T O T H E
Q U E E N.

M A D A M,

I Account it more a *Duty* than a *Presumption*, to appear to *Your Majesty*, though with such a *Trifle* as the following Book; and therefore chose to break through that *Difficulty*, rather than to be guilty of such a *Fault*, of letting slip any *Opportunity* in which I might let *Your Majesty* know, with what a *Profound Respect* I approach *Your Great Presence*.

Our *Great Island*, which ever since the *Memory of Man*, has been divided into two distinct Kingdoms, of different *Names, Powers, Governments, Religions, Customs, Affections and Interests*, your Majesty has *United and Made one*. It was what your Great and Royal Ancestors, with all their *Power and Industry*, were never able to perform: But it was a *Work*, the *Honour of which*, the *Supreme Powers* reserv'd for *You*. This *U N I O N* of the *British Nations*, was an *Undertaking* so *Great* in its *Performance*, so *Noble* in its *Kind*, so *Admirable* in its *Effects*, so *Desirable* in its *Good*, so *Singular* in its *Appearances*, and so *Profound* in its *Structure*; that none could have been able to have done it, but a *Greatness of Mind* like *Yours*: One of a *Superlative Prudence and Resolution*, of an *Unwearied Industry*, of an *Unmatchable and Unshaken Zeal* for the *Publick Good*; of a *Magnanimous Soul*, *Inspir'd* with the *Holy Spirit* of the *Immortal GOD*.

You have *Madam* by this *U N I O N*, shut up the *Back-Door*, by which *Great Britain* was always liable to be *Assaulted*; and thereby have added a *Jewel more to the Imperial Crown*; and *Adorn'd* it with an *Illustration*, the *Greatest and most*
desirable

THE DEDICATION.

desirable in its Kind, which will be, both to the *British Isles*, and to *Your Majesty* also, not only an *Important Security*, but an *Everlasting Ornament of Glory*.

Surely *Madam*, You who could *Unite Hearts in an Eternal Bond of Friendship*, was the most fit Instrument to *Unite Kingdoms* in one Bond of Interest and Duty. To make those who were so different in *Climate, Sovereignty, Religion and Manners, One People*, in the Bonds of *Nature and Affection*: And to make them, with one *Joint Design, Intention and Will*, to become *One United and Faithful People*, to so Desirable and Generous a Mistress. But what might not be expected from such a Lady, so Great and so Good a *Queen*? Whose *Conjugal Friendship* was, and is still the *Wonder of Mankind*, (a Noble Pattern to all the Sex) which exceeded even to *Admiration*, whatever has been yet seen upon Earth: Who is it that has *Sense and Gratitude* in his Soul, would not even lay down his Life for such a *Friend*?

When I consider the Admirable Hand of Providence, which has brought Your Majesty to the Throne of the *British Kingdoms*, and has put their Crowns upon *Your Imperial Head*, which has made *Glorious Your Reign*, with a Series of *Wonderful Successes*, and even *Amazing Victories*, over the *Most Formidable Tyrant of the Earth*; rendring his mighty *Attempts* against You, *Vain and Foolish*; notwithstanding his *Confederacy with Destruction*, his *Covenant with Death*, and his *Agreement with Hell*; to the Delivering You and Your People out of *his Snare*, and the Establishing of *Your Just Title*, upon *Everlasting Foundations*, against all *Pretenders whatsoever*: I humbly prostrate my self to that Tremendous Being.

What can I say, but that *G O D* is with You, and that You are an *Especial Object* of his Care, who thus stedfastly holds You as in the *Palm of his Hand*: Your Sincerity, and Generous Love to Mankind, have prevail'd with that *Almighty Power*, who has given You a *Transcendent Portion of Wisdom*, to Conduct You through the *Labyrinths of Dominion and Government*; even whilst You have been Fighting the Publick Enemy of all *EUROPE*; and putting a *Hook into his Jaws*, by which You have already Tamed the *Monster*, fill'd him with Shame and Contempt, and cover'd him with Confusion of Face.

What may I call the *Instruments of Your Warfare*, which have made You thus to prevail? Who is it that has set Your Feet

THE DEDICATION.

Feet upon the Necks of Your Enemies, and given You Strength to humble the Pride of the Lesty? Who is it that has Established Your Strength, to break in Pieces the Invincible Powers, (as they were Foolishly called,) by which You have given a Demonstration to the World, of that Prophanity and Vanity? Who is it that has thus made Your Majesty to Triumph, and adorned you with the Palms of Victory?

'Tis the Great and the Holy One, the Mighty God of Jacob, who has done all these things for You; to whom I make my Daily Addresses, that he may yet Defend and Support the Righteous Cause in which You are engaged; Direct Your Counsels with Wisdom and Prudence; Prosper Your Arms wherever they are engaged; and that the Angel of his Presence may Attend and Conduct You in all Your Ways: So that making You the Restorer of the Breaches, You may Establish such an Universal Peace in Europe, as may Recognize Your Happy Reign, and cause it to shine with a most Resplendent Lustre, to all Succeeding Ages of Time.

You Contemn Madam, the Poor and Little Artifices of Tyrants; You have a Soul too Great to think of such Meanness, and a Spirit too Noble for the bare Thoughts of such Depraved Vileness: You act with the Magnificence of Grandure, made Illustrious with Piety, and an Unbounded Goodness, repleat with all the Ornaments of Sincerity and Vertue, by which You will Live in After-Ages, and Your Name be made Immortal. So that instead of the Diadems being an Honour to Your Majesty, You are become the Exalted Honour of Royalty, and the Glory of the Purple; which makes Your Sovereignty Shine as the most Splendid Brightness, among the Heroes of Time.

G O D has not only made You a Great Queen, but even the Greatest of Princes; and Your Early Piety, as it has advanced You above the best of Women Kind; so it has Exalted You above the Greatest of Crowned Heads. Your Vertues merit a perpetual Encomium, and your Excelling Goodness to your People, is that which is never to be forgotten; whom you have been pleas'd to Oblige with Transcendent Acts of Kindness; so Extraordinary and Superlative in their kind, as all Succeeding Generations, under an Eternal Sense of Gratitude, will be forced for ever to acknowledge.

You carry with You Madam, Majesty and Honour, and Your Sword determines the Successes of War, making with Your Thunder, the World afraid; giving Laws as far as

Your

T H E D E D I C A T I O N .

Your Dreaded Name does reach ; which makes the *Tyrants of the Earth*, those *Barbarous Murderers of Mankind* to tremble, and affrightens the *Obsequious Slaves to Villany*. *Your Triumphs* are not in the Ruin of Nations and Kingdoms, not in Victories of Blood and Cruelty, not for Dominion and Sovereignty ; but *to give Freedom and Ease to Mankind*, and set the World at Liberty.

May the High and the Lofty One, the *Almighty G O D*, He by whom *Kings and Queens* Reign, and *Princes* decree Justice, give *Your Majesty* a Long and a Happy Life ; may He Prolong it to an *Accomplish'd Period*, for the Good of *Your People*, to whom *You* have shewn *Your^s Self* so exceedingly Kind. May he Bless *You* with *Prosperity*, and give *You* that *inward Consolation and Peace of Mind*, which may as Infinitely exceed all the Enjoyments of this Life, how Great and Magnificent soever, as *the Heavens are high above the Earth* ; and make *Your Great and Illustrious Soul*, enjoy the Fullness of Satisfactions, to the *Ultimate* of whatever *You* can desire. So that *Crowning You* with *Glory and Honour* here, *You* may very late Ascend, as on *Eagles Wings*, to those *Eternally Serene Habitations of Peace and Tranquility*, where *You* may be for ever *Transcendently Happy*.
So Ardently Prays

Madam,

Your Majesties

Most Humble,

Most Faithful,

A N D

Most Obedient

Subject and Servant,

WILLIAM SALMON.

T H E
P R E F A C E :
O R ,
I N T R O D U C T I O N .

C H A P. I. Of the *W O R K* it self.

I. *W*E Pretend not here to an universal History of Plants, but chiefly to such as are most Known, and Virtuous, most Experimented, and Useful in Physick. 'Tis a Work highly of Use for Physicians, Chyrurgians, and Apothecaries, and for their Sakes, and the Publick Good it was principally Designed and Intended.

II. As to the Authors made use of in this Undertaking, we shall not be so vain as to enumerate them all, 't would be to no Purpose; and yet it will be Necessary for the Credit of the Book, to give you an Account of the Chief of those, in Treating of each Plant, whose Leaves we were obliged continually to turn over.

III. The Authors we made most use of in Composing this Herbal, were these following, viz. Bauhinus, Brunfelsius, Cæsalpinus, Camerarius, Clusius, Dioscorides, Dodonæus, Durantes, Fuchsius, Johnson on Gerard, Lobel and Pena, Lonicerus, Lugdunensis, Matthiæus, Parkinson, Ruelius, Schroder, Tabernamontanus, Theophrastus, and Tragus. These, I say, were those which were chiefly consulted, and without whom, we passed not off from the Discourse of any Plant: But we cannot say these were all, for occasionally as it fell in our way, and where some particular Occurrences required it, we had recourse to many others, more than twice that number besides, without the Help of which we could not have so Compleatly performed what we here Present you withall.

IV. As to the Historical Part, we could not much deviate, but were obliged to follow the most celebrated Authors of this Subject, viz. in their Names, Kinds, Descriptions, Places of Growth, and Times of Flowering and Seeding. In their Names, we have given you the most usual, and those chiefly by which the Plant (in all Ages) has been most known and called, whether Arabick, Greek, Latine, or English; in doing of which, we hope we have in some measure rectified the Latine Nomenclature, which, even in all our Dictionaries, has hitherto been very Faulty and Impetfect.

V. As to the Kinds of any Plant, we own we have not given you all that you will find in Parkinson, and many other Authors, because those which we have Omitted, an English Reader, may not possibly come to the Knowledge or Sight of in many Ages, they growing in Foreign and Far-distant Countries, as Turkey, Persia, East India, the Moluccas, China, &c. Besides, having no known Virtues or Uses assigned to them, but only their Names and Descriptions, we thought they would only take up room, and rather encumber the Book, than add any real Excellency or Advantage to it, considering it was chiefly design'd for the Benefit and Use of the Practical Physician.

VI. As to the Descriptions, we say they are the same as in other Authors, little or nothing differing from those in Bauhin, Clusius, Dodonæus, Fuchsius, Gerard, Johnson, Lugdunensis, Matthiæus, Parkinson, Tabernamontanus, and Tragus: But we have almost every where revers'd the Order of Describing; for whereas they many times begin at the top or upper parts of a Plant, and so go downwards to the Root, we on the contrary, generally begin at the Root, first Describing it, and so ascend upwards to its Stalks, Leaves, Branches, Flowers and Seed, or Fruit, which we take to be the most natural Order or Method.

VII. As to the Places of the Growth of Plants, they may be very uncertain, because, where they have been found to Grow in great plenty, in former Ages or Times, the footsteps of the same Plant is not to be found now. In some places where I have found several Plants to Grow as Natives of the same, when I was a Youth, now in my present declining Years, there are no remainders of them to be found. The Egyptian Arum, or Pseudocolocasia, which we now call the Carolina Eddo, (because there every where planted) did formerly Grow plentifully in Egypt, which I suppose was its Native place of Growth, and was there planted for their use in Meats, and for Food: Now our late Travellers say, it has not for some Ages been known to Grow there at all. But 'tis possible that it has been neglected and disused: Yet I am of Opinion, that if it were diligently sought after, some remains of it might be found again. It grows in vast plenty

in Carolina, where it is a great part of their Food and Living; but it prospers only as under the Planters Hands, for should they neglect it, it would quickly be totally lost in that Country too.

VIII. We have every where given the various Qualities of each Plant, by which an Estimate may be given in Grofs, of their Virtues, and to what Diseases they may be properly applyed, or may be helpful against: The consideration of which alone, is of mighty a Use to the Pratical Physician; because they indicate to the Mind or Understanding, to what various Purposes and Intents they may be converted, and in what Diseases they may be specifically useful.

IX. How these Qualities are to be applyed to Diseases, may be easily exemplified: I know it may be objected, by such as are Ignorant of Medical Qualities and Indications, that a great many Virtues are ascribed to most Plants, for the Curing of Diseases, which they can never perform, nor any Author before ever signified: To which I answer; That I do not affirm nor say, that every Herb is a Specifick for the Cure of all Diseases, which in the particular Preparations and Virtues thereof, I may ascribe to it; but he that reads me, ought to read me with a Medical Atind, or Soul, and with a good Understanding; I will exemplify the Matter. Suppose it to be Rosemary. As to its first Qualities, it is Hot and Dry in the third Degree; and that it is Cephalick, Neurotick, Stomack, Alexipharmick: From these Qualities, we conclude that it must be helpful against all cold and moist Diseases, of the Head, Brain, Nerves, Stomach, and Poison; then when we consider what Diseases are apt to afflicke those parts, from a hot and dry Cause, we fix the Virtues to be such as may resist these Diseases, not to be an absolute and Specifick Cure for the same, but to be very helpful in these Cases, and so may be drawn into Compositions, with other Ingredients for the same purposes. And thus I desire every Genuine Son of Art to understand me. What I have said in this Paragraph, may be of admirable Use, if it be rightly understood and applyed.

X. Thro' the whole Book in every Chapter, we have given you the various Preparations of each Plant, both Galenick and Chymick, which may be made of them, which is a thing never performed by any other Author before me. This being rightly considered, gives you the whole Result of the Plant, and in a few Words teaches you how it is to be used and applyed, in all the Cases, and to all the Distempers to which it may be appropriated: But that this may be more perfectly understood, we particularly Exemplify the whole thereof, in this present Introduction; in those several Forms, both Galenick and Chymick, and that to the Capacities of such as are Ignorant of the Medical Arts.

XI. Having done all this, when we come to explicate upon the Virtues, we do not give you the Virtues of the Plant in Grofs (for that is before done in its Specification) but show you particularly, how all these several Preparations are (in every Disease) to be used and applyed, which as it never was done before me, by any other Author, so I think it is of universal Use in the Art and Practise of Physick: It is performed so as to answer every particular and singular Preparation, and in a Stile so full and plain, that the meanest Understanding cannot easily mistake me, by which means it is accommodated to the Use of the Vulgar, tho' they understand little or nothing of the Art of Physick.

XII. The last thing which I shall here take notice of, is more matter of Ornament, than any thing of Necessity, which I have done for the sakes of all such as are lovers of Flowers, and of a Flower-Garden: It is a compleat FLORILEGIUM, of all or most of the Choice Flowers, which are Cultivated in England by our FLORISTS: This is not done as a particular Work by it self, but is interspersed thro' the whole Book, each Flower in its proper place of the Alphabet; where you will have their Culture, Choice, Increase, and several ways of Management, as well for Profit as Delicetation; a noble Subject it is, but never brought into any Herbal before this.

CHAP. II.

Of the Greek Names of Plants.

AT First entrance upon this Work, we thought to have given you the known Greek Names of all the Herbs and Plants described in this Herbal, in the order they were treated of; but finding that it would have been too tedious a Labour, and an Undertaking that would not have answer'd the End, and that withall, besides the taking up of room, it would have mightily encombr'd the Discourse; we in a manner wholly declined the same: However, for the sakes of all such as are Lovers of the Greek Tongue, and desirous to call the Species of each Plant by its proper Appellation in that Language, we have in the body of this Work, given you the known Greek Name or Names of each Genus, and the various Latine Epithites, by which the differing Species of that Plant ought to be distinguished; by which, applying to those several and various Latine Epithites, (which are in this place ranked Alphabetically) the Greek Words answering to them, you will have the complicated Greek Names, as full and compleat, as if we had severally perfected them, in the order of their several Chapters.

CHAP. III.

Of the First Qualities of MEDICINES.

I. THE Qualities of Medicaments are five-fold, according, 1. To their Temperaments. 2. As they are Alteratives. 3. As they are Appropriate. 4. As they Diminish something. 5. As they Add or Restore something, all which Qualities we come now to explicate in order.

II. The Temperaments of Medicaments are five-fold, considered, 1. As they are perfectly Temperate, viz. neither Hot nor Cold, Dry nor Moist. 2. As they are Hot. 3. As they are Cold. 4. As they are Dry. 5. As they are Moist. In the four last of which, there are said to be 4 Degrees, receding from their principal, viz. gr. An Herb which is Hot, may be hot in the first, second, third, or fourth Degree of heat. Again, from the four prime Qualities, these also proceed, viz. that a Medicament, 1. as it is Hot, may be hot and dry, or hot and moist. 2. As it is Cold, also cold and dry, or cold and moist, and these likewise in all the four Degrees of Temperature.

III. Temperate Medicaments are such which work no change at all, in respect of heat, coldness, dryness, or moisture.

And these may be Temperate in some respect. 1. As being neither hot nor cold, and yet may be moist or dry. 2. As being neither moist nor dry, and yet may be hot or cold. Their Use is, where there are no apparent Excesses of the four other Qualities, to preserve the Body Temperate, conserve Strength, and restore decayed Nature.

IV. Hot Medicaments (and so also Cold) are considered in respect of our Bodies, and not of themselves: For these Simples are called Hot, which heat our Bodies.

Their Uses are, 1. To make the offending Humour thin, to be expelled by Sweat, or thro' the Pores. 2. To help Concoction. 3. To warm and comfort the Viscera. 4. And by outward application, to discuss Tumors. 5. Or raise Blisters, make Cantharides, &c. according to the degrees of Heat.

V. Cold Medicaments are such, as cool our Bodies being over-heated, by any adventitious or accidental Causes.

Their Uses are, 1. To cool the Parts or Bowels. 2. To condense Vapours. 3. To thicken Humours. 4. To abate the heat of Fevers. 5. To refresh the Spirits almost suffocated. 6. Allay Inflammations. 7. Repress Sweating. 8. Ease violent Pains.

VI. Drying Medicaments, are such as make dry the Parts overflowing with moisture.

They are used, 1. To stop Fluxes. 2. To comfort and strengthen Nature. 3. To consume a superfluity of Humours. 4. To fortify the Bowels. 5. To restore in Consumptions, where great fluxes of the Bowels have been.

VII. Moist Medicaments, are such as are opposed to drying, which moisten, loosen, are lenitive, and make slippery.

They are used, 1. To moisten an over dry and constipated Habit of Body. 2. To ease Coughing. 3. To help the roughness of the Wind-pipe. 4. To loosen the Belly. 5. To relax Parts contracted or hardened.

VIII. Things hot in the first Degree, gently warm the Body being over cooled, and outwardly open the Pores. Hot in the second Degree as much exceed the first, as the first exceed Temperature, and these cut rough Humours, open Obstructions, and the Pores also outwardly. Hot in the third Degree, more powerfully heat, and are able (if much used) to inflame the Body, and cause Fevers, provoke Sweat exceedingly, and resist the malignity of the Plague or Pestilence, and more powerfully also cut tough Humours. Hot in the fourth Degree, burn the Body if outwardly applied, raise Blisters, corrode the Skin.

IX. Things cold in the first Degree, qualify the heat of the Stomach, and refresh the Spirit. Cold in the second Degree, are chiefly of use to abate Inflammations. Cold in the third Degree, are Repellive, and drive back the Matter, repress Sweat, and keep the Spirits from Fainting. Cold in the fourth Degree, stupify the Senses, ease violent Pains, and are used in extream Weakings.

X. Things dry in the first Degree, Strengthen. In the second Degree, Bind. In the third Degree, stop Fluxes, and restore in Consumptions. In the fourth Degree, stop Catarrhs, and all Fluxes of Blood and Humours, are highly Stiptick, and dry up a super-abundancy of moisture.

XI. Things moist in the first Degree, are opposed to drying in the same Degree: They moisten the Body, and Parts dried. In the second degree, they Lenify, loosen the Belly, and make slippery. In the third degree, they smooth the roughness of the Wind-pipe. In the fourth degree, they cure a constipation of the Bowels.

XII. Thus Medicines after according to their Temperature: Whose active Qualities are Heat and Cold; and by them Diseases are said to be eradicated. The Passive are dryness and moisture, and they are subservient to Nature.

CHAP. IV.

Of the Second Qualities.

I. **T**HE Second Qualities of Medicaments are such as are Alterative; which alter the Habit, and Constitution of the Body, as it has a respect to the Blood, Lympha, Serum, and other Humours of the same; and these Alteratives are considered as they are Medicaments Internally used, or Externally applied.

II. Of Internal Alteratives Authors have made many Titles; but the Whole of the Matter is comprehended under the thirteen following Appellations, viz. 1. Aperitives. 2. Abstersives. 3. Astringents. 4. Digestives. 5. Incisives. 6. Carminatives. 7. Anodyns. 8. Narcoticks. 9. Bechicks. 10. Solutives. 11. Attenuaters. 12. Coagulatives. 13. Confortatives.

III. Of External Alteratives, we have these following fourteen, viz. Symplics, Hemopticks, or Antihæmorrhagicks. 2. Anodyns. 3. Repercussives. 4. Diffusives. 5. Emollients. 6. Attrahitives. 7. Suppuratives. 8. Corrosives, or Pyroticks. 9. Digestives. 10. Abstersives. 11. Incarnatives. 12. Agglutinatives. 13. Cicatrizers. 14. Cosmeticks: Of all which we shall treat in order.

I. Of Internal ALTERATIVES.

IV. 1. APERITIVES. These are such Medicaments as open the Obstructions of the Viscera, as Stomach, Lungs, Liver, Spleen, Glands, Mesentery, Intestines, Reins, and Womb. They are all hot at least in the second Degree, for the most part in the third, and many times in the fourth degree; of very subtil and thin parts, for without heat there can be no rarefaction, and without rarefaction, no opening of the obstructed Bowels.

V. 2. ABSTERSIVES. These are cleansers, which after opening Obstructions of the affected Parts, cleanse them, by taking away the Recrements which obstructed them, being the superfluities of the Blood, Lympha, and other Juices, and without which work be done, all that Aperitives or Openers do, is done in vain. They have a sharpness and tenuity of Substance, and it is not any great matter whether they be Hot or Cold, by reason neither quality (if not excessive) hinder their Action. They also remove glutinous and clammy Humours in the Superficies, or adhering to the Pores of the Skin and Ulcers.

VI. 3. ASTRINGENTS. These are Binders, and are generally dry in the second and third Degrees, whether they be hot or cold; they are Symplics, and in some measure constrict the Bowels in Fluxes, dry up Fluxes of Humours, help Catarrh, and strengthen the Tone of the Stomach and other Bowels, when aver Lax, or weakened by long Defluxions, over much moisture, or the vehemency of any inveterate Disease; and are therefore often given in the end of a Cure.

VII. 4. DIGESTIVES. These are such as Concoct the Food in the Stomach, and are all naturally hot; for it is Heat which causes Concoction, and excites the natural Fermentation in the Stomach, by which a good Chylus is made, in order to Sanguification, and Nourishment of the Body: Yet some things may cause Digestion, which are not naturally hot, but cold, and may excite the natural heat, by way of Antiperistalsis, whereby the sulphureous Particles in the Stomach are more fermented and heat, or set a boiling.

VIII. 5. INCISIVES. They are such things as pierce into and cut tough Matter, which is not easy to be broken, or separated into parts; such are Juice of Limons, Vinegar, and all acid things which by their points enter into and make a division, not a dissolution, whereby tough Flegm, and tartarous or viscid Matter, is prepared for Abstersives, and so made fit either to be expectorated by the Mouth, or expelled by Urine and Stool. These, whether hot or cold, are of very thin and subtil Parts.

IX. 6. CARMINATIVES. These are Medicaments which spread, discuss, or expel Wind, and are generally hot and dry, and of very thin and subtil Parts proper in Pains of the Stomach and Bowels, the Cholick, and other Indispositions whatever caused of Wind, as Vapours, Hypochondriack Pains, Hysterick Fits, &c.

X. 7. ANODYNS, or PAREGORICKS. These are easers of Pain; which tho' they do not often Cure Diseases, yet all, in order thereto, they regarding the Pain chiefly, while both Cause and Disease are remaining. They are of thin Parts, and are moderately hot, seldom exceeding the first Degree, and rareficient, and so Digesting, Concocting, Dissipating, Extenuating, and in some measure Evacuating, whatever Humour is sharp, tough, or gross, by it alcalious property absorbing the acritude of the Matter, contained in any Cavity, or its Pores.

XI. 8. NARCOTICKS. These are stupifying Medicines, and ease Pain, not by mitigating it, but by Stupification; not by taking away the Cause, but by Obstruction of the Animal Spirits for the time. Yet Stupor is something less than Insensibility, or the provocation of Sense: They are also called Hypnoticks and Somnificks, because they induce Sleep: These being taken too liberally, or to excess, cause Death, as all Opiates, if immoderately dosed. They are to be administered at such times, when the Symptoms are so grievous, as to threaten a greater danger than the Disease.

XII. 9. BECHICKS. These are such as abate or ease Coughing. And they are things which incrassate thin Humours, stop Defluxions, and so ease the Cough. Narcoticks of the middle kind, are agreeable to the Breast and Lungs; which if they are cold, they incrassate thin Humours, and stop Coughing, and especially such as are much Narcotick, or Stupifying: But such things as are hot and of thin parts, and extenuating, which expectorate tough Humours, oftentimes ease it.

XIII. 10. SOLUTIVES. These are Loosning Medicines, not such as are Purging, but by their hot and moist Qualities, keep the Body soluble; they not only open the Pores of the Viscera or Entrails but in some measure removing Obstru-

tions, they open the inferiour Ductus of the Bowels, as do Nitrous Salts, Soluble Salt of Tartar, Oat-Meal, &c. and this they may do, altho' they may have some small Astringent, and by reason of Substance, do not differ from those which are Astringent, but in degree. For these things which cleanse the Pores and inward Passages, have a great tenuity of Parts, and are moderately Astringent, which cleanse, and as it were seemingly Purge the greater Passages, yet withall strengthen the same. Some things are Soluble by lenifying, as Fat things; and some by washing and absterion, as Whey, Solutive Waters, New Beer and Ale, &c.

XIV. 11. ATTENUATERS. These are such things as make thin, and are of hot and thin Parts, and so extenuate gross and tough Humours, and are for the most part hot and dry in the second and third degrees, as things Sharp, Piquant, and Aromaticall, generally they are strong provokers of the Terms, because they make the Blood and Lympha, more thin and fluid: They also facilitate the Delivery of Women in Labour, bringing forth both Birth and Afterbirth. Hereto belong Incisers of Viscid Humours, which are more strong. And Dissolvers of what is Grumous and Coagulated, as Sal Volatile Oleosum, and all Alcalions and Volatile Salts and Spirits. Also Extenuants, or wasters of the Fat Substance, and Gross Parts of the Body. And Luxatives, which are Solutive, and moderately hot, moist, and thin. The use of Attenuating Medicines, is previously in order to open the Obstructions of the Bowels, Lungs, and Womb.

XV. 12. COAGULATIVES. These are such as make thick, being contrary to those things, which make thin or rarefy. They make Rheum and Humours, tough and thick, and so are accounted either cold or temperate. They are given in Colds, Coughs, and vehement Catarrhs and Distillations, whereby the Phlegm or Rheum being coagulated or thickned, it is made more fit for Expectoration: They also take away the sharpness of the Blood and Lympha, and thicken it, whereby they stop the overflowing of the Loches and Terms in Women, and perfectly prevail against a Diabetes. They also stop too much Sweating, and the disposition of the Spirits, which often happen to such as are Weak, and in Consumptions.

XVI. 13. CONFORTATIVES. These are Strengtheners of the universal Man, of the Spirits as well as the Body, and are generally of hot, dry, astringent, and subtil Parts, that they may warm those Parts which are cold, dry and confirm those which are weakened by too much moisture; bind or stop the too openness of the Pores, by which the Spirits are dissipated; and of subtil and volatile Parts, that they may unite with or join, the Natural, Vital, and Animal Spirits, to revive and exhilarate them. But sometimes, when the Body is weakened by heat and dryness, cold things may become Confortatives, by overcoming those Qualities by which the Body is weakened, and so we see the Spirits and Oils of Nitre, Salt, Sulphur, and Vitriol, Lime Juice, Juice of Limons, &c. Confortatives in the highest degree, where the Body has been weakened by Hætic and continual Fevers, and other hot and dry Indispositions, not easily to be expressed in few words.

II. Of External ALTERNATIVES.

XVII. 1. STYPTICKS, HÆMOPTOICKS, or Antihæmorrhagicks. These are such things, as stop Bleeding in what part of the Body soever. They are for the most part cold, at least temperate, exceeding drying and repulsive: For things which are cold, repel, and many of them coagulate, or thicken; and so if they have a crassitude of Parts, as things acerb and austere. And Medicines vehemently drying, which are Astringent, repel also, because they thicken the Blood and Lympha: These, if they be of thin parts, much conduce to Astringent: Some Stypticks have a crassitude of Body, for which reason they then cannot easily penetrate the more remote Parts, precluding the Passages, therefore those which have a thinness of Substance, are rather to be chosen, unless the cause lies in the superficies, as in all fresh and bleeding Wounds. Stypticks are indeed the highest Astringents, and Binders, and if joined with Narcotics, transcend in the highest degree.

XVIII. 2. ANODYNS, or PAREGORICKS. These are easers of Pain; and are moderately hot, viz. in the first degree, not much exceeding temperate, and of thin Parts, and rareficient: So by opening the Pores, they Evacuate, Rarefy, Extenuate, Digest, and Concoct; equally encountering whatever Humour, is either sharp, cold, gross, or tough, inhering in the Pores, or near adjacent grieved Parts, which by reason of the obstruction of the Pores, could not find a way out; besides, they are aqueous or moistening, and aerial or of subtil Substance, not in the least Astringent. But there are some Cold Anodyns, which are such as give ease in Tumours, or Pains caused from great heat. Again, Anodyns are said to be Proper or Improper. Proper, are such as we have already been speaking of: Improper, are such as they call Narcotics, made of Opium, Henbane, Hemlock, Mandrakes, Nightshade, &c.

XIX. 3. REPERCUSSIVES. These are Repelling Medicaments, which drive back the Humour. They are generally cold and drying, and of gross Parts; for that which is cold, repels, and if it has a crassitude of Parts also, it acts with more force, as that which is acerb or austere. Those things also repel which are Astringent, if they have also a tenuity of Parts, for the thinness of their Substance, does much conduce to Astringent. And therefore other things which are Astringent, by reason of the thickness of their Substance, cannot easily penetrate the more remote Parts, precluding the Passages. And hereto Defensatives, and Intercipients may be reduced, being Cold, Astringent, and Repulsive. These, by their Coldness, repel the Humour; and by their Astringency, strengthen the Part afflicted.

XX. 4. DISCUSSIVES. These are such as resolve the Matter contained in the Part. They are moderately hot, with a tenuity of Parts, and very little resiccant or drying: For as Discussives rarefy and make thin, causing the Matter to be dissipated, so excessive heat does condense and dry; whereas moderate heat opens the Pores, or Passages, and deeply penetrating, by the tenuity of its Substance, opens the Pores, attenuates the Matter, and so eases the Pain. Their use therefore is, 1. To open the Pores. 2. To attenuate the Matter,

or make it thin and fluid. 3. And to evacuate it for the most part by Perspiration.

XXI. 5. EMOLLIENTS. These are such things as mollify or soften any hard Tumour or Part. These are generally hot and moist; hot in the first degree, and moist in the first or second degree. Their heat is a little beyond the Proportion of Nature, and they are of thin and humid Parts, that they may pierce into the Matter, and mollify or soften it. For which reason it is of use in Strumous or Scirrhus Tumours, Oedema's, and others of like Nature; to soften the hardness, and reduce it to its pristine heat: And these are either Common, or Proper. 1. The Common are such whose general Operation is to soften hard Swellings, and such parts and places of the Body, as are hardened by Congelation. 2. The Proper, are such as are applied or appropriated to peculiar Humours, which being either hot or cold, the Emollient must be opposite to them, in those active Properties, but retaining its due humidity.

XXII. 6. ATTRACTIVES. These are drawing Medicines, which attract or draw the Humours from the Center to the Circumference. They are hot, and of thin Parts: For that which is hot, attracts, and that more strongly, if it has conjoin'd with it a tenuity of Parts. Those which are hot and dry in the second degree, moderately attract; if in the third, more effectually; but most those which are hot in the fourth, for the attraction is according to the strength or degree of heat: Yet some things attract Specifically, and not by any manifest Quality, as Emeticks, Catharticks, &c. These are contrary to Repercussives, for their Nature is to drive from the Circumference to the Center; but Attractives draw from the Center to the Circumference. They are of use in Wounds, made by the Bittings of Mad Dogs, Serpents, and other Poisonous Creatures; in Burnings, Venereal and Pestilential Tumours, &c. where it is absolutely necessary to draw the Poison and Malignity outwards, in order to the saving of Life.

XXIII. 7. SUPPURATIVES, or Maturatives. These turn into Matter, confused Flesh, and Humours, as also the Substance, of which many Tumours or Swellings consist, and bring it to perfect ripeness. They are moderately hot, and next to Emollients, yet differing in this, that Suppuratives have an Emplastick faculty, where, by obstructing the Pores, they produce heat, most like unto that of the Body, without any Consumption or Addition of the Humidity. These are friendly to Nature, and conspire together with it, to bring the superfluous Matter to form, and to such a form, as that it may be separated and cast out, and the affected Part thereby eased.

XXIV. 8. PYROTICKS, or CORROSIVES. These are threefold. 1. Cathereticks, 2. Septicks, 3. Causticks, or Escharoticks. I. Cathereticks, or Eaters. These are meanly strong; they by their corrosive Properties, consume Excrecencies, and eat away proud and dead Flesh. II. Septicks. They are Corrosives, vehemently hot and dry, of thin Parts, and consence, which by their vehement heat, eliquate the Part, and are called Putrefactives; and their use is to draw Blisters; these are Vesicatories. III. Causticks, or Escharoticks. These are vehemently hot and burning, being the strongest of all, so that they consume all they come near. They cause Crusts upon the place they are applied

to, and are chiefly of use to make Issues, or open Apostems.

XXV. 9. DIGESTIVES. These are a kind of Maturatives, which bring laudable or well digested Pus, or Matter, into Complex or confused Wounds, and ill natured eating Ulcers, without which the Pain can neither be taken away, nor the Wound or Ulcer healed, or a stop put to the eating, &c. Of these we have largely discoursed in our *Artis Chirurgica*, where you may find a plentiful number of Prescripts in exemplification thereof.

XXVI. 10. ABSTERSIVES. These are Cleansers, which separate and remove the glutinous, clammy, or putrid Matter, adhering to Wounds and Ulcers, which hinders their healing. They have a power to exsiccate with tenuity of Substance; and they may be either hot or cold; nor is it of any great moment, which of them, by reason neither Quality can hinder their action, except Excessive. Yet some count them chiefly hot and drying, with a certain thickness of Parts to compass the Humours: And because they cannot be defined, by either heat or coldness, since some of both sorts cleanse, they are to be understood to have a terrene Substance, which may take away the filth with them; and must a certain roughness, or nitrous Quality, to carry away the compacted filth.

XXVII. 11. SARCOTICKS, or Incarnatives. These generate Flesh in hollow Wounds and Ulcers, and fill up their cavities, as far as Nature will admit. They are hot in the first degree, a little Deterfive, and that without Biting or Attrition. Also moderately drying, viz. under the second degree. And such as Impinguate, or breed Fat, are Heating, Nourishing, Impulsive, Attractive, Retentive, or Specifick; as Hemp-Seed, Powder of Sarcocol, Kernel of the Indian Nut. They dry, and change the Blood that comes to any part into flesh. Their degree of dryness must be according to the Part: If the Ulcer happens in a dry part of the Body, the Sarcotick must be very dry, and therefore some of them are drying, even in the fourth degree. But if the part of the Body is moist in which the Ulcer is, the Incarnatives are to be less drying: They ought not to exceed the first degree, unless the Ulcer be very moist. They breed not good Blood, nor correct the intemperature of the place affected; they only defend the Blood from ill Symptoms, and the Ulcer from Corruption in breeding Flesh; for Nature in breeding Flesh, produces either serous or purulent Excrements, and these Medicines which cleanse and consume those Excrements, by their drying Quality, are said to breed Flesh, because by their help, Nature performs that Office.

XXVIII. 12. AGGLUTINATIVES. These are such as glew the Lips of Wounds, and separated Parts together. They are also called Symphitica, which is the reason that Constry is called Symphitum, because of its glewing Quality. They are generally drying in the second degree; and are in a mean between Incarnatives, and Circutizers. They are not Absterfive, but Astringent, and prohibit the Flux of Humours, to the Lips of Wounds, Ulcers, and Fistula's. They are temperate, in respect of heat, and of a thick Substance. By their dryness, they absorb that humidity, which intervenes between the Lips of Wounds, that thereby they may be conjoined: And that is the true Cure

Cure of an Ulcer, which conjoins the sides of an Ulcer, before brought together. And Ulcers require a greater degree of drying than Wounds, not only to consume what flows out, but also what remains liquid in the Flesh.

XXIX. 13. CICATRIZERS, or Epuloticks. These are such things as skin a Wound, Sore, or Ulcer. They dry and bind without biting; absorbing the humidity of the Flesh, contracting it with a Skin, or a thin Callus like unto a Skin, and therefore are more drying than Incarnatives or Glutinatives: For these bind, contract, constrict, and indurate; being cold, and of a thick Substance. There is also a sharp and biting Epulotick, which consumes dead Flesh, as Cathereticks, and a third sort, which dries without astriction. The last part of the Cure of a Wound or Ulcer, is to cover it with Skin, and restore the place to its pristine beauty: Now these Medicines meddle with the Flesh, no further than only to convert it into Skin.

XXX. 14. COSMETICKS, or Beautifiers. These adorn the Body by adding beauty to it, by absterging or cleansing it from defilements, as Leprosie, Leuce, Scabs, Itch, Pimples, Redness, Wrinkles, Ereckles, Yellowness, Tanning, Sun-burning, and the like. Those which proceed from heat, are to be remedied by cooling things: If the defilement is imprinted in the Skin, extenuating Medicines are to be applied; if Ereckles or Worms affect it, the Skin it self is to be absterged by Em-plasters of Soap, or Oil of Tartar per deliquium, diluted with Water; if Leprosie, Scabs, or Pustules, constantly breaking out, the Cuticula must be taken off by Epispasticks, &c.

CHAP. V.

Of the Third Qualities.

I. THE third Qualities of Medicines are such as are Appropriate, that is to say, which are appropriated to some principal and noble Parts of the Body, the knowledge of which Physicians have learned and obtained, either, 1. From the signatures of the Medicaments themselves. 2. Or from a long series of Practice and Experience.

II. And therefore as Medicines are said to be appropriate, to the most noble and principal Parts of the Human Frame, so from them they take their Denominations or Names, and accordingly are said to be, 1. Cephalicks. 2. Neuroticks. 3. Stomachicks. 4. Pulmonicks, or Pectorals. 5. Pleuriticks. 6. Cardiacks, or Cordials. 7. Hepaticks. 8. Spleneticks. 9. Mesentericks, or Hypochondriacks. 10. Nephriticks. 11. Hystricks. 12. Arthriticks. Of which in their respective order.

III. 1. CEPHALICKS. These Medicines are said to be appropriated to the Head, and have respect chiefly to the Brain, the Medulla oblongata, and the Membranes called Pia & Dura Mater, but have very little to do with the Tongue, for that is a very warily Member. The Brain is the seat of Apprehension, Judgment, and Memory, and by Nature moderately hot; and so is very easily affected by either too much heat or cold, but

chiefly by the latter, and for the most part by too much moisture, and therefore the Medicaments appropriated to the Head and Brain, are generally hot and dry, and of very subtil, thin, and volatile Parts, for otherwise they could have no affection upon those Parts. To these some add Ptarmicks, and Sternutatories; 'tis true, these will purge the Brain and Head from a world of pituitous, cold, and moist Recrements, but these are not proper Cephalicks, for what they do, is by the Virtue of their violent heat, and strong attractive power. Whether there be any cooling Cephalicks is a doubt, if cooling things affect the Head and Brain, they do it simply, either by their cold Quality, or by cooling other Parts over-heated, which by Sympathy or Consent, affect the Head.

IV. 2. NEUROTICKS. These are Nervous Medicaments, and are all hot and dry, from the second even to the fourth degree, of a very thin Substance and penetrative Parts, without which they could not pierce and affect the Nerves, to ease their extravagant Pains, as in Cramps and Convulsions, or to warm, comfort, and strengthen them, as in Palsies, &c. they ought to be very subtil and volatile, that they may agree with the Animal Spirits, and as it were recuperate them. Their use is both Internal, given in some proper vehicle; and External, being applied to the Parts affected, and all along down the Spine or Back-Bone, from whence all the Nerves of the extrem Parts, as well as some others spring. They very much agree in their Qualities with Cephalicks, because the Root or Original of all the Nerves thro' the whole Body, arise from the Brain.

V. 3. STOMACHICKS, or Stomach Medicaments. These are such as open Obstructions in the Stomach, ease its Pains, and strengthen its Tone. They may be either hot or cold, and so affect the Part, according to the Indisposition which attends it. 1. When it is obstructed, the Appetite is diminished or depraved, with a kind of nauseousness concomitant: And this is remedied chiefly by acid Aperitives. 2. When it is pained, or there is a sickness at Stomach, it is commonly from being either over-heated, and then cooling Stomachicks are to be given; or over-cooled, and then hot Stomachicks are to be exhibited; or from vehemently acid or sharp Humours in it, and then Absorbents, or fixt Alkalies, will be chiefly of use. 3. When its Tone is weakened, or hurt, then the Digestion is bad, the Concoction is weak, and so a bad Chylus is generated; whence the Retentive Faculty is also many times prostrated, and whence proceed sometimes the Scurvy, and Rheumatick Pains, or the Gout; and if it be of long continuance, it induces a Consumption, because the Body will want a suitable Nourishment. And these things are remedied (after due evacuation) by Stomachicks, of a hot and dry Quality, of thin Parts, and Confortative withall, which have power to warm, comfort, and strengthen it, and have likewise an Astringent property, which strengthens the Retentive Faculty.

VI. 4. PULMONICKS, or Pectorals. These are Medicaments appropriated to the Lungs, and have regard either to the Part afflicted, or to the Matter afflicting. 1. Those which regard the Part afflicted, are such as stop bleeding, if any Vessel is broken in the Lungs, and by a kind of Symp-tick Quality, have power to conglutinate or heal it; or if there be any Ulcer in the Lungs, have the power of cleansing it, and healing it withall, which

is done by either a Balsamick Property; or by a Specifick, of which Nature is Cinnabar of Antimony, and all sweet Preparations of Mercury, which entering into the mass of Blood, and being dissolved in it, give such a healing property to it, that by its continual passage thro' the Lungs, it does at length perfectly heal them. 2. Those which regard the Matter; and these are such as digest and thicken the Rheumatick or pituitous Matter, stuffing them (which causes Asthma's, Wheezing, Hoarseness, loss of Voice, Coughs, &c.) and cause it to be expectorated, and those are they which are most usually called Pectorals. Besides, they many times clear the Stomach of what sticks to it, causing it in some measure to be spit up.

VII. 5. PLEURITICKS. These are such things as are appropriated to the Pleura; and generally give present ease to Pains and Swellings in the Sides, Stitches, the Pleurisie, &c. and they are either Anodyns or Narcoticks. The Anodyns, are such things as are hot and dry, and abound with an admirable volatile Spirit and Salt, such as Salt of Urine, volatile Sal Armoniack, volatile Salt of Tartar, volatile Salts of Beans, Pease, and other Pulses, as also Sal Volatile Oleosum. The Narcoticks, are such things as are made of the Wild or Corn Poppy Flowers and Heads, and of Opium; so that Opiates, especially such as are repleat with volatile Sal-Armoniack, Salt of Hartshorn, of Tartar, &c. all immediately affect the Pleura, and give present ease in the disaffections thereof.

VIII. 6. CARDIACKS, or Cordials. These are Medicines appropriated to the Heart; the Fountain of Life, and Seat of the Vital Spirit; the Original of Innate Heat, and of Vigor and Action. And therefore Cordials ought to abound with Subtilty and Volatility, to revive the Spirits, and with Heat to strengthen the Heart, and make it perform its action. Those Cordials which revive and refresh the Spirits, must be Spirituous, as Wine, and Spirit of Wine: And those which strengthen the Heart, are either Hot, when its natural heat is decayed or wasted: Or Cold, when it is heat above Nature, by either Fevers or any violent Passion, or by Poison; the first of which are Antifebriciticks. The second, Confortatives. The third, Alexipharmicks, or Antidotes against Poison.

IX. 7. HEPATICKS. These are Medicaments appropriated to the Liver. And these are considered in a three-fold respect, 1. As they open its Obstructions. 2. As they resist its Diseases. 3. As they strengthen it. As to the first, Hepatick Aperitives are to be chosen, which may open its Vessels, and keep them free from Obstruction, without which it is impossible that the Person should be Well, but must at long run fall into a Consumption: These cut and extenuate without any vehement heat, and yet cleanse. As to the second, Hepaticks opposite to the Disease afflicting the Liver, are to be chosen: So if there is an Inflammation, cooling, cleansing, and extenuating things are to be used: If a Scirrhus, things softening and dissolving. With a Decoction of Juniper-berries in Water, drank for a Year together as ordinary Drink, I cured a vastly great Scirrhus of the Liver, outwardly to be felt, hard, and as large as a great two penny Loaf. As to the third. The Liver after all is to be strengthened, and this is done by Hepaticks, gently Astringent, for seeing its use is to help towards the perfection of the Blood, it needs some adstriction to preserve its heat, and strengthen it.

Yet the Liver requires not so great astringents as the Stomach, because the passages of the Stomach are larger, and more open, than those of the Liver; so that if they be very Binding, they may be hurtful to the Liver, and cause Obstructions.

X. 8. SPLENETICKS. These are Medicines appropriated to the Spleen. Spleneticks are considered in a threefold respect also. 1. To such as open its Obstructions, and they are Aperitives, which ought to be so powerful, as to penetrate into its most inward recesses, for the whole Substance of the Spleen, is a kind of Animal Honey-comb. 2. To resist its Diseases; and these in an Inflammation, ought to be cooling and dissolving: In a Scirrhus, to be highly Resolutive, not in the least binding; and outwardly Emollients may be applied. 3. To strengthen it. And these are such as are temperate, in respect to heat or dryness; yet they ought to have so much adstriction, as to confirm its natural and healthful Tone.

XI. 9. MESENTERICKS, or Hypochondriacks. These are Medicines dedicated to the Mesentery: Its grand failure is from Obstructions, which are either from viscous or clammy Humors, or from Wind, which induce a profound Pining, or universal Consumption of the whole Man; and in the end (if not removed) Death. Upon this Axle-tree, the whole Orb of Life turns; and when it breaks, the Man sinks, and the Body returns to its first Principles. And therefore the most powerful Deobstructors or Aperients, are Specifick Mesentericks; and these in the Mineral Kingdom, are deduced from Chalybeates: In the Animal, from Volatil Salts, as Sal Volatile Oleosum Sylvij: And in the Vegetable Kingdom, such things as have power to dissolve congelation of the Juices, as Volatil Salts of Beans, and of Tartar; or to cut the viscid and clammy Matter, as Cresses, Horse Radish, Mustard, Rocket, in cold habits of Body; or Juices of Citron, Limons, or Lime Juice, and their Syrups, in hot Constitutions joined with other proper Aperients, which may have a power to penetrate into the most inward recesses of this Bowel. Add to these Carminatives, conjoined with Sylvius's Spiritus Anticolicus, where Wind seems to have the predominancy.

XII. 10. NEPHRITICKS. These are Medicines appropriated to the Reins and Bladder. In the Reins, a separation is made of the Serum from the Blood, without which Man could not live, and the Bladder, of a sufficient magnitude, is the receptacle to contain it. Therefore it is necessary by appropriate Medicaments, to keep those parts clear, and free from Obstruction, and to retain their strength, that they may the better perform their Offices. The Diseases afflicting the Reins and Bladder, are chiefly, 1. Obstructions by a tartarous or viscid Mucilage. 2. Stones, Gravel, or Sand. 3. Inflammation. 4. Pissing Blood. 5. Ulcers. The first is cured by Aperients and Diureticks. The second, by Lithontripticks. The third, by cooling Diureticks, as Sal Prunella dissolved in a Diuretick Wine. The fourth, by Symplics and Narcoticks, as Catechu, and Opiates prepared with Acids. And the last, by Balsamicks, as Balsams of Chili, Gilead, Peru, Capiivij, Venice, Strasburg, and Chio Turpentine, and sweet prepared Mercury, which transcends all other things.

XIII. 11. HYSTERICKS. These are Medicines appropriated to the Womb. It is a Part

Part which one would think had some Sense in it, because it is pleased and delighted with some things, as Aromatics, Perfumes, and the like; and displeased (so as to fly from them) with stinking and ill-scented things, as Turds, *Alia foetida*, and other stinking things of like nature. Therefore since Vapours, Hysterick Fits, and Hysterick Convulsions, proceed from the Womb, those things which alleviate them, suppress the Fumes, and reduce the Womb to its place, ease its Pains, and profligate it. Convulsive Motions are properly called Hystericks, so Musk, Ambergrise, Aromatics, applied to the Nose, induce Vapours, Fits, Convulsions, &c. Whereas applied to the place of Conception, suppress them all. But *Alia foetida*, and other stinking things applied below, bring those Diseases; whereas held to the Nose, or taken inwardly by the Mouth, they frustrate and Cure them. Medicines which provoke the Terms, or Loches, &c. or which suppress or stop them, are accounted Hystericks; but of them we shall treat in the fourth Qualities.

XIV. 12. ARTHRITICKS. These are Medicines appropriated to the Joints. And seeing that they consist chiefly of tendinous and nervous Parts, therefore they are chiefly composed of Neurotick Medicaments, which have a heating and drying Quality, gently astringent or binding, and without having a peculiar strengthening Property: But because the Joints are the extrem parts of the Body, and more remote from the Vital Center, they require the stronger Medicaments. Pains are eased by Anodyn Arthriticks, mixed with Narcotics, as a mixture of Camphir, and Spirit of Wine, with Opiales. Inflammations are abated by Arthritick Baths: And the Arthritick Tumour is removed either by Epispasticks, or Burning; or by the application of Arthritick Repercussives, mixed with Camphir, or Opium, or both.

CHAP. VI.

Of the Fourth Qualities.

I. THE fourth Qualities of Medicaments are such as are Abstractive, to wit, such as by their Power or Operations, take away some thing from the Body; or from some of its Bowels or Parts.

II. And these receive their Names from the variety of their Operations, which they each perform in the respective parts of the Body, to which they are adapted; which are the Nine following, viz. 1. Emetics. 2. Catharticks. 3. Salivaticks. 4. Ptarmicks. 5. Emmenagogicks. 6. Diureticks. 7. Lithontripecticks. 8. Sudorificks. 9. Veneficks.

III. 1. EMETICKS, or Vomitories. These by giving a reluctance to the nervous Fibres of the Stomach, cause their Relaxation and Stimulation, whereby afterwards as the reluctance grows more and more, and the nauousefulness encreases, those nervous Fibres before relaxed, suffer a kind of Convulsion, or Contraction, and so eject the offending Matter upwards, or by the Mouth, whereby that Viscus, by such a discharge, comes to be restored to its pristine Health. Nor is the Stomach otherwise to be cleansed, for ten Catharticks, or

Purges, how strong soever, will not so well cleanse the Ventricle, as one proper and well-designed Emetic. The Stomach therefore is to be cleansed upwards by Vomiting; the Entrails, or Intestines, downwards by Purging, which is according to the Law of Nature.

IV. 2. CATHARTICKS, or Purging Medicines. These peculiarly cleanse the Entrails, but will draw the Peccant Matter from all parts of the Body, as has been seen in some who have for many Months lost all the Uses of their extrem Parts, or Limbs, by violent and inveterate Rheumatisms, and Colicks; who by only Purging with proper Catharticks, have been perfectly restored; for which purpose, the Pulvis Cornachini has been notoriously known. They remove Obstructions, not only by opening the Pores of the Skin, but the interior Ductus of the Bowels, as in those things Nitrous and Bitter, altho' they have some small astringent. They are also Absterive in degree, for those things which open the Pores and cleanse the Passages, must have a power of Attraction, and a great tenuity of Parts, moderately hot, nitrous, and bitter, and so have a power of absterging and purging the greater Passages; but some purge by lubricating, as Fat things. Some by washing and absterfion, as Whey impregnated with Sena and Beets. And some by resolving, penetrating, and pricking, as several Salts.

V. 3. SALIVATICKS. These are salivating or spitting Medicines, which resolving all the Lympha of the Body, into a pituitous or serous Substance, it is conducted from all parts of the Body to the Head, and passing thro' the salivatick Glands, is spit forth. This is only or chiefly performed by Mercury, and some of its Preparations, which melting the coagulated Juices, and carrying them with it, causes this Operation. The order of it, and how it is to be performed, is not our Business here. They who would know more of this, may see what I have said at large upon this Subject, in the Third Edition of my Synopsis Medicinæ, in my Ars Chirurgica, and in my Praxis Medica; the Second Edition of my Annotations upon Dr. Sydenham's Processus, lib. 3. cap. 28. sect. 113. ad sect. 155. to which I refer you.

VI. 4. PTARMICKS, or Errhines. These are for the most part hot and dry in the third degree, and are endowed with a very piercing Acrimony, by which they extremely irritate, or shrivel up as it were the Membranes of the Brain, (as Emetics do the Tunicks of the Stomach;) and by means whereof, the Head and Brain are cleansed or freed from their Recrements, and the viscid and pituitous Humour, or Matter, is expelled thro' the Nostrils, in a very extraordinary measure: If these Nasaes, as some call them, cause Sneezing, they are then called Sternutatories. But proper Errhines, which only attract the Recrements from the Brain, are of mighty use in curing Apoplexies, Lethargies, Megrims, Vertigo's, Epilepsies, and other Cephalick Diseases of like nature, proceeding from Cold and Moisture.

VII. 5. EMMENAGOGICKS. These are such as provoke or draw forth the Terms. They are hot in the third degree, and of thin parts, concol and digest crude Humours, extenuate and incise the Gross and Tough, and remove Obstructions, by opening and cleansing the Passages. And such are all proper Diureticks, for that they pro-

note the expurgation of the Menfes; and if they are bitter as Aloes, and fatid as *Asia foetida*, stinking Arach, &c. they are so much the more effectual; stinking things depressing the Womb, and bitter things purging it. There are also accidental Emmenagogicks, which refrigerate and humect the Body, dried by too much heat: And these things, which by their potency expel the Secundine and dead Child, as also a Mola, or false Conception, which are stinking, bitter, with Acrimony, and thinses of parts, and are to be given often, and in pretty large quantities.

VIII. 6. DIURETICKS. These are Medicaments provoking Urine. They may be either hot or cold, but moist, liquid, thin consistence, and easy penetration, that they may encrease the quantity of Urine, as it were by Accident. 2. But in things cleansing, attenuating, and aperient, they open the Passages; and these may be cold, and of thin parts, as *Sal Prunella*, which sometimes expels what sticks in the Passages; or operate after a middle-way, allaying the extrem Heat, and causing the Serum and Humours, to be more easily attracted by the Reins, and descend to the Bladder. 3. By things which cleanse the Passages, and open the same, having a Quality of extenuating gross Humours, attenuating or thinning the Blood, and separating what is extenuated from the grumous Parts, by which the protrusion of the Serum into the Reins, will be made more easy, as also its passage thro' the urinary Parts; which kind of Diureticks are hot and dry in the third degree, sharp, of very thin parts, coactive and separating. Diureticks then are of two sorts. 1. Such as conduce to the separation of the Serum from the Blood; and they are very hot, sharp, biting and cutting, whence they penetrate to the Reins, and cut the gross Humours there. 2. Such as open the Urinal Passages. And these are generally cold things, which provoke Urine, but bite not, yet have a nitrous Quality, by which they open and cleanse, as Nitre, *Sal Prunella*, Winter Cherries.

IX. 7. LITHONTRIPTICKS. These are such as break and expel the Stone, Gravel, Sand, or tartarous Mucilage; and they have a power of dissolving, cleansing and expelling the same: Being Diuretick, hot and dry, and of thin parts, sharp and cutting, and somewhat bitter. Also some do it by Incision and Deterfion, without heat, as Spirits and Oils of Nitre, Salt, Sulphur and Vitriol, some by asperity, or by some occult property.

X. 8. SUDORIFICKS, or Hydroticks. These are Medicaments provoking Sweat. They are generally hot, and of thin parts, yet some are said to be astringent and cold, working occultly: But the hot being of thin parts, are subtil and volatill, thinning the Blood and Humours, and giving them a piercing volatility; so that being forced by the native heat, excited into action, they penetrate thro' all the coats of the Vessels and Glands, thro' Fleesh, Fat and Skin, to the superficies or most external parts, of the whole Body, from the crown of the Head to the soles of the Feet, expelling all noxious Fumes, malign and venene Humours, and pestilential Miasmata, from the Center, viz. from the Heart and Vital Parts, and so defending them from their deleterious assaults.

XI. 9. VENEFICK, or Poisoning. These are things which take away Life, being wholly

inimical to Human Nature, and they are in the extremities of heat or cold; now they poison not from being in the extremes of intemperature, but from another peculiar property, by which they corrupt the Vital Juices, and by a malign and pestiferous Gas or Steem, smite both the Animal and Vital Spirits; but which Property is excited or stirr'd up into action, by those extrem degrees of intemperature. Of the Hot Kind, are Bears-foot, Hellebor, Leopards-bane, Monks-blood, Woolfs-bane, &c. Of the Cold Kind, are Hemlock, Hen-bane, Nightshade, &c. There are Poisons also which act by a Narcotick Property, as Poppies, and Opium. Add to these Poisons which do it by a Congelation of the Blood, whence proceed a Stagnation, and almost immediate Death; as the biting of a Viper, Rattle-Snake, &c. There are also burning Mineral Poisons, as Arsenick, &c. And Poisons which are only so by Accident, as Corrosive Sublimate, Spirits and Oils of Antimony, Nitre, Salt and Sulphur; which diluted and prudently given, are Salubrious and Healthful.

CHAP. VII.

Of the Fifth Qualities.

I. THE fifth Qualities of Medicaments are such as are Adductive, to wit, such as by a peculiar Property, add something to the Body, or to some of its Juices or Parts.

II. And these are such as restore, or daily add to the principal Juices and Parts of the Body, even to the whole Body, without which Human Life, or its Generative Powers, could not be conserved; and they are, 1. Chylificks. 2. Analepticks. 3. Galactogeneticks. 4. Spermatogeneticks. 5. Alexipharmicks.

III. 1. CHYLIFICKS, or Breeders of the Nutritive Juice. These are such things as conserve the natural heat of the Stomach, so that it may be able to concoct and digest the Food received in, without which a good Chylus could not be bred. They are generally hot in the second, third and fourth degrees, so that they may not only preserve but restore the Tone of the Stomach if hurt; and these are proper Stomachicks, hot, dry, and of thin parts, sharp and attenuating. But when the Stomach is over-heated, and so the Concoction is hurt, as also the Appetite in a great measure destroyed. Then cold Chylificks are to be chosen, which may allay the preternatural heat, and reduce it to its just Temperament; and these are Cotocumers, Lettice, Pw'slane, and generally Acids, as all ripe Fruits, Lime Juice, Limon Juice, Vinegar, Spirits of Nitre, Salt, Sulphur and Vitriol; all which not only allay the preternatural heat, but also excite the Appetite, and help the Digestion.

IV. 2. ANALEPTICKS, or Restorers. These are such things as breed a Restorative Chylus, which is of absolute necessity in such as are in Consumptions. The Stomach may breed Chyle, and that plentifully, yet it may not be good, or restorative; such a nutritious Juice is to be educed from those things, which have naturally in them a restoring Virtue, which as they ought to be Stomachicks,

or mixed with Stomachicks, so they ought to warm the Stomach if cold. They are hot in the first and second degrees, and for the most part of a fat or glutinous Substance, yet spirituous withall; of this kind are Meats made of Wheat Flower, as thick Milk, Hasty Pudding, also Parsneps, Turneps, Potatoes, &c. and a Liquor called Punch, thus made. Take choice Brandy, fair Water, of each a Quart, Lime Juice, a Pint, or three quarters of a Pint, double refined Sugar, a Pound; mix and dissolve: Of which the Consumptive may drink half a Pint at a time, in the Morning, just before Dinner; at four in the Afternoon; and at Bed-time. To these things you may add Milk-meats, Cheese-cakes, Custards, Oysters, &c.

V. 3. GALACTOGENETICKS. These are things which breed Milk in Nurfes. This is done partly by Meats, and partly by Medicine. For Food it is such as is Eulichmick, and Polytophick, of good Juice, and of much Nourishment, a little hotter and drier than the Blood, if it is chilly and pituitous; but more moist, and less hot, if affected with Choler. Medicaments breeding Milk, are hot and of thin parts, and of affinity to those things which gently provoke Urine. But such things as are strong, and provoke the Courses, hinder its Generation by too much eliquation of the Humours. Things also too cold, thickning, digesting, or drying, do the same.

VI. 4. SPERMATOGENETICKS. These are things generating Sperm or Seed. They are hot, and not very dry, but stultent and spirituous, and breed of the purest and most spirituous parts of the Blood; and therefore all such things as encrease a strong and good Chylus, and from thence much and good Blood, encrease the quantity of Seed. It is also stimulated by things hot, volatil, thin of Substance, penetrating and sharp; and hindered by things cold, insipid, non-nutritive, and discent.

VII. 5. ALEXIPHARMICKS, or Anti-dotes. These are Medicaments adding Vigour to the Vital and Animal Spirits, to resist and overcome Poison, and are antipathetical to it. They are hot and dry in the second, third and fourth degrees, subtil and volatil, confortative to the Stomach and Heart, and homogene with the Spirits, enlivening the Human Body. They 1. Strengthen Nature, that it may be the more able to encounter the Poison. 2. They oppose the Poison, just by its opposite Quality. 3. By their potency, volatility and expulsive force, they violently expel it. Vomits, Catharticks and Sudorificks, immediately used, and in this order, are good expedients. If in the Stomach, Vomiting. In the Entrails, Purging; but if in the Spirits, (as in the Plague) Sweating.

CHAP. VIII.

Of Preparations Galenick Internal.

Authors have made a great number of them, we have reduced them to the following ten Heads.

1. Juices.
2. Infusions.
3. Decoctions.
4. Syrups.
5. Pouders.
6. Electuaries.
7. Lozenges.
8. Pills.
9. Troches.
10. Salts Essential.

I. JUICES. 1. They are to be pressed out of Herbs, when they are young and tender, or rather, when they are just come to their flowering, because then the Juice is in its greatest Vigour, and gathered withall in a fair and dry Season. 2. They are made by beating the Roots, Herbs and Flowers, in a Stone or Iron Mortar, with a Wooden Pestle, and expressing the Juice with a Press. 3. They are either Liquid or Insipissate. 4. The Liquid are either from hot Herbs, and such as are volatil; or from cold: If from hot Herbs, they are to settle 6, 8, or 10 Hours, then to be decanted from their settlings, and put into a Glass or Bottle, putting Oil Olive upon them 2 or 3 Inches thick, to preserve them. 5. If cold Herbs, after settling, the clear is to be decanted, and clarified by boiling and scumming, or with Whites of Eggs, and then Bottled, with Oil put over the June. 6. Insipissate Juices, are never made from hot, dry, and volatil Plants, but from such as have a more glutinous or clammy Juice, such as Acatia, Aloes, Cambogium, Catechu, Comfrey, Elaterium, Liquorice, Meconium, Opium, Scammony, Sloes, &c.

II. INFUSIONS. 1. They are made from such Plants, Roots, Barks, Leaves, Flowers, Seeds, which are of hot, dry, and volatil Parts, and of such a Substance, as being rare, easily yield their Tincture. 2. They are very rarely or never made of cold Herbs and Plants, such as are of a thick Substance, and it may be Resinous withall. 3. If their Substance is thin and rare, a cold Infusion, or Digestion, (if in Summer-time) may do. 4. But if of a more compact, solid or tenacious Substance, after being reduced into a gross Powder, they are to be digested in a warm Oven, or in a Sand heat for some days, shaking the Bottle once or twice a Day; then being settled, the clear is to be decanted, and kept close stopp for use. 5. The Infusion may be made in Water, Wine, or Vinegar, according to the Design and Intention of the Physician: If in Simple Water, it is then called by the bare Name of an Infusion: If in Wine, it is called a Medicated Wine: If in Wine Vinegar, a Medicated Vinegar.

III. DECOCTIONS. 1. They are never made of hot, dry, subtil, spirituous and volatil Parts, because, in boiling, all those fine Particles would be lost. 2. Or if they are decocted, it ought to be always in an Alembick, with a Receiver luted to it, to receive its spirituous and volatil Parts, that when the Decoction is made and clarified, they may afterwards be mixed therewith. 3. The Boiling is half an Hour, an Hour, or two, more or less, according to the crassitude of the Body; as they may be either Herbs, Roots, Barks, Woods, &c. 4. It is made either in Water, Broth, Wine, or Vinegar, according to the Intention and Design; but for the most part in Water. 5. It is a Medicament for present use, and therefore there needs no Decoctions for its keeping or preservation.

IV. SYRUPS and JULEPS. They are made, 1. Of Infusions. 2. Of Decoctions. 3. Of Juices, of Herbs, Plants, Flowers, Seeds, &c. 2. Those

2. Those made by Infusion, are chiefly from Flowers, as of Balaustians, Blew-bottle, Clove-gilliflowers, Damask Roses, Peony, Peach Flowers, Poppies Wild, Rosemary, Saffron, Violets, &c. by being digested one whole Night close covered, either in the heat of a Bath, or Sand heat, often repeating the Infusion. 3. Those made by Decoction, are from such Herbs, Plants, Roots, Barks, &c. as will admit of Boiling, as we have declared in the former Section. 4. Those by Juices, are made of all your succulent Herbs and Plants, freed from their faces or impurities, by settling or clarifying with Whites of Eggs. 5. The way of making. To every Pint of clear Infusion, Decoction, or Juice, put two Pounds of Double refined Sugar, which mix together by melting only in Balneo, not at all Boiling it. 6. All Syrups will keep a Year, if kept close stopp'd in Glasses, but stop them not with Cork or Bladder, for then they will be apt to break the Glass, only bind a piece of thin Leather, or Paper, prick'd with a few small holes over the mouth thereof. 7. Juleps, are thin, or half Syrups, being made of Infusions, Decoctions, or Juices, with but half the quantity of Sugar; and these will keep but a little while, viz. 2 or 3 Months, being apt to grow sour.

V. POWDERS. 1. The Ingredients, whether Roots, Barks, Leaves, Flowers, Seeds, Rosins, &c. are to be made very dry, either by Sun, a warm Oven, or some other Artificial heat. 2. By the help of a proper Mill, they are to be ground into Powder. 3. But where a Mill is not to be met with, or it is but a small matter, which is to be reduced, it must be done by beating in a Brass or Iron Mortar, with an Iron Pestle, and then made to pass thro' a fine Searce; beating the remainder which will not pass, and searcing it, so long till it is all, or very near all pass thro'. 4. Resinous Bodies, such as Scammony, &c. will not easily be reduced without the help of a little Oil; anointing the bottom of the Mortar now and then, as also the end of the Pestle with a little Oil Olive, by which means, it will with much more ease and speed be reduced. 5. Camphir, tho' it may be reduced with a few drops of Oil; yet it is much better done, by adding to it a very small quantity of Brandy, or Spirit of Wine, and then to grind it in a Mortar. 6. All Powders ought to be kept in Glass Bottles, close stopp'd with good Corks, but rather with Glass Stoppers; otherwise they presently loose themselves, and will be good for nothing.

VI. ELECTUARIES and LOHOCHS.

1. They are made of subtil, or levigated, or fine searced Powders, mixed with Honey, or a Syrup of double refined Sugar, made into Syrup with Water or Wine, of the thickness of Honey. 2. The Proportion for a good bodied Electuarie, is 3 Ounces of clarified Honey to an Ounce of Powder, or 2 Pounds of clarified Honey, or as much double refined Sugar dissolved and reduced to the Substance of Honey, to one Pound of Powder, which are to be mixed well together, either by beating in a Mortar, or over a very gentle Heat, then to be put into Gally-Pots, and to be tyed over with White Paper and Leather, and so kept for use. 3. A Lohoch, or Licking Medicine, is only a thin kind of Electuarie, in which to every Ounce of Powder, there is to be put 5 or 6 Ounces of clarified Honey, or Sugar: These are used chiefly as Pectorals, in all Diseases of the Breast and Lungs. 4. Electuaries, (if well lookt after) will keep

nearly a Year, but Lohochs will keep twice that time.

VII. LOZENGES. 1. A thick Mucilage is to be made of Gum Tragacanth, with Water, or rather with equal parts of Water and Spirit of Wine, or Juice of Limons: This is to be thickned with double refined Sugar in very fine Powder, and beat together in a Mortar, till it comes to a stiff Paste. 2. Or fine Sugar may be dissolved in Brandy to a Candy height, and then mixed with the Mucilage aforesaid. 3. Lozenges are made either for Vomits, and then you may put to each half Dram 3 Grains of Emetick Tartar, which may be made into one Lozenge, and so the Patient may take either one, two, or three Lozenges, according to Age and Strength. 4. Or the Lozenges are Opiales, in which one or two Grains of choice Opium in fine Powder, may be mixed, to make one Lozenge of half a Dram, or a Dram, to be given as a Dose according to Age, Strength, Necessity, and other Circumstances, in vehement Coughs, Catarrhs, &c. 5. Or as Common Pectorals, against Asthma's, Wheezings, Hoarsness, Shortness of Breath, and then Powders of Liquorice, of Catechu, Cloves, Ginger, Mace, Nutmegs, &c. may be mixed with the Mucilage and Honey, or Sugar, in such proportions, as the Physician shall think fit. 6. Then being well beaten, or wrought together, the Paste is to be rowled out into thin Plates or Cakes, and so with a straight Ruler and a Knife, to be cut out into quadrangular Lozenges, which are to be carefully dried, and kept for use.

VIII. PILLS. 1. The ingredients are severally to be reduced to a subtil Powder, by first beating in a Brass or Iron Mortar, and then to be pass'd thro' a fine Searce. 2. To this Powder so much choice Honey, or some proper Syrup is to be added, as may make it (by well beating it in a Mortar) into a Paste, of such a stiffness as may be made into Pills; which Paste, is not to be so hard or stiff as to crumble; nor yet so soft as to fall flat, and not keep up the roundness of its form. 3. Some Gum-Resinous Bodies, as Aloes, Cambogia, Scammony, &c. being reduced into a fine Powder, are rather to be made up into Pills with fair Water, than with Honey or Syrup; for they will as soon dissolve in the Stomach, and keep a long time without mouldiness: But then they are immediately to be formed into Pills, as soon as the Mass is made; otherwise it will grow hard, and not afterwards to be done.

IX. TROCHES. 1. These are in form like little Cakes, much about the bigness of a Copper Farthing, beingionty designed, that Powders, which of themselves are not able to resist the intromission of the Air, might be kept a long time pure, and free from spoiling. 2. Take half an Ounce of pure white Gum Tragacanth, put to it half a Pint or more of fair Water: Let it stand warm for 24 Hours, till it becomes a Mucilage, or Gelly. 3. Take the Powders (being made impalpable) and mix with this Mucilage, by beating in a Mortar, so much as may make a stiff Paste; which rowl out into thin Plates, and with a round hollow thin edged Brass, Silver, or Steel Instrument, cut it out into little Troches, or Cakes. 4. These you are to dry either in the Sun, or a warm Oven, after the Bread is out; and being through dry, put them up into a Gally-Pot, or other proper Vessel, for use, tying

tying them over with a Paper and Leather, to keep them from the Air.

X. SALTS ESSENTIAL. 1. Take a Plant when it is full of Juice, viz. in its Flowering time, a sufficient quantity; bruise it in a Wooden Mortar, and add a pretty deal of fair Water: Boil till half be consumed: Strain the Decoction by strongly pressing it out; and then Boil it to the thickness of Honey. 2. Take this mucilaginous Magna, put it into a Glass or glazed Vessel, and set it in a cold place for 8 or 10 Days; so will a Crystall Salt arise like Sal Gem, which gather, and wash it with the distilled Water from the same Plant, which dry and keep it for use. 3. Thus is made Salt of Carduus, Magwort, Wormwood, and other bitter Herbs; but of other Herbs with much difficulty. 4. But such as yield a sweet Juice, give a plentiful quantity of Essential Salt, as the Sugar Cane: For Sugar is the Essential Salt of that Plant; so also do Figs, Raisins of the Sun, and other like sweet things; for Figs and Raisins, when old and dried, will shew some small quantity of that Essential Salt on their outskides, hard, dry, and of a white colour.

CHAP. IX.

Of Preparations Topical, or External.

THE Authors have multiplied the Titles of these Topical Preparations, yet these following are all that we think necessary for External Uses, or Outward Application.

- | | |
|---------------|----------------|
| 1. Lotions. | 5. Powders. |
| 2. Oils. | 6. Emplasters. |
| 3. Ointments. | 7. Cataplasms. |
| 4. Balsams. | 8. Clysters. |

I. LOTIONS, or WASHES. I. Washes are made 1. Of fair Water. 2. Of Infusions, or Decoctions. 3. Of Wines. 4. Of Vinegars; of which a choice is to be made, according to the Purpose or Design for which it is intended. II. The general Intentions of Lotions, or Washes, are five-fold, viz. 1. To beautify the Skin. 2. To ease Pain. 3. To discuss Tumours. 4. To cleanse old putrid Sores or Ulcers. 5. To attract or draw-forth any Poison, Venom, or Malignity, in the Part. III. First fair Water is used either simply by it self, as hot as the Patient can bear it, either to bathe with it, or to let the whole Arm, or Leg, to lie in it for half an Hour, or 3 quarters of an Hour, more or less, which repeat as need may require, twice or thrice a Day: It opens the Pores, abates Inflammations, and absterges old putrid Sores and Ulcers, making them apt for healing. Or it is used with Castile or Genoua Soap, a quarter of a Pound dissolved in 3 Gallons of it, by a gentle Heat. This opens the Pores, and absterges more potently. IV. Secondly, Infusions or Decoctions. These are made of such Herbs as are appropriate to the intention, and which the Physician

shall advise, in which also Castile or Genoua Soap may be dissolved, and may serve for easing of Pain, discussing of Tumours, &c. V. Thirdly, Wine simply of it self, is used to comfort and strengthen weak Parts, discuss Tumours, ease Pain, &c. by fomenting therewith as hot as the Patient can endure it, once, twice, or thrice a Day: And so it is of use (viz. Red Wine) to cure the falling-down of the fundament. But mixed with Camphir, a Dram or Dram and half, dissolved in a little Brandy, to a Quart of Wine, it will be yet more powerful to all those Intentions, as also to prevent a Mortification. VI. Fourthly, Vinegar, simply of it self, used hot, is excellent to ease Pain, stop Bleeding, and take away Deformities of the Skin; but used with Honey dissolved in it, it absterges putrid Ulcers, and heals Ulcers of the Mouth and Throat. If it is used with dissolved Camphir, and Saccharum Saturni, it not only cleanses the Skin, but cures most of its Deformities, and also beautifies it. These are some of the things which Lotions perform; and in imitation of these Examples, you may make a thousand others, which may have admirable Effects.

II. OILS. I. They are made 1. by Expression. 2. By Infolation. 3. By Boiling. II. Those which are made by Expression, are either Oil Olive, which if it is made out of Ripe Olives, is said to be temperate, in respect of heat, coldness, driness, or moisture; or Oils out of Nuts, as Oil of Almonds, Sweet and Bitter, of Wall-nuts, Oil of Ben, which has that Property with it, never to grow Ranc, or Oils out of Seeds, as Aniseed, Linseed, Rapeseed, &c. III. Oils by Infolation. Take Oil Olive, or rather Oil of Ben, a Gallon; of the Herbs or Flowers, or Seeds you design to make the Oil of, 24 Handfuls well bruised; mix them, cover the Pot with a Paper, and set it in the Sun (in the hottest Season) for 14 Days or more, stirring it every Day: Then having warm'd it over a gentle Fire, press out the Oil from the Ingredients in a wooden Press. Repeat this Infolation with more bruised Ingredients, three times at least; at last pressing out the Oil as before, let it stand to settle or defecate, and pour off the clear, which keep in Glass Bottles close stopp for use. Where note, that Oils by Infolation, ought to be made only of Herbs and Seeds which are hot and dry, of very thin, subtil and volatile parts, as of Cranes-bill Musked, Hyssop, Lavender, Marjoram, Mint, Rosemary, Sage, Savory, Southernwood, Thyme, &c. of Aniseeds, Carraways, Coriander, Cloves, Fennel, Mace, Nutmegs, Parsly-seed, &c. IV. Oils by Boiling. Take Oil Olive, a Gallon; of the Herbs, Flowers, Seeds, &c. bruised, 20 or 24 Handfuls: Boil all over a gentle Fire to Crispness, and press out the Oil strongly in a wooden Press. Repeat this Collion to Crispness, and expressing at least 3 times: Then letting it defecate or settle for a Day or two, decant the clear Oil and keep it for use.

III. OINTMENTS and LINIMENTS.

1. Ointments are made three ways, viz. first by making the Ingredients into an Oil by the former Section. Secondly, Of the Ingredients themselves by Infolation. Thirdly, Of the Ingredients by Collion or Boiling. 2. The first way, by making the Ointment of the Oil. Take a strong Oil made of the designed Herbs, 2 Quarts; Strasburg, Venice, or Chio Turpentine, Bees Wax, of each 12 Ounces.

Ounces: melt and mix them well together, and put the Mass into Gally Pots for use. 3. The second way, by Insolation. Take such Roots, Herbs, Flowers, Seeds, &c. which are hot and dry, of very thin, subtil and volatil parts, bruised, eight Handfuls; Hogs Lard, four Pounds: Beat them well together in a Stone Mortar, with a Wooden Pestle; put the Mass into a broad Stone or Earthen Glazed Pot, tie it over with a Paper, and insolate it for 14 Days, or for want of a hot Sun, digest it as long in a mild Sand heat, that the Lard may be all that time perfectly melted; and whilst hot, strain out the matter by pressing. Repeat this Insolation or Digestion, 3 or 4 times, in the same manner; and at length, take the expressed Substance, and add thereto; Venice or Strasburg Turpentine, Bees Wax, of each 8 Ounces: melt and mix them over a gentle Fire without boiling, and keep the Ointment for use. 4. The third way, by Coction or Boiling. Take of the bruised Ingredients 8 Handfuls; Hogs Lard, 4 Pounds, boil over a gentle Fire to Crispness, and strain out by pressing: Repeat this work 3 or 4 times; and lastly, to the expressed Matter, add Turpentine, Bees Wax, of each 8 Ounces; boil and mix, and keep the Ointment for use. 5. Sometimes Powders are added to Ointments for particular Uses, the chief of which, are of Aloes, Birthwort Roots, Camphir, Coloquintida, Opium, Rosin, Scammony, Stavesacre, Tobacco, &c. of Minerals, Burnt-Alum, Burnt-Lead, Flowers of Sulphur, Mercurius Dulcis, Saccharum Saturni, Turbith Mineral, Red Precipitate, White Precipitate, Verdigrise, &c. 6. Liniments. They are Soft Ointments, and made in all respects as Ointments are, saving, that they are generally made without Wax, or with only the half quantity of Turpentine and Wax.

IV. BALSAMS. 1. These are Artificial, and made in Imitation of the Natural, by mixing such Ingredients together as may constitute a body of equal Density or Substance. 2. Take Oil of the Ingredient you would add to your Balsam, as strong Oil of Hypericon, or strong Oil of the yellow of Orange Peels by Insolation, 12 Pints; Oil of Nutmegs by Expression, Balsam of Peru, choice Chio Turpentine, of each 4 Pounds; mix, melt over a gentle Fire, and keep it for use. 3. Take Oil of Ben, 12 Pounds; Chio Turpentine, 6 Pounds; Balsam of Peru, 5 Pounds; Oil of Nutmegs, 4 Pounds: mix and melt over a gentle Fire, and keep it close stopp'd for use.

V. POWDERS. 1. Those intended in this place, are only such as are for External use, applicable to the Eyes, stopping Blood, Wounds, Ulcers, &c. 2. They are made of Ingredients perfectly dried, and then reduced to a subtil kind of Powder, either by grinding in a Mill, or beating in a Mortar, and so passed thro' a fine Sieve. 3. Powders for the Eyes, as Alabaster calcin'd and levigated, or Lapis Calaminaris calcin'd and levigated, or Flints calcin'd, beaten and levigated; any of which Powders being blown into the Eye, consume Pearls, Films, &c. so also fine Powder of Rice, which with ones Finger may be daily and several times a day rubbed upon Films, Pearls, &c. which in time wears them off. 4. Powders for stopping Blood, are chiefly Catechu, Vitriol calcin'd with fine Bole and Camphir. Powder of Puffs or Fufs Balls, of Mans Blood, of Alcanet Root, &c. 5. Powders for digesting, cleansing, and healing old Ulcers, as Aloes, of

Rosin, of Scammony, of Tobacco, &c. which two last things are without comparison.

VI. EMPLASTERS, and CERATS, or CERECLOTHS. 1. Emplasters are made first with Oil Olive. Secondly with Hogs Lard, or some other Fat or Grease, adding the other proper Ingredients. 2. First with Oil. Take Oil Olive a Quart, some proper Gum or Gums, from 10 to 16 Ounces, Bees Wax 4 Ounces, melt, mix, and boil to the Consistence of an Emplaster. 3. Where Turpentine, and any proper Powders of Vegetables are added, Bees-Wax will be needful, and if any proper Juices be added, it is to be boiled to the Consumption of the Juices. 4. Some Mineral Powders, as Red Lead, White Lead, Litharge, &c. being added to the Oil with Vinegar, will sufficiently bring the Oil to the Body of an Emplaster, without the addition of Gums or Wax, by a pretty long boiling and constantly stirring, with a wooden Spatula till it is perfected. 5. Secondly with Hogs Lard, or some other Fats or Greases. It is made altogether as the former, save in this case it needs much less boiling, and a smaller quantity of Gums or Powders. 6. Cerats or Cerecloths. They are soft Emplasters, which will spread without melting in a Pan, or the Help of Fire; being for the most part made with Oil Olive, and in a much larger quantity. 7. The Emplaster being brought to its due Consistency, it is then made up into Rows, and so kept for Use.

VII. CATAPLASMS, or PULTICES. They are made with Oil or Fats, adding the boiled Pulps of Roots, or Figs, and the other proper Ingredients according to the Intention; as baked or boiled white Lilly Roots, Turneps, Onions, Garlic, Leeks, Comfry Roots, &c. and so bringing it to a due Consistency with Flower of Oatmeal, Barley-Flower, Orbus-Meal, Crumbs of White Bread, Milks, &c. boiling all to a due softness. 2. Some Pultices are made to disperse Tumors which will not probably break; some to ease Pain, some to allay Inflammations, and some to Maturate Tumors which tend to breaking; so that according to the Intention of the Cataplasim, such ought the Ingredients to be, to answer the same. 3. It ought to be laid on as hot as the Patient can well endure it; and to be renewed 2 or 3 times a day, or as often as the Nature of the Malady afflicting requires it.

VIII. CLYSTERS. 1. They are Liquids made with Posset drink, or Meat Broths, with the addition of such other Ingredients as are proper to the Intention of Cure. 2. The chief Purposes for which they are used are, First, to ease Pain in the Bowels from the Colick or sharp Humors. Secondly, for the Cure of Fluxes of the Belly, and Bloody Fluxes. Thirdly, to remedy Costiveness, Fourthly, to purge the lower Bowels. 3. Clysters for easing Pain, are made with Carminative Decoctions adding half, 3 quarters, or an Ounce of Strasburgh Turpentine, well mixed with 1 or 2 Yolks of Eggs, and then with the Decoction, and so exhibited something more than Blood warm. 4. For the Cure of the Bloody Flux, or other Fluxes of the Belly, to a strengthening Decoction in Whey, a quarter Part of Brandy ought to be added, and the Clyster to be several times repeated: If the Flux is inveterate, and not easy to be stopp'd, 6, 8, or 10 Grains more or less of Laudanum, ought to be dissolved in the Brandy and mixt with the Decoction. 5. For an extream Costiveness. The Clyster ought to be made of Lubrificatives, as a Decoction of Althea Roots, in

which a small quantity as 2, or 3 Drams of Castile, Genoa, or Venice Soap ought to be dissolved, or a quarter part of Oil to be mixed therewith, well seasoned with Table Salt. 6. For purging the Belly and giving Stools. It may be made of Carminative Decoctions, or Meat Broths, or Posset-drink; to a Pint of which, a quarter of a Pound of brown Sugar or Honey, and half an Ounce, of Salt are to be added, and dissolved in the same, without the Addition of any Oil; because Oil will Obtrude the points of the Salts, and so hinder the Operation or Working. 7. As to the Quantity to be exhibited at a time, to little Infants, give a quarter of a Pint or 6 Ounces; to Children from 5 to 10 Years Old, half a Pint; to bigger Children from 10 to 16 Years Old, 3 quarters of a Pint; to Men and Women, from a Pint, to a Pint and half.

C H A P. X.

Of Preparations Chymical.

THE chief Chymical Preparations, as they may have respect to this present Work, are these ten here enumerated, viz.

- | | |
|---------------|-------------|
| 1. Essences. | 6. Oils. |
| 2. Tinctures. | 7. Balsams. |
| 3. Extracts. | 8. Powers. |
| 4. Waters. | 9. Elixirs. |
| 5. Spirits. | 10. Salts. |

I. ESSENCES. 1. By Essences here, we do not mean those highly rectified and sublime aetherial Chymical Oils, which Perfumers and others use, and so call, but another Preparation which is taken from the whole Substance of the Plant. 2. Take Angelica, Bawm, Mint, or any other like fitting Herb; beat it in a Marble Mortar with a Wooden Pestle, to a Pulp or Mass; put it into a Matrass or Bolt-head, which Seal up Hermetically, (or otherwise stop it up with Cork dipt in Wax, then closed fast with Sealing-Wax, and after that luted over) set it to digest in a Horse Dungbil, or some other analogous Heat, as Balneo, Sand, &c. for 40 or 50 Days; so will the whole be reduced almost to an uniform Substance: Afterwards take out the Matter, which is now more liquid than it was before, or reduced into a Liquor; which press from the Facces. Digest it again in a gentle Balneo, that the remaining grosser parts may subside: decant the clear Liquor, or filter it thro' Brown Paper, or Cotton, in a Glass Funnel. And from the former Facces, being dried and calcin'd, extract a fixed Salt, which add to the filtrated Liquor. This is Le Febure's Essence of Plants; and may be given in any proper Vehicle, from one Spoonful to two, or three. 3. Some add to this Essence, when it is for long keeping, to every Quart, a quarter of a Pint of the best Brandy, or Spirit of Wine. 4. But if you would exalt this Essence to a higher degree of purity and excellency, the said Le Febure proceeds thus. Take of the former Essence, Water of decipitated common Salt, made

per deliquium, of each equal parts; put them into a Matrass or Bolt-head, which Seal up Hermetically, or stop up as before: Digest in the Sun, or in Balneo, or a Sand heat, for 40 or 50 Days more, so will this saline Liquor, without any other Operation, separate all the heterogeneous and slimy Matter, or Substance, which hinder its purity and exaltation: And there will swim upon the top, the pure exalted Essence of the Plant, either green and transparent as an Emerald, or of a reddish color, according to the nature of the Plant, which separate and keep for use. This exalted Essence, may be taken from half a Spoonful to a Spoonful, Morning and Night, in a Glass of Canary, or other proper Wine. 5. The Essences of Cold Herbs. Take the whole Plant well beaten in a Mortar, Juice and all; add to it an equal quantity of Spirit of Wine, or Brandy: put them into a very large Bolt-head, which stop close as aforesaid, so that nothing may breath forth: set it to digest in Horse-dung, or its equal heat in Balneo, or Sand, for 40 or 50 Days, or more; then strain out all the Liquor by hard pressing; which put into the Bolt-head again: being stop close up as before, digest in a gentle Sand heat for 40 or 50 Days more; so will the Essence meliorate, supernate the Facces, and grow fine; which decant and keep for use, adding to it the fixed Salt of the Pressings. Dose from one Spoonful to three, in some proper Vehicle.

II. TINCTURES. 1. There are several sorts of Tinctures, which are to be drawn out with such Menstruums, as are most proper to the Disease afflicting; the chief of which are these four following. First, A Spirituous Tincture. Secondly, An Acid Tincture. Thirdly, An Oily Tincture. Fourthly, A Saline Tincture. 2. The Spirituous Tincture. Take any Root, Bark, Wood, Herb, Flower, or Seed, being dried, and reduced into gross Ponder in a hot Iron Mortar, with an eighth part of Salt of Tartar or Pot-Ashes: affuse thereon, in a large Matrass, the best rectified Spirit of Wine, so much as may over-top the Ingredients 4 or 5 Inches, shake them well together, and stop the Vessel very close: digest 20, 30, or 40 Days, (the longer the better) in a place naturally warm, or in a gentle Sand heat, shaking the Vessel once every Day: then decant the clear Tincture, and keep it close stop for use. Dose 1, 2, or 3 Drams, if prepared from Alteratives. 3. The Acid Tincture. The Ingredients being prepared as in the former, affuse thereon the dulcified Spirit, either of Nitre or of Salt, Sulphur or Vitriol, so much as to supernate 4 or 5 Inches: digest as before, then decant the clear Tincture, and keep it in a Glass close stop for use. Dose from 40 to 60 Drops, or so much as to give the Vehicle a little acidity. 4. The Oily Tincture. Take the Ingredients as before directed to be prepared, which put into a Matrass, or Bolt-head, and affuse thereon pure aetherial Oil of Turpentine, so much as may over-top it 4 or 5 Inches; stop it close up, and digest only in a warm heat for 14 or 21 Days, shaking the Vessel once every Day: strain out the Tincture by pressing; let it stand till it is fine, and then decant the clear, and keep it for use. Dose from 6 to 12, or 18 Drops; first dropt into Sugar, and then mixt with any proper Vehicle, and so taken. 5. The Saline Tincture. First make the Spiritus Intimus thus. Take Spring Water, 6 Quarts; choice Pot-Ashes, 2 Pounds; Sal Armoniack, one Pound: mix, digest

digest close stopp 3 Days, strain, filter, and keep it for use. Then take the Ingredients as before prepared, which put into a Matrafs or Bolt head, and affuse thereon of the former Spiritus Intimus, as much as may over-top the Ingredients 4 or 5 Inches: digest cold (being close stopp) for 2 or 3 Days, shaking the Vessel twice a Day; let it settle for one or two Days; decant the clear from the Faces, which filter thro' Brown filtering Paper, and keep it in a Glass close stopp for use. Dose from half a Dram, to 1 or 2 Drams; Morning and Night, in a Glass of Canary, or some other proper Vehicle. Where note, that by this Menstruum, you may extract the Tincture from any Root, Bark, Herb, Flower, or Seed, as well green as dry, and that in a manner extemporanee.

III. EXTRACTS. 1. Take the Spirituous Tincture of any thing you design to have the Extract of; put it into a Bolt-head, with its Alembick and Receiver, and luting the Joints well; by a gentle heat abstract the Spirit in Balneo; the Magma at bottom is the Extract. 2. Extracts are either soft, fit either to be dissolved in any proper Vehicle, or to be made up with Powders, if very soft, into an Eleduary, but if of a more thick body, to be made with Powders into Pills: Or they are of a solid body, so that they may be formed into Pills of themselves, without any addition. 3. And therefore according to the consistence you design the Extract to be of, to such a degree you must abstract the Spirit. 4. The abstracted Spirit is something more than the simple Spirit of Wine, and may very well be called the Spirit of that Ingredient, or Matter, of which the Extract is made, and contains some of the most volatil Spirits and Particles thereof.

IV. WATERS. 1. They are Distilled in Common Stills, putting good Store of Ashes underneath, to avoid an Empyreuma, or Smell and Taste of Burning; or in an Alembick, in Balneo. 2. If you Distil in an Alembick, it will be good that the Roots, Herbs, Flowers, be bruised, and by adding common Salt, or Leven, to be mixed with them to be digested; then putting Spring Water to them, to Distil them in an Alembick with its Worm or Refrigeratory, till the change of the Taste shews the Virtue to be drawn off, separating the Oil if any be. 3. By adding the Salt or Leven, or Yest, and digesting the Herbs therewith, till they have a kind of Winey Smell; by which means the Water is made twice or thrice as strong, and Smells much stronger of the Herbs, Flowers, &c. 4. Waters from dried Herbs. Let them be cut and infused a while in hot Water, and digested with Salt, Leven, or Yest, and then distilled in Balneo; and if it be cobobated upon more dried Herbs, it will be so much the better and more noble. 5. Waters from tender Herbs and Flowers, and from cold Plants, are distilled in Balneo, with Cobobation upon fresh Herbs. 6. Waters from hot Seeds, Spices, &c. beat or bruise them grossly, infuse them in a little warm Water; then distil them by a Copper Vesica, Tin'd within: You may also steep them in Wine, so will the Water be more excellent, with some Oil. 7. If from green Roots or Barks, bruise or shave them; but if from dried Roots, Barks, rasp them, or grossly beat them in a Mortar, and infuse them in a little warm Water, &c.

V. SPIRITS. 1. Take the Herbs, Flowers, &c. beat them in a Mortar, and Pickle them

with Salt, in an Earthen Vessel, by mixing the Salt therewith; put all into a well glazed Earthen Jar, pressing them well down: stop the Vessel very close, and put it into a Cellar for 3 or 4 Months, till they have a sharp or Wine-like Smell; then distil in a Vesica, in Balneo, or Sand, or Ashes, to drincks: cobobate the Spirit and distil again, after which rectify it in a Glass Matrafs, in a gentle Balneo, or Sand-heat. 2. Spirits from Juices. Beat the Roots, Herbs, Flowers, Fruits, if Juicy, and press forth their Juice: But if they be not Juicy, sprinkle hot Water on them, and then express the Juice. Steep in this Juice fresh Herbs, and press out again, which work repeat till you have Juice enough; this Juice ferment with Sugar, Leven, or Yest, dissolved in a little Water, and then distil it as before. Where note, that the Fermentation of the Juice, is best done in Wooden Vessels. 3. Spirits from Fruits which have a Pulp, as Black Cherries, Elderberries, Goosberries, Mulberries, Raspberries, Strawberries, &c. Either make a Wine of them, which let grow a little Acid; and distil it as before directed, or as you distil Brandy, or Spirit of Wine from Wine: Or else take their Pulp, freed from their Stones or Kernels, to which put warm Water, to make it thin; then with Leven, Yest, or Sugar, dissolved also in warm Water, cause them to ferment; after which distil. 4. Spirits from hot Seeds, Spices, &c. Bruise them well, and macerate the Mass with Wine, cause them to ferment with Leven, &c. and then distil; so will you have a Spirit mixt with a great deal of Water: cobobate and distil again, so will the Spirit be much better; which after separate from the Water by Distillation: reserve the Spirit by it self, and the Water by it self, as Water of the same Seeds, Spices, &c.

VI. OILS Distilled. 1. Oils from green or dry Roots, Herbs, Flowers. Bruise them well in a Stone or Iron Mortar, digest them 14 days or more in Water, and let them putrify; then distil by a Vesica with a great Fire; so will you have Water and Oil come over, which you are to separate. 2. If you distil Oils from Angelica, Anise, Bawm, Caraway, Dill, Fennel, Lavender, Marjoram, Mint, Origanum, Pennyroyal, Rosemary, Sage, Savory, Southernwood, Thyme, Wormwood, and the like hot Herbs: It is to be done when in Flower, and you are only to take the upper Branches with the Flowers, for then they yield the greatest plenty of Oil, and those parts of the Plants the most; the Leaves, Stalks, &c. little or none at all. 3. Oils from hot Seeds, as Annise, Cardamoms, Cubebs, Caraways, Coriander, Dill, Fennel, Mustard, Parsly, Rocket, &c. Bruise them grossly, affuse on them hot Water; add some Salt, or Crude Tartar in Powder, digest 10 or 20 Days, then distil with a Copper Vesica, with its Head and Receiver well luted; so will you have Water and Oil together, which you are to separate, keeping the Oil by it self; and the Water for Aniseed Water, Cardamom, Caraway Water, &c. 4. Oils from Roots being dried. Bruise them well, or beat them into gross Powder, digest them with Water and Salt, then distil: cobobate the distilled Water, digest and distil again; separate the Oil from the Water: and in that Water, digest more fresh Roots, and so on continually. 5. Oils from Citrons, Limon, and Orange Peels. Let them putrify or rot; add Water to them; then distil them as the former Roots, so will you have Oil and Water, which separate. The Water may be used
in

in like manner to more prepared Peels. 6. Oils from Spices. Bruise them grossly, (for Powders yield less Oil;) digest them 8 or 10 Days in the Menstruum you intend, adding Nitre, Salt, or Tartar: then distil in a Vesica; so will you have Water and Oil, which separate: cohobate the Water upon the Faces several times, so will all the volatil Oil ascend: The Water reserve to make more Oil with, upon fresh Spices. The weighty Oils (as of Cinamon) will separate from the Water, in 14 or 16 Days, by sinking to the bottom. 7. Oils from Aromatick Woods, as Cassia Lignea, Cedar, Cypress, Juniper, Rhodium, Sanders Yellow, Sassafras, Xyloaloes, &c. Take their raspings, or let their Chips be exceedingly well bruised in an Iron Mortar, which digest a good while in Water, then distil by a Vesica: cohobate, and continue distilling for some Days; at length the noble odoriferous Oil will come forth very subtil and volatil. 8. Oils from Rosins, Turpentine, &c. Add to them a good quantity of Water, and distil by a Vesica; so will you have Water, and an Oil swimming upon it, (which Oil is called Spirit;) continue the distillation, and by degrees it will be Yellow; then change the Receiver: Separate this yellow Oil, and keep it by it self, distilling till no more appears. This is called Oil. The Matter remaining is called Colophony. 9. The Rectification of Chymical Oils. They are rectified by distilling them by a Cucurbit, or Vesica, with much Water; so will the pure aetherial Oil ascend, with some Water, which separate. They are also rectified in a Bolt-head, with its Receiver, in which the pure aetherial Oil will ascend, the thicker Substance remaining at bottom.

VII. BALSAMS. 1. The true difference between Chymical Oils and Chymical Balsams lies chiefly in two things, viz. first the Oil contains the principal or chief of the sublime and volatil parts. Secondly, That it is of a thicker Consistence or Substance, than the Balsam; which as this latter is less subtil and thicker, so it is more fit for old Sores and Ulcers. 2. Hence it appears that as Oils are the more thin, pure, and aetherial parts, so they rise first in Distillation, from the Matter they are separated from; but the Balsam is that other thicker Oily Matter, which by the force of a stronger Fire, ascends next after the former pure, aetherial, volatil Oil is drawn off, which as it is of a thicker body, so it is also of a deeper color. 3. Balsams Chymical, are oftentimes also made in Rectification of Chymical Oils; when drawing off the thin, subtil, volatil Parts, or Oil, the thick Balsam is left at bottom. 4. But they are properly Balsams which (the thin Oil being drawn off in a Vesica) are afterwards drawn from the Colophony by a Retort. 5. Take the Colophony remaining after the Oil is drawn from Rosins and Turpentine; put it into a Retort, and distil with a gradual Fire, first soft and gentle, then greater, and so encreasing the Heat, till the Colophony has given up all its Oily or Balsamick parts, which will be of a body thick and red. And this is that which is properly called Balsam; which if it be rectified again in a Glass Retort, in a Sand-heat, will be much more fine and pure.

VIII. POTESSTATES, or POWERS.

1. Take the rectified Spirit of the Plant, suppose of Mint, or Pennyroyal, a Pint; Chymical Oil of the same Plant, an Ounce, or so much as the Spirit will absorb, or swallow up: mix them together, and keep them for use. 2. But if you take the

fixt Salt of the same Plant, and grind it with an equal quantity of the volatil Salt Armoniack, subliming and re-subliming, so long till the fixt Salt ascends with the Volatil; and add 2 Drams thereof to the former mixture, it will be so much the more powerful to all the Intentions for which the said Potesstates are used. 3. And many times for want of the particular Spirit of the Plant, whose Powers you would make, the best rectified Spirit of Wine is used as a Succedaneum; to which may also be added, if you please, the volatilized Salt of the same Plant, or a volatil Salt of Tartar.

IX. ELIXIRS. 1. An Elixir is the sulphureous Tincture of any Vegetable, drawn out of the dried Vegetable, (ground grossly with Salt of Tartar in a bot Mortar) with the rectified Spirit of the same Vegetable. 2. Or thus. Take any dried Herb or Plant, beat it into gross Powder, which put into a Matrass or Bolt-head: Take the Powers of the same Plant, six Pints, rectified Spirit of Nitre, 12 Ounces: mix, and digest for 10 Days, affuse so much of this Mixture upon the former Powder, as may supernate 4 or 5 Inches: digest cold for 20 Days, shaking the Glass every Day; then decant the clear Liquor, and keep it for use. 3. But you are not always necessitated to use Spirit of Nitre; but may in place thereof, as the nature of the Disease may require, take Oils of Salt, of Sulphur, or of Vitriol, and digest with the Powers as above directed. 4. Again, by Infusion of any Vegetable (suppose Rosemary) in Powers of the same, acuated with Oil of Salt, and Salt of the same, you shall have the Elixir thereof.

X. SALTS. 1. Salts Chymical are either Volatil or Fixed: And tho' all Plants have indeed a volatil Salt, yet the most of them having but little, and that little very difficult to be gotten, Authors have taken little or no notice thereof: Those which really abound with it are but few, of which Beans, Pease, and Tartar, are chief. The way of making their Volatil Salts, we shall not declare here, having taught it fully and at large in their proper places, in the following Book. 2. Fixed Salt of Vegetables is thus made. First burn or calcine the Herb you would make a Salt of, into white Ashes, yet avoiding a too fierce or hasty Burning, lest it should vitrify. Boil these Ashes in fair Water, to make a Lixivium of them; which filter thro' filtering Brown Paper, by help of a Glass Funnel. This filtered Liquor Boil in a Glass Vessel, with a gentle Fire, to the consumption of all the Water; so will the fixt Salt of the Plant be left at bottom. 3. If the Salt be not purely White and Fine, you must dissolve it again in more fair Water; filter and coagulate by an absorption of the Water; which work you are so often to repeat, till it is freed from all Impurity, and is very White. 4. These alcalious Fixt Salts, are very apt to melt in the Air; but if they be first calcined with Sulphur, it much preserves them from that Accident, and makes them withall somewhat more grateful to the Palate.

CHAP. XI.

Of the Virtues of Medicines.

I. **T**HAT some Plants Heat, some Cool, and some Dry, and some Moist, is manifest; and this is from their First Qualities, which are found out, first by their Taste. Secondly, by their Smell. Thirdly, by their Operations, or Effects. Fourthly, by Experience.

II. **T**HAT some Plants open Obstructions, and some stop, as in Catarrhs and Fluxes of Blood; some Bind, and some Relax; some Attract, and some Repel; some Mature, and some Absterge, &c. These Virtues, which are their Second Qualities, they draw from their First Qualities, but are more perfectly known and found out by Experience, and a continued Series of Observations.

III. **T**HAT the Appropriation of Medicaments to the several principal Parts of the Body, has been found out partly by their Signatures, and partly by Experience, and sometime by both of them together: And so this Appropriation of them to the Head and Brain, Nerves, Stomach, Lungs, Pleura, Heart, Liver, Spleen, Mesentery, Reins, Womb, and Joints, is called their Third Qualities.

IV. **N**OW IF a Plant is hot and dry, it naturally follows, that it must resist and be helpful against Diseases, proceeding from cold and moisture: So also if a Plant is cold and moist, it must resist and be helpful against Diseases proceeding from heat and dryness: The same may be said of Plants hot and moist, or cold and dry, which doubtless resist, and are helpful against Diseases proceeding from the opposite Qualities.

V. **T**HIS being said, if we consider what Diseases afflict those principal Parts of the Body, and from what Causes they proceed; it follows that those Plants, which are endowed with those First Qualities, and which are in the predicament of the Third Qualities, must generally resist and be auxiliaries in the Curing those Distempers, afflicting those particular Parts; and therefore in giving you the Virtues of the Medicament, tho' there are in almost every Plant, and in the Variety of their Preparations, a great number of Diseases enumerated, against which they be Good or Helpful, yet we do not intend thereby, that they are Specificks, and absolute Cures for all the Diseases there named, but chiefly helpful against the same; and in Compositions framed against such Maladies, may as a Vis duplicata, add to their Force and Effects.

VI. **A**S FOR Example, take Angelica, Lavender, or any other Plants, which are hot and dry in the second, third, or fourth degrees, as to their First Qualities; and which are appropriated to the Head, Brain, and Nerves: We say that those Plants, and their Preparations, are good for and helpful against all the Diseases of those Parts, proceeding from cold and moisture, and accordingly we enumerate them, as Catarrhs, or Defluxions, Megrims, Vertigo's, Apoplexies, Epilepsies, Lethargies, Carus, Coma, Palsies, Cramps, De-

fluxions into the Eyes and Nose, heaviness of the Head, weakness of the extrem Parts, thro' the hurts of the Nerves, &c. more especially if the Habit of the Body be cold and moist too. These and other like Diseases of those Parts, proceeding from a cold and moist Cause, we say, these and the like Plants are proper for, and helpful in their Cure, tho' we do not say they will absolutely do the Work: And yet a great deal is to be said, if Alteratives be given in a full Dose, assiduously used, not by fits and starts, and continued for a good length of time; for so Nature acts in conjunction with the Medicine, and the Cure is performed and perfected at length, which otherwise could not be either expected or hoped for.

VII. **A**GAIN, those Plants which are in the Fourth Qualities of Medicines, are Abstractive, which abstract or take away all superfluous Humours, Recrements, and Excrements out of the Body, its Ventricles, or principal Viscera, and Vessels, which are Emeticks, Catharticks, Salivaticks, Ptarmicks, Emmenagogicks, Diureticks, Lithontripticks, and Sudorificks, and these are said to be Curative, at least helpful in Curing all Diseases of Repletion.

VIII. **T**HE KIND of the Abstractive is to be chosen, according to the site of the Part, or Parts afflicted; and nature of the Diseases afflicting. So if it be the Head, stuffed with pituitous, cold and moist Humours, Ptarmicks are to be chosen: If the Stomach, by Surfs, Fulness, Obstructions, sharp Humours, &c. then Emeticks. If the Entrails, with sharp Humours, Colicks, Worms, &c. then Catharticks. If all the Juices of the Body are contaminated, as in the French Disease, Leprosie, Leuce, Elephantiasis, &c. then Salivaticks. If the Womb be obstructed, or the Courses stop, then Emmenagogicks. If there be a repletion of Urine, thro' an Obstruction of the Reins, and Urinary Vessels, then Diureticks. If Gravel, Stones, &c. in Reins or Bladder, then Lithontripticks. If Universal Obstructions over the whole Body, with a repletion of Watery Humours, as in Dropsies, then Catharticks first, and Sudorificks afterwards.

IX. **A**ND SO the Diseases proceeding from Repletion, are enumerated according to the Part or Parts afflicted; and accordingly the proper Abstractive are applied, which taking away the superfluous Humours, or Recrements, causing, or some ways contributing to those Diseases; those particular Medicaments according to their Kind, are said to cure, or be helpful, or contributory to the removal, or cure of those Diseases.

X. **T**HOSE HERBS, or Plants, which add something to the Body, or its principal Parts, are in the Fifth Qualities of Medicines, and are Adductive, and said to cure, or be helpful in curing, all Diseases of Ablation, viz. such Distempers as are caused from the want of some Nourishment, Juices, or Humours, in order to the conservation of the whole Body, or of some particular and respective Parts: And so they are said to be Chylificks, Analepticks, Galactogeneticks, Spermatogeneticks, and Alexipharmicks; that is to say, to cure, or to be helpful in curing, all Diseases and Weaknesses, caused by a deficiency of what Nature requires, for preservation of the Body and its Principal.

XI. **A**ND THEREFORE the Kind of the Adductive

is to be chosen, according to the nature of the Matter deficient, the Parts affected and the approaching Evils to be feared: So if the Tone of the Stomach is hurt, that it cannot breed good Chylus, whereby an Atrophy or Pining may be feared, Chylificks are to be administered, which are withall Stomachick, or Stomachicks are to be added to them. If a grand Wasting of the Flesh be, as in a Phthisis, or deep Consumption, Analepticks are of use. If a deficiency of Milk, then Galactogeneticks. If a deficiency of Seed, then Spermatogeneticks. If Poison be taken, then the Vital Powers are to be strengthened and augmented by Alexipharmicks.

XII. AND SO the Diseases proceeding from Abilation, are enumerated, according as the whole Body, or its Parts may be affected, and accordingly the proper Adductives are chosen; which adding to Generating, or encreasing the Nutrient, or Juices defective, are said either to cure, or some ways contribute to the cure, of the prevailing Illnesses, either present, or intruding upon the Patient.

XIII. THIS IS the Method, joined with Experience, [and a long Series of Observations, thro' all preceeding Ages from the first beginnings of the Art of Physick, by which the Virtues of Medicaments have been investigated and found out; and according to which, the Virtues ascribed to Herbs and Plants in this our Herbal, are rationally to be accounted for.

CHAP. XII.

Of Doses, Uses and Application.

I. THE DOSES of Alteratives. 1. Pouders, if temperate, or hot, or cold in the first degree, may be given from one Dram to two Drams; in the second and third degrees, from half a Dram to a Dram, or more: In the fourth degree, from half a Scruple to half a Dram. 2. Infusions, Decoctions and Waters, from two Ounces to four, six, or eight. 3. Extracts, from one Dram to two Drams. 4. Electuaries, from one Dram to four, or half an Ounce. 5. Elixirs and Powers, from 30 Drops to 60, or 80 Drops. 6. Clysters, a Pint at a time to a Man or Woman; but to Infants and Children, from a quarter of a Pint to half a Pint.

II. DOSES of Abstratives. 1. Emeticks, if of Antimony, as Tartar Emetick, from three Grains to eight: If Infusions of Crocus Metallorum, Vitrum Antimonij, or Regulus Antimonij, from half an Ounce to an Ounce; and if strong, from an Ounce to an Ounce and half, or two Ounces: Emetick Decoctions of Herbs, from half a Pint to three quarters of a Pint, or Pint. 2. Catharticks, if Pouders, from a Scruple, or half a Dram, to a Dram, or Dram and half, according to the strength of the Species, and the Age and Strength of the Patient; the Strongest may be given from half a Scruple to half a Dram. 3. Lenitive Electuaries,

from half an Ounce to two Ounces: Purging Electuaries, from half an Ounce to an Ounce.

4. Purging Infusions and Decoctions, from an Ounce to six Ounces, according to their Strength; the Strong, from an Ounce to four Ounces; the Strongest, from an Ounce to two Ounces. 5. Purging Extracts, from half a Scruple to two Scruples. Purging Pills, from a Scruple to a Dram. 6. Purging Salts, from half an Ounce to an Ounce, or Ounce and half. 7. Salivaticks, according to the Discretion of the Learned Physician. 8. Emmenagogicks, if Infusions or Decoctions, from a quarter of a Pint, to half a Pint, or more. If Tinctures or Elixirs, from two Drams to three Drams, or half an Ounce. 9. Diureticks and Lithontripticks, if Pouders, from a Dram to two Drams: If Infusions or Decoctions, from a quarter of a Pint to half a Pint, or more: If Salts, from ten Grains to a Scruple, or half a Dram. 10. Sudorificks, if Infusions, from half a Pint to three quarters of a Pint, or more: If Electuaries, from a Scruple to a Dram, two Drams, four Drams, or an Ounce. But if an Opiate, you must be regulated according to the quantity of Opium which is in it. If Salts, from half a Scruple to half a Dram.

III. BUT IN ALL these Cases you are to observe, that these Rules, nor any other, can be absolutely General, but that different Accidents which may be, as to the Age, Habit, and Strength of the Patient, Recency or Inveteracy of the Disease, together with the different Strengths or Weaknesses of the Medicine, may cause some Exceptions, or particular Cautions and Observations necessary to be known, and which we could not comprehend in these general Directions; so that notwithstanding the Limitations of these Doses in this place, they must be proportioned from hence, according as the Accidents may be, in respect both to the Patient and the Preparation; giving to Grown Persons the larger and more compleat Doses; whilst to Weak Persons, Children and Infants, they are to be diminished, according to their Weaknesses, Disabilities, and tender Years.

IV. THE USES of Internal Medicaments: And they are to be considered, 1. As to the Time of Giving. 2. As to the Way and Manner of Giving. FIRST, as to the time of Exhibition, Alteratives may be given in the Morning Fasting; but without doubt, all Aperitives are best given at Night, (but upon an Empty Stomach) because there will be the less fear the next Day of taking Cold. Catharticks and Emeticks, are best given in the Morning, because as the Stomach is then most Empty, so they will the easier all upon the Offending Matter, and the sooner Operate; besides, the better Attendance may be given, in the time of their Working.

V. SECONDLY, As to the Way and Manner of Giving them. And this is taken for the most part from their Form. 1. Waters Distilled, Syrups and Juleps, are used chiefly as Vehicles, to convey other things down the Throat in. 2. Infusions, Decoctions and Wines, are generally given by themselves, dulcified with White Sugar, or some proper Syrup. 3. Effences and Juices, are generally mixed with some proper Syrup, or with Wine (as the nature of the Disease may require) sweetened with White Sugar, Honey, or Syrup. 4. Tinctures, if Spirituous, Acid, or Oily, are almost always given in a Glass of dulcified Wine.

But

But Saline Tinctures, are generally given in some Diuretick Decoction, sweetned with Syrup of Althæa, or of Parsly, Winter Cherries, &c. 5. Powders and Extracts, if soft, are made into Bolus's with Honey, Pulp of a Rosted Apple or Pear, or some proper Lohoch. 6. But Extracts, if stiff enough to be made into Pills, (while Recent) are swallowed as Pills by themselves: If kept till they are hard, they will scarcely dissolve in the Body, but must be reduced to a soft Electuary. 7. Troches, are to be reduced into a Powder, and made into a Bolus with some proper Syrup, or Honey. 8. Lozenges are held in the Mouth, and swallowed down only as they melt. 9. Electuaries are swallowed either as a Bolus, or dissolved in some proper Infusion, Decoction, or Wine, sweetned with some Syrup, Honey, or Sugar. 10. Pills are swallowed by themselves, washing them down with some proper distilled Water, Infusion, Decoction, Wine, Julep, Posset-drink, or Broth. 11. Spirits are dulcified with some proper Syrup, or mixt with Wine sweetned with Syrup, or White Sugar, and so taken. 12. Potestates and Elixirs, are always given in a Glass of dulcified Wine. 13. Oils and Balsams, are always dropt into soft White Sugar, and so well mixt with it, then put into a Glass of some proper Wine and so drank. 14. Salts Essential, Elementary, or Fixt, and Volatil, are generally dissolved in some proper distill'd Water, Infusion, Decoction, or Wine, and dulcified with Syrup, Honey, or Sugar, and so swallowed.

VI. THE APPLICATION of Topicks or Externals. 1. Lotions are either for Bathing in, or for Washing old Sores and Ulcers; for Gargarisms, for Sore Mouths and Throats; or for Injections into Fistula's, the Yard, or Womb, to be used with proper Syringes. 2. Oils, they are to be anointed upon the Parts affected, rubbing them well in, Morning and Night, or two or three times a Day. 3. Ointments and Balsams; these may be anointed withball; also they are spread upon Pledgets, and applied to Green Wounds, Old Running Sores and Ulcers. 4. Powders; these are either mixed with some Ointment or Balsam, and so applied; or simply strewed upon the Wound, Sore or Ulcer. 5. Emplasters and Cerates, are to be spread upon supple Cloth or Leather, and so applied simply upon the naked Tumor, Wound, Sore or Ulcer, or laid over Pledgets, dress'd or arm'd with Balsam, to keep them on. 6. Cataplasms are put upon Cloth or Leather, to be applied to Tumors and Apostems, to discuss, soften or suppurate. 7. Clysters are to be used either with a Clyster-Pipe and Bladder, or with a Clyster-Syring, to force it up the Intestinum rectum, by the Anus.

VII. WHERE NOTE, that Clysters are either Anodyn, or Healing, or Purging: If Anodyn, some choice Opiate is dissolved in it. If Healing, they are mixed either with Spirit of Wine, or some Oil, Balsam, or Liquid Rolin. But if Purging, they have always a proportional quantity of Brown Sugar in them, with some Common Salt; but no Oil or Oily body by any means, because they always blunt the points of the Saline Particles.

CHAP. XIII.

Conclusion of the Introduction.

I. **THUS HAVING** given you a short Explanatory Introduction to our History of Plants, without the Knowledge of which, this Work could not well be understood, and upon which principles a great part of the Practise of Physick is founded and built; the Observation of which, is truly a practising according to Art, and not a going hand over head, and a doing of things at all adventures, as Empiricks do, by which the Life of a Patient is not only put into Danger, but by such Empirical Practises, a thousand Miscarriages are daily committed; to the great prejudice of the Sick, and disreputation of the Medical Arts.

II. **MANY GREAT** things have been performed by simple Medicines and Preparations; and by that prime and simple Practise, the Qualities and Virtues of Simples were first investigated or found out. This was the first step of Art. Afterwards when the Faculties and Virtues of many things were discovered, the succeeding Practisers began to add one thing to another, which they thought to have like Virtues; believing, that two things of equal strength being join'd, the Power and Force of that Medicine must be doubled; and indeed it many times succeeded according to expellation.

III. **FROM THESE** beginnings, Artifs began to redouble their Forces, and to multiply Ingredients; making continually Complex Compositions, and from the belief of a Vis unita, to form Compounds, which in process of many Ages, became a Magazine or Store-House, as it were, of Remedies for all Diseases; which they formed into a method of Prescriptions, and under proper Titles, and particular forms of Preparations; they made at length a Repository for general Practise, consisting of a great number of Prescripts, serving for all Indications, and for the Cure of the most common and reigning Diseases; which they called by the name of a Pharmacopœia or Dispensatory.

IV. **THUS THE** Medical Arts, under this natural and primitive Simplicity, continued for many hundred Years; and obtained the name of Hippocratical and Galenical Physick, without any considerable or manifest advantage, alteration, or advance of Reputation; except in forming a Farrago of not only Compound, but decompound Recipes, which being a Hodge-Podge of Complications, tended rather to the Detriment and Reproach of our Art, than the adding of any Honour or Glory to it; and thereby reduced the Science from Natural and Simple Empiricism, into an Artificial and Reputable Art of Quackery.

V. **THE ART** thus groaning under this Labyrinth of Misfortunes, by the ill Practises of supposed Learned Men; or rather Empiricks, began to sink under the Burthen, and indeed would in a short time have been reduced into the most profound Mystery of Empiricism, or Quackery; had it not pleased God, to make the Light of Chymistry to Arise and Shine upon us, by the Means of

of that wonderful Spirit, and great Man, Paracelsus: who not only shew'd the weakness of Empiricism, of Galenick Medicines, and Medicasters, but unvail'd and brought the Arts of Medicine out of their Rubbish, and set them in a true light, for the general Good of Mankind.

VI. IF IT BE OBJECTED, that Chymistry was in being long before Paracelsus was Born. To this we answer, so was the Circulation of the Blood before our Great Harvey: But as it was Harvey, who first brought the Circulation to Light, for the reforming, and more full elucidating the Art of Physick; so we say, that it was Paracelsus who brought the Light of Chymistry to arise and shine in our Horizon; and let us into its Secret Recesses, shewing us all its hidden Treasures, and brought them forth for the Glory of our Art, the Increase of true Medical Knowledge, and an Universal Good.

VII. YET WE DO NOT SAY, that the Old Physick is wholly to be cast away: There are many (tho' Simple) excellent things in it; which, by a Skillful and Prudent Physician may be excerpted, and collected together; and which if conjoined with the Chymical, open into a great Field of Knowledge, and wonderful Productions, that not only shew us the Genesis, but also Analysis of all natural things; and with what an amazing Harmony they sympathize with Human Bodies, and how admirably they conspire to Operate in Mankind, to the extirpation of Diseases, and support of Life, against whatever may be opposite to Health, and the well-being of a Living Man.

VIII. THE NEXT thing then which the Physician had in his View, was the Composition and Structure of the Human Frame, that thereby he might know how the Body grew, and was nourished, and by what means it might fall to decay, and so fail. And since the Growth and Nourishment was from the Matter received in by the Mouth into the Stomach, they considered that there was an innate Property in that Viscus, viz. Natural Spirits, to convert the received Food into a kind of nourishing Juice, which the Greeks (our first Physicians) were pleas'd to call Chylus, which being more perfected in the Entrails, was thence conducted by proper Vessels, and convey'd to the Heart; where being converted into Blood, it was thence by the Arteries distributed over the whole Body, to contribute to its encrease of Magnitude, and nourishment of all its Parts, that it might not fall to decay. The Meanders, or Ways, by which this Bloody Juice pass'd and rest'd, was discovered by Dissection of the Human Carcase; how it pass'd from the Heart by the Arteries, to abase every individual Part of the Body, for its Nutrition; and how, what was more, than was fit for that Purpose, was return'd by the Veins to the Heart again; which for that reason seems to be the Fountain of the Vital Spirits, and so by a perpetual Circulation, conserves the Microcosm in a habitual State of Life and Strength. And by the same Art, they came to a discovery of the Nervous System, (whose Original is in the Head) by which the Animal Spirits, generated in the Brain, were convey'd thro' the whole Man, giving Sense or Feeling, Life and Motion, to every part of the same.

IX. HOW THE Body fell to decay, or failed, was the next Consideration, which was either, I. By External Accidents, by Blows, Falls, Cuts, Punctures, Gunshot, &c. from whence came Contusions, Wounds, Fluxes of Blood, Ulcers, Fractures, Luxations, Dismembrings, and loss of Substance, which directed them to Topicks, or External Applications, whence from a long Series of Experiences, arose the Practice and Art of Chirurgery. II. Or Internal, from a defect of Natural Spirits in the Stomach and Bowels, whereby their Tone, or innate concollive Property being hurt, they either 1. generated a bad Chylus, which did not nourish as it ought to do, but either profligated the Blood and Lympha, by depauperating them; or otherwise created a tartarous kind of Mucilage, by which not only the Vessels thro' which it was to pass were obstructed, but the Viscera also themselves were perturbed in their Operations, by glutinous Slime, Sand, Gravel, Stones, &c. Or 2. They generated not Chylus enough to nourish and sustain the External Man, whereby the Body falls into Lassitudes or Weaknesses, Pinings, and a lingering Consumption; which if not prudently remedied, and that in time, reduces the poor Patient to a meer Skelton, and so making him past hopes of Cure, sends him decently to his Grave. An indigested Chylus, or defective in its quantity, as it creates a depauperated Blood, and Lympha, so it makes either weak Vital Spirits, or a deficiency of them; whence comes Faintness, Languishings, and the like, and an universal decay of the Strength of the whole Man. And according to the poverty of the Blood and Lympha, such also are the Animal Spirits proceeding from it, from whose weakness or decay, proceed all the Nervous Diseases afflicting the Body, as Tremblings, Numbness, loss of Strength and Motion, Convulsions, Palsies, &c.

X. THE BODY being thus afflicted with Diseases, it was natural to believe, that they could not be without their proper Signs, by which they might be known, as also several attendant Symptoms, all which must arise from some certain Cause, or Causes, the Signs of which Causes, (which they call Diagnosticks) they daily learnt from Observation. These Causes, whether Original or Accidental, they gradually searched out, that the Sources whence they were deriv'd, might be at length discovered. All which was absolutely necessary towards the investigation of the Cure: For that without the Cause was known and removed, the Effects thereof, viz. the Disease, could not cease, or be taken away. As Diseases then appeared in the World, they observ'd the Signs accompanying them, and the Symptoms which many times accrued, which they set down in Writing, under the Names of those several Diseases. And enquiring into the Course of the Patients Life, and what Accidental Matters might also happen, at the introitum of the Disease; the antecedent Causes of the Malady, became in some measure manifest. Whence by a great number of Remarks, not only the Antecedent and Remote Causes came to be discovered, but also the conjoined and near Causes, were at length brought to Light: From whence the Diagnostick part of the Art, received its Illustration. Again, from the Greatness or Lightness of the Causes; from the impending Symptoms, as they seem'd more or less dangerous; and from attending to the end of the Disease, thro' a long Series of Observations, being all rationally considered together, the Prognostick Precepts were educ'd. And if the Disease was thought Curable, the Indi-

Indications of Cure, voluntarily flow'd from the morbid state of the Sick, which proceeded 1. From the Causes Antecedent and Present. 2. From the nature of the Disease, whether Similar, Organick, or Common. 3. From the Symptoms, as being Dangerous, or not. 4. From the Vital Powers, respecting the Strength or Weakness of the Diseased Body.

XI. ART BEING by these Advances, and so many Degrees, or Steps, brought on towards Perfection; what remains for the Learned Professor to do? Truly to know what Disease it is which afflicts the Person, and by the Crisis, and manifest Symptoms, to make his Medical Prognosticks, whether the Patient be Curable or not; that he may do every thing for the Reputation of his Art, and of himself. So that if he sees the Sick past hopes of Recovery, he may decline his Attacks, and let the Relatives and Attendants know the Danger impending. But if there be Hopes of Life, (tho' but small) he may make his Artful and Masterly Prescriptions, according to the Indications of Cure, which with a Rational and Modest assurance, he may hope and conclude, will not go without their desired Effects.

XII. LIKE AS THE Art of Rhetorick was not the foundation of Oratory, or of the first Orators, Demosthenes, Cicero, &c. but the Orators the foundation of the Art, out of whose unexampled Orations, all its Precepts and Rules

were Excerpted, or Gleaned, and by Wise Men reduced into the form of an Art, by which all succeeding Rhetoricians regulated and made their Orations: So the Medical Art, and all its Rules, even the Fabrick of the whole Art, was Reared and Built out of Empiricism, or Quackery; and its Original or Foundation, was laid by Empiricks, or Quacks, (as the Learned are pleased to phrase it) and that the first Physicians were no other than Empiricks, Quacks, or Tryers of Skill; out of whose Tryals, Observations and Practises, some Wise Men collected a Set of Precepts and Rules; which being reduced into Method, we now call the Art of Physick. But all the to be deplored Misfortunes of the Art is, that it makes not a great many Real Physicians, but too many Ignorant or Conceited Doctors, and too great a number of Formal and Rattle-headed Empiricks or Quacks.

XIII. WHAT WE have farther to say is, to commend the sincere Lovers of Art, to the good Providence of God. That in their Search and Enquiries into Nature, and unravelling (as it were) the Rules and Precepts of Medicine, they may find the Answer of their Expectations; and have their Minds or Souls, enlignited with the Splendor and prevailing Excellencies, of true Wisdom and Knowledge; so as to be able to perform the Great things, wrapt up in the Mysteries of this Science they are Professors of; for the Good of the Sick, their own Benefit, and the Reputation of the ART of PHYSICK.

W. SALMON:

Black-Friers, London.

ADVERTISEMENT.

I Request all those Gentlemen and others, who send Letters to me, about their own Concerns, to be so Civil, as to pay Postage for them; or else they may expect to go without an Answer. It is not reasonable that I should be at Charge for Persons, I have no Acquaintance withall, and the Business their own. I should not say this, was it but now and than a Letter. But to receive about two thousand Letters a Year (as I have formerly done) upon other Peoples Affairs, or some trifling Matter, and to pay Postage for them, makes a considerable Sum. And besides, it is as Burthenfome and Troublesome to Answer hem, as it is Chargeable to Receive them.

HISTORY
OF
PLANTS.

Liber Primus.

OF
English Herbs and Plants.

CHAP. I.

Of ADDERS-TONGUE.

I. **T**HE Names. It is called in Greek *Ὠφίγγιον*; in Latin, *Lingua Serpentina*, *Lingua Serpentina*, *Lingua Vulneraria*, *Argentina*, *Lancea Christi*, *Herba Lucciola*, *Ophioglosson*: in English, *Adders Tongue*, and *Serpents Tongue*.

II. The Kinds. There is properly but One Species, which is sometimes misshapen, and therefore are called the Common and misshapen: and differ only in one or two things: the latter has sometimes two or three stalks, and sometimes but one stalk; and sometimes two or three Crooked Tongues.

III. The Description. The Root is small and Fibrous, abiding under Ground all Winter, from which rises up but one leaf, which with the stalk, arises not above five or six Inches from the Ground, being flat or thick, and of a fresh green colour, not much unlike in form to the head of a broad Javelin, or rather the leaves of Water Plantane, but lesser, without any middle rib in it: from the bottom or bottom of which leaf, on the inside, rises up ordinarily one small slender stalk, about two or three, and sometimes four Inches long, the upper part of which is somewhat bigger, and dented with small round dents, of a yellowish green colour, much resembling an Adders-Tongue (whence the name) which never shews any other flower, and vanishes away without yielding any Seed.

IV. The Places. It grows in moist Meadows in most parts of England; in the Meadows by Colebrook; in the Fields in Waltham-Forrest; in a Meadow near Barton, as you go from Oxford to Stow-Wood: in a Close near Botely on the West-side of Oxford; and in many Meadows in Kent, Sussex and Surrey, as also near London, and several other parts of this Kingdom.

V. The Times. It is in its Prime in April and May, and flourishes sometimes till the beginning of June: but a little heat quickly makes it vanish.

VI. The Qualities. It is hot in the first degree, and dry in the second degree. It is Cleansing, Attringent, Sarcotick, and Traumatick, or Vulnerary; by appropriation, it is Arthritick and Hepatick. It is also an Alterative, and Antifebricitick.

VII. The Specification. It is Vulnerary, good to heal Wounds, broken Bones and Ruptures. Mr. Ray saith, that Baptista Sardus affirms that the Powder of the Herb, being given inwardly for some time, will Cure all Ruptures whatsoever. And Matthiolus in his Epitome says, that the fresh leaves being applied, not only heal Wounds after a wonderful manner, but also Cure Ruptures, Burnings and Scaldings.

VIII. The Preparations. There are no Preparations of it kept in the Shops: but if you please you may

may make from it, 1. *A Juice.* 2. *A Powder.* 3. *A Sphureous Tincture.* 4. *A Saline Tincture.* 5. *An Oily Tincture.* 6. *An Essence.* 7. *An Ointment.* 8. *A Balsam.* 9. *A Cataplasim.*

The Virtues

IX. *The Juice Clarified,* cleanses Ulcers outwardly, and heals Ulcers in the Lungs, which it the sooner performs, if digested with Spirit of Wine: it also stops Vomiting, and a little Nitre being dissolved in it, it is profitable against the Gout, and so drunk inwardly takes away the heat of Fevers.

X. *The Powder of the leaves,* &c. given from half a Dram to a Dram, stops bleeding inwardly, overflowing of the Terms, as also bleeding at Mouth and Nose, and other fluxes of Blood, being applied: strewed upon Ulcers, it cleanses and dries them, and disposes them to healing.

XI. *The Tincture of the dried Herb in Spirit of Wine,* heals Wounds admirably, being washed therewith mixed with Wine, and dries up Ulcers: so also being taken inwardly from a Dram to 2 Drams.

XII. *The Saline Tincture,* drawn with *Spiritus Universalis*, allays all Inflammations, and dissolves hot Tumors: taken inwardly it is good against burning Fevers, is Traumatick, and heals all inward Wounds and Ulcers, as also bruises of Breast, Stomach, and other Viscera.

XIII. *The Oily Tincture,* drawn with Oil of Turpentine, Cures not only all Green Wounds of the Nerves and Tendons, but also a Cold Gout, as also Aches, Pains, and Lameness, from a cold Cause by anointing therewith: it also dissolves Tumors and the beginning of Apoplems, and puts a stop to the Itch, and spreading Ulcers.

XIV. *The Essence.* It is Vulnerary, good against the bitings of Mad Dogs, Serpents, or any other venomous Creature. It resists Poysons, and all sorts of burning Fevers. Dose from a quarter of an ounce to half an ounce, mixt in any proper Vehicle.

XV. *The Ointment.* It is made by boiling the green leaves shred 2 Pounds, Sheep Suet, Oil Olive, of each half a Pound, till the Herb is crisp, which

press out, putting in as much more fresh Herbs, boiling and pressing out as before, then adding to the strained matter 12 Ounces of Turpentine, which mix together. It Cures not only Green Wounds but also cleanses and heals Inveterate and Putrified Ulcers; also Burnings and Scaldings in a very short time.

XVI. *The Balsam,* made of the Juice, and Strassburgh Turpentine, is as good a Vulnerary as can ordinarily be used; for it commonly heals any Simple Wound at first dressing: and applied with a Truss is good against Ruptures, the Powder of the Herb being also given inwardly.

XVII. *The Cataplasim,* made of the Green Herb, and pure Yellow Sweet Palm Oil, Cures the Gout, or any Pain in the Joynts, being applied for some time.

CHAP. II.

Of ADONIS-FLOWER.

I. **The Names.** It is called in Greek *ῥεσβίδευος*, in Latin, *Eranthemum*, *Adonis*, *Flos Adonis*, & *Flos Adonis*: in English, *Adonis flower*, *Red Camomil*, *Red Maithes*, *Pheasants Eye*.

II. **The Kinds.** It is numbered among those Herbs which are *semine nudo polysperme*: and it seems there are two chief Species of it, viz. that with Red Flowers, called *Flos Adonis flore Rubro*: the other with yellow flowers called *Adonis flore Luteo*.

III. **The Description.** It has a root with very many slender, weak, small and thready strings, perishing every year; from this root rises up several slender weak stalks, trailing or leaning to the Ground, set on every part with fine jagged leaves, very deeply cut, like those of Camomil, or rather those of Mayweed, upon which stalks, arising a foot higher or better, do grow small red flowers, consisting of 6 or 8 round leaves, almost like Field Crowsfoot, having a blackish green head, or point in the middle, set round about with many blackish threads, without any smell at all; after the flowers are past, there grows up heads with many roundish white seeds at the tops of them, set close together, very like

like unto the heads or seeds of the great Ox Eye, or not much unlike to a little Bunch of Grapes: The Plant rises of its own Seed again, many times before Winter, which will abide till the next year. That with the yellow flower is much like the former, but its stalks and leaves are of a more dilute Green.

IV. *The Places.* The Red grows in the West part of England amongst Corn, just as Mayweed does in other parts, and is likewise an enemy to Corn, as Mayweed is: from thence (for the Beauty of the flower sake) the Seed has been brought into some Gardens: The Yellow is a stranger in England, unless Nurfed up in Gardens.

V. *The Times.* They flower in the Summer Months, as May, June, July and August, as the Year falls out to be early or late: and the seed is ripe soon after, and presently falls away, if not Gathered.

VI. *The Qualities.* They are hot and dry in the first degree, but *Bauhine* and *Tabernmontanus* say they are hot and dry in the second; yet by the taste we can hardly judge so. They are Discussive, Digestive, Aperitive and Carminative: and by appropriation they are Stomack, Hepatick and Nephritic, and of the kind of Alteratives.

VII. *The Specification.* They are said to be Specificks against Colick; and Stone, which *Parkinson* says has been confirmed by Experience; a dram of the seed being given in some specific Vehicle.

VIII. *The Preparations.* The Shops keep nothing of it, but you may make, 1. A Powder of the Seed. 2. A Sulphureous Tincture. 3. A Saline Tincture. 4. A Chymical Oil of the Seed. 5. An Essence of the Herb. 6. A Bath of the Herb.

The Virtues.

IX. *The Powder of the Seed.* It powerfully expels Wind, is good against Gripping of the Bowels and Colick, and expels Sand and Gravel from the Reins and Bladder: it also strengthens the Stomach, and causeth a good Digestion.

X. *The Sulphureous Tincture.* It is made of the Seed, and is Stomack and Carminative, good against pains of Head, Stomach and Belly: helps in the Vertigo, and cures a violent Flux. Dose from one Dram to two Drams in some fit Vehicle.

XI. *The Saline Tincture.* It is made both of Seed and Herb, and has all the virtues of the former: besides which it is an excellent thing against most Diseases of the lower Ventricle: it powerfully opens all Obstructions, and expels both Wind and Water out of the Bowels; and has a more singular and Specifick force against Stone and Gravel, whether in the Reins or Bladder, or any other matter obstructing those parts. The Dose is from half a dram to a dram, or dram and half in White Wine.

XII. *The Chymical Oil.* It gives present ease in the Stone and Stoppage of Urine, if given from six drops to twelve in a Glass of White Wine, or Parsley or Armarat Water. Drop it first into Sugar, which mix well together, and then mix it with the Liqueur, and so let it be taken morning and evening. It provokes Urine powerfully, gives immediate ease in the Pain, expels the Gravel, and is an admirable thing against the Colick.

XIII. *The Essence.* It has the Virtues of the Seed, but not altogether so powerful: daily taken, it strengthens the Stomach, and is good against the Scurvy in a cold Habit of Body: Dose one Spoonful better, in Ale, Beer, Wine, or in some proper Water.

XIV. *The Bath.* It is made of the Herb boiled in a sufficient quantity of Water, in which a little Castile or Venice, or Genoua Soap is dissolved. It opens the Pores, cleanses the Skin, and is good against a Rheumatism, and pains of the Bowels and Joints, by sit-

ting for some time in the Bath something more than Blood Warm, and several times repeating of the same.

CHAP. III.

Of AGRIMONY Common and Bastard.

I. *THE Names.* It is called in Arabick *Gnaphat*, *Gnatzat*: in Greek *Ευωιατον*. (of *Eupator* the first Founder of it, as *Pliny* saith:) in Latin *Eupatorium*, *Hepatorium* (as being good for the Liver,) *Agrimonia*; and in English *Agrimony*. The Bastard *Agrimony* knows no Greek name: and is called in Latin *Agrimonoidea*.

II. *The Kinds.* It is accounted amongst the number of Spiked Plants, and has several Species, as, 1. *The Common Agrimony*. 2. *The Bastard*. 3. *The Water Agrimony*, which is both male and female. The Common again is either sweet scented, or not sweet scented.

III. *The Description.* Common *Agrimony* has a root black, long, and somewhat Woody, abiding many years, and shooting out afresh every Spring, from which arises one stalk somewhat hoary and rusty, hard and round, half a yard high (plus minus) from whence comes forth divers long Leaves, some greater, some lesser, set upon a stalk, all of them dented about the edges, somewhat greyish underneath, and hairy withall: and from the main stalk also arises some smaller leaves set here and there, towards the top whereof grows many small yellow flowers, one above another in long spikes, after which comes many rough seeds, hanging down like to small Burrs, which when they are ripe, will catch hold and stick upon Garments, or any thing which shall rub against them: the whole Plant is of a pretty pleasing smell.

IV. *The sweet scented or Aromatick differs little or nothing from the former, except in the smell, so that he that knew the one may certainly know the other, but the Plant is somewhat less, with rounder and whiter leaves, and the root of a darkish red, but the taste*

and swell of this much surpasses the common, as being Astringent.

V. The Agrimonoides, or Bastard Agrimony has a root small, reddish and Woody, abiding all the Winter, from whence arises many long, soft and hairy Leaves next the Ground, every one upon a long hairy footstalk, which are cut and divided into many parts and Leaves, seven for the most part, three on each side, and one at the end, but having some smaller ones between them, much like to Common Agrimony, yet somewhat rounder than they, and all of them smaller dented, and sharper pointed, of a dark green Colour on the upper side, and Greyish underneath. Amidst these Leaves rises up several Stalks, not fully standing upright, but leaning downwards, on which are placed very sparingly such like Leaves as before described, but smaller and rounder, with small pieces at the joints of every of them. At the Top comes forth three or four hairy green husks like Cups, dented at the Brims, out of which comes forth a small yellow Flower, like to Common Agrimony, yet sometimes scarcely appear above the husks, in which, after they are fallen and past, small long and round Seeds appear like Grains of Wheat, two standing together, like to small Lumps, which fall out of the husks themselves when they are ripe, leaving the husk empty and gaping. The Taste of the Plant is bitter and astringent, and smells like sweet Agrimony.

VI. The Places. The Common grows near the sides of Hedges in Meadows, and by Borders of Groves and Coppes, in most parts of England and Germany, and in many other Countreys: I have found both the Common and sweet Scented, growing Wild in the Plantations of South Carolina. The sweet Scented grows with us only in Gardens, but is Natural to Italy in many Places.

VII. The Bastard is found in some places of this Land by dry Ditch sides, where the Earth is light, hollow, loose and sandy: Columna found it in Naples: and Bauhinus says he found it in many Places of Italy: It grows generally in Untill'd places, among Briars, Brambles, and such like.

VIII. The Times. The Common and Sweet Scented Flower in July and August, and their Seed is ripe in a short time after; but in warmer Climates it comes to its Perfection much sooner. The Bastard Flowers in April and May, and comes to Perfection on the latter end of May, or beginning of June, and the Seed is ripe soon after.

IX. The Qualities. They are all of them hot and dry in the first Degree, but the Aromatick something hotter. They are Discussive, Aperitive, Cleansing, a little Astringent, Traumatick or Vulnerary, and Strengthening: And by appropriation, Stomackick, Heparick, Splenetick, and Nephritick: and of the stock of Alteratives.

X. The Specification. They are Specificks in curing old Ulcers, Pissing Blood, and the Heparick Flux: and indeed are good against most Diseases of the Liver, for which reason they are accounted Noble Heparicks: The Bastard is said to be excellent in drying up Catarrhs, its Fume (burnt green) being received into the Mouth and Throat by a Funnel.

XI. The Preparations. The Shops keep of the Common Agrimony, 1. The dried Leaves and Tops. 2. A Distilled Water of the whole Plant, gathered in June. 3. A Syrup of the Juice. But besides these you may make from all the Plants, the following Preparations. 4. An Infusate or Liquid Juice of Leaves and Flowers. 5. An Essence of the whole green Plant. 6. A Powder. 7. A Sulphureous Tincture. 8. A Saline Tincture. 9. An Oily Tincture. 10. A Balsam. 11. A Fixed Salt of the whole Plant Calcined.

The Virtues.

XII. The dried Leaves and Tops. They are Heparick, and good against any inward weakness of the Bowels; and are kept mostly to make Infusions, Decoctions, Wines of, &c.

XIII. The Distilled Water. It is used as a Vehicle, to give any other of the Preparations of this Herb in, in any of the following Cases: Dose is from ij. ounces to iv. or vj.

XIV. The Syrup. It is an excellent Pectoral, good against Coughs, Colds, Asthma's, Wheezings, and most other Distempers of the Breft and Lungs; and is commended against the Rickets in Children. Dose from j. ounce to ij. morning, noon, and night.

XV. The Juice Liquid and Infusate. It Powerfully opens Obstructions of all the Viscera, and has all the Virtues of the Essence: The Liquid may be given from ij. ounces to iv. in a Glass of Wine: The Infusate to iij. drams, dissolved in Wine, and so taken fasting.

XVI. The Essences of the whole Plants. They are approved to be good against Putrefaction of the Blood, Obstructions of the Liver and Spleen, and other Viscera, against the yellow, black, and green Jaundice, Dropsies, (by strengthening the Bowels and parts affected, after Purges and Diureticks) inward Wounds and Bruises, bitings and stings of Serpents or other Venomous Creatures, the Flux of the Liver, Strangury, Colick, Coughs, Asthma's, Diseases of the Breft and Stomach, salt and thin Catarrhs, all sorts of Agues, Palfies, pains of the Spleen and Hypochonders, the Plague or Pestilence, bitings of mad Dogs, Greensickness, Tertian and Quartan Agues. They contribute much, being taken inwardly, to the healing of old Sores, and long continued Rebellious and running Ulcers. Dose is from iij. drams to j. ounce, in Wine, Mead, Cyder or Ale: Dropt into foul running Ears it cures them; and dropt into the Eyes it strengthens the Eye-sight. They stop all Fluxes of the Bowels and Fluxes of Blood, open Obstructions of the Reins, and Urinary Passages. Taken Dietetically they are Traumatick or Vulnerary.

XVII. The Powder in made of the dried Herbs. Being applied it stops Bleeding in Wounds of any Part: It is thus Compounded it will be better. Take of the Powder of the dried Herbs, j. ounce; Catechu, Powder of Toads, Man's Blood dried and Powder'd, of each half an ounce, mix them for a Powder to stop Bleeding internally or externally, which it does incomparably: It dries up Catarrhs, and is good against the Dropsy. Dose from half a dram to a dram, at night.

XVIII. The Sulphureous Tincture. It has all the Virtues of the Essence, besides which it is more drying and healing. Dose from j. dram to ij. drams. It strengthens the Stomach admirably, resists Vomiting, and causes a good Digestion.

XIX. The Saline Tincture. It has also all the Virtues of the Essence, but is much more powerful against all obstructions of the Viscera, as Liver, Spleen, Womb, Reins, &c. It opens the stoppages of the Urinary Passages, bringing away Sand, Gravel, Filth, Matter and Slime. Dose from j. dram to ij. drams or more. Outwardly it is good against old Sores, running Ulcers, inveterate Scabs, Cankers, and the like in any part of the Body.

XX. The Oily Tincture. It cures Palfies, Lameness, Numbness, and all Pains and Aches, proceeding from a cold Cause: it gives ease in the Sciatica, and helps the cold Gout; it strengthens the Nerves, Muscles, Vessels and Weakned Joynts, after Dislocations, and stops a Flux of Blood in any Part. Inwardly taken it is good against the Colick, Gravel, Stone,

Stone, and obstruction of the Reins, Ureters and Bladder, and may be given from x. drops to xx. in a Glaſs of White Wine.

XXI. *The Balsam.* It cures green Wounds sometimes at fiſt dreſſing, more eſpecially if to ij. ounces hereof, half an ounce of Balsam de Chili is mixed, and ſo applied to the Part, the Blood and Filth being fiſt waſht away with a little Spirit of Wine or Brandy. It cures alſo old Sores, Ulcers, Scurf, Morpew, inveterate Scabs, ſtubborn and rebellious Fiſtula's, and other like affects of the fleſhy parts. It draws forth Nails, Thorns, and Splinters of Wood, or other things gotten into the Fleſh, ſtrengthening much the Nerves, Ligaments and Joynts; it is a ſingular thing to cure wounds of the Head.

XXII. *The Fixed Salt.* It Purifies the Blood and Viſcera by Urine, deſtroys the Acidities of the Lungs, and the acritude of the fiſt Digestions, Fevers, &c. Doſe is j. ſcruple or more, in any ſit Vehicle.

CHAP. IV.

Of Water AGRIMONY the Male Kind.

Water Agrimony male.

I. **THE Names.** It is called in Greek, *Ευμαρία*, *εὐμαρία* or *εὐμαρία* *γύρε*, In Latin, *Eupatorium aquaticum mas*, *Eupatorium Cannabinum mas*, *Agrimonia aquatica mas*: In English, *Water Agrimony Male*, alſo *Agrimony Hemp-like*, and by Gerrard, *Dutch Agrimony*.

II. *The Kinds.* It is of the third Species of Agrimony, and of the Water Kind it is the fiſt, which is the Male, of which it is the *Genus* to

three other Kinds, viz. i. Our English Male Water Agrimony. 2. The New-England, or Hemp-like Agrimony. 3. The Virginian Kind.

III. *The Deſcription.* The Root is full of thready ſtrings of a mean Bigneſs; from whence ſpring up long round Stalks and ſome what reddiſh, about a Yard high or more, which are beſet with long green Leaves, indented about the edges; whereof you ſhall commonly ſee ſix or ſeven, hanging upon one Stem, like Hemp Leaves, but yet ſofter. The Flowers are Little, of a pale reddiſh Colour, conſiſting of Round ſoft Tufts, which ſtand upon the top of the Sprigs, and at length vaniſh away into Down.

IV. *The New-England Kind*, is like the former, but has a hairy brittle Stalk, and narrow Leaves, ſome dented, and ſome not, two, three, or four Inches long a Piece, and half an Inch broad, or leſs: the Flowers conſiſt of Moſſie pale Threads on every Branch, out of ſmall green Huſks or Heads, which with the Seeds is almoſt inſenſibly carried away with the Wind, ſo that one would think it to have no Seed at all.

V. *The Virginian* has a great, hard, ſolid, brown, round Stalk, of three, four, or five Foot high, is wonderfully full of Long Branches, from the bottom, ſet with Joynts, ſpotted red, on the younger green ones, with large green Leaves on them, having below five Leaves on a Stalk, thoſe upwards but three, yet larger than the former; the Flowers and Seed are alſo larger, not rough but ſmooth, blackiſh, and flat, without ſharpeness of Taſte.

VI. *The Places.* The English grows about the brinks of Ditches, and in Plains, as alſo on the edges of wet Grounds, and ſtanding and running Waters, almoſt every where.

VII. *The Times.* It Flowers in July and Auguſt; and in Winter the Stalks and Leaves wither away, but the Root is ſaid to continue.

VIII. *The Qualities.* It is hot and dry in the fiſt Degree: Is Aperitive, Abſterſive, and Vulnerary: It is by appropriation *Hepatick* and *Splenetic*; and of the number of *Alteratives*. But the Root as *Gefner* thinks is *Emeric*.

IX. *The Specification.* I am Informed by a Worthy Gentleman, that it particularly cures the *Kings-Evil*, and all ſorts of *Ulcers* and *Fiſtula's*: which peculiar properties he knew it had by Experience.

X. *The Preparations.* The Shops keep nothing hereof; but you may Prepare therefrom, 1. A Juice. 2. A Powder of the Herb. 3. A Decoction. 4. A Balsam. 5. A Sulphureous Tincture. 6. A Saline Tincture. 7. An Oily Tincture. 8. An Eſſence. 9. A Fixed Salt. 10. A Wine of the Root.

The Virtues.

XI. *The Juice.* It attenuates and makes thin groſs Humors, cleanſes and purifies the Blood, is good againſt the *Scrophula* in Men, and the *Rickets* in Children. Doſe from j. Ounce to ij. mixt with Ale or Wine, in the Morning Faſting: It is alſo good againſt Tertian Agues.

XII. *The Powder.* It has the ſame Virtues, and may be given from j. dram to ij. drams, Morning and Evening, in a Glaſs of new Beer or Wine.

XIII. *The Decoction.* It is Traumatick, more eſpecially if to every Pint of it ij. or iij. ounces of ſtrong Cinnamon Water be added; and then be drunk Morning and Evening from iv. ounces to viij. ounces.

XIV. *The Balsam.* The Juice being Inſpiffate to the thickneſs of new Honey, is mixt with an equal quantity of Turpentine, and Incorporated with a little Oil, over a gentle Fire. It is Vulnerary, and cleanſes and heals Wounds, either inward or outward, admirably.

XV. *The*

XV. *The Sulphureous Tincture.* It is a singular Traumatick, and effectual against Poyson and Malignity. Dose from j. dram to ij. drams.

XVI. *The Saline Tincture.* It is an extraordinary thing against the Kings-Evil, and all Scrophulous Symptoms, as also against the Cachexia, Dropfie, and Rickets in Children, and opens obstructions of the *Viscera*, expelling gross Humors by Urine. Dose from j. dram to iij. drams, in White Wine.

XVII. *The Oily Tincture.* It cleanses Wounds, helps Lameness, strengthens the Sinews, and is of good use against Palsies, Numbness, Pains and Aches from a Cold cause, being anointed on the part afflicted, Morning and Night. Inwardly taken from x. drops to xij. or xv. in Wine, or Parley, or Arsmart Water.

XVIII. *The Essence.* It has all the former Virtues, cleanses the Blood, and is of good use to such as have scabby and filthy Skins; it takes away hardness of Liver and Spleen, and prevails against the Jaundice: Dose from j. ounce to ij. Wounds and Ulcers being washed therewith, it heals them.

XIX. *The Fixed Salt.* It opens the obstructions of the Reins and Urinary Passages and causes a separation of the Morbick matter of a Struma, sending it forth by Urine. Dose in Arsmart Water or Wine, from viij. grains to xx.

XX. *The Wine.* Gesner in his Epistles, affirms that a Purgative of the Fibres of the Root, boiled in Wine, and the Wine Drunk, gave him in an hours time one Stool, and afterwards ten Vomits, whereby he cast out much Flegm; that it works (says he) like white Hellebor, but much more easily and safely, and that it did him much good.

IV. *The Places.* It grows in cold Grounds, by Ponds and Ditch sides, as also by running Waters; and sometimes you shall find it to grow in the very Water it self.

Water
Agrimony
Female.

CHAP. V.

Of Water AGRIMONY, the Female Kind.

I. *THE Names.* It is called in Greek, *Eumari-
on*, in Latin by Fuschius, *Eupatorium Adulterinum*; by Gesner, *Eupatorium Aquaticum*, by Matthioli, *Eupatorium Vulgare*; by Lobel, *Eupatorium Cannabinum Femina*; by Bauhinus, *Cannabina aquatica folio tripartito diviso*; by Tabernmontanus, *Eupatorium Cannabinum Chrysanthemum*; by Dodonaeus, *Pseudo-hepatorium Femina*; by Sardus, *Terzola*; and by Camerarius, *Eupatorium Avicenne*; in English, Female Water Agrimony, and Hemp-like Agrimony.

II. *The Kinds.* This is the second Species of Water Agrimony; to wit, the Female Kind, as you may see, chap. 3. Sect. 2. foregoing.

III. *The Description.* The Root consists of many long slender Strings, and is of long continuance, from whence Stalks grow up about two Foot high, or higher, and are of a dark purple Color. The Branches are many; growing at distances nearly equal one from the other; the one from one side of the Stalk, the other from the opposite Point. The leaves are winged, and much indented on the edges. The flowers grow at the Tops of the Branches, of a brown yellow Color, spotted with black spots, having a Substance within the midst of them, like that of a Daisy. If you rub them between your Fingers, they will smell like to Gum Elemi, Rosin or Cedar, when they are burnt. The Seeds are long, and easily stick to any Woollen thing. It plainly differs from our Common Agrimony, because it wants the interposed little Leaves: and its flowers are much unlike.

V. *The Times.* It Flowers in July and August; and the Seed is ripe not long after the fading of the Flower.

VI. *The Qualities.* It is hot and dry in the first Degree: it is opening, cleansing, Pectoral, and Traumatick; and by appropriation is Hepatick, and Pulmonick, or Pectoral; it is Sudorifick and Alterative.

VII. *The Specification.* It is said to be a peculiar cleanser of the Blood, and restorer of its Crasis; and has a singular Property in curing of old Ulcers and Fistula's.

VIII. *The Preparations.* The Shops prepare nothing from it; but there may be made thereof, 1. A Decoction. 2. A Juice. 3. A Balsam of the Juice. 4. An Essence. 5. A Spirituous Tincture. 6. A Saline Tincture. 7. An Oily Tincture. 8. Ashes.

The Virtues.

IX. *The Decoction in Wine.* It is Traumatick, and a restorer of the Blood; attenuates and makes thin, gross, tough, and viscous Humors; and is a singular thing against Scabs, Itch, and other Salt Humors, being given from ij. ounces to vj. morning, noon, and night.

X. *The Juice.* It provokes the Terms in Women, and taken with the Juice of Fumitory, rectifies the saltness and sharpness of the Blood: it is good against Scabs, Itch, salt and sharp Humors, Apoplexies, &c. Dose from j. ounce to ij. morning, noon, and night.

XI. *The Balsam.* Take of the Juice vj. ounces, Turpentine iij. ounces, Oil ij. ounces, Bees Wax j. ounce, Rosine half an ounce, mix and make a Balsam, by Evaporating to a Consistence, or till the watry part of the Juice is gone. It is an excellent thing, for the curing of Wounds, Ulcers, old running Sores and Fistula's: Fills Ulcers with Flesh, and brings them to a speedy healing: Applied also in the

the Gout, it abates the Tumor, and gives ease in a little time.

XII. *The Spirituous Tincture.* It is singular good against Agues, taken to the quantity of an ounce: It also heals all green Wounds and old Sores, inwardly taken, and outwardly wash't therewith.

XIII. *The Saline Tincture.* Taken inwardly it is good against the Stone, opens Obstructions of the Liver and Spleen, and is good against Leprosies, Cachexies, Dropsie and Yellow Janndice: It removes stoppages of the Lungs, provokes Urine, and prevails against Gravel and Tartarous Matter, whether in the Reins or Bladder. Dose from j. dram to ij. or more, in Ale or Wine.

XIV. *The Oily Tincture.* It is good against the Stone in the Reins, being taken from iv. drops to xx. in a Glass of Ale, Wine, or some Nephritick Water, as Parsly, or Arsmart water. Outwardly used, it is of Excellent Service against a Cold Gout, and all manner of Aches and Pains proceeding from a Cold Cause, in what part of the Body soever; it warms and Comforts the Part, and prevents a Gangrene and Sphacelus, and is good against Scurf, Morpew, Itch and the like, being anointed on the Part.

XV. *The Effence.* It is Traumatick, and an excellent thing to open Obstructions of the *Visera*, cleanse the Blood, and heal Ulcers of the Lungs, and has been approved of by some to be good against the Leprosie, inwardly taken from j. ounce to ij. twice a day in some proper Vehicle: things proper being also outwardly applied for the same purpose.

XVI. *The Fixed Salt.* It Dissolves Tartar in the Blood, and Urinary Passages, absorbs and evaporates sharp and malign Humors, which are the cause of Scabs, Itch, Leprosy, and other breakings out of the Skin: it also cuts and makes thin those Humours which are tough and thick. Dose j. Scruple in a Glass of White Wine.

Lips which hang down: the whole Plant is of a strong Smell and bitterish Taste.

IV. *The lesser Alehoof* is altogether like the former, save that the Leaves are every way smaller, the Flowers of a paler blew colour, the Plant it self is shorter or grows lower, but more upright.

V. *The Mountain Alehoof* is like the first kind, but yet larger in all the parts thereof, as Stalks, Branches, Leaves and Flowers; but the Leaves are more rough and hairy, and the Flowers of a more deep purple colour.

CHAP. VI.

Of ALEHOOF, Great, Small, &c.

I. **T**HE Names. This Plant is called in Greek, Χαμαίβοη, ἡ ἑρπυρία, ἡ ἑρπυρία, ἡ ἑρπυρία. In Latin, *Hedera terrestris*, *Chamacissus*, *Corona Terræ*: and in English, *Ground-Ivy*, *Alehoof*.

II. *The Kinds.* There are four sorts, 1. *The Common Ground Ivy*, or *Alehoof*, called Χαμαίβοη, ἡ ἑρπυρία. 2. *Hedera terrestris*, *Corona Terræ*, common or large *Ground Ivy*, or *Alehoof*. 3. Χαμαίβοη, ἡ ἑρπυρία, *Hedera terrestris* Minor, the lesser *Ground Ivy*. 4. *Hedera terrestris* *montana*, *Mountain Ground Ivy*. 5. *Hedera terrestris* *Saxatilis*, *Stone Alehoof*, or *Ground Ivy*.

III. *The Description.* The large *Alehoof* has a very large and ibready Root, from which rises many Stalks of an uncertain height, from 8. to 14. or 15. Inches long, it being but a low Herb, creeping and spreading upon the Ground, thither and thither, all about: the Stalks are slender, something cornered, and green, sometimes a little reddish: from whence grow Leaves somewhat broad and round, hairy, and a little nicked in the edges, for the most part, two Leaves out of every joyn't. At the joyn'ts likewise with the Leaves, towards the end of the Branches come forth hollow long Flowers, gaping at the ends, of a blewish purple colour, not much unlike to those, of *Germander*, with white spots upon the Label or

Alehoof Stone

VI. *The Stone Alehoof* creeps and spreads all about the Ground, with its slender weak Branches, set with Leaves like the former by couples, but larger and

and more unevenly dented, or rather waved at the edges: the Floccers which stand at the Joints with the Leaves, are longer, the buds larger, and of a paler purplish colour than the former.

VII. *The Places.* The first sort grows under Hedges, and by Ditch sides, High-ways, and by Houses, in shaddowed Lanes, and the borders of Meadows, and other waste Grounds in most places of the Kingdom. The second kind is found at the feet of old Trees in England and Germany, and many times in old Orchards. The Mountain grows upon Hills and Mountains. The last kind grows in Narbone and Provence in France; and in some places of Somersetsshire, as Lobel says.

VIII. *The Times.* They all begin to Flower in April, and continue flowering for a long time, even till the Summer is far spent, and remain green not only in Summer, but also in Winter, and abiding the Winter, if it is not too vehement or sharp.

IX. *The Qualities.* They are all of one nature, hot and dry in the first degree: but the two latter are dry in the second degree. They are Aperitive, Absterive, Bechick, Attenuaters and Vulnerary: by Appropriation, they are Pectoral, Nephritick and Arithritick: and operate only as Alteratives.

X. *The Specification.* They are peculiar against vehement Coughs and Catarrhs: the Mountain prevails against the Gout, and the Saxatile against Stone and Gravel.

XI. *The Preparations.* The Shops have only the Herband Flower; but from them you may prepare,
1. A Juice. 2. An Infusion. 3. A Decoction. 4. A Syrup. 5. A Mixture. 6. A Conserve. 7. A Lohoch. 8. An Ale. 9. A Powder. 10. Troches.
21. A Balsam. 12. A Cataplasim. 13. An Essence. 24. A Spirituous Tincture. 15. A Saline Tincture. 16. An Oily Tincture. 17. A Distilled Water. 18. A Spirit. 19. An Extract. 20. A Fixed Salt. 21. An Ophthalmick.

The Virtues.

XII. *The Juice.* It is bitter, cleansing and opening the Obstructions of the Viscera: put into the Ears, it helps the Noise in them, as also their Ringing and Deafness, and is profitable against the Jaundice, Catarrhs and Rheumatisms; it has Cured many (says Hollerius) at point of Death. Dose from j. ounce to iv. ounces, according to Age and Strength.

XIII. *The Infusion.* Made in fair Water, or a weak Lime Water, and Drank three or four times a day, from iv. to viij. ounces, it Cures Coughs, Colds, Spittings and Wheezings.

XIV. *The Decoction.* It is a good Vulnerary and Bechick, more especially if ij. ounces of Spirit of Wine or Brandy be added to every pint thereof: it disposes old Sores, running Ulcers and Fistula's to a healing. Dose from ij. ounces to vi. 3. or 4. times a day. This Decoction mixt with Honey and a little burnt Alum, is good to wash Sore and Ulcerated Mouths, as also Ulcers in the Privy parts of Man or Woman.

XV. *The Syrup.* It is peculiar against an old Cough, and other Distempers of the Breft and Lungs, as Catarrhs, Wheazings, Asthma's, Ulcers of the Lungs, spitting of Blood, &c. Let it be often taken with a Liqueorice Stick: or it may be taken a large spoonful at a time, as oft as need requires.

XVI. *The Mixture.* Take of the Juice ij. ounces, Honey j. ounce, burnt Alum iij. drams, purified Verdigrise half a dram, mix them well together: It Cures Sore Mouths and Throats, Ulcers of the Gums and Tonils, as also other Ulcers and running Sores in other parts of the Body.

XVII. *The Conserve.* It opens the Breft and Lungs, and gives relief in Coughs, Colds, shortness of Breath, Wheezings, and forenefs of Breft and Stomach.

XVIII. *The Lohoch.* It is made of the clarified Juice, mixed with clarified Honey in equal proportions: and is good against the most vehement and violent Coughs, very powerful against Phthisicks, or Ulcerations of the Lungs, causing a speedy healing; let it be taken with a Liqueorice Stick oftentimes in a day.

XIX. *The Ale.* You may put iij. large handfuls of the green Herb to every Gallon of Ale, whilst Working: it is said to clarify and make fine the Drink in about 24 hours time, from whence came the name of *Ale-boof*, or *Tun-boof*; and in old Time supplied the use of Hops: it makes the Drink very opening and Diuretick.

XX. *The Powder.* It is made of the dried Leaves, and is given from half a dram to a dram: it may be taken in iv. or v. ounces of its own distilled Water; it is said to Cure the Yellow Jaundice in 7. or 8. days, and in 40. or 50. days the Sciatica.

XXI. *The Troches.* They are made of the Powder aforegoing, with Iling-glafs and white Sugar Candy: and are of excellent Use against Coughs, Colds, Phthisicks, Consumptions, Wheezings and shortness of Breath, being held often in the Mouth, and suffered gradually to dissolve, the Sick also drinking Milk every day, in a pretty large quantity.

XXII. *The Balsam.* It is made of the Juice Boiled to the thicknefs of new Honey 4 Ounces, mixed with Turpentine of Chio, and Oil of sweet Almonds, of each ij. Ounces. It heals green Wounds, running Sores, old Ulcers, Fistula's, &c. after an admirable manner, being applied to the Part.

XXIII. *The Cataplasim.* Take Turpentine ij. ounces, Yolks of three new-laid Eggs, mix them well together, then add of the green Herb, cut small and beaten in a Mortar, iij. large handfuls, mix and apply it; it gives excellent relief in the Gout, and other Pains of the Joints; applied hot to the Region of the Liver or Spleen, it eases their Pains: and upon the Abdomen, it is said to be a present Remedy in the Colick.

XXIV. *The Essence.* It is excellent good against weak and aching Backs, Coughs, Wheezings, Asthma's, shortness of Breath, spitting Blood, Ulcers of the Lungs; and is singular good for all Wounds, inward or outward, it cleanses and rarifies, and is good against any griping Pains, or windy Cholerick Humors in Stomach, Spleen or Belly: it helps the Yellow Jaundice, by opening the Obstructions of the Viscera, and is good against Poison and Plague: it provokes Urine, and the Terms in Women; and being Drunk with Wine for some considerable time, it is said to Cure the Sciatica, as also the Gout in Hands, Knees or Feet, dissolves and disperses the Peccant Humors, and so gives ease. Dose from j. ounce to ij. ounces in Wine, Mead, &c.

XXV. *The Spirituous Tincture.* It prevails against Catarrhs, coldness of the Stomach, spitting Blood, Wind, Pains, Gripings, and other like Diffaffections of Stomach, Liver, Spleen and Bowels. Dose from j. dram to ij. drams, in its own distilled Water, or other fit Vehicle.

XXVI. *The Saline Tincture.* It helps the Yellow Jaundice, opens Obstructions of the Viscera, provokes Urine and the Courses, facilitates the Birth, expels Poison and the Plague, and has all the Virtues of the Essence, but operates more by Urine. Dose from j. dram to ij. in any fit Liqueor.

XXVII. *The Oily Tincture.* It is good for the Sciatica or Hip Gout, as also the Gout in any other Part, proceeding from a cold Cause, being anointed very hot upon the part twice a day.

XXVIII. *The*

XXVIII. *The Distilled Water.* It is made from the Green Herb in April or May, and used chiefly as a Vehicle with most of the former Preparations.

XXIX. *The Spirit.* It is made of the Fermented Juice, and is of singular Use against the Scurvy, whether in a hot or cold Constitution; it strengthens the Stomach, and causes a good Appetite. Dose from half an ounce to j ounce, mixt with Wine, or with the Syrup of the Juice.

XXX. *The Extract.* It Cures Diseases of the Breast and Lungs, and opens Obstructions of the Reins and Womb. Dose j. dram or more, dissolved in Sack. It contributes as a Traumatick to the healing of Wounds and Ulcers.

XXXI. *The Fixed Salt.* It is Diuretick and Nephritick, opens Obstructions of the Reins, Ureters and Bladder, dissolves Tartarous Humors in those parts, or in the other Viscera, and is found by Experience to be good against Stones, Sand, Gravel, &c. being given from xij. grains to xxiiij. in its own distilled Water, Parsley Water, Arisart or Onion Water, and repeated twice a day.

XXXII. *The Ophthalmick, or Eye-Wash.* Be Juice of Alehoof iij. ounces, Juice of Celandine, Juice of Daisies, Rose Water, Honey of each j. ounce, mix and dissolve, then drop it into the Eyes: It helps all Inflammations, Spots, Pin and Web, Itch, Smarting, and most other Disaffections of that part; and Cures, tho' almost Blind. Use it 5 or 6 times a day, or oftner.

CHAP. VII. OF ALEXANDERS.

I. **THE Names.** It is called in Greek *Ἰπποκρίανον*, ἢ *ἐμερύνιον*. in Latin *Hippocrepis*, *Smyrniacum*, *Equapium*, *Oliv atrum* (from making the Potage black:) in English *Alexanders*, *Alifanders*, and *Horse Parsley*.

II. *The Kinds, or Species.* It seems to be a Spe-

cies of the *Apia* or *Parsleys*; this being the largest of all, and therefore called *Hippocrepis* or *Horse-Parsley*. This Species is said to be twofold, 1. The *Common* or *English Alexanders*. 2. The *Cretick*, or that which grows in *Candy*, but with us in some Gardens.

III. *The Description.* The Root is great, thick and long, blackish on the outside, and white within, of a hot and bitterish Taste, spreading under Ground. From thence rises up a Stalk or Stalks, thick and round, a Yard high, more or less, with sundry Leaves on them, parted into smaller divisions: from the Joints issue Branches, from whence, upon foot Stalks, proceed Leaves, cut out into many parts, somewhat resembling Smalage, but greater, broader and rounder, and more cut in about the edges, smooth also, and of a deep green colour, having a somewhat hot and spicy Taste, and a little bitter withal. At the extremities of these Branches, grow large tufts or umbels of white Flowers: after which come great blackish Seed, almost round, but a little striated on the back, of a hot Taste, not much unlike that of the Root.

SMYRN-VM.

IV. *The Cretick or Candy Alexanders* has a Root almost round, yet a little long withal, white on the outside, which afterwards grows thicker and longer, and greatest at top, ending small, and perishing after it has born Seed. From whence rises up Leaves like some kind of *Selinum*, the whole Leaf being large, and more divided into smaller parts than the former, as if it were some great *Parsley*, of a dark green shining colour, and dented about the edges, from the midst of which Leaves rises up a Stalk, round and stiff, firm and not hollow, 4 feet high or higher, having commonly at all its Joints whole and almost round Leaves, yet something longer than round, and here and there cut in on the edges, of a yellowish green colour, which do not so much compass the Stalk, at the bottom of them, as that the Stalk in a manner grows through them: from the Joints likewise rise sundry Branches, with the like yellowish round Leaves on them, and the Stalks running thro' them to the top, resembling Through-wax, or Through-leaf; where stand thick tufts

rusts or umbles of yellowish flowers, which afterwards yield small round blackish Seed, about the bigness of Radish Seed.

V. *The Places.* They are commonly Sown in Gardens throughout all Europe, but the first is also found Wild in several Places in England, as at Prest-holm, an Island on the North of Anglesey; on the Rocks near the Sea-shoars in many places, in some places on the Rocks near the Scotch Shoars, not far from Berwick, and about Scarborough Castle.

VI. *The Time.* It Flowers in June and July, and the Seed becomes ripe in August: But Gerard will have it, that the Seed is not ripe till the second year, which I confess I have not observed. Yet being an annual Plant, I see not why its Seed should not be annual.

VII. *The Qualities.* It is hot and dry in the third degree: Attenuating, Carnitative, Diuretick and Lithontripick: by Appropriation, it is Stomack, Hystrick and Nephritick; and operates as an Alterative.

VIII. *The Specification.* It effectually provokes Urine, helps the Strangury, and prevails against Gravel and Tartarous Matter in Reins and Bladder.

IX. *The Preparations.* The Shops keep nothing of this Plant. But you may prepare from it, 1. *A Powder* from the Seed. 2. *A Decoction* of the Roots and Leaves. 3. *An Expressed Juice.* 4. *A Condit* of the Roots. 5. *A Balsam* of the Juice or green Herb. 6. *A Cataplasim.* 7. *A Distilled Water* of the Plant. 8. *An Oil* of the Seed. 9. *A Spirit* from the Seed or Plant. 10. *A Spirituous Tincture.* 12. *An Oily Tincture.* 13. *A Salt* from the whole Plant. 14. *An Essence.*

The Virtues.

X. *The Powder from the Seed.* Being taken from half a dram to j. dram in white Port or Rhenish Wine, or distilled Water of the Plant, it powerfully provokes the Terms, expels the Birth, moves U-

rine, helps the Strangury and Cholick, breaks Wind, and is good against the bitings of Serpents, Mad Dogs, or other Venomous Creatures.

XI. *The Decoction.* It opens Obstructions, provokes Urine and cleanses the Blood admirably: it is good also for such as have stoppages in their Urine, or are troubled with the Strangury. Dose from iv. to viii. ounces.

XII. *The Expressed Juice.* Given from iij. to vi. ounces mixt with Rhenish Wine, or white Port, it is a Specifick against Stone and Gravel, eases the Strangury, and brings away Urine or Matter obstructing the Urinary passages, when almost all other things fail.

XIII. *The Condit, or Pickled Roots.* They are Eaten raw as a Sallet, with Oil, Vinegar and Pepper: they strengthen the Stomach, create a good Appetite, cause Digestion, resist Crudities, and expel Tartarous and Viscous Juices from the Stomach.

XIV. *The Balsam.* It is an excellent Vulnerary, curing all sorts of green Wounds in a short time: it cleanses running Sores, and old rotten and putrified Ulcers, and causes them speedily to heal.

XV. *The Cataplasim.* It is made of the bruised Leaves, and applyed hot to the part afflicted: being made of the Leaves boiled, it dries up old Sores and fetid Ulcers, without any pain, and heals them; and either dissolves or maturates Scrophulous Tumors: if it is made of the raw Herb, beaten in a Mortar with the Yolks of Eggs, and applyed cold, it stops bleeding in Wounds new made.

XVI. *The Distilled Water.* It may be Distilled either from the Seed, or from the whole green Plant: it is a Specifick against Gravel and stoppage of Urine.

XVII. *The Distilled Oil of the Seed.* It is given from iij. drops to x. in any convenient Vehicle, and comforts and warms a cold Stomach, strengthens it, causes a good Appetite and Digestion, expels Wind, gives ease in the Colick, provokes the Terms in Women, and facilitates the Birth; opens Obstructions of the Breſt, Lungs, Liver, Spleen, Reins and Womb, helps shortness of Breath, and comforts the Head, Brain and Nerves, being singular good against Megrims, Vertigo's, Lethargies, Apoplexies, Palfies, Convulsions, and the like; you may give it in Extremity, as also morning and evening.

XVIII. *The Spirit.* It is weaker than the Oil, but much pleasanter, and has all the same Virtues, but operates not in so powerful a manner. It is Carnitative and Cordial, and given against fainting Fits. Dose j. ounce.

XIX. *The Spirituous Tincture.* The Virtues are the same with the Oil, but more penetrating; and is indeed much more powerful than the Spirit, for that it abounds much more with the Sulphur of the Vegetable: it may be given in the distilled Water, from j. dram to iij. drams, morning and night.

XX. *The Saline Tincture.* It is a Lithontripick, or Stone-breaker, opens all Obstructions of the Reins, Ureters and Bladder; attenuates, cleanses, brings away Sand, Gravel and Tartarous Slime, opens the Womb, provokes the Terms, and strengthens that part, so as to cause Fruitfulness in Women, and brings away both Birth and After-birth: it eases the Spleen, and removes its stoppages. Dose from j. dram to iij. drams.

XXI. *The Oily Tincture.* It has the Virtues of the former, but is particularly good against the Palfie, being outwardly anointed on the part, and inwardly taken from vi. drops to xx. in a fit Vehicle.

XXII. *The Salt of the whole Plant.* It is Diuretick and Nephritick in a peculiar manner, provokes Urine, brings away Sand and Gravel; and is good against Diseases of the Brain and Nerves, by powerfully

fully opening Obstructions. Dose from x. grains to j. scruple, in its own distilled Water.

XXIII. *The Essence.* It prevails against Phlegm, and a Phlegmatick habit of Body, opens Obstructions of the *Viscera*, cleanses and purifies the Blood, warms a cold Stomach, is Cumulative, provokes the Courses, and brings away both Birth and After-birth. Dose j. ounce, more or less, according to the Necessity and Age of the Patient, in a Glass of Wine.

CHAP. VIII.

of ALKANET.

I. *THE Names.* It is called in Greek *Άγκυρα*. in Latin *Anchusa*, *Onocleia*, *Buglossa Hispanica*, and in English *Alkanet*.

II. *The Kinds.* It is said to be a Species of *Bugloss*; but of this there are several kinds, as, 1. The great yellow *Alkanet*, called simply *Άγκυρα*, *Anchusa*. 2. The lesser *Alkanet*, with purple Flowers, called *Άγκυρα έριτα*, *Anchusa altera*. 3. The small *Alkanet*, with yellow Flowers, called *Άγκυρα τριστη*, *Anchusa tertia*. 4. *Anchusa Lignosior*, Woody *Alkanet*. 5. *Anchusa humilis Cretica*, Low *Alkanet* of *Candia*. 6. *Anchusa arborea*, Great or Tall *Alkanet*. Of these, we shall only discourse of the three first, as being only useful for our purpose.

III. *The Description.* The first kind has a great and thick Root, of a dark reddish colour, with many Branches from the same. The Leaves are long, narrow, hairy and green, like the Leaves of *Bugloss*, which lie very thick upon the Ground: the Stalks rise up, and are compassed round about thick with Leaves, which are lesser and narrower than the former; they are tender, and slender, not much above a foot and half high, at the tops whereof stand small yellow Flowers, with a small Leaf at the foot of every Flower, which are somewhat long and hollow, very like to Comfrey Flowers, but a little opening themselves at the brims like unto *Bugloss* Flowers, with a Point in the midst,

after which come in their places, small, long, blackish Seed, not unlike to *Bugloss* and Comfrey Seed. The Root is as big as ones Finger or Thumb, and about two Fingers long, whose outward Bark is somewhat thick, and of an excellent orient red colour, ready to colour ones Hands and Fingers with its red colour, if handled: its inner Pith is white and woody, and the whole Plant is of a Styptick or Astringent Taste.

IV. The second kind has a Root pretty large and thick, and of a dusky red colour, with many Branches from the same; the Leaves are greater and longer than the next kind, narrow, hairy and green, like *Bugloss* Leaves, and somewhat like to the former, but yet lesser and narrower, but more plentiful, as well those which lie upon the Ground, as those which rise up with the Stalks, which are many, slender and tender, of about a foot and half high, whose Flowers are like the others, save that they are of a reddish purple colour, and the Seed following more gray, the whole being of a rough and astringent Taste.

V. The small yellow *Alkanet* is like unto the first, having a Root great in respect to the Plant, red, and tender whilst it is young, but growing blackish and woody when it is old, and lives and abides after Seed time, which some others do not; its Leaves also are narrower and shorter than the first, and covered with an Hoariness, as are also the Stalks, which in some are but a foot, in others a foot and half high, with smaller Leaves thereon: the Flowers are hollow and yellow like the first, but lesser, the Seed also is like the Seed of the first. These Plants are famously known throughout all Europe, for the beautiful red colour contained in the Roots, which will colour White Wine of the delicate colour of deep Claret.

VI. *The Places.* They are nourished up with us, chiefly in Gardens, but the second of them, *Lobel* says, grows near *Rocheſter* in *Kent*; as also in the West of England, as in *Devonshire* and *Cornwall*.

VII. *The Times.* They flower in *July* and *August*, and the Seed is ripe not long after; and the Roots yield their glorious red or purple Juice or Tincture in Harvest time, as *Dioscorides* saith.

VIII. *The Qualities.* It is Temperate as to heat and cold, but is dry in the second degree. It is Repercussive, Absterſive, Styptick, Astringent, and Traumatick or Vulnerary. And by Appropriation it is Stomack, Cardiack, Hysterick and Nephritic: of the Stock of Alteratives.

IX. *The Specification.* It is peculiar in resisting of Poyſon, of all kinds, and stopping Fluxes.

X. *The Preparations.* The Shops keep nothing hereof, but the Root; but these Preparations may be made therefrom, 1. An Essence of the whole Plant. 2. A Juice. 3. A Decoction. 4. A Wine. 5. A Vinegar. 6. A Spirituous Tincture. 7. A Saline Tincture. 8. An Oil. 9. A Cataplasim. 10. A Cerote. 11. A Pessary. 12. *Sanguis Veneris*.

The Virtues.

XI. *The Root.* It is used to colour Wines with, Syrups, Waters, Gellies, and such like things; and boiled in Wine, and taken with sweet Butter, it helps Bruises by falls, &c.

XII. *The Essence of the whole Plant.* It is binding and strengthening, and stops Fluxes of all kinds, and allays the heat of Choler: and by its Traumatick Property, is good for the healing of Wounds, running Sores and old Ulcers, prevails against the Yellow Jaundice, the Spleen, Agues, and Diseases of the Reins and Bladder: it is good against all sorts of Inflammations, burning Heats, Erysipelas, and the bitings of Venomous Beasts; it strengthens a weak Back, and is good against Fits of the Mother. Dose j. or ij. ounces.

XIII. *The Juice.* It has the Virtues of the Essence, but not so pleasant to be taken, because it is not of so fine and pure a body: it may be kept either in a liquid form or inspissated, as is the *Spanish Juice of Liquorice.*

XIV. *The Decoction.* It has the Virtues of the Essence, but not so powerful; it is of good Use in the Yellow Jaundice, and stopping Fluxes of the Bowels or of the Womb. Dose iv. vj. or viij. ounces, sweetened with treble refined Sugar.

XV. *The Wine.* It is made by Infusion of the Root, either fresh or dry, so long or so often, till the Tincture is as deep as Blood. It is a Specifick in the Hepatick Flux, and in stopping all other kinds of Fluxes whatsoever. It is also a most singular Wound-drink, scarcely inferior to any other. It is good against the bitings of Mad Dogs, Serpents, and other Venomous Creatures: it strengthens a weak Back, and stops the Whites in Women, and helps to bring forth the Measles and Small-Pox in Children. Dose ij. iij. or iv. ounces.

XVI. *The Vinegar.* It has the Virtues of the Wine, but is peculiar against Morpew, Scurff, Leprosie, and other Defilements of the Skin; and prevails against the bitings of Venomous Creatures, being inwardly taken, and outwardly applied: Dose j. or ij. ounces in any fit Vehicle.

XVII. *The Spirituous Tincture.* This is made only of the red part of the Root; and has all the Virtues of the Essence and Wine; but is much more fit in cold Constitutions, and where the Plague or any other infectious Disease is feared. Dose ij. drams, more or less in Wine.

XVIII. *The Saline Tincture.* It is made from the whole Plant, and has all the Virtues of the Plant in it; but this is more peculiar in opening some Obstructions, chiefly of the Reins; for it brings away Sand and Gravel, kills Worms, and is good against Fits of the Mother. Dose ij. or iij. drams.

XIX. *The Oil.* \mathfrak{R} Oil Olive j. pound, Oil of Spike vj. ounces, Oil of Juniper-berries ij. ounces, Alkanet Roots vj. ounces; make an Oil by a gentle Digestion, in a Sand-bath, till it is very red. It is an excellent thing for deep Punctures, Wounds made with pointed Weapons, and Punctures or Wounds of the Nerves.

XX. *The Cataplasm.* Take of the red part of the Root iv. ounces: beat it soft in a Stone Mortar; then add to it Oil of Mace by Expression iij. ounces, Mithridate ij. ounces, Oil of Spike half an ounce; mix them. It is an excellent thing against deep Punctures, chiefly of the Nerves. A Cataplasm made of it with Whey or Cream, is good against Burnings.

XXI. *The Cerote.* A Cerote being made of the pulp of the Root with a little Oil and Wax, Cures old Ulcers: and made with Barley Meal, it prevails against an Erysipelas, Leprosy, Tettars and Ring-worms.

XXII. *The Pessary.* A Pessary being made of the Root, viz. Of its pulp, with Wax, Turpentine and Barley-flower, it is said to bring away the Dead Child, and the After-birth.

XXIII. *Sanguis Veneris.* It is thus made: \mathfrak{R} Oil Olive libj. Alkanet Root 3. or 4. ounces, Earth-Worms cleaned or purged, number 40. boil them well together, then strain out whilst hot, and keep it close for Use. This was Invented by John Arderne, and is a most singular Vulnerary in deep Wounds and Punctures of the Nerves, made with Thrusts, Stabs or Pricking with any pointed Weapon, &c. it eases the Pain, and prevents Convulsions.

CHAP. IX.

Of Clowns ALL-HEAL.

Clownes Allheale

I. **THE Names.** It has no known Greek Name, but is called in Latin, *Panax Coloni*, *Panax Heracleum Alterum*: and in English, *Clowns Allheal*, and *Clowns Wound-wort*.

II. **The Kinds.** It is accounted one of the kinds of *Sideritis*, and is, with *Parkinson*, the fifteenth, called in Latin *Sideritis Anglica Strumosa Radice*, or English Iron-wort with a Tuberos Root.

III. **The Description.** The Root is composed of many long Sirings, with some tuberos long knobs commonly growing among them, of a pale yellowish or whitish colour, from whence grows up four square, green, rough Stalks, half a yard or two foot high, furrowed in, a little upon every square, the Joyns standing somewhat far asunder, with two very long and somewhat dark green Leaves, bluntly dented about the edges, and sharp pointed at the end: the Flowers stand towards the top, compassing the Stalks at the Joyns, as do those of Horehound, but end in spiked tops, which Horehound does not, having long and much gaping hoods of a purplish red colour, with whitish spots in them, standing in somewhat rough Husks, wherein afterwards stand blackish round Seeds. The whole Plant is of a strong Smell, not much unlike to sinking Horehound.

IV. **The Places.** It grows almost every where in England, by several Brooks and Ditch sides, and sometimes by the Path-ways, and borders of Fields, as in Middlesex near London, by the Path-sides, in Fields going to Chelsea and Kennington; by Hackney, in the Ditch-sides of a Field called *The Shoulder of Mutton Field*; and in Surry in *St. George's Fields*; and in the Meadows by Lambeth, and near Standgate: in Kent by Southfleet; and on the back-side, of the Church-yard of Nettleshead, and in some places near the foot of Shooters-bill: in Essex by the Ditch-sides, and on the Ditch-sides on the Left Hand of the Highway beyond Stratford Bow; as also in Cambridgeshire.

bridgeshire, Huntingdonshire and Suffolk, in all which it grows plentifully.

V. *The Times.* It flowers in *June* and *July*, and sometimes in *August*, and its seed comes to ripeness soon after, *viz.* in *August* or *September*.

VI. *The Qualities.* It is hot in the second degree, and dry in the first: It is Agglutinative, Afringent and Vulnerary: and by appropriation, it is Nephritick and Arthritick; and of the kind of Alteratives.

VII. *The Specification.* It is absolute for healing of Wounds whether inward or outward, and that by the first intention.

VIII. *The Preparations.* The Shops keep nothing of it; but you may prepare from it, 1. *A Juice.* 2. *An Essence.* 3. *A Powder.* 4. *A Diet-drink.* 5. *A Spirituous Tincture.* 6. *A Saline Tincture.* 7. *An Oil.* 8. *A Balsam.* 9. *A Cataplasim.* 10. *An Emplaster.*

The Virtues.

IX. *The Juice.* It is Traumatick and contributes to the Curing Wounds (whether outward or inward) being taken from ij. Ounces to iij. in a Glass of Alicant: and so also it is good for Ruptures, Bloody-flux, Vomiting, Spitting and Pissing Blood.

X. *The Essence.* It has all the former Virtues, but much more effectual to all those Intentions; and taken inwardly to ij. Ounces, or more, it alters the habit of the Body, makes the blood Balsamick, and destroys the Cancerous humor, when spread over the whole Body.

XI. *The Powder.* It is given in Ruptures of the Peritonæum, as also in spitting and vomiting of blood, for it stops the bleeding and consolidates the broken Veins. Dose from half a dram to j. in any fit Vehicle; and outwardly being strewed upon Wounds it stops their bleeding, and many times heals at the first Intention: It is made of the dried herb.

XII. *The Diet-drink.* It is made by boiling the Herb in half Wine half Water: or by Tunning it up with new drink, four large handfulls of the herb bruised to every Gallon of new Ale or Beer, put up into a bag with a stone in it to make it sink, and so to work with the Drink; which after 2 or 3 days may be drunk. It is an excellent thing to be taken a good draught of it at a time, morning, noon and night, by wounded people, and such as have inveterate running Sores, old Ulcers and rebellious Fistula's upon them: it alters the whole habit of the Body, and disposes the Wounds, Ulcers, &c. to a speedy Healing, and a perfect Cure.

XIII. *The Spirituous Tincture.* It has all the Virtues of the former, but is much better for inward Wounds, broken Veins, and Ruptures, &c. because it more easily and speedily enters into the Mass of Blood, and brings it to a Balsamick Crasis. Dose j. dram to iij. drams in Alicant.

XIV. *The Saline Tincture.* This is better for the Cleansing, Healing and Curing of Wounds and Ulcers of the Reins, Ureters and Bladder, because the *Menstruum* more easily and readily conveys the virtue of the Medicine to those parts: It is also Absterfise, and Cleanses those parts of Sand, Gravel, or any Tartarous matter lodged in, or adhering to them. Dose from j. dram to ij. drams in Smallage or Parsley Water.

XV. *The Oil,* made of the Green Herb with Oil Olive and a ninth part of Oil of Turpentine: It is Vulnerary, and heals Wounds of the Nerves with much speed and facility.

XVI. *The Balsam.* It Cures Wounds and Ulcers: the first it does by the first intention: the later, by Digesting them, Cleansing them, and then Healing them up as a Green Wound.

XVII. *The Cataplasim.* It is made of the Green Herb, by chopping and bruising it in a stone Mortar, and then beating it up with a little Hogs-lard: This applied heals up Wounds by the first intention, closing up the tips of them, without bringing the Wound to matter. With this Cataplasim a Country-man, who had cut his Leg with a Sithe to the Bone, healed it perfectly in seven days.

XVIII. *The Plaster,* made of the Juice inspissate to the thickness of New Honey, the Powder of the Herb, with Frankincense and a little Oil Olive: It is good against Ruptures of the Bowels, and is profitably applied to both *Aneurism* and *Varix*, more especially if Comfrey root is also added to it.

CHAP. X.

Of Common ALL-HEAL.

All heal. Panax recentiorum

I. **T**HE Names. It is called in Greek Πανάξ & πᾶνᾱς. in Latin, *Panax*, & *Panaces*, *Panax Heracleum alterum*; *Panaces Peregrinum* Dodonæi, *Panax Syriacum* Theophrasti; and in English *All-heal*, *Common All-heal*, *Hercules* his *Common All-heal*.

II. *The Kinds.* There are several kinds of *All-heals*, or *Wound-worts*, as, 1. *Clovens All-heal.* 2. *Hercules All-heal.* 3. *Æsculapins* his *All-heal.* 4. *Doris's All-heal* or *Wound-wort*. Of the first we have already treated in the former Chapter. Of the third we shall treat in the next Chapter: and of the fourth in Chap. 858 following. The second kind which is the *Hercules All-heal* is manifold, 1. The Common which is sixfold, 1. *Panax Heracleum vel Herculeum Alterum*, *Hercules* his common *All-heal.* 2. *Panax Heracleum alterum Americanum.* 3. *Panax Cofinum Matthioli*, *Matthiolus* his *Cofus-like All-heal.* 4. *Panax Racemosum Americanum*, The American cluster-bearing *All-heal*. 5. *Panaces Moschatum Americanum*, The American Musk'd *All-heal*. Of these five we

we treat in this Chapter. 6. *Panaces Hungaricum et Tartarianum*, Hungarian and Tartarian All-heal, of which we have nothing here to say. II. The true, which is called *Panax Heracleum Verum*, The true *Hercules All-heal* or *Wound-wort*, which see in its proper place, viz. in Chap. 857 following.

III. The Description. The first Kind, viz. *Panax Heracleum alterum*, or *Hercules his Common All-heal*, has a Root somewhat great, growing deep down into the Ground, with 2 or 3 long branches from it, of a whitish yellow on the out side, and more white within, full of a yellow Sap coming from it, if it is cut or broken, of a little strong scent, and hot bitter taste more than either Leaf or Seed: from this root springs many large winged Leaves round about upon the Ground, most of them two feet long, consisting of four, five or six Couples of rough winged Leaves, set against each other on a round great footstalk, narrowed on the upper side, each of them consisting likewise of three or 4 Couples of rough but large, fair, fresh, yellowish green Leaves, and one at the end, broad below, and growing narrower to a point at the other end, the one side of the leaf next its footstalk, being always deeper at the bottom than the other side, and finely dented about the edges, tasting a little hot and biting in the mouth, and yielding forth a yellowish juice in the Summer, called *Opopanax*, much more Gummy, but and bitter than the leaves: from amongst these leaves rises up a strong, great, round, green stalk, 4 or 5 feet high or more, with some joints and leaves thereat, and a few branches towards the top, breaking forth into small yellow umbles of flowers, which afterwards yield whitish, yellow, flat, short Seed. Note, *Libel* supposes this to be the *Panax Syriacum* Theophrastus, which yields the Gum *Opopanax*, and not without some ground of reason for it, because (says he) a famous Apothecary in Antwerp found in a parcel of the Gum *Opopanax* certain Seeds, which being Sowed by him in his Garden produced this very Plant.

IV. The second Kind, or *Americanum* has a great and white Root with sundry long strings, and a pith in the middle, not enduring after Seed time, which is sometimes the second year after its springing up, and sometimes the third. From this Root springs up a Plant much like the last, having such like winged leaves, set in the same manner, and the wings with 4, 5 or 6 Couples of Leaves, but differing in Greatness and Colour; for the whole stalk is not above half so long, nor the leaves above half so great in length or breadth, but rather somewhat short, and of a deep green Colour, very much shining on the upper side, but of a paler green underneath, much hotter and sharper in taste than the former; (and not bitter) drawing Water into the mouth. The stalk is seldom above a yard high with joints, and leaves thereon, and more branches towards the top than the other, and bearing larger umbles of flowers of a yellow Colour, succeeded by flatish, but almost round Seed of a pale brown Colour. This is supposed to be the American *Lasertitum*, or *Lasertwort* which yields a kind of *Asia fatida*.

V. The third Kind, or *Cottus* like All-heal, differs not much in form from the second, but in its greatness, and in the substance of its yellow juice, which this has not, and therefore is not of that Kind: this has such large winged leaves, set in the same manner together, but lesser, each leaf whereof is larger than a Parsnip leaf, thicker, rougher and more crumpled, also a little dented about the edges. The stalk is small and about a yard high, full of joints and lesser leaves set at them, branched towards the tops, and bearing round tufts of yellow flowers, after which follows flat and somewhat round Seed: The Root is Sappy, with a thick fleshy Bark, and of a shining Ash Colour, bitter and sharp in taste.

VI. The fourth Kind, or Cluster-bearing All-heal,

has a Root of the thickness of ones Thumb, and very long, from whence rises up a round, pithy, brownish, purple stalk, set at the joints with large leaves, divided into many parts, usually by three at a place, a little dented about the edge, bearing both at the joints with the leaves and at the tops on sundry branches, many tufts of flowers, made of small threads, like *Vine Blossoms*; at the first greenish, but whiter afterwards, which turn into small branches of green Berries, and come afterwards to be of a dark red when they are ripe, full of a pleasant juice, with many Seeds therein. It looses both Stalks and Leaves every year, and they spring up new again after Winter: the whole Plant, Leaves and Roots are eaten as Pot-herbs and Sallets, by the Indians, where it is natural; as also by our Europeans which dwell among them, and taste more pleasant than the Fruit it self.

VII. The fifth Kind, or *Panaces Moschatum Americanum*: The Root is long, white, and a little sharp and bitter, from whence springs up its first leaves, which are large, and about a foot long, only dented about the edges, somewhat like unto *Cottus* leaves, lying on the Ground, and compassing the long white root at the head; but those which follow are so deeply cut in, that they reach to the middle Rib almost: the stalk rises to be about a yard high, without any leaves thereon, save only about the middle, where it has a Knot and a Leaf which encompasses it, of a differing form from the rest: the top branches are so heavily laden with umbles of white flowers, that before they open, they hang down their heads, which have so admirable, sweet and odouriferous smell, that it is not inferior to Musk, and may be smelt a great way from the place where it grows: the leaves taste sharp and a little bitter, the Seed is like the first Kind, but not so broad.

VIII. The Places. The first grows in Italy, and generally in our Gardens in many places; as in the Physick Gardens at Oxford, Westminster and Chelsea: The second was brought from America, and is now Nourished in our Gardens also. The third grows on Mount Garganus in Apulia. The fourth and fifth grow in America, as in New-England, Canada, New-York, Maryland and Virginia.

IX. The Times. They all flower in the latter Summer Months, and their Seed is perfected in the end of Summer.

X. The Qualities. The herb, as also the Gum *Opopanax*, are hot and dry in the second degree; tho' some Authors will have the Gum to be hot in the 3d. degree, which I do not believe. The Herb, as also the Gum, Attenuate, Rarefie, Discuss, Resolve; are Vulnerary, and very gently attract: and by their appropriation they are Cephalick, Stomack, Pectoral, Splenetick, Hysterick and Arthritick. And are accounted among the number of Alteratives; yet the Gum has been found sometimes to purge, tho' but very gently; for which reason, it is often mixt with Catharticks.

XI. The Specification. * Both Herb and Gum are singular Vulnerarys, and are known to Cure Wounds and Ulcers before most other things in the World. The Gum also is specific in Diseases of the Spleen and Womb, removing Vapors, and helping Fits of the Mother, as also outwardly to discuss or resolve hard Tumors or Swellings, (if resolvable) in what part of the Body fever.

XII. The Preparations. The Shops keep nothing of this Herb, but the Gum: from the Herb you may prepare. 1. A Powder of the Seed. 2. A Juice. 3. An Essence. 4. A Syrup. 5. A Spirituous Tincture. 6. A Saline Tincture. 7. An Oily Tincture. 8. A Decoction. 9. A Wine. 10. An Oil. 11. A Balsam. 12. An Ointment. 13. A Cataplasim. 14. An Emplaster or Cerote. From the Gum you have, 15. The strained or purified Gum. 16. Pills of *Opopanax*.

max. 17. *A Volatil Acid Spirit.* 18. *A Distilled Oil.* 19. *A Saline Tincture* of the Gum 20. *A Balsam* of the Gum. 21. *A Cerote* of the Gum.

The Virtues.

XIII. *The Powder of the Seed.* This drunk in Wormwood Wine, from half a dram to j. dram, is good against Poyson, and the bitings of all Venomous Creatures.

XIV. *The Juice of the Herb.* It is good against Pains and Ulcers of the Bladder, and helps against the Strangury, or difficulty in making Water: It expels Worms, is good against the bitings of mad Dogs, or any other Venomous Creature. Dose j. ounce.

XV. *The Essence.* It is Cephalick, Pectoral, Hysterick and Vulnerary, curing most Diseases of the Head, Brest, Lungs, and Womb, and is very contributory to the healing of Wounds, or any old Sore, or running Ulcer, helps Pains and Stitches in the side, hardness in the Spleen, and suffocations of the Mother, provokes the Courses and expels the Birth. Dose to j. ounce in any proper Vehicle.

XVI. *The Syrup of the Juice.* It has all the Virtues of the *Juice* and *Essence*, but not altogether so powerful and effectual, but something more pleasant, and may be exhibited to j. ounce more or less in Wine, or Arsmart Water.

XVII. *The Spirituous Tincture.* It has all the Virtues of the *Essence*, but is much more fit for cold Constitutions, it strengthens the Brain, Nerves and Sensitive Parts, warms a cold Stomach, and is good against any cold Diseases in those Parts. Dose from j. dram to iij. in Ale, Mead, or Wine.

XVIII. *The Saline Tincture.* It has all the former Virtues, but is more peculiar against all Diseases of the Womb, Reins, Ureters and Bladder, for it dissolves all Tartarous Slime, Sand, Gravel and the like in those Parts: brings down the Courses in Women, and forces away both Birth and Afterbirth, and clears the Urinary Passages of whatever obstructions them. Dose from j. dram to ij. in Wine or Parsley Water.

XIX. *The Oily Tincture.* It is good against the Colick, and Windiness of the Bowels, and is said to expel the dead Child: it heals Wounds by the first intention, especially those of the Nerves, and is good against the Toothach, (held awhile in the Mouth) old Sores, numbness of the Limbs, Palfies, &c. outwardly applied, by anointing therewith, and inwardly given, from vj. to xij. or xvj. drops in Ale, Beer, Mead, Wine, or some proper Liquor.

XX. *The Decolion of the Herb,* in water or Wine, may be used as a Diet-Drink for the curing of Wounds, old Ulcers, running Sores and Fistula's, and to heal internal Ulcers in the Lungs: Dose iv, v, or vj. ounces at a time, two or three times a day; it is said gently to evacuate Cholera.

XXI. *The Wine.* It is only an Infusion of the Herb in Wine, and is something more powerful, at least more proper than the *Decolion*, for all the same purposes in cold Constitutions or habits of Body, to ease cold Diseases of the Head and Nerves, and give ease in the Cholick: Dose ij, or iij. ounces or more, two or three times a day.

XXII. *The Oil.* It is Vulnerary, and heals Wounds after an admirable manner: anointed it dissolves Oedema's, or cold Tumors in any Part, dissolves hard swellings in the Joints, and gives ease in the Gout, Spleen, and other Pains from a cold cause, being anointed on the place.

XXIII. *The Balsam.* This is more excellent for curing of Wounds, and commonly performs the Work by the first Intention; it cleanses and heals

Ulcers; and is a singular thing for the curing of Fistula's, being injected scalding hot into the same. It gives ease also in the Gout, and in all Aches and Pains from a cold cause: And covers naked Bones with Flesh.

XXIV. *The Ointment.* It softens the hardness of the Spleen, and is of good use in dissolving or dissolving hard swellings of the Kings Evil.

XXV. *The Cataplasim.* It is Diffusive, Resolutive and Anodyn; and an excellent thing to be applied to Kings evil swellings, or any hard Tumor in any part of the Body: The Green Leaves beaten into a *Cataplasim* with Honey, and applied, cures Wounds and Ulcers, incarnates, and covers naked Bones with Flesh.

XXVI. *The Cerot or Emplaster.* It is Diffusive; Resolutive and Anodyn: and applied to any weak Part or Joynt, it so strengthens it, as to hinder an afflux of Humors to that Place: it is also good against Spasms and Cramps, and numbness of the Limbs; helps the pain, swellings, and hardness of the Spleen and Hypochonders, being spread upon Leather or new Cloth and applied.

The Virtues of the Gum Opopanax,

XXVII. *The strained or purified Gum.* It is a Gummy Juice flowing from the Root of *Panax. Herculeum*, being cut or wounded; which is afterwards inspissated or brought to a thickness, and is then called in the Greek, *Ἀποπαναξ*, *Apopanax*; and in Latin, *Opopanax*: it is a fine fragrant Gum of a reddish, or reddish yellow color outwardly, but inwardly of a whitish yellow: it comes out of the Plant white, and in round loose drops, and is white within, but being glutinous it sticks together in Lumps, and by degrees it becomes thick, and of a Gold color on the out side, but being dissolved is almost like Milk. It dissolves Wind, purges Flegm which is thick and tough, even from the remote parts of the Body, as from the Head, Brain, Nerves, Joints, Reins and Womb: it dissolves Tartarous mucilage in the Brest, Lungs and Misentery, digests, and softens Tumors, and is a good thing against an old Cough, sharpness of Humors, shortness of Breath, difficulty in breathing, and other obstructions of the *Viscera*. It is depurated by dissolving it in Vinegar, straining and inspissating. It may be given from half a dram to a dram or more, corrected with Ginger, and Nutmeg. Dissolved in Vinegar and drunk an hour before the Fit of an Ague, it is said to cure it.

XXVIII. *The Pills of Opopanax.* Take *Opopanax* (made soft with *Syrupus Catharticus* prepared as in our *Pharmacopœia Chirurgica*) ij. ounces: *Scammony fine Powder* iv. ounces: *Cremor Tartari*, a sufficient quantity: *Oil of Lemons* ij. drams: mix and make a mass of Pills. Dose from xvi. grains to xxx. grains or half a dram. They purge all Humors, and from all parts of the Body, without making sick, or griping; dissolve and expel tartarous and sharp humors out of the Bowels, which are the original Causes of the Gout, Stone, hardness of the Spleen, Hypochondriack Melancholy, and fits of the Mother; and have most of the Virtues of the Gum at *Sett.* 27. foregoing: They are an excellent Medicine, not enough to be valued, and may be taken twice or thrice Week, &c.

XXIX. *The Volatil Acid Spirit.* It is made of the Gum by Distilling it in a Glass Retort either in Sand, or *Balneo Mariæ*, as we have taught in Our *Septisum*, lib. 9. cap. 40. *sett.* 8. It admirably opens the obstructions of the Lungs, Liver, Spleen, Bowels, Reins, Ureters and Womb; brings down the Courses, causes Urine, and prevails against Vapors

pors, and Fits of the Mother, and most Diseases in Women proceeding from a stoppage of their Terms: Dose from xx. to xxx. drops or more, in some Hystrick Water.

XXX. *The Distilled Oil.* This is made with the Spirit, and comes last after the Spirit, as is directed in the place afore quoted of Our *Sepalsium*; it has the Virtues of the Spirit, but is much more nauseous to be taken, and is chiefly given against Fits of the Mother in Women from ij. drops to iv. or vj. in some proper Liqueur, but is mostly used in such like Cases to anoint the Nostrils therewith, or to smell to.

XXXI. *The Saline Tincture.* It is a Famous thing, and has all the Virtues of the simple Gum, at *jest.* 27. foregoing: But this operates more speedily, and more Powerfully opens all obstructions of the *Viscera*, chiefly the Lungs, Spleen, Reins and Womb. Dose from j. dram to ij. in a Glass of White Port Wine, Mead, or other fit Vehicle.

XXXII. *The Balsam.* It is made of the Gum, dissolved in *Vinegar* iv. ounces, mixt with Turpentine, Balsam Capivi, of each ij. ounces: Gum Elemi, Oil Olive, Oil of Ben, of each ij. ounces: mix and evaporate to a just consistency. It cures Wounds by the first intention, and is excellent in all Wounds of the Head, Brain, Nerves, Joynts, and other parts: It also cleanses running Sores, old Ulcers, malign Fistula's, and quickly heals them.

XXXIII. *The Cerote.* It is made of the former Balsam, by adding to every xvj. ounces of Balsam, j. ounce and half of Oil of Peter, and a sufficient quantity of Wax, to bring it to a due consistency of a soft Cerote: It cures Wounds in any part, and is an excellent thing to soften hard Tumors, disperse or resolve them, as Nature most designs: It eases the Gout, and Pains proceeding from a cold Cause. See a Discourse of the Gum more at large, in Our said *Sepalsium*, the place afore quoted.

The Virtues of Panax Costinum.

XXXIV. *Its Qualities.* It is completely hot and dry in the third Degree. It opens, cleanses, cuts, and makes thin; and by appropriation it is Cephalick, Pectoral, Hepatick, Splenetick, Hystrick and Nephritick: performing its operations altogether as an Alterative.

XXXV. *The Specification.* It is prevalent against shortness of Breath, Distempers of the Head and Brain, and the Cholick, or Gripping of the Guts.

XXXVI. *The Preparations.* You may Prepare from it, 1. An Essence. 2. A Spirituous Tincture. 3. A Saline Tincture. 4. An Oily Tincture. 5. A Decoction. 6. A Wine. 7. A Cataplasm.

The Virtues.

XXXVII. *The Essence.* It is an Admirable thing against cold Diseases of the Head, Brain and Nerves, as Headaches, Vertigo's, Fallingickness, Lethargies, Convulsions and the like: it is good against Coughs, Colds, shortness of Breath, obstructions of the Lungs, Liver, Spleen and Womb. Dose ij. or iij. spoonfuls in a Glass of Wine, Mead, or other proper Liqueur.

XXXVIII. *The Spirituous Tincture.* It Warms a cold Stomach, is good for Nerves obstructed, and chill'd through Cold; and is prevalent against the Fallingickness, Spleen and Hypochondriack Melancholy. Dose from j. to iij. drams.

XXXIX. *The Saline Tincture.* It has all the Virtues of the Essence, and Spirituous Tincture, but heats not so powerfully; however it better opens obstructions of the *Viscera*, provokes the Courses, represses the Fits of the Mother, cleanses the Womb, kills Worms, expels the Urine, Birth, Deadbirth,

and Afterbirth, and dissolves Tartarous Concretions, as Stone, Gravel, slimy matter, &c. Dose from j. dram to ij. in Partly Water.

XL. *The Oily Tincture.* It comforts the Nerves, provokes Urine, helps in Diseases of the Reins and Bladder, and prevails against Cramps, Convulsions, Gouts, pains and aches proceeding from Cold, Palfies, Rheumatism, being outwardly applied, and inwardly taken from iv. drops to xij. in some convenient Vehicle.

XLI. *The Decoction.* It opens Obstructions, dissolves the Tartarous Matter which breeds the Gout, and carries of the most of the Morbifick cause by Urine. Dose from iv. to viij. ounces.

XLII. *The Wine.* It expels Wind, strengthens the Stomach and Bowels, and is good against the Cholick, or Gripings of the Guts. Dose iij. or iv. ounces, morning and evening, or in Extremity.

XLIII. *The Cataplasm.* It is made of the Herb beaten in a Mortar, and mixt with Hogs-Lard and Turpentine, of each of the two last a like quantity. It gives ease in the Gout, or any pain in the Joynts proceeding from a cold Cause, is good against Cramps, and the shrinking up of the Sinews, by reason of violent Convulsions.

CHAP. XI.

Of ALL-HEAL of Æsculapius.

I. *THE Names.* It is called in Greek Πάναξ Ἀσκληπιανόν: in Latin, Panax & Panaces Æsclepium: and in English, Æsculapius his All-beal.

II. *The Kinds.* Gerard says it is a *Ferulaceous Plant*; of which there are said to be five Kinds. 1. *Panax Asclepium Lobelij*, Lobel his *Æsculapius*'s All-heal. 2. *Panax Asclepium Matthioli*, that of Matthiolus. 3. *Panax Asclepium Columnæ*, That of Columna. 4. *Panax Asclepium Dalechampi*, That of Dalechampsius. 5. *Panax Asclepium Anguiluræ & Camerarii*, That of Anguilura and Camerarius. These differ not much one from another, being all *Ferulaceous Plants*, except that of Dale-

Dalechampius; and are much of a Nature, but not easily to be gotten except the first, and of that we shall only treat in this Chapter.

III. *The Description.* The Root is long, white, and of a strong smell, not growing deep, nor abiding after its giving Seed; from whence springs up a slender Stalk, of about a Foot and a half high, crested and jointed, and from these Joints proceed Leaves, bigger than those of Fennel, and also rougher, and of a strong smell: at the Tops of the Branches grow Umbles of Flowers; which are yellow, after which comes a broad and flatish Seed, not so small as that of Fennel, but more like to that of Ferula, and of a quick taste and smell.

IV. *The Places.* It was first found growing in *Istria*; but now is nourished in our Gardens in *England*, as also in Gardens in most places of *Europe*.

V. *The Times.* It Flowers in *June*, *July* and *August*; and the Seed is ripe not long after, or in *September*; after which the Stalk with its Leaves perish.

VI. *The Qualities.* It is hot and dry in the second Degree. Attenuating, inciding, absterfve, binding, strengthening, and Vulnerary; and by appropriation is Cephalick, Neurotick, Hyterick and Arthritick: It is also Alexipharmick and Alterative.

VII. *The Specification.* It resists Poyson, and is found by long experience to be a famous healer of Wounds.

VIII. *The Preparations.* The Shops keep nothing of it, but you may prepare from it, 1. A Juice. 2. An Essence. 3. A Saline Tincture. 4. An Oily Tincture. 5. A Decoction in Wine. 6. A Spirituous Tincture from Flowers and Seed. 7. An Oil. 8. A Balsam. 9. A Cataplasm. 10. An Emplaster or Cerot.

The Virtues.

IX. *The Juice.* Inwardly taken and outwardly apply'd, it is a good Vulnerary, healing, conglutinating, and drying up Wounds.

X. *The Essence.* It not only heals and conglutinates Wounds, but cleanses old and running Sores, putrid Ulcers, and cacoethick or ill condition'd Fistula's. It may be given inwardly from ij. to iij. ounces; and Cloths wet in the same may be apply'd to the Sore or Ulcer: if it is a Fistula, it is to be injected in, pretty hot, twice a day with a Syring.

XI. *The Saline Tincture.* It cuts, makes thin, cleanses and carries off by Urine thick and tough humors; cleansing the Breast and Lungs from all cold phlegmatick humors. Dose ij. drams or more.

XII. *The Oily Tincture.* Dropt into Wounds of the Nerves and Tendons, and plegets dipt in the same and apply'd upon the part; it heals them commonly at first dressing.

XIII. *The Decoction in Wine.* It is an Antidote against Poyson, and is profitably drank against biting of Serpents, as Vipers, Rattle-Snakes, &c. and other Poysonous Creatures. Dose vj. or viij. ounces.

XIV. *The Spirituous Tincture from the Flowers and Seed.* It restores the Habit of the Body, makes the Blood Balsamick, and gives it its due Crasis, inducing the healing of green Wounds, running Sores, old Ulcers, and other external breakings out in the Skin. Dose ij. drams, morning and evening in a draught of the Decoction.

XV. *The Oil.* It smooths the Skin, takes away Wheals, Pustles, Scurf, Morpew, and other breakings out, being anointed therewith; heals Wounds, cleanses Ulcers, and brings them to a speedy cure.

XVI. *The Balsam.* It is made of the Juice inspissated to the thickness of New Honey, iv. ounces, mixed with Gum Elemi, Balsam Capivi, and Stral-

Burg Turpentine, Oil of Ben, of each ij. ounces. It heals Wounds of the Head, Joints, Nerves, Tendons, &c. by the first Intention, cleanses Ulcers, Fistula's, &c. Incarnates, and suddenly cures them.

XVII. *The Cataplasm.* It is made of the green Herb bruised and beaten up with a little Honey. It cleanses Ulcers powerfully, and is good against fretting and running Sores, Cankers in the Mouth, Pustles, &c. being apply'd.

XVIII. *The Cerote or Emplaster.* It is made of the Balsam, by adding to every vj. ounces, Frankincense and Bee's Wax, of each ij. ounces, mixing them over a gentle fire. It heals green Wounds, and incarnates Ulcers and heals them after cleaning.

CHAT. XII.

of ALL-SEED.

I. *THE Names.* It is called in the Greek, Πολύσπερμον; In Latin, *Polyspermon*, and *Polyspermon Cassani Bassi*; *Atriplex Sylvestris*: And in English, *All-seed*, or *Wild Arrach*.

II. *The Kinds.* It is of the Kind of *Blites*, and of the Wild sort, of which it is singular: But some Authors account it among the number of *Araches*, and therefore call it *Atriplex Sylvestris*, but it is none of those Plants.

• III. *The Description.* The Root is white, slender and long, with some strings; and the Plant is something like to the *Blite*, being one of the Wild Kind as aforesaid, but lesser than the *Garden Blite*, the Leaves are uneven on their edges, broad towards the Stalk, and growing narrower till they end almost in a point, but yet round pointed: It has several Stalks which are much Branched, on the upper parts of which is a great abundance of small Flowers, growing on long and spikie greenish Heads; set very thick together, after which follows the Seed, which being so very close and thick set makes it look as if it was all Seed, whence came the name *Poyfpermon*: which Seeds are black and shining.

D IV.

IV. *The Place.* It grows Wild, in many places in England, and in many Gardens as a weed, where it is Weeded out.

V. *The Times.* It Flowers and Seeds from June to the end of August, or the beginning of September, the Seed being ripe not long after the falling of the Flowers.

VI. *The Qualities.* It is cold and moist (according to *Galen*) in the second Degree. It is something opening, absterfiv and emollient: and by appropriation Uterine and Arthritick; being of the Stock of the Alteratives.

VII. *The Specification.* Its chief intention is to cool Inflammations, and soften hard Tumors.

VIII. *The Preparations.* The Shops keep nothing of this Plant; but you may prepare therefrom. 1. An Effence. 2. A Juice. 3. A Decolion. 4. An Ointment. 5. A Cataplasim. 6. A Powder of the Seed.

The Virtues.

IX. *The Effence.* It cools inward Inflammations and abates the heat of Fevers, and is good inwardly taken against an Erysipelas, and other like heats; and opens the obstructions of the Liver. Dose from j. to ij. ounces sweetned with Sugar.

X. *The Juice.* It has the Virtues of the Effence, but cools more, and is good to Gargle with in a Quinsy; and is profitable against heat of the Stomach, and Inflammation of the Lungs. It cleanses the Womb, and makes the Belly Soluble. Dose j. or ij. ounces in any fit Vehicle. Outwardly it is good to bathe with in an Erysipelas.

XI. *The Decolion.* It is good against heat in the Reins, and scalding of Urine in making Water: and if a little Nitre is dissolved in it, it not only takes off the burning heat in Pissing, but opening all the Obstructions of the Urinary passages, it causes a plentiful making of Urine, and takes off the heat of any Burning Fever, tho never so great. Dose vi. or viij. ounces well sweetned with Sugar, in which half a dram of Nitre, or more may be dissolved: it may be taken twice a day.

XII. *The Ointment.* It cools Inflammations, eases pain of the Gout and other Aches proceeding from a hot cause, and is good against Scurff, Morpew, Scabs, Pimples, and other breakings out, and defilements of the Skin: and anointed is good to soften hard Tumors.

XIII. *The Cataplasim.* It is made of the Herb beaten in a Stone Morter, to every handful of which ij. drams of Nitre in fine Powder is put, and dissolved, and brought to a consistency with Barley Flower. It gives present ease in the Gout, and all other pains proceeding from a hot Cause. Is good in an Erysipelas being spread thin, as also Scurff, Morpew, Leprosy, and is to be renewed two or three times in twenty four Hours.

XIV. *The Powder of the Seed.* It is cooling, affects the Stomach, Reins, Bladder and Womb, taking away any preternatural heat in any of those parts: and being taken from half a dram to j. dram, it is said to be an effectual cure for the Yellow Jaundice; and to repress the overflowing of Choler.

CHAP. XIII.

Of Garden ANEMONIES.

I. *THE Names.* This Plant is called in Arabic, *Jackick*, *Attabamen*, *Sakaick*, *Mamira*: in Greek, *Ἀνεμώνη*, *ἀνὸν τὴν ἀνίαν*, *quasi herba Ventri*: in Latin also, *Anemone*, & *Herba Venti*: and in English, *Anemone* and *Wind-Flower*.

II. *The Kinds.* Some Authors will have them of the Stock of *Crowfoot*, by reason of the shape of the Leaf. But to me it seems to be a peculiar Plant of it self: and is divided into three principal Kinds, viz. The Garden, the Wild, and the *Baslard*. The Garden Kinds are almost innumerable, at leastwise not easie to be reckoned up; and for my part I believe, it would puzzle the most experienced Florist, to give a just enumeration of them, and therefore I shall not here attempt it, but give you the Description of these few following. 1. *The single Anemone*, which is purple, red, blood-Colored, blew, yellow, white. 2. *The Double Anemone*, which is red or scarlet, purple, crimson, blewish, orange, tawny, white, &c. to which we add the following Wild Anemonies, viz. 3. *The great Wild or Wood single Anemone* white. 4. *The smaller Wild or Wood single Anemone*, purple, yellow, white. 5. *The Wild double Anemone*, purple, red and white. These last three we Treat of in the next Chapter. The third Kind are the *Baslard Anemonies*, which tho' they may be accounted as one of the Kinds of the same Tribe, yet by reason the English Name, which is *Pasque-Flower*, falls not in the present Letter of the Alphabet, we shall refer you to its proper Place and Letter, which will be in Chap. 572. following.

ANEMONE

III. *The Description.* 1. *The single Garden Anemone.* It has a Root which is thick and Tuberos, or knobby; from whence rises up many Leaves, much cut in or jagged, almost like unto *Adonis* Flower, or not much unlike to the more jagged or finely cut *Crowfoot*, among which rises up a Stalk or Stalks, bare or naked almost up to the Top, at which place it is set with two or three Leaves: at the top of the Stalk comes forth a fair Flower consisting, some of them, of six, some of seven, and some of eight Leaves, of a Delicate Color, some purple, some red, some Crimson, some blew, some yellow, and some white Colored, &c. impossible to be described, to their full perfection; with Threads or Threads in the middle, of a blackish purple Color, and sometimes various Colored, according to the Color of the Flower. But here

here is to be noted that the yellow Anemone differs much from all the rest of the single various Colored Anemonies, for its Leaf is much like to a Common Mallow Leaf finely divided about the edges, green on the top, and somewhat reddish underneath, its Flower is yellow, and the Head or Thrum in the middle is yellow also. In all these Colored single Anemonies, when the Flowers are blown away, there remains a Head, whereon grows the Seed, which is small and black, or blackish, inclosed in a kind of soft Wool or Down.

IV. The Double Garden Anemone. The Root is thick and Tuberosus much like to the Root of the former: and indeed the Roots, Leaves and Stalks much resemble the former single Anemonies, but the Leaf is not altogether so finely cut and Divided, as the red or Purple-flowered single are: at the top of the Stalk there stands a fair Flower either red or scarlet, crimson, purple, blewish, orange, tawney, yellow or white, or mixt with some of these, Consisting of divers broader Leaves, with several rows of narrower Leaves one within another, which together make a very fair and beautiful Flower, the middle Head being thick closed either of a greenish, or whitish Color, or with red Colored Thrums tip with blew, or various according to the Colors of the Flower. After the Flowers, there follows the Heads which contain the Seeds as the former. Here note, that the double yellow Anemone has such broad roundish Leaves as the single Kind, but somewhat larger or ranker, and the Stalks are beset with larger Leaves, more deeply cut in on the edges, and the Flowers are of a more pale yellow, with some purplish Veins on the out side; and there is besides these, so great a variety of mixt Colors, in this Kind of Anemone, with broad Leaves arising every year from the sowing of the Seed of some of the choicest, that it is wonderful to observe, not only the variety of single Colors, but the mixture of two or three Colors in one Flower, besides the diversity of the bottoms of the Flowers, and of the Thrums or Threads in the Middle. But in all these various Colored double Anemonies, the greatest wonder of beauty is in the variety of double Flowers, that arise from the other single ones, some having two or three rows of Leaves in the Flowers, and some so thick of Leaves as a double Marigold, or double Crow-foot, and of the same several Colors that are in the single Flowers, that it is almost impossible to express them severally; some falling out to be more double in one year which are less double in another year, yet very many abiding constantly double as at first. This we thought good to advertise in General, that it may be applied to each variety, and every Kind of Flower of each variety in particular, to save the farther trouble of endless Descriptions, and a needless multiplication of Words to no purpose.

V. The Places. These were most of them brought to us from Constantinople, some from Italy, and some from Germany; but now they are Inhabitants, and Natives of our own Country, and may be found almost every where in Gardens, especially in Physick-Gardens, and the Gardens of industrious Florists.

VI. The Times. They Flower from the beginning of January to the end of April; and when they begin to fade, the Seed (where there is any) is carried away with the Wind. But if they bear Seed, it must be carefully gathered, but yet not before it is thoroughly ripe, which you may know by the Head, for when the Seed with the Wooliness begins to rise a little of it self, at the Lower end, it must then be presently gathered, and laid to dry for a Week or more, when then being gently rubbed with a little dry Sand or Earth, will cause the Seed to be somewhat better separated, tho' not perfectly from

its Down or Wooliness, that encompasses it: within a Month at the most after the seed is thus gathered and prepared, it is to be Sown, for so you will get a Year in its growth, more than you would do, if you sowed it in the next Spring: if there is any Wooliness in the Seed, they are to be separated from it as well as may be, and then sown pretty thin, not too thick, upon a plain smooth bed of fine Earth, or rather in Pots or Tubbs, after the Sowing, sift or gently strew over them some fine, good, fresh Mould, about an inch deep at most for the first time: about a month after their first springing up, strew or sift over them in like manner, another inch thickness of fine Earth, and in the mean Season, if the Weather proves dry, you must water them gently and often, but not to over-glut them with moisture: thus doing, they will spring up before Winter, and grow so strong, as to be able to abide a sharp Winter, tho' in their Infancy; but you ought to take some care in covering them loosely with Straw, Fern-leaves, or such-like, to keep them from the extremity of cold, which yet must not lye close upon them, nor too far off neither. The next Spring after Sowing, you may, if you so please, remove them; but in my Opinion it will be better to stay till the next August, when you may remove and set them in order by rows, with a sufficient distance one from another, where you may keep them till you see what kind of Flower each Plant will bear, which you may afterwards dispose according to your mind: many of these Plants thus ordered (if your Mould is fine, loose, fresh and black Earth, not Stony, Clayish, &c.) will bear Flowers the second year after Sowing, and most or all of them the third year, if the place you put them in is in a clear Air, free from the Smoak of Chimnies, Fornaces, Brewers or Dyers Fats, Mault Kilns, &c. in which they will never thrive. The ordinary time to Plant Anemonies is in August, and then they will be in flower sometimes before Winter, but most commonly in February, March and April, few of them abiding until May; but if you keep some Roots out of the Ground unplanted, until February, March and April, and Plant some at one time and some at another, you shall have them bear Flowers, according to their Planting: those which you Plant in February will flower about the middle or end of May, and so the rest accordingly, as to the time you Plant them in; and thus you may have the pleasure and variety of these Plants, out of their natural Seasons, which is scarcely to be had in any other Herb; Nature not being so apt to be provoked or forced in other things, as she is in this. But in keeping your Anemone Roots out of the Ground for this purpose, you are to keep them neither too dry nor too moist, that they may neither wither, sprout nor rot; and in Planting them, you must not set them in too open and sunny a place, but where they may have something of shadow.

VII. The Qualities. They are hot and dry in the third degree. They Attenuate, Incise, and vehemently Attract; and by Appropriation are Cephalick, Uterine and Arthritick: and are only Alteratives in respect to Heat or Cold.

VIII. The Specification. It is peculiar against Apoplexies, Epilepsies, Lethargies, Madness, Vertigo's proceeding from a cold and moist Humor, or Distemper of the Head and Brain.

IX. The Preparations. The Shops keep nothing of this Plant in Store, but you may have, 1. The Roots, Stalks and Leaves. 2. The Juice. 3. The Essence. 4. The Decoction. 5. A Mollificatory. 6. A Gargarism. 7. A Pessary. 8. An Ointment. 9. A Cataplasm. 10. A Saline Tincture. 11. An Oily Tincture.

The Virtues.

X. *The Roots, Stalks and Leaves.* These boiled in Water, chiefly the Roots, or Roots and Leaves, till such time as their fiery and biting Taste is mostly gone, and being Eaten as a Salet, with a little Butter, Salt and Vinegar, are said to encrease Milk in Nurts.

XI. *The Juice.* Being snuffed up the Nose morning and evening, but chiefly at Bed time, it mightily Purges the Head and Brain, and brings away abundance of cold, moist, flegmatick Humors, and thereby frees the Patient from Apoplexies, Epilepsies, Lethargies, and most other cold Distempers of the Head, Brain and Nerves, caused by those Humors lodged in the Head, in the Cavities of the Brain, or between the *Meninges* thereof, viz. between the *Pia* and *Dura Mater*.

XII. *The Essence.* It has the same Virtues, being used as an Erhine, but is chiefly given inwardly to provoke the Terms, bring away the Birth, After-birth, or Dead Child. Injected into running Sores, old Ulcers and Fistula's, it admirably cleanses them, and disposes them to healing. Dose from half an ounce to i. ounce, in any proper Vehicle.

XIII. *The Decoction.* If it is made of the Leaves with half Water half Wine, it powerfully provokes the Terms, and brings away the Dead Child, and the Body or Places affected being bathed therewith, it Cures Sun-burnings, Tanning, Scurff, Morpew, Leprosie, Scabs, &c. Dose iv. ounces twice a day.

XIV. *The Masticatory.* The Root chewed in the Mouth, draws out a Flux of cold Rheum, by which the Tooth-ach, Head-ach, Megrin, Apoplexies, Epilepsies, Carus, Lethargies, and other sleepy Diseases proceeding from a cold and moist cause, are Cured.

XV. *The Gargarism.* It is made of equal parts of the Juice and Decoction mixt together, in which, to every iv. ounces of the Mixture, ij. drams of Nitre are added and dissolved. It has all the Virtues of the Juice and Masticatory, and purges and cleanses the Head and Brain so admirably as to Cure all those Diseases afore-named of those parts, and where they are not present, but are only feared from a coldness of the Head and Parts adjacent, a Sleepiness, and a being stuffed with cold flegmatick Humors; the use hereof now and then prevents their coming, and secures the Patient for the future.

XVI. *The Pessary.* It is made either of the Root cut into form, or of the Juice made up with melted Wax and Barley Flower; put up into the Womb or Vagina, it opens the Veins of the Womb, and by its attractive force, provokes and draws down the Terms: but it ought to be several times renewed, taking proper things also by the Mouth.

XVII. *The Ointment.* It is made of the green Herb or Juice. The Eye-lids being anointed therewith, it helps Ophthalmies or Inflammations of the Eyes, and applied to running Sores, old Ulcers, putrid Fistula's, and other malign and corroding Disfigurements, it perfectly cleanses them, strengthens the Part Affected, and promotes their healing.

XVIII. *The Cataplasma.* It is made of the green Herb beaten with Hogs Lard, in which a little Alum and Nitre, in fine Pouders, are mixt and dissolved: applied, it eases Pain in any Part, and Cures Scurff, Morpew and Leprosie, being used for some considerable time.

XIX. *The Saline Tincture.* The External Parts of the Body being washed with it, it removes all sorts of Disfigurements, cleansing the Part, and killing the Humor, by destroying the Ferment which breeds it. Mixt with double quantity of Juice, it becomes

an excellent Gargarism or Liquid Erhine, purging the Head and Brain of all cold Humors. Let Physicians talk what they please, all the Cephalick or Head-purging Pills in the World cannot purge the Head and Brain like to powerful Erhines, Gargarisms or Masticatories.

XX. *The Oily Tincture.* This is indeed truly beneficial for all such as are troubled with Oedema's, cold Tumors, Pains and Aches in any part of the Body from a cold Cause, as also for such as are afflicted with Spasms, Cramps, Convulsions, weakness of the Nerves, Tremblings, Numbness, Palfies, and the like, being anointed effectually twice a day upon the place affected, (and in Palfies, along the Back Bone also,) and continuing the Use thereof, for some considerable time.

CHAP. XIV.

Of Wild ANEMONES.

Wild ANEMONE, *great,*

I. **THE Names.** This Plant is called in Greek, *Ἀνεμών Ἑγγρα*. in Latin, *Anemone Sylvestris*, *Anemone Nemorum*, *Herba Venti Sylvestris*; and in English, *Wild Anemone*.

II. **The Kinds.** They are twofold, 1. The single *Anemones*. 2. The double *Anemones*. The single *Anemones* Wild are, 1. The Greater or Broad-leaved Wild White *Anemone*. 2. The Common or Smaller-leaved Wild *Anemone*, Purple, Carnation, Yellow, White. 3. The Wild double *Anemone*, Purple, Red, White.

