnamon, Liquorice, Saffron, Xylolaoes, Cloves, Gallia Muschata, Seeds of Anise and Fennel, Seeds of Basil, of Barberries, of Succory of Purslane, the four greater cold Seeds cleansed, White Poppy Seed, of each a Scruple; Pearls, Bone of a Stags Heart, of each half a Scruple; Camphir 7 Grains; Musk 4 Grains; make all into a Powder according to Art. It is a delicate cooling Cordial Powder, Pectoral and Carminative: It is Stomack, and Stops Fluxes of the Bowels. Dose from half a Dram to a Dram and half.

LXXXVII. *Powder of the Anthere*. The Anthere are the yellow Threads in the middle of the Rose, (which some tho' erroneously, call the Seed.) These Anthere of the Red Rose especially being made into Powder, and drank in the Distilled Water of Quinces, stops the overflowing of the Countess in Women; and is a powerful Remedy against Catarrhs, and other defluxions of Rheum upon the Gums and Teeth, and is said to preserve them from Corruption: and fastens them if they be loose, being mixed with Vinegar of Roses, and the Mouth and Teeth be washed and gargled therewith.

LXXXVIII. *The Powder of Damask and Musk Roses*. Taken to a Dram or Dram and half, in Whey of Goats Milk, it opens the Bowels, and Purges the Belly of Flegm, Choler and Watery Humors, much like as the Syrup does, as Costeus in his Comment upon Mesues says.

LXXXIX.

LXXXIX. *The dried Leaves of Damask and Red Roses.* The dried Leaves of the Damask and Musk Roses serve chiefly for Sweet Bagns. But their Infusion in Clarified Whey, or White Port Wine, gently open and purge the Body, more especially if it is dulcified with Manna, or Syrup of Violets. The Dried Leaves of the Red Roses are used in Decoctions and Infusions, both inwardly and outwardly, as a Cordial, and to cool, bind, strengthen, stop Fluxes of the Bowels, and ease the Cholick.

XC. *The Rose Cake.* If it is moistened with Vinegar of Roses, or with Vinegar of Roses mixt with Rose Water, and cut fit to the place it is to be applied to, It is said to ease the Head-ach, and unquietness thereof, and to procure Rest and Sleep.

XCI. *The Epithem.* Take Damask Rose Leaves, either fresh or dried, moisten them with Vinegar of Roses, after they have been a little beat between a double folded Cloth or Paper in a Frying Pan, or before the Fire, then streu upon them a little Grated Nutmegs and Poppy Seed, on that side which is to ly next the Skin, and apply it to the Fore-head and Temples, and so bind it on all Night, it eases the Head of Pain, and causes Rest, Quietness and Sleep.

XCII. *Oleum Rosaceum Omphacinum, Oil of Roses Omphacine.* Take Red Roses exungulated not yet ripe, and bruised in a Stone Mortar with a Wooden Pestle, 4 Ounces; Oil Omphacine several times washed a Pound: mix, and expose them in a Glass close stopt, to the Sun for a whole Week, shaking them every Day, then boil them gently in Balneo: press them out, and put in fresh Roses, doing in like manner, and repeat a third time, and keep the Oil upon one Pound of Juice of Roses. It cools and strengthens, and eases pain proceeding from a hor Cauce: it stops the Flux of Humors, cools the Head, Stomach, and Joints, and extinguishes an Erysipelas.

XCIII. *Oleum Rosaceum completum, Oil of Roses complet.* It is made in the same manner of sweet and ripe Oil Olive, often washed, and Red Roses fully blown, bruised, and set in the Sun, and gently boiled in Balneo, letting the third Infusion stand in the Sun forty Days, and then to keep the Oil and Roses together without Expression. It is Anodyn, Emollient, and Arthritick, and has the Virtues of the former, but is less cooling and binding.

XCIV. *Unguentum Rosatum, Ointment of Roses.* Take fresh Hogs Lard, cleansed and well washed, a Pound; fresh Red Rose Leaves a Pound; mix and digest 7 Days; then boil with a gentle Fire, and strain out. Repeat the same Work with fresh Roses bruised, for 7 Days more, then boil and strain out as before. At length affuse Juice of Red Roses half a Pint; Oil of Sweet Almonds 2 Ounces; boil them with a gentle Fire to the consumption of the Juice: strain out, and make an Ointment according to Art. It is Anodyn, cooling, and refreshing: it strengthens weak, pained, and wearied Limbs, heals gaulings and frettings of the Skin, angry Pustles, Wheals, Tettars, Ringworms, and clears the Head, and other parts from Scurff, Morpew, and other like Leprous Disilements: having all the Virtues of both the Oils of Roses.

XCV. *The Cataplasm.* It is made of fresh Red Roses beaten to a Pulp, and either boiled soft with Vinegar of Roses, or not boiled, adding Vinegar of Roses, and Powder of the Antheræ, or Powder of Balaustians. This being applied hot to the Throat and Jaws, is good against pains in the Ears, Throat, and Gums: applied to the Fundament, it is good against the Piles, and stops their

excessive Bleeding. Applied to the Region of the Heart, it prevails against its Palpitation, allays Inflammations, cures Ambony's Fire, and is good against most Diseases of the Stomach. Applied to the Joints, it strengthens them, and gives ease in the Gout.

XCVI. *White Rose Water.* It is used as an Ophthalmick, is excellent good to cool Inflamed Eyes, stop the Fluxion of Rheum, and ease their pain. Take white Rose Water a Quart; choise Brandy a Pint; Honey 4 Ounces; Powder of Cochenele half an Ounce; mix, dissolve, digest, and keep the Water upon the Powder for Use. It is truly a most excellent Eye Water.

XCVII. *Aqua Rosarum Rubrarum, Red Rose Water.* It is well known, and of familiar use almost upon all occasions. It is Cooling, Cordial, Anodyn, Refreshing, and Chearing the weak and fainting Spirits, whether used inwardly in Draughts, or Broths, as Barly Broth, Chicken Broth, Veal Broth, &c. or used outwardly to bath with, as the Forehead, Temples, Nostriis, &c. to ease their pain, heat, &c. besides it has all the Virtues of the White Rose Water, being used as an Ophthalmick.

XCVIII. *Aqua Rosarum Damascenarum, Damask or Musk Rose Water.* Take Damask or Musk Rose Leaves, as much as you please, and without bruising put them into a Common Still, and draw off the Water with a gentle Fire without burning, till the Rose Leaves are dry. Or thus, Take whole Damask or Musk Roses, as many as you please (i.e. The Rose Leaves not exungulated) beat them in a Mortar, and in a fit Vessel affuse on them a good quantity of fair Water, which digest together for a Day or two, and then Distill with a good Fire in a Copper Vesica Tinn'd within, as is usual: You will find upon the top of the Water some few Drops of a very Sweet and Odoriferous Oil, called by some Adepts Rosarum, which if you please you may separate from the Water. Or thus, Take Damask or Musk Roses, bruise them as before, and then put them into a Wooden Vessel with a narrow Mouth, laying them Stratum Super stratum with Salt in fine Powder, and so much on top, as may over-top all 3 or 4 Inches, stop the Vessel close with Cork and Pitch, and let it stand in a Cellar for a Month, 2, or 3, then Distill by a Copper Vesica, so will you have a most odoriferous Rose Water, much exceeding all those which are Distilled the common ways. Or thus, Take Damask or Musk Roses, and macerate them in Canary, or White Lisbon, or Madera Wine, for a Week or more, then Distill in a Copper Vesica as before. This is indeed a much shorter way, but far inferior to that of pickling with Salt, because in this you have a mixture of Spirit of Wine, with your Water; whereas, the other is the pure Water alone. It is Cordial, and cheers the Heart and Spirits, and is generally mixt with Cordial Waters and Medicaments, to make them the more acceptable. Cossens in his Commentary upon Mesues, says, that 10 Ounces of Damask Rose Water drank in a Morning Fasting, does open and purge the Belly. If it will do this of its self, it will do it much beter if it be sweetened with Syrup of Violets, or with Syrup of Roses solutive.

XCIX. *Spiritus Rosarum Damascenarum & Muschatarum, Spirit of Damask or Musk Roses.* Take Flowers of Musk or Damask Roses 40 or 50 Pounds, bruise them in a Stone Mortar with a Wooden Pestle, and streu them by degrees with Bay Salt finely Powdered 4 Pounds; put the whole into a large Earthen Jar with a narrow Mouth; croud the Flowers hard in, and stop the Mouth of the Vessel so firmly

firmly with Cork and Pitch, Rosin or melted Wax, that no Air may penetrate it. Set the Vessel so stopp'd, in a Cellar for 6, 8, 10 or 12 Weeks: so will the Flowers when open have a kind of Acid and Wine like Smell, which is a sign of their Fermentation. Take of these Pickled Flowers 6 or 7 Pounds, put them into a Glass Cucurbit, and in Balneo Distil to dryness. Take the Rieces out of the Cucurbit, and put in again 6 or 7 Pounds more of the said Flowers, and the first Distilled Water, and distill in a Sand heat, with a gentle Fire, till the humidity is almost all come over. Then put in new Flowers, pouring upon them the last Distilled Water, and distill again as aforesaid, repeating this Work so long as you have any Flowers. This done, to make a Rectification. Put a small part of the former Water into a Bolt-Head, and in Balneo, with a gentle Fire, draw off about a twelfth part, which keep by it self: put in more of the former Water, and do again as we have just now directed; repeating the same Work, till all the first Distilled Water is rectified. Put all these twelfth parts together, which keep in a Glass Bottle with a Glass Stopple. All the remaining Waters put also together, and continue Rectifications at several Repetitions, till you have all that is Spirituous: the Spirituous Liquor keep in the Bottle with the Glass Stopple: rectify a new in an evaporating Bath, in a Bolt Head having a long Neck, perfectly luted, so will you have an Aetherial Inflammable Spirit, laden with Volatil Salt, which is Spiritus Rosarum, or, Spirit of Roses. The remains of this last Rectification, put to the former remaining Waters after Rectification: so will you have an Excellent Rose Water, much better than any you can draw by any ordinary means, which keep in Glass Bottles close stopp'd. If you keep these Bottles in a Celler a while, new Oil will ascend by degrees to the top of the Water, and swim above it in little flakes almost like Snow, which you may separate according to Art: This is Adeps Rosarum, Fat of Roses. Now if you desire the Oil or Fat, rather than the Spirit, you will sooner have your desire by re-distilling several times the aforesaid Rose Water upon new Roses; for fresh and new Roses yield more Oil or Fat by far, than those which are Pickled or Fermented. Or thus, Take Damask or Musk Roses not exungulated 20 Pounds, beat all in a Stone Mortar, and put them into a large Earthen Jar, so as that a quartar part of it may remain empty: affuse thereon Juice of Damask or Musk Roses a Gallon, mixed with a Pint and half of Ale Test, with a wooden Spatula, stir all well together, and stop all up close with Cork and Wax, digest in warm Horse Dung, or a Sand heat for four or five Days, till the Smell becomes Vinous, then distill in Balneo Vaporis, (the Joins being first well luted.) Be cautious of the heat, that it may be gentle, that only the Spirituous parts may ascend. Continue the Distillation till nearly 5 Pounds and a half of Spirit is drawn off: then take off the Receiver, and rectify the Spirit in a Glass Matras with a long Neck, as is directed towards the end of the former Operation or Process. This Spirit is very odoriferous and grateful to the Smell, inflammable in its Substance, and of very Volatile parts, for which reason it is to be put up into Glass Bottles with Glass Stopples, that it may be kept close. It seems to be only an Oil raised up, and rarified or dilated with its Essential Salt, and therefore the whole Rose without Exungulating is taken, as containing more Oily Parts, and the Yest in the last Process is added to hasten the Fermentation. This Spirit is one of the greatest Cordials in Nature, it fortifies the Stomach and other Viscera, clears the Heart, revives the Spirits Natural, Vital, and Animal, and strengthens

Nature to a Miracle. It is good against Melancholly, Grief, Palpitation of the Heart, Fainting, and Swooning Fits: it comforts the Head, Brain, Nerves, and Womb, and is an Excellent thing against Convulsions, Palsies, Lethargies, and other cold Distempers of the Brain and Nerves. Dose from 20 to 60 Drops or more, in a Glass of Damask Rose Water sweetned with Syrup of Citron Peels; or in a Glass of Choice Canary. Besides all this, it is a most admirable Perfume. It is a true Specifick, to exhilarate the Mind, quicken the Senses, and corroborate all the Faculties.

XCIX. *Oleum Rosarum Chymicum*, Chymical Oil or Fat of Roses. The Noble Oil of Roses is made according to the latter part of the first Process in the former Section. It has all the Virtues of the Exalted Spirit with advantage; for that 1 Drop of the Volatile Essential Oil or Fat, is equivalent, to 40 Drops of the most Subtle and Sublime Spirit; and therefore is never given but from 1 to 2, 4, or 6 Drops. It to be is Drop first into White Sugar, with which it is to be well mixt, and then you may put that mixture, into a Glass of Generous Wine, or any other proper Vehicle, as some Spirituous Cordial Water, and so let the Patient take once, twice, or thrice a Day, as need may require. In the London Dispensatory, the College gives us this way of making this *Oleum*, seu *Pinguedo*, vulgo *Spiritus Rosarum*, Oil, Fat, or Spirit of Roses. Take as many fresh Damask Roses as you will, steep them 24 Hours in a sufficient quantity of warm Water; Press them out; and repeat the Infusion certain times, till the Liquor is sufficiently strong, which distill in an Alembick with its Refrigeratory, or a Copper with its Worm: separate the Spirits from the Water; and keep the Water for another Infusion. This Oil or Fat, is a great Cephalick, Neurotick, and Cordial, cheers and recreates the Animal and Vital Spirits, quickens the Senses, clears the Heart, exhilarates the Mind, expels Melancholly, is wonderful against all Fainting and Swooning Fits, and in a Word, performs whatever any Cordial can do.

C. *Potestates Rosarum*, Powers of Roses. Take of the former Oil or Fat of Roses an Ounce; Volatile Sal Armoniac, Sublimed or Raised from fresh Damask Roses, 4 Drams; rectified Spirit of Wine drawn off also from fresh Damask Roses, and cobobated 3 times, a Quart; mix them, and unite them in a cold Digestion. It has all the Virtues of the Spirituous Water, Sublime Spirit, and Oil in Sect. 97, 98, and 99. aforesaid, and may be given in any proper Vehicle from 50 Drops to 100. It is an extraordinary Neurotick, and a Secrer against Convulsions, and Palsies, but a Medicament fit only for Kings and Princes, and other great Personages, by reason of its great Price.

CI. *Elixir Rosarum*, Elixir of Roses. Take of the Powers of Damask Roses a Quart, Damask or Musk Roses exungulated, and carefully dried, 3 Ounces; Ambergrise 10 Grains; Musk 4 Grains; mix, digest cold, for a Month, shaking of the Glass twice every Day, then decant off the clear Elixir, which keep in a Glass with a Glass Stopple, for Use. This has all the Virtues of the Water, Spirit, Oil, and Powers Exalted; and may be given from 20 to 60 Drops or more in a Glass of Generous Wine, or some other Spirituous Vehicle, 2 or 3 times a Day. It is an exalted Medicament, and beyond my Commendation.

CII. *Sal Rosarum Fixatum*, The Fixed or Elementary Salr of Roses. Take the Remains of all the Distillations at Sect. 97, or 98, aforesaid, which put into a very large Crucible and in a Calcining Furnace reduce them to Ashes, adding in the time of

Calcining fresh Damask Roses, 10 40 times the weight of the Rose Cakes; Calcine to whiteness; and with Distilled Rain Water make a Lixivium, from which educe the Salt according to Art. It is Stomackick, Antiscorbutick, and admirably Diuretick; an excellent thing to dissolve Flegm, and Tartarous mucilage in any part of the Body, whether in the Lungs, Stomach, Liver, Reins, Bladder, Womb, or Joints. I commend it as a Jewel. Dose from 10 Grains, to half a Dram, in Parsly or Hydropiper Water; or in Rhenish, or White Port, or White Lisbon Wine, 2, 3, or 4, times a Day.

III. Quintessentia Rosarum Palidarum, The Quintessence of Damask Roses. Take of Damask or Musk Roses what quantity you please, bruise them, express the Juice, from which draw a Spirit, which rectify; then impregnate it with so much of the Essential Oil, and Fixed Salt of Roses, as the Body of the Spirit will Receive; to which, if you please, you may add a small proportion of Ambergrise and Musk. This Medicine Daniel Horstius Commends to the Skies, in respect of which, the most benign Purges, as Rheubarb, Sena, Cassia, Manna, says he, are a kind of Malign Poison; for this Medicament, is as well as Cathartick, both Cephalick and Cordial; and from its fragrant, and most incomparable Odor and Sweetness, comforts both Heart and Brain. It may safely be given to the least Infant, to Women with Child, and the most delicate of all Persons. It is Dedicated to Kings, Princes, Noble Men, and Great Ladies. It is most powerful in all dejections of the Mind: it cools and comforts the Animal Spirits: it is most prevalent against Swooning Fits, the Epilepsy, Vertigo, Carus, Lethargy, and Suffocation of the Womb. It revives all the Spirits Natural, Vital, and Animal, and is one of the greatest preservatives against the Plague or Pestilence; fortifying the Heart, and defending it against all manner of Poison, Infection, and Peltiferous Atoms. It may be used in all Diseases where Purging is required, for it easily, safely, and pleasantly evacuates all noxious Humors. All other things seem unpleasant, being compared to it, because in its Taste and Odor, it exceeds every other Medicament. Dose is from 2 Drums to half an Ounce or more, in a Glass of Generous Wine, in the Morning Fasting, walking up and down the Chamber after taking it.

CHAP. DCII.

OF ROSE Wild;

OR,

BRIAR -- BUSH.

I. THE Names. It is called in Greek, Ρόδον ἄγριον, ἢ κυνέβητος; in Latine, *Rosa Sylvestris*, *Rosa Canina*; and in English, the Wild Rose, Briar Rose, and Dog Rose, or Canker Rose.

II. The Kinds. These twelve following Species are found with us, either growing Wild, or else Nurst up in our Gardens, but being Wild Plants in their own Native Countries, viz. 1. *Rosa Sylvestris inodora*, *Rosa Canina communis*, Our common Wild Briar Bush. 2. *Rosa Sylvestris Flore odorato carneo*, The Wild blush Briar Rose. 3. *Rosa Sylvestris Russica*, The Mulcovia Briar. 4. *Rosa Sylvestris Virginensis*, The Virginian Briar

Rose. 5. *Rosa Campestris Flore albo odoro*, The Sweet white Briar Rose. 6. *Rosa Sylvestris Austriaca Flore Phœniceo*, The Vermilian Briar Rose of Austria. 7. *Rosa pumila rubra Austriaca*, The Dwarf red Briar Rose of Austria. 8. *Rosa Sylvestris pomifera major*, The greater Apple Briar Rose. 9. *Rosa Sylvestris pomifera minor*, five *Rosa Sylvestris Pimpinella*, The small Apple Briar Rose, or Burnet Briar Rose. 10. *Rosa Sylvestris pumila alba Rosa Campestris humilis alba*, The Dwarf white Briar Rose. 11. *Rosa campestris pumila sine Spina simplex*, The single Dwarf Briar Rose without Thorns. 12. *Rosa semper Virens*, The evergreen Briar Rose.

The Descriptions.

III. The first, or Our common Wild Briar Bush, Has a Root which grows great, and runs far and deep into the Ground. It grows of it self in Hedges very high, with long, straight, upright, woody Stems, covered over with a grayish Bark, especially the older ones, which are set with sharp Thorns or Prickles up to the tops, but not so thick as the Sweet Briar. It has divers Leaves something larger, and

Rose-Bush Wild Common;

OR,

Common Wild Briar.

not so green on the upper side, nor so grayish underneath, as the other, the middle Rib whereof has several small crooked Prickles, and without any Smell at all. The Flowers grow at the tops of the Branches divers set together, of a whitish blush color, made of five round pointed Leaves, something longer than those of the Sweet Briar or Eglantine Rose, and standing in such like Husks as they

they, or other Roses do. After the Flowers are past, come the Fruit or Heps, somewhat long and round, which are first hard of a yellowish red, or of a reddish yellow color, or rather of a bright shining Coral color, which as they grow ripe, the color grows more perfect, and then the Pulp within, becomes perfectly soft and of a pleasing acid Taste. Within that soft Pulp is a Kind of hairy Down, within which the Seed is enclosed. Upon this Wild Rose Bush or Briar, as well upon the Eglantine Bush, there sometimes grows *Spongiola Plinij*, a Spongy Burr or Ball of Threads composed of many little roundish hollow Cells, each one of which, has for the most part a live Worm or Maggot in it.

IV. The second, or Wild bluish Briar Rose. This is so like to the former, that it is scarcely to be discerned from it, either for the height of the Stem, or great store of Prickles, or smallness of the Leaves, but only by the Flowers, which are something larger, and of a deeper bluish, or pale purple color, and something sweeter withall.

V. The third, or *Muscovia* Briar Rose. This Wild Briar has several reddish yellow Stalks rising from its Root, spotted or rather bunched out as it were with Blisters in several places, with Prickles thereon like the first Common Briar or Wild Rose. The Leaves are not many, but small like the Common Wild Hedge Briar, or rather smaller, and turning red in Summer. The Roses are single and small, of a deep incarnate color.

VI. The fourth, or Virginia Briar Rose. It has several as large Stems and Branches as any other Wild Rose, whose young ones are green, and the elder grayish, set with many small Prickles, and a few great ones among them. The Leaves are very green, and shining, small, and almost round, many set on a middle Rib, one against another, something like unto the Single yellow Rose. The Flowers grow at the tops of the Branches, consisting of five small Leaves of a pale purple, or deep incarnate color, like unto those of the Sweet Briar, which fall away quickly, as they and others do.

VII. The fifth, or Sweet white Briar Rose. It has woody Stems, about three Feet high, set as thick with sharp Prickles, as either the Common Wild Briar or Eglantine is: and set with like Winged Leaves, but not so green. At the tops of whose green Branches stand usually but one Flower apiece, consisting of five white Leaves, reasonable large, and of a sweet Smell, with several yellow Threads in the middle. These being past away, the Heps (such as in the former) come in their places, saving that these are black when they are ripe, and not yellow, containing within them a Kind of Hairy Down, in which the Seed is enclosed.

VIII. The sixth, or the Vermilian Briar Rose of Austria. The younger Branches of this Rose Bush are slender and reddish, the elder of a brownish gray, set with several Prickles, but not very thick, great or sharp. The Leaves are something larger than those of the Single yellow Rose, else not much unlike. The Flowers are single, as large as those of the Yellow Rose, of which this is thought to be a Species, but differing in color, this being of an excellent Orange tawney color, with an Eye of Vermillion cast over it, and of a paler yellow on the out side, after which (being past away) the Fruit succeeds.

IX. The seventh, or Dwarf red Briar Rose of Austria. It grows scarcely two Feet high, with slender green Stems, set with few or no Thorns below, but repeat up higher with many, having whitish green Leaves upon them like the Common red Rose, and grayish underneath, five or seven set together upon a Stalk. At the tops of the Branches, come forth very great bearded Husks, wherein are contain-

ed the Flowers or Roses, which are large, and consisting of five Leaves apiece, something sweet, red at the first, but when decayed with standing, growing much more pale, before they fall away, with yellow Threads in the middle. After the Flowers the Fruit or Heps succeed, which are red as the others, but greater than any of the former, and made more in the fashion of a Pear, than any of them.

X. The eighth, or The greater Apple Briar Rose. Its Stock or Stem is great, covered with a darkish gray Bark, but the younger Branches are something reddish, armed here and there with great and sharp Prickles, but nothing so great or plentiful as in the Eglantine, altho it be a Wild Kind. The Leaves are of a whitish green color, almost like unto the first White Rose, and five always set together, seldom seven. The Flowers are small and single, consisting of five Leaves, without any Smell, or very little; and but a little bigger than those of the Sweet Briar Bush, and of the very same deep bluish color, everyone of them standing upon a rough or prickly button, Bearded in the manner of other Roses, which when the Flowers are fallen, grow great, somewhat long and round, Peat fashioned, bearing the Beards on their tops, and being full ripe are red, keeping the small Prickles still on them, with a soft Pulp, in which is contained many white hard and roundish Seeds, like unto those of the Eglantine Heps. The whole Plant consists more in the graceful appearance of those Apples or red Fruit, hanging on the Branches, than in the Flowers, or any other parts thereof, for the beauty of which, it has been brought into Gardens.

XI. The ninth, or Small Apple Briar Rose, or Burnet Briar Rose. This small Rose seldom rises above a Foot high, being of two sorts, whereof the one has but few Prickles on its Stalks, and the other full of small Prickles (both which are oftentimes found in one Ground, but the very prickly, the more frequent) set with long winged Stalks of Leaves, being many small round greenish Leaves set one against another upon a middle Rib, finely dented about the edges, seeming much like to a Burnet Leaf, for the form and number set together, from whence came one of its Names. The Flowers are single, small and white, without Smell, after which come small round Heads, which are black when they are full ripe, and full of Seed, as in the Heps of other Roses.

XII. The tenth, or Dwarf white Briar Rose. Its Root creeps more than the rest, and it is one of the smallest Roses, scarcely rising a Foot high, being set with small Prickles, and with Leaves also, according to the proportion of the Plant, and the wildness of the Kind. The Flowers are white and small, giving Heps, or Fruit and Seed, like the rest.

XIII. The eleventh, or Single dwarf Briar Rose without Prickles. It grows very low, even almost upon the Ground, with green Stalks without any Prickles on them, and set with small winged Leaves, so small that they scarce seem to be Leaves of a Rose. The Flower is small, single, and of a pale reddish color, very sweet in some Soils, and as it were without Scent in others, and flowering in some places both in the Spring and Autumn.

XIV. The twelfth, or Ever-green Briar Rose. It is a Bush very like to the Wild single Eglantine, as having many very long green Branches, but more slender and weak, so that many times they bend down again, not being able to sustain themselves without some help, and armed with hooked Prickles, as other Roses be. The winged Leaves consist of seven smaller Leaves for the most part, of which some two, which are lowest and opposite, are smallest, the next two bigger than they, the highest couple bigger than any of the former, and the end

Leaf largest of all. This proportion it generally holds in every winged Leaf through the whole Plant, which at the first coming forth are something reddish, with the young Branch which shoots out with them; but being full grown, are of a deep green color, somewhat shining withall, and dented about the edges, which fall not away from the Branches, as other Rose Leaves do, but abide thereon, for the most part all the Winter. The Flowers grow four or five together at the tops of the Branches, being single, consisting of five Leaves apiece, of a pure white color, much larger than the ordinary Musk Rose, and of a pleasing Smell, having many yellow Chives or Threads in the middle.

XV. The Places. The two first grow in the Hedges almost every where throughout all England, but the second not so frequent as the first. The third came from Muscovy, where it is a Native. The fourth from Virginia. The fifth from Germany, where it grows Wild in many places. The sixth and seventh was brought to us out of Austria. The eighth grows, (tho' a Wild Plant in other Countries) with us only in Gardens. The ninth is found growing in many Barren and Heathy Grounds by Woods and Hedge sides, in many parts of this Kingdom. The twelfth, as also the third, fourth, fifth, sixth and seventh, (tho' growing Wild in their Native places) yet are Inhabitants with us only in our Gardens.

XVI. The Times. Some of these Roses appear earlier than others, but generally from the end of May to the middle of August, and sometimes longer, according as the Seasons may prove favourable.

XVII. As to their Qualities, Specification, Preparations and Virtues of these Wild Roses, they are much the same with those of Red Roses in the former Chapter, tho' indeed they are seldom or never used in Physick: however there are some other parts of the Wild Rose Bush, whose particular Virtues Authors have taken some notice of, viz.

XVIII. The Preparations. 1. A Decolion or Infusion of the Root of the Common Wild Briar. 2. A Pulp, or Conserve of the ripe Heps of the same. 3. A Powder made of the same Pulp. 4. A Powder of the Briar Balls.

The Virtues.

XIX. The Decolion or Infusion of the Root in Wine. The Bark of the Root is to be shaved or scraped very thin, or finely, whilst fresh and green; and then to be infused or Decolied in Wine 3 or 4 Ounces of it to a Quart. Pliny Lib. 8. Cap. 4. says, that it is good to cure the Biting of a Mad Dog; I suppose inwardly taken for some time, and also to be outwardly applied.

XX. The Pulp of the ripe Heps. The Pulp is generally used whilst it is fresh: but if it is done for keeping, it must be made into a Conserve with Sugar. It is most pleasant and delectable to the Taste, helps Digestion, stops Catarrhs, Spitting and Vomiting of Blood, and gently Binds the Belly.

XXI. The Powder of the Pulp. It is made of the Insipillate Pulp of the ripe Heps. Taken in Cryptick Red Wine, it is good against a Diabetes; stops all Fluxes of Blood whether upwards or downwards; all Fluxes of Bowels, as also the overflowing of the Terms, and the Whites in Women. Dose from 1 to 2 Drams.

XXII. The Powder of the Briar Balls. Being Drank in White Port Wine, or in Mead, or rather

in the Infusion of Lignum Nephriticum, it powerfully provokes Urine, expels the Stone, Sand, Gravel, and Tartarous matter out of the Reins and Bladder, and gives ease in the Strangury and Colick; it also kills Worms in the Belly and drives them forth. Dose from half a Dram to a Dram and half. The Balls are first to be well dried in an Oven, and then the whole, viz. Worms or Miggots and all which are within them, are to be reduced to a Powder by beating in a Mortar.

C H A P. DCIII.

of ROSMARY.

I. THE Names. It is called in Arabick, *Elkia gaber*: in Greek, *Λιβανός στεφανώτης*, *Libanotis Stephanomatike*: in Latine, *Libanotis Stephanomatiæ*, or *Coronaria*, which Epithite is added to the *Libanotis*, to distinguish it from the other *Libanotis* which are Umbelliferous Plants: it is also called *Rosmarinus*, and *Rosmarinum*: in English, *Rosmary*.

II. The Kinds. Formerly there was but one Species known, but now there are more, as, 1. *Libanotis Coronaria* (because it is used in Garlands) *Rosmarinum Vulgare*, Our common Rosmary. *Dalechampsius* on Pliny, takes it to be the *Cassa nigra* Theophrasti: and *Anguillaria*, will have it to be the *Cassa Higini*, acceptable to Bees, and therefore Sown near their Hives. Gesner in *Hortis*, calls it *Rosmarinus minor*. 2. *Rosmarinum striatum*, *five aureum*, Gilded Rosmary. 3. *Rosmarinum latifolium*; *Rosmarinus major* Cordi; *Rosmarinus alter* Gesneri. Broad Leav'd Rosmary. To these you may add, 4. *Rosmarinum Sylvestre nostras*, our Wild Rosmary.

The Descriptions.

III. The first, or Our common Rosmary, has a long woody Root, spread out into many Arms or Branches, with a great number of Fibres adjoining to them, of a brownish color on the out side. It springs up with a woody Stem, of close, firm, compact Substance, and whitish, which in time grows up to a great height. It has been well observed to grow in divers places of our own Land (as well as in Spain and other Foreign Countries, where it is a Native) to grow to the Body of a Tree of a considerable magnitude, fit to make Instruments of, being cut into long thin Boards for that purpose. I saw 6 such large bodied Rosmary Trees, when I was a Boy, of about 8 Inches or more Diameter, and above 2 Feet round in the Body, which was straight, and about 7 or 8 Feet high, with fair, large and ample Heads, with their Arms and Branches, in proportion to those Bodies, these grew in the Garden of one Mrs. Wormal, in Kings-Lyn, Norfolk, Living in the Street near to the South Gate. However in those Plants, which grow not to such a prodigious Magnitude, the Stem is great and woody, of a close and fine Grain, branching it self forth into several Arms, and from them again into many other smaller Branches, and those again into a vast number of yet smaller and slender Boughs: at the Joins whereof are set at several distances, many long and very narrow Leaves, green above, and grayish underneath.

neath, and with them all along the Stalks, towards the tops, many small gaping Flowers, of a pale bleak bluish color, standing in whitish Husks; the Seed is small and reddish, which being Sown with us will grow admirable well, and thrive afterwards, if care

Rosmary Common.

be taken of it the first Winter after it is Sown, and until it is grown up to some considerable bigness and strength. I have Sown whole Beds with the Seed, which has come up like an ordinary Herb, and being Transplanted and kept in order, has in time come to the common or ordinary Stature and Magnitude of Rosmary; but I am apt to believe, it might be kept to be a Dwarf Plant like to our Dwarf Box. But our usual way of encreasing the Plant here in England, is by slipping it, and setting those Slips, I seldom ever found them to fail growing. The whole Plant, especially when in its Flowering time, is of a pleasing, subtil, sharp, and volatile Smell, and exceeding sweet.

IV. The second, or Gilded Rosmary. This in its Roots, Woodiness, Body or Stem, Arms, Branches, Leaves, Flowers, and Seed, magnitude, manner and form of growing, differs not at all from the former, but only in the color of the Leaves, which in this are edged or striped, or pointed, with a fair Gold yellow color, which so continues all the Year throughout, yet fresher in Summer than in Winter.

V. The third, or Broad Leav'd Rosmary. This also grows like the former, and tho' it grows very large in its Leaves, with us here in England, yet it groves not so great, nor with such woody Branches, as it does in Spain, Italy, and other hot Countries, where it is a Native, and withall, with us, it is more tender to be kept. The Leaves are larger, and of a more deep shining green color on the upper side, and little or nothing whitish underneath, more thinly also, or sparsely set on the Stalks; but its Flowers and Seed are altogether the same in form, magnitude, and color, with the two former.

VI. The fourth, or Our Wild Rosmary. This

Our North-Country Plant, grows not to be so high as the former, and has smaller Leaves, nothing so great and long as Rosmary Leaves, but thicker and shorter; of a dark green shining color above, and of somewhat a yellowish green underneath, which grow very sparsely on very slender and pliant blackish green Twigs, at the tops of which grow the Flowers, not out of Scaly Heads but of a reddish color; the whole Plant is either scentless, or the Smell is so small that it is scarcely to be perceived.

VII. The Places. The first three are Natives of Spain, Italy, France, Greece, Asia, and other hot Southern Climates; and are now also become Natives with us here in England, and grow also admirably well in our Plantations in the West Indies, where they come to a greater Perfection than they do with us in our more Northern Climate. They grow also in Germany, Denmark, and other Northern Countries, but will not live or abide, in many of those Northern places, unless Housted in Winter, and kept in Stoves. The fourth grows in England, in several places of Lancashire and Yorkshire, and other parts bordering upon them, from whence it has been brought, and introduced into some Gardens more for its novelty, than for any special use it has. The Gilded or Silvered Rosmary, ought to be Planted in the most Sunny parts of the Garden, for the more they are exposed to the Sun, the better they will be Striped or Marked, and the more Florid they will grow.

VIII. The Times. The three first Flower sometimes in April, but always in May; and sometimes again in August: and the Seed is ripe not long after. They are encreased also by setting the Slips in March, and afterwards again, in the end of August. The Wild Rosmary, Flowers in June and July. Gerard says, that it was found by Mr. Hesketh in a Field called Little Reed among Hurtle Berries, near to a small Village called Maudsley in Lancashire, and that it is called by Cordus, Chamepeuce.

IX. The Qualities. The last or fourth is scarcely ever used in Physick: the first three have all of them, the same Qualities, Virtues, and Operations, and are said by Authors to be hot and dry in the third Degree: Anodyn, Aperitive, Attractive, Carminative, Cosmetick, Digestive, Diffusive, Cephalick, Neurotick, Stomackick, Pectoral, Cordial, Hysterick, Arthritick, Emmenagogick, Sudorifick, and Alexipharmick.

X. The Specification. It prevails against the Head-ach and Megrim, from a cold cause, the Vertigo, Lethargy, Epilepsy, Apoplexy, Palsy, Convulsions, Catarrhs, Drowiness, Dullness of the Senses, Loss of Memory, coldness of the Stomach, stinking Breath, Wind, in the Stomach and Bowels, Dimness of the Sight, Jaundice, Obstructions of the Terms, Gout from a cold cause, all external pains and aches from a cold and moist cause, Lameness, Numbedness, Weakness of the Joints; and in Contagious times, prevails even against the Plague it self and all Contagious and Infectious Diseases.

XI. The Preparations. You may make therefrom, 1. A Juice or Essence of the Leaves and Flowers. 2. A Decoction or Infusion of the Leaves and Flowers. 3. A Pouder of the Leaves and Flowers. 4. A Conserve of the Flowers. 5. An Insolated Oil of the Leaves and Flowers. 6. A Smoak or Fume. 7. A Tincture of Leaves and Flowers. 8. A Distilled Water. 9. Hungary Water. 10. A Cymical Oil. 11. Potestates or Powers. 12. A Spirit. 13. An Elixir.

The Virtues.

XII. *The Juice or Essence.* They Warm, heat and comfort the Stomach, helping all cold Diseases thereof, as also of the Head, Lungs, Liver, Spleen, and Belly: they are good against all cold Diseases of the Head, Brain, Nerves and Womb, as Vertigo, Dullness, Drowiness, Lethargy, Carus, Stupidness of the Senses, loss or hurt of the Memory, Dumb Palsie, or loss of Speech, Falling-sickness, Palsie of the Head and extrem parts, Convulsions, coldness and weakness of the Womb, Whites, and other Distempers of those Parts. Dose one Spoonful more or less, Morning and Night in a Glass of Wine.

XIII. *The Decoction or Infusion.* These have the Virtues of the former if made in Milk, Whey, or Wine, but nothing near so powerful, and therefore may be taken in four, five, or six times the quantity. They are comfortable to the Stomach in all cold griefs thereof, quicken the Senses, and are good against Loathing and Vomiting, Coughs, Colds, Wheezing, shortness of Breath, Asthma, and expel Wind out of the Stomach and Bowels, Hypochondriack Melancholy, and ease passions of the Spleen. They are good for such as are Liver grown, and open the obstructions there of, by warming its coldness, extenuating the grossness of Humors afflicting it, and withal strengthening it: They are said also to cure the Yellow Jaundice.

XIV. *The Powder of the Leaves and Flowers.* It has all the Virtues of the Juice, Essence, Decoction and Infusion, but exerts nor its Power or Effects so soon as they do. It may be given to a Dram every Morning Fasting, and last at Night going to Bed, either mixed with a little Honey, or some proper Syrup, as Syrup of Citron Peels, or in a Glass of Wine, or some other proper Vehicle.

XV. *The Conserve of the Flowers.* It is an excellent Cephalick, and Stomackick, and has all the Virtues of the Powder, and may be given to 2 or 3 Drams, Morning and Evening, Drinking after it, a Glass of Generous White Port, or Lisbon Wine, or Canary.

XVI. *The Insolated Oil of the Leaves and Flowers.* It may be made the common way by Infusion or Decoction: but Parkinson teacheth us to make it after this manner. Take what quantity you will of the Flowers, and put them into a strong Glass, which stop close, and digest in hot Horse Dung for 14 Days, which then being taken forth of the Dung and unstopped, tie a fine Linnen Cloth over the Mouth of the Glass, and turn the said Mouth into the Mouth of another strong Glass, which being set in the Sun, an Oil will distil down into the lower Glass, which is to be kept and preserved as a precious thing for many Uses both inward and outward. It is good for the cure of all the Diseases before spoken of, and may be given from 8 to 16 Drops first dropt into Sugar, and then mixt with a Glass of choice Wine, or any other fit Vehicle, and so to be taken Morning and Evening. It has been found by experience to clear a dim Sight, to cure the Palsie and Lethargy, and to take away Spots, Marks, and Scars of the Skin.

XVII. *The Smoak or Fume.* The dried Leaves shred small, and taken in a Pipe, like as Tobacco is taken, is profitable for such as are troubled with Cararrhs, or Distillations of Rheum, or Vehement Coughs, Asthma's, Consumptions, &c. for it warms and comforts the parts, dries up the thin Rheum, which causes those Diseases, and helps to restore the weakened and decayed parts.

XVIII. *The Tincture of the Leaves and Flowers.* It has all the Virtues of the Essence and Infusion, and may be given in a Glass of Wine, or other fit Vehicle, from half a Spoonful to a Spoonful Morning, Noon and Night. It is also an excellent thing to bath withall, any pained, weak, cold, benumbed, trembling, or Paralytick Member; and is profitable against a cold Gout, being applyed to the part, and in an especial manner to be taken inwardly, if it be found to have seiz'd the Stomach, and to make approaches thereto.

XIX. *The Distilled Water.* It is good against sickness and pain at Stomach, and clears the Eye Sight, the Eyes being oftentimes in the Day time washed therewith. You may therewith make an excellent Eye Water, after this manner. Take Water distilled from Rosemary Leaves and Flowers a Quart, Common Spirit of Wine a Pint and half, Clarified Honey 4 Ounces, Madder Roots 6 Ounces very well bruised, Alum half an Ounce; mix and infuse in a cold Digestion close stop for a Month, shaking the Glass every Day; then being perfectly settled and fine, Decant the clear Water, and keep it for Use.

XX. *Agua Hungarica, The Hungarian Water.* Take Rosemary Flowers gathered a little after the rising of the Sun a Pound, put them into a double Vessel and assise on them a Pint and half of Alcohol'd or Tartariz'd Spirit of Wine, lute exactly the Joints, digest in a gentle heat for 3 Days, then distil with a Copper Vefica or Alembick Tind within, in Balneo to driness, so have you in the Receiver a subtil Liqueur, which is, the Queen of Hungaries Water. It prevails against all cold and moist Diseases of the Head, Brain, Nerves, Stomach, Heart, Lungs, Spleen, Womb, and other Viscera; as Apoplexies, Epilepsies, Convulsions, Cramps, Numbness, Palsies, Tremblings, weakness of the Nerves and Joints, Head-ach, Megrim, Vertigo, Carus, Lethargy, Sleepiness, and dimness of Sight. It comforts the Head and Brain, refreshes the Senses, cheers the Heart, resists Poison, and revives all the Spirits Natural, Vital, and Animal. It is good against Palpitation, Fainting, and Swooning Fits, Sickness at Heart and Stomach, stinking Breath, Indigestion, want of Appetite, and other defects of those parts. It opens obstructions of Liver, Spleen, and Womb, and is an excellent thing against the Jaundice. It is good against the most vehement Catarrhs, cold Rheums, windy Gouts, Rheumatism, old Aches and Pains in any part of the Body, especially those of the Back and Loins. It is famous against Gripping of the Guts, the Colick, Wind and sharp or acrimonious Humors in the Stomach and Bowels. It provokes Urine and the Terms, and facilitates both Birth and After-birth. It warms, comforts, and strengthens all parts weakened by cold and moisture, hard Labor, or overstraining, or that have been hurt by any Fall, Bruise or Wound. It causes Watchfulness, and takes away Drowiness, strengthens the Nerves powerfully, and is said to be a Specifick in After-Pains, the Palsie, Cramp, and other like Infirmities. It preserves Health, and keeps back Old Age, making those who take it, to look always young. It is good against the bitings of Mad-Dogs, Serpents, or Vipers, or other Venomous Creatures, and is an absolute Antidote against the Malignity of the Plague, or any Malign and Pestilential Fever, being an excellent preservative in all Infectious Times and Places. It is prevalent against the Pleurisy, for it attenuates thick Humors, digests Crudities, opens Obstructions, dissolves Congelations, and provokes Sweating. And being given in a large Dose about 2 Hours before the coming of the Fit of an Ague, it has been often found to Cure it. It takes

takes away by long using it, all manner of Pimples, Scurf, Morpew, Sunburnings, or any other discolorings of the Skin, as also Scurvy Spots, Herpes, and other breakings out, by bathing the Skin therewith. It is not harmful as other Washes are, which are made of *Mercury*, but it makes the Skin so incomparably pure and clear, and so frees it from all its Deformities and Defects, that it is not much inferior to any other *Cosmetick* whatsoever. Dose is from 50 to 80 drops, more or less, 2 or 3 times a Day or oftener, in a Glass of Generous Wine, Sack Whey, Posset Drink, Ale, Beer, or other Liquors which the Sick drinks, continuing its use for some Weeks, or Months, as you see occasion. Outwardly bath the parts pained or hurt, therewith twice a Day, Morning and Evening, and continue it for 10, 15, or 20 Days or more, if need requires.

XXI. *The Chymical Oil.* It is drawn from the Leaves and Flowers, as you draw the *Chymical Oil* of *Lavender*, *Sage*, *Savin*, &c. thus, Take of dried *Rosmary* Leaves, Flowers and Tops 2 Pounds; Spring Water 15 Quarts: digest them 24 Hours, and distill in a great Alembick with its Refrigeratory; or a Copper one with its Worm running through cold Water; so have you Water and Oil, which you may part by the help of a Funnel, or separating Glass; the separated Water may serve for a New Distillation, which then will yield the more Oil; you may take 2 or 3 of the first Pints of Water, to keep for *Rosmary* Water. The Oil may be drawn out of the *Rosmary* fresh gathered. It strengthens the Brain and Memory, fortifies the Heart, resists Poison, and cures all sorts of Agues. It is absolutely the greatest strengthener of the Sight, and restorer of it also, if lost, of any thing in the World, it makes the Heart merry, and takes away all foolish Fancies from the Brain. It eases the Tooth-ach, and all pains from a cold Cause, and removes the causes hindring Conception, and has indeed not only all the Virtues of the *Hungarian Water* beforegoing, but also of the *Potestates* or *Powers* following. Dose a gut. 4 ad 10 dropt into Sugar, and to be taken in any proper Vehicle, as you take other Oils.

XXII. *Spiritus Rosmarini*, Spirit of *Rosmary*. It is good against all cold Diseases of the Head, Brain, Nerves, Joints, Stomach and Womb, prevails against Rheumatisms, cold Gouts, and pains of the Head arising from Flegm, or any cold Cause. It is good against the Vertigo, and Lethargy, strengthens the Memory and Eye Sight, helps Deafness, and stifles Noises in the Ears. It opens obstructions of the *Viscera*, revives and preserves the Natural heat, and restores the Functions of all the parts of the Body. Dose from 1 to 2 Drams or more, Morning and Evening in any Cordial Water.

XXIII. *Potestates Rosmarini*, Powers of *Rosmary*. They are made in all respects of the Leaves, Flowers and Tops, as are the Powers of *Lavender*; uniting the perfectly destegmated Spirit of *Rosmary* with its Volatile Oil before Named, and Salt, by Digestion, Circulation, and a repeated Distillation. Where Note, The greatest part of the Volatile Salt rises, and mixes with the Spirit and Oil by Distillation; nor is there the tenth part of the Fixt Salt left in the Feces, which after Calcination may be drawn forth, as you do Salt of Tartar. And that remaining part after putrefaction of the Feces may, by many Cohobations of the Spirit be wholly drawn forth, and made to ascend, without any Calcination at all. This is evident, for that after Incineration, they will yield no Fixt Salt of any Kind, without very much Labor; and then it will be a quantity very inconsiderable, not being the twentieth part of what might have otherwise been extracted. This is a Medicine

of wonderful Virtues, nor do I know how to praise it enough, my perpetual use thereof, has given me large satisfaction, as to its Excellency, which is indeed above the Force or any ordinary Remedy. It prevails against all cold and moist Diseases of the Head, Brain, Nerves, Stomach, Heart, Womb, and other *Viscera*, as Apoplexies, Epilepsies, Convulsions, Cramps, Palsies, Tremblings, Numbness, and other Diseases of those parts: and indeed it has all the Virtues of the Spirit, Oil, and *Hungarian Water*, but in a ten times more exalted Degree. Dose from 30 to 60 Drops, Morning and Night in Wine, or some Cordial Water.

XXIV. *Elixir Rosmarini*, Elixir of *Rosmary*. This has all the Virtues of the *Potestates*, Spirit, Oil, and *Hungary Water*, Elixirated, or yet more Exalted, even to the highest Sublimity; and may be taken Morning and Night, or oftner if need requires, from 20 to 50 Drops in Wine, or some other proper Vehicle.

CHAP. DCIV.

Of RUE Garden and Wild.

OR,

HERB -- GRACE.

I. **T**HE Names. It is called in *Arabic*; *Sadel*: in *Greek*, *Ῥίγανον*, *Peganum*, quia candidate, semen genitale coagmentat: in *Latine*, *Ruta*: and in *English*, *Rue*, and *Herb-Grace*.

II. *The Kinds*. There are many Plants called by the Name of *Rue*, with certain Epithites, which are not *Rue*, nor any of the Kindred thereof. Those which we shall take notice of in this Work, are only these following, viz. I. *Ruta Hortensis*, Garden *Rue*. II. *Ruta Sylvestris*, Wild *Rue*, of both which we shall treat in this Chapter. III. *Ruta Pratenfis*, Meadow *Rue*, of which in Chap. 605. IV. *Ruta Capraria*, *Galga*, Goats *Rue*, of which in Chap. 606 following.

III. *The Kinds of the Garden and Wild sorts*. Of the Garden Kinds there are three Species, viz. 1. *Ruta Hortensis major*, *Ruta Communis*, *Ruta Sativa*, *Ruta Domestica*, *Ruta Latifolia*, vel *major*, Our common Garden *Rue*. 2. *Ruta Deaurata*, Gilded *Rue*. 3. *Ruta Hortensis minor* *Tragi*; *Ruta Sativa minor*, & *Ruta tenuifolia* *Cordi*; *Ruta grave Olens* *Dodonai*, The lesser Garden *Rue*. Of the Wild Sort, there are also these Kinds Nurst up in our Gardens, viz. 4. *Ruta Sylvestris major* *Muthioli*, *Lobelii*, *Lugdunensis*, *aliorumque*, The greater Wild *Rue*. 5. *Ruta Sylvestris minor*, *Rutula Lobelii*; *Peganum Sylvestre*; *Ruta Sylvestris Secunda* *Dodonai*, The smaller Wild *Rue*. 6. *Harmala*, *Basafan*, *Ruta Sylvestris Syriaca*, Wild *Asyrian Rue*.

The Descriptions.

IV. *The first*, or Our Common Garden *Rue*. It has a Root which is white and woody, spreading far about in the Ground, and abiding many Years. It grows up with hard woody Stalks, Branching forth on all sides, and bearing thereon several long Leaves,

Rue Garden.

Leaves, divided into other small ones, being somewhat thick and round pointed, of a dark bluish green color. The Flowers which grow at the tops, consist of 4 small Leaves which are yellow, with a green Button in the midst, compassed about with several small yellow Threads, which growing ripe, contains within it small black Seed.

V. Gerard gives us a more ample Description of it in these Words. Its Root is woody, and fastned with many Strings: and is a Shrub full of Branches, now and then a Yard high, or higher. The Stalks whereof are covered with a whitish Bark, but the Branches with a more green. The Leaves hereof consist of divers parts, and divided into Wings, about which are certain little ones, of an odd number, something broad, more long than round, smooth, and somewhat fat of a gray color, or greenish blew. The Flowers in the tops of the Branches, are of a pale yellow, consisting of four little Leaves, something hollow: in the middle of which stands up a little Head or Button four square, seldom five square, containing as many little Cells, as it has corners, being compassed about with little yellow Threads, in which little Cells the Seed is contained. The Leaf is of a very strong and rank Smell, and has a biting Taste.

VI. The second, or Gilded Rue. This in its Roots, Stalks, Branches, form of the Leaves, Flowers, Seed, Magnitude, and manner of growing, is exactly the same with the former, saving only in the color of the Leaves, which are most of them gilded on the edges, or at the ends; some of them are wholly green, some wholly gilded or of a yellow color, and some of them part green, part gilded, either on the edges or ends, or both, as before expressed.

VII. The third, or Lesser Garden Rue. Its Root is white, woody, and stringy, spreading it self abroad under the Earth, like the first sort. This whole Plant is so like to the Ordinary or Great

Garden Kind, that if not heedfully minded, it may easily deceive the beholder. It rises up not so high, nor has it so great a Stalk: The Leaves are very like to the Greater Garden Kind, but that they are smaller, and of a blacker or darker green color. This more seldom gives any flowers with us, nor is the Smell thereof so strong, nor the Taste altogether so bitter, as the other, and in these things consist the chief differences. Some are of Opinion that this Plant is the first or greater sort of Wild Rue, described in the next Section, Transplanted and Manured in Gardens.

VIII. The fourth, or Greater Wild Rue. This is in all things like unto the Garden Rue, but that the Leaves are somewhat longer and narrower, and

Rue Wild.

their color darker, more tending to green. The Stalk is strong and woody in its Native places of growth, much more than it is in these colder Climates, but rises not fully so high, as our Garden Kind does; and with us, it scarcely attains to any woodiness. The Flowers are also yellow, composed of 4 yellow Leaves like unto it, having within them four square Heads (sometimes but three cornered) in whose Cells is contained the Seed like that of the Garden. The Leaves and whole Plant are of a more strong and virulent Smell than our Common Garden Kind.

IX. The fifth, or Smaller Wild Rue. Its Root is long and woody, and the Plant is small, yet like unto the former, saving that the Leaves hereof are much more finely cut than it, both shorter and smaller; but the Smell is as strong, or rather stronger than the other; as also its Taste and Qualities. The Stalk hereof, rises not so high as the last described above, but Branches it self out at the top, bearing small yellowish Flowers, having four square Heads with Cells therein, like the others, in which is contained small Seed.

X. The sixth, or Wild Assyrian Rue. Its Root is thick and something yellowish, with several small fibres

Fibres adjoining to it. It rises up with many dark round green Stalks, about a Foot or more high, on which are set divers long Leaves, divided into many parts, each of which is longer, thicker and greener than the former Small Wild Rue, but not of so strong or virulent a Smell and Taste, yet somewhat strong, and a little sharp and bitter. At the tops of the Stalks grow many Flowers, consisting of five white Leaves, larger than in any of the other sorts of Rue. In the middle whereof rises up a green triangular Head, compassed about with many yellow Threads: in the Cells of which is contained small brownish cornered Seed.

XI. *The Places.* The first three grow only in Gardens. The fourth and fifth are Wild Plants, and grow upon the Mountains of Spain and Italy. The sixth grows in Syria, from whence it has been brought into our Northern Climates, as also about the Hedges near to Constantinople, as Bellonius says, in his *Observations*, Lib. 3. Chap. 5. But all these three Wild Kinds grow with us only in Gardens, where they are Planted and Nurst up with much care.

XII. *The Times.* The two first Flower with us in July and August, but in hot Countries earlier. The third, as also the 3 Wild sorts, scarcely ever bear good Seed here.

XIII. *The Qualities.* The Garden Rue is hot and dry in the end of the third Degree, and the Wild Rue's are hot and dry in the fourth Degree. They are all of them of Thin and Subtil Parts; Aperitive, vehemently Attractive, Cosmetick, Carminative, Digestive, Discussive, Diuretick, Cephalick, Neurotick, Splenetick, Nephritick, Hyfsetick, Parmick, Emmenagogick, Sudorifick and Alexipharmick. The Wild Kinds are so vehemently hot that they may be accounted almost amongst the Number of *Pyreticks*, being apt to raise Blisters, Wheals and other Accidents, for which reason they are seldom used in Meat or Medicine: Their violence is indeed scarcely tolerable, except for outward Grievs and Applications, for the Epilepsy, Palsie, Gout, Sciatica, Rheumatism, and the like, in all which Diseases they are more Powerful than the Garden Kinds: and if they should be taken inwardly by Women with Child, they would destroy the Birth, for which reason especially they ought to be avoided.

XIV. *The Specification.* The Garden Kinds provoke Urine and the Courses, bring away the Birth, and After-Birth, are Antidotes against Plague and Poison, destroy the Seed, and cause Barrenness, are good against Pains and Stitches of the Sides, the Pleurisy, Peripneumony, and the most vehement Cholick. They Expel Wind, and are good against Vapors, Hyfsterick Fits, Epilepsy, kill Worms in the Stomach and Belly and drive them forth, cure Agues, and are profitable against the Gout, and other pains of the Joints.

XV. *The Preparations.* You may make therefrom, 1. A Liquid Juice. 2. An Essence. 3. A Decolion or Infusion in Wine. 4. A Powder of the Leaves. 5. A Powder of the Seed. 6. An Elestuary. 7. A Counter Poison. 8. A Cosmetick. 9. A Collyrium. 10. An Errhine. 11. A Bath. 12. An Oil by Decolion or Infolation. 13. An Ointment. 14. A Cataplasim. 15. A Pickle. 16. A Distilled Water. 17. A Spirituous Tincture. 18. An Acid Tincture. 19. An Oily Tincture. 20. A Saline Tincture. 21. A Spirit. 22. An Oil Distilled. 23. The Potestates or Powers. 24. An Elixir.

The Virtues.

XVI. *The Liquid Juice.* Being often taken to half a Spoonful or more, in some potable Liquor, or made up into a Lohoch with Honey, it destroys the Seed, and causes Barrenness; but it gives ease in the Colick, and Gripings of the Guts, and expels Wind. Easing all inward pains and torments of the Bowels and other Viscera. It eases pains and stitches in the Sides, helps the Pleurisy, and Inflammation of the Lungs, and given to a Spoonful for some few times 2 or 3 Hours before the coming of an Ague Fit, it is said to cure it; it is good against Windiness of the Womb, represses Vapors, and is prevalent against Fits of the Mother. It kills Worms in the Belly drank with Honied Water. And dropt warm into the Ears, it eases their pain. Drank in Parsly Water, it gives ease in the Strangury, Stone, and stoppage of Urine.

XVII. *The Essence.* It has all the Vertues of the Liquid Juice, and is much more powerful to the purposes intended. It is said also to prevail against the Plague and all Pestilential Malignity, to cure the Epilepsy, Vertigo, Lethargy, and Megrim from a cold Cause. And is profitable against Coughs, Colds, Hoarseness, Wheezing, Asthma, and hardness of the Spleen, opening obstructions of Lungs, Liver, Spleen, and Mesentery. Dose from half a Spoonful to 1 whole Spoonful in any proper Liquor.

XVIII. *The Decolion and Infusion in Wine.* They have all the Virtues of the Juice and Essence, but in a less degree, and therefore may be taken Morning and Evening, to a quarter of a Pint at a time.

XIX. *The Powder of the Leaves.* It has all the Virtues of the Juice and Essence, but operates not so speedily, because Nature must first Digest it and draw forth its Virtue in the Stomach: you may give it from a Scruple or 20 Grains, to a Dram, or 60 Grains mixt either with Honey or some proper Syrup.

XX. *The Powder of the Seed.* Being given to a Dram or more in a Glas of Wine, it is an Antidote or Counter Poison, and prevails against all sorts of Poison, whether inwardly or outwardly received, and is good against the pernicious Consequences of dangerous Medicines; but this, as also the Powder of the Leaves, consumes and destroys the Seed, and causes Barrenness being often and long taken.

XXI. *The Elestuary.* Take Powder of the Leaves and Seeds of Rue, of each 2 Ounces; Cardamoms, Cubebs, Cloves, Nutmegs, Winters Cinnamon, of each in fine Powder, 2 Drams; Virginia Snake Root, Contrayerva, Zedoary, Saffron, Cochinele, Thebean Opium, of each in fine Powder, 1 Dram; Clarified Honey 16 Ounces; mix, and make an Elestuary. It is a singular good thing against the Plague and Pestilence, and all Malign and Pestilential Distempers; having the Virtues of the Juice, Essence, and Powders. Dose from a Dram to 2 or 3 Drams, Morning and Evening, drinking a Glas of Wine after it.

XXII. *The Counter-Poison.* It was Invented by Mithridates King of Pontus, and is thus made. Take 20 Leaves of Rue; 2 Wall-Nuts; 2 Figs; a Scruple of Salt; beat all together in a Mortar to a Mass. This is the quantity to be taken at a time, every Morning Fasting, and was the Antidote or Counter-Poison of King Mithridates, by which he secured himself that Day from any Poison, as also any Infectious Distemper, and from the Plague it self.

It is profitable also against the Stinging and Bittings of Scorpions, Hornets, Serpents, Mad-Dogs, and other Venomous Creatures.

XXIII. *The Cosmetick.* Take Rue Water a Quart, Juice of Rue a Pint, Sal Nitre an Ounce and half in fine Powder; mix, dissolve and filter through brown Paper. It is good against Wheals, Pimples, Tanning, Sunburning, Scutif, Morpew, and other Vices of the Skin: Bathed also on places pained, it gives ease to the same. Or thus, Take of the Decoction in Wine 3 Pints, Sal Nitre an Ounce and half, Pepper in fine Powder half an Ounce; mix, digest 7 Days in a gentle Sand heat, decant the clear, filter and keep it for Use.

XXIV. *The Collyrium.* Take Juice of Rue, Juice of Fennel, of each a Pint, Honey 6 Ounces, Gall of a Cock 2 Ounces; mix, dissolve, digest a Week, and being well settled, decant off the clear for use. It heals Sore and Running Eyes, and helps Dimness of Sight.

XXV. *The Errhine.* Take Powder of the Leaves and Seeds of Rue, Powder of Nitre, of each equal parts; mix them. Being Snuff up the Nostrils, it cleanses the Head of cold, thick, and glutinous Humors, and being now and then used, it is good to prevent Apoplexies, Epilepsies, Lethargies, Vertigoe's, &c. by bringing away the Morbifick Matter.

XXVI. *The Bath.* A Decoction made of the Leaves of Rue 4 parts, Bay Leaves 2 parts, Southernwood 1 part, by boiling them in a sufficient quantity of fair Water, is of good use to Bath such in, and to sit in the same who are troubled with the Jaundice, Gout, Sciatica, Rheumatifms, and other the like Diseases, the Herbs being also applied warm to the parts affected. It helps also the Swelling of the Cods, they being also Bathed therewith.

XXVII. *The Oil by Decoction or Insolation in Oil Olive.* It is made of the bruised Herb, and ripe Oil Olive, as you make Oil of Roses. It warms and heals, comforts the Nerves and Joints, strengthens them, and is prevalent against Trembling, Numbness, Cramps, Convulsions, Palfies and Dead Palfies. It is good against the Wind Colick, as also the Swelling, Hardness and Windiness of the Womb, Vapors and Hysterick Fits, if the share and parts thereabouts, and other parts affected, be anointed therewith.

XXVIII. *Unguentum Rutaceum.* Ointment of Rue. Take green Rue 4 Handfuls, Mint, Origanum, Penny-Royal, Sage, Wormwood, of each 2 handfuls; bruise them in a Mortar, put to them old or Salted Hogs Lard 2 Pounds: digest 4 Days in an Earthen Vessel in Horse-Dung, till the Grease is Melted, then press it out in a Press, and add new Herbs, repeating this Work 4 times. Take of this Digested Lard 16 Ounces, Deers Marrow, Oil of Bays, of each 4 Ounces, Tucamahacca, Gum Elemi, of each 3 Ounces, Oil of Nutmegs by expression 2 Ounces; Oils of Juniper Berries, of Rosmary, of Spike and Petrolcum, of each an Ounce, of Castile or Genoa Soap, 6 Ounces; Essence of Castor, extralld with Spirit of Wine rectified, 2 Ounces; mix, and melt them which are to be melted, with a gentle Fire; then add the Chymical Oils, at the end and make an Ointment according to Art. It dissolves, discusses, and heals, or else it matures and brings to Suppuration. It is Anodyn, Carminative, and Arthritic: good against most cold and moist Diseases of the Head, Brain, Nerves, Stomach, Belly, Womb, Reins, and Joints. It prevails against the Gout, Rheumatifm, Sciatica, Palfie, Dead Palfie, Cramps, Convulsions, loss of Memory, Catarrhs, Megrim, Vertigo, Carus, Lethargy, Colick, weakness of the

Limbs, Rickets in Children. It dissolves the hard Tumors, Nodes and Gums in the Flesh, and is of singular use against all cold and moist Diseases whatsoever.

XXIX. *The Cataplasm.* It is made of the bruised Herb 4 parts, Cummin Seed 2 parts, Oil 1 part, adding a little Vinegar, and so much Ceruse as to bring it to a Consistency. It is good against pains of the Stomach, Sides, Spleen, Reins, Belly, and Womb; as also the Gout whether in Hands or Feet, being applied as hot as it can be endured.

XXX. *The Pickle.* The Leaves are first boiled gently in Water, then being taken out and drained, they are put into Pickle, such as is used to Samphire. This is kept by many to eat as Sawce with Meat; it is profitable against Dimness of Sight, to warm a cold Stomach, and cause a good Appetite and Digestion.

XXXI. *The Distilled Water.* It is distilled as you distill other Waters; or rather after the manner taught in the next Section. It has the Virtues of the Juice and Essence, but vastly weaker. It is a good Ophthalmick and Cosmetick; and may be used as a Vehicle to convey other Preparations of the Plant in. Being taken to 3 or 4 Ounces, a little sweetned with Syrup of Citron Peels, it gives present relief in Fainting and Swooning Fits, and to such as are troubled with pain and sickness at Stomach.

XXXII. *Spiritus Rute.* Spirit of Rue. Take fresh Rue bruise it well, put it into a Wooden Vessel, and add to it warm Spring Water a sufficient quantity; and to every Gallon of the whole Matter, a Pound of Sugar or Mellossor; let it ferment for 3 Days, then put in more Water, and distil in a Copper Vessel, drawing off a third part for Spirit of Rue; and a third part more for Rue Water, for the uses in the former Section, which keep apart; and the Spirit you may rectify according to Art. Or thus, Take fresh green Rue bruised 4 Pounds, Rectified Spirit of Wine 8 Quarts; mix, digest 48 Hours, then distil in Balneo to dryness. This Spirit put upon as much more fresh Rue bruised, digest and distil as before, which repeat in like manner a third time, if you would have a very strong Spirit, and fully repleat with the Essential properties of the Herb. It is hot and dry, piercing and attenuating, discusses and expels Wind, is Cephalick, Neurotick, Hysterick, and Alexipharmick, used chiefly against the Plague and all other Malign Diseases. It is highly Sudorifick, expels Poison, cures the Plurisie, weakness of the Stomack, Colick, Gripping of the Guts, bittings of Mad Dogs, and all other Venomous Beasts. It is profitable against Agues, inwardly taken 2 or 3 Houts before the Fit, and outwardly bathed upon the Back Bone; as also the Megrim, Head-ach, Vertigo, Sickness at Stomach, Palpitation at Heart, Surfeits, and the like. It is a provoker of the Terms in Women, and therefore not be given to Women with Child. Dose from 1 Dram to 2, in any Cordial Draught, or in a Glass of Wine. It facilitates the Birth, and forces away the After-Birth and Dead Child.

XXXIII. *Oleum Rute.* Oil of Rue. It is made altogether in the same manner as you make Oil of Rosmary Chymical. It is filled with the Essential Salt of the Plant; and by reason it is of a quick and penetrating Quality, it ought to be given warily, and in a small Dose, as from 2, to 6, or 8 Drops; never alone, but mixed with some other convenient Medicine, because it has a Vehement heat and burning. It has all the Virtues of the Juice, Essence, Powder, Infusion and Spirit aforesaid, and may be given in all those cases, with the Caution now hinted. The way to take it is to drop the intended quantity upon

upon Sugar, letting it soak into it, or mixing it well with it, and then to dissolve the Sugar in some Cordial Water, or Wine, or Sack Whey, or other Proper Vehicle, by which means the *Oil* will be the better incorporated therewith, and then it is to be drunk up.

XXXIV. *Potestates, or Powers.* These have all the Virtues of the *Juice, Essence, Spirit, and Oil* aforesaid, as also of the *Elixir* following. But tho they may, and do much exceed the *Juice, Essence, and Spirit* in their Strength by their Sublimity and Exaltation, yet they fall below the Force and Excellence of the *Elixir*, in the next Section, which answers to all the Intentions of the whole Plant. These *Powers* may be given Morning, Noon, and Night, from 40, to 80, or 100 Drops in a Glass of Wine, or other Liquor conducing to the Intention for which they are given. They Facilitate the Birth, bring away the After-Birth, and cause a due cleansing afterwards.

XXXV. *Elixir Ruta, Elixir of Rue.* Take Powers of Rue a Quart: Rue in fine Powder 4 Ounces: Ground very well in a hot Mortar with 2 Ounces of highly calcin'd Salt of Rue: mix all together, digest cold for a Month, shaking the Glass once or twice a Day: then being fully settled, decant the clear Elixir, and keep it in a Glass close stop'd for use. Or thus, Take of our Spiritus Leptus a Quart, Rue in fine Powder 6 Ounces: mix and digest cold for a Month, shaking the Glass once or twice a Day; then the Vices being subsided decant the clear Elixir, and keep it close stop'd for use. It is a great and famous Antidote, and Counter Poison, not only against all Vegetable and Animal Poisons, but against the most contagious Malignity, and mighty force of the Plague and Pestilence, whether given as a Prophylactick, or as a Curative. It is also a powerful thing against the Measles, Small Pox, Spotted Fever, and all sorts of Malign, Burning, or Pestilential Fevers: It effectually cures the Bitings of Mad-Dogs, Rattle Snakes, Vipers, and of all other Venomous Serpents or Creatures, destroying their Poison in its Root and Essence. It dries up Watery Humors in Dropfies, eases pains in the Ears, being mixt with Oil of Bitter Almonds and dropt into them. It helps dimness of Sight, being mixt with a Gall of a Cock and a little Honey, and so dropt into the Eyes. It eases all sorts of Pains and Torments whatsoever, being inwardly taken and outwardly applied to the place; but it is not too often to be taken inwardly, because it is apt to dry up and consume the Seed, and destroy the Generative Power and Faculty. It helps pains in the Breast and Sides, Stitches, Plurisies, inward bruises, Coughs, Colds, Hoarseness, Wheezing, shortness of Breath, Asthma, Inflammation of the Lungs, and the shaking Fits of Agues. It is powerful against the Wind Cholick, gripings in the Guts, sickness and pain at Stomach, warming, comforting and cherishing those parts, prevails against Surfeits, and causes a good Appetite, and a strong Digestion. It is prevalent against Vapors, Fits of the Mother, and other disorders of the Womb: and being given in time of Labor, it facilitates the Birth, and brings away the After-Birth, and after a very admirable manner either prevents or Cures After-pains. It effectually kills Worms of all sorts, whether in old or young, and outwardly applied eases pains of the Gout, proceeding from a cold Cause, whether in the Hands, Knees, Hips, or Feet, for which it is a very admirable thing. Outwardly by bathing it also upon the Back Bone, it is very beneficial against the Fits of Agues. It may be given from half a Dram, to a Dram or more, mixt with some proper Syrup, or in Angeli-

ca Water, or some other Cordial Water, or in Sack Whey, or in a Glass of Generous Wine, in the Morning Fasting, and at Night going to Bed, and sometimes once or twice in the Day besides, according to the Exigency of the Disease.

XXXVI. *The Spirituous Tincture.* It has all the Virtues of the *Juice, Essence, Spirit, Powers, and Elixir*, but in a much lower degree of Power and Efficacy: but it may be of good Service and use where the *Powers* or *Elixir* are not to be had. It may be given from one Dram to three in any Cordial Water, or Generous Wine, Morning, Noon, and Night.

XXXVII. *The Acid Tincture.* Is a peculiar thing against the Plague and Spotted Fever; and in all malign and pestilential Diseases; it destroys the malignity, and so extricates the Patient in the greatest danger, if the hopes of Life be not past. Dose 40 or 60 Drops at a time in Scordium Water, Angelica Water, or some Generous Wine, 3, 4, or 6 times a Day.

XXXVIII. *The Oily Tincture.* It provokes Urine Powerfully, and is profitable against the Stone, Sand, Gravel, Strangury, and other Diseases of the Urinary parts; as also against the Cholick, gripings of the Guts, Wind and other Diseases of the Bowels. Inwardly taken Morning, Noon, and Night, from 15 to 30 Drops or more, it is a most excellent thing against numbness, Trembling of the Limbs, and Palsie, more especially if the parts affected and Spina Dorsi, be Morning and Night anointed with the same for some considerable time.

XXXIX. *The Saline Tincture.* It is chiefly for External uses, gives ease in the Gout in Hands or Feet, and other like pains in the External parts of the Body. It is also a good Cosmectick, and is profitable against Tanning, Sunburning, Scurff, Morpew, Pimples, Pustles, Discolorings, Tettats, Ring-Worms, and other Breakings out, and Deformities of the Skin; the Skin (first wash'd clean with warm Water) being wash'd or bathed therewith 2 or 3 times a Day.

CHAP. DCV.

OF RUE Medow.

I. *THE Names.* It is called in Greek, *Θαλίτρι*, *ἑσπερί*, & *Θαλίτριον*, à *Θαλλίς*, *Vireo*, as some think, *eo quod dum germinare protrudit eleganter vireat*: in Latine, *Thalidrum*, & *Thaliotrum*, also *Ruta palustris* & *Ruta pratensis*: and some have called it *Piganum*, quasi, *πῖγανον*, which is *Ruta*: others *Pseudo-rhabarbarum* (but very improperly, for it is no Rheubarb of any kind) but I suppose they so called it from the yellow color of the Root, and its truly purging and binding Qualities, in all which, it is very like to Rheubarb. In English, *Meadow Rue*.

II. *The Kinds.* Authors make ten or more Kinds of this Plant, but we shall describe only the five following, as being Inhabitants of our Country, or of our American Plantations. 1. *Thalidrum majus vulgare Lobelij*; *Ruta Sylvestris Cesalpini*; *Piganum Lugdunensis*; *Thalidrum Germanicum latifolium Camerarij*; *Saxifraga Latea Gesneri*; Our common greater Meadow Rue. 2. *Thalidrum majus album Hispanicum*; *Thalidrum italicum Camerarij*, Great Spanish Meadow Rue. 3. *Thalidrum minus, Dodonai*; *Ruta pratensis tenuifolia Lobelij* 6 H 2 & alio

aliorum, *Hypocoum Lugdunensis*, The smaller Meadow Rue. 4. *Thalictrum Americanum*, *Thalictrum Virginianum*, Virginia Meadow Rue. 5. *Thalictrum Americanum*, vel *Virginianum minus purpureum*, The lesser purple Virginia Meadow Rue.

The Descriptions.

III. The first, or Our common Meadow Rue. Has a Root which is yellow and stringy, spreading much in the Ground, and shooting forth new Sprouts round about with many herby green Stalks, two Feet high, crested or cornered their whole length, set with joints

Rue Meadow great.

here and there, and many large Leaves on them, as well as below, being divided into smaller Leaves, nicked or dented in the fore part of them, of a sad green color on the upper side, and a pale green underneath. Towards the tops of the Stalk, several short Branches shoot forth, on every one of which stands 2, or, 3 or 4 small round Heads or Buttons, which breaking the Skins which enclose them, shew forth a Tuft of pale greenish yellow Threads, which falling away, small three cornered Cods come in their places, wherein is contained small long and round Seed. The whole Plant as well Leaves as Flowers have a more strong unpleasant Smell than the next following Kind.

IV. Gerard describes this Plant thus. Its Root is yellow, long, round and knotty, dispersing it self far abroad under the upper Crust of the Earth. It has large Leaves parted or divided into divers other small Leaves, somewhat snipt about the edges, of a black or dark green color. The Stalks are crested or streaked of a purple color, growing to be two Cubits high, at the tops whereof grow many small and hairy white Flowers, and after them come small

narrow Husks like little Cods, four or five growing together.

V. The second, or Great Spanish Meadow Rue. Its Root is much like the former, but its Leaves are much larger, and more divided on the edges, being so like unto Columbine Leaves, that they may easily deceive one not well acquainted therewith, yet are they lesser, and of a sadder color, standing on long foot Stalks, among which rises up a strong round Stalk, three Feet high at least, Branching forth into 2 or 3 parts, with Leaves at their several Joints, at the tops whereof stand many small round yellowish Buttons, in a Tuft together enclosed in a white Skin, which breaking, each Button shews it self to be a small Tuft of Threads, like the former but greater, and of a white color, but tipped with yellow, and something purplish at the bottom, of a strong Smell, and abiding long in flower, if it grows not too open, and then falls away like short Threads. The Seed is like the former, but greater, and the Roots are yellow like it, which retain neither Stalk nor Leaf all Winter, but shoot forth a new the next Spring.

VI. The third, or Smaller Meadow Rue. Its Roots likewise are yellow, but do not spread or creep so much as the former. This small kind is in almost all respects like unto the first, but smaller

Rue Meadow small.

both in its Leaves, which are of a little fresher green color and somewhat more shining: and in its Stalks, which are round and not crested: and in its Flowers also, which as they are lesser, are somewhat whiter too.

VII. Gerard thus describes it. This small Kind is very like unto the first Species, but that it is altogether lesser; its Stalks are a Span, or Foot long, its Leaves are thinner and tender; its Root is fine and slender; and the little Flowers grow together in small Bundles or Tufts, of a light yellow color, almost white, and are of an unpleasant Savor.

VIII. The fourth, or Virginia Meadow Rue. This in its Face or outward appearance is so like the second

cond or Great Spanish Kind, that they can scarcely be known *asunder*; but that this is fuller of Stalks and Leaves. The Flowers at the tops of the Branches, are at first of a pale bluish color; but being blown open, consist of five white Leaves; and a great number of white Threads in the middle tip with yellow.

IX. The fifth, or Lesser purple Virginia Meadow Rue. This is in almost all respects much like the former, but smaller; and differs most in the color of its Flowers, which in this are of a purple color tip with yellow.

X. The Places. The first grows in many places in England, in the borders of moist and plashy Meadows and by Ditch sides. The second is also found in our moist Meadows and by Ditch sides but near the Sea, as at Margate on the Chalky Clift on the left Hand, as you go from the Town to the Sea side, and in other places farther from the Sea. But this grows also in Spain, from whence it has been brought to us, whence came the Name of Spanish Meadow Rue, but is truly a Native also of England. The fifth grows also in lower Grounds by River sides. All these Gerard says grow along Ditch sides leading from Kentish Street to St. Thomas Waterings, (the place of Execution) on the right Hand. They grow also upon the Banks of the Thames leading from Black-wall to Woolwich, near London, and in several other places. The two last came to us from Virginia.

XI. The Times. They all Flower in the Months of July and August; and the Cods of Seed are ripe in some short time after.

XII. The Qualities. It is hot and dry in the second Degree, is Absterfivè, Aperitive, and gently Cathartick or Soluble.

XIII. The Specification. It is used to cure the Plague or Pestilence, and the Yellow Jaundice: and is profitable for such as have the Falling-sickness.

XIV. The Preparations. There is, 1. The Herb it self, used as a Pot Herb. 2. A Juice or Essence. 3. A Decoction of Roots or Leaves in Ale. 4. A Decoction of the same in Water. 5. A Cataplasm of the Leaves. 6. A Distilled Water. 7. An Acid Tincture of Roots, Leaves, and Flowers. 8. A Saline Tincture of the Roots.

The Virtues.

XV. The Fresh Herb and Roots. They are commonly used as Pot-Herbs, with other Herbs; and if they are put in plentifully, they gently purge the Belly, and provoke to Stool; but the Roots more than the Leaves.

XVI. The Juice or Essence of the Roots and Leaves. They open Obstructions of the Viscera, and cleanse: and being taken from 2 Spoonfuls to 4 or 5, or more, they very pleasantly and easily purge and cleanse the Belly of thick, clammy and gross Humors. They are profitably given against the Plague, and all other malign, contagious, and pestilential Distempers. In Saxonie the Juice is used against the Jaundice; it is indeed profitable in that Cure, if some Antimonial Emetick be given once or twice beforehand. Lugdunensis in transferring the Name Pigamum to Meadow Rue, does therewith ascribe to it a Virtue proper to Rue, as if it did belong to this, viz. that it raises or restores him out of his Fit, that is troubled with the Epilepsie or Falling Sickness, if some of the Juice of it be put up into his Nostrils, and kept there a while.

XVII. The decoction of the Roots or Leaves in Ale. Being drank pretty largely, it provokes to Stool and gently purges: but the Decoction of the Roots is more powerful than that of the Leaves; and carries off much of the Morbifick Matter of the Jaundice and Epilepsie.

XVIII. The Decoction of the Roots or Leaves in Water. Being washed upon the places troubled with Vermine or Lice, whilst it is very warm, it is said perfectly to destroy them: besides it dries up old Sores, and moist running Scabs, the places effected being bathed therewith very hot, 2 or 3 times a Day or more, for near half an Hour at a time; it warms, comforts, loosens, and opens the Pores of the Scabs, Ulcers, and Flesh, as also the Skin adjacent thereto, and powerfully attracts and draws forth the Virulent and Morbifick Matter.

XIX. The Cataplasm of the Leaves. It is made by bearing them in a Mortar fresh and green; and so applied to old Sores it brings them to cicatrizing, and does perfectly cure old Ulcers, as Dioscorides says; and Galen says, it dries without any heat or sharpness.

XX. The Distilled Wator of the Roots, Lerves, and Flowers. It has the Virtues of the Juice, Essence, Decoction, and Cataplasm; but is not so powerful in its effects: but if a little Nitre be dissolved in it, it becomes a good Cosmetick.

XXI. The Acid Tincture of Roots, Leaves, and Flowers. It has all the Virtues of the Juice and Essence; and a Specifick against the Plague or Pestilence, and all sorts of malign and pestilential Distempers. Dose 40, 50, or 60 Drops in all that the Patient drinks, as also in all his Broth or Spoonmeat, except it is made of Milk.

XXII. The Saline Tincture of the same. It is very Absterfivè, and a great cleanser of the Flesh and Skin from Pimples, Pusches, Tettars, Ring-worms, Scabs, Itch, running Sores, Scurff, Morphew, and other breakings out, and withall kills Lice, and other Vermine, to which the Patient is Subject, being used very hot 2 or 3 times a Day, and for some considerable time, as nearly half an Hour, every time it is used; it opens the Pores of the Flesh and Skin, and draws forth powerfully the Purulent and Morbifick Particles of the same.

C H A P. DCVI.

OF RUE -- GOATS.

I. THE Names. The Greeks knew nothing hereof: the Latines call it Galega, Ruta Capraria, also Herba Gallica, as Fracastorius does: in English it is called Goats-Rue.

II. The Kinds. Those which Authors have chiefly taken notice are these two, 1. Galega vel Ruta Capraria Vulgaris, Our common Goats-Rue. 2. Galega Montana Lugdunensis, Mountain Goats-Rue.

The Descriptions.

III. As to the Descriptions of these Plants; their Places of Growth, and Times of Flowering and Seeding, as also their Qualities, Specifications, Preparations, and Virtues, we shall say nothing to in this

Rue Goats.

this place, having largely treated of the same in Chap. 220 foregoing: saying, that whereas we were something defective in that Chapter as to the several Preparations of them, and their respective Uses and Applications; we shall endeavour to add and make amends here, for what we were deficient in there.

IV. *The remaining Preparations.* To those ten in the said Chapter, enumerated; we add the six following particulars, viz. 1. *The Green Herb.* 2. *A Rob of the Juice.* 3. *A Syrup of the Juice.* 4. *An Oil of the Flowers.* 5. *A Spirit, from the whole Plant.* 6. *A Wash.*

The Virtues.

V. *The Green Herb.* It makes good Food or Fodder for Sheep, Goats, Cows, Oxen, and other Cattle, whom it Feeds and Fattens very well: being chopt small, and mixt with Bran and Barly Meal, and given to Hens, is said to fatten them also, and to make them to lay Eggs plentifully. Reduced into Powder, and taken to a Dram Morning and Evening in a Glass of choise Canary, it is a preervative against the Infection of the Plague or of any other Malign, Contagious, Epidemical or Pestilential Disease, and to kill Worms in Children.

VI. *The Rob of the Juice.* Take the Expressed Juice, Clarifie it with Whites of Eggs, then Evaporate it to the thickness of new Honey, or something thicker: to every Pound of which add, half a Pound of double Refined Sugar: melt, mix, and keep it for Use. It has the Virtues of the Juice and Essence, tho' not altogether so powerful, because many of the Volatile Particles are lost in the absumption; but is of great use in making the *Electuary*, and in that Case much transcends Honey. It may be taken from half a Spoonful to a Spoon-

ful in Wine or some other proper Vehicle to kill Worms in Children.

VII. *The Syrup of the Juice.* It is of good use in the Plague, and all sorts of Pestilential Diseases being taken in Treacle Water, or some other Antidotal Vehicle Morning and Night, both as a prophylactic and as a Curative: if the Person is Infected it will be good to put them to Bed, and cause them to Sweat two or three Hours thereupon. Dose 2 or 4 Spoonfuls at a time. It is given also against the Measles and Small Pox, with the same Success.

VIII. *The Oil of the Flowers by Insolation or Decoction.* Anointed upon the Navel it is said to kill Worms in the Belly. Anointed on the Stomach, Back Bone, Crown of the Head, and Temples, it has been found profitable against the *Epilepsie* or Falling-sickness. Anointed all over the Belly, it gives ease in the Colick, gripings of the Guts, and Convulsions of the Bowels.

IX. *The Spirit from the whole Plant.* It is singularly Cordial, and profitable against all Pestilential and Infectious Diseases, having all the Virtues of the Juice, Essence, Infusion, or Tinctures, and may be given to a Spoonful at a time mixed with the Syrup. It preserves and defends the Heart against Palpitations, Faintings, Swoonings, Sickness at Stomach, and other like Diseases of the *Precordia*, and is an Antidote against Melancholy Vapors oppressing the Spirits.

X. *The Wash.* It is made by a mixture of the Spirit, Juice, and Wine Vinegar in equal parts. Being applied very hot to the part, it defends it against Gangreens, and prevents their running farther; is profitable to cleanse and heal running Sores and Ulcers, to destroy their Malignity, to prevent their fretting and spreading; and to defend the Vital Powers from danger, more especially if it be bathed also upon the Region of the Heart, and over the whole Belly.

CHAP. DCVII.

OF RUPTURE--WORT.

OR,

BURST--WORT.

I. *THE Names.* It has no Greek Name that we know of, unless you will allow of *Ἐμπέτρον* *Empetron*, which *Tragus* and *Lonicerus* give it, yet can scarcely be admitted of, because, it is more peculiar to *Sampire*: in *Latine* it is called *Herniaria*, and *Herniola*: in *English*, *Rupture-wort*, and *Burst-wort*.

II. *The Kinds.* The Chief Sorts which are most usual with us are, 1. *Herniaria major*, *Herniaria vulgaris*, *Empetron Tragii* & *Loniceri*, *Polygonum minus Matthioli*, who calls it also *modicum saturejæ*, *Nonnullis*, *Millegrana*; *Quibusdam*, *Herniola*, *Epipallus Anguilina*; *Herniaria multigrana serpilli folio* *Pena in adversaria*; *Herba Turca Lobelij* & *Cesalpini*; *Herba Cancris minor Cordi*, in his *Scholias*; & *Millegrana*, in his *Historia Plantarum*; *Polygonum minus*, seu *Millegrana major Baubini*; but generally *Herniaria* by *Camerarius*, *Dodoneus*, *Gesner*, *Gerard*, *Lugdunensis*, *Tabernamontanus*, and *Thalius*, Our common Rupture-wort, or the greater Rupture-wort. 2. *Herniaria major Afri-*

cana, African great Rupture-wort. 3. *Herniaria minor*, *Millegrana minima* Lobelij; *Herniaria altera* Thalij; *Herniola*, *Polygonum minimum*, *sive* *Millegrana minima* Bauhini, The small or smallest Rupture-wort.

The Descriptions.

III. The first, or Our common Rupture-wort, or Greater Rupture-wort. It has a Root which is very long and small, thrusting it self deep into the Ground: from which spring up many small Branches, or Stems, round about upon the Ground, about a

Rupture-wort Common.

Span or more long, which are divided into many other smaller and almost thready parts, full of small Joints, set very thick together; whereat come forth likewise, a great number of exceeding small yellowish Flowers, scarcely to be discerned from the Stalks and Leaves, which turn into Seed as small as the very Dust. This Plant has neither Smell nor Taste at first; but afterwards it has a little Styptick or Astringent Taste, without any heat, yet a little bitter and sharp withall. The Cut which we have given you here is from *Matthiolus* his *Epitome*, but the Cutter has not well represented the vast number of Flowers and Seed at every Joint with which this Plant is usually replenished.

IV. The second, or African great Rupture-wort. This in its Roots, Stalks, Leaves, Branches, Flowers, Seed, form and manner of growing, differs little from the former, saving that this is something greater and larger, grows more upright, and is fuller of Branches.

V. The third, or Small or smaller Rupture-wort. Its Root is small but not so long as the former: it rises up with small thready Stalks, but with fewer Joints, having long narrow Leaves, something rough and hairy set at them; fuller of Branches towards the tops, where the Flowers and Seed do grow, like as in the other, and in as plentiful a manner also.

VI. The first of these Plants Gerard does thus describe. It has a Root which is slender and single, a low creeping Herb, having many long slender Branches trailing on the Ground, yet very tough, and full of little knots, somewhat reddish; upon which do grow many small Leaves like these of Time: among which come forth, little yellowish Flowers, which turn into very small Seed, and a great quantity thereof, (considering the smallness of the Plant) growing thick and clustering together by certain spaces. The whole plant is of a yellowish green color.

VII. The Places. The first grows in many Countries in England, as well as in several others, in dry Barren Grounds, where it will be small; and in the moister Places also; but not in such as are Boggie, or Moorish which are not shadowed. The second grows near Tunis in Africa, where *Guillame Boel* gathered it, from whence it has been brought to us and transplanted into our Gardens. The third grows in dry Chalky and Stoney Grounds in Kent, and other Countries. *Johnson* in Gerard says, that he found it in Kent, on a Heath not far from Chislehurst, in the Month of July.

VIII. The Times. They are fresh and green and Flower in May, June, July, and August; and perfect their Seed in the mean time.

IX. The Qualities. It is cold in the first Degree, and dry in the second; Styptick or Astringent, Diuretick and Nephritick.

X. The Specification. It is said to Cure Ruptures of the Peritonæum, to stop all sorts of Fluxes of the Bowels and of the Womb, to give ease in the Strangury, and provoke Urine.

XI. The Preparations. You may have therefrom, 1. A Juice or Essence. 2. A Decoction in Wine or Water. 3. A Powder of the Dried Herb. 4. A Cataplasm of the Green Herb.

The Virtues.

XII. The Juice or Essence. They provoke Urine, and are said to break the Stone if it is composed of a Gritty Substance: yet they stop all sorts of Fluxes of the Belly and Womb; and are profitable to conglutinate Ruptures of the Bowels in young people, being taken for 40 Days together, the Patient lying all the time in Bed. Dose 2 Spoonfuls at a time, Morning, Noon and Night, in a Glass of Red Styptick Wine; given in the same Dose in White Port or Lisbon, it provokes Urine, and is profitable against the Strangury.

XIII. The Decoction of the Herb in Wine or Water. It has all the Virtues of the Juice and Essence, and may be given at like times from a quarter of a Pint to half a Pint.

XIV. The Powder of the dried Herb. A Dram of it taken at a time, Morning and Evening in a Glass of White Wine is good against the Strangury, and for such as are troubled with Gravel in the Reins or Bladder, causing to make Urine plentifully. Taken in Red Styptick Wine, it stops Fluxes of the Bowels, and helps Ruptures.

XVI. The

XV. The Cataplasm of the Green Herb. It is an excellent thing to conglutinate Green or Fresh Wounds, and to heal them being applied thereto: and is profitable to stop Defluxions of Rheum, from the Head upon the Eyes, Nose, or Teeth, being bound upon those parts: It is profitable also to dry up the moisture of moist and running Ulcers, being put upon them, they being throwed over first with the Powder.

C H A P. DCVIII.

of RUSHES.

I. **T**HE Names. The Rush is called in Arabic, Dis: in Greek, $\Sigma\gamma\iota\upsilon$ (Σ à Loris & Funibus:) in Latine, *Juncus* (Σ à Jungendo,) from the same use, of binding things together: and in English, *Rush*.

II. The Kinds. Authors have given us almost thirty several sorts of *Rushes*, most of which grow neither in our British Islands, nor yet in any of our Foreign West-India Plantations; the most usual with us are the thirteen following, viz. 1. *Mariscus* Plinij *Baubino* & *Gaza*; *Holoscyanos*, *Juncus Floridus*, which some take to be, *Gladiolus Palustris*, as *Lugdunensis* thinks; others call it *Scirpus*, tho' the Ancients (as it is thought) took them to be different Plants: yet *Terence* in *Andria*, says, *Junci Species est Scirpus levis* & *enodis*: and such a one is this *Rush*, having neither Joint or Knot in it, whence came the Proverb, *Nodum in Scirpo querere*, speaking of such as scruple or doubt, where none is to be made or found. It is called by *Dioscorides* $\Sigma\gamma\iota\upsilon$ $\nu\alpha$, *Juncus levis*; but some think the Text is there corrupted, and that it ought to be $\Sigma\gamma\iota\upsilon$ $\nu\alpha$, *Juncus palustris*, as *Paulus Agincta* calls it, which *Hermolaus Barbarus* observed also; *Juncus grantis* *Holoscyanos* *Dodonai* & *Gesneri*; *Holoscyanos* *Theophrasti* *Lugdunensis*; *Juncus palustris* *major* *Tragi*; *Juncus aquaticus* & *Levis maximus* *Lobelij*, *altorumque*; Our common great Bull Rush. 2. *Juncus Levis vulgaris*; *Juncus sive Scirpus Medicus* *Baubini*; *Juncus Sylvaticus* *Tabernaemontani*. Our common sort of smooth Water Rush, or middle sort of Bull Rush. 3. *Juncus Levis panicula sparsa major*, *Juncus vulgaris alter* *Tragi*; *Juncus Levis* & *vulgaris Cordi*, *Dodonai*, & *Lobelij*; *Oxyechanos* *Anguillare* & *Lugdunensis*, Another sort of great smooth Rush. 4. *Juncus Levis panicula sparsa minor* *Baubini*, The smaller Bull Rush with dispersed Tufts. 5. *Juncus Levis Flore Glomerato* *Lugdunensis*, Round Headed Rush. 6. *Juncus acutus vulgaris*, $\Sigma\gamma\iota\upsilon$ $\nu\alpha$, *Oxyechanos*; *Juncus acutus* & *asper*; *Juncus acutus vulgarior* *Dodonai*, & *Lobelij*, Our common small hard Rush. 7. *Oxyechanos sive Juncus acutus Cambro* *Britanicus*, Our Welch sharp Rush. 8. *Juncus acutus Maritimus Anglicus*, English Sea hard Rush. 9. *Juncus Capitulis Equisetij*, *Juncus aquaticus minor capitulis equisetij* *Lobelij*; *Juncus clavatus* *Dalechampij* *Lugdunense*, The greater Aglet Headed Rush. 10. *Juncus capitulis equisetij alter*, The lesser Aglet Headed Rush. 11. *Juncus Floridus major*, *Cal-*

magrostis secunda *Tragi*; *Juncus floridus* *Camerarij*, *Lugdunensis* & *Marthioli*; *Juncus Cyperoides floridus paludosus* *Lobelij*, The greater Flowering *Cyperus* *Ruth*. 12. *Juncus Gramineus*; *Juncus Maritimus*; *Gramen Juncus Maritimum* *Gerardi*, *Sea* *Ruth*, *Marsh* *Ruth* *Grass*, called by some *Goose* *Corn*.

The Descriptions.

III. The first, or Our common great Bull Rush. Its Root is of a blackish brown color, grows somewhat great and sloping, with several Fibres or Strings thereat. It sends forth several tall soft, round and smooth Shoots, which are the Rushes, of a fresh pale green color, greater and larger than

Bull Rush great.

any of the other sort of Rushes, having certain Sheaths like Leaves, encompassing them at the bottom, and pointed at the ends, but not sharp, full of a white Pith, which are serviceable, (the outward Rinde being peeled away) for Lights, to make Rush Candles of, being dip't into Suet or Tallow. Towards the tops of which Rushes on the one side, break forth several small brownish Chaffie Heads, each upon a short foot Stalk, in which are contained three corner'd blackish Seed.

IV. The second, or Our common sort of smooth Water Rush, or middle sort of Bull Rush. Its Root is not great as the former, but are a Bush of Strings or Threads. This Rush is in all things like the first, but much lesser and shorter, having a whitish Pith within, as the other has, which serves for the like Uses; but the Heads are longer, and the Tuft or Panicle is close, and not spread open as the next is.

V. The

Rushes smooth common.

Rushes hard, small, Common.

V. The third, or Other sort of great smooth Rush. The Root of this is bushy like the last just now described. And this other greater sort is very like to it, saving that it grows with a lesser store of Rushes, of a darkish green color, and the Taft, or brownish Panicle also, is more spread abroad at large, each part of it standing upon a pretty long foot Stalk, and is broad below, and pointed upwards.

VI. The fourth, or Smaller Bull Rush with dispersed Tufts. This differs from the greater sort just before described, only in the smallness of the Plant, it growing in drier Ground, which some suppose to be the Cause of its smallness.

VII. The fifth, or Round Headed Rush. Its Root is Bushy like to the second sort above; from which rise up several Shoots, like to that Kind also, and partly within like it: The chiefest difference consists in this, that the Tufted Heads stand something close together, are round and not pointed at all.

VIII. The sixth, or Our common small hard Rushes. They have a short bushy, fibrous or stringy Root; from whence come forth several Shoots; they grow in the same manner as the others do, but that sometimes the Stalks or Rushes, send as it were other Rushes out of their sides, or one from another, and not all from the Root separately as the others. They are also hard and sharper pointed, with little or no Pith within them, yet are they hollow, porous or spongy, and their Tufts at the upper end of the Rushes are small, hard, spread abroad, and short, which break out near the tops as the others do.

