V. The third, or Tansie Party-Coloured. This in its Roots, Leaves, Stalks, Branches, Flowers and form, and manner of Growing, is not to be distinguished from our common Garden Tansie: The only difference between them is this, That upon the first shooting up the Heads of Leaves, they are almost all White, and after they are grown great, there will be many Leaves remaining White among the Green, which makes it the more pleasant to behold, seeming like a Party-Coloured Feather, in respect to the fine cut Leaves of White and Green.

VI. The fourth, or Woolly Tansie. It has a Root which is thick, blackish, fibrous and spreading, which sends forth divers winged Leaves, something like unto the former Tansies, and nearly like to Yarrow Leaves; which some would make it a Species, but that the Smell convinces us to the contrary, this being very strong and Sweet like to Tansie, whereas Yarrow has no Smell at all. The Leaves are also very Woolly, set close together about the Root; from among which spring up several Woolly Stalks, having such like Woolly Leaves upon them, and at their tops many Tufts of yellow Flowers, much like those of the former Tansies.

VII. The Places. They are all Garden Plants with us. The first three are Natives of our own Land: The Curled Tansie and the Party-Coloured, are Aborigines of England, and are thought to be Degenerations from our first Common Kind, being made so by Planting of Slips, which many times loose some parts of their Original Stocks, and sometimes add something to them, which may also be caused in part from the differing Soils, and their Richness or Poorness in which they are Planted: The first Common Tansie grows in some Foreign Southern Countries and warm Climates, by Hedge and Ditch sides, and in the Borders of Fields; and the fourth grows in the Southern parts of France, and other Southern hot Countries.

VIII. The Times. They all Flower in the Summer Months, viz. in June, July, and August; and if the Flowers are gathered in their Prime, will keep their Colour and Beauty for a long time without fading; from whence might possibly come the Greek Name *Athanasia*, from *athanatos* immortalis, sine Morte, or non Moriens.

IX. The Qualities. They are hot in the second degree, and dry in the third. Tansie is Absterfve, Aperitive, Affingent, Diuretick, Stomarick, Neurotick, Hysterick, Arthritick, Nephritick and Emmenogogick.

X. The Specification. It provokes Urine, forces away Sand, Gravel and Stones from the Reins and Bladder, eases the Colick, resists Vapors and Hysterick Fits, provokes the Terms, gives ease in the Gout, whether in Joints, Limbs or Stomach; and

is a singular Remedy against the Scurvy, in a cold Habit of Body.

XI. *The Preparations.* You may make therefrom, 1. *A Liquid Juice.* 2. *An Essence.* 3. *A Syrup.* 4. *An Infusion or Decoction in Wine.* 5. *A Powder of the Flowers and Leaves.* 6. *An Infolated or Decoiled Oil.* 7. *A Cataplasim of the Leaves.* 8. *A Tansie Pancake.* 9. *A Distilled Water.* 10. *A Spirituous Tincture.* 11. *An Acid Tincture.* 12. *An Oily Tincture.*

The Virtues.

XII. *The Liquid Juice.* It potently provokes Urine, and cleanses the Urinary passages from Sand, Gravel, Stones, and Tartarous Mucilage, which many times afflict Patients with Strangury or Ichuria; and a heat and scalding of Urine. It potently expels Wind, and prevails against the Collick, whether in the Stomach or Belly; kills Worms in the Bowels, resists Vapours, provokes the Terms, and is profitable against Fits of the Mother. Dose from 3, to 6 or 8 Spoonfuls in any fit Vehicle, Morning and Night: So taken, it gives ease in the Gout, whether in Limbs or Stomach, and carries off by Urine, the Morbifick Tartarous matter of that Disease.

XIII. *The Essence.* It has all the Virtues of the former and much more powerful to all those Intentions; besides which, it is of singular use to cure the Scurvy, and prevent Miscarriage in Women, being bathed warm two or three times a day upon the Belly, and lower parts thereof towards the Share: Dose from 3 to 5 Spoonfuls, as before directed.

XIV. *The Syrup.* It has the Virtues of Juice and Essence, but nothing near so powerful for those purposes; but is of good use against Asthma's, Coughs, Colds, Hoarseness, Wheezing, Phtisicks, Sickness at Stomach, and other Distempers of those Viscera. Dose two Spoonfuls Morning, Noon and Night, either alone, or in some fit Diuretick Vehicle. So taken, it is a very good thing against the Dropsy, *Anasarca*, or *Sarcites*.

XV. *The Infusion or Decoction in Wine.* They are very Stomackick, and if sweetened with the former Syrup Pectoral also, have all the Virtues of those former Preparations; but as they are weaker, must be given in a larger Dose, as from a quarter of a Pint, to half a Pint, Morning and Night, &c.

XVI. *The Powder of the Heads of Flowers and Leaves.* It is Anti-Collick, kills Worms in Children and elder People; and is found profitable against the Epilepsy in Young People. Dose from half a Dram to a Dram and half, in Ale, Beer, or Wine.

XVII. *The Infolated or Decoiled Oil.* It is made of the green or fresh Heads of Flowers and Leaves well bruised, and put into choise Oil Olive, &c. It restores Nerves shrunk up by Cramps, Overstraining, &c. and gives ease in pains afflicting any part, whether the Head, Stomach, Belly or Limbs, by anointing, &c.

XVIII. *The Cataplasim of the Heads and Leaves.* Applied to the Belly of Women with Child, it prevents Miscarriage, and causes then to go out their whole time, who are apt to that weakness; and being applied, it also gives ease in pains of the Gout.

XIX. *The Tansie Pancake.* It is pleasant Food being eaten in the Spring, is very Stomackick, warms and comforts that *Viscus*, and causes good Digestion, and precipitates ill Humors from the same.

XX. *The Distilled Water.* Sweetened with the Syrup, it may be given from two Ounces to a quarter of a Pint or more, against Fainting and Swooning Fits, Sickness at Heart, ill Digestion, &c. Outwardly applied, it cleanses the Face and Skin, making it smooth, soft, white and pleasant.

XXI. *The Spirituous Tincture.* It has all the Virtues of the Juice, Essence, Infusion, and Powder; and which as it is more powerful than them all, so it is to be given in a much less Dose, as from one Spoonful to two Spoonfuls in the Syrup, or in a Glas of Stomack or Diuretick Wine, morning and night.

XXII. *The Acid Tincture.* It is wonderfully Aperitive, and of admirable use against all Burning, Malign and Pestilential Fevers, as also against the Plague it self. It comforts the Stomach, stays Vomiting, and kills Worms; and is to be taken in all that the Patient drinks, for many Drops at a time, as to give it a pleasing Acidity.

XXIII. *The Oily Tincture.* This is much more potent in Diseases of the Urinary parts than any of the former Preparations; and may be given against Sand, Gravel, Stone, or Tartarous Mucilage in the Reins, Ureters or Bladder, from 15 to 30 or 40 Drops, being mixed with a little white Sugar, and then with some proper Diuretick Vehicle. It is also good against Asthma's, and other Diseases of the Lungs, Palsies, Cramps, Convulsions, and other like Weaknesses and Distempers of the Nerves.

CHAP. DCLXXXII.

OF TANSIE *Wild.*

O R,

SILVER - WEED.

I. *THE Names.* Tho' it has no known Greek Name, yet it is thought to be the same which *Pliny*, lib. 26. cap. 13. calls *Stephanomelis*, and in lib. 25. cap. 9. and lib. 26. cap. 8. *Argemone*, *Argemone*; and others *Argemone*: in Latine, *Potentilla*, (*ab extimijis viribus quibus pellet*;) *Argentina*, *Tanacetum Sylvestris*, *vel agreste Brunfelsij*, *Argemone altera Gesneri & Tragi*, *Anserina Tabernemontani*; and by some, *Agrimonia Sylvestris*: In English, *Wild Tansie*, or *Silver-weed*.

II. *The Kinds.* It is *Planta Singularis sui generis*; nor do I know any other Author which has given us another Species thereof, it being not a kin to the Tansies.

The Descriptions.

III. Its prime or chief Root runs downward like that of Cinkfoil; from whence springs forth weak slender creeping Branches, almost like Strings, which creep upon the Ground, taking Root again at the joints every where, round about the place where it grows, so that it will quickly overspread a great deal of Ground. From these creeping Branches or Strings, shoot forth several winged Leaves, which are large, and made of many lesser ones, set on both sides a middle Rib; some smaller being set among

the greater, but the smallest are always at the bottom of the said Rib, gradually increasing in bigness as they grow higher towards the top of the Rib, not much unlike in Form to Agrimony or Mead-sweet, but much differing in smoothness and color; and almost like in Form to Garden-Tansie, from whence it took its Name; all which little Leaves are finely dented about the edges, and are of a fair green color on their upper side, and of a white shining

Tansie Wild: Or Silverweed.

Silver Color underneath. It sends up no Stalk, but the Flowers every one of them in particular, spring from the Joints (with those winged Leaves) of those creeping Strings, standing upon a small slender, and not very long Footstalk. They consist of five small yellow round pointed Leaves, very like to those of Cinkfoil.

IV. Gerard describes it after this manner. It creeps along on the Ground with fine slender Stalks and clasping Tendrils; the Leaves are long and winged, made up of many small Leaves, like unto those of the Garden-Tansie, but lesser; which are on the upper side Green, but on the under side very White. The Flowers are yellow, and stand upon slender Stems, as do those of Cinkfoil.

V. The Places. It grows Wild almost every where in most parts of England, and many other Countries; more especially near High-ways, moist places, and running Waters.

VI. The Times. It Flowers in the Prime Summer Months, chiefly in June and July.

VII. The Qualities. It is cold and dry in the second degree; Altringent, Obstruative, Anodyne, Vulnerary and Arthritic.

VIII. The Specification. It stops all Fluxes of the Bowels, even the Bloody Flux; also Spitting, Vomiting, or Pissing of Blood, or any other inward Bleeding. It helps the Whites in Women, and is profitable against Ruptures in Children, and is good to dissipate Contusions; fastens loose Teeth, and heals Wounds or Ulcers in the Mouth, Throat, Secrets, or in any other part of the Body; drying up old, moist, corrupt and running Sores. It re-

lifs the Fits of Agues, is said to break the Stone, and is good to cool Inflammations in the Eyes, as also to take away all discolourings of the Skin, and to cleanse it from any kind of Desquedation.

IX. The Preparations. You may have therefrom, 1. A Liquid Juice. 2. An Essence. 3. A Decoction in Wine. 4. A Powder of the Herb. 5. A Gargarism. 6. An Ointment or Balsam. 7. An Ophthalmick. 8. A Cataplasim. 9. A Distilled Water. 10. A Spirituous Tincture. 11. An Acid Tincture. 12. An Oily Tincture.

The Virtues.

X. The Liquid Juice of the whole Herb. Taken to 4 or 6 Ounces, 2 or 4 hours before the coming of the Fit of an Ague, it is said to cure it, after some few times taking. It stops all Fluxes of the Bowels, and Bloody Fluxes of what kind so ever, whether by the Nose, Mouth, Bowels, Urinary parts or Womb; stops the Whites, is profitable against Catarrhs, fastens loose Teeth, and is good against Ruptures in Children; and to break the Stone whether in Old or Young.

XI. The Essence. It has all the former Virtues, besides which, it heals Wounds; cleanses, incarnates, and dries up old running Sores, foul Ulcers, and weeping Fistula's: It is also excellent against an Ophthalmia, abating the inflammation to admiration; and after a singular manner dissipates Contusions. Dose 2, 3, or 4 Spoonfuls or more, in some fit Vehicle Morning and Night.

XII. The Decoction in Wine. It has the Virtues of the Juice and Essence, but in a lower degree, and therefore is to be given in a much larger Dose, as to half a Pint or more. It eases also pains and Gripings in the Bowels, and helps Fainting of the Spirits.

XIII. The Powder of the Herb and Flowers. It has the Virtues of the Juice, but operates not with that speed, because it must be first digested in the Stomach. It is chiefly given to stop the Cartiers of Agues, Spitting and Vomiting of Blood, and the Whites in Women. Dose from half a Dram to a Dram and half, in some Symplick Wine or Decoction, or in the Decoction of this Herb, sweetened with Syrup of Consrey.

XIV. The Gargarism. It is made of a Decoction of the Herb and Heads of Flowers, in Red Port or Barabar Wine, with the addition of a small quantity of Alum, sweetning it afterwards with Honey. It consolidates green Wounds, cleanses and heals Ulcers in the Mouth, Jaws and Throat, they being often Gargled therewith; it cleanses and heals Ulcers also in the Privy parts of Man or Woman, as also in the Legs and other places of the Body; eases the Toothach, fastens loose Teeth, strengthens and fixes the Gums which are loose and spongy; and restores the Tone of the Uvula when hurt and weakened, so as to hang down. If the Decoction is made with Water and Common Salt, it dissolves Contusions, dissolves congealed Blood, by bathing with it; and so also it eases the pains of the Gout.

XV. The Ointment or Balsam. They are very healing, and after cleansing and incarnating of a Wound or Ulcer, they quickly dry it and heal it up.

XVI. The Ophthalmick. Take of the Juice or Essence four parts; of the Gargarism foregoing two parts; redified Spirit of Wine one part; mix them. It cures Ophthalmies, inflamed and sore Eyes, and such as are affected with a continual hot, fiery and sharp Rheum; it also cures running Sores, and Ulcers of the Eyes.

XVII. The

XVII. *The Cataplasm.* It is made of the whole Green Herb, by beating in a Mortar. Being applied to the Soles of the Feet, it abates the burning heat of Fevers; and bound pretty hard on to the Wrists of both hands, and kept on for some days, it cures Agues tho' of long continuance. Applied to Gouty parts it eases their pains.

XVIII. *The Distilled Water.* It is a cleanser of the Skin from all Discolorings and Defeciations; but if to a Pint of the Distilled Water you add fix Drams of *Sal Prunelle* in fine Powder, dissolving the same in a gentle Sand heat, and when cold, filtering it thro' brown Paper, it will perform those things much more effectually; not only removing Freckles, yellowness of the Skin, Tanning, Sun-burning, Pimples, Scurf, Morpew, and the like, but withal making the Skin white, soft, smooth and very fair.

XIX. *The Spirituous Tincture.* It strengthens the Stomach, refills Vomiting, and stops Fluxes of the Belly potently. Dose a Spoonful at a time Morning and Night, in a Glass of generous Wine.

XX. *The Acid Tincture.* It prevails against Old Fetid, Rotten and Stinking Ulcers, and disposes them to heal; and is of singular use to quench thirst in all vehemently hot and burning Fevers; and to enervate and profligate the Poison and Malignity of the Plague or Pestilence, and of all other Malign and Pestilential Diseases. Dose 50 drops.

XXI. *The Oily Tincture.* It is good against the Gout in the Stomach, and gives ease in the Gout in the Limbs or Joints, if anointed thereon. It prevails against Cramps, Convulsions, Palsies, and other cold and moist Distempers of the Nerves, and of the parts affected, and very much strengthens them. It gives ease in the Stone and Strangury, opening the Obstructions of those parts, and expelling Sand, Gravel, and Tartarous Slime from the same. Dose from 10 to 30 Drops, in some Nephritick or Diuretick Vehicle.

Onobrychidis flore; and may be called *Vicia Sylvestris Nemorum*, or Wild Wood Vetch. 3. *Vicia multiflora five Spicata*, The Tufted Tare or Vetch. 4. *Arachis five Cracca major* (which is the *Aegus Galeni*) *Vicia major Tragi*, The greater Wild Vetch or Tare. 5. *Arachis five Cracca minor*, The lesser Wild Tare or Vetch. These two last *Dodonæus* thinks may be that kind of Pulse growing among Corn, which the Greeks call *Agagis*, *Arachis*. Of all which in Order.

The Descriptions.

V. The first of the Manured, or our common Manured Tare. Its Root is small, with a great number of Strings, and perishes every Year. It rises up with divers square Stalks, sometimes two Feet or more long, entangling themselves one with another, that they stand in the Field without need of any Prop or Stay. The Leaves are winged, thicker set together than in the Wild Kinds, and growing on both sides of a middle Rib; the end of which, runs out into a divided Tendrel or Clasper, which are larger also than those in the Wild Kinds. The Flowers grow two together, and are long and nar-

Tare or Vetch, Manured.

row, of a dark Purple Color, and the Pods which succeed them are long and somewhat broad, in which lie 5 or 6 flat blackish Seed, but in some Grayish.

VI. Gerard describes it thus. It has slender four square Stalks, almost three Feet long. The Leaves are long, with clasping Tendrels at their ends, which are made up with many little Leaves, growing upon a middle Rib; every one of which is greater, broader, and thicker than that of the Len-

C H A P. DCLXXXIII.

Of T A R E Manured and Wild.

I. *THE Names.* It is called by *Galen* in Greek, Βίανον, *Bicium*, as the *Asticks* term it: But Σάρακον, and Κράνον: *Saracum* and *Cyamum*, with the *Athenians*: in Latine, *Vicia*, and in English, *Tare* or *Vetch*.

II. *The Kinds.* There are 1. *Vicia Sativa*, the Manured Tare or Vetch. 2. *Vicia Sylvestris*, The Wild Tare or Vetch. 3. *Vicia Sylvestris flore luteo*, *Vicia perennis*, Tate Everlasting, of which see in the next Chapter.

III. *The Manured Kinds* are, 1. *Agagis*, *Aphace*, and *Aphaca Matthioli*, *Vicia Sativa*, *Vicia vulgaris Sativa* (*Vicia à Vinciendo* as *Varro* will have it from Binding:) Our Common Manured Tare. 2. *Vicia Sativa alba*, *Vicia Sativa fructu albo*, The White Manured Tare or Vetch. This Gerard calls *Vicia Indica fructu albo*, because it is probable, that it was first brought to us from the *Indies*.

IV. *The Wild Kinds* are, 1. *Vicia maxima Durætorum Bauhini*, *Cracca major aliorum*, Os *Mundi*, *Vicia Sylvestris altera Tragi*: The great Wild Hedge-Tare or Vetch. 2. *Vicia Sylvestris alba*, *Vicia Sylvestris flore albo Clusii*, White Wild Tare or Vetch. This *Parkinson* says is the same with *Dodonæus* his *Galega altera*, and also with his *Vicia*

til The Flowers are like to those of the Garden Bean, but of a black Purple Color. The Cods are broad, small and long, containing for the most part, 5 or 6 Grains in each, of a blackish color, flattish, and of no very pleasing Taste.

VII. The second Manured, or white Manured Tare or Vetch. This in its Root, Stalks, Winged Leaves, Fashion of its Flowers, or their Color, Cods, Form and manner of growing, nor scarcely in any thing else, differs from the Common Tare before described, saving, that this grows higher; the Leaves are not so thick, and the fruit is larger and rounder, and of a very clear white Color, more like to Pease than Tares.

Descriptions of the Wild Kinds.

VIII. The first of the Wild Kinds, or the Great Wild Hedge Tare or Vetch. This has a creeping and living Root, growing much like to the first Manured Tare, but is larger in the Size, and number of the Leaves. Its Stalks are crested, being between 2 and 2 Feet in height. The Leaves are Winged, commonly a dozen growing upon one Rib, which ends in a Winding Tendril: Each peculiar Leaves broader towards the bottom, and sharper towards the top, which ends not flat, but somewhat pointed. Out of the bosoms of the Leaves, towards the tops of the Stalks, grow (on short Footstalks) two, three, or more, pretty large Pease fashioned blewish Purple Flowers, which are somewhat large, but shorter than the former. The succeeding Cods are like the first, but shorter and lesser, and of a black color when ripe, which then fly open of themselves, and shew their contained Seed or Grains of a blackish Color also. This Plant Tragus judges to be the Aphace Dioecoridis.

Tares Wild Small.

IX. The second, or small White Wild Tare or Vetch. Its Root is perennial, as many of the Wild Kinds be. It sends up Crested Branches about a Foot and half high, growing in Form like unto the other, having thereon, such like Winged Leaves as the former, but whiter, having a kind of hoary Down upon them. The Flowers which grow on short Footstalks, out of the Bosoms of the Leaves towards the tops of the Stalks and Branches, are of a whitish Color, with dark Purple Veins running thro' them. The Cods are like those of the Common Tare, and the Seed is flat like them also.

X. The third, or Tufted Tare or Vetch. Its Root creeps under Ground far about, shooting out new Branches every Year, the old ones being perished. It has such like trailing Branches as the others have, but weaker; the Winged Leaves are more in number, 12, 16, 20 or more, set on a Rib, longer and narrower than the former, and standing more upright, but they are not always set exactly opposite one to another, but unequally. The Flowers likewise which stand upon long naked Footstalks, are more in number, sometimes twenty together, but smaller, and something like to the Flowers of Onobrichis, or Cocks-head, and of a bright blewish purple Color, and sometimes of a dark Purple with some white in them. The Cods are long, containing within them black Seed.

XI. The fourth, or the greater Wild Tare or Vetch. Its Root is small, and perishes every Year. It has a few slender Crested Stalks lying on the Ground, if it finds nothing on which it can climb or take hold. At the joints come forth Winged Leaves, many small ones being set on both sides of a middle Rib, which ends in a Clasper, but lesser than those of Lentils or the Manured Tare. The Flowers are Purple, in form like those of the Tare, and grow usually but one at a joint. After which come small long black Cods, lesser than those of the Common Tare. The Seed or Grains are also less, and round, not flat as those of Tares are.

XII. The fifth, or Lesser Wild Tare or Vetch. Its Root is fibrous, and has several small white Kernels hanging among them. This differs nothing from the former but in its smallness, excepting that this has whitish Flowers standing in Tufts at the tops of the Stalks. The Cods which follow, are shorter and something hairy, and the Seed or Grains within, Whitish.

XIII. The Places. The two first kinds are Sown in Fields for their profit of Feeding Cattel, either with the Grain or Straw, or both; and of the Grain the poorer sort of People in many Countries, are forced to make Bread, Cakes, Puddings, &c. The Wild kinds are found by Hedge Sides, in Woods and moist Grounds, and among Bushes in many parts of this Kingdom; for they will grow in any Ground or Soil whatsoever. The fourth and fifth of the Wild Kinds are often found in the Fields among Corn, where they will in a rainy Season quickly overspread it, and kill it, or any other Herbs they grow by.

XIV. The Times. The Manured, and the three first Wild Kinds, Flower in May and June; the fourth and fifth in July, and the Cods or Grains are ripe in August or September.

XV. The Qualities. They are temperate in respect to heat or cold, drinels or moisture; Astringent, Glutinative, Vulnerary, and Restorative.

XVI. The Specification. They stop Fluxes, and cure running Ulcers and Cankers which are ready to Gangrene.

XVII. The Preparations. You may make of them, 1. Bread, Cakes and Puddings. 2. Potage. 3. A Mealer Flower. 4. A Cataplasm.

The

The Virtues.

XVIII. *The Bread, Cakes, Pudding, &c.* They are made and used constantly in many Countries, among the poorer sort of People; which tho' coarse Food, and something hard of Digestion, yet nourish much: And in many other places they are forced to be eaten by all sorts of People, in times of Famine.

XIX. *The Potage.* It is made by boiling them soft in Water, then adding thereto Meat, Pork, Cabbage, Coleworts, and other Herbs, or Milk. It nourishes very much, restores in Consumptions, and stops Fluxes of the Bowels.

XX. *The Meal or Flower.* Applied plentifully to Bleeding Wounds, and old running Sores, it stops the Bleeding, and the Flux of Humors to the part; more especially, if an eighth or sixth part of Roch Alum in fine Powder be added to it.

XXI. *The Cataplasme.* It is made of the Meal or Flower being mixed with Milk, or Smiths Forge Water. Being applied to running Sores or Ulcers, it stops the Defluxion, cleanses them, and prevents a Gangrene if approaching; and being laid warm all over the whole Body, it stops Fluxes of the Bowels.

XXII. *Nota.* The fourth and fifth of the Wild Kinds, are Pulses with which Doves or Pigeons are much delighted: And altho' the Fowls are wild, yet where the Dove-Houses are served herewith, they will resort to the same, and in some little time become Tame with the rest. And therefore in some Countries, whole Fields are Sown with them to serve for that use.

Tare or Vetch, Everlasting.

CHAP. DCLXXXIV.

OF TARE Everlasting.

I. *THE Names.* It is called in Greek, *Αδβυγ* ^{αδβυγ}; in Latine, *Lathyrus perennis*; in English, *Tare Everlasting*.

II. *The Kinds.* We make two sorts hereof, viz. 1. *Lathyrus perennis*; *Lathyrus Sylvestris flore luteo*; *Vicia perennis*, *Vicia Sylvestris flore luteo*; *Tare Everlasting*, properly so called. 2. *Vicia Sylvestris perennis*, *Vicia Sylvestris vulgaris*, *Strangle Tare*, and *Common Wild Tare*.

The Descriptions.

III. *The first, or Tare Everlasting.* Its Root is small and rough, running infinitely under Ground, scarcely to be destroyed. It is a ramping Wild Tare or Vetch, and is the most pernicious Herb that can grow on the Earth, for Corn or any other Herbage, by over-running, strangling as it were, and killing them: It sends forth long rough trailing Stalks, bearing small, long, and sharp pointed Leaves set on them one opposite to another, at due distances, with Tendrils or Claspers at the ends of the Branches: The Flowers stand upon pretty long Footstalks, proceeding from the Bosoms of the Leaves, which are many upon a Stalk, and yellow; after which come small round Cods with blackish small Grains within them.

IV. Gerard describes it thus. Its Roots are very small, long, tough, and in Number infinite; inasmuch, that being once gotten into a Ground, it is almost impossible to root it forth, unless the Earth be digged up with the Roots, and both cast into a River or Burned. From these Roots spring divers very small ramping Stalks, tough, and leaning this way and that way, not able to stand of themselves without the help of Props, or something standing by them to be a Support. The Leaves are very thin, and sharp pointed. The Flowers grow along the Leaves, in form like Pease Blossoms, but of a bright yellow Color. Doubtless this is one of the most hurtful and pernicious Weeds that grows, to all manner of green Herbs, or any Wood whatsoever. Johnson says, for the resemblance it has to Aphaca, he uses to call it *Aphacoides*.

V. The second, or *Strangle Tare*, or *Common Wild Tare*. Its Root is long, slender and stringy, from whence springs up many slender weak Branches. The Leaves are winged, and much smaller than in the Common Manured Tare, round or broad pointed, and sometimes dented in in the middle of the end, standing upon a middle Rib, which ends in clasping Tendrils. The Flowers are of a Purple Color, and commonly grow but one at a joint upon short Footstalks; after which come long, flat, sharp pointed Cods, which contain for the most part, 9 or 10 Grains or Seeds in each. In some Countries this Plant is called *Tine*; it is a ramping Herb, like to the Common Tare, climbing up upon Corn, if it chanceth to grow among it, and will then press or bear it down to the Ground, and overgrows the same in such a manner, that it strangles, spoils and kills it; not only Wheat, but all other Grain whatsoever. So that among Country Farmers it is better known than desired.

VI. The

VI. *The Places.* The first is generally found in Fields and Orchards, and other like places; also in Grassy Pastures, Borders of Fields, and in Corn Lands almost every where: It is found oftner than the Owners of Grounds would have it, being a kind of Plague, or mighty Incumbrance to any place where it once gets footing. The second grows generally in Plowed Lands, where it becomes the Husband-Mans Vexation in hurring and deffroying his Corn. But both these Plants will grow in any Ground or Soil whatsoever.

VII. *The Times.* They Flower in the latter end of May, thro' all June, and sometimes in some part of July; and the Grain is ripe in August and September, sooner or later, according to its time of Flowering.

VIII. *The Qualities, Specification, Preparations and Virtues* of these, are the same with those of the Common Manured Tare, in the former Chapter; so that no more need be said of them in this place. The Grain may be made into Meal or Flower, or boild into Pulrage and eaten, as other Pulses are, but these are of a thicker Consistence, and therefore may be thought to nourish very much: Without doubt in time of Famine it would be an acceptable Food; at other times they are not eaten, but the Grain, as also the Straw, are Food for Cattel, as nourishing them exceedingly.

CHAP. DCLXXXV.

OF TARRAGON.

I. *THE Names.* It has no Greek Name that we know of, but it is called in Latine, *Tragum*; *Tragum vulgare Clusij*; *Tarchon*; *Draco*; *Dracunculus Hortensis*; *Draco Hortensis*; and in English, *Tarragon*.

II. *The Kinds.* It is *Singularis sui generis*, tho' some have held it not to be an Herb of its own Kind: And *Ruellius* was of that vain and false Opinion, That it was first produced by putting Linseed into the Root of a Radish, or of an Onion being opened, and so set into the Ground, which when it springs up, brings forth this Herb *Tarragon*; which Folly, *Mathiolus* by certain Experience says has been found false.

The Descriptions.

III. *Its Root is white, and creeps about under Ground, by which it much increases. It has many long, narrow, sharp pointed green Leaves, sometimes of a dark green, and sometimes of a more light Color, growing upon short slender Footstalks; which are so numerous, as even to hide in a manner the Stalks themselves, which are of the same Color, round and brittle, sometimes two Feet or more high; at the tops of which come forth long slender Spikes, of small yellowish Flowers, which seldom give any good Seed, but a dusty or chaffy matter, which is dispersed with the Wind, the whole Herb is of a hot and biting taste.*

IV. *Gerard* describes it after this manner. *Its Root is long and fibrous creeping far abroad under*

Tarragon.

Ground, as do the Roots of Quich-Grass, by which sprouting up, it increases, yielding no Seed at all. It has long and narrow Leaves of a deep green Color, longer than those of our Common Garden Hyssop, with slender round brittle Stalks, about two Cubits high. Round the Branches whereof spring forth little round Flowers, which never perfectly open, of a yellow Color mixed with black, like those of Common Wormwood: after which succeeds a certain Chaffy or Dusty matter as it were, which flies away with the Wind.

V. *The Places.* For all that I know it is a Native of England, and grows with us only in Gardens, where (if the Ground is good) it flourishes admirably.

VI. *The Times.* It is green all the Summer Months, and a great part of Autumn, and flowers in July.

VII. *The Qualities.* It is hot and dry in the end of the second Degree: Aperitive, Astringent, Attractive, Digestive, Disensive, Diuretick and Traumatick; Stomackick, Cephalick, Neurotick, Cardiack, Splenetick, Nephritick, Arthritick and Hysterick; Emmenagogick, Sudorifick, and Alexipharmick.

VIII. *The Specification.* It resists Vomiting, restores Appetite lost, cures Convulsions, Falsies, Trembling and Weakness of the Limbs or extreem parts; is profitable against a *Leucophlegmatia*, expels Wind, gives ease in the Cholick, provokes Urine and the Terms in Women; and is an admirable Remedy against the Scurvy in a cold Habit of Body.

IX. *The Preparations.* You may have therefrom, 1. A Liquid Juice. 2. An Essence. 3. A Decoction in Wine. 4. A Distilled Water. 5. A Spirituous Tincture. 6. An Acid Tincture. 7. An Oily Tincture. 8. A Balsam. 9. A Salter.

The

The Virtues.

X. *The Liquid Juice.* It is an Antidote against a cold Scurvy, prevails against an incipient *Leucophlegmatia*, is good against Faintings, Weakness of the Stomach, want of Appetite and Digestion; *Stranguria*, or Stoppage of Urine, thro' Stones, Gravel, Sand or Tartarous matter obstructing the Urinary Passages. Dose one or two Spoonfuls in a Glass of White Lisbon, or other Diuretick Wine Morning and Night.

XI. *The Essence.* It has all the Virtues of the Juice, but more potent, warming and comforting the Stomach and Viscera; it dissolves and expels Wind, gives ease in the Cholick, is profitable against Convulsions and Palsies, resists Vomiting, causes Appetite, and admirably provokes the Terms in Women. Dose one or two Spoonfuls in Wine as aforesaid.

XII. *The Decoction in Wine.* It has all the Virtues of the Juice and Essence, but much weaker, and therefore may be given to half a Pint at a time, sweetened with *Syrup of Clovegilliflowers, Violets, or Marsh Mallows.* It heals inward Wounds, and being drunk constantly at Physical Hours, it disposes old running Sores and Ulcers to heal; more especially if they be outwardly washed therewith, being first sweetened with a little Honey.

XIII. *The Distilled Water.* It is sometimes used as a Cosmetick to Beautifie the Face and Skin, and to take away the Descadations thereof; which it does more effectually, if either *Sal Prunella*, or *Saccharum Saturni*, (half an Ounce of either of them to a Pint of the Water) be dissolved therein. Inwardly taken, it has the Virtues of the Juice and Essence, but in a far weaker degree; however it is profitable in Obstructions of the Reins and Bladder, if it be taken 3 or 4 Ounces at a time, sweetened with *Syrup of Marsh Mallows.*

XIV. *The Spirituous Tincture.* It comforts and warms the Stomach, strengthens it, and causes a good Digestion: And after due purging off the Morbifick matter, it is very profitable against the Palsie, Colick, Gout, Dropsy and Scurvy, restoring after an excellent manner, the depraved Tone of the Viscera. Dose one or two Spoonfuls at a time in a Glass of Wine, or well sweetened with *Syrupus de Althæa*; and this, Morning, Noon, and Night.

XV. *The Acid Tincture.* It is Antisebricitic, Anripestilential, and Anriscorbutic; it cools all preternatural Heats, expels Poison, and is singularly Alexipharmick, resisting not only Vegetable Poisons, as those of Henbane, Monks-hood, Nightshade, Wolfsbane, &c. but also Animal Poisons, as those of the Bittings of Serpents, as Vipers, Rattle-Snakes, Mad Dogs, &c. and the Stingings of Hornets, Scorpions, &c. Dose so much as to give the Vehicle (which ought in this case to be some sort of Alexipharmick Wine) a pretty sharp acid taste, so as it may be tolerably drunk.

XVI. *The Oily Tincture.* It is profitably given against the Strangury, Stone, Gravel, Sand, and Tartarous matter in the Reins, Ureters and Bladder; it takes away the heat and scalding of the Urine, gives ease in the pains of the Back, and strengthens it; is good against the Colick, and of singular use in inward Convulsions, as also in Palsies, being taken from 12, to 30 or 40 drops (according to Age and Circumstances) in any appropriate Liquor, Morning and Evening. Anointed with also outwardly any pained, cold, weak, or benum-

med part, it gives ease to the same, and in a short time restores and strengthens it.

XVII. *The Balsam.* Take Chio Turpentine 4 Ounces, Balsam of Peru 2 Ounces, Bees Wax one Ounce; melt and mix them well together; then add of the former Oily Tincture an Ounce and half; mix and stir them till the Mass is cold. Applied to any weak part it strengthens it, and eases pains proceeding from a cold Cause: It also cures simple green Wounds, many times at once dressing: Also old running Sores, putrid and rotten Ulcers, &c. it cleanses, incarnates, and heals them up in a short time. Inwardly take a Dram or more at a time, it cures the Bloody Flux, and Ulcers of the Intestines; stops the whites in Women, and a Gonorrhœa in Men, after due cleansing with other proper Medicines.

XVIII. *The Sallet.* It is commonly mixed with cold Herbs, as *Lettice, Purslane*, to temper their Coldness, and make them more agreeable to the Stomach and Bowels, and withal it gives them a more grateful or pleasant Flavor, and makes them more Stomachick.

XIX. *Nota.* Authors I must confess have said little or nothing of this Herb; but finding by its Grateful Smell and Taste, that there must be something more than ordinary in it, I was resolved to make some Trials of it in the Practice of Physick, and accordingly at several times, have made all the Preparations of it before named; which after some Years using of them, have found them beneficial for curing, helping, or giving relief in all or most of the Diseases aforesaid; so that whatever I have here said of it, is truly from my own Experience.

C H A P DCLXXXVI.

Of TEASLE Garden and Wild.

I. *THE Names.* It is called in Arabick *Chir*, and *Moleta*: in Greek, *αΐλας*: In Latine also *Dipsacus*: and *Labrum Veneris* from the Greek *αεθρις νερεϋ*: it is also called, *Carduus Veneris*: in English, *Teasle*.

II. *The Kinds.* Authors make many sorts of this Plant, we shall only take notice of two which are common with us, viz. 1. *Dipsacus sativus*; *Dipsacus Fullonum*, *Carduus Fullonum*, (which is thought to be *Gallidragon Xenocratis Plinio*.) Our Garden or Manured Teasle. 2. *Dipsacus Sylvestris*, The Wild Teasle. Some add a third, viz. *Virga Pastoris*, Shepherds Rod, which we think is no Species of this Plant, and therefore have treated of it in another place.

The Descriptions.

III. The first, or Our Garden or Manured Teasle. Its Root is white, long, and somewhat great at the Head, with several long Strings and small Fibres adjoining to it, which dies every Year after the Heads are ripe. The lower Leaves for the first Year are very large and long, formed something like to Lettice, of a pale green Color; more gentle, or not so hard as those which are set on the Stalks, but dented about the edges; and the middle Rib on the back or underside thereof, is set very thick with short

short Prickles. From among these Leaves rise up the Stalks 3 or 4 Feet high, armed from the bottom to the top, with small hard, short, and sharp Prickles, jointed in several places, and two such Leaves set at them; both of which Leaves are so joined together at the bottom or joint, so as to en-

Teasle Manured.

Teasle Manured.

compass the Stalk about, that they do contain the Run or Dew which falls upon them, being something harder and stiffer, and more prickly than the lower Leaves, as was before hinted. From between the Leaves and the Stalks on each side, spring forth Branches prickly also, and with Joints, set with the like encompassing hollow Leaves, but lesser. And from their joints rise long prickly Stalks, but bare of Leaves, having on their tops, a round Head something legg, armed with stiff, short, and crooked Prickles fashion'd like Hooks, bending their points downwards towards the Stalk; these are green at first, but when ripe white. From about this Head, come forth whitish hooded Flowers appearing in Circles, and Flowering by degrees, for the most part beginning in the middle, and from thence Flowering downwards and upwards. In the several Cells of which Flowers, is contained the Seed, which is small, somewhat long and round, and of a whitish Color, almost like Fennel Seed. The middle part of the Head is always hollow, which being opened, you will find it to contain one or more long whitish Worms, almost like Caterpillars, which are (the Head being ripe) for the most part found Dead.

IV. The second, or Wild Teasle. Its Root is like the former, so also its Stalks and Branches, which are full of sharp Prickles. Its Leaves are

Teasle Wild.

smaller, yet longer, but narrower, armed on the underside of its middle Rib, with the like sharp Prickles. It has like Heads as the former, which bring forth like Flowers, saving that they are of a fine Blush, or Pale Carnation, or Delicate Purple Color. The Prickles on the Heads of Flowers are small, soft, and upright, nothing so hard, or sharp, as the other; and so not hooked, or with their Points bending downwards as the former. And the Seed is like the same, with very little Difference. In the

the hollow of the middle, there is generally found one long Worm, which in Form and Shape much resembles a Caterpillar, and of a black Color,

Wild Teasle.

but (the Heads being full ripe) is for the most part found Dead, like as in the Mammred.

V. *The Places.* The first is only Sown in Gardens or Fields, for the use of Clothworkers. The second grows in wild and waste Places, by Hedge and Ditch sides, also in moist Grounds, near Brooks, Rills, and standing Waters, in almost all parts of this Kingdom.

VI. *The Times.* They Flower for the most part in June and July; and the Heads with the Seed, are ripe in August, or not long after.

VII. *The Qualities.* The Teasle is said to be cold and dry: Galen says it is dry in the second Degree, and Absterive, or of a cleansing Faculty.

VIII. *The Specification.* It cures Wounds, cools Inflammations of the Eyes and other parts; and is profitable against Frenzy and Madnels.

IX. *The Preparations.* You may have therefrom, 1. A Juice of the Leaves. 2. A Cataplasim of the Roots. 3. A Cataplasim of the Leaves. 4. A Distilled Water from the Leaves.

The Virtues.

X. *The Liquid Juice of the Leaves.* If it is dropt into the Ears, it kills Worms in them; Snuff up the Nostrils, and bathed upon the Forehead and Temples, it eases the pain of the Head from a hot Cause, and is good against Deliriums.

XI. *The Cataplasim of the Roots.* It is made of the Roots bruised and boiled in Wine to a pulpy thicknes, after which it is put into a Brass or Copper Basin, or Pot, to be Tinctured with the Verdigrise of the same. This spread upon Pledgets of

Tow or fine Flax, and applied to the Fundement, heals the Clefts thereof; as also Ficus, Cankers, Ulcers and Fittula's therein; and applied to Warts and Wens, it waxes, consumes, and takes them away.

XII. *The Cataplasim of the Leaves.* Beaten first in a Mortar with a little Spirit of Wine, in which some Camphir and Opium are dissolved, and applied to the Forehead and Temples, it allays the preternatural heat, gives present ease in vehement Headachs, and abates the Paroxysms of Frenzy and Madnels: Applied also to parts pained with the Gout, it gives ease in the same.

XIII. *The Distilled Water of the Leaves.* Being dropt into the Eyes, it is good to cool their Inflammation, and take away Blood-Shot, and clear them of such Mists, &c. as darken the Sight. The Face and Skin being first wash'd with warm Water, and wiped with a Cloth, and then wash'd with this Distilled Water, it preserves the Beauty and Fineness thereof, and if lost restores it again; taking away Redness, Inflammations, Pimples, Breakings out, Scurff, Morpew, Scabs, and other the like Defordations. But it will be so much the more effectual, if to every Pint of the Water, 2 or 3 Drams of *Succcharum Saturni* be added, and dissolved therein.

TETTER-BERRY, see Bryony, Chap. 89.

TETTER-WORT, see Celandine, Chap. 120.

THEE, see Lib. II. Chap.

C H A P. DCLXXXVII.

Of THISTLES Common and Wild.

I. *THE Names.* The Thistle is called in Greek, *Ἀγρίον* and *Σκορδύλεον*, (which almost all Authors translate by the General Name *Carduus*;) and *Ἀγρίον*, (which is also a Common Name for all kinds of Thistles;) but these two latter Names are also peculiar to two singular Plants, or kinds of Thistles, viz. 1. *Σκορδύλεον* or *Σκορδύλεον*; *Scolymus*, which is *Wart* Theophrasti, i. e. *Cinera Syloestris*, The Wild Hartichoke, which see in Chap. 339. aforegoing. 2. *Ἀγρίον* ὁ *ἄγριος*, i. e. *Branca Ursina*, Bears-Breech, which see also in Chap. 58 of this Book. In Latine, the general Name is *Carduus*, pl. *Cardui*; to which for every particular Species, some proper Epithite is commonly adjoined. The Prickly Heads are called *capitula*; *Echinus*.

II. *The Kinds.* All the kinds of Thistles are too many to be either Named or Treated of in this Work, which would be as Vain as it would be tedious and useles; many of them being insignificant as to their Virtues, and many others Natives of Foreign Countries, and so perfect Strangers to us, that possibly they might not be seen by an English Man in many Ages. We shall therefore Treat only here of those which are most Common and Wild in our Land. Fifteen Species of which, we shall discourse of in this Chapter, viz. 1. *Carduus Ceanothus*, *Carduus Viarum* & *Vinearum*, *Ceanothus* Theophrasti (Lib. 4. Cap. 11.) *Anguillarā* & *Columnā*; *Carduus Vinetorum* repens Bauhini, (because its Root creeps much under Ground;) 7 F *Carduus*

Carduus vulgarissimus Viarum, The Common Highway Thistle. 2. *Polycephalus* (quasi spine multa) *Polycephalus* (quasi plura capita) so called from the many Prickles and many Heads: *Aculeosa Gaze*: The most Prickly Thistle, or Thistle upon Thistle. 3. *Onopoxus*, (quasi *Afinus Buxus*) and so *Gaza* renders it out of *Theophrastus*, (quasi sit *Afinis Cibus gratissimus*.) *Carduus Sylvestris Dodonaei*, *Carduus Afinus Gesneri*: The Common Affes, or Way-Thistle. 4. *Onopoxus alter angustifolius*, Another narrow Leav'd Way-Thistle. 5. *Onopoxus parvus aculeatus*, The Gentle Way-Thistle. 6. *Onopoxus Onopordon*, (quod si comederint *Afini crepitus reddere dicuntur*) *Carduus Afinus*; The Affes Faring Thistle, for that it is said when Affes feed thereon, it causes them to break Wind backwards more than at other times. 7. *Drypis*, (dictum putent à *Lancinando*.) *Drypis quorundam Lugdunensis*, The Lancing Thistle, from its Prickles Wounding almost like a Lancet. 8. *Carduus pratensis Tragi, Gesneri & Lobelij*; *Acanthus Sylvestris Lugdunensis*, The Broad Leav'd Field Thistle. 9. *Carduus pratensis Acanthifolius laciniatis Baubini*, *Eristibales Plinij*, (Lib. 26. Cap. 12.) *Lugdunensis*, The Yellow jagg'd Meadow-Thistle. 10. *Carduus Bulbosus*; *Leucacantha Anguillare*; *Carduus pratensis Asphodeli radice latifolius Baubini*; The Bulbed Field Thistle. 11. *Carduus pratensis Asphodeli radicibus, Folij profunde & tenuiter Laciniatis Baubini*; *Acanthus Sylvestris alter Dalechampij Lugdunensis*, *Jacea aculeata sive Tuberosa Tabernamontani*; *Jacea Tuberosa Gerardi*; Meadow Thistle with Asphodil Roots. 12. *Carduus pratensis polycephalus Baubini*, The many Headed Meadow Thistle. 13. *Carduus palustris Baubini*, The Marsh, or moist Meadow-Thistle. 14. *Carduus Avenarius Thalij*; *Carduus Arvensis Tabernamontani*; *Carduus in Avena proventus Baubini*; *Drypis Loniceri Lugdunensis*; *Carduus Muscatus Gerardi*; The Oat-Land, or Musk-Thistle. 15. *Carduus Lanceatus latifolius major*, The Greater Broad Leav'd Spear Thistle.

III. The remaining Species are, 1. *Carduus Benedictus*, The Blessed Thistle, of which in Chap. 688. 2. *Carduus Tomentosus*, The Cotton or Woolly Thistle, of which in Chap. 689. 3. *Carduus Carlina dictus*, the Carline Thistle, of which in Chap. 690. 4. *Carduus Crithum dictus*, The Melancholy Thistle, of which in Chap. 691. 5. *Carduus Lalleus*, vel *Marie*, The Milky or Ladies Thistle, of which in Chap. 692. 6. *Carduus Stellatus vel Stellaris*, The Star-Thistle, of which in Chap. 693. 7. *Carduus Scolymus*, The Thistle Scolymus, which see in Chap. 694. following.

The Descriptions.

IV. The first, or our Common Highway Thistle. Its Roots are very small and whitish, running both deep and far about under Ground, like unto Quich-Grass, but not knotted in the Joins like it, but shoots up heads of Leaves from the Branches of the Root, so that it will be as bad or worse than Quich-grass, to root out of any Ground or place, where it is once got in. The Leaves are of a pale green Color, somewhat like unto the rough or prickly Sow-Thistle; a little cut in, and as it were crumpled on the edges, armed with very small and sharp hard prickles. The Stalk grows to be about a Tardigh, striated and prickly, with some such like Leaves thereon as the lower be, but smaller towards the Tops, where it is stored with cruel sharp, hard, prickly Heads, repleat with Purple Flowers made of Thrums in the middle, which afterwards pass into Down, in which is wrapped the Seed.

V. The second, or most Prickly Thistle, or Thistle upon Thistle. Its Root is long, slender, and branched forth, having several Fibres adjoining to it, not running very deep into the Earth. This

Thistle upon Thistle.

is the most Prickly Thistle of the whole kind, and as it were, composed wholly of Prickles. The Stalks thereof are very long, and seem to be corner'd, by reason of certain thin Skins growing to them, proceeding from the Leaves, which are, (as also the Branches) plentifully stored with sharp Prickles up to their tops, that nothing else is to be seen. The Leaves are short and narrow, cut in on every side with many deep Gashes, so thick set on both sides with small sharp Prickles up to their very ends, that they take up all the show of Leaves. The Heads are very many, and very thick set in every place, with stiff sharp Prickles, clothed with a multitude of Scales, out of which come Purple Flowers like Thrums, with Down and Seed therein contained, as in other Thistles.

VI. The third, or the Common Affes, or Way-Thistle. Its Root is blackish, hard and woody, which perishes every Year after Seed time. From whence rises several long Leaves, lying Compass-wise on the Ground, very hairy all over, especially whilst they are Young, of a deep or sod green Color, long and somewhat narrow, rent or torn in on the edges, and set with very many sharp Prickles. From among which, rise up very Prickly Stalks, armed with sharp prickly Fibres, branching forth in several places, and set with the like Leaves up to the tops, where grow several Heads, very much stored with sharp Pricks on all sides; out of whose middle come forth the Flowers, consisting of a great number of Purplish Threads, of an excellent, brisk, lively Color, which being past away, the Seed comes, lying in Down as in other Thistles.

VII. The

Asses Thistle.

VII. The fourth, or another Narrow - Leav'd Way - Thistle. Its Root, Form and manner of Growing, is much like the former, but it differs in this, that the Leaves hereof are longer, narrower, more gasht, or rent in on the edges, and not hairy, but smooth all the Leaf over. It has Heads of Flowers which are Purple like the other, but sometimes white, in its Prickles differing little or nothing from other Thistles, and when the Flowers are past, there remains the Down and Seed, like as in all others of the Species.

VIII. The fifth, or the Gentle-Way Thistle. Its Root, Stalk, and manner of Growing, is very like the former, but it differs chiefly in the Heads, which grow many together, and are but thinly set with Prickles, nothing near so much as some of the others, but the Leaves are more jagged, and set very thick with short Prickles. The Stalks are round and a little prickly, but not filmed as the former, and at the tops of the Stalks and Branches are scaly Heads, of like Purple Flowers, containing within them Down and Seed.

IX. The sixth, or the Asses Farting Thistle. Its Root is about a Foot long, thick and black, with some Fibres adjoining to it. It has many long Leaves, set on cornered Woolly Stalks, which grow sometimes almost to a Mans height, but not Branched at all; the Leaves seeming like Branches, being a Foot or more long, and much divided into many other Leaves, some long or narrow, others smaller and shorter, set with them at certain spaces, each ending in a sharp long Prickle. From the upper joints of the Stalks with the Leaves, and at the tops also, come forth Woolly Heads upon small Footstalks, set with long Prickles; from the midst whereof, thrust forth several bright reddish Purple Threads, which are the Flowers, which being past away, there remains the Down containing the Seed, in like manner as in other Thistles.

X. The seventh, or the Lancing Thistle. Its Root is white and thick, not growing very deep. It rises up with divers slender Stalks, sometimes almost to a Mans height, whose long and narrow Leaves are made up of many parts, small cut in or divided into many small points, with a short Footstalk encompassing the Stalk at the lower end. At the tops grow single, scaly, green, Prickly Heads, from whose middle comes forth the Flower, which in some is Purplish, in some Whitish, and in others very Red, or of a bright Crimson Color, which consists of a great number of long Threads like a Thrum. After the Flowers are past, there remains the Down, in which is contained the Seed, which is small, smooth, and reddish.

XI. The eighth, or Broad Leav'd Field-Thistle. Its Root is something long and thick, abiding several Years, which sends forth several large and long Leaves, cut in on the edges, and every part finely dented, and set with small Prickles which are very tender, of a whitish green Color. Those which grow up higher upon the Stalks are smaller, two of them set together at a Joint, where they so encompass the Stalk, that they will contain or hold Water in them. At the tops upon long Stalks, grow single green Prickly Heads, out of which come pale Coloured Thrums, encompassing a few Purple Threads in the middle. After they are faded and gone, there remains the Down, as in all other Thistles, in which is contained small whitish Seed, something larger than that of Cyanus, Corn - Flower, or Blew-Bortle.

XII. The Ninth, or Yellow Jagg'd Meadow-Thistle. Its Root is great, long, crooked and spreading in the Earth. It has very large Leaves, almost a Foot long, and somewhat broad, cut in on both sides into 4 or 5 deep Gashes, even to the middle Rib, and set with Prickles at the Dents of the Edges. From whence rises up a straked Stalk about two Feet high, set with a few lesser Leaves, at the tops whereof, stand several small green Prickly Heads, out of whose middles come yellow Threads or Thrums, which afterwards yield Down, in which is enclosed the Seed.

XIII. The tenth, or the Bulbed Field Thistle. Its Root is composed of several Tuberous small long Clogs, like unto those of the Asphodil, fastned together at the Head. The Leaves are whitish, of an hand breadth long, something fat and thick, cut in on the edges, but not very deep, armed at every Dent with small sharp Prickles. The Stalk is about a Yard high, hairy and slender, with few or no Leaves thereon, at the top of which, there are harmless Prickly Heads, standing upon long Foot-Stalks, out of which come pale Purplish Threads or Thrums, and after them much Down, in which the Seed is contained.

XIV. The eleventh, or Meadow-Thistle with Asphodil Roots. Its Root consists of several, or many long blackish Tuberous Clogs, like unto those of the Asphodil or Peony, which are fastned together at the Head, which after Seed time, wither and perish every Year. From whence come forth several thick, long, pale, green Leaves, cut into many parts, and armed with sharp Prickles on all sides, every Prick ending in three Points; from among them rises up a small Stalk, a little branched, with one or two Prickly Heads at the top of every Branch, out of which come purplish Threads or Thrums which are the Flowers, and after them the Down, enclosing small long Seed.

XV. The twelfth, or the many Headed Meadow Thistle. Its Root is long, hard and woody. It has but few Leaves lying upon the Ground, being both short and narrow, armed with sharp and long Prickles.

Prickles. The Stalk is round, straked, and without Prickles, spreading it self into several Branches, bearing many small heads with Threads or Thrums of a purplish Color coming out of their middle, which constitute the Flower, which Heads are set with large and sharp Prickles, after which is the Seed inclosed in the Down, as the rest are.

XVI. *Polycephalos alter.* There is another many Headed Thistle; whose Root is hard and woody. Its Stalk has neither Film or Prickle, but branched forth into divers parts, and they again into other smaller Branches, on which stand many Heads, and smaller ones under them, with several small prickles about them, out of which rise purplish Thready Flowers as in the other. The Leaves are but few on the Stalks, being short and narrow, but as thick set with Prickles, as the second or most Prickly Thistle, at Sect. V. above.

XVII. The thirteenth, or Marsh, or moist Meadow Thistle. Its Root is single, the Stalks about 4 Feet or more high, strait and full of prickles, thick set with dark green Leaves, unevenly waved, and sometimes more deeply cut in on the edges, having a few prickles at them, and branched towards the top, with many small Heads upon slender Foot-stalks, which bear purple Thrum Flowers, and turn into Down, in which the Seed is involved, like as in other Thistles.

XVIII. The fourteenth, or Oate-Land, or Musk-ed Thistle. Its Root is small and long, perishing at the approach of Winter. It has an upright Stalk, and rises up in Corn and Oat-Lands, some-

Thistle Oate-Land: Or, Musk-ed.

times to a Mans Height, but is found growing lower in other places; on which do grow broad, sharp, prickly, jagged Leaves, set round the Stalk and Branches; the tops are branched out with many

short Stalks, into as many short Heads set close together, out of which come the Flowers, consisting of Threads or Thrums, as in the other Thistles, of which some will be White, some of a White Color tending to Purple, and others of a pale Purple Color tending to bluish, of a most pleasant sweet Smell; and in some places smelling sweet like Musk, which being faded, Downy Heads succeed, in which the Seed is contained.

XIX. The fifteenth, or Greater Broad Spear-Thistle. Its Stalk is armed with Prickles like many other Wild Thistles, and the Leaves set thereon are very long, cut in or divided on the

Thistle Spear, Broad Greater.

edges, in 2 or 3 places, set at distances one from another; and the several parts cut into 5 or 6 points or corners, sharply armed, the end being long and narrow, pointed like the Head of a Javelin or Pike, (whence came the Name:) The Flowers are purplish in scaly prickly Heads, after which comes the Seed wrapped up in Down, as in other Thistles.

XX. The Places. All these Thistles Grow Wild by Way-Sides, in Fields, Meadows, Orchards, Gardens, and in Corn Lands in most places of this Kingdom, as also in many other places beyond Sea; also on Heaths, Greens, and waste places up and down almost every where. The thirteenth grows in moist Meadows; and the fourteenth in Oat-Lands, and other Corn-Lands. Gerard says, it grows in the Fields about Cambridge; and I have seen it in some other places adjacent to it.

XXI. The Times. They all Flower from the beginning of June to the end of August, and their Seed is ripe in some little time after.

XXII. The

XXII. *The Qualities.* Thistles according to *Galen* are hot and dry in the second Degree: They are also Aperitive, Diuretick, Stomatick and Nephritick.

XXIII. *The Specification.* They help the Strangury, or Roppage of Urine, take away the rank or evil Smell of the Arm-holes, or whole Body, Cure a Stinking Breath, and make Hair grow again upon Bald places.

XXIV. *The Preparations.* You may have,
1. A Liquid Juice or Essence of the whole Plant.
2. A Decoction of the Roots in Wine. 3. A Decoction of the Leaves and Heads of Flowers, when just or newly Blown, in Wine. 4. An Infusion of the whole Plant, when just beginning to Flower, in Wine, or in Brandy. 5. A Masticatory. 6. A Cataplasm of the Root.

The Virtues.

XXV. *The Liquid Juice or Essence of the whole Plant.* (*Pliny lib. 20. cap. 23.*) says, That if any bald place be Bathed with the Juice, it causes the Hair to grow again speedily. And if the Juice or Essence be made before Flowering, and Drank, he says they help a Stinking Breath, and strengthen the Stomach; so that it is probable they may be good for the Cure of the Scurvy, that always beginning in the Stomach, and being called by the Greeks, the *Stomach Disease*: Dose 2, 3, or 4 Spoonfuls, in a Glass of Stomach Wine, Morning and Night.

XXVI. *The Decoction of the Roots in Wine.* *Galen* says, that it drives forth Stinking Urine, and takes away the rank or evil Smell of the Arm-holes, and of the whole Body. Dose half a Pint, Morning, Noon and Night.

XXVII. *A Decoction of the Leaves and Heads of Flowers when just blown, in Wine.* It has the Virtues of the Juice and Essence, but much weaker; as also of the former Decoction of the Roots, and may be taken in the same quantity and manner. It is certainly an Antidote against the Scurvy in a Cold Habit of Body.

XXVIII. *The Infusion of the whole Plant when just beginning to Flower, in strong Wine or Brandy.* It has all the former Virtues, but more effectual to comfort and strengthen a cold and weak Stomach, and to resist a Cold Scurvy, as also to cause a Sweet Breath, more than any of the former Preparations. Dose 2 or 3 Spoonfuls, sweetned with any proper Syrup.

XXIX. *The Masticatory.* *Pliny* says, that being chewed in the Mouth, it cures a Stinking Breath. But this I suppose is such an offensive Breath as is caused by stinking or rotten Teeth, or some Sore or Ulcer in the Gums and Mouth, it drawing away a great deal of Rheum, Purulent and Putrid Stinking matter from the same.

XXX. *The Cataplasm of the Root.* *Dioscorides* says, that being applied, it corrects the Stinking and Filthy Smell of the Arm-Pits, and of the whole Body.

C H A P. DCLXXXVIII.