III. **The Description.** 1. The Greater or Broad-leaved Wild White *Anemone*. The Root consists of a great number of long black Strings, encreasing very much by running under Ground, and shooting up in divers places, from whence springs forth divers broad green Leaves, cut into divisions, and dented about, very like unto a broad Leaved Crowfoot, from among which rises

riseth up a Stalk, having some such like cut Leaves in the middle thereof, as grow below, but smaller; on the top thereof stands one large white Flower, consisting of five Leaves for the most part, with some yellow Threads in the middle, standing about such a green Head as you see in the Garden Anemones, which growing greater after the Flower is past, is composed of many small Seeds, wrapped up in a white kind of Down, which as soon as they are ripe, raise themselves up from the bottom of the Head, and fly away with the Wind, as the Garden kinds do.

IV. 2. The Common or Smaller-leav'd Wild single-flower'd Anemone. It has a Root long and small, somewhat like unto the Root of Polypody, creeping under the upper crust of the Earth, from whence rises up one or two, and sometimes more small, round, naked Stalks, bearing about the middle of them, small, soft and tender jagged Leaves, deeply cut in and indented on the edges about, from above which also does grow the Stalk, bearing small Flowers, Purple, Carnation, Yellow or White, not much unlike to a Crow-foot, (standing upon weak foot Stalks) with some Threads in the middle.

V. 3. The Wild double-flower'd Anemone. This double kind is very like unto the single white kind before described, both in its long running Roots, and its thin jagged Leaves, but somewhat larger: the Flowers whereof are very thick and double, but small, of a faint sweet Scent, which are of a purple, red, or white colour after they are blown, for five or six days; the purple and red are of a fine light colour towards the tops of the Leaves, but the bottoms of the Leaves of a very deep colour of the kind: and the White-flowered are very white when full blown, but afterwards they become a little purplish on the inside, but more on the outside, after which comes a small Head like the former kinds, but seldom or never give any Seed, especially the White kind.

VI. The Places. The first broad-leav'd grows Wild in divers places of Austria and Hungary; but with us, is nourisht up in Gardens: the other single

kinds grow wild in most places in England, in Woods, Copes, Groves, Orchards, &c. except that with yellow Flowers. The double-flowered are only found in Gardens; but *Clusius* says they are found in the Low Countries, in a Wood near Lo-vain.

VII. The Times. They flower from the beginning of March, (which is the earliest) and continue flowering till May, or the middle of May; and the double kinds begin to flower presently after the single kinds are past.

VIII. The Qualities. They are hot and dry in the third degree. They cut, incise, attenuate, attract and inflame; are dedicated to the Head, Womb and Joynts, and Alteratives only in their Operation.

IX. The Specification. They are peculiar against cold and moist Dilempers of the Head, Brain and Womb, and to cleanse old Ulcers.

X. The Preparations. Tho' the Shops keep nothing of this Plant, yet you may prepare therefrom, 1. A Juice. 2. An Essence. 3. A Decoction. 4. A Gargarism. 5. A Saline Tincture. 6. An Oily Tincture. 7. An Ointment. 8. A Cataplasim. 9. A Masticatory. 10. A Pessary.

The Virtues.

XI. The Juice. It is a singular good Errhine, for by snuffing it up the Nostrils morning and evening, it Purges the Head and Brain of cold, thick and tough flegmatick Humors, whereby it prevails against Apoplexies, Epilepsies, Carus, Lethargies, Vertigo's, Megrims and cold Head-aches, proceeding from a cold Cause.

XII. The Essence. It has the same Virtues used as an Errhine; but is most commonly given inwardly, from ij. drams to half an ounce, mixed with a draught of Mead, Wine, or some proper Water, to open Obstructions of the Womb, and to bring down effectually the Terms in Women, as also to hasten the Birth, and bring away the After-birth.

XIII. The Decoction. It is not so hot as the former, and therefore not so strong, but yet is effectual for the same things the Essence is, but may be given in a larger Dose, as from ij. ounces to iij. sweetened with white Sugar.

XIV. The Gargarism. It is made of the Juice or Essence, mixt with an equal quantity of the Decoction, to 8. ounces of which you may add iij. drams of pure Nitre, dissolving it therein. Used as a Gargle, it powerfully attracts cold and moist Humors out of the Head and Brain, and Parts adjacent, and so is good in the Cure of those Diseases, the Juice is said to be good against.

XV. The Saline Tincture. It more powerfully opens the Womb than the Essence does, and is used in inveterate Obstructions thereof when the Essence is not found powerful enough. It also opens Obstructions of the Reins and Bladder, provokes Urin, and expels Sand and Tartarous Matter. Dose from j. dram to ij. in some fit Vehicle.

XVI. The Oily Tincture. Tho' this may be used inwardly, yet its chief Use is for External Applications against Weakness and cold Affections of the Nerves, Tendons, Ligaments and Joynts; against all sorts of Aches and Pains proceeding from Cold, or an Afflux of cold Humors, as also against Numbness, Tremblings, Cramps, Convulsions, Palsies, and the like Disaffections of the Nerves.

XVII. The Ointment. It has the Virtues of the Oily Tincture, but not so powerful; but is better for cleansing old running Sores, fatid Ulcers, malign and rebellious Fistula's, and taking away Scabs, Itch, Scurff, Morpew, and other like Desilements of the Skin.

XVIII. The

XVIII. *The Cataplasn.* It has the Virtues of the Ointment, opens the Pores of the Skin more, and prevails against Scabs, Scurf, Morpew, Leprosie, &c.

XIX. *The Masticatory.* It has all the Virtues of the Gargarism, but is better to be used by such as cannot away with the other. It's made of the Root.

XX. *The Pessary.* It is made either of the Root or Juice, with Wax and Barley-Flower, and is put up into the Womb, to bring down the Courfes.

CHAP. XV.

Of Garden ANGELICA.

I. *THE Names.* It is called in *Greek*, Άγγελική, (and yet some Authors say it was unknown to the *Greeks*, unless by some other Name) in *Latin* Angelica, and so also in *English*: and by this Name it is called in almost all *European Nations*, so far as their Dialect will admit: *Cordus* will have it to be *Panax Heracleum*, but this I much question; yet according to its Virtues, it may very well be accounted among the number of the *All-heals*: but its condensed Juice is no *Opopanax*. Others, as *Dodonæus* and *Lucena*, will have it to be a kind of *Laserpitium*, or *Laserwort*, but of that see lib. 3. cap. 115. and 116. of this present Work.

II. *The Kinds.* There are four several kinds of Angelica; as, 1. *The Garden Angelica.* 2. *The Wild.* 3. *The Water Angelica.* 4. *The Mountain kind*; of which last we shall say nothing in this Book.

III. *The Description.* Our Garden Angelica has a Root, which is great and large, something pulpy before flowering; but after flowering it becomes woody, extending it self into many and long Arms or Branches, which perish after Seed-time; but if the Plant, by being often cut down, is kept from seeding, the Root will then endure many years together: this Root, if cut or bruised, smells strong, and discharges

out of it self an Oily, or rather Gummy, Liquor, which being inspissated Yields no unpleasant Gum, and not much unlike to Opopanax, but yet it is not the same thing. From this Root Springs forth divers large and fair spread winged Leaves, half a yard long, and sometimes longer, made of many great and broad ones, set usually one against another on a middle Rib, of a pale, but fresh green colour, and dented about the edges; from among which usually arises one round hollow Stalk, very thick, and four or five feet high, with divers great Joints, and Leaves set on them, whose foot-stalks do encompass the main Stalk at their bottoms; and from thence also, towards the top, comes forth Branches, with the like, but lesser Leaves at them; and at their tops, there comes forth large round spread Umbles of white Flowers, after which comes the Seed, which is somewhat flat, thick, short, and of a whitish brown colour; two always set together, (as is usual in these Umbelliferous Plants) which is a little crested on the round side.

IV. *The Places.* It is found in great plenty in Norway and Island, where it grows very high, and whose Inhabitants it is said do eat it, for want many times of other Food, peeling off the Bark: It is also said to grow upon the Rocks, not far from Berwick: But with us, it grows only in Gardens, being first brought hither from beyond Sea.

V. *The Times.* It flowers in July and August, and the Seed is ripe not long after: if this Seed is suffered to fall of its own accord, it will more certainly grow, than that which is gathered and sown by hand, at any other time.

VI. *The Qualities.* It is hot and dry in the second degree; but Schröder saith in the third degree, which I believe not. It opens, incides, attenuates or makes thin, Digests, Dissolves, and is Sudorific. As to its appropriation, it is Cephalick, Neurotick, Cardiack and Hysterick. It is Bezoardick or Alexipharmick, Vulnerary, and the most famous of all Vegetable Alteratives.

VII. *The Specification.* It is a peculiar Antidote against the Plague or Pestilence, and all malign, infectious and pestilential Diseases: it is also an Antidote against the Poyson of Mad Dogs, the biting of Vipers, Rattle-snakes, and other Serpents, or other Venomous Creatures, and, as an *All-heal*, Cures Wounds by the first Intention; and is singular against the Scurvy in a cold Constitution.

VIII. *The Preparations.* The Shops sometimes keep hereof, 1. *The dried Root.* 2. *The Seed.* 3. *A Distilled Water* from the whole Plant. 4. *A Juice* from the fresh Root and Herb. 5. *An Extract* with Spirit of Wine. 6. *The Root Candy'd.* 7. *A Distilled Oil* which ascends with the Water. 8. *A Balsam* made with the said Oil, and Oil of Nutmegs. 9. *A Common Salt.* Besides all these things, you may make therefrom, 10. *A Syrup.* 11. *A Decoction.* 12. *A Wine.* 13. *A Spirit.* 14. *A Spirituous Tincture.* 15. *A Saline Tincture.* 16. *An Oily Tincture.* 17. *The Powers.* 18. *An Essence.* 19. *A Balsam* for Wounds. 20. *An Ointment.* 21. *A Cataplasn.* 22. *A Cerote* or Emplaster. 23. *A Gargarism.* 24. *An Errhine.* The virtues and uses of all which follows.

The Virtues.

IX. *The dried Root.* Used as a Masticatory, it attracts cold and moist humors out of the Head and Brain, and gives ease in the Tooth-Ach: the Pouder thereof taken to j. dram, is good against the bitings of Mad Dogs, Vipers, and other kinds of venomous Creatures, and also prevails against the Pleurisie, Plague, and all other kinds of infectious Diseases. Take of this Pouder j. dram, Mixturate a dram and half,

half, mix for a Dose; to be given in the aforesaid Cases.

X. *The Seed.* The Seed has the same Virtues, but not all out so powerful: the Powder thereof may be given to j. dram or j. dram and half to Sweat upon: it defends the Heart, Spirits and Blood against Poyson, and is a good preservative against Pestilential Infection.

XI. *The Distilled Water from the whole Plant.* It is Bezoartick and Alexipharmick, good against Sickness at Heart, which it many times eases upon the spot; but is mostly used as a Vehicle to convey other preparations of this Plant, and others of like Virtues in.

XII. *The inspissate juice of the Root, and also of the Herb.* It warms, comforts and restores, incides and attenuates thick humors, resists Poyson, and is good against the Plague, or malignity of any other Epidemick and infectious Disease: It Cures also the bitings of Mad Dogs, Serpents, &c. and is Pectoral, good against Wind in the Bowels, Coughs, Hoarseness, Phthisicks, Asthmas, shortness of Breath, Peripneumonies, and indeed all Diseases of the Breast and Lungs: outwardly applied, it warms, discusses, and resolves hard Tumors; and therefore is good in an Oedema and other like swellings of the Joynts. Dose inwardly is, from j. dram to ij. drams or more, dissolved in Wine and drunk.

XIII. *The Extrall with Spirit of Wine.* It is made of the *Caput Mort.* of the Herb and Plant after Distillation, &c. given from j. dram to ij. drams in Sack, it provokes Sweat powerfully, and is an Antidote against the Plague or Pestilence, Measles, Small-Pox, Spotted-Fever, Poyson inwardly taken, or outwardly given by the biting of any Venomous Creature. It Cures Agues if given to Sweat upon.

XIV. *The Candied Root.* It is a pleasant thing, and being often eaten is good against Coughs, Hoarseness, and strengthens, heals and comforts a cold and weak Stomach.

XV. *The Distilled Oil which ascends with the Water.* It is very powerful against the Pleurisie, Obstructions and Wind in the Bowels, the Colick and Gripings of the Guts, Poyson of all Kinds, and the Infection of the Plague or Pestilence: It is also good against most Diseases of the Breast and Lungs, and has all the Virtues of the Inspissate Juice of the Root, but this is more excellent, subtil, penetrating and effectual: It opens all Obstructions of the Urinary Passages, provokes Urine and the Courses, and expels both Birth and After-birth. Dose from iij. drops to 10, first dropt into Sugar, and mixt well therewith, and then mixt with a Glass of Wine.

XVI. *The Balsam with Oil of Nutmegs.* Take Oil of Nutmegs or Mace made by expression j. ounce: Balsam of Peru, ij. drams: Oil of Angelica j. dram and half, mix them. It eases all pains of the Head, as Head-Aches, Megrims, &c. proceeding from a cold cause, being anointed thereon. Inwardly taken to j. Scruple, in a Bolus of Mithridate, or in any proper liquid Vehicle, it has all the Virtues of the Oil aforesaid: besides which, being put into an hollow Tooth; it eases the pains thereof.

XVII. *The fixed Salt of the whole Plant.* It is a singular thing against the Pleurisie, Peripneumony, Plague, or any Pestilential Disease, the Colick, Strangury, and stoppage of Urine, for it absorbs the acid and acrimonious or malign humors, which is the cause of those disaffections, it loosens the Blood, and causes a present and speedy Circulation, and withall it opens all Obstructions of the Lungs, and causes a free breathing. Dose from j. Scruple to j. Dram, in the Distilled Water, or in Wine, or other proper Vehicle.

XVIII. *The Syrup.* It is Pectoral, good against

Coughs, and all sorts of inward Obstructions of the Viscera, chiefly of the Lungs, but is used mostly as a Vehicle to convey other Medicines in. Dose from j. Ounce to ij. Ounces.

XIX. *The Decoction.* Taken from iij. Ounces to viij. Ounces, it is good against inward bruises, and to dissolve congealed Blood; strengthens the Stomach, and is effectual against the Suffocation of the Mother. It makes an excellent Wound-drink, for such as have Gunshot or Contused Wounds; old Sores, running Ulcers, fetid and callous Fistula's, disposing them to a speedy healing.

XX. *The Wine.* It is to be made of the roots and stalks, (as is also the Decoction) and has all the Virtues of the Decoction, save that this is much more powerful to all the said Intentions. Dose from iij. to vi. Ounces twice or thrice a day.

XXI. *The Spirit.* It is either *Simple* or *Compound*. The *Simple* is a most famous Cordial, scarcely inferior to any other Vegetable Cordial in the World: it removes Sickness at Heart and Stomach, prevails against Fainting, Swoonings and Convulsions, whether in Old or Young, warms and comforts a cold and weak Stomach, and as much as may be, restores old Age. I cannot speak enough in the praise of it! It resists Poyson, whether inward or outward, and the Contagion of a Pestilential Air. Dose from j. dram to half an ounce, well dulcified with treble refined Sugar, and then it may either be taken alone, or in a Glass of Wine. The *Compound Spirit* you may have its Composition, Preparation and Virtues, in Our *Pharmacopæia Londinensis*, Lib. 4. Cap. 1. *Secl.* 2. to which you are referred.

XXII. *The Spirituous Tincture.* It is a great Cordial Restorative, and an excellent thing for such as are wounded, and have old running Sores or Fistula's about them, which have been of long standing, and not easily cured: for it alters and changes the discreasy of the Blood, and makes it more Balsamick, as also the other Juices, and so contributes to healing; besides it has all the Virtues of the Spirit, and indeed much more powerful. It may be taken morning, noon and night, for some considerable time, from ij. drams to half an ounce, in some proper *Vehiculum*.

XXIII. *The Saline Tincture.* It is a good Vulnerary, and carries off much of the Morbick Faculencies and Defilement by Urine; opens Obstructions of all the Viscera, takes away Heat, Burnings, is good against the Strangury, stoppage of Urine, and other Diseases of the Reins and Bladder: It is good against shortness of Breath, and difficulty of Breathing, because it dissolves the Tartarous Mucilage of the Lungs, &c. Dose from j. dram to iij. drams in the Distilled Water, or in Mead or White Wine.

XXIV. *The Oily Tincture.* It is good to anoint with in the Gout and Sciatica, and all Pains and Aches of the Nerves, Tendons and Joynts, proceeding from a cold Cause. 'Tis excellent against Convulsions, Cramps, Numbness, Lameness and Palsies, and the Scurvy in a cold Constitution. You may anoint with it outwardly twice a day, and take it inwardly as often, from iv. drops to xvj. or xx. in any proper Liquor.

XXV. *The Potestates or Powers.* They have all the Virtues of the Oil and Spirit, to which you are referred: 'tis true they are not altogether so strong as the Oil, but they are more subtil and penetrating, and more pleasant to be taken. Dose is from j. dram to iij. or iv. in the Distilled Water or Syrup, or in a glass of Wine, thrice a day.

XXVI. *The Essence.* This is the most necessary and useful of all the Preparations made of *Angelica*, and is made of the Juice of the whole Plant. It is good against

against the Plague, and all sorts of malign infections and Pestilential Fevers: It resists Poysons of all sorts, as the bitings of Mad Dogs, Vipers, Rattle Snakes, or any other Venomous Creature. It defends the Vital and Animal Spirits, and is a great preservative against all kinds of Pestilential Infection. It gives ease in all Pains and Torments coming of Cold, and is a most admirable thing against Peripneumones or Inflammations of the Lungs and Pleurifies. It is a great Pectoral, opening all obstructions of the Brest and Lungs, and thereby gives relief in vehement and old Coughs, Hoarseness, Asthina's or difficulty of breathing, shortness of Breath, and Phtisicks. It gives present ease in the Colick, Provokes the Terms, hastens and facilitates the Birth, and brings away the After-birth and dead Child. It opens all obstructions of the Liver, Spleen, Gall, Bowels, and Mesentery, diffuses inward Tumors, and Cures Agues, if given several times, so as to sweat well upon it. And as it mightily strengthens and fortifies the Stomach, so it is one of the best things against a Suseit in the World, a Vomit or Emetick being given before hand. Dropt into the Eyes it clears them from Clouds, Films, Specks, Pearls, &c. and strengthens the Sight. Dropt into the Ears, it helps their pain and deafness, noise and ringing in them. It heals inward Bruises, dissolves congealed Blood, and is one of the best remedies against a Cold Scurvey. Lastly, It is a most singular Vulnerary, not inferior to any of the *All-heals*, *Confounders*, or *Wound Herbs*: and being given inwardly dietetically it is inferior to no kind of Wound-drink whatsoever, for after an admirable manner, it disposes all Wounds, of what kind so ever, (if curable,) as also running Sores, old Ulcers, and Fistula's, to a very speedy healing. Dose from j. ounce to iij. or iv. ounces, two or three times a day, according as you see the occasion requires.

XXVII. *The Balsam for Wounds.* Take of the Juice of the Root and Stalks inspissated to the thickness of new Honey vj. ounces, Gum Elemi iij. ounces, Balsam Capiviij, Balsam of Peru, of each ij. ounces, Chio Turpentine j. ounce, mix and melt together, and stir them till they are nearly cold. Or take Oil Olive a Pound and a half, of the Roots Stalks and Leaves well Bruised together, iv. handfuls, boil till they are Crisp, and press out the Oil, this work repeat three times, with the same quantity of Bruised Roots, &c. Lastly, Press forth the Oil: then to every vi. ounces of this Oil, add Gum Elemi iij. ounces: Balsam Capiviij, and Peru, Erankincense, of each ij. ounces: Chio Turpentine j. ounce, mix them well. These Balsams whether the first, or second, cure all simple Wounds by the first Intention: Cleanse running Sores, old Ulcers, and Fistula's, of all their filth, then Incarnate, and in a very short time heal them, almost to a wonder. Apply'd also, they give ease in the Gout. And in Ulcers, where the Bone is bare, the Powder strewed on, and the Balsam apply'd over that, covers the Bone with Flesh, and heals it up.

XXVIII. *The Ointment.* It has the Virtues of the Balsam, but not altogether so powerful: yet a singular Vulnerary, heals Wounds and Ulcers, and eases pains in any part being anointed thereon.

XXIX. *The Cataplasim.* It is made of the Roots and Stalks shred small and beaten to a Pulp, mixt with Hogs Lard, and Crums of Wheaten Bread, till it is of a Consistence. It is good against the Gout, Sciatica, or any External pain from a Cold Cause: and is of singular use being presently apply'd to the Bitings of Mad Dogs, Serpents, &c. to draw forth the poison: applied to the Region of the Spleen, it eases the pain thereof.

XXX. *The Cerote or Emplaster.* The Powder of the Root is made into a Plaster, with the Juice of the Roots inspissated to thickness of Honey, and Pitch added to it, with sufficient Quantity of Bees Wax. It draws strongly, and therefore is good to be apply'd to the bitings of Mad Dogs, Vipers, &c. as also to the Sciatica, and the Gout whether in Hands or Feet.

XXXI. *The Gargarism.* It is made of the Essence and Decoction mixed in equal Quantities, with a third part of Vinegar. It heals Ulcers and Sores in the Mouth, and attracts cold Humors and Rheums, from the Head and Brain; it may be used morning and evening.

XXXII. *The Errhine.* It is made of the fresh Juice drawn out of the Root and Stalks, in vj. ounces of which iij. drams of *Sal Nitre* in fine Powder is dissolved. Being drawn up the Nostrils evening and morning, it admirably purges the Head and Brain of Cold, thick Flegm, and other Humors, which are the foundations and Causes of many pernicious Diseases.

CHAP. XVI.

Of Wild ANGELICA.

I. *THE Names.* It is called in the Greek, Ἀγγελική ῥίζη: in Latin, *Angelica Sylvestris*: and in English, *Wild Angelica*.

II. *The Kind.* It is the second Species of *Angelica* before enumerated in chap. 15. *sett. 2.* aforementioned: and of this there is a greater and lesser sort.

III. *The Description.* The greater sort. The Root of this is nothing so great as the former, neither are the strings so great or long, but it is of a blacker Color on the out side, of a pretty strong scent, But nothing near so Aromatick, as the Garden kind: From this Root rises up large spread Leaves on the Ground, having smaller Stalks, and lesser Divisions.

sions by much, of a dark green Color, and not smelling half so strong as the Garden kind, yet smelling so much like Angelica, that by the smell, one may easily see and know it, to be of the Kinds of Angelica, tho' Wild: The Stalks are much slenderer and smaller, yet growing three or four Foot high, with

Wild.
Angelica.
Great.

smaller Joyns and lesser Leaves thereat; at the tops grow Umbles of Flowers, but lesser also, and white, like the Garden kind, which turn into smaller Seed, and of a darker Color on the out-side.

Wild.
Angelica.
the Smaller.

IV. The smaller sort, has a great thick Root, from whence rises up Leaves not much differing from the other, but only in being smaller and not so much divided, from whence arises one or more Stalks, low-

er than the former also, at the Joyns of which come forth Leaves not much unlike the Garden Angelica, except in the Magnitude, the Stalks also being reddish: at the top of these Stalks grow Umbles of white Flowers, yet lesser than the other, after which comes the Seed, which is thicker than the former, and something longer.

V. The Places. These grow Wild in many places of this Kingdom, in Essex, Kent, and Middlesex, particularly at Kentish-town near London, and in other places.

VI. The Times. The Roots are in their Prime in February, March, and April; they Flower in July and August, and their Seed is ripe soon after.

VII. The Qualities. They are hot and dry in the second Degree. Are opening, inciding, attenuating, digestive, discussive and sudorifick, and are appropriated to the Head, Stomach, Heart, Womb and Joyns: they are also Alexipharmick, Alterative and Vulnerary.

VIII. The Specification. They are peculiar Antidotes against Plague and Poyson, Specificks against the Gout, and singular Wound Herbs.

IX. The Preparations. The Shops keep nothing of them; but you may Prepare therefrom. 1. A liquid Juice. 2. An Inspissate Juice from the Root. 3. An Essence. 4. A Wine. 5. A Gargarism. 6. An Errhine. 7. A Decoction. 8. A Spirituous Tincture. 9. A Saline Tincture. 10. An Oily Tincture. 11. A Cataplasim. 12. A Balsam. 13. An Ointment. 14. A Cerote or Emplaster.

The Virtues.

X. As to the Virtues of these Wild Angelica's, they are exactly the same with the Garden Kind, which we have largely delivered before, and we were the more willing to be explicate in the Garden kind, there, because we intended to say nothing of the Virtues here: For every Preparation of the Wild kinds has the same Intentions and Uses with those of the Garden, and therefore to them you are referred: Yet here is one thing to be taken notice of, viz. That tho the Virtues of both Garden and Wild kinds are one and the same, yet the Garden kind much exceeds the Wild in Strength and Vertue, and therefore is rather to be chosen (where it may be) before them. These are dryer than the Garden kind, and ought to be put into all Diet Drinks for Wounded Persons.

CHAP. XVII.

Of Water ANGELICA.

I. The Names. It is called in Greek, *Ἀγγεῖκη* *ἁγία*; in Latin, *Angelica Aquatica*, *Archangelica*: And in English, *Water Angelica*.

II. The Kinds. It is the third Species of *Angelica* aforementioned, in chap. 15. sect. 2. above: of which there is known to us, this singular kind only. And it is by some called *Wild Angelica*, whence the Name upon the Cut, which is the first Cut in the former Chapter, and was placed there by a mistake, and Answers only to the following Description.

III. The Description. The Root of this Plant is great according to its kind and magnitude, thick and White, with some strings hanging to it, and endures many years without perishing: from whence arises Leaves like unto the Garden *Angelica*, more in number, and smaller divided, which are set upon a great Stalk gross and thick, which is much taller and greater.

greater than the Garden kind, and somewhat Reddish at the Joints, from whence the Leaves by a large Foot-Stalk rise, whose lower part seems to enclose the whole Joint, and to be of a redish Color also; the Leaves are of as deep a green Color as those of the Garden sort: from this Stalk also rises up several long Branches, coming forth of an Husk or Case, not much unlike the common Garden Parsnip; at the top of which Branches come forth Tufts or Umbles of white Flowers, very like to those of the Garden kind: After the Flowers come the Seed, broader, longer, thicker, and of a much darker Color than the Garden Angelica: and the smell of the Plant is much like the same.

Water Angelica.

IV. *The Places.* It grows naturally in England, in moist and watery Ditches and Places, from whence it took its Name; and in particular in the Marsh-Ditches by Redriff.

V. *The Times.* It Flowers also in July and August, and its Seed is ripe not long after: but its Root is in its prime in March and April.

VI. *The Qualities.* It is hot and dry in the second Degree: is Inciding, Attenuating, Aperitive, Digestive, Discussive, Attractive and Absterfive: it is Cephalick, Stomack, Cardiack, Uterine and Vulnerary.

VII. *The Specification.* It is a thing peculiar against the Scurvy in a cold habit of Body, and one of the greatest Vulneraries among Vegetables.

VIII. *The Preparations.* The Shops keep nothing hereof, yet you may make therefrom, 1. An Essence. 2. A Liquid Juice. 3. A Decoction in Wine and Water. 4. A Saline Tincture. 5. A Diet Drink. 6. A Cataplasm. 7. A Balsum. 8. A Cerote or Emplaster.

The Virtues.

IX. *The Essence.* Setting Scurvy-Grass aside, I can speak by singular Experience, that I know nothing among Vegetables so effectual for the curing of the Scurvy in a cold habit of Body: and as a Vulnerary, I have used it I believe above an Hun-

dred times, with such a success as is admirable. Again in Diseases of the Womb, I know this to be more prevalent than the Garden, in cleansing it, in repressing the Vapors, and helping fits of the Mother. I remember I once gave this to a Woman, who had a kind of a Honey hardness in the Womb, with a Tumor as big as a small Ostriches Egg, which almost continually bled, with very great pain, but not continual: This some Physicians and Chirurgeons determined to be a Cancer of the Womb, and so incurable: it was dubious what to say, and the Disease seemed difficult to cure, if at all Curable: however I advised her to the Plentiful use of it for some time: She took iv. ounces of it, morning, noon and night, and continued it for six Weeks, at the end of which time she became perfectly well, and by the use thereof, she voided great quantities of hard clotted Blood.

X. *The Liquid Juice.* Either alone, or with a little Nitre dissolved in it, it is an excellent Errhine, to be snufft Blood-warm up the Nostrills, till it comes out of the Mouth: it purges the Head and Brain of much cold, stegmatick Humors, raking away sleepiness and heaviness of the head.

XI. *The Decoction in Wine and Water.* It is an excellent Hystrick and Vulnerary, and may be of good use to such, who cannot be obliged to take either the Juice or Essence. Dose viij. ounces twice a day.

XII. *The Saline Tincture.* It is an excellent thing in a Scorbute, where the whole Mass of Blood is tainted, and the Patient breaks forth into Botches, Boils, Scabs, Leprosy, &c. depurates the Humors, and carries off their Faculencies effectually by Urine. Dose from j. dram to ij.

XIII. *The Diet Drink.* Tho this is chiefly intended for Wounded People, and such as have inveterate and running Sores, Ulcers, and Fistula's, yet it is of as great service for such as are afflicted with the Scurvy, have an obstruction, pain or tumor of the Spleen, or any grand disaffection of the Womb. It is drunk daily Spring and Fall as ordinary Drink: and at any other seasons when necessity requires it. It is also found by experience to be good against Hypochondriack Melancholy.

XIV. *The Cataplasm.* It is used against a cold Gout, to discuss tumors, ease pains, and absterge filthy running Sores and Ulcers.

XV. *The Balsum.* It cures simple Wounds, (which are without fracture of the Bone or Contusion) by the first intention: It also cleanses foul Ulcers, incarnates and heals them.

XVI. *The Cerote or Emplaster.* It has an attractive force, incarnates and heals, eases pain, and strengthens the part it is applied to.

CHAP. XVIII.

of ANISE.

I. *THE Names.* It is called in Greek *Ἀνίσον*; In Latin, *Anisum*: And in English, *Anise*. I am apt to believe it is called *Ἀνίσον* quia habet folia *anisa*, inaequalia, vel quia est sine aequali, there being no Plant equal to it in goodness. It is also called in Greek, *Ἀνικeton*, *Anicetum*, quasi, *invictum*, because it seems to be invincible, or not to be overcome, which, I suppose, is in respect to its extraordinary Taste and Smell, which overcomes the Taste and Smells of all other Vegetables in the World.

II. *The Kinds.* It is two-fold, 1. *The Common*, of which we shall Treat in this Chapter. 2. *The*

Starry

Starry Headed of Clusius growing in *China*, and other parts of the *East-Indies*, of which we have nothing to say in this Work.

III. The Description. It has a small long Root, with some few strings, which Perishes every Year, from which rises up a Stalk round and hollow, about two or three feet high, (seldom higher, for it is a slender Plant) which is divided into divers small Branches, set with Leaves next the Ground, somewhat broad and dented in about the edges; but those which grow higher are more jagged, much like to those of young Parsley, but Whiter: the higher Leaves are also lesser than the lower, of a whitish green color, and of a good sweet Taste and Smell: the higher the Stalk the rounder it is; and spreads not into Branches, saving near the top, where it thrusts it self forth into several spoke rundles or tufts; on the top of which, Umbles of white Flowers do stand, which afterwards do give small roundish long Seed, of a whitish grey colour, and very sweet, and of a quick, yet pleasant Taste and Smell, and more in Quantity than any other Umbelliferous Plant whatsoever.

IV. The Places. It grows plentifully in *Egypt*, *Syria*, *Candia*, and other Eastern Countries: It grows also in *England* in the Gardens of Herbalists, where it has well enough thriven, and brought forth Seed perfectly ripe and good.

V. The Times. It is Sown with us in *England* in *May*, and the Seed is Ripe in *August*. But you may Sow *Aniseeds* here, in *England*, in *February*, when the Moon is at Full, or any time between the Full and the Change: If by reason of Frost, you cannot take the Full Moon, you must take the next opportunity, and cast them into the Ground, raking them well in; after which, strew fresh or new Horse-Dung, thinly upon the Ground, to defend them from the Frost, so will these seed and be ripe about *Bartholomew-tide*: Then Sow again in the Full Moon in *May*; these, if the Weather is kind, may be ripe sooner than the former. *Aniseed* will also come well up, if they be Self-sown, only the Ground is to be broken up near to and about them, when they begin to ripen. The time of their Flowering does continue four or five Months, so that, at one time,

you may find the Plant in full Flower, and the Seed near to its full Growth, as you often see in *Fennel*, *Dill*, &c. That Ground which you would Sow in *February*, you ought to break up about *Michaelmas*, and to let it lye and Crumble all Winter, and when you intend to Sow it, you must stir it up again, that it may be mellow; for the mellowest, the better; and a black, rich, mellow Mould is the best, for they delight in a well dung'd rich Soil.

VI. The Qualities. It is Hot in the second Degree, and Dry in the first: The Seeds are Opening, Inciding, Attenuating, Digestive, Discussive, Carnative and Anodine; and by Appropriation, they are Cephalick, Stomackick, Pectoral, Hysterick, Nephritick, and Arthritick: They are also Laetogenetick, Spermatogenetick, and Alterative.

VII. The Specification. They have a peculiar property against Coughs, Shortness of Breath, Difficulty of Breathing, and the Colick.

VIII. The Preparations. The Shops keep, 1. The Seed. 2. *Aniseed Comfits*. 3. *Aniseed Comfits Laxative*. 4. A Distilled Water. 5. *Aniseed Water*, made with *Aqua Vite*. 6. A Chymical Oil. 7. A Fixt Salt of the Plant by Incineration. To the former things you may add these following. 8. The Green Herb. 9. The Essence. 10. The Potestates or Powers. 11. A Spirituous Tincture. 12. A Saline Tincture. 13. An Oily Tincture. 14. A Decoction. 15. A Balsam. 16. A Cataplasm. 17. An Extract. 18. A Spirit.

The Virtues.

IX. The Seed. *Schroder* says, it is milder when green, Attenuates, Discusses, provokes Urine, breeds Milk, is Pectoral, and good for the Stomach, and to open Obstructions in the Lungs; it is given in Powder to such as have their Bellies swollen up with Wind: A scruple given to a Child, Purges and Vomits gently, and carries off those green Excrements, which in those little ones cause Gripings, vehement Pain, sickness at Stomach, and sometimes Convulsions: It is a Specifick also in curing a stubborn Hiccough.

X. *Aniseed Comfits*. They are good against Coughs, open the Lungs, expel Wind, and give ease in the Colick.

XI. *Aniseed Comfits Laxative*. They are made by a Maceration of the Seed in Water, in which Scammony has been Dissolved; or by mixing the Powder of Scammony with the first Coverings of Sugar; or by Macerating them in an Infusion of *Vitrum Antimonij*. The former Purge gently, without any Pain, Griping or making Sick; the last both Purge and Vomit; but they all carry off Sharp, Corroding, Slimy, Flegmatick, and Tartarous Humors, help Digestion, empty the Lungs of the matter Obstructing them, and Cure the Colick. Dose from half a dram to ij. drams.

XII. The Distilled Water of the whole Plant, or of the Seed. It is a good Vehicle to convey other Medicines in; besides which it expels Wind, is good for Sore Eyes, and encreases Milk in Nurses. Dose from ij. to iiiij. Ounces.

XIII. *Aniseed Water Distilled off from Aqua Vite*, or Spirit of Wine. It comforts the Stomach, opens the Lungs, helps Obstructions of the Liver, expels Wind, causes Digestion, and prevails against the Colick. Dose ij. Drams to half an Ounce, now and then upon occasion.

XIV. The Chymical Oil. It is an admirable Pectoral, Curing most Diseases of the Breast and Lungs, as Coughs, Colds, Asthma's, Rawness, Windiness of the Stomach, Phthisick, Colick, and indeed all Diseases proceeding from Cold, and Wind; it

provokes Lust, and is often given with good Success in Fits of the Mother, in Epilepsies, Apoplexies, Vertigo's, Megrims, Head-aches, Lethargies, Crurs, and other Diseases proceeding from Cold Hegmatick Humors. Dose from iij. Drops to x. in some fit Vehicle or Liqueur.

XV. *The Fix'd Salt.* It is an admirable Pectoral and Nephritick; it Dissolves Tartarous Matter in the Lungs, Reins, Ureters, Bladder, or Womb, opens all Obstructions of those Parts, provokes Urine, and brings away Sand, Gravel, or whatsoever creates a Stoppage in those Parts. Dose j. Scruple to half a Dram.

XVI. *The Green Herb.* The Decoction in Water and Wine, being drunk several times a day increases Milk in Nurses; and Boiled in Oil of Roses, and dropt into the Ears, takes away their Pains, and removes the noise in them. The planting this Herb near Bees, is the best means for the keeping of Bees, and multiplying of them, as also for their Breeding great store of Honey: For first it yields an innumerable company of Flowers, and is continually in Flowering for Four and sometimes Five Months, according as the Year is Seasonable, and these Flowers yield much Sweetness and Honey, and carry a Scent so pleasant and grateful with them, that the Bees rather chuse to feed upon it, than upon any other Plant whatsoever; besides they contain an excellent Sweetning Ferment, by which the Dew is converted into a more Thick and Sweet Substance, by many degrees passing simple Dew, which contains within it a Saccharine Salt, which the Bees greedily resort to, and suck, and with it load themselves: But the main excellency is the long duration of its flowering time, so that it will afford them a supply, the greatest part of their gathering-time, whereas the Blossoms of Fruit-trees, and Flowers of other Herbs, are only at a peculiar season, and of small continuance. The Green Herb being taken, and the inside of the Hives, as also the Orifices thereof being rubbed therewith, will so much delight the Bees, that when their Swarming time comes, which will be Three Times a Year, if they feed on this Herb, they will certainly enter into them, and go no where else: But in case when they Swarm, they should settle upon some Tree, or other Place, the fault may be helped by rubbing the inside of the new Hive with Green Anise, and holding it on the Top of a Pole to the Bees; for by the Sweet Scent or Smell of the Anise, they will be allured, to enter therinto, of their own accords. It is reported, that a certain Lord of *Austria* so thrived by this Secret, that he furnished many Countries with Honey and Wax, whereby he Accumulated to himself vast Wealth, and a very great Estate.

XVII. *The Essence.* Whether it is prepared of the Herb, or Green Seed, or both, has all the Virtues of the Chymical Oil, but not all out so powerful, for which reason this is to be given in a much larger Dose, as from j. Ounce to ij. Ounces, or more; it powerfully opens Obstructions of Liver, Spleen, Lungs, Reins, and Womb, and is singular against the Falling-sickness, Convulsions, and Colick: It powerfully provokes Lust, is good for such as are Impotent, and makes others more Vigorous; for it mightily encreases Seed in the Seminal Vessels, as also Milk in Nurses, and prevails against Poison, and the Bittings of Mad Dogs, or other Venomous Creatures.

XVIII. *The Potestates or Powers.* This Preparation has all the Virtues both of the Oil and Essence, and is much more pleasant to be taken, and in par-

ticular is a singular thing against Vapors, the rising of the Mother, Frensie, Madnes, and other like Distempers of the Brain; you may give from j. Dram to iij. or iiij. Drams, in any convenient Vehicle: It is very good against Convulsion Fits, and Cures (outwardly by Bathing the place with it) all kinds of Pains, Aches, and Cramps, proceeding from a cold Cause: It is good also to Prevent and Cure After-pains of Women in Child-bed, being inwardly taken, and outwardly bathed upon the Region of the Belly, a warm Flannel dipt also in the same being laid over it.

XIX. *The Spirituous Tincture of the Seed.* It has the Virtues of the Oil and Powers, but scarcely so strong; and causes an Expectoration of Flegm in such as have Coughs, Colds, Shortness of Breath, Asthma's or Difficulty of Breathing; and is excellent good against the Bittings of Mad Dogs, Vipers, or other Venomous Creatures: It prevails much also against Hypochondriack Melancholly. Dose from j. Dram to ij. or iij. Drams, in some fit Vehicle.

XX. *The Saline Tincture.* It is a Specifick to dissipate both the Wind and Water in the Dropisie Tympanites; it increases Milk in Nurses, facilitates the Birth, brings away the After-birth, and dissolves Tartarous Matter, whether in the Lungs, Womb, Reins or Bladder, and therefore powerfully Provokes Urine, and Expels Sand, Gravel, &c. Dose from j. Dram to ij. Drams, or more, according to the Age and Necessity.

XXI. *The Oily Tincture.* Altho' it is good in Diseases of the Reins, Ureters, and Bladder, and may be given inwardly, for many Diseases of the Liver, Spleen, and Lungs; yet its principal use is in External Applications; for being Anointed upon the Part, it cures Cramps, Old Aches and Pains, Gouts, Numedness, Lameness, Tremblings, and Palfies, proceeding from a cold Cause, and Viscous, Tartarous Humors; yet in these very cases it may also be taken inwardly from v. or vj. Drops, to x. or xij. in Wine, &c.

XXII. *The Decoction of the Seed.* It is peculiar for breeding Milk in Nurses; and if made in Wine, it opens Obstructions of the Liver, and is very profitable in curing the Dropisie, Ascites, or Anasarca; it stops the Hiccough, helps Digestion, stirs up Lust, is good against the Colick, Poison, and Bittings of all Venomous Creatures, helps a Stinking Breath, Provokes Urine, and Expels Wind in any part, whether Head, Stomach, Spleen, Bowels, Mesentery, or Womb. Dose from iij. to viij. ounces, two or three times a Day.

XXIII. *The Balsam.* It has all the Virtues of the Oily Tincture, being outwardly Applied, and Cures Wounds, though of the Nerves, by the first Intention.

XXIV. *The Cataplasim.* If it is made of the Seed, either Green or Dry, and applied to the Eyes which have any thing fallen into them, it quickly draws it forth; and being applied to any place Bitten with a Mad Dog, Viper, Rattle-Snake, or Venomous Creature, it effectually draws forth the Poison.

XXV. *The Extract.* Take the Seed bruised, upon which Affuse Spirit of Wine, which Digest three or four Days, then press forth the Liqueur out of the Seed; put this Liqueur into an Alembick or Glafs Vesica, and Abstract the Spirit by Distillation till what remains is of the thickness of Honey. This Spirit is Spirit of Aniseeds. Dose from j. Dram to ij. Drams, against the Falling-sickness.

XXVI. *The Spirit.* It has all the Virtues of Aniseed Water, and is not much inferior to the Powers. Dose from j. to ij. Drams, in Wine.

CHAP. XIX.

OF LOVE APPLES.

I. THE Names. It is called in Greek, as *Anguillara* says, *Αυκωνανδρ*, & *Αυκωνανδρ*: in Latin, *Pomum Amoris*, *Pomum Aureum*; *Malum Amoris*, *Malum Aureum*: And in English, Love Apples.

II. The Kinds. There are but two sorts thereof, viz. The Greater kind and the Lesser kind: and of the Greater, there are also two sorts; but they differ in nothing but in the colour of the Fruit, the one being of a fair Reddish colour; the other of a pale Yellow.

Love Apple

III. The Description. The Root of the Greater Kind, which is Small and Thready, shoots forth into many small Strings, and larger Branches, under ground, which perishes at the first approach of our Winter, from whence springs forth very long round Stalks or Branches, fat and full of Juice, trailing upon the ground, not able to sustain it self upright, by reason of the weakness of its Stalks, and also of the great weight of its Leaves and Fruit wherewith it is loaded. The Leaves are many, long, and winged, viz. many Leaves set on both sides a middle Rib, some greater, others less, deeply jagged or dented about the edges, of a grayish, over-grown green Colour, somewhat rough and hairy in handling: From among these Leaves and Branches come forth long Stalks, with many Yellow Flowers set thereon, upon several short foot Stalks, clustering together in Bunches, consisting of Six, and sometimes of Eight small long yellow Leaves, with a kind of Prick in the middle: After the Flowers are fallen, there comes in place the Fruit, which is about the bigness of a Golden Pippin, very fair and pleasant, chamfred, uneven, and bunched out in many places, (there being scarcely any which are completely round without these Bunches) of a fair, or bright shining pale reddish colour, and

sometimes deeper; and of the yellow kind, not much unlike to a pale Orange colour. The Pulp or Meat is very full of moisture, soft, reddish or yellowish, of the substance of a Wheaten Plum, in which the Seed lies, which is small, white, roundish, flat, and somewhat rough. The whole Plant is of a rank smell.

IV. The Lesser Kind has a Root like the former, which perishes in like manner every Year, from whence comes long trailing Branches, beset with such like Leaves as the Greater Kind, but smaller in every part; the Flowers also stand many together on a long Stalk, and yellow as the former, but much smaller; the Fruit are also small, viz. round, yellowish, red Berries, not much bigger than great Grapes; in which are contained white, round, flat Seed, like the former, but smaller. If you would have them every Year, you must new Sow them every Spring, or else let them Sow themselves, so will they rise without any further trouble.

V. The Places. They grow naturally in hot Countries, as in *Ethiopia*, *Barbary*, *Aegypt*, *Syria*, *Spain*, *Italy*, and other hot Countries: Some report they were first brought to us from *Peru*; and I have seen them grow in *Carolina*, which is the South-East part of *Florida*; but with us in *England* they grow only in Gardens, where being nourish'd up, they bring forth their Fruit to perfection.

VI. The Times. The Seed is sown in the beginning of *April*, in a Bed of hot Horse-dung, after the manner of *Musk Melons*, and such like cold Fruits; they Flower in *June*, *July*, and *August*, and the Fruit is ripe for the most part in the middle or end of *September*.

VII. The Qualities. The whole Plant and Apples are Cold and Moist, almost in the fourth Degree; but not so cold as *Mandrakes*. They are *Cephalick*, *Stomatick*, *Nephritick*, and *Uterine*; of an *Attenuating*, *Cleansing*, *Repercussive*, and *Anodine* Quality; and operate only as *Alteratives*.

VIII. The Specification. They are peculiar to allay the heat of Inflammations, but more especially of an *Erysipelas*.

IX. The Preparations. The Shops keep nothing of this Plant; but you may have from it, 1. The Apples themselves. 2. The Juice. 3. An Essence. 4. A Cataplasim. 5. An Oil. 6. A Balsam for Wounds.

The Virtues.

X. The Apples. In *Spain*, and those hot Countries, they use to eat the Apples prepared and boiled in *Vinegar*, with *Pepper* and *Salt*, and served up with *Oil*, and *Juice of Limons*: Likewise they eat them raw, with *Oil*, *Vinegar* and *Pepper*, for Sawces to their Meat, as we here do *Cucumbers*; but they yield not much nourishment, but only please and cool or quench the Heat and Thirst of hot Stomachs.

XI. The Juice. Applied upon Inflammations, but especially bathed upon an *Erysipelas*, and *Linen Cloths* wet in the same, laid thereon, abate the Inflammation, and take away the preternatural heat.

XII. The Essence. It represses Vapors in Women; is good against Fits of the Mother, opens the Obstructions of the Urine, taking away the heat and scalding thereof; is good against Sand, Gravel, and the Stone, and gives ease in all Pains proceeding from a hot Cause. Dose from j. to ij. ounces.

XIII. The Cataplasim. It is good against the Head-ach, Megrin, Gout, Sciatica, and all Pains whatsoever proceeding from a hot and dry Cause: In outward Applications it ought to be renewed twice a Day.

XIV. The Oil. It Cures all manner of Burnings, and Scaldings, whether of Fire, Water, Oil, Lead,

&c. and has the Virtues of the Cataplasim, and may be anointed upon those places where a Cataplasim cannot be applied.

XV. *The Balsam.* It is a singular good thing to cool Inflammations in Wounds and Ulcers, heal all sorts of Burnings and Scaldings, cleanse old Running Sores, and so give ease in the Gout, pain in the Back, or any other part proceeding from vehement hot and fiery humors: It admirably heals Wounds, and, when cleansed, Ulcers also, after the manner of Preparations from *Alk-hals*.

XVI. *A special Note.* It appears that this Plant abounds with a vast humidity; for in the hottest time in Summer, the superfluous Branches being cut off from the Mother Root, and carelessly cast away in the Allies of the Garden, though at a time when no Rain shall fall, yet will they grow as fresh, as if they had not been cut off; which shews indeed the exceeding moisture of the Herb.

CHAP. XX.

OF MAD APPLES.

I. *THE Names.* This Plant has no known Greek name, (except Στρυγίς μανιός, may be taken for it, which is more properly the name for *Solanum Lethale*:) but to supply the place, we may call it Μαλον μανιόν Pl. *Māla manīs*; in Latin, *Mālum insanum*, Pl. *Mala insana*; in English, *Mad Apple*, and *Mad Apples*.

II. *The Kinds.* There are three Kinds, 1. *The Syrian.* 2. *The European.* 3. *The Ethiopian*, of which we shall say nothing in this Work.

III. *The Description.* 1. *Of the Syrian.* It has a Root composed of many strings, some great, others small, not thrusting down deep into the ground, which continues not all Winter, but perishes with the first frosts; from this Root rises up a great, hard, round, purplish, or brownish green Stalk, two foot high, di-

vided from the bottom into divers Branches, whereon are set many hairy, broad, rough Leaves, somewhat unevenly cut on the edges, and somewhat like the Thorn Apple Leaves: At the Joints with the Leaves come forth several large Flowers, consisting of six large pointed Leaves; in some Plants white, in others of a pale, but deadish purple Colour, with yellow threads in the middle; which passing away, there comes forth large, somewhat long, and round Fruit, in the warm Countries as large as a Cucumber; but in colder Countries seldom bigger than a large Duck or Goose Egg, set in the same Husk or Cap, which before contained the Flower, whose Colour on the outside is usually according to the Flower it bore, either of a whitish Green, more yellowish, or of a grayish Ash Colour, or of a Pale or Wan purplish Colour, with a very thin Skin or Peel, and full of a whitish Pulp, and Juice, having many small flat whitish Seeds within it, somewhat greater than those of the Love Apple.

IV. *The Mala insana Europæa*, have a Root stringy, and not much differing from the former, and perishing every year, after Seeding time; from whence grows an upright round Stalk, about the thickness of a Man's Finger, and about a foot and half high, from whence spring forth at several Joints, sometimes on the one side, and sometimes on the other, divers long, and somewhat broad green Leaves, unevenly cut in on the edges, and ending in a long point, three for the most part coming together, each of them upon a short Root-stalk; at the tops of the Stalks, come forth the Flowers, consisting of six several Leaves; after which succeeds the Fruit, which are round reddish Berries or Apples, about the bigness of a Plum, and very full of Seed.

V. *The Places.* The first grows in Syria, and Ægypt, where it grows plentifully Wild, and in most of those Eastern Countries, where the Fruit grows to the bigness (as *Belonius* reports) of a great Cucumber: It also grows with us in our Gardens, where it bears Flowers, and as *Gerrard* says, in a temperate or warm Year, Fruit also, which he saw of the bigness of a Goose Egg, but came not to ripeness. The European grows in shadowy places upon the Appenine Mountains, and has been translated also into our Gardens.

VI. *The Times.* The Seed must be sown in April, in a Bed of hot Horse Dung, as Musk Melons are, and then it will Flower in August. The European Flowers in August, and if the Summer is warm, its Fruit comes to perfection in September.

VII. *The Qualities.* They are cold and moist almost in the fourth Degree. They are Cleansing, Repercussive, Anodine, or rather Narcotick, and Vulentary. And by Appropriation are dedicated to the Head, Stomach, Reins, Womb and Joints; acting only as Alternatives.

VIII. *The Specification.* Their chief use is for cooling an Erysipelas, and Inflammations, easing Pains proceeding from vehement hot and sharp Humors, and healing of Wounds; but they cause no Madness, as the name would seem to import.

IX. *The Preparations.* The Shops keep nothing of this Plant; but you may have therefrom, 1. *The Apples themselves.* 2. *A Juice.* 3. *An Essence.* 4. *A Cataplasim.* 5. *An Oil.* 6. *A Balsam.*

The Virtues.

X. *The Apples.* They are boiled in Fat Broth, or rather in Water and Vinegar, and so eaten, being served up with Oil, Vinegar, Pepper, and Salt, and this at Genoua is a great Dish. *Fuchsius* says, there is a superabundant coldness and moisture in them, as there is in Cucumbers and Mushrooms; but the beauty

beauty of the Fruit, and the wonderful delight they give to the Palate, also their inciting to Venery, (which most Windy things, as these are, do) are the great Motives which incite to the eating of them: Wherefore in *Italy*, and other hot Countries, where they come to their full Maturity, and proper Relish, they eat them with more Desire and Relish, than we do *Cucumbers*, and therefore Prepare and Dress them in divers mannets; some eat them Raw, as we do *Cucumbers*; some Roast them under the Embers; some first Boil them, then Pare and Slice them, and so eat them as first related; some strew Flower over them, and Fry them with Oil or Butter, and serve them to the Table with Pepper and Salt; and some keep them in Pickle, to spend in Winter, and the next Spring. Yet *Avicenna*, lib. 2. cap. 455. Condemns them as hurtful things: On the contrary, *Averroes* Commends them. I believe it is true, that they yield but little Nourishment, and breed much Wind, whereby 'tis possible they may provoke Bodily Lust. At *Toledo* in *Spain*, they eat them with great Desire, being Boiled with Fat Flesh, then putting thereto some scraped Cheese, then keep them in Honey, or Vinegar and Salt Pickle all Winter, to eat as Viands, when they have a mind to it, to procure Lust.

XI. *The Juice*. It cools the heat of the Reins, and the scalding of the Urine, taken to j. ounce in Arsmart Water: Applied upon Inflammations, and bathed upon an *Erysipelas*, and Linen Cloaths wet therein being laid thereon, it abates the heat of the Inflammation, and cures the *Erysipelas*: It is also of singular use against Burnings and Scaldings, of what kind soever: if the Skin is not broken, dissolve in it a good quantity of Salt, and bathe therewith.

XII. *The Essence*. It is an excellent thing against hot vapors of the Womb, and Fits of the Mother; and is good against Sand, Gravel, and Tartarous matter obstructing the Urinary Passages. Dose from j. to ij. ounces.

XIII. *The Cataplasim*. It is good to be applied upon Burnings and Scaldings from what cause soever, it takes out the Fire, and allays the Heat and Inflammation: It may be good also in an *Erysipelas*, being often renewed; and is prevalent against the Gout in Elbows, Wrists, Hands, Fingers, Legs, Feet, Toes, or any other Pain or Ach, proceeding from a cold Cause; and is good to be applied to a slight Contusion or Blow, being laid on before any Tumor arises.

XIV. *The Oil*. It is good against all sorts of Burnings and Scaldings, with Fire, Water, Soap Lees, Oil, Pitch, Tar, Lead, Gunpowder, &c. being anointed therewith, and the Cataplasim foregoing presently after applied, and often renewed; and has all the Virtues of the Cataplasim, except in the case of an *Erysipelas*, where Oily Bodies rather inflame, than do any good: It gives ease in the Megrim, and Head-ach, from a hot Cause, and takes away the black and blew Marks which arise from Blows, Falls, &c.

XV. *The Balsam*. It is a singular Vulnerary, prevents, and allays Inflammations in Wounds and Ulcers, coming from what accident soever: It cleanses Ulcers and Fistula's, and speedily heals them afterwards.

CHAP. XXI. Of THORNIAPPLES.

I. *THE Names*. It is called in *Greek*, Πασχία καλή ἢ Βουρκοκκαλον (i. e. a Nut causing Drownsins:) In *Latin*, *Stramonium*, *Melissinum*, *Alatum Spinosum*, *Pomum Spinosum*: In *English*, *Thorny Apple*, and *Thorn Apple*. *Marthius* thinks this to be the *Nux Metel*, of the *Arabians*.

II. *The Kinds*. It is twofold, 1. That which generally grows with us in *England*. 2. That of *Peru*. And of the first Kind there is both single and double, with variety of Colours in the Flowers.

Stramonium

III. *The Description*. The Root is small and thready, from whence springs up, one great Stalk, four, five, or six feet high, seldom higher; and two or three Inches, or more, thick in Diameter, and sometimes four or five Inches thick, upright and straight, having very many Branches, and sometimes but few, upon jointed Stems; on which do grow Leaves, smooth, very broad, and cut in, or jagged about the edges, long and broad almost as a Spinage Leaf; and not much differing from the shape of Goose-foot. The Flowers come forth of long Toothed Caps, great, white, and of the form of a Bell, or like the Flower of the great Bindweed, which spreads it self in Hedges, but altogether greater, and wider at Mouth, and sharp cornered at the brims; of a strong smell, so that it offends the Senses: After the Flowers follows the Fruit, something of the fashion of an Egg, set about on every side and part with sharp Prickles, almost like Thorns, within which Shell is contained very much Seed, of the bigness of a very small Tare, and almost of the same fashion, and of a blackish brown, or black Colour.

IV. *The Thorn Apple of Peru* has a Root thicker than the former, with some thick Branches, from whence runs several small strings, and out of which springs one pretty thick upright Stalk, about four or

or five feet high, seldom higher; nearly two Inches thick, having very few Branches, sometimes none at all, from which Stalk and Branches (where there is any) spring forth pretty large Leaves, smooth and even, little or nothing indented about the edges, longer and broader than the Leaves of Nightshade, or Mad Apples: From the Bottoms or Foot-Stalks of the Leaves spring forth long Toothed Cups, out of which come the Flowers, great, white, and of the form of a Bell, or the Flowers of the great Bindweed, but greater and wider at Mouth, and sharp cornered at the Brims, like the former, which contain white Chives or Threads in the midst, of a strong Pontick Savour, offending the Head when it is smelled to: When the Flower is gone, the Fruit comes forth, of the bigness of a small Walnut with the green on; this fruit is full of Prickles; within the Shell are a great number of Seeds, of the bigness of small Tares, or Seeds of Mandrakes, and of the same form. The whole Herb is of a strong Savour, and smelling to it causes Drowsiness.

V. The Places. The First was brought from Constantinople, and now grows with us plentifully in our Gardens; it also grows Wild and very plentifully in the South Carolina. The latter was found growing in the Mountains of Peru, from whence the Seed was sent to Manardus in Spain: and from thence it was conveyed unto other parts of Europe; and now it is nourished up in some of our Gardens in England.

V. The Times. The first may be sown in March or April, and it brings forth ripe Seed in September, Flowering in the Summer Months: The latter is sown in a hot Bed of Horfe Dung, as we do Cucumbers and Musk-Melons. Authors say, of both these sorts, there is a greater and a lesser Kind, and that the greater Kinds are plentiful enough in our Gardens, and will abide and give with us ripe Seed: but the lesser Kinds are very rare, because they seldom come to maturity, and so we are every Year to seek for new Seed.

VII. The Qualities. These Plants are said to be cold and moist in the fourth Degree: and to be Repercussive, Narcotick, or Srupefactive, and Vulnerary: and are by appropriation, Cephalick, Hysteric and Arthritic, and operate only as Alteratives by their cold and moist property.

VIII. The Specification. Manardus says, that the Indians commend these Plants for provoking Urine, and expelling Sand and Gravel from the Reins and Bladder: and by Gerard's account, it is a famous Wound Herb outwardly used.

IX. The Preparations. There are taken from it, 1. The Seed. 2. The Juice. 3. An Essence from the same. 4. An Oil. 5. An Ointment. 6. A Cerote or Emplaster. 7. A Cataplasim.

The Virtues

X. The Seed. It is of great Estimation in the Indies, both by the Spaniards and Indians themselves, in that it provokes Urine, and expels Gravel and the Stone both in the Reins and Bladder, for which it is most commended: it is said to break the Stone in the Bladder if it is not too hard and inveterate, or may by any medicine be dissolved; of which there has been many proofs, as Manardus says, has been declared to his great admiration: For, as he says, he did not think that the Stone in the Bladder could be dissolved and expelled by any means whatsoever, and that the Cure thereof consisted only in Cutting it out by a skillful hand: but it was said of this Seed, that being taken in any Fit and convenient Water for that purpose, that it would by little and little dissolve the Stone into small Gravel; which

after it is expell'd, or driven forth, would again stick together and grow into a hard Stone.

XI. The Juice of the Herb. It is singular good to bath with in all Sorts of hot Inflammations and an Erysipilis, by laying Cloths dipt in the Juice upon the same, and often repeating the Application.

XII. The Essence of the Juice, Dropt into the Eye, it allays the Inflammation thereof, and removes hot and sharp Rheums: Injected up the Womb it is good against the continual running of the Whites, strengthens the Part, and cools any Inflammation of the same, or of the Secrets: it also is good against all sorts of Inflammations in Wounds and Ulcers.

XIII. The Oil, made by boiling the bruised Herb in it till it is crisp, is good against all sorts of Inflammations, Burnings and Scaldings, and gives ease in a hot Gout, and Pains and Aches, in the Head chiefly, proceeding from a hot Cause and Humour.

XIV. The Ointment, made of the Juice or bruised Herb, boiled to crispness, and twice or thrice repeated, in Hogs Lard, and then pressed forth, cures all Inflammations whatsoever, and heals all manner of Burnings and Scaldings, whether of Fire, Water, Oil, melted Lead, Gun-Powder or Lightning, and that in a very short time: This was proved upon a Merchants Wife at Colchester, who (after the use of many other things in vain, and when all hopes were past) being grievously Burned was herewith perfectly cured.

XV. The Emplaster. It is made of the bruised Herb, boiled in Oil Olive to crispness, and pressed forth, and three times repeated, and then brought to a body with Turpentine, Rosin and Wax, of each a sufficient quantity. It cures malign Ulcers, and Apostems, helps a hot Gout, and prevails against fresh and Green Wounds, and old Sores and running Ulcers, especially upon the Glandulous parts of the Yard, and other places where they are hard of Cure.

XVI. The Cataplasim. It is good against Recent Bruises especially upon a bony part, to allay Inflammations, and ease the Gout and other Pains proceeding from a hot Cause.

CHAP. XXII.

of Red ARCHANGEL.

I. THE Names. It is called in Greek, *ῥαγιον πορφυρεον*: In Latin, *Lamium purpureum*, *Urtica iners purpurea*, *Urtica mortua rubra*: In English, Red Archangel, or Red Dead Nettle.

II. The Kinds. It is twofold, 1. The Sweet, called simply *Lamium purpureum*. 2. Stinking, *Taxidion*, *Taxidion*, *Taxidion*: And in Latin, *Lamium fetidum*, *Urtica iners fetida*, *Urtica mortua fetida*, *Urtica Labeo*, stinking Dead Nettle or Hedge Nettle. And of this stinking kind there are divers sorts, as 1. *Galeopsis vera*, The true stinking Dead Nettle, or Hedge Nettle. 2. *Galeopsis altera pallida*, pale stinking Dead Nettle. 3. *Galeopsis altera incana*, Hoary stinking Dead Nettle. 4. *Galeopsis lutea Dalechampij*, Yellow stinking Dead Nettle.

III. The Description. 1. The Sweet kind. It has a Root small and thready, perishing every Year, from whence rises divers hollow square Stalks, somewhat Hairy, with Joyns at a good distance, one from another, and also two sad green Leaves, dented about the edges, set opposite one to another, the lowermost upon long Foot-Stalks, but without any towards the

top, which are somewhat round, yet a little pointed at the ends, and a little crumpled and Hairy; round about the upper Joints with the Leaves, grow sundry gaping Flowers of a paleish red Color, not much unlike Batony Flowers, after which come Seeds, three or four set together in a husk, the whole Plant smells strong, and pleasant enough, not sinking.

IV. The Galeopsis Vera, has a Root composed of many strings, shooting out fresh heads every Year, and thereby increasing very much, from whence comes forth divers square, soft, and hairy Stalks rising up to be two or three feet or more high, according as the Ground is in goodness; at the Joints whereof grow two Leaves a piece upon Foot Stalks, not much unlike to Nettle Leaves, but that they are soft and somewhat hoary, and not at all stinging, of a strong unpleasant sent, especially if growing in shadowy places, but nothing so strong if growing in the open fields: at the tops of the Stalks grow the Flowers, set in Rundles, for or five at a space, and many of them one above another in manner of a spiked head, every one standing in a greenish Husk, like unto those of the other more pleasant sented Dead Nettles, but not so great, nor of so sad a red or purplish Color, especially the Heads or upper parts, but the lower Labels or Lips have some white spots in them: after the Flowers are fallen, there grows within those Husks, small round, but somewhat rough Seed, four of them for the most part stand together, which are of a black Color when Ripe.

V. The Pale stinking Dead Nettle, has a pretty thick Root and full of Strings, from whence rises up a long, square, hairy Stalk or Stalks, out of which comes several pale green broad Leaves, set upon long hairy Foot Stalks, and higher up, such like but lesser Leaves thereon, with sundry small pale yellowish Flowers, set together at spaces, which turn into small round pointed Heads, with small blackish Seed in them, the whole Plant is of a strong stinking smell.

VI. The Hoary stinking Dead Nettle, has a Root much like to the former kinds, from whence comes

Stalks square, soft, and hoary, but shorter, very slender and weak, creeping as it were by the Ground, with two Leaves set by the Joints likewise, soft and hoary, but more hoary underneath, and not so large as the first kind of Galeopsis: the top of the Stalks end in a long spike of purplish Flowers, set in Rundles as in the other, after which comes the Seed, Black also as the former.

VII. The yellow stinking Dead Nettle, has much such a like Root as the others, whence comes forth square low Stalks, not above a Cubit or a Foot and a half high, with long Leaves set thereon by couples, very like unto Nettle Leaves, smaller below next the Ground, than up higher upon the Stalks, being hairy, but not so stinking as the first, yet smelling very strong: the Flowers grow in long spiked Heads in like manner, but are all yellow when fully blown, consisting of two Leaves, the uppermost whereof is not so much hooded as the former, but is as it were a cover to the lower, and turns it self up again, having some yellow threads in the middle; but while it is in the bud, it is somewhat redish, after which comes forth the Seed in the same Husks.

VIII. The Places. Red Archangel grows almost ever where, by Ditch and Hedge sides, throughout the whole Kingdom. The first Galeopsis grows very frequently in England in divers Counties, as at Hamstead, going from the Town to the Church, and many other Places from Hamsted-Heath to London, as also at Greenwich in some places not far from the Park. The second Kind, grows also wild by Hedge and Ditch sides, and as a Weed in many Gardens. The two last Kinds, are not found to grow wild at all with us, but only nourished up in Gardens.

IX. The Times. They Flower for the most part all Summer long, beginning in May, and all June and July, and the Seed is ripe not long after the Flowers are past.

X. The Qualities. Red Archangel is hot and dry in the first Degree, but the Galeopsis are hot in the second Degree, and dry in the third Degree, much of the temperature of Horehound. They are all Attenuating, something Repercussive and Afringent: and by Appropriation, they are Cephalick, Splenetick, Hyfterick and Arthritick, and operate only as Alteratives.

XI. The Specification. They dry up moist Humors in Ulcers and Fistula's, are Vulnerary, and stop the overflowing of the Terms in Women.

XII. The Preparations. From Archangel there are, 1. A Powder of the Seed. 2. A Conserve of the Flowers. 3. A Juice of the Plant. 4. An Essence. 5. A Spirituous Tincture. 6. A Saline Tincture. 7. An Oily Tincture. 8. A Distilled Water of the whole Plant, 9. A Decoction. 10. An Oil. 11. An Ointment. 12. A Cerote or Emplaster. 13. A Cataplasim. The Galeopsis are used in 14. A Decoction. 15. A Juice. 16. An Essence. 17. A Syrup. 18. An Ointment. 19. A Balsam.

The Virtues of the Red Archangel.

XIII. The Powder of the Seed. It is dry and binding, and of good use in stopping Fluxes of the Bowels, as the Diarrhæa, Dysenteria, Lienteria, and Hepatick Flux. Dose from half a dram to j. dram in Red Wine.

XIV. The Conserve of the Flowers. Eaten morning, noon, and night, the quantity of a large Walnut at a time, it has been found by Experience to be effectual against the overflowing of the Courses, and all Fluxes of Blood whether by the Mouth, Stool, or Urine: but this more especially, if to a Pound

Pound of the *Conserve*, ij. ounces of *Crocus martis* *Astringens* be added.

XV. *The Juice of the Plant.* It is Antihysterick, represses Vapors in Women and Fits of the Mother, opens obstructions of the Liver and Spleen, and is good for Wounded Persons to Drink. Dose ij. or iij. ounces in Wine.

XVI. *The Essence.* It has all the Virtues of the *Juice*, besides which it is an exceeding good thing for such as have old running Sores, Fætid Ulcers, and Malign Fiftula's running upon them; it corrects the Malignity of the Humors, dries them up and disposes the Ulcers to healing. Dose from j. to iij. ounces: Outwardly it is good to wash the Ulcerations withal, and to inject into Fiftula's.

XVII. *The Spirituous Tincture.* It stops Fluxes of the Belly of what kind soever; and the overflowing of the Courses in Women, quickens and cheers the Spirits, drives away Melancholy, makes the Heart merry. Dose iij. drams.

XVIII. *The Saline Tincture.* It operates by Urine, and carries off much of the Morbifick matter in such as are afflicted with Ulcers, Sores and Fiftula's, by the Urinary passages; and is good against inward Bruises, dissolving the congealed Blood. Dose from j. dram to ij. drams, in a Glass of the *Distill'd Water*.

XIX. *The Oily Tincture.* Taken from vj. Drops to xx. or xxx. according to Age and strength, in some proper Vehicle, it has been found to be good against Quartan Agues. Outwardly applied or anointed, it is good against all Pains and Aches, as also the Gout in any part proceeding from a cold Cause: it strengthens the Nerves, and is good against the Palsie.

XX. *The Distill'd Water.* It is used chiefly as a Vehicle to convey the other Various preparations of this Herb in. Dose vj. ounces.

XXI. *The Decoction.* Made in Wine, and Drank, to vj. or viij. ounces; it strengthens the Bowels much, it is good to open obstructions, and softens the hardness of the Spleen: Fomenting also hot with the same upon the Region of the Spleen: or applying the hot Herb also thereon, for some time.

XXII. *The Oil.* made by boiling the bruised Herb in Oil *Olive*, &c. It is good to discuss or resolve cold and hard Swellings in any part of the Body, Chiefly those in the Neck and Throat proceeding from the *Kings-Evil*.

XXIII. *The Ointment.* It has the same Virtues, besides which it is very good to discuss Inflammations, and heal all green Wounds by cleansing them, drying, and closing up their Lips.

XXIV. *The Cerote or Emplaster.* It heals also green Wounds, cleanses old Ulcers, and resists their Malignity; puts a stop to their fretting, corroding, and spreading, and brings them to a speedy healing.

XXV. *The Cataplasim.* made with the beaten Herb, and Hogs Lard, Vinegar and Salt, boiled to a softness and consistency, and then apply'd to hard and Scrophulous Tumors whether in the Neck or other parts, it helps to discuss and resolve them; gives ease in the Gout, Sciatica, and other Joynt-Aches, strengthen the Nerves, and eases their Pains, caused by Cramps, Convulsions, &c. it is good against Inflammations, and the Malignity of old running Sores. A Cataplasim of the raw Herb beaten up with Vinegar, being apply'd to the Nape of the Neck, stops bleeding at the Nose: and helps Whitloes, being apply'd to the roots of the Nails.

The Virtues of the flinking Archangel. or Dead Nettle.

XXVI. *The Decoction.* It is good to bathe places Swelled with hard Kernels, Wens, Inflammations, or Scrophulous Tumors in the Neck, under the Ears, Jaws, Armholes and Groin; and if the *Decoction* is made in Wine, and drunk to vj. or viij. ounces for a Dose, it is a good Traumatick, and wonderfully helps all inward Wounds, Hurts, Bruises, Falls, or the like, and is singular good for the Spleen and the Diseases thereof.

XXVII. *The Juice.* It has all the foregoing Virtues; besides which being applied warm with Vinegar, to the Hemorrhoids or Piles, when they are very painful and much Swelled, it gives ease, and discusses the Tumor. It is good also against Warts, Figgs, Cistie, Condylomata, and the like which grow in and about the Fundament. Dose inwardly from j. to iv. ounces.

XXVIII. *The Essence.* It has all the Virtues both of the *Decoction* and *Juice*, and may be used as a Wound Drink, for which purpose it is a most singular thing; and contributes very much to the healing of Ulcers, Fiftula's and other inveterate and running Sores, which resist most other Remedies. Dose from ij. ounces to iv. twice a day: Outwardly it is good also to wash Sores, Ulcers and Fiftula's with, and cleanses them from their filth.

XXIX. *The Syrup.* It may be a Vehicle to mix with the *Essence* for all the purposes aforesaid, as also against Fluxings, Vapors, and fits of the Mother, or Hypochondriack melancholy.

XXX. *The Ointment.* Being anointed upon the Region of the Spleen, it eases the pain, and softens the hardness thereof; and anointed on the Fundament, it is good against Clifts, Warts, Figgs, Piles, and other Swellings thereof. It dissolves or discusses Wens, Kernels, and hard and Scrophulous Swellings of the Neck and Throat, and other hard and Oedematous Tumors in any other part of the Body.

XXXI. *The Balsam.* It is of singular use, and much Commended against Gangreens, Cancers, Corroding Fiftula's, and all manner of other running Sores, inveterate and fordid Ulcers happening in what Place soever.

CHAP. XXIII.

Of the White ARCHANGEL.

I. **T**HE Names. It is called in Greek, *Λαυον* *Λαυον*: *Banum album*, *Urtica iners Alba*, *Urtica mortua alba*: and in English, *White Archangel*, or *Dead Nettle*.

II. *The Kinds.* Of *Archangels* there are three special Kinds, viz. 1. *The Red.* 2. *The White.* 3. *The Yellow.* This then which we Treat of in this Chapter is the second Species, to wit, that of the *White Kind*.

III. *The Description.* It has a Root *White* and *Thready*, not perishing every year, from whence rises divers four square Stalks somewhat hairy, about a Foot and a half, or two Feet high, and sometimes more, as the ground on which they grow is in farness and goodness, leaning this way and that way by reason of the Weight of its Head and Leaves, Branches and Flowers: at the Joynts whereof stand two Leaves, larger and more pointed than the Red, almost in shape like

like Nettles, but not stinging, and dented about the edges, greener also than the Red, and somewhat soft, as it were, and hairy and downy. At the Joints with the Leaves stand larger and more gaping Flowers than those of the Red, in Husks, and encompassing the Stalks at certain distances, like as those of Horeboud do (of which Gerard will have this to be a Species) but not having such a busb of Leaves and Flowers, so closely set at the Tops, as they are in the Red: These Flowers are white in Colour, and shaped like to little gaping Hoods, or Helmets, after the Flowers in the same Husks grow small roundish Seed, which, when ripe, becomes black; or of a blackish Colour. Its Root grows not downward, but spreads and encreases under the upper Crust of the Earth, and abides many Years, still encreasing: The whole Herb has a smell pleasant enough, and much differing from Galeopsis, or the Stinking Kind.

IV. *The Places.* It grows by old Hedges, and Ditch sides, and in some places by the Highways, and borders of Fields, almost every where through the whole Kingdom; and many times in Gardens ill Husbanded.

V. *The Times.* It Flowers from the beginning of the Spring, almost all the Summer long; and the Seed ripens thro' all the same Seasons.

VI. *The Qualities.* It is hot and dry in the second Degree: it is Attenuating, Inciding, Dificussive, Resolutive, Astingent, Vulnerary, and Alterative: and is appropriated to the Head, Nerves, Liver, Spleen, Womb, and Joints.

VII. *The Specification.* It cures Wounds and Ulcers, stops Fluxes, and in particular the Whites in Women.

VIII. *The Preparations.* The Shops keep, 1. The Herb. 2. A Conserve of the Flowers. But you may also prepare therefrom, 3. A Powder of the Seed. 4. A Juice of the Plant. 5. An Essence. 6. A Spirituous Tincture. 7. A Saline Tincture. 8. An Oily

Tincture. 9. A Distilled Water of the whole Plant. 10. A Decoction. 11. An Oil. 12. An Ointment. 13. A Cerote or Emplaster. 14. A Cataplasm.

The Virtues:

IX. The Virtues of all these Preparations are the same with those of the Red, in the Chapter foregoing, from *Sett.* 14. to *Sett.* 26. and may serve in all the same Cases, there not being much difference in their strength and goodness; but if any should be supposed, these of the White may be said rather to excel in Virtue: but this difference there is between them in the Flower, that as the Red seem to be specifick, to stop the Reds, or overflowing of the Terms, and Loches in Women; so the Flowers of the White are said to be specifick in stopping the Whites, or White Flux in the same Sex; for which reason the Shops in many places keep the Conserve of the Flowers in a readines, upon any occasion.

X. *The Conserve of the White Flowers.* It is given for the purposes aforesaid, and to strengthen the Womb, from vi. drams to an ounce and half, Morning, Noon, and Night. And it will be more effectual, if the Powder of boiled Turpentine is added to it, iv. ounces to every pound of the Conserve: thus Prepared, it is truly an excellent thing for the purpose intended.

CHAP. XXIV.

Of Yellow ARCHANGEL.

I. **T**HE Names. It is called in Greek, *Αρχανγελος*: In Latin, *Lamium Luteum*, *Urtica lutea*, *Urtica mortua lutea*: and in English, Yellow Archangel, or Dead Nettle.

II. *The Kinds.* It is the third and last Kind of the *Archangels* or *Dead Nettles*.

III. *The Description.* The *Roots* hereof are much like to those of the *White*, but are not observed to creep so much under ground as they: from whence rises up square hoary *Stalks*, and large green dented *Leaves*, very much like the *White Archangel*, but that the *Stalks* are more straight and upright, not bending downwards; and the *Joints*, with their *Leaves*, are further asunder, and the *Leaves* are something longer than the former. The *Flowers* also are larger, and more gaping, growing in *Randles* about the *Stalk*, of a fair *Yellow* or *Golden Colour* in most, and in some more faint, exactly of the shape of those of the *White Archangel*, but gaping wider. After the *Flowers* follow the *Seed* in the same *Husk*, little or nothing differing from that of the *White*.

IV. *The Places.* It grows usually in *Woods*, and wet *Grounds* in *Woods*, and sometimes in dryer places, in divers *Countries* of our *Land*: *Gerard* found it under the *Hedge* on the *Left Hand*, as you go from *Hamstead* near *London*, to the *Church*, and in the *Wood* thereby, as also in many other *Copses* about *Lee* in *Essex*; near *Watford* and *Bushy* in *Middlesex*, and in the *Woods* belonging to the then *Lord Cobham* in *Kent*.

V. *The Times.* It *Flowers* from the beginning of *May*, and all *June* and *July*, and the *Seed* ripens gradually in the mean season.

VI. *The Qualities.* It is hot and dry in the second Degree: *Attenuating*, or making thin, *Discaufive*, *Resolutive*, *Vulnerary*, and *Alterative*: and is appropriate to the *Head*, *Stomach*, *Liver*, *Spleen*, *Womb* and *Joints*.

VII. *The Specification.* It is observed to be a more peculiar *Vulnerary* than any of the other kinds.

VIII. *The Preparations.* You may prepare from it: 1. A *Powder* from the *Seed*. 2. A *Conserve* of the *Flowers*. 3. A *Distilled Water* of the whole *Plant*. 4. A *Decoction* in *Wine*, or *Wine* and *Water*. 5. A *Juice* from the *Plant*. 6. An *Essence* of the whole *Plant*. 7. A *Spirituos Tincture*. 8. A *Saline Tincture*. 9. An *Oily Tincture*. 10. An *Oil* for *External Uses*. 11. An *Ointment*. 12. A *Cerote* or *Emplaster*. 13. A *Cataplasim*. 14. A *Balsam*.

The Virtues.

IX. This has all the *Virtues* both of the *Red* and *White* foregoing, and much of the same strength and goodness; and therefore as to the *Uses* of the various *Preparations* thereof, we shall wholly refer you to what we have said of the like *Preparations* of the *Red*, in *Chap.* 22. from *Self.* 14. to *Self.* 26. Yet this we have to say in relation to the *Flowers*, that as they strengthen the *Womb* very much, so they have a peculiar property against both *Reds*, and *Whites*, which yet may be made more powerful by compounding the *Conserve* of it, according to the following *Prescript*.

X. *The Conserve.* Take of the simple *Conserve* 20 ounces: *Turpentine* boiled in *Water*, till it will *Powder*, v. ounces: *fine Powder* of *Catechu* ij. ounces and half; mix them. Dose, from iij. drams to vj. drams, Morning, Noon and Night, for some time, taking the *Essence* also inwardly: A *Spirituos Tincture* of the dried *Flowers*, taken from j. dram to ij. drams, does also the same thing.

XI. *The Balsam.* It heals green *Wounds*, cleanses old *Ulcers* and *Fistula's*, obtunds their *Malignity*, and stops their fretting, corroding, and spreading, especially where they are *Inveterate*, very *Filthy*, and *Corrupt*, and where *Fistula's* are *Cavernous*, with many crooked *Windings* in them: First wash them with the *Essence*, by injecting it in *Blood-*

warm; then inject into the hollowness, some of this *Balsam* melted, and lay a *Pledgit* dipt in the same over the *Mouth* thereof, and over all the *Cerote* or *Emplaster*; letting the *Patient* also, in the mean time, take the said *Essence* inwardly twice or thrice a day, as the manner is in wounded *Persons*, so you will find a wonderful and sudden *Cure*. This for a *Vulnerary* use is much more powerful than any of the other *Archangels*.

CHAP. XXV.

of Garden ARACH.

I. *THE Names.* It is called in *Arabic*, *Cataf*, or *Caraf*: In *Greek*, *Ἀράχης ἢ Χρυσάνθου*, from its yellow *Flowers*: In *Latin*, *Atriplex*, and *Olus Aureum*: In *English*, *Arach*, and *Orach*.

II. *The Kinds.* There are four several *Kinds* thereof, 1. *The Garden.* 2. *The Wild.* 3. *Stinking.* 4. *Sea.* Of all which in their several *Chapters*. The *White* is that we treat of in this *Chapter*, and that is threefold: 1. *Atriplex sativa alba major*, The greater *White Garden Arach*. 2. *Alba minor*, The lesser *White.* 3. *Atriplex sativa purpurea*, *Purple Garden Arach*.

Arach Garden large.

III. *The Description.* The *Great White Garden Arach* has a *Root* growing deep into the *Ground*, with many small *Fibres* fastened thereto, which fades away as soon as it has born *Seed*; from whence rises up a *Stalk* square or cornered, and of a white mealy Colour; out of which comes several *Branches* and *Leaves*: the *Leaves* are many, standing upon their *Foot-stalks*, broad at bottom, and ending in two *Points*.

Points like an Arrow, with two Feathers at the Head, and sharp pointed at the end of the Leaf, of a whi-
tish yellow green Colour, and as it were firewed over
with Flower or Meal, or rather small white Sand,
especially whilst young; the Stalk likewise is Mealy,
or rather Sandy, bearing many Branches, with small
yellow Flowers on them, which turn into small leafie
Seed.

IV. The Lesser White Kind is altogether like the
former, and differs nothing from it, unless in the mag-
nitude, and the Sandy Flower, which seems to be whi-
zer than the former: but I am apt to believe that
these two are but one kind, and differ only in respect
of the Ground they grow on, this growing upon a
more sandy, lean, or poor Soil: the richer the Earth,
the greater the Plant; the poorer the Soil the
lesser.

V. The Purple Arrach is in its Roots, Stalks,
Branches, Leaves, Flowers, and Seed, and manner of
growing, and indeed in all things like unto the
White, except only in the Colour, the Stalks, Leaves
and Seed being of a Mealy, or Sandy Purplish Colour.

VI. The Places. They grow chiefly in Gardens, as
their names do specify, very rarely Wild.

VII. The Times. They Flower and Seed from
June to the beginning of September, their Seed ri-
pening all the time of their Flowering.

VIII. The Qualities. They are Cold and Moist
in the second Degree; but Schröder will have it on-
ly in the first Degree. They are Alterative, Aper-
ient, Absterfiv, Emollient, and Expulsive; and are
appropriated to the Lungs, Liver, Womb, and Joints.

IX. The Specification. They are peculiar against
the Jaundice, and Diseases of the Breft and Lungs.

X. The Preparations. You may have therefrom,
1. A Juice. 2. An Essence. 3. A Decolition. 4. A Sy-
rup. 5. A Cataplasm.

The Virtues.

XI. The Juice. It cools Inflammations, and is good
to be applied in an Erysipelas, Linen Cloths being
dipt therein, and applied thereto; and taken from
ij. to iij. or iv. ounces, it loosens the Belly, clean-

ses the Bowels, and fortifies the Expulsive Faculty.

XII. The Essence. It is good against the Yellow
Jaundice, and cleanses the Womb of all Impurities;
and is an excellent thing to open Obstructions of
the Liver, and help Diseases of the Breft and Lungs.
Dose iv. Spoonfuls.

XIII. The Decolition, has the same Virtue, but is
weaker, and, drunk plentifully, is a singular good
thing against the Poison of Cantharides, and Stru-
matick Tumors, or Swellings in the Throat, or o-
ther parts, and admirably repelles Cholier. Dose
from iv. to viij. ounces, twice a day.

XIV. The Syrup of the Juice made with Honey.
It is an excellent Pectoral, opens stoppages in the
Breft and Lungs, and prevails against Colds, Coughs,
Asthma's, or shortness of Breath, and Difficulty of
Breathing. Dose from j. ounce to ij. ounces, Morn-
ing and Night.

15. The Cataplasm. The Herb bruised and ap-
plied as a Cataplasm, is excellent to ease Pains and
Aches, from a hot Cause, and Acrimonious Humors,
and to give ease in the Gout. A Cataplasm made of
the boiled Herb, is said to be good (being applied)
to discontinue hard swellings in the Throat.

XVI. Nota. This Herb is used as a Pot-herb, or
rather boiled for a Sallet, (as they boil Spinage)
and so to be eaten with Butter and Vinegar, Pepper
and Salt, in which way it proves very grateful to a
hot Stomach. And the Seed drunk with Mead to
j. Dram, is good against the Yellow Jaundice: and
Matthioli says, it purges both upwards and down-
wards.

CHAP. XXVI.

*Of the Common Greater Wild
ARACH.*

Arrach wild common.

I. THE Names. It is called in Greek, Ἀριδάρις
ἀριδάρις; In Latin, *Atriplex fylvestris*
vulgaris

vulgatior sinuata major; *Atriplex Sylvestris major*: and in English, The Common Greater Wild Arach.

II. The Kinds. It is the first Species of the Wild Kind, which Wild Kind, is, 1. Greater, the Subject of this Chapter. 2. Lesser. 3. Narrow-leaved, &c.

III. The Description. It has a Root somewhat Long, Woody, and Fibrous, perishing Yearly, from whence springs up strong, round hard Stalks and Branches, with large Leaves on them, like those of the Garden, but not so broad, or pointed at the Bottoms, yet much waved or cut in on the edges, and of a dirty, mealy, green Colour: the tops of the Branches are repleat with long spikes of Coffy Husks, out of which come small yellowish green Flowers, which afterwards grow small blackish Seed, like unto Purslane.

IV. There is another of this larger Kind, but it is lower, and lesser in every part; it is also narrower, and a little waved on the edges, and perishing every Year, as the former does.

V. The Places. It is found by Hedge and Ditch sides, and often times on or near Dunghills in most places of this Kingdom.

VI. The Times. It Flowers in June and July, and the Seed Ripens in the mean time; and if the Year is warm, it is sometimes in Flower in May.

VII. The Qualities. It is cold and moist in the second Degree: Alterative, Attenuating, Digestive, Emollient, and Cleansing: and in its appropriations is Hysterick, and Arthritic.

VIII. The Specification. It is a peculiar remedy against an Erysipelas, or Ignis Sacer, as they call it, and Fits of the Mother.

IX. The Preparations. 1. The Seed in Ponder. 2. A Juice. 3. An Essence. 4. A Syrup. 5. A Cataplasim. 6. The Balsam.

The Virtues.

X. The Seed. Given from half a dram, to a dram and half, in Ponder, in Ale, Mead, or Wine, it purges upwards and downwards, troubles the Stomach

and Bowels, evacuates Choler, and is helpful in the Yellow Jaundice.

XI. The Juice. It is an effectual thing against all sorts of Inflammations in what part of the Body soever; and injected up the Womb, with a Womb-Syringe, it is prevalent against Fits of the Mother: Bathed on an Erysipelas, and Cloths dipt therein, being also laid thereon, it is said to cure that Disease.

XII. The Essence. It cleanses the Womb of its filth, is good against Vapors, and Fits of the Mother, and a vehement heat of the Stomach. Dose from j. ounce to ij. ounces, mixt with White Port Wine.

XIII. The Syrup. It opens Obstructions of the Lungs, and if timely given, helps an Empyema, or Inflammation of the Lungs, and Hysterick Diseases, cooling the heat of Lust. Dose from j. to ij. ounces.

XIV. The Cataplasim. It abates Inflammations, and eases the Gout, and other Pains proceeding from a hot Cause. It gives ease also in a violent hot Megrim or Head-ach.

XV. The Balsam. It removes an Inflammation in Wounds and Ulcers, cools, cleanses, and disposes them to healing, being a good Vulnerary.

CHAP. XXVII.

Of the Lesser Wild ARACH.

I. THE Names. It is called in Greek, *Ἀρρίπλεξ ἄγρια μικρὰ*: in Latin, *Atriplex Sylvestris parva*: in English, Wild Arach, the less.

II. The Kinds. The lesser Wild Arach is threefold, 1. Narrow Leaved. 2. Berry-bearing. 3. Broad Leaved. I. The Narrow Leaved, is, 1. *Atriplex Sylvestris angustifolia*, Narrow Leaved Wild Arach. 2. *Atriplex Sylvestris angustifolia altera*, Another kind of Narrow Leaved. II. *Atriplex baccifera rubra*, Red Berry-bearing Arach. III. *Atriplex Sylvestris*

vestris latifolia minor, five, *Pes Anserinus*, The lesser Wild Broad Leaved Arach, or Goose Foot; whose Description, Virtues, &c. you may see in Chap. 312. following. This last Broad Leaved kind is called *Minor*, in respect it is accounted of the lesser Kind, and is lesser than the Great Broad Kind, described in the former Chapter.

Narrow Leaved Wild
Arach

III. The Descriptions. The first, Narrow Leav'd Wild Arach, has a long slender Root, with many strings coming from it, from whence rises up one pretty large Stalk, with many large Branches on it, all over Mealy or Sandy, with a greenish gray or white Sandiness, as also are the Leaves: the Leaves grow single, and are placed irregularly up and down the Branches, they are long and narrow, almost like the Leaves of *Hydropiper*, or *Loostrife*, but that they are shorter and narrower, not dented on the edges, set at the joints, smooth, and pointed at the ends: The Stalks and Branches shoot up into long Spiky Heads, of green yellow Flowers, not much unlike to the great broad kind in the former Chapter, and the Seed like the same also.

IV. The other Narrow Leav'd Arach of the lesser kind, is not much unlike to the former, but every way lesser, and the Leaves narrower, mostly smooth on the edges, and pointed, but sometime some of them are divided or jagged, or a little notched, for which reason *Lobel* called it, *Atriplex Sylvestris polygoni aut Helxines folio*. The Stalks, Flowers and Seed, are also like the former.

V. The Red Berry-bearing Arach, is a Wild Arach also in Spain; but with us it's Nurs'd up in Gardens: It is an Elegant Plant, having a Root small and Fibrous, and perishing after Seed time, whence comes divers slender Branches somewhat Woody, about a Foot high, more or less, (according as the place where it grows, and the goodness of the Ground will produce, for all the kinds of Araches, both Garden and Wild, delight to grow in a Fat, Rank Soil, as on Dungbills, &c.) from these Stalks and Branches come forth small corner'd Leaves, not much unlike to the

Broad Leav'd Wild Arach in the former Chapters, set at the joints one above another; and at every of the said joints with the Leaves, which stand upon Foot-stalks, even from the lowest Leaves, near the Root, stands a small Red Berry, Cluster fashion, that is like to a Bramble or Dew Berry, Clear, and almost Transparent, with many small Grains in it, and full of an admirable Juice, as Red as Blood, or deep Red Wine, which being bruised upon the back of the Hand, while it is fresh, will seem as if you had drawn Blood out thereof; which Berry being dry grows blackish, and contains in it small blackish Seed, out of which this very Beautiful Plant will spring up every Year of its own accord, if suffered to shed.

VI. The Places. The two first grow by Walls, old Hedges, Ditch sides, and Dungbills, in almost all places throughout the Kingdom: the Berry-bearing is Wild in Spain, from whence being brought to us, it is planted and nourished up in Gardens.

VII. The Times. They all Flower in the Summer Months, as May, June, July, and August, the Seed continually ripening in the mean Season.

VIII. The Qualities. These Wild kinds are not so Cold and Moist as the former, not exceeding the first Degree. They are Absterive, Attenuating, Emollient, and Alterative; dedicated, as the others, to the Womb and Joints.

IX. The Specification. They are proper against Wounds and Ulcers, the Gout, Pains and Aches, proceeding from a hot Cause.

X. The Preparations. There are made thereof, 1. A Powder of the Seed. 2. A Juice. 3. An Essence. 4. A Decoction. 5. A Syrup. 6. A Cataplasm. 7. A Balsam. 8. The Juice of the Berries of the Red Berry-bearing.

The Virtues.

XI. The Uses of all these Preparations are the same with those in the two foregoing Chapters, and therefore to them we refer you; these Herbs having the same Virtues and Properties, but not full out so Cold and Moist.

XII. The Berries of the Red Berry-bearing Arach. The Beauty of the Juice is admirable; but what Physical Virtues it may have is not so fully known: being given inwardly to j. dram, or more, in Red Wine or Alicant, it is good against Spitting Blood, Pissing Blood, or the Bloody Flux: The Juice being inspissated and reduced to a Powder, is good to stop Bleeding outwardly; and inwardly given, it stops the overflowing of the Loches, or the Terms in Women, and strengthens the Womb. Doubtless out of it there may be made several glorious Pigments, or Limning Colours, for the uses of Limners, Painters, &c. Dose of the inspissate Juice is half a dram, or more, in any proper Vehicle.

CHAP. XXVIII.

Of Stinking ARACH.

I. THE Names. It is called in Greek, *Ἀρτίκασις* *Arcticasis*; in Latin, *Atriplex fetida*: and by *Cordus*, *Garofmos* (because it smells like Stinking Fish) from *ῥέσος*, *Piscis*; whence comes *ῥέσις*, i. e. *Liquamen seu sanies Piscium*: also, *Tragium Germanicum*; and by *Pena* and *Lobel*, *Atriplex fetida garum olens*: It smells more stinking than the Ram, or Male Goat; and therefore, says *Gerard*, some have called it by a Figure, *Vulvaria*: in English it is called, *Stinking Arach*.

II. The

II. *The Kinds.* There seems to be but one single kind hereof, and by reason of its growing Wild, it may be accounted one of the Wild kinds.

III. *The Description.* It has a Root consisting of several long Branches, filled with many Thready strings, from whence rises up one or more feeble Stalks, which lie flat upon the Ground, it being but a small low Plant; and from those Stalks come forth many weak and feeble Branches, upon which grow very small Leaves, almost round, yet a little Pointed, without Cut or Dent, in shape not much unlike to Basil, of a Greyish Colour, sprinkled over with a certain kind of Dusty Measles, or like to very small White Sand: among which Leaves, here and there confusedly, are the Seeds dispersed, which can be likened to nothing but Dust and Ashes. The whole Plant is of a most Loathsome Savor or Smell, not much differing from that of old Rotten Fish, or something worse. It perishes in Winter, and rises yearly again from its own Sowing.

IV. *The Places.* It grows naturally upon Dunghills, and other the most filthy places that may be: sometimes it is found in places like Brick-kilns, and old Walls, and near the Emptying places of Ordure or Dung; but the cleanness of the Ground may in some measure alter its Smell, which, as some fancy, may be like old Rotten Cheese: but that which grows in its natural place, smells like abominable Stinking Fish, whence came the name *Garrasinos*, as is before declared.

V. *The Times.* It is an Annual springing Plant, Flowers in June and July, and the Seed is ripe presently after, at what time it perishes, and rises again of its own Seed; so that if it is once gotten into a Ground, it is not easie to be destroyed, or rooted out again.

VI. *The Qualities.* It is Cold and Moist in the first Degree; is Alterative, Cleansing and Emollient; and is chiefly Hysterick, or appropriated to the Womb.

VII. *The Specification.* It is a pure Antihysterick, curing Vapors, and Fits of the Mother, arising from almost what Cause soever.

VIII. *The Preparations.* You may have from it, 1. A Decoction. 2. A Juice. 3. An Essence. 4. A Syrup. 5. A Saline Tincture. 6. An Injection. 7. A Cataplasm. 8. An Ointment, or Balsam.

The Virtues.

IX. *The Decoction.* If made in Wine, and drunk from three ounces to six, it quells hot Vapors arising from the Stomach to the Head: if made in Water, it cools the Stomach and Womb, being inwardly taken, and outwardly injected with a Womb Syringe.

X. *The Juice.* It may be taken from j. ounce, to ij. ounces, or more: It cleanses the Womb, if it is foul, and strengthens it exceedingly; it provokes the Terms, represses Vapors admirably, and cures Hysterick Fits: give it in a Glass of White Port, and let the Patient smell to it.

XI. *The Essence.* It makes Barren Women Fruitful, provokes the Terms, if they be stop'd; and stops them if they flow immoderately; it facilitates the Birth, and brings away the After-birth, or Dead Child: it is commended as an Universal Medicine for the Womb, both easily, safely and speedily curing any Disease thereof, as Vapors arising from the foulness of the Womb, or too great abundance of Seed, Fits of the Mother, and the like. Dose from j. ounce to iij. ounces, in a Glass of White Wine, &c.

XII. *The Syrup.* It has the Virtues of the Juice, and Essence, but not full out so powerful as either of them, and therefore is to be given to more queasie Stomachs. It is also used as a Vehicle to convey the Juice or Essence down in: you may make it with Sugar; but for cleansing the Womb, it is much better to be made with Honey. Dose iij. or iv. Spoonfuls.

XIII. *The Saline Tincture.* This is more powerful in cleaning the Womb, and repressing Vapors, and Hysterick Fits, than either the Juice or Essence, and may be exhibited from j. dram to ij. drams, either in the Syrup, or White Port Wine. Mixt with equal parts of the Juice, it is good to smell to, in Vapors, and Mother Fits, for the ill Scent thereof, causes the Womb to fly from it, or precipitates the Vapors downwards: and being thus mixed with the Juice, it is good against the falling down of the Womb, being cast in with a Womb Syringe; it also kills Worms which breed in the Sores or Ulcers of Horses, or other Cattel.

XIV. *The Injection.* It is made of the Juice mixed with equal parts of the Syrup, and Red Wine. It cleanses Ulcers of the Womb, is good against the Whites, strengthens the Matrix, and is helpful against its falling down.

XV. *The Cataplasm.* It is applied to the Share-Bone in Women, in a *Procidencia Uteri*; and gives ease in the Gout, or other Pains arising from a hot Cause: applied to the Stomach, it represses Fits of the Mother.

XVI. *The Balsam.* It cures Ulcers in the Womb, and Privy Parts of Man or Woman, and is a singular thing to give ease in the Gout, being applied; as also to cool and dissipate Inflammations.

CHAP. XXIX.

Of Sea ARACH.

I. *THE Names.* It is called in Greek, *Ἀραχίς θαλάσσια*; in Latin, *Atriplex marina*; and by Lobel, *Xerampelina*; in English, *Sea Arach*, *Marsh Arach*.

II. *The*

II. The Kinds. It is twofold, 1. *Atriplex marina repens latea*, Yellow Creeping Sea Arach. 2. *Atriplex maritima angustifolia*, Narrow Leaved Marsh Arach.

Arach Sea

III. The Description. The first of these has a great Root with many strings, which perishes not every Year, and is of a saltish Taste, tho' it is bred up in a Garden; from whence comes forth several Stalks, lying in some measure, and creeping upon the Ground, with many White, Hoary, Mealy or Sandy Branches, and with White, Broad, Mealy or Sandy Leaves, deep cut on the Edges, and Pointed, set on them without any order, cut in on the Edges, near at the Bottom, and pointed at the Ends, somewhat like unto a small Goose-foot Leaf: at the top of the Branches grow divers slender, hoary, yellowish Spikes of Seed, set close together like Clusters: sometimes I have seen it reddish, like the Red Garden Arach, and sometimes nothing so Mealy, but rather Green.

Sea=Arach=

IV. The other kind has a Woody Root, with many small strings, from whence springs forth a Woody and Hoary Stalk, about a foot high, spread at the top into many small Branches, spotted with black spots, which end in long yellow spikes of Clustering Seed, like the former. The Leaves which grow below are somewhat long and narrow, about two inches long, of a dark green Colour, with some Corners about the Edges, which yet are smaller and smaller, as they grow higher.

V. The Places. They grow in many parts of England, by the Sea shore, and Banks of Salt-water Rivers, and Borders of Salt Marshes, and in Marsh Grounds, particularly at Queenborough, at Kings-Lyn in Norfolk, at Margate in the Isle of Thanet, and in many other places by the Sea side. The first grows on the Sea shore near Little Holland in Essex, and at Kings-Lyn in Norfolk, by the Banks of the Creek, running out of the Haven by the South side of the Town, where some years since I found it in great plenty; as also in the Isle of Mersey, not far from Colechester. The latter, Mr. Ray says, grows plentifully by the River, and on the Banks of the Marshes about Malden in Essex, and doubtless in many other the like places.

VI. The Times. They Flower from the beginning of June, all July and August; even to September, and the Seed successively ripens in the mean Season.

VII. The Qualities. It is Cold and Moist in the first Degree; but some Authors will have it to be Dry. It is something Cathartick, at leastwise Solutive, Diuretick, Absterfive, Attenuating, Discurfive and Emollient; and is appropriated to the Womb, Reins and Joints.

VIII. The Specification. It is peculiar against a Polysarcia, or a too great Flethiness and Fatness of the Body, and the Dropsie.

IX. The Preparations. You may prepare from it, 1. A Juice. 2. An Essence. 3. A Decoction. 4. A Syrup. 5. A Spirituous Tincture. 6. A Saline Tincture. 7. An Oily Tincture. 8. A Cataplasme. 9. An Ointment. 10. A Balsam.

The Virtues.

X. The Juice. This by reason of its Saltness does purge the Bowels, and habit of the whole Body, of Cold and Watry Humors, being taken from j. ounce to iij. ounces, in the Broth of Fat Meat.

XI. The Essence. It is in property much like to the Wild Araches; and being taken Morning and Evening for some time, it has been found prevalent against a Polysarcia, or too great Corpulency, and Bulk of Body; and preserves the Lungs from putrefaction. Dose from j. ounce to iij. ounces.

XII. The Decoction in Wine. It has the Virtues of the Essence and Juice, but not full out so powerful: it provokes Urine, and is good against Gravel and Stone. Dose from iij. to vj. ounces, Morning and Evening.

XIII. The Syrup of the Juice. It cleanses the Lungs and Bowels, opens the Body; 'tis said, that there is not many better Medicines against the Dropsie than this, to take it to iv. ounces, or more, Morning and Evening; I have proved it. It also causes Leanness in them who are too Fat, as experience has manifested.

XIV. The Spirituous Tincture. It strengthens the Womb, and is good against the Diseases thereof, taken to ij. drams in Wine: mixed, half an ounce of it at a time, with vi. or vij. ounces of the Decoction in Water, it cleanses the Womb of the Whites by injection, and stops them.

XV. The Saline Tincture. It is a good Nephritick, and

and Diutrick, it opens the obstructions of the Urinary Passages, provokes Urine, and expels Sand, Gravel, and gritty Stones. Dose from ʒ. dram to ʒj. drams, in white Wine.

XVI. *The Oily Tincture.* It has the Virtues of the former taken inwardly, from vi. drops to xvij. in white Port Wine; but it is best to be given in a cold habit of Body: it opens obstructions of the Womb, and provokes the Terms.

XVII. *The Cataplasim.* The Herb Cut, Bruised, and Boil'd to a Cataplasim with Oatmeal, discusses outward cold Tumors, and gives ease in the Gout.

XVIII. *The Ointment.* It is good to cool Inflammations, and ease Pains and Aches proceeding from a hot Cause: and is good to anoint on the Legs, to discufs Hydropical Tumors.

XIX. *The Balsam.* It is a good Vulnerary, abates Inflammations in Wounds and Ulcers, cleanses them of their filth, makes them ease, and in a little time after heals them.

XX. *The Correction.* By reason this Herb is something Flatulent, or apt to stir up Wind, it ought to be Corrected in its various preparations, as Juice Clarified, Essence, Decoction, and Syrup, with Aniseeds, Carraways, Cloves, Fennell Seeds, Ginger, Liquorice, Pepper, Zedoary, &c.

CHAP. XXX. of ARROW-HEAD.

I. **T**HE Names. It is called in Greek, *Πισαία*: In Latin, *Sagitta*, *Sagittaria*, *Sagittalis*: And in English Arrow-head.

II. *The Kinds.* It is threefold, *Πισαία μέγας*: *Magopistana*, *Pistana Magonis*, *Barba Sylvana* *Casalpini*, *Sagittaria major latifolia*, the greater broad Leav'd Arrow-head. 2. *Πισαία μέγας*, *Sagittaria minor latifolia*, the lesser broad Leaved Arrow-head. 3. *Sagittaria angustifolia*, narrow Leav'd Arrow-head.

III. *The Description.* The Greater broad Leav'd Arrow-head, or Water Anchor, as some call it, has a thick Bushy Root with many Fibres or Strings, from whence comes forth several thick square and juicy Stalks, with great broad green Leaves on the tops of them, divided at the bottoms into two long and pointed parts, so that the whole form or shape of the Leaf, is not much unlike the forked Head of a Broad Arrow, or one of the points of an Anchor, save that the two points at the bottom are longer; which parts Grow but a little above the Waters wherein they Grow, toberther deeper or shallower: From among these former Stalks, rise up other thick, round, spongy Stalks two or three Feet long, and higher than the Leaves, bearing divers rows of Flowers at the Joynts, one above another, and for the most part three in a row, each of which is composed of three large white Leaves with several reddish Threads in the midst, after which come in, their places, round rough Burrs, which are green when they are ripe, much like to those of Sparganium, or the Burr Reed; in which Burrs are contained the Seed.

IV. The lesser Broad Leav'd sort has also a thick and bushy or stringy Root like the former, with broad Leaves standing upon large Foot Stalks near two Feet or more high, in shape like the former, but every way lesser; among which rises up a fat and thick Stalk, something higher than the Leaves, having at the top many pretty white Flowers, declining to a light Corruption, but yet less than the former, made also of three small Leaves, and in the middle of which are several Reddish Threads; which being past, there comes several Knobs or Burrs greater than the former, in which in like manner are contained the Seed.

V. The Narrow Leav'd Arrow-head has a small and thready Root, from whence rises up a tender Foot Stalk about Eighteen Inches high, at the top of which are Leaves shaped like the former, except in their length and narrowness, not being above half the breadth of the others, yet of their full length; and the two lower forked ones, are almost as long as the fore right Leaf; the Flowers and Burrs are also lesser.

VI. *The Places.* They grow sometimes altogether, sometimes apart in Watery Ditches, and standing Waters, in most places throughout this Kingdom, particularly in the Ditches near the Walls of Oxford; by Chelmsford in Essex; in the Ditch near St. Thomas's Waterings not far from London; and in some Ditches in St. George's-Fields, and not far from Lambeth: The Narrow Leaved grows on the Thames Shore by Lambeth Bridge, over against the Archbishop of Canterbury's Palace; plentifully before the Earl of Peterborough's house, above the Horse-Ferry on Westminster Side, &c.

VII. *The Times.* They Flower generally in May and June; and the Burrs or Seed are ripe in the beginning or middle of August.

VIII. *The Qualities.* They are Cold in the first Degree, and Temperate in respect to dryness or moisture. They are also Alteratives, Astringents, Abstersives, Incarnatives, Glutinatives, and Traumaticks or Vulneraries; and appropriated to the Spleen, Reins and Joynts.

IX. *The Specification.* I have had great Experience of the Virtues and Use of this Herb, and have found it to be a peculiar Wound Herb, whether inwardly taken or outwardly apply'd, besides its signature bespeaks the very same thing.

X. *The Preparations.* I have used it in its; 1. Decoction. 2. Juice. 3. Essence. 4. A Spirituous Tincture. 5. A Saline Tincture. 6. An Oily Tincture. 7. An Ointment. 8. A Balsam. 9. A Cerote or Emplaster. 10. A Cataplasim. 11. A Powder of the Seed.

The

The Virtues.

XI. *The Decoction* made in Wine, or half Wine, half Water. It is a good Gargle for Sore Mouths, and if a little *Alum* and Honey is dissolved in it, is a singular Medicine, for a Thrush in Children, and to Gargle with for sore Throats in Elder Persons: and used as an Injection into the Womb, it is of excellent use to cleanse the Womb, and stop the Flux of the Whites: Inwardly taken from iij. to vj. ounces, it is good to stop Fluxes of the Bowels and Fluxes of Blood, whether by the Mouth, Urine or Stool: and used as a Diet Drink, it is good for Wounded Persons, and such as have running Ulcers, and Fistula's about them.

XII. *The Juice*. It stops spitting of Blood, and is good against the Bloody Flux taken from ij. Spoonfuls to vj. in a Glass of Red Wine or Claret twice or thrice a day: it contributes also to the healing of all sorts of Wounds, whether inward or outward: and bathed upon an *Erysipelas* abates its heat.

XIII. *The Essence*. It is a singular Traumatick taken from j. ounce to iij. ounces twice a day, in the Decoction, or a Glass of Wine: It not only causes Wounds suddenly to heal, but wonderfully promotes the healing of all running Sores, Cacoethick Ulcers and Fistula's where or whatsoever. It is drying, binding, and Astringent, stops Fluxes, abates Inflammations, stops Fluxes of Blood, pissing Blood, Catarrhs, and Consumptions.

XIV. *The Spirituous Tincture*. It has the Virtues of the former, but is best to be exhibited in a cold habit of Body fro j. to iij. drams, &c.

XV. *The Saline Tincture*. It powerfully opens Obstructions of the Spleen, Reins, Womb, and Urinary Passages, carries off the Excrencies in Cachymick habits of Body, and which supply old running Sores, putrid Ulcers, and Cacoethick Fistula's, with the evil and malign Matter which keeps them from Healing: it dissolves Gravel, and expels Sand and Tartarous Slime out of the Reins and Bladder. Dose from j. dram to ij. drams.

XVI. *The Oily Tincture*. It eases the Spleen, expels Wind, provokes Urine, and is good against Wounds or Ulcers of the Reins or Bladder: Outwardly poured upon Wounds of the Nerves it heals them. Dose from vj. drops to xvj. drops.

XVII. *The Ointment*. It allays Inflammations chiefly in Wounds, heals Green Wounds; and has an absterfve faculty in cleansing old Sores and fetid Ulcers.

XVIII. *The Balsam*. It cures Wounds by the first Intention, where they are simple. But where they are Contused, or Complex, it brings them to digestion, and afterwards by its absterfve property cleanses the Ulcer, then incarnates, and heals after an admirable manner: it also dissolves Inflammations in the beginning, and in time resolves them.

XIX. *The Cataplasim*. It is good to allay Pains proceeding from a hot Cause in what part of the Body soever; and I have often found it to give ease in the hot Gout, and other Joynt-Aches. It is something reperfusive, more especially if it is apply'd cold, which is best to be done, when it is used to a Contusion or Blow upon a Bone, as the Forehead, it hinders the rising of the Tumor, reperfuses the Juices which would flow thither, and prevents its blackness.

XX. *The Cerote or Emplaster*. It Cures Green Wounds, cleanses, and heals old Sores and Ulcers, and fills up Wounds and Ulcers with Flesh. It is drying, astringent and strengthening, good to be apply'd to weak Backs, or feeble Joynts, and places

Afflicted with Pains and Aches, from a Flux of Humors, or over-straining of the Part through any Violence or Force put upon it.

XXI. *The Powder of the Seed*. Being drunk in White Wine from j. dram to a dram and a half, it is said to cure the Falling-sickness, and help other Diseases of the Head and Brain: it is prevalent also against the Dropsie, carrying off the Morbifick Matter by Urine; and is found by experience to be good against Sand, Gravel and Tartarous Slime in the Reins, and Urinary Passages. Being strowed over Wounds, Sores or Ulcers Inflamed, it takes away the Inflammation, and so does the Powder of the Leaves: and kills Worms in Children.

CHAP. XXXI.

Of Mild or Spotted ARSMART.

I. *THE Names*. It may be called in the Greek, *Περσικαία Ἀμεργία* from the Peach Tree; its Leaf being like to a Peach Leaf: In Latin, *Persicaria*, and by some *Plumbago*: In English, *Mild or Spotted Arsmart*, and *Peach-Wort*.

II. *The Kinds*. There are two Principal Kinds, 1. *Persicaria maculosa* Anglica, in English, *Spotted Arsmart*, lesser and greater. 2. *Persicaria maculosa Virginiana*, The *Virginian Spotted Arsmart*, which is also twofold, with White Colored and Flesh-Colored Flowers.

*Arsmart.
mild.*

III. *The Descriptions*. The first of these has a long Root with many threads and strings thereat, from whence rises up several Jointed Stalks, smooth round and hard, of a light green or reddish Color, especially at the Joynts, which are manifold: from whence springs several smooth long Leaves, almost Peach fashioned (whence came the name Peach-wort) broad towards the Foot Stalk, after declining Pyramidally to a Point, being even on the edges without any cut or dent, and having thereon (for the most part) a leaden Colored or dark Spot, in form of an

half Moon, or Semicircular. The Flowers grow in long spiked Clusters upon long Stems, either blewish or whitish, or whitish red, after which, comes a small, blackish, brownish, or redish Colored flat Seed: the whole Plant has no hot, sharp, or biting Taste with it, as has the Hydriper, or the biting Arsmart, in the next Chapter; but rather almost sweetish, like Somel, cooling and drying, or esse almost without Taste. The Greater is like the former in all respects, but the Stalks, Leaves, Spikes, and Seed are every way much larger.

IV. The first sort of the white Flowered Virginian Arsmart, has a woody Root consisting of a great bush of long black strings or threads, with Perish not Tearly, but abide, tho the Stalks with the Leaves may die away, and Spring again the next Year: from this Root rises up several hard round green Stalks with many great Joints on them as the other has; and fair, large, broad, dark, blewish, green, smooth Edged, and long pointed Leaves, spotted oftentimes like our English or Common sort before described, and sometimes without spots, many of them six Inches long and better, and three Inches and a half broad, with several Competing Veins rising from the middle Rib, and others less and transverse, at the tops of the Stalks, and from the Joints with the Leaves, Spring Branches of spiked white Flowers, like close Grains as in the other, but greater, and succeeded by black and flat shining Seed.

V. The second sort of bluish or flesh Colored Virginian Arsmart, has also a like woody Root, thick, with many Fibres at it, but greater and more Woody than the former, from whence Springs up straight round Stalks, much higher than the last, with much larger and narrower Leaves, marked also oftentimes with Spots in the like manner, and often also without those Spots: this also has many more Branches of Flowers, which are much shorter Spikes, or bob Spikes, and very much thicker set with fine bluish Colored, or flesh Colored Flowers, much larger than the former, which gives also much the like Seed, but in greater plenty.

VI. The Places. The Lesser and Greater English sorts grow by the sides of Rivers and Ditches; the Lesser almost every where both in standing and running Waters, and in such places as are many times wet in Winter, and dry in Summer, and in other moist Grounds in most parts of this Kingdom, where it may many times be gotten almost in Cart Loads. The Larger sort has been found in great plenty, in the Lands and Furrows of Hedington Field above St. Bartholomew's Hospital, half a Mile from Oxford. The Virginian Kinds are only to be had with us in our Gardens, nourished up by such as are Curious.

VII. The Times. The English Arsmarts Flower only in June and July; and their Seed is ripe in August: But the Virginian Kinds Flower with us much later, and scarcely perfect their Seed here.

VIII. The Qualities. They are cold and dry in the first Degree: Alteratives, Astringents, Ineffluents, Repersives, Glutinatives, Anodyns, and Traumaticks or Vulneraries: Also Hystericks and Arthriticks.

IX. The Specification. Its peculiar property is in curing of Wounds, and healing old running Sores and Ulcers.

X. The Preparations. There are taken from it, 1. The Green Leaves. 2. The Distilled Water. 3. The Mixture. 4. The Juice. 5. The Essence. 6. The Ointment. 7. The Balm. 8. The Cataplasim.

The Virtues.

XI. The Green Herb. Authors say, that if a handful of Arsmart wet in Water, and apply'd for some time to a Wound, or Sore, and afterwards Buried in moist Ground, or under a Stone, as the Herb rots, so the Sore will Miraculously heal. And being put on Horses or other Cattle's Sores, 'twill drive away Flies in Summer time.

XII. The Distilled Water. Being mixt with a half part of Aqua Vita, and bathed on any pained place for a Week, more or less; it will perfectly take away the pain.

XIII. The Mixture. Take the Distilled Water, Ox Gall, Oil of Spike, of each equal parts, mix them well together by shaking them in a Glass. This anointed upon any place troubled with the Gout, and a Flannel dipt in the same, being also apply'd, takes away the pain thereof.

XIV. The Juice. If therewith any old running Sore, or old Ulcer, is constantly washed, it cleanses and heals it: it is also excellent to be put into Diet Drinks for Wounded Persons, and such as have old and running Sores upon them: and washing the Sores of Beasts therewith, it keeps Flies from them.

XV. The Essence. It is more powerful than the Juice, and is more useful to all Intentions, healing also much more outwardly, being apply'd.

XVI. The Ointment. It is excellent against all hot Swellings and Inflammations in any part of the Body, especially being apply'd in the beginning, being something Repersive: it also allays Inflammations in Wounds and Ulcers, and eases pains proceeding from a hot Cause.

XVII. The Balm. Being made of the Bruised Herb boiled in Oil Olive, and made into a Balm with Turpentine and Wax, It heals all sorts of green Wounds wonderfully; it cools, dries and heals; and therefore is good for putrid Sores, and running Ulcers, whether in Man or Beast, cleansing purifying, incarnating them, and healing them.

XVIII. The Cataplasim. The Herb beaten with Rue and Wormwood, and heat very hot in a Frying-Pan, and apply'd to the Bowells, as hot as can be endured, in a Cholick, it gives present ease to a Wonder.

CHAP. XXXII.

Of Hot or Biting ARSMART.

I. THE Names. It is called in the Greek, *ῥοδία*: In Latin, *Hydropiper*, *Piper Aquaticum*, *Perscaria non maculata*, *Perscaria Urens*, vel, *Mordax*: *Angulara* calls it *Crateogonon*; and some call it, *Zinziber Caninum*: in English, *Hot or Biting Arsmart*, *Water Pepper*, and *Peach-Wort*, or *Lake-Weed*.

II. The Kinds. It is the second general Species of Arsmart or Peach-wort, and is, 1. *Hydropiper*, seu *Perscaria acris vulgaris minor*, the Common Lesser Biting Arsmart. 2. *Perscaria acris Virginiana*, the Virginian Biting Arsmart, or *Hydropiper*.

III. The Description. The first or English sort, has a Root somewhat long, with many Fibres thereat, which as well as the rest of the Plant, is of a very sharp and quick Taste, biting the Tongue more than Pepper, from whence springs forth a faint crooked Stalk, not so High nor so Great as the former Mild Kind, but with a greater store of Branches and Leaves

some.

somewhat like unto Peach Leaves, but much lesser and narrower, they are also long, but somewhat narrower than those of the Mild Asinart, and without any spots at all, yet sometimes they have been found with redish Marks upon them. The Stalks are about a foot and half high, round, smooth and jointed, with a kind of Knee at each Joint: at the greater Joints, as well towards the tops of the Stalks and Branches, as at the tops also, come forth small spiky heads of bluish or reddish Colored, and sometimes more red or white Flowers Mixed, clustering together, which falling away, there comes little blackish Seed, somewhat broad or flatish and sometimes of a reddish yellow Color, of a hot and biting Taste, (as is all the rest of the Plant) almost like unto Pepper, whence came the name of Water Pepper; but the Herb it self is without any smell.

Biting Arsmart Or Hydropiper

IV. The Virginian Kind is in most things, as its Roots, Stalks, Branches, Joints, Leaves, and Flowers like unto our English before Described, and differs only in the form of the Flowers growing, and their Color, these growing on more slender and long spikes, and their Color being white.

V. The Places. Hydropiper grows almost every where, throughout the Kingdom, in moist and watry Places, and near unto Rivers and Ditch-sides, standing plathy Waters, running Brooks and such like. The latter has been brought out of Virginia, and is nourished up with us in Gardens.

VI. The Times. They Flower in June and July, to August, and the Seed is Perfected or Ripe not long after, yet it is to be observed the Virginian Kind Flowers something later here, and therefore its Seed is somewhat later Ripe.

VII. The Qualities. Hydropiper is hot and dry in the fourth Degree. It Incides, Attenuates, opens, and is Diuretick, and Emmenagogick, and by Appropriation is Cephalick, Neurotick, Hyfterick and Nephritick.

VIII. The Specification. It is known by manifold

and large Experience to be a peculiar Plant against Gravel and Stone, whether in Reins or Bladder.

IX. The Preparations. The Shops keep only, 1. The Dried Herb. But you may prepare therefrom, 2. The Distilled Water- 3. The Juice. 4. The Essence. 5. The Oil. 6. The Ointment. 7. The Cataplasim. 8. The Root, and Seed.

The Virtues.

X. The Herb. It is hot and dry, used chiefly in Wounds, hard Tumors and inveterate Ulcers. Some use it in the Transplantation of Diseases, and removing of Inchantments. The Green Herb strewed in a Chamber, is said to kill all the Fleas; and a good handful put under a Horses Saddle, will make him go briskly, altho' half tyred before.

XI. The Distilled Water. It is a Specifick against Stone and Gravel in both Reins and Bladder, and has cured to admiration when all other things in the World has failed; and so great things have been some hundreds of times experimented of this simple Distilled Water, which seem to be even Miraculous, it performing what much reputed greater Medicaments cannot do: I write not this from my own Experience only, which in this case is very considerable, but we have also the Suffrage of very Great and Learned Men, as to the same thing. And this thing I would have to be noted, That in any of my Books, wheresoever I have mentioned *Perficary* or *Arsmart Water*, either simply or with other Preparations against the Stone, Gravel, &c. I always in all those places, intend the Water of this present Herb, of which we now speak, viz. *Hydropiper*, or *Biting Arsmart*.

XII. The Juice. Given to j. ounce in White Port Wine it provokes the Terms, facilitates the Birth, and brings away the After-Birth; and given in vj. or viij. ounces of the Distilled Water, it provokes Urine, and opens obstructions of the Urinary Passages.

XIII. The Essence. It has the Virtues of the Juice, comforts the Head, Nerves, Stomach, Lungs, Womb, and Reins, provokes the Terms, and causes a good Digestion, eases pains of the Gout from a cold Cause, waists and consumes superfluous Humors in any part, and is admirable against all cold and moist Diseases of the Brain, Nerves and Womb, as Falling sickness, Vertigo, Lethargy, Apoplexy, Palsie, Megrism, Bartennels, &c. and made into a Syrup with Honey it is a good Pectoral. Dose ij. drams.

XIV. The Oil. It dissolves and diffuses all cold Swellings, Scrophulous and Scirrhous Tumors, Quinies, Congealed Blood, Pleurifies, &c.

XV. The Ointment. It is good against Bruises in any part, and prevails against Oedema's, and other cold Tumors of the Joints, Kings Evil Swellings, and Kernels in Neck and Throat.

XVI. The Cataplasim. It prevails against Contusions, hindering putrifaction; and applied to a Fellon or Whitloe, it takes away the Pain almost presently, and in a short time after cures it.

XVII. The Root and Seed. Either the Root or Seed bruised and applied to an Aching Tooth, gives present ease, and in short time after perfectly cures it: Put into a hollow Tooth, it does also the same thing.

C H A P. XXXIII.

Of Garden ASARABACCA.

I. THE Names. It is called by the Arabians, *Afaron* : in Greek, *Ἀμεν*, & *Νάρδος Ἀγία* : in Latin, *Asarum*, *Nardus Sylvestris*, *Nardus Rustica* (because of its Aromatick or Sweet Smell,) by *Macer*, *Vulgago*, as by his Verse, *Est Afaron Græce, Vulgago dicta Latine; quod Vulgam vel Bulgam seu Ventrem movent* : and in English, *Asarabacca*. I suppose our English Name came by a mistake, taking this Plant for *Baccharis* or *Flowmans Spicknard*, which it is not; and so out of the two names, of *Asaron* and *Baccharis*, they made the name of *Asarabacca*. Others thought *Asarum* and *Baccharis* to be one Plant, and so compounded the name out of them both; and called it *Asarabaccara*, as it is called in Spain at this day.

II. The Kinds. It is twofold, 1. *Garden*. 2. *Wild*, of which in the next Chapter. The Garden kind is also twofold, 1. *Asarum boxgerum Vulgare*, Common Garden *Asarabacca*. 2. *Asarum Virginianum*, Virginian *Asarabacca*.

Asarabacca.

III. The Descriptions. Our Common Garden *Asarabacca* has small Roots, and whirish, spreading many ways in the Ground, and increasing into divers Heads, but not running or creeping under Ground, as many other creeping Herbs do; they are sweet in Smell, resembling *Spicknard*, but more when they are dry, than when green, and of a sharp, but not unpleasant, taste : from these Roots rise up many Heads, from whence comes many smooth Leaves, every one upon his own Foot-stalk, which are smoother, rounder, and bigger than *Violet* Leaves, thicker also, and of a darker green shining colour on the upper side, and of a paler yellow green underneath, little or nothing demed about the edges; from among which, rise up small, round, hollow, brownish, green Husks, upon Stalks of about an Inch long, divided at the brims with five divisions, very like the Cups or Heads of

the *Hembane* Seed, but that they are smaller : and these are all the Flower it has, which being smell'd unto, are somewhat sweet; and wherein, when they are ripe, are contained small covered rough Seeds, very like the Kernels or Stones of Grapes or Raisins.

IV. The Virginian Asarabacca, grows very like the former; but its Roots are somewhat greater, and fuller of substance, spreading in the same manner, and something more fragrant, and a little hot in taste, biting a little the Tongue : From this Root springs up the Leaves as the former; but they are a pretty deal larger, stiff also, and thick, somewhat crumpled about the edges, of a dark green colour, and not so much shining as the former; nor yet so round, but a little pointed at the end, very much resembling the flat shape of an Heart; some of which Leaves will be spotted or streaked. The Flowers have but three divisions or points, and of a paler green colour.

V. The Places. The first grows naturally Wild under the shades of Trees, and upon shady Hills in *Pontus*, *Phrygia*, and other places of the East : The other grows Wild in *Virginia*; but they are both of them Nurst up in Gardens with us; of which the first is very common.

VI. The Times. They both keep their Leaves green all the Winter, but shoot forth new in the Spring; and with them come forth those Heads or Flowers, which give ripe Seed about *Midsummer*, or in *July* or *August*, whose Seed is ripe not long after : but their Roots and Leaves are gathered in the Spring.

VII. The Qualities. They are hot and dry in the second Degree, or rather in the third. They Open, Incise, Attenuate, and Resolve, and are Cathartick, Emetick, and Diuretick; and are appropriated to the Head, Stomach, Liver, Spleen, Reins, Womb, and Joints.

VIII. The Specification. It is a peculiar remedy for the *Dropsie*, *Jaundice* and *Gout*; as also for *Agues* of all sorts.

IX. The Preparations. In the Shops there are, 1. *The Roots in Powder*. 2. *The Leaves in Wine*. 3. *An Infusion*. 4. *A Decoction*. 5. *An Extract*. 6. *An Essence*. 7. *Disarum Fernelij*, an *Eleuary*. 8. *A Saline Tincture*. 9. *An Oil by Infolation*. 10. *A Cataplasm*. 11. *The Juice*. 12. *A Conserve*.

The Virtues.

X. The Roots. They Vomit, working both upwards and downwards, but not so strongly as the Leaves : Dose from half a dram to j. dram in Powder : Being given in White Wine, a little before the Fit of an *Ague*, it takes away the shaking Fit, and thereby causes the hot Fit to be more remis, and in twice or thrice taking, it is said to cure it, whether it is *Quotidian*, *Tertian* or *Quartan*. *Dioscorides* saith, that vi. drams of the Root in infusion in honied water, being drunk, powerfully provoke the Terms : I fear the Dose is very much too large in substance, iij. or iv. drams may be infused in the Mead, and so drunk : *Parkinson* says, it will work like *Black Hellebor* : It is good also against the Bittings of Serpents, and other Venomous Creatures. The Powder, the finer it is, the more it purges by Vomit and Urine; the coarser it is, the more it purges by Stool. Dose j. dram in Powder, as Authors say.

XI. The Leaves. Wine being made of the Leaves, by steeping them therein, is an Emetick, and provokes Urine, as *Dioscorides* saith, eases the Pains of the Stone, and an old *Sciatica*, and is profitable against *Dropsies*. *Mesue* says, it not only Vomits, but works downwards, and by Urine also, purging both

both Choler and Flegm, but it purges Flegm more manifestly than Choler. It wonderfully helps the Obstructions of the Liver and Spleen, and therefore is excellent against the Dropsie and Yellow Jaundice, and stubborn Agues, which come from plenty of Evil Humors. You may steep 6, 7, 8, or 9, of the Leaves in Wine for one Dose, according as the Age and Strength of the Patient may be, and repeat it twice or thrice a Week.

XII. *The Infusion.* Made of the Leaves in Mead or Whey, with the Addition of some Spikenard to Correct it, it performs all that the Wine doth, and is very effectual for those that are afflicted with a Sciatica, and other like Pains of the Joints.

XIII. *The Decoction.* Made in Whey, Mead, or Wine, of the Leaves, adding also a little Mace, Cinnamon, or Spikenard, by Boiling, which ought not to be much, because then the Virtue will be lost; it mightily prevails against Quotidian, Tertian and Quartan Agues, and performs all that the Wine, or Infusion can do: this may be given every other day, anointing also the Back Bone and Soles of the Feet with the following Oil. Now here is to be noted, that in making this Decoction, the Liquor in which the Leaves are put, ought first to boil, that they may not remain long in the Decoction, because of losing their Virtue, as aforesaid.

XIV. *The Extract.* Made of the Roots, being Green, and beaten into a Mass, and the Juice Extracted with Wine, till the whole Virtue is drawn forth, and then evaporated to the due thickness of an Extract. Being thus made, it will keep all the Year, and is more safe than the simple Powder of the Root; and may be given from xv. grains to half a dram. But Schröder has an *Alcalisate Extract*, which is called also *Coagulum Asari*, thus made. *Be Take Roots and Leaves of Asarum, extract a strong Tincture with Spirit of Wine rectified, which filter through brown Paper, to which add the fixed Salt of the Ashes, made by elixivation, and calcined again, even to melting; digest a while, then abstract the Spirit, till the Extract becomes of the thickness of Honey. Dose from j. scruple to iij. scruples.* It may be given against the Bittings of Serpents, and mad Dogs, King's Evil, Asthma's, Quartans, Worms in Children, and in any of the Cases which the Powder of the Roots, or Wine, Infusion or Decoction of the Leaves, are intended for.

XV. *The Effence.* It is a good Emetick and Cathartick, but works not so strongly Upwards as the simple Juice, or the former Powders, Wine, Infusions, or Decoctions; and after it has done working, it commonly provokes Sweat powerfully, expelling the Relicks of the Disease that way. Dose from j. dram to ij. or iij. drams in Wine or Mead, as the Patient is in Age and Strength.

XVI. *The Elethuary.* You may see the Preparation of it in our *London Dispensatory*, lib. 4. cap. 22. sect. 95. It may be given from ij. drams to iv. to evacuate by Vomit all sorts of Humors from the Stomach, and Parts adjacent: 'tis so gentle that Aged People, and Women with Child may safely take it; give it in Mead or Wine.

XVII. *The Saline Tincture.* It is extracted from the green, or fresh gathered Roots and Herbs. This works more by Urine and Sweat, and is gentler than many of the other Preparations. Dose from j. dram to ij. drams; it carries off the Morbifick Matter of many inveterate Diseases, as the Dropsie, Jaundice, Gout, Sciatica, King's Evil, Agues, Cachexies, Green-sickness, Apoplexies, Lethargies, Megrim's, Surfeits, &c. by all the ways, as Vomit, Stool, Urine and Sweat. The Head washed or Bathed therewith, comforts the Brain and Nerves,

which are disaffected with taking Cold, and strengthens a weak Memory.

XVIII. *The Oil by Insulation.* The Herb and Roots well bruised, and put into a sufficient quantity of Oil, with the addition of j. ounce of *Ladanium*, to every pound of Oil; and insulated for two Months in a hot Sun, then pressed forth; (for want of a hot Sun, a Sand heat may do better, which will be continually Night and Day the same.) This Oil warm, being anointed upon all the Back, from the Neck to the Hips, as also upon the Soles of the Feet, in a warm Bed, it provokes Sweating; and being upon the accels of an Ague, it prevents the cold and shaking Fit, and thereby cures those who have been long afflicted with Quotidians, Tertians or Quartans; it is good also against Cramps, and other disaffections of the Sinews, and an old Cough.

XIX. *The Cataplasim.* The Leaves bruised, and applied as a Cataplasim, to the Forehead and Temples, eases the Head-ach, and causes Sleep: and applied to the Eyes, it takes away their Inflammation.

XX. *The Juice.* The common use of this Herb is, to take the Juice of 5, 6, or 7 Leaves (according to the Age and Strength of the Patient) and to mix it with a small draught of Ale, Mead or Wine, and so drink it to cause Vomiting. It works very strongly, cures Surfeits, and has all the Virtues of the Powder of the Root, Wine, Infusion, Decoction, Extract, or Effence. Mixed with a little Tutia prepared, and dropt into the Eyes, it clears the Eye-sight, and helps the Dimness and Mists, which are often before them.

XXI. *The Conserve.* Made of the Flowers, with refined Sugar or Honey. This being eaten is found by Experience to strengthen very much the Auditory Nerves, and to help difficulty of Hearing, Deafness, and a bad Memory. Dose from j. dram to iv. drams, in the Morning Fasting.

XXII. *Nota.* That most of the Preparations of this Plant are not to be given to Women with Child, for that through their Violence, they cause Miscarriage.

CHAP. XXXIV.

of Wild ASARABACCA.

I. **T**HE Names. It is called in Greek, *Ἀσάριον*; in Latin, *Asarina*, *Asarum* *Sylvestre*; in English, *Bastard* or *Wild Asarabacca*.

II. *The Kinds.* It is the second Species mentioned in Chap. 33. Sect. 2. aforesaid; and a singular Herb of the sort.

III. *The Description.* It has Roots long and slender, creeping under the upper crust of the Earth, and not shooting deep down, having a somewhat sharp taste, and a little bitter within; from whence spring forth Leaves, almost like to our Garden Asarabacca, but somewhat rounder, and rougher than they, slightly and unevenly indented about the edges, growing upon long slender hairy Foot-stalks, yet is it but a low Plant, and creeping, as it were, upon the Ground. The Flowers grow near unto the Ground, like unto those of Camomil, but much lesser, and wholly yellow, as well the border of the Leaves, as the Thrum in the middle; but Gerard says, they are of a Mealy or Dusty Colour, and not unpleasant in Smell. This Plant Clusius thinks to be his *Tusilago Alpina* *fecunda*; but Parkinson says, that by reason of its sharp Taste,

Taste, and creeping Root, it may more probably be taken to be the Coryledon palustris acris, vel, Ureas.

Bastard-
Asarabacca=

IV. *The Places.* It is found, as Matthiolus says, on the Mountains in Bohemia: and our Lobel found it in several places in Somersetshire; it delights in Woody and Shadowy places.

V. *The Times.* It Flowers in May and June; and the Seed is brought to its ripeness much about Midsummer.

VI. *The Qualities.* It is hot and dry in the beginning of the third Degree: it Incides, Attenuates, and is Aperitive, and Cathartick: Appropriated to the Head, Stomach, Liver, Womb, and Joints.

VII. *The Specification.* I cannot yet find either from Authors, or my own Experience, what Disease it is peculiarly good for; but 'tis certain, 'tis a good Decopillative, or opener of Obstructions.

VIII. *The Preparations.* You may have from it, 1. The green Herb it self. 2. A Powder of the same. 3. The Juice. 4. An Essence. 5. A Saline Tincture. 6. A Syrup of the Juice, or Herb. 7. A Decoction.

The Virtues.

IX. *The Green Herb.* A little of it eaten with other Herbs, as a Sallet, opens and loosens the Belly, and purges out Cold, Gross, Thick, Flegmatick Humors.

X. *The Powder.* It may be given to j. dram in Mead, Canary, Sherry, Malaga, or White Florence Wine, and so it will loosen the Belly, and purge thence Tough Thick Phlegm, and Black or Burnt Humors.

XI. *The Juice.* It has a Cleansing, Attenuating Quality; makes thin that which is thick, cuts that which is tough, and breaks that which is hard, opens the Bowels which are obstructed, and purges out the Morbifick Matter of many grievous Distaffections, and therefore is profitably given to such as are afflicted with the Palfie, Falling-sickness, or Yellow Jaundice: It may be given from ij. drams to iij. or iv. according as the Patient is in Age and Strength, in a Glass of Mead or Wine.

XII. *The Essence.* It has the Virtues of the Juice, but is more grateful to the Stomach, and may be given to half an ounce, or more, in a Glass of Wine:

It prevails against the Gravel in Reins and Bladder, and gives Ease in the Gout, inwardly taken, and outwardly applied; and whirling it kills Worms in Children.

XIII. *The Saline Tincture.* It opens Obstructions of the Womb, Reins and Bladder, provokes Urine, and expels Sand, Gravel, and Tartarous Slime: it kills Worms in old or young, and is profitable against the Dropic. Dose from j. dram to ij. in a Glass of White, or Rhenish Wine and Sugar.

XIV. *The Syrup of the Juice or Herb.* It has all the Virtues of the Juice, but must be given in full the double quantity, and is much better for Queasy Stomachs, and Children, than either the Juice or Essence; but it ought to be made in a Bath, for boiling will cause much of its Virtue to be lost.

XV. *The Decoction.* If it is made in Wine, it is a good Cephalick, and excellent against most cold Diseases of the Head, Brain and Nerves: Used as an Errhine, it purges the Head of cold and gross Humors: and taken inwardly from ij. to iv. ounces, or more, it prevails against Epilepsies, Apoplexies, Lethargies, Vertigo, Megrin, Head-ach, Palfies, Convulsions, &c.

CHAP. XXXV.

Of Common ASPHODEL.

THE Names. It is called in Arabick, Barba-cob: in Greek, Ἀσφύδελος: in Latin, Asphodelus, Haustula Regia, Aluacum, and Albuacum: in English, Asphodel.

II. *The Kinds.* It is fourfold, 1. The Common Garden Asphodel. 2. The Onion Asphodel. 3. Marsh, or Lancashire Asphodel. 4. Kings Spear Asphodel: of this last see Chap. 404. following: The Second and Third we shall treat of in the two following Chapters. The Common Garden Asphodel is also White or Yellow: and the White is either the Greater Single or Branched, and the Lesser Hollow, and Least.

III. *The Descriptions.* The Common single White Asphodel has a Root compact of many knobby Roots, growing out of one Head, like those of the Peony, full of Juice, with a small bitterness, and Astringent Taste; from whence springs up many long narrow Leaves, like almost to those of Leeks, sharp pointed: the Stalk is round, smooth, naked, and without Leaves, two Cubits high, garnished from the middle upwards, with a number of Flowers Star-fashion, made of six Leaves apiece: the colour White, with some dark Purple streaks, drawn down the Back side; within the Flowers are several small Chives; which being past, there springs up little round Heads, wherein are contained hard, black, and three corner'd Seed, like those of Buck-wheat or Staves-acre.

IV. *The Common Branched White Asphodel* has a Root composed of many tuberos long Knobs, which are thickest in the middle, and smaller at both ends, fastned together at the head, of a dark grayish colour on the outside, and yellow within; whence rises up many long and narrow hollow triangular Leaves, sharp pointed, and lying upon the ground round about the Root; the Stalk is smooth, round and naked without Leaves, which rises from the midst of them, divided towards the Top, into divers Branches, (if the Plant has been of any long continuance) or else into but two or three small Branches, from the sides of the main great one, whereon stand many large Flowers, Star-fashion, made of six Leaves apiece, on the inside whitish, and streaked with a Purple line down the

the backside of every Leaf, having in the midst of the Flowers some small yellow Threads: the Seed is black, and three square like the former, and greater than the Seed of Buck-Wheat, contained in roundish Heads which open into three Parts.

Great
White

Asphodil

Asphodil

Smalest.

V. There are also, the little hollow white Asphodel, and the least white Asphodel, which differ not

much but in the Magnitude, except in the first of them in the Roots, which are not Glandulous, but stringy long and white; bearing Flowers from the middle to the top Star-fashion: And in the second, in the height chiefly, it being seldom above a Foot high, having Glandulous Roots like the great Asphodels.

VI. The Garden yellow Asphodel, has many Roots growing out of one Head, made of several tough, flat and oleous yellow Sprigs, or Grofs strings, from the which rises up many Grassy Leaves, thick and Grofs, tending to squareness; among the which comes up a strong thick Stalk, set with the like Leaves, even to the Flowers, but less: upon which do grow Star-like yellow Flowers, not unlike to those of the greater White Asphodels, with much the like Seed following them.

Asphodil

small yellow

VII. The Places. They Grow naturally in Greece, Italy, Spain and France; but are nurst up with us only in Gardens, where now they are become natural, and Natives of our Soil.

VIII. The Times. The Glandulous Great white Asphodels do Flower in May and June: The least white One, in August and September, even till the cold hinders it: the hollow white, and the yellow, Flower in June and July; and the Seeds are ripe, the Month following.

IX. The Qualities. They are hot and dry almost in the third Degree: They are Emetick, incise, attenuate, open, discuss, resolve, and are Vulnerary: They are also Cephalick, Neurotick, Pectoral, Hysterick and Nephritick.

X. The Specification. They are known by experience to be peculiar against the Kings Evil, as the Signature in the Roots demonstrate.

XI. The Preparations. The Shops keep nothing hereof, but you may prepare therefrom. 1. A Juice of the Root. 2. An Essence of the same. 3. A Decoction in Wine. 4. A Syrup. 5. A Saline Tincture. 6. An Oily Tincture. 7. Ashes of the whole

whole Plant. 8. An Oil. 9. An Ointment. 10. A Balsam. 11. A Powder of the Roots. 12. A Cataplasim.

The Virtues

XII. *The Juice of the Root.* It cleanses, and takes away the white Morpew in the Face, or other parts of the Body, the place being first chafed well and rubed with a course Linnen Cloth. If it is mixed with *Sherry Sack* in which a little *Myrrh* has been dissolved, and a twelfth part of the *Tincture of Saffron*, it makes an excellent Collyrium for the Eyes to heal Inflammations, take away Mists, Cloudings, dimness of Sight, and other disaffections, being dropt into them.

XIII. *The Effence.* It may be taken from j. to ij. ounces in Mead or Wine against the Kings Evil, Coughs, Colds, Asthma's, shortness of Breath, or any Vehement obstructions of the Lungs. If the Stomach is foul, it will Vomit the Patient: it evacuates evil Humors, and is contributory to the Cure of running Sores, old Ulcers, Fistula's, and the like, Bathing and Washing the Swelling and Sores with it also.

XIV. *The Decodion in Wine.* It is Emetick if it meets with a foul Stomach, is opening and cleansing, good for a Cacoethick habit of Body, and prevails against the bitings of any venomous Creatures, Stone and Gravel, or any stoppage of the Urinary parts. I know it to be an excellent thing to be constantly taken by such as are troubled with the Evil, Oedema, or other like Tumors, for it consumes the Morbifick Matter which Composes them. It may be given to iij. iv. or vi. ounces, or less, &c.

XV. *The Syrup.* It has the same Virtues with the former Preparations, but much weaker, yet pleasanter to be taken by such as are queasy Stomached: It is an excellent Pectoral, and causes easy expectoration in stoppages of the Lungs. Dose ij. ounces morning, noon and night. 'Tis fit for Children.

XVI. *The Saline Tincture.* It works downwards, and carries off the Causes of Diseases by Urine: given from j. to ij. drams in White Port Wine, it provokes Urine and the Terms powerfully, is good against Plurifies, and an old Cough, Pains and Stitches in the side, &c.

XVII. *The Oily Tincture.* It is Excellent being Bathed with, against Punctures and Wounds of the Nerves, bitings of Mad Dogs, Vipers, and other Venomous Creatures.

XVIII. *The Ashes of the whole Plant.* Galen says, that if they are mixed with Ducks Grease, the mixture is good against an Alopecia, and brings Hair again where it was fallen off, by means of that Disease.

XIX. *The Oil.* It is good against cold Tumors, and to anoint with in Cramps, and for any Ach or Pain in any part, proceeding from a cold Cause, and is good to discuss Tumors and Swellings in Womens Breasts, Testicles, and other Glandulous parts.

XX. *The Ointment.* It cleanses old running Sores, putrid Ulcers, and rebellious Fistula's, disposes them to healing, and puts a stop to fretting and eating Ulcers: Discusses Inflammations in Womens Breasts, and Testicles, and is good against Fellons in the Fingers ends.

XXI. *The Balsam.* It is an Excellent thing indeed, for healing all sorts of Green Wounds; cleanses Ulcers to the bottom, incarnates and heals them, and is also profitable against the Gout from a cold Cause.

XXII. *The Powder of the Roots.* It may be given to j. dram in a Glass of White Port Wine, it provokes Urine and the Terms in Women, helps Pains in the Sides, Ruptures, Convulsions, and old Coughs: Used as an Errhine, it purges the Head and Brain of cold and moist Humors which cause Head-Aches, Lethargies, Vertigoes, Epilepsies, Apoplexies, &c. And j. dram taken in Broth provokes Vomit, and helps such as are bitten with Venomous Creatures.

XXIII. *The Cataplasim.* It is singular good to discuss Contusions, Inflammations and the like, to give ease in a cold Gout, or any Ach or Pain from a cold Cause, strengthens the Nerves, and cures Cramps, in what part soever: and is good to be apply'd in Tumors of the Kings Evil, Kernels and Swellings in the Neck and Throat, &c. I have had large Experience of the Virtues of the Root of this Herb; and I write little more of it, than what is true to my own knowledge.

CHAP. XXXVI.

Of Onion ASPHODEL.

Onion Asphodel

I. **The Names.** It is called in Greek, *Ἀσφοδελός*; in Latin, *Asphodelus Bulbosus*, by Dodonæus, *Asphodelus Femina*; by Lobel, *Asphodelus Hyacinthinus*, and *Hyacintho Asphodelus*; and that rightly, because the Root is like the *Hyacinth* or *Jacinth*, and the Flowers like the *Asphodel*: *Clusius* calls it *Ornithogalum Majus*, the *Greater Star of Bethelem*, and that fitly enough: in English we call it, *Onion Asphodel*, and *Bulbous Asphodel*, from the form of the Root.

II. **The Kind.** It is a singular Plant, having no particular Species under it.

III. **The**

III. The Description. It has a yellowish round Bulbous or Onion like Root, with some Fibres hanging thereat, from the which come many whitish green Grassy Leaves, long and narrow, not much unlike in shape to Leeks, and spread upon the Ground; these come forth at the beginning of the Year, and abide till May, and then they withering, amongst those Leaves, rises up a naked smooth Stalk, replenished towards the top with many Star like Flowers, of a whitish, or pale yellow green Color on the inside, and wholly Green without, consisting of six little Leaves, sharp pointed, with certain Chives or Threads in the Middle, and growing on short Foot Stalks, on a reasonable long Head spike fashion: after the Flowers are past, there succeeds a small Knop, or Head three square, in which lies the Seed which is roundish and black. It differs from Kings Spear, which is also a kind of Asphodel, in the pods, the which are round, but in this long and three square: from the Marsh or Lancashire Asphodel, in the Stalk, which is not wholly Naked; and the Common Asphodel in the Pods and Roots, which in those the Pods are round, and the Root multiform and knobby.

IV. The Places. It grows in the Corn-fields in the Upper Hungary: but with us, it is only nourished up in Gardens.

V. The Times. It Flowers in May, June, and July: and the Seed is ripe in August, or not long after.

VI. The Qualities. It is hot and dry in the third Degree, having almost the same temperature with Aron. It is aperitive, inciding, attenuating, absterive, discutive, and something Emetick. And are appropriated to the Stomach, Lungs, Womb, Reins and Joynts.

VII. The Specification. The Roots which are only used, open obstructions of the Lungs; and are peculiar against Asthma's, causing Expectoration.

VIII. The Preparations. You may have from the Root. 1. A Juice. 2. An Essence. 3. A Lohoch. 4. A Saline Tincture. 5. An Oily Tincture. 6. An Ointment. 7. A Balsam. 8. A Cataplasim. 9. A Syrup. 10. Ashes.

The Virtues.

IX. The Juice. Given from half an ounce more or less as the Patient is in age and strength in a Glass of White Wine, it opens obstructions of the Viscera, and is a singular good Medicine against the Yellow Jaundice.

X. The Essence. It is good against Pains and Aches of the Bowels, Pleurisies, Stitches, and other Diseases caused by Obstruction, whether in the Lungs or elsewhere: It prevails against Coughs, Colds, Asthma's, shortness of Breath, and difficulty of Breathing, and disposes wounds and Ulcers to a speedy healing. Dose from j. ounce to j. ounce and half in Wine or Mead.

XI. The Lohoch. It is made of the Juice Boiled up to a thickness with Honey, with a quarter part of the fine Powder of Elecampane Root, it is a famous Pectoral: with this I once cured a supposed incurable Phthisis, in less than two Months time: at first it Vomited, and continued to do so, more or less for 10 or 12 Days, after which time the Patient took it very Pleasantly; it cleaned the Lungs, caused a great Expectoration, and in short time after healed them and performed the Cure Pleasantly. It is good for Coughs, Colds, Asthmas, Wheezings, shortness of Breath, and other Distempers of the Lungs. Dose j. ounce in the morning Fasting, and as much at four in the afternoon.

XII. The Saline Tincture. It provokes Urine and is good against Gravel, Stone, and Tartarous

Slime in the Reins and Bladder. It represses Vapors and Fits of the Mother, provokes the Terms, and prevails against the Gout. Dose from half a dram to ij. drams morning and evening in a Glass of Wine.

XIII. The Oily Tincture. It is good against an Oedema in the Knees, Traumatick Tumors in the Neck and Throat, and any other cold Swelling in any part whatsoever, being anointed thereon. It prevails against a cold Gout, and other like Pains and Aches. Inwardly taken from vi. drops to xvj. in a Glass of Wine, it Comforts the Head, Brain, Nerves, and Womb.

XIV. The Ointment. It is good to anoint Kernells and Scrophulous Tumors in the Throat, cleanse old Ulcers, and being put Scalding Hot into Fiftula's to remove the Callus and Heal them.

XV. The Balsam. It is prevalent against Oedemarus Tumors, and the Gout, heals Wounds, cleanses old Sores, running Ulcers and Fiftula's, makes the Flesh grow, and heals them. It also diffuses hard and scirrhous Tumors.

XVI. The Cataplasim. It takes away black and blew marks of the Skin occasioned by Blows or Bruises, diffuses or resolves Inflammations, and abates pain by its Anodine Property: It is good in Tumors of the Breasts and Cods.

XVII. The Syrup. It is Pectoral, good against all diseases of the Breast, Lungs, and Womb; causes Expectoration, and a free Breath, and provokes the Terms. You may give it from j. ounce to ij. ounces, in a Glass of white Wine morning and evening.

XVIII. The Ashes of the whole Plant. Galen saith, That the Ashes of the Root mixed with Oil, or Hens Grease, cures the falling of the Hair in an Alopecia, and restores it where it was lost; and also cures a Scald Head. It is good against Scurff, Morphew, and other like vices of the Skin.

CHAP. XXXVII.

Of Marsh or Wild ASPHODEL.

I. The Names. It is called in Greek, Ἀσφodelos ἰσάδης: in Latin, *Asphodelus Paluster*, *Pseudo-asphodelus Luteus*: in English, *Marsh Asphodel*, *Wild or Bastard Asphodel*, and *Bastard yellow Asphodel*, and *Lancashire Asphodel*.

II. The Kinds. There are two special Kinds hereof, 1. *Pseudoasphodelus major*, *Asphodelus Lancastriae*, the greater *Marsh*, *Wild*, or *Bastard Asphodel*, *Lancashire Asphodel*. 2. *Pseudoasphodelus minor*, *Asphodelus Lancastriae verus*, the lesser *Marsh*, *Wild* or *Bastard Asphodel*, the true *Lancashire Asphodel*.

III. The Descriptions. The first of these has a Root long and Jointed, creeping as Grass does, with many Fibres thereat, from whence rise up several long and narrow Leaves, like unto Corn Flag, but not so stiff or hard, of a beautiful green Color, and somewhat Chamfered, furrowed or striked down right, yet compassing one another, as the Corn Flag and Flower de lucas do at the bottom, among which rises up a Stalk about a Foot and a half high, with divers short Leaves enclosing the Stalk, as it were hosed at their bottoms; and at the tops stand several yellow Flowers, as it were in a Spiked Head, each of them made of six Leaves a piece, as are those of the other Asphodels, in the midst of which come forth several small Threads or Chives, which being past, there comes

Seed in somewhat long and square pointed Husks or Cods, which Seed is very small and Blackish.

Lancashire Asphodil.

IV. The lesser Kind, has a Root which consists of a few whitish long Fibres, not creeping far, or much, but increasing into sundry Heads, from whence spring forth many smooth green Leaves, narrower, shorter, and fresher than the former. (Gerard says, two Inches and a half or three Inches long, somewhat broad at the bottom and sharper towards their ends) not much unlike to a narrow Flower de luce, but neither so hard nor so thick, from among which Leaves rises up a Stalk, which scarcely attains to be a Foot high, having very few small Leaves thereon. (Gerard says it is smooth and without any Leaves thereon,) towards the top whereof, in a Spiked Head comes forth small Flowers, of a paler yellow than the former, and of a pretty Star like fashion, which being gon, there succeeds small three square reddish Husks, or longish little Cods, which, Gerard says, are sometimes four or five Square, and in which is contained small reddish brown Seed.

V. The Places. They are both found Wild in England, as well as in other places beyond Sea, in Marsh and Wet Grounds: the first near Lancaster, in the Moorish Grounds there, as also near unto Mandley, and Marton, two Villages not far from thence; as also at the Foot of Bagshot Hill in the West of England, near to a Village of the same Name. The second grows near Egham, not far from the River side there, and in many other places, in the West of England.

VI. The Times. They Flower in May, June, and July, and the Seed is ripe, about a Month after the Flowers are gon: most of their Leaves remain green in the Winter Time, if it is not extreme cold and hard weather.

VII. The Qualities. They are hot and dry in the second Degree; Inciding, Attenuating, Aperitive, Absterfiv and Diuretick: Dedicated to the Lungs, Reins, Womb, and Joynts.

VIII. The Specification. There has been nothing in a constant Observation, to which they can be said to be peculiar; Authors having as to their Virtues been silent.

IX. The Preparations. You may make from the Roots, 1. A Decoction. 2. A Juice. 3. An Essence. 4. A Syrup. 5. An Ointment. 6. A Balsam. 7. A Cataplasm. 8. A Saline Tincture.

The Virtues.

X. Altho' Authors have said nothing of the Vertues of these Plants; yet, by their Tastes, and other Signatures, they seem to have the Virtues of the Garden Asphodels, tho possibly not so Potent and Efficacious: I have made several tryalls of them, and have found the Decoction to open obstructions of the Lungs and provoke Urine. With the Juice given to ij. ounces for some days in White Wine, I once provoked the Courses in a Woman where they were obstructed: and with the Syrup and Essence, I have cured some that have had extreme Colds. The Balsam I know to be a good Vulnerary, and the Ointment is very discurfiv and resolute, and good against the Gout. The Saline Tincture provokes Urine, and clears the Reins and Urinary Passages of Sand, Gravel, Slime and Tartarous Matter, given to ij. drams in White Wine: the other Preparations I have not much used; but this last, (as it is the easiest made) I have oftentimes proved, and that with good Success.

C H A P. XXXVIII.

Of Garden ASPARAGUS.

I. The Names. It is called in Arabick, *Halion*, & *Helion*: In Greek, *Asparagus*, & *Asparges*, *Ospinos*, *amrē*, *ospar*, from provoking Lust: In Latin, *Asparagus* & *Coriuda*: In English, *Asparagus*, *Sparagus*, and *Sperage*.

II. The Kinds. There are several Species of this Plant, 1. The Garden Kind. 2. The Wild Kinds, of which there is, 1. The Sea or Marsh. 2. The Rock Kind. 3. The Prickly: of which three last, in the two following Chapters. The Garden Kind is also 1. *Asparagus Sativus* vel *hortensis vulgarior*, seu *Minor*, The Common Garden Asparagus, or Lesser Kind. 2. *Asparagus Sativus*, vel *hortensis Major*, The Greater Garden Kind.

III. The Descriptions. The first or Smaller Kind, has very many Roots, dispersed from a Spongie head, which are long, thick, soft and spongie strings, hanging down, and spreading themselves all about, whereby it greatly encreases: from this Root there rises out of the Ground, divers whitish, green, scaly Sprouts, thick, tender, very soft and Brittle, of the thickness of the greatest Swans Quill, or somewhat thicker, in Taste not much unlike to Green Beans or Pease, having at top a certain scaly soft Bud, which in time does rise up into very long and slender round green Stalks, bigger or lesser as the Roots are in Growth, and growing to be three or four Feet high or more (as the Ground is in goodness) which Stalks send forth divers smaller Branches, whereon are set many little green Leaves, like Fennel, but shorter and smaller, and growing up to the top, much finer than the Leaves of Dill: among which, at the Joynts thereof, come forth, small Mosses, yellowish Flowers, Which yield a Fruit or Berries, green at first, afterwards red as Coral, of the bigness of a White Pea, wherein is contained grofs blackish Seed, and

and exceeding hard, which is the cause it lies so long in the Ground after sowing, before it Springs up.

ASTARAGVS:

IV. *The other or Greater Kind* differs nothing from the former, but in the Colour of the Shoots, their Magnitude, and Taste, they being much whiter, vastly larger, and much more sweet and pleasant. It is almost beyond belief the relation of the vast Magnitude to which this Great Kind will grow: This present Year 1696. a present was made to a Lady of one single Bunch containing but one hundred of Sprouts or Heads, which weighed (as was reported to me) above forty Pounds weight: and the last Year I cheapened a Bunch or hundred, of the same Kind in Newgate-Market, which they would not Sell me under eight Shillings, and warranted to weigh above twenty Pounds Weight. So that it is manifest that the larger sort is either another Kind, or else, the former sort vastly improved by Art and Industry.

V. *The Places.* They grow with us only in Gardens, where they are nourished up for the daily Service of the House, being an Excellent Boiled Sallet.

VI. *The Times.* The bare tender Shoots, which are sold in Markets in Bunches or Hundreds, come up commonly in the Spring, and may be had all March, April, and May, and sometimes in June, but the Gardener has arrived now to such a dexterity in his Art, that if the Winter or Season is Warm, you may have them all January and February, as was manifest this present Year, when I could have had what quantity I pleased on New-Years Day. They spring up after that, to a kind of diminutive Bush, and Flower in June and July, and bear their ripe Berries in September, or late in the Year.

VII. *The Qualities.* They seem to be Temperate in respect to heat or coldness, dryness or moisture. They incise, attenuate, open, cleanse, and are very Diuretick: and seem to be chiefly Cephalick, Hystrick and Nephritick; and, if Authors say true, Spermatogenetick withal.

VIII. *The Specification.* They are peculiar against

the Strangury, or stoppage of Urine, and difficulty of making Water, to provoke Urine, and to expel Sand, Gravel, and small Stones out of the Reins, which even the signature of the hardness of the Seed, seems also to intimate.

IX. *The Preparations.* You may have therefrom, 1. *The Roots.* 2. *The Seed.* 3. *The Distilled Water of the whole Plant,* distilled in September, when its Berties are Red; which things the Shops are said to keep: But besides them, we have, 4. *The tender Shoots or Heads.* 5. *The Decoction.* 6. *The Juice.* 7. *The Essence.* 8. *The Saline Tincture.* 9. *A Gargarism.* 10. *A Bath.*

The Virtues.

X. *The Roots.* Being reduced into Pouder, and given from j. dram to ij. drams in White Wine, or the Distilled Water of the Plant, it provokes Urin, and opens the stoppages of the Urinary parts.

XI. *The Seed.* It is held to be very effectual for the purposes aforesaid, j. dram of it being given in White Wine; so also, if it is mixed in equal quantities with the Pouder of the Root, and given in like manner from j. to ij. drams.

XII. *The Distilled Water.* It is drawn from the whole Plant, and is to be rectified (as Schroder directs) by putting it upon more fresh Herbs. It provokes Urine, and gives ease in the Stone, being drunk daily three times a day, from iv. to viij. ounces: It is used also as a Vehicle for other things.

XIII. *The tender Shoots or Heads.* They are Boiled, and Eaten as a Sallet, with Butter, Vinegar and Pepper, being very Nuttitive; and tho' cleansing, as to the Reins, Bladder, and Urinary Passages, yet they comfort the Stomach, are easy of Digestion, and restore in Consumptions.

XIV. *The Decoction of the Roots in Wine.* It opens Obstructions of the Bowels, provokes Urine, being stopped, and expels that Tartarous Matter in the Reins, Ureters and Bladder, which causes the Strangury. Dose from iv. to viij. ounces.

XV. *The Juice of the Roots and young Sprouts.* It prevails against the Strangury, or difficulty in making Water, when it is done by Drops; it expels Gravel and the Stone out of the Reins and Bladder, and helps vehement pains in the Back. Dose iij. or iv. ounces in Wine, twice a day.

XVI. *The Essence made of the Juice, or bruised Plant.* It has all the Virtues of the Juice beforegoing; besides which, it is good against the Obstructions of the Lungs, Pains of the Stomach and Bowels, Falling-sickness, Fits of the Mother, Yellow Jaundice, and dimness of sight: and taken every Morning and Evening, from ij. to iv. ounces in a Glass of Generous Wine, it is said to stir up Bodily Lust, Generate Seed, and remove Impotency.

XVII. *The Saline Tincture.* It has all the Virtues of the Decoction, Juice, and Essence; but more powerful in provoking Urine, and expelling Sand, Gravel, Stones and Slimy Tartarous Matter: besides it particularly Stimulates the Generative Faculty by its penetrating and subtil Quality, and effectually cures the Yellow Jaundice. Dose from j. to ij. drams in Wine.

XVIII. *The Gargarism.* The Roots bruised and boiled in White Wine Vinegar, being gargled in the Mouth warm, gives ease in the Tooth-ach: and the Root it self is said to be profitable to be applied to an *Aneurism.*

XIX. *The Bath.* It is made of a good quantity of the Roots and Seeds bruised, and boiled in a great store of Water, which is to be put into a large Vessel, in which a Man may fit up to the Breasts

at least : This has been found effectual against Fits of the Mother, Cholick, and Pains of the Back and Reins, and generally 'tis good against Cramps, Convulsions, Sciatica's and other vehement Pains of the lower Parts of the Body.

CHAP. XXXIX.

Of Sea or Marsh ASPARAGUS.

I. **THE Names.** It is called in Greek, Ἀσπάργος ἁλῶδης : in Latin, by *Anguillara* and *Tubermontanus*, *Asparagus Palustris* : and *Asparagus marinus*, by *Clusius* and *Camerarius* : by *Bauhinus*, *Penna*, and *Lobel*, *Asparagus maritimus* : in English, *Sea*, or *Marsh Asparagus*.

II. **The Kinds.** This is the first sort of the Wild Kinds ; which some would have us to believe will, by Transplantation, and Manuring in Gardens, become the Garden Kind ; at least as good as the Garden Kind.

III. **The Description.** This Wild, or Sea, or Marsh kind of Asparagus has a Root with many Strings and Fibres dispersed from a spongy Head like the former, from whence rises up many, but shorter Stalks than the Garden Kinds, stronger also and thicker, branching forth in the same manner, and having such like winged Leaves, but shorter, thicker, harder, and of a bluish, green Colour. The Flowers are like the other, and so are the Berries or Seed which follow, but greater than they, and not of so fresh a red colour.

IV. **The Places.** It is found to grow in the Marshes of Tidman, near Chesham, and in Appleton Meadow in Gloucestershire, about two Miles from Bristol, where the Poor People do gather the young Shoots or Heads, and sell them in the Market at Bristol, much cheaper than our Garden Kind is sold in London. Mr Ray says he has found it also at the Lizard Point ; and it is said to be found about

Harwich in Essex, and divers other Marsh Grounds and Places, as in a Meadow belonging to a Mill near Thorp in Essex ; and at Singleton not far from Corbie : also in the Meadows near Moulton in Lincolnshire : At a place called Badmor-lading, not far from Harwich, and at Moulton in Holland, which is also a part of Lincolnshire.

V. **The Times.** The Tender Shoots spring up in March and April, at what times they are gathered and Eaten ; they Flower in June and July, and the Berries are ripe in September.

VI. **The Qualities.** It is, as to its first Qualities, temperate : Mr. Ray says, that the Roots are Diuretick, and Lithontriptick, and are one of the five opening Roots : They are appropriated to the Liver, Spleen, Reins, Womb and Joins.

VII. **The Specification.** The Roots are peculiar against the Yellow Jaundice, Stone or Gravel in the Reins and Bladder, as also the Sciatica and Gout.

VIII. **The Preparations.** You may have therefrom, 1. The tender Sprouts or Heads. 2. A Decoction of the Roots in Wine. 3. A Juice from the same. 4. An Essence of the Roots. 5. A Syrup of the same. 6. A Saline Tincture.

The Virtues.

IX. The Virtues of the Roots and Seed, and even of the whole Plant, are the same in all respects with those of the Manured or Garden ; so that we need not here be particular in explicating the Virtues and Uses of the afore enumerated Preparations, but wholly refer you to that which has already been said in the last Chapter.

CHAP. XL.

Of Wild ASPARAGUS.

I. **THE Names.** It is called in Greek, Ἀσπάργος ἄγριος, Μονάγριος, ἀσπίγγος, ἁλῶδης : in Latin, *Asparagus Sylvestris* : in English, *Wild Asparagus*, or *Stone Asparagus*.

II. **The Kinds.** There are two principal Kinds, 1. *Myacanthinus Galeni*, *Asparagus Sylvestris foliis acutis* : *Gesner*, *Dodonæus*, *Camerarius*, and others, call it simply *Asparagus Sylvestris* : *Cordus*, *Lobel*, *Lugdunensis*, and others, *Corruda* : *Bauhinus* and *Parkinson*, *Asparagus foliis acutis* ; and is thought to be the *Asparagus Petreus* of *Galen* and *Dioscorides*. 2. *Asparagus Petreus*, or *Corruda aculeata*, *Prickly Rock Asparagus* : this is called by *Clusius*, *Corruda altera* : by *Dodonæus*, *Asparagus Sylvestris*, (so that he makes little difference between this and the former, tho' indeed there is much :) and by *Bauhinus*, *Asparagus aculeatus alter, tribus aut quatuor spinis ad eundem exortum*.

III. **The Descriptions.** The first, Wild Asparagus with sharp Leaves, has a Head of Roots, having many Strings and Fibres depending from it, thicker and shorter than any of the other Kinds ; from whence rises up three or four Stalks, which are shorter, stronger, and tougher than the others, diversly spread and branched into many Wings, on which are set at several distances, many small, short, hard, and sharp pointed Leaves, five or six standing at a joint together : At these joints likewise, with the Leaves, come forth the Flowers, many, set upon a long Stalk, which are Yellow, and consisting of six Leaves apiece, smelling as sweet as a March Violet ; after which come small Berries, green at the first, and of a blackish.

ish Ash-colour when they are ripe, wherein is contained a hard Black Seed.

IV. The second Wild Kind, or Prickly Rock Asparagus, which some call Thorny Asparagus, has very thick and short Roots; with many thick strings, all meeting together at the head of the Root, from whence rises up several branched green Stalks, having three or four sharp green Thorns (more like indeed to Thorns than Leaves, they are so hard, small, long, and sharp pointed) set together all along the Stalks and Branches; from which come forth small, mossy, yellowish green Flowers; and after them store of Berries, greater than in the former, and of a blackish green colour, when they are ripe, full of a greenish Pulp; wherein usually lies but one black hard Seed, or at most two, having a White Kernel within it.

V. The Places. The first Kind grows in Stony and Rocky places, as, near to Salamanca in Spain, also under Hedges, and in the very Fields in Castile and Granada; about Narbone and Montpellier in France; as also in Crete or Candy. The second grows in stony and ragged or rocky places, as also by hedge sides, not only in Spain, but also in Portugal and Crete. But with us, both the Kinds are only found Nurst up in Gardens of the Curious.

VI. The Times. They send forth their tender Shoots early in the Spring, and Flower in June and July, having ripe fruit in September: But with us in England, it scarcely comes to perfection, unless the Season is very warm, and they grow in a warm place, which may defend them from cold Blasts and nipping Winds.

VII. The Qualities. They are Temperate as to the first Qualities, but rather more drying than any of the former. They incide, attenuate, and open powerfully, and are strong Diureticks and Lithontripicks: and peculiarly appropriated to the Liver, Spleen, Reins, and Womb.

VIII. The Specification. I have been informed by

some intelligent English Men, who have lived in Spain for some Years, that the People of the place esteem them as one of the most peculiar Remedies against the Stone and Gravel, and much Superiour to the Garden or Marsh Kinds.

IX. The Preparations. You may make from the Root, 1. A Decoction. 2. A Juice. 3. An Essence. 4. A Saline Tincture. 5. A Distilled Water: and from the Seeds or Berries, 6. A Powder.

The Virtues.

X. The Virtues are the same with the Garden and Marsh Kinds: and therefore the Designation and Uses of each Preparation the same, to which you are referred; save, that these Wild Kinds are esteemed to be double in Force and Goodness.

CHAP. XLI.

Of Common AVENS.

I. THE Names. This Herb, for all that we can learn, was unknown to the Greeks, and therefore we can furnish you with no Greek name for it: but it is called in Latin, *Caryophyllata*, and *Garyophyllata*, (from the smell of its Root) also *Herba Benedicta*, *Sanamunda*; and *Tragus* would have it called *Nardus agrestis*, (not only for the sweet scent of its Roots, but for its excellent Virtues) and is supposed to be the *Geum Plinij*, in *Hist. lib. 26. Sed.* 21. It is called in English, *Avens*, and *Herb Bennet*.

II. The Kinds. The General Kinds are two. 1. *Caryophyllata vulgarior*, the common Avens. 2. *Caryophyllata Montana*, the Mountain Avens; of which in the next Chapter. The Common Avens is two-fold, 1. That, *Flore minore*, with the smaller Flower, (which is the more Common:) 2. That, *Flore majore*,

fore, with the greater Flower, as Mr. Ray has noted, *Hist. Plant.* pag. 606.

III. The Descriptions. The first of the Common Kind with the smaller Flower, has a Root consisting of many thick Strings, and smaller Fibres, somewhat of a brownish yellow without, and reddish within, smelling somewhat like unto Cloves, especially if it grows in the higher, hotter and dryer Ground, and in a freer and clearer Air; but nothing so much, or not at all in many other places, especially if they be moist: From this Root spring forth many long, rough, dark, green winged Leaves, every one made of many Leaves, set on each side of a middle Rib; the three largest whereof grow at the ends, and snipt or dented round about the edges; the other being small pieces, sometimes two, and sometimes four, standing on each side of the said middle Rib, under them: among which do rise up divers rough or hairy Stalks, about a Foot high, branching forth with Leaves at every Joint, not so long as those below, but almost as much cut in on the edges, some into three parts, and some into more: on the tops of the Branches stand small, pale, yellow Flowers, consisting of five Leaves, like Cinquefoil Flowers, but larger; in the midst whereof, stands a small green head, which, when the Flowers are fallen, grows to be rough and round, being made of many long, greenish, purple Seeds, like grains, which will stick on your Cloths.

IV. The other Avens with a large Flower, is a Plant little differing from the former in any particular, except in the Flowers, which are greater than those of the common, and fairer: This I have sometimes formerly seen and gathered in Woods and Coppes in some parts of Cambridge-shire, where the whole Plant grew large and very fragrant; but the Roots not much inferior (in my opinion) in their Scent to Cloves themselves.

V. The Places. They are found to grow Wild in many places of our Land, under Hedge sides, and near By-paths in some Fields, as also in Woods and Coppes, delighting to grow rather in Shadowy than Sunny places. And in many places they are brought into Gardens, chiefly about London, and in some great Towns and Cities, that they may be near at hand upon occasion. The Large Flowered Avens is found in Tedford Wood, in the Wouds of Lincolnshire.

VI. The Times. They Flower in May and June generally, and their Seed is ripe in July at farthest.

VII. The Qualities. Avens is hot and dry in the first Degree; and is Inciding, Attenuating, Opening, Alterative, Discussive, Resolutive, Carminative, Alexipharmick, Astringent, and Vulnerary. Schroder says, it is Cephalick, and Cardiack; and we know by Experience that it is Stomariack, Hepatick, Hystrick, and Arthritic.

VIII. The Specification. Schroder says, its chief use is in drying up Catarrhs, and resolving Coagulated Blood: it is a singular cure for Wounds and Ulcers.

IX. The Preparations. The Shops keep nothing hereof; but only, 1. The Root: but you may prepare therefrom, 2. A Decoction. 3. A Wine. 4. A Juice from the Roots and Plant. 5. An Essence. 6. A Spirituous Tincture from the whole Plant. 7. A Saline Tincture. 8. An Oily Tincture. 9. An Ointment. 10. A Balsam. 11. A Cataplasim. 12. A mixture for Callous Ulcers.

The Virtues.

X. The Root. The Pouder of the dried Roots given from half a dram to j. dram, strengthens the Stomach, opens Obstructions, is good against Spir-

ting or Pissing Blood, or the Bloody Flux; and strewed on moist or running Sores, or Ulcers, dries them up, and dissolves them to healing. The dried Roots are also used to be laid among Cloths, to perfume them, and keep away Moths.

XI. The Decoction, Made in Mead, or half Wine half Water, it is good for stoppages of the Brest and Stomach, Stitches and Pains of the Sides, opens Obstructions, and corrects cold and crude humors in the Stomach and Bowels. Dose *vi.* ounces.

XII. The Wine. It is very Aromatick, and if it is drunk for some continuance of time, every Morning fasting, it warms and strengthens a cold Stomach, takes away sickness at Stomach, comforts the Heart, expels Wind, makes a good Digestion, opens Obstructions of the Liver and Spleen, resists Poison, and is a singular preservative against the Plague, or any Pestilential Disease: Dose, in infectious times, *iv.* or *vi.* ounces, Morning, Noon, and Night.

XIII. The Juice from the Root, &c. It is Peccoral, Warming, Comforting, and Strengthening a cold Stomach, and is good for Inward bruises and hurts, for it dissolves congealed Blood, happening by falls or bruises, as also spitting of Blood; it opens Obstructions of the Liver, Spleen, and Womb, provokes the Terms, and is good against the Colick. Dose from *ij.* Spoonfuls to *iv.* or more, in Wine, Mead, or Ale: Outwardly, it is good to wash old running Sores, or putrid Ulcers with, in order to their cleansing and healing.

XIV. The Essence. It is good for Diseases of the Brest and Lungs, is Cephalick, Stomariack, Cordial, Hystrick and Vulnerary, eminent against cold and moist Diseases of the Head, Brain and Nerves; it strengthens Digestion, and causes a good Appetite, taking away pains of the Stomach, from the coldness thereof; it cheers the Heart, and is good against Sickness and Fainting Fits; prevails against Barrenness in Women, by rectifying the cold and moist Distempers of the Womb. It is also an excellent Vulnerary, for by taking this Essence Daily, from *j.* to *ijj.* or *iv.* ounces, Morning, Noon and Night, it causes Wounds, Ulcers, and Fistula's to heal after an admirable manner.

XV. The Spirituous Tincture. It has the Virtues of the Essence, but not full out so powerful, except in Vulnerary cases, in which it may do full as well. Dose from *j.* dram to *ij.* drams, or more, in a Glass of Wine or Diet Drink.

XVI. The Saline Tincture. It opens Obstructions of the Reins, is good against the Plague, and all Pestilential Diseases, Wounds, Ulcers, Sores, Fistula's, and many Diseases of the Head, Brain, Nerves, Lungs, Brest, Liver, Spleen, Womb, and Reins, carrying off the Morbifick Cause by Urine. Dose from *j.* to *ij.* drams in Ale, Mead, Wine, or Diet Drink.

XVII. The Oily Tincture. Applied to Wounds and Punctures of the Nerves and Tendons, it cures them: it helps Lameness, Numbness, Trembling of the Limbs, and Palsies, being anointed Morning and Evening on the parts affected; as Pains, Aches, and Gouts, proceeding from cold Causes, or a defluxion of cold Humors. And inwardly taken, from *vj.* drops to *xvi.* or *xx.* drops, in some proper Vehicle, it prevails against Lethargies, Vertiges, Apoplexies, Convulsions, and other cold Diseases of the Head, Brain, and Nerves: It eases the Colick, and is good against Sand, Gravel, Stone, &c.

XVIII. The Ointment. It eases Pains from a cold Cause, discusses Oedema's, Scrophula's, and Phlegmons, or Inflammations, and abates Inflammations in Wounds and Ulcers, by discussing the Cause; and is good against the Piles in *Ano*.

XIX. The Balsam. It is a true Vulnerary, and cures

cures simple Wounds by the first intention: It cleanses running Sores; old foetid Ulcers; and stubborn and rebellious Fistula's; washing them first with the Juice, or Effence, and then applying of this Balsam: it cleanses, incarnates, or breeds Flesh, and brings to a speedy healing.

XX. *The Cataplasim.* It discusses Inflammations in their beginning; is good against Contusions, or Bruises, eases pains or Aches in any part, and is singular good in a cold Gout. I have applied it with great success in vehement Head-achs, proceeding from taking cold, or any recent Cause.

XXI. *The Mixture.* Take Juice of the Roots iv. ounces, fine Verdgreefe ij. drams; mix them. It takes off the Callus in hollow Ulcers, and Fistula's, where it must be injected with a Syringe. But if the Callosity is in an open Ulcer, the Mixture may be thus made: Take of the foregoing Ointment ij. ounces: Powder of Tobacco ij. drams: Verdgreefe j. dram: mix them. Or thus: Take of the former Balsam ij. ounces: Powder of round Birthwort Roots ij. drams: fine Verdgreefe j. dram: mix them. Any of these mixtures take off a Callus from any Ulcer or Fistula, cleanses the same, and induces it to a speedy healing; and this it will do, if the affect is in the Joints.

CHAP. XLII.

Of Wild or Mountain AVENS.

I. *THE Names.* They are called in Latin, *Caryophyllata agrestis*, *Caryophyllata montana*; and in English, *Wild or Mountain Avens*. The Epithet *Wild* is put to these, to distinguish them from the former, which are never called *Wild*; for tho' they grow Wild in Fields and Woods, yet it is always near home, and besides, they are many times Nuried up in Gardens, which these are never, except as meer Rarities.

II. *The Kinds.* There are several Kinds of *Mountain Avens*, but those growing in our Country chiefly, are, 1. *Caryophyllata montana purpurea*, as Gerard calls it: Or *Montana palustris purpurea*, as Parkinson: Also *Aquatica nutante flore*, and *Aquatica flore rubro striato*, by the Bauhins; *Purple Mountain Avens*, or *Water Avens*. 2. *Caryophyllata flore amplo purpureo*, *Avens* with a large double flower. 3. *Caryophyllata Chamedrys folio*, as Morison calls it: *Chamedris spuria montana Cistiflore*, as Parkinson: *Alpina Cistiflore*, and *Alpina flore fragrantia albo*, as the Bauhins: *Teucrium Alpium Cistiflore*, as Gerard; *Mountain Avens* with *Germander Leaves*. 4. *Caryophyllata Pentaphyllea*, as Bauhin and Parkinson: *Alpina Pentaphyllea*, as Gerard: and *Alpina quinquefolia*, as Caspar Bauhin; *Cinquefoil Avens*. To which add, 5. *Caryophyllata montana Virginienfis*, *Virginia Mountain Avens*. 6. *Caryophyllata montana flore magno luteo*, *Mountain Avens* with a great yellow flower.

III. *Descriptions.* 1. *Purple, or Water Mountain Avens.* It has a Root about a Fingers thickness, with many Strings or Fibres thereat, from whence rises up many long and hairy Leaves, composed of divers little Leaves, with larger at the top, and these snipt or dented about the edges, like as the Common Avens: among these Leaves rise up several Stalks, a Foot or more in height, on which grow Flowers, whose Heads hang down: the tops of the Stalks, and Cups of the Flowers, are commonly of a purplish Yellow, but the Flowers scarcely appear above the Husks that contain them: These Flowers themselves are of a

pretty Red Colour, and are of divers Shapes, and grow divers ways: (which is the reason that Clusius, and some others, have judged them to be several Plants, giving the Flowers here express for a differing Kind.) For some of these Flowers, even the greatest part of them grow with five Red, round pointed Leaves, which never lye fair open, but only stand straight out, the middle part being filled with a hairy matter, and yellowish Threads: Some of these Flowers consist of Seven, Eight, Nine, or more Leaves, and some again lye wholly open, with Green Leaves, growing close under the Cup of the Flower; and some few now and then may be found composed of a great many little Leaves, thick thrust together, making a very double Flower: after the Flowers are fallen come such hairy Heads, as you see in the Figure, and in other Plants of this Kind, among which lies the Seed.

IV. 2. *Avens* with a large double purple Flower. Tho' some make this to be a different Kind from the last, yet doubtless it is not, but is one of the Sportings of Nature, wherein she acts variously in one and the same Plant; and therefore the Description of the last may fully serve for this, there being in truth no variation but in the Flower, as we have in the former, above, already declared.

V. 3. *Mountain Avens* with *Germander Leaves*. It has a long, thick, hard, woody Root, with many Sprigs or Strings growing from it, and spreading under ground, of a brown blackish colour; from whence spring up several hard, woody Stalks, eight or nine Inches long, spread upon the Earth, of a brown, reddish colour, which have Leaves growing upon them without any order, like to *Germander Leaves*, but lesser, harder, more wrinkled, and saw-like indented on the edges, of a White Honey colour below or underneath, and of a blackish Green colour above, having an Astringent Taste. The Flowers are White, and each Flower stands upon a slender hairy Foot-stalk, about three or four Inches long, twice as big as a Strawberry Flower, and consisting of six Leaves apiece, or more, in the middle of which is a Thrummy Head, of a small hairy substance, which being fallen, there succeeds little Downy

ny or feathered Heads, not much unlike to those of the Pasque-flower, with an oblong Seed, of a Sad Red Colour. And the bottoms of the Flowers are sustained, as it were, with narrow oblong hairy Leaves.

VI. 4. Cinquefoil Avena. It has a Root composed of many tough Strings, of a brownish Colour, and smelling somewhat like to the former Kinds, from whence rises up Leaves divided into five parts like unto Cinquefoil, dented about the edges, and having Stalks about a Foot high, having such like Leaves thereon, at the Joints where it branches forth: at the tops whereof stand Pale Yellow Flowers, like those of the Common Avena, but smaller, with many Yellow Threads, somewhat Downy in the middle.

VII. 5. Mountain Avena of Virginia. This is wholly like to the Purple Avena, first described in this Chapter, but it is taller and larger than that, almost in every respect, and scarcely differing in any thing else, and it yields flat, thin, blackish Seed in Husk.

VIII. 6. Mountain Avena, with great yellow Flowers. This has a thick, long, brownish round Root, of the bigness of ones Finger, creeping under the upper Crust of the Earth, not altogether so stringy as the Common, described in Chap. 41. Sect. 3. foregoing, but having some small Fibres shooting downwards in several places, and Smelling and Tasting like to Cloves, or those of the first Common sort, from whence comes forth divers winged Leaves, made of many small Leaves towards the bottom, standing on both sides of the Rib, the end Leaves being largest and whole, not divided, but somewhat deeply dented, or cut in on the edges, of a fresher green colour likewise, softer also and gentler in handling, than those of the Common Kind: from among which rise up slender Stalks, seldom branched, having very few Leaves thereon, at the Tops whereof stands usually one Flower apiece, and sometimes more, made for the most part like those of the Common sort, consisting of five or six Leaves, much larger than those, and of a deeper Yellow Colour, and sometimes with a White Flower, as Camerarius in horto says, tending to redness, having many Yellow Threads in the middle, compassing a Green Head, which when the Flower is past, increases to be a round Head, beset with flat Seeds, not so rough, or ready to stick to ones Cloths, but every one of them having a long Feather-like Hair or Thread at the end. The whole Plant, as well Leaves as Flowers and Seed, are covered with a small soft hairy Down, which is not much, or easie to be discerned, unless one takes good notice thereof, or heeds it very well.

IX. The Places. The first of these are found by Water Sides in Wet or Marsh Grounds on the Mountains; in Northern Mountainous Places in England, as about Settle and Ingletton, &c. also in Wales, about Snowden Hill, &c. and in divers other places. The second has been found near Strickland magnium in Westmorland. The third is found in several of the Alpine Mountains; and in Ireland, on the Mountains between Gort and Galloway. The fourth was found by Pena on the Rhetian Alps near Clatena, who at first took it to be a kind of Cinquefoil, but by the Smell and Taste, found it to be Avena: it has been found in the Den of Berbaick in Scotland. The fifth grows in Virginia, Carolina, and other parts of Florida, and is only nourished up with us in Gardens. The sixth is found upon divers Mountains, as on Cerenos in Bohemia, by the Springs of the River Albia, as Matthiolus says, and upon Mount Baldus, as Pena says, and in many other places. Bauhinus found it in Mount Braulium of the Rhetians; and Chiffus on the Ridges of the Highest Alps, not every where, but amongst Grass and Shrubs; but with us it is chiefly nourished up in Gardens.

X. The Times. They Flower from the beginning of May, to the end of July; and their Seed is ripe in August, or not long after.

XI. The Qualities. These are all generally of a Nature, and have the same Qualities and Virtues. They are hot and dry in the second Degree: They incise, attenuate, open, cleanse, discuss, resolve, expel Wind; are Astringent, Vulnerary, and resist Poison: and are appropriated to the Head, Nerves, Heart, Stomach, Liver, Spleen, Womb, and Joints.

XII. The Specification. They have a peculiar property in curing Wounds and Ulcers, opening all sorts of Obstructions, drying up Catarrhs, and stopping pretematural Fluxes of the Bowels.

XIII. The Preparations. The Shops keep nothing of them; but you may have from their Roots, (which are chiefly in use) 1. A Powder of the Root, 2. A Decoction. 3. A Wine. 4. A Juice. 5. An Essence. 6. A Spirituous Tincture. 7. A Saline Tincture. 8. An Oily Tincture. 9. An Ointment. 10. A Balsam. 11. A Cataplasm. 12. A mixture for callous Ulcers.

The Virtues.

XIV. The Virtues of all these Mountain Avena, are the same with those of the Common Avena, and are applied to all the same Diseases, and differ in nothing but the degree of their strength, force, or efficacy; for that these Wild or Mountain Avena, are much stronger than the Common Kinds, and operate more powerfully, speedily and effectually than they can possibly do: and therefore, the Virtues and Uses of the several Preparations aforementioned, are the same with those of the Common Avena before declared in Chap. 41. Sect. 10. to Sect. 21. to which you are referred.

C H A P. XLIII.

Of Common BARLEY.

I. THE Names. It is called in Hebrew סעורה, Segnorah, Job 31. 4. and Joel 1. 11. &c. In Arabick, Xabaer, Shair: In Greek, Καβή: in Latin, Hordeum: and in English, Barley.

II. The Kinds. It is either Manured or Wild, of which latter in the next Chapter. The Manured is, Hordeum Distichum, Common Barley. 2. Hordeum Distichum latius, Bear or Battledore Barley. 3. Hordeum Polydichon, Square Barley, or Winter Barley. 4. Τριτίζιον, Galeni, Zebraves, Hordeum nudum, Zeopyrum, Tritico Speltum, Naked Barley.

III. The Descriptions. The first has a Grassy Root, with many small Fibres or Strings, from whence rises up several Grassy Leaves and Stalks, sometimes more, sometimes less; which are shorter and softer than those of Wheat, and the Grassy Leaves are also shorter, broader and rougher, and the Stalks rise up to be 12, 14, 16, or 18 Inches high, according to the goodness of the Ground: at the Tops whereof comes forth Ears, having two rows of Corn, set in good order, each inclosed in a Husk, sticking close to the Grain, and having a long rough Aune or Beard thereat, which is many times greater and longer than Wheat, and whiter also, not very easily falling out of the Ear. Cordus says, that this kind makes a recompence for the smallness of the Ear, by the number of the Stalks each Grain or Root produces; for,

says he, I have numbred about sixty Stalks rising from the Root of one Corn, but usually twenty, thirty, and forty.

IV. The second Kind is like the other in all respects, excepting in the Ear, which is indeed much broader, (tho' it has but two rows, as the former) for that the Grains lye more straight out, not so much sloping upwards, and withal they are something larger, but the Awnes or Beard, not full out so long.

V. The third Kind. This is also altogether like the other Kinds in the Root, Stalk, Leaf and Grain, but differs only in the Ear, this always having four Rows of Grains, whereas the others have but two: Some Authors will have it, that this Kind has sometimes six Rows of Grains on the Ear, called, *Hecdeum Hexalticum*, or *Cantherinum*. But I am of Opinion it is of a different Kind from the four Rowed, or Square Barley; for that this is lesser, and without doubt is that small kind which is brought to us out of Germany, and sold in our Grocers Shops, called Pearl Barley: There is also a sort of large hul'd Barley, called French Barley, which is only our common English Barley hull'd; and is called French, because it was first of all hul'd in France.

VI. The fourth Kind. The Root is Grassy, with many Fibres or Strings at it; whence rises up Stalks, like to the Common Barley, or rather like unto Spelt, save that the Ears are rounder; but it has not so many Stalks rising from the Root, as the Common Barley has; it has many rows of Corns in the Ears, which are inclosed in the Husks, but have not that hard or harsh Skin or Husk upon them, which the Common Barley has, with long, rough Awnes or Beards at their ends; and the Grains or Corns are more lank, small, yellow, and short, and naked, without Husks, growing almost like Wheat, the which in its yellowish Colour it somewhat resembles.

VII. The Places. The first or our Common Barley, is sown in all the Southern parts of the Kingdom: the second is sown in the North parts only: the third is reasonably frequent in our Land. The last is sown in several places of Germany, for the same uses as the other Barley is; this is rare with us, yet it is sown in our Gardens, where it flourishes very well.

VIII. The Times. Barley is sown with us in March, especially the two first kinds: the Square or Winter Barley, is said to be sown before Winter; but all sorts of Barley (even the Winter Barley) are sown with us in England in March or April, and are ripe or fit for cutting in August following, or beginning of September at farthest.

IX. The Qualities. They are cooling and drying in the first Degree. They are gently Reperculsive, Absterfiv, Diuretick, and Anodyne, appropriated to the Lungs and Reins; also Antifebricitick and Galactogenetick, or breeding Milk.

X. The Specification. They are peculiar for allaying the heat of Blood in Fevers, to help Pissing Blood, and sharpness of Urine, being caused thro' the Application of Veficatories, by an unskilful hand.

XI. The Preparations. You may have from the Grain, 1. Malt. 2. Beer. 3. Ale. 4. A Spirit. 5. *Peculenta*. 6. Maza. 7. Pifson. 8. Yest. 9. Faeces or Bottoms of Ale or Beer. 10. A Balsam. 11. The Meal or Flower. 12. Bread. 13. Cream. 14. Barley Water. 15. A Cataplasim. 16. A Mixture. 17. A Julep. 18. A Bath. 19. An Emplaster. 20. A Distilled Water from the green Plant, whilst the Grain is yet green, or not fully ripe. 21. Brewers Grains.

The Virtues.

XII. The Malt. This is called in Greek, *Bónus* by *Etius*: in Latin, *Byne*, and *Maltum*; which is a made Latin Word, from the German Word *Maltz*, or our English Word *Malt*, which is Barley prepared for Brewing Ale or Beer; the manner of which Preparation is thus: Take a Quantity of Barley, as much as you please, put it into Cisterns made for that purpose, which you may fill full with the Barley, then affuse so much Water thereon as may cover it, and there let the Grain soak for two or three Days

and Nights, till it is well sweln; then drain the Water from it by a Cock or Pipe below; which done, the swelled Barley is to be taken out of the Cisterns, and spread equally, or of an equal thickness, upon the Floor of a Malting House, about half a Foot thick, or more, and according as the Air is cold, it is covered with Cloths, or not covered, and is to lye till it begins to sprout, ready as it were to grow, which will be performed in two or three days, if the Weather is warm, or not very cold, otherwise it may lye longer: before it grows hot, which it is apt to do, it is to be turned with Shovels for that purpose, two or three times a Day for a Week or ten Days together, to cool it, and dry it: When it is thus dried, it is put upon a Malt Kiln, and there it is thoroughly dried by the help of Fire, made either of Straw, Furzes or Wood, to cause it to have the sweeter Relish or Taste: If it is dried with Faggots or Wood, the Malt will taste Bitterish from the Smoak, and will easily be perceived in the Drink, which will taste Bitter: If it is dried with Furzes, or other light stuff, it will taste less Bitter; but the only choice Malt is that which is dried with Straw, for that is truly Sweet, and makes the only pleasant Drink. Malt being grossly Ground is made into Beer and Ale, as we shall in the next place shew. Ground Malt Fryed, and applied in a Bag, as hot as can be endured to the Sides or Belly, gives ease in Pains proceeding from Stitches, Colick, or Gripings caused through Cold or Wind: Made into a Pultice, it is good to allwaie Inflammations, or other like Tumors or Swellings.

XIII. Beer. This is called in Greek, Ζυθον: in Latin, Zythum, Cerevisia Lupulata; and in English, Beer. It is made by Infusion of Ground Malt, and a due Quantity of Hops in a sufficient Quantity of Boiling Water in a proper Fat or Vessel, so long till the whole Virtue and Goodness is Extrall'd out of both Malt and Hops; then this Liquor is drawn off: Now left any goodness should yet be left in the remaining Malt, another Quantity of Boiling Liquor is put thereon, and so stirred well together, and kept in Infusion till the remaining Sweetness is Extrall'd into the Liquor: These two Liquors (or more, if you think needful to make them) which are called Worts, viz. the Stronger and the Smaller Worts, are put together, and being mixed, are put into Coolers, to bring them to a just Heat, or rather Warmth, to make them fit for a succeeding Fermentation: Being thus only brought to a Warmth, the Liquor is put into the Working Fat; and to cause or facilitate the Fermentation or Working, a proportional Quantity of Ferment or Yest is added, and mixt with it, and the Working is continued so long till both Taste and Smell give a Demonstration, that the Nature of the Liquor is changed, and turned from a dull, heavy, sweet Taste, to a kind of a Vinous Activity and Flavor. I know our Common Brewers Boil their Worts, and it is their Opinion, that the Beer or Ale will not keep without such Boiling; but Experience has long since refuted the Error or Vanity of such Conceptions: 'tis only the Liquors being strong of the Malt, which makes the Ale or Beer keep; if it is weak in that, boil it as long as you will, it will soon grow Small, Hard, and Soure, nor can you prevent it, do what you can: and if it is very strong of the Malt (and not too much fermented) tho' the Worts were never Boiled at all, yet will the Drink keep several Years Good, and grow neither Soure, nor Hard, as your Drink made of Boiled Worts does; and of this I am a particular and faithful Witness: See more Arguments against the Boiling of Worts in my *Septisium*, or *Druggists Shop*, lib. 8. cap. 7. sect. 26. where you may receive abundant Satisfaction, almost next to Demonstration.

XIV. Ale. This was called in Greek by Dioscorides, Κίμα, & Κίμα: In Latin, Carui, (from the Greek,) also Cerevisia, Cervisia, & Cerevisia non lupulata, or Drink not Hopt, now called Ale. It is made of Malt exactly as Beer is made, without any difference, except in the Hopping, which is here wanting. But of late, in the Summer Time, the Brewers put in a small quantity of Hops, to make the Ale keep the better, which is the property of the Hops, confirmed to us by Experience. Ale without doubt is the most Ancient Drink of our Land; But it has lost much of its Reputation since Beer came into Fashion or Use, because the Hops make it more durable without fowering, and less fullsome and more wholesome. However, whether it is Ale or Beer that is drunk, that is the best and more wholesome which is recent or new, than that which is hard or stale, the former being cleansing, and keeping the Body open and more Soluble; whereas the stale is Astrengent, and stopping, causing heart-burnings in many, and breeding Acid Humors, and laying the Foundation of an Acid Ferment.

XV. The Spirit. It is drawn from Beer or Ale grown very hard, prickt, or almost sewer. It may be drawn in a Copper Vesica, with its Serpentine or Worm, with a gentle Fire, drawing off two thirds of the Liquor: or it may be mixt with double the quantity of fair Water, and one third part or better may be drawn off with a strong Fire, so will it have less of an Empyreuma: this Spirit thus drawn off must be rectified, by mixing it with an equal quantity of Water, and drawing off the one half: and by repeating this Work several times, you will so purely wash, and perfectly cleanse the Spirit, that all its Empyreuma and ill scent will be taken totally from it: This being done, you may either keep it in its present condition, of the Strength of Common Brandy, for common and ordinary Uses: or you may Detegmate it by reiterated Distillations *per se*, either in a Copper Vesica run'd within with its Worm, drawing off only the fine Spirit, leaving the Flegm behind; or you may Distill it in a Glass Body or Bolt Head in Balneo Marie, or a very gentle Sand heat, which will cause the subtil Spirit only to Ascend, leaving the Watry parts below; and this Work is so often to be repeated, till the Spirit is become purely fine, and free from Flegm, strong enough to fire Gunpowder. This Work will the better be done, if a proportional quantity of Common or Bay Salt, or Pot-Ashes be cast into the Spirit: for the Salt dissolving in the Flegm, will keep it down or make it stay behind, and cause the Liquor to yield its Spirit with much more ease and freedom, and more pure from Flegm and Empyreuma. As to its Virtues and Uses, it has the same Nature, Quality, and Use with the Spirit of Wine, and performs all the same things, in making Tinctures, Cordial Water, Elixirs, Powers, Volatile Spirits, Baths, &c. and therefore to that you are referred.

XVI. Potenta. This the Ancients made variously: Pliny lib. 18. chap. 7. says that the Greeks made it of Green Barly taken out of the Ear before it was fully ripe, steeped in Water, then beaten in a Mortar, after washed in Baskets, to free it from the Husks, so dried in the Sun, and afterwards steeped and beaten again, till it was thoroughly cleansed, which being dried was ground small: of this they took xx. pounds, and added thereto, Lin-seed, Coriander-seed of each j. pound: Salt ij. ounces: these last things well beaten together were mixed with the Barly, and so prepared for use. II. Other Grecians, says Pliny, made it of Barly steeped for a Night in Water, and blusked by beating in a Mortar, after dried, and so parched or fried in the next day, and then ground it to Meal, to make Bread, Cakes, Puddings

or Broath of. III. The *Italians* Made it of *Parched Barly*, without any moistning, ground small, to xx. pounds of which they added *Millet-seed* in Powder iij. pounds: *Coriander-seed*, *Lin-seed*, well beaten of each j. pound, *Salt* ij. ounces and a half, and then mixt them all together. IV. *Galen* Commends it to be Made of *Fresh Barly* not full out ripe or hardened, and before the *Beard* was white, or quite dry, and then indifferently parched, and reduced to Flower, adding nothing else to it. Many Nations used this *Polenta* instead of *Bread*, and the *Cypriots* tho' they had *Wheat* growing with them, yet mostly eat this. It dries and astringes more than *Barly* it self, binding the Belly and stopping fluxes, being drunk with *Alicant*, or red *Wine*: drunk with *Water*, it quenches thirst, and allays Inflammations of the Throat or Lungs. It was often eaten mixed with new *Wine*, or boiled up with *Wine*, and so eaten, as every one liked best.

XVII. *Maza*. This is only *Polenta*, or the Flower of *Parched Barly*, moistned with some kind of *Liquor*, as every one liked best: some with *Water*, some with *Water* and *Oil Olive*, some with sweet *Wine*, some with *Wine* and *Oil*, and some mixed it with *Honey*, as *Hesychius*, *Hippocrates* and *Galen* declare: but *Galen* says that *Maza*, is hard of Digestion, and generates Wind: if it is well moistned with *Water*, sweet *Wine*, or *Oil*, and *Honey* also is added to it, it the sooner passes off.

XVIII. *Prisana*. The Ancients made it of several sorts of Grain, not of *Barly* only, but of *Wheat*, *Rice*, *Oats*, *Pease*, *Lentils*. But *Prisana*, simply considered, is always understood to be made of *Husked Barly* only. *Hippocrates* his way of making of it is thus, Take the best *Barly*, steep it in *Water* four Hours or more, then put it into a course Bag, and beat it with a Mallet or wooden Pestle till the Husks come off which take away by washing, dry it in the Sun, and keep it for use. Take of this bulled *Barly* what you please, and boile it in a sufficient quantity of *Water* till it breaks, and that the liquor is thick like Cream: this liquor is the *Prisana*, which ought to be moderately liquid. This has no Affliction, nor troubles the Stomach or Bowels, nor swells or fills them with Wind, for the Windy part is vanished by boiling: it clogs not the Breth or Stomach, but by its Lubricity it easily digests and passes off, and quenches Thirst by its moistning quality; and for these properties sake, it is profitable both for sick and well: Thus *Hippocrates* and *Galen*. But *Dioscorides* further adds, That this *Prisana* by reason of its being boiled, yields more nourishment than *Polenta*, is good against Exulcerations, and to help the hoarseness and Roughness of the Throat: This was the *Prisana* of the Ancients: but the Physicians in our Times make it thus, Take bulled *Barly*, commonly called French *Barly*, boil it in *Water* till it be soft or broken, then beat it in a Mortar, and strain it, to which add blanched Almonds, Melon and Citrus Seeds, beaten to a Pulp, and then mixt together. This is their usual *Prisana*, or *Barly Milk*. *Prisana Drink* is thus made, Take bulled *Barly*, boil it in a first *Water*, and then in a second *Water*, but something less than in the former Recipe, strain away the *Water* from the *Barly*, and to iij. quarts of this *Water*, add Raisins of the Sun stoned iv. ounces, Blew Currants ij. ounces, *Liquorice bruised* j. ounce, sweet Fennel seeds iij. drams, *Coriander seeds* j. dram and half, Maiden Hair a handful, boil again a quarter of an Hour, or better, then strain out for ordinary Drink. It is good against Coughs, Colds, Hoarseness, shortness of Breath, difficulty of Breathing, obstructions of the Lungs, costiveness of the Bowells, and also for weak and Consumptive Bodies.

XIX. *The Yest*. It is the Superficial Faculency of the Drink, raised therefrom in Working; and *Yest* begets *Yest*, hastning on and more speedily perfecting the Fermentation of the Liquor, which is a separating of the Flowery or Mealy Particles of the Malt from the Wort, and the stirring up an innate and latent Acid into act, to give the Drink a pleasant sort of briskness or Quickness, enlivening it with a Subtil and kind of Vinous Spirit. This *Yest* by Diffillation yields a Vinous Spirit, of equal Virtues with the Spirit of Wine: and Bakers use *Ale Yest* insteap of Leaven, to make their Bread light, which would otherwise be sad: but Physically it is chiefly of External use. Being immediately apply'd in Burns and Scalds, it presently takes out the Fire, and eases the smarting Pain, making the affect more easy and yielding to other Medicaments. Apply'd to Phlegmons, and other like Tumors, it helps to dissolve and resolve them, unless they be Apottemated, and then it hastens the suppuration of the Apottem or Tumor, and alleviates the pain. Being boiled to a Salve or Emplastick body, and apply'd, it strengthens a weak Back, and weak Joints, eases Pain in those or other parts, and is discutient and resolutive.

XX. *The Feces or bottoms of the Barels*, called by some, *Emptyings*. They yield a Spirit by distillation like the *Yest*, which may be rectified to the like degree of Subtily and purity, and may serve for all the same intentions the other will serve for, whether Chymical or Pharmaceutical: And the *Feces* or *Bottoms* themselves are good to be outwardly applied in all the same cases, and to all the same Diseases for which we have prescribed the *Yest* in the former Section to be applied. But this is not so good for the Fermentation of Worts, as *Yest* is, because it will scarcely work at all and if it does it is so meanly and weakly that it makes rather a Flat and Insipid or dead kind of Liquor, than any thing which has briskness and Life: But it may be renewed, by adding a little sower Leaven to it, dissolved in a little of strong or sweet Wort, mixing them well together, and digesting them in a warm place, for some little time.

XXI. *The Balsam*. It is made of strong Ale, by gently boiling it so long till it becomes thick like Chio Turpentine, and will spread on Leather like a Salve, or soft Cerote. This being apply'd warm to the Neck or Throat troubled with the Kings Evil, of Kernels, or other hard Swellings, gives much ease and either dissolves or resolves them: it is good to resolve contracted Sinews and Tendons, comfort and strengthen weak Nerves and Joints, and is an excellent thing for weakness and pain in the Back, and to apply it to any part or Member which is hurt by spraining, falls, blows, or other the like Accidents.

XXII. *The Meal or Flower*. The Ancients of old, made of it Bread, 2. Kings 4. 42. John 6. 9. and 13. They made also Cakes of it, Judges 7. 12. Ezek. 4. 12. And so they have done almost in all Nations, and in most parts of this Kingdom, within these three or four score years last past, they made also of it a kind of boiled Bread or Puddings, and fried Bread or Pancakes; but now in our days *Wheat* being so plentiful with us, *Barly* is wholly disused, unless amongst the poorest of the People. The Turks at this day make a kind of Drink of the Meal or Flower which they call *Chausset*: Thus, they take the Meal or Flower which they make into Pesse, and boil it in a great Caldron, after which it is made into small balls: these balls being cast into the Water, it will presently boile up of it self, and grow hot, without the help of any fire, and become by working a kind of thick Drink. It is of a whitish Color, thick, of a good nourishment,

tunels

tumes into the Head, and causes Drunkenness if it is too largely taken; and this kind of *Drink*, says *Petrus Bellonius*, is usually sold in all the Cities of *Asia*, in the *Tap Houses* appointed for it, and generally with them called *Chausset*. In the *Levant*, and other the *Eastern parts* of the World *Barly* is yet more eaten, and made more into *Bread* than *Wheat*, I suppose because it is more cooling, and preventive of Fevers; it is also cheaper for the poor and ordinary sort of People: it nourishes much less than *Wheat*, but the Grain being Maulted, makes a more excellent *Drink*, clearer, thinner, purer, more stomatick and Diuretick.

XXIII. The Bread. It is made of the Flower with a proportional quantity of Water and Salt; to every bushel of which Flower, a four Leaven, as big as a Mans fist doubled, or a Pint of Ale Yeast, is added, being dissolved in the warm Water, with which the Paste or Dough is made: this being mixed with one part of the Flower, is covered with the other, and left in digestion for an hour or two, that the whole may be Leavened, then the Paste or Dough is made by mingling all well together, and kneading it with the hands, till it becomes a stiff Paste, which then is suffered to ly again about half an hour, and then made up into Loaves, which are after baked in an Oven. This Bread is proper to be eaten whilest new, agreeing then most with the Stomach, and nourishing best. Apply'd to the place where the Pain is, in a Velethead-ach, as soon as it comes out of the Oven, or as hot as the Patient can endure it, it gives present ease; and in a few times Application, cures it.

XXIV. The Cream. It is made of hulled Barley, boiled in a first Water and cast away, then boiled in a second Water, till the Grain bursts, and is perfectly soft: which is then beaten well in a Mortar, and mixed in the Water in which it is boiled, and strained through a Cheese Cloth: then Melon seeds blanch'd are beaten to a Pulp, and mixed with Milk, and strained till all the oily and moist part of the seeds are taken forth: This Milk is sweetned with double Refined Sugar, and mixed with the former strainings of the Barley, so you have Barley Cream. Some at Eating mix with it a little Damask Rose Water and Juice of Limons. This ordinarily taken is good against hot burning Fevers, and such as are weak, faint and feeble, labouring under Hecticks, and Consumptions, for it cools preternatural heats, and restores much. Without the Juice of Limons, it is good against sharpness of Urine, and such as make a Bloody Water.

XXV. Barley Water. It is made of hulled Barley, boiled in a first Water, and that cast away, and then boiled in a second Water, half a pound of Barley to a Gallon of Water, adding also an ounce and half of burnt Hartshorn, boiling them so long till the Barly is breaking; then the Water is strained from the other things, and made pleasant with the Juice of Limons, and double Refined Sugar. This is used as ordinary Drink for such as are in Burning or Malign Fevers, Hectick Fevers, Consumptions, or any other ways disturbed with heat; it cools, admirably quenches Thirst, and prevails against Diseases of the Lungs.

XXVI. The Cataplasim. 1. Take Barley Flower xij. ounces, Meal of Fleawort seeds iij. ounces, Honey, Oil of Lillies, of each ij. ounces, Water a sufficient quantity, mix and boil it to the consistence of a Pultise. This apply'd warm cures Tumors under the Ears, in the Neck and Throat, and other the like places. 2. Take Barley Meal Flower, xvi. ounces, Poulders of Fennugreek seed, Lin seed and Rue, of each iij. ounces, Flowers of Melilot and Camomile chopt small of each ij. ounces, boile all in sweet Wine to a thicknes. This apply'd warm, dissolves Infla-

mations, expels Wind out of the Bowels, and eases Pains of the fides, Stomach, and Spleen. 3. Take Barly Flower xij. ounces, Powder of Pomgranat peels and Myrtle Berries, of each iij. ounces, Red Wine, a sufficient quantity, mix, and boile to a Consistency: apply'd to the Belly, it is said to stop the Loofness, or other Fluxes of the Belly. 4. Take Barley Flower xvj. ounces, sharp Wine Vinegar, a sufficient quantity, mix and boile to the thicknes of a Cataplasim. It is good against Scurff, Dandriff, or Morpew in the Head or any other part, being laid on hot, and as Authors say helps the Leprosy. 5. Take Barley Flower xvj. ounces, white Salt and Honey, of each iij. ounces, white Wine Vinegar a sufficient quantity, mix and make a Cataplasim. Apply'd it is said certainly to cure the Itch.

XXVII. The Mixture. Take Barley Water xij. ounces, Sirup of Corn Poppies iij. ounces, Tindure of the same Flowers made with Spirit of Wine ij. ounces, mix them. Dose iij. ounces twice or thrice a day; with this I have cured several Plurifies. But *Tho. Bartholinus*, *Germ. Ephem. An. 2. obs. 2.* Professes to cure Vehement Plurifies with Barley Water alone.

XXVIII. The Julep. Take hulled Barley iij. ounces, boil it in a first Water, which cast away; boil it again in iij. quarts more of Water, Liquorice bruised, Strawberry Leaves, Violet Leaves, of each ij. handfuls, boile till a quart or three pints is consumed, then strain out, and dilcise it with iv. ounces of Sirup of Violets: It provokes Urine, and is very good in Cholerick Fevers. 2. Take hulled Barley viij. ounces, boil it in Water, which cast away; and boile it again in iij. quarts more of Water, adding Fennel seeds bruised, (towards the end of the boiling) iij. ounces, boil till the Barley breaks, then strain out, and sweeten with white Sugar Candy. It breeds Milk in Nurres plentifully, cools the heat and sharpness of Urine, and helps Pissing Blood, especially if it is caused by the Application of Veficatories, or Blistering Plaisters. It is good against Coughs, Colds, Wheezings, Hoariness, Asthma's, &c.

XXIX. The Bath. Take Leaves of Mallows, Violets, Beets, Fumitory, Black Hellebor, of each iij. handfuls, Barley iv. pound, boil them in a sufficient quantity of Water for a Bath, till the Barley breaks, the Grain is to be boiled a considerable time first, and then the Herbs to be put in towards the end of the boiling. It is a very effectual thing against Scurff, Morpew, Leprosie, Scabs, Itch, and other breakings out, being often used.

XXX. The Emplaster. Take Barley Flower ij. pounds, Tar j. pound, Wax half a pound, Oil Olive a sufficient quantity, mix and boil to the consistence of a Cerote, or soft Emplaster. It is said to cure hard Swellings of the Throat and other places called the Kings Evil. Apply'd also, it is an admirable thing to cure the Gout.

XXXI. The Distilled Water from the green Barly, and the whole Plant. It is Distilled in the end of May, and is good to cool Inflamed Eyes, and for such as have Defluxions upon them, to stay the Humors, and to ease the Pain, being often dropped in to them; white Bread being also dipt therein, and apply'd upon them, does the same.

XXXII. The Grains, which are left after Brewing. Tho they are generally used as Food or Meat for Horses, Cows, Sheep, Hogs, and Fowls; yet they have some Physical Virtues also: for they are beneficial in curing Lameness in the Hands, Arms, Legs or Feet, caused through Cold, or evil Humors, being fallen into them, as also shrinkings of the Sineus, Cramps, and pains in the Nerves or Joynts, if a Bathing-Tub or Barrel be filled with them whilest

whilest they are hot, or if cold, heated again as hot as may possibly be suffered, and the Patient fit therein, so as to cover those parts, that they may gently sweat, as long as he can well endure it without Fainting: this I say, if it is done three or four times, or more if need requires it, will both abate the Swelling and ease the Pain; also restore the Nerves, Joints, and Limbs, to their pristine health and strength.

CHAP. XLIV. of Wild BARLEY.

THE Names. It is called in Greek, *ῥεῖθρον ἀγρίον*: In Latin, *Hordeum agreste*: In English, Wild Barley.

II. The Kinds. There are several Kinds thereof, 1. *Ζέα ἢ Ζεία Μονόκοκκος*, and by Lobel, *Bryza Monococcis*; Wild or Bram Barley, Peters Corn. 2. *Ἀγρίων*, *Ægilops*, *Festuca*, Degenerate Barley, or Havergrafs. 3. *ῥεῖθρον ἰσθμίου*, (*ἀπὸ τοῦ ἰσθμοῦ, à trabendo, quòd aristas è corpore trahat*): *Hordeum spuri-um*, *murinum*, vel *spontaneum*, *Ristida*; Way Barley, Wall Barley, which last is also said to be greater and lesser.

III. The Descriptions. *Zea*, or *Bryza*, has a small Fibrous or Stringy Root, from whence rises up slender and short Stalks, but firm, bearing a small, thin Spiked Ear, set with Grains or Corn in two rows, one Corn on each side opposite to the other, from the bottom of the Ear to the top, whereby the Ear is flat, like unto Barley, with rough Awnes or a Beard, as Barley also has; every Grain is contained singly in a husk, which sticks to it, so as not easily to be gotten off, the Ear much resembles Barley, and the Colour of the Grain, is a dark Red: it makes blackish or dark brown Bread, and not altogether so pleasant as our Common Barley.

IV. Ægilops, (which in my opinion ought rather to be called *Monococcus*) has a Root which from a small Head sends forth many Fibres or Strings, from whence springs forth Stalks 2. or 3. handfals high,

resembling Wheat or Barley, Jointed in three or four places, from whence comes forth divers Grasse Leaves, of a pale green colour, and at the top of the Stalks two or three Heads, set one above another, which are round and somewhat long, hard and striped, having also many Beards at the end of each, wherein, when they are ripe and look whitish, 1. 2. or 3. small Grains or Seeds a little smaller (says Gerard) than Barley: these Seeds are wrapped or infolded in a Crested Film or Skin, out of which the Awnes come forth; Matthi-olus says, that as *Lolium*, or Common Darnel is known to be a Seed degenerate from Wheat, being found for the most part among Wheat: So by his own experimental knowledg, he had found that this *Ægilops* or *Festuca*, was a Seed or Grain, degenerating from Barley, and is found among Barley, or where Barley has grown.

V. The greater Way Barley, or Wall Barley, has a Fibrous or Thready Root, continuing many Years, from whence springs up many Grassy Leaves, and among them several Bent Stalks about 16. or 18. Inches high, at the top of which grows several whitish yellowish Ears, with somewhat rough Beards, but much shorter than those of Barley, and some have scarcely any Beards at all. The Ear is much more like that of Rye than Barley, and the Corn, or Grains which come out of it are brown Coloured, lank and small, in Color and shape resembling Rye, so that it might more properly be called Wild-Rye, Way-Rye, or Rye-Grass, rather than by any Appellation of Barley, to which in my opinion it has no resemblance.

VI. The lesser Way or Wall Barley, is like the other in its Roots, Leaves, Stalks, Ears and Grains, so that many have taken it to be the same with the former, but in this it differs, that it is much lower, so that it scarcely attains to be a Foot high; and indeed it comes so near to the former Barley, or rather Rye-Grass, that many have taken it to be one and the same, as even I my self also do.

VII. The Places. The first was anciently sown in Greece, and the Eastern Countries; now it is sown in some parts of Germany and France, but with us

it is chiefly found in *Gardens*, tho it grows well and naturally enough here as other Grains do. *Gerard* says, that he had often times found many Ears of it among our ordinary *Barley*, when he lived in the farther side of *Lincoln-shire*, and they there called it *Brant Barley*. The second is Sown in many places of *Italy* and *France*, as in *Provence* and *Narbonne*, among their Corn, and grows well in a moist Ground, but prospers most in a more fruitful dry Soil: *Gerard* says, it grows commonly among their *Barley* in *Italy*, and other hot Countries; but only with us in *Gardens*. The third and fourth, by the High-ways, and Path-sides, as also on Mud Walls, and at the Foot of other Walls, and Way-sides in Fields, almost every where through the whole Kingdom.

VIII. *The Times.* the first is a *Summer* Corn, and Sown in *March* and *April*, and is ripe in the beginning or middle of *August*. The second also is a *Summer* Grain, and is ripe towards the latter end of *July*, or the beginning of *August*. The two last are found coming to ripeness all the *Summer* Months.

IX. *The Qualities.* They are all of them temperate in respect to heat or coldness; and dry in the first Degree. The first and second Attenuate, digest and cleanse; and the two last are aperitive, absterfitive, and Vulnerary; and are all appropriated to Diseases of the Joyns.

X. *The Specification.* They have a peculiar property to cleanse and dry up Ulcers, and resolve Tumors in the Joyns. The *Ægilops* is said to be a Specifick against the *Ægilops* or *Fistula* in the Corner of the Eye.

XI. *The Preparations.* The first Kind has much the Nature and Virtues of Common *Barley*, and therefore may have most of those Preparations, so that we shall say no more of them here. From the *Ægilops* or *Festuca*, you may have, 1. An Infusion of the Seed in Drink or Wine. 2. A Decoction in Wine. 3. A Syrup of the whole Plant. 4. A Powder of the Seed or Grain. 5. A Juice. 6. *Afhes* of the Stalks. And from the *Way Barley* or *Rye-Grafs* you have, 7. A Cataplasim.

The Virtues.

XII. *The Infusion in Ale, Beer, or Wine.* The Seed Infused, or Drunk in Powder in any of these Liquors, affects the Head and Brain much, and causes Drunkenness.

XIII. *The Decoction in Wine.* If it is made with the Addition of dried *Damask Roses*, and drunk from ij. to iv. ounces; as also the Mouth and Throat, Gargled therewith; it is good against a stinking Breath, I suppose caused by some filthy Ulcer or Ulcers in those parts, for that it has a property to heal Ulcers.

XIV. *The Syrup.* If the whole Herb, Roots, and Seed be bruised, boiled in Water, strained, and made into Syrup with Honey, to viij. ounces, of which if j. of *Aloes Succotrina* in fine Powder be added, you have an excellent Medicine against foul Ulcers of the Nostrils, by wetting Tents therein, and putting them up the same, holding them a pretty while therein, and often repeating it.

XV. *The Powder.* Mixed with Watter in which a little *Roeb Alum*, or *Saccharum Saturni* has been dissolved, and laid upon the *Ægilops* or *Fistula* in the Corner of the Eye; it cures it; it also cleanses, dries up and heals Ulcers in other parts of the body, being so used, or strewed on dry.

XVI. *The Juice.* It is mixed with *Barley* Meal and so dried: and then upon occasion moistned with *Rose Water*, and apply'd Plasterwise, it heals (as *Gerard* says) the *Ægilops*, or *Fistula* in the Eyes: it also softens and asswages hard Tumors, and swellings in the Joyns. *Lobel* says, this has been often tried to he effectual against the *Ægilops*, for that it has a drying quality without sharpness.

XVII. *The Afhes of the Stalks or Straws.* Made into a Lixivium with Water, it is good against the Gout from a flegmatick cause, by often bathing there with, and to dissolve hard Tumors or Swellings in the Fleth, and discuss Tumors of the Joyns.

XVIII. *The Cataplasim of Way Barley or Rye Grafs.* Being made of the Green Ears and Grafs by beating it in a Morter, and then apply'd to places bald, or where the Hair is wanting, *Gerard* says, it causes it to come forth and grow again.

CHAP. XLV.

OF BARREN-WORT.

I. *THE Names.* It is called in the *Greek*, *Ἐπίμηνιδιον*: In *Latin*, *Epimedium*; *Epipetron*, *Epimenidium*: In *English*, *Barren-wort*.

II. *The Kinds.* It seems to be a singular Plant of the Kind, without any Species, tho *Parkinson* talks of an *Atherum fruticosum*, &c.

III. *The Description.* It has a Root small and reddish, spreading much under ground, in shadowy rather than Sunny places; from whence springs up several hard round Stalks, twenty or twenty four Inches high, each Stalk divided for the most part into three Branches, and each of them bearing three Leaves apiece, which are several, somewhat broad and round, yet pointed at the ends, hard or dry in feeling, and a little sharply dented about the edges, of a light green Colour on the upper side, and whiter underneath: from the middle of some of the Stalks of Leaves, shoots forth with them, from the first rising up of them, a small long Foot Stalk of Flowers, not much higher than the Stalks of Leaves, divided into Branches, containing on each of them, three Flowers apiece,

apiece, separated into four parts, as if the Flower consisted but of four Leaves, when as each part has two leaves, one lying close upon another, the inner being yellow, and smaller than the lower which are red, so that the red edge appears round about the yellow, making it seem a yellow Flower of four Leaves with red edges, having also a few yellow Threads in the middle, set with green, the under side of the Flowers being of a yellowish red Colour, striped with white lines. Gerard says, the Flower is but small, consisting of four Leaves, whose out sides are purple, the edges of the inner side red, the bottom yellow, the middle part of a bright red Colour, and the whole Flower somewhat hollow. The Flower being past, small long Pods or Cods appear much like to Saracens Confound, but shorter, in which is contained flattish red seed. It is a pretty shrubby Plant, and its smell is rather strong than pleasant.

Barren Wort.

IV. *The Places.* It grows on the Mountains of Liguria, and in most Meadows in Italy, about Bononia and Vicentia; also in Romania, and on the Euganean Hills. It grows with us in Gardens only, in moist and shadowy places, where it brings forth its Seed to perfection, tho' Dioscorides and Pliny say, that it is without either Flower or Seed.

V. *The Times.* It Flowers at its first coming forth, or first Year of its growth from June till the middle of August: but after it has taken fast hold, and well Rooted it self in the Earth, a Year before, it then Flowers in April and May.

VI. *The Qualities.* Galen affirms it to be moderately cold and moist: I judge it to be cold and moist in the first Degree: it is Repercussive and Discutient, and appropriated to the Joints.

VII. *The Specification.* Parkinson says, it is without any special property, more than to keep Womens Breasts from growing over great.

VIII. *The Preparations.* By reason much of the Virtues of this Plant is not known, there are not many Preparations from the same: the chief being,
1. A Juice. 2. A Powder of the Roots and Leaves.
3. A Cataplasma.

The Virtues.

IX. *The Juice.* Whether it is taken out of the Roots or Leaves, it is good to cool Inflammations, and is profitable to bath with in an Erysipilas.

X. *The Powder.* It may be made of the Roots or Leaves, for of either the Virtue is the same, tho if made of the Root it is thought to be stronger; Parkinson says it is reported, that being taken inwardly for some time, it makes Women Barren: from whence possibly the Name might come.

XI. *The Cataplasma.* The Leaves made into a Pultise, by beating them up with Oil, and applied to Womens Breasts, keeps them from growing great; and is good to Discuss a slight Contusion:

CHAP. XLVI.

Of Common BASIL.

I. *THE Names.* It is called by the Arabians, Bedarog, Berendaros: in Greek, βασιλικόν; Basilikon: in Latin, Ocimum, Basilicum, Regium: in English, Basil.

II. *The Kinds.* The general Kinds are, 1. Garden. 2. Wild. The Garden Basil is, 1. The Common Great, Ocimum Vulgatum. 2. The small or Rust Basil, Ocimum Vulgare minus. 3. Anisated Basil, Ocimum Anisatum, of which in this Chapter. 4. Basil Gentle, or Clove Basil, Ocimum Caryophyllum. 5. Citron Basil, Ocimum Citratum, of which in the next Chapter. 6. Ocimum Americanum maculatum, Spotted American Basil. 7. Ocimum Americanum crispum non maculatum, Crisped American Basil not spotted, of which two in Chap. 48. The Wild Basil is either Stone or Field, of which in their proper Places in Chap. 49. and 50.

III. *The Descriptions.* The Common Great Basil, has a Thready and Fibrous Root which perishes
K

at the first approach of Winter, and therefore is to be sown a new every Year if you will have it, from whence rises up usually but one upright Stalk nearly a foot high, variously branching forth it self on all sides, whereon, at every Joint, are set two Leaves, broad, thick, and fat, a little pointed, of a pleasant sweet smell, of a fresh green Colour, and a little snipt about the edges; of which some one here and there, are of a black reddish hue: towards the upper part of the Stalk and Branches come forth a number of small whitish Flowers, which many times tend to a dark purple, with two small Leaves at the Joint, in some places green, in others brown, after the Flowers come small black Seed.

IV. The Small Bush Basil, has a Fibrous perishing Root much like the former, from whence rises up small tender Stalks, which grow not so high as the former, but is thicker spread with Branches, and smaller Leaves thereon, and set closer together; these Leaves are little, less than those of Pennyroyal, and the whole Plant is low, and fine or small, growing into a kind of diminutive Bush, whence the Name of Bush Basil; and is of a more pleasing sweet sent than the former by much: the Flowers are small and white, and the Seed black like the other, when it yields Seed with us, which is more seldom, it not often yielding ripe Seed here, because it neither Springs, Flowers, nor Seeds so early as the others. Parkinson adds another middle Kind something larger than this both in the height of the Bush, and magnitude of the Leaves, but not otherwise differing, which to me seems to be one and the same Herb, but differing according to the goodness of the Soil.

V. The Anistated Basil, Is truly of the self same Kind with our ordinary Garden Basil but of a middle size between the Common Great and Bush Basil, and differs nothing in its Roots, Stalks, Leaves, Flowers, nor Seed, but a little in the magnitude, and something in the smell, which is like the smell of Aniseeds.

Common-Basil Anistated.

VI. The Places. Whence these Herbs first came, is unknown to us, but in Italy, France, Spain and England, they are only nourished up in Gardens.

VII. The Times. They Flower in the heat of Summer as in June and July, by little and little, whereby they are long a Flowering, beginning at the top first, and so Flowering as 'twere downwards.

VIII. The Qualities. They are hot and moist in the second Degree: They incise, attenuate, open, discuss, resolve, concoct, digest, and are carminative and anodyne, being Cephalick, Neurotick, Stomack, Pectoral, Cardiac, Nephritic, and Uterine; also Emmenagogick, and Alexipharmick.

IX. The Specification. Schroder says, it is a peculiar thing to cleanse the Lungs, and provoke the Courses in Women.

X. The Preparations. The Shops make use of, 1. The Leaves. 2. The Seed. 3. And Distill therefrom a Water. But you may farther prepare, 4. A Juice. 5. An Essence. 6. A Spirituous Tincture. 7. A Saline Tincture. 8. An Oily Tincture. 9. A Decoction in Wine. 10. A Syrup. 11. An Oil. 12. A Cataplasim.

The Virtues.

XI. The Leaves. Their smell comforts the Brain (whatever some Authors say to the contrary) and were eaten in Galen's time (I suppose as a Sallet) being corrected with Oil and Vinegar. Some Authors will have it that they dry up Milk in Womens Breasts, which in my opinion is against their proper Nature, being hot and moist, and therefore more apt to breed Milk.

XII. The Seed. Being made into a fine Powder, it may be given from half a dram to j. dram, in Wine, against the Palpitation or Trembling of the Heart, to cheer and comfort the same, and expel Melancholly, or sadness of Mind: It is good also against Poyson and the Stinging of Scorpions.

XIII. The Distilled Water from the whole Plant. It is good to clear the Eye-sight, and to be used as a Vehicle for the other Preparations.

XIV. The Juice. If it is put into the Eyes, it takes away their Dimness, and dries up Humors which fall into them; thrust up the Noftrills it causeth Sneezing; and so Purges the Brain: given to j. ounce in a Glass of Generous Canary morning and evening, it provokes Venery, or Lust, and is good for such as are troubled with Heart Qualms, or Swooning Fits, or stoppage of their Terms.

XV. The Essence. It much exceeds the Juice for Inward uses, being corrected, and made more Pure or fine, as being freed from its gross and faculent parts. It has the Virtues of the Juice, besides which it is an excellent Stomack, Cardiac, and Pectoral, freeing the Lungs from the Tartarous Matter which obstructs them, and causing thereby a free respiration, and therefore is profitable against Coughs, Colds, Asthma's, and other like Diltemper of the Lungs. Dose from j. ounce to ij. ounces in Wine, or Syrup, or some other Pectoral Vehicle, morning and evening.

XVI. The Spirituous Tincture. It is Stomack and Cardiac, resists Poison, and is good against the Stinging of Scorpions, or bitings of other Venomous beasts: prevails against Fainting and Swooning Fits, Sicknes at Heart, and is good for such as are troubled with Lethargies, Carus and Apoplexies, and other Cold Diseases of the Head, Brain and Nerves. Dose ij drams or more, in the Distilled Water.

XVII. The Saline Tincture. It is powerful against Diseases of the Reins, opening their obstructions, and removing the Tartarous and Viscous Matter which affects them. It provokes Urine, expels Sand, Gravel, Slime and Stones out of the Reins and Urinary Passages. It provokes the Terms in Women, and facilitates

cilitates the Delivery of such as are in Labor, bringing away both Birth and After-birth. Dose from j. to iij. drams in a Glas of White Wine. It is good against the Stinging of Scorpions, and Hornets, biting of mad Dogs and other Venomous Creatures, as also against the Jaundice and Dropsie, carrying off the Morbifick Cause by Urine.

XVIII. *The Oily Tincture.* It is singular against the Stone, Sand, Gravel, obstructions of Urine, as also the Yellow Jaundice, Coughs, Colds, Hoarseness, and the like, being taken in the *Syrup* of the same Herb, from iv. to xij. drops: it prevails also against Palsies, Convulsions, Lethargies, Apoplexies, &c. and outwardly anointed it is good against the bitings of mad Dogs, and Pricks, Punctures, or Wounds of the Nerves.