IX. The seventh, or Our Welsh sharp Rush. Its Root consists of a Bush of brownish hard Fibres or Strings. The Rushes of this Kind are about 6 or 7 Inches long or more; something great, hard, and sharp pointed; from among which rise up naked Rushes or Stalks half a Yard high, and from between two short Leaves, breaks forth a sparsed Panicle, of several small Chaffy Husks, like unto Reed Grass, of a brownish Color.

X. The eighth, or English Sea hard Rush. It has a long, hard, creeping and fibrous Root, with several broten skinny Heads, out of which rise thick, round, hard, long, and very sharp pointed Rushes, from among which rise up other Rushy Stalks two or three Feet high, bearing near the tops, about 3 Inches below them, a slender and long Panicle, composed of many Chaffy Husks, which when they are ripe, open and shew their Seed.

XI. The ninth, or Greater Aglet headed Rush. It has a creeping spreading Root, replenished with many intricate Fibres, from which spring forth several slender naked Rushes, about a Foot and half long, full of whitish Pith, and having at the bottoms of them, certain reddish Skins encompassing them, and bearing each of them at their tops, a small Catkin or Aglet, like the first Head of an Asparagus, blooming with small white Threads like a Plantain Head, which quickly fall away.

XII. The tenth, or Lesser Aglet headed Rush. It has a creeping fibrous or stringy Root like the former, from which rise up several short Rushes; and from among them other slender and taller Rushes about a Foot high, each of them bearing such

such a like Aglet as the former, but something lesser.

XIII. The eleventh, or Greater Flowering Rush, or Greater Cyperus Rush. It has a long creeping or spreading Root, like the Rushes, bushing out with many Fibres; from whence spring round smooth Rush like Stalks two or three Cubits high, bearing at the Head or top, a large spread Tuft or Umbel of pale bluish colored Flowers (which yet Tragus says are white) with some Threads tipped with yellow in the middle, which falling away, there come in their places, small, round, blackish Heads, which contain within them small Seed. This Great Flowering Cyperus Rush, as it differs from all the other sorts of Rushes, so it excels them all in Beauty; and has several Heads of Leaves rising from its Root, like to those of Cyperus.

XIV. The twelfth, or Lesser Flowering Cyperus Rush. Its Root is small, whitish, and jointed; from whence proceeds a small Stalk of a Hand breadth high, having three long sharp pointed Rush like Leaves, two whereof rise higher than the Stalk; and at the top five Flowers, flowering one after another; after which come two small round Heads set together on each foot Stalk, of the largeness of the Candy bitter Vetch.

XV. The thirteenth, Gramen junceum maritimum Gerardi, or Sea Rush, or Marsh Rush Grass, called by some Goose Corn. It has a Root which consists of many small, long, and tough Strings, making a kind

Rush Grass.

of bush as it were; from which rises up many Rushy Leaves tough and hard, of a brown color, and well resembling Rushes. The Stalk or Stalks which are one, two, three, or more, are twice as high as the Leaves, overtopping them as it were, and

are bare and naked of Leaves unto the top; which are much thicker and larger than the Leaves, on the tops of which are such Husks as on Rushes, with many small pretty chaffie Buttons, or Heads, in which is contained the Seed.

XVI. The Places. The first five grow in standing Waters and by River sides, and in watery plashy Places, and overflown Grounds, but the first usually in the deeper Waters, not only all over England, but also in Virginia, Carolina, and other of our English Plantations in Florida. The sixth, seventh and eighth grow in Fields and by High way sides, also in moist and waste Grounds in all Counties of England, but the seventh more particularly, *Lobel* found upon a high Hill in Wales, called *Beworin*, in several wet and moorish Grounds, in many places thereabouts: and the eighth grows in several places upon our English Coasts. The ninth and tenth, both in Flanders and England, and with us in Brooks, Ponds, and other moist places, as also in several parts of Wales. The eleventh in watery Ditches, Pools and Plashes in most parts of this Kingdom. The twelfth grows in moist and watery Grounds, and has been found to grow plentifully in several places of Switzerland. The thirteenth grows in watery and marshy Places near to the Sea or other Fenny Grounds, and in muddy and mirie Ditches in several places in England, not far from the Sea.

XVII. The Times. The first five flourish chiefly all the Summer to the end of September, but abide green all the Year. The sixth, seventh, and eighth flourish all the Summer Months also, and abide in like manner always green. The ninth and tenth, flourish and are to be seen towards the end of Summer. The eleventh and twelfth, Flower all the Summer long, and their Seed ripens in the mean Season. The thirteenth is green, and Flowers in the Summer Months to the end of August, and its Seed is ripe in a short time after.

XVIII. The Qualities. Rushes are cold and dry in the first Degree, Astringent, Narcotick and Hypnotick.

XIX. The Specification. The Root is profitable against the biting of the Phalangium: and the Seed stops Fluxes, provokes Urine, and induces Sleep pretty strongly, stopping the most vehement Cough.

XX. The Preparations. You may have therefrom, 1. A Decolion of the Root in Water. 2. A Powder of the Seed. 3. A Cataplasm of the bottoms of the Leaves next the Root, and of the Root it self.

The Virtues.

XXI. The Decolion of the Root in Water. It induces Sleep, gives ease in the most vehement Coughs, stops all Fluxes of the Bowels, and the Terms in Women. The Decolion ought to be boiled two thirds away: Dose a quarter of a Pint Morning and Night.

XXII. The Powder of the Seed. Given from a Scruple to two Scruples in any fit Vehicle, it provokes Urine, induces Sleep and Rest, stops all Fluxes of the Bowels, and the Terms in Women, and eases a violent Cough: it ought to be given with Caution, lest the Patient sleeps the Sleep of Death.

XXIII. The Cataplasm of the bottoms of the Leaves and Roots. Being applied it is said to cure the biting of the Phalangium, or poisonous Spider.

XXIV. Nota.

XXIV. *Nota.* All the severall sorts of *Rushes* have one and the same *Virtues*: but the *Bull-Rushes* as they are most effectual to the purposes intended, so they are only or chiefly in Use.

C H A P. DCIX.

Of RUSH NUT,

O R,

EDIBLE CYPERUS.

I. *THE Names.* It may be called, in *Greek*, *Κύπερος* *ναυαγέος*, *ῥ*, *ῥαγιν* *ῥαγιν*: in *Latine*, *Cyperus dulcis rotundus esculentus*, *Trafi dulce vocatus*, *Cyperus esculentus*, *Juncus nuceus*, *Cyperus nuceus*: in *English*, *The Nut Rush*, *Nut Cyperus*, *Edible Cyperus*; and by some the *Rush Nut*, or *Cyperus Nut*.

II. *The Kinds.* We have but one Species of this Plant, whose name in *Greek*, *Cesalpinus*, *Clusius*, *Columna*, and *Dalechampius* upon *Pliny*, think to be the *Μαλακάριον*, *Malinathalla* *Theophrasti*, and that it is the *Anthalum* *Plinij*: it is also called *Dalichinum*, and by the *Italians*, *Trafi*, by which name the Roots are cryed up and down the Streets in *Italy*, as *Oranges* and *Lemons* are cryed here. By the *Sicilians*, called, *Castanatos*, because the Roots taste like *Chestnuts*.

The Description.

III. *The Roots* of this Plant are small, long, and round, and many of them smaller at the one end, than at the other, hanging or growing at the ends of

Rush Nut Flowering.

long Strings, something like to the manner of growing of the *Virginia Potatoes*, of a pale reddish color on the out side, and white and firm within, of the bigness of large Beans. They have a sweet Smell, no bitter or aromatick Taste, as the other Sweet Cyperus or *English Galangal* has; but they are pleasant to the Taste, eating like Chestnuts, or rather more delicately. The Leaves of this Plant are long and narrow like the other Cyperus's in Chap. 187. foregoing, with a thick Ridge in the middle, and sharp pointed, being about half a Yard in length, from among which rise up the Stalks, smooth and without joints, three square or triangular, very near two Feet high: at the tops of which stand five or six narrow Leaves, compassing the Stalk, and standing like a Star; out of the bottoms of which come forth pale, yellowish spiked Ears, which are the Flowers, and in which lyes the Seed, after that their color is perfectly wasted and decayed. Where note, the Root of

Rush Nut without Flowers.

that without Flowers is not so perfectly delineated as it should be, for sometimes one String has more than one, yea sometimes, two, three, or more Tubers adjoining to them as in the first Cut.

IV. *Johnson* in *Gerard* Describes it thus. The *Italian Trafi* is a Plant that has many small Roots, hanging at stringy Fibres, as our Ordinary Dropwort Roots do; but they are of the bigness of a little Medlar, and have one end flat, and as it were Crowned like a Medlar: and it has also several streaks of Lines, seeming to divide it into several parts. It is of a brownish color without, and white within, the Taste whereof is sweet almost like a Chestnut. The Leaves are very like those of the Garden Cyperus, and never exceed a Cubit in length. It is increased by setting the Roots, at the beginning of November, being first steeped in Water.

V. *Nota.* *Pons* in his Description of *Mount Baldus*, confidently affirms, that he had found it by experience, in suffering the Plant to grow un-

remov'd for three or four Years, that it bears neither Stalk, nor Flower, nor Seed. And *Clusius* in his Annotations on *Bellonius*, Lib. 2. Chap. 40. gives a Figure without Flowers, as if it bears none; but certainly both *Pona* and *Clusius* (if he thought so) might be both as much deceived in this matter, as they that affirmed the *Colocasia*, or *Arum Aegyptium*, which is the *Carolina Eddo*, in Chap. 241. aforegoing, never bore Flower, which *Columna* has disprov'd. But *Matthioli*, *Cesalpinus*, *Lobel*, *Dodonaeus*, and *Columna*, do all say, that this *Cyperus* or *Juncus efculentus*, has both Stalk, Flowers and Seed, and do give the Figure thereof, in all their Works.

VI. *The Places*. It is said to grow Naturally no where but at *Verona* in Italy: But *Amatus Lusitanus* says, that they are brought out of *Aethiopia* and *S. Thomas Island*; and it is said that they grow in *Sicilia*, and other hot Countries where they are Planted as being a pleasant kind of Food. They would grow no doubt naturally and pleasantly in our *West-Indies*, if they were once Planted there: but with us in *England* they grow in *Gardens*, being nurs'd up with care, but come not up to that absolute perfection which they do in hotter Climates, because they will not abide the extremities of our *Winters*; for as *Camerarius* says, the Roots will Rot, if they be not taken up before *Winter*, and new Planted again in the *Spring* after that they have been for some time before hand laid in Water.

VII. *The Times*. As to the Seasons of its Flowering or Seeding, Authors have observed nothing: but the Roots are taken up for eating, a little before *Winter*, at which time they are then said to be come to their perfection.

VIII. *The Qualities*. They are Temperate in respect to heat or coldness, dryness or moisture, Abiterfive, Aperitive, Pectoral, Analeptick, and Spermatogenetick.

IX. *The Specification*. It is profitable against Obstructions of the Lungs; and to stop Fluxes of the Bowels, as *Diarrhæa*, *Dysentery*, &c.

X. *The Preparations*. You have, 1. The Raw, or Roasted, or Boiled Roots or Nuts. 2. An Emulsion; Cream or Milk. 3. A Decoction made in Beef or Mutton Broth.

The Virtues.

XI. *The Raw, or Roasted, or Boiled Roots*. They are eaten as you eat *Chestnuts*; and so eaten with a Glass or two of *Canary*, *Malaga*, or some other choise Wine, they nourish and restore much, are good against Consumptions; and is said by some Authors to incite to Venery, being eaten for some considerable time. They absorb Acidities, and allay the sharpness of Humors in the Bowels, cool the heat of Urine, and stop Fluxes of the Belly, as *Diarrhæa*'s, *Dysenterias* and *Lienteria*'s.

XII. *The Emulsion, Cream, or Milk*. It nourishes much and restores in Consumptions, more especially if it is made with the strong Broth of Flesh; and so made and taken with some Generous Wine, it more powerfully excites to Venereal actions: In a word, it has all the Virtues of the Simple Roots, but strengthens more speedily and with greater vigor: It eases a violent Cough, and expectorates Phlegm out of the Lungs.

XIII. *The Decoction in Beef or Mutton Broth*. It is made of the Roots sliced or bruised, and so boiled all to a Pap, or Pulp. It has all the Virtues of the Simple Root, and Emulsion or Cream, and may be taken from half a Pint to a Pint, (according to

Age, &c.) Morning and Evening, as ordinary food. It is an excellent thing, and restores Consumptive Persons admirably.

CHAP. DCX.

Of SAFFRON Garden.

I. *THE Names*. It is called in *Arabic*, *Zahafaran* and *Zaffaran*: in *Greek*, *Κροκός*: in *Latine*, *Crocus*: and in *English*, *Saffron*.

II. *The Kinds*. Authors make many Species of this Plant: but we shall give you the History only of the four following sorts, viz. 1. *Crocus Hortensis* & *verus*, The true or Garden Saffron, of which in this Chapter. 2. *Crocus Sylvestris*, The Wild Saffron, commonly called *Crocus*, of which in Chap. 611. 3. *Crocus Pratensis Colchicum*, Meadow Saffron, of which in Chap. 612. 4. *Crocus nothus, Carthamus*, Bastard Saffron, of which in Chap. 613. following.

III. *The Garden Kind*. This is the *True Saffron*, and is simply called *Crocus*: That which grows in *England* exceeds all others, growing in what part of the World soever: It is a singular Plant of the Kind, and is called *Crocus verus*, *Crocus Hortensis*, and *Crocus Sativus Autumnalis*, The *True Saffron*.

The Description.

IV. Its Root grows often to be as great or greater than a *Green Wallnut*, with its outward Shell or Green on it, covered with a grayish or Ash colored

Saffron Garden Flowering.

Skin, which breaks out into long hairy Threads, otherwise than in any other Root or Crocus. From which Root Spring forth first some narrow, long, green Leaves, and after a while, about the end of August, in September and October, the Flowers come forth from among their middle, which are mean, or large and fair, according to the goodness of the Soil, and Climate, in which they grow. These Flowers are as large as any of the Flowers of the Wild Kinds in the following Chapter, composed of

Saffron Garden True.

six Leaves apiece, of a murky or reddish purple color, having a shew of blew in them: in the middle of these Flowers there are some small yellow Chives standing upright, which are as unprofitable, as the Chives in any of the other Crocus's or Wild Saffrons in the following Chapter. But besides these, each Flower has two, three, or four greater and longer Chives, hanging down upon, or between the Leaves, which are of a fiery red color, which are the true Blades of Saffron, which we daily used in Food and Medicine, and no others. All these Blades being pickt from the several Flowers, are laid together in Cakes, and so pressed, and then dried cautiously in a Kiln, or Stove, to preserve them, just as you see the Saffron Sold in the Shops. We never saw or heard that the Flowers yielded Seed whether in England, or any other Country where ever it yet grew.

V. Gerard describes this plant after this manner. Its Root is small, round and bulbous. The Flower does first rise out of the Ground nakedly in September, and consists of six small blew Leaves, tending to purple, having in its middle many small yellow Strings or Threads, among which are two, three, or more thick fat Chives, of somewhat a reddish and fiery color, and of a strong Smell when they are dried. Shortly after the Flowers, come forth small, long, grassy Leaves, the Plant never bearing its Flowers and Leaves at once or together. We have here given you two Figures of the True Gar-

den Saffron, which do yet set forth but one and the same Plant, the first shewing it in its prime state of Flowering; the second in its small, long, grassy Leaves.

VI. The Places. It is a Native of England, and in our Island the best Saffron in the World grows. The best Saffron is said to grow at Saffron Walden in Cambridge-shire, and places adjacent thereto; also most excellent Saffron grows in several places in Wales: but besides it grows plentifully in Spain, Italy, Barbary, Germany, Flanders, France, and several other Countries of Europe.

VII. The Times. The Times of its Flowering are at the end of August, and through all the Month of September, and sometimes in October if the Weather is mild: presently after the Leaves spring up, and remain green all the Winter. It looses its Fibres with its Leaves, and may then be taken up, and kept dry until August; but the Roots of this Garden Kind (which are bigger than of any other Crocus, and are covered with a hairy Skin, and so easily to be distinguished from all others) are generally taken up but once every third Year, which is often enough; and then the Ground is to be prepared again for their replanting.

VIII. The Qualities. It is hot in the second, and dry in the first Degree; a little Astringent or Binding, Digestive, Cardiack, or Cordial, Analeptick, and Alexipharmick.

IX. The Specification. It is profitable against Convulsions, Fainting and Swooning Fits, Palpitation of the Heart, Measles, Small Pox, Spotted Fever, and the Plague or Pestilence, as also all other Malign and Contagious Distempers: It is said also to cure Consumptions, or Ulcers of the Lungs, and most dangerous Asthma's, the Yellow Jaundice, and all Diseases of the Eyes: It provokes Urine and the Terms, facilitates the Birth, and brings away the After-birth, and causes a due cleansing.

X. The Preparations. You may have therefrom, 1. A Powder of the Saffron. 2. An Infusion in Wine. 3. An Infusion in Fennel, or Damask Rose Water, or Milk Water, or in Womens Breast Milk. 4. A Tincture. 5. Tinctura Croci Composita, A Compound Tincture of Saffron. 6. A Spirit. 7. A Distilled Oil. 8. An Extract, or Essence. 9. An Oil by Insolation, or Infusion.

The Virtues.

XI. The Powder. Given from 10 Grains to a Scruple in a little Syrup of Citron Peels, or in a Glass of Generous Wine, it is said to cure the Asthma, even the most dangerous shortness of Breath, and difficulty of Breathing, and that when it is said that Death as it were stands at the Door. It is also a special Remedy for Consumptions, or Ulcers of the Lungs, taken Morning and Night, more especially if exhibited in a half a Dram, or a Dram of Balsam of Peru. And given in a Glass of Madera, or other Generous Wine, it is good against Surfeiting, Concocts crude and raw Humors of the Stomach, opens Obstructions of the Lungs, Liver, Spleen and Womb, revives the Spirits, and cheers the Heart.

XII. The Infusion in Wine. It has all the former Virtues; but is not altogether so powerful as the Tincture following. And is thus made, Take choise Canary a Quart; of the best English Saffron an Ounce; mix, and Infuse in a cold Digestion for 40 Days or more, shaking the Bottle once every Day; let it settle, and decant the clear: to the
Feces

Frees put a Pint more of the same Wine, digest 3 Weeks, shaking the Bottle once every Day, and then letting it stand till it is settled, decant the clear into the former Infusion, and so keep it for use. Sixty or eighty Drops may be given of it at a time in a Glass of Wine, against Fainting and Swooning Fits; as also it may be given in Barly Broth, or other proper Vehicle, as Aqua Mirabilis, against the Measles, Small Pox, Spotted Fever, and the Plague or Pestilence, as also against all other Malign and Contagious Diseases, both as a Prophylactick or Preservative, and as a Curative. It provokes the Terms in Women, and facilitates the Birth of Women in Labour, bringing away the After-birth, and causing a due cleansing afterwards; but then it ought to be given from half a Spoonful to a Spoonful at a time, in a Glass of White Port Wine Mull'd, and to be repeated according at you see need requires. Dropt into the Ears it is good against Pain and Deafness.

XIII. The Infusion in Fennel, or Damask Rose Water, or in Milk Water, or in Womens Breast Milk. It cures Diseases and Soreness of the Eyes, Blood-shot, and the like; and is of excellent use to preserve them from being hurt in the Small Pox or Measles, being dropt into them, defending them from the Flux of Humors, which is apt to fall upon them.

XIV. The Tincture. It is made by mixing an Ounce of the best English Saffron with a Quart of Spirit of Wine in a cold Digestion for 40 Days, shaking the Bottle once every Day, if half an Ounce of Cochinele be added to the Saffron, and 2 Ounces of the best rectified Spirit of Salt, digesting cold, as aforesaid, and then decanting the clear Tincture; it will be of double strength, and have all the Virtues of the Powder and Infusion in a superabundant manner. It cheers the Heart, relieves Melancholy, and enervates the Venom of Malign Diseases: being profitable against the very Plague or Pestilence it self, defending the Head, Brain, Nerves, Stomach, Heart, and Vital Powers from the Contagion, and the very extream force of the Disease. It may be given from half a Dram to a Dram, or 2 Drams, according as the exigency requires, in any proper Vehicle. You may also make it thus, Take choise English Saffron an Ounce; Spirit of Saffron, or Tincture of Salt of Tartar a Quart; put them into a Bolt Head, and digest cold, or in a very gentle heat for 8 or 10 Days, then decant the clear Tincture, and keep it for use. It has all the former Virtues, besides which it is good against Hysterick Fits, Convulsions, Palpitation of the Heart, Sickness at Stomach, and other like Distempers. Take Angelica, or Bawm, or Borage Water, 3 Ounces, Syrup of Citron Peels 1 Ounce, Tincture of Saffron 1 Dram, mix for a Cordial in Fainting and Swooning Fits, Convulsions, &c. Take Angelica Water, Treacle Water, of each an Ounce, Syrup of Clovegillflowers 6 Drams, Tincture of Saffron a Dram and half, mix for a Dose, to be given in Malignant Fevers, Small Pox, Measles, Plague, &c.

XV. Tinctura Croci composita, The Compound Tincture of Saffron. Take choise English Saffron an Ounce and half; Cochinele in fine Powder an Ounce; Cloves, Nutmegs, Virginia Snake Root, Winters Cinamon, Mace, of each 6 Drams all in Powder; Spirit of Saffron, or Tincture of Salt of

Tartar, 3 Pints, or something more: Spirit of Salt 2 Ounces: mix, digest in a Bolt Head close stop for 8 or 10 Days, then decant the clear Tincture and keep it for use. It has all the Virtues of the Powder, Infusion, and Simple Tincture, but is more potent to all the said purposes and Intentions, and may be given in the same manner and Dose. Take Hydropiper Water, choise Canary, of each 2 Ounces; Syrup of Pennyroyal an Ounce; of this Tincture 2 Drams, or more; mix them for a Dose, to facilitate the Birth, or bring away the After-birth.

XVI. Spirit of Saffron. It is made as you make Spirit of Lavender, and other like things. It strengthens and fortifies the Heart, comforts all the Spirits, Natural, Vital, and Animal, provokes the Terms, and facilitates both Birth and After-birth. The Elxir is much better than the Spirit, being the Potestates Croci impregnated with the Saffron it self; but it is a thing rare, or very difficult to be obtained, by reason it is so chargeable a Medicine.

XVII. The Distilled Oil of Saffron. It is Drawn like other Vegetable Oils with Water; so have you a Water and Oil of Saffron together, from which the Oil is to be separated, with a separating Funnel. It is very costly, for a Pound of Saffron will yield but one Dram of pure Oil. It has all the Virtues of the Powder, Tincture, and Spirit, and may be given from 2 to 6 Drops in any proper Vehicle. But some cheating People make a Counterfeit Oil of Saffron, thus, Take choise Saffron a Pound, impregnate it with Oil of Turpentine an Ounce; Spirit of Wine 10 Drams: Distill from Water with many Cobobations, then separate the Oile from the Water. It is useful for the purposes aforementioned, and for external Disaffections of the Nerves, Muscles, and Joints, as Pains, Aches, Gouts, Cramps, Palfies, &c.

XVIII. An Extract, or Essence. It is made by evaporating the Tincture to a due Consistence. It has all the Virtues of the Tincture but not so potent, because many of its Volatile and Spiritual parts are lost; but if the Spirit be evaporated or drawn off in Balneo, you may keep it for Spirit of Saffron. Take Extract of Saffron an Ounce; Mithridate half an Ounce; Virginia Snake Root, Cochinele in Powder, of each 3 Drams; mix them. Dose 1 Dram Morning and Night, against Fainting and Swooning Fits, Measles, Small Pox, Plague, difficult Labor, &c.

XIX. Oil of Saffron by Insolation or Infusion. It is Anodyn, comforts the Nerves, Muscles, and Joints, eases pains of the the Stomach and Spleen, and ripens Apoplems, &c. See more of Saffron, in our Sepiasium; Or, Druggists Shop, Lib. 8. Chap. 4. Sect. 4.

CHAP. DCXI.

of SAFFRON Wild;

Commonly called,

CROCUS.

I. **THE Names.** It is called in Greek, *Κρυός* *ayēs*; in Latine, *Crocus Sylvestris*: and in English, *Wild Saffron*, but more commonly by our Gardiners and Florists, *Crocus*, and *Crocus's* when speaking of the several Kinds thereof.

II. **The Kinds.** There are several Species of this Plant. As they are denominated from their Times or Seasons of Flowering, which are, *First, those of the Vernal Kinds*, or which Flower in the Spring, which are I. *Those of a white Color*, II. *Those of a Purple Color*. III. *Those of a Yellow*. under every one of which Colours there are several Varieties. Secondly, *Those of the Autumn Kind*, or which Flower in the Fall of the Leaf. The several Varieties of all these general Species are so many that we shall not trouble you with the Catalogue of their Names in this Paragraph, but rather give you each of them in their order as we shall now describe them.

The Descriptions.

I. Vernal White Crocus's.

III. 1. *Crocus vernus albus perfectus minor*, The Vernal or Spring smaller pure white Saffron Flower, or Crocus. Its Root (by which it is plentifully encreased) is small, round and flat at Bottom, something White on the outside, but whiter within, shooting out small Sprouts on every side thereof, which is the best Observation to know this kind, and the lesser Purple by their Roots being both alike, and differing from all other, the Roots of the Saffron Flowers or Crocus's. This small Crocus springs up in the beginning of the Year, with three or four small green Leaves, something broader, and much shorter than the true Saffron in the former Chapter, each Leaf having a white Line down its middle, between these Leaves out of a white Skin, rises up one or two small Flowers, consisting of six Leaves a piece, as all the rest in general are, of a pure white Color, without any Mixture in it, which abide not in Flower above a Week or scarcely so much, so quickly is the delightful Appearance of this, and the purple Crocus, lost. It flowers not for the most part untill a Month after the flowering of the yellow Crocus, and ordinary stript Crocus's are past. The Seed is small, round and reddish, yet not so Red as the Seed of the Yellow, contained in three cornered Heads, which yet notwithstanding, very seldom bears so as to be fruitful.

IV. 2. *Crocus albus major multiflorus*, The great Snow White Crocus. This greater Saffron Flower or Crocus rises up usually with three or four green Leaves, larger than the former, with a white Line in every one of them. The Flowers are greater and more in Number, rising together, but flowering one after another, of a pure Snow white Color, and continuing but a little longer in Flower than the former.

V. 3. *Crocus albus major alter*, *Mesiacus Diffus*, The other great White Saffron Flower or Crocus, or Crocus of Mesia. Its Root is not covered with any reddish Skin, but rather with a pale Tunicle or Coat. This great White Mesian Crocus rises up out of the Earth, almost as early as the first sort of the yellow, with four or five Leaves, being very like unto the Leaves of the Yellow Crocus, and as large, with white Lines in them. The Flowers also are as large as the Flowers of the Yellow, and many likewise, rising one after another, like unto it, but not of so pure a white Color, as the former last described, but rather tending to a Milky or Cream Color.

VI. 4. *Crocus albus Mesiacus fundo violaceo*, The great Mesian white Crocus with a blew Bottom. This Kind is like unto the former in all things, saving that the bottoms of the Flowers, with some part of the Stalk next the Flower, are of a pale shining purple color, and rising up a pretty way into the Flower: whereas another also of this Kind, has a little shew or mark of blew, and not purple, at the bottom of the Flower only, which makes the difference.

VII. 5. *Crocus albus fundo purpureo*, The white Crocus with a purple bottom. This is of the same Kind with the first, as well in its Root, as in its Leaf and Flower, in none of them differing from it; but that in the bottom of this Flower, with that part of the short foot Stalk next unto it, is of a Violet or purple color, and sometimes having here and there some small purple Lines or Spots on the white Leaves. Its Flowers also with the first White, or something later.

VIII. 6. *Crocus Vernus albus striatus*, The striped white Crocus. Its Root is white on the out side like the first White, but greater, with young ones growing round about it. This Stript Crocus is likewise near a kin to the first White Kind, having the like Leaves and Flowers, somewhat larger, but fading almost as soon as they: but herein this Flower differs, that it has pale blewish Lines and Spots, in all the Leaves thereof, but more especially on the three outward Leaves.

IX. 7. *Crocus Vernus albus polyanthos versicolor*, The greater particolored white Crocus. Its Root is something like the Second White, but of a little more dusky color on the out side, and not budding out on the sides, or but very little. This Greater particolored Crocus has its green Leaves like unto the Second great white Crocus before described, at Sect. 5. having more Flowers than any of the former, except the First great White at Sect. 4. above, the Leaves whereof have greater Stripes than the last described Crocus, but of a purple Violet color, making each Leaf seem oftentimes to have, as much purple as white in them.

X. 8. *Crocus Vernus albus versicolor minor*, The lesser particolored white Crocus. Its Root is like unto the last, and its Leaves and Flowers, are for their bigness equal in a manner with them: but it has not so many Flowers rising together from the Root. The Flower is finely mark'd with blew Strakes on the white Leaves, but nothing so much as in the former.

XI. 9. *Crocus Episcopalis*, The Bishops Crocus. This Flower is particolored, and is very like both in its Leaves and Roots unto the Neapolitan blew Crocus, but something larger. The Flowers do abide not so long a time blown, and have all their Leaves wholly white, with blew Stripes on both sides of them, or wholly of a fine delayed blew Violet color, and the three inmost more blew, and finely Striped, both on their insides and outsides, and sometimes it has been seen to have 3 Leaves white, and 3 Leaves of a pale blew.

XII. 10. *Crocus Vernus striatus vulgaris*, The common striped Crocus. This is another sort of striped Flower, which is the most common and plentiful in almost every ones Garden; it is here brought under the Classis of the White Kinds, tho it differs signally in its Root, Leaf and Flower from them all. Its Root is differing from all the former, being rounder and bigger than any of them; except the Mesian Kinds, yet something flat withal, not having any Shoots from the sides, but setting off into Roots or little Bulbs plentifully, having a round Circle encompassing the bottom of the Root, which easily falls away, when it is taken up out of the Ground, and covered with a brown Coat, something near the color of the Yellow Crocus, but not altogether so bright. The Leaves of this rise up sooner than the Leaves of the Yellow or White Crocus's, lying spread upon the Ground for the most part, and narrower than any of the former. From among these Leaves spring up several Flowers, almost as large as the former Great white Crocus, of a very bleak or pale purple color, tending to white on the inside, and in many almost white, with some small whitish Chives, tipped with yellow in the middle. The three outward Leaves are of a yellowish white color on their back side, striped every one of them with 3 broad Stripes, of a dark murky or purple color, and a little sprinkled with some small purple Lines on both sides those Stripes, but on the inside, of the same pale purple or white color with the rest. The Seed hereof is somewhat darker colored, than that of the White, and is more plentiful in bearing.

XIII. 11. *Crocus Vernus striatus Turcicus*, The Turkey striped Crocus. The Flower of this Kind is a little larger, and of a deeper purple color, both on the inside, and on the outside: the green Leaf is also bigger, and of a more whitish hue.

XIV. 12. *Crocus Vernus capillaris folio albus*, The small Leaved, or Grass Leaved white Crocus. This White Crocus is in all things like unto the purple of the same Kind in Sect. 27. following, but that the Flower of this is whitish white; the full Description whereof, therefore we shall here forbear, for that you will have it at large in the said Sect. 27. to which I refer you.

XV. 13. *Crocus plumatus pallidus*, The pale Feathered Crocus. It is something like the White Crocus Masfacus, but larger, and not so round pointed. The Stalk and bottom of the Flower is blew, like unto it. The three outward Leaves on the backs or outsides are all white, or Silver colored; and on their insides finely striped with smaller and longer Stripes of a pale bluish purple. The three inner Leaves are striped with the same color, but smaller on both the sides thereof: this is not so common as many of the others are, and is indeed one of the best we have.

XVI. 14. *Crocus Imperialis*, The Imperial Crocus. It has many Flowers rising from one Root, which are of a Silver color, striped on the backs of the Leaves with purple, which when they are open, are seen through on the other side. This encreases so fast, that it is grown very common. Of this Kind there are two other, the one larger, and the other smaller, and of the same fashion, and color, and marking.

XVII. 15. *Crocus Regalis*, The Royal Crocus. It is like to the Imperial but larger, and better striped with deep purple, more especially in the backs of the three outward Leaves. From the Seeds of this, several varieties have been raised, differing from the Original, some being larger, others smaller, and striped with deeper or paler purple: but in all these Flowers the White has the Mastery, and therefore they are numbered with that color.

II. Vernal Purple Crocus's.

XVIII. 16. *Crocus Vernus purpureus minor*, The smaller purple Crocus. This has its Root, and green Leaves so like unto the first White Flower'd Crocus, that they can scarcely be distinguished, only they seem to be a little narrower. The Flower is also much about the same bigness, or a little bigger, and seldom bears above one Flower from a Root, even as the first does, of a deep purple Violet color, the bottom of the Flower with the upper part of the Stalk next thereunto, being of a deeper or blacker purple; in the middle of the Flower, are some small pale Chives, tipped with yellow Pendants, and a longer Pointel, divided or forked at the top. It bears Seed very sparingly as the White does, and is reddish like unto it, but recompenses that defect with a plentiful encrease by the Root; and flowers at the very same time with the White, and enluring as little a while. Its Root is in all things so like unto the first White, that it is impossible for the wisest and most conversant therein, to know the one from the other.

XIX. 17. *Crocus Vernus purpureus maximus*, The greatest purple Crocus. Its Root is like unto that of the Greater blew Neapolitan Crocus, which is flat and round, with a dusky colored outside, whose Head for springing in it, is scarcely to be discerned. It is of the same Kind with the Neapolitan as well in its Leaf as its Root, but greater: for the green Leaves hereof are the greatest and broadest of all other Crocus's, with a large white Line in the middle of every one: it springs up much later than the former, and does not shew its Flower till a good while after the other is past. The Flowers also are the largest of all these Spring Crocus's, and equalling, if not surpassing that Purple Kind which flowers in Autumn, hereafter described, of a very fair, and deep Violet color, almost as deep as the former. The Seed Vessels are large also and white, in which is contained pale reddish Seed, like unto the Neapolitan blew Kind, but something greater.

XX. 18. *Crocus Vernus purpureus alter Apicibus albidis*, The purple Crocus the tops of whose Flowers are whitish. This Species of the Purple, has the tops of its purple Flowers whitish for the breadth of half the Nail of a Man's Hand, and abides constant every Year in that manner, and in that thing it only or chiefly differs from the last before described, being of the same Species.

XXI. 19. *Crocus Vernus Neapolitanus*, free, *Ceruleus major*, The greater blew Crocus of Naples, or Greater Neapolitan blew Crocus. Its Root is not very great, but a little dark on the outside, being round and flat withal, so that one can hardly know which is the upper side thereof. It rises up with divers green Leaves broader than any of the former, except the *Purpureus maximus* at Sect. 19. above, with a white Line running down the inside of every Leaf, as in that: from among which rises up (out of divers great long white Skins) several large white Flowers, but not fully so great as those of the *Maximus* at Sect. 19. consisting of six Leaves apiece, of a paler blew or Violet color than in the said *Maximus*; having in the middle of the Flowers, a few pale Threads tipped with yellow, and a longer Pointel of a Gold yellow color, forked or divided at the top, smelling sweeter than the *Maximus*, and abiding a great while longer, being in Flower usually even with the Striped yellow Crocus, or before the *Maximus*, and yielding greater plenty of Seed.

XXII. 20. *Crocus Neapolitanus precocior*, The more early Neapolitane Crocus. This Species differs very little from the former, either in its Root, Leaf, or Flower, whether for Largeness or Color; saving that it seems to be of a little bleaker or paler blew, and that it flowers something earlier.

XXIII. 21. *Crocus Vernus purpureus striatus*, The Striped Purple Crocus. Its Root is like unto the first Neapolitane, and Flowers much about the same time with it: Its Leaves are also as large and broad as those; and rather a little longer. The Flowers are also as plentiful and as large, of a fine Diluted Purple Colour on the outside, with three broad streaks or lines down the back of the three outward Leaves, and of a little deeper Purple on the inside, as the other three Leaves also are, and striped with the same deep Purple about the ground or bottom of the Leaves. This sometimes yields three square Heads, containing in them brownish Seed.

XXIV. 22. *Crocus Vernus purpureus versicolor*, The Silver striped Purple Crocus. The Root of this is not so flat as that of the Neapolitane, tho' like it, and covered with a dark Ash Coloured Skin. It is in its Leaves and flowers something like unto the last before Described, but a little smaller: The Flowers are of a little deeper Purple through the whole Leaves, striped with white Lines, both on the Leaves and towards their edges, which makes it a peculiar Species from all the rest, and it flowers about the same time.

XXV. 23. *Crocus Purpureus Flammeus major*: The greater Purple Flame Coloured Crocus. Its Root is White on the outside, somewhat flat and round, but not so flat as the Neapolitane Crocus before described. Its green Leaves are of a reasonable length and breadth, and of a Pleasant fresh Greenness, with a fair broad white Line down their middles, but not rising out of the Ground so early as the next described Crocus. The Flowers are likewise of a mean bigness, of a pale Purple on the outside, something whitish, especially the three outward Leaves, but on the inside of a deeper Purple, and striped with great Stripes like Flames, having some Chives in the middle, and a longer one also feathered a little at the top.

XXVI. 24. *Crocus Purpureus Flammeus minor*, The lesser Purple Flame Coloured Crocus. Its Root is very like unto the former, but a little lesser. It has almost as broad and long green Leaves as the former, and of the same Greenness, which rise up earlier than they. It is in Flower something before that, and its Flower is a little smaller, but of as deep a Purple on the outside, as on the inside: Flamed with fair broad Stripes from the middle of the Leaves, or somewhat lower, unto the Edges; each of these give Seed of a pale reddish Color.

XXVII. 25. *Crocus Vernus Purpureus Capillarisfolio*: The Purple Crocus, with small or almost Grass like Leaves. Its Root is very small and round, having one side at bottom lower than the other, very like the Roots of Colchicum, or Meadow-Saffron; and something near resembling also the Hoof of an Horse Foot, covered with a very thick Skin, of a dark or blackish brown color. This small Crocus rises out of the Earth with two or three long and small green Leaves, very like unto the Leaves of the fine Feather-Grass, standing upright at first, but afterwards lying upon the Ground. From among which, come forth the Flowers, sometimes three, but most usually two upon one Stalk, if the Root be not young, which then will bear but One on a Stalk, which is very short, so that the Flowers scarcely rise above the Ground, yet laying themselves open in the Day time if it is fair, and the Sun shines; otherwise they remain close, and open not at all. And

after one Flower is past, which does not continue above 3 or 4 Days at most, the others follow, which are of a bleak bluish Purple in the middle of the Flower, and of a deeper Purple towards the ends or points of the Leaves, but of a more dull or dark Purple on their outsides, and yellowish at bottom, with some yellow Chives in the middle. The Seed is small, and darker coloured than any of the former Crocus's, contained also in smaller Heads, standing one by another upon the same short Footstalk, which then rises up a little higher, shewing the manner of the standing of the Flowers, which in their Flowering time could not so easily be discerned. This Flowers the last of all the former sorts of Crocus's, even when they are all past.

XXVIII. 26. *Crocus Vernus Purpureus Striatus Capillarisfolio*, The Striped Purple Crocus with Capillary or small Leaves. The Root of this is somewhat larger than the former, and rounder, but covered with as thick and as brown a Skin. This small Crocus has such like Leaves as the last Described; from among which, rises up the Flower upon as short a Footstalk, consisting of six Leaves like the former, of a fair Purple color on the outside of the outward Leaves, with three Lines or Streaks down each Leaf, of a deeper Purple color; and on the inside of a paler Purple, as the other three Leaves also are, with some Chives tips with yellow Pendants, and a forked Pointel in the middle. It flowers about the same time with the former.

XXIX. 27. *Crocus Plumatus Purpureus*, The Purple Feathered Crocus. This is like the greater Purple, but a little bigger and rounder pointed; the three outward Leaves of the Flowers, are of the same Purple color, and feathered with white on both sides thereof; the three inner Leaves are thick Striped with White upon a paler Purple on both sides likewise: And this is accounted the best of all the sorts of Crocus's, which have hitherto come to our Knowledge.

III. Vernal Yellow Crocus's.

XXX. 28. *Crocus Vernus luteus, sive Masficus*, The yellow Crocus, or Mesian Crocus. Its Root is great and round, as great or greater than a Walnut sometimes, and covered with reddish Skins or Coats. It rises up with 3 or 4 Leaves out of the Ground, being somewhat near the breadth of the Great purple Kinds, with a white Line in them, as in most of the rest. The Flowers grow out from the middle of of these Leaves, and are very large, of a Gold yellow color, with some Chives, and a forked Point in the middle. The Seed hereof is of a brighter color, than in any of the other. This Plant yields more store of Flowers than most of the former, and begins to blow with the first sorts, or presently after, yet out lasts many of them, the Flowers being of a pleasant good Smell.

XXXI. 29. *Crocus Vernus luteus Flore aureo*, The yellow Crocus of a deeper Gold yellow color. This is of the same Kind with the former, but its Flowers are of a deeper Gold yellow; so deep, that they appear reddish withal.

XXXII. 30. *Crocus Vernus luteus Flore pallido*, The pale yellow Crocus. This is another Kind very like the former, whose Flowers are very pale, between a white and a yellow, but not differing from it, in any thing else.

XXXIII. 31. *Crocus Vernus luteus Flore viridante luteo*, The greenish yellow Crocus. This is a Crocus something smaller than the former; and

its Flower has a shew of greenness in the yellow, and also more green at the bottom.

XXXIV. 32. *Crocus Vernus luteus maximus*. The greatest yellow Crocus. This is like the First yellow Crocus at Sect. XXX. above, being a variety raised from the Seeds thereof. The Flowers are of a deep yellow color, and as large as the Greatest Purple, for which thing it is very much esteemed.

XXXV. 33. *Crocus Vernus flavus striatus*. The yellow striped Crocus. Its Root is very like the Root of the First yellow Crocus at Sect. XXX. foregoing, but something smaller and shorter, and covered with the like reddish Skins, but a little sadder. It rises up with a greater store of narrower and greener Leaves than the First Yellow, and after the Leaves are spread, many yellow Flowers rise up from among them, which are not of so bright and fair yellow color, but more dead or dull, having on the backside of each of the 3 outermost Leaves, 3 small Stripes of an overworn or dull purple color, with some Chives, and a Pointel in the middle. It Flowers not so early as the First Yellow, but abides almost as long as it.

XXXVI. 34. *Crocus Vernus luteus versicolor primus*. The best Cloth of Gold Crocus. Its Root is easily known from the Roots of any other Crocus, because the outward Feelings or Shells, are hard and as it were Netted on the outside, having certain Ribs, rising up higher than the rest of the Skins, made in the form of Network, of a dark brown color, and withal, it is smaller and rounder than the former Yellow, and encreases not so plentifully by the Root. This is the fairest Cloth of Gold Crocus, and rises up very early, even with the first Crocus's, with 3 or 4 very narrow and short Leaves, of a whiter color than any of the former, which quickly after sends forth its Flowers, rising from among the Leaves out of the same white Skin, which includes also the said Leaves, but they are not so plentiful as the former Yellow, being but 2 or 3 at most, of a fair Gold yellow color, yet something paler than the First Yellow, having on the back of the 3 outward Leaves, 3 fair and great Stripes, of a fair deep purple color, with some small Lines at the sides or edges of those purple Stripes. On the inside of these Flowers there is no sign or shew of any Line or Spot, but wholly of a fair Gold yellow, with Chives, and a Feather top Pointel in the middle. The Seed of this is like the former, but not so red.

XXXVII. 35. *Crocus Vernus luteus versicolor alter*. The second Cloth of Gold Crocus, or Duke Crocus. There is no difference either in the Root, Leaf, or color of the Flowers, or time of Flowering, in this Kind, from the last before described: for the Flowers of this are of the same bigness and color, the chief variation of this from that, being in the marking of the three outward Leaves, which in this have not 3 Stripes as they have, but are wholly of the same deep purple color on their backs, saving that their edges are yellow, which is the form of a Duke Tulip, from whence came the name of a Duke Crocus.

XXXVIII. 36. *Crocus Vernus versicolor palido luteus*. The pale Cloth of Gold Crocus. The Root of this is Netted like the others, which shews that this is but a variation of the same Kind. This third sort of Cloth of Gold Crocus has Leaves and Flowers like the former, but differs in this, that the color of the Flower is of a pale yellow by much, but Striped in the same manner as the first of this Kind, with a fainter purple color.

XXXIX. 37. *Crocus Vernus versicolor albo dilutus*. The Cloth of Silver Crocus. The Root of this is also Netted as the others are, which shews it is a variety also of the same Kind. The chiefest note

of difference in this is, that being as large a Flower as any of the former of this Kind, it is of so pale a yellowish white, that it is more white than yellow, which some do call a Butter color. The 3 outward Leaves are striped on their backs with a paler purple blew shining color, the bottom of the Flower, and the upper part of the Stalk, being of the same purple blew color.

IV. Autumnal Crocus's.

XL. 38. *Crocus Byzantinus argenteus*. The Silver colored Autumn Crocus. Its Root is pretty big, and rounder than any other Crocus, without any Flat bottom, and covered with a dark russet Skin. It springs up in October, and seldom before, with 2 or 4 short green Leaves at first, but growing longer afterwards, and in the midst of them, presently after they have appeared, one Flower for the most part, and but seldom two come forth, consisting of six Leaves, the three outwardmost whereof, are something larger than the other three within, and are of a pale bleak Blew Color, almost White, which many call a Silver Color, the three innermost Leaves being of a pure White, with some yellow Chives in the middle, and a longer Pointel, ragged or feathered at the top. This very seldom bears Seed, but when the Year falls out to be very mild, and then it is small, round, and of a Dark color.

XLI. 39. *Crocus Pyreneus Purpureus*. The Purple Mountain Crocus. Its Root is small and white on the outside, so like unto the Root of the lesser Vernal Purple or White Crocus foregoing, that it cannot be distinguished, until about the end of August, when it does begin to shoot, and then by the early shooting up a white long Sprout for Flower, it may be known. This Purple Crocus rises up but with one Flower usually, but sometimes with two, one after another, without any Leaves at all, sometimes in August, but generally in September, standing upon a longer Footstalk than any other kind of Crocus's, either of the Spring or Autumn, and is as large as the Flower of the greatest Vernal Purple Crocus, of a very deep Violet Purple color, which decays after it has stood blown three or four Days, and becomes more Pale, having in the middle some yellow Chives, and a long feather-top Pointel, branched, and rising sometimes above the edges of the Flowers. About a Month after the Flowers are past, and sometimes not until the beginning of the Spring, there rise up three or four long and broad green Leaves, with a white Line in every one of them, like unto the first Vernal Purple kinds, which abide until the end of May or June. It has not been observed to give any Seed, the Winter coming so quickly on after the Flowering, which hinders its coming to Perfection.

XLII. 40. *Crocus Montanus Autumnalis*. The Autumn Mountain Crocus. Its Root is very great and flat bottomed, covered with a dusky greyish Coat or Skin, and very little, or seldom encreases. It Springs up later than any of the former, and does not appear until the middle or end of October, when all the Flowers of the former are past, appearing first with three or four short green Leaves, like unto the Byzantine Crocus, and afterwards the Flowers between them, which are of a pale or bleak Blew, tending to a Purple, their Footstalks being so short, that at first they scarcely appear above Ground, but two or three Days after, they grow a little higher.

XLIII. The Places. Some of these have been found out in one Country, and some in another, as the

the small *Purple and White*, and *Striped White* in *Spain*. The *Yellow* in *Mesia* about *Belgrade*; the great *Purple* in *Italy*. But the several places of these *Crocus's*, are in part set down in their Titles. These by the help of Friends, have been sent to us from their Native Countiees, and prosper extreamly well with us, and Flourish as well in our Gardens, as in their Primary Native Places. But this is to be Observed, that some of the Species here Described in this Chapter, have been raised up by us, from the Sowing of their Seed. The best place to Plant Spring *Crocus's* in, is close up to a Wall or Pale, or by the edges of Border Boards, round about the Garden, mingling the Colors of those of a Season together, as the *Whites* with the *Purples*. The best Cloth of *Gold*, with the *Royal*, the deep *Purple Feather'd*, with the *Lighter*, and so of the rest. By Observation, most of them may be distinguished by their Roots, and so placed according to the Mind of the Planter; but the aforementioned places are best, for that few other Flowers appear until they are past. Should they be set among *Tulips*, the Gravel Leaves after the Flowers are gone, would more trouble and Disgrace the place, than the Flowers did before Adorn it.

XLIV. The Times. Their several Times are also express'd in their Descriptions, for some bring forth their Delectable Flowers in the Spring, in which for the first three Months, our Gardens are furnished with one Variety or another: The others in *Autumn*, so that both early and late in the Year, we have an Ornamental Appearance. All these several *Crocus's*, both of *Spring* and *Autumn*, loose their Fibres with their Leaves, and must then be taken up and kept dry; those of *Autumn* until *August*, and of the *Spring*, until *October*. They are hardy, and will prosper in any place. The *Vernal* increase exceedingly, if they stand any time unmoved; but the *Autumnal* increase very little. Many more Varieties than are yet Discovered, may be raised from the Seeds of the best Kinds, being Sowed in *September*, and every other Year in *July* removed and set wider, until they bear Flowers, making the Ground light and rich, into which you transplant them, which will make a great addition to their Beauty.

XLV. As to their Qualities, Specification, Preparations and Virtues, Authors have said nothing, nor do we know any thing of them by Experience: They are the Florists property, and more used as Ornaments for the Adorning of Gardens, than for any thing else; and if Wisely managed, will give a singular Delight and Pleasure to the Eyes of the Beholders. And for this Reason it was that we took this Trouble upon us, to insert them into this Herbal.

chicum; and by some *Ephemerum*, (but there are other Plants called by that Name, which are *non Lethale*, or not Deadly, as 1. a Species of *Digitalis* or Fox-Glove. 2. *Lilium Convallium*, Lilly of the Vallies. 3. *Gramen Sericum Virginianum*, or a kind of Silk Grass, (of which we shall speak in its proper place.) It is also called *Colchicum Ephemerum*, *Colchicum Strangulatorium*, (from its suffocating or choking Quality;) and by some, *Bulbus agrestis*, and *Filius ante Patrem*, The Son before the Father, because it is said to give the Seed before the Flowers: But the Roots of this, as of most other Bulbous Plants, after the Stalk of Leaves and Seed are dry and past, may be transplanted, and then it Springs again, and gives Flowers before Leaves; but the Leaves and Seed follow successively after the Flowers, before it can be removed again: So that here is not Seed before Flowers, but contrarily, Flowers upon the first Planting or Springing up, and the Seed afterwards, as in other Plants, tho' in a different manner. In *English* it is called *Meadow-Saffron*, and as often *Colchicum*, which is the *Greek* and *Latine* Name, brought into our Language.

II. The Kinds. They are manifold; as First, some Flowering in the Spring: Secondly, some Flowering in *Autumn*, which are most in number. Again, 1. some are Single Flowered, which are the greatest part. 2. Some few are double Flowered, of all which, because of the many Varieties, we shall here (as in the former Chapter) give you their Appellations or Names, with their Descriptions, as following.

The Descriptions.

III. 1. Colchicum Anglicum album, The white *English Colchicum*, or *Meadow-Saffron*. It is common to all the *Colchic's*, or, *Meadow-Saffrons*, (ex-

Saffron Meadow English White.

CHAP. DCXII.

OF SAFFRON-MEDOW,

O R,

COLCHICUM.

I. THE Names. It is called by the *Greeks*, *Kolchikon*, (so Named from the Island *Colchis*, where it was first found growing;) also *Equisetum*, from its Killing in one days space; in *Latine*, *Col-*

cept that of the Springs, and one other) to bear their Flowers alone in Autumn, or later, without any Green Leaves with them, and afterwards in February their Green Leaves: So that we shall not need to make many long Descriptions, but having given you a full Description of the first, to shew you the differences, which chiefly consist in the Leaves and color of the Flowers; and so briefly to pass from one to another, taking notice only of those Variations which are most worthy of Note. The Root of this our first English kind, is Bulbous or round, and is White within, but without covered with a thick blackish Skin or Coat, having one side thereof, at the bottom, larger than the other, with an hollow-ness also on the one side of that long Eminence, where the Flowers rise from the bottom, and shooting down from thence a number of White Fibres, by which it is fastened in the Ground. This Root remains in the Earth, without shew of Leaf above Ground, most part of the Winter, and in February there Spring forth from it, three or four large and long green Leaves, rising from the top or head of the Root, long after the time of its flowering, which is the Autumn before: These Leaves when they are fully grown up, stand on the top of a round, weak, green and short Footstalk, something like unto the Leaves of White Lillys, but not so large; and in the midst of these Leaves, after they have been up some time, appear two or three loose Skinny Heads, standing in the midst of the Leaves, upon short thick green Stalks, which being ripe, contain in them small round brownish Seed, which lyes as it were loose therein, and when the Head is dry, being shaken, may be heard to rattle. But the Flowers which are not more than three or four at

most, appeared the Autumn before, or just betwixt Winter, standing severally upon weak Footstalks, a Fingers length or more above the Earth, to consist of six white Leaves, something long and narrow, and not so large as most of the other kinds, with some Threads or Chives in the middle, like unto the Spring Crocus's in the former Chapter, without any color of Saffron in them, or any Saffron like Virtues: These Flowers being past, the Leaves appear not yet, but the Root lying with in the least appearance of them, most part of the Winter, they afterwards Spring up in February, &c. as we before declared.

IV. 2. *Colchicum Anglicum purpureum*, The Purple English Colchicum, or Meadow Saffron. This both in its Roots, Flowers, Leaves and Seed, Magnitude, manner and form of Growing, differs not at all from the former, saving only in the color of the Flowers; which as these in the first were wholly White, are in this of a diluted Purple Color, with a small appearance of Veins therein.

V. 3. *Colchicum Pannonicum album*, The White Hungary Meadow Saffron. This in its Root, Leaf, Flower, manner and form of Growing, is like to the first or White English Colchicum; the greatest difference between that and this is, that the former White, is in all particulars lesser than this, and besides, that this has a greater store of Flowers together, which continue longer in their Beauty, without fading, so soon as the former, and are also something of a fairer white color.

VI. 4. *Colchicum Pannonicum purpureum*, Purple Hungary Meadow Saffron. It is something like unto the White of this kind, but that it bears not so plentifully as the White does, nor does the Root grow so great; but the Flowers are in a manner as large as they, and of the like Pale diluted Purple color, or somewhat deeper, as is in the Purple English, with some Veins or marks upon the Flowers, making some shew of a checker on the out-side, but not so conspicuous as in the true chequer'd kinds.

VII. 5. *Colchicum Pannonicum versicolor*, Party coloured Hungarian Meadow Saffron. This is a Species of the fourth or last kind before Described, and differs only from it in this, that the Flowers hereof are Party-colored with white Streaks and Edges, which abide constant: It is thought that this was first raised from the Seeds of the former.

VIII. 6. *Colchicum Byzantinum*, The Byzantine or Constantinople Meadow Saffron. Its Root is in the middle greater and rounder than the others, with a longer Eminence, whereby it may be easily known from all other sorts. Its Leaves are so broad and large, so that one who had never seen Colchicum, could scarcely judge it to be a Species thereof, for that they are much larger than any Lilly Leaves, and of a dark green color. The Flowers are correspondent to the Leaves, larger, and more in number than in any of the former Purple kinds, of the same color with the last Purple kind, but of a little deeper Purple on the inside, with divers Marks running thro' the Flowers, like unto it, or like to Chequers, but yet somewhat more apparently.

IX. 7. *Colchicum*

English Purple Meadow Saffron.

IX. 7. *Colchicum Illyricum*, The true Colchicum, or true Greek Meadow Saffron. This has a great thick and bulbous Root, full of Substance; from which rises up a fat thick and gross Stalk, set about from the lower part to the top with Leaves by equal distances, which Leaves are long, thick and gross, sharp pointed, and not much un-

Saffron Meadow Illyrick,

OR,

The true Greek Colchicum.

like to the Leaves of Leeks; from among which Leaves, come forth yellowish Flowers, very like to the English Colchicum, or Meadow Saffron, but smaller.

X. 8. *Colchicum Lusitanicum Fritillarium*, The Portugal Chequer'd Meadow Saffron. Its Root is like to the Root of the English or Hungarian, without any Difference, but that this grows something greater. Its Leaves do rise up sooner than in any other of the Autumn kinds, for they are always up before Winter, and are four or five in Number, short rather than long, broad below, and pointed at the end, canalled or hollow, and standing round above the Ground, one encompassing another at the bottom, like the great Spanish Star Jacinth, called the Jacinth of Peru, but shorter, and of a pale or grayish green color, differing from the color of all the other Meadow Saffrons. The Flowers are larger and longer than the Flowers of either English or Hungarian, and almost as large as the sixth kind at Sect. VIII. foregoing, and of the same color, but a little deeper; the Spots and Marks whereof, are something more easie to be seen, even afar off, like unto the Flowers of a Fritillary, from whence it took part of its Name. This is one of the first Meadow Saffrons, or Colchicums which flower in the Spring.

XI. 9. *Colchicum Neapolitanum Fritillarium*. The Chequer'd Meadow Saffron of Naples. The Root of this is like unto the Root of the last before Described, but a little bigger, by which the Species is multiplied. This Neapolitan kind is very like unto the Portugal Species last Described, but that its Flower is something larger, yet sometime very near of equal bigness with that; the greatest Note or Mark to distinguish them by is, that the Flowers of this are of a deeper color, and so are the Spots on the Flowers likewise; which are so conspicuous, that they may be discerned a great way off, more like unto the Flowers of a deep fritillary, than the former, and make a more goodly and more Glorious Show. The Leaves of this do rise up earlier after the Flowers, and are something longer, of a darker green color, yet inclining to a grayish color, as those other, not lying so neatly or round, but stand up one by another, being as it were folded together. Neither this nor the Portugal, have given any Seed with us that I have yet heard of, but are both increased by the Root as aforesaid.

XII. 10. *Colchicum Fritillarium Chienfe*, The Chio or Scio Chequer'd Meadow Saffron. Its Root is like unto the others of this kind, but small and long, and not so great. This most Beautiful Flower or Plant, rises up with its Flowers in Autumn, as the others before specified do, altho' not of so large a size, yet far more Pleasant and Delightful in the thick, deep blew, or Purple coloured Beautiful Spots therein; which make it to excel all others whatsoever. The Leaves rise up in the Spring, being smaller than the former, for the most part three in Number, and of a paler or fresher green color, lying close upon the Ground, broad at the bottom, a little pointed at the end, and turning or folding themselves in and out at the edges, as if they were indented. It has not been seen to bear Seed here. Its Flowers later for the most part, than any of the others, not till November, and is very difficult to be preserved with us; for that its Root grows less and less every Year: Our cold Climate being so different from its Native place of Growth, (when by reason of the Warmth of the Season, it Flowers any thing early, that it may have the comfort of the warm Sun, is the Glory of all these kinds of Flowers.

XIII. 11. *Colchicum varicolor*, The party-coloured Meadow Saffron. Its Root is like the former English or Hungarian kinds, but thicker and greater for the most part, and shorter also. Its Flowers do not usually appear, till most of the other Autumn sorts are past, except the last, which are very low, scarcely rising with their Stalks three fingers breadth above the Ground, but oftentimes half hid within the Earth: The Leaves hereof are smaller, shorter, and rounder than in any of the others before specified; some being altogether White, and others wholly of a very pale Purple or Flesh color; and some again parted, the one half of a white Leaf, and the other half of the same Purple; and sometimes striped Purple and White, in divers Leaves of one and the same Flower. And again, some will be the most part of the Leaf white, and the bottom Purple, thus varying as Nature is pleased; for that many times, from one and the same Root, may be seen to arise all these Varieties before mentioned. These Flowers do stand long before they fade and pass away, and have been sometimes observed to keep their Flowers fair until the beginning of January, or till the Extremities of Winter Frosts and Snows have made them hide their Heads. The Leaves therefore do rise up accordingly, after all others, and are of a brownish or dark green color,

at their first springing up, which afterwards grow to be of a deep green color.

XIV. 12. *Colchicum variegatum alterum*: Another party-coloured Meadow Saffron. This is another Plant, whose party-colored Flowers rise a little higher, diversly striped and marked, with a deeper Purple color, and a pale or whitish bluish throughout all the Leaves of the Flowers, in other particulars it is much like the former.

Saffron Meadow Indian, or Assyrian.

XV. 13. *Colchicum Indicum*, *Colchicum Syriacum*, *Colchicum Alexandrinum*: The Assyrian or Indian Meadow Saffron. This has a bulbous Root, and made as it were of two pieces; from the middle cleft whereof, rises up a soft and tender Stalk, set with fair broad Leaves, from the middle thereof, to the top; from among which, come forth one single Flower, like unto those of the Common Meadow Saffron, or the White Anemone of Matthioli's Description.

XVI. 14. *Colchicum Montanum Hispanicum minus*, The small Spanish Meadow Saffron. Its Root is small and long, according to the the rest of the Plant, and like in form to the others. The Flowers are narrower and smaller than any of the former, and of a deeper reddish Purple color, than either the English or Hungarian kinds: The green Leaves are also smaller than any other, lying upon the Ground, of a deep or sad green color, rising up within a while after the Flowers are past, and abide green all the Winter long.

XVII. 15. *Colchicum Montanum minus Flore versicolor*, Small party-colored Meadow Saffron. This small sort differs not from the small sort last Described, but in the Variety of the Flower, which is as small as the former, the three inner Leaves being all White; and the three outward Leaves, some of them Pale or Bluish, and some party-colored, with a little green on the back of some of them.

XVIII. 16. *Colchicum Hermodactylum*, The Hermodactyl, like Meadow Saffron. It has a bulbous or round Root, not much unlike to the Hermodactyl, (which in truth is no Hermodactyl, but a *Colchicum*.) It Springs up with its Leaves in Autumn, before its Flowers appear, which none of the former kinds do. The Flower does (after the Leaves are up) shew it self in the middle of them, consisting of six white Leaves, with drovers Chives in the middle, and passes away without giving any Seed, that has yet been observed. The Green Leaves abide all Winter and Spring following, decaying about May; and appear, or Spring not up again until September following, when (as is said) the Flowers shew themselves, and that presently after the Leaves are Sprung up.

XIX. 17. *Colchicum atropurpureum*: Dark Purple colored Meadow Saffron. Its Root, as also its Seed, are like to those of the English Purple kinds. The greatest difference in this Species, consists in the Flower, which at the first appearance, is of as pale a Purple as the Flower of the former Hungarian kind; but after it has stood in Flower two or three Days, it begins to change, and will after a while, become of a very deep reddish Purple, as also the little Footstalk on which it does stand. The Flower is of the bigness of the Hungarian Purple, and so also is the green Leaf.

XX. 18. *Colchicum atropurpureum variegatum*: The Party colored dark Purple Meadow Saffron. This is another sort of the former kind, differing chiefly in the Flower, which is variously striped thro' every Leaf of the Flower, with a paler Purple color, so that the Flower is of great Beauty. This might seem to be a degenerate Plant from the former, but that it has abode constant in its appearance, in some Gardens for many Years, and gives Seed as plentifully as the former.

XXI. 19. *Colchicum flore pleno*: Double Flower'd Meadow Saffron. This in its Root and Leaf, is very like unto the English kind, the Flowers are of a fine, pale, diluted color, consisting of many Leaves set thick together, which are somewhat smaller, as in the English Flower, being narrow and long, and as it were round at the points, which make a very double Flower, having some Chives with their yellow Tips, dispersed as it were among the Leaves in the middle. It Flowers in September, a little after the first shew of the earlier Meadow Saffrons are past.

XXII. 20. *Colchicum variegatum pleno flore*: The Party color'd double Meadow Saffron. This Plant is diversified from the former in the dividing of its colors, as is seen in the single party colored Meadow Saffron before Described, having some Leaves white, and others pale Purple, and some Leaves half white and half purple, diversly set or placed in the double Flower, which does consist of as many Leaves as the former; yet sometimes this party color'd Flower, does not shew it self double like the former; but has two Flowers, one rising out of another, making each of them to be almost but single Flowers, consisting but of eight or ten Leaves apiece. But this diversity is not constant; for the same Root, which this Year appears in this manner, will the next Year return to its former kind of double Flowers again.

XXIII. 21. *Colchicum variegatum dictum Agrippina*: The variegated Meadow Saffron, commonly called Agrippine. This is of later Discovery than the rest, and has more Variety than any of the former; the Difference chiefly consisting in the color, and marking of the Flowers, which in this, are White and Red interspers'd, or variegated like a Tulip.

XXIV. 22. *Col-*

XXIV. 22. *Colchicum maximum flore pleno*: The greatest double Flower'd Meadow Saffron. This has Flowers much bigger and doubler than any of the former, containing very many round pointed Leaves, of a pale purplish bluish color, spreading open, and forming a Gallant double Flower, far transcending any of the former double kinds.

Meadow Saffrons of the Spring.

XXV. 23. *Colchicum Vernum flore carneo*: Spring Meadow Saffron, of a pale red or deep bluish color. Its Root is small, something like unto the Roots of the former, but shorter, and not having so long an Eminence on one side of the bottom. It rises up very early in the Year, viz. in the end of January sometimes, or in the beginning of February, or middle thereof at farthest, presently after the deep Frosts and Snows are past, with its Flowers inclosed within three green Leaves, which opening themselves, as soon almost as they are out of the Ground, shew their Buds for Flowers within them; very white oftentimes before they open far, and sometimes also purplish at their first appearing, which never shew above two at most upon one Root; and never rise above the Leaves, nor the Leaves much higher than they, while they last. The Flower consists of six Leaves, long and narrow, every Leaf being divided both at the bottom and top each from other, and joined together only in the middle, having also six Chives, tip with yellow in the middle, every Chive being joined to its proper Leaf, which is of a pale red, or deep bluish color, when it has stood a while blown, and is a smaller Flower than any other Meadow Saffron, except the small Spanish kinds only; but continues in its Beauty a considerable time, if the extremity of sharp Frosts do not spoil it. The Leaves wherein these Flowers are inclosed, at their first coming up, are of a brownish green color, which so abide for a while, especially on the outside; but on the inside they are hollow, and of a whitish or grayish green color, which after the Flowers are past, grow to be of the length of a Mans middle finger, and narrow withal. There rises up likewise in their middle, the Head or Seed Vessel, which is smaller and shorter and harder than any of the former, in which is contained small round brown Seed.

XXVI. 24. *Colchicum Vernum atropurpureum*: Purple Meadow Saffron of the Spring. The Flower of this, is in the rising up of its Leaves and Flowers together, and in all things else, like unto the former; only the Flowers of this kind, are at their first appearing, of a deeper Purple color; and when they are blown, are also much deeper than the former; divided in like manner both at bottoms and tops, as the other are; so that they seem, like as if six loose Leaves were joined in the middle parts to make one Flower: It has also its small Chives tip with yellow, cleaving in the like manner to every Leaf.

XXVII. The Places. Where they all grow naturally, is expressed in the Title of almost every Plant: Some grow in Fields and Meadows, and Champion Grounds; and some on Mountains and hilly Grounds. The English kinds grow in the West Parts of our Land, as about Bath, Brisfol, Warmister, and other places also. The Double kinds are said to be brought out of Germany; all the Foreign kinds have been transplanted from their Native Soil into our Gardens, where they now grow as well as in their Natural places.

XXVIII. The Times. These are also declared in their Descriptions; those which Flower earliest in Autumn, Flower in August and September; the later in October; and the latest in the end of October and in November. The two last Flower in the Spring, after the depth and hardness of Winter is past, as in January and February, if Frost and Snow prevent not.

XXIX. Nota 1. The Roots of the Colchica being set about the end of August, or beginning of September, will suddenly put forth Fibres, and shortly after Flowers; being the first blown from the Time of the Setting of the dry Roots, of all others; altho' vulgarly accounted the last, which are indeed the first which Flower; some of them in September, others in October; the first are the Party-colored; the latest are those of Chio.

XXX. Nota 2. They are easily Planted, the Roots loosing their Fibres, which may be taken up as soon as the green Leaves are dried down, and then kept out of the Ground, until the aforementioned time for their Planting. They delight in a moist Earth, but being hardy, will thrive and increase almost in any Soil; only that of Chio is tender, and will not prosper unless Planted in a warm place, where it may have the Comfort of the Sun, and be shelter'd from Frosts, Wet, and Cold in Winter, all which it very ill endures. It is not doubted, but that other fine Varieties may be raised from Sowing of the Seeds of the best kinds. The manner of managing them, is the same with that of Tulips, and other bulbous Roots which loose their Fibres.

XXXI. The Qualities, Specification, Preparations and Virtues, Authors have said nothing of, save that they are deadly, or very dangerous at least, having a Suffocating Quality. The only use we make of them is for an Ornament to our Gardens, and so to gratifie the Florists, and others which delight in things of this Nature, we thought good to introduce them into this present Work.

C H A P. DCXIII.

OF SAFFRON BASTARD:

O R,

SAFF--FLOWER.

Called also,

C A R T H A M U S.

I. THE Names. It is called in Arabick *Kartam*, (whence our Latine Name *Carthamus*: in Greek, *Κάρταμος* & *Κάρταμος*, either *ἀνὰ τὴν καρτάνην*, quod est pungere vel modere: or, *ἀνὰ τὴν καρτάνην*, quod pungendo pruriginem excitet: or, *ἀνὰ τὴν καρτάνην*, quod est purgare as some think. In Latine, *Cnicus*, and sometimes *Cneus*, but for the most part *Carthamus* in Apothecaries Shops, *ἀνὰ τὴν καρτάνην*, quod est Purgare as some think. In English, Bastard Saffron, also *Carthamus* and *Saff-Flower*.

II. The Kinds. It is I. *Cnicus vel Carthamus Sativus*, Garden or Manured Bastard Saffron. II. *Cnicus vel Carthamus Sylvestris*, *Aradylis*, Wild Bastard Saffron, or Distaff Thistle.

III. The

III. The Kinds of the Manured. It is threefold.

1. *Cnicus Sativus*, vel *Urbanus*, *Cnicus* vel *Carthamus vulgaris*, our most common or Manured Bastard Saffron, or Carthamus; which is also called *Saff-Flower*, and is a peculiar Name, distinguishing it from all the other kinds. 2. *Cnicus singularis Alpini*, *Cnicus alter Creticus*, Bastard Saffron of Candy. 3. *Cnicus alter Ceruleo flore Clusij*, (as most Authors call it) and *Cnicus alter perennis Clusij*, Clusius his Everlasting Bastard Saffron. These are the chief Manured Kinds yet taken notice of.

IV. The Kinds of the Atractylis, or Wild Cnicus. Of this there are three sorts. 1. *Atractylis* & *ατρεκτύλις*, *Atractylis*, *Atractylis flore Luteo*,

Cnicus alter Clusij, (because it is so like the first *Cnicus Sativus*) *Cnicus caruleus Camerarij*, *Lobelij*, *Lugdunensis*, *aliorumque*: The yellow Wild Carthamus, or Cnicus, or Distaff Thistle. 2. *Atractylis flore Purpureo*, Purple Distaff Thistle. 3. *Atractylis purpurea Cypria*, Purple Distaff Thistle of Cyprus.

The Descriptions:

I. Garden Cnicus, Carthamus, or Saff - Flower.

V. The first, or our most Common Manured Bastard Saffron, or Carthamus Sativus, called also Spanish Bastard Saffron, and Saff-Flower. It has a Root which is long, great and woody, perishing quickly with the first Frost, or after Seed time.

Saffron Bastard Garden.

It has several large broad Leaves, lying next the Ground, without any Prickles upon them in our Country, or with very few white ones, at the Corners of the Leaves and Divisions; from among which, rises up a strong hard and round Stalk, 3 or

4 Feet high, with shorter Leaves thereon up to the top, and towards the top branching it self forth, which bear yet shorter Leaves, sharp pointed, and sometimes prickly about the Edges; bearing at the end of each Branch, a great open fealy Head, out of which come forth a great many Gold Yellow Threads, of a most Orient and Shining color; when being gathered in a warm dry time, and kept dry, will abide in the same Delicate color, (which they had whilst fresh) for a long time: And this flower is that which is called Saff-Flower, and Sold for the same every where by our Druggists and Dry-Salters. It is Manured in Spain for the profit which is made of it, for the Dying of Silks and other things, and for the Merchandise thereof, Transporting great Quantities of it into several other Countries; but the Flowers which grow with us here in England in our Gardens, are of a fairer and more lively color. When the Flowers are past, the Seed comes, which when it has attained its Maturity, is white and hard, somewhat long and round, and a little corner'd.

VI. The second or Bastard Saffron of Candy. Its Root is thick, long and black, from whence rises up one strait round Stalk, half a Cubit high, or somewhat more; set here and there with long sharp pointed Leaves, thick set with Prickles at the Dents of the Edges: At the top of this Stalk grows a fealy Head, encompassed with prickly Leaves, of the bigness of the Atractylis or Distaff Thistle; out of which spring forth a great many thick, yellow Saffron like Threads, close thrust together; after which comes the Seed, which grows therein, of a white color, and as large as the Seed of the Greater Centory.

VII. The Third, or Clusius his Everlasting Bastard Saffron. Its Root runs down deep into the Ground, and being there increased, does run and

Saffron Bastard Everlasting.

spread it self, taking up a great deal of room. It rises up with several hard strong and round Stalks, without any Branches at all from them, to the height of three or four Feet, bearing thereon at several places, somewhat large and long Leaves, dented about the edges, of a sad or dusky green color. At the top of every Stalk, stands one great close hard scaly Head, but not prickly at all; not so great as the other Cnicus or Bastard-Saffron, never opening the Scales of the Head, as it does: From the middle of which, comes forth a great many Threads (yet nothing so many as in the other) of a sad blewish Ash color, and whitish at their bottoms. The Seed which lies in the Down in these Heads, is greater (as it grows with us) also thick and short, of a brownish color, and fewer in number in each Head.

II. Wild Bastard Saffron, *Atractylis* Or Distaff Thistle.

VIII. The first of this Wild Kind, or Yellow Wild Carthamus, Cnicus or Distaff Thistle. Its Root is whitish and woody, perishing every Year after Seed time. Its lower Leaves are winged, long and narrow, very much cut in on the Edges, very hairy, or as it were a little Hoary, and not prickly whilst they are young, and before the Stalk rises up; but then are harder and more prickly; and still the higher, the more sharp set with Prickles; which rising to be three or four Feet high, are rough, round and branched from the middle upwards; and has at the top of every Branch, a few smaller, but more prickly Leaves, under every prickly Head, which from their middles, shoot forth a few pale yellow Threads, which are the Flowers; and being past, have in them several blackish hard Seeds, somewhat larger than those of

Saffron Bastard Wild.

Or,

Distaff Thistle.

the Garden Cnicus or Carthamus, but lesser than those of the Bastard Saffron of Candy, lodged in Down, but nothing so much in it. The leaves hereof being gently broken (but not bruised) before they grow hard and old, will yield a reddish or bloody Juice.

IX. The second, or Purple Distaff Thistle. This differs not from the last in the form of the Flower, but only in its color, this being of a purplish Red; nor in its Leaves, saving that these are not hairy or Hoary; nor in its Stalk, excepting that it seldom rises so high. In all other things it is so like the former, yea even in the Bloody Juice also, that one would say (without a particular Observation,) that it were the very same plant.

X. The Third, or Purple Distaff Thistle of Cyprus. The whole Stalk and Branches rise to be about a foot and a half in height, it has Leaves like unto the Garden or Manured Cnicus or Bastard Saffron, but lesser, and something Rugged or Crumpled, from among which rises up the Stalks aforesaid, bearing a Thistle-like head at the Top; which sends forth also slender Branches bare or without Leaves, half a foot long or more, having on each of them a small prickly Head, like that on the top of the main Stalk. The Flowers are Purple in the middle, but in some Countries inclining to yellow: and the seed is White, like to that of Cnicus or Carthamus Sativus, or Garden Bastard Saffron.

XI. The Places. The first of the Garden Kinds are Sown in Fields in divers places of Spain, Italy, Germany, England and France: but Pliny, Lib. 25. Cap. 15. says that in the Reign of Vespasian it was not known in Italy; and is accounted by Theophrastus and Dioscorides to be a Manured Plant, so generally Sown for the many uses thereof. The second Alpinus says was brought out of Candy. The Third is a Native of Spain about Sevil and Corduba, and as Clusius says, grows in other places; Pena says upon Mount Baldus.

XII. The Wild Bastard Saffron or Distaff Thistle. The first Species there of Clusius says grows about Sevil and Corduba in Spain. The Second and Third kinds grow in many Countries, as about Mompelien and Narbon in France; as also in Italy, Greece, &c. Angulara says the Third is found growing in Cyprus; and Lugdunensis says he found it in France, but something differing in the color of the Flower. The first of these Wild Kinds more especially grows in our English Gardens.

XIII. The Times. The Three Garden Kinds Flower in the latter end of July or beginning of August; and the seed is ripe about the end of August or beginning of September. The Three Wild sorts Flower about the end of Summer, and the seed is ripe towards the end of August, or in September; but the last of the three flowers and seeds something sooner than the other two sorts.

XIV. Nota. 1. Of these plants the *Atractylis* or Wild Bastard Saffron, has few or no Virtues ascribed to it by Authors, yet Galen says, That it is of a Drying faculty, and moderately digesting. Dioscorides says that if any one is Stung by a Scorpion, he shall feel no pain so long as he holds it in his hand, but being laid by, that the pain will immediately return again. Pliny says, that it is very good against the poison of all kind of Creatures, and is good for such as are poisoned by eating of Muthromes.

XV. *Nota.* 2. Of the *Cnicus*, *Carthamus*, or *Garden Kind*, the first *Species*, called peculiarly by the name of *Saff-flower*, is the chief and principal, and that which is only *Sold in Shops*, and used in *Physick*, and chiefly *Cultivated in all our Fields and Gardens*, both in *England and beyond Sea*, in many other Countries; and of this first kind it is, that all the *Sections of the following Discourse* relate to. But it is true, that the *Second Species*, as *Alpinus* says, is used by some in the same manner, and to the same purposes, to purge with, as that first is. Of the *Third Species* there is little or nothing written by Authors, but by reason of its likeness in form to the first *Species* or *Saff-Flower*, it is thought to possess some of the same *Qualities and Virtues*.

The Qualities, Specification, Preparations, Virtues, Culture, and Cure of Cnicus, Carthamus or Saff-Flower.

XVI. *The Qualities.* The *Flowets* are hot and dry in the first Degree, as *Mesues* writes: *Aperitive, Absterfivè, Vulnerary, Pectoral, Arthritick, Emetick, Cathartick, and Spermatogenetick.* But the *Seed Galen* says, is hot in the third degree.

XVII. *The Specification.* Formerly the *Seed* was only used in *Physick*, which as *Galen* says, *Purges*: Now in our *Days* the *Flowers* are used, and to all the same *Intentions*, besides their *Mechanick Application* for *Dying of Silks, Coloring, Staining, &c.* They are said to *Cure an Asthma*, and all other *Diseases of the Lungs*. The *Jaundice, Dropsy, Gout, Rheumatism, Kings Evil, Impotency in Men, and Barrenness in Women.*

XVIII. *The Preparations.* You may make therefrom, 1. An *Infusion of the Flowers in Chicken, Mutton, or Veal Broth.* 2. A *Tincture of the Flowers in Canary, White Lisbon, White Madera, or White Port Wine.* 3. An *Extrakt of the Flowers with Spirit of Wine.* 4. An *Emulsion of the Seed in Mead or Honied Water, or Chicken Broth.* 5. *Cnicimel or a Lobocho of the Seed with Honey, or Extrakted Juice of Juniper-Berries.* 6. *Diacarthamum.* 7. *Diacarthamum novum.* 8. *Enema, or the Clyster.* 9. A *Powder of the Flowers.* 10. A *pulp of the Seed.*

The Virtues.

XIX. *The Infusion of the Flowers in Chicken, Mutton or Veal Broth.* A dram of the *Flowers* in *Infusion*, opens *Obstructions of the Liver and Spleen*, purge the *Bowels gently*, and are profitable against the *Yellow Jaundice, Green-Sickness*, and other *Diseases* proceeding from the *Obstruction of the Womb.*

XX. *The Tincture of the Flowers in Canary, White Lisbon, Madera, or White Port Wine.* It has the *Virtues of the former Infusion*, but much more agreeable to the *Stomach and Bowels*, and therefore is more profitable against the *Jaundice*: it opens, cleanses and purges, but in a more gentle manner than the *Tithyinales or Spurges*, and so also is good against *Asthmas, Coughs, Colds, and Obstructions of the Lungs.*

XXI. *The Extrakt of the Flowers.* It may be made with *Wine, or Spirit of Wine, Mead*, and other things of like nature. It is good against the *Dropsy, Jaundice, Gout, Scurvy, Rheumatism, Kings Evil, Obstructions of the Womb*: *Purges gently*, and may be given from a *Scruple to two*

Scruples, or more, according to *Age*, and other *Accidents*, and repeated every other *Day*, for 5 or 6 times together.

XXII. *The Emulsion of the Seed in Mead, Honied Water, or Chicken Broth.* It provokes to *Stool* and so *Purges Viscous Flegm*, and sharp *Humors*; prevails against the *Colick, Asthma's*, and shortness of *Breath*; as also against the *Scurvy, Dropsy, Gout, Rheumatism and Kings Evil, Coughs, Colds*, and other *Distempers of the Breast and Lungs*. But by reason of its harshness it ought to be corrected with *Aniseeds, Caraways, Cardamoms, Cloves, Galangal, Ginger, Sal Gem, &c.*

XXIII. *Cnicimel. Or Lobocho of the Seed made with Honey.* Take the *Inner Kernels of Cnicus or Carthamus Seed 3 Drams: Almonds Blanched 1 Dram: Pine Kernels half a Dram: Honey a sufficient quantity, Aniseeds, Caraways, Galangal, Ginger, of each in fine powder a Scruple: Sal Gem Levigated gr. 12. mix and make a Lobocho.* It is good against all the *Diseases* for which the *Emulsion* is given: it takes away *Asthma's, Hoarseness, Wheezing*, and most other *diseases of the Lungs*, and causes a clear *Voice*, besides which it very much encreases *Sperm or Seed* in both *Sexes*, and therefore is profitable against *Impotency in Men, and Barrenness in Women.* If it is made with the *Honey like Extrakt of Juniper-Berries*, it will be yet much more powerful to all the purposes and *Intentions* aforesaid.

XXIV. *Diacarthamum.* An *Electuary of Carthamus Seeds.* Take *Carthamus Seeds husked, Hermodactils, of the Species Diatragacanthi frigid, of each half an Ounce: White Turbith in fine Powder 6 Drams: Diagridium in fine Powder 3 Drams: White Ginger in Powder 2 Drams: Pure White Sugar 12 Ounces, Manna in Grains 2 Ounces: Honey of Roses solutive strained, Sugar Candy, Pulp of preserved Quinces, of each 1 Ounce: mix the Honey, Manna, and Pulp of Quinces with the Sugar whilst hot, being Boiled to a Consistency, then add the Powders, and make a solid Electuary, to be formed into *Tables* according to *Art.* It is an *Excellent thing* to purge *Choler, Flegm, Wind* and watery humors from all parts of the *Body*, but chiefly from the *Head and Joints.* It is good against the *Scurvy, Dropsy, Jaundice, Gout, Rheumatism, King's Evil, Palsie*, and an inveterate or old head ach: and being made up into *Lozenges*, it may be given to *Children* to Kill *Worms.* Dose from half an *Ounce* to an *Ounce*; and in very strong *Constitutions* to an *Ounce and half.**

XXV. *Diacarthamum Novum.* Take *Carthamus Seeds Husked an Ounce: Diagridium, Hermodactils, Resinous Tallow of each half an Ounce: Cambo-gium 2 Drams: Cloves, Ginger, Nutmegs, Winters Cinnamon, Zedoary, of each 3 Drams: all being in fine Powder, mix them with the Triple weight of Honey of Roses solutive strained, or Syrup of Peach-flowers, and make an Electuary according to Art.* It has all the *Virtues of the former*, but much more powerful to every *intention*; and may be given in the morning fasting, from half an *Ounce* to an *Ounce*, to be swallowed alone, or in some convenient *Vehicle* cold.

XXVI. *Enema, Or the Clyster.* Take fat *Mutton or Chicken Broth three quarters of a Pint, of the Emulsion at Sect. 22. above a quarter of a Pint or something better: Sal Gem in fine Powder half a Dram, mix for a Clyster.* It *Evacuates the Bowels*, and gives ease in the *Colick* and *Gripping of the Guts*; cleansing the *Bowels* from *Viscous Flegm*, and other *Acrid and sharp humors.*

XXVII. *The*

XXVII. *The Powder of the Flowers.* Given to a Dram in Barly Water, or Mead, or Honied Water, it prevails admirably against the yellow Jaundice.

XXVIII. *The Pulp of the Seed.* Given to a Dram in an Ounce of Syrup of Wormwood; it is said to cure the Jaundice, gives ease, in the Colick, and kill worms in the Stomach and Bowels.

XXIX. *Nota.* Some Authots say that the Seeds of *Cnicus* or *Carthamus* which are brought to us out of the Levant Countries are more quick in their Cathartick or purging Qualities, and more powerful in their Operation, than those which grow in *England*, or our more Northern *Climates*.

XXX. *As to its Vulnerary Vertue.* It is very manifest in its effects, being used either in its *Powder*, which may be constantly given inwardly, and outwardly strewed upon the Sore; Or, in its *Tincture*, given inwardly daily, and washing the Wound with it; Or in its *Extrall*, in like manner given, and applied; Or, in its *Infusion in Wine*, or Wine and Water, Or in *Syrup*, inwardly and outwardly used, by which it absorbs the acid particles by which the Wound or Ulcer is kept open, and gently carries off the Recrements of the humors, diverting them another way; and for these very reasons, it is of Admirable use in Curing Sores and Ulcers of the *Kings-Evil*, being used in the ways above-mentioned; or thus. Take the *Balsam of Peru*, 4 Ounces: *Powder of Extrall of Saff-flower* 2 Ounces, mix them. Outwardly Lay it upon the Sore or Ulcer: and inwardly give it from half a Dram, to a Dram or more, according to Age and other Accidents, so long as need requires.

XXXI. *The Culture of Saff-flower, or Carthamus.* What we shall say to this shall be from a Letter of Henry Hall Esq; whose Experience in the management thereof is worth Observation. This flower in my Opinion (says he) is improperly called *Saff* or *Saff-flower*, for its Seed is the same we call *Carthamus*, and is Cultivated after this following manner. The ground being prepared and made fine, the Seed is sowed in Rills, as Pease here about *London* are most usually sowed; but this at a greater distance, that with more conveniency it may be hewed and cleansed from the Weeds; besides it must be Sowed vety thin, for it is a strong plant, and requires room to spread, one Stalk producing Seven, Ten, or Twelve Heads of Buttons, all which bear Flowers. The exact quantity of Seed to an Acre (for want of my Notes) I dare not affirm; but ro the best of my remembrance, it was about five Pecks to an Acre. After it is come up, about 6 inches in height, the ground must be well cleansed from Weeds; from which afterwards, for the most part, the plant defends its self; but if once risen, they must be carefully weeded out; other looking to it needs not, until the Flower grows ripe, which is known by its color, for then it will be of a deep Orange Tawney; it ripened here with us in the beginning of August.

XXXII. *The Gathering of the Flower.* Such hands as are cheapest got, are made use of in this work, as Women and Children, who with little spud knives, take out the Flower from the Buttons which they put into Baskets they carry on their left Arm, which when filled, they empty into other great Baskets, in which it is carried home to be cured. The ripest of the Flowers must first be gathered; the others will ripen suc-

cessively. The work may take up a Week or Ten Days, before all will be fit to gather. The planters thereof affirm, that the gathering the Flowers, does not impede the ripening of the Seed: but in this I am a little doubtful, for some Experiments I have made, have evinced to me the contrary. After the Flowers are gathered, the Seed ripens, which is known by the cleaving of the Buttons, or some other tryal. Then they cut the Plant, and allowing it time to dry, having bound it in sheaves and bundles, they house it, and at convenient times Thrash it.

XXXIII. *The Curing of the Flower.* There is no other Ceremony in this, than the laying it on a clear Floor, where the Air may have a free Access; it is lay'd about 2 inches in Thickness, and stirred about 2 or 3 times a day, to accelerate the drying, and avoid Fermentation, which would spoil the color of the Flower. In performance of this, I think a *Strove* would with more advantage, and quicker dispatch, prepare the Flower for packing, which when thorow dry they put into Canvas Bags.

XXXIV. *Nota.* 1. *Saff-Flower* is a Drug which now usually comes from *Germany*, and is chiefly Cultivated about *Strasburgh*: here it is much used by Silk Dyers, who give a good price for it, which encouraged a Gentleman of my Acquaintance, to procure some Seed from thence, which he sowed in some Grounds not far from him, with so good success, that notwithstanding several Discouragements he met with, he sent an Agent purposely to get a considerable parcel of Seed, which was disposed of in several places.

XXXV. *Nota.* 2. Some small quantity of this Seed I got, to make some experiments with; but recommended for the sowing of a Quantity, a piece of Ground in the Valley of *Eversham* in *Glocestershire*, belonging to a Sister of mine, who the year before had from this Ground a Crop of Wheat. The Ground was a mixt Sand, of about 15 shill. per Acre value, and was then dressed as is usual in that Country for Barley, only it had a Harrowing extraordinary, for the better and finer lying of it. This piece of Ground consisting of about 25 Acres, was taken for 2 years by an Adventurer in this Seed, at the Rate of 25 shill. per Acre, in consideration that the plant is said to be a great impoverisher of Land; he sowed his Seed in April, and gathered the Flower in August; which having cured, was put into Bags and Sold at *London*, at Ten Pounds per Hundred Weight; a price he said, much below his Expectation; but at that Rate we computed he might gain above 30 shillings per Acre clear profit, all charges discounted, excepting the price of the Seed. There was also a plentiful return of Seed, which had it been well managed would have amounted to a considerable Value, perhaps as much as the Flower, which for want of Experience was a little too timely gathered. This Field might yield by Estimation 140 Bushels, for only some part of it was Thrafit; the residue was put up in a Stack, in the open Air, but Thatch't, to preserve it from Wet.

XXXVI. *Nota.* 3. What I have here writ, is from the relation of some of the planters, and the person that Sowed the Ground here mentioned and gathered the Flower. Now since the sowing of this Seed, and propagating of the Plant, may arrive to a very great improvement if rightly managed, I will offer some Experiments of my own, for the encouragement of this Plantation; and which seem to me to Obviate the main Objections which have been made a-

against it; as first, That the Plant being a hardy and strong Plant, will endure to be sowed much sooner without any prejudice, so that the Flower will come to be ripe before Wheat Harvest, when plenty of hands may be had to get it in. I Sowed some in February, and some about the middle of March, both thrived very well, Flowered, and was ripe to be gathered in July, before the 20th day. That which was Sowed in February was not so well colored, as the other Sowed in March; but that I impute more to the neglect of my Gardner than to any premature Sowing of the Seed. That which is Sowed in an open place, and constantly exposed to the Sun and Air, produces a larger Flower, much better colored, and more upon a Stalk than that which is Sowed in the shade.

XXXVII. *Nota* 4. Secondly, It is Objected, that our English Seed is not so good as the German, and will hardly serve one year, and then double the quantity must be Sowed, so that the procuring of more Seed every second year out of Germany, would be too great a charge to answer expectation. To which I answer, that I think this may be a great mistake; for the gathering of the Flower does without doubt impair the ripening of the Seed. For having left some Flowers standing purposely, that nature might do her own work, I gathered the Seed when ripe, which proved brighter, larger, and much heavier than any of the other, whose Flower was forced from it: therefore am confident, that if some part be left to stand, to have its full time of ripening, without gathering the Flower, and the Seed preserved to a second Sowing; that that Seed will be full as good as what is brought from Germany.

XXXVIII. *Nota* 5. Thirdly, It is Objected that it is a great impoverisher of Land, for after a Crop of Saff-Flower, it will hardly bear any thing. I believe it impoverishes the ground, but not so as to disable it to bear another Crop: The piece of ground afore-mentioned which was Sowed with Saff-Flower, did the year following, bear a good Crop of Oats; and had it been the third year, followed and well dressed, would have been fit for Wheat or Saff-Flower again.

XXXIX. *Nota* 6. This I also observed, that very much of the Seed where the Flower was gathered from the Stalk, was not only light, but hollow and black within, for which reason, I am of Opinion, that if some part of a piece of Ground was left standing to ripen of it self, the goodness of the Seed would fully compensate in its product, the loss of the Flower, and the remaining Seed might be very profitable for other uses, for the Fatning of Turkeys, Geese, and other Creatures, being well fed therewith, for that it causes them to grow Fat much sooner than when they are Fed with other Grains.

XL. *Nota* 7. The Novelty of this Flower, as it drew several Spectators in the Country, to see it in the field; so it likewise begot an Opinion in some of the more Ignorant, that it was Saffron, in which they were confirmed from the Name, and the Tincture of it: so that they privately stole considerable quantities, when it was ripe, and used it in their Puddings, Cakes, yea even in their Bread it self, till they were convinced by its purgative quality, which to some was very Troublesome.

XLI. Plot in his *Natural History of Oxfordshire*, Chap. 6. Parag. 35. page, 155. says, that Cnicus, five Carthamus Sativus, Manured Bastard Saffron or Saff-Flower, used for dying of Scarlets,

and therefore by some called Scarlet Flower; was once Sown at North Aston, by Colonel Vernon; the Seeds being planted in Rows, about a Foot distance, for the more convenient howing, and keeping it clean from Weeds. In these Rows it rises with a strong round stalk, three or four Feet high, branching it self to the Top: where it bears a great Scaly Head, out of which it thrusts forth many Gold yellow Threads, of a most Orient and shining color; which they gather every day as fast as they ripen, and dry them well; which done, it is fit for Sale, and dying of Scarlet.

CHAP. DCXIV.

Of SAGE GARDEN.

I. **THE Names.** It is called, by the Arabians *Alifacos*, and *Aelisacos*: In Greek *Ἐλσακόν* (derived I suppose from the Arabick Name:) in Latine *Salvia* (quia *Salvos* homines & incolumes efficiat:) and in English, Sage.

II. **The Kinds.** There are two principal species of Sage, viz. 1. *Salvia hortensis*, Garden Sage, of which in this Chapter. 2. *Salvia agrestis vel sylvestris*, Wild or Wood Sage, of which in the Chapter following.

III. **The Kinds of the Garden Sage.** There are many species of this sort, some of which grow not with us; the chief of them which we have in our Gardens are these following, viz. 1. *Salvia major alba vulgaris*, *Salvia alba latifolia*, our common greater white or Green Leav'd Sage. 2. *Salvia major rubra vulgaris*, *Salvia rubra angustior*, our common red Sage. 3. *Salvia maxima latifolia*, *Salvia latifolia ferrata*, great white Sage. 4. *Salvia Virtutis*, *Salvia minor Matthioli*, *Salvia pinnata*, *Salvia nobilis Gefneri*, *Salvia angustifolia*, & *tenuifolia*, *Salvia aurita*, *Salvia auriculata*, Sage of Virtue. 5. *Salvia aurita minor odoratissima*, *Salvia aurita Hispanica*, the most odoriferous small Sage, or Spanish Sage. 6. *Salvia absinthifolia*, *Salvia minor altera Clusii*, Wormwood Sage, Roman Sage. 7. *Salvia Variegata*, Party-colored Sage. 8. *Salvia Variegata altera*, speckled Sage, of all which in order.

The Descriptions.

IV. The first or our common greater white or Green Leav'd Sage. It has a long and pretty thick Woody Root, with many Strings adjoining to it, which sends forth four square Woody Stalks in some green, and in others of a whitish green, as are also the Leaves, which stand by pairs or couples at the joints, being somewhat long and broad Rough and Wrinkled, of a strong but pleasant aromatick scent, at the tops of the Stalks come forth the Flowers, set at certain spaces, one above another, which are long and gaping, like unto the Flowers of Clary, or Archangel, but of a blewish purple color: after which come small round Seed in the bottom of the husk which contained the Flower. This Plant is more usually propagated by Slips, thrust into the Ground in the Spring time, than by the Seed.

V. The

V. The second, or our common red Sage. This in its form, as to its Roots, Stalks, Branches, Leaves, Flowers and Seed little differs from the

Sage Garden Common and Red.

former, saving that in this the Leaves are of a red or purplish color, of the same length but narrower; and it seems to be the more generous and fragrant Plant of the two. Parkinson thinks, that both the former and this are but one and the same Plant or species, or that they both rise from the same Plant being split off, and set.

VI. The Third, or great white Sage. This differs not much from the first, or our common white or green Sage before described in the manner of the Growing, or the color of the Leaves, or sweetness of the whole Plant. The chief difference consists 1. in the Leaves, which are much larger and a little dented about the edges, and sometimes much more, making them seem curled, divers of the Leaves being four Inches long, and three Inches broad. 2. in the Flowers, some Plants bearing purplish Flowers, like the common sort, and others Milk white Flowers, which is the more rare.

VII. The Fourth or Sage of Virtue. This in its Root, Stalks, and Branches, grows like unto our first or common green Sage, but that the Branches are longer and slenderer, the Leaves also whitish, and never red, and much smaller and narrower, having for the most part at the bottom of each Leaf, on each side, a small piece of a Leaf, which makes it seem like Finns or Ears. The Flowers are also of a bluish purple color but lesser. There is another of this kind which bears white Flowers, differing in nothing else from the other.