Of THISTLE Blessed :

O R,

Carduus Benedictus.

I. *THE Names.* It has no Greek Name that we know of, but it may well enough be called, *Angelus bonus*: in Latine, *Carduus Benedictus*; and in English *Blessed Thistle*: But we often call it by the Latine Name, as *Carduus*, and *Carduus Benedictus*.

II. *The Kinds.* It is a singular Plant of the Species; but some will have it to be a sort of *Arratylis*, or *Wild Mustard Saffron*, which I can scarcely admit of.

The Descriptions:

III. *Its Root is white, long and Fibrous, perishing every Year after it has given Seed. It has many weak tender Branches, lying for the most part*

Thistle Blessed :

O R,

Carduus Benedictus.

on the Ground, on which are set long and narrow Leaves, much cut in or waved on the edges, which are hairy or rough in handling, yet without any hard or sharp Prickles at all, so that the tenderest hand may

may touch them without harm : but those which grow towards the tops of the Stalks are somewhat more prickly ; and the Heads which grow on the tops of the several Branches, are somewhat sharp, set with Prickles like a Thistle. The Flower is yellow, which being past away, the Head encloses a quantity of Woolly or Flocky down, in which is contained (as in all other Thistles) the Seed, which is blackish, long and round, with a few Hairs on the Head thereof.

IV. Gerard describes it after this manner. The Root is white and parted into Strings. The Stalks are rough, round and pliable, which being parted into Branches, do lye flat on the Ground. The Leaves are jagged round their edges, and full of harmless Prickles. The Heads on the tops of the Stalks, are also set with Prickles, and environed with sharp and pricking Leaves, out of which comes forth a yellow Flower ; the Seed is long, and set with white Hairs like a Beard. The whole Herb, Leaves and Stalks, as also the Heads, are covered with a soft and thin Down.

V. The Places. It grows with us only in Gardens, where it Flourishes admirably well ; but in the Island Lemnos, in the Mediterranean, where it grows naturally, it grows wild in Champion Grounds and Fields, as Petrus Bellonius says.

VI. The Times. It Flowers in July and August, in which times it is to be gathered for Medicinal Uses ; and then it will keep good a whole Year or longer.

VII. The Qualities. It is hot and dry in the second Degree, Absterfive, Aperitive, Diuretick, Anodyn and Alexipharmick.

VIII. The Specification. It is good against Agues, Malign and Pestilential Fevers, recent Surteits, Pleurifies, Stone, Gravel, Vertigo's, and the Bittings of Mad Dogs, and other Venomous Creatures.

IX. The Preparations. You may have therefrom, 1. A Liquid Juice. 2. A Decoction. 3. A Powder of the Leaves. 4. An Extrakt. 5. A Cataplasim. 6. The Down within the Heads. 7. A Distilled Water. 8. Roger Dixon's Antipestilential Sudorifick. The Herb is chiefly used.

The Virtues.

X. The Liquid Juice. Put into the Eyes it clears the Sight, taking away Blood-shot and redness ; drop into the Ear it eases the pain thereof : It kills Worms in the Belly, and given from an Ounce to two Ounces, in any proper Vehicle, it is good against Quartan Agues and the Plague ; as also recent Surteits, and admirably cleanses a foul Stomach.

XI. The Decoction in Wine, Water, or Posset-Drink. It is good against Agues of long continuance, and Pestilential Fevers, which if timely given, it has the greater Effects ; and is also profitable against Pleurifies, and Stitches in the Side. It is good against a Vertigo, and Deafness, and strengthens the Memory. It provokes the Terms in Women, is good against the Strangury, as also Sand and Gravel in the Urinary parts.

XII. The Powder of the Leaves. It stops Bleeding at Nose, and is given from half a Dram to a Dram, against all the aforementioned Diseases. It is Sudorifick, and cures all sorts of Agues, being given some few Hours before the coming of the Fit, for several times together.

XIII. The Extrakt. It has all the former Virtues, and being given from half a Dram to a Dram

or more, it particularly is said to cure the Quartan Ague ; kill Worms in the Bowels, and is a Specifick against the Lues, or French Pox.

XIV. The Cataplasim. Made of the Green Herb and applied, it is good against hot Tumors, Erysipelas, Botches, Boils, Plague Sores, the bitings of Mad Dogs, Serpents, Spiders, Stinging of Venomous Creatures, &c. But made up with Hogs Lard and Wheat Meal, and applied, it cures Stubborn or rebellious Ulcers. The Cataplasim made of the Juice with Orobus Meal, is profitable also against Gangrenes.

XV. The Down within the Heads. Applied to simple Green Wounds it stops the Blood, and presently heals them : Applied to Ulcers after Cleansing and Incarnating, it causes a speedy Cure.

XVI. The Distilled Water. It is said to have all the Virtues of the Decoction, but is nothing near so effectual, tho' much more pleasant to be taken. It is esteemed a peculiar thing for the Eyes, and help their Soreness, and a Dimness of Sight.

XVII. Roger Dixon's Antipestilential Sudorifick. Take Leaves of Carduus Benedictus and Scabious ; Roots of Butterbur, of each 4 Ounces ; Posset Drink 3 Quarts ; make a Decoction and strain out. If you have not Posset-Drink, you may make it with thin Water-Gruel. With this Drink, he told me, he Cured many Hundreds of the Plague (when the last Great Plague was in London, Anno 1665.) who, by drinking largely of it, were Cured (many of them) in the space of twenty four Hours, when nothing but Death was expected : and thereby he also stayed Pestilential Vomittings and Loosenesses. It produces a potent Sweating an Hour or two : In the Sweating, he gave the Sick Mutton or Chicken Broth, or some proper Alexipharmick Posset-Drink, wiping the Sweat from the Face and Neck with warm Cloths, but forbearing to Shift the Patient ; and this Course he took every Day, till the Malignity of the Disease was wholly rooted out.

C H A P. DCLXXXIX.

Of THISTLE Cotton :

O R,

Woolly Thistle.

I. THE Names. It is called in Greek, *Ἀκανθίον*, (being supposed to be the *Acanthium* of Dioscorides) in Latine, *Acanthium*, *Cardus Tomentosus*, and in English, the Cotton or Woolly Thistle.

II. The Kinds. Among the many sorts Authors have given us of this Thistle, there are but four which are frequent with us, viz. 1. *Acanthium Vulgare*, as Camerarius, Dodonæus, Durantes, Lobel, Lugdunensis, Matthioli, and Tabernaemontanus do all agree : Our Common Cotton, or Woolly Thistle. 2. *Acanthium Anglicum*, *Cardus Tomentosus Anglicus*, *Spina Arabica* Dioscoridis, Plinij, Matthioli, & Casalpini Bauhino, *Cardus Tomentosus Capitulo majore* Bauhini ; Our English Cotton, or Woolly Thistle. 3. *Cardus Tomentosus minor*, *Cardus Spherocephalus quintus* Dodonæi, *Cardus Tomentosus Capitulo minore* Bauhini, The Lesser Cotton, or Woolly Thistle. 4. *Cardus Tomentosus, Corona Fratrum dictus*,

diffus, Carduus Sphaerocephalus Spinossissimus Bauhini, rigidis aculeis armatus; Carduus Erioccephalus, sive Tomentosus Gerardi, Our Cotton, Down, or Woolly Headed Thistle.

The Descriptions.

III. The first, or our Common Cotton, or Woolly Thistle. Its Root is great and thick, spreading much, but usually dying after Seed time. It has many large Leaves lying upon the Ground, somewhat cut in, and as it were crumpled on the edges, of a green Color on the upper side, covered over

Thistle Cotton or Woolly, Common.

with a long hairy Wooll, or Cottony Down; and not much more White or Hoary underneath, set with most sharp and cruel Prickles; from the middle of whose Heads of flowers, come forth many Purplish Crimson Threads, (which are sometimes White, tho' very seldom.) The Seed which follows, lies in a great deal of fine white Down, being something large, long and round, resembling the Seed of Silibum, or Ladies-Thistle, but something paler.

IV. The second, or our English Cotton, or Woolly Thistle. Its Root is great and thick, brownish on the outside, and white within, and not unpleasant to the Taste. It has divers large and long Leaves, covered all over with a Cotton, Down, or soft Wooll, cut very deeply in on the edges, at certain distances, into several parts or Leaves, even almost to the middle Rib, making each Leaf seem Winged, with small and long Leaves on each side, and set in divers places with long and sharp Prickles. The Woolly Stalk rises up to the height of three, four, or five Feet, with few Leaves set thereon, and with but few branches, bearing at their tops, a large round hoary Head something flat, covered over as it were with fine Woolly Threads like

unto a Net, not very Prickly, with many Purplish Threads in the middle, like unto those of the Artichoke; after which, come Thistle like Seeds, greater and rounder than those of the former.

V. The third, or Lesser Cotton, or Woolly Thistle. It has many white Woolly, or hoary long Leaves, much cut in on the edges into many parts; and each part also divided and set with small Prickles. The Stalk is not very great, not much above two Feet high, but branched out towards the top, being white and Woolly also, bearing on them small roundish Prickly Heads, having many Purple Threads rising out of their middles, and small Thistle-like Seed after them.

VI. The fourth, or Our Cotton, Down, or Woolly Headed Thistle. It has a Stalk branched forth, on which grow Winged Prickly Leaves, which are large, long, and somewhat broad, thick set with sharp Prickles, but sparingly placed on the Stalks; at the tops of which, grow Spherical or round Heads, thick set, and strongly armed with long Prickles: out of the middle whereof, come forth

Thistle Cotton, or Woolly Headed.

white Threads, which have a small sweet Smell. The Seed following, being envolved in Down, is long, and Crested or Cornered.

VII. Gerard thus describes this last. It rises up with thick and long Stalks; the Leaves thereof are jagged, set with Prickles, and white on the under side. The Heads are round, and many in Number, covered with a soft Down and sharp Prickles standing out round about them. The flowers come forth of their middle, being a bush of Purple Threads. The Seed is long and shining, like the Seed of some other Thistles.

VIII. The Places. The first Grows on Ditch and Banksides, and in Corn-Fields and High-ways, almost every where throughout our Land, and is also often

often found growing in Gardens. The second has been found growing in divers Barren Fields in *Somersetshire*, as *Lobel* says; as also in several other places of *England*. The third is sometimes found growing in Gardens, as also in several other places, in dry and Sandy Ground. The fourth, *Johnson* in *Gerard* says, he found by *Pocklington*, and in other places, in the Woods in *Torkshire*; and *Mr. Goodyer*, found it also in *Hampshire*. *Baubin* says, it was sent to him under the Name of *Carduus Arabicus*; Some say it is called *Corona Fratrum*, because it somewhat resembles the Heads of Bald Pated Friars.

IX. *The Times*. They all Flower and bear their Seed in *July*, or about the latter end of Summer, when other Thistles Flower and Seed.

X. *The Qualities*. The Root and Leaves are according to *Galen*, hot, and dry, about the end of the 11th Degree: They are *Aperitive*; *Anodyn*, *Digestive*, and *Analeptick*.

XI. *The Specification*. Authors say they Cure *Convulsions*, *Cramps*, and the *Rickets* in Children.

XII. *The Preparations*. You may have from the Roots and Leaves, 1. A *Liquid Juice* or *Essence*. 2. A *Decolion* in *Wine* or *Water*. 3. A *Powder* of the same.

The Virtues.

XIII. *The Liquid Juice* or *Essence*. Taken inwardly, from one Spoonful to three, in any proper Vehicle, Morning Noon and Night, it is said to cure *Cramps* and *Convulsions*, especially that in the Neck, called *Tetanus*, in which the Neck cannot be stirred or turned, without rurning the whole Body. It is good also against *Cramps* and *Convulsions* in other parts of the Body, more especially, if besides taken inwardly, as now directed, the parts affected be also very well Fomented or Bathed with the Essence thereof very hot, or with the Juice mixt with an equal quantity of Spirit of Wine. And so also used (both inwardly and outwardly) it is said to cure the *Rickets* in Children, which is a Disease that so vehemently constricts the Nerves and Ligaments of the Back and Joints, and indeed of the whole Body, that it hinders the Progression of the Nutrimment, and so frustrates the Growing of the Child, diminishing its Height, Strength and Vigor.

XIV. *The Decolion* in *Wine* or *Water*, or *Water* mixt with *Wine*. If made strong, it has all the former Virtues, but as it is much weaker than those Preparations, so it must be given in much greater quantities, viz. from a quarter to half a Pint, and that Morning, Noon and Night.

XV. *The Powder*. It is given for all the same purposes, from half a Dram to a Dram, or Dram and half, in some proper Syrup, as Syrup of *Elderberries*, Syrup of *Elecampane* Roots, or the like, and that Morning and Night.

C H A P. DCXC.

of THISTLE Carline.

I. *THE Names*. It is called in Greek, *Ἰεῖον* by *Theophrastus*; and *Λευκαρίδα* by *Dodonaeus*: in *Latine* *Carlina*, and in *English*, the *Carlina Thistle*.

II. *The Kinds*. We shall here Describe four Species of this Plant, viz. 1. *Carlina humilis Columna*, *Ixine Theophrasti*, *Carlina humilis acaulis*, *Carlina acaulis gummifera Baubini*, *Cardopatum caule nullo*, *Carlina Sessili flore*; also *Carolina*, (so called at first from *Charles* the Great, whose Army (as it is reported) being Infested with the Plague or Pestilence, was by the use of this Plant, Cured and preserved from the same:) and this is that Species which both *Baubinus* and *Gerard* will have to be *Chameleon albus Dioscoridis*, but is indeed a manifest Error: in *English*, The Low, Dwarf, or Lesser Carlina. 2. *Carlina Caulescens Columna*; *Carlina Caulescens magno flore Gerardi*; *Carlina Leucacantha Dodonaei*; *Carlina alterum genus Casalpini*; *Carlina magna & elatior Clusij*; *Carlina caulem habens Lugdunensis*; *Carlina caule donatus*; *Cardopatum majus*, The Greater Carlina Thistle, or Carlina with a Stalk. This is *Chameleon niger vulgaris Tragi & Besleri*, which is also a Mistake. 3. *Carlina acaulis Septentrionalium*, *Carlina acaulis minor flore purpureo Baubini*; *Carlina minor flore purpureo Clusij*; *Carduus acaulis Septentrionalium Lobelij*; Our Low Wild Carlina Thistle. This is *Chameleon albus & exiguus Tragi & Lugdunensis*, and *parvus Loniceri*, by the same Mistake. 4. *Carlina Sylvestris major Gerardi*, *Carlina Sylvestris vulgaris*, *Carlina Sylvestris Dodonaei*; *Acarna*, vel *Crisum luteum Sequanorum Lobelij*: The great Wild Carlina Thistle, or Wild Carlina with a Stalk.

The Descriptions.

III. The first, or Low, Dwarf, or Lesser Carlina Thistle. This is that which is principally used in *Physick*; and is by some accounted the *Chama-*

Thistle Carlina Low, or Dwarf.

leon albus. Its Root is something Aromatick, small, long, growing downwards into the Ground, and blackish on the outside. This low Thistle has many long

long and large Leaves lying on the Ground, jagged or cut in on both sides, and set with white sharp Prickles; from among which, rises up a large Head without any Stalk, encompassed with several long, thin, and narrow Leaves, cut in on the edges, and as prickly as the undermost, and both of a whitish green Color: These Leaves about the Head, though whitish above, yet are a little Purplish underneath, and stand about the Head like a Crown or Border, being thin, long, hard, and shining, encompass the Flower or Thrum in the middle, being yellow and flat, as the whole head it self is; which being past away, there follows the Seed of a whitish or Silver Color. This Head before it Seeds, opens in the Day time, and closes again at Night. From the Root of this (in some places) as also from its Head, proceed a Viscous or Glewish Gum, which being dried or hardened, very much resembles Maltich.

IV. The second, or Greater Carline Thistle, or Carline with a Stalk. Its Root is blackish on the outside, but whitish within, and as it were bitten off, and being cut or broken, yields such a like white Viscous Milk or Juice, which being hardened, becomes a Gum like the former, without Smell, but

Thistle Carline with a Stalk.

a little sweet in Taste, from which Reason, the Plant is judg'd to be of the same Nature, Property, Qualities and kind with the former. This does not Flower as the former, without a Stalk to stand on, but there springs up a reddish Stalk of about a Foot or more high, on which grows narrower, greener, and more Prickly Leaves than on the first, or Low Kind; the Head or Heads of Flowers are at the top or tops of the Stalk and Branches, each standing on its own Footstalk, composed of a Border, but of smaller Leaves, which are hard, thin, smooth and whitish like the former: The Thrum in the middle is yellowish, before the Flowers therein begin to open, but then are of a reddish Purple Color, which particular, unless one heed it well, the same Plant may be taken to be two several Kinds.

V. The third, or Our Low Wild Carline Thistle. Its Root is great, thick and blackish on the outside, and whitish within, enduring many Years. This Low Thistle does yearly send forth several very long and narrow Leaves, very much cut in on the edges, into many parts, set with small Prickles,

Thistle Carline, Low Wild.

and of a dusky Green Color, not lying flat upon the Ground, but a little raised up from it; from among which at the latter end of Summer, comes forth a short Stalk, scarcely two Inches long, bearing thereon a large round scaly and prickly head, with many bright purplish Threads rising out of its middle, which keep their Color a long time; after which, (they being past) comes the Seed which is numerous, small, whitish, or of a Silver color, enclosed amongst the Down in the Head.

VI. Johnson in Gerard describes it after this manner. This Purple Carline Thistle, has a pretty large Root, divided many times at the top, into several Branches, from which rise many green Leaves, lying spread upon the Ground, deeply cut in on the edges, and set with sharp Prickles. In the midst of these Leaves come up sometimes but one, and sometimes more scaly Heads, which carry a pretty large Flower, composed of many Purple Threads, like those of Knapweed, but larger, and of a brighter Color. These Heads grow usually close to the Leaves, yet sometimes they stand upon Stalks 3 or 4 Inches high. When the Flower is past, comes the Seed which is small and grayish, enclosed in the Down, all which are carried away with the Wind.

VII. The fourth, or the Greater Wild Carline Thistle; or Wild Carline with a Stalk. Its Root is long and slender, with a twinging or sharp and biting Taste. It rises up with a Stalk or Stalks, a Foot and half, or two Feet high, which are round and prickly, divided towards their tops into several Branches. From the bottom at the Root, come forth many

many Leaves, partly lying on the Ground, and partly standing upright, which are long, not very broad, unevenly dented about the edges, and full of Prickles, not much unlike to the third or former Carline, but lesser; with many such like Leaves, but smaller, growing about the Stalks up even to their tops, and to the tops of the Branches of each Flower. At the tops of the Stalks and Branches, grow the Flowers in a Prickly head, being set with bordering Leaves like a Pole round about it, of a yellowish color, enclosing a reddish Thrum, or great number of Threads of a reddish color.

VIII. *The Places.* The first and second grows upon the Mountains in Germany and on the Alps; but the second is sometimes found growing by it self in other places, but with us only in Gardens. Parkinson says, that he had observed, that the Seed of the Low kind, Sown in our Gardens, has sometimes grown up high, or with a Stalk, not retaining its former Dwarf State. The third is very frequent in our Country, especially in Kent, almost every where, and is also to be found in France and Germany. It grows upon Black-Heath, and on the Chalky Hills about Dartford, and in many other such like places. The fourth grows also with us in Untill'd and Desert places, and oftentimes upon Hills, and is also found growing upon Black-heath, and on many other places in Kent.

IX. *The Times.* They all Flower late in the Year with us, but in the middle of Summer in their Native places. The third Flowers in July and August, and the fourth in June and July, the Seed ripening not long time after.

X. *The Qualities.* The Root is chiefly used, and that of the first or Low Dwarf Carline. It is hot and dry in the end of the second Degree, but Gerard says, it is dry in the third Degree. It is Aperitive, Anodyn, Diuretick, Cardiack, Nephritick, Hysteric, Emmenagogick, Sudorifick, and Alexipharmitick.

XI. *The Specification.* It preserves from, and cures the Plague or Pestilence; kills Worms in the Belly and Stomach, eases the Strangury, provokes Urine, and the Menfes; resists and expells all manner of Poisons; eases pains of the Teeth; cures Dropsies, Cramps and Convulsions; eases pains in the Sides, Stitches, Pleurisie, &c.

XII. *The Preparations.* There are used in Physick, 1. The Crude or Raw Root. 2. The Liquid Juice. 3. The Decoction in Wine.

The Virtues.

XIII. *The Crude or Raw Root.* Being chewed long in the Mouth, it attracts much cold Rheum, and so gives ease in the Tooth-ach, and pains in the parts adjacent.

XIV. *The Liquid Juice.* It is given from one Spoonful to two or more, Morning and Night, against the Plague, and all Pestilential Diseases, Measles, Small Pox, Spotted Fever, Poison, the Bittings of Mad Dogs and Serpents. It cures Cramps, Convulsions, Pleurisies, Strangury, Dropsy; eases pains and Stitches in the Sides, and kills Worms in the Bowels. It may be given in Wine or some other convenient Vehicle: It potently provokes Sweat, as also the Terms in Women.

XV. *The Decoction in Wine.* It has all the former Virtues, but as it is weaker, so it must be given from a quartet to half a Pint or more, Morning and Night, and so to be continued for some considerable time.

CHAP. DCXCI.

Of THISTLE Melancholy.

I. *THE Names.* It is called in Greek, Κίσθος (Κίσθος, i. e. Varices quos sanet, ut refert Dioscorides:) in Latine, *Cirsium*, *Carduus Mollis*, and *Spina Mollis*; and in English, *The Soft Thistle*, and *Melancholy Thistle*.

II. *The Kinds.* Authors make a great many sorts of this, but those only growing with, and most known to us, shall be here Described, which are the three following, viz. 1. *Cirsium Anglicum primum*; *Cirsium Pannonicum primum pratense Clusij*; Our First English Melancholy, or Soft Thistle. 2. *Cirsium Anglicum alterum*, *Cirsium aliud Anglicum*; *Cirsium Pannonicum alterum Clusij*; *Cirsium Britannicum secundum*, Our other English Soft, or Melancholy Thistle. 3. *Cirsium majus latifolium*; *Cirsium primum Lugdunensis*; *Cirsium Tertium Dodonei*; *Cirsium Latissimum Boubini*: The Great Broad Leav'd, Soft or Melancholy Thistle.

The Descriptions.

III. The first, or our first English Soft, or Melancholy Thistle. Its Root has many long Strings coming from its Head or upper part, which is blackish, and perishes not every Year. From which Root springs up a tender single hoary green Stalk, having

Thistle Melancholy English, First.

thereon four or five green hoary Leaves, dented about the edges; the points whereof are little or nothing prickly; and at the top usually but one head,

head, yet sometimes from the bosom of the uppermost Leaf, there comes forth another smaller head, which is scaly, and something prickly, with many reddish Purple Threads or Thruins in the middle, which being gathered fresh, will keep their Color a long time; and standing on the Stalk, will not fade in a long Season, after which it perfects its Seed, which is of a mean Proportion for bigness, enuolued in its Down.

IV. The second, or our other English soft, or Melancholy Thistle. Its Root at its Head is somewhat Tuberosus, and blackish on the out-side, shooting forth several long Fibres or Strings, which run under the Earth here and there, and send forth new

Thistle Melancholy English, Second.

Heads for increase. From this Head spring up long, narrow hairy Leaves, set about the edges with slender Prickles, not much unlike to the former, but more hoary underneath, and more green above. From the midst of these Leaves grows up a Stalk, a Foot, or Foot and half, or two Feet high, which is tender, stiff and Downy, upon which grow Leaves lesser than those below, which are something broad at there setting on, and these also a little nickt, notch, or cut in. This Stalk sometimes is single, without any Branches, and sometimes it has one or two, or three long slender ones. Out of each of the tops of which Stalk and Branches, grows one large scaly Head, with many Purple Threads in the middle, not much unlike the Common Knapweed, which at length, Thistle like, turn into Down, in which the small shining Thistle like Seed is enuolued.

V. The third, or great broad Leav'd, Soft, or Melancholy Thistle. Its Root is small and long, with several Fibres adjoined thereto. Its Leaves, are large and long, as large as those of Bugloss,

dented and set about the edges with soft Prickles, of a greenish Color, the middle Rib being white. The Stalk is tender and brittle, easy to break, and crested or corner'd, on which grow such like Leaves as are below, large at first, but gradually growing lesser towards the tops, being also more torn in or

Thistle Melancholy Great.

rent on the edges. The Stalk is also branched towards its top, each Branch bearing from among a Tuft of small Prickly Leaves, a small Prickly Thistle like head, which sometimes stand upright, and sometimes lean a little down. Out of these Heads when fully blown, appear the Flowers, consisting of a great many elegant Purple Threads, which pass into Down, in which the Seed is wrapt.

VI. The Places. The first and second grow in moist Meadows in many places of England, both in the Southern and Northern parts of our Island. *Clasius* found them growing in Hungary, and in the Mountainous Medows a long the side of the Danube in Austria; our *Pena* found them growing in the Meadows at the foot of Inglebrow-Hill in Yorkshire; *Lobel* in the Meadows at Aiton, in Gloucestershire; and *Johnson* says, that he once found the second in a Meadow between Highgate and London. The third grows in the Fields on the Mountains in Germany; and *Johnson* says it grows Wild upon the Sea-Coasts of Holland, Flanders and Zealand; and an English Gentleman told me he had found it in some Meadows on the Feet of some Mountains in North-Wales, as also in some other parts of the Kingdom.

VII. The Times. They Flower in June, July and August, and their Seed is ripe in some short time after.

VIII. The Qualities. They are hot and dry in the end of the first Degree; Aperitive, Absterive, a little Astringent, Splenetick, Nephritick, Hystrick, and Sudorifick.

IX. *The Specification.* It opens Obstructions of the Spleen and other *Viscera*, eases pains thereof, and is said to Cure Hypochondriack Melancholy.

X. *The Preparations.* You may make therefrom, 1. A Liquid Juice or Essence. 2. A Decoction in Wine. 3. A Spirituous Tincture. 4. An Acid Tincture. 5. An Oily Tincture.

The Virtues.

XI. *The Juice or Essence.* They potently open Obstructions of the Spleen, Liver, Reins and Womb, give ease in pains of the Spleen, Sides, Reins and Melentery, allay Vapors, are good against Fits of the Mother, provoke Urine and the Terms, and potently repress Melancholy, carrying off the Morbifick matter by the Urinary parts. Dose from two to four Spoonfuls, in a Glass of White Port or Lisbon Wine, or any other fit Vehicle, Morning and Night.

XII. *The Decoction in Wine.* It has all the former Virtues, but is not so strong in Operation, and therefore is to be given from a quarter to half a Pint at the times aforesaid. If a good Draught of it be given every Night at Bed-time, for some considerable Season, it cures the *Incubus*, or Night-Mare, as has been several times proved by Experience.

XIII. *The Spirituous Tincture.* Taken from half a Spoonful to a Spoonful or more in a Glass of Wine, it is not only good against all the Diseases before specified, but is a good Cordial against Sickness at Heart, Fainting and Swooning Fits, Vapors, and withall makes the Patient Chearful and Merry, wonderfully exhilarating the Spirits.

XIV. *The Acid Tincture.* It opens Obstructions, represses Vapors, strengthens a weak Stomach, and provokes Urine. Dose so many Drops in a Glass of Ale or Wine, as to give it a pleasing Acidity. It may be taken several times in the day, viz. as often as the Patient drinks.

XV. *The Oily Tincture.* It is singular against the Cholick, provokes Urine strongly, eases the Strangury, and gives wonderful relief in the most profound Melancholy. It has all the Virtues of the Juice and Essence, but ought not to be given to such as are of a very hot Constitution, unless by a Skillful Hand. It is good against Convulsions and Pulses in cold Habits of Body; potently provokes the Terms, cleanses the Reins and Womb, causes Conception, and at time of Travel eases Delivery. Dose from 10 to 20 or 30 Drops, which may be dropt into Sugar, and then mixt with a Glass of Canary, white Lisbon, or any other Vehicle the Physician shall most approve of, and to drunk up.

C H A P. DCXCH.

Of THISTLE Milky:

O R,

Ladies Thistle.

I. **T**HE Names. It is supposed to be that which the *Arabians* call *Bedeguar*: called in Greek, *Σισυμβριον*: and in Latine, *Silybum*, *Cardus lacteus*, *Cardus Marie*, & *Sancta Marie*; in English, The Milky Thistle, and Ladies Thistle.

II. *The Kinds.* We have but two special sorts of this with us, viz. 1. *Cardus Lacteus vulgaris Lobelij*; *Cardus albus Brunfelsij*; *Cardus Argentatus*; *Cardus Marie Tregi*, *Loniccri*, *Fuchsj*, *Gesneri*, & *Camerarij*; *Cardus Marianus Cordi* & *Tabernemontani*; *Cardus Leucographus Dodonei*; who with *Lacuna*, *Matthiolus*, *Cornarius*, *Fuchsius* and *Ingdunensis*, took it to be the *Leucographis Plinij*; *Silybum Angulare* & *Lobelij*; *Cardui Sytvestris aliud genus Casalpini*; Our Common Ladies Thistle, or Milky Thistle. 2. *Silybum majus*, *Cardus Spineus*, vel *Spinofus*, *Spina alba*, *Leucacantha*, The white Thorn Thistle.

The Descriptions.

III. The first, or Our Common Ladies Thistle, or Milky Thistle. Its Root is great, spreading in the Ground, with many Strings and small Fibres fastned to them; from whence rise up many large and very broad Leaves lying on the Ground, cut in, and as it were crumpled, but somewhat hairy on the

Thistle Milky:

O R,

Ladies Thistle.

edges, and of a white green shining color, wherein are many Lines, Strakes or Veins, of a Milky color, running all over the Leaf, some very small, some larger, and other some very large: These Leaves are set with many sharp and stiff Prickles all about, among which rises up one, and sometimes more Stalk or Stalks, round and full of Prickles, set full of the like Leaves up to the Tops, where at the end of every Branch, comes forth a great prickly Thistle head, strongly armed with Prickles, which contain in their middle bright Purple Thrums or Threads, which being past away, there follows the Seed, which

is large and brown, long, somewhat flattish and shining, lying enclosed in a great deal of fine, soft, white Down. All the whole Plant is bitter in Taste, which argues the excellency of its Virtues.

IV. The second, or white Thorn Thistle. Its Root is long, with some Strings adjoining to it, and perishes always before Winter. From whence rise up some Leaves lying upon the Ground, very large and long, but nothing near so large and broad as the former, which are dented or gash'd in with more or fewer large gashes, so great, as to reach almost to the middle Rib, armed sometimes in the middle spaces where there are no Dents; but especially at all the corners of each Leaf, with cruel long sharp Prickles, some longer, some shorter, which are of a hard Substance, and almost of a Milk white, or rather Cream color. The Leaf is not so green as the former, but rather of a dirty Green, nor so smooth

Thistle White Thorn.

as that, but is overspread with a green hoariness or Down upon it, through which runs some whitish Veins, almost of a Cream color, but nothing so numerous, nor so large, nor yet so white as the first. From the middle of these Leaves rises up a pretty strong, hard, prickly Stalk, of about 2 or 3 Feet high, with some few Branches towards its top; at the tops of which grow pretty large, Thistle like heads, with a purple Thrum in the middle, after which comes Thistle like Seed, enveloped in a great quantity of fine, white, soft Down.

V. The Places. They both grow almost every where in England; the first on almost every Ditch and Bank-side, and in waste Fields almost every where. The other grows also in waste and untill'd Grounds, and in many places where the other grows, and sometimes in Fallow Fields, also among Corn, and many times by High-ways sides, and the Borders of Meadows.

VI. The Times. They Flower and Seed in June, July and August, when other Thistles do; and their Seed is generally ripe the next Month following, being their time of Flowering.

VII. The Qualities. The Milky Thistle is hot and dry in the first Degree, Aperitive, Afringent, Stomackick, Sudorific and Alexipharmick:

VIII. The Specification. It is used for the Cure of Agues and Fevers, both Malign and Pestilential, to open Obstructions of the Stomach, Lungs, Liver and Spleen, and other Viscera, provoke Urine, help the Jaundice and Dropsie, and give ease in the Strangury, Dysurie, Stone, Gravel, and other Diseases of the Reins and Bladder: It is also good against Palpitation of the Heart, and other Passions of the same.

IX. The Preparations. You may make therefrom, 1. A Liquid Juice or Essence, 2. A Decoction of the Herb, Roots and Heads. 3. A Powder of the Seed. 4. A Distilled Water. 5. A Sallet of the young Stalks.

The Virtues.

X. The Juice or Essence. They are thought to be as effectual as *Carduus Benedictus*, for all the same purposes, viz. for Agues, Infectious Diseases, Malign and Pestilential Fevers, and the Infection of the Plague, both to prevent and cure it. They open Obstructions of Stomach, Liver, Spleen, Reins and Womb, are good against Hypochondriack Melancholy, Scurvy, Dropsy, Jaundice and Gout: They ease pains in the Sides, Stitches, and are profitable against the Colick and Gripings of the Guts. Dose from 2 to 4 Spoonfuls, Morning and Night, in a Glass of Mull'd Canary.

XI. The Decoction in Water or Posset-Drink. It has all the other Virtues before specified, but must be given to half a Pint or more, Morning and Night, mixed with a little Mull'd Canary, or White Port Wine.

XII. The Powder of the Seed. It may be given to a Dram Morning and Night, in any convenient Vehicle. It is said to be as good, if not more powerful for the Cure or help of all the aforementioned Diseases.

XIII. The Distilled Water. It is good against all inward Fevers and the like, to allay the heat and inflammation of the Stomach, Liver, Spleen, Reins and Womb; and besides is often applied outwardly with Cloths or Spunges, to the Regions of the Liver and Heart, to cool the hot Distempers of those parts, and to resist Fainting and Swooning Fits.

XIV. The Sallet. It is made of the young Stalks peeled and dressed, as the Stalks of other Chardons and Wild Artichokes are, which being eaten, are said to increase Milk in Nurfs Breasts.

C H A P. DCXCIII.

Of THISTLE Star.

I. THE Names. It is without doubt the *Maryas Theophrasti*, lib. 6. cap. 4. In Latine it is called *Carduus Stellatus*, and *Carduus Stellaris*, in English, the Star Thistle.

II. The Kinds. The most usual sorts of this Plant with us are only two, viz. 1. *Carduus Stellaris vulgaris*, *Carduus Stellatus Camerarij*, *Dodonai & Lobelij*; *Carduus Stellatorius sive Stellari Gesneri*; *Stellaria Augerij*; *Polycantha Cordi*; *Spinosa Stella Tabernaemontani*; *Nyctanthos Theophrasti Dalechampio*; *Carduus Muricatus Clusij*; *Hypochaeris Columnae*; *Carduus Stellatus Folij papaveris*

pisaveris erratici, Dioscoridis & Bauhini; Our Common Star Thistle. 2. *Carduus Stellaris flore albo, Carduus Stellatus flore albo*, The white Flowered Star Thistle.

The Descriptions.

III. The first, or our Common Star Thistle, has a Root which is small, long, woody, and perishing every Year, the Plant raising it self every Spring from the Seed of its own Sowing. It has divers long and narrow Leaves lying next unto the Ground, cut or torn in on the edges very deeply, into many almost even parts, soft, or a little woolly all over the green, which is a little whitish; from among

Thistle Star Common.

which rise up several weak Stalks, spread out into many Branches, all lying, or leaning down towards the Ground, rather than much raised up; so that it forms a pretty Bush set with divers the like divided Leaves up to their tops, on which do stand long and small whitish green Heads, set with very sharp and long whitish Prickles; no part of the Plant being in any part or place there prickly besides. These Prickles are of a whitish yellow, and as sharp as in any other Thistle. Out of the middle of the Head comes the Flower, composed of many small reddish Threads or Threads, after which in the said Head lies the Seed, which is small, whitish and round, enveloped in fine soft Down.

IV. The second, or white Flowered Star Thistle. Its Root is long and brown without, from whence spring up many soft frizled Leaves, deeply cut or lashed on the edges, wholly without Prickles; among which rises up a Stalk dividing it self into many Branches, and growing about two feet high, on the tops whereof are small Thistle like heads, armed round about with many sharp Prickles, not much

Thistle Star white Flower'd.

unlike to a large sparkling Star. The Flowers are of a white color, and the Seed is small and flattish round. In a word, there is little or no difference in the Form of this from the former, but in the white greenness of the Leaves, and the white threaded Flowers.

V. The Places. They are said to grow on waste and Barren places, near Cities and Towns, almost every where: The first has been found in many parts about Mile-End Green near London. The other is much more rare, not being so common to be met withall.

VI. The Times. They Flourish and Flower in June and July, and their Seed is ripe in July and August.

VII. The Qualities. It is hot and dry in the fifth Degree, Aperitive, Diuretick, Stomack, and Nephritick.

VIII. The Specification. It is used for the Cure of the Strangury, Gravel and Stone in Reins or Bladder, Fistula's, French Pox, Obstructions of the Stomach, Liver, Spleen, Reins and Womb, Agues, the Plague, and all sorts of Pestilential Diseases.

IX. The Preparations. You may make therefrom, 1. A Liquid Juice or Essence of the whole Plant. 2. A Powder of the Seed. 3. A Powder of the Root. 4. A Distilled Water from the whole Plant.

The Virtues.

X. The Juice or Essence. Drunk from 2 to 4 Spoonfuls in a Glass of white Port, or Lisbon Wine, it opens all Obstructions of the Viscera, cleanses the Stomach, Womb, Reins and Bladder, gives ease

ease in the Strangury, provokes Urine, helps to break gritty Stones, and to expel them. It prevails powerfully against the French Pox, induces the Cure of Fistula's, is profitable against the Plague, and all Pestilential Diseases, and Cures Quotidian and Tertian Agues.

XI. *The Powder of the Seed.* Given to a Dram or Dram and half, Morning and Evening, in white Port, or Lisbon, or Sherry Wines, either raw or Mull'd, it gives ease in the Strangury, provokes Urine, and is profitable against Gravel, Stone and Tartarous Mucilage, whether in the Reins or Bladder.

XII. *The Powder of the Root.* It may be given from one Dram to two in Mull'd Sack, Morning and Night, against the Plague or Pestilence, and all sorts of malign and Pestilential Diseases; and so taken also for some time, it is said to induce the Cure of Fistula's in any part of the Body.

XIII. *The Distilled Water.* *Bupispha Sardus* commends it (being drank) against the French Pox, to open Obstructions of Liver and Spleen, cleanse the Blood, and to cure Quotidian and Tertian Agues. If these are the Virtues of the *Distilled Water*, I am sure the *Juice* or *Essence* aforementioned, will perform the same things much more powerfully.

C H A P. DCXCIV.

Of THISTLE Hartichoak-like.

I. **T**HE Names. It is said to be the *Συλίσμα* Dioscoridis; in Latine *Scolymus*, *Carduus Cinarus*, *Carduus Cynareus aculeatus*; in English, *The Hartichoak-like Thistle*.

II. *The Kinds.* It is *Singularis sui generis*, a true Thistle like Plant, its Leaves being armed with Prickles as most other Thistles are.

Thistle Hartichoak-like.

The Description.

III. *As its Root is great, so it spreads much, and springs forth out of the Earth with several large hard narrow Leaves, which as they are variously and irregularly indented and gash in on the sides, so are they at every corner of those dashes, armed with stiff and sharp prickles, as other Thistles generally are. These Leaves where they close upon the Stalk, encompass the same, and are of a dark green color. It sends up sometimes but one Stalk, and sometimes two or more, at the top of which Stalk comes forth a Thistle-like scaly prickly Head, lesser than those of the Chardons, which are kept to be eaten, which is also armed with stiff sharp prickles, from the middle of this Head comes forth a purplish Gimson Thym, or heap of Threads, which after some few days pass away, and the Seed remains in the Heads being flat, and like other Thistle-Seed, enveloped in Down.*

IV. *The Places.* It grows wild in many Southern Countries, as about *Mompether in France*, but with us it is only to be found in our Gardens.

V. *The Times.* Its Flowers in the end of Summer, and the Seed is ripe in about 4 or 5 Weeks after.

VI. *The Qualities.* It is hot and dry in the first Degree, Aperitive, Astringent and Diuretick.

VII. *The Specification.* It has the general property of most other Thistles, viz. to remedy the stinking Savor of the Arm-Pits, and indeed of the whole Body, and to expel strong and stinking Urine, thereby cleansing the Reins and Bladder of Filth, and mucilaginous Recrements lodg'd in those parts.

VIII. *The Preparations.* The Decoction of the Roots or Heads, or both in Water or Wine, is that which is chiefly used Medically.

The Virtues.

IX. *The Decoction aforementioned.* Made with Water or Wine, or half Water half Wine, being taken Morning and Evening to half a Pint or more, sweetned with double refin'd Sugar, provokes Urine after a singular manner; and by the Urinary passages carries off all the fetid or stinking Recrements of the Blood and Humors, which cause the Arm-Pits and whole Body to have an ill Smell; and withal cleanses the Reins and Bladder of Gravel, Sand, and Tartarous matter lodg'd in those parts.

C H A P. DCXCV.

Of THROUGH-WAX:

O R,

Through - Leaf.

I. **T**HE Names. Since no Greek nor Antient Latin Authors have wrote of this Plant, we can give you no Names from them. Our modern Authors do generally call it, *Perfoliata*, and *Perfoliatum*: In English, *Through - Leaf*, and *Through-Wax*.

II. *The*

II. *The Kinds.* We have an account of ten or twelve sorts of this Plant, but most of them being Strangers to us, we shall only take notice of such as are to be met with in Great-Britain, which are the three following, viz. 1. *Perfoliata vulgaris*, Our common Through-Leaf. 2. *Perfoliata flore multiplici*, *Perfoliata longifolia* Dalechampi in Lugdunensi, Double Flowered Through-Wax, or Through-Leaf. 3. *Perfoliata siliquosa vulgaris*, *Napifolia Anglorum siliquosa* Lobelij, Camerarij, Gesneri, Tabernamontani, & Tragi; *Perfoliata Napifolia* Lobelij, because as he says, it partakes of the Navev; and therefore some have called it also *Brassica campestris*, *Sylvestris* vel *Agrestis Siliquosa*, or *Perfoliata*: Our Common Codded Through-Wax, or Through-Leaf.

The Descriptions.

III. The first, or our Common Through-Leaf, has a Root which is small, long and lignous, perishing every Year after Seed time, and rising plentifully of its own Sowing the Spring following. It sends forth one straight round Stalk, and sometimes more, two Feet or more high, whose lower Leaves being of a blewish green Color, are smaller and narrower than those up higher, and do stand close thereto, not encompassing it, but as they grow higher, they do more and more encompass the Stalk they spring from, until it wholly (as it were) passes thro' them; branching towards the top into many

Through-Leaf Common.

parts, where the Leaves grow smaller again, every one standing singly, and never two at any Joint. The Flowers are very small and yellow, standing in Tufts at the heads of the Branches, where (the Flowers being pass'd away) the Seed follows, which is small and blackish, many thrust thick together.

IV. The second, or Double Flowered Through-Leaf. This differs in nothing from the former, but in the Heads of Flowers, which are thicker set together, and larger, but give no Seed, being wholly a degenerate Species, rising from the Seed of the former, spending its Strength and Increase in its plentiful Heads of Flowers.

V. The third, or our Common Codded Through-Leaf. Its Root is small and woody, perishing after Seed time, which sends up weak Stalks, spreading themselves out at every Joint, with Leaves set at them, encompassing them at the bottom, very like unto the first Common Through-Wax, but thicker, fatter, and longer pointed, and of a whiter green Color, most like unto Cabbage or Colewort Leaves, and usually with an unevenness on the edges. The tops of the Branches are furnished with many small white Flowers, standing one above another, consist-

Through-Leaf Codded.

ing of four Leaves a piece, which afterwards turn into small long Cods, which are as it were square, in which is contained round brownish Seed.

VI. Gerard describes this Codded Plant thus. Its Root is long and single, dying when it has brought forth its Seed. It has small tender brittle Stalks 2 Feet high, bearing Leaves which wrap and enclose themselves round about, altho' they are not run thro' as the others are; yet they grow in such a manner, that upon the sudden view thereof, they seem to be pierced or pass thro' as the others are. Upon the small Branches do grow small white Flowers, which being past, there follow slender long Cods, like those of Turneps or Navevs, whose Leaves and Cods do somewhat resemble the same, from whence came the Name *Napitolia*. There is a wild Kind hereof growing in Kent, in many places among the Corn, like this in each respect, but altogether less; which if it was brought into Gardens, would no doubt prove the very same.

VII. The

C H A P. DCXCVI.

OF THROAT-WORT:
OR,
CANTERBURY-BELLS.

I. THE Names. This Plant is called in Greek, *Τετρακλιν*; in Latine, *Trachelium, Cervicaria*, (for that it is good against the Strumous Kemels in the Neck and Uvularia, (because it helps the Uvula, or Palate of the Mouth as some call it.) in English Throat-Wort or Canterbury-Bells.

II. The Kinds. Authors make Fifteen or Sixteen, or more Kinds of Throat-Worts, but most of them being Strangers with us, and scarcely to be seen in some Ages, unless by Travellers, we shall only take notice of those which grow in our Country either Wild, or in Gardens, which are the seven following, viz. 1. *Trachelium minus Dodonæi, Lobelij, aliorumque, Cervicaria minor Tabernemontani, Uvularia exigua Tragi*, The lesser Throat-Wort or Canterbury-Bells. 2. *Trachelium majus flore albo vel purpureo simplex*, The greater Throat-Wort or Canterbury-Bells. 3. *Trachelium majus flore duplici albo & Ceruleo*, The greater Throat-Wort or Canterbury-Bells double flowered, white and blew. 4. *Trachelium majus Belgarum Lobelij*, The greater Dutch Throat-Wort. 5. *Trachelium Gigantum flore purpurante*, Giants Throat-Wort, or Canterbury-Bells with a pale purple Flower. 6. *Trachelium serotinum*, Late Flowering Throat-Wort or Canterbury-Bells. 7. *Trachelium Americanum flore ruberrimo, Planta Cardinalis*, The rich Crimson American Throat-Wort or Cardinals Flower.

Throat-Wort small, Common.

7 H

The

VII. The Places. The first is found oftentimes in our Land, in Corn Fields, and Pasture Grounds. *Johnson* in *Gerard* says it grows plentifully in many places about *Kent*, and between *Farningham* and *Aimsford*, it grows in such quantities in the Corn-Fields, as one *Mr. Bowles* says, on the tops of the Hills, that it may well be termed a Nuisance. The second is Nurst up in Gardens, as indeed are all the three Kinds. The third grows also in our Corn-Fields, and Wild as *Lobel* affirms; but is for the most part Nurst up in our Gardens.

VIII. The Times. They all Flower thro' the Months of *June* and *July*; and their Seed is ripe in *July* and *August*.

IX. The Qualities. Through-Leaf is hot and dry in the first Degree; Absterfve, Astringent and Vulnerary.

X. The Specification. It is used for Bruises and Wounds whether inward or outward, and Ruptures of all kinds, whether in Old or Young.

XI. The Preparations. You may make therefrom, 1. A Liquid Juice or Essence from the whole Plant. 2. A Decoction in Water or Wine. 3. A Powder of the dried Herb. 4. An Oil or Ointment. 5. A Cataplasm of the Leaves. And these may be made of either of the Kinds: The Coddled Species having (as *Tragus* says) the same Operation and Virtues with the other, and working the same Effects.

The Virtues.

XII. The Liquid Juice or Essence. Either of them may be given inwardly from 2 to 4 Spoonfuls in red Port Wine, or Barabar Wine Mull'd, Morning and Night, for inward Wounds or Bruises, or inward Ulcers in the Lungs, Reins, Bladder or Womb; as also for Ruptures whether of the Navel, Testicles or Groin, and the parts outwardly affected may be washed and fomented with the same, to induce a speedy Cure, whether in Old or Young.

XIII. The Decoction in Water or Wine. It has the same Effects, but is much weaker, and may be used in the same manner: When taken inwardly, it may be given to half a Pint or more at a time.

XIV. The Powder of the Leaves. It has the force of the Juice or Essence, being given to a Diam or more at a time Morning and Evening, so long as need shall require. Outwardly strewed upon old, putrid and running Ulcers, it cleanses them, has an incarnate force, dries, and quickly heals them.

XV. The Oil or Ointment, made of the green Herb. It is good to ease Pain, repels a Flux of Humours to any part, to cleanse and dry old Ulcers, and speedily to heal up green Wounds, being Artfully applied.

XVI. The Cataplasm. Applied outwardly; it has the same Force and Virtues with the former Preparations; it dissolves simple and recent Contusions, but is of principal use for the cure of Ruptures in Children, before they grow too old.

THREE-FACES in a Hood, see Hearts-Ease, Chap.

Grass, Chap. 327. Self. 226, 227.

THRIFT, see } 228.

Pinks, Chap. 564. Self. 18. 19,

40.

The Descriptions.

III. The first, or lesser Throat-Wort or Canterbury-Bells. The Root is lasting, shooting up a fresh every Year. It has smaller Leaves, and nothing so broad as the great Kind, but long, and little or nothing dented about the edges. The Stalks are square, and brownish if it bears purple Flowers, but green if it bears white Flowers, which in Form are alike, and grow in a Bush or Tuft thick set together, more than any of the others, and smaller also, being not much bigger than the Flowers of the Field or Garden Rampions.

IV. The second, or greater Throat-Wort, or Canterbury-Bells. Its Root is hard and white, spreading it self out into many Branches under Ground, not perishing every Year (tho' it looses all its Leaves in Winter) but abiding many Years, and increasing into several Heads or Knobs, from whence spring up new Leaves and Branches. It has many large and rough Leaves, something like unto Nettle Leaves, being broad and round at the bottom, and pointed at the end, and notched or dented on the edges, every one standing on a large Footstalk. From among these Leaves rise up divers square rough Stalks, divided at the top into several Branches, on which grow the like Leaves as at bottom, but lesser; towards the ends of the Branches stand the Flowers intermixed with some longer Heads, every one in its several Husk, which are hollow, long and round, like a Bell or Cup, wide open at the Mouth, and cut at the Brim into five Corners or Divisions, somewhat lesser than the Coventry Bells, in Chap. LXIV. Sect. V. foregoing; which in some Plants are of a pure white, in some whitish, and in others of a fair, deep, Purple color, and in other some paler. After the flowers are past, come smaller and rounder Heads than in the Coventry-Bells, containing flat Seed, but blacker, and not so red as these.

V. The third, or greater Throat-Wort, or Canterbury-Bells. Its Root is like the last foregoing, nor does it differ in any thing therefrom, but in the duplicity of its Flower; and there is of both white and Purple Kinds, a double Flower'd Species, which bears double white Flowers, and double Purple or Blue.

VI. The fourth, or greater Dutch Throat-Wort. Its Root is pretty large, spreading under Ground, and has many fibres adjoining. It rises up with several Branches or Stalks, which are tall, great and hairy, with several Leaves set thereon at distances, sometimes singly, and sometimes two together upon short Footstalks, which are pretty long, broadish at bottom, and so growing gradually to a sharp Point, and are notched like a Saw on the edges, not much unlike those of the greater Throat-Wort at Sect. IV. above, saving that these are much greater both in the Leaves and Stalks. The Flowers are of a Purplish blew color, and almost as large as those of the Coventry-Bells: In all other particulars it agrees with the former greater Kind.

VII. The fifth, or Giants Throat-Wort, or Canterbury-Bells. Its Root is great, thick and white, not perishing Annually, but abiding many Years. This tho' it has a Gigantine Name, yet scarcely ever grows higher than the second sort foregoing. Its Leaves are not so rough, but as large, and dented about the edges, somewhat larger pointed, and of a fresher green color. The Stalks bear such like Leaves on them, more thinly or dispersedly set, having a Flower at the bottom of every Leaf from the middle upwards, being somewhat like the great Throat-Wort in Form, but of a pale or black reddish

purple color, turning their Brims or Corners a little backward, with a Forked Clapper in the middle, which is eminent and yellow. The Seed is white, and plentiful in the Heads, which will abide all the Winter upon the Stalks, until all the Seed being shed, the Heads remaining seem like torn Rags, or thin pieces of Skin eaten with Worms. There is another of this Species, but it differs in nothing from this now Described, but in its Flower, which is White.

VIII. The sixth, or late Flowering Throat-Wort, or Canterbury-Bells. Its Root is thick and bushy, its lower Leaves are Downy, dark, green, and pretty soft in handling, broad at bottom and small, and sharp at the point, unevenly waved or notched about the edges. The Stalk rises up to be about 3 Feet high, being soft, and almost woolly like the Leaves, spread out into some Branches at the top, bearing many Bell-fashioned Flowers, like the first greater sort (at Sect. IV.) but smaller, and of a pale blewish or purplish Ash color, which by reason of their late Flowering, gave occasion for the Name.

IX. The seventh, or rich Crimson Throat-Wort of America, or Cardinals Flower. This brave Plant has a white Root, which spreads it self divers ways under Ground, and sends forth many green Leaves, which are spread round about the head thereof, each of which is something broad and long, pointed at the end, and finely snipt about the edges. From the midst of which rises up a round hollow Stalk, two Feet high at least, beset with divers such Leaves as grow below, but longer below than above, and spreading it self out at top abundantly, every Branch bearing divers green Leaves on them, and one at the Foot of every one of them also, the tops whereof do end in a very large Tuft of Flowers, with a small green Leaf at the foot of the Stalk of every Flower, each Footstalk being about an Inch long, bearing a round green husk, divided into five long Leaves or Points turned downwards; and in the midst of every one of them, a most Rich Crimson coloured Flower, ending in five long narrow Leaves, standing all of them fore-right, but 3 of them falling down, with a long Umbone or Pointle, set as it were at their back, bigger below, and smaller above, with a small Head at top, being of a little paler color than the Flower, but of no Smell at all, admirable only for the so great a Bush of Orient red Crimson Flowers. The Seed is inclosed in small Heads, within those green husks which held the Flowers, which is very like to the Seed Vessels of the Coventry-Bells, and is small, and of a brownish color.

X. The Places. The first has been found growing in the Meadow next to Ditton's Ferry, as you go to Windsor; upon the Chalky Hills near Greenbith in Kent; and in a Field by the Highway, going from thence to Dartford; in Henningham-Park in Essex; and in Sion-Meadow near Brainford, not far from London. The second grows plentifully in Woods and Hedge rows in Kent, about Canterbury, Sittingbourn, Gravesend, Southfleet and Greenhithe, especially under Cobham Park Hall, leading from Southfleet to Rochester; at Eltham, about the Park not far from Greenwich, and in most Pastures about Watford and Busby, and parts adjacent to them. The third grows in Gardens. The fourth grows in Holland and Flanders, and several parts of England. The fifth grows plentifully Wild upon the Banks of the River Ouse in Yorkshire, and other places. The sixth sometimes Wild, but mostly in Gardens. The seventh grows near the River Canada, and in some parts of New-England and other parts of America; but in a word, all these several Species are Nurst up in many of our Gardens here in Great-Britain.

XI. The

XI. *The Times.* They Flower from May to the end of July or August, the Seed ripening in the mean time.

XII. *The Qualities.* They are cold and dry in the first Degree, Absterfivē, Afringent, and Vulnerary.

XIII. *The Specification.* Throat Wort cures Inflammations, Wounds and Ulcers in the Tonfils, Palate, Throat, Mouth, and Secret parts of Man or Woman.

XIV. *The Preparations.* You may make therefrom, 1. A Liquid Juice or Essence. 2. A Decoction in Water or Wine.

The Virtues.

XV. *The Liquid Juice or Essence.* They are Afringent, and found to be effectual to gargle and wash the Mouth and Throat, where is any Tumor, or Inflammation of the Tonfille, Uvula, Throat, Mouth, Gums; as also Wounds, Sores or Ulcers in those parts, being gargled withal warm, or Syringed into the Throat: So in like manner it is appropriated to running Sores and Ulcers in the Neck, or Secret parts of Man or Woman, whether outward or inward, being often wash'd therewith; if outward, or injected in with a proper Yard or Womb Syringe, they wonderfully cleanse, dry, and heal them: But if the Sores or Ulcers are inveterate or stubborn, it will begood to add an oth part of Spirit of Wine thereto, and sweeten the same with Honey, and towards the conclusion, to every Pint of the Liquid, to add an Ounce or six Drams of Roch Alum in fine Powder.

XVI. *The Decoction in Water or Wine, or in half Water half Wine.* If it is made strong, it has all the same Virtues, being used in like manner with Spirit of Wine, Honey and Alum, and so applyed as a Gargarism, or as a Lotion, or as an Injection with a proper Syring; and it performs the like in old running Sores or Ulcers in the Neck, or any other part of the Body; and by its Faculty of drying and binding, it restrains the Flux of sharp humours to any Ulcer, Sore or part, which fretting the place, keeps it from healing: It heals also simple green Wounds, conglutinating their Lips after an excellent manner.

C H A P. DCXCVII.

Of T H Y M E, Vulgarly called

THYME - Garden.

I. *THE Names.* The Arabians call it *Hafce*: in Greek it is called *Θυμ* (and *τὸ θυμ*), quod *ipsi qui animi deliquimus patientur adhibetur*; in Latine, *Thymus* and *Thymum*: in English *Thyme*, and *Time*.

II. *The Kinds.* The cheif or principal Kinds are two, viz. 1. *Thymus Hortensis*, Garden Thyme, of which in this Chapter. 2. *Thymus Sylvestris*, *Serpillum*, Wild Thyme, or Mother Thyme, of which in Chap. 698. next following.

III. *The Species of the Garden Kind.* They are chiefly five, viz. 1. *Thymus Hortensis*, *Thymum Hortense commune*, *Thymus durior*, *Thymus vulgaris nostras*, *Thymum durius* & *nigrum*; *Pepolina*

Cesalpini, Our Common Garden Thyme. 2. *Thymum Legitimum capitatum*, *Thymum verum Dioscoridis*, *Thymum capitatum*, *Thymum creticum*, The true Thyme of the Antients. 3. *Thymum durius Candidius*, Hoary Garden Thyme. 4. *Thymum Ciratum*, *Thymum Limonatum*, Limon Thyme. 5. *Thymum Masticeum*, *Thymum Latifolium*, also *Serpillum Hortense*, Mastich Thyme.

The Descriptions.

IV. The first, or our Garden Thyme, has a scrubby, fibrous, woody Root, which will live thro' many Winters, if they be not too vehement or sharply cold, and the Plant it self be not grown too great or woody, which will also cause it to perish or dye. It is a small low shrubby or woody Plant, with brittle

Thyme Garden, common.

Branches, and small hard green Leaves on them, with small white purplish Flowers, and some Leaves among them, standing in rundles round about the Stalks, after which comes the Seed, which is small, and browner than that of Marjoram. The whole Plant is of an exceeding Aromatick and sweet Smell, very acute and pleasing to the Senses.

There is a Defect in the Cut of this Species, for here it is represented like Thyme cut off or cropt, the Graver having cut off the Tops, or left out its rundles of Flowers and Seeds. This kind is for the most part propagated by Slips, set in the Spring-time, after the very cold Weather is past.