XIX. *The Decoction in Wine.* Given from iv. to viij. ounces, it is good against Poyson, the stinging and biting of Venomous Creatures, Faintings, Swoonings, fits of the Mother; provokes the Terms, expels both Birth, and After-birth, as also Sand and Gravel from the Reins and Bladder, and is good against all cold Diseases of the Head, Brain, Nerves, Womb, and Bowels.

XX. *The Syrup of the Juice.* It is an admirable Pectoral, good against Coughs, Colds, Asthma's, shortness of Breath, Hoarseness, &c. causing expectoration, and making the Brest and Lungs easy. Dose ij. ounces either alone, or mixt with *Alicant*, *Tenn*, or *Malaga*.

XXI. *The Oil.* It is made by Boiling the Juice or Bruised Herb with Oil of Mirrles or Roses and Vinegar. Being anointed with, it prevails against Pains of the Head and Nerves, Lethargies, Palsies and other cold Diseases of those Parts; and eases pains of the ears being dropt into them.

XXII. *The Cataplasim.* It is Discaussive and Resolutive, good against the beginnings of Phlegmons, or Inflammations in any part of the Body: it is also good to take away black and blew spots of the Skin, discufs Confusions, and ease pain proceeding from any cold Cause.

like those of the ordinary Common Basil, and the Seed Black also, like those of the former.

Citron Basil

V. The Greater Clove Basil: Its Root is like the former, and perishes in like manner, being one of the Great Kind of Basils, and not differing from the former, either in stalks, branches, growing, or largeness of the Leaves, or colour of the Flowers, except that sometimes they are a little purplish; but in the Smell of the whole Plant, it has a stronger and a quicker Scent, much like the smell of Cloves, for which reason it is called Caryophyllatum.

Basil largest clove scented

K 2

VI. The

CHAP. XLVII.

Of Citron and Clove BASIL.

I. **THE Names.** The first of these is called in Greek, *οκίμιν* "οκίμιν": in Latin, *Ocimum*, vel *Basilicum alterum*, *Ocimum Citratum*: in English, *Citron Basil*.

II. The second of these is called, *οκίμιν* *καρυοφυλλάτον*: in Latin, *Ocimum* vel *Basilicum Caryophyllatum*: and in English, *Clove Basil*, or *Basil Gentle*.

III. **The Kinds.** The first or *Citron Basil*, is the *Greatest Basil*, and is singular. The *Clove Basil* is, 1. *Ocimum Caryophyllatum majus*, the *Greater Clove Basil*. 2. *Ocimum vel Basilicum caryophyllatum minus*, the *Lesser Clove Basil*.

IV. **The Descriptions.** *Citron Basil*: It has a pretty thick Root, with many Strings, which perishes after Seeding time, or upon the approach of Winter; from whence grows up one upright Stalk, spreading it self into many Branches, not much unlike to the Common Garden Kind, with Leaves set by couples at the joints, but much larger, and of a reddish Colour in the hotter Countries, but not so in our colder, a little dented about the edges, of a very pleasing Smell, much resembling that of a Citron Peel, and therefore called *Citratum*; the Flowers are White,

VI. The Lesser Clove Basil : It has a pretty long, woody Root with many fibres thereat, from whence rises one Upright Stalk, which admirably spreads it self forth in Arms and Branches, looking very much like to a bush, and not very much unlike Mother of Time, both in the form of its growing, and the shape and magnitude of its Leaves, which grow more dispersedly upon the Branches ; the Flowers grow at the Tops of the Branches, after the manner of those of Basil, of a White Colour, but bending somewhat more backwards. The smell is the strongest and most fragrant of all the Basils, and smells perfectly like Cloves, from whence it is also called Caryophyllatum, and this is the true Basil Gentle. An Exact Figure hereof you have in Dalechampius Hist. Plantarum, lib. 5. cap. 51. fig. 5. pag. 681.

VII. The Places. They grow in the Eastern Regions, and hot Countries, where they are more odoriferous, than in our Northern Climes : but now they grow in all the Northern Nations in Gardens, where they flourish well, and yield their Seed in perfection, but their fragrant Scent is not altogether so strong.

VIII. The Times. They Flower gradually during the hottest Summer Months, as all June, July, and some part of August, Flowering at the Top first ; and then is gradually Ripe not long after.

IX. The Qualities. These are hot in the second Degree, and moist in the first Degree : Inciding, Attenuating, Opening, Digestive, Resolutive ; Carminative and Anodyn. And appropriated to the Head, Nerves, Stomach, Breſt, Lungs, Heart, Reins and Womb : they are also Emmenagogick, and resist Poison.

X. The Specification. They comfort the Nerves, prevail against Palsies, cleanse the Lungs of Tartarous Matter, and provoke the Terms.

XI. The Preparations. You may prepare therefrom, 1. A Powder from the Seed. 2. A Distilled Water from the whole Plant. 3. A Juice. 4. An Essence. 5. A Spirituous Tincture. 6. A Saline Tincture. 7. An Oily Tincture. 8. A Decoction in Wine. 9. A Syrup. 10. An Oil. 11. A Cataplasim.

The Virtues.

XII. All these Plants have the same Virtues with those in the former Chapter, and therefore the Preparations have the same, for which, and their particular Uses we shall refer you thither.

CHAP. XLVIII.

Of American BASIL.

I. THE Names. This was wholly unknown to the Greeks, and therefore can have no Original Greek Name, but considering it is an Indian Plant, may well enough be called, *οικωνος βασιλικον* : in Latin, *Ocimum Americanum* vel *Indicum* : and by Camerarius, *Basilicum Hispanicum* : in English, *American Basil*.

II. The Kinds. It is twofold, 1. *Ocimum Americanum maculatum* large, smooth, spotted American Basil. 2. *Ocimum Americanum crispum* non maculatum, crisped American Basil, not spotted.

III. The Descriptions. The smooth spotted American Basil, has a Root like those in the former Chapters, which perishes after Seeding time ; from whence rises up a four square reddish green Stalk, a foot high, or better, from the Joints whereof spread out many Branches, with broad fat Leaves set thereon, two always at a Joint, one against another, as the Basils have, but somewhat deeply cut in on the edges, and sometimes a little crumpled, standing upon long reddish Root-stalks, of a dark purple colour, spotted with deeper purple spots, in some greater, in others less ; the Flowers stand at the Top of the Stalks, Spike-fashion, of a White Colour, with Reddish Stripes and Veins running through them ; set or placed in dark

dark purple coloured Husks: The Seed is greater and rounder than any of the former Kinds, and somewhat long withal: the whole Plant smells strong like to the common or ordinary Basil and Camphire put together.

IV. The Crisped or Curled American Basil, not spotted: It has a Root like the foregoing, being a degenerate of the other kind, risen (as Parkinson supposes) from the Seed of the former Plant, gathered in these colder Countries; and is indeed of the Kind of the American spotted Basil, having like Stalks, and such like large Leaves, cut somewhat deeply in on the edges, and curled or crumpled, as they also sometimes are, together with swelling bunches like Bladders in them, but wholly of a green colour, and without any spots, or spot upon them: the Flowers hereof are all white, and without any spots as the other has: the smell hereof is very strong, and perfectly resembling the former.

V. The Places. They Originally grew in America, from whence they were brought into Spain, and from thence to us, being nourished up in our Gardens; the latter of which seems now to be a Native of our own Country.

VI. The Times. They Flower gradually in June and July, as the others do, and their Seed is ripe in August.

VII. The Qualities. They are hot in the second Degree, and moist in the first; highly Cephalick, Neurotick, Cardiack and Hysterick; they Attenuate, Open, Resolve, Discuss, are Carminative, Anodine, Alexipharmick, and Emmenagogick.

VIII. The Specification. I have found them peculiar against Palfies, and Pains and Aches proceeding from a cold Cause.

IX. The Preparations. You have, 1. A Powder from the Seed. 2. A Distilled Water. 3. A Juice. 4. An Essence. 5. A Spirituous Tincture. 6. A Saline Tincture. 7. An Oily Tincture. 8. A Decoction. 9. A Syrup. 10. An Oil. 11. A Cataplasim: the Virtues and Uses of which, are the same with the same Preparations in Chap. 46. Self. 12. to Self. 22. foregoing. 12. A Distilled Oil. 13. The Powers.

The Virtues.

X. The Distilled Oil. It cures Head-aches, Megrims, Lethargies, Apoplexies, Epilepsies, Palfies, Convulsions, Tremblings, and weakness of the Nerves, Obstructions of the Womb, Reins and Bladder, Punctures and Wounds of the Nerves, and all sorts of Pains, Aches, Sciatica, and Lameness from a cold Cause, being taken inwardly from iv. drops to xij. in some proper Vehicle; and outwardly anointing the part affected therewith. It expels Wind, and cures the Colick.

XI. The Potestates or Powers. They have all the former Virtues, but penetrate more, as being more Subtil or Volatile: They provoke the Terms in Women, ease Pains and Stitches in the Side, are good against Fits of the Mother, and Vapors, cheer the Heart, revive the Spirits, resist Poison, and remove Melancholly, It strengthening the Stomach, and all the Viscera. Dose from j. dram to ij. drams, in a Glaſs of Wine, or some other proper Vehicle.

CHAP. XLIX.

Of Stone BASIL.

I. THE Names. It is called in Greek, *Ἀκινός* & *Ἀκινός*: in Latin, *Acinus* and *Acinos* by Lobel and Dalechampius: *Clinopodium Vulgare*, by Matthioli: *Clinopodium majus*, by Camerarius: *Botanica Pauli*, by Guilandinus: *Pulegium montanum*, by Lonicerus; *Polycnemum*, by Gesner; and *Clinopodium Origano simile*, by Bauhin: in English, Stone Basil, and Great Wild Basil.

II. The Kinds. This is properly the first and chiefest of the Wild Basils, and is twofold. 1. *Acinus major*, the greater Stone Basil. 2. *Acinus minor*, the lesser Stone Basil.

Stone Basil Greater.

III. The Descriptions. The Greater Stone Basil has a bushy Root, of many Strings set together at, and depending from one Head, which shoot forth sockets round about: from this Root springs forth several hard, four square, hairy or hoary Stalks, a foot, or foot and half high, or more, set with two hairy green Leaves at each Joint, being covered also as the Stalks are with a hairy Down, somewhat larger than any of the other Wild Basils, coming near unto the bigness and fashion of the Leaves of Origanum: the Flowers grow in Rundles, or round the Stalk, in greater plenty than in the Wild Basils of the following Chapter, and of a purplish colour, but sometimes white, the Husks of which are somewhat larger and rougher.

IV. The Lesser Stone Basil, has like Roots, Stalks, Leaves, Flowers and Husks, and differs not any thing from the former, save that the Stalks are lower, the Leaves lesser, and the Husks of the Flower's smaller; in a word, it is of the same Kind, but the whole Plant is every way less.

V. The

V. *The Places.* Gerard says they grow plentifully in *Autumn*, almost by every Hedge: *Parkinson* says, they are found sometimes in Corn Fields in *England*, but more often in open Woods and Copses which have been filled, and thar almost through all our Countrey; more especially if they are stony places.

VI. *The Times.* They Flower in the latter end of *May*, all *June* and *July*, and the Seed is gradually ripe in *July* and *August*.

VII. *The Qualities.* They are hot and dry in the first Degree: *Discussive*, *Astringent*, and *Vulnerary*; and dedicated to the Womb.

VIII. *The Specification.* They are peculiar for stopping Fluxes, and the Terms in Women; more especially for Fluxes of Blood.

IX. *The Preparations.* You have from them, 1. *A Juice.* 2. *An Essence.* 3. *A Spirituous Tincture.* 4. *An Oily Tincture.* 5. *A Decoction.* 6. *A Balsam.* 7. *A Cataplasim.*

The Virtues.

X. *The Juice.* Given from j. ounce to ij. ounces, it strengthens the Stomach and Bowels; and bathed upon an Inflammation it asswages it.

XI. *The Essence.* This is more Stomatick than the former, and given inwardly, stops all sorts of Fluxes, whether of Humors or Blood, as also the Terms in Women. Dose from j. to iij. ounces, in some proper Vehicle.

XII. *The Spirituous Tincture.* This has all the Virtues of the former, and is good to take inwardly, to heal Wounds and Ulcers, from j. dram to half an ounce, in a Decoction of the same Herb; 'tis an excellent Vulnerary.

XIII. *The Oily Tincture.* It is good against Pains and Aches from a cold and moist Cause, gives ease in the Gour, and heals Wounds, Punctures, or other hurts of the Nerves, by anointing therewith Morning and Evening.

XIV. *The Decoction in Wine.* By fomenting therewith, it Discusses hot Tumors and Inflammations; used as an Injection into foul, fetid, and hollow Ulcers, it cleanses them: and daily drunk from iv. to viij. ounces, it stops the overflowing of the Terms in Women, the Bloody Flux, and other Fluxes of the Belly.

XV. *The Balsam.* It is an excellent Vulnerary, cures Wounds by the first intention; and digests and cleanses, old, foul, rotten, and filthy Ulcers with great facility, after which it incarnates, or fills the Ulcer with Flesh, and presently heals it up.

XVI. *The Cataplasim.* It is made of the Herb chopt small, beaten in a Mortar, and boiled in Milk, and brought to the thickness of a Pultise, with Yolks of Eggs, and Crumbs of Bread. It is Discussive, Resolutive, and Anodine, and of singular good use to be applied to a recent Contusion, or a Gout from a cold Cause.

CHAP. L. of Wild BASIL.

I. *THE Names.* It is called in Greek, *Κλωνίδιον* (*quasi* Leſtipes, Bedsfoot Flower, because they resemble the Beds feet:) in Latin, *Ocimum Sylvestre*, *Basilicon Agreste*, *Clinopodium*; and in English, Wild, or Field Basil, Beds-foot Flower.

II. *The Kinds.* There are three several Kinds hereof, 1. *Clinopodium Vulgare*, *Clinopodium minus*, (because less than the Stone Basil.) *Ocimum Sylve-*

stre, by *Lobel* and *Clusius*; *Acinos* and *Ocimastrum*, by *Fuchsius* and *Dodonæus*; *Clinopodium*, by *Anguilara* and *Turner*; *Clinopodium majus*, by *Camerarius*; *Pulegium Petraeum*, by *Gesner*; *Clinopodium Alterum*, and *Pseudo-Clinopodium*, by *Maitbiolus*; *Clinopodium Arvenſe Ocimi facie*, by *Bauhinus*; and *Basilicum Tertium*, by *Tragus*; in English, Field Basil; but the People call this as well as the next following, where they grow, *Horſe Tine*, and *Poley-mountain*. 2. *Acinos Anglica Clusij*, (which is thought to be, by *Clusius*, the true *Acinos* of *Dioscorides*;) *Clinopodium Ocimi facie alterum* of *Bauhinus*; our English Wild Basil the lesser. 3. *Acinos odoratiſſimum*, *Latifolia Columnæ*, Broad Leav'd sweet Scented Wild Basil.

III. *The Descriptions.* The first has a Woody Fibrous Root, full of hairy Threads, creeping along the Ground, and springing up Yearly of it self without Sowing; from whence rises up several square Stalks, about six or eight Inches high, with two small Leaves set at every Joint, being somewhat like Wild Marjoram, or the fine bush Basil, a little dented about the edges, but not much, and some Leaves not at all dented; and in some Plants and Places a little rough and hairy, and in others, less, or not at all: the Flowers grow at spaces with the Leaves, like as Horehound does, standing in green rough Cups, which are of a purplish Colour, and parted, as it were, into four equal short pieces at the end, like to the four square foot of a Bedstead, and open with several Leaves like other hooded flowers; the Cups of the Flowers have not every one of them a single Root-stalk, but many stand together upon the same Pedicle or Stem; after which comes small round reddish Seed, growing three or four together in small swollen Husks. The whole Plant, has some small heat, but more dryness in the Taste thereof, and sweet or odoriferous in Smell between Basil and Calamint.

IV. The second Kind has also a Bushy, fibrous Root, which perishes every Year, from whence rises up several slender four square Branches or Stalks, seven or eight Inches high, lying on the Ground, on which

which grow divers small grayish green Leaves, two always set together at a joint, resembling much the former, or those of the Stone Basil, but smaller, shorter, and fuller of Juice, not denied about the edges at all, and almost like to Mother of Time, or the smaller Garden Basil, called Basil Gentle, having an excellent sweet Scent, but not Heady: from the middle of the Branches up to the Tops, grow the Flowers in Randles or Spaces about the Stalks, being very like to the former just now described, but of a more blewish purple colour, with a White Eye, or Circle in every Flower, which being past, there comes three or four small Seeds, like the first in the Husks where the Flowers stood, which fall and rise again every Year of their own Sowing.

V. The third Kind has a bushy Root with many Fibrous Strings like the former, from whence rises up four, five, or more, four square hard Woody Stalks, divided into many Branches, covered with a soft white hairyness, two foot long, or longer, not growing upright, but trailing in some measure upon the Ground: the Leaves grow upon short Foot-stalks, by couples, of a light green colour, somewhat like the Leaves of Basil, or rather Bawm, about three quarters of an Inch broad, and not fully an Inch long, a little sharp pointed, and lightly notched about the edges, covered also with a light soft hairyness, of a very sweet smell, not much inferior to Garden Marjoram, of a hot biting Taste: out of their Bosoms grow other smaller Leaves, or else Branches: the Flowers also grow out of the Bosoms of the Leaves, towards the Tops of the Stalks and Branches, not in Whorls or Rounds, like Acinos, or Stone Basil, but having one little short Foot-stalk, on which is placed three, four, or more, small Flowers, gaping open, and divided into four unequal parts at the top, like the Flowers of Basil, and very near of the likeness and bigness of the Flowers of Garden Marjoram, but of a pale blewish colour, tending towards a purple, after which come the Seed Vessels, which contain small roundish blackish Seed.

VI. The Places. The first grows commonly in the borders of Fields, and among Corn it self, as at Sutton in Kent, not far from Dartmouth; at Thetford in Norfolk, and in divers other Dry, Sandy, and Untilled Grounds. The second grows Wild in Kent in divers places, where Cusius says he found it, also in several other parts of England; Gerard says he found it a little on this side Pomfret in Yorkshire, and since by Dartford in Kent, and in the Isle of Thanet: he says it is brought to our London Markets, and is called by the Herb Women Poly-mountain. The third grows Wild in hot Countreys, but with us in Gardens, and is often found amongst Sweet Marjoram.

VII. The Times. The two first Flower in June and July gradually, and their Seed is ripe in July and August: The third Flowers in July and August, and its seed is ripe in August and September.

VIII. The Qualities. They are all of a nature, hot and dry in the end of the second, or beginning of the third Degree: they are also, Attenuating, Inciding, Opening, Carminative, Discurfive, Resolutive, Vulnerary and Anodine; Cephalick, Neurotick, Stomackick, Cardiac, Hyfterick, and Arthritick; and powerful Alexipharmicks and Emmenagogicks.

IX. The Specification. The Field Basil has been experimented against Convulsions, Cramps, and Neurotick Distempers. Acinos or English Wild Basil is approved for Stopping Fluxes: and the Broad Leav'd sweet Scented Wild Basil is good to facilitate the delivery.

X. The Preparations. The Shops keep nothing of them; but you may prepare, 1. An Inspissate Juice of the Acinos. 2. A Spirit from the first and third. 3. A Spirituous Tincture. 4. An Oily Tincture. 5. A Saline Tincture. 6. A Balsam or Oil of the first.

The Virtues.

XI. An Inspissate Juice of the Acinos. Being given to a dram in Red Wine, it stops all sorts of Fluxes of the Belly, and Fluxes of the Terms; and dissolved,

dissolved, and mixed with Lard into an Ointment it dissolves hot Tumors.

XII. *The Spirit from the first and third.* It is singular good against Convulsion-fits, Megrim, Vertigo, Lethargy, and other cold and moist Diseases of the Head, Brain, Nerves, and Womb: outwardly bathed upon places troubled with the Cramp, it cures them. Dose from j. dram to ij. in Wine or Ale.

XIII. *The Spirituous Tincture.* If made of the first or third, it warms, comforts, and strengthens the Stomach, causes a good Appetite, and is good against the sickness thereof. Dose ij. drams, more or less in Wine, Ale, or Posset-Drink.

XIV. *The Oily Tincture.* Taken to half a dram in any fit Vehicle, it prevails against the Stone and Stoppage of Urine: outwardly anointed upon places pained from any Cold Cause, it eases the Pain, warms and comforts the Part, and restores it to its due strength.

XV. *The Saline Tincture.* It opens Obstructions of the Viscera, and being made of the third Kind, it provokes the Terms, and expels the Dead Child, and After birth. Dose from j. dram to ij. drams in Wine.

XVI. *The Balsam or Oil of the first.* It is good against Convulsions, Cramps, Ruptures, Strangury, Stinging and Bittings of Venomous Beasts, and other Diseases of like kind, being anointed upon the Part afflicted, Morning and Evening.

CHAP. LI.

BALSAM-APPLE Male.

BALSAMINA MAS.
Balsamine male

I. **THE Names.** It was unknown to the *Greeks*: The *Latins* call it *Balsamina*, which name it took from its fanative or healing properties. Some call it *Viticella*, from its Vine-like appear-

ance: *Cordus* calls it *Cucumis puniceus*: *Gesner*, *Balsamina pomifera*: *Lobel*, *Balsamina Cucumerina punicea*: Some, *Pomum Hierosolymitanum*: and we in *English*, the *Male Balsam Apple*. It is thought by some to be that which *Pliny* speaks of, *lib. 20. cap. 3.* which the *Greeks* call *Cucurbita Sompbos*; but this is disputable.

II. *The Kinds.* Of the *Balsamina* there are three principal kinds. 1. *Balsamina Mas*, which is that we treat of in this Chapter, and is called by all the names aforegoing: as also *Balsamina* by *Matthiolus*: *Balsamina prima* by *Fuchsius* and *Anguila*: *Charantia* by *Dodonæus* and *Lonicerus*: *Balsamina Mas* by *Gerard* and *Parkinson*: *Momordica* by *Castor*: *Momordica fructu luteo rubescente*, in *Horto Eyst.* 2. *Balsamina femina*, of which in the next Chapter. 3. *Balsamina lutea*, *sive noli me Tangere*, which is called *Herba Impatiens*; in *English*, *Coddled Ar-smart*.

III. *The Description.* It has a Root which is small and stringy, creeping a good way within the Earth: it springs up with divers slender reddish Stalks and Branches, shooting forth many clasping tendrils, much like to a Vine, by which it takes hold of any Pole, Twig, or other thing which stands near it; but without any such Supporters, it lies upon the ground, not being able to support it self, for which reason it is reckoned among the number of the Climbers, or a kind of *Cucumber*, in respect to the Flowers and Fruit. The Leaves grow from the Stalks, and stand upon foot-stalks, being cut in on the edges, into several divisions, like to a Vine leaf, or those of white Bryony, but much smaller, tenderer, and more divided. The flowers are yellowish, like to those of the *Cucumber*, coming forth in the same manner at the Joints with the Leaves: after which comes the Fruit, which is somewhat long and round, pointed at both ends, and bunched on the out side in rows, the skin it self being smooth and very red, almost black when the Fruit is ripe, which has a reddish Pulp within: The Seed is manifold, rough, hard, flat, and reddish; but when dry, of a grayish black colour, something like unto Citrus, or Water Melon Seeds, both for the form and largeness.

IV. *The Places.* It is nursed up with us in Gardens, but the Seed came originally to us from Italy, and we yet generally make use of the Italian Seed.

V. *The Time.* It flowers late with us, and the whole Herb withers before the Fruit comes to ripeness; it being a tender Plant, and so not able to endure our early cold Nights, for which reason we have no ripe Seed here.

VI. *The Qualities.* It is almost cold in the first Degree, and dry in the second: It is Pectoral, Pulmonick, and Vulnerary, and purely an alterative.

VII. *The Specification.* It is a peculiar Specifick for the Curing of Wounds and Ulcers.

VIII. *The Preparations.* 1. A Powder of the Leaves. 2. A Decolion of the Plant. 3. The Infusate Juice. 4. A Spirituous Tincture. 5. An Oleaginous Tincture. 6. An Oil by Infusion in Oil Olive. 7. The Balsam.

The Virtues.

IX. *The Powder of the Leaves.* Given to j. dram Morning and Evening in Red Port Wine, it is said to be good against Ruptures or Burstenness; and applied, it heals Wounds.

X. *The Decolion in Wine, or Wine and Water.* Being drunk to five or six ounces, it gives ease in the Colick, helps the Gripings of the Bowels, and stops inward fluxes of the Blood, whether from the Stomach or Bowels; reprefes Vapors in Women, and what some call the Rising of the Lights.

XI. *The*

XI. *The Inspissate Juice.* Dissolved in a mixture of Red Wine and Water, it is a singular thing to heal internal wounds, and stop inward bleedings, and to repress the Fits of the Mother. Injected up the Womb two or three times a day, it stops the overflowing of the Terms, and the Whites in Women. If it be reduced to powder, and drank to one dram in Red Port Wine it heals inward Wounds, and outwardly being strewed upon any fresh green Wound, it heals it.

XII. *The Spiritous Tincture.* It heals inward Wounds, and gives ease in the Colick; and is found to be of excellent use in fainting and swooning Fits. Dose from j. dram to ij. drams in any proper Vehicle.

XIII. *The Oleaginous Tincture.* Given to j. dram, it opens obstructions of the Womb, and is good against Fits of the Mother. It also eases vehement pains in the Back and Reins, being given in a proper Vehicle twice a day.

XIV. *The Oil by Infusion in Oil Olive.* It is a most singular Vulnerary, not only for all sorts of external Wounds, but for inward Wounds also, being drunk (in some proper Vehicle) from ij. drams to four, twice or thrice a day. And as for all sorts of outward Wounds which are green or fresh, it dries them, consolidates their Lips, and heals them. It also dries up the moisture of inveterate or old Ulcers, which hinders them from healing, and disposes them to a speedy cure. Being applied with Lint, it is good against the Piles or Hemorrhoids; and being applied hot, it is effectual against Punctures of the Nerves. Some Authors say, that anointed on the Bellies of Women which are Barren, it causes them to be fruitful. It also cures burnings with Fire, or scaldings with Water, and eases the stinging of Bees, Wasps, Hornets, &c. and being anointed on the Marks, Scars, or blemishes of Wounds; it takes them away, or much abates them.

XV. *The Balsam.* If it is made of the former Oil, by addition of Venice Turpentine, or Balsam Capivi, and Bees Wax; it becomes a most singular Vulnerary, and in many respects more excellent than the simple Oil, and indeed is much more profitable for the healing of rotten running Sores, and old putrid Ulcers; applied to Cramps or Convulsions for some time, it helps the same, and is a singular thing to cleanse and heal Ulcers in Womens Breasts, and such as happen in the Secret Parts of Man or Woman.

CHAP. LII.

BALSAM-APPLE Female and Yellow.

I. *THE Names.* It is also unknown to the Greeks; but is called in Latin by Matthioli, *Anguilla*, *Euchysus*, *Gesner* and *Tragus*, *Balsamina altera*: by Dodonæus, *Balsaminum*: by Lugdunensis, *Balsamina*: by Cordus, *Balsamella*: by Gesner ad Cordum, *Balsamina amigdaloides*: by Camerarius, *Tabernmontanus*, and Gerard, *Balsamina Famina*: by Lobel, *Balsamina famina persicifolia*; and by Cesalpina, *Catanance*: and in English *Balm Apple female*.

II. *The Kinds.* It is the second kind of the *Balm Apple*, viz. the *Female*; differing very much from the former, both in the form and manner of growing. The *Yellow Balsamine* is the third kind, and by Lobel, Camerarius, Gerard, and others, is called *Persicaria Siliquosa*, in English, *Coddled Arsmart*;

by J. Baubin, *Noli me tangere*: by Tragus, *Mercurialis sylvestris altera*: by Dodonæus, *Impatiens Herba*; and by Columna, *Balsamita altera*.

Balsamin female.

III. *The Description.* The *Female Balm Apple* does much differ from the former: It has a Root dispersed into manifold Arms, from whence proceeds many small strings spreading under the Earth: The Stalks arise from the main stock of the Root, which are thick, fat, full of Juice, in substance like the stalks of Purslane, of a reddish colour, and somewhat shining. The Leaves are long and narrow, much like those of the Willow or Peach tree, a little toothed about the edges: among which come forth the Flowers, of an incarnate colour, tending to blueness, with a little tail or spur annexed thereto, like to Larks heels, of a faint, light crimson colour. These being gone, there comes up in their places the Fruit, or Apples, rough and hairy, round, and sharp at the point, and lesser than those of the Male, at first green, but afterwards yellowish when ripe, the which open of themselves when full ripe, and cast abroad their Seed, much like unto a Vetch, says Dodonæus; or like to Lentils, as other Authors say. But that which Gerard had in his Garden cast forth the Seed like Cole-flower, or Mustard-seed, which made him to think that either the Climate had altered its shape, or that there was two kinds thereof.

IV. The yellow Balsamin (which Gerard places with the Arsmarts, and Parkinson with the Mercuries) has a black and thready Root, which perishes every year from which spring forth Stalks about two foot high, tender, green, and somewhat purplish, hollow, smooth, juicy and transparent, with large and eminent joints: from whence proceed Leaves like those of French Mercury, a little larger and broader towards their Stalks, and thereabouts also cut in with deeper Teeth or Notches. From the bottom of each of these Leaves, come forth long Stalks hanging downwards, which are divided into three or four branches, upon which hang yellow flowers, much gaping, with crooked Spurs or Heels, and spotted also with red or crimson spots. The Flowers being gone, there succeeds Cods containing the Seed, which are about two Inches long, slender, knotted, and of a whitish

ish green, crested with greenish lines; which as soon as they begin to be ripe, are so impatient, that they will by no means be touched, but presently the Seed will fly out of them into your face (from whence came the name herba impatientis) and for which reason Lobel, and others have called it, Noli me tangere.)

V. *The Places.* The first of these is only Nurs'd up with us in *Gardens.* The latter grows in shady Woods in *France, Germany* and *Italy.* It has also been found in shady Woods side, and shady sides of Mountains, and their Vallies in *Wales;* in *Shropshire* at *Marington;* on the Banks of the River *Kemlet,* and at *Guerudee* in the Parish of *Cherstock,* half a mile from the said River, in the Highway among great Alder-trees: but it will grow and abide in our *Gardens* very well, and every year sow it self, being set in a shady place.

VI. *The Times.* The first of these (as also the former Male kind) must be sown in the beginning of *April,* and in a hot bed of Horse-dung, as you do *Musk-Melons, Cucumbers,* and such like cold Fruits: then they must be replanted abroad from the said beds, into a hot, moist, and fertile place, at such time as they have gotten three Leaves a piece. They flower in *July* and *August,* and their fruit comes to the greatest perfection our Country will give it in *September* following. The *Noli me tangere* flowers in its natural place, about the middle or end of *August,* and presently after Seeds: but that which grows with us in *Gardens* flowers in *June* or *July.*

VII. *The Qualities.* The first of these is cold in 1° and dry in 2°; Cephalick, Neurotick, Vulnerary, and Alterative. The *Noli me tangere,* is hot and dry in the third degree; Nephretick, Diuretick and Emetick.

VIII. *The Specification.* The latter Specifically provokes Urine, even unto a wonder, as *Gesner* testifies.

IX. *The Preparations.* They may be the same with those of the Male kind, as, 1. *Powder.* 2. *Decolion.* 3. *Insipissate Juice.* 4. *Spiritous Tincture.* 5. *Oleaginous Tincture.* 6. *Oil by Infusion.* 7. *A Balsam.* From the *Noli me tangere,* there is, 1. *A Powder of the Herb.* 2. *An Insipissate Juice.* 3. *A Distilled Water.*

The Virtues.

X. *The Powder.* It dries up green Wounds, consolidates, and heals them.

XI. *The Decolion.* It cleanses old Ulcers, and rotten Sores, and disposes Fistula's (being injected into them) to a healing.

XII. *The Insipissate Juice.* Being reduced into a powder, and strewd upon a green wound, it presently conglutinates it, and heals it.

XIII. *The Spiritous Tincture.* It is helpful to a Gangrene in beginning, and by its gentle styptick quality, restores and conserves the heat of the Part.

XIV. *The Oleaginous Tincture.* It has the same Virtues with the Spiritous Tincture, but much more powerful; bathed upon the Nerves, it comforts and strengthens them, helps Cramps, and eases Aches and Pains, and is good against punctures of the Sinews.

XV. *The Oil by Infusion,* heals Wounds, abates Inflammations, and cures fiery Pustules of the skin.

XVI. *The Balsam.* It cleanses and heals Ulcers, and gives ease in Punctures of the Nerves: being applied, it cures old rotten Ulcers, running Sores, and kiked Heels.

XVII. *The Powder of Noli me tangere.* It is

Emetick, and sometimes Cathartick, working (as some Authors say) strongly; for which reason *Doneus* says, it has a pernicious faculty, and is deleterious: yet it may be given from a scruple to half a dram in some convenient Vehicle, in strong Bodies.

XVIII. *The Insipissate Juice.* It is Emetick like Cambogia, and sometimes it works downwards like Scammony, but its operations are not altogether so certain. It may be given from ten grains to a scruple, made up into a Bolus, and so swallowed.

XIX. *The Distilled Water.* It is of mighty power to provoke Urine, and if largely drunk, it is said to induce a Diabetes; and some magnifie it, as to expel the Stone in the Reins: but without doubt it powerfully cleanses the Reins and Urinary passages, expelling Sand, Gravel, Slime, and other things which obstruct the Passages of the Urine.

CHAP. LIII.

BAWM Garden and Bastard.

I. **T**HE Names. It is called in *Arabic,* *Bedereugie, Bedarungi, Cederenzegum, Turungen, Marmacor:* in *Greek,* *Μελισσουργα, μελισσα, id est, Apiastrum, & ἀμυλίστα, Apes delictentur, Dioscor. lib. 3. cap. 18. Pliny lib. 21. cap. 20. Melysophyllon & Melitis:* in *Latin,* *Melissa, ab Apibus quæ etiam μέλισσαι dicuntur:* and in *English,* *Bawm.*

II. *The Kinds.* There are Six several kinds of *Bawm,* of which Authors treat: viz. *Melissa hortensis,* the Garden *Bawm,* called by *Anguillara, Brunsfelsius, Cesalpinius* and *Gerard, Melissa:* by *Tragus, Melissa domestica;* by *Gesner* in horti. *Castellus, Lugdunensis* and *Tabernaemontanus, Melissophyllum:* by *Fuchsius, Melissophyllum vulgare:* by *Matthioli, Cordus, Lacuna, Lobel, Apiastrum:* by *Parkinson, Melissa vulgaris odore Citri:* and by *Gesner, Citruga.* 2. *Melissa*

liffa norba, Bastard Bawm, called by *Euchsius*, *Melysophyllum*; by *Clusius*, *Lamium Pannonicum*: these we treat of in this Chapter. 3. *Melissa Turcica*, Turkey Bawm. 4. *Melissa Moluccana odorata*, of which we treat in the next Chapter. 5. *Melissa Peregrina*, called by *Matthiolus* and *Lugdunensis*, *Melissa Moldavica*. 6. *Melissa Moluccana fatida*, of which we say nothing in this Work.

III. The Description. The common Garden Bawm has a Root of a Woody substance, and full of strings, which endure long, and fasten themselves strongly in the ground, the Leaves and Stalks only dying every Year: from this Root springs up divers square green Stalks, with round hard dark green Leaves (and sometimes of a lighter green, according to the place it grows in) a little dented about the edges, set by couples at the Joints, and almost of a Citron or Lemon smell: the Flowers are small, and gaping, growing at Tops of the Stalks, of a pale Carnation colour, and almost white.

IV. *Fuchsius* his Bastard Bawm has a hard woody, stringy Root like the former, from whence springs square Stalks half a yard high, with Leaves like unto common Bawm, but larger and darker coloured, and not so pleasant a scent; the Flowers are white, and sometimes of a pale purple colour, but much larger than those of the former, almost like to the yellow Lamium, or Dead Nettles, or to those of the Mountain Calamint. *Parkinson* says the flowers are of a pale purplish colour on the lower parts, and whitish above, not being so pleasantly scented as the common Garden Bawm.

V. The Places. The first grows with us only in Gardens, and is profitably planted there, as *Pliny* lib. 21. cap. 12. says, for the delight of Bees, for which cause it is called *Apiastrum*, and by some *Apium folium*, Bees leaf. The other is a Native of *Hungaria*, but is nourished up by curious Herborists in their Gardens. I have sometimes found it growing in *England*, on the Sunny side of Ditch and Bank sides, where the ground has been pretty dry.

VI. The Time. They flower in June, July and August, and wither or dye away towards Winter, springing forth a fresh from the old Roots.

VII. The Qualities. They are both hot and dry in the second degree: they are Cephalick, Neurotick, Cardiack, and something Hyfterick: famously Cordial (chiefly the Garden) and Vulnerary, Alexipharmick, and Alterative.

VIII. The Specification. It is approved against fainting and swooning Fits, Poisons, Sickness at Heart, and Hypochondriack Melancholy.

IX. The Preparations. You may prepare from it, 1. A cold Distilled Water. 2. A Spirituous Water. 3. A Spirit. 4. A Spirituous Tincture. 5. An Oily Tincture. 6. A Saline Tincture. 7. An Essence. 8. A Syrup. 9. A fixed Salt. 10. A Balsam or Oil. 11. A Cataplasim. 12. An expressed Juice.

The Virtues.

X. The cold Distilled Water. It is a Cordial Water, and only used as a Vehicle to convey Cordial Medicaments in.

XI. The Spirituous Water. If it is a little dulcified with Syrup of Bawm, it is an excellent Cordial, and good against Fainting and Swooning Fits, Convulsions, and the like, and this chiefly in Children: it eases gripings in the Bowels, and comforts Universal Nature. Dose from half an ounce to two ounces, according to the Age of the Patient.

XII. The Spirit. This is much more excellent than the former water, and has a mighty power to repress Hypochondriack Melancholy: it revives the

Spirits, and makes the Heart merry and chearful, easing the Passions thereof after a wonderful manner. Dose from j. dram to ij. drams in any proper Vehicle.

XIII. The Spirituous Tincture. It has the former Virtues, and more powerful to all the said intentions, but not so pleasant: It is indeed a declared thing against all Passions of the Heart, the Colick, and Gripping Pains of the Bowels. Dose j. or ij. drams, sweetened with the Syrup of the fame.

XIV. The Oily Tincture. Outwardly bathed upon any place pained from a cold and moist cause, it gives ease and relief: and taken inwardly from xij. to xxx. drops in some fit Vehicle, it gives ease in pains of the Spleen, Sides and Stomach, especially if they proceed from a cold cause: it also eases pains in the Back and Reins proceeding from weakness and obstructions: and being taken in a right time, it has been found to provoke the Courses in such as have them preternaturally stop.

XV. The Saline Tincture. Being given from one dram to two, or more, in some proper Liqueur, it is good against Poison, and the bitings of Mad-Dogs, eases the pains of the Stomach, and the gripings of the Bowels, proceeding from sharp humors; it opens the obstructions of the Lungs, and causes such to breath freely, who before could scarcely take their breath: It may be made pleasant with the Syrup, of which we shall speak anon.

XVI. The Essence. It causes speedy and easie delivery to Women in Travel; and in a more especial manner is recommended against Hypochondriack Melancholy, being assiduously taken for some time. It has all the Virtues of the Spirit and Tincture, but must be given in a larger Dose, by reason of the gross Particles which are mixt with it: mixed and made pleasant with Rose-water and Sugar, or its own Syrup, it may be profitably given to Women in Child-bed, to bring away the After-birth, or cause a perfect cleansing. *Galen* lib. de Simplic. says, that Bawm is like unto Horehound in Qualities, but much weaker. I will not gainsay *Galen* totally; but that it may be so in some Cases; as in Hyfterick Diseases: but where a Cordial is intended, I am sure Bawm is much the superiour, and is much better for Women in their Lying in, when they are fainting, from their fore Travel or hard labour. Dose from half an ounce to two ounces. It is good against Poison, and the bitings of Venemous Beasts, and such as have been long troubled with the Bloody Flux.

XVII. The Syrup. It is Cordial, but is chiefly used as a Vehicle to other Cordial Medicines, and to make them palatable: however it is of it self a singular pectoral, and good against Coughs, Colds, Asthma's, Spitting of Blood, Obstructions of the Lungs, and other like Diseases of the Breast, and parts adjacent.

XVIII. The fixed Salt. It strengthens the Stomach and Spleen, resists Vomiting, and carries off much of the Morbiſick Cause by Urine. To stop Vomiting you may give it thus: Take of this Salt a scruple; Spirit of Sulphur viij. or x. drops: mix them till the effervescence is over: then dissolve it in a Glass of Canary, or some other Stomack Vehicle; and so give it the Patient to drink.

XIX. The Balsam or Oil. They are most singular Vulneraries, and many times cure Wounds at one Dressing: and it is my opinion (grounded upon the experience I have had of the Plant, in Chirurgery) that it is not inferiour for curing Wounds and Ulcers, to any of the Allheals: and from its vulnerary and healing Properties it was, that our Ancestors called it *Balm*, as being of the nature of Balsam. Outwardly applied it is good against the stinging or striking

king of *Scorpions*, and the Poysonous Bite of the *Phalangium*.

XX. *The Cataplasme*. Being applyed it eases Pains coming from a cold Cause, and Dissolves Flatulent Tumors: and being mixt with a little *Niter*, or the *Amalgamation of Mercury with Lead*, it prevails against Wens, Kernels and hard Swellings in the Neck and Throat or other parts, and is good also to give ease in the Gout, and ripen Biles and break them.

XXI. *The Expressed Juice*. It strengthens the Vital Spirits; and being given to iij. iv. or vj. Spoonfuls in a Glass of *White Port Wine*, it causes speedy Delivery to Women in Travel, and brings forth both Birth and After-birth. It is an Antiscorbutick, and helps the Bloody Flux, by reason of its Balsamick and healing Virtues. Put into the Eyes, it is a singular remedy for dimness of Sight, and being mixed with Honey it takes off Films which obfuscate and hinder the Sight.

XXII. *The Bastard Bawm*. You may make the same Preparations of this, as of the former, and they have in General the same Virtues, but as to the Vital Indications, they are not so powerful. However in all *Hysterick Diseases* they very much exceed, as being more effectual in opening Obstructions of the Womb, and resisting Fits of the Mother.

CHAP. LIV.

BAWM M, Turkey and Syrian.

I. **T**HE Names. The first is called in Latin, *Melissa Turcica*, or *Melissophyllum*, or *Melissophyllum Turcicum*: by Gesner in Hort. Cedromella, and *Citrage Turcica*, and in English, Turkey Bawm.

II. The other is called in Latin, *Melissa Syriaca*,

and by some *Melissa Moluccana*: by Matthiolus, *Melissa Constantinopolitana*: and by Tabernmontanus, *Cardiaca Syriaca*: by Lobel, *Majeluc Turcorum*.

III. *The Kinds*. The Turkey Bawm, is the Third Species, in our order: The Syrian, or Moluccan constitutes the Fourth Species, which are all that are necessary for us to confider in this Work. This Syrian Bawm, Authors will have to be twofold, viz. *Levis* and *Aspera*, or *Asperior*: or *Odorata*, and *Inodorata*.

IV. *The Description*. The Turkey Bawm has a Root small and thready, which perishes every Year at the first approach of Winter, and therefore must be Sown fresh again, every Spring. From this Root rises up one square brownish green Stalk, two Feet high and sometimes more, if it grows in good Ground, spreading it self with two Branches from every Joint, where the Leaves are set; and this course is continued up almost to the Top. The Leaves are narrower and longer than those of Common Garden Bawm, and more dented in about the edges, of a sweet Limmon scent, rather exceeding that of Common Bawm: they are rough also, and of a like Green Colour. The Flowers are gaping or hooded, growing at the Tops of the Branches at certain Distances, standing in sharp, rough, pointed Husks; and they are of a blew or purplish blew Colour; but in some the Colour is perfectly white, whence several Authors would make several Kinds thereof, tho at the same time they differ in nothing but the Colour of the Flowers; but some say the Leaves are of a fresher green Colour, which I have not yet observed. After the Flowers are past, then comes the Seed, which is black and roundish, with a white Spot in each Seed, whilst it is fresh, which afterwards in a manner Vanishes, not being so discernable when dry.

V. The Syrian Bawm, has a Woody thick Root, and full of strings, which perishes every Year. From whence rises up, a round hollow Stalk, thick, and of a reddish Colour, about Two Feet high, branching forth variously on all sides up to the Top, on which are set shorter and rounder Leaves, at the end of longer Foot Stalks. The other Leaves stand also upon Foot Stalks, and much resemble those of the Common Bawm (for which reason, some Authors have taken this to be one of the Kinds thereof) somewhat less dented about the edges, than the Garden Kind. At the Joints of the Stalk, from the middle upwards, come forth round about it, certain hard, whitish Skins, small and round at the bottom, and wide open at the brims, a little prickly at the corners, and much like unto a Bell, being for the most part five Cornered. From the bottom of each of these, comes forth one Flower, somewhat small, and like to those of the Common Bawm, almost white in Colour, or with a small blush of Red therein. After they are past, in the bottom of the same skinny Bell, the Seed grows (but it very rarely comes to be Ripe with us) which is whitish and Cornered. The Plant has nothing of the smell of Bawm in it, but it is strong, and the Taste is bitter.

VI. The other Syrian Kind, which is called *Asperior*, differs not much from the former, as to its Form, yet it rises a little higher, and grows somewhat greater, but after the same Fashion: the Stalk of this is Four Square, and lightly hollowed or furrowed. The Leaves are somewhat longer and sharper on the edges. The Cups or Bells in which the Flowers grow, are more prickly than the former, and much sharper at the corners of them, longer, more in number, and of a paler white Colour. The Tunnels of the Flowers are brownish, and not so white as the other; and the Seed is three cornered, and sharp upwards like a Wedge.

VII. The

VII. *The Places.* The *Turkey Bawm* grows naturally in *Moldavia* and several parts of *Turky*, from whence it is brought to us, and Nourish'd up in *Gardens*. The *Syrian Bawm*, called also *Moluccan*, was thought by *Matthiolus* to grow in the *Molucca Islands* (whence that Name.) But *Parkinson* says he was mistaken: and that *Sequinus* an *Italian* sent them from *Syria* to *Verona*, from whence they were brought to us, and nourish'd up in *Gardens* only.

VIII. *The Times.* The *Turkey Bawm* Flowers the latter end of *June*, or in *July*: but the *Syrian Kinds*, seldom Flower before the middle of *August*, for which reason, they seldom give any good Seed, which the *Turkey Bawm* fails not to do.

IX. *The Qualities.* The *Turkey Bawm* agrees herein wholly with our *Common Garden Bawm*. The *Syrian Bawm* is hot in one Degree and dry in two, *Hysterick*, *Vulnerary*, and *Alterative*.

X. *The Specification.* The *Turkey Bawm* is peculiar against *Vertigo's*, *Faintings*, and *Sickness* at *Heart*. The *Syrian* relits fits of the *Mother*, and *Vapors* from the *Womb*.

XI. *The Preparations.* The *Shops* keep nothing of them, but you may Prepare therefrom. 1. A Powder from the *Leaves* and *Flowers*. 2. A Decoction in *Wine*. 3. An Expressed Juice. 4. A Spirituous Tincture. 5. An Oily Tincture. 6. A Saline Tincture. 7. An Essence. 8. A Syrup. 9. A Fixed Salt. 10. A Balsam or Oil. 11. A Cataplasim.

The Virtues.

XII. All these several Preparations of the *Turkey Bawm*, have the same Virtues, Uses and Doses, with those of our *Common Garden Bawm*; so that no more need be said of them in this place, and therefore we refer you to their respective Titles in the Chapter foregoing.

XIII. The Powder of the *Syrian Bawm*, heats, rarifies, and cleanses.

XIV. The Decoction of it in *Wine*, Kills Worms, and is good against the pains of the *Mother*, *Vapors*, and the like. Dose iv. ounces.

XV. The Expressed Juice of it, Kills Worms, and gives relief in *Hysterick Fits*, pains of the *Spleen*, and the like. Dose j. ounce or more.

XVI. The Spirituous Tincture of it, Expels Poyson or *Venom*, and is good against the *Plague* or *Pestilence*, and all sorts of *Malign fevers*. Dose half an ounce.

XVII. The Oily Tincture of it, Gives ease in the *Colick*, given to one *Dram* in *Ale* or *Wine*: and outwardly applied helps *Palsies*, and eases Pains from a cold Cause, in any part of the *Body*.

XVIII. The Saline Tincture of it, Is a Specifick for killing Worms in the *Body*, whether of old or young. Dose j. or ij. Drams in *Wine* or *Ale*.

XIX. The Essence of it, Kills Worms, and cures Fits of the *Mother*, *Convulsions* of the *Bowels*, &c. Dose from ij. Drams to vj. in *Ale* or *Wine*.

XX. The Syrup of it, has the Virtues of the Essence, but is much weaker, and is mostly used as a Vehicle to convey the other Preparations in.

XXI. The Fixed Salt of it, removes Obstructions of the *Spleen* and *Womb*. Dose to xx grains of it, in a Decoction of the *Herb*, sweetned with the Syrup thereof.

XXII. The Balsam or Oil of it, is *Vulnerary*, and eases Pains of the *Spleen* and *Joints*.

XXIII. The Cataplasim of it, Discusses Tumors arising from *Cold* and *Wind*, and gives ease in the *Spleen* being applied to the *Region* thereof.

CHAP. LV.

BEANS Garden and Bastard.

I. THE Names. The *Bean* is called in *Arabick*, *Bachale*, *Bachele*, *Bakilla*, and *Hachille* in *Greek*, *κῆραι*: and in *Latin*, *Faba*. The *Cod* is called in *Greek* by *Aristotle* *βῆλον*: by *Nicander*, *κῆραι*, *κῆραι*, *κῆραι*: by *Hesichius* *κῆραι*, *κῆραι*: and by *Apollonius* *κῆραι*: and in *Latin*, *Theca*.

II. The Kinds. There are many Kinds of *Beans*, but those which we shall chiefly take notice of, are 1. The *Garden*. 2. *Kidney* or *French*. 3. The *Field* or *Horse Bean*. Of the *Garden Kind* there are said to be two sorts, 1. The *True*. 2. The *Bastard*.

III. The Description. The *True*, *Large*, *Sweet* *Garden Bean*, has a *Root* thick, with many *Fibres* or *Strings* annexed to it; from which rises up *One*, *Two*, or *Three* *Stalks* (according to the goodness of the *Ground*) *smooth* and *square*, and sometimes *Four* or *Five* *Feet* high or more. Upon these *Stalks* are set the *Leaves* at certain distances upon a *small Foot-Stalk*, from the very bottom almost to the top, by *Two* and *Two*, which are *fleshy*, *thick*, of a *light green*, and *long*, a little pointed at the ends. Between these *Leaves* and *Stalk* come forth divers *Flowers*, all of them looking one way for the most part, which are clove, a little turn'd up at the brims, *White*, and spotted with a *blackish Spot* in the middle, and somewhat purplish at the foot or bottom; of the Form almost of *Broom*, or *Pease* *Flowers*, many of which, that grow upwards towards the top, do seldom bear *Seed*, and therefore are gathered by many to be *Distilled*; and the tops also being cut off, it makes the rest of the *Plant* to thrive the better. The *Flowers* being gone, there grows forth *long*, *great*, *smooth*, *green* *Cods*, greater than in the other *Kinds* of *Beans*, which grow

grow black when they are ripe, and contain within them, Two, Three, or Four, flat and somewhat roundish long Beans, either white or reddish, which latter when ripe grow many times black withall.

IV. The Bastard Bean, Differs little or nothing in the Form and Shape of the Plant, or in the manner of its growing, from the former, save that it seldom grows full out so large as the True Garden one doth, nor are the Beans themselves altogether so large: but that which is the principal note of distinction, between this and the True Kind, is their want of that sweetness, pleasantness, and excellent Taste which the Right Garden sort has: and therefore by reason of the small difference which is between them in respect to their Form and growing, they are generally Sold in the Market the one for the other: tho at the same time the Gardener can distinguish between them.

V. The Places. These are both Sown in Gardens with us, but the latter are for the most part Sown abroad in large Fields, and Sold in Markets for the former.

VI. The Times. They Flower in April and May, and that gradually, so that they are long in Flowering: and the Beans themselves are Ripe in July and August.

VII. The Qualities. They are Temperate as to heat or cold, and moist in the first Degree; Nephritick, Lithontriprick, Spermatogenetick, Suppurative, and Alterative.

VIII. The Specification. They are peculiar against Gravel in Reins or Bladder, restore in Consumptions, for they nourish much, and being much Eaten cure a Diarrhæa.

IX. The Preparations. The Shops keep, 1. A Water from the Flowers or the whole Plant. 2. A Meal or Flower from the Beans. But you may make therefrom also, 3. A Decoction of the Beans in Water or Wine. 4. An Essence of the Leaves and Cods. 5. A Cataplasm of the Beans. 6. A Volatile Salt, Spirit and Oil from the Beans. 7. The Ashes of the Cods and Stalks. 8. A strong Broth.

The Virtues.

X. The Distilled Water from the Flowers, or whole Plant when in Flower. They are chiefly used as Cosmeticks, to soften, whiten, cool, and beautify the Skin, it being often washed therewith, and suffered to dry on: but before it is applied, the Face and Hands ought to be made purely clean with warm Water in which Wheat Bran or Bean Meal has been boiled: some Ladies have affirmed to me, that by a continued and long using this Wash, or Water Distilled from the Flowers, they have had Lentils, Freckles, and other Deformities of the Skin perfectly removed. This I believe, that if it is acuated with some small quantity of the Volatile Salt, and then used, it may do much in that Kind.

XI. The Meal or Flower. Being used with warm Water to wash the Face and Skin with, it cleanses it admirably, and is said to take away Deformities thereof, as Scurf, Spots, Wrinkles, Tanning, Sunburning, and the like.

XII. The Decoction in Wine or Water. It is very good against the Stone and Gravel whether in the Reins or Bladder, and provokes Urine, so also a Decoction of the Green Cods, or a Water Distilled from the same.

XIII. The Essence from the Leaves and green Cods. It is Diuretick and Lithontriprick, removing the Matter causing the Strangury, whether it be Gravel, Sand, Slime, or other Glutinous Matter. Mixed with Honey and taken, it prevails against Coughs, Colds, Rheums, Catarrhs, and other Distempers of the Lungs.

XIV. The Cataplasm of Bean Flower or Meal. If it is made with Vinegar and Oil, and applied to Womens Breasts, swelled with abundance of Milk, so that they can scarcely hold, it will not only repress the Milk, but also disperse the Tumor or Swelling occasioned by Curdling thereof. If the Cataplasm be made with Fenugreek and Honey, and applied to Felons, Biles, Bruises, Apotems, as also Kernels about the Ears, and Kings-Evil Swellings, it helps them all. If the Cataplasm is made with Wine, and applied to Watering Eyes, or Eyes having a Contusion by blows, it gives ease and does them good. If made with Whites of Eggs, Rose Leaves and Frankincense, and applied, it helps Eyes which Swell or grow out. If it is made with White Wine, and with Vinegar and Oil, and applied to the Cods, it takes away their Pain and Swelling. If it is made with Wine only, and a little Oil, and Eaten, it is good against Impotency, and fits up Lust in such as cannot use the Act of Generation, by reason of the coldness, sluggishness, and weakness of their Members. If Fried in Oil with Garlic to the thickness of a Hasty Pudding, and Eaten as daily Food, it helps inveterate Coughs, almost past cure, and the hoarseness of the Voice: and being for some time Eaten, it breaks Apotems of the Breast and Lungs.

XV. The Ashes from the Cods and Stalks, Being Infused in Ale or Wine, and the Liquor Drunk, they are very Diuretick, and open all Obstructions of the Reins and Bladder, and therefore are very good against Sand, Gravel, Stone, Dropsy, Jaundice and Gout. The Ashes made into a Cataplasm with Hogs Lard, and applied, are good against old Pains, Contusions, Wounds of the Nerves, Defluxions upon the Joints, the Sciatica, and Gout, whether in Hands, Arms, Knees or Feet.

XVI. The Volatil Salt, Spirit and Oil of the Beans. Beans and Pease yield a vast Quantity of Volatil Salt, and in much larger Proportion than any other Vegetable Production. It is thus made. Be Beans 5 lb. whole and dry, put them into a large Earthen Retort, or into a large Glass one well Luted, so large as that about a third part may remain Empty: put it into a close Furnace of Reverberation, luting to it a large Receiver or great Glass Ball: stop the Registers of the Cover of the Furnace, and make a small Fire in the Cinder or Ashes place, at first, only to warm the Retort, and heat the Matter within, which keep so for an Hour, then kindle a Fire in the Grate Place, gentle at first for an Hour more, after which increase it gradually from Hour to Hour, but not to an Excess: in the mean season, the Aqueous parts will come over in large quantity, then give a little Air to the Register of the Cover of the Furnace on the Receivers side, continually encreasing the Fire, till you see the Receiver to be filled with white Clouds, which will by degrees condense into Liquor; the Oleaginous and Salt parts sinking to the bottom of the Vessel; keep now an equal Fire, for about two Hours, giving a little Air to the Register, after which open it for altogether, giving a more violent heat, and at length a flaming Fire, which continue till the Vapors cease, and the Receiver is clear: let then the Fire go out, and the Vessels cool. In the Receiver you will have much Vlegn mixt with Oil, and Spirit, and Volatile Salt, so penetrating that you will not be able to hold your Nose and Eyes over the Mouths of the Vessels. Put all these Substances immediately into a a Bolt Head with a long Neck, covered, with its Head well Luted, and fitted with a Beak and Receiver: place it in a Sand heat, in a cool Airy place, so may you see the Volatile Salt ascend by little and little, and coagulate it self in the Head (which you must often cool by double Cloths dipt in cold Water, to hinder the Dissolution of the Salt): This Salt with what speed may

may be take out of the Head, and keep it in a Glass Bottle close stopp'd, and in a cool place, for it turns into Liqueur or Spirit with the least heat, and sooner than any other Volatile Salt: but you must have another Head ready to put on in the place of the former, whose junctures being well Luted, continue the rectification, so will you have in the Recipient, the rest of the Volatile Salt Dissolved in a little of the Flegm (which is the Spirit) and the Volatile Oil, which you may separate and keep a part, the uselefs flegm, and sinking part of the Oil remaining at bottom of the Matrass.

XVII. This Volatile Salt of Beans, is a strong Sudorifick, and one of the most Subtil and Volatile Salts that is, being of the same use with all other Volatile Salts. It is good against Palfies, Cramps, Withered Limbs, Epilepsies, Apoplexies, Gouts, Rheumatisms, Colicks, and other diseases of the Head, Brain, Womb, Nerves, and Joints. It kills Worms, and is admirably good in Fits of the Mother. The Spirit is also of the same Virtue. The Oil, is stronger, and therefore in outward applications, it may be mixt with Oil of Bitter Almonds, or Oil of Ben, and the Stomach and Navel anointed with it, for Fits of the Mother. In Diseases of the Brain, also of the Womb, you may put it up the Nostrils. Dose of the Salt, a gr. vi. ad xij. of the Spirit, from xv drops to xxx. or xl. and of the Oil a gut. ij. ad vj. all which are to be given in some proper Vehicle.

XVIII. The strong Broth of the Beans. It is Nutritive in the highest Sense so far as a Vegetable can be Nutritive; It also stirs up Lust, and is of good use where there is an Impotency in the Male Kind, who have not the power to use the Act of Generation, by reason of a weakness in the Instruments of Generation, or defect of Seed, as it has respect either to Quantity or Quality. And by reason the Bean, (especially the Field Kind) has the Signature of the Glans of the Penis, Pythagoras and his Followers judged then to provoke Lust, which afterwards by multitudes of Experiments and Observations, has been confirm'd to us, even from that time to this day. This Broth strengthens the Bowels and restores Nature, stopping all sorts of Lasks and Fluxes of the Belly, inveterate Coughs and other Distempers of the Lungs: It is Nephritick and Diuretick, much provoking Urine, and therefore is good against all Obstructions of the Reins and Bladder. If this Broth is made for Nutriment sake, it will be necessary to boil the Beans till they are Broken, and the Flowery part of them mixed and as it were dissolved in the Liqueur, which afterwards may be made savory with a little Salt, Juice of an Orange, and a bit of sweet Butter. Beans are indeed Flatulent (by which property they are said to stir up Lust) yet accounted good Food. Nos Trago Subscribimus recentes innoxias esse in Cibo, & bonum succum gignere. Ray, Hist. Plant. lib. 18. cap. 2.

C H A P. LVI.

BEANS Kidney and Scarlet.

I. THE Names. This Plant is called by Hippocrates, Theophrastus, and most of the Ancient Writers *Διόλον*: some from the Seed call it *Λέον*, & *Λέλον*: others name it *φασόλον* a diminutive from *φάσος* Dioscorides calleth it *Σμάλας κνίμια*, & *κνίς*, *Λέον*: in Latin, *Smilax Hortensis*, *Siliqua*, *Phaseolus*: in Arabick, *Lubia*: in English, *Kidney Bean*, and *Garden Kidney Bean*.

II. The other is called in Greek *Κόκκινος φασόλος* & *κόκκινος*: in Latin, *Faba Coccinea*, & *Phaseolus Coccinus*: and in English, the *Scarlet Bean*.

III. The Kinds. The Species of the *Kidney Bean* are very many: whose chief differences consist most in the Colour of the Beans, which every Child is able to distinguish at Sight, as the *White*, the *Black*, the *Red*, the *Purple*, the various Coloured, the *Great*, the *Small*, &c. as for other Differences, as they would be superfluous and needless, so they would be almost endless.

IV. The *Scarlet Bean* is said to be of two Kinds: 1. That which Grows and is Common with us in England. 2. The *Indian Downy or Hairy Bean*, which is called *Cow Ireh*, which see in the *Exoticks*, lib. 3. chap. 73. following.

Kidney Beans

V. The Description. It has a long Root with many Fibres springing from it, which perishes every Year, from which rises up at first but one Stalk, which afterwards divides it self into many Arms or Branches, every one of them being so weak, that they cannot sustain themselves, but are upheld by Sticks or Poles, or other adjacent things, taking hold with its clasping tendrils thereupon, in like manner as does Bryony, Hops, and the Vine, otherwise they would lie Fruitless upon the Ground. From these Branches grow forth at several places long Foot Stalks, every one of which has three broad, round, pointed Leaves, of a green Colour, growing together by three's as in the Common Trefoil: Towards the Tops of the Branches come forth divers Flowers in form like to Pease Blossoms, which varie and differ in their Colours according to the Soil in which they Grow, sometimes White, Black, Red, Yellow, Purple, Pale and Various Coloured, for the most part of the same Colour the Beans will be of. After which come forth long and slender, flat, lightish green Pods, mostly crooked a little, and some straight, in which are contained the Beans, made almost in form of a Kidney, flat and much about the Magnitude of Horse Beans.

VI. The *Scarlet Bean* is a large Plant, but differs not much in its manner of growing from the former

Kidney

Kidney Bean: but the Flowers are large and many, and of an Elegant Scarlet Colour; for which reason it is commonly called by our Florists, The Scarlet Bean.

Beans
Kidney
Garden
Scarlet.

VII. *The Places.* They Grow both of them, not only in England, but also in most parts of Europe, and with us they are nourish'd up in Gardens. The first or Common Garden Kidney Bean (which some call the French Bean) extend their Branches to a very great length, having Poles or other like things to support and fasten themselves upon. The Scarlet Bean was first Brought to us by John Tradescant, and made to Grow in our Gardens, where it now very naturally flourishes.

VIII. *The Times.* They are sown in the Spring, chiefly about the middle of April, and not before, and the Beans themselves are ripe, about the latter end of the Year.

IX. *The Qualities.* The former are Hot and Moist in the first Degree: (as for the latter they are more for the Show and Beauty of the Flowers, than for any Physical use.) They are also Suppurative, Astringent as to the Bowels, Nephritick, Spermatogenetick, and Alterative.

X. *The Specification.* There is nothing Observable in this, saving that they have been found to provoke Urine.

XI. *The Preparations.* The Shops keep nothing of them; but you may make thereof, 1. A Distilled Water from the green Cods, and whole Plant. 2. A Decoction of the green Cods, or whole Plant in Water or Wine. 3. An Essence of the Leaves and Cods. 4. A Volatile Spirit, Oil and Salt, from the dry'd Beans. 5. The Ashes of the Straw and Cods. 6. The green Cods to be eaten as a Sallet.

The Virtues.

XII. *The Distilled Water,* May be used as a Vehicle to convey Nephritick, Diuretick, and Lythontriptick Medicaments in.

XIII. *The Decoction in Wine or Water* is very Diuretick; and as its Signature shews, powerfully opens Obstructions of the Reins, Ureters and Bladder: It may be Drank a Pint at a time morning, noon, and night a little sweetened with Honey, and be continued for some days.

XIV. *The Essence.* It has the Virtues of the Decoction, but much more Powerful, and is a singular sweetener of the Blood.

XV. *The Volatile Spirit, Oil, and Salt.* They are made from the dry'd Beans, exactly as we have Taught in the former Chapter, *Sett.* 16. and their several Virtues, Uses, and Doses are the same, so that we need say no more of them in this place.

XVI. *The Ashes of the Straw and Cods,* being Infused a Night or two in a Bottle of Ale or Wine close stopp'd up; and that Liquor Drank Morning, Noon and Night, half a Pint at a time, or more, it powerfully provokes Urine, opens obstructions of the Reins and Ureters, and plentifully brings away Sand, Gravel, Slime, or other Tartarous Matter offending those Parts. You may put xvj. ounces of the Ashes to a Gallon of Ale or Wine.

XVII. *The Green Cods.* They have the Virtues of the other Beans, provoke Lust and breed Seed: boiled and eaten with sweet Butter and a little Salt, and Juice of Oranges, they loosen the Belly, provoke Urine, strengthen and please the Stomach, and make good Blood; but they ought to be eaten whilst they are green and tender (otherwise they will not be so Toothsom) and the Rib (or String which runs along the Cod, being taken away, then to be boiled close Covered, till they are softish, and so dress'd up with Salt, melted fresh Butter and Juice of Sevil Oranges, as aforesaid; in which manner they are very wholesom, nourishing, restorative, and of a pleasant and grateful Taste, and not in the least inferior to the other large Garden Beans.

CHAP. LVII.

BEANS Field or Horse.

I. *THE Names.* It is called in Greek, *Κόκκος ἄγριος*: in Latin, *Faba Equina, Faba Minor*: and by Dodonæus, *Phaselus Minor, Faba agria*, vel *Russica*: and in English, *Field Bean*, and *Horse Bean*. *Κόκκος Græcis dicitur creduntur quia sunt ut* τὸ νέον δυνάμις ἔχει τὸ νέον. Ray.

II. *The Kinds.* We shall take notice but 'of three sorts of these Beans. The First Kind, is our Common Field Bean, which is usually sown with us for Horses and Hogs; and is Named as afore declared. The Second Kind, is that which the Greeks call *κόκκος*, and by some *Κόκκος ἄγριος*: in Latin, *Faba Sylvestris, Faba Græca*; and in English, *The Wild Bean*. The Third Kind, is the Old Greek Bean, called *Κόκκος ἄγριος*: in Latin, *Faba Vetterum Græcorum, Faba Sylvestris Græcorum antiquorum*: in English, *The Greek Bean of the Ancients*.

III. *The Description.* The Field or Horse Bean has a short Root, going down right, with many small strings springing from it, which perishes every Year; from whence springs forth one, two, or more Stalks, which grow upright like the Garden Bean, not leaning down; the Leaves are like unto the Garden Bean, without any dents on the edges, but they are smaller, more at a Joint, and growing closer: the Flowers stand also more at a Joint, lesser, and of a more Purplish Colour: the Cods succeeding them

them are long and round, smaller than the Garden Kind, and standing upright: within which are small longish round Beans, which when they are Ripe, are some blackish, some brownish, and some of a dirty yellow.

IV. The Wild Bean differs in its description not much from the former, save that it is something less in the Magnitude of the Plant, and the Beans themselves are black and round.

V. The Greek Bean has a Root which goes not deep nor far into the Ground, but sends forth many long Fibres or Strings, dying every Year, from whence springs forth two or three long flat Stalks, with two edges, lying or running upon the ground, if it has nothing to rise or clasp upon. The Stalks branch out on every side into stalks of Leaves, four commonly set thereon, by two and two, with a distance between them, like unto the Garden Bean, and each Branch bending in a long Clasper. The Flowers grow singly at the Joints of the Branches, under the Leaves, and are of a kind of dead, dull, purple Colour, with some paleness at bottom of them: after which succeed long and somewhat flat Cods, with two sharp edges, dented about, and a little hooked or bowing, green at first, but afterwards black and hard when they are Ripe. In these Cods are contained four or five, or more round Beans, very black, and as large as Pease.

VI. The Places. The First grows with us every where, in Fields, and are chiefly Sown for the Food of Hogs and Horses, whence their Name: The Second and Third sorts grow with us only in Gardens; but are Natives of Spain and Greece, where they are plentifully to be found.

VII. The Times. They all Flower in April, and May, and June, and that gradually, for they are long in Flowering; and the Seed is Ripe sometimes in July; but mostly in August and September.

VIII. The Qualities. Our Field Beans are hot and moist in the first Degree, suppurative, strengthening and spermatogenetic: nephritick, diuretick, and alterative: and used externally, as in Washings, they are of an absterfiv faculty. The Wild Bean, and *Faba Veterum*, or Greek Bean, which *Discordes*, *Galen*, and other Greek Authors intend, when they give us their Virtues, are used to all the same purposes and intentions ascribed to these Our Field Beans.

IX. The Specification. They have a peculiar Faculty to remove Obstructions of Urine; and to make a clear passage for the Water.

X. The Preparations. They are exactly the same with the former, as 1. A Distilled Water from the Flowers and green Cods. 2. A Decoction of the same. 3. An Essence. 4. A Volatile Spirit, Oil, and Salt. 5. The Ashes and Fixed Salt. 6. A Broth of the Beans. 7. A Cataplasm of the Meal.

The Virtues.

XI. The Distilled Water. It is used as a Vehicle for other Preparations, and as a colicemick for the Face and Skin, to take away Scurf, Morpew, Tannings, Sunburnings and other like Deformities, by often washing therewith, and letting it dry on.

XII. The Decoction of Cods and Plant, opens Obstructions of the Viscera, but chiefly of the Reins, Ureters and Bladder, and provokes Urine.

XIII. The Essence, Is said to dissolve the Stone in Reins or Bladder, but then I conceive it must be a soft and gritty Stone, not of a Flint like Substance: it increases Seed, and provokes Lust.

XIV. The Volatile Spirit, Oil, and Salt of the dry'd Beans, They are made as those of Garden Beans chap. 55. Sect. 16. and have all the same Virtues, Uses and Doses.

XV. The Ashes and Fix'd Salt. They are Diuretick, and powerfully provoke Urine, and therefore are singularly good against the Dropsy Sarfites, Gout, Stone, Gravel, and Jaundice. Dose a scruple in White Wine, morning and night.

XVI. The Broth of the Beans. It has the same Virtues, but not all out so Powerful.

XVII. The Cataplasm. Made with Wine, it is good against suffusions and Blows of the Eyes, and is profitably applied to ease the Pains of the Gout. Made with Wine Vinegar, and applied, it takes away the Inflammation of the Testicles, and Womens Breasts, and apply'd where Hairs are first and immediately plucked forth, it consumes their Nutriment, and in some measure hinders their growing again. And if beaten up with Whites of Eggs, it is good against the Pin and Web, and helps the Watering of the Eyes. If made with Vinegar and equal parts of Barley Meal, it is said to waft away the Swellings of the Kings Evil. If made up with equal parts of Meal of *Fanugreek*, it takes black and blew spots, occasioned through Blows, and Discusses hard Swellings under the Ears. If the Cataplasm is made with *Oxymel*, it is good against the Stinging of *Scorpions*, and Bitings of Venomous Beasts, Discusses Tumors caused by Blows and Bruises, abates the Milk in Womens Breasts, and eases Wounded Nerves, if apply'd upon the Wound.

CHAP. LVIII.

BEARS BREECH.

THE Names. It is called in Greek, *Ἀκανθὸς* & *Ἀκανθα* : in Latin, *Acanthus*, *Acantha*, *Branca Ursina* : and in English, *Brank Ursine*, or *Bears-breech*.

II. The Kinds. It is twofold ; 1. The Garden Kind, called in Greek *Ἀκανθὸς ἡμετέρος*, & *ἡσυχίου* : in Latin, *Acanthus Sativus*, *Acantha Hortensis*, *Paderas*, *McLampyllos*, and *Herpicantha*, *Acanthus verus* & *levis*, *Branca Ursina levis* : and in English, *Garden Brank Ursine*, or *Bears Breech*. 2. The Wild Kind, is called in Greek *Ἀκανθὸς ἄγρος*, in Latin, *Acanthus Sylvestris*, and *Aculeatus*, *Acantha Spinosus* & *aculeata*, *Herbacantha* : in English, the Wild or Prickly Bears-breech. *Acanthus* is the common name for all Thistles, but here it is used by the figure, *Antonofia*, *qua loco proprii nominis ponitur Appellativum, ut Croas pro Londino*.

III. The Description. Garden Bears Breech has a Root thick and long, with many long strings spreading far and deep in the ground, of a blackish or dark colour on the outside, and white within, full of a very clammy Juice, more mucilaginous than the Leaves, so full of life, that if a small piece be but left in the ground, it will spring up again, and bring forth the whole Plant, but requires a shelter or defence from the extremity of the Winter. From this Root there shoots forth many large, thick, smooth, sad green Leaves upon the ground, with a thick middle rib, divided into many parts, with great and deep gashes on the edges, from among which (after it has stood long in a convenient place) rises up a reasonable great Stalk, three or four foot high, without either joint or branch thereon, set with some Leaves ; and from the middle upwards, set with a spike, as it were, of white hooded or gaping Flowers, standing in brownish Husks, somewhat sharp at the points, and a small long undivided Leaf under each Flower : as-

ter which come (in more hot Countries, but not in ours that I know of) broad, flat, round, thick, brownish yellow Seed. Dodoneus says, that the Leaves are great, large, of a sad green colour, thick, gross, smooth, and deeply cut in by the sides, like the leaves of Rocket.

IV. Wild Bears Breech has a Root not spreading so deep, or so far as the former, nor so great in magnitude, but more tender, as less able to endure the Winters cold. From this Root rises up several long Leaves lying upon the ground, but much narrower, and more divided on the edges into smaller parts, and each part with small incisions, set with very sharp white prickles ; from among which a lesser and lower Stalk arises, with the like spiked heads of Flowers, and a few prickly Leaves thereon, in their way coming up, standing in more sharp and prickly husks than the former ; after which comes Seed, small as a little Pea, hard, black, and round. Gerard saith, that this Thistle is in Stalk, colour of Leaves, Flowers and Seed much like the first kind, but the Plant is shorter and lower, and the Leaves pretty large, dented or jagged with many cuts and incisions, not only in some few parts of the Leaves, as some other Thistles, but very thickly dented or cloven, and having many sharp, large, white and hard prickles, about the sides of the divisions and cuts, not very easy to be handled or touched, without danger to the hands and fingers.

V. The Places. They naturally grow in Greece, Italy, Spain, and France ; but with us, and in Holland, Germany, and other cold Countries, it is only to be found nourished up in Gardens. Dioscorides says it grows only in moist and stony places. The Wild grows in many places of Italy near the Sea, and Pena says, he found it in moist and gravelly places near to the Walls of Mompelier ; but with us it is only in Gardens.

VI. The Times. The Root keeps alive in Winter in hot Countries, and so with us, but sometimes it dies, if the weather is too cold : but in England that is rare in the Garden kind. The former flowers in June and sometimes in July ; but yields no perfect Seed with us : the latter flowers later ; seldom or never giving with us any ripe Seed : but in those Countries where the Seed comes to perfection, it is always in Autumn, or latter end of Summer.

VII. The Qualities. They seem to be Temperate in respect of heat, and drying in the first degree. They are Arthritic, and whilst green, Digestive, afterwards Astringent, Drying, Restorative and Alterative.

VIII. The Specification. They are peculiar against Consumptions and Spitting of Blood.

IX. The Preparations. The Shops keep nothing of it : but you may make thereof, 1. An *Inspissate Juice*, or *Liquid*. 2. An *Essence*. 3. A *Decoction* in Wine. 4. A *Syrup*. 5. A *Chyster*. 6. A *Cataplasme*. 7. A *Saline Tincture*.

The Vertues.

X. The Liquid or Inspissate Juice, prevails against spitting of Blood, pissing of Blood, and the Phthisick, being said to cure Consumptions, meaning those of the Lungs. Dose of the Liquid, one or two spoonfuls ; of the Inspissate one or two drams, dissolved in Red Wine, or Tent, and so either of them to be taken.

XI. The Essence. It has the Virtues of the former, besides which it stops Fluxes, and the Courses in Women, and is prevalent against Ruptures in Children, and vehement Coughs. Dose one spoonful in Red Wine or Tent, Morning and Evening. Applied it is good against burnings.

XII. The

XII. *The Decoction in White Wine.* It provokes Urine, and binds the Belly.

XIII. *The Syrup.* It is good against Coughs, Colds, Asthma's, Phthiticks, spitting and pissing of Blood, Bloody Fluxes, &c. Dose two spoonfuls in Wine.

XIV. *The Clyster.* By reason the whole Plant is of a Glutinous, Clammy, and Slimy Mucilaginous Nature; it is given Clyster-wise to procure Stools, and heal the Excoriations of the Bowels.

XV. *The Cataplasim.* From its Glutinous and Mucilaginous property, it is (like Comfrey) applied to weak parts to strengthen them: and applied to the Gout in the Joints, it eases the Pain, dissolves the Humor, and cures the Disease: It also is profitable against Cramps in any part, and Ruptures in Children, being timely applied to the Part: made into form of an Emplaster, and applied to the Back, it eases Pains there, and strengthens a weak Back.

XVI. *The Saline Tincture.* It opens obstructions of the Urinary Passages, and powerfully provokes Urine. Dose, one or two drams in a draught of White Wine: and Cloths dip in it, and applied to parts burned (where the skin is not broken) it presently draws forth the fire.

XVII. *The Wild Bears Breach has the same Preparations, Virtues and Uses.*

CHAP. LIX.

BEARSEARS.

I. *The Names.* They know no Greek Name, but have obtained several Latin ones, according to the variety of Authors, who have treated of them: but they may well enough be called in Greek, *Λόβη των ὀρέων*: They are called variously by several Authors, as *Lunaria Arthritica*, also *Lunaria Paralytica Alpina*, and *Sanicula Alpina*, by Gesner: *Primula veris Pachyphyllus*, by Ligdon: *Auricula Urſi*, by Matthiolus, Bauhinus, and others: and at this day they are so generally called by Mr. Ray, and other Authors. Some Authors, as *Fabius Columna*, will have them to be the *Alisma*, or *Damaſonium of Dioscorides*, but are, in my opinion, mistaken, because the form of the Flowers plainly demonstrate the contrary: in English they are generally called *Bears-Ears*, and *Auricula's* by the Florists. They are certainly of the Family of the *Cowslips*, and therefore are also called *Alpine Cowslips*, and *Mountain Cowslips*, from the places whence they first came: *Sanicula Alpina*, *Alpine* or *Mountain Sanicle*, *a ſanandis vulneribus*: and *Auricula's* from the form of the Leaf.

II. *The Kinds.* There are three principal Kinds, as 1. That with long dented Leaves. 2. That with long Leaves not dented. 3. That with round Leaves; and of each of these there are many varieties: as, the *Yellow*: the *Purple*: the *Red*: the *Scarlet*: the *Bright Red*: the *Bluish-coloured*: the *Various-coloured*: the *Blew*: the *White*: the *Hair-coloured*: the *Straw-coloured*: and the *Variable Green*.

III. *The Description.* Those with long dented Leaves (of which the Yellow kind is principal) which is a beautiful fine Plant, has a thready Root, very like to the Oxlip; which sends forth green, thick, and fat Leaves, somewhat finely snipt about the Edges, much like to those of Cowslips, but greener, smoother, and nothing so crumpled: among which arises up a slender, round Stem, an handſul high, bearing a Tuft of Flowers at the Top, from six to twelve in number; sometimes of a Yellow, sometimes of a Purple, or Red,

and sometimes of a White colour, or various coloured, not much unlike to the Flowers of Ox-lips, but more open, and consisting of one only Leaf like Coteledon, or Pennywort: after which come small beads with a point at Top of them, not rising to the height of the Caps, containing small blackish Seed.

Bears-Ears.

IV. Those with long Leaves not dented, have a Root greater and thicker than the former, with long strings or fibres like unto the other sorts, but greater; from whence springs up many fair, large, thick Leaves, somewhat mealy or hoary upon the greenness, smooth about the Edges, and without any indenting at all. The Stalk is great, round, and not higher than in the former, but bearing many more flowers thereon, more in number than any other kind, amounting sometimes to twenty or more, yea sometimes to thirty, standing so round and close together, that they seem to be a Nose-gay alone: their form is like some others, but that the Leaves are shorter and rounder, yet with a notch in the middle, like the rest, of a fair Yellow, &c. colour, neither very pale nor deep, with a White Eye or Circle in the bottom, about the middle of every Flower, giving them an extraordinary grace; after which comes round heads greater than the former, with a small point striking in the middle, in which is contained Seed of a blackish brown colour.

V. The round Leav'd, which Tabernmontanus, and Gerard, call *Sanicula alpina*; and Matthiolus, Cortusa, and we Bears-Ear fanicle; has a Root consisting of a thick Tuft of small whitish Threads, rather than Roots, much interlaced one among another: from whence spring up Leaves; first, such as are much crumpled, and as it were folded together, which afterwards open themselves into fair, broad and roundish Leaves, somewhat rough, or hairy, not only cut into five divisions, but somewhat notched also about the edges, of a dark green colour on the upper side, and more whitish green underneath. The Leaves of this Plant die down every Year, and rise up anew every Spring, whereas all other Bears-Ears keep their Leaves green all the Winter, especially the middlemost, which stand like a close head, the outwardmost for the most part perishing after Seed-time.

time. From among these Leaves rises up one or two naked round Stalks, five or six Inches high, bearing at the Tops several small Flowers, somewhat sweet, and like unto the purple Bears Ear, hanging down their Heads, consisting of five small pointed Leaves apiece, of a dark, reddish, purple Colour, with a white Circle or bottom in the middle, and some small threads therein: the Flowers being past, there appears small round Heads, somewhat longer than any of the former kinds of Bears Ears, standing upright upon their small foot Stalks, in which is contained small, round, and blackish Seed.

VI. *The Places.* The native places of these Plants are on the *Alpine Mountains*, and other like places, as the *Pyrenea*: those with the *blew Flower* and *Borage Leaf*, grow on the *Mountains* in *Spain*, and on that side the *Pyreneans* next to *Spain*, from whence they have been Transplanted to us, and are only nourish'd up with us in *Gardens*.

VII. *The Times.* They all Flower in *April* and *May*, and their Seed is ripe in the end of *June*, or beginning of *July*: and sometimes they will Flower again in the end of *Summer*, or in *Autumn*, if the Season proves moist, rainy, and temperate. As for the great variety of these Flowers, *Parkinson* is of opinion, that they have risen from the Seed, according to the differing Climes and Soil in which it has been Sowed.

VIII. *The Qualities.* They are Temperate in respect of heat or cold; and dry in the first Degree. They are Cephalick, Neurotick and Arthritick, Vulnerary, Afringent, and Alterative.

IX. *The Specification.* It is a most admirable Vulnerary, as well for Internal as External Wounds.

X. *The Preparations.* The Shops keep nothing of it Prepared, but you may make therefrom, 1. *An expressed Liquid Juice.* 2. *An Infusate Juice.* 3. *An Essence.* 4. *A Decolion in Wine.* 5. *An Oil.* 6. *An Ointment or Balsam.* 7. *A Spirituous Tincture.*

The Virtues.

XI. *The Expressed Liquid Juice.* Taken inwardly one or two spoonfuls at a time in a Glass of Tent or Red Wine, it stops inward Bleedings, and heals Wounds in the Stomach and Lungs: being snuff'd up the Nostrils it purges the Head and Brain of Phlegmatick and Serous Humors, and therefore is good against Epilepsies, Apoplexies, Vertigo's, Megrimms and other Head Diseases.

XII. *The Infusate Juice.* Dissolved in Red Wine, and used as the former, it is prevalent to all the same Intentions, and against all the same Diseases: besides it strengthens the Stomach to a Miracle.

XIII. *The Essence.* It has all the Virtues of the *Expressed Liquid* and *Infusate Juices*: besides which taken every day from 1. to iij. spoonfuls in any proper Wine or other fit Vehicle, it prevails as a Vulnerary potion for the Curing of all sorts of new Wounds and old Ulcers, and is found to be a singular thing against the Palsie, dimness of Sight, and many other Diseases of the Head, Brain, and Nerves.

XIV. *The Decolion in Wine.* It is Vulnerary taken inwardly, opens Obstructions of the Lungs, and causes free breathing, gives ease in Gripings of the Belly, and the Bloody Flux; for which Disease, also in a Diarrhea, and Lienteria, the *Liquid, Infusate Juices* and *Essence* are all profitable.

XV. *The Oil.* It is made with Sallet Oil by boiling. It cures External Wounds, as *Camerarius* in his *Hortus Medicus* saith, tho' of the Nerves to a Miracle, dissolves Swellings, eases pain, and is

found to be profitable in the Gout whether arising from a hot or cold Cause.

XVI. *The Balsam.* It has the Virtues of the Oil; but more excellent for the Cure of Wounds than it, especially of the Nerves; is good against the bitings of the Sea Hare, and of the Toad, and resolves *Oedema's*.

XVII. *The Spirituous Tincture.* It cures Gripings of the Belly, the Dysentery, Convulsions, Fits of the Mother, and other Distempers of the Womb. Dose 1. spoonful Morning and Evening.

XVIII. *Parkinson* says the Leaves of *Cortusa* tast a little hot, and if one of them be laid whole, without bruising, on the Cheeks of any tender Skinn'd Woman, it will raise an Orient Red Colour as if some *Venus* had been laid on, which will pass away without any manner of hurt, or mark where it lay.

CHAP. LX.

BEETS Common and White.

I. **THE Names.** This Plant is called by the *Arabians*, *Decca*, and *Calab*: by the *Greeks*, *Τύκλον*, & *Ζεύκλον*, *ab impulsu quod facile excrecat*, because it comes up in few days after the Sowing, and then grows very fast till it comes to its bigness. In *Latin*, *Beta*, *quoniam figuram literæ B dum semine turget referre videtur*, because the figure of it being in Seed, is somewhat like to the *Greek* Letter *Beta*, as *Columella* observes. And in *English*, it is called, *Beet*.

II. *The Kinds.* *Dioscorides* makes a *White* and a *Black*: So also *Theophrastus Hist. Plant. lib. 7. chap. 4.* who says, *Candida sapore nigrâ præstantior*: So *Pliny, lib. 19. chap. 8.* *Beta à colore duo genera Græci faciunt, nigram & Candidius.* *Parkinson* is almost

almost of the opinion that the *Black Beet* of the Ancients was that we now call *Our Red Beets*: but Modern Authors have found out several other Kinds. As, 1. *Beta viridis Communis*, The Common Green Beet. 2. *Beta alba*, called also *Candida* & *Pallescens*, The White Beet. 3. *Beta rubra nostra*, called also *nigra*, & *rubra vulgaris*, The Red Beet. 4. *Beta rubra*, called also, *Beta Romana*, *Beta rubra Rape radice*, *Rapum Rubrum*, *Rapum sativum Rubrum*, *Beta nigra Romana*, *Beta erythrorrhizos*, by *Lugdunensis*, The Roman Red Beet. 5. *Beta Cretica spinosa*, Prickly Beets of *Candia*. 6. *Beta Sylvestris maritima*, Sea Beets. 7. *Beta Lucia Syriaca*, Yellow Beets. 8. *Beta platicaulos*, *Beta Costa lata*, *alba Lutea*, *aurea*, *ruberrima*, *Italica*, *ficula*, The yellow or flat Stalk'd Beet. Of all which Kinds we shall only Treat of the first Four in this Book, as being only proper for this purpose. And of them, we shall Discourse of the two first Kinds in this Chapter.

III. The Description. *Our Common Green Beet* is almost like unto the *White Beet*, having a great long hard Root, of no use after Seed time, from whence springs up many large Leaves lying upon the Ground of a green Colour, amidst which rises up a large green Stalk crested, with some Branches and many Leaves thereon, almost up to the Top. The Flowers grow in long Tufts or Spikes, small at the ends and turning down their Heads, and yielding cornered Seed.

IV. *Our Common White Beet* has a long thick, great Root, and hard after bearing Seed, which endures all the Winter, and with its Leaves upon it, but perishing commonly the second Winter. From whence comes forth great broad Leaves, smooth and Plain, lying next the Ground; these says Parkinson, grow in hot Countries to be three Foot long and very broad, and in our Country they are very large but nothing near that Proportion, and they are of a whitish green Colour. From this Root rises up a Stalk great, strong, and Ribbed or Crested, bearing great store of Leaves upon it, almost up to the very top: the Flowers grow along the Stalks in long tufted

Spikes small at their extremities, and bending down their Heads, and they cluster together in shape like little Stars; which being past, there are small pale greenish yellow Burrs, yielding cornered, and uneven prickly Seed.

V. *The Places*. The *Green Beet* Parkinson says has been found near the Salt Marthes by Rochester, in the Foot way going from the then Lady Levesons House thither. The *White Beet* is said to grow Wild upon the Sea Coast of Tened, and divers other places by the Sea. They delight to grow in fat and moist Ground, but are chiefly nourished up with us in Gardens.

VI. *The Times*. They ought to be sown in the Spring: they flourish and are green all the Summer long, as also in Winter; and they Flower in the beginning of July, and the Seed is ripe in August.

VII. *The Qualities*. They are Temperate in respect to heat and moisture; and of a Nitrous Quality, Absterfiv, a little Diuretick, Opening, Cephalick, and Hepatick, Parmick, Alterative, and Alexipharmick.

VIII. *The Specification*. They are found to be Specifick against Diseases of the Head and Brain.

IX. *The Preparations*. The Shops keep nothing thereof, but you may prepare therefrom, 1. A Liquid Juice. 2. An Inspissate Juice. 3. An Essence. 4. A Decoction. 5. An Errhine. 6. A Cataplasim.

The Virtues.

X. *The Liquid Juice*. It is Nitrous and cleansing: being taken vi. or viij. Spoonfuls at a time, at going to Bed, for some Nights, it opens the Obstructions of the Liver and Spleen, and is good against the Head Ach.

XI. *The Inspissate Juice*, made with Vinegar into the thickness of a Balsam, and apply'd to the Temples, prevails against the Inflammations of the Eyes, and mixed with Oil Olive, is good against Burnings and Scaldings.

XII. *The Essence*. It is good against the Yellow Jaundice, opens Obstructions both of Liver and Spleen, is good against the Vertigo, and the Bitings of any Venomous Creature. It is good against the Itch, the parts affected being bathed therewith, and cleanses the Head of Dandriff, dry Scurff, Scabs, and heals fretting and running Sores, Ulcers and Herpes in the Head, Legs, or other Parts: it is also said to cure Baldness, and hinder the falling of the Hair. Dose 3. or 4. Spoonfuls or more.

XIII. *The Decoction*. If it is made with Equal parts of Water and Vinegar, it has all the Virtues of the Essence; besides it prevails against St. Anthony's Fire, and all other Inflammations in any Part.

XIV. *The Errhine*. It is made of the Liquid Juice iv. ounces, Niter half an ounce mixed and dissolved. Being snufft up the Nostrills it powerfully empties and cleanses the Head and Brain of superfluous Humors which cause the Apoplexy, Epilepsy, Vertigo, Megrim, Cephalalgia, Cephalæa, Lethargy, Carus, and other like Distempers of those Parts; it also eases the Tooth Ach, and pains in the Ears, and being outwardly apply'd, has all the Virtues of the Essence and Decoction.

XV. *The Cataplasim*. Made of the boiled Herbs with or without the Addition of a little Niter and Alum, and apply'd, it is good against all sorts of Wheals, Pufes, Boils, Blains, and other eruptions of the Skin, as also for Chilblains or Kibes whether on Hands or Feet, speedily Curing them.

C H A P. LXI.

B E E T S Red.

I. THE Names. This Plant is called by the Greeks, *ῥάβδον ῥαβδον*: by the Latines, *Beta rubra*, and *Beta nigra*: and by us in English, The Red Beet.

II. The Kinds. It is the third Species of the Generick Kind, as is before declared.

III. The Description. This Kind differs nothing from the former White Beet, but only that it is not so great, and that both the Roots and Leaves are somewhat red: the Root is red, spongy, and not used to be eaten. The Leaves are in some more red than in others, which have but red Veins or Streaks in them; in some of a fresh red, in others of a very dark red, streaked here and there confusedly. The Flowers and Seed differ little or nothing from the former.

IV. The Places. It grows where the former grows, and with us are only brought up in Gardens.

V. The Times. They are Sowed in the Spring: endure all Summer, and sometimes all Winter, Flower in July, and the Seed is Ripe in August.

VI. The Qualities. It is temperate as to heat and cold; and dry in the first, some think in the second Degree. It is Alterative, Astringent, and Vulnerary: Cephalick, Splenetick, Nephritick, Hystrick and Arthritick, Alterative, and Analeptick.

VII. The Specification. It is a peculiar thing for stopping the Blood in any kind of Hemorrhage.

VIII. The Preparations. They are the same with the former, as, 1. A Liquid Juice. 2. An Infusate Juice. 3. An Essence. 4. A Decoction. 5. An Errhine. 6. A Cataplasin.

The Virtues.

IX. All these Preparations have the same Virtues with the former, and may be given in the same manner and Dose. But this difference is observed, that these are more Astringent or Binding; and therefore, both the Liquid and Solid Juices, the Essence and Decoction, all very effectually stop the overflowing of the Terms in Women, and stop other Fluxes of Blood: and are more effectual for curing any Ulcer, or running Sore, and to dry up and remove moist and running Scabs, and other like defecations of the Skin. They are good against the Bloody Flux, and other Fluxes of the Bowels, stop the Whites in Women, and help the Yellow Jaundice, and this more especially if daily given for some time mixed with a small quantity of the Tincture of Mars.

C H A P. LXII.

B E E T S Roman.

I. THE Names. This Plant is called in Greek, *ῥάβδον ῥαβδον*: In Latin, *Beta Romana*, *Romana rubra*, *Raposa*, *Beta rubra radice Rapa*, *radice rubra crassa*, and in English, Roman Beet, Red Beet, and Carrot Beet.

II. The Kind. It is our Fourth Species of Beets; and a singular Kind.

III. The Descriptions. It has a Root red as Blood, and as long and as big as the greatest Carrot, very red both within and without, very sweet and good, and fit to be eaten (which none of the former are) and sometimes the Root is short like a Turnep, whence it took the Name *Rapa* and *Raposa*: From this Root springs up a Stalk, higher than our Common Red Beet, which in its make and form of the Leaves, and proportion, differs little or nothing from the former, but only are

are of a better taste, and of a red Colour like the former Beet. Gerard says, they are of a very red Colour, and that they, as well as the Root, Stalk, and Flowers, are repleat with a perfect purple Juice, tending to Redness: the middle Rib of the Leaves is for the most part very broad and thick, like the middle part of the Cabbage Leaf, which is equal in goodness with Cabbage being boiled: the Flowers (excepting the height of the Colour) and the Seed are all one with the former Common Red Kind. Gerard says that in 1596. it grew with him to the height of viij. Cubits, which is xij. Feet, and did bring forth its rough and unpleasing Seed very plentifully. With this Plant (says he) Nature seems to Play and Sport her self: for the Seeds taken from that Plant, which was altogether of one Colour, being Sown, do bring forth Plants of many and variable Colours, very beautiful. Now if I may be admitted to render a Reason of this Variety, I am of opinion it is from the differing Soils in which they are Sown, which thing I have observed in several other Plants, even to admiration.

IV. *The Places.* It is Originally a Foreign Plant, and brought to us out of Italy, but now is become a free Denizon, or rather a Native of our Country, in which it thrives as well as in any place of the World. It is nourish'd with us only in Gardens where it prospers very well.

V. *The Times.* It Flowers in the latter end of June if the Season is warm, or beginning of July; and yields its ripe Seed in August.

VI. *The Qualities.* It is temperate as to heat and cold, and dry in the end of the first Degree, Traumatick, very Astringent, and something Styprick withall, Splenetick, and Hyfterick, Alterative, and Analeptick.

VII. *The Specification.* It is a peculiar thing for stopping Hemorrhages.

VIII. *The Preparations.* You may Prepare from it 1. A Liquid Juice. An Infusate Juice. 3. An Essence. 4. A Decoction. 5. A Cataplasim. 6. A Saline Tincture.

The Virtues.

IX. *The Liquid Juice.* Given to iij. or iv. ounces in White Wine, it is good against the Yellow Jaundice: it also stops all Fluxes of Blood in the internal parts causing Spittings, Vomiting, or pissing of Blood; besides which it is admirable for the cure of a Dyfentery, and other Fluxes of the Bowels, very much strengthening them.

X. *The Infusate Juice.* Being reduced to Powder, and strewed upon any bleeding Wound, it presently stops the bleeding. So also being dissolved in Vinegar or Oxycrate, and then Struphes to be dipt in and apply'd. This Juice dissolved in Syrup of Limons, and made into a Lohoch, is excellent to strengthen a Weak Stomach, being sometimes taken with a Liqueurice Stick.

XI. *The Essence.* Being taken daily with *Tinctura Martis*, it powerfully opens Obstructions of the Spleen: And being taken with *Crocus Martis Astringens*, it powerfully stops the overflowing of the Courses.

XII. *The Decoction.* It has the Virtues of the Juices and Essence, but is somewhat weaker, and therefore ought to be taken longer. It will be better if it be made with Red Stiptick Wine, or with the Roughest Red Florence.

XIII. *The Cataplasim.* If it is made of the raw Leaves and apply'd, it removes Dandriff or the white Scuff, the place being first well rubbed with *Sal Nitre*; it also stops the spreading of running Sores, and helps Scald-Heads, (if mixed with a

little *Nitre*) as also the Tinea, Alopecia, and other ill-natured breakings out of those parts, which cause the Hair to fall. If it is made of the boiled Leaves, it is good against Burnings and Scaldings, Inflammations, and other hot Tumors, Tubercles, Wheals and such like, proceeding from Inflamed Blood and Choler.

XIV. *The Saline Tincture.* It is good against Scabs, Itch, Scurff, Dandriff, Scales, Scurvey, Spots, Lice, Nits, &c. Chilblains, Kibed Heels, the parts affected being often washed, and sometimes well soaked in the same.

XV. It is used (I mean the Root) as a Sallet, and to adorn and furnish out Dishes of Meat withall, being as sweet and good as any Carrot: and if boild as Carrots, and eaten with Butter, Vinegar, Salt and Pepper, it makes a most admirable Dish, and very agreeable with the Stomach.

CHAP. LXIII.

BELL-FLOWER Small.

I. *THE Names.* Some Authors will allow this Plant no Greek Name; but others suppose it to be the same with *Dioscorides* his *βότρυμα*: It is called in Latin, *Campanula*: and in English, *Bell Flower*.

Bell-flower-round-leaved

II. *The Kinds.* Authors make almost an Infinite number of Kinds, amongst which are the *Throat Worts*, *Campions*, *Rampions*, and several other Nominals, so that they run into so great Confusion about them that it is not easy to be set right. To avoid therefore all this clutter and trouble, we shall Treat of those otherwise Denominated under their proper Titles and Names they are best known by; and in this and the succeeding Chapter, discourse only of the Chief of those which are peculiarly called *Bell-flower*.

Flowers. Of the Bell-flowers of which we shall take notice, there are two Principal Kinds, viz. 1. The Small Bell-Flower, of which we Treat in this Chapter. 2. The Great Bell-Flower, of which in the next Chapter.

III. Of the Small Bell-flower, we take notice of three kinds : 1. *Campanula Cerulea vel Rotundifolia*, Blew or Round-leav'd Bell-flower. 2. *Campanula alba*, White Bell-flower. 3. *Campanula lutea*, Yellow Bell-flower.

IV. The Description. The Blew or Round-leav'd has a small thready Root, from whence rises up Leaves which lye upon the ground, round and small, almost like unto a Violet-leaf, but rounder, and snipped or dented, from whence rise up divers weak, slender Stalks about two foot high, set from the bottoms to the tops, with many very small, long, narrow leaves, where the flowers stand upon small long stalks, very like in fashion and bigness unto the small Garden Rampions, but of a perfect blew colour, most commonly turning towards Purple, and sometimes White, tho' seldom : after which follows small Seeds, in small Heads, like these of Rampions.

V. The White Bell-flower (which some account a kind of Wild Rampion) is a small Plant with a slender Root, of the bigness of a small straw, with some strings springing from it. The leaves are somewhat long, smooth, and of a perfect green colour, lying flat upon the ground. From thence rise small tender stalks set here and there with a few leaves, and the flowers grow at the tops of them of a Milk-white colour.

VI. The Yellow Bell-flower is a very beautiful Plant of an handful high : It has roots like to the Blew or Round-leav'd, and the leaves are almost like to the same, save that those which lye next the ground are not so round as the former, a little larger, and longer, and some of them a little dented about the edges ; the flowers in their way and manner of growing, are like the former, but differ only in the colour, these being of a pale yellow.

VII. The Places. They grow wild in most places in England, especially upon barren sandy Heaths, and such other like places.

VIII. The Times. They flower all the Summer long, some continuing till the cold of Autumn makes them decay.

IX. The Qualities. They are cold and dry in the first degree, of the nature of Rampions : Afringent, Stomack, and Alterative.

X. Preparations. You may make therefrom, 1. A distilled Water of the whole Plant. 2. A Cataplasim of the Root.

The Virtues.

XI. The Distilled Water. It is good against discolorings and deformities of the skin, cleansing it, and making the face very clear and fair.

XII. The Cataplasim. The roots beaten into a Mass, and made into a Cataplasim, with Meal of Lupins and Vinegar, is restrictive, abates the Milk in Womens Breasts, takes away spots and marks of the skin, and removes many other of its deformities.

C. B. M. S. LXIV.

BELL-FLOWER Great.

I. THE Names. It has no known Greek Name : the Latins call it *Campanula*, and *Campanula magna* : in English, Great Bell-flower.

II. The Kinds. This is the second Species of our Generic Kinds, and is three-fold. 1. *Campanula persicifolia*, the Peach-leav'd Bell-flower. 2. *Campanula lactescens pyramidalis*, *Campanula major*, the Pyramidal milky Bell-flower. 3. *Viola Mariana*, Coventry Bells.

III. The Description. The Peach-leav'd Bell flower has a Root very small, white, and thready, creeping under the upper crust of the ground, so that oft times the heat and drought of the Summer does parch it, and cause it to wither away : from whence springs many Tufts or Branches of Leaves lying upon the ground, which are long and narrow, much like to an Almond or Peach leaf, being finely nick'd about the edges, and of a sad green colour. From among these rise up divers Stalks two foot high, or more, set with Leaves to the middle, and from thence upwards, with many flowers standing on small foot-stalks, one above another, with a small Leaf at the foot of every one. The flowers stand in small green husks, small and round at bottom, but wider open at the brim, and ending in five corners, with a three forked Clapper in the middle, set about with some small threads tipped with Yellow, which flowers in some Plants are pure White, but in others of a pale Blew, or Watchet colour, having little or no scent at all : the Seed is small, and contained in round flat Heads, or Seed-Vessels.

IV. The Lactescens Pyramidalis is a great Bell-flower, whose Root is thick and whitish, yielding more store of Milk, being broken, (as the Leaves and Stalks also do) than any other of the Bell-flowers, every one of which do yield Milk, some more, some less : From this Root rises divers Stalks, a yard high, or better, on which grow divers smooth, dark, green Leaves, broad at the bottom, and small at the point, somewhat unevenly notched about the edges, and standing upon longer foot-stalks below, than those above. The Flowers are Blew, and in some White, not so great or large as the former, but near of the same fashion, growing thicker, and more plentifully together.

ther, with smaller Leaves among them, bushing thick below, and rising smaller and thinner up to the Top like a Pyramid, or Spire Steeple.

Bell flower Milkey

*Coventry
Bell flower.*

V. *Coventry Bells* is a Plant which has a White Root, which being young as in the first year Sowing, is tender, and often eaten as other Rumpions are,

but the next year when it runs up to Seed, it grows hard and perishes. From hence spring up Leaves of a pale or fresh green colour, long and narrow next to the bottom, and broader from the middle to the end, somewhat round pointed, a little hairy all over, and dented about the edges. The next year after the Sowing, rise up Stalks, something hairy also, and branching forth from the Root into divers Arms, upon which grow several Leaves, smaller than the former, and of a darker green color. At the end of every Branch stand the flowers in green husks, from whence come large, round, hollow Bells, swelling out in the middle, and rising somewhat above it, like the neck of a Pot, and then ending in five Corners, which are either of a fair or faint White, or of a pale blew Purplish colour, and sometimes of a deeper Purple or Violet. The flowers being past, there grows up great, square, or corner'd Seed-vessels, in which are contained in five several Cells, or Divisions, small, hard, brown, shining flat Seed.

VI. *The Places.* All these grow with us in Gardens, where they are brought up for the beauty of their Flowers. The *Coventry Bells*, Ray says, grow in Woody and Mountainous places; and Gerard says, in dark Valleys, under Hedges, among Bushes, more especially about *Coventry*, whence the name, and where they grow very plentifully abroad in the fields, but are also with them Nurfed up in Gardens, as they are with us in *London*, which pleasant *Bell-flower*, is kept chiefly for its hearty sake, though its Root is also eaten as *Rumpions* are. The first of them also requires to be planted in shady places.

VII. *The Times.* These plants are to be continued by sowing them every other year. They flower generally all the Summer Months; but the *Peach-leaf'd* flower for the most part earlier than the others: The *Coventry Bells* flower in June, July, and August, and the Seed ripens in the mean Season, in regard they bring not forth their flowers all at once, but as some flower, others seed.

VIII. *The Qualities.* They are cold and dry in the first degree, Astringent, Traumatick, Vulnerary, Stomackick, and Alterative.

IX. *The Preparations.* You may make thereof,
1. An expressed Juice of the whole Plant. 2. A Decoction thereof in Wine. 3. A Cataplasim.

The Virtues.

X. *The Expressed liquid Juice.* Being bathed upon any Inflamed Part, it abates the Inflammation, and stops the fluxion. And if a little Alum and Honey is dissolved therein, it makes a good Lotion for old Sores, running Ulcers, and a virulent Gonorrhæa in Man or Woman.

XI. *The Decoction in Wine.* It makes an extraordinary Gargle for a sore Mouth and Throat, inflammation of the Uvula and Almonds, more especially if a little Alum and Honey be also dissolved therein.

XII. *The Cataplasim.* It allays Inflammations, eases Pain, and repels the Flux of Humors.

CHAP. LXV.

BETONY Wood.

I. *THE Names.* It is called by the *Arabians*, *Chusfra*; by the *Greeks*, *Kisev*, & *Pyxigesson*; by the *Latins*, *Betonica*; and by us *English*, *Betony*.

N

II. *The*

II. *The Kinds.* There are two principal kinds thereof, 1. *Keger, Betonica, Betony*; which is that of the Wood: it is twofold, viz. either with *Purple flowers*, which is most common; or with *White*: which two kinds differ nothing one from another, but only in the colour of the Flowers. 2. *Betonica Aquatica, Water Betony*, of which in the next Chapter.

III. *The Description.* Wood Betony has a Root consisting of many white, thready strings like unto those of Plantane, which generally endures all the Winter; from whence rises many Leaves, the lowermost whereof are somewhat broad, and roundish at the ends, slightly indented about the edges, and stand upon pretty long Footstalks: but those which grow by two and two at the Joints upon small slender four square and somewhat hairy Stalks, are much lesser. The Stalk is for the most part near a Foot high, and sometimes higher, and perishes every year, upon which grow some Leaves, and whereon are set several spiked heads of Flowers, of a Redish or Purple colour, spotted with white spots all over. The Seeds are longish and uneven, and of a blackish colour.

IV. That with White Flowers is wholly like to the former, save that the spiked heads of Flowers are somewhat smaller, the Flowers without any spots in them, and the Leaves something greener. There is also a Mountain Betony, which differs nothing from the first, but that the Leaves, Stalks and Flowers are smaller. There is a Broad Leav'd Betony, which differs not from the first, but in the Leaves, being two or three times as big, a larger and higher Stalk, and the Flowers being larger; this is called *Betonica Danica*. Also *Betonica Alopecuros*, Fox-tail Betony, so called from the form of the spiked head of flowers, but is every way less, as also are the Stalks and Leaves.

V. *The Places.* The common sort is usually found in Woods and Coppes, and other shady places throughout the Kingdom, and is many times nursed up in Gardens: but that with the White Flower is more usually found in stiff Clay Grounds, and in the Woods by Bromly in Kent. The first I have seve-

ral times found in, and by the Borders of Hornsey Wood, not far off the New River. That with the other are also nourished up in Gardens.

VI. *The Times.* They flower for the most part in the Months of June and July, and the Seed is ripe not long after.

VII. *The Qualities.* They are hot and dry in the second degree; Absterfve, Digestive, Disfluxive, Incarnative, and Vulnerary; Cephalick, Neurotick, Stomack, Cardiac, Hysterick, Arthritick, Alterative, and Analeptick.

VIII. *The Specification.* They are peculiar against Diseases of the Head and Nerves, as Falling-sickness, Apoplexies, Palsies, Gouts, Madness, &c.

IX. *The Preparations.* You may make thereof, 1. A liquid Juice by Expression. 2. A Decoction. 3. A Wine. 4. A Vinegar. 5. A Syrup. 6. A Spirituous Tincture. 7. An Oily Tincture. 8. A Saline Tincture. 9. An Acid Tincture. 10. An Essence. 11. A fixed Salt. 12. An Ointment. 13. A Balsam. 14. A Cataplasim.

The Virtues.

X. *The liquid Juice by Expression*, being drunk to fix or eight spoonfuls it is good against Fits, chiefly the Falling-sickness, Convulsions, and the like; and being mixed with a little powder of Sena, it prevails against Madness: being snuffed up the Nostrils, it purges the Head of Phlegm, and Cold Humors, and gives relief in the Apoplexy, Palsie, Lethargy, and other like Diseases.

XI. *The Decoction.* If made with Wine, it is Stomack and Cephalick, comforts the Nerves and Brain, refreshes the Spirits, opens Obstructions of Liver and Spleen, and is said to kill Worms, ease the Gripings of the Bowels, and the Colick. Dose half a pint.

XII. *The Vinegar.* It is Stomack, and being drunk to half a pint, or three quarters of a pint, it is said to cure Quarzan Agues, and abate the Humors which fall into the Eyes, and cause Blindness.

XIII. *The Syrup.* It is Pectoral, and causes an Expectoration of Phlegm, and other tough Viscous Humors out of the Lappets of the Lungs, and other places adjacent. It may be taken with a Liquorice Rick.

XIV. *The Spirituous Tincture.* It is a notable Medicine against all cold and moist Diseases, of the Head, Brain, Nerves and Joints; is good against Epilepsies, Apoplexies, Convulsions, Palsies, Pains and Aches of those parts; Gouts, and Weakness of the Joints, &c. Dose from half an ounce to six drams, in some fit Vehicle.

XV. *The Oily Tincture.* This is of chief use for external Applications, and is profitable to be anointed upon any pained place, proceeding from Cold, Blows, Bruises, or other weaknesses of the Limbs and Joints: being bathed upon the Head, it eases the Head-ach, Megrim, and other like Diseases.

XVI. *The Saline Tincture.* Outwardly bathed upon the Joints, it prevails against the Gout, and other pains of the Limbs, Palsies, Convulsions, or shrinking of the Sinews: drunk in White Wine from one dram to two drams, it is good against the Jaundice and Dropie, and opens Obstructions of the Reins: and given to Children from a scruple to a dram, it kills Worms, and is good against the Rickets, and expels Sand and Gravel in Reins, Ureters, and Bladder.

XVII. *The Acid Tincture.* This possibly is one of the greatest Stomackics in the World, and is an excellent thing to strengthen the Head, Stomach, and Womb, to help Digestion, cause a good Appetite,

tite, open Obstructions of the *Viscera*, and to cure Coughs, Colds, Wheezings, Shortness of Breath, stop inward Bleedings, and to remove Catarrhs, which fall upon the Lungs. Dose, a quarter of a Spoonful, more or less, in a Glass of Generous Wine.

XVIII. *The Essence*. Taken inwardly two or three or more Spoonfuls at a time, Morning and Evening, it is good against the Jaundice, Falling-sickness, Convulsions, Megrims, Vertigo, Stuffings of the Lungs, Gripping pains of the Bowels, and Wind Colick; it opens the Womb, and provokes the Terms in Women when stopt. It is a famous Traumatick, or Vulnerary, causing a speedy healing to old Sores, Running Ulcers, and the like; and given to Women in Travel, it causes speedy Delivery, and gives ease in the After pains, which many times come through taking cold.

XIX. *The fixed Salt*. Given to one scuple with a little Juice of Limons and Canary, it stops Vomiting; and mixt with Essence of Winter Cherries, it provokes Urine, removes stoppages of the Urinary Parts, and expels Sand, Gravel, and other Tartarous and Viscous Matter.

XX. *The Ointment*. It eases Pains and Aches, dissolves Tumors, relaxes shrunk Sinews; dissolves Congelations, and is good against Indurations of what kind soever, except they be Cancerous.

XXI. *The Balsam*. It is an excellent thing for the curing of Green Wounds, in any part of the Body, but chiefly of the Nervous Parts. It Digests, Cleanses, Incarnates, Cicatrizes, and heals Wounds of all sorts after an admirable manner; and in many cases performs the Cure in a few days time; dressing the Wound with it twice a day.

XXII. *The Cataplasim*. Made of the green Herb, and applied to the Head, it eases the Head-ach and Megrims in an hours time: applied to hard Tumors, it softens them, and dissolves the Humors gathered together in Contusions, where no Bones nor Vessels are broken. Applied to inveterate Scabs, it removes them, qualifies the sharp Humors, and in a short time after cures them.

C. M. D. LXVI.

Water BETONY.

I. *THE Names*. It knows no Greek Name: but it is called in Latin by Dodonæus, Gerard, Lobel, Lugdunensis, Parkinson, Tabernmontanus, and Turner, *Betonica Aquatica*, and *Aquaticis*. Tragus makes it his greater *Ocimastrium*: Thalius calls it *Scrophularia major aquatica*: so also Bauhinus: We in English call it Water Betony, and some Brown-wort; but this Name is more proper for the *Scrophularia major*.

II. *The Kinds*. It is the second Species of the Generick; and is also either the Greater, or the Lesser: the Greater is called in Latin and English, as aforesaid; the Lesser is called by Lobel, *Betonica aquatica minor*: Camerarius, in his Epitome of *Matthioli*, calls it *Scrophularia famina*: and in English, Water Betony the lesser, Brook-Betony, and Bishop-leaves.

III. *The Description*. The Greater has a Root consisting of a thick bush of strings and threads proceeding from a head; or of a great number of fibrous strings, which being fastned to the bottom of the Stalk, seeds it with nourishment in Summer, at the end of which time it perishes. From this Root the Stalks

rise up somewhat like Fig-wort, but generally higher, square, hard, and green, sometimes brown, set with dark, broad, green Leaves, so very like unto those of Fig-wort, that they have been often mistaken one for another, being also dented about the edges, but with rounder Notches; by the careful observing whereof, they may be distinguished; and in that respect something resembling Wood Betony Leaves, but of a larger size, and two for the most part set at a joint. At the tops of the Branches, as also at the Joints, where the Leaves come out from the middle of the Stalk upwards, come forth many round bellied Flowers, which being perfectly blown, are open at the brims, but divided into two parts, the uppermost like a hood, the lowermost like a lip hanging down, of a dark red color: which being past away, there comes round heads with small points in the ends, containing small and brownish Seed.

IV. *The Lesser kind* has thready Root almost like the former, differing only in smallness: the Stalks are square and green; the Leaves round almost, but yet pointed, and of the same dark green colour, and the Flowers are of a sad red or purple. In a word, this is in all things like the former, save only in the magnitude; this being lower and lesser by three parts in four.

V. *The Places*. The first grows in England as frequently as any Herb whatever, by Brooks, Banks of Rivers, and other Water-courses; but is seldom found far from the Water-side, unless it has been planted in a Garden. The other is found in like places in Germany near Bafil, and grows also with us, if planted in Gardens.

VI. *The Times*. They flower in July and August, and their Seed is ripe in a little time after.

VII. *The Qualities*. They are hot and dry in the end of the first degree; or beginning of the second: they are Astringent, Absterive, Digestive, Traumatick, and Vulnerary: Pectoral, Hepatick, Splenetick, Hysterick, and Arthritic; Alterative, and Analeptick.

VIII. *The Specification.* They are peculiar, the Greater especially, for the curing of the Kings-Evil, and other malign and inveterate Sores and Ulcers.

IX. *The Preparations.* There may be made from it: 1. *A liquid Juice by Expression.* 2. *A Powder.* 3. *An Effence.* 4. *A Decoction.* 5. *A Wine.* 6. *A Spirituous Tincture.* 7. *An Oily Tincture.* 8. *A Saline Tincture.* 9. *An Acid Tincture.* 10. *A Spirit.* 11. *A Salt.* 12. *A Wash.* 13. *An Oil.* 14. *A Balsam.* 15. *A Cataplasim.* 16. *A Distilled Water.* 17. *A Syrup.*

The Virtues.

X. *The liquid Juice of the whole Plant.* Mixed with Vinegar, and applied Morning and Night, it wafts and dissolves any hardness or swelling: The Juice drank five or six Spoonfuls at a time, cures the spitting of Blood, bleeding at Nose, bloody Flux, overflowing of the Terms, and represses the afflux of Blood to the Tumor in the Throat, called a *Quinsy*.

XI. *The Powder of the whole Plant.* Being drunk Morning and Evening to one dram, in any convenient Vehicle, it is much commended against the Piles or Hemorrhoids.

XII. *The Effence.* It has all the Virtues of the Juice, besides which, being taken inwardly every day for some time, Morning, Noon and Night, to three or four ounces, it wonderfully prevails against the Kings-Evil, and induces Running Sores, Old Ulcers, and Fistula's in what part of the Body soever to a speedy healing: It is also good against Scabs, Itch, Boils, Wheals, Pulhes, Leprosie, being daily drunk, as aforesaid, and outwardly bathed, and applied upon the Parts affected.

XIII. *The Decoction in Water.* It allays the heat of Fevers, quenches Thirst, and is good to Bath with in Leprosies, Scabs, Breakings out, or any other defilements of the Skin: It also gently dissolves Inflammations, and other hot Tumors.

XIV. *The Wine.* Drunk daily as a Diet Drink, wonderfully prevails against the *Scrophula*, or Kings Evil, and strikes at the Root of the Disease, whether in Old or Young: relists Vapors in Women, and helps Fits of the Mother.

XV. *The Spirituous Tincture.* Being taken for some time, it warms and dedicates a cold and moist habit of Body, comforts a cold and moist Brain, gives relief to the Nerves, strengthens the Liver and Spleen; and, as I have been told by a very understanding Midwife, it so corroborates and warms the Womb, as to cure Barrenness in Women, the which it has done in several. Dose, half a Spoonful Morning and Evening, in a Glass of Generous Wine.

XVI. *The Oily Tincture.* It cures wounds of the Nerves, takes away Pains and Aches of the Joints, proceeding from a cold Cause, gives relief in Rheumatism; and softens cold indurated Tumors. Taken daily inwardly from ten drops to twenty, in any proper Vehicle, Morning and Night, it cleanses the Reins and Womb of cold stimy Humors, and other Tartarous Mucilage.

XVII. *The Saline Tincture.* It is a famous thing to clear the Skin of Tanning, Sun-burning, Freckles, Lentils, Scabs, Itch, Scurf, Dandriff, Boils, Wheals, Scabs, Leprosie, and other like Defordations, being bathed therewith Morning and Evening for 3 or 4 days, more or less, as occasion requires: 'tis possible it may take off the old Skin, under which a new one will come beforehand. It ought to be used

simple of it felt at first; afterwards it is to be weakened, and so used, mixed with Rose-water.

XVIII. *The Acid Tincture.* Being taken for some considerable time Morning, Noon and Night, from thirty to sixty drops in any convenient Vehicle, it cures the Scurvy radically with all its Symptoms, and destroys that humor which is the cause of the Kings-Evil; it also kills Worms in Children, and by correcting the matter which breeds them, prevents their future increase.

XIX. *The Spirit.* It is Cordial, Hyfterick, Arthritic, and Antifcorbutick, and has the Virtues of the Spirituous Tincture. Dose one or two Spoonfuls.

XX. *The Salt.* It opens obstructions of the Womb, Reins, Ureters, and Bladder, carries off Watry and Hydropick Humors; is good against the Rickets in Children, and the Cachexia in Virgins, and other young Women: and dissolved in Water, is good to wash the face withal, to clear it of Sun-burnings, Tanning, Roughness, and other like deformities of the Skin.

XXI. *The Wash.* It is made of the clarified Juice mixed with the fixed Salt: to a quart of the Juice, one ounce of Salt. It is an admirable thing indeed for the Face and Skin, clearing it, as it were, of all deformities: and if to the former composition, an ounce of pure Nitre is added, it abates all manner of heats, redness of the Skin, Inflammations, and other like distaffections. If also yet you add thereto *Lac Sulphuris*, or if but flowers of Sulphur, you will find it effectual against the Itch, Pimples, Scabs, Scurfs, Dandriff, Leprosie, and all other Breakings out of the Skin whatsoever.

XXII. *The Oil by Infusion or Insolation.* It eases Pains, dissolves Tumors, and is good against Contusions or Bruises in what part of the Body soever.

XXIII. *The Balsam.* It has all the Virtues of the Saline Tincture; and, being applied, is a singular thing against Wounds new or old, running Sores, old Ulcers, malign Fistula's, and it cures Scrophula's, or Kings-Evil Sores almost to a miracle, for which reason it is called by some Authors *Scrophularia*; it being also applied to the Gout, and other Aches and Pains of the Limbs, it gives ease to them, by attracting the Humor through the Pores of the Skin.

XXIV. *The Cataplasim.* It is Diffusive, wafts and dissolves Swellings, and is profitable, being applied in Strumatick, or Kings-Evil Tumors. It the Cataplasim is only made of the green leaves beaten, and mixed with a little Vinegar, and applied Morning, Noon and Night, it does not only dissolve hard Tumors, but heals old, rotten, corrupted, spreading and fretting Sores and Ulcers, corrects the virulence of Pockey Sores, and stops the malignity of Cancers; and this more especially, if a proportional quantity of *Litharge*, or *Saccharum Saturni* be added thereto.

XXV. *The Distilled Water.* It is Cosmetick, and is of the nature of the Saline Tincture, and the Wash, having the same Virtues; but it is nothing near so powerful. However, where water is necessary to be mixed with them, this, as being more homogene, may be used in its place.

XXVI. *The Syrup; if it is made with Honey and Juice of Limons, or pure Wine Vinegar.* It is an excellent thing to open Obstructions of the Brest and Lungs, help shortness of Breath, cause Expectoration, and to expel those gross and obnoxious Humors which cause the Scurvy, Gout, Rheumatism, Kings-Evil, and are the Ground and Foundation of all sorts of Fevers happening to the Bodies of Human Kind.

C H A P. LXVII.

BIFOIL, or TWA-BLADE.

THE Names. It was not known to the Greeks, unless the *Ophris* of Pliny be it, which some Herborists believe, and therefore call this Plant by that name: in Latin it is also called *Ophris* and *Bisfolium*: and in English, *Bifoil* or *Twa-blade*.

II. The Kinds. There are two Kinds thereof, viz. 1. *Ophris seu Bisfolium, sylvestre vulgare*, Common Wood Bifoil or Twa-blade. 2. *Bisfolium Palustre*, Marsh Bifoil.

III. The Description. It has a Root somewhat sweet, with a head or top somewhat thick (which some call a Bulbe) shooting many long Fibres downwards, from which Root rises up a round green Stalk, bare or naked next to the ground, for an Inch, two, or three, to the middle thereof, as the Plant is in age and growth, as also from the middle upwards unto the Flowers, having only two broad and short ribb'd pale green or hoary Leaves, very like unto Plantane leaves, but whiter, and set at the middle of the Stalk, one on each side, and encompassing it at bottom: sometimes it will have three leaves, but is more rare; and this some account to be a different sort, but is rather to be looked upon to be *lufus Naturæ*, in ground which abounds with too much nourishment, the which happens also to many other Plants; (as in Herb Paris, which has sometimes five, six or seven leaves, and sometimes it wants a leaf of its ordinary number being but four, and in common Trefoil, which usually has but three leaves, yet oftentimes four are found upon several Stalks, &c.) the Flowers at top of the Stalks, are in a spiked head, and they are many, small, long, whitish green, and almost shapeless bodies, somewhat like unto some of the Orchides or Vulgar Satyrians: these passing away, there remains small heads, with a kind of dust in them, which is accounted to be the Seed.

IV. The Marsh Bifoil has a Root which runs or creeps in the Earth, and the whole plant is so little differing from the former, that the differences have scarcely been observed, whereby several have been deceived in their judgments; but in these following particulars it is distinguished, 1. In its Site, or place of growing. 2. In the smallness of the Plant, this being much lesser, and having sometimes three leaves also. 3. In the Greenness, the other being of a more hoary White. 4. In the spike of Flowers, which although of the same fashion or colour, or very near, yet are less by far.

V. The Places. The first usually grows in Woods or Copses, and such like shady places, as between Highgate and Hamstead, also at Southfleet in Kent; in a Wood by Longfield Downs: in the Woods by Ootenden near to Clare in Essex; as also in the Woods by Dunmow in Essex. The other grows not only in the low wet grounds between Hatfield and St. Albans, but also in divers places in Ramney Marsh.

VI. The Times. They flower for the most part in May, and so continue to the middle or end of June, and then wholly wither away, and are gone in July.

VII. The Qualities. They are Temperate in their first qualities, Glutinative and Vulnerary; Neurotick, Arthritick, and Alterative.

VIII. The Specification. They are Adapted for the Cure of Green Wounds.

IX. The Preparations. These may be made from it: 1. A Liquid Juice. 2. An Essence. 3. A Decoction in Wine. 4. A Powder. 5. An Ointment. 6. A Balsam. 7. A Cataplasim.

The Virtues.

X. The liquid Juice. If mixt with Nettle, it always Inflamations; and gives ease in the Gout; so also if mixed with Vinegar.

XI. The Essence. It is Glutinous, and heals Wounds (if simple) by washing them therewith; more especially if at time of using, it is mixed with a third part of Wine, or Spirit of Wine: it prevails also against Ruptures.

XII. The Decoction. It is of admirable use in dilacerated Contusions, for it draws forth the scattered and bruised Blood, cleanses the Wound, and disposes it to healing.

XIII. The powder of the Leaves. It disposes green wounds to healing, dries and heals.

XIV. The Ointment. It softens, gives ease in pain, and cleanses Wounds without any sharpness, whether new or old: and is of good use in Ruptures.

XV. The Balsam. It cures all simple wounds commonly at one dressing, and if they be contused and dilacerated, it digests them, cleanses them, and after an admirable manner speedily heals them.

XVI. The Cataplasim. It dissolves soft Tumors, and Contusions, where the skin is not broken: and applied upon an old open Ulcer, causes a separation of the Stuff from the quick flesh, and disposes it for healing, to be accomplished by other proper Medicines.

C H A P. LXVIII.

BIND-WEED Common.

THE Names. It is called in Greek, by Galen, and Paulus Aegineta, *ῥάδα*; in Latin, *Smilax levis*: it is called *Levis* or *Smooth*, because the Stalks and Branches have no prickles at all. Pliny lib. 21. cap. 5. calls it *Cervolentia*, and

Campd.

Companella, Convolvulus albus, also Vinis Arborum: others call it *Volubilis*, also *Volubilis communis*: and in English, Bindweed, White Bindweed, and the Greater Bindweed.

Gr. Bindweed common.

II. *The Kinds.* Of the Bind-weeds we have to treat of in this Work, there are chiefly three, 1. *The Common great Bindweed*, as also the *Less* aforementioned, of which in this Chap. 2. *The lesser Blew Bind-weed.* 3. *The Black Bind-weed.* Of which in the two next.

Great Bindweed

III. *The Description.* The Root is whitish and small, of the largeness of Quitch-grass, or something

bigger, running much under ground, and shooting forth again in several places: it lives under ground all Winter, and shoots forth a fresh every Spring, and yields Milk, being broken. From this Root springs up slender winding Stalks, which run up, and wind themselves upon hedges, bushes, or what is next it to catch hold of; and if there is nothing for it to climb upon, it runs it self along upon the ground, especially on the banks of dry ditches. The Leaves are divers and large, growing severally on the Stalks, somewhat long, and pointed at the further end, and parted into two parts or points at the broad part next to the Stalk, making it seem almost three square, being smooth, and of a pale green colour, yielding a milk, being broken, but not so plentifully as Scammony. At the Joints with the Leaves towards the tops of the Branches come forth large White Flowers, in fashion of a Bell, without any cut or division in them; which being passed off, there comes forth round skinny Husks, or Heads, containing within them many small blackish Seeds, and almost three cornered. This Great Bind-weed is so like unto Scammony, that excepting the largeness of the Roots, and the greater force in purging, which may both of them proceed in part from the Climate, one would think it to be one of the kinds of Scammony, whose many slender winding Stalks run up, and wind themselves upon whatever stands next, or near to them.

Bindweed Common Small

IV. *The Lesser* is like the Greater in most respects, except the Magnitude.

V. *The Places.* It grows throughout this Kingdom, near hedges and dry ditches, and other like places.

VI. *The Times.* It Flowers with us in June, July and August; and the Seed is ripe in some small time afterwards.

VII. *The Qualities.* It is hot and dry in the first degree: Vulnerary, Arthritick, and a little Cathartick.

VIII. *The Specification.* It is peculiar for wasting and dissolving Tumors.

IX. *The Preparations.* You may make therefrom, 1. *The inspissate Juice.* 2. *The liquid Juice.* 3. *The powder of the Leaves, Flowers, and Roots, or of the inspissate Juice.* 4. *The Balsam.* 5. *The Cataplasm.* 6. *The Distilled Water.*

The

The Virtues.

X. *The inspissate Juice.* Being dissolved in Wine, it makes an excellent Wash to cleanse old Sores, filthy, putrid, and running Ulcers, and hollow Fistula's, inducing them to a speedy cure.

XI. *The liquid Juice.* Mixt with Red Wine, it is a very good thing for a sore Mouth, and is of use to heal Cankers in the Mouths of little Children: and if Childrens Feet, who are usually troubled with Chilblains or Kibes, be washed often herewith, it perfectly cures.

XII. *The Powder of the Roots, Leaves, Flowers, or inspissate Juice.* It admirably cleanses and heals old, rotten, and stinking Ulcers: and where the Bone has been putrified, it has perfectly cleansed the Ulcer, dried the Bone, and in a little time sealed it, and afterwards by the continual application, it has covered it with Flesh, incarnated the Ulcer, and in a little time healed it: I speak this by great experience: One time it happened, that a Youth who had Kibes in his Feet, and so much corrupted, that the Bone it self was putrified; by the sole application of this powder, dry, upon the Ulcer, I cleansed it, sealed the Bone which was black, and afterwards incarnated and healed the Ulcer, beyond the expectation of any one that then saw it.

XIII. *The Balsam.* It is singular good for the curing of Wounds, but chiefly of old and putrid Ulcers, and especially of those Ulcers which arise from Kibes in Childrens Feet, or from Tumors in the Kings-Evil.

XIV. *The Cataplasim.* Being made of the green Herb, and applied to the grieved place, it waxes, dissolves, or discusses Tumors or Swellings, as *Galen* saith: I know it to be excellent to discuss Chilblains in Childrens Feet.

XV. *The Distilled Water.* It is a good Cosmectick, and as some say, good against Freckles, Pimples, Scurf, and other defilements of the Skin: it takes away Tanning, Sunburning, and redness of the Face and Hands: and this it does more especially, if it is mixt with a small quantity (some say, equal parts) of Vinegar, or Juice of Limons.

CHAP. LXIX.

The Lesser BLEW BINDWEED.

I. *THE Names.* It is called in *Latin*, *Convolvulus minor*, and *Volubilis minor*, to which they add *Purpureus*, because of the Purple color of the Flower: And in *English*, *Bindweed the lesser*, and *Blew or Purple Bindweed*.

II. *The Kinds.* There are several Species of it, as, 1. *Convolvulus minor vulgaris*, The Common Small Bindweed. 2. *Althæa foliis*, Mallow leav'd. 3. *Purpureus*, Purple Bindweed. 4. *Ceruleus Hispanicus*, Blew Spanish Bindweed. 5. *Convolvulus Spice foliis*, Lavender leav'd Bindweed: of all which in order.

III. *The Description.* It has a Root small and slender, running both very deep into the ground, and spreading also far about, especially where the ground is loose and mellow: From this Root comes Stalks, which rise up and wind themselves upon any thing which is near it, but otherwise usually spreads every way on the Earth, with long trailing and winding Branches, one within another, having Leaves thereon, somewhat like unto the greater White Bindweed, but much lesser: The Flower is for form, like the former White Bell-Flower, and is sometimes wholly

White, or has Plaits purplish, but less, made of one leaf plaited as it were into five folds, and opening wide at the Brims: after which come small blackish Seed, contained in small, long and round heads.

Small Bindweed
Blew.Bind weed
Blew.

IV. The Mallow leav'd has a small and brownish Root, creeping under ground, and shooting up branches in distant places: From this Root springs branches, which grow not high, nor climb much upon any thing, but for the most part lyes with its small, slender, hairy twigs upon the Earth, having divers leaves

very

very thin, or porcely set on them, something broad and long, like unto the leaves of Marsh-mallows, but smaller, crumpled, and cut in on both sides, at the lower ends, dented about the edges, and of a hoary or dusky grayish green Color, which when they are cleaved, are clammy, or sticking like Gum to the Teeth, sharp, and somewhat bitter in taste. The Flowers come forth one by one at the Joints with the Leaves, all along the Stalk, up to the top, every one upon a long Stalk, which are very like the former, just before described; they consist of one whole leaf, yet plaited as it were before the opening into five points, and being open, have five corners, as if it had five leaves, broad like a Cup or Bell at the brims, and small at the bottom, of a fine pale Purple color, and sometimes deeper, after which come forth heads of small Seed.

V. The Small Purple Bindweed, is in all things like unto the first of these described in this Chapter, saving that the Flowers are of a pale purplish, or blewish color, the folds being White, or of a deeper Purple without, and White within, the bottom being also agreeable therewith, which is of much beauty.

VI. The Spanish Blew Bindweed, has a small thready Root, which dies every Year, from which shoots forth several small Branches a yard long, or more, having several Leaves standing singly thereon, small and long at the bottom, and broader, and almost round at the end, a little hairy as it were, all over. At every leaf for the most part, from the middle of the Stalks upwards, comes forth a Flower, like unto the common sort, folded into five points, which open into so many corners, of a most admirable Sky colored Blew (so pleasant to behold, that it amazes the Spectators) with White bottoms, pointed upwards, and Yellow in the middle, which passing away, there comes small, round white heads, containing within them, small blackish cornered Seed, which is to be new sown every Year.

VII. The Lavender leaved, This is like the first in all things, except the Leaves, which are long and narrow, resembling those of Lavender, or Linaria: But it has a finer Flower, plaited or folded in the compass of its Bell very orderly, especially before the Sun rise, for afterwards, when it opens its self, the folds are not so much perceived, and it is of a deep Purple color: the Seed is not unlike the rest, corner'd and flat, growing out of slender Branches, which stand upright and thick together, proceeding from a White woody Root.

VIII. The Places. The First of these is common, and grows almost every where in Fields, By-ways, dry Ditches, Ditch banks, and Hedge sides, through England. The Second and Fourth grow in Spain, and are nourished up with us in Gardens. The Third and Fifth are common with us in England: This Fifth or last, Gerard says he found it growing in the Corn Fields about Great Dunmow in Essex, in such abundance, that it does much hurt to the Corn, and Parkinson says, it is as great a plague to the Fields where it grows, as the first is.

IX. The Times. They all flower from May to the end of August, and the Seed ripens gradually in the mean Season.

X. The Qualities. They are all much of a Nature, being hot and dry in the first Degree, a little Astringent, Vulnerary, Arthritick, and Alterative.

XI. The Preparations. You may have, 1. A li- quid Juice. 2. An Essence. 3. A Powder. 4. A Balsam. 5. A Cataplasm. 6. A Distilled Water.

The Virtues.

XII. The liquid Juice. Being often snuffed up the Nostrils till it comes out again at the Mouth,

it cleanses and heals Running Sores or Ulcers in those parts: And if a little Nitre is dissolved in it, it purges the Head and Brain.

XIII. The Essence. It has the same Virtues, but is more Discurfve, and prevalent for the cleansing of Ulcers, and healing of Wounds.

XIV. The Powder. Strewed upon a foul Ulcer, it cleanses it (if also washed with the Essence) and afterwards it incarnates and heals.

XV. The Balsam. It is an excellent Vulnerary, and cures simple Wounds many times at once dressing.

XVI. The Cataplasm. Made of the Green Herb, it discurfes Tumors, and applied upon Contusions disperses the Humors gathered together.

XVII. The Distilled Water. If you dissolve a little Sal Prunella, or Nitre in it, it is good against Heats and Breakings out in the Face, Tannings, Sun-burnings, Pimples, Scurf, and other like Deformities.

CHAP. LXX.

BINDWEED Black.

I. THE Names. It is supposed to be called in Greek *Εὐκλιν καὶ σάουρα* &c. In Latin, *Helxine Cissampelos*, *Convolvulus minor niger*; Label calls it *Cissampelos altera atriplicis effigie*: Dodonæus calls it, *Convolvulus niger*: Thales calls it, *Volubilis media five nigra*: Columna calls it, *Polygonum Hederaecum*: Cordus on *Diescorides* takes it to be *Elatine*: And *Angulora* will have it to be *Centunculus Phniz*: in English, *Black Bindweed*.

II. The Kinds. There is, 1. The Common Black Bindweed, which though it is one of the small Bindweeds, yet is the greater of the Black. 2. *Cissampelos altera Anglica minima*, The smallest Black Bindweed, of English Growth.

III. The

III. The Description. It has a Root small and slender, perishing every Year, and rising again from the Seed every Spring, unless it be weeded out of the Garden. From this Root rises up Branches, which if they meet not with upright tall Herbs, or other things whereon it may climb, it rises up but a little height, and leans down again to the ground; but otherwise if it meets with fit things, on which it may cling, it will wind it self with its long, slender, reddish, thready Branches about them, to the height of three or four Feet, or more, shooting forth its Leaves singly at the Joints as the others do, either somewhat like to an Arrach leaf, or almost like the first small field Bindweed, or like the leaf of Black Briony, for of those kinds there are, but much smaller. The Flowers, Gerard says, are small, like those of the Arrach; and Parkinson says, they are very small, and many, standing together upon a small long Stalk, which comes from the Joint where the leaf stands, and are of a reddish green color, but so small, that they are oftentimes not taken notice of, and they so quickly fade, that they are scarcely regarded: The Flowers being gone, then comes the Seed, which is small, blackish, and three cornered, like, but less than that of Buck Wheat.

IV. The smallest kind of Black Bindweed, differs from the former only in the Magnitude, this rising not above a hand breadth high.

V. The Places. They grow in many places of this Kingdom, both in Fields and Gardens, where they grow as a Weed. The larger of them is not only a hurtful Weed, but of an ill smell, and too often found amongst Corn.

VI. The Times. They flower in May, June, July and August, and the Seed ripens in the mean Season, in a little time after the Flower is gone.

VII. The Qualities. They are hot and dry in the first Degree, Discussive, Vulnerary, Arthritic and Solutive.

VIII. The Preparations. You may make thereof, 1. A liquid Juice. 2. An Essence. 3. A Balsam. 4. A Cataplasim. 5. A Distilled Water.

The Vertues.

IX. The liquid Juice. It is made of the Leaves only, and if it is taken inwardly 3 or 4 ounces at a time, it loosens and opens the Belly very much.

X. The Essence. It has the same Virtues to loosen the Belly; besides I have heard it confirmed from Experience, that it is prevalent against the King's Evil.

XI. The Balsam. It is very good for healing green Wounds, and to cleanse Old Ulcers, and Running Sores, and to cure Kibes in Childrens heels.

XII. The Cataplasim, made of the Green Leaves. It dissolves and discusses Tumors or Swellings, and hard Lumps in the Flesh, as Galen says: and if mixed with a little Nitre, it allays Inflammations.

XIII. The Distilled Water. It is good against Pimples, Scurf, Freckles, Tannings, Sun-burnings, and other deformities of the Skin; more especially if a little Vinegar, or Juice of Limons is mixed with it.

CHAP. LXXI. BINDWEED Sea.

I. THE Names. I cannot find that the Greeks knew any thing of it: The Latins call it *Soldanella*, and *Soldana*, *Convolvulus Marinus*, and *Tussilago Marina* (from the resemblance of the Leaves:) And we in English only Sea Bindweed, and

Sea Bells, or Bell-flower. I know that *Moribolus*, *Cordus*, *Gesner*, *Camerarius*, *Nodonzus*, and others, call it *Brafica Marina*, but it is no such thing, for that is clearly another Plant.

II The Kinds. There are three Kinds thereof.

1. *Soldanella*, Sea Bindweed, properly so called.
2. *Soldanella Maritima major*, the Greater Sea Bindweed.
3. *Soldanella Alpina*, Mountain *Soldanella*.

III. The Description. The first of these has a Root small and long, spreading a little in the ground, and shooting up divers heads in several places; and if any part of it is broken, there comes forth from it (as also from the Leaves) a whitish water, which is bitter, salt, and unpleasant. From this Root rises many weak, slender, brownish green branches, trailing or lying upon the ground, rather than raising it self up, or climbing upon other things. Upon these Stalks are set divers Leaves, not always two together at a Joint, nor yet always single, one at a Joint, which are always round like the Leaves of Asarabacca, but a little unevenly dented about the edges, and thicker, every one standing on a long footstalk, and of a grayish green color: among which come forth the Flowers towards the ends, each Flower by it self, springing forth at the Joints, much like in shape or form to the Common Small Bindweed, which grows upon the ground by way sides almost every where; but they are a little larger, and of a reddish purple color: These being past away, there comes round heads, containing within them 2 or 3 round black Seeds.

IV. The greater Sea Bindweed, has a Root a little creeping in the Earth, from whence shoots up several long slender Branches, on which are set larger Leaves than on the former, many of them having a division on both sides the Leaf next to the bottom, and many of them but on one side, and several of them which are smaller, having none at all; yet all of them for the most part a little sinuated on the edges towards the ends, which are round, or with a dent in the middle, making the point seem double forked, with many Veins running therein. The Flowers are of a red purple color, and are not Bell or Cup fashion like

the former, but consist of five somewhat large and long Leaves. The Heads and Seeds are like the other, and Spring up by being scattered after Seed time.

V. *Soldanella Alpina major*, The greater Mountain *Soldanella* (for there is a lesser, of which we shall take no notice here) has a long round Head or Root shooting forth many Fibres, or small Strings. From whence rises many hard round Leaves, standing upon long Root-stalks, something unevenly cut about the edges; green on the upper side, and of a grayish green underneath, and a little reddish like the leaves of Sowbread, and much resembling the Sea *Soldanella* (this Mountain *Soldanella* being so called from the likeness of the Leaves to the former:) The Stalks are slender, small, round, and reddish, about a span high, having upon them four or five Flowers at Top, every one hanging down their heads like unto a Bell-Flower, consisting but of one leaf, plaited into five folds, each of them ending in a long point, which makes the Flower seem to have five leaves, having a round green head in the middle, with a prick or point at the end thereof. The Flower is of a fair blew color, some deeper, some paler, and some almost white, as nature pleases, but without any smell at all. The middle head, after the flower is fallen, grows to be a long, round Pod, bearing the pointed it had at the end thereof, in which is contained small greenish Seed.

VI. *The Places*. The two first Kinds grow on our own Sea Coast in great plenty, in many places, as near *Lee* in *Essex*, at *Mersy* in *Essex*, and in most places in the Isles of *Thames* or *Shepey*, as also along the Northern Coast: The last grows on the *Alps*, and Mountains of *Germany*: It also grows on the Mountains of *Wales*, not far from *Cowmers Meer* in *North Wales*.

VII. *The Times*. The two former flower, *Gerard* says, in *June*, but *Purkinson*, about the end of *Summer*, and their Seed is ripe in *August*. The third flowers on the *Alps*, &c. not till *July* or *August*, as the Snow melts sooner or later; but in Gardens it flowers in *April*.

VIII. *The Qualities*. *Soldanella* is hot and dry in the second Degree, Astringent, Hepatick, Cathartick and Emetick; but is said to be a great Enemy to the Stomach.

IX. *The Specification*. It is said to be a peculiar thing for curing the Dropick.

X. *The Preparations*. 1. *The Decolion*. 2. *The Juice*. 3. *The Inspissate Juice*. 4. *The Essence*. 5. *The Powder*. 6. *The Cataplasim*. 7. *The Balm of the Mountain Soldanella*.

The Virtues.

XI. *The Decolion*. It ought to be made in Fat Mutton or Beef Broth, (because of its strength, and aptness to trouble the Stomach) opens the Belly powerfully, and purges violently in Dropicks, and Timpanies, and therefore is not to be given, but so such as are of a strong Constitution; it opens Obstructions of the Liver, and strengthens the same.

XII. *The liquid Juice*. It is both Emetick and Cathartick, and makes Sick; but in such Bodies as can bear its violence, it effectually carries off Watry Humors. An ounce mixt with a good Glas of White Wine will purge some People very well: others may take two ounces or more; whereas half an ounce will powerfully purge others.

XIII. *The Inspissate Juice*. This is not to be press'd out, but suttered to issue out of its own Accord when the Herb or Stalk is broken; this being dried, and afterwards softened with the Essence, or Wine, or other like Liquid, so as to be used Plaster-wise, being applied to the bottom of the Belly, admirably draws forth the Watry Humor in Dropicks.

XIV. *The Essence*. It has the Virtues of the liquid Juice, but more correct and free from Crudities, and therefore more gentle in its Operation: Being given in Wine from half an ounce, to an ounce, it kills Worms both in Children, and Elder People.

XV. *The Powder*. It is made of the Leaves dried, and ought to be corrected with Anniseeds, Carraways, Cinnamon, Cubels, Ginger, Zedoary and Sugar: So prepared and given, it kills Worms in Children, and purges the Belly: The simple powder is good also to cleanse Sores and Ulcers, to incamate or breed Flesh in deep and hollow Ulcers, and also to heal them.

XVI. *The Cataplasim*. Made of the Green Leaves, and applied to the Belly, it is said to purge the Bowels by Stool, and drive forth the Watry Humor which causes the Dropick: but it must be often applied, and renewed with fresh Herbs; and so it is profitable against the Sciatica and Gout.

XVII. *The Balm of the Mountain Soldanella*. It is an admirable Vulnery, curing not only green Wounds with much ease and speed; but it also cleanses old and rotten Ulcers, and putrid Sores, destroying the Putridity. It wonderfully incarnates or breeds Flesh in Wounds, and heals them.

XVIII. *Gerard* says, That the German Physicians do much boast of the Wonders they have done with *Soldanella Montana*: That the Leaves applied as a Cataplasim to the Navel, and somewhat lower, draws forth Water from the Bellies of such as are Hydropick: and this effect (says he) it works in other parts without heating.

CHAP. LXXII.

BIRDSEYE.

I. *THE Names*. I find no Greek Name that this Plant has: but it is called in *Latin*, *Paralytica Alpina*, *Primula veris minor*; by some *Sanicula angustifolia*: in *English*, *Birds-Eye*, and *Birds-cyne*.

II. *The*

II. *The Kinds.* This Plant doubtless belongs to the tribe of the *Cowslips*, of which it is a special Kind, as being a *lesser sort*. There are also two Species of *Birds-Eye*, viz. 1. *Paralysis minor flore rubro*, the *lesser Cowslip*, which is also the *lesser Birds-Eye* with Red Flowers. 2. *Paralysis minor flore albo*, the *lesser Cowslip*, which is the greater *Birds-Eye* with White Flowers.

III. *The Description.* Red *Birds-Eye*, which is the smaller Plant, has Roots small, white and thready, from which arises up a head of Leaves so closed together, that it seems a small white head: this afterwards opening it self Spreads round upon the ground, and has small long and narrow Leaves, snipt about the edges, of a pale green colour, on the upper side, but very white or mealy underneath: among these Leaves rise up one or two Stalks, small and hoary, half a foot high, bearing at top a bush or tuft of much smaller flowers, standing upon short Foot-stalks, something like to Cowslips, but more like unto Bears-Ears, of a fine reddish purple colour, in some deeper, in others paler, with a yellowish Circle in the bottoms of the Flowers, like unto many of the Bears-Ears, of a faint, but little scent; after which comes a Seed, smaller than that of Cowslips.

IV. *White Birds-Eye*, which is the greater of the two, differs little from the former, save that it is a little larger both in its Leaf and Flower, and that the Flowers hereof are wholly white, without any great appearance of a Circle in the bottom of them, unless it is well observed, at least it is not so conspicuous as the former: both these Kinds of Cowslips have sometimes, though but seldom, from the midst of the Flower on the Stalk, sent forth another small Stalk, bearing Flowers thereon likewise.

V. *The Places.* They have been found growing wild in Clofes and Pasture Grounds in many places of England, from whence they have been transplanted into Gardens for the pleasantness of their Flowers.

VI. *The Times.* The Red *Birds-Eye*, for all the care and industry we can use to keep it, will scarce-

ly endure in our Gardens, but all the Winter long, till the Spring begins, its Leaves are so closed together, that it seems a white head of Leaves. They both flower in the Spring of the Year, some earlier, and some later, according to the mildness of the Season.

VII. *The Qualities, Specification, Preparations and Virtues* are the same with those of *Cowslips*, and therefore referring you thither, we shall say no more concerning the same in this place.

CHAP. LXXIII.

BIRDS-NEST.

I. *THE Names.* It is called in Greek by *Dodonæus*, *Neotia*: and in Latin, *Neottia*, *Nidus Avis*: by *Gesner*, it is called, *Orobanche*: by *Lobel*, *Satyrion abortivum*, and *Orchis abortiva*: but we in English call it *Birds-Nest*, or *Goose-Nest*, from the Platting of the Roots, like the sticks and straws of a *Crows* or *Birds-Nest*.

II. *The Kinds.* Authors make two sorts thereof, the one not much differing from another, save in the color: the first and longest known is of a yellowish colour: the other of a purplish Violet, and is called by *Clusius*, *Limodorum*, and *Pseudolimodorum*.

Birds-nest.

IV. *The Description.* Yellow *Birds-Nest* has a great number of Fibres or thready Roots crossing one over another, and as it were platted, or intricately entangled together like a *Crows Nest*: from which rises up a thick, soft, gross, brown Stalk, set with small short Leaves, of the color of a dry Oaken leaf, which has laid under the Tree all Winter. *Parkinson* says, the Stalks are upright, weak, and sappy, and that the Leaves are only a shew, being rather

very short thin skins than leaves, of a brownish dead yellow color. The Flowers also are of a dead yellowish color, and stand upon a spiked head, like unto that of the Orchis, and of the same fashion; after which follows Husks of dusty Seed.

IV. The Purple Birds-Nest has a Root exactly like the former, from whence rise up a Stalk or Stalks about eight or nine inches high, the lower part of which within the ground is not round like the former, but slender, and of a yellowish white color: the Stalks are set with a few small, narrow, short, skinny, sharp pointed Leaves, set without any order, very little, or almost nothing at all wrapping or enclosing the Stalk, which has a spike of Flowers very like the former, without Tails or Leaves growing amongst them. The whole Plant, as it appears above ground, Stalks, Leaves and Flowers, is of a Violet, or deep Purple color: after the Flowers are fallen, there succeed Vessels full of small Seed, like the former.

V. The Places. They are both found in many places of England, in Woods, and low Copfes: but they are not so much found in the Southern Parts of the Kingdom, as in the Northern: It is said, that they grow near to a Village called *Knaresborough* in *Yorkshire*. Gerard found it growing in the middle of a Wood in *Kent*, two Miles from *Gravefend*, near to the then Mr. *William Swans* house of *Hooch-Green*; the Wood then belonging to one Mr. *John Sidley*; the ground in the same place (says he) is covered all over with the Herb *Samice*, and with that kind of Orchis, called *Hermaphrodita*, or *Butterfly Satyrion*.

VI. The Times. It flourishes and flowers in *June*, *July* and *August*, and its Seed (if it may be called Seed) which is mealy or dusty, falls in the end of *August*: But Gerard will not allow it to be any Seed at all.

VII. The Virtues. No Authors that have ever wrote of it, have assigned it any Virtues: however it is certain, that it is of the Nature of the Orchis, and possibly may have their Qualities, Properties, and Effects, being in like manner applied.

CHAP. LXXIV.

BISHOPS-WEED Common.

THE Names. It is called in Greek *ἄμμι*, and *ἄμμι*, (from the finallness of the Seed which resembles Sand:) In Latin, *Ammi*, and *Ameos* (the Genitive Case:) Some call it *Cuminum Ethiopicum* (from the likeness to that of *Cumin*,) also *Cuminum Regium*, *Royal Cumin* (from its excellent properties:) In Arabic it is called *Hanochab*, *Anzave*, *Nacachau*, *Nacachave*: And in English it is called, *Bishops-Weed*, *Herb-William*, and by some, *Bullwort*.

II. The Kinds. They are of two principal Kinds, 1. Domestic, called in Latin, *Ammi Vulgare*, and *Vulgatus*: It is called by *Tabermontanus*, *Ammio scelinum*, which is our English *Bishops-Weed*.

2. Foreign, and is twofold, 1. *Ammi Creticum*, as *Camerarius* calls it, *Ammi Creticum Aromaticum*, as *Lobel* calls it, *Bishops-weed of Candy*. 2. *Ammi parvum foliis semiculi*, *Ammi alternum parvum*, by *Dodonæus*; *Ammi verum* by *Gesner*, (but *Parkinson* says, the true *Ammi* of *Dioscorides* is not known) 'Tis true, *Dioscorides* does not describe it; but from some remarks taken from him, from *Pliny*, and from *Galen*, it is almost plainly deciphered, especially the Seed, as being much smaller and whiter than *Cumin* Seed, and smelling like *Origanum*: Now none of

the Seeds which the Apothecaries use, or have been shew'd for *Ammi*, can be compared with *Cumin*, nor have they the smell of *Origanum*: in English, *Small Bishops-weed*: Of these two last we shall treat in the next Chapter.

III. The Description. Our Common *Bishops-weed* has a Root White and Fibrous, perishing every Year, after it has Seeded, and commonly rising again of its own sowing: From this Root rises up a round straight Stalk, sometimes as tall as a Man, but commonly 3 or 4 feet high, set with several small, long, and somewhat broad Leaves, cut in, in some places, and snipt or dented about the edges, growing on both sides of a long footstalk one against another, of a dark green color, somewhat like unto *Skirret* Leaves, having several Branches on them; and at the tops small Umbles of white Flowers, which turn into small, round, and brown Seed, little bigger than *Parsley* Seed, and not so large as *Anise* Seed, of a brisk quick smell, and hot taste.

IV. The Places. It is found growing Wild in many places of England and Wales; by a hedge side next field beyond *Green Hilde*, on the way as you go to *Gravefend*; and with us it is also nourished up in Gardens.

V. The Times. It flowers in *June* and *July*, and the Seed is ripe towards the latter end of *August*.

VI. The Qualities. It is hot and dry in the third Degree, the Seed more especially. It is attenuating, Disculsive, Diuretick, Nephritick, Hyfterick, and Arthritick; Alterative, and Alexipharmick. It is bitter in taste, of thin parts, and sharp withal.

VII. The Specification. It is approved against the Cholick, and mightily provokes Lust; which I believe is from its Spermatogenetic faculty.

VIII. The Preparations. You may make therefrom, 1. A liquid Juice. 2. An Essence. 3. A Distilled Water. 4. A Powder from the Seed. 5. A Spirituous Tincture of the same. 6. An Oily Tincture. 7. A Saline Tincture. 8. A Spirit. 9. A Chymical Oil of the Seed. 10. A Fixed Salt. 11. Potestates or Powers. 12. A Balsam. 13. A Cataplasm of the green Herb.

The

The Virtues.

IX. *The liquid Juice.* It is very thin and subtil, digests Humors, expels Wind, and gives ease in the Gripings of the Guts. Dose from iv. to viij. spoonfuls in a glass of Canary, Sherry, or other generous Wine, two or three times a day.

X. *The Essence.* It has the Virtues of the Juice, but more powerful to the purposes intended, it provokes Urine, and the Courses in Women when stopt, helps the Cholick, and is very powerful against the biting of Mad Dogs, Serpents, as the Viper, Rattle-snake, Slow-worm, or the biting or stinging of any other Venemous Creature whatsoever, being given Morning, Noon and Night, from iij. ounces to vi. in a glass of any generous Wine.

XI. *The Distilled Water.* It is stomachick, and has the Virtues of the Essence, but very much Weaker, and therefore may serve as a Vehicle, to convey any Medicine in, good against those kinds of Diseases.

XII. *The Powder of the Seed.* It expels Wind, comforts the Stomach, and other *Viscera*, gives ease in the Cholick, and has been found, by experience, to be profitable against the Stone, Sand, Gravel, or any Tartarous or Slimy Matter in the Reins, Ureters and Bladder. It may be given (mixed with Sugar) in a glass of White or Rhenish Wine.

XIII. *The Spiritous Tincture from the Seed.* It is Cordial and Stomachick, good against Vapors, Wind, Fainting and Swooning Fits, *Cardialgia*, Palpitation of the Heart, Poyson of Vipers, Rattle-snakes, Mad-Dogs, and the biting or stinging of any other venemous Creature. Dose from one Dram to two, in a glass of excellent Wine.

XIV. *The Oily Tincture.* It is good against Palsies, Convulsions, Rheumatisms, Pains, Aches, Weaknesses, and Punctures of the Nerves in any part of the Body: It eases the pain of the Gout, proceeding from a cold cause, softens, dissolves, and wasts cold Tumors, and is of admirable use, being taken inwardly, for the most inveterate Pains of the Back, or any Obstruction of the Reins, Ureters or Bladder. Dose from half a dram to one or two drams Morning and Evening in a glass of White Wine.

XV. *The Saline Tincture.* This may be made either of the Seed, or of the whole green Plant. It is good to take away Black and Blew Marks, Spots, Tanning, Sun-burning, and other deformities of the Skin, it being often washed therewith, it also is said to abate an high color, and a Spong being dipt therein, and applied upon the biting of any Venemous Beast, especially that of a Mad Dog, it effectually attracts and draws out the Poyson: It also dissolves the afflux of humors in Contusions; and being drank to one dram in White Wine, it is prevalent against Fits of the Mother in Women, and is good against the evil Effects of *Cantharides*, if timely taken in some proper Emulsion.

XVI. *The Spirit.* It is an excellent Cordial, good against Fainting and Swooning Fits, eases the Passions of the Heart, cheers the Spirits, comforts Nature, provokes Lust, strengthens the Womb, and all the Instruments of Generation in both Sexes; and has indeed all the Virtues of the Spiritous Tincture, but not altogether so powerful. Dose from two drams to four, alone by it self, if dulcified, otherwise to be taken in a small glass of Wine.

XVII. *The Chymical Oil of the Seed.* It is said to correct the Vitulency of *Cantharides*, that if they be digested in it for some time, they may be given inwardly without any danger; this may be true, but the true Corrective of Spanish Flies is Spirit of Nitre, as we shew in its proper place. This Chymical Oil is an admirable Carminative, and gives present ease

in the Cholick, by giving it inwardly by the Mouth, if the Disease lies in the *Stomach*, *Pancreas*, and upper Bowels; or giving it Clyster-wise, if it lies in the *Colon*, or other lower parts. It also provokes Urine, and the Terms, is good against Poyson, and the bitings or stings of Venemous Creatures. It opens Obstructions of the Spleen, and has been found very helpful against Hypochondriack Melancholly. Dose from six drops to twenty in a glass of Wine, or Wine and Water; drop the Oil into Sugar, and mix them well together, then mix it with the Wine, and so drink it up.

XVIII. *The Fixed Salt of the whole Plant.* It is a powerful Diuretick, and being taken in all the Liquor the Patient drinks, as Ale, Beer, Wine, it has been found profitable against the Dropsie and Jaundice: It also cleanses the Womb, Reins and Bladder, of any Tartarous Matter obstructing them. I once knew a Gouty Person, by the constant use of this Salt, and drinking Milk and Water, to become perfectly freed from his Gout, and had not so much as one Fit of it in above 18 Years time, which was confest'd to me at the writing hereof. Dose from xv. grains to xxx. in Water, or Whey, or Milk and Water, if for the Gout; but in Ale, Beer, Cider Mead, or Wine, if against the Dropsie, or other Diseases.

XIX. *Potulates or Powers.* They have all the Virtues of the Essence, Spirit, Spiritous Tincture, Chymical Oil and Salt, and may be given from one dram to two, Morning, Noon, and Night, in Wine, Mead, Hypocras or any other fit Vehicle.

XX. *The Balsam.* If it is made of the Chymical Oil, with Turpentine and Wax, it is of excellent use in all Wounds and Punctures of the Nerves; and applied, gives ease in the Gout, proceeding from a cold Cause, as also in the Sciatica, and other Pains and Aches of the Nerves and Joints. If it is made of the green Herb, it is good against Pains and Aches also, but is a peculiar Vulnerary, for healing wounds made in Scorbutick, Cold, Moist, and ill habited Bodies, and in depending places, because besides its admirable healing property, it dries powerfully, and strengthens the part affected.

XXI. *The Cataplasim.* It is excellent to be applied to Contusions, for it prevents the further afflux of Humors, and dissolves those which are present, dissolves and scatters congealed Blood, and this more especially if it is mixed with Honey: it also takes away Black and Blew marks, which come by blows or falls, or other discolorings of the Skin.

XXII. *The Seed.* It is one of the four lesser hot Seeds, always commended as a Carminative: and it is said the Egyptians make use of the Seed, to provoke Lust or Venery, for which it is very powerful.

CHAP. LXXV.

BISHOPS-WEED *Fercin*.

I. *THE Names.* It is called in *Greek* also *ἄμμι*, which is the Name given by *Dioscorides*: and in *Latin*, *Ammi*, *Coninum Regium*, and *Æthiopicum*; and in *English*, *Fercin* or *Outlandish Bishops-weed*.

II. *The Kinds.* It is twofold, 1. *Cretick*, or that of Candy, called *Ammi Creticum*, and by *Lobel*, *Ammi Creticum Aromaticum*, *Bishops-weed of Candy*. 2. *Egyptian*, called by *Gesner*, *Ammi verum*: by *Dodonæus*, *Ammi alterum parvum*: *Ammi perpusillion*,

lum, by Lobel and Gerard : *Amnium primum Alexandrianum*, by Tabernmontanus : *Amni parvum folii fenicali*, by C. Bauhin and Parkinson : and *Amni tenuifolium* & *Odoratissimum*, by J. Bauhin : *Alexandrian Bishops-weed*.

Candia

Bishops weed.

III. The Description. Bishops-weed of Candy has a Root like unto the Garden Carrot, and of a yellowish color, and brown on the outside, as Parkinson says, with some fibres or Strings thereon : From this Root comes forth several slender Stalks of fine cut Leaves,

sometimes like unto those of Wild Carrots, or *Daucus Creticus*, smelling fowching quick, and of an excellent Aromatick or Spicy flavor, not much unlike *Origanum* ; from which rise up slender Stalks, with some joints, with like Leaves as the former set thereon, and at the Tops, Umbles of white Flowers, in Tufts or Roundles like *Carum*, which turn into small Seed like *Smallage*, of a sweet sharp scent, and quick hot taste.

IV. The *Alexandrian Bishops-weed* has a small white Root, perishing after Seed-time ; from which small Root rise two or three slender Stalks, about a Foot, or Foot and half high, arched towards the tops, and set with several very fine small Leaves, like unto *Dill*, and finer than *Fennel* ; at the Extremities whereof grow small Umbles of white Flowers, after which come very small blackish Seed, much like to *Parsley Seed*, pleasant in smell, and sharp or quick in taste.

V. The Places. The first of these came to us from Candy ; as also from Syria to Venice, and from thence to France, the Low Countries and England ; which Seed has been often sown, but without effect ; The second grows in Arabia, and at Alexandria in Egypt ; from whence it has been brought to us.

VI. The Times. They do all Flower and Seed reasonably well with us (says Parkinson) if the Year proves kindly, otherwise not : if they flower, it is in June and July, and the Seed is ripe in August.

VII. The Qualities, Specification, Preparations, Virtues and Uses are the same with that in the former Chapter in all respects ; so that no more need be said of them in this place. Note, It is supposed, That the true *Amni* is wholly lost to us ; but Parkinson is of Opinion, that *Cuminum Sylvestrum* may be the true *Amni* of *Dioscorides*.

CHAP. LXXVI.

BISTORT English.

I. THE Names. This is a Plant that I cannot perceive the Greeks knew any thing of, no Greek name being yet assigned it : it is called in Latin, *Bistorta*, (by most Authors) & *convolutus* & *intortus radicebus* (says Roy) by *Tragus*, *Lonicerus*, and others, *Colubrina*, and the Root *Radix Colubrina* ; *Præcostorius*, *Bulapathum*, as well as *Bistorta* : and we in English call it *Bistort* and *Snake-weed*. Some will have it to be *Behen Rubrum* ; others *Molybdana Plinii* ; others again *Dracunculus Plinii* : Some again, as *Gesner*, *Limonium* : Lobel and *Clusius* say, that it is the *Britannica* of *Dioscorides* and *Pliny* ; but in all these they are mistaken, as those who please to Examine those several Plants in their proper Chapters, and compare them with the Descriptions here, may easily perceive.

II. The Kinds. What we shall discourse of here, are principally two, 1. *Bistorta major*, as Gerard, and the Bauhins call it : *major vulgaris*, as Parkinson : *Radice minus intorta*, as the Bauhins ; *major rugosioribus foliis*, as J. Bauhin : and we, The greater Bistort, or Snake-root. 2. *Bistorta minor*, as Gerard ; *minor nostras*, as Parkinson ; *Colubrina minor*, as *Tragus* ; *Alpina media*, as C. Bauhin : and we, The lesser Bistort, or Snake-weed : But besides these, Authors make mention of four Kinds more, as, 3. *Bistorta Latifolia*, Broad leav'd Bistort. 4. *Bistorta Alpina major*, and *Alpina maxima*, The Greater or Greatest Mountain Bistort. 5. *Bistorta Alpina*

Alpina media, & *Alpina minor*, The lesser Alpine Bistort. 6. *Bistorta Alpina pumila foliis variis*, Low Variable leaved Bistort; of all which we shall say nothing in this Work.

English
Bistort.

Great
Bistort.

III. The Description. The Greater Common Bistort has a thick, short, Tuberous or knobbed Root, blackish without, and something reddish within, a little crooked or writhed together, and of an harsh or astringent Taste, with divers blackish Fibres or Threads growing thereat: From whence spring up every Year, several Leaves standing upon long foot-stalks, being somewhat long and broad, not much unlike to a Dock Leaf, and a little pointed at the ends,

but that it is crumpled, of a blewish green color on the upper side, and of an Ash colored grey, and a little purplish underneath, having several veins running therein: from among which, rise several small and slender Stalks about half a Yard high, almost naked, and without Leaves, or with very few narrow ones, bearing a spiky bush of pale, fresh colored Flowers; which being past, there is found a small, brown, cornered Seed, not much unlike to Sorrel Seed, but greater.

Small Bistort or Snake-weed

IV. The Lesser English Bistort has a Tuberous Root, small in proportion, but something crooked or turned like the former, being of a blackish color without, and somewhat whitish within, of the same austere, styptick, or binding taste, with the former: This Root sends forth 3 or 4 small narrow Leaves, scarcely an Inch broad, and near four Inches long, green above, and grey underneath: The Stalks are slender, and with but one or two Leaves set thereon; at the tops whereof stand long, round, spiky heads of white Flowers, with several small green Leaves among them; after which comes a reddish Seed, almost round, which being dry, becomes blackish, and is bigger than that of the former, about the bigness (says Gerard) of a Pear.

V. The Places. The first grows at the Foot of Hills, and in shadowy moist Woods near to them, in many places of Germany; and in England in like places, but is chiefly with us nourished up in Gardens. The other grows in the North of England, as in Lancashire, Yorkshire, and Cumberland, in several places; also in Westmorland, at Crosby, Ravensworth, at the head of a Park formerly belonging to one Mr. Pickering, from whence it has been brought, and dispersed into Gardens. The first is also said to grow in a Meadow, about a Stones cast above the Abby Mill at St. Albans, about an Acres breadth or more from the River side, where it is said to grow in great plenty.

VI. The Times. They both flower about the end of May, and the Seed is ripe about the beginning of July.

VII. The Qualities. They are cold and dry in the third Degree; Astringent, Styptick, and Vulnerary; Cordial, Hysterick, Alterative, and Alexipharmick.

VIII. The

VIII. *The Specification.* It is famous for the refitting and expelling Poyſon, as alſo to ſtop the Flux of Blood in Wounds, or any other bleeding, whether inwards or outwards.

IX. *The Preparations.* 1. *A liquid Juice of the whole Plant.* 2. *A diſtilled Water of the Roots and Leaves.* 3. *A Powder of the Leaves.* 4. *A Powder of the Root.* 5. *A Powder of the Root compound.* 6. *A Decoction of the Root in Wine or Water.* 7. *A Decoction compound of the Root.* 8. *The Diet Drink made of the Roots, Leaves, and Seeds.* 9. *The Spirituous Tincture.* 10. *The Acid Tincture.* 11. *The Oily Tincture.* 12. *The Saline Tincture.* 13. *The fixed Salt.* 14. *The Effence.*

The Virtues.

X. *The liquid Juice.* Taken inwardly 3, 4, or 6 Spoonfuls at a time in a Glaſs of Red Florence, or other Syſtick Wine, it preſently ſtops any internal Flux of Blood, refits the Poiſon of Vipers, or any other Serpent, and the bitings of any other Beaſt whatſoever; and is very powerful againſt the Plague, and all other Malign and Peſtilential Fevers.

XI. *The Diſtilled Water.* It is a ſingular remedy to waſh any place bitten or ſtung by any Poiſonous Creatures, as Spiders, Toads, Serpents, Vipers, Rattleſnakes, or the like, and has the Virtues of the Juice, but not with equal power or force. It is good alſo to waſh Sores or Cankers which happen in the Noſe, or any other part; more eſpecially if the powder of the Root be applied thereto afterwards.

XII. *The Powder of the Leaves.* Taken to a dram, it is good to kill Worms in Children: prevails againſt a *Diabetes*, and helps ſuch as cannot keep their Water, but are apt to piſs a Bed, and this more eſpecially if given with Juice of Plantane.

XIII. *The Powder of the Root.* Being given to a dram, more or leſs, in Wine, or other fit Vehicle, it prevails againſt the Malignity of the Purples, Meaſles, and Small Pox, and expels the Poiſon of the Plague or Peſtilence, or of any other infectious Diſeaſe, driving it forth by Sweating. It ſtops alſo all manner of inward Bleeding, as Dyſentery, Spitting, Vomiting, or piſſing Blood, and is profitable againſt Ruptures in Children, or Elder Perſons; it is good alſo for any Contuſion, or Bruiſe cauſed by Blows or Falls, diſſolving the congealed Blood, diſcuſſing the aggregated Humors, and eaſing the Pain. Given to one dram in the Diſtilled Water, in which ſome red hot Iron has been quenched, it is ſaid to help or cure a Gonorrhæa, or Running of the Reins, Universals being firſt preſcribed. And being ſtrewed upon any Cut, or Wound of a Vein, &c. where there is a great Flux of Blood, it preſently ſtops it.

XIV. *The Powder of the Root compound.* It is made of equal quantities of *Biſſort Root*, *Root of Pellitory of Spain*, and of *Burnt Allum*. This Powder being made into a Paſte with a little Honey, and ſome of it put into an hollow Tooth, or held between the Teeth, if there is no hollowneſs in them, eaſes their Pain, and ſtops the deſuxion of Rheum upon the Part, cleanses the Head and Brain, and cauſes an evacuation of abundance of Rheumatick Matter.

XV. *The Decoction of the Root.* If it is made with Water, with the addition of ſome Pomegranate Peels and Flowers, it makes a moſt admirable Injection for the Womb, cleanses it of any filth lodged there, ſtops the overflowing of the Terms in Women, and cures a long continued Flux of the Whites, dries up Ulcers in that part, and ſtrengthens the Ligaments of the Womb, being relaxed, whereby the Womb ſeems to preſs or fall down. If the

Decoction is made with Wine, it ſtops all manner of Inward Bleeding, as Spitting of Blood, Vomiting Blood, and all Fluxes of the Bowels, whether in Man or Woman, is available againſt Ruptures in Old or Young, diſſolves congealed Blood, and diſcuſſes Contuſions to admiration. It is ſaid to cure the Jaundice, and being inwardly given, and outwardly applied, it is eminently good againſt the biting of Vipers, or any other poiſonous Serpent, and the bitings and ſtingings of any Venomous Creature whatſoever. Given to Women with Child, it prevents Abortion, or Miſcarriage, and helps ſuch as cannot hold their Water; and uſed as a Gargariſm in the Mouth, it allays Inflammations, heals Ulcers, and ſtaſens looſe Teeth.

XVI. *The Decoction of the Root compound.* *Biſſort Roots* fix ounces: *Angelica Roots*, *Zedoary*, of each four ounces: *Virginea Snake-root* three ounces: *Clove-bark* an ounce and half: *Winters Cinnamon* one ounce: all being bruſed, infuſe in Red Port Wine, or Canary, five quarts, for ſix hours: Then giving it two or three boils, take it from the Fire, and ſtrain out the Wine from the Ingredients, which let ſettle: then decant the Clear from the ſcums, and ſweeten it with Syrup of Limons, or Syrup of Vinegar. It is a noble Medicament againſt the Meaſles, Small Pox, Purples, Calenture, Spotted Fever, and even the Plague it ſelf, being given either preventively, as two or three Spoonfuls of it Morning, Noon, and Night: or Curatively, in which four or fix ounces of it may be given to ſweet upon, and to be repeated as need requires. It is an excellent thing againſt the biting of Mad Dogs, Vipers, Rattleſnakes, or the bitings or ſtingings of any other Venomous Creatures. It alſo prevails againſt any Vegetable Poiſon, which is taken inwardly, if timely given.

XVII. *The Diet Drink.* It is made of the Roots, Leaves, and Seeds, boiled in half Wine, half Water. It is an excellent Traumatick, cures all curable Inward Wounds, and Ulcers, and Fluxes of Blood, of what kind ſoever, and alſo being regularly drank, contributes very much to the cure of Wounds, and old Ulcers in the External parts.

XVIII. *The Spirituous Tincture.* It defends the Heart againſt Poiſon, whether Inward or Outward, whether a Vegetable or Animal Poiſon, or the Malignity of the Plague, or of any other infectious Diſeaſe. Doſe, one or two drams at a time, two or three times a day, in a glaſs of Wine, or other Vehicle.

XIX. *The Acid Tincture.* This is more peculiar againſt the Plague, and other Malign Fevers, and infectious Diſtempers than the former. It allays the Inflammation of the Jaws, Almonds of the Ears, and Throat, being often taken inwardly, and alſo uſed as a Gargle, by mixing it with the Decoction in Water or Wine ſtoregoing. It alſo heals Cankers and Sores of the Mouth and Throat, if often waſh'd therewith; and being ſwallowed, cures tough Flegm, and clears the Throat.

XX. *The Oily Tincture.* It is good againſt Punctures, and Wounds of the Nerves, eaſes their Pain and cures them, being bathed thereon, and applied thereto: and reſſes the Flux of Humors attending them.

XXI. *The Saline Tincture.* Outwardly uſed, it penetrates, and contributes to the curing of Ruptures. Old Ulcers being waſhed therewith, it cleanses them, and diſpoſes them to healing: and Phlegmons or Inflammations being bathed therewith, it abates the heat. Inwardly given, it cleanses the Reins, Ureters and Bladder, after the uſe of it, for ſome time; if there be any Ulcers in thoſe parts, they are cured by giving Inwardly the Decoction in

Wine,

Wine, Juice, or Essence, and continuing it for some time. This Saline Tincture is also prevalent against the Jaundice. Dose from half a dram to a dram and half, in any convenient Vehicle.

XXII. *The Fixed Salt.* It is good against Poison, and all malignity of the Plague, opens Obstructions, resists Putrefaction, and defends the Vitals against any kind of Infection, or the malignity of Evil Airs. It provokes Urine, and cleanses the Urinary Passages, carrying off the Recrements of the Humors by those Passages, by which it has been found good against the Jaundice and Dropsie. Dose from ten grains to a scruple in Ale, Beer, Cider, Mead, or Wine.

XXIII. *The Essence.* It resists Poison, Plague, or Pestilence, and all sorts of malign Fevers, stops all Fluxes of the Belly, as Diarrhæa, Dysenteria, Lien-teria, and the Hepatick Flux, as also all Hemorrhagies whatsoever, whether inward or outward, the overflowing of the Terms in Women, and the preternatural flux of the Whites: but in these last Cases, Universals ought to be premised. In a word, the Essence has all the Virtues of the Liquid Juice, the Powder of the Root, and the Decoction in Wine at Sect. 10, 12 and 15, foregoing. But it peculiarly stops the afflux of Humors to any part, being applied to the same outwardly, and also taken inwardly. Dose is from two to six ounces in Wine, or any other Vehicle, proper against the Disease for which it is given. *Note,* The Root of this Plant is that which is chiefly used, as having most Virtue in it.

CHAP. LXXVII.

BITTER-SWEET.

THE Names. It is called in Greek *Γλυκύμηστρον*, *Glycyphoron*, i. e. *Amara dulcis*, and *στυγνόν*, *Strychnodendron*, i. e. *Solanum Arborescens*: but no Greek Author, that I know of, has said any thing of it; but some of the Moderns have im-

posed these Greek names upon it. The Latins call it, *Solanum Lignosum*, and *Solanum Arborescens*, and yet in Truth, it is not properly any Night-shade; but only so called for the conformity of its Leaves. Also *Amara dulcis*, and *Dulcamara*: Some will have it to be *Melortum Plinij*, others *Vitis Sythoesifris Theophrasti*, as *Camerarius* in his Epitome: (but *Vitis Sythoesifris* is truly *Black Bryony*, as *Matthiolus* has it:) In English, it is called *Bitter-sweet*, or *Woody Night-shade*, and *Fellon-wort*.

II. *The Kinds.* It is twofold, 1. *Purple-flowered*, called, as aforesaid. 2. *White-flowered*, which *Dodonæus* thinks to be *Cyclaminus altera Dioscoridis*: *Guilandinus* took it to be *Salicifolium Plinij*, but very erroneously: *Baobinus* calls it *Solanum Scandens seu Dulcamara, flore albo*, *Bitter-sweet*, with the *White flower*.

III. *The Description.* It has a Root which spreads it self with many strings under the Earth, not growing into any great or thick Body: from whence comes up many slender, winding, brittle, woody Stalks, five or six Foot high, without any Claspers, or Tendrills, but folding it self about Hedges, or any other thing which stands near unto it; these stalks are covered with a whitish rough Bark, which being chewed in the Mouth, tastes bitter at first, but sweetish afterwards: and in the middle they have a Pith, and shoot out into many Branches on both sides, which are Green whilst young: whereon grow many Leaves without order, somewhat like unto those of Night-shade, but that they are something broad, long, and pointed at the ends, with two small Leaves, or rather pieces of Leaves at the bottom of most of them, something like the Sage with Ears; and many of them likewise, with but one piece on one side; sometimes also these pieces are close to the Leaves, making them seem as if they were jagged, or cut in on the edges into so many parts; and sometimes separate therefrom, making the Leaves seem winged, or composed of many Leaves, which are of a pale green color. At the tops and sides of the Branches come forth many flowers, (standing in fashion of a long Umbel) upon short Foot-stalks one above another, which consist of five narrow and long violet purple colored Leaves, not spread like a Star, or very seldom, but mostly turning themselves backwards to the Stalks again on which they stand, with a long golden yellow Pointel in the midst, sticking forth, which afterwards turns into round, and somewhat long Berries, green at first, and very dry, soft, and full of Juice when ripe, which are sweet at first tasting; but afterwards of an unpleasant bitter taste; in which Berry is contained many flat white Seeds.

IV. *Dulcamara flore albo*, *Bitter-sweet*, with white flowers, differs in nothing from the former, but in the flowers, whose outward Leaves are white, and its Pointel yellow.

V. *The Places.* The first grows usually by Ditch-sides and hedges, where it may climb up; almost every where: The second is more rare, and seldom to be met with, but grows by or near *St. Margaret's Church* near *Romney Marsh*.

VI. *The Times.* The Root is Perennial, and the Branches, tho' they are dispoiled of their Leaves all the Winter, yet they perish not, but shoot forth new Leaves in the Spring: they flower in July, and the Berries are ripe in August.

VII. *The Qualities.* The Leaves and Berries are hot and dry in the first Degree; Astringent and Cleansing; Cephalick, Hepatick, Splenetick, Hysterick and Cathartick.

VIII. *The Specification.* It is a peculiar thing for the Cure of Jaundice and Dropsie.

IX. *The Preparations.* You may make therefrom, 1. *The Liquid Juice.* 2. *The Essence.* 3. *The*

Decoction. 4. *The Spirituous Tincture.* 5. *The Acid Tincture.* 6. *The Saline Tincture.* 7. *The Cataplasm.*

The Virtues.

X. *The Liquid Juice.* Being given to two or three ounces, it purges well, and powerfully opens Obstructions of the Liver and Spleen, and helps such as are Asthmatick, or are troubled with difficulty of breathing, being taken every Morning fasting for some time.

XI. *The Essence.* It has all the Virtues of the Juice aforegoing, besides which it is a powerful Medicament against a Phthisick, and for the Cure of the Yellow and Black Jaundice, as also the Dropsie: It brings away the After-birth, and effectually cleanses Women newly brought to Bed: you may give it from two ounces to four in a glass of White Port Wine every Morning fasting: It is also good for inward bruises caused by any fall or blow, dissolving the congealed Blood in what part of the Body so ever. It purges well, and not churlishly.

XII. *The Decoction.* You may make it thus: *Re* Of the young tender twigs or woody substance, and of the Leaves, *℥j.* bruise them well, and put them into a Glass Vessel, or Bolt-head; affuse thereon White Port Wine *℥ij* ss. cover it with a blind head, and infuse in a Sand heat for twelve hours; and then make the heat so great as it may boil gently, which done, decant, and strain out for use. It has the Virtues of the Essence, is a Specifick for cure of the Jaundice and Dropsie, according to *Tragus* and *Dodonæus*, is good against the Vertigo and Megrims, and other Head Diseases, cleanses Women in Child-bed, and represses Hysterick Vapors. Dose four ounces every Morning: it purges the Body very gently.

XIII. *The Spirituous Tincture.* It purges not, but very much strengthens the Viscera, chiefly the Liver and Spleen, and represses Vapors ascending from the Stomach, and other parts, to the Head and Brain, causing Vertigo's, Megrims, and other Distempers of that Ventricle. Dose two drams, or more, every Morning fasting, and Evening at Bed time in a Glass of generous Wine.

XIV. *The Acid Tincture.* Let it be made with Spirit of Wine acuated with Spirit of Salt. It powerfully provokes Urine, cleanses the Reins, Ureters, and Bladder, and cures the Dropsie to a miracle; but it ought to be taken a considerable time, and always in the Decoction of the same Plant, or in a Decoction of Centory, Gentian, and Roman Wormwood. Dose from half an ounce to an ounce, more or less, so as to give a pleasant Acidity, Morning and Evening: and it is to be put into all the Ale, Beer, or Wine the Patient drinks.

XV. *The Saline Tincture.* Bathed with, it takes away Scurf, Morpew, and salt, and sharp breakings out of the Skin: inwardly taken to one dram, it provokes Urine, and cleanses the Urinary passages of Slimy, Viscous, or Tartarous Matter, which is commonly the matter that breeds the Stone and Strangury.

XVI. *The Cataplasm.* It is to be made of the bruised Berries, and Rosin in fine Powder. This applied to Felons, which commonly come on the Fingers ends, cures them in a very short time.

CHAP. LXXXVIII.

BLEW-BOTTLE.

I. *THE Names.* It is called in Greek, *Κύανος*, à *floris Cyaneo, vel Caruleo colore*: In Latin, *Cyanus*: and in English, *Blew-bottle*, or *Corn-flower*.

II. *The Kinds.* It is twofold: 1. *Single-flowered*, of which in this Chapter. 2. *Double-flowered*, of which in the next. The single flowered is also 1. *Cyanus magnus, vel Cyanus major vulgaris; Cyanus hortensis*, The greater Common Blew-bottle, or Garden Blew-bottle. This some call *Cyanus montanus*; *Hermolaus* takes it to be the *Leucoium Diofcoridis*; *Cesalpinus* to be a kind of *Struthium Theophrasti*; *Fabius Columna*, thinks it to be *Papaver Heracleum Theophrasti*; and *Lobel* questions whether it be not a Species of *Chondrilla*. 2. *Cyanus minor vulgaris, Cyanus segetum*, The lesser Common Blew, or Field Blew-bottle: It is called by some *flos Frumenti*, *Corn-flower*: *Baptifecula* (as *Ray* has it) and *Baptifecula*, or *Blaptifecula*, from its turning the Edges of Sickles in cutting down Corn; *Secula*, i. e. *Falx*, à *secundo dicta*, being taken for a Sickle in Ancient times.

III. *The Description.* The Greater or Garden Blew-bottle has a Root which creeps under ground, spreading it self divers ways, so that its heads with green Leaves will abide all the Winter, (which in the other sorts do not so, but perish wholly after Seed time, rising again of their own Sowing before Winter) and grows Yearly into new shoots and Springs, by which it very much increases: from this Root rises up a crested or rather winged Stalk, of a whitish green color, about two or three Feet high, on which are set divers Leaves, something long and broad, without any division, or denting in about the edges, green on the upper side, and grayish underneath, each

of them encompassing the Stalk about, at the lower ends, which is divided at the top into a few Branches, bearing somewhat large, scaly, green heads, with white or Silver-like edges; from the midst of which comes forth a larger Flower than in the smaller Kind, thinly set, and of a deeper Violet-blue color: in which Heads, after the Flowers are past, there is found a Down, containing some few white Seeds, like those of the lesser Kind, but a little larger, and flatter.

IV. The lesser Common, or Field Blew-bottle, or Corn-flower, has Roots somewhat long and large, which perish every Year, but are Annually renewed by its own sowing; rising or springing up before Winter, and abiding green all the Winter Season, until the next Spring and Summer, when it Flowers, Seeds, and perishes again. The Leaves are long and narrower than the former, of a whitish green color, deeply cut in on the Edges in some places, but some more than others, something like unto Scabious leaves. The Stalks are two or three Feet high, according to the goodness and fertility of the Ground, set with such like Leaves, but smaller, and little or nothing cut in on the Edges: the tops are spread forth into several Branches, bearing many small green, scaly Heads, out of which rise Flowers, consisting of five or six, or more, long and hollow Leaves, small at the bottom, and opening wider and larger at the brims, notched, dented or cut in on the Edges, and standing round about many small threads in the middle. The colors of these Flowers are manifold, and very variable, for some are wholly Blew, or White, or bluish, or of a sad or light Purple, or of a light or deep Red, or of an over-worn Purple color, or else mixed of these colors, in some, the edges White, and the rest Blue or Purple; or the edges blew or Purple, and the rest of the Flower White, or Striped, Spotted, or halved, the one part of one color, the other of another, and the Threads also in the middle varying in many of them; for in some the said middle Thread will be of a deeper Purple than the outward Leaves, some will have it reddish, deeper, or paler, whilst the

Leaves are White, or bluish. The Flowers being past the heads or bottles contain a Down, in which the Seed is wrapped, which is small, hard, white and shining. Note, That the Flower of that which grows Wild in the Fields, is for the most part only Blew.

V. The Places. The first grows Wild in Germany upon Sandy Hills, but with us it is nourished up in Gardens: The other with Blew Flowers grows Wild, in many Corn Fields throughout our Kingdom: It is found in Fields of Wheat, Rye and Barley; but is also Sown in Gardens, which the skilful Artift, by looking after, makes to become of other colors, as in the Description thereof is declared.

VI. The Times. They flower from the beginning of May, to the end of Harvest, and their Seed comes to ripeness in the mean season.

VII. The Qualities. They are temperate in respect to heat or cold, and dry in the first Degree: But Schroder says, they are cold and dry in the second Degree: They are Astringent, Ophthalmick, Cardiac, Alterative, and Alexipharmick.

VIII. The Specification. They have a peculiar faculty for the curing of sore and bleared Eyes, and resisting the force of Poison.

IX. The Preparations. In the Shops are: 1. The Flowers. 2. A Powder of the dried Leaves. 3. An Essence of the Juice with Spirit of Wine. 4. A Collyrium of the Flowers. 5. A Distilled Water of the Flowers. 6. A Spirituous Tincture of the Flowers. 7. A Cataplasim of the Flowers. 8. A Juice. 9. A Distilled Water of the Herb.

The Virtues.

X. The Flowers. They are cold and dry in 1^o: are Styptick, and good to take away Redness and Inflammations of the Eyes, and pains thereof: they cool in Fevers, resist Poison, and help in Dropsies. You may make an Acid Tincture of them with Spirit of Wine, mixed with a half part of Spirit of Salt, which in Fevers, Plague, &c. may be given from 20 to 40 Drops, in any fit Vehicle.

XI. The Powder of the dried Leaves. It is taken in Tent to one dram, for the curing of inward bruises, and to heal a Rupture of the Veins, &c. whereby they void much Blood at Mouth. Give it in Plantane, Comfrey, or Horse-tail-water, acuated with a little White Wine Vinegar.

XII. The Essence of the Juice of the Leaves and Flowers. It has all the former Virtues both of the Acid Tincture and Powder: It helps in the Dropsie, resists all manner of Venoms and Poisons, and is peculiar against that of the Scorpion, Phalangium, Viper, Mad-Dog, and Plague, as also all other Pestilential Fevers, and Infectious Diseases: being dropt into the Eyes, it takes away their heat, inflammation and pain.

XIII. The Collyrium, or Eye-Water. Of the Blew-flowers as many as you please: put them into Rye Dough or Paste, bake them in the Oven with Household Bread, then taking it forth, distil all, viz. Flowers and Rye Paste, in a Glass Body, in B.M. and keep the Water for use. With this the Eyes are to be wash't three or four times a day. It is admirable for the cure of most Infirmities of the Eyes, especially Heat, Inflammation, Pain, Blood-shot, &c. It clears, strengthens and preserves the Eye-sight, especially of old People, for which reason some are pleased to call it Break-Spectacle-Water: for that those that use it, need never come to the use of Spectacles: If the Dis temper is inveterate or stubborn, use it five or six times a day.

XIV. The Distilled Water of the Flowers. *Aqua florum Cyani*, Blew-bottle-flower-water. Of Flowers

of blew-bottles, with their Caps, as many as you please : bruise them, and macerate them in a sufficient quantity of Snow-water, for 24 Hours, or rather two Days ; then Distill in a gentle B. M. or Sand heat. It is said to be a wonderful Water for the Eyes, and their Diseases, as Inflammations, Soreness, Dimness of Sight, and the like : it has the Virtues of the former, but not altogether so powerful. Drop it into the Eyes 3, 4, 5 or 6 times a day.

XV. *The Spirituous Tincture of the Flowers.* Made with Common Brandy, it is a secret for curing Sore and Running Eyes, if some few times dropt into them. It is Alexipharmick, and has all the Virtues of the Essence. Dose half a Spoonful in any proper Vehicle.

XVI. *The Cataplasm of the Flowers.* Being applied to Sore and Running Eyes, afflicted with a hot Rheum, it strengthens the Part, cools the Inflammation, repels the flux of Humors, and heals the Eyes.

XVII. *The Liquid Juice.* It is very effectual to heal all Sores and Ulcers of the Mouth ; and put into fresh or green Wounds, it conglutinates their Lips, and quickly heals them : And dropt into the Eyes, it takes away their Heat, Inflammation, and Pain.

XVIII. *The Distilled Water of the Herb.* It has the same properties with the Juice, and Essence, but not altogether so powerful.

CHAP. LXXIX.

BLEW-BOTTLE Double-flowred.

I. **T**HE Names. They are called in Latin, *Cyanus multiflorus* : and in English, Double-flowred Blew-bottle, or Corn-flower.

II. *The Kinds.* They are of the lesser Kind of Blew-bottle, and are twofold, 1. *Cyanus caruleus multiflorus*, Double Blew-flowred Blew-bottle, or Corn-flower. 2. *Cyanus purpureus multiflorus*, Double Corn-flower Purple-flowred. 3. To these we add, *Cyanus floridus Turcicus*, *Cyanus floridus odoratus Turcicus*, *Cyanus Orientalis*, which is also Major and Minor. The Turkey Blew-bottle : The Turkey Sweet-scented Blew-bottle, and the Sultan's Flower, because the Grand Senior copying it as he was walking abroad, liked it, and wore it himself, for which reason his Vassals held it in great esteem : of this there is a Greater and a Lesser.

III. *The Description.* The first of these differs not at all from the small Field Corn-flower in the former Chapter, neither in the Roots, Stalks, Leaves, nor Seeds, but only in the Flowers, for that the Flowers of this Plant, are of a fair Blew color, and very double, whereas the other are single.

IV. *The Second of these is also like unto the former in all respects, saving in the color of the flower ; for whereas that is double, and of a fair blew ; the flowers of this are also double, and of a bright purple color.*

V. *The Third is a Plant or Flower of much beauty : It has a Root like the other Blew-bottles, which perishes every Year ; the Leaves hereof are not much greener, but larger, and more gashed in on the edges ; the Stalks are three feet high at least, and lower than in the other, beset with the like Leaves, but smaller, and branching into several parts, each of them bearing a larger scaly head than the former, and bigger in the Greater of this kind, than in the Lesser, with Blew-bottle like flowers, but larger, and consisting of eight or nine hollow Leaves, with wider open brims, and small, pale or almost white threads in the middle ; the circling Leaves are of a fine beautiful purple color, very glorious to behold. This Flower is of so exceeding a sweet scent, that it surpasses (says Parkinson) the best Croet that is. The Seed is blackish, and enclosed in a Downy substance like the former.*

VI. *The Places.* The two first are often found in Corn

Corn fields, and are also nourished up in Gardens. The last was brought to us from Turkey, or Constantinople, and grows in the Gardens of some Herborists.

VII. *The Times.* They flower for the most part thro' all the Summer, and their Seed ripens in the mean season.

VIII. *The Qualities, Specification, Preparations, Virtues and Uses,* are all exactly the same with those in the former Chapter, so that we shall say no more thereof in this place.

CHAP. LXXX.

BLITES White.

I. *The Names.* It is called in Greek Βάλλον: In Latin, *Blitum*: and in English, *Blites*. Yet Parkinson says, that none of the Ancients have made any mention of them.

II. *The Kinds.* There are two principal Kinds, viz. 1. *Blitum album*, the White Blite; and this is both *Majus* and *Minus*, of which we treat in this Chapter. 2. *Blitum Rubrum*, The Red Blite, which is also *Majus* and *Minus*, of which in the next Chapter.

Greater White Blite

III. *The Description.* The Great White Blite has a Root very thick, and long, and very full of Threads or Strings; from whence rises up several Stalks, making a kind of bush, till it comes to be three or four Feet high; the Stalks are grayish, white, and round: the Leaves are plain and smooth almost like to those of Arach, but not so soft nor mealy: the Flowers grow thrust together, like those of Arach: after which comes the Seed inclosed in round, flat, husky skins.

IV. *The Lesser White Blite,* which is called the Wild White Blite is very like unto the former, except that the Roots, Stalks, Leaves, Branches, and the whole Plant are altogether of a green color, and

every way less than the former, growing upright and not creeping at all.

White Blites
Lesser.

V. *The Places.* The first is a Garden herb, and grows chiefly there, but is in some places found Wild. The second is as a Weed, growing Wild, tho' also in Gardens.

VI. *The Times.* They flourish and flower all the Summer long, their Seed is ripe in August and September; and grow very green even in the Winter time.

VII. *The Qualities.* The Blite, says Galen (*lib. 6. fac. Med. Simp.*) is a Pot Herb, which serves for Meat, cold and moist (in the second Degree:) Hysterick, and Solutive. Yet Parkinson, will have them to be Cold, Dry, Astringent or Binding.

VIII. *The Specification.* They are peculiar against Fluxes and Distempers of the Womb.

IX. *The Preparations.* You may have therefrom, 1. A Liquid Juice. 2. An Essence. 3. A Decoction in Wine. 4. A Syrup.

The Virtues.

X. *The Liquid Juice.* Taken to five or six ounces in a Glass of Wine, it purges by stool, makes the Belly soluble, and cools the Bowels: but sometimes it overturns the Stomach, and cleanses it by Vomiting.

XI. *The Essence.* It does the same thing with the Juice, but with less detriment to the Stomach; and being taken Morning and Evening from two ounces to three, or four, it stops the Whites in Women, and a Gonorrhoea in Men, Universals being premised.

XII. *The Decoction in Wine.* This is yet less troublesome to the Stomach, and has the Virtues of the Essence; but not altogether so powerful; and may be taken without any danger by a Woman with Child.

XIII. *The Syrup.* It is not only Hysterick, but Pectoral also: it cleanses the Womb, Breast, Stomach, and Lungs, of Slime, and Viscous or Tartarous Matter, eases Coughs, and taken for some time, helps Asthma's, and shortness of Breath.

C H A P. LXXXI.

B L I T E S Red.

THE Names. It is called in Latin, *Blitum Rubrum*, and in English, the Red Blite.

Red Blite

Bliteth
much seed

II. The Kinds. There are two Species of it
1. *Blitum minus Rubrum*, *Blitum Rubrum Hortense*, the greater Red Blite, or Garden Red Blite. 2. *Blitum minus Rubrum*, *Blitum Rubrum Sylvestre*, the

lesser Red Blite, or Wild Red Blite. 3. Red Blite with much Seed.

III. The Description. The first is almost exactly like the Great White Blite described in the former Chapter, except that the Stalks, and Leaves, and also the rest of the Plant are reddish, and reddish mixed with a dark green color, and in all other respects they seem to be like.

Blite small red

IV. The second, lesser, or Wild Blite, is almost like to the Wild White Blite, saving that in this, the Stalks and Branches trail upon the ground, and are reddish, like the former for their color: the Seed is small and clustering together, green of color, and almost like unto the Seed of Coronope Ruellij, or Bucks-horn.

V. The third Kind differs little from the first, save that the Leaves are longer, and it is much fuller of Seed, and with a multiplicity of spiky heads.

VI. The Places. The first or Greater is a Garden Plant, and a Pot-herb: the other grows Wild, but for the most part in Gardens, and is taken for a Weed: but is sometimes found Wild in other places.

VII. The Times. They Flower all the Summer long, and their Seed is ripe in August and September; and keep alive in Winter also.

VIII. The Qualities. They are cold and dry in the second Degree, Astringent, Hysterick, and Solutive.

IX. The Specification. They are peculiar to stop the Terms in Women.

X. The Preparations. You may make therefrom,
1. A Liquid Juice. 2. An Essence. 3. A Decoction. 4. A Syrup.

The Virtues.

XI. They are exactly the same with those Preparations in the former Chapter, save, that whereas those are peculiar for stopping the Whites in Women, and Gonorrhoeas; these are peculiar for stopping their Courses when they overflow; and are also of great use to stop other Fluxes of Blood in either Sex.

CHAP. LXXXII.

BLOOD-WORT.

I. THE Names. It is called in *Greek* Ἀνδροπέδιον: In *Latin*, *Lapathum Sanguineum*, as *Parkinson*: *Sanguis Draconis Herba*, as *J. Bauhin*: *Lapathum folio acuto rubente*, as *C. Bauhin*: In *English*, *Blood-wort*.

II. The Kinds. It is a Species of the Dock, and differs little but in its color.

Blood wort.

III. The Description. It has a Root not great, but something long, and very red, abiding many Years, yet sometimes killed by the extreme hardness of the Winter: And as it is one of the sort of Docks, so has it long Leaves, like unto the smaller yellow Dock, but overspread with many red Veins, and overshadowed with red upon the green leaf, that it seems sometimes almost wholly red. The Stalk is red or reddish, bearing such like Leaves, but smaller, up to the Top, where it is divided into divers small Branches, on which grow purplish Flowers; after which come three square, dark, red Seed, like unto other Docks.

IV. The Places. It grows chiefly in Gardens, as a Pot-herb, almost throughout the Kingdom: but *Parkinson* says, it is sometimes found growing Wild.

V. The Times. It rises up in the Spring of the Year; Flowers through all June and July; and the Seed is ripe in August.

VI. The Qualities. Blood-wort in respect to heat or cold is temperate, and dry in the second Degree: It is Astringent, Digestive, Discussive, and Traumatick; Stomackick, Heparick, Splenetick, and Alterative.

VII. The Specification. It is peculiar for cleansing

the Blood, and strengthening it in its Crasis, and therefore powerful against the Scurvy.

VIII. The Preparations. You may make thereof, 1. A Liquid Juice. 2. An Essence. 3. A Decoction in Red Wine. 4. An Acid Tincture. 5. A Syrup. 6. A Saline Tincture. 7. A Balsam. 8. A Cataplasim. 9. A Powder of the Seed.

The Virtues.

IX. The Liquid Juice. Taken from one ounce to four, either alone by it self, or mixed with Wine, it removes the Discreasie of the Blood and Humors, cleanses it, and renews the whole Bloody Mass, like to the Blood of a young Child: It ought to be given Morning and Night for several Days.

X. The Essence. It has the Virtues of the Juice, strengthens the Stomach, Liver, and other Bowels, stops Fluxes of the Belly, chiefly the Bloody Flux, helps Spitting of Blood, and the Subversion or Loathing of the Stomach through Choler: It opens Obstructions, and is profitable against the Jaundice. Dose four or six Spoonfuls, or more.

XI. The Decoction. It has the Virtues of the Essence, but not full out so powerful; and being outwardly used it is good against Freckles, Tannings, Sun-burnings, Morpew, and other like defilements of the skin. Taken inwardly to six ounces, it opens Obstructions of the Liver and Spleen, strengthens the Viscera, and stops all Fluxes of Blood. It may be made both of Roots and Leaves in Red Port Wine.

XII. The Acid Tincture. This is more stomackick than any of the former, purifies the Blood, rectifies the Humors, and cures the Scurvy whether in Old or Young: The Dose is from a quarter of a spoonful to half, in Wine, or any proper Vehicle. Besides all this, it kills Worms in Children, and is good against the Dropfie; quenches Thirst, restores lost Appetite, and takes away the Premature heat of Fevers: A Julep may be made of it, with the Syrup thereof, to be given in all malign and burning fevers.

XIII. The Syrup. It is Pectoral, good against Coughs, Colds, Wheezings, and shortness of Breath.

XIV. The Saline Tincture. It purifies the Blood by the Urinary passages, allays the heat of Fevers, is prevalent against jaundice and Dropfie, and loosens the Belly: Outwardly used, it is good against Pimples, Scurf, Morpew, and other breakings out of the Skin.

XV. The Balsam. It eases Pains, being anointed upon any Part, speedily cures Green Wounds, cleanses Ulcers, incarnates, and heals them.

XVI. The Cataplasim. It is Discussive, and somewhat Repercussive, is profitably applied to Contusions, and other Tumors, and gives ease in the Gout.

XVII. The Powder of the Seed. It is drying and binding, stops Fluxes of all sorts, and bleedings of the Viscera: and taken in Wine to one dram, it is good against the wounds of the Scorpion, Mad-Dogs, and of other Venomous Beasts.

CHAP. LXXXIII.

BORAGE.

I. THE Names. It is called in *Greek*, Εὐφροσύνη, *Euphrosyne*, ab efficienda Voluptate: In *Latin*, *Borago*; dicitur videtur à *Corago*, ut à *litera* variat. *Apuleius* said that it was called, *Corago*, quod cordis affectibus medetur, and from thence it is thought

thought came our name *Borage*, by the alteration of one Letter; but this name is not to be found in any of the Ancient Writers: In *English*, we call it *Borage*.

II. *The Kinds*. There are several Kinds hereof: as, 1. *Borago Vulgaris*, *Borago Hortensis*, *Horibus Ceruleis*, Common Garden Borage with Blew Flowers. 2. *Borago flore albo*, Borage with a White Flower. 3. *Borago semper Vivens*, Everliving Borage.

Porrage.

III. *The Description*. It has a Root, thicker and shorter than that of Buglofs, something blackish without, and whitish within, perishing after Seed time, but rises again of its own Sowing, in the Spring of the Year. The Leaves are broader, shorter, greener, rougher, and more crumpled than are the Leaves of Buglofs. The Stalks hereof are not so high, but branched out into many parts, whereon stand larger Flowers, and more pointed at the end than Buglofs, and of a paler blew color for the most part, yet sometimes the Flowers are reddish; each Flower consists of five Leaves, standing in a round whitish hairy husk, divided into five parts, or leaves; in the middle of the Flower grow forth a number of fine black Threads, standing out, pointed at the end, and broad at the bottom; which being past away, there succeeds several roundish black Seeds.

IV. *Borago floribus albis*, Borage with white flowers, is a plant like to the other in all respects, except the color of the Flowers, for as they are perfectly blew, these are purely white, and in this particular the difference only consists.

V. The Everliving Borage, has Roots black, thicker than either of the former, and more spreading, not dying in the Winter, but yielding green Leaves all the Winter long. It has very many broad Leaves, rough and hairy, more resembling Comfrey than Borage, yet not so large as either, of a black, dark, green color. Among which rise up stiff hairy Stalks, but not so high as those of our Common Garden Borage, upon which do grow many small, fair, blew flowers, very like to the Flowers of Buglofs for the form, and of Borage for the color: There are Buds, Flowers, and ripe Seed, all at once, for

which reason it is called Everlasting, and that very properly, beca. it not only lasts both Summer and Winter, but is seldom without Buds, Flowers, and Seed, ripe and unripe together, by which it wonderfully increases.

VI. *The Places*. The first is common in almost all Gardens: The second and third are not so common, but they grow with us in Gardens, as easily as the former.

VII. *The Times*. They Flower throughout all the Summer Months, till the Autumn is well spent; and their Seed ripens in the mean season.

VIII. *The Qualities*. They are Temperate in respect of heat or cold, and moist in the fifth Degree, absterive, Aperitive, Emollient, Cordial, alterative, and Alexipharmick.

IX. *The Specification*. They wonderfully cheer the Heart, expelling Sadness and Melancholly, according to the Verse,

*Stultis, Leprosis, Tabidis, Timidis, Furiosis,
Dicit Borago, gaudio semper ago.*

Purificat Sanguinem, & Cor lætificat. It purifies the Blood, and makes the Heart merry.

X. *The Preparations*. You may have therewith: 1. A liquid Juice. 2. An Essence. 3. A Distilled Water of the whole Plant. 4. A Syrup. 5. An Infusion in Wine. 6. A Conserve of the flowers. 7. An Acid Tincture. 8. A Balsum. 9. Ashes. 10. A Spirit.

The Virtues.

XI. *The liquid Juice*. It effectually purifies the Blood, and is of excellent use in all Putrid, Malign, Spotted and Pestilential Fevers, to defend the Heart from their Poison and Malignity, and to expell the same, as also the Poison of other Creatures. It cools, opens Obstructions, cleanses the Blood and Humors, and is effectual in the cure of the Yellow Jaundice. Dose from three to eight Spoonfuls, or more, in Wine, or mixed with the Distilled Water, or in some other fit Vehicle, two or three times a day.

XII. *The Essence*. It has all the Virtues of the former, more exalted, and therefore more powerfully and effectually cheers the Heart, and expells Melancholly. It is an excellent Cordial, revives the Spirits, strengthens Nature, is good against fainting and Swooning Fits, and other Passions of the Heart, and restores such as have been long waiting in a Consumption. It may be given from two to four or six ounces at a time, and that two or three times a day, in Wine, or some other fit Vehicle, and it may be sweetened, or made pleasant with Syrup of Borage. This Essence is Traumatick, and contributes very much towards the curing of Wounds, or old running Ulcers, and fistulas, in Bodies of an ill habit.

XIII. *The Distilled Water*. It has the Virtues of the former, but nothing near so powerful; but it may be used as a Vehicle to convey the other things in.

XIV. *The Syrup*. It is of the Nature of the Essence, tho' not so Strong and Intellectual; it is Cordial, opens Obstructions of the Breth and Lungs, helps Coughs, Colds, Wheezings, Asthmas, shortness of Breath, and mixt with Juice of Fumitory, it cools and cleanses the Blood, and is profitable against the Yellow Jaundice. Dose two ounces.

XV. *The Infusion of the Herb in Wine*. It very sensibly and admirably recreates the Spirits, and gratifies or pleases the Stomach, is good against the Cardiack Passion, and Melancholly, and is prevalent against the Falling-sickness: If it is a strong Infusion, it

it is good against redness and inflammation of the Eyes, they being washed therewith.

XVI. *The Conserve of the Flowers.* They are chiefly used as a Cordial Sweet-meat, and to restore such as have been long in a Consumption, being often taken with new Cows Milk, viz. such as is warm from the Cow, and in which the heat is preserved all day, by the help of the heat of a Sand Furnace.

XVII. *The Acid Tincture.* It is an admirable Stomack and Cordial, refreshes the languishing Stomach, and causes a good Appetite: It prevails against the Scurvy, Dropsie, Jaundice and Gout; removes Sickness at Heart, and stops a vehement and preternatural Vomiting. If used as a Gargle, by mixing it with some of the Distilled Water; and Syrup, it cures Cankers, and Ulcers of the Mouth and Throat, and allays Inflammations of the Tonsils. This *Tincture* is a notable thing against all burning, malign, putrid, and pestilential Fevers, and profligates even the Plague in itself; for it immediately allays the preternatural heat, quenches the violent thirst, resists the putridity of the Humors, and profligates the Poison of the very Pestilence in itself. It cools, opens Obstructions, and rectifies the Discrepacy of the Blood and Humors, beyond many other more Specious, and much Celebrated Medicaments.

XVIII. *The Balsam.* It is an excellent Vulnerary; it cleanses old Ulcers, and other Putrid and Running Sores; and heals green Wounds to a miracle; I commend it by Experience to my Countrymen.

XIX. *The Ashes.* If they be boiled in Mead or Honeyed Water, it will be a Gargle for the curing Inflammations of the Throat and Tonsils, Ulcers of the Mouth, &c. And if they be boiled in fair water, and that water mixed with Juice of Fumitory, it will make a Lotion against Scabs, Itch, Tettars, Ringworms, Scurf, Morpew, and other breakings out, arising from sharp and acrid Humors.

XX. *The Spirit.* It is made of the Juice of the Plant, fermented with Honey, Sugar, Melloffus, or Leaven, and then Distilled in an Alembick. It is a great Cordial, much exceeding Spirit of Wine in Fainting and Swooning Fits, Sickness at Heart, Palpitation, and other Passions of the Heart: It cheers the Spirits, recreates Nature, and makes Merry, profligating the most profound powers of Melancholly. Dose one Dram, or two, to four Drams, alone, if dulcified, otherwise to be mixed with a Glass of Wine.

CHAP. LXXXIV.

BROOM Common.

THE Names. This our Broom was scarcely known to the Ancient Greeks, though some have given it the name of *Σπάρτιον* Spartion: However it is called generally in Latin, *Genista*; and *Scoparia*, as Gerard and Parkinson; some suppose it to be called *Genista à genium flexilitate*, from the flexibility of its joints; or, *Quia genibus medeatur dolentibus*, because it eases the pain of the Knees: or, *quod facile generet, speciemque propaget*, because it easily encreases, and is not without trouble destroyed where it takes Rooting: also *Genista angulosa trifolia*, as J. Bauhin and Mr. Ray: In English, Broom, and Common Broom.

II. *The Kinds.* There are but two kinds, which we shall take notice of in this Book: 1. The English. 2. The Spanish. The English Broom is twofold, viz. 1. *Scoparia*, or *Genista vulgaris*, our Common

Field or Heath Broom. 2. *Genistella*, *Chama-genista* Dwarf Broom. Gerard calls it, *Chama-genista Anglica*.

Common Broom.

III. *The Description.* Common Broom has a Root which is long and woody, but tough withal, spreading several ways under the Earth, never perishing, but sending forth new shoots every Year, and more especially, if the old Stalks are cut down, and taken away. From these Roots come forth many woody Stems or Stalks, of the bigness of a Man's Finger at bottom, sometimes bigger, sometimes lesser, according to its length of time in growing, rising up to the height of four or five feet, or more; and spreading into several the like woody Branches, making a kind of Shrub or Bush, as it were, covered with a hard and thin dark, greyish, green Bark, from which shoot forth a great number of slender, pliant, square or cornered small Twigs; like Rushes, upon which grow small, dark, green Leaves. The Flowers are large, and of a golden yellow shining color, growing one above another for a good space, till they come to the Tops of the Branches, which turn into hard, flat, small Pods, almost black when they are ripe, and in which are contained small and shining, brownish Seed.

IV. *Genistella* or Dwarf Broom has a Root long and tough, long lasting, and spreading much under ground: This Plant never grows very great or high, neither come its slender, pliant, green Branches to be hard or woody, but they always keep low, rising up but a little more than a foot in height. Upon its green pliant twigs, are set small and something long Leaves, of a dark, green color on the upper side, and gray underneath, abiding on them all the Summer time: at the tops grow small yellow Flowers, not so yellow, nor so large as the former, but like unto them for the form; which being past, there succeeds little long Pods or Cods of Seed, which are like to the first, but smaller.

V. *The Places.* The first grows very plentifully in many places of our Land, as upon Heaths, Barren Places, and Uncultivated Grounds, as well as in France, Germany, Italy, and Spain: The other is also found in many Parts of this Kingdom; and is

also found in *Hungary*: about thirty Years since as I was a walking, I found it in some Wasse and Barren Grounds about *Low-Layton* near *London*: This is supposed to be *Clusius* his *Chamaenista Pannonica septima*.

VI. *The Times*. They Flower sometimes earlier, sometimes later in the *Summer* Months, as in *June* and *July*, to the end of *August*, and the Seed ripens in the mean season.

VII. *The Qualities*. They are both hot and dry in the second Degree, and said to be of one and the same, and equal Virtues: They are Aperitive, Absterfve, Diuretick, and Traumatick or Vulnerary: Hepatick, Splenetick, Hysterick, Nephritick, Arthritick, and Alterative: but the Seed some say is Cathartick.

VIII. *The Specification*. It is of peculiar use against the Dropfie, Jaundice, Gout, and Kings-Evil, as also Distempers of the Reins and Bladder.

IX. *The Preparations*. You may make from these Plants: 1. A Distilled Water. 2. A Decolion in Wine. 3. A Liquid Juice. 4. An Inspissate Juice. 5. An Essence. 6. An Oil distilled. 7. A Spirituous Tincture. 8. An Acid Tincture. 9. An Oily Tincture. 10. A Saline Tincture. 11. A Syrup. 12. A Fixed Salt of the Ashes. 13. A Powder of the Leaves and Seeds. 14. A Conserve of the Flowers. 15. An Oil. 16. An Ointment. 17. A Balsam. 18. Gensivemel. 19. A Cataplasma. 20. A Pickle of the Buds.

The Virtues.

X. *The distilled Water*. Whether it is made of the Flowers, or of the green Branches, or both, it is said to be good against Surteits; and taken with equal quantities of the lesser Centory Water, and the Patient laid down to Sweat upon it, it is said to alter the Fits of Agues. It is a good Vehicle for some of the following Preparations.

XI. *The Decolion in Wine*. It is good against the Dropfie, Jaundice and Gout, and to cleanse the Reins, Ureters, and Bladder, of Sand, Gravel, and other Tartarous matter.

XII. *The liquid Juice, made of the young Branches, and flowery Heads*. It purges downwards Phlegmatick and Watry Humors, and therefore is good for such as have the Dropfie, more especially if it is used with White Port, or *Rhenish* Wine: but possibly in some other cases it may be better used with Water. It is profitable against the Gout and Sciatica, and other pains of the Joints and Limbs. It eases pains in the Sides, and is good against Tumors of the Spleen. It cleanses the Reins, Ureters, and Bladder, of Stones, Sand, and Gravel, or any Tartarous Matter Obstructing them, bringing forth the offending Matter by Urine, which it admirably provokes. Dose three, four or six ounces in Wine, twice or thrice a day, as you see need requires.

XIII. *The Inspissate Juice*. The Virtues are the same with the former. Dose from j. to iij. drams: dissolve it in Wine over a gentle heat, and so drink it.

XIV. *The Essence*. It has all the Virtues of the Liquid Juice, before enumerated: It opens Obstructions of the Liver and Spleen, is good against Pains and Stitches in the Sides, difficulty of Breathing, and shortness of Breath; and as it cleanses the Reins and Urinary passages of Gravel and Stones, it is said so perfectly to remove the Cause, as to hinder their ever breeding again. Moreover, it prevails against the Kings-Evil, and powerfully strikes at the Root of the Cause. It opens Obstructions of the Womb, and provokes the Terms in Women, where

they are stoppt. Dose five, six or eight spoonfuls, in White Port or *Rhenish* Wine.

XV. *The distilled Oil*. It is made from the Seed and Roots dried, as Oil of Sassafras, and other like things is made. Its use is External to Anoint with, to take away Spots, Freckles, Pimples, and other deformities of the skin.

XVI. *The Spirituous Tincture*. It is a peculiar thing against the Scurvy, and to strengthen the Stomach and Bowels, whilst the Dropfie is in curing. Dose two drams.

XVII. *The Acid Tincture*. If it is often and long taken, it destroys the Scurvy, Dropfie, and Kings-Evil in their Roots, and destroys the præternatural heat in all Burning, Malign, and Pestilential Fevers. It opens Obstructions of all the *Viscera*, and in a word, performs all that the Liquid Juice or Essence can do; and with this advantage, that this may be taken where there is an extreme weakness of the Stomach, when those things cannot. It helps shortness of Breath, and difficulty of Breathing, strengthens a weak Stomach, and causes a good Appetite in such as loath their Food, or cannot endure to see it in their sight. Dose from a quarter to almost half a spoonful, in Ale, Beer, or Wine, three, four or five times a day.

XVIII. *The Oily Tincture*. It is good against external Evils, and deformities of the Skin, as Spots, Freckles, Lentils, Pimples, Wheals, Scurf, Morpew, and such other like Diseases; eases Pains and Aches from a cold cause, in what part of the Body soever: and being taken inwardly from ten drops to twenty, or more, in any Diuretick Vehicle, it gives present ease to Pains of the Back, though never so extreme, provokes Urine, takes away the heat and scalding thereof, and expells Sand, Gravel, and Tartarous Matter.

XIX. *The Saline Tincture*. It is good in hot Tumors, and all hot Eruptions, and deformities of the Skin, proceeding from heat, or where they happen in hot Constitutions. Inwardly given, it powerfully provokes Urine, and therefore may be of good use in the Dropfie *Sarcites*, to drain the water out of the whole Body. It kills small Worms in the Skin, which breed in an extravagant manner in some People, chiefly in the Forehead, Nose and Chin.

XX. *The Syrup*. If it is made of the Juice, it has the Virtues of the Juice, and Essence, but not full out so powerful; however it is better for Children, Ladies, and such as are Queasie Stomached: It purges gently, and carries off the Recrements of Humors. Dose two ounces to four in a Glass of Port Wine: It is a singular thing against the Dropfie, Jaundice and King's-Evil.

XXI. *The Fixed Salt*. It is made of the Ashes by Elixiviation in Water, being drank daily in Ale, Beer, or Wine, it is said alone to cure the Dropfie, and to be a Specifick for the same. Dose from a scruple to half a dram, in every good draught of Ale, Beer or Wine. And so taken in White or *Rhenish* Wine, it is not only a Specifick against the Dropfie, but as Authors say, it cures the Green-sickness also: however it is not to be used in too great a quantity, lest it should by its vehement aperitive and absterfve Qualities, fret or hurt the Bowels, but it may be given in the Liquid Juice or Essence, whereby it exalts their Virtues, and makes them the more powerful to all the intentions they are propofed for.

XXII. *The Powder of the Leaves and Seed*. Taken to a dram, or dram and half, in Beer or Wine, it purges downwards Cold, Flegmatick, and Watery Humors, expells the Water in Dropfies, helps the Gout and Sciatica; and by a constant use thereof in Wine,

Wine, it cures the Black Jaundice, and preserves from the Gout and Stone.

XXIII. *The Conserve of the Flowers.* Made with Sugar or Honey, and often eaten, it waists and destroys the Humors which feed the Kings-Evil.

XXIV. *The Oil.* It is made of the young Branches and Flowers, boiled in Oil Olive, till they are Crisp, &c. It is a safe and sure Medicament to kill Lice, Nits, and other Vermin, in the Head or Body; and being applied to the Sciatica, it helps it.

XXV. *The Ointment.* It is made of the young Branches bruised, and the Flowers, by boiling them in Oil, adding Sheeps Suet and Wax to bring it to a body, &c. This being applied to Sides pained, or where Stitches are, or to the Spleen, eases the pain, and removes it at twice or thrice using.

XXVI. *The Balsam.* It is made of the young Twigs and Flowers, &c. being applied to green Wounds, or foul, running, and putrid Ulcers, it cleanses, incrusts, and heals them in a very short time: The same will be done by a Balsam made of the Liquid Juice and Turpentine, boiled to a thicknes, adding a little Oil and Wax.

XXVII. *Genistæwel.* It is made by boiling the liquid Juice and Honey to a thicknes. It cures green Wounds presently. It also cleanses old, running, and putrid Ulcers, fills them with Flesh, and heals them: And apply'd to Kibes in the Feet, with powder of Scammony, it cures them in a very short time.

XXVIII. *The Cataplasn.* It is to be made of the tender Tops and Flowers, beaten till they become a Mass in a Wooden Mortar. Being applied, it is said to help the bitings of Serpents, and other Venomous Creatures.

XXIX. *The Pickle.* The young Buds of the Flowers are usually Pickled; and they make an excellent Sallet for the Winter time, but it is of use thro' the whole Year; it excites the Appetite, causes a good Digestion, opens Obstructions of the Liver, Spleen and Reins, and provokes Urine.

ers, fashioned like unto Broom Flowers, but larger as yellow as they, and smelling as well; after which come small, long, round, yellowish red Cods, crested at the back, wherein is contained blackish flat Seed, fashioned very like unto the Kidney Bean, but the Cods (says Gerard) rarely contain more than one Seed, seldom two.

CHAP. LXXXV.

BROOM Spanish.

I. **T**HE Names. It is called in Greek *Σπάρτιον*: in Latin, *Spartium*, and *Spartum Hispanicum*: and in English, Spanish Broom.

II. *The Kinds.* There are, 1. *Spartum Hispanicum*, and *Spartum Hispanicum frutex* (to distinguish it from the Sedge or Rush, that is so called) *Spartum Grecorum*, *Genista Hispanicum*, and *Spartum Hispanicum vulgare*, Common Spanish Broom. 2. *Spartum Hispanicum majus flore albo*, *Pseudo-spartum Hispanicum Aphyllum*, Spanish Broom with a White Flower, Bastard Spanish Broom without Leaves. 3. *Spartum Hispanicum flore luteo*, *Pseudo-spartum luteum Aphyllum*, Spanish Broom with a yellow Flower, or the yellow Bastard Broom without Leaves.

III. *The Description.* The first of these has a rough, woody Root, spreading it self under the Earth many ways; from whence rises up a Stalk five or six Feet high, with a woody Stock below, covered with a dark Gray, or Ash-coloured Bark, and having above many pliant, long, and slender crested green twigs, whereon, in the beginning of the Year, are set many small, long, green Leaves, which abide not long, but fall away when the Plant comes to flower. Towards the tops of these Branches or Twigs grow the Flow-

IV. *Spartum Hispanicum majus flore albo*, The greater White flowered Spanish Broom, has a Root like the former, from whence grows up a Stem much higher than the yellow, even to five or six Feet high, whose Branches are more tough, apt to bend, and compliant, than the former, or that following, having

Small Leaves on them like the others, and as soon fading: the Flowers also stand upon long Stalks, and are like the others for form, but larger, and of a White color, and of little or no smell: which being past away, there comes small round Pods or Cods, like the others, but smaller, each one containing, for the most part, but one Seed, something less than the others also.

V. The third Kind, or Pseudospartum flore luteo, is a smaller Spanish Broom, which has also a hard, tough, woody Root, from whence grows a Stem or Stalk of the bigness of ones Thumb at bottom; and grows to be about two Feet high, whose bark is rough, and streaked all along, sending forth many green, slender, pliant Branches, which divide themselves again into many other smaller Twigs, whereon for a while after they are shot forth, abide a few small Leaves, until they begin to shoot out flowers, and then fall away, leaving the Branches naked, and without Leaves all the rest of the Year after: from the Sides and Joints of the smaller Twigs, shoot forth small long Stalks, bearing many Flowers, smaller and yellower than the former Spartum, without any Scent for the most part: after which come small round skinny Cods, containing for the most part but one Seed in them, and fashioned somewhat like unto the Kidney Bean, which when they are ripe, will by the shaking of the Wind, make a noise in their Pods.

VI. The Places. They all grow in Spain, Italy, France, and other Southern Countries; but the first of them grows with us in Gardens, only, as an Ornament, says Parkinson, among other delightful Plants, to please the Senses of Seeing and Smelling.

VII. The Times. The first and second Flowers in April and May, and beginning of June; the third Flowers in February: and their Seed is ripe before Winter: the first, which grows in our Gardens, its Seed is not ripe till very late in the Year.

VIII. The Qualities, Specification, Preparations, Virtues and Uses, are the same in all respects with English Broom, excepting, that these Spanish Brooms are stronger in operation, and more effectual to the purposes intended; insomuch, that being given inwardly in many of their Preparations as the English, they not only work downwards, but cleanse the Stomach and Body by Vomiting also: this being said, we shall say no more of them here, but refer you to the former Chapter.

CHAP. LXXXVI.

BROOM Rape.

I. THE Names. It is called in Greek *Οροβάνη*: in Latin, *Orobanchē*, *Cauda Leonis*; *Clusius* calls it *Hæmodoron*, as *Theophrastus*, lib. 8. cap. 8. or *Lemodoron*, as others have it: and in English, it is called *Broom-Rape*.

II. The Kinds. Of this Broom-Rape there are several Kinds, as, 1. That which proceeds from the Roots of the English-Broom. 2. That which proceeds from the Roots of the Spanish Broom. 3. That which proceeds from the Dyes Weed: all these have but one Description, though arising from the Roots of those several Plants. *Lobel* and *Clusius* make other Varieties, 1. That which has longer and smaller Flowers than the other, or common sort has. 2. That which has larger Flowers, and those of a blewish color, and is sometimes found among Corn. 3. That which is parted towards the Top

into several Branches, whose Flowers are either Blew, Purplish or White, and is sometimes found amongst Hemp.

III. The Description. Broom-Rape has a bulbous Root, or a Root round and scaly, which adheres or grows unto the Roots of Broom, big or large below, and smaller above, covered with blackish Scales, and of a yellowish Pulp within: from this Root does rise up a Stalk of the bigness of a Finger or Thumb, and about a span long; sometimes a Foot, or two Feet high, which has a shew of Leaves on it, and many Flowers about the Top of it, somewhat whitish, almost

most like to those of dead Nettles; or something resembling the Flowers of Orchis, but larger, and of a deadish yellow color, as the Stalks and Leaves also are, after which grow forth long, thick and round husks, in which are contained very many Seeds, yet good for nothing; but Parkinson says, it perishes without Seed.

IV. *The Places.* Gerard says, that Broom-Rape is not to be found any where but where Broom grows. It may be found in a Broom-field at the foot of Shooters-hill next London; upon Hampstead-Heath, and in several other places. But Parkinson says, it grows more often where no Broom grows, viz. by Fields and Hedge sides, and upon Heaths; and other Authors say, in Corn-fields and Hemp-lands.

V. *The Times.* It rises up, and appears, and is in its chief perfection in the Month of June.

VI. *The Qualities.* It is Temperate in respect to Heat or Cold, Dryness or Moisture, Aperitive, Absterfivè, Diuretick, and Vulnerary; Hepatick, Nephritic, and Alterative.

VII. *The Specification.* Its peculiar property is to provoke Urine, and help the Strangury.

VIII. *The Preparations.* You may make therefrom, 1. A liquid Juice. 2. An Essence. 3. A Decoction. 4. An Infused Oil. 5. A Balsam. 6. A Cataplasm.

The Virtues.

IX. *The liquid Juice.* It is an extraordinary thing to cure not only green Wounds, but also running Sores, old, filthy, running Ulcers, and malignant breakings out whatsoever.

X. *The Essence.* It is thought to be as effectual in opening Obstructions of the Reins, Ureters and Bladder, provoking Urine, and expelling Sand, Gravel, Stones, or any Viscous, Tartarous or Slimy Matter out of the Urinary passages, as Broom it self. Dose three or four ounces at a time, Morning and Evening, in a glass of White Wine.

XI. *The Decoction.* It has the Virtues of the Essence, but not all out so powerful.

XII. *The Infused Oil.* It ought to be made of four or five repeated Infusions of the top Stalks with the Flowers, strained forth and cleared. It is said to cleanse the Skin of all manner of Spots, Freckles, Lentils, Sun-burning, Tanning, and other like deformities which rise through heat of the Sun, or superabundance of malign Humors.

XIII. *The Balsam.* It is cleansing, incarnative, and healing, and therefore beneficial against all sorts of old, putrid, malign, and running Sores and Ulcers: It heals Wounds admirably, and conglutinates their Lips in a very short time.

XIV. *The Cataplasm.* It is good against Burnings and Scaldings, eases Pain, dissolves Swellings and Contusions, where the Skin is not broken, and softens hard Tumors.