VIII. The fifth or most odoriferous small Sage, or Spanish Sage. This small Sage is in most things, like unto the former Sage of Virtue with Ears, so like, that unless it be well heeded or considered, it may be thought all one with the other: but herein consists the Difference. 1. It seldom grows so great or large as that. 2. Its Leaves are

Sage of Virtue.

somewhat smaller and greener, or not so white. 3. It is more tender to keep, and does sooner perish in the Winter, unless it be better defended than the other. 4. Its smell is more Mild, Sweet, and Pleasant, yet a little quicker withall than the former, which is easily discerned by any that can judge of smells. 5. Lastly, some kinds hereof bear white Flowers, and others blew.

IX. The Sixth, or Wormwood Sage, or Roman Sage. This differs little in the form of growing, or of

largeness,

largeness, or color of the Leaves, from the ordinary small Sage of Virtue, but that it has not Ears so frequently as that has; but the chiefest difference is, that its Flowers are red, and that this Plant in both its smell and taste is like unto Wormwood.

X. The Seventh, or partly colored Sage. This kind grows with Roots, Branches and Leaves very like unto our first or common Sage, but somewhat smaller: the chief difference consists in the color of the Leaves, being diversly Marked and Spotted, with white and red among the Green. For upon one Branch you shall have the Leaves severally Marked one from another, as the one half of the Leaf white, and the other half green, with Red shadowed over them both, or more white than green, with some red in it, either parted, or shadowed, or dashed here and there: Or more green than white, and red therein, either in the middle, or end of the Leaf; or more or less parted or striped with white and red in the Green; or else sometimes wholly Green, the whole Branch together, as Nature is pleased to exhibit the Varieties. This manner of Growing, rising from one and the same Plant, because it is so much Variable, is the more delectable and Valuable.

XI. The Eighth, or Speckled Sage. This in its Roots, Stalks, Branches, Leaves, Flowers, Seed, form and manner of growing, as also in its magnitude, is very like the last described, being really a species thereof; but in this kind the Leaves are speckled as it were, partly with white and green; but it has not the beauty of the former, because that has three colors evidently to be discerned in every Leaf almost, the red adding a superabounding beauty to the rest; whereas this is only spotted with two colours white and green. The two last, or seventh and eighth kinds, are only different sorts of the first or common kind before declared.

XII. The Places. The first, second, third, fourth, fifth and sixth grow naturally in Spain and Italy; and all of them, as also the seventh and eighth are now Natives of England, and grow and flourish admirably in our Gardens.

XIII. The Times. Almost all these several kinds of Sage Flower in July, and have ripe Seed in August, or not long after their times of Flowering. But the Sage of Virtue, tho' most commonly and in many places, it yields no Seed at all, yet in some Countries and in some Years it does: however its defect of Seed is supplied, in its increase by setting of slips in the proper season.

XIV. The Qualities. Sage is said to be hot and dry in the third Degree, Astringent, Anodyn, Carmine, Digestive, Discurtive, Diuretick, and Traumatick: Cephalick, Neurotick, Stomackick, Hysterick, Arthritic, Emmenagogick, Sudorific, Alexipharmick and Analeptick.

XV. The Specification. It is good against a Vertigo, Lethargy, Headach, from a cold Cause, Palsie, Convulsions, spitting Blood, weakness of the Nerves, Barrenness in Men or Women, Poison, the bitings of Serpents and other Venomous Creatures, the Plague, and other Malign and Pestilential Diseases, Catarrhs, Rheumatisms, &c.

XVI. The Preparations. You may have therefrom, 1. The Green Leaves. 2. The Juice. 3. The Essence. 4. An Infusion in Wine or Water. 5. A Powder of the Leaves. 6. An Oil, or Ointment. 7. A Cataplasm. 8. Pills. 9. A Gargarysm. 10. A distilled Water. 11. A Spirituous Tincture. 12. An Acid Tincture. 13. An Oily Tincture. 14. A Spirit. 15. A distilled Oil. 16. Potashes or Powers. 17. An Elixir. 18. A Conserve of the Flowers.

The Virtues.

XVII. The Green Leaves. They are usually eaten in the Spring as a Sallet, with a little Vinegar, Salt, and Pepper, with good Butter and Bread; so eaten it strengthens the Stomach, expells Wind, comforts the Bowels, and resists Poison, and is profitable for such as are Dull and Drowsie, and apt to be afflicted with Vapors from the Spleen or Womb.

XVIII. The Juice. It stops the Bleeding of Wounds, and cleanses foul putrid Sores and Ulcers. Agrippa says, that if it be taken with a little Salt by Childing Women, for some days before they accompany with their Husbands, whose Wombs are too moist and slippery, and are unfruitful by reason of that default, that it will help them to conceive; and such as have conceived, and are subject often to miscarry upon any small occasion, it will prevent the Abortion, and cause them the better to retain the fruit in the Womb, and also make it the more lively. Therefore in Cyprus and Egypt, after a great Plague, Women were ordered to drink the Juice of Sage, to cause them to be the more fruitful. And Orpheus says, that three Spoonfuls of the Juice of Sage, sweetened with a little Honey, and taken fasting, does presently stop the Spitting or Vomiting of Blood. Matthiolus says, that it is very profitable for all manner of Pains of the head coming of Cold, and Rheumatick humors, as also for all pains of the joints, whether used inwardly or outwardly; and for such as have the Falling Sickness, Lethargy, or drowsie Evil, and such as are dull and heavy of spirit, and for those who have the Palsie, or are troubled with Defluxions of their Rheum upon the Lungs, as also for other Diseases of the Thorax or Breft. Dioscorides says that it provokes Urine, brings down the Courtes, and forces away the dead Child. Pliny says that it provokes Womens Courtes; and yet that it stops them, when they come down too fast; helps the stinging and bitings of Serpents, and kills Worms breeding in the Ears, as also in Putrid Sores or Ulcers.

XIX. The Essence. It has all the Virtues of the Juice, and is more potent to all those Intentions; besides which, it is of good use in the Plague it self, and against all Malign and Pestilential Diseases, being taken Morning and Evening, and at other times as the Physician shall advise, from a spoonful to 3 spoonfulls, according to Age and other Accidents, in any proper Vehicle.

XX. The Infusion or Decoction in Wine or Water. They have all the Virtues of the Juice or Essence, but much inferiour to them in Potency, and therefore may be given from a quarter of a Pint to half a Pint at a time, as the occasion may require; and may be used Ordinarily, infused in Water, after the manner of Tea, by which many have found very good Effects. Bathed upon the Cods it abates their Itching.

XXI. The Powder of the Leaves. Taken to a Dram, it rectifies the evil disposition of the Stomach, corrects and expells Wind, is good against Scrophula or Struma; and outwardly applied stops the bleeding of Wounds, and also cleanses and dries up old Putrid and running Sores or Ulcers. It also stops the immoderate Flux of the Courtes, and stays Vomiting.

XXII. The Oil or Ointment. They are Anodyn, or easers of Pain, discuss Tumors in their first appearance,

pearance, are profitable against the Gout from a cold cause, strains and weakness of the Joints, and to cleanse, dry and heal old running Sores.

XXIII. *The Cataplasm.* If it is made of fresh Sage Leaves and Nettles, beaten together, and it be laid upon an Apopleme behind the Ears, it does much discomf and help it. And if it is made of Sage Leaves alone, by scalding them in Wine, and bruising them, and so applied to any Paralytick Part, it does much good; more especially, if at the same time the Patient takes inwardly Morning and Night, the Effence, Powers, or Elixir of Sage also.

XXIV. *The Pills.* Take Sage Seed reduced to Powder ten Drams: Long Pepper 12 Drams; Ginger, Spicknard of each two Drams: All being in fine Powder, with Juice of Sage make them up into a Mass of Pills. These Pills are commended for the Cure of Consumptions, being taken every Morning fasting, and every Night going to Bed, a dram at a time in any convenient Vehicle. They also expell Wind, gives ease in the Colick, provoke the Terms, and facilitate the Birth.

XXV. *The Gargarism.* Take Juice of Sage 4 parts, Juices of Hony Suckles, of Plantane, of each 2 parts: Juice of Columbine one part: in which dissolve a little Alam, and sweeten with Honey. It cures Cankers, Ulcers, and Sores in the Throat, Mouth and Gums, by gargling therewith, as also in the secret parts of Man or Woman, by washing therewith often.

XXVI. *The Distilled Water.* It has the Virtues of the Juice and Effence, but in a much lower degree, and may be given to fix or eight Ounces at a time sweetened with Honey, otherwise it is used only as a Vehicle to convey other of the preparations down in.

XXVII. *The Spirituous Tincture.* It has all the Virtues of the Juice and Effence, but more Stomack, Digestive, Cordial; it comforts the Head, Brain, Nerves, Womb and Joints, and resists all Diseases affecting those parts, occasioned by cold, moist, acid and sharp humors or weakness: Dose 60 or 80 drops, Morning, Noon, and Night, in a glass of Generous Wine.

XXVIII. *The Acid Tincture.* It is a noble Medicament against the Plague and all sorts of Pestilential and Malign Diseases whatsoever, destroying the poison in its Root. It prevails also against the poison of Vipers, Rattle-snakes, and other Serpents; as also against the Malignity of the biting of Mad Dogs and other Venomous Creatures: and being bathed upon any part troubled with the Gout, gives ease to the part. Dose inwardly 60 Drops or more, twice or thrice a day, in a Glass of White Lisbon, or other fit Vehicle.

XXIX. *The Oily Tincture.* It prevails against the Stone, Gravel, Sand, and Tartarous Mucilage in the Reins, Ureters and Bladder, provokes Urine, and gives ease in the Strangury and intolerable pains and Weaknesses of the Back. It provokes the Terms, opens obstructions of the Womb and cleanses it, it gives ease in the Colick and Gripings of the Guts, and is a potent Remedy against most diseases of the Brain and Nerves, proceeding of cold, as Carus, Lethargy, Headach, Palsie, Convulsions, Cramps, and other like diseases of those parts, being anointed along on the Back Bone, and upon the parts affected, and taken inwardly Morning and Night, in some proper Vehicle, from 20, to 30 or 40 Drops, as the Physician shall advise.

XXX. *The Spirit.* It is made as you make Spirits of Lavender, Pennyroyal, Rosemary, &c.

It is highly Cordial and Neurotick, and has all the Virtues of the Juice and Effence. Dose half an Ounce or more in a Glass of generous Wine. It comforts and warms the Womb, and promotes Conception.

XXXI. *The Distilled Oil.* It is Cephalick, Neurotick, Cardiac, Uterine, Carminative, Anodyn, Alexipharmick, and Analeptick: quickens the Senses and Memory, Strengthens the Head, Nerves, and Joints, is good against Apoplexies, Convulsions, Epilepsies, Lethargies, Megrims, Palsies, Vertigo's, helps against Catarrhs, Rheumatisms, Pleuritick pains, Coughs, Colds, Spitting of Blood, Consumptions, and pains of the Sides; it expels Wind, dries up watery humors, and is good against the Bittings of Mad Dogs, Serpents, and other Poisonous Creatures; it provokes Urine wonderfully, brings down the Terms, and hastens the Birth, causing easy Delivery; and in a word has all the Virtues of the Juice, Effence, and Spirit foregoing. Dose a gutt. iij. ad x. in some convenient Vehicle. It must never be given alone, because of its exceeding heat.

XXXII. *The Potestates or Powers.* These have all the Virtues of the Juice, Effence, and Distilled Oil, and may be given to all those purposes and Intentions, twice a day, in a Glass of Generous Wine, from a quarter of a Spoonful to half a Spoonful. They facilitate the Birth and After-Birth, force away the Dead Child, and potently resist a Paralysis.

XXXIII. *The Elixir.* This is yet stronger than the Powers, and of more exalted properties, but may be given in the same Dose with them, and after the same manner.

XXXIV. *The Conserve of the Flowers.* It is used to warm and comfort the Brain and Nerves, to help and restore the memory, quicken the Senses, and Stop Fluxes of the Bowels.

CHAP. DCXV.

OF SAGE WILD.

I. *THE Names.* It is called in Greek *Ἑλσακη* *Ἑλσακη*; in Latine *Salvia Sylvestris*: and in English, *Wild Sage*.

II. *The Kinds.* We shall Treat but of three Species in this Chapter, viz. 1. *Salvia agrestis*, *Salvia Sylvestris*, *Salvia Montana* *Gesneri*, *Salvia Bosci* *Loniceri*, *Tabernamontani* & *Tragi*, *Scordonia*, & *Scorodonia* *Cordi*, *Gerardi* & *Thalij*, *Melinum alterum* *Cesalpini*, *Scordium alterum* *quibusdam*, *Ambrosia quibusdam*, *Wood Sage*, *Wild Sage* or *Garlick Sage*. 2. *Salvia lutea latifolia*, *Salvia fruticosa lutea latifolia*, *Yellow wild Sage* with *Broad Leaves*, called by some also *French Sage*. *Anguilara*, *Castor Duranter*, *Clusius*, and others do call it, *Verbascum Sylvestre*, and *Verbascum quantum Martioli*, making it a Species of the *Mulleins*; but it is certain, it is not a kin to them; for tho the Leaves are Woolley like *Mullein*, yet their form and shape, with the Flowers and other Circumstances shew it to be a kind of *Sage*, and so it is called in *England*, *Flanders*, *France*, and *Italy*, viz. *Wild Sage*. 3. *Salvia fruticosa angustifolia*, *Phlomis*, *Lychnitis Dioscoridis* *Clusio*. The greater *Wild Sage*.

The Description.

III. The First, or Wood Sage, Wild Sage, or Garlick Sage. Its Root is long and Stringy, with many Fibres adjoining, abiding many years. It rises up with Square Hoary Stalks, two feet high at least, having two Leaves set at every Joint thereon, which are something like unto Sage Leaves, but smaller, softer, whiter, and rounder, a little dented about the edges, and smelling somewhat strongly. At the tops of the Stalks and Branches grow flowers on a slender long spike, turning themselves all one way when they blow, and are of a Pale or Whitish Color, smaller than Sage, but hooded, and gaping like to them. The Seed is blackish and round, four usually set together in a husk.

IV. Gerard describes it thus. Its Root is full of Strings, from whence spring up Stalks 4 square, somewhat hairy, upon which are set Leaves like those of Sage, but shorter, broader, and softer. The flowers grow up all upon one side of the Stalk, open and forked like those of Dead Nettle, but lesser, of a Pale White Color: after which comes the Seed, four together in one husk. It is a plant which lives but a year, and smells of Garlick when it is bruised, being thought to be a kind of Garlick Germanander, as it its Garlick smell testifies.

V. The Second, or Yellow Wild Sage with Broad Leaves, called by some French Sage. Its Root is Woody with divers Strings and Fibres adjoining to it. It has several square Woody hoary Stalks, on which grow at several spaces, rugged, hoary

Sage Wild Yellow Broad Leav'd.

Sage Wood or Garlick.

broad, and almost round pointed leaves, many set together, very like unto the great Sage, but larger. The Flowers grow likewise, in Rundles or Spaces towards the Tops of the Stalks, very like also unto the Flower of Sage, or Archangel, but of a Yellow color. The Seed is greater than of any Sage, somewhat brownish, and round like the next or third kind following. The whole Plant smells somewhat strong and heady.

VI. Gerard describes this second kind thus. Its Root is thick, tough and of a Woody substance, as is all the rest of the Plant. It grows up like a small Woody Shrub, having many Woody Branches, of a Woolly and Hoary color, soft and downy: On which are placed thick hoary Leaves, of a strong Pontick Savor, in shape like to the Leaves of Sage, whereupon the Vulgar People call it French Sage. Towards the Tops of the Branches are placed Roundles or Coronets of Yellow gaping Flowers, like those of Dead Nettle, but much greater.

VII. The third or great Yellow Wild Sage with narrow Leaves. Its Root is blackish and Woody. This Species has very many hoary and woolly Leaves, the lower sides especially, more than the upper; longer and narrower also, than those of the small Sage; from among which rise up square hoary and hairy Stalks, about a Foot high, on which do grow such like long hoary Leaves as grow below, two always set together, at the Joints, one against another; where the Flowers grow at spaces, about the Tops of the Stalks, with two Leaves under them, broad at the bottom, and encompassing the Stalks, being shorter than the rest. The Flowers are large, open and gaping, like unto Sage, or somewhat more like to those of the Dead Nettle or Archangel, of a Yellow color, and coming forth out of hoary, woolly Husks, covered with pale colored Hairs; the Tops by reason of their length and weakness, bending

ing a little downwards, after which come brownish Seed inclosed in Woolly Hairs.

VIII. *The Places.* The first grows in many wet Grounds and by Water sides in many places of England. *Dioscorides* says, it grows as well on Hills, as by Water sides, and it will thrive well if it be Transplanted into Gardens. *Camerarius* says, that it is found to be stronger and sharper which grows on high Grounds, than that which grows on the lower. *Gerard* says, it grows on Heaths and barren places, and is found also in Woods, and near unto Hedge rows, about the borders of Fields. It delights in somewhat a lean Soil, and yet not altogether barren and dry. The second and third grow plentifully throughout Portugal and Spain, and in some parts of France, on dry banks and stoney places: but with us they grow only in Gardens. All these sorts will grow by Slips taken from them, and Planted in March or April.

IX. *The Times.* They all Flower in June and July, and sometimes in August, but much about the Times when the Common Sage Flowers, and the Seed is ripe in some small time afterwards.

X. *The Qualities.* They are all of them hot and dry in the second degree, Cephalick, Neurotick, Stomack, Cardialck, Hepatick, Hysterick, and Arthritic, Aperitive, Subastringent, Alexipharmick and Analeptick.

XI. *The Specification.* The first is good against Ruptures, Contusions, Wounds, Strangury and the French Pox. The two last are good against Burnings and Scaldings.

XII. *The Preparations.* From the Scorodonia or Wood Sage, you may have 1. *A Juice.* 2. *An Essence.* 3. *A Decoction.* 4. *A Powder.* 5. *A Distilled Water.* 6. *A Spirituous Tincture.* 7. *An Acid Tincture.* 8. *An Oily Tincture.*

The Virtues.

XIII. *The Juice.* It is good against Ruptures or Bursenness, Contusions, and Wounds. It is good also for moist Ulcers and Sores in the Legs or other parts, to cleanse and dry them, and cause them speedily to heal.

XIV. *The Essence.* It has all the former Virtues; besides which being used daily mixt with a proper Vehicle, or otherwise Dietetically it has been found successful in curing the French Pox, being mixt with a Decoction of Guaiacum, and being taken for 20 or thirty days together, it causes Sweat, dries up Ulcers, digests Humors and dissolves Tumors or Swellings. It is an incomparable thing against the Scurvy in a cold habit of Body, as also against the Plague and all Malign and Pestilential Diseases, bitings of Mad Dogs, Serpents, and other Venomous Creatures. It opens Obstructions of the Liver, Spleen, Reins and Womb, represses Hypochondriack Melancholly, provokes Urine, gives ease in the Strangury, provokes the Terms, and facilitates the Birth. Dose 3 or 4 spoonfuls in a Glass of Wine, or other proper Vehicle.

XV. *The Decoction.* Made whether in Water or Wine, (but the latter is more effectual) it has all the Virtues of the Juice and Essence, but must be given in much a greater quantity, as to half a Pint two or three times a Day. *Gerard* says it is given to such as have had a Fall, and are inwardly bruised, and also provokes Urine. And that this Decoction is given to drink with good success to such as are infected with the French Pox, for that it causes Sweat, dries up Ulcers,

causes Digestion, and consumes Tumors or Nodes in the Flesh, being taken for thirty or forty Days together, or put into the Decoction of Guaiacum, with the other Ingredients. *Parkinson* says it provokes Urine if it is stoppt, as also Womens Courfes. The Decoction is to be made rather of the Green Herb, than of the Dried, and in Wine rather than in Water, for such as are bruised by Falls, or Blows, or where some inward Vessel is broken; because it disperses and expels the congealed Blood, and consolidates the Vein.

XVI. *The Powder of the Herb.* It has all the former Virtues, but not so effectual as the Juice or Essence, being put upon running Sores and old Ulcers in the Legs or other parts, it cleanses, dries and heals them, causing them to come to a speedy Cure. And it is no less effectual in curing of Green Wounds, because it stops the Blood and causes them to consolidate presently.

XVII. *The Distilled Water.* It has the Virtues of the Decoction but less powerful, and may be used as a Vehicle, to convey the Essence, or Tinctures following in. If 3 grains of white Vitriol be dissolved in it, it becomes a good Ophthalmick for Weak, Sore and running Eyes.

XVIII. *The Spirituous Tincture.* It is Cordial and Antiscorbutick, good against the Colick, and Gripings of the Guts: It expels Wind, is good against Fainting and Swooning Fits, and is profitable for such to take who are troubled with the Palsie, Rheumatisms, and sickness at Stomach.

XIX. *The Acid Tincture.* It prevails against the Scurvy in a hot constitution of Body, profitably the Plague and all Malign and Pestilential Diseases, and is of great power against the bitings of Mad Dogs, Serpents and other Venomous Creatures, by obliterating their Volatile Poisons, &c. It rectifies the disorder of the Blood and Lympha, and restores the Tone of the Stomach, &c. Dose so many Drops at a time, as may give the Wine or other Vehicle a grateful Acidity.

XX. *The Oil Tincture.* It opens the Obstructions of the Reins and Womb, provokes Urine gives ease in the Strangury, Stone and Gravel, removes Tartarous Mucilage from the Urinary parts, and provokes the Terms in Women; it hastens and facilitates the Birth, and brings away the After-Birth, as also the Dead Child if any be. It is of singular use also against Pains, Aches, Numbness and other weaknesses of the Nerves, Limbs, and Joints, gives ease in the Gout from a cold Cause, and is of extraordinary use in the Cure of the Palsie, being anointed Morning and Evening upon the Back Bone, as also upon the parts affected. Dose (in any proper Vehicle) from 15 to 30 or 40 Drops Morning and Night.

XXI. *Nota.* The two latter Plants called *Wild yellow Sage* with both broad and Narrow Leaves, have all the Virtues of *Our Common Sage*, declared in the former Chapter, so that we need not say much of them in this place: but besides all that is said there, *Dioscorides* says that a Cataplasim made of the Green Leaves by beating them in a Mortar, and applied to burnings and scaldings, Cures them.

C H A P. DCXVI.

OF S A M P I R E,

O R,

S E A - F E N N E L.

I. **T**HE Names. It is called in Greek *Κέλυαν*, & *κελδαρον*, & *Κεῖδρον* Galeni: in Latine, *Critb-mum*, *Feniculum marinum*: in English, *Sampire*. Some will not have this to be *Critbnum Diosco-ridis*, for that he saith that his has Whiter and Broader Leaves than *Purslane*, whereas this has small, long, and narrow Leaves; and that the *Critbnum* of *Dioscorides* is rather *Portulaca ma-rina*; and that this our *Sampire* ought rather to be called *Feniculum Marinum*, for as much as not only the form of the Leaf; but the Um-bles and Heads of Flowers, and the whole face thereof does assimilate a Fennel-like form. *Pe-trus Crescentius* calls it *Critbnum* & *Rincum Marinum*.

II. The Kinds. There are five kinds of *Sam-pire*, viz. *Critbnum marinum vulgatus*, *Critb-mum sive Feniculum marinum minus* *Baubini*; *Baticula alterum genus ex Sicilia Cesalpini*; and is thought to be that which *Pliny* calls *Batis*, as *Gesner* in *hortis* does, who also calls it *Critbnum marinum*. The Italians call it *Herba de San Petro*, and some from thence *Sampetro*, whence comes our English word *Sampire*. This first kind is doubtless Our Common Rock *Sampire*. 2. *Critbnum marinum majus*, *Critbnum sive Feniculum marinum majus* *Baubini*, The greater Rock *Sampire*. 3. *Critbnum marinum*, *Critbnum tertium* *Matthioli*, *Marsh* or *Sea Sampire* of *Matthiolus*. 4. *Critbnum maritimum spinosum*, *Dodonæi*, *Pastinaca Marina* *Lobelij*, *Lugdunensis*, *altiorumque*; *Anguilara* took it to be *Seracul*, and *Camerarius* calls it *Cachry marinum*; and *Baubinus* thinks it is the *Tribulus maximus quo-rundam* of *Dalechampius*; *Thorny Sampire*, or *Sea Parsnip*. 5. *Critbnum Chrysanthemum* *Dodonæi*; *Crysanthemum litoreum* *Lobelij*, *Anthyllis prima* *Dioscoridis* *Cesalpino*; *Anthyllis major* *Cordi*; *Critbnum maritimum flore* *Asteris Attici* *Baubini*, & *Aster atticus maximus* of some others, *Golden flowered Sampire*.

The Descriptions.

III. The First, Or our common Rock *Sampire*, has a Root which is Great, White, and Long, of a hot spicy taste, enduring long, and continuing many years. It grows up with a Tender green Stalk, about half a yard, or two feet high at most, branching forth almost from the bottom, and stored with several Thick, somewhat long, and almost round Leaves, of a deep green color, sometimes two and sometimes three together, and sometimes four or five or more on a Stalk, which are fleshy or sappy, and of a pleasant hot or spicy taste. At the tops of the Stalk and Branches come forth Umbles of White Flowers, and after them come large Seeds bigger than Fennel, and some-what like to that Seed.

IV. The Second, Or Greater Rock *Sampire*. This plant in its Root, Stalk, Branching forth,

Sampire Rock Common.

Leaves, Flowers, Seed, and form and manner of Growing, differs little from the former, and indeed in nothing but its Largeness, and that it is not of so good a Relish, or of so spicy a Taste as the first is, but smelling somewhat strongly, almost like Smalage, and having a more bitterish Taste.

V. The third, or Marsh or Sea *Sampire* of *Matthiolus*. Its Root is long, round, smooth, with several Strings adjoining to it. The Plant is of a

Sampire Marsh.

Shrubby

Shrubby or Woody kind of Substance, having many Stalks rising up from one Root, which are straight or upright, yet a little enclining towards their Tops, all which are replenished with many Leaves set round about them, by spaces or distances as it were Joints, many Leaves rising together from one Stock or Footstalk which are a little long, and thick of substance, having a saltish Taste. Underneath the springings forth of these Leaves, come forth other single Leaves of nearly twice the length of the other. The Flowers grow at the Tops of the Stalks, and are round, and hairy or downy, and of a pale whitish red Color.

VI. The fourth, or Thorny Sampire, or Sea Parsnep. Its Root is long and white, somewhat like unto a Parsnep, but more divided into parts,

Thorny Sampire.

and is of a good relish, somewhat resembling that also of a Parsnep. This is very like the two first Kinds of Sampire, but it grows greater and higher, with shorter and narrower Leaves, much more divided, and sharp and pricking at the ends. The Stalks are more sappy, and of a fresher green color, breaking into 3 or 4 Branches, towards the Tops, where grow large Umbles of white Flowers, and afterwards Fennel like Seed in prickly Husks.

VII. The fifth, or Golden Flower'd Sampire. Its Root is pretty thick, divided into several Branches, having many strings adjoining thereto. It rises up with several hard round Stalks, very thickly covered or replenished with very narrow, long, and somewhat thick Leaves cut in at the ends. At the Tops of the Stalks stand single Flowers like unto Aster, or Chrysanthemum, wholly Yellow, both

Sampire Golden Flower'd.

the Border and the Thrum in the middle, in which lies the Seed when they are ripe, and are blown away with the Wind.

VIII. The Places. The first and second grows upon Rocks and Cliffs near the Sea; The third, Nascitur in littore Maris, locis planis, non elevatis: grows not on Rocks and Cliffs as the former two do, but upon the Sea shore, on plain Ground. The first and second grow on the Rocky Cliffs at Dover, Winchelsey by Rie, about Southampton, the Isle of Wight and Purbeck, and moist Rocks about the West and North parts of England; more especially on such Rocks, as are often moistned at the least, if not overflowed with the Sea Water. The third, fourth and fifth in other grounds not far from the shore; The fourth or Thorny kind, grows upon the Sands and Beaches, between Whitstable and the Isle of Tenet by Sandwich; and by the Sea near West Chester. The Fifth and last grows in the Muddy Marsh in the Isle of Sheppy, going from Kings-Ferry to Shetland-house.

IX. The Times. Rock Sampire is said to Flower in May, June and July; and must be gathered to be kept in Pickle in the beginning of August; all the others Flower in July, and their Seed is ripe in August.

X. The Qualities. Sampire is hot and dry in the end of the first degree; Absterive, Aperitive, Digestive, Diuretick, Stomatick, Splenetick, Nephritick, Hytterick, Emmenagogick, Analeptick, and Spermatogenetick.

XI. The Specification. It is used to provoke Urine, give ease in the Strangury, open obstruction of the Viscera, chiefly of the Spleen and Womb,

provoke the Terms, strengthen the Stomach and help Digestion.

XII. *The Preparations.* You may have therefrom, 1. *A Juice and Essence.* 2. *A Decoction in Wine or Water.* 3. *A Pickle or Sallet.*

The Virtues.

XIII. *The Juice or Essence.* They provoke Urine and the Courses, are helpful against the Yellow Jaundice, open obstructions of the Stomach; Liver, Spleen, Mesentery, Reins and Womb, and so remove those diseases which afflict those parts. They are profitable against the Strangury, and carry off any Tartarous mucilage, which afflicts the Urinal Vessels. Dose 2 or 3 Spoonfuls in a Glass of White Port or Lisbon Wine morning and night.

XIV. *The Decoction in Wine.* The Roots, Stalks, and Leaves boiled in Wine and Drunk, provokes Urine, removes the difficulty of making Water, and is good against the Jaundice: It has an excellent property to open, cleanse and dry: It helps Digestion, cleanses the Urinary parts from Stones, Gravel, Sand, and Slimy matter, is good against Hypochondriacal Melancholy, and has all the Virtues of the Juice and Essence. Dose half a pint morning and night.

XV. *The Pickle or Sallet.* It is a very pleasant thing both to the Palate and Stomach, helps Digestion, opens obstructions of the Viscera, provokes Urine and cleanses those Vessels of all Heterogeneous matters obstructing them. It strengthens the Stomach, provokes Appetite; and is a most excellent and familiar Sawce, of extraordinary advantage and most agreeable to the Bodies of Human Kind.

C H A P. DCXVII.

OF SANICLE, OR, HEAL-WORT.

I. *THE Names.* We do not find that this Plant, or any of its Species were ever known to the Ancient Greeks or Latines, and therefore no Names can be derived from those Fountains; but our Modern Authors have called it in Latine, *Sanicula* (*à potiore sanandi munere*) and by some *Sanicula mas*, because those make the *Astrantia nigra* Dioscoridis, or the *Helleborus niger* *Sanicula folio major*, to be *Sanicula femina*: It is the *Diapensia Brunfelsij*, *Gerardi*, *Lobelij* & *Matthioli*; *Sideritis tertia* Dioscoridis *Columna*; *Consolida quinquifolia* *Tabernaemontani*; *Quinquifolium Quartum* *Matthioli*, in English *Sanicle*, *Healtwort*, and *Self-heal* by some.

II. *The Kinds.* Besides the *Sanicula major* or *Alchimilla*, or *Great Sanicle*, commonly called *Ladies Mantle*, of which we have treated already in Chap. 421 foregoing; we have these following Species of this Plant, viz. 1. *Sanicula*, *Sanicula Vulgaris*, *Diapensia Gerardi*, Our Common Sanicle. 2. *Sanicula Guttata*; *Sanicula Montana altera* *Clusij*; *Sanicula Alpina* & *Guttata* *Camerarij* *aliorumque*; *Sanicula Caryophyllata*, five, *Geum Alpinum recentiorum folio hederaceo* *Lobelij*; *Spotted Sanicle* and *London Pride*. 3. *Sanicula Alpina*, *Sanicula Cortusa*

(from its Author) *Matthioli*; *Caryophyllata Veronensium flore* *Sanicula Ursina* *Lobelij*; *Sanicula Montana prima* *Clusij*, Bears Ear Sanicle. 4. *Sanicula fruticosa Americana*, *Sanicula five Cortusa Americana fruticosa*, Shrubby Sanicle of America. To these add, 5. *Sanicula Eboracensis* *Pinguicula*; *Cucullata* *Gesneri*, *Sanicula Montana flore calcari donata*, *Yorkshire Sanicle*, or *Butterwort*, of which we have already discoursed in Chap. 102. foregoing, and therefore shall say nothing of it in this place, saying, that the Cut there inserted is error, and belongs to the first *Sanicle* in this Chapter.

The Descriptions.

III. *The First, Or our Common Sanicle.* Its Root is composed of many black Fibres or Strings, as it were set in a Bunch together, proceeding from a little long head, which abides with the Green Leaves upon it, all the Winter and perish not. From this head of the Root rise up many great round Leaves, standing upon long brownish Stalks, every one somewhat deeply cut or divided into five or six parts, and some of these cut in also, somewhat like the Leaf of a Crowfoot, or some of the kinds of Dovefoot, and finely dented about the Edges, smooth, and of a dark shining green

Sanicle Common.

color, and sometimes reddish about the brims, from among which rise up small round green Stalks, without any joint or Leaf thereon, saving at the Top, where it Branches out into Flowers; having a Leaf divided into three or four parts, at that joint with the Flowers, which are small and white, starting out of small round greenish yellow Heads, many standing together in a Tuft, in which afterwards the Seeds are contained, which are small, round, rough Burrs, something like unto the Seeds

of Clevers, and Stick in the same manner upon Cloaths or other things which they touch.

IV. The Second, or Spotted Sanicle, or London Pride. Its Root is Scaly or covered with a Chaffie matter, having many small white Fibres underneath, by which it is fastened in the Ground. It has many small round Leaves bluntly indented about the edges, something like unto the Leaves of our White Saxifrage, of a full green color above, and whitish hairy, and somewhat reddish withall underneath. The Stalks are set here and there, with the like Leaves, rising a foot and half high or more, very much divided at the Top into several small Branches, bearing very many small white flowers, consisting of five small Leaves, in which are many small red spots to be seen, as small almost as Pins points, or very small Pins heads, of a pretty sweet smell, almost like the smell of Hawthorn Flowers; in the middle whereof are many small Threads compassing a head, which when it is ripe, contains small black Seed.

V. Of this Second Species there is a Second Sort, called *Sanicula guttata minor*, being a smaller kind than the former, both in its Leaf and Flower; the Leaves whereof are smaller, but rounder, and more finely Snipt or Indented about the edges, like the Teeth of a fine Saw; the Stalk is but a little above a Span high, having many small white flowers, spotted as the first, but with fewer Spots.

VI. There is also a Third Sort of this kind, called *Sanicula minor non guttata*; This in its Root, Stalk, Leaf, Flower, form and manner of growing is like to the first sort of this spotted kind at Sect. 4 above, as well in its Root, as its Stalks, Leaf and flower, but the only difference is, that this is lesser than that first sort, and has no Spots in the Flowers, as that has.

VII. The Third, or Bears Ear Sanicle. Its Root consists of a Tuft of small Whitish threads,

rather than Roots, much interwoven one among another. The Leaves which spring up first are much Crumpled, and as it were folded together which afterwards open themselves into fair broad and roundish Leaves, somewhat rough, or hairy, not only cut into five divisions, but somewhat Notched or dented also about the edges; of a dark green color, on the upper side, and more Whitish green underneath; from among these Leaves, rises up one naked round Stalk, and sometimes two or more, five or six Inches high, bearing at the tops several small Flowers, somewhat sweet, like unto the purple Bears ears, hanging down their heads, consisting of five small pointed Leaves apiece, of a dark reddish purple color, with a White Circle or Bottom in the middle, and some small threads therein. After the Flowers are past, there come small round heads, somewhat longer than any of the Bears ears, standing upright upon their small Footstalks, in which is contained small round and Blackish Seed. The Leaves of this plant dye down every year, and spring up anew in the beginning of the Year following, whereas the Bears Ears, hold their Leaves Green all the Winter, standing like a close head, the outermost only perishing after Seed time.

VIII. The Fourth or Shrubby Sanicle of America. This has several almost round Leaves lying upon the Ground, each upon a little long Footstalk, divided at the edges into two parts, dented likewise about the brims. From among which rise up hard woody Stalks, near two feet high, having such like Leaves thereon, as grow below; and branching forth with several small white, Starlike Flowers in a tuft together at the Tops.

IX. Gerard describes the Bears Ear Sanicle thus. The Leaves shoot forth in the beginning of the Spring, very thick and fat, and are like a Purse or round Lump at their first coming forth; and when it is spread abroad, the upper part thereof is full of Veins or Sinews, and hollow or curled like the Crumpling of a Cabbage Leaf, and are not only indented about the edges, but each Leaf is divided into six or more Jags or Cuts, deeply backt; greenish above, and of an overworn green colour underneath; and hot in Taste. From the middle whereof shoots forth a bare or naked Stalk, six Inches long, somewhat purple in color, bearing at the Top, a Tuft of small hollow flowers, looking or hanging downwards, like little Bells, not unlike in form to the common Cowslips, but of a fine deep red color tending to Purple, having in the middle a certain Circle of White, and also certain pointels or strings, which turn into an head, in which is contained the Seed. The whole Plant is covered as it were with a rough Woolliness. The root is Fibrous and Theady.

X. The Places. The first or Common Sanicle grows in shady Woods and Copfes almost every where, and delights in a far fruitful and moist Soil. The second grows in shady Woods on the Alps in several places; but with us in Gardens in many places, where they Thrive very well, but delight more in the shade than the Sun. The third grows also in many shady Woods both in Italy and Germany, Austria and Stiria; but with us in Gardens. The fourth was brought to us from the back parts of Virginia called Canada.

XI. The Times. The First Flowers in May and June, and the Seed is ripe in July or August. The Leaves of the Herb are green all the year, and are not hurt with the cold of Winter.

The

Sanicle Bears Ear'd.

The Second Sorts Flower in *May* and continue Flowering until *June*, and the Seed ripens soon after, the Roots abide all the Winter with some Leaves on them, springing afresh in the beginning of the year. The Third Flowers in *April* and *May*, and sometimes in *June*, and the Seed ripens in the mean season. The Fourth Flowers in *July*, and its Seed is ripe in *August*.

XII. *The Qualities.* *Sanicle* is hot and dry in the second degree, Absterlive, Astringent, Traumatick or Vulnerary, and Hyfterick.

XIII. *The Specification.* It is a speedy healer of all sorts of Green Wounds, Cleanses Apoftems or foul Ulcers, helps Tumors in the Body, represses humors and discusses them. It is good against Spitting Blood, and the Bloody Flux, Ulcers of the Reins or Bladder; and stops the overflowing of the Terms in Women.

XIV. *The Preparations.* You may make therefrom, 1. *A Liquid Juice.* 2. *An Essence.* 3. *A Decoction in Wine or Water.* 4. *A Powder of the Leaves and Root.* 5. *A Cataplasim of the same.*

The Virtues.

XV. *The Juice.* It is exceeding good for the speedy healing of all sorts of Green Wounds, or any Apoftem, Ulcer, or Bleeding inwardly; It cleanses the Sore or Ulcer, and induces the healing by its astringency, being inwardly taken and outwardly applied, for it represses a Fluxion of Humors to the part, and discuses the Tumor thereof.

XVI. *The Essence.* It has all the former Virtues exalted; besides which it heals any Wound or Ulcer of the Lungs, or other Viscera, cures the Flux and Bloody Flux, as also Spitting, Vomiting and Pissing of Blood, Ulcers in the Reins and Bladder; gives ease in the Belly-ach, and stops the overflowing of the Terms in Women; and is profitable for such as are troubled with any Rupture or Bristiness.

XVII. *The Decoction in Wine or Water.* It has all the Virtues of the Juice and Essence but much weaker, and therefore must be given in a larger proportion, as from a quarter of a pint to half a pint. It gives present help when the disease falls upon the Lungs or Throat, and cleanses and heals all manner of putrid, stinking and Malign Ulcers of the Mouth, Throat, and private parts, by gargling and washing with a Decoction made of the Leaves and Roots, in Water or Wine, and Sweetned with a little Honey. It is profitable also against a Virulent Gonorrhoea or running of the Reins, being drank Morning Noon and Night after due cleansing.

XVIII. *The Powder of the Leaves and Root.* It has the Virtues of the Juice and Essence, and being strewed upon old putrid Sores and Ulcers, it cleanses, dries and heals them.

XIX. *The Cataplasim of the same.* It dissolves and discusses cold Tumors or Swellings, is Anodyn, and gives ease in a recent Gout.

XX. *Nota.* In short, *Sanicle* is as effectual in binding, restraining, heating, drying, consolidating and healing, as Bugle, Comfrey, Self-heal, or any other of the Confounds or Vulnerary Herbs whatsoever, and is used in Vulnerary Diets and Wound Drinks, for the healing of all inward and outward Wounds and Ulcers.

CHAP DCXVIII.

OF SATTIN FLOWER,

OR,

HONESTY.

I. *THE Names.* It was unknown to the Ancient Greeks and Latines: But modern Authors have call'd it *Bolbonac*, and *Bolbonach*; also *Lunaria Græca*, *Lunaria major*, *Lunaria odorata*; *Viola Lunaria*, *Viola latifolia*, *Viola peregrina*, in English we call it *Satin Flower*, also *Honesty*, *Money Flower* and *Penny Flower*.

II. *The Kinds.* Some Authors think it to be a kind of *Tiblaspi* or *Treacle Mustard*, *Tiblaspi Crateræ*; for *Dioscorides* says that *Cratæas* makes mention of a certain *Tiblaspi*, with broad Leaves, and large Roots, such as this Plant has; but it is generally taken for *Lunaria major*, or the greater Moon Wort. 1. *Viola Lunaria Vulgaris*, *Bolbonac*, Our Common white Sattine Flower, or *Honesty*. 2. *Viola Lunaria altera*, seu *peregrina*, Long living, or long Codded Sattine Flower. To these we may add, 3. *Hedysarum clypeatum*, *Securidaca*, *Onobrichis altera Dodonæi*, The Red Sattine Flower, which some foolishly call the Red or French Hony-Suckle.

The Descriptions.

III. The first, or our common white Sattine Flower or *Honesty*. Its Root is something round,

Sattin Flower; or Honesty.

long,

long, and thick, resembling the Roots of Lillium nonbulbarum, or Day Lilly, It perishes after Seed time, but is eaten, as divers other Roots are, for Sallets, both in England and many other Countries besides. The Leaves are broad below, and pointed at the end, snipt about the Edges, and of a dark green color. The Stalks are round and hard, two Feet high, or higher, divided into many Branches, set with the like Leaves, but smaller, the Tops of the Branches are beset with many purplish Flowers, like unto Dames Violets or Stock Gillflowers, but larger, having no great Smell. After the Flowers are past, there come in their places, round, flat, thin Cods, of a dark color on the outside, but having a thin middle Skin, which is white and clear, shining like unto pure white Satine it self, whereon lye flat and round brownish Seed, somewhat thick and great.

IV. Gerard thus describes it. Its Root is compact of many Tuberous parts, like Key Clogs, or like the great Alphodel. It has hard and round Stalks, dividing themselves into many other small Branches, beset with Leaves like to those of Dames Violets, or Queens Gillflowers, somewhat broad and snipt about the Edges, and in fashion almost like Sawce alone or Jack by the Hedg, but that they are longer, and sharper pointed. The Stalks are charged or loaden with many Flowers, like the common Stock Gillflower of a purple color: which being fallen, the Seed comes forth, contained in a flat thin Cod, with a sharp point or prickle at one end, in fashion of the Moon, but somewhat blackish. This Cod is composed of three films or Skins, of which the two outmost, are of an over worn Ash color, and the innermost in the middle, on which the Seed does hang or cleave, is thin, and clear, shining like a piece of white Satin. The whole Plant dies the same Year that it has born Seed, and must be sown yearly.

V. The second, or long living, or long Coddled Sattin Flower. Its Root is composed of many long strings, which die not as the former, but abide all Winter, and shoot out new Stalks every Spring. This has broader and longer Leaves than the former, the Stalks also are greener and higher, Branching out into Flowers, of a pale purple color, almost white, consisting of four Leaves in like manner, and smelling pretty sweet, bearing such like Pods, but longer and slenderer than they.

VI. Gerard thus describes this second Species. Its Root is Thick, whereunto are fastned an infinite number of long thready strings, which Root dies not every Year as the other does, but multiplies it self as well by falling of the Seed, as by new shoots of the Root. It has many great and broad Leaves, almost like those of the Great Burdock. From among which rises up a very tall Stem or Stalk about four Cubits high, stiff, and of a whitish green color, set with like Leaves but smaller. The Flowers grow upon the slender Branches of a purple color, compact of four small Leaves, like those of the Stock Gillflower. After which come thin long Cods of the same substance and color with the former.

VII. The third, or Red Sattin Flower, which some foolishly call the Red or French Hony Suckle. Its Root perishes the same Year it bears Seed, for often times it Flowers not the first Year it is sown. This Red Sattin Flower (which some call a Red Flower'd Fitchling) has many Stalks of Winged fair green Leaves, many of them set on both sides of a middle Rib, whereof that at the End is the largest of them all. From the Joints where the Leaves stand, come forth pretty long small Stalks, bearing on them very many Flowers, up to the Top, one a-

bove another, of an excellent shining red or Crimson Color, very like to Sattin of that Color, and sometimes of a white or whitish Color, which are somewhat large, and almost closed together, almost flat, and not open, not much unlike the Medics's. After the Flowers are past, rough, flat, round Husks come forth, something like unto the old fashioned Bucklers, without Pikes, three or four standing upon one another, in which are contained small brownish Seed.

VIII. The Places. The first is frequent in Our Gardens, and is found Wild in some places of England as Gerard says, viz. in the Woods about Pinner and Harrow on the Hill, and in Essex likewise about Horn Church. The second is not so common in Gardens, but grows about Watford, fifteen Miles from London. The third is generally Sown in Gardens for an Ornament to the same.

IX. The Times. The two first flower in April or May and sometimes more Early: Gerard says they flower in April the next Year after they are sown. The third flowers in June and July, and its Seed is ripe soon after.

X. The Qualities. The Seeds of the first and second are hot and dry in the end of the second, or beginning of the third degree, of a sharp and biting Taste, as are also the Roots: and are said to have the Qualities and Nature of Treacle Mustard, being eaten in Sallets, as other like things are.

XI. The Specification. White Sattin Flower is said to Cure the Falling Sickness and heal green Wounds.

XII. The Preparations. You have 1. A Sallet of the Root. 2. A Powder of the Seed. 3. An Ointment of the Leaves.

The Virtues.

XIII. The Sallet of the Roots. It is made of the young Roots before they run up to Flower, and is eaten as Rampions with Oil and Vinegar.

XIV. The Powder of the Seed. It is given to a Dram or more at a time, mixed with Honey, or some other convenient Vehicle, Morning and Evening, for the Cure of the Epilepsy or Falling Sickness.

XV. The Ointment of the Leaves. It is made of the Leaves of our common white Sattin Flower, and Leaves of Sanicle, of each a like quantity stamped together, which is boiled in Oil Olive to Crispness, then strained out and repeated 3 times; and afterwards a sufficient quantity of Wax is to be added to bring it to the consistency of an Ointment. It is a singular thing for the Curing of Green Wounds.

C H A P DCXIX.

Of SATYRION.

I. THE Names. It is called in Greek *Σάτυρον* *Σάτυρον τελευλλον*: in Latin, *Satyrion*; and in English, *Satyriion*, it having yet obtained no other Name.

II. The Kinds. Gesner first, and after him Camerarius, Clusius, Lobell, Parkinson, Gerard, and many others refer this Plant the *Satyriion Dioscoridis*, to the *Tulipa* or *Tulip*, (of which we shall here-

hereafter particularly speak) and this Opinion is very probable for several reasons. 1. For that the Tulip grows in many places of Greece and the lesser Asia, which could not but be known both to Theophrastus and Dioscorides, and was accounted among the Bulbous Roots, although by several Names. 2. As Dioscorides says of his Satyrion, so this most commonly bears three leaves upon a Stalk (altho' sometimes it has with us four or five like unto a Lily) of which some are often seen to be both in the first springing up, Red; and also in the decaying, especially in a dry time, and in a dry ground. 3. The Flower likewise of some is White, and something like a Lily. 4. The Root is round, and as white within as the white of an Egg, covered with a Brown Coat, having a sweetish, but not unpleasant Taste. 5. From some Experiments which

Satyrion Triphyllum verum.

have been made of its Root, it appears to have the same Virtues with the True Satyrion, which the Tulip is supposed by our Modern Authors to have. This Description here given does so lively set forth this Plant, that we need not any longer to be in doubt, but that our Tulip is the true Satyrion Triphyllum Dioscoridis: and that our red Flower'd Tulip may very well agree with his *Σάτυριον ἐρυθρόν*, or Satyrion Erythronium for that the Descriptions in Dioscorides, Lib. 2. Cap. 143 and 144. are both alike as to their Qualities. The greatest Objection which is made against this Opinion is from the description of the Seed: for the Seed of the Tulip is very like unto the Seed of Lilly's, as may easily be seen by comparing them, as being flat, hard, and slimy: Whereas Dioscorides says, the Seed of his Satyrion is like to Flax or Line-Seed: it is true as to the hard and shining properties, tho' not to its form, magnitude, and color, they being more like to that of the Lilly. But it is not impossible but that there may be a mistake in the Orthography or true writing of the Name in the Greek Text, putting *Λευκοστίχου* for *Κερασσιέτης* a fault very subject to such as Copy other Mens Writings, and know nothing of the reason of the matter.

III. Then as to the Species of Tulips; tho' the whole Progeny of them may be accounted as so many Kinds of Satyrion, yet Modern Au-

thors give the Title of Satyrion chiefly to these following. viz. 1. *Satyrion Boloniense*, Tulipa *Boloniensis*. The greater Red Satyrion, or Bolonian Tulip. 2. *Satyrion Boloniense flore luteo*, five Tulipa *Boloniensis flore luteo*. The Yellow Bolonian Satyrion or Tulip. 3. *Satyrion Pumilum*, Tulipa *Pumila lutea*. The Dwarf Yellow Satyrion, or Tulip. 4. *Satyrion Italicum*, five Tulipa *Italicum major & minor*. The Italian Satyrion or Tulip, greater and lesser. 5. *Satyrion Pumilum*, Tulipa *Lusitanica*, five *Pumilio versicolor*. The Dwarf striped Satyrion or Tulip. 6. *Satyrion*, five Tulipa *pumila alba*. The White Dwarf Satyrion or Tulip. 7. *Satyrion minus*, five Tulipa *Bicolor*. The small partly colored Satyrion or Tulip. 8. *Satyrion*, five Tulipa *de Caffa*. The Satyrion or Tulip of Caffa. 9. *Satyrion Pumilum rubra*, five Tulipa *Bergomensis rubra media & minor*. The Red Dwarf Satyrion, or Bergamo Tulip, greater and lesser. 10. *Satyrion Byzantinum*, five Tulipa *Byzantina duobus floribus Clusij*. The small Satyrion of Constantinople, or small Turkey Tulip. 11. *Satyrion Persicum*, Tulipa *Persica*. The Persian Satyrion or Tulip. 12. *Satyrion Creticum*, Tulipa *Cretica*. Satyrion or Tulip of Candia. 13. *Satyrion Armenicum*, Tulipa *Armenica*. The Satyrion or Tulip of Armenia.

The Descriptions:

IV. The First, or Greater red Satyrion or Bolonian Tulip. Its Root is plainly discerned to differ from all others, for that it is longer, and has not so plain an Eminence at the bottom thereof, as some of the earlier and later Tulips have,

Satyrion Boloniense, or Tulip Bolonian.

but more especially because the top is plentifully stored with a yellowish Silk-like Wooliness, the outside likewise, or Skin of it, is of a brighter or paler Red, not so easily to be peeled away, and runs under ground both downright and sideways (especially in Country Ground and Air, where it encreases abundantly, though not so in our London Air and foret grounds.) It is something like to the yellow Bolonian Tulip next following. It shoots out of the Ground, with broad and long Leaves, like the Cassia Satyrior or Tulip, at Sect. 11. following, but neither so broad nor of so White or Mealy a Green color as it, but more dark than the late flowering Tulips; so that this may easily be discerned by its leaf from any other Tulip above ground, by such as are skillful in them. It bears likewise 2 or 4 Leaves upon the Stalk like the Cassia Satyrior, and a Flower also at the Top, of the same Fashion, but that the Leaves hereof are always long, and somewhat narrow, having a large black bottom, made like unto a Chevron, the point of which rises up unto the middle of the Leaf, higher than in any other Tulip. The Flower is of a pale red color, nothing so lively as in the early or late Red Tulips, yet sweeter for the most part than any of them, and nearest unto the yellow Bolonian Tulip next following, which is much of the same smell.

V. The Second, or Yellow Bolonian Satyrior or Tulip. The Root of this may be known from the former, (or any other Tulip) in that it seldom grows to such a largeness, and is not so woolly at the top, and the skin or outside is somewhat paler, harder, and sharper pointed, but the bottom is like the former Red, and not so eminent as the early or late Tulips. This has much longer and narrower leaves than any (except the

Satyrior Dwarf.

O R,

Tulip Dwarf.

Persian and Dwarf yellow Satyrior or Tulips following in Sect. 6. and 14.) and of a Whitish green color. It bears sometimes but one Flower, on a Stalk, and sometimes two or three yellow, but smaller and more open than the other kinds, and as is said, smells sweet. The head for Seed is smaller than in the others, and has not that Crown at the head thereof, yet the Seed is like but smaller.

VI. The Third or Dwarf Yellow Satyrior, or Tulip. This is very like unto the last, as well in its Root, as in its Leaf and Flower, as also in the color thereof, being yellow. The only difference is, that it is in all things lesser and lower, and is not so apt to bear, nor so easily nor plentifully to be encreased by the Root.

VII. The Fourth, or Italian Satyrior or Tulip, greater and lesser. Both these kinds, do so near resemble the last kind, that we might almost say they were the same, but that some difference which is seen in them, makes them to be treated of apart, and it consists in these particulars. The Stalks of neither of these rise up so high as of the first yellow Bolonian Tulip. The Leaves of both these sorts are writhed, in and out at the edges, or made like to a wave of the Sea, lying nearer the ground; and the Flower being yellow within, is brownish or reddish on the back, in the middle of the three outward Leaves, the edges appearing yellow. Both these sorts do differ one from another in nothing, but in that one is bigger and the other smaller, &c.

VIII. The Fifth, or Dwarf Strip'd Satyrior or Tulip. This is also of the same Kindred with the three last described; nor is there any other difference from them, than that the Flowers in this has some red Veins running in the Leaves thereof.

IX. The Sixth, or White Dwarf Satyrior or Tulip. The Stalk of this is longer than of other Dwarfs; its Leaves are narrower than those of the White Tulips; its Flower is also larger, and of a White Color.

X. The Seventh, or small party colored Satyrior or Tulip. This is one of the former Species, and was brought to us out of Italy. Its Leaves are small, long and narrow, of a dark green color, something like unto the Leaves of an Hyacinth. The Flower also is small consisting of six Leaves, as all other Tulips do; three of which are wholly of a Red Color, and the other three wholly of a Yellow.

XI. The Eighth, or Satyrior or Tulip of Cassia. Its Root is like unto others of this kind, so that they cannot be distinguished: It is an early Tulip, yet differs from other early Tulips: its pale green Leaves are as broad and large as they, and sometimes crumpled or waved about the edges: in some the edges of the said Leaves only are of a whitish, or whitish yellow color for a good breadth, but in others the Leaves are lifted or parted with whitish yellow and green. The Stalk rises not up so high as the other early Tulips, but bears at the top, a Flower like unto them; in some of a reddish yellow color, with a russet colored ground or bottom, and in others of several colors: the Seed is also like unto the early flowering Tulips. Of this Cassia Species there are both Præcoces and Serotinae, early Flowering and late Flowering which the Diligent Florist may easily observe.

XII. The Ninth, or Red Dwarf Satyrior or Bergamo Tulip, greater and lesser. These are a Species of the first kind, or greater Red Satyrior or Bolonian Tulip, and are called by this Name, because they were found about Bergamo; of which the one Species is the bigger; the other Species the lesser,

lesser, yet neither of them so large or great as that first kind aforesaid; and have very little other differences in them, than that they are also smaller in all their respective parts.

XIII. The Tenth, or small Satyrion of Constantinople, or small Turkey Tulip. Its Root is very like to that of the yellow Bolonian Tulip at Sect. V. foregoing. It is a small Plant, and bears for the most part but two Leaves on the Stalk, which are fair and broad, almost like unto the Cypria Satyrion or Tulip, anon to be described. The Stalk itself rises not to be above a foot high, bearing sometimes but one flower, but most commonly two thereon, one below another, and are no bigger than the Flowers of the yellow Bolonian Satyrion or Tulip, but differing in Color; for this on the outside, is of a purplish Color, mixed with White and Green, and on the inside of a fair-blush color, the bottom and Claves being yellow; and the Tips or Pendants blackish.

XIV. The Eleventh, or Persian Satyrion or Tulip. Its Root is but small, covered with a thick hard blackish shell or skin, with a yellowish Woolfiness both at the top, and under the shell. The Roots also for the most part (in our Climate) grow always less and less, decaying every year, and so perish for the most part, by reason of our Frosts and Cold, although we have many times set them deep in the earth to defend them; but they are apt of their own accord to run deep into the Ground: nor are they so apt in parting or setting off buds or little Roots, as the Bolonian or Dwarf yellow Tulips are; nor do they ever grow or abide so great, as when they are brought unto us from abroad, and seldom Flower with us after the first year. It rises out of the Ground at the first with one very long and small round Leaf, which when it is 3 or 4 Inches high, does open it self, and shew forth another small Leaf (as long almost as the former) breaking out of the one side thereof, and after it a third, and sometimes a fourth and a fifth, but each shorter than other, which afterwards be of the breadth of the Dwarf Yellow Satyrion or Tulip or something broader, but much longer than any other, and abiding more hollow, and of the color of the early Tulips on the inside. The Stalk rises up a foot and a half high sometimes, bearing one Flower thereon, composed of six long and pointed Leaves, of the form of other small Tulips, but not shewing much bigger, than the Yellow Italian Tulip; and is wholly white both inside and outside of all the Leaves, except the three outermost, which have on their backs from the middle towards the edges, a shew of a brownish blush, or pale red color, yet deeper in the midst, the edges remaining wholly white. The bottoms of all these leaves are of a Dark or Dun Tawny Color. And the Chives and Tips of a Darkish purple or Tawny also. This does seldom bear Seed with us in England; but when it does, it is small like to the Seed of the Bolonian, or Dwarf yellow Tulip, aforesaid.

XV. The Twelfth, or Satyrion or Tulip of Candy. Its Root is small and somewhat like to the Root of the Dwarf Yellow Satyrion or Tulip, but a little larger. This plant has come later to our knowledge than the Persian last described, and does more difficultly thrive, with respect to our Cold Climate. It has fair broad leaves, resembling the Leaves of a Lilly, of a greenish color, and not very whitish. The Stalk bears at its top one Flower, larger and more open than many others; which is either wholly White, or of a deep red color, or else is variably mixed, White with a fine Reddish Purple, the bottoms being yellow, with Purplish Chives, tipped with Blackish Pendants.

XVI. The Thirteenth, or Satyrion or Tulip of Armenia. Its Root is not much bigger than the ordinary Yellow Bolonian Tulip, or Satyrion, before described. It is a small Satyrion or Tulip much differing from all the former (except the small or Dwarf White one before described) in that it bears 3 or 4 small, long, and somewhat narrow green Leaves, altogether at one joint or place. The Stalk is not high, and is naked or without Leaves, from them to the Top, where it bears one small Flower, like unto an ordinary Red Tulip, but something more Yellow, tending to an Orange color, with a black bottom.

XVII. The Places. The Titles shew from whence many of them came; but now they are all of them Nurst up in our Gardens, where they thrive and flourish very well.

XVIII. The Times. These are all of them Precoces, or early Flowers; and Flower in those times and Months with the other sorts of early Tulips: They Flower from the beginning of March (if the Season is Warm or Temperate) and continue Flowering sometimes to the end of April, the Seed being ripe in about a Month after the time of Flowering.

XIX. The Qualities. Satyrion is Temperate in respect to heat or cold, moisture or dryness, rather inclining to hot and moist in the first degree: Digestive, Relaxive, Pectoral, Hepatick, Chylifick, Analeptick, and Spermatogenetick.

XX. The Specification. Its said to restore in Consumptions, and Excite Lust, and strengthen the Spermatick and Generative parts.

XXI. The Preparations. You may have therefrom. 1. The prepared Roots. 2. A Juice or Essence. 3. Sanguis or Blood.

The Virtues.

XXII. The prepared Roots. They are done by baking in a Pan or Pot in an Oven, covered over with Paste, or by boiling or stewing over the fire. When baked or boiled soft, the pulp is eaten with Milk or Cream, or with Pepper, Salt and Sweet Butter, adding a little Vinegar, or Wine, as is most agreeable to the Palate. It nourishes much, restores in Consumptions, encreases Seed in both Sexes, excites Lusts, and is good against Barrenness.

XXIII. The Juice or Essence. It has all the former Virtues, but more effectual being drank 3 or 4 Spoonfuls at a time, morning noon and night, in a Glass of choise Canary. Drank in strong red Wine, it is said to be good against Convulsions in the Neck.

XXIV. Sanguis, Or the Blood of Satyrion. It is made as that of Comfrey, Parsheps, Potatoes, &c. It has the Virtues and Excellencies of the Pulp, Juice or Essence, foregoing; but more excellent than them all; for it restores weak and decayed nature admirably, breeds Seed, provokes to Venereous Acts, and mightily refreshes the Spirits. Dose one Ounce or more, morning, noon, and night, in a Glass of Canary, or other Spirituous and Generous Wine.

C H A P. DCXX.

OF SAVINE.

I. **THE Names.** It is called in Arabick, *Ab-hel*, in Greek, *Βελύχον*, *Βελύχον*, & *Βελύχον*, *Brathos*, *Bratly*, *Barathron*; in Latine, *Sabina*, and *Savina*, and of some *Savinera*; in English, *Savine*, and is a Shrubby kind of Plant.

II. **The Kinds.** Authors make three Sorts of this Plant. 1. *Sabina Vulgaris*, *Savina Communis*, our common Savine. 2. *Sabina Baccifera Matthioli*, *Camerarij*, *aliorumque*, *Sabina altera Dodonæi*; *Sabina Capressio similis Cordi & Lugdunensis*, Berry bearing Savine. 3. *Sabina altera baccata Lobelij & Lugdunensis*: *Sabina semina major Tabernamontani*, *Sabina alterius altera icon Dodonæi*: Savine Gentle, or the greater Berry bearing Savine.

The Description.

III. The first, Or our Common Savin, has a long, Branched out, woody Root, from which springs up a small low Bush or shrubby Plant, three or four Feet high: having a Woody Stem, with many woody Branches on it, crooked or bending; on which are set many small, short, hard, thick, and prickly Leaves of a dark green color, which are fresh and green both Winter and Summer. The Leaves are small, in great Numbers, and almost like Cypress or Tamarisk, but thicker and more sharp or prickly, of a very strong, but yet not unpleasing Smell. It is said to be Barren, because it is seldom seen to bear any Seed or Berries with us; but Lobel says, that it does bear Berries, altho but in a few places and but seldom, and holding the Fruit on its Branches all Winter till green Fruit grows on them again the next Year; and this is confirmed by good experience, as Cordus, Dodonæus, Fuchsius, Gelsner and Lugdunensis do testify: in its Native Countries it bears small Black Berries like unto Juniper.

IV. The second or Berry bearing Savine. This is the greater plant of the two; it spreads not so much as the former, but grows somewhat higher, as to the height of four, and sometimes of five feet, spreading forth Arms and Branches fully furnished with Leaves, which at their first coming forth, are somewhat like unto Tamarisk Leaves, but being grown old, are more like unto the Leaves of the Cypress Tree, hard and pricking, and of a dark green color, with an eye of blew shadowing them; having a less strong smell, and nothing so sharp as the common kind before described. It has not been observed to bear any Flowers, but small round Berries, like unto Juniper Berries, but larger, and of a sharper taste, black when they are ripe, with an eye of blew upon them, like to the Juniper, or those of the common Savine before described, which Berries remain on the Branches all Winter also, till new green ones come upon them again.

V. The third, or Savine Gentle, or greater Berry bearing Savine. This grows somewhat higher than the second, with us, spreading out more slender and weak Branches, on which are set small and

Savine bearing Berries.

long Leaves, of a more pleasing and gentle smell than the others. On the Branches among the Leaves, came forth such like Berries, as on the other, and very like unto Juniper, black also when they are ripe, and but a little bitter in Taste, not altogether unpleasing.

VI. **The Places.** The first is planted in our English Gardens almost every where. The second and third grow upon Hills and in Woods in Candy, Misia, and in other parts of Greece, and other those Eastern Countries; The third on Mount Taurus, Olympus, and Amanus; as also upon the Mountains in Apulia and Calabria, as also upon the Plains of the Alps, near unto Gratianople. Gerard says, that both these latter grew in his Garden. They are all planted by the Slip; but the second both by the Seed and the Slip, which must be set in a ground somewhat Moist and Shadowy, till they have taken Root. The Plants growing from the Slips, decline towards one side, still retaining the Nature of the Bough: but the Savine which is produced by the Seed grows more upright.

VII. **The Times.** These all of them, continue always green both Winter and Summer. And those which bear Berries, have them ripe commonly in Winter; but they have fruit at all times, for before that the old Berries fall off, new come on upon the same Branches.

VIII. **The Qualities.** Savin is hot and dry in the third degree and of subtil parts: Aperitive, Absterfive, Anodyn, Atractive, Diuretick, Neurotick, Hyfterick, Emmenagogick, and Alexipharmick.

IX. **The Specification.** Savine is held to be a very good Remedy against the Kings-Evil, Stone, Sand, Gravel, and Tartarous matter in the Reins or Bladder.

der, the Pleurisie, Colick, obstructions of the Terms, Worms in Children, &c.

X. *The Preparations.* You may make therefrom, 1. *A Juice or Essence of the Leaves.* 2. *A Decoction of the same in Water or Wine.* 3. *A Powder of the Leaves.* 4. *A Fume.* 5. *A Decoiled Oil.* 6. *An Ointment.* 7. *A Cataplasm.* 8. *A Distilled Water.* 9. *An Oil Distilled.* 10. *Oleum Sabine Crocinum Mynsichti.* 11. *Potestates or Powers.* 12. *An Elixir.* 13. *A Fixt Salt.*

The Virtues.

XI. *The Juice or Essence of the Leaves.* They are of thin parts, and by reason of their strong drying and heating qualities, they have no consolidating or glewing property in them; but by reason of their great acrimony, they digest more, and resist putrefaction as powerfully as those preparations of the Cypress; mixed with Honey and applied, they cleanse the filth of Ulcers, and take away their blackness, and break or dissolve Carbuncles, or Plague Sores. They provoke the Courses, and force away both Birth and After-Birth. They are also profitable against the Kings-Evil. Dose one or two Spoonfulls or more Morning and Night, in a Glass of White or Rhenish Wine.

XII. *The Decoction in Wine or Water.* It has all the Virtues of the Juice or Essence, but much weaker, taken to half a pint, it expells blood by Urine, and is profitable against the Stone, Sand, Gravel, or any Tartarous Mucilage in the Reins, or Urinary parts. Given with 30 Drops of Spirit of Hartshorn, or Tartarised Sal Ammoniac it is a present help against the Pleurisie, and Wind Colick, &c.

XIII. *The Powder of the Leaves.* It has the Virtues of the Juice, Essence and Decoction, and may be given from half a Dram to a Dram, in any proper Vehicle; some give it as a Specifick to Kill Worms in Children. Take *Savine in Powder a Dram: Nitre finely powdered 3 Ounces: Honey 2 Ounces, mix them.* It wonderfully helps such as are Asthmatick and short winded, being taken upon a Knives point morning and night.

XIV. *The Fume.* It is made of the Green Herb cut small and flung upon live Charcole; received up the Body with or without a Funnel, it induces the Terms, and Loches stoppt, hastens the Birth, and Facilitates the Delivery.

XV. *The Decoiled Oil.* It eases pains, is good against Tumors, and King-Evil, Swellings, and is said to Kill Worms in Childrens Bellies being anointed therewith.

XVI. *The Ointment.* It is made of the Green Herb, as is usual after which, to every pound of the Ointment 2 Ounces of the fine Powder of the Leaves is added. It has all the Virtues of the foregoing Oil, and is more powerful than it to all intentions; anointed on the heads of Children which are vehemently Scabby, commonly called Scald Heads, it thoroughly cleanses them, stops their running, dries, and perfectly heals them, and is good against Anthones Fire.

XVII. *The Cataplasm.* It is made of the Green Leaves by bruising them in a Mortar. Laid upon Old Ulcers, running Sores, and fretting Cankers, and such like, it digests, cleanses, destroys their malignity, dries and heals them, being first Bathed or Washed with a strong Decoction of the Leaves.

XVIII. *The Distilled Water.* It is a proper Ve-

hicle to convey some of the former Medicines in: it is also of singular good use to cleanse the Skin, and clear it from discoloring, spots, marks, and other like deformities; and is profitable for the Vertigo, or a Giddiness of the Head and Brain, being taken inwardly morning and night to 4 Ounces or more, sweetned with double refined Sugar.

XIX. *The Distilled Oil.* It powerfully provokes the Terms, hasten and facilitates the Birth, forces away the After-Birth, and dead Child, provokes Urine, gives ease in the Stone, Gravel, Strangury, or any Obstruction of the Urine, gives present ease in the Colick, and is profitable against the Pleurisie, as also the Gout proceeding from a cold cause, being anointed thereon. Dose from 3 Drops to 10, Dropt into fine Sugar, and so drank, with a quarter of a Pint of the Distilled Water, or some other proper Vehicle.

XX. *Oleum Sabine Crocinum Mynsichti.* Mynsicht's Oil of Savin with Saffron. Take of the former Distilled Oil of Savine 3 Ounces: Oriental Saffron, or the best English Saffron 2 Drams, rectified Spirits of Magwort, Centory the less, and Cinnamon, of each one Ounce; digest 10 days, then abstract the Spirit and keep the Oil for use. It has all the Virtues of the Distilled Oil, and much more powerful for all the intentions. It may be given morning and evening (after due purging) from iij. drops to x. in Rhenish Wine, or some appropriate Water or Decoction.

XXI. *Potestates, Or the Powers of Savine.* These are possibly one of the greatest Hystericks in the whole Vegetable Kingdom, for suppressing Vapors and curing Fits of the Mother. They are admirably Nervous, and cure cold diseases of the Head, Brain, Nerves and Womb, proceeding from too much moisture. They are of thin and subtil parts, provoke Urine and the Terms, hasten the Birth, force away the After-Birth, and expell the dead Child if any be. They open and cleanse the Womb so powerfully, that they are not to be taken by Women with Child, lest they cause Abortion or Miscarriage. And yet they have this Excellent quality (if a Woman is not with Child) as well to comfort and strengthen the Womb, as to open and cleanse it. Tho' they potently provoke the Terms when Stopt, yet when they flow too much, they will as well stop them again, because they warm, comfort, and strengthen the Nerves; and the Womb being very Nervous, it receives the same advantage thereby. They famously ease pains, in what part of the Body soever, especially those of the Colick, of the Stone, and alter-pains; and all such as proceed from Cold, Bruises, Strains, Blows, or other Contingent causes. They are of extraordinary force in Curing Barrenness in both Sexes, but chiefly in Women, for they warm, comfort, restore and strengthen the Instruments of generation, acuate and enliven the Seed, making it brisk, potent and fruitful, and that in both Men and Women. They cure Cramps and Convulsions, as also a cold Gout and Sciatica, and strengthen all the parts weakened by those diseases, or any external Violence. They cure the Palsie, trembling of the Hands, Arms, or Feet, and the benumbedness of any part, if taken inwardly in due dose, and he also outwardly applied to the parts affected, as also bathed on the back Bone, as often and as long as the Vehemency of the disease requires. They become a cure for the Palsie, if diligently used according to these directions. The Dose. They may be given from 40 to 80 or an 100 Drops, yea to half a Spoonful or more, if

to a Woman in Labor to excite the pains and hastens the Expulsion of both Birth and After-Birth, and so be repeated again, if the Midwife thinks needful. For Vapors and Fits of the Mother, give them in fair water in the time of the Fit, and at other times only Morning and Evening. In Convulsions, Faintings, Swoonings, Palfies, &c. give them in Canary, Madera, White Port, or White Lisbon Wines, or any other strong and generous Wine, two or three times a day or oftner if need requires.

XXII. *The Elixir.* It has the same Properties, Qualities, and Virtues with the Powers, saving that this is much stronger, yet may be given in the same manner and dose without exception.

XXIII. *The Fixed Salt.* It is Hyfterick and Antipleurectick, being given in proper Vehicles. It absorbs the acidities of the Stomach and other Viscera, chiefly of the Womb, and gives ease in Vehement pains of the Stomach and Bowels, Womb, Reins, and Bladder. Dose from gr. 10 to 20 in Syvin Water, Decoction of Winter Cherries, or other fit Vehicle.

CHAP DCXXI.

Of SAVORY.

I. *THE Names.* It is called in Arabick, *Sibuter*, and *Sabutar*; in Greek, *Θύμλεον*; in Latine, *Satureia*, also *Thymbra*: and in English, *Savory*.

II. *The Kinds.* There are about five sorts of Savory commonly to be met with in our Gardens, viz. 1. *Satureia Vulgaris*, *Satureia hyberna*, *Satureia perennis Camerarij*, *Satureia*, sive *Thymbra altera Lobelij*, *Satureia hortensis Cespitini*, *Hyssopus agrestis Brunfelsij*, *Thymbra Sylvestris Angulara*, *Thymbra agrestis Gesneri*, & *Satureia Montana Bauhini*; Our Common Winter Savory. 2. *Satureia estiva*, *Satureia hortensis*, & *Sativa* or *Thymbra Sativa* by most writers; *Cunila Cespitini* & *Tabernemontani*, *Thymbra agrestis Cespitini*, *Thymbra vera Gesneri*, *Satureia hortensis Bauhini*, *Cunila Columella*; Our Summer Savory. 3. *Satureia Cretica*, & *Legitima*, *Thymbra Cretensis Alpini*, *Thymbra Legitima Clusij*, *Thymbra Legitima Dioscoridis Pona*, *Dioscorides his True Savory of Candy*. 4. *Thymbra Spicata Pene*, *Thymbra vera Lobelij Lagdunense* & *Tabernemontano*, *Thymbra Vera Juliani*, *Thymbra vel Satureia Rupis vel Saxatilis*, Rock Savory.

The Descriptions.

III. The first, or our Winter Savory. It has a Woody Root, with divers small strings adjoining to it, and abides with green Leaves all the Winter, which is more usually encreased by slipping or dividing the Root, and new setting it again in the spring, than by sowing the Seed. It is a small Low, and Bushy Herb, very like unto Hyssop, but not much above a Foot high, with divers small hard Branches, and hard dark green Leaves thereon, as thick set as the Leaves of Hyssop, and sometimes with but four Leaves at a joint, of a reasonable strong aromatick or sweet smell, yet not so strong or sweet as the summer kind following. The Flowers are of a Pale Purplish color, set at several distances, towards the tops of the Stalks, and with Leaves also under them.

Savory Winter.

Savory Summer.

IV. The second, or our Summer Savory. Its Root is Woody, and has many strings, yet fewer than the former, which perishes wholly every year, and must be Sown again every Spring, if you will have

have it. It is a small tender herb, growing not above half a yard high or thereabouts, rising up with divers brittle Branches, slenderly or sparsely set with small, long narrow Leaves, two at every joint, one against another, soft in handling, and of a pleasant, strong and quick smell and taste, stronger, sweeter, and pleasanter than the former. The Flowers are small and purplish, growing at the tops of the Stalks, and with two small long Leaves at the joints, under them. The Seed is small and of a dark color, and larger than Time Seed by half, which must be Sown every Spring for the increase of the Herb.

V. The Third, or Dioscorides his true Savory of Candy. Its Root is somewhat woody, long, and hard, with some small blackish Fibres spreading from it, and will as hardly endure the Winter with us as the last, although the lower branches which lye on the ground are apt to take Root, which shews, that in its native place of growth, where it feels no cold Winter, it can by that means spread, and increase it self. Its branches

Savory of Candy.

forth from the ground like Time, with many purplish square Stalks or Branches, covered over with a rough or hairy down. From the lower joints of the Stalks come always two Branches, and two Leaves set at them; and so in the like manner all along the Branches, two at every joint one against another on the contrary side, and are very like unto the Leaves of the true Time, but something larger and a little hairy, of a sweet smell, and sharp taste, between those of Time and Savory. On the Tops of the Branches, at certain distances one above another, grow forth heads or Tufts of green Leaves, from among which come forth many purplish flowers like to those of Time, standing in brownish husks. The

Seed is of a blackish brown color, and very like also to the Seed of Time.

VI. The fourth, or Rock Savory. It has a somewhat long and woody Root, with Fibres adjoining to it towards its lower end, from which rise up many slender, hard, and woody Stalks, about a foot high, on which do grow at several spaces, many very small and narrow Leaves, very like to the Leaves of the true Time, but something longer, of a sharp quick Taste, and of a strong sweet smell. At the Tops of the Branches come forth many spiked heads of small Leaves, and out from among them, come forth purplish Flowers, which afterwards yield a small brownish Seed, more like to the Seed of Time than of Savory. The whole Plant will be sometimes, of a sad purplish color, dusted over with a white mealliness, as for the most part all Sea plants are. This is a very tender plant, and does seldom endure the Winter with us.

VII. The Places. These Plants grow wild in several parts of the South of Europe, and in Asia, especially in Groves, where many times they are to be found very plentifully; but with us they all grow in Gardens.

VIII. The Times. They all Flower the first year of their Planting or Sowing; the first two and the fourth in July and August; the third (in its native places) in October and November.

IX. The Qualities. They are all hot and dry in the third degree, Astringent, Aperitive, Altringent, Attactive, Carminative, Digestive, Diuretic, Cephalick, Neurotick, Pectoral, Cardiac, Hysterick, Parmick, Emmenagogick, Alexipharmick, and Analeptick.

X. The Specification. Savory expells Wind, is good against the Colick, Vapors, and Fits of the Mother, provokes Urine and Womens Courses, stirs up Lust and causes Fruitfulness in both Sexes; it causes a good Appetite, and as good a Digestion, taking away loathing, and an inclination to vomiting, it cuts tough flegm in the Breast and Lungs, and helps to expectorate it easily. It is good also against Cramps, Convulsions, Palsies, Lethargies, Dullness of the Spirits, Vertigo's, and most other cold and moist Diseases of the Head, Brain, Nerves, Womb, and Joints, as Gout, Sciatica, &c.

XI. The Preparations. You may have thereof from. 1. A Juice or Essence. 2. A Decoction, or Infusion. 3. A Powder of the Leaves. 4. A Cataplasm. 5. A Spirituous Tincture. 6. An Acid Tincture. 7. A Spirit. 8. An Oil. 9. Potestates or Powers.

The Virtues.

XII. The Juice or Essence. Taken from an Ounce to two Ounces in a Glass of Canary or Madera Wine, it gives ease in the Colick, provokes Urine and the Courses, and Excites Lust in both Men and Women. They cut tough flegm in the Breast and Lungs, and cause an easy expectoration thereof; the juice being used as an Errhine, by Snuffing it up the Nostrils, enlivens the Spirits, takes away dullness and heaviness, and is profitable against a Carus, Lethargy, and other sleepy diseases; by drawing our, and purging the head and brain of cold, viscous and pituitous humors: and dropt into the Eyes, it is a good Ophthalmick to clear the Sight, if it proceeds of thin cold humors distilling from the Brain.

Brain. The same Juice or Essence, mixed with a little Oil of Roses and dropt into the Ears, it eases their pain, and takes away Deafness, Noise, and Singing in them.

XIII. *The Decoction or Infusion in Wine.* It has the former Virtues, but is weaker and therefore may be given to 4, 6, or 8 Ounces at a time; it is good against loathing and Vomiting, creates an Appetite, and causes a good Digestion.

XIV. *The Powder of the Leaves.* It may be given to a Dram at a time, morning and evening either in a Glass of Wine, or mixt with Honey, or some proper Syrup. It has the Virtues of the Juice, Essence and Decoction, but operates not with that Celerity and Excellency as they do, by reason of its earthy substance which very much clogs it; besides it must be first digested in the Stomach before it can exert its Virtue in remedying those Distempers against which it is given.

XV. *The Cataplasme.* The Juice made into a Poultrice with Wheat Bread, or Rye Bread, and applied to the Joints or Hips, is said to give ease to the raging pains of the Gout and Sciatica, as also difficulties simple contusions, and takes away the Stinging of Bees, Hornets, Wasps, &c.

XVI. *The Spirituous Tincture.* It is excellent against the Colick, and all Windy Distempers in the Stomach and Bowels; is good against Hypochondriack Melancholly, and prevails against Fainting, Swooning, Convulsions, Vertigo, Lethargy, and other cold and moist Distempers of the Head, Brain and Nerves, and has all the Virtues of the Juice, Essence and Decoction or Infusion. Dose a quarter of a Spoonful at a time Morning and Evening in a Glass of Generous Wine.

XVII. *The Acid Tincture.* It is a most admirable Stomack, not inferior to that of Mint, it is good against an Asthma and shortness of Breath caused by Obstructions of the Lungs thro' Phlegm and other cold and Viscid Humors, inciding or cutting them, and so causing them to be easily Spir up. It is profitable against all Burning, Malign and Pestilential Fevers, and even against the Plague it self; resists Poison and the bitings of Vipers, Rattle-snakes and other Venomous Creatures, it creates an Excellent Appetite to Food, and causes a good Digestion thereof, strengthening after a singular manner the Tone of the Stomach. Dose so many Drops as to give a Glass of Wine or other Liquor a grateful acidity, and to be repeated 3, 4, or 6 times a Day or oftner.

XVIII. *The Spirit.* It is a singular Stomack and Cordial, good against Fainting and Swooning Fits, Fits of the Mother, pains and gripings in the Stomach and Bowels, and all the Disorders of the *Viscera* proceeding from Cold, Moisture, Wind, and Obstructions. Dose from a Dram to two Drams in a Glass of Wine.

XIX. *The Oil by Distillation.* It may be given from 2 Drops to 10, being dropt into Sugar and mixt well therewith, and then put into a glass of Wine or other fit Vehicle to be taken in. It is good against Vapours, Fits of the Mother, Obstructions of the Terms and other cold and moist Distempers of the Womb. It warms and comforts the Instruments of Generation, excites Lust, and is said to Cure Bartenness in both Sexes. It facilitates the Delivery of Women in Labor, brings away both Birth and Afterbirth, and either prevents or eases after-pains caused either by hard Labor, or raking Cold. It is also good against all cold or moist Distempers of the Head and Brain, as vehe-

ment Headachs, Megrim, Carus, Lethargy, Vertigo, Apoplexy, Epilepsy, Convulsions, Palfies, either particular or universal, &c. inwardly taken and outwardly applied, as the prudent Physician shall advise. It is also good against Fainting and Swooning Fits, Cardialgia, and the most severe Colick, proceeding from whar cause soever. It also resists Poison and the bitings of Poisonous Creatures, as also the Malignity of the Plague or Pestilence, and all sorts of Malign and Pestilential Fevers.

XX. *Potestates or Powers.* These have all the Virtues of Juice, Essence, Tinctures, and Oil, but are much more subtil than them all; and not being so concentrated as the Oil is, may be given in a larger Dose, as from 50 to an hundred Drops in Wine, or some other proper Liquor. They have a mighty power upon the Brain and Animal Spirits, as also on the Heart and Virals, acting as it were in a Moment, and so giving many times present Relief.

CHAP. DCXXII.

of SAW-WORT.

I. **THE Names.** It has no Greek, nor ancient Latine Name: The Moderns call it *Serratula* (a *folijs minutim ferratis*) and we in English, *Saw-wort*.

II. *The Kinds.* Some will have this to be a Species of the *Jacobs* or *Knapweeds*, from its Scaly Heads; but *Thalius* takes it to be a kind of greater Centory: and *Lonicerus* thinks it to be a Species of *Solidago Sarafenica* Saracens Confound, from its Effects. Some have called it *Serratula Tindoria*, or *Tindoris*, because it was formerly used by Dyers in Dying and setting of a green color; but *Parkinson* thinks it was called *Tindoria* by a mistake of *Tragus*, applying it to another Plant, viz. his *Flos Tindorius*, into which error, *Baubinus* was led, as he himself says, by *Thalius*. There are three kinds of this plant sometimes found, viz. 1. *Serratula Vulgaris flore purpureo*, our common Saw-wort with Purple Flowers. 2. *Serratula flore albo*, White Flowered Saw-wort. 3. *Serratula flore rubro*, Red Flowered Saw-wort.

The Descriptions.

III. The first or our common Saw-wort with Purple Flowers. Its Root is a bush of many strings, which encreases into many heads, which shoot forth every one of them, many like leaves, whereby it grows quickly to be a great Tuft or Bush. It rises up with many of its first Leaves somewhat broader and longer, than those of Betony, and sharper dented and pointed, all of them set upon long foot Stalks; but those which rise up after them, are longer and broader, and deeply cut in, or gashed on the sides into many parts, and each part finely dented also in the same manner. From among which Spring up many brownish Stalks, with divers Leaves on them, the lowermost whereof are divided in the same manner aforesaid, and so the

the higher they grow upon the Stalks, the less divided they are unto the Tip, which are branches forth into many parts, bearing Sealy Heads like to the Knotweeds, (but nothing so great,) round and hard, with divers Purple Threads or Threads in the middle, like unto them but shorter.

Saw-Wort.

The Seed is small and black, like to that of the Jacea but lesser than it, and lying in Down, which sheds and falls away. This plant when it is young has many, or most, or all its first and lowest Leaves whole and not jagged or divided into parts; but when it grows older, and higher the leaves which come forth afterwards higher upon the Stalks, are many, or most of them divided into several parts.

IV. The second or White Flowered Saw-wort. This in its Root, Stalks, Leaves, Branches, Flowers and Seed, and form and manner of growing is very like to the former; nor is there any difference or distinction between this and that, but only in the color of the flower, or of the Threads in the middle of the Sealy Heads, which in this is White, and the heads themselves, and the Stalks of a fresh green color.

V. The third or Red Flowered Saw-wort. This is also in all respects as to the form of its Root, Stalks, Branches, Leaves, Flowers, Seed, and manner of growing, like unto the two former, the difference between them being chiefly in the flower, which is of a deeper Red Color. This is more rare than any of the former, and not so easy to be found, or in so many places, as the two foregoing are.

VI. The Places. They all grow in Woods and Shadowy places, and sometimes in Meadows.

The first is common in the corners of fields and Wood sides, both open and Shadowed; that with a White Flower has been found growing at the farther end of Hampstead Wood, near unto a Rill of Water, running by the side of a Cottage there; as also upon Water Down Forest in Suffex, near unto the path which leads from Eridge unto Ivy Bridge by a Brook side. The last is not so common to be met with.

VII. The Times. They all Flower in July and August, or towards the end of Summer, and the Seed is ripe not long after.

VIII. The Qualities. Saw-wort is hot and dry in the end of the first degree, or beginning of the second; Absterfive, Astringent, Anodyn, Vulnerary, and Arthritick.

IX. The Specification. It heals Contusions, Green Wounds, Old Ulcers, Hemorrhages, Colick, and all inward Torments of the Bowels, Ruptures, Hemorrhoids or Piles, &c.

X. The Preparations. You may make thereof, 1. A Juice or Essence. 2. A Decoction or Infusion in Wine. 3. A Powder of the Leaves. 4. An Oil or Ointment of Herb and Root. 5. A Cataplasm of Herb and Root. 6. A Fomentation.

The Virtues.

XI. The Juice or Essence. They are Singularly good for such as are Bruised by a Fall, and have thereby any Vein broken within them; or are much Bruised by cruel Blows, or otherwise much hurt by any violence or over straining or lifting; they ease their Pains and Soreness, and stop the said inward Bleeding, by conglutinating the mouths of the Vessels. And for the same reason they are commended to heal Ruptures, or Burstness, being as well as taken inwardly, bathed warm outwardly upon the Place. They are good also for all Wounds new or old, to cleanse, dry, heal, and consolidate them; or being old and filthy Ulcers, to digest, cleanse, incarnate and Cicatrize them; they being often wash'd therewith, and after washing, the Ointment or Balm of the same Herb being applied.

XII. The Decoction or Infusion in Wine. They have all the same Virtues with the Juice and Essence, but much Inferior, as being weaker in their effects, and therefore may be given from a quarter of a pint, to half a pint, morning and evening; besides which, they are of good use against the Colick or Gripings of the Guts, and all inward Pains and Torments of the Bowels proceeding from Wind or sharp Humors.

XIII. The Powder of the Leaves. Inwardly given (in any fit Vehicle) to a dram at a time, morning and evening, it has the Virtues of the Juice or Essence, but operates not with their speed, nor does it pierce so far, nor so effectually; but is an extraordinary thing for the present stopping or pissing of Blood, or of a Bloody Flux. Outwardly, it stops bleeding also, heals green wounds; and cleanses, dries and heals old running Sores, and foul Ulcers though of long standing.

XIV. The Oil or Ointment of the Herb and Roots. They ease pains in any external part, being anointed upon the same. And the Ointment is good to heal Green Wounds, they being first wash'd with the Essence or Decoction, then strewd over with the Powder, and after all the Ointment

ment being applyed spread upon fine Tow; and after the same manner they digest, cleanse, incarnate, dry, and heal foul running Sores, and old foetid Ulcers, if drest therewith twice a day.

XV. *The Cataplasme of the Herb and Root.* It is good to heal simple Contusions as also simple new Wounds, and to cleanse foetid and putrid Sores. And to Consolidate Ruptures in Children and Young Men, being applyed to the part, after bathing of the same with the Juice or Essence.

XVI. *The Fomentation.* Take of the Decolition or Infusion two parts; of the Juice or Essence one part, mix them. It is of singular effects in easing the Hemorrhoids or Piles, when they are very painful, by fomenting them therewith very hot for an hour together, twice or thrice a day: and if they be very full of Blood, after Leeches have been applyed, by fomenting them very hot, it perfects the Cure.

C H A P. DCXXXIII.

Of SAXIFRAGE English.

I. **T**HE Names. Saxifrage, (as to the general) was scarcely ever known to the Ancient Greeks or Latines, yet there is *Σαξίφραγος* Dioscoridis, which what that Plant was, is scarcely known to us, but some of the Moderns have applyed that Name to those Plants which we call Saxifrage: And by late Writers it is called in Latine *Saxifraga*; and in English, *Stone-break*, and *Saxifrage*.

II. *The Kinds.* There are several Species of Saxifrage, the chief of which are. 1. *Saxifraga facie Sefeli pratensis Saxifraga Anglicana Lobelij, Sefeli pratense nostra Parkinsoni, Saxifraga Anglorum, Our English Saxifrage.* 2. *Saxifraga palustris Anglicana, Our Marsh Saxifrage*; of these two Species we shall Treat in this Chapter. 3. *Saxifraga Alba, Our White Saxifrage*, of which in Chapter. 624. 4. *Saxifraga Pimpinella, Our Burnet Saxifrage*, of which in Chapter 625. following.

III. *The Kinds of the English so called.* 1. *Saxifraga Anglicana Lobelij, Our English Saxifrage* specially so called; it is a singular Plant of the Kind, and by Parkinson enumerated among the *Hart-woorts*. 2. *Saxifraga Anglica Occidentium Lobelij, Our West Country Saxifrage*, which Lobel thinks to be a Species of *Matthiolum* his Italian great Saxifrage. 3. *Saxifraga palustris Anglicana, Saxifraga palustris Alsine folia, Marsh Saxifrage*, or small Water Saxifrage. 4. *Saxifraga major Italorum Matthioli, The great Italian Saxifrage*.

The Descriptions.

IV. The first, Or our English Saxifrage, specially so called. It has a Root which is long, thick, Black without, and White within, and of a good flavor. It rises up with Stalks two or three feet high, and something Crested, from which spring Stalks of Winged Leaves, finely cut, almost like to Fennel, but thicker and broader, and not so

Saxifrage English Common.

largely spread, not much unlike to *Sefeli pratense montpelienium*, and of a deep green color; the Stalks bear at the Tops Umbels of small Whitish Yellow Flowers, and the Seed after them is like to Common Fennel Seed, both for form and magnitude, but of a browner color, and lesser Taste.

V. The second, Or, Our West Country Saxifrage. It rises up with pretty thick woody stems, some of them standing upright, and other some creeping as it were upon the Ground, towards their lower ends full of Chinks or Clefts, spreading themselves out very thick, and are full of Joints, out of which grow two small long whitish green Leaves, out of whose Bosoms come divers lesser Leaves, smaller and shorter growing with them. The Flowers grow at the Tops of the Branches or small Stalks, in small Tufts, of a White, or Whitish color, the whole plant being also white.

VI. The third, or Marsh Saxifrage, or small Water Saxifrage. Its Root is small and Fibrous, growing in the Mire with its Strings. It rises up from the Root, with several very small grass-like leaves, about an Inch long, very small and narrow, (a great deal smaller and slenderer than small Pins, says Gerard) from among which spring up divers slender, round, smooth, firm Stalks, about six or seven Inches high, full of Joints, which are sometimes branched here and there with small Branches: at the Joints of all which both Stalks and Branches grow small Leaves, many together almost like the former (but two for the most part longer than the rest) set by couples, with others shorter coming forth of their bosoms, which Leaves the higher they grow toward the Tops, grow still shorter and shorter,

Small Water Saxifrage.

so that the Top of this Plant resembles the hard branched Thyme. At the Tops of the Stalks and Branches grow the Flowers, which are white, and consist of five round pointed Leaves, with some small Chives in the middle, which Flowers are great, considering the smallness of the Plant.

VII. The fourth, or great Italian Saxifrage. Its Root is long, and Woody, with some Fibres adjoining to it, from which Springs forth a great Woody Stem, of the thickness of ones finger, which is full of Clefts as it were below, which spreads it self out very thick, with many slender hard whitish Branches full of Joints, and two small whitish green pointed Leaves set at every Joint like unto Pinks, and many other smaller and shorter growing with them. The Flowers stand at the Tops of the Branches, out of white greenish husks, consisting of five, and sometimes six small white leaves, indented at the ends, of a sweet smell, standing above the husks, and laid open like a little Star, after which follow small round and somewhat long beads, full of small reddish round Seed, much lesser than that of Poppy: but this Plant grows not with us in England so great and Woody.

VIII. The Places. The first grows in Fields and Meadows, in most places of this Kingdom. The second and fourth, in the West parts of England as Lobel says, who relates in his *Adversaria*, that he found the second between Chipnam and Marlborough in the high way from London to Bristol, on a Chalky hill. The third Mt. Goodyer found on a boggy Ground below the Red Well of Wellinborough in Northamptonshire. The fourth, also Matthioli says grows on Mount Baldus in Italy.

IX. The Times. The first flowers from the beginning of May, to the end of August. The others flower (all of them) late in the Year, as in July and August, and their Seed is ripe not long after.

X. The Qualities. Saxifrage is hot and dry in the third Degree, Aperitive, Absterfise, Anodyn,

Carminative, Digestive, Diuretick, Neurotick, Stomack, Nephritick, Hyfterick, Emmenagogick, Alexipharmick, and Lihonriptic.

XI. The Specification. It is good against the Strangury, Sand, Gravel, Stone, and Tartarous Mucilage in the Reins, Ureters, and Bladder, to expel Wind, give ease in the Colick, provoke the Terms, &c.

XII. The Preparations. You may have therefrom. 1. A Juice. 2. An Essence. 3. A Decoction of the Herb in Wine or Water. 4. A Powder of the Seed and Root. 5. A Distilled Water.

The Virtues.

XIII. The Juice. Drank from 2, to 4 or 6 Spoonfuls in White Port or Lisbon, Wine it provokes Urine powerfully and is said by Authors to break and expell the Stone in the Reins or Bladder, (which I suppose to be a Gritty one, for that of a Flint-like Substance, can never be broken by a Medicament) and to expell it, as also Gravel, Sand, or any Tartarous matter in those parts.

XIV. The Essence. It has all the Virtues of the Juice, besides which it expels Wind, is good against the Colick, provokes the Terms, in Women, hastens and facilitates the Birth, strengthens a weak Back, and eases the Pain thereof. Dose from 2 to 4 Spoonfuls. If taken with Honey, it eases Coughs, and causes Expectoration.

XV. The Decoction in Wine or Water. It is made of the Root and Herb together, and has all the Virtues of the Juice and Essence, but must be taken in much greater Quantity, (because it is weaker in Operation) as from 4 to 8 Ounces, or from a quarter to half a Pint Morning and Night, sweetned with Honey or Sugar.

XVI. The Powder of the Seed and Root. Taken to a dram at a time morning and night for a month together, it eases the Pain of the Reins and Bladder, proceeding from Tartarous matter, Sand, Gravel or Stone, provokes Urine, gives ease in the Colick, and has all the other Virtues of the Juice and Essence.

XVII. The Distilled Water. It is of the same Nature, and has the same Virtues with all the aforementioned Preparations; but as it is much weaker than any of them, so it is given in greater quantity: you may give half a Pint or more at a time morning and night sweetned with Honey; but it is chiefly used as a Vehicle for other Preparations.