V. The second, or true Thyme of the Antients. Its Root is woody, pretty long, (respect being had to the Magnitude of the Plant) and slender, with many Fibres adjoining to it. It is a very tender Plant, having hard and hoary brittle Branches, spreading out from a small woody Stem, nearly a Foot high, on which grow at several Joints, many small, whitish or hoary green Leaves, of a quick Aromatick sweet Smell and Taste. At the tops of the Branches stand small whitish green Heads, somewhat like unto the Heads of Stoechas, which are made up as it were of many Leaves or Scales; out of which come forth small purplish Flowers, not having any manifest Seed, as Theophrastus, and some of the other

Thyme true of Dioscorides.

Ancient Authors say, but the produce of those heads being Sown, give a new increase of the Plant, which is a perfect Demonstration that it is not without its proper Seed.

Thyme Hoary.

VI. The third, or Hoary Thyme. Its Root is woody, brittle, small, fibrous, and perennial. It is in form almost like the first Describ'd, saving that

it grows not so high, its Leaves are longer or larger, and withal Whiter, or a little Hoary, and a little more thinly or dispersedly set: Its Branches are also smaller, but its Flowers and Seeds grow in rundles towards the tops like that, and not unlike them for Form; but more acute or quick in its Smell and Taste, than Our Common Garden Thyme.

VII. The fourth, or Limon Thyme. It is a tender but Noble Plant, not much differing in its Root, Stalks, Branches, Leaves, Form and manner of Growing, from our Common Thyme, saving that it grows more upright, bushing or spreading it self out thick with Branches. The Leaves are small, and of a green color, which with its Heads or Rundles of Flowers and Seed, have the perfect Smell of a Citron or Limon, but more acute and Aromatick; and the Flowers are also whiter than those of the Common sort.

VIII. The fifth, or Mastich Thyme. Its Root is woody, fibrous and perennial. It grows not so upright as the former kinds, but rather lyes or spreads upon the Ground with small Branches, but many more in number, and nothing near so woody; the Leaves also are not so hard, but stiffer and broader. The Flowers grow in rundles at the tops of the Stalks and Branches of a purplish robian color, like those of the first and third sorts foregoing. This better endures the Winter, and longer, but gives no Seed with us, and is therefore propagated by Slip-ping. It has an Aromatick, Odoriferous pleasant Smell and Taste, yet scarcely so quick as the Common Kind.

IX. The Places. The second grows plentifully about Sevil in Spain, (where they know no other Thyme) as also in Italy, Syria, Condia, and several parts of Greece; but that, with all the rest, are Nurst up with us in Gardens. The fourth Kind Gerard says, he found growing Wild in a Barren Field at Southfleet in Kent; but it is truly with us a Garden Plant; yet it is found in many places in Kent, between Southfleet and Lingsfield-Downes, and between Rochester and Sittingbourn, even in the High-way, where, by its very Smell, it may be known from the Common.

X. The Times. They Flower with us about the latter end of June, and thro' all July; but the second Species Flowers later, viz. scarcely till August.

XI. The Qualities. They are hot and dry in the third Degree at least; Aperitive, Absterfive, Afringent, Diuretick, Stomackick, Cephalick, Neurotick, Hytterick, Nephritick, Alexipharmick, and Emmenagogick.

XII. The Specification. Thyme is used chiefly for Diseases of the Head, Brain and Nerves, as Lethargies, Vertigo's, Palsies, Convulsions, Apoplexies; also for Sickness at Heart or Stomach, Faintings, Swoonings, Palpitation of the Heart, Obstructions of the Lungs, and the Strangury. It provokes the Terms in Women, expels both Birth and After-birth, and helps such as are dull Sighted, and have a bad Memory.

XIII. The Preparations. You may make therefrom, 1. A Liquid Juice. 2. An Essence. 3. A Decoction in Water and Wine. 4. A Decoiled Oil. 5. A Powder. 6. A Cataplasm. 7. A Distilled Water. 8. A Spirit. 9. A Distilled Oil. 10. Potestates or Powers. 11. A Spirituous Tincture. 12. An Acid Tincture. 13. An Oily Tincture.

The Virtues.

XIV. The Liquid Juice. Bathed upon Warts it takes them away; it dissolves cold Tumors, and eases

eases Pains in any part proceeding from a cold Cause, by applying it to the Place: And snufft up the Nostrils as an Errhine, it purges the Head and Brain of cold pituitous Humors which cause Apoplexies, Lethargies, Vertigo's, Palsies, dullness of Sight, weakness of the Memory, Head-achs, Megrim, &c.

XV. *The Essence.* Given from one Spoonful to two Spoonfuls or more, in the *Distilled Water*, or other proper Vehicle, it causes an expectation of Flegm (so also if it is taken with Honey, Salt and Vinegar:) It is good for the Spleen, shortness of Breath, and difficulty of breathing; kills Worms in the Belly, provokes Urine and the Terms, facilitates both Birth and After-birth, expels the dead Child; and being bathed upon recent Tumors, it dissolves them.

XVI. *The Decoction in Water or Wine, or in a mixture of both.* It has the Virtues of the *Essence* aforegoing, but as it has not the same strength, so it ought to be given in a much larger quantity, as to half a Pint at a time, more or less; it helps such as are dull Sighted, have a bad Memory, and an ill Digestion, because it warms, comforts, and strengthens the Tone thereof.

XVII. *The Decoiled Oil.* It is Anodyne, eases all Aches and Pains in any part, as also painful Tumors, Gout, &c. arising from cold and moist Causes, being bathed Morning and Night upon the parts affected before the Fire: It eases Gripping pains in the Belly, pains of the Spleen, and is very effectual in curing the Cramp.

XVIII. *The Powder of the Leaves and Heads.* Used as an Errhine, it cleanses the Head and Brain of cold and moist Recrements, which are the causes of many Diseases. It is of good use in Meats and Broths, to warm and comfort a cold and moist Stomach, to help Digestion, and expel Wind. If given to three Drams (I should think two Drams to be enough) in Oxymel fasting, it is said to purge Cholera and other sharp Humors, and help such as have the Gout, and is profitable for such as have an Apoplexy, Falling-Sickness or Lethargy. Given to a Dram, or Dram and half every Morning fasting in Mead, or Oxymel, it brings down a great Belly, and takes away the hardness thereof. It is good against the swelling and pain of the Spleen, pains in the Reins and Hips; eases pains in the Eyes, and helps such as are Blear-Ey'd. Given to two Drams in White Port or Lisbon Wine, it provokes Urine, gives ease in the Strangury, and expels Sand, Gravel, and Tartarous Slime in the Reins and Bladder: Mixt with a double or treble quantity of Honey, and given in *Aniseed Wine*, it is comfortable to the Head and Stomach, expels Wind, eases the Strangury, and helps a dry Cough.

XIX. *The Cataplasim.* The Leaves beaten into a pulp in a Stone or Brass Mortar, adding a sufficient quantity of the *Liquid Juice*, and brought to a Consistency with Bean or Wheat-Flower, or white Bread, eases the pain, and dissolves the Tumor in the Cods which are much tumified or swollen: So also applied to the Forehead and Temples, it eases the Megrim, Headach, and helps other Diseases of those parts.

XX. *The Distilled Water.* It has the Virtues of *Juice* and *Essence*, but much weaker: Mixed with *Vinegar of Roses*, and applied as an *Epithem* to the Forehead and Temples, it is said to ease the raging pain of the Headach and Megrim; help against the Vertigo, and abate the raging in Frenzies and Deliriums. Given inwardly to 4 or 6 Ounces, with 40 or 60 Drops of *Oleum Tartari per deliquium*, it is said to break the Stone in the Bladder; at least it potently cleanses the Urinary

parts of Sand, Gravel, and Tartarous Mucilage odg'd in those parts.

XXI. *The Spirit.* Given to a Spoonful or more, at a time, either alone well dulcified with Sugar, or *Syrup of Clovegilliflowers*, or in a Glass of generous Canary, it very much comforts the Stomach, warms and strengthens it, is good against palpitacion of the Heart, Sickness at Heart, Fainting and Swooning Fits, and other illnesses of the middle Ventricle.

XXII. *The Distilled Oil.* It is of excellent use for all cold and moist Diseases of the Head, Brain and Nerves; and therefore is a most potent thing against Convulsions, Cramps, Apoplexies, Epilepsies, Vertigo's, Lethargies, Palsies and Agues. Dose from 4 Drops to 10, according to Age and the exigency of the Disease, being dropt into fine Sugar, and then mixt with some proper Vehicle to swallow it down in.

XXIII. *The Potestates or Powers.* They have all the Virtues of the *Essence, Oil and Spirit*, are very subtil, and penetrate more than either of them; (and in my Opinion) are better to be given in Vertigo's, Lethargies, Convulsions, Apoplexies, Epilepsies, Palsies, Gout, &c. and much more effectual than the *Essence* or *Spirit*, and more sife than the *Oil* for outward application. Dose from 30 to 60 Drops or more in Canary, or any other convenient Vehicle Morning and Night, to be used with a *Continuando*, so long as the necessity of the Disease shall require.

XXIV. *The Spirituous Tincture.* It is Cephalick, Neutotick, Stomatick and Hysterick, good against all the cold and moist affections of those parts; warming, comforting and strengthening them, and restoring their Tone when profligated or hurt. Dose from 20 to 50 Drops in Wine, or some other fit Vehicle, which may best agree with the Stomach of the Patient.

XXV. *The Acid Tincture.* It is an *Alexipharacon*, good against the Plague or Pestilence, and all sorts of Pestilential Diseases, by defending the Heart, and destroying the very Essence of the Malignity: It is also good against the bitings of Serpents or Mad Dogs, or any other Venomous Creature, by destroying the ferment of the Poison, and so putting a stop to its Carrere, that it may not infect the Blood, and contaminate the Vital and Animal Spirits. Dose so many Drops as to make the Vehicle, as Canary or other Wine, pleasantly sharp, and to be repeated 3 or 4 times a day as necessity may require.

XXVI. *The Oily Tincture.* It is a Nephritick, and powerfully opens all Obstructions of the Reins, Ureters and Bladder, as also of the Womb: It gives ease in the Strangury, provokes Urine, and cleanses the Urinary passages of all sorts of Heterogene matters; and many times carries off by Urine, the Morbifick cause of Palsies, Lethargies, Apoplexies, Epilepsies, Rheumatisms and Gouts: It opens Obstructions of the Womb, provokes the Terms, facilitates the Birth, gives ease in the Collick, and suppresses Vapors, whether arising from the Stomach, Spleen or Womb. Dose from 6 Drops to 10, 15, or 20, in any proper mixture, as the Age and Nature of the Disease may require.

CHAP. DCXCVIII.

OF THYME - WILD :

OR,

MOTHER-THYME.

I. **THE Names.** It is called by the Arabians *Hemen* : in Greek *Ἑστιακὸν* and *τὸ ἑστῆν*, & *Serpento dictum* in Latine, *Serpillum*, and *Serpillum*, *Thymum Sylvestre* : and in English, *Wild Thyme*, *Mother Thyme*, or *Mother of Thyme*.

II. **The Kinds.** There are many Kinds of this Plant, but we shall treat only of the five following, viz. 1. *Serpillum majus flore purpureo*, & *flore albo*, vel *Candido*, The greater Wild Thyme, or Mother Thyme, both with a purple and white Flower. 2. *Serpillum Sylvestre Clusij*, *Serpillum Narbonense Lobelij*, *Clusius* his Wild Thyme. 3. *Serpillum vulgare minus*, *Ἑστιακὸν ἁγρὸν*, *Serpillum Sylvestre minus*, Our Common Wild Thyme, or Mother Thyme. 4. *Serpillum Moschatum*, Musk'd Mother Thyme. 5. *Serpillum aureum*, *flore variegatum*, Gilded or changeable Coloured Wild Thyme.

The Descriptions.

III. The first, or greater Wild Thyme, or Mother Thyme. Its Root is bushy and fibrous, almost like that of Our Common Garden Thyme. It grows more upright than other Wild Thyme does, with two Leaves for the most part at a Joint like the other, but greater, and not of so dark a green

Mother of Thyme.

color. The Flowers grow at the tops of the Stalks, not much unlike to the Garden Thyme, of a reddish purple color, but somewhat larger, as the whole Plant is : Its Smell is not vehemently strong, but Thyme-like sweet, and of a hot Taste. There is another sort of this Species, differing only in these things, that its Leaves are of a fresher green, and its Flowers of a white color.

IV. The second, or *Clusius* his Wild Thyme. Its Root is woody, and it springs up with many hard or woody Branches, standing in a manner upright, or but a little inclining, set with many Leaves together at spaces, somewhat longer than in any other sort of Thyme. The Flowers grow in Rundles by spaces towards the tops of the Stalks, with some few Leaves at them, being of a purplish color, very like to Garden Thyme, which Leaves, as also the Stalks, are of a whitish hoariness, and abide all Winter. It is of a strong heady Aromatick Smell, a little like to Southernwood.

V. The third, or our common Wild Thyme, or Mother-Thyme. Its Root runs several ways under the upper Surface of the Ground, with many small Fibres springing from it ; which spreading Root

Thyme Wild, Small

springs up in several places, so that the Plant seems to be a roundish Bush or heap of Thyme laid and spread about the same. It springs up with many hard brownish Branches round about the said Root, all of them lying as it were upon the Ground, which also take Root again as they lie, and so spread themselves every way. The Leaves are small and of a sad green color, smelling like unto Thyme, but not altogether so acute or quick, nor yet of altogether so hot or quick a Taste. The Flowers grow at the tops of the Branches of a purple color. There is another sort of this Species, differing nothing at all therefrom, but only in the color of the Flower, which is white.

VI. The fourth, or Musk'd Mother - Thyme. It has a running small fibrous Root, which sends forth Branches, growing as it were upright, but with fewer Stalks, and thinner set with Leaves, which are somewhat longer than those of the Com-

mon

mon Thyme, and not of so sad a green color : Its Flowers grow in rundles towards the tops of the Stalks and Branches, and the Smell of the whole Plant is very near to that of Musk, from which it took its Name.

VII. The fifth, or Gilded, or Changeable colored Wild Thyme. The difference of this Species from the common Wild kind, consists chiefly in the variable mixture of Green and Yellow, in the Leaves of this Thyme ; for the green Leaves thereof are in some striped, and in others edged with a Gold yellow color, which has given occasion to its Gilded or Changeable colored Name.

VIII. The Places. In many Foreign Countries where the Climates are warm, as Syria, Greece, Creet, Spain, Italy, &c. they are said to grow Wild, whence they are called *Wild Thyme* ; but with us in England, they are all Nurst up in Gardens : However the third Species I have found growing in many Counties of our Land, as in Norfolk, Cambridgehire, Essex, Kent, Surry, &c. That with white Flowers which is the more rare, has been found growing on Bushy Heath, in Digwell-Meadows by Hatfield.

IX. The Times. They Flourish all the Summer long, but their Flowering time is chiefly in June and July.

X. The Qualities, Specification, Preparations and Virtues of these Mother-Thyme Plants, are altogether the same with those specified of Garden-Thyme in the former Chapter ; nor is there any manifest difference between them as to their Force, Strength and Effects, so that we need say no more thereof in this place.

TORCHES, see Mullein, Chap. 507, 508, 509.

C H A P. DCXCIX.

of TOBACCO English.

I. **THE Names.** It has no Arabic nor Greek Name that we know of, being a Plant unknown to the Antients ; but our Moderns have called it in Latine *Petum* (which is said to be the proper Indian Name) and *Nicotiana*, (from one Nicot a French-Man, Resident in Portugal, who first sent it to the Queen of France, from whence it was also called *Herba Regina* :) It was also called *Tabacco*, as first coming to us from an Island of that Name in the West-Indies : *Lobel* accounts it a kind of *Hyoscyamus* or *Henbane*, and therefore called it *Hyoscyamus Luteus*, and *Hyoscyamus dubius*, as being a yellow or doubtful kind of *Henbane*. We in English call it *Tobacco*.

II. The Kinds. It is either 1. English, called *Petum Anglicum*, *Nicotiana Anglica*, English Tobacco, of which in this Chapter. 2. Or *Petum Indicum*, *Petum Americanum*, *Petum Hispanicum*, *Nicotiana Mexicana* vel *Peruviana*, *Nicotiana Virginiana*, Indian or American Tobacco, of which in the second Book of this Work.

The Descriptions.

III. Its Root is neither so great nor woody as that of the Indian Kinds, and perishes every Year with the Frosts in Winter, but generally comes up again of the Seed, which is shed of its own accord. It rises up with a thick round Stalk, about two Feet high, on which do grow thick, fat, and fleshy green Leaves, nothing so large as the other Indian Kinds, neither for length nor breadth, a little roundish pointed, and smooth on the edges. The Stalk is branched out variously, bearing at the tops of each Branch several Flowers, set in green Husks like the others, but nothing so large, scarcely growing above

Tobacco English.

the brims of the Husks, round pointed also, and of a greenish yellow color. The Seed which follows, is not so bright as the Spanish or Virginian, but larger than it, and contained in the like large Heads.

IV. Gerard describes it thus, Its Root is small and thready, it grows to the height of two Cubits: the Stalk is thick, fat and great, full of a spongy Pith, and is spread out into several Branches, set with smooth and even Leaves, thick, and full of Juice. The Flowers grow at the tops of the Branches, orderly placed, of a pale yellow color, something lesser than those of the Black Henbane. The Cups in which the Flowers do stand, are like, but lesser, tenderer, and without sharp points, in which stands the Husk or Head, something round, full of very small Seed, not much unlike the Seed of Marjoram.

V. The Places. This was brought into Europe in Seed by Nicot, with the Seed also of the true Indian or American Tobacco, of which this present Plant is certainly a Species. *Lobel* thought it

to participate both of *Henbane* and *Tobacco*, from whence he was induced to give it those particular Names; but it is used by many instead of *Tobacco*, and is also called by the same Name, being first brought (as it is thought) from some parts of *Brasil*, which is probable from *Nicots Agency* in *Portugal*, to whose King the whole *Brazilian Country* was subject. It is also said to be brought from *Trinidad* (an Island in the *West Indies*) and from *Virginia*, and several other places; and being taken in Pipes as other *Tobacco*, its fumes or smoke, work the same effects, of Drunkenness, satiating the Stomach, reviving the Spirits, and strengthening the whole Man (in such as be accustomed to *Tobacco*) as the true *Spanish* or *Virginian* do. It is planted in our Gardens in *England*, and is more familiar with us than the other *Indian Kinds* are. Being Sown here, it prospers exceedingly, inasmuch that it is not easy to be destroyed where it once has Sown itself.

VI. *The Times*. *Parkinson* says it early gives ripe Seed, whereas the other *Indian Kinds* seldom do. It Flowers from the beginning of *June*, to the end of *August* or later, and oftentimes till the *Autumn* is far spent; the Seed ripening in the mean time.

VII. *The Qualities*. Tho' some thought this Plant to be cold, yet *Lobel* is of Opinion that it is hot, because of its biting taste, and it is probable to be hot and dry in the second Degree: It is *Aperitive*, *Absterfive*, *Astringent*, *Vulnerary*, *Emeric*, *Cathartick* and *Salivatic*.

VIII. *The Specification*. It causes an expectoration of tough *Flegm* out of the Stomach and Lungs; it kills Worms in the Stomach and Belly, and eases Gripping pains in the Bowels, provokes Urine, cleanses the Urinary passages; is good against Tumors, Apoptems, Bitches, Boils, Scabs, inveterate Ulcers, Kings-Evil-Sores and the like.

IX. *The Preparations*. You may make therefrom, 1. A Liquid Juice of the Herb. 2. A Syrup of the same. 3. The Seed. 4. An Ointment. 5. A Powder of the Leaves and Stalks. 6. The whole Leaves. 7. A Cataplasm of the Leaves. 8. A Distilled Water. 9. A Liquor. 10. A Decoction of Leaves and Stalks. 11. The Ashes. 12. The cut Leaves for Smoking.

The Virtues.

X. *The Liquid Juice*. *Parkinson* says that it is effectual to cure the Dropfy, by taking 4 or 5 Ounces of the Juice fasting, which will strongly purge the Body both upwards and downwards. I have had no experience of it, but 'tis very probable that it may cure the Dropfy, if given by a wife Hand and in a due Dose. I should be afraid to give 4 or 5 Ounces at a time, by reason of its Violence; but it is a continued use of it, beginning with a small quantity, and gradually increasing it, that must determine how much may be safely given at a time. *Monardus* says it is an *Alexipharmicon* against the Stinging or Biting of any Venomous Creature, being immediately applied to the hurt place.

XI. *The Syrup of the same*. It is found by good Experience to expectorate tough *Flegm* out of the Stomach and Lungs. It kills Worms in the Stomach and Belly, eases the Head-ach and Megrim, as also the Cholick and Gripping pains in the Bowels; tho' for some time it may seem to cause more trouble in them, and disaffect the Stomach. It is profitable for those who have the Stone or Gravel in

the Reins or Bladder, to ease their pains, expel them, and provoke Urine.

XII. *The Seed*. It is said to be more effectual to ease the Toothach, than any *Henbane Seed*.

XIII. *The Ointment*. Take of the Green Herb 4 handfuls; bruise it, and add to it Oil Olive a Quart; boil them on a gentle Fire till the Herb grows crisp, and the Oil will bubble no longer; strain out the Oil by pressing, and add to it Bees-Wax, Berf-Suct, Resin, of each a quarter of a pound, Turpentine two Ounces; melt them together, and then throw in powder of round Birthwort-roots an Ounce, putting it in when the Mass is almost cold, and so stir them well together. Gerard makes it thus. Take of the Green Leaves three Pounds and a half well bruised in a Mortar, Oil Olive a Quart, mix, and boil gently to crispness, and the bubbling to cease. Strain hard out by pressing, and add thereto of Wax, 8 Ounces, Resin 4 Ounces, Turpentine 2 Ounces; melt and mix them well together, and keep it for use. If to this there be added three Ounces of fine subtil Powder of Virginia Tobacco, it will be so much the better. It dissolves stumous Tumors, and cures Ulcers and Sores of the Kings-Evil; it also cleanses and heals all sorts of old Sores and running Ulcers in any part of the Body, being applied; as also simple Burnings and Scaldings, caused by what means soever; and in healing simple green Wounds, Contusions, &c. it has no second.

XIV. *The Powder of the Leaves and Stalks*. Used as a Sternutatory, it opens the Head, and cleanses it of the Recrements of the Brain: Strewed upon old Ulcers, it disposes them to a speedy healing: It also kills Lice in the Head.

XV. *The whole Leaves*. Applied to any Ulcer cleanses it, and disposes it to heal; applied to recent Contusions and Tumors, it dissolves them: It eases also the Head-ach and Megrim.

XVI. *The Cataplasm of the Leaves*. Applied to the Belly in a dry Belly-ach, it gives relief and cure; and kills Worms in the Stomach and Belly. Made by simple bruising and applied, it much prevails against the Evil in 12 or 14 days time. Applied to any green Wound, it induces a speedy healing.

XVII. *The Distilled Water*. It is often given dulcified with Sugar, before the Fit of an Ague, both to lessen the Fits and to alter them, which in 5 or 6 times using it is said to cure. This Water will taste of the sharpness of the Herb, which is not usual in other Distilled Waters: It also expectorates *Flegm* out of the Stomach and Lungs.

XVIII. *The Liquor*. It is made of the Faces not Distilled to dryness, (the Herb being bruised before Distillation) digested in Horse-Dung for 14 days, and then hung up in a Bag in a Wine-Cellar, from whence this Liquor will distil or drop down. It is good for Cramps, Aches, Gouts, Sciatica, Itch, Scabs, foul Sores, running Ulcers, Cankers, &c.

XIX. *The Decoction of the Leaves*. It has all the Virtues of the Juice and Syrup, but weaker. It kills Lice, and cures running Sores in Childrens Heads.

XX. *The Ashes of Leaves and Stalks*. They cleanse the Gums and Teeth, and make them white. Their Infusion in Water is said to cure the Itch, Scabs, Leprosie, &c.

XXI. *The Cut Leaves for Smoking*. It is held to be nearly as good as our *Common Virginia*, commonly Smoked in Pipes; but because of the plenty of that, is seldom used.

CHAP. DCC.

of TOOTH-WORT:

OR,

TOOTH-RAPE.

THE Names. It has no Greek Name that is known, being a Plant the Antients were ignorant of; our modern Authors have called it in Latine *Dentaria*, (from the likeness of its Roots to Teeth) also *Dentillaria*; by some *Squamaria* and *Squamata*, also *Radix Squamata*, (from its likeness to Scales) in English *Tooth-Wort*, *Tooth-Rape*, or *Toothed-Lungwort*.

II. The Kinds. There are several sorts of *Tooth-worts* which are nothing of Kin, or have no relation one to another, excepting in their Names; as the *Dentaria*, commonly called *Coralworts*, of which we have already spoken at large, in Chap. 152. foregoing, which are no Species of the Plant we here intend. The *Tooth-Worts* in this place are of another form and purport, and are chiefly two, viz. 1. *Dentaria*, *Dentaria major Matthioli*, *Anblatum Dodonzi*, *Arachidum Cesalpini*; *Æglebros Plinij Gesneri*; *Squamaria*; *Squamata*; *Rulix Squamata*; *Orobanchæ radice Dentata major*, The greater *Tooth-Wort*, *Tooth-Rape*, or *Toothed-Lungwort*. 2. *Dentaria minor*, *Dentillaria*, *Dentaria "Aquilæ"*, *Aphyllus Clusij*, *Dentaria Coralloide radice*, The lesser *Tooth-Wort*, *Tooth-Rape*, or *Toothed-Lungwort*.

The Descriptions.

III. The first, or the greater *Tooth-Wort*, *Tooth-Rape*, or *Toothed Lungwort*. It has for its Root small Scales, (if they may be so called,) like as the Stalks or Branches have, which consist likewise, wholly of blackish purple, shining thick Scales, lying

Tooth-Wort Greater.

pretty close together, compact one upon another. In the beginning of the Spring, there rise out of the tops of these scaly Branches, tender and brittle sappy Stalks, about a span in length, without any Leaves, but bearing many whitish purple gaping Flowers, and blackish inward, standing in Husks, in which afterwards grow up small Vessels, with small Seed in them.

IV. Gerard describes it after this manner. There is often found among the Mushrooms, a certain kind of Excrecence consisting of a Gelly, or soft substance like that of the Mushroom. It rises forth of the Ground, in Form like unto *Orobanchæ* or *Broom-Rape*, and also in substance, having a tender, thick, tuberos, or misshapen Body, consisting as it were of Scales like unto Teeth, (whence it took its Name) of a dusky shining color, tending to Purple. The Stalk rises up in the middle, garnished with little gaping hollow Flowers, like those of *Satyrion*; on their outside of an overworn whitish color. The whole Plant resembles a rude form of that Gelly or slimy Matter found in the Fields, which is called the Falling of Stars, or *Ignis Fatuus*. Its Root is small and tender.

V. The second, or lesser *Tooth-Wort*, *Tooth-Rape*, or *Toothed-Lungwort*. Its Root is smaller, less scaly, and more white and transparent, diversely divaricated like Coral, white of color, full of Juice, and without any Fibres annexed to it. The Stalk is in like manner without Leaves, having whitish purple Flowers at the top, sometimes but two or three, and sometimes many more, but varying in some places, as being of a more purplish color. Gerard says, that this differs not from the former, saving that it is altogether less, but in most other respects alike.

VI. The Places. They grow most commonly under Trees where they have much shadow. Gerard says they grow at the bottoms of Elme Trees, and such like, in shadowy places. He found them growing in a Lane called *East-Lane*, going from *Maidstone* in *Kent*, unto *Cocks-Heath*, half a Mile from the Town, and in other places thereabouts; as also in the Fields about *Croydon*, especially about a place called *Grouts*; and in a Wood in *Kent* called *Row*, or *Rough-Hill*, near *Crayfoot*; also near *Harwood* in *Lancashire*, in a Wood called *Talbot-Bank*, a Mile from *Whanley*.

VII. The Times. They spring up and grow thro' all the Summer Months, and Flower in May and June; and sometimes they are found in Flower in July and August.

VIII. As to their Qualities, Specification, Preparations and Virtues, Authors have said nothing; but from the use our Country People make of them, it is probable that they may be Cooling, Drying, Aperitive, Absterfiv, Astringent and Pulmonick, or appropriated to the Lungs, for which reason they have called it *Lungwort*, which Authors have distinguished (as aforementioned) into the greater or lesser kinds.

IX. The Decoction in Wine or Water. Being well sweetned with Honey, it is good to open Obstructions of the Lungs, to loosen and expectorate thick tough Flegm which stuffs them up, and causes Hoarseness, Wheezing, shortness of Breath, and difficulty of Breathing; and therefore may be of good use in Asthma's, Phthicks, and other like Diseases of those parts, proceeding from Repletion.

CHAP. DCCL.
OF TORMENTIL
OR,
SETFOIL.

I. **THE Names.** It has not been writ of by any of the Antient Greek or Latine Authors, yet some of our Moderns have given it a Greek Name from its form, or number of Leaves, viz. *ἑπτάφυλλον*, *Heptaphyllum*, from whence it has been called in Latine *Septisolum*, in English *Setfoil*, or *Seven-Leav'd Grass*, which is not properly so, for it has not seven Leaves, but each Leaf for the most part is divided into seven parts, or very eminent divisions, so that each part looks as if it were a particular Leaf. It is also called in Latine *Tormentilla*, and by some *Stellaria*, from the Form of the Leaves; and by others *Consolida rubra*, from the effects and color of the Roots, and in English *Tormentil*.

II. **The Kinds.** There are several Species of it, but we shall only treat of two, which are most common with us, viz. 1. *Tormentilla vulgaris*, *Pentaphyllum commune*, *Tormentilla minor*, Our Common Tormentil or Setfoil. 2. *Tormentilla major*, *Pentaphyllum majus*, *Tormentilla vulgaris major*, *Tormentilla Alpina Camerarij*, The greater Tormentil or Setfoil.

The Descriptions.

III. The first, or our Common Tormentil or Setfoil. Its Root is smaller than Bistort, but blacker without, and somewhat thick, and not so

Tormentil Common.

red within, and sometimes a little crooked, having many blackish Fibres adjoining. This Plant is so like to Cinkfoil, that many mistake it for the same. It has many reddish slender weak Branches rising up from the Root, which lye upon the Ground, or rather leaning than standing upright, with many short Leaves which stand closer to the Stalks than those of Cinkfoil do, with the Pedicels or Foot stalk encompassing the Branches at divers places; but those which grow next to the Ground, are set upon long Footstalks, each of whose Leaves are like unto the Leaves of Cinkfoil, but something longer and lesser, and dented about the edges, many of them divided into but five Leaves or parts, but most of them into seven, from whence it took its Name of Setfoil. And standing round (as it were) in the division like a Star, thereby obtain'd the Name also of *Stellaria*; yet some Stalks have six Leaves sometimes, and some eight, as Nature and the Fertility of the Soil are pleas'd to form them. At the tops of the Branches, come forth several small yellow Flowers, consisting each of five Leaves, exactly like those of Cinkfoil but smaller.

IV. The second, or greater Tormentil or Setfoil. Its Root is black without, reddish within, and thick, tuberos or knobby. As this (with the former) may be accounted among the Species of Cinkfoil, so it brings forth many Stalks slender and weak

Tormentil Greater.

scarcely able to lift it self up, or stand upright, but rather leaning aside; the Leaves tho' something lesser than Cinkfoil, yet are something larger than the former; sometimes they may chance to be but five in number, but for the most part seven (as the first above described) a little snipt about the edges; and the Flowers grow on the tops of the Stalks, very like to those of Cinkfoil. This differs but very little

little from the former, but only in the Magnitude of the Leaves and Roots, which are much greater and redder, and of a livelier Smell, but in all things else alike.

V. *The Places.* The first grows as well in Woods and shady places, as in open Champion Grounds, and about the Borders of Fields in many places of this Kingdom. The second grows in such like places, but delights chiefly in a richer, and sometimes a more sandy Soil: They are both Planted also in many Gardens.

VI. *The Times.* They Flower all the Summer Months, as from May to the end of August.

VII. *The Qualities.* It is very little hot, scarcely in the first Degree, but dry in the third; Astringent, Absterfivè, Vulnerary, Stomackick, Cardiack, Sudorifick, and Alexipharmick, of very thin and subtil parts.

VIII. *The Specification.* It prevails against the Plague, and all manner of Malign and Pestilential Diseases, expels Poison, and defends the Heart. It cures Agues, the Bloody-Flux, and all other Fluxes of the Bowels; also Spitting, Vomiting, and Pissing of Blood, and stops the overflowing of the Terms in Women, and the Defluxion of Humors to any Wound, Sore or Ulcer. Opens Obstructions of the Lungs, Liver and Spleen, and is of excellent use in the Cure of the Jaundice, and to heal simple green Wounds in any part.

IX. *The Preparations.* You may make therefrom, 1. A Liquid Juice of the whole Plant. 2. An Essence of the same. 3. A Decoction of the Root, or Root and Leaves. 4. A Powder of the Root. 5. A Balsam. 6. A Cataplasim. 7. A Distilled Water. 8. A Spirituous Tincture.

The Virtues.

X. *The Liquid Juice of the whole Plant.* It stops all Fluxes of Blood or Humors in Man or Woman, whether at Nose, Mouth, Belly, or any Wound in any part; refits all Poison, and the Plague or Pestilence it self, and all Pestilential Diseases, and such as are Infectious, as the Measles, Small Pox, Purples, Spotted Fever, by expelling thro' a gentle Diaphoresis, the malignity from the Heart. Dose 3 or 4 Spoonfuls Morning and Night, in a Glas of Mull'd Sack, or other Styptick or fit Wine.

XI. *The Essence.* It has all the former Virtues with advantage, as being the more efficacious Medicament. It cures Agues, being given some Hours before the coming of the Fit, and the Patient laid down to Sweat thereupon, being repeated for some considerable time. It is an effectual Antidote or Counter-Poison, Antipestilential, and a Cure for the yellow Jaundice. There is scarcely any more effectual Remedy against the Bloody-Flux, or any other Flux of the Belly; it strengthens the Stomach, stops Cholerick Vomiting, helps the disticity of the Blood, and opens Obstructions of Stomach, Lungs, Liver and Spleen. It is good against Fumes, Vapors, and fower or bitter Belchings, and loathing of the Stomach: It is profitable against the malignity of Venereal Diseases, and cures the Lues, because it so mightily refits Putrefaction. It strengthens the Womb, stops all its Fluxes, and prevents Miscarriage. It is good against Ruptures or Burstings, and to cure all sorts of simple Wounds in what part soever, whether inward or outward. Dropt into the Eyes, it cures Sores and Ulcers there; stops Fluxions of hot and sharp Rheums, eases the pain, and clears the Sight.

It makes a good Injection for foul, corrupt, and rotten Sores and Ulcers in any part, chiefly in the Mouth, Throat, Jaws, and privy Parts of Man or Woman. And is of singular use for the Cure of the Kings-Evil, being inwardly taken and outwardly applied: Mixed with Vinegar, and applied to Sores, Ulcers and Scabs in the Head, and other parts, it quickly heals them. It is effectual against the Hemorrhoides or Piles, they being bathed and fomented therewith warm; and is profitable against the Whites or Reds being inwardly taken, and outwardly applied, by injecting it up the Womb with a Womb Syringe. Dose 3 or 4 Spoonfuls Morning, Noon and Night, in some proper Wine or Liquor.

XII. *The Decoction in Wine.* It has all the Virtues of the Juice and Essence, but not altogether so potent, and therefore must be taken in greater quantities, as to half a Pint at a time or more: Mixt with Honey and Alum, it makes a good Lotion to cleanse, dry and heal, old filthy corrupt running Sores and Ulcers in any part: And *Andreas Valesius* says, that the Decoction of the Root is no less effectual to Cure the French-Pox, than *Guaiacum* or *China*, because it so mightily refits Putrefaction. Used as a Bath, it is an effectual remedy against Abortion, in Women who are apt to Miscarry.

XIII. *The Powder of the Root.* It is Styptick, and has the Virtues of the Juice and Essence, being given in any proper Styptick Wine, or other like Vehicle, from a Dram to a Dram and half, Morning and Evening for some time. Stewed upon moist running Sores and Ulcers, it dries them, and induces their healing; and so much the more, if mixed with a quarter part of *Scammony* in Powder. *Lobel* says, that *Rondeletius* used it in the head, or in the same manner, as he used *Hermodactylis* for Joint-achs. Taken in Juice of Plantane, it is said to kill Worms in Children, Cure Ruptures, and discuss and heal Contusions from Falls, &c. being inwardly taken, and outwardly applied.

XIV. *The Balsam.* Take of the Powder 4 Ounces, Oil Olive 3 Ounces, Balsam of Peru 2 Ounces, Bees Wax two Ounces and a half; melt, mix and make a Balsam. Applied to the Reins, it eases the pain thereof, and helps such as cannot hold their Water; eases the Gout in any part, is profitable against the Piles, and dissolves all Knots, Kernels and Tumors in the Neck, &c. from the Kings-Evil, and heals the Sores and Ulcers proceeding from the same.

XV. *The Cataplasim made of the Roots and Leaves.* It discusses simple recent Contusions, gives ease in the Gout, represses the Flux of Humors to any part; and is profitable to dissolve or discuss Tumors, Swellings or Kernels in the Neck, caused by the Kings-Evil, or super-abundance of Evil Humors.

XVI. *The Distilled Water.* Take the Herb and Root, bruise them well, steep them in Wine for 24 Hours or more, and then draw off the Water in Balneo. It has the Virtues of the Juice and Essence, but much weaker in its Effect, and may be given dulcified with fine Sugar, from a quarter to half a Pint. If it is given with 2 Drams of *Venice-Treacle* or *Mithridate* dissolved in it, and the Patient (being in a Naked Bed) put to Sweat thereupon, it will potently provoke Sweat, and so expel the Poison, and defend the Heart and Vitals from the Malignity and Infection of the Plague or Pestilence, and from the danger of any Pestilential or Infectious Disease. It is good to give ease in the Piles or Hemorrhoids, by bathing them therewith; and if a little *Camphir* be dissolved

ved in it, and *Lapis Tutie*, or *Calimmaris* in fine Pouder, be mixed therewith, it becomes a good Ophthalmick-Wash for Bleared, Sore, and running Eyes. But if the *Distilled Water* be mixed with Levigated Pouder of *Amber*, or *Catechu*, and so drank, it stops the overflowing of the Terms, and Whites in Women.

XVII. *The Spirituous Tincture*. It has the Virtues of the *Juice*, *Essence* and *Pouder*, is more Cordial, adds Life or Activity to the Spirits; warms and comforts the Stomach, Bowels, Womb and Blood; strengthens the *Viscera*, refills Poison, and the Infection and Malignity of Pestilential Diseases; fortifies the Heart, and is good against Convulsions, fainting and swooning Fits, Vapors, Fits of the Mother, &c. Dose from 50 to 100 Drops, in a Glass of Mull'd Sack, or some other generous Wine.

CHAP. DCCII.

of TOUCH-WOOD: OR, TREE-MUSHROOME.

I. *THE Names*. It is called in Greek *Ἀγνί-εμς* (*ab agni-εμς*, *Populus nigra*.) because in Asia, Greece, and those Southern Counties, it was gathered most from the Tree, or the Wood thereof; tho' it was also found on Oak-Trees, the *Ilex*, *Olive*, and other Trees. It is also called *Mourras*, vel *porramidans*, *Fungosus*; because of its Fungous substance or property: In Latine *Fungus Ignarius*; *Fungi Arborum*; *Fungi Arborei*; in English *Touch-Wood*, or *Tree-Mushroome*.

II. *The Kinds*. It is 1. *Fungus arborum durus*, *Fungus arboreus durior*, *Fungus ignarius durior*, The harder Touch-Wood. 2. *Fungus ignarius mollior*, *Fungus arborum mollior*, The softer, or more Spongy Touch-Wood.

Touch-Wood: OR, Tree-Mushroome.

The Descriptions.

III. The first, or harder Touchwood. It is a kind of Mushroome, which grows harder than other Mushrooms, and is of a dry Fungous substance on the inside, which may be cut thin into slices, or into bits, or broken into several pieces, having a hard or woody Crust on the outside. It is of differing Forms and Colors, some being great and flat at the Head, and smaller and rounder underneath, of a brownish yellow color, which Lobel compares to Agtick.

IV. The second, or softer, or more Spongy Touch-wood. It very much resembles *Auricula Judæ*, or *Jews Ear*, and does in continuance of time, grow almost to the substance of soft Wood, but more porous, softer, and gentler than the former, and more skinny; being for the most part half circled, or half round, whose upper part is somewhat plain, and sometimes a little hollow, but the lower part is as it were, plaited or purst together. In short, it does not much differ from the former, but in its more soft, Spongy and pliable property.

V. *The Places*. They grow upon the old bodies of Trees, and other old Wood; as on the Oak, *Ilex*, *Olive*, *Poplar*, and many other kinds of Trees when they grow Aged, Diseased, or begin to decay.

VI. *The Times*. They may be gathered at any time after they are come to their Magnitude, and hardness or consistency.

VII. *The Qualities*. They are Deleterious or Poisonous as Authors say, and therefore never given inwardly.

VIII. And as to their Specification and Virtues, we have nothing to declare; as not knowing any thing of them either by our own Experience, or by relation from others.

IX. *The Preparations*. Of them there is made, 1. *Tents* to enlarge narrow Orifices in *Apoftems* when broken, or opened by Incision. 2. *Touch-wood*, which is used in place of *Tinder*.

X. *The making of Tents*. The outward Skin being taken off, the *Fungus* is to be boiled in a *Lixivium* of Wood Ashes, then taken forth and pressed very dry; after which, it is to be well soaked in a strong Mucilage of *Gum Tragacanth*, or *Gum Arabick* scalding hot, for 12 Hours or more; then the Gum to be squeezed out, and to be pressed hard together in a wooden Press, letting it lye therein till it is dry, and so it is to be laid up and kept for use. This you may shape into *Tents* of what Form and Magnitude you please, which are used to widen the hole of a Tumor, *Apoftem*, or Ulcer after it is broken, or to keep it wide and open after Incision, the better to let out the putrid or corrupt matter: And this it does by reason of its swelling, being moistned with the *Sanies* or *Humidities* of the Sore to which it is applied.

XI. *The making of Touch-wood*. It is done two ways, The first way is, after the outward Skin is pared off, to boil it exceeding well once or twice, in a pretty strong *Lixivium* of Pot-Ashes, or Wood or Nettle-Ashes, letting them dry at leisure; which being cut or broken into pieces, will take Fire from the Steel and Flint like *Tinder*.

XII. *The second way*. Take Pot-Ashes or Wood-Ashes eight or nine Pounds, make thereof a strong *Lixivium* or Lye in Water, in which dissolve a Pound of pure *Salt Petre*; in this Liquor boil the prepared *Fungus*, till all, or most of

of the Lye be waſted ; which if you pleaſe, you may repeat a ſecond time ; then dry it, and keep it for uſe. This is much better than the former.

CHAP. DCCIII.

OF TRAVELLERS-JOY:

OR,

WILD CLIMER.

I. **THE Names.** It is called by *Theophrastus* lib. 5. cap. 10. in Greek, *Ἀνγκυλίς*, & *ἀγκυλίς*; in Latine, *Clematis Sylvestris*, & *Viorna* Gerardi & *Lobelii* (*quæſtiones ornans*;) *Viburnum* Gallorum *Ruellij*; *Vitis nigra* *Eusebij*; *Vitalba* *Dadonei*; *Artogene* *Theophrasti* *Anguillarâ* & *Cluſto*; *Vitis Sylvestris* *Plinij* lib. 15. cap. 4. *Vitis Sylvestris caustica* *Gesneri* in *Horti*; *Vitis Sylvestris* *Dioscoridis* *Anguillarâ*; in English, *Travellers-Joy*, or *Wild Climer*.

II. **The Kinds.** There are but two which are chiefly known to us, viz. 1. *Clematis Sylvestris* *Lobelij*; *Clematis Sylvestris latifolia*, five *Viorna* Gerardi; *Clematis altera prima* *Cordi*; *Clematis tertia* *Matthioli*; (known alſo by all the Names in the former Paragraph:) Our common great Wild Climer, or *Travellers Joy*, as *Gerard* calls it. 2. *Clematis Sylvestris altera*; *Clematis Sylvestris Batrica*; *Clematis altera Batrica Cluſij*; *Clematis peregrina folijs Pyri incisis* *Baubini*; The great Spanish Wild Climer, or *Travellers Joy*.

The Descriptions.

III. The firſt, or our common great Wild Climer, or *Travellers Joy*. Its Root is great, tough, woody and thick, ſpreading it ſelf out into ſeveral long Branches under Ground. It has in ſome places, (eſpecially if has ſtood long in a place) a thick, ſtrong, ragged, woody Stem, Stalk or Trunk, with ſeveral Chaps or Riſts in the Bark, of a grayiſh color; from whence ſhoot forth many long, pliant, grayiſh, green Branches, more ſtrong and woody than any of the other Climbers, (as the *Periwinkle*, *Virgins-Bower*, *Ladys-Bower*, *Virginian-Bower*, &c.) ſo that their Branches do in many places, ſerve as *Withes*, to bind about, or bind up any thing withal, or to bind about Garden or Field Gates. Theſe Branches ſpread upon the Hedges or Trees, or whatſoever it ſtands next unto, dividing or ſpreading it ſelf out into many other Twigs, on which are ſet at the ſeveral Joins, two long Stalks of winged Leaves, conſiſting of five Leaves, two and two together, and one at the end, each of them being dented on their ſides; on each ſide for the moſt part with but two Notches, yet ſometimes, tho' more rarely, with three: They are of a pale green color, taſting ſharp and hot, biting upon the Tongue, but not ſo much as the *Burning Climer*,

or *Virgins-Bower*. Theſe Branches wind themſelves about any thing ſtanding near unto them, for a great way, length or height, riſing up to the top of the tallſt Cypreſs-Tree if Planted near it, on which it may clime; (and ſome of theſe Trees I have ſeen above 150 Feet high in America.) *Gerard* ſays, that theſe Twigs or Branches are full of clapping Ten-

Travellers Joy :

OR,

Wild Climer.

drels, by which it takes hold of Hedges, and climbs up every thing that ſtands near to it; but *Parkinſon* ſays, it has no clapping Tendrels like the Vine, to take hold of, or wind it ſelf thereby, ſo far as ever he could obſerve. At the Joins where the Leaves ſtand, come forth towards the tops of the Branches, divers Bunches or Tufts of white Flowers, ſet together upon ſmall long Footſtalks, with ſeveral yellow Threads in the middle, ſmelling very ſweet: And after they are paſt, there come in their places ſeveral Heads of many long, hoary, Silver-like Plumes, as if they were Feathers ſet together, with a browniſh flat Seed at bottom of each of them, which continue a great while, even till Winter before they fall off, or are blown away with the Wind: Theſe ſays *Gerard*, make in the Winter a goodly Show, covering the Hedges all over with its Feather-like tops. The Leaves fall away in Winter, and grow again a freſh in the Spring.

IV. The ſecond, or great Spanish Wild Climer, or *Travellers Joy*. This other Climer has ſuch like running or climbing Branches, very full of Joins, admirably long, and ſpreading much farther. At the Joins round about it, grow ſeveral hard and ſomewhat broad Leaves, each by it ſelf upon a ſmall Footſtalk,

Footstalk, not much unlike to those of the Pear-Tree, indented about the edges, but stiffer and smaller, which are of as sharp and hot a Taste as the former; from whence come also two clasping Tendrils on each side, by which it catches hold of any thing which stands in its way, or near to it. From the Joints likewise, where the Leaves stand, come forth the Flowers with long Tufts or Heads, in the same or like manner as the former, with the like Tufted Plumes of Feathers of a hoary white color, with Seed like the other below them, but smaller.

V. *The Places*. The first grows in many parts of England, in Hedges of Fields, and by the Highway side in Bedfordshire, Buckinghamshire, and Essex, but chiefly in Kent; where from beyond Woolwich to Gravesend, and from thence along to Canterbury, you may see it in many places; as also in most of the Southern parts about London. The second is a Native of Spain, found by *Clusius*, between *Medina Sidonia* and *Culpe*, and in other parts thereof: It is also said to be a Native of our own Land, for *Gerard* says, that he had found it in the Isle of Wight, and in a Wood by *Waltham-Abby*.

VI. *The Times*. They both Flower in July; and their Plumes appear in November and December, and in some places all the Winter.

VII. *As to their Qualities, Specification, Preparations and Virtues*, Authors have said nothing at all; and therefore are not at all used in Physick that I know of, tho' they are both very hot and sharp in Taste. They are esteemed for the Pleasure which they give by their goodly Shade, which is caused by their bulking out and climbing; as also for the Beauty of their Flowers and Plumes, accompanied with a sweet and fragrant Smell.

VIII. *Nota*. These (as well as the other Climbers) may serve very well to make Arbors in Gardens, Orchards, or other places for Pleasure; for which purpose they are much more fit, than for many other things which are used on that account.

TREFOIL Spiked, see Hares-Foot, Chap. 337.

CHAP. DCCIV.

Of TREFOIL Sweet:

O R,
Garden CLAUER.

I. *THE Names*. Trefoil is called in Greek, *Τριφυλλον*; in Latine *Trifolium*, (because of its having three Leaves upon one Footstalk) and in English, *Three-Leav'd Grass*, *Claver*, *Clover*, and *Trefoil*.

II. *The Kinds*. There are a great many Species of this Name, but we shall only take notice of those which are to be found with us, which are, 1. *Trifolium Odoratum*, Sweet or Garden Trefoil, of which in this Chapter. 2. *Trifolium pratense*, Meadow Trefoil, of which in Chap. 705. 3. *Trifolium Siliquosum*, Coddled Trefoil, of which in Chap. 706. 4. *Trifolium Paludosum*, Marsh Trefoil, of which in Chap. 707. 5. *Trifolium vel Lotus Siliquosus*, Peate Trefoil, of which in Chap. 708. following. 6. *Trifolium fragiferum*, & *Stellatum*, Strawberry and Starry Trefoil, of which in Chap. 709. 7. *Trifolium Arboreum*, Cytisus, Tree Trefoil, of which in Chap. 710. 8. *Trifolium Acetosum*, Sower Trefoil, or Wood-Sorrel, which see in Chap. 641. foregoing.

III. *The Garden Kinds*. There are but three sorts of this Sweet Trefoil, which grow with us in our Gardens, viz. 1. *Acoris Sweet*, *Dioscoridis*: *Trifolium Odoratum*, *Lotus Urbana Lacuna*; *Lotus Sativa Camerarij*, *Cordi*, *Dodonai*, *Euchysj*, *Gesneri*; *Trifolium Dioscoridis Trago*; *Trifolium Odoratum alterum Dodonai*, (because he called *Melilot Trifolium Odoratum*;) *Lotus Hortorum Olera* *Labelij*; *Lotus Hortensis Odora Bauhini*; (but *Tabernaemontanus* calls it *Melilotus vera*, which it is not.) Now most call it *Trifolium Odoratum*, which is our Sweet or Garden Trefoil, or Claver. 2. *Trifolium Asphaltites*, vel *Asphaltum*, *Trifolium Bituminosum*; *Oxytrichyllum Gesneri* in *Hortis*, The stronger scented Garden Trefoil or Claver. 3. *Trifolium Americanum*, American Trefoil.

The Descriptions.

IV. The first, or our sweet Garden Trefoil, or Claver. Its Root is small, white and thready, perishing every Year, and rising again every Year by the Seed that it Sows it self, or being Sown in the

Trefoil Sweet:

O R,
Garden CLAUER.

Spring. It rises up with one strong, round, whitish Stalk, 3 or 4 Feet high, spreading out many Branches on all sides, about which are set many Leaves upon long Footstalks, three always set together, of a whitish green color, very soft, and a little dented about the edges, smelling not much unlike to Fennel-greek. At the tops of the Branches grow Flowers, closely set together, each of them like to those of Melilot, but larger, and of a bleak or pale reddish blew color; after which, come round white heads, containing dark yellow colored Seed.

V. Gerard

V. Gerard describes it after this manner. It has a Root consisting of divers Strings or Fibres, from which springs up an upright Stalk, hollow and about 2 Feet high, dividing it self into divers Branches, on which do grow Leaves by three and three, (like to the other Trefoils) slightly and superficially nicked on the edges; from the bottom whereof come the Flowers, every one standing on its own single Footstalk, consisting of little Chaffy Husks, of a light or pale blewish color: After which, comes up little Heads or Knobs, in which lyes the Seed, of a whitish yellow color, and lesser than that of Fanugreek. The whole Plant is not only of a whitish green color, but also of a sweet Smell, strong, Aromatical or Spicy, and yet more sweet when it is dried; which Scent the gathered and dried Plant, does continue in a long time. Also whilst growing, it smells more in moist and rainy Weather, than in hot and dry Weather.

VI. The second, or stronger smelling Garden Trefoil, or Clover. It has a Fibrous Root, which with us perishes every Year, but abides all Winter in hotter Climates, where it is Natural. Its first Leaves are a little larger than those which grow higher upon the Stalks, three always standing together upon a long Footstalk, of a dark green color, almost shining, set with some hairiness thereon. The Stalk is strong, round, and hairy also, rising up to the height of two Feet or more, on which grow the Leaves, more long and pointed than the lower. It branches from the bottom usually, to the top, where grow many large Flowers in a Bush or Tuft, thick set together, of a blewish purple color, and somewhat hairy or hoary withal, especially the Husks containing the Flowers, which afterwards turn into broad brownish hairy Cods, each containing but one Seed, which is a little broad, rough and pointed at one end. The Smell of the Leaves and whole Plant is strong, which whilst it is young, some fancy to smell like Rue; but growing old, the said Smell grows stronger, which they fancy then smells something like Bitumen. With us this strong Smell grows weaker every Year than other, and after the second Years Sowing, has almost no Smell at all; tho' in its Native Countries, it always retains its Original Smell.

VII. The third, or American Trefoil. Its Root is small and branched out, being Fibrous or stringy, and so spreading two several ways. From whence springs several round Stalks leaning to the Ground, and spreading themselves out into many Branches, on which grow several Leaves, three Leaves upon one long Footstalk, each of which is somewhat round, not much unlike the last Described; saving that they are larger or broader, and of a dark green color. The Form of the Leaves, and the manner and growing of this Plant, differs not much from our Common Meadow Trefoil, so much they are alike. The Smell of the Leaves, and whole Plant is strong, and not much unlike the last Described. At the tops of the Stalks and Branches, grow long spiky Ears of whitish Flowers, being something smaller than those of the second Kind before Described, after which, come in their places small round and flattish Seed.

VIII. The Places. The first and second grows in France, Germany, Italy and England, but only in Gardens. And Dioscorides says, that the first grew in Gardens in his time, and not Wild in Greece, or any other place that ever he heard of. The third grows in the more Northern parts of America, as Canada, New-England, Virginia, &c. for which reason I put it in this place, for that possibly some of our English Planters may at some time or other, find it in some of their Plantations.

IX. The Times. They flower in June and July, and their Seed is ripe in some little time after; but the other two Flowering later with us, seldom perfect their Seed here.

X. The Qualities. The first (which is chiefly used) is according to Galen, temperate in respect to heat or cold, dryness or moisture. They are Aperitive, Anodyn, Diuretick, Vulnerary, Hystrick, and Alexipharmick.

XI. The Specification. It cures Diseases of the Eyes, dissolves Tumors and Contusions, heals Wounds and Ulcers, eases the Gout and other pains; provokes the Terms, as also the Loches when stoppt, and is prevalent against the bitings of Vipers and other Serpents, as also gives ease in the Strangury, and other stoppages of Urine.

XII. The Preparations. You may make thereof, 1. A Liquid Juice and Essence. 2. A Decoction in Wine or Water. 3. An Oxy-mel. 4. A Powder of the Seed. 5. An Oil by Infusion or Decoction. 6. A Balsam, 7. A Distilled Water.

The Virtues.

XIII. The Liquid Juice or Essence. They may be given to 4 or 6 Spoonfuls alone, or in Wine, or other fit Vehicle; it eases the pains of the Spleen and Hypochonders, opens Obstructions of the Viscera, provokes Urine and the Terms, as also the Loches when stoppt; gives ease in the Strangury, or heat and scalding of Urine, and is good against the bitings of Vipers and Serpents, or of other Venomous Creatures. Any simple Wound, Sore or Ulcer, being washed herewith, it cleanses, dries, and induces the healing; dissolves Tumors and recent Contusions, and gives ease to external pains: Both Dioscorides and Galen, commend this Plant in particular, against the bitings or stinging of any Serpent, or other Venomous Creature. The Juice is also good to wash the breakings out with Scurf, or Scabs of Childrens Heads, or any other part; and to wash places bitten or stung, &c. as Pliny lib. 21. cap. 21. advises.

XIV. The Decoction in Wine or Water. It has also the former Virtues, but because weaker, may be given Morning, Noon and Night, to half a Pint or more; outwardly also, applying it by Bathing or Fomentation, to the parts affected.

XV. The Oxy-mel. It is made of a Decoction of the Herb, Flowers and Seed in Vinegar, and then compleated with Honey. This being drank, is a special remedy for such as are bitten or stung with any Venomous Creature.

XVI. The Powder of the Seed. This is of most force with Galen, who appoints it to be put into Treacle or Mithridate, against all Diseases for which the Herb is good. It is indeed singular good against the Pleurisie, heat, scalding, and stoppage of Urine, and the Strangury: It is profitable against the Epilepsy, Vapors, and Hystrick Fits. Dose two Drams or more, in some fit Vehicle.

XVII. The Oil by Infusion or Decoction of the Leaves, Heads and Flowers. It is excellent to dissolve all hard Swellings, or Wen-like Tumors in any part of the Body; to allay Inflammations, digest Sores and Ulcers, bringing them to maturity; then cleansing them from their putrid Matter, and healing them in such a manner as is to be admired: It heals also green Wounds, as well as old Ulcers; helps Contusions, and eases pains of the Gout; as also Pains and Aches in any part, Stitches, Cramps, Lameness of the Joints, &c.

XVIII. The

XVIII. *The Balsam.* It is made of the former Oil, by adding to it a proportional quantity of Chio Turpentine and Bees Wax. It has all the Virtues of the Oil aforesaid to advantage, and is a more excellent Vulnerary and Arthritick, being applied.

XIX. *The Distilled Water.* It is good to clear the Skin, and dry up Scabs and running Sores in Childrens Heads. If it is mixed with 3 or 4 times the quantity of the Juice or Essence, and taken to 4 Ounces at a time or more, it is good against the Dropsy; and taken and continued for some time, it lessens, and at length cures the Fits of Tertian and Quartan Agues. It also stops all sorts of Fluxes of Blood, as Vomiting, Spitting and Pissing of Blood; and is good against inward Bruises, caused by Falls, &c.

XX. *Nota.* The first is most used because most common; but the second is the most effectual of them all. It is used also to be laid up in Chests and Presses, to keep Moths from Garments.

CHAP. DCCV.

OF TREFOIL Meadow :

OR,

Field Claver : Or, Clover-Grass.

Called also,

Meadow Honey-Suckles.