II. *The Kinds.* The Arabian, Greek and Roman Authors affirm it to be a Species of *Lapathum*, or *Dock*; which that laborious Botanist Abraham Manning in his famous Herbal, published in Holland, in Folio, Anno 1696. has sufficiently demonstrated. And of this Plant there are two special kinds, 1. The European, simply called *Britannica*, and *Britannica Antiquorum vera*, or *Britanny*. 2. The American, called by the aforementioned Author, *Britannica Americana*; and from some of the places where it grows, *Britannica Virginiana*, *American*, or *Virginian Britanny*.

Britannica or Dark coloured Water-Dock

III. This Plant has layen in the Dark for many Ages, ever since the Times of the Ancient Romans, to whom it was well known, and by whom it was much used, as *Avicen*, *Dioscorides*, *Pliny*, *Galen*, *Egineta*, *Ætius*, *Orobascus*, and others, testify, whereby it is manifest, that in Ancient times it was famous for its cures, which it performed in the Roman Armies, which in *Britanny* and the *Loth Countries*, they laboured under, being chiefly the Scurvy, or Scorbutick Distempers, as *Diarrhæa*, or Fluxes of the Bowels, Pains or Aches, Looseness of Teeth, &c. for which reason *Claudius Cæsar* carried it along with him to *Rome*, ordering it to be spread upon the Pageants of his Triumph, and to be hung up in the Capitol. And *Nero* himself took care of it afterwards for its Culture, by causing it to be Nurst up in the Gardens of *Rome*. But it seems when the *Goths*, and other Barbarous Nations overrun the Roman Empire, and the greatest part of Christendom, destroying and rooting up every thing they came near, that this Plant was buried or lost, in that Universal Destruction of almost all things, and

CHAP. LXXXVII.

BRITANNY.

THE Names. It is called by *Pliny*, lib. 20. cap. 21. in Greek *ῥαπαθιον*, *Hydrolapathum*: in Latin, *Lapathum Sylvestris longifolium nigrum*, *Hydrolapathum*, *Hydrolapathum nigrum*, and *Britannica*: in English, the Wild Black long-leaved Water-Dock, or Black Water-Dock, and *Britanny*, which last is its most Common Appellation.

and has lain forgotten for above eight hundred Years, till this our Author discovered it anew.

IV. The name of this Plant, *Britannica*, came not, says *Munting*, from the Island of that Name, but its Etymology (says he) is taken from the *Frishan* Language, *Brit* signifying *Consolidare*, vel *firmare*, Tan, *Dens*, and *Ica*, *loose*, or a thing going forth, which is as much as to say, to fasten loose Teeth, the looseness of the Teeth and Gums being one of the Grand Symptoms of the Scurvy. But by that great Man's favour, we can give little credit to that far fetch'd Etymology, it being always a thing known, that the pride of the Ancient Romans was too great to invent, or investigate any thing whatsoever with a Latin Name, whose Etymology should arise from the unpolished Particles or Words of Barbarous Nations: Without doubt the Romans first finding it in England or *Britannia* in great plenty (tho' afterwards they might find it in *Friesland*, and other places of the Low Countries) gave it the Denomination from the Name of the Country they first found it in, and so called it *Britannica*, quasi *Herba Britannica*, and this is that which I adhere to, and really believe.

V. All the Botanists of the last six or seven hundred Years, knew nothing at all of it: indeed they have named *Britannica*, but they never durst venture to fix it, so as to describe it, or figure it in Sculpture. And according to the several Ages, several kinds of Herbs or Plants, were taken to be this Plants of ours, as, *Bistorta*, *Betonica*, *Beccabunga aquatica*, *Bugla*, *Cochlearia*, *Heptaphylon*, *Plantago aquatica*, *Primula veris*, *Tormentilla*, *Veronica*, and several others; all which were false, in their several Ages, said to be the *Britannica* of the Ancients: and the two famous *Baubins*, who spent their whole lives in the Botanical Study, made so great a mistake, as to take *Colubrina*, or a sort of *Snake-weed* for it: And *Camden* makes our English Herborists to say, that *Scurvy-grass* was the true *Britannica Phnij*; than which nothing is more remote: without doubt this our *Hydrolopathum nigrum*, is the genuine or true *Britannica* of the Ancients, its description agreeing exactly in every particular with their descriptions, and performing every thing, and more than they ascribed to it.

VI. The Description. The first of these, which is our European or English kind, has a Tubercous Root, large and roundish, sending forth from it almost round about, several Arms or Branches of a considerable thickness, all which seem knobbed or gouty, and ill shaped: From this Root rises up several Leaves pretty large, not much unlike to those of the largest Dock, but every way broader and longer, growing upright, and sharp pointed, sometimes of a blackish green, sometimes of a purplish green, and sometimes of a yellowish green color, sometimes spotted, and sometimes not. From the midst of these Leaves rises up, one pretty large Stalk, sometimes three or four Feet high, of the shape and color of an ordinary Dock, except that sometimes it is inclining to a reddish green; it has a kind of Joints, whence spring forth Leaves like the former, but much less; and from the same place it sends forth manifold Branches, not much unlike to the Common Water Dock, but more numerous, larger and higher. The Flowers grow all over these Branches, almost from their very beginning, up even to their several Tops, in a kind of Cise or Husk, each set upon a small, slender, short rootstalk, and of a brown color; which being vanished, the Seed is contained in Chaffy husks, not much unlike to other Dock Seed, especially that of the Water Dock.

VII. The American or Virginian Britanny has a Root consisting of a Head thick and gouty, but not of

a round tubercous body like the former, from which Head grows downward into the Earth, several Arms or Branches, which are thick, brownish without, and yellowish within: from this Root rises up one upright Stalk of several feet high, which has also Joints upon it like knecs, from whence come forth very long and large Leaves, strong and hard, not much unlike to *Monks Rhubarb*, but that these are much longer. The Stalk (which is very like that of other Docks) rises up oftentimes to a considerable height, about the middle of which it sends forth a great number of Branches not much unlike the European, which have some few Leaves like the others upon them, but much less. The Flowers grow in vast numbers upon all these Branches single, and each upon a small short footstalk, even from their beginning up to their very tops, set in spaces at certain distances, in a seeming Uniform manner: After the Flowers are past away, the Seed comes, which is contained in a Chaffy Husk like the first, and differs not much from it neither in shape, nor color, nor magnitude.

VIII. The Places. It commonly grows in Marshy and Fenny Grounds, banks of Ditches, and moist Places, and in sides of Ditches, and watry Places which are between the Land Ground and Fen Grounds in several parts of this Kingdom: I found some of it in the Borders of the Fens in *Cambridgeshire* and *Huntingdonshire*, and in other moist and watry places. It grows plentifully also in *Friesland*, *Overijssel*, *Gelderland*, and *Holland*, and possibly in many other places in the Low Countries.

IX. The Times. It shoots forth its Leaves in April; its Flowers in the latter end of May, or beginning of June; and its Seed is ripe in August. The Root is to be gathered in the beginning of the Spring, or in Autumn, viz. in March or September; the Leaves and Flowers in June and July; and the Seed in the latter end of August, or beginning of the next Month.

X. The Qualities. It is temperate in respect of heat or cold, but dry in the latter end of the second Degree. It is Astringent, Aperitive, Digestive, and Traumatick; Stomatick, Hepatick, Hylicterick, Arthritic and Alterative.

XI. The Specification. It is peculiar for the curing the Scurvy, and all sorts of Fluxes of what kind, soever; and *Munting* says, it is a Specifick against Poisons and Convulsions.

XII. The Preparations. You may have therefore, 1. A liquid Juice. 2. An Essence. 3. A Decolion. 4. A Spirituous Tincture. 5. A Spirit by Fermentation. 6. A Balsam or Ointment. 7. The fixed Salt. 8. The Powder of the Root.

The Virtues.

XIII. The liquid Juice. Given to five or six spoonfuls, or more, either by it self, or mixt with Red Port Wine, it strengthens and confirms the Stomach and Bowels, and powerfully resists the Scurvy in all its appearances, viz. with all its Symptoms, as Ulcers and Cankers in the Mouth, looseness of the Teeth, wandering pains, weakness and sickness at Stomach, &c. It is good also against all manner of Fluxes whatsoever, as *Diarrhæa's*, *Dysenteries*, *Lienteries*, *Hepatick Fluxes*, overflowing of the *Terms* in Women, &c. It is to be taken Morning and Evening for some time.

XIV. The Essence. It has all the former Virtues, besides which, it is said to cure *Pleurisies*, *Quinsies*, the Hemorrhoids, and all sorts of Inflammations; and is very powerful and successful in the cure of *Hydropical Distempers*, more especially if it is impregnated with the fixed Salt of the same Plant. It is also an extraordinary Traumatick, for the curing of Wounds and old Ulcers, being taken Morning,

ing, Noon, and Night for some time, two or three ounces for a Dose in a Glas of Wine.

XV. *The Decoction.* It has all the Virtues of the Juice and Essence, but not all out so powerful; it is an excellent Traumatick, and Antiscorbutick, and prevails against spitting and pissing of Blood, and all other Fluxes of Blood whatsoever.

XVI. *The Spirituous Tincture.* It has all the Virtues of the liquid Juice and Essence, a famous thing against the Scurvy in a cold and moist habit of Body, a very great stomack, strengthening that Viscus in all its faculties: It is a kind of *Panacea*, and a Specifick against Convulsions, and Poisons, yea the Plague it self; it stops all sorts of Fluxes, and strengthens the *Viscera* to a Miracle: but it (as also the other Preparations) ought not to be given to Costive Bodies, by reason of their Astringency.

XVII. *The Spirit.* It is made of the Juice by Fermentation: and is used (being dulcified) as a Cordial Antiscorbutick, and to comfort and strengthen the Bowels in Hydropick and Consumptive Persons, and such as have been in long Fluxes: being held in the Mouth, it strengthens the Gums, and fastens loose Teeth. Dose from half an ounce to an ounce twice a day, or upon any fainting or illness.

XVIII. *The Balsam, or Ointment.* It cleanses, incarnates, and heals singularly well; it cures Green Wounds at two or three times dressing, by reason of its Stypticity. Applied to the Hemorrhoids, and the Gout, it eases the pains of those Parts.

XIX. *The Fixed Salt.* It is singular against Quinicks, Pleurifies, and other Inflammations of the *Viscera*, opens Obstructions of the Reins, provokes Urine, and absorbs the Acid Humor, which is the cause of Fluxes of the Bowels; it also helps to carry off the Watry Humor in Dropsies. Dose from fifteen to thirty grains, in any Homogene Liquor, Decoction, &c. proper against the same Diseases, two or three times a day.

XX. *The Powder of the Root.* It may be given from half a dram to two drams, Morning and Night, in any Flux of the Bowels, whether Simple or Bloody; it is also good against the Terms in Women, spitting and pissing of Blood, or any weaknesses of those parts; it strengthens the Stomach and resists Vomiting. It may be given in Port Wine, or other Vehicle proper against the Distemper. Strewed upon moist and running Ulcers, it dries up the Humor, and disposes them to heal.

XXI. *The American* has the same Qualities, Specification, Preparations, Virtues and Uses with the former.

crenato, great Brooklime, with a long dented Leaf.
4. *Anagallis aquatica rectius Veronica aquatica minor foliis oblongis non crenatis*, The lesser Brooklime with a long leaf not dented. There are several other Kinds, as that *foliis Pulegii, foliis Alfine*, and *Angustifolia*, but not being common with us I forbear them.

Brooklime.

Brooklime
Greater

CHAP. LXXXVIII.

BROOKLIME.

I. **THE Names.** It is called in Greek, *Ἀναγallis* *ἁγία*; In Latin, *Anagallis aquatica*, and *Becabunga* (from the German Word) and in English, *Brooklime*, and *Water Pimpernel*.

II. *The Kinds.* There are several Kinds of this Plant, as, 1. *Anagallis Aquatica vulgaris*, *Becabunga*, as Parkinson calls it, *Common Brooklime*, which Mr. Ray calls *Anagallis rectius Veronica aquatica minor, folio subrotundo; flore ceruleo*, as, J. Baubin. 2. *Anagallis rectius Veronica aquatica folio rotundiore major*, five *Becabunga major*, the greater Brooklime, and greater round-leav'd Brooklime. 3. *Anagallis rectius Veronica aquatica major folio oblongo*

III. *The Description.* Our Vulgar Brooklime has a Root white, low, and creeping, with fine strings springing therefrom at every joint; from whence rise up flat, thick Stalks, which are roundish, and divided

divided into several Branches, having on them thick, smooth, and broad deep green Leaves, somewhat like to those of Purslane, but of a deeper green color, and set upon the Stalks by couples. The Flowers grow upon small, long, tender Footstalks, which thrust themselves forth from the Bosom of the Leaves, of a perfect blew color, and not much unlike to the Leaves of the Flowers of the Land Pimpernel, consisting of five small round pointed Leaves apiece, which being gone, in a short time after comes a sort of small Seed.

IV. The Greater Brooklime; this differs nothing from the former, but in having larger and rounder Leaves, and a paler blew colored Flower.

V. The Greater long leav'd Brooklime; this differs little, or almost nothing from the former, but in the leaf, which is longer pointed, and dented about the edges; and in the Flowers, which are of a pale whitish blew color.

VI. The Lesser long leav'd Brooklime, this has a Root consisting of a small bush of White Fibres, but not running far, from whence spring many smooth, pale, green Leaves, small at the bottoms, but broad and round at the ends, long and not dented, which lying upon the ground, are almost like those of the Common Field Daisy: the Stalk is round, about a Foot, more or less, high, with divers smaller Leaves thereon, set one by one up to the Top, from whence come forth many branched Spikes of white Flowers, consisting of one Leaf divided into five parts, growing at first as it were in an umbel, but afterwards more spike fashion'd.

VII. The Places. They grow by River sides, small running Brooks, standing Waters, and Ditch sides. The last of them grows in the Marshes of Dartford in Kent, also between Sandwich and Sandown-Castle, and in the Ditches on this side Sandwich.

VIII. The Times. They all flower in June and July, and yield their Seed in August.

IX. The Qualities. They are hot and dry in the second Degree, Digestive, Diffusive, Attractive and Diuretick; Stomatick, Hepatick, Nephritick, Hysterick, Alterative, Spermatogenetic.

X. The Specification. It is peculiar against the Scurvy, to cleanse the Blood, and open Obstructions of the Womb.

XI. The Preparations. You may make therefrom, 1. A Distilled Water. 2. A Spirit. 3. A liquid Juice. 4. An Essence. 5. A Spirituous Tincture. 6. An Acid Tincture. 7. A Saline Tincture. 8. An Oily Tincture. 9. A Fixed Salt. 10. A Cataplasin.

The Virtues.

XII. The Distilled Water from the whole Plant. It is good against Stone and Gravel in the Reins, Ureters, and Bladder, opens Obstructions of the Urinary Passages, and is used as a Vehicle, to convey the other Preparations of the Herb in. Dose five or six ounces twice or thrice a day.

XIII. The Spirit. It is made as Spirit of Scurvy-grass. It is good for a weak Stomach, rectifies Crudities, and removes Nauousefulness and Vomiting, and other Distempers of that Bowel, and therefore is a very effectual thing against the Scurvy, which the Greeks call the Stomach Disease, as having its Root and Foundation there. Dose thirty or forty drops in Wine, or some other proper Vehicle, Morning and Evening chiefly; but it may be given at other times of the Day upon any occasion of Stomach sickness. It is an excellent thing in cold Constitutions; but such as are of a hot habit of Body are to forbear it.

XIV. The liquid Juice. It is said to be effectual to break the Stone in Reins and Bladder (if made

of a gritty friable substance) and to expell it, for it opens all the Urinary passages, and powerfully provokes Urine, giving ease in the Strangury, Difficulty, and other like affections of those parts. Dose from two spoonfuls to six, Morning and Evening, in a Glass of Ale, Beer, Mead, or Wine.

XV. The Essence. It has all the Virtues of the Liquid Juice, besides which it is profitable against Ulcers of the Bladder, to provoke the Terms in Women, and expell the Dead Child. It is a singular thing against the Dropsie Scirites, if its impregnated with the Fixed Salt of the Plant, and be daily given in all the Liquor the Patient drinks. It purges, or cleanses the Blood from all ill humors, and perfectly eradicates the Scurvy in a cold habit of Body, Universals being also premised. It is best taken in the Spring time, and Fall of the Leaf, because then the Blood and Humors are thin and fluxile, and more apt to pass a depuration. Dose from one ounce to three ounces Morning and Evening.

XVI. The Spirituous Tincture. It has the Virtues of the Spirit aforementioned, at Sect. XIII. foregoing, but much more powerfull; and may be given from twenty drops to forty in any proper Stomatick Vehicle, or Wine.

XVII. The Acid Tincture. It is a potent Antiscorbutick, and may safely be given as well in a hot as a cold Constitution. It powerfully opens Obstructions, provokes Urine, and the Couries, breaks and dissolves the Stone, expells Tartarous Matter out of the Body, helps in Rheumatifms and the Gout, and gives ease in wandering pains running over the whole Body. Dose so many drops at a time, as may make a Glass of Ale, Beer, Mead, or Wine gratefully sharp, so as if the Juice of an Orange was squeezed into it.

XVIII. The Saline Tincture. This, tho' given inwardly, powerfully provokes Urine, and opens Obstructions, yet it is mostly used in outward applications, as to discuss Swellings in the Legs in the Dropsie, by fomenting them therewith; to ease pains of the Gout, and to prevent an incipient Gangrene. It clears the skin of Scurf, Morpew, and such other like defilements, if often washed therewith.

XIX. The Oily Tincture. It is good against the Palsie, and Convulsions of the Nerves, being often anointed upon the Parts affected. It eases all sorts of Pains in any Part, proceeding from a cold Cause; and being applied to moist Wounds, it defends them from Accidents. Being well anointed upon any Tumor or Part inclining to a Mortification, it prevents it, and conduces much to the Cure.

XX. The Fixed Salt. It is Deobstructive and Diuretick, bringing away much Water in Hydroptic Persons, and carrying off much of the Morbick cause of the Scurvy, by Urine, being given in White Port, or Rhenish Wine, or some other proper Vehicle, three, four, or five times a day. Dose from fifteen grains to half a dram.

XXI. The Cataplasin. It is made of the Leaves or Herb, boiled, and beaten in a Stone or Wooden Mortar. Applied to Swollen Legs, or any other part Tumified with the Dropsie, it is said to discuss or abate the Tumor. If it is made into a Cataplasin, with the addition of Hogs Lard, the Pulp of Marsh-mallow Roots, and the powders of Fenugreek seed and Linseed, and be applied warm, it takes away any Swelling in Arms or Legs; and is also powerful in defending Wounds, so as to prevent their Apostumating, and to prevent any other ill accident which may happen to them. Farriers sometimes use it also in curing Horfes, to remove Tumors, and heal their Scabs, with other like Diseases incident to them.

CHAP. LXXXIX.

BRYONIE White.

I. **THE Namer.** It is called in Greek "Αμύγδαλος λευκή, i. e. *Vitis alba*, not that it is a Vine, but because it is something like one. Also *Βρυονία λευκή*, i. e. *εμάνο, scateo*, from putting forth, because it puts forth many Branches and Tendrells, whereby it climbs up the adjacent Bushes, Hedges, Trees, or other things adjoining to it. It is also called by some *Λαδύγεν*, because the Seeds or Grains of it were formerly used to take away Hair. In *Arabic* it is called *Fesire, Alfesire, Fesfera, and Alfesfera*: In *Latin*, *Bryonia*, and *Bryonia alba*, *Vitis alba*, *Vitalba*, sic dicta, non quod sit *Vitis*, sed quod ei similis, as aforesaid: also *Viticella*, *Rorastrium*, *Apia-stellum*: In *English*, *Bryonie*, *White Bryonie*, and *Wild Vine*. The Uva or Berries are many times called in *English*, *Tettar Berries*, because of their Effects in curing Tettars.

II. **The Kinds.** There are two principal Kinds of *Bryonie*, 1. The *White*, of which in this Chapter. 2. The *Black*, of which in the next. The *White* is also threefold, 1. *Bryonie alba vulgaris*, *Vitis alba vulgaris*, with all the names above mentioned, Our Common *White Bryonie*. 2. *Bryonia alba vulgaris fructu nigro*, *Vitis alba baccis nigris*, *White Bryonie with Black Berries*; Which some from the Blackness of its Berries call *Bryonia Nigra*, and *Vitis Nigra*, but erroneously, for this is not the *Black Bryonie*, but a Species of the *White*. 3. *Bryonia dicoccos* of *Honorius Bellas*; *Bryonia Cretica maculata*, of *Baubin*; *Bryonia Cretica*, and *Cretica dicoccos*, by *Parkinson*, *White Bryonie with Double Berries*.

Vitis alba White Bryony

III. **The Description.** The Common *White Bryonie*, has a Root which grows to an exceeding largeness, weighing sometimes half an hundred weight, and of the bigness of a Child of a year old, with ma-

ny long Branches or Arms growing from it, of a pale whitish color on the outside, and whiter within, of a sharp, bitter, and fulsome taste. From this Root proceeds many long, rough, but very tender Branches at the beginning, which as they grow up, climb up upon Hedges, Trees, or other Bushes adjoining to it, from these Branches come forth many very rough broad Leaves, divided into five partitions for the most part, in form very much like a Vine leaf, but smaller, rougher, and of a whitish, or hoary green color, spreading very far upon Trees or Bushes, or whatever it is which stands next to it: from the joints with the Leaves come forth small Tendrells or Claspers, which twine about whatever small thing is next it: at the several joints also with the Leaves and Claspers (especially towards the tops of the Branches) come forth a long Stalk, bearing thereon many whitish flowers in a long Tass, as it were in a Cluster, consisting of five small Leaves apiece, laid open like a Star, after which come the Berries, standing more open or separate one from another than in a Cluster of Grapes: they are green at first, but very red when they are through ripe, about the bigness of *Nightshade berries*; of no good or pleasant smell, and of a loathsome taste provoking to Vomit, or causing a nausea in the Stomach.

Bryonia or Wild Vine

IV. The Common *White Bryonie with Black Berries*, seems to be absolutely the same with the former, save, that the Root of this is of a pale yellow color on the inside, and somewhat brownish on the outside; and the Berries after their greenness is past, change not into a red color, but into a perfect black, when they are through ripe; but as to all other parts of the Plant, as in its long, tender, and climbing Branches, form of its Leaves, Tendrells or Claspers, and Color, Shape, Magnitude and Mode of its Flowers, it is exactly the same with the former, so that one cannot be known from the other.

V. The *Bryonia dicoccos*, has a Root very long, but never growing to be bigger than a Mans Arm, of a browner color on the outside, and not so white within as the common. From this Root springs forth many

many long, rough, trailing Branches, in the same manner like the former in all respects, from which spring clasping Tendrils, winding it self upon any thing which stands next it, as the other does. It has broad Leaves, with such divisions therein, as the other have, but that they are somewhat smaller, greener, and striped with white lines through the middle, as likewise in the Vines which go to the Corners. The flowers are somewhat greater than the former, of a pale whitish color, standing every one upon a little longer footstalk, which being past, there comes Berries in their places, which are at first green, but red when full ripe, and differing in form from the others, for standing Semicircular upon the Stalks they are joined at the bottom, as if it were but one Berry, but are parted at the tops into two parts, wherein are contained two Seeds, from whence arose the Surname of *Dicoccos*.

VI. *The Places.* The first grows on Banks, or under Hedges where are Trees, Shrubs, and Quicksets, in many places throughout the Kingdom. The second is found in like places, but where the former with red Berries is not, and is found in some places in Germany, Bohemia, &c. The last grows plentifully in Candia, from whence *Honorius Bellus* sent the Seed to *Christus*, and others.

VII. *The Times.* They all flower in the Month of July and August, some earlier, some later, according to the Climate they grow in, and the warmth or coldness of the Seasons of the Year; and their Fruit or Seed is ripe in some little time after.

VIII. *The Qualities.* They are hot and dry in the third Degree, Attractive, Absterfiv, Cephalick, Nephritic, Hystrick, Arthritic, and Cathartic, purging as well Cholera as Phlegm, and Watry Humors.

IX. *The Specification.* It is a peculiar thing against the Dropsie, and Kings-Evil.

X. *The Preparations.* You may make therefrom,
1. A Distilled Water of the Root, Berries, and whole Plant. 2. A Juice of the Berries. 3. A Juice of the Root. 4. An Essence of the Root. 5. A Decoction of the Root. 6. A Syrup of the same. 7. A Powder of the Root. 8. An Electuary of the Root. 9. A Foccula thereof. 10. A Pessary of the Root. 11. A Saline Tincture thereof. 12. A Bath of the Root, and whole Plant. 13. A Cataplasm of the Root. 14. An Oil, or Ointment.

The Virtues.

XI. *The Distilled Water of the whole Plant.* It is good against Scurf, Morpew, Leprosie, Manginess, Spots, Freckles, Tanning, Sun-burning, &c. the Face and Skin being often washed therewith.

XII. *The Juice of the Berries.* It has all the same Virtues, but is much stronger, and is said to be a peculiar thing for the cure of Tetters and Ring-worms, Herpes, Scabs, Itch, and other breakings out.

XIII. *The Juice of the Root.* It is thus Made or Extracted. In April take away the Earth, and uncover the Root; which done, make a deep but narrow overthwart cut or gash into it; and put in a Goose Quill a little under the Skin, letting the Quill lye sloping or leaning downwards, when thrust into the Root; but first make a hole with your Knife to get in the Quill; then placing a Receiver under the Quill, you will get a great store of the Juice, which will drop therein. A spoonful hereof taken by such as are troubled with Fits of the Mother, it helps them; and it is likewise profitable against the Apoplexy, Epilepsie, Palsie, Vertigo, and other like Diseases of the Head and Brain, which it performs by a Specifick Virtue, which it has in attracting or

drawing away Flegm, and Rheumatick Humors which oppress and afflict those parts. It may be also used as an Erhine upon the Nostribs, by which way also it purges the Head and Brain admirably, evacuating all such Superfluons Humors, which cause Lethargies, Megrimms, Head-ach, or any of the aforementioned Diseases afflicting those parts.

XIV. *The Essence.* It has all the Virtues of the aforementioned Juice, and may be given from half an ounce to an ounce, more or less, according to the age and strength of the Patient. It is a peculiar thing against the Dropsie, Kings-Evil, Rheumatism, and Gout; but it purges with great Violence, troubling the Stomach, so that it works both upwards and downwards, and therefore according to the Opinion of Authors, it ought to be corrected with Ginger, Cinnamon, Winters Cinnamon, Nutmegs, Cloves, Pepper, Juice of Quinces, &c. It is very profitable against Watry Humors, which it evacuates abundantly, both by Vomit and Stool, and therefore is a peculiar thing against the Dropsie, &c. It may be mixed with White Port Wine, and so drank. It opens Obstructions of the Urinary parts, provokes Urine, and cleanses the Reins and Ureters from Sand, Gravel, Slime, and other Viscous and Tartarous Matters apt to be lodged in those parts. It opens Obstructions of the Spleen, and takes away the hardness and swelling thereof. It is good (being outwardly applied) to cleanse the Skin of Scurf, Morpew, Leprosie, Scabs, Itch, Manginess, Herpes, Tetters, Ring-worms, Freckles, Lentils, black and blew Spots, which come from falls, bruises, and the like, and dissolves new Swellings, and expells the dead Child.

XV. *The Decoction of the Root in Wine.* It has all the Virtues of the Essence, but not full out so powerful, and therefore ought to be given in a larger Dose, as from one ounce to two, three, or four, according to age and strength. It is an excellent thing against Hystrick Fits, and Vapors in Women, for it opens Obstructions of the Womb powerfully, and facilitates the birth of Women in Travel, but you ought to be sure the time is near, lest it do mischief; let it be corrected with hot Spices in the making, as before directed, because they also promote this end.

XVI. *The Syrup.* It may be made either of the Juice, Essence, or Decoction, according to which, it will be of more or less strength. It has all the Virtues of those things of which it is made, but not altogether so effectual, because of its being clogged with such a quantity of Honey or Sugar, which is necessary to bring it into a Syrup. But it is better for Women and Children, and Quasie Stomachs, because of its pleasantness in taking. It is good against Coughs, Colds, shortness of Breath, Asthma's, and kills Worms in the Body: Dose, one, two, or three ounces in a Glass of Wine.

XVII. *The Powder of the Root.* It has the Virtues of the Juice and Essence, but is thought to work stronger: being taken in White Port Wine, from a scruple to a dram, it is good against the bitings of Venomous Creatures, and kills Worms in Children; prevails against the Gout, Rheumatism, Dropsie, and King's-Evil, and provokes the Terms in Women, but it ought not to be given to Women with Child, because it may induce miscarriage or Abortion. If it is thus compounded, it becomes a famous Medicament. *℞. Bryonie Root in fine powder a pound: Scammony twelve ounces: Cambogium in powder eight ounces: Liquorice in powder six ounces: Aurum Vite four ounces: mix all together.* Dose from sixteen Grains to half a Dram. It is a famous thing for the cure of the Gout, Sciatica, Rheumatism, Dropsie, Jaundice, and King's-Evil.

Where

Where a Rheumatism has been so vehement that the Patient has roared out Night and Day with the Vehemency and Extremity of the pain, and has lain Bedrid for two whole Years together, not being able to use Hand or Foot, or in the least help themselves, not so much as to put their Hand to their Mouths; this Medicament, or Composition, being given but five or six times, has perfectly restored them, beyond all expectation. I commend it against a Rheumatism, as a Composition which has no equal in the whole Republick of Medicine.

XVIII. The Electuary. R. Powder of Bryonia Roots, four ounces: Scammony in powder, Liquorice in powder, of each two ounces: Cloves, Ginger, in powder, of each one ounce: Nutmegs in powder, Zedoary, of each half an ounce: Tartar vitriolate two ounces and half: Honey clarified, thirty six ounces: mix and make an Electuary. It cures the Scurvy, Dropic, and Gout; and is an admirable thing against the King's-Evil: It produces the Terms in Women, and expels the Dead Child; and cleanses the Stomach, and other Bowels, of Cold, Raw, Windy, Slimy, Tartarous and Gripping Humors: Dose, in a Bolus, from one dram to two drams in the Morning fasting.

XIX. The Fecula. It has the Virtues of the Juice and Essence, but not altogether so violent; it may be given, say Authors, from five to ten grains; but in strong Bodies you may give it from ten grains to twenty: mix it with Honey, the Pulp of a Prune or Roasted Apple, or some such like substance, and so let it be taken in the Morning: being mixed with the Distilled Water or Essence, or any other proper Wash, it cleanses the Skin, and takes away Wrinkles, Freckles, Lentils, Spots, black and blew Marks, Tanning, Sun-burning, and the like; let it be laid upon the Skin, and suffered to dry on.

XX. The Pessary. It is made of the solid substance of the Root: being put to the Womb, it provokes the Terms in Women, opens Obstructions of the Womb, and educes both Birth and After-birth, as also the Dead Child.

XXI. The Saline Tincture. Taken inwardly to a dram, or more, in some proper Liquor, it provokes the Terms, and facilitates the Birth: and outwardly applied, it removes all the Vices and Deformities of the Skin, as effectually as either Essence or Fecula. You must wash therewith, and suffer it to dry on, repeating it several times a day, if the Disease is inveterate.

XXII. The Bath of the Root and whole Plant. It is peculiar against all external Defecations of the Skin; as also to open Obstructions of the Womb, and educe the Terms, and to cleanse it from all other Recrements of Humors, the Patient sitting for some time therein, and repeating it, if need be.

XXIII. The Cataplasim of the Root. Being bruised and applied Cataplasim-wise to any place where Bones are broken, it helps to draw them forth: and being mixt with a little Wine, and applied, it breaks Boils, and draws forth Pustles, and is good against Felons and Whittoes, which infect the Fingers ends, and Roots of the Nails. It is also good to cleanse the Skin from Morpew, Leprosie, Scabs and Manginess.

XXIV. The Oil or Ointment. It is made by boiling the bruised Root in Oil Olive, or Hogs-Lard, or Oil mixt with Beef or Mutton Suet, &c. they being anointed with it, dissolve or dissuelt recent Tumors, help Contusions, and take away black and blew Marks which come from blows or falls; and withal remove most of the other deformities of the Skin, if applied for some reasonable time.

CHAP. XC.

BRYONIE Black.

I. The Names. It is called in Greek *Ἀμνιό-μελαινα*, & *Βρυονία μελαινα*: In Latin, *Vitis nigra*, and *Bryonia nigra*: In English, Black Bryonie.

II. The Kinds. There are three kinds of this: 1. *Ἀμνιό-μελαινα*, and *μελαινα*, *Vitis Sylvestris*, and *Vitis nigra*, *Bryonia nigra*, *Bryonia nigra Sylvestris*, *Bryonia nigra communis*, *Sigillum Sanctæ Mariæ*, Common Black Bryonie: but why it should be called *Vitis Sylvestris*, or *Wild Vine*, I know not, because there is a *Vitis Sylvestris*, which is *Vinifera*, and differs but little from the true manured Vine, but that it grows Wild, and bears few or no Grapes; but *Pliny* I suppose was the cause of it, who, *lib. 23. cap. 1.* being not able to distinguish them, confounded 'em, and made them all one. 2. *Bryonia nigra Baccifera*, Black Bryonie with single Red Berries: This *Bauhinus* in his *Prodromus* calls *Bryonia Sylvestris Baccifera*, and in his *Pinax*, *Bryonia levis*, five *nigra Baccifera*. 3. *Bryonia nigra Dioscoridis*, *Vitis nigra*, (ita dicta ab acinis, radiceque nigris, & quod *Vitis similitudinem habet*.) *Vitis Chironia*, The true Black Bryonie of *Dioscorides*.

Vitis Nigra. Black Bryony

III. The Description. It has a Root which is brownish, or inclining to blackish on the outside, in some places by long standing, but white within; it is large if it grows in moist grounds; but much smaller and whiter, if it grows in dry, hard, and stony places, as *Dalechampius* says, somewhat hot, and of a sharp taste: From this Root arises long trailing Branches, without any clasping tendrils; but by reason of the vast number of Branches, and their tenderness, it takes hold of, and climbs upon those things which stand next to it, tho' easy to be loos'd therefrom, contrary to the other kinds. The

Leaves are somewhat broad, and like unto the Leaves of the rough or prickly Bindweed, and terminate in a sharp point. The Flowers come forth at the Joints upon long Stalks, many clustering together, in long, thin, or sparsed Clusters, each one consisting of five small white Leaves, and after they are fallen, there come in their places small Berries, first green, and red when they are ripe, and sometimes changing a little blackish as they grow old.

IV. The second Kind, has a great thick Root, long, and not much unlike the former, having a clammy kind of Juice: from which rises up many, long, and square Branches, more hard and woody than the other, and without any Claspers at all. The Leaves are somewhat like to those of the Great White Bindweed, of a shining color, a little unevenly dented about the edges, and standing upon long Rootstalks: towards the tops of the Stalks at the Joints, with the Leaves come forth white Flowers, every one standing on a short Stalk, which afterwards grow five single Berries, green at the first, and red when they are ripe, not much less than Cherries, in which are contained four or five somewhat large, round, and black Seed.

V. The third and last Kind, has a Root somewhat great and blackish on the outside, but of a yellowish color within, and full of a clammy moist Juice, which will cleave to your Fingers: whence comes forth many long green Branches, on which grow several broad Leaves, somewhat long pointed, and not divided on the edges at all, of a sad or dark green color, having at the Joints, with the Leaves, clasping tendrels, by which it takes hold, and winds it self about any thing which stands next to it. Towards the tops come forth long Bunches of whitish Mossie Flowers, which being past, there come Berries, which are green at first, and black when they come to ripeness.

VI. The Places. The first of these grow on Banksides, and under Hedges, and Woody places in many places throughout this Kingdom. The second grows in several places in Germany, as in Hesse, Saxony, Westphalia, Pomerania, and other places where the White grows not: the last grows in Gracia, Italy, Spain, and several Southern Countries, and is not with us unless nourished up in Gardens.

VII. The Times. They spring in March, and flower in May, June and July, and their Fruit is ripe in August and September.

VIII. The Qualities. They are the same with the White, but much weaker in their Cathartick Virtue, as in purging Flegm, Choler, and Watry Humors.

IX. The Specification. It prevails against the Dropfie, King's-Evil, Diseases of the Womb, and Defilements of the Skin, whatsoever.

X. The Preparations. 1. The roasted Root. 2. The Juice. 3. The Essence. 4. The Decollion. 5. The Powder. 6. The Cataplasim. 7. The Facula.

The Virtues.

XI. The roasted Root. Matthiolus says, that the Root of our Common Black Bryonie being roasted in the Embers, and eaten, is a powerful Medicine to increase Lust, provoke Venery, and stimulate the Instruments of Generation to that act: but Lobel sharply reproves him for it, as not believing it.

XII. The Juice. Mixed with Wine and Honey, and drunk, it is good against the King's-Evil: and simple of it self, it cleanses the Skin of Spots and Marks, Morphew, Scurf, Leprosie, Tettars, Ring-Worms, &c. it eases Pain, strengthens the Nerves, dissolves Contusions, &c. Dose half an ounce, to one ounce, or more.

XIII. The Essence. It purges Flegm, and Watry Humors, provokes Urine, and is good against the Falling-sickness, Palsie, Hysterick Fits, Vapors from the Spleen and Womb, with other like Diseases of those parts. It is prevalent against the King's-Evil, all sorts of Kernels, Knors, and hard Swellings in the Neck and Throat, or other parts. Dose, two, three, or four spoonfuls in a Glas of Wine, according to age and strength.

XIV. The Decollion in Wine. It has the Virtues of the Essence, but not altogether so powerful, and may be taken to six or eight ounces: it is prevalent against the Dropfie, Jaundice, and King's-Evil, and such other Diseases as proceed from the Plenitude and Corruption of Humors.

XV. The Powder. It is made of the Root, and may be given from a scruple to two scruples, to purge away Cold, Serous Flegmatick, and Watry Humors, and to remove the Original Cause of the King's-Evil: It has the Virtues of the Essence.

XVI. The Cataplasim. It is made of the Root beaten to a Pulp in a Mortar, and mixed with a little Honey. This being laid or spread upon Sheeps Leather, whilst it is yet fresh and green, takes away black or blew Marks, and all Scars and Deformities of the Skin, ripens and breaks hard Apoptems, draws forth Splinters, Thorns, and broken Bones, dissolves congealed Blood; and being applied to the Hips, and Huckle-bones in the Scatica, Shoulders, Arms, or other parts, where there is great Pains and Weakness, it effectually removes the same in a very short time: Gerard. And applied to any place out of Joint, it is good to ease the Pain, to consolidate and strengthen the Nerves, that they may not easily again be put out of their places. Parkinson.

XVII. A Cataplasim of the Leaves. Being bruised and sprinkled with Wine, and applied to the galled Necks of Oxen, which are hurt with the Yoke, it heals them: I suppose it will heal Gallings and Sores in Mankind also, being applied.

XVIII. A Cataplasim of the Berries. It removes Sun-burnings, Tanning, Spots, and other blemishes of the Skin, takes away black and blew Marks, which come from falls, blows, bruises, &c. being applied to them.

XIX. The Facula. It has the Virtues of the Powder and Essence, is very powerful to the purposes intended; it is prevalent against Pfora, or Scabs, Manginess, Leprosie, King's-Evil, Dropfie, &c. Dose. It may be given in Wine or Broth from ten grains to a scruple, plus minus, according to the age and strength of the Patient.

CHAP. XCI.

BUCKSHORN.

I. THE Names. It is called in Greek Κορωνόρις, from the similitude it has to a Crows foot: but the true Greek name is 'Αυξορία: the Latins call it Cornu Cervi, or Cervinum, Coronopus Ruellij, Herba Stella, (both, from the form of the Leaves) Sanguinaria and Sanguinalis (from its stopping of Blood:) Harenaria, (from the Sandiness of the place it grows in:) and Nasturtium Verrucarium, (from the likeness of its Seeds to Warts:) And we in English call it, Bucks-horn, Swines Cresser, and Wart Cresses.

II. The Kinds. It is twofold, 1. Coronopus recta Ruellij, Ambrosia Matthioli, Upright Bucks-horn, or

or Wart Cress. 2. *Coronopus repens* Ruellij, *Pseudocoronopus Dodonæi*, *Cornu Cervi alterum Valgi*; Creeping Bucks horn, or Wart Cress.

Creeping-Bucks-horn

III. The Description. The first has a small, long, white Root, with many Fibres thereat, running deep into the ground, the taste of which is somewhat like to the Garden Cress, but much milder. From this Root come forth several Branches, which grow upright, but not very high; which Branches are also branched forth into others that are smaller: upon which grow very many small, long, and divided or cut green Leaves, all along on both sides of them, whose cuts very much resemble the snags of a Bucks

horn, or of some of the Leaves of the Garden Cress. The Flowers grow among the Leaves, coming forth with them at the Joints, they come forth in small rough Clusters, and are small and white, or of a very greenish color, many of them set upon a small long stalk, one above another: which being past, there come in place, small, flatish, rough, round basks, something resembling rough or seeded Warts, which divide themselves into two parts, and contain in each of them a small brownish Seed.

IV. Ambrosia, or *Coronopus repens*, is altogether like the former, saving in the manner of its growing: It is a small low herb, most usually creeping with many long Branches, and spreading a great way, almost round about, upon the ground (yet in some places standing more upright: This Creeping kind never rises above four or five Inches high, but the trailing Branches are furnished with such like Leaves and Flowers as the former, which have a taste a little like Cresses. It is many times used to be eaten as a Sallet Herb, with Salt, Oil, and Vinegar, and that both raw and boiled.

V. The Places. They grow almost every where round about London, and in many other parts of the Kingdom in moist Grounds, and at the foot of Banks, where there is any low Trench, or places continually plashed with Water: sometimes by Highway sides, especially in those places where Hogs frequent, from whence, as is supposed, they were called Swines Cresses.

VI. The Times. They flower and feed all May, June, and July; and their green Leaves abide fresh in a manner all Winter.

VII. The Qualities. They are hot and dry in the first Degree; Astringent, Absterive, Digestive, Carminative and Vulnerary; Cephalick, Stomack, Pectoral, Hepatick, and Hysterick; Alterative, Alexipharmick, and Spermatogenetic.

VIII. The Specification. They are said to be peculiar for taking away Warts, for that the Seed bear the perfect signature of the Warts upon a Man's Hand.

IX. The Preparations. You may make therefrom, 1. A Liquid Juice. 2. An Essence. 3. A Decoction. 4. A Balsam or Ointment. 5. A Cataplasim.

The Virtues.

X. The Liquid Juice Given to three or four ounces, it is Traumatick, or contributes to the more speedy cure of Wounds and Ulcers, more especially in Scorbutick and Cachectick habits of Body: made thick with fine Bole, and applied, it stops bleeding.

XI. The Essence. It strengthens the Head, Stomach, Liver, Womb, and Joints, and is of singular good use against the Scurvy, Cachexia, and disaffections of the Womb. It represses Vapors, and is good against Fits of the Mother. It is also Traumatick, having all the Virtues of the Liquid Juice. Dose from one ounce to three, Morning and Evening, either by it self, or mixt with a Glass of Wine.

XII. The Decoction. If made in Wine, it is a good Stomack, and Hepatick, has the Virtues of the Essence, but not all out so powerful: and externally applied to Wounds, it cleanses, dries, and contributes to their healing, and withal represses the flux of Humors into the part, hindering Pain and Inflammations.

XIII. The Balsam or Ointment. It is an excellent thing for healing of green Wounds, which it speedily performs: it also cleanses, incarnates, dries and heals old Ulcers, or running Sores, strengthens the parts

parts affected, and makes them able to resist a flux of Humors falling upon them.

XIV. *The Cataplasim.* Being applied it has (says *Moribolus*) an adstringent and repelling power: and therefore must necessarily repercuss Humors, abate Inflammations, ease Pain, and strengthen the part, especially in the Gout, Sciatica, and other like Distaffections: Applied upon Warts, it cures them.

CHAP. XCII.

BUGLE.

I. **THE Names.** This is a Plant unknown to the Greeks as far as I can find; and therefore has no Greek name: It is called in Latin *Bugula*, and *Bugulum*, *Consolida media*, and *Solidago minor*: *Moribolus* calls it *Laurentina*, and *Herba Laurentina*: And in English, *Bugle*, middle *Consolid*, and by some *Sicklewort*.

II. **The Kinds.** Authors make fix kinds of this Plant, but all that grow with us, are referred unto two, 1. *Bugla vulgaris*, *Bugla flore Caruleo*, Common Bugle, or Bugle with a Blew Flower; this *Tragus* calls, *Prunella carulea prima*, vel *major*: but most Writers call it, *Consolida media pratensis cerulea*. 2. *Bugula flore albo*, Bugle with a White Flower.

III. **The Description.** The first of these has a stringy Root, spreading under the Earth round about, like unto Money-wort, or Penny-royal, from whence rises up a hairy square Stalk, about a foot or foot and half high; It has Leaves long, fat, and oleous, like those of *Prunella* or *Self-heal*, but larger, and a little longer; some green on the upper side, others more brownish, a little dented about the edges, and somewhat hairy. The Stalk is also set with such like Leaves, which stand thereon by Couples, from the

middle almost whereof upwards, stand the Flowers together in roundles, compassing the Stalk, of a fair blew color, with Leaves also, but smaller and browner than those on the Stalk below: these Leaves and Flowers are set at distances, leaving between every roundle bare or void spaces. Among the Flowers are also small ones, as those of *Self-heal*, of a blewish, and sometimes of an Ash-color, fashioned like the Flowers of *Ale-hoof* or *Ground-Ivy*: which being past, there succeeds small, round, blackish Seed.

IV. *Bugula flore albo*, Bugle with a white flower differs not in its form or magnitude, either in its Roots, Stalks, Leaves, Flowers or Seeds, from the former, excepting in the color of the Stalks and Leaves, that these are always green, and never brown as the former; and in the color of the Flowers, that they are always White.

V. **The Places.** They grow in Woods and wet Coppes and Fields, generally throughout England; but the latter is not so common to be met withal: *Gerard* says, that he found the first of these Plants in a moist ground upon Black Heath near London, and near a Village called Charlton, but the Leaves were green, and not brown.

VI. **The Times.** They flower from May until July, perfecting their Seed in the mean season: But the Root and the Leaves next unto it, lying as it were upon the Ground, remain all the Winter until the next Spring.

VII. **The Qualities.** They are Temperate as to heat or cold, and dry in the first Degree: Astringent, Absterive, Incarnative, Traumatick or Vulnerary; Neurotick, Stomatick, Hepatick, and Alterative.

VIII. **The Specification.** They are peculiar for the Cure of Wounds and Ulcers.

IX. **The Preparations.** You may make therefrom, 1. A liquid Juice. 2. An Essence. 3. A Decolion. 4. A Syrup. 5. A Distilled Water. 6. A Spirituous Tincture. 7. An Acid Tincture. 8. An Oily Tincture. 9. A Saline Tincture. 10. A Lotion. 11. An Ointment. 12. A Balsam. 13. A Cataplasim. 14. A Fixed Salt.

The Virtues.

X. **The Liquid Juice.** It is excellent for such as are Livergrown, or troubled with the Rickets: It strengthens the whole Body, and being drunk inwardly to two, three, or four ounces at a time, it contributes to the healing of old Ulcers, running Sores, and Fistula's, and to the uniting of broken Bones, and Corroborating any Member out of Joint.

XI. **The Essence.** It Dries and Astringes moderately, and is of good use for such as have got a fall, and are inwardly bruised, for that it dissolves the congealed Blood, and disperses it. It has all the Virtues of the Liquid Juice, and is very effectual to strengthen the inward parts, and to cause to heal all manner of running Sores, foetid Ulcers, and Fistula's, whether they be old or new. Dose five or six spoonfuls in a Glass of Red Port Wine.

XII. **The Decolion in Wine.** It has the Virtues of the Juice and Essence, but not full out so powerful: it is good to cleanse old running Sores and Ulcers, by washing them therewith.

XIII. **The Syrup.** Whether it is made of the Herb, or of its Juice, it is an excellent thing against Coughs, Colds, Hoarfiness, Wheezings, shortness of Breath, difficulty of breathing, Soreness of the Breast and Stomach, and other Distempers of those parts: it stops spitting of Blood, and cures Ulcers of the Lungs.

XIV. **The Distilled Water.** It is a good Vehicle

to convey the other things in: But mixed with half its quantity of the Juice or Essence, it is good to wash a Sore or Ulcerated Mouth, and to cure such Sores or Ulcers which happen in the Secrer Parts of Men or Women.

XV. *The Spirituous Tincture.* It heals admirably any Sore or Ulcer, whether inward or outward. In Ulcers of the Lungs it may be mixed with the Syrup aforementioned, thus: *℞ of the said Syrup, one ounce: of the distilled Water an ounce and half: of the Tincture two drams: mix for a Dose to be given in Ulcers of the Lungs.* Outwardly mixed with the Juice or Essence, it cleanses old Ulcers, Incarnates and heals, and sometimes heals simple Wounds at once or twice dressing; you may make it thus: *℞ of the Juice or Essence four ounces: of the Syrup an ounce and half: of this Tincture one ounce: mix them, to wash the Ulcer withal.*

XVI. *The Acid Tincture.* It is an admirable thing against inward Wounds, Thrusts, or Stabs into the Body or Bowels, and is excellent to be mixed with all Wound Drinks, and to be given mixed with the Syrup, against the Rickets in Children: It stops the running of Gangreens, being applied; and opens Obstructions of the Liver, and Gall; and is good to be mixed with Washes for sore Mouths and Throats. Dose inwardly from thirty to forty drops, in any specifick Vehicle.

XVII. *The Oily Tincture.* It cures Wounds at a few times dressing, but chiefly Wounds of the Nerves, for which it is a Sovereign thing: If a Nerve is prickt or wounded, it presently eases the pain, and prevents the return of Convulsions upon that account.

XVIII. *The Saline Tincture.* It is cleansing, and is good to wash and bathe those parts which are apt to break out with Botches, Boils, Scabs, Itch, Scurf, Morpew, and other Defecations of the Skin.

XIX. *The Lotion.* It is made of the Juice thus: *℞ Clarified Juice of Bugle a pint: Honey three ounces: Allum six drams: mix and dissolve over a gentle fire.* It is good to wash inveterate and running Sores with, which are very foul, and have been of long continuance; and it is as powerful and effectual to heal all running and stinking Ulcers in the Secrer Parts of both Men and Women, and is an excellent Gargle for curing Sores, and Cankers in the Mouth and Throat.

XX. *The Ointment.* It is made of the Leaves of Bugle two parts: of Self-heal, Sanicle, and Scabious, of each one part; bruised and boiled in Hogs Lard, or in a mixture of equal parts of Sheeps Suet, and Oil Olive, until the herbs are crisp, and then strained forth, and kept for use. It is a very good thing for healing any fresh or green Wound, tho' lacerated, torn, or bruised; it brings it to digestion, cleanses, incarnates, and speedily heals it. *Parkinson* says, that he could wish that all the good Women and Ladies, that desire to do good to their own Families, or their poor Neighbours, not to be without this Ointment, always ready prepared, and at hand by them.

XXI. *The Balsam.* It has the Virtues of the Ointment, but more digestive, cleansing, and incarnative, and therefore more fit for complicated Wounds, which are accompanied with Contusions, Dilacerations, and other ill Symptoms.

XXII. *The Cataplasim.* Made of the green Herb, it is good to abate Inflammations, and other hot Swellings in the Neck, Throat, and other Parts. It dissolves Contusions, dissolves congealed Blood, and is profitably applied to those Parts which are hurt by any blow or fall: It is also profitable to be applied to all sorts of Ulcers, whether recent or in-

veterate, washing the same also with the Lotion prescribed in *Sett. 19.* foregoing, every time you dress them. It is good to be applied to broken Bones, and Dislocations, where the parts have been long out of Joint, and have been often reduced, and fall out again by reason of Weakness: but as these things ought to be applied outwardly, so the Essence, or Juice, ought to be used all along inwardly, to corroborate the Tone of the Parts.

XXIII. *The Fixed Salt.* It is opening, cleansing, and diuretick, removes all Tartarous matter out of the Reins, Ureters, and Bladder: and taken to one scruple with the Essence, it is good to heal Wounds, and Ulcers of the Urinary parts.

CHAP. XCIII.

of BUGLOSS Garden.

I. *THE Names.* It is called in *Greek*, Βάγλασσα, (but it is rather the name of *Borice*, for so the *Greeks* called that Plant, and this our *Bugloss* was rather the *Lesser Bugloss*; also Λύαβις, with *Dodonæus*: which *Parkinson* says was unknown to the Ancients. In *Latin*, *Buglossum*: and in *English*, *Bugloss* (after the *Latin* name.)

II. *The Kinds.* There are several sorts of it, as, 1. *The Garden*, which is *Buglossum Hortense*. 2. *Buglossa Sylvestris*, Wild *Bugloss*. 3. *Echium*, *Vipers Bugloss*. 4. *Wall and Stone Bugloss*. 5. *Limonium*, *Marsh Bugloss*: Of these last four we shall treat in the four next Chapters. 6. *Anchusa*, *Alkanet*, of which we have treated in Chap. 8. foregoing.

BVGLOSSA.

III. *The Garden Kind*, of which we treat in this Chapter, is twofold, viz. 1. Λύαβις, *Lecepsis*, *Buglossum Vulgare*, which is the *Greater Bugloss*. 2. *Buglossum Interm*, which is the *Lesser Bugloss*, and

and by some called Ox-Tongue, or Garden Ox-Tongue.

IV. The Description. Our Common Bugloss has a Root which is black without, and whitish within, long, thick, and full of a slimy Juice (as the Leaves also are) which continues and perishes not every Year, as the Root of Borage does; from this Root comes up several long, narrow, hairy, whitish green Leaves, among which rise up two or three very high Stalks, branched at the top, whereon stand many blew Flowers, consisting of five small round pointed Leaves, with a small Pointel in the middle, which are very smooth, shining, and of a reddish purple, whilst they are Buds, and not blown open, which being fullen, there grows in the green Husks, in which the Flowers stood, three or four roundish black Seeds, having that Thread or Pointel, standing still in the middle of them.

V. The Lesser Bugloss, which some will have to be Ox-tongue, is much lesser than the former, the Roots are long and creeping in the ground: and the Leaves are very rough, and rougher indeed than the former, like the rough Tongue of an Ox or Cow, (whence came the name) the Stalk is about two Feet high, more or less, and commonly of a reddish color: at the top of the Branches grow the flowers in rough scaly heads, which Flowers are composed of many small yellow Leaves, much like those of Dandelion, and fly away in Down like as they do, these Flowers are bitter of taste, whence Lobel calls it, Buglossum Echioides luteum Hieracio cognatum.

VI. The Places. The first is only nursed up in Gardens, so also is the second: but this latter is found to grow wild in many places, as between Redriff and Deptford, by watry Ditch sides, as Gerard says.

VII. The Times. They flower in May, June, and July, to the end of Summer, and the Seed ripens in the mean Season.

VIII. As to their Qualities, Specification, Preparations, Virtues and Uses, they are altogether the same with those of Garden Borage, of which we have treated before in Chap. 83. to which you are referred. But this is to be noted in Bugloss, that its Roots are much more Mucilaginous, Viscous, or Clammy than those of Borage, and therefore are held not to be so convenient for opening Apozems: but the said Juice being made into a Looch or Licking Elixuary, may be prevalent against the Cough, Hoarseness, and Colds, and to condense thin Distillations of Flegm upon the Lungs.

C H A P. XCIV.

Of BUGLOSS Wild, or Ox-Tongue.

I. THE Names. It is called in Greek Βαγλίσσιν: in Latin, Buglossum Sylvestre: and in English, Wild or Field Bugloss, or Ox-Tongue.

II. The Kinds. There are several Species of the Wild Bugloss, as 1. Buglossum Sylvestre majus, sive nigro, The Great Wild Bugloss. 2. Buglossum Sylvestre minus, The Small Wild Bugloss. 3. Buglossum Sylvestre minus Asperum, Rough Wild Bugloss. 4. Buglossum dulce, ex Insulis Lancastriae, Sweet, or Lancashire Bugloss.

III. The Description. The first of these differs little from the Garden Bugloss, but in its greatness, this being larger in every part: and in the color of the Flowers, which are of so deep a purple color, that they are accounted as black,

IV. The second Kind, has a small long Root: its Leaves are somewhat broad, short, and rough, smaller than either the former Wild Kind, or the Garden Kind, and something more unevenly dented on the edges: the Flowers grow at the Tops, of a blewish purple color, but smaller than the former, and the Seeds grow three or four together, and blackish also, like the other kinds.

Ox-tongue

Or
Wild Bugloss

V. The Rough Wild Bugloss, has a Root like the former, but its Leaves are much rougher than any of the other Kinds, and sharper or smaller towards their ends: the Flowers on the Tops of the Branches, are more like the Flowers of Galioflis, or stinking Dead Nettle, than of any of the other sorts of Bugloss: in some Plants they are of a blewish purple color, and in some they are white, but both colors are never found in one Plant.

VI. The Lancashire Bugloss, has a great Root, blackish on the out side, and divided downwards, in several large Arms or Branches. From whence shoots forth many slender Stalks, a Foot and half high, more or less. The lower Leaves whereof next the ground, are much lesser than those of Borage, and of a whiter green, and somewhat rough; but those which grow on the Stalks are lesser, having the Flowers set at the Joints with them, whose Buds before they are blown, are of a reddish color, but when they are open, of a blewish purple, somewhat like those of Vipers Bugloss, or between them and Borage Flowers, of a very sweet, or Honey like Taste.

VII. The Places. The first, second and third grow Wild in several Countries, and are sometimes found growing Wild in England. The fourth was found by Mr. Hesketh growing in one of the Islands about Lancashire.

VIII. The Times. They all flower in June and July, and their Seed comes to ripeness in a short time after, the Seed growing ripe, even in the time of Flowering.

IX. The Qualities, Specification, Preparations, Virtues and Uses, are mostly the same with those of

of Borage, but especially with those of *Vipers Bugloss*, of which we treat in Chap. 95. next following.

CHAP. XCV.

of BUGLOSS Vipers.

I. THE Names. It is called in Greek, *Ἐχίνιον*, *Ἀλκίβιον*, and in Latin, *Echium*, *Alcibiadion*, *Alcibion*, & *Alcibiaceum*, (from the first finder of it out, who being bitten by a Viper, and gathering this Herb, and chewing it, and following down the Juice, and applying the rest of the Herb to the bitten place, was cured thereby) it is also called *Buglossum Viperinum*, and *Sylvestre Viperinum*, as some say, from the effects of the Roots in curing the bitings of Serpents; but as others say, from the color of the Stalks which are speckled like a Serpents skin: In English *Vipers Bugloss*. *Apuleius* saith, that the Greeks called it also *Θερριόριον*, *Therriorizon*, *Radix Viperea*; and *Ἐχίνιον*, from the form of the Seed, which, as *Dioscorides* says, is like the Head of a Viper; whence came the name *Echium*.

II. The Kinds. Authors make twelve several Kinds of *Vipers Bugloss*, of all which, two only are said to grow with us, viz. *Ἐχίνιον λευκόν*, *Echium Vulgare*, Common *Vipers Bugloss*. 2. *Ἐχίνιον αλευκόν*, *Echium Vulgare flore albo*, White flowered *Vipers Bugloss*.

III. The Description. The first of these has a Root which is somewhat large and blackish, and grows woody at the approach of Seed time, perishing in the Winter: from whence springs forth many long, rough Leaves, lying on the ground, and from among which rise up several hard round Stalks, which are very rough, as if thick set with prickles or prickly hairs, having many black spots on them, not much unlike

to the skin of a Viper, upon which grow such like long, rough, prickly or hairy green Leaves, something narrow, the middle rib being for the most part white. The Flowers stand at the tops of the Stalks, branched forth into many spiked Leaves or Flowers bowing or turning like to the Turnsole, all of them opening generally on the one side, which are long and hollow, turning up the brims a little, of a purplish violet color, where they are fully blown; but more reddish, where they are but yet in the Bud, or not blown open, as also when they are upon their decay and withering: but in some places they are of a paler purple color, with a long Pointel in the middle, feathered, or pointed at the top. The Flowers being fallen, the Seeds grow inclosed in round beads, which growing to be ripe, are blackish, cornered, and pointed something like to a Vipers Head.

IV. The second Kind differs not much in any thing from the former, save that in some places it grows larger, the Leaves are of a fresher green color, and the Flowers are wholly of a white color.

V. The Places. The first of these grows wild almost every where, and as *Gerard* says, it is found in great abundance, where *Alkanet* grows. The second grows about the the Cattle Walls of Lewes in Sussex.

VI. The Times. They flower in the Summer Months, as the other *Buglosses* do, and their Seed comes to ripeness in the mean season.

VII. The Qualities. They are temperate in respect to heat or cold, and dry in the first Degree: Appetitive, Absterfitive, and Traumatick, or Vulnerary; Cephalick, Stomackick, Cordial and Neurotick; Alterative and Alexipharmick.

VIII. The Specification. The Experiences of many Ages have proved them to be peculiar against the Poison and Malignity of Serpents, Vipers, and other Poisonous and Venomous Creatures.

IX. The Preparations. You may make thereof, 1. A liquid Juice. 2. An Essence. 3. A Syrup. 4. A distilled Water. 5. A Tincture of the Flowers. 6. A Powder of the Seed. 7. A Decoction of the Root. 8. An Ointment or Balsam. 9. A Cataplasm of Roots or Leaves.

The Virtues.

X. The liquid Juice. The Juice of these Plants are wonderfully clammy and slimy, so that it is hard to Express the same; for which reason, after you have well beaten the Herb, you must set it close covered in a cold Cellar, or some other cold and moist place, for two Days and Nights, and then press forth the Juice in a Wooden press: after which you may clarify it with Whites of Eggs, beaten into Glair, and passed gently thro' a thick Hippocras Bag. It is a famous thing against the biting of the Viper, and of all other Serpents, or any other Venomous Creature, and prevails also against Poison, and the Malignity of Poisonous Herbs. You may give five or six spoonfuls at a time in a Glass of Wine, and repeat it as you see Occasion.

XI. The Essence. It has all the Virtues of the Liquid Juice, besides which, it is an excellent thing against the Plague or Pestilence, Spotted Fever, Purple, and all other Burning and Malign Fevers whatsoever. It is a most admirable Traumatick or Vulnerary, so that scarcely any of the Vulneraries or All-heals go beyond it. It comforts the Head, Brain and Nerves, strengthens and fortifies the Stomach, and cheers the Heart admirably. Dose, three or four spoonfuls or more, two, three or four times a day, in a glass of the Distilled Water, or in a glass of Wine, or some other proper Vehicle.

S

XII. The

XII. *The Syrup.* Parkinson makes it thus. *Be of the Clarified Juice four pounds: fine white Sugar three pounds: Infusion of the Flowers one pound: mix and boil these gently to the consistence of a Syrup, which keep for use.* It is (says he) very effectual for comforting the Heart, and to expel Sadness and Melancholly. Dose two spoonfuls or more.

XIII. *The Distilled Water.* It is drawn from the whole Plant, when it is in its chiefest strength, which is, when it is in Flower; it is profitable for all the Diseases aforementioned, being inwardly taken, and outwardly applied; and is used as a Vehicle to convey the other Preparations in.

XIV. *The Tincture of the Flowers.* It is highly Cordial, and Alexipharmick, and resists Poisons of all kinds: it defends the Heart from the Malignity of Pestilential Fevers, and of the Plague it felt, and suppresses Melancholly Vapors: It has the Virtue of the Essence, and may be given in the Distilled Water to two Drams.

XV. *The Powder of the Seed.* It is Alexipharmick, comforts the Heart, expels Sadness and Melancholly, attenuates the Blood, allays the hot Fits of Agues, encreases Milk in Nuries, and eases pains in the Loins, Back and Kidnies. Dose one dram.

XVI. *The Decoction of the Root.* It prevails against Poison, and the Plague, and the biting of Vipers, and other Venomous Creatures, and is a singular good thing (if made with Wine, or Wine and Water) to be drank as a Diet Drink by wounded Persons, and such as have inveterate, filthy, and running Ulcers and Fistula's, &c.

XVII. *The Ointment or Balsam.* They are Venerary, cure admirably both Wounds and Ulcers; and are of especial use to be applied to Wounds made by the bitings of Venomous Creatures, as Vipers, Mad Dogs, &c. or made with any Poisoned Weapon, it extracts the Poison or Venom, and induces the healing.

XVIII. *The Cataplasm.* Applied to the biting of a Viper, Mad Dog, or other Venomous Creature, it extracts or draws forth the Poison, and so secures the life of the Patient; other Alexipharmicks being given in the mean season inwardly.

Root arises Leaves which spread upon the Ground, which are many, long, narrow, rough, and rugged, hairy, and of a dark green color, somewhat like to Echium, or some other Wild Bugloss: These Leaves abide in this manner, some years, without sending forth of any Stalk, or Flowers at all (which some having taken notice of, thought that it never did bear Flower or Seed:) But truly though it bears no Stalk for Flowers or Seed some years, yet it has been found to bear them in some others, for that divers Plants hereof have been found as well with Stalk and Flowers, as Void, or without: When it bears a Stalk, it rises up about two Feet high, bearing such like Leaves as grow below, but set one distant from another, without order, and smaller up to the Top, where the Flowers stand upon their several Branches, which are spread about, as also come forth with the Leaves at the Joints, like unto the hollow Flowers of Echium, or Wild Bugloss, with uneven and gaping dented brims or edges, of a pale Purple color, with a long Stile or Pointel in the middle growing out of the Flower above the long brims, after which follows the Seed, much like to Bugloss Seed, but not altogether so great or black.

Wall-Bugloss=

C H A P. XXVI.

OF BUGLOSS, Wall and Stone.

I. *THE Names.* The first of these is called in Greek, *Λυκόψα*: In Latin, by Bauhin, *Lycopsis*; and by Dodonæus, *Lycopsis Echij altera Species*: and in English, Wall Bugloss.

II. *The other* is called in Greek, *ὄνοςμα*: by Galen *ὄνοςμα οξυφύλον*, *Osma Phlontis*: In Latin, *Onofma*: and in English, Stone Bugloss.

III. *The Kinds.* Of the Wall Bugloss there are two Kinds. 1. *Lycopsis Echij folio*, That with a Vipers Bugloss leaf. 2. *Lycopsis Anglica*, the English Wall Bugloss. The Stone Bugloss, is a singular Plant of its Kind.

IV. *The Description.* The first kind of Wall Bugloss has a Root which is somewhat woody, long, and not much thicker than a Finger, with some Fibres thereat; it is of a brownish red on the outside, but little or nothing colors the Fibres as the Anchusa's do: yet Dioscorides says, it was called by several Anchusa, and Galen says, that in his time it was accounted a kind thereof; but it is much like to Echium, and other sorts of Wild Bugloss. From this

V. The English Wall Bugloss has a Root a little reddish like the other, but giving as little color: but as to its Leaves, Stalks, and Flowers, it differs very little from the former: the only difference is, that the Flowers do all grow at the Tops of the Branches, and are of a deeper purple color, with divers threads shooting out of them.

VI. Stone Bugloss is said by Dioscorides to have a reddish Root, but to be without either Stalk, Flower, or Seed, which thing he says also of *Lycopsis*, and *Cynoglossum*, both which are known (in divers of their Plants) to have all the three, and therefore it may be as probable in this. This Plant in its form has a great resemblance or likeness to the former *Lycopsis*, as also to *Anchusa* or *Alkanet*; but differ-

differing from them in its Virtues. It has many long and narrow smooth Leaves lying upon the ground, not above an Inch broad, but about four Inches long, like to those of the lesser Alkanet.

VII. *The Places.* The first two grow upon Stone Walls, and upon dry, stony, and barren Grounds: the first has been found about Frontignan near Montpellier in France, as Pena and Lobel say: The second Lobel observed to grow in the West Country, in the way from Bristol and Bath to London. The Stone Bugloss grows in Rocky and Stoney Places.

VIII. *The Times.* The Wall Buglosses flower in July, and sometimes in August; and the Seed is ripe in the following Month. The Stone Bugloss is green all the Year; but its times of flowering and feeding (if it does so) has not been as yet observed.

IX. *The Qualities.* Wall Bugloss is temperate, or rather cold and dry in the first Degree, Astringent, Styptick, Traumatick or Vulnerary, Pectoral, Hepatick and Alterative. Stone Bugloss is hot and dry in the second Degree, Aperitive, Cleansing, Hysterick, and Alterative.

X. *The Specification.* The Wall Buglosses are peculiar Vulneraries for healing Green Wounds. And Stone Bugloss is a Specifick for the speedy Delivery of Women in Labor.

XI. *The Preparations.* The Wall Buglosses have all the Preparations and Virtues of the Wild Buglosses, to which we refer you: But 1. *The Juice.* 2. *The Essence.* 3. *The Oil,* have some peculiar Virtues. Of the Stone Bugloss you may make also, 1. *A liquid Juice.* 2. *An Essence.* 3. *A Powder of the Leaves.* 4. *A Decoction.*

The Virtues.

XII. *The liquid Juice of Wall Bugloss.* Taken alone, or mixed with Honey, it stops Catarrhs, falling upon the Fauces and Lungs, and resists Fluxes of the Bowels: and being applied upon Inflammations, as a Phlegmon, Erysipelas, &c. it cools them: inwardly taken, it is a good Traumatick.

XIII. *The Essence of Wall Bugloss.* It is Astringent and Styptick, stops Catarrhs, and all Fluxes of the Bowels; as also all Fluxes of sharp Humors, to old running Sores and Ulcers, and so renders them easie of cure. Dose one ounce at a time, Morning and Evening, in any specifick Vehicle, as a mixture of Plantane and Poppy Water, an Infusion of Catechu in fair Water, &c.

XIV. *The Oil of Wall Bugloss.* It is made by boiling the Leaves and Roots in Oil Olive to Crispnets, &c. It admirably heals Green Wounds, abates Inflammations, and cures Burnings, being anointed upon the Part, and also mixed with Barley Flower, and applied: Parkinson says, that this Oil cures *S. Antonies fire*, but usually Oily and Greasie Bodies do mischief in that case: to bathe with the liquid Juice is much better, and to apply over the Erysipelas, Cloths often wet with the same: or a soft Cataplasim of the Juice mixt with Barley Flower.

Virtues of Stone Bugloss.

XV. *The liquid Juice.* It provokes the Terms in Women powerfully, and therefore ought not to be given to Women with Child, lest it causes them to miscarry: a spoonful or two of it may be given Morning and Evening in a Glas of White Wine.

XVI. *The Essence.* It has the Virtues of the liquid Juice, and is very effectual to cause speedy Delivery to Women in Labor. It cleanses the Womb of all its feculencies, resists Vapors, and

helps against Fits of the Morher. Dose one or two ounces in a Glas of Wine to Women in Travel.

XVII. *The Powder of the Leaves.* It is good against Vapors and Fits of the Mother, and taken ad j. dram in Wine by Women in Travel, it facilitates and hastens the Delivery, for which it is said to be an excellent thing: it has the Virtues of the Juice and Essence, and therefore ought not to be given to Women with Child.

XVIII. *The Decoction in Wine.* It has the Virtues of the Essence and Powder, but not altogether so powerful.

CHAP. XCVII.

OF BUGLOSS Marsh.

I. *THE Names.* It is called in Greek, *Λιμόνιον*, *lymonion*, by Dioscorides; so called, because it grows *in limonibus*, in pratis rigidis vel palustribus: In Latin, *Limonium*: and in English, *Marsh* or *Sea Bugloss*, and *Sea Lavender*.

II. *The Kinds.* Parkinson makes seven Kinds hereof: Mr. Roy, eleven: but we (because here in this Book we treat chiefly of English Plants) shall only describe three Kinds, viz. 1. *Limonium majus vulgatum*, the Greater Common Marsh or Sea Bugloss. 2. *Limonium medium Anglicum*, The Colchester Marsh Bugloss. 3. *Limonium Virginianum*, which is the *Limonia Congener Clusij*; Virginian Marsh Bugloss.

Sea or Marsh Bugloss.

III. There has been some controversy among Authors about this Plant *Limonium*, some will have what we here describe to be the true *Limonium*, which it is: others will have some other Plants to be it: *Matthioli* describes two kinds, but made no sensible distinction between them, nor yet told us which was the True, but as ignorant of the matter, speaks not a word of them; but to cease the

conect, the true Limonium is that which has fair Leaves, like those of the Limon or Orange tree, of a dark green color, somewhat fatter, and a little crumpled.

IV. Gerard calls this Plant in English, Sea Lavender, (and from him Mr. Roy) but without any other ground, than that the color of the flowers is somewhat near those of Lavender, for which reason Parkinson altered the Title, to a more proper name, and call'd it Sea or Marsh Bugloss, as being in form and color most like to Bugloss.

V. The Description. The first or Greater Marsh Bugloss has a Root somewhat thick and long, like unto a small Red Beet Root, whence comes several fair, long, thick, or fat green Leaves, somewhat like unto Small Beet Leaves, (and that is the reason that Pliny refers the Limonium unto the Beets, and calls it a Wild Beet, though Galen will have it, that there is no Wild sort of Beet :) or Leaves of the Limon Tree, from among which spring up several brittle, naked Stalks, without Leaves, near half a yard high, branched at the tops into several parts, whereon stand many small blewish purple Flowers, all on one side for the most part, something like unto Bugloss Flowers, but smaller; after which come small reddish Seed, inclosed in the husks, which the Flowers shed in before.

VI. Colchester Marsh Bugloss, is like unto the former almost in all respects, the Root being reddish, but much lesser, the Leaves also lesser, and the Stalks lower, being but a little more than a foot high; the Flowers also of the same color with the former, but yet lesser: so that the difference between them seems to be only in the magnitude.

VII. The Virginian Marsh Bugloss has a long Root, an Inch thick in Diameter, or more, and going almost straight down into the ground, sending forth from it several Branches, and small Fibres: It is a very strange Plant, for from this Root springs forth very strange Leaves, such as are not to be seen in any other Plant that we know of, being nine, or ten, or more, rising from the head of the Root aforesaid, each by it self, being small below, and growing great-

er upwards, with a Belly bunching forth, and a bowing back, of a pale whitish yellow color, hollow at the upper end, with a flap, not much unlike the to Flowers of Aristolochia or Birthwort, and round at the Mouth like a half Circle, full of great dark purplish Veins on the inside. The whole Leaf is of a thick substance, almost like unto Leather, and among these Leaves springs up a Stalk, at the top of which comes forth a Flower with four or five Leaves, in a roundish Seed Vessel, with a Tubercous Thrum in the middle.

VIII. The Places. The two first grow in Marsh grounds near the Sea in many parts of England. The first grows plentifully upon the Walls of the fort against Gravesend, as also on the Banks of the River below the same Town, and below the King's Stone-house at Chatham; also by the King's Ferry going into the Isle of Sheppey; and in the Salt Marshes by Lee in Essex; in the Marsh by Harwich, and many other places. The second grows in the fields near the Sea, by Colchester, as Lobel says; and Clusius saith, may be found about Valencia in Spain. The third has been found growing in Virginia; and my self found it in South Carolina, in a Marshy piece of Land at Conoi up Wando River, about nine Miles from Charles Town; it was also sent to Clusius from Paris, by one that received it in the same manner from Lisbon in Portugal.

IX. The Times. The two first flower in June and July, and their Seed ripens not long after: The last I saw in Flower in Carolina, in the Month of July, but stayed not in the place, to see its Seed.

X. The Qualities. They are temperate as to heat or cold, drying in the third Degree, Astringent, Styptick, Stomackick and Alterative.

XI. The Specification. They are peculiar against Catarrhs and Spitting of Blood.

XII. The Preparations. You may make therefrom, 1. A liquid Juice. 2. An Essence. 3. A Powder of the Seed. 4. A Decoction of the Roots. 5. An Oil or Balm of the Leaves.

The Virtues.

XIII. The liquid Juice. It stops Catarrhs or Distillations of Rheum upon the Breast and Lungs, and prevails much against Fluxes of the Bowels; as also all sorts of Bleedings, whether by the Mouth, as Spitting and Vomiting Blood, Pissing Blood, the Bloody Flux, or overflowing of the Terms. Dose three or four Spoonfuls in a Glass of Red Florence, or Red Port Wine, Morning, Noon and Night.

XIV. The Essence. It has all the Virtues of the Juice, but more Stomackick, and therefore better for such as have weak Stomachs. Dose two or three spoonfuls in Red Wine, as aforesaid, and at the same times.

XV. The Powder of the Seed. Gerard says, that being drunk in Wine, it helps the Collick, Strangury, and Dyfentery, or Bloody Flux: Dose one dram. It also stops the overflowing of the Courses in Women, and all other Fluxes of Blood.

XVI. The Decoction of the Roots. Being made in Red Wine, it is very Astringent and Styptick, good against Catarrhs, and Fluxes of Blood, and has all the Virtues of the Juice and Essence, but not altogether so powerful: It has been found to be a specificke against Agues, whether Quotidian, Tertian, or Quartan.

XVII. The Oil. It is made by boiling the Leaves in Oil Olive till they are Crisp, &c. Applied to Contusions, weakned Joints, weak Backs, and Burnings, it cures them.

C H A P. XCVIII.

of BURDOCK Great.

I. **THE Names.** It is called in Greek, Ἀρκύον, ἁρκύωνος, & ἁρκύωνος : In Latin, *Artium*, *Protopium*, *Protopis*, *Personata*, *Lappa* and *Bardana*, in Shops : In English, *Burdock*, and *Clot Bur*.

II. **The Kinds.** There are several Kinds hereof, as, 1. Ἀρκύον μέγαν, *Lappa major*, *Bardana major vulgaris*, The Common Burdock. 2. *Lappa Virginiana*, The Virginian Burdock. 3. *Lappa seu Bardana languinis capitis*, The woolly headed Bur. 4. *Bardana major Rosea*, The Rose Bur : Of all which we shall treat in this Chapter. 6. *Lappa minor seu Xanthium*, The small Burdock. 5. *Petastis*, The Butter Bur, of which two last, in the two following Chapters.

III. **The Description.** The Common Greater Burdock, has a Root great and thick, black on the outside, and whitish within, sweet and pleasant in taste at first, but something bitter afterwards : from whence spring forth many large, hard, green Leaves, somewhat like to the Butter-Bur, or Wild Dock, but more crumpled, and of a darker green color on the upper side, but greyish underneath : among which rise up hard and rough green Stalks, two or three feet high, with many Branches from them, bearing many the like, but lesser Leaves on them, bearing at their Tops several rough heads or burs, with crooked pointed Prickles, apt to stick on Cloths, or other things which they touch : out of the tops of each of which come forth many hard purplish threads, which are the Flowers ; which being faded and past, turn to Down in the Heads, and opening themselves, shed their Seed, which is grayish, something like to the Knap-weeds, which together with the Wind, is often

carried away, and many times falls down to the ground, in the place where it grows, by which it multiplies it self.

IV. The Virginian Kind, is a kind of the former, having like Roots ; but its Leaves are rounder and smaller : the Burrs are also smaller and harder, and furnished with very sharp, crooked points, which stick very fast to every thing they lay hold on.

V. The woolly headed Bur, it differs little from the first, but only that the Leaves grow not altogether so great, and the heads being smaller, are woolly all over, and the prickles not so sharp or sticking. Gerard says, that the Leaves and whole Plant are somewhat less than the first or common kind, and that the Heads are hairy or downy, but otherwise like to it. Lobel calls this *Artium Montanum*, and *Lappa minor Galeni* ; but it is indeed the *Lappa minor altera Matthioli*.

VI. The Rose Bur, differs little or nothing from the first kind, but in the head, which instead of the prickly Burrs, has many small green Leaves, set together like a small Rose Plantane, and not much prickly at their ends.

VII. **The Places.** The first of these grows plentifully with us every where, by Ditch sides, Water sides, Waste places, and High ways. The Virginian is found in Virginia, Maryland, New England, and in other Provinces upon that Coast. The third is not so frequent with us, as is the first, yet I have found it in several places of England ; Lobel found it growing in Somersetshire, about three Miles from Bath, near the then House of Mr. John Colt : also in the High way leading from Dratton to Iwer, two Miles from Colebrook. The last grows not with us, but near Lipswick in Germany.

VIII. **The Times.** They Head, Flower, and Seed in June, July and August ; the Seed being ripe in a few Weeks after the Flowers are gone.

IX. **The Qualities.** They are all cooling and drying in the first Degree ; yet Gerard says, that the Roots are moderately hot : They are Astringent, Discussive, Digestive, and Traumatick ; Cephalick, Neurotick, Nephritick, and Hysterick ; Alterative, and Alexipharmick.

X. **The Specification.** The Burdock is peculiar against the Poison of Serpents ; and Obstructions of the Reins, Bladder and Womb.

XI. **The Preparations.** You may have hereof, 1. The Leaves. 2. The Juice. 3. The Essence. 4. The Saline Tincture. 5. The Oily Tincture. 6. The Decolition. 7. A Powder of the Root. 8. A Powder of the Seed. 9. A Conserve of the Roots. 10. A mixture. 11. A Cataplasim. 12. A Salt.

The Virtues:

XII. **The Leaves.** Being applied either dry or green, they cool, moderately dry, and discuss withal, as Galen says ; whereby they are good to heal old Sores and Ulcers, and help the Cramp, or shrinking of the Sinews.

XIII. **The Juice.** The Juice of the Leaves mixt with Honey, provokes Urine, and takes away the Pains of the Bladder : and mixt with Wine, it is wonderfully good against the bitings of Serpents, Mad Dogs, and other Venomous Beasts. The Juice of the Root taken to the quantity of three or four ounces, and drank with a good draught of Ale, is an excellent thing against Wind, and coldness of the Stomach.

XIV. **The Essence.** It has all the Virtues of the Juice, besides which it is excellent against Poison inwardly taken ; and is good, being given Dietetically, against Venereal Diseases, as the Pox, Gonorrhæa,

thra, &c. It heals inward Ulcers of the Lungs, and is good to cure spitting of Blood. It is good against Gravel, Sand, Slime, and Tartarous Matter, Obstructing the Reins, Ureters and Bladder, and prevails against Vapors in Women, Obstructions of the Womb, and Hyfterick Fits. Dose from one Spoonful to four, or six, mixt with any proper Vehicle.

XV. *The Saline Tincture of Seeds, or Leaves.* It powerfully opens Obstructions of the Womb, Reins, and Bladder, bringing away the Matter causing the Obstruction: Outwardly, it is good to wash the part bitten by a Mad Dog, for it draws out the malignity and Poison. Dose inwardly j , or ij drams in *Arsmari* or *Parsly* Water, or any other proper Vehicle.

XVI. *The Oily Tincture.* It is an excellent thing against Punctures, and other Wounds of the Nerves, prevails against Cramps and Convulsions, inwardly given from twenty to thirty Drops, and outwardly applied.

XVII. *The Decoction of the Root.* Drank liberally for some time, it has been found very good to exterminate the Reliques of the *French* Disease: The Decoction of the Root, as also of the Seed, is commended by *Dioscorides* against the Tooth-ach, being held in the Mouth. It is also good to foment withal against Burnings and Kibed heels: and made with Wine, and drank, it prevails against the Strangury.

XVIII. *The Powder of the Root.* It is good against spitting Blood, helpful in Consumptions, and expels Sand, Gravel, and Tartarous Matter out of the Reins, Ureters and Bladder. Dose one or two drams in White or Red Wine, &c.

XIX. *The Powder of the Seed.* Taken to one dram, in a proper Vehicle, it is an excellent thing against Sand, Gravel, or Tartarous Matter in Reins or Bladder, and gives ease in the Strangury, and other like Diseases of those parts: and drank with Wine for forty days together, it wonderfully helps the *Sciatica*.

XX. *The Conserve of the Roots.* It is helpful in Consumptions, and good for such as are troubled with the Stone, or any Flux of the Bowels.

XXI. *The Mixture.* Take Juice of the Root, which make with *Alicant* two pounds: Old *Tent*, a pint and half: mix them. Four ounces of this being drank Morning, Noon and Night, (after due purging) is good against the Running of the Reins in Men, and the Whites in Women. Or thus: Take Juice of the Root, made as aforesaid, twelve ounces: old *Tent* eight ounces: Yolks of new laid Eggs, n° iiij : powder of *Acorns*, an ounce and half: *Nutmegs* in powder half an ounce: mix them. It has the Virtues of the former, besides which, it eases pain in the Reins, and wonderfully strengthens a weak Back.

XXII. *The Cataplasm.* Made of the Leaves bruised, with the White of an Egg, and laid on any place burnt with fire, it takes the fire out, gives sudden ease, and afterwards heals it. The Roots made into a Cataplasm by being beaten with Salt, and applied (as *Apuleius* says) to the biting of a Mad Dog, cures it, and so speedily frees the Patient from all danger. *Columella* says, the Cataplasm made of the Leaves beaten up with Salt, being laid upon the biting of a *Viper* (the part being first scarified with a Lancet) draws out the Poison. The former Cataplasm of the Roots with Salt, is more available than the former against the Poison of Serpents; and being applied, is also good against the King's-Evil.

XXIII. *The Salt from the Ashes.* Taken in White Wine, *Arsmari*, or *Parsly* Water, from a scruple to half a dram, it is good to provoke Urine, cleanse the Urinary Passages, and to carry off the Watry Humor in Dropsies.

CHAP. XCIX.

Of BURDOCK small.

I. **T**HE Names. It is called in Greek, *ἄλβαν* & *ῥαργανόν*: In Latin, *Xanthium*: In the Shops, *Lappa minor*, *Lappa inversa*, and by some, *Strumaria*, and *Bardana minor*: In English, the Lesser or Small Burdock.

II. The

II. *The Kinds.* It is the leſſer ſort of the *Burdocks*, and ſingular of the Kind.

III. *The Deſcription.* It has a ſmall Root ſome-
what long and fibrous, and perishing every year :
from which Root riſes up a rough creſted Stalk,
about two feet high, breaking out into ſeveral
Branches, with many blackiſh ſpots upon them, with
two much ſmaller and whiter Leaves at every Joint,
ſtanding upon long Footſtalks, which Leaves are
uſually divided into three parts, ſomething like unto
a Maſh Mallow leaf, unevenly notched or dented
about the edges : at the Joints of the Stalk and
Branches with the Leaves, towards the tops of them,
come forth ſmall Flowers, which abide not long ; and
after them, two or three ſmall, cloſe Burs, a little
pointed at the top, wherein lye two or three ſmall
lank Seeds, ſomewhat like unto an Oat, which fall
not out, nor do the heads open.

IV. *The Places.* It grows in many places of this
Kingdom, as particularly in two or three places be-
tween *Tidenham* and *Cheſtew*, in the foot way ; in
the Highway between *Stanes* and *Egham*, and be-
tween *Drayton* and *Iwer*, two Miles from *Colebrook* ;
and at *Southwick* ſheet in *Hampſhire*.

V. *The Times.* It Flowers and Seeds when the
great *Burdock* does ; viz. in the Summer Months,
June, July and *Auguſt*.

VI. *The Qualities.* It is temperate as to heat and
cold, dryneſs and moiſture, yet *Galen* will have the
Seeds to be hot and dry, digeſtive, alſo diſcuſſive,
Neurotick, *Splenetick*, and *Hysterick* ; Alterative,
and *Alexipharmick*.

VII. *The Specification.* It is ſingular againſt the
pain and hardneſs of the Spleen.

VIII. *The Preparations.* You may keep hereof,
1. *The Juice.* 2. *The Eſſence.* 3. *The Saline Tin-
dure.* 4. *The Oily Tindure.* 5. *A Powder of the
Root.* 6. *A Powder of the Seed.* 7. *A Conſerve of
the Roots.* 8. *A Salt.* 9. *A Decoction of the Roots.*
10. *A Lotion, or Waſh.* 11. *A Cataplaſm of the
Roots or Seeds.*

The Virtues.

IX. *All theſe Preparations* have the ſame Vir-
tues, Uſes, and Dotes, with thoſe of the ſame
name in the Chapter of the *Great Burdock*, to
which you are refer'd ; but there are ſome peculiar
Virtues in this Plant, not obſerv'd to be inherent in
the former, for which reaſon we ſhall ſay ſomething
more of its *Eſſence, Decoction, Lotion, and Cataplaſm*,
in the Sections following.

X. *The Eſſence.* It ſtrikes at the Root of the
Leproſie, prevails againſt *Faintings* and *Swoonings*,
opens Obſtructions of Liver and Spleen, but more
eſpecially of the laſt, and gives eaſe in pains of the
Hypochonders and *Bowels*. Doſe three or four
ſpoonfuls Morning and Evening in a Glaſs of *Sher-
ry Wine*.

XI. *The Decoction.* It is to be made with *Wine* ;
and has the Virtues of the *Eſſence* ; it conſumes
the hardneſs of the Spleen, being taken inwardly
Morning, Noon, and Night, to ſix ounces, and as
often bathed warm upon the part affected.

XII. *The Lotion.* It is made of the Burs, before
they are ripe, being bruised and laid to ſteep in *Wa-
ter, or Wine*, in which a little *Nitre* is diſſolved, for
twenty four hours. It diſcuſſes Tumors, and gives
eaſe in Pains, being bathed warm upon the parts
affected. If the Hair is ſometimes waſhed there-
with, it makes it become yellow. It is an excel-
lent Gargle for a ſore Mouth and Throat, taking
away the Inflammation, and healing of it in a very
ſhort time.

XIII. *The Cataplaſm.* It is made of the Roots or

Green Burs, being beaten to a Pap in a Mortar,
and mixed with a third part of *Mitbridate*. Being
applied upon hard *Kernels, or Swellings* in the *Fleſh*
(as thoſe proceeding from the *Kings-Evil*) it is
ſaid to ſoften and diſſolve them : but more eſpe-
cially, if in the mean ſeaſon, the *Juice, Eſſence* or
Decoction in Wine aforementioned be daily given
inwardly two, three or four ounces at a time, and
that Morning, Noon, and Night ; for theſe Prepa-
rations very much ſweeten the *Blood* and *Juices*,
and correct the *Diſeaſe* of the *Humors*.

CHAP. C.

of BUTTER-BUR.

I. *THE Names.* It is called in *Greek* *Uteroceras* ;
In *Latin*, *Petaſites* ; (from the largeneſs of
the Leaf, it being large like *πτερον*, a Hat : ſome
take it to be *ἰκκον* *Theophrasti*, and ſome to be *Per-
ſolata* *Plinij* : In *English* it is called alſo *Petaſites*,
and *Butter-Bur* : The *Germans* call it *Pestilence-
wort*, or *Plague-wort*.

II. *The Kinds.* It is of two ſorts, a *Greater*,
and a *Leſſer*, and differing alſo in the Flowers ;
but ſo very like one another, that one Deſcription
will ſerve for both. *Camerarius* calls the more
common *Maſ*, the other *Femina* : but in his *Epito-
me of Matthiolus*, he calls the *Greater, Tuſſilago*
major, for that ſome will have it to be a kind of
Coltsfoot.

Butter Bur with out flower

III. *The Deſcription.* It has a long Root and
thick, ſpreading under ground, blackiſh on the out-
ſide, and whitish within, ſometimes Worm eaten,
and of a bitter and unpleaſant taſte : It ſprings up
very early in the Year, with a thick Stalk about a
foot high, on which are ſet a few ſmall Leaves, or
rather

rather pieces, and at the Tops a long spiked head of flowers, in the one (which is the less, and the more rare to find) wholly white, and of a better scent than the other (though some say it has no scent) in the Greater, which is the more common with us, of a bluish, or deep red color, according to the Soil in which it grows; a clay ground bringing forth a paler color, somewhat weak; and before the Stalk has stood with the Flowers a Month above ground, it will be faded away and gone, and blown away with the Wind: after which the Leaves will begin to spring, which when they are full grown, will be very broad and large, big enough to cover the whole Body, at least the Head, like an Umbrella, which hides from Sun and Rain; they are somewhat thin, and almost round; whose thick red Footstalks, being about a foot or more long, stand under, or towards the middle of the Leaves, the lower parts of which, are divided into two round parts, close almost one to another, of a pale green color above, and hoary underneath. That which brings white Flowers, brings forth also smaller leaves than the other doth, having divers ribs and veins therein.

Butter Burr.

IV. Gerard has another kind of Description, which in some measure explicates the former, for which reason I think it necessary to insert it here: *Butter-Bur* (says he) does in a manner bring forth its Flowers before the Leaves, as *Colts-foot* does (for which reason some have thought it to be one of the kinds of *Colts-foot*; and for which reason *Matthiolum* and *Camerarius* in their *Epitome*, have called it *Tuifilago major*, as is before mentioned.) These Flowers, says he, are small and mossie, tending to a purple color, which are made up into a big Ear, as it were, and quickly after, together with its Stem, (which is thick, full of substance, and brittle) fade and fall away: then comes up the Leaves, which are very great, like a round Cap or Hat, called in Latin *Petatus*, of such a wideness or largeness, as that of it self one leaf is big enough to keep a Man from a shower of Rain, or from the heat of the Sun, and therefore are much larger than the Leaves of the great Burdock; their color is somewhat white, but

whiter underneath; every Stem bears his Leaf, which is sometimes a Cubit long, thick and full of substance, which stands, as it were, under the Leaf in the Center or Middle almost of the Circumference, like to one of the greatest Mulhrooms, setting aside the Cleft at the lower part of the Leaf near the Stem, especially when they are perishing or withering away: at first the upper superficial or outside of the Mulhroom stands out, and when they are in withering it stands more in, and the edges, as it were, turn up; so is it in the Butter Bur Leaf, which has on the out side a certain shallow hollowness.

V. The Places. They both grow in wet and moist Grounds by Rivers and Water sides, and upon the Brinks and Banks of Lakes and Ponds, almost every where.

VI. The Times. The Flowers rise and decay in February and March, and then fade away; Gerard says, in March or April: when they are gone, then come up the Leaves, which remain all Summer, even till Winter, new ones still growing up, and being added to the former.

VII. The Qualities. The Roots, which are mostly used, are hot and dry in the third Degree, Digestive, Diffusive, and Sudorific; Cephalick, Neurotick, Stomack, Hysterick, and Cordial; Alterative, and Alexipharmick.

VIII. The Specification. It has a peculiar power and force against Poison of all kinds, and the Infection of the Plague.

IX. The Preparations. You may prepare from the Root, 1. A Powder. 2. A Juice. 3. An Essence. 4. A Spirituous Tincture. 5. A Decoction. 6. A Mixture.

The Virtues.

X. The Powder. Being given to one dram, and drunk in Wine, it is a most excellent thing against the Plague, and all sorts of Pestilential Fevers, as Spotted Fever, Purples, Measles, Small Pox, &c. because it is Sudorific or provoking Sweat, and drives from the Heart all sorts of Venom and Poison: it kills Worms, and is powerful against Hysterick Fits, or Vapors and Suffocation of the Mother: If it is strewed on old and filthy running Ulcers, it cleanses, dries, and heals them. It also provokes Urine, and the Monthly Terms in Women.

XI. The Juice. It is expressed out of the Root by being beaten in a Mortar, and squeezed out with White Port Wine. It has all the Virtues of the Powder, and may be given from one ounce, to two or three ounces, Morning and Evening, as a preventive against the Plague, and every six hours after Infection.

XII. The Essence. It has all the Virtues of the Powder and Juice, but more powerful to all the Intentions: It provokes Urine, and the Courses, and kills the flat, broad Worms in the Belly. Dose one or two ounces mixed with Wine. It is a powerful thing in the cure of the Yellow Jaundice, and the bitings of Vipers, &c.

XIII. The Spirituous Tincture. It is good against Poison, and the Bitings of Mad Dogs, prevails against Fainting and Swooning Fits, and is a famous thing to rectify the Distemper of the Stomach. Dose one or two drams in a Glass of Canary.

XIV. The Decoction. It is good against Coughs, Colds, Asthma's, Wheezings, difficulty of Breathing, and other Distempers of the Lungs, causing Expectoration. It kills Worms, provokes the Terms, and has all the other Virtues of the Powder and Essence foregoing, but not full out so powerful: Dose from two ounces to four or six, as hot as it can

can well be taken, Morning and Evening, to prevent the Infection of the Plague; and as much every six hours, for those who are already seized with it.

XV. *The Mixture.* It is thus made: Take of the Juice expressed with Vinegar, or the Essence, twelve ounces: Juice of Rue four ounces: Venice Treacle, or Mithridate two ounces: mix them well together by shaking. It is an Antidote against the Plague or Pestilence, Spotted Fever, Purples, Small Pox, Measles, Poison, biting of Vipers, or other Serpents, and the bitings of Mad-Dogs, or of any other Venomous Creature. Dose two ounces at a time, as often as need requires.

CHAP. CL

of BURNET.

I. *THE Names.* It is called in Greek by Nicotylus Myrsifus, Πικρινέλη, or as Gesner has it, Πικρινέλη: In Latin, Pimpinella, Sanguisorba, Bipennula, Peponella, Sorbastrella, and Sanguinaria, quod Sanguineos fluxus sistat: In English, Burnet.

II. *The Kinds.* It is fourfold, 1. *Pimpinella vulgaris five minor,* The Common or Lesser Burnet. 2. *Pimpinella inodora,* Smellefs Burnet. 3. *Sanguisorba seu Pimpinella Major five Sylvestris,* Great or Wild Burnet. 4. *Pimpinella Maxima Americana,* The Greatell, or American Burnet. Where Note, that some Authors think our Garden or Field Burnet to be the *Sideritis secunda Dioscoridis*; but I think them to be mistaken, because this latter answers in the form of the Flowers to our Burnet.

Small Burnet

III. *The Description.* The first of these has a Root which is small and long, and of a blackish brown on the outside, growing deep into the Earth, with some fibres thereat; from whence comes forth many long winged Leaves, spread upon the Ground, which

consist of driers small roundish, or rather oval-leaves, green on the upper-side, and grayish underneath, finely dented about the edges, set on each side of a middle rib: amongst which rise up several crested brown Stalks a foot high or better, and in rank ground sometimes a foot and half high, with some smaller Leaves set in some places thereon, divided into several Branches. At the Tops grow small round loose heads, upon long Footstalks of a brownish color, from whence start forth small purplish Flowers, and after them cornered Seed. The whole Plant has a pleasant quick Smell and Taste, much like to the favor of a Smelt, and put into a Glass of Wine, gives it a pleasant Relish.

IV. *The Inodorous Burnet in Roots, Stalks, Leaves, and Heads,* is altogether like the former, save that the Leaves are not so round, but something longer, and have no manifest Smell or Taste in them.

Large Common Burnet

V. *The Great or Field Burnet,* has a Root black and long like the first Kind, but greater, from whence springs up such like winged Leaves, but nothing so many, and each of these Leaves on the Wings, are twice as large at least as the other, and nicked about the edges in the same manner, of a grayish color on the under side: Stalks are greater, and rise higher, with many such like Leaves set thereon, and greater round heads on the Tops, of a brownish green color, out of which come small dark purple Flowers, very much like the former, but greater: The Plant it self has very little of Smell or Taste in it, which can be perceived.

VI. *The American great Burnet,* has a Root much greater than the former, and woody, longer also, and blacker than the last; but in all its other parts, it is like our Field Burnet, but much greater: often times all its Leaves are of a blewish green on the upper side, and folded half way together inward, so that the under sides of the Leaves, which are grayish, show themselves upwards; and they are dented somewhat deeply about the edges, with greater dents, which makes them show the more comely and pleasant. The tops of the Stalks bear smaller, and much longer,

longer, whitish green spiked heads, set thick with Knops, each of which when it flowers (beginning below, and so rising higher) shews to be four whitish green Leaves, having many small white long threads in the midst, after which come in their places cornered Seed like the other. The whole plant has not much smell, but in its Taste, is much like the first.

VII. *The Places.* The first grows wild in several Counties of our Land, in dry sandy places, but is usually kept in Gardens. The second, Bauhin saith is found in Spain, and I have found it in some Meadows in Norfolk, not far from Lyn Regis. The third is found in several Counties of England, in the Meadows in Norfolk, Suffolk, Cambridge-shire, Huntingdon-shire, and Northampton-shire; as also near London, by Pancras Church, in two or three Fields nigh Booby's-Burn, and in the middle of a Field by Puddington: I have also found it in some Fields between London and Newington, as also going towards the Boarded River. The last is found in the French Settlements in Canada, and in the North parts of Virginia, where it is Natural: from whence it has been transplanted to us, and is nourished up in Gardens.

VIII. *The Times.* They all flower in June, and beginning of July; and their Seed is ripe in August.

IX. *The Qualities.* They are generally hot and dry, the first of them in the Second Degree; the other three in the First Degree: They are Lucarnative, Astringent, Styptick, Repercussive, and Traumatick, or Vulnerary: Cephalick, Neurotick, Stomackick, Cardialck, and Alterative: Alexipharmick, and Analeptick.

X. *The Specification.* Burnet is a peculiar Plant for stopping all sorts of Fluxes of Blood; whence came the names *Sanguisorba*, and *Sanguinaria*.

XI. *The Preparations.* You may prepare therefrom, 1. A liquid Juice. 2. A Decoction. 3. A Syrup. 4. A Wine. 5. A Vinegar. 6. A Spirituous Tincture. 7. An Acid Tincture. 8. A Powder. 9. An Oil. 10. An Ointment. 11. A Balsam. 12. A Spirit. 13. The Seed.

The Virtues.

XII. *The liquid Juice.* Taking it inwardly from three to five ounces, either alone or mixed with Red Wine, it stops all manner of Inward bleedings whatsoever, whethet spitting or vomiting Blood, pissing Blood, or Bloody-flux: It also strengthens the Stomach and Heart: and is singular good for all sorts of Wounds, whether inward or outward.

XIII. *The Decoction.* It has the Virtues of the liquid Juice, but is much weaker, yet very good to repress Vapors in Women. Dose six ounces Morning and Evening.

XIV. *The Syrup.* It is excellent against spitting of Blood, and heals Bloody-fluxes of the Bowels; and it is so much the more effectual with Steeled Water or Wine: If it is made of the Juice, it is good for healing all sorts of Wounds of Head and Body, inward or outward, for all old Ulcers, Ulcerated Cancers, and Running Sores, which are hard to be cured. Dose two or three ounces at a time.

XV. *The Wine.* It cheers the Heart, revives the Spirits, and is good against Melancholly, drooping of the Mind, and fainting of the Heart.

XVI. *The Vinegar.* It is a special thing to preserve from, and cure the Plague or Pestilence, the Spotted Fever, or any other malign acute Disease of that kind; for in a special manner defends the Heart from Poisonous and Noisom Vapors, and all contagious Diseases, being given mixed with

the Juice in equal quantities, and the Patient laid to Sweat thereupon. Dose three ounces.

XVII. *The Spirituous Tincture.* It comforts and warms the Stomach and Bowels, strengthens Nature, and takes away the weakness of the Stomach and Intestines, thereby stopping Fluxes of the Belly of all kinds: It strengthens the Heart and Liver, and other principal Parts, and therefore is good against Faintings and Swoonings. Dose one Spoonful at a time in a Glas of Wine.

XVIII. *The Acid Tincture.* This has all the Virtues of the Vinegar foregoing, but is much more powerful than it, to all the purposes and intentions there specified: besides this is an extraordinary Stomackick, and therefore powerful in stopping Vomiting, and also spitting of Blood, being given in a Glas of Canary, or Red Port Wine. Dose thirty or forty drops, to fifty or sixty, two or three times a day.

XIX. *The Powder.* Used outwardly to old Ulcers, moist and running Sores, it dries them up wonderfully, and prepares them for healing. It may be made of the whole Plant.

XX. *The Oil.* It is used to abate Inflammations, ease Pains, strengthen weak Parts, cure Burnings and Scaldings, and to draw malignity out of Wounds made by the bites of Venomous Beasts.

XXI. *The Ointment.* It has the Virtues of the Oil, but penetrates not so much, yet is more effectual for the cure of Wounds, Ulcers, and other Running and Malignant Sores.

XXII. *The Balsam.* If it is made of the Juice, or green Herb, it is one of the best Vulneraries in the World: it digests, cleanses, dries, strengthens and heals all green Wounds, old Ulcers, running Sores, and other ill natured Diseases of that kind. It is certainly a most excellent Wound Balsam. If it is mixed with Powder of Scammony, it takes away rotten Fleth, and destroys Putridity or Rottenness.

XXIII. *The Spirit.* It stops inward Bleedings, comforts the Heart and Bowels, and is an excellent thing against Fluxes of the Belly of all kinds, more especially the Bloody-flux, and the overflowing of the Terms in Women: and this it does the more powerfully, if a little Catechu be dissolved in it. It prevails also against the Contagion of the Plague. Dose from one dram to half an ounce.

XXIV. *The Seed made into a Powder.* This, says Parkinson, is no less effectual, both to stop Fluxes, and to dry up moist or running Sores, being given inwardly (to one dram) in steeled Water or Wine, that is, if Water in which hot Gads of Steel have been quenched; or if Wine, in which old Nails have been infused for two or three Months beforehand: The powder of the Seed may also be mixed with Ointments or Injections.

XXV. *The American Burnet* has all the same Preparations with our English, and the same Virtues, Uses, and Doses.

CHAP. CII.

BUTTER-WORT.

I. *THE Names.* It seems not to be known to the Greeks, and therefore we have no universally received Greek name for it, only Gesner thought it to be *Dodecatheon* Plinij: *Lugdunensis* thinks it may be *Crisa Apulei*, and calls it *Cucullata*: but it is called in Latin, *Pinguicula* by Gesner, and from him all others call it so: others *Lingula* Plinij,

Plinij, *Viola humida*, *Viola Palustris*: Bauhin calls it, *Sanicula montana flore calcare donata*: with us it is called, *Sanicula Eboracensis* (because it grows so plentifully in *Yorkshire*.) In *English* it is called *Butter-wort*, and *Butter-root*, because of the Unctuousity of the Leaves; or else from *Fattening*, as Gerard says, who also saith, they call it *White Rot*, and not *White Root*, because the Countrey people think, that if their Sheep should eat it, that it would give them the Rot; and they give it the Epithite *White*, from the color of the Leaf: as they have another which they call *Red-Rot*, which is *Pedicularis*, *Red-Rattle*.

II. *The Kinds*. It is a singular Species of the *Sanicles*; being Genus to none else.

III. *The Description*. It has a Root composed of divers white Fibres, or small Strings, which die not in the Winter, but abide all the time with green Leaves upon them: From this Root spring forth divers fat and long Leaves lying upon the ground round about it, broad at the bottom, and pointed at the end, of a pale green color on the upper side, but white underneath, folded together at their first rising, which then are more White. From among these Leaves, rise up two or three, or more, slender naked Stalks, about five or six Inches high, bearing but one only Flower at top of each Stem, set in a small green husk, in form somewhat like a Violet Flower, or those of Larks Heels or Spurs, having a small Heel or Spur behind, in some of a purple, in others of a more blew color, and in some white. When the Flowers are past, there come in their places small pointed round beads, in which is contained small, long, black Seed.

IV. *The Places*. It is chiefly found in the Common Field, and in several Bogs on the Hills in *Yorkshire*: and in many places also in the West Country, and *Wales*: as also in a Common, about a Mile from *Oxford*, near a Village called *Herington*. Gerard says, it grows in *England* in squashy wet Grounds, and will not yield to any Transplanting or Cultivating of it; and that it grows especially in a field called *Crag-Close*, and at *Crosby*, and *Ra-*

venfworth in *Westmorland*; upon *Ingleborow Fells*, twelve Miles from *Lancaster*; and in *Harwood* in the same County, near to *Blackburn*; ten Miles from *Preston* in *Aundernefs* upon the Bogs, and Marsh Grounds: and in the Boggy Meadows about *Bishops-Hatfield*: also in the *Fenns* in the way from *London* to *Whitsea Mere* in *Huntingtonshire*: It grows also in *Hampshire*, and in great abundance in many places in *Wales*.

V. *The Times*. It Flowers towards the latter end of *May*, and all the Month of *June*, even to *July*, (according as the Weather proves) and the Seed is ripe not long after.

VI. *The Qualities*. It is Temperate in respect to heat or cold, and Drying in the Second Degree. It is Astringent, and Cathartick, like *Rhubarb*; Consolidative, and Traumatick, or Vulnerary.

VII. *The Specification*. It is dedicated to the curing of Green Wounds, and healing of Recent Ruptures in Children.

VIII. *The Preparations*. You may make therefrom, 1. A liquid Juice of the Plant. 2. A Syrup. 3. An Ointment. 4. A Balsam.

The Virtues.

IX. *The liquid Juice*. Country People, who live where it grows do use to wash their Hands with it, when they are Chapt by the Wind or Weather: and in *Yorkshire* they anoint the Dugs of their Kine, with the Fat and Oily Juice, when they are bitten with any Poisonous Worm or Fly, or are Chapt or Rift by Weather, or any other means.

X. *The Syrup*. The Poorer sort of People in *Wales*, make a Syrup thereof, as of *Roses*, and therewith Purge themselves, and their Children: they mix it with Broth for the same purpose, and so it purges Flegm effectually. Dose from two to four spoonfuls.

XI. *The Ointment*. They also with the Herb make an Ointment, which is held to be singularly good (and that by the Experience of some Physicians) against the Obstructions of the Liver.

XII. *The Balsam*. It is said to cure Ruptures in Children, being applied Plaister-wise: It is a singular Vulnerary; for it digests, cleanses, and heals Green Wounds in any part, being highly Astringent, Drying, and Consolidating, not much inferior to any of the Wound Herbs.

CHAP. CIII.

CABBAGE.

I. *THE Names*. It is called in Greek, *Κεράβη καλαωτή*: In Latin, *Brassica Capitata*: In *English*, Cabbage, or Headed Colewort.

II. *The Kinds*. It is twofold, 1. *Κεράβη λευκή*, *Brassica Capitata Alba*, White Cabbage. 2. *Κεράβη καλαωτή ερυθρή*, *Brassica Capitata Rubra*, Red Cabbage.

III. *The Description*. The Common White Cabbage has a Root going right down, but not deep, nor spreading far, and usually dies in Winter: from which Root springs up one thick Stalk, having at top thereof a great thick Head of crumpled Leaves: this Head is closed hard and round, and has at first great large thick Leaves, of a grayish green color, with thick, great, and lying open most part of the Summer, without closing: but towards the end of the Summer, being grown to have many Leaves, it then be-

gins to grow close and round in the middle, and as it closes, the Leaves grow white inwards; yet there are some kinds, which will never be so close as these, but will remain half open, which are not accounted to be so good as the other. In the middle of this Head, the next Year after the Sowing (in other Countries especially, and sometimes in ours) if the Winter is mild, you may see in divers Gardens a great thick Stalk to shoot forth, which is divided in the top into many Ramifications, or Branches, bearing thereon divers small Flowers, sometimes white, but most commonly yellow, made of four Leaves, which being past, turn into long, round, and pointed Cods, containing therein small round Seed, like to Turnep Seed. Now here is to be noted, that by reason of the hard Frosts, and Cold of our Countrey, some of our Gardiners, for the preventing the danger of the said Winter Frosts, do use to take up such Cabbages (as they intend to reserve for Seed) with their Roots; and tying a Cloth or some such thing about the Roots, do hang them up in their Houses, that thereby they may be defended against the Cold; and then set them again after the Frosts are past.

IV. The Red Cabbage is in all things like unto the White, excepting in the color, this being deeply Red; as also in the magnitude, the Red being for the most part less than the White; and though it is many times found large, yet it is scarcely ever found so large as the large ones of the White. In this also the color of the Leaves is very variable, in some it is Green striped with Red; in others it is more Red; and again in some, it is a very deep Red, and sometimes declining to purple.

V. The Places. They are found growing with us only in Gardens, being nourished, and brought to perfection chiefly by the care and industry of Gardiners.

VI. The Times. They Flower for the most part in June or July, and the Seed is ripe in August.

VII. The Qualities. They are Temperate in respect of heat or coldness; and moist in the first Degree: They are also Opening, Absterive, Diuretick and Emollient: Also Pectoral, Hepatick, Nephritic, and Hysterick; Galactogenetic and Alterative.

VIII. The Specification. It is in vain to be particular, for the old Romans having expelled Physicians out of their Territories for Six Hundred Years, did maintain their Health by using and applying Cabbages and Coleworts as their only Medicine, or Remedy, in every Disease. And therefore as they thought them to be effectual against all Diseases of the Body, whether inward or outward, so Chrysisus wrote a Volume of their Virtues, applying them to every part of the Body.

IX. The Preparations. You may make therefrom,
1. A liquid Juice. 2. A Decoction. 3. A Syrup.
4. An Electuary. 5. Ashes. 6. The whole Substance. 7. A Collyrium. 8. The Seed.

The Virtues.

X. The liquid Juice. Drunk in Wine to three or four ounces, it is good against the bitings of Vipers, or other Venomous Creatures: mixed with Honey, and taken, it is good against Hoarseness, or loss of the Voice, and helps to restore such as are in Consumptions: mixed with Wine or Vinegar, and drank, it is good against the Venom of Mulhrooms: Galen applied it to the Temples of such as had the Head-ach, arising from Drunkenness; it cleanseth so strongly, that it is said to cure the Leprosie.

XI. The Decoction. The first Decoction is said to open the Body, but the second does Astringe or Bind, for that the Nitrous quality is quite consumed or spent. If it is made in Water, with an old Cock beaten to peices boiled in it, it prevails against Consumptions, and helps such as are troubled with Gripings, and pains in their Stomachs and Bowels, it is also good for such as are troubled with Obstructions of Liver or Spleen, and the Stone or Gravel in Reins or Bladder. It restrains the Vapors arising from Wine, and suddenly makes them sober again. It takes away the Swelling and Pain of Gouty Knees, being bathed warm therewith, dispersing the Humors. It also cleanses and heals old and filthy Ulcers or Sores, and Scabbiness, being often washed therewith, as also Pustules and Wheals which break out in the Skin.

XII. The Syrup. Made of the Juice, has the Virtues of the same, but in a more peculiar manner it is good against Coughs, Colds, Wheasings, thorniness of Breath, Consumptions, and other Diseases of the Brest and Lungs: dropt into the Eyes, it consumes Films, Clouds, or other things which obfuscate the Sight, and heals Sores and Ulcers in the Eyes.

XIII. The Electuary. It is made of the Pulp of the great middle Ribs of the great Leaves, boiled soft in Almond Milk, or Cows Milk, and compleated with Honey. It is profitably used for such as are Hoarse or Wheeze, or are Purse or Short-winded; being taken three, four or five times a day, as much as a Wallnut.

XIV. The Ashes. They are made of the Stalks, and are of such a drying Quality, that as Parkinson saith, they become almost Caustick: being mixed with Oil Olive, and Beef Suet, in a small proportion, they are found to be effectual to anoint the Sides of such as have had vehement and inveterate Pains there; as also it is good for Pains in any other place, caused by the access of Melancholick and Flarulent Humors, helping mightily to disperse and scatter them; and therefore must be very profitable against the Gout.

XV. The whole Substance. It is usually boiled in Water, or in Mutton or Beef Broth, till it is soft; and so with Butter, Vinegar, and Pepper, it is eaten as a Sallet, and for Food: and so eaten it nourishes, cleanses the Bowels, creates Seed, also Milk in Nurses,

Nurses, helps Coughs, and Hoarsness, and restores in Consumptions, being very Stomack, (for Stomacks are indeed the greatest restoratives.)

XVI. *The Collyrium.* It is made of the Juice mixed with Honey, and boiled to the thickness of a thin Syrup. Drop'd into the Eye, it clears the sight, and clears it of Clouds or Films, or any other matter which hurts it. It prevails against an Ophthalmie, and heals Sores or Ulcers of the Eye, removing the weakness, and much strengthening the part affected.

XVII. *The Seed.* If it is bruised, and mixed with a sixth part of Mustard Seed, and so drunk with Wine, it kills Worms in the Stomach or Bowels: it also expels Wind in the Bowels, and eases the pains of the Ventricle caused from Acid, or Cold and Moist Humors. Dose one dram, Morning and Evening.

CHAP. CIV.

CALAMINT Common and Small.

I. **T**HE Names. It is called in Greek, *Καλαμίνθη* (*quasi bona vel utilis Mentha*) in Latin, *Calamintha*: and in English, *Calamint*, or *Mountain Mint*.

II. *The Kinds.* It is chiefly twofold, 1. *Καλαμίνθη κοινή*, *Calamintha vulgaris*, Common Calamint; of which in this Chapter. 2. *Καλαμίνθη ἄγρια*, *Calamintha agrestis*, Field or Wild Calamint; of which in the next Chapter.

III. *The Common Calamint*, of which we here treat, is three fold, viz. 1. *Calamintha vulgaris magna*, The Great Common Calamint. 2. *Calamintha Praestantior*, The Greatest Calamint, which grows plentifully in our English Plantations in America. 3. *Calamintha minor*, The Lesser Calamint.

CALAMINTHA Communis.

Calamintha Americana.

Calamint Small

IV. *The Description.* Our ordinary Calamint has a Root small and woody, with divers small twigs, or fibres, spreading within the ground, not dying Annually, but abiding many Years; from which Root rise up several square hoary and woody Stalks, about a foot high, seldom higher: The Stalks and Branches have two hoary Leaves set at a Joint, about the bigness of Marjoram, or not much bigger, a little dented about the edges, and of a very piercing and quick Scent, as the whole Herb is: The Flowers stand at several

several places of the Stalks, from the middle almost upwards, which are small and gaping, much like to those of Mint, and of a pale bluish color. The Flowers being gone, there follows small, round, blackish Seed.

V. *Calamintha Praestantior Americana*, has a woody Root, which abideth, and sends forth new Branches every Year. It is a Sweet Herb, and rises up to be about a foot and half high, with square, hard, and hoary Stalks, which are many, and more slender than those of the Wild Mint; on which are set at every Joint, two small, and somewhat round Leaves, deeply dented about the edges, yet larger than those of the Wild Kind, being somewhat hoary, but not very hoary, rather of a sad green color, of a very sweet Scent, and not strong or heady as the other. The Flowers are gaping, and like the former, but larger, and of a purple color; which being gone, then comes the Seed, which is black, small, round, and something like unto Purslane Seed.

VI. The Small Calamint, is another sort of the first, and is like unto it in all thing, except the magnitude, being something less, and differing chiefly in the Flowers, which are not so large by one half, and therefore denotes it to differ from the same.

VII. The Places. The first grows in many Gardens, and in Dry and Upland Grounds, and on Heaths in many places of England. The second grows in many places of English America, it having been found in several old Plantations, after they have been flung up for rest, as also in the Borders of several Woods. It has also been found on the Euganean Hills near Padua, on Hills near Vicenza in Italy; on rocky Cliffs of Sevena in Provence, as also in Germany: Lobel also found it growing in England. The Small Sort is found for the most part in those places where the first is also found, or not far off from them.

VIII. The Times. They all Flower about the latter end of June, and in July, and their Seed is ripe in some short time afterwards.

IX. The Qualities. It is hot and dry in the third Degree: Astringent, Carminative, Digestive, Dis-cussive and Sudorifick. It is also Cephalick, Neurotick, Stomatick, Pectoral, Cordial and Hysterick: Alexipharmick and Alterative.

X. The Specification. It powerfully provokes the Terms in Women, and facilitates the Delivery of Women in Labor.

XI. The Preparations. You may make therefrom,
1. A Powder of the Leaves. 2. A liquid Juice.
3. A Decoction. 4. A Distilled Water from the Herb gathered in June or July. 5. A simple Syrup of the Juice. 6. A Spirituous Tincture. 7. An Acid Tincture. 8. An Oily Tincture. 9. A Saline Tincture.
10. A Spirit. 11. A distilled Oil. 12. A Balsam.
13. An Ointment. 14. A Pessary. 15. A Cataplasm.

The Virtues.

XII. The Powder of the Leaves. Made into an Electuary with Salt and Honey, it kills Worms in the Body, helps the Leprosie, and such as are troubled with shortness of Breath.

XIII. The liquid Juice. It provokes Urine and the Terms, eases shortness of Breathing, and Choleric Torments of the Stomach and Bowels: It also facilitates the Delivery of Women in Travel, and expels the Dead Child, and therefore Women with Child ought to forbear the use of it. Dropped in to the Ears, it kills Worms in them; and opens Obstructions of Lungs, Liver, Spleen and Womb. And the Body being first well purged, if it is given from

two to four ounces, to such as are troubled with a Tertian Ague, it cures it.

XIV. A Decoction in Wine. It has all the Virtues of the Liquid Juice, but not full out so powerful; but as it is less in power, so it is much more pleasant to be taken, and therefore may be given in the larger Dose. It brings down Womens Courtes, and provokes Urine, and is good for those who are Bursten, or are troubled with Convulsions, Cramps, or shortness of Breath. It helps the Yellow Jaundice, and stays Vomiting, and is good against the bitings of Vipers, or other Venomous Creatures: It provokes Sweat powerfully, and therefore is singular good against all malign Fevers, as Measles, Small Pox, Spotted Fever, and the Plague it self. Dose from four to six or eight ounces.

XV. The Distilled Water. It has all the Virtues of the Decoction, but much weaker, and therefore is chiefly used as a Vehicle to convey any of the other Preparations in.

XVI. The Syrup of the Juice. It is highly Pectoral, and therefore a most excellent thing to open all Obstructions of the Lungs, and heal their Distempers, prevailing against Colds, Coughs, Hoarseness, Wheezing, shortness of Breath, difficulty of Breathing, hardness of the Spleen, and other Distempers of the Bowels. Dose two spoonfuls Morning and Evening, for some considerable time.

XVII. The Spirituous Tincture. It is a singular thing against all manner of Malignity, Poison, and Infection whatsoever: It powerfully cures Convulsions in the Bowels, Stomach, or in any other part of the Body; it strengthens Nature, cheers the Heart, revives the Spirits, and is an excellent thing against cold Sweats, Faintings, Swoonings, Fits, and all sorts of Deliquiums of the Spirits or Heart, and other Bowels, proceeding from Cold, or a cold and moist Cause. Dose half an ounce in a Glass of Wine, Morning fasting, and Evening, or in the time of the Paroxysm.

XVIII. The Distilled Oil. It has all the Virtues of the Juice and Decoction, but much more efficacious than either of them: being drop ten or fifteen drops into Sugar, and so drunk in a Glass of Wine, it gives immediate relief in the Cholick; and so given to a Woman in Labour, it presently forces away the Child, either alive or dead; outwardly anointed upon parts Paralytick, or affected with the Cramp, it presently gives relief in the latter, and in some few times using helps the former.

XIX. The Acid Tincture. It is most admirable against the Plague, Spotted Fever, and all other sorts of Malignant Fevers; as also against the Poison of Serpents, as Vipers, Rattle Snakes, &c. bitings of Mad Dogs, or other Venomous Creatures, the Acid destroying all sorts of malignity and Poison whatsoever: It may be given inwardly from half an ounce to two ounces every six hours in some proper Vehicle; and outwardly bathed upon the Region of the Heart, or upon the place bitten or hurt, and Cloths dipt therein may be laid on, and this three, four, or five times a day.

XX. The Oily Tincture. Given inwardly to two drams, it gives ease in the Cholick presently, and opens Obstructions of the Reins and Womb, provoking Urine, and forcing away Sand, Gravel, and other Tartarous Matter obstructing those parts: Anointed upon Spasms, it cures them in a short time: and well rubbed in, Morning and Evening for several days, upon any part troubled with the Palsie, it restores them, comforting the Nerves, and warming and strengthening the Parts afflicted: It is also profitable against the Piles, proceeding from a cold cause, (if not broken) they being anointed therewith two or three times.

XXI. The

XXI. *The Saline Tincture.* It is good to wash such parts as break out with any sharp or salt Humor, as the Leprosie of the *Greeks*, Scurf, Morpew, Scald Heads, Dandriff, and the like: bathed upon parts troubled with the Gout or Sciatica, and continued for some time, Morning and Evening, it gives ease of the Pain, does much good, and in time removes the Disease.

XXII. *The Spirit.* It is Cephalick, Neurotick, Stomack, Cordial, and Alexipharmick: It stops Vomiting, strengthens a weak Stomach, cheers the Heart, revives the Spirits, and is good against Fainting and Swooning, Vapors, and Fits of the Mother, and preserves (being taken in a Morning fasting) from the Infection of the Plague, or of the Spotted, or any other Malign Fever. You may take a spoonful or two of it at a time (if Dulcified) and that twice a day, or upon the spot, if any Paroxysm is present: It is also good to bathe with, if any thing like a Gangrene is feared.

XXIII. *The Balsam.* Being applied to a cold Gout, it gives ease to the Pain, and anointed upon the Hemorrhoids, or Piles, it heals and cures them.

XXIV. *The Ointment.* It is good to anoint Womens Breasts, which are swollen and painful, proceeding either from Cold, or Curdled Milk, or some external Violence.

XXV. *The Pessary.* The green Herb made into a Pessary with Wooll, and put up the *Vagina Uteri*, it provokes the Terms, eases the pains of the Mother, relieves Vapors and Hysterick Fits, and if it is near the time of Travel, hastens and facilitates the Birth.

XXVI. *The Cataplesm.* It is made of the green Herb, with Lard, Crumbs of Bread, or Pouder of Bay-berries: being applied to any part pained with the Gout, it eases the Pains, abates the Tumor or Swelling, and discharges or draws forth the Humors. It must be continued Morning and Evening for some considerable time, by which means it is said to perfect those Cures. Being applied upon places black and blew, or yellow, or otherwise discolored, it takes away the ill color, and cleanses the skin.

CHAP. CV.

CALAMINT, Wild.

I. **T**HE Names. It is called in *Greek*, *Kalamindon* *ayena*: In *Latin*, *Calamintha agrestis*: and in *English*, Wild Calamint.

II. *The Kinds.* We shall treat here of three several Kinds of it: 1. *Calamintha arvensis verticillata*, sive *Aquatica Lobelij*, Field Calamint with whorled Coronets. 2. *Calamintha altera odore Pulegij, foliis maculosis*, Calamint having the Pennyroyal Smell, and with Spotted Leaves. 3. *Calamintha minor incana*, The lesser hoary Calamint.

III. *The Description.* The first of these has a small Root, abiding long, and not perishing after Seed time: From which Root come forth several square hoary Stalks full of Joints; and two small, and almost round hoary Leaves set thereat, up to the tops, something like to Pennyroyal leaves, of a brisk, sharp, and quick Scent, yet Sweetish, like unto Pennyroyal. Towards the Tops of the Stalks and Branches there stand, with the Leaves, many purplish Flowers, several being set together, in a kind of Whorle or Coronet; after which comes small blackish Seed.

IV. *The second or Spotted Calamint, differs not much from the Common Calamint in the former Chapter, but that it grows nothing near so great nor high; it has square, hard, hoary Stalks, and hoary Leaves thereon like it; but spotted here and there, of a very strong Scent like unto Pennyroyal. The flowers grow in the same manner as the Common Calamint*

Calamin in Cap. 104. Sect. 4. but smaller, and of a pale purplish color, having much like small blackish Seed.

Calamin Lesser Hoary.

V. The third, or Lesser hoary *Calamin*, has a fibrous Root like the others, and not perishing yearly. From which spring up small, low, and slender hoary Stalks, not above a Foot high, on which, at every Joint, are set two Leaves, as in the other Kinds, but smaller, and more hoary, yea smaller than the least Bush Basil. The Flowers are very small, but like the last described, and of a less heady smell, with like Seed also, but something lesser.

VI. The Places. The first grows in many places of England, both in plowed Grounds, and moist Meadows. The second, *Pena* says he found on certain Hills in Lombardy; and in several places of our own Land, but not always spotted: I have found it in several places of South Carolina. The third and last is not common with us, but only nourished up in Gardens: It grows in Candia, from whence the Seed came first to *Camerarius*.

VII. The Times. They Flower in June and July, and their Seed is ripe soon after.

VIII. As to their Qualities, Specification, Preparations, Virtues and Uses, they are exactly the same with those in the former Chapter, and therefore to those I refer you.

CHAP. CVI.

CALTROPS, Land.

I. THE Names. They are called in Greek *Τριβύλος*, & *Τριβύλος*: In Latin, *Tribulus*: In English, *Caltrops*. The Arabians call this Plant *Hajach*, and *Hajerk*; the Spaniard, *Abrolos*, and the French, *Saligot*.

II. The Kinds. It is twofold, first of the Land, called in Greek, *Τριβύλος*; and in Latin, *Tribulus*

terrestris; and in English, *Land Caltrop*, of which in this Chapter. Secondly, *Water Caltrop*, of which in the next.

Land Caltrop

III. The Description. *Land Caltrop* has a Root which is white, grows downwards, and has many Fibres or Strings. From this Root rise up several hard, small, long Branches, full of Joints, and spread abroad upon the ground; which are furnished with many winged Leaves, having a middle Rib, on which stand several small Leaves, on both sides the said Rib, after the manner of *Orob*us or *Vetches*. At the Joints come forth singly, small, pale, whitish Flowers, consisting of five small Leaves, like the Flowers of *Tormentil*. These being past, there comes forth little, rough, prickly beads, full of Prickles, and having five or six Corners, within which prickly Husk lies the Kernel or Seed.

IV. The Places. It is said to grow plentifully in Spain in their fields, being sometimes hurtful to Corn: It is also found in most places of Italy and France: And, as *Gerard* says, it grows with us in England; he found it in a moist Meadow adjoining to the then Wood or Park of *Sir Francis Carew*, near *Croydon*, not far from London, from whence he brought Plants of it for his Garden. *Parkinson* says it grows amongst Rubbish, and the Ruins of Buildings, and by Walls sides.

V. The Times. It Flowers in June and July; and the fruit or Seed is ripe in August.

VI. The Qualities. It is cold in the first Degree, and dry in the second. It is Astringent and Repellent, it is Alterative and Alexipharmick.

VII. The Specification. By reason it is of thin Parts, it is said to waste the Stone, Tartar, or Gravel in the Reins, and parts adjacent.

VIII. The Preparations. You may have therefrom, 1. A liquid Juice. 2. An Essence. 3. A Decoction. 4. A Powder of the Root. 5. A Collyrium. 6. A Cataplasma of the Leaves. 7. A Lotion. 8. The Seed.

The Virtues.

IX. The liquid Juice. Being applied, it abates the Inflammation, and cures an Erysipelas: It hinders the breeding of Inflammations and Apoplems,

and stops the Flux of Humors; and being drank from two ounces to four, it breaks or waxes the Stone in the Reins, expelling Sand, Gravel, and Tartarous Humors; and stops all sorts of Fluxes of the Bowels.

X. *The Effence.* It has all the same Virtues, and the more pleasant Medicine to take. It cures sore Eyes, being dropt into them, and abating the Inflammation, takes away the Blood-shot. If it is drank to two or three ounces in Wine, it prevails against the poison of the Viper, and the bitings of other Venomous Beasts.

XI. *The Decoction.* It has the Virtues of the Juice and Effence, but not all so powerful: It may serve as a good Vehicle to convey the Pouder of the Root in.

XII. *The Pouder of the Root.* It stops Fluxes of the Belly, and binds it: given to two drams, it is good against the biting of Vipers; consumes Nodes and Kernels in the Neck, or other Parts, and in a good measure strengthens the Stomach.

XIII. *The Collyrium.* It is made of the Juice or Effence made into a thin Syrup with Honey. This put into the Eye three or four times a day, stops fluxions of Humors into the Part, cools and takes away the Inflammation, and heals Sores or Ulcers therein.

XIV. *The Cataplasm of the Leaves.* It is good against a hot Gout, repercuſſes the flux of Humors, hinders Apoptems, and diffuſes Swellings in the Legs, or other parts of the Body.

XV. *The Lotion.* It is made of the Decoction in Wine, in a quart of which, Honey three ounces, and Roch Allum half an ounce, is dissolved. It is made to heal corrupt Sores and Ulcers of the Mouth, Throat, and Gums; and to cleanse Fistula's, as also Apoptems newly broke, or opened, by injecting it with a Syringe.

XVI. *The Seed or Fruit.* It is Alexipharmick; *Galen* and *Pliny* say, that the *Thracians*, who dwell near the River *Stirmon*, lived themselves of the Fruit or Kernels, making them into a sweet and fine kind of Bread, which something bound up the Belly: And that with the Herb they fed their Horses. But this making Bread of the Kernels is affirmed by some, to be only meant of the Fruit of the *Water Caltrop*, following.

CHAP. CVII.

CALTROP, Water.

THE Names. It is called in Greek *Τειλαρο*: in Latin, *Tribulus aquaticus*, *Tribulus marinus*, and by *Cordus*, *Lacustris*: in English, *Water Caltrop*; *Saligot*, and *Water Nuts*.

II. *The Kinds.* There are two sorts of *Water Caltrops*. 1. *The Greater Water Caltrops.* 2. *The Lesser Water Caltrop*: And of the Lesser there are also two Kinds, viz. The former and the latter. The Greater *Water Caltrop*, is called in Latin, *Tribulus Aquaticus major*; *Tribulus Aquatilis*, and *Castanea aquatilis*. The lesser sorts are called by *Clusius*, *Tribulus aquaticus minor*; and distinguished by him, the former of which he calls, *Tribulus aquaticus minor prior*; and the latter, *Tribulus aquaticus minor alter*.

III. *The Description.* The Greater *Water Caltrop* has a Root which grows somewhat long, and full of Joints, with a Tuft of Hairs or Fibres at each of them. From the head of this Root lying under Water, rise up several long slender Footstalks,

which rising from the bottom of the Water, mount above the same; at the top of each of which, there are broad, and more than half round Leaves, in some places Spotted on the under side, and dented about the Edges. The Footstalks on which these Leaves stand, are smaller at the lower end next the Root, than they are at top of the Water next to the Leaves. Among these Leaves rise up sappy round Stalks, no higher than the Leaves, bearing whitish Flowers at the Tops. After which come thick, hard, and Woody, almost round heads, with three or four sharp pricks or points sticking out, of the bigness of Hazle Nuts, and blackish in some places: some of them are as large as great Walnuts, having a sweet white Kernel within, which is not much unlike to a Chestnut. This Fruit, with its outward Husk, or Shell, is hard, triangular, sharp pointed and prickly, in shape almost like to those things called Caltrops, which in War they cast in the way of the Enemy, to annoy the Feet of their Horses, and from whence this Plant took its name. The Kernel is tasted almost like a Chestnut, and are usually eaten green: And being dried, they are ground to powder, and so serve to make Bread of.

IV. *The former lesser Caltrop, the whole Plant,* is commonly covered over with Water, having very long, slender, creeping Roots, from whose several Parts or Joints come forth divers Tufts of small Fibres or Strings, which take hold of the Mud. From this Root, at the lower Joints thereof come forth thin, flat, knotty Stalks, of a reddish color, three, four, or five Feet long, or longer, according to the depth of the Water in which it grows; which being dry, are pliant, and flexible, and fit for many occasions. They are divided towards the Top, into many Parts or Branches, carrying single Leaves at the lower Joints, on both sides, being about two Inches long, and half an Inch broad, thin, and almost transparent, or as it were shining: so waved, wrinkled, or crumpled on the Edges, that they seem to be torn, and for the most part of a reddish green color. The Footstalks are somewhat long and thick, and rise up from among those Leaves, which always grow two, one opposite against another, in a contrary manner to those which grow below on the Stalk. From the Joints

with the Leaves come forth small Footstalks, bearing at their ends small, whitish, long and thick Flowers. Gerard says, out of these Stalks, at the Tops, grows small Grape-like Husks, out of which spring small reddish Flowers, like those of the Oak, every Flower having four very small round top Leaves: after every Flower, there comes commonly four sharp pointed Grains growing together, containing within them a little white Kernel.

V. The latter small Water Caltrop, has a Root not much unlike to the former, but longer, and fuller of single Fibres or Strings. From whence spring up Stalks, not flat, as the former, but round kneed, and always bearing two Leaves at every Joint, one opposite against the other, greener, shorter, and lesser than the other, sharp pointed, and not much wrinkled or crumpled on the Edges. Clusius says, that they are not at all crumpled. But our English Herborists never observed any without crumples or wrinkles. The Flowers grow on short small Footstalks, of a whitish green color, like those of *Muscicella Cordi*, called by Gerard, *Radix cava minima viridi flore*, to wit, two flowers at the top of every Footstalk, one opposite against another, every flower containing four small Leaves: which two flowers being past, there comes up eight small Husks, making six several ways a square of flowers.

VI. The Places. The greater is found in several Lakes and moist places in Germany, as also in *Brahant* and *Flanders*, and in many places of Italy near the Sea. One *Fincham* a Merchant of London found it in the *East Indies* in the *Mogul's* Countrey, where it grew like a Weed in moist Ponds there, the Kernel of which, he says, is much eaten by the Natives. See *Purchas his Pilgrims*, lib. 4. cap. 4. sect. 5. pag. 429. *Cordus* says it grows in Germany in Muddy Lakes and Places, and in Ditches which have Mud in them, as also in Standing Waters, and sometimes also in Running Waters. And *Matthioli* says, it grows not only in Lakes of Sweet Water, but also in Ditches by the Sea side near to *Venice*. The second or former lesser grows in standing Waters, or Pools, Ditches, or Fish Ponds: It was found in Ponds adjoining to a dissolved Abby called *Durford*, which divide *Hampshire* and *Sussex*, and in other standing Waters in several places. The third or latter small grows plentifully in the River by *Draxford* in *Hampshire*.

VII. The Times. They all Flower in June and July, and give their Fruit or Seed in August.

VIII. The Qualities. They are all cold and moist in the first Degree, and more Watery than the *Land Caltrop*. They are Emollient, Repercussive, Nephritic, Alterative and Alexipharmick.

IX. The Specification. They are good against the Obstructions of the Reins, Gravel, Tartar in the Urinary Passages, heat of Urine, and pissing of Blood.

X. The Preparations. You may make therefrom, 1. A liquid Juice. 2. A Decoction. 3. A distilled Water. 4. A Lotion. 5. A Cataplasm. 6. The Nuts. 7. A Powder of the Nuts.

The Virtues.

XI. The liquid Juice. Being applied, it cures an Erysipelas; and is good against Inflammations in any part of the Body; and cures the King's-Evil, Running Sores, or Ulcers, by washing with it.

XII. The Decoction. If made in White Wine, or in Wine and Water, it opens the Obstructions of the Reins and Ureters, expels Tartar, Sand and Gravel, out of the Urinary Parts, and helps scalding of the Water.

XIII. The Distilled Water. If it is drunk with a little Roch Allum dissolved in it, it stops the pissing of Blood, and is profitable against the Diabetes.

XIV. The Lotion. It is made of the Decoction in Water with the addition of Honey; Gerard says, it perfectly cures Cankers of the Mouth, Throat, Almonds, and sore Gums.

XV. The Cataplasm of the Herbs. *Dioscorides* says, it is good against all sorts of Inflammations, or hot Swellings. It may be profitably applied in a hot Gout, after sufficient cleansing of the Body, both with Emeticks and Catharticks.

XVI. The Nuts. Eaten raw, they resist Poison, and are said to be good against the bitings of Venomous Beasts: Eaten also, and drinking White Wine with them, they are said to be good against Stone and Gravel. In like manner eaten, and also beaten, and applied to the place, they resist the Poison of the bitings of Venomous Beasts.

XVII. The Powder of the Nuts. Gerard says, it is given to such as piss Blood, and are troubled with Gravel, and that it binds the Belly. It is doublet's a singular thing against the Bloody Flux, and other Fluxes of the Bowels, if it is given from a dram, to two drams, in a Glass of Sherry, or *Mader* Wine: Being dried, and ground to Powder in Quantities, a pleasant kind of Bread may be made thereof.

CHAP. CVIII.

CAMOMIL.

I. THE Names. It is called in Greek, by *Dioscorides*, *Ἀνθέμις*; by *Theophrastus*, *Ἀνθέμιον*; by some *Λευκάνθεμος* (from the whiteness of the Flowers:;) also *Χαμαίανθος*, quod Mali odorem habet, from having the smell of Apples. It is called in Latin, *Chamemelum*, and *Chamomilla*, also *Ambemis*, and *Leucanthemum*: In English, *Camomil*.

II. The

II. The Kinds. There are four several kinds hereof, viz. 1. The Common Garden kind, which is called in Latin, *Chamomilla hortensis*, and *Chamamelum hortense*. 2. The Naked flowered, called *Chamamelum nudum*. 3. The Double flowered, called *Chamamelum flore pleno*, and *Chamamelum Anglicum flore multiplici*. 4. The Roman, called *Chamamelum Romanum*. As for the Wild Kinds, or *Cotula*, Parkinson thinks them to be not so much of the Camomil kind, as of the *Parthenium*, or *Featherfew*, of which see May Weed.

III. The Descriptions. The Common Camomil has a small and fibrous Root, from whence spring many weak and feeble Branches, trailing or leaning to the ground, which take hold on the Top of the Earth as it runs, whereby it much encreases. The Leaves are very fine, and much jagged, or deeply cut, of a very strong sweet smell. Among which, at tops of the Branches come forth Flowers like unto the Field Daisie, having a border of small white Leaves, with yellow thrums in the middle, crowded close together, as is that of the Daisie, or Featherfew, but larger, and not so hard, but more soft and gentle in handling; which give a small white Seed, not observed by many, but being sowed, or cast into the ground, will bring forth Plants as other Seed doth.

Camomil naked flowered

IV. The Naked flowered, has Roots, Leaves, Stalks and Branches like to the former, and creeping upon the Surface of the Earth as that doth; but its Leaves are finer, and shorter, and it bears naked Flowers, which consist only of the middle yellow Thrum, without any pale or border of white Leaves round about it, and smelling as sweet as the former. The whole Plant is of a pleasing smell, for which reason some have given it the Epithite of *Odoratum*, as Gerard says.

V. The Double flowered has also Roots, Leaves, Stalks and Branches like to the first, it creeps as

much on the ground, and yet grows higher, and more upright: its Leaves are of a fresher green color; and in its Flower the white Leaves going round the same are manifold, or much doubled, insomuch that the yellow thrum in the middle is little seen, so that it seems but a little yellowish spot. This Plant is of a sweeter Scent than the first, and is more tender to be kept in Winter. It has also Seed in the middle of the Flowers, which being broken and cast into the Ground, will produce Double flowered Camomil.

Roman

Camomil

VI. The Roman Camomil, has a Root somewhat thicker than the former, but fibrous without, from whence rise up many slender Stalks, yet stiffer, and stronger than any of the others, for which reason it stands more upright, and does not creep upon the Earth, as the rest do. The Leaves are fine, but rather shorter, and of a more whitish color, tending something to the color of Wood Leaves: the Flowers are like to the first, having a single border of white Leaves, and a close yellow Thrum in the middle, after which comes small white Seed, like that in the Common Camomil: The whole Plant has a very sweet Scent.

VII. The Places. The first grows in most Gardens throughout England, besides it grows Wild (as Parkinson says) in many places of this Land: the other three kinds grow with us only in Gardens.

VIII. The Times. They Flower for the most part through all the Summer Months, and their Seed comes to perfection in the time of flowering.

IX. The Qualities. They are all of them hot and dry in three: Aperitive, Anodyne, Digestive, Diffusive, Diuretick, Sudorifick, Alterative, and Alexipharmick.

X. The Specification. The Egyptians dedicated it to the curing of Agues: and experience has confirm'd it an admirable thing against Diseases of the Pleura.

XI. The Preparations. There are, 1. A Liquid Juice. 2. An Essence. 3. A Syrup. 4. An Infusion. 5. A Decoction. 6. A Powder. 7. An Oil by Infusion. 8. An Ointment. 9. A Balsam. 10. A Cataplasm.

Cataplasim. 11. *A Distilled Water.* 12. *A Spirituous Tincture.* 13. *An Acid Tincture.* 14. *A N Oily Tincture.* 15. *A Saline Tincture.* 16. *A Spirit.* 17. *An Oil Distilled.* 18. *Potestates.* 19. *An Elixir.* 20. *A Fixed Salt.*

The Virtues.

XII. *The liquid Juice.* It is Antiscorbutick, resists the Infection of the Plague; and being taken inwardly to four or six ounces, two hours before the coming of the Fit of an Ague, whether Quotidian, Tertian, or Quartan, it commonly cures it at three or four Doses; besides which it cures an exquisite Pleurisie, more especially if a little Salt of Blood (whether of Man or Beast) is added to it, and this I have had experience of in my own Person, and since that have cured several others by the same Medicament. It provokes the Terms in Women, opens the Urinary passages, and gives ease in the Strangury to a Miracle.

XIII. *The Essence.* It has all the Virtues of the former, besides which it facilitates the Birth, and brings away the Child, whether dead or alive, as also the After-birth: It causes a free Breathing, is good against Colds, Coughs, Asthma's, and other Obstructions of the Lungs, as also Stitches in the Side. Dose four ounces, Morning and Evening.

XIV. *The Syrup.* Made of the Juice of Double-flowed Camomil, saith *Baubin*, but of our Common Garden Camomil, say *Pena* and *Lobel*, with the Flowers also, and a little White Wine, being taken three or four spoonfuls at a time, is a remedy against the Jaundice and Dropfie, as also the evil disposition of the Spleen.

XV. *The Infusion.* If it is made in White Port Wine, it provokes Urine, opens Obstructions of the Urinary Parts, expels Sand, Gravel, and Tartar, and helps a stinking Breath. It has the Virtues of the Juice and Essence, but not altogether so powerful.

XVI. *The Decoction.* If made in Wine, or part Wine part Water, and taken inwardly, it has the Virtues of the Juice and Essence, but very much weaker, yet it prevails powerfully against the Cholick: *Parkinson* says, it takes away all Pains and Stitches in the Sides. Tired Limbs being bathed therewith, it takes away their Weariness, and eases Pains to what part of the Body soever it is applied. It comforts the Nerves that are over-strained, mollifies Tumors, and dissolves those which are not very hard; and moderately comforts those parts which have need of warmth, or are chill'd by any Cold Paralytick Humor.

XVII. *The Powder.* Made of the dried Herb, but chiefly of the Flowers, being given from half a dram, to one dram, it helps the Gripping of the Guts, Wind, and Pain of the Stomach.

XVIII. *The Oil by Infusion of the Flowers in Oil Olive.* If the Person troubled with an Ague, be anointed with this Oil, before a good fire, from the Crown of the Head to the Soles of the Feet, and after that, be laid to Swear in a Bed, being so warm covered that they may Sweat well, it cures it, let the Ague be what it will. This is an *Aegyptian* Medicine, and *Galen* seems to confirm it: For he saith, that the *Sophi of Aegypt*, Consecrated this Herb to the Sun, for its Virtue in curing all sorts of Agues. But therein, says *Galen*, they were deceived, for it cures only those where the Humors are already digested; but it is very profitable (says he) for all other sorts of Agues, which come either from Flegm or Melancholly, or from an Inflammation of the Bowels; for these (says he) Camomil is a Sovereign Remedy to be applied, the Humors

being first Concocted. It is good against cold Gouts, coldness of the Limbs, and Pains and Aches proceeding from Cold and Moisture.

XIX. *The Ointment.* It heals Wounds in a Cold, Scorbutick habit of Body, gives ease in the Gout, and mollifies Tumors proceeding from an afflux of Humors.

XX. *The Balsam.* It is more excellent for healing Wounds than the Ointment, and being mixed with other proper things, it brings Apostems and Tumors to suppuration, and prevails singularly against the Gout, whether it proceeds from a hot or a cold Cause, and it will be so much the more effectual, if *Camphir* be added to it, which contains in it a subtil Fire, which draws forth the Essence of the Gout through the Pores of the Skin.

XXI. *The Cataplasim.* Being applied, it is useful to disengage, or dissolve Tumors, and Wind, in any part of the Body, and to ease Pains and Aches in the Joints. Being applied to the Ribs, and Hypochonders, as hot as it can be endured, it eases the Spleen, expels Wind, and gives immediate relief in the pains of the most exquisite Pleurisie: It also takes away Pains and Stitches in the Sides, removes shortness of Breath, and causes presently an easiness of breathing.

XXII. *The Distilled Water.* It is good against fainting of the Heart and Spirits, is good against Vapors and Fits of the Mother, as also Pains and Distempers of the Spleen; but it is chiefly used as a Vehicle to convey the other Preparations of this Plant into the Body: six ounces of it being drank with a scruple or half a dram of Salt of Camomil dissolved in it, prevails wonderfully against stoppage of Urine, and so is helpful against the Strangury.

XXIII. *The Spirituous Tincture.* Made from the Flowers, or the Herb and Flowers together, it prevails against Fainting and Swooning Fits, coldness of the Stomach, and sickness at Heart. It comforts all parts which have need of warmth; it digests crude Humors, dissolves Wind in the Stomach and Bowels, alleviates the Pains and Torments of the Belly, and provokes Urine gently: It induces Sweat, and expels cold Aches and Pains in what part of the Body soever.

XXIV. *The Acid Tincture.* It digests, loosens, eases Pain, is highly Antiseptic, Anticolick, and strongly Diuretick. It powerfully opens Obstructions of the Lungs, and helps such as have a shortness of Breath, difficulty of Breathing, are Hoarse, and Wheeze much, so as in a manner they have lost their Voice. It Attenuates, Cleanses, Purges, Opens, Expecterates tough Flegm, and is profitable for all Diseases of the Breast, caused by the Afflux of moist and Hegmatick Humors, whether Thin or Thick, Tough, Rotten, or Corrupted, causing the same to be spit forth. You may make it pleasant and grateful with Syrup of Violets, or Clovegilliflowers, or a pure Tincture of *Spanish* Juice of Liquorice, and so to be taken often in the Day, and that for many Days together.

XXV. *The Oily Tincture.* This being rubbed in daily, Morning and Night, before a good Fire, all along the Back-bone, from the Head to the *Anus*, and also over all the affected Limbs, it cures a Palsie above most other things in the World. It also cures Rheumatick Pains, being well anointed upon the parts affected twice a Day, and continued for some time. It expels Cold, eases Pains, dissolves cold and windy Tumors, eases the Pains of the *Pleura*, and After-pains of Women in Child-bed, being anointed a little above the Share Bone, and twenty drops of it given inwardly, in a Glas of Canary. In all outward applications, if you add a little *Camphir* to it, one ounce of *Camphir* to a pound of the

the Tincture, it makes it so much the more powerful and effectual.

XXVI. *The Saline Tincture.* It may be given from half a dram to a dram, in White Wine, against Stone, Gravel, Sand, and Tartarous Matter in the Reins and Bladder; it opens Obstructions of the Urinary parts, and of the Womb; is good against Vapors, and Fits of the Mothers, and dissolves Coagulations in the *Pleura*. Outwardly used, it is good against the Gout, or any other Pains proceeding from a cold Cause.

XXVII. *The Spirit.* It is a singular Cordial, cheers the Heart, revives the Spirits, strengthens Nature, and makes the Body able to withstand Diseases. It is good against Convulsions, and prevails much against Wind, Fainting and Swooning Fits, Vapors, and Distempers of the Womb, for which it is a Specifick. It comforts the Head, Nerves, and Brain, and is so great a Stomackick, that there is but few greater. Dose two drams, being dulcified.

XXVIII. *The Distilled Oil.* It is a famous thing for the Head, Nerves, Womb, and Joints; and therefore is good against Vertigo's, Apoplexies, Epilepsies, pain of the Stomach, Convulsions, Fits of the Mother, Palsies, Lameness of the Limbs, and all sorts of Rheumatick pains. In Diseases of the Head and Nerves, as Palsies, it ought to be anointed down the Back-bone, as also upon the parts affected; and is also to be given inwardly in a Glass of Wine, from three drops to twelve or sixteen: drop it first into White Sugar, which mix well, then dissolve it in the Wine, and so let the Patient drink it up. In Vertigo's, Apoplexies, Epilepsies, Convulsions, Stomach Pains, and Mother, it needs only to be given inwardly, Morning and Evening, as directed.

XXIX. *The Potestates or Powers.* They have all the Virtues of the Juice, Essence, Tinctures, Spirit and Oil, and indeed more subtil and penetrating, piercing like Lightning thro' the Universal Frame; and may be given Morning, Noon, and Night, in some proper Vehicle, from one dram to two or three drams, according to age and strength.

XXX. *The Elixir.* It has the Virtues of Juice, Essence, Tincture, Spirit, Oil and Powers; but much more subtil, and effectual to all the purposes intended: it is singular in the Cure of a Pleurisie beyond most other things. Dose from one to two drams.

XXXI. *The Fixed Salt.* It is singularly Nephritick, and Antipleuretick; eases Pains in the Reins, opens Obstructions of the Urinary parts, dissolves the Congelation of Blood in the *Pleura*, Womb, and carries off the Seminalities of those Diseases by Urine. Dose half a dram.

CHAP. CIX.

Of CAMMOCK, Or REST HARROW.

I. *THE Names.* It is called in Greek by Dioscorides and Piny, *Arwis*: by Galen and Theophrastus, *Orevis*: In Latin, *Anonis*, and *Ononis*: Also *Arestia Bovis*, *Restia Bovis*, *Remorum Aratri*: because that the Roots of it being very tough, and so deeply and strongly fastned in the Ground, it causes the Oxen which draw the Plough to be as it were at a stand for the first pull, and so stops the Plough Share, that it cannot so readily go on. In English it is called *Cammock*, or *Rest Harrow*.

II. *The Kinds.* There are many kinds of it; but those which are only Common with us, are these following five: 1. *Anonis spinosa flore purpureo*, Common Rest Harrow, with purplish flowers. 2. *Anonis spinosa flore albo*, Rest Harrow, with white flowers. 3. *Anonis spinosa lutea minor*, Rest Harrow, with yellow flowers, the lesser. 4. *Anonis non spinosa flore purpureo*, Rest Harrow not thorny, with purple flowers. 5. *Anonis non spinosa lutea major*, Rest Harrow not thorny, with yellow flowers the greater.

Cammock *Rest harrow*

Rest harrow

III. *The Descriptions.* The first and Common Rest Harrow, which is frequent, as well in Arable as Waste Grounds, and Ey-lands, has a Root which

is blackish on the out side, and whitish within, very tough and hard to break, whilst it is fresh and green, and as hard and tough as a horn when it is dried, thrusting it self down very deep into the ground, and spreading it self likewise far about, every little piece, though cut off from the Stock, being apt to grow again, if it be left in the ground. From this Root it rises up, with divers tough woody twigs, two or three feet high, set at the joints without order, with little roundish Leaves, sometimes more than two or three at a place, of a dark green color, without thorns while they are young, but afterwards armed, or furnished with them in several places, the thorns being short but sharp. The Flowers come forth at the top of the Twigs and Branches, whereof it is full, in fashion much like to Pease or Broom-blossoms, but lesser, flatter, and somewhat closer, of a faint purplish color. They being past away, there succeed small Pods or Cods, containing within them small, flat, and round Seed.

IV. The second Rest Harrow differs not from the former in the Root, Stalks, Branches, Thorns, nor in the Leaves, save that these are of a little fresher green color; but the chief difference is in the Flowers, which are very white in some places more than in others; in all other things they are alike.

V. The third, which is the Lesser yellow prickly Rest Harrow with us (for the greater grows not in England) has Thorns or Prickles thereon as the others: But the Plant is lower, and smaller, not rising little above half a foot high, not differing in any other great matter from the last.

VI. The fourth, which is the Purplish Rest Harrow without Prickles, has no other difference in it from the first or Common Cammock, but in this, that it has no Thorns or Prickles upon the Sprigs or Branches, no not in the Autumn, or declining part of the Year, when the other will be full of them. Of this sort there is one also which beareth white Flowers, which makes all the difference.

VII. The fifth and last has a Root which is long, tough, rough, and blackish, spreading much about: from this Root spring forth several woody Twigs, very flexible and tough, branching forth on all sides, covered with a brownish red Bark, set pretty thick with Leaves, which are for the most part three standing together upon a long Footstalk, not much unlike to Trefoil, but somewhat small, long, and narrow, with notches at the ends, much overspread with a strong Scented clamminess, which will stick so fast to the Hands of those which touch them, especially in the heat of the Year, and in hot Countries, that it is difficult to get off again. At Tops of the Branches or Twigs, stand many Pease-blossom-like Flowers, of a fair yellow color, which being past away, there comes forth small and long Cods, with a crooked point at the end of each, in which is contained small flat-tish Seed: of this there is a lesser sort; also another with a more reddish Flower.

VIII. The Places. The first, second, and fourth grow in many places of England, both in Arable Land, and Waste Grounds. The third, Lobel faith he found growing both about London and Bristol; but Parkinson says, he never found it growing naturally. The fifth and last I found in several places of Florida, as in the Southern Provinces of Carolina. It also grows about Narbonne and Montpellier in France, as also in Spain and Portugal.

IX. The Times. They all Flower about the beginning or middle of July, and the Seed is ripe in August.

X. The Qualities. Galen says, that the Root of Rest Harrow is hot in the third Degree; it is also drying, but seems not to exceed the second Degree: it is Absterive, Aperitive, Astringent, Diuretick,

Traumatick, or Vulnerary; Nephrick, Anthrick, and Alterative.

IX. The Specification. It is peculiar to destroy Viscosity or Tartar in the Reins and Urinary parts, to open their Obstructions, and to cleanse them.

XII. The Preparations. You may have therefrom, 1. A Decoction in Wine from the Bark of the Root. 2. A Decoction in Vinegar from the same. 3. A Powder of the said Bark. 4. A Distilled Water of the Roots. 5. A Spirituous Tincture. 6. An Acid Tincture. 7. An Oily Tincture. 8. A Saline Tincture. The Bark of the Root is that in this Plant, which is chiefly used.

The Virtues.

XIII. The Decoction in Wine. Take Rest Harrow Roots thin sliced, four pounds: choice Canary a gallon: mix and put it into a Stone Pot, which let be close stopp'd, and let that Pot be put into a gentle boiling Balneo for twenty four hours; so will you have a noble and pleasant Medicine to open Obstructions both of Liver and Spleen, as also of the Urinary parts, provoke Urine, and to break and drive forth the Stone, as also Gravel and Sand out of the Reins, Ureters and Bladder: and also cures the Hemorrhoids or Piles.

XIV. The Decoction in Vinegar. Being gargled in the Mouth, it eases the Tooth-ach, more especially when it proceeds from Rheum; it also heals Cankers in Childrens Mouths, and other Running Sores, and Ulcers in the Gums, Mouth, and Throat, if they be three or four times a day gargled, and wash'd therewith.

XV. The Powder of the Bark of the Root. Parkinson says, it is good to provoke Urine when it is stopp'd, and to break and drive forth the Stone effectually, being taken to one or two drams in generous Wine. Matthiolus says, that he knew divers freed from those Diseases, that used the said Powder in Wine for many Days together. The said Powder is also good to help the Hernia Carnosa, or Flethy Rupture, which Flethy Carcinomy it consumes by little and little, taking it constantly for some Months together: and this it has done when the Physicians and Chirurgeons had given them over as desperate, or no other ways to be cured, but by Cutting, &c. being strewd upon the hard, callous brims or edges of Ulcers; or if the said Powder be mixed with Honey, or with any proper Balsam, and applied, it consumes the hardness, and causes the Ulcer to heal.

XVI. The Distilled Water of the Roots. To every pound of the Roots sliced, put a quart of Canary: digest forty eight hours warm, then draw off the Water to dytness in a gentle Balneo. It is good for all the purposes aforesaid, and to cleanse the passages of the Urine, not suffering any Tartarous, Viscous or Clammy matter to gather together in those parts, so as to harden, or become a Stone.

XVII. The Spirituous Tincture. It is a very good Stomackick, and admirably strengthens the Bowels, stopping Vomiting, and all sorts of Fluxes thereof, as Diarrhaea, Dysenteria, Lienteria, and the Hepatick Flux: and although it purges, and cleanses the Urinary parts of any Preternatural Matter lodged in them, yet it stops and cures pissing of Blood, and speedily heals any Wound or Ulcer in those parts.

XVIII. The Acid Tincture. It is more Stomackick than the former, and an excellent Styptick; it stops spitting of Blood, and heals Ulcers of the Lungs, if given in a proper Vehicle; and by its Aperitive, Absterive, and Incisive power, it breaks to pieces.

or dissolves Gritty Stones in the Reins or Bladder. Dose sixty or eighty drops, in Ale, Beer, or Wine.

XIX. *The Oily Tincture.* This is more excellent, if there is any Wound or Ulcer in the Reins or Bladder; for many of those parts being Nervous; this Homogene and Oily Body wonderfully comforts the Parts, gently cleanses them of all Foreign, Tartarous, Viscous, Clammy or Sharp Humors, palliates the Pain, and in some short time heals them. If there be no Wound or Ulcer, but only Obstructions, or a weakness in the Reins and Back, it effectually opens them, smoothly cleanses them, and makes the Patient Piss free and easie, and withal so strengthens the Back, and eases the Pains thereof, as if there had never been any such Weakness, or Disaffection there. Dose twenty drops in a Glass of Wine.

XX. *The Saline Tincture.* Being bathed upon any parts affected with Pimples, Scurf, Morpew, Dandriff, or other like Preternatural Eruptions of the Skin, it cleanses it, and takes them away. I was informed by a Gentlewoman who had used it for some time, that it had taken away Tawiness, Sunburnings, and Freckles, and cleared the Skin to admiration. Inwardly it is given to one dram in White Wine against Stone, Gravel, Sand, and other Obstructions of the Reins.

XXI. It is reported, that in former times the young Shoots, and tender Stalks, before they become prickly, were pickled up, to be eaten as a Sawce for Meat: and that they were wonderfully commended against a stinking Breath, and to take away the smell of Wine in such who had drunk too much.

on, and at every Joint two such like hoary green Leaves, as those below, but smaller, diversly branched at the Top, having one flower upon each several long Footstalk, consisting of five Leaves, somewhat broad and round pointed, of a perfect Red, Crimson color, standing out of a hard, long, round husk, ridged and crested in four or five places: After the flowers are fallen, there come up round hard beads, in which is contained small blackish Seed.

Garden Campions, red, single flowered.

CHAP. CX.

CAMPIONS, Garden.

I. **THE Names.** They are called in Greek, by Dioscorides and Theophrastus, *λύχνος* (from *λύχνος*, *Lucerna*,) and *ἑλλόχυνος*, quasi *lucerna funiculum*, for that in former times they used the Leaves of Campions in their Lamps, to burn instead of Wicks: they also called it *Ἀθάνατος*, id est, *immortalis*, quod diutius *Venustatem suam retinet*: In Latin, *Lychnis*, *Lychnis Coronaria*, *Lychnis Sativa* & *Rosa Græca*: In English, *Campions*, and *Rose Campions*.

II. **The Kinds.** They are twofold, 1. *λύχνος ἑκαρπυμῆς*, *Lychnis Coronaria*, *Lychnis Sativa* vel *Hortensis*, Garden Campions, of which in this Chapter. 2. *Lychnis Sylvestris*, Wild Campions, of which in the next Chapter. The Garden Kind, are, 1. Single. 2. Double. The Single are, *Lychnis coronaria rubra simplex*, The single red Rose Campion. 2. *Lychnis coronaria alba simplex*, The single white Rose Campion. 3. *Lychnis coronaria albescens*, five incarnato maculata, & non maculata simplex, The bluish Rose Campion, spotted and not spotted. The Double, 4. *Lychnis coronaria rubra Multiplex*, The Double red Rose Campion.

III. **The Descriptions.** The Single red Rose Campion, has a Root small, long, and woody, with many fibres annexed unto it, and oft times shoots forth anew, and sometimes also dies and perishes. On the Top of this Root, there are divers thick, hoary, or woolly, long, green Leaves, abiding green all the Winter; From among which in the end of the Spring, or beginning of Summer, there shoots forth two or three hard, round, woolly Stalks, with some Joints there-

Campions Gard. single flowered Whits.

IV. The second Single white Campion, is in all things as Roots, Leaves, Stalks, and Flowers, like to the former, saving only the color of the Flowers, that being of a Red Crimson color, this of a pure White.

V. The third sort of Single Campions are like unto the former also, these other sorts having no other difference to distinguish them by, but the colors of the Flowers, which are of a pale or bleak whitish bluish color, chiefly about the brims or edges of the Leaves, or as if a very little Red was mixed with a great deal of White, the middle of the Flower being more White; the one being spotted all over the Flower, with small spots and streaks, the other not having any spot at all.

Campions Gard double flowered.

VI. The fourth, or Double red Rose Campion, is in all respects like unto the Single red Rose Campion, excepting that this bears Double Flowers, consisting of two or three Rows or Courses of Leaves at most, not so large as the Single. The whole Plant is more tender, and therefore more apt to die or perish than the Single is.

VII. The Places. They are only nurs'd up with us in Gardens: both Single and Double are only by Nature not Art: and the Double, ones have been found so Wild: for I could never observe that any Art or Industry of Man could ever so alter the properties of Nature, tho' by never so many repetitions of Transplantations, and Observation of the Phases of the Moon; as to make any Flower Single by Nature, to become Double, tho' many Men have affirmed the same; and of this Opinion was Parkinson, who says, that whatsoever has been found Wild to be Double, Nature it self, and not Art, so produced it, and so was brought into Gardens, where they are much encreased by slipping, and parting the Root, because they give no Seed.

VIII. The Times. They do all of them flower in the Summer Months, through May, June and July, to the end of August.

IX. The Qualities. The Seed, which is chiefly used, is hot and dry in the second Degree. It is Vulnerary, Alterative, and Alexipharmick.

X. The Specification. It is peculiar against the Poison of Scorpions.

XI. The Preparations. There are but few Preparations of this Plant; the chief things taken from it are the Leaf, and the Seed: of which there are used, 1. The Green Leaf. 2. The Powder of the Seed. 3. The Spirituous Tincture. 4. The Acid Tincture.

The Virtues.

XII. The Green Leaves. Being applied whole, or beaten in a Mortar into a Cataplasim, with a little Hogs Lard and Turpentine, and applied to any old or foul Ulcers in the Legs, Arms, or other parts; it does cleanse and heal them.

XIII. The Powder of the Seed. Galen affirms it to be hot and dry in the second or third Degree. And Dioscorides says, that being drunk in Wine, it helps those who are stung by a Scorpion; and so it is also thought to be good against the malignity of the Plague or Pestilence. Dose one dram at a time, Morning and Evening.

XIV. The Spirituous Tincture. It has the former Virtues, but more powerful against the Plague or Pestilence, the Spotted Fever, bitings of Serpents, Mad Dogs, or other Venomous Creatures. Dose half a spoonful, or a spoonful, in a Glass of Wine, Morning and Evening.

XV. The Acid Tincture. It has the Virtues of the former, is more Stomackick, and more powerfully resists the Malignity or Poison of the Plague, it destroying that, and the Fever together. Dose sixty or eighty drops, or more, in generous Canary.

CHAP. CXI.

OF CAMPIONS Wild.

I. THE Names. They are called in Greek *Λύχνις* *ὄρεα* & *ἀγρία*: In Latin, *Lychnis Sylvestris*: and in English, Wild Campions.

II. The Kinds. They are manifold, as, 1. Single. 2. Double. The Single are, 1. *Lychnis Sylvestris flore albo simplex*, Wild Campions with a white Flower. 2. *Lychnis Sylvestris flore rubro simplex*, Wild Campions with a red Flower. 3. *Lychnis Sylvestris flore rubro minor simplex*, The lesser red Campion with a red Flower. 4. *Lychnis Sylvestris vel Segetum Vaccaria rubra dicta*, Corn Campion. 5. *Lychnis Marina alba & rubra*, The Sea Campion white and red. 6. *Lychnis arvensis minor Anglica*, The English small Wild Campion with a white Flower. 7. *Lychnis plumaria Sylvestris simplex*, *Armoraria pratensis*, The feathered Wild Campion simple.

III. The Double Wild Campions, are, 1. *Lychnis plumaria Sylvestris multiplex*, *Armoraria pratensis flore pleno*, The feathered Wild Campion Double. 2. *Lychnis agrestis multiflora*, of Lobel; *Ocymoides flore pleno*, of Camerarius; *Lychnis Sylvestris purpurea multiplex*, of Gerard; *Flore pleno rubro*, of Parkinson, Red Batchelors Buttons. 3. *Lychnis Sylvestris multiflora*, by Pena and Lobel; *Ocymastrum*, of Tabernmontanus; *Lychnis Sylvestris alba multiplex*, by Gerard; *Flore albo pleno*, by Parkinson; White Batchelors Buttons. 4. *Lychnis agrestis abortivum multiflora flore viridi*, Batchelors Buttons with green Flowers.

IV. The

IV. The Description. The first of the Single Wild Campions has a Root white and long, spreading forth divers Branches in the ground, and perishing after Seed time: from whence come forth many long and somewhat broad, dark, green Leaves, lying upon the ground, with several Ribs therein, not much unlike to Rib-wort Plantane, but somewhat hairy, broader, but not so long. The Stalks are hairy, and rise up in the midst of them, three or four feet high, and sometimes more, with several large white Joints at several places thereon, and two such like Leaves thereat up to the Top. From these hairy Stalks come forth divers Branches also at their various Joints, all which bear on various Footstalks white Flowers at their several Tops, consisting of five broad pointed Leaves, every one cut in on the end unto the middle, making them to look like two apiece: they smell something sweet, and each of them stand in a large, green, striped, hairy Husk or Case, large and round below next to the Footstalk. The Seed is small and greyish in the hard heads, which come up afterwards.

Campions Wild Single flow.

V. The second Single Wild Campion, has a Root like the former, which perishes also after Seed-time. This Red Campion grows after the same manner as the former; but its Leaves are not so perfectly ribbed, are something shorter, rounder, and more soft or wooly in handling. The Flowers are of the same form and bigness, in some of a pale, in others of a bright reddish color, cut in at the ends more finely, which makes the cut or jagged Leaves seem to be more in number than the other. The Seed is like the former, small and greyish.

VI. The third Single Red Wild Campion, which is the lesser, has a Root like the former, which perishes after Seed-time, as they do: This whole Plant is very like the foregoing; but smaller and lower; yet very much branched, and replenished with darker green Leaves. The Flowers are reddish: but smaller, and not so much cut or dented in at the ends. The Husks and Seeds are also like the former, but every ways lesser.

Corn Campions

English = Sea = Campion

VII. The fourth, or Corn Campion of the Gardens, has a Root, long, white, and woody, with several Branches springing from it, (and is but an Annual Plant) from which rises up for the most part but one round Stalk, spreading it self out every way into several Branches, having two long Leaves set opposite at the Joints, being broad at the bottom, and encompassing the Stalk and Branches, not much unlike to Through-wax, ending in a small point, of a pale green color. At the Tops of the several Branches, stand divers Flowers, consisting of four Leaves a

pices, of a pale red color; which being past away, come forth Skinny Husks, containing small, round, hard, black Seed. This Plant for the beauty of its Flowers, is brought into, and nursed up in our Gardens.

VIII. The fifth, or Sea Campion White. It has a long slender Root, which abides many Years, from whence springs up several weak, flexible Branches, lying all about upon the ground, (which Branches are much divided into many other smaller ones) two or three Feet long; thick set with small, long, fat, and whitish green Leaves. At the top of every Branch stands one short, thick, whitish green Husk, parted or cut in at top; out of which springs forth a small long neck'd white Flower, not much unlike to that of the Spotted Poppy, and as white, composed of five small, round pointed Leaves, with some blackish threads in the middle: which being passed away, there comes forth Husks like those of the other Wild Campions, containing within them small brown Seed.

IX. The Red flower'd Sea Campion differs not from the former, neither in its Root, Stalks, Branches, Leaves, Flowers, Husks, nor Seed, nor yet in the manner of growing, excepting only in the color of the Flower, this being of a fine pleasant Red, whereas the former is White: so that some have thought it to be one and the same Species, Nature only sporting it self in the variety or color of the Flower: this Plant Herborists call in Latin, *Lychnis Marina flore rubello*, Red flower'd Sea Campion.

X. The sixth, or English small white Field Campion, has a Root which is small and white, and perishes every Year; from whence spring forth Leaves, which are small and hairy, not much unlike to the small Mouse Ear: and from among which springs forth a slender small Stalk, sometimes but one, which is single of it self; and sometimes many, not exceeding a Foot high. At every Joint two Leaves are set together, smaller than those below, and spotted with white spots; from the bottom whereof, viz. between them and the Stalk, come forth two other Leaves, much smaller than they, without any sensible Taste. The Flowers are small and white, like unto the other Wild Campions. After which come small, long Heads, with small greyish Seed in them.

XI. The seventh, or Single Feathered Wild Campion has a Root very fibrous, or full of small strings, from whence springs forth a Stalk; as also Leaves, somewhat like the ordinary White Wild Campion, but not so large, or rather resembling the Leaves of Sweet Williams, but that they grow not so close, nor so many together. The Stalks have smaller Leaves at the Joints, than those below, and branched at the Top; on which several Tops grow many pale, but bright red Flowers, jagged or cut in on the edges, like the Feathered Pink, for which thing sake, some have taken it to be a Kind, and some for a kind of Wild William; but notwithstanding all this, it is but a Wild Campion, as may easily be observed from several other parts of the Plant. It has a Husk which bears the Flower, like the Campions, and also round greyish Seed.

• Double Wild Campions.

XII. The first of these (in our Account) is the Double Feathered Wild Campion, which in its Roots, Stalks, Branches, Leaves, Flowers, Husks, and Seed, is like unto the Single Feathered Wild Campion; excepting only in two things, 1. That the Flowers are very Double. 2. That the whole Plant in its magnitude and manner of growing is smaller and lower.

White Batchelars Buttons.

XIII. The second, or Red Batchelors Buttons has a thick large Root, white and long, with many Branches and Fibres springing from it; from whence come up many rough broad Leaves, somewhat woolly and hoary; among which rise up long soft and hairy Stalks, branched into many Arms, two or three Feet high, or more, set with the like Leaves, but less: The Leaves grow at the Joints, two opposite one to another, up to the top; and from these Joints other Branches spring forth, at top of every one of which Flowers grow compassed of a multitude of Leaves, and of a red color. These Flowers are very double, composed of a great many red Leaves, very thickly packed or crowded together, and commonly set in a short or broken Husk, whereby the Flowers seem to stand on one side; but are not jagged, or cut in on the tops, as the Flowers of other Campions are, but altogether smooth. It is like in all its parts to the first Single Wild Campion as to its manner of growing, excepting that it is every ways less, and its Flowers are Red, and very Double.

XIV. The third, or White Batchelors Buttons: As the Leaves of the former Red Buttons were like unto the Leaves of the second Single Kind, with Red Flowers; so the Leaves of this are like unto the Leaves of the first Single White Knid, and the whole Plant differs nothing from it, but in the Doubleness of the Flowers; nor very little from the Red Batchelors Buttons, but in the color of the same, these being wholly White; and so very Double, that by the multiplicity of Leaves being crowded together, they break the Husk in which the Flowers stand, as the other does, so that there is not one Flower in a great many which is whole. Gerard says, That the similitude which these Flowers (both of Red and White) have to the jagged Cloth Buttons, formerly worn in this Kingdom, gave occasion to our Ladies, and other Florists of those times, to give them the names which now they bear.

XV. The.

XV. *The fourth, or Green Batchelors Buttons, have no difference from the two former in the Roots, Stalks, Branches, Leaves nor Seed, saving only in the Flowers, which in this are of a Greenish color; and sometimes through the midst of them they send up Stalks, bearing also Tusks of the like Double Flowers.*

XVI. *The Places.* Of these, the three first Single forts grow for the most part in our Countrey Fields, by Hedge and Ditch sides in many parts of England. The fourth grows in many Corn Fields in Germany, but with us is nourisht up in Gardens. The fifth, or *White and Red Sea Campions* grow by Hurst Castle near the Isle of Wight, and in the said Isle in many places by the Sea side: They grow also by the Sea side in *Lancashire* at a place called *Lytham*, five Miles from *Wigan*, in which place grows that with Red Flowers also. *Johnson* found it also growing in great plenty in the Marsh Grounds in *Thanet*, which lye directly opposite to the Town of *Sandwich*: The Red has been found about a Mile from *Southampton*, and both of them chiefly in the Southern parts of England, on the moist Stony Banks by the Sea side. The sixth grows in several grounds by *Colchester*, and in a Field called the *Mill-field*, behind the House of *Sir Thomas Lucy's* near *Colchester*. The seventh is only nourished up in Gardens.

XVII. *Of the Double Wild Campions, the first grows here only in Gardens. The second and third grow Wild in several places, but with us are chiefly nursed up in Gardens, for the beauty of their Flowers sake. The fourth also grows in Gardens.*

XVIII. *The Times.* They all Flower in the Summer Months of *June, July* and *August*, some earlier than others, some later, and their Seed is ripe soon after.

XIX. *The Qualities.* They are all of them hot and dry in the second Degree: Astringent and Alterative; and much of the nature of the Garden Kinds.

XX. *The Specification.* They have been found good to stop the Fluxions of Blood and Humors.

XXI. *The Preparations.* The same Preparations may be made of them which we have said to be made of the Garden Kinds in the former Chapter.

The Virtues.

XXII. Authors have said little of their Virtues, nor have we much to say of them by Experience; the general use is for the beauty of the Garden, the Flowers being very beautiful in their Seasons. *Parkinson* says, that being Drying and Astringent, the several Preparations of them may be profitably applied to stay the Fluxes of Blood and Humors in any part, and thereby also conduce to the healing of old and moist Running Sores and Ulcers.

XXIII. *Gerard* says, the Seed of *Wild Campions* being given to two drams (in powder) and so drunk, that it purges Choler by Stool, and is good for them that are Bitten or Stung by any Venomous Creature.

CHAP. CXII. OF CATCH-FLIE.

I. *THE Names.* It is called in Greek by *Thalium*, *ῥεκαὶδάλαν*; by others *ἀρχυὸς ἀγροῦ*, *αρχυός*; In Latin, *Lychnis Sylvestris Viscosa*, *Muscipula* (quia muscas capiunt) *Viscaria*, *Silene Theo-*

phrastris, *Armerius flos Quartus Dolenci*, *Ben rubrum Monspeliensium*: In English, *Catch-flie*, and *Lime-wort*: also by *Gerard*, *Wild Williams*.

II. *The Kinds.* *Parkinson* will have this Plant to be of the Kinds of *Wild Lychnis*, or *Wild Campion*; but *Gerard* says, they are of the Stock of *Wild Pinks* and *Gilliflowers*, and so calls them also with the other names *Wild Williams*. Those which we shall handle in this Work are such as are usual in England, viz. 1. *Muscipula Lobelij*, *Lychnis Sylvestris prima Clusij*, sive *Ben-rubrum Monspeliensium*, The French Catch-flie. 2. *Lychnis Sylvestris latifolia Clusij*, *Muscipula Cretica Auricule Ursifacie*, Catch-flie of Candia. 3. *Muscipula sive Viscaria Lobelij*, *Viscago Camerarij*, *Lychnis Sylvestris tertia Clusij*, *Gerard's first Catch-flie*, or *Lime-wort*. 4. *Muscipula angustifolia*, *Lychnis Sylvestris quarta Clusij*, *Narrow-leaved*, or *German Catch-flie*.

III. *The Descriptions.* The first has a small Root, somewhat Fibrous, which perishes after it has given Seed, and afterwards rises again of its own Seed, if it is suffered to shed it self. If it sheds it self, it springs up in the latter end of the Year for the most part, or else in the Spring, with five or six small Leaves, very like unto the Leaves of Pinks, and of the same Willow, or whitish green color, but a little broader and shorter. When it begins to shoot up for Flower, it bears smaller Leaves on the Clammy or Viscous Stalks, which Viscosity is strong enough to hold any small thing or flie which lights on it. These Leaves are broad at bottom, compassing the Stalks and Branches, being set two at a Joint, one against another. The tops of the Stalks are diversly branched into several parts, every Branch having divers small red Flowers, not notched, but smooth, standing out of small, long, round, stript Husks, which after the Flowers are past, contain small, greyish Seed. This *Parkinson* accounts of the Species of Campions, being a pretty thing to furnish and deck out a Garden.

IV. Gerard will have it to be a kind of Sweet Williams, and says, it has many broad Leaves like the Sweet Williams, but shorter, set upon a stiff and brittle Stalk, from the bottom of which Leaves spring forth smaller Branches, clothed with the like Leaves, but much less: the Flowers grow at top of the Stalks, many together, Tasty subson, of a bright red color. The whole Plant is possessed of a Viscousness, or Clammyness, like the other Kinds, but in a less proportion.

Candia
or
Clusius } *Catch Fly.*

V. The second has a Root small and fibrous, from whence come forth many Leaves lying upon the ground, which are thick, fat, and hoary, white, somewhat like to the Leaves of the yellow Auricula Urli, Bears Ears, or French Cowslips, smooth on the edges, and a little pointed, which do so abide the first Year of the springing: the Stalk rises up the next Year to the height of three or four Feet, with two Leaves at each Joint, and spreading on both sides into Branches from the ground, which are Viscous, Glutinous and Clammy, causing every light or small thing to cleave thereto, as Flies, Pismires, Down, Straws, &c. at the tops whereof, and at the Joints next below them come forth many Flowers together, standing in Clusters, but very small, whose small Husks contain every one of them a small greenish yellow Flower, parted in two at the broad end: the Seed is small and blackish in the Husks, and generally Sows it self.

VI. The third, which is Gerard's first, and by him called Viscaria or Lime-wort, and which he will have to be of the Stock and Kindred of Wild Gilliflowers, (notwithstanding Clusius has joined it with the Wild Campions, and Lobel among the Sweet Williams) has a Root which is large, with many Fibres, from whence spring many Leaves like those of the Crow-flower, or Wild Sweet William, among which rise up many reddish Stalks, with Knees or Joints at certain Spaces, set with Leaves by couples one against another, at the Top of which come forth fine Red Flowers. They being past, there comes in place small blackish Seed. The whole Plant, as well Leaves and Stalks as Flowers, are in most places overspread with a very thick and viscous or clammy matter, like to Bird-lime, which if you touch or take on your Fingers, the viscousness is such, that your Fingers will stick and cleave together, as if you had touched Bird-lime. If Flies also do light upon it, they will be so intangled therewith, that they cannot

fly away, so that in some hot Days you may see many Flies caught thereby, from whence came the names, Catch-fly or Lime-wort.

VII. The fourth, or Narrow-leav'd Catch-fly, has a Root thick and black, with many Fibres, putting up new Shoots and Stalks after the first Year, and not dying every Year, as the two last described: from this comes forth one Stalk a foot, or more, high, of a green, purplish color: But Parkinson says, that the Root sends forth divers long and narrow dark green Leaves, lying upon the ground, pointed at the ends, somewhat rough or rugged, and not fully smooth, as many of the other sorts are; and from among these Leaves, there springs up one Stalk, and sometimes two or three, brown of color, and two or three feet high, having two small Leaves set at their joints, but much separate one from another, and which will be clammy like the other in the hot Summer time: from the middle to the top of the Stalk grow little Branches, which upon pretty long Footstalks bear Flowers, every Stalk one Flower by it self, consisting of five little round Leaves, yet divided in the middle at the tops. These Flowers are of a lively deep red color, almost like the Single Red Rose Campion, but with a paler red Circle at bottom, set in green Husks, smaller at bottom and larger at head, in which (after the Flowers are past) there grows small Seed, and of a brownish color.

VIII. The Places. These Plants, says Gerard, grow wild in the West of England, among Corn: But they are also nursed up in Gardens, merely for pleasure sake, more than for any Virtues they are hitherto known to possess.

IX. The Times. They flourish and flower in the Summer Months; and they last not until near the Winter Season; and their Seed ripens in the mean while.

X. As to their Qualities, Specification, Preparations and Virtues, they may be refer'd, says Parkinson, to those of the other Wild Campions, whereunto they are likeliest in face, and outward appearance. But Gerard says, the Virtues of these Wild Williams are to be referred to the Wild Pinks and Gilliflowers.

CHAP. CXIII.

of CATS-TAIL.

I. THE Names. It is called in Greek, *Τύφη*: In Latin, *Typha*, and by some *Cestrum Alorionis*, as Dodonæus saith; by some *Typha aquatica*, or *Palestris*, to put a difference between it, and that kind of *Typha* which is among Corn, called *Typha Cerealis*: and in English it is called *Cats-tail*, from its soft downiness, and Reed Mace.

II. The Kinds. Authors say it is a mean between the Rushes and the Reeds; and is threefold, 1. *Typha maxima*, The greater, or greatest *Cats-tail*. 2. *Typha minor*, The lesser *Cats-tail*. 3. *Typha minima*, The least *Cats-tail*.

III. The Descriptions. The first of these has a Root which is white, somewhat thick, hard, knobby, jointed, spreading much in the Water, full of many long Fibres, and sweet in Taste, if it is chewed; of good use to burn, where there is plenty of it: From this Root shoots forth several very long, soft and narrow Leaves, pointed at the Ends, in a manner three square, because the middle on the back side is great, and sticks much out. Among which Leaves rise up divers smooth, round, and taper Stalks, stuf-

fed

led with a white Pub, and not hollow, near a Man's height, with Joints and Leaves on them, from the lower part upwards a good way, but bare and naked from thence to the top, where they have small, long, and round heads, shewing forth at first some yellowish flowers, which being past, the Torch-head or Spike grows greater, and consists wholly of a Downy substance, of a blackish brown, and sometimes of a reddish brown color on the outside, and whitish within; somewhat solid or weighty, which yet is in time blown away with the Wind.

Reed
Cau taile

Or Reed
Mace.

Cats-tail.

IV. The second differs nothing from the former, but in this, that it grows not so high, nor great, the heads being also less than them of the former.

V. The third differs not from the second, but in being smaller than it, in both Leaf and Stalk, which are more hard and rough; and in the head or top, which in some places bears a smaller spike above, the lower being greater, with a small distance between them, and a small Leaf at bottom of it.

VI. The Places. They grow in Pools and standing Waters, and sometimes in running Streams, as also in the middle of watry Ditches or Ponds, and by their Banks and Sides in many places of this Kingdom. Gerard says, he found the smaller sort growing in Ditches and Marshy Grounds in the Isle of Shepey, going from Sherland-House to Feverham. I have also found them growing in many places in the Fens, and in Moist and Standing Waters in Fenny Grounds in Cambridge-shire, and the Isle of Ely. And in the South part of Carolina, at the head of Stono River, in the Matthes near the New Cut leading into Wad-wadmalaw River, which are overflowed with every Tide, I have found them growing plentifully.

VII. The Times. They flower in June and July, and their Heads, Torches or Maces, are ripe in August; but the Down hardly flies away till the end of August, or Month of September.

VIII. The Qualities. They are cold and dry in the first Degree: Astringent, and very Styptick, Alterative, and Analeptick.

IX. The Specification. The Down is a Specifick to stop the bleeding of External Wounds.

X. The Preparations. You may have, 1. The Down. 2. A Powder of it. 3. A Cataplasm.

The Virtues.

XI. The Down it self. Applied dry to bleeding Wounds, it presently stops their bleeding: applied to running ulcerated Kibed Heels, it quickly cures them; so also used to moist Sores, and running Ulcers, it dries almost to a Miracle, incarnates and heals. In the Fen Countries it is sometimes used to make Beds of, for poor People to lye on. And mixed with Butter, as a Bait for Rats and Mice, it kills them by choking them.

XII. The Powder of the Down. Matthioli says, it is good to help the burstenness or Ruptures of Children, wherein the Intestines fall down into the Cods. This others contest against, as being dangerous to be taken inwardly, as being rather fit to strangle than help them, because it choaks Rats and Mice. But this latter opinion I think to be an Error, for as it is used to choak and kill Rats and Mice, it is used Whole, and not in the Powder, whereas, if it is reduced to a very subtil Powder, as Matthioli orders it, it can no ways be able to effect any such thing. This Powder may be given, says Gerard, mixed with Powder of Betony, Roots of Gladiol, and Leaves of Horsetongue. This is to be mixed with the Yolk of an Egg, and so eaten; it is (says he) a most perfect Remedy against Ruptures in Children, and must be Administred every Day fasting, for thitty Days together, one dram at a time: it not only helps Children and Striplings, but grown Men also, if in time of their Cure they use convenient Ligatures or Trussings, and fit proper Emplasters upon the grieved place, according to Art; thus be. For my part I have had no Experience hereof, and therefore can say but little to it, having, I confess, not much Faith in the Prescription, yet think it not of such a dangerous consequence, as some would have it; nor have I any great opinion of any Internals, given for this kind of Rupture, for that those Medicaments passing through the Intestines, can never come actually to the part where the Wound is, and so can do little in order to the Cure.

XIII. The

XIII. The Cataplasm. Made into a Cataplasm with Hogs Lard, it is said to heal Burnings and Scaldings with Fire or Water.

XIV. The Leaves are usually kept to make a fine sort of Mats of, and other like purposes.

CHAP. CXIV.

Of CARROTS, Garden.

I. **THE Names.** It is called in Greek, Σμαρκις, & παρκις δις: In Latin, *Staphylinus*, *Staphylus Hortensis*, and *Pastinaca tenuifolia Hortensis*: In English, Carrot, and Garden Carrot.

II. **The Kinds.** Carrots are either Garden or Wild. The Garden, are, 1. *Pastinaca tenuifolia sativa lutea*, Yellow Garden Carrots. 2. *Pastinaca tenuifolia altera sativa atro-rubra*, Red Garden Carrots.

III. **The Description.** The Yellow Carrot has a large long Root, great or thick, and yellow, big above, and small pointed below, without any Fangs or Twines, of a pleasant sweet Taste, and therefore generally spent for Food. From this Root spring forth several long Leaves, and well spread, made up of many thin, cut, deep, green Leaves, divided into many parts: among which rises up a round Stalk, a yard, or more, high, bearing large Tufts of Umbles of white Flowers, which crowd close together, and spread not much, but turn into small whitish rough hairy Seed, sticking one to another.

IV. The Red Carrot has a Root round and long, thick above and small below, running to a point at the other, and differs from it only in the color, which

is wholly red quite throughout: From this Root rise many winged Leaves, much cut and divided into many other Leaves; and these cut again, and divided into many parts, of a deep green color like the former; some whereof in Autumn will turn to be of a fine Red or Purple; (the beauty of which makes several Persons many times to gather the Leaves, to stick them in their Hats, or Heads, or Bosoms, or pin them on their Sleeves instead of Feathers) from among which Leaves rises up a Stalk, bearing many Leaves likewise upon it, but not so high as the Parsnip, being about a yard high, bearing many Tufts or Umbles of white Flowers, which turn into small rough Seed, seeming as if it were hairy, and smelling gracefully enough, if rubbed between the Fingers. In a word, the whole Plant differs very little from the former, except in the redness of the Root.

V. Now here is to be noted, 1. That the Yellow Carrot is of two sorts, viz. The long and the short. One of the long sorts is of a pale yellow, and this has the greatest and longest Root, and likewise the greatest head of Green: this for the most part is the worst sort of Carrot, not being so sweet and firm as the other. The other long sort is of a deep Gold yellow color, having a smaller head of Green Leaves upon it, and this is always the best and sweetest. Parkinson says, that yellow Carrots, by sometimes sowing themselves, do oftentimes make their Roots become White. The short Roots are also divided into pale and deep yellow, or Golden color. 2. That the red Carrots, besides those which are red quite throughout, there is another, whose Root is red without for a pretty way inwards, but the middle is yellow.

VI. **The Places.** They are only Sown in Gardens, or other manured Fields, chosen and fitted out for that purpose, and delight to grow in a Sandy and light ground, that their Roots may the more easily pierce deep downwards, which in a stiff clay ground they cannot so well do.

VII. **The Times.** They are to be sown in March and April, the first year they only strike down their Root; and the year following they bring forth their Flower and Seed. In Carolina I saw a Carrot above four years old, which brought forth its ripe Seed in the fifth year: The reason thereof I conceive to be, because the Master of the House cut off every year its green Tops, that it might not Seed, whereby the Root grew very great, as also the green head the fifth year; which was four or five times as big as any ordinary Carrot head: This head he let stand for Seed, and it produced him an incredible quantity thereof, very fair, and nearly twice as large as ordinary Carrot Seed.

IX. **The Qualities.** The Seed is hot and dry in the first Degree, Aperitive, Discussive, Diuretick, Carminative, Stomackick, Nephritick, Hysterick, and Alterative: The Roots are Sweet, Flatulent, Analeptick, and Spermatogenetic.

X. As to their Specification, Preparations and Virtues, they are the same with those of the Wild Carrot, treated of in the next Chapter, to which we refer you; but with this note, that these Garden Kinds are nothing near so strong and powerful as those of the Wild Kinds, the Seeds of both being chiefly used in Medicine: As for the Roots, the Garden Kind a thousand fold exceed the Wild for Food, not only for the pleasure of Eating them, but also for their Analeptick or Nourishing faculty.

CHAP. CXV.

of CARROTS, Wild.

I. **THE Names.** It is called in Greek *Σαπυλίσκος* : In Latin, *Pastinaca tenuifolia Sylvestris*, by Matthioli, and others ; *Pastinaca Eratica*, by Fuchsius, Cordus, and Tabernmontanus : *Staphylinus Sylvestris*, by Tragus and Casalpinus : *Daucus agrestis*, by Galen, in libro de Alimentis, (and yet truly it is no *Daucus* :) *Daucus Vulgaris & Officinarum*, by Lobel and Clusius : and in English, *Wild Carrot*, and *Birds-nest*.

II. **The Kinds.** We shall only describe two Kinds, viz. 1. *Pastinaca tenuifolia Sylvestris Anglica*, The English Wild Carrot. 2. *Pastinaca tenuifolia Sylvestris Germanica*, The German Wild Carrot.

III. **The Descriptions.** The first of these has a Root, small, long, and hard, and therefore unfit for meat, being somewhat sharp and strong : from this Root rise up Leaves, in a manner altogether like the Garden kinds, but that they are somewhat whiter and rougher, or more hairy, and so are the Stalks likewise, which bear large spiked tufts of white Flowers, with a deep purple spot in the middle, part being hollow and low, the outward Stalks rising higher, all which are so crowded or contracted together, as makes the whole Umbel shew, when the Seed is ripe, like unto a Birds Nest, for which reason it has been called by some Birds Nest, not much unlike to the Flowers of the *Gingidium verum*.

IV. **The German Wild Carrot** has a white Root, which is often a Foot long, sometimes single, and sometimes divided into two or three parts, not much unlike in Taste and Smell to Parsley Roots, but better in the Mouth for a long time. From this Root rises up a Stalk half a yard high, as thick as ones little Finger at the bottom, being something round, but plainly crested or cornered, very hairy, and full of joints, at which come forth large crested Branches of winged Leaves, encompassing the Stalk at bottom, a

foot in length, and divided into several Leaves, and they again into other smaller parts, very rough and hairy also, and of a yellowish green color, from between which Leaves and Stalks at the Joints, come forth other crested Stalks, and the like Leaves at their Joints, but lesser, which do very much resemble our Garden Carrot Leaves, but that they are larger and fester, if one does handle them hard, but rough on the back and edge, being gently touched.

From every one almost of these Joints, both of the Stalk and Branches, arises a certain long husk, consisting of six small long Leaves, close set together, which when it opens, shews forth a small Tuft, or close Umbel of white Flowers, and sometimes yellowish, and a little sweet ; after which follows a roundish Seed, two always joined together, and very prickly on the back side, the inner side being flat, and more yellow than Carrot Seed, otherwise much like to it.

V. **The Places.** The first grows plentifully in England by the field sides, and in untilled places, almost every where ; the other grows in like places in Germany, but with us is sometimes nursed up in Gardens, where it grows very well.

VI. **The Times.** They flourish and flower in June and July, and the Seed is ripe in August.

VII. **The Qualities.** The Seed and Root are hot and dry in the second Degree : Aperitive, Absterfitive, Discurfitive, Carminative, Diuretick, Sudorifick, Cephalick, Stomackick, Nephritick, and Hysterick ; Alterative, Alexipharmick, and Spermatogenetick.

VIII. **The Specification.** Both Seed and Root are Lithontripticks, and good against the bitings of Venomous Beasts, Wind, and rising of the Mother.

IX. **The Preparations.** From Seed and Root, singly, you may have, 1. A Powder. 2. A Decoction. 3. A Spirituous Tincture. 4. An Acid Tincture. 5. An Oily Tincture. 6. A Saline Tincture. 7. A Spirit. 8. A Fixed Salt.

The Virtues.

X. **The Powder of the Root or Seed.** It expels Wind, and eases Stitches in the side, provokes Urine and the Terms, and helps to break and expel the Stone. Dose one dram in White Wine.

XI. **The Decoction of Root or Seed.** If it is made in White Port Wine, it has all the Virtues of the Powder, and is peculiarly good against the Dropfie, and such whose Bellies are swollen with Wind. Dose six or eight ounces, Morning, Noon and Night, it induces the Terms, provokes Lust, and facilitates the Delivery of Women in Labour.

XII. **The Spirituous Tincture.** It has the Virtues of both Powder and Decoction, but is a singular thing against the Cholick, and good to help Conception. Dose one spoonful, Morning and Night, in a Glass of generous Wine.

XIII. **The Acid Tincture.** It is good against Stone and Gravel in both Reins and Bladder, and is very powerful to resist Vapors and Hysterick Fits, as also to cure the bitings and stings of Venomous Creatures : and *Dioscorides* saith, it is so powerful, that if it is taken beforehand, their bitings shall not hurt. Dose forty or sixty drops in Wine.

XIV. **The Oily Tincture.** It opens Obstructions of the Reins and Urinary Parts, eases Pains, and cures weaknesses of the Back and Loins, provokes Urine, and the Courses. Dose twenty drops.

XV. **The Saline Tincture.** Outwardly bached withal, it draws forth the Poison and Malignity of Venomous Creatures, takes away Scurf, Morpew, and Sun-burnings, as also other deformities of the Skin:

Skin : and being taken inwardly to one dram, it provokes Urine, and prevails against the Dropſie.

XVI. *The Spirit.* It comforts the Head, Stomach, Heart and Womb, refits Poiſon, and the Plague, expels Wind, and gives eaſe in Pains and Stitches of the Side. Doſe one ſpoonful.

XVII. *The fixed Salt.* It provokes Urine powerfully, and expels Sand, Gravel, and other Tartarous matter from the Reins, Ureters and Bladder : it powerfully opens and cleaſes, and given from a ſcruple to half a dram, or more, in a ſpoonful of Juice of Limons, it ſtops Vomiting, and admirably ſtrengthens the Stomach.

XVIII. *The green Leaves.* Dioſcorides and Galen both ſay, that the Leaves being appli'd with Honey (I ſuppoſe in form of a Cataplaſm) to running Sores or Ulcers, do cleaſe them.

CHAP. CXVI.

of CARROTS of Candy.

I. **T**HE Names. It is called in Greek, *Δαυκός* : In Arabick, *Dauco*, and *Giezar* : In Latin alſo *Daucus*, *Daucum*, and *Daucium*, and *Daucus Creticus* : In Engliſh, *Daucus*, and *Dauke*, and *Candy Carrots*.

II. *The Kinds.* Parkinson makes ſixteen kinds of *Daucus's*, many of which are nothing to our purpoſe : Thoſe which we are chiefly to treat of in this Chapter, are the *Candy* or *Cretick Kinds*, which Dioſcorides makes to be three, viz. 1. *Daucus Creticus* verus Dioſcoridis, The true *Daucus* of *Candy*. 2. *Daucus Selinoides*, The *Parsley* Leav'd *Daucus*. 3. *Daucus Coriandri foliis*, *Daucus tertius* Dioſcoridis Bello, *Coriander* Leav'd *Daucus*, or *Bellus* his third *Daucus* of Dioſcorides. 4. To theſe we think good to add a ſecond kind of the *Daucus Selinoides*, which is *Daucus Selinoides maxima*, The greateſt *Parsley* Leav'd *Daucus*.

Daucus. or
Wild Carot of *Creet.*

III. *The Descriptions.* The True *Daucus* has a Root ſmall, long, and white (leſſer ſays Gerard, than the Root of a *Parsnip*, which is of a fragrant ſmell, and almoſt as quick and ſharp in Taſte as the Seed, but will not abide our Winters here in England, without the ſkill we can uſe, ſo that we are forc'd to ſow

it anew every Year. From this Root riſe up ſeveral Stalks of Winged Leaves, as finely cut as *Fennel*, but ſhorter, ſet at diſtances one againſt another, of a whitish or hoary color, ſmelling a little ſweet. From among which riſe up divers ſlender Branches or Stalks a Foot high, bearing at their Tops ſmall Umbles of white flowers, and after them ſmall hoary grayiſh Seed, ſomewhat long and round, and of a ſharp or quick Smell and Taſte.

IV. The ſecond *Daucus* has a Root ſomewhat great, thick, long and white, with a buſh of hairs at the Head, as many other Umbeliſerous Plants have, and of a hot and ſharp taſte, as the Seed alſo is ; from whence riſe up large Stalks of ſomewhat broad pale green Leaves, bigger than *Parsley*, and with diſpoſitions of the ſame ſuſion and manner, next the ground : And alſo large Stalks almoſt two feet high, with the like Leaves at the Joints, but ſhorter ; and at the tops ſpokie rundles of white flowers, which turn into long creſted Seed, bigger than ordinary *Fennel* Seed, and of a yellow brown color.

V. The third *Daucus* of Dioſcorides, according to *Honorius Bellus* his account, has a Root great, thick and ſhort, perishing yearly. The whole Plant is Aromaticall, and both Root and Leaf are eaten by the *Cretians* as a common Sallet Herb. From this Root ſpring ſeveral Stalks of fine cut Leaves, not much unlike to the Leaves of *Coriander*, but leſſer and thicker. The Stalks are near two feet high, with great and ſwollen Joints, (and therefore called by ſome *Setili* nodofum, knotted Hartwort, but by *Bauhinus*, *Daucus Criticus* nodofus *Umbella lutea*) and ſmaller Leaves at them, at the tops whereof grow yellow Umbles of flowers (but white with us in England) which being paſt away, there comes much Seed, larger than that of *Fennel*.

VI. The fourth *Daucus*, which is the large or largeſt kind of the *Parsley* Leav'd, has a Root ſometimes as large as ones Arm, or being young, of the bigneſs of ones Thumb, parted into ſeveral Branches at the bottom, and covered with a rugged black Bark, of a Viſcous taſte at the fiſt, but ſharp afterwards, ſo as to cauſe ſpitting, having at the top many hairy Heads, from whence come ſeveral very large, and great Winged Leaves, much divided and denied about the edges, much about like the laſt, but bigger, and of a pale or ſaint green color, a little ſhining on the upper ſide, and of a greyiſh aſh-color underneath. Among theſe Leaves riſes up, a large, great, creſted Stalk, of a Fingers thickneſs, with ſome Joints, and Leaves at the Joints, and with Branches alſo between them : at the tops whereof ſtand ſmall Umbles of whitish flowers, and ſomewhat like Seed to the ſecond kind, but larger.

VII. *The Places.* *Candia* is the Natural place of their Growth, but with us in England they are only nourished up in Gardens. The fiſt has been found upon ſeveral Mountains of Germany ; and upon the Hills and Rocks of *Jura* near Geneva, from whence it has been tranſported into ſeveral of our more Northern Regions.

VIII. *The Times.* They flower in June and July, ſome earlier, ſome later ; and their Seed is ripe in Auguſt ; ſome of it ripening in the time of flowering.

IX. *The Qualities.* The Seed and Roots are hot and dry in the third Degree ; the Herb ſcarcely exceeds the ſecond Degree of heat, and therefore is leſs powerful. They are Aperitive, Attractive, Digeſtive, Carminative, Diuretick, Cephalick, Stomacktick, Nephritick, Hyſterick, Lithontriprick, Alterative, Alexipharmick and Spermatogenetick.

X. *The Specification.* It is chiefly dedicated to the Strangury, Stone, and ſtoppage of Urine.

XI. *The Preparations.* You may make theſe of

1. *A liquid Juice of the Herb and Root.* 2. *An Effence of the same.* 3. *A Powder of the Seed.* 4. *An Infusion of the Seed.* 5. *A Decoction of Seed or Root, or both.* 6. *A Cataplasm of the Herb and Root.* 7. *A Distilled Water.* 8. *A Spirituous Tincture.* 9. *An Acid Tincture.* 10. *An Oily Tincture.* 11. *A Saline Tincture.* 12. *A Spirit.* 13. *A distilled Oil.* 14. *Potestates or Powers.* 15. *An Elixir.* 16. *A Salt.*

The Virtues.

XII. *The liquid Juice of the Herb and Root.* It helps the Strangury, provokes Urine, and the Terms, and expels both Birth and After-birth, and is good for those who have been bitten by the *Phalangium*, or any other Venomous Beast. Dose four spoonfuls in Wine.

XIII. *The Effence.* It has all the Virtues of the liquid Juice, and is stronger, finer, and a much more noble Medicine: It prevails against Vapors and Hysterick Fits, as also the malignity of the Plague, or Pestilence. Dose one or two ounces in generous Wine, Morning and Night, or three or four times a Day, as the necessity or extremity may require.

XIV. *The Powder of the Seed.* This (according to Authors) has that powerful heat in it, that it becomes a principal Medicine to help the Strangury, to ease the pain, and remove all stoppages of Urine. It provokes the Terms, facilitates the Delivery, and brings away the Dead Child, and After-birth, and helps Vapors and Hysterick Fits. Dose one dram, to one dram and half, in a Glass of White Port Wine, Morning and Night, and in time of a Paroxysm.

XV. *The Infusion of the Seed in Wine.* It has all the Virtues of the Powder, but I fear not full out so effectual. Dose half a Pint, Morning, Noon, and Night.

XVI. *The Decoction of Seed, or Root, or both.* It ought to be made in White Port Wine, and so given to drink, two, three or four times a day, half a Pint at a time: It has the Virtues both of the Effence, and Powder of the Seed; and a most famous thing against the Plague, the Patient being put to Bed, well covered, and so made to Sweat upon it.

XVII. *The Cataplasm.* The Herb, but more especially the Roots made into a Cataplasm, by beating in a Mortar, and so mixed with Hogs Lard, and applied, does ease, disperse, or assuage Tumors or Swellings in any part. Made into a Mixture or Cataplasm with Honey, and applied to the Throat, it eases an Inveterate Cough.

XVIII. *The Distilled Water.* It prevails against Stone, Gravel, Sand, Strangury, and all stoppages of Urine, but is weak, in respect to the Juice, Effence, and other more noble Preparations of the Plant, and therefore is only used as a Vehicle to convey other Preparations of the same in.

XIX. *The Spirituous Tincture.* It is an excellent thing against the Plague or Pestilence, and against all other malign Fevers, as Purples, Spotted Fever, Measles, Small Pox, and Fevers derived from the bitings of Serpents, as Vipers, Rattle Snakes, and others of like kind: It provokes Sweat gently, and defends the Heart after an admirable manner. Dose two, three, or four drams in the Distilled Water, or rather in Wine, or some other fit Vehicle.

XX. *The Acid Tincture.* It has all the Virtues of the Spirituous Tincture, and if the Fever is very high or intense, is much the better Medicament; besides the Acid, destroys the Malignity much more powerfully. Dose to one dram, or more, in the Distilled Water.

XXI. *The Oily Tincture.* In an extremity of the Strangury this is the most powerful Preparation, being given to thirty drops, or more, in a Glass of White Port Wine: It is powerful to disperse Gripping Pains, and Torments of the Bowels, to facilitate the Birth, and bring away the Dead Child: It eases Convulsions, and heals Wounds in the Body or Bowels.

XXII. *The Saline Tincture.* It cleanses the Reins and Urinary Passages, being taken to one dram, or more, in White Wine; but heals not like the Oily Tincture. It digests humors, and provokes Urine, and the Terms in Women.

XXIII. *The Distilled Oil of the Seed.* It has all the Virtues of the Juice, Effence, Powder of the Seed, Decoction, Spirituous, Acid, and Oily Tinctures: and therefore may be given from eight drops to sixteen, being first dropt into Sugar, and then mixed with the Distilled Water, or some other fit Vehicle: It helps the Strangury upon the spot, cleanses the Reins of all Tartarous Matters, and all other the Urinary Parts, provokes the Terms, resists Vapors, and Hysterick Fits, eases the Cholick, produces the Birth, expels watry Humors in Dropfies, and resists the Poison of Mad Dogs, or any other Venomous Creature; and cures intolerable Pains of the Stomach proceeding from Cold, Weakness, and other like disaffections.

XXIV. *The Potestates or Powers.* They have all the Virtues of the Oil, and are also more subtil and penetrating, and more pleasant to be taken, being more easily mixed with Wine, or any other potable Liquor. Dose from two to four drams.

XXV. *The Elixir.* This is yet more excellent and noble than the Powers, being the Tincture of the Seed or Root extracted by the sublimity of the Potestates; by which you have all the noble parts of the Plant concentrated in one Medicament: and so has all the Virtues of the Juice, Effence, Powder, Tinctures, Oil, and Potestates, in the highest exaltation. Dose one dram to two drams in a Glass of Wine, Morning and Evening.

XXVI. *The fixed Salt.* It is strongly Diuretick, strengthens the Stomach, being given in the Acid Tincture, mixed with the Distilled Water, or some other fit Vehicle. Being taken for some time in White Port Wine, it destroys all Præternatural Acids, in what part of the Body soever, and dissolves the Stone, if it is of a gritty, friable, or brittle substance. The Dose is from a scruple to half a dram, or two scruples, Morning and Evening.

C H A P. CXVII.

of CARAWAY.

THE Names. It is called in *Arabicke*, *Karvia*, *Karavia*, and *Carvi*: In *Greek*, *καριον*: In *Latin*, *Carum*; also *Carui*, as the Apothecaries call it: *Simon Sethi* calls it *Carnabadiou*: It took its name from the Countrey of *Ciria*, from whence it came: Some call it *Caræum*, some *Carvum*, as in the Shops: and in *English*, *Caraway*.

II. *The Kinds.* We shall here enumerate but two Kinds, 1. *Carum Vulgare*, our Ordinary or Common Caraway. 2. *Carum pratense*, Meadow Caraway.

III. *The Descriptions.* The first has a Root whitish, small, and long, somewhat like unto a Parsnep, but with a more wrinkled Bark, and much less, having a little hot, and quick taste, stronger than a Parsnep.

Parsnep, and abiding after Seed time. Gerard says, the Root is like that of Parsley, white, and in taste like unto a Carrot, and (says he) may be sodden, and eaten as the Parsnep or Carrot is. From this Root spring up divers Stalks of fine cut Leaves, lying on the Ground, somewhat like to the Leaves of Carrots, but not bushing out so thick, of a little quick taste in them. From among which rises up a square Stalk, not so high as the Carrot, at whose Joints are set the like Leaves, but smaller, and finer cut; and at the tops there are small open Tufts, or Umbles of white Flowers, which turn into small blackish brown Seed, smaller than the Anniseed, and of a quicker and hotter Taste.

Caravaies.

IV. The second has a Root small and slender, of a Smell not much unlike to Daucus, but of a hot and sharp Taste, yet not so hot and sharp as the Seed; from this Root grows Leaves like the former, but larger; and from among those Leaves, come forth Stalks greater and higher than the Common Kind. The spoke Umbles of white Flowers are in like manner larger, and the Seed like unto Cummin Seed, but much bigger.

V. The Places. Caraways grow naturally in Caria, as Dioscorides saith, whence came the name: now they are found to grow almost every where in Germany, as Tragus says, in many places in the Fields, and by the Way sides; as also in Meadows, and in the fat and fruitful Fields of Bohemia, and likewise in low grounds, which are now and then over run with Water; but with us they are usually sown in Gardens, where they prosper admirably.

VI. The Times. They Flower and Seed from May, and continue so till the end of August.

VII. The Qualities. Caraway Seeds are hot and dry, as Galen says, almost in the third Degree. They are Aperitive, Carminative, Digestive, Discurfitive, Diuretick, Cephalick, Neurotick, Stomatick, Nephritick, Alterative, and Alexipharmick.

VIII. The Specification. They powerfully expel Wind, and ease Pains of the Cholick.

IX. The Preparations. You may have, 1. The Root. 2. The Herb. 3. The Seed. 4. A Juice of Herb and Root. 5. An Essence of the same. 6. A Decoction of the Seed. 7. A Powder of the Seed. 8. A Cataplasim of the Herb. 9. A Distilled Water of the whole Plant. 10. A Spirituous Tincture. 11. An Acid Tincture. 12. An Oily Tincture. 13. A Spirit. 14. A Distilled Oil. 15. Potestates, or Powers. 16. An Elixir.

The Virtues.

X. The Root. Parkinson says, that it is better Food than that of the Parsnep, and is pleasant, and comfortable to the Stomach, helping Digestion.

XI. The Herb. Being dried, and made into Powder, and strewed upon moist and running Sores and Ulcers, it dries them up, and in short time after heals them; it also heals Kibes in Childrens Feet.

XII. The Seed. It is used whole in Bread, Cakes, Apple Pies and Pasties, to give a relish to them, and to add a stomatick and warming Quality, in room of Spice; also to be made into Comfits to correct the Wind in the Stomach. Being bruised, fried, and laid hot in a Bag, or double Cloth, to the lower parts of the Belly, it disperses the Wind, and eases the pains of the Cholick.

XIII. The Juice of the Herb and Root. It is prevalent against Wind, and all cold Diseases of the Head, Nerves, Stomach, Bowels, Womb and Joints: gives ease in the Cholick, and griping of the Guts; represses Vapors, and Hystrick Fits, and provokes Urine. Dose two ounces in Wine.

XIV. The Essence. It has the Virtues of the Juice, but more efficacious in opening Obstructions of the Reins, Ureters and Bladder, and expelling Tartarous matter from those parts. It prevails against the Cholick, and all Distempers of the Bowels proceeding from cold and moisture.

XV. The Decoction of the Seed. It has the Virtues of the Juice and Essence, and is very good for such as have the yellow Jaundice, and Virgins troubled with the Green-sickness, and such as are daily afflicted with Wind in the Stomach and Bowels. It ought to be made in Wine, and may be taken to half a pint at a time sweetened with White Sugar.

XVI. The Powder of the Seed. Taken to one dram, daily Morning and Night, mixed with fine Loaf Sugar, it has been found to sharpen the sight, to expel Wind, and help a bloody Flux, and other fluxes of the Bowels, though they have been of a long standing. And by the constant use thereof, a periodical Cholick has been often cured.

XVII. The Cataplasim. Made of the Powder of the Seed with White Bread and Sherry Wine, it dissolves flatulent Tumors or Swellings, eases pains in any part proceeding from Cold, comforts and strengthens weak Limbs, and takes away the black and blew spots of Blows, Bruises, and the like. The same laid as hot on as can be endured to the lower parts of the Belly, gives ease in the Cholick.

XVIII. The Distilled Water of the whole Plant. It is only used as a Vehicle to convey Stomatick and Carminative Medicaments in, down into the Body.

XIX. The Spirituous Tincture. It is good against Lethargies, Carus, Vertigo, Apoplexy, Palsie, Fainting, and illness of the Stomach, sickness at Heart, swooning Fits, Convulsions, coldness and weakness of the Nerves, and all those other Diseases for which the Essence is proper. The Dose is half a spoonful

in a Glass of Wine, Morning, Noon and Night, in all cold and moist Constitutions.

XX. *The Acid Tincture.* It admirably helps Digestion, creates a good Stomach, repulses Vapors, and is good against Fits of the Mother. Dose thirty or forty drops in any Liquor the Patient drinks, or in a Glass of Wine two or three times a day.

XXI. *The Oily Tincture.* It is Diuretick, eases pains of the Back and Reins, being taken inwardly to twenty or thirty drops in any proper Vehicle: outwardly bathed upon the part, it gives ease in Pains of the Gout, proceeding from a cold Cause; and is eminently good against Cramps in any part, Convulsions, and the Palfie, if it be well anointed on the Paralytick part before a good fire, and rubbed in for an hour together, and so continued daily for twelve, fifteen, or twenty days, till the Patient finds he comes to the feeling strength, and use of his Limbs, &c.

XXII. *The Spirit drawn from the Seed.* It revives the Spirits, cheers the Heart, comforts Nature, repulses Melancholly, warms and strengthens a cold Stomach, and is good against Fainting and Swooning Fits. Dose half an ounce, or more, at a time, being dulcified, upon occasion.

XXIII. *The Distilled Oil from the Seed.* It has all the Virtues of the Juice, Effence, Decoction, Powder, Tinctures and Spirit, but much more powerful to all the said purposes and intentions. Dose from eight to sixteen drops, dropt into Sugar, and then dissolved in any proper Vehicle the Patient likes best, and is also agreeable to the Medicament in resisting the Disease.

XXIV. *The Powers.* They have all the Virtues of the Oil, but much more subtil and penetrating, and more pleasant and easie to be taken by delicate and weak Stomachs. Dose two or three drams in a Glass of generous Wine, Morning and Night.

XXV. *The Elixir.* It provokes Urine, (having all the Virtues of the Spirit, Tincture, Oil and Powers exalted) and breaks the Stone, if it is soft and gritty, expelling Gravel, Sand and Tartarous Matter from all the Urinary Vessels. It opens Obstructions of the Liver and Spleen, cleanses the Blood from corrupted Humors, and is commended against the Catarrhia, or evil disposition of the whole Body, arising from a cold, moist, and watry habit of the same; and therefore, in the going off of a Dropsie, when the Bowels are much weakened, and the Tone of them extremely hurt, it so comforts and strengthens them, as to make the Body to withstand the return of the Disease, into which if the Patient should Relapse, it is generally fatal. The Dose is half a spoonful in Sherry, Canary, or Madera Wine.

CHAP. CXVIII.

CENTORY the Greater.

I. **THE Names.** It is called in Greek, *Karmieuon* *ῥιζα*: In Latin, *Centaurium majus*: of Theophrastus *Karmieuon*: and in English, Centory the Greater, or Greater Centory.

II. *The Kinds.* There are four Kinds of this Centory, 1. *Centaurium majus vulgare*, *Centaurium majus*, The Common Great Centory. 2. *Centaurium majus alterum*, The other Great Centory, or Whole leaved Centory. 3. *Centaurium majus Americanum*, or *Canadatum*, *Centaurium foliis Gynure*, *Centaurium Pyreneum*, The American Centory, with Artichoke Leaves. 4. *Centaurium majus luteum*, The great yellow Centory.

III. *The Descriptions.* The first of these has a Root which grows to be more than two feet long, and is large as a reasonable great Parsnep-root, blackish on the outside, and something of a reddish yellow within, abiding many years, and sending forth fresh Leaves every Spring, those dying for the most part which were green all the Summer; which Leaves are many, large, long, and soft, deeply cut in on the edges, of a pale green color on the upper side, and whitish underneath, without any thing of the great bitterness which is in the lesser Centory, which is no Species of this Plant. The Stalk is long and round, and three or four feet high, divided at the top into many Branches, on which stand large, round, scaly green heads, shooting forth at their tops, many small Threads or Thrums, of a pale blewish Ash-color. In which, after they are fallen, do grow, large, whitish, smooth, shining Seeds, not much unlike Thistle Seeds, but larger, and lying amongst a great deal of Downy Matter.

IV. *The second Great Centory* has a Root growing to be as great or greater than the former, and black on the out side, but yellowish within, yielding a yellowish red Juice, which is a little bitter, but more Aromatical than the former. From the head of this Root comes forth many Leaves lying almost upon the ground, which are long, and as large almost as the former, but without any jaggedness or division at all in them, yet deeply dented about the edges, and of a deep green color. The Stalk is round and great, but rises not up so high as the other does, nor divides it self at the top, into so many Branches, but bearing only two or three heads on a Stalk, which are scaly, in the same manner, and in it such like Thrums or Thready Flowers, of a pale whitish color, which being past, there comes such like Seed in the heads, lying in a Flocky or Downy Substance, and every one bearded in the same manner, but a little blacker.

V. *The third, which is the American, or Floridian Great Centory*, has a Root great and black on the out side, but longer than the first, and of the bigness of ones Wrist. It has larger Leaves than the first, and more jagged, or cut in deeply on the Edges,

Y 2 some

Junceus resembling an Artichock Leaf in the divisions, whence the name *Folius Cynaris*, green above, and gray, or as it were hoary underneath. The Stalk rises about a yard high, cornered and hoary, having several smaller Leaves, and less jagged, set thereupon, and parted at the top into some Branches, each bearing a few small Leaves, under the Heads, which are much greater, and more scaly, with sharp prickles at their ends, like a little Wild Artichock Head. The rest of Threads, which are the Flowers, are more purple, than in the first; and the Seeds are white, wrapped up in Down in like manner.

VI. The fourth, or Yellow Great Centory; has a Root which grows in time to be greater than any of the former, having many Heads which shoot forth new Leaves in the Spring, the old Leaves going away or dying upon the ground every Year, which is wrinkled, and black on the out side, and yellowish within, full of a viscous or slimy moisture, and striking deep into the ground, with some greater Branches, and a few small fibres. The new Leaves which this Root sends forth are both larger and longer from the Root than the others, some of the lowest having fewer divisions in them, than some others of them have; but those which grow upon the Stalk, as well as some of the others below, are very much divided into many parts, making every winged leaf to consist of fourteen or sixteen Leaves, the great rib in the middle between them being whitish, each for the most part set against another, with an odd one at the end, and every of them being narrow and long, without any dents on the edges, and of a whitish green color. The Stalks are manifold, round and strong, a little striated down length ways, each being divided into some other Branches, which bear scaly Heads greater than any of the others, and larger spread thrums in the middle, of a delicate pale, but lively yellow color, which continue in their glory and beauty for a long time, without decaying; but they seldom yield any Seed here with us in England, because that the scaly Heads are so full of moisture (as is supposed) which hinders the Seed to grow ripe therein; for if they are but a little pressed between the Fingers, there will issue out on all sides small clear drops of Water, almost of a Honey like Sweetness, and that not only at Noon-time of the Day, as Bauhin is pleased to say, but also at all other times of the Day, and not for one only time and no more, but often times, and every Day, as long as the Flowers are fresh, and not yet withered: but when it perfects its Seed, it is not much unlike to the Seed of the second kind, but a little lesser, blacker, and more shining.

VII. The Places. The first delights in a fat and fruitful Soil, and in Sunny Banks, full of Grasse and Herbs. The first and second grow upon the Alps, and Mount Baldus: Dioscorides saith, they grow plentifully in Lycia, Peloponnesus, Arcadia, &c. The third grows upon the Pyrenean Hills, and upon stony Hills near Lisbon in Portugal, near the River Tagus: It has also been found to grow in America, upon the Floridian Continent, near Canada, New England, Virginia, and parts adjacent to them. The fourth not far from Lisbon, near the Tagus, and also on Mount Baldus, as Pena saith: With us, they are only nourished up in Gardens, where they thrive and flourish very well.

VIII. The Times. They all Flower about the end of June, and in July, and the Roots may be gathered in Autumn. The American seldom Flowers with us, because of the coldness of our Climate, nor does it live, unless with much care.

IX. The Qualities. It is hot and dry in the third Degree. It is Aperitive, Absterfve, Astringent, Digestive, Discurfve, Incarnative, Anodyn, and Traumatick, or Vulnerary. It is dedicated to the Sto-

mach, Lungs, Liver, Spleen, Reins and Womb: It is Alterative, Alexipharmick, and Hemopock.

X. The Specification. It is a noble Wound Herb: Pliny and Theophrastus set it down among the number of Panacea's, All-heals, or Wound Herbs, this Great Centory, (as also the Lesser, of which in the next Chapter.) Pliny, lib. 25. cap. 4. reciting the words of Theophrastus, says, that they were found out by Chiron the Centaure, and that from thence they were called *Centauria*: and in cap. 6. he repeats and affirms again the same thing, and thereupon, he saith, they were both named *Chironia*, though in truth they, viz. the Greater and Smaller, are no Kin one to another, not being Species of the same Genus, and so have no relation but only in name. It is reported, that Chiron was cured herewith of a Wound in his Foot, which was made with an Arrow, which fell upon it, when he was entertaining Hercules in his House, upon which it was called *Chironium*: or else from the curing of the Wounds of his Soldiers, for the which Intention it is most excellent.

XI. The Preparations. The Roots and Herb are both used, but the Root chiefly: and from them you may prepare, 1. A liquid Juice. 2. An Essence. 3. An Infusion. 4. A Decoction. 5. A Powder. 6. A Balsom. 7. An Ointment. 8. A Cataplasme. 9. A Spirituous Tincture. 10. An Acid Tincture. 11. An Oily Tincture: all made from the Root.

The Virtues.

XII. The liquid Juice. Being taken to two or three ounces, or more, Morning and Evening, opens Obstructions of the Liver and Spleen, and prevails against the Dropie and Yellow Jaundice, stops spitting of Blood, and is prevalent against Ruptures, Cramps, and Pleurifies, and for those who have an old and continued Cough, or are short Winded, and can hardly draw their Breath.

XIII. The Essence. It has all the former Virtues, but more powerful to every Intention; besides which, this Preparation is profitable against Agues, eases the Cholick, and all sorts of Gripping Pains, both of Belly and Womb. It is also a singular Traumatick, for it heals all inward Wounds and Excoriations of the Bowels, and outwardly applied to Wounds, running Sores and Ulcers, it digests, cleanses, dries, and Disposes the same to a speedy healing. Dose two or three ounces in a Glass of generous Wine.

XIV. The Infusion. It is a weak thing compared with the former Preparation; yet being made in Wine, it opens Obstructions of the Viscera, and is good against the Jaundice, pains of the Pleura, or Stitches in the Side. Dose four or six ounces Morning and Evening.

XV. The Decoction. It is something more powerful than the Infusion, and is good for the same Diseases which that and the Essence are good against. Sweetned with Honey, or Sugar Candy, it is good against Wheefings, Hoarseness, Obstructions of the Lungs, shortness of Breath, and an inveterate Cough. It is good against the Strangury, or pissing by drops: and used as a Lotion, it cleanses Wounds, old Sores, and running Ulcers; and as a Gargarism, it cleanses and heals Cankers and Ulcers in the Gums, Mouth and Throat: being drank half a Pint at a time, it expels the malignity of Wounds made by the bitings or stinging of Venomous Creatures. Dropt into the Eyes it clears them, and sharpens the Eyesight.

XVI. The Powder. It has all the Virtues of the Juice, Essence and Decoction, being taken one dram, or dram and half at a time, Morning and Evening,

in Wine: besides which, being strewed upon moist, running Sores, it cleanses, dries, and heals them.

XVII. *The Balsam.* It heals Wounds at once or twice dressing: if they be contused, it digests them, cleanses and heals. Applied to foul, corrupted, rotten Sores, and old Ulcers, it digests them, cleanses, dries, and heals almost to a Miracle. Applied to the Gout, it draws the humor out through the pores of the skin, and so cures it.

XVIII. *The Ointment.* It is vulnerary, drying, and healing, good against burnings, scaldings, and fluxes of sharp Humors, which it represses by virtue of its Astringency, the Sore, Ulcer or Wound, being first wash'd with the Juice or Effence: then the Pouder of the Root being strewed upon it, and afterwards pledgets being dipt in the Ointment, and laid over all, with a *De Minio Emplaster* upon that to hold it on: by this means desperate old and running Sores and Ulcers have been suddenly and effectually cured.

XIX. *The Cataplasim.* It is an excellent Anodyn and Discussive, prevalent against flatulent Tumors: If it is made up into a Pessary with the Pouder of the Root, and put up the Womb, it provokes the Terms in Women, and educeth the Dead Child and After-birth.

XX. *The Spirituous Tincture.* It is good against Convulsions, Lethargies, Palsies, Cramps, Pains and Aches in the Limbs, as also in the Stomach and Belly, Colick, and all Diseases of those parts proceeding from Wind: Let it be taken inwardly three times a day, from two drams to four in any proper Vehicle: and outwardly, let it be bathed upon the part affected Morning and Evening, till health is recovered.

XXI. *The Acid Tincture.* It is good against Malignity, and the Poison of Pestilential Fevers: is good against the bitings or stings of Venomous Creatures; opens Obstructions of the Lungs, helps against Coughs, Colds, shortness of Breath, Wheezing, Hoarseness, &c. being taken in all that the Patient drinks, whether Ale, Beer, or Wine, so many drops at a time as may make the Liquor pleasingly sharp.

XXII. *The Oily Tincture.* It opens Obstructions of the Reins, Ureters and Bladder, is prevalent against the Strangury, pains and weakness in the Back, being taken from ten to twenty or thirty drops in White Port Wine twice a Day, viz. Morning and Night; and withal being bathed well in, upon the *Spina Dorsæ*, or Back Bone.

XXIII. *The whole Plant, as well Herb as Root,* is available in all sorts of Wounds, Sores and Ulcers, to digest, cleanse, dry, conglutinate, and heal them; and therefore are principal ingredients, and should be in all vulnerary Ointments, Balsams, Drinks, Lotions, and Injections, according to some of the foregoing prescribed Preparations, respect being had to the parts afflicted, and the way and Method of Application or Exhibition, whether Inward or Outward.

CHAP. CXIX.

of CENTURY the Lesser.

I. *THE Names.* It is called in *Arabick*, *Kantarian Sages*, and *Canturion Sege*, or *Sagir*: In *Greek*, *Κανταριον το μικρον*: In *Latin*, *Centaurium minus*, & *parvum*: Of some, *Centaurea*, *sebrifuga*,

from its Quality; *Fel Terra*, from its excessive bitterness. *Dioscorides* says, it was called *Limnæstion*; and *Pliny*, *Libadion*, because it loves to grow in moist places. It is thought to be that Plant which *Theophrastus* called *Leptophyllum*: In *English*, *Century the Lesser*, and *Lesser Century*.

II. *The Kinds.* It is no Species of the *Greater Century*, nor claims any the least Kindred with it, having no Relation in any kind, but only in the name, and therefore is *Genus* or General it self. It is six fold, as growing with us, viz. 1. *Centaurium minus vulgare flore rubente*, The Common Red Small Century. 2. *Centaurium minus flore albo*, White flowered Century. 3. *Centaurium minus luteum*, Small yellow Century. 4. *Centaurium minus luteum perfoliatum ramosum*, Branched through-leav'd Small yellow Century. 5. *Centaurium minus luteum non ramosum*, Small yellow Century, not Branched. 6. *Centaurium minimum luteum*, The very small, or smallest yellow Century.

III. *The Descriptions.* The first of these, which is our Common small Century, has a Root small and hard, perishing every year, from whence springs up for the most part, but one round and crested Stalk, about a foot high, or something more, branching out at the top into many Sprigs or Branches, and some also from the joints of the Stalks below. The Leaves are small, and a little roundish, very like unto *St. John's Wort*, but without any holes in them, as that has. The Flowers stand at the tops, as it were in a Tuft or Umbel, and are of a pale red color, tending to a Carnation. They consist of five, and sometimes of six, small Leaves, very like unto those of *Hypocyon*, opening themselves in the Day time, and closing at Night, after which come Seed in little short Husks, and in form like unto Wheat Corns. The whole Plant is of an exceeding bitter Taste.

IV. The second, with the White Flower, differs nothing from the other, as to the form, neither in Root, Stalk, Leaves, Height, Flowers or Seed, saving only in the color of the Flowers, which is White, as the other is Red; and the bitter taste is the same in its full Latitude.

V. The

Century yellow small

V. The third, which is the Small Yellow Century, is a little like to the second, and a little greater than it; the Leaves are also larger and broader, and broad at the bottom, but yet not so broad as to encompass the Stalk, as the next does: the Flowers are also a little greater, and yellow, which is the principal thing in which it differs from the last; and withal the whole Plant is not altogether so bitter.