C H A P. DCXXIV.

Of Saxifrage White and Golden:

O R,

B R E A K - S T O N E .

I. **THE Names.** These were, as far as I can find, unknown to the Greeks. The Latines call them *Saxifraga alba*; and we in English *White Saxifrage*.

II. **The Kinds.** We shall describe the three following Varieties. 1. *Saxifraga alba Vulgaris*; *Saxifraga alba Chelidonides Lobelij*; *Saxifraga rotundifolia Baubini*, *Saxifraga radice tuberosa Clusij*; Our Common *White Saxifrage*. 2. *Saxifraga alba bulbosa altera*, & *bulbifera Montana Columna*, *Saxifraga adfolia bulbos gerens Baubini*, Mountain *White Saxifrage*. 3. *Saxifraga aurea Gerardi*, *Saxifraga Lichenis facie* & *Natalitij Lobelij*; *Hepatica Palustris Besteri*; *Chrysosplenium Tabernaemontani*, Our *Golden Saxifrage*.

The Descriptions.

III. **The first, Or our Common White Saxifrage.** It has a few small reddish Kernelly Roots, covered with some Skins, lying among many small blackish Fibres, which send forth several round faint, or yellowish green Leaves, of a grayish color underneath, lying above the Ground, unevenly indented about the Edges, and something hairy, every one growing upon a small Foot Stalk; from whence rises up a round brownish hairy green Stalk, two or three Feet high, with a few such

Saxifrage White.

like round leaves thereon, as grow below, but smaller; and branched at the Top, whereon stand pretty large White Flowers, consisting of five Leaves a piece, with some Yelloro Threads in the middle, standing in long crested brownish green Husks. After the Flowers are past, some time, arises a round hard head, by-forked at the Top, in which is contained small blackish Seed, which usually fall away without any Seed at all. That which is commonly called *White Saxifrage Seed*, are the *Kernels or Grains of the Roots*, which are always used for the same.

IV. Gerard describes the foregoing Plant after this manner. It has a Root compall of a Number of black Strings, whereunto are fastned very many small reddish grains, or round Roots, as big as Pepper corns, which are used in Medicine, and are called *Semen Saxifrage alba*, or *White Saxifrage Seed*. From this Root spring up round leaves spread upon the Ground, and somewhat jagged about the Edges, not much unlike the Leaves of Ground Ivy, but softer and smaller, and of a more faint yellowish green. Among which rises up a round hairy Stalk a Cubit high, bearing at the Top small white flowers, almost like *Stock Gilliflowers*. The Seed follows the Flower which is small, and contained in little Husks.

V. The second, or Mountain *White Saxifrage*. The Roots of this, although they are round, red, and bulbous like the other, yet are they twice as great, and made as it were of Scales or Cloves, laid one upon another, like the Root of a Lilly; in all other things, almost in every part it is like the former; the Leaves are round and hairy, but something lesser, with brownish Foot Stalks. The Stalks are greater, having leaves thereon, as in the first, but at every joint with the leaf comes forth a small Bulb, Tuber, or Kernel

Saxifrage White Mountain.

(which the Cutter has omitted in the Figure) like unto those at the Root, which when it is through ripe, will encrease to be Plants, as the Bulbs of the Bulbed Lilly, or of the bulbed Coral Root will.

VI. The third, Or our Golden Saxifrage. Its Root is Bushy, composed of a great number of small Strings or Fibres. It is a small low Herb, having many round Leaves lying upon the Ground, bluntly indented about the edges, something like the former common White Saxifrage, but not hairy, somewhat thicker also, and of a darker green color. From among which rise up several slender and weak Stalks, little above an hand bredth high, with such like Leaves on them, as grow below, up to the Tops, where among the Leaves come forth small Gold Yellow colored Flowers, not easily observed, because they fall away so soon, that they are seldom seen. After they are past, there appear in their places, round heads, in which is

Saxifrage Golden.

contained small round reddish Seed. The whole Plant is almost insipid, or without Taste, and nothing hot, which does not shew any property it has to operate upon the Stone or Gravel, either to dissolve or expell it, unless it be by some occult or Specifick Quality. It can scarcely be thought that so many Authors as have wrote of it should ascribe a Stone Breaking property to it, unless it had been confirm'd to them by much Practice and Experience, but I having observed nothing concerning it, shall say no more of it at this time.

VII. The Places. The first grows plentifully in many parts of England, in the lower moist, as also in the upper dry corners of Meadows, and Grassy Sandy Places. It is said that it has grown on the back side of Grays-Inn, not far from Lamb's Conduit Head: also in a Field on the left hand of the high way going from Thomas Watring unto Deptford near London: in the

great Field by Islington called the Mantles; in the Green Places by the Sea side at Lee in Essex, among the Rushes in Georges Fields near Southwark, and in thousands of other places in this Kingdom. The second grows on the Hills and Mountains of Italy in the Kingdom of Naples, and I have been informed by a Traveller and singular Herbarist, that he has found it growing on some of the Hills and Mountains in Wales. The third grows in Moist places by Well sides, or other standing, and sometimes running Waters, and sometimes also in Moorish or Fenny Grounds; as about Tidnam in the Forrest of Dean, at Ashford and Iden in Kent; in moist and Marsh grounds about Bath and Wells; in the Fens and Moors by Boston in Lincolnshire, and Wisbich in Cambridgeshire; at Chiselmurst in Kent; and abundantly in the Shadowy Moist Rocks by Mapledurham in Hampshire; as also in the like places in Yorkshire.

VIII. The Times. They Flower sometimes in April, but generally in May, in which Month the first is gathered for the Grains or Kernels upon the Roots, or those upon the Stalks, as also for Distillation, quickly withering away when any heat comes. The latter continues Green all the Year.

IX. The Qualities. The first and second kinds are hot and dry in the second degree, Absterfivè, Incisive, Diuretick, Neurorick, Stomatick, Nephritick, Hyterick, Emmenagogick, and Lithontriptick.

X. The Specification. It is peculiar to break or dissolve the Stone in the Reins and Bladder, and to expell it, and cleanse those parts of any Tartarous Substance, or obstructive matter lodg'd in them. It gives ease in the Strangury, provokes Urine and the Terms powerfully, and cleanses the Stomach and Lungs from Pituitous humors offending them.

XI. The Preparations. You may have therefrom, 1. A Juice or Essence of the Leaves and Roots. 2. A Decoction of the same in Wine or Water. 3. A Powder of the small Kernelly Roots. 4. A Distilled Water of the whole Plant, Roots, Stalks, Leaves, and Flowers.

The Virtues.

XII. The Juice or Essence. They cleanse the Reins, Ureters and Bladder, and are said to break or dissolve the Stone, (if consisting of a Gritty Concretion) in those parts, and to expell it, as also Sand, Gravel, and Mucilaginous Matter, of which the Stone is bred. They cure the Strangury or pissing by drops, and provoke Urine to admiration, open obstructions of the Lungs, and Womb, and provoke the Terms, cleansing the same from the Pituitous matter lodg'd in them. Dose from two Spoonfuls to four or fix in White Port Wine, or in the Decoction of the Leaves and Roots.

XIII. The Decoction of the Leaves and Roots in Wine or Water. It has all the Virtues of the Juice or Essence, but less powerful and therefore may be taken from a quarter to half a pint at a time, Morning and Night, for a Month together, sweetned with our Syrupus Nephriticus, or with despumated Honey.

XIV. The Powder of the Kernelly Roots; commonly called the Seed. It may be given to a Dram, or Dram and half in White Wine every morning fasting, and at Bed time, for 40 days together, for all the Intentions and purposes for which

which the Juice or Effence are given. It mixed with *Honey* and so taken, it is an excellent thing to open Obstructed Lungs, and to cause an easie expectoration of the Pituitous matter afflicting them.

XV. *The Distilled Water of Roots, Leaves, and Flowers.* It has the Virtues of the Juice and Effence, but in a much inferior degree, and may be given half a Pint at a time, sweetened either with our *Syrupus Nepriticus*, or with *Clarified Honey*, and so taken Morning, Noon, and Night. It causes Flegm to be easily voided from the Lungs.

C H A P DCXXV.

Of SAXIFRAGE Burnet.

I. **T**HE Names. The Ancient Greeks and Latines knew nothing of this Plant: Our Modern Authors have call'd it, *Pimpinella Saxifraga*: And we in English, *Burnet Saxifrage*.

II. *The Kinds.* These following are the Chief, viz. 1. *Pimpinella Saxifraga major nostras*, Our Greater English Burnet Saxifrage. 2. *Pimpinella Saxifraga minor nostras*, *Pimpinella Saxifraga tenuifolia Bauhini*, Our smaller English Burnet Saxifrage. 3. *Pimpinella Saxifraga hircina major*, *Pimpinella Cordi*, *Fuchsi*, *Gesneri*, *Lobelij*, *Tragi*, *Pimpinella Saxifraga Matthioli*, *Camerarii*, *Saxifraga hircina Gesneri* & *Clusij*, *Bipemela Locune*, *Bipinella Saxifraga Lobelij*, *Tragoselinum majus Tabernamontani*, The great German or Hircinian Burnet Saxifrage. 4. *Pimpinella Saxifraga hircina major flore rubente Gesneri*, The great German or Hircinian Burnet Saxifrage with a reddish Flower. 5. *Pimpinella Saxifraga hircina minor*, *Saxifraga hircina minor*, *Pimpinella Tragi*, *Daucus selinoides Cordi*, *Dauci tertium genus Lugdunensis*, *Tragium Dioscoridi Columna*, & *Pimpinella minor*, by divers, The small German or Hircinian Burnet Saxifrage.

The Descriptions.

III. The first, or our greater English Burnet Saxifrage. It has a long whitish Parsnep like Root, of a hot and biting Taste like Ginger, which continues many Years. It grows up in the same manner like the great German Saxifrage at Self. V. following, having an hollow Stalk two or three Feet high, with joints and knees, beset with large Winged Leaves, which do more nearly resemble Smalage than Burnet, which consists of many small Leaves growing upon one Stem, snipt or dented about the Edges like a Saw. The Flowers grow at the tops of the Stalks and Branches in white round Tufts, or Umbels: The Seed is like Common Parsly Seed, saving that it is hotter, and biting upon the Tongue, being sharper and hotter than that at Self. V. following.

IV. The second, or our smaller English Burnet Saxifrage. This is the best known of all the rest. Its Root is long and white, smaller than the former, and puts it self forth into Branches, being of a hot, sharp and biting Taste also. It springs up with Leaves almost like unto Burnet, or Common Parsly of a dark green Color, and smooth or void of hairs, which if tenderly broken with your Hands, you may

Saxifrage Burnet Greater.

draw forth small Threads, like those of a Spiders Web, and such as you may draw from the Leaves of Scabious. The Stalk is hollow, dividing it self from its Joints or Knees, into several small Branches, at the Tops of which do grow small Tufts or spokie Umbels of white Flowers, after which comes the Seed, of a hot sharp Taste, like to that of Caraways.

V. The third, or great German or Hircinian Burnet Saxifrage. Its Root is small, long and white, very like unto a Parsnep or rather a Parsly Root, but much hotter in Taste, which perishes not after Seed time, but endures several Years. It springs up with several large and long Stalks of Winged Leaves, one set directly opposite to another, on both sides the middle Rib, each being somewhat broad, a little Pointed, and somewhat deeply dented about the Edges, of a fresh green color, almost shining. From among which rise up one or more round hollow Stalks, three Feet high or better, set at the Joints with the like, but lesser Leaves, and bearing at their several Tops, small Umbels of small white Flowers, after which come small, blackish, round Seed, like unto Parsly Seed, but much hotter in Taste, and sharper upon the Tongue. The Leaves of this species are grosser cut in or dented than our great English kind at Self. III. above, and at least double their Breadth, they both being indented after the same manner.

VI. The fourth, or great German or Hircinian Burnet Saxifrage with a Reddish Flower. This sort differs little or nothing from the former, neither in its Roots, Stalks, Leaves, Branches, Flowers, nor Seed, nor yet in its Magnitude or form of Growing, saving only that the Flowers in this are of a reddish, or bluish color.

VII. The fifth, or smaller German or Hircinian Burnet Saxifrage. Its Root is long and White, but smaller than the Roots of the two last described; also more hot, quick, and sharp,

as

as is also the Seed hereof. It has several shorter Stalks of finer cut Leaves by much than those of the third and fourth kinds, every one set against another, being very narrow, and much cut in, or deeply dented about the Edges, which makes the Leaf seem as if it were made of many fine cut and jagged Leaves, set on both sides of a middle Rib, or Stalk, which sometimes grows Reddish, and is very near of the same fresh green color which is seen in the third or great German kind before described. The Stalks rise as high almost, and the Umbels of Flowers are white like those: the Seed also is blackish, but smaller than the Seed of that third Species.

VIII. An Observation. Parkinson says, that there is growing at the Roots of these Saxifrages, in some Countries, certain Grains, which will give a Scarlet Die, as Lacuna and Anguilara have related, and by them called Coccus Radicum: but Amatus Lusitanus says that the like Grains are found at the Roots of many other Herbs. Tragus calls this Saxifrage Piper Germanicum, and says that no other Plant, can be more fitly referred to the Petroselinum Macedonicum Dioscoridis, than it, who compared the Seed to the Seed of Ameos, yet to be sweeter, and in smell like to Spice, being very sharp and hot in Taste: and truly the Seed hereof is so Aromatical, and very sharp and piercing withall, that he had Reason to say as he did: And Gerard says, it answers to the true Phellandrium of Pliny, more than any other Plant.

IX. The Places. The two first are found growing very plentifully in most Meadows throughout England, and are easily seen of such as know them, and look for them, tho' they lye hid among the Grass, and often times scarcely to be discern'd. The other three grow in the Fields, in Germany, as also on their Mountains and Rocky Grounds, but very much in Sylva Hircinia, or the Hircinian Wilderness or Woods, from which place it takes part of its Name: Yet notwithstanding, they have been found by divers, to grow as well in England as in those other places.

X. The Times. They all flower from the end of June to the end of August, and their Seed ripens in the mean Season.

XI. The Qualities. They are hot and dry in the end of the third degree, being indeed as hot as Pepper, and (as Tragus says by his often experience) more wholesome: They are of thin and subtil parts, being Incisive, Aperitive, Alterative, Attractive, Carminative, Digestive, Discurfive, Diuretick, Cosmetick, Neurotick, Stomatick, Nephretick, Hystrick, Emmenagogick, Lithontriptick and Alexipharmick.

XII. The Specification. They provoke Urine and the Terms, give ease in the Strangury, cure the Colick, expel Wind from the Stomach and Bowels, are good against pains and fits of the Mother; break or dissolve gritty Stones, in Reins and Bladder, and expel the same, resist and expel Poison, strengthen the Stomach, causing a good appetite and digestion, and an Expectoration of cold Pituitous Humors from the Breast and Lungs. They are also Cosmetick, freeing the Skin from many Deformities.

XIII. The Preparations. You may make therefrom 1. A Juice. 2. An Essence. 3. An Infusion or Decoction Wine or Water. 4. A Powder of Seed, Leaves and Roots. 5. Comfits of the Seed. 6. A Cataplasm. 7. A Spirituous Tincture. 8. An Acid Tincture. 9. An Oily Tincture. 10. A Saline Tincture. 11. A Distilled Water. 12. A Spirit.

The Virtues.

XIV. The Juice of Leaves and Roots. It provokes Urine and the Terms powerfully, facilitates the Birth and expels the Afterbirth, gives ease in the Colick, and breaks or dissolves gritty Stones in the Reins and Bladder, suppresses Vapors, and helps fits of the Mother. Dose from one Spoonful to three, Morning and Night, in a Glass of white Port or Lisbon Wine.

XV. The Essence. It strengthens the Stomach, fortifies the natural faculties, causes a good appetite and a strong Digestion, and is an excellent thing against Coughs, Colds, Asthma's, thornes of Breath, Hoariness, Wheezing and other cold and moist Diseases of the Breast and Lungs, and has indeed all the other Virtues of the Juice. Dose one or two Spoonfuls sweetened with Symplic Nephriticus, or with Honey, Morning and Night.

XVI. The Infusion or Decoction in Wine or Water. They are given for all the former purposes, from a quarter to half a Pint, sweetened as aforesaid; besides which, they resist and expel Poison, and if made with Wine, comfort the Heart, expel Wind, and are good against Fainting and Swooning Fits.

XVII. The Powder of the Seed, Leaves and Roots. It may be given to a Dram for all the aforesaid Intentions; and if it is made into an Electuary with Clarified Honey, it causes Expectoration of Viscous tough Hlegm sticking in the Stomach and Lungs, expels Wind, and absorbs acid and acrimonious Humors which vellicate the Bowels.

XVIII. The Comfits made of the Seed. They are made as Caraway Comfits, according to the Art of the Confectioner. They warm and comfort a cold Stomach, cause good Digestion, take away nauouseousness and resist Vomiting.

XIX. The Cataplasm. Applied to green Wounds, it stops their Bleeding, dries, consolidates and quickly heals them; more especially if the Wound was first Washed with the Juice of the Herb or Root, and this it does even in Wounds of the Head, where there is no fracture of the Skull.

XX. The Spirituous Tincture. It is Cordial, comforts the Heart, revives the Spirits, retreles Nature, warms the Stomach, Bowels and Womb, potently expels Wind, and is good against the Belly-ach, and gripings of the Guts. Dose half a Spoonful or more in a glass of Wine, especially if the Patient is Sick at Heart, or in any Fainting or Swooning Fit.

XXI. The Acid Tincture. It resists the malignity and Poison of the Plague and all sorts of Malign and Pestilential Fevers, is good against the bitings of Vipers, Rattle-snakes, Mad Dogs, and other Venomous Creatures, strengthens the Stomach, causes a good Appetite and an excellent Digestion, and is a very potent Medicine against Stone, Sand, Gravel, or Tartarous slime in the Urinary parts; provokes Urine, allays Vapors, and resists fits of the Mother: Dose so many Drops at a time as to give the Vehicle, Wine, Ale, Broth, &c. a pleasing acidity.

XXII. The Oily Tincture. It is strongly Diuretick, gives present ease in the Strangury, or pissing by Drops, breaks gritty Stones in the Reins or Bladder, and expels them, as also Sand, Gravel, &c. Dose from 15 to 30 Drops first dropt into Sugar, and then mixt with Wine.

XXIII. The Saline Tincture. It has the Virtues of the Oily Tincture, but is for the most

part used Externally against detoxations of the Skin, as Freckles, Pimples, Tanning, Sunburning, Scurff, &c.

XXIV. *The Distilled Water from the whole Plant.* It is used for the more nice Stomachs for all the purposes for which the Juice, Essence, Infusion and Tinctures are used, being sweetened with Sugar: It is also used by Ladies to take away Freckles, Scurff, Morpew, Tanning, Sunburnings, and other Deformities of Skin or Face, and to make it more smooth and clear.

XXV. *The Spirit.* It is Cordial and a restiter of Poison, good against Fainting and Swooning Fits, Convulsions of the Nerves, Cramps, Numbness, Paralytick Diseases, and other weaknesses of the Body: it expells Wind, and gives present ease in the Colick. Dose from half a Spoonful to a Spoonful in a glass of Wine upon occasion.

C H A P DCXXVI.
of SCABIOUS,
O-R,
SCAB-WORT.

I. *THE Names.* This was a Plant unknown to the Greeks, but *Muthiolus* in his Epitome calls the lesser Species of it *Læsc*, which is as much as to say *Scab-wort*; in *Larise* it is called *Scabiosa*, and in English *Scabious* or *Scab-wort*.

II. *The Kinds.* Authors have multiplied the Species to a great number; but we shall take notice only of such as are to be found growing Wild in England, or in our Gardens, viz. 1. *Scabiosa Vulgaris pratensis*, *Scabiosa communis*, vel, *Officinarium*, our Common Field Scabious. 2. *Scabiosa minor campestris*, *Scabiosa media*, (by some) *Columbaria Lobelij*, *Scabiosa quinta Classij*, our lesser Field Scabious. 3. *Scabiosa major segetum*; *Scabiosa Campestris seu segetum Lobelij*, also major *Satorum Vulgatiore*, Our Common Corn Scabious. 4. *Scabiosa Ovella Dodonæi*; *Scabiosa montana minimum minima Lobelij*, Our smallest Sheeps Scabious. 5. *Scabiosa Ovella major*; *Scabiosa media Dodonæi*; *Scabiosa Ovella hirsuta*, The Greater, or Middle, or hairy Sheeps Scabious. 6. *Scabiosa minor hortensis Vulgaris*; *Scabiosa flore albo gemino*; Our Common small Garden Scabious. 7. *Scabiosa media*, The middle sort of Scabious. 8. *Scabiosa flore albo*, White Flowered Scabious. 9. *Scabiosa rubra Austriaca*, Red Scabious of Austria. 10. *Scabiosa rubra exotica*, seu *Indica*, Exotick or Indian red Flowered Scabious.

The Descriptions.

III. *The first or Our Common Field Scabious.* It has a Root which is great, white and thick, growing down deep into the Earth, and abides many years. It grows up with many hairy, soft, whitish, green leaves, some of which are either not at all jagged, or divided on the Edges, or very little; others are much Rent and Torn on the sides, and have Threads in them, which upon the breaking may be plainly seen, and are not in several of the other kinds: from among which rise up, one or more, round, hairy, green Stalks 3 or 4 feet high, with such like hairy green leaves on them, but more deeply and finely divided, branched forth a little. At the Tops of which, which are Naked

Scabious Field Common.

and bare of leaves for a good space, stand round heads of Flowers, of a Pale bluish color, many set together in a head or knob, the outermost of which are larger than those inward, with many Threads also in the middle, something flat at the Top, and not so round or Globe like, as are the heads of some other sorts.

Scabious Field lesser.

IV. The

IV. The second, or Our lesser Field Scabious. It is like in its Root, Stalks, Branches, Leaves, Flowers, form and manner of growing, to the first, saving that the Leaves are not so large, or deeply jagged, nor do the Stalks rise so high, nor are the Flowers so great or large, but yet of the same blackish bluish color. Some think this to be the same species with the former, but differing only in the rankness of the Ground where they grow.

V. The third, or, Our Common Corn Scabious. Its Root runs not deep into the Ground, but rather creeps under the upper Crust of the Earth. It differs but little from the first before described, saving that it is greater in all respects, the Leaves being larger, with greater Divisions, and some whole leaves with them also. The Stalks are greater and stronger, and the Flowers larger and more laid open, and not so closely thrust together, but of the same bluish color, yet a little more declining to Purple.

VI. The fourth or Our smaller Sheeps Scabious. The Root is like unto the other Field Scabious's but lesser. It has divers whitish green leaves at the ground, divided on both sides of the long pointed leaf, only into one Division, on each side, making every leaf seem like the small Sage leaf, called Sage of Virtue, which has small pieces of leaves like Ears on each side thereof, but a little dented about the ends. The Stalks are small and low, and are furnished likewise with such like Leaves, but lesser, and small bluish Flowers or heads on them, like unto the other Field Scabious.

VII. The fifth, or the greater, or middle or hairy Sheeps Scabious. This is greater than the former just now described, growing a foot high or better. Its Root is single, and like that of a Rampion

(whence Fabius Columna refer'd it to the Rampions, its Seed and Milky Juice inducing him thereto.) It has slender rough Stalks, or Branches, set with leaves not so much divided, but only nick'd about the Edges. The Flowers are in Color and shape, like those of the last described, of a bluish color, consisting of much Thrummy fibres close thrust together like a Button, not much unlike to that of the blew daisy.

VIII. The Sixth, or Our Common small Garden Scabious. Its Root is long and abides many years. It has long smooth Leaves below notched about the edges, but otherwise not much divided, in form almost like a Sage Leaf, from among which rise up a Stalk or Stalks almost two Feet high, pretty stiff or strong, and branching themselves out, not leaning their heads downwards. The leaves upon the Stalks are pretty large ha-

Scabious Garden small Common.

ving two or more long smooth Leaves divided to the middle rib on both sides, and each part divided also, or pretty deeply Notched. The Flowers, which are two upon long foot Stalks at the head of each Stalk or Branch, are of a pretty large size, and round at the head. Sometimes there is but one Flower at the tops of the Branches, and sometimes three, but most usually two, of a fair pure white color, which being put away, the heads with Seed appear more round and not flat, but rather a little Corn fashion'd, rising a little higher in the middle.

IX. The seventh, or Middle sort of Scabious. This kind is almost in all things like unto the second or our lesser Field Scabious before described, saving that the knob, or head, does not spread it self so much abroad, nor is its Thrums so thick or closely thrust together, nor are the lower Leaves so deeply cut or jagged, but the upper are much smaller, and also more divided.

X. The

Scabious Sheeps Greater.

Scabious Middle.

X. The Eighth or White Flower'd Scabious. This has many long Leaves, very much jagg'd or gash'd in on both sides, of a mean or middle bigness, being neither so large as many of the Field, nor so small as any of the small kinds. The Stalks rise about a Foot and half high, or somewhat more, at the Tops whereof grow round heads, thick set with Flowers, like in all respects to the Field Scabious, but of a Milk white color.

XI. The Ninth, or Red Scabious of Austria. Its Root is composed of a Number of slender Strings fastned to the head thereof. It has many Leaves lying upon the Ground, very like unto Devils bit, but not so large, being shorter and snipt, not gash'd about the Edges, of a light green color: (yet there is another of a darker green color, whose Flower is of a deeper red:) the Stalks have divers such like Leaves on them, (set by couples at the Joints) as grow below; and at the Tops small heads of Flowers each consisting of five Leaves; the biggest Flowers standing round about in the outer compass, as is usual almost in all kinds of Scabious, of a fine light purple or red color. After the flowers are past, comes the Seed, which is something long and round, set with certain hairs at the head thereof like unto a Star.

XII. The tenth, or Exotick or Indian Red flowered Scabious. Its Root is long and round, compassed with a great many small Strings, which perishes usually as soon as it has lost its Flowers and Seed: otherwise if it does not flower the first year of its sowing, if it be carefully defended from the Extremity of the Winter, it will flower the sooner the next year, as has been often found (with us in England) by Experience. It has many large fair green Leaves lying on the Ground,

jagged or cut in on both sides to the Middle Rib, every piece whereof is narrower than that at the end, which is the broadest. From among which rise up several slender and weak Stalks, yet standing upright for the most part, set with smaller or more jagged leaves at certain distances, two or three at every joint, Branching forth at the top into other smaller Branches, bearing everyone of them, a head of Flowers, like inform unto other Scabious's, but of an excellent deep red Crimson Color, (and sometimes more pale or dilated) having no Smell at all. After which come small roundish Seed, like unto the Field Scabious.

XIII. The Places. The first five, and seventh, grow in Pastures, Meadows, and Corn-Fields, and barren Sandy Grounds, almost every where, as Gerard says; the other four are Nurst up in our Gardens, where they flourish Very well. The first grows usually in moist Meadows in this Land, especially about London almost every where. The second grows likewise in some of the Dry-Fields about the City, but not so plentifully as the former. The third grows both in the Grounds where Corn is standing, and in such Grounds as have been formerly Sown and now lye Fallow, as also in the borders of such like Fields. The fourth is found in many dry Gravelly and Heathy Grounds throughout almost all England. The fifth likewise grows also in such like places. The Sixth is not known where it grows Wild, but with us it is Nurst up in Gardens. The seventh sort grows in Fields, and Meadows. The eighth, ninth, and tenth, grow Wild in hotter Climates; but with us they are brought up in Gardens; yet the eighth has been often found growing in Meadows, and Marshes near the Sea side, in several parts of England.

XIV. The Times. They all, except the last flourish in the Summer Months, and Flower in June, and July, and abide Flowering till it is late in August, and the Seed ripens in the mean time. The Tenth Flowers not until September or October, and sometimes is not apt to Flower with us the first year; so that many times it perishes without bearing Seed, whereby we are oftentimes to seek for Seed from beyond Sea, to supply our selves with it again, unless great care be taken of it in the Winter time.

XV The Qualities. Scabious is said to be hot and dry in the end of the second Degree, and is of thin and subtil parts. It incides, attenuates or makes thin, digests, is Anodyn, Cosmetick, Vulnerary, Cardiack, Pectoral, and Alexipharmick.

XVI. The Specification. It is peculiar to cure all manner of Puslules, Pimples, Scurf, Scabs, Tettars, Ringworms, and other like breakings out; it prevails against Obstructions of the Lungs, Asthma's, Coughs, Colds, Wheezings, Pleurifies, inward Ulcers, and Apostems, and potentially resists the Infection of the Plague or Pestilence, exterminating its malignity or Poison.

XVII. The Preparations. You may make therefrom, 1. A Juice. 2. An Essence. 3. A Decolion or Infusion. 4. A Syrup. 5. A Powder. 6. A Balsam or Ointment. 7. A Cosmetick. 8. A Cataplasm. 9. A Distilled Water. 10. A Spirituous Tincture. 11. An Acid Tincture. 12. A Saline Tincture.

The Virtues.

XXVIII. *The Juice.* It is very effectual for Asthma's, Coughs, Colds, shortness of Breath, Hoarseness, Wheezing, and all other Diseases of the Breast and Lungs, ripening and digesting cold Flegm, and other Viscous humors, expectorating them by Coughing and Spitting. Four Ounces of the Clarified Juice of Scabious, taken in the morning fasting, with a Dram of Mithridate or Venice Treacle, frees the person from any Infection of Plague or Pestilence, yet though already seized therewith, if after the taking of it, the patient Sweeten for two or three hours in their Bed, and it be repeated again, as the Physician may advise. Drank likewise to the quantity aforesaid, it is good against Scabs, and all manner of breakings out, as Tetters, Ringworms, Scorbatic Boils and Pustules, yea tho' they proceed from the French Pox, which Maribolus says he has proved by Experience.

XIX. *The Essence.* It has all the Virtues of the Juice, but being stronger and a more depurated substance; so it may be given in a lesser quantity, as to 3 Ounces, in some proper Vehicle, as its own distilled water, or the same water mix'd with half as much Wine, and it ought to be taken morning and night so long as need requires.

XX. *The Decoction or Infusion in Wine or Water.* It is made of the whole Plant, Roots and all. If mixed with an equal quantity of the Juice or Essence, and so taken, it has all the Virtues of the said Preparations, besides which it ripens all sorts of inward Apostemes, cleanses inward Ulcers, heals internal Wounds, and Cures Pleuritis, being drank morning and night for some days together. It is good against Pains and Stitches in the sides; and taken for Forty days together, it is good to heal all sorts of breakings out, Sores and Ulcers, proceeding from the French Pox. Outwardly the head being washed therewith warm, it cleanses it from Dandriff, Scurf, Morpew, Sores, Scabs, and the like.

XXI. *The Syrup.* It is generally made of the Juice with Honey or Sugar, and has all the Virtues of the said Juice; but more particularly it is Specifick against Diseases of the Stomach and Lungs, curing their Diseases, and causing an easy Expectoration. It hath been told by an old Practiser of Physick and Chirurgery, that this Syrup is an excellent Cure for Ulcers of the Lungs, cleansing, drying and healing them, and that he had cured several therewith, by giving six Spoonfuls thereof morning and night in Symplic Red Wine, &c.

XXII. *The Powder.* It has the Virtues of the Juice and Essence: a Dram of the Powder of the Roots taken for 6 or 7 Weeks together, in Wine Clarified with the Herb, is good against all manner of breakings out proceeding from what cause soever, yea though from the Foul Disease it self.

XXIII. *The Balsam or Ointment.* They are excellent against Scurf, Morpew, Dandriff, Pustules, Ringworms, Tetters, Scabs, and all other Cuticular Defilements, being anointed upon the parts affected morning and night. Tents also being dipt therein heal not only green Wounds, but likewise Old Sores and running Ulcers. They help all sorts of cold and hard swellings in any part,

and are effectual to restore contracted or shrunk up Sinews, if not of very long standing.

XXIV. *The Cosmectick.* It is made of the Juice mixed with Camphir made into Powder, with a little Spirit of Wine, and Powder of Borax. It cleanses the Face and other parts of the Skin from Freckles, Tanning, Sunburning, and other discolorings, Morpew, Leprosie, Pimples, Scabbiness, and other like breakings out.

XXV. *The Cataplasm of the Green Herb.* Applied to a Carbuncle or Plague Sore, it has been found by Experience, to discess or maturate and break it in some short time. It discesses cold and hard Tumors, and being applied does in a short time loosen and draw forth any Splinter, Thorn, broken Bone, or such other like things, which may lick and lye in the flesh.

XXVI. *The Distilled Water.* It has the Virtues of the Juice, Essence, Decoction or Infusion, but nothing near so powerful as they be, and therefore may be taken a quarter or half a Pint at a time, sweetned with the Syrup of the Herb, but it is most used as a Vehicle.

XXVII. *The Spirituous Tincture.* It is Alexipharmick, refits Poison, strengthens the Heart, revives the Spirits, and comforts the Universal frame of the Body. Dose 2 Drams, mixt with some of the Syrup.

XXVIII. *The Acid Tincture.* It prevails against the Poison of Venomous Creatures, Bittings of Mad Dogs, the malignity of the Plague or Pestilence, and all sorts of Malign and Pestilential Fevers; it is a singular thing also against Asthma's, Coughs, and all other diseases of the Breast and Lungs, proceeding from Obstructions, Colds, Blows, and the like. It refits Vomiting, cleanses and strengthens the Stomach, and causes a good Appetite, and a strong Digestion. Dose so much at a time as to make the Drink, Wine, Liquor, or Vehicle gratefully pleasant.

XXIX. *The Saline Tincture.* It is chiefly used in all Defecations of the Skin, absorbing the acid and acid humors, cleansing, drying, and healing the same, and so restoring the Skin to its pristine Smoothness, Softness, Whiteness, and Beauty, by only Bathing therewith Morning and Night.

Of SCORPION HERB,

OR,

CATERPILLERS.

THE Names. Tho' it scarcely appears whether the Ancient Greeks knew any thing of this Plant, yet our Modern Herbatists have given it the Greek Name, *Scorpioides*, in Latine, *Scorpioides*: and in English, *Scorpion Herb*, *Scorpioides*, and *Caterpillers*.

II. *The Kinds.* There are various sorts of this Plant, viz. 1. *Scorpioides major*, *Scorpioides bupleurifolia major* Lobelij, great Scorpion Grass, or rough Caterpillers. 2. *Scorpioides minor*, *Scorpioides bupleurifolia minor*, the lesser Scorpion Grass or Caterpillers. 3. *Scorpioides bupleurifolia pluribus* Cerniculis

Corniculus asperis, *Scorpioides bupleurifolia repens* Lobelij, small ordinary Caterpillars with many Cods: some, as *Guilandinus*, *Anguilana*, *Bauhinus* and *Cesalpinus*, will have this to be *Telephium Di-scorides*, but *Dodonæus* was of another opinion. 4. *Scorpioides Bupleurifolia filiquis lenibus*, smooth Codded small Caterpillars. 5. *Scorpioides Matthioli*, *Scorpioides Portulaca folio*, Matthiolus his Scorpion Grass with Purslane like Leaves. 6. *Myosotis Scorpioides palustris*, Water Scorpion Grass. 7. *Myosotis Scorpioides arvensis*, Moule Ear Scorpion Grass.

The Descriptions:

III. The first or great Scorpion Grass, or rough Caterpillars. Its Roots are small and Fibrous, perishing every Year. It is but a small low Plant, with Branches lying upon the Ground, which have something long, broad and hard Leaves growing thereon; from among which come forth small Stalks, bearing at their ends for the most part, two small pale yellowish Flowers, like unto Tares or Veiches, but smaller, which turn into Writted or Crooked rough Cods, pretty thick, round, and white, and not so much turn'd or wound together as those of the smaller next following; in which are contained brownish yellow Seed, much like unto a Medica.

IV. The second, or lesser Scorpion Grass, or lesser Caterpillars. This in its Roots, Branches, Leaves, Stalks, Flowers and Seed, is much like the former, saving that it is every way less: but in this the Cods are more Writted or Crooked, much slenderer and rounder, and more wound or turned together than those of the greater, yet not closing like unto Snails, but blacker and more like unto a Caterpillar than the former.

V. The third, or small ordinary Caterpillars with many Cods. The Root is Annual and very Stringy. This small Caterpillar grows in the same manner with trailing long Branches as the first small rough sort does. The Leaves are likewise of a fresh green Color, and of the same fashion, but somewhat lesser. The Flowers also are small, and of a deep Yellow, four or five oftentimes standing together, which are of the same largeness and fashion with the other, only this has as many Crooked Cods together as there are Flowers.

VI. The fourth or smooth Codded small Caterpillars. This is in all things like the former sort, saving that it has seldom two Flowers together on a Stalk, and the Caterpillars which follow as few, being Crooked and Winding in the very same manner, and small and smooth without any roughness at all upon them, and of the same pale brown Color.

VII. The fifth or Matthiolus his Scorpion Grass with Purslane like Leaves. Its Root is long and Fibrous perishing yearly. It has several upright pale green Stalks, with pale green Leaves set thereon each of which is something long, broad, and round pointed, like a Purslane Leaf, sometimes having two small Leaves joined together at the bottom of the greater, and oftentimes in many without them. At the Tops of the Stalks, and out at the joints likewise, come forth small pale yellow Flowers, much resembling those of Medica or Snail Clover Grass. After which follow small long slender and Crooked Horns, small at the end, jointed or parted as it were, all the length of it, something resembling the long Crooked Cods of the Colutara *Scorpioides*, but that this is more conspicuously jointed, and of a pale Color, within which lie small long whitish yellow Seed.

Scorpion Herb.

VIII. This fifth kind, because it has some resemblance of *Prose*; and therefore called by some *Scorpioides Leguminosa*, as Gerard says, is by him thus described. It has small and tender Roots like small Threads. It has many Branches, weak and tender Trailing upon the Ground, if there is nothing for it to take hold of with its Claspings and Crooked Seed Vessels; otherwise it rampeth upon whatsoever is near unto it. Its Leaves are few and small. The Flowers very little, and yellow of Color, and the Seed follows little and blackish, contained in little Cods like unto a Scorpions Tail.

IX. The sixth or Water Scorpion Grass. This grows in almost every shallow gravelly running Stream, having Leaves like to Brooklime. The Flowers grow at the Top of tender but green Stalks, of a Blew Color, and sometimes with a spot of yellow among the blew, and the whole Branch of Flowers does turn it self round like a Scorpions Tail. There is another species of this Water Plant, which has Leaves like unto *Anagalis aquatica*, or Water Chickweed, having like slender Stalks and Branches as the former, and the Flowers not unlike, saving that these are of a Watchet or light blew Color, something bigger and laid more open, whereby the yellow spot is seen.

X. The seventh or Moule Ear Scorpion Grass. It has a Root which consists of a Ball of small Fibres or Strings. It has rough and hairy Leaves of an Overworn russet Color. The Flowers grow upon weak feeble rough Branches, as is all the rest of the Plant. And they grow likewise for the most part on one side of the Stalk of a blew Color with a little spot of yellow on the same, turning themselves round backwards, not much unlike the Tail of a Scorpion. There is another sort of this species, much like this now described, called *Myosotis Scorpioides repens*, in which the flowers are thicker thrust together, and do not Grow all upon one side as the former do:

2/3 part of the flowers are blew, and part Purple, confusedly mixed together. Gerard.

XI. *The Places.* The Native places of the two first are unknown, but with us they grow only in Gardens. The third and fourth were brought out of Spain by Boel, and grow Wild both in their Mannured Fields and Vineyards, and with us in Gardens. The fifth grows not Wild in England: but Gerard says he had Seed of the first and fifth from beyond Sea, by which they are now dispersed thro' England, and are esteemed for the Beauty of their Flowers, and strangeness of their Crooked Cods resembling Caterpillars. The sixth grows in Waters and shallow running Streams in many parts of this Kingdom. The seventh, grows for the most part upon dry, gravelly and barren Ditch Banks, and other like barren places in many parts of this Kingdom.

XII. *The Times.* They Flower in *June* and *July*, and their Seed ripens in the mean season, or in some little time after.

XIII. *The Qualities.* They seem to be Temperate in respect to Heat, Cold, Dryness or Moisture; Absterfive, Vulnerary and Alexipharmick.

XIV. *The Specification.* Authors ascribe but few Virtues to them, being much of the Nature of the Meadow Trefoils. Yet they are said to remedy the stinging of Scorpions, the bitings of Serpents and other Venomous Creatures, and heal green Wounds.

XV. *The Preparations.* You may have therefrom, 1. A Juice. 2. A Decoction in Wine, 3. An Ointment. 4. A Cataplasm.

The Virtues.

XVI. *The Juice of the Herb.* Drank to the quantity of 3 or 4 Ounces, it is good against the bitings of Serpents, or other Venomous Beasts, being repeated Morning and Evening, so long as need requires.

XVII. *The Decoction in Wine.* It has the same Virtues, and may be taken to half a Pint or more, Morning and Night.

XVIII. *The Ointment.* It is made of the Juice or green Herb, with Oil, Wax, and a proportional quantity of Gum Elemi. It is good to discuss Simple Contusions, and to heal green Wounds being applied.

XIX. *The Cataplasm.* It is made of the green Leaves being beaten in a Marble or Wooden Mortar. Being applied upon the place hurt, it is said to be a present Remedy against the stinging of Scorpions.

CHAP DCXXXVIII.

OF SCURVY GRASS:

OR,

SPOON-WORT.

I. *THE Names.* This Plant was unknown to the Ancient Greeks and Latines: but our Moderns have called it *Cochlearia* (from the form of its Leaf) and in English *Scurvy Grass* and *Spoon-wort*.

II. *The Kinds.* There are several Species of this Plant; but these three following are chief.

1. *Cochlearia Vulgaris*, *Cochlearia Marina*, *Cochlearia Anglicana*, Sea Scurvy Grass; or, Our Common or English Scurvy Grass. 2. *Cochlearia rotundifolia* *Cochlearia hortenensis*; *Cochlearia Belgica*, *Telephium Lacune*, *Cochlearia rotundifolia major*, Our Great Garden or Dutch Scurvy Grass. 3. *Cochlearia rotundifolia minor*, Small Dutch Scurvy Grass.

The Descriptions.

III. The first, Or Sea Scurvy Grass, Or Our Common or English Scurvy Grass. It has a short thick Root, replenished with a great many Fibres, even to a Bush as it were of White Strings, which Stick deep in the Mud, in which it chiefly delights to grow; yet it will flourish very well in the more upland and dryer grounds, Tasting a little Brackish even there, though nothing so much as where it has the Salt Water to Nourish it. It has many thick fat Leaves more long than broad, and some-

Scurvy-Grass Common, or Sea.

times longer and narrower, sometimes also smooth on the edges, and at other times a little Waved, for in all these forms it is to be seen, as also plain, smooth, and pointed, and sometimes a little hollowed in the middle and round pointed, of a sad green color, and sometimes a little brownish, every Leaf standing by its self, upon a long foot Stalk, which is greenish or brownish also, from among which Leaves, rise up small slender Stalks, having a few Leaves thereon like the other, but longer and lesser for the most part. At the Tops whereof grow many whitish flowers, with yellow Threads in the middle, standing about a green head, which becomes the Seed Vessel, and will be somewhat

what flat when it is ripe, very like unto some of the kinds of *Tblospi* or *Treacle Mustard*, wherein is contained reddish small Seed, Tasting something hot.

IV. The second, or Our great Garden or Dutch Scurvy Grass. It has a Root which is small, white, and Thready, from which rise up several fresh, green, and almost round Leaves, nothing so thick as the former, yet in some places, viz. in a rich and well dunged or manured Ground, they will be very large, even twice as big as in others, not at all dented about the edges, nor with any

Scurvy Grass Garden or Dutch.

sensible hollowness to be perceived in the middle, every one of them standing also upon a long foot Stalk. From among these rise up divers long, slender, weak Stalks, higher than the former, and with a greater store of small white Flowers, at their Tops, which convert into smaller Pods, and smaller brownish Seeds than the former. The Taste of this Plant is not Salt or brackish at all, but has an hot Aromatick Taste almost like Spice.

V. The third, Or small Dutch Scurvy Grass. Its Root is very small, consisting of a few Fibres, which perish as soon as it has perfected its Seed. It grows like the last, with many small, roundish Leaves, sometimes a little Crumpled at the edges, not bigger than the Nail of ones little Finger, every one growing upon its own foot Stalk, which abide all the Winter, if it is Sown before Winter, or that it is rises up of its own Sowing : otherwise, if it is Sown in the Spring, it shoots forth divers long, slender Stalks lying on the Ground, a foot long or better, on which grow such like small round leaves, very thinly set, up to their Tops, whereon do grow many small White Flowers,

like to the last, but much smaller, according to the proportion of the Plant, with small Seed answerable thereto. This will spring up again if the Seed be suffered to shed, or Sown it self, in the same place, towards the latter end of Summer, or before Winter : and do what you can almost, if you will gather any ripe Seed thereof, there will be some of it shed, before you can gather it.

VI. The Places. The first grows along on the Thames-side, on both the Essex and Kentish shores, from Woolwich, where the Water begins to be Saltyish, round about the Sea Coast to Dover, and also from Dover round about the Coast to Portsmouth, and even to Bristol, where it is to be had in great plenty. It has not been observed yet to grow on our Northern shores, but on many other places on the Western Coast. The second, or our Garden Scurvy Grass, grows in the Marshes in Holland in Lincolnshire, and in many places thereabouts by the Sea side. It grows by the Sea side at Hull, at Boston, and at Lynn in Norfolk, and in several place in Lincolnshire, as in Whapload, and Holbeck Marshes in the same County. It has been found of late, growing many Miles from the Sea side, as upon a great Hill in Lancashire called Ingleborough Hill ; (one of the highest Hills in England) but indeed it will grow in any Soil, Place, or Climate whatsoever. It is said to grow also near to a Castle in the Peak in Derbyshire, full 30 Miles from the Sea ; but it is now Sown in most Gardens (for its usefulness) throughout the Kingdom, it will grow in Moist and Cold shadowy places, and yet will prosper very well in the Sun also ; and in many upland Countries of this Land, it is Sown in great Quantities, not only for the peoples own spending, but to sell to others for Profit : And in our Gardens it flourishes, and bring forths its Seed, as Naturally as by the Sea side, and retains the same hot and Spicy Taste, which shews that it refuses no place of growing, as many other Maritime Plants will. The third grows in the Low-Countries, but prospers well enough in Our Gardens, if Planted or Sown therein.

VII. The Times. They all Flower early in the Year, as in April, and many times in May, and their Seed is ripe not long after, as in June, and the latter end of May.

VIII. The Qualities. It is hot and dry in the fourth degree, plentifully stored with a Mercurial Volatile Spirit, and both a Volatile and fixt Salt, whereby it becomes Aperitive, Absterfive, Attractive, Cosmetick, Digestive, Discurfive, and Diuretick, Stomatick, Pectoral, Hepatick, Splenetick, and Hyfterick ; Emmenagogick, Sudorifick, and Alexipharmick.

IX. The Specification. It is peculiar for curing the Scurvy in a cold habit of body, with all its Symptoms ; it opens obstructions of the Liver, Spleen and Womb, Cures the Palsie, and all sorts of Sores and Ulcers in the Mouth, and cleanses the Skin of Spots, Scurf, Mophew, and other like defilements thereof.

X. The Preparations. You may make therefrom. 1. A Liquid Juice or Essence. 2. A Diet Drink. 3. An Infusion or Decoction in Wine or Water. 4. A Conserve. 5. A Tincture. 6. A Distilled Water. 7. A simple Spirit. 8. A purging Spirit. 9. A fixed Salt. Where Note, that the Garden Scurvy Grass is the strongest and most effectual to the purposes intended and that which is most used.

The

The Virtues.

XI. *The Liquid Juice or Essence.* It may be taken from one to two Spoonfuls or more, every morning fasting, in a Glass of Ale, Beer, or Wine, for the Cure of the Scurvy; it cleanses the blood, open all obstructions of the Liver, Spleen and Womb, rectifies, warms and comforts the Stomach, causes a good Appetite and Digestion is good against Surfeits, and takes away the Swelling, Pain, and hardness of the Spleen, and is profitable for such as are subject to, or troubled with Botches, Boils, Scabs, Scurf, Morpew, or other defilements, from the Corruption or Purification of the blood.

XII. *The Diet Drink.* Take Juice of Garden Scurvy Grass five Pints: Juice of Angelica, a Pint: Burdock Roots, half a Pound: Horse Radish Roots 4 Ounces, all Bruised or thin shaved: Mustard Seed Bruised, Coriander Seed Bruised, of each 4 Ounces: Cloves Bruised, Nutmegs thin sliced, of each half an Ounce: Yellow of Orange Peels, cleared from the White 3 Ounces: Choice Sena 4 Ounces: New Ale Ten Quarts. Put the Juices first into the Ale; then put all the other Ingredients into a long close knit Net Bag, with a Stone in it, which put also into the Ale. Let them work together, and after two days let the Patient drink of it, a Pint (or less according to Circumstances) at a time Morning and Evening, Squeezing into every Draught as it is Drank the Juice of a Sevil or Sore Orange. The Recipe may be repeated with fresh Ingredients, 3 or 4 times Spring and Fall, according as necessity may require. It has all the Virtues of the Juice and Essence aforementioned, and is a most excellent thing to cleanse the Blood of all its defilements, which it many times manifests in various sorts of breakings out in the Flesh and Skin.

XIII. *The Infusion or Decoction.* They may be made in Wine or Water, or in half Wine, half Water; but made with White Port or Lisbon Wines they are best. They have the Virtues of the Juice or Essence, but not altogether so powerful; but are good for the Cure of the Scurvy in a cold Constitution. If the Infusion or Decoction be mixed with an equal part of the Juice or Essence, and then very well sweetened with Honey, it makes a most excellent Gargrism for the healing of Sore Mouths and Throats, and curing of the Scurvy in the Mouth and Gums.

XIV. *The Conserve.* It is made of the round or Garden Kind (which is much the more preferable sort) according to the usual Method. It is a delicate Medicine for weak and tender Stomachs, and for such as are over-run with the Scurvy, and are apt to be sick in a Morning, or after Eating, or cannot digest their Food: It causes a good Appetite, and has all the Virtues of the Juice and Essence foregoing.

XV. *The Tincture.* It is made of the Green Herb, by digesting it in Spirit of Wine, either simple or acuated with Spirit of Salt or Sulphur. It is a potent thing against the Scurvy in a cold Constitution, as also for the Cure of the Palsie, and restoring of Paralytick Members. It gives ease in the pains of the Stomach, Liver, and Spleen, and in the Colick proceeding from Wind and sharp humors. Dose half a Spoonful to a Spoonful in a Glass of Wine, or Wine mixt

with Water, morning and night, or upon point of Extremity.

XVI. *The Distilled Water.* Take Garden Scurvy Grass 20 Pounds: Horse Radish Roots cut into thin slices 6 Pounds: Fair Water 3 Gallons: infuse warm for Twenty Four Hours, then draw off 3 Gallons of Water. Bute's Pharm. This ought to have a different distillation from that of Aromatics: for as Scurvy Grass, &c. abounds with more Volatile Spirits, and more Volatile Salts, so it admits of less Fermentation, and therefore ought to have a proper Menstruum (if stronger than Water, as Perry, Mead, not sower or hard, &c.) which may attract, dissolve, and join with the Essential parts of the Ingredients, and carry them along with it in Distillation, without changing their Natures and Virtues. It is essentially good against the Scurvy, Dropfy, Gout and Stone, or any Tartarous Concretions in the Reins or Bladder, as also against the Colick, Rheumatism, Surfeits and other like general distempers, which hardly admit of any singular Name or Denomination. Dose one Ounce or more in a Glass of Ale.

XVII. *The Simple Spirit.* Take Garden Scurvy Grass as much as you please, which cut or shred in pieces, put the same into a Copper Vessel Tinn'd within, and affuse thereon Rhenish, White Port, White Lisbon, or Madera Wine, so much as may over-top the Ingredients four or five Inches, digest 24 Hours, and distill through a Serpentine or Worm, with a very gentle Fire, that the Spirituous and Volatile parts may ascend, continuing the Distillation, till the falling Drops are almost inspid. To this Water put the same Quantities of the Ingredients again in like manner, with the former Quantity of Wine, digest and distill again as aforesaid, repeating this Distillation with fresh Herbs only, so long till the Spirit is strong enough. This done, redistill the Spirit in Balneo, keeping that which is repleat with Sulphur and Volatile Salt, and ascends first, a part by it self. Then continue the Distillation, till the Drops are almost inspid, which is also a Spirituous Water, and keep that by its self. This Spirit, and Water have all the Virtues of the former distilled Water. The Water may be given in the same Dose in Wine, Ale, or other proper Vehicle; but the first Volatile Spirit is to be given in Drops only, from 20 to 50, once or twice a day.

XVIII. *Another way to make this Simple Spirit of Scurvy Grass.* It is made of Garden Scurvy Grass whilst in Flower, fermented, or not fermented, then distilling it in an Alembick with its Worm, that which comes first, save by it self for Spirit: what follows is only Scurvy Grass Water. Some make this Simple or plain Spirit thus. Take Proof Spirit a sufficient quantity, put into it as much Scurvy Grass as it can contain: digest 3 or 4 Hours, then distil in an Alembick with its Worm, saving the first half or draught for Spirit: and what comes after for Scurvy Grass Water. Another way of making Simple Spirit of Scurvy Grass. Take fresh and large Garden Scurvy Grass when in Flower, as much as you please, Bruise it well in a Mortar, then put it into a Wooden Vessel, affuse thereon so much Water as may cover it, add to it 2 or 3 handfulls of Salt, and a little Yell, and let it ferment a day or two, and so distil it in a Copper Alembick Tinn'd within, saving the first running by it self for the true Spirit, which you may distill again from fresh Scurvy Grass, saving the first running as before, so will you have a very strong Essential Spirit

Spirit of Scurvy Grass. But *Roscinus* dislikes this way by Fermentation, and makes it thus. Take fresh Garden Scurvy Grass as much as you please, bruise it grossly, gently and speedily, add to it Generous White Wine (not fermenting it before hand, by which means there is much of the Volatile Spirit lost) and draw off the Spirit in an Alembick according to Art, separating the Oil, if any be found supernating. The Spirit he Exhibits in any proper Vehicle. The Oil he mixes with Sugar and makes thereof an *Eleo-saccharum Cochleariae*, which may be given in small Dose and in a proper Vehicle for the same purposes for which the Spirit is given, but they are only to be administered to people of a Cold and Moist Constitution; in a hot habit of Body, they will put all into a flame.

XIX. *The true way of making this simple Spirit.* Take Leaves and Flowers of Garden Scurvy Grass, as much as you please, Bruise them, and make them up into Balls (like those of Wood, which Dyers use) or being Bruised, put it into an Earthen Jar, pressing it in; upon which affuse strong Scurvy Grass Water, or rather, Scurvy Grass Wine, made of the Juice of the former simple Spirit and Water at Self. XVI. and XVII. aforegoing.

XX. *The Purging Spirit.* Or Golden Spirit of Scurvy Grass so called. Take of the best Spirit of Wine 24 Pounds: fresh Garden Scurvy Grass whilst in flower, so much as may fill the Spirit: digest twelve hours, and then distill off the one half. With this Spirit and the Resin of Scammony or of Jalap (extracting the Tincture and filtering) you may prepare *Spiritum Cochleariae purgantem*, the Purging Spirit of Scurvy Grass. Or thus. Take of some of the former Simple Spirit of Scurvy Grass 4 Pounds: Powder of Scammony six Ounces; or in place thereof Powder of Jalap 9 or 10 Ounces; digest in a warm sand only, or in a very gentle Balneo, in a large Bolt head, so long till you see the Tincture grow very Red, which decant and keep for use. It is highly Antiscorbutick, Antiparalytick, Antilethargick, Splenetic, and Diaphoretick, making fixt and crude humors Volatile, and resisting putrefaction. It is profitable against Hypochondriack Melancholy, Rheumatism, Gout, and other Tartarous Diseases. It destroys Acidities and prevails against obstructions of Liver, Spleen, Reins and Womb, comforting and restoring those parts. It is not to be given to such as abound with Choler, or are of a hot Constitution, but only to gross bodys of a cold and moist habit, much abounding with humors. Dose 20, 30, or 40 Drops, or more, in the morning fasting, in Ale, Beer, or Wine, or some other proper Vehicle. Where Note, that in this latter prescription of the purging Spirit, we use the Drugs themselves,

instead of their Extracts or Refins, which is much Cheaper, and full as well, considering the Spirit is fully strong enough, to extract the Tincture.

XXI. *The Fixed Salt.* It is made of the Ashes according to the usual or common way. It enters into the Mafs of Blood and Lympha, depurates or cleanses them, makes them thin, pure, and Limpid, facilitates the Circulation, strengthens the Stomach, causes a good Appetite and Digestion, opens Obstructions of the Lungs, though obdurate, dissolves Tartar and Gravel in the Reins, and Bladder, and is excellent against the Scurvy, Cachexy, Dropsie, Palsie, Lethargy, Jaundice, and Gout, opens Obstructions of the Stomach, Liver, and Spleen, and is profitable against the most Vehement Colick, and other pains of the Bowels. Dose from 10 Grains to 20 or 30 in any proper Vehicle, morning and night.

C H A P. DCXXIX.

OF SELF-HEAL.

I. **THE Names.** This Plant was generally unknown to the Ancient Greek and Latine Authors; but our Modern writers call it *Prunella*, (from the German Name *Brunella*, or *Brunellen*, because it cures that Disease which they call *die Bruen*, which is an Inflammation in the Mouth, Throat, and Tongue, with blackness therein, accompanied for the most part with a Burning Fever, common to Soldiers in Camps and Garisons.) It is also called *Consolida minor*, and *Solidago minor*, *Consolida minima Camerarij*; in English *Self-Heal*.

II. **The Kinds.** There are several Species of this Plant, but those which are to be found with us are these three, viz. 1. *Prunella Vulgaris Tragi*, *Brunella Brunfelsij*, *Dodonai*, & *Lobelij*, Our common Self-Heal. 2. *Prunella Vulgaris flore albo*, Self-Heal with a White Flower. 3. *Prunella laciniato folio Bauhini*, *Symphytum petraeum Lobelij*, Self-Heal with Jagged Leaves.

The Descriptions.

III. The first, or Our common Self-Heal. Its Root consists of many Strings or Fibres running downwards; and spreading sideways under Ground, whereby it encreases. The small Stalk, with the Leaves creeping upon the Ground shoot forth Fibres, which take hold of the Earth, by which means it is made a great Tuft in a little time. It is a small low creeping herb, having many small and something round yet pointed Leaves, somewhat like the Leaves of Wild Mint, of a dark green color, without any Dents on the Edges at all, or very seldom: from among which rise up divers square hairy Stalks, scarcely a foot high, which

Self-Heal, or *Prunella*.

which spread sometimes into Branches, with divers such small Leaves set thereon, up to the Tops, where stand brown spiked heads, of many small brownish Leaves like scales, and flowers set together, almost like the heads of *Stachas* or *Callidony*, which flowers are gaping and of a blewish purple, or more pale blew color, and in some places smelling sweet, tho' not so in some others.

IV. The second, or Self-Heal with a White Flower. This differs little or nothing from the former, neither in its Root, Stalk, Leaves, Branches, Flowers, Seeds, Magnitude, nor in its manner and form of growing, saving that in this the small scales of Leaves are not brown, but green, the flower is of a pure white color, and it encloses or spreads not so much.

V. The third, or jagged Leav'd Self-Heal. The Root is long with many fibres or Strings, and encloses by the shooting of its strings, which put forth fresh Leaves every Year. The Stalks are likewise square and hairy, as the Leaves are, which grow thereon, by couples at the Joints, the lowest of which are long and whole, without any cut or jag in them, all the rest being longer and narrower, are cut in or jagged on the sides, and the higher Leaves more divided or Cut. The heads are like those of the first common sort, and of the same form and magnitude, but varying in color as the former sorts do; for some plants are found with purplish flowers, others more dilated, like blew, some between blew and white, like an Ash color, and others all together White.

VI. The Places. The first and second are found in Woods and Fields every where almost throughout all England. The third grows naturally upon Rocks, Stoney Mountains and Gravelly Grounds, and is found also on many Hills and Mountainous Places in several Parts of France and Germany.

VII. The Times. The two first flower in April, May, and June. Gerard says, for the most part all the Summer long. The last, later than the other two, as most Mountain Herbs do, viz. in June and July, the Seeds of them all ripening in the mean season.

VIII. The Qualities. Self-Heal is Temperate in respect to Heat or Coldness, Dryness or Moisture, yet rather enclining to Dryness, Absterfitive, a little Astringent, and Traumatick or Vulnerary.

IX. The Specification. It cures Sore Mouths, and Throats, and the burning disease in the Throat at the Root of the Tongue, called *Prunella*; stops bleeding, and cleanses and heals all sorts of Wounds and Ulcers whether inward or outward.

X. The Preparations. You may make therefrom. 1. A Juice or Essence of the Herb. 2. A Decoction in Wine or Water. 3. A Mixture. 4. An Ointment. 5. A Cataplasm.

The Virtues.

XI. The Juice or Essence. The Juice is good to heal that Soreness in the Throat or Root of the Tongue, called *Prunella*, by gargling the Mouth and Throat therewith, and swallowing some of the Decoction down; but because there is a severe inflammation in the Mouth and Throat, with a roughness, or ruggedness and blackness of the Tongue, and a hot burning Fever withall, they commonly bleed under the Tongue with the use of these means, without which the Cure is scarcely effected. It is good for inward Wounds and Bruises, dissolves congealed Blood, and opens obstructions of the Liver and Spleen. The Essence, has the same Virtues, stops Fluxes of Blood in any Wound or Part, and cleanses whether inward or outward, and causes them to heal. Dose of either 3 or 4 Spoonfuls, morning, noon, and night.

XII. The Decoction in Wine or Water. It is used as an Excellent Wound Drink; and is good to heal the *Prunella* in the Throat, and other Ulcers in the Mouth, Gums and Tongue, as also all Wounds inward or outward, being inwardly taken, and outwardly used as a Wash or Gargle, or as an injection into hollow Ulcers and fistulas, and so causes them speedily to be healed; it cures inward Wounds, Pricks, or Stabs into the Body or Bowels, opening the obstructions of the Viscera, and strengthening the parts.

XIII. The Mixture. It is made, 1. With the Juice or Essence mixt with Honey of Roses. This used as a Gargle, it cleanses and heals all Sores and Ulcers, in the Mouth and Throat; and as a Wash it heals Ulcers in the secret parts. 2. Made with the Juice and Oil of Roses: it is good to anoint the Temples and Forehead with, to ease pain and Cure the Head-Ach, and stop defluxions into the Eyes. 3. The Juice mixed with Wine Vinegar, and some of the Decoction, it makes a good Gargle for a Sore Throat, Tongue, Mouth, and Gums; and eases all pains and Inflammations in those parts.

XIV. The Ointment. It is good for all sorts of Simple Contusions, Hurts, Sores, Wounds, and Ulcers, in any part of the Body. It also helps to consolidate broken Bones; and strengthen and confirm such as have been lately out of Joint, and newly reduced. It heals also Sores and Ulcers, in the Secret parts of Man or Woman.

XV. The Cataplasm. It is made of the Green Leaves by beating in a Mortar. It cures Simple

ple Contusions, Pains, Aches, Sore Ulcers, whether New or Old, represses defluxions of humors, as also their heat and sharpness, flowing to any part, abates the Inflammation, and prevents a Gangrene, whereby it presently restores the parts to their Pristine health.

C H A P. DCXXX.

OF SHEPHERDS NEEDLE.

OR,

VENUS COMB.

I. **THE Names.** It is called in Greek *Σκάνδιξ*, in Latine, *Scandix*, also and *Acus Veneris*, *Acus Pastoris*, *Pecten Veneris*, *Acula*, and *Scanaria*; and in English, *Shepherds Needle* and *Venus Comb*.
II. **The Kinds.** There are several sorts of this Plant, viz. 1. *Scandix Vulgaris*, *Pecten Veneris*, *Scanaria*, Our Common *Shepherds Needle*. 2. *Scandix Minor*, *Antbriscus Plinij*, *Anisofomarathum Columne*, *Scandix Cretica Minor*, Small *Shepherds Needle*. 3. *Scandix Major*, *Scandix Cretica major*. The Greater *Shepherds Needle*. 4. *Scandix altera Capite Glomerato*, round headed *Shepherds Needle*.

The Description.

III. The first, Or our Common *Shepherds Needle*. Its Root is very small and Fibrous or Thready. It rises up with several long, hard, large, green Stalks of Leaves, much divided, and into more parts, and of a sadder brown green color, than Chervil, having no smell. The Stalks grow a foot high, bearing small Tufts of white Flowers, and after them five or six, more or less, of long Seeds, something round, and pointed at the ends, a little rough as if they were dented, and all of them coming from one Head, or Umbel, with a few small Leaves under them.

IV. Gerard says, its Root is white and of a fingers length; that it does not much differ in the Quantity of the Stalks, Leaves and Flowers, from Chervil, but has no such pleasant smell as

Shepherds Needle or Venus Comb.

that has; the Leaves are lesser, more finely cut, and of a brown green color. The Flowers grow at the tops of the Stalks in small white Tufts; after which come up long Seeds very like unto Pack-Needles, and orderly set one by another like the great Teeth of a Comb, from whence come the Name *Pecten Veneris*, *Venus Comb*, or *Venus Needle*.

V. The second, or small *Shepherds Needle*. Its Root is small, long and white. It has several Stalks of very fine cut leaves, not bushing thick like the former, but more sparfed and thin, coming something near to Camomil, but finer, and a little hairy, of a pleasant smell and taste; from among which rise up slender short Stalks, somewhat hairy or hoary, with but few joints or Leaves on them, at the tops of which stand five or six small white flowers close set together, consisting of five Leaves apiece: in the middle whereof is a dark purplish stile or leaf longer than the rest, spreading forth like a blazing star; after which follow long Seeds, like the former, but smaller, bigger below, and ending above in two small points, whose edges are more rough, and seem more dented, and are a little Purplish, as the young ones are, before they be ripe, which are the Seeds themselves. This has been observed to have a better smell growing in void, untill'd and gravelly Ground, than that which grows in the fields.

VI. Gerard, describes it thus. From a long, slender, and whitish Root, it sends up many small Leaves, like those of the former, but of a pleasing smell and taste, something like that of the

the Common Chervil. From amongst these Leaves, grow up slender Stalks, a little hairy, divided into short green and slender Branches, carrying at their Tops little Umbels of Flowers, consisting of five, six, seven, or eight small flowers, composed of five Leaves apiece, with a dark purplish Chive in the middle; the flowers are succeeded by, or rather grow up, with long slender Cods, of about an Inch long, resembling those of the first kind. Clusius says, it flowers in June, and that he received it from Honorius Bellus out of Candy, who writes that there, in the Spring time, it is much used in Sallets; and this Plant he takes to be Anthriscus Plinij, by which Name Clusius sets it forth; and Columna calls it Anisomarathrum, because its smell is between that of Anise and Fennel.

VII. The third, or greater Shepherds Needle. Its Root is long, small and Fibrous. It has a Crested small Stalk a Cubit high, parted into divers Branches, a little hairy at the very joints, having its lower leaves broad, and somewhat round, divided much like to the lesser Burnet Saxifrage, one set opposite to another, standing upon long Foot Stalks, which together with the Leaves are a little hairy; but those which stand at the joints are much more finely cut in, and like unto the Leaves of the first described. The Umbels are a little spread, and small, yet greater than those of the first described; which are succeeded by a greater store of long, rough, denot and pointed Seed than the last described, having each of them two small Pricks at the end.

VIII. The fourth, or round headed Shepherds Needle. Its Root is like that of the Wild Parsnep, white and of a bitter and sharp taste. It has Stalks of larger Leaves than the Wild Carrot, coming something near to Parsly, smooth, and of a Pale Green Color. Those which grow at the joints of the stalks, come forth out of a broad Film or Skin, as it were, and as is seen in many Ferulous and Umbeliferous Plants, and bearing at the Top a round head, of many greenish white threads set close together.

IX. The Places. The first grows plentifully almost every where in Corn-fields among Wheat and Barly, throughout all England. The other three grow wild in Candy, Greece, France, Italy, and Spain, but with us only in Gardens.

X. The Times. They flower in May and June; and the Seed is ripe in July and August.

XI. The Qualities. Shepherds Needle is sharp and bitter, and said to be hot and dry in the beginning of the third degree: Aperitive, Attractive, Diuretick, Hepatick, Stomatick, and Nephriticck.

XII. The Specification. It opens obstructions of the Stomach, Liver, Reins, and Womb, cleansing those parts; and by its Attractive Virtue, draws forth Thorns, Pricks, Splinters, and other things sticking in the flesh.

XIII. The Preparations. You may make therefrom, 1. A Liquid Juice or Essence. 2. A Decoction in Wine or Water. 3. A Powder of the Seed. 4. A Sallet of the second kind. 5. A Cataplasm of the Root.

The Virtues.

XIV. The Liquid Juice or Essence. They are good for the Stomach, Liver, Spleen, Bowels, Reins, Bladder, and Womb. They provoke Urine admirably, increase Seed and Lust, and free the Viscera from Obstructions, being profitable also against the Colick. Dose 3 or 4 Spoonfuls in a Glass of Generous Wine, or some other Vehicle.

XV. The Decoction in Wine or Water. It has the Virtues of the Juice or Essence; but being much weaker, must be given in a great deal larger quantity, as from a quarter of a Pint to half a Pint, morning and night, a little sweetened with white Sugar.

XVI. The Powder of the Seed. It is astringent, stops Fluxes of the Bowels, and taken with Vinegar, it presently stops the Hiccough: and mixt with Hogs Lard and Sheeps Suet in equal Quantities, it is said to Cure Burnings with Fire.

XVII. The Sallet of the second kind. It breeds Seed, provokes Lust, and excites to Venery; yet is said to restore such persons as are spent therein, or weakened thereby: and by cleansing the Womb, opening its obstructions, and strengthening the seminal parts, it is said to cure Barrenness and cause Conception. And all these things do the Liquid Juice or Essence do, in a more admirable manner, being daily taken.

XVIII. The Cataplasm of the Root. It draws forth the fire in places burnt or scalded: and being applied to parts having Thorns, Pricks, Splinters, or other like matters gotten into the flesh, it draws them forth.

C H A P DCXXXI.

OF SHEPHERDS PURSE.

I. THE Names. This Plant was unknown to the Greeks, at leastwise it has no Greek Name that we know of: but it is called in Latine, *Bursa Pastoris*, and *Pera Pastoris*; by Castor Durantes, *Herba Canceri*; and by Gesner, *Thlaspi fatuum*: and by us in English, *Shepherds Purse*, and *Shepherds Pouch*; and in the North parts of England, *Toy-wort*, *Pick-Purse*, and *Cafe-weed*.

II. The Kinds. We have growing with us, 1. *Bursa Pastoris major vulgaris*, Our greater common Shepherds Purse. 2. *Bursa Pastoris minor*, Our small Shepherds Purse. 3. *Bursa Pastoris major folijs non sinuatis*, Great Shepherds Purse with undented or whole Leaves.

The Descriptions.

III. The first, Or our Common Greater Shepherds Purse. Its Root is small and white, with some Fibres annexed to it, and perishes after Seed time. It springs forth with several small and long Leaves, something deeply jagged or cut

in on both sides, into several parts; of a Pale green color. From among which rises up, a small round Stalk, parted into some Branches, having smaller and lesser divided Leaves on them, and towards the Tops not divided at all. At the Tops or upper ends of the Stalks and Branches

Shepherds Purse.

grow many white flowers one above another, almost in a spiked manner; after which follow whitish flat pouches or Seed Vessels, small at the Footstalk, and broad at the other end, almost like a Triangular Purse, save that it is a little dented in on the middle, almost resembling a Heart: these Purse or Pods are parted like the Thlaspi, in each side of which lies small brownish yellow Seed. There is no sharpness in this Plant, and but a very little Heat in it, or in its Seed, tho' some Authors say, it has some little Acrimony, but it is certainly Astringent and drying.

IV. The second, Or our smaller Shepherds Purse. Its Root is like the former. It comes forth of the Ground like the Cuckow Flower, or Ladies Smocks, having small Leaves, deeply jagged or indented about the Edges. From among which rise up many small tender Stalks with Flowers at the Tops, as it were chaff: The Pods or Cases and Seed are like the former before described. It is in all things like to that, but that it is less in every part thereof. There is also *Bursa Pastoris minor folio integro*; another small one, which is in all things like the other, saving that there is no divisions in the Leaves.

V. The third, or great Shepherds Purse with undented or whole Leaves. It has a small Root with Fibres adjoin'd to it like the first, from whence usually rises up one small Stalk a Span long, Branched into two or three parts, whose lower Leaves are whole, without division, having long

Footstalks to them; and these upon the Stalks, encompass them at the bottoms; the flowers are flat; and the Pods or Seed Vessels flat like to those first described.

VI. The Places. The first and second sorts are found frequently in a great many places throughout the whole Kingdom; for the most part near Common High-ways, in desert and untill'd places, and among Rubbish, and near Old Walls: The third grows not in England but only in Gardens.

VII. The Times. They Flourish, Flower, and Seed all the Summer long; and sometimes they are so early that they Flower and Seed twice in the same Year.

VIII. The Qualities. *Dodoneus*, *Martbiolus*, and *Ruellius* say, that Shepherds Purse is cold and dry: But *Lobel* and *Pena* hold them to be hot and dry, judging so from the taste of the Seed, it having a little heat upon the tongue. Doubtless tho' the Seed may be hot and dry in the first degree; yet the Plant it self is temperate in respect to heat or cold, and dry in the second degree. It is Astringent, Incrassating and Vulnerary.

IX. The Specification. It stops all sorts of bleeding whether inward, as Spitting, Vomiting, Pissing of Blood, or Overflowing of the Loches or Courses in Women; or outward, as that of Wounds; and Cures all sorts of Fluxes of the Belly of what kind soever. It cools and represses Inflammations and *Anthones* Fire; cleanses mattering or running Ears, and heals Green Wounds, conglutinating or closing their Lips; and is an especial thing for Wounds of the Head.

X. The Preparations. You may make therefrom. 1. A Juice. 2. An Essence. 3. A Decoction. 4. A Syrup. 5. A Balsam or Ointment. 6. A Cataplasim.

The Virtues.

XI. The Juice. Dropt into Sore or running Ears, it dries and heals them. Drank to 3 or 4 Spoonfuls morning and night, either alone, or in some Styptick Red Wine, it stops all sorts of inward Bleeding, as by the Mouth, Nose, Anus, Bladder and Womb, and cures all sorts of Fluxes of the Belly, as *Cœliaca*, *Diarrhœa*, *Dysenteria* and *Lienteria*, as also the Fluxus Hepaticus. Bathed upon *Anthones* Fire, or other Inflammations, it cools and represses them.

XII. The Essence. It has all the former Virtues with advantage, and singular for healing the Bloody Flux, and Conglutinating the Lips of Green Wounds. And being mixed with a third part of Juice of Plantane, it powerfully suppresses, the overflowing of the Loches, as also of the Terms in Women. Dose 3 or 4 Spoonfuls morning and night in a Glass of the Decoction made in Smiths Forge Water.

XIII. The Decoction. It may be made in Styptick Red Wine, or rather in Smiths Forge Water, adding after the Boiling a quarter part of the said Styptick Red Wine. It has all the Virtues of the Juice and Essence, being taken morning and night, 6 or 8 Ounces at a time, either alone or sweetened with the Syrup thereof: It is good also to heal inward Wounds, and Ruptures in Children.

XIV. *The Syrup.* It has the Virtues of the Juice, Essence and Decoction, but not so powerful as they; and is fit to be given to Children in all those cases; as also to sweeten those several preparations, to make them more palatable, and easie to be swallowed. It is made of the Clarified Juice, with its equal quantity of Clarified Honey or double refined Sugar, if it be not for long keeping; otherwise, it requires double quantity, &c.

XV. *The Balsum or Ointment.* They are Absterfitive, drying and healing; admirable for the Curing of simple Green Wounds, and that upon the spot, in what part of the Body soever: applyed also to parts overstrained, or where there is any weakness, it strengthens them, and restores them to their former strength.

XVI. *The Cataplasim.* Being laid upon *Anthony's* Fire, or other Inflammations, it cools, and represses them, very much refreshing the parts: Applied (pretty hard bound on) to the Wrists, and Soles of the Feet, it is said to help the Yellow Jaundice, but how true this last is, I cannot tell, for I never tryed it. It is made of the Green Herb cut, and beaten in a Mortar.

C H A P. DCXXXII.

OF SHEPHERDS ROD.

I. *THE Names.* It has no known Greek Name: but is called in Latine, *Virga Pastoris*: and in English, *Shepherds Rod*, or *Shepherds Staff*.

II. *The Kinds.* Authors account it to be a Species of the *Dipsacus Sylvestris*, or *Wild Teasle*: *Bauhinus* calls the *Dipsacus Sylvestris*, or common *Wild Teasle*, *Virgo Pastoris Major*, and this, *Our Shepherds Rod*, *Virga Pastoris minor*, which is thought to be the *Galedragon* *Plinij*, Lib. 27. Cap. 10. and the *Dipsacus satius Camerarij*.

The Descriptions.

III. It has a Root which is long, branched out, and furnished with several Fibres or Strings. Its Leaves are large, dented about the Edges, and of a sad green color; a little prickly on the back, but not so prickly as the *Wild Teasle*. The Stalks grow higher but not with such large Prickles, and the Leaves are set by Couples at the Joints, but not encompassing the Stalk so as to hold water, as the *Teasle* does. The Stalk and several Branches bear at their Tops, small heads, not much bigger than Walnuts, with soft Prickles thereon, and bluish colored Flowers, much like to those of the *Wild Teasle*. The Stalk cleared from its Prickles, *Shepherds* formerly made use of to hold in their hands to guide their Sheep withal, whence came the Name of *Virga Pastoris*, or *Shepherds Rod*, or *Staff*.

IV. In Gerard it is described thus. It is a kind of *Wild Teasle*, and accounted among the *Thistles*, but growing higher than that, but much like it, saving that its knobbed Leaves are no bigger than a *Nutmeg*. Its lower Leaves are deeply cut in with one Gash, on each side, at the bottom of the Leaf, which make them to have (as it were,) little Ears,

Shepherds Rod.

which the Cutter has carelessly omitted in the Figure. The Leaves also are less than those of the *Wild Teasle*, narrower at their setting on, and do not hold water at the other does, the whole Plant being less. But *Bauhinus* says, it grows just as high.

V. *The Places.* It grows in many places thro' the Kingdom, which are moist, and in moist high ways; as in the high way leading from *Braintree* to *Hemmingham-Castle* in *Essex*; and here and there in the high way from *Much-Dunmore* to *London*. It has been found growing also in great plenty at *Edgecomb* by *Croydon*, in several Places thereabouts.

VI. *The Times.* It flowers for the most part in *July*, and the Seed is ripe in *August*, or not long after the flowering.

VII. As to its Qualities, Specification, Preparations and Virtues. Authors have said nothing, yet it is supposed to have the same with those of the Common *Wild Teasle*. And the Distilled water thereof is commended to be drank after eating by Women who have a depraved Appetite.

C H A P. DCXXXIII.

OF SKIRRET.

I. *THE Names.* It is called in Arabick, *Fisfarum*, & *Seisaron*; in Greek, *Σκίρρετ*, in Latine, *Sisfarum*, & *Sifer*: in English *Skirret*.

II. *The Kinds.* There are but two kinds generally taken notice of by Authors, viz. 1. *Σκίρρετ*

Sisifum Hortense, *Sisifum Dodonaei*, *Lobelij*, & *Tragi*; *Sifer Camerarij*, *Cordi*, *Gesneri*, & *Matthioli*; *Sifer Germanicum* *Casalpini*. Our Common Garden Skirret. *Tiberius* the Emperor was so in Love with this Root, that he sent for it out of *Germany*, from *Gelduba*, a Castle or Place about the *Rhine*, as *Pliny* *Lib. 16. Cap. 5.* says, this Emperor, was so much taken with it, that he caused it to be brought to him every year out of *Germany*. *Columna* and some others took this plant to be the *Elaphoboscum* *Dioscoridis*, but they were deceived, for this Herb is neither *Ferulous*, nor has it *Umbels* of *Yellow* Flowers, nor Seed like the *Parfney*; but it has white flowers, and Seed like *Parfley*. *Pliny* his *Sifer*, which is all one with the *Sisifum* *Dioscoridis*, has a strong tough string, almost *Woody*, running through the middle of each Root, which is to be taken away after the boiling, that they may be eaten with the more pleasure, which this Our Common Skirret has also, and which no other Root, that was then, or is now edible, has besides, for which alone reason there is no doubt but this Our Skirret is the true *Sifer*, or *Sisifum* of the Ancients. 2. The other is called by the *Arabians*, as *serapio*, *Secacul*; in *Greek* *Σισυριανόν*, in *Latine*; *Sisifum* *Sylvestre*; *Sifer alterum*, *Sifer* *Syracum*; in *English* *Wild Skirret*, and *White Carrot*. *Rauwolfius* says that this grows in *Egypt*, and is there called also *Secacul*, by the *Arabick* Name.

The Descriptions.

III. The First, Or Our Common Skirret. It has a Root which is compatted of several small, long, round, white Roots, set together at one head, like to *Asphodil*: bunched out or uneven in many places, and rugged, or as it were wrinkled withall, and not smooth, as divers other Roots are, each of which

Skirret Garden.

has a small tough Pith within them, which being removed, the rest is very pleasant to be eaten. From the head of these Roots, rise up several Stalks of Winged Leaves, something like to those of the *Parfney*, but that they are smaller, and set further asunder, smoother, and greener, and also dented about the edges. From among which rises up the Stalk, little more than half the height of the *Parfney*, having at the Top, *Umbels* of *White* Flowers, which afterwards turn into small dark Seed, somewhat larger than *Parfley* Seed.

IV. Gerard describes this Plant after this manner. The Roots are many in number, growing out of one head, an hand breadth long, and most commonly not a finger thick; they are sweet, white, good to be eaten, and pleasant in Taste. Its Leaves do consist of many small Leaves fastned to one Rib, each particular one whereof, is something Nicked in the Edges, but they are lesser, greener, and smoother than those of the *Parfney*. The Stalks are short, and seldom a Cubit high. And the Flowers which grow in spiky Tufts are white.

V. The second, or Wild Skirret. This has a long, tender and smooth Root, grayish on the outside, and white within, as thick as ones finger, and easy to be broken, and nine or ten Inches, or almost a foot long, having several small knots or bunches thereon, like to *Warts*, of a pleasant sweet Taste,

Skirret Field or Wild.

like unto our Carrots. From this Root rise up many Stalks of Winged Leaves, much divided and cut into many parts, not very unlike to *Carrot* Leaves. The Stalks have also such like Leaves at the joints, and *Umbels* of Flowers at the Tops, like unto them for form, but of a yellowish color.

VI. The Places. The first grows at *Narbonne* in *France*, as *Lobel* says, but is sown with us, almost every where in Gardens. *Parkinson* says, that it is rather Sown than Planted; for Sown among *O-*
nions,

nions, the one will not hinder the Growth of the other; the Onions being still drawn away, to make room for the Skirrets, that they may have their full growth against Winter. But Gerard says, they are Planted (in Gardens) by the Roots, for the greater and thicker ones being taken away, the lesser are put into the Earth again, which is best to be done in March or April, before the Stalks come up. The second grows Wild in Egypt; but with us in Gardens.

VII. *The Times.* They Flower and Seed later than the Parsnep, viz. about the latter end of July, or beginning of August, and the Seed is ripe about the end of August or beginning of September. And the Roots are taken up to be eaten about the end of February and all March, and sometimes in April.

VIII. *The Qualities, Specifications, Preparations, Virtues, and Uses,* are altogether the same with those of our Garden Parsneps in Chap. 544. to which you are referred, so that no more need be said of them here.

IX. *The Wild Skirret* is more Physical having Aperitive, Attenuating, Inciding and Absterfive Qualities. It resists poison, is good against the Bittings of Vipers, expels Wind both in Stomach and Bowels, eases pains and stitches in the sides, helps in the Colick, and provokes Urine. The Root is often used for the former purposes, but the Seed much more.

CHAP DCXXXIV.

of SMALLAGE

OR,

Water PARSLEY.

I. *THE Names.* It is called in Arabick, *Asifilis*: in Greek *Ἐριόλαβον*: in Latine *Paludapium*, *Apium*, *Apium Palustre*, *Apium Aquaticum*, *Apium Rusticum*, *Eleoselinum*; in English *Smallage*, or *Water Parsly*.

II. *The Kinds.* We make three several kinds thereof, tho' there are no more than two properly, viz. 1. *Apium*, *Apium Vulgare*, *Apium Palustre*, *Paludapium*, *Eleoselinum Dodonzi*, & *Lobelij*; Our Common Smallage. 2. *Apium Hortense*, *Apium Crispum*; this *Columna* will have to be *Apium Spontanum*, which *Quatramius* calls *Geoselinum*, and that it is only the first or Common Smallage altered by Transplanting. Our Garden or Curled Smallage, which being whitened, by laying the Stalks in Sand or Earth, is then called *Sallary*, as being then a *Saller Herb*. 3. *Apium Dulce*, *Selinum Dulce*, Sweet Smallage. The Stalks of this being also laid in the Earth or Sand for some time, will become *White* as the former, and is then called likewise *Sallary* or *Sweet Sallary*.

The Descriptions.

III. The first, or Our Common Smallage. Its Root is greater than that of Parsly, but not so long and slender, with a number of Fibres or Strings adjoining to it. It grows up with greater hollow, and more Crested Stalks than Parsly, and greater and larger Winged Leaves, set one against another, broader, and of a darker green color, and shining more than Parsly, somewhat unevenly dented about the Edges. At the Tops of the Stalks stand large

Smallage Common.

Tufts of small White Flowers, which turn into Seed, very like, but smaller than Parsly Seed. The whole Herb and Root is strong in smell, and much more unpleasant and bitter in Taste than Garden Parsly, not well to be eaten alone, unless eaten as a Boiled Sallet.

Smallage Curled.

IV. The

IV. The second, Or Our Garden or Curled Smallage, called Sallary. *This is in all things, like the former, saving that the Leaves are of a lighter green color, and Curled or something Crumpled withal, which being laid along in the Ground, and covered with Earth or Sand, become very white and edible, and are very pleasant to the Taste or Palate. Some Authors will have this to be the former Common kind, altered by Transplanting out of Wet Moist Ditches and places into Dryer Gardens, but Parkinson is not of that Opinion, and says that it grows so naturally in Sardinia, from whence the Seed has been dispersed into other parts, and so brought to us.*

V. The third, or Sweet Smallage. *Its Root is great and long, with divers Fibres set thereto, white, and much more suppy and pleasant, than either those of Our Common Smallage, or Parsly, having a very Warming and Comfortable Relish, and nothing Offensive, but they, and even the whole Herb, is as pleasant as if Sugar had been mixed with it; it grows up in the same manner as the first Common Smallage does, but larger than it, the Leaves likewise are larger, but not of so deep a green color. The Flowers and Seed likewise are like those but something bigger. This plant in both its Relish or*

Smallage great or Garden.

Taste and form, has been found to hold, for the first or second year, from the Seed which has been Sown, coming from beyond Sea. But as Sweet Fennel does degenerate, more and more when Sown in England, which always continues sweet whilst growing in its Native warm Countries, so is it with this Sweet Smallage; the Leaves also decay in their Verdure, and lose of their freshness, becoming more sullen or sad, like to those of our Common Smallage. If the Stalks of this be laid in the Ground, and covered with Earth or Sand as the former, they become white like them, and so are more pleasant to be eaten raw as a Sallet with Salt, Vinegar and Oil, and then it is called Sallary as the former.

VI. *The Places.* The first grows in moist and wet Grounds, and in Ditches and Ditch sides, which are always filled with Water, but if Planted in Gardens will also thrive and prosper well. The second and third grow only in Gardens with us, being Nurst up as Sallet Herbs. They are said to grow also familiarly in Greece and Italy, where both Herb and Root are eaten with great delight, as a Sallet, even as they are now eaten with us in England, in which places they are Sown, and replanted again.

VII. *The Times.* They flourish when the Garden Parsly does, and their Stalks come up, the next year after they are Sown, and then they bring forth Flowers and Seed, which are ripe in July and August.

VIII. *The Qualities.* Smallage is hot and dry in the beginning of the third degree: Aperitive, Absterive, Attractive, Carminative, Digestive, Discussive, Diuretick, Incisive, Suppurative, Neurotick, Stomack, Pectoral, Nephritick, Hysterick, Emmenagogick, Alexipharmick, and Spermatogenetick.

IX. *The Specification.* Smallage opens all Obstructions of the Viscera, provokes Urine and the Terms, is good against Stone, Gravel and Strangury; it cleanses the Blood, and prevails against the Yellow Jaundice, Tertian and Quartan Agues, cleanses and heals fordid Ulcers in the Mouth and Throat.

X. *The Preparations.* You may make therefrom. 1. A Juice. 2. An Essence. 3. A Decoction. 4. A Syrup. 5. A Mundificative. 6. A Gargle or Lotion. All these of the whole Plant, or of the Root. 7. A Powder of the Seed. 8. A Tincture of the Seed. 9. A Sallet of the Stalks and Roots. 10. A Cataplasm. 11. Unguentum ex Apio.

The Virtues.

XI. *The Juice.* Taken to 2, 3, or 4 Ounces, in a Glas of White Wine, it opens all obstructions of the Stomach, Lungs, Womb, Reins and other Viscera, is very effectual against the yellow Jaundice, Tertian and Quartan Agues, as also the Strangury, Sand, Gravel, Stone, or Tartarous Mucilage in Reins, Ureters or Bladder. It dissolves congelations of the humors, and thick flegm, and powerfully provokes the Terms in Women, being taken Morning and Night for several days together.

XII. *The Essence of the whole Plant.* It has all the former Vertues, and more powerful to the Intentions. It comforts and warms a Cold Stomach, expels Wind, gives ease in the Colick, and Gripings of the Guts proceeding from Cold, as also from acrimonious and sharp humors: mixt with Honey of Roses it cleanses old Ulcers in the Mouth and Throat, or in what other part of the Body soever. Dose 3, 4, or 5 Spoonfuls morning and night, in a Glas of White Port or Lisbon Wine.

XIII. *The Decoction of the whole Plant in Wine or Water.* It has all the Virtues of Juice and Essence, but much weaker, and therefore is to be given in a much larger Dose, as from a quarter of a Pint, to half a Pint, morning and evening.

XIV. *The Syrup.* It has the Virtues of the Juice and Essence, besides which, it is an excellent Pectoral, opening all obstructions of the Lungs, and easing Coughs, Colds, and pains in the Lungs and Stomach; it causes easie expectoration, and breathing,

ing, takes away hoarseness and shortness of breath, as also obstructions of the Urine. If it is made of the Juice with Honey, it is admirable to cleanse Ulcers, Cure the Jaundice, and Dropsy, by expelling the Water by Urine, and to provoke the Terms in Women. Dose 4 or 6 Spoonfuls morning and night in a Glass of White Lisbon Wine, or in the Decoction of the Herb and Root in Wine.

XV. *The Mundificatione. Take of the Juice 4 Ounces: Honey, or Honey of Roses, 2 Ounces. Bean Flower 2 Ounces, mix them. Or thus from Aquapendens. Take Juice of Smallage 3 Ounces. Syrup of Roses, or Mel Rosarum an Ounce: Turpentine half an Ounce: Meal or Flower of Barly and Lupins, ana, a sufficient quantity, to bring all to a consistence; mix them.* These are excellent Absterfives, and cleanse old, running, fœtid, and foul or rotten Ulcers admirably, in what part of the Body soever. But if Red Precipitate in an eight part be added to it, it will be so much the more effectual in fordid and putrid Ulcers. The first of these applied, stops the weeping of hurt Nerves or Sinews, in simple Members which are not fat, or very fleshy, and brings the same to perfect digestion.

XVI. *The Gargle or Lotion. Take of the Decoction eight Ounces: of the Juice 6 Ounces: Mel Rosarum 4 Ounces; mix them.* It Cures malignant Ulcers of the Throat, Tonfils, Mouth, and Gums, by gargling and washing them therewith several times a day: It heals exulcerated Cankers, and removes their Putrification. If to the former Quantity 2 Ounces of Spirit of Wine be added, it will be so much the more potent and healing.

XVII. *The Powder of the Seed.* It has all the Virtues of Parsly-Seed but much more potent in every respect. It prevails against the Colick, Wind, Strangury, Sand, Gravel and Stone in Reins and Bladder, obstructions of the Lungs, Wheezing, Hoarseness, Shortness of Breath, Stinking Breath, provokes Urine and the Courses, and kills Worms in the Stomach and Belly. Dose from half a Dram to a Dram mixt with Honey and so taken morning and night.

XVIII. *The Spirituous Tincture of the Seed.* It has all the former Virtues, but more Stomachical, and may be taken from 2 to 4 Drams, mixt with a Glass of the Decoction, dulcified with Syrup of Smallage.

XIX. *The Sallet of the Whited Stalks and Roots.* They are cut or sliced and eaten with Salt, Vinegar and Oil, raw, they make a pleasant Sallet, are grateful to the Palate and Taste, strengthen the Stomach, and cause a good Appetite and Digestion.

XX. *The Cataplasm.* It is made by boiling the Bruised Leaves and Roots in Hogs-Lard. Applied warm, it is discutient, takes away the Pain of Fellons and Whitloes in the Fingers; and Ripens and heals them.

XXI. *Unguentum ex Apio.* Ointment of Smallage. Take Juice of Smallage a Pint: Honey 9 Ounces: Wheat Meal or Flower 3 Ounces: mix and make an Ointment by Boiling to a just Thickness according to Art. It is an admirable and gentle cleanser of Wounds and Ulcers: opens obstructions of Liver and Spleen, applied to the Hypochonders; provokes Urine anointed on the Regions of the Kidnies and Share; is good against the Colick, anointed on the Belly; and helps the Stuffing of the Lungs applied to the Breast.

CHAP. DCXXXV.

OF SNAP-DRAGON,

OR,

CALVES SNOOUT.

I. **THE Names.** It is called in Greek *Ἀντίρρινος*: in Latine, *Antirrhinum*, also *Orontium*, *Os Leonis*, *Herba Simiania*, *Leo herba*, *Venusta minor*, *Opalis grata*, and *Canis Cerebrum Apuleij*; in English, *Snap Dragon*, or *Calves Snout*.

II. **The Kinds.** There are several sorts thereof, as 1. *Antirrhinum album*, White Snap Dragon. 2. *Antirrhinum purpureum* see *Roseum*, Purple Snap Dragon. 3. *Antirrhinum Variegatum*, Variable Snap Dragon. 4. *Antirrhinum luteum*, Yellow Snap-dragon: these four are all of the large Garden kind, the following are of the smaller sorts, called the wild kinds. 5. *Antirrhinum Sylvestris medium vel majus*, The Greater Wild Snap Dragon. 6. *Antirrhinum rubrum Beticum*, Small Red Spanish Snap Dragon. 7. *Antirrhinum flore albo alterum*, Small White Flower'd Snap Dragon. 8. *Antirrhinum Sylvestris minus*, The lesser Wild Snap Dragon.

The Descriptions.

III. The first, or White Snap Dragon. Under this Description We shall comprehend in the main, the first four Garden kinds. Its Root consists of many White Strings, which perish in most places after they have given Seed, unless they be carefully defended in the Winter against the Cold. The Leaves of these Snap Dragons are broader, longer, and greener, than the Leaves of the Mannered Flax, or of the Wild Flax, and are set confusedly upon the tender Green Branches, which are spread on all sides from the very bottom, bearing at the Tops many Flowers, somewhat resembling those of Toad Flax, but much larger, and without any heel or Spur, of a fair white color, with a Yellow Spot in the Mouth, or Gaping place. After the Flowers are past, in their places come hard round Seed Vessels, fashion'd somewhat like unto a Calves head, the Snout being cut off, wherein is contained small black Seed.

IV. The second, or Purple Snap Dragon. This is in Stalks, Leaves, and Flowers altogether like the former, and as large and great in every part or greater; the only difference is, that this bears pale Stammel, or Rose colored Flowers, with a Yellow Spot in the Mouth, and sometimes of a Paler color, almost Blush.

V. The

V. The third, or Variable Snap Dragon. The Roots in this are smaller than either of the former, and always perish after Seeding time. This Plant is something less than the foregoing, and tenderer than the last described, having also a Reddish or Blush colored flower, lesser than the former, but much bigger than the middle kind described in Sect. VII. following. The Yellow Spot in the Mouth of the flower, has some white about it, and extending to both sides of the Spot, and their Heads and Seeds are like the former.

VI. The fourth, or Yellow Snap Dragon. It is like in form to the former kinds, and has Leaves as large as any of them, and very fair yellow flowers as large likewise as they, not differing in

Snap Dragon White and Yellow.

Snap Dragon Wild greater.

VIII. The sixth, or small Red Spanish Snap Dragon. The Flower of this is much more Beautiful, being of a bright Crimson color, the Mouth or Chaps being of a yellowish White, much like to some of the Garden kinds, but more lively for its color.

IX. The seventh, or small White Flower'd Snap Dragon. This differs very little from the

Snap Dragon white flower'd wild.

any thing else from the first described. Let none imagine this to be a Linaria or Toad Flax, for in all its parts it is agreeable to the Snap Dragons.