I. **THE Names.** It is called in Greek Τρίφυλλον λευκόν : in Latine, *Trifolium Pratense*, by all Authors, as being the most common belonging to it, because of its three Leaves always growing together upon one Footstalk; and in English, *Trefoil*, *Three-Leav'd Grass*, *Meadow-Trefoil*, *Meadow-Claver*, or *Clover-Grass*, and *Honey-Suckles*; because Bees gather much Honey from their Flowers.

II. *The Kinds.* They are very many, but we shall here have respect chiefly to such as grow with us in our Meadows, which are, 1. *Trifolium pratense vulgare purpureum*, Our Common Purple Meadow-Trefoil, or Meadow-Honey Suckles. 2. *Trifolium Pratense vulgare album*, Our common white Meadow-Trefoil. 3. *Trifolium purpureum magnum*, Great Purple Trefoil. 4. *Trifolium album magnum*, Great white Trefoil. 5. *Trifolium purpureum minus*, Small Purple Trefoil. 6. *Trifolium album minus*, Small white Trefoil. 7. *Trifolium Cordatum*, Heart-Trefoil. 8. *Trifolium parvum*, *Lagopus vulgaris*, *Lagopus minor*; Common Meadow Hares-Foot Trefoil, or small Hares-Foot Trefoil. 9. *Trifolium parvum luteum*, Small Yellow Trefoil. 10. *Trifolium luteum minimum*, The Smallest Yellow Trefoil.

The Descriptions.

III. The first, or our Common Purple Meadow Trefoil, or Meadow Honey-Suckles. It has a long slender and fibrous or stringy Root, which spreads much, and indures long. It has many Leaves ri-

sing from the said Root, three set together upon a pretty long Footstalk, and each of them almost round; among which rises up small Stalks of Flowers, not much higher than the Leaves, bearing many deep Purplish Crimson Flowers together in a Tuft, rising smaller up to the top, which turn into little Coats

Trefoil Purple Meadow, Common.

with small Seed in them : Sometimes this is found with half round Spots of white in the Leaves.

IV. Gerard Describes it thus. Its Root is long, woody, and grows deep. It brings forth Stalks a Cubit long, round, and something hairy, the greater part of which creeps upon the Ground; on which grow Leaves consisting of three joined together, one standing a little from another; of which those which are next the Ground and the Roots, are rounder; but those growing on the upper part of the Stalks, having for the most part in their middle, a white Spot like a Half-Moon. The Flowers grow at the tops of the Stalks in a Tuft, or in a small Fox-Tail Ear, of a purple Color, and sweet Taste; after which comes the Grain or Seed, round and blackish, in little Husks.

V. The second, or our common white Meadow Trefoil. This differs little, or almost nothing from the former, saving in the colour of the Flowers; for as those are of a bright Purple, contrariwise, these are very white. The Leaves and Flowers, and indeed the whole Plant, being something less than that; yet this is sometimes found with longer Leaves, tho' the Heads themselves are less. There is also another sort, whose Leaves are all longer than the first, and pretty sharp pointed withal, whose Flowers are of a very pale Red or Purple; of which kind, the Leaves are sometimes spotted with black Spots;

Trefoil white Meadow, Common.

Spots; and it is sometimes found with a Tuft of green Leaves on the Stalks, which is thought to be only accidental, and rather *Lusus Naturæ*, than any special Kind.

Trefoil Purple Great.

VI. The third, or Great Purple Trefoil. Its Root is woody, long, slender and fibrous. It seldom grows much above a Foot, or Foot and half high, having several Leaves thereon, which are large and long, three always set together on long Footstalks, and pretty sharp pointed: At the tops grow large and somewhat long Heads, of pleasing Purple Flowers, like those of the first Meadow Trefoil, but greater. It is also found sometimes with longer and narrower Leaves, and a more spiked Head of Flowers.

VII. The fourth, or Great White Trefoil. Its Root is long, and about the thickness of ones little Finger, being fibrous without, brownish on the outside, and whitish within. The Stalk is not so great, nor so high as the third: The Leaves are smaller and hoary, and something

Trefoil White Great,
Common.

long without, growing many below, but fewer and smaller above on the Stalks; at the top whereof, grow one or two short Branches, each with a Head of small white Flowers, somewhat sweet, whereas the former are of an Elegant red color.

VIII. The fifth, or Small Purple Trefoil. It has a Root which is long, fibrous, and stringy. Its Stalks are about a Foot in length: Its Leaves are like to the first Common Trefoil, saving that they are lesser, and of a brownish or dirty red color, always growing in threes together, whose Leaves, and also its Flowers,

Trefoil Purple Meadow, Small.

are in form shape like the Common Meadow Trefoil, but of a Purple color.

IX. The sixth, or small white Trefoil. Its Root is small and thready, and rises up with many Stalks, spread out into several Branches

Trefoil White Meadow, Small.

and Leaves, bearing small Spikes or Heads of Flowers at their tops, of a white color: Of the Leaves, those below are rounder, or almost quite round, those above are longer and narrower, but all of them smaller than the first or second common Kinds. They grow pretty close together, and are many, the Plant being full of Branches, three for the most part growing together, and sometimes four or more, as Nature is pleased to produce them.

X. The seventh, or Heart-Trefoil. Its Root is small, slender, fibrous or thready, and Annual, which sends forth very slender and weak Stalks, spread out into many Branches, and full of Joints, repeat with round pointed greenish Trefoil Leaves, upon long Footstalks; round and broad at their ends, and dented in, in the middle of the end, making the Leaf to be in form of a Heart, as it usually

Trefoil Heart.

grows with us in our Meadows, each Leaf having a kind of reddish, or some other like colored Spot in its middle. The Flowers grow at the end of a Stalk coming from the Joints, which are small and yellowish, and after turn into prickly turning Heads, not much unlike to small Medica's, or Clover-Grass.

XI. The eighth, or common small Haresfoot-Trefoil. Its Root is slender and very fibrous, a small but well known Plant, growing greater and higher in some places than it does in others, with whitish Woolly small Trefoil Leaves, on short Footstalks. It spreads it self out into many Branches, which have Heads at their tops, small and somewhat long with the roundness, composed as it were all of a hairy hoary downiness, whose Flowers are in some of a white, in others of a bluish color. It is an Annual Plant as the Haresfoots are, perishing every Year, whereas the other Trefoils do not so.

XII. Gerard describes this Trefoil thus. Its Root is small and hard; it has a rough round and hairy

Trefoil Hares-Foot, *Small*
Common.

Trefoil Yellow, *Small.*

hairy Stalk, spreading it self out into several Branches, on which grow small Leaves, three joined together, like those of the small Trefoils. The Flowers grow at the very Points of the Stalks and Branches, consisting of a rough Knap, or Besh of Hairs, or Down, like that of Alopecurus or Fox-tail, of a whitish color tending to a light Blush, with little white Flowers among the Downings.

XIII. The ninth, or Small yellow Trefoil. It has a small slender and fibrous Root, from whence rise up smooth, slender weak Stalks, about a Cubit high, set with few Leaves on them, which are small and round pointed, and sometimes dented in the middle of the end, almost in form of an Heart, (not much unlike to the Common Meadow Trefoil,) each standing severally on their own short Foot-stalks. The Flowers come forth at the tops of their Stalks and Branches, made as it were of brownish yellow Scales, laid one upon another, well resembling an Hop, of which it took one of its Names, viz. *Lupulus Sylvaticus*. Johnson in Gerard says, that the Heads are pretty large and yellow, which afterwards become of a brownish color, and somewhat resemble an Hop, whence Thallius called it *Lupulus Sylvaticus*, or *Tritofolium Luteum alterum Lupulinum*; but Dodonæus, *Tritofolium agrarium*, Field Trefoil. The Flowers being past away, are followed by many little crooked clustering Seeds.

XIV. The tenth, or smallest yellow Trefoil. Its Root is small and thready, which sends forth a few weak slender Stalks, (but little bigger than small Ruthes) lying on the Ground, on which grow small Trefoil Leaves, sometimes more than three on a small Footstalk, and sometimes a very little dented about the edges. The Flowers are small

and yellowish, set close and round together, after which follow small, blackish, flat, and crooked Seeds in Husks, almost like a Medica, or Claver. It has two little Leaves close at the bottom of the three-Leav'd Footstalk; as its Leaves are much smaller than the former, so the yellow Heads are also much lesser.

XV. The Places. These are all Meadow-Plants with us, but the third and fourth are Sown in Fields in Italy, and in Flanders and Holland, and several other parts beyond the Sea, of which they make an excellent Food for Cattel, as well to Fatten them, as to give good store of Milk; where they are Manured, they come up ranker than they do in our Meadows where they grow Wild and of their own accord; as also on the Mountains and Hills of Spain and Germany. The seventh is said to grow in Arabia, and is by Camerarius called *Medica Arabica*, but it is common with us in England. The eighth and ninth grows almost every where throughout our Land, in dry Grounds, as also among Corn, especially among Barly, and likewise in Barren Pastures in most places.

XVI. The Times. They are fresh and green pretty early in the Spring, and flower in June, July and August, perfecting their Seed in the mean time.

XVII. The Qualities. They are temperate in respect to heat or cold; and dry in the first Degree: Aperitive, Digestive, Anodyne, Vulnerary, Diuretick and Alexipharmick.

XVIII. The Specification. They are used to clear the Eye-Sight, abate Inflammations, ease Pains, heal Wounds, help the Strangury, stop the Whites in Women, and resist the Poison of Venomous Creatures, and cure all sorts of Fluxes.

XIX. The Preparations. You may have therefrom, 1. A Liquid Juice or Essence. 2. A Decoction in Wine or Water. 3. A Powder of the Seed. 4. A Decolled Oil. 5. A Cataplasm. 6. The Ashes of the whole Plant.

The Virtues.

XX. *The Liquid Juice or Essence.* Taken to 5 or 6 Spoonfuls, they open Obstructions of the Viscera, cleanse the Bowels of slimy Humors which stick to them, help against the bitings of Vipers, and other Venomous Creatures; provoke Urine, give ease in the Strangury, stop the Whites in Women, as also Fluxes of the Belly, after it has cleansed it. It heals Wounds by washing with it, cools Inflammations, and eases Pain. Dropt into the Eyes, it allays the heat, takes away the Blood-shot, and clears them of any Film which begins to grow over them.

XXI. *The Decoction in Wine or Water.* It has all the former Virtues, but as it is weaker, must be taken to half a Pint or more, Morning, Noon, and Night.

XXII. *The Powder of the Seed.* Pena says it is of so powerful a drying and binding Faculty, that it will wonderfully stop the Running of the Reins: Dose from a Dram to two Drams, Morning and Night. It is also profitably used in all foul and hollow Ulcers, (being first cleansed) to incrustate, and then to cicatrize or heal them. It is also said to be good against Ruptures, and cure spitting of Blood.

XXIII. *The Decolled Oil.* It is made of the whole Plant. It is good against recent Contusions, the bitings of Serpents, or of any other Venomous Creature; abate Inflammations, ease pain, and discuss Tumors being applied.

XXIV. *The Cataplasim.* Applied to the Share, it allays Inflammations thereof, and eases Pains in any part. The Herb being bruised, and heat between two Pewter-plates, and applied hot to the Share, it is said to cause them to make Water in a Strangury. It discusses Tumors and recent Contusions, and cures them. Also applied to the biting of a Viper, or other Serpent, Mad Dog, &c. it is said draw out the Poison, and prevent farther mischief.

XXV. *The Ashes of the Heads.* They are good to apply to the Hemorrhoids or Piles, to stop their Bleeding, and ease the Pain: And have also been found profitable, being applied to a *Procedentia Ani*, or falling out of the Fundament.

C H A P. DCCVI.

Of TREFOIL Coddled :

O R,

Pease Claver.

I. **THE Names.** It is called in Greek, Τριφυλλον, λυγιστον: in Latine, *Trifolium Siliquosum*: and in English, Coddled Trefoil, Pease Trefoil, or Pease Claver.

II. **The Kinds.** Of this Plant we shall take notice only of these following, viz. 1. *Trifolium Siliquosum majus*, The greater Coddled Trefoil. 2. *Trifolium Siliquosum minus*, The lesser Coddled Trefoil.

The Descriptions.

III. The first, or greater Coddled Trefoil. Its Root is long and reddish, branched and fibrous. It rises up with a Stalk a Foot or two high, which is spread out into many Branches, thick set with Trefoil Leaves upon short Footstalks, small and sharp pointed, very little differing from the Common

Trefoil Coddled, Greater.

Meadow Trefoil, (with lesser Leaves growing at the bottom of the Footstalk) but in their Magnitude, these being very much less, and of a grayish green color. The Flowers are in small Tufts or Heads, of a fair yellow color, not much unlike to those of Broom, but lesser; after which come several Cods, four or five, more or less, in which is contained round Seed. Both the Stalk, Branches and Leaves, have a little soft Downiness upon them, and the Flowers grow clustering together on the tops of the Stalks, which being past away, the Cods succeed.

IV. The second, or lesser Coddled Trefoil. This in its Stalks, Branches, and manner of growing, is very much like to the last described; but the Leaves are much less, the former being four times larger than these. These Leaves as they are so much less, being also sharper pointed, so they grow also upon shorter Footstalks, having two single Leaves growing out below them, at the bottoms of their Footstalks, they all of them having a little soft Downiness upon them. Their Flowers come out of the tops of the Stalks and Branches in a Tuft or Cluster, being of a yellow color, and almost like those foregoing, saving that they are lesser, and fewer in number; having generally but 2, 3, or 4 Cods succeeding them, in which is contained the Grain or Seed, not much unlike the former.

V. The

Trefoil Codded, Lesser.

V. *The Places.* They are all of them found growing in our Fields and Pastures, in such as are Fertile and of good Soil, almost every where.

VI. *The Times.* They all Flower and Seed from May, to the end of Summer.

VII. *The Qualities, Specification, Preparations and Virtues,* are the same with those declared in the last Chapter, to which you are referred; so that no more need to be said of them in this place.

CHAP. DCCVII.

OF TREFOIL Marsh :

O R;

BUCK-BEANS.

I. *THE Names.* It is said to be the *Muscaria*, *z. Muscaria* Theophrasti; which the Latins call *Trifolium Paludosum*; *Trifolium Palustre*, *Trifolium Hircinum*, also *Trifolium Fibri-num* *Tabernamontani*; *Menianthes Palustre* Theophrasti *Lugdunensi*: In English, Marsh-Trefoil, and Buck-Beans.

II. *The Kinds.* *Tabernamontani* makes two kinds hereof, viz. 1. *Trifolium Paludosum vel Palustre majus*, The Greater Marsh-Trefoil, or Buck-Beans. 2. *Trifolium Paludosum vel palustre minus*, The lesser Marsh-Trefoil or Buck-Beans, whose Descriptions follow.

The Descriptions.

III. The first, or greater Marsh-Trefoil, or Buck-Beans. Its Root is long and white, creeping in the Mud all about, and shooting up afresh at its several Joints. It rises up with a spongy flexible Stalk half a Yard high or more, with several smooth thick and somewhat broad dark green Leaves set thereon, at far distances, three always standing together on a long Footstalk. From the middle of the Stalks up to the tops, comes forth a long Bush or Spike, of five pale bluish Flowers, each of them consisting of five round pointed Leaves, with a long thick pointed Umbone in the middle, which together

Trefoil Marsh, Greater.

O R,

Buck-Beans.

with the Leaves thereof, are covered with a fine hairy Down or Frize, which adds a greater Beauty to it; which after they are past, small round Heads come in their places, containing in them brownish yellow bitter Seed.

IV. Gerard describes it after this manner. Its Roots creep divers ways in the Marshy Ground, being full of Joints, white within, full of Pores and spongy, sending forth several by-Shoots, Stalks and Leaves, by which means it much increaseth, and largely multiplies its self. This great Marsh Trefoil has thick fat Stalks, weak and tender, full of a spongy Pith, very smooth, and of about a Cubit long, on which grow Leaves much like to those of the Garden Bean, set upon long Footstalks, three together, like in manner to the other Trefoils, smooth, shining, and of a deep green color: From among which, towards the top of the Stalk, grows out

out a Bush of Feather-like Flowers, of a white color, dash over slightly with a Wash of light Carnation; after which follows the Seed, contained in small Buttons, or knobby Husks, of a brown yellowish color, like unto Millet, and of a bitter Taste.

V. The second, or lesser Marsh-Trefoil, or Buck-Beans. It differs not in its Roots, Stalks, Leaves, Flowers, Seed, and manner of growing, from the former or greater kind, but only in its Magnitude, this smaller Species (if it be a different sort) being only less: But some Authors think, and I am almost of the same Opinion, that they are both of them but one and the same Plant and Kind; and that the difference between them of greater and lesser, arises chiefly from the Climate or Country, place of growing, and quality of the Soil.

VI. The Places. Marsh Trefoil grows only in wet and moorish Grounds, and will not thrive out of them, but will quickly grow rank and wither; and therefore is to be sought for in Marsh and Fenny places, and may be found in a boggy Soil, almost every where.

VII. The Times. It Flowers from June to the end of July, and sometimes in August, the Seed ripening in the mean season.

VIII. The Qualities. It is hot and dry in the first Degree, Aperitive, Absterfiv, Diuretick, Anodyn, Pectoral, Heparick, Splenetick, Nephritick, Arthritick, and Hysterick.

IX. The Specification. It is an experimental Preservative, and Cure of the Gout and Rheumatism, whether in Old or Young; opens Obstructions of Stomach, Lungs, Liver, Spleen and Womb; resists Hypochondriack Melancholy, and is excellent against Asthma's, Coughs, and other Distempers of the Lungs.

X. The Preparations. You may make therefrom, 1. A Liquid Juice or Essence. 2. A Syrup of the same. 3. A Decoction, or rather Infusion, in Wine or Water. 4. A Powder of the Seed.

The Virtues.

XI. The Liquid Juice or Essence. Taken inwardly from 3 Spoonfuls to 6, in any convenient Vehicle Morning and Night, for some considerable time, it destroys the very Essence of the Gout; it not only cures Gouts and Rheumatism, but is also a preservative from the same, and prevents their return again; this Plant being found to be the greatest of all Simple Vegetable Alterative Productions, for the rooting out those Diseases. The Essence cures Hypochondriack Melancholy in Men, and Vapors and Fits of the Mother in Women, and powerfully opens all Obstructions of the Viscera, chiefly of the Stomach, Lungs, Liver, Spleen, Mesentery, Reins and Womb; and therefore is a remedy against the Diseases of those parts caused thereby; for by removing the Obstructive matter, and restoring the Tone of the Bowels, it quickly brings Health to such Diseased Bodies. These Preparations have been found also experimentally good to stop a spitting of Blood.

XII. The Syrup of the same. It has the former Virtues, but is chiefly adapted to Obstructions and Distempers of the Lungs, as Asthma's, Coughs, Colds, Hoarseness, Phthisick, Wheezings, loss of Voice, &c. being given for some considerable time, Morning and Night, as before directed.

XIII. The Decoction, or rather Infusion in Wine or Water. It has all the Virtues of the Juice, Essence and Syrup; but if it is given against the Gout, Rheumatism, Melancholy, and such like Diseases, it ought to

be made in Water; but if against Diseases of the Stomach, Mesentery or Reins, in White Port or Lisbon Wine. It may be given half a Pint or more at a time, Morning, Noon and Night, either simply alone, or dulcified with Sugar, as the Patient likes best.

XIV. The Powder of the Seed. It may be given from two Scruples to a Dram and half, or four Scruples, mixed with Syrup of Clovegilliflowers, or Syrup of Hyssop, or for want of them with a little choice Honey, Morning, Noon, and Night, against Asthma's, Coughs, Phthisicks, shortness of Breath, difficulty of Breathing, and other Diseases of the Breast and Lungs; for it cuts tough Flegm and gross Humors, and makes them easier to be expectorated; thereby cleansing the Stomach, Lungs, Liver, Spleen and Mesentery, and strengthening them withal against their Habitual Weaknesses.

C H A P. DCCVIII.

OF TREFOIL Pease.

I. THE Names. It is called in Greek, *Λότος*: in Latine, *Lotus*, and in English, *Pease Trefoil*.

II. The Kinds. *Dioscorides* and *Galen* make two kinds of *Lotus*, viz. *Λότος μέγας*, *Lotus Urbana*, which is our *Τραφάλιον ήμέτερον*, *Trifolium Odoratatum*, Sweet or Garden Trefoil, of which we have already discoursed largely in Chap. 704. The other to be *Λότος άγριος*, *Lotus Sylvestris*, *Trifolium Sylvestris*, The Wild Lotus, or Pease Trefoil, of which we shall treat in this Chapter.

III. The Kinds of the Pease Trefoil. Authors make the best part of twenty Species of them, the most of which are perfect Strangers in our Country, and not to be seen of us (unless a great Traveler) in many Ages. We shall only take notice of such as grow either in our Gardens, or Wild abroad in the Fields, which are the six following, viz. 1. *Lotus edulis Creticus*, *Lotopisum Pons*; *Lotus Cretica Baubini*, *Trifolium Pisi* genus, The common Candy Pease Trefoil. 2. *Lotus Pifatus major*, *Trifolium Hemorrhoidale majus*, The greater Pease or Pile Trefoil. 3. *Lotus Pifatus minor*, *Trifolium Hemorrhoidale minus*. The lesser Pease or Pile Trefoil. 4. *Lotus corniculatus frutescens*, Bushy horned Trefoil. 5. *Lotus corniculatus minor pilosus*, The lesser hairy horned Trefoil. 6. *Lotus corniculatus incanus*, *Trifolium corniculatum vulgatissimum*, The common hoary horned Trefoil. 7. *Lotus Siliquadratis*, vel *Siliquis Quadrupinnatis*, *Trifolium Siliquosum flore rubro*, Crimson, or square Coddled Trefoil.

The Descriptions.

IV. The first, or common Candy Pease Trefoil. Its Root is small, Fibrous and Annual, which shoots forth several slender Stalks, set with brownish green Leaves at several distances, three always growing together on a footstalk, which are sappy, a little thick, and pointed. The Flowers are yellow, but like unto small Pease Blossoms, which are succeeded by roundish Cods a little crooked, and are great in respect to the smallness of the Plant, in which are contained round Pease of a sweet Taste, like

like to our ordinary Pease, which whilst they are young and green, are usually sold in their Markets, and as much desired of them, as our Pease are by us. The whole plant with Stalks and Leaves, are a little hairy.

V. The second, or greater Pease, or Pile Trefoil. Its Root is long, straight, and something woody, with a few Fibres adjoining to it: From whence rises up usually but one Stalk, two or three Feet high, spread out into several hard, weak, flexible Twigs, and they again into other smaller, bearing at every Joint five Leaves, two of which stand close to the Stalk, each upon a small Footstalk, and the other three rise up between them higher than they, upon another Footstalk like a Trefoil; the Leaves and Stalks being all hoary, yet in the younger Plants only the three Leaves stand together on a Footstalk, without the other two at the bottom. The Flowers grow many together in a Tuft, of a bluish or whitish red color, somewhat large, which turn into long round Cods, greater and thicker than the next following, and are of a blackish red color, something swoln as it were, representing in a manner the Hemorrhoidal Vein, as it appears when it is swoln and fallen down, (whence came its latter Name,) or also from its singular Virtue which it has in curing the Piles; within these Cods are contained small round blackish Pease or Seed.

VI. The third, or lesser Pease, or Pile Trefoil. Its Root is a little thick and woody, full of Fibres or Strings; from whence rises up a Stalk two or three Feet high, parted into long Branches, with two something large Leaves, both set close to the Foot of every Branch, and to the Joints where the Leaves grow; from whence come forth other Leaves as large as the ordinary Trefoil Leaves, three standing together upon a long Footstalk. The Flowers grow in Tufts at the ends of the Branches, of a light bluish color, which are followed by small, round, and shorter Cods than the former, and with such like Pease or Seed in them. This Plant dyes yearly with us, but in a kind Year gives us ripe Seed.

VII. The fourth, or Bushy horned Trefoil. It has small smooth green Stalks a Foot or more high, spreading it self out into many small and short Branches, almost like a Bush, with Trefoil Leaves on not long Footstalks, the Leaves being long and narrow. The Flowers are yellow, shooting forth at the tops 2 or 3 together, and sometimes more. After which come thicker and shorter Cods than in the next following, ending in a long point, in which are contained small Pease or Seed. Sometimes it has broader Cods, and end in shorter Points, as it generally does with us.

VIII. The fifth, or the lesser hairy horned Trefoil. It has a slender woody fibrous Root, which sends up slender Stalks covered with very small reddish Hairs, which are set with small hairy sharp pointed Leaves, three on a Footstalk, and two below at each Joint, from whence spring the Flowers, one or two at the most on a small Stalk like an Hair, of a deep yellow, tending to a Saffron color; after which succeed very slender long Cods, containing very small Seed.

IX. The sixth, or common hoary horned Trefoil. This is but a low Plant, but has a little larger Leaves and Flowers than the last, and of as deep a Saffron yellow color, or rather with a Shadow of Crimson on them, growing three or four together; which being faded away, small, long, crooked Cods succeed, containing within them round Pease or Grains.

X. The seventh, or Crimson Blossom, or square Coddled Trefoil. Its Root which is small, and

perishes every Year, sends up three or four small weak Stalks, divided into many Branches, having two Stalks of Leaves at every Joint; and three small soft Trefoil Leaves standing together on a very small Footstalk, coming from the Joint. The Flowers grow for the most part two together, of a perfect red or Crimson color, almost like to a Pease blossom. After which come long, thick and round Cods, with two Skins or Films, running all along the Cod on the upper side, and two other such like Films all along on the Cod on its under side, which makes it seem four square; in which Cods are contained round discoloured Pease, a little smaller and harder than our Common Pease.

XI. The Places. The first is a Native of Candy, it growing among their Corn, and in the Borders of their Fields; but with us it is only Nurst up in Gardens. The third is a Stranger, and only a Garden Plant with us. The seventh is a Garden Plant also, and we Cultivate it chiefly for the Beauty of its Flowers. The second, fourth, fifth and sixth, grow Wild, and are often found in many of our Fields or Meadows.

XII. The Times. They Flower in the Summer Months, in June and July, when the other Trefoils Flower, and their Seed is ripe in the Month following, or not long after the falling of the Flower.

XIII. The Qualities. They are all Temperate in respect to the first Qualities; Appetitive, Absterive, Diuretick, Nephretick, and Lichontripick. The Pile Trefoil is Anodyn and Discussive.

XIV. The Specification. The first is Analeptick, and restorative in Consumptions. The Pile Trefoil is approved for curing the Hemorrhoids or Piles; but all the Species open Obstructions, cleanse the Urinary passages, and are profitable against Sand, Gravel, and Stone in the Reins and Bladder.

XV. The Preparations. You may have from the first and seventh, 1. A Putrage of the Pulse, or kind of thick Pottage. 2. A Decoction of the same in Water. 3. A Decoction of the Grains of all the other kinds, as also of the whole Plants in Water. 4. A Powder of the dried Herb, of any of the kinds. 5. A Juice or Essence of the whole Plant.

The Virtues.

XVI. The Putrage made of the Pease of the first or seventh kind. It is made with Water, in which the Pease are boiled till they break; then the Pottage is strained thro' a hair wooden Sieve; after which it is mixed with Milk or Cream, or eaten without, being made savory with a little Pepper, Salt and Butter: Some weak Stomachs which cannot away with Milk, may put into it a proportional quantity of Wine, and then make it pleasant with Sugar. Often eaten it nourishes, restores in Consumptions, and makes Fat and Flethy: It also cleanses the Reins, Ureters and Bladder, of Tartarous matter lodg'd in those parts.

XVII. The Decoction of the Pulse of all the kinds, or of the whole Plants in Water. Let it be made very strong, and then mixt with a half part of White-Port Wine, and so drank. It opens Obstructions of the Urinary parts, helps the Strangury, and cleanses those Vessels from Slime, Sand, Gravel, Stones or Tartarous matter lodged in them, being often used.

XVIII. The Powder of the dried Herb of any of the kinds. It may be given from half a Dram to a Dram and half in White-Wine, for all the purposes aforementioned. The Powder of the Pile Trefoil given

given to the same quantity in red Wine, is said to be of good effect against the Hemorrhoids or Piles: But I suppose it ought to be taken for some considerable time; I have had no experience of it, but the Learned about Montpellier affirm it.

XIX. *The Liquid Juice or Essence of the whole Plant.* They are more effectual to all the intentions and purposes aforementioned, than any of the said Preparations; and may be given from two to four Ounces, either alone, or mixt with some proper Wine, or a Decoction of Parsly Roots, and then sweetned with Sugar, to be taken Morning and Night, so long as the Prudent Physician shall order or direct. The Juice and Essence, besides restoring in Consumptions, giving relief in the Stone, &c. are of excellent use to breed plenty of Milk in Nurfs Breasts.

C H A P. DCCIX.

Of TREFOILS Strawberry, and Starry.

I. *THE Names.* We know no Greek Names belonging to these Plants: The first is called in Latine, *Trifolium fragiferum*; and in English, *Strawberry Trefoil*. The second tho' not mentioned by any Greek Authors, may be called Τριφυλλον ἀστέρη, or Τριφυλλον ἀστέρη: in Latine, *Trifolium Stellatum*, *Trifolium Stellare*; in English, *Starry Trefoil*, and *Starry Headed Trefoil*.

II. *The Kinds.* Of the first or Strawberry Trefoil, we have but one Kind growing with us, viz. *Trifolium fragiferum* Gerardi; *Trifolium fragiferum Frisicum*, because it also grows in Friseland; and some call it *Trifolium Vesicarium*. The second is called, *Trifolium Stellatum glabrum* Gerardi, *Trifolium capitulis Stellatis*; smooth Starry headed Trefoil.

The Descriptions.

III. *The first, or Strawberry Trefoil.* Its Roots spread themselves with many long Fibres; and it grows up with several Stalks and broad pointed Trefoil Leaves upon them, being dented in, in the middle of their broad ends, making each Leaf in form much like a Heart, or not much differing from the Leaves of the *Trifolium Cordatum*, or Heart Trefoil, growing upon long Footstalks; which Stalks are bare towards the tops, where grow small round Heads, with small bluish Flowers, rising out of their Husks, which are like small Bladders made of thin Skins; after the Flowers are past, these Bladders swell somewhat bigger, and turn down their Brims, forming a Head like a Strawberry, of many red Grains set together, but greater in each Husk, wherein is contained a few small yellow Seeds.

IV. *Johnson in Gerard, describes it after this manner.* The Roots, Stalks and Leaves, of this pretty Trefoil, do not much differ from the common white Meadow Trefoil; but there is some difference in the Flowers and Seed: For the Flowers of this are small, grow thick together, and are of a robitish bluish color; after which follow Heads made of little Bladders or thin Skins, in such like man-

Trefoil Strawberry.

ner as they resemble a Strawberry or Raspberry; and they are of a grayish color, here and there marked with red: The Leaves are shaped in form of a Heart, and the Stalks seldom grow above a Hand breadth, or four Inches high.

V. The second, or smooth Starry Headed Trefoil, (for there is a rough sort of it growing in Spain, not much differing from this, but is an absolute Stranger with us:) It has a small long white Root, with several Fibres adjoining to it, from which rise up Stalks sometimes a Foot high, and sometimes very much shorter, hairy, and divided but into few Branches: The Leaves which are of a Trefoil fashion, stand upon long Footstalks, and somewhat longish withall, (but those which grow in France, are found to be in form of an Heart;) having no small sharp pointed Leaves growing at the bottom of the Footstalks, next to the Stem of the Plant: The Leaves are green of color, and not snipt, but smooth about the edges. The Heads which grow on the tops of the Stalks are round, short and green, with small purple, or else robitish Flowers, like those of the Common Trefoil, but lesser; standing in Cups divided into five parts, viz. into five long sharp Leaves, which lying open, do very much resemble the Form of a Star. The Flowers being fallen, the Heads grow somewhat bigger, harsher, and more prickly, opening themselves a little, but not much. The Seed is like that of Millet, but somewhat rounder.

VI. *The Places.* The first grows in Friesland, in the Low Countries, and other places adjacent to them, as well as with us. It grows here in moist Salt-Marshes, as in Dartford Salt Marsh in Kent, and in those below Purfleet, and the like places. The second Johnson observed in Dartford Salt-Marsh;

Marsh, and I have seen them both in several other parts and places of this Kingdom.

VII. *The Times.* The first Flowers in *July* and *August*, and the Seed is ripe not long after. The second Flowers in *June* and *July*, and the Seed is ripe in *July* and *August*.

VIII. *The Qualities, Specification, Preparations and Virtues,* are the same with the Common Meadow Trefoils, in Chap. 705. foregoing, to which we refer you, so that no more need be said of them here.

CHAP. DCCX.

of TREFOIL Tree :

O R,

Cytisus; and Bean Trefoil.

THE Names. It is called in Greek *Κύνος* : in Latine *Cytisus* à *Cybnio Insula*, as *Pliny* says, and in English *Tree Trefoil*.

II. *The Kinds.* Authors make 15 or 16 several Species of this Plant, most of which are perfect Strangers to us, and not to be seen unless we Travel many Foreign Countries; we shall only describe such as are Nurst up in our Gardens, which are the five following, viz. 1. *Cytisus Dioscoridis* & *Galen*, *Cytisus Maranthæ*, (so called because it was first brought to light by one *Bartholomeus Marantha* of Naples;) *Cytisus Cornutus*, *Cytisus Lunatus* & *Cytisus verus*. The true Tree Trefoil of *Dioscorides* and *Galen*, or Horned Tree Trefoil. 2. *Cytisus vulgaris*, *Cytisus vulgarior*, *Cytisus pinatus Gerardi*. The common Tree Trefoil, as being the most common with us in England. 3. *Cytisus incanus Germanicus*, *Cytisus hirsutus Gerardi*, *Cytisus albus Sylvæstris Cordi*; The German hoary Tree Trefoil. 4. *Cytisus Hispanicus arboreus*, *Cytisus quartus Hispanicus Clusij*, The Spanish Tree Trefoil. 5. *Cytisus Hispanicus incanus sextus Clusij*, *Cytisus incanus Gerardi*, The low Spanish hoary Tree Trefoil.

III. And because the *Bean-Trefoil* is a *Tree Trefoil*, tho' it be no *Cytisus*, we shall add it to the rest in this place, to avoid making a *New Title* or *Chapter*. It is called in Greek, *Ανὰγυς* *ίνης*, & *Ανὰγυς* *αλτήρ*, *Anagyris altera*, (because there is another *Anagyris*, or *Bean-Trefoil*, which is Stinking;) in Latine *Laburnum*, and in English *Bean-Trefoil*, or *Tree Bean-Trefoil*; and this is twofold, viz. 1. *Anagyris non fetida major*, five *Laburnum majus*, The greater Tree Bean-Trefoil. 2. *Anagyris non fetida minor*, five *Laburnum minus*, the lesser Tree Bean Trefoil. As for the *Anagyris fetida*, we have nothing to say to it here, because it grows only in very hot Countries, and so is a perfect Stranger in our Climate.

The Descriptions.

IV. The first, or True Tree Trefoil of *Dioscorides* and *Galen*, or Horned Trefoil. Its Root is hard and woody, running out several ways under Ground : It rises up to be 4 or 5 Feet high or more, (according as it likes the Soil,) the Stalk being as thick as

Trefoil Tree, True.

a Mans Thumb, covered with a whitish Bark, and spreading it self forth very far into many whitish Branches, beset in many places with small Leaves, three always standing together upon one small short footstalk, which are rounder and whiter than the

Trefoil Tree, True.

Leaves of the Tree Bean-Trefoil. At the ends of the Branches for the most part, come forth the Flowers, three or four together, of a fine Gold color, and of the fashion of Broom-Flowers, but not so large. After the Flowers are past, in their places come crooked, flat, thin Cods, in form or shape of an Half Moon, or Crooked Horn, whitish when they are ripe, in which is contained blackish Seed; the whole Plant has a pretty hot Smell, but not strong. Gerard says, That its Branches are rough and hairy; that the Leaves are like those of the Meadow-Trefoil; that the Cods are crooked like a Sickle; that the Seed or Grains taste like Cicers or Chick Pease; that the whole Plant is hoary like Rhamnus or Buckthorn; and that being broken or bruised, it smells like Rocket.

V. The second, or common Tree Trefoil. Its Root diversly spreads it self under Ground; from whence arises a Stem or Stalk, larger both in height and thickness than the former, having a blackish coloured Bark, replenished with Trefoil Leaves, but smaller and greener than the former. The Flowers are smaller, but of the same fashion and color. The Cods are blackish and thin, not very long or great, but lesser than Broom Cods, in which is contained small blackish Seed. Gerard says, That it grows to the height of a tall Man, (but that is as the Soil is in goodness:) That the Leaves are like some of the Common Trefoils, but smaller, of which the middlemost of the three is always the longest; that the upper side of the Leaf being green, the under side is somewhat reddish and hairy; that the Flowers grow on the Stalks almost from their bottoms to their tops, but greater than any of the rest, of a Gold yellow color, Broom fashion'd; and that the Seed has a Cicer, or Chick-Pease Taste.

VI. The third, or German hoary Tree Trefoil. Its Root is woody, running it self out under the Earth many ways; from which rises up several slender hoary Stalks, which are but low, and more Woolly than some others, with long Trefoil Leaves, which in several places of them, are on the backside somewhat more hoary than on the upper side, the middle Rib being somewhat great, of a kind of sweetish Taste, and a little sweet in Smell also. The Flowers are of a Gold yellow like the other sorts, and like Broom Flowers, standing many together, one above another at the end of the Branches. After which comes hoary, and somewhat hairy, little, long, narrow and flat Cods, containing therein small Seed like that of Broom, tasting like Tares. Gerard says, that its Stalks and Branches grow not very high, but are plentifully spread out round about; that the Leaves are greater than the former, but lesser than those of Meadow Trefoil: That the Flowers grow close together, as tho' they were bound up, or compast into one Head, or speky Tuft, somewhat greater than the former; that the Cods are also greater and more hairy; that it falls out to be more hairy or woolly in one place than in another, and the more hairy and woolly it is, the whiter it grows; and that the Branches of this often lye upon the Ground. Johnson also says, That the Leaves are smooth and green above, and hoary underneath; that the yellow Flowers when fading, become sometimes Orange coloured; and that the Cods are round, and Seeds brownish.

VII. The fourth, or Spanish Tree Trefoil. Its Root is woody and fibrous, spreading it self abroad, which sends up usually but one Stalk, rising to a Mans height, and covered with a dark grayish Bark, which spreads it self out round into Branches, which are replenished with small pale greenish Trefoil Leaves on the upper side, and a little reddish and hairy underneath. The Flowers are of a

Gold yellow color, somewhat longer than others, and coming forth at the bottom of the Leaves in several places, commonly two or three at a place, which turn into small, short, and flat Cods, lesser than Broom Cods, and somewhat blackish when they are ripe, containing within them small, flat, and blackish Seed, as small as that of Broom.

VIII. The fifth, or low Spanish hoary Tree Trefoil. Its Stalks and Branches are not above half a Yard high, long, slender and hoary, repleat with Trefoil Leaves, the two lower of which are smaller than the middle Leaf, which is of twice their length, but of a hoary Ash color, standing on short Footstalks, of an Astringent drying Taste. The Flowers come forth with the Leaves at the Joins, all along the Branches two or three together, which are sustained by soft hoary white Husks, wherein they stand. Gerard says, That it grows to the height of a Cubit or more; that it has many Branches which are slender and twiggy, like Broom, streaked and very hard; that the Leaves are Trefoil like, or very like Foenugreek, yet all hoary; that from the bosoms of which, or between the Leaves and Stalks, the yellow Flowers come forth, very like Broom or Pease Flowers, but smaller; that the Cods are like Broom Cods, of an Ash color, but slenderer, rougher and flatter; that in their several Cells are contained bright shining Seed, like the black Seed of Broom; and that the whole Plant is hoary like Rhamnus or Buckthorn.

IX. The sixth of the Greater Tree Bean-Trefoil. Its Root is woody, runs deep into the Ground, and spreads far about, being of a yellowish color. It rises up to more than the height of a Man, if it abides long in any place, and is covered with a smooth green Bark. The Branches are very long, pliant, and bending any way, on which grow here and there Trefoil Leaves upon long Footstalks, being something long, narrow, and pointed at the ends, green on the upper side, and of a shining Silver color underneath, without any Smell at all. At the Joins of these Branches where the Leaves stand, come forth many Flowers much like to those of Broom, but not so large or open, growing about a very long Branch or Stalk, sometimes a good Span or more in length, and of a fair yellow color, but not very deep; after which come flat thin Cods, not very long or broad, but as tough and hard as those of Broom, in which is contained blackish Seed: Those Twigs of Flowers hang down, and do not stand up, being almost a Foot long, as do also the Cods. Gerard says, that the Leaves are rather like to Vixes, or those of Cytisus, and that the Seed is like to that of Galega, or Tree-Trefoil.

X. The second, or lesser Tree Bean-Trefoil. It is in most things like unto the last described; but it grows nothing near so great, nor are the Leaves so large by half, nor yet either the Flowers or Seed.

XI. The Places. The first four of the Tree-Trefoils are found in the Kingdom of Naples, and several parts of Greece; as also the second, third and fourth in Hungary, Austria, &c. but all the first five are Strangers in England, but as they are Nurst up in Gardens; the second of them being the most common with us. The Tree-Bean-Trefoil grows in Spain and France, also in Candy, as Bellonius says, but with us are Cultivated under a Gardiners Care.

XII. The Times. The first five Flower for the most part in May, June and July, and give ripe Seed in August and September. The latter two Flower in May and June, and their Seed is ripe in September.

XIII. The Qualities. The Cystis are temperate in respect to heat or cold, dryness or moisture, yet some

some say they are cold and moist in the beginning of the first Degree; are Digestive, Dificussive, Anodyn, Diuretick, Nephritick, and Lactogeneick. The *Laburna* are hot and dry as *Galen* says, Aperitive, Digestive, Dificussive, Pectoral, Hyfterick and Emmenagogick; and that their Seed is also Emetick.

XIV. *The Specification.* The *Cytis* wonderfully increases Milk in Nurseries, for which reason in Foreign Countries where they naturally grow, they are Planted for feeding Sheep, Goats and Cows, both to make them give more Milk, and also to Fatten them; and for Bees to gather Honey from their Flowers; and from whose Flowers they gathered more Honey than from the Flowers of any other Plant whatsoever: And abiding green for eight Months of the Year, it became excellent Pasturage for their Cartel, and might be kept dry the rest of the Year following as dry Fodder. It is said to be a remedy against the Sciatica, and all other kinds of Gouts. The *Laburna* discusses cold Swellings, eases the Head-ach, opens Obstructions of the Lungs, Reins and Womb, provoke the Terms, and bring away both Birth and After-birth.

XV. *The Preparations.* Of the *Cytis* you may make 1. A Liquid Juice. 2. An Infusion or Decoction in Water. Of the *Laburna* you may make, 1. A Liquid Juice of the Roots and Leaves. 2. A Decoction or Infusion in Water or Wine. 3. A Powder of the Leaves. 4. A Cataplasm of the Leaves.

The Virtues.

XVI. *The Juice of Cytisus.* Being drank from two Ounces to four, mixt with Canary or Sack-Whey, it increases Milk in Nurseries admirably; and also restores in Consumptions, more especially if made into a Lohoch with Clarified Honey.

XVII. *The Infusion or Decoction of Cytisus, in Water.* It has the same Virtues: If three quarters of the Infusion or Decoction, be mixt with a quarter part of Wine for Nurseries to drink, it will breed good store of Milk in their Breasts, and make their Children strong and lusty; and gives ease in the Sciatica or Gout.

XVIII. *The Liquid Juice of Laburnum.* It is a strong Vomit, and besides which it Purges also downwards pretty strongly, by which means it opens Obstructions of the Stomach, Lungs and Womb, eases the Gout and Rheumatism, provokes the Terms, and brings away both Birth and After-birth: Dose from an Ounce to two Ounces, in any convenient Vehicle.

XIX. *The Decoction in Water or Wine.* It has the Virtues of the Juice, and may be given from a quarter to half a Pint, according to Age and Strength.

XX. *The Powder of the Leaves.* Taken to a Dram in Wine or Mead, provokes the Terms, expels both Birth and After-birth, and Dead Child, opens Obstructions of the Lungs, Mesentery and Womb; and helps such as are short Winded, and can hardly breathe, or are vehemently troubled with the Head-ach: It purges strongly both upwards and downwards.

XXI. *The Cataplasm of the Leaves.* Laid upon cold Tumors it eases the Pain, discusses and waxes them, restoring the part to its Primitive Health.

CHAP.

CHAP. DCCXI.

Of TUFTS Garden.

THE Names. This Plant is called in Greek, *Θάλασσιον, ή θάλασσιον ήμερον, and θάλασσιον ζυμωτόν*: in Latine, *Tblaspi Hortensis, & Tblaspi Umbellatum*: in English, *Garden Tufts*.

II. *The Kinds.* We observe but two sorts of this Plant in our Gardens, viz. 1. *Tblaspi Creticum, Tblaspi Umbellatum, flore albo & Purpureo*, Candy Tufts white and purple; it is a Flower of the large kind, and serves for an Ornament to great Parterres. 2. *Tblaspi Baticum, Tblaspi Marinum*, Spanish Tufts, or Spanish Sea-Tufts.

The Descriptions.

III. The first, or Candy Tufts, white and purple. Its Root is small and thready, is like that of the Treacle Mustard, enduring many Years, which sends up Stalks about a Foot or more high, divided or spread out into several Branches, each of which bears Leaves of about two Inches long, without Foot-stalks, large at bottom, indented round the edges, and pointed at their tops. At the upper end of its Stalk grow very small Flowers, composed of four Leaves, in the form of a Cross. In the middle of each Cup rises a Style, which becomes a Fruit, round at top, border'd with a Wing or little Leaf, and divided into two Chambers, which are filled with flat Seeds, that at first are red, but afterwards when they become ripe turn black.

IV. The second, or Spanish Sea-Tufts, are very much like the former, which sends forth some Leaves (before its Stalks,) which are a little notch'd or finely dented about the edges; but it divides or spreads not it self out into Branches as the former does, but has at its top an Umbel of purplish Flowers like unto the former, but with paler yellow Seed.

V. *The Places.* The first grows in Candia; the second in Spain, not far from the Sea-side, but with us they both are Nurst up in Gardens.

VI. *The Times.* They Flower about the middle or end of June, or beginning of July; and the Seed is ripe not long after.

OBSERVATIONS.

VII. *Obs.* 1. This Plant (of which there are many sorts, but) two Kinds of which we Sow only in our Gardens, is propagated by its Seed which is Sown in September, in open Grounds, or in hot Beds: It is sown in Drills, on the edges of our Beds or Borders, or else in little Circles, at one, two, or three Feet distance, to make a show the first Year, after which the Plants produce their Seed and dye, and are accounted hardy Annuals.

VIII. *Obs.* 2. If you Sow the Seed in open Ground, it ought to be upon a Bed well dug, and set out by Lines, which should likewise be scatter'd over with Mould about an Inch thick, and laid afterwards very even. After having drawn Rills length-ways and cross-ways, you may Sow the Seed, yet but very thin to the end, that your Flowers may be the finer, and not subject to fade:

These Plants when in Beds, have sometimes occasion for Watering, especially when the Season happens to be serene and dry, and therefore you must be sure to do it, as oft as need requires it.

IX. *Obs.* 2. If you Sow the Seed in hot Beds, you must wait till February, which is the time you ought to make them, observing in Sowing the method before prescribed: When March is come, and you think the Plants have strength enough to bear Transplanting, then take them out of the places where they are, and place them in those where they may bear Flowers. The Plants which are Sown in September, are not to be sooner Transplanted than those Sown upon hot Beds; and so you reserve places for other Flowers, much more valuable.

X. *Obs.* 4. When you Transplant them, put them among Flowers of the large kind, and fill whole Beds with them, or at least adorn the middle of the Borders, by which means they will be set off, so that being planted regularly, and intermix with other Flowers in the same Row, few things can be more pleasant to the Sight. As to any particular sort of Earth in which they should be Planted, nothing need be said; for being put into Beds of good Mould, they will certainly thrive.

XI. *Obs.* 5. As soon as you have Planted them, you must Water them, for that makes the Earth lye closer to their Roots, whereby they will the more aptly receive their *Pabulum*, so as to grow very fair: And as these Flowers are Enemies to Weeds, or Weeds Enemies to them, which are apt to choke them up, you must therefore take care to free them therefrom, and to Water them as you see occasion.

XII. *Obs.* 6. When after Sowing they first begin to peep out of the Ground, Frosts many times happen, which would certainly much hurt them; therefore defend them, by covering them with large dry Dung or Straw, and so let it lye over them all the Winter, if Sown in open Grounds: But if in hot Beds, then cover them with Straw-Bells, and they will then do well: But if there happen only white Frosts, you need not to cover them but only a Nights, and uncover them the next Morning.

XIII. *The Qualities, Specification, Preparations and Virtues*, are the same with our *Common Mustard*, in *Chap.* 511. saving that this Plant is not so vehemently acute, hot and sharp; and therefore may be used with the more pleasure.

C H A P. DCCXII.

Of the TUBEROSE.

I. *THE Names.* Tho' it has no known Greek Name, being an *Indian* Plant, yet being thought to be of the kindred of the *Facinch*, it may properly enough be called *Jacynthus indicus*: in Greek; and in Latine, *Hyacinthus Indicus*, but our Modern Authors call it simply, *Tuberosa*, quasi *Ralix Tuberosa*, and *Flos Indicus radice Tuberosa*: in English, *The Tuberosa*, so called because its Root is Tuberos.

II. *The Kind.* It is the Opinion of almost all Authors, that it is a Species of the *Facinch*, but whether it is the *American Facinch*, of which we have discoursed before in *Chap.* 391. is very much

to be doubted; because of the discrepency which seems to be in the Flower, as also in some other particulars: Besides Authors describe two Species of that Plant, whereas this seems to be a singular of its own kind.

The Description.

III. *Its Root is thick and Tuberos*, which gave occasion to its Name, with some Fibres or Strings issuing from it: From this Root shoot forth several Leaves, about half a Foot long, smooth, and pointed at the end; in the middle of which rises up a Stem, three or four Feet high, and about the thickness of ones little Finger. On the top of this Stem or Stalk, the Flowers come forth like Lillys, single Leav'd, and shaped like a Pipe or Bell, pointed, or notch'd in six places, and looking almost like a Bell. At the bottom of the Flower rises a Chive, which in time becomes a roundish Fruit, full of Seed of the same color.

IV. *The Places.* It is said to be Originally an *Indian* Plant, but now almost all *Europe* is stored with it. It is brought to us in the Roots, generally out of *Italy*, where they thrive and prosper exceedingly; which when we have them, we only Plant them in Pots, and so place them in our Gardens, that they may be housed in Winter, or when the Season grows cold.

V. *The Times.* If the Season is warm and temperate, the Roots may be Planted in February or March, and then they will possibly Flower in June, July, or August; but if you Plant them in May, they will then Flower in Autumn, viz. in August or September.

OBSERVATIONS.

VI. *Obs.* 1. The *Tuberosa* delights wonderfully in heat, for which reason, it never bears so large Flowers in our cold Countries, as it does in its Native hotter Climates; wherefore we ought to repose it in such places where the heat or Sun is more sensibly felt.

VII. *Obs.* 2. Chuse such Roots as are hard and firm, which you may know by feeling them with your Thumb and Fore-finger, refusing such as are soft, and incline to be rotten, which is discerned by running your Nail into the side of the Root; if the Substance is not white, reject it, and chuse others.

VIII. *Obs.* 3. Then chuse middle siz'd Pots, which fill (within 2 Inches of the tops) with Earth made of two thirds of Mould, and one third of Kitchen Garden Earth well mixt together; in which set the *Tuberosa* Roots an Inch deep, leaving the other part, which cover with pure Mould, to receive the heat of the Sun, which will by this means the more easily penetrate to the Roots.

IX. *Obs.* 4. If you would have early Flowers, plant them in the latter end of February, or beginning of March, and place their Pots in hot Beds up to their Rim, and cover them with Glasses; letting them enjoy (if the Weather is mild) the Beams of the Sun thro' the Glasses; but if Frosty or Cold, then cover the Glasses with Mats: And if it Freezes hard, cover the Mats also with Straw; for the least Cold imaginable hinders their Growth, and may make them to fail, how well soever they are disposed to bear Flowers.

X. *Obs.* 5. Thus managed, their Shoots will show what they will be, since Heat almost alone, it

it is that makes them prosperous; but some Moisture will also be requisite, and therefore it will be necessary from time to time to Water them, (as your Prudence shall direct,) with Water newly drawn out of a Well.

XI. *Obs.* 6. The Glasses must be continued, till the Air is grown warm or mild; nor must the Pots be yet taken out of their Beds, which preserve a certain Warmth within them, which has an admirable influence upon them, in causing them to fructify.

XII. *Obs.* 7. If you have no Dung, and are loth to be at the charge thereof, you must not Plant your *Tuberose* Roots till the end of *March*, or beginning of *April*, for the great Colds being then over, many Inconveniencies of early Planting will be avoided. Then fill the Pots in the manner before prescribed, and Plant your Roots therein; which Pots expose in the most Sunny places, setting them upon Boards under a Wall, that they may have the reverberation of the Heat from the Wall also, which will make them the sooner come to their desired Perfection.

XIII. *Obs.* 8. If you Plant them in *May*, then your Plants will Flower in *Autumn*; but you must observe the same Method as you do in those which are more early Planted, always placing them where the Sun is hottest: And to forward them in their growth, you must Water every day at Noon, with Water warmed in the Sun.

XIV. *Obs.* 9. This Plant is not to be raised in open Grounds, because the Heat in our colder Climates is not sufficient to make them grow and thrive as they ought; but being Planted in Pots as before directed, they are to be exposed to the Solar heat; yet some do not only expose them to the strongest heat they can in the Day time, but also put some Glasses upon them to retain the Heat the longer.

XV. *Obs.* 10. If it happens that some Roots shoot not up their Stems so soon as others, you must remove the Pot out of the hot Bed it is in, and set it in another hot Bed new made, (provided it has discharged its first heat;) or for want of such a Bed, to place it on a heap of Horse-Dung moderately warm, which expedient has been found very well to succeed.

XVI. *Obs.* 11. When the Stems grow high, and the Flowers begin to appear upon their tops, you must support them with a little Rod or Stick, of a Fingers thickness, which is to be stuck into the Earth, near the Foot of each Plant, to which the Stems are to be tyed; for otherwise the weight of the Flowers would make them exceedingly to bend, and possibly also to break: When they begin to blow, each Flower blows successively one after another, which keeps them a long time in Flowering; the Smell and Odour of which is very sweet and grateful, Perfuming the place or room in which they grow or are placed.

XVII. *Obs.* 12. This Plant is multiplied by Suckers, but this is chiefly done in hot Climates; for tho' we look never so carefully after these Suckers, yet their Stems (in our cold Climates,) will never grow high as those which are Planted from their Original Roots, brought to us out of *Italy*, and other like Countries; nor will their Flowers be so numerous or so beautiful; wherefore it is a Folly to think of augmenting of their numbers this way.

XVIII. *Obs.* 13. Lastly, Authors have said nothing of their Virtues, but only suppose them to have the same Qualities and Specification with the other *Hyacinths*: But the great care and trouble in their Cultivation, is chiefly for the Beauty of

their Flowers, and their Fragrant Odour, with which they replenish the places of their abode.

C H A P. DCCXIII.

Of the TULIP, or Turks-Cap.

I. **THE Names.** It has no Greek nor Latine Name that we know of; but Authors have Latiniz'd a Name for it, and call it *Tulipa*, from the Turkish Word *Tulipan*, which is the Name the Turks give their *Head-Tyres*, or *Caps*; and we in *English*, in conformity to this Name, call it the *Tulip*, which is much like a *Turks-Cap*.

II. **The Kinds.** Some as *Dodonæus*, and *Matthioli* upon *Dioscorides*, refer it to the *anemone*, or *Theophrasti*, in lib. 7. cap. 13. as if it was a kind of *Wild Hyacinth*; but in the place cited, *Theophrastus* gives us neither its Form nor Qualities, but barely the Name; but I suppose they might attribute it to be a Species of some of those Plants, because of its Bulbous Root. *Gesner* first of all, and after him *Camerarius*, *Clusius* and *Lobel*, with many others since, refer it to the *Satyrium* *Dioscorides*, which seems to be the very truth it self, for these following Reasons. I. From its place of Growing; for that it grows frequently and plentifully in many parts of *Greece*, and the *Lesser Asia*, and so no doubt could not but be sufficiently known both to *Theophrastus* and *Dioscorides*.

II. **From the Form of the Plant.** The *Satyrium* *Dioscoridis* commonly bore three Leaves on a Stalk, not much unlike to a *Lilly*; (ours has sometimes three, rarely four or five;) whereof some are oftentimes seen to be red in the first Springing, and also upon the Decaying, especially in a dry time, and a dry Ground. III. **From the form of the Root.** *Dioscorides's* *Satyrium* has a round Root, and as white within as the white of an Egg, as the *Tulip* has, covered with a brown Coat, having a sweetish, but not unpleasant Taste. IV. **From the form of its Flower.** Those which have red Flowers, may very well agree with that Species called *Erythronium*, which see in *Matthioli* upon *Dioscorides*, page 637. and *Bodeus* his Comment on *Theophrastus*, lib. 9. page 1171. which *Camerarius* in his Epitome, *Lobel* and others, call *Lilio-Narcissus*, because it has some resemblance of the *Lily* in the Leaf, Flower and Seed; and the *Narcissus* or *Daffodil* in its Root.

V. **From the Qualities.** For that some very Learned Physicians have affirmed to me, and that from Experience (as they say,) that the *Tulip* Roots have the same Virtues which *Dioscorides's* *Satyrium*, and *Theophrastus's* *Herba quam Indus attulerat* have, and that not inferior to the same. The greatest difference with *Dioscorides*, is in the Seed, which yet I think, (considering the usual way of speaking,) is none at all: For, as he says, it is something like to *Linseed*; so we often say of many other things, which are far from being exactly like the same. The Seed of the *Tulip* is flattish, hard and shining, and agrees well enough (generally speaking,) to *Flax* or *Linseed*, altho' of another Color, and larger as *Dioscorides* himself says: But if there should be a mistake in the Writing of *anem. Lini*, *Flax*, for *kelon* vel *kleion*, *Lilij*, *Lilly*, (as was easy in Copying Manuscripts, before the Mystery of Printing was invented;) the slip of the Pen being both easy and likely,) then it is out of all doubt, that

that these two Plants, or Plant going by two Names, viz. *Satyrion* and *Tulipa*, are absolutely one and the same. VI. Lastly, if this *Our Tulip*, be not the true *Satyrion* of *Dioscorides*, we know nothing this Day in the World that can answer to it, which has but one single Bulb as this has; the *Testiculi* being in truth, nothing of kin to it. There are, (as Authors will have it) three remarkable Kinds of the *Tulip*, (which yet have only respect to the time of their Flowering;) viz. 1. The *Præcox*, or *Præcocus*, which the *Turks* call *Cassa Lale*. 2. The *Media*, or *Mediæ*, the middle Flowering *Tulips*. 3. The *Serotina*, or *Serotine*, the late Flowering *Tulips*, which the *Turks* call *Cava Lale*. All these *Dalechampsius* calls by the name of *Oulada*, and we only *Tulips*. Of these three Seasons of *Tulips*, there are many Varieties, of all which, one General Description will be enough to give you the full of all those various Flowers; after which, we will give you the Principal of all those Varieties. 1. As they were more Antiently taken notice of, and the Names they were then known by, from *Mr. Parkinson*. 2. As they are now specified, and the modern Names they are called by, from *Mr. Rea*. These Varieties chiefly arise from their diversities of Colours, produced by their often Sowing of their Seed, Planting and Re-planting them, which various Colourings seem to be admirable in them, beyond what can be found in any other Flower in the World besides; every Year yielding a new mixture and variety, which possibly was never seen or observed before. The *Mediæ*, which Flower between the early and late Flowering, some will not have to be a Species by it self, because they nearer partake with the *Serotine* than with the *Præcocus*, as well in the color of its Leaf, being of the same Greenness, as in the bigness and height of its Stalk and Flower, being as high and large as the *Serotine*; as also because the Seed of a *Media Tulip*, never brings forth a *Præcox*, but many times a *Serotina*; as again, a *Serotina* Seed many times brings forth a *Media Tulip*, never a *Præcox*. But because the *Media Tulip* is taken as a Species by most Authors, we shall not here break the Order, but treat of them as they are generally received.