VI. The fourth, which is the Through-leav'd Centaury, has a Root small and white, like the former, from whence comes some Leaves next the ground

like unto the former Centories, but somewhat greater. From this Root comes forth a Stalk, which sometimes spreads it self forth into many long Branches, from every one of the Joints; and sometimes it spreads it self only at top: At the Joints stand two somewhat broad and long pointed Leaves, so encompassing the Stalk about the bottom, and making it seem as if it run through them, that they will hold the Rain, or any Water which falls upon them: The Flowers which stand at the tops of the small Branches are a little larger than those of the Common Centory, composed of six or eight Leaves, of a fine pale yellow color, and sometimes of a deeper yellow; after which comes larger Heads than those in the first, and Seed a little bigger. This Plant is not full out so bitter as the first.

VII. The fifth, which is a Small yellow Centory not Branched, and differs not in Leaf or Flower from the fourth: The Stalk bears perfoliated Leaves, but spread not themselves forth in Branches, as the former doth: It bears also but one only Flower at the top, which thing, together with its not being branched, makes it to be different, and another Species of the perfoliated kind, the whole Plant is less bitter than the first.

VIII. The sixth, and smallest of the Yellow Centories differs very little from the fifth, or last described Through leav'd Centory, excepting in this, that it is wholly less in every part of it, and whereas the former bears but one Flower at the top of it, this bears two or three, and sometimes more, small Flowers at the top of every of its Branches.

IX. The Places. The first grows in great plenty throughout all England, in most Pastures and Grassy Fields; and indeed they are all of them found in many places of this Kingdom, but the first or common sort almost every where, in Fields, Pastures and Woods, but that with the White Flowers is more sparingly to be had than the first. The first I found growing in the South parts of Carolina, in many Plantations, but particularly in that, formerly Captain Abbot's, up Wando River, about five Miles from Charles Town: The third of these enumerated in this Chapter, grows in many places in Kent, as in a Field next unto that which was formerly Sir Francis Carew's House, at Bedington near Croydon; and in a Field next beyond Southfleet Church towards Gravesend, and in many other places, where also the other kinds are sometimes found.

X. The Times. They all Flower in July and August, and their Seed is ripe in about a Month after. They ought to be gathered in their Flowering time: but some people out of a meer Superstition, gather them between the two Lady-days.

XI. The Qualities. They are generally hot and dry in the second Degree: but Gerard says, that our third, which is the first yellow Centory, is hot and dry in the third Degree, and yet it is not so bitter as the first. They are all highly Stomack, Pectoral, Hepatick, Splenetick, and Hysterick: they are noble Aperitives, and Absterfives, Vulneraries, Alteratives, and Emmenagogicks.

XII. The Specification. It is Antifebricit, and good against Distempers of the Stomach.

XIII. The Preparations. You may have therefore, 1. A liquid Juice. 2. An Essence. 3. An Infusion. 4. A Decoction. 5. A Powder. 6. An Oil by Insolation or Boiling. 7. An Ointment. 8. A Balsam. 9. A Cataplasme. 10. A Distilled Water. 11. A Spirituous Tincture. 12. An Acid Tincture. 13. An Oily Tincture. 14. A Saline Tincture. 15. A Spirit. 16. A Collyrium. 17. A Fixed Salt from the Ashes. 18. An Essential Salt.

The Virtues.

XIV. *The liquid Juice.* Being given from four to six ounces two hours before the coming of the Fit of an Ague (as also given in the same quantity Morning and Evening for some days) it removes the Fit, and perfectly cures the Ague. It evacuates and carries off Choleric and Gross Humors, and prevails against the Sciatica: And yet with *Dodonaens*, I do not perceive that it has any sensible Purg- ing, or Cathartick quality, though in the mean time, many things which are not purely Catharticks or Purg- ing, are found to be very cleansing, and in passing off themselves, carry many other Humors along with them.

XV. *The Essence.* This has all the Virtues of the Juice; it opens Obstructions of the Gall, Liver, Spleen, Reins and Womb, prevails against Hypo- chondriack Melancholly, and the Yellow Jaundice; it eases Pains in the Sides, and hardness of the Spleen, making thin both Blood and Humors. It is of good use for those that have the Drop- sic, or Green-sickness, because it strengthens the Stomach, and all the other *Viscera*: I know some will not al- low it to cure the Drop- sic; but this I know, that if the Hydropick Humors are carried off by other means, and the parts affected are once emptied of their Water, that if this Essence be duly given, it so strengthens the Bowels, that that Disease returns no more. It kills Worms in the Belly, and dries up Rheums.

XVI. *The Infusion in Wine.* It cleanses gross Hu- mors, and eases pains in the Hips, the Gout, and other like Diseases proceeding from Tartarous Hu- mors: It is good in Agues, strengthens the Stomach, helps Digestion, and causes a good Appetite. It also prevails against Stitches, pains of the Sides, and other disaffections of the *Pleura*.

XVII. *The Decoction.* It has the Virtues of the Infusion, is good against Agues, Catarrhs, and the vehement pains of the Colick: It provokes the Terms in Women; and brings away the Birth, whe- ther dead or alive, as also the After-birth, easing the pains of Mother, and causing an effectual Clean- sing after Delivery. It is good against the Rickets in Children, evacuates Tartar out of the Urinary Passages, and brings away Sand and Gravel, stop- ping the passage of the Urine.

XVIII. *The Powder.* Taken to one dram in Wine, it gives ease in the Colick, kills Worms in Chil- dren, and (as *Parkinson* says) is a wonderful good help against the biting and poison of a Viper or Adder. Strewed upon moist and running Sores and Ulcers, it cleanses, dries, and heals them.

XIX. *The Oil by Isolation or Boiling.* It is An- dyn, eases the Spleen, and pains of the Mother, and is very effectual in all old pains of the Joints, and Limbs, as Gouts, Sciatica, Convulsions, Cramps, &c. proceeding from a Cold Cause. It is also a very good thing to anoint Womens Breasts which are swollen, hard, or pained, through Cold, or Cur- dling of the Milk, or any other accident, as of a blow, &c.

XX. *The Ointment.* It has the Virtues of the Oil, but is more strengthening and sanative: It cleanses, dries, and heals foul Ulcers, and other spreading Scabs of the Head; and to anoint the Back-bone and Joints of such Children as have got- ten the Rickets: It strengthens and gives ease in pains of the Back, by anointing therewith.

XXI. *The Balsam.* It is an incomparable Vul- nery, and cures simple Green Wounds at the first intention. If they are composed by bruising, and dilaceration of the flesh, it first digests, then clean-

ses, dries, and heals them: It also cleanses foul and foetid Ulcers, fills them up with flesh, and consoli- dates their lips. It heals old running Sores, clean- sing, incarnating and drying, and perfectly curing them, tho' Hollow, or Fistulous.

XXII. *The Cataplesm, made of the green Herb.* It has the Virtues of the Balsam, but is an especial thing for cleansing and healing putrid Ulcers in what part soever, if duly applied thrice a day: washing the hollowness or fistulous part also with an Expressed Juice of the Herb.

XXIII. *The Distilled Water.* It has the Virtues of the Infusion or Decoction, but is pleasanter, as being less bitter; but by so much, it is the less ef- ficacious: and is many times used as a Vehiculum, to convey other Preparations of the Herb in: It is said to take away Tanning of the Skin, Sun-burn- ing, and other the like disaffections.

XXIV. *The Spirituous Tincture.* It comforts all the *Viscera* after a singular manner; and therefore if it is taken from one dram to four drams, Morn- ing, Noon, and Night, it so strengthens the Bowels, as that it prevents the return of a Drop- sic in those Persons where it has been lately cured. It also re- moves the Gout out of the Stomach, (which many times is fatal) is good against the Jaundice, and Hypochondriack Melancholly: It is indeed a good remedy against the bitings of Vipers, Rattle-Snakes, and other Serpents, as also the Poison of Mad Dogs.

XXV. *The Acid Tincture.* It is excellent against Vapors, Fits of the Mother, and other disaffections of the Womb. It strengthens a weak Stomach, resists Vomiting, causes a good Appetite and Digestion, removing faintness and sickness at heart. It is good against Poison, and the Plague, as also all Putrid, Malign, and Pestilential Diseases, being taken in all that the sick drinks from twenty to forty drops at a time, at least five or six times a day; it takes away the malignity of the Dis temper, and wonder- fully abates the putrid heat of the Fever, whether Continent, Continual or Contermittent.

XXVI. *The Oily Tincture.* It carries off the yel- low Jaundice, as also the Morbick cause of Ob- structions of the Reins and Ureters by Urine: being given from one dram to two drams, in a good draught of *Carduus* Posset-drink, it has been known to cure Agues: more especially if the *Spina Dorsi* be effectually anointed therewith, from the *Verte- brae* of the Neck almost to the *Anus*. Anointed on the sides, it eases their Pains; and given inwardly, gives ease in the Colick. Given to a Woman in Labor from fifteen to thirty or forty drops, in some convenient Vehicle, it facilitates the Delivery, whe- ther alive or dead, and effectually brings away the After-birth.

XXVII. *The Saline Tincture.* It is good against foul Ulcers, and spreading Scabs of the Head, or other parts; takes away Cutaneous Deformities, as Tannings, Sun-burnings, Spots, Marks, Scurf, Dand- riff, Morpew, and other like defects of the skin: And being long applied, it is said to remove Freckles, tho' of great continuance.

XXVIII. *The Spirit.* It strengthens the Stomach wonderfully, cheers the Heart, revives the Spirits, and fortifies the Universal Oeconomy of Nature: it is good against Vomiting, and Indigestion, and causes a good Appetite to Food; makes a fresh and lively Countenance, and restores the Pristine state of the Bowels. It is a very good thing against *Diarrheas*, *Dysenterias*, *Lienterias*, and the *Hepa- tick Flux*, and gives ease in an exquisite Colick, when sometimes many other things will do nothing. Dose from one spoonful to two, in some proper Vehicle.

XXIX. *The*

XXIX. *The Collyrium.* It is made of the *Liquid Juice, or Essence, mixt with an equal quantity of clarified Honey.* Being put into the Eyes, four, five or six times a day, it clears them from Dimness, Mists or Clouds, or any thing which obfuscates or hinders the sight : and if a little Spirit of Wine (about an eighth part) be added to it, it becomes profitable for sore, inflamed and running Eyes ; it strengthens the weakened part, and powerfully stops the Fluxion. It also cleanses Ulcers in the Eyes, dries, and heals them : And I was informed by a very skilful Chirurgion, that he once cured a *Fistula Lachrymalis* therewith, by injecting it in, with a proper Syringe. This I am sure of, that it singularly cleanses, and dries hollow Ulcers in other parts of the Body, and disposes them to an effectual healing ; and dries up moist Scabs, and other breakings out like Scurf or Morpew, though of long standing, if it is assiduously used and applied for some time. Taken inwardly, from half an ounce to two ounces at a time, it prevails against Colds, Coughs, Hoarseness, Wheezings, shortness of Breath, difficulty of Breathing, and other distaffections of the Lungs. Being thus continued for some considerable time, I have known it to cure Ulcers of the Lungs ; the Patient drinking with it, new Milk worm, sweetned with double refined Sugar, drinking no other Liquor, and wholly forbearing all Wines, and Maulted Drinks.

XXX. *The fixed Salt.* It is highly Antifebricitic and Diuretick. Dissolved to one dram in the Distilled Water, and so drank, it carries off the Morbifick cause of all Fevers by Urine, and cleanses all the Urinary parts of Gravel, Sand, and Tartar, lodged in them. It is also excellent good against the yellow Jaundice, and all Obstructions of the Liver, Spleen, Reins, and Womb. It dissolves Choler in the Body, and casts it out by Urine : Take of this Salt half an ounce : of the distilled Water a pint : mix and dissolve. This cures Cutaneous Diseases, and takes off Freckles from the Face, if constantly used for some time ; and also removes other deformities of the Skin.

XXXI. *The Essential Salt.* It has all the Virtues of the Liquid Juice and Essence, and may be given in all those cases from one dram to two or three drams at a time, in a glass of generous Wine, Morning and Evening. It is a great Stomack, and Sweetner of the Blood ; a noble Antifebricitic ; and Kills Worms in Young or Old, being taken for some time. It is highly Traumatick, and therefore good to be taken Dietetically, by such as have Wounds and Ulcers about them.

CHAP. CXX.

of CELANDINE.

I. *THE Names.* It is called in Greek, *Χελιδών*, or *Χελιδών το μέγα* : In Latin, *Chelidonium*, and *Chelidonium majus*, *Hirundinaria major* : In Arabic, *Kauroch*, seu *Memiran* : and in English, *Celandine*, and *Celandine the Greater*. This latter name is given to it, because another Plant lesser than this, has the name of *Celandine* given to it, and is called the lesser ; and yet it has no Kin or Relation to it : and therefore for distinction sake, this is called *Celandine the Greater*. It is also sometimes called *Swallow wort*, in answer to the latter Latin name. The name is said to arise from Swallows curing the Eyes of their young ones when

they were hurt, therewith ; but as it is a thing wholly fabulous, so we leave it.

II. *The Kinds.* It is twofold, 1. *Χελιδών το μέγα καυρόν*, *Chelidonium majus vulgare*, Common Great Celandine. 2. *Χελιδών το μέγα καλαμάδες*, *Chelidonium majus Laciniatum*, Jagged Celandine.

Common
Great
Celandine

Celandine

III. *The Description.* Common Celandine has a Root somewhat great at the Head, shooting forth several other long Roots, with small reddish Fibres or Strings springing from them, the inside being yellow, and full of a yellow Juice : From this Root springs

up several tender, round, whitish, green Stalks, with larger Joints than are ordinary in other Plants of like magnitude, like as it were knecs, very brittle, and easie to break, from whence spring forth Branches of a dark blewish green color on the upper side, like unto Columbines, and of a more pale blewish green underneath, full of a yellow Juice or Milk, which issues forth, when any part is broken, of a bitter Taste, and strong Smell. At the tops of the Branches, which are much divided, grow gold yellow Flowers, having four Leaves a piece, after which come small long Cods, with blackish Seed therein.

IV. The Jagged Celandine, grows in its Roots and Stalks, and almost in all things else like unto the former, save that the Leaves are thinner, and the divisions slenderer, and more cut in on the edges: the Flowers consist also of four Leaves a piece, and are of the same golden yellow color, but somewhat larger than the other, and are each of them cut in on the edges, as the green Leaves are, for which reason Clusius calls it, *Chelidonium majus laciniato flore*; this, as the other, by shedding its Seed, rises again before Winter, and so continues flowering the next Spring, and seeding in Summer.

V. The Places. The first is nourished up by many in Gardens; but is also found growing Wild in many places by old Wall sides, and by the Hedges and Way sides in untilld ground in several parts of this Kingdom, delighting in shady places. The second is only found growing in Gardens.

VI. The Times. They both flower all the Summer long, from the Month of April; and in the mean season the Cods come to perfection, and yield ripe Seed.

VII. The Qualities. They are both hot and dry in the third Degree; and of an Absterfiv or Cleansing Faculty; Aperitive, Sudorifick, Hepatick, Arthritic, Alterative and Alexipharmick.

VIII. The Specification. It is said to be a peculiar thing against the yellow Jaundice.

IX. The Preparations. You may have thetrefrom, 1. The liquid Juice. 2. The Essence. 3. The Decoction in Wine. 4. The Powder of the Root. 5. The Infusate Juice. 6. The Distilled Water. 7. The Spirituous Tincture. 8. The Acid Tincture. 9. The Saline Tincture. 10. A Cataplasme. 11. A Mixture.

The Virtues.

X. The liquid Juice. Being taken fasting from one ounce to two ounces mixed with a dram or two of Mithridate, and a Glas of Wine, it is of singular good use against the Plague or Pestilence, the Patient being laid to Sweat thereupon. The Juice dropped into the Eyes, cleanses them from Films, and Clouds which hinder the sight; more especially if mixed with a little of the Distilled Water, to allay it. It is also to good purpose used in old running Sores, and filthy and corroding Ulcers wherefoever, to hinder their malignity, and stop their running and fretting, and to cause them the more speedily to heal. The Juice often applied to Warts, Corns, Tettars, Ring-worms, or such other like spreading Sores, destroys their Acid Ferment, and also cures them.

XI. The Essence. It has all the Virtues of the Liquid Juice, but much more powerful to the intentions, and may be given in the same Dose in Wine. It opens Obstructions of the Gall, Bladder, Liver, and Spleen, and prevails against the Dropick, and yellow Jaundice.

XII. The Decoction of the Herbs and Roots in Wine. You may boil with them a few Anniseeds also. It has the Virtues of the Liquid Juice, and Essence, but not altogether so powerful. It cleanses much, and so is helpful against the Yellow Jaundice, and gargled in the Mouth eases the Tooth Ach.

XIII. The Powder of the Root. Put upon Aching Gums or Teeth, or upon a loose or hollow Tooth, it will ease the Pain presently: and as Authots say, quickly cause them to fall out. *Vix Credo*. The over Credulous may easily make a Tryal.

XIV. The Infusate Juice. This is thought to be better for the Eyes than the liquid Juice, because many of the sharp Particles by the Infusation are Evaporated. You may dissolve it with a little Breast Milk, or Cows Milk, and so drop it into the Eyes, it is good against Clouds, Films, Blood-shot, Inflammations, Pearls, and other Diseases of the Eyes.

XV. The Distilled Water. It is said to be a good thing to clear the Eye-sight; and taken with a little Mithridate or Venice Treacle, and Sweating thereon, it is good against Malign and Pestilential Diseases; and may be used as a Vehicle for other Preparations.

XVI. The Spirituous Tincture. It has the Virtues of the Essence; and is a singular good thing against cold and moist Distempers of the Head, Nerves, Stomach, Liver and Womb. It prevails against Vertigo's, Lethargies, Convulsions, Cramps, Palsies, Lameness, Numbness, and Contortions of the Bowels. By the constant use of this Tincture for about six or seven Months, I knew a Man of about thirty six or thirty eight Years of Age, perfectly cured of the Palsie. Dose one, two or three drams at a time, Morning and Evening (and in very cold habits of Body, Morning, Noon, and Night) in a Glas of Madera, or other generous Wine. In Cramps and Convulsions it would be good to bathe the parts affected therewith: and in Palsies, to bathe those parts of the Back Bone, whose Vertebra send Nerves to the places afflicted.

XVII. The Acid Tincture. It has all the Virtues of the liquid Juice, and Essence, and is indeed a powerful thing against all Malign and Pestilential Fevers, for it actually destroys the malignity, and abates the heat of the Fever. Outwardly applied, it is found of singular good use to take away detestations, or defilements of the Skin.

XVIII. The Saline Tincture. It is good for those who are troubled with the Itch, or have old Sores in their Legs, or other parts of their Bodies: it also takes away Tanning, Sun-burning, Scurf, Morpew, black and blew Spots, and other discolorings and deformities of the Skin.

XIX. The Cataplasme. The Green Herb, with the Roots, being bruised, and made into a Cataplasme, with a little Oil of Camomil, and powder of Orrice Roots and Zedoary, and applied hot to the Navel, it eases the Gripping pains of the Belly and Bowels, as also the pains of the Mother. And applied to the Left side takes away Stitches, and eases the pains of the Spleen. Applied also to Womens Breasts, who have their Courses in too great a measure, it stops them, and gives great relief to distastefuls of the Mamillary parts.

XX. The Mixture. *R* of the liquid Juice four ounces: Oil Olive one ounce: Flowers of Sulphur an ounce and half: mix them. It cures the Itch, Morpew, Scurf or Dandriff, scald Heads, discolorings of blows or Wounds, Tettars, Ring-worms, and other like discomposures of the Skin, being anointed therewith, Morning and Evening, for some time.

C H A P. CXXI.

of CHARLOCK.

THE Names. I do not find that this Plant was known to the Greeks, and so have no Greek name for it. It is called in Latin, *Rapistrum*: and in English, Charlock, Carlock, and Chadlock.

II. The Kinds. Some would have it to be a Species of the Wild Turnep, others of *Sinapi*; some of *Erysimum*; others refer them to the *Lampfana* of Dioscorides: but it took its name *Rapistrum*, à similitudine *Rapifoliorum*, for which reason it was that some have called it Wild Turnep. But taking it as Genus, There are several kinds of them to be found in England, viz. 1. *Rapistrum Commune*, Common Charlock. 2. *Rapistrum Sylvestre*, free *Arvorum*, Wild, or Field Charlock: *Matthioli* calls it *Lampfana*; so also *Angulata*, *Lonicera*, *Lugdunensis*, *Gerard* and *Gesner*, in *Hortis*: *Fuchs* and *Turner* call it *Irion*: *Bauhin*, *Rapistrum flore luteo*. 3. *Rapistrum alterum Arvorum*, A second Field Charlock; which is also called by all the former names. 4. *Rapistrum album Articulatum*, White Field Charlock; which is the *Lampfana* of *Turner* and *Casalpini*, who also calls it *Radix Sylvestris*: The third *Sinapi agreste* of *Tragus*: *Rapistrum flore albo Erucæ foliis Lobeli*; *Armoracia Tabermontani*; *Rapistrum flore albo siliqua articulata Bauhini*. 5. *Rapistrum Monospermon Bauhini*, One Grained Charlock. 6. *Rapistrum Aquaticum*, Water Charlock.

Common Field Charlock

III. The Descriptions. The first of these has slender Roots with several fibres or strings hanging at

them, which perishes when the Seed is ripe; from this Root rises Leaves almost like to the *Rapum Sylvestre*, but lesser, and smaller at the bottom, not jagged: among which rises a rough, slender, brittle, and somewhat hairy Stalk, a foot and half, or two feet high, having larger Leaves than the former, and somewhat jagged and Waved: The Stalk towards the top is divided into many Arms and Branches, on which do grow little yellowish Flowers, which make a great shew; but sometimes they are found to be of a purplish color; which being past there follows long Pods, sharp towards the end, containing several flatish Seeds, of a whitish yellow color.

Water Charlock.

IV. The second, has a Root long and white, which grows woody when it runs up to Stalk and Seed, and perishes after Seed time. From which Root springs forth many long and broad rough Leaves, hairy and green, lying upon the ground round about the Root, somewhat deeply gashed in on the edges, and round pointed: from among which rises up one slender hairy Stalk, seldom many, branched from the middle upwards into many Arms, with divers lesser Leaves on them to the tops; on which stand many yellow Flowers, having four or five Leaves a piece, which in a Hemp Land, or Corn Field make a mighty and glorious shew (but much to the Owners disprofit:) after these Flowers are past, there follows long rough Pods, not very slender, with divers round, small, reddish brown Seed therein, like unto Mustard Seed, but larger, as quick and sharp in taste, but more bitter than it.

V. The third has a long Root, with many Fibres at it, like the former, which dies every year, from whence spring up many large Leaves waved in, a little rough or hairy, but not cut or jagged as the former, the upper Leaves being whole and smaller. The Stalk rises up rough and hairy like the others, of about eighteen Inches high, or more, spread out into many Branches; at the tops of which are a great number

number of pale yellow Flowers, which being passed away, long pointed Pods follow, rough like the former, and with a shew of divisions in them, in which are contained little round, and almost Ash-colored, sometimes reddish Seed.

VI. The fourth has a Root small and long in some Plants, in others thicker and rounder, near to the bigness of a small long rooted Turnep, which is Annual, or perishing every Year: From this Root there comes forth fewer Leaves than in the former, but smaller and rougher, and in some little or nothing jagged, but in others more: the Stalks are rougher and lower than the others, which also spread forth into Branches towards the top: and on the tops of which grow the Flowers, not so many as in the Common, or second kind, nor yet altogether so great or so yellow, but either of a pale yellow, or more white; after which come forth smaller rough Pods, with Joints or Divisions in them, in which are contained smaller brownish Seed, nothing near so fiery or hot, as in the first or second kind: of this kind also, some have been found with a purplish Flower.

VII. The fifth has a Root long and white, and somewhat Fibrous; from whence spring forth its lower Leaves, which are somewhat large, thick, and hairy, of a very fresh green color, torn on both edges at the bottom, but broader at the ends, where they are only waved: The Stalks also are a little rough and hairy, of about twelve or sixteen Inches, or more, high, set with a few such Leaves as the lowest, but smaller; towards the top they branch forth into long spikes of gold yellow Flowers, the length of three, four, or five Inches; which being past, there comes in their places small, round, striped Heads or Husks, with a small point at the end; containing in every one of them but one Seed, from whence came the name.

VIII. The sixth, which is the Water Charlock, has a Root long, tough, and full of strings, creeping and putting forth many Stalks; from whence comes forth Stalks of a Yard high, and sometimes more, with many Branches, slender and smooth, in respect to any of the rest, which are set with rough ribbed Leaves, deeply indented about the lower parts of the Leaf. The Flowers grow at top of the Branches in Umbel or Tuft fashion, sometimes of one color, and sometimes of another: the Seed Vessels are short and small, containing in them small Seed.

IX. The Places. The first has been found growing in divers places of England, as going from Shore-ditch by Bednal-Green to Hackney: The second, third, and fourth are found growing in Corn Fields, Hemp Lands, in Barren Grounds, and often by the Borders of Fields and Hedges, Bank-sides and Untilled Grounds, and such other like places: The fifth grows in many places of Germany, and with us is nourish'd up in Gardens. The sixth grows in moist Meadows, and Marsh Grounds, and in Water Ditches, and other plashy places.

X. The Times. They flower all April, and continue flowering till the Summer is far spent; and the Seed ripens in the mean time.

XI. The Qualities. The Seed is hot and dry in the third Degree; in some as some do make use of it instead of Mustard Seed, or mingle it therewith. It is Cephalick, Neurotick, Stomatick, Nephritick and Hysterick; Aperitive, Absterfve, and Diuretick: Alterative, Parnick, Mastivative, and Alexipharmick.

XII. The Specification. It opens the Obstructions of Brain and Nerves, and is good against the Palse, weakness and trembling of the Nerves.

XIII. The Preparations. You may have from the Seed, 1. An Expressed Oil. 2. An Errhine. 3. A Sauce imitating Mustard. 4. A Spirit, like Spirit of Scurvy-grass. 5. A Spirituous Tincture. 6. An Oily Tincture. 7. A Saline Tincture. 8. A Cataplasim.

The Virtues.

XIV. The Oil by Expression. It discusses any cold Tumor, and eases pains proceeding from a cold Cause, being anointed upon the part warm, and well rubbed in. It is of good use to make Soap withal, instead of Oil Olive, and much exceeds Train or Whale Oil for that purpose; and where Butter and other Oil are wanting, it may serve to Fry with.

XV. The Errhine. It is made of the Seed by grinding it with fair Water, in a Boul, with a Bullet, then straining the thin or liquid part from the gross: this liquid part being sometimes snufft up the Nostrils, so as it may come out again at the Mouth, purges the Head and Brain effectually, by the Nostrils, of cold, moist and mucilaginous Humors, and by that means prevails against vehement and inveterate Head-achs, proceeding from a cold cause, Vertigo's, Lethargies, Carus, Apoplexy, Epilepsy, Convulsions, Palsie, and other like Distempers of the Brain and Nerves. And I have known by often using of it, in some who have been Dim sighted, or almost Blind, and in others who have had a constant flux of Rheum into their Eyes, for some considerable time, that it has cleared the sight, diverted the Rheum, and strengthened the Eyes so admirably, as if they had never ailed any thing at all.

XVI. The Sauce. It is made as Mustard, and so to be used: it strengthens the Stomach, sharpens the Appetite, and causes a good Digestion: but it is nothing near so pleasant as Mustard: applied immediately upon a Contusion where the skin is not broken, it discusses the Tumor, and prevents the afflux of Humors to the part.

XVII. The Spirit. It is admirable against the Scurvy in a cold habit of Body; it excites the Animal Spirits, and causes liveliness and cheerfulness in such as are Sleepy, Drowsie and Lethargick: and is indeed an excellent thing for such constantly to take of, who are Paralytick, or troubled with numbness, tremblings, and other weaknesses of the Nerves; more especially, if it is also bathed down along the Back-bone, and parts affected, Morning and Evening, and also taken from one dram to two drams, or more, Morning, Noon, and Night, in some convenient Antiparalytick, and Antiscorbutick Vehicle.

XVIII. The Spirituous Tincture. It has the Virtues of the Spirit, and in some cases more effectual, being more Stomatick than that is; and being bathed upon any part afflicted with a cold Tumor or Swelling, or with cold and moist Humors, or with Rheumatick Pains proceeding from cold, it warms and comforts the Part, discusses the Humors, and eases the Pain: mixed with White Wine, and used as an Errhine, it purges the Head and Brain of Cold Phlegmatick Matter which offends it, causing Head-achs, Vertigo's, Drowiness, Lethargies, &c.

XIX. The Oily Tincture. It is used chiefly outwardly, in Gouts from a cold cause, in which it gives admirable ease. As also in Numbness, Trembling of the Limbs, and Palsies, in all which cases, it ought to be bathed all along upon the Back bone, from the Vertebra of the Neck, almost to the Anus, and this to be repeated oftentimes, and well rubbed in both Morning and Evening; the parts af-

lected are likewise to be bathed with the same. Anointed upon a Nerve prickt or hurt, it eases the Pain and Anguish, and abates the Tumor, if any be present.

XX. *The Saline Tincture.* If given inwardly, from half a dram to two drams, it opens Obstructions of the Urinary parts, and of the Womb; but it is of greatest use in outward Applications against Tanning, Sun-burning, Scurf, Morphew, Dandriff, and other like Defecations of the Skin; for it cleanses after a singular manner, by reason of its Volatile Particles.

XXI. *The Cataplasma.* Made of the Green Herb, but principally of the Seed, with the addition of a quarter part of Mithridate, and so much Orice powder as will bring it to a consistence, and applied to cold flatulent Tumors, it dissolves them: if Nature designs the Tumor for breaking, it brings it to maturation or ripeness, and that in a little time, because of its heat. If it is applied to the Gout, it eases the Pain, and attracts the Morbifick Humor through the Pores of the Skin, in manner of Sweat.

C H A P. CXXII.

Of C H E R R Y Winter.

I. **T**HE Names. It is called in Greek, *Στράγγις*, *ἢ Στράγγις ἀνδροκας*: In Arabick, *Kekengi*, & *Alkekengi*: In Latin, *Alkakengi*, *Halicacabum*, *Solanum Halicacabum* Theophrasti, *Vesicarium* Plinii, *Saxifraga quarta rubra* Brunfelsii, and *Solanum Vesicarium*: In English, *Winter Cherries*.

II. *The Kinds.* Parkinson says, it is one of the kinds of *Solana*, or *Night-shades*, set forth and spoken of by *Dioscorides* and *Galen*, and one of the two of *Theophrastus*. We make two Kinds thereof, 1. *Halicacabum* five *Alkakengi* *Vulgare*, Our Common *Winter Cherry*. 2. *Halicacabum* five *Alkakengi* *Virginienſe*, The *Virginian Winter Cherry*. There is another Plant, which some Authors have joined with *Winter Cherries*, and called it, *Halicacabum Peregrinum*, *Vesicaria Peregrina*, and *Halicacabum Repens*, *Winter Cherries* *Creeping*, as *Tragus*, *Euchsius*, *Gesner*, *Matthiolus*, *Dodonæus*, and others; but *Cordus* opposes, and makes it another Plant: *Bauhinus* puts it among the *Pease*, as a kind thereof, and calls it *Pisum Vesicarium*: *Lobal* thinks it to be the *Isopyum* *Dioscoridis*, and calls it, *Cor Indum*, *Pisum Indicum*, and *Pisum Cordatum*; for all which Reasons, it being rather a *Grain* than a *Berry*, we have forbore to put it in this place: and so much the more also, because it is no *Native* or *Denison* of our Countrey, nor does it grow naturally, as some think, in any Part of *Europe*.

III. *The Description.* Our Common *Winter Cherry* has a running or creeping Root in the Ground, long, and not much unlike to the Roots of *Spitch-grass*, running very far abroad under the upper crust of the Earth, causing it greatly to encrease; it is sometimes of the thickness of ones little Finger, shooting forth at several Joins, and in several places, by which means it quickly fills a great piece of Ground. From this Root rises up a Stalk two or three Feet high, round, slender, smooth, and somewhat reddish, reeling this way, and that way,

by reason of its weakness: upon which come forth many broad and long green Leaves, not much unlike to those of Common *Nighthade*, but larger: at the Joins whereof, and among which Leaves come forth whitish Flowers, consisting of five small Leaves apiece: In the middle of which Flower comes forth a Berry, green at first, and red when it is ripe, like almost in color and bigness to our Common Red Cherries (whence the English name;) These Berries are enclosed in Skins, or Bladders, of a pale reddish color. In the Berry is contained a reddish Pulp, and the Seed lying in the same, which are many, small, and flat, and of a pale yellow color.

IV. *The American kind*, has a small Root spreading under ground, but not so far as the former, and perishes every Year. From this Root comes forth Branches with Leaves on the ground, scarcely rising up so much as the other, seldom above eighteen or twenty Inches high, (which I observed when in its perfection, and growing upon fertile ground) but the Branches are greater, as also are the Leaves, and something more uneven about the edges, of a sad, or deep green, almost of a Sea-green color: at the Joins come forth the Flowers singly, to wit, one at a place, and more towards the bottom than upwards (this I observed not, for I always found each Plant very full of Fruit, almost from the bottom to the very top:) but as they grow to the height of the Branches, both Flowers and Fruit are rather smaller than those which are below: the Flowers are composed of five small whitish Leaves, with a Circle of red, or every Leaf is spotted Circle-wise towards their bottoms: the Flowers being past there follows the Fruit, enclosed in a thin Skin or Bladder, of a whitish, or pale greenish color; and not full out so big as the former. Within this Husk or Bladder is contained the Berry, which never grows full out so large as our English *Winter Cherry*, yet whilst recent, fills almost the Bladder in which it is contained: when the Cherry or Berry comes to its perfection, it is never red, but of a pale whitish green color,

color, sometimes of an Amber color, or of a light palish yellow; and sometimes those which the Sun looks full upon, may have some small streaks of red, mixed with Amber-colored and pale yellowish green colored. The Berry contains a Pulp like the English, but whitish yellow, or green, in which Pulp is contained the Seed, which is small and flat, like the other, and of a whitish color.

V. *The Places.* The first grows by Hedge sides, and old Walls, and about the Borders of Fields, in moist and shadowy places (this it may possibly do, in several Southern Regions and Countries beyond Sea) but with us it grows chiefly in Gardens. The other grows Wild in English Plantations in Virginia. I found it growing in a Plantation up *Wabnawo* River in Carolina, and in several other Plantations of that Country, where it grew spontaneously, and that in vast plenty. *Parkinson* makes mention of a third kind of *West India Alkakengi*, which I take to be the same with that before described, and differs from it only in largeness, and strength of its Stalks, Branches and Berries, which I believe arises only from the differing goodness of the Soil, they being in all other respects exactly the same. I have found them both growing on the same ground, but could not possibly take them to be two differing Species of the same Genus.

VI. *The Times.* They Flower about the middle or latter end of July, and the Fruit is ripe about the latter end of August. In Carolina they flower something earlier.

VII. *The Qualities.* The Herb is cold and moist in the second Degree, not Aperitive: but the Berries are of the same Quality, and Opening; Diuretick, Nephretick, Alterative, and Lithontiptick.

VIII. *The Specification.* They are peculiar against Obstructions of the Reins, Ureters, and Bladder, and to help in the Strangury, Stone, Gravel, Sand, and Tartarous matter, lodged in those Parts.

IX. *The Preparations.* You may have therefrom, 1. A Distilled Water from the Fruit or Leaves. 2. A Juice of the Fruit made with White Wine. 3. An Infusion or Decoction of the Berries. 4. A Diet Drink. 5. A Powder of the Berries. 6. An Oil of the Root. 7. A Cataplasm of the Leaves or Fruit.

The Virtues.

X. *The Distilled Water.* It is Cooling and Diuretick: It may be Distilled from the Fruit or Leaves with a little Milk. It may be drank from two ounces to five or six, sweetened with a little Sugar, Morning and Evening, against the Strangury, heat of Urine, and all the Distempers of the Urinary Parts.

XI. *The Juice of the Fruit.* It may be given from one ounce to two, in a glass of White Port Wine, against Stone, Gravel, Sand, Tartarous Mucilage, or what ever stops the Urine in either Reins, Ureters, or Bladder: but it is not so powerful as the powder.

XII. *The Infusion or Decoction of the Berries in White Wine, or Water.* It opens the Urinary Parts, and is an excellent thing against the Strangury, provoking the Urine plentifully when it is stopped, or grows hot, sharp, or painful in the passage. It is good to expel the Stone and Gravel out of the Reins and Bladder, helping (where it is composed of a gritty Substance) to dissolve it, and to expel and send it forth by Urine in form of Sand or Gravel. It is good to cleanse inward Apostemations, and Ulcers in the Urinary Parts, and to relieve such as make a foul, filthy, or stinking Urine, or that piss Blood. It is profitable also against the Jaundice,

by carrying off the Morbifick Cause by Urine. Dose from four to eight ounces, Morning, Noon, and Night: and to be continued as the Exigency of the Disease requires.

XIII. *The Diet Drink.* It is made of the Berries put up into new Wine, when it is new made, that working with the Berries therein, their Virtues may be drawn forth into the Wine. Or because our Country affords not new Wine in the *Must*, you may put them into new Beer, or Ale, as you set them to Work, and also Tun them up therewith, that they may fully Work with the same. The proportion is two large handfuls, whilst green, to a Gallon of Wine or Ale: and one large handful well bruised when dry. This may be drank as ordinary drink, but at least a Pint of it Morning, Noon and Night. It has all the Virtues of the Infusion or Decoction.

XIV. *The Powder.* It is made of the dried Berries, in which the Seeds themselves are reduced into a Powder. The Dose is from fifteen grains to half a dram, Morning and Night, in a Glass of White Port Wine. Or you may Infuse it in the same Wine, two ounces of the Powder to three Quarts of Wine, letting it stand in a cold Digestion a Month before hand, shaking the Bottle every day. When you drink it, shake the Bottle, and pour it out thick and thin together, and let the Patient take a quarter of a Pint at a time, Powder and all, Morning and Evening, and continue this course till he has found the desired relief. This Powder, and thus taken, is much more efficacious than either the Infusion, Decoction, or Diet; and ought to be very much valued of such as are troubled or afflicted with the Stone, Strangury, or stoppage of Urine.

XV. *The Oil of the Root.* It is good against the poisonous stroke of the Scorpion: This Oil being applied, *Parkinson* says, it is powerful against their stinging. *Pliny* says, that the Root hereof is so powerful to stupify the Venom of the Scorpion, that if it be put to them, they will utterly loose their strength.

XVI. *The Cataplasm.* It is cooling, and profitable to be applied to allay the heat of Inflammations, and to ease pains coming from a cold cause.

CHAP. CXXIII.

of CHERVIL Garden.

I. *THE Names.* It is called in Greek, *Χαρδιον* λον, and is thought to be *Βανανιον* *Theophrasti*, lib. 7. cap. 7. translated by *Gaza*, *Entusiscum*: In Latin, *Cerofolium*, and *Charifolium*: In English, *Chervil*.

II. *The Kinds.* It is threefold, 1. *Garden.* 2. *Wild.* 3. *Tooth-pick Chervil.* The *Garden Chervil* is threefold, 1. The *Common Garden*, called *Cerofolium Sativum*. 2. The *Great Sweet Chervil*, *Sweet Cistley*, called *Cerofolium magnum*, *five Myrrhis*. 3. The *Small Sweet Chervil*, *Small Sweet Cistley*, called, *Myrrhis altera parva*. The *Wild* we shall treat of in Cap. 124. and the *Tooth-pick Chervil* in Cap. 125. following.

III. *The Description.* *Garden Chervil* has a small and long Root, which perishes every Year, and is raised up every Year, with Seed sown in the Spring, as also in Autumn for Salleting. It rises up with Stalks not a foot high, and in its Leaves much resembles Parsley, but after it is grown bigger, the Leaves are very much cut in and jagged, somewhat resem-

resembling Hemlock, being a little hairy, and of a whitish green color, but turning reddish in Summer, with the Stalks also, bearing at the top of its Branches spoked Tufts of white Flowers, which being past, turn into long and round Seed, pointed at the ends, and blackish when they are ripe, of a sweet taste, but no smell; but the whole Herb it self, has a pretty kind of sweet Scent.

Chervil.

Neat Chervil or Sweet Cifley

IV. The Great Chervil, (called also Sweet Cifley) has a great Root, blackish on the out side, and whitish within, from which springs forth many fibres; it perishes not, but abides many years, and is of a

sweet, pleasant, hot, spicie Taste, pleasing unto many: From this Root comes forth several Stalks of winged Leaves, consisting of many Leaves set together, deeply cut in on the edges, and every one also dented about, very like, and resembling the Leaves of Garden Cresses, from which they are not easily to be distinguished, but by good observation of those who know both: Their taste is not unpleasant (for which reason many put them into Sallets) and is not much differing from the Taste of Aniseeds: There also rises up a Stalk reasonable large, and a little crested, about a yard high, spreading it self out into many Branches, at the tops whereof stand many spiky Tufts or Umbles of white Flowers, which being past away, there follows brown, long, cornered, great Seed, two always joined together.

V. The Small Sweet Chervil, (or Small Sweet Cifley) has a Root not like the former, but consisting of almost nothing but fibres, thick and matted together; its Leaves, Stalks, and Umbles of Flowers differ not much from the last, saving that they are every ways less. The Seed is long, smooth, small, and shaped like to an Oat, and in taste not much unlike to that of Daucus Creticus.

VI. The Places. The two first grow in Gardens, and that almost throughout this whole Kingdom: The last is found in some parts of the Alps, as about Genoua, and other places, but with us only in Gardens of Botanists, and such as are curious of Plants.

VII. The Times. They Flower and Seed in May, and their Seed is ripe in July: and therefore are Sown again in the end of Summer.

VIII. The Qualities. It is hot and dry in the first Degree; Galen says in the second: Aperitive, Absterive, Carminative, Digestive, Diuretick and Anodyn. It warms and comforts the Head, Brain, Nerves and Stomach, is Pectoral, Nephritick and Hystrick: Also Alterative, Alexipharmick and Spermatogenetick.

IX. The Specification. It is found by great experience to comfort the Stomach, and provoke Urine, even where it is stoped.

X. The Preparations. You may have herefrom, 1. The Green Root. 2. The green Herb. 3. The green Seed. 4. The Distilled Water. 5. The Liquid Juice. 6. The Essence. 7. The Balsam, or Ointment. 8. The Roots Candied. 9. The Decoction of the Roots in Wine.

The Virtues.

XI. The green Root. Gerard says, they are excellent to be eaten in a Sallet, being first boiled, and then dressed up to the Table, as the Cook can tell best, either with Butter and Vinegar, or Oil and Vinegar. They are good (says he) for old People which are Dull, and without Courage: they rejoyce and comfort the Heart, strengthen and provoke Lust much.

XII. The green Leaves. They are very good, wholesome and pleasant, being eaten raw as a Sallet Herb with other Salleting, giving the whole a little relish of Aniseeds. Used as a Pot-herb, it is pleasant to the Stomach; and is used by the Dutch in a kind of Loblolly or Hotchpotch, which they call Warmus.

XIII. The green Seed. Parkinson says, they are commended, being put into a Sallet of green Herbs, and eaten with Oil and Vinegar, to strengthen the Aged, and comfort a cold Stomach. Gerard says, that the green Seed eaten as a Sallet, with Oil, Vinegar, and Pepper, exceed all other Sallets by many Degrees, both in pleasantness of Taste, sweetness of Smell, and wholesomeness as for Food, being good for a cold and weak Stomach.

XIV. *The Distilled Water.* Being drank to four or six ounces, it is good to dissolve congealed Blood, and provoke Urine.

XV. *The Liquid Juice.* It dissolves congealed Blood in the Stomach, Guts, Pleura, Lungs, Womb, or other Bowels: it provokes Urine, and the Terms in Women, and to expel Sand, Gravel, and Stones out of the Reins, Ureters and Bladder: and prevails also against the Pleurisie, very much comforting a weak, sick, and cold Stomach. Dose four ounces, Morning and Night, in a Glass of Wine.

XVI. *The Essence.* It has all the Virtues of the liquid Juice, besides which it facilitates the Birth, and brings away the After-birth, is good against Poison, and the Venomous biting of the *Phalangium*, as *Dioscorides* saith, is nutritive, and restores in Consumptions: Being often taken it breeds Seed, and very much provokes Lust, and has restored some who have been Impotent.

XVII. *The Balsam and Ointment.* They soon cure green Wounds, and digest them, if Contused or Lacerated: Applied to filthy, stinking, and fordid Ulcers, they digest, cleanse, dry, conglutinate, and heal admirably: and applied to the Gout, they ease the pain thereof, drawing forth the Morbifick matter thro' the Pores of the Skin.

XVIII. *The Candied Roots.* They are very good to warm, comfort and strengthen a cold and weak Stomach, and excite *Venus*: And *Purkinson* says, they are thought to be a good Preservative in the time of Plague.

XIX. *The Decoction of the Roots in Wine.* It has the Virtues of the Juice and Essence, but not all out so powerful: It is good against the bitings of Vipers, Mad Dogs, and other Venomous Creatures; is profitable against the Pthitick, and such as have an Impotency, or are in a pining Consumption. Dose, Morning and Night, from four to eight ounces.

Branches, against the Leaves, so that they spring out of bosoms, as it were, of the Leaves, which carry Umbles of small white Flowers; after which follow the Seeds, rough, hairy, round and longish, about the bigness of Aniseeds, and growing two together. The Leaves are small, and finely cut or divided, like those of Hemlock, but of a whitish color, and hairy.

Wild Chervil

CHAP. CXXIV.

of CHERVIL Wild.

THE Names. It is called in Greek, *Χαρίσιον*: In Latin, *Cerfolium*, or *Cherfolium Sylvestre*: and in English, *Wild Chervil*.

II. *The Kinds.* This is the second Species of Chervils, and is threefold: 1. *Charophyllum Bauhini*, *Cerfolium Sylvestre Vulgare*, Common Wild Chervil. 2. *Myrrhis Aëquicolum nova Fabij Columne*, Small Hemlock Chervil. 3. *Cicutaria alba Lugdunensis*, *Cicutaria Palustris Camerarij*, Wild Cilley.

III. *The Descriptions.* Wild Chervil has a whitish woody Root, from which rise up round about it, round, red, and hairy Stalks, a yard high, or more, many times large, and swollen about the Joints, which Stalks are not hollow, but full of Pith: towards the top they are divided into many Branches, which have on their tops Umbles of small and very fine white little Flowers, which being passed away, are succeeded by longish Seeds. The Leaves are commonly parted into three principal parts; and each part again subdivided into five, which are snipt about the edges, soft, hairy, and of a dark green, or reddish color.

IV. *Small Hemlock Chervil*, has a Root small and white, which when it has perfected its Seed, perishes every Year: from which rise up Stalks slender, hollow, smooth, not hairy, and seldom exceeding the height of two feet. They are divided into several

V. *Wild Cilley*, has a Root very large, and divided into several parts, white, and spongy, of a pleasant strong Smell, and with a hot and biting taste: This Root, tho' the Stalks fade and perish, yet lives, and the Leaves are green all the Year. The Stalks (if they grow in good ground) come to be three or four feet high, are hollow, jointed, pretty thick, green, and much Crested, sending forth out of the bosoms of the Leaves many Branches, which have on their tops, Umbles of white Flowers, each Flower consisting of five little Leaves; of which the lowest is twice as big as the rest; the two side ones less; the uppermost the least of all. The Leaves are large like those of Myrrhis, or Sweet Cilley, but of a dark green color; and those which grow on the Tops of the Stalks, are commonly divided into three parts, and these again subdivided into several long sharp pointed and snipt Leaves, like those in Sweet Cilley, the Seeds are longish, round, sharp pointed, black and shining. This Plant may very well be called Wild Cilley, for that it so much resembles the Garden Sweet Cilley, not only in its form, but (as Authors believe) in its Virtues too.

VI. *The Places.* The first grows almost in every Hedge, and by every Hedge side: The second, about Mudd Walls, High Ways, and such like places, about London, and many other parts of the Kingdom: it is but a small Plant. The third is found very frequently in all places, especially where the ground is moist and fat, in Meadows, Orchards, and the like.

VII. *The Times.* The first flowers in June and July, and the Seed ripens in the mean Season, or not

not long after. The second comes up in March, flowers in May, and its Seed ripens in June. In Italy they eat the young Leaves in Sallets, and call it *Wild Chervil*. The third flowers also in May and June, and its Seed ripens in the mean Season, or not long after.

VIII. The Qualities, Specification, Preparations and Virtues, are said to be the same with the *Garden Chervil*, to which I refer you. Parkinson says, that *Wild Chervil* will help to dissolve any Tumor or Swelling, and that in any part of the Body, as also to take away the spots and marks in the Flesh and Skin, proceeding from Congealed Blood, by bruises or blows, in a short time, by applying it (bruised I suppose) to the place.

IX. A Cataplasim of the green Herbs and Roots. I once knew a Man who had been for a long time, even for many years, afflicted with the Gout; so that sometimes for four, five or six Months together he could neither go nor stand, which put him so much out of heart, as to think himself past all cure. A Beggar Woman going by, and begging at the Door, at such time as the Paroxysm was upon him, and understanding by some Discourses the Masters illness, told them she would cure him: she advised him to apply a Pultice of green *Wild Chervil* to the parts afflicted, and to renew it as often as he saw need: (fetching to him also at the same time some of the Herb, that he might know it:) he did so, following exactly the Beggar Woman's advice, and he had in a little time ease, and in less than a Months time a perfect Cure. If at any time afterwards he found any Grumbling Pain, in the same parts, or in any other, he had still recourse to the same remedy, and aver'd upon his faithful word, that he never apply'd this Cataplasim in vain.

CHAP. CXXV.

Of CHERVIL Tooth-pick.

I. THE Names. It is called in Greek, *Τρυζιδω*: In Latin, *Gingidium*, and *Bisacuta*: In English, *Tooth-pick Chervil*, and *Strange Chervil*. The Syrians call it *Vishaga*, as Rauwolfius saith.

II. The Kinds. There are three principal kinds, 1. *Gingidium verum*, five *Syriacum Dioscoridis*, *Syrian Tooth-pick Chervil*, called in that Language *Vishaga*. 2. *Gingidium Hispanicum Matthioli*, The Spanish kind. 3. *Gingidium Chercsolij, Folis Tabernmontani*, *Tooth-pick Chervil*, with *Chervil* Leaves.

III. The Descriptions. The first has a Root almost like a Carrot Root, not great, but long, white and woolly, perishing every Year after Seed-time, which is the same Year it is Sown, or else springing up late, and not shooting up into Stalks for Seed, it will abide a Winter: from this Root it grows up with an upright Stalk, somewhat rough, branching forth from the very ground almost, on which are set Stalks of fine cut Leaves, smaller than Fennel, especially those on the Stalks and Branches, for the lowest are a little broader. At the tops of the Branches grow broad Umbles of white Flowers, somewhat purplish in the middle, which Umbles before they flower, hang down their Heads, and after the Flowers are past, the Umbles do contract, or draw themselves rounder, the outward parts being higher than the middle, which then is so hollow, that it represents a Birds Nest, something like to the Umbles of the *Wild Carrot*: The Flowers being past, there succeeds a great plen-

ty of very small Seed. The whole Plant has a kind of Resinous Taste and Smell. There is another sort also of *Syrian Chervil*, which has but a few Stalks of winged Leaves, almost like to *Parineps*, but that every divided Leaf is broad and round, but lesser; the Stalk is somewhat hairy, crested, small, low, and naked of Leaves to the top, whereon grow several long Stalks with Umbles of white Flowers, and two or three small long leaves with them, whose Smell and Taste is like the former.

The True Tooth Pick Chervil

Tooth pick Chervil.

IV. The Spanish Kind, has a Root long and white, from whence rises up a Stalk higher than the first Syrian kind, and is every ways greater, as to the whole,

whole, but the Stalk is more slender than it, and the Leaves more tender at the Joints, thicker, and more finely cut at the tops, on which stand large Umbles of white Flowers, divided into many parts, and standing upon long Stalks, which when the Seed grows ripe and hard, being long and slender, will serve very well for Tooth-pickers. Gerard says, that in its Leaves, Flowers, and knobby Stalks, it is like unto Wild Carrots, saving that the Leaves are somewhat finer cut, or jagged, and tenderer, but not rough or hairy at all, of a reasonable good Smell, and a bitter Taste, among which rise up bushy rundles, or spoky Tufts, like those of the Wild Carrot or Birds Nest, which are closely drawn together, when the Seed is ripe, at what time the sharp Needles are hardened, fit to make Tooth-pickers of, and for which purpose they very well serve; and from thence came the English name.

V. The third kind has a Root long, white, and bitterish, from which spring up drovers Stalks of winged Leaves, very like unto the Common or Ordinary Garden Chervil, but not divided into so many parts: the Stalk is round, striated and blackish, about a foot and half high, with Joints and Leaves like the others. The Umbles of white Flowers, are encompassed about with smaller and finer cut Leaves; when the Flowers are past, the Umbel is contralled together, which are clammy, and in which lies small Seed.

VI. The Places. They all grow in Syria; The second in Spain plentifully: but with us they are only nourished up in Gardens.

VII. The Times. They flower in July and August, and the Seed is ripe in October; but with us they flower late, and therefore the Seed is much later; so that if the Year is not hot and kindly, the Seed will scarcely ripen, or come to perfection with us.

VIII. The Qualities. They are said to be temperate in respect of heat or cold, and dry in the end of the Second Degree: Astringent, Stomack, and Alterative. They are more used as Nutriment than Medicine, both in former times and now, for Dioscorides and Galen say more concerning their Edible Properties, being eaten raw or boiled, or otherways ordered, according to several Mens liking, for that they are bitterish, and a little Styptic, and so the more welcome and agreeable to the Stomach: But Galen says, that they are rather Medicinal than Nutritive, for that though they may have a temperate Quality, as to heat and cold, yet that they have a manifest bitterness and astringency, by both which properties, though they may be very agreeable to the Stomach, yet they are more of the Nature of a Medicine, than of Food; for that by those Properties, they cleanse and dry up the moist Humors, which by superabounding, may offend the Stomach, and by it the Liver, and other parts.

IX. The Specification. Besides strengthening the Stomach, as aforesaid, they are proper against Diseases of the Reins, Ureters, and Bladder, and to provoke Urine.

X. The Preparations. You may have therefrom, 1. The Juice. 2. The Essence. 3. The Decoction in Wine. 4. The Spirituous Tincture. 5. The Acid Tincture. 6. The Oily Tincture. 7. The Quills on which the Seed does grow.

The Virtues.

XI. The liquid Juice. It is good against Vomiting, and strengthens the Stomach; it provokes Urine, and expels Sand and Gravel from the Reins and Bladder. The Dose is three or four ounces, Morning and Evening, in a Glass of White Port Wine.

XII. The Essence. It has the Virtues of the Juice, but strengthens the Stomach more, and is withal more Diuretick. Dose three or four ounces in White Port Wine.

XIII. The Decoction in Wine. It is an admirable Stomack; and being drunk to six or eight ounces, Morning, Noon, and Night, it opens Obstructions, and cleanses the Reins and Urinary parts of Sand, Gravel, small Stones, and Tartarous Slime lodged in those parts; but it is not full out so powerful as the Essence.

XIV. The Spirituous Tincture. It strengthens the Stomach, helps Digestion, cheers the Heart, revives the Spirits, and comforts Universal Nature. Dose a spoonful at a time.

XV. The Acid Tincture. It stops Vomiting, cleanses the Stomach of Tartar, and Viscosity, causes a good Appetite, and helps Wheezing, Hoarseness, and shortness of Breath.

XVI. The Oily Tincture. It is Nephritick and Diuretick, cleanses the Reins and Bladder, and so is good against Stone and Strangury. Dose twenty or thirty Drops in White Port Wine.

XVII. The Quills, Needles, or Tooth-pickers. They serve to pick and cleanse the Teeth and Gums of any thing sticking in them, which they do without any hurt to them, and leave a good scent in the Mouth.

CHAP. CXXXI.

Of CHICHLINGS Annual.

THE Names. I do not find that it has any Greek name: The Latins call it *Lathyrus*, which is a kind of Pease, (and differs from *Lathyrus*, Spurge:) We in English call it Chichling.

II. The Kinds. It is either Perennial or Annual: The Perennial we shall treat of when we come to treat of Pease Everlasting. The Annual is the subject matter of this Chapter: They are 1. *Lathyrus Annuus major Batiscus*, The Great Spanish Annual Chichling. 2. *Lathyrus Batiscus elegans, siliquis Orobi*, Spanish party-colored Chichling. 3. *Lathyrus major siliqua brevi*, The greater short-coddled Chichling. 4. *Lathyrus minor siliqua brevi*, The lesser short-coddled Chichling. 5. *Lathyrus, five Cicercula flore albo*, *Aracus Dodonæi*, *Eryum Lucune*, *Pisum Græcorum Tragi*, *Eryum album sativum Fuchsii*, *Eryum angulosum aliquibus*, White flowered Winged Chichling. 6. *Lathyrus, five Cicercula flore purpureo*, *Aracus five Cicera Dodonæi*, Purple flowered Winged Chichling. 7. *Lathyrus, five Cicercula Batica flore Caruleo*, *Aracus Hispanicus Camerarii*, *Cicercula Egyptica Clusii*, Blew flowered Winged Chichling. 8. *Lathyrus, five Cicercula flore rubente*, Red flowered Winged Chichling. 9. *Lathyrus, five Cicercula Batica Dametorum*, Wood Chichling.

III. The Descriptions. The first of these has a Root small, not running deep nor far, but persisting every Year; from whence proceeds two or three flat Stalks, three feet or more long, webbed as it were with skins or films on both edges, having two small Leaves apiece at each Joint, from whence shoot forth the Branches, bearing two pretty long and broad Leaves about the middle thereof, one opposite to another, with a twining Clasper or Tendril running between them. The Flowers stand singly upon long Footstalks, of a deeper purple color, but lesser than the Perennial: after which come long pale colored

Cods, very like the Perennial, as the Pease within them also are.

IV. The second has a small Root, from whence spring up Branches or Stalks five or six Feet long, with such like Welts, or skinny Membranes on both edges at every Joint, from whence come forth long Leaves, divided at the top into two other smaller Leaves, and higher upwards set with six Leaves on both sides: and in the middle between them comes forth a small Clasper or Tendrel, by which it catches hold of every thing which stands next unto it. At the Joints also come forth the Flowers, either one or two at the most, upon long Footstalks, like unto the other kind, the upper Leaf of a fine Crimson, or Orange color, and the other in the middle of a perfect White. After the Flowers are past, comes the Pease or Seed in long Cods, every Seed bunching out, as in the Cods of Orobus, and as large almost as the smaller Pease.

greater short coddled Chickling

V. The third has a small slender Root, from whence rises up several Stalks, which lye upon the ground, unless supported by something standing near them: in its manner of growing it differs but little from the former; but its Leaves are something longer, turning a little roundish, almost Cicle fashion'd. The Flower has its inner Leaves white, and the outward somewhat purplish, the Cods which follow are thick and short, which contain within them, small, round, blackish Pease.

VI. The fourth differs little from the last, but only in the smallness of the Plant, and the Cods, having a little roughness upon them.

VII. The fifth has a small Fibrous Root, perishing every Year, from whence springs up weak Winged Stalks lying along on the ground, if not supported by something near them, like as all the former, having also two small Leaves at the Joints, and two others narrower likewise on the Branches, which terminate in divided Claspers or Tendrels. The Flow-

ers are white, and stand on long Footstalks, which being past away, there comes after them short Cods, somewhat flat, with two little narrow films all along the back of them, which contain within them Seed, or Pease, flat, white, and cornered, and somewhat larger than those of the former sorts.

VIII. The sixth in its Roots, Stalks, Leaves, and manner of growing, is like the former: the Flowers and Seed chiefly declare the difference; the Flowers are of a dark dead purple color, and the Cods which follow, are smaller, with films at their backs like the former. The Seed or Pease within them, are also cornered, but of a dark brown color, so that they are almost black in appearance.

IX. The seventh has a small fibrous Root perishing as the rest do, every Year; and differs in nothing from the fifth and sixth, but in the Leaves, which are much larger; and the Flowers, which are of a pale blew on the outside, the inner Leaves being more blew. The Cods are small, and almost round, winged at the back like the former, in which is contained brown cornered Seed.

X. The eighth has Roots, and Stalks, like the last, and resembles it in its manner of growing; but its green Leaves are narrower and longer than those, and its Flowers are of a dull dead kind of Orange color, which being past away, there follows short Cods, and somewhat round, with brownish cornered Seed.

XI. The ninth has a small fibrous Root as the rest have, from whence there comes forth several long, weak Stalks with films on the edges; at the Joints are two small Leaves, and from between them come forth the Branches, which have several small dark green Leaves on them, somewhat round at the ends, and are sometimes three on a side, and sometimes but two, but not always one against another. From the bottom of the Stalk and Branches, come forth commonly two Flowers on a long Footstalk, the upper Leaf being reddish, and the other purplish, after which come forth long smooth Cods, without any film at the back, containing within them, round, but somewhat flat Seed, or Pease, of a brownish color.

XII. The Places. They all grow in Spain, from whence they were first brought to us: the first four grow Wild: the latter five are Manured there: but with us they all grow only in Gardens.

XIII. The Times. They Flower in July, and the Seed is ripe in August or September.

XIV. The Qualities, Specification, Preparations, and Virtues, are the same with our Pease or Beans, to which we refer you. The five last Manured sorts, Boel says, are eaten by the poor People of Spain instead of Bread; for where these are eaten for Food, seldom any Bread Corn is eaten: They are of a very solid Substance, and extremely Nutritive, and therefore nourish more than other Grain, but are more hard of Concoction.

C H A P. CXXVII.

Of CHICKWEED Common.

I. **T**HE Names. It is called in Greek, *Άλφιν*: In Latin, *Alfina*: In English, Chickweed.

II. The Kinds. There are three principal kinds, 1. *Άλφιν κοινόν*, *Alfina Communis*, Common Chickweed. 2. *Άλφιν ενδής*, *Alfina aquatica*, Water or Marsh Chickweed, of which in the next Chapter. 3. *Άλφιν ερίν*, *Alfina notha*, Buffard Chickweed, of which we shall treat in Chap. 129. Of the Common kind, there is, 1. *Alfina maxima*, *Lug-danensis*,

Aurens; *Angustifolia Bauhini*, Our Greatest Chickweed: Gerard calls it, *Alfne major*. 2. *Alfne minor*, Our Common small Chickweed. 3. *Alfne Baccifera*, and *Baccifera repens*, *Cucubulum Plinij*, *Alfne repens Clusij*, Berry-bearing Chick-weed, and Spreading Chickweed.

III. The Descriptions. The first has a white thready Root, small, and consisting of several little strings like hairs, from whence rise up Stalks a foot or foot and half high, and sometimes higher, a great many from one Root, long, and round, slender, full of Joints, with two Leaves growing out of every Knot or Joint, almost as large, and as long or longer than Pellitory Leaves, to which they are very like in shape or form, but smooth, without any hairyness or downiness; and of a light green color. The Stalks are somewhat clear, and as it were perucid, or transparent, and about the Joints they are often of a very light red color. The Flowers are at the tops of the Branches, being white, and consisting of six Leaves apiece, standing in long green Husks, not much unlike to the Flowers of Starchwort, but lesser. Which being past, in their places succeed long Knops, or Seed Vessels, but not great, containing within them small yellowish Seed.

IV. The second has a Root white, and full also of little strings, from whence spring many Stalks or Branches, as in the former, which for the most part lye upon the ground: The Stalks are small, round, long, slender, brittle, or very tender, and jointed: from which slender Branches spring Leaves, resembling the precedent, but much less, as is likewise the whole Plant, which in no respect attains to the greatness of the former, the Flowers are also in like manner white and small, standing in like fashioned green long husks, which being past, the said Husks or Knops contain small yellowish Seed.

V. The third has a Root which is white and long, creeping much under ground, and shooting forth in divers places every year new shoots, the old dying away every Year: from this Root come forth many flexible Branches full of Joints, rising higher than

a Man, if it stands by bushes or other things, where it may take hold; otherwise, through weakness, they lye upon the ground, and so seem not so long or tall. At every one of the Joints stand two Leaves, one against another, much like to the Common Great Chickweed Leaves, but larger, and coming somewhat near to those of Pellitory of the Wall, and of a fresh green color. At the Joints also, on both sides of the Stalks come forth other Branches, jointed and set with the like fashioned Leaves in the same manner, and at the ends of them large, green, round Husks, ending in five points, with white Flowers growing out of them, consisting of five, and sometimes of six white Leaves apiece, cut in at the ends: in which Husks, after the Flowers are past, stand small round Heads, like Berries, green at the first, and blackish when they are ripe, containing within them many flat, blackish, purple Seed. This Plant has only an herby taste, like to the Common Chickweeds, and therefore the Learned Botanists refer it to them.

VI. The Places. The first grows almost every where throughout England, by Highways and Ditch sides, in moist and waty places, especially if the Earth is rich. The second is found also in many of the like places, as also in Gardens, where many times it is a most pernicious Weed. The last, *Clusius* says, grows in several places of Spain and Germany; as also in Flanders and England, as *Pena* and *Lobel* say; *Parkinson* says, that he had sometimes found it by Hedge sides in our own Land.

VII. The Times. Chickweed is mostly green in Winter; they Flower in Spring and Summer; and their Seed is ripe in June and July.

VIII. The Qualities. They are cold and moist in the second Degree: Emollient, Arrhritick, Anodyn, and Alterative: *Galen* and *Oribasius* say, they are without any Astringent Quality.

IX. The Specification. Their Juice is peculiar against the Inflammation called *St. Antonies* fire.

X. *The Preparations.* You may have therefrom,
1. *A Juice.* 2. *An Essence.* 3. *A Distilled Water.*
4. *An Oil.* 5. *A Cataplasim.* 6. *A Compound Oil.*

The Virtues.

XI. *The Juice.* It is very Cooling and Emollient, without any binding property. *Galen* and others say, that it has the Virtues of *Pellitory of the Wall*; but that I doubt; however it is commonly found to be as effectual as *Purslain* to all the purposes whereunto that serves, except for Meat or Salleting only. Applied with Cloths or Spunges dipped therein, to the Region of the Liver, and as they dry, to have fresh applied, does wonderfully temperate the heat of the Liver. The same also is effectual for all hot Apoplems and Tumors wherefoever, and is profitable against *Ignis sacer*, or *Antonies Fire*, and the like; as also for all redness of the Face, Wheals, Pustles, Itch, Scabs, either simply used, or made into an Ointment with Lard. It is good for all heat and redness of the Eyes, being dropt into them; also put into the Ears warm, it eases their pain proceeding from a hot cause. The Piles bathed, or fomented therewith, it abates their pain, and takes away their heat and sharpness, and eases all other pains of the Body proceeding from heat and sharpness of Humors. It is good against hot and virulent Sores and Ulcers in the Privy Parts, Legs, or elsewhere, they being often washed therewith.

XII. *The Essence.* It cools Inflammations of the Lungs, without any binding property, and takes away the heat of the Stomach and Liver, breaking out into the Lips, causes Appetite, being lost thro' too much heat, is prevalent against *Hætick Fevers*, as also the heat and pain in the Back, and the sharpness and scalding of Urine. Dose from one to two or three ounces Morning and Night.

XIII. *The Distilled Water.* It has the Virtues of the Juice, but much less effectual; and may be used as a Vehicle to take the Essence in.

XIV. *The Oil.* Made by boiling the Herb in Oil Olive, till it is crisp, and repeating it three or four times with fresh Herbs, it heals sore Legs, Ulcers, Wheals, Pustles, Scabs, and the like: and being anointed upon thrunk up Sinews, it extends them, eases their pains, and makes them pliable again.

XV. *The Cataplasim.* Take of Chickweed four handfuls: Marsh-mallows, two handfuls; mix and boil them to a Pultise, with *Kenugreek Seed*, Linseed, ana, two ounces, bruised. This applied to Tumors, or Apoplems, ripens and breaks them, asswages the Swelling, and eases the Pain.

XVI. *The Compound Oil.* Take green Chickweed, fresh Red Rose Leaves, of each two handfuls: Oil of Trotters, two pounds: boil till they are crisp, and strain out: repeat this boiling with fresh Chickweed, and Red Rose Leaves, twice more: strain out, and keep it for use. Being anointed warm, and well rubbed in upon Sinews which are strained, it is a most excellent thing: Let it be used Morning and Evening, and in a little time the Patient will be cured.

XVII. *The Virtues of the Alfine Baccifera.* Some Authors say, that it is no less fatal to be eaten than the sleepy *Nightshade*: but others say, of the *Cacubulum Plinij* otherwise: and that if the Leaves thereof be beaten with some Vinegar, and applied to the place stung with Scorpions or Serpents, it helps them: And that the Juice thereof taken, with twice as much honied Wine, it eases the pains of the Back and Loins; also the Head-ach (from a hot cause) if it is applied with Rose Water to the

Forehead and Temples: and that being bound to Wens or Kernels, or they bathed often with its Juice, it dissolves them.

C H A P. CXXVIII.

Of CHICKWEED, Water.

I. *THE Names.* It is called in Greek, *ἄλφινα ὕδωρ*: In Latin, *Alfine Aquatica*: And in English, *Water Chickweed*.

II. *The Kinds.* It is fivefold, 1. *Alfine aquatica major*, The greater Water Chickweed. 2. *Alfine aquatica minor*, The lesser Water Chickweed. 3. *Alfine aquatica minima*, & *serpillifolia Bauhini*, The smallest Water Chickweed. 4. *ἄλφινα θαλάσσια*, *Alfine marina*, Sea Chickweed: *Lobel* calls it, *Hippia major*; and *Casalpini*, *Centunculus*. 5. *Alfine recta*, flore *Ceruleo*, Upright blew Chickweed. There is another which some account a Sea Chickweed, viz. *Alfine Palustris minor folio oblongo*, which others more properly call, *Portulaca marina*, Sea Purslain, and under that Title you will find it.

III. *The Descriptions.* The first of these has a creeping Root, shooting out with divers fibres, very long, and of the thickness of a Wheat Straw, not much unlike to the Roots of Quitch-grass, from whence rise up divers upright Stalks, slender, and jointed from the bottom to the top, set with pretty large sharp pointed Leaves, standing by pairs at certain distances, somewhat like those of Pellitory of the Wall. At the tops of the Stalks grow small white Flowers, like to the other Chickweeds, or like to Stitchwort, but lesser, having many small and pointed Leaves in each Flower, after which come small whitish yellow Seed.

IV. The second of these has a bunchy fibrous Root, from whence several weak and tender Stalks rise up, jointed like the former, and with Leaves at the joints, as in the other, not much unlike in shape and

and bigness to the Lesser Chickweed, in the former Chapter. The Stalks rise up sometimes to be a yard high, full of Branches, and small long Leaves on them, of a pale green Color. The Flowers are many, which at the tops of the Branches are small and white, consisting of five Leaves apiece; after which follows in Husks small yellowish Seed.

Smaller Water Chick weed

Smallest water Chick weed

V. The third, or smallest kind, *Serpillifolius*, has a small Root, with many fibres, from whence spring

up many weak and tender creeping Branches, set with two narrow sharp pointed Leaves at each Joint, green above, and of a whitish color below; at the setting on of these Leaves grow small Vessels parted as it were into two, with a little crest on each side, in which Capsule are contained very small Seed.

VI. The fourth, or *Alfine marina*, has a bunched and three ly Root as some of the former, which sends forth for the most part Branches tying upon the ground, very like unto the lesser sort of Chickweed in the former Chapter, but that the Stalks are shorter, and thicker, and closer jointed, with Chickweed like Leaves on them, yet thicker, and whiter: The Flowers also stand at the tops of the Branches, and are composed of many small Leaves in form of a Star; which being past away, the Seed Vessels follow, which are long and round like the others, but flat, and somewhat broad, in which are contained three or four greater Seeds.

Sea chick weed.

VII. The fifth has a Root white and long, with some fibres thereat, from whence rise up for the most part several upright Stalks or Branches, jointed in several places, and divers small Leaves growing thereon at the manifold Joints, somewhat divided like unto Leaves of Rue, and a little resembling a Trefoil Leaf: at the tops of the Joints come forth small blew Flowers, consisting of four Leaves apiece: which being past away, there appears small round Chickweed like Heads or Husks, with small Seed therein.

VIII. The Places. The first three, and the fifth, are found to grow in or near Waters, and Watry places in most Parts of England. The *Serpillifolia* may be found in Watry places, between Clapham Heath and Tooting, and between Kentish-Town and Hamstead. And the fourth grows near the Sea shore, and in Salt Marshy places, upon several Coasts of this Kingdom.

IX. The Times. Their Flowering time is in the heat of Summer, and their Seed ripens in the mean Season, and in a little time after.

X. The Qualities, Specification, Preparations and Virtues, are the same with those in the former Chapter, to which we refer you.

C H A P. CXXIX.

of CHICKWEED, Bastard.

I. **T**HE Names. It is called in Greek, *Ἀλφεινὴ* : In Latin, *Alfine notha* ; and in English, *Bastard Chickweed*.

II. The Kinds. There are many kinds hereof, but these following are chief. 1. *Alfine foliis subrotundis* Veronica, Speedwell Chickweed. 2. *Alfine folio Triplinari*, Germander leav'd Chickweed. 3. *Alfine sparia prior Dolonei*, *Alfine folio hederae minor*, Ivy leav'd Chickweed. 4. *Alfine hirsutia foliis Auriculae Maris*, Hairy Chickweed, with Mouse Ear Leaves. 5. *Alfine viscosa*, Clammy Chickweed. 6. *Alfine Petrea*, Stone or Rock Chickweed. 7. *Alfine fluvialis*, River Chickweed.

III. The Descriptions. The first of these has a small and thready Root, which perishes not in the Winter ; from whence many Branches spring up, and spread abroad, full of small and almost round Leaves, set in couples or pairs, very like to those of Veronica, or Pauls Betony, called Speedwell, but not like to Elatine or Fluellin of any kind. The Flowers grow at the Joints with the Leaves, from the middle of the Branches upwards, being very small, made of five blew Leaves, after which come small flat Seed Vessels like Pouches, in which is contained small round yellowish Seed.

IV. The second has a small long Root, full of many fibres or threads, which continue all the Winter, from which come forth several small weak Branches spreading upon the ground, three or four Inches long, set with small and somewhat round Leaves, which are dented about the edges, and pointed at the ends, standing by couples one against another : At the Joints whercof towards the tops, come forth small blew Flowers, and fourtimes white, consisting of five round pointed Leaves ; after which succeed small round Seed Vessels, two always joined together, having small round Seed within them.

V. The third or Ivy leav'd Chickweed, has a small and thready Root, from whence rise up hairy tender Stalks or Branches, many of which spread themselves upon the ground, set with two Leaves at a Joint, hairy and Ivy like, but nothing so large. The Leaves, says Gerard, resemble the Back of a Bee when it flies. The flowers grow at the tops,

and consist of five small blew round pointed Leaves, which being past away, round Heads or Husks appear, in which is contained small Chickweed like Seed.

VI. The fourth, or Hairy leav'd Chickweed, has a very small Root, with a few Fibres at it, from which spring up several hairy Stalks or Branches, which creep upon the ground ; upon which grow in pairs, small, long, whitish, hoary Leaves, of a Mouse Ear like fashion : the Flowers grow at the ends of the Branches, of a bluish color, which give long and pointed Seed Vessels, in which is contained small Seed, like that of the Common Chickweed.

VII. The fifth, or Clammy Chickweed, has a small fibrous Root, from whence come forth Branches, which stand more upright than the last, with rough, hairy, and clammy Leaves, somewhat like the Common Chickweeds, but of a more blewish green. The Flowers are small and white, and scarcely open themselves but in the hot time of the day, standing at the tops of the Stalks, which from the middle upwards are so clammy, that they will stick to ones Fingers, if touched, whereby they are apt to catch Flies, and other small things which fall upon them.

VIII. The

VIII. The sixth, or Stone Chickweed, has a small and thready Root, which sends forth many small and upright Branches, thick set; which so interfere one with another, that the whole Plant (which is indeed but a small Herb) seems like unto a small Bush. The Leaves are small and pointed; and the Flowers small and white, like the other Small Chickweeds. Which being past away, round Heads or Husks come forth, like unto those of *Lime Tree Flax*, in which the Seed, (which is very small) is contained.

IX. The seventh is a Bastard kind of Chickweed, growing by River sides; it is a very small Plant, but has an admirable thick matted Root like a Haddock, made up of a vast number of fibrous or thready strings, from whence rise up many small tender Branches, stretching or trailing along the Stream, upon which grow long Leaves, having a long middle Rib, upon which grows on each side thereof a great number of other smaller Leaves, like those of *Lentils*, or the *Wild Vetch*. The Flowers grow at the tops of the Stalks, which are small and white, after which comes in husky Heads a small Seed.

X. The Places. The sixth grows on Mountains, and in Stoney and Rocky places: the seventh grows in Rivers: the others grow in Fields, as well Till'd, as Untill'd, and by Way sides, &c.

XI. The Times. They do all Flower in Summer, some in the latter end of May; and some in June and July; some earlier, and some later than others; and their Seed is ripe quickly after; but the fourth or hairy Chickweed Flowers not till Autumn.

XII. The Qualities, Specification, Preparations, and Virtues, Authors assent to be the same with those of the Common Chickweed, to which you are referred; and therefore we shall say no more of them in this place.

spreading and creeping on the Earth, with long slender Branches, or Strings, like to the Strawberry Plant, which take Root again, and shoot forth many Leaves. These Leaves are five in number, (sometimes seven, though but rarely) long, finely dented about the edges, and ending in a pretty sharp point, somewhat hard, and of a lightish green color. The Stalks are slender, leaning downwards, and bear many small yellow Flowers, with some yellow threads in the middle, standing about a smooth green Head, which when it is ripe is a little rough, and contains small brownish Seed.

Cinkfoil

CHAP. CXXX.
OF CINKFOIL.

I. THE Names. It is called in Greek, *Πεντάφυλλον*: In Latin, *Pentaphyllum*, and *Quinquefolium*, a numero foliorum: In English, *Cinkfoil*, and *Five-leav'd Grafs*.

II. The Kinds. Authors make at least sixteen Kinds, or more; many of which grow not in England, nor any place belonging to our Territories: The most usual with us are, 1. *Pentaphyllum Vulgatissimum*, Our most Common Cinkfoil. 2. *Pentaphyllum majus album Vulgare*, The Greater Common white Cinkfoil. 3. *Pentaphyllum magnum flore luteo vel albo*. The Great Common Cinkfoil with a white or yellow Flower. 4. *Pentaphyllum rubrum Palustre*, Red Marsh Cinkfoil. 5. *Pentaphyllum spinum Potentilla facie*, Low Silver-weed Cinkfoil. 6. *Pentaphyllum incarnum repens majus & minus*, The Greater and Less creeping hoary Cinkfoil. 7. *Pentaphyllum rectum majus & minus*, The Greater and Lesser Upright Cinkfoil. The first of these is called generally by all, *Pentaphyllum*, or *Quinquefolium vulgare*, and *Quinquefolium majus repens Bauhini*, Common Cinkfoil. The second, *Quinquefolium album*, and *Quinquefolium album majus alterum Bauhini*. The third is called, *Quinquefolium album majus caulescens Bauhini*.

White Cinkfoil.

III. The Descriptions. The first has a Root of a blackish brown color, very rarely so large as ones little Finger, but growing long, with several fibres springing from it; and by which small strings it quickly spreads over the place it grows on: From this Root rises up several weak Stalks, lying on,

IV. The

IV. The second has a Root thick and long, blackish on the out side, but reddish within, having many fibres appertaining to it. From whence spring forth Stalks with many Leaves, also Leaves growing from the Root. The Stalks are small, weak, and a little hoary, and the Leaves springing from them are five-fold, or divided into five parts, a little dented and pointed at the ends, green on the upper side, and a kind of hoary white underneath: between these Leaves grow weak Branches, leaning down to the ground near a foot long, with many such like Leaves on them, but lesser than those below. The Flowers are about the largeness of the former, but not full out so large as the next following, of a white color, consisting of five rounder pointed Leaves than the others are, having a nick in the middle, and several small yellow threads in the middle of the Flower, set with a woolly Head, having many small Seeds set together like unto a Crowsfoot head of Seed. Of this kind there is another whose green Leaves are not dented about the edges, little differing in any thing else.

V. The third has a Root somewhat thick and long, of a blackish brown color without, and reddish within: From this Root spring forth many Leaves, also Stalks or Branches, the Leaves stand upon their own Stalks, and are divided into five parts, as if they were five several Leaves, dented about the edges, and almost sharp pointed, very like to the first or Common Cinkfoil, but that these are every ways larger, and a little hoary; from which rise up straight or upright Stalks for a while, till they are grown up to a considerable length, then they incline, or lean somewhat down towards the ground, as both the former do. These Stalks are a little hoary also, and divided near their tops into two or three Branches, and they again into others smaller; upon the tops of every one of which grows one Flower, of a white color, and larger than in either of the former, consisting of five Leaves, as all the other sorts do; in the middle of which stands a small downy head, encompassed with many reddish yellow threads. This kind, says Gerard, is so common, and so universally known, that he thought it needless to give any Description thereof. Johnson upon Gerard says, it has many long slender Stalks lying spread upon the ground, out of which grow Leaves, made of five longish snipt Leaves, fastened to one long Footstalk; the Flowers also grow upon the like Footstalks, and are composed of five yellow Leaves. The Root is pretty large, of a reddish color, and round, but dried, it becomes square.

VI. The fourth, or Marsh kind, has a Root of a Woody substance, with some fibres, or thready strings adjoining thereto: From which Root rise up Leaves almost like to the former, consisting of five parts, notched about the edges, and standing close together at their lower ends, upon one long Footstalk: the Stalks are about a foot and half high, and of a reddish color; The Flowers grow at the tops of the Stalks, like unto the other Cinkfoils, save that they are of a dark red color; in a word the whole Plant is very like to the other kinds, especially the great Kind last before this described.

VII. The fifth or Silver-weed Cinkfoil, has a Root small, long, and blackish, like the first Common Cinkfoil: from which springs forth long Stalks of Leaves, divided into many parts next the ground, set on each side thereof, two at a space, one against another, and an odd one at the end, all of them dented about the edges, very like unto Wild Tansey Leaves, but not hoary, or silver like, as they are, but only green. The Flowers come forth at the joints with the Leaves, towards the tops of the Stalks, which Stalks creep not, nor stand upright, but being weak lean down towards the ground, having very long

Stalks of Leaves on them. The Flowers which grow on the tops of the Stalks, are lesser, and less divided than those which grow below: they are single, every one by its self, small, of a pale yellow color, and with a head in the middle, which after it is ripe, is like unto the other Cinkfoil heads of Seed, viz. like to a small, hard, dry Strawberry.

Cinkfoil wit wild tansey leaves

VIII. The sixth, or Hoary Kind, is all over hoary, whence it took the name of Incanum: It has a long slender Root, and Woody, from whence rise up several

veral woody thick Stalks, somewhat red, wrinkled also, and of a brown color, which grow of unequal lengths from the Root, spreading themselves into many Branches, shadowing the place where it grows. The Leaves are thick set, and snipt on the edges, almost like Tormentil, and are thought by some to be of equal force with it against Poyson, and for which reason, some have thought it to be the Leucas Diofcoridis. The Flowers stand also upon long Footstalks, and consist of five yellow Leaves apiece, having a yellow thrummy head in the middle like to the other Cinkfoils. This is twofold, viz. the Greater and Lesser, which differ in nothing but in their magnitude.

IX. The seventh, or Upright Kind, has a thick black fibrous Root, from which spring forth Leaves and Stalks: the Leaves stand upon long Footstalks, the Stalks are strong and upright, not much above half a yard high, spreading forth several ways into divers Branches. The Leaves are somewhat longer, larger, and greener than any of the former kinds, stand upon long Footstalks, and are divided into five parts, as the others, and dented about the edges; sometimes into seven, but that more rarely, having three Leaves only at the top. The Flowers grew at the tops of the Stalks, which are large, and of a pale yellow color, and in some Plants of a purplish color, which turn into Seed, much as the other kinds do: this is the Greater kind. But there is a Lesser of this Upright Kind, which has smaller and rounder Leaves, of a sad green color on the upper side, and grey or hoary underneath; the Stalks are tenderer, and lower, the Flowers on the tops smaller, and of a more Gold yellow color, in which consists the chief difference.

X. The Places. The first grows almost every where throughout England, by Highway sides, Ditch sides, and other Untilled places. The second is found in shady and woody places, under Hedges, and other moist places, and by Highway sides. The third is to be found growing almost every where upon good Ground, by Highways, and in low and moist Meadows. The fourth grows in Moist and Marshy Grounds, and in Watry places; it grows in a Marshy Ground adjoining to the Land called *Bourn Ponds*, half a Mile from *Colchester*, from which place, Gerard says, he brought some Plants for his Garden, in which they flourished and prospered well. The fifth, Gerard says, grew upon Brick and Stone Walls about London. The sixth, Gerard says, is a rare Plant, and that he found it growing on the Mountains of the Peak, and dry Gravelly Valleys. The seventh grows in many places of France and Germany, where it bears white Flowers; and in Italy, where the Flowers are purplish; but with us it is only nourish'd up in Gardens.

XI. The Times. They are said to Flower all the Summer Months, as May, June and July; even from the beginning of May; and the Seed ripens in the mean Season.

XII. The Qualities. The Cinkfoils are Temperate in respect of heat or coldness, but dry in the third Degree. They are Absterive, Neurotick, Arthritic, Alterative, Analeptick, and Alexipharmick. Although it is supposed by Authors, that they have all one and the same Virtues, yet it is manifest, that some of them are stronger, and more efficacious than others. Those which are esteemed the most powerful, are the first, second, third, and seventh, these are the chiefest for use, and strongest in effect, of all the rest, and are held to be as effectual for all the purposes whereunto Tormentil is applied, so that instead thereof, and where that is wanting, Cinkfoil says Parkinson) may be used to as good purpose.

XIII. The Specification. It is an especial remedy against Agues and Fevers, and to stop all sorts of Fluxes, whether of Blood or Humors, in any part of the Body whetsoever.

XIV. The Preparations. You may prepare therefrom, 1. A liquid Juice. 2. An Essence. 3. An Infusion or Decoction. 4. A Powder of the Root. 5. A Vinegar. 6. A Cataplasm. 7. A distilled Water. 8. A Spirituous Tincture. 9. An Acid Tincture. 10. An Oily Tincture. 11. A Balsam, or Ointment. 12. A Collyrium.

The Virtues.

XV. The Juice. It is good against all sorts of Agues and Fevers, whether Continential, Continual or Contermittent: whether they be burning Fevers only, Malign, or Pestilential. It cools and attemperates the Blood, and Humors, and is an excellent thing for a Lotion, Injection, Gargle, and the like, for sore Mouths, Ulcers, Cankers, Fistulas, and other corrupt, foul, and running Sores. The Juice is given to four ounces at a time, for some Days together, two or three Hours before the coming of the Fit of an Ague, whether Quotidian, Tertian, or Quartan, it is said to cure it, but it ought to be drank Morning and Evening in the intermediate Days also. And taken in the same quantity for the same time, viz. for thirty Days together, it cures the Falling Sicknes, as also the Quinsy, and Yellow Jaundice, and all Fluxes in Man or Woman, as Whites, Reds, and Bloody Flux, Diarrhæa, &c. The Juice mixt with a little Honey, prevails against Hoarseness, as also the Cough of the Lungs.

XVI. The Essence. It has all the Virtues of the Juice, but more effectual to all the purposes aforesaid; besides which it is very effectual to cure Consumptions of all sorts, and to heal Ulcers of the Lungs: And if the hands be often washed therewith, and it is suffered every time to dry in of it self, without wiping, it will in a short time help the Palsie, or shaking of them.

XVII. The Infusion or Decoction in Red Port Wine. They have the Virtues of the liquid Juice and Essence, but not all out so effectual: yet however they are very powerful against all sorts of Fluxes of the Bowels: But where there is a sharpness of Humors, the Decoction is best made in Milk. The Decoction outwardly applied, and inwardly drank as a Diet drink, very much contributes to the Cure of the Gout and Sciatica; as also to consolidate Ruptures of the Bowels.

XVIII. The Powder of the Root. Taken to a dram Morning and Night, it is good against Fluxes of the Belly, ipitting and pissing of Blood, Ruptures, and Agues of all sorts; but it ought also to be given over and above on the day the Ague comes, three hours before the Fit, in a Glas of Red Port, or Red Florence Wine.

XIX. The Vinegar. The Roots boiled in Vinegar, and that held in the Mouth, is said to ease the pains of the Teeth: it also is good against all sorts of Nodes, Kernels, hard Swellings, and Excrecences growing in the Flesh, in any part, being applied thereunto. It allays all kinds of Inflammations, and alleviates Anthonic Fire and the Shingles; it prevails against Apostems, and painful Sores or Ulcers, attended with pain and putrefaction, as also all other kinds of running Sores, Ulcers, Foul Scabs, Itch, &c. It gives ease in pains of the Joints, and the Gout, whether in the Hips, Hands or Feet. It is also good against bruises, or hurts by blows, falls, or the like, and to stop the bleeding of Wounds in any part inward or outward.

B b

XX. The

XX. *The Cataplasma.* Made with Vinegar by boiling, and applied, it softens hard Tumors, is good against Contusions, stops the Flux of Humors to any part, and gives ease in the Gout.

XXI. *The Distilled Water.* It has some small matter of the Virtues of the Juice, Essence and Decoction; but is chiefly used as a Vehicle, to convey other Preparations in.

XXII. *The Spirituous Tincture.* It is a famous thing against all manner of Fluxes of Belly and Womb, but especially those of Blood; it stops spitting, vomiting and pissing of Blood, and wonderfully strengthens the Stomach, Bowels and Womb; and it timely and prudently given, prevails against a *Diabetes*, because by its Spirituous Nature, it so admirably strengthens all the Vessels and Passages. Dose two drams Morning and Night.

XXIII. *The Acid Tincture.* It has all the Virtues of the Vinegar at Sect. 19. foregoing, besides which it is an excellent Stomachick, stops Vomiting, strengthens the Stomach, cuts Flegm, causes a good Appetite and Digestion, opens Obstructions, and cleanses the Bowels: mixed in equal quantities with *Tinctura Martis*, and given Daily, Morning, Noon and Night, in some convenient Vehicle to one dram, more or less, it perfectly cures the Green-sickness in Virgins, and the Yellow Jaundice in Elder People.

XXIV. *The Oily Tincture.* It prevails against Defecations of the Skin, Scurf, Dandriff, Morpew, and that kind of Disease called *Acne*, *Leuce*, or the Spotted Leprosie; inwardly taken to half a dram, or one dram in White Wine, it admirably strengthens the Back, and eases the pains thereof; opens Obstructions of the Urinary Parts, and expels small Stones, Gravel, Sand, and other Tartarous matter.

XXV. *The Balsam or Ointment.* It digests contused Wounds; cleanses old, putrid, running Sores and Ulcers, dries them, and suddenly heals them. There are but few better Vulneraries than this Balsam and Ointment; and being applied to the Gout, especially the Balsam, it eases the pain, and so effectually draws forth the Morbifick matter, that for the most part the Patient remains perfectly cured.

XXVI. *The Collyrium.* It is made of the Juice mixed with Honey; a quarter of a pound of Honey to a pint of the Juice. Put into the Eyes, it clears the sight, and stops fluxes of Rheum falling down into them: there is nothing better for curing Ulcers in that part, the Eye being washed therewith three or four times a day. It is also an excellent Lotion to heal a sore and ulcerated Mouth, as also Ulcers in the Throat and Gums, the parts affected being often Gargled and Washed therewith: and if the sore or Ulcer seems to be inveterate, or putrid, the *Collyrium* will be so much the more excellent, if to the former quantity two or three ounces of Common Spirit of Wine be added.

to us, and therefore not to be taken notice of: Those which are Natives of our Countrey are chiefly three: 1. *Helianthemum Vulgare*, *Chamaecistus flore luteo*, *Flos Solis quorundam*, Our Common Dwarf Cistus, or small Sun Flower. 2. *Helianthemum flore albo*, White Dwarf Cistus. 3. *Chamaecistus serpilli foliis flore Carneo*, The Great Dwarf Cistus with Wild Time Leaves, and a bluish colored flower.

Dwarf Cistus
or Holy Rose

III. The Descriptions. The first has a hard and woody Root, of a brownish color, and growing in time to be somewhat great, and very long, and divided into small Branches at the lower end: From this Root come forth several small and weak, yet hard and almost woody Branches, lying for the most part round about the Head of the Root upon the Ground, on which grow by pairs, many small and somewhat long Leaves, thick, fat, and full of substance, a little soft or hairy, or covered with a soft Down, with other small Leaves also growing between them: at the tops whereof stand three or four small pale yellow, and sometimes gold yellow colored Flowers, consisting of five round pointed Leaves apiece, with some yellow threads in the middle, of a pretty savor or smell in some places, but less or none in others: which being past away, there follow small round Seeds, in which are contained small yellow Seed. This Plant dies not, but continues many years, increasing in its Branches, which yield a Viscous or Mucilaginous Juice, like unto Comfrey, and is of an Astringe, Astringent taste.

IV. The second has a Root like the former, and differs not much from it, but that it grows up somewhat higher, the Leaves are a little longer, and not so thick set together, also more Woolly and Downy, thereby obtaining a whiter color. The Flower has the same number of Leaves, is also somewhat longer, and white without; being in some places a little sweet, in others little or nothing at all; and its Taste is Astringent like the former.

V. The third has a Root very Fibrous, spreading much under Ground: from whence rise up many red-

CHAP. CXXXI.

Of CISTUS Dwarf.

I. *THE Names.* It is called in Greek, *Ἡλιανθεμὸν ἢ Χαμαίσις*: In Latin, *Helianthemum* and *Chamaecistus*: In English, Dwarf Cistus, and Small Sun-flower.

II. *The Kinds.* Parkinson makes Nine Kinds of this Plant, but a great part of them are Foreigners

dist Branches like unto Wild Time, with such like small Leaves set upon them very thick, or as it were in a double row, of a dark green color, and a little hairy or downey within, but a little longer and whiter next unto the Flowers, which stand three or four together, every one on a pretty long hairy Footstalk, consisting of five small yellow Leaves, like unto the other, and somewhat sweet.

VI. *The Places.* They all grow in divers places of England, but the first and second more especially in Kent, in almost all places throughout it, which in some places are greater than in others; but that with the *white Flower* is more rare to be met with than the other. The third is that which *Parkinson* thinks is most usual with us in England. *Gerard* says, that those of our English growth, he has found in many places, especially upon the Chalky Banks about *Gravefend* and *Southfleet* in Kent, and for the most part all the way from thence to *Canterbury* and *Dover*, they delighting to grow in rough, dry, and Sunny places in open Fields, and upon Mountains.

VII. *The Times.* They Flower in Summer, viz. in June, July and August; some earlier, and some later: but their Flowers are so soon fading, that they seldom endure above a day or two; and their Seed is perfected in some small time after.

VIII. *The Qualities.* They are temperate in respect of heat or coldness, and dry in the second Degree: Absterfive, Astringent, Vulnerary, Neutotick, Alterative, and Alexipharmick.

IX. *The Specification.* They are peculiar for stanching Blood, and stopping all Fluxes of Blood in any part of the Body whatsoever, whether inward or outward.

X. *The Preparations.* You may prepare therefrom, 1. *A liquid Juice.* 2. *An Essence.* 3. *A Decoction.* 4. *A Powder.* 5. *A Distilled Water.* 6. *A Spirituous Tincture.* 7. *An Acid Tincture.* 8. *A Syrup.* 9. *A Balsam or Ointment.* 10. *A Cataplasim.*

The Virtues.

XI. *The liquid Juice.* It dries and astringes, stops bleeding, spitting Blood, pissing Blood, overflowing of the Terms, and all other fluxes of Blood, and heals Wounds, by strengthening the Parts, and conjoining their Lips together: it prevails also against all manner of fluxes of the Belly, and consolidates Ruptures. Dose from one ounce to three in a Glass of Red Port Wine.

XII. *The Essence.* It has all the Virtues of the Liquid Juice, besides which it is powerful to Wash and Gargle sore Mouths and Throats, and to heal them; as also to cure Ulcers in the Privy Parts of Man or Woman, and old running Sores in other parts of the Body, as in the Legs and Feet, which have been of a long standing, and which by reason they are depending parts, by a defluxion of moist and sharp Humors, are kept long from healing; It is also good against Coughs, Colds, and violent Catarrhs, or defluxions of Rheum, which induces, by continuance, a Consumption. It cleanses, dries, and heals old Ulcers, and Conglutinates the Lips of Green Wounds, because it is very powerful in consolidating, binding and strengthening any part; and is as effectual as *Comfrey* for Ruptures, strengthening weak Joins, or any other Glutinating property, to which *Comfrey* is proper.

XIII. *The Decoction in Red Wine.* It has all the Virtues of the Liquid Juice and Essence, but not altogether so effectual; but drank from four to eight ounces, it stops Catarrhs, Coughs, and inward Bleedings, and heals a Rupture of any of the Vessels.

XIV. *The Powder of the Leaves.* It is wonderfully astringent, dries up moisture in running Ulcers, cleanses and heals: it is a peculiar thing against spitting and pissing of Blood, and the Disease called *Diabets*. Dose one dram, in some proper Vehicle.

XV. *The Distilled Water.* It is said to be a good Cosmectick, to beautify or make fair the skin of the Face, Neck, Breasts, and Hands, or of any other Parts of the Body.

XVI. *The Spirituous Tincture.* It has the Virtues of the Juice, Essence, and Decoction, besides which it is good against the stinging or biting of any Venomous Creature, stopping the farther spreading of the Poyson, and in a short time curing the sick. Dose one or two drams in a Glass of Canary, Morning, Noon, and Night.

XVII. *The Acid Tincture.* It prevails against the Malignity and Venom of Serpents, or the bitings of any other evil Beast: it is good against malignant Fevers, and the Infection of the Plague, and of any other malign or infectious Disease: it may be inwardly taken, and outwardly applied, in any of the cases aforesaid, where outward applications are requisite. It is good against a *Leuce*, or Spotted Leprosie, Scurf, Morphea, and such like, if it is mixed with the Distilled Water, and then the parts affected to be Washed therewith.

XVIII. *The Syrup.* It is an incomparable rhing against Coughs, Colds, Catarrhs, or sharp and Salt distillations of Rheum, and spitting of Blood, also all sorts of Fluxes of the Bowels. Dose two spoonfuls in some proper Vehicle, Morning, Noon, and Night.

XIX. *The Balsam or Ointment.* They are most incomparable Vulneraries, so that few Medicaments exceed them. They not only speedily cure Green Wounds by conglutination, but also digest Lacerated Wounds, and cleanse, incrustate, dry, and heal, old, foul, hollow, running Ulcers.

XX. *The Cataplasim.* Being applied, it is good against the biting or stinging of any Venomous Creature, staying the farther spreading of the malignity. Applied also in the Gout, from what cause soever, it eases the pain, prevents the defluxion, and quickly cures it.

CHAP. CXXXII.

Of CISTUS Male.

I. **THE Names.** It is called in Greek, *Kis-Sajpous*: In Latin, *Cistus mas*: And in English, *Male Cistus*, *Sage Rose*, and *Holly Rose*, as *Gerard* calls it.

II. *The Kinds.* It is either *Male*, of which in this Chapter: Or, *Female*, of which in the next. *Parkinson* makes four several kinds thereof, of which the first of them, viz. *Cistus mas*, or *Male Cistus*, is the chief which grows with us.

III. *The Description.* It has a woody Root, and will abide some years with us, if care be taken to keep it from the extremity of our cold Winters, which it will scarcely endure. From this Root grows up a shrubby Plant, about a yard or more high, having many slender, brittle, woody Branches, covered with a whitish Bark; on which grow many whitish green Leaves, long, and something narrow, crumpled, or wrinkled, as it were, with Veins, and somewhat hard in handling, especially the older Leaves, for the young ones are softer, something like unto

our Sage: Leaves, for the form and color, but much smaller, two always set together at a joint. The Flowers stand at the tops of the Branches, three or four together, upon several slender Footstalks, consisting of five small round Leaves apiece, somewhat like unto a small single Rose, or the Rose of the Wild Bryar, of a fine reddish purple color, with many yellow threads in the middle, without any Smell at all, and quickly fading or falling away, abiding seldom one whole day blown at most: when the Flowers are past, there come up round hard hairy Heads in their places, containing within them, small brownish Seed.

Cistus male & the *Hypocistis*

IV. The Places. It naturally grows in Italy, Spain, Portugal, and France, and other hot and Southern Countries: but with us it is only nourished up in Gardens.

V. The Times. In its Native places, it Flowers generally in May: but with us about the latter end of June, also in July and August; and the Seed is ripe quickly after.

VI. As to its Qualities, Specification, Preparations and Virtues, they are the same in all respect with those of the Dwarf *Cistus*, to which I refer you.

CHAP. CXXXIII.

OF CISTUS Female.

I. THE Names. It is called in Greek, *Κιστός* & *κιστός*: In Latin, *Cistus femina*: and in English, Female *Cistus*, or Sage Rose.

II. The Kinds. Parkinson makes eight several kinds of the Female *Cistus*: but two of them are

chiefly nourished up in our Gardens, viz. *Cistus femina*, The Female *Cistus*, specially so called. 2. *Cistus Annuus*, The Annual or Yearly *Cistus*.

III. The Descriptions. The first Female *Cistus*, has a woody Root like to the former, from whence grows a kind of shrub, lower and smaller than it, having blackish Branches, less woody, and not so brittle as the Male. The Leaves are somewhat rounder and greener, but a little hard and rough withal, growing in the same manner upon the Branches, as the other, by Couples. The Flowers grow at the tops of the Branches like to the Male kind, consisting of five Leaves, but somewhat lesser, and wholly white, with yellow threads in the middle, as soon fading, and of as little Scent as the other, but the Heads and Seed are somewhat larger.

IV. The second, or Annual *Cistus*, has a small woody Root, which perishes as soon as its Seed time is past; for the Plant endures but a Year, and therefore requires you to Sow it every Year, if you will have it: From this Root rise up strait, but slender hard Stalks, set here and there confusedly with long and narrow greenish Leaves, very like unto the Leaves of the Gum-*Cistus*, being a little clammy withal. At the tops of the Stalks, and at the joints with the Leaves, stand two or three pale yellow Flowers, consisting of five Leaves apiece, with a reddish spot, near the bottom of every leaf of the Flowers, which as soon fades as any of the former. The Flowers being past, small three-square Heads follow after, which contain within them small Seed like to the Female kind, but somewhat paler or yellower.

V. The Places. The first grows naturally in hot Countries, as Spain, Portugal, Italy, Languedock; The second in colder Countries, as Germany, Bohemia, Kriesland; and with us they are both brought up in Gardens.

VI. The Times. They Flower in the Summer Months, as June, July and August; and their Seed ripens in the mean Season.

VII. The Qualities, Specification, Preparations, and Virtues, are the same with the Dwarf *Cistus*, so that no more need be said of them here.

CHAP. CXXXIV.

OF CIVES, or CHIVES.

I. THE Names. They are called in Greek, *Σκηνόπρασον*: In Latin, *Schanoprasum*, as though you should say, *Funceum Porrum*, Rush Leek: In English, *Cives* or *Chives*, which are a kind of Small *Grafs* Leeks.

II. The Kinds. They are either *Schanoprasum sativum*, Garden Chives: or *Schanoprasum agrestis*, Field or Wild Chives.

III. The Descriptions. Chives have many little beaded Roots or Bulbs fastned together, out of which grow down into the Earth, a great number of white little threads, or strings, which have both the Smell and Taste of Onions and Leeks, jointly, so as if they were participating of both. From these Roots spring up about a handful high, long, slender, round, green Spires, almost like to Rushes, amongst which grow up small and tender Stalks, which send forth certain knops, or heads, like those of the Onion, but much less, in which are contained the Seed.

IV. The second, or Wild Kind, has a small, and somewhat Bulbous Root, but nothing near so many joined together, from which spring downwards a great

great many white threads or strings. And from the same upwards spring forth a great number of small blades, almost as high again as the former, harder, and of a darker green, and sometimes not absolutely round: otherwise (excepting their thick growing together) they are much alike, and differ but a very little in their Taste and Smell.

V. *The Places.* The first are nourished up, and grow only in Gardens: the other grows Wild in the Fields, and by way, sides in uncultivated places in several Parts of this Kingdom. I have found them by the sides of the Highway, and in the Field going from Canbury-Houfe near Iflington, towards the Boarded River, and that in several places as I walked along.

VI. *The Times.* They flourish long, and continue many Years, and well endure the cold of Winter.

VII. *The Qualities.* They are hot and dry in the third Degree; Aperitive, Absterfive, Digestive, Diffusive, Diuretick, and Suppurative; Stomatick, Pectoral, and Nephritick; Alterative, Emmenagogick, Lithontriptick, Alexipharmick, and Spermatogenetick.

VIII. *The Specification.* They are peculiar against Diseases of the Reins and Bladder.

IX. *The Preparations.* You may prepare from them, 1. A liquid Juice. 2. An Essence. 3. A Decolion. 4. A Distilled Water. 5. A Cataplasma. 6. The Seed.

The Virtues.

X. *The liquid Juice.* It provokes Appetite, causes thirst, heats, warms, and strengthens the Stomach, opens Obstructions, yet is something flatulent; it loosens the Belly, provokes Urine, and the Courtes, and is good against the bitings of Mad Dogs, Serpents, and other Venomous Creatures. Dose, one ounce or more in White Wine; it cures the Strangury, and is good against all Obstructions of the Reins, Ureters, and Bladder, expelling Stones, Sand and Gravel.

XI. *The Essence.* It has all the Virtues of the Juice, but is indeed more powerful; the constant use of this Preparation, or the Juice, admirably encreases Seed, and excites Venery. And this, or the former Juice, being snuffed up the Nostrils, it purges the Head and Brain, of cold, moist, and flegmatick Humors, and prevails against the Lechargy, and other Diseases of the Head and Brain, proceeding from cold and moisture. Dose from one to two ounces in any proper Vehicle.

XII. *The Decolion in White Port Wine.* It has the Virtues of the Juice and Essence, but not full out so powerful, and may be given against the Stone and Strangury, from four ounces to eight, once or twice a Day, as also in the Paroxyfin.

XIII. *The Distilled Water.* Being drank to fix ounces, or more, either alone, or mixt with White Port Wine, it provokes Urine, and is said by some to break the Stone, and drive it forth.

XIV. *The Cataplasma.* Made by beating the whole Plant with Mithridate, and Pulp of Figs, and applied, is good to ripen and break a Plague Sore, or any other Apofsem. It is profitably applied to Scaldings or Burnings by Water or Fire, or Gunpowder: As also to the Piles when extremely inflamed and swelled.

XV. *The Seed.* Made into Ponder, and given a dram at a time, it encreases Seed, and stirs up Lust both in Man and Woman: and given to Children which have Worms, it kills and expels them: It is also good against the bitings of Venomous Beasts.

CHAP. CXXXV.

Of CLAVER-GRASS.

I. *THE Names.* It is called of Dioscorides, as it is thought, in Greek, *Medon*: from its being brought from the Medes into Greece; and to the *Medicum malum*, or *Pomeatrum*, was so called, being brought first from Media: In Latin, *Medica*; and in English, *Claver-grass*. The Arabians call it, *Cot*, *Alasaleri*, and *Alfosofa*: and this is the very Plant which the French call *Saint Foin*, which our Moderns have found so mightily to improve Land.

II. *The Kinds.* This *Claver-grass* it self is a Species of the *Trefoils*, but being better known under this name, we thought good to treat of it here. *Claver-grass* is manifold, 1. *Medica legitima*, *Fenum Burgundiacum*, *Trifolium Cochleatum*, *Claver*, *Claver-grass*, *Medick Fodder*, *Snail Claver*, *Snail Trefoil*, and *Saint Foin*. 2. *Medica Racemosa*, *Trifolium Cochleatum Polycarpon*, *Clustering Snail Claver*. 3. *Medica Frutescens*, *Medica flore luteo*, *Trifolium Sylvestre luteum*, *Silvaia Cornuta*, *Lens major repens*, *Tabernmontani*, *Woody Snail Claver*. 4. *Medica Marina*, *Trifolium Cochleatum Marinum*, *Sea Claver*. 5. *Medica Cordata*, *Trifolium Cordatum*, *Heart Claver*, or *Trefoil*. 6. *Medica Lunata*, *Trifolium Lunatum*, *Moon Claver*. *Parkinson* has four other kinds, but these are the chief which grow in England.

III. *The Descriptions.* The first of these has a Root which runs deep down into the Earth, sometimes two feet or more; it is thick, and sends forth many tough thready strings, and continues long, sometimes ten, twenty or thirty Years. From this Root rise up several weak, green Stalks, with divers small sad green Trefoil Leaves, set thereon without order. The Flowers grow upon long Stalks, coming from the Joints.

Joints and Tops of the Branches, clustering in a thick short Tuft, of a blewish purple in those which grow in our parts, but in others of divers and several colors, as more purple, near a violet, or paler blew, or of a brownish blew, and yellow colors, parted: In some parts of Spain, and at Narbon in France, they are of a yellow color also. The Flowers being post, small, Snail-like, round Cods followe, set together, not so much inclosed as many other Medica's are, containing within them small pale colored Seed.

Claver-Grass, or Snail Trefoil of Lobel.

IV. *Observations.* 1. The Author of the *Country Lurme* gives a mighty commendation of this Plant; and says, That there is not any Pulse, or other Food which is more agreeable, and good for the Feeding of Beasts, than this *Claver-grass* or *Snail-Claver*, called by the *French, Saint Fein*, not only for the nourishing and fattening of Cattle, but also to cure Beasts which are sick. It is called *Burgundy-Hay*, because the *Burgundians* have always been very careful in Sowing this Herb, and managing Sandy and Barren Land therewith, for that it makes the Worst and Poorest Land very Rich and Fruitful. The benefit of this Herb is so great, that every good Husbandman ought to reserve a good part of his Ground to be sown therewith.

V. *Observat.* 2. In Sowing of this *Saint Fein* Seed, though it grows well in fit Grounds freed from Weeds, yet it grows also very well in Poor, Lean, Sandy and Barren Grounds, especially such as are eafie to be Plowed, and such as have been thrice Sown with Grain, before this is put into it, that it may the easier take deep rooting in the Earth, which it naturally does: but in sowing of this Seed, you must not be sparing of it, for by how much the more Seed you Sow, by so much the more will the Herb grow in thickness; nor will there grow any other Grass or Herbs there, by which the profit will be so much the greater.

VI. *Observ.* 3. As soon as it is Sown, it must be Harrowed several ways, as long ways, broad ways, and corner ways; and if it is a dry Season, and a dry Ground, it ought to be gently watered, but not in those Months between the latter end of Septem-

ber and beginning of April, lest any hard Frost should come, which might nip it, and so kill it. Authors also say, it ought to be Mowed, or Cut down, five or six times the first Year, others fly three or four times, but your Experience must guide you in this; and in after Years two or three times a Year, by which great advantages are made of it; and that Land which has not been worth twelve Pence an Acre *per Annum*, by the Improvements of *Saint Fein*, have in a few Years been made worth forty Shillings, and three Pounds an Acre, and sometimes more, which is much for the Encouragement of the Husbandman, to proceed in this kind of Husbandry.

VII. *Observ.* 4. The fit times for Cutting it down, are in May, June, July, and August, in the New of the Moon, but you must not let it lye upon heaps any longer than a Day in the Meadows, for if it should lye any long time, it would endanger the killing the Roots which are under it, and utterly destroy it, for which reason it is necessary to dry it forthwith, and as soon as may be, stirring and turning it every day from day to day, and then as soon as ever it is dry to carry it away.

VIII. *Observ.* 5. This is also to be taken special notice of, That none of your Cattel ought to feed on the Grounds on which it is sown, because it is apt to be killed by them, by bruising it with their Teeth in biting it off, whereas cutting it with a Sythe hurts it not: nor must Cattel be suffered to eat it green, because it is apt to make them Sick, by reason of its heat and moisture: for which reason it is always cut down, dried, and made into Hay; and then it is to be given to your Beasts, but in small quantity, because it breeds much Blood, Fleth and Fat, even to such a Degree, as with Fatness to choke them.

IX. *Observ.* 6. You must always be careful to gather and reserve Seed of this Grass, to Sow again, when you see you shall have occasion for it: it must not be gathered the first Year it bears, by reason of its weakness and poorness, but in all the following Years, so soon as the Husks in which the Seed is contained shall appear dry, and the Seed or Grains themselves are turned yellow, which will be in the Months of June and July, you may then save it.

X. *Observ.* 7. That this Grass being sowed in barren Land is very profitable there is no doubt; and it is considered that the first charge is the principal charge, even for a long time, it is so much the more valuable: for Land being once Sowed with this, it not only enriches the ground for the present, but for many years after: for this first sowing will be sufficient for ten or twelve Years, let the ground be what it will; and as the Soil may be, it may last twenty or thirty Years, or more, according as it is carefully lookt after, and well managed, which is a matter of so great weight, as ought to put every prudent Husbandman into the thoughts and consideration of it.

XI. The Second Kind has a Root long and running pretty deep into the ground, which endures long, from whence it has Branches lying upon the Earth, a foot in length or more, set with small round Trefoil Leaves on pretty large rootstalks: the Flowers of a purple color it sends forth at the Joints, on long rootstalks, small and many clustering together, after which come forth somewhat rough, small, wrinkled Snail-like Shells or Husks, in which are contained the Seed.

XII. The third, or Woody Snail Claver has a long Root, consisting of many long strings, and contains many Years, shooting forth new Stalks every Year, which are many, hard, round, flexible, and so weak as not to be able to stand upright, but lying on

the Ground, about a foot or more in length, and divided into many Branches, on which grow small, long, and narrow Leaves, by three's on a long Footstalk, with a thick middle Rib, on the back of each: the Flowers are small, and many together, of a yellow color, and somewhat sweet; which being passed away, several small, flat, twined Cods follow, like to those of the first kind, but smaller, which contain within them smaller Seed likewise, flatish, and almost of a Kidney fashion.

XIII. The fourth, or Sea Claver, has a Root somewhat thick, and enduring many Years, from whence rise up several hoary trailing Branches, spreading themselves on the ground a foot or two long, with many small and very hoary round Trefoil Leaves, on short Footstalks. The Flowers are many, small, and yellow, growing at the end of the Branches; which being past away, many small withered Shells or Husks do follow, much like to the other small Snail Clavers. There is also another kind of Sea Claver, whose Root perishes yearly, but it grows bigger and greener than the other, and the Flowers are small and yellow, coming from the Joints of the Branches, but one at a place, which are followed by small hard and round prickly Heads, and whose windings are difficult to be discerned.

XIV. The fifth, or Heart Claver, has a thick and thready Root, which perishes every Year; from whence spring forth several very slender, small, and weak Branches, full of Joints, and round greenish Trefoil Leaves, standing upon long Footstalks, broad at the ends, and dented in, in their middle, making the fashion of a Heart, with dull, red, or purplish, and sometimes almost blackish spots on them. The Flowers grow two or three together upon Footstalks coming from the Joints; they are small and yellow, which being past away, leave behind them small prickly twining Heads, like unto the other small Claver-grasses.

XV. The sixth, or Moon Claver, has its Roots, Stalks, Leaves, and manner of growing, much like to the other Snail Trefoils, or Clavers, before described, especially like to the first: the Leaves are

hoary, and dented about the edges: the Flowers are small and yellow, which being passed away, crooked, flat Cods, of an indifferent breadth, after the shape or fashion of a Moon three quarters old, follow: in which are contained Seed, in shape or form of small little Kidneys.

XVI. The Places. The first grows naturally in Italy, Spain, Portugal, and France, from whence it was brought into Flanders and England, in both which places it flourishes admirably, and serves them and us for Hay for our Cattel, and Horses: in Spain they have no other Hay with which they feed their Horses, which makes them exceeding Fat: the same they do in the Low Countries, whereby their Cotes yield the greater abundance of Milk. It is sown in the Fields of Italy, Spain, France, the Low Countries and England, for Food for their Beasts. The second grows oftentimes in Fields, Meadows, and Pastures. The third grows in Meadows, by Hedge and Wood side, and places somewhat shaded. The fourth grows near to the Sea in several places, as in our Marshes and Fields at Woolwich, Deptford, &c. and by the Sea side about West Chester, as also on the Mediterranean Sea shore, and about Venice. The fifth is often found in our Fields and Meadows; and though *Camerarius* calls it *Medica Arabica* (I suppose because it grows in that Country:) yet, with *Johnson*, we say, it grows Wild with us in our Meadows in England, having seen it, I believe, an hundred times. The sixth grows also plentifully in our Fields and Pasture grounds.

XVII. The Times. The first of these, (the ground being first made fit for its entertainment, by well Ploughing it up, and killing the Weeds thereof) is to be sown in the end of April, or something earlier, in the New of the Moon, and towards the latter end of the Day, that it may receive the refreshing Dews of the Night, by which means it will the sooner, and more easily spring out of the Earth, and you may Mow it in June, and July, and August, for Hay, and after the first Year somewhat earlier. The first, and all the rest flower in June and July, and their Seeds are ripe in the end of August, or soon after. But the Seed of the first is not to be gathered in the first Year, by reason of its weakness, as is before observed, but in all the following it may be gathered in July, or as soon as it appears ripe.

XVIII. As to the Qualities, Specification, Preparations, and Virtues, of the first, or the other five, Authors have observed nothing concerning them, but that they (especially the first) are a good nourishing food for Horses, Cows, and other Cattel, and that the first is so powerful to fatten them, that they usually flint them to a quantity, for fear of suffocating them, by reason of their growing too fat.

XIX. Observation 1. From this it appears, that it is of a nourishing Virtue, and by reason it encreases Flesh and Fat, I am of the Opinion, that the Liquid Juice or Essence, or Syrup thereof, may be very powerful in restoring such as are in Consumption: it is indeed good against Coughs, Colds, Wheezings, vehement Catarrhs, Obstructions of the Lungs, and other Distempers of those parts.

XX. Observ. 2. The signature of the Plant, chiefly of the Cods and Seed, the latter being somewhat like a Kidney, made me believe it might be good against the Stone, Gravel, and Sand, or Tartarous Matter in the Reins, Ureters, and Bladder, which occasions Stranguries, &c. I made tryal of the Juice, Essence, Decoction in White Wine, and the Syrup, and in the first Patient I gave it to, I found it excellently to answer my Expectation: I have since made tryal of it upon several other Patients with very

very good success; yet I cannot say, but in some cases it has not answered the end. The Decoction of the Seed in White Port Wine, has the same Virtue, but I believe not full out so powerful as the Juice and Essence of the Plant; but the powder of the Seed given to one dram is more effectual: So also the Fixed Salt of the whole Plant made by Incination.

XXI. *Obfero.* 5. *Dioscorides* says the Green Herb has a cooling property, and for that purpose it is chiefly used. *Avicenna* commends the Oil made of it against the Trembling of the Heart. *Gesner* says, that a Liquor may be drawn out of it by fire (*Parkinson* supposes he means an Oil to be drawn out of the Seed, as out of Sweet Almonds) good against the Stone. From this I observe, and am apt to believe, that if an Oily Tincture, or a Saline Tincture, be made of the whole Plant, they may be very effectual for that purpose, being duly taken in a proper Vehicle.

CHAP. CXXXVI.

of CLEVERS, or GOOSE-GRASS.

THE Names. It is called in Greek, *'Ανδρυν*, as the most usual Name, but it has also several others, *ακίστιον*, *ερατρίον*, as *Galen* out of *Hippocrates* saith; and *ερατρίον*, as *Dioscorides* saith (because the Seed is Navel fashion:) it is also called, *ερατρίον*, *quasi hominis amans*, and *ερατρίον*, for the same reason. In Latin, *Aparine*, *Lappa minor* *Plinij*, *Asperugo*: In English, *Clevers*, and *Goose-grass*.

II. The Kinds. They are chiefly twofold, viz.
1. *Aparine Vulgaris*, The common or rough Clevers.
2. *Aparine Levis*, Smooth Clevers, not mentioned by any Author but *Thalij*, and from him by *Parkinson*.

III. The Descriptions. The Common Rough Clever has a small and very fibrous Root, spreading much in the Earth, but dying every Year; from whence rise up divers very rough square Stalks not bigger than the lower part of a naked Wheat Straw, creeping up so as to be sometimes two or three yards high, if it has any tall Bushes or Trees near it, or any Hedge on which it may Climb, but yet without any Claspers, otherwise they are much lower, or lye upon the ground, being full of Joints; from every one of which shoots forth a Branch besides the Leaves, which are commonly six in number, set round the Stalk almost like a Star, or the Rowel of a Spur. From between the Leaves at the Joints, towards the tops of the Branches come forth very small white Flowers, every one upon a small thready footstalk, which after they are fallen, two small round rough brown colored Seeds (but at first green) joined together like a pair of Testicles, do appear. When they are ripe, they grow hard, and of a whitish brown color, having a little hole or hollowness on the side (some what like unto a Navel) on which the Stalk grows to them. The Stalks, Leaves and Seeds are so very rough, that they will cleave almost to any thing which shall touch them, and seem to be a little clammy withal.

IV. The Smooth Kind has a Root like the foregoing, and grows much like unto it, but it neither grows so high, nor are the Leaves so great, and not at all rough or sticking to what it touches, as the former is. The Leaves are the same in number, and stand in the same order, and at the Joints also: the Flowers are small and white, consisting of four very little Leaves, like the other, and grow such like Seed growing together in Pairs, but smooth also, and not rough as the first is. There is another sort of this Smooth Kind, but it little differs from it, excepting in the Seed, which is said to be rough, much like unto a Coriander Confit.

V. The Places. The first Kind grows by Hedge sides and Ditch banks in most places of England, and almost every where in Gardens, it being there nothing but a Weed, and is rooted out with much labor and diligence, for that it will run upon every thing it grows next, and be apt to choak and kill it, if not Weeded up. The second is a Native of Spain, but grows in England in the Gardens of the Curious, where it is apt to be as troublesome as the other is, if it is suffered to Sow its Seed.

VI. The Times. They Flower in the end of May, and in June and July; and the Seed is ripe, and falls by the end of July, or in August, from which it springs afresh the next Year, and not from the old Roots.

VII. The Qualities. It is hot and dry in the beginning of the first Degree, according to *Galen's* judgment; and are Aperitive, Absterive, and Astringent, Traumatick, or Vulnerary, Alterative and Alexipharmick.

VIII. The Specification. It is peculiar for stopping Fluxes, and healing Green Wounds.

IX. The Preparations. You may have therefrom,
1. The Green Herb. 2. A liquid Juice. 3. An Essence. 4. A Decoction. 5. A Powder. 6. An Ointment. 7. A Balsam. 8. A Cataplasma. 9. A Distilled Water. 10. The Oily Tincture.

The Virtues.

X. The Green Herb. *Parkinson* says, that it serves the Country People well, instead of a strainer, to cleanse and clear their Milk from Straws, Hairs, or other gross things which fall into it.

XI. The Liquid Juice. Made of the Herb and Seed together, being taken in Wine, is good against the

the bitings of Vipers, or the great Spider *Phalangium*, by preserving the Heart from their Poyson, as *Proscorides* and *Pliny* from him say. *Galen* says, that it cleanses moderately, and dries, and is of subtil parts. It is generally taken in Broth to make such Lank and Lean, as are apt to grow fat. It is also good to heal Wounds, and stanch Blood, being applied: and *Matthiolus* says, it is commended to conglutinate, or close the Lips of Green Wounds: dropt into the Ears, it eases their pain, though vehement.

XII. *The Essence.* It has all the Virtues of the Juice, but more powerful; besides which, it is very effectual to strengthen the Bowels, and stop all sort of Fluxes of the Belly whatsoever: and being taken thrice a day, it helps the yellow Jaundice.

XIII. *The Decoction in Wine.* It is Stomack, causes Leanness, stops Bleeding, and being drank twice or thrice a day promotes the healing of Wounds, old running Sores and Ulcers.

XIV. *The Powder.* It is an excellent Vulnerary, and conglutinates the Lips of Green Wounds, being strewn thereon: it also cleanses old running Sores and Ulcers, dries up their moisture, and induces their healing. Taken inwardly to a dram in Red Port Wine, Morning and Evening, it stops spitting, vomiting, and pissing of Blood, and cures the Bloody Flux, as also other Fluxes of the Bowels; and being applied, the bleeding of Wounds.

XV. *The Ointment.* Being made with *Auxungia*, i. e. Hogs-Lard, or other proper fat body, and anointed upon the part affected, it helps all sorts of hard Swellings, or Kernels (proceeding from the King's-Evil) in the Neck, Throat, or other Parts.

XVI. *The Balsam.* It is a singular Vulnerary, and cures Green Wounds (not Contused, Lacerated, or otherwise compos'd) at one, two, or three Dressings. It digests Apoplems, as also complicated Wounds, then cleanses them, incarnates, dries, and suddenly heals them. It is indeed a very singular Vulnerary, or Wound Balsam.

XVII. *The Cataplasma.* Being applied to any wound or place which bleeds, it presently stops the Blood; and in a simple Green Wound cures it at the first intention. It is best to be made of the Green Herb, by beating, and made thick by the Powder of the same.

XVIII. *The Distilled Water.* It has in a weak manner the Virtues of the Juice, Essence, and Decoction; and may be used as a Vehicle for the two first, or the Powder.

XIX. *The Oily Tincture.* It is an excellent thing to be applied to Wounds of the Nerves and Joints; and taken inwardly, prevails against the Jaundice, and gives present relief in the Colick. Dose thirty or forty drops in a Glass of White Port Wine.

CHAP. CXXXVII.

Of CLARY, Garden.

I. *THE Names.* It is called in Greek, *Ὠκρίνον* *ὠκρίνον*, *ab Imperu quod ad Venerem stimulat*, as *Dioscorides* says: In Latin, *Horminum*, *Scalaria*, and *Scarlea*, *Orminum Cordi*, *Gallitricum Tragi*, and so of *Lugdunensis* and *Gerard*: In English, *Clary*, *quasi* *Cleer-Eye*.

II. *The Kinds.* It is, 1. *Ὠκρίνον ἡμέτερον*, *Horminum Hortense*, Garden Clary; of which in this Chapter. 2. *Ὠκρίνον ἄγριον*, *Horminum Sylvestre*, Wild Clary, of which in the next. The Garden Clary,

is, 1. *Ὠκρίνον ἡμέτερον*, *Horminum Commune*, Common Clary. 2. *Horminum sativum verum Dioscoridis*, The true Garden Clary of *Dioscorides*. 3. *Colus Jovis*, *Lobeli*, *Chesij*, *Camerarij*, *Lugdunensis*, *Eystensis*, *Gerardi*; *Orbula Tertia Dodonzi*; *Melium Casalpini*, *Galopstis*, *Lutea Dalechampij*, *Horminum Luteum Glavinsam Barbini*, *Horminum Tridentinum*, *Horminum luteum aliorum*; *Camphorata* & *Sphacelus alius*, Yellow Wild Clary, or *Jupiter's Distaff*. 4. *Horminum humile Germanicum*, *Gallitricum alterum Gerardi*, The Smaller sort of Clary; or German Clary.

III. *The Descriptions.* The first, Common Clary has a Root which is blackish and spreads not far, but perishes after Seed time; from whence proceeds a Stalk a foot and half high, or more, which as it grows up branches it self into others; these Stalks are four square, thick and rough, sending forth broad, rough, wrinkled, whitish, or Hoary green Leaves, somewhat evenly cut in on the edges, and of a strong sweet Scent, some of them growing near the ground, and some by Couples upon the Stalks. The Flowers grow at certain distances, at the joints, (with two small Leaves under them) somewhat like unto Sage Flowers, but smaller, and of a very whitish pale blew color. The Seed is blackish, or somewhat flat, and not so round as the Wild, and is contained in long toothed Husks, which serve instead of Cods.

IV. The second, or True Garden Clary of *Dioscorides*, has a Root which is small, and perishing every Year, from whence it rises up but with one square hairy Stalk, about a foot and half high, more or less, as the ground is in goodness: This Stalk spreads it self into several square Branches, on which are set at every Joint two Leaves, one against another, which are something broad and round, a little rugged like unto Horehound, but more green than white, and of a reasonable good Smell: at the tops of the Stalks stand divers Leaves, one row under another, of a very fine, deep, purple violet color, the lower being paler than the uppermost, and seem afar off to be flowers, but approaching nearer to them, are found only to be Leaves, the flowers coming forth under

under them at set Spaces about the Stalks, of a whitish purple color, smaller than the Flowers of any other sort of Clary, and standing in brownish purple Husks, which after the said Flowers are past, whilst the Seed ripens (which is then black) turn themselves downwards, by reason whereof, if it is not gathered in due time, it is lost. Gerard says the Leaves are somewhat round, and lay'd over with a hoary Cottony substance, not much unlike Horehound: the Stalks are square, small and hairy; and the Flowers coming forth between these beautiful purple Leaves, towards the tops, are small, of a blewish or watched color, in fashion like to Rosemary-flowers.

Clary of Dioscorides

V. The third, or Colus Jovis, has a knobby Root, which is composed of many long strings, by which it takes strong hold in the Earth, and abides many Years: from whence rise up several four square rough Stalks, a yard high, or more, which branch forth themselves into divers four square Stalks or Branches. The Leaves are many, large, hoary, or of a whitish green, dented about the edges, and standing upon long Footstalks, rising some from the Root, and some from the Joints of the Stalks, which are broader at the bottom, smoother also, and somewhat fat or clammy in handling, and somewhat hairy, as the square Stalks also are. These Leaves upon the Stalks stand by Couples, and are like the Leaves which grow below, but somewhat lesser. At the tops of the Stalks the Flowers come forth at set Spaces, set round about in Coronets or Whorls, which are gaping, and like unto those of Common Clary, but of a faint yellow color, after which comes brown blackish Seed. Gerard says, that this kind of Clary, called Colus Jovis, represents in the very top of the Stalk, a Distaff, wrapped about with yellow Flax, and that from thence it took its name; and that the Leaves are like those of Nettles, rough, sharp pointed, and of an overgrown green color: both Leaves and Flowers have somewhat a strong Smell.

VI. The fourth, or Small Clary, has a Root of the thickness of a Man's Thumb, black on the outside,

with divers fibres springing therefrom, which perish not, but abide many years: from this Root come forth several square and somewhat hairy Stalks, a foot and half high, on which do grow large Leaves, very like unto our common Garden Clary, hairy, rough, and rugged, but not all out so large, nor of so white a color, growing two at a joint, on the contrary part thereof, one unto another, and somewhat cut in on the edges, and deeply dented likewise, having also a less strong scent than they. The Flowers grow at Spaces about the Stalks, to the tops, bowing their spiky Heads, which are of a purple color, not much larger than Lavender-flowers, which being past away, there comes after them, small blackish Seed.

German Clary

VII. The Places. These are all nourished up with us in Gardens, the fourth of them being brought to us out of Germany; and all of them (except the third) are sometimes found to grow Wild in several places. The Colus Jovis, which only grows in Gardens here, is found to grow in great plenty throughout all Hungary and Austria, and in many other places.

VIII. The Times. The first is most usually sown, for the Seed rises of its own shedding: The second also requires to be new sown in the Spring, for it seldom comes up of the Seed which falls, the Frosts and Winter with us, for the most part, killing of it. They all Flower in the Summer Months, as in June, July and August, some a little later than others, and their Seed is ripe in August, or September.

IX. The Qualities. Gerard says, Clary is hot and dry in the third Degree: Aperitive, Absterfive, Astringent, Traumatick or Vulnerary; Pectoral, Hyfterick, Alterative, Analeptick, and Spermatogenetic.

X. The Specification. It strengthens weak Backs, stimulates to Venerie, and causes fruitfulness.

XI. The Preparations. You may have therefrom, 1. The green Leaves. 2. A liquid Juice of the Herb. 3. An Essence. 4. A Syrup. 5. A Decoction.

tion. 6. *A Powder of the Leaves.* 7. *A Balsam.* 8. *A Cataplasim.* 9. *The whole Seed.* 10. *A Powder of the Seed.* 11. *A Mucilage of the Seed.* 12. *An Electuary of the Powder of the Leaves and Seed.*

The Virtues.

XII. *The green Herb.* Because of its properties of Strengthening, and provoking Venery, it is very much used by some people, especially in Country Towns, to be fried in a Frying Pan, being first dipt into a Batter made of Flower, Eggs, and Milk or Cream, and so (being served up to the Table) to be eaten.

XIII. *The liquid Juice of the Herb.* Used as an Erthine, it cleanses the Head and Brain of Cold, Flegmatick, and Viscous Humors, or other matter afflicting those parts: and taken from three ounces to fix, mixt with a Glaſs of Tent or Alicant, it admirably strengthens the Back, and excites *Venus*: It thickens the Seed, warms and comforts the Womb, and is said to cause fruitfulness in Women, being taken and used Morning and Night for some considerable time. It also cleanses, and heals green Wounds.

XIV. *The Essence.* It has the Virtues of the liquid Juice, besides which, it provokes the Terms in Women, warms and comforts a cold and moist Womb, and takes away the Weakness and Slipperiness thereof: it facilitates the Birth, and expels the Secundine, or Afterbirth. And as it is good to be given to Women which are Barren, through a cold and moist disposition of the Womb; so is it also good to stop the Whites, and to comfort a cold and weak Stomach, oppress'd with Viscous Flegm. Dose from one ounce to two, three, or four ounces, in a Glaſs of generous Wine.

XV. *The Syrup of the Juice.* It has the Virtues of the two former, but not so powerful, because it is so much clogg'd with Honey. But in other cases as a Pectoral, it is much beyond them, for it causes better Expectoration, and therefore is good against Coughs, Colds, Hoarseness, Wheezings, shortness of Breath, difficulty of Breathing, and other like Distempers of the Breast and Lungs. Dose two or three ounces, Morning and Night.

XVI. *The Decoction in Wine.* It is weaker than the Juice or Essence, but has all the Virtues of the foregoing Preparations in a lower Degree. It helps to expectorate rotten and purulent matter from the Lungs in a Pleurisie, as also in Coughs, and other Distempers of those Parts; and possibly may be good for such as are troubled with the Sciatica. Dose fix ounces Morning and Night.

XVII. *The Powder of the Leaves.* Snuffed up the Nostrils causeth sneezing, and thereby purges the Head and Brain of Rheum, and cold thin Flegm, and Tartarous Matter afflicting those parts, causing Head-achs, Vertigo's, Apoplexies, Drowiness, Sleepiness, and Lethargies: and being taken inwardly to one Dram, Morning and Evening, in a little of the Syrup, it strengthens the Back, increases the Seed, and excites Venery.

XVIII. *The Balsam.* Whether it is made with the Juice, or with the green Leaves, it is as singular a Vulnerary as is to be met withal. It not only cures Green Wounds at once or twice dressing them, but also digests, cleanses, and heals foul, putrid, or rotten and running Ulcers: and being applied, is an excellent thing to give ease in the Sciatica.

XIX. *The Cataplasim.* Being applied to Contusions, it diffuses them, if no Vessels are torn: and applied to Green Wounds, it suddenly heals them.

XX. *The whole Seed.* It is used to be put into the Eyes to clear them from Films, Clouds, Moats

or other like things which offend them. It also clears them from Pearls, and white or red Spots, which chance to grow upon them.

XXI. *The Powder of the Seed.* Put into the Eyes, it clears the sight; and being taken inwardly from half a dram, to a dram and half, Morning and Night, in Syrup of Clary, it admirably stimulates *Venus*, strengthens the Reins, and eases Pains of those Parts.

XXII. *The Mucilage of the Seed.* If it is made with Water, and applied to Tumors or Swellings; it diffuses and removes them. It also draws forth Splinters, Thorns, or other things gotten into the Flesh. If made with Vinegar, it is good against hot Inflammations, as also Biles, Felons, and other hot Excretions in the Flesh and Skin, more especially if it is applied to them before they are come to too great a head.

XXIII. *The Electuary of the Powder of the Leaves and Seed.* Put into Sore or Ulcerated Eyes, it heals them; and being used Morning, Noon and Night, for some considerable time, it clears the Eye-sight of Pearls, Films, Clouds, and other like things, and helps dimness of sight, washing the Eyes also between whites four or five times a day, with the Juice or Essence of the Herb. This Electuary being also taken inwardly from one dram to two drams, Morning and Night, for some time, helps Coughs, and Ulcers of the Lungs, restores in Consumptions, strengthens weak Backs, breeds Seed, excites Lust, and admirably fortifies the whole Man.

XXIV. *Colus Jovis*, yellow Clary, or *Jupiter's Distaff*, is hot and dry in the second Degree, and its Juice and Essence, are singular good to cleanse and heal old Ulcers, and foul running Sores, being applied to the Parts afflicted, according to Art.

CHAP. CXXXVIII.

Of CLARY, Wild.

THE Names. It is called in Greek, *ὄκλιον* *ὄκλιον*: In Latin, *Horminum Sylvestre*, *Oculus Christi*, and by some, *Geminialis*: and in English, *Wild Clary*.

II. *The Kinds.* There are several Species hereof, but the chief, and which we intend to handle in this Work, are these following, viz. 1. *Horminum Sylvestre vulgare*, *Oculus Christi*, Wild Clary, especially so called by *Camerarius*, *Cordus*, *Clusius*, *Fuchs*, *Gesner*, *Gerard*, *Lobel*, *Lonicerus*, *Lugdunensis*, and *Turner*; *Brunfelsius* calls it, *Salvia agrestis*; and *Besler* in his *Hortus Eystetensis*, *Salvia agrestis flore purpureo*: *Gesner* and *Tragus*, *Salvia agrestis vera*; *Gallitricum vernum* (in Italy) *Cesalpini*; *Scarea Sylvestris Tabernmontani*. 2. *Horminum Sylvestre incanum flore albo*, *Horminum Sylvestre quantum Niveo flore Clusij*, *Scarea Sylvestris flore albo Tabernmontani*, *Salvia agrestis flore albo horti Eystetensis*, Hoary Wild Clary with a White Flower. 3. *Horminum Sylvestre Lavendule flore Baubini*, *Scarea Hispanica Tabernmontani*, *Gallitricum alterum Gerardi*, Wild Clary, with Lavenler Flowers. 4. *Horminum Sylvestre salvifolium majus & minus Baubini*, *Horminum Sylvestre Matthioli*, *Cesalpini*, *Lugdunensis*, *Ornula altera Dodonaei*, *Horminum Sylvestre quintum Clusij*; *Verbascum nigrum salvifolium flore purpureo Lobeli*; *Salvia Sylvestris adulterina Tragi*, Sage Leav'd Wild Clary. Authors make many other kinds, but these are all that are found growing with us, either Wild or in Gardens.

III. The Descriptions. The first kind, or *Oculus Christi*, has a Root which is long, tough, and black, attended with many fibres, by which it takes fast hold of the Earth, from whence rise up many square Stalks two or three feet high, on which grow broad dark green Leaves, dented about the edges, and somewhat rugged and hard in handling; the Flowers grow along towards the tops of the Stalks, like unto the gaping or hooded Flowers of the Garden Clary, but smaller, and of a pale or whitish blew color; which being past away, there comes in small husks, round blackish or brownish Seed; the whole Plant has a strong Smell, but it is nothing so quick as that of our common Garden Clary. There are two other kinds hereof: One, the tops of whose Stalks are purplish, with Flowers of a deeper purple color, and somewhat larger Leaves. Another, differing only in this, that the tops of the Stalks are green, and not purple; the Flowers of a pale blew color, and the Leaves a little torn on the edges.

Wild Clary

IV. The second kind, or Hoary Wild Clary, with white Flowers, has a long tough black Root, not much differing from the former; the Leaves in this being almost like those, but more hoary, and a little deeper dented in on the edges, the Stalks are square, and almost a yard high, upon which grow the Flowers in the same manner, saving that these are wholly white, which being past away, there follows small round brownish Seed.

V. The third, or Lavender flowered Wild Clary, has a Root not much differing from either of the former Wild Claries, from whence come forth square hairy Stalks, two or three feet high, set with harder, narrower, and smoother Leaves, more deeply indented about the edges, and rounder pointed; the Flowers are much less than the former, and neither in bigness, nor color, are they greatly differing from the Flowers of Spike or Lavender, they growing in spaces and rundles as the rest do; the Seed is like

to the others, nor does the Smell of the whole Plant differ much from them.

VI. The fourth, or Sage Leav'd Wild Clary, has a long Root, tough and black without, but yellow within, which abides without perishing for many Years, as the Roots of most of the Wild kinds do: from whence rise up low square Stalks, much about half a yard high, whereon grow hard rugged Leaves, set two at a joint, very like unto Sage Leaves, but not hoary at all, of a dark green color, and dented about the edges: the Flowers grow at set Spaces round about the Stalks, as in rundles, in some Plants of a fair purple, violet color; in others more pale; and in others yet, of almost an Ash-color; which being past away, there comes forth (when it is ripe) black small Seed. The Smell of this Plant is more pleasing and less heady than most of the former kinds be. There is another Species of this fourth kind, which differs chiefly from it in this, that it grows much higher, has thicker Stalks, larger and thicker Leaves, spotted with divers white spots and streaks therein; else in form and color of Leaves and Flowers, no difference appearing.

VII. The Places. The first grows Wild in England, almost every where by the Way side, and so does the other with the purple Stalks: but that with the green Stalks is not common with us, but grows in many places of Germany and Hungary: Gerard says, that the *Oculus Christi* grows in Barren places, almost in every Countrey, especially in Holborn-fields, near unto Grays-Inn, in the Highway by the end of a Brick-Wall (there it might possibly grow formerly, but none can be had there now:) also at the hither end of Chelsey towards London, and in the Highways leading from Richmond Palace to the Water-side, and in divers other places. The second grows not Wild here, but only in the Gardens of the Curious. The third grew with Clusius, of the Seed which he had out of Spain, but he saith he found it likewise near the Riding-place of Greenwich; so that it is manifest, that it is a natural inhabitant of our Countrey. The third grows Wild in Hungary almost every where, in their Vineyards, and by the Way sides, but with us it is chiefly nourished up in Gardens.

VIII. The Times. They all Flower in June and July, as do the Garden Kinds; and their Seeds are ripe in the end of August, or not long after.

IX. Their Qualities, Specification, Preparations, and Virtues, are the same with those of the Garden Clary, so that little more need be said thereof here.

X. Observation 1. Dioscorides saith, That the Seed of *Oculus Christi*, or Wild Clary, drunk with Wine (from one dram to two drams) excites Lust; and being mixed with Honey, and applied, cleanses the Eyes from Films, and other imperfections lodged in them: and being put whole into the Eyes, it not only simply cleanses, but also purges them very much from Waterish Humors, and so frees them from Redness, Inflammations, and divers other Diseases which happen to them, taking away their Pain and Smarting, one Seed, and no more, being put into the Eye at a time. This, says Gerard, is a general Medicine in Cheshire, and other Countries thereabout, known of all, and used with good success.

XI. Observ. 2. The Liquid Juice, or Essence of the Leaves, given from two ounces to four or six, mixed with a Glas of Generous Wine, and drank warm, dissolves congealed Blood in the Stomach, warms and comforts it, and is very good to help against dimness, and to restore the Eyes to their Pristine State.

C H A P. CXXXIX.

OF CLOVE-GILLIFLOWERS.

THE Names. It was unknown to the *Greeks*, as far as we can learn, but is called of the *Latins*, *Caryophyllus hortensis*, also *Vetonica*, *Vetonica altilis*, *Coronaria*, *Herba Tunica*, *Ocellus Damascenus*, and *Barbaricus*, of some *Cantabrica Plinii*, *flos Caryophyllus*. Some will have them to be the *Iphium Theophrasti* in *lib. 6. cap. 6 & 7.* others to be his *Dios Anthos*, or *Flos Jovis*, but *Ruellius* saith that they were unknown to the *Old Writers*; and his judgment seems to be good, because the *Gilliflower* is not like to that of *Vetonica*, or *Cantabrica*; and it is a wonder, says he, that such a famous Flower, of so pleasant a Form, and sweet a Smell, should lye hid, and not be known to the *Ancients*, which may be thought not inferior to the *Rose*, in its Variety, Smell, and admirable Beauty. The name *Caryophyllus* was given to it, I suppose, from its Smell, which is very like to that of the *Indian Clove*. We in *English* call it *Clove-gilliflower*, and *Gilliflowers* (quasi *July-flowers*, because they begin to flower in the Month of *July*) some also are called *Carnations*, but that name arises chiefly from the color.

II. The Kinds. They are either *Garden* or *Wild*: of the *Garden Kinds* we shall treat in this Chapter. The *Wild* are vulgarly called *Pinks*, of which we shall say nothing here, but refer you to the Chapter under that Title, where we shall fully discourse of them. Of the *Garden Kinds*, or *Gilliflower*, some are *Single*, and some *Double*. The *Single Clovegilliflower* some will have to be a *Pink*, but it is no such thing, for it is oftentimes produced by the Seed of most of the *Double Clovegilliflowers*, and differs from *Pinks* in its Shape, Magnitude and Smell: That all the Kinds of *Double Flowers* produce Seed I am apt to believe; though some of them, as the *Clovegilliflower* and *Carnation*, not very often; and *Parkinson* says, that they seldom give any Seed, as far as he could observe, and here in *England*, are usually increased by *Slips*.

III. As to the Variety of Kinds of this Flower in respect to their various and accidental differences, they are little or few in their Roots, Leaves, Stalks, and manner of growing, but manifold in respect to the Flowers; as to their Form, Magnitude, and Color, some being of one Color, some of another, some of many, some Striped, some Spotted; some finely Dented only, some Jagged or deeply Cut in, &c. I say as to these, we shall take no notice, leaving that work to their consideration, who make the *Flower Garden* their whole business. Those which we shall treat of here, are only the three following, (which comprehend all the other Kinds, and Varieties under them) viz. 1. *Caryophyllus hortensis pleno rubro*, The *Clove-gilliflower* of a deep *Crimson Red*. 2. *Caryophyllus maximus Anglicus*, The *Great English Carnation*. 3. *Caryophyllus minor flore pleno*, The *lesser Carnation* with a *Double Flower*. As to the first of these, viz. the *Clove-gilliflower*, there are the *Single Clove*, and the *Double Clove*; only of the *Double Clove*, there are some more *Double* than others. As to the second, viz. *Caryophyllus maximus*, or *Great Carnation*, with that which we describe in *Secl. V.* following. *Parkinson* in his *Garden of Flowers* makes twenty several Varieties; to wit, The *Great Eng-*

lish, the *Grey Hulo*, the *Red Hulo*, the *Blew Hulo*, the *Prince*, the *White Carnation*, the *French Carnation*, the *Ground Carnation*, the *Crystal* or *Crystalline*, the *Red Crystal*, the *Fragrant*, the *strip'd Savage*, the *Blush Savage*, the *Red Savage*, the *Oxford Carnation*, the *King's Carnation*, the *Granado*, the *Grand Pere*, the *Camberfine*, the *Great Red Lombard*. As to the *Caryophyllus minor*, or *lesser Carnation*, called a *Gilliflower*, we have in *Parkinson* thirty four Varieties, to wit, The *lesser Carnation*, the *Gallant* or *Westminster*, the *Bristol Blew*, *Red Dover*, *Light* or *White Dover*, *Fair Maid*, *Queens Gilliflower*, the *Dainty*, *Brasil Gilliflower*, *Small Granado*, the *Turkie*, *Pool Flower*, *Pale Pageant*, *Dainty Lady*, *best White Gilliflower*, *London White*, *Stamell*, *Purple Gilliflower*, *Peach Color*, *blew Gilliflower*, *Blush Color*, *Great Tawney*, *Light Tawney*, *Sad Tawney*, *Deep Blush*, *Pale Blush*, *Infants Blush*, the *Great Blush*, *Marbled Tawney*, *Princes* or *Variable Tawney*, *Flaked Tawney*, *Feathred Tawney*, *Speckled Tawney*, and *Rose Gilliflower*.

IV. The Descriptions. The first of those, or deep red *Clove-gilliflower*, (which is that which we only use in *Physick*) has a pretty long, hard, or woody Root, having some small fibres appendent thereto, which endures all the *Winter* long; from this Root rises up one or more Stalks, like to those of the *Carnations* following, growing up sometimes to be a foot and half high, or more, which is round, of an *Ash*, or whitish color, and pretty hard, not so thick set with joints and Leaves, as are the *Carnations* following; but the Stalks are more in number, the Leaves are narrower, and whiter for the most part, and in some do a little turn. The Flowers are much smaller than those of the *Carnation*, of a deep red crimson color, very thick, and double in most; the green husks in which they stand are also smaller: the ends of the Leaves in this Flower (as in all the rest) are dented or jagged, yet in some more than in others. Some also have two white threads, crooked at the ends

ends like horns, in the middle of the Flower, whereas several others have none. These kinds, and especially this that has the Deep Red Crimson colored Flower, do very well endure the Cold of our Winters, and are with much less care preserved. This Description take as a President for all the kinds of Clove-gilliflowers.

Great
Carnation.

V. The second, or greatest English Carnation, has a Root which is branched into several great, long, and woody Arms or Parts, having many small Fibres annexed to them, yet is very difficultly preserved in Winter, for which reason it is not altogether so common as the other Carnations and Glove-gilliflowers. From this Root rises up a great thick round Stalk, divided into several Branches, somewhat thickly set with joints, and at every joint two long Leaves, rather green than whitish, somewhat broader than Clove-gilliflower Leaves, turning or winding two or three times round; (yet in some other kinds of Carnations, they are plain, but bending their points downwards, and in some also of a dark reddish green color, in others not so dark, but rather of a whitish green color:) The Flowers stand at the tops of the Stalks, in long, great, round, green husks, which are divided into five points, out of which rise many long and broad pointed Leaves, deeply jagged at the ends, set in order, round and beautiful, making a noble great double Flower, of a deep Carnation color, almost red, spotted with many bluish spots and streaks, some greater, and some lesser, of an excellent, delightful and pleasant sweet Smell, not too quick, as many others of this kind are, nor yet too dull, and with two whitish crooked threads, like horns in the middle. This kind never bears many Flowers, but as it is slow in growing so it is also in bearing; it is a magnificent Flower, and shews a kind of stateliness, for it will not endure to be often handled. This description may serve for all them of this kind.

VI. The third, or Lesser Kind of Carnation, has a Root much like to the former, but something lesser, having from it Stalks next the ground, thick set, but with smaller or narrower Leaves than the

Clove-gilliflower for the most part. The Flowers are like unto the Clove-gilliflowers, and about the same bigness and duplicity, yet in some they are much greater than in others, but of a pale yellowish Carnation color, (tending something to an Orange) with two small white threads, and crooked at the ends, in the middle, but some have none. The Smell is weaker than that of the Clove-gilliflower, yet delectable enough to that Sense. This kind is more apt to bear Seed than any other, which is small, black, flat, and long, and being sown, yields wonderful varieties of Flowers, both Single and Double; some being of a lighter or deeper color than the Original or Mother Plant; some with stripes in most of the Leaves; others are striped or spotted, like one of the great speckled Carnations or Gilliflowers, in various sorts or kinds, and that both Single and Double: Some again are wholly of one color, like the Original or Mother Plant, and are either more or less Double than it; or else are Single, with one row of Leaves, like to a Pink. And some of these are also wholly of a crimson red, or deeper, or lighter, or variably spotted, double, or single as a Pink, or bluish, either single or double, yet but very seldom white; whilst all of them in the green Leaves of the Stalks nothing at all perceptibly differing.

Single
Clove-gilliflower

VII. The Places. These are all nourished in Gardens throughout all England: of the first kind, I have seen whole Fields of them planted in Kent for the use of the Markets in London. The third was brought out of Silesia, but now is become a free Denizen, and absolute native of this Kingdom, it growing and thriving as well here with us, as any of the former.

VIII. The Times. They Flower not until the heat of the Year, which is about the latter end of June and in July, (unless it be an extraordinary hot Season) and they continue flowering, until the Cold of the Autumn nip them, or till they have wholly spent themselves out; and are generally, (as was said before) increased by Slips. The Clove-gilliflowers by reason of their hardness, being better able to endure the Cold of Winter, are usually planted in

in Gardens : but the Carnations and Gilliflowers, by reason of their tenderness, are usually Planted in Pots, that they may be housed, and so kept and preserved from the extreme cold of our Winters.

IX. *The Qualities.* These Plants as to their Roots, Leaves and Flowers, are temperate in respect to heat or cold : Astringent, Sudorifick, Traumatick, Cordial, Neurotick, Alterative, and Alexipharmick.

X. *The Specification.* It is peculiar against Fainting and Swooning Fits.

XI. *The Preparations.* You may have therefrom, 1. *An Inspissate Juice.* 2. *A Syrup.* 3. *An Essence.* 4. *A Conserve.* 5. *A Distilled Water.* 6. *A Spirituous Tincture.* 7. *An Acid Tincture with Vinegar.*

The Virtues.

XII. *The Inspissate Juice.* It is highly Cordial, and may be dissolved in white Port Wine or Canary, to make a Tincture of at pleasure, against fainting and swooning Fits, Sicknes at Heart, Malignity of the Plague and Poison.

XIII. *The Syrup made with Water,* as is taught in our *Pharmacopœia Londinensis lib. 4. cap. 16. sect. 18.* thus : Take Clove-gilliflowers (the Whites being cut off) a pound : infuse them all night in Spring Water two pounds : being strained, with double-refined white Sugar four pounds, make a Syrup (without boiling) only by melting the Sugar. This Syrup is temperate in Quality, strengthens the Heart, Stomach and Liver ; it is Pectoral and Cordial, and may be mixt with other Cordial Liquors, against malignant Fevers, and the Plague ; as also against Faintings, Swoonings, and the like. It refreshes the Vital Spirits, cheers the Heart, and resists Poison.

XIV. *The Syrup made with white Port Wine or Canary.* It is made exactly as the former, and has all the same Virtues ; only it is a greater and more famous Cordial, more powerful against Faintings and Swoonings, to comfort a languishing Stomach, as also to cheer the Heart and revive the Vital Powers.

XV. *The Syrup made with Wine Vinegar.* It is made exactly as that with Water, putting in the same quantity of Vinegar instead of the Water. It is opening, and resists Vapors which fly into the Brain ; it fortifies the Stomach, comforts the Heart, cheers the languishing and drooping Spirits ; it helps Digestion, and prevails against all Diseases proceeding from Choler or heat of Blood, as Malign and Pestilential Fevers, and Fevers not Pestilential : it cools the Blood, resists Poison, quenches Thirst, and is helpful against the Vertigo. Dose of any of these three Syrups, an ounce at a time in any convenient Vehicle.

XVI. *The Essence.* It has all the Virtues of the Inspissate Juice and Syrup ; it is good against Diseases of the Heart, Head and Stomach, very Cordial, special good against Heftick Fevers, to stop Fluxes and help such as spit Blood : and as it cheers the Heart and revives the Spirits, so it powerfully resists Melancholy. Dose from two drams to four.

XVII. *The Conserve.* It is Cordial, cheers the Heart and strengthens the Stomach, and is only eaten as a Sweet-meat. It is good for old People, to eat in a morning fasting.

XVIII. *The distilled Water.* It is made by a very gentle heat in *Balneo*, is Cordial, and may be used as a Vehicle, to convey other Cordial Medicaments in ; besides which, it is of excellent Use to wash sore Eyes withal, washing them therewith five or six times a day.

XIX. *The Spirituous Tincture.* It is a great Preservative against all manner of Malign, Infectious, and Pestilential Diseases, and ought to be used preventively, as first in the Morning fasting ; secondly about four in the Afternoon ; thirdly at Bed time. It more powerfully comforts the Stomach, cheers the Heart, and revives the Spirits, than any of the former Preparations. It may be prepared with common Spirit of Wine : and then it may be taken alone of it self, from one spoonful to two, according to the Age of the person ; or otherwise mixt with Wine, or some other Vehicle.

XX. *The Acid Tincture made with Vinegar.* It comforts the Stomach much, cheers the Heart, helps Digestion, stops Vomiting, is good against spitting Blood, and strengthens the Retentive Faculty. It cuts tough Flegm, corrects the heat and malignity of Choler, helps Expectoration, and quenches Thirst in burning Fevers. It is an excellent thing to be given in the Cure of the Plague, and of all manner of Malign and Pestilential Diseases.

CHAP. CXL.

of COCKLE.

I. *THE Names.* It is called in *Greek*, *Λύχνος ἀγρία* : In *Latin*, *Lychnis Segetum*, *Lychnoides Segetum* ; by *Tragus*, *Githago*, and makes it *Rose mariane genus sextum* ; *Anthemon soliosum Ruellij* ; *Nigellastrum* & *Anthemon Dodonei*, *Pseudomelanthium Matthioli* ; *Lychnis segetum major*, *Bauhini* ; (because he makes the *Asine Corniculata Clusij*, to be his *Lychnis segetum minor* :) In *English*, *Cockle*, or *Corn Wild Camphion*.

II. *The Kinds.* It is a singular Plant, and accounted to be one of the *Wild Kinds of Camphions*. It is a kind of Wild or Bastard *Nigella*, as some Authors think ; for which some Herbarist, from the sound or likeness of the word, thought it to be the true *Gith*, or *Melanthium*, but were absolutely deceived ; for it not only differs in Leaves from the true *Gith*, but also in other properties : if it has any resemblance to *Nigella*, it is more in the blackness of the Seed, than in the Flower, or in any thing else ; and therefore *Matthioli* called it as aforesaid, *Pseudomelanthium*, as also divers others since him.

III. *The Description.* It has a small and woody Root, which perishes as soon as it has born Seed ; from whence springs up an upright bairy Stalk, shooting forth Branches on all sides, with two long bairy, or soft Woolly Leaves at the joints. The Flowers grow forth at the tops of the Branches, in bairy long Husks, whose ends or points are longer than any of the Camphions, standing upright both before the Flowers open, and after they are past, and laying themselves between the five round pointed Leaves, when they are blown, which are of a bright reddish purple or crimson color : The Seed which follows (which is in hard round heads) is bigger and blacker than in any of the Wild *Lychnides* or *Camphions*. Here is to be noted, that some have observed another Kind of Cockle, with white Flowers, but having no other material difference besides.

IV. *The Places.* Cockle grows too plentifully in most of our Corn-fields, (chiefly in our *Wheat-fields*) throughout this whole Kingdom : for which cause *Hippocrates* calls it *Melanthium ex Tritico*.

V. *The Times.* It Flowers in the beginning of Summer, and the Seed is ripe in Harvest-time.

VI. *The*

VI. *The Qualities.* It is hot and dry in the end of the second Degree; Aperitive, Cleansing, Narcotick, and Hysterick.

VII. *The Specification.* It is peculiar against Scabs and running Sores.

VIII. *The Preparations.* You may prepare therefrom, 1. A Decoction of the Herb in Red Port Wine. 2. A Liquid Juice. 3. A Decoction of the Flowers in Red Port Wine. 4. A Powder of the Flowers. 5. A Decoction of the Seed in Wine. 6. A Powder of the Seed. 7. A Pessary of the Seed. 8. A Balsam.

The Virtues.

IX. *The Decoction of the Herb in Red Port Wine.* Being taken inwardly two or three ounces at a time, it is good to stop the Terms in Women, as also the Whites, and to stop any inward Bleeding; it is good also to open Obstructions of the Reins, Ureters and Bladder, and to provoke Urine, and expel Stones, Gravel, Sand, and other Tartarous Matter.

X. *The Liquid Juice.* It has the same Virtues, but is seldom given inwardly: but outwardly applied, it stops all sorts of External Bleedings of Wounds; cleanses and heals Scabs and running Sores, Ulcers, Cankers, Fistula's, &c. by correcting the putrefaction, and drying up the moist Humors which offend them.

XI. *The Decoction of the Flowers in Red Port Wine.* It is good against all the Diseases against which the Decoction of the Herb is good; but is withal a more pleasant and delicate Medicine, and more powerful to stop the Terms in Women, and may be given three, four, or five ounces at a time, Morning and Evening. It is a peculiar opener of Obstructions in the Reins and Bladder: Used as a Gargle in the Mouth, it cleanses, dries up, and heals Cankers, running Sores, and Ulcers in the Throat, Mouth, and Gums, stops the Putridity, cleanses and heals them. It is good against Poison, stinging of Scorpions, and the bitings of Serpents, or other Venomous Beasts.

XII. *The Powder of the Flowers.* It may be given to a dram in Red Port Wine, against all sorts of Fluxes, (and Bloody-fluxes in special) of the Belly, Reins, and Womb: outwardly applied to Sores and old Ulcers, it cleanses, dries and heals them. Inwardly given, it is good against the Plague, Malign and Pestilential Diseases, and the bitings of Serpents, or other Venomous Creatures. Outwardly applied to, or strewed upon Ulcerated Kibes, it effectually cleanses them, dries up the humidities, and heals them, tho' the Ulcer has penetrated to the Bone.

XIII. *The Decoction of the Seed in Wine.* It helps such as are stung by Scorpions, being inwardly taken to two or three ounces; and the place outwardly bathed therewith. It has also an especial property to cure the Itch, as also Scabbiness, and running Sores; and to correct the putrid Humors flowing to any Wound, Ulcer, or Fistula.

XIV. *The Powder of the Seed.* Being given from a dram to two drams, according to the age of the Person, and strength of the Constitution, it has been found to purge the Belly of Choleric Humors, to expel Poison, and resist the malign force of the Plague: It is also of very good use in all sorts of running Sores, old Ulcers, inveterate Cankers, putrid and malign Fistula's, and the like; for it resists the putridity, cleanses and dries up the Moisture, and heals beyond all imagination. *Olivarius Hortianus* gives the Seed parched, and beaten to powder. to be drunk against the Yellow jaundice.

XV. *The Pessary.* Made of the Seed with Honey. Being put up the Womb, it provokes the Terms, as *Hippocrates* testifies in his Book of *Womens Diseases*.

XVI. *The Balsam.* It is made of the Juice or green Leaves and Flowers, by boiling in Oil Olive to crispness, straining out, and repeating the boiling three times, then mixing with every pound of that Oily Decoction, twelve ounces of Venice Turpentine, and six ounces of Wax, boiling to a thickness. It heals Wounds, Ulcers, old running Sores, Fistula's, by digesting, cleansing, incarnating, drying, &c.

CHAP. CXLI.

of COCKS-HEAD.

I. **THE Names.** It is called in Greek, (by the Ancient Herbarists) *Ὠκίσχυρος*; and is thought to be the *Onobrychis* of *Dioscorides*; in Latin, *Onobrychis*, and *Caput Gallinaceum*: In English, Cocks-head, Medick Fetch, and Red Fetchling.

II. **The Kinds.** Authors make many varieties hereof; *Parkinson* makes nine Kinds; but whereas they are not all Natives of our Countrey, we shall only describe those which are natural to the place, and to be had with us, which are chiefly three, viz. 1. *Onobrychis vulgaris*, *Caput Gallinaceum*; *Onobrychis Dodonæi*, *Clusij*, *Thalij*; *Glaux* five *Onobrychis Gesneri in hortis*; *Caput Gallinaceum Belgarum Lobeli*, the lesser sort of which is called by *Baobinus*, in *Prodromo*, *Caput Gallinaceum minus*; Cocks-head, the Common Kind, also *Medick Fetchling*; and by the French, *Saint Jean*: But this is not the *Saint Jean* so much talked of for the Improvement of Land, that we have discoursed of before in Chap. 125. where we have shewed the excellent uses thereof in Agriculture. 2. *Onobrychis spicata* *flore*

Aere purpurea, *Onobrychis Pannonica prima Clusij*; *Cicer Astragaloides Foss.*; spiked Cocks-head with purple Flowers. 3. *Onobrychis floribus Cæruleis*, *Onobrychis Pannonica secunda Clusij*, Bew Flowered Cocks-head.

III. The Descriptions. The first or common kind has a Root which is tough, and somewhat woody; from whence spring forth several weak but rough Stalks, leaning downwards, about a foot and half high, beset with Winged Leaves, each being longer and more pointed, than those of Lentils, and whitish underneath; from the tops of these Stalks rise up other slender Stalks, naked without Leaves, unto the tops, where there grow many small Flowers, in manner of a spike, of a pale reddish color, with some blewness among them: after which rise up in their places, rough, round, and somewhat flat heads. Of this first Species, Bauhinus has given us the Description of a lesser, differing in nothing from the former, but only in the magnitude, or rather smallness thereof.

IV. The second has a Root great and long, hard, and of a woody substance, spreading it self far abroad, and growing very deep into the ground; from whence rise up many Stalks, especially when it is grown to an old Plant, round, hard, and leaning to the ground like the other Pulses, and has Leaves very like Galega, or the Wild-Vetch, of a bitter Taste, and lastly some Savor: among which come forth small round Stems; at the ends of which do grow Flowers spike fashion, three Inches in length, and in shape like those of the great Lagopus, or Meadow Trefoil, but longer, of an excellent shining purple color, but without Smell: which Flowers being past away, small cods follow, containing little, hard and black Seed, in taste like to the Vetch or Tare.

V. The third has also a small, tough, and woody Root, from whence spring up many twiggy Branches, about a foot and half high, full of Knots, ramping and creeping on the ground. The Leaves are like the former, but smaller and shorter: among which come forth small slender Stems, upon which do grow little Flowers, like those of the Tare, but of a blew color, tending to purple. The Flowers being fallen, small Cods come forth in their places, which contain little black Seed like a Kidney, and of a black color when it is full ripe.

VI. Note. It is supposed that the first of these is the *Onobrychis* of *Dioscorides*, also of *Pliny*: for *Dioscorides* describes it thus; *Onobrychis* has Leaves like a Lentil, but longer, a Stalk a Span high, a crimson Flower, and a little Root; and grows in moist and untilld places. *Pliny* writes thus; *Onobrychis* has the Leaves of a Lentil, but somewhat longer, a red Flower, and a small and slender Root; and that it grows about Springs, or Fountains of Waters.

VII. The Places. The first and second grow (says *Gerard*) upon Barton-hill, four Miles from *Leiston* in *Bedfordshire*, and likewise upon the *Grassie Balke*, between the *Corn Lands* two Miles from *Cambridge*, near to a Water Mill towards *London*; and in divers other places in the way from *Cambridge* to *London*. The third grows not Wild here, but is only nourished up in Gardens.

VIII. The Times. They all Flower from the end of June to the end of August, and the Seed is ripened in the mean Season, and in some little time after.

IX. The Qualities. They seem to be temperate in respect of heat or coldness, dryness or moisture: and *Galen* says in his Books of the Faculties of Simple Medicaments, That they rarifie, or make thin, and waste away. This is certain, by Experience from the feeding of Cattel with them, that they are *Galadogenetick*, or breeders of Milk.

X. The Specification. They have been found to be singular good for the discharging, confuming, or wasting away of hard Tumors or Swellings.

XI. The Preparations. You may have therewith, 1. A liquid Juice. 2. An Essence. 3. A Powder of the Leaves. 4. An Oil. 5. A Cataplasm.

The Virtues.

XII. The liquid Juice. Taken from two ounces to six, either alone by it self, or mixt with a Glass of White Port Wine, it prevails against the Strangury, and all Obstructions of Urine, caused by Stones, Gravel, Sand, or Tartarous Matter in Reins or Bladder: and taken by Nurses, it causes them to breed abundance of Milk.

XIII. The Essence. It has the former Virtues, but opens and cleanses more, being taken in like manner, Morning and Evening: Bathed upon any Tumor or Swelling, not malign nor maturated, it discharges or wastes it away. Dose from two, to three or four ounces.

XIV. The Powder of the Leaves. *Dioscorides* says, that if it is drunk with Wine (I suppose from one dram to two drams, Morning and Evening) it cures the Strangury. It has indeed a singular faculty to open Obstructions of the Urinary parts.

XV. The Oil, made by boiling the Green Herb in Oil Olive to Crispness, and repeating the Operation three or four times, and so straining it out. This, says *Dioscorides*, being anointed on the Body, it provokes Sweating. Anointed on hard Tumors, it softens them, is discutive, and causes them to waste away.

XVI. The Cataplasm. Being bruised green, and laid on (in the form of a Cataplasm), upon hard Tumors or Swellings, or waxen Kernels in the Neck, or Throat, or in other Parts; it causes them to consume and waste away; and this more especially; if the Juice or Essence, aforesaid, be taken daily, Morning and Evening, in a Glass of White Port Wine, as is directed; and the Patients withal, purge once or twice a Week (according as their Bodies will bear it) with my Family Pills.

CHAP. CXLII.

OF COCKS-COMB.

I. THE Names. The Ancients we cannot find knew any thing of this Plant, unless it be *Ἀσπερὶδος* *Plinij*, i. e. *gallinacei Cristam habens*. Our Moderns call it in Latin *Crista Galli*, vel *Gallinacea*, because the Flowers, as some think, stand at the tops of the Stalks, like a Cocks Comb; others think it to be so called from the form of the Leaves, whose dentings on the edges, resemble the Comb, or Crest of a Cock: In English, it is called *Cocks Comb*, *Yellow Rattle*, and *Yellow Loose-wort*.

II. The Kinds. It is one of the Kinds of *Rattle-grass*, or *Loose-wort*. Now *Rattle-grass* is either Yellow or Red; the Yellow, which is called *Cocks-Comb*, we shall treat of in this place; the Red we shall treat of under the Title of *Rattle-grass Red*, in some of the Chapters following. Of the Yellow Kind there are four Species, of which two of them are only found to grow in England, viz. 1. *Crista Galli Lutea*, *Crista Gallinacea*, *Crista Galli Bauhinii*, *Pedicularis pratensis lutea Bauhini*; *Pedicularis Campestris Tragi*; *Crista Galli vel Gallinacea Do-*

Donai;

donci, Labelij, Clafij; Cocks Comb, Yellow Rattle, and Yellow Louie-wort. 2. *Crista Galli Lutea Umbellati*; *Bauhini*, Yellow Rattle, with Tufted Flowers.

*yellow Rattle
or Cockscomb*

III. The Descriptions. The Common Cocks Comb, or Yellow Rattle, has a Root small and slender, which perishes every Year; from which Root seldom grows more than one round green Stalk, which rises up about half a yard, or two feet high, and with but few Branches thereon, having two long, and somewhat broad Leaves set at a Joint, deeply dented, or cut in on the edges, resembling therein the Crest or Comb of a Cock, broadest next to the Stalk, and narrower or smaller towards the end. The Flowers grow at the tops of the Stalks, with some shorter Leaves with them, being hooded as the Red Rattle-Grasses are; but of a fair yellow color in most, or else in some paler, and in some more white: The Seed is contained in large Husks, which being ripe will rattle, and make a noise, it lying loose within them.

IV. The second has a small slender Root, which sends forth a few narrow Leaves, of about an Inch long apiece; and a Stalk from among them but a little more than an hand breadth high, on which grow many yellow Flowers, set together at the top, as it were in an Umbel or Tuft, fashioned like the other with hooded and gaping yellow Flowers, but three times longer than these, which being past away, leave great broad husks, containing the Seed.

V. The Places. They grow in our Meadows and Woods generally through the Land; where they are rather a Plague and Annoyance to it, than of any good use for Cattel. Gerard says, that the first grows in dry Meadows and Pastures, and is accounted as an unprofitable thing.

VI. The Times. They Flower in June, July, and August, and the Seed ripens in the mean Season.

VII. The Qualities. It is held to be cold and dry, of an Alterative property, and Pectoral.

VIII. The Specification. It is peculiar against Coughs, and Diseases of the Lungs.

IX. The Preparations. You may have therefrom, 1. A liquid Juice. 2. An Essence. 3. A Decoction in Wine or Water. 4. The whole Seed.

The Virtues.

X. The liquid Juice. If it is mixt with Honey, and put into the Eyes, it takes away Mists, Clouds, Films, and other things which dim the sight: mixt with a little small, or weak Lime Water, it dries up Rheums in the Eyes, and heals any Sore or Ulcer with which they may be affected.

XI. The Essence. It has the Virtues of the Juice, besides which, being dulcified with White or Brown Sugar Candy, it is an excellent thing against Coughs, Colds, Hoarseness, Wheezings, and shortness of Breath. Dose a Spoonful or two at a time.

XII. The Decoction in Wine, or in Bean Broth, or Water. It may be sweetened with Honey, and then clarified with Whites of Eggs. It is a good thing against Coughs and Colds, causes easie Expectoration; and is a good Collyrium to wash weak, dim, sore and running Eyes withal, for it admirably clears the sight.

XIII. The whole Seed. If it is put into the Eyes, it cures dimness of sight from any pure external Cause, and removes Mists, Cloudiness, Films, Skins, or Pearls, or any other outward matter which obfuscates the sight.

CHAP. CXLIII.

Of COLEWORT Garden.

I. THE Names. It is called in Greek, *Κοκκιν*, *Attice*, *Κοκκιν*, vel *Κοκκιν*: It is also called *Αμύδι*, (not because it drives away drunkenness, but also because it is like in color to the *Amerhyss*.) which name is intended of the first sort of the following Coleworts: In Latin, *Brassica*, and by the

the Apothecaries, *Caulis* : In English, Cole, and Colewort.

II. The Kinds. There are two principal Kinds, viz. 1. The Headed Colewort, which is our Common Cabbage, of which we have at large Treated in Chap. 103. aforegoing. 2. The not headed, or open Colewort, of which there are several Species, viz. 1. The Garden Kinds, of which in this Chapter. 2. The Cole-Flower, of which in Cap. 144. 3. The Wild Kind, of which in Cap. 145. 4. The Sea Colewort, of which in Cap. 146. Of the Garden Kind there are many Species, as 1. *Brassica vulgaris sativa*, Our common Garden Colewort. 2. *Brassica sativa Crispa*, Curled Garden Colewort. 3. *Brassica Rubra*, The common Red Colewort. 4. *Brassica Patula*, The open Cabbage Colewort : Of all which in their order.

III. The Descriptions. The first which is our common Garden Colewort, has a woody strong Root, with many Fibres or Strings adjoining to it : From which Root rise up many broad, thick, fat Leaves, of a deep black green color, through the middle of which Leaves runs in each a great Rib, which is thick and high on the backside, with many smaller Ribs or Branches rising from that middle Rib, of Reddish, Whitish, and Ash-colors. The Stalk grows out of the midst from among these Leaves, which spreads it self forth into several Branches, bearing at the top, small yellow Flowers : which Flowers being past, long Cods succeed, full of round Seed, like those of the Turnep, but smaller.

IV. The second, or Crisped Kind, has a Root, Stalk, Flowers, Cods, and seed not much differing from the former : but the greatest difference lyes in the magnitude, this being something lesser than the former ; and in the Leaf, this being divided with many deep Cuts, even to the middle Rib on both sides, by which means it becomes rough every where in its edges, and very much Crisped or Curled.

V. The third Kind, is so like unto the first in its

Roots, Stalk, broad, thick, fat Leaves, Flowers, Cods, and Seed, that it would seem to be wholly the same individual Species, did not the color make the difference, that being of a green color, this of a Red : some of a deep purple, others of a lighter Red, and some of a reddish Green.

VI. The fourth Kind, has a Root somewhat thick, strong, and woody, filled with almost an innumerable company of fibres, some greater, some smaller, some shorter, and some longer, like in number as it were to the hairs of ones head ; from which Root springs up one thick Stalk, having at top thereof a great thick head of crumpled Leaves : the Leaves are large, and of a white green color, and set with thick large white Ribs : the outermost of which gather the rest of the Leaves closely together, which are lesser than those next the ground, these lye open most part of the Summer, without any seemingness to close : but towards the end of the Summer, being grown to have a great many Leaves, it then seems as if it would shut up or close together ; but standing a while at a stay, it on the contrary rather dilates and spreads it self abroad, looking something like a thick, hard, whitened Colewort, and is indeed nothing else.

VII. There are besides these, several other Species of edible Coleworts ; some Curled, and wholly of a Green color, some of divers colors in one Plant, as White, Yellow, Red, Purple, or Crimson, so variably mixed as to cause admiration, the Leaves being curled on the edges like a Ruff, very beautiful to behold. 2. There is also another curPd Colewort, of less beauty and respect, being but a little curPd on the edges, whose Leaves are white, and edged with green : or green and edg'd with white. 3. There are two other sorts of Coleworts, one of a Popinjay green color : the other of a fine deep green, like unto the Savoy. 4. There is the Cole Rape, which is also a Colewort, which bears a white Head, or headed Stalk above the ground, as large as a reasonable Turnep, but longer, and from the top whereof spring out divers great Leaves, like unto other Coleworts, among which rise up divers Stalks, which bear yellow Flowers, and Seed in

Pods, almost as small as Mustard Seed, whose Root is very long, and very thick or bushy, with a vast number of Fibres.

VIII. *The Places.* They all of them grow every where through England, Scotland and Ireland, in Gardens, being chiefly nurs'd up to supply the Markets, and for the use of the Kitchen.

IX. *The Times.* They all Flower in July, and their Seed is ripe in the end of August.

X. *The Qualities.* They are temperate in respect to heat or cold, but are said to be drying in the first Degree, and of a binding Faculty: and yet the Broth of the first boiling, some Authors say, loosens the Body; the second Decoction (say they) is only Astringent. They abound with a certain Nitrous or Salt Quality, whereby they mightily cleanse the Bowels, whether in their Juice or Broth: but the substance of the Colewort is of a drying and binding Faculty, because in boiling it looses its Saline Particles, and leaves them in the Decoction or Broth.

XI. *The Specification.* They are peculiar against Asthma's, breathing Obstructed, and shortness of Breath; for being of a cleansing quality, by taking away the superfluity of matter in the Lungs, and other Bowels, they so open the Passages, as to leave the parts for respiration free and clear.

XII. *The Preparations.* You may have therefrom,
1. A liquid Juice. 2. An Essence. 3. A Syrup made with Honey. 4. A Lohoch. 5. A Decoction. 6. A Collyrium. 7. A Cataplasim. 8. Ashes of the Stalks. 9. The Seed. 10. A Saller.

The Virtues.

XIII. *The liquid Juice.* Pliny says, that if it is mixed with Wine, and dropt into the Ears, it is beneficial against Deafness. Dioscorides says, that if it is mixed with Juice of Flowers de luce and Nitre, that it will make the Body soluble. The Juice having some Nitre dissolved in it, and used

as an Errhine, up the Nostrils, it purges the Head and Brain, of Cold, Moist, and Pituitous Humors.

XIV. *The Essence.* Being mixed with Wine, and so drunk, it helps such as are bitten by Vipers or Adders, or any other Venomous Serpent. It is also good for those who have been Poisoned by eating Venomous Mushrooms. Dose three or four ounces twice a day.

XV. *The Syrup made of the Juice with Honey.* It is good against Coughs, Colds, Hoarseness, shortness of Breath, and loss of Voice: and being often used, it causes easie Expectoration; heals the Lungs, and soreness of the Stomach, and so is good for such as are entering into a Consumption. Dose two ounces two or three times a day, in Tent, Malaga, &c.

XVI. *The Lohoch, or Elestuary.* If it is made of the Pulp of the Stalks with Honey, it is good for such as are short winded, and are purfie, breath difficultly, and have a vehement Cough. You must take the middle fleshy Ribs, boil them in Milk till they are soft, then take out their Pulp, and so mix it with Honey to a Lohoch or Elestuary.

XVII. *The Decoction.* It encreases Milk in Nurses; and being drunk, strengthens the Nerves and Joints. And Gerard says, that if those sores in the Eyes called Carcinomata, be washed therewith, it heals them, though they could be healed by no other means. The first Decoction loosens the Belly, but the second binds it: The first is said to provoke the Terms, and cause Conception, but the second hinders it. If the Decoction is made in Cock Broth, by boiling the Coleworts with the Cock, it will be a singular help for such as are troubled with Wind, and Gripping Pains in the Stomach and Belly. The same Broth, is also very good for those who are troubled with Obstructions of the Liver and Spleen; and for such as have Stones, Gravel, Sand, or other Tartarous Matter in the Reins, Ureters, or Bladder. Taken before meat, it is a very good thing to keep one from Surfeiting, as also from Drunkenness, though they drink much Wine, by restraining and keeping down the Vapors, which otherwise would ascend up, and intoxicate the Brain; and this it will the more effectually do, if it is made pleasantly or gratefully sharp with Juice of Limons. Swoln and Gouty Hands, Knees, Legs, and Feet, (into which gross Humors are protruded or fallen) being bathed with Decoction of Coleworts Warm, eases the Pain, dissolves the Humor, and takes away the Swelling. The Decoction (as also the Juice and Essence) cleanses, dries, and heals Scabbiness, old Ulcers, and filthy running Sores, being often washed therewith. And Galen says, it cleanses so strongly, that it will even Cure the Leprosie.

XVIII. *The Collyrium.* It is made of the Juice, Essence or Decoction, by dissolving Honey in the same, three ounces of Honey to every Pint. This being often dropt into the Eyes, it clears the sight by removing any Cloudiness, Film, or Pearl: it is helpful against Inflammations and Blood-shot, and also cures sore and running Eyes.

XIX. *The Cataplasim.* Made of the Juice or Essence with Powder of Fenugreek, and applied, it eases the Pains of the Gout, and dissolves the Tumor: it also heals filthy running Sores, and old putrid Ulcers. If it is made of the Leaves beaten to a Pulverice, it prevails against all sorts of Inflammations, and hot Tumors. If it is made of the Herb or Juice, made into a Body with Barley Meal or Flower, and a little Common Salt, it is said to break Carbuncles, or at least some kind of Tumors, which much resemble them. If it is made up into a Pefary,

fary, and so put up the Womb, it provokes the Terms,

XX. *The Ashes of the Stalks.* They are wonderfully drying and piercing, so that they almost become Caustick; being mixed with Hogs Lard, the mixture is very effectual to anoint the sides and Stomach of such, who have of a long time been pained in those parts, or in any other place, where the pain arises from the oppression of the Spleen, or excess of the Melancholly Humor, by helping to digest it, and dissolving flatulencies.

XXI. *The Seed.* Being bruised and drunk, it kills Worms, as *Galen* says: it also takes away freckles of the Face, and other parts of the Skin, Sunburnings, Tanning, Scurf, Morpew, and other Deformities thereof. *Arbenans* also says, that it takes away Drunkenness.

XXII. *The Sallet.* The fourth sort eaten raw, being chopt small, and dress'd up with Vinegar, Oil, Salt, and Mustard, strengthen the Stomach, cause a good Appetite, preserve from Drunkenness, and cause a good Digestion. The first kind, or any of the rest, being boiled with Meat till they are soft, then chopt small, and dress'd up with melted Butter, Vinegar and Salt, become an admirable Sallet for such as have weak Stomachs, or are going into a Consumption, have dim Eyes, are affected with the Spleen, Flatulencies or Melancholly, or are troubled with Tremblings of the Limbs, or the Palfie. The Ancient Romans thought them to be effectual against all Diseases of the Body, whether Inward or Outward, for which reason *Chrysippus* wrote a whole Volume of their Virtues, applying them to all parts of the Body. And that the Senate of Rome having expell'd all the Physicians out of their Territories for the space of six hundred Years, did for all that length of time, preserve and maintain their health, against the assaults of all Diseases, by the only use of these Plants.

CHAP. CXLIV.

OF COLE-FLOWER.

I. **THE Names.** I cannot find that this Plant was ever known to the Greeks; for which reason it has no Greek name: or yet that the Ancient Romans had any knowledge thereof: but our Modern Authors call it in Latin, *Brassica florida*, *Caulis florida*, *Cauli flora*, *Brassica Cypria*, in English, *Cole Flowers*, and *Colle-Flowers*.

II. *The Kinds.* It is a singular Plant, but is certainly one of the Kinds of Coleworts: and that Species, which *Pliny* lib. 19. cap. 8. calls *Brassica Pompeiana*.

III. *The Description.* It has a Root spread out into several pretty thick Branches, which are full of Fibres or Strings, from which spring forth divers large Leaves, which are large, of a whitish green color; very like to Cabbage Leaves, slightly indented about the edges, yet smaller, narrower somewhat, and sharper pointed than those of Cabbage: In the midst of which Leaves, sometimes in the beginning of Autumn, and sometimes sooner, there rises up a great white Head of white hard Flowers closely thrust together, sometimes they are of a Milk, or Cream, or yellowish white color: these never open, or spread much with us, and are then fittest for the Table, the green Leaves being cut away close to the Head: in all the other parts, the Plant is like to the Cole-

worts. These Flowers have a much pleasanter taste, than either Coleworts or Cabbages of any kind, and therefore are the more Valuable as for Food.

IV. *The Places.* They grow in most parts of Europe, but very plentifully in England, Scotland and Ireland, and are only nourished up in Gardens.

V. *The Times.* The Colle-Flower must be planted in April in a Bed of hot Horse-dung, and covered with Straw, or the like, to keep it from cold and frosty Mornings; and having gotten about six Leaves, then it is to be removed into the place where you design it shall grow. The Flowers are in their Prime in most of the Summer Months.

VI. *The Qualities, Specification, Preparations and Virtues,* are the same with Cabbages and Coleworts, of which we have already spoken in Cap. 103. and 143. aforegoing, to which you are referred: only take this Note, That for the Table and Food, this is much the more excellent and noble Plant. Note also, That being boiled in Milk, and then eaten with Sweet fresh Butter, and Salt, and Juice of Limons, they have been found to restore admirably in Consumptions.

CHAP. CXLV.

OF COLEWORT Wild.

I. **THE Names.** It is called in Greek, *Κεράλον* *ἀγρια*: In Latin, *Brassica Sylvestris*: and in English, Wild Colewort.

II. *The Kinds.* It is a singular Plant, and the second Species of Coleworts, being the Wild Kind.

III. *The Description.* It has a Root pretty thick, spread into some Branches, with several Fibres adjoining, white, hard, and somewhat woody, from whence rise up several Leaves, and one principal Stalk. The Leaves are long and broad, not much unlike

unlike the common Garden Colewort leaf in shape, substance, and color, but that they are less, (as is also the whole Plant) being greyish, long, roundish Leaves, much gashed or torn on the edges. Among these ground Leaves rises up the said Stalk, bearing such like, but smaller Leaves, which is spread forth into divers Branches: at the tops of which Branches, grow small yellow Flowers, which being past away, they are succeeded by small rough Pods, which contain within them small round Seed. This Plant is of its own nature Wild, and therefore not used as Food, or sought after for that purpose.

IV. The Places. It grows in most parts of England in open Fields, and new digged Ditch Banks, and such other like Grounds: and is in some places Husbanded and Sown for the Seed sake, which is many times very gainful.

V. The Times. It may be Sown in the Spring time, as in March and April, and sometimes in May. It Flowers in July, and the Seed is ripe in August or September.

VI. The Qualities, Specification, Preparations and Virtues, are the same with those of the Garden Colewort: (except in the matter of eating them as Food, which is wholly forborn:) and for any Medicinal Use, whether internal or external: The Wild is much to be preferred, as being much stronger, and so more powerful to all the purposes and intentions, the Garden are said to be good for, or against.

CHAP. CXLVI.

Of COLEWORT, Sea.

THE Names. It is called in Greek, *Κεχρη*
κεχρη: In Latin, *Brassica Marina*, *Brassica*
Marina multiflora, *Brassica Maritima Bauhini*, *Bras-*

sica Marina Monospermos, *Brassica Marina Anglica*
Gerardi: In English, Sea Colewort.

II. The Kinds. It is the last of the principal sorts of Coleworts, and a singular Plant of the Kind.

III. The Description. It has a Root somewhat Great, shooting forth many Branches under ground, having many Fibres also adjoined, and keeping its Leaves green all the Winter. From this Root rise up several somewhat broad and large, thick wrinkled Leaves, and as it were curled about the edges, growing each upon a several thick Footstalk, very easie to be broken, and so tender, that they can scarcely be handled without breaking, of a greyish green color; from among which rises up a strong thick Stalk, two feet or more high; Cubits, says Gerard, with some Leaves thereon, up to the top, where it branches much out; on every Branch stands a large Bush of pale whitish Flowers, consisting of four Leaves a-piece, which being past away, small roundish, or thick and short Pods come forth, containing each but one roundish, greyish Seed a-piece, of the bigness of a Tare, or Vetch, and much greater than Soldanella, or Sea Bindweed, to which Plant this Sea Colewort is not in the least measure akin; though some Authors have mistaken the former, viz. Soldanella, for this latter.

IV. The Places. It grows in many places upon the Coast of England, as well on the Kentish as Essex shore; at Lidde in Kent, and at Colchester in Essex: Gerard says it grows Naturally upon the Bayche and Shores of the Sea, where there is no Earth to be seen but Sand, and Rouling Pebble Stones, which they who grow near the Sea, call, Bayche: he found it growing between Whitstable, and the Isle of Thanet, near the Brink of the Sea, and in many places near to Colchester, and in other places by the Sea side.

V. The Times. It Flowers in the end of June, and all July, and the Seed is ripe towards the end of August.

VI. The Qualities, Specification, Preparations and Virtues, are the same with those of the Garden Colewort, (except those various Preparations and Uses of them for Food) but in all the cases there mentioned, this is the stronger, and more efficacious.

VII. Note 1. The Decoction of the Sea Colewort, (some Authors say) doth by its bitter Quality, and sharp Nitrous Particles, open the Belly, and purge the Body; but as Galen thinks, not without some hurt or damage thereto, because it differs much from the Temperature of our Bodies, being hotter and drier than the Garden Kinds: For as all other Wild

Wild Herbs are more potent or stronger in their Operations, so also this; for which reason it digests and cleanses more powerfully than the others do.

VIII. Note 2. The young Leaves boiled in Lye of Pot-Ashes, (as Dioscorides says,) or in Fair Water (as is most usual in our times) are eaten as other Coleworts are, by several poor People near the Sea, the boiling taking away much of the bitterness thereof.

IX. Note 3. The young Leaves, or their Juice, applied to Sores or Ulcers, cleanses and heals them, dissolves Tumors, or Swellings, and takes away Inflammations.

III. The Descriptions. The English, or European Kind, has a Root small and white, spreading very much in the ground, so that where it once takes, the ground is very difficultly cleansed from it again; for if any little piece or bit of it remains therein, it will from it spring forth afresh. From this Root slender naked Stalks shoot up very early in the beginning of March or April, about a span long, bearing at their tops small yellow flowers, which quickly fade away, and after they are past, Leaves broad and somewhat roundish come up, yet sometimes a little dented about the edges, much lesser, thicker, and greener than those of Butter Burr, with a little downy hoariness, over the upper side of the green Leaf, which may be rubbed away, and whitish or mealy underneath the Leaf.

CHAP. CXLVII.
of COLTS-FOOT.

I. THE Names. It is called in Greek, Βίρα, also Χαμαίαιον; In Latin, *Tussilago*; but by the Apothecaries, *Farfara*, and *Ungula Caballina*, of some *Populago*, (from its likeness to the Poplar Leaves;) *Farranum*, and *Farrugium* Plinij; of divers *Pala Equina*, also *Bechium*, *Chameleuce*, (from the Poplar Tree, called in Greek, Δάμνη;) In English, *Colts-foot*, *Fole-foot*, and *Horse hoof*: Gerard says, it may very well be called *Cough Wort*.

Colts foot

Coltsfoot in flower.

IV. The American has a Root which consists of a Bush of blackish Threads or Fibres, (which abide the hardness of the Winter, both the Stalks and Leaves perishing yearly,) but grow brownish at the end: From this Root rise up many round Stalks about a foot and half high, and two broad, and somewhat round, but pointed Leaves, a little dented about the edges, at each Joint of them; the upper Leaves being smaller, and little or nothing dented: at the tops of the Stalks come forth several Branches with many pure white Flowers, being but small, and made of five Leaves apiece, rising out of each bush, which being past, there succeeds small long Seed, sticking each to a little Down, which are carried away together with the Wind: The whole Plant has little or no Smell, neither Root, Leaf, nor Flower, whatsoever Cornutus says to the contrary.

II. The Kinds. Camerarius makes three sorts of *Bechium*, or *Tussilago*, viz. 1. The True, which we intend in this Chapter. 2. The *Petasites*, of which we have treated before in Cap. 100. and the *Caltha Palustris*, or *Marsh Marigold*, which he calls *Tussilago major*, but is indeed no *Colts-foot*, and of which we shall treat in Cap. following. The true *Colts-foot* is either European or American, the Descriptions of both which we design here. The American is called *Calcilia Americana*.

V. The Places. It, viz. the first, usually grows in wet grounds, as also in dryer places: It is found likewise near unto Springs, and on the brinks of Brooks and Rivers, in wet Furrows, by Ditch sides, and in Ditches, and in other moist and watry places near unto the Sea, almost every where. The latter grows in America, in many places of Canada, New Eng-

England, New York, New Jersey, Pennsylvania, Virginia, and Carolina, in which last place I have found it several times, travelling through moist, wet, and Moorish places.

VI. *The Times.* The first begins to Flower in the end of February, or beginning of March, and the Leaves appear about the middle or latter end of March, when the Flowers are all gone, and remain green all the Summer long; and for this cause it has been thought that *Cold-foot* had never born Flowers, as *Pliny lib. 26. cap. 6.* has hinted.

VII. *The Qualities.* They are cold and dry in the first Degree; Appetitive, Astringent, Traumatick or Vulnerary, Pectoral, and Analeptick.

VIII. *The Specification.* They are peculiar against Coughs, and Discaes of the Lungs.

IX. *The Preparations.* You may have therefrom,
1. A Liquid Juice. 2. An Essence. 3. A Syrup.
4. A Decoction. 5. A Cataplasm. 6. Dried Leaves.
7. A Distilled Water. 8. Tinder.

The Virtues.

X. *The liquid Juice.* Taken alone, or sweetned with Sugar or Honey, it is prevalent against Coughs, Colds, Wheezing, Hoarshness, and other Distempers of the Lungs. Dose from one to three ounces, Morning and Night at Bed time; and at other times of the Day, if the Cough is vehement.

XI. *The Essence.* It has all the Virtues of the Juice, but more powerful; besides which, it is singularly good to cure Ulcers of the Lungs, and Stomach, as also the Bloody Flux, and Ulcers of the Bowels; it stops thin Rheums and Distillations, or Catarrhs, and helps in Consumptions. Dose from one ounce to three, two or three times a day, either alone, or mixed with the Distilled Water.

XII. *The Syrup.* It cures Coughs, chiefly dry Coughs; but has an Influence against all Distempers of the Breast and Lungs, being often taken, even by spoonfuls, as also with a Liqueurice stick.

XIII. *The Decoction.* If it is made of the green Leaves and Roots, it cures a Cough proceeding from a thin Rheum, and helps Hoarshness, you may sweeten it with Sugar or Honey.

XIV. *The Cataplasm of the green Leaves.* If it is made alone, or with Honey, it is good to abate hot Inflammations, and Anthonies fire, and to cure other hot excretions of the Skin; and being applied, it is good to heal Ulcers, and other old and running Sores.

XV. *The Dried Leaves.* Taken as Tobacco, they are good for thin Rheums, Distillations and Coughs; so also the Root taken in like sort, as *Dioscorides* and *Galen* say: viz. the Fumes of it, taken (from burning Coles) into the Mouth thro' a Funnel; as also the Fumes of the Leaves so taken (for I suppose the Ancients knew nothing of Tobacco Pipes, that being a Modern invention,) they effectually help such as are troubled with shortness of Breath, and draw their Breath thick and often. The Fumes also ripen and break Apoplems of the Thorax and Lungs, and that without any danger.

XVI. *The Distilled Water.* Used simply of it self, or mixed with *Elder-flowers* and *Nightshade*, it is a singular remedy against all hot Agues, to drink two ounces at a time, and to have Cloths wet therein, and to be applied to the Head and Stomach. The same applied to hot Swellings, or any Inflammation, does much good, and prevails against Burnings and Scaldings, and Anthonies fire. It is singular good also to take away red Pimples, Wheals, and other small eruptions of the Skin, which arise through heat; and is profitable against the inflammation of the Piles, and burning heat of the Privy Parts, cloths being wet therein and applied.

XVII. *The Tinder.* It is made, as *Matthiolus* says, of the Cotton or white Wool, which grows in some parts of the Root; the said Cotton being cleafned from the Roots, and bound up hard in Linnen Cloths, and boiled in Lye for a while; then adding some Salt petre to it, it is to be dried in the Sun. This, says *Parkinson*, is the best Tinder to take Fire that can be, being struck from a Flint. Applied to moist Ulcers, it dries up their Humidities.

CHAP. CXLVIII.

of COLUMBINE.

I. *THE Names.* It is said to be called in Greek, *κισσός*, as *Cosinus* thinks from *Theophrastus*, *lib. 6. cap. 7.* and yet some think the Greeks knew nothing at all of it: *Dalechampius* upon *Atheneus*, calls it, *κισσός*, *Diosanthos*, i. e. *Flos fovis*. *Fabius Columna*, in his *Phytobojanos*, to whom *Clusius* gives the greatest approbation, refers it to the *Ισχυρὸν*, *Isopyrum Dioscoridis*. In Latin, it is called, *Aquilena*, *Aquilina*, *Aquilegia*, *Aquilegia Rosea*, *Aquilegia Stellata*, *Leontostemon Gesneri*, *Herba Leonis*; and in English, *Columbine*.

II. *The Kinds.* Authors describe many Kinds hereof, but those which we shall treat of, are these seven following: 1. *Aquilegia Vulgaris flore simplici*, The Common Single Columbine. 2. *Aquilegia Vulgaris flore pleno*, Common Double Columbine. 3. *Aquilegia inversis Corniculis*, Double inverted Columbines. 4. *Aquilegia Rosea*, The Rose Columbine. 5. *Aquilegia Degener*, The Degenerate Columbine. 6. *Thalictrum vel Thalictum Hispanicum album & purpureum*, *Ruta Falustris*, *Ruta Fratenfis*, *Pseudorhabarbarum*, Tufted Columbines, White and Purple. 7. *Aquilegia Virginiana flore rubescente præcox*, The early red Columbine of Virginia.

Columbines

III. *The Descriptions.* The first has Roots thick and round, for a little way within the ground, and then it is divided into Branches, furnished with ma-

ny small Fibres, abiding many Years, and from the round Heads of the Roots which abide all the Winter, shooting forth afresh every Spring, both Leaves and Stalks. The Leaves are divers, and large spread, standing on long Footstalks, every one divided into several parts, and roundly indented about the edges, in color of a blewish green, and not much unlike to the Great Celandine. The Stalks rise up sometimes two or three feet high, reddish, and slightly haired, which usually spread themselves into many Branches, bearing one long divided Leaf at the lower Joint, above which the Flowers grow, every one standing on a long Footstalk, consisting of five hollow Leaves, crooked or horned at the ends, turning backward, the Flower is open, shewing almost like to little Birds (says Gerard) and hollow. The variety of their colors are very much, for some are wholly white, some blew, some of a violet color, others of a bluish or flesh color, some of a deep Red, some of a pale Red, some of a dead Purple, or dead Murry, and some of mixt colors, as nature is pleased to exert her powers, all which to distinguish severally would be to little purpose, they being so commonly known. The Flowers being past, small long Cods appear, four or five together, in which are contained small black, and glittering or shining Seed.

many other of the Double sorts. These Double Kinds do give as good Seed as the Single Kinds, which thing is not observed in many other Plants.

*Columbine: double flower
inversed.*

*Columbine
manifold
double.*

IV. Double Columbine has a Root like the former, and differs not in Leaf or manner of growing from the Single, so that until they come to flower, they cannot be discerned one from another, the only or chief difference is, that this bears very thick and double Flowers, that is, many horned or crooked hollow Leaves set together, which Leaves are not so large as the Leaves of the single Flowers. The variety of colors in this Double Kind is as great or plentiful, or rather more than in the Single, for of these there are party-colored blew, and white, and spotted variably, which are not in the Single Kind, as also a very deep Red, very thick and double, but a smaller Flower, and less plentiful in bearing, than

V. The third, or Double Inverted Columbine, is not to be differenced either in Roots, Stalks, Leaves, or Seed from the former, but only in the Flowers, which makes the chief Distinction: these are as double as the former, but the Heels or Horns of these are turned Inwards, and stand out in the middle of the Flowers together: neither is there that plentiful variety of colors in this Kind, which is in the former, there being never above three or four colors seen in this sort, to wit, White, Purplish, Reddish, and a Dun, or dark overworn purplish color. These double Flowers being past away, there come in their places small long Cods like the former, bearing Seed, continuing its kind, and not changing into any of the former.

VI. The fourth, or Rose Columbine, in its Roots, Stalks, and Leaves differs little or nothing from the former Columbines; the chief difference consists in the Flowers, which although they stand in the same manner severally upon their small Footstalks, but somewhat more sparingly than the others do, yet they have no heels or horns, either inward or outward, or very seldom; but stand sometimes with eight or ten small, smooth, plain Leaves, set in order one by one, as in a Compass, in a double row, and sometimes with four or five rows of them, every one directly before the other, like unto a small thick double Rose laid open, or a spread Marigold: but sometimes it happens, that some of these Flowers will have two or three of the first rows of Leaves, without any heel; and the rest which are inwards, each of them with a piece of a small heel or horn at them, as the former have. The colors of these Flowers are almost as variable, and as variably mixt, as the former double kinds. This also gives its Seed, which for the most part preserves its own kind in perfection.

VII. The sixth or Degenerate Columbine holds the proper form of a Columbine, being much like to the Double Rose kind, but that the outwardmost row of Leaves are larger than any of the rest inwards, and is of a greenish, or of a purplish green color, which is not altogether so apt to grow good Seed like the former. This kind of Columbine might seem to some to be but a casual Degeneration, and no true natural kind, happening by some cause of Transplanting, or otherwise by Art; but finding it to hold and keep its own proper Species, (being raised from its own Seed) and not variously to change into other forms, I am obliged, I think, to conclude the contrary.

VIII. The sixth, or Spanish Tufted Columbine, has a Root made of many long yellow Branches and Strings, which endure many Years, and encrease much. These Plants (whether white or purple) have both one form in Roots, Stalks, Leaves, and Flowers, and therefore need but one Description: The Leaves are hoib for color and form, so like unto Columbine Leaves (tho' lesser and darker, yet more spread, and on larger Stalks) that they may easily deceive one, that does not considerably observe them. For the Leaves are much more divided, and in smaller parts, and not so round at the ends. The Stalks are round, strong, and a yard high at least, branching out into two or three parts, with Leaves at their several Joints; at the tops whereof stand many Flowers, which are nothing but a number of Threads, made like unto a small round Tuft, breaking out of a white Skin or Leaf, which incloses them, and which being unblown, appear like unto little Buttons. The color of these Threads or Tufts are whitish, with yellow Tips on them, and somewhat purplish at bottom, having a strong, but no good or pleasant Smell. They abide in their Beauty (more especially if they grow in the shade, and not too hot in the Sun) a great while, and then fall away like short Down, or Threads: The Seed Vessels are three square, containing small, long, and round Seed. The purple Tufted Columbine differs only from the white, in that it is not full out so high, nor so large, and that the color of the Flowers or Tufts, is a blewish purple, with yellow Tips, and is much more rare than the white.

IX. The seventh, or Virginian Columbine, has a Root long, with many Fibres thereat, but differs little from our common single sort, except in the following particulars. The Stalk (Cornutus makes to be a Dwarf, but) is as tall as our common English, and of a reddish color. The Leaves are smaller, and somewhat like to those of the Thalictrum last described, or Meadow Rue, but of a paler green color. The Flowers are of a sad reddish color, and single from the middle of them to the ends; but yellowish from thence to the bottom; the ends of whose Leaves are not blunt, as in ours, but stiff, rough, and pointed, within which horned Leaves there are five other smaller, and of a reddish color also, their points bending downwards, having many small white Threads in the middle tip with yellow; after which come five pointed or horned Seed Vessels, containing within them black shining Seed.

X. The Places. They all grow with us in our Gardens, as Garden Flowers: but Clusius says, that the single Kinds have been often found on some of the Woody Mountains in Germany. The seventh Kind is a Native of Virginia, and was brought to us from thence by John Tradescant.

XI. The Times. They most of them flower not until May, and for the most part of June, and (as Gerard says) in July, their Seed ripening in the mean time. The *Aquilegia Virginiana*, or Virginian Kind, flowers somewhat earlier than any of the other Kinds, usually sooner by a Month.

XII. The Qualities. They are Temperate in respect of Heat or Coldness, Dryness or Moisture: Aperitive, Absterive, and Astringent; Hepatick, Nephritic, and Hyfterick, Alterative, Vulnerary, and Lithoniptick.

XIII. The Specification. It facilitates the Delivery of Women in Child-bed.

XIV. The Preparations. You may have, 1. A Liquid Juice from the Herb and Root. 2. An Essence from the same. 3. A Decoction in Wine. 4. A Lotion. 5. A Powder of the Seed. 6. The Root of the Common Kinds. 7. The Root of the Tufted Kind.

The Virtues.

XV. The Liquid Juice. Mixed with Milk and Honey, it is good to heal sore Mouths: and taken four or six spoonfuls at a time in White Port Wine, Morning and Night, it opens Obstructions of the Liver, and prevails against the Jaundice.

XVI. The Essence. It has more potently the Virtues of the Liquid Juice, besides it is of excellent use to heal old running Sores, and putrid Ulcers: and being taken for some time, it is an admirable thing against Obstructions of the Reins and Bladder.

XVII. The Decoction of the Herb and Root in Wine. This being perfumed with some Grains of Ambergrise, is good against those Swoonings, which the Greeks call *adynasia*; as also to open the Obstructions of the Liver, Reins, and Womb.

XVIII. The Lotion. It is made of the Leaves boiled in Milk or Posset-drink, and sweetened a little with Honey; it is good against the soreness of the Throat, also prevails against the Inflammation, Swelling, Falling and Excoriation of the Uvula; Cankers in the Mouth and Gums, and other moist and running Sores in those parts; all which it heals by Virtue of its drying and binding Quality.

XIX. The Powder of the Seed. Given to one dram in Wine, with ten grains of Saffron, it opens the Obstructions of the Liver, and helps against the yellow Jaundice, as *Tragus* says, but he advises that the Patient after taking of it should be laid in a warm Bed, and made to Sweat well thereupon. *Clusius* says, that a Physician in *Bruges* gave it to Women in Travel (in a Glas of Wine) to cause speedy Delivery, repeating it two or three times, as need required.

XX. The Roots of the Common Kinds. *Camerarius* says, that in Spain they eat the Root for many days together, to help such as were troubled with the Stone in the Reins.

XXI. The Roots of the Tufted Kind. They are said to have the Virtues of *Rhubarb*, by reason that (besides their being yellow) they have an opening and drying Quality, as *Rhubarb* has. They are good (as *Dioscorides* says) to cleanse and dry old Ulcers, and to heal them. *Camerarius* says, that in Italy they are used against the Plague; and in Saxony against the Jaundice.

CHAP. CXLIX.

OF COMFREY.

I. THE Names. It is called in Greek, *Σύμφυτον*, & *Σύμφυτον*, a *facultate Glutinandi*; also *Πυρρὸν*, & *Κυρρὸν*, as *Dioscorides* saith: In Latin, *Symphitum*, *Symphitum*, *Consolida*, *Consolida major*; and by

by some *Solidago*, *Osteocollon* (a Bone Soderer) and by *Scribonius Largus*, *Inula Rustica*: and in *English Comfrey*.

II. The *Kinds*. Authors make several sorts of *Comfrey*; but the three following are only, or chiefly to be had in *England*, viz. 1. *Symphitum majus vulgare*, Our Common Great *Comfrey*. 2. *Symphitum majus flore purpureo*, Our Great *Comfrey* with purple flowers. 3. *Symphitum Tuberosum*, *Tuberos Comfrey*, or *Comfrey* with knobbed Roots.

Comfrey with Purple Flowers.

III. The *Descriptions*. The first of these has *Roots* which are large and long, great and thick, and spreading it self out into great, long, and thick *Branches* under ground, black on the outside, and whitish within, short and easie to break, and full of a *Glutinous* or *Clammy Juice*, having little or no taste in it. From this *Root* springs forth divers very large and hairy dark green *Leaves*, lying on the ground, so hairy or prickly, that if they touch any tender part of the *Hand* or *Face*, or other part of the *Skin*, it will cause it to itch or tingle. From among these *Leaves* rises up a *Stalk*, two or three feet high, hollow and cornered, which is also very hairy, having many such like *Leaves* on it as grow below, but lesser and lesser up to the top, which are long, rough, pretty broad, and sharp pointed. At the joints of the *Stalks*, it is divided into many *Branches* with some *Leaves* thereon; and at the ends stand many *Flowers* in order, one before, or above another, which are something long and hollow, like the finger of a *Glove*, of a pale whitish color, after which comes small black *Seed*.

IV. The second *Kind* in its *Roots*, *Leaves*, *Stalks*, *Flowers*, and manner of growing, is altogether like the former; and differs from it only in this, that, as to the whole body of the *Plant*, it is somewhat less: and as to the *Flowers*, that these are of a pale purple color.

V. The third *Kind*, has a large *Tuberos* or *Knobbed Root*, which *Branches* it self out into other *Thick* and *Tuberos* parts, more *Tuberos* or *Knobbed* towards their ends, with several *Fibres* adjoining, black on the outside, and yellowish within, replenished with such *Viscous*, *Glutinous* or *Clammy Juice* as the others, but not altogether so stony: The *Roots* are also as tender and easie to be broken, or more easie than the others, and spread themselves under ground in like manner. From this *Root* rises up a hairy, crested, or cornered *Stalk*, not so high as the former, with smaller *Leaves*, and more thinly set thereon.

of the same form, and greenness, that thereby it may at the first sight be known to be a Comfrey, by any who has well observed the Common Kind; but more especially when the top Branches are in Flower; which being placed after the same manner, and of the same hollow fashion, but smaller, are of a more sad yellowish color; whose Seed following is also like the Seed of the other Kinds. The Stalks and Leaves Dye away, or perish every Year, as they do in the others, the Roots abiding and increasing in the Earth, and shooting forth new Stalks and Leaves every Spring. Some make a lesser Species of this Tuberculous Kind, which if there is any such thing, I am apt to believe, arises only from the differing goodness of the Soil; a fat and rich Soil making or producing a larger Plant than that can do which is poor and lean.

VI. *The Places.* The two first grow by Ditches and Water sides, and in divers low, fat, and moist Fields, Orchards and Grounds; for in such they chiefly delight to grow: The first is found generally through all England; The second but in some particular places: The third grows with us only in Gardens, but is found Wild in Woods and moist places in Austria, Hungary, and Germany.

VII. *The Times.* They Flower in June and July, and perfect their Seed in August. There are several of the *Consolida's*, which have their different times of their flowering and feeding, as, 1. The *Symphitum*, or *Consolida Petrea*, of which Dioscorides speaks. 2. *Consolida Saracenic*, Saracens Confound. 3. *Consolida Media*, Bugle, or Middle Confound. 4. *Consolida minor*, *Prunella*, or Self-heal. 5. *Consolida Media*, vel *Bellis major Vulgaris*, The Great White Wild Daifse. 6. *Consolida minor*, vel *Minima*, *Bellis minor Sytheftris*, The Common Small Field Daifse. But as these are all of them different Plants, and not a Species of one and the same Genus, nor properly any of the *Comfrey's*, so we shall say nothing of them here, but to avoid Confusion treat of them in their several and respective Chapters; our intention being in this Chapter, to treat of that Plant, which we properly call *Comfrey*, and the *Latins*, *Symphitum majus*, which is of several sorts, as are before described.

VIII. *The Qualities.* It is cold and dry in the first Degree: Altringent, Anodyne, Repercussive and Vulnerary: Neurotick, Pectoral, and Arthritic; Alterative, Antiemmenagogick, and Analeptick.

IX. *The Specification.* It is of a Clammy and Glewing Nature, and is peculiar against Fluxes of Blood, of what kind soever, whether internal or external.

X. *The Preparations.* You may have therefrom, 1. A Juice of the Leaves and Roots. 2. An Essence of the same. 3. A Syrup of the Juice of the Root. 4. A Decoction of the Root. 5. A Powder of the Root. 6. A Balsam of the Root. 7. A Cataplasm of the Root. 8. A Distilled Water. 9. An Acid Aqueous Tincture.

The Virtues.

XI. *The Juice of Leaves or Roots.* Camerarius says, that two ounces of it being drunk at a time, does much good in the Lethargy, and Dead Sleep: it is drying and binding in a great measure, and is good for such as spit Blood, bleed at Mouth, or make a bloody Urine: yet it opens Obstructions of the Lungs, and causes easie Expectoration.

XII. *The Essence.* It has all the former Virtues, but is much more effectual to stop any Flux of Blood, in any part whatsoever. It prevails against all inward hurts, bruises and wounds, cleanses Ulcers of the Lungs, dries and heals them; and being taken Daily, Morning and Evening, it prevails against Ca-

tarrhs, and stops the defluxion of Rheum from the Head upon the Lungs; fluxes of Blood, or Humors by the Belly, and the immoderate or overflowing of the Courfes in Women: It stops also the overflowing of the Whites; and (universals being premised) it cures a Gonorrhæa, or Running of the Reins in Men, coming from what cause soever. Dose two or three ounces in Red Port Wine.

XIII. *The Syrup of the Juice of the Root.* It has the Virtues of the Essence, but causes a better and more easie Expectoration out of the Lungs; is good against Coughs and Colds, Wheezings, and other like Distempers of those Parts. It is said to be good for such as have broken Bones, because it hastens the breeding of the Callous; and for the same Reason, it is said also to be good to cure Ruptures in Children. It is so powerful to Consolidate or knit together, whatsoever needs knitting, that if the Roots be boiled with flesh cut into pieces, or very deeply slash'd, in a Pot, they will join them together again.

XIV. *The Decoction in Wine or Water.* It is good against inward Bruises and Wounds, inward Bleeding, Spitting, Vomiting, or Pissing Blood, as also the Bloody or Hepatick Flux; and has indeed all the Virtues of the Juice, Essence and Syrup, (but not full out so effectual as they are) being drunk to six or eight ounces, Morning, Noon, and Night. It is also good to cleanse, dry, and heal external Wounds, Ulcers, and Running Sores, they being washed therewith once or twice a day.

XV. *The Powder of the Root.* Being taken inwardly to one dram in a little of the Syrup, it stops inward bleeding, heals Wounds in the Stomach and Thorax, as also Ulcers in the Lungs. If it is applied to green Wounds, as soon as the Wound is made, it conglutinates or joins the Lips thereof together, and causes it speedily to be healed: mixed with the Syrup, and applied to the Hemorrhoids or Piles, it cools the Inflammation, and represses their over much bleeding, and allays the heat of the Parts adjacent, taking away, and easing all the pain.

XVI. *The Balsam of the Juice of the Root.* It is a singular Vulnerary, and cures simple green Wounds, generally at one dressing. It is digestive, and cleansing, and dries up and heals running Sores, and old Ulcers, in any part of the Body, but chiefly in those parts which are not depending; resisting Gangrenes, Mortifications, &c.

XVII. *The Cataplasm of the Root.* If it is made of the simple Root, beaten into a Mucilage raw, and then spread upon Leather or Linnen Cloth, and applied to parts pained with the Gout; it gives present ease to the pain, and so admirably strengthens the part, as that the Disease never returns any more from the old Cause; and this I have several times proved. If it is made of the Root boiled till it is soft in Water, and then beaten into a Pulp, adding to it the Powder of the Root, enough to bring it to the Consistence of a Cataplasm, and it is presently applied to any simple Green Wound, or Cut, it quickly heals it by consolidating, or conjoining the lips thereof together: Apply'd also upon broken Bones, it facilitates and speeds the Cure, by preventing a Flux of Humors, inducing the Callus, and strengthening the Part; and applied, is also profitable against Ruptures in Children. It is good also to be used to Womens Breasts, which swell and grow hard and sore by the abundance of Milk flowing into them, which it does by a repercussive Virtue: It also cools the Inflammation, abates the Swelling, and eases the Pain of the Piles, as experience has sufficiently proved. It is also very profitable against moist and running Ulcers.

Gangrenes.

Gangrenes, Sphacelus, and the like, in which cases it has been experienced, and found often helpful.

XVIII. *The Distilled Water from the Leaves, Stalks, and Roots thin sliced.* It has the Virtues of the Juice and Essence, but very much weaker; yet Authors say, it is good for outward Wounds or Sores, whether in the fleshy or nervous parts of the Body wheresoever; as also to take away the Fits of Agues, and allay the sharpness of the Humors: but this it the more effectually does, if it is mixed with equal parts of the Liquid Juice or Essence.

XIX. *The Acid Aqueous Tincture.* Take Spring Water, a gallon: Oil of Vitriol, or Oil of Sulphur per Campanum three ounces, mix them: then put into it of the powder of the Root, six ounces: digest in a gentle Sand heat for a Month, shaking the glass three or four times a day: afterwards being well settled, decant the clear Tincture for use. Given inwardly in Wine, or any other proper Vehicle, it stops inward bleedings, and strengthens and restores the Tone of the Stomach: And mixed with Red Port Wine, it makes a good Lotion to cleanse, dry, and heal any old Ulcer, or running Sore, and effectually destroys the Putridity (if any) therein.

CHAP. CL.

of CONSOUND Saracens.

I. **T**HE Names. It was unknown to the Greeks, and therefore among them we have no name for it. The Latins call it *Consolida* (from *Consolidare*, to Soder, Close, or Glew up:) *Consolida Saracenicæ*, (because used by the Turks and Saracens in healing of Wounds:) *Herba fortis*, from its strong Smell and Taste: Also *Solidago*, and *Herba Vulneraria*: In English, it is called *Saracens Confound*, also *Saracens Wound-wort*.

II. *The Kinds.* Authors make four Kinds thereof, viz. 1. *Solidago Saracenicæ vera salicis foliis*, *Consolida Saracenicæ vera*, The true Saracens Confound, or Wound-Wort. 2. *Solidago vel Consolida Saracenicæ major Lugdunensis*, The greater Saracens Confound, or Wound-Wort. 3. *Solidago vel Consolida Saracenicæ, vel Germanica Siliquosa*, Codded Saracens, or German Confound, or Wound-Wort. 4. *Solidago vel Consolida Saracenicæ, vel Germanica altera, Consolida Tertiæ Tragi, Herba Vulneraria Tragi*, Tragus his third Saracens Confound, or second German, which he also calls Wound Wort: These Plants the Germans generally call *Vulneraria Turcica*, Turkish Wound Wort.

III. *The Descriptions.* The first (which is the True Saracens Confound) has a Root consisting of many Fibres or Strings, set together and growing from a Head, which perish not in Winter, but continue, though the Stalks fade and dye away, without so much as a Leaf appearing in that Season: From this Root proceed several long and narrow green Leaves, snipt about the edges, like to those of the Almond or Peach Tree, or Willow Leaves, but not of such a whitish green color: From amidst these Leaves rises up a Stalk or Stalks, very high, growing sometimes to a Man's height, which are of a brownish, or brownish green color, and hollow, having many long and narrow green Leaves (as before described) set thereon. At the tops of the Stalks grow many pale yellow Star-like Flowers, standing

in green Heads; which when they are fallen, and the Seed ripe (which is of a somewhat long, small, and yellowish color, and wrapped in Down) is carried away with the Wind. The Root and whole Plant is of a strong and unpleasant Smell and Taste.

IV. *The second, or Greater Saracens Confound,* has a Root composed of a great Bush of white Fibres or Threads, growing very deep and strongly in the ground, and shooting forth strings on all sides, which produce new Plants, encreasing in a little time, and over-running a great quantity of ground. From this Root springs forth a head of Leaves, which is somewhat brown at the first shooting out of the ground, (and so also is the head of the Root before the Spring,) which is of a bitter Taste, and binding withal: This Plant differs not much from the former, and therefore from amidst this head of Leaves, there rise up upright, hard, round hollow Stalks, as high as the former, with many dark green Leaves at the first, set (as aforesaid) at the head of the Root, which afterwards rise up with the Stalks, and are set there without any order, somewhat larger than the others, and a little dented about the edges. The Flowers are much greater than those of the first Kind, more in number, and with yellow long Leaves, Star fashion, standing in green heads many together, wherein, after they are past, is contained the Seed, which with the Down thereof, flies away with the Wind, in the same manner as the former does.

V. *The third, or Codded Kind,* has a Root which in time grows to be very great, even to the bigness of a Man's Arm, and runs very deep also into the ground (as those who are acquainted with the Plant well know:) It is of a strong unpleasant Smell and Taste, sharper than Cressies, and very like unto that of Flixweed, abiding many Years, but the Stalks perish Annually, springing forth afresh from the same Root every Spring. These Stalks thus Annually rising up, are great, round and woody, and in height equal to any of the former, or rather (when they

they have attained to their height) higher, but are so weak, by reason of the length and weight of the Leaves thereon, that they cannot stand upright, but fall down upon the ground, bearing many dark green Leaves thereon, long and narrow like to the first, with a white Rib in the middle, and snipt gently, or dented about the edges. At the tops of the Branches or Stalks, come forth many yellowish Flowers, but smaller than those of the other kinds, which being past away, there come forth very small and long round dark Pods or Cods, as small and long as those of *Sophia Chirurgorum*, or *Flixweed*, which contain within them small brownish Seed, of a hot and quick, sharp and unpleasant Taste, as the whole Herb it self is, but much more the Root.

VI. The fourth, or *Tragus his German Confound*, has a Root which creeps in the ground, and shoots up Branches round about it, which are somewhat like both in Stalks and Leaves unto the middle kind of *Nep* or *Camint*, with long Leaves, and white as they are. The Flowers come forth at the tops of the Stalks, many together, upon small, round, green heads, not unlike to the first sort, being small, and yellow. After that they are past, and the Heads, with the Seed, are ripe, they open themselves, and with the Down in them, the Seed is carried away with the Wind, after the manner of the first.

VII. The *Placer*. These do all grow in moist and wet grounds, by Wood sides, and sometimes in the moist places of shadowy Groves, as also by Water sides. The first of these has been found growing in *Shropshire*, in the Hedge, by the way as one goes from *Dudfon* in *Cherberry Parish*, to *Guarthlow*. *Gerard* also says, that it grows by a Wood, as you go from *Great Dunmow* in *Essex*, unto *Clare* in the same County.

VIII. The *Times*. They Flower in *July*, and the Seed of the two first is soon after ripe and carried away with the Wind. The third has not its Pods and Seed ripe until the end of *August*, or beginning of *September*.

IX. The *Qualities*. *Saracens Confound*, (under which singular name we comprehend all the kinds) is temperate in respect to heat or cold, but dry in the third Degree; Astringent, Anodyne, Incarnative, and Vulnerary: It is Neurotick, Arthritick, Alterative and Analeptick.

X. The *Specification*. It is not inferior to any of the Wound-Herbs whatsoever, being inwardly given, and outwardly applied in suitable Preparations.

XI. The *Preparations*. You may have therefrom, 1. A liquid Juice. 2. An Essence. 3. A Decoction in Wine or Water. 4. A Gargarism. 5. An Oil by insolation or boiling. 6. An Ointment. 7. A Balsam. 8. A Cataplasim. 9. A Distilled Water. 10. A Spirit.

The Virtues.

XII. The *liquid Juice*. It cures internal Ulcers of the Lungs: I suppose it was with the Juice thereof, that *Gerard* (as he says) cured one *Cartwright*, a Gentleman of *Grays-Inn*, who was grievously wounded into the Lungs; and that in a short time: In this case, it will be the best way to make it into a Syrup with Honey. It cleanses, dries, and heals old Ulcers, and foul running Sores, and Consolidates Wounds by washing them.

XIII. The *Essence*. It has all the Virtues of the liquid Juice exalted, and is an excellent thing to give inwardly, for the cure of those who have lain long languishing with old, running Fistula's, ill-natured Ulcers, and other stubborn and rebellious putrid Sores; washing them also outwardly therewith, or

injecting it with a Syringe. However the application of it to Green Wounds is a matter beyond all Exception. Inwardly taken, it opens Obstructions of both Liver and Spleen, and is profitable for the cure of the Yellow Jaundice.

XIV. The *Decoction of the Leaves in Wine or Water*. It has the Virtues of the former, but in a much lower Degree; and being made in Water, it is said to cure Agues or Fevers, even of a long continuance: Made with Wine, it opens Obstructions of the Gall Bladder, as also of the Liver and Spleen, and therefore is said to be prevalent against the Dropic in the beginning thereof; and heals all inward Ulcers of the Reins, Ureters, or Bladder, or else where: It cures also inward Wounds and Bruises.

XV. The *Gargarism*. Take of the Decoction in Wine a pint: of the Decoction in Water half a pint: Alum in fine Powder a dram: mix and dissolve: then add choice Honey four ounces: dissolve, and just boil them up together. It is excellent to heal a fore Mouth or Throat, by gargling therewith; and to wash Sores and Ulcers in the Privy Parts of Man or Woman: and to inject into Fistula's with a proper Syringe.

XVI. The *Oil made with Oil Olive*, &c. It is excellent against burnings and scaldings, and is proper against Pains and Aches in any part of the Body, arising from Cold: as also to anoint Nerves which are strained, or Joints which are weakened, by any extraordinary force, or by being put out of Joint. It is good also against dry Scabs or Scurf, to bring it off, and clear the Skin.

XVII. The *Ointment*. It heals green Wounds admirably; digests, cleanses, incarnates and dries running Sores, and old Ulcers, and is prevalent against fractures of the Bones, inducing the Callus, and strengthening the part affected. It is good (being mixt with a little Red Precipitate) against Venereal Ulcers in the Privy Parts of Man or Woman, cleansing them from their putridity, and quickly afterwards healing them up.

XVIII. The *Balsam*. It cures simple green Wounds at the first Intention. But if they be composd with Contusion, Fractures of the Bone, &c. It admirably digests them by a speedy maturation, then cleanses, and incarnates, afterwards dries and heals them: The same thing it does to old running Sores, putrid Ulcers, and Fistula's, (being first laid open) and then duly applied according to Art. I have seen very few things more prevalent against Sores and Ulcers of the King's Evil, which after a singular manner resists the malignity of the Disease, the Patient also taking the Juice or Essence thereof inwardly.

XIX. The *Cataplasim*. It ripens Phlegmons or Inflammations, as also other Tumors which Nature designs to have brought to Maturation, and to break them. Applied, it gives ease to Pains of the Gout, dissolves Simple and Recent Contusions, strengthens Weak Parts, and cleanses Ulcers in any Part, be they never so foul or stinking.

XX. The *Distilled Water*. Whether it is Distilled from the green Herb, or the Liquid Juice, or the Essence, it is effectual to heal any green Wound, or old Sore or Ulcer whatsoever, cleansing, drying, and healing them as Nature requires; but yet after all, the Juice or Essence are much more effectual for the same purposes.

XXI. The *Spirit*. It is made by Infusing the Herb forty eight Hours in Wine, and then drawing it off in a gentle Balneo. It is singular good to heal inward Ulcers of the Reins, Ureters, or Bladder, inward Wounds or Bruises, and to rectify the Discre-

Difcrasie of the Liver and Spleen : It is good also to ease gnawings in the Stomach, Pains and Torments in the Bowels, to expel Wind, and ease the Pains of the Mother. Dose one spoonful in a glass of Wine Morning and Night.

CHAP. CLI.

of CONSOUND Daisie.

I. *THE Names.* It was unknown to the Greeks : the Latins call it, *Consolida media*, *Oculus Bovis* *Branselstij*, and *Bupthalmus*, *Bellium majus* *Tabernmontani* : but by all other Authors, *Bellis major*, and *Bellis major* *Vulgaris*, five *Sylvestris* : in English it is called *Daisie* or *Middle Consound*, *Ox Eye*, the *Great Field White Daisie*, and *Maudlin-wort*.

II. *The Kinds.* It is a Species of the *Daisie*, being the first and great Kind of *White Field Daisie*, and is twofold, 1. *Consolida media* *Anglica*, *Consolida media* *Vulnerariorum*, *Bellis major* *agrestis* *Anglica*, The *English Middle Consound*, or *English Great Field Daisie*. 2. *Consolida media*, vel *Bellis major* *Americana* vel *Virginiana*, The *American* or *Virginian Middle Consound*, or *Great Field Daisie*. 3. *Consolida media*, or *Bugle*, which see in Cap. 92. aforegoing.

Consound-Daisie.

III. *The Descriptions.* The first or *English Kind*, has a Root which is only a Bush of *White Strings*, which abide many Winters, with the Leaves shooting forth every Spring afresh : From this Root come forth many long, narrow, and round pointed Leaves next the ground, pretty deeply cut in on both sides, making it look almost like the divisions of some sorts of *Oaken Leaves*, or rather like those of *Groundsel* : From among these Leaves come forth the Stalks,

which grow to be about a foot and half high, with divers like Leaves thereon, but smaller, and lesser divided than the lower. At the tops of the Stalks and Branches grow large Flowers, each upon several Footstalks, consisting of many white and narrow Leaves, as a *Pale*, or *Border*, about the yellow Thrums in the middle, like those of *Mayweed*, having no Smell at all : The Seed is somewhat long, and is blown away with the Wind. Of this Kind there is one which bears double Flowers, differing from the former in nothing else.

IV. The second, or *Virginian Kind*, has a Root full of Fibres not much unlike to the former ; from which Root rise up Stalks higher and greater than those before described : the Leaves also are larger, and broadest towards the ends, but longer and smaller at the bottoms, dented likewise about the Edges, shooting forth several Branches, at the tops of all which they bear many white Flowers, as it were in an *Umbel*, yet not so great, nor the white Leaves so large as the former, but smaller, and more in number, with a greenish yellow in the middle ; and some a little larger than others, and succeeded with Seed somewhat smaller than the former.

Middle Consound.

or Bugle.

See Cap. 92.

V. *The Places.* The first grows every where by Hedge sides in Meadows, and in the Borders of Fields, and other waste Grounds, The second grows in *Virginia*, from whence it was first brought to us here.

VI. *The Times.* It Flowers in *May* and *June*, and the Seed is ripe in some short time after.

VII. *The Qualities.* This *Consound*, or *Great Daisie*, is cold in the end of the first Degree, and dry in the second Degree : It is *Anodyn*, *Vulnerary*, *Neurotick*, *Arthritick*, and *Alterative*.

VIII. *The Specification.* It is a famous thing for the immediate cure of Wounds in any part.

IX. *The Preparations.* You may have therefrom, 1. A *Liquid Juice*. 2. An *Essence*. 3. A *Syrup*. 4. A *Decolition* in *Wine* or *Water*. 5. A *Lozion* or *Gargarism*. 6. An *Ointment* or *Balsam*. 7. A *Caplasm*. 8. A *Distilled Water*.

The

The Virtues.

X. *The liquid Juice.* It much attenuates the heat of Choler, refreshes the Liver, and other Inward Parts, and Consolidates Wounds, whether Inward or Outward, after an admirable manner. It is good to cure the Wounds of the Thorax or Breast, being taken two, three, or four ounces at a time, either alone, or mixed with a Glass of Wine, Morning and Evening. Outwardly it also Consolidates Wounds, cleanses old running Sores and Ulcers, and dries and heals them: Dropt into fore and running Eyes, it cleanses, strengthens, and heals them.