VII. The fifth, the middle kind, or Greater Wild Snap Dragon. Its Root is small, and perishing every year, springing up again from the falling Seed. This greater wild kind rises up usually, but with one Stalk, branching forth on all sides into some other, on which are set long, and somewhat narrow thick dark green Leaves by couples, at the Tops of the Stalks and branches stand (in several places) reddish purple gaping flowers, in shape like those of the Garden kinds, but far less, and without any white color therein, after which come such like heads, like Calves Snouts, as in the oiber, but not half so big, wherein is contained very small and brown Seed.

soft and fix'd kinds, saying, that it spreads abroad a little more than they, and that its flowers are of a pleasant Milk White Color.

X. The eight, or lesser Wild Snap Dragon. The Middle or greater kind we have described at Sect. VII. above: this lesser sort grows lower by one half, yet Bastes out thicker with Branches, having long narrow Leaves not half so great,

Snap Dragon Wild lesser.

flowers small also and whitish, and the Seed small and blacker than the Seed of that. Its Root likewise perishes after Seed time, and the Plant is raised the next year again of the Seed.

XI. The Places. The first four are called the Garden kinds: the latter four, the Field or Wild kinds; altho' they all grow Wild in Spain, Italy, and other hot Regions: but with us they all of them grow only in Gardens, the first four of which are chiefly set by.

XII. The Times. The first four flower for the most part the second year after Sowing, from April, even to July, and the Seed is ripe not long after. The Wild flower also much about the same times, thro' June and July even to the end of August. All these several sorts of this Plant, if they be once Sown in Gardens, they will grow continually there of their own accord, if they be suffer'd to shed their Seed.

XIII. The Qualities, Specification, Virtues and Uses of these Plants are as yet unknown in the Art of Physick: But Matthiolus says, that given (I suppose he means their Juice) mixed with Rose-water, or the Pouder of the Seed, in like manner, they are good against Fits of the Mother. And Apuleius says, that the Distilled Water or Decoction of the Herb and Root in Water, is a speedy remedy against the Rheum or Watering of the Eyes coming of a Hot Cause, by washing them therewith, and bathing the Forehead, Temples and Eye-Brows with the same.

OF SNEES-WORT.

I. THE Names. It is called in Greek, *πρασιν*, in Latine, *Parmica*, *Parmica Sylvestris*, and *Sternutamentoria*: in English, *Snees-wort*.

II. The Kinds. There are several sorts hereof, as, 1. *Parmica agrestis vel sylvestris*, *Sternutamentoria Sylvestris*. Wild or Common Snees-wort. 2. *Parmica Sylvestris flore pleno*. Snees-wort with Double Flowers. 3. *Parmica austriaca Clusij*. Snees-wort of Austria. 4. *Parmica Imperati*, *Parmica minor*. Spanish or Naples Snees-wort.

The Descriptions.

III. The first, or Wild or Common Snees-wort. Its Root is tender, and full of Strings, creeping far about in the Earth; and in no long time takes up much Ground. It springs up for the most part with but one Stalk, which is replenished with many round and brittle Branches, beset with long and narrow Leaves, dented about the Edges like a Saw. At the Tops of the Stalks do grow

Snees-wort Wild Common.

small single flowers, like those of the Wild Daisy. The whole Plant is sharp, biting the Tongue and Mouth. And the smell thereof provokes Sneezing, from whence it took its Name *Sternutamentoria*, or *Snees-wort*.

IV. The second, or *Snees-wort* with double flowers. Its Roots are many long strings, running here and there in the Ground. It has straight and slender Stalks, beset with long and narrow leaves, snipt round about the edges in all respects like to the former single Wild Kind, which grows common with us almost every where: on the Tops of the Stalks grow four, five, or more white flowers, one above another, with a green leaf at the Bottom of the footstalk of every one of them; being small, thick, and very double, with a little yellowishness in the middle of every flower, like both for form and color to the flower of the Double *Violet*, but smaller. This Plant has no smell at all, but is delightful only for the double white flowers.

V. The third, or *Snees-wort* of *Austria*. Its Root is hard and black, with some Fibres adjoining to it, perishing every year. It sends forth many Leaves, lying upon the Ground, being soft and smooth, somewhat long and narrow, green on the upper side, and hoary underneath, of a little sower relish or Taste. From among which rises up an hoary Stalk, about two feet high or better, having divers such like Leaves thereon, but lesser, spreading out into some few slender Branches, with every one for the most part, a small scaly white Sitter head on them; from whence spring forth about twelve or fourteen hard, and small long pointed leaves, as a border or Pale, about a number of small short Thrums in the Middle, almost like, or as if they were made of Parchment; whitish at the first appearing, but afterwards being come to their maturity, of a most fair black bleuish purple color, without any smell to commend it; pleasant only by the Prospect of its form and color, and by its Durability, for being gathered in its perfection, it withers not, or loses its color in a long time, but keeps the same hue and aspect without changing, for many years together, being put into a Paper Book: otherwise being let stand upon the Stalks, they become something brownish, having many small blackish long Seeds, lying among a great deal of White Down.

VI. The fourth, or small Spanish or Naples *Snees-wort*. Its Root is like the former, but smaller, and perishes in the same manner every year. It has such like long and narrow soft hoary Leaves, but not full out so large as the former: the Stalk rises not so high, but is divided into more, and more slender hard Branches: at the Tops whereof stand such like Scaly heads, but not so white or Sitter like, from whence shoot forth such like stiff hard Leaves, as the Border or Pale, but neither so large nor so many, being seldom above 8 or 10: neither are they of so fair a bleuish purple color, but of a more pale dilated color, having many Thrums in the Middle. The Seed which follows is like the last foregoing, but smaller. This Plant being a little handled or rubbed between ones fingers, gives forth a pretty sweet smell, or what is not unpleasant.

VII. This last in Gerard, is thus described. The Root is small, whitish, hard and threddey, perishing when the Seed is ripe; soon springing up again by the fall of the Seed. It rises up with a small, hard, tough, corner'd, whitish

woolly Stalk, divided into many Branches, and those again divided into other branches like those of *Cyanus*, or *Blew bottle*, about two feet high, on which grow long, narrow, whitish Cottony leaves, without order, and of a bitter Taste; whiter below than above, of the color of *Wormwood* leaves, having but one Rib or Sinew, and that in the middle of the leaf, and commonly turn downwards: on the Top of each slender Branch, grows one small Scaly head or knob, like that of *Cyanus*, which brings forth a pale Purple flower, without smell, containing six, seven, eight, or more, small, hard, dry, sharp pointed leaves: in the middle of which grows many Stiff Chives, their Tops being of the Color of the flowers, which flowers fall not away, till the whole Herb perishes, but change into a Rusty color. Among those Chives grow long, flat, blackish Seed, with a little beard at the Top. It remains green all the Winter, and the next Spring sends forth a Stalk as aforesaid. The Herb being touched or rubbed, sends forth a pleasant Aromatick smell.

VIII. The Places. The first grows Wild in dry and barren Pastures and other places: and has been found in the three great Fields next adjoining to *Kentish-Town* near *London*: and in several fields in *Kent* about *Southfleet*. It is also brought into Gardens in many places. The second grows here in Gardens. The third grows, as *Mathiolus* says, in *Italy*; *Clusius* found it in *Austria*; it has been found growing also in *Hungary*, and as *Lobel* says in *France*. The fourth grows in *Spain* and *Naples*, from whence the Seed has been brought to us, these two last grow with us only in Gardens.

IX. The Times. They flower in the end of *June*, and in *July* and *August*, and the Seed is ripe in some little time after, as in *August* or *September*.

X. The Qualities, Specification, Preparations, Virtues and Uses of the first and second Species we have declared at large in Chap. 553. foregoing, under the Title of *Pellitory* of *Spain*, Wild: so that we shall say nothing more of them in this place.

XI. The two latter, *Parkinson* says have not been much used in Physick, but *Clusius* says, that about *Vienna* in *Austria*, the People sell it to the Apothecaries for *Scabious*; and that the Decoction of them, given to Children, is very good to ease them of pains and Torments in the Stomach and Bowels: and some Authors think, that it may have some of the Properties of *Scabious*, or of *Facea* at least, because it so near approaches to them both in its form and Temperature.

CHAP DCXXXVII.

of SOLOMONS--SEAL.

I. THE Names. It is called in Greek, *Πολύγωνον*: in Latine, *Polygonatum* (*à Radicis geniculorum frequentibus nodis*, from the many Nodes or Knots in the Roots;) of some *Scala Celi*, Heavens Ladder, from the form of the Stalks of Leaves, being set one above another: also *Sigillum Solomonis*; in English, *Solomons Seal*,
6 R 2 from

from the White Knobs in some places of the Root, with a flat round Circle, representing a Seal, whence came this Name.

II. The Kinds. Authors have made a dozen several sorts or more, but we shall content our selves, with what grows in Our Own Nation, or in Our West-India Plantations in America. viz.

1. *Polygonatum Vulgare*, by some *Polygonatum latifolium*, by others *majus*; and by many *Sigillum Solomonis*, Our Common Solomon Seal. 2. *Polygonatum Majus flore majore*, *Polygonatum latifolium secundum Clusij*, The Greater flowered, or sweet smelling Solomons Seal. 3. *Polygonatum Virginianum*, Solomons Seal of Virginia. 4. *Polygonatum racemosum Americanum*, Cluster like Solomons Seal. 5. *Polygonatum Racemosum perfoliatum Americanum majus & minus*. Thro-leav'd Solomons Seal of America greater and lesser.

The Descriptions.

III. The first, or Our Common Solomons Seal. The Root is of the thickness of a Mans Finger or Thumb, white and knobbed in some places, with a flat round Circle, representing a Seal, lying along under the upper face of the Ground, and not growing downwards, but with

upon the Green, but more yellowish underneath, with some Ribs running through them. At the foot of every Leaf almost, from the bottom of the Stalk up to the Top, come forth small, long, white, and hollow pendulous flowers, something like the Flowers of Lilly-Convally, but ending in five longer Points, for the most part two together, at the end of a long foot Stalk, and sometimes but one, and sometimes also, two Stalks with Flowers at the foot of a Leaf, which have no smell at all, and stand all on the one side of the Stalk. After they are past, come in their places, small round berries, green at the first, and blackish green, tending to blewness, when they are ripe, in which lie small, white, hard, and stony Seed. Camerarius in his Epitome says, (citing Matthiolus as his Author) that it is sometimes found with red Berries, and also with Purple. These Berries being ripe are of the bigness of Ivy Berries, of a very sweet and pleasant Taste. The Root also is sweet at the first tasting, but afterwards of a bitter Taste with some sharpness.

IV. The second, or greater flower'd, or sweet smelling Solomons Seal. The Root if this is exactly like the former, but larger if it grows in good Ground, otherwise lesser. The Stalks are shorter, not much above a foot high, and somewhat flatter. The Leaves are flatter, and rounder pointed, set on one side of the Leaf, as the

Solomons Seal Common.

many Fibres underneath. It rises up with a round Stalk, about half a yard high, bowing or bending down the Top, set with single leaves one above another, which are something large, and like unto the Leaves of Lilly Convally, and of the same color, viz. with an Eye of blewishness

Solomons Seal greater Flower'd.

the former, but stand close together. The Flowers are larger than the foregoing (but by a fault of the Cutter, in this figure they are made lesser) of a greenish white color, swelling sweet like those of the Hawthorn, arising from the bosoms of the Leaves, upon short foot Stalks, which being past, Seeds or Berries follow, which are first Green, but afterwards black, containing within a small

small Seed, as big as a Vetch or Tare, and as hard as a Stone.

V. The third, or Solomons Seal of Virginia. The Root of this is slender, long and Creeping, like as many others of the Virginia Plants, and not Tuberosus as the former are. It rises up with a Stalk or Stalks, a foot or more high, with Leaves of the same fashion, long, Nervous, very green and shining, standing one above another upon a single upright Stalk, which is sometimes a little branched. These leaves are not of so sad a green as the other, nor discolored underneath, at the very Top of the Stalk come forth the flowers, and many of them grow together, which are whiter and smaller, and nothing so long and Pendulous, ending in small fine pointed Leaves. After which come the Berries, which in this are smaller than any of the former, and of a most Orient Red, or scarlet color (which some by a mistake formerly took for Cherries Berries, but were in truth no such thing, these not being fit to dye withal) which while they are white, and before they are ripe, have six black Strakes on every of them, equally distant, but are quite worn out being ripe; within which are contained, white, hard, stony grains or Seeds, like those of the others.

VI. The fourth, or Cluster-like Solomons-Seal. Its Root is thick, white, Tuberosus, long, and jointed, as it were by distances, with several Fibres thereon. It shoots up a round brownish single Stalk, and sometimes parted or branched, about 2 or 3 feet high, set with many fair, broad Leaves, some ribs being of a reddish, others of a sad green color, harder than others, and compassed about the edges with a rougher and darker Lift. At the Tops of the Branches, grow in open Clusters, many small pale colored Threds, like unto Vine Blossoms, which passing away, there succeed several small Berries, in form almost of a Cluster of Grapes, and each of the largeness of a Juniper Berry, yellowish before they be ripe, and finely spotted with blood speckles, which after they have hung so long to be ripe, wear out, and the whole Berry grows red like a Cherry, whose Pulp or Juice is sweet, and contain within them small white roundish Grains or Seed.

VII. The fifth, or Thro-leaved Solomons Seal of America, the greater kind. Its Root is nothing so thick or white, as the last described, but is fastened by many strings into the Earth. It has a slender smooth Stalk or two, about half a foot high or more, parted about the middle into two branches, and each of them again into others, having fair, broad and long, and very pale green ribbed Leaves, encompassing the Stalk wholly at the bottom; at each of which joints, with the Leaves, and at the Tops, also stand the flowers singly, composed of six long and narrow yellow Leaves hanging downwards, in the middle whereof is a crooked head or horn, compassed with six yellow heads or Chives, when the flower, is past the foot Stalk thereof rises up, bearing that Crooked or horned, three cornered skinny Col on the end, having whitish Seed within it. The lesser sort is in all things and respects like to the greater, but every ways lesser, the Leaves being not only smaller but much narrower also.

VIII. The Places. The first grows Wild frequently in many places of England, as on the North side of Mendip in the Parish of Shepton-Mallet, in Somersetshire; upon a Row Hill by Crayford in Kent, in Odiam Park in Hampshire,

in Bradfords Wood near a Town four Miles from Bath, in Wiltshire; in a Village near Horley, five Miles from Guildford in Surrey; in a Wood by Fishpool-Hill, two Miles from Canterbury; in a Bushy close belonging to the Parsonage of Alderbury near Clarindon, two Miles from Salisbury; and in Chesson-Wood on Chesson-Hill, between Newington and Sittingburn in Kent, as also in several other places. The second grows Wild in Our Gardens; and I found it also growing in Carolina. The other three, grow in several places in America, but with us only in Gardens.

IX. The Times. They all spring up in March, and the first flowers in May; the other American kinds in June and July; the Berries are ripe in September, and continue on the Stalks, till the Frosts come, and then they fall down with the Stalks, which rot and perish with all above Ground; the Root abiding all Winter, and shooting forth a new every year.

X. The Qualities. Solomons Seal is temperate in respect to heat or cold, but dry in the second degree. It is Astringent, and as Galen says, of a mixt property, being partly binding and partly of a sharp and biting quality, with a little bitterness, which properties we perceive not in those which grow in Our Countries.

XI. The Specification. The Root is chiefly used and that principally, of the first kind. It heals Ruptures and broken Bones, stops Fluxes of the Belly, the Reds and Whites in Women, and running of the Reins in Men: as also Vomittings, Bleedings, and defluxions of humors upon any part; and is very available to heal simple Green Wounds, running Sores, and other like Hurts whether outward or inward.

XII. The Preparations. You may have therefrom. 1. A Juice or Essence of the Root and Herb. 2. A Decoction of the Root in Wine or Water. 3. An Infusion of the Root in Wine. 4. A Powder of the Root. 5. An Ointment or Balsam of the Root. 6. A Cataplasim of the Root. 7. An Apoplegmatism of the Root. 8. A Distilled Water. 9. A Spirituous Tincture.

The Virtues.

XIII. The Juice or Essence. A Spoonful of either of them, or something more, taken at a time morning and evening in a Glass of Symplic Red Wine, or in Smiths Forge Water; is said to Cure Ruptures when the Guts fall into the Cods, a Cataplasim of the Root being applied outwardly to the same. They are also available, to cure the over-flowing of the Terms and Whites in Women, and a Gonorrhoea in Men, and incomparably good to knit and conglutinate broken bones inwardly taken: outwardly applied being made into a Cataplasim with Rye or Wheat Meal, They dry up and conglutinate the lips of Green Wounds, and stop the flux of humors upon Ulcers, they being washed and cleansed therewith. Snuff up the Nostrils, they are said to draw flegm out of the head, and to ease the pain thereof.

XIV. The Decoction in Wine or Water. It has all the former Virtues; is available for outward and inward Bruises, Falls or Blows, ease pains, dissolve congealed blood, and take away the black and blew marks made by Contusions, or other hurts. Dose half a Pint.

XV. The

XV. *The Infusion in Wine.* It is made of the Root being Bruised, and steeped all Night in the Wine. It has all the Virtues of the Juice, Essence, and Decoction: taken to a quarter of a Pint or more, morning and night, it sodders and glews together broken Bones very speedily and strongly, tho' the Bones be but slenderly and unhandfomly placed; a Cataplasm of the Juice, or Root, being applied also to the same.

XVI. *The Powder of the Root.* It is given to a Dram or more, morning and evening, in Drink or Broth, against Ruptures, broken Bones, Wounds and Inward Bruises, and being also made into a Cataplasm with the Juice, and outwardly applied to the parts affected.

XVII. *The Ointment or Balsam.* They wonderfully dry, heal and conglutinate simple green Wounds, and Knit, and join together simple fractures of bones, ease pains, and strengthen a weak Back whether in Men or Women.

XVIII. *The Cataplasm of the Root.* It is applied outwardly in simple Contusions or Bruises, Falls, Blows, Ruptures of the Peritonæum, Fractures of the Bones, Dislocations, Destuxions of Humors, and weaknesses in any part. It has been found by late Experience, to be incomparably good to knit and join broken Bones in any part of the Body, and is profitable for those which by any weakness, have their Bones often out of joint, or will not stay long in when they are set; being applied for some considerable time.

XIX. *The Apoplegmatis of the Root.* The simple raw Root being chewed in the Mouth, draws away much Flegm and Viscous Humors from the parts adjacent, and gives ease in the Tooth-ach.

XX. *The Distilled Water of the whole Herb and Root.* It is said to cleanse the Skin from Scurff, Morpew, Tanning, Sunburning, Spots, Freckles, and other Marks and Defecations, leaving the places soft, fresh, and fair, after it has been for some time used; and is used also as a Vehicle to take the other preparations in.

XXI. *The Spirituous Tincture.* It has all the Virtues of the Juice, Essence, Decoction and Infusion, being inwardly taken to a Spoonful at a time in any proper Vehicle, and outwardly applied to the parts affected. It also stops all Fluxes of the Bowels after an admirable manner, chiefly the Bloody Flux.

C H A P. DCXXXVIII.

of SOLDIER - WATER.

I. **T**HE Names. It is called in Greek *Στρατιώτης*, & *Στρατιώτης ὁ ἀνὰ τὸν ὕδωρ*; in Latine, by *Matthiolus*, *Stratiotes aquaticus*, and so also by *Lugdunensis*, it is the *Stratiotes five* *Militaris Arizoides Lobelij*, *Stratiotes potamios* & *Sedum aquatile Dodonæi*; in English *Water-Soldier*, *Fresh Water Soldier*, and *Water House-leek*.

II. *The Kinds.* It is a singlar Plant of the sort; but *Baibinus* accounts it among the sorts of *Aloes*, and calls it, *Aloes palustris*, *Water or Marsh Aloes*.

The Descriptions.

III. *At the bottoms of the Leaves there is a small short head, broadest next unto the Leaves and smallest downwards, from whence proceed several long Strings like small Worms (where-with as Dodonæus says, some Crafty Quack Salvers, putting them into Glasses, with water, to make them shew the greater, make others believe, that they are Worms which came out of the Bodies of their Patients:) these Strings having several Fibres at their Ends, take Root in the*

Water Soldier.

Mud under the Water. From the aforesaid head upwards, spring forth many long narrow Leaves, sharp pointed, and set close together, something like to the Leaves of *Aloes*, for the form: but much less, and sharply toothed about the Edges like it also. From among these Leaves rise up short Stalks, not much higher than the Leaves, and sometimes not so high, bearing one green threeforked head only at the Top, much like a *Lobsters Claw*, which is the husk, out of which comes a white flower, consisting of three Leaves, with several yellowish hairy Threds in the middle.

IV. *Gerard* describes it thus. Instead of Roots there are long Strings round and White, very like to great Harp-strings, or long Worms, which falling down from a short head, (which sends forth the Leaves) go to the bottom of the Water, even to the Mud, and yet are seldom fastened there, from whence come forth also other smaller Strings or threds alope, by which the Plant is Multiplied, after the manner of *Frog-bit*. The Leaves are like those of the *Herb Aloes*, or *sempervivum*, but shorter and lesser, set round about the

the edges with certain stiff and short prickles: among which come forth divers Stalks with cafes or husk very like to Crabs Claws; out of which when they open grow white Flowers, consisting of three Leaves, altogether like those of Frog-bit, having little yellowish Threds in the Middle: The Leaves and Flowers grow upon the Top of the Water.

V. *The Places.* It Grows in Italy, Germany, Flanders, Holland and other Countries plentifully: and in Gerard it is said to be found growing plentifully in the Ditches about Rotsay, a small Village in Holderness in Yorkshire; and one Mr. William Broad found it in the Fens in Lincolnshire.

VI. *The Times.* It Flowers in June and July, and sometimes in August, the Seed ripening in the mean season or not long after.

VII. *The Qualities.* It is cold in the second degree, and dry in the first; but Galen says, it is moist. It is Astringent, Obstructive, Repulsive, and Vulnerary.

VIII. *The Specification.* It stops Fluxes of Blood from the Reins and Womb, abates Inflammations, prevails against Antonies Fire, and cures Wounds, Ulcers, and Fistula's.

IX. *The Preparations.* You may make therefrom, 1. A Juice or Essence from the Leaves. 2. A Decoction of the same. 3. A Powder of the Leaves. 4. A Cataplasim of the Leaves. 5. An Ointment or Balsam. 6. A Distilled Water.

The Virtues.

X. *The Juice or Essence.* Taken to One or Two Spoonfuls or more at a time, in any proper Liquor, as some Sytyck Red Wine, or in Smiths Forge Water, or in its own Distilled Water, it cures Pissing of Blood, as also the Bloody Flux, and the overflowing of the Terms in Women; but Pliny adds, Olibanum in Powder thereto. Bathed upon Antonies Fire, and Inflammations, it cools them, and eases the Pain; and is good to heal simple Wounds, foul running Sores, Ulcers, and Fistula's.

XI. *The Decoction in Wine or Water.* It has all the former Virtues, but may be given in a much larger Dose, as from a quarter of a Pint to half a Pint: If Honey is dissolved in it, it makes a good Gargarism for a Sore Mouth and Throat; and being Bathed very hot upon any Inflammation or painful Tumor, it abates it, and gives ease in the Pain.

XII. *The Powder.* It has the Virtues of the Juice and Decoction; and may be given a dram at a time, morning and evening, for all the purposes aforesaid, in any proper Vehicle, strowed thick upon any foul running Sore or Ulcer, it cleanses, dries up the humors, and induces the healing. *Alpinus* says, it is given every morning fasting, to stop the overflowing of the Courses in Women, as also other Fluxes of Blood, in any part of the Body.

XIII. *The Cataplasim.* It is made of the Bruised Leaves, and is applied by Country people, to heal any simple green Wound, which it is said to do, to admiration. Applied in the Extremity of the Gout, it is a singular thing to ease the Pain, and that in a short time.

XIV. *The Ointment or Balsam.* They are good Vulneraries, repress the flux of humors to the part, ease pain in a Wound, running Sore or Ulcer, cleanse, dry, and heal the disaffected

part, being also washed with the Juice or Decoction.

XV. *The Distilled Water.* It is used as a Vehicle, to take the Juice or Essence in; and mixed with Honey makes a Gargarism for a Sore Mouth and Throat: a little Camphir dissolved and mixed with it, makes a good Ophthalmick, for Sore, Rheumy, and Watering Eyes; and so also it is a very good thing to clear the Skin from any kind of Deformity.

C H A P. DCXXXIX.

of SOPE-WORT,

OR,

BRUISE-WORT.

I. *THE Names.* It is called by some in Greek *Στρυβνιον*; *Struthium* (from its scouring and cleansing quality, but it is not the *Struthium* of *Dioscorides*, *Galen*, *Pliny*, or *Theophrastus*) in Latine, *Saponaria* (from its great scouring faculty) *Viola agrestis Tragi*; *Struthium Fuschij*; and in English, *Sope-wort* or *Bruise-wort*.

II. *The Kinds.* We have but three sorts of it growing with us in England. viz. 1. *Struthium Vulgare*, *Saponaria Vulgaris*; Our Common Sopewort. 2. *Saponaria flore duplici*, Sopewort Double Flowered. 3. *Saponaria Anglica folio convolato*, which Gerard calls *Gentiana Concava*. Hollow Leav'd Sopewort. He plac'd it next to the *Gentians*, thinking it a Species of them; but it is plainly manifest to agree in its form with *Saponaria*, as in its Roots, Leaves and Flowers, and not at all with *Gentian*, but only in its bitterness, which is no distinguishing sign.

The Descriptions.

III. The first, or Our Common Sopewort. Its Root creeps under ground far and near, with many Joins, of a brown color on the outside, and yellowish within, shooting forth in divers places many weak round Stalks, full of joints, set with two Leaves apiece at every one of them, on the contrary side, which are Ribbed something like unto Plantane, and fashioned like the Common field white Campion Leaves, seldom having any Branches from the sides of the Stalks, but set with divers flowers at the Top, standing in long husks like the Wild Campion, made of five Leaves apiece, round at their ends, and a little dented in their middles, of a pale Rose color, almost White, sometimes paler, and sometimes of a deeper color, having a reasonable good smell.

IV. Gerard describes it thus. Its Roots are thick, long, creeping aslope, having certain strings hanging at them, like the Roots of black Hellebor, which if they have once taken good and sure footing in any ground, it is almost impossible to destroy the Plant. The Stalks are slippery, slender, round, jointed, and a foot and a half high or higher: the Leaves are broad, set with Veins, very like broad Leav'd Plantane, but lesser, growing

Sope-wort or Bruise-wort.

growing out of every joint by Couples for the most part, those especially which are nearest the Roots bowing backwards. The Flowers in the Tops of the Stalks, and about the uppermost joints, are many, well smelling, and sometimes of a beautiful red color like a Rose, sometimes of a light Purple or White, which grow out of long Caps, consisting of five Leaves in the middle of which are certain little Threads.

V. The second, or Sopewort Double Flower'd. The Root is like the former, spreading it self within the Ground, and rises up in several distant places like the single. It has many long and slender round Stalks, scarcely able to sustain themselves, or stand upright, being full of joints, and ribbed Leaves at them, every one something like a small Gentian or Plantane Leaf. At the Tops of the Stalks stand many Flowers, consisting of two or three rows of Leaves, of a Whitish or Pale Purple color, and of a strong sweet smell, something like the smell of Jasmine or Jessamy Flowers, standing in long, thick, pale, green husks, which fall away without giving any Seed, as most other double flowers which increase by the Root do.

VI. The third, or Hollow Leav'd Sopewort. This Plant (which is peculiar to our Own Land) has a Root which in its form and manner of running, is very like unto the first described, but much smaller. It sends forth divers weak, round stalks, with fewer joints than in the first kind, and at every one of them One Leaf, seldom more, which either encompasses the Stalk at the bottom (as many of them do) or being

hollow, the whole Leaf like a Pipe or Trunk, encompasses it before it opens it self on the outside, and sometimes it opens not it self at all. These Leaves are Ribbed like the former, somewhat broader and rounder at the ends. The Stalks have no Branches at all, but from some of the upper joints, and at the Tops, grow three or four flowers upon slender Footstalks, in long husks, consisting of five Leaves for the most part, something broader at the ends than the single sort, and uneven, which many times break the husks, in which they stand, either on the one side or the other, and are of a Pale White color tending to a Blush, especially on the sides.

VII. The Places. The first grows Wild in many low and wet grounds in several parts of this Land, and near to Rivers and running Brooks in Sunny places; but is now brought into Gardens for the flower sake, serving chiefly for the decking up of Houses. The second or Double flower'd was brought to us from beyond Sea, and is only Nurst up in Gardens. The third is a Native of England, and has been found growing in a little Grove, called the Spinny near Litchborough in Northamptonshire.

VIII. The Times. They flower in June and July, and so continue all August, and part of September, before they are quite spent.

IX. The Qualities. They are hot and dry in the first degree; Aperitive, Absterive, Diuretick, Emollient and Vulnerary, Stomatick, Hepatick, Nephritic, and Laxative, from their scowring faculty.

X. The Specification. They open obstructions of the Reins and Womb, cleanse the Bowels, and are good against Sand, Gravel and Tartar in the Reins and Bladder: profitable for the healing of Wounds; and is said by some to be a Cure for the Lues Venerea, or French Pox.

XI. The Preparations. You may make thereof, 1. A Juice or Essence. 2. A Decoction of the Leaves according to Septalius. 3. An Ointment or Balsam. 4. A Cataplasim.

The Virtues.

XII. The Juice or Essence. They provoke Urine, and cleanse the Urinary passages from Sand, and Gravel, and Tartarous matter, give ease in the Strangury, loosen the Belly, and are said to be profitable against the Dropsie and the foul Disease. Dose 2 Spoonfuls or more mixt with any proper Vehicle.

XIII. The Decoction of Septalius. Take fresh or green Sopewort 2 handfals: Infuse for a night in a Gallon of Water, the next morning boil them together, and strain out by pressing, the one half of the Water sweeten with Raisins or white Sugar, to be drank as ordinary drink at Meals: the other half is to be reserved to be taken 7 or 8 Ounces at a time every morning fasting whilst in bed, and gently to sweat upon it. To such as are Choleric, it is to be exhibited being made with the addition of a handful of Sow-Thistles, or Navel-wort, and in Womens cases with the farther addition of half a handful of Filipendula. Valet (dixit ille) & pro mulieribus ad menstrua alba absumenda. Septalius says, that one Zopata a Spaniard found out the Virtue of this Plant, since whose time it has been written of by Eustachius Rudius de morbis occultis & venenis,

his Lib. 5. Cap. 18. and by *Cesar Claudinus de ingressu ad infirmos* pag. 411. and pag. 417. but principally by *Ludovicus Septalius Animadversf. Med. lib. 7. Numb. 214.* where Treating of Decoctions in Use against the French Pox, he mentions the singular Effects of this Herb against that foul Disease. His words are these: I must not in this place omit the use of another Alexipharmical Decoction, being very effectual and useful for the poorer sort, namely that which is made of Sopewort, an Herb common, and known to all: Moreover I have sometimes used it with happy success in the most contumacious diseases: but it is of somewhat an ingrateful Taste, and therefore is reserved for the poorer people. This Decoction *Septalius* says, he has used *Sepè ac sæpius*, oftentimes, or over and over again many times.

XIV. The Ointment or Balsam. Being applied they heal simple green Wounds to admiration: and if they be foul, they cleanse them after a singular manner, and then heal them in a short time after.

XV. The Cataplasim of the Green Herb. Country people in divers places, do use to bruise the green Leaves, and apply them to their fingers, hands, legs, or other parts, when they are cut, to heal them again. It hinders Inflammations, and a flux of humors, and speedily induces the Cure.

C H A P. DCXL.

of SORREL Garden and Wild.

I. THE Names. It is called by the Arabians, as *Sarapio*, *Humaath*: in Greek, *ὄζαλις*, and by *Galen*, *ὄζουράνθη*, i. e. *Lapathum acidum* or *Rumex acidus*; in Latine, *Oxalis* from the Greek, and *Acetosa*: in English Sorrel.

II. The Kinds. There are several species of this Plant. 1. *Oxalis fove Acetosa hortensis*, also simply *Acetosa*, Our Common Garden Sorrel. 2. *Acetosa maxima Germanica*. Great German Sorrel. 3. *Oxalis five Acetosa Sativa vel Romana rotundifolia*, Round Leav'd or Roman Sorrel. 4. *Oxalis radice Tuberosa*, Tuberous Rooted Sorrel. 5. *ὄζαλις μικρή*, *Acetosa Sylvestris*, *Acetosella*, *Lapathium acidum*, *Acetosa minor Lanceolata*, Sheeps Sorrel, or Field Sorrel. 6. *Acetosa Cambro-Britannica Montana*, Mountain Sorrel of Wales. 7. *Acetosa Americana*, *Acetosa Vesticaria Americana*, West-India Sorrel, or American Sorrel.

The Descriptions.

III. The first, or Our Common Garden Sorrel. Its Root is smaller than any Dock Root, brown, and full of Strings, abides all Winter without decaying, and has green Leaves all the while, except in the very extremity of Frost and Snow, which many times causes its Leaves to perish. It springs up with tender long green Leaves, fat and full of Juice, broad, and bicorn'd as it were, next unto the Stalk like *Arach*, *Spinage*, or Our English *Mercury*, having a pleasant sharp

sovere Taste. The Stalks are slender, bearing purplish long heads, in which lye three corner'd, shining, brown Seed, like, but lesser than that of Docks.

IV. The second, or Great Getman Sorrel. Its Root and manner of growing is like the former, but the Leaves thereof are much larger, and sometimes a little Curl'd at Edges, the joints of the Stalks are great and Tuberous, sticking out like knots, which being taken from the Stalk, and put into the Ground, will take Root, and bring forth Leaves like the Mother Plant, the Seed, and so all its other parts, are answerable to the proportion of the Leaves.

V. The third, or Round leav'd, or Roman Sorrel. Its Root is small and thredly, creeping about for the most part every where, and shooting up heads of Leaves round about. In the Leaves of this Sorrel the chief difference consists, which are short and almost round in some plants, and in others somewhat round pointed, with Ears or pieces on both sides next the Footstalk, of a paler green color than the former. The Stalks are weaker, not standing upright, but the flowers and Seed differ not from the Common Garden sort. The Taste is of a much more pleasant sharpness than the others, and therefore the more desirable in Sallets and Sawces.

VI. The fourth, or Tuberous Rooted Sorrel. Its Roots are many Tuberous clogs fastned by strings to the lower part of the stem, not much unlike to those of Peony, or *Filipendula*; from the head of the Root the Leaves spring forth, which are in form something like to the Ordinary or Common Garden Sorrel, but larger, sharp pointed, and not so broad next to the Footstalk. The Stalks, Flowers and Seed, are answerable to the Common Kind; but the Leaves grow confusedly upon the Stalk, without any order, not differing much in form, from those of *Patience*, *Garden Dock*, or *Monks Rhubarb*.

VII. The fifth, or Sheeps Sorrel, or Field Sorrel. Its Root is long, branched out and stringy. It does not much differ from the Common Garden Sorrel,

Sorrel, but in its smallness, and length of its Leaves, which are something small, pointed at the farther end, broadest in the middle, with two small ears at the lower end next to the Footstalk, of a pale green color, somewhat whitish, and of

Sorrel Field or Sheep.

a severe taste like the Garden Sorrel, but not full out so acute, but more Styptic or Astringent. In its Stalks, Seed, and form of growing it is much like to the first Garden kind.

VIII. The sixth, or Mountain Sorrel of Wales. Its Root is small and threddy, abiding many years. It grows up with small Stalks, branched forth diversly with round Leaves set thereon, as also growing at their bottoms, every Leaf upon a long Footstalk, in form something like to the Wall Penny-wort, but that they cut in on the lower part, which ends on both sides, almost like to the third Species foregoing. The flowers are whitish, and not red like others, but the husks with Seed which comes afterwards are reddish, and contain brown, shining Triangular Seed, almost in shape like a Tetrahedron, and very like to the Seed of the Common Garden and Field Kinds.

IX. The seventh, or West-Indian, or American Sorrel. Its Root is small and Threddy, perishing for the most part every year. It has slender straked Stalks of about a Foot and a half high, leaning sometimes down to the Ground, and spreading themselves into many Branches, something reddish towards the Tops. The Leaves are smooth and thick, of a reasonable size, something like a Garden Sorrel Leaf, but that the lower points are not so long, but rather short like an Arach Leaf, of a pale green color, and something Mealy whitish, every one, upon a long Footstalk, and of a more sharp severe Taste, than our Sorrel. At the Tops of the Stalks and Branches, the flowers grow in a long Spike, like our Common Sorrel, but greater, and of a greenish red color. After

which come round, yet cornered skinny swollen husks hanging downwards, of a reddish color, striped with redder Veins, very beautiful, in which are contained two, or three Triangular shining Seed.

X. The Places. The first four grow only in Gardens, tho' the first has been said to have been found growing Wild. The fifth grows wild in many of the Meadows of this Kingdom; I have also found it growing Wild in several places in the South Carolina. The sixth grows upon barren Sandy grounds, and has been found growing upon several of the Mountains in Wales. The seventh grows in several parts of America, and our West-India Plantations.

XI. The Times. They Flower and Seed in May and June, much about the time when the common sorts of Docks, Flower and Seed.

XII. The Qualities. Sorrel is Cold in the first degree, and temperate in respect to moisture or dryness. It is Astringent, Alstringent, Stomachic, and a restorer of putrefaction. It is much used in Sawces both for the Well and the Sick, cooling a hot Stomack and Liver, provoking Appetite and refreshing the Spirits when almost spent. It is of a pleasant Acid Taste, and if well Cook't up, gratifies the Stomach Admirably.

XIII. The Specification. It is good against Fevers and Inflammations, Quenches Thirst, stops vomiting, removes Nauseousness and loathing, encreases Appetite, heals foul Ulcers and Cankers in the Mouth and Throat, and is of excellent use against all malign, contagious and pestilential Diseases.

XIV. The Preparations. You may make therefrom, 1. A Juice or Essence. 2. A Decoction. 3. A Conserve. 4. A Syrup. 5. A Cataplasm. 6. A Distilled Water. 7. A Powder of the Seed.

The Virtues.

XV. The Juice or Essence. Given from one Spoonful to three, either alone, or with some proper Vehicle, they cool the heat of Fevers, quench Thirst, and take away the malignity of Infectious and Pestilential Distempers; stop vomiting, given with Syrup of Mint, or mixt with Mint Water; abate the heat and over-boiling of Choler in the Stomach, provoke Appetite, and after a singular manner refresh the Spirits. Mixt with Honey, or Syrup of Mulberries, and a little Styptic Red Wine, they cure Cankers and Ulcers in the Mouth and Throat.

XVI. The Decoction in Water or Wine. It has all the Virtues of the Juice or Essence, but nothing near so powerful, and therefore may be taken to half a pint or more at a time. Mixt with the Honey of Roses, and Wine, it makes a good Gargarism for a sore Mouth or Throat; and it will be so much the more excellent if in every Pint thereof two or three drams of Sal Prunella be dissolved in it, more especially if it proceeds from heat and Inflammation.

XVII. The Conserve. It is cooling, grateful to the Stomach, creates Appetite, stops Vomiting, and applied outwardly, abates the pain and heat of Inflammations; it also stops Bleeding being outwardly applied

XVIII. The

XVIII. *The Syrup.* It is generally made of the Juice, and is effectual in all the cases aforesaid; and is profitable against a hot Catarrh, or flux of Rheum falling upon the Throat, and Lungs, &c. resists putrefaction.

XIX. *The Cataplasim.* It may be made either of the Cold Green Herb, a little bruised: or of the Green Herb, stewed by it self without any addition in a Sawce-pan, or between two Pewter Dishes; it is good against Wounds and Ulcers made by Punctures, Thrusts, Cuts and the like, stops their bleeding, cleanses and heals them speedily. It also eases pains of the Gout, and cools the heat of Inflammations, &c. It is good against frettings and galling of the Skin, Ringworms, Tettars, &c. The Leaves wrapped up in a Colewort Leaf, and so roasted under the Embers, and then applied as a Cataplasim to any hard Apostem, Bitch, Boil, or Plague Sore, it ripens and breaks them, and helps also to disperse Strumous or scrofulous swellings in the Throat and other parts.

XX. *The Distilled Water.* It is good for all the purposes aforesaid, but must be taken in larger quantities, as four or six Ounces at a time, sweetned with the Syrup aforesaid. Take Juice of Sorrel six Ounces: of the Distilled Water two Ounces: Syrup of Sorrel one Ounce and a half, mix them. Of this the Patient may take two or three Spoonfuls now and then, in any hot disease, or burning Fever: it cools Inflammation and heat of the Blood in Agues, resists pestilential diseases, abates the heat and Boiling of Cholera, restores the Crasis of the Blood, revives the fainting Spirits, represses the violence and furious hot fits of Agues, quenches Thirst, provokes Appetite, Kills Worms, and is truly Cordial, expels Gravel and Stone from the Reins and Bladder, and is profitable against the Jaundice.

XXI. *The Pouder of the Seed.* Given to a Dram in any proper Vehicle, it clears the heart, revives the Spirits, Kills Worms in the Body, stops Catarrhs, and the Terms in Women, also the Bloody flux, and all other fluxes of the Bowels, Vomiting, &c. likewise being taken 2 or 3 times a day, it is said to resist the Poison of the Scorpion.

II. *The Kinds.* The chief sorts common with us are, 1. *Oxys Plinij, Alleluja, Lajula, Oxys alba Communis, Trifolium acetosum Vulgare;* Our Common Wood Sorrel. 2. *Oxys flore Luteo Clusij, Oxys lutea corniculata repens Lobelij, Trifolium acetosum corniculatum Bauhini, Oxys Americana, Yellow Flower'd Wood Sorrel.*

The Descriptions.

III. The first, or Our Common Wood Sorrel. Its Roots are nothing but Strings fastned to the end of a small long Piece, all of them being of a yellowish color, not perishing every year, but abiding with some Leaves thereon in the Winter. It grows low upon the Ground without any Stalk, rising from it, having a number of Leaves coming from the Root, which Leaves are made of three parts like a Trefoil, but broad at the ends, and cut or dented in their middle (almost in form of a Heart) of a faint yellowish green color, each one standing on a long Footstalk, which at

Sorrel Wood Common.

their first coming up, are close folded together to the Stalk, but opening themselves afterwards, and are of a pleasing sour relish, more grateful and pleasing than any of the former Sorts, and yielding a juice, which will turn red when it is clarified, and make a most delicate clear Syrup. Among these Leaves rise up divers slender weak Footstalks, not growing higher than them, each one having a Flower at its Top, consisting of five small and pointed Leaves, Star fashion, of a white color in most places, or in some dash'd over with a small show of bluish, and in some (but on the backside only) of some other colors. The flowers being past, there follow small round heads, with small yellowish Seed in them.

IV. Gerard describes it thus. Its Root is very thready, and of a reddish color. It is a kind

CHAP. DCXLI.

OF SORREL WOOD,

OR,

SOUR TREFOIL.

I. *THE Names.* It is called in Greek *Ὠξύς*: and in Latine, *Oxys, Oxys Pliniana Lib.* 27. Cap. 12. *Oxytriphylum Tragi* and *Lacune*, (but *Oxytriphylum*, is a more proper Name for the sharp pointed Trefoil:) *Trifolium acetosum, Paris Cuculi*, (Cuckows meat) also *Alleluja*, (because it was in flower, when in Ancient times, *Alleluja* was wont to be Sung in Church's:) and *Lajula* (a corrupted word from *Juliola*, as in *Calabria* in the Kingdom of Naples it is called:) in English, *Wood Sorrel*, or *Sour Trefoil*.

of three Leav'd grasse, and is a low and humble herb, without Stalk: the Leaves immediately rising from the Root upon short stems: at their first coming forth folded together, but afterwards spreading themselves abroad, of a fair light green color, in number three, like the rest of the Trefoils, but that each Leaf has a deep cleft in the middle. Among these Leaves come up small and weak tender stems, such as the Leaves do grow on, which bear small Starlike flowers of a white color, with some brightness of Carnation dyght over the same. The flower consists of five

Sorrel Wood Yellow Flowered.

small Leaves, after which come little round knaps or husks, full of yellowish Seed. The whole Herb is in Taste like Sorrel, but much sharper and quicker, and makes better Green Sauce than any of the former Sorrels. Johnston in Gerard says, that he had some of these Plants sent him, with very fair red flowers, which were gathered in a Wood of Sir Thomas Walsingham's, called Stockwell Wood, at Chiffel-hurst in Kent, and in a little round Wood thereto adjoining.

V. The second, or Yellow Flower'd Wood Sorrel. Its Root is a bush of Fibres, and abides all Winter without perishing, if it be not too Violent or Cold, the Extremity making them rot and perish, so that then the Plant must be raised from Seed sown again. It shoots forth several slender, weak, reddish Stalks, trailing upon the Ground, yet growing in a heap as it were, the Stalks take Root at the Joints as they lye, spread into many Branches, with many Leaves on them, standing singly one above another, and made of three Leaves, cut in at the ends like

the former, but are much smaller, and of a Paler Green Color: at the Joints with the Leaves come forth three or four small flowers together, at the end of a long Footstalk, yet each separate from the other, consisting of small and Pointed Leaves like the former, but contained in smaller, and longer beads, like Cods or Horns, yet not Crooked but pointed small, which quickly fall away being touched when they are ripe, and spring up again all about where it grew.

VI. The Places. The first grows very plentifully in many places in England, in Woods and by Wood-sides, where it may be moist, and shadowed from the Sun, also in other places not too open to the Sun Beams. The second grows in Spain, Italy and Sicily, but in a vast plenty in almost all our worne out Plantations of Maze, in South Carolina, and other places adjacent thereto, where I have gathered it many times: there is scarcely any Herb which grows in greater plenty in those Countrys than this.

VII. The Times. The first Flowers early in April and May, the other in June, July and August, and so continues in flower, till the Cold of Autumn causes it to perish, the Seed ripening in the mean time.

VIII. The Qualities. These are of the Temperature, and properties of Common Sorrel in the former Chapter; but more Potent to all those purposes, and are special Alexipharmicks or Antidotes against the Plague, and all sorts of Pestilential, Malign, and Burning Fevers.

IX. The Specification. Wood Sorrel resists Vomiting, strengthens the Stomach, hinders putrification of the Blood, quenches Thirst, provokes Appetite, and is effectual against the Plague, Spotted Fever, Calentures, and other like Malign diseases.

X. The Preparations. You may make therefrom, 1. A Juice. 2. A Decoction or rather Infusion. 3. A Syrup. 4. A Conserve. 5. A Cataplasm. 6. A Distilled water.

The Virtues.

XI. The Juice. It has all the before Specified Virtues, cools Inflammations, takes away all preternatural heats, whether in the Stomach, Bowels, or habit of the Body, resists putridity, and is most singularly excellent against any Contagious sickness, or Pestilential Fever. Mixt with a fit quantity of double refined Sugar, it makes most incomparable Green Sauce.

XII. The Decoction or Infusion. They have the Virtues of the Juice, but not so effectual, and may be given half a Pint at a Time: if they are made in Wine (whether White or Red,) they will be so much the more effectual in some cases, more especially where no Fever is present.

XIII. The Syrup. It is effectual in all the Cases aforementioned, does exceedingly cool, and abate the heat of Fevers; and mixed with the Juice, makes an excellent Gargarism for a Sore Mouth and Throat, being Gargled therewith and spit out, and then fresh taken in; it wonderfully helps a stinking foul Canker, or Ulcer in those parts; and is singular good in Wounds made by Cut or Puncture, stopping their bleeding, and causing them speedily to heal.

XIV. The

XIV. *The Conserve.* It is Cordial, refreshing in hot Fevers, stops Vomiting, and strengthens a weak Stomach, and is profitable against Catarrhs or hot defluxions of Rheum upon the Stomach and Lungs.

XV. *The Cataplasm.* It is made either of the whole green herb bruised: or made of the Herb, stewed between two Pewter Dishes, and brought to a Consistence with Crumbs of white Bread. It abates the heat of Inflammations and other hot Tumors, cures simple Contusions, being presently applied, viz. whilst they are recent; applied to simple green Wounds also, it heals them in a short time, by stopping the Hemorrhage and conglutinating their Lips.

XVI. *The Distilled Water.* It has all the Virtues of the Juice and Decoction or Infusion, but very much weaker: It quenches thirst, and cools inward heats of the Stomach, Lungs and Liver, being taken morning, noon, and night, half a Pint at a time, sweetned with the Syrup aforementioned; and so mixed it makes a good Gargarism for Sore and Cankerous Mouths and Throats.

C H A P. DCXLII.

of SOUTHERNWOOD.

I. **THE Names.** It is called in Arabick, *Cuthsum*, *Kesum*, or *Gaisum*: in Greek, *Ἀγροσυον*: in Latine *Abrotonum*, after the Greek, but more usually *Abrotonum* as the Shops call it: and in English, *Southernwood*.

II. **The Kinds.** Authors have a great many Species of this Plant; we shall only Treat of the four following, as being more usual with us. 1. *Abrotonum mas*, *Abrotonum vulgare*, *Abrotonum nigrum Cordi*, Our Common Southernwood. 2. *Abrotonum mas angustifolium Baubini*; *Abrotonum Alagnum Camphoratum quibusdam Incensaria Camerarij*, Great Southernwood. 3. *Abrotonum Fœmina arborescens Dodonæi*; *Abrotonum latifolium arborescens Baubini*, *Asinthium arborescens Gerardi*, *Lobelij*, *Lugdunensis*, and *Tabernamontani*. Tree Southernwood, or Female Southernwood; formerly, and by some Authors *Lavender Cotton* was accounted to be the Female Southernwood, and called *Abrotonum fœmina*, but that is error. 4. *Abrotonum odoratum humile*, *Abrotonum humile* & *dense frutescens Lobelij*; *Abrotonum Tertium Tragi*; *Abrotonum mas angustifolium minus*, Small sweet Southernwood.

The Descriptions.

III. **The first, or Our Common Southernwood.** Its Root grows not very deep, but is Woody with several Strings adjoining to it. It rises up with many weak and Woody Branches bending downwards, if they be not held up, especially while they are small, for the elder Stems are more strong and great, rising in time to be higher than a Man; from which grow out many small and long Branches, on which are set many small, fine and short Leaves, as fine as Fennel, but not so

Southernwood Common Male.

long, of a Grayish or Russet green color, of a strong pleasant smell, and somewhat bitter taste. From the middle almost to the Tops of the upper sprigs, grow small round yellow Flowers, hanging like little Buttons, which never open much, but pass away, and after them come the Seed, which is smaller than that of Wormwood. The Stalks and Branches lose all their Leaves every Year, and shoot forth afresh in the Spring. This is our Common Garden Southernwood; the others being not so usual, and for the most part called by other Names, scarcely being acknowledged to be any Species hereof.

IV. **The second, or Great Southernwood.** The Root is like the first which is woody, and runs under ground in the same manner. This greater kind is altogether like the former, growing as high, or rather higher, and with Leaves like thereunto, but somewhat larger and greener, and of a strong resinous smell, not altogether so pleasant as that, but coming something near to Camphir or Frankincense. The flowers and Seed differ not from the first common, but are like to them in all respects.

V. **The third, or Tree Southernwood, or Female Southernwood.** Its Root is woody, spreading it self out with many Strings and Fibres. It is a rare Plant, grows upright with one stem or stalk, to a Mans height, if the lower small sprigs be cut off from it in the growing, and shoots forth many Branches on all sides, on which grow many leaves, very much cut in, and divided, but are nothing so fine and small as the former; but yet a little quicker, and nearer resembling Wormwood, as it does also in its taste, and more Aromatick than common Southernwood. The flowers stand at the Tops of the Branches, being more plentiful, and larger than

than the former, but yellow like them, after which comes the Seed, which is also somewhat larger. This Plant is more tender than the others, and requires some care to preserve it in Winter, more than those do.

VI. The fourth, or Small sweet Southernwood. Its Root is woody, made of many little strings, and spreads like the others. It shoots up with many small woody Branches, rising seldom above half a yard high, but very thickly spreading into other smaller sprigs, set full of small Leaves, somewhat longer, greater, and greener than the Common. The Tops of the Stalks are replenished with many small round heads, which yield small yellow greenish flowers. The whole Plant, as well Leaves as Flowers and the Sprigs, give a very good and pleasant smell, more than the others do, but a little inclining to the Wormwood scent.

VII. The Place. Theophrastus says, that Southernwood delights to grow in Places open to the Sun. Dioscorides says, it grows in Capadocia and Galatia in Asia, and in Hierapolis a City of Syria. Pliny commends that most which grows in Galatia and Sicily. They are all of them Planted in Gardens with us, and the first grows almost in all Gardens every where. The second grows in Germany, from whence it was brought to us. The third grows in Italy, and other warm and Southern Countries. The fourth is only found in the Gardens of Exact and Curious Herbarists.

VIII. The Times. They most of them flower in July and August, and sometimes in September. When they flower late they seldom bear Seed; and the Seed of the third is seldom seen.

IX. The Qualities. Southernwood is hot and dry in the end of the third degree. It is Aperitive, Attractive, Absterfivè, Dissolvive, Carminative, Anodyne, Diuretick, and Rarefactive; Cephalick, Neurotick, Cardiack, Hysterick, Nephritick, and Alexipharmick.

X. The Specification. It cures Cramps and Convulsions, is good against the Strangury, Ifcuria, Stone and Gravel, provokes the Terms, is an Antidote against Deadly Poison, the biting of Serpents and other Venomous creatures: Cures Agues, Kills Worms in Children, eases the Spleen, is good against Fits, heals Ulcers in the Privities, and draws Splinters and Thorns out of the Flesh.

XI. The Preparations. You may make therefrom, 1. A Liquid Juice. 2. An Essence. 3. A Decoction or Infusion of the Leaves, Tops and Flowers. 4. A Powder of the Herb. 5. A Powder of the Seed, or Seed Bruised. 6. An Oil by Infusion or Decoction. 7. A Balsam. 8. A Cataplasm. 9. The Ashes. 10. A Distilled Water. 11. A Spirit. 12. A Distilled Oil. 13. A Spirituous Tincture. 14. An Acid Tincture. 15. An Oily Tincture.

The Virtues.

XII. The Liquid Juice. It is a counter-poison, or Antidote against all deadly poison, the bitings of Serpents, of the Phalangium or other Venomous Creatures; provokes Urine, and the Terms in Women, facilitates the Birth, and brings away the Afterbirth. Dose one or two Spoonfuls in a Glass of Wine.

XIII. The Essence. It is good against Convulsions, obstructions of the Terms, Strangury, Sand, Gravel and Tartarous matter in the Reins, Ureters and Bladder; and taken to 2 Spoonfuls or more in a Glass of Vinegar, or Brandy, sometime before the coming of the fit of an Ague, it is said to cure it. It has indeed all the Virtues of the Liquid Juice, but more potent, and withal more pleasant to take. It rectifies the Crudity of the Stomach, is good against Surfeits, Obstructions of the Liver and Spleen, and Kills Worms in the Bodies of human kind.

XIV. The Decoction or Infusion of Leaves, Tops, and Flowers in Wine or Water. They have all the Virtues of the Liquid Juice, and Essence, but may be given in a much larger dose, as from a quarter of a Pint to half a Pint, morning, noon, and night. The Plant is a singular good Wound Herb, and therefore these preparations may be of exceeding good use in curing simple Wounds, and other ill conditioned Sores, not easie to be healed.

XV. The Powder of the Herb. It is often given to a half Dram to Kill Worms in Children: and taken in Wine it is a counter-poison, and profitable against the Stinging of Scorpions, and bitings of Spiders, Mad Dogs, or other Venomous Creatures.

XVI. The Powder of the Seed. Infused in warm water and drank, it is said to help such as are Burthen, and are troubled with Cramps, Convulsions, Sciatica, and Strangury, or difficulty of making Water, and provokes the Terms in Women. The same powder taken in Wine has the Virtues of the Juice and Essence, and is an Antidote against Poison, gives ease in the Colick, and other pains of the Stomach and Belly, and Kills Worms in Children. Dose from half a Dram to a Dram in any proper Vehicle, morning and night.

XVII. The Oil by Infusion or Decoction. Anointed on the Back-Bone, before the coming of Ague fits, it is said to take them away, and allays the Inflammations of the Eyes being mixed with the Pulp of a Roasted Quince and applied: anointed also upon other Parts pained from a cold and moist cause, it eases the Pain, and strengthens the part: and is said to Kill Lice also in the Head.

XVIII. The Balsam. It is Absterfivè, Anodyne, drying, healing, and therefore good for the curing of simple Green Wounds, and old running Sores, and putrid Ulcers, more especially if a little powder of Scammony be mixed with it and applied, besides which, it strengthens the parts, and hinders defluxions of humors upon the same.

XIX. The Cataplasm. Made by boiling the Herb with Barly Flower, it is good against Pimples, Pusthes or Wheals, which appear or rise in the face, or other parts of the Body. Made of the Bruised Herb and applied, it draws forth Splinters and Thorns out of the Flesh. The Powder of the Herb, or its Tops and Seed made into a Cataplasm with Pulp of Quinces and Crumbs of White Bread, and applied to Inflammations in any part, it cools, allays, and eases the Pain.

XX. The Ashes. They dry, and heal old Ulcers which are without Inflammation, although they be sharp and bite much; they also heal Sores and Ulcers in the private parts of Man or Woman: mixed with Old Oil Olive, and a little Chymical Oil of Savin, and anointed upon a

Bald

Bald Pate, it is said to cause the Hair to grow again; and some say, that the juice thereof mixed with Oil does the same thing.

XXI. *The Distilled Water.* It is Diuretick, and said to help them much which are troubled with the Stone; and prevails also against Wind, Vapours, and obstructions of Liver, Spleen, Reins, and Womb. It is not so grateful as Wormwood Water, yet strengthens the Stomach, and other *Viscera*.

XXII. *The Spirit.* It comforts and strengthens the Head, Brain, Nerves, Eyes, Stomach, Spleen, Reins, and Womb, is good against Faintings, Swooning, Convulsions, and other distaffections of the *Præcordia*, &c.

XXIII. *The Distilled Oil.* It is prevalent against Palfies, Numbness, Tremblings, Cramps, Convulsions, Pains, Aches, and other like Distempers of the Head, Brain, Nerves, and other parts, being anointed upon the *Spina Dorsi* and places affected: so also taken inwardly from 5 to 10 Drops in any convenient Vehicle. It provokes Urine and the Terms, hastens and facilitates the Birth and After-Birth, eases or prevents, after pains and causes due cleansing, &c.

XXIV. *The Spirituous Tincture.* It has all the Virtues of the Juice, Essence and Infusion, but is much more Stomachical, and may be given from 2 Drams to 4, in any convenient Vehicle.

XXV. *The Acid Tincture.* It is prevalent against the Plague or Pestilence, Spotted Fever, Calenture, and all other Contagious and Infectious Diseases; strengthens the Stomach, and other *Viscera*, causes a good Appetite and Digestion; and after an Emetic, is a singular good thing against Surfeiting and Drunkenness; and has indeed all the other Virtues of the Liquid Juice, Essence, Decoction and Powder. Dose, so many Drops as to make the Vehicle gratefully Acid.

XXVI. *The Oily Tincture.* It is a potent thing against Sand, Gravel, Stones, and Tartarous matter in the Reins, Ureters, and Bladder, gives ease in the Strangury, rakes away Pain, Heat, and Scalding of Urine, is profitable against the Colick, expels Wind, provokes the Terms, hastens and facilitates the Birth, After-Birth, &c. Dose à gut. x. ad xxx. or more, (upon an Exigency) in any proper Liquor.

C H A P. DCXLIII.

of S O W - B R E A D.

I. *THE Names.* It is called in Greek, *Κυκλάμιον*; by the Arabians, *Buchomarian*; in Latine, *Cyclamen*, *Cyclaminos*, *Artanita*, *Paris Porcinus*, *Tuber Terre*, *Terre Rapum*; in English, *Sow-Bread*.

II. *The Kinds.* Authors have given us many Species of this Plant, at least a Dozen several kinds thereof; but we shall chiefly Treat of those which are most common with us, which are the following, viz. 1. *Cyclamen Vulgare folio rotundo*, *Artanita Communis*, Our Common Sow-Bread. 2. *Cyclamen folio hederae autumnale*, *Ivie Leaf'd Sow-Bread*. 3. *Cyclamen Vernum flore purpureo*, Spring Sow-Bread Purple Flower'd.

4. *Cyclamen Vernum flore albo*, Spring Sow-Bread White Flower'd. 5. *Cyclamen Romanum Rotundifolium*, Roman Sow-Bread round Leaf'd. 6. *Cyclamen estivum*, Summer Sow Bread.

The Descriptions.

III. The first, Or Our Common Sowbread, (which is most used in Apothecaries Shops.) Its Root is round and not flat, of a brown color, and not so black on the Outside as some of the others. It has many Leaves spread upon the Ground, rising from certain small long heads, which grow from the greater round Roots, as those of the following do, being in like manner with them folded together, and afterwards spread themselves into round green Leaves something like to the Leaves of *Asarum*, but not shining, without any white spots (for the most part) on the upperside, and red or purplish underneath, and very seldom greener. The flowers stand upon small foot-stalks, and shew themselves open for the most part, before any Leaves do appear, being smaller and shorter than those with the Ivy Leaves next following, and of a pale purple color, yet somewhat deeper, hanging down their heads, and turning up their Leaves again, as all the others do, but more sweet than any of the Autumn flowers. After the flowers are past, come the heads, turning or winding themselves down in like manner as the others do, having such like Seed as they have, but somewhat larger, and more uneven, or at least not so round.

Sowbread Common.

IV. Gerard, describes this first Species after this manner. Its Root is round like a Turnep, black without, and white within, with many small strings annexed thereto. It has many green and round

Leaves, like unto *Aforabacca*, saying that the upper part of the Leaves are sometimes mixed here and there confusedly with white spots, and under the Leaves next the Ground of a purple color. Among which rise up little Stems like unto the Stalks of Violets, bearing at their Tops small purple Flowers, which turn themselves back; and (being full blown) are in form of a Turks Cap or Tulip, having but a small smell, or almost none at all, which being past, little round knots or heads succeed, in which are contained slender brown Seed. These knots are wrapped after a few days in the small Stalks, as thread about a bottom, where they remain so defended upon the Ground, from the Injury of the Winters cold, covered also with the green Leaves afore said, by which means it is kept from the Frost, even from the time of its Seeding (which is in September) until June; at which time the Leaves fade away, the Stalks and Leaves remaining bare and naked; whereby having the power of the Sun upon them, they are the sooner brought to Maturity.

V. The second, or Ivy Leav'd Sow-Bread. Its Root grows to be great, being round and flat, and of a blackish brown color on the outside. It grows in the same manner which the others do; and brings forth flowers with the Leaves sometimes, or most commonly before them: whose flowers are greater than the common round leav'd Sow-Bread, somewhat longer than the Roman or Italian Sowbreads, and of a Paler purple color, almost black, without that Sweet Scent as is in the next following. The greater Leaves hereof,

Sow-Bread Ivy Leav'd.

are more long than round, pointed at the ends, and having also one or two corners on each side, sometimes much spotted on the upper side with white spots and marks, and sometimes but a little or not at all. And so likewise, sometimes

more or less Purple underneath. All the Leaves and Flowers do stand usually every one severally by themselves upon their own slender Footstalks, as most of all the other kinds do. But sometimes it happens that both Leaves and Flowers are found growing from one and the same Stalk, which I take rather to be Accidental than Natural, so to continue. The Seed hereof is like the Seed of the other kinds, which being Sown produces Variety, both in the form of the Leaves, and color and smell of the Flowers, some being paler or deeper, and some more or less sweet than others. The Leaves are some of them more or less corner'd than others.

VI. The third, or Spring Sow-Bread Purple Flower'd. This has a smaller Root than most of the others, yet round and blackish on the outside, as all or most of the rest are. From whence rise up divers round, but pointed Leaves, and something corner'd without, green above, and spotted with white spots Circlewise about the Leaf, and reddish underneath, which at their first coming up, are folded together. From among which come forth the flowers, of a reddish purple color, and very sweet, every one upon a small, long, and slender reddish Footstalk, which hanging down their heads, turn up their Leaves again. After the Flowers are past, the Head or Seed Vessel shrinks down, winding its Footstalk, and Coiling it self like a Cable, which when it touches the Ground, abides there, hid among the Leaves, till it is grown great and ripe; in which are contained a few small round Seeds, which being presently Sown, will grow first into round Roots, and afterwards from them, shoot forth Leaves.

VII. The fourth, or Spring Sow-Bread white Flower'd. This is almost in all respects like the former; the chiefest differences being in its Leaves, which though they are much like the last described, yet are not fully so much corner'd: the flowers are also small, and Snow White, being full out as sweet as the former Purple Flower'd.

VIII. The fifth, or Roman round Leav'd Sow-Bread. Its Root is round and Black, and not so flat as some are, but growing sometimes to be greater than any other kind of Sow-Bread. It has round Leaves, something like unto the first or Common Sow-Bread, but not fully so round pointed at the ends, a little corner'd sometimes also, or as it were indented, with White spots round about the middle of the Leaves, and very conspicuous, which makes it seem the more beautiful. The Flowers come forth in Autumn, and are shorter, and of a deeper purplish red color, than the Ivy Leav'd Sow-Bread, rising up for the most part before the Leaves, or at least with them, and little or nothing sweet. There is sometimes some Variety to be seen both in the Leaves and Flowers of this kind, for that sometimes the Leaves have more corners, and are either more or less spotted with white. The flowers are likewise some larger or lesser, some longer or rounder, and some paler or deeper colored one than another; which happens very likely from the Sowing of the Seed, and quality of the Soil, as is oftentimes also seen in the Ivy Leav'd Sow-Bread. The Seed of this, (as of all the rest) is small and round, contained in such like heads as the former, standing almost like the head of a Snake, which is twined or folded within the Body thereof. This and the other Autumnal kinds, presently after their Sowing in Autumn, shoot forth Leaves, and so abide all the Winter, according to their kind.

IX. The sixth, or Summer Sow-Bread. Its Root is likewise small, black, and round. It has round Leaves like unto the Roman Sow-Bread, but somewhat corner'd, yet with shorter corners than the Ivy Leav'd Sow-Bread; full of white spots on the upper side of the Leaves, and very purple underneath; sometimes they have fewer spots, and little or no Purple underneath. The flowers are small and as Purple, and as sweet as the purple Sow-Bread of the Spring, at Sect. VI. foregoing.

APPENDIX.

There are some few other Species of this Plant, which though not common, yet because they are to be found in the Gardens of some curious Florists, we shall adventure to add in this place.

X. A seventh Species. *Cyclamen verum Creticum flore albo*: Candy Spring Sow-Bread white flower'd. This is almost in all things like to the former white flower'd Spring Sow-Bread at Sect. VII. foregoing, saving that the Leaves grow much larger and longer, with more corners at the Edges, and more eminent spots on them. The flowers are white also but something longer and larger, in which things consist the chief differences.

XI. An eighth Species. *Cyclamen folio hedera autumnale flore albo*: Ivy Leav'd Sow-Bread white flower'd. This has its Leaves rounder, and not so much corner'd as the former Ivy Leav'd, at Sect. V. foregoing. It flowers in Autumn as that does, but its Flowers are wholly White, and has no other notable difference.

XII. A ninth Species. *Cyclamen angustifolium Autumnale*: Long leav'd Sow-Bread. Its Root is Tuberosus and blackish; and by reason its Leaf is longer and narrower than others, it is easily to be distinguished from all other kinds, it being fashioned at its bottom with Points, something like to Aron or Wake Robin Leaves. The flowers are like the other sorts for form, but of a purple color. There is also another of this kind, in all things like this now described, saving that the flowers are white.

XIII. A tenth Species. *Cyclamen Antiochenum Autumnale flore purpureo duplici*: Double flower'd Sow-Bread of Antioch. Its Leaves are something round, like unto the Leaves of the Summer Sow-Bread at Sect. IX. foregoing, but with less notches or corners, and full of white spots upon them. It bears flowers on its Stalks like unto others, saving that they are double; and likewise some Stalks which have two or three of those double flowers on them, which are very large, with ten or twelve Leaves apiece, like unto the flowers of the Spring Purple Sow-Bread, at Sect. VI. above, being of a fair Peach color, and deeper color'd at bottom.

XIV. An eleventh Species. *Cyclamen Antiochenum Autumnale flore simplici*: Single flower'd Sow-Bread of Antioch. This Species is also like the last described in its Roots, Stalks, Leaves, and Flowers, saving that the flowers of this are single. There is also a Spring Sow-Bread of this kind with single flowers, exactly like the eleventh sort, differing from it only in the season or time of flowering.

XV. A twelfth Species. *Cyclamen Antiochenum*

Vernum flore albo duplici. White double flower'd Spring Sow-Bread of Antioch. This is exactly like the tenth Species at Sect. XIII. foregoing, saving that this flowers in the Spring, which flowers are as large and as double as those, and of a pure white color.

XVI. The Places. All or most of these grow in Foreign Countries as Syria, Candia, Greece, Italy, France, and Germany; but with us they are generally Nurth up in Gardens. Gerard says, that he had heard it from Men of good Credit that Sow-Bread (the first common kind) grows upon the Mountains of Wales; on the Hills of Lincolnshire, and in Sommersetshire, upon a Fox Burrough near to a Town called Hardington.

XVII. The Times. The Spring kinds flower in March and April. The Summer kind in May June and July; and the Autumn kinds in the latter part of August and through the whole Month of September, when the Plant is without Leaf, which does afterwards spring up, continuing Green all the Winter, covering and keeping warm the Seed till Midsummer next, at which time it will be ripe.

XVIII. Observat. 1. Of the Spring Cyclamen's, some have round Speckled Leaves, Red Flowers and smell Sweetly; others have long Leaves, and White Flowers; others Yellowish Flowers, and others, whose Leaves are like Violet Leaves, and their Flowers Pale.

XIX. Obs. 2. Of the Autumn Cyclamen's there are some whose Root is round and as broad as the Palm of Ones Hand, bearing a Red Flower with a sweet Smell. There blows one in this Season, called the Constantinople Cyclamen, which the first year bears twenty flowers; the second, fifty; the third, two hundred: but they have no smell. Others of them bear White Flowers: Other Flowers of a Carnation color. The German Cyclamen has a very great Root, and red flowers, but without any smell.

XX. Obs. 3. They are raised by Seeds; but the Spring Cyclamens are to be Sown in the Spring, and those of the Autumn, in the Autumn. They are rarely Sown in Borders or Beds, but in Pots, fill'd with a very light Earth mix'd with Mould, which when it is well prepared, the Seed is to be Sown in it; which ought to be full ripe, viz. when the Leaves are fallen, the Footstalk quite shrunk up, and the head or Case containing the Seed opens of it self.

XXI. Obs. 4. They are to be set in the Ground an inch deep, and two inches distance asunder; and then they are to be exposed to the Sun, and prudently watered; that the heat and humidity which contribute to Vegetation, may cause them the sooner to spring up: other Plants bring forth their Leaves first, but the Cyclamen first forms its Bulbs, and afterwards it Flowers.

XXII. Obs. 5. They are not to be Transplanted till three years after they are Sown; and then they are to be put into Pots fill'd with Substantial Earth, abounding with Nitrous Salt: the larger the Pots are, the more room they will have to grow in, whereby they will the more extend themselves, and produce the greater quantity and the finer flowers.

XXIII. Obs. 6. When you Transplant them, put their Bulbs two Inches deep in the Ground, not deeper, lest they should sink, so as to deprive the Eye of these Plants from the Enjoyment of the Air, whereby hurting their springing, you may for that reason hinder them

from producing their Flowers; they ought also to be kept warm, and Hous'd in Winter, for the Winters Cold is a Mortal Enemy to them in respect both to its Flowers and Leaves.

XXXIV. *Obs.* 7. The Spring *Cyclamen's* ought to dwell in an Airy place, and where the Sun Beams strike directly upon them, because they begin to bring forth Flowers at the end of Winter, when the heat of the Sun is very feeble or small, and has no great power on Vegetables. But the *Autumnal Cyclamen's*, are to plac'd in a little shade, because they blow better, where the Sun Beams are not over piercing, than where they are exposed to greater heat.

XXXV. *Obs.* 8. If the *Cyclamen* thus put into a Pot, shoots out abundance of new Branches, and you find it too close therein, or that it begins to droop a little, you must immediately change the Pot for a larger, full of new Earth, and abounding with Salts, and then it will certainly thrive to your content.

XXXVI. *Obs.* 9. Always be sure also, when you displant your *Cyclamens*, not to take away the Earth which is about their Roots; for if it happens that their Fibrous Roots are put out of order, they will not grow, and their Roots will decay and rot: wherefore the safest way will be, when you remove them, to take up Earth and all.

XXXVII. *Obs.* 10. These Plants, tho' they may be multiplied by Seed; yet they are sooner propagated by Roots slipp'd off. One Stock is enough to produce a great many, because it is a Vivacious Plant.

XXXVIII. *Obs.* 11. They are Multiplied thus. As soon as the Leaves are fallen, pull up your Stocks, and cut them so when you slit them, that there may be one good Bud upon each Stock: then put them into a cool dry place; and let them remain there, till they are dry'd so much, that there will appear a sort of Skin, on the part where you made the Incision.

XXXIX. *Obs.* 12. Then you must cover the cut place with Turpentine, or *Spanish Wax*, and so replant them, taking care to supply them at first with lean Earth; but afterwards, to fill the Pot, with a fatter sort of Earth, not watering them presently, or for some time, viz. till it begins to shoot; and then it is to be lookt to, as before directed.

XXX. *The Qualities.* Authors say that Sow-Bread is hot and dry in the beginning of the third degree. And *Galen* says, it is Attenuating, Aperitive, and Absterive, Attractive, and Digestive, and an opener of the Mouth of the Veins, all which properties are manifest from the particular operations thereof. It is also Catharrick, given by Clyster, or external Application: And tho' it may and has been given inwardly, yet it ought to be given with Caution by reason of its danger.

XXXI. *The Specification.* It opens Obstructions, provokes the Terms, eases the Head-ach, helps the Spleen, gives ease in the Colick and Torments of the Bowels, is profitable against running Sores and Ulcers, and a singular thing against the Yellow Jaundice.

XXXII. *The Preparations.* You may make therefrom, 1. A Liquid Juice. 2. A Decoction. 3. A Gargarism. 4. An Ophthalmick. 5. An Ointick. 6. A Powder of the Root. 7. An Ointment Compound. 8. A Pessary. 9. A Cataplasm. 10. A Distilled Water.

The Virtues.

XXXIII. *The Liquid Juice of the Root or Herb.* It opens the Hemorrhoids or Piles, and strongly moves to Stool, being put up with Wool or some such like, as a suppository. And *Clysterwise Mesues* says, it causes tough Flegm to be avoided. It is also mixed with such Medicines as disperse Swellings, Kernels, and other hard knots, in any part of the Body; and Snuffed up the Nostrils as an Errhine, it purges (as the same *Mesues* says) the Head and Brain from evil humors which offend it; it eases also the Head-ach and the Megrim. *Galen* also farther says, that if the Belly be Bathed with the Juice, it will forcibly move it downwards, and Kill the Child in the Womb.

XXXIV. *The Decoction in Water.* It has the former Virtues, but much weaker; It heals Wounds and running Sores in the head, eases pains in the Bones, and strengthens Limbs out of Joint. It is said also to cure Chilblains and Kibes, and give relief in the Gout.

XXXV. *The Gargarism.* It is made of the Juice, 4. Ounces mixed with Honey an Ounce, by dissolving or melting the Honey in it. It draws Rheum and Humors from the head and parts adjacent, gives ease in the Tooth-ach, and heals Sores in the Mouth and Throat.

XXXVI. *The Ophthalmick.* The Juice mixt with equal parts of Honey, it draws away the offending Humors in the Eyes by the Nostrils being Snufft up, and outwardly applied to them, it removes that disease of the Eyes called the Pin and Web.

XXXVII. *The Ointick.* Let the Root be Beaten with Peachstone Kernels, and Bitter Almonds, and then steeped in a little Brandy for three days, after which press out the Milk or Cream. Two or Three drops of this being put into the Ears which are Deaf, or have a great Noise in them, gives relief after a short time of using it.

XXXVIII. *The Powder of the Root.* The Root either drank in Pouder, or used as a Pessary, provokes the Terms in Women, and is profitable for such as have the Yellow Jaundice, driving the disease forth thro' the Pores of the Skin. It may be given from 2 Scruples to a Dram, or Dram and half, in Mead, or Honied-water, and so it purges downwards tough and gross Flegm; and other sharp Humors. Taken in Wine it is said to be profitable against all sorts of Poison, and the Bittings of Venomous Creatures, being also outwardly applied to the Part, and taken inwardly in White Port Wine, it opens obstructions of the Liver and Spleen, and helps such as are Purly and short winded; but some say it ought to be corrected with Pouder of Mastic or Nutmeg, which hinders its Violence in purging; and thereby many have had help of the hardness and swelling of the Spleen, which could find no Remedy by the use of other things. It gives ease also in the Colick, Belly-Ach, and other Torments of the Bowels.

XXXIX. *The Ointment Compound, called Unguentum de Artanita.* Take Juice of Sow-Bread 3 Pounds: Oil of Orrice 2 Pounds, fresh sweet Butter, Juice of Wild Cucumbers, ana, 1 Pound: Polypodium 6 Ounces: Pulp of Coliquintida 4 Ounces: Euphorbium half an Ounce: The things

to be bruised being bruised; let them be steeped in a Glazed Vessel close shut 8 days; afterwards boil them in a double Vessel, till the Juice is almost consumed, then press out the Liquor, and dissolve therein Yellow Wax five Ounces: and whilst warm mix with it Sagapenum dissolved in Vinegar, Bulls Gall abstraited to the thickness of Honey, ana an Ounce: Then put in these things following in Powder, Scammony, Turbit, Coloquintida, Mezereon Berries or Leaves, Aloes, ana, 7 Drams: Sal Gem half an Ounce: Euphorbium, long Pepper, Myrrh, Ginger, Camomil flowers, ana, 3 Drams; mix and make an Ointment. It purges by anointing it upon the Stomach and Belly, and therefore is good for such as cannot take Purges by the Mouth; and so used it is good against the Dropsy, because it plentifully evacuates the Watery Humor. So anointed it also Kills Worms, and drives them out. Anointed upwards to the Pit of the Stomach it causes Vomiting. It is a strong kind of Purge, and doublets is of extraordinary service in curing such as have the Dropsy, for the reason before Specified.

XL. The Pessary. It is made either of the Green Root, or of the Powder of the Root. It strongly provokes the Terms, endangers miscarriage, facilitates the Birth, brings away the After-Birth, and forces away the Dead Child.

XLI. The Cataplasim. The Root made into a Cataplasim with a little Honey, and applied, draws forth Splinters and Thorns out of the Flesh, and gives ease in the Pains of the Gout.

XLII. The Distilled Water from the Roots. Matthiolus says, that being Snufft up the Nostrils it wonderfully stays their Bleeding; and that if six Ounces of it be drank sweetened with an Ounce of fine Sugar, it will stop any Flux of Blood from the Viscera, as Stomach, Lungs, Liver, &c. after an admirable manner, yea tho' some Vessel or Vein be broken. If two Ounces of the Water is mixed with four Ounces of the Juice, and the Skin be Bathed therewith, and suffer'd to dry in, it cleanses it, takes away Freckles, Pimples, Scurf, Tanning, Sunburning, and all other deformities thereof.

hederaceo Lobelij; Sonchus Levis vulgaris secundus Clusii; Sonchus Sylvaticus quartus Tabernamontani; Seariola Sylvestris Lactuca Species Galeni Angularis; Lactuca Sylvestris flore luteo Gesneri in hortis Germanie; Lactuca Murorum Cesalpini; Sonchus Levis Laciniatus Muralis floribus parvis Bauhini; Our Lesser Common Smooth Sow-Thistle. 3. Sonchus Levis latifolius flore albo Gerardi & Tabernamontani; Sonchus Levis Minor paucioribus Laciniis Bauhini; Broad Leav'd Sow-Thistle with White Flowers. 4. Sonchus Levis Angustifolius Bauhini; Sonchus Levis Matthioli Lobelio; Sonchi genus terra Criffa Gesneri in hortis; Terra Crepola Cesalpini; Crepis Dalechampi Lugdunense; Narrow Leav'd Sow-Thistle. 5. Sonchus arboreseens; Sonchus quintus Clusii; Sonchus Lavior altissimus, Great or Tree Sow-Thistle. 6. Sonchus Dendroides Dalechampi; Sow-Thistle Tree not Branched.

III. Of the second Species, or prickly Sow-Thistle, there are also several sorts of which these are chief, viz. 1. Sonchus major asper non laciniatus, Intybus Sylvestris seu erraticus folijs acutis Tragi; Sonchus asper major Cordi; Sonchus tenerior aculeis asperior, aut horridiuscula Lobelij; Sonchus asperior Dodonai & Lugdunensis; Sonchus asper non laciniatus Bauhini; Sonchus alter in rudibus Cesalpini; The Greater Prickly Sow-Thistle with whole Leaves. 2. Sonchus asper minor non laciniatus, Sonchus asper minor Cordi, The lesser prickly Sow-Thistle. 3. Sonchus asper Laciniatus, Sonchus asper vulgaris; Sonchus asper Euchisii, Gesneri, Matthioli, aliorumque; Cicerbita asperior Ericij Cordi; Sonchus Spinofus Angularis; Andryala major Lugdunensis, Our Common prickly Sow-Thistle. 4. Sonchus asper Laciniatus Creticus Bauhini, Cretick prickly Sow-Thistle.

Sow-Thistle Smooth Common.

CHAP. DCXLIV.

of SOW-THISTLE.

I. THE Names. It is called in Greek Σῶν, (and in Latin, quod Salubrem fundat Succum;) in Latine, Sonchus: and in English, Sow-Thistle.

II. The Kinds. We make but two principal kinds of this Plant, viz. 1. Sonchus Levis, The Smooth Sow-Thistle. 2. Sonchus asper, The Prickly Sow-Thistle. Of the first Species there are several sorts, of which these are chief, viz. 1. Sonchus Levis vulgaris, Lactuca Leporina Apuleij, Brassica Leporina, Lactucella being accounted by some as a kind of Wild Lettice.) Intybus Sylvestris seu erratica Tertii Tragi; Endrya Sylvestris Loniceri; Andryala minor Dalechampi; Sonchus Lenis seu Levis Cordi; Sonchus non asper, Sonchus vulgaris, Sonchus folijs Laciniatis; Our Common Smooth Sow-Thistle. 2. Sonchus Levis alter, Sonchus Levis floribus parvis; Sonchus alter profundis Laciniis Sinuato

*The Descriptions.**I. Of the Smooth Kinds.*

IV. The first, or Our Common Smooth Sow-Thistle. Its Root grows downright, and has many fibres adjoining to it, perishing every year, and raising it self from the Sowing of its own Seed every Spring. It is a plant well known, and rises up with a round hollow Stalk, two, three, and sometime even four feet high, if it grows in good ground, or in Gardens, as usually it does, set with many long and much torn leaves, of a whitish green color, not having that roughness, or those sharp prickles on them, which are in the Prickly Kinds. Its Branches forth towards the Top into divers arms, all which bear pale yellow flowers, which pass away into down, which with the Seed are carried away with the Wind. The whole Plant being cut or broken, gives forth plentifully a White or Milky juice, which is more pleasant than that of the Prickly kinds, and not so bitter.

V. The second, or Our Common lesser Smooth Sow-Thistle. The Root of this is like the former, and it grows much like it, but not so high, nor has it so many Leaves set on its Stalk, but they are long and more torn on the Edges, else not unlike to the foregoing. The many Branches of the Stalk have fewer and smaller leaves. The flowers are like, but much smaller than the first,

Sowthistle Smooth small Common.

of the same pale yellow color in most, which passing into down, with the Seed are blown away with the Wind. And the whole Plant has the same, or like Milky juice with that.

VI. The third, or Broad Leav'd Sow-Thistle with White Flowers. The Roots, Stalks, and

Sow-Thistle broad Leav'd.

Sow-Thistle narrow Leav'd.

Leaves of this are like the last, but the Leaves are something larger and broader, with fewer rents, cuts, or divisions on the Edges; the flowers hereof are like in form, but white, which with the breadth and magnitude of the Leaves, make the principal differences. The Root and other parts of the Plant are Milky; and the leaves are great, smooth, green of color and sharp pointed. And Johnson in Gerard says, that the flowers of this are for the most part yellow like as the former: and indeed all that ever I have yet seen have been of the yellow color; nor ever saw any of them which tended to white; though possible in some other Foreign Countries and Climates they may be really White.

VII. The fourth, or Narrow Leav'd Sow-Thistle. Its Root is long and slender, and gives Milk, as the whole Plant does besides. It has but few Leaves, and those very long and narrow, whose lower parts are narrowest, and have no incisure at all: but from the middle almost forwards, they are broader and have divers Gashes on both sides, greater and deeper, and others smaller, especially towards the ends where they are broadest. The Stalks grow something low, and spread out into but one or two branches, which are set sparingly with Leaves, the uppermost whereof are long, but not divided, or very little, and encompass the Stalk at the Foot, which bear one large yellowish flower, upon a long straked top branch, which being ripe, with the Seed fly away with the Wind.

VIII. The fifth, or Great, or Tree Sow-Thistle. Its Root is great and whitish, accompanied with many great Fibres or strings, not perishing in the Winter but encreasing every year. It grows to the height of a Man, with a strong Stalk,

Sow-Thistle Tree, or Great.

an Inch or more thick in its diameter, smooth straked, and without any prickles; about which grow many Leaves, divided into four, and sometimes into five divisions, placed on each side, one against another, and encompassing it about at the lower end, where they have many small pieces sticking forth beyond the Stalk. The upper Leaves have no divisions, nor prickles on the Backs, but soft ones on the edges upon the dents, and are green on the upper side, and grayish underneath, the whole Plant being full of Milk. The Stalk is parted at the Top into several Branches, bearing at their Tops many flowers set together, as it were in an Umbel, all of them being of an even height, which are small in comparison of the tallness of the Plant, else not much unlike those of the Common Sow-Thistle first described, composed of many yellow Leaves, cut in at the ends, encompassing a middle thrum, which is more yellow; which when they are ripe pass into down with grayish striped Seed therein, both which are carried away with the Wind.

IX. The sixth, or Tree Sow-Thistle not Branched. It has a great blackish Root with several Strings adjoining to it; from whence rise up several strong, tall, round Stalks three or four feet high, without any Branches at all, but thick set with broad Leaves from the Bottom to the Top on both sides, waved or cut in on the edges, smaller at the bottoms, and broader towards the ends, which are pointed. From the Tops of the Stalks, and likewise from the joints with the Leaves, come forth short Footstalks, with 3 or 4 small Lettice, or Sowthistle like flowers on them, which turn into down, which is carried away with the Wind. Gerard says, the Root is great, thick and hard, the Stalk of a Woody substance, the Leaves not unlike Languet but not so rough and more deeply cut in about the Edges: that it has double yellow flowers, and the whole Plant being replenished with a Milky juice, shews it to be of the kind of Herby Sowthistles, otherwise that it might have been referred to the Hawkweeds, whereunto in face and shew it is very like. And Johnson says, the heads and tops of the Stalks are very rough and hairy.

II. Of the Prickly Kinds.

X. The first, or Greater Prickly Sow-Thistle with whole Leaves. Its Root is long, yellowish, and somewhat hard when its grown up with a Stalk, having a number of small Fibres adjoining to it. Its Leaves are something long and broad, of a whitish green color, unevenly dented, but not gash or torn on the edges, and every dent set with a sharp prickle, somewhat hard, and sometimes prickly also along the middle rib, on the under side, yielding a more bitter Milky juice in every part, when cut or broken, than those of the smooth kind. The Stalk is hollow, somewhat tender, and as it were winged, with a Filw running upon it, rough and sharp, set with such like leaves, as grow below, diversely branched, with small pale flowers growing at their Tops, which turn into Down and are blown away with the Wind.

XI. The second, or Lesser Prickly Sow-Thistle. This is in all things like the former, but lesser in every part, having a round Stalk, seldom above-

above a Foot high, somewhat firmer, and not so tender, with smaller leaves, but as sharp and prickly as the former, which are for the most part whole, and not rent or divided.

XII. The third, or Our Common Prickly Sow-Thistle. Its Root is like to the others. Its Leaves are very much cut or torn on the Edges into three or four parts, much separate asunder one from another, and smaller pieces of Leaves set between them, of a whitish green color like the former, and having prickles on the dented Edges likewise. The Stalk grows very high sometimes, also rough and prickly, with such leaves thereon, as are below; branched at the Top, on which grow such like pale yellow flowers turning into down.

XIII. The fourth, or Cretick Prickly Sow-Thistle. Its first Leaves are little or nothing divided on the edges, of about an hand breadth long or more, but those which rise up with the Stalk, are very much torn in, into great and deep gashes, set with some prickles likewise. The Stalk is rough, striated and hollow, half a yard high, branched from the middle upwards, with such like leaves, set at the joints, but smaller. At the Tops stand large yellow Flowers, in rough green husks upon long Footstalks, which convert into down as the other do.

XIV. The Places. The first four grow in Gardens and Manured Grounds, as also in Fallow Lands and Fields, and sometimes by Old Walks and path sides of Fields, and High ways. The fifth and sixth, grow among Willows and Reed, and sometimes by Old Walls, and Places of Rubbish, not often frequented, and many times in our Gardens. The Prickly Sow-Thistle grow in unmanured as well as in manured Soils, also in Pastures, Meadows, Woods, Ditch sides, and moist Grounds, in Orchards also and Gardens, where the Leaves are usually lesser, and lesser divided, than in the rough and unmanured Grounds. The last grows naturally in Candy, and as I am informed has also been found growing in England, in several places.

XV. The Times. The first four Smooth ones flower quickly after they are sprung up, for it is late before they rise out of the Ground, and continue flowering till August. The Tree or Great Sow-Thistles flower in July and August. The Prickly kinds flower and shed their Seed from the middle of June all the Summer long, and sometimes even to the end of August.

XVI. The Qualities. They are cold and dry in the first degree, Anodyn, Deobstructive, and Diuretick, Pulmonick, Stomack, Nephritick and Uterine.

XVII. The Specification. They cure Nauseousness at Stomach, and want of Appetite, Obstructions of the Lungs, shortness of Breath, and difficulty of breathing, help a Stinking Breath, provoke Urine, and are profitable against Stone, Gravel, Sand, or Tartarous matter in the Reins, Ureters and Bladder, causing the Strangury; facilitate the Birth, and cause speedy and easie Delivery to Women in Travel, ease pain in the Ears, help the Hemorrhoids or Piles, take away Warts, and by a Cosmetick property cleanse the Skin from most defecations usually attending it.

XVIII. The Preparations. You may make therefrom. 1. A Liquid Juice or Essence. 2. A Decolion of the Herb in Wine or Water. 3. An Ointment. 4. A Cataplasm. 5. A Distilled Water.

The Virtues.

XIX. The Juice or Essence. The Milk or Juice taken from the Roots or Stalks, &c. helps such as are short Winded, and have a Wheezing withall. Erasistratus (as Pliny says) did therewith cause the Stone and Gravel to be voided by Urine, and that the eating of the Herb is profitable against a Stinking Breath. The Juice taken to the quantity of three Spoonfuls in a Glass of White Wine warmed (putting a little Oil Olive thereto) causes speedy and easie delivery to Women in Labor, and will make them to Walk presently after. The said Juice taken in Water drink, or White Port Wine helps the Strangury, or Pissing by drops, and eases the pain in making Water.

XX. The Decolion in Wine or Water. It has the Virtues of the Juice or Essence, but not altogether so powerful, and therefore may be taken to half a Pint at a time, given to Nurses it causes them to have abundance of Milk, prevents their Milk curdling in their Breasts, and makes their Children healthy and well colored in the Face.

XXI. The Ointment. It is made of the Juice mixt with a quarter part of Oil of bitter Almonds beaten together, and heat in the Peel or Shell of a Pomegranate. This being dropt into the Ears, is said to be a sure Remedy for Deafness, Noise, Ringing, and other Diseases of the Ears.

XXII. The Cataplasm of the Herb &c. The Herb bruised and bound upon Warts, is said quickly to take them away; and applied, (or the Juice of the Herb) to hot Inflammations of the Eyes, or other parts, as also to Pustules, Wheals, and other eruptions of the Skin, proceeding from heat, as also in the heat and pricking or Itching of the Hemorrhoids or Piles, and heat and sharpness of Humors happening in the Secret parts of Man or Woman, it gives ease in all these cases, allays the heat or Inflammation, alleviates the pain, dissolves the Tumor, and prevents farther mischief.

XXIII. The Distilled Water. It is not only effectual for all the Diseases aforesaid, to be taken inwardly a quarter of a Pint or more at a time, dulcified with a little white Sugar; but it is that which the most Nice Stomach will not refuse. Outwardly applied with Cloths or Sponge; wetted or dipt therein, it cools Inflammations, and abates the fiery heat of an Erysipelas or Anthones Fire. And it is said to be wonderfully good for Women to Wash their Faces and Skins with, because it clears them of any defecation or defilement, and adds a Lustre or Beauty thereto.

C H A P DCXLV.

Of S P E A R -- W O R T :

O R, B A N E -- W O R T.

I. THE Names. It has no Greek Name that we know of: but it is called in Latine, *Flammula* and *Ranunculus Flammeus*: in English, *Spearwort*, and *Banewort*, because it is said to

rot

not, or exulcerate the Entrails of Sheep if they eat it, and kill them.

II. *The Kinds.* There are various sorts hereof, as, 1. *Flammula major*, The Greater Spearwort. 2. *Flammula minor*, The lesser or Our Common Spearwort. 3. *Flammula serrata*, Saw-like Spearwort. 4. *Flammula Maritima*, Marsh-Spearwort. 5. *Flammula palustris rotundifolia*, *Scelerata Apuleij*, round leav'd Marsh Spearwort. This some will have to be the true *Apium risus*, or *Apium Sardonium*, whilst others are of another Opinion, taking that to be a kind of *Pulsatilla* or *Pasque-flower*.

The Descriptions.

III. The first, or Greater Spearwort. It has a long jointed Root, stored with many blackish Fibres, from whence rise up a thick jointed smooth Stalk, two feet high, furnished with large and long shining and smooth Leaves, thinner than those in the next; some of them, being more than half a foot long, and two or three Inches broad, but smaller up towards the top, where stand a few pale yellow Crow-foot like flowers, but larger than in the others.

IV. This Plant Gerard describes thus. Its Root is compact of divers bulbs, or long clogs mixed with an infinite number of hairy Threads. It has an hollow Stalk full of Knees or Joints,

Spearwort Greater.

on which do grow long Leaves a little hairy, not unlike those of the Willow, of a shining green color. The flowers are very large, and grow at the Tops of the Stalks, consisting of five Leaves, of a fair yellow color, very like to the Field Gold Cup, or Wild Crowfoot. After which come

round knobs or Seed Vessels, in which the Seed is contained.

V. The second, or Lesser, which is Our Common Spearwort. Its Root consists of an infinite number of Strings, but in its Stalks, Leaves, and Flowers it is much like the former, saving that it is altogether lesser. Its Root is nothing but

Spearwort Common or less.

Spearwort Sawlike.

a bush of Fibres or Threads, which grow and run deep into the Mud. It grows up with a greater store of sapry green stalks, with thicker, narrower, and sharper pointed Leaves thereon, and a greater store of pale yellow flowers, like to those of Crowfoot; and the Vessels, Knobs or Seed, are also like to those of the Crowfoot.

VI. The third, or Sawlike Spear-wort. Its Root consists of a great number of hairy Strings. It is almost like the last, saving that this is oftentimes found, having the Leaves dented about the Edges, in more plenty than in the other, because both of them are often seen, the plain with some dented Leaves, and the dented with some plain Leaves among them. Its Stalk or Stalks, are thick, fat, and hollow, dividing themselves into divers Branches, on which are set sometimes by Couples two long Leaves sharp pointed, and cut in about the Edges like the Teeth of a Saw. The flowers grow at the Tops of the Branches of a yellow color, in form like those of the field Crowfoot.

VII. The fourth, or Marsh Spearwort. Its Root is like the former; and it has such like long Leaves as the lesser Spearwort has at Sect. V. above: which grow upon long Footstalks, but lesser and narrower by much. The Stalk is bare without Leaves, saving that at the Top where the flowers break forth, it has no small long Leaves. The flowers are smaller than those of the common small sort, but purely white, the Knobs and Seed being also alike. There is another sort of this kind, which we have had from Bayon in the Bay of Biscay, which grows in their Marshes near the Sea Coast; whose Roots are like the former, Stalk Branched, Leaves long and narrow, and sharp pointed at the ends, bearing larger yellow flowers than the former.

VIII. The fifth, or round Leaf'd Marsh Spearwort. Its Root is a bush of small white strings growing in the Waterish Mire or Mud. From which shoots forth a Stalk round and hollow, about half a yard high, spreading it self forth into several Branches, the lower Leaves of which are rounder than those above, and are divided much like to those of Doves Foot, or Cut Mallova, but something greater, of a bright shining color. These Leaves are divided some into 3 parts, which are the first and largest, and others which are higher on the Stalk, into five divisions, and each of them dented about the edges, somewhat like unto Coriander Leaves, which are smooth, and of a paler green color. Those which are yet higher on the Stalks and Branches, are still more and more divided, and some of the highest, have no division or Dent in them at all. At the Tops of the Stalk and Branches stand small yellow flowers, like unto those of Water Crowfoot (but Cordus says that he has observ'd some to bear Purplish Flowers:) after which come small long round heads, in which many Crooked Seeds are set together, as in the other sorts is to be seen.