The General Descriptions.

III. Its Root being well grown is round, and somewhat great, small and pointed at the top, and broader, yet rounder at the bottom; with a certain eminence, or bunching out on one side, as the Root of the *Colchium* has, but not so long or great; it has also an hollowiness on the side, (if it has born a Flower) where the Stalk grew: For tho' in the time of its first Springing up, until it shews its Buds for Flowers, the Stalk which with the Leaves thereon, rise up out of the middle of the Root; yet when the Stalk is risen up, and shews the Bud for Flowers, it presses to one side, making an impression therein. This Root is covered over with a brownish thin Coat or Skin like an Onion, having a little wooliness at the bottom, but white and firm within; yet composed of many Coats, one closing in, or enfolding within another, like as the Root of a *Daffodil*, or *Narcissus*, of a reasonable good Taste, not very sweet, but not in the least unpleasant. From this Root comes a little Sprout out of the Ground, with its Leaves folded one within another. The first, or lowest Leaf rises up first, sharp pointed, and folded up round together, until it be an Inch or two above the Ground, which then opens it self, shewing another Leaf folded also in the Bosom or Belly of the

first, which in time likewise opening it self, thrusts forth a third, and sometimes a fourth and fifth. The lower Leaves are larger than the upper, are fair, thick, broad, long, and hollow like a Gutter, and sometimes crumpled on the edges, which will hold Water falling thereon a long time; they are of a Willow, or pale whitish green color, (but the *Mediæ* and *Serotina*, more green) covered over as it were with a Measiness, or hoariness, with an Eye or Shew of redness towards the bottom of the Leaves, and the edges being more notably white, (which are two principal Notes in a *Præcox*, and distinguish it from a *Media* or *Serotina*.) The Stalk with the Flower, rises up in the middle, as it were thro' these Leaves, which in time stand one above another, encompassing it at certain unequal distances, which is often observed to bend it self crookedly, so as to look towards the Ground, as if it would thrust its Head thercinto, but turning up its Head again, which then comes to be the Flower, stands afterwards upright: This Stalk is in the *Præcox* sometimes but 3 or 4 Inches high, sometimes half a Foot, and sometimes a Foot high; but in the *Mediæ* and *Serotina*, much higher, carrying for the most part, but one Flower on the top thereof, not much unlike a Lilly, consisting of six Leaves, green at the first, and afterwards changing into divers and sundry colors, making manifold Varieties. The bottoms of the Leaves of the *Præcox*, sometimes, but most especially of the *Mediæ*, being as variable as the Flower,

The TULIP.

which are in some yellow or green, or black; in others white, blew, purple, or tawney; and sometimes one color circling another. Some of these Flowers have little or no Smell at all, some smell better than others, and some smell Sweet. After it has been blown three or four Days or more, it will in the heat of the Sun spread it self open, and lay it self almost flat to the Stalk. In the midst of the Flower grows a long green Head or Pointle, (which will be the Seed Vessel,) compassed about with six Chives, which vary very much, in being sometimes of one color, and sometimes of another, tipped with Pendants diversly varied likewise. This Head in
the

the middle of the Flower, grows (after the Flower is fallen) to be long, round and edged, as it were with three Angles or Sides, the edges meeting at the top where it is smallest, and making as it were a Crown, (which is not seen in the Head of any Lilly;) which when it is ripe, divides its self on the inside, into six rows of flat, thin, brownish, gristly Seed, very like unto the Seed of Lillys, but brighter, stiffer and more transparent. Something more is to be said of the Tulip, which take in the following Observations.

IV. *Obs.* 1. All sorts of Tulips usually bear but one Stalk, and that without any Branches; but sometimes Nature is so free in producing, that it has two or three Stalks, and sometimes two or more Branches out of one Stalk, each Stalk or Branch bearing one Flower at the top, but this is very rarely seen; and when it does happen once, it is hardly ever seen again from the same Root; but is a great Sign, that such a Root being now old, will in the same Year divide it self into several Roots, each of which, being of a reasonable greatness, will bear both its Stalk and Flower the next Year, agreeing with the Mother-Plant in color, as all the Off sets of Tulips do for the most part: For altho' the young Off sets of some do vary from the main Root, even whilst it grows with them, yet being separated, it will be of the same color with the Mother-Plant.

V. *Obs.* 2. There grows oftentimes in the *Media*, and sometimes also in the *Præcoces*, tho' but seldom, a small Bulb or Root, hard above Ground, at the bottom of the Stalk, and between it and the lower Leaf, which when the Stalk is dry, and is ripe, being put into the Ground, will bring forth in time, a Flower like unto the Mother-Plant, of which it came.

VI. *Obs.* 3. The Flowers also of Tulips consist commonly of six Leaves; but sometimes they are seen to have 8 or 10, or more Leaves; but usually those Roots bear but their ordinary number of six Leaves the next Year. The Head for Seed, is then for the most part four square or cornered, which at all other times is but three cornered; or when the Flower wants a Leaf or two, as sometimes also it does, it is then flat, having but two corners or edges.

VII. *Obs.* 4. The form of the Flower is also very variable, for the Leaves of some Tulips are all sharp pointed, or all blunt and round pointed; and some, the three outermost, sharp pointed, and the three inner round pointed, and some contrariwise. Again, some have all the Leaves of the Flowers, long and narrow; and some again have them broader and shorter. Some *Præcoces* have their Flowers very large and great, equal to those of the *Media* or *Serotina*, which most commonly are the largest; and others have them as small as the *Bolonia* Tulip.

VIII. *Obs.* 5. The bottoms of the Leaves of the Flowers are also variably diversified, and so are both the Chives and Pendants which hang loose on their tops within: And by the difference of the bottoms or Chives, many Flowers are distinguished, which otherwise are very like in color, and alike also marked.

IX. *Obs.* 6. In the Smell also there is some diversity; for that the Flowers of some have no Smell at all, some a small Scent, not offensive; some a little sweetish, and some very sweet: And some again have a strong ill Smell; which are not to be distinguished by Writing, but by ones own smelling to them. The Seeds of sweet smelling Plants, many times do not follow their Mother-Plants, no more in their smell, than they do in their color.

X. *Obs.* 7. When the Flower has been for several Years of one intire color, yet afterwards it has altered very much, as if it had not been the same Plant, as from a Purple or Stamel, it has been variably either parted or mixed, or striped with white, either in part, or thro' the whole Flower; and so in a red or yellow, that it has had either red or yellow edges, or red or yellow Spots or Streaks, Veins, Lines or Flames, running thro' the red or yellow color; sometimes three Leaves have been equally parted in the middle with red and yellow, the other three remaining of one color: In some the red has some yellow in it; and the yellow some red Spots in it also. These Varieties proceeding from such Roots as had been for several Years of one constant color, shew the weakness and decay of those Roots; and that this extraordinary Beauty of the Flower, is but as the Blaze of a Light, or Candle just upon its going out; and by this means declares to them, that it is upon taking its Farewell, and can do no more service.

XI. *Obs.* 8. That the chief differences (setting aside the Seasons of Flowering) consist in the Form and Magnitude of the Leaves, as some great and large, some smaller; some long and pointed, others broad and blunt. 2. In the colors, with their several mixtures, marks, and variableness of changing, as has been before declared. This large Description, with the Observations appendent to it, may well serve for all the Seasons of Tulips, whether *Præcoces*, *Media* or *Serotina*, concerning their springing up, form and bearing; there being no other great Varieties besides worth the noting.

XII. Mr. Rea describes the Tulip after this manner, in his *Flora*, pag. 47. The Roots are some rounder and bigger than others, whose bottoms are large, round, with a woolly eminence on one side, whence the Fibres come forth; and on the other side of such as have born Flowers, there is a hollow Channel where the Stalk grew, which yearly shifts from side to side, arising every Year a new from the aforesaid eminence, which is in the bottom of every Root, but more in some than in others. These Roots are sharp at their upper end, and if they will bear Flowers the next Year are forked, and shew forth two Points to put forth two Leaves; but if they will not bear Flowers, then they appear but with one Point: These Roots are also composed of several thick Skins, folded one upon another, and at last are covered with a brown Coat, which is every Year renewed, the old being cast off. These, whether they be the *Præcoces*, *Media* or *Serotina*, spring out of the Ground with Leaves folded one within another, and opening by degrees become broad, thick, long and hollow, turning up their edges, and holding Water falling thereon; commonly three in number, but sometimes in old Rooted Plants four or five, of a whitish green color, with whiter edges, chiefly in the *Præcoces*, by which they are known from the *Media* or *Serotina*, whose Leaves are of a fresher green. The Stalk with the Flower, comes up in the middle of the Leaves, which rise up with it, and encompass it at unequal distances, many of the *Præcoces* bending to the Ground, but before they Flower, are drawn upright by the Sun, as all the rest are. They all bear (usually) but one Flower on a Stalk, which Stalk in the *Præcoces* is not above a foot high, and many of them lower, but in the *Media* and *Serotina* much higher, stands upright, and at its top has a Flower composed of six Leaves, green at first and closed, which by the influence of the Sun Beams opens, changes into divers Glorious colors variously mixed, edged, striped, feathered, guarded, agotted, marbled, streaked

ked, speckled even to admiration: the Leaves of some of them being round pointed, some sharp pointed; and in some Flowers, the one half of the Leaves are round pointed, the other half sharp pointed, three of one fashion, three of another. The color of the bottoms and Chives, especially in the Medix and Serotinae, do also notably differ one from another; for in some they will be white, yellow, Straw color; and in others blew, black, or purple, deeper or lighter. Some Flowers will be sweeter than others, and many of them have little or no smell at all. In their middle is a long green Head, commonly three cornered, which is the Seed Vessel, compassed about with 6 Chives, tipped with Pendants, in color answerable to the bottom, which often changes; for when a red or purple Flower, has a blew or dark colored bottom and Chives, marked well with white, the bottom will be white also, the said bottom running up into the Leaves, which is a prime cause of their being well marked; but the Chives remain without alteration; by which the Flower may be known thro' all its various mutations, the rule holding certain in most of the best Flowers. After the Flower is fallen, the Seed Vessel grows bigger, rounder, and longer, containing usually six rows of flat, thin, brown gristly Seed. The greatest difference is in their Flowers, from the diversity of their colors, order of marking, bottoms, Chives, bigness, fashion, and manner of growing; the which in what follows, shall be particularly express'd, whereby each Flower by its Name and Face, may be known and distinguished. As the Tulip is a stately Flower, so it has been, and is much esteemed; and one Root has been sold with us at all Prices, from a Penny to five Pounds: But in other Countries where they are more affected with them, at much higher Rates; inasmuch that Thirty Pounds have been given for a Root; but that heat is now much abated, considering how great a Folly it was to dote upon a Flower, especially one that was so apt to change, and subject to degenerate.

XIII. Observations. 1. The Tulip is a Plant whose Bulb is of a whitish brown outwards, almost round, and composed of several small white coverings, which are laid one upon another, from which Bulb comes forth pretty large Leaves, of about 6 Inches or more, long, waved on their edges, and ending in a Point; out of whose middle, comes forth a Stalk a Foot more or less, long, which at its top produces a Flower, in form of a Cup, sometimes of one color, sometimes of another, which has six Leaves, in whose middle rises up a Pointel, (with six Chives about it,) which in time becomes an oblong Fruit, opening on three sides, with six rows, fill'd with flat Seeds, of a roundish Figure, and reddish color. 2. Of the six Leaves of the Flowers, the three innermost are generally larger than the three outward ones, and their form if it is flat, is more Beautiful than when sharp, and their bottoms ought also to be proportion'd to their tops; where also the Cup is least Convex, it is preferable to that which is very much so. 3. If its form and green are of a middling bigness it is good, as well as when they have a requisite largeness; so also if its green is a little frizled, or accompanied with small streaks. Its bottom is also much taken notice of, because the Stripes which arise from thence, are generally the finest colors. And therefore a Tulip is not to be judg'd of at its first opening; you ought to wait 2 or 3 Days, before you can judge rightly of it. 4. If it opens with its Leaves turned either inwards or outwards, 'tis not to be valued, no more than when its Leaves are too small or too thin: And of the better sorts of Tulips, those are most to be esteemed, whose

color is Lustrous, and looks like Sattin; or of a flame colour'd Red upon a white Ground; of divers colors with Shadings, and yellow striped with gray. 5. Those Tulips look only agreeable to the Eye, whose Stripes are not confusedly blended, but are well or manifestly separated one from another; and to add to their perfection, it is necessary their Thrums should be of a brown color, but 'tis no matter how their Chives are. These Flowers are sometimes incommoded with Diseases, but 'tis only for want of Care, for if they are well managed or lookt after, they are never subject to any defect.

I. Of the PRÆCOCES:

OR,

Early TULIPS.

XIV. Having thus done with the General Descriptions, we will now proceed to a more particular relation of the several Varieties, under their several Seasons, or times of Flowering: And first of the Præcoces, or Early Flowering Tulips, which are either white, purple, red or yellow; of which

The Early Tulip.

those of the first or more common sort, are called Edgers, and are either Red, Carnation, Crimson or Scarlet, deeper or paler, with yellow, Straw color, or white edges; or else sadder or paler Violet, Graydeline, or Murry Purple, with greater or lesser white edges, of which there are multitudes of diversities, many of them now not much esteemed; of which we will give you some of the best, and then a plentiful Variety of those of the other and better

better sorts, which tho' they may be of the same or like colors, yet notably differing in their *Marking*, being either striped, feathered, or variably marbled, with two or more colors in each Flower; and this we shall (God willing) perform, thro' all their *Seasons of Flowering*. I. From *Parkinson*, that you may know their more Ancient Appellations and Varieties. II. From Mr. *Rea*, that you may know their present Appellations, and the Varieties which are now most esteemed with our *Florists*; and are as follows.

Tulipa Præcox alba: White Early Tulips.

XV. 1. *Nivea tota interdum pupureis flaminibus*, vel *saltem luteis, fundo puro luteo*. The pure Snow white, sometimes with Purple, or at least with yellow Chives, without any yellow bottom.

XVI. 2. *Alba sine nivea fundo luteo*. The pure White with a yellow bottom.

XVII. 3. *Albida*. The Milk white, (which is not a pure white.)

XVIII. 4. *Alba, Caruleis in dorso*. White, with blew Veins on the outside.

XIX. 5. *Alba, pupureis oris, constans vel dispergens*. White, either constant or spreading, with Purple edges.

XX. 6. *Alba constans, vel dispergens, Carneis oris*. Constant, or spreading White, with bluish edges.

XXI. 7. *Alba constans, vel dispergens sanguineis oris*. A Constant or spreading White, with red edges.

XXII. 8. *Alba oris magnis carneis, & venis intro respicientibus*. White, with great bluish edges, and some Streaks running from the edge inwards.

XXIII. 9. *Alba extra, carnei vero coloris intus, oras habens carneas saturatiores*. White without, and somewhat bluish within, with edges of a deep bluish.

XXIV. 10. *Albida, oris rubris, vel oris pupureis*. Whitish, or pale white, with red or purple edges.

XXV. 11. *Albida, purpurascens maculis extra, intus vero carnei vivacissimis*. Whitish without, with some purplish Veins and Spots, and of a lively bluish within.

XXVI. 12. *Alba pupureis maculis aspersa extra, intus vero alba purpurantibus oris*. White without, spotted with small purple Spots, and white within with purple edges.

XXVII. 13. *Dux alba, coccineis & albis variata flaminis, à medio ad oras intercurrentibus*. A white Duke, parted with white and crimson Flames, from the middle of each Leaf to the edge.

XXVIII. 14. *Prinçessa, Argenteis coloris maculis purpurascens*. The Princess of a Silver color, with fine deep bluish Spots.

XXIX. 15. *Regina Pulcherrima, albis & sanguineis aspersa radiis & punctis*. The most Beautiful Queen Flower, sprinkled with Blood red Spots and Strakes.

Tulipa Præcox Purpurea; Purple Early Tulips.

XXX. 16. *Purpurea satura rubescens, vel Violacea*. A deep reddish Purple, or more Violet coloured.

XXXI. 17. *Purpurea Pallida, Columbina dista*. Pale purple, called a Dove color.

XXXII. 18. *Persici coloris Saturi*. A deep Peach bloom color.

XXXIII. 19. *Persici coloris pallidioris*. A more pale Peach bloom color.

XXXIV. 20. *Pæoniae Floris coloris*. A Peony Flower color.

XXXV. 21. *Rosea*. The Rose coloured Tulip.

XXXVI. 22. *Chermesina peramena*. A Crimson very bright.

XXXVII. 23. *Chermesina parum striata*. A Crimson striped with a little white.

XXXVIII. 24. *Princeps, purpurea saturatior, vel dilutior, oris albis magnis vel parvis, fundo luteo, vel albo Orbe, quæ multum varicatur, & colore & oris, ita ut purpurea est elegans oris magnis albis, dista est, Princeps excellens*. Prince, or most excellent Prince, having a deep or pale Purple with white edges, greater or smaller, and a yellow bottom, or circled with white, varying much both in the Purple and Edges; so that it is a fair deep Purple, with great white edges.

XXXIX. 25. *Princeps Columbina, purpurea dilutior*. The Dove colored Prince, paler purpled, with white edges.

XL. 26. *Purpurea Chermesina, rubicundioris coloris, albidis, vel albis oris*. The Purple Crimson colored Prince of a rubicund color, with white, or whitish edges.

XLI. 27. *Purpurea, vel Obsoleta albidis oris Princeps Brancion*. The Obsolete Brancion Prince, purpled with white edges.

XLII. 28. *Purpurea diluta, oris dilutioris pupurei coloris*. A dilated or pale Purple, with paler Purple edges.

XLIII. 29. *Purpurea in exterioribus, carnei vero ad medium intus, oris albis, fundo luteo*. Purple without, and bluish half way within, with white edges and a yellow bottom.

XLIV. 30. *Purpurea albo plumata extra, oris albis, intus purpurascens, fundo luteo, vel orbe albo*. Purple feather'd with white on the outside, with white edges, and pale Purple within, the bottom a little yellow, or circled with white.

XLV. 31. *Purpurea alia, minus elegans plumata, minoribusque oris albidis*. Another Purple feather'd, but not so elegantly or fairly plumed, being more obscure, with lesser white edges.

Tulipa Præcox Rubra; The Early Red Tulip.

XLVI. 32. *Rubra vulgaris fundo luteo, & aliquando Nigro*. The common or ordinary red Tulip; with a yellow bottom, and sometimes with a black.

XLVII. 33. *Rubra satura oris luteis parvis, dista Roan*. The Roan, being a deep red, with a small yellow edge.

XLVIII. 34. *Baro, rubra magis intensa, oris luteis parvis*. The Baron, which is a fair Red, with a small edge of yellow.

XLIX. 35. *Dux major & minor, rubra magis aut minus elegans saturo, oris luteis maximis vel minoribus, & fundo luteo magno.* A Duke, greater and lesser, having a more or less fair deep red, greater or lesser edges, and a great yellow bottom.

L. 36. *Alia alijs est magis amena, in alijs etiam fundo Nigro, vel obscuro viridi.* Some others of this sort, which are much more or less fair than others, and some which have also a black, or dark green bottom.

LI. 37. *Ducissa, quæ duci similis, at plus lutei quam rubri, oris magnis luteis, & rubore magis at minus, intus in gyram alto, fundo item luteo magno.* The Dutchess, which is like unto the Duke, but more yellow than red, with greater yellow edges, and the red more or less circling the middle of the Flower on the inside, with a large yellow bottom.

LII. 38. *Dux Briancion, quæ rubra Sanguinea saturo, aut minus rubra, oris Palladis, magnis vel parvis, alia alijs magis aut minus elegans diversimodo.* A Briancion Duke, which is a fair deep red, or less red, with a paler yellow, or Butter colored edge, some larger, others smaller. Some also more pleasing than others, in a very variable manner.

LIII. 39. *Flambans ex rubore & Flavedine radiata strita fundo luteo.* A Flambant, differing from the Dutchess, this having no such great yellow edge, but streaks of yellow thro' the Leaf, unto the very edge.

LIV. 40. *Mali Aurantij coloris, ex rubore, & Flavedine integro, non separatim mixta, oris luteis parvis, vel absque oris.* The Orange colored, which is a reddish yellow, or red and yellow equally mixed, with small yellow edges, and sometimes without yellow edging.

LV. 41. *Minij, sive Cinnabaris coloris, quæ ex purpurea rabedine, & Flavedine radiata, anguibus luteis, & aliquando oris.* A Minium, Cinnabar, or Vermilion colored Flower, which is a purplish red streaked with yellow, the bottom yellow, and sometimes the edges.

LVI. 42. *Rex Tuliparum, quæ ex Sanguineo & Aureo radiatim mixta, à Flammea diversa, fundo luteo, orbe rubro.* The King flower, which is a Crimson, or Blood-red, streaked with a Gold yellow, differing from the Flambant; the bottom yellow circled with red.

LVII. 43. *Tunica Morionis, quæ ex rubore & aureo separatim divisa.* The Fools Coat, which is parted with red and yellow Guards.

Tulipa Præcox Lutea ; The Early Yellow Tulip.

LVIII. 44. *Lutea Aurea sive Flava Aurea intensa.* A fair Gold Yellow without mixture.

LIX. 45. *Pallida Lutea, sive Straminea.* A pale yellow, or Cream color, or Straw color.

LX. 46. *Aurea, oris rubicundis.* A fair Gold yellow, with rubicund, or reddish edges.

LXI. 47. *Straminea oris rubris.* A Straw color with red edges.

LXII. 48. *Aurea, rubore perfusa extra.* A fair Gold color, being reddish on the outside only.

LXIII. 49. *Aurea, vel magis pallida, rubore in Gyrum alta simillima Ducisse, nisi minus rubedinis habet.* A paler Gold yellow, circled on the inside with a little red, very like the Dutchess, but that it has less red therein.

LXIV. 50. *Aurea, rubris extremitatibus dici potest, Morionis Pileus Præcox.* A Gold yellow with red Tops, and may be called the early Fools Cap.

Tulipa Præcokes :

O R,

Early Tulips, according to Mr. R E A.

LXV. 1. *Admiral Crinki.* It is in all respects like the *Corn Heart*, but more constantly well marked with white.

LXVI. 2. *Admiral Encusen.* It has a weak Stalk and small Flower, with sharp pointed Leaves, tipped with Crimson, and Feather'd with white; the bottom white, with pale yellow Nails and Chives.

LXVII. 3. *Aurora, or Grenseg.* This is another good Flower, of a rich Carnation color; well striped and marked with white; the bottom and Chives of a pale yellow.

LXVIII. 4. *Aurora van Bart.* It is a well formed early Flower, variably marked with red and white, and much esteemed; the bottom and Chives of a pale yellow.

LXIX. 5. *Alectus.* It is one of the last of the early Tulips, and well esteemed; the Leaves are narrow, of a very good purple color, well striped with Snow white; the bottom and Chives of a blew Purple.

LXX. 6. *Bonaventura.* It is a very good early Tulip.

LXXI. 7. *Brandenburgh.* It is a middle sized Flower, the tops of the Leaves of a Pease Blossom color, and the sides from the middle to the bottom, white with yellow Chives.

LXXII. 8. *Brun Moreco.* It is a pretty pleasing early Tulip, and by some much esteemed.

LXXIII. 9. *Clitus Præcox.* It is another early Tulip, of good account.

LXXIV. 10. *Corn Heart.* It is a small low Flower, Carnation striped, and marked with white, but seldom enough white; the bottom and Chives of a pale yellow, as in most of the early Tulips.

LXXV. 11. *Clermont.* In the manner of its growing, it is like the *Religious*, the Stalk strong, and the Flower large; sometimes prettily marked with deep Carnation and white, the bottom and Chives both yellow.

LXXVI. 12. *Clermont Paragon.* In the manner of its growing, it is like the last, but much a better Flower, more constantly marked with white, upon a bright blewish Carnation; this is more esteemed than the former, by all that have both Kinds; for tho' the first be in many Hands, this is not truly so; for it is a Trick much used by those that Sell Flowers about London, to add *Paragon* to the Name of any common Flower, when it comes well marked, and then impose a treble Price.

LXXVII. 13. *Climene.* It is a pretty pleasing early Tulip.

LXXVIII. 14. *Dofs de Chamoy.* Another good early Tulip, well marked.

LXXIX. 15. *Dorade.* It is an early Tulip, and by some much esteemed.

LXXX. 16. *Dutchess Briancion.* It is a fair large Flower, with long, round pointed Leaves, of a deep shining Scarlet color, with deep Butter colored edges; the bottom large, round, and pale yellow, with chives of the same color.

LXXXI. 17. *Everfoind.* It is both Purple and white, a very pleasing early Flower.

LXXXII. 18. *Early Perseë.* It grows something taller than the *Aurora*, or *Grenseg*; the Flower fine Crimson and white.

LXXXIII. 19. *Fair*

LXXXIII. 19. *Fair Anne*. It is an upright Flower, in shape like the *Clerimont*, with round pointed Leaves, marked with great Flakes of white, and Claret-Wine color; the bottom white, with pale yellow Chives.

LXXXIV. 20. *Florifante*. It is a low Flower, most of a pale Horse-Flesh color, finely variegated and marked, with some Crimfon, and at first pale yellow, which after turns white. It is a little apt to run, that is, in one or two hot Days to flubber its Colors, and run one into the other, which takes away the Beauty of the Flower. The bottom and Chives are both blew.

LXXXV. 21. *General Briancon*. It is a strong upright Flower, of a bright Scarlet color, with even and well parted Butter colored edges, which, before the Leaves fall, turn white; the bottom is of the color of the edges, and the Chives purple.

LXXXVI. 22. *General Duke*. It Flowers later than the *Winter Duke*, and is a fairer and better Flower, of a bright red, or Cherry color, with large and well divided yellow edges; the bottom and Chives like those of the *Winter Duke*. There are several sorts of *Dukes*, some deeper, others paler, but they are all red with yellow edges; of which this and the *Winter Duke* are esteemed the best.

LXXXVII. 23. *General Malswick*. It is of the same Family with the *Admiral Crinki*, or *Corn Heart*, and of the same colors, but much better marked than either of them.

LXXXVIII. 24. *Galatea*. It is a fine Flower, of a bright Gredeline color, striped with white; the bottom and Chives of a pale yellow.

LXXXIX. 25. *Gilden Bloom Brentel*, and *Gilden Bloom Sconie*. They may for Variety be entertained, being both large Flowers of pale red colors, with some large Stripes of a Gold color thro' the Leaves; the bottoms and Chives of both are yellow.

XC. 26. *Lac Verine*. It is an early Flower, and accounted amongst the best edgers; of a fine blewish red color, with large and well parted pure white edges; the bottom and Chives a pale yellow.

XCI. 27. *Maria*. It is a pretty pleasing Flower, of a pale Gredeline color, well striped and marked with white, the bottom and Chives of a pale yellow.

XCII. 28. *Marques*. It is a Flower of small Beauty, respected only for the strangeness of its colors, which in this are sad Horse-Flesh, dark yellow, and some small Veins of red, confusedly placed; the bottom and Chives are both yellow.

XCIII. 29. *Morillion Cramosine*. It is an excellent Flower, much more esteemed than many others, of a fine bright Crimfon, and pure White; finely striped, spotted, and well parted; the bottom and Chives of a pale yellow.

XCIV. 30. *The Noble*. It has Flowers much better marked with Crimfon and White, in bearing off Sets and young Roots, than in the old; whose Flowers (tho' larger,) are little marked with white, scarce appearing to be the Parents of such Beautiful Children; the bottom and Chives are both of a pale yellow.

XCV. 31. *Nonsuch Petits*. It is of the Size and Fashion of the *Brandenburgh*. The Flower is of a pale blush almost white, prettily marked with many small Stripes, and Specks of *Orange Tawney*; the bottom and Chives of a pale yellow.

XCVI. 32. *The Omen*. It is the last Flower of any of the *Præcoces*; has a strong upright Stalk, a fair Flower, large and well formed, of a pale *Rose* color, with many Veins and marks of Crimfon, circling and guarding, and great Stripes of

white. The bottom and Chives are both blew, which is seldom found in a *Præcox*.

XCVII. 33. *Paragon Iterant*. It is a pretty pleasing early *Tulip*.

XCVIII. 34. *Paragon Grebberi*. It is a fine early Flower, very well striped upon Camation with white; the bottom and Chives are of a pale yellow.

XCIX. 35. *Palto van Leyden*. It ought to be the first of the feathered and variegated Kinds, in respect of Antiquity and Colors, which are red and yellow. In the younger Roots well placed, feathered and striped; but commonly the Flowers of the older Roots are more yellow than red, and often all yellow, as the bottoms and Chives are.

C. 36. *Perisbot*. It is a strong Flower, of a fair shining blewish red color, sometimes well marked, with greater and lesser Stripes of white throughout every Leaf: But if the red has the Maltory, it will quickly run all over the Flower. The bottom is white, and the Chives are yellow.

CI. 37. *Pretty Betty*. It is a good *Edger*; the Flower is of a bright Crimfon, with pale Butter colored edges, which soon turn white. It has a Star-pointed bottom, of the color of the edges, and blew Chives.

CII. 38. *Princess*. It is something like the *Perisbot*, but of a more blewish red color; sometimes well striped and feathered with white. The bottom and Chives are of a pale yellow.

CIII. 39. *Religious*. It is a strong healthy Flower, of a dark red color, with many small Stripes of white, but commonly the red has the Maltory; and if the Season be hot, will soon run over the white. The bottom is of a pale yellow, and the Chives of a dusky brown.

CIV. 40. *Retrocede*. It is an early *Tulip*, but of no extraordinary account.

CV. 41. *Superintendent*. It is a Flower of good account, rises higher than ordinarily others do; the Flower is fair and large, excellently marked with Violet, Purple and good White: the bottom and Chives being of a pale yellow.

CVI. 42. *Ugenia*. It is a good, but common early *Tulip*.

CVII. 43. *Venetian*. It is another early *Tulip*, but more esteemed than the former.

CVIII. 44. *Vice-Roy*. It is an old Flower, of a Violet Purple color, edged, feathered, and striped with white: the bottom and Chives of a greenish yellow. They often add *Paragon* to the Name of this Flower, as if it were a distinct Kind; when it is but the same better marked than usual.

CIX. 45. *Violet Rotgans*. It is a reasonable tall Flower, with a woolly Stalk, and sharp pointed Leaves, of a Violet Purple color, with large Snow white edges. The bottom and Chives both yellow.

CX. 46. *Violet de Remou*. It grows taller than the last, with a smooth Stalk, and a fair large Flower, of a Rich Violet Purple color, with large and well divided Snow white edges, a white bottom, and black Chives.

CXI. 47. *Unique of Delf*. It is a pretty pleasing early *Tulip*.

CXII. 48. *Witten-Root Hodie*. It is another good sort of early *Tulip*.

CXIII. 49. *Winter-Duke*. It is so called, in respect that it Flowers commonly in Winter, that is in *February*, or before the Tenth of *March*; at which time the Spring begins. It has a very low Stalk, and bears a short Leav'd Flower, of a deep red color, with large yellow edges, a round yellow bottom, and brown Chives.

II. TULIPÆ MEDIÆ, Middle Flowering Tulips.

First from Mr. PARKINSON.

CXIV. *Tulipæ Mediæ*, the *Middle Flowering Tulips*. These begin to Flower about a Month after the *Early Tulips*; yet some longer after, and some sooner: And in the variety of the colors of the *Mediæ*, such Mixtures and Varieties are to be observed, which can never be seen in the *Præcoces*; as there are some in the *Præcoces*, which are not in the *Mediæ*. But the Varieties in the *Mediæ* are far greater, which chiefly happens from the Sowing of the Seed; for which Reason, it is very difficult for any one to come to the Knowledge of all their Distinctions; but the most remarkable are these following.

Tulipæ Mediæ albæ :

The mean Flowering White Tulips.

CXV. 1. *Nivea, fundo albo vel luteo*. The Snow white Tulip, with a white or yellow bottom.

CXVI. 2. *Argentea, quasi alba cineracea fundo lutescente, purpureis Stamina*. Silver colored, which is a very pale or whitish Ash color, with a yellowish bottom, and purple Chives.

CXVII. 3. *Margaritina alba, carneo dilutissima*. Pearl colored with a diluted bluish.

CXVIII. 4. *Alba, fundo ceruleo vel nigro*. A white with a blew or black bottom.

CXIX. 5. *Albida*. Cream colored, or light Straw colored.

CXX. 6. *Alba oris Rubris*. A white with Red edges.

CXXI. 7. *Alba oris Purpureis*. A white with Purple edges.

CXXII. 8. *Alba oris Coccineis*. A white with Crimson edges. These three last sorts do hold their Edges constant in some, but well spread in others.

CXXIII. 9. *Albida primum, deinde abidior, oris Purpureis, & venis intro respicientibus: nobis dicta Hackquenoy*. A pale or whitish yellow, which after a few Days grows more white, with Purplish red edges, and some Streaks running inwards from the edges, which we call an *Hackney-Tulip*.

CXXIV. 10. *Alba, colore Sanguineo variata, fundo albisimo vel alio*. White, mixed with a Blood-red color very variably; the bottom either of a pure white, or some other color.

CXXV. 11. *Alba, radiatim disposita Flammi, & Maculis Coccineis*. A White streamed with Crimson Flames and Spots, throughout the whole Flower.

CXXVI. 12. *Alba, Purpurea rubedine plumata, diversarum specierum, quæ cum superiore, vel albo, vel luteo, vel parvo ceruleo constanti fundo, &c.* A White plumed or speckled with a reddish Purple, more or less, of divers sorts, with white, yellow, or blew bottoms; all which do hold their Marks constant, and do not spread their colors, but shew fairer after they have stood Blown three or four Days.

CXXVII. 13. *Panni Argentei coloris, quæ alba plumata, punctata, striata, vel diversimodè*

variata, rubedine ditutiore, vel saturiore purpurea, interius vel exterius, vel utrinque diversarum specierum. Cloth of Silver color of divers sorts, that is a white feathered, spotted, striped, or otherwise marked with red or purple, in some paler, in some deeper, either on the inside, or on the outside, or on both.

CXXVIII. 14. *Tunica Morionis alba varia, quæ ex albo & purpureo striata diversimodè, fundo albo vel alio*. A white Fools Coat of divers sorts, that is of Purple, or pale Crimson and White, as it were empaled together, either with a white bottom, or some other color, of which there is great variety.

CXXIX. 15. *Holias alba vel albida, absque fundo, vel fundo Purpureo ceruleo, vel ceruleo albo circumdato, diversè signata, vel variata intus ad medietatem foliorum, sursum in orbem ad plurimum, vel ad oras pertingens amplas & albas*. A white Holias, that is a fair white or paler white, either without a bottom, or with a blewish purple bottom, or blew and white circling the bottom, and from the middle upwards speckled, and straked on the inside for the most part with Blood-red, or purplish Spots and Lines, unto the very edges, which abide large and white. Of this Kind there are found very great Varieties, not easily to be expressed.

Tulipæ Mediæ Purpureæ ; Mean Flowering Purple Tulips.

CXXX. 16. *Purpurea Satura*. A fair deep Purple Tulip.

CXXXI. 17. *Purpurea ditutior, diversarum specierum, quarum Rosea una, Carnea sit altera*. A paler Purple of many sorts, of which a Rose color is one, a Blush color another.

CXXXII. 18. *Perfici coloris, duarum aut trium specierum*. A Peach colored, which is of two or three sorts.

CXXXIII. 19. *Chermesina, obscura aut pallida*. A Crimson colored, which is either deep, dull and obscure, or pale colored.

CXXXIV. 20. *Stamela, intensior aut remissior*. A Stamel colored, which is either more dark or deep, or else more cheerful and light.

CXXXV. 21. *Xerampelina*. A Murrey, which is a dark brown or Dun red color.

CXXXVI. 22. *Purpurea Striata*. Purple colored, Striped and Spotted.

CXXXVII. 23. *Perfici Saturi, vel diluti coloris, undulata, vel radiata*. Peach colored, deeper or paler, waved, and radiated or striped.

CXXXVIII. 24. *Columbina, oris & radijs albis*. Dove colored, edged and radiated, or straked with white.

CXXXIX. 25. *Purpurea rubra, oris albis, similis Præcoxi, Princeps dicta*. A fair red Purple colored with white edges, like to the *Early Tulip*, called the *Prince*.

CXL. 26. *Chermesina, vel Helvola, Lineis albis in Medio, & versus oras, fundo ceruleo, vel albo, itemque albo orbe*. A fair Crimson, or Claret-Wine color with white Lines, both in the middle and towards the edges; most have a blew bottom, yet some are white, or circled with white.

CXLI. 27. *Purpurea remissior aut intensior, oris albis, parvis aut magnis, ut in Principe Præcoxi; fundo vel ceruleo, orbe alba, vel orbe alba ceruleo amplo*. Purpled light or deep, with white edges,

edges, greater or smaller, like the *Early Prince*, the bottom either blew, circled with white; or White circled with a large blew.

CLXII. 28. *Holias vel Helvola, Sanguineis guttis intus à medio sursum in orbem, fundo ceruleo.* A Purple *Holias*, of a pale Claret-color, marked and spotted with Blood-red Spots, round about the middle of each Leaf, upwards on the inside only, the bottom being blew.

CLXIII. 29. *Tunica Morionis purpurea rubra sativa, albido striata, quam in alba saturatio, fundo ex ceruleo & albo.* A Fools Coat, dark Crimson and pale White, empaled together differing from the white *Fools Coat*, the bottom blew and white.

CLXIV. 30. *Purpurea rubra sativa vel diluta, albo, vel albedine, punctata vel striata diversimodè, Caryophyllata dista.* A Purple colored deeper or paler, spotted or striped with a purer or paler white, of divers sorts, called the *Gilliflower-Tulip*.

Tulipæ Mediæ Rubræ: Mean Flowering Red Tulips.

CLXL. 31. *Rubra communis, fundo luteo vel nigro.* The common fair red colored, with a yellow or black bottom.

CLXLVI. 32. *Mali Aurantii coloris.* A Tulip of a deep Orange color.

CLXLVII. 33. *Cinnabaris coloris.* A Cinnabar or Vermillion colored Tulip.

CLXLVIII. 34. *Lateritii coloris.* A Tulip of a pale dull red, or of a Brick color.

CLXLIX. 35. *Rubra luteo aspersa.* A Greed-line, or red sprinkled and mixed with yellow.

CL. 36. *Testamentum Brancion, rubra sativa, oris pallidis, diversarum specierum, rubore variantium, & orarum amplitudine.* Brancion Testament of divers sorts, differing both in the deepness of the red, and largeness of the pale colored edges.

CLI. 37. *Rubra oris luteis.* A red Tulip with small yellow edges.

CLII. 38. *Cinnabaris radiata, magis aut minus Serotina.* A Vermilion irradiated or flamed, later or earlier Flowering.

CLIII. 39. *Rubra purpurascens obsoleta, foliis exterioribus, perfusa luteo intus, oris pallidis luteis.* A dead Purplish red without, or on the outward Leaves, and of a yellowish red within, with pale yellow edges.

CLIV. 40. *Rubra purpurascens elegans extra, & intus lutescens, oris pallidis luteis, fundo luteo vel viridi.* A bright Crimson red on the outside, more yellowish on the inside, with pale yellow edges, and a yellow or green bottom.

CLV. 41. *Rubra flambans coccinea, crebris maculis, absque fundo.* A red flambant, spotted thick with yellow Spots, without any bottom.

CLVI. 42. *Rubra flambans elegantior, quæ radiis luteis, intercurfantibus ruborem.* A more excellent red flambant, with Flames of yellow running through the red.

CLVII. 43. *Flambans remissior, utroque colore.* A more pale colored flambant in each color.

CLVIII. 44. *Panni Aurei coloris.* A Cloth of Gold colored Tulip.

CLIX. 45. *Tunica Morionis verior, seu Palto du fol, optima tenuis amplis amenis & crebris, ex rubro & flavo separatim divisis & excurrentibus, flos constans.* A true Fools Coat; the best of which

is a fair red, and a fair yellow, parted into Guards, every one a part; varied through every Leaf to the very edge, yet in most abiding constant.

CLX. 46. *Tunica Morionis altera, tenuis minoribus & minus frequentibus, magis aut minus alia aliis inconstans.* Another Fools Coat, not so fairly marked, nor so much, some of which are more or less constant in their Marks, and some more variable than others.

CLXI. 47. *Tunica Morionis pallida, quæ tenuis vel strus frequentibus in utroque colore pallidis, flos est constans & elegans.* A pale Fools Coat, which has many Guards or Stripes with red and yellow, which are both pale, and is a constant and fair Flower.

CLXII. 48. *Pileus Morionis, radiis luteis, in medio foliorum latis, per ruborem excurrentibus, fundo luteo, apicibus luteis, oris rubris, vel absque oris.* Fools Cap with yellow Stripes, which are broad in the middle of the Leaves, the red running quite through the Leaf, with a yellow bottom and yellow Chives; the three outward Leaves being yellow, with red edges or without.

CLXIII. 49. *Le Suisse, tenuis radiata magnis, ex rubore & pallore.* A Swiss radiated with a fair red, and pale white, or Straw color.

CLXIV. 50. *Suisse Goliath, dista à Floris magnitudine, tenuis radiata, simillima Le Suisse, nisi rubor & albedo sint elegantiores.* The Swiss Goliath, so called from the bigness of the Flower, most like to the former Swiss, in the streaming or radiated Guards, but that the red and white is more lively.

CLXV. 51. *Holias rubra, quæ Sanguinea Argenteis radiis & guttis in orbem dispositis, presertim interius, fundo viridi saturo.* A red *Holias*, which is a Blood-red, striped with Silver white Veins and Spots, with a dark green bottom.

CLXVI. 52. *Holias Coccinea, rubra Coccinea, albo radiata in orbem, Circa medium foliorum interius, fundo albo.* A crimson *Holias*, which is a fair Purplish red, spotted with white circle-wise about the middle of the inner Leaves, with a white bottom.

CLXVII. 53. *Alia huic similis, fundo albo & Ceruleo.* Another like thereunto, with a blew and white bottom.

Tulipæ Mediæ Luteæ: Mean Flowering Yellow Tulips.

CLXVIII. 54. *Lutea, sive Aurea vulgaris.* The common yellow, or Gold colored Tulip.

CLXIX. 55. *Straminea.* The Straw-like, or Cream colored:

CLXX. 56. *Sulphurea.* Sulphur colored, or pale yellowish green.

CLXXI. 57. *Mali Aurantij pallidi coloris.* Pale Orange colored.

CLXXII. 58. *Lutea dilutè Purpurea Striata, Aurei Panni pallidi instar.* A yellow, palely purple streaked, or pale Cloth of Gold color.

CLXXIII. 59. *Lutea pallidè Fuscedine Adumbrata.* A Cream or Custard colored pale yellow, shadowed over with a brown.

CLXXIV. 60. *Flava oris rubris magnis, aut parvis.* A gold yellow with red edges, greater or lesser.

CLXXV. 61. *Straminea oris rubris magnis intensis, vel parvis remissis.* A Straw color, with deeper or paler red edges, great or small.

CLXXVI. 62. *Obscura & Fuliginosa lutea, instar*

star folij decidui, ideoque folium Mortuum appellatur. A Sullen or Smoaky yellow, like a dead fallen Leaf, and therefore called the Dead Leaf.

CLXXVII. 63. *Flava, rubore perfusa, etiamque Striata per totum dorso Coccineo, oris pallidis.* A yellow shaded with red, and striped also thro' all the Leaves, the back - sides of them being of a Crimson, and the edges pale.

CLXXVIII. 64. *Lutea pallide perfusa, magisque aut minus rubore striata, fundo vel luteo vel viridi.* A pale yellow, shaded and striped with red, in some more, in some less, the bottom being either yellow or green.

CLXXIX. 65. *Testamentum Clusij; quæ lutea pallida fuligine obscura, exterius & interius, ad oras usque pallidas, per totum vero Floris Medium, maculis interius aspersa.* Clusius's Testament, which is a shadowed pale yellow, both within and without, with pale yellow edges, and spotted round about the middle on the inside, as all other *Holias*'s are; the back of the Leaves being more obscure, or shaded with pale yellow, with a green bottom.

CLXXX. 66. *Flambans lutea, diversimodè intus magis aut minus striata, vel in aliis extra maculate rubore, fundo at plurimum nigro, vel in aliis luteo.* A yellow Flambant of divers sorts, in which the whole Flower more or less, is streamed or spotted on the inside; and in some, on the outside with red, the bottom in most being black, yet in some yellow.

CLXXXI. 67. *Flambans pallidior & elegantior.* A paler yellow Flambant, but more fair or Beautiful.

CLXXXII. 68. *Holias lutea intensior & remissior diversimodè, in orbem radiata interius, rubris maculis ad supremas usque oras, aliquoties crebrè alias parce, fundo viridi, vel tanetto obscuro.* A yellow *Holias*, paler or deeper yellow, very variable, spotted on the inside round about the middle with red, sometimes more plentifully, sometimes more sparingly, with a green or dark tawny bottom.

CLXXXIII. 69. *Holias Straminea, rubore striata & punctata, instar Holias alba.* An *Holias* Straw colored, streamed and spotted with red, like as in the *White Holias*.

CLXXXIV. 70. *Tunica Morionis lutea, aliis dicta Flammea, in qua color, Flavus magis & conspicuus rubore, diversimodè radiata.* The yellow Fools Coat, of some called a Flame color, in which the yellow is more than the red, diversely streamed.

Tulipe Medie Virides: Mean Flowering Green Tulips.

CLXXXV. 71. *Prima Viridis intensior, cujus flos semper ferè, Semiclausus manet Staminiibus fimbriatis.* The first of a deep Green, having a great Flower, yet seldom opening it self, but abiding always almost half thur up and closed, the chives being as it were feathered.

CLXXXVI. 72. *Altera remissior, instar Psittoci pennarum Viridium, luteo variata oris albis.* Another of a paler or yellowish Green, feathered with yellow, and is called the Parrot with white edges.

CLXXXVII. 73. *Tertia ad huc dilutiori viridate oris purpureis.* The third of a more yellowish green, with red or purplish edges.

CLXXXVIII. 74. *Quarta cujus folia aquali-*

ter Purpurea diluta, & Viridate diversa sunt. A fourth, which has the Leaves of the Flower equally almost parted, with green and a light Purple color, which abiding a long time in Flower, grows in time to be much fairer marked; some call it a *Green Sweiffer*.

CLXXXIX. 75. *Quinta, foliis longissimis Stelamodo expansis, ex rubore & Viridate coacta.* A Fifth, which has the longest Leaves, standing like a Star, consisting of a mixed Green and Purple color.

Tulipe Medie: Mean Flowering Tulips,

ACCORDING TO

Mr. JOHN REA.

CXC. 1. *Agat Marine.* When it comes well, it is a pretty Flower, of a dark reddish color, variably marked with sad *Isabella* and Straw color; the bottom and chives a dark Purple.

CXCI. 2. *Agat Robine.* It is a long Leav'd old Flower, of a sullen reddish color, with some Flakes and Marks of an over-worn Dove color, with a whitish bottom and black chives.

CXCII. 3. *Agat de Gorier.* A pleasant good Flower, of a Purple color, mixed with white.

CXCIII. 4. *Agat Bizar.* It is a deep Orange, light Flesh color, and pale yellow, with a greenish bottom and black chives.

CXCIV. 5. *Agat Picot.* It is a large Flower, well marked with a pale Rose color, some crimson and white; the bottom and chives blew.

CXCV. 6. *Agat Robine Paragon, or Robiner.* It is like the *Agat Robine*, but much better, of the same sad red color; often well marked with Dove color, crimson and white; the bottom white, and chives black.

CXCVI. 7. *Agat White.* It is like the last, but a lesser Flower, Dove color, well marked with deep red, inclining to murrey and white; the bottom and chives blew.

CXCVII. 8. *Agat Rampard.* It is a fine Flower, of a heavy sad *Isabella* color, with some marks of Rich crimson, and great Stripes of yellow, a dark bottom, with large black chives.

CXCVIII. 9. *Agat Gekeire.* It is a low Flower, with long, narrow, sharp pointed Leaves, of a color between Horse-Flesh and *Isabella*, a little striped with white, blew bottom, and large Purple chives.

CXCIX. 10. *Agat Royal.* It is a beautiful Flower, striped, agatted, and variously marked with Rose color, deep crimson, and fine white; the bottom and chives Purple.

CC. 11. *Agat Oriental.* It is a good Flower, finely marked with Rose color, Gredeline, some crimson and white, the bottom and chives Purple.

CCI. 12. *Agat Port Vin, or Pas's Citadel.* It is an old Flower, with narrow sharp pointed Leaves, of a pale Gredeline, and Murrey purple, sometimes Agatted, Veined and marked with white, the bottom and chives blew.

CCII. 13. *Agat Hammer.* It is a beautiful Flower of three good colors, pale Gredeline, deep Scarlet, and pure White; commonly well parted, striped, agatted, and exceedingly well placed, abiding constant to the last, with the bottom and chives blew.

blew. This *Gallant Tulip* has its Name from Sir Thomas Hanmer, who first brought it into England.

CCIII. 14. *Agut Dennis*, or *Argus*. It is of the same color with the last, and like it in the manner of marking. The chiefest difference is, that the Leaves of this are sharper pointed, and not so broad as those; the Gredeline a little redder, and the Scarlet paler; the bottom and chives blew, but much inferior to the former.

CCIV. 15. *Admiral Vander Poole*. It is of a dark red, inclining to Liver color, feathered and marked with pale yellow, which one hot Day turns white; the bottom and chives white. This is a pleasing Flower, but runs a little at last.

CCV. 16. *Admiral Cataline*. It is an old Flower, of a bright carnation, some crimson, and constantly well marked with white.

CCVI. 17. *Admiral of France*. It is like the *Paragon Francoise*, in color and manner of marking; but the Leaves of this twine, and do not stand round as those of other Flowers. The bottom and chives are blew.

CCVII. 18. *Admiral Heart*. It is a fine Flower, of a good carnation color, deep crimson, and deep white; the bottom blew, and chives black.

CCVIII. 19. *Admiral de Mans*. It is an old Flower, of a deep red, striped with white, but flubbed, and not well parted; besides it is apt to run: the bottom and chives yellow.

CCIX. 20. *Altes Royal*. It is sometimes a pretty Flower, of a deep blewish red color, marked with some light crimson and white; but when the Red has the Mastery, it will quickly run over the other colors; the bottom and chives are a dark blew.

CCX. 21. *Ariana*. It was raised from the Seed of the *Turgiana*, from which it differs, in that the Leaves are thicker, a purer white from the first opening, and very well marked with bigger and lesser broken Streaks, and Drops of bright crimson: The chives are Purple.

CCXI. 22. *Anvers Brown*. It is a fair well formed Flower, of a sad brown purple color, striped and marked with some brighter Purple, and more or less white; the bottom blew, with dark purple chives.

CCXII. 23. *Anvers Blew*. It is like the last, only the colors are brighter, and the Flower commonly better marked.

CCXIII. 24. *Althea*. It is a very good Flower, composed of purple and white.

CCXIV. 25. *Anidore*. It is a fine *Tulip*, pale yellow, well marked with dark cinnamon color, and the chives purple.

CCXV. 26. *Amazon*. It is a specious Flower, with many good colors.

CCXVI. 27. *Arch-Duke Imperial*. It is an excellent Flower, composed of several purples and white.

CCXVII. 28. *Arch de Anckre*. It is almost like the former, but not so noble a Flower.

CCXVIII. 29. *Aurora*. It is of the color of a bright clear Morning, a pale yellow, with some very small Streaks of Red, and brown chives.

CCXIX. 30. *Ambrosio*. A fine *Tulip*, composed of purple and white.

CCXX. 31. *Augustina*. A delicate Flower composed of a Violet color and white, variously mixed.

CCXXI. 32. *Armiente*. It is a good Flower, flamed with purple and white.

CCXXII. 33. *Bel la Bar*. It is an old Flower, almost like the *Blew Turnier*, of the same color, but more constantly marked with white.

CCXXIII. 34. *Blew Turnier*. It has a Flower in form like *Envy*, the colors are Gredeline, crimson and white, but very unconstant, and often little or no white.

CCXXIV. 35. *La Billy*. It is a fine Flower, with variety of colors.

CCXXV. 36. *Brown de Marris*. It is a dull sad purple, but by some much esteemed.

CCXXVI. 37. *Brown Purple Blafack*. It is a fine Flower, composed of several Purples, but the brown most predominant, and marked with white.

CCXXVII. 38. *Bel Breire*. It has a weak Stalk and small Flower, of a good crimson color, well guarded and striped with pale yellow, which one hot Day turns white; the bottom and chives are a pale yellow.

CCXXVIII. 39. *Bel Brune*. It is a fair Flower; of a dark brown crimson color, well marked, feathered and striped with white. The bottom pale yellow, with large dusky brown chives.

CCXXIX. 40. *Brown George*. It is a large round Flower, thick striped, and powdered with a fadder and a brighter Cinnamon color, upon a pale yellow with black chives.

CCXXX. 41. *Bien Venu*. It is like the *Pearl* in the fashion of the Flower, but much better: It is of a pale carnation color, striped and variously marked with white; the tops of the Leaves are of a pale Flesh color, and the bottom and chives blew.

CCXXXI. 42. *Belline*. It is a small weak Stalked Flower, of a blewish carnation color, a little marked with white, the bottom and chives blew.

CCXXXII. 43. *Benediffine*. It is a pretty Flower, of a bright carnation color, well marked with white; the bottom and chives are of a dark purple.

CCXXXIII. 44. *Bel Pallas of Paris*. It is a better Flower than the ordinary *Pallas*, is commonly well marked, and striped upon a blewish red, with some crimson and more white; the bottom and chives blew.

CCXXXIV. 45. *Brown Purple de Marris*. It is an excellent fair Flower, of a rich shining Purple color, and pure white, marked with great Stripes up the middle of the Leaves; the bottom blew, with Purple chives.

CCXXXV. 46. *Brabafon*. It is of several sorts, and all of them fine Flowers, and of several Purple colors, as *Brabafon Adrian*, *Brabafon Hugon*, *Brabafon Pore*, *Brabafon Puke*, *Brabafon Swallins*, & *Brabafon Petit*; all of them of several Purples and Whites, much differing from each other in colors, and manner of marking. But the *Petit* as it is the most common of them, so it is the smallest, well marked with two Purples and White.

CCXXXVI. 47. *Consergi*. It is a *Tulip* adorned with several Purples, mixed with White variously.

CCXXXVII. 48. *Cleomedon*. It is a *Tulip* arising from a self color, produced from Seed.

CCXXXVIII. 49. *Clytus*. It is a fine Flower, of a dark yellow color, finely marked with small Lines of Hair color, and dark crimson, having Purple chives.

CCXXXIX. 50. *The Curle*. It differs from all others in the form of the Flower; for this has the Leaves thick, and curiously plaited and curled about the edges; the color is dark yellow, finely marked all over with small Lines or sad red, or Liver color; the bottom and chives are a Violet Purple.

CCXL. 51. *Charamante*. It is a fine sort of *Tulip*, variously marked, not much unlike to the *Cleomedon*.

CCXLI 52. *Car-*

CCLXI. 52. *Cardinal Flamant*. It is of a pale Scarlet color, well marked with white; the Flower is short and handfom, and its bottom and chives are blew.

CCLXII. 53. *Cardinal*. It is a low Flower, of a deep dark red color, sometimes feathered with white, and often all red. Some of them are rectified, and come much better marked, the bottom and chives blew.

CCLXIII. 54. *Clelia*. It is a fine Flower, variously colored, arising from Seed.

CCLXIV. 55. *Cardinal Prince*. It is a large long Leav'd Flower, well marked with Flesh color, crimfon and white, the bottom and chives blew.

CCLXV. 56. *Camusetta*. It is a fair large Flower, apt to be known by the green Leaves, which are large, and full of whitish Spots. It has large Leaves, well Veined, striped and marked, especially on the insides, with carnation, some gredeline, and much white; the bottom (by the well marking of the Flower,) is commonly white, and the chives blew.

CCLXVI. 57. *Chimney-Sweeper*. It is a low short Leav'd round Flower, of a blackish dark red color, with a large round whitish bottom, and pale yellow chives. Some of these will happen to be Striped, with more or less white, and then they are called the *Striped Chimney-Sweeper*.

CCLXVII. 58. *Cedo Nulli*. It is of near Affinity with the *Zeabloom Royal*, but much a better Flower, of a good blewish carnation color, well marked and variegated with crimfon, some gredeline and good white. Of this there are two or three forts, but the best has more white, and is not apt to run as the others are; the bottom and chives are blew.

CCLXVIII. 59. *Carthago*. It is something like the *Dorile*, but much a better Flower, of the same bright blewish carnation color, varied and striped with good white; the bottom and chives blew.

CCLXIX. 60. *Carolus*. It is an excellent Flower, elegantly marked and striped with shades of Murry, Purple, and pure White, through every Leaf thereof; the bottom blew, and the chives purple.

CCL. 61. *Cataline Brown Purple*. It is like to the *Otter* in the fashion of the Flower, but of a better brown purple color, feather'd, and striped up the sides and middle of the Leaves, with large Lifts of white; the bottom and chives purple.

CCLI. 62. *Dantile de Flure*. It is of a pale Rose color, prettily Leaved, marked and spotted with white; the bottom and chives yellow: This is a pleasant Flower, but runs a little at last.

CCLII. 63. *Dorile*. It is a handfom Flower, of a blewish bright carnation, varied and striped with good white; the bottom blew, and the chives purple.

CCLIII. 64. *Diana*. It is of several forts, the best is called *Bella Diana*, which is a good Flower of a bright blewish carnation, varied, striped, and well marked with deep Red and pure White, throughout every Leaf, with a blewish bottom and purple chives.

CCLIV. 65. *Dianea*. A Tulip raised from the Seed of the *Diana*, from which it differs, in that the Leaves are edged, and finely whipped about with a deep brown Purple, and feather'd in the middle, with the same color upon Snow white; the chives dark blew.