XI. *The Essence.* It has all the Virtues of the Juice, and is indeed more effectual, outwardly applied, it heals Sores in the Privy Parts, gives ease in Pains of the Gout, diffuses Tumors, and disperses Kernels in the Flesh; and helps bruises and hurts which come by Falls or Blows. Inwardly taken, it induces the cure of Wounds, Ulcers and Fistula's, whether inwards or outwards, and hastens the Callus breeding, in Fractures of the Bones: for which reason also it is said to be good against Ruptures, and other inward Breaches of any Vessel within the Body. Dose two or three ounces Morning and Night.

XII. *The Syrup.* It has the Virtues of the Juice and Essence; and is better to be given to Children in Ruptures because of its pleasantness. And if it is made with Honey, it is more effectual in Wounds and Ulcers of the Breast and Lungs, or of any other Bowel: It thickens Rheum, and is good against Coughs, Colds, Wheezings, or any Obstruction of the Viscera.

XIII. *The Decoction in Wine or Water.* It helps to cure Wounds of the Thorax, and may be used Dietetically in all the Cases for which the Juice, Essence or Syrup are commended. It singularly refreshes the inward Parts, removes the Discreasie of the Blood and Humors, and as a most admirable Vulnerary induces the healing of Wounds and Ulcers. If there is any Inflammation in or about the part afflicted, or if a Fever is present, the Decoction is best to be made with Water; but otherwise with Wine. It is also of good use to wash the Wound, (if made with Wine) or cleanse foul Ulcers or Fistula's, by injecting it with a Syringe, or otherwise, as often as they are dress'd, by which they are daily cleansed and kept clean, and if hollow, incarnated, by which means the healing speedily follows. If it is made with Wine, with the Addition of a third part of *Agrimony* and *Angelica*, and the parts afflicted with the Palfie or Sciatica, be daily, Morning and Night, fomented therewith very warm for half an hour, or thereabouts, it gives great ease and relief.

XIV. *The Lotion.* Take of the Decoction in Wine eight ounces, of the Essence four ounces: Alum in fine powder three drams: Honey of Mulberries four ounces: mix and dissolve. It heals and cures all Wounds, Ulcers, Sores and Pustules of the Mouth, Gums or Throat, as also of the Secret Parts of Man or Woman, if duly wash'd therewith. Dropt into the Eyes, it clears the sight, raking away Clouds, Films, Inflammations, Flux of Humors, &c.

XV. *The Ointment or Balsam.* They do wonderfully help all Wounds which have an Inflammation about them, or have a Flux of sharp and moist Humors upon them, by which they are kept long from healing. Any simple green Wound the Balsam many times cures at the first intention: and other degenerated Sores it digests, cleanses, incarnates (if flesh is wanting) and quickly heals them, and this although in the Joints, whether of the Arms or Legs.

XVI. *The Cataplasim.* It is excellent to discuss Contusions or Tumors coming upon simple Bruises, if applied upon the Spot. Applied to the Testicles, or to any other part which is Swollen, and Inflamed, it allays the Heat, diffuses the Humors, and resolves it: Applied also immediately to a simple green Wound, it prevents Inflammation, conglutinates the Lips, and heals it; and this more especially if it is made of the raw green Herb. And so made and applied, it is very effectual to ease the pains of the Gout, discuss the Tumor, and strengthen the Part: but whether it is altogether so effectual as the Cataplasim of Comfrey Roots, I will not presume to say.

XVII. *The Distilled Water.* It has the Virtues of the Juice and Essence, but much less effectual. Dropt into the Eyes, it allays an Inflammation there: and if Powder of White Sugar Candy, or clarified Honey be added, j. ounce, to vj. ounces of the Water, it makes a *Collyrium* which cures dim, cloudy, fore, and running Eyes, being often dropt into them.

C H A P. CLII.

OF CORALWORT.

I. *THE Names.* *Dioscorides* nor *Pliny*, nor any other of the Ancient Writers, knew any thing of this Plant, so far as I can learn; but it seems to be purely an invention of the Moderns. The *Latins* (from the Form and Color of the Roots) call it *Coraloides*, *Dentaria*, *Dentillaria*, *Dentillaria* or *Dentaria Coralloide Radice*, *Alabastrites Lobelij*, *Viola Dentaria Dodonaei*, (from the Roots and Flowers, being like unto Stock-Gilliflowers:) by *Gesner*, in *Hortis*, *Sanicula alba*, *Pulmonaria*, *Saxifraga montana* (from its Virtues,) but *Columna* takes it to be the *Ceratia Plinij*, because it has all the Virtues which *Pliny* ascribes unto his *Ceratia*, but this is doubtful. *Dalechampius* in *Lugdunensis* took it to be an *Aconitum*, but this was wholly Error. In *English* it is called *Coralwort*, *Toothwort*, and *Toothed Violets*.

II. *The Kinds.* *Matthiolus* places this between *Symphita* and *Consolida*, it being wholly of their Nature and Qualities. *Parkinson* makes seven Kinds thereof; some other Authors more; but we shall only discourse of those which are to be had with us, either Wild in our Fields and Woods, or nursed up in our Gardens; and they are, 1. *Dentaria Bulbifera*, vel *Baccifera*, Bulbed, or Berrybearing Coralwort. 2. *Dentaria minor*, or *minima*, *Alabastrites*, Small Coralwort. 3. *Dentaria Pentaphyllos*, Cinkfoil Coralwort. 4. *Dentaria Pentaphyllos alter*, The second Cinkfoil Coralwort. They are generally called *Dentaria*: and most of them from the number of their Leaves, as, *Triphyllus*, *Pentaphyllos*, and *Heptaphyllos*; but the *Triphallos* or *Enneaphyllos Lobelij*, and the *Heptaphyllos*, are strangers in our Country.

III. *The Descriptions.* The first of these has a Root very white, smooth, and shining, made of divers small round knobs set together, not growing downwards, but lying along, and encreasing under the upper crust of the Earth, having very few fibres thereat; its taste is somewhat bitter, hot and sharp, like Radish, as all the rest of the Kinds are. From this Root shoots forth one or two Winged Leaves, upon long brownish Rootstalks, which in their rising out of the ground, are, as it were, doubled, or folded downwards, and then open themselves, most commonly,

into seven Leaves; and sometimes into but five, each of which is something long, dented about the edges, and pointed, of a sad green color, and set on both sides of the middle Rib, one against another. The Stalk, which beareth Flowers, rises up in the same manner with the Leaves, and is bare or naked of Leaves, to the middle thereof, where it shoots forth a Leaf, and so one or two more up higher, each consisting but of five Leaves, and sometimes but of three, having also the uppermost single; at each whereof comes forth a small round Bulb, cloven, or as it were, divided into several parts or cloves, of a sad purplish green color, which being ripe, and put into the ground will grow to be a Root, and bear Leaves, like as the Bulbs of a red Bulbed Lilly; about which, at the very top, stand four or five Flowers in long Husks, upon short Rootstalks, opening into four several Leaves, of a purplish color, and very like unto the Flowers of Stock-gilliflowers, or Dames Violets. These being past away, small long horns, or Cods, pointed at the ends come forth; in which Pods or Cods lyes such like Seed as are in the Cods of Dames Violets; which as soon as it is ripe, the Cod opens, and the Seed falls out: The Leaves, and indeed the whole Plant, is of a bitterish, hot, sharp, Radish-like Taste.

*Bulbed
Coral wort*

IV. The second, or Small Coralwort, has a Root small, and somewhat long, composed as it were, of many small, very shining, white thick scales, growing upwards, and having many white Fibres at the head of them, of a little sweetish bitter, sharp and astringent Taste. From this Root spring forth three or four slender pale green Stalks of Leaves somewhat divided on their edges, not half a foot high, and not of half that height in some places, very like unto those of the hollow Root, but smaller, and of a paler shining green color; fewer among which rise up one or two small Stalks, with two such like Leaves thereon, but smaller, and a little above them,

a small round greenish yellow head, which spreads not into Leaves, but into four or five mosse heads of Threads, and so abides a while, (having no other Flower) which pass away leaving in their room many small kernelly Seed. The Leaves have a bitter sweet scent, somewhat like unto the Musked Cranes Bill, yet more sweet when it grows Wild in its natural places, than when it is transplanted out of them into Gardens. This Plant is referred by many unto the Ranunculi or Crowfeet, to which it has but a small resemblance, and ought rather to be incerted in this place, for the likeness of its Root sake.

Small Coral wort

Coral-wort five leaved

V. The third Kind, which is the first Cinkfoil Coralwort, has a Root which is greater than the first, and made as it were into Joins, not so white as that is, but with longer Fibres coming from between the Joins. From this Root rises one or two Leaves

F f upon

upon long twinstalks, consisting of five Parts, or Leaves, each of them somewhat like the first, and dented about the edges, but they are longer, rougher and harder in feeling, and more closely set together, rising for the most part from one Joint, like as the Cinkfoils do: upon the Stalks also are some such like Leaves set one above another; at the top four or five such like Flowers, but somewhat larger, of a purplish color, something deeper than the first, which turn into such like Pods, with the like Seeds in them, but has no Bulbs on the Stalks.

VI. The fourth, or second Cinkfoil Kind of Coriawort, has a Root very like the first, consisting of many round clear white Knobs, but more in number, set together by pieces, with divers long Fibres growing out of it: From this Root shoots forth a lower and smaller Stalk than the former, being not above a foot high, with some Leaves set thereon; as also there is some of these very like the last, but narrower, more smooth and gentle, and also of a paler green color: the Flowers stand at the top, like unto the other, and are of a purplish color, after which come the like Pods with Seed in them, as in the rest.

VII. The Places. The first and second are found Wild in England, the first at Mayfield in Suffex, in a Wood called Highbred; and in another Wood there also, called Fox-holes; as also in divers shadowy and dark Mountains, or Hills: the two last are only nurs'd up with us in Gardens.

VIII. The Times. They Flower about the middle of April, and beginning or middle of May, and the Seed is ripe in August, after which they quickly wither and perish; the Roots abiding safe all the Winter.

IX. The Qualities. They seem to be Temperate in respect of heat or cold, but are drying in the first Degree. They cleanse, astringe, dry, bind, and strengthen.

X. The Specification. They are dedicated to the curing of Wounds.

XI. The Preparations. You may make therefrom, 1. A liquid Juice. 2. An Essence. 3. A Decoction in Wine. 4. A Syrup. 5. A Powder. 6. A Balsam.

The Virtues.

XII. The liquid Juice. It strengthens the Bowels, and makes them able to perform their Offices, provokes Urine, and is said to expel the Stone and Gravel, being drunk, Morning and Evening, from three ounces to six, in a Glass of Port Wine.

XIII. The Essence. It has the former Virtues, besides which it is said to cure any inward Wounds, especially those Wounds which have pierced into the hollowness of the Thorax. It is also good to ease the Gripping Pains of the Bowels, and Sides, being taken to four or six ounces in a glass of Red Port Wine, or old Malaga.

XIV. The Decoction in Wine. It has the former Virtues, but much weaker, and is good against Lasks or Fluxes which proceed from hot and choleric Humors: you may give it to six or eight ounces, Morning and Evening, for many Days together.

XV. The Syrup. It is made of the Juice or Essence, and is proper to be given to Children which have Ruptures, or are troubled with Gripings, Vomiting, or other Diseases of the Bowels.

XVI. The Powder of the Root. It has the Virtues of the Juice and Essence; and heals Wounds of the Breast and Lungs, being given to a dram in Red Wine for some considerable time. It is also profitable against Burstnells, being given in the Syrup atore said.

XVII. The Balsam. It is good to be applied to green Wounds, for it quickly consolidates and heals them; it also digests, cleanses, incrustates, dries, and heals old, running, filthy and hollow Ulcers; facilitating the cure after an admirable manner.

CHAP. CLIII.

of CORIANDER.

I. THE Names. It is called in Greek, *Κόριανδρον*, and *Κόριαννον* (from *Κόρις*, Cimex, the Wall-Louse, which we call Bugs; for that Coriander in its scent, very much resembles their stinking Smell when they are killed:.) In Latin, *Corion*, and *Coriannon*, but mostly in the Shops *Coriandrum*: In Arabic, *Casberra*, and *Elcosbur*: In English, *Coriander*.

II. The Kinds. There are but two sorts of it which are found with us, viz. 1. *Coriandrum vulgare*, The common Coriander. 2. *Coriander minus odorum*, The lesser sweet Coriander. And by the name *Coriander* these Plants are known in almost all Nations.

Coriander

III. The Descriptions. The first has a small Root, which perishes every Year after Seed time: from this Roots spring up Leaves which are something broad, almost like unto Parsley or Chervil; but after the Stalk or Stalks come forth, which are three or four feet high, being full grown; the Leaves then are smaller and fine, every one than other, up to the top, being of a faint green color, and very much cut or jagged in, almost like to the Leaves of Fumitory, but a great deal smaller, tenderer, and more jagged. The Flowers are white, and grow in small loose Umbles, like unto Dill; which being passed away, there comes forth a round striked hollow Seed, of a whitish yellow color when it is ripe. The whole Plant, Seed and all, while it is green and growing, has

has a strong and loathsome Smell, scarcely to be endured; but when the Seed is full ripe and dry, it is of a very good Scent, and of an agreeable Taste.

IV. The second has Roots and Stalks almost like the former; but the Leaves, the lower as well as the higher, are all finely cut in, and jagged; the Stalks are much lower, not above half a foot high, (says Parkinson) and lying almost on the ground: the Flowers on its Tops are white; and the Seed round as the other, but fuller and larger, and two always joined together.

V. The Places. They are only Sown in Gardens now, as in old time. Pliny says, they are not found Wild; nor are their natural places known.

VI. The Times. They Flower in July, and their Seed is ripe in August.

VII. The Qualities. The green Leaves are said to be Cold and Dry. The dried Seed is Hot and Dry in the end of the second Degree, or beginning of the third. It is Aperitive, Anodyn, Carminative, Diffusive, Stomackick, and Alexipharmick.

VIII. The Specification. It stays Vomiting, and helps Digestion.

IX. The Preparations. YOU may have therefrom, 1. A Juice from the Green Herb. 2. An Essence of the same. 3. An Ointment or Balsam of the same. 4. A Cataplasim of the Green Herb. 5. Coriander Comfits. 6. A Powder of the Seed. 7. A Spirituous Tincture of the Seed. 8. An Acid Tincture thereof. 9. An Oily Tincture of the same. 10. A Saline Tincture thereof. 11. A Spirit. 12. An Oil by Distillation.

The Virtues.

X. The Juice of the Green Herb. Authors say, it is of a cold Quality, and that being drunk, altho' but to half an ounce, it kills them that take it. But outwardly applied, it dissolves Knots and Kernels; and dissolves other hard Tumors, being assiduously used.

XI. The Essence of the same. It has the Virtues of the Juice, and being applied by Rags dipt therewith, it is said to cure Amblyopia, and other hot Tumors.

XII. The Ointment or Balsam of the same. It is made with Ceruse, Litharge, Vinegar, and Oil of Roses. It is commended against an Erysipelas, running and fretting Sores, Wheals, Pustules, Carbuncles, and Botches, rising in the Skin or Flesh; it cools the Inflammation, and takes away also the Swelling of the Cords.

XIII. The Cataplasim of the Green Herb made with Barley Meal, or Barley Bread. It has the Virtues of the Ointment, but is more powerful to allay Inflammations, or discuss hot Tumors or Swellings. It is also good to dissolve or discuss Wens, fleshy Tumors, and protuberances of the King's-Evil, being duly applied.

XIV. The Comfits of the Seed. Gerard says, they prevail much against the Gout, being eaten upon a fasting Stomach, before Dinner; and also after Dinner without drinking after the same for three or four hours time: and they have yet a greater power over that Disease, if they be eaten in the same manner also after Supper.

XV. The Powder of the Seed. If it is taken fasting to almost a dram in a Glass of Generous Wine, it strengthens the Stomach, causes an Appetite, and makes a good Digestion, depresses Fumes and Vapors rising from the Stomach, Spleen or Womb, and ascending up into the Head. It stops Cataracts, helps the noise in the Ears, and discusses that Tumor in the Throat, vulgarly called the Quinsy.

XVI. The Spirituous Tincture of the Seed. It is a most singular Stomackick, strengthens the Ventricle, stops Vomiting, helps Digestion, and eases the most inveterate Pains of that Bowel: and is indeed a most excellent thing against the Gripings of the Guts.

XVII. The Acid Tincture. This is yet a more excellent Stomackick than the former, where there is a lassitude or weakness of the Stomach, and the Tone thereof seems to be deprived or undone, and the Acidities thereof so diminished, as that the Patient wants an Appetite, and cannot at all digest their Food, but that it comes up again undigested, with Vomiting, manifold Reachings, and vehement Sickness thereof, being taken in Red or White Port Wine, or in a generous Canary, to a pleasing Acidity; it restores the Tone of the Stomach, and kills Worms in the Body.

XVIII. The Oily Tincture. If it is daily taken, viz. Morning and Night, in any generous Vehicle, from twenty drops to forty, it cures the Colick, and Griping of the Guts, and mightily stirs up Veneries. It prevails also against the bitings of Serpents, especially of that called *Amphisbena*, the place bitten being also anointed therewith. And as it is comfortable to the Stomach and Bowels, by its healing and drying property, and prevails against a Paralysis, or Palsie, so also it is eminently good against that Disease by anointing the whole length of the Back-bone therewith, as also the parts affected, twice a day before a fire, and rubbing it very well in for a long time: And by outward application in like manner, it prevails against Cramps, Convulsions, Gouts, and the Sciatica, and all cold and moist Diseases happening in what part of the Body soever.

XIX. The Saline Tincture. It opens Obstructions of the Reins, Ureters, and Bladder, provokes Urine, and causes an Evacuation of Sand, Gravel, and Tartarous Matter out of those parts. Dose to one dram, or more, in a Glass of generous White Port Wine.

XX. *The Spirit.* It is very comfortable to the Stomach, and exceeding Cordial; by heating and refreshing of it, and taking away the cold and moist Temperature thereof, which is the ground and foundation of Catarrhs and Rheumatisms; it helps Digestion, repels the Vapors, which ascend thence up into the Head, and forcibly relieves the Tortures of the Colick, proceeding from Cold, Wind, and the like: and being moderately used, it stirs up Venery by an increase of Blood and Seed, and by a gentle warming, and, as it were, vivifying the same. Dose one spoonful, or more, in the Morning fasting, a little afore Dinner, and at Bed time, either alone, or in a Glass of Canary.

XXI. *The Oil by Distillation.* Being taken inwardly from ten to fifteen or twenty drops, and in some very cold and moist Constitutions to thirty or forty drops; first dropt into, and mixt well with White Sugar, and then mixed well with a glass of Wine, and so taken, it is a famous thing against the Palsie, Cramps and Convulsions, whether in Old or Young, and the Gout in the Stomach; anointing all those parts which are affected with those Diseases, outwardly, Morning and Night, and rubbing or chafing it well in. It effectually opens the Urinary Passages, and powerfully stirs up to Coition, by encreasing Seed, making it Spirituous, and strengthening the parts of Generation.

XXII. *An Observation.* The Arabian Physicians, and others of the Ancients, tell us how we should correct *Coriander Seed* before we use it, viz. by steeping it all Night in Vinegar, and then drying it again, thereby to take away (as they think) its Venene Qualities. But this *Lobel* seems to despise, and that truly with very good reason, because no such thing can be extracted from it; for after it is ripe, if it is suffered to dry of it self, or in the Sun, all those pretended Obnoxious Qualities will vanish away of their own accord; nor needs it any other Preparation when it is made into Comfits, and is so far from being hurtful to the Stomach, and Bowels (as some Authors have affirmed) that on the contrary, it has been found by great Experience to be an excellent Stomack, exceeding many others: and this even Country People have found by the use of it, without any Preparation at all: for being only Dry, it has a warming Faculty, and a Sweet, and no Noisome Smell or Taste, that being contained only in its Humidities whilst it is Green, and not in the Seed when only dried.

C H A P. CLIV.

of CORN-FLAG.

I. *THE Names.* It is called in Greek, *Χιζιον*, and *χαιοζανον*: In Latin, *Gladiolus*, and of some *Ensis* (as it were the Sword Flag:) of some *Gladiolus Segetalis*, *Vidiorialis semina Cordi*, and *Vidiorialis Rotunda*: In English, *Corn-Flag*.

II. *The Kinds.* There are several sorts thereof, as,
1. *Gladiolus Narbonensis*, The French Corn-Flag.
2. *Gladiolus Italicus binis florum ordinibus*, The Italian Corn-Flag.
3. *Gladiolus Byzantinus*, The Constantinopolitan or Turkish Corn-Flag.
4. *Gladiolus flore rubente*, Blush-colored Corn-Flag.
5. *Gladiolus flore albo*, White-flowered Corn-Flag.
6. *Gladiolus purpureus minor*, The small purple Corn-Flag.
7. *Gladiolus Lacustris*, The Water, Corn, or Sword Flag, described by *Chisius*.

French Corn-Flag.

Italian Corn-Flag.

III *The Descriptions.* The first has a Root which is somewhat great, round, flat and hard, looking as if it was netted, having another short spongy one under it, which when it has done bearing, and the Stalk dry, that the Root may be taken up, sticks close to the bottom, but may be easily taken away, having commonly a number of small Roots encreased about it, the least of which will quickly grow, so that if it is suffered any long time in a Garden, it will even choak it up. From this Root, three or four broad, long, and stiff green Leaves rise up, one, as it were, rising

rising out of the side of another, being joined together at the bottom, somewhat like unto the Leaves of Flower-de-luces, but stiffer, more full of Ribs, and longer than many of them, and sharper pointed. The Stalk rises up from among the Leaves, bearing them on it as it rises, having at the top divers Husks, out of which come the Flowers, one above another, all of them turning and opening themselves one way, which are long and gaping, like unto the Flowers of Fox-Glove, a little Arched or bunching up in the middle, of a fair reddish purple color, having two white spots within the mouth thereof, one on each side, made of a Lozenge fashion, viz. square, and long pointed. After the Flowers are past, round Heads or Seed Vessels come up, in which is contained reddish flat Seed, like unto the Seed of Fritillaria, but thicker and fuller.

IV. The second, or Italian Corn-Flag, is like unto the former French kind, in its Root, Leaf, and Flower, without any other difference, than that the Root is smaller, and browner, the Leaf and Stalk of a darker color; and the Flowers (darker also in their color, and a little smaller) standing out on both sides the Stalk.

V. The third, or Turkey Corn-Flag, except that it is larger in its Roots, Leaves, and Flowers, is like in all things to the first Corn-Flag; the Flowers on this standing only on one side, of a deeper Red color, and being later in the Year before they appear, viz. after all the rest are past. The Root is netted in this, as plainly as in any of the others; it is plentifully also encased, but is more tender, and less able to abide our cold Winters.

VI. The fourth is like unto the French Corn-Flag in all respects, excepting only that the Flowers are of a pale red color, tending to whiteness, commonly called a Blush color.

VII. The fifth differs not from the last, excepting that the Roots are whiter on the outside, the Leaves are greener, without any brownness or darkness, as in the former, and the Flowers are of a pure Snow white color.

VIII. The sixth differs not from any of the former, but in the smallness of the Leaves, Stalk and Flowers, which stand all on one side, like unto the French kind, and of the same color: and the Root of this sort is netted more than any of the others.

IX. The seventh, or Water Gladiol has a matted bushy fibrous Root; from whence rise up Leaves about a span long, thick and hollow, with a Partition in their middle, like as you see in the Cods of Stock-gilliflowers, and the like: their Color is green, and Taste sweet, so that they are an acceptable Food to Wild Ducks, diving to the bottom of the Water; for they sometime lye some Yards under Water; which notwithstanding are over-topt by the Stalk, which springs up from among those Leaves, and bears Flowers of a white color, and larger than those of Stock-gilliflowers: but in that hollow part which is next to the Stalk, they are of a blewish color, almost in shape resembling the Flowers of the Corn-Flag, but not absolutely like them. They consist of five Leaves, whereof the two uppermost are reflected towards the Stalk; the three other being broader, hang downwards: after the Flowers are past, round pointed Vessels follow, filled with red Seed.

X. The Places. Their Titles, of the chief, generally shew from whence they first came: but with us they are only nats'd up in Gardens: they seem to be Natural to Barbary, where John Tradescant saw many Acres of Ground overspread with them. In those Countries where they grow Wild, as in Turkey, Italy, Spain, and France, they grow in Meadows, and in Earable Land among Corn: and we have great plenty of them in our Gardens near and

about London, which serve for their Beauty and Ornament. The Water Gladiol is found in some places of West Friesland, growing in Waters which have a Gravelly bottom, and which scarcely bring forth any other Plants besides.

XI. The Times. They Flower from May, to the end of June, and sometimes in July; but the Byzantine, or Turkey, after all the rest, as is above-said.

XII. The Qualities. They are hot and dry, but in what Degree Authors have not said: but Galen says, they have a power to Dry, Attract, Waste and Consume; and that they have a subtil and digestive Quality.

XIII. The Preparations. You may have therefrom,
1. A liquid Juice of the upper Root. 2. An Essence of the same. 3. An Emplaster. 4. A Cataplasm.
5. A Powder of the Cods and Seed.

The Virtues.

XIV. The liquid Juice. If it is drunk with Red Port Wine, it is said to cure the Rupture in Children, called Enterocoele, which is when the Guts fall into the Cods.

XV. The Essence of the same. It has the former Virtues, and being drank Morning and Evening for some time, to four or six ounces in a Glas of Sherry Wine, it is said to provoke Lust, and strengthen the Viscera.

XVI. The Emplaster. It is made of the Root mixed with Frankincense and a little Wine: Being applied, it eases the Pains of the Gout: it also draws forth Thorns, Prickles, Splinters, or broken Bones out of the Flesh; it Digests, Maturates, and Cleanses.

XVII. The Cataplasm. It is made of the Root beaten up with Meal of Darnel, and Honey, and a little Lard. It wastes and dissolves hard Nodes, lumps of Flesh, and other like hard Tumors. It is also found to be a certain and approved remedy against scrophulous Swellings in the Throat, vulgarly called the King's-Evil.

XVIII. The Powder of the Cods and Seed. If it is drank in Goats, or Asses Milk, to one dram, or more, Morning and Evening, as also in the time of the Patoxyism of the Colick, it eases the pains of the Colick: but if it is drank in Juniper Water, it is much better.

CHAP. CLV.

Of CORN-SALLET,

OR,

LAMBS-LETTICE.

I. THE Names. It may be called in Greek, *Λευκοδάκτυλον*: In Latin, *Lactuca Agnina*, and *Olus Album Dodonaei*: In English, *Corn-Sallet*, or *Lambs-Lettice*.

II. The Kinds. It is not a Kin to the Lettice, though called by that name, which I suppose was, because it is eaten for a Sallet, as the Lettice is. And is a singular Plant by it self.

III. The Description. It has a Root consisting of many small and long Fibres; from whence spring up many slender, round, weak Stalks, trailing, as it were, upon the ground, about a foot high, if it grows in good and fertile ground; otherwise but a hand or

1200 high, with several Joints, and two Leaves standing at each Joint, narrow and long. Likewise from the same Root, at its first coming forth out of the ground, many Leaves, long, narrow, and round pointed, of a whitish green color, spring forth, which grow close upon the ground, which live all the Winter, and from among which, in the beginning of the Spring, (if it is sown in Autumn, as is usual, when it is to serve for an early Sallet) several small, round Stalks rise up, branching forth at the top, and bearing Tufts of small black blew flowers, (but Dodonæus say, they are very small white flowers, closely compact together :) These Tufts of white flowers are broad, but the flowers themselves are very small, so that they can scarcely be known to be flowers, saving that they grow many together, like a Tuft or Umbel.

IV. *The Places.* This Herb grows Wild in Corn-Fields: (whence the Name) but since it has grown into use amongst us for Salletting, it is also sown in Gardens for a Sallet Herb.

V. *The Times.* It is found Green all Winter and Summer: and runs up to Flower and Seed in March, April, and May.

VI. *The Qualities.* It is Temperate in respect of heat or cold; and moist in the first Degree. It is Emollient, Hepatick, Alterative, and Galactogenetick.

VII. As to the Specification, Preparations, Virtues and Uses of this Herb, Authors have been silent. It is doubtless an innocent Plant, and pleasant to be eaten: for which reason it is used as a Winter Sallet, at least wile very early in the Spring; for which purpose it is dress'd up to the Table as Garden Lettices are, with Salt, Vinegar, and Oil, and sometimes with Sugar also, as the Eater best likes.

Flowers; somewhat like unto Tansey flowers, but lesser; which afterwards are the Heads which contain the Seed, which is small, flat, and long: These flowers being gathered before they be ripe, keep their color and beauty a pretty while without Withering; and the whole Plant is of a very pleasant Smell and Taste, and very agreeable with the Stomach.

CHAP. CLVI.

OF COSTMARY.

I. *THE Names.* It seems not to have any Greek Name: but the Latins call it *Costus hortorum major*: some call it *Balsamita major*, *Mentha Græca*, *Mentha Romana*, *Mentha Corymbifera major*, *Mentha Saracenicæ*; by Gesner, in *Hortis*, *Oviaria*: by Casalpini, *Herba Maria*; and *Lassulata* by others: In English, *Costmary*, or *Alecoast*.

II. *The Kinds.* Of the *Costus hortorum*, there are two Kinds, viz. 1. The Greater, which is *Costmary*, of which in this Chapter. 2. The Lesser, which is *Maudlin*, of which in its place, in some one of the following Chapters of this Book: Many Authors join these two Plants together in one Chapter, making them as two Species under one Genus: But in my Opinion, notwithstanding the Unity or Sameness of the Latin Name, they are truly two differing Herbs.

III. *The Description.* *Costmary* has a Root which is somewhat hard, and very full of Strings, which being divided with the Heads of Leaves, may be replanted in the Spring time for encrease. From this Root spring forth many broad and long pale green Leaves, dented, or cut a little about the Edges, every one standing upon a long Footstalk; among which rise up many round green Stalks, with such like Leaves thereon, but lesser up towards the top, where it spreads into three, four, or more Branches, every one bearing an Umbel or scaly Tuft of gold yellow

IV. *The Places.* It grows almost every where in Gardens, and is nurs'd up with us for the sweet Smelling of its Flowers and Leaves. But in Italy it has been found to grow naturally Wild in rough and untill'd places, especially in the Duke of Tuscany's Dominions.

V. *The Times.* It Flowers in June and July, and the Seed is ripe some time after.

VI. *The Qualities.* It is hot and dry in the end of the second Degree. It is Aperitive, Absterfive, Camminative, Digestive, Disculfive, Diuretick, Traumatick or Vulnerary; it is also Cephalick, Neurotick, Stomatick, Cordial, Nephritick, and Hysterick; Alexipharmick, and Analeptick.

VII. *The Specification.* It is singular in curing all sorts of Green Wounds.

VIII. *The Preparations.* You may prepare therefrom, 1. A liquid Juice. 2. An Essence. 3. An Infusion or Decoction. 4. A Powder. 5. An Oil by Insolation. 6. An Ointment. 7. A Balsam. 8. A Cataplasm. 9. A Spirituous Tincture. 10. An Acid Tincture. 11. An Oily Tincture. 12. A Saline Tincture. 13. A Spirit. 14. An Oil Distilled. 15. Potestates or Powers. 16. An Elixir. 17. A Fixed Salt.

The Virtues.

IX. *The liquid Juice of the Herb.* It provokes Urine mightily, by opening Obstructions of the Urinary Parts; and by injection takes away the hardness of the Womb, if it be not Cancerous: It gently evacuates Choler and Flegm, attenuates that

that which is thick and gross, cuts and divides that which is tough and glutinous, cleanses that which is foul, hinders Corruption or Putrefaction, dissolves without Attraction, opens Obstructions, and removes their evil effects. It strengthens the Stomach and Liver, and all the other *Viscera*; and if it is taken from two ounces to four, or six, in Clarified Whey, it operates the more effectually to all the aforementioned intentions. Being also duly given Morning and Evening, as also about two or three hours before the coming of a Quotidian Ague, it is very powerful in repressing it, and for the most part Cures it.

X. *The Essence.* It has all the Virtues of the liquid Juice, and indeed more powerful to all the intentions; besides which, it is an excellent thing to be used Dietetically by all those who have composed Wounds, running Sores, old and putrid Ulcers, inveterate Fistula's, or have a Cachexia, or are inclinable to the Green-sickness, in which last case, it does as much as most Vegetables can do. It may be given either alone of it self, or mixt with a glass of White Port Wine, from one ounce to six, every Morning, fasting, and last every Night at Bed time. Thus taken, it is also very profitable against continual Pains of the Head, to stop, dry up, and consume all thin distillations, which are apt to fall upon the Lungs, and helps to digest raw Humors. It is a truly beneficial thing to the Bowels, and kills Worms in Children.

XI. *The Infusion, or Decoction in Wine.* They have the Virtues of the Juice and Essence, but not full out so powerful, and therefore may be given to half a Pint, Morning, Noon, and Night. It opens Obstructions of the Womb, and if seasonably taken, viz. about a Week before the time, it provokes the Terms in Women.

XII. *The Powder of the Leaves.* It is a good Stomack, and may be taken from half a dram, to two drams, Morning and Night, in any proper Vehicle. I commend it to such as are apt to have the Gout to fly upwards into the Stomach: it is Astringent, resists Poison, and the bitings of Venomous Beasts, and kills Worms in Humane Bodies.

XIII. *The Oil by Infusion, or boiling in Oil Olive.* It warms and comforts Parts affected with any Præternatural Coldness, and resists the afflux of cold and moist Humors, it dissolves Swellings, and gives ease in the Gout, Sciatica, and other like Pains.

XIV. *The Ointment.* If it is made with the addition of *Adders-tongue*, it is an excellent thing to cure Burnings and Scaldings, whether with Fire, Water, or Oil, and to cleanse and heal old Ulcers, and particularly to discuss hard Tumors in Womens Breasts.

XV. *The Balsam.* It not only cures simple Green Wounds at the first Intention, but also digests and maturates those which are Composed or Complicated. It digests putrid and eating Ulcers, and by its Anodyn quality eases their Pains; it cleanses them, and if hollow, or wanting in flesh, it incarnates; and by its Astringent property, it dries up their Humidities, strengthens the part, and brings the Sore to a speedy healing.

XVI. *The Cataplasm.* Applied, it discusses recent Contusions, cleanses old and running Sores, resists the putridity of Ulcers, eases the Gout, strengthens weak Limbs and Joints, abates Inflammations, and draws out the fire in Burnings, being applied before they are blister'd.

XVII. *The Spirituous Tincture.* It warms and dries a cold and moist Stomach, and is an especial thing to help an evil, weak, cold, and disaffected Liver. It prevails against Convulsions, and the distemperature, or tortions of the Bowels,

strengthens the Nerves, Head and Brain, and heats all cold and moist disaffections of those parts. By the constant taking of it, stops and dries up Catarrhs, and the affluxes of cold Rheums to other parts of the Body; and is very profitable against an inveterate Head-ach, proceeding from a cold and moist Cause. Dose one spoonful Morning and Night, in a Glass of Sherry, Canary, White Port, or other Generous Wine.

XVIII. *The Acid Tincture.* It is a most singular Stomack, resists Crudities and Putrefaction, and therefore is very good against all Putrid, Malign, and Pestilential Fevers: it quenches Thirst, causes a good Appetite to Food, and helps digestion. And being prudently administered, it is a very effectual Medicament to kill Worms in Children. Bathed well in, Morning, Noon, and Night, upon places affected with the Gout, it opens the Pores, attracts and draws forth the malign Humor, eases the Pain to a Miracle, dissolves the Tumor, and quickly restores the Patient to his desired health. When it is taken inwardly, it is to be given in some proper Vehicle, or Wine, to a grateful Acidity; it represses Vapors from the Womb, and is to be taken Morning, Noon, and Night.

XIX. *The Oily Tincture.* It eases all external Aches or Pains in any part of the Body whatsoever, proceeding from a cold and moist Cause, it takes away the relaxation of the Nerves, and Muscles, prevails wonderfully against the Palsie, and strengthens the Muscles, Nerves, Tendons and Joints, being weakened through Pain, or any afflux of Humors. But in case of the Palsie, the Back-bone, from the Neck to the *Anus*, is daily, Morning and Night, to be well anointed therewith, as also all the Parts which are affected, rubbing and chafing it in. It cures the Nerves, being Prick'd or Wounded, immediately easing the Pain, and abating the Tumor; and in a short time after heals the Wound. If it is taken inwardly from twelve to twenty or thirty drops, in any Homogene Vehicle, it cures cold and moist Distempers of the Head, Breast and Lungs, and prevails against the Head-ach, Megrim, Vertigo, Carus, Lethargy, Apoplexy, Falling-sickness, Palsie of the Head and Tongue, and other Diseases of like kind. It also opens Obstructions of the Reins and Womb, and is prevalent against Vapors, and Fits of the Mother.

XX. *The Saline Tincture.* Given to one dram, or more, in a Glass of White Port Wine, Morning and Evening, it singularly opens the Urinary Passages, and powerfully provokes Urine, expelling all præternatural, or Tartarous Matter out of the Reins, Ureters, and Bladder, and is very prevalent against a *Sarcitis*, or *Anasarca*, which is a *Dropsie* in the fleshy parts of the whole Body.

XXI. *The Spirit.* It is Cordial, and resists Poison, and is prevalent against Fainting and Swooning Fits, Vapors, and Fits of the Mother: it resists the malignity of the Plague or Pestilence, and the contagion of the Spotted Fever, or other infectious Diseases; it is good also against the Venom of Serpents, as of the Viper, Rattle Snake, and others of that kind, the poison of Mad-Dogs, for which there are but few better remedies. It is a singular thing against Vomiting, and sickness at Heart, by reviving the Spirits, and strengthening the Parts.

XXII. *The Distilled Oil.* Taken inwardly in any proper Vehicle (being first dropt into White Sugar) it comforts the Head, Brain, and Nerves, dries up cold and moist Humors, and is helpful against all those Diseases which are caused by them, in any of the Parts aforementioned. It cures Palsies, inwardly taken and outwardly applied; so also Convulsions, happening in what part of the Body soever.

fever. Taken to a dram at a time, in some proper Vehicle, two hours before the coming of the Fit of an Ague, it cures it; more especially if it is taken or repeated two, three, or four times: The best thing to take it in (in this case) is the strongest Wine: in the same (and in the same Dose) also in a Palsie; but in other Distempers it may be taken from ten to twenty or thirty drops: outwardly also anointed upon Cramps, and parts Convulsed, it gives relief in a short time.

XXIII. *The Powers.* They have all the same Virtues with the Oil, and are much more Subtil and Penetrative, yet may be taken in a much larger Dose, as from a dram to four drams, in any proper Vehicle. They have also all the Virtues of the Spirit, aforementioned, and strengthen the Stomach admirably. Given Morning and Night in White Port Wine, or in some other Diuretick Vehicle, as in Parsley, or hot Asmart Water, Decoction, or Infusion of Winter Cherries, &c. they powerfully open Obstructions of the Reins, Ureters, and Bladder, provoke Urine, and expel all Tartarous Matter, as Stones, Gravel, Sand, Slime, Matter, &c. lodged in those Parts.

XXIV. *The Elixir.* It has all the Virtues of the Spirit, Distilled Oil, and Powers, exalted, performing more effectually, and more gratefully to the Stomach, all that it is possible for those Preparations to do. It renovates, as it were, the Blood, and all the Juices, strengthens the Heart, and comforts the whole Universal Frame, making the Patient pleasant, lively, cheerful, and giving him a healthful habit of Body. Being bathed upon parts affected with the Gout, in a cold habit of Body; it gives relief, and in a short time. Taken inwardly in a Glass of Canary, from one dram to three or four, it gives present ease in the Colick, by dissipating and expelling the Wind.

XXV. *The Fixed Salt.* It is good against Difficulties of the Nerves, by carrying off the Matter which obstructs them, by the Reins; for it dissolves Viscous Juices in all parts of the Body, especially in the Blood, and causes them to be piss'd forth; for as it opens Obstructions of the Urinary Parts, and provokes Urine, by its mixture with the Blood, so it carries off the Morbifick Matter of Palsies, Numbness, Rheumatisms, and Obstructions (be they where they will) the right way, viz. by that way which Nature seems most inclin'd to promote, which is most commonly by Urine. Dose twenty, thirty, or forty grains Morning and Night, in a large glass of White Port Wine.

CHAP. CLVII.

of COWSLIPS.

I. *THE Names.* Some doubt whether the Greeks knew this Plant or no; however later Authors have called it *Παράλυσις*, & *Βότρυς παραλύσις*: In Latin, *Paralysis*, *Herba Paralysis*, *Herba Paralytica*, *Alisma Dioscoridis*, according to *Fabius Columna*, *Alisma Pratorum*, *Arborea*, *Herba Arthritica*, *Dodecalbeon*, *Primula veris major*: and in English, *Cowslips*, *Oxlips*, and *Paigles*.

II. *The Kinds* There are several sorts hereof, as, 1. *Paralysis vulgaris pratensis flore flavo simplici odorato*, The Common Field Cowslip. 2. *Paralysis altera odorata flore pallido polyanthos*, The Primrose, or many flowered Cowslip. 3. *Paralysis flore*

Viridante simplici, The single green Cowslip. 4. *Paralysis flore & Calice Crypo*, The curled Cowslip. 5. *Paralysis flore geminato odorato*, The double Cowslip, one within another. 6. *Paralysis flore flavo simplici inodoro sine Calicibus*, Single Oxlips. 7. *Paralysis flore geminato inodora*, Double Oxlips, hose in hose. 8. *Paralysis inodora calicibus dissectis*, Oxlips with Jagged Husks. 9. *Paralysis flore fatuo*, The foolish Cowslips. 10. *Paralysis hortensis flore pleno*, Double Garden Cowslips. 11. *Paralysis flore viridante pleno*, Double green Cowslips. 12. *Paralysis flore viridante, flore Calamistrato*, The Double green feathered Cowslip, or green Rose Cowslip.

III. There are several Plants called by the name of *Primula veris*, (from their being the first Flowers which appear in the Spring) and to which that name is *Genus*, they being all various Species of the same, viz. 1. *Primula veris major, flore Paralysis*, The Cowslip or Oxlip, of which we have before enumerated twelve several Kinds, whose Descriptions we shall give in this Chapter. 2. *Primula veris minor*, The Primrose, Single and Double, of which hereafter. 3. *Primula veris Pachyphyllas, Auricula Ursti*, Bears Ears, three several Kinds of which we have treated in Chap. 59. past. 4. *Primula veris minor flore Rubro & albo*, The White and Red Birds Eye, of which in Chap. 72. foregoing: this being said, we come to the matter in hand.

IV. *The Descriptions.* The first, or Common Cowslip, has Roots like to the Primrose, with many Fibres annexed to the greater Root; from which spring up several green Leaves, very like unto the Wild Primrose, but shorter, rounder, stiffer, rougher, more crumpled about the edges, and of a sadder green color, every one standing upon its Stalk, of an Inch or two long. From among these Leaves rise up divers round naked Stalks of a whitish color, a foot, more or less, high, bearing at the top many fair single yellow Flowers, growing out of a long Husk, upon a short Footstalk, with spots of a deeper yellow at the bottom of each Leaf, and smelling very Sweet.

V. The

V. The second, which is the Primrose Cowslip, or many flowered, has a Root like the former, from which spring forth Leaves, which are larger than the Common Field Cowslip, and of a dark yellowish green color; from the midst of which spring up several Stalks like the other; at the tops of which are the Flowers, which are manifold, and growing together in Husks like the former, sometimes to the number of thirty in one Head, at the top of one Stalk, and sometimes more, every one of them having a longer Footstalk than the Common Kind, which is requisite by reason of their great number: they are of a pale yellowish color, almost like those of the Field Primrose, with yellow spots at the bottom of the Leaves, as the Common Kind have, and of a sweet Smell.

VI. The third, or Single Green Cowslip, has a Root like the first, with many Fibres annexed, and from which there is but little difference either in its Root, or Leaf; the chief difference in this Kind being, that the Leaves are somewhat greater; the Flowers being in all respects like in form to the first Field Kind, but somewhat larger, and of the same color with the whitish yellowish green Husks, or rather a little yellower, and of very little Smell: In any other thing there is no diversity, but that it is much longer in flower, before it fades, especially if it grows out of the Sun.

VII. The fourth, or Curled Cowslip, differs chiefly in the Flowers, which are folded or crumpled at the edges, the Husks of the Flowers being larger than any of the former, more swelling out in the middle, as it were Ribs, and crumpled on the sides of the Husks.

VIII. The fifth, or Double Cowslip, one in another, which some call hofe in hofe, has each Single Flower growing out of another, which makes the same Double; for which reason Pena calls it *Geminata*, for that the Flowers are brought forth like Twins: The Smell is the same with the common Field Cowslip, but something weaker.

IX. The sixth, or Single Oxlip, is a kind of Cowslip, which has Roots, and Leaves, and Stalks like the first Kind, but somewhat smaller: the Flowers are yellow like the first Cowslip, and smaller also, standing many upon a Stalk, but bare or naked, without any Husk to contain them, and having no other thing besides differing from the Common, or Field Cowslip.

X. The seventh, or Double Oxlip, called, Hofe in Hofe, is almost like the former Double Cowslip, or Hofe in Hofe, having its single Flowers one within another, saving that this has no Husks to contain them, no more than the former Oxlips, but stands bare or naked, and of the very same bigness each of them, and of the same deep yellow color with it, and with as little Smell as the Single. There is another of this Species whose Leaves are somewhat larger, as also the Flowers, but of a paler yellow color.

XI. The eighth, or Oxlip with Jagged Leaves, differs not from the first Single Oxlip in the smallness of the green Leaves, but in the Flower, which standing many of them together on a reasonable high Stalk, are very small and yellow, and scarce open, or lay abroad themselves, but appear only, as having a green Husk under each Flower, which is divided into six several small long pieces.

XII. The ninth, or Foolish Cowslip, differs not much in Leaves from the former Cowslip, but bears at the top of the Stalk a Tuft or Bush of small, long, green Leaves, with some yellow Leaves, as it were pieces of Flowers broken, and standing among the green Leaves. And sometimes some Stalks among those green Leaves at the Top (which are a little

larger than when it has but broken pieces of Flowers) do carry whole Flowers in Husks like the Single Kind.

XIII. The tenth, or Double Garden Cowslip, has smaller and darker green Leaves, than the first Single Field Kind has, and longer Footstalks also, on which the Leaves do stand: It bears several Flowers upon a Stalk, but not so many as the Single Kind, every one of which is of a much deeper and fairer yellow color than any of the former, standing not much above the brims of the Husks which hold them, consisting each of two or three rows of Leaves, set round together, which makes it very thick and double, of a pretty pleasant sweet Smell, but not Heady.

XIV. The eleventh, or Double green Cowslip, is so like to the single green kind, before described, that until it is near flowering, it can hardly be distinguished from the Single Kind: but when it is in flower, it has large Double Flowers, of the same yellowish green color, with the Single Green, and more laid open or spreading than the Flowers of the former Double Cowslip.

XV. The twelfth, or Double Green Feathered Cowslip has but little difference in the Leaves from the Double Green last described, but that they are not of so dark a Green. The principal difference consists in the Flowers, which are many, standing together at the tops of the Stalks, but far differing from all others of these kinds; for every Flower standing upon its own Stalk, is composed of many very small and narrow Leaves, without any Husk to contain them, but spreading open like a little Rose, (whence came the name of Rose Cowslip) of a pale yellowish green color, and without any Smell at all, abiding in flower (especially if it stands in a shadowy place out of the Sun) above two Months, almost in as perfect beauty, as in the first Week.

XVI. The Places. All these Kinds have been found growing Wild in England, and from their natural places of growth, they have been transplanted into our Gardens, where they abide; and being in a richer Mould, grow larger and fairer than in their natural places.

XVII. The Times. They all flower in the Spring of the Year, some earlier, and some later, according as they are defended from Cold and Frost, and as the mildness of the Season will permit. They flower at the latter end of April and in May, (later than Primroses do) and the Single and Double green Cowslips the latest, and continue flowering a pretty while after all the rest.

XVIII. The Qualities. They are all hot and dry in the first Degree. They are Aperitive, do Attenuate, are Digestive, Discurfative, Incarnative, Traumatick or Vulnerary; Cephalick, Neurotick and Arthritic.

XIX. The Specification. They are singular for the cure of Palfies and Gouts.

XX. The Preparations. You may have therefrom,
1. A liquid Juice. 2. An Essence. 3. A Wine of the Flowers. 4. A Powder of the Leaves. 5. An Ointment of the Flowers. 6. A Cataplasm of the Whole Plant. 7. A Distilled Water of the Whole. 8. A Spirituous Tincture of Leaves and Flowers. 9. An Oily Tincture of the same. 10. A Saline Tincture. 11. A Spirit. 12. A Fixed Salt. 13. A Balsam.

The Virtues.

XXI. The liquid Juice. Snufft up the Nostrils, it is an excellent Errhine to purge the Head and Brain of cold, gross, viscid Humors, which obstruct the Roots of the Nerves, and parts adjacent. Given inwardly from two ounces to four, it eases

G g

pains

pains in the Back and Bladder, and opens the passages of the Urine, causing a free and easy pissing.

XXXI. *The Essence.* It has the former Virtues, and as it is an admirable Neurotick, so it helps all infirmities of the Head, Brain, and Nerves, coming of Cold, Wind, or moist Humors, as the Vertigo, *Ephialtes* or Night-mare, false Apparitions or Whimfies, Paresies, *Epilepsies*, or Falling-sickness, Palsies, Convulsions, Cramps, and other Pains of the Nerves and Joints. Dose three ounces or more in a Glass of Wine, Morning and Night, bathing also twice a Day very well, the parts affected with the same.

XXXII. *The Wine of the Flowers.* It is Cordial and Comfortative, refreshes the Spirits, and is conducive to all the purposes aforementioned: The Patient may drink a Glass of it half an hour afore Dinner, or any other time of eating.

XXXIV. *A Powder of the Leaves.* It is a small kind of an Errhine, being snufft up the Nostrils, and so purges the Head, but yet very gently. Being strewed upon old running Sores or Ulcers, it cleanses, dries, and heals them, and takes away the sharpness of Humors, Pain, or Inflammation therein, if present: it may be strewed on dry, or mixed with *Unguentum Nicotiana*, and so applied.

XXXV. *The Ointment.* If it is made of the Flowers, either by Insolation, or a boiling to Crispness, and a treble repetition of the same, it is said by Authors to take away spots and wrinkles of the Skin, Sun-burnings, and Freckles, adding Beauty, and heightning the Complexion. If the Ointment is made of the Leaves, it is an excellent thing to heal simple Green Wounds, cleanse old Ulcers, dry up and heal inveterate running Sores, &c.

XXXVI. *The Cataplasm.* Applied upon the spot, it dissolves simple Contusions, and prevails against the Gout in the Hands or Feet, by comforting and strengthening the Nerves, and easing their pain, being often repeated as need requires.

XXXVII. *The Distilled Water of the whole Plant.* It is used as a Vehicle for other *Cephalick* and *Neurotick* Preparations: In the mean Season it is said to be *Cosmetick*, and therewith the Face and Skin may be washed every Morning after the Ointment is rubbed off.

XXXVIII. *The Spirituous Tincture.* It has all the Virtues of the Essence; and is much more Cordial, and therefore better against Fainting and Swooning Fits, sickness at Heart, and other Distempers in which the Vitals are concerned. Dose half a spoonful or more in a Glass of Generous Wine.

XXXIX. *The Oily Tincture.* It is peculiar against the Palsie and Gout, as also Convulsions, Cramps, Punctures of the Nerves, &c. in all which cases, it has scarcely any equal: In Palsies anoint with it Morning and Evening, all along the Back-bone, from the *Vertebra* of the Neck, almost to the *Anus*, as also the Parts affected, rubbing it very well in; in Gouts, (from a cold Cause) Convulsions, Cramps, Punctures, &c. you may only anoint the parts affected; but in Convulsions, it will be good also to take it inwardly (in some Neurotick Vehicle) Morning and Night, from fifteen drops to thirty or forty, as the Exigency may require.

XXX. *The Saline Tincture.* If it is daily taken twice a day, from half a dram to one dram, in a good Glass of White Port Wine or Canary, it powerfully opens Obstructions of the Urinary parts, and eases pains in the Reins, Ureters and Bladder; and if any Sand, Gravel, Small Stones, or Tartarous Mucilage be lodged in those parts, it cleanses them thereof, and expells it.

XXXI. *The Fixed Salt.* It is Neurotick and Diuretick, peculiarly dedicated to the Head, Brain, Nerves, Reins and Bladder: It is good against the Jaundice, and carries it off, as also Febrick Distempers by Urine, being given to half a dram in White Port Wine.

XXXII. *The Balsam.* It is an admirable Vulnerary, curing simple Green Wounds at the first intention: If they be composed, it digests them, or brings them to maturation, resists putrefaction, cleanses, incarnates, dries and heals them in a very short time. If it is mixt with equal parts of *Unguentum Nicotiana*, it performs all these things the more admirably, and is a Medicament which every good Country man ought to keep always in his House.

CHAP. CLVIII.

of COWSLIP Spotted.

THE Names. It does not appear that this Plant was known to the *Greeks*, yet some, as accounting it among the Kinds of *Comfrey*, have called it *Σκουερνός πομενός*: It is called in *Latin*, *Pulmonaria*, (and yet it is no Species of the *Lung-worts*, as we shall, God willing, hereafter shew:) also, *Symphitum maculosum*: and in *English*, *Jerusalem Cowslip*, and *Spotted Cowslip*, (and yet it is not of the Species of *Cowslips*:) also *Sage of Jerusalem*, *Sage of Beiblem*, *Spotted Lungwort*, and *Spotted Comfrey*.

II. *The Kinds.* Authors make three Species or Kinds of this Plant, viz. 1. *Pulmonaria maculosa vulgaris*, Common spotted Jerusalem Cowslips. 2. *Pulmo-*

2. *Pulmonaria maculosa altera*, (Parkinson says, *non maculosa*) *Pulmonaria Echij folijs*, Buglofs Leav'd Jerusalem Cowslip. 3. *Pulmonaria angustifolia* (*secunda Clusij*) Narrow Leav'd Jerusalem Cowslip. All which Plants, Gerard says, are the True Lungworts.

III. The Descriptions. The first of these has a Root composed of many long and thick black strings; from whence arise many rough, large, and round Leaves, but pointed at the ends, standing upon long Footstalks, spotted with many round white spots on the upper sides of the Leaves, which are of a sad green or brown color on the tops, but of a grayer green underneath. From among these Leaves spring up several brown Stalks, a foot, more or less, high, bearing many Flowers at the tops, very much resembling those of Cowslips, being of a purple or reddish color, while they are Buds, and of a dark blewish color when they are blown, standing in brownish green Husks (sometimes this Plant has been found with white Flowers :) The Flowers being past, small round Heads, like Buttons, come up, in which is contained small black Seed.

IV. The second, or Buglofs Jerusalem Cowslip, is like unto the former, but greater in each respect: the Roots black like unto the first; the Leaves, says Gerard, are bigger than the former, (but Parkinson says smaller) being rough like the former, resembling Wild Buglofs Leaves, of a fairer color above, and of a whiter underneath, spotted with white spots like the first, says Gerard (but without any spots at all, says Parkinson :) The Stalks are a little more bronched than the other: at the tops of which come forth Flowers like to the first in form, and of an exceeding red shining color.

V. The third, or Narrow Leav'd Jerusalem Cowslip, or Lungwort, which is the second of Clusius, has a Root which is black, and stringy, in which last respect it is like unto Cowslips, as are both the other. From this Root spring forth Leaves somewhat longer than the last described, and not so broad, which are rough and hairy like unto the Leaves of Echium or Wild Buglofs, but narrower, and spotted with whitish spots also like the former. The Stalk is about a foot high, or better, set with the like long hairy Leaves, but smaller, bearing at the top a bundle of many Flowers, standing in Husks like the first (in fashion, says Gerard, like those of Buglofs, or those last described;) being somewhat reddish in the Bud, and of a dark purplish blew color, when they are fully blown, and having Seed also like the others. All these Plants do well resemble Buglofs or Comfrey in most parts, excepting in their Roots: And these are they which, Gerard says, are the true Lungwort; (but Cowslip is indeed the more usual name.)

VI. The Places. All these grow naturally in the Woods of Germany in divers places: Parkinson says, that the first Kind is found in England. Johnson upon Gerard says, that the second *Pulmonaria folij Echij* was found by Mr. John Goodyer flowering in a Wood by Holbury House in the New Forest in Hampshire. Their natural place is in moist and shadowy Woods, but with us they are for the most part Nurs'd up in Gardens.

VII. The Times. They flower generally very early in the Year, for the most part in March, and in the beginning of April.

VIII. The Qualities, Specification, Virtues and Uses, are much like those of Comfrey, in Chap. 149. foregoing, to which you are referred; but doubtless as these have not such a Viscosity, as our common Comfrey has, so in many cases they may not be all out so powerful: but as these are more drying and binding than Comfrey, so also in some other cases,

they may exceed Comfrey. And whereas in Comfrey the Root is chiefly used; in these Plants, the Leaves are the most considerable.

IX. An Observation. The liquid Juice or Essence of the Leaves, or whole Plant, have been found by large Experience to be singularly good for the Cure of Ulcerated Lungs, which are full of corrupted and rotten Matter: and it has been found to be a Cure for those who spit Blood. Dose two, three, or four ounces in a Glass of pure Red Port Wine. But the greatest use which our Country People make of it, is for a Pot Herb.

CHAP. CLIX.

Of CRANES-BILL Garden.

I. THE Names. It is called in Greek, *Γερανιον*; in Latin *Geranium*; also *Gruanalis*, *Rostrum Gruis*, or *Gratum*, *Rostrum Ciconie*, (from the form of the Seed Vessels :) in English, *Storks-bill*, and *Cranes-bill*.

II. The Kinds. There are many Kinds of this Plant, as 1. *Γερανιον ηυαγρον*, *Geranium Hortense*, Garden *Cranes-bill*, of which in this Chapter. 2. *Geranium Moschatum*, Musk'd *Cranes-bill*, of which in Chap. 160. 3. *Geranium Butrachoides*, *Crowfoot Cran-es-bill*, of which in Chap. 161. 4. *Geranium agreffe*, Field *Cran-es-bill*, of which in Chap. 162. 5. *Geranium Columbinum*, *Doves-foot*, of which in Chap. 163. 6. *Geranium Robertianum*, *Herb Robert*, of which in Chap. following.

III. The Garden Kinds, of which we treat in this Chapter, are manifold, viz. 1. *Geranium Tuberofum*, Tuberous or Knobbed *Cranes-bill*. 2. *Geranium Anglicum Variegatum Besteri*, *Geranium Versicolor*, five striated, the Variable, or Striped *Cranes-bill*. 3. *Geranium fuscum sive maculatum*, Brown, or spotted *Cranes-bill*. 4. *Geranium Hematoides*

natoides, vel Sanguineum, Geranium Grunale hematoïdes Lobellij, Bloody Cranes-bill, or Red Rose Cranes-bill.

IV. The Descriptions. The first or Tuberous Cranes-bill has a Root Tuberous and round, like almost unto the Root of Cyclamen, or common Sowbread, but smaller, and of a dark russet color on the outside, but white within, which encreases under Ground by several strings running from the Mother Root, swelling out into small round Tubercles or Knobs, like unto the Roots of Ground Nuts, which will quickly shoot out Leaves, and in a short time bear Flowers; but will not endure to be kept long out of the ground, without danger to be quite spoiled. From this Root spring forth three or four large Leaves spread upon the ground, of a greyish, or rather dusty green color, every one of them being as it were of a round form, but divided or cut into six or seven long parts or divisions, even unto the middle, which makes it seem to be so many Leaves, each of the cuts or divisions being deeply notched or indented on both sides. Among these Leaves rises up a Stalk a foot or more high, bearing thereon at the Tops and Joints, several pale, but bright purple Flowers, made of five Leaves apiece; after which come small Heads, with long pointed Beaks, resembling the long Bill of a Stork or Crane, or some such like Bird; which after it is ripe, parts a sunder at the bottom, where it is biggest, into four or five Seeds, every one of which has a piece of the Beak-head fastened unto it, and falls away if it be not gathered.

Striped Cranes-bill

V. The second, or Striped Cranes-bill, has a Root made of many small yellow threads or strings; from which rise up many broad yellowish green Leaves, divided into five or six parts, but not unto the middle, as the former is; each of these Leaves has a blackish spot at the bottom corners of the divisions; the whole Leaf, as well in form, as color and spots, is very like unto the Leaf of the Geranium Fuscum, or Spotted Cranes-bill, next to be described; but

that the Leaves of this are not so large as the Leaves of that: From among these Leaves spring up several Stalks a foot or more high, jointed and knobbed here and there, bearing at the Tops two or three white Flowers, consisting of five Leaves a piece, so thickly, and variably striped with fine small reddish Veins, that no green Leaf, which is of that bigness, can shew so many Veins in it, nor so thick running, as every Leaf of the Flower of this beautiful Cranes-bill doth. In the middle of the Flower stands a small pointel, which when the Flower is past, does grow to be the Seed-Vessel, on which is set several small Seeds, like unto the small Seeds of the other Cranes-bills.

VI. The third, which is the Brown, or Spotted Cranes-bill, has a Root consisting of divers great Strings, joined to a Tuberous or Knobby Head; from which head arises Leaves in all respects like those of the last described, as well in the form and divisions, as in the color of the Leaves, being of a yellowish green, and having a blackish spot at the bottom of every division in every leaf, whence came the name, but larger and stronger by much. The Stalks of this rise much higher also, and are jointed or knobbed with reddish Knees or Joints, on the Tops whereof stand, not many, but large Flowers, consisting of five Leaves apiece, each whereof is round at the end, and a little snipt round about, and do bend or turn themselves back, towards the Stalk, making the middle of the Flower to be the highest, or most eminent part: The color of the Flowers is of a dark, or deep blackish purple, the bottom of every Leaf being whiter than the rest: it has also a middle Pointel growing forth, which afterwards turns into Seed, like unto the other kinds of Cranes-bill.

Bloody Cranes bill

VII. The fourth Kind, or Bloody Cranes-bill, has a Root which is hard, long, and thick, with several Branches spreading from it, of a reddish yellow color

on the outside, and whitish within, which abides, and perishes not, but shoots forth some new green Leaves, which abide all the Winter, although those which turn red, do fall away. From this Root divers Leaves also spring, which spread themselves upon the ground, very much cut in or divided into many parts; and each of them again slit or cut into two or three pieces, growing upon slender long Footstalks, of a fair green color all the Spring, and Summer, but reddish in Autumn. From among these Leaves spring up several slender and weak Stalks, beset at every Joint (which is something reddish) with two Leaves for the most part, like unto the lower. The Flowers grow severally on the Tops of the Stalks, but not many together, in Bunches or Branches, as in all the other kinds of Cranes-bills; every Flower being as large as a Single Rose Campion Flower, consisting of five large Leaves, of a deeper red color than in any other Cranes-bill at the first opening; but changes more blewish afterwards: when the Flower is past, there does arise such like Beaks, or Heads of Seed, as are produced in the other kinds; but they seem to be smaller.

VIII. *The Places.* All these grow Wild in Foreign places, but are only nurs'd up with us in Gardens. Matthioli says, that the first grows very plentifully in Dalmatia and Illyria: and Camerarius, Clusius, and others say, that the rest grow in Germany, Bohemia, Austria, &c.

IX. *The Times.* All these Cranes-bills do Flower for the most part, in April, May, and June: but the Variable or Striped Cranes-bill Flowers usually later than any of the rest.

X. *The Qualities, Specification, Preparations, Virtues and Uses,* of all the Cranes-bills, being one and the same, we shall forbear the declaring thereof in this place, as also in some of the following Chapters; till such time as we have fully described all such kinds as are to be found growing in our Country: and therefore I refer you to Chap. 162. where we shall (God willing) discourse the same at large, and to full satisfaction.

Edges; among which rise up weak tender Stalks scarce able to stand upright, about a foot, more or less high, with some such like Leaves growing upon them, as you find below, but smaller the higher they grow on the Stalk, and the finer cut in on the edges on the Tops; also among the upper Leaves sometimes, several very small Red or Crimson Flowers grow, after which very small and long Beaks or Bills come forth, with Seed at the bottom, as all the rest of the Cranes-bills have, which twines it self, as most of them do. The whole Plant, and every part thereof above ground, has a very fine and pleasing sort of smell, very much resembling that of Musk, whence came the name.

Musked kind With Out Smell.

IV. *The second kind, or Inodorous, in its Roots Leaves, Stalks, Flowers, Magnitude, form and manner of growing, so much resembles the former, that at first sight there seems to be no difference: but that which makes the distinction is, that this whole Plant*

CHAP. CLX.

of CRANES-BILL Musked.

I. *THE Names.* It is called in Greek, *Μοσχάριον*; in Latin, *Geranium Moschatum*, also *Acus Moschata*, *Rostrum Ciconie Moschatum*, *Myrrhida Plinij*, and *Acus Pastoris*: In English, *Musked Cranes-bill*, or *Storks-bill*, of the Vulgar, *Musk*, *Muschata*, and *Herb-Musk*.

II. *The Kinds.* We have four several sorts of this Plant, viz. 1. *Geranium Moschatum Vulgare vel Hortense*, *Herba Moschus*, the Common, or Garden Musked Cranes-bill, or Herb Musk. 2. *Geranium Moschatum inodorum*, Musked Cranes-bill without smell, being only called Musked from its form. 3. *Geranium Apulum odoratum*, alterum odorum folio Coriandri, Italian Musked Cranes-bill. 4. *Geranium Creticum*, Candy Cranes-bill.

III. *The Descriptions.* The first, or Musked Cranes-bill, has a Root somewhat long, with divers Fibres thereat, from whence spring up several long winged Leaves, of a dark green color, (and sometimes of an Ash green color, or somewhat whitish by reason of the hairs which are thereon,) lying upon the ground, and cut or divided into many Parts or Leaves; and each of them cut in or split on the

Plant has no Smell at all; or if it has any, it is not of the Musky kind; this has Red Flowers: But there is also another Species of this Inodorous kind, nothing differing from the last, but in the color of the Flowers, the color of these being white.

V. The third, or Italian Musk'd Cranes-bill, has a Root small and yellow, lifting up its head a little above ground, from whence spring up several long Leaves, somewhat hairy, lying upon the ground, and a little snipt or cut in on the edges, and divided into parts, even to the middle Rib, not much unlike to the *Geranium Molchatum* first described, which stand upon reddish Footstalks, the two lowest Jags being greater than the rest; but those which rise up with the Stalk are more cut in, somewhat like unto the lower Leaves of Coriander or Fetherfew, but with rounder dents; the Stalks are jointed and kneed, with two such like Leaves at them, but more finely jagged: at the tops of the Stalks and Branches the flowers grow, of a pale blewish purple color, each standing in a green hairy Husk, wherein afterwards stand the heads of Seed, very like to the other kinds, great below and small above. The whole Plant above ground is of a Pleasing Sweet Musky Smell, like the first of these, and of which it is a Species.

VI. The fourth, or Candy Cranes-bill, has a Root which is long and white, with some Fibres adjoining to it; and perishes when it has perfected its Seed: from this Root spring up several long and tender Stalks, soft and full of Juice, upon which grow several broad and long winged Leaves, not much unlike to the first Musk'd Cranes-bill, cut in, or notched on the edges. These Stalks spread themselves out into many Branches, more especially towards the Top, on the Tops of which grow many Flowers made of five Leaves apiece, of a reasonable bigness, and of a fair Blew, or Watchet color, with a purplish Point in the middle, which being past, beak-like heads follow, as in the other Cranes-bills, but greater, and containing larger, greater, and sharper pointed Seed, able to pierce the skin. This Plant springs up many times of its own Sowing, if the Winter is not too sharp; otherwise being Annual, it must be Sown in the Spring of the Year.

VII. The Places. The two first grow Wild (says Parkinson) in many places of this Land, as well in Meadows as waste Grounds. But the first is now nursed up in Gardens for its pleasant sweet Smell. The second is found sometimes upon Heaths, and dry Gravelly places, but much smaller than when it grows in better or richer Ground. The third was brought to us out of Italy, and the fourth out of Candia, and in England are only nurs'd up in Gardens, where they grow very well.

VIII. The Times. They Flower in June and July, and the Seed ripens not long after: the Candy Cranes-bill, Gerard saith, flowered with him for the most part in May.

IX. As for the Qualities, Specification, Preparations and Virtues (these being of the same nature with the Wild Cranes-bills) see them in Chap. 162. following. These here are accounted excellent Wound Herbs, and equal to Doves-foot: The Cre-tick or Candy Cranes-bill being used in Wound Drinks, does far excell (as Gerard says) any of the Cranes-bills, and is equal with any other Wound Herb whatsoever for the same purpose.

CHAP. CLXI.

OF CRANES-BILL-Crowfoot.

I. THE Names. It is called in Greek, *Γερανιον* *Geranion*: In Latin, *Geranium Batrachio-* *oides*, *Gravia Dei Fuchij*, *Ranunculus caruleus*: and in English, Crowfoot Cranes-bill.

II. The Kinds. There are six several kinds hereof, 1. *Geranium Batrachioides flore Caruleo*, Blew Crowfoot Cranes-bill. 2. *Geranium Batrachioides flore albo*, White Crowfoot Cranes-bill. 3. *Geranium Batrachioides alterum, flore purpureo*, Purple Crowfoot Cranes-bill. 4. *Geranium Batrachioides, pullo flore*, Dark Red Crowfoot Cranes-bill. 5. *Geranium Batrachioides flore albo & Caruleo vario*, Party colored Crowfoot Cranes-bill. 6. *Geranium Batrachioides longius radicans Lobelij*, Long Rooted Crowfoot Cranes-bill.

III. The Descriptions. The first, or Blew Crowfoot Cranes-bill, has a Root which is composed of many reddish strings, spreading in the Ground, from a head made of divers red heads, which lye oftentimes above ground, from this Root spring forth many large Leaves, cut into five or six parts or divisions, even to the bottom, and jagged also on the edges, set upon very long slender Footstalks, very like to the Leaves of the Field Crowfoot: from among which Leaves divers Stalks spring up with great joints, somewhat reddish, set with Leaves like to the first Garden kind: The Stalks towards their Tops spread themselves into many Branches, on which grow several Flowers, made of five Leaves apiece, as large as any of the Field Crowfoot, round pointed, and of a fair Blew, or Watchet color, which being past, such like heads and bills do succeed, as are found in other Cranes-bills.

IV. The second, or White Flowered Crowfoot Cranes-bill, is in Leaves, Stalks, Branches, Flowers, Magnitude, Form, and manner of growing, altogether like

like to the former, excepting in two particulars, viz. 1. In the Root, which has not such red heads as the former Blew Flowered has. 2. In the Flowers, the former being Blew, whereas the Flowers in this are wholly White, and fully as large as the first.

V. The third, or Purple Crowfoot Cranes-bill, has a Root which is composed of a great Tuft of strings, fastened to a Tuberous or Knobby Head, from whence many Leaves spring forth, set upon long Footstalks, somewhat like unto the other, yet not so broad, but more divided or cut, viz. into seven, or more fliits, even to the middle, each of which is also cut in on the edges, more deeply than the former. The Stalks are a little Knobbed or Gouty at the Joints, set with Leaves like unto the lower, and bearing a great Tuft of Buds at the Tops of the Branches, which bud and put out into fair large Flowers, made of five purple Leaves, which do something resemble the Flower of a Mallow, before it be too full blown, each whereof has a reddish Pointel in the middle, and many small threads compassing of it, (ten in number) as Gerard says. This Umbel or Tuft of Buds, does Flower by Degrees, and not all at once, and every Flower abides open but a little more than one day, and then sheds its Leaves; so that every day yields fresh Flowers, which because they are so many, are a long time before they are all blown and spent. The Flowers being past, small Beak or Bill Heads come forth, like unto the other Cranes-bills, with small turning Seed.

VI. The fourth, or Dark Red Crowfoot Cranes-bill, has a Root with great reddish heads above, with many long strings and fibres descending from it; from this Root spring several broad spread, soft, and somewhat hairy Leaves, growing upon long Footstalks, cut into five, six, or seven deep gashes or divisions, with a blackish spot at the bottom of every one of them, and dented also about their edges. The Stalk rises up about two Feet high, spotted with many bloody spots, and is strong, somewhat hairy, and spread forth into three or four Branches, with such like Leaves on them, but lesser, and at their Tops, two or three Flowers apiece, each of them consisting of five Leaves, cut in on the edges (which is a mode differing from all other Cranes-bills) of a deep red color, almost blackish, and in the middle a long Stile or Pointel, with many withered threads about it. The Flowers being past, there follows brown pointed Seed, like to the other Cranes-bills.

VII. The fifth, or Party-colored Crowfoot Cranes-bill, is in its Roots, Stalks, Leaves, Flowers, Seed, Magnitude, Form, and manner of growing, so like to the first described in this Chapter, that until it is perfectly in Flower, this cannot be known from that: but when it is blown out, the Flowers are found to be variably striped and spotted, and sometimes divided, the one half of every Leaf being white, and the other half blew; sometimes with greater or lesser spots of blew in the white Leaf, very variable, and more in some years than in others; so that it would be a very difficult matter to express all the varieties which may be observed, at the same and differing times, in the blown Flowers.

VIII. The sixth, or Long Rooted Crowfoot Cranes-bill, has a Root very long and great, with small fibres adjoining thereto, of a reddish color without, and abiding all the Winter: from this Root spring forth Leaves (upon long Footstalks) somewhat large, but yet less than those of the other Crowfoot Cranes-bills, otherwise very like. From among these Leaves rise up several Stalks, bearing fair and beautiful red Flowers, of a more excellent red color than those of the Tuberous Cranes-bill, and of a lighter red than those of the third kind be-

fore described in this Chapter: they are also contained in thicker and shorter Cups, and are of a sweet Musk-like Smell: The Flowers being past, the Seed succeeds, which is like to that of the other Cranes-bills, saving that the Bills are a little shorter.

IX. The Places. These are all Wild of their own Nature, and grow in Barren Places, and in Vallies, rather than in Mountainous Grounds. Some say, that the first has been found growing naturally in England, but Parkinson says, he never could find it: but with us they are for the most part Nurs'd up in Gardens.

X. The Times. They all Flower in June and July, and their Seed is ripe in a short time afterwards.

XI. The Qualities, Specification, Preparations and Virtues, being the same with all the foregoing Cranes-bills, as also with those in the following Chapter, where we have declared them at large, we shall forbear to speak any more in this place, referring you thither.

CHAP. CLXII.

Of CRANES-BILL Field.

THE Names. It is called in Greek, *Ἰσχυρὸν ἄγρον*: In Latin, *Geranium agreste*: and in English, Field Cranes-bill.

II. The Kinds. The Field Cranes-bill is manifold, but those which we design under that Name, are, 1. *Geranium agreste*, *Geranium Violaceum*, Field, or Violet colored Cranes-bill. 2. *Geranium Cicutæ folio inodorum*, Field Cranes-bill without Smell; of this we have discoursed in Chap. 160. Sect. 4. 3. *Geranium Columbinum*, Doves-foot. 4. *Geranium Robertianum*, Herb Robert; of which two last we shall speak in some of the Chapters following.

III. The

III. The Description. It has a Root which is thick and woody, having some few strings adjoining thereto, and is wholly red, both within and without, not smelling so strong as the Root of Herb Robert: from this Root rise up several slender hairy reddish Stalks, about two or three feet high; at the Joints of which grow Leaves, upon shorter, yet reddish Footstalks. The Stalks spread themselves out also into other small Branches, whereon are set confusedly broad Leaves, made of three, four or five Leaves apiece, and those jagged or cut about the edges. Parkinson says, the Leaves are most usually divided into three parts, as large, or rather more than the other, and turning red likewise. The Flowers which consist of five Leaves apiece grow at the Tops of the Stalks and Branches, and are of a perfect Violet color, (whence came the name) or as Parkinson says, of a Purplish Red, of the bigness of the Flowers of Herb Robert; which being past away, the Seed comes in such bearded Beaks or Bills as the other Cranes-bills produce.

IV. The Places. It is often found by Way-sides, Ditch-banks, Borders of Fields, and other waste Grounds.

V. The Times. It Flowers in June and July, and the Seed ripens in the mean Season, or not long after.

VI. The Qualities. All the Cranes-bills seem to have one and the same Qualities; they are temperate in respect of Heat or Cold, and Dry in the first Degree. They are Absterfve, Astringent, Diuretick, Traumatick or Vulnerary and Incarnative: Pectoral, Nephritick, Hysterick, and Anti-emmenagogick, Hemorrhoeick and Analeptick.

VII. The Specification. They heal Wounds speedily, conglutinate their Lips, stop Fluxes of Blood, and cure Ruptures.

VIII. The Preparations. You may have therefrom, 1. A liquid Juice. 2. An Essence. 3. A Syrup. 4. A Decoction in Red Port Wine. 5. A Powder of the Herb. 6. A Balsam. 7. A Cataplasm.

The Virtues.

IX. The liquid Juice. It is said to be good against Fluxes of the Bowels, whether Diarrhæa, Dysentery, Lienteria, or Hepatick Flux, healing them, and so easing the Gripping Pains, it prevails against Hysterick Fits, and is good against Sand, Gravel, and Stone in Reins and Bladder. Dose four ounces, or more, either alone, or in Wine, Morning and Night.

X. The Essence. It has all the former Virtues, and more powerful to all the same Intentions; besides which, it is a famous thing to stop the overflowing of the Terms in Women, and to consolidate Ruptures, whether in old or young. It is good against Fits, and the extremest Tortures of the Colick, as also to heal Wounds, whether inward or outward; cures Spitting, Vomiting, or Pissing Blood, dissolves coagulated Blood, whether in the Stomach, Bowels, or Reins, and expels it, and is a singular thing to be taken as a Wound drink, for them who have any Wounds, running Sores, old Ulcers, or Fistula's, to induce them to a speedy healing. Dose three ounces, Morning, Noon, and Night in a Glass of Red Port Wine.

XI. The Syrup. It has all the former Virtues (being made either of the Juice or Essence) but is so much the weaker by the Sugar which is added to it: however it is more fit for Children, and squeamish Stomachs, and may be given to them against Ruptures.

XII. The Decoction. It has the Virtues of the

Juice and Essence, but very much weaker, and may be given to those who cannot be induced to take them. However you make thereof an exceeding good Wound drink, to all the purposes aforementioned. Being injected into Fistula's, or running Sores, and Ulcers, being washed therewith, it perfectly cleanses and heals them, and also conglutinates the Lips of Green Wounds.

XIII. The Powder. It is good against Ruptures, or Burstings, given to one dram, in some proper Vehicle: outwardly strewed upon old running Sores or Ulcers, it cleanses, dries and heals them, and is good to stop Bleeding in Wounds, and to consolidate their Lips.

XIV. The Balsam. It is a singular Vulnerary, and cures simple Wounds at the first Intention: it digests, cleanses, incarnates, and dries old running Sores, and rebellious Ulcers, and by strengthening the Part, brings on the healing after an admirable manner: applied in the Gout, it gives ease, and by continuing of it, cures it in a short time.

XV. The Cataplasm. Being applied to simple Contusions, it Discausses, prevents Pain and Inflammation, and so cures them: It conglutinates simple Green Wounds, and gives ease in the Gout, as also in all other Pains of the Joints, Nerves, or Tendons, coming from blows, strains, or the like.

CHAP. CLXIII.

Of CRESS Garden.

I. THE Names. This Plant is called in Greek, *Καρδαμον*, *καρδαμον*, Cardamon quod cordatos faciat, vel quod Cor foveat, quia in sincope Cardiacæ plurimum valet: And of this Herb, the Greeks had this Proverb, *καρδαμον*, Ede Nasturtium, propterea quod Nasturtio inesse Credebant animi vigorem excitandi. In Arabick, *Narf*, vel *Naf alchaf*: In Latin, *Nasturtium*, à narium tormento, as Pliny saith: And in English, *Cress*.

II. The Kinds. They are manifold, as, 1. *Nasturtium Hortense*, Garden Cress, of which in this Chapter. 2. *Nasturtium Indicum*, Indian Cress, of which in Chap. 164. 3. *Nasturtium Pratense*, Meadow Cress, of which in Chap. 165. and 166. 4. *Nasturtium agreste*, Wild Cress, of which in Chap. 167. 5. *Nasturtium Ischiadicum*, vel *Ischiacum*, Sciatica Cress, of which in Chap. 168. 6. *Nasturtium Hibernum*, Winter Cress, of which in Chap. 169. 7. *Nasturtium Aquaticum*, Water Cress, of which in Chap. 170. following.

III. Of the Garden Kind, *Καρδαμον ἡσπερι*, there are these following, viz. 1. *Nasturtium Sativum vulgare*, The common Garden Cress. 2. *Nasturtium Hortense Latifolium*, and *Nasturtium Latifolium Hispanicum*, Broad Leav'd Garden Cress. 3. *Nasturtium Hortense Crispum Latifolium*, and *Angustifolium*, Curled Cress, with Broader and Narrower Leaves. 4. *Nasturtium impatiens*, *Sium minimum*, *Sium Nasturtij Silvestris folio*, *Noli me tangere*, The impatient Cress, being called a Cress, more from the form of its Leaf, than any thing else.

IV. The Descriptions. The first has a long Root with some Fibres adjoined to it, which perishes every Year after the ripening of the Seed, or upon the approach of Winter; from this Root the Stalks grow up half a yard, or two feet high, having many small, tender, whitish, broad, indented, or torn Leaves set thereon, growing together upon a middle rib next the ground; but

but those which grow higher upon the Stalks are smaller and longer: The Leaves in general are so like to those of Garden Chervil, or Sweet Cicely, that it must be a very observant Eye which can distinguish them, and whilst young are scarcely to be differed but by the taste. The tops of the Stalks are replenished with white Flowers, which turn into flat Pods or Pouches, not much unlike to Shepherds Purse, in which is contained flat reddish Seed; the Smell of both Leaves and Seed is strong and spicy, and their Taste is hot, sharp, and biting, almost like Pepper, for which reason some call it, Pepper-wort.

Garden Cresses

Garden Cress

V. The second, or Broad Leav'd Garden Cress, has a Root which is small and long, perishing every year, and therefore must be constantly sown in the Spring; and for this reason also, because after it is sown, it springs up quickly, and will not endure the cold of Winter. Its first Leaves are small like Basil, among which rises up a Stalk about half a yard high, set with larger Leaves thereon, without any division, but slightly dented about the edges, and pointed at the ends, every one standing upon a long Footstalk, branched from the middle to the Top with lesser and narrower Leaves, like to the Top Leaves of Garden Cress: From whence break forth many white Flowers set in spikes, one above another, after which come Pouches or Purfes containing brownish Seed like to the other Cresses, but much more bitter, and yet not all out so fiery or sharp.

VI. The third, or Curled Cress, has a Root like to the former, which goes pretty deep into the Earth, and perishes every year after Seed time, as the other does. It grows like the first, or common Garden Cress, and differs therefrom only in the Leaves, which are of two sorts: the one with broad Leaves, cut, and roundly dented, and curled about the edges, every one by it self, on a long Stalk. The other, consisting of many smaller Leaves, set one against another upon a middle rib, each part of which is in the same manner cut in, and curled as are the others. The Flowers are white, like the common Garden Kind; and the reddish Seed also like the same in Form and Magnitude.

VII. The fourth, or Impatient Cress, has a small Root spreading forth it self into many Branches; from whence arise many winged Leaves, not much unlike to the smaller Sium, which spread themselves at first upon the ground, not much above an Inch or two long, which so abide from Autumn, when it springs up, all the Winter long. In the Spring of the year, they grow somewhat bigger, and the said Leaves are a little dented about the edges, the bottom of the Leaf being for the most part the biggest. From among these Leaves rises up a slender Stalk, about a foot and half high, which is divided into several Branches, from the middle thereof to the Top. On the extremities or tops of all which Branches grow many very small white Flowers, which being past away, as many slender long pointed Cods follow, in which is contained small yellowish Seed; when these Cods are ripe, they are so impatient of being touched, and the Seed is so hard to be gathered, that the Pod breaks it self, even of its own accord, upon the least touch of the hand, or any thing else, and so the Seed flies away, not being then possible to be gathered: This Seed has little or no heat in it.

VIII. An Observation. It is indeed the Nature of this Impatient Cress, that if you but touch the Cods when the Seed is ripe, though you do it never so gently, yet will the Seed fly all away with a great Violence, not suffering it self to be touched, from whence came the name, *Noli me tangere*, and *Nasturtium Impatiens*; as for the like quality, the *Periscaria Siliquosa* is named. The nature of this Plant is somewhat admirable, for if the Seed is fully ripe, though you put your hand but near the Cods, as proffering to touch them, though you touch them not, yet will the said Cods be apt to open, and the Seed to fly out upon you, when you may expect no such thing. *Prosper Alpinus* is the only Man who formerly wrote hereof, from whom our *Parkinson* and *Johnson* have taken their Discourses.

IX. The Places. These Plants are all of them nurs'd up with us in Gardens. The first matters not what Soil it grows in, for it likes any ground, especially if it is well watered: The second came

H h first

trit out of Spain, but grows well with us in England, as does also the third. The fourth *Johnjon* found about Bath, and other Parts of our Land, which, says he, is now kept in divers of our London Gardens, in some of which I have seen it grow.

X. *The Times.* They may be Sown at any time of the Year, unless it be in Winter. They quickly spring up, after sown, flower in April and May, and the Seed is ripe in June, or not long after their flowering time; after which they die every Year, and recover themselves, i. e. spring up again of the shaken or fallen Seed.

XI. *The Qualities.* All *Cresses* (except the *Nolime tangere*) are hot and dry in the fourth Degree, but more especially the Seed. They attenuate, incise, attract, digest, discuss, are Carnitative, Diuretick, and in some measure Suppurative. They are Cephalick, Stomack, Pectoral, Nephritick, Hysterick and Arthritick: Parmick, Emmenagogick, Lithontriptick and Alexipharmick.

XII. *The Specification.* They are peculiar against Poison, the Bitings of Venomous Beasts, and to purge the Head and Brain of cold and moist Humors.

XIII. *The Preparations.* You may have therefrom, 1. *The green Herb.* 2. *A liquid Juice.* 3. *An Essence.* 4. *A Spirituous Tincture.* 5. *An Acid Tincture.* 6. *An Oily Tincture.* 7. *A Saline Tincture.* 8. *A Spirit.* 9. *A Cataplasim.* 10. *The Seed.*

The Virtues.

XIV. *The Herb.* Eaten as a Sallet with other Sallet Herbs, as Lettice, &c. it warms, comforts and pleases the Stomach: bruised and applied, it takes away Spots and Marks, eases the Pains of the Loins and Sciatica, and draws forth broken Bones, Thorns and Splinters; and puts a stop to the Corroding of putrid and creeping Ulcers: held or chewed in the Mouth, it cures the Tooth-ach.

XV. *The Liquid Juice.* Used as an Erthine, it purges the Head and Brain of cold and viscous Humors, thereby easing all kinds of Head-aches proceeding therefrom, and for the same Reason prevails against Palfies, Lethargies, Apoplexies, Epilepsies, Vertigo's, Carus, Convulsions, and all other like Diseases afflicting those Parts. Given from half an ounce to two ounces, in a Glass of Generous Wine, it powerfully cuts gross and viscous Flegm, opens Obstructions, provokes the Terms in Women, and Urine obstructed, cleanses the Reins, Ureters and Bladder from Sand, Gravel, Stones, or any Tartarous Matter lodged in them. It powerfully provokes Venery, but is said to kill the Child in the Womb.

XVI. *The Essence.* It has all the former Virtues exalted, besides which, it cuts and expectorates tough Flegm, out of the Breast and Lungs, and as Authors say, loosens the Belly, and cleanses it from viscous Humors, opens Obstructions of both Liver and Spleen, heals all inward Wounds, and resists Poison, whether inwardly taken, or outwardly received from the biting or stinging of any venomous Creature. Dose from one ounce to two ounces in any proper Vehicle, Morning fasting, and at Night going to Bed.

XVII. *The Spirituous Tincture.* It is Cordial, provokes Urine, and expels Wind, and prevails against the Obstruction of the Courses in Women, being given Morning, Noon and Night, in some proper Vehicle, for a Week before the expected time of their coming. Dose from half a Spoonful to a Spoonful. It expels Wind, and prevails against the Cholick, and Gripping of the Guts to Admirati-

XVIII. *The Acid Tincture.* It wonderfully strengthens the Stomach, and is an admirable thing, as well to preserve from the Contagion and Infection of the Plagne or Pestilence, as to cure the same, for which it is an approved thing. It cures the Scurvy in a cold Constitution or Habit of Body, being assiduously used, and so removes all the Symptoms of that troublesome Disease. Dose from 30 to 40, 60, or more Drops in Ale, Wine or other Vehicle, according to the quantity the Patient drinks at a time.

XIX. *The Oily Tincture.* It cures the Palfie, being anointed well Morning and Evening upon the Back-bone, and Parts affected. But that Part of the *Spina Dorfi* is to be chiefly bathed therewith, from whence the Nerves proceed, which replenish the Parts afflicted with that Disease. It is also good against Cramps, Convulsions and Gouts arising from a cold Cause; and gives ease in the most intollerable Pains of the Back, as also of the Reins, being outwardly anointed therewith, and inwardly given from 15 to 30 Drops, Morning and Evening in any Nephritick or Opiate Vehicle.

XX. *The Saline Tincture.* It powerfully opens Obstructions of the Womb, Reins, Ureters and Bladder, promotes the Secretion of Morbifick Humors by Urine, and provoking Urine, it expels Sand, Gravel, Stones, and Tartarous Matter out of the Mass of Blood, and cleanses all the Urinary Parts from the same. Dose from 40 to 60 drops in Wine.

XXI. *The Spirit.* How it is to be made, we have shewn at large in the Second Edition of our *Pharmacopœia Bateana*, lib. 1. cap. 2. *secl.* 67. This Spirit thus prepared, is very subtil and volatile, an admirable Antiscorbutick, and powerful against all Diseases arising from viscous Flegm, and other Tartarous Humors: it thins and rarifies the Blood, provokes Urine and the Terms, and cleanses the Womb. And as it is famous against the Scurvy, so it is excellent against the Dropsie, Jaundice, Stone and Gout: it is a good Nephritick, and cures most Diseases of the Reins, expels Sand, Gravel and Slime, and prevails against the Colick, and Virulent Diseases of the Bowels. It is said to be good also against the Green-sickness in Virgins, because it powerfully opens Obstructions, and purifies the Blood, for which Reason it is singularly good against the Kings-Evil: it warms the Instruments of Generation, provokes Lust, and is good against Impotency. The Dose of this Spirit is from 20 drops to a dram, in some proper Vehicle. The distilled Water of *Cresses*, which is made after the Distillation of the Spirit, by a stronger Heat in *B. M.* will be much stronger and better than that which is made the vulgar way, it being impregnated with much of the Essential Salt, loosened by Fermentation, which yet remains behind, and does impregnate the Water. This Water may be given from one ounce to fix, its Virtues being the same with the Spirit, but much weaker in its Operation.

XXII. *The Cataplasim.* It is good against the Gout and Sciatica, as also itching Humors and Eruptions in the Skin. It draws forth Thorns, Splinters and other things gotten into the Flesh. If it is made with Vinegar, and applied, it is said to be good against the Kings-Evil, whether in the Throat or any other Part: If made with Hogs Lard, it cures sore, running and scabby Heads, ripens Plague Sores, and breaks them; is good against Whitloes and Fellons on the Fingers ends, and takes away the Deformity of the Nails.

XXIII. *The Seed.* If it is chewed in the Mouth, and held for some time, it eases the Tooth-ach, (and so also does the Herb:) it also helps the Palfie of the Tongue, provokes Sneezing, and is good against

against Sleepiness, Drowsiness, and such as are troubled with the Lethargy.

C H A P. CLXIV.

of CRESS Indian.

I. **THE Names.** It is called in Greek, *Κισσός* *Kissos*; in Latin, *Nasturtium Indicum*, *Flos Sanguineus Monardis*; and in English, *Indian Cress*, or *Yellow Larks-heels*, from the Form of the Flower.

II. **The Kinds.** It is a singular Plant of the kind, and by its Taste declares it self to be one of the kinds of Cresses. Some do account it among the *Clematides* or *Convolvuli*, the *Chamberers* or *Bind-weeds*, but any of these it cannot be, because it has no Claspers, nor does it wind it self about any thing, but by reason of the number of its Branches which run one within another, it may seem to climb-up a Pole, or the like, which yet it does but only close, as having something whereon to rest or lean its Branches. But *Parkinson*, from *Lobel*, makes two kinds, viz. the *Round Leaved*, (which is the Common) and the *Cornered Leaved*.

*Cress Indian.
round leaved*

III. **The Description.** This fair and noble Plant has Roots which are small, and spreading under Ground, which perish with the first Frosts, and must be sown afresh every Year: from this Root arise many long trailing Branches, interlaced one within another very confusedly, (yet it does not wind it self with any Claspers, about either Pole, or any other Prop, but if you would have it lie close thereto, you must tie it, or else it will lie upon the Ground) four or five feet in length at the least, for which Reason it takes up a great deal of Ground. The Leaves are

smooth, green, and as round as the Pennywort which grows on the Ground, without any Cut or Incisure in any part, the foot Stalks of which stand in the middle of each Leaf, and grow forth at every Joint of the Stalk, where they are a little reddish, and knobbed or bunched out: the Flowers are of an excellent Gold-yellow color, and grow all along the Stalks, almost at every Joint, with the Leaves, upon pretty long foot Stalks, which are composed of five Leaves apiece, not hollow or gaping, but standing open, each Leaf apart by it self; two of them, which are larger and longer than the other, stand above, and the other two, which are lesser, stand below, which are a little jagged or bearded on both sides; and the fifth lowest. In the midst of each of the three lower Leaves, (yet sometimes it is but in two of them) there is a little long Spot or Streak, of an admirable Crimson color, (whence the Name *Flos Sanguineus*:) and the Flower has a long Heel or Spur behind it, hanging down, (from which and the Color, came the Name of *Yellow Larks-heels*:) the whole Flower has a great Beauty, and Sweetness withal, very pleasing, which being placed in the middle of some Carnations or Clove-gilliflowers, (which are both in flower at the same time) make a noble Nosegay, both for Sight and Smell. When the Flowers are past, come the Seed, which are rough or uneven, round, greenish, yellow Heads, sometimes but one, and sometimes two or three standing together upon one Stalk, bare or naked of themselves, without any Husk, containing a white pulpy Kernel.

*Cress Indian.
Cornered Leaved.*

IV. **The second, or Cornered Leaved kind,** in its Root, Stalks, Branches and Flowers differs little or nothing from the former: the chief Difference is in the Leaves, for as in the former they are round, and are fastened upon a long foot Stalk underneath, nearly in the Center or Middle of each Leaf, and bunched out; in this, they are broad, and seven, eight or nine cornered, of the same Smoothness and Color, sharp pointed at their tops, and growing upon a long foot Stalk, which is joined to the Leaf at the lower

part thereof. The Flowers are Lark-spurred, like the other, and in the whole, differs nothing from it in its Manner and Form of growing. Parkinson seems to say it was taken from the Life, which tho' it has not been seen here with us in England since, yet that hinders not (says he) the Verity of the thing. When I was in the West Indies, in my Travels up and down, I saw it several times.

V. The Places. This goodly and beautiful Plant was first found in the West Indies, and brought thence into Spain by Monardus; from whence it was afterwards conveyed into France, Flanders and England. It grows now familiarly in most of our Gardens, where it flourishes, and is become as it were a natural Inhabitant. It need not be planted or sown in Beds of Horse-dung, or the like, for the natural Ground will be sufficient, so that it is but a little defended from those Frosts in the Spring of the Year, which are apt to nip it whilst but tender, or newly sprung up.

VI. The Times. It may be sown in March or April, the which, when it is sprung up, and having gotten three Leaves, must be taken up, and carefully replanted abroad, in the hottest place of the Garden, and in the finest and farthest Mould. It flowers sometimes in June, but usually in July, if it is well defended, and in good Ground; and so continues flowering till the cold Frosts and Weather in the latter end of October, does check it, and put a stop to its Luxuriant Nature; the Seed growing continually ripe in the mean Season, which after it is ripe, soon falls down on the Ground, whence for the most part the best is gathered.

VII. The Qualities, Specification, Preparations and Virtues, are exactly the same with those of Garden Cresses in the former Chapter, to which I refer you; so that no more need be spoken of them here, except that the same Preparations of this Plant, as they are stronger, so they are more Efficacious.

CHAP. CLXV.

OF CRESS Meadow,

OR,

CUCKOW-FLOWER, Single.

I. THE Names. It is called in Greek, *Καρδαμύνη*; in Latin, *Flos Cuculi*, *Nasturtium Pratense*, *Sisymbrium alterum Dioscoridis*, and *Cardamine*; and in English, *Meadow Cress*, or *Cuckow-flower*: in some Countries it is called, as Gerard says, *Ladies Smocks*.

II. The Kinds. They are either Single or Double: the Single we shall treat of in this Chapter, the Double in the next following. Of the Single, so many as grow with us in England, there are three Varieties, viz. 1. *Nasturtium pratense majus Tragi* & *Gesneri*, *Cardamine latifolia*, *Nasturtium agreste Euchsii*, & *Sylvestre Loniceri*, *Lepidium minus Cordi*, *Flos Cuculi Dodonei* & *Brusselsii*, The Great or Broad-leaved Cress, or Cuckow-flower. 2. *Cardamine altera minor*, *Sisymbrium Cardamine Lacune* & *Lugdunensis*, *Sisymbrium aquaticum alterum Matthioli* & *Tabernmontani*, *Hiberis Euchsii*, *Iberis Thalii*, *Cardamine altera Lobelii* & *Clusii*, *Agriocardanum*, five *Cardamantica Nasturtii foliis*, *Nasturtium pratense magno flore Bauhini*, *Nasturtium aquaticum simplicis flore Besteri*, The Small Cuckow-

flower. 3. *Cardamine altera parvo flore*, The Small flowered Cuckow-flower.

Great Cuckow-flower:

III. The Descriptions. The first has a Root composed of many white Heads or Fibres, from which shoot forth several long Stalks of winged Leaves, that is, many together, somewhat broad and round, tender, and dark green Leaves set one against another upon a middle Rib, the greatest being at the ends; among these winged Leaves rise up divers tender, weak, round, green Stalks, somewhat straked; on which grow much smaller and longer Leaves, very like the smallest divided Leaves of Garden Cress, at the tops whereof stand several Flowers made of four Leaves apiece, somewhat large, and almost like to Stock-gilliflowers, but rounder, and not full out so long, whitish in Color, or a little dusky over with Blush, and many times but at the edges only, each of them growing in a green Husk, which being past away, small Pouches grow forth, containing reddish Seed, something sharp and biting in Taste; as is the Herb also it self, coming near to the Taste of Cresses.

IV. The Small Cuckow-flower with great Flowers, is in its Roots, Leaves, Stalks, Flowers, Form and Manner of Growing, like to the former but now described, excepting that it is smaller in every part, not bushing out with so many Leaves or Stalks; and that the Pods of Seed are something longer than those of that foregoing.

V. The Small Cuckow-flower with the small Flower, is almost in all Respects like to the Small Cuckow-flower foregoing; save, that the Leaves of this are smaller and longer, and yet round sometimes also, growing in the same manner as the former does: the Flowers are also like them, but smaller, and the Pods of Seed are somewhat longer.

VI. The Places. They are all found in several parts of England, in moist Meadows, and near unto Brook sides, and small Rills of Water, passing thorough Grounds. They have been found in the Castle Ditch at Clare in Essex.

VII. The

VII. *The Times.* They flower somewhat early in the Spring about April and May, at farthest, and continue with the lower Leaves all the Winter.

VIII. *The Qualities, Specification, Preparations and Virtues* are the same with *Garden Cress* in Chap. 163. aforegoing, to which you are referred.

C H A P. CLXVI.

of CRESS Meadow,

O R,

CUCKOW-FLOWER, Double.

I. *THE Names.* This is called in Latin, *Cardamine flore pleno*, (that it was known to the Greeks, I cannot learn) and in English, *Double Meadow Cress*, and *Double Cuckow-flower*.

II. *The Kinds.* Taken as Garden Flowers, there are two of them, viz. 1. *Cardamine flore pleno*, being the double kind of that Plant, which growing Wild abroad, is called, *Cardamine altera*, and *Sisymbrium alterum* Dioscoridis, also *Elos Cuculi*; but this Name is more usually given to the Wild feathered Campions, both single and double: in English we call it *Double-flowered Cuckow-flower*, or *Ladies Smocks*. 2. *Cardamine trifolia*, *Trefoil Meadow Cress*, or *Cuckow-flower*; this is not truly a double-flowered Plant, but rather a Plant very full of Flowers, which at first sight makes it look as if it was double-flowered. These two being the fairest of all the Meadow Cresses or Cuckow-flowers, and for their Beauty being brought into Gardens, we thought best to place them both in one Chapter.

III. *The Descriptions.* The first double-flowered has a Root which creeps under Ground, sending forth many small white Fibres or Strings, and shoots up in

divers places: from this Root spring forth several winged Leaves, weak and tender, lying on the Ground, very like to the single Meadow kind; from among which rises up a round green Stalk, set here and there with the like Leaves that grow below, the top whereof has a few Branches, on which stand several Flowers, every one of them upon a small foot Stalk, consisting of many small whitish round Leaves, a little dast over with a blew Blush, set round together, which make a double Flower.

IV. The second, or *Trefoil Cuckow-flower*, has a Root composed also of several white Fibres, from the Heads whereof run forth small Strings, of a dark purple color, by which it encreases. From this Root spring forth several dark, round, green Leaves, a little uneven about the edges, and always three set together on a blackish small foot Stalk, among which rise up small, round, blackish Stalks, six, seven or eight inches high, with three small Leaves at the joints where they branch forth: at the tops whereof grow many Flowers, consisting of four Leaves apiece, of a whitish, or very pale bluish color. The Flowers being past, small, thick and long Pods come forth, in which is contained small round Seed.

V. *The Places.* The first generally grows with us in Gardens, but is also found Wild in divers parts of England, as near Mitcham, about eight Miles from London, also in Lancashire, in several places: the other was brought to us at first from beyond Sea, and is here only nursed up in Gardens.

VI. *The Times.* They flower usually in the end of April or May; but the latter of them commonly flowers before the former.

VII. *The Qualities, Specification, Preparations, Virtues and Uses*, are the same with those of *Garden Cress* in Chap. 163. or with those of *Water Cresses*; to which you are referred.

C H A P. CLXVII.

of CRESS Wild.

I. *THE Names.* It is called in Greek, *Καρδαμυς ἄγριος*: in Latin, *Nasturtium agreste*, *Nasturtium Sylvestre*: in English, *Wild Cress*.

II. *The Kinds.* There are three which go under the Name of *Wild Cress*, viz. 1. *Nasturtium Sylvestre Oxydis foliis*, *Narrow-leav'd White Cresses*. 2. *Nasturtium agreste Carolinianum*, The *Carolinian Wild Cress*. 3. *Nasturtium Petraeum*, The *Stone or Rock Cress*.

III. *The Descriptions.* The first of these has a woody Root, which perishes after Seed time, from whence spring forth many small, round and hard Stalks, with several small, round and narrow Leaves growing thereon without Order, branched from the middle upwards into many parts, at the tops of which come forth a great number of small white Flowers, (but some have been found with yellow Flowers, tho' not often) one standing above another, Spike fashion, after which appear Husks, containing small Seed.

IV. The second, or *Carolinian Wild Cress*, has a long and slender Root, with many Fibres proceeding from it, which also perishes every Year; from which Root grows up a round, green and hairy Stalk, about a foot high or more, and if it grows in rich or fertile Ground, sometimes about a foot and half high; sometimes but one Stalk grows up, and sometimes more, which Stalk or Stalks spread into Branches from the very Ground, at every Joint whereof stand long winged Leaves, very much divided, like unto the

Common

Common Garden Cress, but yet more finely cut or divided, and sharp in Taste, like Cresses. The Flowers are many, and of a pale whitish yellow color, standing in long Spikes at the tops, which being pass'd away, small, short Pouches appear, divided into two parts, which stand not upright, but hang downwards, in which is contained small reddish Seed, like unto Cress Seed.

Stone Cress.

V. The third, or Rock Cress, has a small and thready perishing Root, from whence rise up several Leaves upon long Foot-stalks, which Leaves are jagged and cut about the edges, much like to Oak Leaves, or rather the Leaves of Shepherds-purse: from amidst these Leaves rise up several Stalks, with small jagged Leaves growing thereon, one only at a place, without any Foot-stalk, and not being above one, two or three in number, to the top of each Stalk: on which tops spiked Heads of Flowers very thick set, which are small, and of a white color, like those of the Garden Cress. The Seed is contained in small Pouches or Seed-Vessels, which are flat, like to Thlaspi, or Treacle-Mustard.

VI. The Places. The first grows Wild in the Fields, by High-ways, and Hedge-sides, and among Rubbish, and in many other places. The second grows plentifully in many places, Wild in the Fields which have been formerly Manured, and afterwards lye as Fallow or Waste: I found a great quantity of it in Capt. Abbot's Plantation up Wando River, not above four or five Miles from Charles Town in Carolina. It grows also very plentifully in the Kingdom of Valentia in Spain, (from whence it was brought to us in England) for which Reason it is called also *Nasturtium Sylvestre Valentianum*. The third has been found growing in Shropshire, in the Fields about Birch, in the Parish of Elefner, and in the Grounds formerly belonging to one Richard Herbert, and that in great plenty: also on the farther side of Black-beath, by the Highway side, leading from Greenwich to Lufam.

VII. The Times. These flower later than some of the former Cresses, viz. in June and July, and the Seed ripens not long after.

VIII. The Qualities, Specification, Preparations and Virtues, are the same with Garden Cress in Chap. 163. foregoing, and to them you are referred.

CHAP. CLXVIII.

OF CRESS Sciatica.

I. THE Names. It is called in Greek, *Ἰβέρη* *ἡ καρχαυανκή*: in Arabick, *Seitaragi*, and *Haysab*: in Latin, *Iberis* five *Cardamantica*, (quod *Cardamo*, id est *Nasturtio* similis est:) and in English, *Sciatica Cress*.

II. The Kinds. It is twofold, viz. 1. *Iberis nasturtii foliis*, *Lepidium Campestre Angulare*, *Iberis secunda Tabernmontani*, *Iberis Cardamantica Gerardi*, *Iberis Nasturtii folio Bauhini*, *Sciatica Cress*. 2. *Iberis latiore folio Bauhini*, *Iberis Lugdunensis Dodonæi*, *Lacuna*, *Gesneri in hortis*, & *Cesalpini*, who also says it is *Lepidium forte Columella*, *Lepidium hortense Angulare*, *Iberis Cardamantica Lobelii*, *Lepidium Iberias Pauli Æginetæ*, *Sciatica Cress* with broader Leaves.

III. The Descriptions. The first has a Root which is long, white and woody, from which rises up a round Stalk about two feet high, which spreads it self into divers Branches, whose lower Leaves are somewhat larger than the upper, yet all of them cut or torn on the edges, somewhat like unto Garden Cresses, but smaller: the Flowers are small and white, growing at the tops of the Branches, which being pass'd away, Husks grow forth, like to those of Cresses, with smaller brownish Seed therein than in the other, which is very sharp and biting in Taste, more than those of Cresses are.

IV. The second, or *Sciatica Cress* with broader Leaves, has a Root like the former, and sharp in Taste as it; from which spring up Leaves somewhat long and broad, not rent or torn at all, but whole, only a little dented about the edges towards the ends, very like to those of the *Thlaspi Creticum*. From among these Leaves rises up a Stalk pretty thick and strong, much about the height of the other, which suddenly spreads it self out into several Branches, on which grow Leaves, which are lesser, shorter and narrower,

narrower, as they grow in height, and stand on the Stalks without any great Order. The Flowers grow at the tops of the Branches in spiked Heads, which with their Seed, are very like the former, the Seed of this tasting as hot, sharp and biting, as the Seed of the other.

V. The Places. They grow by the Way sides in rough and untill'd places, and by the sides of old Walls, and such-like: they have been found in Corn-fields about Southfleet, near to Gravesend in Kent.

VI. The Times. They flower according as they are early or late sown in the Fields; but for the most part in June and July, and their Seed is ripe not long after.

VII. The Qualities, Specification, Preparations, Virtues and Uses, are in the main the same with those of Garden Cress in Chap. 163. foregoing. But more especially these are said to be Specificks in curing the Sciatica and Gout in any Part.

VIII. Observation. A Cataplasim made of the green Leaves, but especially of the Roots, either alone or mixed with old Hogs Lard, and applied to the place pained with the Sciatica, letting it to lye on for four hours in Men, and two hours in Women, is said by Galen from Damocrates, to cure the Disease; and not only this Disease in the Hips or Huckle-bone, but also the Gout, and all other Pains and Aches in the Joints, whether of Hands, Knees or Feet; likewise all other inveterate Griets of the Head, or other Parts of the Body difficult to be cured, as vehement and long continued Catarrhs, universal Rheumatisms, &c. he also says, that Damocrates cured hereby all those Diseases, to which Sinapi, Thlapsi and Thapsia are applied. Pliny recites the same method and manner of Application, and says farther, that if any part of the Grief remains, that the same Medicine after twenty days is to be applied again. And applied to the Skin, it takes away the Blemishes thereof, as Freckles, Lentils, Scars, Scabs, Scurf, Leprosie, &c. it is true, that it exulcerates or blisters the Part, but that is to be healed with a Balsam made of Oil and Wax, with the Addition of a little Strasburgh Turpentine. After the Application of the Cataplasim in the Sciatica, the Part, says Gerard, is to be bathed with warm Water; or, as Parkinson says, with warm Wine and Oil mixed together; and then wrapped up with Wool or Skins, or a Lamb-skin may be applied whilst it is yet hot, and but newly taken off from the Creature. Dioscorides and Pliny say, that if the Root is hung about the Neck, or tyed to the Arm, it will give ease in the Tooth-ach.

II. The Kinds. They are threefold, 1. *Barbarea simplex*, *Barbarea sive Eruca lutea latifolia*, *Nasturtium Palustre Gesneri*, *Eruca Palustris Lugdunensis*, (it is called also by all the Names in the former Section;) Common Winter Cress. 2. *Barbarea flore pleno*, sive *Eruca lutea Bankini*, Double-flowered Winter Cress. 3. *Barbarea minor*, *Herba sancti Alberti Cesalpini*, Small Winter Cress, or Winter Rocket.

III. The Descriptions. The first has a Root something fibrous, which always perishes after the perishing of its Seed, from which spring up several Leaves indifferently large, and of a sad green color, lying upon the Ground, and torn or split into several parts, something like unto Rocket or Turnep Leaves, (but nothing like to Cresses) which Leaves have smaller pieces next the bottom, and broad at the ends, which so abide all the Winter, (if it springs up in Autumn, when it is used to be eaten either green or stewed:) from among these Leaves rise up divers small round Stalks, which spread themselves into many Branches, bearing in a spiked manner many small yellow Flowers, each having four Leaves apiece, which being past, small long Pods come forth, containing small reddish Seed within them.

IV. The second, or double-flowered, has a Root like the former, which perishes not in Winter, but abides many Years: the Stalks are bigger than the former, and crested withal. The Leaves are shorter, and are about an inch in length, cut in on the edges in the same manner as the others are. The Flowers are yellow, like the former single, but something larger, and double withal, which makes the greatest part of the difference.

V. The third, or Small Winter Cress, has a Root like the first, and perishing as it; from which spring forth blackish green Leaves, somewhat jagged or torn in on the sides, resembling Moth-mullein: the Stalks and Leaves both are less than the first, nor does it grow so high: The flowers are yellow also

CHAP. CLXIX.

Of CRESS Winter.

THE Names. It is thought to be that Plant which the Greeks (as Dioscorides) call *Ψευδοβουνίας*, (tho' it is *Ψευδοβουνίας* in the Text, which I judge is by a mistake in transcribing, *Βουνιον* being Earth-nuts, and *Βουνias* Bunnias, the Navel or Wild Turnep, to which latter, this our Winter Cress is something a kin:) in Latin it is called *Nasturtium Hybernum*, *Pseudobunias Dodonaei*, *Nasturtium Barbaricum*, *Barbarea*, *Sanctae Barbare Herba*, *Scopa Regia Angulata*, *Sideritis Latissima Euchsii*, *sinapi quinti generis Tragi*; and in English, Winter Cress.

as the others, but single and lesser; and so also are the Cods which follow the Flowers, and yield much the same kind of Seed, but lesser in proportion to the Magnitude of the Cods.

VI. *The Places.* The first grows oftentimes of its own accord in Gardens, as also in Fields by Paths and Ways sides in several places of England; as in the next Fields beyond that called *Lambs-Conduit*, (from whence comes *Lambs-Conduit Water* a little below *Spaw-hill*;) the other two are only nurs'd up in Gardens.

VII. *The Times.* They all flower in May, and the single ones seed in June, and then perish; but the double kind abides green both Winter and Summer. The Italians and Spaniards are scarcely acquainted with any of these *Winter-Cresses*, or rather *Winter-Rockets*, they being more peculiar to these our colder Climates.

VIII. *The Qualities, Specification, Preparations, Virtues and Uses* are the same with those of *Garden-Cress* in Chap. 163. aforegoing, to which you are referred: But besides all that is there said, we have these following Observations.

IX. *Observation 1. The Green Herb.* It is used as *Rocket* or *Cress* to be eaten as a *Sallet* in Winter, and that with great pleasure and satisfaction, when other Salleting is difficult to be gotten.

X. *Observ. 2. The Liquid Juice.* If it is drunk inwardly, it is found by good Experience to be a singular good *Water* Herb, to cleanse and heal inward Wounds; and being outwardly applied, to wash filthy running Sores, and putrid old Ulcers, cleansing them by its Sharpness, and removing the dead Flesh, and hindering proud Flesh from growing therein, and so healing them by its drying Quality. It is also profitable to provoke Urine, help the Strangury, and expel Gravel and the Stone. Dose two or three ounces Morning and Night for some time, in some proper Vehicle.

XI. *Observ. 3. The Essence.* It has all the Virtues of the liquid Juice exalted; besides which, it is a most powerful thing to be used against the Scurvy, Dropsie and Gout, in cold Constitutions: it may be taken Morning, Noon and Night, from 1. to 3. ounces, in some proper Vehicle, the Use of which is to be continued a Month, two or three, according as the occasion or force of the Disease requires. It is truly a good thing against the Bloody-flux, and all other Fluxes of the Bowels whatsoever.

XII. *Observ. 4. The Seed.* It provokes Urine, is good against Dropsies and Gouts; warms and comforts a cold and moist Stomach, and causes a good Appetite and Digestion. And if it is made into a Lohoch with Honey, it is good against Asthma's, Coughs, Colds, Wheezing, shortness of Breath and difficulty of Breathing, by cutting the tough, thick, viscous Flegm or Matter, and causing an easy Expectoration. Dose as much as a large Nutmeg three or four times a day.

XIII. *Observ. 5. The Spirit.* It comforts and warms a cold and weak Stomach, cheers the Heart, exhilarates the Spirits, absorbs Acidities, eases Pains and Griplings of the Bowels, expels Wind, prevails against the Colick, dissipates inward Apoplems, dissolves coagulated Blood, and prevents or helps its Stagnation, and thereby refreshes wearied Nature, and Strengthens the whole Body. Dose 20, 30, or 40 drops in a Glass of Wine or Ale. But this is to be observed, That it is only to be given to such as are of a cold Constitution, or Habit of Body; for such as are hot, it puts all into a Flame, and therefore such are to avoid it.

CHAP. CLXX.

OF CRESS Water.

I. *THE Names.* It is called in Greek, *Κάδυσκον* *Wudegy*: in Latin, *Nasturtium Aquaticum*; and in English, *Water-Cresses*.

II. *The Kinds.* There are four several sorts of this Plant, viz. 1. *Nasturtium aquaticum vulgare*, which is generally taken to be the *Sisymbrium alterum* Dioscoridis, and by Celsus and Tabernmontanus, it is called *Sisymbrium aquaticum*: by Cordus, Gesner and Thalius, *Sisymbrium alterum*; by Euchsius and Lugdunensis, *Sisymbrium Cardamine*; The Common or Vulgar *Water-Cress*. The second is called, *Nasturtium aquaticum rotundifolium majus*, *Sisymbrium aquaticum Matthioli*, *Sisymbrium alterius Speciei secunda Thalii*, *Nasturtium aquaticum alterum*, & *aquaticum amarum Bauhini*; The Greater round-leav'd *Water-Cress*. 3. *Nasturtium Aquaticum rotundifolium minus*, *Sisymbrium Aquaticum minus Matthioli*; The Lesser round-leav'd *Water-Cress*. 4. *Nasturtium Aquaticum erectum folio longiore Bauhini*, *Sium vulgare Matthioli*; *Sium Matthioli*, & *Sium Italorum Lobeli*, & *Lugdunensis*; *Matthioli* his *Water-Cress*, or the Italian *Water-Cress*.

III. *The Descriptions.* The first has a long Root, which is filled with nothing but Knobs or Bunches of white Fibres or Threads; from whence spring forth many weak, hollow, sappy Stalks or Branches, trailing upon the Water and gravelly Earth where it grows, taking hold in several places as it creeps, by which means it spreads it self very much, shooting forth Fibres at the Joints. As the Stalks grow upwards, they are filled with long winged Leaves, having many small Leaves set upon a middle Rib, one against another, excepting the point Leaf, which stands by it self, as does that of the Ash-tree. The upper

upper Face of the whole Plant is of a brown green color, and the Leaves are green underneath, which, says Gerard, is the perfect mark to know the Physical kind from the others. The Flowers are many and white, standing on long Foot-stalks at the tops of the Branches: which being pass'd away, are succeeded by a like number of small long Pods, like Horns, which contain within them small yellow Seed. The whole Plant abides green in the Winter, and tastes sharp and biting, somewhat like to other Cresses.

Water Cresses, round-leaved.
Great.

Small.
Water Cresses round-leaved

IV. The second, or great round-leav'd, has a Root almost like the former, shooting forth many Fibres at

the Joints, from whence rise one or more Stalks, which are hollow, weak and sappy, with a great number of long winged Leaves, which are made up of several broad, sappy, and almost round Leaves, of a reddish brown green color on the top, and green underneath: when it runs up into Stalk, the higher Leaves are longer and more pointed, yet round pointed withal. The Flowers grow at the tops of the Branches, like the former, nor does the Pods and Seed differ much therefrom. Parkinson says, that it is so extremely bitter, that it cannot be eaten till it is boiled in Water, and shifted again: I have seen it grow several times, and have gathered it, but never could find that bitter Taste in it, but only a very sharp biting Taste, like other Cresses; Matthiolus says, Nasturtio simile quiddam gustu praefert.

V. The third, or lesser round kind, has a white fibrous Root, from whence spring forth a great number of long winged Leaves, very like to the last, in their Substance and Form, being fat, broad and roundish like them, but very much less: from amidst these Leaves spring forth several long Stalks, when run up to Seed, which are almost naked, save that here and there they have a single winged Leaf, cut into five long slender parts, almost to the middle Rib. The Stalks at their tops, abound with a great number of little Branches, filled with small fine whitish Flowers, which in the very tops of all, appear exceeding small and diminutive, so as they are not easy to be seen asunder.

VI. The fourth, or Italian kind, has a long Root, which creeps not so much as any of the former, nor is it so full of Fibres: the Leaves grow many on a winged Stalk, and differ not much from the first, saving that the Stalk is crested, and the Leaves are dented or snipt in a little round the edges, being in shape between the Garden-Cress and Cuckow-Flower, the Stalks are crested, and divided into many Branches: the Flowers are white, which being pass'd away, are succeeded by Pods, like the Ordinary or Common Water-Cress, and with like Seed. The Taste of both Herb and Seed is more mild and pleasant than that of the other Water-Cresses.

VII. The Places. They all grow for the most part in small standing Waters; and sometimes in small Rivulets of running Water: but the last is sometimes found growing in Gardens.

VIII. The Times. They spring and grow green in March and April. That Water-Cress which is eaten in Sallets, is best in March and April: they flourish all the Summer, and flower in June and July, their Seed ripening in August.

IX. The Qualities. They are hot and dry in the third degree: are Diuretick, Cephalick, Neurotick, Stomackick, Hyfterick, Nephritick, Alexipharmick and Antiscorbutick.

X. The Specification. They are peculiar against the Scurvy in a cold Habit of Body.

XI. The Preparations. You may have, 1. A Sallet. 2. A liquid Juice. 3. An Essence. 4. An Infusion. 5. A Lotion. 6. A distilled Water. 7. A Spirituous Tincture. 8. An Acid Tincture. 9. An Oily Tincture. 10. A Saline Tincture. 11. A Spirit. 12. A fixed Salt.

The Virtues.

XII. The Sallet. It is made of the green Herb, gathered in March and April, pickt and washt clean, and dress'd up with Salt, Vinegar and Oil, or Sugar, and so eaten raw: it is generally eaten in the Spring time, to cleanse and purifie the Blood, sweeten the Juices of the Body, and cure the Scurvy.

XIII. The liquid Juice. It is more powerful than that of Brooklime against the Scurvy in a cold Habit

habit of Body, for it cleanses the Blood and Humors: it is also said to be good to break the Stone, and to expel it, as also Sand, Gravel, and other Tartarous Matter; it provokes Urine and the Terms, it given in a proper time. If 3 parts of the Juice is mixed with 1 part of the Juice of Oranges, it will be still more prevalent against the Scurvy. Dose of the Juice is from 1 ounce to 2 or 3, twice or thrice a day, being mixed with any proper Vehicle.

XIV. *The Essence.* It has all the Virtues of the Juice, but much more Stomack; it strengthens the Stomack and warms it, creates an Appetite, and causes a good Digestion, and very powerfully provokes Urine and the Terms. Taken from 1 to 2 ounces or more, well sweetened with Honey, it opens Obstructions of the Lungs, and takes away Hoarseness, Wheezing, difficulty of Breathing, and shortness of Breath. Both the Juice and the Essence, being bathed on, or applied to the Face or other parts of the Skin, it takes away Freckles, Lentils, Pimples, Spots, Sun-burning, Tanning, Yellowness, and other Deformities thereof.

XV. *The Infusion in Water or Wine,* in a simmering or scalding heat. It has the Virtues of the Juice and Essence, but not full out so powerful. It is good to wash filthy foul Ulcers, Fistula's, running Sores, Herpes, Scurf, Morpew, &c. cleansing them, and making them much the more fit to be healed.

XVI. *The Lotion.* Take of the Juice 3 parts; of White-wine Vinegar 1 part, mix them. It is an excellent thing against almost all Deformities of the Skin, as Freckles, Pimples, Scurf, Leprosy, &c. and it is good also to bath the fore part of the Head therewith, Morning and Evening, for such as have the Lethargy, or are dull, drowsie, and very sleepy: but in this last case, the Patient ought to snuff up the Juice of *Water-Cresses* every day for some time; both in the Morning, and at Night also, an hour before Bed time; because as an *Errhine*, it purges the Head and Brain of all cold, moist and noxious Humors causing the Lethargy, and other the like Diseases of those Parts.

XVII. *The distilled Water.* It has much Spirit and volatile Salt in it, and may be used as a Vehicle, to convey any of the other Preparations into the Body.

XVIII. *The Spirituous Tincture.* It cures the Scurvy in a cold Constitution, and is of excellent Use to rectifie the Distempers of the Stomach: it warms and comforts it, causes a good Appetite and Digestion, and prevails against Gripings, Colicks and Convulsions of the Bowels. It is a singular thing against cold and moist Distempers of the Head, Brain and Nerves; and is good against Dullness, Drowsiness, Heaviness, Sleepiness, Apoplexy, Falling-sickness, Convulsions, Palsies, and the like Diseases, being bathed outwardly upon the Parts affected, and taken inwardly Morning, Noon and Night from 1 dram to 3 drams, in any proper Vehicle. In Diseases of the Head, it will be also good to snell it to it often, and sometimes to snuff it up the Nostrils, by which it eases Pains of the Head, and helps against Vertigo's, and other cold and moist Distempers of those Parts.

XIX. *The Acid Tincture.* It is more Stomack than the former, and a powerful Resist of the Scurvy, and all its Symptoms. It opens Obstructions of the Viscera, provokes the Terms, prevails against the Cachexia and Green-sickness in young Women, more especially if it is given with a proportional quantity of *Tinctura Martis*. It removes Laziness and Weariness of the Body, comforts the weak Bowels, and strengthens the whole universal Frame. Dose so much as may make the Vehicle

pleasantly sharp; and may be taken three or four times a day, according as the Occasion may require. Outwardly applied to the Skin, it is of singular good Use against Freckles, Lentils, Spots, Sun-burning, Tanning, Yellowness and Brownness of the Skin, Scurf, Morpew, Leprosy, and other like Deformities thereof, being gently applied or laid thereupon.

XX. *The Oily Tincture.* It is a singular good thing against Palsies, Gouts, Lameness, Numbness, Coldness of any Part, Pains and Aches of the same; as also Cramps and Convulsions, being daily taken inwardly Morning, Noon and Night in any proper Vehicle, from 20 drops to 60, according to the Occasions and Necessities for the same; but it is also to be used outwardly at the same time, by anointing it well upon all the parts affected, twice a day, viz. Morning and Evening. Inwardly taken, it is also good against the Stone, Gravel, Sand, or any Tartarous Matter in the Reins, Ureters and Bladder, opening Obstructions of those Parts, and causing Urine to be plentifully evacuated.

XXI. *The Saline Tincture.* It may be given inwardly against Obstructions of the Urinary Passages from 40 to 80 drops, or more, in any Diuretic Vehicle; but is used chiefly externally against all sorts of Deformations of the Skin, as Scurf, Morpew, Leuce, Leprosy, Tetters, Ring-worms, Pusshes, Boils, Pimples, and other like Disaffections. It is also said to cure the Itch, being well rubbed in twice a day upon all the Parts affected.

XXII. *The Spirit.* How this Spirit is to be made see the Second Edition of our *Pharmacopœia Batæana*, lib. 1. cap. 2. *sect.* 67. It has all the Virtues of the Spirituous Tincture, with this Advantage, that it is a much finer and purer Medicine to see to, and a much pleasanter Preparation to be taken. It may be given from 20 drops to 60 in any proper Vehicle, two or three times a day. It prevails against the Scurvy, Dropsie, Jaundice, Stone and Gout.

XXIII. *The fixed Salt.* It is admirably Diuretick and Antiscorbutick, and carries off the Morbifick Cause of the Scurvy, Dropsie, Jaundice, Gout, Stone, Struma, Cachexia, Chlorosis, Rickets, &c. by Urine, opening all manner of Obstructions. Dose from 1 Scruple to 2 Scruples.

C H A P. CLXXI.

of C R O S S - W O R T.

I. *THE Names.* This Plant, as it was unknown to the ancient Greeks, so it has no Greek Name retaining to it: but it is called in Latin, *Cruciata*, and *Crucialis*, from the Situation of the Leaves. *Tbalus* calls it *Cruciata herniaria*; and *Lobel*, *Cruciata minor*, to distinguish it from *Gentiana Crucifolia*. *Lugdunensis* calls it *Asterula aurea*; it is also called *Gallium Secundum Tragi*, for his *primum* is *Gentiana Crucifolia*; *Bauhinus* calls it *Cruciata bifurca*; in English, *Cross-wort*, and *Golden Cross-wort*.

II. *The Kinds.* Authors make four kinds thereof, as the *Cruciata vulgaris*, our Common Cross-wort; *Cruciata minor lutea*, Small yellow Cross-wort; *Cruciata minor montana*, Small Mountain Cross-wort; and *Cruciata minima muralis*, The least Wall Cross-wort; but as of these, there is but one, and that is the first of them, which grows in England, so we shall take the Pains only to describe it.

III. *The Description.* It has a Root which is very small and full of Fibres, which taking hold of the Earth, spreads with the Branches over a great deal

of Ground, which perishes not in the Winter, tho' the Leaves die away every Year, and Spring again afresh. From this Root Spring up square hairy brown Stalks, something more than a foot high, having four small, broad and pointed hairy, yet smooth, not ruged, yellow green Leaves, growing at every joint, each against other cross-wise, from whence proceeds the Name. Towards the tops of the Stalks, at the Joints with the Leaves, in three or four rows upwards, stand small, pale, yellow Flowers, after which come small, blackish, round Seed, four for the most part contained in every Husk.

Cross wort.

IV. *The Places.* It grows in many moist Grounds, as well Meadows as other wild and untill'd places about London: in the Church-yard at *Hampstead*, near London: at *Wye* in *Kent*: at *Rand*, near *Ringmore* in *Sussex*, along the High-way; and in a Pasture adjoining to the Church-yard at *Hampstead* by the Mill: also in a Lane or Highway beyond *Charlton*; a small Village near *Greenwich*, and in several other places.

V. *The Times.* It flowers for the most part from May all the Summer long, in one place or other, as it grows more or less in the Sun; and the Seed ripens soon after.

VI. *The Qualities.* It is temperate in respect of Heat or Cold; and dry in the second degree. It is singularly Astringent; and admirably Traumatick or Vulnerary.

VII. *The Specification.* It is dedicated to the Cure of green Wounds, Ulcers and Ruptures.

VIII. *The Preparations.* You may have therefrom, 1. A liquid Juice. 2. An Essence. 3. A Decoction. 4. A Powder. 5. An Ointment or Balsam. 6. A Cataplasm. 7. A Spirituous Tincture. 8. An Acid Tincture. 9. An Oily Tincture.

The Virtues.

IX. *The liquid Juice.* Taken to 2 or 3 ounces in Red Port Wine, or Wine mixed with Water, it stops inward Bleedings, as also the Bleedings of inward Wounds, and consolidates and heals them: applied also outwardly to green Wounds, it does the same; for by closing the Lips of Wounds quickly together, the Cure soon after succeeds.

X. *The Essence.* It has the Virtues of the Juice, but more powerful for the same Intentions: *Camerrarius* says it helps to expectorate Flegm out of the Thorax, and is good against the Obstructions of the Lungs or Stomach; as also other Obstructions in the Meseraick Veins, Lacteals, and other Viscera. Dose 2 or 3 ounces in Wine, &c.

XI. *The Decoction.* It has the same Virtues with the Juice and Essence, but not full out so effectual: nevertheless, (the Decoction being made in Wine, or in Water with Wine added to it) it is often given as a Wound-drink, in which way of Exhibition it is very efficacious: and mixed with Spirit of Wine, it is good to cleanse old running Sores, and putrid Ulcers; cleansing the same, and inducing them to a speedy healing. It cures also Ruptures.

XII. *The Powder.* It is made of the dry'd Leaves. Taken to a dram Morning and Evening, it is good to stop any inward Bleeding, spitting of Blood, pissing of Blood, or Bloody-flux: the same it does also being applied to any bleeding Wound. It also dries up Moisture in Ulcers, and stops the Flux of any running Sore, being applied after washing the same with the Juice, Essence or Decoction of the same Plant before specified.

XIII. *The Ointment or Balsam.* They cleanse, and are admirably drying and healing; give Ease where the Pain is extravagant, allay the Inflammation, breed Flesh where it is wanting; dry up the Moisture, and produce the Cicatrize in a very short time.

XIV. *The Cataplasm.* Made of the green Herb with the Powder of the dried Herb, and applied, it stops the Bleeding in Wounds, prevents the Afflux of Humors, and so by consequence Pain and Inflammation. Applied to simple Contusions, it dissolves them, and quickly restores the Part to its former State of Health.

XV. *The Spirituous Tincture.* It heals inward Wounds, and stops inward Bleedings, restores the Tone of the Bowels being hurt, is good against Ruptures, Bloody-fluxes, Diarrhea, Lienteria, and the Hepatick-flux, and has indeed all the Virtues of the Juice and Essence. Dose 1 or 2 ounces in Wine, or any other fit Vehicle.

XVI. *The Acid Tincture.* It is good to expectorate tough and viscous Humors, opens Obstructions of the Viscera, strengthens the Stomach, and helps a decayed Appetite: it may be taken inwardly in Wine to a grateful Acidity every day, two, three or four times a day: if mix'd with Water to a Gratefulness, and a little dulcified with Syrup of Clove-gilliflowers, it abates the Heat of Fevers, allays Inflammations of the Lungs, quenches Thirst, and represses Vapors, being taken as ordinary Drink.

XVII. *The Oily Tincture.* It is eminently good against Punctures of the Nerves, heals nervous Wounds, gives ease in the Gout tho' never so extreme, and in a short time cures it: it strengthens the Joints, and is singularly good against Convulsions and Palsies, being duly anointed upon the Parts affected.

C H A P. CLXXII.

Of CROWFOOT Meadow.

THE Names. It is called in *Greek*, *Batesizon*, (*Frog-wort*:) in *Latin*, *Ranunculus*, also *Pes Corvi*, and *Pes Corvinus*: in *English*, *Crowfoot*, *King Cob*, *Gold Cups*, and *Butter-flowers*.

II. *The kinds.* Authors are in a Wood about this Plant, and make so many general kinds thereof, that it is difficult to reduce each Species to its proper Classis. However, since we intend only to treat of them which grow in England, (setting aside the *Ranunculi Montani*, which were never known to grow with us in our Country) and that we may be intelligent to the Vulgar, we shall divide them into the five following Classes, viz. 1. *Βατράχιον λευκόν*, *Ranunculus Pratenfis*, Meadow Crowfoot, of which in this Chapter. 2. *Βατράχιον μέλαν*, *Ranunculus A-gressifis*, Field, or Fallow-field Crowfoot, of which in Chap. 173. 3. *Βατράχιον κνίδειον*, *Ranunculus Nemoralis*, of which in Chap. 174. 4. *Βατράχιον ὑδαεον*, *Ranunculus Aquaticus*, Water Crowfoot, of which in Chap. 175. 5. *Βατράχιον ὀρεον*, *Ranunculus Hortensis*, Garden Crowfoot, of which in Chap. 176. following.

III. Of *Meadow Crowfoot* we have growing with us five several kinds. 1. *Ranunculus Pratenfis communis*, The Common Meadow Crowfoot. 2. *Ranunculus pratenfis dulcis*, *simplex* and *multiplex*, Meadow Crowfoot sweet, (or not biting) single and double flowered. 3. *Ranunculus pratenfis repens*, Common creeping Meadow Crowfoot. 4. *Ranunculus Bulbosus sive Tuberosus*, Knobbed or Tuberosus Crowfoot. 5. *Ranunculus Globosus*, Globe Crowfoot.

Common Meadow Crowfoot.

IV. *The Descriptions.* Common Meadow Crowfoot (whose Branches or Stalks stand upright, and bend not down again unto the Ground, neither creep thereon, or spread, taking root again in divers places, as the third kind following does) has a white Root, which is almost wholly fibrous; from whence spring up many large dark green Leaves, cut into divers parts, somewhat resembling the spreading of a Crow's Foot, having a very sharp, hot and burning Taste, very much biting the Tongue, and blistering the Skin, if laid thereon, not much less than any other hot Corroding and Exulcerating Herb can do; which Leaves have now and then some blackish Spots upon them, but these Spots happen not in all, nor in all places.

Among these Leaves rise up small twiggy Stalks, which stand upright, a foot high, or higher, sometimes (according to the goodness of the Ground) a foot and half high; at the tops of the Stalks and Branches come forth many fine yellow Flowers, glittering of a Golden color, having five Leaves apiece, the middle part of which Flowers are filled with many small Threads of like color; which being past, the Seed follows, contained in a rough Ball or Husk. Of this kind there is also one with double Flowers.

Sweet Meadow Crowfoot

V. The second, or sweet kind, has a Root consisting of many white Fibres, as the former, from whence rises up several great, broad, dark, green Leaves, spread upon the Ground, a little hairy, cut in on the edges into five Divisions, and a little dented also about, especially at the ends, and of a paler yellowish green on the under-side, of a sweet and not unpleasant Taste; for I call it Sweet Crowfoot, not because it smells sweet, but because it has no sharp, biting or exulcerating Taste, as most of the other Crowfoots have, being so sweet, soft and pleasant, that the People in many places do strew the Leaves, when they are young, with other Herbs, to eat them after the manner of a boiled Sallet. From among these Leaves rise up several hairy Stalks, a foot or foot and half high, with some Leaves upon them more divided, and cut into smaller and narrower parts than those which are lower. At the tops of these Stalks and Branches stand many fair Golden yellow colored Flowers, with yellow Thrums in their middle, so very like to the former Common Meadow Crowfoot, that they are not easy to be discerned asunder: the rough Heads and Seed following them are also like the other before described. Of this kind there is one also with double Flowers.

VI. The third, or creeping kind, has a white and thready Root, from whence spring forth several Leaves, which are divided into many parts, commonly into three, sometimes into five, cut here and there in the edges, as if they were snipt, of a deep green color, upon which are found divers white Spots. From among these Leaves spring up the Stalks, which are round

Creeping Meadow
Crowsfoot

round, and something hairy; some of them bend down towards the Ground, trailing as it were, and put forth many Roots at the Joints, which are small white Fibres, by which it takes hold of the Ground, and so encreases or spreads it self far about. Some of the principal Stalks stand upright, a foot high or higher, and sometimes they seem to be rather leaning than upright: at the tops of these Stalks and their Branches come forth the Flowers, consisting of five Leaves apiece, and of a glorious Gold yellow color, and a Golden-colored Thymb in the middle, which being past, yield knobby rough Heads of Seed, very like to the first. The sharp Taste of the Leaves and Flowers are also like to the same. Of this kind there is also one with double Flowers, which is nurs'd up in Gardens.

VII. The fourth, or tuberous kind, has a Root white and round, of the bigness sometimes of a Wall-nut, and sometimes much less, not much bigger than a Bean or large Filbert, with some long Fibres, especially at the end of it, which is of a more sharp and biting Taste than any of the former: from this Root spring up divers Leaves, much more cut in and divided than any of the former, every one of them standing on a short Foot-Stalk, of an over-worn green color: among which rise up several slender Stalks, a foot or foot and half high, with some Leaves thereon at the Joints, more divided, and into longer and narrower parts than those below; at the tops of the Stalks and Branches come forth fair shining Gold-colored Flowers, consisting of five Leaves apiece, like the former kinds, with many Threads in the middle, standing about a green Head; which after the Flowers are past, grows to be more rough or prickly than the seedy Heads of any of the foregoing. Of this kind is that thought to be which bears double yellow Flowers, one out of another, called *Anglicus bulbosus* or *tuberosus*. Also another, whose Flower is single, and red, like an Orange.

VIII. The fifth, or Globe kind, (called in the Northern Countries of England, where it grows, *Locker Goulous*) has a Root composed of many blackish Fibres or Strings, from whence rise many fair,

broad, dark green Leaves next the Ground, standing upon long Foot-stalks, which Leaves are deeply cut or jagged into five, six or seven Divisions, and besides nipt in or dented on the edges; among which rises up a Stalk, divided towards the top into some Branches: on the Stalk are set such-like Leaves as are below, but smaller. On the tops of the Stalk and Branches grow several large fair yellow Flowers, consisting of five Leaves apiece, or rather of eleven Leaves for the most part, set or placed in three rows, and always folded inwards, or rolled up together like a round Ball or Globe, like a close Flower never blowing, (from whence came the Name:) they have many yellow Threads in the middle, standing round about a green rough Head, which in time grows to be full of small Knobs, wherein is contained small black Seed.

IX. The Places. They all grow in Fields and Meadows, or Pasture-Grounds, thro' all England, especially the four first kinds. The fifth kind grows wild in most places of Lancashire and Yorkshire, and other bordering Shires in the Northern parts of this Kingdom, almost in every Meadow; but has not been yet found wild in any of the Southern or Western parts of England.

X. The Times. They flower in May and June, and the Seed is ripe in July and August.

XI. The Qualities, Specification, Preparations, Virtues and Uses, see in Chap. 176. following, where they will be handled at large.

CHAP. CLXXIII.

Of CROW FOOT Field.

THE Names. It is called in Greek, *Βαρεγαν* *ἀνὰ γέναν* *ἢ τῆς ἀγρῆς*: in Latin, *Ranunculus arvens*, vel *arvorum*; and in English, Field or Fallow-Field Crowsfoot.

Fallow field Crows foot

II. The

II. The Kinds. It is a singular Plant, and is called by Lobel in his Icones, *Ranunculus arvorum*; and is the same with *Ranunculus arvensis* Gesneri, *Ranunculus arvensis echinatus* Bauhini, *Ranunculus Jegetalis* Cordi; *Ranunculus Sylvestris tertius* Dodonæi & Lobelii in *Observationibus*, Fallow-field Crowfoot.

III. The Description. It has a small white fibrous Root, from whence spring forth some deeply jagged Leaves upon long Foot-stalks, but smaller than any of the former, and divided into many narrower parts, of an over-worn green color; they are fat and thick, much jagged, and something resembling (says Gerard) the Leaves of Sampire, but not near so green. From among these Leaves rises up a Stalk about a foot or more high, which towards the top is divided into other Branches; the Leaves on the higher part of the Stalk are more jagged or divided than those which are lower. The Flowers grow at the tops of the Branches, which are consisting of five small Leaves, of a pale or faint yellow color, which being past'd away, there come Clusters of rough and sharp-pointed Seed, set as it were in Heads, many together.

IV. The Places. It is found chiefly in Ploughed Lands and Fallow Fields in many parts of England; the Latins called it *Ranunculus arvorum*, because it is commonly found in Fallow Fields, where Corn has lately been sown, and so may be called Corn Crowfoot.

V. The Times. It flowers in May and June; the Seed ripening in the mean while in August and September.

VI. The Qualities, Specification, Preparations and Virtues thereof are the same with the Common Meadow Crowfoot, which may be found at large in Chap. 176. following.

CHAP. CLXXIV.

Of CROWFOOT Wood.

THE Names. It is called in Greek, *Βατεχων* *Βατεχων*; in Latin, *Ranunculus Nemoralis*; and in English, Wood Crowfoot.

II. The Kinds. There are, 1. *Ranunculus nemorosus albus simplex*, *Ranunculus Phragmitis* Gesneri, *Ranunculus Sylvestris Tragi*, White single-flowered Wood Crowfoot. 2. *Ranunculus nemorosus albus minor*, *Ranunculus nemorosus Anemones flore minor* Bauhini, The least or lesser white Wood Crowfoot. 3. *Ranunculus nemorosus flore Carneæ*, & flore purpureo, The single bluish and purple Wood Crowfoot. 4. *Ranunculus nemorosus luteus*, The yellow Wood Crowfoot. 5. *Ranunculus nemorosus dulcis*, *Ranunculus Sylvestris secundus* Tragi, *Ranunculus Auricomus Lobelii*, Sweet Wood Crowfoot. 6. *Ranunculus montanus albus minor simplex*, *Ranunculus Alpinus albus*, The lesser single white Mountain Crowfoot. 7. *Ranunculus Virginensis vel Virginianus albus*, White Virginian Crowfoot.

III. The Descriptions. The first, or White single-flowered, has a Root commonly of the bigness of a Wheat Straw, not growing right down, but creeping at length, under the upper Crust of the Earth, spreading into several small Knobs, like Branches or Arms, of a dark brown color on the outside, and white within, of a sharp biting Taste, inflaming the Mouth. From this Root rise up two or three Stalks, about an Hand

breadth high or more, about the middle whereof come forth usually three Stalks of Leaves, each being something broad, hard, and cut in on the edges into three parts, of a sad green color, and dented also: the Stalk rises up two or more inches high, bearing at the top one single Flower, hanging down the Head for the most part, consisting of five Leaves, somewhat broad, and almost round-pointed, of a light bluish color on the outside, before it is blown open, but white afterwards, and more white on the inside, having a few white Threads in the middle, tipped with yellow, standing about a green Head; which growing ripe in length of time, is something like the other Heads of Crowfeet, composed of many small Seeds compacted together.

Single white wood Crowfoot.

IV. The second, or least or lesser White kind, has a Root small and long, and creeping under the upper Crust of the Earth, like the former, and it has such-like Leaves as the other single White kind, divided into three parts, and each of them into others again, standing upon little long Foot-stalks, but they are much lesser, so that the whole Leaf hereof is not much bigger than one of the Divisions or Parts of the other: the Stalk is very small, with few Leaves thereon, divided in two places more than the lower, little more than two inches high: at the top grows a white Flower, consisting of six white Leaves, with a few yellowish Threads in the middle; which being past'd away, leaves a round Head composed of many small Seeds, not much unlike the former.

V. The third, or single bluish-colored Wood Crowfoot, is in its Roots, Stalks, Leaves, Flowers, Heads, Seeds, and Form of Growing, like unto the former; so that until it is in flower, there can scarcely any difference be discerned: but when the Flower appears, it shews it self much more reddish on the outside, and of a fair pale purple or bluish color on the inside, which makes it a distinct Species of it self, differing from the rest. But sometimes different Varieties are found of this kind, having its Stalk something

thing browner, and its Flower of a pale purplish blew color, (from whence it is called *Ranunculus nemorosus* flore purpureo coruleo) like unto a pale Violet Flower, without any great Smell. These three foregoing kinds the Italians call Wild Ginger, either because the Roots of them all are very sharp, hot, and biting the Tongue, like Ginger, or because their Roots do grow a little spreading into several Arms or Tuberosities, like to Ginger.

VI. The fourth, or yellow kind, has Roots very like to the first described in this Chap. from whence spring forth such-like Stalks of Leaves, and growing in the same manner, but the Leaves are not so broad, nor so hard in handling, and are more deeply cut into more long and narrower parts, each also dented about the edges, especially about the ends of the Leaves, which are of a darker green color. From between these Stalks of Leaves shoots forth sometimes but one, and sometimes two or three Stalks, at the top of each of which grows one Flower, something smaller than the former, consisting generally of six or seven, and sometimes of eight Leaves, which are of a fair pale yellow color, with many small Threads in the middle, which being pass'd away, there succeed like Heads of Seed, as in the others. These Flowers have the least Smell of them all. And unto this kind belongs that sort of Anemone (but rather Crowfoot) which Dodonæus calls *Trifolia*, having the Leaves parted into three, snipt about the edges, and which bears a whitish bluish Flower.

Golden haired Crow foot

VII. The fifth, or *Auricomus* of Lobel, which is the Sweet Wood kind, has a Root composed of many white Strings or Fibres, like unto some others, but neither its Root nor Leaf, has any sharp biting Taste in them, but are almost Tasteless. From this Root spring up Leaves first of all, which are round, not much unlike to Violet Leaves, and not divided in the least; but those which spring up next after them, are more divided, and so also those which grow after up-

on the Stalk, are still more divided than the former. The Flowers are small, and of a fair shining Gold-yellow color, standing at the tops of the Stalks, like unto the Common kinds of Crowfeet. After the Flowers are pass'd away, come the rough Heads, like a small Strawberry, in like manner as other Crowfeet have, in which Heads are contained the Seed, many set together.

VIII. The sixth, or lesser single white Mountain Crowfoot, has Roots greater than any of the kindred of Crowfeet; from which Root spring forth fair, large, well-spread Leaves, (standing upon a long Foot-stalk) which are cut into five Divisions, and somewhat dented about the edges, green on the upper side, and paler underneath, having many Veins running thro' the Leaves: these Leaves are like those of the Common Crowfoot, but greater, of a deep green color, much like to those of the yellow Aconite, called *Aconitum luteum Ponticum*: it has great fat Stalks, about two feet or more high, spread into many Branches; at the tops of which come forth white Flowers, consisting of five Leaves apiece, with small yellow Chives in the middle, smelling like the Flowers of May or Haw-Thorn, but more pleasant; after which comes the Seed, which is contained in Heads, like to the other Crowfeet.

IX. The seventh, or Virginian Crowfoot, has a reddish, thick, tuberous Root, with some small Fibres springing from it: from which shoot forth three or four somewhat large, broad, whitish-green Leaves upon long Foot-stalks, rent or torn on the edges for the most part; among which rises up a slender, round, naked Stalk, five, six or more inches high, bearing one white Flower at the top, made of ten or twelve small, narrow and pointed Leaves, with a few yellowish Threads in the middle, set about a greenish Head, which in time grows to be a long slender Pod, in which is contained round whitish Seed.

X. The Places. They are almost all found growing in Woods, Groves and Orchards in most places of this Land. The fourth is found as well by Brook-sides, which pass by Meadows, as in Woods, and by Hedge-sides. The sixth, is called *Ranunculus Alpinus*, because that those which first found it, met with it upon the Alpine Mountains; however, since it has been found to grow plentifully Wild in England, especially in Hampstead Wood, from whence it has been transplanted into Gardens. The seventh, bears in its Name the place of its Growth, but it has been found in many other parts of Florida.

XI. The Times. They flower pretty early in the Spring, sometimes in March, but for the most part in April, and sometimes in May; and the Seed is ripe in June, July and August.

XII. The Qualities, Specification, Preparations, Virtues and Uses, see in Chap. 176. these being of the same Nature with those others, where you may have them at large.

CHAP. CLXXV. OF CROWFOOT Water.

I. THE Names. It is called in Greek, Βαταχάριον; in Latin, *Ranunculus aquatilis*; and in English, Water Crowfoot.

II. The Kinds. Authors make several kinds of Water Crowfoot; as, 1. Water Spear-wort. 2. Water Ivy. 3. Water Star-wort; none of which we can admit into this Kindred; for tho' they be hot, like the

the *Crowfoot*, yet they have nothing of the Form, and we think that something more than the Taste ought to conclude the several Species, otherwise *Ginger* may as well be admitted into the same Stock, which I am sure no Herbarist will ever grant: for this Reason we refer you for the three afore-named kinds of Plants to their proper places, which you will find in some of the following Chapters of this Book.

III. The *Water Crowfoot* then, which we shall treat of in this Chapter, are four; 1. *Ranunculus aquaticus vulgaris major*; *Ranunculus aquaticus Hepaticæ facie Lobelii*; *Ranunculus aquatilis Dodonæi*; *Hepatica aquatica Lugdunensis*; *Hepatica palustris Thalii*; *Ranunculus aquaticus folio rotundo & capillaceo Bauhini*; The Common greater *Water Crowfoot*. 2. *Ranunculus aquaticus Communis minor*; *Ranunculus Hederule folio aquaticus*; The lesser *Water Crowfoot*. 3. *Ranunculus palustris Sardonius levis*; *Strumea*, & *Apiastrum Plinii*; by some *Apium Rifus*; *Herba Sardoæ Guilandini*, (who says, when he was taken Prisoner by Pyrates, and carried into *Sardinia*, he saw this Herb growing plentifully there:) *Apium aquaticum Tragi*; *Apiastrum Cordi*; *Scelerata Apuleii*; *Ranunculus palustris Cordi* in *Historia Lugdunensis*, *Thalii*, &c. *Ranunculus palustris Apii folio levis Bauhini*; *Ranunculus palustris rotundior folio Lobelii*; Smooth-leav'd *Marsh Crowfoot*. 4. *Ranunculus palustris Sardonius languinosus*; *Ranunculus Sardonius verus Dioscoridis*; *Ranunculus Sardonius Angulare*; *Apium Sylvestris*; *Ranunculus palustris Apii folio languinosus Bauhini*; *Ranunculus palustris secundus Matthioli*, & *Cordi* in *Historia*; The true *Sardinian Marsh Crowfoot*.

Water Crowfoot the Greater.

IV. The Descriptions. The first, or Common *Water Crowfoot*, has a small fibrous or thready Root, from whence comes forth a long trailing tender Stalk, with several Joints therein, at every one of which, that are under Water, come forth fine jagged or feathered Leaves, almost like fibres, but that they are

green, but towards the tops of the Branches growing above the Water, there be none of those fine Leaves at the Joints, or very few of them, but only round Leaves, growing upon short Foot-stalks, cut in a little, and dented about the edges: and with them come forth likewise small Milk-white Flowers, consisting of five Leaves apiece, with some Yellowness in the middle; after which come small, rough, round Heads of Seed, almost like to those of the Land *Crowfoot*.

Water Crowfoot the Lesser.

V. The second, or Small *Water Crowfoot*, with Alehoof or Ground-Ivy Leaves, has a great number of fibrous Roots, from whence come many long, slender, trailing Branches or Stalks, shooting forth at almost all the Joints under Water many other fibrous Roots, by which it spreads and very much encreases it self. From the several Joints, as well under as above the Water, spring forth several small, roundish, indented Leaves, not much unlike to those of Alehoof, standing each upon a pretty long Foot-stalk: from some of the Joints with the Leaves, and at the tops of the Stalks, come forth palish Flowers, having five pointed Leaves apiece, which being pass'd away, leave roundish Heads of Seed after them.

VI. The third, or Smooth-leav'd *Marsh Crowfoot*, has for a Root a Bunch of small white fibres, from whence shoot forth several Leaves upon long Foot-stalks, rounder than those growing higher upon the Stalk, and not so deep cut in, but dented about the edges: from among these Leaves shoot forth a round hollow Stalk, near a foot and half high, spreading it self forth into several Branches; the lower Leaves whereof are more round than those above, and are divided some into three parts, which are the first and lowest, others into five Divisions, and each of them dented about the edges, somewhat like unto Coriander Leaves, smooth, and of a pale green color; but those up higher on the Stalk and Branches are still more and more divided; so that some of the highest have no Division or Dent in them. At the tops stand small yellow Flowers, (but *Cordus* says, he has observed some to bear purplish:) which being pass'd away, there come in their places small, long, round Heads, of many crooked Seeds set together, as in some other sorts is to be seen: the whole Plant is as hot, sharp, biting, and as exulcerating as any of the other kinds, whether of the Land or Water.

VII. The fourth, or True *Sardinian Marsh Crowfoot*, has a Root consisting of a Bunch of white Strings, from which spring forth several large winged Leaves, upon Foot-stalks of a moderate length, divided into several parts, and dented about the edges: from among which spring up one or more Stalks, spreading themselves out into divers Branches, on which grow Leaves, some winged, and some single

Leaves

Leaves not winged, more divided than the former kind, and so hairy withal, as if there was a small soft Cotton upon them : at the tops of the Branches and Stalks come forth the Buds of Flowers, consisting of five broad-pointed Leaves apiece, each Leaf being on its end hollowed in a little ; which being pass'd away, there succeed Heads of Seed, much like to the former.

VIII. *The Places.* These all grow in moist, wet and morish Grounds, and sometimes by the sides of Waters, Ponds and Ditches, and in plashy places. The first is common in many places of this Kingdom : the second is more rare to be met with : the third and fourth are often found ; but not altogether so frequent to be seen as the first.

IX. *The Times.* They all flower in May and June, and their Seed is ripe some time after.

X. *The Qualities, Specification, Preparations, Virtues and Uses,* see in the following Chapter, these being of the same Nature and Temperament with the former and those following.

C H A P. CLXXXI.

Of CROWFOOT Garden.

THE Names. It is called in Greek, Βαρβάνθιον, *κωνιστὶν* ἢ *σποδομαν*, ἢ *ῥιμσον* : in Latin, *Ranunculus Sativus* vel *bortensis* : in English, Garden or Manured Crowfoot.

II. *The Kinds.* Of the *Ranunculi* which Florists now stuff their Gardens withal, there is such a great number of them, that it would not be easie to name them all, much less to describe them ; a great part of them being originally Exotics or Foreigners, but being brought to us, and prospering well by a Cultivating in our Gardens, they were made free Denizens, (as it were) and so at length became Natives of our Soil. The chief of those which we shall take notice of in this Work, are the eighteen following.

III. 1. *Ranunculus montanus albus major*, Great single white Mountain Crowfoot. 2. *Ranunculus montanus albus humilior duplici flore*, The low double white Mountain Crowfoot. 3. *Ranunculus albus flore pleno*, The double white Crowfoot. 4. *Ranunculus pratensis flore multiplici*, The double yellow Field Crowfoot. 5. *Ranunculus Anglicus maximus multiplex*, Garden double yellow Crowfoot, called also Batchelors-burtons. 6. *Ranunculus Gramineus duplici flore*, Double-flowered Grass-like Crowfoot. 7. *Ranunculus Creticus Latifolius*, Broad-leav'd Candy Crowfoot. 8. *Ranunculus Creticus albus*, The white Candy Crowfoot. 9. *Ranunculus Asiaticus flore Rubro*, Single red Asian Crowfoot. 10. *Ranunculus Asiaticus flore Amplo rubro*, The large single red Asian Crowfoot. 11. *Ranunculus Asiaticus flore rubro vario simplici*, The single red tripart Asian Crowfoot. 12. *Ranunculus Asiaticus flore luteo vario simplici*, The single yellow tripart Asian Crowfoot. 13. *Ranunculus Asiaticus flore rubro pleno*, The double red Asian Crowfoot. 14. *Ranunculus Asiaticus flore pleno prolifero*, The double-buttoned red Asian Crowfoot. 15. *Ranunculus Thalictri folio major*, The greater Columbine-leav'd Crowfoot. 16. *Ranunculus Thalictri folio minor Asphodeli radice*, Small Columbine-leav'd Crowfoot. 17. *Ranunculus Illyricus*, Illyrian Crowfoot. 18. *Ranunculus folio Plantaginis*, The Plantain-leav'd Crowfoot.

IV. *The Descriptions.* The first, or Great single white Mountain Crowfoot, has a Root consisting of many long, thick, whitish Strings, running out from a thick Head. From this Root spring forth large and green Leaves, divided into three parts, and sometimes into five special Divisions, and besides each of those parts are dented about the edges, somewhat resembling the Leaves of Globe Crowfoot, but larger. The Stalk is two feet and half high, having three small Leaves, set at the Joint of the Stalk, where it branches out into Flowers, which stand four or five together upon long Foot-stalks, made of five white Leaves apiece, very sweet in Smell, with some yellow Threads in the middle, encompassing a green Head, which, with the Seed, is very like to other Crowfeet of the Wild kind. There is one of this kind which is also lesser.

V. The second, or Low double white Mountain Crowfoot, has a Root composed of many white Strings, from whence proceed three or four broad thick Leaves, almost round, and pretty deeply cut in on the edges, of a fine green and shining color on the upper side, but not so green underneath, among which rises up a small short Stalk, bearing one Snow-white Flower on the top, pretty large, and a little double as it were, with two rows of Leaves, with divers yellow Threads in the middle, standing about a green Head, which in time grows to be like to a small green Strawberry, and full of Seed. There is also a single sort of this kind, having only one white Flower on the top of each Branch, which is lesser, and consists only of five round-pointed Leaves, being in all things else like the other.

VI. The third, or Double white Crowfoot, is of the same kind with the first, but lesser ; its Roots, Stalks and Leaves being alike in all respects : the chief Difference is in the Flowers, which in this Plant are very thick and double. The Leaves are fair, cut into five Divisions, and a little dented about the edges, green on the upper side, and pale underneath, having many Veins running thro' the Leaves : the Stalk grows not very high, not much above a foot and half in height, which is spread into many Branches, whose tops are reasonably stored with double white Flowers, as aforesaid.

VII. The fourth, or Double yellow Field Crowfoot, has a Root running and creeping under the Ground, like as the single does ; from whence proceeds its Leaves and Stalks, in which there is but little difference from the single Wild kind, which grow in every Meadow, being large, and divided into four or five parts, and indented about the edges, but they are something smaller, and of a brisker green. The Flowers stand on the many Branches, much divided or separated, being not very great, but very thick and double.

VIII. The fifth, or Great English Garden double yellow Crowfoot, called also Batchelors-burtons, has a Root round, like unto a small white Turnep, with several Fibres adjoining to it : from which arise many great black, green Leaves, jagged and cut into three Divisions, each to the middle Rib : from among these Leaves spring up the Stalks, which spread themselves out into several Branches, and which have some smaller Leaves on them ; and those which are next under the Branches, are long and narrow, the higher up, the longer and narrower. The Flowers are of a greenish yellow color, very thick and double of Leaves ; in the middle of which rises up a small Stalk, bearing another double Flower, like to the other out of which it grows, but smaller ; which being pass'd away, there comes a roundish rough Head of Seed, much like to the other Crowfeet.

IX. The sixth, or Double-flowered Grass-like Crowfoot, has a Root composed of many thick, long,

round, white Strings, from whence proceed long and narrow Leaves, somewhat like unto Grass, or rather like to the Leaves of single Gilliflowers or Pinks, being small and sharp-pointed, a little hollow, and of a whitish green color. From among these Leaves spring up several slender Stalks, bearing at the tops each one small yellow Flower, which is double, as consisting of two rows of Leaves, with some Threads in the middle. There is also a single sort of this Species, the Flower being small, and consisting of five yellow Leaves, with yellow Threads in the middle, like to other Crowfeet.

X. The seventh, or Broad-leav'd Candy Crowfoot, has a Root somewhat like those of the Asian Crowfoot, or composed of a number of tough Roots, like those of the yellow Asphodil: it has the greatest and broadest Leaves of all the sorts of Crowfeet, being almost round, and without any great Divisions, denied a little about the edges here and there, as large or larger sometimes than the Palm of ones Hand; of a light green color, yet some of the Leaves are here and there deeply divided. Among these Leaves rises up a Stalk, not very high when it does first flower; but afterwards as the Flowers do open themselves, it grows to be about a foot and half high, having some Leaves on it deeply cut in and divided. The Stalk is also thick, round and stiff, and shoots it self forth into two or three Branches, at the setting on of which grow longish Leaves, a little denied about their ends. These Branches bear many fair yellow Flowers, consisting of five round-pointed Leaves apiece, standing each a little distance from other, so that the green points of the Cups shew themselves between them, and having yellow Threads in the middle, but become somewhat whitish when the Flower has stood blown a little time.

XI. The eighth, or White Candy Crowfoot, has a Root consisting of many small Grains or Kernels, of a dark or dusky greyish color, set together, and its Leaves are very like to the Leaves of the Red Asian Crowfoot, being somewhat broad and indented about the edges, some of the Leaves being cut in or gasht, making thereby as it were three Divisions, of a pale green color, with many white Spots in them. The Stalk rises up a foot high, with some Leaves on it, which are more divided than the lower, and divided at the top into two, and sometimes into three Branches, each of them bearing a fair Snow-white Flower, something large, included at first in a brownish Husk or Cup of Leaves, which afterwards stand under the Flowers, consisting of five white, large, round-pointed Leaves, having in their middle many blackish purple Thrums, encompassing a small, long, green Head, composed of many Scales, or chaffie whitish Husks when they are ripe. They yield Seed, but it is unprofitable, as yielding no new Plants. Some of this kind have their Flowers purple-edged: some again have their Flowers with Veins of the same purple; and some of them are edged with a bright red color, not differing in any other particular.

XII. The ninth, or Single red Asian Crowfoot, has a Root made of many Grains or small Kernels set together, and closing at the Head, but spreading it self, if it likes the Ground, under the upper Crust of the Earth into many Roots, encreasing from long Strings which run from the middle of the small Head of Grains, as well as from the Head it self. The lower Leaves are always whole, without Divisions, being only somewhat deeply indented about the edges: but the others which rise after them, are more cut in, sometimes into three, and sometimes into five Divisions, and notched also about the edges. The Stalk rises higher than any of the former, and has on it two or three smaller Leaves, more cut in and divided than those below; at the top whereof stands one

large Flower, consisting of five Leaves, every one of them being narrower at the bottom than at the top, and not standing round and close one to another, but with a certain distance between, of a dusky yellowish red color on the outside, and of a deep red on the inside, the middle being set with many Thrums of a dark purple color. The Head for Seed is long, and scaly or chaffy, and not profitable for sowing, as not springing again.

XIII. The tenth, or Large single red Asian Crowfoot, has a Root much like the former, its Leaves are broader and greater. The Stalk is much of the same height as the other, and branched out, with like Leaves thereupon: the Flower is also larger, and the Leaves thereof broader, being sometimes eight in a Flower, standing round and close one to another, of a deep red color, which makes it look the fairer, and have the more excellent shew: in all other respects, it is like the last.

XIV. The eleventh, or Single red stript Asian Crowfoot, has a Root, Stalk and Leaf very like to the two last foregoing, and in the manner of growing, differing chiefly in the Flower, which being red, like the two foregoing, has yet some yellow Stripes or Veins thro' every Leaf; these Stripes are sometimes but few and little, and sometimes so much that it seems to be partly colored red and yellow. It is a very tender Plant, and apt to perish, unless carefully lookt after.

XV. The twelfth, or Single yellow stript Asian Crowfoot, has a Root not much unlike to any of the three last described, but the Leaves are very different, being very much divided. The Flower is large, of a fine palish green yellow color, consisting of six and seven, and sometimes of eight or nine round Leaves; the tops of which have reddish Spots upon them, and the edges also sometimes, with like purplish Thrums in the middle as the other have. It has been observed, that none of the kinds of Crowfeet with these kernelly Roots, ever bear so good Seed, which being sown, will spring up and grow in England; so that with us they can only be propagated from their Roots, by a careful and skilful looking after.

XVI. The thirteenth, or Double red Asian Crowfoot, has a Root so like to the Single red kind, as sect. 12. above, that none can perceive any difference between them, so also it is the same in its Stalk and Leaves, that the difference or kinds are not to be known till the Buds of the Flowers do appear, which after it is any thing forward, may be perceived to be greater and fuller than the Buds of the single kind. This double sort bears most commonly but one fair large double Flower on the tops of the Stalks, composed of many Leaves set close together in three or four rows, of an admirable Crimson color, declining to Scarlet, the outer Leaves being larger than the inner; and instead of Thrums, it has many small Leaves set together. It has also six small, narrow, green Leaves on the back-side of the Flower, where the Foot-stalk is joined to it.

XVII. The fourteenth, or Double buttoned red Asian Crowfoot, has Roots, Stalks, Leaves and Flowers so like the former, but before the time of flowering they are not to be distinguished one from another. The Flower is of the same Color and Duplicitly, but herein they differ, that this has another double Flower growing upon a Foot-stalk issuing out of the middle of the first Flower, of the same color, but much smaller, which Gerard thinks does happen by reason of the Strength of the Root, and Goodness of the Soil where it is planted. It is a noble Flower, and of great Excellency.

XVIII. The fifteenth, or Greater Columbine-leav'd Crowfoot, has a Root made of a tuft of white Fibres

or Strings, very bitter; and creeps here and there, putting up new Shoots. The Leaves of this Crowfoot have long Stalks, and are very like unto the smaller Leaves of Columbines, or the Great Spanish Thalictrum, or Meadow-Rue, which has Leaves very like unto Columbine Leaves, four or five several ones rising from the Root. The Stalk grows up to the height of about half a yard, something reddish, and beset here and there with the like Leaves: at the top stand several small white Flowers, consisting of five Leaves apiece, with some pale white Threads in the middle: the Seed is round and reddish, and contained in small Husks or Horns. This is the *Aquilegia minor Dalechampi*, and *Ranunculus praecox secundus Thaliectri folio Clusii*.

XIX. The sixteenth, or Small Columbine-leav'd Crowfoot, has a Root consisting of three, four or more, thick, short and roundish or oval yellow Bulbs or tuberos Productions from the main Root or Head, like unto the *Alphodil* Root. From this Root spring forth three or four winged Leaves spread upon the Ground, standing upon long Stalks, and consisting of many small Leaves set together, spreading from the middle Rib, every Leaf somewhat resembling the smallest and youngest Leaves of Columbines. The Flowers are white, standing at the tops of the Stalks, made of five round Leaves.

XX. The seventeenth, or Illyrian Crowfoot, has a Root which consists of a Bunch of small oval tuberos Roots or Grains, growing close together, with some Fibres adjoining, not much unlike to those of Pilewort: from whence spring forth (upon long Foot-stalks) three, four or more narrow greyish green Leaves, divided into four, five or more long slender parts, of a Silver-white shining color underneath, and covered with a certain Downiness. The Stalks are firm and round, but small, a foot high or more, having some such-like Leaves thereon about the middle, and spreading into three or four Branches, every top bearing a small shining pale yellow Flower, consisting of five Leaves, and sometimes two together upon a Stalk. There is a greater kind of this Plant, like to it in all respects, but only that the Leaves, Stalk and Flowers are greater and larger, the Leaves broader and greener on the upper side, and not fully of so Silver a white color underneath: the Flowers are of a fair deep yellow color, and greater than the former; but the Root has not so many small Grains of Kernels set together, from whence white Strings shoot forth, by which it is nourished and encreased.

XXI. The eighteenth, or Plantane-leav'd Crowfoot, has a Root composed of many white Strings or Fibres, proceeding from a Head which is somewhat hairy, and abides many Years; the Leaves wholly perishing in the end of Summer, and springing again in March: from this Root rise up three or four Leaves set on pretty long Foot-stalks, being somewhat long and broad, like unto Plantane Leaves, with Ribs therein, but more pointed at the ends, not divided or dented about the edges, but smooth and plain, with some Veins running thro' the length of them, and pointed at the ends, of a whitish grey green color, circled as it were with a white Down. The Stalk is firm, round and green, about half a yard high, bearing two or three longer Leaves, broad at the bottom, and encompassing the Stalk, which divides it self at the top into two or three small Branches, having every one of them a small long Leaf at the foot thereof, and a reasonable large Flower at the Head, (without any Smell) consisting of five white round-pointed Leaves, with many yellowish Threads in the middle, which growing ripe, has many Seeds set together, like to divers other kinds of Crow-

XXII. The Places. The Names of most of these Plants shew whence they originally came; however, by Transplantation, they are now Natives of our own Land, being all of them found in some one or other of our Florist's Gardens, where they flourish admirably well.

XXIII. The Times. The Broad-leav'd Candy Crowfoot flower more early, viz. in March or April: the others flower from April to the end of June; and the Seed is ripe in July and August.

XXIV. The Qualities. The hot, biting and exulcerating kinds, (which are those only whose Virtues we design to give you in this place) are hot and dry in the fourth Degree, and exulcerating.

XXV. The Specification. They are peculiar for curing the Scrophula or Kings-Evil.

XXVI. The Preparations. You may have therefrom, 1. A liquid Juice of the Roots or Leaves. 2. An Essence. 3. A Powder of the Roots, Flowers or Leaves. 4. A Cataplasm of the same. 5. A Decoction. 6. An Ointment. 7. A distilled Water. Some are for using the Roots only, some for the Flowers, some for the Leaves, but they may be all taken and used promiscuously, according to the Intentions; but none of them to be used inwardly, being but little better than Poyson, by reason of their exulcerating Property; more especially the *Illyrian Crowfoot*, which some call *Apium Sylvestris*, and some *Apium Rifus*, but is not the true *Apium Rifus*, of which we speak in its proper place. But as to this *Illyrian* or *Laughing Crowfoot*, if it is taken inwardly, it is said to cause the Person to see divers strange Sights, and to kill them Laughing: without doubt, it hurts the Senses and Understanding, and rather causes Cramps, Convulsions, and Wringings or Drawings of the Mouth and Jaws awry, seeming to the Standers by as if the Patient Laughed, and dying in this Condition, to dye Laughing, whereas it was no Laughing, nor was the Party in any Condition to Laugh, but rather it was a violent Convulsion of the Nerves, causing the Man or Woman to die with great Torment.

The Virtues.

XXVII. The liquid Juice. It is sharp and biting, good to bath gently those Parts of the Skin which are affected with Scurf, Morpew, Leprosie, Freckles, Spots, Yellowness, Roughness, &c. The Skin is first to be washed with warm Water very well, to loosen and open the Pores thereof; then being wiped dry, to be immediately bathed with this Juice, which is to be done twice a day. It is good also to dry away Scabs and Itch.

XXVIII. The Essence. It is powerful to all the Intentions aforesaid, but more drying. It is good to waste away and consume Warts, Corns, hard Scabs of the Skin, Ruggedness of the Nails, and other like Deformities of the Cutis. The Head being washed with it, it kills Worms at the Roots of the Hair, which eat the same and cause it to fall off. Neither Juice nor Essence, by reason of their Violence, are ever used inwardly.

XXIX. The Powder. It is cleansing and drying, and is good to be strewn into old, running and putrid Sores, and Ulcers which have Worms in them. Snufft up the Nostrils, it purges the Head and Brain by Sneezing.

XXX. The Cataplasm. Laid to the Wrists of the Hands, it is said to drive away Agues, especially if a little Bay Salt is also mixed with it. If it is made of the Root of the *Bulbous* or *Tuberos* kind, the Germans, as *Camerarius* says, apply it to Plague Sores and Pestilential Bubo's, to induce Maturation: and it is not unlike, for it will suppurate and

break other Apolloms or Tumors, being wisely applied. *Tragus* says, That a bit of this Tuberous Root put to Teeth which do ake, or into an hollow Tooth, takes away the Pain; but Authors also say, That many times it breaks those which are hollow, or causes them to fall out. This Cataplasim (or the simple Root) being applied to the Finger of one troubled with the Tooth-ach, eases the Pain, which it does by Attraction, and thereby causes a Pain in the Part to which it is applied. Applied to a foul Ulcer, it will cleanse it, and take away all the filth and corrupt Matter therein, leaving the Sore fair, and easily to be healed with other Vulneraries; but the Cataplasim is not to lye too long upon the Sore, by reason of its Violence. Applied to Scrophulous Tumors or Kernels in the Neck, or under the Ears, called the Kings-Evil, it breaks them, and causes them to waste away. Authors say, That applied to Hemorrhoids or Piles which swell and bleed not, it helps to discuss or take them away; but that it is in no wise to be applied to those which are open and bleed. Applied to a *Leuce* or spotted Leprosie, it kills the virulent Humor, and clears the Skin.

XXXI. *The Decoction.* It has the Virtues of the liquid Juice and Essence, but not full out so efficacious. It cures Scabs and Itch, they being often washed therewith; and is good to take away Tannings, Sun-burnings, Freckles, Lentils, Yellowness of the Skin, Scurf, Morpew, &c. It is good also to hinder the falling of the Hair, the Head being washed therewith warm; and then afterwards to be washed again with warm Water.

XXXII. *The Ointment.* It has all the Virtues of the Cataplasim, being anointed upon the Parts affected. The Cataplasim may also be made therewith, instead of Hogs-Lard, by which means it will be yet so much the more effectual.

XXXIII. *The distilled Water of the whole Plant,* whilst it is in flower, is safe to all the Purposes aforesaid; and, as some say, is given with good Success inwardly, with Species *Lithontribon*, to provoke Urine when it is stop'd, and to break the Stone; and being used as a Wash, it takes away most of the usual Deformities of the Skin.

XXXIV. *An Observation.* Tho' all these Preparations and Virtues aforesaid, are applicable to all the hot, biting and exulcerating *Crowfeet* promiscuously, whether of the Land or Water, and that probably they may all do the same things; yet they are generally and for the most part pradicated (except in the Cases where any particular one of them is named) of the most Common and Meadow *Crowfoot*.

XXXV. *Observ. 2.* That the Sweet *Crowfoot*, or that which has no sharp or biting Taste, is held to be harmless, for the Germans, as *Tragus* says, do eat it familiarly among other Herbs. *Tragus* also says, That even this sweet kind will discuss and dissolve hard Tumors in any Part of the Body, being applied.

have it to be the *Hemerocallis* of *Discozides*: in *English*, *Crown Imperial*.

II. *The Kind.* It is of the Stock or Kindred of *Lillies*; and among the wonderful Variety of *Lillies* known at this day, of which some are White, some Orange Tawny, some Red, some Yellow, some Blush, some Purple, some Spotted, others without Spots; some standing upright, others turning downwards, &c. This *Crown Imperial*, for its excellency Beauty and Stateliness, exacts the first place among them. Some have called it *Lilium Persicum*, but there is another which is more usually called by that Name, as shall be shewed hereafter; and therefore we rather chuse to call it *Corona Imperialis*, the *Crown Imperial*, than by any other Name, for that this Name is now also more generally received. It is a singular Plant of the kind, yet some will have it, that there is a *single* and a *double* sort: but the Truth is, that as the Plant grows old, so does it grow rich, bringing forth a Crown of Flowers among the uppermost green Leaves, which is, their *double* kind, altho' indeed they are but one and the self-same Plant, which in time is thought to grow to a *Triple Crown*; all which is but accidental, and happens by the Age of the Root, and Fertility of the Soil.

Crown Imperial.

III. *The Description.* It has a thick, firm and solid bulbous Root, covered with a yellowish Film or Skin, composed of several, but much thicker Scales than any other Lilly, except the Persian, and does grow sometimes to be as great as a pretty big Child's Head, and somewhat flat withal. From the sides whereof, and not from the bottom, it shoots forth long thick Fibres, which perish every Year, having a hole in the middle thereof at the end of the Year, when the old Stalk is dry and withered, and out of the which a new Stalk does spring again (from a Bud or Head to be seen within the Hollowness on the one side) the following Year: the Stalk then filling up the Hollowness,

CHAP. CLXXVII.

OF CROWN-IMPERIAL.

THE Names. It has no Greek Name that we know of: the Turks call it *Tufai*, *Tousai*, *Tuschai*, *Turfani* and *Turfandi*: in Latin, *Corona Imperialis*, & *Lilium Byzantinum*; *Clusius* will

Hollowness, and thus springing up, rises up to be three or four feet high, being great, round, and of a purplish color at the bottom, but green above, beset from thence to the middle thereof, with many long and broad green Leaves, very like to the Leaves of our Common white Lilly, but something shorter and narrower, confusedly without Order, and from the middle upwards it is bare or naked without Leaves, for a certain Space; and then it bears four, six or ten Flowers, more or less, according to the Age of the Root, and the Fertility of the Earth where it grows. The Buds at the first appearing are whitish, standing upright among a Bush or Tuft of green Leaves, smaller than those below, and standing above the Flowers; after a while they turn themselves, and hang downwards, every one upon its own Foot-stalk, round about the great Stem or Stalk, sometimes of an even depth, and sometimes again one lower or higher than another, which Flowers are almost in Form like to those of an ordinary Lilly, but somewhat lesser and closer, consisting of six Leaves, of an Orange color, striped with purplish Lines and Veins, which add a great Grace and Beauty to the Flowers. At the bottom of the Flowers next unto the Stalk, every Leaf thereof has on the outside a certain Bunch or Eminence sticking forth, of a dark purplish color; and on the inside there lies in those hollow bunched places, certain clear drops of Water, like unto Pearls, of a very sweet Taste, almost like to Sugar or Honey. In the midst of each Flower is a long white Stile or Pointel, forked or divided at the end; and six white Chives tipped with yellowish Pendants, standing close about it: after the Flowers are past, six-square Seed-vessels appear, standing upright, winged as it were, or twisted on the edges, yet seeming but three-square, because each couple of those winged edges are joined closer together. In these Pods or Vessels are contained broad, flat and thin Seeds, of a pale brownish color, like unto other Lillies, but much greater and thicker also. The Stalk of this Plant does sometimes grow flat, two, three or four Fingers broad, and then bears many more Flowers, but then generally they are smaller than when it bears round Stalks. Sometimes it happens that the Stalk is divided at the top, carrying two or three Tufts of green Leaves, without any Flowers on them: and sometimes likewise it bears two or three Heads or Crowns of Flowers (as we have before hinted at Sect. 2. above) upon one Stalk; this is not often seen, but when it happens, it is merely accidental. The whole Plant, and every part thereof, Roots, Leaves and Flowers do smell somewhat strong, much like to the Scent of a Fox; which, if any do but come near it, they cannot chuse but smell it.

IV. *The Places.* This Plant was first brought from Constantinople into our Country among other bulbous Roots, and being made Denizens in our Gardens, they are now become Natives of our Land, where they thrive admirably well.

V. *The Times.* They flower in April, and sometimes in March, if the Weather is mild; and the Heads with Seed are ripe in the end of May and in June. It is quick in its Growth, but it springs not out of the Ground till the end of February or beginning of March.

VI. *The Qualities, Specification, Preparations, Virtues and Uses,* are the same with those of the White and Orange-tawny Lilly, treated of in some of the following Chapters, to which you are referred.

VII. *Observ.* 1. To obtain the true color of the Flowers of this noble Plant: Take Sap-berries, and lay them in steep in a proportional quantity of fair Water for two hours, and mix a little Saffron in that Infusion, and it will give the perfect color, to limne or illumine the Flower withal.

VIII. *Observ.* 2. As in the bottom of each of these Bells, there is placed six drops of most pure clear shining Water, sweet in Taste, like to Sugar, resembling in Shew fair Oriental Pearls; these drops, if you take them away, new and fresh drops will immediately come in their places again. But if they may be suffered to continue in the Flower, they will never fall away, no, tho' you strike the Plant till it is broken.

CHAP. CLXXVIII.

of CUCUMBER Garden.

I. *THE Names.* It is called in Arabick, *Chathe* & *Chethete*: in Greek, *Σίκυς ἡμεσος*: in Latin, *Cucumis* & *Cucumer Sativus*: in English, *Garden Cucumber*.

II. *The Kinds.* Of these we make four several sorts, viz. 1. *Cucumis vel Cucumer vulgaris*, The Common Garden Cucumber. 2. *Cucumis Anginus*, The long Snake-like or Serpentine Cucumber. 3. *Cucumis vel Cucumer Pyriformis*, Pear-fashioned Cucumber. 4. *Cucumis vel Cucumer Hispanicus*, The Spanish Cucumber.

Garden Cucumbers.

III. *The Description.* The first has a Root which is long and white, with divers Fibres adjoining to it, from whence spring forth many trailing rough green Branches, lying on the Ground; all along whereof grow several Leaves, which are rough, broad, uneven at the edges, and pointed at the ends, with long crooked twisting Tendrels or Claspers, coming forth at the same joint with the Leaf, but on the other side thereof. Between the Stalks and the Leaves, at the Joints, come forth Flowers severally, each standing on a short Foot-stalk, opening it self into five Leaves, of a yellowish color; at the bottom of which grows

the fruit, long, and green at first; but when it is through ripe, a little yellowish, having many furrows and uneven Bunchings out the whole length of it, with long yellowish white flat Seed, lying dispersed in Rundles as it were, and very regularly thro' its whole Substance. The inward Pulp or Substance is clear or through shining, which together with the Seed is eaten a little before they be fully ripe: of this Cucumber there is the shorter, which is of an equal bigness in the body thereof; and the longer, of an unequal bigness at both ends; and a very long one, which is near a foot in length: there is also the early kind, called the French kind, which are the worst of all; and the Dantisk kind, which bears but small fruit, growing on short Branches or Runners, of which kind the Cucumbers we usually Pickle are.

IV. The second, or Long Serpentine Cucumber, has a Root much like the former, having long trailing Branches, Tendrels and Leaves, (tho' lesser) much like the former. The fruit, says Gerard, is very long, (and something twining, like a Serpent or Snake) which (says he) were at first made by Art and Manuring, and were afterwards so brought forth by Nature: for at first, when the fruit was small and little, it was put into some hollow Cane, or other like thing made of purpose, in which the Cucumber did grow, and that in length according as the Cane it was enclosed in would permit it. It grew long by reason of the narrow Hollowness in which it was enclosed, which being filled up, it increased in length. The Seeds of this kind of Cucumber being sown, bring forth not such as it were before this Application of Art; but such as these are which Art has framed, which now of their own Growth are long, and oftentimes very crookedly turned; whence came the Name Anguini, or Long Cucumbers.

V. The third, or Pear-like fashioned Cucumber, has a fibrous or thready Root, from whence come many trailing Branches, lying flat upon the Ground, rough and prickly; whereon do stand at each Joint, one rough Leaf, sharp-pointed, and of an over-worn green color: among which come forth clasping Tendrels, and also slender Foot-stalks, on which do grow yellow Star-like Flowers: the fruit is at first green and longish, which coming to its bigness, forms it self much like to a Pear, greenish on one side, and of a whitish green on the other, and is much about the largeness of a great Warden: the Seed is long, flat and whitish, like the other.

VI. The fourth, or Spanish kind, (which were brought out of Spain first to Strasburgh, and from thence to us) is a rare and beautiful Cucumber: it has a fibrous Root, from whence come forth rough and hairy trailing Branches, set with very large rough Leaves, sharp-pointed, in Form like unto the Leaves of the great Bur-dock, but more cut in or divided: among which at the Joints come forth upon tender Foot-stalks, fair, naked yellow Flowers; the which being past, the fruit comes in its place a foot in length, green on the side towards the Ground, and yellowish on the Sunny part, streaked with many Spots and Lines of divers colors, whose Pulp or Meat is hard and full, like that of our Melon or Pom-pion.

VII. The Places. These Cucumbers all grow in Gardens, not only in England, but in most parts of the World, especially in all the more Southern Countries, where the Heat of the Sun makes them to grow and flourish admirably well.

VIII. The Times. They are planted in April, and they are fit for eating in June, July and August; and the Seed is tully ripe about the latter end of September.

IX. An Observation about Planting them. About

the middle of April, or something sooner, (if the Weather is warm) you must make a Bed or Bank of hot and new Horie-dung, taken from the Stable, and not from the Dung-hill, of an Ell in breadth, and two feet and half in depth, but of what length you please, accordingly as it may hold the quantity or numbers of the Seed you intend to use: this Bank you shall cover with Hoops or long slender Sticks, to bent and bowed, that you may cover the whole Bank or Bed with Mats or some other warm Covering, Straw, or the like, to keep it from the Injury of cold frosty Nights, that the Seeds which are planted or sown, may not be nipt: then shall you cover your Bed over with the best and fattest Earth, finely sifted thro' a Wire Sieve, that it may be half a foot thick, in which you shall set or sow your Seed: this being done, cast your Straw or other Coverture over the same, and so let it rest without looking upon it, or taking away of your Covering, for the space of seven or eight days at most; for commonly in that space of time they thrust themselves thro' the Earth. Then must you cast upon them, in the hottest time of the day, some Water which has stood in the House or the Sun a day before, or Water of which the Cold is just taken off; for otherwise, if the Water cast upon them is just taken forth out of the Pump or Well, it will so cool and chill them, being brought forth and nourished in such a hot place, that presently, even in one day, you will have kill'd all your Plants: your Plants will not only be kill'd, but your Bank also will be chill'd and loose its Heat.

X. Observ. 2. This is also to be noted, That the young Plants must every day when the Sun shines warm, be opened and exposed to its Beams, and at Evening every Night they must be covered again; this must be done from time to time, till the Plants have four or six Leaves apiece, and that the Danger of the cold Nights and nipping Season is past; then they must be replanted with a great deal of Care, taking each Plant up with the Earth sticking to its Root, and they must be placed as near as may be in the most fruitful and fat Soil; and in that part of the Garden which is most sheltered from Cold and piercing Winds, and where the Sun shines warmest. Now, you must also observe, That upon this Replantation, you must cover them with some thin Mats or Wilps of Straw, propped up with forked Sticks or some such-like thing; and this thing is to be done every Night, to keep them from the Cold of the Night, and sometimes in the Day-time, to keep them from the too great Heat of the Sun; otherwise, tho' you have brought your Work thus far on, all your Labor may be lost: for they cannot, whilst they be young and newly planted, endure either over-much Cold or over-much Heat, till they be well rooted and fixed in this their new Habitation.

XI. Observ. 3. Sometimes it falls out that some Seeds are more forward than the rest, and therefore do commonly rise up very nakedly, with long Necks, not much unlike to the Stalk of a small Mushbroom of a Night old. This naked Stalk you must cover with the like fine Earth, even up to the green Leaves: you must also have that regard to your hot Bank, so to place it, that by its Situation it may be defended from the North, North-East and East Winds. If these Instructions be carefully observed, you never will have cause to complain that your Seeds were not good, nor your Climate too cold or intemperate, by reason of which you should be frustrated in having of Fruit; but if your Seed is hard, plump, firm and good, it will certainly prove fruitful, tho' in the most Northern parts of Scotland.

XII. The

XII. *The Qualities.* They are all cold and moist in the second Degree: Aperitive, Diuretick, Stomack, Alterative, and highly Antiforbatick.

XIII. *The Specification.* It cures the Scurvy, and prevails against Heat of Urine.

XIV. *The Preparations.* You may have therefrom, 1. *A liquid Juice of the Fruit.* 2. *An Essence of the same.* 3. *The green Fruit* 4. *Pottage.* 5. *A Lotion or Wash* 6. *A distilled Water* 7. *The Seed.* 8. *Pickled Cucumbers.* 9. *Pickled after the Mango fashion.*

The Virtues.

XV. *The liquid Juice.* It is expressed from the *Cucumber*, either ripe, or almost ripe, or unripe, as they are most fit to be eaten. It opens, is cool and cleansing, provokes Urine, and opens the Obstructions of the Breast, Lungs, Liver and Reins, and takes away Inflammations of those Parts. It helps Heat, Sharpness and Scalding of Urine. Dose from 1 to 3 ounces twice a day. Outwardly applied, it makes the Skin smooth and fair: and being taken for some considerable time, it perfectly cures the Scurvy in a hot Habit of Body.

XVI. *The Essence.* It has all the Virtues of the former, but not full out so cold; for which Reason this may be taken by it self, from 1 to 3 ounces or more; whereas the other ought to be taken mixed with Ale or White Port Wine. It is an excellent Stomack, very much pleasing and gratifying the Viscera, if inflamed or over-heated.

XVII. *The green or unripe Fruit.* It is first pared, then sliced thin; after which it is seasoned with Pepper, Salt, Vinegar and Oil, an Onion or two being also thin sliced and shred, and put thereto. It is grateful to the Stomach above all other Sallets, it cools the Heat thereof, as also the Inflammation of the Lungs and other Viscera. It cures the Scurvy in a cold Habit of Body, nor is there a greater Antiforbatick in the World, and may be freely eaten two or three times a day, and in large quantities too, without any danger or hurt to the Stomach and Bowels, tho' some ignorant People may affirm the contrary. God and Nature has replenished all the hot Regions and Countries of the World with them in a very ample manner; and it is my Opinion, that they are a great means of the Preservation of Life in all those sultry hot Parts of the Earth, and a singular Preventive of Diseases, especially of all such as proceed from Inflammation, violent Heat and Fevers, of what kind soever. It was not without some Reason that the Children of Israel lusted after them in the Wilderness: *Numb. 11. 5. We remember (said they) the Fish which we did eat in Egypt freely, the Cucumbers, and the Melons, and the Leeks, and the Onions, and the Garlick.* And by this it appears also, that *Egypt* was very well stored with them.

XVIII. *The Pottage.* Take the Fruit, cut it in pieces, and chop it as Herbs to the Pot, and stew the same in a small Pipkin (or Stew-pan) with a piece of Mutton, (Beef, Veal, Lamb, or other Flesh,) adding in the stewing fine Flower of Oat-Meal, to give it the Consistence of Pottage: *Gerard.* This may be made savory with a little Salt, and if you so please you may also add to it the Juice of an Orange, to make it grateful, of which you may eat from half a pint to a pint, or a good Porringer full every Morning to Breakfast, as much at Dinner, and the same again at Supper. Eaten in this manner for the space of three Weeks together, without Intermission, it will perfectly cure all manner of salt Pustles, and copper or red Faces, red and fiery shining Noses, (tho' as red as red Roses)

tho' the Skin is filled with Pimples, Rubies, Scurf, Morpew, Herpes, Tetters, Kingworms, and other like Breakings out.

XIX. *The Lotion or Wash.* *A strong White Wine Vinegar a quart, Juice of Cucumbers a pint, Orrice-Root in fine flower or powder, Flowers of Sulphur, or Sulphur in fine powder, of each an ounce: Camphir in fine powder half an ounce, beaten with four blanched Almonds; Juice of eight severe Limons, eight Onions apples cut thro' the middle: put all these into a strong double Glass, shake them together very strongly, and set it in the Sun or an equivalent Sand heat for 12 or 14 days.* This does not only help red and fiery Faces, but also takes away Pimples, Rubies, Freckles, Lentils, yellow Spots, Scurf, Morpew, Herpes, Tetters, Kingworms, Tanning, Sun-burning, and all other Deformities of the Face and Skin. The Face or Skin ought first to be washed pure and clean with fair warm Water, to open the Pores thereof, and then to be dried with a Cloth; and then as soon as that is done, this Wash is to be used and laid on, and so to be suffered to dry in of it self, without wiping away. It is to be used Morning and Night, and always during the whole time of eating the above prescribed Pottage.

XX. *The distilled Water.* It is good to cool the hot Distemper of the Liver and Blood, to quench thirst, cool the Heat of Fevers, and take away the Dryness and Roughness of the Tongue. It is good against the Heat of the Reins, as also the Sharpness, Scalding and Stoppage of Urine. Outwardly used, it cools Inflammations, helps Blood-hot and Redness of the Eyes, clears, cools and smooths the Skin, and is good against most Deformities thereof, being often applied thereto.

XXI. *The Seed made into an Emulsion with the distilled Water.* It wonderfully cools the Heat of the Reins, and takes away the Scalding and Sharpness of Urine; and that Pain which is caused by the Application of *Cantharides* in *Epispasticks*, or Blistering-plasters, which sometimes, by their lying on too long, cause pissing of Blood, and almost the greatest Extremity; these ill Accidents this Medicine suddenly and easily cures, &c.

XXII. *Pickled Cucumbers.* There are various ways of pickling Cucumbers, which we have taught in our *Doron Medicin lib. 2. cap. 19. sect. 14, 15.* and other ways in some other of our Books; but this following is best. Take a thousand *English Cucumbers*, wipe them very clean with a dry Cloth, and lay them in a Stone Pot or Jar, with *Fennel* and *Dill*, and Cloves of *Garlick*, lay upon lay: upon which put boiling hot this Pickle. Take the best White Wine Vinegar four Gallons; salt Brine (made so strong as it may bear an Egg) six quarts; choice Brandy or Sugar Spirits three quarts; white Pepper bruised three ounces; *Cloves* slit, *Mace*, of each half an ounce: having stood a day, stop them close up; and they will be fit to eat in about a Weeks time. After three Weeks or a Month draw off or decant the Pickle, which boil, scum and put to the Cucumbers again, and so keep them for use. This is the usual Method. But Experience has told me, 1. That there is no need of drawing off, and boiling the Pickle at all, for the Brandy or Sugar Spirits are a sufficient Preservative of it. 2. That the first adding of the Brandy or Spirits ought to be after the boiling of the Pickle, when you are just a going to put it upon the Cucumbers. These pickled Cucumbers excellently strengthen the Stomach, resist the Scurvy, and cause a good Appetite.

XXIII. *Pickled Cucumbers after the Mango fashion.* Take Cucumbers which are pretty large, but such as are very hard and green; wipe them clean, slit them on one side, and take out all the Seeds and middle

middle Pulp; and put in, in the place thereof, three or four or more Cloves of *Garlick*, a slice of *Ginger*, and half a dozen or more of *Pepper* Corns, only crackt into three or four pieces; which done, tye them up with a Thread: then take the best White Wine Vinegar as much as will cover them, adding what Salt you think fit, with *Pepper*, *Ginger*, *Cloves* and *Mace*; make this Pickle jult boil, and put it upon your Cucumbers boiling hot: repeat the boiling the next day, and pour it on hot as before. After this take a well glazed Stone Pot, into which put your Cucumbers, laying them smooth and well one by one, and then having put to every gallon of Pickle a pint of pure Lime Juice, not adulterated, put it upon the Cucumbers, which cover, and let them stand over a moderate Fire till the Liquor is scalding hot, taking care that it may not boil: when you see the Cucumbers green enough, take them out and put them into a Stone jar, placing them one by one very smooth and well: this done, when the Pickle is cold, you may add to it to every gallon thereof, a quart of Brandy or Spirit of Wine, and half a pint of whole Mustard Seed tyed up loose in a Rag. *Note*, Some, in making of the Pickle, take pure White Wine Vinegar, to a gallon of which they add Lime Juice a quart, salt Brine strong enough to bear up an Egg three pints or better, not putting in any other Salt: with this they proceed as before is directed; and at the last add the afore-said proportion of Spirit of Wine, which makes an absolute and singular Pickle, and so good, as will keep your Cucumbers all the Year round. These are more Stomachick than the former, more grateful to the Palate, cause a good Appetite, resist the Scurvy, and have all the good Properties of the former, with many other Advantages.

C H A P. CLXXIX.

of CUCUMBER Wild.

I. *THE Names*. It is called in *Greek*, *Σκωρ* *Σκωρ*; in *Latin*, *Cucumis* & *Cucumer* *agrestis*, and in the Shops, *Asinarius*, *Cucumis* *Sylvestris* *Matthioli*, *Tragi*, *Dodonæi*; also by some, *Noli me tangere*, (because of the spitting of them, if rudely handled, when ripe:) in *English*, *Wild Cucumber*, *Spirting Cucumber*, and *Touch me not*.

II. *The Kinds*. It is a Species of Cucumbers, the Wild sort, but a singular Plant of the kind.

III. *The Inspissate Juice*, is the Juice of the Fruit, or rather a *Facula* thereof, which being dried, is called almost in all places throughout Europe, *Elaterium*: *Pliny*, lib. 20. cap. 1. The *Greeks* call it also, *ἐλατήριον* *ab ἐλατρίω*, *Impellere*, *stimulare*, *infligare*, *pungere*; which is as much as to say, to impel, stir up, or force violently, to purge vehemently, and therefore *Elaterium est medicamentum vehementer purgans*. *Gaza* in his Translation of *Theophrastus* calls it, *Agitatorium*. 'Tis doubtless one of the strongest of all Purgers.

IV. *The Description*. It has a Root white and firm, thicker and shorter than any other sort of Gourd or Cucumber has, having withal some adjoining Fibres, very bitter, as are all the other parts of the Plant. From this Root spring forth many juicy, fat, hairy, rough trailing Branches, spreading themselves over the Surface of the Earth, like to other Cucumbers or Gourds, on which grow very rugged, rough, hairy and ill-colored green Leaves, sharp-

pointed, of an over-worn greyish green, something whitish underneath, little or nothing divided or parted at the edges. At the Joints between the Branches and the Leaves spring forth small pale yellow Flowers, opening into five Leaves, at the end of small green Heads for the most part, as all other kinds of Cucumbers, Gourds, &c. do: but such as have Flowers only, without such Heads, quickly fall away, without Fruit. For that green Head, as in all others, comes in time to be the Fruit, which is small, rough, long and round, and something of a greyish green when they are ripe. The Root-stalks upon which the Cucumbers grow, are short and rough, crooked withal, and bend the Fruit downwards, which when they are thoroughly ripe, with a very little touch, will quickly open at the end next the Stalk, and spit out its Juice and some of its Seed upon the Hands or Faces, or other Parts of those who touched it. The Seed when ripe is blackish and something rugged, but otherwise white, lying in a green moist Substance, which is very bitter and loathsome to the Taste. The Fruit when it is perfectly ripe, squirts forth its Water with the Seeds, either of its own accord, or being touched, tho' never so gently; and many times it strikes so hard, especially if it hits against the Face or Eyes, that it will smart for a pretty while after; but this Smarting arises purely from the Acrimonious Quality of the Juice. And from this voluntary spitting of the Seed came the Name of *Noli me tangere*.

Wild Cucumber.

V. *The Places*. In Italy, Spain and other hot Countries, it is found among Rubbish, Gravel, waste and other untill'd places, where casting its Seed, it multiplies it self, and easily springs up again; but in the Low Countries, and thro' most parts of England, it grows only in Gardens.

VI. *The Times*. The Root many times abides in the Ground all the Winter, if it stands warm, and the Ground is rich; but in cold Grounds, and where it is not defended, it is apt to perish every Year: where the Root dies not, it comes up in the Spring; but if it springs from the Seed in April or May, it flowers in June and July; and the Fruit

is usually ripe in *August*, at which time the *Elatarium* is also made of it.

VII. *The Qualities.* The whole Plant is hot and dry in the third Degree; Aperitive, Absterfve, bitter in Taste, and wafting away. *Galen* will have the Juice to be hot but in the second Degree, cleansing, and of thin parts: it purges watry Humors, and is certainly the best Cathartick in the whole Republick of Medicine.

VIII. *The Specification.* *Elatarium* is a peculiar Medicament for the Cure of Dropsies.

IX. *The Preparations.* You may have herefrom, 1. *A liquid Juice of the Leaves.* 2. *A liquid Juice of the Root.* 3. *An Errhine of the Juice of the Leaves or Root.* 4. *A liquid Juice of the Fruit.* 5. *A Syrup of the Juice of the Roots or Fruit.* 6. *An Infusion of the Root.* 7. *A Vinegar of the Root.* 8. *A Decoction of the Root.* 9. *A Powder of the Root.* 10. *An Electuary of the Root.* 11. *An Oil of the Root.* 12. *A Cataplasm of the Root.* 13. *A Substitution of the Root.* 14. *A Cataplasm of the Leaves.* 15. *A Cataplasm of the Leaves with Goats-dung.* 16. *Elatarium Viride, Green Elaterium, or the Insipifate Juice of the Fruit.* 17. *Elatarium album vel optimum, White Elaterium, or the Fœcula of the Juice of the Fruit.* 18. *The distilled Water.*

The Virtues.

X. *The Liquid Juice of the Leaves.* Dropped into the Ears, it eases them of the Pains and Noises therein, and very much prevails against Deafness: bathed upon the Skin, it takes away Freckles, Lentils, Discolorings, yellow Spots, Scurf, Morpew, Tettars, Ringworms, Herpes, and other Deformities thereof, used Morning and Evening for some time.

XI. *The liquid Juice of the Root.* It is good against the Falling-sickness and Kings-evil, put into the Nostrils, and taken inwardly also; and the Strumattick Swellings being daily Morning and Evening bathed therewith, it provokes the Terms, but is not to be given to Women with Child, because it is apt to destroy the Fruit in the Womb. It purges viscous and watry Humors, and that strongly; and therefore it is used in Clysters. It has also all the Virtues of the Juice of the Leaves, as to external Dissections, if it is applied in like manner. Being taken from 2 to 4 drams in any convenient Vehicle, it prevails against the Dropsie and the yellow Jaundice, and opens all Obstructions of the Liver and Spleen, powerfully evacuating Water.

XII. *The Errhine made of the Juice of Leaves or Roots.* It is made by mixing 2 parts of the Juice with 1 part of Water in which Nitre is dissolved. Some make it by mixing the Juice 2 parts, with Milk 1 part. Snuff up the Nostrils it cures an Epilepsy, as also an inveterate Megrim or Head-ach; for it wonderfully purges the Head and Brain from Excrements, and cures a stinking Breath coming from the Nostrils; and is a prevalent Medicine against Lethargies, Carus, Sleepiness and Apoplexies.

XIII. *The liquid Juice of the Fruit.* It has all the Virtues of the Juice of the Leaves and Roots, and may be used in the same manner to all those Intentions; but it is much more powerful, as being more Acrimonious, and therefore is to be used in a smaller Dose. And an Errhine, may be also made of it, as of the Juice of the Leaves or Roots, very beneficial and potent to all the same Purposes, being much stronger than is Juice of Beets or Primroses.

XIV. *The Syrup of the Juice of the Roots or Fruit.* It is good against the Scurvy, Dropsie, Jaundice and Gout, carrying off all sorts of purrid Humors,

chiefly Flegm and Water, by which it gives a general Relief to the whole Body, and so prevails against Head-achs, Apoplexies, Epilepsies, Carus, Lethargy, Vertigo and Madness. It is good against Surfeits and Agues, and kills Worms in the Body. The Dose is from a spoonful to 2, 3 or 4; in the Morning fasting, mixed with a Glas of warm Posset-drink or White-wine: if it is acuated with choice *Sena*, it will be much more powerful and efficacious to all the Intentions and Purposes before enumerated.

XV. *The Infusion of the Root.* Take of the fresh or green Root well bruised a pound; put it into a pint and half of strong White Port Wine, in which let it infuse for 24 hours or more. Dose 3 ounces, for three or four days together, or until the Hydro-pick Swelling is plainly discerned to be very much wasted and fallen. This is *Dioscorides* his Medicine, for curing the Dropsy; which thing (says he) it doth, without any troubling of the Stomach.

XVI. *The Decoction of the Root.* It may be made in Wine or Water, or with a Mixture of both. This being drunk (says *Mesue*) helps the Dropsy, for it wonderfully evacuates watry Humors, and prevails against the Yellow Jaundice, and all Obstructions of both Liver and Spleen. This Decoction gargled in the Mouth, and held therein for some time, gives present Ease in the Tooth-ach.

XVII. *The Vinegar of the Root.* If the Root is infused or boiled in strong Vinegar, and that Vinegar is bathed upon the Skin two or three times a day, it is good to cure Tettars, Ringworms and a simple Herpe, as also to cure Scurff and Morpew, and to cleanse the Skin of all Discolorings, as Yellowness, Tawniness, Freckles, Lentils, and other Spots of that kind.

XVIII. *The Powder of the Root.* Snuff up the Nostrils, it is a good Errhine to purge and cleanse the Head and Brain of cold moist and viscous Humors, which cause the Head-ach, Megrim, Vertigo, Lethargy, Apoplexy, Epilepsy, Palsy, &c. *Dioscorides* says, that being applied to the Skin or Face, it cleanses it from all Scurff, and takes away the Discoloring of Scars. Inwardly taken, to a scruple or half a dram, mixt with Cream of Tartar, it kills Worms, purges the Bowels, and carries off slimy Humors.

XIX. *The Electuary of the Root.* It is made of the Powder mixt with Honey. Taken inwardly, from a dram to two drams, according to Age and Strength, in the Morning fasting, it purges Flegm, Choler and watry Humors, and abates the rebellious Ferment of the King's-evil: it cleanses and heals old Sores and Ulcers, being used Plaister-wise, cleansing them thoroughly, and wonderfully healing them. Applied upon a Herpes, Tettar or Ringworm, or other like Breakings out, or put upon any Deformity or Scar, does attenuate the Skin, attract forth the malign Juices, and heal those Breakings out; taking away also Marks, Spots, Blackness and Blewness coming upon the Skin and Flesh by Contusions and Blows.

XX. *The Oil of the Root.* It is made of the bruised Root or of its Juice, by Infolation, or boiling in Oil Olive. Anointed often upon the Temples, it is said to cure an inveterate Megrim, an Errhine of the Juice, being snufft also up the Nostrils. Anointed well upon the Hip and Huckle-bone Morning and Evening, for half an hour together, it eases the Pain of the Sciatica, &c.

XXI. *The Cataplasm of the Root.* It may be made either of the Root bruised, &c. or of the Juice of the Root brought to a thickness, with Powder of Elicampagne-roots. Applied after anointing with the former Oil, it gives great ease in the Gout and Sciatica;

atica; diffuses Tumors arising from simple Contusions, absorbs acid Humors lurking in the Skin and Scarf-skin, and takes away Deformities thereof, as Scurf, Morpew, Leprosy, Yellowness, and other Discolorings of the Skin.

XXII. *The Substitution of the Root.* Apothecaries, says *Parkinson*, do most usually take the Root of this *Wild Cucumber*, as a Substitute for the Root of *Coloquintida* or the bitter *Gourd*, that not being so frequent, or so easy to be had as this is.

XXIII. *The Cataplasim of the Leaves.* It has all the Virtues of the Cataplasim of the Root, but not full out so effectual, because the Leaves have not the same Strength with the Root: yet, notwithstanding, it is an excellent thing for the Purposes intended, exceeding many other things of like kind. It cleanses the Skin from Discolorings and many other Deformities.

XXIV. *The Cataplasim of the Leaves with Goats-Dung.* If it is laid upon any hard Tumors, Swellings or Kernels, such as are those of the Kings-Evil, it resolves them; and also eases Pains of the Gout in what part of the Body soever; and resists the Putrefaction of malign Ulcers.

XXV. *Green Elaterium, or the Insipifate Juice of the Cucumber.* Take *Wild Cucumbers* almost ripe, open them on one side, and take or squeeze out their thinner Juice and Seeds, which strain from the Seeds, reserving the Juice: then beat the rest of the *Cucumber* grossly in a Marble Mortar; put all into a Bag, and in a Press force forth all the Juice; put this Juice to the former, which put into a Retort, and in a gentle Sand-heat draw forth all the Water, (which keep for a Cosmetick;) continue the said gentle Heat till the Magma is perfectly dry'd; then break the Retort, take forth the Matter, and keep it in a Jar-Glass, tyed close over with a wet Bladder, for Use. If you have no Retort, and care not for keeping the Water, you may evaporate it to dryness over the same gentle Sand-heat in an open flat-bottomed Glass, often stirring it, (to break the Skum) that it may evaporate the better, which then take and preserve in a Jar-Glass, as before. It has the Virtues of the following, but not full out so strong, and therefore may be given in double Dose to it, viz. from 6 grains to 20 or 24, in any convenient Vehicle. 'Tis, notwithstanding its being weaker than the following, a most noble Medicament.

XXVI. *Elaterium album, The white or common Elaterium, which is indeed the strongest and best.* It is thus made: Take *Wild Cucumbers* almost ripe, open them with a Knife upwards, press out the Juice gently with your fore Fingers, let it run thro' a Sieve into a clean glaz'd Vessel, let it settle, and decant the clear Water into another Vessel: then dry the Settling in the Sun, and in a Jar-Glass, tyed close over with a Bladder, keep the *Elaterium* for Use. See our *Pharmacopæia Londinensis*, lib. 1. cap. 6. sect. 32. If you please, you may keep the clear Water for *Unguentum Artanita*. Some Authors say, that this *Elaterium* will keep two hundred Years, and yet be of wonderful Virtue, *Vix Credo*: others, as *Paracelsus*, say it retains its Virtues well fifty Years, at which Age it will be so abundant in Humidity, that put to the Flame of a Lamp or Candle, it will put it out: but *Dioscorides* says it is good from two Years old until ten, and that that is the best which being put to the Flame of a Candle, will make it burn the more bright. *Theophrastus* his *Elaterium* is green, (which is, as I suppose, the former Insipifate Juice of the *Cucumber*;) *Dioscorides* his *Elaterium* is white, which is the *Fæcula* of the Juice, as is taught in this Section, and this is that which *Mesue* says is the best. The

green will continue moist many Years, after it is evaporated and dried up hard, relenting or giving with the Air, so that it requires a long time to consume its Humidity; whereas the white sort being once dried, will remain white, hard and dry for a great number of Years, unless it is left open in a moist Air, or stand in a moist place. This white *Elaterium* works very well, being given from 1 to 5 grains, in strong Bodies; Authors say it may be given to 10 grains. *Parkinson* says, that half a grain being put into a purging Medicine, to quicken it, has oftentimes been seen to trouble the Stomach, with very much disquiet, and vomiting, and working also downwards with more Violence than it could be thought that double the quantity could do. *Dioscorides* says the Dose is from half an *Obolus* to a whole *Obolus*. Now, the *Obolus* is 10 grains, or 12 at the most, as some take it; which shews the large Doses which the Ancients gave of this Medicine, which we dare scarcely follow. It purges Choler and Flegm from all parts of the Body, and drives forth watry Humors to a Miracle, being an extraordinary thing to open the Pipes of such as are Purisy and short Winded; and is indeed a Specifick for the Cure of the Dropsy, especially of that kind called *Sarcites* or *Anasarca*. When you give it for Purging, it may be given mixt with Milk, or rather Cream, because the Unctuousity thereof will not suffer it to stick to the Tunicles of the Stomach, but cause it to purge off the more speedily. If you would have it to Vomit, *Dioscorides* advises to dissolve it in Water, and with a Feather dipt therein, to touch the lower part of the Tongue, as low as you can; but in my Opinion, it is much better to take the whole Dose down into the Stomach. It is a prevalent thing against the Megrin, Head-ach, Carus, Lethargy, Vertigo, Apoplexy, Epilepsy, being used sometimes as an Errhine, dissolved in Water or Milk, and sometimes taken inwardly to both Vomit and Purge. And thus taken, it is said also to cure the Kings-evil, the Parts affected being appointed likewise with it outwardly. It provokes the Courses in Women where they have been long stopt, and very much prevails against the Green-sickness in Virgins. It is so strong and forcible, that it is said to kill the Child in the Womb, so that a Woman Impregnated must by all means avoid it; but this is more especially to be understood, being applied in a Pessary or Ointment to the Womb. It cures the Gout in any Part, by its strong Cathartick Faculty, carrying off the tartarous, viscous or clammy Humors from the Joints, which breed it. The common Dose is $\frac{1}{2}$ gr. i. ad v. and to very strong Persons $\frac{1}{2}$ gr. iii. ad x. well corrected with Nutmeg, Spicknard, Aniseeds, Liquorice-powder, &c. It cures Asthma's, Jaundice, Scurvy and Hypochondriack Melancholy. Mixed with Ox Gall and applied, it helps the Quinsy and Gout, and clears the Skin of Scurf, Morpew, Tettars, Ringworms, Mange, Itch, Pustles, Scabs, and other like Deformities.

XXVII. *The distilled Water from Roots or Fruit.* If to every quart of it you add an ounce of fine Nitre, dissolving it over a gentle Heat; it becomes an excellent Cosmetick to beautify and clear the Skin of any Deformity, being two or three times a day or oftner laid on, and suffered to dry in, after it is first well cleansed with fair warm Water. This Wash is also an excellent thing against an *Erysipelas* or *Anthony's fire*, the Parts affected being bathed therewith, and Cloths wet therein being laid on, and so suffered to dry upon the Part. It abates Inflammations, and being given inwardly, (well sweetened with white Sugar) it cools and abates the most violent Heat of Fevers. Parts affected with the Gout, being well bathed therewith Morning and Evening,

Evening, (after due and sufficient Purgings) are presently eased of their Pains after a singular manner. Given inwardly from 1 ounce to 4, well sweetned with white Sugar, it purges well by Urine, carries off Water in Dropfies, prevails against the Scurvy in a hot Constitution, helps the Strangury, and expels Sand, Gravel, Slime, or any kind of Tartarous Matter.

CHAP. CLXXX.

Of CUDWEED Common,

OR,

COTTONWEED.

THE Names. It is called in Greek, *τραπεζιον*: in Latin, *Gnaphalium*, *Centunculus*, *Centuncularis*, *Tomentum*, *Tomentaria*, *Tomentitia*, *Cottonaria*, *Bombax humilis*, *Albinum*, *Chamaexylon* Plinii and *Filago*: in English, *Cudweed* or *Cottonweed*.

II. The Kinds. There are four principal sorts of *Cudweed*. 1. The Common, of which in this Chapter. 2. *Gnaphalium Impium*, Wicked *Cudweed*, of which in Chap. 181. 3. *Gnaphalium Marinum*, *Sea Cottonaria*, *Sea Cudweed* or *Cottonweed*, of which in Chap. 182. 4. *Gnaphalium Americanum*, *American Cudweed*, of which in Chap. 183.

III. Of the Common-kind there are, 1. *Gnaphalium vulgare majus Johannis Thalii*, *Gnaphalium Anglicum folio longiore Lobelii*, *English Cudweed*. 2. *Gnaphalium minus*, *Filago minor*, *Dodonæi*, *Gnaphalium vulgare minus*, *Gnaphalium medium Tabernmontani*, The *Vulgar* or *Common lesser Cudweed*.

English Cudweed

IV. The Descriptions. The first, or *English Cudweed*, has a Root which is small and thready;

from whence rise up one, two or three Stalks, set thick on all sides with long and narrow whitish or woolly Leaves, almost from the bottom of the Stalk up to the top: with every Leaf stands a small Flower, of a dun or brownish yellow color, but not so yellow as in some others; in which Heads, after the Flowers are fallen, come small Seed, enclosed in the Down, and which, when perfected, is carried away with the Wind.

V. The second, or *Lesser Cudweed*, has a fibrous Root, almost like the former; from whence shoots forth small hoary Stalks, full of Branches almost from the very Ground, with divers smaller, shorter and narrower Leaves thereon, of a more dusky hoary color, like fine Cotton or Wooll; some standing singly, and some more at a Space or Joint: the Flowers heretof stand at the tops of the Stalks and Branches only, and not all along, as in some of the other kinds, one Branch above another, but all of them rising almost to an even height, and are of an overworn yellow color: it grows commonly about nine or ten inches high, seldom to a foot, unless in choice Ground. The Flowers are yellow, and grow like Buttons at the tops of the Stalks, and the Seed is carried away with the Wind.

VI. The Places. They both grow in barren, dry, sandy and gravelly Grounds in most places of England: the first has been found growing in *Hampstead Wood*, and in Woods near to *Deptford*; by *London*.

VII. The Times. They flower in *June*, *July* and *August*; and their Seed is ripe in a little time after.

VIII. The Qualities. They are temperate in respect of Heat or Cold, but dry in the third Degree; and therefore very Astringent, Hepatick, and withal Anodyne.

IX. The Specification. They are peculiar against Catarrhs, Fluxes of the Bowels, Profusions of Blood in any Part, and the Quinsy.

X. *The Preparations.* You may have therefrom,
1. *A liquid Juice.* 2. *An Essence.* 3. *A Decolli-*
on in Wine. 4. *A Powder.* 5. *A Cataplasim.*

The Virtues.

XI. *The liquid Juice.* Taken inwardly to an ounce or more, mixed with a Glas of Red Port Wine, or in some other proper Vehicle, it stops any inward Bleeding: it cleanses old and filthy Ulcers, and causes them quickly to heal. Taken in Wine, or in Milk, it is (as *Pliny* says) a sovereign Remedy against Heat and Swellings in the Throat, and that which is vulgarly called the Quinsy: and he farther says, That whosoever shall take it shall never be troubled with that Disease again. And for the same Reason Country People give it to their Swine, with this Observation, That whichever of them will not take it, will assuredly die.

XII. *The Essence.* It has the Virtues of the liquid Juice, but more powerful; and over and above in the curing of old running Sores and Ulcers, it is of admirable Excellency. It stops and cures all Fluxes of the Bowels, tho' of long standing, and restores their Tone again to Admiration. It cures the Whites in Women, as also the overflowing of their Terms, is singular against rebellious Catarrhs, and dissolves simple Contusions; kills Worms in Children, and heals Ruptures.

XIII. *The Decolliation in Wine.* It has the Virtues of the Juice and Essence, but in a lower degree, and may be given from 4 to 6 or 8 ounces, according to Age; 1. In the Morning fasting. 2. Half an hour before Dinner. 3. At Night going to Bed. Possibly this may be best for weak Stomachs.

XIV. *The Powder.* It dries, binds and astringes, and therefore is profitable for Defluxions of Rheum from the Head upon the Lungs, as also to stop Fluxes of Blood wheresoever. Taken from 1 to 2 drams in Red Port Wine, it prevails against the Bloody-flux, and eases the Torsions of the Bowels coming thereby: it stops the overflowing of the Terms, and heals Wounds whether inward or outward, being made into an Electuary with the liquid Juice, and so used. This Powder being either drunk or injected up the *Intestinum Rectum*, mixed with Red Port, cures the Disease called *Tenasmus*, which is an often Provocation of going to Stool and doing nothing.

XV. *The Cataplasim.* It may be made either of the green Leaves bruised with a small quantity of Wine, or else of the Powder of the Herb made into the Consistence of a Cataplasim with the liquid Juice. Being applied, it immediately stops the Bleeding of Wounds, and in a short time afterwards cures them: it also cleanses, dries and heals all old and filthy Ulcers.

C H A P. CLXXXI.

Of CUDWEED Wicked.

I. *THE Names.* It is called in Greek, *Γναφαλίον* *μικρότερον*: in Latin, *Gnaphalium impium*, *Gnaphalium minus*: in English, Wicked Cudweed, Wicked Herb, Cudweed the lesser.

II. *The Kinds.* Of these there are two sorts, 1. *Gnaphalium minus*, *Herba impia*, *Gnaphalium Eufcbii*, *Matthioli*, *Lobellii*, *Lugdunensis*, *Altiorumque*, *Filago* (*a foliorum inusitata superbia*) and *Cantafilago angulare*, The lesser sort of the lesser Cud-

weeds, Wicked Cudweed the lesser. 2. *Gnaphalium majus generis minoris*, *Filago major*, *Herba impia major*, *Gnaphalium impium major*, The greater sort of the lesser Cudweed, Wicked Cudweed the greater.

III. *The Descriptions.* The first of these has a fibrous Root, from whence shoots up a low or short Stalk, set with shorter Leaves than the former, but somewhat more white or hoary, and a little broader; at the tops whereof stand a larger and more open Flower than in the two others, and of a paler yellow color; from the sides of this Stalk spring forth divers short Branches, set with such like, but smaller Leaves than those which grow below, with such a like yellow Flower as the other; which Branches, with their Flowers, do always rise higher than the middle Stalk, and the Flower upon it: sometimes also the Branches will have other small Branches spring from them, bearing Leaves on them, and Flowers on the top of each; these also rising above the Branches, with their Flowers in the said manner, that the first Branches did unto the main Stalk: the Seed follows the Flowers in a downy Bed, and is carried away with the Wind, as the rest are.

IV. *The Second, or Larger Wicked Cudweed,* has a large Root with several pretty thick Branches, and many Fibres springing from the same; from which sometimes springs up but one Stalk, and sometimes two, three or more principal Stalks, very much, in their Magnitude, way of Growing, Shape or Form of the Leaves and Flowers, like the former, but much larger; and for the most part those Flowers which appear first, are the lowest and basest, and are always overtopy by other Flowers which come on younger Branches, and grow higher, as Children seeking to overgrow or overtop their Parents, (as many wicked Children do;) for which Cause it obtained the Name of *Gnaphalium impium*, and *Herba impia*, Wicked Cudweed, or Wicked Herb, and not for any evil or malignant Quality in the same.

V. *The Places.* They both grow in dry, barren, sandy, gravelly and desert places in many parts of England.

VI. *The*

VI. *The Times.* They both flower in July, and the Seed is ripe in August.

VII. *The Qualities, Specification, Preparations, Virtues and Uses,* are the same with the Common Cudweed in Chap. 180. foregoing, to which I refer you.

C H A P. CLXXXII.

of CUDWEED Sea.

I. *THE Names.* It is called in Greek, *Γναφάλιον θαλασσίου*: in Latin, *Gnaphalium Marinum*, *Elichrysium Sylvestre flore oblongo Bauhini*: in English, *Sea Cudweed*.

II. *The Kinds.* It is a singular Plant of the Sea kind; and is called for the most part, *Cottonaria*, or *Cottonweed*: also *Gnaphalium Maritimum tomentosum*.

III. *The Description.* It has a long and woody Root, which perishes not yearly, as several of the other sorts do. From this Root rise up several small and very hoary white Stalks, seldom growing above a handful or half a foot high, set thick with many short, flat and very white, soft and hoary or woolly Leaves, so hoary as tho' they were nothing but Cotton, bearing at their tops small hoary or cottony Heads, with a yellow Thruwb breaking out in their middle; these are the Flowers, which, at the tops of the Stalks, look like small round Buttons, of Color and Fashion like to the Common Cudweeds. Within these Heads, in a downy Bed, the Seed is contained, which is somewhat longer than the Seed of the others.

IV. *The Places.* It is found upon the Western Sea Coasts of England, in divers places. It is found growing also at a place called *Merezey*, six Miles from Colchester, near the Sea side. It has also been gathered upon the Sea Coasts of Wales.

V. *The Times.* It flowers from June to the end of August, and the Seed is ripe in September.

VI. *The Qualities, Specification, Preparations and Virtues,* are the same with the English and Common Cudweed in Chap. 180. to which you are referred: yet it is thought by some, who have made Tryal of both, that this *Sea Cudweed* is the stronger and more effectual Medicament to all the Purposes for which the Common is intended.

C H A P. CLXXXIII.

of CUDWEED American.

I. *THE Names.* This Plant, as far as I can learn, was wholly unknown to the Greeks; yet modern Authors have given it this Greek Name, *Ἀργυροκάρην*, *Argyrocome*, (i. e. Silver-leav'd:) in Latin it is called, *Gnaphalium Americanum*; and in English, *American Cudweed*, also *Live-long*, and *Life-everlasting*.

II. *The Kinds.* It is a singular Plant of the kind: and is accounted one of the Species of *Gnaphalium* *Carolus Clusius*, from the Likeness of the Umbles or Tufts of Heads, tho' they are greater and whiter than those of the other kinds of Cudweed; all of which are of kin to the Golden Tufts. This Plant has been called by some of our English, *Live-long* and *Life-everlasting*, because of the Durability or long Duration of their Flowers in their Beauty.

III. *The Description.* This Silver Tuft or Indian Cottonweed, has Roots which are long, and black on the outside, creeping very much under Ground: from whence spring up many white Heads of Leaves, covered with a hoary Woolliness, like Cotton, which rising into hard, thick, round Stalks, contain still the same Hoariness upon them, as also upon the long and narrow Leaves which grow thereon, more especially on the under side; for the upper sides are of a dark shining green color. The Stalks are divided at the top into many small Branches, each of which have many scaly, rusted Heads set together, covered over with Cotton before their opening, and then parting one from another, abiding very white on the outside when they are fully grown, but with a small yellow Thruwb in the middle of each Flower, which in time will turn into yellow Down, apt to be blown away with every Wind.

IV. Gerard says, that this Plant is of greater Beauty than the rest, and has straight upright Stalks, three feet high or more, covered with a most soft and fine Wooll, and in such a plentiful manner, that a Man may with his Hands take it from the Stalk in great quantity. This Stalk is beset with many long and narrow Leaves, green on the inner side, and hoary on the other side, somewhat like in Form to Rosemary Leaves, but greater. The Flowers do grow at the tops of the Stalks in Bundles or Tufts, consisting of many small Flowers of a white color, and very double or compass, or as it were consisting of little Silver Scales thrust close together, which do make the same very double. When the Flower has long flourished, and is grown old, then comes there, in the midst of the Flower, a certain brown yellow Thruwb, such as is in the midst of the Daisy: which Flowers being gathered when they are young, may be kept in such manner as they were gathered, to wit, in such Freshness and good Color, for the space of a whole Year after, and that in a close Chest or elsewhere: from this long keeping of their Freshness and Color, it was, that our English Gentlewomen called it *Live-long*, &c. to which, on this occasion, it very aptly answers.

V. *The*

V. *The Places.* It grows plentifully in America, in several parts of the *West Indies*. I found it growing in some of the Southern parts of *Carolina*. It grows naturally near unto the *Mediterranean Sea*, from whence it has been brought and planted in our *English Gardens*. *Bauhinus* says, that it grows frequently in *Brasil*: but *Clusius*, who first set it forth by the Name of *Argyrocome* or *Gnaphalium Americanum*, had his Plants out of *England*. We have also had it brought to us out of *Florida*, so that now it grows well and plentifully with us, if Care be taken of it by a skilful Gardener.

VI. *The Times.* It flowers in *June* and *July*, and the Seed is ripe in *August*.

VII. *The Qualities, Specification, Preparations and Virtues* of this, are the same with the last and the others foregoing, and therefore refer you to *Chap. 180.* for full Satisfaction.

CHAP. CLXXXIV.

OF CULLIONS Sweet,

O R,

LADY-TRACES.

I. *THE Names.* This Plant is called in *Greek*, *ὄρχις ἁδύς*: in *Latin*, *Orchis odorata*, *Tesculculus odoratus*, *vel aromaticus*; and in *English*, *Sweet Cullions*, *Sweet Orchis*, *Sweet Lady-Traces*.

II. *The Kinds.* They are of the Kindred of the *Orchis* and *Ordis quinti*, according to *Parkinson*: of this Species he makes eight several sorts; but there are four principal kinds of these *Sweet Cullions*, viz. 1. Those with one single Testicle or Stone. 2. Those with two Testicles. 3. Those with three and sometimes with four Bulbs. 4. The *Creeping* or *Bastard* kind.

III. *Of the single bulbed Orchis*, there is but one Species, viz. 1. *Orchis pusilla odorata*, *septima Clusii*, The *sweet Musk Orchis*.

IV. *Of the double bulbed*, there are three Species, viz. 2. *Orchis alba odorata minor*, *Orchis spiralis minor Lobelii*, The *lesser sweet Cullions*, or *Lady-Traces*. 3. *Orchis Fritia Litoralis Lobelii*, *Friezland Orchis* or *Lady-Traces*. 4. *Chamaorchis latifolia Zelandica*, *Orchis lillifolia Lobelii*, *Pseudo Orchis Clusii*, The *dwarf Orchis* of *Zeland*.

V. *Of the treble bulbed Orchis*, there are also three Species, viz. 5. *Triorchis alba odorata*, and *odorata major*, *Triorchis alba spiralis Lobelii*, The *greater sweet Lady-Traces*. 6. *Triorchis lutea Leodienfis*, *Orchis minor Leodienfis Lobelii*, *Lady-Traces* of *Liege*. 7. *Triorchis lutea altera Gemme folio glabro*, *Triorchis lutea tertia Lobelii*, *Lady-Traces* yellow, with smooth Leaves.

VI. *Of the Creeping kind*, there is one only Species, viz. 8. *Orchis Radice repente*, *Small Creeping* or *Bastard Orchis*.

VII. *The Descriptions.* The first of these, or *Musk Orchis*, has a Root which consists but of one small round Bulb, of the bigness of a *Pea*, above which it has long Strings running forth, by which new Plants are encreased. From this Root spring up usually but three small and narrow green Leaves, among which grows up a Stalk of an Hand breadth in height, having a long narrow Spike of pale green Flowers, ending in three Points, and smelling like *Musk*.

VIII. *The second, or Lesser sweet Cullions*, have their Roots growing by Couples or Pairs, which are small, and somewhat long as well as round: from these Roots these Lesser *Lady-Traces* have much smaller Leaves shooting forth, and lying next the Ground, than those of the Greater *Lady-Traces* in *Seet 11.* following; but they are of the same Fashion with those, and almost like unto a very small *Plantane* Leaf; the Stalk is not above four, five or six inches high, with some small show of little pieces of Leaves thereon to the Flowers, which are of a white color, daz'd over with a thin Blush, standing in thin long Spikes, compassing the Stalk, which are of a very sweet Smell.

IX. *The third, or Friezland Orchis, or Lady-Traces*, has a Root consisting of two small round Bulbs, from whence spring up two or three small, somewhat long and hairy Leaves, yet shorter than those of the *Ribwort Plantane*. The Stalk is above a span high, viz. about four or five inches, and bears round about it small yellowish green Flowers, much like unto the former, and set in the same Order.

X. *The fourth, or Dwarf Zeland Orchis*, has a Root consisting of two Bulbs for the most part, and sometimes of three, which are covered of whitish Coats or Skins, being greenish within, and sweetish in Taste, the lower of them being lank, as in others. It has two fair, but small Lilly like Leaves, about two inches long, rising up from them; and a Stalk about three or four inches high, the Flowers being not much unlike the former. This sort is thought to be the *Pseudo-orchis Clusii*.

XI. *The fifth, or Greater sweet Lady-Traces*, have triple bulbd Roots, which by chance may sometimes be fourfold, being round, and longer than any of the former Orchides, with several short Fibres springing out round about them, contrary to the modus of all the rest. From this Root come forth several very sad green shining Leaves, like unto the Lesser *Plantane*, but sharper pointed, which rise up in September, after the Stalk, with the Flowers, are withered, which do abide green all the Winter, and perish in May. The slender Stalk, which crooketh and windeth it self a little, rises up in August, full

set

set for a great length, with many small, white and sweet Flowers, compassing it round, and hanging down round about it.

XII. The sixth, or Lady-Traces of Liege, have a triple bulb'd Root, and sometimes Quadruple round and a little long, not much unlike in Shape to some kinds of Pears, the sharper end tending downward into the Ground, of which two are for the most part large, one small, out of which several small Fibres proceed. The Leaves of this are somewhat more like unto those of a broad-leav'd Plantane, but yet smaller and narrower, three or four at the bottom of the Stalk, which otherwise is bare, and has none upon it, and the Flowers are yellowish, like the others, at the top, one growing above another.