IX. The Places. They all grow in Moorish and Wet Grounds, and sometimes by standing Waters, Ponds and Ditch sides, almost every where. The first is more scarce to be met withall, but the two next are plentifully enough in many parts of England. The two last are not so common, but are also to be found in Marsh and Wet places, in several parts of this Land.

X. The Times. They flower in May, June, and July, and give their Seed in June, July and August, or soon after.

XI. The Qualities. It is hot and dry in the fourth degree; raises Blisters, and being taken inwardly kills without Remedy. It opens Apoplems, is profitable against Rooted and Putrid Ulcers, drawing out their Superfluous moisture. It is said to be good against the Palsy, and help Quartans, as Paracelsus, Dodonaus and others say. And the last or round Leaf'd sort is as sharp and virulent, as any of the other kinds. They are in Faculties and Virtues like to the Water, Fiell, and other Crowfeet, whose Specification, Preparations, and Medical Uses, see in Chap. 176. Sect. XXV. ad XXXIV. foregoing of this Book.

C H A P DCXLVI.

Of SPEED-WELL:

OR,

PAULSBETONY.

I. **THE Names.** It has no Arabick nor Greek Names that I know of: but it is called in Latine, *Veronica*, *Veronica Pauli*, *Veronica Mas*: in English, *Speedwell*, or *Pauls Betony*.

II. **The Kinds.** Authors make two kinds hereof, viz. *Mas* & *Femina*. The *Mas* or Male kind is called *Speedwell Pauls Betony*, and by Dodonaus, *Betonica Pauli Aegineta*: of which in this Chapter. The *Femina*, or Female kind is called *Fluellin* and *Elatine*, of which we have already Treated in Chap. 295. foregoing of this Book, this being another Herb, of a differing form (as Parkinson says) from *Speedwell*.

III. **The Kinds of Speedwell.** Authors make at least half a Score Species thereof, but most of them growing on the Alps, and in Austria, Mount Baldus, Hungary, Styria and other Forreign places far distant from us, I shall overpass them, and only Treat of such as grow in England, which are the two following, viz. 1. *Veronica*, *Veronica Vulgaris* *Veronica Mas*, *Veronica Mas Vulgaris* *Veronica Pauli*, *Betonica Pauli*, *Tenerium Tragi*, Our Common *Speedwell*. 2. *Veronica minor*, *Veronica pratensis minor*, *Veronica minima*, Our small Meadow *Speedwell*.

The Descriptions.

IV. The first, or Our Common *Speedwell*. It has a Root running under Ground, and consisting of many Fibres. It rises up with divers soft Leaves, of an hoary green color, a little dented about the Edges, and somewhat hairy also, set by couples at the joints of the hairy brownish Stalks, which lean down to the Ground, never standing upright, but shooting forth Roots as they lye upon the Ground at divers joints. The Flowers grow one above another at the Tops, being of a blewish purple color, and sometimes of a white color; after which come small flat husks in which is contained small blackish Seed.

V. The second, or Our small Meadow *Speedwell*. Its Root is Woody, creeps with small Fibres

or

or Strings, in the same manner as the former. It has many Leaves, smaller, smoother, and rounder than that, growing by Couples on the divers spreading Stalks, and at the Top, several

Speedwell Meadow Small.

small blew flowers, succeeded by very small brownish Seed, in small Seed Vessels. Gerard says at the Tips of the Stalks or Branches come forth slender Spikes, closely thrust together, and full of blewish flowers, which are succeeded by many horned Seed Vessels.

VI. The Places. The first grows almost in all parts of England upon dry Banks and Wood sides, but more especially upon other waste Sandy Grounds: in Borders of Fields, in Woods and on Grassy Mole Hills, almost every where. The second is more scarce, but has been found in a close by *Burns* near London, and in several other Places: I have formerly found it also in some Meadow Grounds near *Lyn Regis* in Norfolk.

VII. The Times. They flower all *June* and *July*, and sometimes in *August*, and their Seed is ripe in *July*, *August* and *September*.

VIII. The Qualities. Speedwell is temperate in respect to heat or coldness, dryness, or moisture; but is said to be a little inclining to dryness: it is Aperitive, Abstersive, Cosmectick, Diuretick, Vulnerary, Pectoral, Stomatick, Nephritick, Sudorifick and Alexipharmick.

IX. The Specification. It prevails against the Scurvy and all foulness and Corruption of the Blood and humors, opens Obstructions of the Stomach, Lungs, Liver, and Reins, prevails against old Coughs, Ulcers, and Inflammations of the Lungs, and other Diseases of those parts; is an excellent Antidote against the Measles, Small Pox, Purples, all Malign, Spotted and Pestilential Fevers, and the very Plague or Pestilence it self; it also prevails against fretting Old Sores, consuming or eating Ulcers, spreading Ringworms and Tettars, malign herpes, and other like distempers of the External parts.

X. The Preparations. You may make therefrom, 1. A Liquid Juice. 2. An Essence. 3. A Decoction in Wine or Water. 4. A Powder of the Herb and Flowers. 5. A Cosmectick. 6. A Balsam or Ointment. 7. A Cataplasim. 8. A Spirituous Tincture. 9. An Acid Tincture. 10. An Oily Tincture. 11. A Distilled Water. 12. A Spirit.

The Virtues.

XI. The Liquid Juice. Drank to the quantity of four Spoonfuls morning, noon and night,

either alone, or mixt with its distilled water, it is good to cure the Leprosy. It is reported that a French King troubled with the Leprosy, was cured of it by the use of this Herb, being advised thereto by one of his Huntsmen. It wonderfully helps the Memory, and all Giddiness or Swimming of the head, and eases the Head-ach. It is said also to make Women Fruitful which are Barren, and cleanses the Blood from impurities: taken with a half part of Honey dissolved in it, it is good for all manner of Coughs, Catarrhs, and diseases of the Breft and Lungs. This thing has been proved by Shepherds, who give this Herb with a little Salt, to their Sheep which are troubled with the Cough. It opens obstructions of the Liver, and Spleen, and prevails against the Yellow Jaundice, being taken for some time together; and a Cataplasim of the Herb with Vinegar applied to the Region of the Spleen outwardly. It cures Ulcers of the Reins, Bladder, and Womb, or any other inward Wound or Ulcer, provokes Urine, and help such as are troubled with the Stone. *Paulus Aegineta* says, it is of good use for diseases of the Back and Reins. It is of good use to heal all simple Green Wounds, at first intention, and is no less effectual against spreading Tettars, Foul, Old, Fretting, and Kunning Sores and Ulcers which have been of long continuance and are hard to be cured. It stops the bleeding of Wounds, and all other Fluxes of the Blood in any part, and dissolves Tumors or swellings, chiefly those in the Neck, &c.

XII. The Essence. It has all the former Virtues, but much stronger, and may be daily given as the former, from two to three Spoonfuls in any convenient Vehicle.

XIII. The Decoction in Wine or Water. It has all the Virtues of the Juice and Essence, but is much weaker, and therefore may be given from four to eight ounces at a time; it is truly an excellent Vulnerary.

XIV. The Powder of the Herb and Flowers. It has the Virtues of the Juice and Essence, but acts not with that speed and facility, because it is first to be digested in the Stomach. It is a singular thing against the Plague, and all Pestilential Fevers and Infectious Diseases, to defend the heart and expel their Poison and Malignity, to corroborate the heart and Stomach, and preserve them from Noisom and Infectious Vapors, being daily given morning and night a Dram or two at a time either alone, or mixt with a Dram or two of *Venice Treacle* or *Mithridate*, in a small draught of Wine, and so laid down to sweat upon it.

XV. The Cosmectick. It is made of the Depurated Juice mixed with an equal quantity of the Distilled Water. It clears the Skin from yellowness, Sun-burning, Tanning, and other discolorings thereof. And if White Vitriol 2 or 4 Drams to a quart of the mixture be dissolved in it, it is admirably good against Scabs, Itch, Scurf, Morpew, Tettars, Ring-worms, and all other defecations of the Skin.

XVI. The Balsam or Ointment. The Juice or Essence being daily taken inwardly, and either of these used outwardly, they heal all simple Green Wounds, many times at the first Intention, and digest, cleanse, incarnate, and heal all Putrid Ulcers, and other running Sores in what part of the Body soever.

XVII. The Cataplasim. It is made of the

Green Herb, and is of singular good use to heal all simple Green Wounds, in what part of the Body soever, to take away hot and sharp humors, disperse Contusions, &c.

XVIII. *The Spirituous Tincture.* It is good against Faintings, Swoonings, indigestion of the Stomach, Sickneſs at heart, and other indispositions of the *Viscera*, and has all the other Virtues of the Liquid Juice or Essence. Dose 2 Drams to 4 in a Glass of Wine, morning and night, or at time of the *Deliquium*.

XIX. *The Acid Tincture.* It is an incomparable thing against the Plague or Pestilence, and all Ptilential or Infectious Diseases, as Measles, small Pox, Calenture, Purples, Spotted Fever, and the like, it strengthens and fortifies the Stomach, resists putridity of the Blood and Juices, causes a good Appetite and strong digestion. Dose so many drops as may give a Glass of Wine, or other Vehicle, a pleasing Acidity.

XX. *The Oily Tincture.* It is a singular thing to open Obstructions and cleanse the Reins, Ureters and Bladder, of small Stones, Gravel, Sand, and Tartarous matter lodged in those parts, to give ease in the Strangury, and help pains and weakness of the Back, &c. Dose a gut. xvi. ad xxx. in any fit Vehicle.

XXI. *The Distilled Water, simple or distilled from Wine.* It has the Virtues of the Juice, but in a much inferior degree, taken inwardly sweetened with Honey, or Sugar Candy, it is good against Coughs, Colds, Consumptions, and other Diseases of the Lungs.

XXII. *The Spirit.* It is Stomack, Cordial and Alexipharmick, good against Faintings, Swoonings, Palpitation of the heart, Sickneſs at Stomach, Colick, and other inward pains of the Bowels. Dose from 2 Drams to 4, in a Glass of Wine.

C H A P. DCXLVII.

Of SPIKNARD European.

I. *THE Names.* It is called Greek *Νάρδος* *κρητικὴ*; in Latine, *Nardus Celtica*, *Nardus Spuria*, and *Pseudonardus*; in English, *Celtick*, or *European Spiknard*.

II. *The Kinds.* Authors have given us almost half a Score Sorts, of this Plant: we shall only describe those which are most common, and such as are to be had with us: which are, 1. *Νάρδος κρητικὴ*, *Nardus Celtica Dioscoridis*, *Spica Celtica*, *Nardum Gallicum Casalpini*, Mountain or Celtick Spiknard. 2. *Νάρδος ὄρενῆς*; *Nardus Montana*, *Nardus Celtica Clusij*, *Spica Celtica Matthioli*, *Nardus Celtica altera*. The other Celtick Spiknard. 3. *Nardus Montana Tuberosa*, Tuberous Mountain Spiknard. 4. *Nardus Spuria Narbonensis*, *Nardus Gallica*, *Nardus Spuria Gallica*, *Nardus Gangitis* (from the Town *Ganges* near which it grows in France) *Baltard French Spiknard*.

The Descriptions.

III. The first, or Mountain or Celtick Spiknard. It creeps upon the Ground under the loose Leaves

and Moss, with small, long, and hard slender Roots, (which ought to be so called rather than Stalks) in which consists the whole Virtue and Efficacy of the Plant, and are only used (by the best Apothecaries) in Mithridate, and no part of the Plant else. These Roots are covered with many short, small, dry Leaves like Scales, and send forth in divers places as they creep and spread, here and there, small blackish Fibres into the Earth, whereby it is nourished. At the head or heads of which come forth several small buttons, or heads, from whence spring many small, narrow, and somewhat thick green leaves, not divided or dented at all, which are smallest at the bottom and broad towards the end, and change yellow in the end of Summer or beginning of Autumn. From among these Leaves rise up sometimes more, and sometimes but one slender stalk, without any Leaves thereon; at the Top whereof stand many small whitish Flowers, like unto the smaller sorts of *Valerian*, every one on a slender Footstalk, which afterwards yield small Seed like to them also. The whole Plant is sweet and Aromatic, more than the *Indian Spiknard*, better also, and sharper in Taste.

Spiknard Celtick.

IV. The second, or other Celtick Spiknard. This in its Roots, Fibres, Leaves, Stalk, Flowers, and Smell, differs nothing from that first described, but in its Stalk of Flowers, which in this is branched towards the Top, bearing three or four Flowers together in a Tuft, at the end of every small branch.

V. The third, or Tuberous Mountain Spiknard. Its Root is Tuberous or Knotted both above and below, and round about it, with some Fibres shooting from them, by which it is increased, and smells very like the Root of the *Garden Valerian* or *Scitwall*, yet not altogether so strong being green, as when it is dry. This kind of Spiknard or *Valerian* (call it which you will) has its first Leaves lying on the Ground, without any division in them at all, being smooth and of a dark green color, which so abide all the Winter, but those which spring up afterwards upon the Stalk when it runs up to flower, are cut in on the Edges, like unto the jagged Leaves of the great *Garden Valerian*, and so the elder

elder they grow, the more cut and jagged they are. The Stalk and flowers are very like the Stalk with Flowers of the Garden Valerian (or as Gerard says like those of the Wild Valerian, in shape and color, growing in an Umbel or Tuft:) they are of a dark or deep red color, and a greater store of them thrust together; the Seed also not being unlike to that of the Valerian.

VI. The fourth, or Bastard French Spiknard. This Plant grows in form, (in all its parts almost) like to the true Indian Spiknard. It has a few small hard Fibres, which thrust themselves into the Ground, from which spring forth several hairy round spiky beads or beards, of the bigness of ones finger, and of an hand breadth high, of a pale brown color, which are not pointed at the Tops, but flat, or blunt, through each of these beads, even from the lowest part next the Root, which shoot forth divers long, rough, green Rushes, scarcely a foot

French Bastard Spiknard.

high, many of them growing close one to another, so that they make the form or shew as it were but of one Plant, which are likewise said to be altogether without smell, except those hairy spiky beads or Beards, which being larger than the Indian kind, do smell something like to the Moss growing upon Oak Trees, or that other which grows upon the Ground. These beads being half way in the Ground, do send forth each of them in the middle of those Rigid Rushes, a tall slender and smooth Stalk, rising about a Cubit higher than the Rushes, from the middle whereof up to their Tops, on each side, come forth many small, Green Cods, pointed at the ends, standing in Caps, like to those of Cranes Bill. The whole form hereof does so nearly resemble the true Indian Spiknard, as Pena, and others have observed, that among a number of bundles

of Indian Spiknard, they have found some which had the parts of Fibres, Heads, Rushes, and Leaves distinctly to be seen, as this is here described, which makes it out of doubt, that this French kind, is a Bastard Species of the Indian.

VII. The Places. The three first are found upon the Celtick Mountains and Alps, as also in Liguria, as Pena and others say. The fourth is found in Mossy and moist places facing the South and Mediterranean Sea, and not far from a small Village in France, call'd Gange. Gerard says that the first and second grow in a Field in the North of England, called Craig-clofe, and at the foot of the Mountain Ingleborow Fels, which is the highest Mountain in England. But that the third is Nurfl up in Gardens with us.

VIII. The Times. They all flourish and flower in the Summer Months, viz. in June, July, and August, some earlier, and some later than others. The Leaves begin to Withers in September, at which time they smell more pleasantly, than when they flourished and were green.

IX. The Qualities. European Spiknard is hot and dry in the second degree; Discussive, Diuretick, Stomackick, Neurotick, Cardiack, Nephritick, and Alexipharmick.

X. The Specification. It is good against Wind, Gripings in the Bowels, Colick, Fainting, Swooning, Convulsions, Strangury, Obstructions of the Spleen, Reins and Bladder, Birings of Venomous Beasts, Pestilential Diseases, and expels poison.

XI. The Preparations. You may make therefrom, 1. An Infusion or Decoction in Wine. 2. A Powder. 3. An Insolated or Decolled Oil. 4. A Spirituous Tincture. 5. An Acid Vinture. 6. An Oily Tincture. 7. A Distilled Oil. 8. A Distilled Water.

The Virtues.

XII. The Infusion or Decoction in Wine. It stops fluxes of the Bowels, but provokes Urine; is Stomackick, and good against loathing of Food, or Nauseousness, gnawings in the Stomach, sickness at heart, and Wind oppressing the Bowels. The Decoction in Water used as a Bath, is good against Fits of the Mother and weaknesses of the Womb, drying up humors in those parts. The Infusion or Decoction in Wine with a quarter part of Wormwood, is a most excellent Stomackick, profitable against the Colick, want of Appetite, ill Digestion, Vomiting, &c. Dose a quarter of a Pint at a time, morning, noon, and night.

XIII. The Powder. It may be given from a Scruple to a Dram, mixt with Honey, or any other convenient Vehicle, and has all the Virtues of the Infusion or Decoction. It is a singular ingredient in Mithridate, that chiefly made of the first Species; for rho' the Indian Spiknard is always intended there, yet when that cannot be had, this first kind always supplies its place. It is said to be good for such as are Liver-grown or have the Rickets, and also for the yellow Jaundice, Bloody Flux, and the stinging or biting of any Venomous Creatures, as also to expel poison, being inwardly taken. Snuff up the Nostrils, it excellently purges the Head and Brain.

XIV. The Insolated or Decolled Oil. It is warming, Anodyn, and comfortable to the Nervous parts: It rhins thick and congealed humors, digests those which are crude and moderately astringes and strengthens the parts which are loose,

and weak, and is said to be profitable against Tremblings, Palsies, and the like.

XV. *The Spirituous Tincture.* It has the Virtues of the Infusion and Decoction, is good against malign Fevers, and the Poison and Infection of the Plague or Pestilence, and all Pestilential Distempers; it comforts the Head, Brain, Nerves and all the *Viscera*, chiefly the Stomach and Heart, warms, digests, stops thin distillations of Rheum, eases pains proceeding from cold, as also the Colick, and is profitable against Palsies, Convulsions, Cramps, &c. Dose from one to two Drams in a Glass of generous Wine.

XVI. *The Acid Tincture.* It is a potent thing against all sorts of hot Burning Fevers, and more excellent than the former against all sorts of malign Fevers; the Plague, and all kinds of Pestilential Diseases, because besides the destroying the Putridity, it takes off (as it were upon the spot) the preternatural heat, and restores the Sick to their natural temper. Dose so many drops as to make the Vehicle pleasant, and to be repeated as often as the Patient drinks.

XVII. *The Oily Tincture.* It is a good against the Colick and Gripings of the Guts, Pain and weakness in the Back and Reins, the Strangury, the Stone, Gravel, Sand and Tartarous matter in the Bladder, and other Urinary parts. It comforts all the lower *Viscera*, and is of singular good effect, against Tremblings, Palsies, pains and weaknesses of the Nerves and external parts proceeding from Colds, over-straining of the Limbs, or any other external hurt, or defluxions of Cold humors from other parts; It is good to dissolve Nodes, and other hard swellings, and is profitable against Diseases of the Spleen, Reins and B'adder. Dose gut. xx. ad xl. or more dropt into Sugar, and then mixt with any convenient Vehicle.

XVIII. *The Distilled Oil.* It is antiparalytick almost in the last degree, and a potent medicament against trembling of any part, weaknesses of the Nerves and Tendons, Cramps, Convulsions, and other like Diseases of the Neurotick parts, as the Stomach, Bowels, Mesentery, &c. giving ease in the Colick, and other inward pains, Fits of the Mother, Fainting, Swooning, &c. almost in a moment. Inwardly it may be taken morning and night from vi. to xij. or xx. drops, in any fit Vehicle. Toast some white Bread very hard and then powder it; drop this Oil upon it, mix them well together, and then with the Vehicle you intend to give it in, and so let the Patient drink it. Outwardly anoint it upon the Back Bone, and the other Parts affected twice a day.

XIX. *The Distilled Water.* Let the Grofs Powder a Pound of it, be digested in White Lisbon Wine a Gallon, for 6 or 7 days, and then distilled in Balneo. The Water hereof is of singular good use for Palsies, Tremblings, Convulsions, Weaknesses, and all cold indisposition of the Members, used both inwardly and outwardly. It comforts the Head, Brain, Nerves, Stomach, Heart, and other *Viscera*, stops Catarrhs, eases pains from a cold cause; and helps also in all suddain passions of the heart, and gives ease in the Colick, 2 or 3 Spoonfuls thereof being taken upon the occasion.

Where Note: That the French Bistard Spiknard is never used, as being a Plant which has little or no Virtues observed to be in it.

C H A P. DCXLVIII.

of SPIKNARD *Plowmans.*

I. *THE Names.* It is called in Greek, *Bakkels*, *Baccharis*, or as some will have it *Πακκας* *vel Παγκας*, *Paccharis* or *Pancharis* (from its excellent smell :) in Latine, *Baccharis*, and in English, *Plowmans Spiknard*, and *Bacchar*.

II. *The Kinds.* *Pliny* says that in his time it was called *Nardus Rustica*, but as he says, and so we also say, it was an error in them which did so call it: but its general Name is *Baccharis*, and *Baccharis Monspeliensium* (altho' it also grows in England :) *Conyza major altera Dodonæi*; *Conyza major Matthioli Lugdunense*, *Conyza major vulgaris Bauhini*, (in his *Pinax*) in English, *Bacchar* and *Plowmans Spiknard*. *Parkinson* tells us of two sorts of this Plant, viz. This treated of in this Chapter, and a Syrian kind; but the latter being unknown in our Climates, we shall say no more of it in this work. Tho' Custom has prevailed upon us, to call it *Spiknard*, yet it is no such thing, nor in the least akin, or has it any relation to that Plant.

The Descriptions.

III. Its Root consists of many Strings and Fibres, bushing somewhat thick, not running deep into the Ground, but so taking hold of the upper face of the Earth, that it may easily be pulled up with ones hand, the smell whereof is somewhat like to *Avens*, but the Scent is less strong when growing in Gardens, than growing Wild; like as *Avens* when made a Garden Plant, and several other sweet Herbs, which are of thin and subtil parts. It springs up with divers somewhat long and large Leaves, full of Veins, lying upon the Ground, which make it seem as if it were Crumpled; soft and gentle in handling, and of an overworn green color, seeming to be Wooly. From among which, (in the Summer time) rises up a strong stiff Stalk, three or four Feet high, set with divers such like Leaves, but smaller up to the Top; where it is divided into many Branches, at the ends whereof comes forth several flowers, three or four, for the most part, at the end of every several branch, and every one on a small Footstalk. Which flowers consists wholly of small Threads or Thrums, standing close and round, and never laid open like other flowers, which consist of Leaves: They are of a dead or purplish yellow color, appearing out of greenish Scaly heads, which Thrums turn into a Whitish Down. At the bottom whereof is the Seed, small and chaffy, which together with the Down, is carried away with the Wind, and rises or springs up in several places of the Garden where it is once Planted, and bears Seed.

IV. *Gerard* describes it after this manner. Its Root is thick, grofs and fat, spreading about in the Earth, full of Strings; the fragrant smell that this Plant yields may well be compared to the flavor of Cinnamon, or Helenium, being a Plant known unto very many or most sorts of People, in most parts of England. It has many blackish rough Leaves something bigger than *Primrose* Leaves; among which rises up a Stalk two Cubits high, bearing at the Top, little Chaffy or Scaly flowers in small Bunches, of a dark yellowish or purple color, which turn into Down, and

and are carried away with the Wind, like unto the kinds of Thistles. Johnson in Gerard says, that this Plant here described is the Conyza major Matthioli, Tragi, and others.

V. *The Places.* It grows plentifully about Mompelier in France, and in many other Countries. It delights in rough and Craggy places, and in a lean and dry Soil, where there is no moisture. And Gerard says, that it grows in divers parts of the West of England.

VI. *The Times.* It flowers with us, about the end of July, or beginning of August. Gerard says, it springs up in April, flowers in June, and perfects its Seed in August.

VII. *The Qualities.* It is Temperate in respect to heat or cold, and dry in the first degree; Astringent or Binding, Pectoral, Nephritic, and Alexipharmick.

VIII. *The Specification.* It is a remedy for Asthma's, Coughs, Colds, Inflammations of the Eyes, swelling of Womens Breasts, stops Fluxes of the Bowels, and as Pliny says, helps to break the Stone.

IX. *The Preparations.* You may have therefrom, 1. *The Green Root.* 2. *A Decoction of the Root.* 3. *A Powder of the Root.* 4. *A Cataplasm of the Green Leaves.* 5. *A Bath.*

The Virtues.

X. *The Green Root.* Authors say, that being bound, or hanged to, (I suppose they mean the Thighs) it brings away the Birth, and facilitates the Delivery. This Root for its sweet smell is oftentimes put among Cloths, to give them a kind of perfumed scent.

XI. *The Decoction of the Root in White Wine.* It opens obstructions of the Vessels (as Paulus Aegineta says) provokes Urine and the Courfes, is good against Convulsions, and for such as are inwardly bruised by falling from an high place. It is good also against Asthmas, Coughs, Colds, shortness of Breath, and other distempers of the Brest and Lungs. Barhed upon Womens Breasts which are swelled, and pained, it gives ease and dissolves the Tumor. It is good against pains of the Pleura and sides, opens Obstructions of the Spleen, and breaks the Stone (as Pliny says) expelling Gravel, Sand and Tartarous Mucilage out of the Urinary parts, and so gives ease in a Dysuria and Stranguria. Dropt into the Eyes it cools the Inflammation and stops the flux of Rheum into them. It may be given to half a Pint Morning and Night, very well sweetned with Honey. It is also Alexipharmick, resists Poison, and is good against the bitings of Serpents and Mad Dogs, and other Venomous Creatures.

XII. *The Powder of the Root.* It has the Virtues of the former Decoction, and may be given to a Dram morning and night, against Violent Catarrhs, and to break and expel the Stone whether in the Reins or Bladder.

XIII. *The Cataplasm of the Green Leaves.* Applied to the place of the Head pained, it eases the Head-ach. It also stops a flux of humors flowing to any Part, and strengthens weak Joints.

XIV. *The Bath made of the Roots and Leaves in Water.* Drank to half a Pint, it stops Catarrhs, applied as a fomentation it stops a flux of Rheum to the Part, Cools Inflammations, and Cures Anthones, Fire, being Bathed therewith, and Cloths wet therein being also applied to the same. Made in great

Quantity, so as the Patient may sit in it in a Bathing Tub, or otherwise put into a Vessel in a Close Stool, so as the Patient may receive the hot Vapors thereof, up into the Womb, it is said to induce the Courfes, when stopt or flow but poorly, as also to provoke, hasten and facilitate the Birth. Taken inwardly it is said to be profitable against Ruptures.

C H A P. DCXLIX.

OF SPIDER-WORT.

I. *THE Names.* It is called Greek, *φωδύγιον*, *φωδύγιον*: in Latine, *Phalangium* & *Phalangites*: and in English, *Spiderwort*.

II. *The Kinds.* There are several sorts of this plant, as, 1. *Phalangium Alobrogicum*, *Phalangium antiquorum*, The Savoy Spiderwort. 2. *Phalangium majus Italicum album*, The Greater Italian Spiderwort. 3. *Phalangium non ramosum Vulgare*, Unbranched Spiderwort: Cordus calls it *Liliago*. 4. *Phalangium ramosum*, Branched Spiderwort. 5. *Phalangium Virginianum*, *Phalangium Ephemereum Virginianum Johannis Tradescantii*, The Virginian Spiderwort, The soon fading Spiderwort, and Tradescants Spiderwort, because Tradescant first brought it into our English Gardens. It has been thought by some to be the *Silk-Grass* which grows there.

The Descriptions.

III. The first or Savoy Spiderwort. Its root consists of many white, round, thick, brittle strings, joining together at the head, but are nothing so long

Spiderwort Savoy.

as those of the other Spiderworts. It springs up with four or five green Leaves, long and narrow, yet broader at the bottom, narrower upwards, and pointed at the end, like those of the Lilly Asphodil, but a little hollow in the middle. From among which arises up a round stiff Stalk, a Foot and a half high, bearing at the Top, one above another seven or eight or more flowers, every one as large as the day Lilly, but much greater than in any of the other Spiderworts, of a pure white color, with some Threads in the middle, tipped with yellow, and a small forked Point. After the flowers are past, the head or Seed Vessels grow almost Triangular, yet something round, in which is contained blackish Seed.

IV. The second, or Greater Italian Spiderwort. Its Roots are long and white like the next following, but something larger. It has divers long and narrow Leaves spread upon the Ground, and not rising up as the former, nor yet so broad, but something larger than the next following. The Stalk is bigger, but seldom rises up so high as the next third Species, being long and unbranched, set full of white flowers towards the Top of a Starlike fashion, but somewhat larger.

V. The third, or Unbranched Spiderwort. Its Root consists of long white Strings running under Ground, like those of the last described, but smaller. It has small Grass-like Leaves, but larger than those of Grass, of a whitish or grayish green color, rising immediately from the head or Tuft of Roots. From among which rise up one or two Stalks, two or three feet high sometimes, set towards the Top, with a great many small white Starlike flowers, which after they are past, turn into small round heads, containing black Seed, like to the Seed of the little yellow Asphodil, but lesser.

VI. The fourth, or Branched Spiderwort. Its Root consists of many Strings, tough and white, like the third: but its Leaves are something broader, and of a yellowish green color, much like in form to Couch or Leech Grass, yet something thicker and fatter, and of a more whitish green color. The Stalk, which comes up from among the Leaves grows to be about a foot and a half high, and spread out with small branches towards the Top, replenished with many small white Starlike flowers, consisting of six Leaves apiece like the former, with Threads in the middle, of a whitish color mixed with a fair yellow: which being fallen, small roundish Triangular Knobs follow, containing black colored Seed.

VII. The fifth, or Virginian Spiderwort, supposed by some to be the Virginian Silk-Grass. Its Root is stringy, and creeps far under ground, rising up again in many places with divers heads of long folded Grass-like Leaves, of a greyish overgrown green color, two or three for the most part together, and not above, compassing one another at the bottom, and abiding green in many places all the Winter, and in some places perishing and rising anew in the Spring, which Leaves rise up with the great round Stalk, being set there at the joints, commonly but one at a joint, broad at the bottom, where they compass the Stalk, and growing gradually smaller towards the end and terminates in a sharp point. At the upper joint which is the Top of the Stalk, there grows two or three such like Leaves, but smaller, from among which break out 12, 16, or 20 or more, round green heads, hanging themselves down by little Footstalks, which when the flowers begin to blow open, grow longer, and stand upright, ha-

ving three small pale green Leaves for a bush, and three other Leaves within them for a flower, which lay themselves flat open, of a deep blew purple color, having a small Point or head in the middle, closely set about with six reddish, hairy, or feathered Threads, tipped with yellow pendants. This flower opens it self in the day time and shuts it self usually at night, and never opens again, but perishes, and then hangs down its head again. The green husk of three Leaves, closing it self again, in the form of a head, as it was before, but greater, the Point in the middle, growing to be the Seed Vessel, in which is contained small blackish long Seed. Of these flowers seldom more than one or two are seen blown at a time upon the Stalk, for which reason it is a long time in flowering, before all the heads are fully blown open.

VIII. The Places. Their Names for the most part shew their Native Soil, or Place of growth, but with us they all grow in Gardens. The Virginian is a great encrease, and thereby is now grown Common almost in every Garden. It was first brought to us out of Virginia: since we have received from thence several other Varieties, differing chiefly in the color of the flowers; for besides this blew Purplish here described, we have another which bears bigger and fairer blew flowers: two also, viz. a greater and lesser, which have Red flowers: and one with Snow White flowers. In some Years the flowers of the Greater Red will come forth double.

IX. The Times. The third or Unbranched Spiderwort flowers before all the rest: and the Branched a Month after it: the other two about one time, viz. towards the end of May, and not much after the Unbranched kind. Gerard says, that first and fourth flower in June, and the third about the beginning of June, and the second about August. The fifth or Virginian, from the end of May until July, if it has had green Leaves all the Winter, but later, if the Coldness of the Winter puts a stop to its Vivacity. These Plants are all hardy, and will live and thrive almost in any Soil, but best in that which is moist. The time to take them and Transplant them is in August; the several heads of Roots may be placed where they may grow 2 or 3 Years unremoved. As they are Seed bearers, so from the Seed, Plants of the best kind are to be raised, but they which spring from the Seed are long before they bear flowers, yet it is worth the labour and attendance.

X. The Qualities. They are hot and dry in the first degree, of thin parts, and Alexipharmick.

XI. The Specification. They resist poison, and are peculiarly good against the biting of the Phalangium or Poisonous Spider, as Authors say, from whence it is thought they derived their Name. That of Virginia, is of no known Virtues or Use.

XII. The Preparations. You may have from the Common Spiderwort, 1. A Decoction in Wine or Water of the Roots, Leaves, Flowers, and Seed. 2. A Powder of the same. 3. A Diet Drink.

The Virtues.

XIII. The Decoction in Wine or Water. Dioscorides says, that being made in Wine, and Drank, it prevails against the bitings of Scorpions,

ons, and the biting of the Spider *Phalangium*, and of other Venenous beasts.

XIV. *The Powder.* It has all the same Virtues, being taken in Wine morning and evening to the quantity of a Dram; or mixed with an equal quantity of Mithridate and so swallowed, drinking a Glas of Wine after it.

XV. *The Diet Drink.* The Roots being run'd up with new Ale, and then drank for a Month together, it expels Poison, yea tho' it be univerally spread throughout the whole Body.

C H A P. DCL.

Of SPIGNEL.

I. *THE Names.* It is called in Arabick, *Mec*; in Greek *Μήν Σπύγιον*; in Latine, *Meum*, and by some Ancient Authors, *Athamanticum*, either from *Athamantes* who first found it out, or from the Mountain *Athamantes* in *Thessalia* where the best grew; Pliny calls it *Macedonicum* and *Hispanicum*, from the places where the best was found in his time, for says he in *Italy* it is only sown by some few, tho' now it is known to grow wild in several places of that Country. In English it is called *Spignel* and *Spicknel*.

II. *The Kinds.* Formerly there was but one sort of this Plant known, now there are many Species thereof, the chief of which are the following, viz. 1. *Meum Vulgatius*, *Meum Antiquorum*, *Terdylon Cordi*, *Anethum Sylvestre*, *Anethum tortuosum aliorum*, *Meum folijs Anethi*, Our Common or ordinary Spignel. 2. *Meum Spurius Italicum* *Matthioli*, *Meum adulterinum Bauhini* & *Tabernaemontani*, *Meum Spinum alterum Italicum Lobelij*, Bastard Spignel. 3. *Meum Germanicum*, illis *Mutetina dictum*, *Meum Alpinum*, German Spignel or Mountain Spignel.

The Descriptions.

III. The first, of Our Common or Ordinary Spignel. Its Roots do spread much and deep in the Ground, many strings or branches springing from one head, which is hairy at the Top, of a blackish brown color on the outside and white within, smelling of a strong good scent and of an Aromatick taste. From whence rise up several long Stalks of very fine cut Leaves, smaller than Dill, set thick on both sides of the Stalk, and of a good smell. From among these Leaves rise up round stiff Stalks a foot and half and sometime two feet high, with few joints, but beset with Leaves resembling Fennel or Dill, but sinner cut; and at their Tops an Umbel of fine pure white flowers at the edges, on which will sometimes be seen a shew of a Reddish or bluish color, especially before they are full blown, and are succeeded by small, longish and somewhat round Seed, larger than the ordinary Fennel Seed, and of a browner color, divided into two parts, and crested on the back, as most of the Umbelliferous Seeds are.

Spignel true or Common.

IV. The second, or Bastard Spignel. Its Root branches out like to that of the former true Spignel, but smaller, somewhat like to Sow or Hog-

Spignel Bastard or Italian.

Fennel.

Presach. In its form and manner of growing it is something like unto the true or former kind, yet more like unto Dill with longer and thicker Leaves: the Stalks rise as high as that with white Umbels of Flowers, and larger Seed on them. The whole Plant and every part thereof, is of a more strong smell and taste than the first, and the Stalks serve themselves out like the former.

V. The third, or German or Mountain Spignel. Its Root is of about a fingers length, covered with a rough or rugged blackish bark, and but few Fibres adjoining to it, with a bush of hair at the Top, of a strong sharp smell like to the first or Common Spignel, but much weaker. It has but few Stalks of Winged Leaves rising from the Root, but they are something broader than the Leaves of the first or Common Spignel and shorter, being a mean between them and Carum or Caraway. From among which rises up a slender striated Stalk a Foot high, bare of Leaves for the most part up to the Top, where grow two or three small Umbels of Purplish flowers, consisting of five small Leaves apiece, bearing Seed afterward something long and pretty large, with respect to the former.

VI. The Places. The first grows Wild in many Places in the Northern parts of England, as Lancashire, Yorkshire, &c. but is Planted almost every where in Gardens. The second grows Wild in Italy, but with us only in Gardens. The third is said by some Authors to be growing Wild in England; it grows Wild in Germany, and on the Alps and other Mountains, but with us is for the most part a Nursery. The two first I have found growing in South Carolina up Cooper River, by a Pathway leading to Capt. Camm's Plantation, from a right hand branch of the said River, where (when I was there) they grew Wild and in vast plenty.

VII. The Times. They flower in June and July, and perfect their Seed in August.

VIII. The Qualities. The Roots of the true Spignel are said to be hot in the third degree and dry in the second. Aperitive, Diuretick, Stomackick, Hepatick, Nephritic, Hysterick, and Alexipharmick.

IX. The Specification. Spignel resists poison, and the bitings of Venomous Creatures, provokes Urine and the Courtes, eases pains in the Reins, Womb, and Bladder, is positable against the Strangury and all Stoppages of Urine, expels Wind out of the Stomach and Bowels; is good also against Catarrhs, Rheumatisms, Arthritic pains, and Colick pains of the Stomach and Bowels, Vapors, Hysterick Fits and the like. The Root is only used with us, but the Seed is very Aromatick, and has the same Virtues.

X. The Preparations. You may have therefrom, 1. A Decoction or Infusion of the Roots or Seed in Wine or Water. 2. A Pouder of the Roots or Seed, which is an Ingredient in Mithridate and Venice-Treacle.

The Virtues.

XI. The Decoction or Infusion of the Roots or Seed in Wine or Water. Taken morning, noon, and night, to the Quantity of half a Pint, it gives ease in the Strangury, helps all sorts of Stoppage of the Urine, and provokes the Terms in Women when stop'd; it eases also pains in the Reins, Womb, and Bladder, opens Obstructions of the Stomach, Liver, and Spleen, gives ease in the Colick, and other like pains of the Stomach and Bowels, re-

presses Vapors, and gives relief in Fits of the Mother, as also in Catarrhs, Rheumatisms and the like. It is an Antidote against Poison, as also against the bitings or Stinging of Vipers, Mad Dogs, Scorpions, Hornets, and other Venomous Creatures.

XII. The Pouder of the Root or Seed. It may be given to a Dram morning and evening, against all the aforementioned Distempers; in any proper Vehicle. Or it may be made into a Lohoch with Honey, and so taken: and then it is proper to open Obstructions of the Stomach and Lungs, cut tough flegm and expectorate it, and to dry up Catarrhs affecting those parts.

C H A P. DCLI.

of SPINAGE.

I. **THE Names.** It is called by the latter Grecians *Σπινάχια*: in Latine, *Spinachia* (a *ratitate in usu medico*) but by most *Spinachia*, *Olas Hispanicum Tragi*, (supposing it a Pot-herb which first came from Spain:) and in English, *Spinage* or *Spinach*.

II. **The Kinds.** Some Authors will have it to be a Species of the *Arachis*; others of the *Beets*; others again of the *Blites*: but I think it has no Relation to any of these Plants, but is a particular kind of its own. Some make four Species of this Herb, accounting that which bears no Seed to be One, which is indeed but accidental, as it happens several times to divers other Plants, as *Hemp*, *Herb Mercury*, &c. There are indeed three sorts hereof, viz. 1. *Spinachia femine aculeato minor*, The lesser Spinage with prickly Seed, which is our Common Spinage. 2. *Spinachia femine aculeato major*, The greater prickly Seeded Spinage, which is also Common to be had. 3. *Spinachia femine non aculeato*, *Spinachia femine Læve*, Smooth Seeded Spinage, which is a more rare kind, and Nurst up but in a few Gardens.

The Descriptions.

III. The first or lesser Spinage with Prickly Seed which is (as before is said) Our Common Spinage. Its Root is long, white and small with many Fibres adjoining to it. It has long green Leaves, broad at the Stalk, and rent or torn as it were into four Corners, and sharp pointed at the ends. It quickly runs up to Stalk, if it is Sown in the Spring time: but else, if Sown at the end of the Summer, it will abide all the winter green, and then suddenly in the very beginning of the Spring run up to Stalk, bearing many Leaves both below, and at the Top, where there does appear many small greenish flowers in Clusters, and after them a small prickly Seed. If it be after cut, it will grow the thicker, or else Spindle up very small, and with but few Leaves upon the Stalk.

IV. Gerard describes it thus. Its Root consists of many Threads, from which Spring forth soft and tender

SPINAGE

tender Leaves of a dark green color, full of juice; which are sharp pointed, and in the largest part or lower end square: parted oftentimes with a deep gash on either side next to the Stem or Footstalk. The Stalk is round, about a Foot high, and hollow within; and on the Tops of the Branches grow little flowers in Clusters, in whose places come afterwards prickly Seeds.

V. The second, or Greater prickly Seeded Spinage. This in its Roots, Leaves, Stalks, Flowers, and Seed, and in its form and manner of growing, is like to the former, saving that in all its parts of Stalk, Leaf and Seed it is larger.

VI. The third, or Smooth Seeded Spinage. It is in its Root like the former, but its Leaves are broader and a little rounder pointed than the first, especially the lower Leaves; for those which grow upwards upon the Stalk are more pointed, and as it were three square, of as dark a green color as the former. At the several joints of the Stalks and Branches stand clustering many small greenish flowers, which turn into clusters of round whitish Seed, without any prickles at all upon them.

VII. This last kind Gerard says is called Wild Spinage, but is found in our Gardens, and is like to the other kinds in goodness, as also in shape, saving that the leaves are not so great, nor so deeply gashed or indented, the Seed having no prickles at all.

VIII. The Places. They are all Sown and grow in Gardens, without any great labour and industry, and thrive in any Ground which is but moderately fertile.

IX. The Times. Spinage may be Sown almost at any time of the Year, but being Sown in Spring, it quickly Springs up, and comes to perfection in about two Months space: but that which is Sown in the Autumn, is longer in coming to its growth, yet continues all Winter, and Seeds presently upon the beginning of the Spring.

X. The Qualities. It is cold and moist almost in the second degree; and by reason it is of a Watery substance, almost without Taste, and therefore quickly descends out of the Stomach into the Belly, being withal Absterfve and Laxative, keeping the Bowels soluble.

XI. The Specification. There are no nominal Virtues ascribed to it by Authors; but as it is cooling so it gratifies a hot Stomach, Quenches Thirst, and is good against Fevers.

XII. The Preparations. It is an Herb fit for Sallets, and other uses of the Table. Many People Stew the Herb in a Pot or Pipkin, or in a Sauce-Pan, or between two Plates, without any other moisture than its own, and after the moisture is a little pressed from it, is drest as a *boiled Sallet*, with Butter, Vinegar, Pepper, and Salt, and so made a very palatable Dish. Some Cooks make it into *Tarts*, by mixing with it *Lemons* very thin sliced, with the addition of a little *Sugar*, and some Spice, which are Palatable enough. But besides these Kitchen Preparations you may make therefrom, 1. A *Liquid Juice* of the Herb. 2. An *Antisebricitick*. 3. A *Conserve*. 4. A *Distilled Water*.

The Virtues.

XIII. The *Liquid Juice*. Mixed with half its weight of Honey and so taken to 4. or 6 Ounces in the morning fasting it loosens the Belly, and cleanses the Stomach and Guts, of Cold, slimy and Pituitous humors, and evacuates Tartarous matter from the Reins, Ureters, and Bladder.

XIV. The *Antisebricitick*. It is made thus. Take of the *Liquid Juice* clarified a Pint: Juice of *Lemons* half a Pint: double refined *Sugar* enough to make it pleasant. Dose a quarter of a Pint or more now, and than especially in the coming of the burning fit, as also in the height thereof, and to quench thirst when necessity requires.

XV. The *Conserve*. It is good against Coughs, roughness and hoarseness of the Breast and Lungs, cools and quenches thirst in hot burning Fevers, and very much refreshes the fainting Spirits, caused from the wasting heat of the Stomach and humors.

XVI. The *Distilled Water*. It may be taken to a quarter of a Pint, acuated with a few drops of Spirit or Oil of Sulphur and made pleasant with double refined Sugar: it cools admirably, and is good against all sorts of Malign and Pestilential diseases, quenches thirst and cleanses the Lungs, Stomach and Bowels of acrid, sharp and Pituitous humors.

C H A P. DCLII.

Of SPLEEN-WORT, Smooth and Rough.

I. THE Names. It is called of the latter Arabians, *Scolopendrium*: in Greek, *Σκωληνίσκος*; in Latine, *Asplenium* and *Splenium*: in English, *Spleenwort*, *Mill-waste*, and *Scale-Fern*.

II. *The Kinds.* There are two special Kinds thereof, viz. 1. Ἀσπληνιον ῥαϊν, *Asplenium*, *Asplenium* *Leve*, Σκολοπενδριον, *Scolopendrium*, and *Scolopendra* (from the likeness of the Leaf to the *Scolopender* worm so called:) also ἡ τριὰς ὁ πτερυγ (as it is in the *Vulgar Copies*) *Theophrasti*, *Scolopendrium*, *Arabice*; and ἡ μύσων, *Hemionum*, which *Galen* calls *Mula Herba*: in *Latine*, it is called *Asplenium*, *Scolopendrium*, *Scolopendria* and *Ceterach*: and in *English*, *Spleenwort*, *Smooth Spleenwort* and *Milt wass*. In former times *Apothecaries* and *Physicians* held *Harts Tongue* to be the *Scolopendrium verum* of the *Ancients*, and that *Asplenium* was not *Ceterach*; but these errors are now sufficiently made manifest. 2. Ἀσπληνιον τεργον, *Asplenium asperum*, *Rough Spleenwort*, and this is threefold, viz. 1. Λονχίτις ἑτέρα ἢ τεργία, *Lonchitis altera sive aspera major Matthioli*, *Matthiolus* his greater *Rough Spleenwort*. 2. *Lonchitis aspera minor Matthioli*, *Asplenium Sylvestre Tragi*, *Struthiopteris*, *Cordi* & *Thalii* (that is to say, *Ostrich Fern*, from the resemblance of the Leaves to *Ostrich Feathers*;) *Lonchitis altera Neotericonum*, & *Asplenium Magnum* by some, The lesser or smaller *Rough Spleenwort*. 3. *Lonchitis Marantæ*, *Lonchitis aspera Marantæ*, *Clusij*, *aliorumque*, *Pseudolonchitis Marantæ* by *Matthiolus*, *Baffard Rough Spleenwort*.

The Descriptions.

III. The first special kind or *Smooth Spleenwort*, which is the true *Scolopendrium*, true *Spleenwort*, and *Ceterach*. Its *Root* is black, threddy, and bushy, which sends forth many long single Leaves, cut in on both sides into round dents, even almost to the middle Rib, which is not so hard as that of

Spleenwort true or Ceterach.

Polypody, each division being not always set right opposite to the other, but as it were between each, smooth and of a light green on the upper side, and with a dark yellow roughness on the back, folding or rolling it self inward at the first springing up, as many other Ferns do, therein resembling these Worms which anglers use.

IV. Gerard describes it after this manner. Its *Root* is small, black, and rough, much platted or interlaced, having neither *Stalk*, *Flowers*, nor *Seed*. It has *Leaves* a span long, jagged or cut on both sides, even near to the middle Rib, every cut or incisure being as it were formed half round (by which it is known from the rough *Spleenwort*;) not one cut right against another, but one besides another, set in their several orders, being slippery and green on the upper side, and soft and downy underneath: which when they be withered are folded up together like a scroul, and hairy without, much like to the rough or hairy *Bear-Worm*, wherewith *Anglers* bait their hooks to catch *Fish*.

V. The first of the *Rough kind*, or *Matthiolus* his greater *Rough Spleenwort*. Its *Root* is composed of many Reddish *Sirings* or *Fibres* like those

Spleenwort rough greater.

of *Harts-Tongue*. It has several *Stalks* of leaves, some are like unto the *Smooth Spleenwort* or *Ceterach*, but more like unto those of *Polypody*, about a span long, cut to the middle Rib on both sides, making as it were so many several little Leaves upon one great *Winged Leaf*, and each small Leaf dented about the Edges with sharp points, and rough on both sides, but without such spots on the backs of them as *Polypody* and *Ceterach* have.

VI. The second rough kind, or lesser or smaller *Rough Spleenwort*. Its *Root* has a thick head which is covered with Scales lying one upon another, with divers *Fibres* adjoining to them. It is something like to the former or first rough kind, but that the divided Leaves set on each side of the soft brownish

brownish Stalks are narrower and longer, each separated from the other, but not fully to the middle Rib. In the middle of these outward Leaves, rise up others which are larger, and having blacker Stalks of Narrower Leaves like unto them, but fully separated, and seeming as if they were Curled, with brownish Spots or Scales on the backs of them, as in other Ferns. There is another of this second kind, which is lesser than this, and is found about Colchester in Essex, and in other places, growing in the wet borders of Fields, and by Hedge sides.

VII. Gerard says, that the Root of this second rough kind is black and set with a number of slender strings, and that it is partly like the other Ferns in shew, bearing neither Stalk nor Seed, having narrow Leaves a Foot long, or something longer, slashed on the edges even to the middle Rib, smooth on the upper side, and of a swarthy green color underneath, and rough as are the Leaves of Polypody.

VIII. The third rough kind, or Bastard Spleenwort. Its Root is small, composed of many strings. It has brown rough Stalks, with winged Leaves on them, something like to the Female Fern, but thicker and greater by much, green on the upper side,

Spleenwort Bastard.

and spotted with brown rough Scales on the other side, much like to Ceterach or the Smooth kind. Gerard says, its Root is thick, black, and bushy like as it were a Crows Nest. And is not only barren of Stalks and Seeds, but also of those marks and spots with which the others are spotted. The leaves are few in number, growing Pyramid or Steeple fashion'd, greater and broader below, and gradually sharper towards the Top.

IX. The Places. The Smooth Spleenwort, or Ceterach grows as well upon Old Stone Walls and

Rocks, as in moist and shadowy places in many parts of England, as about Brillol and other the West parts plentifully, as also on Framingham-Castle, on Beckensfield Church in Berkshire, at Stroud in Kent, and in many other Places. It is also found about Bath, Wells, and Salisbury, where it grows in great plenty. The first of the Rough kinds grows in moist places, and Moorish grounds: It is found growing in Italy, and I have found it growing plentifully in several low and moist places in the South Carolina. The second and third grows in moist places and Groves, as also on barren Heaths in several places both of England and Germany. The second grows not only on dry barren Heaths, but on Sandy Banks and shadowy places in moist parts of England, but especially on Hamstead-Heath near London, where it grows in great abundance.

X. The Times. The Ceterach or Smooth Spleenwort, like Polypody, abides green all Winter, and the Rough kinds flourish and appear in their Vigor, at the same times and seasons in which the other Ferns do.

XI. The Qualities. They are all temperate in respect to heat or cold, moisture or dryness, or if they exceed it any ways, they are rather hot and dry in the beginning of the first degree, they are Aperitive, Absterive, and wasting or consuming, Diuretick, Hepatick, and Spleneick.

XII. The Specification. Spleenworts of all the kinds, but the Ceterach or Smooth kind, more especially, (and which is mostly and chiefly used) cures all sorts of pains, Tumors, or Swellings, and Obstructions of the Spleen, is good against the Yellow Jaundice, Hiccough, and the Strangury or Pissing by drops; and is said also to wattle the Stone in the Bladder, to cure Melancholy, and speedily to help a Virulent Gonorrhœa, and other Symptoms arising from the French Disease.

XIII. The Preparations. From the Ceterach or Scolopendrium, you may have, 1. A Decoction of the whole Plant in Wine or Water. 2. A Powder of the same. 3. A Dust from the Backsides of the Leaves. 4. A Lye from the Ashes. 5. A Distilled Water. And from the Lonicitis or rough kind, you may have, 6. A Powder of the Dried Leaves. 7. A Cataplasm of the Green Leaves.

The Virtues.

XIV. The Decoction of Ceterach, (the whole Plant) in Wine or Water. Dioscorides says, that the Decoction of the Leaves in Wine, being drunk for the space of forty days, Cures Melancholy, takes away Infirmities of the Spleen, helps the Strangury and Yellow Jaundice, and causes the Stone in the Bladder to moulder and pass away, this Plant being of thin and subtil parts. He says likewise, that it stops the Hiccough, cures Venereal diseases, but induces Barrenness in Women, and therefore by them is to be avoided.

XV. The Powder of the same. It may be taken to a Dram morning and night in any convenient Vehicle for all the purposes aforesaid. It is also by some affirm'd, that it is not only good against swelling and hardness of the Spleen, but that all Distempers of the Liver may in a very short time be cured therewith.

XVI. The Dust from the backsides of the Leaves. Matthiolus says, that if a Dram thereof be mixed with Amber in fine Powder half a Dram, and taken in the Juice of Purslane or Plantane,

6 X 2 (4 Ounces)

(4 Ounces) it will speedily cure the *Gonorrhœa* or running of the Reins.

XVII. *The Lye elixiviated from the Ashes of the whole Plant.* Camerarius says, that being drank for some time (I suppose it must be made of such a strength that it may be drinkable) it cures such as are troubled with the Spleen: I am sure it is of good use against the Strangury, Stone, Gravel, and Tartarous matter, the in Reins, Ureters, and Bladder, and is profitable against the Yellow Jaundice.

XVIII. *The Distilled Water.* Camerarius says, that being given (to half a Pint or more) is very effectual against the Stone and Gravel, in both Reins and Bladder. I suppose that if it be mixed with an equal part of White Wine and a *Scruple of the Salt of Spleenwort*, or 2 Drams of the former Lye, it will be much more effectual to all the purposes intended thereby.

XIX. *The Powder of the Dried Leaves of the lesser rough Spleenwort*, or *Lonchitis*, given to a Dram in White Wine Vinegar morning and night for some time, it is held to be very good to dissolve the hardness of the Spleen.

XX. *The Cataplasim of the Green Leaves.* Applied to simple Green Wounds, it prevents Inflammations and Flux of Humors, and induces their healing.

SPOON-WORT, see *Scurvigrass*. Chap.

C H A P. DCLIII.

Of SPONGE.

I. *THE Names.* It is called in Greek *Σπγγη*: in Latine, *Spongia*: and in English, *Sponge*: from the Greek Name.

II. *The Kinds.* It was the opinion of some that Sponges were *Zoophyta*, i. e. *Plantanimantes* vel *Plantanimalia*, viz. *Animal* or *Sensible Plants*: and tho' this was the thoughts of some in *Aristotle's* time, yet he seems not to be of that Opinion, for in his *Historia Animalium*, Lib. 5. Cap. 16. He says, that tho' divers did think and say in his time that Sponges had Sense in them, for that as they say, they would shrink if any did pluck them, and were hard to be pull'd up, and that they do so likewise, when the Surges of the Sea would break them off from their Seats or Residence; yet (says he) divers did doubt of the truth of that Relation. 'Tis doubtless a foolish and false Opinion, for a Sponge is no more a *Sensitive substance* than a *Mushroom*, and is nothing else, but a Plant like *Excrecence*, bred from the matter it grows upon, as *Agarick* is from the *Larch-Tree*, and *Jews-Ears* from the *Elder*. We have no more to Treat of here, but of the Common or Ordinary Sponges which are daily in use, of which some are greater, some are lesser, some round, some cornered, some flat, some Tuberous: some close and hard, others more loose and open, some of a fine and thin substance, others of a courser and thicker: some of a brown yellow color, others of a pale yellow, or almost white, And *Bauhinus* says, that some were called. 1. *Hircina*, Goat Sponges, from a hairyness they had upon them. 2. *Velaria*, from the smallness of their holes, being almost as close and narrow as those in Vails. 3. *Ramosa Fistulosa*,

from their being branched with a great Pipe-like hollowness.

The Descriptions.

III. *Sponge is of a light, hollow, soft substance, neither Stony, Woody, nor Herb-like, but rather like a hollow matted substance made of fine Wool or Cotton wrought together by nature, full (in all parts of it) of small holes, some greater, some lesser, which are ready to receive and hold much Water, and by pressing or wringing it hard, to yield it out again; but as it encreases in the Water, viz. in its place of Growth, it sometimes gathers into it, or else there is driven into its holes, several small gritty Stones, which are commonly found therein, which shew the breeding and growth thereof, is upon some Rocky, or Gravelly Places, or not far from the Earth.*

IV. *The Places.* It is usually found in the Sea, and upon some shoars, after it has been by some accident broken off from the place on which it had Grown, which possibly might have been on the side of some Stone, or Rock, or Gravelly or Rocky Creek, or hole near the bottom of the Sea or Sea shoar, which lyes always covered with Water.

V. *The Times.* The Seasons of its flourishing and Age is unknown, its possible it may equally grow through all the parts and days of the Year, the external Air not penetrating, or much operating upon the bottom of the Sea, or those parts which are always pretty deeply covered with Water, so as to cause any difference in the times of the flourishing of such things as grow, and are always overwhelmed with the Waters of the Deep.

VI. *The Qualities.* It is temperate in respect to heat or coldness, dryness or moisture, Aperitive, Absterive, Diuretick, and Nephritick.

VII. *The Specification.* It is said to be a peculiar Remedy for the Kings Evil, Sand, Gravel, Stone, or any Tartarous matter in the Reins or Bladder: Profitable against Blains, Batches, Boils, Pustles, and other breakings out in the Face and Skin, and to clear the Eye-sight.

VIII. *The Preparations.* You may make therefrom, 1. *A Decoction*. 2. *A simple Powder of Sponge*. 3. *Helmonts Powder*. 4. *Ashes*. 5. *Powder of the small Stones in Sponges*. 6. *Volatile Spirit, Salt and Oil of Sponge*. 7. *A Compound Powder*. 8. *Tents of the substance thereof*.

The Virtues.

IX. *The Decoction in Wine or Water.* It is used for a Fomentation or Bathing; it eases pain, dissolves recent Tumors, and softens such as are hard: after Bathing the Sponge it self may be applied as hot as it may be well endured and so bound on.

X. *The simple Powder of Sponge.* It is made by drying the Sponge thoroughly by the Fire, or in an Oven, almost to scorching it, and then beating it to powder in an Iron Mortar. Dose a Dram in any fit Vehicle; taken in Wine, it is said to Purge like *Cremor Tartari*, cutting thick, gross and Viscous humors; it eases pains of the Stomach, Gripping of the Guts, Colick, Strangury, Stone, Gravel, &c.

XI. *Helmonts Powder of Sponge.* Take Sea

Sponge

Sponge burnt up to a Coal 3 Ounces: Cattle Fish Bone Calcind, Egg-shells Calcind, Sal Gem, Galls, Ginger, Long Pepper, Pellitory of Spain, ana, an Ounce: all being in fine Powder, mix them together with the Water Distilled from the aforesaid Sponge, which defecate or dry by degrees. It cures the Kings-Evil, being taken for a Month together, half a Dram at a time mixt with half an Ounce of White Sugar, beginning to take it when the Moon begins to decrease, or presently after the Full. It also is said to cure Pusthes, Borches, Boils, and Swelling Pimples in the Face and other Parts.

XII. The Ashes. They are made by a simple and naked Calcination in an open Fire; or of the Caput Mort. at the bottom of the Retort after the Spirit and Volatile Salt are ascended or drawn off. Mixed with a little Wine, it is used to clear the Eye-sight, and to cure them when Blood-shot, or troubled with a Rheum or Watering.

XIII. The Powder of the small Stones in the Sponge. It is given to such as are troubled with Stone, Gravel, Sand, and Tartarous Mucilage in the Reins and Bladder: to help to break the Stone, and to cause it to pass away with the Urine. Dose a Dram morning and night in a Glass of White Wine, &c.

XIV. The Volatile Spirit, Salt and Oil of Sponge. They are made by distillation in a Glass Retort; Take as much Sponge as you please, cut it very small, put it into the Retort, which place in a close Reverberatory, with its receiver: Lute the juncture well, and give Fire Gradatim, like as in distillation of Tartar; and continue to increase it by little and little, till the white and Oily Clouds begin to come, and that you see the Volatile Salt does Sublime, and stick to the sides of the Receiver; continue the fire in the same degree, till all is come forth, and the Receiver grows clear of its self. Then waste the fire, and all being cold, take away the Vessels, pour out the Spirit and Volatile Salt together, and separate the Oil by a Funnel, or some Cotton, which keep in a Glass by its self. Put the Spirit and Volatile Salt into a low Glass Body, and rectify them in Sand, keeping them together. This Spirit is a singular Lithontriptick, or breaker of the Stone. The Salt also is good to break the Stone in the Reins and Bladder. It is powerful also to discuss and cure all Strumous Swelling or Kings-Evil, in the Neck or any other part, being given from gr. 6. ad 16. in any proper Vehicle. This Volatile Salt and Spirit of Sponge are said to be some of the greatest Specificks in Nature for the Cure of the King-Evil, being given morning and night in the proportion aforesaid, in any proper Vehicle Universals being premised. And indeed the Spirit, Volatile Salt, and foetid Oil of Sponges, are not only excellent against the Evil; but also to dissolve and cure the Bronchocele, which is a Bunch or great Swelling round the Throat, to open Obstructions in the Reins, Ureters, and Bladder, to break the Stone, and to expel it, as also Sand, Gravel, and the like from the Urinary parts. By following these Medicines for some time, you will daily and evidently see these Scrophulous, Strumous, and Bronchocele Tumors to decrease and vanish to nothing. In the Distillation, part of the Volatile Salt will arise and stick to the Top and Neck of the Retort, and part of it will mix, and be dissolved in the Spirit. You may rectify each a-part if you so please, or dissolve all the Salt in the Spirit, and rectify them together from the Oleaginous particles, as we have in many places taught in Our Sepialum, or Druggists Shop. The Cal-

cind Sponge at the bottom of the Retort may be reduced into Powder or Ashes for the purposes at Sect. XII. aforesaid; and it may also serve to stop violent Fluxes of the Blood. From the Caput Mortuum, as it is left in the bottom you will get but little fixt Salt, without a new and open Calcination, and therefore it is necessary to Calcine it again in a Crucible till it is white, after which you may draw forth the said fixt Salt after the Vulgar Method. This fixt Salt is of the nature of other fixt Alkalies, as Salt of Tartar, Salt of Oyster-shells, and the like, and may be given in the same Cases à gr. 12. ad 24. in Arimart, Parfly, or Onion Waters, against Obstructions in the Reins, Ureters and Bladder, Stone and Gravel, and to absorb Acid humors, which are the causes of many pernicious Diseases. See more at large hereof in the Third Edition of Our Pharm. Batteana. Lib. 1. Cap. 2. Sect. 33. and Cap. 10. Sect. 40. where you will find much satisfaction.

XV. The Compound Powder. Take Powder of Sponges, Powder of Sows or Hog-Lice, ana, an Ounce, Powders of Crabs-Eyes and Winter Cherries, ana, half an Ounce, mix them. Dose from 2 Scruples to 4, or a Dram and half in Wine, Ale, Arimart or Parfly Water, sweetened with Syrup of Marsh Mallows, against the Stone, Gravel, Strangury, Kings-Evil, Bronchocele, &c. to be given morning, and night, &c.

XVI. Pledgets or Tents made of Sponge. The Sponge being Dipt into a thin Gum Water, is then to be squeez'd hard, and press strongly in a Press, and so kept till they are perfectly dry, and then to be cut out into Tents, or Pledgets, of what form or bigness you please. They are put into hollow Ulcers which are ready to close, before they are thoroughly cleansed, and to open and widen the Orifices of Fistulas, hollow Ulcers, &c. a Thred being first tyed to them before they are put in, thereby to pull them out again.

CHAP DCLIV.

Of SPURGE Garden.

I. THE Names. It is called by the Arabians, Mandana, and Mahendane: in Greek, Ἀδύων: in Latine, Lathyrus, and Cataputia minor (because the Seed of Ricinus or Palma-Christi in Chap. 656. following, is called Cataputia major) and in English, Garden Spurge.

II. The Kind. There are above half a hundred particular sorts of this Plant, but we in this work shall not take notice of above Eight Generic Species thereof, and under each of their Titles, we shall Treat only of such as either grow and are Nutt up in Our Gardens, or Grow Wild abroad in Our Fields, Woods, Marshes, &c. or are found growing in Our West-India Plantations, and American Islands. 1. Ἀδύων, Lathyrus, Cataputia minor, Garden Spurge, of which in this Chapter. 2. Πιτυύσα, Pityusa, Esula, and Esula minor, small Spurge, of which in Chap. 655. 3. Χερύς, Kherus, Cici, and Croton, Ricinus, Palma-Christi, Great Spurge, of which in Chap. 656. 4. Θυμέλεα, Mezereon, Chamælea Germanica, Thymela, Spurge Olive, of which in Chap. 657. 5. Τίθυμαλὸς ἡερακίς, Tithymalus, Tithymalus Charac-

cias, (i.e. Vallaris, because it usually grows in Valleys and low moist places.) Wood Spurge, of which in Chap. 658. 6. *Tithymalus Palustris*, five *Efula major Germanica*, Marsh Spurge, or Greater Efula, of which in Chap. 659. 7. *Tithymalus palustris*, *Lactaria, herba Lactaria*, Sea Spurge, of which in Chap. 660. 8. *Sarcocolla*, *Laureola*, Spurge Laurel, of which in Chap. 661. following: of all which in their order.

III. The Kinds of the Garden Species. The most common are these three, viz. 1. *adversus*, *Lathyrus major hortensis*, *Cataputia minor*, The Greater Garden Spurge. 2. *Lathyrus minor hortensis*, *Cataputia minor*, The lesser Garden Spurge. 3. *Lathyrus minima*, *Lathyrus minor Dalechamplij*; *Lathyrus minor flore conglomerato Bauhini*, The smallest Garden Spurge, and this very probably is the *Cataputia pusilla Cesalpini*. The Name Spurge, is supposed to be derived from its Purging Quality, it being an exceeding great and very Vehement Purger.

The Descriptions.

IV. The first, Or Our greater Garden Spurge. Its Root is long and Woody, perishing as soon as its Seed time is over, and springs again every year of the Seed of its own Sowing. It rises up with one hollow straight whitish Stalk, of a fingers thickness, shadowed over as it were with a brown color; on which grow up to the Top for the first year, many thick fat long and somewhat narrow Leaves, of a bluish green color on the upper side, and more whitish underneath, something like unto Willow Leaves for the form, which being cut or broken yield Milk as plentifully as any of the other Spurges. The next year after, it spreads it

Spurge Garden.

self into many small Branches, with smaller Leaves at every partition, every part whereof yield Milk as the others do. The flowers are of a Pale yellow color, and stand in Cups, as the other kinds do, but are smaller than some of them, yielding sweet, and nothing near so hot and burning Seed, which is enclosed in Triangular heads or husks, something like to those of Palma Christi, but rounder and larger, than in many other of the Spurges, which in the hot Sun (the heads or husks cracking or dividing) will fall out of their own accord.

V. The second, or Lesser Garden Spurge. This in its Roots, Stalks, Leaves, Branches, Flowers, Seed and form and manner of growing is wholly like the former, saving that in every part thereof it is lesser, and can only be discriminated from it by that very sign, and by which it is distinguished from the other.

VI. The third, or Smallest Garden Spurge. Its Root is small, having many Strings with Fibres adjoining to them. It springs up with many slender branches lying on the Ground, set full of small Leaves, no bigger than those of Knotgrass, from among which rises up a Stalk, about a Foot high, having many other Branches springing from it, almost from the bottom to the top, which are set full of such like small Leaves, as grew below.

Spurge Garden Smallest.

At the Tops whereof come forth many flowers, which are small and yellow, clustering thick together, upon small Footstalks, but not spread abroad like the former. The Leaves and Stalks of this yield a Milky juice like those foregoing.

VII. The Places. These all grow in some places Wild about the borders of Fields; but for the most part in Gardens almost every where, in which when they are once Planted, they do not easily quit their habitation.

VIII. The

VIII. *The Times.* They all flower about the latter end of *June*, and throughout *July*, and their Seed is ripe in *August*.

IX. *The Qualities.* They are hot and dry in the fourth degree, Cathereticks, and very strong Emeticks and Catharticks. Of which the Seed is for the most part in use with us, to purge with, both by Vomit and Stool.

X. *The Specification.* Spurge is proper against the Scurvy, Dropsy, Jaundice, Gout, and Rheumatism arising from a Cold cause.

XI. *The Preparations.* You may have therefrom. 1. A Liquid Juice or Milk. 2. Troches of the Juice. 3. A Decoction in Wine or Water or Broth. 4. The whole Seed. 5. A Distilled Water of the whole Plant.

The Virtues.

XII. *The Liquid Juice or Milk.* It works more Violently than the Seed, and therefore is scarcely fit to be taken inwardly, but to be outwardly applied, and that carefully too; and so it is a depilatory, and helps to take away hair on the Eye-brows, Fore-head, Temples and other parts; but it ought not to touch any other part of the Face or Skin. Being also Cautiously applied, it takes away proud and dead flesh in Wounds, hard Callous substances, Knots, Corns, or Warts in the flesh (if they be first pared to the quick, and then applied) It is also good against running Scabs and Sores, as also to obliterate Scars, Spots, and blemishes or other marks of the Skin. If it is put into an hollow Tooth, (which you must do with thar Caution, so as it may touch no other Tooth, Gums, nor Mouth) it will ease he Pain thereof.

XIII. *The Troches.* If the Milk is made up into Troches or little Balls, with Meal or flower of Beans, Pease, Barly, or Wheat, and kept dry, it will serve all the Year to use, as occasion is offered for the purposes aforesaid.

XIV. *The Decoction in Wine, Water, or fat Broth.* It has all the Virtues of the Liquid Juice, but much more gentle, and is good to remove most external deformities of the Skin. Taken inwardly it works to some purposes (as in the Scurvy, Dropsy, Jaundice, Gout, Evil, and Rheumatism,) more safely than the Seed, and somewhat more weakly.

XV. *The Seed.* It is given 5, 7, 9, or 10 grains or Seeds at a time, according to the Age and Strength of the Patient, which purges both ways, viz, both by Stool and Vomit, and evacuates rough Flegm, Cholera, Melancholy, and Water as *Dioscorides* says, and so cures those diseases caused by the abounding of those humors. The usual manner is to swallow the Seeds whole, without breaking either Husk or Kernel, and then they work the more gently and weakly: but if the husks are broken, and the Kernels swallowed whole or Chewed, or otherwise bruised and mixed with Drink or Broth, they will then work the more violently, and therefore are to be taken with the more Caution.

XVI. *The Distilled Water of the whole Plant.* It is of an especial use to cleanse the Skin from Freckles, Scurff, Morpew, or any other discoloring, defilement or deformity of the Skin, used either by it self, or mixed with Bean flower or Bastard Dittany, or Crowfoot water, being gently Bathed on the affected places, removing the Dis-

affections of the parts in a short space of time. The simple water is also profitable against putrid and foul Ulcers and running Sores.

Nota. *The Garden Spurges are said to be essential for all the purposes to which the Palma Christi or greater Spurge may be applied.*

C H A P DCLV.

Of S P U R G E *small,*

OR,

E S U L A *small.*

I. *THE Names.* It is called in Greek Πιτυσα: in Latine, and in the Shops *Esula*, *Esula minor*, *Pityusa*, (as if it was a Pine Spurge:) and in English, *small Spurge* and *small Esula*.

II. *The Kinds.* There are Twelve or Thirteen several sorts of this Plant, but the five following are chiefly known to us, viz. 1. *Esula minor*, *Esula rotunda*, *Esula minor rotunda*, *Peplus* round headed Spurge. 2. *Esula minor*, *Pityusa minor*, *Tithymalus pinea*, *small Esula* or *Pine Spurge*. 3. *Esula Cyprina*, *Cyparissias vulgaris*, *Tithymalus Cyparissias vulgaris*, Our Common Cypress Spurge, or Welcome to our House. 4. *Esula five* *Tithymalus Helioscopius*, *Esula solisegua*, Sun Spurge, because it follows the motion and course of the Sun. 5. *Esula exigua* *Tragi*, *Peplus minor* *Dalecampij*, *Tithymalus Leptophyllos* *Mattbioli*, Dwarf Spurge, or small Annual Spurge.

The Descriptions.

III. The first, or Round headed Spurge. Its Root is small and long, with many small Strings and Fibres at it, perishing every year, and rising again

Spurge round headed small, or Peplus.

of its own Sowing. It shoots forth round about the Root, many small weak reddish upright branches, with small Leaves set by Couples for the most part, somewhat like to the Leaves of the Sun Spurge at Sect. VI. following, but rounder pointed, and smaller, of a grayish green color on the upper side, and a little reddish or purplish underneath, which will oftentimes change to be wholly Purple, in the Summer time. The flowers are very small and yellow, standing more round or close together, as it were in an Umbel, otherwise like unto the rest. The Seed is very small and contained also in a kind of Triangular heads. There is another sort of this with red flowers.

IV. The second, or small Esula, or Pine Spurge, (which is thought to be *Rulandus* his Esula.) Its Root is small and long, of the bigness of ones finger, something blackish on the outside, but white within, and abiding many years; yet the Extremity of Winter does sometimes rot it, and cause it to perish. The Root of this Esula, is accounted by the most learned Physicians to be the true Esula minor and that out of which the *Extractum Esulae Rulandi* is to be made. This small Spurge has divers weak and slender Stalks, half a yard high, on which grow many small, long, and narrow pointed Leaves without order, round about them, very like unto the Leaves of Tond-Flax; at the Tops of the Stalks grow yellow flowers, sometimes dasht over with Purple, like some of the other Spurges, but lesser, and growing in the like Caps: which falling away, the Seed comes after, which is small and round and contained in Triangular heads or husks.

V. The third, or Our Common Cypress Spurge. The Root of this is very like the second kind just before described, inasmuch that many have mistaken it, for the true Esula minor out of which the *Extract* ought to be made. And have used it instead thereof. But this Cypress Spurge is so like to that Pine Spurge, that it has deceived many, who have not carefully view'd it, and observ'd the differences: for this has also several slender brownish Stalks, on which grow small narrow Leaves, but something shorter and thicker than those former, and thicker set upon the Stalks. And in its Flowers and Seed, it is like the same also.

VI. The fourth, or Sun Spurge. Its Root is small and Threddy, perishing every year after Seed time, and rising again of its own Sowing. It has for the most part but one reddish Stalk, half a yard high, bare of leaves at the bottom, almost half way upwards, and then spreading it self into two or three small Branches, on which grow Sparsedly divers yellowish green Leaves, smaller at the bottom, and broader at the ends, something like unto Purslane Leaves. The flowers are yellow like unto the rest, standing in hollow Cups of two Leaves a-piece, the Stalk running through them, as is to be seen in most of the others. The whole Top or head of flowers is said to turn with the Sun, (whence the Name *Tithymalus Helioscopius* five Solis-equius.) The Seed is small and round, contained in like Triangular heads as the former.

VII. The fifth, or Dwarf Esula, or small Annual Spurge. Its Root is small, long, hard, and Woody, perishing every year, as soon as it has given its Seed. It has many small slender weak Stalks about two handfuls high, bushing forth into many Branches, and spreading far upon the Ground: on which grow very small, long, and narrow Leaves, standing upright, and which grow pretty thick thereon, which oftentimes are not sharp but flat pointed; the uppermost whereof are somewhat broad at the bottom, and compass about

the Stalks, ending in a long sharp point for the most part. The flowers are yellow like unto the others, and very small, after which come Triangular heads, which are small and contain small round grayish Seed, not much bigger than Poppy Seed.

VIII. The Places. The first grows in Vineyards in France, as also in Ditches and borders of Fields: Gerard says, it grows in Salt Marishes near the Sea, as in the Isle of Thanet by the Sea side, between Reculvers and Margate, in great Plenty, it also grows in many of Our Gardens. The second and third grow in some places in Germany and France, both by Rivers sides and borders of Fields, but with us only in Gardens. The fourth, grows wild with us in many places, Gerard says, it grows in barren and waste grounds, and in earable Land, almost every where. The fifth grows in many Chalky grounds in dry hilly places, as also in our Cornfields.

IX. The Times. The third kind commonly flowers in May; all the others in June, July, and August, and their Seeds are ripe in the months following.

X. The Qualities. Esula is hot and dry in the fourth degree; Inflaming, Catheretick, strongly Emericck and Cathartick; of these the second kind is chiefly used.

XI. The Specification. The Seed and Root are chiefly in use with us, and are good to evacuate Viscous humors of all kinds, and Cure the cold Scurvy, Dropsy, Jaundice, Evil, Rheumatism, Sciatica, and Gout. The Milky juice has all the Properties but much more violent.

XII. The Preparations. There are of Use, 1. The whole Seed. 2. A Decoction of the same in Fat Broth. 3. The Root prepared. 4. The Milk or Juice. 5. Pills of Esula. 6. A Distilled water of the whole Plant. 7. A Powder of the Seed and Leaves. 8. An *Extract*.

The Virtues.

XIII. The whole Seed. They may be given hull'd from 3 to 8 (tho' *Dioscorides* says they may be taken to a dram, which is too large a Dose by much for our English Constitutions) against the Scurvy, Dropsy, Sciatica, Gout, Rheumatism, pain in the Stomach, and Hypochondriack Melancholy, they both Vomit and Purge briskly and expel Water, Flegm, Melancholy, Choler, and other Viscous humors and Tartarous matter from all parts of the Body.

XIV. The Decoction of Seed or Leaves in Fat Broth. By Bathing with it, it cures the Stings or Bittings of Scorpions, Hornets, Serpents, and other Venomous Creatures, and purges strongly downwards Choller and Flegm, eases the pains and takes away the hardness of the Belly, and swelling of the Breasts. And is singular against the Dropsy, Sciatica, Rheumatism and Gout, being taken every other morning inwardly.

XV. The Root prepared. It is done by bruising it, and steeping it in Vinegar, and so reducing it to powder. *Dioscorides* says, it may be given to 2 Drams: but I am satisfied that given from half a Dram to a Dram, according to Age and Strength may be a sufficient quantity: it may be given in Mead or Honied Water, for all the purposes aforesaid.

XVI. The Milk or Juice. It is dangerous to be taken inwardly: but outwardly, it is good against the Stinging of Scorpions and Hornets, the Bittings of Serpents, Mad Dogs, &c. and applied to Warts,

Warts, Corns, and other Excreſcencies, it takes them away. And mixed with a ſufficient quantity of Honey, it is good to clear the fight, help dimmeſs of the Eyes, watering and running of them, and to take away Films or Scars growing in them. The Juice is made by beating in a Mortar and Expreſſing it; but *Dioſcorides* ſhews us another way of doing it: Thus. Beat the Roots, and put them into a Veſſel full of water, ſtirring or beating them well therein, and with a feather gather the uppermoſt upon the Water, which being dried and kept, ſerves for the uſes aforeſaid, and for thoſe which have the Dropſy.

XVII. *Pills of Eſula.* Take the Root prepared by ſleeping a night and day in White Wine Vinegar, reduced to Powder, an Ounce: Aloes two Ounces: Muſtick 2 Drams: all being in Powder make them up into Pills with Fennel Water. Doſe from a Scruple to 2 Scruples. *Tragus* ſays, theſe Pills are good againſt the Dropſy, and ſuch as are ſhort winded, and may be taken without pain or danger.

XVIII. *The Diſtilled Water of the whole Plant.* It makes a good Waſh againſt Tanning, Sunburning, Yellowneſs, Freckles, Lentils, Scurf, Morpew, and all other kinds of diſcolorings and deformities of the Skin, it being waſht therewith 3 or 4 times a day; the Pores of the Skin being firſt opened, by waſhing with warm Water. It may be made much more potent, if a little of the Juice be added thereto.

XIX. *The Powder of the Seed and Leaves.* They are firſt to be prepared by ſleeping them in ſtrong White Wine Vinegar, then drying them, and afterwards reducing them to Powder by beating. *Diaſcorides* ſays, the Powder may be given to 3 Drams; but in our Climate, if it is given from half a Dram to a Dram it will be Doſe large enough. It is given againſt the Dropſy and Gout.

XX. *The Extraſtum Eſule Rulandi.* It has all the former Virtues; and may be given from a Scruple to Dram, with fat Broth, according to Age and Strength. With this *Rulandus* did wonders, and almoſt incredible Cures in the moſt rebellious, inveterate, and deplorable Diſeaſes.

mon Great Spurge, or vulgar Palma Chriſti. For the Seed of this Plant is for the moſt part called *Cataputia major*; and by ſome *Ficus infernalis*: and its Oil in the Shops is called *Oleum de Cherva*, and by ſome, *Oleum Cicinum*. 2. *Ricinus minor*, *Palma Chriſti minor*, The leſſer Species of the great Spurge, or Palma Chriſti: the Seed of this which *Parkinſon* firſt ſaw, he ſays came from *Bermudas*, where they made Oil thereof. 3. *Ricinus Americanus*, *Curcas Indorum*, The American great Spurge, or Palma Chriſti.

The Descriptions.

III. The firſt, more Common Great Spurge or Vulgar Palma Chriſti. Its Root conſiſts of long and great ſtrings and ſmall fibres, which with us periſh quickly after it has felt the firſt Froſts, and muſt be ſet new every year by ſuch as will have it, but abides all Winter in Warm Countries which have no Froſt. This great Spurge ſprings up in our Country, to be Eight and ſometimes Nine or Ten Feet high, with a hollow Stem, as big almoſt as our Ordinary Canes, of a browniſh color, with an Eye of blew hoarineſs upon it. The Leaves which ſtand upon the Stem, and upon the branches it ſends forth every one ſeverally on all ſides upon long Footſtalks, are very broad or large,

Spurge great common: or Palma Chriſti.

and divided into 5, 7, 8, or 9 parts or diviſions (repreſenting the hand of a Man with the fingers ſpread abroad, of a dark or deep green color on the upperſide, and of a whitish green underneath. The flowers are many round buttons, ſhooting forth together, and ſtand all along upon a long
6 Y Stalk,

C H A P. DCLVI.

of SPURGE Great,

OR,

PALMA CHRISTI.

I. **T**HE Names. It is called by the Arabians, *Cherva*, and *Kerva*: in Greek, *Κίχρα ἡ Κέρμα*, *Cici* and *Croton*, à *Crotonis* ſive *Ricini animalis ſimilitudine*, quod reſert ſemen: *Arias Montanus* in his Commentary upon *Jonas Cap. 4.* ſays, that this Plant is ſignified by the Hebrew word *Kikajon*, tho' in our Bibles it is tranſlated a Gourd. In Latine *Ricinus*, *Palma Chriſti*, *Cataputia major*, *Granum Regium* by *Meſues*; and by ſome, *Pentadactylus*. In Engliſh, *The Great Spurge*, and *Palma Chriſti*.

II. *The Kinds.* There are ſeveral ſorts of this Plant, but the chief are, 1. *Ricinus*, *Cataputia major vulgarior*, *Palma Chriſti*, The more Com-

Stalk, at the Tops of the Stem and Branches, consisting of many pale yellow Threads, which fall away without bearing any Seed, but farther or higher up, upon the Stem, or main Stalk, and sometimes upon the Branches, break forth other heads, which are the Seed, upon long Footstalks, being Triangular, rough and ascolored on the outside, or outward shell, which opening it self, or being opened, there lies within it the Seed, whose outward husk is discolored, or as it were spotted and shaped like unto a Tick or Pike, which contains within it, a pretty large, round, somewhat long and flat shining Seed, of a brown color, having a white Pulp or Kernel within it, of a fiery hot Taste, burning the Mouth and Throat of such as eat it, but very Oily, and from which (in the West-Indies, as in Carolina, &c.) they press forth an Oil, which is used for External purposes, and serves also to burn in Lamps, but is hurtful to be used with foot, as Dioscorides says; and yet I have been told by some in those West-Indies, that they eat it as Oil Olive, without any hurt or detriment; this may be true for all that I know, and yet I should be loath to make the Experiment.

IV. Gerard describes it after this manner. Ricinus, Palma Christi or Kik, from a long well branched Root, springs up with a great round hollow Stalk, five Cubits or seven or eight Feet high, of a brown color, dyed of a blewish Purple upon green. The Leaves are great and large, divided into several sections or parts, fashioned like unto the Leaves of a Figtree, but greater, and spread wider open like a Mans hand. Towards the Top, there comes forth a bunch of flowers clustering together like a bunch of Grapes, of which the lowermost are of a pale yellow color, and wither away without bearing any fruit, but the uppermost are reddish, bringing forth three cornered heads or husks, in which are contained the Seed as big as a kidney bean, of the color and shape of a certain Vermin which haunts Cattel, called a Tick or Pike.

V. The second, or lesser Species of the Great Spurge or Palma Christi. It is like the former, but lesser in every part, altho it grow in the same ground, whose Seed being ripe is manifestly much lesser than that of the former. This Plant Clusius in his Exoticks, Lib. 2. Cap. 21. has taken notice of; and Bellerus in his Hortus Eystettensis, has largely prefigured.

VI. The third, or American Great Spurge, or Palma Christi. This differs from the two former sorts, not only in the greatness, but also in the form; for as Monardus and Aldinus say, it grows to be much greater than any growing in Spain, whose first Leaves are almost round, and larger than those of the first Species, but those which follow are broad like to the Palm of an hand, and cut in or Torne on the edges for the most part into five divisions, something resembling or answering to the five fingers of a hand (whence probably came the Name Pentadactylus, and is an appellation more proper for this Species, than for either of the former.) In the Seed there is some difference also, which tho' the heads or husks are Triangular as other Spurges are, and the former Ricini, yet the outward husk is not prickly or rough, but smooth, and of an Ash color, the innermost Seed is self being somewhat like the former but more black, and not spotted at all, and is full as Oily as the first before described, and of which a great quantity of Oil is made for outward uses. Its sub-

stance is woolly and is of the magnitude of a Hedge Sbrub.

VII. The Places. The first grows with us in England in our Gardens, and was brought to us from America: but it grows also in the hotter Countries of Europe, Asia, and Africa, as in Syria, Egypt, and other parts adjacent to them, where as Bellonius in *Osferout*, lib. 1. cap. 18. says, the Stalk grows to be as big as the Body of a Man, and as Tall as a reasonable great Tree, whose Seed cannot be gathered without a Ladder, its leaves not falling away in Winter; nothing of which we know in our Colder Climates. This Syrian or Egyptian Seed contains a violent heat in it, for the half part of one Seed being taken by a strong young Man of about 20 Years of Age, very much troubled with the Head-ach, purged him very forcibly and eased the Pain: But by accident chewing the Seed in his Mouth (which he ought to have swallowed whole without Chewing) it so vehemently inflamed his Chaps and Throat, and Mouth of the Stomach, that it put him into a Fever and gave him an intolerable Thirst with a Fainting of the Spirits, which continued for the space of nine days, and then he dyed, notwithstanding he was under the care of three Physicians, who used all the means imaginable. The second and third kinds, grow in several parts of America; the second in particular I found in some Plantations in South Carolina, and Parkinson says, his first Seed thereof came from the Bermudas, as before is hinted.

VIII. The Times. With us in England they are Sown in the beginning of April, and flower in the end of July and beginning of August, their Seed being ripe towards the latter end of the same Month.

IX. The Qualities. The Seed is only used being hot and dry in the fourth degree. It is inflaming, extremely Attractive, and strongly Emetick and Cathartick.

X. The Specification. It is peculiar for the Cure of a cold Scurvy, Cephalalgia, Dropsy, Jaundice, Scrophula, Sciatica, Rheumatism and Gout.

XI. The Preparations. You may have, 1. The hull'd Seed. 2. A Decoction thereof in Broth. 3. An Expressed Oil of the Seed. 4. A Cataplasim.

The Virtues.

XII. The hull'd Seed. Dioscorides says, that 30 Seeds freed from the Husks, being bruised and taken in Drink, or other proper Vehicle, does purge choler, water and flegm, and expel Aqueous humors abundantly from the Belly, provoking Urine also; but as Dioscorides himself confesses, it troubles the Stomach, and overturns it mightily; yet with good Advice it may be given to strong and Vigorous Bodies, corrected with Aniseed, Carraways, Fennel Seed, or Winters Cinnamon; and so may be given to such as are troubled with the Dropsy, Sciatica, Gout, Rheumatism, Kings-Evil, Melancholy, Jaundice, Madnes, &c. because it draws water and flegm strongly from the remote Parts. Costeus in his Commentary upon Mesues, thinks that the Dose of 30 Grains or Seeds to be a fault in those who Copied out Dioscorides, setting down 30 for 3, which latter number is the utmost Dose, which may be safely given. Clusius says, he knew divers Empyricks give of the small Seed, which came out of

of *America*, in a small quantity, as a Purge in many Diseases, which they held as a secret of Worth, because by its purging the Body well, they found it a great Remedy.

XIII. *The Decoction of the Seed in Cock Broth.* It is good for all the purposes of the hull'd Seed before related, the Dose of which is to be regulated according to the number of the Seeds.

XIV. *The Expressed Oil of the Seed.* *Durantes* says, put into Clysters, it opens obstructions of the Bowels, expels Wind, eases the Colick, and helps Fits of the Mother. *Monardus* says, the Oil of the *Indian Seed*, is found by daily Experience to Cure all diseases proceeding from Cold Causes, dissolve Tumors or Swellings, diffuses Wind, eases the Colick and Mother, if the places grieved be anointed therewith, and some few drops of it be taken in fat Chicken Broth. It wonderfully helps the Cramp, and Convulsion of the Nerves, and shrunk up Sinews, being anointed upon the places: It eases the Spleen, opens its obstructions, and takes away the hardness of the Belly by anointing the Sides and Belly therewith; it also helps Scabs and running Sores of the head, and cleanses the Skin from all manner of Spots, Blemishes, Scurff, Morpew, and other Deformities thereof. A Drop two, or three, given to Children troubled with the Worms, in Milk or Fat Broth, it kills and expels them. And Dropt into the Ears, it cures deafness and takes away the Pain, Noise, or Ringing therein.

XV. *The Cataplasim of the Green Leaves.* Applied of themselves, or Beaten up with Barly Meal or Flower, it cools and allays Inflammations and Swellings of the Eyes; and applied to Womens Swoln and hard Breasts after lying in, it softens them, abates the Tumor or Swelling, and dissolves the Coagulated Milk, making it to run, or be drawn freely.

are Berries of differing Species, yet are much of one and the same nature, and have the same Cathartick qualities. 4. *Chamaelea alpina incana Lobelij;* *Chamaelea altera* & *Italica Clusii*, Mountain Spurge Olive.

The Descriptions.

III. The first, or Our Mezereon, Dwarf Bay, or Dwarf Olive, called also Flowering Spurge Olive. Its Root spreads out into many ramifications and long tough branches, which are covered with a yellow Bark. It rises up with a thick woody Stem two or three Feet high, and sometimes higher, according to the goodness of the Ground: of the thickness (if they be old) of a Childs or Youths Wrist, at the Ground, which rising up, spreads it self out into many tough flexible or Limber Branches, covered with a tough grayish Bark or Rinde, beset with small long Leaves, something like

Spurge Olive or Mezereon.

C H A P. DCLVII.

OF SPURGE Olive,

OR,

MEZEREON.

I. *THE Names.* The Arabians call it *Mezereon*, or *Mesereon*: the Greeks *Θυμιαμα* in Latine, *Thymelaea*, (*quasi Thithymelaea, ex Thithymalo & Olea deducta*) *Chamaelea*, and *Mezereon*: in English, *Spurge Olive*, and *Mezereon*.

II. *The Kinds.* Authors make many Species of this Plant; we shall only Treat of the four following, viz. 1. *Mezereon*, *Chamaelea*, *Germanica*, *Camerarij* & *Dodonaei*; *Daphnoides Eufhj;* *Daphnoides nostrum vulgare Gesneri*; *Laureola femina Lugdunensis*; *Piper Montanum Anguilare*; *Lauras Pustilla*, & *Mesereon Germanicum Lobelij*: Our *Mezereon*, Dwarf Bay, or Dwarf Olive. 2. *Mezereon verum Arabum*, *Chamaelea vera*, *Chamaelea triccocos*, *Widdow Waile*. 3. *Thymelaea*, *Mezereon* also by the Arabians, for they promiscuously call this Species by this Name, with the *Chamaelea* of all Kinds, *Spurge Olive*, or *Spurge Flax*. The Berries of this, as also of the first kind, are called by the Greeks: *ἀκκος κρινδύς*, and in Latine, *Coccum Cnidium*, which tho' they

unto Privet Leaves, but smaller, paler, thicker, and fatter, and rounder pointed. The flowers appear before the Leaves, oftentimes in January and February, clustering together about the Stalks at certain distances, which are small, consisting of four Leaves, very many growing together, and breaking out of the Branches (as it were) by themselves, of a whitish color tending to Purple, and of a fragrant pleasant sweet smell. After the flowers are past come the Berries, which are at first green, but being ripe, of a shining red color, which if they stand too long upon the Branches become of a blackish red, of a very hot and burning taste, inflaming the Mouth and Throat with danger of Choking.

IV. The second, or Widdow Waile. Its Root

spreads its self in the Earth, but not very far, being of a hard and Woody substance, which easily perishes, if it be not carefully defended from the Extremity of sharp Winters. It has no great Stem, but a small shrub of about three Feet high. The whole Plant spreads it self from the Ground, into many flexible tough green Branches, with many small twigs, on which stand several small, narrow, long, dark, green Leaves, like Privet, but smaller and blacker, which abide green all the Winter. The flowers grow at the ends of the Branches and are very small, scarcely to be seen, of a pale yellow color, and come forth between the Leaves and the Stalk, made of three Leaves apiece. Which being past there comes a small, blackish triangular berry, very like to the Tithymales, three usually set together, for which reason the Plant is called *Tricocos*. These Berries are green at first, afterwards red, and brown, when they be withered: which contain in them an Oily fatness, like that of the Olive, and are of a hot biting taste, burning the Mouth and Tongue, as do also both the Rinde and Leaves.

V. The third, or Spurge Olive, properly so called, or Spurge Flax. Its Root is soft and tender whilst it is young, very like unto a Radish Root as Clusius says; but woody when it is grown elder, covered with a tough thick bark. It rises up with divers tough Stalks, a Cubit or two Feet high, sometimes in very good ground a yard high, of about the thickness of ones thumb, covered with an Ash colored bark, and spread out into many Branches, covered round in a manner with Leaves, which are many, small, narrow and long like Myrtle Leaves, or rather like unto the narrow Leaves of the Olive tree, narrower and lesser than the Leaves of Widdow Wail, something like to those of Flax, to which many compare them, but that they are larger and broader, being also clammy, flat, and pointed, continually abiding on the branches, without falling off as those of the Chamælea do. At the Tops of the branches grow many small Starlike flowers, consisting of four white Leaves apiece, after which come small round berries, which at first are green, and when ripe of a red Coral-like color, but are a little more long than round, of the bigness of a Myrtle berry, with a pulp or substance like unto a Hawthorn or Cherry, in which is a white Kernel covered with a black and soft, yet brittle shell or skin. These are very hot and burning in the Mouth, like Mezereon.

VI. The fourth, or Mountain Spurge Olive. Its Root is long, and spreads about, under the upper part of the Earth. It rises up with a small Woody Stem, 3 or 4 or more feet high, branching out towards the Top, into many small slender and tough branches, covered with a rough, hoary and green bark, beset at the ends thereof with flatter, fuller, and smaller round pointed Leaves than the first or Our Mezereon, of a grayish green color on the upper side, and hoary underneath, which fall away before Winter, as Our Mezereon does. The flowers are many, set together at the ends of the branches, greater than the former, consisting likewise of four Leaves apiece, of a light bluish color, standing in small grayish husks, of very little smell. The berries are small long grains, of an excellent red color, which afterwards turn black.

VII. The Placer. The first grows very plentifully in many places of Germany, and naturally in moist and shady Woods in Poland and those Eastern Countries; and in great abundance in most of our English Gardens. The second grows in Spain, and in Provence in France, as also in Lan-

guedock, in rough and desert places, but with us only in Gardens. The third grows in Spain, and in Tuscany in Italy, and about Trent, in rough Mountains, and untill'd places, and in England in Gardens. The fourth grows on the Alps, in the Mountains of Savoy, from whence it has been brought to us, and Nufft up in manured Grounds.

VIII. The Times. The first flowers in December, January and February, and their berries are ripe in August. The second flowers Early in the Spring, as in April and May, and the fruit is ripe in Autumn, as July, August, and September. The third flowers not in Spain till July and August, and its fruit is ripe in September. The fourth flowers in April, if the weather be temperate, and the fruit is ripe in Autumn.

IX. The Qualities. They are all of them in their Roots, Barks, Leaves and Berries, hot and dry in the fourth degree; Aperitive, Inflaming, Attractive, and violently Emetick and Cathartick.