CCLV. 66. *Doria Dispute*. It is a kind of *Diana*, the Flower is like the *Dorile*, but commonly better marked, and striped with small Lines of deep Red and Snow white; the bottom and chives like those of the *Diana*.

CCLVI. 67. *Deesse*. It is of the Family of the *Widows*, and formerly esteemed. Of this we have two forts, the best is a good deep Purple, well striped and feathered, thro' every Leaf thereof with white. The other is a lesser Flower, the Leaves narrow and sharp pointed, not so well marked as the former: the bottom and chives of both like those of the *Widows*.

CCLVII. 68. *Dorothy of Holland*. It is a good Flower of a deep brown Purple color, finely whipt about the edges, and well striped and marked with a redder and lighter Purple, and pure White: the bottom and chives Purple. Of this there are two forts, but the best is called *The North Dorothy*.

CCLVIII. 69. *Envy*. It is a good Flower, of an excellent crimfon color, well marked with good White, especially on the inside of the Leaves, the bottom and chives both blew.

CCLIX. 70. *Etoile*. It is a pretty Flower, composed of Purple and White.

CCLX. 71. *Eagle*. It is a fair Flower, Peach color, pale gredeline, some deep crimfon and pure White; the bottom and chives Purple.

CCLXI. 72. *Eminentissime*. It is at first a fine Flower, with long sharp pointed Leaves, well striped with Peach color, carnation and white; the bottom and chives a dark Purple.

CCLXII. 73. *Finette*. It is a delicate crimfon and white.

CCLXIII. 74. *La Fine*. It is an excellent Flower, of a very fine color, from Self-colors, raised by Seed.

CCLXIV. 75. *Flanders Widow*. It is a common Flower of a sad Purple color, and marked towards the bottom with a sadder Purple and some White: Its bottom, (as also the bottoms of all the other *Widows*;) is small, and of a greenish blew color, with Purple chives.

CCLXV. 76. *Fair Widow*. It differs from the *Good Widow* next following, in that the Flower is shorter, more and better striped, and marked with two sad Purples and a White.

CCLXVI. 77. *Good Widow*. It is in all things like the *Flanders Widow*, but more and better marked with White.

CCLXVII. 78. *Gracious Widow*. It is of the same fashion and color with the other *Widows*, but commonly marked and striped with more White.

CCLXVIII. 79. *General Effex*. It is of the same colors with the *Prince of Orange*, but not so deep an *Orange*, the yellow paler, and more constantly well marked. The bottom and chives dark Purple, almost black.

CCLXIX. 80. *General Gouda*. It is a large Flower of a bright crimfon color, sometimes well marked with White, but commonly the Red has the Mastery: The bottom and chives are both a pale yellow.

CCLXX. 81. *General Sweman*. It is a fair Flower, bright carnation gredeline and white, variably placed, and parted at the tops of the Leaves; the bottom white and chives blew.

CCLXXI. 82. *General of Holland*. It is an old Flower, of a deep blewish red color, with great Marks, and small Stripes of White: The bottom and chives blew.

CCLXXII. 83.

CCLXXII. 83. *General Bolefon*. It is a fine Flower, of a blewish bright Carnation, pulled about the edges, well striped and marked with Crimson and pure White, which commonly has the Mallery; the bottom blew, with small black chives.

CCLXXIII. 84. *General Anvers*, or *Brown Duke of Brabant*. It is like the *Blew Anvers*, but better marked with a brown and lighter Purple, and often well striped with White; the bottom blew, with dark Purple chives.

CCLXXIV. 85. *General Bole*. It is a good Flower, of near Affinity with the *Brown Anvers*, the Flower is agitated, striped, and variably marked, with a darker and lighter reddish Purple and White, with a blew bottom and Purple chives. It is a tender Flower, and its Root apt to perish in a hot or over dunged Soil. There are two or three sorts of it, but the best is that called *General Bole Talbon*.

CCLXXV. 86. *Grand Purpur de Book*, or *Puff Heron*. It is an old Flower, with 2 Leaves standing up like a Hens top, and three turning down, of a Sullen, yet shining Purple color, with many small lines of Milk-white; the bottom and chives a pale yellow.

CCLXXVI. 87. *General Richard*, or *Emperor*, or *Sattine*. It is an old Flower, with a tall upright Stalk, and short Leaves, of a pale Carnation color, flaked, and marked with White, a little apt to run; the bottom and chives yellow.

CCLXXVII. 88. *Hispaniolet*. It is a very good Flower, made up of a mixture of several Purples and White, the Purples deeper, redder, blower, and very fine.

CCLXXVIII. 89. *Harvey*. It is a large variable Flower, but will sometimes be of a dark Purplish red color, with great Flames of deep shining Crimson, and small stripes of White; the bottom and chives of a dark purple.

CCLXXIX. 90. *Holofernes*, or *Goliath*. It is a very tall Flower, marked all over with Shadows of Rose color and pale yellow; the bottom and chives yellow.

CCLXXX. 91. *Hercules*. It is a Noble fine Tulip, large, with variety of good colors, well marked, and embellished with white.

CCLXXXI. 92. *Jacobine*. It is a very good and fine Flower, composed of Carnation, Crimson and White.

CCLXXXII. 93. *Jeronymus Royal*, or *Paragon Jerom*. It is a good Flower, striped and marked with Shades of Purple and good White; the bottom and chives of a dark blew.

CCLXXXIII. 94. *Jasper Marble*. It is like the *Puff Bel Tew*, but a fairer and more constant Flower, of a brighter Gredeline, agatted and marbled upon white; the bottom blew, with brown dusty chives.

CCLXXXIV. 95. *Jacoba rectified*. It is in colors like the *Admiral de Mins*, but much a better Flower, commonly marked up the middle of the Leaves with a great feathered stripe of deep red, the rest white, the bottom and chives are yellow.

CCLXXXV. 96. *Jasper Tudart*. It is a larger Flower than the *Tudart*, and of a brighter Red, some Dove color and much white; the bottom and chives black.

CCLXXXVI. 97. *King-brown Purple*. It is a fine Flower, of a brown Purple and White, well marked and streaked.

CCLXXXVII. 98. *Lanscot Bole*. It is a fine Flower, of a bright Carnation color, finely agated and striped with gredeline and white, the bottom and chives blew.

CCLXXXVIII. 99. *La Perfeit*, or *Turdif rectified*. It is a pretty low Flower, of a pleasant Carnation, well marked with White: the bottom and chives of a dark blew.

CCLXXXIX. 100. *La Towers*. It is a weak Stalked Flower, which when it comes well, has one or two large broken Stripes of a blewish red color, through the middle of every Leaf, the rest white, the bottom blew, and the chives black.

CCXC. 101. *Memorable*. It has a long Leav'd Flower, of a pale Tann'd Leather color, prettily marked with fad purple, and bright yellow with purple chives.

CCXCI. 102. *Manera*. It is a Flower of a middle size, the Leaves sharp pointed, of a bright Crimson color, finely spotted, and marked with small Stripes, and drops of pale yellow: The bottom and chives Straw color.

CCXCII. 103. *Morillion Nacarot*. It is an old Flower, of a light Scarlet color, and Milk-white, sometimes well marked, but the Leaves are hollow, and at last run: the bottom blew, with black chives.

CCXCIII. 104. *Morillion de Anvers*. It is an ordinary low Flower, pale Scarlet, and marked with pale yellow, and runs at last.

CCXCIV. 105. *Mazarine*. It has long, narrow, sharp pointed Leaves, of a pale Scarlet color, marked with deeper red, and a white, but unconstant: the bottom blew, and the chives black.

CCXCV. 106. *Morillion de Argiers*. It is an ordinary Flower, of a blewish red color, marked somewhat like *General Richard* with white: the bottom and chives pale yellow.

CCXCVI. 107. *Marvel de Quaele*. It is of a pale Isabella color, with many red Spots standing together on the inside of the Leaves, like unto a Sprig of *Barberries*, and sometimes a little striped with White: the bottom and chives a dark blew.

CCXCVII. 108. *Morillion Curtis*. It is a large strong thriving Flower, most of a Carnation color, a little Crimson about the edges, and well feathered with White: the bottom and chives of a pale yellow.

CCXCVIII. 109. *Nosse*. It is a valuable Flower, the Leaves are sharp pointed, and a little twine, finely marked with bright fresh color, deep Scarlet and pale yellow: the bottom and chives black. It usually puts forth a Bulb or young Root, between the bottom of the Stalk and lower Leaf, by which it is easily increased.

CCXCIX. 110. *Nonfuch*. It is a fair well colored and marked Tulip, both spotted and striped with some White.

CCC. 111. *Otter*, or *Otho de Mans*. It is a large, tall, old Flower, often containing eight or more Leaves, of a dull heavy Purple color, lifted up on the sides, and sometimes feathered through the Leaves with White: the bottom and chives are yellow.

CCCI. 112. *Orient Virgin*. It is a good Flower, pale Scarlet and pure White, well divided in small Marks and Stripes: the bottom and chives both blew.

CCCII. 113. *Paragon Brown Purple*. It is a fine Flower, and well marked and differenced, with brown purple and white.

CCCIII. 114. *Paragon Oudinard*. It is almost in all things like the *Puff Oudinard*, only the colors are brighter, more constantly well placed, and in some Years will come so well marked, that few rich Flowers excel it; the bottom and chives both blew.

CCCIV. 115. *Paragon Francoise*. It is a pretty Flower, of a good deep carnation color, well marked with long Stripes of white; the bottom and chives blew.

CCCV. 116. *Paragon Blackburn*. It has a tall Stalk and fair Flower, with broad Leaves, yet sharp pointed, of a light carnation color, with some Marks of deeper red, Flamed and Striped with white; the bottom and chives both blew. It was raised from the Seed of the *Pas Oudinard*.

CCCVI. 117. *Paragon de Gilden*. It is a good Flower, of a fine carnation color, deep crimson and pure white, well placed and broken. The bottom and chives are blew.

CCCVII. 118. *Paragon Lifgin*. It is an ordinary Flower, a little marbled and striped about the edges, with an *Isabella* color, and pale yellow, and sometimes over all the Flower; it has a greenish dark bottom, and sad blew chives.

CCCVIII. 119. *Paragon Florison*. It is a good Flower, Leaves sharp pointed, variably Veined, striped and marked with *Isabella*, Peach color, and Milk white: bottom blew, chives dark Violet Purple.

CCCIX. 120. *Paragon de Costa*. It is like the *Jacobaea rectified*, but a better Flower, well striped and marked with the same deep red color, and good white: the bottom and chives yellow.

CCCX. 121. *Parot*. It is of several sorts, some all green, unless a little whitish towards the sides of the Leaves; others have the Leaves half folded, green in the middle, and the sides almost white: But there is one Noble kind hercof, which is called

CCCXI. 122. *Parot-Noble*. It grows tall and strong, the green Leaves rent in the sides, the Flower large, and formed something like the last, only it has Spurs on the sides of the Leaves, which are of a dark brown color, and lighter by degrees to the middle, which is of a whitish green color, very change in Fashion and colors from all others. The bottoms and chives of all the *Parots*, are of a pale greenish yellow color.

CCCXII. 123. *Pas Oudinard*. It is an old Flower of a sad reddish color, sometimes well marked with brighter Red and Straw color. It is common and unconstant: the bottom and chives both blew.

CCCXIII. 124. *Pas Belline*. It differs from the *Belline* chiefly in its colors, which in this are some gredeline, some carnation, and much white, well placed and parted: the bottom and chives both blew.

CCCXIV. 125. *Pas Rose*. It is a fine round Flower, variably marked upon a pale Rose color, with crimson, and some Veins of Straw color, resembling a well Water'd *Tabby*: the bottom and chives pale yellow.

CCCXV. 126. *Pas Bell Tew*, or *Numero une*. It is an old Flower, agated and marbled with gredeline and white, but unconstant: the bottom and chives of a dark blew, dusted with yellow.

CCCXVI. 127. *Pas Cittadel White*. It is in all things like the *Agat Point Vin*, or *Pas Cittadel*, but that the white in this Flower has the Mastery, and therefore much more esteemed than that.

CCCXVII. 128. *Pas Zeablom of Paris*. It is the best of all the *Zeabloms*. The Flower is fair, of a deep Purple color, very well marked with white: the bottom blew, with dark Purple chives.

CCCXVIII. 129. *Pearl*. It is an old Flower, of a bright carnation color, marked and striped

with more or less white. The Leaves of the Flower twine, and stand different from others. The bottom and chives a pale yellow.

CCCXIX. 130. *Pelican*. When it comes right it is a pretty Flower, of a good carnation color, marked thick with smaller and greater Stripes of white: the bottom and chives of a greenish dark blew color.

CCCXX. 131. *Pompeza*. It is a fair large Flower, constantly well marked with fine light carnation and pure white: the bottom and chives blew.

CCCXXI. 132. *President*. It is a round Glob'd form'd Flower, marked with purplish red, lighter and fadder yellow: the bottom and chives Violet.

CCCXXII. 133. *President Royal*. It is much a better Flower than the former, finely marked with crimson and white.

CCCXXIII. 134. *Prince of Orange*. It is of a good Orange color, striped with yellow, of which color the bottom and chives are.

CCCXXIV. 135. *Princes Royal*. It is a production from the *Flanders Widow*, and differs from it only, in that the Leaves of the sad Purple Flower are lifted about the sides with white.

CCCXXV. 136. *Princes Turgiana*. It is the best of all the Species of the *Widow*. It has thin Leaves well marked with two purples, and much white, which commonly has the Mastery: the bottom and chives are like those of the *Flanders Widow*.

CCCXXVI. 137. *Pluto*. It is a dark fullen Flower, of a Soory Orange color, variably marked with darker and lighter yellow, a sad greenish bottom and blewish chives.

CCCXXVII. 138. *Paragon Bembrig*, *Rundelo*, or *Angelica*. It is a large long Leav'd Flower, of a deep reddish purple color, flaked and marked with white: the bottom and chives of a dark purple color.

CCCXXVIII. 139. *Paragon Alette*. It is a singular good Flower, composed with crimson and white.

CCCXXIX. 140. *Prelate Brown-Purple*. It is a fine Flower, of a brown purple color, well marked with white, and notably differing from others.

CCCXXX. 141. *Portugal Noble*. It is but a small, yet a Noble Flower, finely marked with small Lines of cinnamon color, and pale straw color, with a dark bottom and black chives.

CCCXXXI. 142. *Proteus*. It is a pretty small Flower, well markt with deeper and lighter crimson and pale yellow: a dark bottom, and Violet purple chives.

CCCXXXII. 143. *Proserpine*. The tops of its Leaves are of the color of the *Memorable*, yellow towards the sides, marked and whipt about with a very brown dark Purple. The bottom is yellowish, the chives purple.

CCCXXXIII. 144. *Phenix*. It is a fine Flower, self colored, raised from Seed, and is of good esteem.

CCCXXXIV. 145. *Resilliant*. It is a large Flower, Rose colored, variably spotted and striped with white, which commonly has the Mastery; the bottom and chives are blew.

CCCXXXV. 146. *Swift of Portugal*. It is a tall large long Leav'd Flower, of a Rich crimson color, with some Marks about the edges of the Leaves, of a deep red, striped with great Guards and Lifts of Straw color through every Leaf thereof; with a large round yellow bottom, and Straw colored chives. There are several sorts of

Swifts,

Swissers, but this is the best, the others being lesser, and not so well colored.

CCCCXXVI. 147. *Semper Augustus*. It was formerly of most esteem, but its Flower is not very large, but well Veined and Striped with deep crimson, and pale yellow. The bottom and chives a dark Violet Purple.

CCCCXXVII. 148. *Sufanna*. It is a pleasing delightful Flower, of a comely Form; the colors bright carnation and Snow white, from its first opening, well parted and divided. The bottom white, with pale greenish chives.

CCCCXXVIII. 149. *Star de Mans*. It is a small Flower, with long and very narrow sharp pointed Leaves, at first opening twisted at the ends, which after open and spread flat, is like a Star, with six Points, of a reddish *Isabella* color, striped towards the bottom with white. The bottom and chives are both pale yellow.

CCCCXXIX. 150. *Sigismund*. It is a good Flower, of a crimson color, interperfed with white.

CCCCXL. 151. *Tudart*, or *Toundart*. It is like the *Agut Robine*, of a heavy dull reddish color, the Leaves edged with a Smoaky Dove color, and sometimes a little marked with white: the bottom and chives black.

CCCCXLI. 152. *Tudart Royal*. It is better than the former, the Flower is of a sad red color, whipt about the edges with crimson, and striped with pale yellow. The bottom and chives are black.

CCCCXLII. 153. *Triumphant*. It is a smaller Flower than *General Gouda*; the Stalk is weak, and the colors good crimson and white, but very unconstant. The bottom and chives blew.

CCCCXLIII. 154. *Turbant*. It is a large round hollow Leav'd Flower, often with eight or more Leaves, of a reddish Peach color, Flamed up the middle and sides with crimson. The bottom blew, with dark brown chives.

CCCCXLIV. 155. *Trencontane*. It is Flesh colored, pale yellow, and *Isabella*; the bottom and chives are also a pale yellow.

CCCCXLV. 156. *Unick la Croy*. It is a fine Flower, made up with a various Mixture, or interposition of carnation and white.

CCCCXLVI. 157. *Vespa*. It has a handsome round Flower, of a deep shining crimson color, variably spread with white; but if the red has the Mastery, it soon runs over the white; the bottom and chives are blew.

CCCCXLVII. 158. *Vesta Royal*, or *Nompare*. It is a better and more constant Flower than the last, being carnation, crimson and white. When the Flower marks well, the bottom is white, and the chives blew.

CCCCXLVIII. 159. *Violetta*. It is one of the first Blown of the *Media*, and is of a Violet Purple color, sometimes well marked with white. The bottom and chives are a pale yellow.

CCCCXLIX. 160. *Velvette*, or *Velvet Tulip*. It is a good Flower, of a deep dark Velvet Purple color, marked with some lighter Purple and white Stripes, especially in the tops of the Leaves. The bottom and chives are black.

CCCL. 161. *Zeablom*. It is of divers sorts, the most ordinary is of a sad blewish red color; sometimes a little marked with white, very unconstant, and apt to run, as most of the *Zeabloms* are: the bottom and chives are a sad purple.

CCCLI. 162. *Zeablom Royal*. It is at first opening a fine Flower, Striped and Veined through every Leaf thereof, with blewish carnation, greenish and white; but if the Season is hot, it will

run, and be flubber'd all over. The bottom and chives are both blew.

CCCLII. 163. *Zelinda*. It is a fine pleasing Flower, risen from a Self-color, and by some much esteemed.

CCCLIII. 164. *Zwenan Garel*, or *Chamolet*. It is an old Flower of a deep Peach color, chameleled, and striped with red and white. The bottom is blew, and the chives purple.

III. Of the SEROTINÆ:

O R,

Late Flowering Tulips.

CCCLIV. These are declared in the *General Description*, so that there is no need of repeating the same things again; and they begin to Flower much about the time when the *Media* are past: The greatest thing in these, is the Mixture of their colors, in which there are no such plentiful Varieties as in the two former sorts. The chief of which, (Flowering from the middle of May to the middle of June, and sometimes longer,) are these few following.

First from Mr. PARKINSON.

CCCLV. 1. *Rosea intensior, aut remissior*. A Rose colored, deeper or paler.

CCCLVI. 2. *Rubra vulgaris, aut Saturatior, & quasi nigricans fundo luteo vel nigro, vel nigro Orbe, aureo incluso: Oculus Solis dicta*. An ordinary red, or more deep, like black Blood, with a black or yellow bottom, or black circled with yellow, called the *Suns Eye*.

CCCLVII. 3. *Lutea communis*. The common or ordinary yellow Tulip.

CCCLVIII. 4. *Lutea oris rubris*. A yellow Tulip with red edges.

CCCLIX. 5. *Lutea guttis Sanguineis, fundo nigro, vel vario*. A yellow with red Spots and Veins, the bottom black, or various colored.

Secondly, from Mr. R E A.

CCCLX. 1. *Agut Romane*. It is an old Flower, most pale Rose colored, sometimes well marked about the edges with crimson, and striped with white.

CCCLXI. 2. *Gresound*. It is a low small Flower, of a dark red color, striped and feathered with pale yellow at first, which after turns white: the bottom and chives both blew.

CCCLXII. 3. *Marbre Harlus*. It is an ordinary Flower, most a Flesh color, marked with *Isabella*, and sometimes a little white: the bottom and chives a dark blew.

CCCLXIII. 4. *Paragon Mullen*. It is a bright carnation, and sometimes well striped with white: the bottom and chives blew.

CCCLXIV. 5. *Pato Madam, yellow Crown, and Crown of France*. It is now a common Flower, of a good full red color, marked and crowned on the tops of the Leaves with good yellow: the bottom and chives are yellow.

CCCLXV. 6. *Prince de la More*. It is a fine Flower, as rare as the former is common, well marked with a deeper and lighter cinnamon color, and pale yellow; with a blew bottom and black chives.

CCCLXVI. 7. *Star of Venus*. It is a large Flower, of a good carnation color, marked and veined with pale yellow at first, which after turns white: the bottom and chives both blew.

CCCLXVII. 8. *Tenebris*. It is a large strong Flower, of a dark, deep red color, like that called *De Roy*, with small Veins of Peach color, a small pale yellow bottom, and dark brown chives.

CCCLXVIII. 9. *Tunica Morionis*. It is an inferior kind of the *Pato Madum*, or *yellow Crown*. The Flower is more yellow than red, for which reason some call it the *Fools Coat*; the bottom and chives are yellow.

CCCLXIX. 10. *Zcablom Serotine*. It is a weak Stalked low Flower, of a deep red color, feathered and marked with some gredeline at first, a pale yellow, which after turns white: the bottom and chives are a dark blew.

CCCLXX. *The Places*. The *Tulip* is an *Asiatick* or *Turkish* Flower, first sent to us from *Dalmatia*, *Constantinople*, and other parts of *Turkey*, and therefore called also *Dalmatian Cap*, and *Turks Cap*: In the Woods and Fields of *Dalmatia*, *Cappadocia*, *Bithynia*, *Aleppo*, also in *Macedonia*, *Thracia* and *Tripolis*, they are said to grow naturally Wild, but with us only in Gardens.

CCCLXXI. *The Times*. The *Præcoces* Flower with us in *February*, (if the Winter is mild,) and all *March*, and sometimes in a warm Winter in *January*. The *Mediæ* Flower all *April*, and some part of the beginning of *May*. The *Serotine* Flower from the middle of *May*, sometimes to the middle of *June*; but if the Seasons are cold, they sometimes Flower a Month longer. However, they are an Ornament to our Gardens for more than three complete Months.

The CULTURE.

CCCLXXII. *For the choice of Seed to Sow*. *Clasius* says the *White Præcox* gives the greatest Variety of colors, (scarcely so from the Red:) but if the White has any mixture of Red or Purple in it, the Variety is more eminent. Next to the White, the Purple is said to be the best, and the next thereto is the Purple with white edges; and so likewise the Red with yellow edges; each of them will bring most of their own colors.

CCCLXXIII. The Seed of the best *Mediæ* is to be taken from those which are light colored, rather White than Yellow; and rather Purple than Red; yea White not Yellow; and Purple not Red: But of these again, the Spotted are the best, and the more Spotted the better. But witbal, and in all these, respect the ground or bottom of the Flower, (which in a *Præcox* cannot be, for they seldom have any other ground than yellow; which if the Flower be white, or whitish spotted or edged, and straked, and the bottom blew or purple, (as in the *Holia's*, and *Cloth of Silver*;) is beyond all other the most excellent, and yields the greatest, choicest, and most pleasant Variety. The Seed of meaner Beauties, will yield you a meaner Variety. The Seed of the red or yellow *Tulip*, or their divers Mixtures, are not worth the Sowing.

CCCLXXIV. The Seed of the *Serotine*, (which are seldom seen with any special Beautiful Variety of colors) can bring forth no rarities; and for the Reasons before specified, little or no diversity at all.

CCCLXXV. Therefore to have *Tulip* Seed, from whence you may reasonably expect Beauti-

ful Flowers; your best way will be to leave some for Seed, which are very fine and large, to the end, that being of a Noble Kind, you may rationally hope for something excellent from them; and yet in this matter, Nature some times deceives our greatest expectations.

CCCLXXVI. *For Seeds*, be sure to make choice of such Flowers as have the strongest Stalks, and the Seed Vessel three cornered, of such kinds as are most constantly well marked, and such as have the bottoms and chives either blew or purple, (which is rarely to be found in the *Præcoces*;) whose bottoms are commonly either white or yellow; yet there is one excellent kind, viz. the *Omen*, described in *Self*. XCVI. foregoing, which aptly marks with three colors, and has the bottom and chives both blew, from the Seed of which, many fine Varieties may be raised; and next to this, are the *Florizantine*, *Marillion*, *Cremesine*, *Admiral Encusen*, and *Perisbot*; the rest of the well Marked *Præcoces*, may produce tollerable Varieties, tho not like the *Omen*: But Seeds from the *Vice-Roy*, and Varieties of *Edgers*, seldom produce better than their Originals.

CCCLXXVII. The Seed of the *Mediæ* afford many more excellent Varieties, as that taken from the *Angelica*, *Anvers Blew*, all the *Brabsons*, *Carthago*, *Cedo Nulli*, *Diana*, *Dorothy of Holland*, *Florisson Paragon*, *General Bolson*, *Jeron Paragon*, *Tudart-Royal*, *Turgiana Princefs*, *Virgin Orient*, and several others; these here named, being well marked with different colors, with blew or purple bottoms and chives, are not apt to run, but will abide constant to the last.

CCCLXXVIII. But tho' we make choice of the best Flowers for Seed, yet often times we fail of our purpose, because some times the Roots loose their Fibres, and the Stalks dry before the Seed comes to be half ripe. To prevent which, make choice of the strongest Roots you have, of such Flowers you design for Seed, and set them in that part of the Garden most exposed to the Sun, fix or seven Inches in the Ground, by which means you will gain good ripe Seed, from almost any Flower.

CCCLXXIX. About the middle of *July*, sooner or later, as the Season is hotter or colder, the Seed will be ready for gathering, which may be known by the drinels of the Stalks, and opening of the Seed Vessels, which gather, (and take up the Roots,) letting the Seed remain in the Pods, until the end of *September*, and then they may be taken out, which being cleaned from the Chaff, and Sowed in Beds of fine Sifted Earth, especially the more ordinary sorts.

CCCLXXX. The time and manner of Sowing the Seed is next to be considered. Sow them not in the Spring, if you hope for any good Flowers, but in the Autumn, or presently after they be through ripe and dry; yet if you Sow them not till the end of *October*, they will come forward never the worse, but the better. For it is often seen, that our early Sowing causes them to spring out of the Ground too early, so that if a sharp cold Spring chances to follow, it may hazard their spoiling, if not of all, yet of most part of the Seed.

CCCLXXXI. The same Years Seed is that which we commonly Sow, but if the Seed is two Years old, and that it was at first good Seed, and well kept, being then Sow'd, it will thrive and do well enough, especially if it was perfectly ripe and well gathered; and in Sowing it, you must observe not to Sow it too thick, for if the Seed lies one upon another, that it has not room upon
its

its sprouting, to enter and take Root in the Earth, it will presently perish.

CCCLXXXII. Some press down the Ground in which they intend to Sow the Seed, then put the Seed thereon, and so cover it an Inch over with Sifted Earth; because they say the Nature of *Young Tulip* Roots, is to run deep into the Earth every Year more than other, which this fastness of the Ground at bottom prevents, by which they think the Root increases the better; but doubtless it is not the best way, for this stiffness of the Earth does cause these young Roots to be long before they grow great, and hinders their thriving: For in a loose Earth they grow faster and greater, and thrive much better: And altho' the Roots may run deeper in such a loose Earth, yet that Fault may easily be help'd by Transplanting, and so they may be raised high enough.

CCCLXXXIII. The Ground therefore must be respected, for the finer, softer, and richer the Mould is, the greater will be the increase and Variety. It is to be Sifted from all Stones and Rubbish, and it ought to be either of it self a fat Earth, or else made so good thro' rotten Dung.

CCCLXXXIV. Those of the choicest Flowers, ought to be Sow'd in Boxes, fill'd with the finest Earth that can be gotten, in respect that the young Roots are apt to run deep into the Earth, so that in Beds many of them will be lost: Sow them not too thick, nor cover them above a Fingers thickness with Mould, (as is before noted.) In *March* following, they will come up with small Leaves like Grass; in *April* Weed and Water them, as often as need requires.

CCCLXXXV. Some remove not their *Tulips* once, from Sowing the Seed to their Flowering; but this rule is not to be followed. About the end of *June*, two Years after their Sowing, they are to be taken up, and the small Roots cleansed, and set again in Rows at a wider distance, and so every other Year, till they bear Flowers, still altering the Ground with fresh Earth, and Sifted compost, before you set them again. And to avoid loosening them, you must take them up whilst their Leaf and Stalk are fresh, and not withered.

CCCLXXXVI. And tho' the Leaves in the first Year are but like to the ordinary Grass Blades, yet the second Year they will be bigger, and so by degrees every Year larger and larger. The Leaves of the *Præcoces* while they are young, may be discerned from the *Medie*, for that they wholly stand up above Ground, shewing their small Footstalks; whereas the Leaves of the *Medie* and *Serotine*, do never wholly appear out of the Ground, but the lower part which is broad, abides under the upper face of the Earth. Thus by Transplanting these Seedling Roots every other Year, (and some of them every Year, as you may see cause for the same) in their due Season, viz. about *Midsummer*, or latter part of *July*, or beginning of *August*, you will (according to your Seed and Soil,) have them in a due time come to bearing. It will be 6 or 7 Years before the *Præcoces* will bear Flowers; but the *Medie* will bear in the fifth or sixth Year after Sowing, (rarely in the fourth Year, unless the Earth be very Rich, and then they are none of the best Flowers:) Again, some of the *Medie* will not Flower till the seventh or eighth Year after, and some weakly Roots not to the tenth Year, which I think are not worth the preserving. This you are also to Note, That as your Roots grow bigger in Re-planting them, you must give them more room and distance one from another, lest they should rot, and by that means hinder each others Growth.

CCCLXXXVII. As many fine Flowers may be raised from the Seed of those well marked, before mentioned; so such as have a good Collection of *Modes*, or Self-colors, observing what colors are aptest to change, and by the bottoms running up into the Leaves, become well marked with several colors: I say by Sowing the Seeds of such, the Product may possibly be answerable to expectation: And tho' at first they may come wholly of one color, yet if they be *Orange*, *Sulphur*, *Hair*, *Dove*, *Gredeline*, *Isabella*, *Shammy*, or any other light or strange color, they are to be esteemed; for in a Year or two, many such have changed into good mark'd Flowers, and so continued in all their increase.

CCCLXXXVIII. To hasten which change, let such of your colors as are Strong and Luxuriant, be set in lean and hungry, but fresh Earth; and the next Year after, in that which is Fat and well Manured; and so yearly removed to contrary Soils, till you obtain the end desired.

CCCLXXXIX. The like course is to be taken with Off-sets, to cause them to alter from the Original, as is daily done. For the *General Bole* came from the *Brown Anvers*, the *Cedo Nulli* from the *Zeablon*; and many fine Flowers from the *Brabanson*, *Tourlon*, and *Widows*.

CCCXC. The Seed of the *Præcoces* does not thrive and come forward so fast as that of the *Medie* and *Serotine*; nor does it give any Off-sets in its running down, as that of the *Medie* does, which usually leaves a small Root at the Head of the other (which is run down) every Year, and besides as they are more tender, so they require more care and attendance than the *Medie*, and therefore are the more to be valued.

CCCXCI. And this is a certain and general rule in all *Tulips*, that all the while they bear but one Leaf, they will not bear Flowers, whether they be Seedlings, or the Off-sets of elder Roots, or the Roots themselves, which have already born Flowers: But when they shew a second Leaf, breaking out of the first, it is a certain Sign that it will then bear a Flower, unless some Casualty or Accident hinder it; as Frost or Rain, to nip or spoil the Bud, or some other untimely chance befall it. The time of 5, 6, 7, or more Years, to wait in expectation of Flowers, is a little long indeed; but if you take care to have good Seed from the better sorts of *Tulips*, you will be sufficiently recompensed for your Patience, from the great abundance of choice Flowers, which they will then produce.

Of the Roots.

CCCXCII. When you Set or Plant the Roots of your best bearing *Tulips*, if the Ground is either cold, or lyes too open to the cold Northern Air, it will be well to Plant them somewhat deeper in the Earth, by which they will be the better defended, and not be so liable to be pierced by Colds or Frosts; for deep Snows and hard Frosts are apt to pierce the *Præcoces*; and them chiefly, if they be too near the upper Crust of the Ground; and therefore many cover their Ground before Winter, with either fresh, or old rotten Dung, which will admirably preserve them. The like you may do with *Seedlings*, to cause them to come on the forwarder, so it be after the first Years Sowing, but not till then.

CCCXCIII. If you remove the Roots after they have shot out their Fibres, or small Springs, which grow

grow under the great round Roots, (which is from *September*, till they be in Flower) it will be very dangerous to them: for by removing them when they have taken full hold in the Earth, you hinder them for Flowering that Year, and it may be the next Year too, and hazard their perishing withal. But after they are risen to Flower, you may safely take them up if you please, and remove them without danger, unless it be a Young bearing Root, which in so doing, you will much hinder, by reason, (bearing now its first Flower,) it is yet very tender.

CCCXCIV. But all *Tulip* Roots, when their Stalks and Leaves are dry, may safely be taken out of the Ground, and be so kept, (so they lye in a dry, and not in a moist place) for six Months, without any great harm: And sometimes they have been kept out of the Ground for nine Months, and yet have proved reasonably well; but then you must know, that they have not been Young, but the Older Roots, and have been orderly taken up and preserved. The dryer you keep a *Tulip* Root the better, so you let it not lye in the Sun or Wind, which may pierce and spoil it.

CCCXCV. When the Roots are ready to be taken up, do it in a fair calm Day, and if the Ground is hard or stiff, do it with a long hollow Trowel fit for the purpose; but in light or soft Grounds, it may be done with the Hands only.

CCCXCVI. Being taken up, lay them on Papers on which the Names are written, and place them open upon some Boarded Floor, where they must so remain to dry, about twenty Days. Then take away the dead Fibres, and loose outward Skins, and such Off-sets or young Roots, as will easily part from the old; which done, it will be necessary to wrap up your best Roots especially, in fresh, well dried Papers, and on the outside to write the Name of the Flower, which may be kept with its Off-set with it, until the middle of *August*; at which time, the Off-sets are to be set in a good Bed prepared for that purpose. But the old bearing Roots must be left in the Papers, till the proper time is come for Planting them.

CCCXCVII. When you have secured your Roots in Boxes, it will be necessary often to look over them, lest any should be mouldy, or grow moist, as it often happens. Then the Mouldiness or Moisture, is gently to be wiped off, with a dry woollen Cloth, and the Root gently dried before the Fire, and so put up again into fresh Papers.

CCCXCVIII. Your Roots being thus carefully disposed, it will be time to prepare a place to Plant them in; which for the best bearing Roots, will be in a Bed, or Beds (according to your Store) which let be about a Yard in breadth, and in length according to your own liking, and as your Ground will permit; which let be Border'd with Rails or Bords, and fill'd two Feet deep, with the lightest, freest, and finest Sifted Earth you can get.

CCCXCIX. These Beds may contain 5 or 6 Roots in every Row, cross the breadth of the Bed, which with a Line drawn, may be exactly divided, and the Roots placed accordingly: But before they be set, the Roots are to be numbred from 1, to 50, 100, 200, &c, more or less, in a Book, with their proper Names to the Numbers; and then to be Planted according to the order of the Numbers in your Book; by which they will be known what they are, both before, and after the time of their bearing.

CCCC. In placing these Roots, some set the saddest colors towards the sides, and the lightest in the middle, but a variable mixture is most pleasing, nor setting too many dark, or light colors

together, tho' different from each other; nor to mingle the *Præcoces* with the *Medie*, but placing each sort in a particular Bed by it self.

CCCCI. When these *Noble Tulips* begin to rise up to Flower, it would be well to cover the Bed with a thin Canvas Tilt, (supported with a small kind of Frame) so as not to touch the Flowers; which may be put over them in cold Nights, to prevent the North, or North-East Winds or Frosts, from nipping and hurting the Buds, by which the Beauty of the Flower may be spoiled; as also to defend them in the Day-time from Hail, great Rains, and scorching heat of the Sun, by which means they will continue the longer in Flower. This Tilt or Canvas, may be taken off before the time of Flowering in fair Days, that they may now and then be refreshed with the Sun Beams, and also with gentle Showers, and then be covered again in the Night: But when fully blown, let them not have above an Hours Sun in the Morning, and as much in the Evening, if the Season be hot; if the Weather is cold, you may permit them a longer Sunning.

CCCCII. The more ordinary sorts may be set in Borders, or in spaces in Knots, without taking any account of their Numbers, Names and Places, unless you so please: And if the Ground is good in which they are set, they may stand two Years without taking up, but not longer, in respect to their Off-sets, which adhere to them; which if not removed, will make their Flowers to be small and weak, and withal exhaust very much the Nourishment of the Plant. And before they are set again in the same place, the Earth must be changed for that which is new and fresh.

CCCCIII. After the Flowers are fallen, break off the Heads or Seed Vessels of every Flower, (except of such as you reserve for Seed;) so will the Stalks dry down the sooner, and the Roots will preserve their Strength the better, and be even fortified thereby.

CCCCIV. Some of the best *Tulips* will sometimes be infected with Diseases, notwithstanding our greatest Care and Diligence in their Preservation; which happens to some Roots while out of the Ground, and to others after they are Planted: If the defect is before it is Planted, the Root will appear shrivelled or crumpled on the outside, and feel soft and spongy, which is a sign that it is in a Consumption, or wasting condition; which to prevent, you must wrap it up in Wooll, dipt in *Oil Olive*, and place it where it may receive some little warmth from the Fire: then about the beginning of *September*, or some little time before, set it in the Ground, putting some Wood Soot, mixed with Sand about it, covering the place with an Earthen Pot, the bottom turn'd upwards, to keep it from Wet, till the Fibres are come forth, which will be by the end of *September*, or beginning of *October*, or not at all. These decaying Roots thus managed, (tho' some of the outward Folds rot and consume, the middle and Heart remaining sound) will revive again, and in two or three Years bear Flowers as formerly.

CCCCV. If the defect happens after they are Planted, and have put forth green Leaves, if any of them begin to fade and wither, you must open the Earth to the bottom of the Root, to find out the cause, and if the Root is moist and soft, it is past Cure or help: But if it be any thing hard, it may be recovered, by putting to it Wood Soot mixt with dry Sand, and covering it as in the former, leaving the place somewhat open, that it may dry downwards the sooner. In hot Days, take off the Pot, and take up the Root as soon as the Fibres

are gone, and keep it in Wooll wet in *Oil Olive*, near the Fire: Afterwards set it again, according to the directions in the former *Paragraph* or *Sedition*. By this means many choice Flowers or Roots have been saved, which otherwise had been undoubtedly lost.

CCCCVI. Contrariwise, we purposely make some Roots Sick, by taking them up a little before they begin to Flower, and laying them in the Sun, to abate their Luxury, and cause them to be better marked the next Year following. This has been often done with the *Agat Robine*, *Pais Citadell*, *Pais Heron*, *Pais Oudinard*, *Turlooz*, *Widow*, and such like ordinary Flowers, by which means some of them will come to be very well marked, so as that they might be taken to be much better Flowers than indeed they are.

CCCCVII. When you Plant your best *Tulips*, you must Yearly make a provision of Manured, fresh, light, sandy Earth, to make new Beds for them; or by taking away that in which they grow, and supplying the place with this new provision: For if *Tulips* be set twice in the same Earth, they will languish and decay for want of agreeable Nourishment. But if you have store of *Neats-Dung* mixed with *Sand*, which has lain on an heap two or three Years: If this I say be Sifted, and in August well mixed with the Earth of your Bed, and the Air be any thing good and temperate, it will be sufficient. By this very means, Mr. Rea says, that he had set his best *Tulips*, for twenty Years successively in one Bed, and that they prospered to his Wish, and oftentimes beyond his Expectation.

CCCCVIII. Some Gardeners give us another kind of Compost, which they make after this manner. Take an hundred Bushels of yellow Sand; Fourscore Bushels of red Mould well mellowed; Threescore Bushels of Kitchen-Garden Earth, which mix altogether with a Shovel, and after a Month lying together, pass it thro' a Skreen, that the Mixture may be well made; and thus Skreen it once a Month, for 12 or 14 Months together, which then keep for use. The more this Earth passes thro' the Skreen, the lighter and better it will become, and the more agreeable to your Flowers.

CCCCIX. Before this Compost, or Compound Earth, is laid on the Natural Soil of your Beds, you are to consider, that if the Soil be wet or moist, (both which are Enemies to the *Tulip*;) you must make it dry, or dig the Bed you design, taking out a Foot and half of the Earth, and then filling it up again with this Compound Earth, mixed with an equal quantity of Sand; but if the Soil of the Garden be naturally dry, light and sandy, then you may save the former trouble of digging up and removing the Earth, and only cover it with the said prepared Earth, about half a Foot thick.

Of the BULBS, nad young BULB-Roots.

CCCCX. Your Beds or Parterries designed, being thus prepared, you may then Plant upon them your *Bulbs* or *Young Roots*, as before directed, taking care, that each *Bulb* or *Young Root*, be well covered about three Inches deep, with Earth on all sides, which may be done from the middle of October, to the end of December.

CCCCXI. As soon as ever they are put into the Ground, you must not neglect to cover them with large Straw, or dried Dung as is before hinted,

to secure them from Frosts, and severe cold Weather; but then they must be uncovered again, as soon as the Frost and Cold is gone.

CCCCXII. When *March* is come, and you perceive that they begin to shoot, take care to Water them if the Season is dry, and you see that they require it; but how much, or how long you must Water them, is wholly to be left to your own discretion. And if Weeds grow, let them be continually plucked up, because they will (if suffered) draw the Nourishment from the Roots of your Flowers.

CCCCXIII. These *Bulbs* of the *Tulip* Roots, are to remain in the Earth for one Year only, during which time, they must be carefully Cultivated, but at a Years end they must be removed in the following manner.

CCCCXIV. Take a Dig-planting Scoop, which thrust into the Ground at a convenient distance from the *Bulbs*, and a little below their Fibres, by which means, you will be able to take them up safe without Wounding; then separate the Earth from them, and continue so to do, till they are all dis- planted.

CCCCXV. The *Bulbs* being out of the Earth, and made clean from the Earth sticking to them, carry them into an open place in the shade, (for these Roots are so tender, that they will not endure the Sun, the least heat being apt to dry them too much;) and be sure that they be not heaped up one upon another; for thereby it may happen, that those underneath may be heated, which would certainly do them harm, because it might give motion to the Sprout.

CCCCXVI. When the Season for Planting the *Bulb*, or *Young Root* is come, you must manage it as is before directed, after having separated the Suckers, which you are to Plant in a Nursery made of the same Earth, as we have ordered for the *Bulb* it self, at *Sell.* 408, 409, and 410, foregoing.

Of the Suckers of a Tulip- BULB.

CCCCXVII. Tho' the Suckers of *Tulip-Bulbs* are Planted chiefly for the increase of the kind, and not so much for Ornament, so that there need not be so much care to fit particular Beds for them, as for their *Bulbs*; yet they ought to be Planted orderly and in Rows, and at 5 or 6 Inches distance one from another, and two Inches deep in the Ground, covering them smoothly with your Hand, after which, you are to take the same care of them as you do of your *Bulbs*.

CCCCXVIII. How long they are to continue in the Ground, is the next Consideration: Some say, two Years, for that say they, the first Year they only sprout, and the second Year they multiply: Others say three Years, for that the third Year they come to such a Perfection as to produce Flowers, which seems to be most Consistent to the Nature and Property of these Plants.

CCCCXIX. To prevent these Suckers growing dry. From the time of separating them from their *Bulbs*, to the time of their Re-planting, you must put them into Moss, in some open place, till you Plant them again; and so used, they will thrive admirably.

Of the Flowers.

CCCCXX. The *Tulip* whose Cup is least Convex, is preferable to that which is very much Convex; a Hat Form is said to be more Beautiful than a sharp, the bottom being also proportion'd to the top: but the bottom is much taken notice of, because the Stripes or Strakes which arise from it, are generally of the finest colors.

CCCCXXI If its Form and Green is of a middle bigness, has a requisite largeness, and the green appears a little frizzled, or accompanied with small Streaks; if its color or colors are Lustrous, and appear like Saffron, or of a Flame colored Red upon a White Ground; or is of divers colors with Stainings, or yellow striped with grey; such as these are esteemed, and accounted of the better kinds; and so much the more, if the color is not confusedly blended, but its Stripes are well separated, looking agreeable to the Eye.

CCCCXII. The color of the chives are not much material, in respect to its Beauty; but a good *Tulip* ought to have its Thrums of a brown color and not yellow: And tho' it may appear fine at its first opening, you ought to suspend your Judgment concerning the Time, as to its Goodness and Value, till 2 or 3 days be past, before you can rightly make an Estimation: But this is certain, that in a well formed *Tulip*, the three inner Leaves ought to be larger than the three outward: And that when it opens, it is be with its Leaves turn'd either inwards or outwards, or that its Leaves are too small or thin. It is of no account or value at all.

CCCCXIII. *The Qualities.* They are temperate in respect to heat or cold, driness or moisture; but at most are only moist in the beginning of the first degree, Appetitive, Stomack, Chylifick, Analentick, and Spermatogenetick.

CCCCXIV. The Specification. Of the Satyrion, Dioscorides, lib. 3. cap. 142, and 144. says, Ταύτην δὲ μίαν ἢ δύο ὑδατὶς ἀποξηρῆται πρὸς ἐμπότιστον. Hanc in Vino nigro nostro bibere oportet, contra Opisthotonos. 2. Καὶ εἰ βλάδι γυναικὶ συνδραμὸς καὶ οὐλῃ quocumq; utere, si cum muliere rem habere volueris. 3. Quæ p̄g̃s αὐτοῦ καὶ ὀφθαλμοῖσιν τ̄ ὀπθιστάς. Eam enim etiam ad venerei impetus constitutivem vim habere affirmat. De Satyrio erythronio ille dixit. 4. Τρεῖσι δὲ ὅν καὶ εἰ τ̄ γαῖα κροβίστα ἢ ἑλλὰς ἐπὶ εἰ τοῖς ἀποδοῖα, ὅν ὁνομαζομένην, πάλιν. Præditur & radix, si molo manū teneatur, venereum stimulare, eoque magis, si bibatur in Vino. And it the Ophthalmy's Herba ab Indo quodam allata, in lib. 9. cap. 20. be the fume with Satyrion, as the most Learned seem to affirm, he ascribes much the same Virtues to it which Dioscorides does. Οὕτωσαν τοῖς δὲ ἀπὸ τοῦτο ἔχει. Οὗ γὰρ προσηγορίαν καὶ οὐλῇ, καὶ αὐτῇ συνδραμὸς ἔστιν ἂν τὸ αἰδέσθαι τρέψεται, &c. καὶ αὐτὴν ενενερεῖ, mirum in modum herba polioct, quam Indus attulerat. Non enim solum edentibus, sed etiam tangentibus tantum. genitalibus vim vehementem adeo inspireare, ut quoties vellent coire possent. Et quidem qui usi fuerant, duodecies potuisse dixerunt. Mulieris vero vehementius etiam curari libidinem, cum eo Medicamine usa fuerint, dicebatur. Hac igitur vis, si vere narratur, mirifica est. The Substance of all this is, that Satyrion (the Root which is only used,) is good againt that sort of Convulsion called the Opisthotonos, (*Japinus raptus*, in which all the parts of the Body are Contracted, Bended, or Convulsed backwards; see my *Praxis Medica*, lib. 2. cap. 3. sect. 2.) to increase Seed, and pow-

etually to provoke Lust, and that both in Men and Women: And it's so, it follows of consequence, that it must restore in Consumptions; for that the Seed is made of the best and most Spirituous, and Saline parts of the Blood, and Blood being the Progenetor of Flesh, it is reasonable to conclude, that since it largely produces Seed, it must as largely generate Blood, which is that only by which pined and wasted Bodies are again Nourished, and restored to their Pristine State of Health. *Bodius* in his Comment upon that place of *Theophrastus*, says, *Tacite (ille Theophrastus) ridet illos, qui tantum tantas ascribunt vires, ut si manu tantum teneantur veneres as libidines immoderatas movere possint.*

CCCCXXV. *The Preparations* As the Root is the only part of the *Tulip*, which is of any approved Physical use, so therefrom you may have, 1. *A Liquid Juicc.* 2. *A Decoction in Milk, Canary, or Water.* 3. *A Conserve.* 4. *Sanguis Satyrionis, or the Blood thereof, according to Quercetanus, ab Heels and Schroder.* 5. *The Compound Extract.*

The Virtues.

CCCCXXVI. *The Liquid Juice.* It may be clarified with Whites of Eggs, or used simply of it self, being immediately extracted; Dose from one Ounce to three, mixt with a Glasse of Canary every Morning fasting, and every Night going to Bed. It corroborates the Womb, and Influxments of Generation, increases Seed, provokes Lust, and is said to cause Fruitfulness in both Sexes, and cure Impotency in Men.

CCCCXXVII. *The Decoction in Milk, or Canary, or in Water.* It has all the former Virtues, but is much weaker; if it is made in Water, it ought to be given mixed with an equal quantity of generous Wine, and so taken Morning and Night, to half a Pint of the Decoction or more.

CCCCXXVIII. *The Conserve.* The Root is boiled or baked soft, then beaten up with Sugar. It is of the same purport, Nourishes much, is Restorative, and is profitable for the Cure of a *Phthisis*, or Ulceration of the Lungs, and a Pining Consumption. Dose as much as a large Walnut, Morning, Noon and Night, drinking after it to wash it down, a Glass of Palm-Wine, or Old Malaga, and sometimes for change, a draught of Milk warm from the Cow.

CCCCXXIX. *Sanguis Satyriosis*, the Blood of Satyrion. *Quercetan* makes it after this manner. Be *Radiceis Satyriosis optime mundatis, quam in Mortario marmoreo probe contunde, donec formam pulpa sortiatur.* Ad libras quatuor hujus pulpa, adice medulle panis Secalini, & panis Tritice, ana, libram unam. Omnia invicem probe mixta, & tantillo vini albi irrigata, injiciantur in Matrarium Vitreum cum collo longo, subere vel cera Hispanica optime obduratum, ut nihil transpiret. Hoc Matrarium collocetur in fimo calido, sive in Balneo Vaporoso, donec Materia in Chyli Sanguinei, ac rubicundi colorem convertatur. Tunc illam fortiter prelo exprime, & expressionem hanc Chylisam, & Sanguineam pone in Balneo Vaporoso, illud in hac Decanditione, majorem acquirat rubedinem; & Sæces aliquot in fundo relinquit, quæ separabis. Continuando hanc digestionem, & depurationem, donec materia clarissima & rubicundissima apparuerit. Separa ab illa tunc liquorem clariorum per Alembicum ad Ignem Balnei Vaporosi, & remanebit in fundo extratum rubicundissimum, quod nominant Sanguinem Satyriosis. 2. Ab Heers, lib. 1. Observat. 8. makes it after this man-

ner. *Re Radicem Satyriionis, contunde ac adde Jensem micam panis albi, propter lentoris dilutionem Spir. Vini è Maluato, ut irroretur. Dein digere in Balneo Mariæ vase clauso Septim. Tum exprime, expressum iterum per Mensam digere. Innatabit Liquor rubicundus, hunc inclinando Collige objectis facibus.* Take Satyriion Roots, beat them in a Mortar with Crumbs of white Bread, adding them gradually, or by little and little; then add Spirit of Malaga Wine, sprinkling it on, for the more easie diluting of the Glutinous or clammy Substānce; digest it in a close Vessel in Balneo for a Week; then strain, and the strained forth Liquor digest again for a Month, so will a red Liquor supernate, which decant, or pour off by inclination. 3. From Schröder: *Fit ex Radice conqualfata, & cum Pane atque Vino (Spiritu Vini) digesta.* It is made of the Root bruised, and beaten up with a sufficient quantity of Crumbs of Bread, and then digested with Wine, or Spirit of Wine. The Virtues of this Preparation, we will give you from Quercetan in his own Words. *Sanguis ex Satyrione singulare Matricis corroborans, & specificum est Remedium ad Conceptionem: prolisque Generationem juvandam, Sterilissimisque quantum libet Mulieribus fecunditatis donum impertit virique Impotentiam ad Pristinum Vigorem reducit.* It causes Fruitfulness in both Sexes, strengthens the Instruments of Generation, and so comforts the Womb, as to induce Conception: It provokes Lust, and cures Impotency in Men, restoring their Virility. Dose two Drams or more, Morning, Noon and Night, in a Glass of Generous Wine.

CCCCXXX. *Extractum Satyriionis Compositum.* Extract of Satyriion Compound. Take of the Sanguis Satyriionis simple, according to the former prescription, a Pound; Salt of Pearl one Ounce, Chymical Oil of Nutmegs, of Cinnamon and of Aniseeds, of each a Dram; mix them, and keep it for use. It has all the Virtues of the Sanguis Satyriionis aforegoing, and very much exceeds it in its Effects: It cures Weakness and Faintings, and restores in Consumptions. Dose 20 Drops, Morning, Noon and Night, in a Glass of Generous Wine.

CCCCXXXI. *Nota. Verus Philosophus ulterius adhuc progreditur, & per eandem Viam tum ex frumento, tum ex Vino, educet substantiam quandam Sanguineam; alendi & vivificandi Facultate potentem; quâ causam Generationis Carnis, in corpore nostro indagabit.* Quercetanus.

er and lesser. 4. *Tulipa Boloniensis flore luteo*, the yellow Bolonian Tulip. 5. *Tulipa Bicolor Italica*, The Italian small party colored Tulip. 6. *Tulipa Byzantina duobus Floribus Clusij*; The small Tulip of Constantinople. 7. *Tulipa de Caffa*, The Turkey Caffa Tulip. 8. *Tulipa Cretica*, The Candy Tulip. 9. *Tulipa Italica, major & minor*. The Italian Tulip greater and lesser. 10. *Tulipa Lusitanica, five Tulipa pumilio versicolor*, The Portugeze Tulip, or dwarf Stript Tulip. 11. *Tulipa Narbonensis, vel Pumilio lutea*, The Narbone, or dwarf yellow Tulip. 12. *Tulipa Pumilio alba*, The white dwarf Tulip. 13. *Tulipa Persica*, The Persian Tulip.

Tulip Bastard.

The Descriptions.

III. The first, or Armenian Tulip, much differing from those in the former Chapter, its Root is Bulbous (as other Tulip-Roots are,) and something larger than the Root of the fourth Kind, or yellow Bolonian following. It bears three, (sometimes four) small, long, and somewhat narrow green Leaves, altogether at one Joint or place, the Stalk being Naked without Leaves, and not high. At its top it bears one Flower, which is small, and like to an ordinary Tulip, but something more yellow, tending to an Orange color, with a black bottom.

IV. The second, or greater red Bolonian Tulip. Its Root is plainly seen to be differing from all others, for it is longer, and has not so plain an Eminence at the bottom thereof, as the former Tulips have, but more especially, because the top is plentifully strowed with a yellowish Silk-like Woolliness; its outside, or Skin of it also, is of a brighter or paler red, not so easie to be peeled off, and it runs under Ground both down-right and sideways, (more especially in a Country Soil and Air,

C H A P. DCCXIV.

of TULIP Bastard.

I. **T**HE Names. It may be called in Latine, *Tulipa Notha*, *Tulipa Spuria*, the Bastard Tulip.

II. The Kinds. These Bastard Tulips are all of them (so far as I have seen) *Præcoces*, or of the Early sorts; of which we have found growing in our Gardens these Species following, denominated for the most part, from the Places or Countries from whence they were first brought to us. 1. *Tulipa Armenica*, The Armenian Tulip. 2. *Tulipa Boloniensis* sive *Bombycina flore rubro major*. The greater red Bolonian Tulip. 3. *Tulipa Bergomenfis, rubra media & minor*, sive *Tulipa pumilio rubra*; The dwarf red Bergamo Tulip, great-

where it will increase abundantly, tho' not so in our London Air, and Fore's Grounds.) something like to the yellow Bolonian Tulip, (at Sect. VI.) following. It shoots out of the Earth with broad and long Leaves, but neither so broad, nor of so white or Mealy a green color, as other Tulips, but more dark than the Serotinae, or late Flowering Tulips, so that this may easily be discerned by its Leaf, from any other Tulip above Ground, by such as are skill'd in these Flowers. It bears three Leaves upon its Stalk, (very rarely four) and at the top of the Stalk (which is not long) a Flower, like to the Tulips, but that its Leaves are always long, and something narrow, having a large black bottom, made like unto a Chevron, whose point rises up to the middle of the Leaf, higher than in any other Tulip. The Flower is of a pale red color, nothing so lively as in the former Early or Late Red Tulips, yet sweeter (for the most part) than any of them, and nearest to the yellow Bolonian Tulip following, which has much the same Smell.

V. The third, or Dwarf red Bergamo Tulip, greater and lesser. These differ very little from the last described, saving that they are much less, and smaller in all their parts, and therefore are called Dwarfs, in respect of them, of which there is a greater and a lesser: They take their Denomination or Name, from the place from whence they came to us.

VI. The fourth, or yellow Bolonian Tulip. The Root of this Tulip may be easily known from the former Red, (or any other kind,) that it seldom comes to be so large or big, is not so Woolly at the top, and the Skin or outside is something paler, harder, and sharper pointed; but its bottom is like the former Red, and not so eminent as the Early or Late Tulips. It bears much longer and narrower Leaves than any (except the Narbone and Persian, at Sect. XIII. and XV. following,) and of a whitish green color: It bears sometimes but one Flower on a Stalk, sometimes two, and sometimes, tho' rarely, three, but smaller; which are wholly yellow, more open than the other kinds, and smelling sweet. The Head for Seed is smaller than in others, and has not that Crown at the Head thereof, for which reason the Seed is also smaller, but like to the Seed of other sorts.

VII. The fifth, or small Italian Party colored Tulip. From its small Bulbous Root, it sends forth Leaves, which are small, long, and narrow, of a dark green color, something like to the Leaves of an Hyacinth. Its Flower is small also, consisting of six Leaves, three of which are wholly of a red color, and three wholly of a yellow.

VIII. The sixth, or small Tulip of Constantinople. The Root is very like to that of the yellow Bolonian Tulip, (at Sect. VI.) It is a small Plant, bearing for the most part two Leaves on the Stalk, which are fair and broad, almost like to the Candy-Tulip, (at Sect. X.) The Stalk rises to be about a Foot high, bearing sometimes but one small Flower, but most commonly two, one below another, and are no bigger than the Flowers of the yellow Bolonian Tulip, but differing in color; for this is on the outside of a Purplish color, mixed with white and green; and on the inside of a fair bluish color, the bottom and chives being yellow, and the Pendants or Tips blackish.