XIII. The seventh, or Yellow Lady-Traces with smooth Leaves, which has a Root composed of three small Bulbs, almost perfectly round, the one full, the other lank, from which spring up longer and smoother Leaves than those of the Frieze Land Orchis at Sect. 9. aforegoing, but the Stalks and Flowers are very like them, yellow of color, and pleasantly sweet: the Figure of this Plant Lobel has given us from Cornelius Gemma.

XIV. The eighth, or Small creeping Orchis, has a Root very unlike all the rest, being long and full of Strings, growing thick together, and interlacing themselves one among another; yet have they at the upper part thereof, next under the Leaves, (as Camerarius says) some shew of small Bulbs sometimes to be seen. From these Roots arise Leaves which are thick and somewhat broad, like Plantane, of a dark green color: the Stalk is slender, and set full at the top with several white Flowers, spotted with Blood-red Spots. Parkinson will have this to come nearer to an Helleborine than an Orchis.

XV. The Places. These all generally grow in dry Grounds, Heaths and waste untill'd Places, in many places of England; but are for the most part nurs'd up with us in Gardens.

XVI. The Times. They all flower late in the Year, scarcely before August or September.

XVII. The Qualities. They are all (except the last) hot and moist in the second Degree; some say hot in the first Degree, and moist in the second. They attenuate, are Stomatick and Hystrick, Alterative, Analeptick and Spermatogenetick.

XVIII. The Specification. They stir up Lust, and cure Barrenness in either Sex.

XIX. The Preparations. You may prepare therefrom, 1. A liquid Juice. 2. An Essence. 3. Sanguis or Blood.

The Virtues.

XX. The liquid Juice. Taken to 2 spoonfuls or more in Canary, or rather Alicant; 1. In the Morning fasting. 2. An hour before Dinner. 3. At Four in the Afternoon. 4. An hour and half after Supper, just at going to Bed; it breeds much Seed, stirs up Lust, strengthens the Instruments of Generation, and cures a simple Gonorrhœa, or Gleet of the thinner parts of the Seed.

XXI. The Essence. It has all the Virtues of the former, and may be taken in the same Dose, and at the same times; but it is much more powerful to all the Intentions, and is effectual to cure even Ulcers of the Prostate from a virulent Cause.

XXII. The Sanguis or Blood. Be Pulp of the Roots made by well beating them in a Stone Mortar, 4 pounds: Crums of Rye and Wheat Bread, of each 1 pound: mix them well together, adding a little white Port Wine, to make them pretty moist: put all into a Bolt-head, stopping it well with Cork and Spaulish Wax, or Sealing Wax, so that nothing may

transpire, digest in a warm Balneo ar Horse-dung, till the Matter is changed into a Rubicund or Bloody Chyle; then force it strongly out with a Press, putting the expressed Blood into a Balneo Vaporis, that by this second Digestion it may acquire a greater Redness, and some Faeces may settle; which continue till the Blood becomes absolutely clear, and of a most perfect Red, which then separate from the Faeces by decanting it: put this into a Glass Alembick, and in Balneo Vaporis abstract some of the thin, clear and limpid Water or Spirit, leaving the Bloody Extract at the bottom of a very red color. This admirably corroborates the Womb, and the Vessels and Instruments of Generation, both in Man and Woman: it is a Specifick to cause Conception in Women, to remove Barrenness and cause Fruitfulness. It also cures Impotency in Men, and restores them to their Pristin Vigor. Dose 1 spoonful Morning, Noon and Night in Generous Wine.

CHAP. CLXXXV.

Of CUMIN Garden.

THE Names. It is called in Greek, *Κύμινον*: in Latin, *Cuminum*: in Arabick, *Camum* and *Kemum*; and in English, *Cumin*.

II. The Kinds. It is twofold, viz. 1. *Κύμινον ἡμετέριον*, *Cuminum Hortense*, Garden Cumin. 2. *Κύμινον πικρόν*, *Cuminum agreste*, Wild Cumin; of this we shall discourse in the next Chapter.

III. The Garden kind is threefold, 1. *Κύμινον ἁπλοῦς*, *Cuminum vulgare*, Our ordinary Cumin. 2. *Κύμινον γλυκὺν*, *Cuminum dulce*, *Cuminum melitense dulce*, Sweet Cumin, and Small Cumin. 3. *Κύμινον ὀξύς*, *Cuminum acre*, *Cuminum melitence acre*, Sharp tasted Cumin, and Great Cumin.

Garden.
Cumin:

IV. The

IV. The Descriptions. The first of these has a Root which is long, small, white, and perishing every Year; from whence spring up several slender Stalks, a foot and half high or more, and some of them not so high, each branching themselves out gradually, and growing white at length, having store of Leaves, which are small and long, like unto those of Fennel. The Flowers are somewhat reddish, growing in Umbles at the tops of the Stalks, which turn into small, long and almost round whitish Seed, crested or striated on the rounder side, and smelling strong.

V. The second, or Sweet small Cumin, has Roots, Stalks and Leaves like to the former, and like it in its manner of Growing; but its Seed is small, and like unto Anise Seed, and sweet as Sweet Fennel Seed: so that it seems to be nothing differing from the former, but in the Shape or Form, Magnitude, and very sweet Taste of the Seed.

VI. The third, or Sharp-tasted great Cumin, is like the Ordinary or Common Cumin in its Roots, Stalks, Leaves, Branches, Flowers and manner of Growing, saving that it is every ways greater; but it principally differs in its Seeds, for they are not only greater than those of the first or Ordinary Cumin, but they are longer also, and pointed at both ends, crested likewise on the rounder side, and of a much duller color, smelling more unpleasantly, and tasting very sharp upon the Tongue, hot, quick and biting, like Cubets or Pepper.

VII. The Places. They grow all of them in England, in our Gardens, the Seed being sown; but they are Natives of other hotter Countries, as Spain, Italy and the Islands of the Mediterranean Sea, as also in Syria, Palestina, and other Eastern Countries, where they grow familiarly and plentifully. The first of these grows most common with us in our cultivated Grounds, but admirably well in the South parts of Carolina, and other parts of Florida, where I saw it in Perfection. The second grows, besides in all the places aforementioned, very plentifully in the Isle of Maltha, where they put it into their Bread and other Meats, and Trade with it to other Parts in exchange for other Commodities. The third (as well as the first) grows in several parts of Arabia, Ethiopia, Egypt and Asia, where it more admirably obtains that acrid or sharp Taste: however, they delight to grow in purified and hot Soils.

VIII. The Times. Parkinson says they come not often to Perfection with us, unless in a kindly Year, and sown in the middle of the Spring: so that, tho' they flower and feed early in hot Countries, yet it is late with us before the Seed comes to Ripeness. Gerard says, that he had proved the Seeds (of the first sort) in his Garden, where they brought ripe Seed, much fairer and greater than any which comes from beyond Sea. It is to be sown in the middle of the Spring: Ruellius says, that a Shower of Rain presently following its Sowing, hinders much the Growth thereof. Gerard sowed it in the midst of May, and it sprung up in six days after, and the Seed was ripe in the end of July.

IX. The Qualities. The Seed, which is principally used, is hot and dry in the third Degree, full of Sulphur and Mercury; it is Aperitive, Anodyne, Astringent, Attractive, Carminative, Digestive, Diffusive, Diuretick and Sudorifick; Cephalick, Neurotick, Stomackick, Pectoral, Nephritick and Hysterick; Emmenagogick, Lithontriprick, Alexipharmick, Analeptick and Spermatogenetick.

X. The Specification. It has been found, by Experience, to be a singular Cure for the Colick.

XI. The Preparations. You may have, 1. A liquid Juice of the green Herb. 2. An Essence of the

green Herb. 3. A Cataplasm of the green Herb. 4. A Powder of the Seed. 5. A Spirituous Tincture of the same. 6. An Acid Tincture thereof. 7. An Oily Tincture of it. 8. A Saline Tincture. 9. A Spirit of the Seed. 10. An Oil from the same. 11. A Spirituous Water. 12. A Balsam made of the Chymical Oil. 13. A Decoction of the Seed. 14. A Cataplasm thereof.

The Virtues.

XII. The liquid Juice of the Leaves. It expels Wind and Urine, provokes the Terms, and is good against the Bittings of Mad Dogs, Serpents, and other Venomous Creatures. Dose 2 spoonfuls at a time Morning and Night, in a Glass of Wine or Ale.

XIII. The Essence of the green Herb. It has the former Virtues, besides which, it prevails against the Colick and Fluxes of the Bowels, is good against Vapors in Women, is a good Pectoral, opening Obstructions of the Breast and Lungs. Dose 1 or 2 spoonfuls Morning and Night in Wine.

XIV. The Cataplasm of the green Herb. It diffuses Wind in the Bowels, strengthens the Joints, diffuses windy Humors in those or any other Parts, repercusses Humors in simple and recent Contusions, diffuses Flatulencies in the Scrotum, and prevails against the Gout.

XV. The Powder of the Seed. Mixed with Honey, (a dram at a time) it is Pectoral, and very good against Coughs and Colds. Mixed with Vinegar and put up the Nostrils, it is said to stop Bleeding there. Made up into a Quilt, sprinkled with good Wine-Vinegar, and made very hot upon a Warming-pan with Coals in it, and so applied to the Side, it takes away Pains and Stitches, and gives ease in the Pleurisy. Taken to 1 dram in a Glass of Generous Wine, it eases Pains of the Stomach and Womb, gives Relief in the Colick, and is good against the Gripings of the Guts. It makes such as use it much inwardly to look very pale.

XVI. The Spirituous Tincture of the Seed. It is a true Anticolick, given to 1 spoonful in Wine or Ale, strengthens the Stomach, and restores the Tone thereof, and is a singular good thing against the Bloody-flux, and all other Fluxes of the Bowels.

XVII. The Acid Tincture. It is a most admirable Stomackick, expels Wind, strengthens the Ventricle, causes a good Appetite and an excellent Digestion; and if a Loathing or Vomiting is present, it presently removes them, restoring the Stomach to its pristine State of Health. Dose so much at a time as to make the Liquor pleasantly sharp. It gives ease in the Gout and cures it, if the Parts affected be bathed therewith for some time.

XVIII. The Oily Tincture. It immediately cures the Cholick to a Miracle, being given from 20 to 40 or 50 drops at a time, in a Glass of Wine, or some other proper Vehicle: it opens Obstructions of the Womb, provokes the Terms, and removes Sand, Gravel and Tartarous Matter from the Reins, Ureters and Bladder, giving singular ease in a very short time. Anointed outwardly upon the Joints affected with the Gout, it gives ease, and in a short time after cures it. It cures Cramps and Convulsions to a Miracle, by anointing it on the Part affected.

XIX. The Saline Tincture. Given from 20 to 40 drops, or more, in a Glass of White Port Wine, it opens Obstructions of the Reins and Ureters, cleanses those Parts of Sand, Gravel or Tartarous Matter, and causes the Patient to Piss freely. Outwardly bathed upon places affected with the Gout,

it gives Ease and Relief. It attenuates, digests and diffuses Humors.

XX. *The Oil of the Seed.* It is a Specifick against Pains of the Stomach and Bowels, gives present ease in the Cholick, as also in the Stone, provokes the Terms in Women, and has all the Virtues of the Spirituous and Oily Tinctures. Given ad gut. 12 or 20 in a Glas of Wine to a Woman in Travel, it facilitates the Delivery. It is good against Coughs, Colds, Asthma's, shortness of Breath, difficulty of Breathing, Wheezings, Hoarseness and other like Distempers of the Brest and Lungs. It encreases Seed, provokes Lust, strengthens the Instruments of Generation, restores in Consumptions, breeds Milk in Nurses, and resists Poyson: it is also prevalent against the Bittings of Vipers and other Serpents; also the Bittings of Mad Dogs, and other Venomous Beasts, being inwardly taken, and outwardly applied to the place.

XXI. *The Spirituous Water.* It may be used as a Vehicle for any of the former internal Preparations, and has in some measure all their Virtues: it is a very good thing for Nurses to take, because it very much promotes the breeding of Milk.

XXII. *The Balsam.* It is made of the Chymical Oil, mixt with six times its quantity of pure Oil of Nutmegs by Expression. It is of wonderful Use to anoint the Genitals of a Man, who is grown Impotent either by Age, Accident, or a long Disuse of the Act; the Oil of the Seed being in the mean Season taken inwardly. Anointed upon Parts affected with Cramps and Convulsions, it generally cures them; and strengthens any Part which is much weakened, either by the Gout or other Accidents. Anointed on the Stomach and Side, it comforts them, and eases the Pains of the Pleurisy.

XXIII. *The Decoction of the Seed in Wine.* If Figs are added in the Boiling, it will be the more Pectoral, and so be good for such as are short-Winded, or are otherwise troubled with an old Cough, Hoarseness or Wheezing, difficulty of Breathing, and other Diseases of those Parts; and withal it expels Wind from the Stomach and Bowels: and if it is constantly drunk for a whole Year together, it obliterates the very Roots and Foundation of the Gout, and by keeping of the Body soluble, and sweetning all the Juices, it carries off the Tartarous Matter which breeds that Disease, and that without either Purgings or any other Medicine. But when it is thus generally used, the Decoction must be made sometimes in Water and sometimes in Wine, for the Stomach sake, and it must be used as the Patients common Drink. I say all this from manifold Experience.

XXIV. *The Cataplasim of the Seed.* If it is bruised and fryed with Yolks of Eggs till they are hard, and then beaten up with a little Oil of Nutmegs by Expression, or with some of the former Balsam, and applied to the Head, (the Hair being first shaved off) it gives wonderful and speedy Relief in an old Head-ach, tho' it be vehement, more especially if it comes from a cold and moist Cause; and applied to the back part of the Head, it stops the Rheum which falls into the Eyes, and helps such as are Blood-shorten; more especially if withal it is made with Wax into the Form of an Emplaster, and applied warm over the Eye-lids. The Cataplasim made only with the Seed and Yolks of Eggs, and applied to a simple Contusion, diffuses it: but with the Oil of Nutmegs, being applied to the Scrotum, it is excellent to discuss a windy Tumor of that Part.

CHAP. CLXXXVI.

of CUMIN Wild.

I. **T**HE Names. It is called in Greek, *Κύμιν* *κύμινον* & *ζυζαν*: in Latin, *Cuminum Sylvestre*: in English, *Wild Cumin*.

II. *The Kinds.* Authors make three kinds hereof, viz. 1. *Κύμινον άγρον*, *Cuminum Sylvestre*, *Cuminum primum Dioscoridis*, (according to Matthiolus) *Cuminum globosum Camerarii*, *Cuminum Capitulis globosis Bauhini*, also *Leporum Cubile*, *Stalimene*, as it is called in the Isle of Lemnos, *Wild Cumin*. 2. *Ψευδοκύνινον*, & *Ψευδοκύνινον*, *Hypecoum* and *Hypopheum*, *Hypecoum verum Dioscoridis*, (according to Dodonaeus and Clusius) *Cuminum Sylvestre alterum vel Siliquosum Camerarii*, *Lugdunensis*, *Tabernmontani* & *Lobelii*; *Cuminum Sylvestre Corniculatum Gerardi*, *Hypecoum Legitimum Bauhini*, The second or Horned *Wild Cumin*. 3. *Cuminum Siliquosum alterum Dioscoridis*, *Lobelii*, *Pene*, *Lugdunensis*, *Cuminum Sylvestre tertium*, & *Siliquosum minus Tabernmontani*, *Hypecoum alterum Bauhini*, The second Horned or small Coddled *Wild Cumin*.

III. As for these two latter, tho' *Camerarius*, *Dodonaeus*, *Lobel* and *Gerard*, with some others, do account them as Species of *Cumin*, or kinds of *Wild Cumin*, yet they are scarcely so to be accounted, for that they have neither the Appearance or outward Resemblance of them, neither yet the Medical Qualities or Virtues answerable to them, but rather have the Qualities and Properties of *Poppies*: however, because Custom has given them the Name of *Wild Cumin*, we submit, and rank them in the same Order.

Wild Cumin.

IV. *The Descriptions.* The first, or *Wild Cumin*, has a Root which is small and white, with some Fibres adjoining to it, and quickly perishes with the least Blasts or Dews of cold Nights, and therefore comes

comes not often to Maturity in our Country : from this Root shoot forth several long, rough and somewhat hard winged Leaves, consisting of many lesser Leaves, each of which are finely dented about the edges, which are in Fashion almost like the smallest Leaves of Wild Parsnep : from among which Leaves springs up a slender, weak, bending Stalk, about a foot high, much like to Pecten Veneris, divided at the top into many parts, each of which has a round whitish soft and woolly or downy Head or Ball, standing upon a small Foot-Stalk, viz. round and bary Buttons or Knobs, like Arction Montanum, or Bardana minor Montana, as Dioscorides has observed, or like to the Plane-tree Heads or Balls : within which Heads is contained a downy Substance, amongst which is the Seed, like the Seed of Dens Leonis, but much lesser.

V. The second, or Horned Wild Cumin, which is the Hypecoum Legitimum, has a single, long and thick Root, with some Fibres appendent to it, which dies every Year, at the first approach of Winter, and is with us very hardly made to spring again, but by an Autumn Sowing : from this Root spring forth several long winged Leaves lying on the Ground, very much divided, and cut into many parts, not much unlike to the Leaves of Sefeli or Masilia, of a pale or whitish green color, so like unto Fumitory in the color of the Leaves, as also somewhat near to it in the many Divisions and Parts thereof, that it may easily deceive one who does but slightly look upon it, but the Leaves are smaller and thinner, and more gentle in handling, (tho' growing larger in Spain, as Clusius has observed.) In the midst of these Leaves rises up a Stalk (or two) a Cubit high or more, very smooth and whitish, with some fine jagged Leaves thereon, which is divided towards the top into several Branches, at the tops of which come forth fine small yellow Flowers, consisting of six Leaves apiece, two of which are larger than the rest, and edged with green on the outside, and stand one opposite to another, the rest being small, and scarcely to be discerned but when the Flower is blown open; the Flowers being pass'd away, there succeed long, crooked, flat Horns, Husks or Cods, crooked, large and full of Knots, Joints or Divisions, somewhat like unto the Husks or Horns of the Scorpioides Matthioli, but greater and longer; in the several Joints whereof lye several square yellowish Seeds, small and flat, and almost like to those of Galega or Goats-Rue, which are very difficultly to be taken out and separated from the Husks or Skins. The Taste of the whole Plant is unpleasant.

VI. The third, or Small Coddled Wild Cumin, has a Root much like the former; the Leaves are also something like, not so broad and long as those, but more cut in, and finely dented and divided, somewhat like unto Sefeli or Hartwort of Marfelles, or Wild Chervil. The Stalks are smooth, small and tender, full of Branches and Leaves, much like unto the small Leaves of Caraway or Pecten Veneris. At the tops of the Stalks and Branches come forth pretty yellow Flowers, made of five pointed Leaves, and much like to those of Great Celandine or Rocket, saving that they are somewhat less. These being pass'd away, long Pods succeed them, which hang down, and stand not upright, nor are crooked, like the former; but the Seeds within the Cods are severally distinct, and separated one from another by equal Partitions, in small Crosses, yellow of color and somewhat long, larger than the other foregoing, and not much unlike to Galega or those of Goats-Rue.

VII. The Places. They are found Natives of Galatia, Lycia, several places of Asia, Italy, Spain and France; and grow in our Gardens here in England, only by sowing the Seed.

VIII. The Times. They flower not with us till the middle of Summer, viz. July and August, and give their Seed late, viz. in September; but the first seeds very late, and is seldom good. Gerard says, that the second did flourish and flower in his Garden.

IX. The Qualities, Specification and Virtues of the first, are the same with those of the Garden Cumin in the former Chapter, to which you are referred. But as for the two latter, tho' they seem to be of the Nature of Poppies, yet since no Author has said any thing of them, we shall be silent concerning the same.

CHAP. CLXXXVII.

OF CYPERUS Sweet,

OR,

HERB-CYPERUS.

THE Names. It is called in Arabick, Sabarade : in Greek, Κύμης : in Latin, Cyperus, Fucus angulosus, Fucus quadratus, Fucus triangularis, Aspalathum, Eryssceptron; and in English, Cyperus, Herb Cyperus, Sweet Cyperus, Galinga, and Galingal English.

II. The Kinds. It is fourfold, viz. 1. Κύμης στρογγύλης, Cyperus rotundus, Sweet or Herb Cyperus, or English Galingal round-rooted. 2. Κύμης μακρής, Cyperus longus, Herb Cyperus or English Galingal long-rooted. 3. Κύμης λίανής, Cyperus litoralis, vel litoreus rotundus, Round Sea Marsh Cyperus, or Marsh English Galingal : all these are found growing in England, and shall be treated of in this Chapter; to these add 4. Cyperus dulcis rotundus esculentus, or Trasi dulce Italorum, Sweet Rush-Nut, which see hereafter in its proper place.

III. The Greeks have other Names for the Plants treated of in this Chapter, tho' Κύμης is the general Name, and is that by which the first kind is called, (so called from the Roundness of the Root) which is the Cyperus rotundus odoratus : Κύμης, Cyperis longus odoratus, is the second, or long-rooted sweet kind : Κύμης, Cyperus litoralis, is the third, or Marsh kind; of all which in their Order.

IV. Note. This is to be taken notice of, That many Apothecaries, by reason of their Ignorance, do use the long sweet Cyperus Roots instead of the round Cyperus Roots; and others, tho' they know better, yet constantly make use of the long, instead of the other, contrary to the Appointment of the Ancients, nor do they desire to be furnished with the Genuine or True, because the one is much cheaper and easier to be had than the others are, thus substituting the long for the round; which, tho' upon necessity a Substitute may be admitted, yet no Succedaneum, viz. a quid pro quo, is to be allowed of, when the true Ingredient is to be had; forasmuch as no Substitute can be so effectual to every Intention as the Genuine is: this Abuse ought indeed to be rectified for the future.

V. The Descriptions. The first, or Common sweet round kind, has a Root which is composed of many long and round blackish brown small Roots, of the bigness of small Olives, or Roots of the Greater Filipendula, which are fastned together by long Strings, and are of a sweet Smell, even whilst they are green, but more when they are dry, which then are

are of a bitter Taste, somewhat like unto Galanga: from this Root shoot forth many Heads of long and narrow Leaves, somewhat ridge'd in the middle, every Leaf seeming thereby to be three square, and something hard and rough in handling; sweet also in Scent: from among these Leaves rise up many smooth square Stalks, about a yard high, stuffed with a white Pith, and not hollow, without any Knot or Joint therein, unto the very tops, where there stand a few short Leaves, and many small Panicles or chaffy green Spikes, or Ears of small Leaves above them, which afterwards contain the Seed within them.

VI. The second, or Long-rooted sweet Cyperus, has Roots which are of a moderate bigness, long and round, and of a black or blackish brown color on the outside, but whitish within, full and firm, and creeping hither and thither, taking up much Ground, by reason of their spreading; it creeps under the superficies of the Earth, round about, by which it is quickly much increased; and is of a most pleasing sweet Smell when it is broken, tho' it be green and fresh, and yet more pleasant when it is dry. From this Root spring forth long Leaves, which are as it were three square, like the former, and as rough and hard in handling also, almost like unto the Common Reed, but that they are lesser and shorter. The Stalk is smooth and three square, stuffed with a white Pith, like the former, and rising three feet high or more, and having also some short narrow Leaves at the tops thereof, and small long Panicles, like unto the other in all things, so that they are scarcely to be discerned asunder above Ground, the only or chief Difference consisting in the Root.

VII. The third, or Marsh kind, has Roots which are tuberos and almost round, hard and black, and without Smell, many Tubers hanging sometimes upon one String; they are not large, but grow almost after the manner of Virginea Potatoes, white and firm within. The Stalk and Leaves are much like to the first kind, but the Heads are unlike, for these are rough and blackish, about the bigness of a Filbert,

hanging about six or seven in number, at top of the Stalk.

VIII. The Places. The first and second of these grow naturally in Fenny Grounds, yet they thrive very well in Gardens, as we daily see by Experience. The first grows naturally in Italy and Spain, as also in Egypt by the River Nilus, as *Alpinus* says, but is only to be found with us in our Gardens, where, unless much Care be taken, it difficultly endures the Hardship of the Winter. The second grows in Syria and Conly, but with us only in Gardens. The third and last grows about Ditches and the Banks of Rivers, where Salt or Sea Water comes: it is found plentifully in the Marshes below Gravesend, in Shippey, Tenet and other like places.

IX. The Times. The first flowers or bears its bushy Tops in August, with us here in England: The second produces its tufted Head in July, or towards the end of that Month, for the most part: and the third Flowers always in July and August.

X. The Qualities. The Roots are only of Use, and are accounted hot and dry in the second Degree: they Attenuate, are Aperitive, Absterfive, Astringent, Carminative, Digestive and Diuretick; Cephalick, Stomack, Nephritick and Hyfterick; Lithontrip tick and Alexipharmick.

XI. The Specification. They are peculiar against the Stone, Gravel and Obstruction of Urine.

XII. The Preparations. You may have therefore, 1. A Decoction in Wine or Water. 2. A Powder. 3. A Cataplasm. 4. Ashes. 5. A Spirituous Tincture. 6. An Acid Tincture. 7. An Oily Tincture. 8. A Saline Tincture.

The Virtues.

XIII. The Decoction in Wine or Water. If it is made in Wine, it ought to be White Port Wine: it cleanses, sweetens and purifies the Blood and Juices of the Body, provokes Urine, and helps to break the Stone in the Bladder, and to abate the Water in a Dropsy, to wit, in an *Anasarca*, being drank Morning, Noon and Night, or oftner, half a pint at a time. It provokes the Terms, and is good against Pains of the Mother or Womb, more especially, if, besides taking it inwardly, it be injected up, and the Region of the Womb be also bathed therewith warm. It is good also to wash all sorts of foul and nasty Ulcers of the Gums, Mouth and Throat, as also eating Cankers, for that it cleanses, dries and heals them. It opens Obstructions, and provokes the Terms in Women: it also helps a stinking Breath, being drunk for some time.

XIV. The Powder. It is an excellent Remedy for all running Sores, old Ulcers, Cankers, tho' spreading and eating, in any part of the Body: it stops Putridity, cleanses, dries and heals, doing what it does without any thing of Heat or Sharpness. It dries up the over much Moisture of Ulcers, and by its Astringent Quality, helps all sorts of sore Mouths, and Ulcers in the secret Parts. It is of an inciding or cutting Quality, and therefore given to one dram Morning and Night in a Glass of White Port Wine, it provokes Urine and the Terms, and helps such as are troubled with the Stone; the Decoction in Wine being drunk inwardly also at the same time.

XV. The Cataplasm. It is made of the Powders of the Roots, and Bay-berries, mixed in equal quantities, and made up with Boys Urine. This being laid upon the Belly of one that has the Dropsy, is said to help them very much, taking at the same time the Decoction inwardly oftentimes.

XVI. The Ashes. They have the Virtues of the Powder, but are more sharp, by reason of the Salt contained

contained in them. *Alpinus* says, that the *Ægyptians* did much use both the Powder of the Roots, and also the Althes of the same, to cure Ulcers both of the Mouth and secret Parts.

XVII. *The Spirituous Tincture.* Taken in the Morning fasting, as also an hour before Dinner, at Four in the Afternoon, and at Bed-time, to the quantity of 2 drams, in Canary or other Wine, or some other convenient Vehicle, it comforts and warms the Stomach, Brain, Nerves, Lungs, Womb and Blood: and if it is taken for some time together, it warms a cold Habit of Body, strengthens the natural Faculties, fortifies the Heart and invigorates the Spirits.

XVIII. *The Acid Tincture.* It is a most admirable Stomack, incises, opens, cleanses, strengthens, warms, comforts and restores the Tone of the Stomach and the other Viscera. It provokes Urine and the Courses, is good against the Stone, as also Vomiting, Sickness at Stomach, want of Appetite and Indigestion, and is good against Catarrhs proceeding from a cold and moist Cause. Dose 30 or 40 drops, more or less, to a pleasing Acidity. It gives comfort to such, who, by long Sickness, are much spent, the whole Body being weak, the Stomach profligated, the Heart dejected, and the Spirits fainting.

XIX. *The Oily Tincture.* It comforts the Nerves, and being outwardly bathed upon Parts affected with Cramps, Convulsions, Numbness, Trembling, Palsy, extream Coldness of any Part, Pains or Aches, Gout or Sciatica from a cold Cause, it cures them, being constantly used Morning and Night for some considerable time. It is good also to prevent Gangrens, and cure the Contusions or Punctures of the Nerves, immediately assuaging the Pain. Anointed on the Head, it cures a Head-ach from a cold Cause. Given inwardly Morning and Night from 15 to 30 or 40 drops, in White Port Wine or some other specific Vehicle, it helps Crudities, warms and comforts the Brain, Nerves, Stomach and Womb, expels Wind from the Bowels, is good against Barrenness from a cold and moist Cause, prevails against cold Catarrhs, fortifies the Senses, helps against Coughs, Colds, shortness of Breath and difficulty of Breathing. It provokes Urine and the Terms, is good against Dropsies, and expels Sand, Gravel and other Tartarous Matter out from the Reins, Ureters and Bladder.

XX. *The Saline Tincture.* It gives ease by bathing therewith, in the Gout proceeding from a cold Cause. Inwardly taken, from 1 to 2 drams in some proper Vehicle, it is very Diuretick, provoking Urine, and expelling the Recrements of the Urinary Passages, as also Water in Dropsies.

C H A P. CLXXXVIII.

of CYPRESS Moss or Heath.

I. *THE Names.* It is called in Greek, *Χαμαί-μοσχος*: in Latin, *Chamaecyparissus*, *Cupressus*, vel *Cypressus pumila*, (*herbe nomen*) *Cupressus* vel *Cypressus muscosus*: in English, *Moss Cypress*, or *Heath Cypress*.

II. *The Kinds.* It is without doubt one of the kinds of *Moss*, and *Singularis sui generis*; for which Reason Authors have called it also, *Muscus clavatus*, and *Cupressi formis*; *Muscus clavatus foliis*, *Cupressi Baudini*, *Selago Plinii*, lib. 25. cap. 11. *Saxifraga Syloestris Tragi*, *Chamaecyparissus*, *Tabernmontani* &

Turneri; and in English it is not unfitly called, *Heath Cypress*.

III. *The Description.* It has a small fibrous or stringy Root; from whence spring up several Stalks, some rough and others naked, being hard and branched, with very short and thick Leaves growing on them, something resembling a Branch of the Cypress-tree, and of a dark green color, bitter in Taste, but without Smell. From the tops whereof sometimes spring forth small and soft spiked Heads, viz. such Ears or Cutkins as are those of the Club or Woolf-Claw Moss, which are of a yellowish color, and growing on small Foot-stalks. This Herb is a low Plant, and abides always green, both Winter and Summer.

IV. *The Places.* It grows in Woody and Mountainous places, where they call it *Wild Savin*.

V. *The Times.* It flourishes and is in its chief Verdure in the Summer Months.

VI. *The Qualities.* It is temperate in respect of Heat or Cold, Drying, Binding, Incarnative and Vulnerary.

VII. *The Specification.* It is of singular Use for stanching of Blood, and other Fluxes of Humors.

VIII. *The Preparations.* You may prepare therefrom, 1. A Decoction in Red Wine. 2. A Spirituous Tincture. 3. A Powder.

The Virtues.

IX. *The Decoction in Red Wine.* It is very Astringent, stops Bleeding, and cures any Flux of the Bowels, if it is recent. It also stops the overflowing of the Terms in Women, and is good against spitting and pissing Blood: Wounds and Ulcers washed therewith, it dries and heals them.

X. *The Spirituous Tincture.* It strengthens the Stomach, stops Vomiting and Fluxes of the Belly, and gives ease in griping Pains of the Bowels, and stops the Loches in Women in Child-bed. Dose from 2 to 4 drams, Morning and Night, in Canary or other fit Vehicle, as the Occasion requires.

XI. *The Powder.* Inwardly given to one dram,

it stops Fluxes and spitting of Blood : outwardly applied, it stops Bleeding in Wounds, and strewed upon moift and running Ulcers, it cleanses them, drys up the Humidities, strengthens the Part and induces the healing.

C H A P. CLXXXIX.

of DAFFODIL Broad-leav'd single, one flowred.

THE Names. It is called in Greek, *Narkissos* : in Latin, *Narcissus* ; and in English, *Daffodil*.

II. The Kinds. It is divided into two principal kinds, 1. *Narkissos dionysios*, *Narcissus verus*, The true or right *Narcissus* or *Daffodil*. 2. *Narkissos vrbos*, *Narcissus notus*, *Bastard Daffodil*.

III. The true kind is genus to four other subordinate Species, viz. 1. *Narkissos πλατυφύλλος*, *Narcissus latifolius*, Broad-leav'd. 2. *Στενιφύλλος*, *Angustifolius*, Narrow-leav'd. 3. *Σχινοειδής*, *Juncus*, Rush *Daffodil*. 4. *Ελαδίνος ή θαλάσσιος*, *Marinus*, Sea *Daffodil*. And these four sorts divide themselves again into eight other inferior Species, viz. 1. *Narcissus latifolius monanthos, simplici flore*, Broad-leav'd *Daffodil*, with one single Flower, of which in this Chapter. 2. *Narcissus latifolius polyanthos simplici flore*, *Daffodil broad-leav'd*, with many Flowers, single-flowred, of which in Chap. 190. 3. *Narcissus latifolius multiplici flore, vel flore pleno*, Broad-leav'd *Daffodil*, with a double Flower, of which in Chap. 191. 4. *Narcissus angustifolius flore simplici*, *Daffodil narrow-leav'd*, with a single Flower, of which in Chap. 192. 5. *Narcissus angustifolius flore pleno*, *Daffodil narrow-leav'd*, with a double Flower, of which in Chap. 192. 6. *Narcissus juncus flore simplici*, Rush *Daffodil* single-flowred, of which in Chap. 194. 7. *Narcissus juncus flore multiplici*, Rush *Daffodil* double-flowred, of which in Chap. 195. 8. *Narcissus marinus, vel litoralis*, Sea *Daffodil*, of which in Chap. 196. following.

IV. The *Bastard kind* is genus to four other subordinate Species, viz. 1. *Ψευδοκάρκιος πλατυφύλλος*, *Pseudonarcissus latifolius*, *Bastard Narcissus broad-leav'd*. 2. *Ψευδοκάρκιος στενιφύλλος*, *Pseudonarcissus angustifolius*, *Bastard Daffodil narrow-leav'd*. 3. *Σχινοειδής*, *Juncus*, *Bastard Rush Daffodil*. 4. *Θαλάσσιος*, *Marinus*, *Bastard Sea Daffodil*. And these four sorts divide themselves again into fix other inferior Species, viz. 1. *Pseudonarcissus latifolius simplici flore*, *Bastard Daffodil broad-leav'd* single-flowred, of which in Chap. 197. 2. *Pseudonarcissus latifolius flore pleno*, *Bastard Daffodil broad-leav'd* double-flowred, of which in Chap. 198. 3. *Pseudonarcissus angustifolius flore simplici*, *Bastard Daffodil narrow-leav'd* single-flowred, of which in Chap. 199. 4. *Pseudonarcissus angustifolius flore multiplici*, *Bastard Daffodil narrow-leav'd* double-flowred, of which in Chap. 200. 5. *Pseudonarcissus juncus*, *Bastard Rush Daffodil*, of which in Chap. 201. 6. *Pseudonarcissus marinus*, *Bastard Sea Daffodil*, of which in Chap. 202. following.

V. These are the most general Heads of *Daffodils* : the particular Species of each are manifold, all which we will not promise to treat of in this Work ; but the most noted singulars under each Head, we shall discourse of, with what Brevity is possible, for the sakes of such as are *Florists*, or *Lovers* of a

Flower-Garden. Those then which we are to treat of in this Chapter, are the first of the aforementioned sub-subordinate Species, viz. *Narcissus latifolius monanthos simplici flore*, *Daffodil broad-leav'd* single-flowred, having but one Flower upon a Stalk, and sometimes by Accident but two Flowers at most.

VI. Authors make about twenty four singular kinds of this ; we shall only describe twenty of the most usual, viz. 1. *Narcissus latifolius omnium maximus, amplo calice flavo, five incomparabilis vel nompareille*, The incomparable or great none-such *Daffodil*. 2. *Narcissus omnium maximus flore & Calice flavo*, The incomparable great yellow *Daffodil*. 3. *Narcissus griseus maximus calice flavo*, The gray peerless *Daffodil*. 4. *Narcissus latifolius flore flavo, amplo calice*, The lesser yellow *nomparril*, with a large Cup. 5. *Narcissus indicus flore rubro, dictus Jacobæus*, The West Indian *Daffodil*, with a red Flower. 6. *Narcissus Trapezunticus flore luteo precocissimus*, The early *Daffodil* of *Trebizond*. 7. *Narcissus albus præcox minor oblongo calice luteo*, The small early white *Daffodil*, with a long Cup. 8. *Narcissus pallidus præcox oblongo calice flavo*, The early Straw-color'd *Daffodil*, with a long yellow Cup. 9. *Narcissus albus serotinus major oblongo calice luteo*, The great late-flowering white *Daffodil*, with a long yellow Cup. 10. *Narcissus pallidus serotinus oblongo calice flavo*, The late Straw-color'd *Daffodil*, with a long yellow Cup. 11. *Narcissus albus serotinus oblongo calice flavo, duobus floribus in caule*, The late white *Daffodil*, with a long Cup, and two Flowers on a Stalk. 12. *Narcissus medio-luteus vulgaris*, The common English white *Daffodil*. 13. *Narcissus medioerocæus serotinus*, The late-flowering white *Daffodil*. 14. *Narcissus medio purpureus præcox*, The early purple-ringed *Daffodil*. 15. *Narcissus medio purpureus serotinus*, The late purple-ringed *Daffodil*. 16. *Narcissus medio purpureus maximus*, The great white purple-ringed *Daffodil*. 17. *Narcissus medio purpureus stellaris*, The stary purple-ringed *Daffodil*. 18. *Narcissus Persicus*, The Persian *Daffodil*. 19. *Narcissus autumnalis major*, The greater Autumn or Winter *Daffodil*. 20. *Narcissus autumnalis minor*, The lesser Autumn or Winter *Daffodil*.

VII. The

VII. The Descriptions. The first, Incomparable, Nomparrille, or None-such Daffodil, has a great bulbous Root, as large as other Daffodils, which bear large Flowers, which is covered over with a brownish Coat or Skin; from whence comes three or four long and broad Leaves, of a greyish green color; among which rises up a Stalk two feet or more high, at top whereof, out of a thin skinny Husk, which all Daffodils have, comes forth one large single Flower, (commonly no more) consisting of six very pale, yellow, large Leaves, the bottom whereof, next unto the Stalk, is narrow and round, rising wider to the Mouth, which is very large and open, and unevenly cut in or dented about the edges. The Calice or Cup much resembles one of our old Silver Beakers, with a narrow bottom, and a wide Mouth. The Flower being past, there comes sometimes (tho' not often) a round green Head, and a black round Seed therein, like to other Daffodils, but greater. This Plant does sometimes bring forth a Flower with ten or twelve Leaves, and a Cup much larger, as if it was two, and as the Flower seems to be.

VIII. The second, or Incomparable great yellow Daffodil, differs nothing in Form, Magnitude or manner of Growing, but only in the Color of the circling Leaves of the Flower, which are of the same yellow color with the Cup. This sometimes degenerates, and also grows Luxurious, bringing forth two Flowers upon a Stalk, each distinct from other, and sometimes two Flowers thrust together, as if they were but one, but this is very rare. This Plant is a peculiar Plant, not constant to its kind, nor abiding yearly in the same Form.

IX. The third, or Grey peerless Daffodil, is wholly like to the two former in Root, Leaf, Stalk and Flower, save that the Leaves are somewhat greater, and the six outward Leaves of the Flower are of a glittering whitish grey color, and the Cup yellow as the former, but larger.

X. The fourth, or Lesser yellow Nomparrille, has, from a bulbous Root, Leaves rising somewhat like to those of the first kind, but not altogether so long or broad: the Stalk rises not all out so high, and bears but one Flower, like the former, which is lesser; and both Cup and Leaves are of one color, of a pale yellow, yet more yellow than the other: the Cup is also a little lesser, and a little differing, neither fully so small in the bottom, nor so large at the edges, nor so crumpled at the brims, so that these Differences shew, that it is manifestly of a quite differing kind from the others.

XI. The fifth, or West Indian Daffodil, has a round large bulbed Root, of a brownish color on the outside, and white within, which sends forth several broad Leaves, somewhat like to the Common white Daffodil, of a greyish green color; from the sides of which, as from the middle of them, rise up sometimes two Stalks together, but most usually one after another, (for it oftentimes flowers twice in a Summer) and often also but one Stalk alone, which is of a faint reddish color, about a foot high or more; at the top whereof, out of a deep red Skin or Husk, comes forth one Flower, bending downwards, consisting of six long Leaves, without any Cup in the middle, of an excellent red color, tending to a crimson: three of these Leaves, which turn upwards, are somewhat larger than the three which hang downwards, having six Threads or Chives in the middle, tipped with yellow Pendants, and a three-forked Style longer than the rest, and turning the end thereof again. This Aldinus, Cardinal Farnesius his Physician, says, that at Rome it rose up with Stalks of Flowers before any Leaves appeared.

XII. The sixth, or Early Daffodil of Trebizond, has a bulbous Root, but not very great, blackish on

the outside, and yellow under that blackish or outwardmost Coat, so very like to the Autumn Daffodil, (excepting for that Yellowness) that they may easily be mistaken one for another: it has three or four very short green Leaves, very like to the Leaves of the Autumn Daffodil, excepting that these are not so broad or so long, nor spring up in Autumn. In the midst of these Leaves rises up a short green Stalk, four, five or six inches high, bearing at the top, out of a whitish thin Skin, striped with green, one flower a little bending downwards, consisting of six Leaves, laid open almost in the same manner with the former West Indian Daffodil, of which some do a little turn up their Points, of a fair pale yellow color, having six white Chives within, tipped with yellow Pendants, and a longer Pointel.

XIII. The seventh, or Small early white Daffodil, has a bulbous Root of a moderate largeness, yet lesser than the Roots of the later kinds; from whence spring Leaves broad, very green, and not whitish, as others, three or four standing together, about a foot long or better; among which rises up a green Stalk, not full so high as the Leaves, bearing one Flower at top thereof, of an indifferent bigness, but not so great as the later kinds, which follow after, consisting of six whitish Leaves, but not perfect white, rather of a Cream color, and of a good sweet Smell. In the middle is a long yellow Cup, half an inch long or better.

XIV. The eighth, or Early Straw-color'd Daffodil, from a bulbous Root has green Leaves, as the former, but much narrower; the Leaves of the Flowers are more inclining to yellow, but yet very pale, as if of a light Straw color, seeming to be a little more narrow, and pointed, as the former: the Cup is long and yellow, and the Smell sweet, like the last.

XV. The ninth, or Great late-flowering white Daffodil, has a moderately large bulbous Root, covered rather with a pale than blackish Skin; from whence come greyish or whitish green-color'd Leaves, somewhat narrow and long, among which springs up a Stalk half a yard high, bearing one Flower at top, made of six white Leaves, having the Cup in the middle, as long as the former, and of a deep yellow. The edges of the Cup are sometimes plain, sometimes a little crumpled, and often circled at the brims with a Saffron color, and often also without it, the Smell of which is very pleasant. This Flower sometimes alters its Form into eight Leaves, which being narrow and long, seem like a white Star, compassing a yellow Trunk.

XVI. The tenth, or Late Straw-color'd Daffodil, has a bulbous Root, with Leaves and Stalk like the last, but the chief difference is in the color of the top of the Flower, for that this is of a more yellow color, and a little larger than it, and the brims or edges of the Cup are of a deeper yellow or Saffron color; the Smell of this being no less sweet than the former.

XVII. The eleventh, or Late white Daffodil, two Flowers on a Stalk, altho' it is very like to the former, yet is certainly a kind of it self. It is constant in its manner and form of Flowering, commonly bearing, without missing, two Flowers upon a Stalk, very like unto the former great kind, so that no difference seems to be between them, but in the Duality of the Flowers on one Stalk; the Cups of which have seldom any touch of a Saffron color on their edges, as some of the former have.

XVIII. The twelfth, or Common English white Daffodil, (called also Primrose Peerless) has a moderate large bulbed Root, increasing more than a better Plant, from whence spring long limber broad Leaves, of a greyish green color; among which rises up a Stalk, bearing at its top, out of a skinny Husk, sometimes but one Flower, but most commonly two, seldom

fellow three, (but larger for the most part than any which bear many Flowers upon a Stalk) of a pale whitish Cream color, near to that of a pale Primrose, with a small round flat Crown, rather than a Cup, in the middle, of a pale yellow color, with some pale Chives standing therein, and of a pretty sweet Smell.

XIX. The thirteenth, or Late-flowering white Daffodil, has a bulbous Root, like the former, but the Leaves are shorter, and the Stalk rises not so high by much, and bears but one Flower, of a pure white color, made of six small Leaves, and something narrow, standing severally one from another, and not so close together as the former, but appearing like a Star; the Cup is small and round, of a pale yellow color, but Saffron like about the brims, having six small pale Chives in the middle, the Smell of which is much sweeter than the former.

XX. The fourteenth, or Early purple-ringed Daffodil, from a bulbous Root, has many long greyish green Leaves, somewhat narrower and stiffer than the former Common white Daffodil, among which rises up a long naked hollow Stalk, (as all other Daffodils have) bearing at the top one Flower, (seldom two) consisting of six long white Leaves, standing close together about the Stalk: the Cup is yellow, and so flat, that it might rather be called a Crown, for it stands very close to the middle, and very open at the brims, circled with a reddish or purple color'd Ring, having also several Chives in the middle of it, whose Smell is very sweet, exceeding several other kinds.

XXI. The fifteenth, or Late purple-ringed Daffodil, from a bulbous Root, greater than the last, has Leaves broader than it, some being near twice as broad. The Flower is like the former, being large, and its Leaves standing close, one to the sides of another. The Ring also, which compasses the yellow Coronet, is sometimes of a paler reddish purple, and sometimes of as deep a red as the former, from which it differs not any thing else, but in the time of Flowering, which is not until the other is past and gone: the Smell is sweet, like the former.

XXII. The sixteenth, or Great white purple-ringed Daffodil, has a bulbous Root, greater than the former, as also its Leaves and Flowers, the largeness of which makes it only to differ from the last, and to be a distinct kind, it flowering with the later of the Purple-ringed Daffodils.

XXIII. The seventeenth, or Starry purple-ringed Daffodil, from a bulbous Root, has a little narrower and greener Leaves than the former kinds: the Flower has six white Leaves, not so broad, but narrower, and seeming longer than they, not closing together, but standing apart one from another, making it seem like a white Star: it has also a yellow Coronet in the middle, circled about with purple, like the former, smelling sweet, but nothing so sweet as the Early purple-ringed Daffodil.

XXIV. The eighteenth, or Persian Daffodil, has a bulbous Root, a little blackish on the outside, somewhat like the Root of the Autumn Daffodil following. From this Root rises up a naked Stalk about a foot high, bearing one pale yellow Flower, breaking thro' a thin Skin, which first enclosed it, composed of six Leaves, the three outermost being a little larger than the rest, and having in its middle six small Chives, and a larger Pointel, of an unpleasant Smell. After the Flower is past, the Leaves come up, sometimes before Winter, but most usually after the deep of Winter is past, in the beginning of the Year, which are broad, long, and of a pale green color, like the Leaves of other Daffodils, but not green, as the Autumn Daffodil is; they also twine themselves a little, as some of the Pancratium or Balfard Sea Daf-

fodils do. This differs from all other kinds of Daffodils in its manner of Growing, for it has never Leaves and Flowers at one time together, wherein it is like unto a Colchicum, but in Root and Leaf it is a Daffodil.

XXV. The nineteenth, or Greater Autumn Daffodil, has a Root great and round, covered over with a blackish Skin, from whence rise up three or four fair broad and short Leaves at first, but afterwards they grow longer, and of a very deep green color; in the middle of which rises up a short stiff round stalk, bearing one fair yellow Flower, enclosed at first in a thin Skin or Husk, and composed of six Leaves, as the former, with several Chives in the middle, as most other Daffodils have, which pass away without any appearance of Seed, or Head for Seed, tho' under the Head there is a little green Knot, which possibly might contain and bear Seed, if the Climate was warm and friendly enough, or our sharp Winters did not hinder it.

XXVI. The twentieth, or Lesser Autumn Daffodil, has a Root like the former, but lesser, and covered with a like blackish Skin; from whence spring forth deep green-color'd Leaves, as in the last, but smaller and narrower, a little hollow in the middle, and after them the Stalk and Flower, which is lesser than the other, and a little paler, consisting in six such like Leaves, narrow and sharp-pointed. Clusius says, that the flowering of this Daffodil is more like to the Persian Daffodil at sect. 23. above, than to the former Great Autumn kind; tho' with us it seems to imitate the latter or Great Autumn most, in sending forth its Leaves first, then its Stalk and Flowers.

XXVII. The Places. Whence the first, second, third and fourth first came, is now unknown: the fifth the Title shews came out of the West Indies, and was first brought into Spain, and from thence it was sent to us, and into several other parts of Europe: the sixth came from Constantinople or Trapezuntia: the seventh, eighth, ninth, tenth and eleventh are Natives of the Pyrenean Mountains, from whence they have been brought to us: the twelfth is said to grow naturally in England, and is plentiful enough in all Country Gardens: the Original of the thirteenth is unknown: the fourteenth, sixteenth and seventeenth are Turkish Plants, and came to us from Constantinople: the fifteenth grows in many places of Europe, as in France, Germany and Italy, as Clusius has said: the eighteenth grows in Persia and Turkey, and came to us from Constantinople: the nineteenth and twentieth are also Turkish Plants, and were sent to us from that Metropolis. Now, by Transplanting and great Care, they are made Denizens, if not Natives, with us, and are to be found in most Gardens of our Great and Exact Florists.

XXVIII. The Times. The first, second, third and fourth flower in March, but most in April: the fifth flowers in June and July: the sixth flowers in December, if the former part of the Winter has been mild; but most usually in the end of January, or in the beginning, middle or end of February: the seventh, eighth, ninth, tenth and eleventh flower in the latter end of March and thro' the Month of April: the twelfth flowers about the middle or end of April: the thirteenth flowers in May: the fourteenth flowers early in March: the fifteenth, sixteenth and seventeenth flower about the middle or end of April: the eighteenth, nineteenth and twentieth flower about the end of September and in October.

XXIX. The Qualities. They are hot and dry in the first Degree; Attractive, Glutinate, Vulnerary, Emetick and Arthritic.

XXX. The

XXX. *The Specification.* They have been found by Experience to be good against Coughs, Asthmas and Colicks.

XXXI. *The Preparations.* The Root is only in Use, and therefrom you may have, 1. *A liquid Juice.* 2. *A Lobeck.* 3. *An Effence.* 4. *An Ointment or Balsam.* 5. *A Cataplasim.* 6. *A Mixture.*

The Virtues.

XXXII. *The liquid Juice.* Taken to 2, 3 or 4 ounces, or more, according to Age and Strength, it causes Vomiting, and very much cleanses the Stomach by that means, causing a good Appetite and Digestion. It may be mixed with White Wine, and taken in the Morning fasting, and so it is good against the Colick.

XXXIII. *The Lobeck.* It is made of the Juice, mixt with half its weight of Honey. It is good against Coughs, Colds, Hoarseness, Wheezings, shortness of Breath and difficulty of Breathing. Dose 1 spoonful at a time, twice or thrice a day: or it may be often taken with a *Liquorice Stick.*

XXXIV. *The Effence.* It wonderfully cleanses, dries and heals: it conglutinates or glews the Mouths of great Wounds together, yea, Incisions of the Veins, Arteries, Nerves and Tendons; the Wound being washed therewith, and Lint dip't therein, being bound thereon.

XXXV. *The Balsam or Ointment.* It is singular against Burnings or Scaldings, whether with Fire, Water, Oil, Gun-powder, Pitch, &c. It cleanses old Ulcers, dries and heals them: and being applied to green Wounds, it consolidates or joins their Lips together, and quickly heals them. It also draws forth Fricks, Thorns, Splinters or other like things gotten into the Flesh.

XXXVI. *The Cataplasim.* If it is beaten and made up with Honey, and applied Emplaster-wise, it is cleansing and attractive, cures Burnings and Scaldings, and conglutinates Sinews which are cut asunder: and so applied to Strains or Wrenches of the Wrists or Ankles, or Joints pained with the Gout, it gives Relief. If to the Cataplasim Meal or Flower of *Darnel* is added, it becomes very attractive, and draws forth Thorns, Splinters, &c. out of the Flesh; and applied upon Sun-burnings and Morpew, it takes them away. The Root made into a Cataplasim with Hogs-Lard and Rye-Bread, it hastens the Suppuration of Apostems, even of those which are not easily ripened.

XXXVII. *The Mixture.* It is made of the Juice mixt with an equal quantity of White Wine Vinegar, and an eighth part of *Nettle Seed* in powder. It is good to remove Defecations of the Skin, as Scurf, Morpew, Tanning, Yellowness, Brownness, Pimples, Freckles, Lentils, Tettars, Ringworms, and other like Affects molesting the face.

C H A P. CXC.

of DAFFODIL broad-leav'd single, many-flowered.

THE Names. It is called in Greek, *Ναρκισσος* *πλατύφυλλος* *πολυανθός* *ἀπλός*: in Latin, *Narcissus latifolius Polyanthus flore simplici*: in English, *Daffodil broad-leav'd many-flowered single.*

II. *The Kinds.* There are about fifteen kinds of

these many-flowered single, viz. 1. *Narcissus Africanus aureus major*, Daffodil the greater yellow African. 2. *Narcissus Africanus aureus minor*, Daffodil the lesser yellow African. 3. *Narcissus Byzantinus totus luteus*, The yellow Turkey Daffodil. 4. *Narcissus sulphureus major*, The greater Limon-color'd Daffodil. 5. *Narcissus sulphureus minor*, The lesser Limon-color'd Daffodil. 6. *Narcissus totus albus polyanthus*, The many flower'd Milk-white Daffodil. 7. *Narcissus latifolius totus albus, mediocri calice reflexus*, The Milk-white Daffodil with the great Cup. 8. *Narcissus Narbonensis medio luteus praecox*, The early Narbone Daffodil. 9. *Narcissus Narbonensis vulgaris*, The common French Daffodil. 10. *Narcissus Narbonensis major flore amplo*, The Narbone Daffodil with great Flowers. 11. *Narcissus Pisanus*, The Italian Daffodil. 12. *Narcissus medio croceus polyanthus*, The French Daffodil with Saffron-color'd Cups. 13. *Narcissus medio croceus alter*, The other Saffron-color'd Daffodil. 14. *Narcissus Anglicus polyanthus*, The great English Daffodil. 15. *Narcissus Narbonensis medio luteus serotinus major & minor*, The late-flowering Narbone Daffodil, greater and lesser.

III. *The Descriptions.* The first, or Great yellow African, (a noble and stately Flower) has a great bulbous Root, covered with a blackish Skin; from whence spring many very long and broad Leaves, of a better green than many others, in the midst of which comes up a Stalk, not rising so high as the Leaves, bearing at the top, out of a skinny Husk, many fair, goodly and large Flowers, ten or twelve in number, if the Root is well grown, and it grows in a warm place, each Flower being larger than any of the French, Spanish or Turkey Daffodils, which bear many single Flowers on a Stalk; (this coming near to the largeness of our English Daffodil (in chap. 189. sect. 18.) before described, or the French described at sect. 12. following, which indeed is also a kind of our English at sect. 16. of this chap. but bearing more Flowers:.) These Flowers are of a fair shining color, having large, round and open Cups or Bowls, yellower than the

the outward Leaves, and of so exceeding sweet a Smell, that it is almost ready to overcome, at least satisfy the Senses.

IV. The second, or Lesser yellow African, is almost the same with the former, but wants somewhat of its stately Height, Largeness of its Flowers and Cup, and Beauty of Color, it being of a paler yellow, and is in all those respects inferior to it; nor is its sweet Smell altogether so strong.

V. The third, or Yellow Turkey Daffodil, altho' from its bulbous Root it has very long Leaves, and a high Stalk, yet it comes short of the Beauty of that which was last described; for in this the Flowers are not so many, not being above four or five, nor so large, being not much greater than the Common French Daffodil at sect. 11. following, nor of so fair a color, but much paler; nor having a Cup so large, this being manifestly smaller; nor of so strong or sweet a Smell, this being also weaker.

VI. The fourth, or Greater Limon-color'd, from an indifferent large bulbous Root, has three or four very long and green Leaves, half a yard long at least; among which rises up a round, yet crested Stalk, not so high as the Leaves, bearing five or six single Flowers thereon, every one of them being greater than the Common French Daffodil at sect. 11. following, or the Italian at sect. 13. they are of a faint, yet pleasant yellow color at first, but when they have been in flower a Fortnight, or thereabouts, change into a deeper yellow. The Cup in the middle is also larger than in those foregoing, and of a deeper yellow color than the other Leaves, having only three Chives within it; and is of a very pleasant Smell.

VII. The fifth, or Lesser Limon-color'd, from its bulbous Root has broader and shorter Leaves than the former, not green like them, but of the color of other Daffodils. The Stalk rises up higher than the Leaves, bearing four or five Flowers upon shorter Foot-stalks, and no bigger than the Common French Daffodil, of a pale yellow, which some call a Brimstone color: the Cup, or rather Crown in the middle, is small, and broad open, of a little deeper yellow, having many Chives within it, and as it were, sprinkled over with a kind of Measles. It is not full out of so sweet a Smell as the former.

VIII. The sixth, or Many-flowered Milk-white, has its bulbous Root covered over with a blackish Skin; from whence spring Leaves of a mean size, both for length and breadth, greener than the ordinary sorts, which have some Whiteness in them. The Flowers are many upon the Stalk, as small for the most part as any of these kinds which bear many together, being wholly of a Milk, or rather of a Snow white color, as well the Cup, which is small, as the outward Leaves, which encompass it: after which come small Heads, in which is contained round black Seed, as all other Daffodils have, but some greater, some lesser, according to the Magnitude of the Plants. The Smell of this is very sweet.

IX. The seventh, or Milk-white with the great Cup, is threefold, 1. One which has its Leaves somewhat broader, and the Flowers greater than the former. 2. Another which has its Leaves smaller, and its Flowers also, whose Cups are likewise small, and are never seen fully open, but as it were half closed at the brims. 3. Another sort, whose Leaves are as broad as any of the lesser sorts, and whose Cup in the middle of the Flower is something larger than in any of the lesser kinds, but lesser than in the greater kinds; the Leaves of whose Flowers do a little turn themselves upwards, from whence it is called Reflexus. These are usually called Narcissus totus albus polyanthos, major, medius, minor, according as the differences are.

X. The eighth, or Early Narbone, has from its

bulbous Root, which is great, Leaves springing up a Month or two before the following kind, being also shorter and narrower. The Stalk is not very high, bearing several Flowers at the top, breaking thro' a thin Skin, as is common with the Daffodils, every one of which is small, consisting of six white Leaves, and a small yellow Cup in the middle, of a pleasant sweet Smell, but nothing so strong as many others. The Root of this seldom parts into off-sets, as all the following do, which bear many single Flowers.

XI. The ninth, or Common French Daffodil, has its bulbous Root covered with a blackish Skin, from which spring long and broad green Leaves, a little hollowish in the middle, and edged on both sides: the Stalk is about half a yard high, bearing on its top several Flowers, somewhat larger than the former, consisting of six white Leaves, something round. The Cup is yellow in the middle, small and round, like unto an Acorn Cup, or a little fuller in the midst. This is the Description of those which came to us first out of France; but with us I think they either degenerate or alter in Form, making in some the Cup shorter, in others flatter, and some longer than the rest; some of a paler and some of a deeper yellow color.

XII. The tenth, or Narbone with great Flowers, has a Root not so great or round as the former, but is more plentiful in Off-sets than any other of the French or Italian kinds. The Leaves are almost like the last, not full out so broad, but full out as long, spring sooner out of the Ground, yet not so early as the eighth at sect. 10. foregoing. The Stalk is flatter and rises higher, bearing four or five Flowers, much larger than any of this kind, every one equaling the English Daffodil (in cap. 189. sect. 17.) but whiter than it, and the yellow Cup larger and more open than in any of the rest.

XIII. The eleventh, or Italian Daffodil, from its bulbous Root has Leaves as large or larger than the Common French at sect. 11. above; but its Stalk is somewhat higher, bearing many white Flowers, very like to the said Common French, but a little larger, as is also the yellow Cup in the middle, and rounder than is commonly seen in any of the French kinds, except the Narbone with great Flowers at sect. 12. above.

XIV. The twelfth, or French many-flowered, with Saffron-colored Cups, has a bulbous Root, Leaves of a greyish green color, not so broad or so long as the Italian, but coming nearer to the Common French. The Flowers are white, and many upon a Stalk: the yellow Cup is somewhat large, and circled with a Saffron like brim or edge, which indeed makes the chiefest difference.

XV. The thirteenth, or Other Saffron-color'd, has also a bulbous Root, from whence spring Leaves large and long; in the midst of which grows up a Stalk, bearing at its top several white Flowers, which are larger than any of the other French, except the Narbone with great Flowers at sect. 12. above; but the Cup is small and short, rather seeming a Coronet than a Cup, of a deep Saffron color all about the brims or edges.

XVI. The fourteenth, or Great English Daffodil, has a bulbous Root, from whence spring Leaves not much broader or longer than the Narbone with great Flowers at sect. 12. above. The Stalk with the Flowers rises not fully so high as it, bearing many Flowers thereon, not altogether so white, yet whiter than the Common English (in cap. 189. sect. 17.) but nothing so large, and with short, broad, and almost round Leaves, standing close one unto another. The yellow Cup in the middle is Bowl-fashion, somewhat deeper than in any of the former, but not much greater; and the Smell thereof is very sweet and pleasant.

N II

XVII. The

XVII. The *fifteenth*, or *Narbone late-flowering*, greater and *lazier*. The greater has its *Root*, as well as its *Leaves*, greater, larger, broader and longer than any of the other former French, Narbone or Italian kinds. The *Stalk* is as high as any of them, bearing at top five or six white flowers, standing open spread, like a *Star*, and not close together, every one whereof is large, and round-pointed. The *Cup* is yellow, small and short, yet not lying flat to the *Flower*, but a little standing out, with some *Threads* in the middle, as all the former *Daffodils* have. This is not so sweet scented as the earlier kinds be. The *leffer* differs not from the former, but only that it is every way lesser, and the *Cup* in the middle of the *Flower* is yet shorter than it.

XVIII. The *Places*. The first and second grow in *Barbary*, about *Algier* and *Fez*, as some, who have been in those Parts, relate: the third grows in *Turkey*, about *Constantinople*: the fourth and fifth have been brought to us from the *Pyrenean Mountains*, as also out of *Italy*: the sixth and seventh grow in *Spain*, in the Southern Parts of *France*, as also at *Constantinople*: the eighth, ninth, tenth, twelfth, thirteenth and fifteenth grow in *France*, as about *Mompelien*: the eighth and ninth grow also naturally in many places in *Spain*, which are open to the *Sea*; as also in *Turkey*: the tenth is a Native of *Italy*, growing about *Pisa* in *Tuscany*: the fourteenth is accounted in Foreign Nations, as a Native of *England*. However, being brought to us from their native Places, they are nurs'd up here by the curious Florist only in *Gardens*, where they flourish well.

XIX. The *Times*. The first, second and third, after they have been accustomed to our Climate, flower very early, even with the first sort of *Daffodils*; but many times upon their first bringing over, they flower in *January* or *February*, if the Season is mild and warm, because they are tender Plants, and soon perish by being left abroad: the fourth and fifth flower in *April*: the sixth and seventh flower earlier in *Turkey* than the others; so also after accustomed to our Air, where they flower in the end of *March*, or in *April*: the eighth flowers earlier than the rest by a Month, viz. in the beginning of *March*, or earlier, if the Weather is mild: the ninth, tenth, eleventh, twelfth and thirteenth flower in *April*, some of them a little one before another: the fourteenth and fifteenth flower not till *May*.

XX. The *Qualities*, *Specification*, *Preparations* and *Virtues*, are much the same with those in Chap. 189. foregoing, to which I refer you.

CHAP. CXCI.

Of DAFFODIL broad-leav'd, double flower'd.

THE Names. It is called in Greek, *Ναρκισσος* *Ναρκισσος*; in Latin, *Narcissus latifolius multiplex flore, vel flore pleno*: in English, *Daffodil broad-leav'd, double-flower'd*.

II. The Kinds. There are six several sorts of this, viz. 1. *Narcissus albus multiplex*, The double white *Daffodil*. 2. *Narcissus medio purpureus multiplex*, The double purple-ring'd *Daffodil*. 3. *Narcissus medio luteus corona duplici*, The double Crown'd *Turkey Daffodil*. 4. *Narcissus Chalcedonicus flore pleno albo polyanthos*, The double white *Daffodil*, with many Flowers. 5. *Narcissus Chalc-*

cedonicus simbritis multiplex polyanthos, The great double many-flower'd purple-ring'd *Daffodil* of *Constantinople*. 6. *Narcissus cypricus flore pleno luteo polyanthos*, The many-flower'd double yellow *Daffodil* of *Cyprus*.

III. The Descriptions. The first, or Double purple-ring'd, from a bulbous Root has Leaves not very broad, but of a mean size, of the same Largeness of the Purple-ring'd *Daffodil* following. The *Stalk* rises up to half a yard high, bearing at top thereof one Flower, and no more, consisting of many Leaves, of a fair white color: The Flower is larger than of any other Double white *Daffodil*, having every Leaf, especially the outermost, as large almost as any Leaf of the Single *Daffodil* with the yellow Cup, or purple Ring. Sometimes the Flower is very little double, and almost single, but then it is either in a bad Ground, or it has stood long in the place without removing; for then it has such a great encrease of Roots, that they draw away the Nourishment, to the spoiling of the Flower: but if you transplant it, taking away the Offsets, and set the Root single, it will thrive, and bear a goodly double Flower, and of a very sweet Smell.

IV. The second, or Double purple-ring'd, from a bulbous Root has broad Leaves spring up, little differing from the Leaves of the Single purple-ring'd, it being probably of the same Species. The Flower (being sometimes but one on a Stalk, and sometimes two) consists of six white outer Leaves, as large as the Leaves of the Single kind, having many small yellow pieces, edged with purple Circles round about them, instead of a Cup: and in the midst of these pieces stand six other white Leaves, lesser than the former, and a yellow Cup, edged also with a purple Circle, parted into pieces, and they comprehending a few other white Leaves, smaller than any of the other, having among them some broken pieces of the Cup, with a few Chires in the middle of the Flower, which is of a very sweet Smell.

V. The third, or Double-crown'd *Turkey*, has a Root like unto the last, or somewhat larger, from whence spring forth three or four Leaves, as large and long almost as the Great double white next following; the *Stalk* is also near as great, and full as high, bearing at the top four or five Flowers, whose Leaves are as large as the Early Narbone or Common French, (in cap. 190. sect. 10, 11.) but not full out of so pure a white color: they are six in number, and stand like the former French *Daffodils* now named, but that the yellow Cup in the middle of this is thick and double, or as it were crumpled together, not standing very high to be seen, but keeping low and short; so that it is not presently taken notice of, unless precisely lookt upon. This Flower is of an exceeding sweet Smell.

VI. The fourth, or Double white many-flower'd, has a Root great and thick, covered with a blackish Skin, which sends forth many very broad and very long Leaves, more green than grey; among which rises up a strong round Stalk, being sometimes almost flat and ribbed, bearing four or five, or more, white Flowers at the top, every one being very great, large and double, the Leaves being confusedly set together, having little pieces of a yellow Cup running among them, without any shew of that purple Ring which is in the former; these fall away without bearing Seed, even as all or most other double Flowers do. It is a beautiful and goodly Flower, desirable for its Beauty and Duplicity, as also for its exceeding sweet and strong Smell; one Stalk of Flowers being instead of a Nosegay.

VII. The fifth, or Great double purple-ring'd, differs little or nothing in Root or Leaf from the former; the only difference is in the Flowers, which,

tho' they are double, and bear many upon a Stalk, like unto the former, yet this has the pieces of the yellow Cups tipped with purple, as if they were shored or scattered among the white Leaves, whereas the other has only the yellow, without any appearance of purple Tips upon them: the Smell of this is as strong and sweet as any of the other.

VIII. The sixth, or Many-flowered double yellow of Cyprus, has a bulbous Root, like to the former, and its Leaves are almost as long and as broad as the other. The Stalk is a foot high and more, bearing on its top four or five Flowers, every one very double, of a fine pale yellow color, and of a strong sweet Smell.

IX. The Places. The first was brought into England out of Cambray, where it grows Wild. All the rest came from Constantinople at several times: the last also grows in Cyprus, and some also say in Barbary, about Argiers and Fez; and some of them grow in Candia, as also about Aleppo, and some other Places in the Turks Dominions. Now they are made Denizens of our Kingdom, and grow frequently in our Gardens.

X. The Times. The first flowers about the middle or end of April: all the other Turkey kinds flower very early, in the middle or end of March, or beginning of April at farthest.

XI. The Qualities, Specification, Preparations and Virtues, are the same with those in Chap. 189. foregoing, to which you are referred.

CHAP. CXCH.

OF DAFFODIL narrow-leav'd, single-flowered.

THE Names. It is called in Greek, *Ναρκισσος*: in Latin, *Narcissus angustifolius simplex*: in English, Single-flowered, narrow-leav'd Daffodil.

II. The Kinds. The most observ'd are about nine in number, viz. 1. *Narcissus angustifolius albidus praecox oblongo calice*, The early white narrow-leav'd Daffodil, with a long Cup. 2. *Narcissus medio croceus tenuifolius*, The Saffron-crown'd narrow-leav'd small Daffodil. 3. *Narcissus minimus medio purpureus*, The least purple-ring'd Daffodil. 4. *Narcissus minimus flore juncefolii*, The least Daffodil of all. 5. *Narcissus autumnalis minor albus*, The little white Autumn Daffodil. 6. *Narcissus autumnalis albus medio obsoletus*, The white Autumn Daffodil with a decayed Crown. 7. *Narcissus angustifolius luteus semper florens*, The yellow Italian Daffodil, always flowering. 8. *Narcissus angustifolius, vel juncefolius maximus amplo calice*, The Great Junquilia with a large Flower or Cup. 9. *Narcissus Virginicus, vel Virginianus, seu Lilionarcissus Virginianus*, The Virginia Daffodil.

III. The Descriptions. The first of these, or Early white narrow-leav'd Daffodil, from a bulbous Root has three or four narrow, long and very green Leaves, a foot long generally. The Stalk rises not so high as the Leaves, on which grows one Flower, (not full out so large as the Late-flowering Daffodil with a long Cup, among the Broad-leav'd kinds) which consists of six pale-color'd Leaves, not of a pure white, but with a mixture of a light yellow among the white. The Cup in the middle is round and long, (yet not so long as to be accounted a Bassard Daffo-

dil) within which is a middle Pointel, compassed with six Chives, having yellow mealy Pendants.

IV. The second, or Saffron-crown'd narrow-leav'd small Daffodil, has a Root small, round and a little long withal, covered with a blackish Skin, which sends forth four or five narrow Leaves, about a span long; among which rises up a Stalk eight, nine or ten inches high, bearing at top one small white Flower, consisting of six Leaves, with a small yellow Cup in the middle, shadowed over at the brims with a Saffron color.

V. The third, or Least purple-ring'd, has a bulbous Root, small narrow Leaves, shorter by much than any of the Purple-ring'd Daffodils before described. The Stalk and Flower keep an equal proportion to the rest of the Plant, being in Form and Color of the Flower like unto the Star Daffodil before described, but unlike in Magnitude. The purple color which encircles the brims of the Cup, is so small, that sometimes it is not easily perceived.

VI. The fourth, or Least of all, has a Root small, even the smallest of any Daffodil, and covered with a black Skin; from whence spring two or three whitish green Leaves, narrower than the two last foregoing, and shorter by half, being not above two or three inches long: nor is the Stalk above three or four inches high, bearing one single Flower at top, something larger than the proportion of the Plant should seem to admit, and not much unlike to the Least Rush Daffodil, and of the same bigness, or rather somewhat bigger, being of a faint yellow color, both Leaves and Cup or Crown; for the middle part is spread very much, even to the middle of the Leaves almost, and lyes flat open upon the Flower.

VII. The fifth, or Little white Autumn, has a bulbous small Root, and blackish on the outside, which rises with its Flowers first out of the Ground, without any Leaves at all. It first springs up with one or two Stalks three or four inches long, every one bearing, out of a small Husk, one small white Flower, laid open abroad, like unto the Star white Daffodil before described. In the midst of the Flower is a small yellow Cup, of a middle size. After the Flower is past, there comes in the same place a small Head, containing small, round, black Seeds, like unto the Autumn Hyacinth. After the Seed is ripe and gone, then spring up the Leaves, which are small and narrow, not much bigger than those of the Autumn Hyacinth afore-named.

VIII. The sixth, or White Autumn with a decayed Crown, from its bulbous Root has two or three Leaves at most, and very narrow, (so that some account it among the Rush Daffodils) somewhat broad at bottom, and more pointed at top; between which Leaves comes up the Stalk, bearing usually two Flowers, and no more, made of six white Leaves apiece, pointed, and not round. The Cup is small and round, like unto the Cup or Crown of the Least Rush Daffodil, of a yellow color at bottom, but of a dun color towards the edge.

IX. The seventh, or Yellow Italian always flowering, has a bulbous Root, from whence spring a number of small, long, narrow, and very green Leaves, broader than the Leaves of any Rush Daffodil; among which rise up divers Stalks, bearing at their Heads two or three Flowers apiece, each of them being small and yellow, with a small Crown, of a deeper yellow than the former. It is said never to cease bearing Flowers, but that after one or more Stalks have been in flower together, and are past, others succeed in their places.

X. The eighth, or Great Junquilia with a large Flower, has a Root which is greater and longer than the Rush Daffodils, covered with a blackish Skin; from whence spring up several long green Leaves,

like unto the Ruth Daffodils, but thicker and broader, so that it may very well be accounted among the Narrow-leav'd Daffodils. Every Stalk bears at its top two or three very fair large Flowers, with a large and more open Cup than in any of the said Ruth Daffodils; both of them of a fair yellow color, but the Cup a little deeper than the Flower, and a little crumpled about the edges, having a pretty strong or sharp pleasant Smell. This Plant, by its Name, should seem to be of the Ruth kind, which Name it obtained by reason of the Likeness of its Leaf to them: but in Consideration its Leaf is broader and larger than any of the Ruth Daffodils, Authors have placed it among the Narrow-leav'd, tho' it might have indifferently been placed in the Rank of either Species.

XI. The ninth, or Single white Virginian, has a Root small, long and round, blackish on the outside, and white within; from whence rise up two or three long, and very narrow, green, shining Leaves, growing sometimes reddish about the edges: between these Leaves rises up the Stalk, about five or six inches high, or more, bearing on the Head thereof one Flower, and no more, standing upright, like a little Lilly or Tulip, made of six Leaves, wholly white, both within and without, except that at the bottom next to the Stalk; and a little on the backside of the three outer Leaves, it has a small dash of a reddish purple color. It has also in the middle a few Chives, standing about a small pointed Head, which Head grows to be small and long, containing small, blackish, flat Seed.

XII. The Places. The first and second of these grows with the Broad-leav'd ones on the Pyrenean Mountains, from whence they were brought into our Gardens: the native places of the third and fourth are unknown: the fifth *Clusius* saw growing in Spain: the sixth is also a Native of the same Country: the Original of the seventh is unknown: the eighth we only know to grow in our Gardens: the ninth was brought to us from Virginia, where they grow in great abundance. All these, by Transplantation and Care, are now found to grow in English Gardens.

XIII. The Times. The first flowers early, a Month before the other Narrow-leav'd kinds, viz. in the very beginning of March, if the Weather is mild: the second, third and fourth flower in April: the fifth flowers in the beginning of Autumn, and the Seed is ripe in the end of October, in hot Countries; but in ours, it seldom comes to more than Flowering: the sixth flowers in Autumn: the seventh flowers all the Summer long, whence came the Addition to its Name of *Semper florens*: the eighth flowers in April; and the ninth in the end of April, and beginning or fore part of the Month of May.

XIV. The Qualities, Specification, Preparations and Virtues, are accounted the same with the Daffodils in Chap. 189. foregoing, so that no more need be said thereof.

C H A P. CXCIII.

OF DAFFODIL narrow-leav'd, double-flowred.

1. **THE Names.** It is called in Greek, *Ναρκισσός* *εὐκρίστος* *πλάγιος*: in Latin, *Narcissus angustifolius flore pleno*: in English, Daffodil narrow-leav'd double-flowred.

II. The Kinds. It is twofold, viz. 1. *Narcissus angustifolius flore albo pleno*, Narrow-leav'd white double-flow'd Daffodil. 2. *Narcissus angustifolius flore aureo pleno*, The narrow-leav'd double Golden-flow'd Daffodil.

III. The Descriptions. The first, or Double-flowred narrow-leav'd Daffodil, has a Root very like unto the former Single Virginian Daffodil (in cap. 192. sect. 11.) but it is a little larger and rounder, a little long withal, and blackish on the outside, as that is, from whence rise up two Leaves, somewhat broader than that, but of a like Greenness. The Stalk rises up between these Leaves about a span high, or not much higher, bearing one fair double Snow-white Flower, very like in the Form or Shape to the Lesser French double Bastard Daffodil hereafter to be described; for it is in like manner laid open flat, and composed of six Rows of Leaves, every Row lying in order just opposite, or one before another, whereof those six Leaves, which make the first or outwardmost Course, are the greatest, and all the rest lying one upon or before another, every Row being smaller than the others: in the middle thereof comes forth a small, long, pointed Fork or Horn, white in some sort, like to the Flower it self.

IV. The second, or Double Golden narrow-leav'd, has a Root almost like the Common Junquilia, or Ruth Daffodil, from which spring up very narrow Leaves, four or five inches long, of a whitish green color; from among which rises up a Stalk, about a foot high, bearing at the top a Flower, consisting of some outward Leaves, which are of a yellow color, and of many other Leaves in the middle, being smaller, and set thick and round together, of a more yellow Gold color, but with some whiter Leaves among them, the middle part a little pointing forth: the Flower stands long before it does perfect its color, and abides long in Flower before its color decays.

V. The Places. It has been found growing in several places of Virginia, from whence it has been brought to us: it has also been found growing in the Lawns of Carolina.

VI. The Times. It flowers in Virginia towards the latter end of March, or beginning of April: but with us here in England in the end of April.

VII. The Qualities, Specification, Preparations and Virtues, are said to be the same with the Daffodils in Chap. 189. to which I refer you.

VIII. An Observation. I have been told by some of the Indians, that if the Juice of the Root be given for some considerable time, inwardly in the Spring of the Year; and that the Root it self, by being beaten and made into a Cataplaim, be also at the same time applied to Tumors in the Neck and Throat, it will cure them. I suppose the Tumors here meant, are *Strumous*.

C H A P. CXCIV.

OF DAFFODIL Ruth, single-flowred.

1. **THE Names.** It is called in Greek, *Ναρκισσός* *εὐκρίστος* *ἀπλός*: in Latin, *Narcissus funiculifolius flore simplici*, *Bulbus Vomitorius* *Dioscoridis*: in English, Daffodil Ruth-leav'd single-flowred, or, Single-flowred Junquilia.

II. The Kinds. There are about twelve several sorts of this Flower, viz. 1. *Narcissus funiculifolius albus simplex*, The white Junquilia. 2. *Narcissus funiculo-*

Functifolius albus magno Calice, The white Junquilia with a great Cup. 3. *Narcissus Functifolius flore albo reflexo*, The white turning Junquilia, or Rush Daffodil. 4. *Narcissus Functifolius flore lateo reflexo*, The yellow turning Junquilia, or Rush Daffodil. 5. *Narcissus Funceus Calice albo foliis reflexis luteis*, The yellow turning Junquilia with a white Cup. 6. *Narcissus Funceus Calice luteo foliis reflexis albidis*, The white turning Junquilia with a yellow Cup. 7. *Narcissus Functifolius luteus magno Calice*, The Junquilia, or Rush Daffodil with a great Cup. 8. *Narcissus Functifolius luteus vulgaris major*, The common or ordinary Junquilia, or Rush Daffodil. 9. *Narcissus Functifolius luteus medius*, The middle-siz'd Junquilia, or Rush Daffodil. 10. *Narcissus Functifolius luteus minor*, The lesser Junquilia, or Rush Daffodil. 11. *Narcissus Functifolius luteus, lineis albicantibus distinctus*, The yellow Junquilia, or Rush Daffodil with white Lines. 12. *Narcissus Functifolius Autumnalis flore viridi*, The Autumn Rush Daffodil, or Junquilia, with a green Flower.

III. The Descriptions. The first, or White Junquilia, has a small bulbous Root, covered with a blackish Skin; from whence spring forth small long Leaves, a little broader, and of a whiter green color than the Ordinary yellow Junquilia, or Rush Daffodil. The Stalk rises up half a foot high or more, bearing two or three small white Flowers upon a Stalk, yet somewhat larger than the Common yellow Junquilia, having a small round Cup in the middle, white also as the Leaves are. The Seed is small, black and round, as the Seeds of other Daffodils are.

IV. The second, or White with a great Cup, has a Root, Leaves and Stalk in all respects like the former; the Flower and Seed is also like, but in this it differs, that the Cup in the middle of the Flower is a little larger than the former.

V. The third, or White turning, has a bulbous or round Root, small, and a little long withal, covered with a blackish brown Skin; from whence spring up four or five long green Leaves, yet shorter and broader than the Common yellow Junquilia, and fully as green; from among which rises up a slender green Stalk, a foot high, bearing at its top, out of a skinny Husk, three or four, or more Snow-white Flowers, standing upon long green Foot-stalks, every Flower hanging down its Head, and turning up its six narrow and long Leaves, even to a very Foot-stalk again: from the middle of the Flower hangs down a long round Cup, as white as the Leaves; within which are contained three small white Chives, tipped with yellow, and a small long Pointel, thrusting out beyond the brims of the Cup: after the Flowers are past, there comes up in their places small three-square Heads, in which is contained very small, round and black shining Seed. The Flower is white, without any good Smell, or indeed rather none at all.

VI. The fourth, or Yellow turning up, has a bulbous Root, from whence rise up long Rush-like Leaves, but they are greater and longer than the former, and of a paler green color: the Stalk rises somewhat higher, bearing two or three Flowers thereon, wholly of a Golden yellow color, both the Cup and the Leaves, which turn up again.

VII. The fifth, or Yellow turning up with a white Cup, has from a round Root several long Rush-like Leaves rising up, and standing upright, like the former, between which rises up a green Stalk, about a foot or more high, bearing two or three Flowers thereon, whose turning up Leaves are of a fair pale yellow, and the Cup of a pale white, but not of so delicate or pure a white as the former.

VIII. The sixth, or White turning up Junquilia with a yellow Cup, differs not much either in its

Roots, Leaves, Stalk or Flowers, save, that as the last had the Leaves of the Flower, which turns up again yellow, and the Cup whitish; so this has contrariwise, the turning up Leaves of a whitish yellow, and the long Cup yellower; otherwise the difference is inconsiderable.

IX. The seventh, or Junquilia with a great Cup, has a round or bulbous Root, from which spring larger Leaves, and longer than the Ordinary or Common yellow Junquilia, being a little flat on one side, and round on the other, but of the same Greenness with all the rest: the Stalk riseth up two feet high, bearing two, and sometimes three Flowers thereon, being of a fair yellow color, with a large open Cup in the middle, of a little deeper yellow color, like unto the Great Junquilia with the great Flower before described, of which this doubtless is a kind, but that this is smaller and lesser than that, both in Leaf and Flower, and Cup, &c. being somewhat lesser in all its other parts.

X. The eighth, or Common or Ordinary Junquilia, has a round or bulbous Root, which is blackish on the outside, from which spring four or five long, round, green Leaves, like unto Rushes, from whence came the Name; from among which Leaves rises up a Stalk, round and green, a foot and half or more high, bearing at the top three or four Flowers, all yellow, but much smaller than the last, and so is the Cup also. The Seed is small and black, enclosed in small cornered Heads. The Smell of the Flower is very sweet in all these sorts of Junquilia, or Rush Daffodils.

XI. The ninth, or Middle-siz'd Junquilia, is like unto the former in its bulbous Root, Rush-like Leaves, Stalks and Flowers, save, that the Leaves are smaller and rounder, the Stalk rises up not so high, nor are the Flowers so great, but the Leaves of the Flower are a little rounder, and not so pointed as in the former, but in all things else they are alike, this being only the lesser.

XII. The tenth, or Small Junquilia, has a Root round, small and black, very like unto the last, from whence spring up five or six small green Leaves, a little broader, but not so long as the last; from among which rises up a Stalk almost a foot high, bearing one or two small Flowers at the top, of a paler yellow color than the former, with a yellow open Cup (or Crown rather) in the middle, bigger than in either of the two last.

XIII. The eleventh, or Yellow Junquilia with white Lines, has a Root not differing from the former, from which spring forth round, long, green Leaves, like to the Ordinary or Common Rush Daffodil, with a Stalk bearing two or three yellow Flowers, having Leaves somewhat round at the point or end, with a Line or Strake of white in the middle of every one of them: the Cup is short and Crown-fashion, and a little crumpled about the edges or brims. The Seed is like to the other kinds.

XIV. The twelfth, or Autumn Rush with a green Flower, sends forth from its Root but one only Leaf, very long, round and green, which while this green Leaf is fresh and to be seen, bears no Flower; but that being faded away, a Stalk afterwards rises up, very much like to the former green Leaf, round, naked and green up to the top, where two or three Flowers break forth out of a small thin Skin, every one consisting of six small and narrow green Leaves, very sharp-pointed at the end, and as it were ending in a small Prick or Thorn; in the middle of which is a small round Cup, (or rather Crown) of the same color with the Leaves and Stalk; which Flower smells very sweet, like unto the rest of the Rush Daffodils or Junquilia.

XV. The Places. The original or native places from

from whence these have been brought to us, were Italy, Spain, the Pyrenean Mountains, and Southern parts of France: the twelfth is a Native of Barbary, and was brought to us from France. Now, by Industry and careful Cultivation, they are all become free Denizens, if not Natives of our Country, where, in the Gardens of our Florists, they thrive very well.

XVI. *The Times.* They most of them flower in the Spring, in March, (if it is mild) and April and May, the Seed ripening in some reasonable time after: but the first or twelfth flowers not till October, and the Frosts coming soon after, causes it suddenly to perish.

XVII. *The Qualities, Specification, Preparations and Virtues,* are much one and the same with those of the Common Daffodil in Chap. 189. to which I refer you.

C H A P. CXC.

Of DAFFODIL Russh, double-flowered.

THE Names. It is called in Greek, *Ναρκισσος ῥοδαῖος*; in Latin, *Narcissus Juncifolius flore multiplici*, *Narcissus Juncifolius flore pleno*, *Bulbus Vomitorius Dioscoridis flore pleno*: in English, Russh Daffodil, or Junquilia double-flowered.

II. *The Kinds.* There are but two usual kinds of this double sort, viz. 1. *Narcissus Juncifolius luteus flore pleno*, The double Junquilia, or Russh Daffodil. 2. *Narcissus Juncifolius luteus flore pleno minor*, The lesser Junquilia, or Russh Daffodil.

III. *The Descriptions.* The first of these has a Root which is bulbous or round, and blackish brown on the outside, so like unto the Common Russh Daffodil, that it is almost impossible to know the one from the other; from which spring forth long, round, green Leaves, like the Leaves of the Common or Ordinary Junquilia, or Russh Daffodil, and of the same bigness, among which rises up a long, slender, green Stalk, bearing two or three, seldom more, small Flowers, yellow and double, viz. with several Rows of Leaves, having the yellow Cup such as is in the single Flower, broken into small shreds or pieces, running among the Leaves of the Flowers; which pieces in some Flowers are not so easily seen, being smaller than in others. This bears no Button or Head under the Flower, for Seed.

IV. *The second, or Lesser kind, is in its Root, Leaves, Stalk and Flowers very like to the former, save that its Flowers are smaller, and not so double, being one, two or three at most upon a Stalk; and also of much less Beauty.*

V. *The Places.* They are Natives of Italy, Turkey, Spain, the Pyrenean Mountains, and some Southern parts of France: but flourish very well with us in our Gardens.

VI. *The Times.* Their chief times of flowering are in March, April and May.

VII. *The Qualities, Specification, Preparations and Virtues,* are much the same with those of the Common Daffodil in Chap. 189. foregoing.

VIII. *An Observation.* The Juice of the Root, whether of single or double Junquilia's. It may be given, to cause Vomit and cleanse the Stomach, from 1 spoonful to 2 or more, mixed with a Glas

of White Wine or warm Water, in the Morning fasting; it carries off thick and viscous Humors, and the Matter which causes the King's-evil: Some mix it with Vinegar for the same purpose. It also purges downwards afterwards, the rest of those thick tough Recrements.

IX. *Observ. 2. The Decoction in Wine.* It does also the same thing with the Juice, but it is pleasanter, and works more gently, and mostly by Stool, if it is corrected with Aniseed, Ginger and other Spices, to abate the Churlishness of the Working. I have found it by Experience to be good against a Paralysis, if it was recent, and the Patients had Strength and Youth on their sides.

X. *Observ. 3. The Root made into a Cataplasma,* and applied, or into an Ointment, as you do Pilewort Roots, is an excellent thing to be applied to Strumous Tumors or Swellings in the Throat or other Parts, whether they be whole, or broken and ulcerated.

C H A P. CXCVI.

Of DAFFODIL Sea.

THE Names. It is called in Greek, *Ναρκισσος θαλάσσιος*; in Latin, *Narcissus Marinus vel Litoralis*; and in English, Sea Daffodil.

II. *The Kinds.* There are four kinds thereof: the first is commonly called, *Narcissus Marinus magnus*, five *Tertius Matthioli*, The great white Sea Daffodil, or Matthioli's his third Daffodil. *Clasius* called it *Lilionarcissus Hemerocallis* and *Hemerocal-lidis facie*; and yet this seems not to be a proper Name, for that his *Hemerocallis* is a plain *Pancrati-um*, or Sea Basilard Daffodil, whose middle Cup is longer than the Cup of any true Daffodil, which is the chiefest Note of Difference between a True and a Basilard Daffodil. It may most fitly be called, *Narcissus Marinus maximus*, The greatest Sea Daffodil, because it is a true Daffodil, and the greatest of all others; as also because it has been found chiefly in Islands, or Places near the Sea. 2. *Narcissus Indicus Autumnalis quorundam Lobelii*, *Pancrati-um Indicum*, The Indian Autumn Sea Daffodil of Lobel. 3. *Narcissus Marinus Africanus*, five *Exoticus Lobelii*, The African Sea Daffodil. 4. *Narcissus Marinus Exoticus*, The strange Sea Daffodil: of all which in order.

III. *The Descriptions.* The first, or Great white Sea Daffodil, has a Root which by Age or a long Continuance, standing in one place without being removed, grows to be much greater and larger than any other Daffodil whatsoever, sometimes to be as large as any Ordinary Squill or Sea Onion, being black on the outside, and having many long, thick and white Fibres or long Roots, variously branched, and spread under the upper part of the Earth, besides some others which grow downwards, and perish not every Year, as the Fibres of all or most of the other Daffodils do; for which Reason this Plant will not thrive and bear Flowers, if it is often transplanted, but delights to continue in one place without removing, and where it may not be overshadowed with other Herbs standing too near it, which then will flourish, and bear many fine Flowers. From this Root arise six or seven, or more Leaves, twice so broad almost as any of the former Daffodils, but not so long by half as many of them, being rather short in Comparison of the breadth, and of a white green color: from the midft

midst of these Leaves, as also from the sides, springs up one Stalk, and sometimes two, or more, thick and roundish, and sometimes a little flat and cornered, a foot or more high, bearing at the top (out of a skinny Husk) eight, ten or twelve, or more very large Flowers, consisting of six white Leaves apiece, spread or laid open, with a white or short Cup or Crown in the middle, lying flat upon the Leaves, cut or divided into six Corners, (and not whole, as the Cup or Crown of any other Single Daffodil,) from every of which Edges or Corners of this Cup or Crown proceeds one white long Thread, a little crooked or turning up at the end, tipped with a yellow Pendent, and some other white Threads, tipped with yellow Pendants, standing also in the middle. After the Flower is past, great three-square Heads come forth, in which the Seed is contained, which is great, black and round, like unto the Seed of other Daffodils, but greater. The Flower has a pretty good Smell, but not very strong.

IV. The second, or Indian Autumn Sea, has a Root, as Lobel says, a span long, and of the thickness of a Man's Arm, covered with many white Shells, of which the outwardmost are of a dark red, or Chest-nut color. The Flowers are eight or ten in number, every one by its self upon a short Foot-stalk, made of six Leaves apiece, somewhat long, narrow and pointed, like unto the Flowers of the English Colchicum, or Meadow Saffron, of a whitish yellow dun color, with six long Threads in the middle. The green Leaves are long and broad, and broad-pointed. Some are of Opinion, that this Plant comes nearer to the Resemblance of an Hyacinth than of a Daffodil; but Lobel has numbered it among the Daffodils, whom we here follow, yet leave it to others Judgments to determine of which kind it is.

V. The third, or African Sea, has a Root very great, made as it were of many scaly Cloves, from whence rises up a small short Stalk, bearing, a little above the Ground, two fair, broad, green, pointed Leaves, longer than they are broad, so encompassing the Stalk at the bottom, that it seems to run through them: the Stalk is spotted with divers discolored Spots, and is bare or naked from these two Leaves unto the top, where it bears one fair double Flower, like unto a Double Anemone, of a diluted reddish color, tending to a bluish, with many Threads set about the middle Head.

VI. The fourth, or Strange Sea Daffodil, has a Root which is very great, yet like unto other Great Daffodils, the outward Skins of which are of a dark brown color. From this Root rise up five or six large and long Leaves, of a pale green color; from among which arises up a strong and large Stalk, bearing at top, out of a thin Husk or Skin, many very large Flowers, made of six long and pointed Leaves apiece, of a blewish purple color, with a large round open Cup in the middle, of a sadder color than the Leaves.

VII. The Places. The first was found by the Sea side in the Isle of Sardinia, and on the high Mountains also of the same Isle, where it has born (by Report) thirty five Flowers upon a Stalk: it grows also about Illyricum, and other Maritime places of the Mediterranean. The second grows in the upper part of Hispaniola in the West Indies. The third grows near the Cape of Good Hope, from whence it was brought into Holland. The last, the place of its Origin is unknown, but now they are all nourish'd up in Gardens.

VIII. The Times. The first springs later out of the Ground than any other Daffodil, viz. about the latter end of March or beginning of April, and flowers in the end of May or beginning of June; and the Seed is ripe in the end of July or beginning

of August. The second flowers in Autumn, viz. in September and October. The third and fourth flower in the Summer Months, earlier or later, as the Season is in Warmth.

IX. The Qualities, Specification, Preparations and Virtues, are the same with those of the Common Daffodil in Chap. 189. foregoing, which see in their places.

C H A P. CXC VII.

Of DAFFODIL Bastard, broad-leav'd single-flowred.

I. **T**HE Names. It is called in Greek, *Πετονάρκις* : in Latin, *Pseudonarcissus latifolius flore simplici* : in English, *Bastard Daffodil broad-leav'd, with single Flowers.*

II. The Kinds. There are nine several kinds commonly taken notice of, viz. 1. *Pseudonarcissus Anglicus vulgaris*, Our common English Bastard Daffodil. 2. *Pseudonarcissus Anglicus vulgaris alter*, Another common English white Bastard Daffodil. 3. *Pseudonarcissus tubo sexangulori*, The six-cornered Bastard Daffodil. 4. *Pseudonarcissus aureus Hispanicus maximus*, The great yellow Spanish Bastard Daffodil. 5. *Pseudonarcissus Pyreneus Hispanico & Anglico similis*, The Mountain Bastard Daffodil of divers kinds. 6. *Pseudonarcissus Pallidus præcox*, The early Straw-colored Bastard Daffodil. 7. *Pseudonarcissus Hispanicus flore albo major*, The greater white Spanish Bastard Daffodil. 8. *Pseudonarcissus Hispanicus maximus albidus*, The greatest Spanish white Bastard Daffodil. 9. *Pseudonarcissus Hispanicus flore albo mediocris & minor*, The lesser and mean white Spanish Bastard Daffodils.

III. The

III. The Descriptions. The first, or Common English, has a Root which is bulbous and somewhat blackish on the outside; from whence spring forth three or four greyish green Leaves, long and somewhat narrow; among which rises up the Stalk, about a span or somewhat more high, bearing at the top, out of a skinny Hunk, (as all other Daffodils have) one Flower, and sometimes two, something large, having the six Leaves which stand like Wings of a pale yellow color, and the long Trunk in the middle of a fair yellow, with the edges or brims a little crumpled or uneven. After the Flower is past, it bears a round Head, seeming three-square, containing round black Seed.

IV. The second, or Our common English white, is in Root, Leaves and Stalk, like to the other in almost all respects: but the Wings of its Flower are much more white than the former, and in a manner of a Milk-white color, the Trunk remaining almost as yellow as that in the foregoing, but not differing in any thing else.

V. The third, or Six-cornered, has a Root like to the others, from whence spring two or three long and somewhat broader Leaves than in the two foregoing; between which comes forth a Stalk, bearing one Flower, somewhat large, having the six outward Leaves of a pale yellow color, and the long Trunk plaited or cornered all along, unto the very edge, into six parts, of a little deeper yellow than the Wings.

VI. The fourth, or Great yellow Spanish, has a reasonable great Root, and blackish on the outside, pressing deep into the Ground, and therefore will run down, where it will encrease into many Off-sets; from whence rise up many thick, long and stiff Leaves, of a greyish green color; among which rises up a round strong Stalk, sometimes a yard high or higher, bearing at the top one only fair large yellow Flower, standing forth right, and not pendulous, consisting of six short and somewhat broad Leaves, with a very great, large and long Trunk, of an equal Bigness, but open at the Mouth, and turning up the brims a little, which are something crumpled. When the Flower is past, there comes in the place a three-square Head, containing round black Seed, like to other Daffodils.

VII. The fifth, or Mountain Bastard, of divers kinds; they have all of them a bulbous Root, which is blackish on the outside: but of this there are several sorts, as, 1. One which has very broad and whitish green Leaves, something short in Comparison with others of that breadth: the Flower is wholly yellow, but a little paler than the former Spanish kind, having the Leaves of its Flower long and a little narrow, standing like Wings about the middle of the Trunk, which is as long as the Leaves, and smaller than in many others of this kind, but a little yellower than the Wings. 2. One which has narrower green Leaves than the former, and longer; the Flower is all yellow, but the Trunk is larger, wider and more open at the Mouth than the other, and almost as large as the former Spanish, but not so high as the last. 3. One which has the Wings of the Flower, of a Straw color, but the Trunk is long and narrow, of a fair yellow. 4. One which has such like Flowers, but that it is shorter, both in the Wings and the Trunk. 5. Another which has the Wings of the Flower longer than the long Trunk, and sometimes shorter. 6. Another which has its Wings all yellow, or only a little more pale or white, like to the English kind. 7. Others which have their Trunks long and narrow, or larger, and wider open, and crumpled at the brims.

VIII. The sixth, or Early Straw-colored, from a bulbous Root, has Leaves rising up, of a mean size, between the broadest and narrower kinds, of a greyish

green color, and not very long: the Stalk rises up a foot high or more, on the top of which grows one large fair Flower, equalling the largest Spanish Bastard Daffodil, before described, in the Largeness of its Trunk, and having the brims turned up a little, which makes it seem the larger. The Wings or outward Leaves are in a manner as short as they are in the greatest Spanish kind, (and not long flagging down, like unto the Mountain kinds) and stand straight outright. All the whole Flower is of one even color, viz. of a fine pale yellow, not much unlike to the color of a fresh Limon Peel, but a little whiter, which we commonly call a Straw-color. It is a large Flower, and early in the Spring.

IX. The seventh, or Greater white Spanish, has a Root greater and thicker than the first Spanish at sect. 6. above, but does not encrease so much, nor is covered with a black, but rather with a whitish Skin. From this Root divers Leaves rise up together, long and broad, somewhat like to the first Spanish kind at sect. 6. but a little broader, and of a whiter green color, yet not so white as in the Lesser Spanish white kinds, after described. From among these Leaves rises up a round strong Stalk, about two feet high, bearing at its top one white Flower, bending down the Head, as all these White kinds do, but is not of so pure a white as the Lesser kinds which follow, yet whiter than the Greatest white Spanish kind, next to be described in sect. 10. The whole Flower, as well Trunk as Wings, is much larger than the Lesser white kinds, and almost equalling the first Spanish yellow, but a little longer and narrower, a little crumpled, and turning up at the brims; after which, there follows a Head and Seed, like to the first.

X. The eighth, or Greatest Spanish white, has a Root like to the former, but greater, being white on the outside, and not black. In the manner of its Growing, it is very like to the last, both in its Leaves and Flowers, but larger in both. The Flower of this is not full out so white, but has some shew of Pale-ness therein, and more upon the first opening of the Flower than afterwards, and is as great altogether as the Spanish yellow, at the least with a longer and somewhat narrower Trunk, after which come Heads of Seed, like the former.

XI. The ninth, or Lesser and mean white Spanish, are two other, one lesser than another, and both lesser than the two former White Spanish Daffodils. The Roots of both are like one another, but do differ in Greatness. The Leaves of both are of a whitish green color, one a little broader than the other. The Flowers of both are pure white, and bending down their Heads, that they almost touch the Stalk again: the greater Flower has the longer and narrower Trunk; and the lesser Flower, the shorter and wider open; yet both a little crumpled at the edges or brims. From the Seed of these has sprung great Variety, few or none keeping either the Color or Height of their Original.

XII. The Places. The first is common thro' all England, in Copses, Woods and Orchards, inasmuch that by its growing Wild, it is of the lesser value in our Gardens. The second is also English, yet is found growing on the Pyrenean Mountains. The third grows in Gardens. The fourth was brought out of Spain. The fifth, sixth, seventh, eighth and ninth came from the Pyrenean Mountains; and are also found in some parts of Spain: but with us they all grow in Gardens only.

XIII. The Times. The first, second and sixth are the most early: all the rest flower in April: and the greatest yellow, somewhat earlier than the other greater or lesser white.

XIV. The Qualities, Specification, Preparations and Virtues, are much the same with the Common

or *Vulgar Daffodils* in Chap. 189. foregoing, to which you are referred.

C H A P. CXCVIII.

OF D A F F O D I L Bastard, broad-leav'd double-flowred.

THE Names. It is called in Greek, *Ψευδο-κισσος πλατυέλλα πολλάπλοη*: in Latin, *Pseudonarcissus latifolius flore multiplici*; and in English, Bastard Daffodil broad-leav'd, with double Flowers.

II. The Kinds. Of this sort there are five kinds, viz. 1. *Pseudonarcissus Anglicus flore pleno*, The English double Bastard Daffodil, or Gerard's double Daffodil. 2. *Pseudonarcissus aureus maximus Anglicus flore pleno, flos Roseus Tradescanti*, The greatest English yellow double Bastard Daffodil, or Tradescant his great Rose Daffodil. 3. *Pseudonarcissus aureus major Anglicus*, The English great yellow double Bastard Daffodil, or Wilmer's great yellow double Bastard Daffodil. 4. *Pseudonarcissus aureus Hispanicus flore pleno*, The great double yellow Spanish Bastard Daffodil, or Parkinson's Bastard Daffodil. 5. *Pseudonarcissus Gallicus major flore pleno*, The greater double French Bastard Daffodil.

III. The Descriptions. The first, or English double Bastard, has a Root which is small, very like unto the French double kinds, especially the Lesser, to which it is so like, that it is hard to know the one from the other. From this Root arise Leaves very like unto the Single kinds, being of a whitish green color, and something broad, a little shorter and narrower, yet stiffer than the following French kind. The Stalk rises up about a foot high, bearing at top one very double Flower, the outermost Leaves being of the same pale color which is to be seen in the Wings of the Single kind; these which stand next them are some of as deep a yellow as the Trunk of the Single, and other some of the same pale color, with some green Stripes on the back of divers of the Leaves. Thus is the whole Flower variably mixt with pale and deep yellow, and some green Stripes among them, when it is fully open, and the Leaves dispersed and broken. Sometimes the Flower shews a close and round yellow Trunk in the middle, separate from the pale outward Wings; which Trunk is very double, shewing some pale Leaves within it, dispersed among the yellow: and sometimes the Trunk is more open, or in part broken, shewing forth the same colors intermixt within it. At length the Flower passes away, and without giving any Seed, as all other bulbous Roots do, which bear double Flowers.

IV. The second, or Greatest English yellow double, (called by Parkinson, The Prince of Daffodils) has a great round Root, like unto other Daffodils, covered with a brownish Skin; from whence rise up four or five somewhat large and broad Leaves, of a greyish green color, yet not fully so long and large as the next following: from the midst of which rises up a Stalk, almost as high and as great as it, bearing at its top, out of a skinny Husk, one fair, large, double Flower, (the Bud, before it breaks open, being shorter and thicker in the middle, and ending in a longer and sharper Point than any of the other Daffodils) very much spread open, consisting of smaller and shorter Leaves than the next following, but more

in number, and thicker and rounder set together, making it to seem as great and double as any Province Rose, and intermixt with divers yellow and pale Leaves, as it were in Rows, one under another. It continues long in Flower, and spreads by standing long, to be the broadest in Compaſs of any of the Daffodils; but it fades away at last without giving any Seed, as all double Daffodils do.

V. The third, or English great yellow double Bastard, has a thick great bulbous Root, which encreases as well as any other Daffodil; from which spring three or four large, long and broad Leaves, somewhat longer and broader than the former, and of a whitish green color. The Stalk rises to be about two feet high, if it grows in a fat and fruitful Soil, and is strong and something round, bearing at the top, out of a thin Husk or Skin, one large and fair double Flower, each Leaf of which is twice as large and broad as the last described, variously intermixt with a Row of paler, and a Row of deeper yellow Leaves, wholly dispersed throughout the Flower, the pale color as well as the deeper yellow, in this as well as in the Small English kind, growing deeper by standing: sometimes the Leaves thereof are scattered and spread wholly, making it shew a fair, broad, open Flower; and sometimes the outer Leaves stand separate from the middle Trunk, which is whole and unbroken, and very thick of Leaves, and sometimes the middle Trunk will be half broken, neither expressing a full open double Flower, nor a close double Trunk, as it is also seen in the Small English kind: at length the Flower passes off without bearing any Seed. This Great double Bastard Daffodil does so near resemble our Common double English kind, that there is little other Difference found between them, but in the Largeness of the Leaves and Flowers, and in its Statelineſs, and magnificent way of Growing.

VI. The fourth, or Great double yellow Spanish, has a great bulbous Root, covered with a dark-colored Skin, and whitish on the inside: from this Root divers Leaves rise up, stiffer, narrower, and not of so whitish a green color as the former, but more dull or greyish, plainly resembling the Leaves of the Single great kind; from whence 'tis said this took its Original: The Stalk hereof also rises almost as high as it, and near the height of the last described, bearing one double Flower at top, always spread open, and never forming a double Trunk, like the former, yet not so fair and large as it; the outermost Leaves whereof, being of a greenish color at first, are afterwards more yellow, and do a little turn themselves back again to the Stalk: the other Leaves are some of a pale yellow, others of a more Gold yellow color: those which stand in the middle are smaller, and some of them shew as if they were hollow-trunked; so that they seem to be greenish, whitish, yellow and Gold-yellow, all mixed one among another. Parkinson thinks himself to be the first that ever had this Flower in England, his being of his own raising, and flowering first in his Garden.

VII. The fifth, or Greater double French, has a Root very like unto the Lesser kind, but a little bigger and longer; from which spring whitish green Leaves, longer and broader than the Smaller French kind, hereafter to be described, and broader and longer, and more limber than the Double English kind at sect. 3. above. The Stalk rises up not much higher than the Smaller French kind, but a little bigger, bearing at its top one great double Flower, which when it is perfectly blown open, (which is but seldom, by reason of the Leaves cleaving very fast one to another) becomes a fair and goodly Flower, larger by half than the Smaller kind, and fuller of Leaves, of the same pale whitish yellow or Limon color with

the Lesser, or rather a little whiter, and not set in the same Order of Rows, as that is, but more confusedly together, and turning back the ends of the outermost Leaves to the Stalk again, neither of which is found in the Lesser kind.

VIII. *The Places.* The first is natural of our own Country; for Gerard found it in an old Womans Garden in the West of England, where it grew before the Woman came to dwell there: and Parkinson says, That he heard that it was a Native of the Isle of Wight. The second is unknown as to its Original, but it seems to be a Native in John Tradescant his Garden. The third, as far as we can learn, is an English Plant, growing in the Garden of Vincent Sion, (a Fleming) dwelling on the Bank side of the River Thames, from whom Mr. Wilmer of Stratford Bow had it; after which it went by Wilmer's Name. The fourth, Parkinson says, was of his own raising: he says it was assuredly raised from the Seed of the Great Spanish single kind, which he sowed in his own Garden, and cherished it, till it gave such a Flower as is described. The last, its Origin is not certainly known; some think it came from France, others from Germany.

IX. *The Times.* They all flower much about one time, viz. from the middle of March, as the Year is in forwardness, unto the middle of April.

X. *The Qualities, Specification, Preparations and Virtues.* are much the same with those of Common Daffodil in Chap. 189. foregoing, which see in the place cited.

C H A P. CXCIX.

Of DAFFODIL Bastard, narrow-leav'd single-flowred.

I. *THE Names.* It is called in Greek, *Ψευδο-κισσος ενόβυλλος ἀπλός*: in Latin, *Pseudonarcissus angustifolius flore simplici*: in English, Bastard Daffodil narrow-leav'd with single Flowers.

II. *The Kinds.* Of this there are three several sorts, viz. 1. *Pseudonarcissus angustifolius flore flavescente Taxo quasi abscesso*, Bastard Daffodil narrow-leav'd, with a clipt Trunk. 2. *Pseudonarcissus Hispanicus medius & minor luteus*, Spanish yellow Bastard Daffodils, the two lesser kinds. 3. *Pseudonarcissus Hispanicus luteus minimus*, The least Spanish yellow Bastard Daffodil.

III. *The Descriptions.* The first, or Narrow-leav'd Bastard, with a clipt Trunk, has a bulbous Root, from which spring long and narrow greyish green Leaves, bearing one single Flower at the top of its Stalk, like unto the former Single Bastard kinds, having its outer Leaves of a pale yellow color, and its Trunk of a deeper yellow. The chief Differences of this from the English double Bastard in the former Chapter, is in the Leaves, being narrow, and then in the Trunk of the Flower, which is not crumpled or turned up, as most of the others are; and that the brims or edges of the Flower, are as if they had been clipt off or cut even.

IV. *The second, or Spanish yellow Bastard lesser kinds, have a Root which is but small, and covered with a darkish Skin. These two Lesser kinds do differ but in Greatness the one from the other, and not in any thing else; so that in describing the one, you may understand the other. The Lesser then has three or four narrow, short, whitish green Leaves; from*

among which comes forth a short Stalk, not above an Hand Breadth or half a foot high, bearing one single Flower, not fully standing out right, but a little bending down, consisting of six small Leaves, standing as Wings about a small but long Trunk, a little crumpled at the brims. The whole Flower, as well Leaves as Trunk, are of one deep yellow color, like unto the Great Spanish kind.

V. *The third, or Least Spanish yellow Bastard, has a Root smaller than either of the former; the Leaves of this Small kind are smaller and shorter than the last, seldom exceeding the length of three inches, and very narrow withal, but of the same greyish green color with the former; every Flower stands upon a small and short Root-stalk, scarce rising above the Ground; so that its Nose, for the most part, does lye on or touch the Earth, and is formed after the same Fashion, and of the same color with those immediately going before, but much lesser.*

VI. *The Places.* The first is a Native of the Pyrenean Mountains. The second are Natives of Spain: and the third was also brought from thence to us: and are all now nurs'd up in our Gardens.

VII. *The Times.* The first flowers at the end of March. The second and third about the beginning of March: but with us they flower something later, because of the Coldness of our Climate.

VIII. *The Qualities, Specification, Preparations and Virtues,* differ not much from the Common Daffodils in Chap. 189. foregoing; but these are supposed to be something weaker.

C H A P. CC.

Of DAFFODIL Bastard, narrow-leav'd double-flowred.

I. *THE Names.* It is called in Greek, *Ψευδο-κισσος ενόβυλλος πολλαπλός*: in Latin, *Pseudonarcissus angustifolius flore multiplici, vel pleno*; and in English, Bastard Daffodil narrow-leav'd, with a double Flower.

II. *The Kinds.* It is singularis sui generis, without any sub-ordinate Species; and is vulgarly called, *Pseudonarcissus Gallicus minor flore pleno*, The lesser French double Bastard Daffodil.

III. *The Description.* The Roots of this Lesser French kind, are like unto the Double English kind, as also to the former Double greater French kind; and the Leaves are of the same whitish green color also, but narrower, and not longer: the Stalk rises a little higher than the English, and not fully so high as the Greater French, bearing one fair double Flower on its top, of a pale yellow or Limon color, consisting of six Rows of Leaves, every Row growing smaller than other unto the middle, and so set and placed, that every Leaf of the Flower does stand directly almost in all, one upon or before another, unto the middle, where the Leaves are smallest, the outermost being the greatest, which makes the Flower seem the more beautiful. This and the Greater kind has no Trunk, or shew of any other thing in the middle, as all or most of the other former Double Bastard Daffodils have, but are Flowers wholly composed of Leaves, standing double even to the middle. Parkinson doubts whether this or the Greater French Bastard, ought to be called Bastard Daffodils or not, because the Flower in neither of them is made after the Fashion of other Bastard Daffodils, but rather resembles the Form of the Double white Daffodil.

IV. *The*

IV. *The Places.* This French double kind grows about Orleans in France, where it plentifully abounds; but with us in England, it is only nurs'd up in Gardens.

V. *The Times.* It flowers from the middle of March to the middle of April.

VI. *The Qualities, Specification, Preparations and Virtues,* are the same with the Common Daffodil, all which are discours'd in Chap. 189. foregoing.

C H A P. CCI.

Of DAFFODIL Bastard, Rush-leav'd.

I. *THE Names.* It is called in Greek, *Ψευδο-κισσος ορειανός*: in Latin, *Pseudonarcissus Funcifolius*, vel *Funceus*: in English, *Bastard Rush Daffodil*.

II. *The Kinds.* Authors make four several sorts of this Plant, viz. 1. *Pseudonarcissus Funcifolius albus*, The white Bastard Junquilia, or Rush Daffodil. 2. *Pseudonarcissus Funcifolius luteus major*, The greater yellow Bastard Junquilia, or Bastard Rush Daffodil. 3. *Pseudonarcissus Funcifolius luteus minor*, The lesser yellow Bastard Junquilia, or Rush Daffodil. 4. *Pseudonarcissus Funcifolius luteus serotinus*, The late yellow Bastard Junquilia, or Rush Daffodil.

III. *The Descriptions.* The first, or White Bastard Junquilia, has a bulbous Root, from which rise up two or three long and very green Leaves, very like unto the Small yellow Junquilia, or Rush Daffodil before described, but not altogether so round: from among which rises up a short Stalk, about six inches high, bearing at top, out of a skinny Husk, one small white Flower, sometimes declining to a pale color, having six small and short Leaves standing about the middle of the Trunk, which is long, and much wider open at the mouth than at the bottom. The small outward Leaves or Wings are a little tending to green, and the Trunk, as I said, is either white or whitish, having the brims or edges a little uneven. The Seed is small, black and round, like unto other Junquilia, or Rush Daffodils, but smaller.

IV. *The second, or Greater yellow Bastard Junquilia*, has a bulbous Root, bigger than the former; and the Leaves of this Greater kind are longer, greater and a little broader than the last described. The Stalk also is higher, and the Flower larger, more open at the Mouth, and more crumpled than the White, but wholly of a yellow color. The Seed is also larger, according to the Proportion of the Plant.

V. *The third, or Lesser yellow Bastard Junquilia*, is in Root, Leaves, Stalk and Flower, and manner of Growing, yea, in all things so like unto the last, it is needless to trouble you with any farther Description thereof; the only Difference is in the Magnitude of the Plants, this being smaller in all its Parts.

VI. *The fourth, or Late yellow Bastard Junquilia*, is in Root, Leaves, Stalk and Flower, also in manner of Growing, very like unto the former Greater yellow Bastard Junquilia, but with this Difference, that this is rather the larger Plant, and bears the fairer Flower, and flowers also something later than that does.

VII. *The Places.* These all came to us from the Pyrenean Mountains; and being tender Plants, are with much Care, nurs'd up in our Gardens.

VIII. *The Times.* The three first flower in April: the last flowers a Month later, viz. in May.

IX. *The Qualities, Specification, Preparations and Virtues,* are much the same with the Common Daffodil, of which we have spoken in Chap. 189. foregoing.

C H A P. CCII.

Of DAFFODIL Bastard, Sea.

I. *THE Names.* It is called in Greek, *Ψευδο-κισσος θαλάσσιος*: in Latin, *Pseudonarcissus Marinus*, and in English, *Sea Bastard Daffodil*.

II. *The Kinds.* So far as we know, It is a singular Plant of the kind; tho' Authors report, that there are other sorts of it, some of which bear yellow Flowers, and others which bear red; but of those we can say nothing in this place.

III. *An Observation.* Some have called this Plant *Pancratium flore Lilii*; but this was a Mistake. Others thought it to be a kind of *Scylla*, and used it instead of *Squills* in *Theriaca*; but this was a dangerous Error. Others, as *Clusius* saith, call'd it *Hemerocallis*, thinking it to be a *Lilly*; and *Clusius* does thereupon call it *Hemerocallis Valentina*, but was wholly in the wrong: for it is neither *Pancratium*, nor *Scylla*, nor *Lilium*; but it is certainly a kind of *Daffodil*, as the Form of Root, Leaf, Stalk and Flower demonstrate.

IV. *Observat. 2.* 'Tis true, *Dioscorides* will have *Pancratium* to be a kind of *Scylla*; and so it was called in his time, viz. *Scylla radice rubra*, which had a Leaf like a *Lilly*, but longer, and was used both with the same Preparation and Quantity, and for the same Diseases that *Scylla* was used for, only that it was said to be weaker. But beware of using of this *Sea Bastard Daffodil* by such a Mistake, because of its dangerous Effects, which are said to be deadly: for it is reported, that one, out of Malice, did before hand cut the Root of this Plant with the Knife which another was presently after to cut his Meat withal, and that with an Intention to kill him by the Poison thereof, with which the Knife was poisoned.

V. *The Description.* It has a large white bulbous Root, from which spring several broad whitish green Leaves, but not very long, among which rises up a stiff round Stalk, at the top whereof break out of a great round skinny Husk, five or six Flowers, every one made somewhat of the Fashion of the Greater Bastard Rush Daffodil, but greater, and wholly white, the six Leaves being larger and longer than in the Junquilia or Rush kind, and extending beyond the Trunk, are tipped with green at the point of each Leaf, and down the middle likewise, on the backside. The Trunk is longer, larger and wider open at the Mouth, cut in or indented at the brims or edges, and small at the bottom, with divers white Threads in the middle, and is very sweet. Under the Flower is a round green Head, which grows very great, having within it, when it is ripe, flat and black Seed.

VI. *The Places.* It grows near the Sea side in Italy, Spain and France, within the Straights, and for the most part upon all the Levant Shore, and Islands of the Mediterranean, but does not often flower in our colder Climates; but it prospers, and I saw it grow admirably well in some parts of the Southern Carolina, and other parts of Florida.

VII. *The Times.* It flowers towards the latter end of Summer, viz. in August and September.

VIII. As to the *Qualities and Medicinal Virtues* hereof, Authors have said nothing about it, but do account it a virulent Poison, rather than any thing else: and yet it is possible it may be prepared for external Applications, with singular Advantage against many stubborn and rebellious Diseases, such as are Struma's, Oedema's, and other Infirmities of like kind.

C. H. A. P. I. (CCIII.)

Of DAFFODIL Chequer'd.

THE Names. This Plant was unknown to the Greeks, as far as we can learn, and so has no proper Greek Name belonging to it: but it is called in Latin, by Authors, *Fritillaria*, by *Dononus*, *Flos Meleagrides*, (*The Ginny Hen-Flower*, because of the Variety of the Colors in the Flower, agreeing with the Colors of the Feathers of a Ginny Hen:) by *Lobel*, *Lilio-narcissus*, *Variegatus*, & *Purpureus Variegatus*, & *Tessulatus*, (making it a kind of *Tulip*;) others, *Likum variegatum*: in English, *The Chequer'd Daffodil*, *The Chequer'd Lilly*, *The Ginny Hen-Flower*, and *Fritillary*, by which last Name it is most known.

II. *The Kind*s. Some Authors will have it to be of the kind of the *Daffodil*; some of the *Tulip*; some of the *Lilly*, and others as partaking of something of all of them, and therefore have placed it between them: but because it is now most commonly called, *A Chequer'd Daffodil*, we have placed it immediately after the *Daffodils*. Hereof there are many Species found out of late, as *White*, *Red*, *Purple*, *Yellow*, *Black*, of each of which there are also several sorts; but the *Purple* kind was that which was first known.

III. Authors make several Species hereof, some more, some less: those which we shall take notice of in this Chapter, are the thirteen following, viz. 1. *Fritillaria vulgaris*, The common Chequer'd Daffodil. 2. *Fritillaria vulgaris pallidior*, *præcox* & *Serotina*, The early and late common Chequer'd Daffodil. 3. *Fritillaria flore atro rubente*, The Blood-red Fritillary. 4. *Fritillaria maxima purpurea*, *flos rubra*, The great purple or red Fritillary. 5. *Fritillaria alba*, The white Chequer'd Daffodil. 6. *Fritillaria flore duplici albicante*, The double bluish Fritillary. 7. *Fritillaria flore luteo puro*, The absolute yellow Fritillary. 8. *Fritillaria flore luteo varia flos punctato*, The variegated yellow Fritillary. 9. *Fritillaria lutea maxima Italica*, The great yellow Italian Fritillary. 10. *Fritillaria polyanthos flore parvo Itorum*, The small Italian Fritillary. 11. *Fritillaria lutea fuscifolia Lusitanica*, The Portugal small yellow Fritillary. 12. *Fritillaria Pyrenæa*, *flos Apenninæa*, The Pyrenean black Fritillary. 13. *Fritillaria Umbellifera Hispanica*, The Spanish Umbelliferous black Fritillary. Some think, that the Name *Fritillaria* was given to it from *Fritillus*, the Chequer'd Board, upon which Gamesters play at Dice; this delightful Flower being Chequer'd in like manner on its Leaves.

IV. *The Descriptions*. The first, or Common Chequer'd Daffodil, has a small white bulbous Root, but somewhat statish, made as it were of two Cloves, and divided in a manner into two parts, yet joining together at the bottom or seat of the Root, which holds them both together. From between this Cleft or Division, the Bud for the Stalk appears, which in time

rises up to be a foot or foot and half high, being round and of a brownish green color, more especially near unto the Ground, whereon there stands dispersedly four or five narrow, long and green Leaves, being a little hollow. At the top of the Stalk, between the upper Leaves, (which are smaller than the lowest) the Flower shews it self, hanging or turning down the Head, but not turning up again any of its Leaves, as some Lillies do. Sometimes this Stalk bears two Flowers, and sometimes, yet but very seldom, three, consisting of six Leaves apiece, of a reddish purple color, spotted diversly with great Spots, appearing like unto square Chequers, of a deeper color. The inside of the Flower is of a brighter color than the outside, which has some Greenness at the bottom of every Leaf. Within the Flower do appear six Chives, tipped with yellow Pendants, and a three-forked Stile or Pointel, compassing a green Head, which, when the Flower is past, rises upright again, and becomes the Seed-Vessel, being something long and round, yet having a small shew of Edges, flat at the Head, like the Head of a Lilly, and without any Crown, as the Tulip has, in which is contained pale-colored flat Seed, like unto those of the Lilly, but smaller.

Fritillary
Daffodil.

V. *The second*, or Early and late common Chequer'd Daffodil, are of the same kind with the former, but with these following Differences, viz. 1. That some of them do flower early, with or before the Early-flowering Tulips; and some of them flower later, to wit, a Month or more after the former. 2. That in some the Color is paler, and in others again of a very high or deep color. 3. That sometimes they have eight Leaves, and sometimes ten or twelve Leaves, as if two Flowers were made one, which some call a Double Fritillary. The Flowers at top of the Stalk are Chequer'd most admirably, and yet in the same, Nature has kept a wonderful Order, surpassing the most curious Painting which Art can perform: one square is of a greenish yellow color; the other purple, keeping the same Order, as well on the backside of the Flower as on the inside; sometimes they are blackish in one Square, and of a Violet-color in another; so that Nature seems in a simple Flower to bring forth Variety in Perfection.

VI. The

VI. The third, or Blood-red Fritillary, has a Root somewhat rounder and closer than the first, from whence the Stalk rises up, being shorter and lower than in any other of these kinds, having one or two Leaves thereon, and at the top thereof two or three more set closer together, which are broader, shorter and whiter than any of them before, almost like unto the Leaves of the Yellow Fritillary, from among which top Leaves comes forth the Flower, somewhat bending down, or rather standing forth, being larger than any of the former, and almost equal in Largeness to the Yellow Fritillary, of a dusky grey color on the outside, and of a very dark red color on the inside, diversely spotted or striated: this very hardly encreases by the Root, and as seldom gives ripe Seed, but flowers with the other first or early sorts, and before the black kind, and abides a less time in Flower than any.

VII. The fourth, or Great purple or red Fritillary, has a Root equal to the Largeness of the rest of its parts, from whence rises up one, and sometimes two Stalks, having one, two or three Flowers apiece on them, as Nature and the Season serves: each one of these Flowers are larger and greater than any of those before described, and pendulous in like manner as they are, of a sad red or purplish color, with many thwart or cross Lines on them, and small long Marks, which scarcely appear Chequerwise, nor are so eminent or conspicuous as in the former. The Stalk is strong and high, whereon are set several long whitish green Leaves, larger and broader than those of the former.

VIII. The fifth, or White Fritillary, has a Root so like unto the former, as not to be distinguished, and the whole Plant is so very like unto the first, that it is needless to make any Description, but only shew the chief Differences. In this the Stalk and Leaves are wholly green, by which this is distinguished from that, which is brownish at bottom. The Flower in this is white, without almost any shew of Spot or Mark in it, tho' in some they are more plainly to be seen, and in some there is again a kind of faint bluish color to be seen in the Flower, especially on the inside, the bottoms of the Leaves of every one of which are greenish, having also a small List of green coming down towards the middle of each Leaf: as for the Head or Seed-Vessel and Seed, they are so like to the first, as not to be differentiated from them.

IX. The sixth, or Double bluish Fritillary, has a white round flattish Root, like unto the last, bearing a Stalk with long green Leaves thereon, little differing from it, or the first described kind. The Flower is constantly the same, composed of many Leaves, being ten at the least, but most usually twelve, of a pale whitish purple color, spotted like unto the Paler ordinary early Fritillary, so that one would think it to be an accidental kind thereof, whereas it is (as is aforesaid) constant in its Appearance and manner of Flowering.

X. The seventh, or Absolute yellow Fritillary, has a whitish Root, more round and not so flat as the former kinds, and of a mean Largeness. From the middle rises up a Stalk a foot and half high, and sometimes higher, on which grow, without any Order, several long and broadish Leaves, of a whitish green color, like unto the Leaves of the Black Fritillary, but not above half so broad: the Flower is somewhat small and long, not much unlike to the Black for Shape or Form, but that the Leaves are smaller and rounder pointed, of a faint yellowish color, without any shew of Spots or Chequers at all, either within or without the Flower, having some Chives and yellow Pendants in the middle, as are to be seen in them all. The Seed is like to that of the first kind.

XI. The eighth, or Variegated yellow Fritillary, has a Root like to the other, but not so flat. It grows not much lower than the former, and brownish at the rising up, having its Leaves whiter, broader and shorter than it, and almost round-pointed. The Flower is greater and larger spread than any of the afore-described, and of a fair pale yellow color, spotted in very good order with fine, small, yellow Chequers, which give it a wonderful pleasing Beauty. It has also some Lists of green running down the back of every Leaf, and seldom yields any Seed.

XII. The ninth, or Great yellow Italian Fritillary, from a Root somewhat like to the others before, it sends up a round and brown green Stalk, on which grow several Leaves, somewhat broad and short, which encompass the Stalk at their bottom, of a dark green color, at the top of which Stalk, which bends a little downwards, do most usually grow three or four Leaves, between which comes forth most commonly but one Flower, which is longer than the last, hanging down the Head, as all the others do, consisting of six Leaves, of a dark yellowish purple color, spotted with some small red Chequers. This flowers late, or not till all the other are past.

XIII. The tenth, or Small Italian Fritillary, has much alike Root and Stalk, but smaller: the Stalk has several small, short, green Leaves thereon to the very top, but it bears a greater store of Flowers than the former, but they are much smaller, and of a yellowish green color, spotted with long and small dark red Marks or Chequers.

XIV. The eleventh, or Portugal small yellow Fritillary, has a Root much like the others beforegoing: the Leaves are so small, narrow and long, that it has caused it to obtain the Name of Ruthes, or Fritillaria Juncifolia, Ruth Fritillary, which grow upon a long, weak, round Stalk, set without Order. The Flower is small and yellow, but thicker Chequer'd with red Spots than any of the other Yellow Fritillaries; the Stalk of the Flower at Head thereof being also of a yellowish color.

XV. The twelfth, or Pyrenean black Fritillary, has a Root which does often grow so great, that it seems like unto the Root of a Small Crown Imperial. The Stalk is strong, round and high, set without Order, with broader and whiter green Leaves than any of the former, bearing one, two or three Flowers, not being so large as those of the Common purple Fritillary, but smaller, longer and rounder, sometimes turning up the brims or edges of the Leaves again, and are of a yellowish shining green color on the inside, sometimes spotted with red Spots, almost thro' the whole inside of the Flower, unto the very edge, which abides of a pale yellow color, and sometimes again there are very few Spots to be seen, and these from the middle only on the inside, (for on the outside of this sort there never appears any Spots at all) and sometimes without any shew of Spots, sometimes also of a more pale green, and sometimes of a more yellow color. The outside of the Flowers do likewise vary, for in some the outside of the Leaves are of a dark dull yellow, sometimes of a more pale yellow, and other times of a dark purplish yellow, which in some is so deep and so much, that it rather seems black than purple or yellow, and this chiefly about the bottom of the Flower, next to the Stalk, but the edges are still of a yellowish green. The Head and Seed are like unto the former, but larger in all respects.

XVI. The thirteenth, or Spanish Umbelliferous black Fritillary, is no doubt of kin to the last described, but is in its Root, Stalk, Leaves and Flowers greater than it, and so greater in the whole, as if growing in a fatter or richer Soil, it were the stronger, and so more prolific and able to bear a greater store of Flowers. The Flowers grow four or five

five from the Head together, hanging down, round about the Stalk, like unto a Crown Imperial, and are of a yellowish green color on the inside, spotted with a few red Spots, the outside being blackish as the former.

XVII. *The Places.* The first of these came from France, where, about Orleans, it grows plentifully: the other sorts grow in those Countries which their Titles indigitate, but are all of them nurs'd up with us in Gardens of Florists, and are most of them become Natives of this Kingdom.

XVIII. *The Times.* The early kinds do flower in the beginning of April, according to the Mildness or Hardness of the foregoing Winter: the others flower after the first are past for a Months space, one after another; and the Great yellow is very late, not flowering till about the middle or the end of May.

XIX. *As to the Qualities, Specification, Preparations and Virtues* of these Plants, or any of them, Authors have said nothing at all, whether inwardly to be taken or outwardly to be applied; nor have I had any Experience of their Effects in my forty Years Practice: they are a glorious and admirable Flower, of an extraordinary Beauty, and their chief Use with us, is to be an Ornament for Gardens, which they nobly beautify, and therefore deserve our Cultivation, Entertainment and Observation; especially of Florists, and other Lovers of Curiosities of this kind.

CHAP. CCIV.

of DAISIE Garden.

THE Names. The Daisie is called in Greek, (as some suppose, from Theophrastus lib. 7. cap. 9.) *Arbakis*; but this I judge to be a Mistake, for it does not plainly appear in any Greek Author, that the Grecians had the Knowledge thereof: in Latin, *Bellis*, Pliny lib. 26. cap. 5. and in English, *Garden Daisie*. The Latins also call it, *Herba Margarita*.

II. *The Kinds.* The chief kinds are, 1. *Bellis hortensis*, The Garden Daisie, of which in this Chapter. 2. *Bellis agrestis*, The Field Daisie, of which in Chap. 205. 3. *Bellis major vulgaris*, The greater common Daisie, of which in Chap. 206. 4. *Bellis spinosa*, The Thorney Daisie, of which in Chap. 207. 5. *Bellis Americana*, The West India or American Daisie, of which in Chap. 208. following.

III. *Bellis hortensis*, or the Garden Daisie is manifold, viz. 1. *Bellis minor flore rubro simplici*, Single red Daisies. 2. *Bellis major flore albo pleno*, The great double white Daisie. 3. *Bellis minor flore pleno variorum colorum*, The lesser double Daisies of divers colors. 4. *Bellis minor prolifera*, Double double Daisies. 5. *Bellis Globularia cerulea*, Blew Globe Daisies. 6. *Bellis Globularia lutea*, Yellow Globe Daisies.

IV. *The Descriptions.* The first, or Single red Daisie, has Roots which are small, white and fibrous or thready; from whence rise many smooth, green, round-pointed Leaves, lying on the Ground, a little snipt about the edges: from among which rise up many slender round Foot-stalks, rather than Stalks or Stems, about an hand breadth high at most, and sometimes not so high, bearing one Flower apiece, consisting of many small Leaves, as a Pale or Border, set about a middle Thrum: the Leaves are almost wholly red, whereas in the middle they are white or whitish,

enclining to red on the edges, the middle being yellow.

V. The second, or Great double white Daisie, has a white fibrous or stringy Root: the whole Plant is so like to the Great single kind, which grows by Highways, and in Meadows and Fields, that there is no difference between them, but in the Flower, which in this is double. It has many long and somewhat broad Leaves, lying upon the Ground, deeply cut in on both sides, somewhat like unto an Oaken Leaf: but those which are on the Stalks, are shorter, narrower, and not so deeply cut in, but only notched on the edges. The Flowers at the top are white and double, consisting of several Rows of Leaves, being greater in Compass than any of the Double Daisies which sell low, but nothing so double of Leaves.

VI. The third, or Lesser double Daisie, has a white fibrous Root, from whence rise Leaves, lying upon the Ground, in Form like to the Common fingle ones, from which they differ little or nothing, but that they are smaller, and little or nothing snipt about the edges. The Stalks likewise are smaller and lower, but bearing as double Flowers as any, being composed of many small Leaves, thick thrust together, of various colors; for some are wholly of a pure white, others have a tittered, either dispersed upon the white Leaves or on the edges, and sometimes on the backs of the Leaves: some again seem to be of a whitish red, more red than white, when indeed they are white Leaves, dispersed among the red; others are of a deep or dark red color; and some are speckled or striped with white and red through the whole Flower: and in some the Leaves will be red on the upper side, and white underneath: and some (tho' but very rare) are of a greenish color. Of this kind some have Stalks and Heads which are round; and some again which are flat: which last I have known to degenerate into round, and so to continue.

VII. The fourth, or Double doable Daisie, has no difference in Root, Leaf or Stalk from the former kind, but only in the Flower; which in this bears many small double Flowers, standing upon very short Stalks round about the middle Flower, which is usually as great and double as any of the other double kinds, and is either wholly of a deep red or speckled with white and red, as in some of the former kinds, or else greenish, all the small Flowers about it being of the same color with the middlemost.

VIII. The fifth, or Blew Globe Daisie, has a hard and fibrous Root, and a great Affinity with the Plant last described, both in Form of its Leaf and Flower. It has many narrower, shorter and blacker green Leaves than the former, lying round about upon the Ground; among which rise up slender, but stiff and hard Stalks, six inches or more high, set here and there with small Leaves; and at the top a small round Head, composed of many small blew Leaves, somewhat like unto a Scabious Head; and sometimes it is also found with white Heads of Flowers. The whole Plant is of a bitter Taste.

IX. The sixth, or Yellow Globe Daisie, has a Root of a Fingers length, round and hard, with a thick Rind, and a woody Pith in the middle, of a sharp drying Taste and strong Smell: from whence rise up many thick, smooth, round, pointed Leaves, spread upon the Ground like the former: among which spring up several small round rusty Stalks, a foot high, bearing about their middle two small Leaves at the Joints, and at the tops round Heads of Flowers thrust thick together, standing in purplish Husks, every one of which Flowers do blow or spread into five Leaves Star-fashion, and of a fair yellow color, smelling not much unlike to Broom Flowers, with many small Threads in the middle, encompassing a flat Pointel, horned or bended two ways. After the Flowers are faded, rise up Seed-Vessels, which are round, swelling out in the middle, and divided into four parts at the tops, containing within them round, flat, black Seed, with a small Cut or Notch in them. The Leaves of this Plant are of a sharp and bitter Taste.

X. The Places. The first four are planted and found only in Gardens; and require to be often replanted, otherwise they degenerate into fingle Flowers, or at least into less double. The two last are also Garden-Flowers, but more rarely to be met with than the others; the Blew Daisie is a Native of Mompelien in France, and of the Mountains in many places of Italy; the Yellow kind is Italian, and found up and down in the Kingdom of Naples.

XI. The Times. All sorts of Daisies almost flow-

er betimes in the Spring, during April and May, and some of them in June; but the former Blew and Yellow flower not until August or September.

XII. The Qualities. They are cold and dry in the first Degree; and are Absterfivè, Astringent, Incarnative and Vulnerary; Hepatick, Arthritic and Analeptick.

XIII. The Specification. They are dedicated to the Curing of Wounds; for which Reason Aurores have accounted them among the *Consolide*, or Wound-Herbs.

XIV. The Preparations. You may prepare therefrom, 1. A liquid Juice. 2. An Essence. 3. A Decoction. 4. A compound Decoction in Wine. 5. An Ointment. 6. A Balsam. 7. A Cataplasim. 8. A distilled Water. 9. An Acid Tincture. 10. An Oily Tincture.

The Virtues.

XV. The liquid Juice. It is good to heal Wounds, whether inward or outward: it unites with and strengthens the Balsam of the Blood, and so induces the Healing, by drying, strengthening and conglutinating. It abates Heat, and alleviates the Boiling of Choler, refreshing the Liver and other inward Parts. It is good to cure the Wounds made in the Cavity of the Thorax or Breast, being taken two or three ounces at a time, three or four times a day, either alone or mixed with a little Wine: dropped into running Eyes, it much helps them.

XVI. The Essence. It has all the former Virtues to a great Advantage, excepting that it heals more; but it much more powerfully consolidates Wounds. It may be given alone, from one ounce to two or three ounces, or it may be mixed with a Syrup made of the Juice of the same Herb.

XVII. The Decoction. It cures inward Wounds of the Breast as the former Preparations do; but it is not altogether so powerful. If it is made with Wine, it cleanses, incarnates and cures all Ulcers and Pustles in the Mouth or Tongue, or in the Secret Parts.

XVIII. The compound Decoction. Take Daisie Leaves and Roots five handfuls: Agrimony, Dwarf, Elder, of each three handfuls: being bruised, boil all in three quarts of Wine till a quart or more is consumed: then strain out for Use. It is good against Palsie, Gout and Sciatica, to foment the parts therewith two or three times a day, so hot as the Patient can endure; it comforts the Nerves, and eases the Pains of the Parts afflicted.

XIX. The Ointment. It cleanses, dries and heals old Ulcers, and dissolves or disperses Tumors, Knots or Kernels in the fleshy Parts of the Body: it dissolves simple Contusions, which come thro' Falls or Blows; and abates Tumors or Swellings in the Scrotum, being duly applied: it is said to cure wonderfully all sorts of simple Wounds accompanied with Inflammation, and such as are kept long from healing by reason of the Afflux of Humors to them, whether in the Joints, Arms or Legs.

XX. The Balsam. It has all the Virtues of the Ointment, but it cleanses putrid and corrupt Sores, and foul Ulcers, much better than that: and sometimes it cures simple green Wounds at one Dressing. It gives ease in the Gout and Sciatica, and strengthens the Nerves and weak Joints, being applied.

XXI. The Cataplasim. It dissolves recent Tumors and simple Contusions; and is effectual, being applied, to Swellings of the Scrotum: applied to a simple recent Wound, after it has been washed with Spirit of Wine, it many times conglutinates the Lips thereof at the first Application.

XXII. The

XXII. *The distilled Water.* It is cooling, and has the Virtues of the liquid Juice, but very much weaker; however, it may be used as a Vehicle to convey refrigerating or cooling things in: it abates the Heat of Fevers, abates inward Inflammations, and allays the Turgency of Choller.

XXIII. *The Acid Tincture.* It is singular good to cure Fevers, especially such as are burning, malignant or peffilential: it cools powerfully, quenches Thirst and composes the Spirits. Dose 30, 40 or 60 drops or more in some convenient Vehicle, or in any thing the Patient drinks, and to be as often repeated as they call for any thing to quench their Thirst with.

XXIV. *The Oily Tincture.* It is a singular thing against all Wounds and Punctures of the Nerves: it also cures Convulsions in what part of the Body soever, and is a famous thing against Palsies, if the Back-bone, as also all the Parts affected, be well anointed therewith by a cheerful Fire, and it is well rubbed in for half an hour at a time, and this twice a day, viz. Morning and Evening.

C H A P. CCV.

of DAISIE Field.

THE Names. It is called in Latin, *Bellis agrestis*, *Herba margarita*; and by some, *Confolida minor*: and in English, *Daisie*, and *Field Daisie*.

II. *The Kinds.* There are two principal kinds thereof, which are very common, viz. 1. *Bellis minor Sylvestris*, The lesser Wild Daisie. 2. *Bellis major vel media Sylvestris*, The greater or middle Wild or Field Daisie.

III. *The Description.* The first, or Small common single Field Daisie, has a Root which is small, white and fibrous; from the Head of which springs forth many thick and somewhat long green Leaves, lying upon the Ground, small at the bottom, but broad, and almost round towards the point or end, and a little dented about the edges. From among this heap or tuft of Leaves rise up many very slender, weak and naked Stalks, or rather Foot-stalks, of three, four or five, or more inches high, bearing every one of them a small green Head, from whence rise many small white Leaves, encompassing a yellow Thrum, which is in the middle. Sometimes the green Leaves will be found much larger in one place than in another; and the Flower likewise will in some be reddish at the ends, and sometimes under stained; and yet notwithstanding all this difference, they are but one kind or sort, and not divers, as some maintain.

IV. *The second, or Greater or middle Field Daisie*, tho' it is another Species, yet it agrees with the former in most respects, saving that its main Root is thicker and longer, with many small white Fibres proceeding therefrom: the Leaves are larger and dented in almost in like manner on the edges: the Stalks are thicker, but round and somewhat higher; and the Flowers, like the other, white, and sometimes on the tips of their Leaves with a blush of red, but they are larger every way: the Thrum in the middle is also bigger, but of the same yellow color with the before described.

V. *The Places.* They grow wild almost every where, in most Meadows and Pasture-Grounds of this Kingdom.

VI. *The Times.* They flower in most of the Summer Months, viz. in April, May, June and July.

VII. *The Qualities, Specification, Preparations and Virtues,* are the same with Garden Daisies, only they are with this Advantage, that the Field Daisie is more effectual for all the Purposes designed: see Chap. 204. sect. 12. ad 24. foregoing.

C H A P. CCVI.

Of DAISIE Great.

O R,

MAUDLIN-WORT.

I. **THE Names.** It is called in *Latin*, *Bellis magna*, *Maxima* & *Major*; and in *English*, *The great Daisie*, (but it is the greatest of all the sorts of *Daisies*) and *Maudlin-wort*.

II. **The Kinds.** It is *Singularis sui generis*; and is called by some Authors, *Consolida media*, The middle Confound; but the true middle Confound is *Bugula*; others, to make a Difference in the Name between *Bugle* and this, call it *Consolida media Vulnerariorum*: however, it is taken by all to be *Consolida medii generis*, or a kind of middle Confound, from the Virtues it is endowed with.

III. **The Description.** It has a Root which is a Bush of white Fibres or Strings, which abide many Winters with the Leaves, shooting forth every Spring anew: from the Head of this Root spring forth many long, narrow and narrow-pointed Leaves, lying next the Ground, but cut in on both sides, making it seem almost like the Divisions of some sorts of Oaken Leaves, or rather like the Leaves of Groundsel: the Stalks grow to be somewhat tall, viz. about a foot and half in height, with divers Leaves thereon, much in Shape like the other, but smaller and lesser divided than the lower; and growing yet smaller and lesser divided, the nearer they grow to the top. At the tops of the Stalks grow pretty large Flowers, with white Leaves, and a yellow Thrum in the middle, like the Flower of the Single Field Daisie, or those of May-weed, but something lesser than this last named; each Flower grows upon a several Foot-

stalk, and the white and narrow Leaves are as a Pale or Border round about the middle yellow Thrum and are of no Smell at all: after the Flowers are past, then comes the Seed, which is somewhat long, and is blown away with the Wind.

IV. **The Places.** It grows almost every where, by Hedge-sides, in Meadows, the Borders of Fields, and other waste Grounds.

V. **The Times.** It flourishes and flowers in the Months of May and June.

VI. **The Qualities.** It is cold in the first Degree, and temperate in respect to Dryness and Moisture, but in some Authors Opinions it inclines to Dryness. It is Astringent, Conglutinative and Vulnerary, appropriated to the Liver and Joints, and is Analeptick.

VII. **The Specification.** It consolidates and conglutinates the Lips of Wounds to a Miracle.

VIII. **The Preparations.** You may have therefrom, 1. A liquid Juice. 2. An Essence. 3. A Decoction. 4. A distilled Water. 5. A Wound Drink. 6. An Ointment or Balsam. 7. A Cataplasim. 8. A Clyster.

The Virtues.

IX. **The liquid Juice.** It is given to very good Purpose to heal any inward Wound, consolidate the Rupture of any Vessel in the Thorax, cure Spitting or Pissing of Blood, and helps Ruptures of the Intestines. Dose two or three ounces Morning and Evening in a Glass of old Malaga or Red Port Wine.

X. **The Essence.** It has all the former Virtues, besides which, it is excellent against Bloody-Fluxes, and all other Fluxes of the Bowels: and has sometimes been found of good Use in overflowing of the Loches, or of the Terms in Women. Dose two, three or four Spoonfuls Morning and Night, in a Glass of Generous Wine.

XI. **The distilled Water.** It is said to be good against Ruptures of the Bowels; and may be used as a Vehicle to convey other Medicines in: sweetened with Sugar Candy, it is very good against a Cough.

XII. **The Wound Drink.** *℞* of this Daisie Leaves six handfuls: Santicle, All-heal, of each three handfuls: Bugle two handfuls: Angelica one handful: boil all in Water six quarts to three: strain out and add thereto an equal part of white Port Wine, which sweeten a little with white Sugar as it is taken. Dose eight ounces Morning, Noon and Night: it is of great Effect in the Cure of all sorts of old and malign Ulcers, Fistula's, and the like.

XIII. **The Ointment or Balsam.** It is made with Oil, Turpentine and Wax, and is excellent for Wounds, especially those in which there is any thing of Inflammation, and will not come to Digestion or Maturation, as are those *Sinovia* or weeping Wounds made in the Knees, Elbows and other Joints.

XIV. **The Cataplasim.** It is good against all burning Apostems and Ulcers, as also an Inflammation and Running of the Eyes, being applied thereto: it likewise eases the extreme Pain of the Gout, being applied, and renewed as often as need requires.

XV. **The Clyster.** It gives ease in the vehement Torments of the Guts, Gripings of the Bowels, and is profitable in the violent Heat of Agues; and alters the Habit of the Belly where there is a great Stypcity or Binding: and in a Bloody-Flux, Diarrhea or Lienteria, it does much good.

C H A P. CCVII.

Of DAISIE Thorney.

I. **THE Names.** It is called in *Latin*, *Bellis spinosa flore luteo nudo*, also *Bellis major spinosa*: in *English*, *The Thorney Daisie*, or *The naked-flowered yellow Daisie*, with prickly Leaves.

II. *The Kinds.* It is a singular Plant of its kind, and noted because of its naked Flower.

Thorney Daisie.

III. *The Description.* It has a Root consisting of a great Tuft or Bush of long blackish Strings, or long fibres, whose Taste is bitter and unpleasant, and its Smell something strong; from the Head of which stringy Root, spring up divers Heads of very small green Leaves, dented about the edges, and every dent sharp at the point, which shooting up into Stalks, with the like, but lesser Leaves on them, become hard and woody up to the tops, sometimes branched and sometimes not, but bearing on their various tops several small round Flowers on several small Foot-stalks, which Flowers have no Border of Leaves, either white or yellow, to encompass them, but are like to those of the Naked Cammofil or Fetherfew, yet somewhat lesser, being a yellow round Knob, something hollow in the middle. When the Flower is past, there come in their places small Heads with Seed, each of which is small, long and whitish, which must be quickly gathered when it is ripe, or otherwise it quickly falls, or is blown away with the Wind.

IV. *The Places.* It was first brought out of Italy by Dr. Flad, from the Garden of Pisa, in the Duke of Florence his Dominions; but is only nurs'd up with us in Gardens.

V. *The Times.* It is in its Vigor in June, and flowers in June, July and August; and seeds in some little time after.

VI. *As to its Qualities, Specification, Preparations and Virtues.* Authors have said nothing, and therefore we shall be silent concerning the same. It is a Curiosity valued by Florists, and serves chiefly as an Ornament for the Garden.

C H A P. CCVIII.

Of DAISIE American.

I. **THE Names.** It is called in *Latin*, *Bellis Americana*, *Bellis Americana Umbellifera*, and *Bellis major Ramosa Americana*: in *English*, *The great white*, or *American Daisie*.

II. *The Kinds.* This is also *singularis sui generis*, and therefore admits but of a single Description.

III. *The Description.* It has a fibrous or stringy Root, from which spring up one, two or more Stalks, which grow higher and greater than the Great Daisie in Chap. 206. foregoing: the Leaves are also larger, and broadest towards the ends, but longer and smaller at the bottoms, dented likewise about the edges, shooting forth several Branches, and all of them bearing many white Flowers at their tops, as it were in an Umbel, yet not so great, nor the white Leaves so large as it, but smaller, and more in number, with a greenish yellow Thrum in the middle, some of which are a little larger than others: the Seed is also smaller than that in Maudlin-wort.

IV. *The Places.* It was first brought to us from Virginia, and grows well enough in our Gardens, being looked after with a little Care: I also found it growing in several places in the Southern parts of Carolina, and other parts adjacent thereto.

V. *The Times.* It flowers in May and June, and the Seed is ripe in some short time after.

VI. *The Qualities, Specification, Preparations and Virtues,* are the same with those of the Great Daisie in Chap. 206. aforementioned. It is indeed a singular Wound-Herb, and ought to be commended for the speedy curing of simple green Wounds, being made into proper Ointments or Balsams, or applied in the Form of a Cataplasn.

C H A P. CCIX.

Of DANDELION,

O R,

PISS-A-BED Common.

I. **THE Names.** This Plant seems to be unknown to the Greeks, and therefore can have no Greek Denomination, tho' some Authors will have it to be the *ἰσχυρὸν*, *Plinn lib. 20. cap. 8.* and others, that it is the *ἰσχυρὸν*, *Theophrasti*, which is *Anhubia*, a kind of Cicory, or Priests Crown: but in *Latin* it is called, *Dens Leonis*, *Rostum Porcinum*, and *Corona vel Caput Monachi*; and in *English*, *Dandelion*, or *Piss-a-bed*.

II. *The Kinds.* It is doubtless one of the kinds of Wild Succory; of which there are several Species, viz. 1. *Dens Leonis vulgaris*, Our common Dandelion,

Dandelion, of which in this Chapter. 2. *Dens Peregrinus*, Outlandish Dandelion, of which in the next Chapter.

III. This our Common Dandelion is also twofold, viz. 1. *Dens Leonis latifolius vulgaris*, *Urnaria*, *Hieracium majus Tragi*, *Hieracium parvum Cordi*, (in *Historia*) *Hieracium minus Gesneri*, (in *Hortis*) *Chondrilla altera Thalii*, *Dodonæi*, *Cesalpini*, *Hedynois major Euchsii*, *Hedynois Dalechampii* & *Lugdunensis*, *Taraxicon minus Loniceri*, *Taraxicon verum* of *Scrapio* & *Avicen*: and so it is used with us in all Compositions wherein *Taraxicon* is named; Our Common broad-leav'd Dandelion. 2. *Dens Leonis angustioribus foliis*: *Aphaca angustioris folii Cesalpini*, The narrow-leav'd Dandelion.

Dandelion.

IV. The Descriptions. The first, or Broad-leav'd kind, has a Root which grows downwards very deep, which being broken off within the Ground, will nevertheless shoot forth again anew, and with difficulty be destroyed when it has once taken deep Rooting: from the Head of this Root spring forth several long and deeply gashed Leaves, lying round about it on the Ground; the ends of each Gash or Jag on both sides looking downwards to the Root again, the middle Rib being white, which being broken, yields much bitter Juice, of a Milk-white Color and Substance, but the Root much more. From among these Leaves (which always abide green) arise many slender, weak, naked Foot-stalks, (rather than Stalks) of about six, eight or ten inches high, very rarely a foot long, every one of them bearing at the top one large yellow Flower, consisting of many Rows of yellow Leaves, broad at the Points, and notched in, with a deep Spot of yellow in the middle, which growing ripe, the green Husk, in which the Flower stood, turns it self down to the Stalk, and the Head of Down becomes as round as a Ball, with long reddish Seed underneath, each Seed bearing a part of the Down on its Head; which Seed, together with the Down, is blown away with

the Wind, and when perfectly ripe, may with a Blast of ones Mouth be blown perfectly away.

V. The second, or Narrow kind, as to its Root, Stalks, Flowers, Down, Seed and manner of Growing is wholly like the before described: the Leaves in springing forth, growing round the Root, the Number and Deepness of the Gashes or Divisions on the edges, are much like the former also; but in this the Difference is, that the Leaves of this latter Plant are narrower; and by this one Note it may be distinguished.

VI. The Places. They grow almost every where, in all Meadows and Pasture-Grounds, in Closets near to Water-Ditches, as also in Gardens and Highways. The first is common almost every where; but the second is somewhat rarer, yet often to be met with.

VII. The Times. They flower thro' all the Summer Months; and the first is found in some place or other in flower every Month of the Year, especially if the Winter is mild, and not extrem cold.

VIII. The Qualities. Dandelion is cold and dry in the first Degree: Aperitive, Absterfiv, Diuretick and a little Astringent; Stomatick, Hepatick, Splenetick and Nephritick.

IX. The Specification. It is singular against Obstructions of the Viscera, and Hypochondriack Melancholy.

X. The Preparations. You may have therefrom, 1. A Sallet. 2. A liquid Juice. 3. An Essence. 4. A Decolion. 5. A distilled Water. 6. An Ointment or Balsam. 7. A Cataplasma.

The Virtues.

XI. The Sallet. Whether eaten raw with other Herbs, or boiled, and so dress'd up with Butter, Vinegar, Salt and Pepper, it is said to be a good Ditch to open Obstructions of the Bowels, cleanse the Stomach, cause a good Appetite, and purify the Blood: the French and Dutch are said to eat them often in the Spring; but I believe for the most part as a boiled Sallet.

XII. The liquid Juice of Leaves and Roots. It may be given to two or three ounces in a Morning fasting, and likewise at Night going to Bed, either alone by it self, or mixt with a Glass of White Port Wine, to purify the Blood and Juices, open all sorts of Obstructions of the Bowels, expel the Jaundice, provoke Urine, resist Hypochondriack Melancholy, and ease the Pain of the Spleen.

XIII. The Essence of Leaves and Roots. It has all the Virtues of the liquid Juice, being more powerful to those Intentions: besides which, this ripens and digests inward Apotems of the Viscera and Urinary Passage, breaks, cleanses and heals them, and more powerfully opens the Passages of the Urine, whether in Young or Old. Dose three or four Spoonfuls in White Lisbon Wine, Morning and Night.

XIV. The Decolion in Wine or Water. It has the Virtues of the former Preparations, but in a lower degree: however, it is good to be drank half a pint at a time Morning and Evening, by such as are inclining to a Consumption, or have an ill Disposition of the whole Body, called by the Learned, *Cachexia*; in which cases being used for some considerable time, it gives a wonderful Relief; besides, being made in Water, and acuated with a few drops of Oil of Sulphur, it prevails against all sorts of burning, putrid, malign and pestilential Fevers.

XV. The distilled Water. Acuated with Oil of Sulphur, it prevails against the Spotted-fever, and the Plague it self: mixt with the liquid Juice or

Efficence, it is good to wash and cleanse old Sores, running Fistula's and putrid Ulcers, and so to dispose them to a speedy healing.

XVI. *The Ointment or Balsam.* It digests, ripens, cleanses, dries and heals old and running Sores, and is a very good thing in all stubborn and rebellious Ulcers, to bring them to a Cicatrize.

XVII. *The Cataplasim.* Being applied hot, and often renewed, it brings Apottemations to Maturity: and being applied cold made of the green Herb, it dissolves Tumors arising in simple Contusions, hinders the Aggregation or Flux of Humors, and eases the Pain.

C H A P. CCX.

of DANDELION Outlandish.

I. THE Names. It has no Greek Name; but is called in Latin, *Dens Leonis peregrinus*; and in English, *Outlandish Dandelion*.

II. *The Kinds.* There are five Species hereof, viz. 1. *Dens Leonis tenuissimum folio*, *Hieracium Fatidum Columna*, Fine jagged Dandelion. 2. *Dens Leonis minor foliis radiatis*, *Trinciarella Italorum Camerarii*, Sweet Dandelion. 3. *Dens Leonis minor folio aspero*, Small rough Dandelion. 4. *Dens Leonis altera Dioscoridis*, *Dens Leonis Monspelienfium*, five *Asphodeli bulbulis*, *Baubini*, Bulhed Dandelion. 5. *Dens Leonis Gadenfis*, *Cichorium Constantinopolitanum*, Spanish Dandelion.

III. *The Descriptions.* The first, or Fine jagged Dandelion, has a thick reddish Root full of Fibres, sending forth many very green and finely cut Leaves, each of them about a Hand breadth long, and two inches broad, being deeply jagged or divided again into two or three other small Rents or Divisions, and ending in a small point. The Flowers which stand at tops of the Stalks (which are naked) are yellow, and much smaller than those in the former Chapter, which being pass'd away, the downey Heads and Seed proceed, as in the former.

IV. The second, or Sweet Dandelion, has a small and blackish Root, which is white within, and very sweet in Taste, (as are the Leaves also) which is so very tender, that it perishes with the first Cold it feels; and therefore with us is always to be housed in Winter and cold Weather, by which means it will endure many Years, and yield its Seed in the due Season. From this Root spring up many Leaves, which spread themselves on the Ground, about three inches long and half an inch broad, cut in on the sides with very deep Gashes, whose ends have each of them three very deep Dents, each of them having drovers Points standing like a Star or Spur, the Root-stalks whereof are a little hairy: from among these rise up many smooth, slender, naked Stalks, one of which stands upright, not above a Hand breadth high; the rest are lower, and bend downwards, each of them bearing a small yellow Flower, like unto other Dandelions, which being past, turns into Down, and flies away with the Wind, carrying the Seed with it, which is something long and broad, with hard Hairs, like a Beard, at the top of each Seed.

V. The third, or Small rough Dandelion, has a Root small and whitish, which sends forth several small Leaves, lying round about the Root upon the Ground, about two or three inches long and one inch broad, cut, divided or torn in on the sides, and each

of them set with small, smooth, sharp Pricks or Hairs, not much unlike to the Prickly Sowthistle. The Stalks are about two or three inches high, and bear each of them a large, pale, yellow Flower, like to the other Dandelions; which being once pass'd away, do presently after turn into Down, with Seed like unto the former.

VI. The fourth, or Bulbed Dandelion, has a Root branched or spread out into several long tuberous Clogs, which some call long Balbs, much like to those of the Alphodil, but smaller, shorter and more pointed at the ends. From the Head of these Roots spring forth many large and blewish green hairy Leaves, lying upon the Ground, unevenly waved or cut in on the edges, but not deeply gash'd, like the Common Dandelion, but which are of a sharp and bitter Taste like it: from among which rise up several bare or naked Stalks, with Flowers at their tops, larger and more double than those of the Common kind, but of a paler yellow color, which pass into Down, like the other kinds, having also like fashioned Seed.

VII. The fifth, or Spanish kind, has a Root of a moderate Largeness, long, white, tender and fibrous, which lives with us all the Winter, if it is mild, otherwise, if we have hard Frosts, it perishes: from this Root spring up several long Leaves, a span or more in length; the middle Leaf of the Root is bare from the Root to the half length of the Leaf, and then it has many Rents or Cuts on each side, very much resembling the Leaf of the Common Dandelion, but smaller and narrower: from among these Leaves rise up likewise long Root-stalks, as in the Dandelion, upon whose tops grow small and yellow Flowers, which turn into Down, that is carried away with the Wind, with the Seed also, which is small, long and reddish, like unto some of the Hawkweeds.

VIII. *The Places.* The first is found in Meadows and Pasture Grounds. The second is an Original of Italy, and from thence it came to us. The third grows about Florence, and other parts of Italy, as also about Mompeliet in France. The fourth is also of Italian Origination. The fifth came from Spain, and grows in the Island of Gades or Cadiz, as Boel faith, who called it *Cichorium Gadenfe*; but *Clusius Curæ posteriores* calls it, *Cichorium sylvestre pumilum*, five *Hedypnois*.

IX. *The Times.* They all flower thro' all the Summer Months: but the fifth or Spanish kind flowers in July, August and September; and the Seed is soon ripe after the Flower is past.

X. *The Qualities, Specification, Preparations and Virtues,* are the same with the Common Dandelion in Chap. 209. foregoing, and therefore we shall say no more thereof.

C H A P. CCXI.

of DARNEL.

I. THE Names. It is called in Greek, *Ἄραξ* by some: in Latin, *Lolium*, and *Era* Plinii; *Triticum temulentum*, *Triticum satuum* *Loniceri*: in Arabic, *Zizania*; and in English, *Darnel*.

II. *The Kinds.* There are three sorts hereof, viz. 1. *Lolium album*, *Hordeum murinum* *Dodonæi*, White Darnel. 2. *Lolium Rubrum*, *ῥοιβὴ*, *Phænix* *Dioscoridis*, (a *femina colore phænicea*) Red Darnel. 3. *Lolium alterum avenacea gluma*, Another Darnel with Oaten tops.

III. The

*Darnell White.*

III. The Descriptions. The first, or White Darnell, has a buncy fibrous Root, from whose Head, all the Winter long, spring forth several fat and rough Leaves, which, the higher they grow upon the Stalks, grow also narrower, but with their continued Roughness: and with these first springing forth Leaves, several Stalks also arise, with many thick joints, almost like Knees; from which Knees arise those aforesaid narrower Leaves, continued up to the spiky tops of Seed; for on the top of each Stalk is a long Spike, composed of many Heads, as it were at so many joints, yet one above another on each side of the Stalk, containing two or three small chaffy Husks, with sharp, but short Beards or Awnes at the ends, in which Husks, being somewhat rough, is contained the Seed, which is less than that of Wheat, and which is easily shaken out of the Ear.

*Red Darnell.*

IV. The second, or Red Darnell, has a Root more bushy or fibrous, from whence arise Leaves shorter and narrower than those of Barley, as also several jointed Stalks, with Leaves springing from each joint, but as the joints are lesser than the former, so the Leaves springing from them are also narrower and somewhat shorter. The Stalks are reddish, with reddish joints, about seven or eight inches high, seldom attaining to the height of a foot, unless the Ground is very good: at the top of each Stalk is a small and tender flat Spike or Ear, very like the former, but smaller and shorter, and somewhat reddish also, more especially when it is found growing in the dryer sort of Land.

V. The third, or Darnell with Oaten Tops, in its Roots, Leaves and Stalks differs little from the first kind, saving that the Stalks grow somewhat higher, and the Leaves are a little larger: but in this it differs from the first, that the several Heads of Seed are more like to winged Oaten Heads, growing on slender Foot-stalks, and which Heads of Seed are also armed with sharp Points.

VI. The Places. These all grow in Arable Land, in Fields of Corn, as of Wheat and Barley, and are to be found in such like places, in most parts of the Kingdom.

VII. The Times. They flourish in Summer, and the Grain is ripe in Harvest time, viz. in August.

VIII. The Qualities. Darnell is hot in the third Degree, and dry in the second, as Galen says: it abounds with a Volatile, Narcotick, Salt and Sulphur, which is thought to be detrimental to the Head and Brain: it was accounted hurtful to the Eyes and Sight, as appears from that Verse in Ovid, lib. 1. *Fastorum*; Et careant Loliis oculos vitantibus agri: and from this Cause it seems came, that the old Proverb in Plautus, *Miles. act. 2. sc. 3. vers. 50.* *Lolio vititare*, was wont to be spoken to one dim-sighted.

IX. The Specification. It is said to be peculiar against Defæcations of the Skin, and to stop Gangrenes.

X. The Preparations. You may have therefrom, 1. A Decoction. 2. Meal or Flower. 3. An Ointment. 4. A Wash. 5. A Cataplasm. 6. The Emigration.

The Virtues.

XI. The Decoction in Red Port Wine. It stops the Terms, and all sorts of Fluxes of the Bowels; and prevails against a Diabetes: Dose two or three ounces: but it is apt to cause a kind of Giddiness in the Head. It is also good to wash places affected with Scurff, Morpew, Leprosy and Ringworms, and stop the Progress of a Gangrene: made with Water and Honey, it is good to bathe with for the Sciatica.

XII. The Meal or Flower. Being applied, mixt with Spirit of Wine or strong Wine, it is of special Use to stop the Running of Gangrenes, and hinder the Fretting and Eating of old putrid Sores, Cankers and Phagedenick Ulcers; and to cleanse the Skin of Leprosy, Tetters, Ringworms, Herpes, Scurff, Morpew, and other the like Distempers.

XIII. The Ointment. It is made thus: R of the Flower or Meal eight ounces: Sulphur Vire in fine powder four ounces: Oil of Roses three ounces: Vinegar enough to make it into the Form of an Ointment. It has all the Virtues of the Meal or Flower aforesaid, and much more powerful to all those Intentions, being applied fresh Morning and Evening.

XIV. The

XIV. *The Wash.* It is thus made: \mathcal{R} of the Flower or Meal two ounces: Water eight ounces: Juice of Radishes five ounces: Vinegar four ounces: Salt of Tartar a dram: mix them; and therewith very warm Morning and Evening wash the Face and Hands, letting it dry on; and after an hours time you may wash again with fair warm Water. It clears and cleanses the Skin admirably of almost all Deformities attending it.

XV. *The Cataplasim.* \mathcal{R} of the Meal twelve ounces: Linseed bruised four ounces: Pigeons dung six ounces: boil all in a sufficient quantity of Wine, to the Thickness of a Cataplasim. It is Discurtive, dissolves Knors and Kernels of the Kings-evil, and breaks those which will not be dissolved.

XVI. *The Fumigation.* \mathcal{R} of the Meal or Flower a pound: Frankincense eight ounces: Myrrh four ounces: mix, melt and make the Mass up into Troches. These being put upon live Charcoal, and the Fume from thence being received up the Womb by a Funnel, warms, comforts and strengthens those Vessels of Generation, and is said to help towards Conception.

as it were branched into others, wherein consists the chiefest Difference.

VII. *The fifth, or Double Darnel Grass, in Roots, Stalks, Joints and Leaves, differs little or nothing from the last, but in the spiked Heads, which are thicker set together, and the tops of them bow down, or turn a little round.*

VIII. *The sixth, or Branched Marsh Darnel Grass, has a creeping white jointed Root, with many Fibres adjoining to it; from which shoot forth two or three jointed Stalks, two feet or more high: the spiked Head is a foot long, branched as the fourth above is, each Branch of a fingers length, with winged Husks, like unto Oats.*

IX. *The Places.* They grow in Meadows, Corn-fields, Fallow-fields, in Paths-ways and Borders of Fields, almost every where: but the last in Marsh and Wet Grounds, and on the Edges of Plowed-fields.

X. *The Times.* They spring and flourish with Corn, and the Seed or Grains are ripe in August.

XI. *The Qualities, Specification, Preparations and Virtues.* Authors have said nothing of: however, it is manifest that they are of a cleansing, drying and astringent Faculty.

CHAP. CCXII.

of DARNEL-GRASS.

I. *THE Names.* It is called in Greek, $\delta\alpha\iota\tau\acute{\iota}\varsigma$ $\alpha\gamma\acute{\rho}\epsilon\sigma\tau\acute{o}\varsigma$, *Lolium Gramineum*, and $\alpha\gamma\epsilon\omega\varsigma$ $\kappa\omicron\upsilon\tau\iota\varsigma$, *Gramen Phanicum*: in Latin, *Phanix Gramineus*; and in English, *Darnel Grass*.

II. *The Kinds.* There are about six kinds hereof, viz. 1. *Phanix simplicis & rarissima Gluma*, The smallest single Darnel Grass. 2. *Phanix altera densifloribus spicis*, The greater single Darnel Grass. 3. *Phanix acerosa aculeata*, Small prickly Darnel Grass. 4. *Phanix multiplici spicata panicula*, Branched Darnel Grass. 5. *Phanix multiplici nutante*, Double Darnel Grass, with a bowing or bending down Top. 6. *Phanix palustris & longius spicata*, Branched Marsh Darnel Grass.

III. *The Descriptions.* The first, or Smallest single Darnel Grass, has a fibrous Root, from whence spring up several grassy Leaves and Stalks, which are very like the Red Darnel, from the first, but that it has very few, slenderer and shorter Stalks, and the Leaves narrower; and the spiked Head has a few single Husks set very sparsely thereon.

IV. *The second, or Greater single Darnel Grass, has Roots and Leaves like to the Red Darnel; but the Stalks grow a yard high, jointed and straked: and the Spike is thinly set with chaffy Heads, but they are bigger, rounder and thicker.*

V. *The third, or Small prickly Darnel Grass, has a small white fibrous Root, whence spring narrow grassy Leaves, six or seven inches high, being rough, hard and full of joints, pointed or prickly at the ends, and with a few short Leaves on them, which have withal small, short, rough and chaffy like Tongues, sharp at the ends, and set at the joints.*

VI. *The fourth, or Branched Darnel Grass, has like Roots, Leaves and Stalks, which are jointed as the others are, and slender, half a yard or more high, and narrow Leaves, Grass like: the spiked Head is*

CHAP. CCXIII.

of DEVILS-BIT Common.

I. *THE Names.* It seems to be unknown to the Greeks, for which Reason it has no Greek Name: but it is called in Latin, *Succisa*, and *Morus Diaboli*; and in English, *Devils-bit*.

II. *The Kinds.* It is certainly a Species of *Scabrous*:

bious : some have thought it to be the *Geum* of the Ancients ; others to be *Nigina Plinii* ; but *Fabius Columna* referreth it to *Picnocomon Dioecoridis* : it is either *Common*, called, *Morsus Diaboli vulgaris*, or which in this Chapter, or *Various*, of which in the Chapter following.

III. The Description. It has a Root which is somewhat thick, but short and blackish, with many Strings fastned thereto, and abiding after Seed-time many Years : from this Root rises up a round, green, smooth (not hairy) Stalk, about two feet high, set with divers long, and somewhat narrow, smooth, dark green Leaves, snipt a little about the edges for the most part, being otherwise all whole, and not divided at all, or but very seldom, even to the tops of the Branches, which yet are smaller than those below, with one Rib only in the middle, and being broken, yield not such Threads, as the *Scabious* does. At the end or top of each Branch, stands a round Head of many Flowers set together in the same manner, or more neatly and succinctly than those of the *Scabious*, and of a more blewish purple color, (not of a dark red, as Gerard says) which being pass'd away, there follows Seed, like unto that of *Scabious*, which falls away in the same manner.

IV. Nota. 1. Some make of this kind a Greater and a Lesser : but this, in my Opinion, comes from the Nature of the Soil or Ground, rather than from the Nature of the Plant ; that being the larger and faster which grows upon the richer or fatter Ground, and that the lesser which grows on the poorer Soil.

V. Nota. 2. Some are of Opinion, that the *Scabiosa rubra Austriaca Clusii* belongs to this Plant, because it has a short Root with many Strings : *Baibinus* makes mention of one of this kind, which has hairy Leaves, and not differing in any thing else, and he, from *Gesner*, calls it *Morsus Diaboli hirsuta*.

VI. Nota. 3. Some Monks and Fryers (as I suppose) have fabled, that the Devil, envying the Good which this Herb might do to Mankind, bit away part of the Root, by which means it became so short a Stump as it is, and from thence it came to have the Name of *Morsus Diaboli*, or *Succisa*, Devils-bit : but the Fable is so ridiculous, that one which has but a Grain of Sense or Reason can never believe such a Fiction.

VII. The Places. It grows as well in dry Meadows and Fields, as moist in many places of our Land ; as also in Woods and by Highways sides : a great deal of it has been found growing in *Hampstead Wood* near *London*, at *Lee* in *Essex* ; also at *Raleigh* in *Essex*, in a Wood called *Hammerel*, and in several other places.

VIII. The Times. It flowers in *August*, which is something later than the *Scabioses* ; and is hardly to be known from *Scabious*, but when it is in Flower.

IX. The Qualities. It is hot and dry in the end of the second Degree ; and is Stomack, Cordial, Sudorific and Alexipharmick.

X. The Specification. It is a peculiar Antidote against the Plague, Poyson and Bittings of Venomous Beasts.

XI. The Preparations. You may prepare therefrom. 1. A liquid Juice. 2. An Essence. 3. A Decoction. 4. A Powder of the Root. 5. An Ointment or Balsam. 6. A Cataplasim. 7. A distilled Water. 8. A Spirituous Tincture. 9. An Acid Tincture. 10. An Oily Tincture. 11. A Saline Tincture. 12. A Salt.

The Virtues.

XII. The liquid Juice. Taken inwardly to two, three or four ounces, according to the Age of the Patient, it is powerful against the Measles, Small-Pox, Calenture, malign and spotted Fever, as also against the Plague, and all malign and pestilential Diseases, Poyson, and the Bittings of Vipers, Rattle Snakes, or any other Venomous Beast : and is an excellent thing to induce the Healing of Wounds and Ulcers.

XIII. The Essence. It has all the former Virtues, but is more powerful to the said Intentions : besides which, it is good against Fits of the Mother and Vapors, and provokes the Terms in Women. Dose two, four or six spoonfuls Morning and Night, in a Glass of the Distilled Water, or in a Glass of White Wine.

XIV. The Decoction in Wine. It has all the Virtues of the Juice and Essence, but is yet less powerful : it may be used as a Wound-drink by such Patients as have Wounds, Ulcers or Fistula's which are inveterate, or of difficult Cure. If it is sweetened with Honey of Roses, it is said to be very effectual to help inveterate Tumors and Swellings of the Almonds and Throat, which do hardly come to Ripeness ; for it digests, cleanses, consumes the Phlegm sticking thereto, and dissolves the Tumors by often gargling therewith. Dose four or six ounces Morning and Night.

XV. The Powder of the Root. If it is taken in any convenient Vehicle, it kills Worms, and drives them forth of the Body. It breaks and dissolves Wind in the Bowels, and resists Poyson and all sorts of malign Fevers. Dose one dram mixt with Honey, the Essence aforegoing, or any other proper Vehicle.

XVI. The Ointment or Balsam. It cures simple green Wounds, many times at once dressing ; for it is an incomparable Vulnerary. It ripens Abscesses, and such other Tumors as will in time come to Suppuration. It digests old Ulcers, cleanses, incarnates, dries, and in a short time induces the Cicatrize, or causes them to be healed. Applied to the Gout, it eases the Pain, and in a short time cures it.

XVII. The Cataplasim. It is made of the green Herb and Root, and applied, it dissolves Tumors in simple Contusions, and is profitable to be applied to any place hurt or bruised by any Fall, Blow, or the like, or crushed by any Casualty, dissolving the clotted or congealed Blood, and taking away the black and blew Marks, which may afterwards remain.

XVIII. The distilled Water. It is good to wash green Wounds and old Sores, cleansing and drying them : and given inwardly with the Juice or Essence, it cleanses the Body inwardly. A little white Vitriol is dissolved in it, it is then good against Scurff, Morpew, Herpes, Tettars, Ringworms, Itch, Pimples, running Sores and Ulcers, Freckles, Yellowness of the Skin, and other like Deformities, if the Parts affected be two or three times a day washed therewith, and so suffered to dry on without wiping.

XIX. The Spirituous Tincture. It is powerful against Poyson, and the Malignity of burning and pestilential Fevers, as also the Bittings of Mad Dogs, Serpents, and other poysonous Creatures. It has all the Virtues of the Juice and Essence, but more effectual than they are, where the Heart and Vitals are immediately concerned. It is good against Convulsions, Lethargies, and all other cold and moist Diseases of the Head, Brain, Heart and Nerves. Dose two or three drams.

XX. The Acid Tincture. It is a singular Medicament

cament against the Plague and Spotted Fever: it abates the Heat, and quenches the Thirst, who never to extrem, in the most violent malign and burning Fever, and that almost upon the Spot, even to a Miracle: besides, it refits all sorts of Poyson, more especially such as are volatile Poysons, destroying them in their very Root and Essence. It admirably comforts and strengthens the Stomach, refits Vomiting, creates an Appetite and causes a good Digestion. It suppresses Vapors and Hyfterick Fits in Women, refits Hypochondriack Melancholy, and is good for such as are inwardly bruised by a Fall, or any other Casualty, dissolving the clotted or congealed Blood, and causing it to be excreted. Dose so much as will make the Vehicle pleasingly sharp, and to be repeated three, four, five, six or more times a day.

XXI. *The Oily Tincture.* It is good against inward Convulsions of the Stomach and other Viscera, it gives ease in the Cholick, and other Torments of the Bowels, whether given by the Mouth in any proper Vehicle, or exhibited Clysterwise in Broth or Posset-drink. It provokes the Courses, eases the Pains of the Mother, breaks and discusses Wind in the Belly and Stomach, opens Obstructions of the Reins, and other Urinary Parts, cleanses them of Sand, Gravel, and other Tartarous Matter, and so gives ease in the Stone and Strangury. Dose from ten to thirty drops in any fit Vehicle.

XXII. *The Saline Tincture.* Given inwardly to one dram or more in a proper Medium, it provokes Urine, opens Obstructions of the Womb, Reins and Ureters, and gives ease in the Strangury and Stone: outwardly applied, it is good against Scabs, Itch, Pimples, Pustles, Scurf, Morpew, Leprous Spots, Freckles, Lentils, Sun-burning, Tanning, Yellowness of the Skin, and other the like Defecations, the Parts affected being bathed therewith two or three times a day, or sometimes oftner.

XXIII. *The fixed Salt.* It is Diuretick, Alexipharmick, Aperitive and Antifebrick: it opens Obstructions of the Urinary Parts, expelling Sand, Gravel and Tartarous Matter: i. refits Poyson, the Bittings of Serpents and Mad Dogs, and the Plague: it opens the Passages of the Womb, cleansing it from Impurities, and given in a proper Vehicle, abates the Heat of burning Fevers, carrying off the Morbifick Matter by Urine. Dose one scruple, or half a dram, in the distilled Water foregoing.

CHAP. CCXIV.

Of DEVILS-BIT Various.

THE Names. It is called in *Latin*, *Morsus Diaboli versicoloratus*, and *Morsus Diaboli diversus*: in *English*, *Various Devils-bit*.

II. *The Kinds.* It is twofold, viz. 1. *Morsus Diaboli flore albo*, Devils-bit with a white Flower. 2. *Morsus Diaboli flore carneo*, Devils-bit with bluish-colored Flowers.

III. *The Descriptions.* The first of these with the white Flowers, has a short Stump of a Root, like the former, from whence many thready Radicle spring: from the Head of this Root arises a round, green, smooth Stalk, near two feet high, with long, narrow, smooth, dark green Leaves, a little notched about the edges, but not at all divided, which Notches or Dents grow smaller and smaller, as they

grow nearer to the tops of the Branches, and on the top of each Branch stands a round Head of many Flowers, like the former Devils-bit, saving that these are only white, whereas they are of a bluish purple: and indeed this Plant differs not from the former in any other thing but in the Color of the Flower, which is of a pure white, as some other sorts of the Scabiouses are, and that the green Leaf is not altogether of so dark a green.

IV. *The second*, or that with the bluish-colored Flowers, is in Root, Stalk, Leaf, Color of the Leaf, and Form of the Flower, the same with the former; but in this it differs therefrom, that the Flowers hereof are of an incarnate or bluish color, whereas in the Common they are of a bluish purple, and in the former of a white color only.

V. *The Places.* These two are more hard and rare to be met with than the Common kind, yet they are both found growing Wild about Appledore, near Rye in Suffex; and in several other places of this Kingdom.

VI. *The Times.* They flower later than any of the Scabiouses, and commonly not until August.

VII. *The Qualities, Specification, Preparations and Virtues,* are the same with the Common Devils-bit declared in the former Chapter, so that no more need be said of it here, saving, that neither of these are in the least inferior to the Vulgar in any of their Preparations or Virtues.

CHAP. CCXV.

Of DILL Garden.

THE Names. It is called in *Greek*, *ἄνισον*, (*anison*), *quod cito crescat* Math. 23. 23. *Theophrast. lib. 5. cap. 67. Plin. lib. 20. cap. 18. in Latin*, *Anethum*, and *Anethum hortense*, as *Bauhinus* has it: in *Arabick*, *Zebet*, and *Sebet*; and in *English*, *Dill*.

II. The

II. *The Kinds.* There are two principal kinds hereof, viz. 1. *Anethon Hortense*, Garden Dill, of which in this Chapter. 2. *Anethum Sylvestre*, Wild Dill, of which in the following Chapter.

III. *The Description.* It has a Root which is small and woody, perishing every Year after Seed-time, and is unprofitable as to Physick, never being put to any Use. From this Root rises up for the most part but one Stalk, seldom more, nothing so large, nor seldom above half the height of Fennel, being round, and with fewer Joints thereon, whose Leaves are smaller, and somewhat long, divided almost into an infinite number of fibrous parts, almost like unto Fennel, but harder in handling, and somewhat thicker, of a stronger Smell also, and not so pleasant. The tops of the Stalks have fewer Branches, and are repeat with Umbles of yellow Flowers, smaller than those of Fennel, which pass into small Seed, somewhat flatter and thinner than Fennel Seed, and of a stronger and more piquant Taste.

IV. *The Places.* It is most usually sown in Gardens, and such like Ground for the purpose; and is also found Wild with us in some places: but if so found, yet it is not of the Wild kind.

V. *The Times.* It flowers in July, and the Seed is ripe in the end of August.

VI. *The Qualities.* It is hot in the third Degree, and dry in the second; more especially being green: but when the Herb or Seed are dry, they are hot and dry in the third Degree; and abound very much with Mercury and Sulphur, being Aperitive, Carnitative, Digestive, Discurive and Diuretick; Neurotick, Stomackick, Pectoral, Splenetick and Hyfterick; Sudorifick, Alexipharmick, Analeptick, Galactogenetick and Spermatogenetick.

VII. *The Specification.* It is a peculiar Remedy for the Cholick, and Windiness of the Stomach and Bowels.

VIII. *The Preparations.* You may prepare herefrom, 1. A Juice of the Herb. 2. An Essence of the Herb. 3. A Syrup. 4. A Decoction of Herb and Seed. 5. A Powder of the Seed. 6. An Ointment of Herb and Seed. 7. A Cataplasm of Herb and Seed. 8. A distilled Water of Herb and Seed. 9. A Spirituous Tincture of the Seed. 10. An Acid Tincture of the Seed. 11. An Oily Tincture of the Seed. 12. A Saline Tincture of the Seed. 13. A distilled Oil thereof. 14. A Spirit therefrom. 15. Potestates or Powers. 16. An Elixir of the Seed: of all which in order.

The Virtues.

IX. *The liquid Juice of the Herb.* Mixt with the distilled Water, one or two spoonfuls of the Juice to four of distilled Water, and so taken Morning, Noon and Night, it encreases Seed, as also Milk in Nurses: it expels Wind, and eases Pains of the Bowels, being drunk. If two or three spoonfuls of the Juice is mixt with Chicken-Broth, and exhibited as a Clyster, it helps in a *Tenasmus*.

X. *The Essence of the Herb.* It has the Virtues of the Juice; besides which, if it be given two or three spoonfuls at a time in the Morning fasting, in a Glass of Generous Wine, it wonderfully strengthens the Stomach, eases the Pains and Windiness of the Womb, and stops Vomiting; and is very effectual to digest raw and viscous Humors in the Stomach and Bowels.

XI. *The Syrup of the Herb or its Juice.* It is Pectoral, good against Coughs, Colds, Hoarseness, Wheezing, and other Obstructions of the Lungs from what Cause soever. Mixt with Nurses Milk,

it encreases Milk in her Breasts, and makes it more wholesome for the Child. It is a singular thing also against a tickling Catarrh, or an inveterate Flux of Rheum upon the Lungs, being often taken.

XII. *The Decoction of the green Herb and Seed.* If it is made in Water, it encreases Seed, as also Milk in Nurses. If it is made in Wine, it stirs up Lust, and provokes to Coition; and if it be too much taken, may provoke so vehemently for a time, as at length, quite to extinguish Venery, by a too Lascivious Ejection of the Sperm.

XIII. *The Powder of the Seed.* Taken to one dram in any fit Vehicle, it warms and comforts the Stomach and Bowels, and powerfully expels Wind: mixed with Honey, it is good against Coughs, Colds and tickling Catarrhs, and is good against Hoarseness, Wheezing and loss of Voice. Drank mixed with Wine, it is good against the Hiccough, Vomiting, Loathing and Convulsions of the Stomach and other Viscera.

XIV. *The Ointment of the Herb and Seed.* It is heating and drying, warms Parts which are cold and chilled; and is good to ease Pains in any Part proceeding from Cold, Moisture and Wind. It diffuses and dissolves recent Tumors; but digests and maturates Apoplems, and is good to anoint with for the Piles, and to discuss any other like Tumor in the Fundament; and dries up all moist and running Sores wheresoever, but more especially in the secret Parts. It is an Anodyn or Easer of Pain, and gives Rest.

XV. *The Cataplasm.* It discusses recent Tumors, and is profitable to be applied to any simple Contusion, provided it is done upon the spot: applied to the Gout, whether in Hands, Arms, Knees or Feet, it has been found to give Relief: if it is heat very hot in a Frying-pan, and applied to the Side, it eases the Pains of the Pleurisy, and takes away Stitches: and so applied to the Region of the Abdomen or Belly, it prevails against the Cholick and Gripping of the Guts. Applied very hot to an Apoplem, and often renewed, it brings it quickly to Suppuration, and breaks it.

XVI. *The distilled Water of the Herb and Seed.* It is a good Vehicle to take any of the Preparations in, whether Galenick or Chymick: and being drank sweetned with double-refined Sugar, breeds much Milk in Nurses Breasts, whatever Galen may say to the contrary.

XVII. *The Spirituous Tincture of the Seed.* It powerfully warms, comforts and strengthens the Stomach, expels Wind, and causes a good Appetite and Digestion. It is good against Loathing and Vomiting, stops Fluxes of the Bowels, and digests raw and viscous Humors in those Parts. It may be given from two drams to half an ounce, in a Glass of fragrant Wine, in the Morning fasting.

XVIII. *The Acid Tincture of the Seed.* It strengthens a weak Stomach, incides tough and viscous Humors in the Bowels, and dissolves them, making them fit for Excretion. It cuts tough Flegm and tartarous Humors in the Stomach and Lungs, and makes it fit for Expectoration; for which Reason it prevails against Hoarseness, Loss of Voice, Shortness of Breath and Difficulty of Breathing. It abates the Heat of Fevers, and resists Putridity in what part of the Body soever. Dose so much as may make the Vehicle pleasantly sharp, whether it be Ale, Beer or Wine.

XIX. *The Oily Tincture of the Seed.* It is good against the Palsy, as also Convulsions, Cramps, Numbness, and Pains in any part of the Body, proceeding from Cold and Moisture, outwardly anointed upon the Parts affected, and inwardly given in any proper Vehicle, from fifteen to thirty drops or

more, as the Exigency or Extremity may require. It provokes Urine admirably, and gives ease in the Strangury and Stone, cleansing the Reins and Bladder from Gravel, Sand and tartarous Slime lodged in those Parts. It is a singular thing also to cure a Puncture of the Nerves and Tendons, in which, being applied, it gives present ease to the Pain, attenuates the Tumor, and soon after cures the Affect.

XX. *The Saline Tincture of the Seed.* Mixt with the distilled Water aforementioned, it makes a good Wash for moist and running Ulcers and Sores, cleansing and drying up the Moisture, and disposing them to healing. Given to two drams in a Clyster, it prevails against the Cholick: and taken inwardly to one dram in White Port Wine, it opens and cleanses the Urinary Passages, &c.

XXI. *The distilled Oil of the Seed.* It has all the Virtues of the Juice, Essence, Decoction, Powder, Spirituous, Acid and Oily Tinctures, but it is more powerful than any of them; and may be given to strengthen the Stomach, resist Loathing and Vomiting, cause Appetite and a good Digestion, expel Wind, ease the Cholick and Torsions of the Bowels from sharp Humors, cure Convulsions, Apoplexies, Lethargies, Palsy, Gout, Stone, Obstructions of the Reins, Ureters, Bladder and Womb, &c. Dose from eight to twenty drops, being first dropt into white Sugar, and then mixt with some proper Vehicle, in which it is to be given Morning and Night.

XXII. *The Spirit of the Seed.* It has all the Virtues of the Spirituous, Acid and Oily Tinctures, but not all out so powerful; yet it is much more grateful or pleasant to the Pallate; and may be taken, being dulcified, either alone or mixt with some proper Vehicle, from two drams to fix.

XXIII. *The Potestates or Powers of the Seed.* They have all the Virtues of the Chymical Oil, Juice, Essence, Tinctures and Spirit, but more powerful and subtil, piercing admirably thro' all Parts of the Body. By outward Application, being bathed upon the Parts affected, they are good against Pains, Aches, Numbness, Palsy, Lameness, Convulsions, Spasms proceeding from a cold and moist Cause: they resolve Humors, discuss Tumors, and resist Deffluxions upon any Part, by strengthening the same. Dose inwardly from one dram to three or four, in any proper Vehicle Morning and Night.

XXIV. *The Elixir of the Seed.* This has all the Virtues of the distilled Oil, Essence, Tinctures, Spirit and Powers, and is more subtil and powerful than any of them; and therefore may very profitably be used to all those Intentions, both by inward Exhibition and outward Application. It is indeed an admirable Stomack, scarcely any better in the whole Republick of Medicine: and for provoking Lust, one of the most powerful of Vegetables. Dose from one dram to two, in a proper Vehicle.

C H A P. CCXVI.

of DILL Wild.

I. **T**HE Names. It is called in Greek, **Anethon* ^{malvion}; in Latin, *Anethum Sylvestre*; and in English, *Wild Dill*.

II. *The Kinds.* It is the second Species of Dill: and of this Species there are two sorts, viz. 1. *A-*

nethum Sylvestre majus, Great Wild Dill. 2. *Anethum Sylvestre minus*, Small Wild Dill.

III. *The Descriptions.* The first, or Great Wild Dill, has a Root like to the Garden kind; and in its Stalks, Leaves, Flowers and Seed differs little from it, but in its Largeness, being much greater in all its parts than the Garden kind is: and the Smell thereof is much the same.

IV. *The second, or Small Wild Dill, has a Root like to the first or Garden kind, but smaller than it: and so likewise, as the first of these was greater in all its parts than the Garden Dill, so is this lesser in its Stalks, Leaves, Flowers and Seed; the Stalk growing not above a foot high: the Leaves are fine and small on the Stalks, the Flowers yellow, and the Seed small and long, like the Garden kind, but only lesser, in which the Difference chiefly lies.*

V. *The Places.* Their native Place is Sicily, and Lisbon in Portugal: from the first place they were sent by Columna to Bauhinus; and from the second place they were sent by Boel to us, and are now nurs'd up in our Gardens.

VI. *The Times.* They both flower in their native places in June, but with us in July; and their Seed is ripe in August, or some small time after.

VII. *The Qualities, Specification, Preparations and Virtues,* are the same with those of the Garden kind, and full out as effectual; and therefore for the same you are referred to the foregoing Chapter.

C H A P. CCXVII.

of DITTANDER,

O R,

PEPPER-WORT.

I. **T**HE Names. It is called in Greek, *Anisodon*, ^{quod ventris, id est, maculas & squamas in cute delent}: or as some think, *anis non ventris*, ^{quod acrimonia urenti ulceret}: in Latin, *Lepidium*, (but it is not the *Lepidium Dioscoridis & Galeni*, for that is *Iberis Cardimantica*, of which we have already treated in Chap. 168. foregoing: in English, *Dittander*, or *Pepper-wort*.

II. *The Kinds.* Authors make three sorts hereof, viz. 1. *Lepidium vulgare*, sive *Piperitis*, *Fuchsi* & *Loniceri*, *Trogi*, *Matthioli* & *Camerarii*, *Lepidium magnum* *Turneri*, *Cordi* & *Fuchsi*; *Lepidium* *Plinii*, according to *Lobel* & *Dodonaeus*; *Lepidium Pauli* & *Plinii*, according to *Matthiolum*, *Lugdunensis* & *Casalpini*; *Raphanus Sylvestris officinarum*, according to *Lobel*, and *Lepidium latifolium* *Baubini*, The vulgar *Dittander* or *Pepper-wort*. 2. *Lepidium Monspelacum*, *Hammula Gesneri* (in *bortis*) *Herba Sancti Antonii*, *Dentillaria Lobelii* & *Lugdunensis*; *Dentaria Rondeletii*, *Molybdena* *Plinii*, according to *Anguilara* & *Camerarius*; *Plumbago Cusii* & *Tabernmontani*; *Glastrum Sylvestre* *Casalpini*, French *Dittander*, or *Scar-wort*. 3. *Lepidium Annuum* *Lobelii*, & *Lugdunensis*; *Lepidium Glastrifolium* *Eaubini*, Annual *Dittander*, or *Scar-wort*.

III. *The*

Dittandar.

III. The Descriptions. The first, or Common Dittander, has a Root which is slender, and runs much under Ground, and shooting up again in many places: both Leaves and Roots are very hot and sharp in Taste, biting like Pepper, whence came the Name of Pepper-wort: from this Root spring forth somewhat long and broad Leaves, of a light blewish green color, finely dented about the edges, and pointed at the ends, standing upon round hard Stalks, three or four feet high, spreading many Branches on all sides, and having many small white Flowers at the tops of them, after which follow small Seed in small Heads.

IV. The second, or French Dittander, commonly called Dentillaria Rondeletii, has a Root which is composed of many great Strings, with a woody Pith in the middle, running down deep into the Earth, and abiding many Years, altho' both Stalks and Leaves perish every Year, fresh springing up again in the Spring. This Root Annually sends up a number of long and limber Stalks, reddish at the bottom, lying down upon the Ground, and not standing upright, because of their length, which are sometimes four, five or six feet long, set with Leaves on all sides, which are somewhat narrow, long and smooth, of a sad green color, smaller at the lower end, and encompassing the Stalk about, but lesser still as they grow nearer to the tops of the Stalks, where they are a little branched, and do break forth into several dark purplish Flowers, set together, consisting of five small pointed Leaves apiece, standing in round brownish Husks, in which afterwards is contained small, round and blackish Seed, very sharp in Taste, exulcerating the Skin, and burning it, being laid thereon, as the Leaves also do.

V. The third, or Annual Dittander, has a Root which is small and fibrous, perishing every Year: from which Root rise up Stalks more upright than the last, about three or four feet high, set with such like Leaves as the last, but somewhat larger, and encompassing them at the bottoms. The Flowers are white, and stand upon small Branches one above another. Spike-fashion, which afterwards give small, round

and pointed Husks, like some of the Tulapies or Thierie-Mustards, in which the Seed is contained, no less hot and fiery in Taste, and exulcerating the Skin, than the Seed of the former.

VI. The Places. The first of these is found growing naturally in many places of England, as Clare in Essex, also near Excester, and upon Rochester-Common in Kent; at Swale-Abby near Wharley, in Lancashire: it delights to grow in sandy and shadowy places which are something moist; and is also nurs'd up in Gardens. The other two are of French Origination, growing about Mompelien; but with us are nourish'd up in Gardens.

VII. The Times. The first flowers about the end of June and in July. The second late with us, in August, but scarcely ever gives ripe Seed in England. The third flowers in July, and the Seed is ripe in August.

VIII. The Qualities. They are hot and dry in the fourth Degree; Pyrotick, Stomatick, Arthritic, Peumick and Alexipharmick.

XI. The Specification. They are peculiar for the Cure of the Sciatica or Hip-Gout.

X. The Preparations. You may have therefrom, 1. A liquid Juice. 2. An Essence. 3. An Infusion in Wine. 4. A Powder. 5. A Cataplasm. 6. A Spirituous Tincture. 7. An Acid Tincture. 8. An Oily Tincture. 9. A Saline Tincture.

The Virtues.

XI. The liquid Juice. Parkinson says, that the Women of Bury in Suffolk do usually give the Juice thereof in Ale or Beer to Women in Labor, to procure a speedy Delivery in Travail. You may give it from one spoonful to two at a time.

XII. The Essence. It has the former Virtues; besides which, it is powerful to provoke the Terms in Women where they are stop'd, dry up Catarrhs and tickling Rheums which fall upon the Lungs; and being held in the Mouth, gives ease in the Tooth-ach to Admiration. Dose one spoonful or more at a time, in a Glass of Ale, Beer or Wine.

XIII. The Infusion in Wine. It warms and comforts a cold Stomach, expels Wind, provokes Appetite, and helps Concoction, and gives ease in all Pains of the Stomach and Bowels proceeding from Wind, or Sharpness of Humors, the Cholick, &c. being drunk for some time by Women, it is said to cause Fruitfulness. Dose a small Gill of three or four ounces Morning and Night.

XIV. The Powder. Snuff'd up the Nostrils, it is a good Errhine to purge the Head and Brain of cold, moist and flegmatick Humors, which it does very effectually. Taken inwardly from a scruple to half a dram, or two scruples in the Morning fasting, it kills Worms in Children, and expels Wind out of the Stomach: and used as a Topick to moist and running Sores and Ulcers, it cleanses, dries and induces their Healing.

XV. The Cataplasm. It is made of the green Leaves, either alone or mixed with Hogs-Lard, by beating them together in a Mortar. It is hot, fiery and sharp, as is that of Sciatica Cresses, and works the same Effects; for both Paulus Aegineta and Pliny say, that it is effectual for the Cure of the Sciatica or Hip-Gout, or any other Pain or Gout in the Joints, or any other inveterate Grief, being applied in the same manner as Sciatica Cresses; and used in the same order, it also is good against the Deformities or Discolorings of the Skin, and takes away Marks and Scars, Scabs, and Deformities made by burning with Fire, or the like.

XVI. The Spirituous Tincture. It cures the Pain

of the Stomach and Bowels, the Cholick, and Torsions of the Bowels arising from sharp and corrosive Humors. It strengthens the Viscera admirably, and stops Fluxes of the Belly of all sorts, as the Diarrhea, Dysenteria, Lienteria, Hepatick-flux, and withal restores the Tone of the Parts hurt, by warming and comforting them. Dose half a spoonful at a time in a Glass of Wine.

XVII. *The Acid Tincture.* It cuts thick and tough Hlegm, dissolves tartarous Matter in what part of the Body soever, strengthens the Stomach, restores its deprived Tone, causes a good Appetite and a strong Digestion: and by its Infiltration into the Mass of Blood, it destroys its Discrepancy, and so effectually roots out the Scurvy, whether in Old or Young. Dose so many drops as to make the Vehicle pleasantly sharp.

XVIII. *The Oily Tincture.* It is good against Rheumatick Pains and Aches in any Part of the Body, the Sciatica and Gout proceeding from a cold Cause, as also Palsies, Convulsions, Spasms or Cramps; in all which Cases it is to be bathed twice a day upon the Parts affected, rubbing it every time well in: in a Palsy, it ought also to be anointed all along upon the Back-bone, as well as upon the Part affected.

XIX. *The Saline Tincture.* It prevails against Tetters, Kingworms, Herpes, Scurff, Morpew, Itch, Pimples, Pustules, Scabs, Leprosy, and other like Breakings out: it also takes away Sunburning, Tanning, Freckles, Lentils, Rednets, Yellowneis, and such other like Defecations of the Skin, being only bathed Morning, Noon and Night upon the Part affected, and then suffering it to dry in.

C H A P. CCXVIII.

Of DITTANY Bastard White.

THE Names. It is called in Greek by some, *Χαμαμηλία, ή Χαμαμηλίων*, (as if it was *Fraxinus humilis*, but that it is not:) in Latin, *Fraxinella*, *Diptamum* and *Distamnium*; also *Distamnium vel Distamnium albus*: in English, *White Dittany*, *White Bastard Dittany*, and *Fraxinella*.

II. The Kinds. There are three kinds, viz. 1. *Fraxinella vulgaris*, *Fraxinella flore rubente*, Common or vulgar Bastard Dittany with a reddish Flower. 2. *Fraxinella flore rubro*, Bastard Dittany with a red Flower. 3. *Fraxinella flore albo ceruleo*, Bastard Dittany with an Ash-colored Flower.

III. The Descriptions. The first, or Common Bastard Dittany, has a white large Root, spreading many ways under Ground, if it stands long: it is a goodly Plant, and rises up with several round, hard, brownish Stalks, near two feet high, the lower parts whereof are furnished with many winged Leaves, somewhat like unto Liquorice or a small young Ash-tree, consisting of seven, nine or eleven Leaves set together, which are something large and long, hard and rough in handling, of a darkish green color, and of an unpleasant strong resinous Smell. The upper parts of the Stalk are furnished with many Flowers growing Spike-fashion, at certain distances one from another, consisting of five long Leaves apiece, of which, four which stand on the two sides are somewhat bending upwards, and the fifth hanging down, but turning up a little the end of the Leaf again, of a faint or pale red color, striped thro' every Leaf

with a deeper red color, and having in the middle a Tassel of five or six long purplish Threads, which bow down with the lower Leaf, and turn up also the ends again, with a little kriese or Thrum at the ends of every one. After the Flowers are past, arise hard, stiff, rough, clammy Husks, horned or pointed at the end, four or five standing together, somewhat like unto the Seed-Vessels of Wolts-bane or Columbines, but greater, thicker and harder, in which is contained round, shining, black Seed, larger than any Columbine-Seed by much, and smaller than Peony-Seed. The whole Plant, as well Roots as Leaves, is of a strong Scent, not so pleasing for the Smell as the Flowers are beautiful to the Sight.

IV. The second, or Bastard Dittany with a red Flower, for Root, Stalks, Leaves, Flowers and Seed, with the Form and Manner of Growing, are all very like to the former, excepting that the Stalks and Leaves are of a darker green color, and that the Flowers are of a deeper red color, and growing in a little longer Spike; in which things the Difference chiefly consists.

V. The third, or Bastard Dittany with an Ash-colored Flower, is also in Root, Stalks, Leaves, Flowers, Seed, Form and Manner of Growing, like to the second, excepting that the Leaves and Stalks are of a fresher green color than any of the former, and the Flowers are of a very pale or whitish blue color, tending to an Ash color, in which the Difference chiefly consists.

VI. The Places. All these kinds are found to grow naturally in many places both of Germany and Italy; but with us they are only nurs'd up in Gardens.

VII. The Times. They flower in June and July, and their Seed is ripe in July or August.

VIII. The Qualities. It is hot and dry in the second Degree; Anodyne, Aperitive, Attenuating, Inciding, Digestive, Stomack, Nephritick, Hyfterick, Emmenagogick and Alexipharmick.

IX. The

IX. *The Specification.* It is peculiar against Poyson, Plague, Stoppage of Urine, and the Courfes in Women.

X. *The Preparations.* You may have therefrom, 1. *A liquid Juice of the Leaves and Root.* 2. *An Effence of the same.* 3. *An Infusion of Leaves and Roots in Wine.* 4. *A Powder of the Seed.* 5. *A Fumigation.* 6. *A Powder of the Root.* 7. *A Spirituous Tincture.* 8. *An Acid Tincture.* 9. *An Oily Tincture.* 10. *A Spirit.* These four last from the Root chiefly, or Root and Herb.

The Virtues.

XI. *The liquid Juice of Leaves and Root.* Taken from one spoonful to two in White Port Wine, it is good against the Strangury, provokes Urine, and is said to break the Stone in the Bladder, and expel it: it also provokes the Terms, and brings away both Birth and After-birth.

XII. *The Effence of Roots and Leaves.* It has all the former Virtues; besides which, it is good for Weakness and Illness of the Stomach, prevails against all cold and moist Diseases of the Womb, and is profitable against the Stingings and Bitings of Hornets, Scorpions, Serpents, Mad-Dogs, and other venomous Beasts: it prevails against deadly Poysons, and all sorts of malign and pestilential Diseases. Dose one or two spoonfuls Morning and Night, in a Glass of Generous Wine.

XIII. *The Infusion of Leaves and Roots in Wine.* It has all the former Virtues, but not full out so powerful, and may be given to four or six ounces: it expels Wind, and eases the Cholick.

XIV. *The Powder of the Seed.* Given to a dram or more in White Port Wine, it prevails against the Strangury, provokes Urine, and breaks the Stone (as Authors say) in the Bladder, and drives it out.

XV. *The Fumigation.* The Root made into little bits, or a very gross Powder, and the Fume of it, being cast upon live Charcoal, and received by a Funnel up the Womb, it warms and cleanses that Part, and is said to bring away the After-birth; some of the Effence thereof being taken at the same time inwardly.

XVI. *The Powder of the Root.* If it is given to a dram with fifteen grains of Rhubarb, it kills and drives forth Worms: and being given from one to two drams, it effectually resists Poyson and the Venom of Serpents, Mad-Dogs, &c. prevails against the Plague and other contagious Diseases, kills Worms in the Stomach and Belly, and gives ease in the Stone.

XVII. *The Spirituous Tincture of the Root, or of Root and Leaves.* It has all the Virtues of the Juice and Effence, but more powerfully warms and comforts a cold, weak and sick Stomach, restores a depraved Appetite, and causes a good Digestion: it expels Wind, and gives ease in the Cholick. Dose two or three drams.

XVIII. *The Acid Tincture.* It heals inward Wounds, and prevails against the Epilepsy or Falling-sickness, Vertigo, Lethargy, Head-ach, Megrim, and other cold and moist Diseases of the Head and Brain. It cuts rough Flegm, opens Obstructions of the Lungs and other Viscera, helps to break the Stone, and expels Sand and Gravel, as also any kind of tartarous Matter from the Breast, Lungs, Reins, Ureters and Bladder. Dose so many drops as may make the Vehicle pleasantly sharp, to be taken three or four times a day.

XIX. *The Oily Tincture.* It is good against Convulsions and Cramps, as also Lameness, Numbness, Pains, Aches, Palfies, and other like cold and

moist Diseases of the Nerves, being well bathed upon the Parts affected Morning and Night: also taken inwardly, from ten to twenty five drops, in a Glass of White Port Wine, it is an excellent thing against the Strangury and Obstructions of Urine by Sand, Gravel, or any tartarous or slimy Matter in the Reins, Ureters and Bladder. Given to forty drops, as aforesaid, to a Woman in Travail, it brings forth both Birth and After-birth.

XX. *The Spirit of Herb and Root.* It is a singular Stomack, warming and comforting a cold and weak Stomach: it restores its Tone, expels Wind, prevails against the Cholick, and causes a good Appetite, and an excellent Digestion, being taken an hour before Dinner. Dose (dulcified) one or two spoonfuls.

XXI. *Nota.* If the green Herb is bruised, and applied outwardly, it draws Prickles, Thorns, Splinters, and such other like things out of the flesh.

C H A P. CCXIX.

Of DITTANY Bastard, Outlandish.

I. *THE Names.* It is called in Greek, *Ψευδοδιταννιον*; in Latin, *Pseudodittamnium*, *Pseudodittamnus*: in English, *Outlandish Bastard Dittany*.

II. *The Kinds.* It is opposed as the false kind of the *Dittany of Crete*, of which we shall treat (God willing) in the Third Book of this *Herbal*. Of this *Bastard Dittany* there are two principal sorts, viz. 1. *Pseudodittamnus primus*, (which, as *Angustura* says, is called by the now Greeks, *Βακινιαδία*) *Bastard Dittany*. 2. *Pseudodittamnus alter* *Theophrasti*, *Dittamnium alterum* *Dioscoridis*, The other *Bastard Dittany*.

Bastard Dittany.

III. The Descriptions. The first has a pretty long Root, which is blackish, hard and woody, shooting down deep into the Ground, with divers Strings springing from it. From this Root rise up Stalks or Branches, half a yard long sometimes, on which are set such like round and hoary Leaves as the True Dittany of Creet has, but neither so thick in handling, nor so thick set on the Branches, but more dispersed, yet two always together, one against another: from the middle of these Branches, to the tops of them, come forth the flowers round about the Stalks at the Joints with Leaves, which are gaping, like those of the True Cretian Dittany, as Pennyroyal, Mint, Calamint, and divers the like Herbs have; which Flowers are of a dull purplish color, standing in hoary Husks; after which comes the Seed, which is greater and blacker than that of the True Cretian. This Herb is somewhat hot and sharp, but not by half so much as is the True, or as is the Fraxinella in the former Chapter.

IV. The second has a fibrous Root, which spreads it self, shooting pretty deep in the Earth; from which rise up many square hoary Stalks, more than a foot high, set with two Leaves at a Joint, like unto the former, but something larger and longer: towards the tops whereof, with the Leaves, come forth hoary Husks, like unto those of the Great Assyrian Bawm, but shallower; out of which start gaping Flowers, mixed with white and red. The whole Plant smells very well, and abides all Winter, as the other does; and is increased (as is also the former) by Slipping.

V. The Places. The first grows in many places of Italy, as near Pisa and Leghorn; the other is a Native of the Island Cerigo; they have been both brought to us, and flourish very well in our Gardens, if the Winter is not too violently sharp and long. The first has been many times raised with us from Seed brought from Italy; but it grows very well also of the Slips, being put into the Ground about the middle of April, and a little defended from the Heat of the Sun for a time, after the setting, and now and then watered in the mean Season.

VI. The Times. The first flowers with us all the latter part of the Summer, but seldom gives any good Seed: but the Seasons of the other have not been observed.

VII. The Qualities, Specification, Preparations and Virtues, differ not from those of the True Cretian Dittany; nor much from those of Fraxinella in the last Chapter, to which you are referred.

C H A P. CCXX.

of D O C K Common.

I. THE Names. It is called in Greek, *δαμάσκη*, *δάμνη*, *δαμάσκη*, quod valet exinanire, vel Ventrem levare, for that it loosens the Belly: in Arabic, *Hamad* and *Humadh*: in Latin, *Lapathum* and *Rumex*; and in English, Common Dock.

II. The Kinds. There are several kinds of this Plant, viz. 1. *Lapathum sylvestre vulgare*, vel *Rumex communis*, Common Dock, of which in this Chapter. 2. *Oxylapathum Discoridis*, *Lapathum acutum*, *Rumex acutus*, Sharp-pointed Dock, of which in Chap. 221. 3. *Hydralapathum*, *Rumex aquaticus*, Water Dock, of which in Chap. 222. 4.

Lapathum Maritimum, Sea Dock, of which in Chap. 223. To these you may add, 5. *Lapathum Sanguineum*, Blood-wort, of which we have already treated in Chap. 182. foregoing. 6. *Hippolapathum Sativum*, Patience, or Monks Rhubarb, of which in the following Part of this Work, in its proper place.

III. The Description. The Common Wild Dock has a great long Root, of a blackish brown on the outside,

side, and of a yellow color within : from this Root springs up one large, stiff Stalk, and sometimes more, of a foot, and sometimes a foot and half high, (according to the Goodness of the Ground) as also a great many long and broad Leaves on long Foot-stalks lying upon the Ground, and some standing almost upright, something round-pointed, having a great Rib in the middle, and full of Veins on each side the Rib, smooth, and not dented round the edges. The Stalk is of a brownish green, set with long narrow Leaves, and somewhat branched towards the top ; the Branches abound with Flowers and Seed in a spiked Form : the Flowers are reddish, and the Seed triangular, almost like a Tetrabedron in Geometry, contained in a brownish red Husk, much resembling Chaff or Sawdust.

IV. *The Places.* It grows in Field and Meadows, waste Grounds, Orchards, by Ditch-sides, and Highway-sides, more especially in the moister Grounds, in most parts of England.

V. *The Times.* It flowers in June and July, and the Seed is ripe in the end of August, and sometimes earlier.

VI. *The Qualities.* It is temperate in respect to Heat or Coldness, and dry in the second Degree, more especially the Seed, which is very Astringent. The whole Plant is very Astringent and Absterfve, with a kind of opening Faculty ; and is Traumatick or Vulnerary and Hepatick.

VII. *The Specification.* It is peculiar for curing all Fluxes of the Bowels, chiefly the Bloody-flux.

VIII. *The Preparations.* The Root and Seed are mostly in Use, the Leaves only whilst they are young. From this Plant you may have these Preparations. 1. The liquid Juice of the Root, extracted with White or Red Port Wine. 2. A Decoction of the Root. 3. A Powder of the Root or Seed. 4. A Vinegar of the Root. 5. The distilled Water of Herb and Root. 6. A Spirituous Tincture of the Root. 7. An Acid Tincture of the Root : of all which in order.

The Virtues.

IX. *The liquid Juice of the Root.* It opens Obstructions of the Liver and Spleen, cleanses and strengthens the Stomach and other Viscera, stops a Diarrhea and Lienteria, and heals the Corrosion of the Guts in a Dysentery, strengthening them admirably ; and prevails against the Jaundice after a singular manner. Dose four ounces or more, first at Night going to Bed, and as much in the Morning fasting.

X. *The Decoction of the Root.* It has all the former Virtues, but performs not full out so effectually ; it is good against the wambling Pains and Sicknes of the Stomach, the Bloody-flux, and Bitings of venomous Creatures ; and prevails against the Jaundice, Strangury or Stoppage of Urine, Stone, Gravel, &c.

XI. *The Powder of the Root or Seed.* It cures Fluxes of the Belly, and stops the over-flowing of the Courfes in Women. Strewed upon moist and running Sores or Ulcers, it cleanses, dries and disposes them to a Healing. Given to a dram or dram and half in choice Red Port Wine, it helps a Diabetes.

XII. *The Vinegar of the Root.* It is Alexipharmick, being inwardly taken, and prevails against malign and pestilential Diseases : outwardly, it is good against Scurff, Morpew, Itch, Mange, Pimples, Pustules, Scabs, and other like Defecations of the Skin, the places affected being bathed therewith two or three times a day.

XIII. *The distilled Water of the Herb and Root.* If it is mixt with the Vinegar just aforegoing, or with Juice of Limons, it is good to clear the Skin of Morpew, Freckles, Lentils, Sun-burning, Tanning, Yellowness, and other Discolorings of the Skin.

XIV. *The Spirituous Tincture of the Root.* It admirably strengthens the Bowels, and is good against all their various Fluxes, as Diarrhea, Dysentery, Lientery, and Hepatick Flux : it is singular against fainting and swooning Fits, and Gripings of the Guts, proceeding from cold, sharp and stumy Humors. Dose one spoonful Morning and Night in a Glass of White or Red Port Wine.

XV. *The Acid Tincture of the Root.* It is good against the Yellow Jaundice, being taken in all that the Patient drinks, whether Ale, Beer or Wine. It strengthens and fortifies the Stomach, provokes Appetite, and causes a good Digestion ; cuts thick and tough Flegm, and carries off tartarous Matter lodged in the Stomach, Lungs, Reins, Ureters and Bladder ; and destroys those Humors which are the Ground and Foundation of the Kings-evil.

CHAP. CCXXI.

Of DOCK Sharp-pointed.

THE Names. It is called in Greek, *Ὠξυλάπαθος* : in Latin, *Oxylapathum*, *Lapathum acutum*, *Rumex acutus* ; and in English, Sharp-pointed Dock.

large red sharp pointed Dock

II. *The Kinds.* It is threefold, viz. 1. *Oxylapathum majus*, *Lapathum acutum majus*, *Rumex acutus Cordi*, The greater sharp-pointed Dock. 2. *Oxylapathum*, vel *Lapathum acutum minus*, *Rumex acutus minor*, The less or small sharp-pointed Dock. 3. *Oxylapa-*

Oxylapathum, vel Lapathum acutum minimum, Rumex acutus minimus, The smaller or least sharp-pointed Dock.

III. The Description. The first, or Greater, has a Root which is great, long, and many times forked, being blackish on the outside, and somewhat reddish and yellowish within, abiding many Tears, but sometimes perishing by the Extremity of Winter. From this great and long blackish Root spring forth many long, hard and narrow green Leaves, very sharp-pointed at the ends, much more sharp than in the former sort: from among which Leaves rises up a stiff hard Stalk, two or three feet high, set with the like Leaves, but smaller still up to the top, not much unlike to *Sorrel*, but that it is neither so tender nor sour, but rather of a bitterish Taste. This Stalk is branched forth towards the top into several large Branches or Sprigs, bearing small reddish Flowers in long Spikes; after which, in brown reddish, or dun-colored Husks, is contained small triangular Seed.

IV. The second, or Less sharp-pointed Dock, has a Root which is long and slender, parted diversly with small Fibres appendent thereto: which Root is of a yellow color on the inside; and from which rises up a strong, stiff Stalk, about a foot, and sometimes a foot and half high, having Leaves thereon, which are long and narrow, wove in on the edges, as if they were crumpled: this Stalk is branched forth into several other large Branches, almost from the bottom to the top; all which Branches are also beset at due distances, with the like long and narrow Leaves, crumpled in like manner: the Stalks, Branches and Flowers, with the Seed following them, are like unto the former, but that they stand not on such long Sprigs or Twigs, but closer together, some at the Joints, or compassing the Stalks, and others at the tops of, a darker color.

V. The third, or Smaller kind, has a Root which is small, and more yellow than the first of this kind

at sect. 3. above; but it differs little therefrom in its Form and Manner of Growing, except in its Greatness, this being much lesser, smaller and lower. The Stalk is not much above half the height of the first, and the Leaves very small, narrow, long and sharp-pointed, not near the quarter part of the Largeness of the first of this Species: the Flower is small, as is the Seed, which is triangular, and contained in the like chaffy Husks.

VI. The Places. They are all found most commonly in moist Meadows, and sometimes in upland Grounds also; at lower ends of Grounds which are moist and plathy, and neat or bordering on Water-Courses.

VII. The Times. They rise up in the Spring of the Year; flower in June and July, and their Seed is ripe in August.

VIII. The Qualities, Specification, Preparations and Virtues, are the same with those of the Common Dock declared in Chap. 220. foregoing, excepting that the Great sharp-pointed Dock is much more efficacious and powerful to all the Intentions there named.

IX. Observation. The Great sharp-pointed Dock is esteemed by almost all Authors, to be a great Aperitive or Opener, and a powerful thing against Scurf, Morpew, Leprosy, Pimples, Pustules, Redness, Tawiness, Tettars, Ringworms, Herpes, and all sorts of Scabbiness happening to the external Parts of the Body; and indeed it is the most excellent of all the kinds of Docks for those Intentions: and therefore the Juice of the Root is commonly put into those Ointments, which are made against Morpew, Leprosy, Herpes, Tettars, Scabbiness, &c. it being a powerful Absterive, to remove those Defectuations of the Skin.

C H A P. CCXXII.

of DOCK Water.

I. THE Names. It is called in Greek, *ὑδροπάθος*, in Latin, *Hydrolapathum*, and *Lapathum aquaticum*, *Rumex aquaticus*: in English, Water Dock.

II. The Kinds. It is twofold, viz. 1. *Hydrolapathum majus*, *Rumex palustris* Tragi; *Lapathum palustre* Tabernmontani; *Hippolapathum sylvestris* Gesneri, Matthioli, Dodonæi; *Hydrolapathum magnum*, vel *majus aquaticum*, The greater or great Water Dock. 2. *Hydrolapathum minus*, *Rumex aquaticus minor*, *Lapathum aquaticum minus*, The lesser or small Water Dock.

III. The Description. The first, or Great Water Dock, has a thick Root, blackish on the outside, but of a dark reddish, or reddish yellow within, which is shorter than the Great sharp-pointed Dock, and fuller of Fibres: from this Root spring up several large Leaves, standing upon pretty long root stalks, which Leaves very much resemble the Common Dock Leaves, but that they are much larger and longer, a little crumpled as to their Substance, but smooth on the edges, and for the most part sharp-pointed. There grows up also one large brownish green Stalk, which is sometimes spotted towards the Root with a few reddish Spots: the Leaves growing upon this Stalk are much like those just now described, but lesser, and growing lesser and lesser as they approach near the top, with some little or lesser Leaves

Leaves springing from the same Joints of the Stalk, where the greater Leaves grow, which lesser Leaves seem to grow in the Bottom, as it were, of the greater Leaves. The top of the Stalk shoots it self forth into several small Sprigs or Twigs; each of which, when in Flower and Seed, are of a spiked Form, and all together with the main top of the Stalk make one great spiked Head of Flowers and Seed; which Flowers and Seed differ nothing in Appearance from those of the *Common Dock*, excepting that they always grow closer together.

Great
Water
DockSmaller
Water
Dock.

IV. *The second, or Lesser Water Dock, has a Root like the former, but it is smaller, and full of long Fibres or Strings: the first Leaves also are like the first Leaves of the former, but much lesser, long and narrower, being also sharp-pointed.* The Stalk is lower, and fuller of Branches, with Flowers and Seed like to the former, and to the rest of the *Docks*: so that there seems to be little or no other Difference between this and the *Greater*, but in the Magnitude of all the Parts, this being less every way; but in its Form and Manner of Growing, it is much the same with the other.

V. *The Places.* They both grow in wet and plashy places, and by the edges of standing Waters and Ditch-sides: I have found them growing plentifully in the *Fens* in *Cambridgeshire*, in Ditches, and by Ditch-sides, and in the midst of standing shallow Waters; as also in low midland Grounds, at the lower parts of the Land, bordering upon the fenny parts, where the Earth is moist and watry, and by shallow Rivers-sides.

VI. *The Times.* These also flower in June and July, and the Seed is ripe in August.

VII. *The Qualities, Specification, Preparations and Virtues* of these, are the same with those of the *Common* and *Sharp-pointed Dock*; and therefore to the two former Chapters I refer you: but this you may take notice of, That the Roots and Seed of the *Water Dock* are little inferior to those of the *Sharp-pointed Dock*; and some learned Men which I know, affirm, that they exceed in Efficacy.

VIII. *An Observation.* The Roots of *Water Docks* or *Sharp-pointed Docks*, being boiled in Water till they are soft, and then beaten in a Mortar with Hogs Lard, and so made into an Ointment, is good against Scabs, Itch, Mange, Scurf, Morpiew, Leprosy, &c. the Patient being daily anointed with it.

C H A P. CCXXIII.

of DOCK Sea.

I. *THE Names.* It is called in Greek, *Ανέμοιον* *ἔρδης*, & *θαλασσίον*: in Latin, *Lapathum Maritimum*, *Rumex Maritimus*: in English, *Sea Dock*.

II. *The Kinds.* It is *singularis sui generis*, and because it is a very strong-scented Plant, Authors are pleased to call it *Lapathum Maritimum fatidum*, *Stinking Sea Dock*.

III. *The Description.* It has a long Root, which is pretty thick with some Fibres thereto, and goes somewhat deep into the Earth, it being generally very light and sandy Ground in those marshy places. From this Root rises up a Stalk which is reddish, a foot, and sometimes half a yard high or long, which bends several ways. The Leaves grow at the gouty Joints upon long Foot-stalks, which are broad at bottom, long with a breadth, roundish towards the top, and then sharp-pointed; they are of a dark red color, waved about the edges, and winged usually at bottom, with two small pieces like Ears. The Stalk spreads it self into many Branches, with the like, but lesser Leaves on them, and a little dented about the edges. At the top of the Stalk stands a Spike of Flowers, composed of four mossy Leaves apiece; after which follow leaved round Heads, which contain the Seed.

R r

IV. *The*

IV. *The Places.* It grows in Salt Marshes, by the sides of Rivers and Brooks which daily flow with Salt Water, and in standing Waters which are sometimes overflowed with Salt Floods, or where the Salt Water flows so high as to reach the Roots thereof. I found it growing in and near the *Marshes* by *Kings-Lynn* in *Norfolk*, and near the *Sea-shore* in many other places.

V. *The Times.* It flowers in *June* and *July*, and the Seed is ripe not long after.

VI. *As to its Qualities and Virtues,* Authors have been silent thereon, and I knowing nothing by Experience concerning it, shall forbear any farther Discourse about it.

CHAP. CCXXIV.

of DODDER.

THE Names. It is called in *Arabic*, *Chif-fath*, and *Cuseuth*: in *Greek*, *Kazavda*, *χζαβδα*: in *Latin*, *Cuscuta*, *Cassuta*, *Cassyta*, *Podagra lini*, *Angina lini*: in *English*, *Dodder*.

II. *The Kinds.* It is a singular Plant of the kind, and yet is various; for being a Climer, it is said by Authors to be as manifold as are the Plants upon which it climbs, and accordingly has gotten as many Surnames; as, *Epithymum*, Dodder of Time: *Epithymum*, Dodder of Spurge: *Epithymum*, Dodder of Nettles: *Epithymum*, Dodder of Hyogo: *Epithymum*, Dodder of Tares: *Epithymum*, *Epithymum* idem: *Epithymum*, Dodder of Broom: *Epithymum*, Dodder of Dittany: *Epithymum*, *Epithymum*, Dodder of Savory: *Epithymum*, *Epithymum*, Dodder of Brambles: *Epithymum*, *Epithymum*, Dodder of Flax: *Epithymum*, *Epithymum*, Dodder of Rosema-

ry, or Herb Frankincense: *Epithymum*, Dodder of Herb Mastic: *Epithymum*, Dodder of Hemp: *Epithymum*, Dodder of Hops: *Epithymum*, Dodder of Polimountain: *Epithymum*, Dodder of Knapweed: *Epithymum*, Dodder of Marjoram: *Epithymum*, Dodder of Wormwood: *Epithymum*, Dodder of Germander: *Epithymum*, Dodder of Dwarf Elder: *Epithymum*, Dodder of Hyssop, &c. And yet, notwithstanding all this Variety of Names, it is but one Plant or Herb, and has but one Description.

III. *The Description:* This Herb taking Root in the Ground from Seed, shoots forth Threads or Strings grosser or finer, as the Property of the Climate, Quality of the Earth, and Nature of the Plant on which it grows will admit, creeping and spreading on that Plant on which it fasteneth, or upon which it climbs, be it high or low, clasping about the very Grass, if it meets with nothing else. These Strings are many, but have no Leaves at all, and wind and interlace themselves so thick many times upon a small Plant, that it deprives it (as it were) of the Heat of the Sun, and seemingly chokes it: after these Strings are risen up to that height and strength, that they may draw Nourishment from the Plant upon which they climb, you shall scarcely see any Appearance of the Rife of those Strings from the Earth, they being broken off by some Accident, or withered by the Heat of the Sun, or otherwise decayed; (from which Appearance I believe it was, that *Matthiolus* and some others did think it to grow without Root, and not first to spring out of the Earth, as it certainly does, and as they who may be pleased to sow the Seed in a Pot by it self, may observe, and see its springing up; but if they meet with no Herb or Plant, upon which they may twine themselves and clamber, they soon perish and die away.) and from this Reason I suppose it is, that several have thought them to grow as *Moss* upon Trees, or like *Mistletoe*: but after they have lost their Ground-roots, I am apt to think, that the whole Plant draws its Nourishment (like as *Ivy*) from those Plants on which it grows. Upon these Strings or Threads, which are sometimes white and sometimes red, according to the Herb or Plant on which they grow, are found Clusters or small Heads of Husks, out of which proceed whitish Flowers, which being past away, do afterwards give small pale-colored Seed, somewhat flat, and twice as large as *Poppy* Seed.

IV. *Observation 1.* *Pliny lib. 26. cap. 8.* makes two sorts of *Epithymum*, making the one to be the Flowers of Time, as *Dioscorides* before him did, both green and white: the other to be red Threads or Strings growing without Root. This Duplicity of kinds *Matthiolus* has confuted, and now most of our modern Authors acknowledge but one kind, tho' it may have sometimes white and sometimes red Strings, as *Tragus* first observed, growing on several Herbs, according to which, they are found to be of those two differing Colors.

V. *Observat. 2.* By this also it may appear, that neither Time nor Savory, nor any other Herb, do naturally, of their particular Seed, bring forth these Strings, but that they spring from their own Seed, either shed or scattered of themselves upon the Ground, or coming among the Seeds of other Herbs which are sown. As also they creep upon various Plants, so in the hotter Countries they close upon hot Herbs, as on *Thyme*, *Savory*, *Hyssop*, *Marjoram*, *Rosemary*, &c. but in *England* they, for the most part, climb upon colder Plants, as on *Fennel*, *Flax*, *Hemp*,

Lump, Nettles, Dwarf-Elder, Tares, on which last it grows abundantly in some places, where it destroys the *Pulse*, or at least makes it much worse; and is called by the Country People, *Hell-weed*, because they know not how to destroy it.

VI. *The Places.* *Dodder* grows in *Asia minor*, or *Natolia, Greece, the Morea, Spain, Italy*, and other hot Countries; as also plentifully in *England*: I found it growing Wild in several places in *Cambridgeshire*, upon *Dwarf-Elder*, and upon *Nettles*, as also in several *Hemp-lands* upon *Hemp*. It grows on several Plants upon *Hamstead-beath*, as upon *Fern*, &c. as also on several places on *Black-beath* in *Kent*, where *Parkinson* says he found it. It grows plentifully upon *Nettles* in *Somersetshire*, and in several other parts of this Kingdom; as also upon *Tares* near *London*.