X. The Specification. They are especially good against inveterate, stubborn and rebellious Scorbutes, Dropsies, Jaundice, Scrophula's, Gouts, Sciatica, Rheumatisms, as also the obstructions of the Terms in Women, and Madnes.

XI. The Preparations. You may have therefrom. 1. A Decoction of the Roots or Leaves in Fat Broth. 2. A Powder of the Leaves. 3. Pills of Mezereon. 4. A Juice of the Berries. 5. The Grains or Seeds. 6. The Ointment.

The Virtues.

XII. The Decoction of the Roots or Leaves in Fat Broth. It purges Pituitous and watery humors from the most remote parts of the Body, and that strongly, and therefore is good against the Gout, Sciatica, Rheumatism, Dropsy, Scurvy, Leprosy, Evil, &c.

XIII. The Powder of the Leaves. When the Leaves are grossly beaten, the Springs are to be taken away out of it, and then it is to be reduced to a subtil powder. Dose half a Dram in any convenient Vehicle: if given to a Dram, it works as strongly as Colocynthis, but it does wonders in inveterate and rebellious Diseases, being effectual for all the purposes for which the former Decoction may be given. The fine Powder may be kept all the year, if it be made up into Troches, or Balls, with a little Spanish Juice of Liquorice, and then carefully dried.

XIV. Pills of Mezereon. Take of the Powder one Ounce: Wormwood in Powder 2 Ounces; with Honied Water make a Mass of Pills, which dry carefully. They dissolve not in the Stomach or Belly, but are for the most part voided whole. Mesues makes them thus. Take Powder of Mezereon Leaves; Pulp of yellow and Chebula Myrobalans, of each an Ounce: with Manna and Pulp of Tamarinds dissolved in Endive water make a mass of Pills. These Pills are commended against the Dropsy, and Gout: they expel watery and Tartarous humors, but work violently.

XV. The Juice or Pulp of the Berries. Given to half a Dram in Wine, or Broth which is better, it purges abundantly all watery humors, and has all the Virtues of the Decoction and Powder aforementioned. If taken alone it burns the Jaws and Throat, and therefore it ought to be swallowed in Honey or in a Raifon Stoned.

XVI. The

XVI. *The Grains or Seeds.* Taken to 20 grains as *Dioscorides* says, they purge by Stool, Choler, Flegum and Water: but unless taken in a Raifon they burn the Mouth and Throat: for some persons half this Dose may be sufficient, and to some others too much. It Cures Melancholy and Madnefs. They ought to be used with Caution, otherwise the Medicament may be dangerous, and therefore not to be taken without Correctives.

XVII. *The Balsam.* It is made of the Powder of the Leaves mixt with Honey. Or, It may be beaten up with a little Nitre and Vinegar. It opens Crufty Sores, and cleanses and heals Old and Filthy Ulcers.

C H A P. DCLVIII.

OF SPURGE Wood,

O R,

T I T H Y M A L.

I. *THE Names.* It called by the Arabians *Kausfer*, and *Erbula*, also *Ethutia*, and by *Mefucs*, *Scebran* and *Alfecbran*: in Greek *Τιθύμαλ* & *χαράκις*: in Latine, *Tithymalus*, and *Tithymalus Characias* (i. e. *Vallaris*, from its growing in Valleys and low and moist places of the Woods) also *Tithymalus nemorosus*: in English, *Wood Spurge* or *Tithymal*.

II. *The Kinds.* Authors make 14 or 15 Species of this Plant, but we shall only take notice of the following five, as being most familiar with us, viz. 1. *Τιθύμαλ & χαράκις δρύιδος*, *Tithymalus Characias vel nemorosus vulgaris*, Our Common Wood Spurge. 2. *Tithymalus Characias major*, *Tithymalus Characias legitimus Clusij*, The Greater Wood Spurge. 3. *Τιθύμαλ & Δεινυμίδος*, *Tithymalus dendroides*, *Tithymalus nemorosus minor*, The lesser Wood Spurge. 4. *Τιθύμαλ & μυρτινός* & *μυρτινός*, *Tithymalus Myrsinutes*, Myrtle Spurge. 5. *Tithymalus dendroides Camerarij*, *Gefneri*, *Matthioli*, *aliorumque*, *Tithymalus dendroides frœ arboreus Myrtiformatus non in folijs sed in frutice Lobelij*, *Tithymalus Characias Tertius Dodonæi*, Shrub Spurge.

The Descriptions.

III. The first, or Our Common Wood Spurge. It has for its Root a small bush of Fibres or Threads, spread every way under the Earth, from whence rises up larger Stalks, with several other lesser, a foot and half, two feet or more high, beset with small, long, narrow Leaves, but shorter and lesser than the next following, not much unlike to the Leaves of the Almond-tree, for which reason I suppose, *Lobel* called it *Tithymalus Characias Amygdaloides*; the flowers are yellow, standing in such Cups of Leaves as other Spurges do, after which come Triangular heads; or Seed, Vessels in which the Seed is contained.

Common Wood Spurge.

IV. The second, or Our Greater Wood Spurge. Its Root is long and somewhat woody, spreading it self under ground but not creeping. It has divers

Spurge Wood Great.

tough,

1086. The My. brownish, red branches about two feet high or more, bare or naked of Leaves for a space from the Root, and afterwards set up to the Tops with many narrow and long Leaves, yet broader than those of the Sea Spurge, and nothing so large as the Garden Spurge, almost like to the Leaves of the Almond Tree; something smooth in handling, and without any dents about the Edges, turning reddish in the Spring, and more in the Summer time. At the Tops of some of the Stalks (for all of them do seldom flower at once, being very much branched) stand many yellow flowers, whose under Cups (viz. the two almost round Leaves encompassing the Stalk) are yellow also. After which come small roundish Triangular heads, standing up a little higher in those Cups, than the flowers did upon the Stalks, each head by it self, in which is contained small brownish round Seed.

V. The third, or Our Lesser Wood Spurge. It has a long Root descending deep into the Ground, with several Fibres or Strings springing from it. It is but a small Plant, and has several slender Branches or Stems pretty thick set with Leaves, which are whitish, long, and narrow, much like to

Spurge Wood small.

the first Wood Spurge, but nothing so large, narrower also, and nothing at all hoary. The Umbels or Tufts of flowers are of a greenish yellow, which before they be open'd do represent the long shape or form of a very small Damson, but in its color it is like to the rest of the Leaves; which opening it yields its flowers and Seed, which in color, form, or shape, are like to the former but something lesser.

VI. The fourth, or Myrtle Spurge. Its Root is small and long and accompanied with many Fibres, Strings, or Threds. It has many upright reddish Stalks rising from the Root, about a foot high or more, fat and slender, on which grow without any order many hoary and whitish green Leaves, like

Spurge Myrtle.

in form, but not in hardness to those of Kneehelm, or of the Myrtle bush (whence came the Name) which Leaves are small at bottom, larger in the middle, and ending in a somewhat small and sharp point. The flowers are small and yellow, but not so many, standing at the Tops of the Stalks, like the other Spurges, of which follow like heads and Seed. Dioscorides describes it after this manner. Ramulos (Dixit ille) ab Radice mittit dorantales. Folijs crescit Myrti proximis, sed majoribus, firmis, in Caeumine acutis, & pungentibus. Fructum fert alternis Annis, Nuci similem, mordaci gustu. The Figure We have given you from Matthioli, which is before it comes to its Flowering and Seeding.

VII. The fifth or thurb Spurge. Its Roots are not so great and long as some of the former, yet sufficiently spread in the Ground to sustain the whole Plant, which Lobel compares to a Myrtle Shrub, for its magnitude, and form of growing, but not as to the form of its Leaves. The Stem of this Shrub grows upright to the thickness of a Mans Thumb, almost like to that of the Pine Spurge, from the bottom, being there bare without Leaves for 6 or 8 inches, and then spreads it self forth into divers branches of a fingers thickness, somewhat hairy, and not red as the others, but white; on which grow narrow long Leaves of a whitish color, something like to the Sea Spurge, or rather the Marsh, or Great Efula; having larger yellow Flowers and Seed, but in other points like to the rest of this kind.

VIII. The Places. The first, which is Our Common, kind grows in moist Woods in England, which are dry and warm; I have gathered it in Hornsey Wood near London. The second and third grow in Woods in many parts of Our Land, as also in France and Spain, and in several of Our Gardens.

Gardens. The fourth and fifth, grow with us only in Gardens.

IX. *The Times.* They all flower in the Summer Months, in *June* and *July*; and their Seed is ripe in the Months following.

X. *The Qualities.* They are all hot and dry in the fourth degree; Vehemently Attractive, heating and burning, and strong Emeticks and Catharticks, like the others.

XI. *The Specification.* They are good for the Cure of Dropsies, Gouts, Sciatica, Rheumatisms, Kings-Evil, Leprosy, Leuce, Jaundice, and other like inveterate and desperate Diseases.

XII. *The Preparations.* The *Milky Juice* is the strongest worker; the *Seeds* and *Leaves* are next to them; and the *Roots* of most of them have the same Operation, but not so violent. The *Myrtle Spurge* has the same effects but is weaker, and Vomits not so much. Now from all these you may have, viz. 1. *The Milk or Liquid Juice.* 2. *A Decoction.* 3. *The Grains or Seed.* 4. *A Powder of the outward Bark of the Root.* 5. *An Oil by Infusion or Decoction.* 6. *The Correction.* 7. *A Distilled Water.*

The Virtues.

XIII. *The Milk or Liquid Juice.* It purges with great violence both by Vomit and Stool, Ptituitous and Watery Humors, as also Choler and Melancholy from the Stomach, Bowels, and Joints; Evacuates the Humidities in Dropsies, and takes away the Tartarous matter which breeds the Stone in Reins or Bladder, Gout, Rheumatism, Sciatica, or Kings-Evil; but it Emaciates and Wastes the Body, and if often used, is apt to induce a Consumption. Three or four Drops of the Milk taken fresh, is often put into a Fig, and mixt with its Pulp, and so used by strong Country People to purge them. The Milk put into Hollow-teeth with a bit of Lint, (so as it touch none of the others) eases the Tooth-ach both effectually and speedily. The Milk laid upon any hairy place, takes away the hairs; but it ought not to lye long at a time, and the places afterwards ought to be presently anointed with Oil of Roses or Nighthade. It also takes away Callous or hard Skin, Knots, Warts, Corns and the like, being cautiously applyed, they being first pared near to the quick.

XIV. *The Decoction in Fat Broth.* It has all the Virtues of the Juice, but acts with much more gentleness, and ought to be given in small Dose; first, as in one or two Ounces, and so gradually increased, as you find the Body is able to bear it.

XV. *The Grains or Seeds.* You may give them from 3 to 20, according to Age and Strength, they work roughly and with a great force, and are good against all the Diseases the Milk or Juice is good against.

XVI. *The Powder of the Outward Bark of the Root.* (or of the Leaves.) They ought to be first steeped a day and night in White Wine Vinegar to abate their Acrimony, then dried, and afterwards reduced to Powder. Half a Dram of it taken in Wine or Honeyed Water, purges all watery humors downwards, as also Choler and Melancholy, and is very profitable to be given to such as have the Dropsy, Gout, Rheumatism, Sciatica, Kings-Evil, Leprosy, Jaundice, Stone, Gravel, &c. And

applyed in Green Wounds and Recent Ulcers, it cleanses and heals them.

XVII. *The Oil by Infusion or Decoction.* It is made of the Milk, or of the Herb, Roots, or Seed beaten in a Mortar and boiled in Oil of Butter Almonds to Crispness, &c. repeating the same 2 or 3 times. It cleanses the Skin of all its deformities, as Freckles, Lentils, Tanning, Sun-burning, Discoloring, Yellowness, Scurs, Morpew, and other like defordations, being anointed therewith.

XVIII. *The Correction.* All these Spurges are heating and Exulcerate the Skin, if but outwardly applyed: and taken inwardly, Operate Vehemently and sometimes excoriate the parts, without great care and caution be taken. *Mesues* says, they are offensive to the Heart, Stomach and Liver, that they break the Veins, and strip the Guts of their Mucus, and heat the whole Body so much that many times they cause Fevers. The first ill qualities are taken away (says he) by adding such things as strengthen the Stomach Heart and Liver. Their second and third ill qualities are taken away by adding things which have a glutinous quality, as Gum Tragacanth, Mucilage of Fleawort Seeds and Purslane. The fourth ill quality is taken away, by adding cold and moist things, as juices of Endive, Nighthade, Purslane, Sowthistles, or Mucilage of Quince Seeds made with Vinegar, &c.

XIX. *The Distilled Water.* It cleanses the Face and Skin from all manner of deformities, being daily applyed, more especially if an Eighth part of the Liquid Juice be added to it, as the inveteracy of the affect may require.

CHAP. DCLIX.

of SPURGE *Marsh.*

I. *THE Names.* It is called by the Arabians *Scebran*, and *Phtias*: in Greek *πύσσαν* *ἐλεα*: in Latine: *Tithymalus palustris*, *Pityusa palustris*: and in English, *Marsh Spurge*, or *Marsh Esula*.

II. *The Kinds.* There are 1. *Esula major*, *Esula major Germanica*, *Pityusa palustris major*, Great Marsh Spurge, or Greater Esula, which some will have to be *Rulandus* his *Esula*, of which he made his *Extrait*: whether the Greater *Esula*, or the Lesser *Esula*, be the *Esula* of *Rulandus* is very doubtful; nor can I find any Author which can truly or certainly determine it, they are both of them very strong and potent Medicaments, and therefore in my opinion may indifferently be made use of: however that which any one by Experience has found to be best, he may stick to. 2. *Πύσσαν ἐμπύαν*, *Peplis*, *Pityusa purpurea palustris*; *Peplion Dalechampij*, *Peplis maritima folio obtuso* *Baubini*, *Peplium Casalpini*; Small Marsh Spurge, or small Purple Marsh Spurge.

The Descriptions.

III. The first, or Great Marsh Spurge, or Greater *Esula*. Its Root is of a blackish color on the outside

side and white within, great, thick, and spreading divers ways; the bark whereof is thicker, and more fleshy, than in any of the rest, and endures the extremities of Winter, tho' the branches thereof perish for the most part every Autumn, and rise anew every spring. It rises up with

Spurge Marsh.

many great round reddish Stalks, on which are sometimes thick set, many long, and somewhat broad green Leaves, yet not so broad, nor so long as those of Wood Spurge, otherwise not much unlike. The Tops of the Stalks are furnished with fewer and smaller yellow flowers, than such a great Plant might be expected to have. Some flowers break forth also below the Tops, at the under joints, standing upon their Stalks, three or four together at most; after which come small round Seed like unto the others. This great Marsh Spurge, is also called Efula major, to distinguish it from the Efula minor, and the other Spurges.

IV. Gerard describes it thus. It has very many and great Roots, covered over with a thick Bark or Rinde, plaited as it were with many Scurlous Sprigs, from which rise up several strong and large Stems of a fingers thickness, and about three feet high, beset with many pretty large and long Leaves like Lathyrus, or Garden Spurge, but that they are not so thick: and the Seed and flowers are not unlike the other Tithymals or Spurges. This Plant says Gerard called Efula major, is that which Martinus Rulandus had in great Veneration, out of which he made his Extract for the cure of many inveterate diseases, as may and does appear at large in his Centuria curationum Frpericamum, dedicated to the Duke of Bavaria. 'Tis true he in that Book often speaks, and makes

use of Extractum Efulæ, with which he did wonderful Cures; but in none of all his works has he left behind him, or discovered together that his Extract was made from the major or minor Efula, so that the true Plant is left only to conjecture.

V. The second, or small Marsh Spurge. Its Root is single, small, and slender, and of no use. It spreads its small purplish Branches upon the Ground, more plentifully than the other, and much lesser; for it brings forth a greater store of branches more closely knit, and as it were wound together with shining twists an handful and half long. The Branches are set with many small Leaves, almost like, but lesser than those of Peplus, but not so round at their ends, of a Purplish colour underneath and oftentimes above, and not much unlike to Wild Purslane, especially in the beginning and heat of the Year. The flowers are small and yellow: and the Seed is great like that of Peplus, but bigger, and standing two together for the most part, not only upon the Tops, but here and there upon the Branches also. As in Name, so in Shape, this resembles Peplus, (saying that it is fuller of Branches) and comes in most respects nearer to the signification of Peplum or Flammeolum than Peplus doth.

VI. The Places. The first grows in many Places of Germany, and as Lobel says in his Observations, in a Wood formerly belonging to one Mr. John Coltes, nigh to Bath, very plentifully; but but for the most part it grows with us in England in Gardens. The second grows near the Sea Side, in Narbone, and about Marfeilles in France, and near the Sea Coasts of other Nations.

VII. The Times. They both flower in June and July, and their Seed is generally ripe in July and August.

VIII. The Qualities, Specification, Preparations, and Virtues of these Plants, more especially of the first, are the same with those of small Efula in Chap. 655. foregoing, to which we refer you.

CHAP DCLX.

Of SPURGE Sea.

I. THE Names. It is called in Greek, Τίθυμας ὁ θαλάσσιος; in Latine, Tithymalus paralius; Maritimus; herba lallaria, and Lallaria maritima (from its Milky juices;) by some, Lac Lupinum, Wolfs Milk; by others Lalluca marina, and Caprina, because Goats delight to eat it: and in English, Sea Spurge, and Sea Tithymal.

II. The Kinds. Those which are most known and of use to us, are, 1. Tithymalus Paralius, five maritimus, Lallaria marina, Our Common Sea Spurge. 2. Tithymalus maritimus Venetus, Tithymalus maritimus Americanus vel Floridanus (because I have found it upon some of the Floridan shoars) Alypum Dioscoridis Auguillurá, Efula rara Venetorum Pená & Lobelio, Sea Spurge of Venice, or American. 3. Tithymalus Linifolius Paraliu congener, vel cognatus Comerarij; Tithymalus maritimo affinis Linariæfolio Baudini; Tithymalus amygdaloides angustifolius Tabernemontani; Balfard Sea Spurge.

The

The Descriptions.

III. The first, or Our Common Sea Spurge. Its Root is long and Woody, abiding long, and so do the Leaves on the Branches, not falling away in Winter. It rises up with several reddish woody Stalks, a foot or foot and half high, thick set with Leaves from the Bottom to the Top, which are

Spurge Sea, or Sea Titbymal.

small, long, and narrow, yet broadest in the middle, something like to the Leaves of Line or Flax, but thick and whitish, full of a white Milk, if any part of it be cut or broken; which is so hot, that being tasted, it burns the Mouth and Throat intollerably. At the Tops of the Stalks, stand many pale yellowish flowers, with two Leaves under them, encompassing the Stalk, as is common to all the other kinds of Spurges, after which come small Triangular heads, in which is contained round discolored Seed.

IV. The second, or Sea Spurge of Venice, or American. Its Root is great, long and woody, perennual and sending forth branches every year. It has longer or taller and thicker Stalks than the former, somewhat hollow and reddish, branching forth into divers parts, beset with small long Leaves, two always standing together, all along the branched Stalks, not much unlike the growing of Liquorice. The flowers are small, pendulous and of a sad Purplish color, consisting of five small Leaves apiece, like a small Star, without any round Leaves under them, as is usual to other Spurges; yet the heads of Seed are Triangular like the others, and contain like Seed.

V. The third, or Bastard Sea Spurge. Its Root

is long, woody and Fibrous. And it rises up with brownish Stalks, having many narrow Leaves growing thereon, much like to the first, or Our Common Sea Spurge, but that they are something larger or longer, and a little broader. The flowers and Seed are like that also.

VI. The Places. The first grows by the Sea side, both in Foreign Countries and on divers places of the English shore. The second grows on the shoars of the Adriatick Sea, and in the Island Lie, belonging to the Venetians, as also in many places of the American Sea Coasts, where I have found it in perfection. The third in Franconia; and other parts adjacent to it, and near to the Banks of the River Mayne; but with us it grows only in Gardens.

VII. The Times. They flower about the latter end of June, and through the Month of July; and the Seed is ripe in August.

VIII. The Qualities, Specification, Preparations, and Virtues of these are the same with those of the Garden Spurge, and small Spurge called *Esula*, being all hot and dry in the fourth degree, Burning and Exulcerating. The first of these Sea Spurges is not mentioned by any Author, Ancient or Modern, to be used in Physick, because of its vehement and sharp Exulcerating Quality, and for that it is so violent a purger both upwards and downwards, that it is scarcely safe to use it inwardly, it Burning and Exulcerating the Skin being outwardly applied, but so used it is profitable to take away Scabs, Scurf, Morpew, Leprosy, Scars, Warts, and other defecations and deformities of the Skin, being prudently applied. Yet I know by Experience, that if it be corrected and prepared by a wife and skilful hand, the preparations thereof may be given inwardly, as the preparations of the other Spurges may, and nearly in the same Dose; But I own, it is not for an unskilful person to meddle with it, because of its violence. Galen says, that the Milk or Juice thereof mixed with Meal of Wheat or Barly, and made into a Paste, and then cast into the Water for the Fish to eat it, that it will so much overcome them, as to make them lye for dead, and to rise and Swim on the Top of the Water, so that they may be taken with ones hand.

IX. The Venetian Sea Spurge. The Roots are used at Venice by the Physicians and Apothecaries there, instead of *Esula*, where they put them into the *Benedicta Laxativa*, Purging Pills, and other Cathartick Medicaments, because, as Pena says, it purges forcibly, and with great violence. Of the last, Authors have said nothing; tho' it may be judged to have the same qualities with other Spurges.

C H A P DCLXI.

Of SPURGE Laurel.

I. THE Names. It is called in Greek, *Δασυφύλλον* & *Χαυροφυλλον*; in Latine, *Daphnoides*, (*à Laurifoliorum similitudine*;) also *Laureola*, (*quasi pusilla Laurus vel Laurus minor*;) in English, *Spurge Laurel*; and this Plant is that which *Dodonæus* thinks to be the *Cneorum nigrum Theophrasti*.

II. The Kinds. The chief Species Authors have taken

riken notice of are, 1. *Daphnoides*, *Daphnoides*, *Laureola*, *Cneorum Nigrum Theophrasti Dodonaei*, *Oar Common Spurge Laurel*, 2. *Xapadaphnoides*, *Chamaedaphnoides*, *Laureola Cretica Alpini*, *Candy Spurge Laurel*.

The Descriptions.

III. The first, or *Oar Common Spurge Laurel*. Its Root grows down deep into the Ground, and spreads also abroad with tough, long, white strings, something woody. It rises up usually with but one Stem, a foot and half, or two feet high, yet sometimes with more, which are very tough and pliant, covered with a whitish, thick, tough bark, branching forth into several Arms towards the Tops, on which are set many long, smooth, thick, somewhat broad and shining dark green Leaves, something like to very small Bay Leaves, but longer, smoother, softer, and not with hard Veins therein as Bay

Spurge Laurel.

Leaves have. The flowers come forth towards the Tops of the Stalks and Branches, and at the joints with the Leaves, many set together, which are something long and hollow, ending or spreading into four small Leaves, of a whitish, yellow green color. After which come small, round and something long black Berries when they are ripe, in which lies a white Kernel. Both Leaf and Flower, also Bark and Root, are very hot and sharp in Taste, heating and burning the Mouth and Throat of such as Taste them. It keeps its green Leaves also, without shedding, all the Winter.

IV. Gerard describes it after this manner. Its Root is woody, tough, long, and diversly parted,

growing deep into the Earth. It is a Shrub of a Cubit height, and sometimes two or three feet high, spreading it self out into many little boughs, which are tough and pliant, and covered with a thick Rinde. The Leaves are long, broad, gross, smooth, and of a blackish green, shining like Laurel or Bay Leaves, but lesser, thicker, and without smell, very many at the Top clustering together. The flowers are long, hollow, of a whitish green color, hanging beneath and among the Leaves. The Berries when they are ripe, are black, with a hard Kernel within, which is a little longer than the Seed of Hemp, whose pulp or inner substance is White. The Leaves, Fruit and Bark, as well of the Root as of the Stalks and Branches, do by their sharpness and burning quality, Bite and Inflame the Tongue and Throat.

V. The second, or *Candy Spurge Laurel*. Its Root is white, small and crooked, from whence spring up three or four Crooked and bending blackish Stalks, thick set with Leaves without any order, covering them almost wholly, which are long and small towards the bottoms, but broader towards the ends, being thick and hard, green above, and grayish underneath, Tasting very hot, and burning very vehemently both Mouth and Throat. The Fruit is very hot also like the former, and the whole Plant of low growth.

VI. The Places. The first grows Wild in many Foreign Countries, as well as in many parts of England; but being brought into Gardens, it will abide and flourish very well there: but it is said to grow abundantly in the Woods in most parts of this Kingdom. The second was brought to us out of Candia, and prospers well enough with us.

VII. The Times. The first flowers very early in the Year, even upon the Winter Tropick thro' all December, January and February, if the Winter is mild: and the Fruit is ripe in May, and June; and the Plant is always green, enduring the coldest Seasons in Winter. The other Flowers more early in its Native Clime, but something later with us.

VIII. The Qualities, Specification, Preparations, and Virtues of Spurge Laurel are the same with Spurge Olive, or Mezereon in Chap. 677. aforegoing, to which you are referred: but a few other Observations Authors have made thereon: viz.

IX. The Green Leaves. Being chewed in the Mouth, they attract or draw much flegm and humors from the Head, Brain, and Eyes, which offend and hurt those parts.

X. The Decoction of the Green Leaves. It purges Pituitous and watery humors by Stool, cleanses also the Stomach by Vomir, if Foul, and provokes the Terms in Women when Stopt.

XI. The Pouder of the Leaves. It may be given from a Scruple to a Dram in broth. *Dioscorides* says, it evacuates watery humors from the whole body, and has all the Virtues of the Decoction aforegoing; and as a Sternutatory purges the Head by Sneezing.

XII. The Berries or Grains. They are given to 15 Grains (more or less) as also the Pouder of the Leaves by Empyricall Physicians, to purge with, and to evacuate watery humors in a Dropfie, and that with good success, as also to ease the Pains of the Colick.

XIII. The Decoiled Oil. The Berries or Leaves boiled in fresh Oil Olive, or Oil of Bitter Almonds, and the Belly being anointed therewith, it gives ease in the Colick. Anointed on the Reins of the Back, and on the Hemorrhoids or Piles,

Piles, it eases pains of those parts and provokes Urine. It is also good against Scurf, Morpew, Scabs, Scald Heads, Freckles, Tannings, Sunburnings, Discolorings, and other like defecations of the Skin.

XIV. *Nota.* The Leaves and Berries of this Plant are violent purgers, and do heat and inflame the Stomach, by whomsoever taken, and excite as many dangerous Symptoms as any of the other *Spurges*; and therefore are to be given only by a prudent hand, and with much Caution, with proper and good Correctives.

C H A P. DCLXII.

of SPURRY,

O R,

SPURRWORT.

I. **T**HE Names. It has no Greek Name that I know of, but a Modern Author *Thalius*, calls it *Ἀνθράκωδης*, *Anthracoides*: in Latine, it is called by almost all Authors *Spergula*: and in English, *Spurry*, or *Spurwort*.

II. The Kinds. There are several sorts hereof, viz. 1. *Spergula major*, *Spergula Sagina major*, and by *Fabius Columna*, *Alfine tenuifolia altera*, vel *Alfine Sylvestris altera*, (yet it is no Species of the Chickweeds) *Tricophyllos*, *Spergula Sagina Lobelij* (à *Saginandis pecoribus*, from its good feeding or fattening of Cattel.) The Greater *Spurry*, or *Spurwort*; Frank-*Spurry*, or Fattening *Spurry*, because in *Brabant* and other parts of the Low Countries, Husbandmen Sow their Grounds therewith for the same purpose, as also to cause their Cows, and Ewes to give the greater store of Milk. 2. *Spergula minor*, *Spergula Sagina minor*, *Spergula marina Dalechampij*, The lesser *Spurry*, or Sea *Spurry*. 3. *Spergula minima*, *Spergula Sagina minima*, *Alfine Spargille facie Bauhini*, as it is called in his *Prodromus*, The smallest *Spurry*, Red *Spurry*, or Chickweed *Spurry*. 4. *Spergula Stellaris*, *Asterias*, *Stellaria*, *Spergula montpelienfis*, Star like *Spurry*, French *Spurry*.

The Descriptions.

III. The first, or Greater *Spurry* or *Spurwort*. Its Root is small and Fibrous, perishing every year after Seed time. It sends forth several small, round and upright Stalks, not above half a foot high, on which at several distances or joints grow many small and narrow Leaves, set together in form of a Star, or of the Rowel of a Spur, from whence came the Name. The flowers are many, small, and white, standing at the Tops of the Stalks, which turn into small round heads, containing therein small black Seed.

IV. Gerard describes it after this manner. Its Root is small and Threddy; from whence rises up a mean and low herb, very tender, having many jointed Stalks, on which grow Leaves in round Circles, like those of Woodroof, but lesser and smoother, in form like the Rowel of a Spur. At

Spurry Greater.

the Tops of the Stalks, grow small white Flowers; after which come round heads, with small round Seed like that of Turneps. This herb is sown in *Brabant*, *Flanders*, and *Holland* for that peculiar use of Fattening Cattel, and to cause them to give much Milk.

V. The second, or lesser *Spurry*, or Sea *Spurry*. Its Root is small, long, woody, hard and rough, with small Fibres adjoining to it. This in its form of growing does not much differ from the former, but that it has not so many long and narrow Leaves set together at the joints of the Stalks. These Stalks are many, springing from the Root, which rise not to above a Span high, but do somewhat more lean downwards to the Ground, which together with the Leaves are more white, and of a saltish or brackish taste, if it grows near the Sea side; otherwise nothing so hoary, white or brackish at all. The flowers are fewer, of a white color, and the Seed black like the other.

VI. The third, or Smallest *Spurry*, or Red Chickweed *Spurry*. Its Root is small and long, which is yet large considering the smallness of the Plant, with some Fibres or Threads adjoining to it. From which rise up several weak slender Stalks 3, 4, or 5 inches long, bowing down, or commonly lying flat upon the Ground, full of joints, and at every one of them two small, short, white Scaly Leaves, encompassing the Stalk at bottom, out of whose bosoms, between the Stalks and the said Leaves, come forth other small, green, sharp pointed Leaves without number. Towards the Tops of the Branches come forth at the joints the flowers, each upon a small Footstalk, which are small and red, and sometimes tending to a bleuish purple, which being past away,

small round beads (smaller than the former) succeed, which contain such like round black Seed also in them.

VII. The fourth, or Star like Spurry. This differs not much from the last sort, sowing that the small, short and narrow Leaves, which stand at the joints of the low Stalks, are all of an equal length, and are stiffer and harder, standing straight out, in an equal distance, one from another like a Star. The flowers hereof are small, having five narrow pointed Leaves, laid open abroad like a Star also, but of a reddish color: so that whether you have respect to the Leaves or the flowers, they are both in the form of a Star, and from thence the Plant took its Name: but there are many other Herbs so called, which very much differ one from another.

VIII. The Places. They all grow in dry Sandy Grounds in divers Countries, as well among Corn, as in untilled and shady places, especially the first and second of them; altho' the second is also found growing near the Sea Shore, in the like places: it has been found growing in the Salt Marshes about Dartford in Kent, and such other like places. The third has been found growing in Sandy Grounds, as in Tuthill-Fields near Westminster, and that, as also the fourth, have been found growing in many other the like places of this Kingdom.

IX. The Times. They all generally flower in June and July, and their Seed is usually ripe in August or before Harvest time.

X. The Qualities. They are hot and moist in the first degree: Glutivative, a little Emetick, Lactogenetic, and Spermatogenetic.

XI. The Specification. The Seed evacuates Pituitous, viscid, slimy and putrid humors out of the Stomach by Vomit: the Herb encreases Milk in Nurses; restores in Consumptions, and makes the Body fat.

XII. The Preparations. You may have therefrom. 1. A Powder of the Seed. 2. A Liquid Juice of the Herb. 3. A Decoction of the Green Herb, in strong Chicken Broth, Cock Broth, Pork or Veal Broth, &c. 4. A Cataplasm of the Green Herb.

The Virtues.

XIII. The Powder of the Seed. It may be given from half a Dram to 2 Drams in the morning fasting in Mutton Broth. It evacuates flegmatick and slimy humors out of the Stomach by Vomit; strengthens the Stomach, and rectifies the Acrasie of the Juices, which in their depraved State hinder digestion, corrupt the Blood, and overturn the healthful State of the Body.

XIV. The Liquid Juice of the Herb. Given to Nurses in White Wine, or Wine mixt with pure clear Ale, or with clear Ale alone, it admirably increases Milk in Nurses Breasts: and being taken for some time in that manner, very much increases Seed in both Male and Female, and restores in Consumptions. And this is in some measure manifest for the effect it has upon Cattel in Brabant, Flanders and Holland, and other parts thereabouts, where they Sowe it on purpose for their Cattel to feed on, for that it causes their Cows to give a greater Store of Milk than otherwise without it, makes their Oxen and Sheep fat, and causes their Poultry to lay a greater Store of Eggs, which says Parkinson is no idle conceit,

for that these people have found it sufficiently true by their daily use thereof.

XV. The Decoction of the Green Herb in Broth, &c. It has all the Virtues of the Liquid Juice, but not altogether so powerful; but if the Broth be strong, it makes good Milk in Nurses Breasts, and restores wonderfully in Consumptions.

XVI. The Cataplasm of the Green Herb. Being made of the Green Herb bruited, and then applied to Cut fingers, or other places which are Cut or Wounded, if the Wound is simple and not complicate with Accidents, it quickly heals it.

C H A P DCLXIII.

Of STARFLOWER

OR,

STAR of BETHLEHEM.

I. THE Names. It is called in Greek, *ὀρνιθόγαλον*; in Latine, *Ornithogalum*: and in English, *Star-flower*, or *Star of Bethlehem*.

II. The Kinds. They are manifold, as, 1. *Ornithogalum Vulgare*, Our Common Star-flower, or Star of Bethlehem. 2. *Ornithogalum Luteum*, *Bulbus Esculentus*, *Bulbus Sylvestris*, *Cepe agraria*, The Yellow Star-flower. 3. *Ornithogalum Arabicum*, The Turks call it *Zambul Arabi*, The great Arabian Star-flower. 4. *Ornithogalum Æthiopicum*, The Æthiopian Star-flower. 5. *Ornithogalum Neapolitanum*, The Star-flower of Naples. 6. *Ornithogalum album unifolium*, *Bulbus Unifolius*, The One Leav'd Star-flower. 7. *Ornithogalum Hispanicum minus*, The small Spanish Star-flower. 8. *Ornithogalum maximum album*; (this Parkinson says, might more fitly be called *Asphodelus bulbosus albus*, if says he, there be any *Asphodelus bulbosus* at all, because this does so nearly resemble an *Asphodel*, both in the early springing and decay of the green Leaves when the Stalk of Flowers rise up;) *Ornithogalum Pannonicum maximum Album*; The greatest white Star-flower. 9. *Ornithogalum Pannonicum* (so called from its Original or Native place of growth) The Hungarian Star-flower. 10. *Ornithogalum majus Spicatum album*, *Ornithogalum Magnum Myconi Dalechampi*, The great white Spiked Star-flower. 11. *Ornithogalum majus flore subnigrescente*, *Asphodelus bulbosus Galeni*, The great green Star-flower. Several Authors refer this to the *Asphodelis*, because its flowers are straked on the back, and its Leaves long and narrow like to the *Asphodelis*; but it is certainly of the kinds of the *Ornithogala*, because of its Bulbous Root, and for that the *Star-flowers* have also strakes on the backs of the flowers, and the like long narrow Leaves. 12. *Ornithogalum luteum parvum*, The Dwarf yellow Starflower.

The Descriptions.

III. The first, or our Common Star-flower. Its Root is bulbous, white both within and without, and encreases abundantly. It has many narrow leaves,

leaves, thick, fat, full of juice, and of a very green color, with a White streak down the middle of each Leaf; from among which rise up small naked Stalks, at the Tops of which grow flowers consisting of six little Leaves, striped on the backside with Lines of Green, the insides being Milk white. These flowers open themselves at the rising of the Sun, and shut again at Sun setting; for which this Plant has been called by some *Bulbus Solsequius*. The flowers being past, the Seed follows, enclosed in Triangular husks. This Plant is so common and so well known in all Countries and Places, that it was almost needless to have described it, saving that the order and course of Our History require it.

Star-flower Yellow.

IV. The second, or Yellow Star-flower. It has a Cloven Bulbous Root, round, whitish, and somewhat clear, and very apt to perish, if it be any little while kept dry out of the ground, as has been found by Experience. It rises up at first with one long round greenish Leaf, which opens it self somewhat above the Ground, and gives out another small Leaf, lesser and shorter than the first; afterwards the Stalk rises from thence also, being 4 or 5 inches high, bearing at the Top three or four small green Leaves, from whence among them come forth 4 or 5 small yellow Starlike flowers, with a greenish Line or Streak down the Back of every Leaf, and some small reddish yellow Threads in the middle, which seldom yield any Seed. Gerard says, that the flowers of this are on the back side of a pale yellow, striped with Green, and on the inside of a bright shining yellow color, with Saffron colored Threads in their middles, and that the Seed is contained in Triangular Vessels.

V. The third, or Great Arabian Star-flower. Its Root is great and white with a flat bottom, after its Fibres are gone, which it yearly looses: it

is very impatient of Frost, and will not abide with us unless carefully preserved and defended against the cold of Winter. And tho' sometimes it abides the Winter, yet it oftens lyes without springing forth into a Blade, or any thing else for a whole year, and then perishes; or if it does spring up, yet many times it does not bear; but most after their first bearing do decay and perish. Let therefore the Root be either Planted in a large Pot or Tub of Earth, and Housed all the Winter, that so it may be defended from the Frosts. Or else, (which is the easier way) let the Root be taken out of the Ground every year, from September, after the Leaves and Stalks are past, until February, and laid in some dry, but not hot or windy place, and then planted in the Ground under a South Wall, or such like defended places, which will then spring up and prosper well, for that the greatest and hardest Frosts are generally past after that time, &c. It springs up with many broad and long green Leaves, very like unto the Leaves of the Oriental Jacinth, but lying for the most part upon the ground, from among which rises up a round green Stalk about two feet high, bearing at its Top divers large flowers standing upon long Footstalks, and at bottom of every one of them a small short pointed green Leaf. These flowers consist of six purely White Leaves apiece, with six white Threads with yellow pendants, which are laid open as large as an ordinary Daffodil, with shining blackish heads in the middle, in form of a Starry Jacinth, or of the first common Star-flower, having a pretty sweet smell but weak, which open every day at Sun rise, and close themselves again at Sun set, especially if they grow in the Sun.

VI. The fourth, or Ethiopian Star-flower. Its Root is thick round and white, somewhat like the *Asphodelus Galeni*, and impatient of bearing cold, as the great Arabian Star-flower. The Leaves of this Plant are a Foot long, and about an Inch broad, which being broken, are no less Woolly than the Woolly Jacinth. The Stalk is about a foot and half high, strong, and green: from the middle whereof unto the Top, stand large Snow white Starlike flowers, upon long, green, thick foot Stalks, and yellowish at bottom of the flower: in the middle of which stands a Triangular head, which is long and containing the Seed, the which is surrounded with six white Threads, Tipt with yellow pendants.

VII. The fifth, or Star-flowers of Naples. The Root is Bulbous, great and white, and something flat at bottom, as divers of these kinds are, which multiplies its self as plentifully into small Bulbs, as the first or Common Star-flower, or any other; increasing indeed too much, and therefore requires to be yearly taken up, and freed from its off sets, with which it is apt to be pester'd. This beautiful Plant rises out of the Ground very early, with 4 or 5 long hollow pointed whitish green Leaves, standing round together, with a white Line down the middle of every Leaf on the inside: these Leaves are something narrow, but long (three feet long in Italy, as Columna says, but not of such an extended length with us.) In the middle of these Leaves rises up the Stalk, about a foot and half or two feet high, bearing many flowers at Top, each flower standing in a little Cup or husk, which is divided into 3 or 4 parts, hanging down very long about the heads for Seed: each flower is large, and consists of six long narrow Leaves, of a shining white color on the inside, and of a bluish or whitish green on the outside, the edges of each Leaf being white on both sides, and turning backwards towards the Stalk,

Stalk, with six either small Leaves in the middle, of a white color, standing round together like a Cup, in the midst of which is a small white Pointel, about which stands six white Threads, Tipt with yellow pendants on their Tops; the whole flower being without any smell. After the flowers are past, come forth great roundish Triangular beads, which are too heavy for the Stalk to bear, and therefore lye down upon the Leaves or Ground, having certain Lines or Stripes on their outside, in which is contained round, black, rough Seed.

VIII. The sixth, or the One Leav'd Star-flower. It has a small Bulbous or round white Root, which sends forth one very long Rush like, or round green Leaf, but that for 2 or 3 inches above the Earth it is a little flat, and guttered; which sends forth a small or little Stalk about 3 or 4 inches high, bearing at its Top 3 or 4 small white flowers, consisting of six very white Leaves apiece, within which are six white Chives, Tipt with yellow pendants, standing about a small Triangular head, which has a white Pointel sticking as it were in the midst thereof: the smell of which flowers is much like the smell of the flowers of the Hawthorn.

IX. The seventh, or small Spanish Star-flower. It has a small white Bulbous Root which sends forth in the beginning of the year, five or six small long green Leaves, much like those of the first common sort, but narrower, and without any white Line or Streak, wherewith those others are striped or marked. From among which rise up one or two small Stalks, about two handfuls high, bearing at their Tops, each Stalk about seven or eight flowers or more, growing each, one above another, yet so that they seem to make a Tuft or Umbel, with small long Leaves at the foot of every Stalk, the lower flowers being equal in length with the uppermost; each of which flowers has six Leaves of an Ash or whitish blew color, with a stroke or line down the back of every one of their Leaves, and so many white Chives or Threads standing about a blewish Pointel or head in the middle, which flowers quickly pass away without giving any Seed.

X. The eighth, or Greatest white Star-flower. Its Root is Bulbous, great, thick and short, somewhat yellowish on the outside, with a flat bottom like that of the Arabian Star-flower, but more hardy to endure the Winter; and more apt to encrease, whereby it is now grown common. It has many fair, broad, long, and very fresh green Leaves, which spring up out of the Ground very early, and are greater, longer, and greener than the Leaves of any Oriental Jacinth, which do abide green from the middle of January, or beginning of February, to the end of May, at which time they begin to fade, and the Stalk with the head of flowers, begins to rise, so that it will have few or no Leaves at all, when the flowers are blown. The Stalk is strong, round, smooth and firm, and rises by flowering time, to be 2 or 3 feet high, bearing at the Top a great bush or spike of flowers, upon long Footstalks; which seem at the first to be a great green Ear of Corn, for it is made spike fashion; which when the flowers are blown, it rises up to be very high, slender or small at the Top of the head, and broad spread, and bushing below, so that it is long in flowering. The flowers open by degrees, for they flower first below, and so gradually upwards, consisting each of six white Leaves, spread open like a Star. These flowers are Snow white, without any line or streak on the backside, but not near so large as those of the Arabian kind, with a white Pointel or head in the middle, beset with many white Threads Tipt with

yellow Pendants. And the Seed is black and round contained in the Triangular beads.

XI. The ninth, or Hungarian Star-flower. Its Root is Bulbous, long and white, and is greater, thicker, and longer than the Root of the first or Common kind, for the most part two joined together, and somewhat grayish on the outside. It shoots forth several narrow, long, whitish, green Leaves, viz. five or six, and that before Winter, which spread themselves upon the Ground, narrow and of about a fingers length, much resembling the Leaves of Clove Gillflowers, but somewhat roughish, and so abide above Ground; from the midst of which the next Spring, about April, when the Leaves are decaying, rises up a Stalk, about half a Foot high, bearing at its Top, a spike of many white flowers, consisting of six Leaves apiece, with green lines down their backs, very like to the first or Common Star-flower, which shew themselves open in May.

XII. The tenth, or Great White Spiked Star-flower. It has a large Bulbous Root, usually larger and whiter on the outside than that of the greatest white Star-flower, at Sect. X. foregoing; and in its form and manner of growing is much like the same eighth kind. It springs not up so early, nor are its Leaves so green or large; but it has broad, long, hollow, whitish green Leaves, pointed at the end; from among which rises up the Stalk, which is strong, and from a Foot and half to three Feet high, whereon at the Top grows a great spiked head, or bush of Star-flowers, standing spike fashion, somewhat like the eighth Species aforementioned, flowering in the same manner by degrees, beginning first below, and gradually upwards to the very Top. But it is not so thick set with these Star like flowers, nor so far spread at the bottom, as that kind, nor are the flowers so white, but each of their Leaves a line or streak of green down their backs, and their edges on both sides are White. After the flowers are past, come Triangular heads like the others, containing within them such like black Seed.

XIII. The eleventh, or Great Green Star-flower. Its Root is yellowish, something like to the eighth Species at Sect. X. foregoing. It has many whitish green Leaves, long and narrow, spread upon the Ground, which spring up in the beginning of the Year, and abide until May: and then withering away, the Stalk springs up almost as high as that greatest white Star-flower, having many pale, yellowish green Starlike flowers, but smaller, and growing more sparsely about the Stalk upon short Footstalks, but in a reasonable long spiked head; after which comes the Seed, which is like that in the last Section foregoing.

XIV. The twelfth, or Dwarf Yellow Star-flower. Its Root is Bulbous, white, and covered with an Ash colored Film. It sends up one only Leaf, two or three inches long, which is narrow, of a whitish color, and of an Acid Taste. Nigh to which rises up a small Stalk, about two inches high, having one or two Leaves thereon; between which come forth small Starlike flowers, yellow within, and of a greenish purple without. The flowers being past, their come Triangular beads, in which is contained small reddish Seed.

XV. The Places. The Titles or Names of many of them shew their Original or Native Places; but with us in England they are all Nurst up in Gardens. The first grows Wild in Germany, Flanders and other Foreign Countrys, as also in several parts of Our Land. The second, Lobel says, he found in the Corn-fields in Somersetshire,

shire, but they are also generally Planted in Gardens.

XVI. *The Times.* The *Arabian* flowers in *May*, and sometimes in *June*. The *Ethiopian* flowers in *August*, or the end thereof. The *small Spanish* flowers in *April* and *May*. The *Neapolitan*, tho' it oftentimes begins to Spring out of the Ground in *November*, but most usually in *January*, yet it flowers not till *May*, and the Seed is ripe in *July*. The *Hungarian* flowers in *May*, and sometimes in *June*. All the rest flower from the middle of *April*, and sometimes sooner, to *June*, and the Seed is ripe in the Months following.

XVII. *The Cultivation.* It is to be observed, 1. That the Roots of these Plants loose their Fibres quickly, and they may be taken up out of the Ground, as soon as their Stalks are dry, and so kept till the end of *September*, except those of the *Yellow*, which will not endure out of the Earth, but a little time.

XVIII. 2. As these Plants are only or chiefly multiplied by their Bulbs, which increase in abundance in the Summer time, so they are to be Planted in an Earth composed of two thirds Mould, and one third light Earth full of Salts, such as are some blackish Sands, which by the productions they yield, you may easily find have a great deal of substance in them.

XIX. 3. The *Arabian*, *Ethiopian*, *Spanish* and *Neapolitan*, or others which come from hot Countries, as they are tender and will not endure our long, cold, and frosty Winters, so they ought to be Planted in Boxes, in rich, hot, dry Sandy Earth, and housed in Winter, and are to be exposed to the greatest heat of the Sun, for which reason they are rather to be put in Pots or Boxes, than into the firm Ground, and so they are easy to be removed from place to place, and put there which best suits with their Natures.

XX. 4. The Time of Planting the Bulbs is in the Month of *September*: they are to be put into the Earth 2 inches deep, and to be well watered when you think they want it. The *Yellow*, may be set among other tender Roots, which require to be covered, and defended from Frosts in Winter: all the rest are hardy, and may be set in any place, among other Roots which loose their Fibres.

XXI. 5. Those kinds which are very apt to be affected with cold, you are to be very careful of when Winter approaches, and to place them in your Green House, that the Cold and Frost may not hurt or injure them. These Star-flowers will not bear to be often transplanted: and when you do it, you must stay, till its flower is quite past, and its Seed ripe, and then being removed at the Time mentioned, they will shoot forth new Roots.

XXII. *Their Qualities, Specification, Preparations, and Virtues,* as Physically considered, Authors have taken no notice of, nor are they known to have any Medical properties; but are rather of Ornamental use, for the adorning of Gardens, for which cause, and the sakes of such as are admirers of all sorts of flowers, we have inserted them in this Our Herbal, that it might not have a deficiency in those things, which a great many Ladys and Gentlemen so singularly affect.

XXIII. Yet *Tragus* says, that the Roots of the Star-flower (I suppose he means those of the common kind) roasted in hot Embers, and made into a Cataplasm with Honey, and so applied, heals old eating Ulcers, and softens and dissolves hard Tumors. By their *Signature*, they may be supposed to be good against *Scrophulous* and *Strumous* Tumors, and Ulcers of the *Kings-Evil*.

XXIV. *Matthioli* says, that the first or Common kind, are much eaten by poor people in *Italy*, both raw and roasted, being sweeter in Taste than any Chestnut, and serve as well for a necessary food for the Belly, as for delight and Ornament in the Garden: But whether any of the rest may be so used, is as yet unknown.

C H A P DCLXIV.

Of STARWORT:

OR,

BUBO - GRASS.

I. *THE Names.* It is called in Greek *Ἀστὴρ*, & *Bubon*: in Latine, *Aster*, *Bubonium*, and *Inguinalis*: in English, *Starwort* and *Bubowort*.

II. *The Kinds.* Authors have given us between twenty and thirty kinds of this Plant, but the most of them growing in Foreign Places, and scarcely ever to be come at by us, we shall here give you only such as either grow in Our Gardens at home, or in some of Our Floridan Plantations in *America*, or *West-Indies*, which are the nine following, viz. 1. *Aster albus*, *Aster Atticus*, (so called I suppose from the place, viz. *Athens*, where it grew in great Plenty) *Aster Atticus luteus vernus*, *Aster Atticus Legitimus*, *Herba Stelaria*, *Bubonium* and *Inguinalis*, The true *Aster Atticus*, or *Yellow Starwort*. 2. *Aster Atticus litorum*, *Aster Atticus flore purpureo*, vel *flore ceruleo*, *Purple Italian Starwort*, or the *Purple Marigold*. 3. *Aster Conyzoides Lobelij*, *Heabane* like *Starwort*. 4. *Aster Virginianus latifolius luteus repens*, (called by the Natives, *Aquascomense*) *Yellow creeping Starwort* of *Virginia*. 5. *Aster Virginianus luteus caule membranaceo*, *Yellow Starwort* of *Virginia* with a *Skinny Stalk*. 6. *Aster Virginianus luteus alter minor*, A lesser *Yellow Starwort* of *Virginia*. 7. *Aster Virginianus latifolius praecoxior flore parvo purpureo*, The more early broad Leav'd *Purplish Virginian Starwort*. 8. *Aster Virginianus angustifolius serotinus flore parvo albo*, The later flowering narrow Leav'd *Virginian Starwort*. 9. *Aster minor angustifolius*, *Aster minor Narbonensium flore Tripolij Lobelij*, *Aster minor purpureus folio medio Linariae*. The lesser *Purple Starwort*, or *French Purple Starwort*.

The Descriptions.

III. The first or true *Aster Atticus*, or *Yellow Starwort*. Its Root is *Fibrous* consisting of a Bunch of Strings, of a sharp and biting Taste, dying every year after Seed time is over. It rises up with two or three rough hairy Stalks a foot and half high, with long rough or hairy brownish dark green Leaves on them, divided into two or three Branches; at the Top of every one of which grows a flat Scaly head, compassed underneath with five or six long, brown, rough green Leaves standing like a Star, the flower is self standing in the middle thereof, is made as a border of narrow, long, pale, yellow Leaves, set with brownish yellow Thrums.

IV. Gerard

W. Gerard describes it after this manner. It has a Fibrous Root of a biting and sharp Taste. It has large broad Leaves like *Verbascum Salvitolum*, or the Great Conyza. From among which rises up a Stalk four or five handfuls high, hard, rough and hairy, beset with Leaves like *Rose Campions* of a dark green color. At the Tops of the said Stalks, come forth flowers of a shining and glittering Golden color. And underneath about these flowers grow five or

Starwort yellow true.

six long Leaves, rough and sharp pointed, not much in shape unlike the Fish called *Stella marina*; which flowers turn into Down, and are carried away with the Wind.

V. The second or Purple Italian Starwort, or Purple Marigold. It has a Root composed of many white strings, which perish not as the former, but abide many years, with green Leaves on their heads, and spring fresh again every year. It has many woody, round, brittle Stalks rising from the Root, something higher than the former, or about two feet in height, sometimes standing upright, and sometimes leaning downwards; on which are set without order up to the Tops, many something hard, rough, and long Leaves, for the most part round pointed; near the Tops they are divided into several Branches, at the Tops of each of which grow single flowers, made like unto a single Marigold, the outward border of its Leaves being of a blewish purple color, which are set about a middle Thrum of a brownish yellow, breaking out of a green Scaly head, like to those of *Knapweed*, but lesser. These flowers abide long in their Beauty, and in the end wither and yield a soft Down, in which lye small, black, and flat Seeds, not much

Starwort purple Italian.

unlike *Lettice Seed*, which with the Down, are carried away with the Wind.

VI. The third or Fleabane like Starwort. Its Root is a small bush of Strings and small Fibres. It rises up with brown Stalks, which are branched, about a foot in height or more, on which grow long and

Starwort Fleabane.

narrow Leaves, set singly thereon without order, not much unlike to those of the small Conyza. The flowers grow singly at the Tops of the Stalks and Branches, composed of many dark or dusky yellow Leaves, with a browner Thrum in the middle, which turn into Down, and their small Seed, is carried away with the Wind. There is another sort also of this Species, which has been brought to us from Virginia, and is very like to this now described, but it has smaller flowers.

VII. The fourth, or Yellow Creeping Starwort of Virginia. Its Root is Stringy, creeping under Ground, and spreading much. It rises up with a strong round Stalk 2 or 3 feet high, bearing at the joints two fair broad Leaves, like the Leaves of a small Flos Solis, but more pointed at the ends, and harder in feeling, being full of Veins: at the Top of the Stalk, which seldom Branches out, grows one large flower, (rising out of a green husk, made of Nine or Ten green Leaves) composed of many long and narrow yellow Leaves, with a brownish Thrum in the middle: which being past, there follows Seed like to that of a small Flos Solis.

VIII. The fifth, or Yellow Starwort of Virginia with a Skinny Stalk. Its Root is knobbed and woody, with several long Strings adjoining thereto, and encreases much at the sides, but creeps not, taking fast hold in the Ground. It grows to be 6 or 7 feet high, with many Stalks, whose lower parts thereof, almost to the half, is round, hard, and strong, the other part upwards, having a small film or skin on four sides thereof (as is to be seen in some other Plants) up to the Top, which branches not, but bears several small flowers, as if they were Tufts at the first, but being blown open, each flower is a yellow Star, consisting of 5 or 6 small and long yellow Leaves, with small, thick, yellow Pointels in the middle, each having a blackish Tip or Point, resembling flowers, which afterwards turn to be flat Seed, broad at the head, which are so singly set together, that they resemble the head of Seed of a Ranunculus, but greater. The Leaves stand singly on a small Footstalk, on each side of the Stalk, being very like to the former, of a dead or fullen green color, yet not altogether so large and broad, but a little longer pointed, and more rough in handling.

IX. The sixth, or Lesser Yellow Starwort of Virginia. Its Root consists of several white and long hardish Strings, with small Fibres adjoining to them, abiding many years, and encreasing it self by the sides. This is also the two former Virginia kinds at Sect. VII. and VIII. lose all their Stalks and Leaves every year, and shoot forth the next Spring from the Old Root. It grows up but with one upright small round stiff Stalk 4 or 5 feet high, bearing two fair, green, long, shining Leaves at every joint, dented about the edges, but smaller than the former, standing on small Footstalks, and somewhat hard in feeling. At every joint with the Leaves on both sides, from the very bottom, come forth Branches half a yard long at least, with the like Leaves on them. At the Top of each Stalk and Branch, grows one flower, whose small, round, green button under it, has several small green Leaves on the head thereof, out of which breaks the flower, consisting of a dozen yellow small and long Leaves, encompassing a middle deep yellow Thrum. The Seed, by reason it flowers late with us in England, has not been observed.

X. The seventh, or more early broad Leav'd Purple Virginian Starwort. Its Root is hard and woody at its head, sending forth long whitish Strings, and abides all Winter with green Leaves

upon it, when the Stalks are withered, and dead. Its Leaves standing upon short Footstalks, grow singly on the several hard, stiff, brown greenish Stalks of a yard high, they are broad and round at the bottom, growing narrower towards the Point, and a little dented about the edges, of a fresh green color on the upper side, and something yellowish underneath. Each great Stalk towards the Top, Branches forth into flowers, which stand in a Tuft or Spike, with several small green Leaves below them on the Stalk: and the flowers being many, set on several small Branches, have a small greenish Scaly husk, and a small pale Purplish flower coming out of it, consisting of several small Leaves laid open like a Star, with several pale yellow Threads rising up like a Thrum, which turn into Down, with small Seed therein.

XI. The eighth, or later Flowering narrow Leav'd Starwort of Virginia. Its Root is composed of several long white Strings, which lives long and encreases much, losing all its Stalks in the Winter, but keeping a Tuft of green Leaves all the cold season, till it shoots forth new Stalks the next Spring. It grows up with many Stalks, and higher than any of the others, bearing single Leaves at every joint, which are long and narrow, without any dents on their edges, and without any Footstalk at the bottom. At every joint, from the middle upwards, it shoots out very long Branches, and they oftentimes branched again: at each joint whereof stand single Leaves, but much smaller, and thicker set than below. The Flowers stand singly at the joints and Tops of every Stalk and branch, which are small and Starlike in form, of a pale white color, with a single Purple Thrum in the middle, rising out of a small green husk, which turn into Down like the former.

XII. The ninth, or Lesser Purple Starwort. Its Root consists of a bush of Strings and small Fibres, from which rise up many slender, straight, upright Stalks half a yard high, each Stalk set with many Leaves up to the Top, longer and narrower than any of the Blew or Purple Starworts, and something like to the Leaves of Linaria, or Toad-Flax. At the Top of each Stalk, stand three or four flowers, consisting of many small Leaves in a Starlike form, of a very pale blewish color, with a yellow Thrum in the middle, which passes into Down, and is carried away with the Wind as the others are.

XIII. The Places. The first, second and ninth grow in Germany, France and Italy, but with us only in Gardens. The third grows in many places in England, in moist and shady grounds, but is also Nurst up in Gardens. All the rest grow in Virginia, as their Titles declare, as also in several other parts of Florida.

XIV. The Times. The three first and the last or ninth, flower in the Summer Months, viz. in June and July: The fourth and fifth flower in July, the sixth in August, the seventh in the end of August, or later if the year prove not warm; and the eighth, much later, viz. sometimes not till the end of October, or beginning of November, but yet sometimes a Month sooner, if the season be warm.

XV. The Qualities. They are temperate in respect to heat or coldness, dryness or moisture, digestive and maturative.

XVI. The Specification. Starwort is dedicated to the Cure of Buboës and other Tumors in the Groin, as Galen saith, whence came the Names, *Bubonium* and *Inguinalis*. It also abates inflammations and eases pain.

XVII. The Preparations. You may make there-
7 A from.

from. 1. A Liquid Juice of the Herb. 2. An Oil or Ointment of the Herb. 3. A Cataplasm of the Herb. 4. A Decoction of the Purple Leaves of the Flowers in Water.

The Virtues.

XVIII. The Liquid Juice of the Herb. Bathed warm, or fomented upon places affected, it abates Inflammations, asswages Tumors, and eases pains in the part, particularly, it is of special use in Buboes and other Swellings of the Groin: The Throat being also outwardly fomented with it, and inwardly Gargled with the same, it is said to be profitable against Inflammations of those parts, and the Quinsy. It is also good against the Piles or Inflammation of the Fundament, and the falling out of the Intestinum Reltum.

XIX. The Oil or Ointment of the Green Herb, and Hogs Lard. It cools Inflammations of the Fundament, also Inflammation of the Eyes, and the bitings of Mad Dogs, as Crotovus says. It consumes Swellings of the Throat, Scrophula's, &c. being anointed therewith; but for these purposes I should advise to chuse that fifth Species at Sect. VIII. because of its Signature in the Root (which if Crollius is to be believed, is much to be considered.) It is also good against Buboes in the Groin, according to Galens Opinion.

XX. The Cataplasm of the Green Herb. Applied it is good for all the purposes of the Liquid Juice, or Oil or Ointment, more especially if it be applied immediately after the fomentation or Uction. It has not only a digestive, but a cooling quality, and is very good to suppurate Venereal Buboes in the Groin, as all Antiquity has affirmed. It also cures or gives ease in the Piles, and in a Ficus in Ano, after fomentation or Uction as aforesaid being applied.

XXI. The Decoction of the Leaves of the Purple flowers in Water. It is good for the Pains and Sores in the Groin (applying after it, the Oil, Ointment or Cataplasm) and gives relief in a Quinsy, abating and taking away the Inflammation and swelling in those parts. Drank it takes away the heat and burning of the Stomach, and is said to cure the Epilepsy or Falling Sickness in Children. The Eyes being bathed therewith, and being also often in the day time, put into them, it abates their Inflammation, cools them and eases their pain.

C H A P. DCLXV.

OF STAR-WORT Sea and Water.

I. THE Names. It is called in Greek Τριπολίον by Dioscorides: and in Latine, Tripolium: in English, Sea Starwort.

II. The Kinds. Authors make six or more kinds hereof, we shall only Treat of those which are more Common with us, viz. 1. Tripolium majus, five vulgare; Anthyllis major Cordi; Amelli Species palustris Columnne; The Common greater Sea Starwort. 2. Tripolium vulgare minus; Anthyllis minor Cordi, The Common lesser Sea Starwort. 3. Tripolium minimum, Anthyllis brevior

Cordi, Tripolium minus Germanicum, The small Sea Starwort of Germany. 4. Stellaria Aquatica, Water Starwort.

The Descriptions.

III. The first, or Our Common greater Sea Starwort. Its Root is composed of several greater Strings, and many smaller Fibres, which grow deep, and stick fast in the Mud of the Marsh Ditches where it grows. It has many long and something broad Leaves rising from the Root next the ground, smooth, fat, and thick, and of a blewish green color, somewhat like to the Leaves of Doras Wound Wort, but much lesser. From among which rises

Starwort Sea Great.

up a smooth herby, or fleshy green Stalk, 2 or 3 feet high, branched towards the Top into several smaller Branches, with such like Leaves on them as grow below, but lesser. The flowers which stand at the Tops, are somewhat larger and greater than of the Attick or Italian Starworts, in the former Chapter, and almost of the same color, having a blewish Purple Border of Leaves standing about a yellow middle Thrum, which after it has done flowering, turns into Down, which with the small Seed it contains, is blown away with the Wind.

IV. Gerard describes it after this manner. Its Root is long and Threddy. From whence spring up long and large Leaves somewhat hollowed or furrowed, of a shining green color, declining to blewness, like the Leaves of Wood. Among which rises up a Stalk two Cubits high or more, which towards the Top is divided into many small branches, garnished

garnished with many flowers like Camomil, yellow in the middle, and set about, or bordered with small blewish Leaves, as in Camomil Flowers, which turn into a whitish rough Down, that flies away with the Wind.

V. The second, or Common lesser Sea Starwort. This is in all things like unto the former greater, but much lesser and lower, in its Root, Leaf, Stalk, and Flower; and in its Original or Native Places, has been observed not to exceed the greatness of the small Conyza, or Fleabane.

VI. The third, or small Sea Starwort of Germany. This is also very like unto the last, but yet less than it, having a shorter Stalk, and narrower Leaves: The flower is also small, and of a more Purplish color.

VII. The fourth, or Water Starwort. It has a long Fibrous Root, which sends forth several weak, slender, flexible Stalks, bending too and fro, in the Water, full of joints, from the bottoms to the Tops, having two small fine Leaves, almost like those of Fennel (whence some have call'd it Water Fennel) set at every one of them: and at Top of each Branch a small white Flower, consisting of eight Leaves, which when laid open are in form of a Star, whence the Name. Gerard says, it has many small Grassy Stems like Threads, coming from the bottom of the Water, to the upper face of the same, upon which grow small double flowers of a greenish Herby color. This Johnson in Gerard will have to be a Water Chickweed, having says he long narrow Leaves at every joint, and half a dozen or more lying close together at the Top of the Water, in fashion of a Star.

VIII. The Places. The two first grow in the Ditches of the Salt Water Marshes near the Sea Coasts, in many parts of this Land: and the First is scarcely to be miss'd in any Salt Marsh, if you look well for it. The second Lobel says grows near the Mouth of the River Padus or Po in Italy. Gerard says, these Herbs grow plentifully along the English Coasts in many Places, as by the For against Gravesend; in the Isle of Sheppy in several parts; in a Marsh under the Town Walls of Harwich; in the Marsh by Lee in Essex; in a Marsh between the Isle of Sheppy and Sandwich, especially where the Tide or Water Ebbs and Flows: and being brought into Gardens, they flourish a long time, but grow very great and rank, changing their greater Roots into Strings. The fourth grows in the very Water it self in Watery Ditches, and shallow Rills or running Springs, and in other moist and plashy places.

IX. The Times. They flower in the Summer Months, viz. in May, June, and July, for the most part.

X. The Qualities. Sea Starwort or Tripolium is as Galen says, hot in the third degree: it is also drying in the same degree, and as Dioscorides says, it is hot in Taste and sweet in Smell: and that it purges the Belly, which yet Lobel denies: but is truly Alexipharmick, for which reason it is put into Antidotes against Poison.

XI. The Specification. It is singular good to heal fresh green Wounds, as also to cleanse and heal Old Sores and Ulcers, to Cure inward bruises and hurts, and to resist Poison.

XII. The Preparations. You may have therefrom. 1. A Liquid Juice of the Herb and Root. 2. A Powder of the Root. 3. An Ointment or Balsam. 4. A Cataplasm of the Leaves.

The Virtues.

XIII. The Liquid Juice of Herb and Root. Injected into Green Wounds or hollow Sores and Ulcers, it cleanses, dries, and heals them, and mixed with Honey or Sugar, and so swallowed, it is good to heal any inward Wound, Ulcer, or Bruise, to help against Coughs, Colds, and Hoarseness, and other Distempers of the Breast and Lungs.

XIV. The Powder of the Root. Taken to two Drams in any proper Vehicle it provokes Urine, and is good to cleanse the Reins, Ureters, and Bladder of any Slimy or Tartarous matter lodg'd in them. It resists poison, and therefore is put into Antidotes for the same purpose. Dioscorides says it purges, but Pena and Lobel deny it; yet it is certain it expels watery humors from the Bowels, corrects Wind, and gives ease in the Gripping of the Guts, by discharging an Acrimonious Water from the same, especially in Dropfies.

XV. The Ointment or Balsam. They have the Virtues of the Liquid Juice, in healing simple Green Wounds and Ulcers, and ease pain proceeding of cold in the Nervous parts, being applied and bound on upon the same.

XVI. The Cataplasm of the Green Herb. The Leaves being only bruised and bound to the place, heal Green Wounds after a singular manner, which Authors say, has been confirmed by Experience.

C H A P. DCLXVI.

Of STAVESACRE:

OR,

LOUSE-WORT.

I. THE Names. It is called by the Arabians, *Alberas*; *Habebras*, *Muibazagi*, *Muibezagi*, *Mathuzagi*, and *Mibbezagi*: in Greek, *Σταγίς ἀγρία*, but by Galen, *Ἀσταγίς ἀγρία*: in Latine, *Staphis agria*, *Pedicularis*, *Peduncularis*, and *Pituitaria* (sic dicta, à viribus quas habet pediculos enecando, & Pituitam educendo:) and in English, *Stavesacre*, and *Louse-wort*.

II. The Kinds. It is a singular Plant sui generis, which at this day, is called by the Natural Greeks, *Πεδουκάρων*, or more properly *σταγίς*, i.e. *Granum Pedicularium*; and thereupon Cordus on Dioscorides calls it *Pthiracottonon*: Pliny lib. 26. cap. 13. calls it *Uva Taminia*; but lib. 23. cap. 1. he says it is corruptly so called.

The Descriptions.

III. Its Root is long and Woody, perishing every year, after it has born Seed. It rises up with a short, but strong blackish green Stalk, spreading it self forth divers ways: on which do grow great large Leaves, cut at the edges into five or

seven divisions, something like unto the Leaves of the great yellow Aconite or Wolfs bane, but deeper edged, and of a sad or dark green color, every one standing upon a long Footstalk. The flowers grow at the Tops of the Branches one above another, upon short Footstalks, being something like to

S. ayesacre.

a Larks Spurflower, for it has a Spur or Heel behind it, of a very deep or dark blew color but much larger. After which come in their Places three or four horned Seed Vessels, like unto the Aconites, but greater, in which are contained great rough Triangular Seed.

IV. Gerard describes it after this manner. Its Root is of a woody substance, perishing after it has perfected its Seed. It has Astraight Stalks of a brown color, with Leaves cloven or cut into several parts, almost like the Leaves of the Wild Vine. The flowers grow upon short Stems, in form somewhat like unto our Monks-hood, of a perfect blew color. Which being past, wetted husks succeed, like to those of Wolfs-bane, in which is contained brownish rough Triangular Seed.

V. The Places. It is Nutt up in Our Gardens, but is with very great difficulty preserved in Our Cold Climates; yea scarcely in very mild Winters, if not well defended: and although covered with Straw or Fern, in the very Month of March, those March Winds will do it much harm, if sharp and severe, as they do to all those Plants which are brought to us out of hot Countries. In Italy and the Kingdom of Naples, as also in Istria and Scavonia, it grows in the open Champion Grounds or Fields.

VI. The Times. It never rises to flower and Seed the first year it is Sown, but the Year after, and flowers in its Native Places in June, but not with us till it is late in the year, tho' it has continued all the preceeding Winter, nor ever gives here any perfect Seed.

VII. The Qualities. The Seed (which is the only matter of the Plant which is used) is hot and dry in the fourth degree: of a Biting and Attractive quality, and burning withall; and being given inwardly is strongly Emetick and Cathartick.

VIII. The Specification. It is proper for the Curing of Scabs, Itch, Scurff, Morpew, Leprosie, foul Ulcers, running Sores, Kings Evil, to kill Lice in the Head, and provoke the Terms in Women.

IX. The Preparations of the Seed. They are chiefly, 1. A Posset Drink. 2. A Decollion in Wine or Water. 3. A Decollion in Vinegar. 4. An Electuary. 5. A Pouder. 6. An Apoplegmatisim. 7. An Ointment. 8. A PASTE.

The Virtues.

X. The Posset Drink. A few of the Seeds about 14 or 15 of them bruised and strained into Posset Drink, and so taken, work very strongly upon the Stomach, expelling much viscous slimy gross flegm. But it ought to be used with great Caution, because it heats extremely, and endangers Suffocation by the Violence thereof: nor indeed ought it to be used without Correctives, and things which may mitigate the force thereof, that it may do no harm; and then it may be given to such as are troubled with Scabs, Itch, Scurff, Morpew, Leuce, Leprosy, Herpes, &c. Also used outwardly, it kills Lice, Crab-lice, Vermin, Worms in the head, share, or Armpits, or any other parts of the Skin.

XI. The Decollion in Wine or Water, or Honied Water. It is Emetick, and brings up gross flegm, but with great Violence. When taken, much Honied Water ought to be taken afterwards, and the Patient to walk up and down to avoid Suffocation, for which cause the Seeds of Staveacre, are very rarely used inwardly. This has all the Virtues of the former, whether used internally, or outwardly applied. It is good for all external detradations of the Skin. as also to cleanse and heal foul Sores and Ulcers in the Mouth and Throat: If it is too strong, it may be weaken'd by mixing it with Vinegar.

XII. The Decollion in Vinegar. If the Gums and Teeth be washed therewith it cures the Tooth-ach, by drawing away the Rheum which caused it, in great abundance. Any running Old Sore, or foul Ulcer being often washed therewith, it cleanses, dries and heals them, and comforts and strengthens any weak part, or Nerves overstrained, or hurt by any Accident.

XIII. The Electuary. First a strong decollion is made of the Seed in Water (proper Correctives being also added.) Then to the strained Decollion, Pouders of Aniseeds, Cinnamon and Liquorice, of each a sufficient quantity, with twice their weight in Honey, are added to make a thin Electuary. Dose is a Dram at a time; it has all the Virtues of the Posset Drink and Decollion, and provokes the Terms in Women: being also dissolved in Plantane or Rose Water, it heals foul Ulcers in the Mouth and Throat, by washing therewith.

XIV. The Pouder of the Seed. Strewed upon Heads over-run with Lice and Nits, it kills and destroys them. Mixt with Vinegar or Wine, it is good to be rubbed upon Loufy Heads, also Loufy Apparel, and to drive away and destroy Lice, Crab-lice, &c.

XV. The

XV. *The Apophlegmatism.* The Seed chewed in the Mouth alone, or mixed with a few bits of the Root of *Pyrethrum* or *Pellitory of Spain*, draws away abundance of Rheum from the Head, Brain, Nerves, Eyes, Nose, Jaws and Teeth, and thereby eases the Tooth-ach, and the pains and distempers of those other parts.

XVI. *The Ointment.* The Seed in Powder mixed with Oil or Hogslard, and made into an Ointment, is good against Itch, Scurf, Morpew, Scabs, Leprosie, Lice, Crab-lice, and other Vermin, being anointed morning and night on the parts affected, after they have been first bathed with the *Decoction*.

XVII. *The Paffe.* The Seed beaten with Meal, and made up into Paffe with a little Honey, has the Virtues of the former Ointment and Electuary: and laid in places where Rats and Mice frequent, will effectually kill or rid the place of those kind of Vermin, by their eating thereof.

XVIII. *Nota.* The Seeds are very truly dangerous to be taken inwardly, unless prepared, corrected, and given by a very skilful hand; and therefore, my Advice is, that such as are ignorant in Physick, should forbear their internal use, for that many times Death ensues upon the taking of them: but as to all their External uses, they are effectual and safe enough.

C H A P. DCLXVII.

OF STITCH-WORT.

I. **T**HE Names. It has no known Greek Name, yet some, as *Dodonæus* and *Lobel*, call it *Oxycos*, *Ruellij*: in Latine, *Græmen Leucanthemum Dodonæi* & *Fuchsij*, *Græmen Floridum Camerarij*, *Græmen Eufrafia Tragi*, *Græmen alterum Matthioli*, *Eufrafia major Loniceri*, *Caryophyllus arvensis Bauhini*, and in English, *Stitchwort*. But why *Dodonæus* and *Lobel*, or *Ruellius* should call it *Holostium*, i. e. *tota Ossæ*, or *Allbone*, there is little reason for, seeing it is one of the most tender Herbs, and has no hardness at all in it.

II. *The Kinds.* There are two sorts of this Plant, viz. 1. *Græmen Leucanthemum majus*, *Græmen floridum majus*, *Caryophyllus arvensis glaber flore major*, *Bauhini*, The greater *Stitchwort*. 2. *Græmen Leucanthemum minus*, *Græmen floridum minus*, *Caryophyllus arvensis glaber flore minor Bauhini*, The lesser *Stitchwort*. But why *Bauhinus* should account them in the kindred of the *Caryophylli*, I see no reason; nor yet why they should be accounted any Species of the *Gramina*, there is as little argument, for that they differ so much in form from them.

The Descriptions.

III. The first, or greater *Stitchwort*, has a Root which is small, jointed and Threddy, runs or Creeps in the Ground all about, with many small Fibres adjoining to it. From whence rise up several

Stitchwort Great.

round slender Stalks, scarce able to sustain themselves, but by the help of Hedges, or other things which grow or stand near it, being full of joints, from which two small, long, hard, rough and pointed green Leaves spring, without any Footstalks. At the Tops of the Stalks and Branches come forth many small flowers, consisting of white Leaves, and in form of a Star, with some white Threads in their middles. Of this sort, there has been some Varieties observed, as well in the Stalks, as in the Leaves and Flowers; some Plants growing greater or higher than others; in some the Leaves larger, and in others the flowers being greater or lesser, and the Threads in the middle, some being paler, and some redder than others. The Seed is contained in small beads, somewhat long and sharp at their upper ends; and when it is ripe, it is very small and brown.

IV. The second, or lesser *Stitchwort*. This in its Roots, Stalks, Leaves and Flowers, grows very like unto the former, its chief difference being in that it is lesser, the Leaves lesser, the Flowers smaller, and each Leaf divided as it were into two, making it seem to have more Leaves than the former. Otherwise in the shape of the Leaves and flowers they are much the same; the Leaves are orderly placed by couples together, and in good proportion, being of a whitish color: and the flowers are made in form of a Star, which when they are faded the Seed follows, which is enclosed in knobs or small round beads, like Lin-Seed, but not so absolutely round; and the Chives or Threads in the middle of the flower, are sometimes of a reddish or blackish color. In this lesser Species there is also some diversity in the Stalks, growing more upright, or else lying upon the ground, and in the flowers, some having white Threads in the middle Tipt with black

Stitchwort Small.

black, so that it makes the whole flower seem to be black, or else they are of a pale yellow.

V. *The Places.* They grow in the borders of Fields upon, Bank sides and under Hedges, almost every where. The first kind grows more usually under Hedges, and upon dry Banks of Ditches, or the like. The second is more Common in Corn Fields, and elsewhere, in the more open and Champion Grounds.

VI. *The Times.* The first flowers a Month earlier than the second, which is in April. The second flowers not until May or June. But when they begin to flower, they continue flowering for about two Months together running.

VII. *The Qualities.* Stitchwort is hot and dry in the first degree, a little sharp and biting as Galen says, and in its use, very like to Millet, and of an Anodyn Property.

VIII. *The Specification.* It is said to ease pains and stitches in the sides, and to take away the Dimness of the Eyes, or clear the Eye-sight.

IX. *The Preparations.* You may make therefrom. 1. A Liquid Juice of the whole Plant. 2. A Powder of the Herb. 3. A Powder of the Seed.

The Virtues.

X. *The Liquid Juice.* It is much commended to clear the Eyes of Dimness, and to rake off Films which begin to grow over the Sight, being daily three or four times a day dropt into them.

XI. *The Powder of the Herb.* It is accounted of, to help Stitches and Pains in the sides, being drank in White Wine from a Dram to 2 Drams:

some advise it to be taken with the Powder of Acorns.

XII. *The Powder of the Seed.* It may be given from a dram to 2 drams morning and evening, in White Port or Lisbon Wines, for the former purposes and intentions. Some say drank 2 or 3 times a day for many days together, that it causes fruitfulness in Women.

C H A P. DCLXVIII.

Of STOECHAS

OR,

CASSIDONY.

I. *THE Names.* It is called by the Arabians, *Astochodes*, *Astochodes*, *Astuchorados*, *Astuchades*: in Greek, by *Dioscorides* *στας*: by *Galen* *σταγας*: In Latine *Stachas* and by most *Stichados*, also *Stachas Arabica*, (because the best was brought out of Arabia. *Dioscorides* says, it took the Name *Stachas*, from the Islands *Stachades*, (over against *Mosilia*) where it grew in great plenty: in English, *Stachas*, *Cassidony*, *Stachadove* and *French Lavender*.

II. *The Kinds.* There are two principal sorts of this Plant, viz. 1. *Stachas* properly so called, of which we shall Treat in this Chapter. 2. *Stachas Citrina Chrysocome*, Yellow *Stachas*, Gold Locks, or Golden Tufts, called also Yellow Tufts, of which we have already Treated, in Chap. 322. foregoing: in which Chapter there is a gross error committed by the Printer, in the Title of the first Figure, page 432. col. 2. which is there, *True Gold Locks of Dioscorides*, whereas that being the Figure of the second Species, its Title ought to be, *Yellow Tufts: or Yellow Cassidony*, and so you are entreated to Correct it with your Pen. Of the *Stachas* properly so called, of which we Treat in this place, there are many kinds, but those which are chiefly to be found in our Gardens, are these following, viz. 1. *Stachas Vulgaris*, *Stachas Matthiola*, *Stachas Arabica*, *Stachas purpurea*, Our Common *Stachas* or French Lavender. 2. *Stachas Vulgaris flore albo Bauhini*, Our Common *Stachas* with White Flowers. 3. *Stachas longioribus ligulis Clusij*, *Stachas nudis Caliculis summis Lebelij*, *Stachas capitulis foliatis Lugdunensis*, *Stachas caliculis non foliatis Bauhini*, *Stachas Cassidony* or French Lavender with long Leav'd Heads. 4. *Stachas folio serrato, folio crispo Clusij*, *Stachas*, or French Lavender with dented Leaves. 5. *Stachas purpurea odorata*, Sweet Purple *Stachas*.

The Descriptions.

III. The first, or Our Common *Stachas* or French Lavender. Its Root is somewhat woody, and will scarcely abide our Cold Winters; after it has flower'd and Seeded, except in some places, unless an especial care be taken of it. As it grows with us, it is a more tender Plant than Lavender, and the whole Plant is something sweeter, but nothing so much as Lavender; it grows more like an Herb than a Bush or Shrub, and is seldom above

above half a yard high. It has long, narrow, whitish green Leaves like unto Lavender, but softer and smaller, set at several distances about the Stalks, which spread into several Branches: at the Tops of which come forth long and round, and sometimes four square heads, of a dark green-

Stæchas common or Cassidony.

ish purple color, compact of many Scales: from which come forth the flowers of a blewish purple color, after which follow the Seed Vessels, which are a little whitish when they are ripe, and contain within them blackish brown Seed.

IV. Gerard describes it thus. Its Root is hard and woody; it has a Body like Lavender, short and of a woody substance; but slenderer, beset with long narrow Leaves of a whitish color, lesser than those of Lavender. It has in its Top bushy or spiky heads, well compact or thrust together; out of which grow forth small purple flowers of a pleasant smell; the Seed is small and blackish.

V. The second, or Common Stæchas with white flowers. This differs not much in its Roots, Stalks, Leaves, Seed, form and manner of its growing, from Our ordinary Garden Cassidony before described, but only in its flowers, which are much like those also in shape, but not in color. In this Plant the Leaves grow thick together upon the Branches, a little larger, and not altogether so white; the heads are short likewise, but the flowers starting from among the Scales are larger than in the former, and of a pure white color. This sort is very rare to be met with.

VI. The third, or Stæchas, or French Lavender with long Leav'd Heads. Its Root is woody, long, slender, and accompanied with Branches, Strings, and Fibres like the first, from which the whole Plant in its form differs not much. In this the Tops of the Branches are bare, without Leaves upon them for the space of 4 or 5 Inches or

more, unto the heads. And the heads of these are not fully so large as in the other, but longer having divers hard, stiff, and longer skinny purplish Leaves, rising up above those heads, than at any time are seen in any of the former, which in some places have a shew of some short pieces, like unto the skinny Leaves, of a purple or blew color. The Flowers and Seed are also like the first, and so is its smell or odour.

VII. The fourth or Stæchas or French Lavender with dented Leaves. Its Root is much like the Roots of the former kinds. And it has such like Stalks, with square, brittle, slender, hoary branches, on which grow very long narrow Leaves, nicked round about the edges, or Toothed like a Saw, not much unlike those of Lavender Cotton: of these Leaves many grow together, and they are so dented or notched about the edges, that they appear CurPd or Crumpled, green on the upper side and hoary underneath, of a hot taste, somewhat bitter. The Tops of the Branches end in somewhat long square Stalks, which are naked and without Leaves unto the spiked heads, which are Scaly, slenderer and longer than any of those before described. The flowers are like unto those also, but of a more purple color, and the Seed is without any difference. At the Tops of the heads, comes forth also, such like skinny Leaves, of a blewish purple color like the former.

VIII. The fifth or Sweet Purple Stæchas. Its Root is woody, hard, long, and blackish: from whence shoot forth woody and hoary branches, on which do grow many long and narrow Leaves, of a dark green color on the upper side, and a little hairy withall, but of an hoary white underneath, and very woolly, a little dented about the edges, or rather rough. It rises up to be about half a yard high, leaning down its branches, spreading it self more in compass than it extends its self in height. At the Tops of the Branches comes forth sometimes but one flower or head; but more often two long heads together, composed of many Scales, at the Tops whereof stand the flowers, which are nothing but long Thrums or Threads, of an excellent purple color, and very sweet in smell, being very pleasant to the sight. After the flowers are past, follows the Seed wrapped up in Down, within those Scaly Heads, somewhat like to the small Pine Thistle Seed. This Plant Parkinson thinks ought to be placed with the Jacea's or Knapweeds, as being a Species of them, rather than here with the Stæchas's: but if you consider the form of the leaf and manner of its growing, it seems to be rather of the kindred of the Stæchas's, than any thing else, for which reason it is put here.

IX. The Places. The first grows in Arabia, Spain, Italy, and France. The second in Castile in Spain. The third in Italy, and Spain, and France. The fourth and fifth, in Italy and France: They all of them grow also in England, but with us they are Nurtd up in Gardens.

X. The Times. Tho' most of these flower more early in their own Native Climates, than with us, as the three first in March and April, and the two last in July and August. Yet in Our Gardens the two first flower not till May or June, and the two latter not till August, if they do abide. They are tender Plants and must be Sown in the end of April, and covered in Winter from the Cold, or else set in Pots, Tubs, or Wooden Chests, fill'd with Earth, to be carried into Houses when the Cold Season begins; by reason
of

of their tenderness, they ought to be lookt after with great care and diligence.

XI. *The Qualities.* They are hot and dry in the third degree: Aperitive, Attractive, Diuretick, Stomackick, Hepatick, Pectoral, Cephalick, Neurotick, Cardiack, Uterine, Emmenagogick and Alexipharmick: but the first of these plants is chiefly in use.

XII. *The Specification.* It opens obstructions, cleanses, strengthens, expels poison, resists putrefaction, comforts the Senses, strengthens the Head, Brain, and Nerves, is good against all Cold Aches, Pains or Grievs, as Apoplexies, Epilepsies, Palsies, Convulsions, Vertigo's, Melancholy, is profitable against all sorts of Agues, provokes the Terms, resists Vapors and Fits of the Mother, and is good against Coughs, Cold, Rheum, Catarrhs, provokes Urine, and cleanses all the Urinary Vessels. *Pena* says it is good against diseases of the Liver proceeding from bad Concoction: and is profitable against the Colick proceeding from Acid, Salt and Glassy Flegm, &c.

XIII. *The Preparations.* You may have therefrom. 1. A Liquid Juice. 2. An Essence. 3. A Decoction or Infusion of Heads and Flowers. 4. A Syrup. 5. A Powder of the Herb or of the Heads and Flowers. 6. An Oil by Insolation or Decoction. 7. The Fumes of the Herb Burnt. 8. An Acid Tincture of the Herb Heads and Flowers. 9. A Spirituous Tincture of the same. 10. An Oily Tincture of the same. 11. A Spirit of the Heads and Flowers. 12. An Oil of the same by Distillation.

The Virtues.

XIV. *The Liquid Juice.* *Stoechas* is said to be as effectual as *Hyslop*, for the Brest and Lungs, for Colds, Coughs, Catarrhs, Hoarseness, Wheezing, &c. It is also a resister of poison, and the Infection of the Plague, and all other Infectious Diseases. *Galen* says, it has a quality of binding and opening, for which reason it is good against all those diseases of the Lungs. The juice taken to 2 Spoonfuls or more in Wine or any other proper Vehicle, extenuates, cleanses, and strengthens all the inward parts and Bowels, as also the whole frame of the Body. *Mesues* says, it cleanses, purges, and resolves all Obstructions of the Liver, Spleen and other Viscera, hinders putrefaction, and corrects their intemperature.

XV. *The Essence.* It has all the former Virtues, besides which it strengthens the Brain, Nerves, Heart, and all other inward parts, corrects and expels Flegm, and Melancholy, comforts the Senses, cheers the Heart, revives the Spirits, and is effectual against all cold griefs in any part of the Body, all Aches or Pains whether internal, as Colicks, or external as Gouts, &c. by taking it inwardly morning and night from one Spoonful to two in any fit Vehicle, and outwardly bathing with it, the parts affected. Authors say, that *Stoechas* has a Cathartick faculty, but I could never find it; and therefore they say or advise it to be given with Vinegar of Squills (either the Juice or Essence) against Vertigo's, Epilepsies, Megrims, and other pains of the Head, as also of the Stomach: and given with *Lapis Cyaneus*, or *Sal Indicum*, it prevails against Melancholy, and terrors and fears accompanying the same: so also, if taken with Juice of Buglofs and Pippins; it takes away the oppression and sadness at heart.

XVI. *The Syrup.* It has all the Virtues of the Liquid Juice, and is a more excellent Pectoral, more especially if it is made with Clarified Honey, or Sugar Candy; it is truly an excellent thing against all distempers of the Brest and Lungs: and used as a Vehicle to take either the Juice or Essence in, it is not only effectual for all the purposes they are intended for; but so mixed, they prevail against all sorts of Agues, whether Quotidian, Tertian, or Quartan, more especially where Flegm abounds. But they are said to be hurtful for such as are hot and dry, and of a Cholerick habit of Body, causing in such both Thirst and Fainting. This Syrup may be made of the Clarified Juice; or of the heads, and flowers boiled in Water, according to the usual method.

XVII. *The Powder of the Herb, or of the Heads and Flowers.* It has all the Virtues of the Juice, Essence, Decoction and Syrup; but operates not with that speed, by reason of the grossness of its parts, and being clog'd with so many Earthy particles. If it has any Cathartick Quality in it, it is very weak and slow, and therefore they advise it to be mixt with *Myrobalani Indi*, or *Chebuli*, or *Sal Gemma*, or *Vinum Scilicicum*, to excite its purgative property and quicken it. They say it is made stronger, if it is before-hand Infused in Whey, or in Wine, or Juice of Pippins, with a few Raisins of the Sun. The Dose is from half a Dram to 2 Drams, morning and evening in the Syrup, or other convenient Vehicle.

XVIII. *The Decoction or Infusion in Whey, Wine, or Water.* It has all the Virtues of the Juice, Essence, Syrup, and Powder; but much weaker, and therefore is given in the larger quantity, as to half a Pint or more, and if they design it to Purge, it is mixt with some of the aforementioned Catharticks, by which it is made the more forcible. It provokes Urine and the Terms, and cleanses the Urinary parts.

XIX. *The Oil by Insolation or Decoction.* It is good against Aches, and pains from a cold cause, gives ease in Cramps and Convulsions of the Nervous parts, and prevails against Palsies, and other like Weaknesses afflicting the extrem parts: anointed upon the Region of the Womb, or put up with a Pessary, it is good for the pains and cold distempers of that Bowel.

XX. *The Fumes of the Herb or heads burnt.* Taken up the Nostrils through a Funnel, it is good against colds in the head, and opens stoppages of the head and brain. Received in the same manner into the Ears, it is good against pains there, as also against thicknes of Hearing, and Deafness: and so taken up the Womb, it comforts and strengthens a cold and moist Womb, and sometimes induces the Terms.

XXI. *The Acid Tincture.* Taken to a Grateful Acidity in any proper Vehicle, it prevails against the Plague, Spotted Fever, and all sorts of Malign and Pestilential Diseases. It suppresses Vapors in Women, and is good against Fits of the Mother. It strengthens the Stomach, and causes a good Appetite and Digestion, and is indeed an excellent thing against the biting of a Mad Dog, both inwardly taken and outwardly applied.

XXII. *The Spirituous Tincture.* It comforts a cold and weak Stomach, is good against Fainting and Swooning Fits, prevails against the Palsie and cold diseases of the Nerves, and is singularly good against the Colick, Gripings of the Guts and Bloody Flux. Dose a Spoonful at a time in the foregoing Syrup.

XXIII. *The*

XXIII. *The Oily Tincture of Heads and Flowers.* Inwardly taken from 10 to 30 Drops, and outwardly applied it is good against the Palfie, and all cold and moist distempers of the Nerves: It gives eases in the Sciatica and Gout from a cold cause; and eases pains and aches in any part of the body being anointed thereon. Inwardly taken it provokes the Terms, facilitates the birth, causes due cleansing after delivery, gives ease in After-pains and in the Colick, is profitable against Sand, Gravel, Stone, or Tartarous matter in the Reins and Bladder, eases the Strangury, and cleanses all the Urinary Vessels from Heterogeneous matter lodged in them.

XXIV. *The Spirit.* It has all the Virtues of the Essence, and Spirituous Tincture, but much more pleasant and Cordial and may be given from half a Spoonful to two Spoonfuls mixt with the former Syrup, against Melancholy, Vertigo's, Epilepsies, Palpitation of the heart, and other diseases of the Head, Brain, Nerves, and Viscera.

XXV. *The Distilled Oil from the heads and flowers.* It is no ways inferior to the Oils of Lavender, Rosemary, Pennyroyal, Angelica, Oranges, or Limons. A potent Medicament against the Palfie, Convulsions, Catarrhs, Colick, Epilepsy, and all cold and moist diseases of the Head, Brain, Nerves, Reins, and Womb. It may be given from *gut. iij. to vj. or viij.* in any proper Vehicle: or it may be dropt upon powdered Sugar, and well mixt with the same, and given in a Glas of Wine morning and night. It wonderfully comforts and strengthens the Womb, is good against Barrenness, provokes the Terms, facilitates the Birth, brings away the After-birth, eases After-pains, suppresses Vapors, and prevails against Fits of the Mother; and has also all the other Virtues of the Juice, Essence, Decoction, Syrup, Tinctures and Spirit aforesaid, being cautiously given as the learned Physician shall direct.

See the Yellow Stœchas, or Gold Locks, in Chap. 322. as aforesaid, whose Qualities, Properties and Virtues, tho' they may be something like to these, and may serve to most of the same Intentions and Purposes; yet 'tis certain, 'tis nothing so effectual as the True Stœchas, of which We have Treated in this Chapter.

C H A P DCLXIX.

OF STOCK-GILLIFLOWERS
Garden.

I. *THE Names.* This Plant is called in Greek, *Λευκοίον* (i. e. *Viola alba*, ex λευκόν album, and ιον, *Viola*;) in Latine, *Leucoium*: and in English, *Stock Gilliflower*.

II. *The Kinds.* We make but three generick kinds hereof, viz. 1. *Leucoium Hortense*, Garden Stock-Gilliflowers, of which in this Chapter. 2. *Leucoium Marinum*, Sea Stock-Gilliflower, of which in Chap. 670. next following. 3. *Leucoium Murale*, *Leucoium Luteum*, *Keiri*, Wall Stock-Gilliflower, or Wall flower, of which in its proper place in the Alphabet. W.

III. *The Garden Kinds.* These are first single, as 1. *Leucoium simplex, sativum colorum diversorum*, Single Garden Stock-Gilliflowers of several

colors. 2. *Leucoium sativum albidum* *Luteum simplex*, The single pale yellow Stock-Gilliflower. 3. *Leucoium Melancholicum*, The Dark or Dull single yellow Stock-Gilliflower. 4. *Leucoium alterum genus flore simplici*, Another kind of single Stock-Gilliflower. Secondly the Double kinds as, 5. *Leucoium flore pleno diversorum colorum*, Double Stock-Gilliflowers of divers colors. 6. *Leucoium sativum Luteum flore pleno*, The double yellow Stock-Gilliflower. 7. *Leucoium flore pleno variegatum*, The double striped Stock-Gilliflower. 8. *Leucoium alterum flore pleno*, The other double Stock-Gilliflower, of all which in Order.

The Descriptions.

IV. The first, or single Garden Stock-Gilliflower of several colors. Its Root is long, white and Woody, spreading divers ways: These single Stock-Gilliflowers tho' they differ in the color of their flowers, yet are in leaf and manner of growing one so like unto another, that until they come to flower, the one colored cannot be known, from another Stock; that which bears red flowers cannot be known from that which bears purple, nor either of them from that which bears white: and therefore One Description of the Plant will serve. It rises up with round Woody whitish Stalks, two,

Stock-Gilliflower Common.

three, feet or more high; on which grow many long and not very broad, soft, and whitish or grayish green Leaves, something round pointed, and parted into divers branches, at the Tops of which grow many flowers one above another, smelling very sweet, consisting of four small, long, and round pointed Leaves, standing in small long husks,

which turn into long and flat Pods, two, three, four, and sometimes five inches or more long, in which is contained flat, round, reddish Seed, with grayish Rings or Circles about them, lying flat all along the middle Rib or Pod on both sides. There is great Variety in the colors of the flowers: for some are wholly of a pure white color: others of a most excellent Crimson red color: others again of a fair red color, but not so bright or lively as the other: some of a Purplish or Violet color, without any spot, mark, or line in them at all. There are again of all these colors, very variably mixed, as White mixed with great or small spots, streaks or lines, of a pure or bright red; or dark red and white with purple spots and lines: And of either of them, whose flowers are almost half white, and half red; or half white, and half purple: The red of both sorts, and the Purple also in the same manner spotted, striped and marked with white, differing neither in form, nor substance in any other point.

V. The second, or single pale yellow Stock-Gilliflower. This is of no great regard, but only for its rarity and diversity from the rest, there being but little difference in this kind from the former, whether as to its magnitude, leaves, or flowers, or manner of growing; only this has greener leaves, and a pale yellow flower, almost white, but in all other respects alike.