IX. The seventh, or Turkey-Cassia Tulip. Its Root is like to others of the Præcoces, or Early Tulips, but differ from them in some other things or particulars. Its Leaves are a pale green, being as broad and large as those of a Præcox; sometimes they are crumpled or waved on the edges, and some

have their edges for a good breadth, of a whitish, or whitish yellow color; and in others the Leaves are lifted or parted with whitish yellow and green. The Stalk rises up scarcely to the height of a Præcox, and bears a flower, not unlike to the Early Tulips, in some of a reddish yellow color, with a Rusty-color'd ground or bottom; and in others of several other colors. The Seed is so like to that of the Præcoces, that it is not to be distinguished from it.

X. The eighth, or Candy Tulip. Its Root is small, and something like to the Narbone, or Dwarf yellow Tulip, at Sect. XIII. but a little bigger. It bears fair broad Leaves, of a greenish color, and not very whitish. The Stalk bears one Flower, which is larger, and more open than in some other kinds; and is either wholly white, or of a deep red color, or else variably mixt, of white, with a fine reddish Purple; the bottoms being yellow with Purplish chives, tipped with blackish Pendants. It does difficultly thrive in this our cold Climate, and prospers not well, unless a great care be taken of it.

XI. The ninth, or Italian Tulip, greater and lesser. Their Roots are like to the yellow Bolonian Tulip, but the Stalks rise not up so high as in that. The Leaves of both sorts are writhed in and out at the edges, or made like a Wave of the Sea, lying nearer the Ground. The Flower is yellow within, brownish or reddish on the back, and in the middle of the three outward Leaves, the edges appear yellow. Both these Kinds do much resemble the Narbone Tulip, and they differ one from another in nothing, but that the one is greater and the other lesser.

XII. The tenth, or Portuguese Tulip, or Dwarf strip'd Tulip. This Dwarf Tulip is of the same kindred with the greater and lesser Italian just before described, and the Narbone, or Dwarf yellow Tulip following; there being no other difference in this from them, but that the Flower of this has some red Veins running in the Leaves thereof.

XIII. The eleventh, or Narbone, or Dwarf yellow Tulip. This is very like to the yellow Bolonian (at Sect. VI. above,) as well in its Root, as in its Leaf and Flower, as also in the color thereof, being yellow. The only difference is, that it is in all respects lesser and lower, and not so apt to bear, nor so easy to increase by the Root.

XIV. The twelfth, or white Dwarf Tulip. Its Root is like the others, its Stalk is longer than other Dwarfs, and the Flower is also larger, (being of a white color,) than other sorts of white Tulips; but the Leaves thereof are narrower.

XV. The thirteenth, or Persian Tulip. Its Root is small, covered with a thick, hard, blackish Shell or Skin, with a yellowish Woolliness both at the top and under the Shell. It is a rare Plant, but is thought nearly to agree with the Bolonian and Indian Tulips, in its Root, Leaf and Flower. It rises out of the Ground at first, with one very long and small round Leaf, which when it is three or four Inches high, does open it self, and shews forth another small Leaf (as long almost as the former) breaking out of the one side thereof, and after it a third; and sometimes, tho' rarely, a fourth and a fifth, but each shorter than other, which afterwards become of the breadth of the Dwarf yellow Tulip, at Sect. XIII. foregoing, or something broader; but much longer than any other, and abiding more hollow, and of the color of the Early Tulips on its inside. The Stalk rises to be a Foot and a half high sometimes, bearing one Flower of six long and pointed Leaves, of the Form of other small Tulips, not much bigger than the yellow Italian Tulip; but it is wholly white on the inside and outside of all its Leaves, saving that on the backs of the three outermost, from the middle

middle towards the edges, there is a show of a brownish blash, or pale red color, yet deeper in the midst, the edges remaining wholly white. The bottoms of all these Leaves, are of a dark, or Dun Tawney, and the Chives and Tips of a darkish purple Tawney. It seldom bears Seed with us, but when it does, it is small like to the Bolonian or Narbone Tulips; nor is it so plentiful in parting or setting off by the Root as they, and seldom Flowers after the first Year.

XVI. *The Places.* Their Names shew their Native Countries, being Nurst up with us only in Gardens.

XVII. *The Times.* They are all *Præcoces*, and Flower here in England, thro' all the time of the Flowering of the Early Tulips.

XVIII. *The Qualities, Specification, Preparations and Virtues* of these, are the same with those declared at large, in the last foregoing Chapter, to which you are referred.

C H A P. DCCXV.

Of TURNEP Garden.

I. *THE Names.* It is called in Greek *Γερνυλον*: of the Lacedemonians, *Ταρης*: of the Boetians, *Ζευανης*: in Latine, *Rapum*, pl. *Rapa*; and in English, Turnep, and Turneps.

II. *The Kinds.* There are 1. *The Garden Kinds*, of which in this Chapter. 2. *The Wild Kinds*, of which in Chap. 716. next following. Of the Garden Kinds there is 1. *Rapum rotundum album commune*, The common white round Turnep. 2. *Rapum rotundum rubrum commune*, The common red round Turnep. 3. *Rapum longum vulgare*, The common long Turnep. 4. *Rapum luteum*, The yellow Turnep.

Turnep Garden round.

*The Descriptions.*

III. *The first, or common white round Turnep.* Its Root is round, (Sometimes of a Globular, and Sometimes of a flatter round Form,) and of a white color both without and within, with a small Pigs-Tail like Root at its bottom, or underneath it: The rounder sorts are said to be the stronger or worse; the flatter kinds the sweeter or better; but there are very good and sweet tasted of both sorts. From this Root spring up many large and long, rough, green Leaves, with deep and uneven Gulches on both edges; from among these Leaves, rises up the Stalk, about two Feet high, spread at top into many Branches, bearing thereon yellow Flowers, which turn into long Pods, with blackish round Seed in them.

IV. *The second, or common red round Turnep.* Its Root is of a fair red color on some parts of the outside, the other parts being white like the former, but of a pure white color throughout within, as the first also is. This in its Leaves, Stalks, Flowers and Seed, is exactly like the first Described, but its Root is larger. This Matthioli says, grows in the Country of Anamia, (where he had seen an infinite number of them) to such a bigness, as to have weighed Fifty Pounds weight a piece, and some an Hundred Pounds weight, (which is almost incredible) but we see this kind is apt to grow very big with us in our cold Climate; and therefore possibly it may grow or extend itself to a far greater Magnitude in those warmer Climates, the Soil being also agreeable to its Nature, and facilitating such an extraordinary Production.

V. *The third, or common long Turnep.* Its Root is round, but not Globular, and long, almost in some like a Cylinder, and in others more peaked or Spear-like, being of a white color both on the outside and inside. The Leaves, Stalks, Flowers and Seed, are like to those of the first Described.

VI. *The fourth, or yellow Turnep.* Its Root is like to the first common kind, but changes to be more yellow, and in some comes near to the color of a yellow Carrot; otherwise whilst it is growing, in respect to its Leaves, Stalks, Flowers, and Seed, it is hard to be discerned from the first common Garden Kind.

VII. *The Places.* The Turnep is a Manured Plant, and grows with us only in Gardens, or Fields kept on purpose for the same. Those which grow at Hackney, near London, are less than many others, and are thought to be sweeter than any of the other Kinds which grow in England. They delight in a fat and sandy, light, loose Earth, and there grow well.

VIII. *The Times.* They are Sown in the Spring, as also in the end of August. They Flower and Seed the second Year after they are Sown. Gerard says, that those which Flower the first Year are a degenerate Kind, which the People about Nantwich in Cheshire, call *Mad-neps*, from their evil Qualities, in causing a Vertigo and Frenzy, or kind of Madness for some little while. But Parkinson says, that these *Mad-neps* are a Species of the *Parsnep*, as we have declared in Chap. 544. See 7. foregoing of this Book.

IX. *The Qualities.* The Roots are hot and moist in the first degree, Aperitive, Digestive, Anodyn, Discussive, Suppurative, Pectoral, Nephritick, Chylifick and Analeptick. The Seed is hot and dry in the third degree, Aperitive, Attractive, Digestive, Diuretick, Stomatick, Pecto-

ral, Nephritick and Alexipharmick; having much the same Qualities, Specification, Preparations and Virtues of Mustard-Seed, to which we shall refer you.

X. *The Specification.* It, viz. the Root, removes Obstructions of the Lungs and other Viscera, breeds a laudable Chyle and good Juices, and cures Rheumatisms, Gouts, and Consumptions.

XI. *The Preparations.* You may have, 1. *The Vinous Juice of the Root.* 2. *A Spirit from the same.* 3. *A Liquid Juice or Sapa.* 4. *A Liquid Juice by expression from the Baked Roots.* 5. *A Decoction of the Roots.* 6. *The Simple Pulp of the Roots, made by Baking or Boiling.* 7. *The Expresed Oil of the Seed.*

The Virtues.

XII. *The Vinous Juice.* It is made of the Expresed Juice of the raw Root, by being first beaten to a Pulp in a Mill, or otherwise, and then expressed out; after which, it is Fermented in wooden Vats or Vessels, as Juices of Grapes, Apples, Pears, &c. It is a pleasing Liquor, and may be drank as Ale, Beer, Cyder, Perry, Wine, &c. at Meals and other times to quench Thirst. It is Diuretick, Cordial, and strengthens the Stomach and Bowels.

XIII. *Spiritus Raporum;* The Spirit of Turneps. It is drawn from the aforementioned Liquor, as you draw Spirit of Wine from Wine. It has much the same Virtues with Spirit of Wine, and may be drank alone, or with Sugar, as you drink Brandy to warm the Stomach, cherish the Bowels, and revive the Spirits. With it you may make Punch with Water, Lime-Juice and Sugar, as you do with Brandy, which being drank, will have the same Effects; and if taken plentifully or freely, viz. about half a Pint at a time, 1. In the Morning fasting. 2. Half an Hour before Dinner. 3. At four in the Afternoon; and 4. At Bed time, and be continued in the same manner for 10 or 12 Weeks together, it will Cure a Pining Consumption. And may be used in Chymical Operations, for making Tinctures, Extracts, Cordial Waters, Spirits, &c.

XIV. *The Liquid Juice or Sapa.* It is done by Expression out of either raw Turneps, or after they are Baked, or Boiled soft in their Skins; and this Juice may be taken Simply as it is expressed out; or otherwise made into an Essence, or Sapa, and so kept for farther use. These Preparations are all Pectoral, Chylifick, Nutritive, and restore in deep Consumptions.

XV. *The Decoction of the Roots.* It is good against the Rickets in Children, Gouts, Rheumatisms, Quartan Agues, Asthma's, Coughs, Wheezings, Shortness of Breath, Consumptions; increases Seed, expels Sand, Gravel, and Tartarous matter in the Reins and Bladder, and provokes Urine, being drank daily as the usual Drink.

XVI. *The Simple Pulp of the Root, made by Baking or Boiling.* If it is eaten without Vinegar or Salt, only of it self, or mixed with a little new Cream, or Milk, and some pure fine white Bread, and the Patient confines himself to Live of it for 6, 7, or 8 Weeks, eating no other Food, neither Flesh nor Fish, Pickles, Sawces, or Sweet-Meats, during that space of time, and drinking in the mean season only a strong Decoction of Turneps, it effectually cures a Rheumatism and Gout, as also the Scurvy and Consumption, altho' the Patient is in a very Deplorable Condition; it is also a very

good Diet to be observed of such, as have come out of a Salivation, or other Course for the Cure of the foul Disease; doing truly much more than could be reasonably expected, in completing the Cures of those Diseases, beyond many other things of much greater Name.

XVII. *The Expresed Oil from the Seed.* Being mixed with Venice Treacle or Mithridate, it is singular good against Poison, and malign and infectious Diseases. Gerard says, that in the Low Countries, as Holland, Zealand, Flanders, &c. it is given to ease the After-pains of Women in Child-Bed; and they give it both to kill and expel Worms in Children: And being washed with Water, and then anointed upon the Skin, it takes away its ruggedness, and makes it soft and smooth.

CHAP. DCCXVI.

of TURNEP Wild:

OR,

Wild R A P E.

I. *THE Names.* It is called in Greek *Λαυδάιν* *Discoridis*; and in Latine *Lampane Matthioli*, also *Rapum Sylvestre*, and *Rapistrum*, (a Similitudine Rapi soliorum, and in English Wild Turnep.

II. *The Kinds.* We have two sorts pretty common with us, viz. 1. *Rapum non Bulbosum*, *Rapum majus Sylvestre*, The greater Wild Rape or Turnep; and this is that Rape which yields the Rape-Seed, or Cole-Seed, out of which Oil is drawn in Mills by Expression, for many Mechanick uses. 2. *Rapistrum Sylvestre*, and *Rapistrum minus*, The lesser wild Rape or Turnep.

Turnep Wild.

The

The Descriptions.

III. The first, or greater Wild Turnep. *Its Root is long and slender, with some few Fibres adjoining to it. Its Leaves and Stalk are very like to those of the Garden long Turnep, but they grow thicker and more plentifully from the Root, and more crumpled and gasht in on the sides, and more rough in handling, and in the Flowers, Pods and Seed, it is much alike, and in the whole in its appearance, differs not much from it: The Seed is called Rape-Seed and Cole-Seed.*

IV. The second, or lesser wild Rape, or Turnep. *Its Root is also long, and much lesser or slenderer than the former, with some few Fibres issuing from it. Its Leaves are smaller at bottom, and not jagged, but a little waved. It is not so plenteous in Leaves as the former, but growing fewer, they are more sparshd upon the Stalks and Branches, grow upon not very long Footstalks, and the higher they grow, are more deeply waved on the edges, and sometimes as it were a little jagged. The Flowers are yellow, after which come pretty long, but small, and sharp pointed Pods, in which are contained small flat Seed, of a whitish yellow color.*

V. The Places. The first is found wild in many Countries, but for the profit which is made of the Seed, we here in England, as also in Flanders, and other the Low Countries, Manure it, and Sow it in Fields, and fill therewith vast Tracts of Land. The second grows wild also in our Country. *Parkinson* says, he found it going from *Shoreditch* by *Bednal-Green*, to *Hackney*.

VI. The Times. They Flower in May and June, and the Seed is ripe in July or August, at what time they reap their Fields Sown with it, as they reap Wheat and other Corn.

VII. The Qualities. The Seed, which is that which is only used, is hot and dry in the beginning of the second Degree, but the Seed of the lesser sort is bitter, and almost as hot as Mustard-Seed, and of which some make Mustard, or mix it with Mustard-Seed, and then use it for that purpose. It is Alterative, Digestive, Diuretick, and strongly provokes Urine.

VIII. The Specification. It helps the Discreasy of the Stomach, (I mean the Seed of the lesser kind) provokes Urine, opens Obstructions of the Reins and Bladder, and gives ease in the Strangury.

IX. The Preparations. Of the Rape-Seed, or Cole-Seed, is made, *An Oil by Expression in a Mill.* Of the lesser kind, *An Infusion in Wine.* And, a kind of Mustard or Sauce for Meat.

The Virtues.

X. The Expressed Oil of the Rape-Seed or Cole-Seed. It is used in Lamps, and therefore called *Lamp-Oil*, for which purpose, it is much better than *Train-Oil*, which is made out of *Whales*, because it stinks not like that. It also serves to make Soap withal, instead of Oil Olive: And in divers places in Germany, Flanders, and the Low-Countries, they use it to Fry their Fish in, &c. It is scarcely at all used in Physick, yet given in Quantities, it opens Obstructions of the Lungs, and makes the Belly soluble, giving ease in the extream pains of the Cholick.

XI. The Infusion of the Seed bruised, of the lesser kind, in White Port Wine. It powerfully pro-

vokes Urine, opens Obstructions of the Urinary Vessels, and expels Sand, Gravel, and Tartarous matter lodged in the Reins, Ureters and Bladder, and for that reason gives ease in the Strangury: You may infuse 4 Ounces in a Quart of Port-Wine, and after 3 or 4 days Digestion, drink twice or thrice a day, a quarter of a Pint of the clear Wine: If it be sweetned with Syrup of Marsh-Mallows, 'twill be so much the more effectual.

XII. The Mustard or Sauce made of the Seed. It is made as you make Mustard of Mustard-Seed. It strengthens and warms the Stomach, causes a good Appetite and Digestion, and pretty strongly provokes Urine: But it is not altogether so pleasant as the Mustard made of Mustard-Seed, because of its bitterness, which it looses not in a long time.

TUN-HOOF, see Alehoof, Chap. 6.

TURBITH, see it in Lib. II. Chap.

TURMERICK, see it in Lib. II. Chap.

C H A P. DCCXVII.

OF TURNSOLE.

I. THE Names. It is called in Greek, *ἡλαιορέμων* (quoniam Flores cum sole circumaguntur; or as *Theophrastus* will have it, because it Flowers in the Summer Solstice,) as also *ζαβόμεστρος*, *Scorpiuron*, (quia spica Florum Scorpionis cauda est Effigie:) in Latine, *Heliotropium*, *Scorpioides album Gesneri*, *Solifegium*, *Verrucaria* (à tollendis verrucis) and *Herba Cancri*: in English, Turnsole.

II. The Kinds. There are several sorts of this Plant, as 1. *Heliotropium*, *Heliotropium majus*, *Scorpioides album Gesneri*, *Herba Cancri major Loniceri*, but most properly *Verrucaria*, Our common greater Turnsole, or Wart-Wort. 2. *Heliotropium majus supinum Clusij*, *Dodonæi* & *Gesneri*; *Heliotropium humi sparsum Clusij* *Lugdunensi*; *Heliotropium minus supinum Baahini*, The greater creeping Turnsole. 3. *Heliotropium minus repens Lobelij*; *Heliotropium minus folio Ocimi Gesneri*; *Verrucaria altera minor Lugdunensis*, small Turnsole. 4. *Heliotropium Tricoccum Plinij*, (but some add unto it minus:) *Herba Clitæ Camerarij*, The Dying Turnsole. 5. *Heliotropium Indicum Tuberosum*, *Flos Solis Farnesianus*, *Jerusalem Hartichöak*, of which we have already treated, in Chap. 340. foregoing.

The Descriptions.

III. The first, or our common greater Turnsole. *Its Root is small and thready, perishing every Year. It rises up with one upright Stalk, about a Foot or more high, dividing or spreading it self out almost from the bottom, into several smaller Branches, of a hoary color. At each Joint of the Stalk and Branches, grow two small broad Leaves; something like to those of Calamint, or Basil, but greater than them of Calamint, and lesser than the greater Basil; something white or hoary also. At the tops of the Stalks and Branches, stand many small white Flowers, consisting of four, and sometimes of five very small*

small Leaves, set in order one above another, upon a small crooked Spike; they grow pretty thick together in rows, upon one side of the Stalk, which Stalk does bend or turn backwards, almost like a Scorpions Tail (whence came that other Name Scorpioides,) which opens by degrees, or grows more straight, as the Flowers blow open. After which, in their places come small corner'd Seed, four for the most part standing together, which shedding it self, rises again the next Spring.

IV. The second, or greater creeping Turnsole. Its Root is small and fibrous, perishing every Winter as the former does. This in the Judgement of Clusius, is in a manner the same with the former

Turnsole Great.

or greater common Turnsole, because it is so like it in most particulars; but herein it differs, that it has many more, and slenderer Stalks, not standing upright as the former, but a little leaning down to the Ground as it were. The Stalks and Leaves are lesser, but hoary in like manner. The Flowers are white, and grow upon crooked spiked Stalks, bending like a Scorpions Tail, as the other; and the Seed is smaller, standing singly, or but two together.

V. The third, or small Turnsole. It has a slender, fibrous, perishing Root, which sends up weak, small, slender Twigs or Branches, growing very low, and lying almost upon the Ground; having thereon many small Leaves like the other in Form, but three times less in Magnitude, neither are the Stalks or Leaves white or hoary as the former, but of a dark green color. The Flowers are much smaller, and yellowish, not growing in long, crooked, or bending Heads like the others, nor at the tops of the Branches, but coming forth at the Joints, upon very small Footstalks, some above the Leaves, and some under them; which afterwards turn into small round Heads or bot-

Turnsole Small.

oms, like unto Warts, in which is contained such like Seed as the last, but smaller, and a little rounder.

VI. The fourth, or Dying Turnsole. Its Root is small, slender, fibrous or threddy, and perishes every Year after it has born Seed. It rises up with an upright Stalk, spreading it self out diversly, into many Branches, and grows to the height of half a Yard, or thereabouts, on which grow broader and softer Leaves than any of the former, much like to those of the Sleepy Nighthade, and whitish withal, set without order at the Joints, up to their tops, yet growing smaller than below. At the ends of the Branches, come forth small Mossy yellowish

Turnsole Dying.

Flowers, which quickly perish, and fall away without giving any Seed; like herein to the Ricinus, or Palma Christi, called the Great Spurge; for in the same manner also, at the Joints with the Leaves, come forth the Fruit or Berries, three always, or for the most part, set or joined together upon a Footstalk,

Stalk, which is sometimes longer, sometimes shorter, as it may happen; which Berries are of a blackish green color, and rough or rugged on the outside, within which is contained Ash colored Seed; which if the Head is suffered to grow to be over-ripe, and be dried in the Sun, will fall out of themselves upon the Ground, and Spring again in their Natural places the next Year, by which means it constantly renews it self. These Berries when they are at their full Maturity, have within them, that is, between the outward Skin, and inner Kernel or Seed, a certain Juice, which being rubbed upon Paper or Cloth, at first appears of a fresh and lively Green color; but presently after changes into a kind of blewish Purple.

VII. The Places. These all grow in *Spain, Italy, France*, and other hot Countries; but the first and second thrive very well with us: The third with Care, is Manured in some of our Gardens: The last I had growing in one of my Plantations in *Carolina*, where I found it would grow and thrive as well as in *Spain or Italy*.

VIII. The Times. They all of them Flower about the Summer Solstice, or when the Sun enters into *Cancer* in their Native Places, and the two first with us; but the two latter scarcely bear any Seed here in *England*, by reason of the coldness of our Climate.

IX. The Qualities. These *Turnsols* are all of them hot and dry in the first degree; Absterfve, Astringent, Cardiack, and Alexipharmick.

X. The Specification. They are said to be Specificks against Fluxes of Blood, and of the Belly, Stinging of Scorpions, Bitings of the *Phalangium*, Poison, Stone or Gravel in the Reins or Bladder; Strangury, provoke the Courses, cause speedy and easie Delivery to Women in Travel; kill Worms, cure Agues and Fevers, give ease in the Gout, Inflammation of the Brain, the Bitings of Serpents, and all other Venomous Creatures; and being rubbed upon Warts, or other like hard Excrecences or Kernels, it is said to consume them by little and little, and to take them away, by often using the same.

XI. The Preparations. You may have therefrom, 1. *The Juice of the Green Herb or Plant.* 2. *The Simple Decoction in Wine.* 3. *The Compound Decoction.* 4. *The Seed.* 5. *The Cataplasme.* 6. *The Turnsole Clouts.*

The Virtues.

XII. The Juice of the Green Herb or Plant. It is said to purge Choler and Flegm; and given to one or two Spoonfuls in Wine, it is good against the Stinging of Scorpions, the bruised Herb being also applied to the part hurt. It kills Worms in the Belly, both long and round; and is good, being mixed with a little Salt, against Warts, Wens, and hard Kernels, they being often Bathed therewith, and the Green Leaves being bruised, being applied thereto.

XIII. The Simple Decoction in Wine. It has all the former Virtues, being given to half a Pint, and it may be given either alone, or mixt with an equal quantity of White Wine.

XIV. The Compound Decoction. It is made by boiling the Herb with *Cumin-Seed, Hyssop, Creses, and Sal Nitre in White-Wine.* It is good against the Stone in the Reins and Bladder, as also against Sand, Gravel, and Tarrarous matter in those parts; kills Worms of all kinds in the Bowels, and cures Tertian and Quartan Agues; Dose

half a Pint as aforesaid; besides which, it has all the Virtues of the Juice aforesaid. If the Decoction is made of the *Dying Turnsole*, it is said to be good against all Venomous Creatures, but chiefly against the Biting of the Spider *Phalangium*, as also the Stinging of Scorpions; the bruised Herb being also applied thereto.

XV. The Seed reduced into Powder. It may be given from a Scruple to two Scruples or more, in any convenient Vehicle at Night going to Bed. It kills Worms in the Stomach and other Bowels; and being taken also every Night constantly, and also 3 Hours before the coming of the Fits of Tertian and Quartan Agues, it is said to cure them.

XVI. The Cataplasme of the Green Leaves. It is good against the Stinging of Wasps, Hornets, and Scorpions, the bitings of the *Phalangium*, Viper, and other Serpents; and prevails against the Gout in any part, or any place much pained; as also the Disease called *Syriasis*, which is an Inflammation of the Head, or parts about the Brain; in all these cases it gives ease after a singular and admirable manner; and being often and continually applied for some time, it perfectly cures them.

XVII. The Turnsole Clouts. These are they which are Sold in our Druggists Shops for *Turnsole*, being nothing else but old Rags dipt into the Juice of the full ripe *Turnsole Berries*, of the fourth Species, that which is commonly called the *Dying Turnsole*. The Juice of these Berries without doubt is Cordial, and cheers all the Spirits Natural, Vital, and Animal; but no other use is made of it, or of these *Turnsole Clouts*, but only to turn White Wines into Claret, or a Claret color, and to color Tarts, Sweet-Meats, Gellies, and such other like things into a Glorious red color. But when one considers, that these *Turnsole Clouts* are old Shifts, Shirts, Smocks, Drawers, old nasty Stockings, coming off from Poor, Mangy, Leprous, and Scabby Creatures, who have worn them several Weeks, yea Months, and sometimes till they have rotted off from those Wretched, Diseased Creatures Backs; and that unwasht, or so foul and filthy as they are, they are dipt into this Glorious and Precious *Turnsole Juice*, which is so dried upon them; it would make not a Nice, but even an Ordinary and Rustick Stomach, loath to touch them, much more to abominate the Wine, Tarts, Gellies, &c. which are colored with them: However I leave the matter to every ones Appetite, to dispense with it according to their several likings. As for my own part, I could never yet bring my Mind to the least using thereof, scarcely to the touching of those Filthy Rags or Clouts, without a detestation and abhorrence of them in the last degree: But as I find them, so I leave them, and remit their use to every ones Discretion, and to gratifie the Stomachs and Appetites of those who make no scruple of such a kind of Nastiness.

C H A P. DCCXVIII.

of TUTSAN; Or Park-Leaves.

I. THE Names. It is called in Greek, *Ἀνθίσκος* (*à Sanguine Humano cui come succus assimilatur.*) Galen says it is of two sorts, the one called *Dionysias* by some; the other *Aseyrium*, or *Aseyroides*, i. e. *Peters Wort*, of which we have already discoursed in its proper place, viz. Chap.

Chap. 560. atoregoing. The first, which is that we treat of in this Chapter, is called in Greek as aforeaid; and in Latine *Androsamon*, or *Androsenum* from the Greek; and in English, *Tutsan*, or *Park-Leaves*; because it is so common or familiar in Groves, Woods and Parks, that it grows almost no where else.

II. The Kinds. The most usual with us are, 1. *Androsenum vulgare*, *Androsenum Camerarij*, *Dodonai*, *Gesneri*, & *Lugdunensis*; *Androsenum Dioscoridis*, *Galen*, & *Plinij*, *Casalpino*; & *Cenaria Theophrasti*, tho' *Lobel* in *Adversaria* denies it, and says it is the *Clymenum Itolorum*, as *Anguilaria*, and *Custor Durantes* also say; and that it is also called, *Herba Siciliana*, because they thought it grew naturally no where but in Sicily. *Androsenum maximum frutescens Baubini*, *Androsenum majus Camerarij*, Our common *Tutsan* or *Park-Leaves*. 2. *Androsenum Matthioli*, *Fuschij*, *Lacune*, *Cordi*, *Gesneri*, *Androsenum minus Camerarij*, *magnum Lobelij*, & *excellentius ejusdem*, (because that he thought that the former or fifth, was not worthy of the Name of *Androsenum*;) *Dodonaeus* will have it to be *Ruta Sylvestris Dioscoridis*, and therefore calls it *Ruta Sylvestris Hypericoides*, because *Dioscorides* says, that *Ruta Sylvestris* was called *Hypericon*, by some in his time: *Parkinson* takes it to be *Hypericon secundum Tragi*, and the *Androsenum Campoclaresse Columne*; *Androsenum alterum solijs Hyperici Baubini*, quod aliquibus *Hypericoides*, The *Tutsan* or *Park-Leaves* of *Matthiolus*, also *Johns-wort Tutsan*. 3. *Androsenum alterum apulum Columne*; *Androsenum persolitum* & *perforatum Baubini*, the *Tutsan* of *Naples*.

The Descriptions.

III. The first, or our common *Tutsan*, or *Park-Leaves*. Its Root is brownish, something great, hard and woody, spreading it self well in the

Tutsan, or Park-Leaves.

Ground. It rises up with Stalks which are brownish, shining and round, (not square, like those of *Alcyum* or *Peters-Wort*.) crested all their whole length, rising to be two, and sometimes 3 Feet high, and spreading out into Branches, even from the bottom; but more thinly set, each being farther offunder, having divers Joints, and at each of them two fair large Leaves, standing but more thinly set than of the other sorts, of a dark blewish green color on the upper side, and of a yellower green underneath, turning reddish towards Autumn, but abiding on the Branches all the Winter. At the tops of the Stalks and Branches, stand larger yellow flowers than in *Hypericon* or *Alcyum*, and Heads or Berries with Seed, which is likewise larger; which being green at first, and afterwards reddish, turn to be of a blackish Purple color when they are through ripe, with small brownish Seed within them; and then yield a reddish Juice, of a reasonable good Smell, something Resinous, and of an harsh or Styptick Taste, as the Leaves and Flowers also be, tho' much less in that Qualification: Gerard says, that the Juice pressed out of the Leaves is like *Claret-Wine*; but *Parkinson* denies it to yield a Liquor of such a high pure redness.

IV. The second, or the *Tutsan*, or *Park-Leaves* of *Matthiolus*, or *Johns-wort Tutsan*, unless you would call it *Alcyum magnum*, Great *Peters-Wort*, because

Tutsan of Matthiolus:

OR,

Tutsan Johns-Wort.

this is so like it. It has a brownish, long, slender, fibrous Root, which is Perennial, and sends up round brownish Stalks, (whereas the Stalks of *Peters-wort* are square, tho' accidentally they are sometimes found to be round,) which have two Leaves at every Joint,

Joint, fuller of Branches, but otherwise very like to Hypericon or Johns Wort; but the Branches are thinner set with Leaves, much smaller and greener than those of the former Tutſan, but greater than those of Hypericon, without any perforations or holes at all in them. The Flowers are yellow, and greater than they, and so are the Heads or Berries with Seed, but spotted with black Streaks on them: The Leaves and Flowers both, do give a red Juice, like to that of Hypericon or Johns wort, by which it may be plainly known, as also distinguished from our common Tutſan before described. The Stalks dye and perish upon the coming on of Winter.

V. *The third, or Tutſan of Naples. Its Root is fibrous and reddish, which sends forth reddish or brownish round Stalks, not much above a Foot high, with two crested Strakes like Films all their whole length; it is full of Branches, and more bushy than the last, but grows not so tall as it, having two Leaves growing at every Joint, so closely joined thereto at the bottom, that the said Stalks or Branches, seem to run through them; yet are lesser than the last described of Matthioli, are sharp pointed, of a fresher green color, and smooth on the upper side, but white underneath, and having many small holes therein, so small as scarcely to be perceived; and for the most part are greater and broader towards the tops, than they are below: The Flowers at the tops of the Branches, are of a paler yellow color, and many more set together than in the other; whose green Husks wherein they stand, have blackish Spots on them, which so abide when the Heads are full of Seed. Both Leaves and Flowers yield a reddish or bloody Juice (as the others do,) being bruised between ones Fingers.*

VI. *The Places.* The first grows in many Groves, Woods, Forests, Parks, and Woody-places, and by Hedge-sides in many parts of England; as by Raily in Essex, in the Woods of Kent, Hampstead-Wood, and many other places. The second is found growing about Bristol and Bath, and several other parts of the West-Country. The third is a Native of the Kingdom of Naples, but with us is only Nurſt up in Gardens.

VII. *The Times.* They all Flower later than Hypericon or Ascyrum: They all Flower in July or August, the Seed or Berries, in the mean time growing ripe. The Leaves become red in Autumn, at which time their red Winey Juice may be press'd forth.

VIII. *The Qualities.* Tutſan is hot and dry in the first Degree, Absterſive, Astringent, Vulnerary, and Cathartick.

IX. *The Specification.* It seems to have all the Virtues of Hypericon and Ascyrum, viz. Johns and Peters-Worts; is good against the Gout and Sciatica, heals Burnings by Fire, stops the Bleeding of Wounds, heals speedily all simple Wounds, also Ulcers and Fistula's.

X. *The Preparations.* You may have three from, 1. A Liquid Juice or Essence from the Leaves, Flowers and Berries. 2. An Infusion of the same in Water or Wine, done as Thea is made, and to be drank in the same manner. 3. A Powder of the Seed. 4. A Wound Drink. 5. A Balsam or Oil. 6. A Cataplasm of the fresh Herb.

The Virtues.

XI. *The Liquid Juice or Essence.* Two or three Spoonfuls of it given in Barabar, or other Styptick red Wine, stops all sorts of inward Bleeding in the Viscera, whether proceeding from inward Wounds,

or opening of the Mouths of the Vessels, or any other cause whatsoever; as Spitting and Vomiting of Blood, the Bloody-Flux, Pissing of Blood, and the Overflowing of the Terms in Women, or of the Loches in Child-Bed. It has many other good Properties also, and is profitable against Agues and Fevers, and stops all sorts of Fluxes of the Bowels; and is of excellent use in curing a Gonorrhæa, Universals being premised.

XII. *The Infusion in Water, &c.* It is made as Thea, and drunk with a little double refined Sugar, in the same manner. It has all the former Virtues, (but weaker) pleases and gratifies the Stomach, and also strengthens it, and all the other Bowels; besides which, it is of good use in stopping Catarrhs.

XIII. *The Powder of the Seed.* It is very Absterſive, and purges Cholerick Humors as Dioscorides says: And being taken to two Drams in Honey'd Water, Mead, or New White-Port Wine, it is a singular Remedy against the Sciatica and Gout, and other like Rheumatick pains; being also applied to green Wounds, it presently stops their Bleeding.

XIV. *The Wound-Drink.* Take of the Infusion of the Leaves, Flowers and Berries, some of them, or all of them, in Wine, or in half Water half Wine, a quart: Of the Liquid Juice or Essence a Pint, of Spirit of Wine 2 Ounces, Honey, enough to give it a pleasing Sweetness; mix and dissolve. It is a good Wound-Drink, being taken inwardly, (to half a Pint at a time) Morning, Noon, and Night, Outwardly used also as a Lotion, it cleanses Wounds, Ulcers and Fistula's, and induces their speedy Healing.

XV. *The Balsam or Oil.* The Oil is made exactly as Oil of Hypericon, in Chap. 405. Sect. 14. 15. The Balsam, as that at Sect. 16. of the same Chapter. Or thus: Take of the Simple Oil two Pounds; Balsam of Peru a Pound; Chio Turpentine half a Pound: melt, and mix all very well together, and then add Chymical Oil of Oranges six Ounces: mix them; and continue to stir them till nearly cold. It has all the Virtues of the Simple and Compound Oils, and is excellent for any Pain or Grief proceeding from cold and moisture, Overstraining of the Joints, Weakness of any other parts, Contusions, Burnings, Punctures of the Muscles, Nerves and Tendons; or any Wound, Hurt, or Ulcer, whether inward or outward, few other Medicaments being superior to it. Dose inwardly from a Dram to two Drams, drinking a Glass of Styptick red Wine after it.

XVI. *The Cataplasm of the fresh Leaves.* It cures Burnings and Scaldings, and applied upon fresh made Wounds, it stops their Bleeding, more especially if the Powder of the dyed Herb or Seed be first plentifully strewed upon them, and then it quickly heals them. Gerard says, that being laid upon Broken Shins, and Scabby Legs, it heals them; as also many other Grievs of like kind.

TWA-BLADE, see Bifol, Chap. 67.

TWO-PENNY-GRASS, see Money-Wort, (Chap. 496.

C H A P. DCCXIX.

Of VALERIAN Garden:

O R,

SETWALL.

I. **T**HE Names. It is called in Arabick, *Fu*: in Greek *ῥῆ*, *ῥ* *Nard* & *ἀγρία*: in Latine, *Thu*, *Nervus agrestis* vel *Sylvestris*; also *Valeriana*, & multa quibus valet facultatibus.) Some call it *Thericaria*, because it is a great Ingredient in *Treacle* and *Mulbricate*:) also *Herba Benedicta*; and by *Paracelsus*, *Terdina*: in English, *Valerian*, or *Setwall*.

II. *The Kinds.* Authors make many Species of this Plant; we divide it into 1. *Valeriana Hortensis*, Garden, of which in this Chapter. 2. *Valeriana sylvestris*, Wild, of which in the next. Of the Garden Kinds, these following are the chief which grow with us, viz. 1. *Thu majus Hortense*, *Valeriana major Hortensis*, Our great Garden Valerian or Setwall. Setwall is also a Name given to *Zedoary*, an Exotick never known to grow in our cold Climates, of which we shall (God willing) particularly discourse in the second Book of this Herbal. 2. *Thu minus*, *Valeriana minor Hortensis*, The lesser Garden Valerian, or Setwall. 3. *Valeriana rufa Dodonæi*, *Camerarij*, *Thu Peregrinum Camerarij*; *Ocimostrum Lobelij*; *Valerianum*, *Polemonij altera species Gesneri*; *Red Valerian*. 4. *Valeriana Græca Dodonæi*; *Valeriana Peregrina Camerarij* & *Lobelij*, *Valeriana Ceruicia haubini*, Greek Valerian. 5. *Valeriana minor Annua*, *Valeriana Peiræa*, Small Rock, or Annual Valerian. 6. *Valeriana Cretica Tuberosa*; *Nardus Cretica Belli*, (because the Roots have the Smell of *Nard*, tho' the whole Form of the Herb is most like a *Valerian*;) *Tuberous Valerian* of Candy. 7. *Valeriana Indica*, *Valeriana Mexicana*; *Tripolium Dioscoridis Cortuso*, Indian Valerian.

The Descriptions.

III. *The first, or our Great Garden Valerian, or Setwall.* It has a Root about an Inch thick, short and grayish, lying for the most part above Ground, (in which particular, our Figure here is defective) shooting forth a Sloop under the upper part of the Earth, and shooting forth on all sides such small pieces of Roots, which have all of them many long and great Strings and Fibres under them, by which it is fastned to the Earth, and by which it draws its Nourishment: This Root is of a pleasant sweet Smell when it is broken, and smells sweeter and more strong than either Leaf or Flower, and is of more use in Medicine. From the Heads of these Roots, spring up many green Leaves, which at first are something broad and long, without any division at all in them, or denting on the edges: But they that rise up afterwards, are more and more divided on each side, some to the middle Rib, being in a manner Winged, as if many Leaves were growing together on a middle part; and those growing also in the Stalk it self, are more divided, but smaller towards the top than those which grow below. The Stalk rises to be about a Yard high or more, sometimes Branched at the top, repleat with small

Valerian Garden, Great.

whitish Flowers, which are sometimes doped over at the edges with a pale purplish color, having but a weak Smell, they being past away, there follows small browrish white Seed, that is easily carried away with the Wind. *Camerarius* says, there is a Mountain Kind of this Species, found in Savoy, which is more sweet than this, smelling not much unlike to a full ripe Citron, and is more soft or gentle in feeling than this is.

Valerian Garden, Small.

IV. The

VI. The second, or lesser Garden Valerian. The Roots of this are long and small, and very full of Fibres or white Threads, smelling like to the small Wild Valerian. It is in its Growth and Leaves very like unto the last, but much smaller, having its Leaves divided much in the same manner; the lowermost at bottom of the Stalk being without any division at all in them. The Stalks are not above half the height of the other, bearing small Tufts of whitish purplish Flowers.

V. The third, or red Valerian. Its Root is great, thick, and white, continuing long, and shooting out new Branches every Year. It has several hard, whitish, brittle green Stalks, full of Tuberous or Swelling Joints, at which stand two Leaves one on each side, and now and then some small Leaves from between them, which are somewhat long and narrow, broadest in the middle, small at the lower end, and sharp pointed, of a pale green color, and without any Division or Dent on the edges. The Stalks are 3 or 4 Feet high, branched at their tops; at the ends of which, come forth many Flowers together, something like to the Flowers of the first, or our great Garden Valerian, but with longer Necks, of a fine red color, without any of the Valerian Smell. After the Flowers have stood blown a good while, they suddenly fall away, and the Seed which is small and naked, with a little Tuft of Down at the top thereof, (whereby it is easily carried away with the Wind,) ripens quickly after.

VI. The fourth, or Greek Valerian. Its Root consists of a number of small, long, blackish Fibres or Threads, without any of the Valerian Scent. It

to many small Branches full of flowers, each consisting of five small round pointed Leaves, of a fair, bleak, blew color in some Plants, and in others white, with some white Threads tipped with yellow Pendants in the middle. After the Flowers are past, there come up in their places, small, hard Heads, containing small blackish Seed.

VII. The fifth, or small Rock, or Annual Valerian. Its Root is small, slender and fibrous. Its Stalk is straight, not rising above a Foot high, dividing it self into Branches towards the top, and that always by couples. The bottom Leaves are whole, long, and a little roundish pointed. The

Valerian Rock :

OR,

Annual Small Setwall.

Valerian Greek.

has many Winged Leaves lying on the Ground, something like to the Wild Valerian, which grows by Ditch sides, but more tender and small; from among which, rise up two or three round, hollow, brittle Stalks, two or three Feet high, on which are set at the Joints, such like Leaves as grow below, but smaller: The tops of the Stalks are divided in-

higher Leaves are deeply notched or dented on both edges. The Flowers are small, of a whitish purple color, consisting of five round pointed Leaves, upon round rough Heads, which when the Flowers are fallen, become Star fashion'd, divided into five parts.

VIII. The sixth, or Tuberous Valerian of Candy. The Root in its upper part is roundish, short and Tuberous; from whence shoot forth round about it small long Strings, each of which having at its end, a small longish round Tuberous Root, fastned to the same, not much unlike to the manner of Filipendula Roots, whose Smell is very much like to that of our first great Garden Valerian, before described. The first Leaves which Spring up from the uppermost great Tuber, lye upon the Ground round about the same, and are green, thick and round, like to the Leaves of Alarabacca, and sometimes greater. The next which come after them are longer, and much divided or cut in on the edges; and those which yet follow, are more and more divided; so that those which grow upon the Stalk, are very like

the divided Leaves of our first, or great Garden Valerian. The Stalk is hollow, and rises up to be about two Feet high or more, having here and there two smaller Leaves set at a Joint. At the top whereof, which is divided into some smaller Branches, stand many white Flowers in an Umbel, thick set together, somewhat larger than those of our first Garden kind, which turn afterwards into small flat Seed, with a little Down at the Head thereof.

IX. The seventh, or Indian Valerian. Its Root is small and stringy, perishing every Year, with the first Frost. It quickly grows up into a Stalk; from the first Leaves which spring up, which are but few, next the Ground, something long and broad, and somewhat like unto the first Leaves of the Mountain Spicknard, of a pale green color. The Stalk is weak and hollow, not standing upright, but leaning or bending downwards, set with some Joints, at which stand two long Leaves, like to those below, but a little more curved on the edges: And at the Joints grow forth also two Branches sometimes, on each side one; and sometimes but one branch on one side, which are divided, and at the tops do send forth many Flowers, set thick together, in an Umbel or Tusi, each of which is somewhat long, and ends in five divisions, two of the uppermost whereof are broader and shorter than the rest, the other two hanging down as Labels or Lips, and the fifth Leaf which is the greatest, standing in the middle: In some Plants, this Flower whilst in its Bud, is of a deep red or purple, and of a pale purple color being open; whilst in some others, it is of a Milk white. Each of them stand in a small green Husk, in which after the Flower is fallen, is a Head which contains the Seed, which opening of it self, sheds its Seed on the Ground, if not (when it is ripe) carefully tended and gathered; which is spongy, rounder, bigger, and blacker than any of the other Valerians, and without any Down at its end. The whole Plant is utterly without any Smell, and almost without any Taste.

X. The Places. The first is said by Dioscorides to grow in Pontus, and is found growing in the wet Grounds of Mountains, and other moist places, and is a common Herb in our Gardens, as also the second. The third and fourth, as also the fifth, are Garden Plants with us, nor do we know any other Natural places of their Growth. The seventh is said to come from Mexico in the West-Indies; but it was first brought to us from Italy; and as Bauhinus says, that which bears the Purple Flowers, grows in that part of Italy called Latium, or the Country of the Latines; and in a place called Siculus, for which reason some have called it, *Valeriana Sicula*; but that with the white Flower in the Country of the Sabines, and is now with us a Garden Plant, being Nurst up by the more Curious. The sixth, tho' growing with us, is a Native of Candy.

XI. The Times. They all Flower in the Summer Months of June and July; and the Indian kind, if it is Planted early, will Flower early, and continue Flowering, till the Frosts put a check to it.

XII. The Qualities. As the Roots are chiefly used, to the green or fresh Roots, are said to be temperate in respect of heat or cold; but being dried, are hot and dry in the first degree, Aperitive, Diuretick, Absterfive, Vulnerary, Nephretick, Cardiack, Alexipharmick, and Emmenagogick.

XIII. The Specification. Valerian is good against the Stone, Sand, Gravel and Strangury, Poison, Plague, yellow Jaundice, Wounds, Ulcers, and the like.

XIV. The Preparations. You may make therefrom, 1. A Liquid Juice or Essence of the Herb and Root. 2. A Decolition Simple. 3. A Decolition Compound. 4. A Pouder of the Root. 5. A Balsam. 6. A Cataplasm. 7. A Distilled Water. 8. A Spirituous Tincture of the Root. 9. An Acid Tincture of the same. Where note, that the first Garden kind is most used; and some say that the lesser kind is strongest, and most efficacious.

The Virtues.

XV. The Liquid Juice or Essence. They warm and comfort the Stomach and Bowels, provoke Urine, and are profitable against the Strangury; are good against Pleuritic pains, and pains of the Hypochonders, resist Poison, and provoke the Terms in Women. Dose 2, 4, or 6 Spoonfuls, taken Morning and Night in a Glass of Generous Wine: It kills Worms in the Stomach and Belly.

XVI. The Simple Decolition. It provokes Urine plentifully, helps Obstructions of the Stomach and Lungs; is good against the Stinging or Bittings of Poisonous or Venomous Creatures, as also the Malignity of any Pestilential Disease, yea, of the Plague it self. Matthiolus says, that the Decolition of the Root of the Lesser Valerian, is more potent in resisting Poisons, or Infections of the Plague, than the greater. In cases of Poison and Infection, it is best made in Wine. This is generally called in England, the Poor Man's Remedy, after taking a great Cold to drink it, and Sweating after it; as also to dispel Wind, and ease the Cholick: dropt into the Eyes, it clears the Eye-sight.

XVII. The Decolition Compound. Take Roots of Valerian 8 Ounces, Raisins stoned 6 Ounces, Liquorice bruised or scraped, 2 Ounces, Aniseeds bruised one Ounce, Wine two Quarts; boil till a Pint is consumed, strain out and keep it for use. It is good against Asthma's, Coughs, Cold, difficulty of Breathing, Hoarseness, Wheezings, and other Distempers of the Lungs, opening the Passages, and causing an Expectoration of the Morbifick matter.

XVIII. The Pouder of the Root. Galen says, that it is like to Nardus, or Spicknard in quality, and for all the same purposes, but much weaker; yet it provokes Urine more plentifully than either the Indian or Syrian Nardus; and therein is like unto the Celtic Nardus. Pliny says, that the Pouder given in Drink, or in the former Simple Decolition in Wine, does help all Obstructions of the Stomach and Lungs, or of any other part; as also pains of the Plicura, Hypochonders and the like; and it is given in the Colick and Stone, or Strangury, or Obstructions of the Terms; against the Plague, and all sorts of Pestilential Fevers, Poison, and the Stinging or Bittings of Venomous Creatures; and has all the Virtues of the Juice, Essence, and Simple Decolition foregoing. Dose to one Dram in Wine, or some proper Vehicle.

XIX. The Balsam. It is good to cure green Wounds, as also old Ulcers, the Sores being first washed either in the aforementioned Simple Decolition, or the Spirituous Tincture following. It also cures Filicula's, if Pouder of Tobacco Leaves be mixed with it.

XX. The Cataplasm. It is made of the Green Herb with the Root, by beating in a Mortar. Being applied to the Head, it eases the Head-ach, and the vehement Shooting therein; stops Catarrhs and Rheums, or thin Defluxions of Humors. It is good to heal Cuts, Wounds or Sores, as also simple

Contu-

Contusions, and to draw Splinters or Thorns out of the Flesh. And is profitably applied to the Swellings of the Cods from Cold or Wind, being applied to them, after fomenting with the *Simple Decoction*.

XXI. *The Distilled Water from Herb and Root, of the greater Valerian in May.* It has all the Virtues of the *Juice, Essence, and Simple Decoction*. Mixt with the *Juice or Essence*, and so taken, it is more effectual, and is a preservative against the Pestilence or Plague when that Disease reigns; so also taken, it kills Worms in the Belly, and the same mixture dropt into the Eyes, it takes away the Dimness of Sight, or any Pearl, Haw, Web, or Film therein. And if therewith green Wounds or old Ulcers be washt, it induces their speedy healing.

XXII. *The Spirituous Tincture.* It strengthens and fortifies the Stomach, and prevails against the Colick, Palpitation of the Heart, Fainting Fits, Sicknes at Stomach, and the like. Dose half a Spoonful to one Spoonful, in a Glass of Wine.

XXIII. *The Acid Tincture.* It is a Specifick against the Plague or Pestilence, and all other malign Fevers and Diseases; strengthens and fortifies the Stomach, cause a good Appetite and Digestion, and resists Poison. Dose 50 drops or more, in a Glass of Wine, or Wine and Water.

C H A P. DCCXX.

of VALERIAN Wild.

I. *THE Names.* It is called in Greek, *αἰ-ἀ-ριον*; in Latine, *Pha Sylvestre, Valeriana Sylvestris*; *Valeriana Palustris*; in English, *Wild Valerian*.

II. *The Kinds.* There are two sorts thereof, viz. 1. *Valeriana Sylvestris major*, The greater Wild Valerian. 2. *Valeriana Sylvestris minor*, The lesser Wild Valerian.

Valerian Wild, Greater.

The Descriptions.

III. The first, or greater Wild Valerian. Its Root is slender, with a Bush of whitish Threads or Strings, which send forth other Fibres or Threads of increase; besides which, the lower Branches do shoot forth Fibrous Roots also. It rises with a Stalk and several Winged Leaves, of which, the end Leaf is the largest, of a sad green color, with few or almost no dents on the edges; the Stalk has two such like winged Leaves at every Joint, as grow below, but smaller; and at the top branched into Heads or Umbels of small whitish Purple Flowers, but deeper than those of the first, or Great Garden Valerian.

IV. The second, or lesser Wild Valerian. Its Roots are slender, growing a-slope, creeping, and full of fine small Threads, having but little Smell. It much resembles the former in its Stalk, winged Leaves, Flowers, and manner and form of growing, but far less. Besides, the first Leaves there-

Valerian Wild, Small.

of are single, whole and undivided; whilst the others which come forth after upon the Stalks, are winged, and exactly like the former, yet much less. The Stalks are not much above a Foot high, on whose tops grow spiky rundles of Flowers, like the first, of a light whitish purple color.

V. *The Places.* They both grow in Marshes and wet Meadows, by Rivers and Waters sides, Watery Ditches and Ponds, in many parts of England; but the greater kind for its usefulness, is now brought into Gardens, and Nurt up there, where it flourishes very well; whilst the lesser will scarcely

scarcely admit of such a Transplantation, nor thrive at all there, unless it be a very moist or watery Ground.

VI. *The Times.* They both Flower in *June, July* and *August*, viz when the Garden kinds also do.

VII. *The Qualities, Specification, Preparations and Virtues* of these, are by Authors accounted to be the same with those of the Garden kinds in the former Chapter.

VIII. *Nota 1.* *The Juice of the Wild Valerian* is held by later Herbarists, to be good for such as are troubled with Ruptures, or broken Bellies, and such as are afflicted with Cramps and Convulsions; and to cure simple Conrusions occasioned by Falls, Bruises and the like. Dose 3 or 4 Ounces, Morning and Evening, in a Glass of Wine.

IX. *Nota 2.* *The Powder of the Roots of either the greater or lesser kinds.* If it is given to a Dram at a time in any convenient Vehicle, especially in White Port Wine, it is said to cleanse the Stomach and Bowels of Stinny, Acrimonious, and Filthy Humors, by Purging them away both upwards and downwards.

VENUS-BASON, see Teasle, Chap. 686.

VENUS-COMB, see Shepherds Needle, Ch. 630.

VENUS-LOOKING-Glass, see Corn-Violet, (Chap.

CHAP. DCCXXI.

of VERVAIN.

I. *THE Names.* It is called in Greek, *ἱερὸν κορίνθιον*, i. e. *Herba Sacra*; and *Περὶστεριον*, *Peristereon*: in Latine, *Sagminalis Herba*, *Matricalis*, *Columbaria*, *Columbaris*, *Columbana*, *Exupera*, *Martialis*, *Herculania*, *Ferraria* and *Verbenaca*; but the most usual Latine Name for it is, *Verbena*, quasi *Herbena*, i. e. *Herba bona*: in English, *Vervain*.

II. *The Kinds.* We shall treat of but three sorts, viz. 1. *Verbena vulgaris*, *Verbena mas*, *Verbena recta*, Common Male, or upright Vervain. 2. *Verbena peregrina*, *Verbena Fœmina*, *Verbena supina*; Foreign, Female, or bending down Vervain; and this sort all Authors call the Female kind. 3. *Verbena Peruana*, *Verbena Americana*, *Verbena Caroliniana*, (which I so call, because I found it thrice in some parts of the South Carolina) American, or Peruvian Vervain.

The Descriptions.

III. The first, or our Common Male, or upright Vervain. Its Root is small, long and stringy, and of little or no use. It has divers somewhat long and broad Leaves next the Ground, deeply gashed towards their bottoms; the other parts being deeply dented about the edges; and some of them only deeply dented, or cut all alike, of a blackish green color on the upper side, and grayish underneath. The Stalk is square, and spread out into divers Branches, rising up about 2 Feet high, (especially

VERVAIN.

if you account therewith, the long Spikes of Flowers at the tops,) which are set on all sides thereof, one above another, and sometimes two or three together, being small and gaping, of a purplish blew color, with white intermixt; after which, come small round Seed, in small and somewhat long Heads.

IV. The second, or Foreign Female, or bending down Vervain. The Root is altogether like the former, perishing after Seed time: It has divers smaller and weaker square Stalks, leaning or bending down towards the Ground, and some of them almost lying thereon, not standing so upright as the former; spread out into many more smaller Branches, and having such like Leaves growing on them as the several Joins, but much smaller, and more divided or cut in, making them seem to be so many Leaves set on both sides the middle Ribs, of a grayish green above, and more gray underneath. The Flowers grow in the same manner which the others do, in small long Spikes, being of a deeper blew color than the other, otherwise in Form not unlike. The Seed which follows is like it also, and falling of its own accord, raises it self of its own Sowing.

V. The third, or American, or Peruvian Vervain. This in its Roots, Stalks, Leaves, flowers, and manner of growing, is much like unto the last, but grows greater, and abides green in Winter, as well as Summer, in its own Native Place of Growth; but with us, it will not abide our cold Winters, but perishes by the Unnaturalness and Frigidity of our Climates.

VI. *The Places.* The first grows Wild generally throughout all England, by Hedges and High-ways sides, in Borders of Fields and other waste Grounds. The second is no wild Plant with us, but is Nisht up in Gardens. The last is a Native of America, as in Peru and Carolina, in the South of which, I found it in three several parts.

VII. *The*

VII. *The Times.* The first Flowers about July, and the Seed is ripe in some small time after. The second will not endure a Winters Blaft before it Seeds with us; and therefore seldom Flowering before Winter, it scarcely brings its Seed to perfection here. The third Flowers in America in July and August.

VIII. *The Qualities.* *Vervain* is hot in the first degree, and dry in the second: Aperitive, Absterfive, Anodyn, Diuretick and Vulnerary; Pulmonic, Nephritick, Arthritick, and Alexipharmick.

IX. *The Specification.* It is good against *Althma's*, Coughs, Colds, Wheezings, Hoarseness, Bittings and Stinging of Serpents, mad Dogs, Hornets, Scorpions, and other Venomous Creatures: It prevails against the yellow Jaundice, Dropsy, Gout, Strangury, Obstructions of the Reins and Bladder, the Colick, and all other inward Pains and Torments of the Bowels. It kills Worms in Stomach and Belly, prevails against Tertian and Quartan Agues, all sorts of malign Diseases, and the Plague or Pestilence it self. It stops Bleeding whether inward or outward, consolidates and heals Green Wounds as also old Ulcers and Fistula's, whether in the Mouth, Throat, Secrets, Arms, Thighs, Legs, or other parts of the Body. It abates Inflammations, takes away Deformities of the Skin, cleanses and clears the Eye-sight.

X. *The Preparations.* You may make thereof, 1. *A Liquid Juice.* 2. *An Essence.* 3. *A Decolion in Wine or Water.* 4. *A Lotion.* 5. *A Powder.* 6. *A Balsam.* 7. *A Cataplasim.* 8. *A Distilled Water.* 9. *A Spirituous Tincture.* 10. *An Acid Tincture.* 11. *An Oily Tincture.* 12. *A Liquid Juice of the American.*

The Virtues.

XI. *The Liquid Juice.* It is drying, bitter and binding, an opener of Obstructions, cleansing and healing: It cures the yellow Jaundice, Dropsy and Gout, opens Obstructions of the Lungs, Liver, Spleen, Reins, Mesentery and Bladder; gives ease in the Click, and all inward Pains and Torments whatsoever. It is good against the Bittings and Stingings of Vipers, and other Serpents, mad Dogs, Hornets, Scorpions, *Taramula's*, and other Venomous Creatures; prevails against the Plague or Pestilence, and all other malign Diseases; cures Tertian and Quartan Agues, and kills and expels Worms out of the Stomach and Belly; causes a good Color in the Face; is effectual against the Diseases of the Stomach and Lungs, as Fainting, Swooning, Loathing, want of Appetite, Indigestion, Coughs, Colds, *Althma's*, Wheezing, shortness of Breath, difficulty of Breathing, and other like Diseases of those Parts. Dose 2 Ounces, more or less, Morning and Night, in White Port or Lisbon Wine, or Honeyed Water.

XII. *The Essence.* It has all the former Virtues, and more effectual to all the same purposes and intentions; besides which, it is good against the Dropsy, as also against the Stone, Gravel, Sand and Tartarous Mucilage in the Reins and Bladder, cleansing them of all sorts of viscous matter which may generate the Stone. It consolidates and heals all simple green Wounds and Ulcers, Fistula's, and other like Sores in the Mouth, Throat, Secrets, Legs, and other parts, they being washed therewith. Applied with Oil of *Roses* and Vinegar, to the Forehead and Temples, it eases their inveterate Pains, and is good for such as are fallen into a Frenzy. Dose from one Spoonful to two, to be taken in the like Vehicle and manner as the former.