VII. *The Times.* It flourishes in *July* and *August*, in which times, and also after, it bears its Flower and Seed.

VIII. *The Qualities.* It is said to be hot and dry in the second Degree: but I am of the Opinion, that that *Dodder* which grows on the hot Plants, as *Thyme, Marjoram, Savory, Hyssop*, is hot in the second Degree; but that which grows on the colder and more temperate Plants, as *Fern, Nettles, Flax, Hemp*, &c. does not exceed the first Degree of Heat: for the Qualities and Properties of this Herb much follows those of the Plants upon which it grows, and so in some measure changes and alters accordingly; so that enquiring into the Nature of the Plant upon which it is nourished, you may in part see into what Nature and Properties it may be altered. It is Absterfivè, with an astringent or binding Quality, especially that which grows upon the *Bramble*, and other astringent Plants; since it is manifest, that it receives a certain Quality from its Parents, by whose Juices it is nourished. That which grows upon hotter Herbs, as *Thyme* and *Savory*, becomes hotter and drier, and of thinner parts. That which grows upon *Broom* is Diuretick, and provokes Urine more forcibly, and withal makes the Belly more soluble. That which grows upon *Flax* is less drying. It is dedicated to the Liver and Spleen, as also the other Bowels; and has a gentle sort of Cathartick or Purging Faculty with it.

IX. *The Specification.* It is a peculiar thing against Oppressions of the Spleen, and Hypochondriack Melancholy.

X. *The Preparations.* This Herb admits not of many Preparations; the chief are, 1. *A Juice or Essence.* 2. *An Infusion or Decoction.*

The Virtues.

XI. *The liquid Juice or Essence.* It opens Obstructions of the Liver and Spleen, and purges Melancholy and adult Choler from the Spleen and Hypochonders, and indeed from the whole Body. Dose three ounces, sweetned with an ounce of choice Manna dissolved in it. It evacuates Flegm from the Head and Viscera, discharges the Lungs, and is profitable against a Vertigo, Megrim, and other inveterate Pains of the Head. It prevails against fainting and swooning Fits, by carrying off the sharp and acrid Humors which cause them. It is powerful against Madness and Agues, especially Quartanes, tho' they have been of a long continuance. And as it is good against Hypochondriack Melancholy, so also it prevails against those Diseases which that Humor breeds, as Scirrhus, Cancer, Hardness of the Spleen, Pain and Windiness of the Spleen, Stoppage of the Reins, Itch, Scabs, Leprosy, Elephantiasis, malignant and cancerous Ulcers, as also the Malignity of the *French-Pox*. It very much cleanses

the Blood from Melancholy and adult Humors, is good against the Yellow Jaundice, and tho' it has a purging Property, yet it also strengthens both Liver and Spleen, and cures Agues in Children, if a little Worm-seed be added to it. It provokes Urine singularly, and cleanses the Urinary Passages from Sand, Gravel and tartarous Matter, especially if a little of the Powder of *Anised* and Tincture of *Wormwood* be added, and then it also eases Gripings in the Bowels, and brings down the Terms in Women. Mix the Dose with a Glass of White Port Wine, and so let it be drunk.

XII. *The Infusion or Decoction in White Wine.* If you make a Decoction thereof, the Boiling must not be much, for it will not endure long boiling, because it will loose it self. It has all the Virtues of the liquid Juice or Essence foregoing, and may be taken to half a pint, more or less, at a time, sweetned by dissolving an ounce of pure Manna in the same. It is said to cure Children of Agues, being given from two to four ounces, as aforesaid.

XIII. *Nota.* *Dodder of Flax* is peculiar for opening Obstructions of Liver, Spleen and Gall. *Dodder upon Brambles* is good against the Yellow Jaundice, and strengthens the Viscera much. *Dodder of Nettles* provokes Urine, opens Obstructions of the Womb, and loosens the Belly. *Dodder of Thyme* comforts and warms a cold Stomach, and rectifies the Discreasy of the Blood and Humors, prevailing against old Head-achs, the Megrim, Vertigo, Madness, Epilepsy, purging downwards black Choler and Melancholy. *Dodder of Broom* is good to open Obstructions of the Reins, Ureters and Bladder, provoke Urine, expel Sand, Gravel and tartarous Matter, and give ease in the Strangury, expelling watry and hydropick Humors. In a word, *Dodder of all other Plants*, in like manner, partakes of the Nature, Qualities and Properties of them on which they grow, (as aforesaid) whether they be hot or cold, cathartick or astringent; and it is thought to work more effectually for those Diseases, whereunto the Herb it self is applied. But *Epithymum*, or *Dodder of Thyme*, is that which, by all Physicians, is accounted the most principal and most powerful *Dodder*; and doubtless is the best of them all, to be used to cold and moist Habits and Constitutions of Body.

C H A P. CCXXV.

of DOGS--BANE.

THE Names. It is called in Greek, *Ἀνίσχυρον*, or *Κυνόβατον*, (*quia Canis interficit*;) the Greeks also call it *μετάνοα*, from its climbing Property: in Latin, *Apocynum*, and *Periploca*: in English, *Dogs-bane*.

II. *The Kinds.* There are five kinds hereof, viz. three European kinds, and two American. The European kinds are, 1. *Apocynum angustifolium five repens*, Climbing Dogs-bane, or Narrow-leav'd Dogs-bane. 2. *Apocynum latifolium non repens*, Broad-leav'd upright Dogs-bane. 3. *Apocynum folio angusto Salicis*, Willow-leav'd Dogs-bane. The American kinds are, 4. *Apocynum rectum minus angustifolium Americanum*, The lesser upright narrow-leav'd American Dogs-bane. 5. *Apocynum rectum majus latifolium Americanum*, The greater upright broad-leav'd American Dogs-bane, or Virginian Silk.

Creeping Doggs bone

Doggs bone Broad leaved

III. The Descriptions. The first, or Narrow-leav'd climbing Dogs-bane, has a Root which spreads in the Ground like the other, and sometimes sends forth Suckers, whereby it is encreased. This Root sends forth several woody Branches, but tough and flexible, of a dark greyish green color, and sometimes brownish, especially near the Ground, where it bears no Leaves after it is grown to any bigness or height, which wind themselves from the Sun-ward, to a ve-

ry great height, twenty foot high, or more sometimes, if any thing grows or stands by it, upon which it may climb higher, or else falling down again with its top, on which stand at several good distances (saving at the tops, where they stand thicker set together) two Leaves longer and narrower than the next described, and pointed at the ends, somewhat thick, and of a deep green color, almost shining. The Flowers stand in the same manner as those in the next, and consist of five thick Leaves, each of them pointed, and bending something backwards, seeming to have two Leaves apiece, one lying upon another, like unto those of *Barren-wort*, the undermost being greener and larger than the upper Leaves which lye upon them, and are not so large to cover them wholly, but leave the green brims or edges of the lower Leaves to be seen round about them, which upper Leaves are of a dark purple or reddish color, and cleave so fast to the lower, that it is very hard to separate them. In the middle of each Flower stands a green Pointel, encompassed with five dark yellow Chives, each of them twining inwards. After the Flowers are fallen, small long Cods appear, (in warm Countries, but scarcely in *England*) two always joined together, but more strictly than in the following Plant, bending something more outward in the middle, and meeting together almost at the points, in which lyes flat Seed, wrapped in a kind of silken Down. This Plant looses its Leaves, but not its Stalks, in the Winter, fresh coming forth again in the Spring.

IV. The second, or Broad-leav'd upright Dogs-bane, has a Root which grows down into the Ground, spreading it self out into several Branches, with divers small Fibres adjoining: from this Root springs up a woody Stem, of the thickness of ones Finger, covered with a greyish Bark; from whence arise several woody, but flexible greenish Branches, easy to twist or wind about any thing, being very tough and hard to break, standing for the most part upright, and seldom trailing, or laying hold of any thing which may grow near it; having two broad dark green Leaves, but sharp-pointed, and not round, set at every Joint all along, but not very near one unto another, full of Veins, and something softer than Ivy-Leaves, but thick withal; whose Stalks and Branches being broken, yield a pale yellow-colored Milk or Juice. But as *Dioscorides* and other Authors say, of a much deeper yellow; which thing may be admitted when it grows in warmer Climates than is this of ours. The Flowers spring forth at the Joints with the Leaves, growing upon Foot-stalks not very long; and at the tops three or four or more of them stand, sometimes together, which consist of five small pointed Leaves, of a whitish color, yet larger than those of *Asclepias* or *Swallow-wort*. After which (in the hotter Climates, but scarcely in ours) grow long, crooked and pointed Cods, something more hard and woody than those of *Swallow-wort*, altho' nothing so much as those of the *Oleander* or *Rose Bay-tree*, two most usually standing together upon one Stalk, but severed at the setting to the Stalk, and are full of a silken white Down, (like the former) in which lye dispersed many flat, blackish brown Seeds. This Plant looses not its Branches in the Winter, but only its Leaves, they every Spring shooting forth new again.

V. The third, or Willow-leav'd Dogs-bane, has a Root much like the first, from which spring woody Stems or Branches, having set at every Joint of the climbing Twigs two narrow Leaves apiece, like to the first kind, but they are not so thick, rather a little thinner, and much narrower than they, almost resembling the Form of a Willow Leaf. The Flowers are like the first, and blow as late, being very much

much like to the former *Narrow-leav'd* in its Form and Manner of Growing; and it looses its Leaves in the Winter, as that other does, renewing them again in the Spring.

VI. *The fourth, or Lesser upright narrow-leav'd American Dogs-bane, has a thick Root, but it creeps not in the Ground, as the Greater American doth; but from many long Fibres, it shoots forth a round brown Stalk, about half a yard high, having at each Joint a pair of long narrow Leaves, and such a large Tuft of Flowers at the top, as the following has, but of a deeper purple color, which have a certain Clammyness on them, which will detain Flies or other light things which happen to fall thereon. After which come long and strait Cods, (not crooked, like the Greater sort following) with flat brown Seed therein, lying in a white kind of Down, like unto *Asclepias* or *Swallow-wort*. This being broken, yields a milky Sap or Juice, like the other.*

VII. *The fifth, or Greater upright broad-leav'd American Dogs-bane, called Virginia Silk, has a Root which is long and white, of the thickness of a Man's Thumb, running under Ground very far, and shooting up again in divers places, the Heads being set full of small white Knobs or Knots, sending forth many Branches, if it stands any long time in a place. From this Root rises up one Stalk, and sometimes more, being strong and round, and three or four feet high, on which are set, at the several Joints thereof, two fair, long and broad Leaves, round-pointed, with many Veins therein, growing close to the Stem, without any Foot-stalk. At the tops of the Stalks, and sometimes at the Joints with the Leaves, grows forth a great Bulb of Flowers, out of a thin Skin, to the number of twenty, and sometimes of thirty or forty, every one with a long Foot-stalk, hanging down their Heads for the most part, especially those which are outwardmost, every one standing within a Husk of green Leaves, turned to the Stalk-ward, like to the *Lysimachia* or *Loosetrife* Flower of *Virginia*, and each of them consisting of five small Leaves apiece, of a pale purplish color on the upper side, and of a pale yellowish purple underneath; both sides of each Leaf being as it were folded together, making them seem hollow and pointed, with a few short Chives in the middle. After the Flowers are past, long and crooked Cods, pointed, and standing upright, succeed, in which are contained flat brownish Seed, dispersedly lying within a great deal of fine, soft and whitish brown Silk, very like unto the Cods, Seed and Silk of *Asclepias* or *Swallow-wort*, but that the Cods are greater, and more crooked, and harder also in the outward Shell. The whole Plant, as well Leaves as Stalks, being broken, will yield a pale kind of Milk or Juice.*

VIII. *The Places.* The first and third grow in *Italy, Apulia* and *Calabria* in the Kingdom of *Naples*. The second grows in *Syria* and the *Eastern* Countries, as also in *Italy*, as *Matthioli* reports; but with us they grow in *Gardens*. The two last came from our *English* Plantations in *America*. The last, *Parkinson* says, came to him from *Virginia*, where it grows abundantly; he raised it from the Seed which he had from thence.

IX. *The Times.* The three first flower late in the Year, if they flower at all with us, viz. about the end of *August*, and to the middle of *September*. The two latter flower in *July* and *August*; and their Seed is ripe in *August* and *September* following.

X. *The Qualities.* These Plants are hot and dry in the fourth Degree, *ῥυακίαι*, Venefick or Poysonous; they are to great Poysons, as to kill Dogs, the which they will do, if the Herb is mixed with their Bread, Broth or Meat, and so given them;

and therefore they are not to be given to Mankind. The three first are said to exceed in Malignity both *Woolfs-bane* and *Oleander* or *Rose-Bay*; but as most Poysons have their Antidotes, as that of *Thora* is *Anthora*, that of *Pardalianches* is *Herba Paris*, so the Antidote to this *Apocynum* is *Asclepias* or *Swallow-wort*. Some may object it as a Fault to me, that I have put into my *Herbal* such poysonous Plants as this is; but to such I answer, That the more poysonous they are, the more necessary to be known, that People may take notice of them, and beware of using them; yet these Poysons are not without their Virtues also; for tho' they are not fit to be given inwardly, yet sometimes they may be applied outwardly to advantage. As to the foregoing Plants, all Authors have concluded the first three under the Character of being Deleterious or Deadly: as for the other two, nothing is yet known of them by Experience; yet by their milky Juice, which is burning, fiery and exulcerating, they may almost be concluded in the same Classis; for which Reason I should desire every one to be cautious in their Use.

XI. *The milky Juice of any of the three first Plants, is very hot and burning, and being outwardly applied, it is good against Tetters, Kingworms, Scurf, Morpew, Leprosy; and to fetch Hair off from Hides, if they be steeped in it. Even in the outward Application it is to be used with Caution.*

XII. *A Cataplasim made of the Leaves of either of the American kinds, by being beaten either crude or boiled in Water, and so applied, it is said to be good for Tumors and Pains proceeding from a cold Cause.*

XIII. *Gerard* says, that the Cods of the last, or Greater upright broad-leav'd American Plant, are stuffed full with a most pure Silk, of a shining white color: The Cods (says he) are not only full of Silk, but every Nerve or Sinew, wherewith the Leaves are ribbed, are likewise most pure Silk; as also are the Peelings or Bark of the Stems or Branches, like as is the Peeling or Bark of *Flox* or *Hemp*, Cordage for making Linnen. But the *Indians* have not the Understanding in them to make use of it, so as to cover their Nakedness, notwithstanding (says he) the Earth is covered over with this Silk. This they daily tread under their Feet, which would be sufficient to Cloath many Kingdoms, if it was carefully Cherished and Manured.

XIV. This last Plant *Parkinson* tells us he raised up in *England*, from Seed which was sent to him from *Virginia*; but he says there is another Plant growing in *Virginia*, called *Silk-Grass*, which is very much differing from this.

C H A P. CCXXVI.

Of DOGS--STONES.

THE Names. This Plant is called in *Greek*, *Κυνόστιξ*; in *Arabick*, *Chasi alkes*, and *Chasi alchels*; in *Latin*, *Cynorchis*, and *Testiculus vel Testiculi Canis*; in *English*, *Dogs-stones*.

II. *The Kinds.* This Plant is chief of the kinds of *Orchis*; now, how manifold the chief and principal Species or Kinds of *Orchis* are, we think necessary to declare here, that things may be set in a true and clear Light. *Orchides* then are divided into nine principal kinds, viz. into, 1. *Cynorchis*, *Dogs-stones*;

stones, of which only in this present Chapter. 2. *Orchis morio*, Fools-stones. 3. *Orchis Serapius*, vel *Testiculus Vulpinus*, Fox-stones. 4. *Trigorchis*, Goats-stones. 5. *Orchis odoratus*, *Testiculus odoratus*, Sweet Cullions, which see in Chap. 184. foregoing. 6. *Orchis abortiva*, vel *Nidus avis*, Stones mis-shapen, or Birds-nest, which see in Chap. 73. of this Book. 7. *Orchis palmata*, Handled Orchis. 8. *Orchis palustris*, Penny-stones. 9. *Orchis Macaria*, Fly Orchis; of all which (not yet treated of) we shall speak hereafter in their proper places.

III. *Dogs-stones* (the subject Matter of this Chapter) are accounted by Authors to be about fourteen or fifteen several kinds, but we shall only treat of those which are found to grow in England, which are these following, viz. 1. *Cynorchis major latifolia*, The greater broad-leav'd Dogs-stones. 2. *Cynorchis major purpurea latifolia*, The greater broad-leav'd purple Dogs-stones. 3. *Cynorchis major spica compacta*, Marsh Dogs-stones, or The greater pale purple-flowered Dogs-stones. 4. *Cynorchis latifolia minor*, The smaller pale purple Dogs-stones. 5. *Cynorchis maculata*, Spotted Dogs-stones. 6. *Cynorchis militaris*, sive *Strateumatica major*, The greater Soldiers Dogs-stones. 7. *Cynorchis militaris minor*, The lesser Soldiers Dogs-stones. 8. *Cynorchis militaris minima*, sive *Pannonica*, The least or Hungarian Soldiers Dogs-stones.

IV. The Descriptions. The first, or Great broad-leav'd Dogs-stone, has a Root which is composed of two round white Bulbs, set together, like the two Stones of a Dog, with long Fibres at the Heads of them, one somewhat higher sometimes than another, and always one of them, which is the higher, is firm, full and hard, the other lank, wrinkled and soft, which wasteth away to nothing, leaving the firm Root, which so abides all the Winter, and in the Spring another is engendred, and encreases from the side of the old one, and then that begins to grow lank, whilst the other new one encreases. This Root sends forth five or six broad Leaves near the Ground; from among which rises up a round green Stalk, half a yard high, bare or without Leaves, or but one or two smaller standing below, at the top of which stands

a spiked Head of purplish Flowers, set thick and close together, made like unto open Hoods, from the middle whereof hangs down a small Body, as it were, of a Dog, or other such Creature, being of a pale purple color it self, spotted with deeper purple Spots, and Lines; after which come somewhat long and round small Husks, containing therein rather small Dust than Seed, it is so small.

V. The second, or Greater broad-leav'd purple Dogs-stone, has a Root like the former; but this sort has Leaves something narrower than the other: the Stalk is nearly of the same height, and the spiked Head of Flowers is neither so long nor so thick; and the Flowers are of a whitish purple color, marked with some purple Spots and Lines more inward, formed like open Hoods, and small Bodies hanging forth, like the former; the Seed being also like the same.

VI. The third, or Marsh Dogs-stone, has a Root like the first also; and the Leaves of this are somewhat narrower than in the last; and the Stalk also is somewhat lower, with Leaves upon it, which are sometimes spotted; and the spiked Head short and close; with the like Flowers for Form, but somewhat less, thick set together, which are of a whitish purple color, and spotted.

VII. The fourth, or Smaller pale purple Dogs-stone, (which Gerard calls White Dogs-stone) has Roots altogether like the first foregoing, from which springs up a Stalk almost a foot high, set with five or six Leaves, clasping or embracing the same round about: and the first Leaves rising up, are likewise smooth, long, broad Leaves, but lesser and narrower than those of the first kind. The spiky Head of Flowers is short, thick, bushy, compact of many small whitish purple-colored Flowers, and spotted on the inside with many small purple Spots, and little Lines or Streaks. The small Flowers are like an open Hood or Helmet, having hanging out of every one, as it were, the Body of a little Man, without a Head, with Arms stretched forth, and Thighs straddling abroad, after the same manner almost that the Children are wont to be pictured, hanging out of Saturn's Mouth.

VIII. The fifth, or Spotted Dogs-stone, have Roots like the others, but lesser; from whence come forth narrow Leaves, ribbed in some sort like unto the Leaves of Narrow Plantane or Ribwort, dashed with many black Streaks and Spots. The Stalk is a foot and half or more high; at the top of which does grow a Tuft or Ear of Violet-colored Flowers, mixt with a dark purple, but in the Hollownels thereof whitish, not of the same Form or Shape which the others are of, but lesser, and as it were resembling something the Flowers of Larks-Spur.

IX. The sixth, or Greater Soldiers Dogs-stone, has round bulbous Roots, great and thick; from the Heads of which Bulbs many Fibres or Threads spring forth. This Root sends forth several large Leaves below, and some lesser on the Stalk, which seem to enclose it. The Stalk is smooth, green, and about half a yard high. The spiked Head of Flowers stands somewhat loose, the Flowers being a little separated one from another: each Flower is also like unto a Man, whose Body has its Arms and Legs cut off, and a Hood set thereon; or a Leg-less Soldier with his Helmet on, the Hood or Helmet being white, and the Body spotted with purple Spots.

X. The seventh, or Lesser Soldiers Dogs-stone, has Roots, Leaves, Stalks and Spike of Flowers altogether like the last, but that they are all of them every ways less, and the Flowers somewhat whiter.

XI. The eighth, or Least Hungarian Soldiers Dogs-stone, has Roots like the others, but smaller much;

much; from whence five or six little Leaves spring forth; the Stalk is about six or seven inches high, set about with somewhat lesser Leaves. The Tuft of Flowers at the top of the Stalk are of a purple color, small, with a white Lip, divided into four Partitions, hanging down, which is also spotted lightly with purple. It has a little Spur hanging down on the hinder part of each Flower. The Seed is small, and contained in such twined Heads as in other Plants of this kind.

XII. *The Places.* These all grow in many places of this Kingdom, in moist and fertile Meadows. The *Marish Dogs-stones* grow for the most part in moist and watery Woods, as also in Marsh Ground. The last grows in *Austria, Germany, Hungary*, and in many places of *England*.

XIII. *The Times.* They flower from the beginning of *May* till the end of *June*; but, says *Gerard*, to the end of *August*.

XIV. *The Qualities.* *Dogs-stones* are temperate in respect to Heat and Coldness, and the full *Testicle* moist in the second Degree. The wrinkled or soft one temperate in respect to Dryness or Moisture. The full *Testicle* seems to be Digestive, Diuretick, Hystrick, Chylifick and Spermatogenetick. The soft or withered Stone is opposite to all the foregoing Qualities, and rarely used Physically. All the sorts or kinds of *Testiculi* provoke or stir up Lust, and they are promiscuously used for that Purpose; but the best and most effectual for that Purpose, are the *Testiculi Canini*, of which the harder and fuller Bulb is to be chosen; as aforesaid. The fuller Root is not always the greater, but oftentimes the lesser, especially if they are gathered before the Plant has shed its Flower, or when the Stalk first comes up; nor does it attain to be the greatest till the Seed comes to be perfectly ripe. For since that every other Year, by course, one Bulb or Stone grows full, the other empty, and so perishes; it cannot be, that the harder and fuller of Juice should be always the greater; for at such time as the Leaves come forth, the harder and fuller Stone begins to encrease, and as that encreases, so the other, by little and little, decreases and withers away, till the Seed is ripe, at what time the whole Plant above Ground does forthwith decay and perish, and that which all this while has been encreasing, remains still fresh and full till the next Year.

XV. *The Specification.* They are peculiar for the curing Impotency in Men.

XVI. *The Preparations.* You may have, 1. *The Effence.* 2. *The Sanguis or Blood.*

The Virtues.

XVII. *The Effence.* Being taken daily, first in the Morning fasting, and last at Night going to Bed, from one spoonful to three in a Glass of generous Wine, it not only provokes Lust, but it also takes away the Imbecility or Impotency of the Instruments of Generation, but also promotes a plentiful Generation of Seed.

XVIII. *The Sanguis or Blood.* It has all the Virtues of the Effence, but is indeed more powerful to all the mentioned Intentions; it comforts and warms the Instruments of Generation, making a liberal encrease of Animal Spirits, stirring up the Person who takes it to an ardent desire of Coition. The Dose is one or two spoonfuls in a Glass of *Madera* or other generous Wine, Morning and Night.

C H A P. CCXXVII.

of DOGS--TOOTH.

I. *THE Names.* Some will have this to be *Σατυριον ερυθηρον*, *Dioscoridis*, i. e. *Satyrium habens Radicis Corticem rubrum*, *Diosc. lib. 3. cap. 144.* but this other Authors will not allow of: *Parkinson* will have that (and I believe rightly enough) to be our *Tulip*. Others will have this Plant to be a kind of *Violet*, (tho' there is nothing like a *Violet* in it) and so call it *Dogs-tooth Violet*. It is called in Latin, *Dens caninus*, *Dentali Clusti & Lobelii*, *Hermodactylus Gesneri*, *Pseudohermodactylus Matthioli*; and in English, *Dogs-tooth*.

II. *The Kinds.* It is doubtless one of the kinds of *Satyrium*, tho' not the true *Satyrium Dioscoridis*, and our Moderns have given to it the Name of *Dens caninus*. It is threefold, viz. 1. *Dens caninus flore albo*, *Dogs-tooth* with a white Flower. 2. *Dens caninus flore purpurascens*, *Dogs-tooth* with a purple Flower. 3. *Dens caninus flore rubro*, *Dogs-tooth* with a red Flower.

III. *The Descriptions.* The first, or White-flowered, has a white bulbed Root, long and small, yet commonly larger than either of the two following, bigger below than above, with a small piece adjoining to the bottom of it. From this Root, in the beginning of the Spring, after the Winter-Frosts are past, two Leaves for the most part (very rarely three) rise up, when it will flower, (otherwise but one) which are closed together when they first come up out of the Ground, and enclose the Flower between them. The Leaves, when they are opened, do lay themselves flat on the Ground, or not much above it, one opposite unto the other, with the Stalk, and the Flower upon it, standing between them; which Leaves are of a whitish green color, long and narrow, yet broader in the middle than at both ends, growing

less by degrees each way, spotted and striped all over the Leaves with white Lines and Spots. The Stalk rises up seven or eight inches high, bearing at its top one Flower, and no more. This Flower hangs down its Head, and is larger than any of the following kinds, and consists of six white, long and narrow Leaves, turning themselves up again after it has felt the Warmth of the Sun, that they do almost touch the Stalk again, very like to the Flowers of *Cyclamen* or *Satobread*: it has in the middle of the Flower six white Chives, tipped with dark purple Pendants, and a white three-forked Stile in the middle of them. The Flower has no Smell at all, but is commendable chiefly for its Beauty and Form. After the Flower is past, there comes in its place a round Head, seeming three-square, containing therein small yellow Seed.

IV. The second, with a purple Flower, has a white bulbous Root, like unto the former, but lesser, as aforehinted: the Leaf hereof is not so long as that, but broad and short, spotted with darker Lines and Spots. The Flower is like the other, but smaller, and of a delayed purple color, very pale sometimes, and sometimes a little deeper, turning it self as the other, with a Circle round about the middle. The Chives hereof are not white, but declining to purple: in all other Respects it is like to the foregoing.

V. The third, with a red Flower, has a like white bulbous Root. The Form and Largeness of the Leaf is like to the last described, so also the Form and Bigness of the Flower: but in this the chief Difference consists, that the Leaves of this are of a yellowish, mealy, green color, spotted and streaked with redder Spots and stripes, and the Flower of a deeper reddish purple color; and the Chives also more purple than the last; but in all other things they are very like one another.

VI. The Places. All the sorts of *Dens caninus* grow in Foreign Countries; as in Italy on the *Euganean Hills*, on the *Apenine*, also about *Graz* the chief City of *Stiria*, and about *Bayonne*, and in several other places: they also grow in the Gardens of our Florists in England.

VII. The Times. They most commonly flower in March, and many times in April, according to the Warmth or Coldness of the Season.

VIII. As to the Qualities, Specification, Preparations and Virtues, they are much the same with the *Orcides* or *Dogs-stones* in the former Chapter, to which I refer you: only it is said, that these are more efficacious for Venereous Actions than any of the *Orcides* and *Satyrians*.

IX. Observation. The Pouder of the Root being given inwardly in Broth, Milk or Wine to one or two drams, is said to be effectual against Worms in the Belly; to ease the Pains of the Cholick, to strengthen and nourish the whole Body, and to cure the Falling-sickness in Children.

C H A P. CCXXVIII.

of DOVES-FOOT.

I. THE Names. It is called in Greek, *ρηνιαν*, *ρηνιαν*; in Latin, *Geranium Columbinum*, *Pes Columbinus*; and in English, Doves-foot.

II. The kinds. There are many kinds of this Plant, but the principal which grow in England are the three following. 1. *Geranium Columbinum vulgare*, *Pes Columbinus communis*, The common Doves-foot. 2. *Geranium Columbinum laciniatum*, *Pes Columbinus alter*, The jagged Doves-foot. 3. *Geranium saxatile*, *Pes Columbinus saxatilis*, The Stone or Rock Cranes-bill, or Doves-foot.

III. The Descriptions. The first, or Common Doves-foot, has a Root which is something long and woody, having some Fibres adjoining to it; from whence arise several small, round, pale, green Leaves, cut in about the edges, much like unto Mallows, or rather a Doves Foot, standing upon long, reddish, hairy Stalks, lying in a round Compass upon the Ground; from among which rise up two or three or more jointed, reddish, hairy Stalks, slender and weak, with some such like Leaves thereon, but smaller, and more cut in up to the tops, where grow many very small, bright, red Flowers of five Leaves a-piece; after which follow small Heads, with small short Beaks pointing forth, as all the other sorts of Cranes-bills do, of which this is a kind, whereby they are known to be of this Family, how differing soever the Face or Form of their Leaves may be.

IV. The second, or Jagged Doves-foot, has a Root like the former, from whence spring up Leaves, which are greener, not full out so round, and somewhat more cut in on the edges, making the Leaf to seem of several parts more than the other, or like the Vervain Mallow, but something lesser. The Stalks are weak and leaning, like the former, as also are the Flowers and Seed with its long Beak.

V. The third, or Rock or Stone Doves-foot, is a lesser Plant than the Common Doves-foot, and has a Root which is small and yellowish, yet abides many Years and perishes not, and also encreases plentifully of the Seed it lets fall. From this Root spring forth many small Leaves, very like to those of the Common Doves-foot, which are somewhat cut in on the edges.

edges, very green and shining, so very like to a small Danicle Leaf, that it may easily deceive the unwary; these Leaves grow upon reddish Foot-stalks, and lye upon the Ground all the Autumn, Winter and Spring until the Summer that the Stalks rise up, which are about seven, eight or ten inches high or more, bearing a few Leaves on them, and very small, purplish red flowers, brighter and redder than those of the Common Doves-foot, which being pass'd away, yield very small Seed, but like the others in its Beak-like Shape or Fashion.

Stone or Rock Doves-foot.

VI. *The Places.* The first grows in Meadows and Pasture-grounds, by Ditch-sides, and Banks of Ditches, and by Path-sides, almost every where. The second is also found in Meadow and Pasture Grounds, where the Ground is fat, and near Ditch-sides, but not so frequent as the former. The third grows in stoney, rocky and gravelly Grounds, in *Harcynia sylvia*, as *Cemerarius* and *Thalins* say, and about Naples, as *Columna* says: and it has been often found in several rocky, stoney and gravelly places of this our Kingdom of England.

VII. *The Times.* They all flower in the Summer Months, in June, July and August, some more early than the others; and their Seed is ripe in some short time after.

VIII. *The Qualities.* They are cold and dry in the first Degree; Afringent, Carminative and Traumatick or Vulnerary; Arthritick and Analeptick.

IX. *The Specification.* It is a peculiar thing to stop Bleeding, and cure Wounds and Ruptures.

X. *The Preparations.* You may make therefrom, 1. A liquid Juice. 2. An Essence. 3. A Decoction in Wine. 4. A Powder of Herb and Root. 5. A Balsam. 6. A Cataplasm.

The Virtues.

*XI. *The liquid Juice.* Given to two or three spoonfuls in a Glass of Sherry, Madera, or other generous Wine, it prevails against the Cholick, as also against Wind and Pains in the Stomach, and o-

ther Viscera: and it given in White Wine, it is good to expel the Stone and Gravel in the Reins.

XII. *The Essence.* It has all the former Virtues; besides which, it is good for such as have inward Wounds, Hurts or Bruises; it stops inward Bleedings, and dissolves and expels the congealed Blood. It is found also by Experience to be a singular good thing for Ruptures or Burstenness, whether in Old or Young. You may give two or three spoonfuls Morning and Night, in a Glass of White or Red Port, Sherry, &c.

XIII. *The Decoction in Red Port Wine.* It is an exceeding good Wound-drink for such as have inward Wounds or Bruises; it stops the Bleeding, cleanses and heals the Parts, and has indeed the Virtues of the Juice or Essence, but in a lower Degree. Dose five or six ounces twice a day.

XIV. *The Powder of the Herb and Root.* Gerard says, that if it is given half a spoonful at a time in the Morning fasting, and half a spoonful at Night going to Bed, in Red Wine or old Charet, for the space of one and twenty days together, it will miraculously cure Ruptures or Burstenness, as he had oftentimes proved, by which he had gotten much Money and Reputation. If the Rupture is in an aged Person, it shall then be needful to add thereto (says he) the Powder of red Snails, (those without Shells) to the number of nine, dried in an Oven; by which the Powder of the Herb will be fortified, so as it shall not fail of a Cure, tho' (says he) the Rupture be great, and of long continuance. It is good also for those who are wounded in the Body, to stop the Flux of Blood, and heal the Wound, as has been often proved. Dose one dram Morning and Night in Red Port Wine.

XV. *The Balsam.* It is admirable in curing of Wounds simple or contused, as also in healing of Sores, Ulcers and Fistula's: it digests, cleanses, incarnates, dries and heals to Admiration.

XVI. *The Cataplasm.* If it is made only of the Herb bruised, and so applied, it heals simple green Wounds after a singular manner. It is good also to discuss simple Contusions; and applied to Parts pained with the Gout, it gives ease in the same. It stops the Bleeding of green Wounds, allays the Heat of Inflammations, and discusses hot Tumors. It gives ease in any Pains of the Extream Parts, proceeding from a hot Cause, or from Destruxion of Humors, or from any over-training of the Nerves or Joints, by strengthening the same.

C H A P. CCXXIX.

Of DRAGON Greater and Lesser.

I. *THE Names.* It is called in Greek, *Δρακόνιον*: in Arabic, *Luf* and *Alluf*: in Latin, *Dracontium*; and in English, *Dragon* or *Herb-Dragon*, and *Dragon-wort*.

II. *The Kinds.* It is manifold, 1. *Δρακόνιον μέγα*, & *Δρακόνιον μέγαν*: in Latin, *Dracontium majus*, and in the Shops, *Serpentaria major*, of some, *Biscaria* and *Colubrina*, The great Dragon, or Dragon-wort.

2. *Δρακόνιον μικρόν*, *Δρακόνιον μικρόν*: in Latin, *Dracunculus*, *Dracunculus minor*, *Dracunculus Polyphyllus Cordi*: in English, *Small Dragon*, or *Dragon-wort*. To these we may add, 3. *Δρακόνιον μέγιστον*: in Latin, *Dracontium magnum*, vel *majus*, The great or greater Dragon; this is the *Dracontium major Matthioli*, which seems not to me to be of the Stock

of *Dragons*, but rather a very large kind of *Bistort*: of these three kinds we shall treat in this Chapter.

4. *Δρακόνιον ὕδρην*: in *Latin*, *Dracontium aquaticum*, vel *Dracunculus aquaticus*; and in *English*, *Water Dragon*, or *Dragon-wort*; of which in the next Chapter.

Dragons
Greater.

Lesser *Dragon.*

III. The Descriptions. The first, or Greater Dragon, has a thick tuberous Root, like to a Knob, many times of the Magnitude of a middle-sized Apple, white, covered with a thin Peel, full of white little

Fibres appendent thereto, continuing many Years, very white within, and like unto Aron-root, tasting somewhat sharp, like to it. From this Root rises up a straight Stalk, a Cubit and half high or higher, which is thick, round, smooth, whitish and bare or naked, but spotted very much with purplish Spots and Strakes, or with Spots of divers colors, like those of the Adder and some other Serpents. This Stalk bears a few green Leaves, standing upon long Foot-stalks, much divided on all hands; they are great and wide, each Leaf consisting of seven or more joined together in order, every one of which is long and narrow, much like to the Leaves of Dock, smooth and slippery. Out of the top of the Stalk, in the middle thereof, comes forth a great long Husk or Hufe, (if the Root is old enough) greater than that of the Cuckow-pint or Aron, of a greenish color on the outside, and of a crimson or dark purplish color on the inside; with a long slender Pestle or Clapper in the middle thereof, which is blackish and pointed like a Horn, the Skin or Film whereof, when the Seed grows big, being stretched or broken asunder, there appears the Fruit, like to a Bunch or Cluster of Grapes; the Berries whereof at first are green, afterwards red and full of Juice, in which is contained Seed, which is something hard.

IV. The second, or Small Dragon, has a Root not unlike to Aron-root, having the Form of a Bulb, full of Fibres or Strings, with divers rude Shapes of new Plants, by which it greatly encreases. The whole Plant is much like to Aron in its Leaves, Hufe or Husk, Pestle and Berries, (and seems to me to be the lesser sort of Aron;) the Leaves are spotted either with white or brownish Spots, and perish not presently, but endure together with the Berries, even till Winter; and the Berries are not of a deep red, but of a color inclining to Saffron.

Greater
Dragon.

V. The third, or Great Dragon of Matthiolum, has a round bulbous Root, larger something than the former, with many Fibres at bottom thereof; from which rises one large, high, upright Stalk, with very great Leaves thereon, folded and lapped one within another: at the top of the Stalk comes forth

a spike of Flowers, not much unlike to those of *Bisfort*, with like small Seed. Some Authors will not have this to be a *Dracontium* or *Dragon-wort*, but rather a very large sort of *Bisfort*. *Dodonæus* says, --- *qui, si in rerum natura est, Bisfortæ Species videtur.*

VI. *The Places.* *Dragons* greater and lesser delight to grow in shadowy places; and with us they grow in *Gardens*.

VII. *The Times.* They flower in *July*, and the Fruit or Berries are ripe in *August* and *September*.

VIII. *The Qualities.* *Dragons* or the *Dragon-worts* are hot and dry in the third Degree; *Aperitive*, *Attractivæ*, *Suppurative*, *Stomatick*, *Pectoral*, *Hysterick* and *Alexipharmick*.

IX. *The Specification.* *Dragon-wort* is an Antidote against *Poyson*, *Plague* and *Bittings* of *Venomous* Creatures.

X. *The Preparations.* You may have therefrom,
1. *The prepared Root.* 2. *A liquid Juice of Leaves or Roots.* 3. *An Essence of the same.* 4. *A Powder of the Root.* 5. *A Loboc of the Root.* 6. *A Cataplasim of the fresh and green Leaves.* 7. *The Fruit or Berries.* 8. *A Spirituous Tincture of the Root.* 9. *An Acid Tincture of the same.* 10. *An Oily Tincture.* 11. *A Saline Tincture.* 12. *A distilled Water of Leaves, Root and Fruit.*

The Virtues.

XI. *The prepared Root.* It is prepared by boiling it till it is soft, and all the Acrimony pass'd off. It then nourishes and is good for Food, it is also good to expel thick and clammy Humors from the *Breast* and *Lungs*: they also restore in *Consumptions*.

XII. *The liquid Juice of Leaves or Root.* It is said to remove the *Pin* and *Web*, as also *Spots* and *Pearls* in the *Eyes*, being put into *Collyriums* or Medicines which are made for the *Eyes*. *Dioscorides* says, that the Juice being dropped into the *Eyes*, cleanses them, and helps *Dimness* of *Sight*. The same mixed with *Oil Olive* and dropped into the *Ears*, eases their *Pain*.

XIII. *The Essence of the same.* It has all the *Virtues* of the liquid Juice; besides which, being taken inwardly (*Universals* being premised) to one spoonful at a time in the distilled Water, or in *White Wine*, and repeated as oft as need requires, it powerfully provokes the *Terms* in *Women*.

XIV. *The Powder of the Root.* If it is made into an *Electuary* with *Honey*, it is good for such as are troubled with vehement *Coughs* and *Catarrhs*, *Convulsions*, *Cramps*, &c. for it incides, absterges and consumes gross, tough and tatarous Humors, and cleanses all the inward Parts. Dose of the Powder from half a dram to a dram. Outwardly applied, it cleanses all fretting and malign *Ulcers*, which are difficult to be healed: it also removes all *Scorbatick* Breakings out in any part of the *Body*.

XV. *The Loboc of the Root.* It is made of the Root prepared by boiling, (at *señ. 11.* above) by beating it in a *Mortar* with twice its weight of *Honey*. It is an excellent thing against *Coughs*, *Salt Catarrhs* and *Defluxions* of thin *Rheum*.

XVI. *The Cataplasim of the fresh and green Leaves.* Being applied, it is good for *Ulcers* and green *Wounds*, and heals them after an admirable manner. Being dry, they are more sharp or biting, and not so fit for *Vulneraries*.

XVII. *The Fruit or Berries.* They are of greater Power than either *Leaves* or *Root*, and therefore are said to cure virulent and malign running Sores; and to eat away that cancerous Excretion in the Nostrils called *Polypus*: they are also good to be laid

to *Cankers*, and such like fretting, eating and consuming *Ulcers*.

XVIII. *The Spirituous Tincture of the Root.* Given to one dram or two in any proper Vehicle Morning and Evening, (after the Use of *Universals*) it opens *Obstructions* of the *Womb*, and provokes the *Courfes*. It eases *Pains* of the *Stomach* and *Bowels* proceeding from *Wind*, or from cold, slimy and tatarous Humors, prevails against the *Cholick*, and warms and comforts all the inward Parts; and is an excellent thing against *Poyson*, *Plague*, spotted *Fever*, or any other malign Distemper.

XIX. *The Acid Tincture.* It is a famous *Stomack*, takes away *Nauseousness* and *Vomiting*, warms and comforts a cold *Stomach*, causes a good *Appetite* and *Digestion*; and strikes at the Root of all *Poysons* Vegetable or *Animal*, especially it resists the *Biting* of *Vipers*, and the *Malignity* of *Mad Dogs*. It is also a singular thing against malign *Fevers*, spotted *Fever*, and the *Plague* or *Pestilence*, by overturning the very *Fountains* of the infectious *Miasmata*. Dose from thirty, forty to sixty or eighty drops in the distilled Water, or any other specific Vehicle, viz. so much as may make it pleasantly acid, according to the quantity given at a time.

XX. *The Oily Tincture.* It is good against *Cramps*, *Convulsions*, *Numbness*, *Palsies*, *rheumatick* *Pains* and *Aches* proceeding from *Cold* and *Moisture*, or in a cold and moist Habit of *Body*: it is to be anointed upon the Parts affected Morning and Evening, and to be well rubbed in.

XXI. *The Saline Tincture.* It is good against *Blackness*, *Greenness* and *Yellowness* of the *Skin*, and to take away *Tanning*, *Sun-burning*, *Scurf*, *Morphew*, *Leprosy*, *Scabbiness*, *Freckles*, *Lentils*, and other the like *Deformities* of the *Cuticula* or *Scarff-Skin*.

XXII. *The distilled Water.* It is used as a *Vehiculum*, to convey many of the foregoing Preparations in: it is also a *Cosmetick*, fit for the beautifying the *Skin*, or to mix other *Cosmeticks* with for that Purpose. It prevails also against the *Pestilence*, or any malign and pestilential *Fever*; as also the *Poyson* of *Serpents* or *mad Dogs*, being drunk warm, with a dram or two of *Mithridate* or other like *Antidote* mixed with it.

C H A P. CCXXX.

of DRAGON,

O R,

DRAGON-WORT Water.

I. *THE Names.* It is called is *Greek*, *Δρακόνιον* *ακουατικόν*, *δ' αιδον*: in *Latin*, *Dracontium aquaticum*, *Dracunculus aquaticus*, *Aronia aquatica*, *Dracunculus palustris sive aquatilis*: in *English*, *Water Dragon*, and *Water Dragon-wort*, *Marsh Dragon-wort*.

II. *The Kinds.* It is the last Species of *Dragon-wort* mentioned in *Chap. 229. Señ. 2.*

III. *The Description.* It has a Root which is not round like a *Bulb*, but very long, creeping, jointed, and of a moderate bigness; out of the joints whereof arise the *Stalks* of the *Leaves*, which are round, smooth, and spungy within, certain white and slender

der Strings growing downwards. The Fruit springs forth at the top upon a short Stalk, together with one of the Leaves, being at the beginning covered with little white Threads, which are instead of the Flowers, (see the second Figure annexed;) after that it grows into a Bunch or Cluster, at the first green, and when it is ripe, red; lesser than that of *Arum*, but not less biting. The Leaves are broad, greenish, smooth and shining as it were, in Fashion almost like those of *Ivy*, yet lesser than those of *Arum* or *Cuckow-point*: and that Substance to which the clustered Fruit grows is also lesser; and in that part which is towards the Fruit, viz. its upper part, it is white.

Water Dragon-wort.

Water Dragons.

IV. The Places. *Water Dragon* or *Dragon-wort* grows in marshy and watery places, and for the most part in fenny and standing Waters in many parts of this Kingdom.

V. The Times. It flowers in *July*, and the Fruit is ripe in *August* or *September*.

VI. The Qualities, Specification, Preparations and Virtues, are the same with the first and second kinds in the former Chapter, so that no more need be said thereof in this place.

CHAP. CCXXXI.

of DROPWORT Common.

I. THE Names. It is called in *Latin*, *Filipendula*, (quod numerosi illi in Radice bulbuli, quasi ex filo pendere videantur.) also *Saxifraga rubra*, (*Red Break-stone*;) in *English*, *Dropwort*.

II. The Kinds. It is threefold, viz. 1. *Filipendula vulgaris*, *Nicholai Myrepsi*, *Filipendula vulgaris*, *Filipendula major vulgaris*, The common great Dropwort. 2. *Filipendula altera major*, Another great *Filipendula* or Dropwort. 3. *Filipendula minor*, Small Dropwort. Some will have this Common Dropwort to be *Oenanthe Discoloridis*, in *lib. 3. cap. 132.* but it is a Mistake.

III. The Descriptions. The first, or Great common Dropwort, has a Root which consists of many small, black, tuberous Pieces or Drops, fastened together by many small, long, blackish Strings, which run from one to another. From this Root shoot forth several long winged Leaves, viz. many small Leaves, some bigger and some lesser, set on each side of a middle Rib, and each of them dented about the edges, almost

almost like a Saw, somewhat resembling Burnet or Wild Tanfie, or rather Agrimony, or between them all, but harder in handling: among which Leaves rises up one Stalk, and sometimes more, two or three feet high, having some such Leaves thereon as grow below; and sometimes also divided into other Branches, spreading at the top into many white, sweet-smelling Flowers, composed of five Leaves apiece, with some Threads in the middle of them, standing together in a Tuft or Umbel, each upon a small Foot-stalk; which after they have continued for a good while open or blown, they fall away, and in their places small chaffy Heads appear, like Buttons, in which is contained a kind of chaffy Seed.

IV. The second, or Other great kind, has a Root consisting of very many small Tuberosities, somewhat longer, and whiter than the former, inclining to redness, which are fastned together by many long Fibres or Strings, as the other are. The Stalks and Leaves are so like the former, that this Plant can scarcely be discerned from that: the Flowers at tops of the Stalks are of a white color, inclining to a purple, and made of five Leaves apiece, like the other; after which come the Heads, which when fully ripe, contain within them round and blackish Seed.

V. The third, or Small Filipendula or Dropwort, has a Root manifestly spread out into several glandulous or tuberos Knots, like the first, but smaller and redder, and tyed together by Strings, like them. From this Root rise two, three or four such like Leaves as in the first, but much smaller, and more nearly resembling Wild Tanfie Leaves, but not white, as they are, but of the same dark green color with the former. From among these Leaves arises up a Stalk, not above an hand breadth high, which is sometimes without Division, and sometimes spread out into two or three several Branches, on which stand many smaller white Flowers, and sweeter than in the former, but with Threads therein, like them, and set together in an Umbel in the same manner: which being pass'd away, then come the Heads of Seed, many set together, and formed almost like unto a small Bunch of Grapes.

VI. The Places. The first grows plentifully upon stony Rocks or Mountains, and rough places, as also in fertile Pastures: it is found upon St. Vincent's Rock by Bristol; and in great plenty in a Field adjoining to Sion-house, some time a Nunnery, near London, on the side of a Meadow called Sion-Meadow; as also in the corners of dry Fields and Clofes, by their Hedge-sides. The second grows on the tops of rocky, stoney or mountainous places. The last also on stoney and rough Grounds, especially about Mompelien in France; and in many the like places in England.

VII. The Times. They all flower in May, June and July, and the Seed is ripe in August.

VIII. The Qualities. Dropwort is hot and dry in the third Degree; Aperitive, Incisive, Carminative, Diuretick; Stomackick, Pectoral, Nephritic, Hyfterick, Emmenagogick and Alexipharmick.

IX. The Specification. It is famous against the Strangury, Stone and Gravel in Reins and Bladder.

X. The Preparations. You may have thereof, 1. A liquid Juice of the Roots or Leaves. 2. An Essence of the same. 3. A Decoction of the same in Wine. 4. A Powder of the Roots, Leaves or Seed. 5. A Balsam of the Root. 6. A distilled Water. 7. A Spirituous Tincture of the Root. 8. An Acid Tincture of the same. 9. An Oily Tincture thereof. 10. A Saline Tincture. 11. The Spirit. 12. The fixed Salt: where note, that you may use Roots or Leaves; but the Roots are much more effectual.

The Virtues.

XI. The liquid Juice. Taken three or four spoonfuls at a time in a Glas of White Port Wine, is very effectual in opening all the Urinary Passages, to help the Strangury, and to expel Sand, Gravel, small Stones, and other tartarous Matter in the Reins, Ureters and Bladder. Authors say it is very helpful in breaking the Stone; and this the Juice will do, whether taken from Roots or Leaves; but that from the Roots is most effectual, as aforesaid.

XII. The Essence. It has all the Virtues of the liquid Juice; besides which, it is very effectual to force away the Birth, as also to expel the Secundine or After-birth, and prevails against the Yellow Jaundice, Epilepsy, as also Obstructions of the Breast and Lungs, it expels Wind and helps difficulty of Breathing. Dose two or three spoonfuls in a Glas of generous Wine, Morning and Night.

XIII. The Decoction in Wine. It has the Virtues of the Juice and Essence, but not full out so powerful: it may be sweetened with Honey, and given Morning and Night, or upon an Exigency from four to six ounces: it very much comforts and strengthens the Stomach.

XIV. The Powder of the Root. Taken from one to two drams in White Port Wine, it provokes Urine powerfully, opens Obstructions of the Reins and Bladder, and is said to dissolve or break the Stone, and expel it; but this must be understood, where the Stone is compacted of a Substance friable or brittle and gritty, and not grown to any great Magnitude. If it is made into an Electuary with Honey, it is an excellent thing for the Wind and Gout in the Stomach, as also to open Obstructions of the Breast and Lungs, help Coughs and Colds, Hoarseness, Wheezing, loss of Voice and shortness of Breath, causing an Expectoration of the cold, tough and viscous Plegm from all the Parts of Respiration.

XV. The Balsam of the Root. It is good to digest, cleanse, dry and heal old Sores, and such as proceed from the Kings-evil, and moist and running Ulcers.

Ulcers. Applied to Parts afflicted with the Gout, it quickly eases the Pain, and in some measure attracts forth the sharp Humors and morbid Matter thro' the Pores of the Skin.

XVI. *The distilled Water.* It is a good Vehicle to convey any of the other Preparations in: it is Diuretick, opening the Obstructions of the Urinary Parts.

XVII. *The Spirituous Tincture of the Root.* It is Alexipharmick, good against Poyson, Plague, and all sorts of peccidental and malign Diseases; it warms and comforts the Bowels, restores the Tone of the inward Parts; and is singularly good against Fluxes of the Bowels of all sorts, and forces away the Birth of a Woman in Travail. Dose from two drams to four in any proper or specifick Vehicle. It powerfully expels Wind, corrects sharp and acrid Humors in the Stomach and Guts, and gives present ease in the Cholick.

XVIII. *The Acid Tincture.* It is a high Stomackick, warms, comforts and strengthens it, causes Appetite and a good Digestion; dissolves crude and tartarous Humors, and makes them fit for Expulsion; cleanses the Urinary Parts, and promotes the breaking or dissolving the Stone in the Reins or Bladder. It strikes at the Root of those Humors which are the Cause of the King's-evil, and of Tumors or Swellings in the Throat or other glandulous Parts, cutting and dissolving them, preventing their Encrease or Generation, and making those which are present to be fit for Excretion. Dose for many drops as to make the Vehicle pleasantly sharp.

XIX. *The Oily Tincture.* It is good against Cramps, Convulsions, Numbness, Palsy, &c. being bathed well in twice a day upon the Parts affected. Given inwardly to twenty or thirty drops in the distilled Water aforesaid, or in some other appropriate Vehicle, it is an admirable thing against all manner of Obstructions of the Reins, Ureters and Bladder, expels stoney and tartarous Concretions, and carries off the morbid Cause of the Yellow Jaundice by Urine. It also prevails against Lethargies, Vertigo, Apoplexy, Convulsions, Epilepsy, Paralysis, and all other cold and moist Diseases of the Head, Brain and Nerves; and provokes the Terms in Women.

XX. *The Saline Tincture.* It is dedicated to Diseases of the Reins, Bladder and Ureters; prevails against the Strangury, and dissolves the Matter breeding the Stone. Outwardly, it is good against Scurff, Morpew, Scabs, Itch, Tettars, Ringworms, and other Defecations of the Cuticula, being bathed therewith twice a day.

XXI. *The Spirit.* It is a singular Cordial, cheers the Heart, revives the Spirits, strengthens the Stomach, and fortifies the whole universal Frame. It is good against fainting and swooning Fits, Sicknefs at Heart, Wind, and the Cholick Torsions of the Bowels, occasioned thro' either Flatulency or sharp and acrid Humors. Dose from two drams to four, either alone or mixt with a little Glas of Canary, as oft as occasion requires.

XXII. *The fixed Salt.* It is a strong Diuretick, opens all the Urinary Passages, and expels large quantities of watry Humors in the Dropsy by Urine, and the morbid Cause of all Fevers. Dose from twelve grains to a scruple or half a dram, in the distilled Water above-mentioned, or in White Wine.

C H A P. CCXXXII.

Of DROPWORT Narrow-leav'd.

I. *THE Names.* Authors ascribe the Greek Name *Oenanthe* to this Plant, tho' it is not the true *Oenanthe Dioecoris*: and therefore it is called in Latin, *Oenanthe recepta verpariorum*, or *Filipendula angustifolia*: in English, *Narrow-leav'd Dropwort*.

II. *The Kinds.* It is the second general Species of Dropworts; and is threefold. 1. *Oenanthe Apii folis major*, *Filipendula folio Apii major*. The common or ordinary great Parsly-leav'd Dropwort. 2. *Oenanthe vel Filipendula Apii folis minor*, *Aurum specierum*, Two smaller sorts of Parsly or Smallage leav'd Dropworts. 3. *Oenanthe angustifolia Lobelii*, *Lobel's Narrow-leav'd Dropwort*.

Dropwort narrowleaved

III. *The Descriptions.* The first, or Great Parsly-leav'd Dropwort, has for Roots many round, white, and somewhat long Asphodil like Clogs, joined together at the tops, making one Head of a Root, and ending in small Fibres: from this Root rise many green winged Leaves, made of many parts, cut into the Form almost of Parsly or Smallage Leaves, but much smaller, even as small as Garden Cress Leaves: and from among them spring forth two or three stiff, round Stalks, a foot and half high, and sometimes two feet high, beset with such like Leaves as grow below, but as they grow higher on the Stalk, grow much smaller, lesser and narrower, to the perfect looking of the Form of those below. At the tops of the Stalks grow Umbles of white Flowers, which being pass'd away, there follows Fennel like Seed, but smaller, and of a dark whitish color.

IV. *The second, or Small Smallage-leav'd Dropwort, which is twofold. The Roots of these two kinds are much alike, but only differing in Greatness, each*

of them consisting of several small Tubers, with many Strings among them. Their Leaves are winged, and like in their Divisions to the former, but both smaller by much, and more green, the one of these being also smaller than the other; and the lesser of them a little finer jagged, which evidently shews the Difference as well as the Seed: the Flowers in both are white, but differing in Greatness. The Seed of the greater of these is smaller by half than the Seed of the former Great kind; and the Seed of the lesser is yet smaller and rounder, and something like unto *Dill* Seed.

V. The third, or Lobel's Narrow-leav'd Dropwort, has a Root composed of many white, long, tuberous parts, sending forth many Strings from their lower parts, and on their tops all uniting in one Head of a Root. From this Head or Root arises a strong crested Stalk, two feet high, dividing it self towards the top into several Arms or Branches. From the hollow Place or Bosom of every Joint, out of which do grow those Branches; the Leaves do also proceed, very much cut or jagged, like *Fennel*. At the tops of these Branches come forth spoky Rundles or Umbles of white Flowers, fashioned like Stars.

VI. The Places. They grow in many places of England, but for the most part near Ditch-sides, and Brooks or Rivers sides, and upon the Borders of Ground near standing Waters.

VII. The Times. They flower from May to the end of June, and the Seed is ripe not long after.

VIII. The Qualities, Specification, Preparations and Virtues, are the same with the Common Dropwort in Chap. 231. so that no more need be said of them here.

C H A P. CCXXXIII.

of DROPWORT Hemlock like.

I. THE Names. It is called in Latin, *Oenanthe Cicuta facie*; also *Filipendula Cicuta facie*: and in English, *Hemlock-leav'd Dropwort*, *Lobel's Hemlock like Dropwort*.

II. The Kinds. It is *singularis sui generis*, there being neither a greater nor lesser sort of it.

Hemlocklike Dropwort

III. The Description. This Plant has a Root which is white and glandulous, or repleat with many long and gouty Glandules, *Alphodil* like, which are soft and tender, but sharp and unpleasant in Taste, yielding a white Milk at the first, and turning yellow afterwards, which is said to be poisonous, virulent and exulcerating. From this Head or Root spring forth several winged Leaves, standing upon a long Foot-stalk, more like *Meadow Rue* than *Smallage* or *Hemlock*, having many small ones set together, of a dull, dark green, and somewhat like *Hemlock* in color, as also in the Flowers; but more in its Effects.

IV. The Places. It grows many times in moist Plowed Land, as in the moist and wet Furrows of a Field belonging to *Battersea* near London: it grows also in great abundance in many places by the *Thames*-side, as a little above the *Horse-Ferry* against *Lambeth*, &c.

V. The Times. It flowers in May and June, and some part of July; and the Seed is ripe in July and August.

VI. The Qualities. It is hot and dry in the fourth

fourth Degree: Pyrotick, Exulcerating, Arthritick, and *Scurvie*, Venefick or Poysoning.

VII. *The Specification.* It troubles and overturns the Brain and Senfes, causing Madnefs, and if taken in any confiderable quantity, Death.

VIII. *The Preparations.* You may make therefrom, 1. A Cataplofm. 2. An Ointment.

The Virtues.

IX. *The Cataplofm.* It exulcerates, or is blifftering, and is of good Ufe to be applied in a Sciatica, or Gout in Hands or Feet: it alfo draws forth the Poyfon if it is immediately applied to the Biting of a mad Dog, or the Biting of a Viper or Rattle-Snake, or other venomous Creatures.

X. *The Ointment.* It is good to anoint with in all forts of fcrophulous or ftumorous Tumors, and to be applied in Kings-evil Sores, where it is not ufed without a fingular Advantage.

CHAP. CCXXXIV.

of DROPWORT Water.

I. *THE Names.* It is called in Greek, (according to our Moderns) *Ουνανθη υδαρδωδης*, *Uvanthe udatardos*; in Latin, *Oenanthe aquatica*, and *Filipendula aquatica*; in English, *Water Dropwort*.

II. *The Kinds.* It is the fourth grand Species of the Dropworts; and is twofold, viz. 1. *Oenanthe, vel Filipendula aquatica major*, The greater Water Dropwort. 2. *Oenanthe, vel Filipendula aquatica minor*, The leffer Water Dropwort.

III. *The Description.* The first, or Greater Water Dropwort, has a Root like to the other Drop-

worts, replenished with many small, white Tubers or Knobs growing among the Strings, joining together above, and making one Head of a Root. From this rise several large spread Leaves next the Ground, and lying thereon, being winged and cut into many small Divisions, somewhat resembling Parsly, but much smaller, and divided into smaller parts than any of the former kinds. From among these Leaves rise up crested, thick, hollow Stalks, with Leaves on them, cut into longer and finer Divisions, bearing at the top Umbles of white Flowers, which turn into small, flat, greyish Seed, somewhat lesser than Fennel Seed, and not much unlike Hemlock Seed.

IV. *The second, or Lesser Water Dropwort, has a Root made up with several small Tubers or Knobs, and fastned among the Fibres, which are as small as Hairs.* From the Head of which Roots spring up many small Leaves, lying upon the Ground, which are very finely cut in: after them springs up the Stalk, which carrying up the first sprung up Leaves with it, they scarcely seem to be Leaves, but rather like the Ribs of Leaves, of a dark and shining green color, as the Stalk also is, which very nearly resembles a Rush; and below the top thereof, which is pointed like a Rush, comes forth a small Umble of small whitish sweet Flowers, which turn afterwards into as small Seed as Smallage, but blacker.

V. *The Places.* They both grow in wet Grounds and near Brook-sides in many places in England; yet will they both flourish being nurs'd up in our Gardens, but grow not there all our so large and fair, as in their natural places: and as it grows by the sides of Rivers and Water-streams, so it has been found near the River of Thames, as, near St. George's-fields, and about the Bishop of London's House at Fulham, and in such other like places.

VI. *The Times.* The second or Lesser, flowers earlier than the Greater; and commonly the flowering time of the Lesser is past before the other comes, which is not until August.

VII. *The Qualities, Specification, Preparations and Virtues,* are the same with those of the Common Dropwort in Chap. 231. foregoing, so that no more need be said of them here.

CHAP. CCXXXV.

of DUCKS--MEAT.

I. *THE Names.* It is called in Arabick, *Taleb*, seu *Tahaleb*; in Greek, *ταχης* & *ταχιδιον*; in Latin, *Lens palustris*, *Lens aquatica*, *Lenticula palustris*, vel *aquatica*; in English, *Ducks-meat*; and by some, *Water Lentils*.

II. *The Kinds.* Authors make four kinds hereof, as, 1. *Lens palustris vel aquatica vulgaris*, Common or vulgar Ducks-meat. 2. *Lens palustris quadrifolia*, Cross-leav'd Water Lentils or Ducks-meat. 3. *Lens palustris latifolia punctata*, Broad-leav'd spotted Water Lentils. 4. *Lens vel Lenticula aquatica bifolia Neapolitana*, Neapolitan Water Lentils. Of all these, 'tis only the first which grows in England, which we shall treat of in this place: the rest being Strangers, we shall have nothing at this time to say concerning them.

III. *The Description.* This small Plant has for a Root only certain small fine Fibres or Threads, which

which grows only from the middle of each Leaf on the under-side, and pass down into the Water, but reach not to the bottom, to draw Nourishment from the Earth: besides this Root, the whole Plant consists of nothing but small, round, green Leaves, lying on the Surface or Top of standing Waters, in Pools, Ditches and Ponds, without either Flower or Seed that could be ever observed.

IV. *Nota.* *Matthiolus*, and from him *Lugdunensis*, makes a strange Relation concerning this Plant, scarcely to be believed; and it is this: That if it should happen (as sometimes it may) by Inundations, or any other Accident, that these small Lemils or Ducks-meat be carried away into running Waters, as Rivers, Brooks, small Streams, &c. as soon as they stick to or touch the Shoar, they are wonderfully encreased; for by their Roots, which grow from them like Threads, they penetrate and fasten themselves into the Ground, and then growing, come to be Plants, like unto *Sylvestrium*, *Water Mint*, or *Ladies Smocks*; and that this thing has been observed by the diligent Searchers of Nature, and not without much Admiration of the Matter of Fact. *Vix credo*, indeed I know nothing of it.

V. *The Qualities.* According to *Galen*, *Ducks-meat* is cold and moist in the second Degree; *Anodyne*, *Repercussive*, *Arthritic* and *Alexipharmick*: but this last it is by Accident.

VI. *The Specification.* It refits and cools Inflammations after a peculiar manner.

VII. *The Preparations.* You have, 1. The green Herb. 2. An Ointment. 3. A Cataplasm. 4. A distilled Water.

The Virtues.

VIII. *The green Herb.* Applied to the Forehead, it eases the Head-ach coming of Heat. Applied in Extremity of the Pains of the Gout, it alleviates them; but sometimes endangers the sending of the Humor up into the Stomach; therefore Universals

ought to be premised, and to be used at the same time. *Diocorides* says it is a Remedy against *St. Anthony's-fire*, all manner of Inflammations, and the burning Fits of Agues. Ducks greedily devour it, also Hens, if mingled with Bran and given them.

IX. *The Ointment.* It is a fine cooling thing, good against Phlegmons and hot Pains of the Joints, and the Hemorrhoids of Piles, whether broken or not broken, if anointed thereon.

X. *The Cataplasm.* If it is made of the Herb beaten up with *Barly-Rowe*, it prevails against the Gout, and consolidates Ruptures in young Children; and is profitable against the Swelling of the Cods, and of Womens Breasts before they be grown too much, because it does not weakly repel the Humors. If it is made with *Wheat Flower* or *Meal*, it prevails much against hot Tumors, as Phlegmons and the like, as also Pains of the Joints proceeding from Heat; and helps the falling down of the Fundament in young Children.

XI. *The distilled Water.* It is good against an Erysipelas; and *Matthiolus* esteems it highly for resisting all inward Heats and Inflammations, as also pestilential Fevers, to help the Redness of the Eyes and the Swellings of the Testicles, by repelling of the Humor, Cloths four times doubled being wet therein and applied: and so applied, it cools an Erysipelas or *St. Anthony's-fire*.

CHAP. CCXXXVI.

OF DYERS--WEED;

Called,

WOLD or WELD.

I. *THE Names.* It is a Plant which was unknown to the *Greeks*: the *Latins* call it *Luteola* and *Herba Lutea*; it is the *Lutea* *Plinii* lib. 33. cap. 5. *Vitruvius* lib. 7. cap. 14. calls it *Luteum*; and *Virgil* *Bucol. Eclog.* 4. calls it *Lutum*: in *English*, *Dyers-weed*, also *Wold* or *Weld*.

II. *The Kinds.* It seems to me to be an Herb of its own kind; but *Bauhine* refers it to the *Genista Tinctorum*, or *Green-weed*, of which we shall, God willing, treat in the next Chapter, but to that we think it has no Relation. Some thought it to be the *Reseda* of *Pliny*, because they agree well in divers parts. *Casalpinius* lib. 9. cap. 35. makes it the *Myagrum*, vel *Melampyrum* *Diocoridis*: but all these things are to be disputed. It took its Name of *Lutea* and *Luteola*, not only from the yellow color of the Herb and its Flowers, when it is dry, but chiefly from the yellow color which it Dyes things into. *Tragus* took it to be *Antirrhinum*, because the Seed-Vessels have (as it were) holes therein. Some will have it to be *Phyteuma* *Diocoridis*; others *Struthium* *Diocoridis*, as *Lacuna* and *Gesner*. *Matthiolus* calls it *Pseudostruthium*. *Dodonaeus*, *Herba Lutea*. *Lobel*, *Luteola*. *Lonicerus* and *Tabernaemontanus*, *Catenance*: but all these things it is impossible to be; I am induced therefore to hold to my own Opinion before declared.

III. It is twofold, viz. 1. *Lutea* vel *Luteola vulgaris*, Common *Wold*, *Weld* or *Dyers-weed*. In *Candia* there grows a small sort of *Luteola*; which some Authors would make to be a different kind from that just now named, which *Honorius Bellus* *Epist.* 2. ad *Clusium* will have to be *Struthium* ve-

from Dioscoridis, and says it is called *Camene* thro' all Greece: but this we think to be one and the same Plant with the foregoing, viz. Our *Luteola vulgaris*; and of this Opinion is *Camerarius* in *Hort.*, who makes it and *Our common sort* all one. 2. *Lutea Cretica maxima*, which is *fecunda & infecunda*, or *fertilis & sterilis*, The great Wold, Weld or Dyers-weed of Candia, which is both fruitful or bearing Seed, and barren bearing no Seed; and differ one from another only as our *Hemp*, which is, bearing Seed, and barren bearing no Seed.

IV. The Descriptions. The first, or Our common Wold, Weld or Dyers-weed, has a Root which is long, thick and white, abiding all the Winter. The Plant grows bushing out, with many long and narrow flat Leaves upon the Ground, of a dark, bluish green color, somewhat like unto Wood, but nothing so large, a little crumpled as it were, and somewhat round-pointed, which do so abide the first Year. And the next Spring rise up from among them several round Stalks, two or three foot high, beset with many such like Leaves, but smaller and shooting forth some small Branches, which with the Stalks bear very many small yellow Flowers, in a long spiked Head at tops of them; after which come the Seed, which is small and black, enclosed in Heads, which are divided at the top into four parts.

V. The Great Candia Dyers-weed has a Root which is very great and woody, and shoots it self forth into many long Arms or Branches, which in the native or natural places of its Growth, and other warm Countries, will abide many Years, but with us will scarcely endure our cold Winters, (unless housed) as has been several times proved. From this Root this great Plant rises up (in Candy) with several great Stalks, some of them as big as a Man's Arm, and in height five, six, seven or eight Cubits; sometimes nine or ten Cubits high, which yet perish in Winter: they are bare or naked of Leaves next the Ground for a foot and half high, the lowest Leaves being without Foot-stalks, joining close at the bottom: the other growing higher up towards the

tops, have all of them Foot-stalks, of a span long: the Leaves of themselves are very large, made of many somewhat broad and long green shining ones, set one against another on a middle Rib, and not yet always directly opposite one to another; every one of them being something like unto the Leaves of *Hemp*, (of which it is most likely to be a Species) ragged or dented about the edges, yet none of them divided, but the end Leaf, which is sometimes parted, seldom into two, but sometimes into three Divisions, each ending in a long Point. The Stalks are branched, but has only divers small Stalks or long Spikes of Flowers thrust forth, which are yellowish, green and mossy, bowing downwards, with many long and narrow Leaves among them, and stand in yellowish green Husks; in which, after the Flowers are fallen, come Heads full of very small reddish Seed. The barren Plant is like the former, save that it bears no Seed.

VI. The Places. The first grows every where by the Way-sides, as well in moist Grounds as in the dry, and in corners of Fields and By-Lanes, in and about Villages almost every where: in some places in *Kent* they sow it in their Fields after their *Barley*, which abides until the next Year, and then it is gathered. The other is a Native of *Candia*, and is nurs'd up with us only in *Gardens*.

VII. The Times. The first flowers in *June* and *July*. The second flowers late with us, and sometimes not at all.

VIII. The Qualities. It is hot and dry in the third Degree, the Root, as also the whole Herb. It is Aperitive, Digestive, Attenuating, Incising and Resolutive; Arthritic and Alexipharmick.

IX. The Specification. It is peculiar against Punctures of the Nerves, Bittings of Serpents, mad Dogs, and other poisonous Creatures, outwardly applied, and inwardly taken; and prevails against the Infection of the Plague; for which Reason, as *Matthiolus* says, it is called *Theriaca*.

X. The Preparations. You may have therefrom, 1. The green Herb bruised. 2. A liquid Juice. 3. An Essence. 4. A Decoction in Wine. 5. A Powder of the Root. 6. A Balsam or Ointment. 7. A Spirituous Tincture. 8. An Acid Tincture. 9. An Oily Tincture. 10. A Spirit.

The Virtues.

XI. The green Herb bruised. Applied to Cuts or simple Wounds in Hands or Legs, it heals them. It is good to be applied also to the Bittings of Serpents, mad Dogs, or other venomous Creatures, to draw out the Poyson.

XII. The liquid Juice. It provokes the Terms in Women, opens Obstructions, incises or cuts tough Humors, and resists Poyson, as also the Malignity of the Plague, being taken from one to three Spoonfuls at a time in a Glass of generous Wine, and repeating the Dose as Reason requires.

XIII. The Essence. It has all the Virtues of the liquid Juice; besides which, it strengthens the Stomach admirably, expels Wind, and gives ease in the Cholick; it also facilitates the Labor of a Woman in Travail. Dose two or three Spoonfuls at a time in a Glass of Canary, Madera or Sherry Wine, or in White Port.

XIV. The Decoction in Wine. It has all the Virtues of the Juice and Essence, but much less efficacious or powerful; and therefore may be given (dulcified with white Sugar) from three ounces to six ounces or more, Morning and Evening. It is a good Gargle also for a sore Mouth and Throat.

XV. The Powder of the Root. It is good against the

the Plague or Pestilence, the spotted Fever, and other pestilential and malign Fevers; resists both Vegetable and Animal Poysons, and is good against Sickness at Heart. Dose one dram in a Glas of Wine. Applied to Wounds, it heals them, and cleanses, incarnates, dries and induces the Healing of moist running Sores, old Ulcers, and the like, being strewed on them.

XVI. *The Balsam or Ointment.* They are admirable Vulneraries. The Balsam cures simple Wounds many times at one or two Dressings. It cleanses foul and filthy Ulcers, dries, incarnates and heals. And it is profitable to any Part affected with the Gout; giving ease to all sorts of Pains from a cold Cause.

XVII. *The Spirituous Tincture.* It resists Poyson, and particularly the Poyson of mad Dogs, of Vipers, Rattle Snakes, and other Venom's of like kind. It removes Sickness at Heart, fainting and swooning Fits, is good against Cramps, Convulsions, Lethargies, Apoplexies, Palfies, and such other like cold Distempers of the Brain and Nerves. It is good against Punctures of the Nerves, and gives present ease to the Pain, the Part wounded being well bathed therewith, and Cloths wet therein being laid thereon. Dose inwardly is from two to three or four drams in a Glas of choice Wine.

XVIII. *The Acid Tincture.* It resists the Infection of the Plague to a Miracle, as also of the spotted Fever, and of all other malign and pestilential Fevers. It cuts tough Flegm in the Brest and Lungs, and is good against Hoarseness, Wheezings, shortness of Breath, and difficulty of Breathing, causing an admirable Expectoration. It opens Obstructions in the Urinary Parts and Passages, expelling Sand, Gravel and tartarous Matter thence; and powerfully resists the Poyson of mad Mogs. Dose so much at a time as may make the Vehicle, whether Mead, Cyder or Wine, pleasantly acid.

XIX. *The Oily Tincture.* Outwardly applied, it is good to give ease in the Pain and heal the Puncture of a Nerve or Tendon. It gives ease also in the Gout in any Part, arising from a cold Cause. Inwardly taken also from ten to twenty or thirty drops (according to Age and Exigency) in any proper Vehicle, it expels Wind, prevails against the Cholick, and alleviates all sorts of inward Convulsions; is a good Hystrick, and a singular thing against the Strangury, or any Obstruction of the Urinary Parts.

XX. *The Spirit.* It is purely an Antipestilential and Alexipharmick Cordial; wonderfully comforting and warming the Stomach and all the other Viscera. It gives ease in Convulsions, and the Tortions of the Bowels proceeding from Wind, Poyson, or the Prevalency of acrid and sharp Humors. Dose one or two spoonfuls at a time, (being first dulcified) as need requires.

XXI. *An Observation.* The great Use we in England make of this Plant, is to Dye Cloth, Linen or Woollen, Yarn, Silk, woven or raw, &c. into a yellow color; and also to give a green color to those Cloths or Silks, Yarn, &c. which have been first Dyed with Woad, into a blew color. And of this *Vitruvius* seems not to be ignorant, for that in his time he says, in *lib. 7. cap. 14.* That a yellow color coming upon a blew, changes it into a green. And for this purpose, there is a great deal of this Herb made use of in all Countries, and many Fields sown therewith, for this very Purpose of Dying Cloths, Stuffs, Silks, &c.

C H A P. CCXXXVII.

of DYERS GREEN-WEED.

I. *THE Names.* It has no known Greek Name: it is called in Latin, *Genista Tinctoria*; and in English, *Dyers-weed*, and *Dyers Green-weed*.

II. *The Kinds.* It is certainly of the Stock or Family of *Genista* or *Broom*; and is a singular Plant of the kind: and by reason it is our Common *Green-weed*, it is called *Genista Tinctoria vulgaris*. It is also called *Genistella infectoria*; *Genistella Tinctoria*; *Flos Tinctorius Brunfelsii*; *Fuchsi*, *Loniceri*, *Corneolæ Anguillare & Cesalpini*; *Chamaeluce Cordi*, & *Genista Tinctoria Germanica Baubini*; in English, *Dyers-weed*, *Green-weed*, and *Dyers Green-weed*.

Dyers green Weed
common.

III. *The Description.* It has a thick and woody Root, much dispersed under Ground: from whence rise up many small, tough, green Stalks, some of them having several Branches, about two feet in height or thereabouts; upon which do grow (without any order) a great many small, long Leaves, somewhat like those of Flax, of a sad green color. The Flowers grow at the tops of the Branches, not much unlike the Flowers of *Broom*, (of which this is a Species) but smaller, of an exceeding fair yellow color, but somewhat paler than those of Common *Broom*: the Flowers being pass'd away, there come in their places small flat Pods or Cods, lesser than those of *Broom*, in which is contained a little, flat, *Broom* like Seed.

IV. *The Places.* It grows in many untill'd or unmanured Grounds throughout England; as also by the Hedges and Way sides, and in many open Commons. It grows also in fertile Pastures and Fields almost every where. Now it is sown in Fields on purpose for the Profit which is made thereof.

V. *The Times.* It flowers from the end of June to the end of August, and the Seed is ripe soon after.

VI. *An Observation.* Clusius sets forth another kind of Dyers Green-weed, which Dodonæus calls also *Gemista Tinctoria*; but then it ought to be *Gemista Tinctoria altera*. It has a thick and woody Root, which sends up Stalks, almost like those of the Spanish Broom. Upon these Branches do grow long and small Leaves, like Flax, green on the upper side, and of an hoary shining color on the other. The Flowers grow at the tops of the Stalks Spike-fashion, which are in Color and Form like the former. But this Plant grows not commonly in England, unless it is planted by the Curious in their Gardens.

VII. *The Qualities, Specification, Preparations and Virtues* of this our Common Dyers Green-weed, are the same with those of our Common Broom, which we have already at large declared in chap. 84. sect. 7. ad 29. of this Book foregoing, to which you are referred.

VIII. *An Observation.* Tho' the Medical Virtues of this Plant are admirable, and not in the least inferior to those of our Common Broom aforementioned; yet the chief Use our People in England have of it, is, for Dying of Cloth, Stuffs, Silks, Yarn, Woollen and Linnen, &c. for the Dyers do Dye a yellowish green Color with it, viz. with the Leaves and Stalks; and therefore provide themselves of it in great Stores: and for which Reason, in some places, whole Fields are sowed with it, as with the *Luteola* or Dyers-weed in the Chapter just foregoing.

C H A P. CCXXXVIII.

OF EARTH-BALLS.

THE Names. This kind of Plant is called in Greek, *ἰδαρ, ἰδαρ, ἰδαρ*, ab imbribus; vel, *ἰδαρ*, ab humore: in Latin, *Tuber Terra*, pl. *Tubera Terræ*: in Arabicke, *Ramech, Alchamech, Tamer* and *Kema*: in English, *Earth-balls*, and *Under-ground Mulhromes*.

II. *The Kinds.* Matthioli will have three sorts of these Balls; but then with the *Tubera Cervina*, there will be four. We divide them into two kinds, viz. 1. *Tuber Terra vulgare*, The common Earth-ball. 2. *Tuber Cervinum*, pl. *Tubera Cervina*, Deers Earth-balls. Of the *Vulgar* or *Common* Matthioli makes three sorts, viz. 1. One whose Pulp is white. 2. One whose Pulp is more brown; and the Rinds of both of them black and full of Chaps. 2. One which is less pleasant or insipid in Taste, and whose Rind is smooth and more brown.

III. *The Descriptions.* They, viz. the Common Earth-balls, have no Roots, but grow under Ground, viz. under the Superficies of the Earth, yet not cleaving thereto, causing it sometimes to swell, and sometimes to break, gape or cleave, by which it is discerned where they grow, being of a black or brown color on the outside, and of a soft white Substance within, having, as John Baptista Porta says, under the outward Skin certain small black Substances, which are the Seed, (tho' Pliny says they have none.) This Seed is like unto the Seed of the Cypress-tree,

by which they not only propagate themselves where they grow naturally; but as it has been often observed, they have sometimes been found growing where the Parings of them have been cast. These Tubera are unequally round, blackish and rough, whose Skins, Shells or Outfides, are without Roots, Fibres or Leaves; and within, their Pulp is white or whitish.

Earth Balls common

Earth Balls Deers

IV. *The Tubera Cervina*, or Deers Earth-balls, which I suppose Matthioli intends in his Epistles, lib. 3. Epist. ult. growing under Ground in the Woods of Bohemia, &c. are always unevenly round, and rugged; their outward Skin is blackish, and the inner Pulp or Substance whitish: while they are fresh they have a strong and evil Smell, which in drying, they loose.

V. *The Places.* The first kinds grow plentifully in Tuscany, and several other places of Italy: they also grow in Spain, Germany, France and England, not only in dry and sandy Grounds, but also in such as are more moist, and in places where Shrubs grow, as in Copses, Groves, Parks, woody Land, &c. The Deers Earth-balls grow also in Woods, and where Deer do much haunt, especially where they Couple, (as the former also do.) Hunts-men and Country People imagine, that these Deers-balls grow up out of the Sperme of those Beasts, which sometimes falls on the Ground; others think, that they are first produced by their Urine; but these are wild Conjectures and Country-mens Philosophy, and so not much to be trusted to; however, it is probable, that in some places that Beast's Urine, &c. may add to their Growth, and the Encrease of their Substance.

VI. *The Times.* They flourish and encrease in April, May and June, and are in Perfection in June, July and August.

VII. *The Qualities.* Galen and Matthioli say they have no manifest Quality in them: Avicenna says they have a more earthy than watry Substance, and so abound more with saline than with sulphureous

or spirituous Principles. The *Deers Earth-balls* seem to be temperate in Quality, as to Heat or Cold, Moisture or Dryness; and are Alexipharmick, Galenogenetick and Spermatogenetick.

VIII. *The Specification.* The *Common*, if much eaten, are said to breed Wind, and to engender the Palsy and Apoplexy. The *Deers* are said to provoke Lust to the last Degree.

IX. *The Preparations.* The first are used mostly in, 1. *A Pickle.* 2. *A Decoction in Wine.* The *Deers Earth-balls* are used in, 3. *A Powder.* 4. *A Decoction in Wine.* 5. *A Fumigation.*

The Virtues.

X. *The Pickle of the Common kind.* They are used as Sawce, and are very pleasant to the Palate, but breed gross and melancholy Humors more than any other Food; they are hard of Digestion, and in some People rise again in the Stomach. Some eat them roasted in the Embers; and some boiled in Broth, and so eat them with Pepper, Salt, Vinegar and Oil; they certainly encrease Lust.

XI. *The Decoction in Wine.* It provokes Lust, as the Sallet before does: but after the Decoction is made, you may dress the Substance with Pepper, Salt, Vinegar and Oil, to be eaten as before. *Pamphylus* or *Diphylus* in *Athenaeus* will have it, that they yield a good Juice, ease the Belly by excreting the Excrements, are windy and encrease Seed.

XII. *The Powder of the Tuber Cervina.* They are first cut into pieces, then dried by hanging them on a String; after which they are reduced to Powder, by beating in a Mortar. Dose of the Powder a dram and half in a Glass of generous Wine, or some other Vehicle provoking Lust: it wonderfully incites to Coition, by breeding much Seed, and encreases Milk in Nurses Breasts: it may be taken also in some Pilsan, with a little Sugar and Long Pepper added thereto.

XIII. *The Decoction in Wine.* It has all the same Virtues with the Powder, more especially if a dram or dram and half of the Powder be given at a time in it. Thus taken, the Medicament expels Poyson, and defends against the poysonous Bitings of venomous Creatures.

XIV. *The Fumigation.* If the dried pieces of the *Tuber Cervina* be put upon live Charcoal, and the Fumes be received up the Womb by a Funnel, help Women troubled with the Mother, and open the Passages of the Womb when they are closed, thereby in some measure provoking the Terms.

~ C H A P. CCXXXIX.

of EARTH--NUTS,

O R,

GROUND--NUTS.

THE Names. Some Authors say, that this Plant has no Greek Name, but what it has acquired from the Latin, which is, *Ayemscavon*, & *Bucogscavon*, which last word is taken from *Trallianus* lib. 7. in Latin, *Agriocastanum*, *Bulbocastanum* and *Nucula Terrestris*: in English, *Earth-nuts*, *Ground-nuts*, *Earth Chest-nuts*, and *Kipper-nuts*.

II. *The Kinds.* It is twofold, viz. 1. *Ondodon*, *Matthioli* (folio 627.) of *Bauhinus* his Edition, *Bulbo-*

castanum majus, *Agriocastanum majus*, *apios Taueri*, *Panaseolus Cestipini*, (because the Vulgar eat the Root of it instead of Bread and Cheese) *Bulbocastanum grandius Luglanensis*, *Nucula Terrestris major*, The greater Earth-nut, or Ground-nut. I am almost of Opinion, that this Plant or Species is the true *Oenanthe Dioscoridis*. 2. *Agriocastanum*, vel *Bulbocastanum minus*, *Bulbocastanum minus Tralliani*, *Bulbocastanum alterum solus & bulbis minoribus Camerarii*; *Ornithogali Species Loniceri*, *Nucula Terrestris minor*, The lesser Earth or Ground Nut.

Earthnut Greater.

III. *The Descriptions.* The first, or Greater Ground-nut, has a large tuberous Root, not fully round or smooth, but bunching out in one place or another, and somewhat rough, of a blackish brown color on the outside, and white within, of a pleasant Taste, between a Chest-nut and a Filbert; for the most part eaten raw, by reason of its Pleasantness, tho' some have also roasted it by the Fire, or under the Embers. From this Root come forth several long Stalks of Leaves, of a bright green color, which are finely cut in and divided, something like unto Parsley Leaves, which grow on the middle or top of the Stalk, as *Dodonaeus* says, when he compared them; but they are larger than the next, or Small Earth or Ground Nuts: from among these Leaves rises up a slender Stalk, a foot or more high, having many Leaves like our English Saxifrage, bearing at the tops many small white Flowers in an Umbel, which turn into small, long, blackish Seed, smelling something sweet.

IV. *The second, or Lesser Earth or Ground Nut,* has a small tuberous or roundish brown Root, like the former, but lesser; from whence rises up a long, slender, whitish Stalk or String, (call it by which Name you please) which is as it were the Clew, which leads you from the upright Stalk to the Root in the Ground, and runs four or five inches deep into the Earth, but folding or crumpling it self to and fro unto the top of the Ground, from whence it rises up a little bigger, but naked or bare of Leaves for an inch or two, and then

then sends forth from the sides of the same Stalk several small Stalks, of very fine cut Leaves, almost like them of *Parsley* or *Hemlock*, but much smaller and finer jagged, of a sad green color. At the top of the Stalk grow several Branches of white Flowers in Umbles, not unlike to the former, or those of *Dill*, but much lesser, and such like Seed as in the *Greater kind*, but that it is lesser, and is sharp in Taste.

V. *The Places.* The first grows Wild, and very frequently in *France*, *Germany* and *Italy*, and in some places in *England*; but with us it is for the most part nurs'd up in *Gardens*. The second grows with us in *Corn-fields*, and in *Meadows*, almost every where, as in the *Meadows in Lynn Regis*, near *Albhallows Church*, and in the *Pastures* going from *Hardwick*, within a Mile of *Kings-Lynn* to *Westwench*: also in some of the *Meadows by Hampstead*, near *London*: in all which places I have gathered it. There is a Field adjoining to *Highgate*, on the right side of the middle of the Village, covered over with the same; and likewise in the next Field to the *Conduit-head* by *Maribone*, near the Way which leads to *Paddington*, not far from *London*: I have found it to grow also in many *Meadows in Kent* and in *Surry*, and in several other places.

VI. *The Times.* They flower in the beginning of *June* (just at which time their Roots are in Perfection) and in *July*; and the Seed is ripe in some little time afterwards.

VII. *The Differences.* The *Greater* differs from the *Lesser*, for that the Leaves are larger and greener: the Root also of the *Greater* is not so far within the Ground; and it also sends forth some Leaves from the Tuber or Bulb it self, whereas the *Smaller kind* has only the end of a small Root, (like a String as it were) which carries the Stem and Leaves upon it, as you may see express'd in the Figure.

VIII. *The Qualities.* They are hot and dry in the first Degree; the Seed in the second: they are

Aperitive, yet Astringent and Diuretick; Stomack, Nephritick, Spermatogenetic and Analeptick.

IX. *The Specification.* They provoke Urine, and peculiarly help such as Spit or Piss Blood.

X. *The Preparations.* The Seeds and Roots are chiefly used; and therefore you may have therefrom, 1. *A Powder of the Seed.* 2. *A Spirituous Tincture of the Seed.* 3. *The raw Roots.* 4. *The Roots prepared.* 5. *Sanguis, or Blood of the Roots.*

The Virtues.

XI. *The Powder of the Seed.* You may give it to a dram or dram and half in a Glass of White Port Wine, Morning and Night, against the Strangury, Sand, Gravel and tartarous Matter in the Reins, Ureters and Bladder; it opens Obstructions of the Passages, provokes Urine, and expels Wind.

XII. *The Spirituous Tincture.* It has the former Virtues, and may be given from one to three drams in any fit Vehicle. It is very Stomack, warming, comforting and strengthening a cold and weak Stomach. It expels Wind from the Stomach and Bowels, gives ease in the Cholick, and is of good Use against all sorts of Fluxes of the Belly.

XIII. *The raw Roots.* They are commonly eaten as *Filberds* and raw *Chest-nuts* are eaten; they yield a good Juice, which cleanses the Urinary Passages, pleases the Stomach, and nourishes in Consumptions.

XIV. *The Roots prepared.* They are prepared by baking in an Oven, covered with Milk; or by boiling them in Water as *Turneps*, *Parsneps* or *Carrots*; and then dressing them up with Butter, Pepper, Salt, and a little Vinegar: they gratify, please and strengthen the Stomach, restore in Consumptions, and provoke Urine. The Root roasted in Embers, stops Bleeding, and is good for them who Vomit, Spit or Piss Blood, or have a Bloody-flux, or any other Flux of the Bowels. The raw Root does also the same thing.

XV. *The Sanguis or Blood.* It is prepared as is that of *Cullions Sweet* in chap. 184. *seff. 22.* *Parsneps*, *Carrots*, *Orchis*, *Satyrion*, and other like Roots. It has all the former Virtues of the Roots, whether raw, roasted, baked or boiled; and is much more powerful, being given from half an ounce to an ounce or more, drinking with it a Glass of generous Wine. It is of singular Use for all Consumptive Persons, breed good Juices and plenty of Seed, and provokes Lust.

CHAP. CCXL.

Of EARTH-NUTS Pease and Wood.

I. *THE Names.* It is called in *Greek*, *Ἄρα*, *Euchis* and *Tragi*: *ῥαυδάνος*, *Matthioli*: *ῥαυδάνος*, *Dodonei* and *Tubernmontani*: in *Latin*, *Apios Tragi*, (I suppose from its Form, being Pear fashion;) *Pseudoapios Matthioli*, *Chamebalanus Dodonei*, (from its somewhat Resemblance to an *Acorn*;) *Terre glans pl. glandes Lobelii* & *Penna*, *Glandes Terrestris Clusii*: in *English*, *Wood* and *Pease Earth-nuts*.

II. *The Kinds.* There are three sorts of them, viz. 1. *Balanus Lathyrine*, *Terre glandes*, *Balanus Pisane*, with all the rest of the Names in a foregoing

ing Section: Pease Earth or Ground Nuts. 2. *Astragalus sylvaticus Thalii*, *Lathyrus sylvestris*, Wood Earth-nuts, or Ground-nuts. 3. *Terra glandes Americane, vel Virginiane*, American or Virginia Earth-nuts.

Pease Earth Nuts.

III. The Descriptions. The first, or Pease Earth-nut, has Roots which are glandulous or tuberous, (not

much unlike in Shape to an Acorn, or some sorts of Pears) which are black and small, but much greater than Acorns, fastned to long Strings, and spread much under Ground; in Taste very like to a dry Chest-nut; out of which beneath does hang one or more long, slender Fibres or Strings; and out of which does also grow other Strings, near to the Head of the Root or setting on of the Stalk; unto which, creeping aslope under the Surface of the Earth, other kernelled or glandulous Roots do grow, by which way this Plant does very much multiply it self. From this Root spring severall weak, slender, square, trailing Stalks, running upon the Ground four or five feet in length. The Leaves are thin and small, usually set two and two together upon slender Stalks, each having a Clasper at its end, taking hold of what stands next to it. The Flowers come forth at the Joints towards the tops of the Stalks, and at the tops of the same, standing upon long Foot-stalks, in Shape like those of Pease, but less, many growing together, being narrow, and of a deep reddish purple color, and bright, in Smell not unpleasant. They being pass'd away, there succeed, in their places, slender long Cods, in which are contained three or four small round Seeds.

IV. The second, or Wood Earth-nut, has not only greater, but longer and harder Roots, consisting of many black Particles, here and there sending forth Fibres, almost woody, or more hard than the former; the Stalks also are harder, and striated or cornered, and rise up to be about a foot high, small below, and somewhat larger above: the Leaves grow forth at the Joints of the Stalks, consisting sometimes of two, and sometimes of four, which are longish and narrow, and sometimes five on a Branch, fastned to one Foot, which at the setting on has two little Leaves or Ears, and one Clasper or Tendrel at the end. Out of the Bosoms of these Ears grow Stalks about two inches long, each of which usually carry a couple of Pease fashioned Flowers, of a crimson or purple color, which fading, usually become blew: after which Cods succeed, which are long, narrow, straight, round and black when they grow old, within which are contained in each Cod nine or ten white, round Seeds something less than a Tare.

V. The Virginian Earth-nut has a Root which spreads it self under Ground many ways, each String of Tubers or Glands consisting of a small String and a Gland, a small String and a Gland to the end of the same, each Gland being almost of an Oval fashion, thick in the middle, and narrow-pointed at both ends, where it is held by the Strings, and having many small Fibres proceeding from its Body in several places: from this Root rises up a Stalk, which spreads it self forth into many large Arms or Branches, and every one of them again are divided into several others, which are manifold. The Leaves are long and green, which are many, and set on both sides of a middle Stalk, the main Stalk it self winding it self upon any thing standing next unto it, and rising from a tuberous brown Root, as aforesaid. At the Joints of the Stalks with the Leaves, and in other places of the Stalks, come forth the Flowers, many standing together Spike fashion, of a dull bluish color, made almost like Hoods: after which, in Virginia, come Cods of Seed, but not bearing any with us: the Leaves and Stalks perish before Winter, and sprout from the old Root again in the Spring.

VI. The Places. The first grows in many places of Germany in Corn-fields, both with the Corn it self and also about the Borders of Fields among Brriers and Brambles. The second, Gerard says, grows in Hampstead and Come Parks, near London; as also

on *Richmond-heath*, and in several other places. That which grows in the Woods has a Root which is more hard and woody; but if it is planted or sown in Gardens, in a good Soil, it is more pulpy and tender. That from *America* grows not with us but in Manured Grounds; and with us they are all planted in Gardens.

VII. *The Times.* They all flower in *June, July* and *August*, and then the Nuts are dug up and gathered.

VIII. *The Qualities, Specification, Preparations and Virtues,* are much the same with the *Earth or Ground Nuts* in the former Chapter; so that we shall not need to say any more of them in this place.

CHAP. CCXLI.

of EDDO of Carolina.

I. *THE Names.* It is called in *Greek*, *Ἀργυρίων, & Ψευδοκόκκισα*: in *Latin*, *Aron Ægyptium*, & *Pseudococcafia*; (for the true *Coccafia* is the *Faba Ægyptia* *Dioscoridis*;) in *English*, *Eddo*, *Eddo of Carolina*, and *Carolinian Eddo*.

II. *The Kinds.* It is certainly of the Family of the *Arons or Wake Robins*, and is here only a singular Plant.

III. *The Description.* It has a great and bulbous or rather tuberous Root, in some more round than in others, some of which are small and long with the Roundness, as large as the Root of a great Squill, or thick, big, round Turnep, having a thin brownish Skin on the outside, and white within, cutting very firm or soft, closer than a heavy close Turnep; some of them are reddish on the outside, having by small Strings many bulbous or tuberous Heads, shooting from all sides thereof, whereby the Root encreases, from whence many fibres shoot deep into the Ground. From this Root shoot forth several very large thi-

ning green Leaves, almost of the Shape or Fashion of *Arum* or *Wake Robin*, pointed at the ends, but much rounder, each of them a foot and half, and some of them near two feet long, and a foot, fifteen inches, or foot and half broad, not so thick and fatty as *Aron* Leaves, but thinner and harder, full of Veins running every way, and refusing Moisture, tho' they be laid in Water, standing every one upon a very thick Stalk, about three feet or something more in height, as I have seen them in *America*, especially in *Carolina*; or about five feet high, as they grow in *Ægypt*, as Authors relate. This Stalk is not set to or fastened to the Leaf at the very Division of the Leaf into two parts, as the *Aron* or *Wake Robin* is, but more towards the middle, somewhat like unto the *Water Lillies*; the Division of each Leaf at bottom, being much rounder than those of the *Wake Robin*. As this Plant is long, and the Leaves thereof very great, without any other main Stalk (for a long time) but only the Stalks of Leaves, so it has been reported to be without Flower and Seed, but very falsely; because the Encrease which it usually has, is by the Fibres, which run and spread themselves from the Root, or by bits of the Root cast into holes or hills in mellow Ground: they usually cut one tuberous Root, as big as a large Apple, into twenty or thirty pieces, so as every piece may have a small quantity of the outside Skin upon it; these being planted in those made or prepared holes, in Artificial Hills of moist fat Earth in the Spring time, will all for the most part of them grow, so that a Crop of the Roots may be gathered in *July* and *August* following; which is the Reason that never any Stalk of Flowers, Fruit or Seed are seen upon them. But if these great Roots are suffered to continue for many Years in a place, (so as they may be defended and preserved from the Frost) you will find, that between these very tall Stalks of Leaves that there will rise up one Stalk, and sometimes two or three, according to the Years of the Age and Strength of the Plant; which length of time helps to the fructifying thereof, for otherwise it would not bear any shew of Hofs, or Pestel, or Flower, as I myself, who have planted them, have manifestly seen. Each of these Stalks are much shorter than those of the Leaves, at the tops of which they bear a long open Husk; in the midst of which rises up for the most part three several narrow Husks or Hofes, (never one alone, as the *Arum* or *Arisarum* do) with every one their Pestel or Clapper in the middle of them, which is small, whitish, and about six or seven inches long; from the middle downwards it is bigger, and set round about with small whitish Flowers, smelling very sweet, the lowermost first flowering, and so by degrees upwards, which last not above three days, and from the middle upward bare or naked, ending in a small long point. After the Flowers are all past, the lower part abides, and bears many Berries, like as *Arum* or *Arisarum* do, but much paler and smaller.

IV. *The Places.* It grows plentifully in *Ægypt*, being planted there for their only Use in Meats, and for Food, which they seldom take without it. It grows naturally in *Candia*, as *Belonius* says; and in *Portugal*, as *Clusius* reports. It grows also in *Italy* in many places, and in the Country of *Salerno* in the Kingdom of *Naples*, as *Columna* relates. It grows also in the Islands of *Jawa* and *Surra*, where they use it as familiarly as they do in *Ægypt*, as the Dutch have declared in their Navigation thither, Anno 1595. It is also found in several places of *Africa*, and in divers other places, which *Theophrastus* remembered. Some will not have it called *Arum Ægyptium*, because our late Travellers say, that

for some Ages it has not been known to grow there at all; 'tis possible, that for some Years past it may have been neglected and disused; yet I am apt to believe, if good search was made for it there, by industrious and skilful Botanists, it might be found again. It grows in a vast plenty in *Carolina*, it being a great part of the Food of the Country, inasmuch as most Families in that Colony plant whole Fields with it, consisting of many Acres, for the principal and almost sole Subsistence of their Families, it being there of a very great Encrease.

V. *The Times.* It comes up from the planted bits in the Spring time, and the Roots come to their Perfection in *July, August, September* and *October*, proportionally according to the times they were planted in. It Flowers (when it is of Age, so as to come to the Perfection of Flowering) with its Hofs and Pessels or Clappens very late, even in warm Countries, seldom before *October* or *November*, and yet the Fruit or Berries do not often come to Perfection.

VI. *The Qualities.* The Root (for nothing else of this Plant is used) is hot and dry in the end of the third Degree: it is Aperitive, Absterive, Inciding, Digestive, Discussive and Carminative, Stomack, Pectoral, Hystrick and Arthritick; Alexipharmick, Chylifick and Analeptick: it is very sharp and biting in the Mouth, not to be tasted or without Caution; yet it is more biting in some Countries.

VII. *The Specification, Preparations and Virtues,* are the same in every Respect with those of *Aron* or *Wake Robin* Roots in Chap. . following of this Work, so that I need say no more thereof in this place; this Plant being indeed a kind of *Aron* or *Wake Robin*.

VIII. *An Observation.* In *Carolina* they boil them in Water till they are soft, then they eat them with Butter, Vinegar, Salt and Pepper; they are incomparable Food, and the very best of all Roots in the World which are eaten boiled: they are grateful to the Palate, pleasing to the Stomach, very Nutritive and Restorative in Consumptions: but in the boiling of them, you must be sure to do it so well as to take away all the biting Quality of them; left, being hot and biting in the Throat, they should cause an Inflammation in those Parts, and also disoblige the Stomach.

IX. *Observat. 2.* In that Country, when I was there, they made the greatest part of their Bread of the Roots boiled soft, by mixing therewith fine Flower of *Maize* or *Indian Wheat*, and kneading it in with their Hands. It made wholsome, good-tasted Bread, which was very nourishing, and which would keep moist a great deal longer than that which was made of *Maize* or *Wheat* alone.

X. *Observat. 3.* Of the boiled Root a *Sanguis* or *Blood* may be made, as you make it of *Comfrey, Orchis, Satyrion* and *Paraspe* Roots, which not only nourishes much and restores in Consumptions, but also breeds Seed, and cures Impotency in Men.

II. *The Kinds.* It is twofold, viz. 1. *Ehulus, Sambucus hamilis vulgaris*, The common Dwarf Elder, Wall-wort or Dane-wort. 2. *Ehulus foliis laciniatis*, Jagged Dwarf Elder, or Wall-wort.

Dwarfe Elder.

III. *The Descriptions.* The first, or Common Dane-wort, has a Root which creeps under the upper Crust of the Ground, springs up afresh in droers places, being of the Bigness of a Man's Finger or Thumb; it is tough, and of a good reasonable Length, having a very great many Branches and Fibres springing from it, being more excellent for Medical Uses than the Leaves. From this Root rises up a four-square, rough, hairy Stalk, which is full of Joints, like to young Branches and Shoots of Elder, and rising to be four or five feet high. The Leaves are winged, and grow by couples, with wide Distances, each Leaf consisting of many small Leaves, somewhat narrower than the Elder-tree Leaves, but else so like, that they might easily deceive one not very well vers'd in the Plants: these Leaves stand upon a thick ribbed Stalk, of which every one is long, with a fit Breadth, and finely cut in on the edges, like a Saw, yet the Dents are wider and greater than in the Leaves of the Common Elder. At the tops of the Stalks grow Tufts or Umbles of white Flowers, dasht or ript with red; they grow in Umbles, very like those of the Elder-tree, but more sweet in Smell, with five little Chives in them, pointed with black: which being pass'd away, black Berries succeed, very like Common Elder Berries, full of a red Juice whilst they are fresh, and in which are contained small, hard, long Kernels or Seed. This Plant is very like to Elder in Leaves, spoky Tufts and Berries, but has not a woody Stalk, but only brings forth green herby Stalks, which wither away in Winter, rising again every Spring from the old Root; but it is doubtless a kind of Elder, as may appear by the Leaves, Flowers and Fruit, as also by the Smell and Taste; in all which Particulars, this is very like to that.

IV. *The second, or Jagged Dwarf Elder,* has a Root like to the former, very full of Branches and Fibres, from which spring up Stalks like the other also, and indeed in all things, excepting in the Leaves,

U u

C H A P. CCXLII.

OF ELDER Dwarf.

I. *THE Names.* It is called in *Greek, Xamauduru*; in *Latin, Chamaedite, Ehulus, Sambucus hamilis*; and in *English, Dwarf Elder, Dane-wort, and Wall-wort.*

Leaves, it is so like to the former, that there is no Difference: but the Form of the Leaves does so alter the whole Face of the Plant, and put it out of Knowledge, like the Jagged Elder, that scarcely any one would think it to belong to the first kind; the Flowers, Fruit and Smell only making us to judge of the Species, and whereunto it is to be referred; for the Leaves are almost as much jagged and divided as the Jagged Elder, which is the only thing in which this differs from the first before described.

V. *The Places.* The first grows Wild in many places of *England*, where, if it is once gotten into the Ground, it will so creep and run, that it will be difficult to get it forth again. It grows in untrill'd places near to Hedges, Ditches and common Ways, and in the Borders of Fields. It grows plentifully in the Lane at *Kilbury Abby* by *London*; as also in a Field by *St. Joans* near *Dartford* in *Kent*, and in the Highway at *Old Brantford* Towns-end next towards *London*, and in many other like places. The second is only nurs'd up with us in *Gardens*.

VI. *The Times.* They flower in *July*, and the Berries are ripe in the latter end of *August*, but for the most part in *September*.

VII. *The Qualities.* It is said to be hot and dry in the third Degree; *Aperitive*, *Absterfive*, *Discurfive*, *Diuretick*, *Pectoral*, *Hepatick*, *Nephritick*, *Hysterick*, *Arthritick*, and *Emetick* or *Cathartick*.

VIII. *The Specification.* It is peculiar for curing the *Droffy*. The Roots and Seed are of greatest Force to purge away watry and pituitous Humors, and the Leaves have the chiefest Strength next, to digest, waite away and consume: the Juice of the Berries are weakest of all.

X. *The Preparations.* You may have therefrom, 1. *A liquid Juice.* 2. *An Essence.* 3. *A Decoction or Infusion in Wine.* 4. *A Powder of the Grains or Seeds.* 5. *An Oil or Ointment.* 6. *A Cataplasim of the Leaves.* 7. *Ebuli-mel, or Honey of Wall-wort*: of all which things we shall now treat in Order.

The Virtues.

X. *The Aquid Juice.* This and all other Preparations of *Dwarf Elder* are more efficacious or powerful than those prepared from *Common Elder*, in all the Diseases, and for all the Purposes unto which that is applied, but more especially in those Cases in which *Elder* is little or nothing prevalent. The Juice of the Root applied to the Throat, prevails against the Quinsy and Kings-evil. The Fundament bathed with it, prevents the falling of it down; the same also put up the Womb in a Pessary, or injected with a Syringe, brings down the Terms in Women. It is also a mighty Purger of stigmatick and watry Humors, and has been approved as the most effectual thing against an *Anasarca* or *Droffy* of the whole Body. Dose from two to four spoonfuls or more in *White Port Wine*, Morning and Night, according as the Strength of the Patient will bear it.

XI. *The Essence.* It has all the former Virtues; and given before the coming of a Fit of an Ague, it prevails so effectually against it, that it will either put it off or make it much more easy; and at second taking seldom fails of perfectly curing it. It opens Obstructions of the Breest and Lungs, incides and dissolves pituitous and tartarous Matter in those Parts, or the Urinary Vessels, carrying off the morbidick Matter of Catarrhs, Stone, Gravel, Gout, Kings-evil, Jaundice, Droffy, and other like Diseases. Dose two or three spoonfuls in *White Wine*, Morning and Night.

XII. *The Decoction or Infusion in White Port Wine.* They have all the Virtues of the liquid Juice and Essence, but much weaker in Operation, and therefore much better and safer to be given to Children, Women kind, and weak People. It cures Agues in Children in two or three Doses, given two hours before the coming of a Fit. And being taken to five, six or eight ounces in the Morning fasting, and sometimes also at Night going to Bed, it prevails against a Cachexia and Leucophlegmatia; and has had a good Effect in curing the Kings-evil and Droffy.

XIII. *The Powder of the Grains and Root.* The Powder of the dried Berries or Seed, given to a dram in *White Port Wine* fasting, has the Virtues of the liquid Juice, Essence and Decoction; for it mightily provokes the Terms, and carries off the Water in Droffies, and cures Struma's. Being given in Decoction of *Chamapitys* or *Ground Pine*, with a little *Cinnamon*, it is an approved Remedy for all Joint-Aches, Rheumatisms, Gouts, Sciatica, Droffies, and even the *French Disease* it self; for it eases the Pains, by withdrawing and expelling the Humors which are fluent, peccant and offensive. The Powder of the Root works after the same manner, and does the same things.

XIV. *The Oil or Ointment made of the green Leaves, or Roots in May.* It is said to be an admirable Remedy for all external Aches, Pains, Cramps, Gouts, shrinking of Nerves or Tendons, and Lameness caused by Blows, Falls, Cold or other Accidents; and to warm, comfort and strengthen all the external Parts so affected; to mollify the Hardness, to open the Pores, and ease the Spleen, the griev'd Parts being therewith anointed: it also cures the Piles or Hemorrhoids by anointing.

XV. *The Cataplasim of the Leaves.* It is Discurfive and Arthritick; and of singular Use to be applied to the Throat in a Quinsy, and to dissolve stumous Tumors in the Neck. Applied to the Region of the Reins or Bladder, it is held to give ease in those Pains. Applied to the Testicles which are swollen and hard, it quickly eases the Pain and dissolves the Tumor: and put to the Fundament, it strengthens the Sphincter Muscle thereof.

XVI. *Ebuli-mel, or Honey of Dwarf Elder.* Often taken to two or three drams or more, as Age and Necessity require, it dissolves the Tartar of the Lungs, opens their Obstructions, as also the Obstructions of the Reins and Ureters, purging away gently *Choler*, *Flegm* and watry Humors; is good against the Bittings of Serpents, or of a mad Dog; prevails against the Colick and Stone, as also the Strangury or other Difficulty of making Water. It helps Coughs, Catarrhs, Hoarseness, Shortness of Breath, and Difficulty of Breathing. And outwardly applied, is good against old running Sores, putrid and fistulous Ulcers: and dissolved in *Wine*, it cures Sores and Ulcers in the Mouth.

C H A P. CCXLIII.

of ELECAMPANE.

I. *THE Names.* It is called in *Greek*, *Ἐρίφρον*: in *Arabic*, *Jasin* & *Rafen*: in *Latin*, *Helenum*, *Unula*, *Enula*, *Enula Campana*: in *English*, *Elecampane*; but in some parts of *England* it is called, *Scab-wort* and *Horfe-beal*.

II. *The Kinds.* It is a singular Plant of its kind. But

But *Anguilara* and *Cordus* took it to be the *Panax* *Chironium* Theophrasti. There is another Plant which is called *Helenium*, or *Helenium alterum Dioscoridis*, which is *Helianthemum* or Dwarf *Cistus*; but it is not akin, nor has any Relation to this, the which you may see (with all its kinds) in Chap. 131. foregoing.

Elecampan

III. The Description. It has a Root which is great, thick and long, branched forth several ways, blackish on the outside and white within, of a very bitter Taste, but good Smell when it is dried, of a very compact and solid Substance whilst it is fresh and newly gathered. From this Root shoot forth many large Leaves, lying near the Ground, which are long and broad, small at both ends, somewhat soft in handling, yet rough withal to look upon, and very full of Veins; of a whitish green on the upper side, and grey underneath, slightly nicked on the edges, each of them standing upon a short Foot-stalk. From among these Leaves rise up several great and hairy Stalks, three or four feet high, with some Leaves thereon, compassing them about at the lower ends, and are branched towards the tops, bearing several large Flowers, like unto those of the Corn Marigold, both the Border and Leaves, the middle Thrum being yellow, which afterwards turn into Down, with some long, small, brownish Seed among it, all which is carried away with the Wind.

IV. The Places. It grows in moist Ground and shadowy places, more than in the dry; in the Borders of Fields and Lanes, and in other waste places almost every where, but more especially in fat and fruitful Land: it is sometimes found also upon Mountains, and shadowy places which are not altogether dry. It grows very much in the Fields on the left Hand going from Dunstable to Puddle-hill; also in an Orchard going from Colebrook to Ditton-Ferry, in the Way to Windsor, at Lidde and Folkstone near to Dover, by the Sea-side. I have often found it growing in Orchards in many parts of this Kingdom.

V. The Times. It flowers in June and July, and the Seed is ripe in August. The Roots are gathered for Use as well in the Spring, before the Leaves come forth, as in the Autumn or Winter.

VI. The Qualities. The Root is the chief thing which is used, and is hot and dry in the third Degree, full of Mercury and Sulphur: it is Aperitive, Absterfitive, Astringent, Anodyne, Catminative, Digestive, Relaxive, Incarnative and Vulnerary; highly Pectoral, Stomackick, Neutrick and Hystrick; Emmenagogick, Sudorifick, Alexipharmick, Spermatogenetic and Analeptick.

VII. The Specification. It is peculiar against old Coughs, Catarrhs, and tartarous Matter obstructing the Lungs.

VIII. The Preparations. From the Root of this Herb you may make the following Preparations, viz. 1. A Juice. 2. An Essence. 3. A Syrup. 4. A Decoction or Infusion. 5. A Powder. 6. An Elixuary. 7. An Ointment. 8. A Balsam. 9. A Cataplasm. 10. A distilled Water. 11. A Spirituous Tincture. 12. An Acid Tincture. 13. An Oily Tincture. 14. A Saline Tincture. 15. A Spirit. 16. A distilled Oil. 17. Potestates or Powers. 18. An Elixir. 19. A fixed Salt. 20. Sanguiis r Blood. 21. The Preserve or Conserve. 22. Emule-mel or Honey of Elecampane.

The Virtues.

IX. The liquid Juice. It expels Wind in the Stomach and Bowels, and takes away pricking Pains and Stitches in the Side, caused by the Spleen: it is also good against Coughs, Colds, Wheezings, Shortness of Breath, and Obstructions of the Lungs by tartarous Matter. Dose two or three spoonfuls in a Glass of generous Wine, Morning and Night.

X. The Essence. It has all the Virtues of the liquid Juice; besides which, it strengthens the Viscera much more, and secures a Person lately cured of a Dropsy, that the Disease shall not return again upon the old Foot. It is good against the Obstruction of Urine, provokes the Terms in Women, and facilitates the Delivery of a Woman in Travail, brings forth both Birth and After-birth; it is good against Vapors and Fits of the Mother, resists Poyson, and prevails against the Venom of the Viper, Rattle-Snake, and other Serpents, as also the Bittings of mad Dogs; it destroys the Putridity of malignant and pestilential Fevers, contending even with the Plague or Pestilence it self. Dose two spoonfuls Morning, Noon and Night, in a Glass of generous Wine, if it is upon an exigency; otherwise twice a day may be enough.

XI. The Syrup of the Juice. It is highly Pectoral, and causes Expectoration to a Muscle, being admirably good against Coughs, Colds, Catarrhs, Hoarseness, Wheezing, Shortness of Breath, Difficulty of Breathing, and all other Stoppages and Obstructions of the Lungs, dissolving the tartarous Matter lodged there, as also in the Reins, Ureters and Bladder: it gives ease to such as are pained with the Stone in the Reins or Bladder: in a word, it has all the Virtues of the Juice and Essence, but must be taken in a larger Dose, because the truly Medicinal part of the Plant is so much clogged with Sugar.

XII. The Decoction or Infusion in Wine. It has all the Virtues of the foregoing Preparations, but less powerful, and therefore may be taken to three, four or five ounces, Morning and Evening: this being daily drunk, besides being a Pectoral, it is said to be good for such as have weak and dim Eyes; for it clears, strengthens and quickens the Sight admirably; kills and drives forth all manner of Worms

in Belly, Stomach or Maw. Gargled in the Mouth, and the Root chewed also, it eases the Tooth-ach from a cold Cause, and fattens loose Teeth, and helps to keep them from Putrefaction.

XIII. *The Pouder of the Root.* It warms and comforts a cold Stomach, rectifies the Indisposition of the Bowels, expels Wind, and gives ease in the Colick: it is good for such as spit or piss Blood, and prevails against the Bloody-flux, and other Fluxes and Weakness of the Bowels proceeding from a cold and moist Cause; and has indeed all the Virtues of the Juice, Essence and Syrup foregoing. Dose from two scruples to a dram and half in Wine or some proper Vehicle, Morning and Night.

XIV. *The Electuary.* It may be made simply with the Powder of the Root, but it is commonly compounded thus: *A fine flower of Elecampane seven ounces, Nutmegs in powder five ounces, Flowers of Sulphur three ounces, Crocus Martis aperitive two ounces, Oil of Aniseeds one ounce, clarified Honey fifty four ounces: mix and make an Electuary.* Dose as much as a Chest-nut, or something more, washing it down with a Glass of prompt Wine, and this to be done Morning and Evening by all such as have any Obstruction of the Lungs, or Ulcer of the same, or spit or piss Blood, or have a Bloody-flux; it is of singular Use for all such Persons who have a Cachexia or Leucophlegmaria, and for Virgins who have the Green-sickness, and want their monthly Purgations. It strengthens the Tone of the Viscera so admirably, that such Persons who, by reason of vehement Obstructions, long Sickness, or Debilities of Age, or some other Accident, have not been able to go cross a Room, or up Stairs, have, by the taking hereof, in four or five days time, been able to go three or four Miles, and that so stoutly as to do it without complaining of any Weakness or Weariness. It opens Obstructions of the Thorax, eases Coughs, and stops the most profuse Catarrhs, tho' inveterate.

XV. *The Ointment.* It is good against Convulsions, Cramps, Aches, Rheumatick Pains, the Gout, Sciatica, Weakness of the Joints, and other like Distempers of the extrem Parts: if it is made of the Pulp of the Root, or the Juice thickned by boiling four pound, mixed with Oil of Trotters, Beef-suet, of each one pound, Vinegar half a pound, Sal Nitre six ounces, Saccharum Saturni three ounces; it will be an excellent Remedy for any Scab or Itch in Old or Young. It will yet be so much the better if Flowers of Sulphur four ounces be also added to the Composition.

XVI. *The Balsam.* It is an extraordinary thing to cure Wounds and Punctures of the Nerves and Tendons: it heals green Wounds at two or three times dressing: and it digests, cleanses, incarnates, dries and heals moist and running Sores, old Ulcers and rebellious Fistula's, some good inward Wound-drink being taken in the mean while. Applied in the Gout, it gives ease to the Pain.

XVII. *The Cataplasim.* It is made of the Meal or fine Powder of the Root, mixt with white Bread, Milk and White Lilly Roots. It suppurates Tumors or Apostems, eases in arthritic Pains; and applied to the side, gives ease in Pains of the Spleen. It dissolves windy Tumors of the Cods; and where the Swelling is such, that it cannot be dissipated without breaking, it quickly brings it to Maturation.

XVIII. *The distilled Water.* It is Pectoral and Carnitative, and good to be used as a Vehicle, to convey other Preparations of the Root in; it is good to cleanse the Skin of any common Defecation, and to be mixed with white Sugar Candy to put into the Eyes, to clear the Sight of Clouds,

Films, or any other thing which may obfuscate or dim the same.

XIX. *The Spirituous Tincture.* It warms, comforts and strengthens the Stomach and other Viscera, resists Poyson, and the Venom of Serpents and mad Dogs, helps Digestion, and tepepresses Melancholy; kills Worms in Children, and provokes the Terms in Women, where they have been long stopt; and is a singular thing in all Coughs, Colds, Catarrhs and Defluxions of Rheum upon the Joints and exream Parts of the Body. Dose two or three drams in a Glass of generous Wine, or in the distilled Water dulcified.

XX. *The Acid Tincture.* It has all the Virtues of the liquid Juice and Essence, powerfully opens all manner of Obstructions, and fortifies the Stomach and Bowels to a Miracle. It creates a good Appetite, causes a good Digestion, incides or cuts tartarous Humors which breed the Stone and Gout, dissolving and expelling them: it opens all Obstructions of the Lungs and Urinary Passages, causing a free Breathing and Expectoration, and cleaning the Reins and Bladder from Gravel, Sand and tartarous Mucilage, which causes the Strangury and Difficulty of Pissing. Dose so much as to make the Vehicle pleasantly sharp, three, four, five or six times a day.

XXI. *The Oily Tincture.* It is an admirable thing against Punctures and Contusions of the Nerves and Tendons: it gives ease in Convulsions, Cramps and Contractures of the Nerves, Tendons and Muscles; and is a mighty Relict in a cold Gout, if it is diligently anointed therewith, and well rubbed in. It gives ease in the Stone and Gravel, and in the Strangury, from what Stoppage soever: it expels Wind in the Bowels, and gives ease in the Colick, and this it does in this latter case, whether it is given by the Mouth or exhibited Clysterwise. If you give it inwardly by the Mouth, you may give it from ten drops to twenty or thirty, according to Age and Strength: if Clysterwise, you may give it to a dram: outwardly anointed upon Paralytick Members, it wonderfully strengthens and restores them.

XXII. *The Saline Tincture.* It is used for the most part outwardly to bathe all such Parts and Places as are affected with Scurf, Morpew, Spots, Blemishes, Yellowness or Tawiness of the Skin, Herpes, Tetters, Ringworms, Scabs, Leprosy, or any other Defecation of the Cutis.

XXIII. *The Spirit.* It is highly Cordial and Pectoral, good against fainting and swooning Fits, Sickness at Heart and Stomach, and gives ease in the Colick, and Gripping in the Guts. It strengthens a weak Stomach, and causes a good Appetite and Digestion. It gives ease in a Cough, exterminates Colds, and conduces to the stopping of Catarrhs. It resists Poyson and the Venom of Serpents and mad Dogs; as also the Malignity of the Plague, and all sorts of malign and pestilential Fevers. Dose a spoonful or more at a time.

XXIV. *The distilled Oil.* It has all the Virtues of the liquid Juice, Essence, Powder, Electuary and Spirit, and may be given in place of all or any one of them, being much more powerful than them all. I have had great Experience of it in facilitating the Birth, and bringing away the After-birth. It powerfully provokes the Terms in Women where they are stopt; cures Vapors and Hysterick Fits. There is nothing better against Coughs, Colds, Catarrhs, Hoarseness, Wheezing, Shortness of Breath and Difficulty of Breathing; as also the Colick in Stomach or Bowels, than this Oil. You may give it from six drops to fourteen or twenty, dropping it first into white Sugar, and mixing them well; and then mixing all with a Glass of good generous Wine, and

and so drinking it off. It opens Obstructions of Reins and Bladder, and provokes Urine powerfully.

XXV. *The Potestates or Powers.* They have all the Virtues of the Juice, Effence, Pouder, Spirit and Oil, and may be used to all the said Intentions, both internally and externally, but are indeed much more subtil and penetrating, striking to the Bone in a moment. They ease the Pain of the Head tho' extream, by snuffing them often up the Nostrials, and also bathing the Forehead and Temples therewith. Dose is fifty drops, more or less, in a Glafs of generous Wine, and in case of Vapors or Fits, in a Glafs of fair Water.

XXVI. *The Elixir.* This Medicament is only the *Potestates* exalted, and brought to the highest degree of Perfection. It is one of the greatest of all Pectorals and Anticolicks; and provokes the Terms in Women after an admirable manner. In a word, it has all the Virtues of the Powers, and performs whatever they can do, with Advantage. Dose from forty to sixty drops in any proper Vehicle.

XXVII. *The fixed Salt.* It is made of the whole Plant, burnt to Ashes whilst it is green. It is highly Diuretick, and a great Purifier of the Blood, destroying all praternatural Acids in the Juices and Humors, more especially in the Stomach, and other places of Digestion. Being mixed about a scruple or half a dram at a time with a spoonful of Juice of Limons, it takes away Vomiting immediately, tho' never so extream, and gives ease in the most pernicious Colick.

XXVIII. *Sanguis or Blood.* It acuates the Juices of the Body, fortifies the Stomach, comforts the Faculties, cheers the Heart, revives the Spirits, and puts whole Nature into an excellent Habit and Condition. And as it is one of the most admirable things in the World against Coughs, Colds, Catarrhs, Asthma's and Spitting of Blood; so it is a most singular thing to restore in Consumptions, there being not many better things upon Earth. Dose from two drams to three, or more, according as the Necessity may require, in a Glafs of homogeneous Wine, such as the Prudence of the Physician shall direct.

XXIX. *The Conserve or Preserve.* It may be taken in a Morning fasting against malign and infectious Airs; and in contagious and pestilential Times, there being very few things much better. I commend it for such as have had an Asthma of long continuance; for the constant taking of it for some considerable time, dissolves the Tartar of the Lungs, and causes free Breathing.

XXX. *Enule-mel or Honey of Elecampane.* It is highly Pectoral, and is very efficacious to warm and comfort a cold and windy Stomach, and to ease Prickings and stitches in the Sides; as also Pains of the Spleen, and to help Coughs, Catarrhs, Wheezing and Shortness of Breath. It is an excellent thing also for provoking of Urine, and to open Obstructions of the Womb where the Courses are stoped, suppressing Vapors, and preventing Fits of the Mother. Dose as much as a Wall-nut Morning and Night for some time.

ba: in Latin, *Intubus* & *Endivia*: in English, *Endive*.

II. *The Kinds.* It is either *Garden*, of which in this Chapter; or *Wild*, of which in the next. The first kind is called *Endivia hortensis*, *Intubus major Matthioli*, *Intubum sativum*, *Garden Endive*.

Garden Endive.

III. *The Description.* It has a Root which is long, white, with Fibres or Strings appendent to it, which withers and dies away after it has perfected its Seed. From this Root spring forth long Leaves, broad, smooth, and more green than white, like almost to those of Lettice, something notched in on the edges. The Stalk grows up among the Leaves, being round and hollow, divided into several Branches: out of which, being broken or cut, there issues a Milk like Juice, a little bitter. The Flowers grow at the tops of the Branches, and consist of many Leaves, in color commonly blew, seldom white.

IV. *White Endive.* It is raised of the Seed of the former *Garden Endive* sowed (not in the Spring, as is usual, but) in July, whereby it remains till Winter, at which time it is taken up by the Roots, and laid for two hours in the Sun or Air, by which means the Leaves will become tough, and easily endure to be wrapped up into a heap, after which they are buried in the Earth, or in Sand, as some say, with the Roots upwards, so as no Earth or Air can get within, (which, if they could would cause Rottenness:) the which so covered may be taken up as need requires, and so used in Sallets all the Winter, as is usual in London, and many other places. This is called *White Endive*, and it seems, that the ancient Romans were not ignorant of it, *Phny*, lib. 20. cap. 8. speaking to the same purpose.

V. *Curled Endive.* There is also another sort of *Garden Endive*, called *Endivia Calamistrata*, *Intubum intortum*, *Intubus Crispus* vel *Crispithmus*: this has a thick Root, with Fibres annexed, as the former has, which Root perishes, as does the whole Plant, after it has brought forth its ripe Seed. From this Root spring up many Leaves, not much unlike to the

CHAP. CCXLIV.

of ENDIVE Garden.

THE Names. It is called in Greek, *Σεν*: by the Arabians, *Dumbebe*, *Anubebe* and *Ende-*

the Leaves of the Curled Cabbage-Lettice, but much larger. From among these Leaves spring up strong and thick Stalks, set with the like Leaves, but less, and not so amply curled or crisped as those below, or as the Leaves were, before it ran up to Seed. The Flowers grow at the tops of the Stalks, much like the former, and are of a like blew color. This (as well as the first kind) being whited according to the following Directions, is called White Endive, and is much used in Winter time as a Sallet, with great Pleasure and Satisfaction: but this Curled Endive is much the tenderer, and far the fairer and better for that purpose.

VI. The Places. These grow in Gardens only, but not only with us, but also thro' all Europe.

VII. The Times. They are sown in the Spring, and they flower in June and July, and their Seed is ripe in August, the whole Plant perishing before Winter. But when they are sown in July, then they will remain till Winter, and so taken up, may be whitened, (by the former Directions) and so be preserved for Salleting all the Winter.

VIII. The Qualities. They are cold and dry in the second Degree, Aperitive, Astringent and Hepatick.

IX. The Specification. They are peculiar against burning Fevers, the burning Heat and also Stoppage of Urine.

X. The Preparations. You may have therefrom,
1. A liquid Juice. 2. An Essence. 3. A Syrup.
4. A Decoction. 5. A Cataplasim. 6. A distilled Water. 7. A Powder of the Seed. 8. A Sallet.

The Virtues.

XI. The liquid Juice. It is a singular Cooler, and therefore cools the excessive Heat of the Stomach and Liver; and is profitable against Inflammations of the other Viscera, and, Heats in any other Parts of the Body: it is of very good Use to be used in the hot and burning Fits of Agues, to cool the same, being given three or four spoonfuls at a time, mixed with fair Water or distilled Water of the Plant.

XII. The Essence. It has the Virtues of the Juice; besides which, it cools the Heat and Sharpness of Urine, opens Obstructions of the Liver, Spleen and Urinary Parts, and heals the Excoriations of the same. Dose three or four spoonfuls at a time in a Glass of the distilled Water.

XIII. The Syrup. It is good in thin Rheums, causes Expectoration, helps the Strangury, and takes away the Burning and Scalding of the Water. Dose two spoonfuls or more at a time.

XIV. The Decoction. It has all the Virtues of the Juice, Essence and Syrup, but nothing near so powerful. It is usually made in Water, because it is more cooling, and more agreeable to the Nature of the Plant; and so it cools inward Inflammations, and heals admirably: it opens Obstructions of the Liver, Spleen, Gall, Reins, Bladder and Womb, and is said to be profitable against the Yellow Jaundice.

XV. The Cataplasim. It being applied, serves to attenuate and cool the Sharpness and Heat of the Humors, and quality the sharp and corroding Matter which proceeds from ill-natured and fretting Ulcers. It is also good against hot and inflamed Tumors or Swellings, and pestilential Sores; and admirably helps not only the Redness and Inflammations of the Eyes, but also the Dimness of Sight: and gives present ease in the Gout.

XVI. The distilled Water. It is finely cooling, and a singular Collyrium to be used to fore, hot, inflamed, red and blood-hot Eyes, being dropt into them four, five or six times a day. It serves also for a Vehicle to convey some of the other Preparations in.

XVII. The Powder of the Seed. It has all the Properties and Virtues of the Juice and Essence, and if we may give Credit to Authors, it is rather the more powerful; besides, it is available for Faintings and Swoonings, and other Passions of the Heart, given in a Glass of generous White Port Wine or Madera, Morning and Evening. Dose one dram or dram and half at a time.

XVIII. The Sallet. It is singularly cooling; and being made of the Whited curled Endive, it is very tender and delicate, agreeable to the Stomach, cooling and refreshing the weak and fainting Spirits; and is one of the best Sallets, to be used both in Autumn and Winter time.

CHAP. CCXLV.

OF ENDIVE Wild.

I. THE Names. It is called in Greek, *Σεν μινθ*, *Σενια*: in Latin, *Endivia sylvestris*, *Intubum sylvestre*; and in English, Wild Endive.

II. The Kinds. It is twofold, viz. 1. *Endivia sylvestris angustifolia*, Narrow-leav'd Wild Endive. 2. *Endivia sylvestris, vel Campestris latifolia*, Broad-leav'd Meadow Wild Endive.

III. The Descriptions. The first, or Narrow-leav'd Wild Endive, has a pretty thick, rough and fibrous Root, which perishes every Year, as that of the Garden does. From this Root several very long, smooth, green Leaves arise, lying on the Ground, narrower than the Garden Endive, and something more bitter. The Stalk is slenderer and lower than the other, yet growing many times half a yard high, being towards its top more full of Branches. On the tops of all which it bears small blew Flowers, like the Common Garden Endive; which being pass'd away, there follows the like Seed also.

IV. The second, or Broad-leav'd Meadow Endive, has

has a thick, tough and woody Root, with many Strings adjoining thereto; from which rise up many broad Leaves, spread upon the Ground, like to those of Garden Endive, but lesser, and somewhat rougher: among which rise up many Stalks, immediately from the Root, every one of which are divided into several Branches, upon which do grow many blew Flowers, in Fashion like the former, save that they are lesser.

V. *The Places.* The second grows in Meadows, and Borders of Meadows in many places. The first is found to grow Wild in several High-ways, and upon the Heads of Ploughed Lands in several Parts of the Kingdom, as also upon wild and untilled barren Grounds, especially in chalky, stoney and gravelly places.

VI. *The Times.* They flower from the latter end of July to the end of August, the Seed ripening soon after.

VII. *The Qualities, Specification, Preparations and Virtues,* are the same with those of the Garden Endive in the former Chapter, so that no more need be said of them in this place.

VIII. *Nota.* In the Spring time the vulgar People are used to boil these Herbs in Pottage or Broths, for sickly Persons, and such as have weak and ill-disposed Stomachs; for so they correct the ill Ferment of the Part, strengthen the Ventricle, and purify the Mass of Blood.

C H A P. CCXLVI.

of ERYNGO,

O R,

SEA-HOLLY.

I. *THE Names.* It is called in Greek, *Ερύγγιον*: in Latin, *Eryngium*, *Erynge* Plinii, *Centum Capita*; and by some Apothecaries it is called, *Iringus*: in English, *Eryngo* and *Sea Holly*.

II. *Nota.* Some refer *Acanos* to *Eryngium*; but Lobel doubts thereof, and refers it to *Drypis* Theophrasti; but *Casparinus* to the *Crocodilion* Dioscoridis: *Lacuna* calls it *Glycyrrhiza spinosa*.

II. *The Kinds.* Authors make six several kinds of this Plant; but there are but two which are known to, and grow with us, viz. 1. *Eryngium Marinum*, *Eryngium Maritimum* Bauhini & Gesneri in hortis, *Glycyrrhiza spinosa* Lacuna. Out common or vulgar Sea Holly. 2. *Eryngium Mediterraneum* Gesneri, Turneri, Gerardi, Lobelii, *Eryngium Campestre* Lobelii; *Eryngium vulgare* Bauhini, Clusii, Camerarii, (because in Germany there is no other so frequent;) *Eryngium Montanum*, Matthioli & Lugdunensis; *Eryngium Lacuna*, Cordi, *Casalpini* & *Tabernmontani*, simply so called without any Epithite, and we in England call it, *Mediterranean*, *Mountain* or *Land Eryngo*.

IV. *The Descriptions.* The first, or Common Sea Holly, has a Root of an admirable Length, even to eight or ten feet long, so that it can scarcely ever be all pulled up, and about the Thickness of a Man's Finger, set with Knots, Rings or Circles here and there towards the upper part, but smooth and without Joints down lower, brownish on the outside, and very

white within, with a Pith in the middle, of a very pleasant Taste, but much more delicate, being Preserved or Candied with Sugar. From this Root spring up several Leaves, broad, almost like to Mallow Leaves, but cornered on the edges, and deeply dented or cut in, set round about with hard Prickles, sharp-pointed, and also a little crumpled, fat, of a blewish white, of an Aromatick or Spicy Taste, and each standing upon a long Foot-stalk, but they which grow up higher with the Stalk, do as it were encompass it at the bottom: these Leaves are gentle, or nothing so hard and prickly as when they grow older. The Stalk it self is round and strong, yet somewhat crested, having Joints, and Leaves on those Joints, more divided, sharp and prickly than the lower; this Stalk is thick, about a Cubit in Height, now and then something red below, branching it self out towards the top, which Branches have also several other Branches proceeding from them, each of them bearing on their tops several blewish, round, prickly Heads or Knots, about the Bigness of a Walnut, held in for the most part with six small, jagged, prickly Leaves under them, or encompassing the top of the Stalk round about, and standing like a Star; which Leaves, as well as Heads, are of a glistering blew, and sometimes are found greenish or whitish. The Flowers coming forth of the Heads are likewise blew, with white Threads appearing in the middle.

Eryngo, or, Common Sea Holly.

V. *The second, or Mediterranean Eryngo, has a long Root, like the former, but shorter and slenderer, yet nearly a Fingers Thickness, black without and white within, being of a Taste and Smell like the other, which whilst new sprung up, and that they are young, are also tender and fit to be eaten, tho' not altogether so sweet to be Eaten, nor fit to be Preferred, nor full out of so Aromatick a Taste.* The Leaves are diversly cut into several parcels or pieces, being all full of Prickles along the edges; they are more divided, more prickly, and less Aromatick than the former. The Stalk and Branches are not so thick as the first; but the Stalk is divided or spread out (like

(like it) into many Branches, which bring forth prickly Heads, but lesser than those of the other; from whence there also come forth blew Flowers, seldom yellow. There grow likewise, under every one of these Heads, six rough and prickly Leaves, like to those of the other, but thinner and smaller.

Sea Holly or Eryngo
Mediterranean.

VI. *The Places.* The first is found upon the Sea Shore or Coast almost in every Country, as in *Spain, Italy, France, England, Holland,* and in most of the other *Northerly* Countries; it grows upon the Sea-side upon *Beechy* and *Stoney* Ground. It has been found growing plentifully at *Whitstable* in *Kent*; at *Rye* and *Winchelsea* in *Sussex*; and in *Essex* at *Landamer Lading*, at *Harwich*; and upon *Langtree Point*, on the other side of the Water; as also in *Gardens*, where it is sometimes planted. The second grows naturally on the *Mediterranean* Coasts, upon the Shores of the *Levant* Sea; as also in most parts of *Germany*, and in *Especial* in *Franconia*, in the Vineyards and Highways every where; as also in the upper and farther remote parts from the Sea, about *Narbonne* in *France*, as *Lobel* and *Pena* say; but with us it is only nurs'd up in *Gardens*, where it very well thrives.

VII. *The Times.* They both flower in *June* and *July*, after the Summer solstice; and give ripe Seed in about a Month after, viz. in *August*.

VIII. *The Qualities.* They, viz. the Roots, are temperate in respect to Heat and Coldness, and dry in the first Degree, having a Thinness of Substance, as *Galen* says; *Aperitive, Absterfive, Anodyne, Carminative, Diuretick, Pectoral, Nephritick, Alexiphannick, Analeptick* and *Spermatogenetick*.

IX. *The Specification.* They are peculiar against *Stone, Sand, Gravel* and *Tartar* in the *Reins, Ureters* and *Bladder*, *Strangury*, and all Obstructions of those Parts, ease the *Colick*, and strongly provoke *Urt*.

X. *The Preparations.* You may have therefrom,
1. *The Root, raw, roasted or boiled.* 2. *A Conditure of the same.* 3. *A Juice thereof.* 4. *An Essence.* 5. *A Decoction in Wine.* 6. *A Powder there-*

of. 7. *An Ointment.* 8. *A Cataplasm.* 9. *A distilled Water of the whole Plant.* 10. *The Juice of the Leaves.*

The Virtues.

XI. *The Root, raw, roasted or boiled.* They are thus eaten to provoke *Urt* and encrease *Seed*: they open *Obstructions* of the *Liver*, are good against the *Bitings* of *poysinous Beasts*, provoke the *Terms* in *Women*, prevail against *Convulsions, Cramps, Epilepsies*, and other like *Distempers* of the *Head* and *Brain*.

XII. *The Conditure.* The way of this dry *Preserving* them is thus: Take double or treble refined *Sugar* a pound or more, fair *Water* a pint or better; boil them together till they become a good strong *Syrup*: to which *Syrup* add (being almost cold) two ounces or more of choice *Damask-Rose Water*, an ounce of strong *Cinnamon Water*, and a grain and half of *Musk* in fine powder, (the three last must be mixed, and the *Musk* infused together first for twenty four or forty eight hours, and then strained out; and so put into the *Syrup*, being first half cold.) This being done, your *Roots* being washed, are to be laid to soak in fair *Water* for twenty four hours, and then very well pickt and cleansd; after which they must be boiled in fair *Water* for the space of four hours, till they are soft; after which they are to be taken out, and peeled clean, as you do *Parsneps*, and the *Pith* must be drawn out at the end of the *Root*; but if there is any whose *Pith* cannot be so drawn out, then you must slit them, and so take it out: these you must also keep from much handling, that they may be clean; put them into the afore prepared *Syrup*, in which let them remain to the next day, then set them on the *Fire*, in a fair broad *Confecting Pan*, (made of *Copper* or *Brass* double Tinned over) until they be very hot, but without any boiling at all; let them remain over the *Fire* an hour or more, removing them gently in the *Pan* from one place to another with a wooden *Slice*. This done, have in a *Readiness* a great *Cap* or *Royal Paper*, upon which flew some *Sugar* double or treble refined, upon which lay your *Roots*, having taken them out of the *Pan*. These *Papers* you must put into a *Stove* or *Hot-house*, or a warm *Oven*, to dry and harden; but for want of such a place, you may dry them over a gentle *Sand Heat*, in a *Sand Furnace*, or by laying them before the *Fire*. After this manner you may *Condite* or *Preserve* any other *Roots* whatsoever. The *Roots* thus *Condited* or *Preserved* are exceeding good for old and aged *People*, such as are withred and consumed with *Age*, and which want natural *Moisture*, or the *Humidum Radicale*, as it is called, and therefore of consequence must be good for such as are in *Consumptions*: they are also good for such as have almost lost the *Desire* or *Appetite* to *Veneral Acts*, nourishing and restoring the *Aged*, and helping against the *Defects* of *Nature* in the *Young*.

XIII. *The liquid Juice of the Root.* It may be taken to two or three ounces *Morning, Noon* and *Night* in a *Glass* of generous *Wine*, as *White Lisbon, White Madera, Mountain White Wine, &c.* It breeds *Seed* admirably, and is said to cure *Impotency* in *Men*. It prevails against the *Kings-evil*, the *Colick*, expels *Wind*, breaks the *Stone*, and drives forth *Gavel, Sand*, and other *tartarous Matter* out of the *Reins, Ureters* and *Bladder*, provokes *Urine*, and cures the *Strangury*, being drunk for about fifteen days together. One would not grutch to drink it for a Month, to have all these great things performed by it. It may be taken to four ounces, upon occasion.

XIV. *The*

C H A P. CCXLVII.

Of EYE--BRIGHT Common or Meadow.

XIV. *The Effence.* It has all the Virtues of the liquid Juice; and by reason of its Fineness, much the better and pleasanter Medicine to be taken. It powerfully opens Obstructions of the Liver and Spleen, Reins, Bladder and Womb; is good against the Yellow Jaundice, Dropsy and Gout, and provokes the Terms in Women. It is good against the Bittings of Serpents, and the Poyson of the *Aconite*, or other poysonous Herbs; but in case of the Stone, Gravel, Sand, Strangury, &c. it ought to be taken for twenty or thirty days together, first fasting in the Morning, and last at Night going to Bed. If the Use of this Medicine is continued longer, it not only removes the Stoppage of Urine and pissing by drops, with the Sand, Gravel and Tartar of the Reins, and all other Defects of the Urinary Parts, but it is said perfectly to cure them, as also those who are troubled with the Stone, so as that those Pains shall never return again; which thing Authors say has been proved by Experience, on such as have been a long time troubled therewith. Dose three or four Spoonfuls at a time in generous Wine.

XV. *The Decoction in Wine.* It has all the Virtues of the liquid Juice and Effence, but is less powerful, and therefore ought to be taken three or four times a day, sweetned with a little double-refined Sugar. It is usually taken (as well as the other things) to excite Coition; and is said to be good against the *French Disease* it self.

XVI. *The Powder of the Root.* This being taken to a dram in a Glass of White Lisbon Wine, with the Addition of half a dram of *Daucus* or *Wild Carrot* Seed, expels Stone and Gravel from the Reins and Bladder, provokes Urine and the Terms, eases the Colick, resists Poyson, and cures the Bittings of Serpents and other venomous Creatures. It is singular good against the *Scrophula*, or those Tumors and Kernels in the Throat called the Kings-evil, being often taken Morning and Night in two or three ounces of the Effence abovesaid.

XVII. *The Ointment.* It is made of the bruised Root, boiled in Hogs Lard. This being applied to broken Bones, Splinters, Thorns, &c. remaining in the Flesh, does not only draw them forth, but heals up the place again, making new Flesh where it was consumed or eaten away.

XVIII. *The Cataplasim.* It is made of the Roots beaten into a Pulp, or raw, or boiled, and then beaten into a Mass. This being applied to Struma's, or Kings-evil Sores, or to the Bittings of mad Dogs, Serpents, or of any other venomous Creature, it draws out the Malignity and Poyson, and quickly heals the Sore. In the Gout, whether of Hands or Feet, it gives present ease; and applied to Apoterns, it quickly ripens and breaks them.

XIX. *The distilled Water.* It is drawn from the whole Plant when the Leaves and Stalks are young; and is profitably taken for all the Purposes aforesaid: it removes Melancholy from the Heart, and is good for Quartan and Quotidian Agues, as also for them who, by Convulsions, have their Necks drawn awry, or cannot turn them without turning their whole Bodies: but in all these Cases the Juice or Effence are more powerful; and they may be taken in this distilled Water for a Vehicle.

XX. *The liquid Juice of the Leaves.* Being droppt into the Ears, it is said to suppurate Apoterns therein. And *Gerard* says, that being drunk with Wine, it is a Remedy for those who are troubled with a Gonorrhoea or Running of the Reins.

I. *THE Names.* It is called, as some say, in Greek, *Ψευδαλμα*: in Latin, *Euphrasia*, *Eufragia*, *Euphrasine*, (which is also a Name of *Bugloss*) *Ocularis*, *Ocularia*, *Ophthalmica* and *Eufrafia*: in English, *Eye-bright*.

II. *The Kinds.* There are many kinds of this Plant; but there are but two principal Species which are known to us, or at leastwise grow in our Country, viz. 1. *Eufrafia*, *Eufragia*, and *Euphrasia vulgaris*, Our common Meadow Eye-bright, of which in this Chapter. 2. *Euphrasia*, and *Eufrafia linifolia Columna*, (yet the Leaves are far less than those of *Flax*;) *Euphrasia sylvestris*, *Euphrasia*, vel *Eufrafia Lignosa*; Woody Eye-bright, of which in the next Chapter.

Eye= bright

III. *The Description.* It has a Root which is long, small and thready at the end, from which usually rises up one small, low, blackish green Stalk, a span high, or not much more, spread out from the bottom into several Branches, on which are set small, long, dark green Leaves, pointed at their ends, and dented about the edges, almost like a Saw, two always set together, and very thick. At the Joints with the Leaves, from the middle upwards, come forth small white Flowers, striped with purple and yellow Stripes, and Spots mixed therewith; after which follow small round Heads, with very small Seed therein. This being found on some hilly Ground, does sometimes vary in Color of the Flower, as being sometimes more whitish, sometimes more yellowish, and sometimes more purple.

IV. *The Places.* It grows in dry Meadows, in green and grassy Ways, and Pastures lying to the Sun.

Soen. I have found it in several Meadows near Lyn Regis in Norfolk, within a Mile or something more of the Town; in Meadows near Harwich, and between Harwich and Westwoud: also in many places in Kent, in the barren Fields and waste Grounds near Gravesend, and in the places thereabouts; and indeed it is frequent in Meadows and Grassy places in most parts of the Kingdom.

V. *The Times.* It flowers in August and continues to September, the Seed ripening soon after.

VI. *The Qualities.* It is hot in the first Degree and dry in the second, and is especially appropriated to the Eyes: it is gently Astringent and Discussive.

VII. *The Specification.* It is a singular Remedy (confirmed by Experience) against all Diseases of the Eyes.

VIII. *The Preparations.* You may have therefrom, 1. *A liquid Juice.* 2. *An Essence.* 3. *A Decoction or Infusion in Wine.* 4. *A Powder of the Herb.* 5. *A Conserve thereof.* 6. *A Drink.* 7. *A Cataplasm.* 8. *A distilled Water.*

The Virtues.

IX. *The liquid Juice.* Taken inwardly Morning and Evening to two or three spoonfuls, in a Glass of generous Wine, it strengthens the Eyes and Optick Nerves, helps a weak Brain and Memory, strengthens a weak Sight, and restores it, being decayed, in a short time. Outwardly dropt into the Eyes five or six times a day, it takes away Clouds, Films, Blood-shot, and other things which obfuscate the Sight.

X. *The Essence.* It has the Virtues of the liquid Juice, being inwardly used and outwardly applied: it may be given inwardly to two or three spoonfuls in a Glass of Wine, Morning and Night.

XI. *The Decoction or Infusion in Wine.* It may be made in White Lisbon or Madera Wine, or your Spanish Mountain Wine. It has the Virtues of the liquid Juice and Essence, but not altogether so powerful: a quarter of a pint of it may be drunk in the Morning fasting, then half an hour before Dinner; as much at five in the Afternoon; and lastly, the like quantity at going to Bed. It strengthens the Stomach admirably, and by consequence the Head and Optick Nerves.

XII. *The Powder.* Its Virtues are the same with the Juice, Essence and Wine foregoing, but it exerts not its Virtue so obviously, or so soon: it may be given to one dram Morning and Night, in a Glass of Wine. If the Powder be thus compounded, you will find it much better: Take Powder of Eye-bright five ounces, Powder of Rosemary-flowers three ounces, Powder of Nutmegs one ounce, Powder of Mace half an ounce, Powder of white Pepper two drams: mix them. Dose one dram, as before.

XIII. *The Conserve.* It has the Virtues of the Powder, but not altogether so efficacious, because of its being clogged with Sugar. You may take as much as a Wallnut of it Morning and Night, drinking after it a Glass of good Wine. If you make it of equal parts of Eye-bright and Rosemary-flowers, it will be so much the more effectual; for Rosemary seems to be a Specifick to cure Diseases of the Eyes.

XIV. *The Drink.* It is to be put into, or Tunnd up with new Ale before it has done Working; to every Gallon you may put eight handfuls of the Herb, which you may gently bruise, and put into a thin Bag made of a Dairy-Wives Milk-cloth, with a Stone in it, to make it settle. This is to be put into the Ale or Beer whilst it is Working, which, after three or four days, may be drunk as ordinary

Drink: the constant Use of it admirably strengthens the Eyes and clears the Sight.

XV. *The Cataplasm.* The green Herb made into a Cataplasm by beating in a Mortar, and then applied to the Eyes, is good against hot, sharp and scalding Rheums, Weeping of the Eyes and Blood-shot, abates the Inflammation, eases the Pain, takes away the Dimness, and clears the Sight.

XVI. *The distilled Water.* It is said to have the Virtues of the Juice and Essence, but much more weak; but may serve as a Vehicle to take some of the other Preparations in. Outwardly used to the Eyes, (especially if a little white Sugar Candy is dissolved in it) it is of good Use against an Ophthalmy, Pains and sharp Humors; it takes away Clouds, Films and Pearls, and clears the Sight.

C H A P. CCXLVIII.

OF EYE--BRIGHT Woody.

THE Names. It is called in Greek, *Ευφρασία* *Ευφραδης*: in Latin, *Eufragia*, vel *Euphrasia Lignosa*; *Eufragia pratensis rubra*: in English, *Woody Eye-bright*, *Red Woody Eye-bright*.

II. *The Kinds.* There are two Species hereof, viz. 1. *Euphrasia lignosa major*, *Eufragia pratensis rubra major*; The greater red woody Eye-bright. 2. *Eufragia*, vel *Euphrasia lignosa minor*, *Eufragia pratensis rubra minor*, The lesser red woody Eye-bright.

III. *Nota.* The first of these is the *Eufragia altera Dodonæi*, *Lobeliæ & Aliorum*: the *Sideritis pratensis rubra Lugdunensis*: the *Odontites Tabernmontani*: the *Ericoides rubrum Thalii*; and the *Crataegonon Euphrosyne Gerardi*, who makes it a kind

kind of *Cratægonon*, against the Evidence of *Dodonæus*, which is indeed an Error. The second is the *Brunella Italica Bauhini*, (in his *Phytopinax*;) but the *Euphrasia pratensis latifolia Italica*, (in his *Pinnax*;) and *Eufrafia purpurea minor*, (in his *Prodromus*;) and the *Eufrafia non scripta tertia Columnæ*.

IV. The Descriptions. The first of these, or Greater red woody Eye-bright, has a Root which is made of several hard and woody Strings; from which rises up one woody, square, brownish Stalk, divided into several Branches, a little above the Ground, so that it seems to be a pretty Bush, about half a yard or two feet high, set with somewhat long and narrow Leaves, pointed at the ends, and a little dented in about the edges, two always set together at a Joint, one against another, which will, in the Heat of Summer, turn reddish: the Flowers are gaping and Hooded, of a purplish red color.

V. The second, or Smaller red woody Eye-bright, has a small woody Root, stringy and black; from whence rises up one square, reddish, hairy Stalk, an handful or more high, sometimes without Branches, and usually but with two, very seldom more, which are compassed with a few thick, hairy and almost round Leaves, set two together, and deeply cut into parts; the lower Leaves, which are the less, but into three parts, but the upper, which are the greater, into five or six parts. The Flowers come forth sometimes from between the Leaves and the Stalks, and sometimes they stand in Tufts at the tops, two standing together, Hooded, and of a purplish color, coming out of long green Husks; sometimes the Flowers have been observed to be white, yet but very seldom: which being faded or pass'd away, there comes after them (contained in the said Husks) long and cornered white Seed.

VI. The Places. They are found in several parts of England, the first chiefly in many places of Kent, in barren Fields and waste Grounds, and in some places near and about Gravesend.

VII. The Times. They flower about the latter end of July, and in August, the Seed ripening soon after.

VIII. The Qualities, Specification, Preparations and Virtues of these Plants, are much one and the same with those in the former Chapter, so that no more need be said thereof in this place.

Tamuscum, so that it seems *Parthenium* was a word applied to many Herbs; but it is only proper to our *Matricaria*. 2. *Parthenium*, vel *Matricaria flore pleno*; *Artemesia tenuifolia flore pleno*, Double-flowered Fetherfew.

Sweet Garden Featherfew

IV. The Descriptions. The first, or Single-flowered, has a Root which is somewhat hard and short, with a multitude of strong Fibres at it, making it like a Bush of them: from the Head of this Root spring up many large, fresh, green, winged Leaves, very much cut in on the edges: the Stalks are hard and round, set with many such like Leaves, but something smaller, and at the tops stand many single Flowers, growing upon many small Foot-stalks, consisting of several small white Leaves, longish and pointed, standing about a yellow Thrum in the middle. The Smell of the whole Plant is strong, but agreeable enough to that Sense, and of a very bitter Taste.

V. The second, or Double-flowered Fetherfew, has a Root like the former; and in its Stalk and Leaves, as also the Smell and Manner of Growing, it is so like the other, as not to be easily discerned from it till it comes into Flower, and in that is the only Difference; for whereas in the former the Flower was only single, in this they are very thick, and double filled, as it were, with white Leaves, so that only a little yellow Spot is to be seen in the middle.

VI. The Places. They both grow in Gardens with us, and yet they have both been found growing Wild in this Kingdom, which is a Rarity. I rather think, that where they have been found growing so, that it was by some Accident they grew there, as the scattering of some Seed, or Weeding the Plants out, and casting them into some other place, where possibly they might take root again, and so grow up and feed, and shed their Seed in the same place.

VII. The Times. They flower in June and July, and their Seed is ripe not long after.

VIII. The Qualities. They are hot in the third Degree, and dry in the second; are Aperitive, Inci-

C H A P. CCXLIX.

OF FETHERFEW Garden.

I. THE Names. It is called in Greek, *Παρθένιον*, (*quasi plantæ Virginalis, quia mulierum morbis uterinis medetur, & inde vulgo matricaria:*) in Latin, *Parthenium, Matricaria & Febrifuga*: in English, *Fetherfew and Feverfew*, (from the Latin Name) it being good against Fevers or Agues.

II. The Kinds. It is twofold, viz. 1. *Parthenium*, vel *Matricaria hortensis*, The Garden Fetherfew, of which in this Chapter. 2. *Parthenium*, vel *Febrifuga sylvestris*, Wild Fetherfew, of which in the next Chapter.

III. The Garden kind is also twofold, viz. 1. *Parthenium, Matricaria, vel Febrifuga vulgaris flore simplici*, The common Fetherfew, with a single Flower. Galen says this was called *Artemisia, Helxine* and *Linosyris* in his time: Pliny says, that *Helxine* was called *Perdicium* and *Parthenium*, also *Leucanthemum* and

five, Absterfive, Aftringent, Carminative, Digestive, Diuretick and Suppurative; Cephalick, Neurotick, Stomack, Pectoral and Hyfterick; Emmenagogick and Alexipharmick.

IX. *The Specification.* It is peculiar for provoking the Terms in Women, and forcing away both Birth and After-birth.

X. *The Preparations.* You may have therefrom, 1. *A liquid Juice.* 2. *An Essence.* 3. *A Decoction of the Herb and Flowers in Wine.* 4. *A Wine.* 5. *A Syrup.* 6. *A Powder of the Herb and Flowers.* 7. *A Cataplasim.* 8. *A distilled Water.* 9. *A Spirituous Tincture.* 10. *An Acid Tincture.* 11. *An Oily Tincture.* 12. *A Saline Tincture.* 13. *A Spirit.* 14. *A distilled Oil.* 15. *Potestates or Powers.* 16. *An Elixir.*

The Virtues.

XI. *The liquid Juice.* It is good against the Fits and Risting of the Morher, the Hardness and Inflammation of the Womb, being taken once or twice a day, two or three spoonfuls at a time, in a Glass of Wine.

XII. *The Essence.* It has the Virtues of the Juice, and comforts and warms the Womb and all the Parts of Generation afflicted with Cold and Moisture, and obstructed with thick, tough and tartarous Humors: it provokes the Terms powerfully, and brings away the Child, either dead or alive; as also the After-birth: it cleanses the Reins, Ureters and Bladder, expelling Stone, Gravel, Sand or viscid Matter obstructing them. It provokes Urine, and gives ease in the Strangury. Dose two spoonfuls in the distilled Water, or in White Lisbon Wine.

XIII. *The Decoction in White Port Wine.* It has the Virtues of the Juice and Essence, but less powerful, and therefore must be given to all the said Intentions in a much greater quantity, viz. to five or six ounces, dulcified with white Sugar, and to be taken thrice a day, viz. Morning, Noon and Night.

XIV. *The Wine.* It is made by a reiterated Infusion of the Herb and Flowers in White Lisbon or Port Wine, for a Week or more. It admirably strengthens the Stomach, warms and comforts the Viscera, and cleanses them from cold, pituitous and viscid Humors: if it is drunk for some Months, it is said to rectify and strengthen the Consistency of the Seed, and to cure Barrenness in either Sex: it is good against Melancholy, and Heaviness or Sadness of the Spirits. Dose a quarter of a pint three or four times a day.

XV. *The Syrup.* It is dedicated to the Breast and Lungs, and is used with good Success against Coughs, Colds, Stuffings of the Lungs, Asthma's, Wheezing, Shortness of Breath and Difficulty of Breathing; it opens the Pipes, and cleanses them of the tough and viscid Matter adhering to them. Dose one or two spoonfuls, to be lick'd alone with a *Liquorice* Stick, that it may distil down the Throat *gradatim*.

XVI. *The Powder of the Herb and Flowers.* If it is taken, as *Dioscorides* says, in Wine, to a dram or somewhat more, mixed with *Oxymel*, it will purge like to *Epithymum*, both Cholera and Flegm, and will be available for all such as are Short-winded, or are Asthmatick, Bechick, or are troubled with Hypochondriack Melancholy, Heaviness, Grief or Sadness of the Spirits. It is good for such as have the Vertigo, or Pains or Aches from Stuffings of Humors, or from a cold and moist Cause.

XVII. *The Cataplasim.* Being made of the green bruised Herb, and applied to the Crown of the Head,

it cures all Pains thereof, as *Camerarius* says, coming from a cold Cause: it is also profitable for such as have a Giddiness or Swimming in the Head. Applied to the Wrists, with some Salt mixt with it, two hours before the coming of the Fit of an Ague, the Patient withal drinking at the same time half a pint or more of the aforementioned Decoction in Wine, it cures the same, being four or five times used.

XVIII. *The distilled Water.* Authors say, that it is good to take away Freckles and other Deformities in the Face and Skin. This I know, that if to every quart thereof you put one ounce of *Sal Nitre* or of *Sal Tartari*, mixing, dissolving and filtering it thro' brown Paper; you will then have an excellent Cosmetick to clear the Skin of Tanning, Sun-burning, Yellowness, Freckles, Lentils, Pimples, Scurf, Morpew, and other like Defecations of the *Cutis*.

XIX. *The Spirituous Tincture.* It expels Wind, and is powerful against the Colick, whether in Stomach or Bowels: it warms a cold Stomach, comforts and strengthens it, revives the Spirits, cheers the Heart, fortifies the Womb, and makes it vigorous and fit for Conception. Dose half a spoonful or more in a Glass of White Lisbon, Morning and Night, or two or three times a day.

XX. *The Acid Tincture.* It is good against Nauseating, and stops Vomiting, strengthening the Stomach after an admirable manner. It is prevalent against the Cachexia, and the Green-sickness in Virgins, makes a good Stomach and a strong Digestion, opens the Obstructions of the Womb and provokes the Terms, and rectifies the Defects of the Instruments of Generation, occasioned thro' Weakness. Dose to many drops as to give the Vehicle a pleasant Acidity, and that three or four times a day or more.

XXI. *The Oily Tincture.* It is good against all cold and moist Diseases of the Head, Brain and Nerves, as Head-achs, the Megrim, Vertigo, Apoplexy, Epilepsy, Convulsions, Palsy, Rheumatick Pains, Colicks, and other like Distempers of those Parts. It is inwardly to be taken Morning and Evening from twelve drops to twenty four or thirty, dropping it first into Sugar, and mixing them well together; then mixing them with a Glass of Wine, and so drinking it off; it powerfully opens Obstructions of the Womb, Reins, Ureters and Bladder, prevails against the Strangury, and expels Gravel, Sand and tartarous Matter from the Urinary Parts. Outwardly against Pains and Aches, Convulsions and Palsies, it is to be well anointed upon the Parts affected Morning and Night.

XXII. *The Saline Tincture.* Tho' it provokes Urine and opens Obstructions of Reins and Ureters, yet it is mostly used against Pains of the Gout, external Affects and Defecations of the Skin, such as we have enumerated at Sect. 18. foregoing; for which Purposes the Parts affected are first to be bathed with warm Water, to open the Pores of the Skin; then being wiped dry with a Cloth, this Saline Tincture is to be laid on, bathing the Parts well with it twice or thrice a day, and letting it dry on.

XXIII. *The Spirit.* It is highly Cordial, good against fainting and swooning Fits, resists the Power of malign Fevers, and the Poyson of the Plague it self. Given in a little Posset-drink, it drives out the Measles and Small-Pox powerfully, and so secures the Life of the Patient. It is singular also against Convulsions.

XXIV. *The distilled Oil from the whole Plant dried.* It has all the Virtues of the liquid Juice, Essence, Tinctures and Spirit, but is much more powerful

powerful than them all, and may be given to all the same Intentions, from eight drops to fifteen or twenty, first dropt into Sugar, and then mixt with the Vehicle you design to give it in, whether it be Wine or any other specifick Liqueur. It may be given twice a day, viz. Morning and Evening; but in case of a Woman in Labor, or in any Fits, whether of the Mother, Colick, Convulsions, Apoplexies or Falling-sickness, it ought to be given at that moment of time.

XXV. *Potestates or Powers.* They have all the Virtues of the Juice, Effence, Tinctures, Spirit and Oil exalted; in which the Virtue and Efficacy of the Plant is so subtilized, as that it penetrates momentarily into any Part they are applied to, whether they be inwardly given or outwardly used. Dose is from one to two drams, and upon Extremity to three, mixed with a Glas of Wine, or any other specifick Vehicle.

XXVI. *The Elixir.* This is the Powers elixirated and brought yet to a greater degree of Efficacy in Operation; being vehemently subtil, and still much more exalted in their Virtues and Effects. It may be given inwardly from half a dram to a dram and half or two drams (according as the Necessity may require) in a Glas of Wine or other fit Vehicle, Morning and Night, or oftner, as you see fit.

C H A P. CCL.

Of FETHERFEW Wild.

I. *THE Names.* It is called in *Greek*, Παρθένιον μέλιον, ἡ ἄγρια; in *Latin*, *Parthenium sylvestre*, *Matricaria agrestis*, *Febrifuga agria*; and in *English*, *Wild or Field Fetherfew*.

Naked-flowered Fetherfew.

II. *The Kinds.* This is the second Species of *Fetherfew*, and is twofold, viz. 1. *Parthenium, vel Matricaria bullatis floribus aureis*, *Naked Fetherfew*. 2. *Parthenium, vel Matricaria grati odoris, Matricaria altera Camerarii, Arthemisia tenuifolia odorata Tabernmontani, Matricaria odorata Paulini*, *Sweet-scented Fetherfew*.

III. *The Descriptions.* The first, or *Naked Fetherfew*, has a bushy fibrous Root, like to the others, from whence spring up Leaves and Stalks, spreading themselves forth into many Branches, not at all differing from the former in Shape or Manner of Growing. At the tops of the Stalks and Branches grow the Flowers, not like the former; for this is a Head of naked yellow Thrums, without any Pale or Border of white Leaves, as are in the others, which is the only thing by which this kind differs from the other two, and for which Reason it is called *Naked Fetherfew*.

Sweet-scented Wild Fetherfew.

IV. *The second, or Sweet-scented Fetherfew*, has a bushy fibrous Root, like the first Common kind, and in its Leaves, Stalks, Branching forth and Flowers, it differs not at all from the first, being in all things so like, that there can no Difference be perceived between them, till you come to smelling to it, and then you will find it to be of a more pleasant and odoriferous Smell, which so continues in the kind, and is not altered, nor made so by Art, but is the Work of Nature only; nor yet degenerates from this Excellency by any Accident or Casualty whatsoever.

V. *The Places.* The first grows in *Essex*, and was there found growing by one Mr. William Cope. The second has been found Wild in many places of *England*, (as well as the former naked kind.) *Camerarius* also says, that it grows in an island called *Ibo*, in the *Levant Seas*: but they are also (both of them) nurs'd up with us in our Gardens.

VI. *The Times.* They flower both of them in June

June and July, and the Seed ripens in the mean time.

VII. The Qualities, Specification, Preparations and Virtues of both these, are the same with the two former in the Chapter just aforegoing, so that no more need be said thereof in this place: but this is to be noted, That these two Plants fall no ways below the other two, in their Power, Force and Efficacy.

C H A P. CCLI.
OF FENNY--STONES,
O R,
MARSH--PALMS.

I. **THE Names.** We know of no Greek Name belonging to them: but in Latin they are called, *Serapias*, vel *Orchis palustris*, and *Orchis palmata palustris*: in English, Fenny-stones, and Palmed Fenny-stones, or Marsh-Palms.

II. **The Kinds.** There are several kinds of them, as, 1. *Serapias vel Orchis palmata palustris latifolia*, Fenny or Marsh handed Stones with broad Leaves. 2. *Serapias vel Orchis palmata palustris leptophylla*, Thin-leav'd Fenny or Marsh handed Orchis or Stones. 3. *Serapias vel Orchis palmata palustris laevifolia*, Marsh or Fenny handed Orchis smooth-leav'd. 4. *Serapias vel Orchis palmata palustris maculata*, Spotted Marsh or Fenny handed Stones. 5. *Serapias vel Orchis palmata palustris draconias*, Marsh or Fenny Dragon handed Orchis or Stones. 6. *Palma Christi palustris maxima*, The greatest Fenny handed Stones. 7. *Palma Christi palustris radice repente*, Creeping Fenny or Marsh Palms.

III. **The Descriptions.** The first, or Marsh handed Stones with broad Leaves, has a Root which has

long Divisions at the bottoms of the Hands; the top of the Root is thick and knobby, divided into Fingers, like those of Palma Christi, of which this may be said to be a kind. From this Root rise up thick, fat and spongy Stalks, set with broad, smooth, green Leaves, like those of Plantane, but much longer; these are growing in order upon the Stalk, even from the bottom to the top or beginning of the Spike of Flowers, growing smaller as they grow higher, and appear nearer to the Spike. The Tuft or Spike of Flowers is large, consisting of many small hooded Flowers, of a somewhat whitish or pale bluish color, spotted within with deep purple Spots, the backside of which Flowers are of a Violet color mixt with purple: and every Flower, at its rising up from the Stalk, has a small greenish Leaf accompanying it.

IV. **The second, or Thin-leav'd Fenny handed Stones,** has Roots exactly like to those last described; the Stalk is also like; but it differs from the former something in the Leaves, for in this Plant they are smaller, being neither so broad nor yet so long, sometimes spotted, but more usually without; neither is the spiky Tuft of Flowers so large or long, tho' they are thick set, like the first, nor has it so many green Leaves or long Leaves mixed with, or growing between the Flowers, which are of a Violet purple color, but not altogether of so dark a purple as the former are.

V. **The third, or Fenny or Marsh handed Stones** smooth-leav'd, has a banded and fingered Root, with some Strings adjoined to the upper parts of them, like unto the two others: the Stalks are much alike: the Leaves are like the last, but smaller and narrower, and without Spots: and the Flowers are of a whitish color, but more purely white; the Flowers and the whole Plant being in Magnitude, Shape or Form, and Manner of Growing, but little differing from the others.

VI. **The fourth, or Fenny or Marsh handed Stones** spotted, has a Root fashioned like a Hand, with some Strings fastened to the upper parts thereof: from the Head of which Root rises up a fair stiff Stalk, armed with large Leaves, very notably dash'd with blackish Spots, clipping or embracing the Stalk round about. At the top of the Stalk stands a fair Tuft or Spike of purple Flowers, with many green Leaves mingled among the same, which makes the Bush or Tuft much greater. The Seed is nothing else but Dust; as it were, (like all the rest of the kinds) and is contained in small twined Vessels, which Vessels are not peculiar to this alone, but common to most of the other Orchides.

VII. **The fifth, or Fenny or Marsh Dragon-handed Stones,** has cleft or divided Roots, like Fingers, much like unto the Roots of Palma Christi, of which this is a kind; and from this Root rises up a Stalk of a foot high, set here and there with very fair Lilly like Leaves, of a red color, and which do clip or embrace the Stalks almost round about, like the Leaves of Thorow-wax. At the top of the Stalk grows a fair Bush of very red Flowers, among which Flowers do grow many small sharp-pointed Leaves. The Seed is a thing hard or difficult to be observed, being much like Dust, which is blown away with the Wind.

VIII. **The sixth, or Greatest Fenny handed Stones,** commonly called, Great Fenny or Marsh Palma Christi, has banded Roots, like to the others, from which rises up a large Stalk, sometimes to the height of three feet: the Leaves are much like to those of the former kinds of Fenny-stones before described; and the Growing on a large spiky Head are of an elegant purple, with little Hoods, like the top of an Helmet; whence Gemma called the Plant, *Cynoforchis* [*Conopsea*,

[*Conopsea*, and *Macrocaulos*, from its height.] These Flowers smell sweet, and are succeeded by Seed, like that of the rest of the Kindred.

IX. To these Gerard gives us another, which he calls, *Palma Christi* (*palustris*) *radice repente*, Creeping Fenny or Marsh Palm, or Creeping Palma Christi: it has creeping Roots, without Testicles, which are many and long, creeping far abroad in the Ground, contrary to all the rest of the Orchides; which Roots are of the Bigness of large Wheat Straws, in Substance like those of Soap-wort; from the which do immediately rise four or five broad smooth Leaves, like unto Small Plantane Leaves: from among which shoot up a small and tender Stalk, at the top of which grows a pleasant spiky Head of Flowers, of a whitish color, spotted on the inside with little bloody Specks, which leave Vessels containing very small Seed.

X. The Places. They all of them grow in fenny Grounds, or in marsh or moory Grounds, also in shadowy Woods or Groves which are watery and marshy, and often over-flowed with Water. The sixth, or Great Palmi Christi, delights to grow in Grounds of an indifferent Temper, not too moist nor too dry. The seventh, or Creeping Palme, was found by Mr. Robert Abbot of Bishops Hatfield, in a boggy Grove, where a Conduit-head does stand, which sends Water to the then Queens-house in the same Town. It also grows plentifully in Hampshire, within a Mile of Petersfield, in a moist Meadow, called Wood-mead, near the Path leading from Petersfield, toward Beryton.

XI. The Times. The first flowers more early than the Ordinary Orchis or Cynosorchis. The second flowers after the former: but they all flower from the latter end of April thro' all May and June, some of them flowering more early, as the first and second kinds; and other some more late.

XII. The Qualities, Specification, Preparations and Virtues, are the same with those of the Cynosorchis or Dog-flower, which we have declared at large in Chap. 226. foregoing, so that no more need be said thereof: yet this is to be noted, That these Fenny-stones are not of so great Power and Force as are the Cynosorchis, and several other kinds of the Orchides or Testiculi, of which we speak in their proper places.

C H A P. CCLII.

Of FENNEL Common.

THE Names. It is called by the Arabians, *Raenigi*: in Greek, *Μάχρη*: in Latin, *Feniculum*; and in English, *Fennel*.

II. The Kinds. There are four principal kinds of Fennel, viz. 1. *Feniculum vulgare*, of which in this Chapter. 2. *Feniculum dulce*, Sweet Fennel, of which in Chap. 253. 3. *Feniculum sylvestre*, Wild Fennel, of which in Chap. 254. 4. *Peucedanum*, Hog or Sow Fennel, of which in Chap. 255. following.

III. Of the Vulgar or Common Garden Fennel, there are two sorts, viz. 1. *Feniculum majus vulgare*, The greater common Garden Fennel. But Celsapinus calls it *Feniculum sylvestre*: Camerarius in hortis says, that some took it to be *Hippomarathrum*; but that was a Mistake, as we shall shew in Chap. 254. 2. *Feniculum minus*, *Feniculum semine*

rotundo minore, Small fennel, or fennel with a smaller round Seed.

Fennel.

IV. The Descriptions. The first, or Common Garden Fennel, has a Root which is long and white, running down deep into the Ground, spreading it self out into several Branches: from this Root rise up divers round stiff Stalks, four or five feet high, which spread themselves out (at many of their Joints) into divers Branches of long Stalks, of fine, small, long, fibrous Leaves, smelling somewhat strong, but not unpleasant: and at the tops, on several Branches, there are Tufts or Umbles of small yellow Flowers, which turn into small, long, roundish-cornered, bitterish, greenish Seed, two always together, as in the other Umbelliferous Plants; which being ripe, and once dried, become of a sad grey color. Of this Plant there are truly two sorts, (tho' one Description does serve them both;) the one wholly with green Leaves; the other with reddish Leaves, or with reddish green Leaves, they not differing one from another in any thing else.

V. The second, or Small Fennel with smaller round Seed, in its Roots, Stalks and Leaves differs not from the former, but only that they are every way less, being much lower than it; and that the Umbles at the Heads of the Stalks are white, and the Seed which follows is less than the ordinary sort, being more like to *Carum* or *Caraway* Seed: the whole Plant, both in Smell and Taste, and in its Form and Manner of Growing, is the same with the other Common Garden kind.

VI. The Places. These Plants grow in all hot Countries, in Asia, Africa and America, and in some of the West India Islands, 'tis said, they feed their Cows with it: but with us in England it grows only in Gardens.

VII. The Times. They flower in June, July and August, and the Seed is ripe not very long after.

VIII. The Qualities. According to Galen, it is hot in the third Degree, and dry in the first: it is admirably Aperitive, Incisive, Anodyne, Carminative

tive, Digestive, Discutive, Suppurative and Traumatick; Neurotick, Stomatick, Pectoral and Hysterick; Emmenagogick, Sudorick, Alexipharmick, Analeptick, Galectogenetick and Spermatogenetick.

IX. *The Specification.* It is peculiar for healing Ulcers in the Lungs, helping against the Strangury, and to open Obstructions of the Womb and all the Urinary Passages, strengthening the Tone of all those Parts.

X. *The Preparations.* You may have therefrom, 1. *The whitened Leaves and Stalks.* 2. *A liquid Juice.* 3. *An Essence.* 4. *A Decoction of Leaves and Roots.* 5. *A Syrup.* 6. *A Powder of the Seed.* 7. *An Oil by Infusion.* 8. *A Balsam of the Leaves and Roots.* 9. *A Cataplasm of the Leaves.* 10. *A distilled Water from the Herb or Seed.* 11. *A Spirituous Tincture of the Seed.* 12. *An Acid Tincture of the same.* 13. *An Oily Tincture thereof.* 14. *A Saline Tincture of Herb, Root and Seed.* 15. *A Spirit.* 16. *An Oil distilled.* 17. *A Balsam.* 18. *Potestates or Powers.* 19. *An Elixir.* 20. *A fixed Salt.* 21. *A Liquor of Kennel.* 22. *The Gum.*

The Virtues.

XI. *The whitened Leaves and Stalks.* They are whitened after the same manner as you whiten *Curl-ed Endive*, or *Sallery* or *Smallage* Stalks, &c. being thus whitened, the *Italians* are said to take great delight in eating them as a Sallet, for then they are very tender, and pleasant to the Taste: they comfort and warm a cold Stomach, help to digest crude Hegmatick Humors bred from viscous Meats. *Kennel* being thus eaten, it breeds Milk in Nurseries Breasts, provokes Urine, and encreases the Seed; opens Obstructions, expels Wind, and provokes Urine. The constant eating of this whitened *Kennel* for some considerable time, I have known to cure a vehemently stinking Breath, and to make it as sweet as theirs which never smelt amiss.

XII. *The liquid Juice.* Mixt with a Glass of Wine or Ale, and so taken by Nurseries, it encreases Milk in their Breasts, expels Wind, provokes Urine, eases the Pains of the Strangury and Stone, expelling all the praternatural Matter in the Urinary Parts. It is said to break the Stone, more especially if it is made of a gritty Substance. Dose three or four spoonfuls Morning, Noon and Night in any fit Liquor.

XIII. *The Essence.* It has all the Virtues of the Juice; besides which, it encreases Seed, prevails against the Colick, eases the Tortions of the Bowels or Gripping of the Guts from acrid or sharp Humors, strengthens the Stomach, and causes a good Digestion. It opens all the Obstructions of Liver, Spleen and Gall, and thereby much conduces to the Cure of all such Diseases as arise from those Causes, as windy Swellings of the Spleen, Hepatick-flux, Yellow Jaundice. Being dropt into the Eyes, it cures almost all Diseases affecting that Part. It opens Obstructions of the Womb, and provokes the Courses effectually. Dose three or four spoonfuls.

XIV. *The Decoction of the Leaves and Roots, or Seeds, in Wine.* Tho' this has not altogether so much Force as the Juice and Essence, yet it is very good for all the same Intentions, and is much more used than either of them, because it is pleasanter; but then it must be taken in a much greater Dose. It is an excellent thing to open all Obstructions in the whole Body, to cleanse the Blood, to stop the Hicough, and take away Nauseating, to provoke Urine and the Menstrues, to amend the ill Color in the Face after a long Sickness, and to cause a good Habit thro' the whole Body. If such as are grown

over fat should often drink of it, it would lessen their Fat, abate their Flesh, and much remove their Unwieldiness, making them more nimble, agil and pleasant.

XV. *The Syrup.* It is one of the greatest of Pectorals; for as it is a powerful Opener of Obstructions of the Lungs, and Dissolver of their Tartar, so it famously causes Expectoration, and gives ease in Asthma's, Coughs, Colds, Hoarseness, Wheezing, Shortness of Breath, Difficulty of Breathing, and other like Difficulties of those Parts. If herewith you sweeten well either the Juice, Essence or Decoction, and let the Patient take two or three ounces three or four times a day, it cures Ulcers of the Lungs, or any Sourness of the Stomach, and much restores in Consumptions: in which last case it is good for the Patient to use a Milk-Diet, and to drink a quart of Milk warm from the Cow, well sweetned with this Syrup, every Morning fasting; as much Milk so sweetned at Eleven before Noon; another quart at Five in the Afternoon; and lastly, another quart at Bed-time in like manner. If the Patient cannot drink a whole quart, let him drink as much as he can; and continue this Course for several Weeks, or till he recovers; by this Method I have known several perfectly restored out of very deep Consumptions.

XVI. *The Powder of the Seed.* It strengthens the Stomach, gives ease in the Colicks, opens Obstructions, and helps Shortness of Breath. You may give it Morning and Evening from half a dram to two drams in any convenient Vehicle. The constant Use of it wonderfully strengthens the Sight.

XVII. *The Oil by Infusion or boiling.* It is Anodyne, and eases all sorts of Pains in any Part of the Body, coming from a cold and moist Cause. It gives ease also in Inflammations, by gently dissolving some part of the thinner Matter. If it is an Apoplemy, which will come to Suppuration, it hastens it, and brings it as much as may be to a point. It eases the Gout and other Pains of the Joints and Nerves.

XVIII. *The Balsam of the Leaves and Roots.* It is one of the greatest of Vulneraries, and cures simple Wounds at one Intention, for the most part at one Dressing. I am apt to believe, that this Balsam, for the Curing of Wounds and Ulcers, &c. is not inferior to any Balsam made of the greatest Wound-Herbs, as *Savicle*, *Self-heal*, *Cleovans Wound-wort*, *All-heal*, &c. It digests fordid and eating Ulcers, cleanses, incarnates, dries and heals after a very admirable manner.

XIX. *The Cataplasm.* It gives present ease in the Gout, being applied, as also dissolves and heals any simple Contusions; and applied as hot as can be endured to the Sides or Hypochonders, it eases the Pains of the Sides, takes away Stitches, and gives Relief to the Distempers of the Spleen and Parts adjacent.

XX. *The distilled Water.* It is of good Use, as a Vehicle, to convey other Preparations of this Plant in, and has all the Virtues of the foregoing Preparations, but in a much lower degree: it is used to be dropt into the Eyes against Ophthalmies or Inflammations and Blood-shot, as also against hot and sharp Rheums, with which the Eyes are commonly afflicted, which causes Clouds, Films, Pearls, &c. to breed in them; but it is better for all those Purposes, if white Sugar-Candy or clarified Honey be dissolved therein; then if ulcerated, it cleanses the Ulcer or Sore, prevents the Afflux of Rheum, dries and heals them.

XXI. *The Spirituous Tincture of the Seed.* It is famous against Pains, Aches and Sickness of the Stomach, Pains of the Spleen and Womb; it gives ease

eafe in the Colick, and prevails againſt the Yellow Jaundice. You may take from two drams to four in a Glaſs of White Port Wine, at time of Extremity, otherwiſe Morning and Night, ſo long as Need requires. Bathed upon places affected with the Gout or Sciatica, Cramps or Conвуlſions, in a ſhort time it gives Eaſe and Relief.

XXII. *The Acid Tincture.* It cures præternatural Vomiting, Nauſeating of Food, want of Appetite and Digefſion, the Colick and the Gout, when by conſent it afflicts the Stomach; it warms and wonderfully corroborates that Bowel, reſtoring and ſtrengthening its Tone, tho' very much depraved. It is powerful againſt the Bitings of mad Dogs, Vipers, Rattle-Snakes, and all other Serpents and venomous Creatures whatſoever: and after a ſingular manner prevails againſt Athma's, and all forts of Obſtructions of the Lungs, inciding, diſſolving and cauſing an Excretion of the tartarous Matter affecting them. Doſe ſo many drops as to make the Vehicle gratefully pleaſant in all the Patient drinks.

XXIII. *The Oily Tincture.* It prevails againſt Cramps and Conвуlſions of the Nerves, is powerful againſt the Colick, and all Obſtructions of the Reins, Ureters and Bladder, whatſoever, breaking any gritty Stone in thoſe Parts, and cauſing it, as alſo Sand, Gravel and tartarous Matter to be expelled by Urine. Bathed upon the Back-bone, and upon the Parts affected with the Palfy, it is very effectual in the Cure of that Diſeaſe, but then you muſt anoint therewith Morning and Night, rubbing it very well in for a conſiderable time. It gives preſent eaſe in the Gout and Sciatica proceeding from a cold Cauſe, and by a conſtant Application thereof many times cures thoſe Diſeaſes. Inwardly, to give Relief againſt Stone and Strangury, you may take from ten drops to thirty in any fit Vehicle.

XXIV. *The Saline Tincture.* It is good againſt Strangury, Stone and Gravel, being given a dram or more at a time in White Lisbon Wine. Outwardly bathed upon Parts affected with Herpes, Tetters, Ringworms, Pimples, Redneſs, Yellowneſs, Tawineſs, Blackneſs or Blewneſs of the Skin, as alſo Scurf, Morpew, Scabs, Leproſy, Freckles, Lentils, &c. it quickly takes them away and cures them, being uſed two or three-times a day.

XXV. *The Spirit from the Seed, or Juice fermented.* It is a ſingular Stomack and Cordial, it reſreſhes, comforts and ſtrengthens the Stomach after an admirable manner, taking away Vomiting, Nauſeating, want of Appetite and Indigefſion, &c. It cheers the Heart, revives the Spirits, fortifies the whole Habit, and makes the Body able to withſtand Diſeaſes. It ſingularly expels Wind, and gives eaſe in all gripping Pains in the Stomach or other Viſcera. It may be taken to one ſpoonful or two, either alone or it ſelf (being dulcified) or mixt with a Glaſs of Wine, every Morning faſting.

XXVI. *The Oil diſtilled out of the Seed.* It has all the Virtues of the Juice, Eſſence, Decoction, Syrup, Pouder, Tinctures and Spirit, and much exceeds them all in its Potency and Might of its Operation. It may be given from four drops to twelve, ſixteen or twenty, according to the Age, and as the Neceſſity of the Occaſion may require. In the uſing of it, drop it firſt into white Sugar, and mix them well together; then mingle all in a Glaſs of Wine, and ſo drink it off. This may be done Morning and Evening, or at the time of any Paroxyſm, ſo long as you ſee need. Outwardly anointed upon the Wound or Puncture of a Nerve, it gives immediate Eaſe and Relief, anointed down the Back-bone, and upon the Parts affected with a Paralyſis Morning and Evening, it wonderfully reſtores the Paralytick Parts, and in a little time after compleats the Cure.

XXVII. *The Balfam.* This Balfam is twofold, 1. *Balfamum Feniculi Vulnerarium.* It is thus made: Take of Balfam Capivi three ounces, Balfam of Peru, Beef-ſuet, of each an ounce and half, Chymical Oil of Fennel-ſeed one ounce, fine Bees-wax half an ounce: melt, mix, and make a Balfam. It is one of the beſt of Balfams for green Wounds, eſpecially thoſe of the Nerves and Tendons, and commonly cures ſimple green Wounds at once Dreſſing. 2. *Balfamum Pectorale.* It is thus made: Take choice Oil of Nutmegs by Expreſſion four ounces, Balfam of Tolu, Chymical Oil of Fennel-ſeed, of each one ounce, Balfam of Peru and Capivi, of each half an ounce; melt, mix, and make a Balfam. It is an excellent Pectoral; and being taken to the quantity of a Nutmeg at a time, it not only helps againſt Colds, Coughs, Catarrhs, Hoarſeneſs, Wheezing, Shortneſs of Breath and Difficulty of Breathing, but alſo cures Ulcers in the Lungs. It may be taken Morning and Evening. It alſo heals, by ourward Application, Wounds of the Nerves and Tendons, and eaſes and takes away any Ach or Pain proceeding from a cold Cauſe, in any Part of the Body, being anointed upon the Parts affected Morning and Evening.

XXVIII. *The Potefſates or Powers.* They have all the Virtues of Juice, Eſſence, Decoction, Tinctures, Spirit and Oil, and are alſo more volatile and ſubtil than any of them; for which Reaſon they more effectually pierce any Part they are applied to. Inwardly you may give from one dram to three in any ſpecifick Vehicle. Outwardly you may bathe any pained, numbed or Paralytick Part with the ſame twice a day, rubbing the ſame well in.

XXIX. *The Elixir.* As this is the Powers ſtill more fortified, ſo it is more efficacious in Operation, and may be given to all the Intentions and Purpoſes for which the Potefſates are given. You may give from one dram to two in a Glaſs of Wine, Morning and Evening; and in caſe of a Paroxyſm or any great Neceſſity, at the ſame time. It is one of the greateſt of all Pectorals, and therefore profitable againſt all Diſeaſes of the Lungs from a cold and moiſt Cauſe; and being given in a moiſt vehement Colick, it gives immediate Eaſe; provokes Urine, and prevails againſt the Strangury.

XXX. *The fixed Salt.* It admirably abſorbs Acids in the Stomach and Lungs, deſtroys the Tartar of the Lungs, Reins, Bladder and Joints, and therefore prevails againſt all ſuch Diſeaſes as proceed from that Cauſe. It is alſo peculiar in opening all Obſtructions of the Viſcera, and in particular thoſe of the Womb. Doſe from ten grains to a ſcruple or more in any fit Liquor.

XXXI. *The Liquor of Fennel.* It is made two ways: 1. Take the green Stalks of Fennel towards the end of Summer, and whiſt green put one of their ends into the Fire, which hold there for a little while, ſo will a certain Liquor drop out therefrom at the other end, which receive and keep for Uſe. It is a very good thing for the Eyes, for it ſtops any Rheum or Deſluxion, heals Blood-ſhor, and clears the Sight from any Miſts, Clouds or Films. 2. Cut a hole in a green Fennel Stalk as it grows, about a foot or more from the Ground, near the upper part of the Joint, and put therein white Sugar-Candy in fine powder, as much as it will hold, then ſtop it cloſe up with Wax, and Leather tied over it, ſo as no Rain or Wet may fall into it: when it has remained three or four days or more, place a good piece of ſoft Wax a little below the lower Joint of the ſame Internode, ſo formed as that it may make a little hollow Gutter; and a little above this Gutter, at the lower part of the Joint, cut another hole, ſo will a Liquor diſtil therefrom,

Y y

which

which, by means of the Gutter, you may receive in a Vessel, which keep for Use. This has all the Virtues of the former, and full as beneficial for sore, blood-hot, dim, cloudy and blemished Eyes as the other, being dropt into them three, four, five or six times a day, as you see need requires.

XXXII. *The Gum of Fennel, or its Infusate Juice.* It has all the Virtues of the liquid Juice, and may be given from one dram to two, dissolved in any specifick Liquor or Wine. If this Gum or Juice is dissolved in some of the distilled Water, and sweetned a little with white Sugar-Candy, and it is given to Nurfs to drink, it breeds much Milk in their Breasts: and if it is dropt into the Eyes, it very much clears the Eyes from Clouds, Mists, Films, Blood-hot, and other like Matters which obfuscate the Sight. In Southern Climes, and very hot Countries, if Fennel-Stalks are wounded whilst they are green and growing, the Juice will exudate and become this natural Gum: but in our cold Countries, it yields not to this Operation; therefore we are obliged to make the Juice by Expression; and then to inspissate it by a gentle Evaporation on a Sand Heat, till it is perfectly dry.

CHAP. CCLIII.

OF FENNEL Sweet.

I. **THE Names.** It is called in *Greek*, Μαγδον; in *Latin*, *Feniculum dulce Matthioli*, *Feniculum vulgare Lugdunensis*; and in *English*, Sweet Fennel.

II. *The Kinds.* It is the second general Species of the *Fennels*; but differs in Sweetness according to the Country in which it grows.

III. *The Descriptions.* This in its Roots, Stalks, Leaves, Flowers and Manner of Growing, is perfectly like our Common Fennel, excepting that it neither in Foreign Climates, where it grows naturally, nor yet here with us in England, does grow so large, or rise to so great a height as the Common large Garden kind does: and with us it with some difficulty endures the Hardness of our Winters; but the Seed of this is much larger and longer than that of the Common kind, yellower, and very much sweeter in Taste, coming near to the Sweetness of Aniseed, which so continues in hot Countries, but holds not out any long time to that Perfection; neither as to its Magnitude, Color or Sweetness; but decaying yearly, does at the third Years Sowing yield as ordinary Seed as the Common kind.

IV. *Nota. 1.* From this you may observe, that it is the Clime and change of Soil which causes this Alteration, making it either larger or smaller, longer or shorter, yellower or paler colored, and makes it to be either sweeter or bitterer in Taste; which Change of Accidents has made some think, that there were divers sorts of this Sweet kind, whereas indeed there is no more than one.

V. *Nota. 2.* There is a kind of Fennel, which the *Italians* call *Carduus Fennel*, and which they would make different from this Sweet kind; but it is no such thing, for it is only the Art of ordering it, which seemingly makes the Difference from this Sweet, which is done by Transplanting and Whitening it, by which means the Leaves are made to grow much more thick and bushing together than the Ordinary, the Whitening of it also giving it a sweeter Relish, a pleasanter Taste, and a shorter Crispness in eating.

VI. *The Places.* It grows universally in almost all hot Countries; and flourishes well enough in our Gardens, being sown with Foreign Seed every Year, where the Seed it self comes to Perfection, but you ought to sow every Year new Foreign Seed, not the Seed of the English Production, because that is very apt to degenerate.

VII. *The Times.* It flowers and seeds with us in July and August, and if it is an early and warm Spring, towards the latter end of June; and the Seed is ripe in August or September.

VIII. *The Qualities, Specification, Preparations and Virtues* of this, are the same with the Common Fennel in the former Chapter, saving that this is accounted the more excellent and efficacious of the two; and therefore to the Discourse and Sections of the former Chapter I shall wholly refer you.

CHAP. CCLIV.

OF FENNEL Wild,

OR,

HORSE-FENNEL.

I. **THE Names.** It is called in *Greek*, Μαγδον; in *Latin*, *Marathrum agrestis*, *Feniculum sylvestre*, *Hippomarathon*; and in *English*, Wild Fennel, and Horse Fennel.

II. *The Kinds.* It is the third Species of Fennel, and is threefold, viz. 1. *Feniculum sylvestre communis*, *Feniculum erraticum Matthioli*, The vulgar or

or common Wild Fennel. 2. *Feniculum sylvestre* Creticum, *Hippomarathrum Creticum*, *Honorii Belli*, *Platycnino Creticum*, Great or Horse Fennel of Candy. 3. *Hippomarathrum sphaerocephalum*, Great round-headed Horse Fennel. *Anguillara* supposes the first of these to be *Hippomarathrum verum*.

III. The Descriptions. The first, or Common Wild Fennel, has a Root like to the Common Garden kind, and grows up with great Stalks, but fewer than it, having also but few Leaves, and those very thinly set thereon, but somewhat stiffer or harder in handling, and shorter also. At the tops of the Stalks grow small Umbles of yellow Flowers, not much unlike the Common, saving that they are lesser, which being pass'd away, the Seed follows, being small and a little roundish.

IV. The second, or Great Horse Fennel, has a great whitish Root, not much unlike the former, from whence springs up a round, but crested Stalk, three, four or five feet high, about the Thickness of ones middle Finger or Thumb, having very fine Leaves thereon, but shorter than the Ordinary sort. This Stalk is divided into several Branches, bearing at their tops Tufts or Umbles of yellow Flowers, which being pass'd away, there comes in their places great, large, and almost round Seed. This is the Plant which *Bellus* makes mention of in his first Epistle to *Clusius*, which is extant in the end of his *History of Plants*, whose Seed, as he there says, is as large as those of *Cachrys* or *Canchrys*, Herb Frankincense, nearly as big as *Hordea Decorata*, or Hull'd Barley.

V. The third, or Great round-headed Horse Fennel, has a Root which is long and white, and endures many Years; from whence rise up large Stalks, four or five feet high, with Fennel like Leaves, and spreading themselves forth towards the tops into many Branches. At the tops of which Branches grow round, Globe like Umbles of Flowers, of a purplish Violet color, which being pass'd away, there comes in their places large Fennel like Seeds, but of a very

strong Smell, almost stinking. This Plant is taken notice of by *Alpinus libro de Exoticis*.

VI. The Places. They all grow naturally in hot places, as *Turkey*, *Barbary*, *Spain*, *Italy*, &c. The first was brought to us out of *Spain* by *Boel*; and the rest grow well in our Gardens, being raised from the Seed brought to us out of their native Countries.

VII. The Times. They all flower in the end of Summer and beginning of Autumn, as in *July*, *August* and *September*; and the Seed is ripe not very long after.

VIII. The Qualities, Specification, Preparations and Virtues of all these, are the same in all respects with those of our Common English Garden Fennel in Chap. 252. foregoing; so that nothing more need be said of them. Authors say, that these Wild Fennels are hotter and stronger than the Common Garden or Sweet Fennel, and therefore more powerful against the Stone, but not so effectual to encrease Milk in Nurses Breasts, because dryer in Quality. *Bellus* says, that in *Candia* they use the Seed of the second sort to Dye their Hair yellow.

C H A P. CCLV.

Of FENNEL Hogs,

O R,

SULPHUR--WORT.

THE Names. It is called in *Arabick*, *Harbatum*: in *Greek*, *ἡσυχιδας*: in *Latin*, *Feniculum Porcinum*, *Pencedanus* and *Peucedanum*; by *Apuleius*, *Pinastellus*, (I suppose from its Pitchy Smell;) and in *English*, *Hogs Fennel*, *Sow fennel*, *Hoar-strange* and *Sulphur-wort*.

Y y 2

II The

II. *The Kinds.* Authors make generally three kinds of this Plant, viz. 1. *Peucedanum vulgare*, *Peucedanum Germanicum* *Ferdini*, *Peucedanum Tragis*, *Fuseli*, *Dodonaei*, & *aliorum*; *Feniculum Porcinum*, *Caula Porcina* *Tabernmontani*, Common or Ordinary Hogs Fennel. 2. *Peucedanum Matthioli*, *anguillare* & *aliorum*, *Peucedanum majus*, & *magus* *Italicum* *Lobellii* & *Lugdunensis*, The greater Hogs Fennel. 3. *Peucedanum minus*, *Peucedanum Jacie*, *perpusilla* *Lobellii*, *Peucedanum Pannonicum* *Clusii*, Small Hogs Fennel: this both *Bauhinus* and *Clavius* suppose to be the *Saxifraga secunda* *Matthioli*.

III. *The Descriptions.* The first, or Common Hogs Fennel, has a Root thick and long, sometimes almost as large or thick as a Man's Thigh, black without and white within, of a strong and sulphureous Smell, and full of a yellow Sap or Milk, which being extruded, quickly grows hard and dry, smelling not much unlike to Sulphur or Brimstone, which induced some to call it Sulphur-wort, having also at the top, towards the upper Face of the Earth, a certain Bush of Hair, of a brown color; from among which the Leaves and Stalks do spring up. From this Root then, springs up a stiff and hard Stalk, full of Knees, Knots or Joints, beset with Leaves, like to Fennel, but greater, coming nearer to *Ferula*, or rather like to the Leaves of the Wild Pine-tree, (from whence, as also from the Smell, might come the Name *Pinastellus*.) At the tops of the Stalks grow round spiky Tufts, full of little yellow Flowers; which being pass'd away, do turn into broad brown Seed.

IV. The second, or Great Hogs Fennel, has a Root growing great and deep into the Earth, with many other Branches and Fibres about them, having a strong Smell, like hot or melted Sulphur, which being cut, yields forth a yellowish Milk or clammy Juice, almost like to a Gum. From the Head of this Root proceeds several long branched Stalks, of thick and somewhat long Leaves, three for the most part joined together at a place; among which rises up a crested Stalk, stait, and near as thick as a Common Fennel Stalk, with some Joints thereon, and Leaves growing thereat; towards the top of which it spreads it self out into several Branches, and on the tops of the Stalk and Branches, grow several Tufts of yellow Flowers, which being pass'd away, there comes somewhat flat, thin and yellowish Seed, twice as large as Fennel Seed.

V. The third, or Small Hogs Fennel, which is the Dwarf kind, has a Root about the Bigness or Thickness of a Man's Thumb, sometimes greater, sometimes lesser, with a Bush of Hairs at the top, blackish or brownish on the outside and whitish within, with a thick Bark, of a pleasant sweet Taste at first, and afterwards sharp: the whole Plant is less than the first kind before described, having smaller and shorter Leaves, of a blewish green color, of a little bitter Taste, but almost of no Smell. The Stalk is slender and round, about half a yard high, which spreads it self into several Branches, at the tops of which grow small Tufts of white Flowers in an Umbel; which being pass'd away, there succeeds thick short Seed, almost like Parsley Seed, but of an Ash color, and of a bitter sharp Taste.

VI. *The Places.* The first grows in many places of this Kingdom, as in the salt low Marthes near *Faversham* in *Kent*, and in the Meadows adjoining, where it is found plentifully; also on the South side of a Wood belonging to *Waltham*; at the Naze in *Essex*, by the Highway side; also at *Whistable* in *Kent*, in a Meadow near to the Sea side, some time

belonging to Sir *Henry Crisp*, and adjoining to his House there. The second grows upon the Sea Coasts of *Italy*, *Spain* and *France*, and is only found with us in Gardens. The third was found on *Vincent's Rock* by *Bristol*, where *Lobel* gathered it, and some others: as to this third kind, *Gerard* says, that it grows not above a foot high, and is in Shape and Leaves like to the True *Peucedanum*, or our first kind: but *Johnson* (the successive Author of that Herbal) says the Stalk is about half a foot high, divided into sundry Branches, crested, broad, bearing at their tops little Umbles of white Flowers, consisting of five Leaves apiece. The Reason for these various Differences, as to the Height of the Stalk or Plant, I suppose must be from the Variety of the places where it grows, and from the Richness or Poverty of the Soil, which makes many Plants differ in that Respect, making one and the same Herb to be sometimes greater, sometimes lesser.

Dwarf Hogs Fennel

VII. *The Times.* They all flower in the end of Summer, viz. in *July* and *August*, and the Seed is ripe soon after.

VIII. *The Qualities.* Hogs Fennel is hot in the second Degree and dry in the third: it is Attractive, Astringent, Cleansing, Anodyne, Carminative and Traumatick or Vulnerary; Cephalick, Neurotick, Pectoral, Hysterick and Arthritick; Cathartick, Ptarmick and Alexipharmick.

IX. *The Specification.* It is singular good against Asthma's, Strangury, Fits of the Mother, and Obstructions of the Spleen.

X. *The Preparations.* You may have therefrom, 1. A liquid Juice of the Root. 2. An Infusate Juice. 3. A Decoction of the Root in Wine or Water. 4. A Powder of the Root. 5. A Cataplasme. 6. A Balm. 7. A Spirituous Tincture. 8. An Acid Tincture. 9. An Oily Tincture.

The Virtues.

XI. *The liquid Juice of the Root.* If it is mixed with a little Vinegar and Rosewater, or with a little *Euphorbium* in fine powder, it makes a good Er-rhine

rhine to purge the Head of pituitous, cold and moist Humors, and so does good to those who are troubled with the Megrin, long and inveterate Headachs, Vertigo, Lethargy, Epilepsy, Apoplexy, Phrensy, Madnefs, Palfy, and most other Difeases of the Nerves and Tendons. Given to two or three spoonfuls in a Glafs of White *Lisbon*, it purges the Belly gently, expels Wind, dissolves the Hardnefs of the Spleen, and eases the After-pains of Women in Child-bed.

XII. *The Inspissate Juice.* It has all the Virtues of the Liquid, being dissolved in Wine or Water, and used in the same manner: dissolved in Wine and dropped into the Ears, it eases the Pains in them, and put into an hollow Tooth, it eases the Pain thereof: dissolved in Water, and given to such as are troubled with Vapors or Fits of the Mother, it cures them: dissolved in Wine to the Thicknefs of Turpentine, it cures the Ruptures of Childrens Navels when they stick forth, being applied with good Bandage: and given to one or two drams, dissolved in White *Lisbon* or Port Wine, it provokes the Terms in Women, and facilitates the Birth, brings forth both Child and After-birth.

XIII. *The Decoction of the Root in White Lisbon or Port Wine.* It has all the Virtues of the liquid and inspissate Juices, but in a much less degree of Efficacy: sweetened with Honey or Sugar-Candy, it is good for Coughs, Colds, Catarrhs, Asthma's, Shortness of Breath and Difficulty of Breathing, expels Wind, and gives ease in the Colick. Dose four, six or eight ounces three or four times a day. It is a good Lotion to wash moist running Sores withal, for it cleanses and dries them, strengthens the Part, and induces the Healing.

XIV. *The Powder of the Root.* Being put into inveterate and foul Ulcers, running Sores, and such like of difficult Cure, it cleanses them thoroughly, removes any Splinters of broken Bones, or other things in the Flesh, strengthens the Part admirably against Defluxions, dries them, induces their Cicatrizing, and perfectly heals them; and therefore is also of extraordinary Use to be put into such Ointments and Balsams as are Vulnerary, and applied to the Cure of stubborn and rebellious Ulcers, Fistula's, and the like. This Powder being taken to a dram or more, mixed with the Seed of *Garden Rue* half a dram, and taken in Wine and Water mixt, or in Water alone, it allays Vapors from the Spleen and Womb, and cures Fits of the Mother.

XV. *The Cataplasim.* It is good to be applied to the Bitings of mad Dogs, Vipers, Rattle-Snakes, and other Serpents and venomous Creatures; for by its powerful attractive Force, it draws forth all the Venom and Poyson from the Part, and secures the Life of the Patient: but this is to be understood, that it must be made of the green Root beaten to a Pulp, and it will be so much the better, if half the quantity of *Garlick* be added to it, and also that it be applied to the Wound whilst it is recent, or presently after it is made. This Cataplasim draws forth likewise Thorns, Splinters, and such like things which are got into and stick in the Flesh; and it is good against Pains and Aches of the Joints, or any other Parts, proceeding from Cold and Moisture.

XVI. *The Balsam.* It is good for cleansing, drying and healing of old Sores, putrid and fetid Ulcers, and the like, in any Part of the Body. It is an excellent thing against the Sciatica and Gout, whether in Hands, Arms, Legs or Feet; and gives ease in any other Pain, as also in Tumors or Swellings, bringing Apoptems to Suppuration in a little time: it warms, comforts and strengthens any Part debilitated thro' Cold, or a Flux of Humors upon the same.

XVII. *The Spirituous Tincture of the Root.* It powerfully warms and comforts a cold Stomach, cleanses and incalidates the Womb, facilitates the Birth, and brings both it and the After-birth away. It is good against fainting and swooning Fits, and all cold and moist Distempers of the Head, Brain and Nerves, as Vertigo's, Apoplexies, Epilepsies, Lethargies, Convulsions, Palfies, and the like, being inwardly taken, and outwardly applied to the Parts affected. Dose from one to two drams in some specifick Vehicle Morning and Night.

XVIII. *The Acid Tincture.* It cures Nauseousness and Vomiting, and so absolutely strengthens a weak Stomach, that there are for that purpose but few things better. It is a singular thing to suppress Vapors and the Fits of the Mother, expels Wind, and gives ease in the Colick. Bathed upon places affected with the Gout for some time, it absolutely cures it. It causes a good Appetite and a strong Digestion, rectifies the Distrally of the Blood and Humors, purifies them, and absolutely cures the Scurvy, whether in a hot or cold Habit of Body. Dose so many drops at a time as may make a Draught of Wine, Beer or Ale pleasantly acid.

XIX. *The Oily Tincture.* It cures Difeases of the extrem Parts arising from Cold and Moisture, strengthens the Nerves and Tendons, being anointed upon the Parts affected, and is a truly noble thing against Convulsions and Palfies. It opens Obstructions of the Reins, and cleanses the Ureters and Bladder from Stones, Gravel, Sand and tartarous or viscid Matter adhering to them, and gives present Relief in the Strangury: it also represses the Fits of Agues, being given in some fit Vehicle two hours before the coming of the Fit. Dose from ten to twenty drops or more in a Glafs of generous Wine, being first well mixt with white Sugar, and that Morning and Night.

C H A P. CCLVI.

Of FENUGREEK Garden.

I. *THE Names.* It is called in *Arabick*, *Olba*, *Hebbe* and *Helbe*: in *Greek*, *Thaps* by *Dioscorides*; *Βύσσος* by *Theophrasti*, a *Cornu similitudine five sit Capri vel Bovis*, the crooked Seed-Vessels being so like to their Horns; *μαστίνος, ἡ δροκίτης Hippocratis*: in *Latin*, *Fenugræcum*, *Fenum Græcum*, for that *Columella lib. 2. cap. 11.* says the *Greeks* had two times of sowing it, the one before Winter, to be Fodder for their Cattel, the other in February, for Seed; for which Reason he calls it, *Silicula*; *Pliny* calls it, *Silicia*; and *Varro*, *Silicula*: in *English* we call it, *Fenugreek*, which is as much as to say, *Greek Hay*.

II. *The Kinds.* They are principally two, viz. 1. *Fenugræcum sativum*, Garden Fenugreek, of which in this Chapter. 2. *Fenugræcum sylvestre* Wild Fenugreek, of which in the next.

III. *The Description.* It has a Root which is small, and made of many Fibres, perishing every Year after it has perfected its Seed, before Winter: from this Root spring forth sometimes but one, sometimes two or three long, slender, trailing, hollow, green Stalks, which spread themselves out into several Branches; on which do grow, at several spaces, many Leaves, almost like those of the Meadow Trefoil, but rounder and lesser, green on the upper side, but tending

tending to an Ash color or grey on the lower side; they are always three set together on a root stalk, almost round at the ends, and a little dented about the edges. From the Joints of the Stalks, with these Leaves, come forth small white Flowers, not much unlike to *Pease* Blooms, but much less; which being passed away, after them, follow long, slender, narrow, flattish, crooked Cods or Horns, small or sharp pointed, in which are contained small, uneven cornered Seeds, of a yellowish color; which being dried, have indeed a pretty strong Smell, but not unpleasant.

IV. *The Places.* It grows almost in all parts of the World: in Foreign Countries they sow whole Fields of it, for Fodder for their Cattel; but with us it is only sown in Gardens, and yet it grows as well here as in any other place.

V. *The Times.* In Foreign Nations they sow it for Seed in the end of *January* or beginning of *February*; but we in *England* sow it not until *April*; and it flowers with us in the beginning of *July*, and the Seed is ripe in the end of *August* or beginning of *September*: but for Food for Cattel, it is sown before Winter, as is before hinted.

VI. *The Qualities.* *Galen* says it is hot in the second Degree and dry in the first: it is Aperitive, Cleansing, Aftringent and Vulnerary; a good Pectoral and Hyfterick; and withal Cathartick, purging away gross Humors.

VII. *The Specification.* It is peculiar against the Dyfentery and other Fluxes of the Bowels, as also a Gonorrhœa.

VIII. *The Preparations.* You may have therefrom, 1. *The prepared Pulse* or Seed. 2. *A Decoction in Wine.* 3. *A Bath.* 4. *A Meal.* 5. *A Mucilage.* 6. *An Oil.* 7. *A Cataplasim.* 8. *A Juice from the Leaves.*

The Virtues.

IX. *The prepared Pulse.* They bury it a while in Earth or Sand till it sprouts a little, to make it sweet; then it is carried to the Market to be sold

for Food. This, says *Alpinus*, the *Egyptians* eat; and *Galen* says it was used (among the *Grecians*) in his time, for that it makes such as eat it to grow fat, and therefore is thought to cure Consumptions, and to be good for Consumptive People. Those *Eastern* People did use to eat it as they did *Lupins*, for that it was more agreeable than *Lupins*, having nothing in its own proper Substance which is obnoxious: sometimes the Pulse is preserved in Pickle, and so eaten to keep the Body soluble.

X. *The Decoction in Wine.* It mollifies the Hardness of the Spleen and Womb, and eases the Pains of those Parts, opens their Obstructions, and is good against Hypochondriack Melancholy, makes smooth the Bowels, and helps the Disease called *Tenismus*, which is a desire often to go to Stool, without doing any thing. It prevails against a Dyfentery or Bloody-flux, and all other Fluxes of the Bowels. Applied to the Forehead with Cloths dipt therein, it stops the Flux of Humors to the Eyes, eases their Pains, and rakes away their Inflammation. Used also in Clysters, it is said to be good against the Stone, by opening and mollifying the inward Parts. It cures Ulcers in the *Intestinum Rectum* and the other Guts: drunk to the quantity of half a pint, it purges and cleanses the Stomach of gross and evil Humors. If the Decoction is made with Dates and Honey, it mundifies or cleanses the Breast and Lungs, causes Expectoration, and heals Ulcers of those Parts. The Decoction being made in Wine or Water, and given inwardly half a pint or more at a time, Morning and Night, for some days together, cures a Gonorrhœa. *Alexis.*

XI. *The Bath.* It is made by boiling the Seed in Water till it is broken. If Women sit in it as hot as they can endure, it opens Obstructions of the Womb, and (if it be about the time) provokes the Terms. Bathed upon Parts affected with the Gout, it eases the Pain thereof, and removes Aches which come of Cold: it is also good to wash the Hair and Head, and to cleanse it from Scurf, Morpew and dry Scabs. It heals Ulcers of the Womb, strengthens the Part, cleanses, dries and restores its Tone.

XII. *The Meal or Powder.* Taken to two drams mixed with a little Honey, it is Pectoral, and causes an Excretion of many pernicious Humors which lodge in the Stomach and Guts, maturates inward Apotems, cleanses Ulcers in the Breast and Lungs, and heals them, and eases the griping Pain of the Bowels: but in some People it is apt to overturn the Stomach or cause a Loathing, especially in such as are weak and tender; but troubles not such as have strong Stomachs, as have most of your robust Country People.

XIII. *The Mucilage.* Applied to the Joints, it gives ease in the Gout and other like Pains. Applied to the Forehead with Cloths dipt therein, it stops Fluxes of Humors to the Eyes, eases their Pains and Inflammations. Taken inwardly with Honey, it is Pectoral, and causes an Expectoration of thick, tough and gross Humors out of the Breast and Lungs, and is profitable against Coughs, Colds, Catarrhs, Asthma's, and other Diseases of those Parts.

XIV. *The Oil, made by Expression or Insolation.* *Label* says it is of more Virtue than will be believed; and that it is good to dissolve hard Tumors or Kernels, disperse scirrhus Swellings, mollifies the Intrails, Womb and other Parts, removes Scurf and Morpew, and cleanses, dries and heals Ulcers of the privy Parts.

XV. *The Cataplasim.* It is always made of the Meal, mixed with other proper Ingredients. If it is made by boiling it to a Thickness with Mead, it is

is Emollient, and waxes away hard Swellings. If it is made with Vinegar and Nitre, it cools all manner of Inflammations, softens hard Tumors, and causes them to waste away, it eases the Pain, and softens the Hardness of the Spleen. Applied to the running Sores of the Head, called *Axcess*, *Achores*, it cleanses, dries and heals them: and if it is also applied to weak and feeble Parts, whether ulcerated or not ulcerated, it strengthens them; and if ulcerated, cleanses, dries and heals them. Made with Linseed and Marsh Mallow Roots, it is an excellent Emollient, and also a Maturative, where the Tumor will be brought to Suppuration. The Meal beaten up with Goose-Grease made into a Pessary, and put up the Womb, softens the Hardness thereof, opens its Obstructions, and mollifies all the Parts adjacent to it. Made into a Cataplasim, by boiling it up with the best White Wine Vinegar, and applied to the Testicles, it is an excellent thing to soften and abate any hard Tumor or Swelling there, and to ease the Pains thereof. Applied also to the Joints, it eases the Pains of the Gout.

XVI. *The liquid Juice of the Leaves.* Physicians seldom use any thing of this Plant besides the Pulse or Seed; yet Experience has informed us, that if the Juice of the Leaves is taken with Honey, that it purges the Body by Stool from all corrupt and obstructive Humors, cleanses the Stomach and Bowels, and by reason of its mucilaginous Substance, alleviates the Sharpness of the Juices, and eases the Tortions of the Guts: and by reason of its cleansing and scouring Faculty, it expectorates tough and sharp Humors out of the Breast and Lungs: this it more effectually Performs, if it is made into a Lochoch, with Pulp of fat Dates.

C H A P. CCLVII.

Of FENUGREEK Wild.

I. *THE Names.* It is called in Greek, *Τάρις*; *ταρις*: in Latin, *Fenum Græcum sylvestre*; and in English, Wild Fenugreek.

II. *The Kinds.* It is twofold, viz. 1. *Fenum Græcum sylvestre majus*, The greater Wild Fenugreek. 2. *Fenum Græcum sylvestre minus*, The lesser Wild Fenugreek.

III. *The Descriptions.* The first, or Greater Wild kind, has a Root which is thick, tough and pliant, having some Fibres adjoining thereto, from which spring forth several Stalks, which are round, and spread themselves forth into many Branches, which are full of Knees or Joints, not much unlike to the Garden kind. From each Joint proceeds a small tender Foot-stalk, upon which do grow three Leaves, and no more, somewhat snipt about the edges, like as the former, or somewhat like to those of Saint Foin or Burgundy Hay: and from the same Joints also come forth small yellow Flowers, like unto the Manured, which stand more together at the end, bringing forth small long Cods, like those of the Garden, and which contain within them smaller and darker Seed.

IV. *The second, or Lesser Wild kind, has a tough creeping Root, with some Fibres thereat; from the Head of which Root rises up but one slender Stalk, and but seldom branched, of about a foot high, and scaly, as it were, at the bottom; upon which does grow such like Leaves as the former; and at the*

Joints Flowers like to those of the Garden kind, but which were lesser, and also standing single; which being pass'd away, Cods or Horns succeed, which are broader and more flat, and ending in a small Thread, in which is contained the Seed, which is also less.

V. *The Places.* They both grow Wild in Spain and Italy, but with us are only nurs'd up in Gardens.

VI. *The Times.* They flower with us in July, and the Seed is ripe in August or September.

VII. *The Qualities, Specification, Preparations and Virtues* of these, are not declared by any Author; but if one may make a Judgment by the Form, Smell, Taste, Substance and mucilaginous Properties of the Herbs and their Seed, they differ not from those of the Garden kind in Chap. 256. foregoing.

C H A P. CCLVIII.

Of FERN Male.

I. *THE Names.* This Plant is called in Arabic, *Sarax*: in Greek, *Πτερίς ♂ Πτερίων*, because the Leaves are like to the Wings of Birds: in Latin, *Filix*; and in English, Fern.

Mal Ferne

II. *The Kinds.* There are many kinds of Fern, as, 1. *Filix Mas*, called by Nicander in *Theriacis*, *Βάριον*, & *Βάριον*, Male Fern, (and yet this very Species *Angulata*, *Casalpinus* and *Gesner* call *Femina*) of which we shall treat in this Chapter. 2. *Filix Femina*, Female Fern, of which in Chap. 259. 3. *Filix Querna*, Oak Fern, of which in Chap. 260. 4. *Filix Saxatilis*, Rock or Stone Fern, of which in Chap.

Chap. 261. 5. *Filix Florida, Aquatica, vel palustris*, Water Fern, or Osmund Royal, of which in Chap. 262. To these you may add, 6. *Polypodium, Filicula, Polypodie*. 7. *Lonicitis aspera*, Rough Spleen-wort, or Elfridges Fern. 8. *Asplenium ceterach*, Smooth Spleen-wort; of all which in their proper places.

III. The Male kind is that which we treat of in this Chapter, and is called by Nicander, *Bleibron*. It is, 1. *Filix mas vulgaris*, Our common Male Fern. 2. *Filix mas aculeata*, *Filix mas aculeata minor Baubini*, Prickly Male Fern. 3. *Filix mas aculeata major Baubini*, The greater prickly Male Fern.

IV. The Description. The first, or Common Male Fern, has a Root consisting of a brown, scaly, thick Head; from which Head nothing but a multitude of small, black, hairy Fibres or Strings proceed, growing from the lower parts thereof: from this Head of the Root spring forth several hard, rough, unbranched Stalks of winged Leaves, naked or bare at the lower ends. These at the beginning of the Spring you may perceive to come forth of their folding Clusters, covered with brownish Scales at the Surfaces of the Earth, very closely joined together. A young Plant has but a few Leaves, but an old one has ten, twelve, or more. Each Stalk of Leaves, at its lower end, near the Joining to its Fellows, at its first appearing, before it is an inch long, has some of those black fibrous Roots for its Nourishment. The Leaves being come to their full Growth, have each of them a threefold Division, (as has the Female Fern.) 1. The main Stalk. 2. The side Branches growing from it. 3. The Nerves growing on those side Branches bearing the Leaves. The main Stalks of some of these Leaves, are sometimes one, two, three or four feet in Length or Height, which are full of those brownish Scales towards the Root, where they are naked of Leaves, as aforesaid. These Stalks of Leaves consist of many side Branches of Leaves up to the tops, with one Leaf at the end, and they are set on both sides thereof, not fully opposite, but, as it were, in the middle, between two Branches of Leaves on the contrary side, each Branch of Leaves not fully divided, but deeply nicked in on the edges, all of them of a pale green color; hard and dry, or without Sap, broadest at the bottoms, and smallest towards the tops: on the backside of which there are certain brownish small Spots, which are said to be the Seed; for by the falling of it this Plant does wonderfully encrease. The main Stalks of these Leaves are firm, flat on one side and round on the other side, naked of Leaves from ten to twenty inches, (according to the Height thereof) where the first side Branches of Leaves begin, the longest of which side Branches are the third pairs from the Root, being in some Plants, six, seven, eight or nine inches long; and from this longest pair they grow shorter and shorter towards the top, and are many times in number fourteen, eighteen or twenty pairs: for the most part towards the Root they grow by couples, almost opposite; but as they grow higher towards the tops, they grow not opposite, but in the middle, between their Opposites. The Leaves on the side Branches, are from an inch to almost an inch and half long, and so grow shorter and shorter towards the tops of the said side Branches or Wings, from twelve or fourteen to twenty in number on each side the longest Wing or side Branch. The small Leaves grow by couples for the most part on the Nerve, each Leaf being a little cut in on the edges, each Dent ending with a sharp Point, green on the upper side, and paler on the under side, each Leaf having two Rows of dusky red Scales, of a brown or

blackish color. Towards the top of the main Stalk those side Branches change into Nerves, bearing only the Leaves. When the Leaves are at their full Growth, you may see in the midst of them at their Roots, the said scaly folding Cluster; and as the old Leaves, with their black thready Roots, wholly perish, so the said scaly folding Cluster springs up again; but in warm places, you will many times find the old Leaves green all the Winter.

V. The second, or Prickly Male Fern, differs not much from the former, but only that the winged Leaves are not dented in, but whole, having a small Prick at the end of each of them, and growing not so high. This Parkinson thinks to be the *Filix mas aculeata minor Baubini*; but thinks, that there is but little difference between it and his major.

VI. Gerard describes that which he thinks to be *Filix mas aculeata major Baubini* after this manner: The Leaves of this are of a deeper green than either of the former, and are placed on the Nerve not very close together, but that you may plainly see between them; each Leaf (especially those next the Stalk) having on that side farthest off the Stalk, a large Ear or Outgrowing, ending with a very sharp Prickle, and very fine, or small, as doth also the top of the Leaf. Some of the sides of the Leaves are also notched or dented in, ending with the like Prick or Hair; and each Leaf has two Rows of dusky Seed-Scales.

VII. The Places. They all grow on Heaths and open places of Hills, as also in shadowy places by Fields sides; and are frequent in many Counties of England. The first grows plentifully in the boggy, shadowy Moors near *Durford Abby in Suffex*; as also on the moist shadowy Rocks by *Maple Durham in Hampshire*, near *Petersfield*: it has also been found growing on the old rotten Stocks or Bodies of Oaks, near the said Moors. The second grows in shadowy Woods and Copes. The third Mr. John Goodyer found growing on the shadowy moist Rocks by *Maple Durham* near *Petersfield*, aforesaid.

VIII. The Times. They seldom keep their Stalks with their Leaves green in Winter, but send forth new from the Root in the Spring, which at their first rising are brownish and folded in round, as aforesaid: the time when these Heads or Scales on the back of them are ripe and do fall, is Midsummer; and falling on the Ground, do spring again, by which the Plant is encreased.

IX. The Qualities, Specification, Preparations, Virtues and Uses of the Male Ferns, are the same with those of the Female, related in the next Chapter, and thither I refer you.

C H A P. CCLIX.

Of FERN Female.

I. THE Names. It is called is Greek, *Θυλακίς*, *ἡ Νυμφαεισθής*, *Thelypteris* and *Nymphæpteris*: in Latin, *Filix Fæmina*; and in English, Female Fern, Brake or Common Fern.

II. The Kinds. It is the second general Species, and is threefold, viz. 1. *Filix Fæmina vulgaris*, Our common Female Fern: but *Gesner in hortis* calls it *Mas*, and *Baubinus* in his *Pinax*, *Filix ramosa pinnulis obrussis non dentatis*. 2. *Filix Fæmina pinnulis dentatis*, *Filix Fæmina altera tenuifolia Thalii*, Female

male Fern dented. 3. *Filix Femina pinnulis aculeatis*; *Filix ramosa minor pinnulis dentatis* Bauhini; *Pteridium musciculon* Cordi & Thalii, Female Fern Sharp-pointed.

Female Fern.

III. The Descriptions. The first, or Common Female Fern, has a Root which is long, and slenderer than the former, of about a Fingers Thickness, and blackish for the most part, creeping under Ground: from this Root rises up but one Stalk, (seldom two) which is round, chamfered, and something edged, growing sometimes higher than the Male, and branched forth into such like winged Leaves, growing on both sides, like to the Leaves of the Male Fern, but lesser, set on both sides thereof, for the most part one against another, and more dented than the Male, yet not sharp, but round-pointed, of as strong a Smell as the former, and having the like Spots on the backside of them. This Stalk (as also the Root, as some say) being cut aslope somewhat long, will in the white Pith thereof have some certain Resemblance or Form of a spread Eagle.

IV. The second, or Dented Female Fern, has a Root like the former; from which springs up one main Stalk, which is fuller of Branches, and grows not up so high as the other, nor so straight: it has also small winged Leaves, like the first or Common Female, which are set on each side of the middle Rib, but somewhat sharp-pointed, of a more sad green color, and narrower than the other, and spotted on the backside; but in any thing else little differing from the first Female kind.

V. The third, or Sharp-pointed Female Fern, from a pretty thick black Root, sends forth the main Stalk, which is about a foot in Height, and branches it self out into winged Leaves, each of which is not dented, but whole, and ending in a small Prick or Point.

VI. The Places. The first grows more frequently than the Male kinds on barren Heaths and Hedge-sides in moist places thro' the Kingdom, and indeed in almost all barren, dry and desert places. The two latter grow rather on moist Rocks and shady Hills.

Female Fern Dented.

VII. The Times. They flourish at the same times that the Male kinds do; and their Leaves perish in Winter in like manner.

VIII. The Qualities. They are all of them, both Male and Female, hot and dry in the first Degree; Astringent, Aperitive, Absterfiv, Cosmetick, Diuretick and Vulnerary; dedicated to the Liver, Spleen and Womb, Cathartick and Emmenagogick.

IX. The Specification. Ferns kill Worms, provoke the Terms in Women, heal Wounds and cure putrid Ulcers.

X. The Preparations. You may have therefrom, 1. The green Leaves. 2. A Decoction of the Roots in Mead or White Port Wine. 3. A Powder of the Roots. 4. An Oil or Ointment. 5. A Mixture. 6. Ashes, of which Spanish Barilla is made.

The Virtues.

XI. The green Leaves. They being eaten purge the Belly, cleansing the Bowels of coleric and waterish Humors; but they also at the same time trouble the Stomach, and cause either Vomiting or Nauseousness.

XII. The Decoction of the Roots in Mead or Wine. It kills Worms in the Body, both long and broad, powerfully opens Obstructions of the Spleen, taking away its Swelling and Hardness, and represses Hypochondriack Melancholy. Dose half a pint Morning and Night, fasting an hour after it in the Morning, and taking it an hour after Supper.

XIII. The Powder of the Roots. Taken to a dram inwardly in a Glass of White Port, it opens Obstructions of the Liver, Spleen and Womb, and provokes the Terms; but the often taking it causes Barrenness. It is used with success in foul, putrid and malign Ulcers, for it cleanses them, incarnates and dries up the putrid Moisture, and induces a speedy Healing. The Powder of the Leaves, brings away both Birth and After-birth, being taken to one

Z z

dram

dram in White Wine, and repeated as the Midwife shall see occasion.

XIV. *The Oil or Ointment.* It is made by boiling the bruised Root either in Oil or in flogs Lard till it is crisp, and so straining it out, and repeating the boiling with fresh Roots, in like manner, two or three times. They are said to be excellent for healing simple green Wounds and Punctures (tho' of the Nerves) in any part. If to every pound of the Oil or Ointment a quarter of a pound of Turpentine be added, it then proves an excellent thing to digest, cleanse, incarnate, dry and heal old running Sores and puid Ulcers.

XV. *The Mixture.* Take Powder of Fern Roots (Male or Female) one dram, Scammony or Black Hellebor Roots in fine powder fifteen grains: mix them for a Dose. It effectually kills Worms in the Stomach or Belly of what kind soever: it also brings away the After-birth of Women in Labor.

XVI. *The Athes.* Country People make them of green Fern, and use them instead of Soap to wash their Cloaths withal; for with the Salt of Fern-Athes much Soap is made. A Salt also for making of fait Crystalline Glafs and Crystal is made of these Athes. They use them in Spain, and the Athes or Salt they make of Fern, is that they call *Barilla*, which is profitable not only for making Soap, Glafs, Crystal, &c. but for many other Physick Uses, as to break and dissolve the Stone, or sandy and gravelly Concretions. See the eighth Edition of our *Polygraphice*, lib. 10. cap. 1. sect. 8, 9, 12, ad 18.

C H A P. CCLX.

of FERN Oak.

I. *THE Names.* It is called in Greek, *Asquithes*: in Latin, *Filix Quercina vel Quercina*; *Beverisces* *Orobastis*, quasi *Filix muscosa*; and in English, *Oak Fern*: but here is to be noted, that there is another sort of *Oak Fern*, called *Polypodie*, which is no Species of the Plant we here intend; and therefore shall say nothing of it in this place.

II. *The Kinds.* This *Oak Fern* is threefold, viz. 1. *Asquithes repens*, *Filix Quercina repens*, *Dryopteris repens* *Lobelii*, *Mutthioli*, *Gesneri aliorumque*; *Dryopteris* sive *Filix arborea* *Tragi*; *Pterion Fœmina* *Cordi & Thalii*, *Creeping Oak Fern*. 2. *Asquithes repens*, *Dryopteris alba*, *Dryopteris Candida* *Dodonei*, *Adiantum album* *Plinii*, *Adiantum filicis folio* *Bauhini*, *White Oak Fern*. 3. *Onopteris mas*, *Black Oak Fern*.

III. *The Descriptions.* The first, or *Creeping Oak Fern*, has a Root which is small and blackish, creeping under the upper Crust of the Earth, with several small black Fibres growing from it, and is somewhat like unto the Root of *Polypodie*, but much smaller and slenderer, and of a more harsh, austere and styptick Taste. From this Root spring forth several slender blackish Stalks, little more than half a foot high, bearing many small winged Leaves, each standing against the other, something like to those of the Female Fern, but much smaller and finer, and of a darkish green color; the backside of which are not brown, but with white Spots on them, set in a double Row, as *Lobel* affirms.

IV. *The second, or White Oak Fern*, has a thick Root, having a Branch or Knot of blackish Fibres or Therals growing forth from it, so many as even to

obscure the thick part thereof. From the Head of this Root spring up many Stalks of winged Leaves, but not much higher than the former, seldom exceeding seven or eight inches in Height; but the Leaves upon the Wings are broader than the other, and shorter; also more deeply cut in on the edges: they are likewise of a much paler green color, and spotted on the backside with Spots something like to those of the Male Fern.