VI. The third, or Dark, Dull single yellow Stock-Gilliflower. This seems to be a Wild kind of this Plant, and has like Roots with the former, but larger, longer, and greener Leaves than any of them, unevenly cast or sinuated on both edges, lying on the Ground, and a little rough or hairy withall. From among which rise up the Stalks a yard or more high, and hairy likewise, bearing thereon, here and there, some such like Leaves as are below, but smaller; and at the Top a great number of flowers, as large or larger than any of the former single kinds, made of four large Leaves apiece, standing in such like long husks, but of a dark, dull or sullen yellowish color: after which come long roundish Pods, in which lie somewhat long but rounder and greater Seed than in any other Stock-Gilliflower, and nearer both in Pods and Seed unto the Hesperis, or Dames Violet. The Root of this does not usually perish after Seed bearing tho' sometimes it does.

VII. The fourth or other single kind of Stock-Gilliflower. Its Root is like to all the former, and dyes every Winter for the most part, after it has born Flowers and Seed, being seldom preserved. This kind differs neither in form of Leaves, Stalks, or Flowers from the former, saving that it oftentimes grows much larger and taller; so that whosoever shall see both these growing together, shall scarcely discern the difference, only it bears flowers, wholly, either White, Red or Purple, that is, of One color, without mixture of other colors in them, which are either single like unto the former, or very thick and double, like unto the next following, but larger, and growing with a greater store of Flowers on the long Stalk. But this is to be understood, that these kind of Plants which bears double flowers, as they bear no Seed at all, so the double flower'd proceeding from the Seed of this single flower'd (which of all the single flower'd kinds, is that only whose Seed gives both single and double flowers) is very seldom increased by slips or cuttings (as the next double kind is) because this sort dyes every Winter for the most part; but is to be produced every year, from the Seed of this single kind, which promiscuously brings forth, some

Plants single flower'd, and some double flower'd, which cannot be distinguish'd one from another, viz. which will be single, and which will be double, till they are seen in flower, or in bud at least; for which reason the Seed of this single kind is always to be saved, which is the only way to preserve the Species. But of the Seed of any of the former single kinds, never any double flowers were ever known to be produced, and therefore you ought to be careful in saving the Seed, to distinguish it from the Seeds of those.

VIII. The fifth or Double Stock-Gilliflower of Divers colors. This kind which bears only double flowers, grows not so great, nor spreads its branches so far, nor are its Leaves so large as the double flower'd of the former single kind, but is in all things smaller, and lower, and yet is Woody or Shrubby like that: bearing its flowers in the like manner, many upon a long Stalk, one above another, and very double, but not so large as those former double, altho' it grows in a fertile soil, which are wholly either White, or Red, or Purple, without any mixture, or else mixed with Spots and Stripes, like the single flowers of the first kind, but more variably, and not in all places alike, never bearing Seed, but is to be increased by the cuttings of the young Sprouts or Branches only, taken in a fit Season. This kind perishes not, as the former double kind does, provided it be defended in Winter from the Extremities of Frosts, and Cold North and North East Winds, and from the Snow falling or resting upon it. The former Stock-Gilliflower of divers colors, raised from the Seeds of the single kind at Sect. VII. above, are in all parts so like the single, and so well known, that they need no Description. The chief difference consists in the flowers, which in this double kind are large, thick, and double, bearing many upon one Branch, and one Stalk having many branches of flowers, which are either of a sadder or lighter purple color, or of a paler, or deeper reddish Murrey. There is also one which has greener Leaves than any of the rest, bearing pure white flowers: but all these (as we said before) come from the Seeds of the single kind at Sect. VII. aforementioned.

IX. The sixth, or Double Yellow Stock-Gilliflower. It has long Leaves somewhat hoary or white, like unto the Stock-Gilliflowers, the Stalks and Branches being also like the same (and not Green like unto the Wall-flower, to which else it might have been referred.) The flowers are fair and double of a pale yellow color. The whole Plant is tender, as the double Stockgilliflowers are, and ought carefully to be preserv'd in Winter from the Cold, and that rather more than the next double, lest they perish.

X. The seventh, or Double Striped Yellow Stock-Gilliflowers. It is in all things like the former single Striped, and has the same diversity of Colours, only differing in that the flowers of these are all striped or marked more or less with white, which adds very much to their beauty and esteem.

XI. The eighth, or other Double Stock-Gilliflower. This has no single of the kind, and is lesser in all the parts thereof, than those raised from Seeds: the Flowers are also smaller, but thick and double, of the same or like colors with the other, both for single colors and mixed; many of them much more, and better striped with white than those of the former kind.

XII. The Places. They grow with us only in Gardens, and that almost throughout all England: But it is said that some of the single kinds in Foreign

Foreign Countries and Warm Climates grow Wild.

XIII. *The Times.* They begin to Flower in *April*, and are in their greatest Glory in *May* and *June*; but many of them continue flowering all the Summer, till they are Check'd by Frosts. Some of the single kinds will continue flowering in a manner all the Year throughout, in some places, if they stand warm and are defended from Frosts and Cold Winds. The single kind, at *Self*. VII. whose Seed bears double Flowers, as well as single, Flowers usually late, and keeps flowering until *Winter*, till the cold Weather or Frosty Seasons nip it. The double as well as the single are raised from Seed, which if the Seed is good, and of the right kind, is to be Sown at the Full of the Moon in *April* in your flower Nursery, not too thick, by any means. But if they are Sown in *March*, it ought to be on hot Beds, in small strait drills, drawn cross, and then covered with Ones hand (after the Seed is Sown) as thin as possible.

XIV. *The Cultivation.* 1. Being Sown in their proper Seasons, when the Plants are grown to be about 4. or 5 Inches high, you ought (in some Rainy Season) pull them up, then turn the Bed over where they grew, and set them again in Rows at convenient distances. After they have stood some time, and begin to grow high, take them up again as before, and set them again the second time; by this means they will become more hardy, not grow so high, and spread out more into Branches, have more strength to endure Winter, and at Spring, be far better Plants to remove, than those which run up to a great height with long Stalks, which are seldom able to endure the Frosts in Winter.

XV. 2. Among these raised from Seed, you will have many with double flowers, which may be perceived in the buds, which will be rounder and larger than those which will prove to be single: these double ones you ought to remove into your Garden, taking them up carefully, not breaking the Roots, and with some Earth about them, which being a while Shaded and Watered, will grow and bear flowers, as well as if they had not been at all removed. Those with single flowers must stand for Seed, which is to be Sown every year, to preserve the kinds; for after they have born flowers both double and single commonly dye.

XVI. 3. The other sort of double Stock Gilliflowers, which bear no Seed, nor have any single of the kind, are to be increased by slips only: These double kinds, being not only more apt to grow, but also continue longer than those which are raised from Seed; but as it is in Carnations and Clovegilliflowers, so it is in these; those from sets, being more easily obtained, has caused the latter from Seed, to be neglected, and almost quite lost; notwithstanding that one Plant from setting, is a much more noble kind, and worth five of those raised from Seed.

XVII. 4. Some think that the Double kind raised from Seed, are not so to be preserv'd longer than their first year of bearing flowers, but that is a mistake; for many of those double Plants have been raised from the slips or cuttings of this kind, as well as the other. 'Tis true, the Old Plant being run up all to flower, dies commonly the next Winter; but the cutting will grow, and bear the next Spring following, almost as well as those raised from Seed, which is to be done in this manner following:

XVIII. 5. Make choice of such Branches as do

not bear Flowers, which cut off some distance from the Stock, so that they be not too long: then slit down the bark at the end of the slip, about half an inch, in 3 or 4 places, equally distant from each other, according to the bigness thereof, which Peel as far as it is slit, and turn up; then cut off the naked woody part close to the Rind which is turned up: make a wide Hole in the Earth, and set the slip therein 3 Fingers deep, with the bark spread open, round about the end thereof: then cover it, which let be shaded for some time, and watered; if the Ground is any thing good, it will grow and prosper very well. This certainly is the best and most absolute way to raise double Stocks of any of the kinds: and in like manner you may cut and set Slips of *Wallflowers*, or of any other Woody Plant, which will grow of slips. They may also be increased by laying the slips after the manner of *Carnations* and *Clovegilliflowers*.

XIX. 6. When the Plants begin to rise out of the Earth from Seed, you ought to secure them from Frosts, and Cold Nipping Easterly Winds, by covering them with dry Dung, Mats, or Glasses. If you cover them with Glasses in order to forward their growth, take care not to uncover them all at once: for after having been enclosed in a Warm place for some time, if you expose them to the Air too suddenly, you run the hazard of killing them: whereas if you gradually expose them to the Air, they will the better encounter the hardship thereof, and gather a sufficient strength, so as the more easily to admit of a Transplantation.

XX. 7. The fourth single Stock, which we preserve for Seed, we always retrench in its Pods, leaving no more to ripen than we think fit for our necessity; so will the remaining Seed be fairer, larger, and stronger, and make more noble and beautiful production of Flowers. It ought also to be gathered when the Pods are quite dry, and begin to open of themselves: for the Seed being then in no danger of shrinking, you may Sow it with expectation of excellent Plants.

XXI. 8. Before you Plant your young Stocks, do not set them immediately in the designed places for them, but fill whole Beds with them, placing them at half a Foot distance one from another, where they continue as in a short Nursery. The Stocks begin to discover themselves towards the latter end of *September*, if Planted in season: sometimes it is later, and now and then not before Winter. For they are in no Esteem, unless they be double; and since Nature has not imparted to them all that advantage, this Method is taken; that having raised them, and found out which of them are double, we may order them according to the following Directions.

XXII. 9. As soon as the Stock appears to be double, prepare Pots or Boxes 16 Inches Wide every way, which fill with one half Earth, the other half Old Mould mingled together, and press'd down with your hands, lest it should chance to sink after the Flowers are Planted, and so make an unevenness in the superficies, which ought to be avoided: fill the Pots, &c. no higher than within four inches of the Top, for the Vacancy which is left is to receive the Foot of the Gilliflower, which we draw up either in Turf, or with no more than its Roots.

XXIII. 10. If it is raised with the Turf or Earth about it, then sink a Spade down, within 4 inches of the Master Stem, and plucking the Spade up, do the same on the other side, directing it so, that it may go sloping under the Roots, and at every turn heave the Flower a little, by

some small Shocks of the Spade at the Top of the handle. Now observe, if the Roots of the Flower be quite disengaged from the Earth; if so, thrust down your hands on both sides of the Turf, and with your fingers opened or stretch'd as wide as possible, raise up the whole; and before it is plac'd in the Pot, Tuh, or Cafe design'd, let another person be ready to cut off those ends of Roots which are too long for the Turf.

XXIV. 11. Then set the Foot of the Stock in its design'd Place, directly in the middle of the Vessel, taking care that the Turf or Earth fall not asunder from it: But if it chances to be disjoint a little, keep one hand close upon it, and in the other take some of the Compounded Earth as before directed, with which cover the Turf all round, pressing it gently down, and so fill up the Pot within an Inch of the Top, casting pure Mould over it, and uniting the superficies as evenly as may be, which done, Water the Plant, and remove it into the shade, till it has taken Root again, after which place it in the Sun, in the Place where you design it shall stand.

XXV. 12. If you don't design to Plant your Stocks with the Turfs about them: then only pluck them up by the largest Stem, and carefully clip the Roots which are too long, after which Plant them, according to the Method before prescribed.

XXVI. 13. Since we only use that Seed, which is of the best kind, you must take care, before Winter comes, to have some of the Production in Pots, to the end you may be able to save the Seed the year following: for know, that Stock-Gilliflowers are only in Preparation (the first year after they are Planted) to produce Flowers and Seeds the year following; so that without this care, you will often be unfurnished.

XXVII. 14. We Plant them in Pots or Cafes, either, 1. because we design they should continue there always, or, 2. with an intent to remove them again in the Spring, to replant them in the borders, or other parts of the Garden, where they may make the best show. But when we would have them remain long in flower, we place them in Pots &c. that they may be removed upon occasion, into the shade: and if the Pots are of right Dutch Ware, and of handsome size, and placed in good order, they will be a singular Ornament to the Garden.

XXVIII. 15. In case the Stocks are not marked the first year, after they are Planted, so that you cannot judge whether they will be single or double; you must be careful during the Winter, to preserve them with a covering from hard Frosts and Cold North and North-East Winds, which might possibly Kill them. And those which are in Pots are to be secured from the same Inconveniences, either in Green-Houses, or in some other place, of a Southern Situation, which is warm and not moist.

XXIX. 16. Stocks ought to be Sown in *Hot Beds*, as we have declared at *Self. XIII.* foregoing, but you may Sow them in the *Naked Ground* also, which is well Till'd, but then it ought not to be done till the middle of *April* or later, by reason of the Cold Weather, which is not over many times before that time: but whether they be Sown in *Hot Beds*, or in *Naked Ground*, they ought to be sufficiently Watered and Weeded, that nothing may hurt their growth.

XXX. 17. The Flowers set in Pots to be preserv'd from Frosts, and Cold Weather, are thus to be removed. Dig a Hole with a Spade or large

Trowel, about as broad and deep as a Har Crown; then lay your hand flat upon the superficies of the Earth in the Pot, in such a manner, that the lower part of the Stems, may be just in the middle of your fingers; turn the Pot upside down, and shake it a little, till you perceive the Earth to descend; bring your hand down a little, take the Pot quite off, and holding the Plant in both your hands, carry it gently to the Hole Dug for it, where having plac'd it as it ought to be, fill the whole up with Earth, and water it, after which, you will find it thrive and flourish to your Satisfaction.

XXXI. *The Qualities.* According to Authors, they are of the same Qualities, Specification and Virtues of the Wallflower, of which in its proper place; and as their Natures are much the same, so they are esteem'd as Effectual to all intentions and purposes; they are hot and dry in the first degree, Absterfivè, Anodyn, Hepatick, Splenetick, Nephritick, Hysterick, and Neurotick, and of thin and subtil parts.

XXXII. *The Specification.* The Flowers ease the hardness and pains of the Womb, provoke the Terms, expel the Birth, Afterbirth and Dead Child, open Obstructions of Liver and Spleen, cleanse the Reins and Urinary passages, provoke Urine, help in the Strangury, and are said to add strength to Paralytick Members.

XXXIII. *The Preparations.* You may make therefrom. 1. *A Liquid Juice or Essence of the Heads of Flowers, rather than of the green Leaves.* 2. *A Decoction of the same in Wine.* 3. *A Powder of the Seed.* 4. *A Gargarism.* 5. *An Ophthalmick.* 6. *A Distilled Water of the Heads of Flowers.* 7. *A Cataplasm.*

The Virtues.

XXXIV. *The Liquid Juice or Essence.* According to *Galen*, they are of a cleansing quality, and of thin parts; they open the Obstructions of Liver, Spleen, Reins, and Womb, provoke the Terms, help the hardness and pain of the Mother, expel Birth, and Afterbirth, and Dead Child, strengthen and restore the Viscera, and any external part weakened by the Palsie, overtraining or any other Accident. Drop'd into the Eyes, they cleanse them from Mists and Clouds, which seem to hinder the sight; and take away such Films, which are beginning to grow over the Eye. Dose two Spoonfuls or more morning and night, in a Glass of the Distilled Water sweeten'd with Sugar; or with *Syrupus de Althea* in case of the Stone or Gravel, or other Tantarous matter in Reins or Bladder.

XXXV. *The Decoction of the Heads of Flowers in Wine.* It may be made of them either Green or Dry; it rectifies the Indisposition and hardness of the Liver and Spleen, and has all the Virtues of the Juice or Essence. Dose from a quarter to half a Pint morning and night.

XXXVI. *The Powder of the Seed.* It has the Virtues of the Juice, Essence and Decoction: and may be given from a Dram to two Drams, made up into an Electuary, with Rob, or Pulp of *Juniper Berries*, or any other proper Vehicle, which has Absterfivè, Diuretick, Hysterick, and Deobstruive qualities.

XXXVII. *The Gargarism.* It is made of the Decoction of the Heads of Flowers in Vinegar, and sweeten'd with a third part of Honey, and

an eighth part of Koch Alum dissolved in it: it is good to heal Ulcers in the Mouth and Throat, they being often Gargled therewith. A Decoction of the Roots in Vinegar is held good for the hardness of the Spleen, being outwardly applied, whilst some of the former Preparations are given inwardly.

XXXVIII. *The Ophthalmick.* Take of the Liquid Juice or Essence 4 Ounces: Clarified Honey 1 Ounce: mix and dissolve. It gives relief in Pains, Waterings, and Inflammations of the Eyes, clears the Eye-sight, and takes away Clouds, Mists, Films, or other things which may obfuscate the Sight, being dropt into the Eyes two or three times a day.

XXXIX. *The Distilled Water of the Heads of Flowers.* It is available to all the purposes aforesaid, and is a good thing to cleanse the Blood, comfort the inward parts, ease pains, and to cause a pleasant, merry, and cheerful Mind: If in eight Ounces of the Water, three or four Drams of *Saccharum Saturni* be dissolved, it makes an excellent Wash for the Face and Skin, taking away Scurf, Morpew, Tanning, Sunburning, Pimples, Soreness, Scabs, and other like Defædations and Deformities thereof, being duly applied and suffered to dry on.

XL. *The Cataplasm.* The Leaves beaten in a Mortar with a little Salt, and applied as a Cataplasm to the Wrists, being tyed pretty hard on, is said to be a Remedy and Cure for an Ague. The Leaves and Heads of Flowers boiled also soft in a little Vinegar, to the consistency of a Cataplasm, and applied warm, upon any place Pained with the Gout, eases the Pain, and dissolves the humor, and strengthens the Weakned Parts. Applied also to the Joints, Nerves and Tendons, troubled with any Pain or Weakness, hard Tumors, Swelling, or Inflammations, it give ease, strengthens, softens, dissolves and reduces them to their Pristine State.

C H A P. DCLXX.

OF STOCK-GILLIFLOWER
Sea.

I. THE Names. It is called in Greek, Λευκοίον Θαλάσσιον, in Latine, *Leucoium Marinum*; and in English, *Sea*, or *Marsh-Stock-Gilliflower*.

II. The Kinds. Authors have made a dozen kinds or more, most of which are not to be found in our Countries: Those more usual with us, are, 1. *Leucoium Marinum purpureum Lobelij*: The Purple Sea Stock-Gilliflower. 2. *Leucoium Marinum Syriacum*; The Levant Stock-Gilliflower. 3. *Leucoium Marinum latifolium Baubini*; *Leucoium Marinum alterum Lobelij latifolium*; *Leucoium Marinum aliud Camerarij*; *Tripolium Angulata Camerario*; broad leav'd Sea Stockgilliflower. 4. *Leucoium Marinum majus Clusij*; *Leucoium marinum latifolium Baubini*; Great Sea Stock-Gilliflower. 5. *Leucoium marinum maximum*; The greatest Sea Stock-Gilliflower. 6. *Leucoium Marinum minus Clusij & Lobelij*; The small Sea Stock-Gilliflower.

The Descriptions.

III. The first or Purple Sea Stock-Gilliflower. It has a very long tough root, thrusting it self deep into the Earth; from which rise up thick, fat, soft and hoary Stalks. The leaves coming forth from the Stalks next the Ground, are long, soft, thick, full of juice, covered with a downy hoariness, and sinuated somewhat deep on both sides. The Stalk is set here and there with like Leaves, but lesser. The Flowers grow at the tops of the Stalks, compass of four small leaves, of a light Purple Colour. The Seed is contained in long crooked Cods, like those of the Garden Stock-Gilliflower.

IV. The second, or Levant Stock-Gilliflower. Its root is white, and grows deep into the Ground, spreading it self about, growing woody when it is in Seed, but perishing afterwards. It rises up at first with several long and somewhat broad leaves, a little unevenly dented or waved about the edges, which so continue the first Year after Sowing. The Stalk rises up the next Year to be about two Feet high or more, bearing all those leaves on it which it first had, which do then grow less sinuated or waved than before. At the top stands many Flowers made of four Leaves a peice, of a delay'd Purple Colour; having but a little smell, which turn into very long and narrow flat Pods, in which are contained flat Seed, like that of the common Garden Stock-Gilliflower, but much larger, and of a dark or blackish brown colour.

V. The third, or broad leav'd Sea Stock-Gilliflower. It has a long root, running very deep into the Earth, with a vast number of Fibres or Strings coming from the same: From which spring forth many hoary leaves lying upon the Ground shorter and broader than those of the other Sea kinds; harder also in feeling, and as it were rugged, more hairy, and finely dented about the edges. From among which, rise up several round hairy Stalks, about a Foot high, bearing at their tops several Flowers of a purplish blew colour, much like those of the Garden; after which follow small long Pods with brownish flat Seed in them.

VI. The fourth, or Great Sea Stock-Gilliflower. Its Root is long, running deep into the Ground, with many branches springing from the same. It has divers long thick hoary leaves, lying on the Ground for the first Year; some of them being cut in on the one edge, and some on both, with but one gash, and some not at all. The Stalk rises up the next Year about a Foot high or more, which spreads it self into divers branches, yet all of them weak, and rather bending downwards, than standing upright; on which grow but few leaves, little or nothing dented or cut in; at the tops of which, grow several Flowers of a pale purple Color, drawing near to the Color of Red Wine Lees, which smell sweeter after the Sun is down, than in the day-time. The Cods which follow, are long and somewhat flat, with reddish flat Seed in them.

VII. The fifth, or Greatest Sea Stock-Gilliflower. Its Root is white, hard, long, and spreading into many Branches, which abides not after it has yielded Seed, but perishes as the other Sea kinds do. It has divers long, thick, whitish soft leaves lying upon the Ground, one within another in a round compass, and are stiffer than the other Sea kinds, or those of the Garden kinds in the former Chapter; jagged also, or cut in evenly on both sides, into deep dents, not much unlike to the Snaggs of a Bucks

Bucks Horn, which makes it seem the more beautiful. Thus it abides for the first Year; but the next Year it bears or sends forth a hoary white Stalk, three Feet high or more, spreading it self out into many Branches, pretty thick, but weak, being scarcely able to stand upright; on which grow narrower leaves, little or nothing jagged about the edges. At whose tops grow a great number of Flowers one above another, for a great length together; each Flower consisting of four broad pointed leaves a peice, not altogether so sweet as those of the Garden Stocks, but somewhat larger, and of a pale blewish purple color, almost like the color of a Dove or Pidgeon: After which, come forth long Seed pods like the others, with Seeds lying in a double row in the same manner, but larger, and of a darker color.

VIII. The sixth, or small Sea Stock-Gilliflower. Its Root is woody like the other, and perishes after Seeding time. This has more upright Stalks than any of the former, divided from the bottom into

Stock-Gilliflower Sea-Small.

many Branches, on which grow soft woolly leaves, smaller, narrower and lesser jagged, than those of the Great Sea-Stock. The Flowers which grow at the tops of the Branches, are smaller than the others which grow lower, but consist of four Leaves only like the rest; of a fresh red or Crimson color, which upon their fading, soon yet to be deeper; and having a weaker Smell than those of the other kinds: After which, in their places, come forth long Pods, in which are contained the like red Seed.

IX. The Places. The first was gathered by Mr. George Bowles, upon the Rocks at Aberdovey, in Merionethshire in Wales, and possibly may be

found near the Sea-shore about Colechester, also in the Isle of Man, near West-Chester, and near to Preston in Oldenness, Yorkshire. All the rest are found growing on the Sea-Coasts of the Levant, and other Foreign Countries; but with us they grow only in Gardens.

X. The Times. They all Flower all the Summer Months, from May, through all June, July and August; and the Seed comes to ripeness in less than a Month after.

XI. The Qualities, Specification, Preparations and Virtues of these, are accounted the same with those of the Garden Kinds, treated of in the former Chapter, saving that they have not altogether so sweet a Smell; but in Galens Judgment they have all of them a cleansing property, and are of thin and subtil parts.

STOB-WORT, see Sorrel-Wood, Chap. 641.
STONE-BREAK, see Saxifrage, Chap. 624.
STONE-HORE, see Stone-Crop, Chap. 671.
STONNARD, see Stone-Crop, Chap. ibid.

C H A P DCLXXI.

of STONE-CROP,

AND

WALL-PEPPER.

I. THE Names. It is called in Greek, *Ἀειζών* ^{μικρὸν}: quasi *Sedum minus*, (because it is a *sempervivum*) in Latine, *Illecebra*, and *Vernicularis*: in English, *Stone-Crop*, and *Wall-Pepper*.

II. The Kinds. Authors make many sorts of this Plant, as, 1. *Illecebra*, *Illecebra minor* Lobelij, *Sedum tertium* Dioscoridis, *Sedum Causiticum* Clusij; *sempervivum minus*; *Dactylon secundum* vel *tertium* Columnæ; *Aizoon acre* Cordi; *Aizoon minus* *severidi* gustus Thalij; small *Stone-Crop*, or *Wall-Pepper*. 2. *Illecebra insipida*; *Vernicularis insipida* Thalij; *Aizoon minimum* Cordi: Insipid *Stone-Crop*, or *Wall-Pepper*. 3. *Sedum minus* *Atrivum* Lobelij, Summer *Stone-Crop*. 4. *Vernicularis flore albo* Camerarij; *Sedum minus* *femina* Fuchsj; *Lugdunensis*, *aliorumque* *Sempervivum minus* *album* Brunfelsij; *Sedum minus* *primum* Clusij. The Greater White-Flowered *Stone-Crop* with round pointed Leaves. 5. *Sedum minus* *Clusij*; *Vernicularis* *Dasyphyllum*; *Aizoon* *Dasyphyllum* sive *densifolium* *Lugdunensis*; A smaller White-Flowered *Stone-Crop*. 6. *Vernicularis scorpioides*; *Sedum minus* *quartum* Clusij; *Aizoon scorpioides* Lobelij; *Aizoon minus* *flore luteo reflexo* Camerarij; *Stone-Crop* with turning heads. 7. *Sedum minus* *flore rubente* Bauhini; *Sedum minus* *tertium* Clusij; *Sedum palustre* Clusij; *Sedum minus* *quartum* Tragi; Field or Marsh *Stone-Crop*.

III. The

The Descriptions.

III. The first or small Stone-Crop, or Wall-Pepper. It has a long, slender, fibrous or stringy Root, creeping under the Earth not very deep. It grows like the other Stone-Crops, with very many and slender Stalks, and small roundish fat thick leaves set thick upon them; at the tops of which, grow small pale yellow Flowers in Tufts, as the others do. The taste hereof is very sharp, hot and biting upon the Tongue, by which it is chiefly distinguished from all the rest; tho' it is also distinguished in some measure by its form, being a small Plant, and its Stalks very thick set with small, fat, or thick leaves as aforesaid, its Root springing up from its Fibres, and so spreading very far, quickly taking up much Ground.

IV. The second, or Insipid Stone Crop, or Wall-Pepper. It is a small Plant like the former, growing altogether like it, in Leaf, Stalks, and Flowers, which are as these, yellowish: and is only distinguished by the Taste from the first; this being nothing biting, but as it were unsavory, and without any Taste.

V. The third, or Summer Stone-Crop. Its Root is small, fibrous and perishing. It has on small Stalks, which spread themselves out into many Branches, many thick, round, long and juicy Leaves, set together without any order; the Branches being stored with many yellow Flowers at their Tops.

Stone Crop White Flower'd:

AND

Prick Madam Common Greater.

VI. The fourth, or Greater White Flower'd Stone Crop, with round pointed Leaves. Its Root creeps like the rest, and its Leaves perish with its Stalks every Year. It creeps upon the Ground in the same manner as the others do, with slender Stalks and long round Leaves upon them, of a bluish green color, not sharp, but round pointed, seeming like Wheat-Corns, or Pine Apple Kernels; being sparsely set thereon: at the tops of which, stand small white Star-like Flowers, in small Tufts, or sparsely Umbels. This very much resembles the Greater Prick-Madam, in Chap. 578. Sect. 5. aforesaid, and differs chiefly from that in the Flowers; these here being white, those being yellow: And therefore the Cut here placed, may indifferently serve for both Species.

VII. The fifth, or smaller White Flower'd Stone-Crop. It in its Roots, Stalks, Branches, Leaves and Flowers, are like the last, but it grows lower, and has a greater store of those small round Leaves like Wheat-Corns, which are thicker set thereon, it differing in nothing else therefrom.

VIII. The sixth, or Stone-Crop with Turning heads. Its Root in like manner as the former, creeps and shoots forth in divers places. This has such like Stalks with Leaves thereon, as that at Sect. VI. above; so that it is hard to distinguish this Plant from that, or the Greater Prick-Madam in Chap. 578. Sect. 5. aforesaid of this Book, until it comes to Flower, which then may be discerned to differ from them, only in the turning of its Tops of yellow Flowers, which turn or bend like the Tail of a Scorpion (whence the Name;) or other Herbs which are resembled to it. Lobel has another whose Heads turn not, which he calls Hamatodes.

IX. The seventh, or Field, or Marsh Stone-Crop. Its Root is long, slender, creeping and fibrous like the former Kinds; which sends up several reddish Stalks set with small fat long Leaves, something hairy, and much greener than any of the former. The Flowers are small, standing like Stars, many in a Tuft together, of a pale red or Carnation color. It abides green all the Winter, and has as little Taste, as any of the five former.

X. The Places. The first tho' it grows naturally on Old Brick, Stone, and Mud Walls, and other Barren, Wast and Untill'd places, yet it is generally nurst up also in Gardens; as are also many of the following sorts. The next five grow either on Mud or Stone, or Brick Walls, or among Rubbish; as also in Sandy, Gravelly, Barren and Untill'd Places; and oftentimes upon the sides of old Tiled Houses and Penthouses; but the last grows only in moist Meadows and Marshes.

XI. The Times. They all Flower in the Summer Months, viz. June, July and August, and sometimes in May; and the Leaves of many of them continue Green all the Winter.

XII. The Qualities, Specification, Preparations and Virtues of the Six last Kinds, are in all respects the same with those of Prick-Madam in Chap. 578. from Sect. IX. ad Sect. XVIII. inclusive, to which we refer you.

*The Virtues of the First Kind, viz.
Stone-Crop Biting, Or, Wall-Pepper.*

XIII. The Qualities. It is hot and dry in the fourth Degree, exulcerating the Skin, and raising Blisters on it, if applied thereto; and will do it as strongly as *Ranunculus* or *Crowfoot*. And inwardly taken, it is Emetick.

XIV. *The Specification.* It cleanses the Stomach of gross and tough Flegm, and is said to cure Quartan Agues, as also Struma, or Scrophula, and the Sciatica, by external application.

XV. *The Preparations.* You may have therefrom, 1. A Liquid Juice. 2. A Syrup. 3. An Oil by Decoction or Infusion. 4. A Cataplasm of the Herb.

The Virtues.

XVI. *The Liquid Juice.* Taken to a Spoonful or two, mixt with as much Vinegar, in some proper Vehicle, it provokes Vomiting, and so by educating thick tough Flegm and other clammy Humors, it conduces to the Cure of old Quartan Agues, the Kings Evil, and the Sciatica, and other Chronick Diseases, or such as have been of long continuance. And it is said to expel Poison, or the force of any Venomous Herbs, as of the Aconite, &c. But Parkinson says, *Caveat qui Jumpsferit*, yet I know no reason for that precaution, provided it be not taken in too great a Dose.

XVII. *The Syrup of the Juice, or Green Herb.* It is made with Vinegar and Honey, and has all the Virtues of the Liquid Juice. Dose two or three Spoonfuls or more, according to Age and Strength, in the Morning fasting.

XVIII. *The Oil by Decoction or Infusion.* It is good against all cold and moist Diseases of the Nerves and Joints, as Aches or Pains, Gouts, Sciatica, Over-strainings, Palsies, Convulsions, Cramps, Strumous Knots or Kemels in the Neck, Throat, and under the Chin or Jaws, or other parts of the Body; and anointed upon the Piles it gives them present ease, and in a short time cures them.

XIX. *The Cataplasm.* Made of the Green Herb and applied, it draws strongly, raises Blisters and exulcerates, and therefore is very profitable being applied to any vehement or extream Gout or Sciatica; and cures those Diseases by drawing forth the Morbifick Humor. If it is made into a Cataplasm by boiling it with Hogs-Lard, adding a little Crumbs of Bread, and applied to Scrophulous swellings, knots and kernels in the Neck, or other parts, it is said to disperse, dissolve, or take them away.

CHAP. DCLXXII.

OF STRAWBERRY.

I. *THE Names.* It has no Greek Name that we know of: but it is called in Latine, *Fragaria*: and in English, *Strawberry*. The Fruit is called *Fraga*; (*a fructu fragrantia odoris & gustus*.) Strawberries. Pliny, lib. 25. cap. 9. makes mention of *Fraga*; and Servius calls them *Mora terrestria*: yet it is no Species of the *Morus*, whether you understand by it the *Mulberry* or *Bramble*.

II. *The Kinds.* Authors make many Kindshereof, but those which are most common with us, are 1. *Fragaria Sylvestris vel Nemorensis*, Wood-Strawberry. 2. *Fragaria vel Fraga Hortensis*, Garden Strawberry. 3. *Fragaria vel Fraga Magna & Alba*, *Fraga maxima & Bohemica*, The great white

Strawberry. 4. *Fragaria Viridis*, The Green Strawberry. 5. *Fragaria minime vesca*, five Sterile, The Wild, or Barren Strawberry.

The Descriptions.

III. The first, or Wood-Strawberry. The Description of this Plant is the general Description of all the Kinds, the material or chief difference being in the Form of the Fruit: Its Root then is reddish and long, with several small Fibres or Threads at it: which sends forth from the head thereof long reddish Strings, running upon the Ground, which shoot forth Leaves in many places, by which it is much increased. Its Leaves are closed together at first springing forth, which afterwards spread themselves into three divided Parts or Leaves, every one standing upon a small long Footstalk, green on the upper side, grayish underneath, and snipped or dented about the edges: From among which, rise up small Stalks, bearing four or five Flowers at the tops, consisting of five white round pointed Leaves; something yellowish in the bottom, with some yellow threads therein: After which, come the Fruit, made of several small Grains set together, in a fleshy Substance (not much unlike in Substance to a Mulberry, Raspberry or Brambleberry;) which are very red when they are ripe, and of a pleasant Winy taste, (as are all the Kinds) in which are enclosed many small blackish Seed. The Berries of the Wood Kind are very red, and the smallest of all the sorts.

Strawberry Garden Red.

IV. The second, or Garden-Strawberry, (which is our most Common Kind. This according to the Opinion of Parkinson, is only the Wood-Plant Transplanted into our Gardens, where by the richness of the

the Soil it is advanced in Goodness, being full as red, if not redder, almost as large again, and also meliorated in its Winy Taste.

V. The third, or great white Strawberry. This is a very large Strawberry, extremely fleshy, and of an admirable Taste, and for Beauty surpasses all others: Parkinson says, that he had seen some of the Berries measured, which had been near five Inches about: I have seen them of an extraordinary bigness, admirable to behold. I am apt to believe, that this is the so much admired Virginia kind, which I have seen grow to an admirable perfection in

Strawberry White Great.

the Gardens in Carolina, exceeding any that ever I saw in England. It has been no long Inhabitant with us, being first brought hither from Bohemia. At first for want of Skill in managing it, it very rarely bore any Fruit; but now, if Planted in a good Ground, it bears in a vast plenty. Formerly a Gardiner (one Vincent Stom.) living by the Bank-Side, near the old Paris Garden-Stairs, said that from seven Roots, in one Year and a half, from their increase, he had Planted an Acre and a half of Ground, besides those which he gave away to his Friends, which bore Strawberries of that Magnitude or Greatness before mentioned. If you would have them bear kindly, you must not suffer them to grow with many Strings, but still cut them away. The Fruit of this differs not from the Garden red, but in its Magnitude, this being so very much bigger, and not so globular, but of a more Oval Form; and in its Color, it being much whiter, viz. of a yellowish White on one side, and inclining to redness on the other, when it is full ripe.

VI. The fourth, or Green Strawberry. It differs not from the second kind, or Garden Strawberry, but in its Fruit only; which is green on all

sides when it is ripe, except on the Sunny side, where it is a little red, or reddish; and in Magnitude is much equal to the second or Garden kind.

VII. The fifth, or Wild, or Barren Strawberry. Its Root is like the former, and in its Leaf much like to the first Wood kind, but differs in its Flower (if it has any) which is Green, bearing rather a small head of green Leaves, many set thick together like unto a double Ruff, in the midst of which stands the Fruit, which when ripe, shews it self to be soft, and something reddish, like unto a Strawberry, but with many small harmless prickles on them, which may be eaten and chewed in the Mouth, without any manner of hurt, and is pleasant like a Strawberry; but it is truly without any great Sapor or Juice, and a little Syttick or harsh upon the Taste. It is no great

Strawberry Barren or Wild.

Bearer, but those it does bear, are set at the tops of the Stalks close together, pleasant to behold; and which a Gentlewoman may wear in her Bosom as a rarity, instead of a Flower.

VIII. Gerard says, Its Roots and Leaves are like the others, but somewhat less, its Leaves softer, slightly indented about the edges, and of a light green color: Among which, rise up slender Stems, bearing such Flowers as the common Strawberry does, but lesser, which wither away, leaving behind a barren or chaffy head, in shape like a Strawberry, but of no worth or value.

IX. The Places. The first grows in Woods both in England and America; upon Hills, Vallies, Woody and Shadowy places: But the four first kinds are Inhabitants in our Gardens, all which I have seen grow admirably in Carolina, exceeding in Beauty, Largeness and Pleasantness, any I ever saw grow in England. The Barren kind is a Wild fort, and has been found growing (as Gerard says,) on Black-beath, Greenwich-Park, &c. but for its rarity has been brought into Gardens.

X. *The Times.* The Leaves are said to continue Green all the Year: In the Spring they spread farther with their Strings, and Flower in *May*, the Berries being ripe in *June* and *July*. The Barren one Flowers in *April* and *May*, but never bears any Edible Fruit.

XI. *The Qualities.* The Roots, Leaves and Berries whillt green, are cold and dry in the first Degree, but the Roots more than the Leaves. Absterive, Allringent, Arthritic and Vulnerary. The ripe Berries are temperate in respect to heat or cold, and moist in the first Degree: Cool the Blood, Liver and Spleen, Comfortative and Cordial.

XII. *The Specification.* The Leaves and unripe Berries stop Fluxes and Catarrhs, cool the heat of Fevers, heal Ulcers in the Mouth, Throat, and Tonils; and stop the Courtes in Women.

XIII. *The Preparations.* Of the Roots, Leaves, and Green Berries are made, 1. *A Liquid Juice.* 2. *A Decoction in Wine or Water.* 3. *A Lotion or Gargarism.* 4. *A Distilled Water.* 5. *An Ophthalmick.* 6. *The Ripe Berries.* 7. *A Syrup of the same.* 8. *A Distilled Water from the same.*

The Virtues.

XIV. *The Liquid Juice.* Taken to the quantity of 3 or 4 Spoonfuls or more, either mixed with the Syrup of the ripe Berries, or with a little Mutton Broth, Morning and Night, it cools the Blood and Liver, allays Inflammations of the Reins and Bladder, provokes Urine, rakes away the heat, sharpness and scalding thereof; stops Womens Courtes and the Bloody Flux, and dissolves the Tumour or Swelling of the Spleen. Applied to the Gums it softens loose Teeth, stops Catarrhs, or Defluxions of Rheum to the Mouth, Throat, Teeth, and other parts; and is singular good for hot, red, and inflamed Eyes, being dropt into them: As also to repell hot, red, and sharp Humors or Eruptions in the Skin, whether Face, Hands or other parts; and to take away redness of the Face, Spots or other Deformities of the Skin.

XV. *The Decoction of Roots, Leaves, or unripe Fruit in Water and Wine.* It has all the former Virtues, being used in the same manner, and may be taken to half a Pint at a time Morning and Night.

XVI. *The Lotion or Gargarism.* Take of the *Liquid Juice* or *Decoction* a Pint, Honey three or four Ounces: Spirit of Wine two Ounces, mix and dissolve. It cleanses and heals foul Ulcers in the Mouth, Throat, Privities or other parts, heals Ulcerated and spongy Gums, and softens loose Teeth.

XVII. *The Distilled Water of the same Roots, Leaves and Berries.* It is good for hot and inflamed Eyes, redness of the Face and Skin, and other Deformities of the same; hot Eruptions of the same, *Anthonyes Fire*, &c.

XVIII. *The Ophthalmick.* Take of the former *Distilled Water* a Pint, Honey three Ounces, Spirit of Wine two Ounces, mix and dissolve. Dropt into the Eyes 3 or 4 times a Day, it is good against an Ophthalmy, redness, inflammation, and hot Rheums in the Eyes.

XIX. *The Ripe Berries.* They cool a hot and cholerick Stomach; as also the Blood, Liver and Spleen: quench Thirst, and refresh weak and Fainting Spirits.

XX. *The Syrup of the same Berries.* It has all

the same Virtues, and may be given two or three Ounces at a time upon Occasion.

XXI. *The Distilled Water of the ripe Berries.* It is a Colicemick for the Skin, good against Fevers, and Inflammations of the Eyes; *Anthonyes Fire*, and other like hot Eruptions; Melancholy, Faintings and Passions of the Heart.

C H A P. DCLXXIII.

of SUCCORY Garden and Wild.

I. *THE Names.* It is called in Greek by *Thophrastus*, *Κικχόριον*, & *Κικχόριον*: also *Ξέον*, (which last Greek Name signifies *Endive* as well as *Succory*;) in Latine, *Cichorium*, also *Cichoreum* or *Cichorea*, as *Horace* has it *Lib. 1. Ode 31.*

*Me pascunt Olivæ,
Me Cichorea, levesque malvæ.*

It is also called in Latin *Intubum*, but that is the more proper Name (in my Opinion) for *Endive*: and in English *Succory* and *Cichory*.

II. *The Kinds.* There are 1. *Κικχόριον ἡμετέρον*, *Cichorium Hortense*, Garden Succory. 2. *Cichorium flore rubello*, Red flowered Cichory or Succory. 3. *Cichorium Sylvestre*, *Κικχόριον ἄγριον*, *Cichorium agreste*, vel *erraticum*; *Ambugia*, *Plinij Lib. 22. Cap. 8.* or rather *Ambubeia* according to *Celsus*, and some truer Copies; Wild Cichory or Succory.

The Descriptions.

III. The first, or Garden Succory. Its Root is tough, long and white, continuing many Years; from which, as also from every part, does issue forth when cut or broken, a bitter Milky Juice. It is

Succory Garden, Broad Leaved.

of two sorts, the one with broad Leaves, the other with narrow Leaves deeply cut or gasht in on both sides. The first with broad Leaves is something like unto Endive, but narrower, among which rise up Stalks, on which grow the like Leaves but smaller. The Stalk divides its self towards the top into many Branches, on which do grow small blew Flowers consisting of many small Leaves, after which follows the Seed; which is so like to Endive-Seed, that it is very hard to distinguish them asunder by Sight; but the Curled Endive gives blackish flat Seed, very like unto black Lettice Seed; whereas the Seed of the Garden Succory is whitish.

IV. The second, or red Flowered Succory. This is that with the narrow Leaves. Its Root is like the former, long, white, and abiding many Years. The Leaves are long, and more divided or gasht in on the edges; and yet longer in the tall, high, round

Succory Garden Narrow Leaved.

Stalks. The Flowers are like the former, with this only difference, that these are of a pale red decayed color, which many times degenerates, and turns to be blew, being produced from the Seed of this red Kind. Of this sort, there is one also which bears white Flowers, not differing else, but the Seed of this white Kind, as well as of the red Kind, will sometimes give blew flower'd Plants, and is in form like to the Seed of the broad leav'd Garden Succory.

V. The third, or Wild Cichory or Succory. Its Root is white, but more hard and woody than the former. It has divers long Leaves lying upon the Ground, very much cut in or torn on the edges on both sides, even to the middle rib, ending in a Point. Sometimes it is found to have a red Rib or Vein down the middle of the Leaves, from among which, rises up a hard, round, woody Stalk, spreading into many Branches, set with smaller and

Succory Wild.

less divided Leaves on them, up to the tops, where stand the Flowers, both for Form and Color like to the first Garden Kind, viz. blew, after which comes like fashio'd Seed.

VI. The Places. The first two grow with us only in Gardens; but the second sort has been found growing wild in Italy, and that with white Flowers Wild in Germany. The third is found growing Wild in many places in England, in waste, untill'd and barren Grounds.

VII. The Times. They are all Sown in the Spring, and quickly come up, Flowering in the Summer Months, and Seeding in August or Harvest time, and then dies down; but being Sown in July, it remains till Winter; at which time it is taken up by the Roots, and laid in the Sun or Air for the space of two Hours: after which time it will be tough, and may be wrapped up in a heap, and buried in the Earth with the Roots upwards, so as no Earth can get within it (which if it should, it would become rotten:) and being thus covered, it may be taken up again, when occasion for its use requires it; and so to be used in Sallets all the Winter, and then is called whitened Succory. Parkinson says, it is usually buried a while in Sand, and so grows white, by which means it becomes both more tender in the Eating, and also looses some part of its bitterness.

VIII. The Qualities. Succory is temperate in respect to heat or cold, or rather hot in the beginning of the first Degree, and drying in the same; Aperitive, Abstersive, Diuretick, and a little Binding; Stomackick, Hepatick, Splenetick and Nephritick.

IX. The Specifications, Preparations, Virtues and Uses, are altogether the same with those of Endive, in Chap 244. Sect. IX. ad XVIII. to which we refer you. But as Succory is less cold, and more drying than Endive, so it is more opening.

X. *The Decoction of Roots or Leaves*, in Wine or Water, drank every Morning fasting to a Pint more or less, expels Flegmatick and Chole-
rick Humors out of the Stomach and Bowels; opens the Obstructions of Liver, Spleen, Gall, Reins and Womb; and is profitable against the yellow Jaundice, heat of the Reins, sharpness and scalding of Urine: It prevails also against the Cachexia, or evil Disposition of the Body, Dropfies, Weakness by long Sickness, and inveterate or lingering and long continued Agues; Pestilential Fevers, Fainting, Swooning, and other Passions of the Heart.

XI. *The Juice or Essence* have all the former Virtues, and besides being outwardly applied, abate Inflammations in any part, chiefly in the Eyes; are profitable against *Anthones* Fire, Wheals, Pimples, or other Breakings out; Pestilential Sores, being mixed with Wine Vinegar and so applied. Dose a quarter of a Pint, more or less Morning and Night, either alone, or mixt with any fit Vehicle.

XII. *The Distilled Water*. All the former Virtues are ascribed to it, but in a much meaner or lower Degree. It is good for sore Eyes, being red or inflamed; and for Nipples sore Breasts, which are hard and pained thro' abundance of Milk.

XIII. *The Wild Succory*, as it is more bitter, so it is more Opening and Absterfive, and also a greater strengthener of the Stomach, Liver, and other Bowels.

CHAP. DCLXXIV.

of SUCCORY Bastard.

I. **THE Names.** It is called in Greek, *Καρδιον* *videt*: in Latine, *Cichorium Nothum*, and *Cichorium Sylvestre floribus luteis*; *Pseudo-Cichoria*: and in English, *Bastard Succory*.

II. *The Kinds*. Out of the great Number which Authors have presented us with, we shall only give you the seven following, viz. 1. *Cichorium luteum Gerardi & Tabernamontani, pratense luteum, Hieracium pratense asperum Gesneri, Intubus Sylvestris sive Cichorium Sylvestre flore luteo Thallij, Cichoria Tertia flore luteo Tragi, Lacturiola altera Celsalpini*, Rough yellow, or Bastard Succory. 2. *Cichorium pratense luteum, Hedynois dictum, Cichorium pratense luteum Lævius Baubini & Lobelij, Hedynois Plinij, Aphaca Theophrasti, Endivia Sylvestris Celsalpini, Dens Leonis Cichorizata Gerardi*, Smooth Yellow or Bastard Succory. 3. *Cichorium dulce Neapolitanum, Sonchus latifolius leviter hirsutus Baubini, Cichorium Sylvestre asperum daniæ, sive, Cichorium Dulce, Sweet Yellow, or Bastard Succory of Naples*. 4. *Cichorium Montanum asperum, Hieracium nonum, vel Hieracium Intubaceum asperum Tabernamontani, Hieracium asperum Gerardi*, Our Rough Mountain Succory. 5. *Cichorium tomentosum fetidum*, stronger ill scented hoary Succory. 6. *Cichorium Verrucarium Matthioli, Zucyntha Clusij & Matthioli, Verrucaria Serilis species Gesneri, Chondrilla Verrucaria folijs Intubaceis viridibus, Chondrilla species Celsalpini*, Wart Succory. 7. *Hypocheris Porcellia, Cichorium Porcinum, Hieracium minus demis Leonis subaspero Baubini*; Swines Succory.

The Descriptions.

III. The first, or Rough Yellow, or Bastard Succory. Its Root is hard, rough, and useles. It has longer and rougher Leaves than those of the former Wild Succory; in one sort with few or no Cuts at all; in others like unto it, with deep Cuts and Divisions. The Stalks rise up to be 3 or 4 Feet high, rough and crested, divided into several Branches, with smaller Leaves on them, and less jagged; bearing small yellow Flowers like unto an Hawkweed, at the end of every one; which when they are ripe turn into Down with a small long yellowish Seed fastened thereto, and are both carried away with the Wind.

IV. The second, or smooth Yellow, or Bastard Succory. Its Root is long, pretty thick, taper, with several Fibres, and full of a bitter Milk. It has long and large Leaves as smooth Succory, but of a whiter green Color, cut in on the edges, but not so much nor so deep as the former. The Stalks rise not up so high, nor are so much branched, and the Leaves on them are less cut in, and towards the tops little or nothing at all. The green Heads which stand at the tops of the Branches, are greater, and the Flowers which spring out of them are larger and more double, something like those of Dandelion, of a yellow Color, which turn into Down, and the Seed therewith are blown away with the Wind.

V. The third, or Sweet Yellow, or Bastard Succory of Naples. Its Root is long and blackish on the outside, and white within, so full of a sweet Milk (without any Bitterness at all) as is also the rest of the Plant, that it will grow hard like a Gum, if it be not rubbed away, but suffered to abide for some small time. This in the Form and Divisions of the Leaves, is very like unto the usual Wild Succory, yet not so deeply gash, but thicker in feeling, covered with a fine soft hairiness, not rough at all, and of a dark green Color. The Stalk rises up to be two Feet or more high, round, firm, and whitish, because of the hoariness thereon; sometimes breaking out into Branches towards the top, set with shorter, somewhat broader and more divided Leaves than below, closing the Stalks at the bottoms; having at their tops green Hairy Heads or Husks, and gold yellow Flowers in long hairy Husks, like unto the Hawkweeds: which growing greater when they are ripe, contain within them small long brownish Seed, with a fine white Down on them, both which are carried away with the Wind.

VI. The fourth, or our Rough Mountain Succory. Its Root consists of many long Strings, which sends forth several long narrow Leaves next the Ground, very sharply dented about the edges, but not divided or cut in at all, and rough also all over. From among which, rises up a Stalk branched forth with such like Leaves set thereon, and divers large double yellow Flowers at the tops, very like to those of Dandelion, which turn into Down as the rest, and blown away with the Wind.

VII. The fifth, or strong ill scented hoary Succory. It has a pretty long thick Root, which sends forth several weak, round, hairy or hoary Stalks, about two Feet high or more, having divers large long hairy or hoary Leaves next the Ground, deeply gash in on both sides, not much unlike Succory Leaves, parted into many Branches, with lesser Leaves thereon than those below, and lesser cut in also: at the tops of which Branches, stand many

many pale yellow Flowers in green Husks, much like to Groundsel, which quickly fade in like manner, turning into Down, which with the Seed is carried away with the Wind. This Plant has a strong ill Smell, which is yet more in the hotter times of the Year, from whence came the Epithite, *freddum*.

VIII. The sixth, or Wart Succory. Its Root is small and stringy, dying every Year after Seed time, and never abiding a Winter, unless it springs up from the Seed in Autumn. It springs up, and spreads out several long, and somewhat hairy green Leaves next the Ground, cut or divided on the edges into deep Dents, but not deep Gashes, something resembling Succory Leaves. The Stalks are straked, and divide themselves into some lesser Branches, with a small long Leaf at every Joint, broad below, and encompassing it at bottom. The Flowers grow severally at the Tops and upper Joints of the Branches, upon short Rootstalks, being small and yellow, composed of many small yellow Leaves, broad pointed, and nickt in, which turn not into Down as the former sorts do; but into small round and flat hard Heads, parted at the Brims into several Bunches or Knobs, like unto Warts, with a little Tuft or Crown in the middle; in each Knob or Wart whereof, is contained a Kernel or Seed.

IX. The seventh, or Swines Succory. It has a small and long Root, from whence spring forth several long and rough Leaves lying on the Ground, smaller at the bottom, and broader towards their

Swines Succory.

ends, unevenly rounded or dented on the edges. The Stalks are a little rough, slender and bare of Leaves spreading out into several long Stalks, about 6 or 8 Inches high, bearing every one a large yellow Flower, like unto Hawkweed. This Plant Parkinson will have to be a Species of the Hawkweeds, but Gerard and Johnson, account it among the num-

ber of the Succories. There is another of this sort, whose Leaves are smooth and narrower, differing but little in any thing else.

X. The Places. The first, second and fourth, are many times found in our Meadows and other moist Grounds. The fifth is often found in Sandy Grounds, and by Woods and Hedge sides. The third Columna found growing on Hills in the Kingdom of Naples; and the sixth is said to grow in the Island Zacyntba, from which places they have been brought to us, and are nursed up in our Gardens. The seventh grows abroad in the Fields, and in waste Grounds and Lanes in divers places of England.

XI. The Times. They all Flower and Seed about the same time with the other Succories; except the second, which Flowers earlier than all the rest.

XII. The Qualities, Specification, Preparations and Virtues of these, are the same with those of our Common Succory, to which you are referred. This is also to be noted, that in Naples and other parts of Italy, the Neapolitan kind is used instead of the True Succory, it being very like to it in its form.

XIII. The Wart Succory. Authors say it is very good for the Curing or taking away of Warts. And this they say it does, by eating the Herb as a Sallet; or by taking at Bed-time a Dram of the Seed in Powder in White-Wine, for certain Days together; so also the Powder of the Leaves given to a Dram in the same manner. But I think there is not much in all this; if there be any Virtue of this Kind in this Plant, it will be best manifested, and mostly exert its power in that kind, by an external Application to the parts affected, after this manner. Take the expressed Juice of the Plant, and heat it almost scalding hot, with which bath the Warts 3 or 4 times a day or oftner, letting it dry in after every time of Bathing; and continue this so long till the Warts are washed away. This says Pena, will certainly extirpate them, as he and divers others had found by Experience. The said Juice being taken in Wine, is said to be helpful also against the biting of mad Dogs.

CHAP. DCLXXV.

OF SUCCORY GUM.

I. THE Names. It is called in Atabick, *Condarel*, *Cadaron*, and *Amiron*: in Greek, *Χονδρίλλη*: in Latin, *Chondrilla*: and in English, *Gum Succory*.

II. The Kinds. Authors make thitteen or fourteen sorts thereof, most of which are perfect Strangers to us. We shall only treat of such as are sometimes nursed up in our Gardens, which are the four following. 1. *Chondrilla prior legitima Dioscoridis secundum Clusium*; *Chondrilla Græca*, *Tabernaemontani*; *Chondrilla folijs Cichorei tomentosis*; The true Gum Succory of Dioscorides: some says, *Dioscorides* called it *Cichorion*, and some *Sera*: and for that the Leaves were like unto Succory, they accounted it a kind of *Wild Succory*. 2. *Chondrilla Cærulea*, sive *purpurea Tabernaemontani*; *Chondrilla Cærulea Belgarum Lobelij*; *Chondrilla altera Dodonæi*; *Chondrilla prima Cichorion similis Cordi*, and *Chondrilla tenera*; *Chondrilla*

drilla carulea flore Camerarij; *Apare Dalechampi*
Lugdunense; *Chondrilla carulea altera Cichorij*
Sylvestris folijs Baubini; Purple Flower'd Gum
 Succory, or Succory with deep jagged Leaves.
 3. *Chondrilla carulea latifolia*; *Chondrilla carulea*
latifolia Laciniata; *Chondrilla prima Lacune*;
 Broad Leav'd Purple Gum Succory. 4. *Chondril-*
la Sefamoides dilla, *Sefamoides parvum Matthioli*,
Camerarij, *Columna* & *Tabeonemontani*; (but
Columna thinks it may be *Cyanus Plinij*:) *Sefa-*
moides parva Dioscoridis Lobelio; *Chondrilla ter-*
tia species Dodonaei; *Catenance quorundam Lugdu-*
nensis; (*Baubinus* makes two sorts of this Species,
 calling the first *Chondrilla carulea Cyani capitulis*
 altera:) Strange Gum Succory.

The Descriptions.

III. The first, or true Gum Succory of
 Dioscorides. Its Root is of a Fingers thickness,
 blackish on the outside, with some Fibres adjoining
 to it, and parted at the top into some Heads, which
 send forth Leaves, &c. till it is full of Juice,
 which is yellowish when it is dry. It has many long,

Succory Gum True of Dioscorides.

and something broad hoary Leaves lying upon the
 Ground, covered with a thick Down, cut in on the
 edges, something like those of Succory: From a-
 mong which, rises up an hoary Stalk a Foot or more
 high, parted into a few Branches with smaller and
 narrower Leaves set without order, on which are
 sometimes found yellowish Grains like unto small
 pieces of Gum, which grow quickly to be hard.
 At the tops of the Branches stand singly yellow
 Flowers like those of Camomil, which when they
 are ripe turn into Down, and with the Seed are
 carried away with the Wind.

IV. The second, or Purple Flower'd Gum Suc-
 cory, or Gum Succory with deep jagged Leaves.

Its Root grows deep down into the Ground, and
 spread into many thick Branches like Dandelion,
 blackish on the outside, and yielding much Milk in
 every part when broken or cut; which are so apt
 to grow, that every little piece in the Ground will
 spring again, and bear Leaves. It shoots forth in

Succory Gum Purple Flower'd.

the beginning of the Spring, several long winged,
 or rather jagged Leaves, consisting of many long
 and narrow jaggs, cut in on both sides to the mid-
 dle Rib, and equally set almost one against another,
 of a bleuish green color, very tender, and full of
 Milk when broken or cut. From among which,
 rise up weak and tender Stalks 3 or 4 Feet high,
 scarce able to stand upright, very brittle also, and
 apt to be broken, and as full of Milk as the Leaves,
 which divides it self towards the tops into a few
 other smaller Branches, with smaller and less
 jagged Leaves upon them; at the top of which grow
 small bleuish Purple flowers, and sometimes white,
 consisting of ten or twelve small narrow Leaves,
 standing round about the middle, which when they
 are ripe, fall away of themselves.

V. The third, or Broad Leav'd Purple Gum
 Succory. This Gum Succory is very like the for-
 mer in every respect, saving that in this, the Leaves
 are something broader and shorter, and the Goss-
 es also larger; in which particulars, the chief
 difference consists.

VI. The fourth, or Strange Gum Succory.
 The Root is small and long, yielding a Milky
 Juice. It has many long and narrow rough Leaves,
 pointed at the ends, and jagged in two or three
 places on the edges, sometimes more or less, lying
 on the Ground, resembling very much the Leaves of
 Coronopus, or Buckhorn Plantane; but with few-
 er, greater, and longer cuts or jaggs. The
 branched Stalks are set from their middle, with
 such

such like Leaves, but narrower, some without any jagg, and some with but one or two jagg; bearing at every one of their tops, upon slender bare long Stalks; a small whitish Silver like scaly Head; out of which break forth fair double Flowers, consisting of many Purplish blew Leaves, dented or cut in at the broad ends, with some yellow threads in the middle; after which comes small Seed, like unto *Sesamum* being compared, (whence the Name *Sesamoides*) but more like to a *Cyanus* or blew Bottle, or Corn Flower, but browner. Bauhinus makes two sorts (as aforesaid) of this Plant, which vary not much one from another, their difference being very probable to arise from the differing Soils in which they are found growing, the like of which has been found in many other Herbs, which yet have been but one and the same Species.

VII. The Places. The first grows Wild in several places in Spain; the other grows Wild also in waste Grounds by Ditch-sides and by Path-ways, in Fields and Pastures in several parts of Italy; but with us they are only Nurst up (by the Curious) in Gardens.

VIII. The Times. They all Flower in the Summer Months, and yield their Seed in a short time after; but are so tender, that they soon perish with our Winters Cold.

IX. The Qualities, Specification, Preparations and Virtues of these, are said to be the same with those of our Common Succory. The first of these is of the same property with Wild Succory, but more bitter, and more drying, and is thereby more effectual in opening Obstructions; and by its drying and astringent Qualities, it stops the Looseness of the Bowels, the Juice of the Root being taken in Wine. The Juice of the Root or Herb, drank is good against the biting of Vipers, and all other Venomous Serpents; it strengthens the Stomach, and helps Digestion. It is said, the Juice of the Root dropt from the point of a Skewer, or some such small thing, upon the Roots of the Hair on the Eye-brows, Forehead, &c. takes them away, and hinders their growing again; but of this I know nothing by Experience. The same Juice with some Nitre dissolved in it, being Bathed upon the Skin, is said to take away Freckles, Lentils, Tanning, Sun-burning, and other discolorings thereof; as also Scurf, Morpew, Spots, Pimples, &c. Injected up the Womb, it also draws down the Courfes.

X. The second and third are also of the same Virtues with our Common Garden Succory, and in Italy they are said to be eaten in their Sallets, as we do our Succory here. We have no Author who gives any special Instance of their Virtues, but only they are referred to the Kindred of the Succories.

II. The Kinds. Authors make two or three sorts hereof, viz. 1. *Ros Solis*, five *Rorella rotundifolia major & minor*, Round. Leav'd Sun-Dew, which they will have to be both greater and lesser. 2. *Ros Solis Sylvestris longifolia*, Long Leav'd Sun-Dew.

The Descriptions.

III. The first, or round Leav'd Sun-Dew. Its Root consists only of a few small Hairs, Fibres or Threads; which sends up divers small round hollow Leaves, something greenish, but full of several red Hairs, which make them seem to look red, every Leaf standing upon its own Footstalk, reddish hairy likewise; the Leaves have this wonderful property, that they are continually moist, or full of Dew in the hottest day; yea, the hotter the Sun shines upon them the moister they are; and even at Noon-time the Hairs will be full of drops of Dew, more especially if the Sun shines strongly and clearly out; which is with a certain Slimness which will rise, or draw out as it were into Threads, the small Hairs always holding this Moisture. From among these Leaves spring up (about a Month after them) small slender Stalks about 4 Inches high, which are reddish also, bearing several white knobs one above another, which are the Flowers, of a whitish color, after which in the heads are contained certain small Seed. Some Authors make a greater and lesser of this Species, which is the only difference or variety.

Sun-Dew round Leav'd, and long Leav'd.

IV. The second, or Long-Leav'd Sun-Dew. This in its Roots, Stalks, Flowers, Seed, Dew, and Formalities of growing, differs not from the former, but only in its Leaf, which is much larger and also long whitish.

V. The Places. They usually grow in Bogs and wet Places, and sometimes in moist Woods; as also in Desert, Sandy and Sunny Places, but yet watery withall; and seldom any where else than amongst white Moorish Moss, which grows on the Ground, as also on Bogs. The second has been found growing near Dublin in Ireland: It

also

CHAP. DCLXXVI.

OF SUN-DEW.

OR,

ROS SOLIS.

I. THE Names. It has no Greek Name that we know of; but it is called in Latin, *Ros Solis*; *Rorella*, and *Rorida* by Lobel; and by some *Salsiflora*: and in English, *Sun-Dew*, and also corruptly, *Rosa Solis*.

also grows by Ellesmere in Shropshire, by the ways sides thereabouts.

VI. *The Times.* They are said to Flower in June, at which time the Leaves are in best condition to be gathered. Gerard says they Flourish in Summer, and Flower in May and June; and are to be gathered when the Weather is Calm, Dry, and Serene.

VII. *The Qualities.* They are hot and dry in the first degree, Aperitive, Astringent, Pectoral, Cordial and Restorative.

VIII. *The Specification.* It is profitable against Catarrhs, and Salt Rheums falling upon the Lungs, Coughs, shortness of Breath, difficulty of Breathing, Asthma's; and is said to cure Pthiticks or Consumptions of the Lungs: It is Cordial, good against Sickness at Stomach, Faintings, Swoonings, Palpitation of the Heart, &c.

IX. *The Preparations.* You may make therefrom, 1. A Simple Distilled Water. 2. A Compound Distilled Water. 3. A more Simple Tincture. 4. A Compound Tincture, commonly called Rosa Solis. 5. A Cataplasm.

The Virtues.

X. *The Simple Distilled Water.* Both Gerard and Parkinson tell you that if it be made with a Glass Alembick or Still, the Water will be of a Gold yellow Colour. It is sharp, quick, drying, and binding, good for such as are troubled with Catarrhs, Rheums, Coughs, Colds, Asthma's, Consumptions, and all other Diseases of the Lungs, and heals Ulcers of the Lungs, comforts the Heart, and is good against fainting of the Spirits. Dose 2 or 3 Ounces either alone or mixt with a little Generous Wine.

XI. *The Compound Distilled Water.* Take Ros Solis a Pound, Bawm, Limon Peel, Orange Peels, ana, a quarter of a Pound, Winters Cinamon in gross Powder, two Ounces; White Lisbon Wine a Quart, Milk Water a Pint; mix, digest a Week, then draw off the Water in a Glass Alembick in Balneo to driness. It has all the former Virtues, but much more Cordial, and more prevalent against Fainting and Swooning Fits, Quartans, Convulsions, Palsies, Lethargies, and the like Diseases.

XII. *The more simple Tincture.* Take Ros Solis fresh gathered a Pound, Bawm, Garden Scurvy Grass, Garden Cresses, of each a quarter of a Pound: Aniseeds; Angelica Seeds grossly bruised, of each 2 Ounces; Saffron, Cochinele, the last in fine Powder, of each 3 Drams: Spirit of Wine 3 Quarts: mix, digest a Month in a gentle Sand heat, shaking the Glass once every day; then letting all perfectly settle, decant the clear Tincture: and keep it in a Glass close stopt for use. It has all the Virtues of either of the former, and a most potent thing against the Scurvy in a cold Habit of Body. Dose from one Dram to two Drams, in a Glass of Wine, or some other proper Vehicle, Morning, Noon and Night.

XIII. *The more Compound Tincture,* commonly called Rosa Solis. Take Ros Solis twelve handfuls, red Rose Leaves two handfuls, Liquorice bruised or scraped 4 Ounces; Cinnamon, Red Sanders, of each 3 Ounces: Aniseed, Corianderseed, Nutmegs, of each 2 Ounces, Cloves, Galanga, Ginger, of each an Ounce; Calamus Aromaticus, Cardamoms, Grains of Paradise, Zedoary, of each a quarter of an Ounce; Spirit of Wine or choice Brandy 2 Gallons; mix, make an Infusion for eight days; then being perfectly settled and fine, decant

the clear Tincture into another Glass, and add thereto of double or treble refined Sugar three Pounds; mix, dissolve, and keep it for use. It is a Noble Tincture, and has all the Virtues of the former Preparations; and being of a drying, binding and strengthening Quality, is appropriated to the Lungs; and therefore of excellent use against all Diseases of that Bowel; as also of the Heart, Midriff, Mesentery, Intestines and Womb. Dose a Spoonful or less, Morning and Night, in a Glass of Wine, or other fit Liquor, with which it may be mixed.

XIV. *The Cataplasm.* It is made of the whole Plant beaten to a Pulp, adding also a little Salt. Being applied to the Skin, it is said to exulcerate and raise Blisters.

C H A P. DCLXXVII.

of SUN-FLOWER of Peru.

I. *THE Names.* It has no Greek name, yet Authors call it *Xanthoxylum Peruvianum*; *Chrysanthemum Peruvianum*; *Flos Solis*; *Flos Maximus*; *Sol Indicus*; *Corona Solis*: in English, Sun-Flower; Golden Flower of Peru, and Marigold of Peru.

II. *The Kinds.* Authors give us the knowledge of two principal Kinds hereof, viz. 1. *Chrysanthemum Peruvianum majus*, *Flos Solis major*; The greatest Sun-Flower. 2. *Chrysanthemum de Peruvianus*; *Flos Solis minor*: The lesser Sun-Flower, or Marigold of Peru.

The Descriptions.

III. *The first, or Greater Sun-Flower, or Golden Flower of Peru.* Its Root is white, compass of many Strings, and strongly fastned in the Ground by some greater Roots branching out, and a number of small strings, which grow not deep, but keep under the upper Crust of the Earth, desiring much moisture, which dye every Year at the first approach of Winter; and therefore must be new Sown every Year in the beginning of the Spring. It riseth up from the Seed, at first like unto a Pompon with two Leaves; and after two or four more Leaves are come forth, it rises up into a great Stalk, bearing the Leaves at a due distance on all sides thereof, one above another up to the very top, being sometimes, and in some places, 7 8 or 10 Feet high, which Leaves standing out from the Stem or Stalk, upon their several great ribbed Footstalks, are very large, broad below, and pointed at the end, round, hard, rough, of a sad green Color, and bending downwards. At the top of the Stalk grows one great, large, thick, and broad Flower, bowing down the head unto the Sun, and breaking forth from a great head, made of scaly green Leaves, like unto a great single Marigold, having a border of many long yellow Leaves, set about a great round yellow thymb, as it were in the middle, which are very like unto short beads of Flowers, under every one whereof, there is a Seed, larger than any Thistle Seed, yet somewhat like; also lesser and rounder than any Gourd Seed, which are set in

so close and curious a manner, that when the Seed is taken out, the head with the hollow places or Cells, seems very like unto an Honey-Comb; which Seed is in some plants very black, in the hotter Countries, or very white, great and large, but with us it is neither so large, black, or white, but some-

to no such Magnitude:) on which are jet great broad Leaves with long Footstalks, very fragil or easie to break, of an overwoon green color, sharp pointed, and somewhat cut or dented about the edges like a Saw. The Flower grows at the top of the Stalks, bordered about with a pale of yellow

Sun-Flower Greater.*Sun-Flower Lesser.*

times blackish or grayish. The whole Plant, and every part thereof, has a strong resinous Scent, much like to that of Turpentine; and the Heads and middle parts of the Flowers do oftentimes, (and sometimes the joints of the Stalks where the Leaves stand) sweat out a most thin, fine, and clear Resin or Turpentine, but in small quantity, as it were in drops, in the hot and dry time of the Year, so like both in Colour, Smell and Taste, unto clear Venice Turpentine, or Strassburgh Turpentine, that it cannot be known from it.

IV. The second, or Lesser Sun-Flower, or Marigold of Peru. This in its Roots, Stalks, Leaves, Flowers, Seed, Turpentine, and manner of its growing, is like the former, save that it is altogether lower, the Leaves more jagged, and very few in number. It is either without Branches, or with many Branches, with a black, or with a white Seed, the form of the Leaves and Flowers differing but only in the greatness or smallness, as has been just now said. Gerard seems to make this to be twofold, viz. 1. The Male. 2. The Female. I. The Male kind he says perishes in its Root, as soon as it has perfected its Seed, being thick, hard, and of a woody substance, with many thready strings annexed thereto. From which rises up a gray or russet Stalk five or six Cubits high, and sometimes as thick as ones Arm. (I suppose this is in its Native Country of Peru, for with us in England, it attains

Leaves. The thrummed middle part is blacker than that of the first or greater before Described: And the whole Flower is encompassed about likewise with divers such Russet Leaves, as they which grow lower upon the Stalks, but lesser and narrower. The Plant and every part thereof smells of Turpentine, and the Flower yields most clear Turpentine. The Seed is long and black, with certain Lines or Streaks of white running along the same. II. The Female kind has also a thick and woody Root, from which rises up a straight Stem, dividing it self into one or more Branches, set with smooth Leaves, sharp pointed, and slightly indented about the edges. The Flowers grow at the tops of the Branches, of a faint yellow color, the middle part being of a deeper yellow, tending to blackness, of the form and shape of a single Marigold, the Magnitude excepted. This Plant says another Author, shoots out into many Stems, and a great many Branches, requiring very much room, so that it is apt to choke other Flowers which grow near it: For which reason, when it is arrived to a reasonable height, and before it is full green, it is to be clipt with a Garden pair of Scissars, to retrench these Branches which spread too much, and such as shoot up too high.

V. Of the first or Greater Sun-Flower at Sect. III. above, Gerard gives us another kind of Description, which because it is something remarkable, we will also give you here. Its Root (he says)

is white, compact of many Strings, which perish at the first approach of Winter. It is a Plant (says he) of such a nature and tallness, that in one Summer, being Sown of a Seed in April, it rose up (in his Garden) to the height of 14 feet; where one Flower was in weight three Pounds two Ounces; and crost overthwart, the Flower was by measure 16 Inches broad. The Stalks are upright and straight, of the bigness of a strong Mans Arm, beset with large Leaves even to the top, like unto the Great Burdock. At the top of the Stalk comes forth for the most part but one flower, yet many times there spring out sucking Buds, but they come to no perfection. This great Flower is in shape like to a Camomil Flower, beset round about with a pale, or border of goodly yellow Leaves, in shape like the Leaves of the Flowers of White Lillies. The middle part of which, is made as it were of unhorned Velvet, or some curious Cloth wrought with a Needle: which brave Work if you do thoroughly view, it seems to be an innumerable sort of small Flowers, resembling the nose or nose of a Candlestick broken from the Foot thereof; from which small Nose sweats forth excellent fine and clear Turpentine, in Sight, Substance, Savor and Taste. The whole Plant in like manner smells of Turpentine being broken; and when it grows to Maturity, and the Flowers fall away, in place thereof comes the Seed, which is black and large, much like the Seed of Gourds, set as though a cunning Workman had of purpose placed them in that Excellent and Exquisite Order, not much unlike to an Honey-Comb.

VI. The Culture. The first or larger sort is produced from Seed in a well Dung'd Ground, after the manner of Cucumbers and Melons. It grows generally with us 5, 6, or 7 Feet high, very straight without Branches, with Leaves jagged at the edges, pointed at their ends, and rough to the touch. This, as it has been very common, so it is at present much neglected, and is now Planted in the Obsolete or almost neglected parts of a Garden, or at the extremities of some Borders. On the top of its Stem appears its Flower resembling the Sun-Beams, whose Disk is commonly of a yellowish Glory or Radiency, made in the shape of a Crown, in the middle of which, are a number of other little Flourishes resting on the Embrio's, separated one from another by Leaves folded gutterwise, and contained in a scaly Cup, which Embrio's in time become Oblong Seed, each separated from another in particular Cells.

VII. The second or lesser kind, tho' it may be raised from the Seed, yet it is generally multiplied from its Roots, whose Tufts are to be divided to Plant other places with. This as it shoots out into many Stems and a great many Branches, ought to be Planted in broad Allys, and all along with Trees between them, at 3 Feet distance one from another; or it may be Planted in the small Corners of Parterres, or in the middle of the same, without any other Flowers near it, by which it will agreeably entertain the Eye. It agrees in any sort of Earth good or bad, and its Roots being split, must be set three Inches deep in the Ground; which when it has attained a considerable height, is to be clipped and trimmed as before directed (See V.) putting it into what Figure will best agree with it, which is generally that of a round Bush.

VIII. The Places. Their Native Place is Peru, from whence they have been brought to us, and now grow generally in most of our Gardens, where they Flourish admirably.

IX. The Times. The Seed must be set or sown in the beginning of April, if the Weather is tempe-

rate, and if in good Earth so much the better, and where the Sun has the most power the whole day. The first Flowers in June, the second in August, and sometimes so late, that the early Frost taking it, the Flower comes not to ripeness.

X. The Qualities, Specification, Preparations and Virtues of them are scarcely known, so that Authors have said little or nothing of them. The Heads of the Flowers are boiled and dressed as Artichokes, with Butter, Vinegar, Salt and Pepper. They are said to be in Quality hot and dry, and vehemently to excite Lust. Gerard says they are exceeding pleasant Food, and are by others accounted good Meat; but Parkinson says, they are too strong for his taste.

CHAP. DCLXXVIII.

Of SUN-FLOWER Creeping.

I. THE Names. It is called in Greek, *Ἡλιανθός*; in Latine also *Helianthemum*, *Flos Solis*, *Chamaecistus*, *Cistus Pumilus*; *Cistus repens*; *Flos Solis repens*; in English *Sun-Flower creeping*; and Dwarf *Cistus*.

II. The Kinds. Authors give us about half a Score sorts of this Plant, we shall trouble you only with the five following, viz. 1. *Helianthemum vulgare*, *Helianthemum Anglicum luteum*; Our English yellow creeping, or Dwarf Sun-Flower. 2. *Helianthemum vulgare vel Anglicum album*, Our white Creeping or Dwarf Sun-Flower. 3. *Helianthemum serpyllifolium flore luteo*, *Chamaecistus secundus Clusij*; *Cistus Humilis serpyllifolius Tabernamontani*, Creeping Sun-Flower with Time-like Leaves. 4. *Helianthemum luteum Germanicum*, Yellow Creeping, or Dwarf Sun-Flower of Germany. 5. *Helianthemum album Germanicum*; White Dwarf Sun-Flower of Germany. Clusius says he should rather refer these Plants to the Family of the Female *Cistus*, making them of his third Order of *Cistus*, and so calling them *Chamaecistus*; because says he, they are like unto them both in Face or Form, and Property. Some take this Creeping Sun-Flower to be the *Helianthe Plinij*, which Cordus calls *Helianthemum*, or *Flos Solis*, and so do Lobel, *Tabernamontanus*, *Thalius*, and divers others.

The Descriptions.

III. The first, or our English Yellow Creeping Sun-Flower. It has a hard and woody Root, growing in time to be something great, but not very long, and divided into small branches at its lower end. From this rise up several small and weak, yet hard and almost woody branches, lying for the most part round about the head of the Root upon the Ground, on which are set by couples, many small and somewhat long Leaves, a little soft or hairy, with other small Leaves also growing between them: at the tops of which grow three or four small pale yellow, and sometimes Gold coloured yellow Flowers, consisting each of five round pointed Leaves, with some yellow threads in the middle, having in some Places or Soils, a pretty pleasing Smell, but less or more in some other places: After which follow small round Heads, containing small yellow Seed.

This

This dyeth not, but abides many Tears, increasing in Branches, which yield a Viscous or Mucilaginous Juice, like unto Comfrey, of an Astringent and Austere Taste; for which reason I believe it was called by divers (as Cordus says) *Consolida aurea*, and so says Clusius also; and some have called it *Panax*, and *Panaces Chironium*, but falsely.

IV. The second, or our white Creeping, or Dwarf Sun-Flower. Its Root is thick, and of a Woody Substance like the former. It is a low and humble Plant, creeping upon the Ground, differing but little from the former, saving that this rises somewhat higher. It has many small tough Branches

each one on a pretty long hairy Footstalk, consisting of five small yellow Leaves like unto the other, and something Sweet.

VI. The fourth, or Yellow Creeping, or Dwarf Sun-Flower of Germany. Its Root is slender, Woody, and something red. The Plant is said to be much like to a Cistus, but lesser by much, and creeping upon the Ground unless it be prop'd up, having a multitude of twiggie Branches, slender and fine, or

Sun - Flower Creeping of Germany;
Yellow and White.

Sun-Flower Creeping English,
Yellow and White.

which grow Leaves lesser than those of *Ledon* or *Cistus*, and very like to our English White Creeping, or Dwarf Sun-Flower, at *Sett. IV.* above; of a full or mucilaginous Juicy Substance, and slightly haired; The Flowers are like unto little *Roses*, or the Wild *Tansie* Flower of a yellow Color.

VII. The fifth, or White Dwarf, or Creeping Sun-Flower of Germany. This in its Roots, Branches, Leaves, Flowers, and manner of growing, is so like the last Described, that they are not to be distinguished asunder till the time of Flowering, the Flowers in this being White, whereas in the former they are Yellow; this being the chief, or only difference.

VIII. The Places. The first and second grow in several places of England, but especially in Kent, in almost every Tract thereof throughout; which in some places is greater than in some others, yet that with the white Flowers is not altogether so common as those with the yellow. Gerard says he has found them in many places in Kent, upon the Chalky Banks about *Gravesend* and *Southfleet*, and for the most part all the way from thence to *Canterbury* and *Dover*. The fourth and fifth differ not much from our English, and I am told; have been found in several parts of this Kingdom; and by reason they so little differ from our English

of a brown colour, on which grow little Leaves set by Couples, thick, fat, and full of Juice, covered over with a soft Down, from whose bosoms come forth other lesser Leaves. These Leaves are a little whiter and longer, and not set so thick together as the former, but are more Woolly. The Flower is also something larger, and of a white Color, in which consists the chief Difference. In some Places or Grounds, it is a little Sweet, but in some other Soils little or nothing at all: and its Juice is of an Astringent and Austere Taste like the other.

V. the third, or Creeping Sun-Flower with Time-like Leaves. Its Root is very Fibrous, and spreads much under Ground, and the Plant creeps upon the Ground, much like unto Wild Thyme, with such like small Leaves, set upon reddish Branches very thick, or as it were in a double row, of a dark green Colour, and a little hairy withal, which are a little longer and whiter next to, or near the Flowers, which grow three or four together,

VI. *The Places.* The first grows in many places of England, as well as in *Brabant* and *Flanders*, and other places beyond Sea, and therefore *Lobel* might as well have call'd it *Anglica* as *Brabantica*, it being truly a Native of our Country, tho' possibly he might not know so much. It grows in *Hartfordshire*, *Kent*, *Sussex*, *Colebrook*, and near *Old Windsor-Park Corner*; as also in several Marshy, Plashy, Moist and Fenny Grounds, as in *Bedfordshire*, *Cambridgeshire*, *Iste of Ely*, *Lincolshire*, and the Fenny Countries thereabouts; of which there is such store, that they make Faggots, Bruihes or Sheaves thereof, to burn and heat their Ovens, and kindle Fires withal, as they do of *Sedge*. It is also found growing in moist places where *Sedge* grows; for which reason it is commonly found bound up promiscuously in *Sedge* sheaves, which Bakers use to heat their Ovens with at *Lyn* in *Norfolk*, and other great Towns and Market-Places where it can be conveniently carried by Water, &c. The second is a Native in several Countries in the *Levant* and *Mediterranean Sea*, as the South parts of *France*, *Italy*, *Sicily*, &c. but with us it is only Nurst up in Gardens. This is that of *Pliny*, lib. 24. cap. 11.

VII. *The Times.* They Flower in May and June, and their Seed is ripe in July and August.

VIII. *The Qualities.* They are hot and dry in the second degree, Absterfivè, Afringent, Austere and Symplick; discurring Wind, Cephalick, Neurotick; and as some think Narcotick.

IX. *The Specification.* The first kind is only or chiefly used: It is good to dry up Humors in the Belly and Stomach, to kill Worms in those parts, to strengthen the Brain and Nerves, and to induce Sleep.

X. *The Preparations.* The first of the two Species being only in use, the Preparations will chiefly have reference to that; and there is a peculiar use of it in 1. *Ale or Beer*, which in some places are Brewed with it, as with Hops. 2. *A Decoction in Water or Wine.* 3. *An Infusion in Wine.* 4. *A Tincture of Leaves and Fruit in Spirit of Wine.* 5. *A Powder of the Leaves or Seed.*

The Virtues.

XI. *The Ale or Beer.* It preserves the Drink from spoiling, or growing sower like Hops, and makes it Drink very strong; and by reason of its pleasing Bitterness, gives it a pleasant Taste or Farwel. As it makes the Drink to be stronger, so it may be more apt to get into the Head, and make People Drunk; but it only affects the Brain by its Strength, not by any ill Quality which is in it, as some Authors seem to hint, it being a true strengthner of the Stomach and Nerves. And so far it is an Antiscorbutick, as all Stomachicks are; the Scurvy being called by the Greeks the Stomach Disease, and for which they have no other name.

XII. *The Decoction in Water or Wine.* It warms, comforts and strengthens cold, moist and weak Heads, Brains, Nerves and Stomachs; resists the Scurvy in its beginning, and cures it when Con, firm'd, a quarter of a Pint or more, being taken in the Morning fasting, half an Hour before Dinner, and last at Night going to Bed. It is singular good also against Palsies, Convulsions, Gouts, Jaundice, Collick, and other like Diseases of the Brain, Nerves and Viscera. It kills Worms in the Bowels, resists Poison, and causes pleasant Rest and Sleep, not much unlike to the manner of Opiales; inasmuch that some who have been long

constant in taking it, have with some difficulty left it off.

XIII. *The Infusion in Wine.* It has all the Virtues of the former Decoction, and may be taken in the same Dose and manner; but as it is only a cold Infusion, so it is much more grateful to the Stomach and Bowels, resisting Poison, and strengthening them after an admirable manner.

XIV. *The Tincture of the Leaves and Fruit, or Seed.* This is much better in a cold Scurvy, than either of the former, and more potent against Cramps, Convulsions, Palsies, and other cold and moist Diseases of the Head, Brain, Nerves, Joints and Viscera. It also prevails against Poison, vehement pains in the Bowels, or any extrem part of the Body, Coughs, Colds, Asthma's, Phthisicks, Hoarseness, Wheezing and shortness of Breath; stops Vomiting, and gives relief in extrem Heart-Sicknesses, Palpitations, Faintings, Swoonings and the like: Dose 2, 3, or 4 Spoonfuls in a small Glass of Wine.

XV. *The Powder of the Leaves or Seed.* It is given from half a Dram to Dram, for all the purposes aforementioned, being an excellent Stomack: but its chiefest use is for killing Worms in Children; as also in Elder Persons.

XVI. *Nota 1.* In those places where it plentifully grows, as also in other places to which it is carried, the Country People lay it in Wardrobes, Chests, Trunks, Presses, and the like, to keep Woollen Cloths from Moths, Worms, &c. and to give them a good scent and pleasant Smell.

XVII. *Nota 2.* The *Rhus Plinij Myrtifolia*, or second Species; tho' we make little or no use of it, (because we have it no great plenty) yet *Pliny* says it kills Moths, and resists Poison.

CH A P. DCLXXX.

OF SWALLOW-WORT:

O R,

S I L K - W O R T.

I. *THE Names.* It is called in Greek, Ἀσκληπιάδα (ab *Asclepiado*) also *Κισσὸν* quasi *Hederula*; and *Κισσόφυλλον*, *Hederasfolium*; and so *Ruellius* calls it *Hederatu*: and yet the Leaf is not at all like Ivy, but are rather like unto Bay-Leaves, saving that these are sharper pointed. In Latine *Asclepias* also, and *Vincetoxicum*, (which is a general Word for any Counter-Poison; for *Vincetoxicum* quasi *Alexipharmicum* dictum, & quod illi insignis adversus venena vis insit. It was also antiently called *Hirundinaria*, (as were also *Chelidonium majus* & minus) because the pointed Cods when they are open, and the Silk appears out of them, do somewhat resemble a Swallow Flying. In English, *Swallow-Wort*, *Silk-Wort*, and by some, *Silken Cistey*.

II. *The Kinds.* It is doubtless the true *Asclepias* of *Dioscorides*, tho' *Angulara* doubts of it, and *Matthiolus* denies it; yet *Dodonæus* and *Euchsius* affirm it, and that it is the true *Vincetoxicum*. We have with us, 1. *Asclepias* five *Vincetoxicum* *Flora albo*, Swallow-Wort white Flower'd. 2. *Asclepias* seu *Vincetoxicum* *Flora nigro*, Swallow-Wort black Flower'd. 3. *Asclepias* *Cretica*, Swallow-

low

low-Wort of Candy. *Fabius Colonna*, took the Italian *Asclepias* to be rather *Apocynum* *Dioscorides*; and *Lobel* calls the Black Swallow-Wort *Periploca minor* (because it clanders like a *Periploca*) but these are not only improper Names, but also false Names as to the Plants they represent; for there is this special difference between *Apocynum* and *Asclepias*, that the first in all its Species has a Poisonous Milky Juice, whereas the latter, or Swallow-Wort has none, but is the true Antidote, or Counter-Poison to the *Apocynum*.

The Descriptions.

III. The first, or Swallow-Wort white Flower'd. Its Roots are a great Bunch of many white Strings fastned together at its Head, smelling somewhat strong when they are fresh and green, but more pleasant when they are dried. It rises up with several slender weak Stalks, two or three Feet in length, not easy to break, and scarce able to stand upright; which therefore for the most part lean or lye down upon the Ground, if they find nothing to sustain them, and sometimes they will twine themselves about it: On the joints of these Stalks are set Leaves by couples, being something broad and long pointed at their ends, of a dark green Color, and having smooth edges. At the joints with the Leaves, towards the tops of the Stalks, and at the tops themselves, come forth divers small white flowers, consisting of five pointed Leaves apiece, of a pretty strong sweet Smell. After which, come small long Pods, thick above, or next to their Rootstalks, and

Swallow-Wort White.

gradually growing less and less to the Point; in which lye small flat brown Seed, wrapped up in a great deal of white Silk Down; which when the Pod is ripe, opens of it self, and sheds both Seed and Silk upon the Ground, if it be not before hand carefully gathered. This Plant yields no Milk of any sort, White or Yellow in our Country, as the *Apocynum* or Dogs-Bane does; but only a thin watery Juice. Both Leaves and Stalks dye away and perish every Year, and rise again the next Year in the Spring, the Stalks being at their first springing up of a blackish brown Color.

IV. Gerard describes this first sort after this manner. Its Root consists of very many white Thread-Strings, and of a strong Smell. It has divers upright Branches of a brownish Color, of about 3 Feet high, beset with Leaves not much unlike to those of *Amara Dulcis*, *Dulcamara*, or *Woody Nightshade*, somewhat long, broad, sharp pointed, of a blackish green Color, and strong Smell: Among which, come forth very many small white flowers, Star Fashion, hanging upon little slender Rootstalks. After which come in their places, long sharp pointed Pods, stuffed full of a most perfect white Cotton, resembling Silk, as well in shew as handling, from which some call it Silken Cistel; in which is wrapped up soft brownish Seed.

V. The second, or Swallow-Wort Black Flower'd. Its Root is a small Bush of white Strings, not much unlike the former. It grows in the June

Swallow-Wort Black.

manner which the other does, having its long slender rough Branches, stretching out to a greater height or length than the former, and twining themselves about whatsoever stands next unto them, and having on them such like dark green Leaves standing by couples, but something smaller than they. The flowers grow likewise in the same fashion, but somewhat smaller also, and of so dark a purplish Color, that they seem to be almost black; and are scarcely

scarcely discernable, unless one look very earnestly upon them. After which, come (more plentifully than in the former) such like Cods, with a white Silver Down, like pure fine Silk, in which the Seed as in the former, are wrapped. This Plant nor its Root, smells not so strong as the first; nor does it give any Milk, but a Watery Juice when broken.

VI. The third, or Swallow-Wort of Candy. Its Root is not composed of so many Strings as the last, but has as well as the rest of the Plant, a strong Smell, and as some think, not much unlike to Box. It rises up in the manner and fashion as the others do, with many slender flexible green Branches, with Leaves set by pairs at the Joints, on either side, as the white kind has, and are very like unto them, but somewhat of a paler green color. The Flowers stand in the same manner, three or four together upon a Stalk, but are something of a paler white Color, not full out so white as they; to whom succeed sometimes but one, but most commonly two Pods together, which are thicker and shorter than those of the White Kind; fraked also all along, and double forked at the ends, which contain within them Seeds and Silk, as in the former.

VII. The Places. They grow Wild in rough and untill'd Places, and on Mountains in Italy and the Southern parts of France, and in other hot Countries; and the last is found growing in Candy, from whence the Seed has been brought to us: But here in England they are only Nurst up in Gardens, where they thrive admirably well.

VIII. The Times. They all Flower in the Months of June and July, but sometimes (as the Season may be for Coldness) not till August; and their Cods with Seed, are ripe about a Month afterwards; the empty Husks abiding on the dry Branches, when the Silk and Seed are gone, being either fallen on the Ground, or blow away with the Wind.

IX. The Qualities. The Roots of these Plants are only, or rather chiefly used. They are hot and dry in the second Degree, Aperitive, Absterfiv, Diuretick, Vulnerary, Pectoral, Cardiack, Hyfterick, and Alexipharmick.

X. The Specification. They are a Sovereign Cure for all sorts of Vegetable and Animal Poisons, but in particular for the Poison of *Apocynum*, or *Dogs-Bane*, (this being the Counter-Poison or Antidote against it:) as also the Bitings of Mad Dogs, &c. It cures also the Plague or Pestilence, and all sorts of Pestilential Diseases, Faintings, Swooning, Convulsions, Fits of the Mother, Coughs, Colds, Asthma's, Phthicks, and all other Obstructions and Diseases of the Lungs, Obstructions of Urine, Dropsy, Jaundice, Epilepsy, Pains of the Mother; provokes Urine and the Terms, eases the Colick and Gripings of the Guts, kills Worms in the Belly, and is of good use to cleanse and heal all Putrid, Filthy and rotten Ulcers in what part of the Body soever.

XI. The Preparations. From the Roots are prepared, 1. A Decoction in Wine. 2. A Powder. 3. An Ointment or Balsam. 4. A Tincture. From the Leaves and Flowers are made, 5. A Cataplasm. From the Down, 6. Dry Pledgets.

The Virtues.

XII. The Decoction of the Roots in Wine. It is a peculiar Cure against the Poison of *Apocynum*, or *Dogs-Bane*, or *Woolfs-Bane*, or any other Vegetable Poison; as also against the Bitings of Mad Dogs, or the Biting or Stinging of any other Venomous

Creature. It gives ease in the Collick, and the Griping of the Guts. It prevails against the Plague or Pestilence, Spotted Fever, Purples, Calenture, Measles, Small Pox, and all other sorts of Malign and Pestilential Distempers. The Decoction made strong in White Wine, and taken for several days together, a Pint at a time, and Sweating presently upon it, cures the Dropsy, also the yellow Jaundice, and stoppage of Urine thro' tartarous matter in the Reins, Ureters and Bladder. It helps also Coughs, Colds, Asthma's, Phthicks, Hoarseness, Wheezing, and other Diseases of the Brest and Lungs. It is also profitable against Vapors, Hysterick Fits, and provokes the Terms in Women. If it is made also with the addition of *Comfrey* Roots, it is good against Ruptures of the Bowels, inward Bruises, Bleedings, and the like.

XIII. The Powder of the Roots. It has all the former Virtues, much excelling the Decoction, and may be given to a Dram or Dram and half in Canary or White Lisbon, Morning and Night. It is good against Fainting, Swooning, and other Passions of the Heart: Taken with *Peony-Seed* it helps against the Falling-Sickness; with Powder of *White Dittany* Roots, it kills Worms in the Belly, and prevails against Melancholy.

XIV. The Ointment or Balsam. The Powder two Drams, mixed with six Drams of any Vulnerary Ointment, or Balsam of Tobacco, &c. Cleanses, incarnates and heals Wounds, and old Putrid and Rotten Ulcers, beyond that of *Birtwort-Roots*, or of any other Vegetable whatsoever.

XV. The Tincture. It has all the Virtues of Decoction and Powder, excelling them ten times in Virtue and Goodness. Dose a Spoonful.

XVI. The Cataplasm of Leaves and Flowers. It cures hard Tumors in Womens Breasts, as also running Sores and foul Ulcers in the same parts.

XVII. Dry Pledgets of the Silk or Down. Applied to old running Sores and Ulcers after cleansing, it dries them, and in a short time after heals them.

CHAP. DCLXXXI.

Of TANSIE Garden.

I. THE Names. It is called in Greek, *'Athanasia*: in Latine, *Tanacetum*, *Athanasia*: in English, *Tansie*.

II. The Kinds. Authors make many kinds of this Plant, but these four are those which are chiefly known to us, viz. 1. *Athanasia Vulgaris*, *Tanacetum Vulgare*, Our Common Garden Tansie. 2. *Athanasia Crispa*, *Tanacetum Sativa Anglica*; *Tanacetum Crispum*, Crisped or Curled Tansie. 3. *Tanacetum Versicolor*, Tansie Party-Coloured. 4. *Tanacetum Lanuginosum*, Woolly Tansie.

The Descriptions.

III. The first, or our Common Garden Tansie. Its Root is tough, and of a Woody Substance. It grows up with many Stalks with Winged Leaves, which are long, having many little Ones set by couples upon a middle Rib, many of them upon one Footstalk, almost like those of *Agrimony*, and not much unlike to those of the Female Fern. The Flowers

Flowers grow upon the tops of the Stalks, in certain cluster'd Tufts (without any Leaves as a Pale about them;) which Flowers are like round But-

Tansie-Garden, Common.

tions of yellow Roman Camomil, or Featherfew; and as yellow as Gold. The whole Plant is bitter, and of a very strong Smell, but yet very pleasant.

Tansie-Garden, Crisped.

IV. The second, or our Crisped, or Curled Tansie. Its Root creeps under Ground, and shoots up again in divers places. Its Leaves are winged like the former, which are hard and green, being many small ones set by pairs one against another upon a middle Rib, snipt about the edges, but closer and thicker set than the first, and withal crumpled, which has caused it to be called double or Curled Tansie. It rises up with several hard Stalks, on which, and on its Branches at their tops, grow Gold yellow Colour'd Flowers almost like Buttons, which being gather'd in their Prime, will hold the fresh Color for a long Season. The Seed is small, and as it were Chaffe; and the whole Herb, both Leaves and Flowers, hath a piercing strong, but very pleasant grateful Smell, and a sharp strongbitter Taste, exactly like to the first Common Kind; so that by the Smell and Taste only, they are not to be distinguished one from another.