XIII. *The Decolion of the whole Herb in Wine or Water.* It has all the Virtues of the Juice and Essence, but as it is weaker, so it must be given in much larger quantities, as from a quarter to half a Pint, sweetned with fine Sugar.

XIV. *The Lotion.* Take a Pint of either Juice or Essence, three quarters of a Pint of the Decolion; Honey 4 Ounces; mix and dissolve. It cures Wounds and Ulcers both external and internal, whether in the Stomach, Guts, or Mesentery; stops Bleeding, and outwardly by washing therewith, heals simple green Wounds, old Ulcers, Fistula's, &c. in Mouth, Throat, Secrets, Arms, Legs, &c. it cleanses, dries, and quickly heals them.

XV. *The Powder of the Herb and Flowers.* It has the Virtues of the Juice and Essence, and may be given Morning and Night from half a Dram to a Dram and half, in any proper Syrup, or other fit Vehicle, which the Patient best likes. Outwardly strewed upon old putrid Ulcers, it cleanses and dries them, and induces their healing.

XVI. *The Balsam.* It is a singular Vulnerary, heals simple green Wounds almost upon the spot; and cleanses old running Sores, Ulcers and Fistula's, and in a short time after cures them. Applied also to the Gout, it gives ease in the same.

XVII. *The Cataplasim.* Made of the bruised green Leaves with some Vinegar, it eases Pains in any part, admirably cleanses the Skin, taking away Morpew, Scurf, Pimples, Freckles, and other like Deformities thereof.

XVIII. *The Distilled Water.* Dropt into the Eyes, it cleanses them from Mists, Clouds, Films, or other things which obfuscate the Sight, and very much strengthens the Optick Nerves; but it is much more effectual for this purpose, if it is mixt with an equal quantity or more, of the Juice or Essence atotegoing. The said Water, (but especially mixed with the Juice or Essence) is an excellent Absterfive, to cleanse and free the Skin from most deformities affecting the same. It heals green Wounds, cleanses and dries old running Sores, Ulcers, Fistula's, &c.

XIX. *The Spirituous Tincture.* It has the Virtues of the Juice and Essence, and gives ease in the Piles, they being bathed therewith. Dose one Spoonful in a Glass of Wine.

XX. *The Acid Tincture.* It is given in the Plague or Pestilence, as also in all malign and pestilential fevers: Dose so many Drops as to give the Vehicle a pleasing Acidity, to be often repeated in the Day.

XXI. *The Oily Tincture.* It is good against the Stone and Gravel in Reins and Bladder, the Strangury, and all Obstructions, Pains and Diseases in those parts. Dose from 15 to 25 Drops, dropt into white Sugar, and taken in a Decolion of *Parisy* Roots.

XXII. *The Juice of the American Vervain.* *Monardus* says, that it goes far beyond either of the former: He says, that a certain Noble Woman in the *West Indies*, having used divers Physicians in vain, an *Indian Physician*, very skilful in Herbs, gave her the Juice of this *Vervain* to drink, with some Sugar mixed therewith, (to abate some of its bitterness) by the use of which, she voided in a few days, a thick long Worm, being hairy, about a Foot long, and forked at the Tail, after which, she grew well. The same Noble Woman, commended the same to another Woman in *Peru*, who had not been well of a long time, who having taken it in the same manner for several days, at length voided many small and long Worms, and among the rest, one very long, like unto a long white Girdle, after which she became well. And this

this very thing being given to many others, who complained in like manner, they were all soon Cured, by voiding their Worms more or less; and some by voiding Rouls or Balls of Hair, and other Heterogeneous things. It is held to be no less effectual against all manner of Poison, as also the Bittings of Serpents, and other Venomous Creatures. Many other great things Monardus speaks hereof, which such as please, may have recourse to the Author for the same.

C H A P. DCCXXII.

of VETCHES not bitter.

I. **THE Names.** The Vetch is called in Greek Βίη, Βίανος, Βίανος, & Βίανος: in Latine, *Vicia*, pl. *Vicia*; in English, the *Vetch* or *Tare*. But we make a distinction; for tho' all the Species are called *Vetches*, yet the Manured kinds are most commonly called *Tares*; and of those, both the Manured and Wild sorts of them, we have already treated in Chap. 683. and 684. foregoing; the other kinds more commonly called *Vetches*, remain to be treated of in this and the following Chapters.

II. **The Kinds.** Of these sorts of *Vetches*, we make two principal Species, viz. 1. *The Vetches not bitter*, of which we treat in this present place. 2. *The bitter Vetches*, of which we shall discourse in the Chapter next ensuing.

III. **The Kinds of Vetches not bitter.** There is a large Stock of these, many of which grow in Foreign Parts, and far distant Regions, which we possibly may not see in many Ages; of these Strangers we shall say nothing; but those of which we treat, shall be what are daily found growing Wild amongst us, or are otherwise Nurst up by the Curious in their Gardens, the chief of which are these following. 1. *Άραβίς*: in Latine, *Aphaca*, *Aphaca Sylvestris*, The yellow Wild Vetch. *Lugdunensis* takes it to be the *Οροβανς*, *Orobanche*; *Theophrasti*, lib. 5. cap. 22. *Cuscutum*; which grows amongst *Orobis* and strangles it. *Angulara* and *Camerarius* take it to be his *Pinus*, *Pinus*: *Lobel* calls it *Aphaca Dioscoridis*; and *Lugdunensis*, *Orobanche Legumen*, (because he acknowledges another *Orobanche*.) It is the *Elatine tertia Tabernemontani*, and the *Vicia lutea folijs Convolvulinis Bauhini*. 2. *Άστρογάλος*, *Astragalus*, Milk Vetch; it is also called *αστραγάλος* *Herbariorum*, *Astragalus Nothus*, *Bastard*, or base Milk Vetch. 3. *Ήδυσαν*, *Hedysarum*, *Securidaca*, *Hatchet Vetch*, which is of two kinds, first, *Hedysarum majus*, *Securidaca major vera*, The true greater *Hatchet Vetch*, or *Sicklewort*. 4. Secondly, *Hedysarum minus*, *Securidaca minor*, The lesser *Hatchet Vetch*. 5. *Έρριον Equinum majus Tabernemontani*, *Solca Equina Lugdunensis*, The greater *Horse-Shoe Vetch*. 6. *Έρριον Equinum minus*, The lesser *Horse-Shoe Vetch*. 7. *Ornithopodium majus*, *Pes Avis major*, The greater *Birds-Foot*, (so called from the form of the Pods.) 8. *Ornithopodium minus*, *Pes Avis minor*, The lesser *Birds-Foot*. 9. *Ornithopodium radice nodosa*, *Knotted Birds-Foot*. 10. *Anthyllus Leguminosa vulgaris Clusij*, *Anthyllus prior Dodonaei*; *Lagopodium Tabernemontani*; *Anthyllus Lentifolius Lobelij*, *Ambetica Saxorum Thalij*; *Vulneraria rustica Gesneri*, (because his Country-Men called it *Wundkraut*, *Wound-wort*;) *Loto affinis vulneraria pratensis*

Bauhini, Our common *Kidney Vetch*, 11. *Stella Leguminosa Lobelij*; *Vicia Sefanacea Columna Bauhini*, (which Name I think *Bauhine* has wrongfully applied;) The *Star Codded Vetch*. 12. *Vicia Glycyrrhizata Gerardi*; *Glaux vulgaris Leguminosa*, The *Liquorice like Vetch*. It is the *Lyngreum Sylvestris Tragi & Dodonaei*; the *Glycyrrhiza Sylvestris Gesneri*; and the *Glaux vulgaris Lobelij*. 13. *Vicia Glycyrrhizata altera*; *Glaux altera Leguminosa*, *Glycyrrhiza Sylvestris ahi Camerarij & Thalij*, The other *Liquorice like Vetch*.

The Descriptions.

IV. The first, or yellow Wild Vetch. Its Root is small and long, with many fibres, not enduring all Winter, but perishing every Year. It rises up higher than *Lentils*, with many weak, slender, and covered Stalks full of Joints, with small Leaves at them, set by couples close together, until they be well grown, which then stand more separate, each of which is broad at bottom, as it were enclosing the Stalk, and small and sharp at the end, something

Vetch Yellow, Wild.

like to the small *Bindweed* Leaves, branching upwards, and every one ending in a small *Clasper*. The flowers come forth at the Joints of the Leaves, and *Claspers* with them, from the middle upwards, of a pale yellowish color, and after them small, and somewhat flat Cods, longer than those of *Lentils*, in which lye 2. or 3. hard, black, round, starchy, shining Grains or Tares.

V. The second, or *Bastard*, or base Milk Vetch. Its Root grows great and thick at the Head, tough and woody, running deep into the Earth, and abiding

ding many Years; but all its Stalks perish every Year, new arising again in the Spring, which are several, upright, and hard crested, growing to a Tard in height, and set on all sides with winged Leaves, four or five couple on a middle Rib, of a very sad green color, no bigger than those of Lentils. The Flowers stand at the tops of the Stalks

Vetch Milk Bastard.

and Branches, many set together, which are small and short, of a dead purplish color, turning Wan with standing; and change into small, black, and almost round pointed Cods, in which are contained 4 or 5 small blackish Grains or Pulse.

VI. The third, or the true great Hatchet Vetch, or Sickle-wort. Its Root is small, perishing every Year. It grows not above a Foot high, with divers winged Leaves growing on its Stalks, which are so weak, as not to stand upright. Each of the Leaves is small, not very long, and round at the end. At the top are many small yellow Flowers, (Matthioli says reddish, in which he was mistaken:) After which, come as many long, flat, thin, reddish, small crooked pointed Cods, containing flat and reddish Grains; so lying in them, that they may be discerned thro' the Cod; the whole Cod being compared in Form to a Hatchet.

VII. The fourth, or lesser Hatchet Vetch. Its Root is like the former, and perishes Yearly with us. In form and manner of growing, it is much like to the former, but something lesser; yet not much lower, if it grows in any good Ground. The Flowers grow many together, of a pale yellow color, and after them come small crooked Cods, bowed almost together, or much like to a Horse-Shoe; in which lye pale brown Grains, not fully round, but square and lesser.

Vetch Hatchet Greater.

OR,

Sickle-Wort Greater.

VIII. The fifth, or greater Horse-Shoe Vetch. Its Root is slender, 3 or 4 Inches long, with several Fibres or Strings adjoining, white and hard, and lives many Years. It has divers small winged Leaves, set on small weak Stalks, leaning, or rather lying upon the Ground, each Leaf being small, short, a little longish, almost round pointed, of a whitish green color. At the Joints with the Leaves, come forth single Flowers, viz. one at a place, on a very short footstalk, being small and yellow; after which, follow a long flat Cod, a little bowed, and cut or divided on the Concave or inner edge, into 4, 5, or 6 Divisions, each being cut in round, something like the Letter C. or like an Horse-Shoe, whence it took its Name; in which lye so many Grains, as there are spaces between the Chasms or Cuts, which are small, longish and crooked.

IX. The sixth, or lesser Horse-Shoe Vetch. This in its Roots, Stalks, Branches, Leaves, Flowers, Cods, and manner of growing, is very like to the former or greater kind, but lesser by the half, the Stalks being not above three or four Inches long, and lying close upon the Ground, and is of a little whiter color than it.

X. The seventh, or greater Birds-foot Vetch. It has a long, slender, stringy Root, running deep into the Earth. It is a small Vetch, (tho' greater than the next) not growing above a Span, or 8 or 9 Inches high, with many Branches spread on the Ground, set with many Wings of small Leaves, in manner of the last Vetches, but much smaller. The Flowers grow upon the Branches, many small ones set in a Tuft or Head together, of a pale yellow color, which afterwards turn into so many small jointed Cods, well resembling the Claws of a small Bird, (whence

the Name;) in which are contained many small round Grains.

XI. The eighth, or lesser Birds-Foot Vetch. *This in its Roots, Stalks, Leaves, Flowers, Cods, and manner of growing, is like the former, but lesser in all its parts, and growing with its Branches and Leaves in a more handson manner, in which is all the difference.*

XII. The ninth, or Knotted Birds-Foot Vetch. *This has in its Roots many small white Knots or Kernels among its Fibres, otherwise in its Stalks, Winged Leaves, Flowers, Cods, and manner of growing, it is like to the greater Birds-foot, saving that the Flowers are of a pale whitish red color; the Cods distinct by Joints, and the whole Plant something larger.*

XIII. The tenth, or our common Kidney Vetch. *Its Root is long, blackish on the outside, white within, parted many times into 2 or 3 or more long parts, with some Fibres adjoining to them. It is a small Plant, scarcely growing to be a Foot high, having many Winged Leaves coming from the Root, which are something small, long, soft, sappy, pointed, green on the upper side, and woolly underneath; not always set orderly one against another, but confusedly, the greatest and longest being at the end,*

Vetch Kidney, Common.

which some unadvisedly have compared to Lentil-Leaves, but bigger; among the Leaves rise up soft Stalks, divided into Branches, with the like Winged Leaves on them. At their tops grow Tufts of many small yellowish sweet Flowers, sometimes of a white, or pale purple, not much unlike, as Clusius says, in form to those of the Meadow-Trefoil, standing in white hoary Husks. After the Flowers are past, there come in those Husks or Pods, small, round, flattish Grains, very like to those of

the Meadow-Trefoil, but a little redder, and usually but one in a Cod.

XIV. The eleventh, or Star Codded Vetch. *Its Root is small, slender, and yellowish, running deep into the Ground. It grows to be about 6 Inches, or it may be a Span high, with upright Stalks, on which are set many Winged Leaves, consisting of many very small Leaves, like unto those of the Birds-Foot. From the Joints of the Stalks with the Leaves, comes a Tuft of small pale yellow Flowers, upon a small prickly fading Footstalk, which turn into 5 or 6 small, long, crooked pointed Cods, standing one against another, like unto a Star, from whence came the Name; but not jointed as the Birds-foot are, having within them small brownish Seed, of the Taste of other Pulse, but a little clammy withal.*

XV. The twelfth, or Liquorice like Vetch. *Its Root is thick and long, dividing it self into two or three very long Strings, running very deep into the Ground, (as deep even as Liquorice Root) sweet in Taste like to Liquorice, which dyes not, but abides long, shooting four new Branches every Year in the Spring. From whence rise up many weak, round, hard Stalks, trailing on the Ground, branched upwards; set something thick with Winged Leaves, made of many lesser ones, set by couples upon a middle Rib, much like to those of the great Wild Tare, in Chap. 683. Sect. 8. foregoing, and one larger, and pointed also at the end. The Flowers come forth at the Joints, many together, standing upon a long Footstalk, of a bleak white color, tending to yellow, which turn into crooked Cods, containing two rows of Grains, cornered, grayish, and of the Taste of other Pulses.*

XVI. The thirteenth, or other Liquorice like Vetch. *Its Root is like the former, thick, and very long, spreading, and running deep into the Ground, and sweet in Taste as the former, abiding many Years; and according to Thalius, is very like to the True Liquorice. It has such like Stalks and Winged Leaves as the last, but not spreading so far, nor leaning so much down; nor are the Winged Leaves so large, but of a darker green on the upper side, and gray underneath. The Flowers are of a Purplish color. The Cods are brownish, long, and round; and the Grains within them more round than the former.*

• XVII. The Places. The first grows in divers Corn-Fields in Kent, as about Dartford, where Gerard says he had found it. The second is Nurst up in Gardens with us. The third and fourth grow also in our Gardens. The fifth and sixth are Natural to the British Climates, being often found upon dry Heaths, as beyond Deptford and Swancomb in Kent, and several other places. The seventh, eighth and ninth, grow also with us on Heaths, and open Untill'd places, in many parts of England. The tenth and eleventh, as also the seventh, are found likewise in many places of this Land: Gerard says, he found them all three growing upon Hampstead-Heath, near London, right against the Beacon, going from London, near to a Gravel-Pit; and that they grow upon Black-Heath, in the Highway leading from Greenwich to Charlton, within half a Mile of the Town. The twelfth Gerard says, he found growing in Suffolk, in the Highway on the right Hand, as you go from Sudbury, to Corner Church, about 100 Paces from the end of the Town; and in many other places of the same County; and in Essex, about Dunmow, and in the Towns called Chare and

and Henningham. It grows also by Purfleet, about the Foot of the Hill on which the Wind-Mill stands, and several other parts of Kent. It grows in many places about Cambridge; in Claringdon-Park by Salisbury, and at Thrappston in Northamptonshire, and many other places of this Land. The thirteenth grows Wild in Germany, but I have not heard that it has been found in our Country, saving where it has been Nurst up in Gardens.

XVIII. *The Times.* The first and second, third, fourth, fifth and sixth, Flower in July, and the Seed is ripe in August or September. The seventh, eighth and ninth, Flower in the Summer Months. The tenth and eleventh Flower towards the latter end of July, and thro' the Month of August, the Seed coming to ripeness in some little time after. The twelfth and thirteenth Flower in June, and their Grain or Pulse is ripe in August.

XIX. *The Qualities.* As to their Qualities, they are all hot and dry in the first degree; their Grains or Pulse abounding in a vast quantity of Volatile Salt, and therefore are Absterfivè, Astringent, Diuretick and Nutritive, having all the properties of the common Manured Tare. The Milk Vetch is Diuretick and Vulnerary. The Hatcher Vetch is Vulnerary, Stomackick, and Alexipharmick. The Horse-Shoe Vetch is of the same nature, but scarcely at all used in Physick. The Birds-Foot Vetch is Aperitive, Astringent, Diuretick, and Vulnerary. The Kidney Vetches are Vulnerary, Diuretick, and Nephritick. The Liquorice Vetch, as to its Root, it has the same properties with the true Liquorice, yet are wholly neglected, and not known to be used in Physick, I suppose because the true Liquorice is so plentiful, common, and easie to be had.

XX. *The Specification.* The yellow Wild Vetch is Astringent, and stops Fluxes. The Milk Vetch is good against the Strangury, provokes Urine, stops Fluxes of the Bowels, stops Bleeding, dries up, and heals Wounds and Ulcers. The Hatcher Vetch, the Grains strengthen the Stomach, cause a good Appetite, open Obstructions of the Viscera, resist and expel Poison, and help against the Bittings and Stinging of Venomous Creatures; kill Worms in the Belly; cleanse and heal old running Sores, and foul Ulcers, and are said to take away Scuff, Morpew, and other Deformities of the Skin. The Horse-Shoe Vetch, has the same Virtues and uses with the Hatcher Vetch, just now enumerated. The Birds-Foot Vetch is said to break the Stone in the Reins, and expel it, help Ruptures, and cure Wounds and Ulcers. The Kidney Vetch, it is an excellent Vulnerary, and used by the Germans to cure Wounds and Ulcers, and for the cure also (as Thalius says,) of the Gout. The Liquorice Vetch, tho' it has scarcely ever been used in Physick, yet I have made some Tryal of it, and find by Experience, that its Root is De-obstructive of the Viscera, chiefly of the Lungs, and very profitable against Asthma's, Coughs, Colds, Catarrhs, Hoarseness, Wheezing, Strangury, and cures Colicks; as also Wounds and Ulcers outward or inward.

XXI. *The Preparations.* 1. The Parched Pulse of the yellow Wild Vetch. 2. The Pulage of the same. 3. A Decoction of the Root of the Milk Vetch in Wine. 4. A Powder of the same Root. 5. A Powder or Meal of the Pulse of the same. 6. A Powder or Meal, of the Pulse of the Hatcher Vetch, and Horse-Shoe Vetch. 7. A Decoction of the same, as also of the Leaves and Stalks of the Green Herb. 8. A Decoction of the Pulse and Herb of the Birds-

Foot Vetch. 9. A Decoction of the Pulse and Herb of the Kidney, and Star Kidney Vetch. 10. A Juice of the same Herbs. 11. A Cataplasme of the same. 12. A Decoction of the Root of the Liquorice Vetch. 13. A Powder of the same. 14. A Volatile Salt from the Pulses of all these Vetches.

The Virtues.

XXII. *The Parched Pulse of the yellow Wild Vetch.* So eaten it is Astringent, and stops Fluxes of the Belly, but is harder of Digestion than Lentils.

XXIII. *The Pulage of the same.* It is made by boiling of them in Water, till their Grains are broken, after the manner of Lentils. So eaten, it stops Fluxes both of Stomach and Belly. Galen says, it is binding as the Lentil, and is used to be eaten as Lentils, but dries more powerfully, and heals moderately; which Astringent quality Dodonæus says, he had found true by his own experience in this Aphace.

XXIV. *The Decoction of the Root of the Milk Vetch in Wine.* It is Astringent, and Galen says, it stops Fluxes, and provokes Urine; and is probably used against the foulness of the Gums, (that is the Scurvy in the Mouth) as Pliny says.

XXV. *The Powder of the Root of the same.* Strewed upon running Sores or Ulcers, or cast into them, it dries them up and heals them. It is good also to stop the Bleeding of Wounds.

XXVI. *The Powder or Meal of the Pulse of the same.* Being dried in an Oven, and cast into Wounds and Ulcers, it dries and heals them.

XXVII. *The Powder or Meal of the Pulse of the Hatcher Vetch, or Horse-Shoe Vetch.* It is Stomackick, strengthens that Viscus, expels Poison, and opens Obstructions of the Bowels; and is good against the Bittings and Stings of Venomous Creatures, as Matthiolus says; and being taken with Honey as a Bolus, it causes the expectoration of tough and thin Flegm; kills Worms, and strewed upon Ulcers it cleanses them; and made into an Ointment with Honey, it heals Ulcers, and takes away Freckles, and other Deformities of the Skin. Dose inwardly, one Dram, Morning and Evening, in Wine, Honey, &c.

XXVIII. *The Decoction of the same in Wine, as also of the Stalks and Leaves of the green Herbs.* It has all the Virtues of the former Powder, besides which, it opens Obstructions of the Stomach, Liver, Spleen, Mesentery, Reins, and other Bowels; strengthens the Stomach, resists Poison, kills Worms in the Belly, and is used as a Wound drink.

XXIX. *The Decoction of the Pulse and Herb of the Birds-Foot Vetch.* It is a little drying and binding, and is used in Wound Drinks, and being a good Vulnerary, is used outwardly for the same purpose. And Lugdunensis says, that the Knotted Birds Foot is found by experience, to break the Stone in the Reins and expel it; and that it wonderfully helps Ruptures inwardly taken, and outwardly applied.

XXX. *The Decoction of the Pulse and Herb of the Kidney Vetch.* It is used as a Diet or Wound-Drink, to induce the healing of Wounds, and also outwardly to wash them therewith for the same purpose.

XXXI. *The Juice of the same Herb.* It is used (mixed with a little Wine) in the same manner as the Decoction, and for the same purposes, in curing Wounds, Ulcers, running Sores, and the Gout.

XXXII. *The Cataplasin of the same.* Mixt with Pouder of Tobacco, it is good to cleanse and heal old running Sores and Ulcers: and applied to the Joints afflicted with the Gout, it eases the pain.

XXXIII. *The Decoction of the Root of the Liquorice Vetch in Wine.* It is good against Asthma's, Coughs, Colds, Catarrhs, Hoarseness, Obstructions of the Stomach and Lungs, and other like Diseases of those parts; and has all the Virtues of the true Liquorice, but not altogether so powerful; but opens all Obstructions of the Bowels, and cures the Colick.

XXXIV. *The Pouder of the same.* It has all the Virtues of the former Decoction, and being made into an Electuary with Honey, powerfully opens Obstructions of the Lungs, and cures all Diseases of that *Viscera*, and outwardly applied, heals Wounds and Ulcers.

XXXV. *The Volatile Salt, made from the Pulses of all the Vetches.* It is made as that of Beans, in Chap. 55. Sect. 16. foregoing, and has all the same Virtues, being good against Palsies, Cramps, Convulsions, Apoplexies, Epilepsies, Gouts, Rheumatism, Colick, and other Diseases of the Head, Brain, Nerves, Viscera and Womb. Dose from 6 Grains to 12, in any proper Vehicle.

By an Over-sight, these two following Cuts being left out in their proper places, we thought good to add them here, rather than they should be lost.

Of VETCH Bitter :

O R,

O R O B U S.

I. **THE Names.** It is called in Arabick, *Herbum*, vel *Erbum*; also *Keisene*, or *Kersene*; in Greek *ὄρος*, *μαρὰ τὸ ἰσχυρὸν καὶ τὸ ἐπὶ βοῶν*, quod *Boves eo Saginentur*, as *Galen* says; in Latine, *Ervum*, & *Orobis*; and in English, *Orobis* also, and *Bitter Vetch*.

II. **The Kinds.** There are first, *Orobis Hortensis*, Garden *Orobis*, which is 1. *Orobis vulgaris*, *Ervum Matthioli*, *Mochus*; *Orobis receptus Herbariorum*; Our common Garden *Orobis*, or bitter Vetch. 2. *Orobis Creticus Matthioli*; *Orobis* or bitter Vetch of Candy. Secondly, *Orobis Sylvestris*, Wild *Orobis*, viz. 3. *Ervum Sylvestre Dodonæi*; *Ervum Sylvestre Herbariorum Lobelij*; and *Catanance Gesneri*, *Lugdunensis* & *Dodonæi*, in his French Herbal; also *Lathyrus Sylvestris minor Baubini*, tho' it has no Claspers at all, as all his

his other *Lathyrus*'s have, whereby he breaks his own order of treating of these Plants, in which he determined to treat of all such Pulses as had Claspers together, whereas this has none; and such as had none, by themselves; Crimſon Flower'd Orobis, or Graſs Leav'd Orobis. 4. *Orobis Sylvæſtris Narbonenſis*; *Orobis Cicereus*; *Orobis Semine, obtuſo Triangulo Baulini*; *Cicer Orobisum Theophrasti Lobelia*; Corner'd or French Orobis. Thirdly, *Orobis Sylvæarum, vel Sylvæaticus, Wood Orobis, viz. 5. Orobis Sylvæaticus latifolius*; *Orobis Sylvæaticus major purpureus*; *Orobis Pannonicus Cluſij*; *Orobis Sylvæaticus Bauhini*; *Orobis Sylvæſtris vernus Thalij*; *Phaſelus Lobelij*; *Phaſeolus Sylvæarum Lugdunenſis*; *Arachis Dodonæi*; and *Aſtragalus Columne*; The broad Leav'd greater, or Purple Wood Orobis. 6. *Orobis Sylvæaticus Anguſtifolius*; *Orobis Tertius Cluſij*, *Orobis Sylvæaticus minor*; Narrow Leav'd, or ſmaller Wood Orobis.

The Descriptions.

III. The firſt, or our common Garden Orobis, or Bitter Vetch. Its Root is ſmall, and perishes every Year. It is a ſmall Puſſe, ſhooting forth divers weak ſlender Branches, leaning to the Earth, and ſcarcely riſing above a Foot high, beſet on all ſides with many winged Leaves, each of which ſmall ones are very ſmall, and ſet on a middle Rib, a little

Vetch Bitter, Common.

O R,

Orobis Verus.

long, narrow, and ſharp pointed, ſet one againſt another as other Vetches, Cicers, &c. The Flowers are ſmall and whitish, (tho' ſome may ſay Purple) ſtanding ſingle, every one by it ſelf at the Joints with the Leaves. After which, come ſmall

round long Cods, no bigger than the Tag of a Point, bunch'd out in 3 or 4 parts, in which the Grain is contain'd, which is almoſt full round, ſmall, and of a pale color, and bitter in Taſte.

IV. The ſecond, or Orobis, or bitter Vetch of Candy. This in its Root, Stalks, Branches, Winged Leaves, Flowers and Grain, as alſo in its manner of growing, is altogether like the former; but whereas Matthiolus ſays, it is leſſer than the firſt, I have always obſerv'd it to be rather larger; otherwiſe the difference is ſo little between them, that ſetting aſide the Name, and Natural place of Growth, I ſhould take them to be but one Kind or Species.

V. The third, or Crimſon Flower'd Orobis, or Graſs Leav'd bitter Vetch. Its Root is long and ſlender, with ſome Fibres adjoining to it, which perishes with us in Winter. This Wild Orobis or Puſſe, riſes up with ſeveral Branches, near two Feet high, eſpecially if it grows in any Fertile Soil,

Vetch Bitter, Crimſon :

O R,

Vetch Graſs Scarlet.

which are beſet unorderly, with many long and narrow dark green Leaves, ſmaller than many Graſſes. At the tops of the Stalks and Branches, grow pretty large Peaſe Bloſſom'd Flowers, of an Orient ſhining Crimſon color, (but Parkinson ſays, that he had ſome in his Garden which came from Seed, which had white Flowers.) After which, come ſmall, ſlender, long, and almoſt round Cods, containing within them ſeveral hard blackiſh Grains.

VI. The fourth, or corner'd, or French Orobis. Its Root is long, ſlender, and Fibrous, which ſends up a weak or leaning hollow Stalk, half a Yard high, ſet at the Joints with many Winged Leaves, having other ſmall Leaves, long, narrow, and ſharp pointed, ſet

set opposite to each other, on a middle Rib, after the manner of those of Lentils: at the joints towards the top, come forth long Footstalks, with many Flowers on them, set close together, which afterwards give long, round, bunched out Cods, dented in between each Grain, which is twice as large as those of the first Orobus, not so round, but a little corner'd, of a pale or yellowish color, differing little from them but in their so exact roundness, and dark appearance.

VII. The fifth, or broad Leav'd greater, or purple Wood Orobus. Its Root is long, black, and hard, bunching forth in some places, with some small long Strings and Fibres adjoined to it, and endures many Years. It grows not much above a Foot high, having many square Stalks, striped along. The Leaves are Winged, the smaller Leaves set one by another on each side of the middle Rib, six, eight, or ten in number; very much larger than any of the other Orobuses, being 2 or 3 inches long, and and an Inch or two broad, and sharp pointed, with 2 or 3 Nerves running thro' them. The Flowers grow at the tops, many together, one above another, as it were in a Spike or Bush, much larger than those of the Vetch, and of a fine blewish Purple color, which when they begin to fade, will change a little, and become more pale; after which, come small, long, slender, brown Cods, with small round, and sometimes longish round Grains within them, variably colored.

VIII. The sixth, or narrow Leav'd, or smaller Wood Orobus. Its Root consists of 5 or 6 long, slender, tuberous Clags, not much unlike to those of the Asphodil or Peony, but smaller, blackish on the outside and white within. It has slender, straight

crested Stalks, about a Foot high. The Leaves stand by couples, being long and narrow. The Flowers grow on long Footstalks, of a pure white color, and the Cods which follow, are long and black, with somewhat large black Grains within them. The Figure here given, is defective, the Cutter having been sparing in his Labor, in not adding to it its Tuberous long Clags before named.

IX. The Places. The two first grow only with us in Gardens, the third grows Wild in Fields, about Hedges and Bushes, and has been found about Highgate and Pancras-Church, near London. The fourth grows Wild about Narbone in France, and is Nurst up with us in Gardens. The fifth and sixth grow in shady places, as Woods and Forests.

X. The Times. The first four Flower in June, July and August, and their Seed is ripe in about a Month after their Flowering time: the two last about the end of April, or in May, and their Seed is ripe in June.

XI. The Qualities. Of all these, the first or Common Orobus is only used in Physick, and of that Plant, the Grain chiefly. It is hot in the first degree, and dry in the second, Aperitive, Absterive, Diuretick and Vulnerary, Pectoral, a little Cathartick, and also Alexipharmick.

XII. The Specification. It opens Obstructions of the Viscera, cleanses the Breft and Lungs of thick Humors, provokes Urine, gives ease in the Strangury, purges the Bowels downwards; dissolves the Tumor of the Spleen, cleanses and heals foul Ulcers, is good against the Bitings of Serpents and mad Dogs, gives ease in a Tenasmus; and is said to restore in Consumptions; it also breaks Carbuncles, and clears the Skin of Deformities.

XIII. The Preparations. Of the Grain there is made, 1. A strong Decoction in Wine or Water. 2. A Meal. 3. A Pultage. 4. A Cataplasm of the green Cods, Stalks and all.

The Virtues.

XIV. The strong Decoction of the Grain, in Wine or Water. By its Bitterness it cleanses, and opens Obstructions of the Viscera, chiefly of the Lungs, Liver, Spleen, Stomach, Mesentery, Reins and Intestines, cleansing those parts of pituitous, thick, and mucilaginous Humors which offend them. Pliny says, it is said in the Emperor Augustus's Epistles, that he was Cured by Ervum, viz. this Orobus, whose Grief was supposed to be tough, pituitous matter infecting the Lungs, and not ealie to be expectorated. It gently purges the Bowels downwards, and being taken fasting every Morning, it eases the Spleen, and opens its Obstructions; mollifies the hardness of the Breasts, and is good against the Bitings of Serpents, mad Dogs, and other Venomous Creatures, being taken mixed with Wine or Vinegar; and so also it provokes Urine, gives ease in the Strangury, and cures the Tenasmus, if the Patient be not reduced thereby to a deep Consumption; but an incipient Consumption, whether Pining, or Phthisis, it Cures by taking away the Obstructions which hinder the Nutriment from going to the respective parts of the Body; and by healing the Ulcers of the Lungs newly begun. Outwardly it heals Wounds, old Sores, and running Ulcers by washing them therewith, whether in the Mouth, Secrets, or other parts.

XV. The Meal. It is made (without steeping the Grain in Water to take out its Bitterness, as some do,) by parching it till its Hulls break, then grinding it, and sifting it through a fine Sieve. A

Dram

Vetch Bitter, Wild :

O R,

Vetch Narrow Leav'd Wild.

Dram of it taken inwardly, mixed with Honey every Morning, gently purges, provokes Urine, and kills Worms in the Belly, and withal gives a good color in the Face. It has indeed all the Virtues of the former *Decolion*, but it is said that if it is taken in too large a Dose, it causes the Head-ach, and to make Bloody Urine, so powerful a Diuretick it is. Mixed with Honey as aforesaid, it cleanses, dries, and heals old running Sores, and foul filthy Ulcers, Fistula's, Cankers, &c. whether in the Mouth, Throat, Secrets, or any other parts; softens hard Tumors in Womens Breasts, and draws out the Poison from the Bitings of Serpents, mad Dogs, &c. being applied; It is also said to cure the Itch, break Apoplems, ripen Carbuncles, &c. if made into a Cataplasm with Wine, and laid thereon.

XVI. *The Paltage*. The Grain is first steeped in Water till its Bitterness is gone, then parched till the Hulls break, and after made into Meal as before. This made into Paltage with Water, or Milk, or Water and Milk, is used to be eaten (mostly in hard times;) it Nourishes much, and restores in Consumptions. If the *Paltage* is made with the former *Bitter Meal*, and applied to the Skin, it is said to take away Freckles, and all other Deformities thereof, washing it also oftentimes with the aforesaid *Decolion*.

XVII. *The Cataplasm of the Green Cods*. Applied to the Hair, (as also their Juice) it causes it to become of a black color.

CHAP. DCCXXIV.

Of the VINE.

I. *THE Names*. It is called in Arabick *Hurin*, *Karin*, and *Karm*; in Greek, *ἄμνα* & *ἄμνος*; & in Latine, *Vitis*, and *Vitis vinifera*, *Vitis Sativa*; in English, *The Vine*.

II. *The Kinds*. They are to be considered, either as to the Country, or the Species of the Grapes. As to the Countries, those which are chiefly known to us, are 1. *Our English Vines*. 2. *Rhenish*, or *German Vines*. 3. *French*. 4. *Italian*. 5. *Spanish*. 6. *Those of the Canaries*. 7. *Portugal*. 8. *Those of the Madera's*. 9. *Those of Florida*.

III. *As to the Species of the Grapes*, there are, 1. *The Rhenish White*, whence comes our *Rhenish Wine*. 2. *The French White*, whence *French White Wines*. 3. *French Red*, whence *French Clarets*. 4. *The White Portugal*, whence *White Port-O-Port* and *White Lisbon Wines*. 5. *The Red Portugal*, whence *Red Port-O-Port Wines*. 6. *The Malaga Grape*, whence our *Malaga Raisons* and *Wine*. 7. *The Greek Black Grape*, which gives a very sweet blackish Wine. 8. *The White Muscadine Grape*, which is a very great Grape, sweet and fitm, some of whose Bunches, (as *Parkinson* says,) have weighed Six Pounds, and some of the Grapes half an Ounce. 9. *The Red Muscadine*, which is as large as the *White*, and differs chiefly in color; from these two last come the *Muscadine Wines*. 10. *The White Frontinack Grape*, which is of a very sweet and delicate Taste, and smells like Musk, whence the pleasant *Frontinack Wine*. 11. *The Tent Grape*, which is black, which yields the *Tent Wine*, of a very sweet Taste, and black color, or very deep red, with which they color other Wines. 12. *The Alicante*

Grape, whence our *Alicant Wine*, which is of so deep a red, that no other is thought to be comparable to it, and therefore is called *Spaniards Blood*.

13. *The Barabar Grape*, whence our *Barabar Wine*, of so deep a red, that it is commonly called *Black Wine*.

14. *The Sherry Grape*, whence our *Sherry Wine*.

15. *The Canary Grape*, whence our *Canary* and *Palm Wines*. 16. *The White Madera Grape*, whence our *White Madera Wine*. 17. *The Red Madera Grape*, whence our *Red Madera Wine*.

18. *The Damasco Grape*, thought to be the *Uva Zibea* *Plinij*, lib. 14. cap. 3. which he makes to be *Vitis Alexandrina*, describing it by those very words which *Theophrastus* does; but is a kind of *Raisin-Grape*. 19. *The Raisin of the Sun Grape*, which is a very large Grape, and consists of very great Clusters, of a reddish color when it is ripe with us, but in its Native Country, which is very hot, it is commonly covered with a notable Blewiness.

20. *The Stoneless Grape*, which is a *Syrian Grape*, and grows near *Askalon* in *Palestina*, as *Becham* says, yielding a red Wine of a very pleasant Taste. 21. *The Carolina*, or *Virginian White Fox Grape*, which is a fair large white Grape, of a Fox-like Smell, and a firm Substance, which when fully ripe, is a very pleasing Grape, very much gratifying the *Pallat*. 22. *The Carolina*, or *Virginian Red Grape*, which is a small Grape, and yields a very deep Blood red Wine. I remember that when I was in *Carolina*, one *Garrat* a *French-Man*, made in one Year about two Hogheads of it, (from Vines which grew Wild in the Woods,) which was not so lusciously Sweet as *Tent*, but when I drank of it at his House, I then thought it to be the pleasantest Wine I ever drank in my whole Life: It was very fine, not of so thick a Body as *Tent*, but of a profound Red, staining every thing of so perfect a *Crimson* color, as not easily to be obliterated, tho' upon the spot. These are the chief of these *Vines* or *Grapes*, which we thought good to take notice of in this Work; and which are most known amongst us: We own there are a vast number more, and possibly a great many which never yet came to our Knowledge; which if we could Name and enumerate them all, would be of as little use to the *Physician*, as they are of profit to us who never saw or heard of them; for which reason, we omit any further Descants concerning the same.

The Descriptions.

IV. *The great diversity of Vines, is equal to that of the Grapes, to many of whose great Numbers, we can give no Names*. *John Tradescant* said, that he had 20 sorts growing with him, which he never knew how, or what to call them; but saving that in their Branches, Leaves, manner and form of growing, all these Varieties seem to be but one and the same, we shall give but one Description for them all; their great differences being chiefly in the several Forms, Colors, Tasts, and Magnitude of the Grapes. The Root is woody, not very great or thick, but tough and long, sending out many Branches, which spread far about and deep. Being Manured, and where it has grown a long time, it comes to have a pretty thick Body, Trunk or Stem, spreading out its Branches every way (if it be suffered) almost without end or measure, inasmuch as some Vines growing in Woods, and near to very tall Trees, of above an hundred Foot high, I have seen to have climbed up to the highest parts of those Trees, and to have spread themselves out over

over almost all their Branches, which at the proper season of the Year, have been every where full of Bunches of Grapes, and so full, even to admiration: These Arms or Branches of the Vine, are according to the Age thereof, some old, some new, some thicker and more woody, some more slender, but all of them so weak as not able to sustain themselves, and therefore climb, and twine and fasten themselves upon whatsoever tall Tree or Poles they grow next to. The older Arms or Branches are covered with a thin scaly Rind, which will often chap and peel off of its self; but the younger or youngest, are of a reddish color, smooth, and firm, with a hollowness or Pith in the middle. From the Joints

Tast, some more pleasing, some very pleasant, some of a mixed Tast, and some sweet. Within every Grape is contained one, two, and sometimes more, small little Stones (excepting in the Stoneless Grape;) which in some Grapes are small, in others larger, according to the Magnitude or kind of Grape. Where note, that to keep your Vines in good order, they ought to be cut low, as to their Bodies or Stems, and not suffered to grow high, nor with too many Branches, whereby they grow the better, and take up the less room, and withal bring forth their Grapes fairer, larger, and sweeter.

V. To the afore-enumerated Species, we shall here add another Vine, called *Vitis laciniatis folijs*, or Parsly Vine, which is scarcely a distinct kind of its self, but rather one of the sorts of the White Muscadine Grape. This kind grows in the very same form and manner as the other kinds do, the main difference consisting chiefly in the Leaves, which are thin, and very much cut in, into many parts, even almost to the middle of each Leaf, and each part dented about the edges. The Grapes are white and great, exactly like to the White Muscadine Grape, and of the same relish or taste, bearing very great Bunches, and ripening with the other sorts of Muscadine Grapes.

VI. *Aumra* & *ayena*, *Vitis Sylvestris*, The Wild Vine growing in Woods. This in its Root, Body, Branches, Leaves, Tendrels, form and manner of growing, differs nothing from the Manured Vine first described, but only in its Fruitfulness; and it seems (as far as I have observed it in Carolina and other parts of the West-Indies,) to be of two sorts, viz. The Grape Bearing, and the Barren. The Grape Bearing yields almost innumerable Clusters, which tho' very pleasant, yet are not altogether so pleasant as those which are Manured, nor full out so large; but these by Transplantation into Gardens, and being managed as the Manured ones are, become altogether the same with them, (both the White and Red kinds) and perfectly forget their Wild Natures, bringing forth their Grape full as large, fair, pleasant and sweet, so that I can scarcely admit it to be a different Species from the Manured kinds. The Barren Wild Vine, differs in nothing from the Fruitful, or Grape Bearing, but only in its not bearing Grapes; which Barrenness, whether it comes from the simple Nature and Property of the Vine, or from the Nature and Barrenness of the Ground, I am not able to determine. If any who live in the West-Indies, or other parts where they grow, would please to Transplant them out of their Native Soil, into one more Fat and Rich, they would in a short time be able to determine the matter.

VII. The Places. Their several Names, shew the places where each Species naturally grows, but all of them being Transplanted into our Country, will thrive and flourish very well, if a reasonable care be taken of them; as may appear by some few of them, which are now become Natives of our Climate.

VIII. The Times. Vines as *Columella* says, are to be Pruned before the young Branches spring forth, which as *Palladius* says, is to be done in February; if they be Pruned later, they lose their Juice and Nutriment with weeping, which if it kills not the Vine, yet very much hinders it from bearing. The Manured Flower sooner than the Wild which grow in the Woods, and therefore their Grapes are also so much the sooner ripe; but the times of their Flowering and ripening, differ very much one from another, as also in respect to the Climates where they grow; for as they are hotter or colder, so their Grapes are either sooner or later ripe.

O B S E R-

Vine Garden.

of the young Branches, and sometimes from the Body of the elder Boughs, break out on every side, broad green Leaves, cut in on the edges into (for the most part) five divisions, and withal notched or dented about. Right against the Leaf, and likewise at the farther end of the Branches, come forth long, twining Tendrels or Clusters, winding themselves about any thing which stands next them. At the bottom of these Leaves, come forth Clusters of small greenish yellow Flowers, and after them the Grapes growing in Clusters in the same manner, but in various Forms, Shapes and Magnitudes, having as many different Colors and Tasts; for some Bunches are close, some open, some exceeding long, with Branches adjoining; some more compact without Branches spreading from them: Some Grapes are round, some oval, some long, some a little corner'd, as it were square: Some Grapes are very great, some in a mean, some lesser, and some very small, (as the small Currants which the Grocers sell, of which we shall speak in the Second Book of this Work next following.) Again, some Grapes are White, some Red, others Blew, others Black, and some again are party-colored. And as to their Tastes, some are absolutely sour, some of a harsh

OBSERVATIONS.

IX. 1. If you would make a Vineyard in our cold and moist Climate, chuse a wholesome, dry, and warm peice of Ground, shelter'd with a Hill from the North-West, North, and North-East Winds, and open to the South-East, South, and South-West Sun; let the Earth be well dig'd, deep, broken small, and cleared from the Roots of Weeds in Summer-time, before *Michaelmas*; then in fair open Weather in *December*, plant your Rooted Vines, of three or four Years old, in even strait Ranks, about 6 Feet asunder, very shallow, yer so that their Roots be covered; and between every Rank of Vines, let there be a Path of 4 Feet broad, that you may easily pass between the Ranks.

X. 2. The first Year after this Planting, do not prune them too much, but let a Stake close by each Root, of about 4 Feet high, to which softly tie the strongest Shoot, and let the other Branches fall down as they will; and in *April* following, or beginning of *May*, just as they bud forth Leaves, bow the tops of each Vine Arch-wise to the next Stake, and there tie it so as it may not slip away; and from this bowed Branch, will come out new Shoots, which will produce Grapes which will hang down to the Earth, and those will be the sweetest which will be nearest the Ground.

XI. 3. This is all which is to be done to them untill Pruning time, which is from the latter end of *January*, till the latter end of *February*, and then you must cut away this Branch which was tied the last Year to the Stake, and Arched down, even as low as the lowest Eye, but one or two at the most; and then tie up another of the strongest Branches from the Stock, instead of the former, Pruning away all the other Branches within an Eye or two of their bottoms; for the fewer Branches you leave to the Root, the more Grapes you will have the Year following.

XII. 4. The Ground in your Vineyard must be digged up every Year, tho' not deep, both between each Vine, and also the Paths between each Rank; and fresh Mould out of the Paths, is to be thrown to their Roots, and so all laid smooth again, and clear from Weeds every Spring; the Weeds in Summer must be Howed up often; for the barer the Earth is kept, the better will your Vines thrive, and the larger and better will be your Grapes; but the Earth about the Vine-Roots must not be stirred in Summer, nor in their time of Bearing.

XIII. 5. The Elder the Vineyard grows, the deeper it should be digg'd, and turn'd up yearly, and some very old rotten Dung or Ashes should then in *February* or *March*, yearly, or every other Year, be mixt with the Natural Earth, but too much Dung, (especially if it be new) is not good, and Ashes are much better than Dung. The Elder your Vines are, if they be Healthy and Sound, the larger and better Grapes will they bring forth; but when you find them to decay, you must set young ones in their stead.

XIV. 6. To increase your Stock, or store of Vines, you must either lay the new Branches in the Earth, or else plant Cuttings; both ways they will be apt to take Root, and in a Year or two, will be ready to Transplant, and dispose as you have occasion; and whilst they stand unremoved, these new Plants must be yearly Pruned at the same time with the Stocks, viz. thro' the whole Month of *February*, and after the same manner.

XV. 7. And therefore to get new Roots either to Plant your Vineyard at first, or to supply the

Stocks as they decay, you must take them from those produced by the former method of Layers or Cuttings, which were partly covered with Earth, that they might take Root in Winter, which in about two or three Years time will be well Rooted, so as they may be removed: Or you may take Suckers from the old Vines or Stocks, which may answer the end full as well.

XVI. 8. But if you will raise a Nursery from the Cuttings of Vine Branches, let them be the Cuttings of that Years growth, which Plant in a Nursery a-part, of good rich Mould: any Cuttings almost will grow, but the largest and strongest Branches of that Year afford the best: These Cuttings must be about a Foot, or Foot and half long, consisting of four or five Joints or Eyes at most, whereof two must be thrust into the Earth, and one or two left above Ground: These Cuttings must stand in the Nurseries 2 or 3 Years to get good Roots, and then they may be Planted in the Vineyard. The Cuttings from Branches which bare well the same Year, and were not much shaded from the Sun are best.

XVII. 9. Vines prosper best in a dry, gravelly, or stoney Earth; Clay, or any stiff or wet Soil, is disagreeable to their Nature, and a rich black over-dung'd Earth, will cause them to shoot too much into Wood, and to bear but few Grapes, and those commonly *Morbide*, that is flat, or ill shaped, and not well tasted. Generally all Vines affect an Easterly and South Sun, but prosper not upon a West or North Wall; and they ought to be defended with high Hills or Trees, from cold North-West, North, and North-East Winds.

XVIII. 10. Every Winter the Earth about the Roots must be opened, and some good old well rotted Dung or Ashes must be added to the Earth, and well mixed therewith, (as is before hinted) and so applied to the Roots of the Vines, which being Planted under good Walls, and well spread, and Nailed thereto, will bear in most Years good store of Grapes. The time of Pruning them, we have told you before, but some begin that work at the latter end of *December*, for the new Shoots only bear Grapes; therefore in Cutting of the Branches, an Eye or two must be left to shoot our new Branches again; for if you cut close to the old Wood, few or no Branches from thence will succeed: So that in Cutting or Pruning of Vines, the Rules for Pruning other Fruit Trees must not be followed; for those are to be cut off close to a Bud; but Vines must be cut about the middle, between two Buds.

XIX. 11. A Fertile Soil is fittest for some Vines, viz. such as bring forth strong Bodied and fat Vines, which is every black Earth, that is not very close nor clammy as *Florentinus* says: *Columella* advises to have regard to the kind or nature of the Vine, to plant it in a Soil agreeable to the Earth of the Country where it was a Native. A poor and lean Vine may be Planted in a Fat and Fruitful Soil that is so of its own Nature, but yet not too Fat. A strong and Fruitful Vine may be Planted in a leaner or more Sterile Ground. A large and spreading Vine, may be Planted in a more close and compact Earth. A Vine of few Branches, may be Planted in a more loose but Fruitful Soil. But says *Columella*, the Vine delights not to grow in a Soil too much Dung'd, let the Dung be of what kind soever. But Mould mixed with some Shavings of Horn, being disposed about the Roots, will cause the Vine to become very Fruitful.

XX. 12. A late *French* Author says, that tho' some are of Opinion that Vines should be Pruned in *February*, or earlier, yet he says they are now usually Pruned in *March*; and that if a Vine be

not Pruned, the Grapes will not be large nor well tasted, and besides, that it will not be of any long Life. That all the dead and useleſs Branches are to be cut off: That the beſt Branches (ſhooring out the laſteſt Stems, are to be cut off to 4 Eyes, and the other Branches lower, or beneath them, to 2 Eyes: That in Pruning, an Inch of Wood is to be left above the Eye, at the upper end of the Branch: That the Cut muſt be made ſloping on the contrary ſide to the Eye, for fear of prejudicing it; for when the Sap is in motion, the Vine weeps very much; ſo that if the Slope were on the Eye ſide, it would in a manner be drowned by the Tears: And that the Vine be diſ-budded and tyed up in May, June and July, that the Grapes may thrive, and grow perfectly ripe. That the lower Branches are Pruned to two Eyes, that they may give us two other good Branches, which may be fit to be Pruned the Year following, whereby you may retrench the Branch before Pruned to 4 Eyes, with all the reſt ſhooting from it. That theſe 2 new Branches ſpringing from the ſaid lower Branch, are to be ſo Pruned, that 4 Eyes may be left to the hiſheſt Branch thereof, and 2 Eyes only to the lower of the ſame. But if the firſt ſaid lower Branch gives but one Branch, that is then to be Pruned to 2 Eyes; if it gives no Branch, then you go to the upper Branch which had 4 Eyes left, which if it has 4 Branches, you muſt cut off the two higher Branches, and Prune the two lower, leaving 4 Eyes to the higher of the two, and two Eyes to the lower.

XXI. 13. But ſince we ſcarcely ever Plant Vineyards in England, but place our Vines againſt Walls, you muſt dig a Trench about a Foot and half broad, and prepare your Layers or Cuttings, which may have each 3 Eyes apiece; cut off a ſmall part of the Fibres, and lay your Layers in the Trench 2 Feet aſunder, that the Lattice may the ſooner be formed; after which, lay on ſome Dung, till the Trench be quite filled up, ſo will the Vines ſhoot out admirably: If the Earth be hot, Cow-dung is the moſt proper, but if that can't be had, then take Horſe-Dung which is well and perfectly rotten, and diſcharged of its heat: But in a wet and cold Ground, Horſe-dung half rotten will do better than the other, which being of a cold Nature, Cow-dung will not ſo well agree.

XXII. 14. Our Vines in England, begin to put forth their Leaves about the end of April, and are in flower about the latter end of June; not very long after it will be good to ſtop the Branch ſome diſtance from the Flowers, that the Grapes coming on, may have the more Nouriſhment, and the Sap not drawn away from them, or ſpent upon other uſeleſs parts.

XXIII. 15. In the end of Auguſt, cut away ſuch Branches and Leaves as keep the Sun from the Grapes, ſo will they ripen the better, and ſome early kinds will be thoroughly ripe in September, others in October; but it often happens, that ſuch as are late ripe, are ſpoiled by Froſts, unleſs they be well defended with a Tilt, eſpecially in the Night, from Sun-fer, till the Sun is nearly an Hour high; and if it is a Froſty Season, all the day long.

XXIV. 16. Beſides the Vines we have enumerated, there are more than an hundred ſorts of others, to which we can give no Names, and many of which are very good kinds; but we in this place are to conſider which of them will grow beſt with us in England, which are 1. The Cluſter Grape, or ſmall Black Grape, which is firſt ripe with us, which are thick ſet on the Bunches, and when ripe, black and well taſted. 2. The White Muſcadine

Grape, which has large Bunches, and has great Grapes, ſweet and good, and ripening well moſt Years. 3. The Red Muſcadine Grape, as large as the White, but requires the moſt Sunny places, becauſe it ripens not here ſo well as the former. 4. The Frontinack Grape, which is a white, ſweet, Muſky Grape, but in ſome cold Seasons, come not to perfection here. 5. The Raiſon of the Sun Grape, which is large, red and good, and in a warm place ripens reaſonably well. 6. The Parſly Vine, or New England, or Canada Grape, which is a White Grape, ripens with the laſt, and but thinly ſet on the Bunches. To theſe we may add, 7. The Burlet Grape, which is the laſteſt Grape we have, but are very ſowre, and ripen not with us, except by accident, as having an extreame hot Season. The Bunches are great, and the Grapes large and white, whereby they make an admirable ſhow on a Wall. Our chief uſe of this Grape, is to make Verjuice of it, which is very excellent. If by chance in a very hot Year, it comes to ripeneſs, the Grapes are ſaid to be pleaſant. There are many other ſorts of good Grapes, which poſſibly may grow admirably well in our Country, concerning which you may conſult the Vinerones.

XXV. 17. The Juice of the unripe Grape, the Greeks call *Ὀψαρίον*: the Latines, *Omphacium*, and *Agreſta*: but we in Engliſh, *Verjuice*. The Flowers of the Wild Vine are called *Ὀνάθις*: in Latine, *Oenanthe*, and *Flos Vini*, (in former times much in uſe, but now wholly neglected.) The Grapes dried in the Sun, are called *Uva Paſſa*, and *Paſſula Solis*, Raiſons; and a Bunch of Grapes ſo dried, is called in Greek, *Σκῆπις*: in Latine, *Uva Paſſa*, and *Paſſula*. A Bunch of Grapes new gathered, is called *Βῆρυς* and *Σκῆπυλλή*: in Latine, *Uva*, and *Racemus*. The Grape it ſelf is called *ἄκνυς*, in Latine, *Acinus*. The Grape Stone is called in Greek, *ῥιζάριον*, and *καρπῶν ἀκνύς*: in Latine *Vinaceus*, *Acina*, and *Nuclei Acini*; alſo *Arilli*, quaſi *Ariduli*, becauſe they are dry, and yield no Juice. The Wine is called in Greek, *οἶνος*: in Latine, *Vinum*. The Wine Lees whiſt moſt and liquid, are called *Ecces Vini*. The Tartar, or dried or hardened Lees, is called in Greek, *Σάκκιν*: in Latine, *Fex Vini Uſta*, *Lapis Vini*, *Lapis Vinæus*, *Tartarum* vel *Tartarus*, (I ſuppoſe from its ſettling into the deep or bottom) and in Engliſh *Tartar* and *Argol*. The Preſſings of the Wine, or Wine-Huſks, are called *Vinacea*, pl. by *Columella*, and by us the *Rape*, or *Preſſings*. The Mother, (which ſometimes comes upon the top of the Wine, whether in Working, or otherwiſe by loſs of its Spirits,) in Greek, *τὸ σίμανα*, pl. in Latine, *Vinacea*, *reliquæ*, *omniæque reſtrimenta quæ ſuperſunt poſt expreſſas Uvas*, *Galen*, de aliment. lib. 2. The Stalk which is in the middle of the Cluſters or Bunches, on which the Grapes do hang, is called by *Galen*, *Βῆρυς*, and of *Varro*, *Scapus Uvarum*. The Vineyard is called *Ἀμπελῶν*, & *Ὀυβῆρον*: and in Latine, *Vinetum*. And the Vinerone is called *Ἀμπελουργός*, and in Latine, *Vinitor*, the Vine-Dreſſer.

XXVI. The Qualities. It is hard to determine the Qualities of Vines and their Productions, becauſe they are ſo various: However, the Leaves and the Stones of the Grapes are temperate in reſpect of Cold, but dry in the ſecond degree, Aſtringent, Vulnerary and Syſtick. The Tears are cooling. The Grapes are cooling and looſening, inducing Fluxes of the Belly, if eaten too plentifully. The Wine hot and dry in the ſecond degree, Aſtringent, or Diuretick according to the Nature of the Grape, moving the Belly, or Syſtick for the ſame reaſon; but all Wines in general, as they

abound

abound with plenty of Spirits, so they are (being moderately and prudently used) grateful to the Stomach, and Cordial, cheer the Heart, revive the Spirits, restore Nature, and refresh and strengthen the whole Body. The *Verjuice* is cooling, drying, Styptick and Stomackick. The *Tartar* is cold, dry, Absterfiv, Aperitive, Stomackick, and moderately Cathartick, more especially when it is freed from its grosser Recrements.

XXVII. *The Specification.* The various and differing Productions of the *Vine*, are such which have as various and differing *Qualities*, from whence their *Specifications* are as various and different; so that it would be very troublesome to enumerate them all severally here, forasmuch as many of those Particulars have a considerable number of Preparations arising from each of them; for which reason, we shall omit their Specifick Properties in this place, and give an account of the same, as we treat in order of the several Products or Parts, and Preparations of this Plant.

XXVIII. *The Preparations.* 1. A Juice of the Leaves and Tendrels. 2. A Decoction of the same. 3. The Tears. 4. The Ashes of the Branches. 5. A Lye of the Ashes. 6. An Unguent of the Ashes. 7. A Lotion or Wash. 8. The Grapes. 9. Verjuice. 10. Must, or New Wine. 11. Rob, or Sapa. 12. Wine Fermented or Perfected. 13. Brandy. 14. Spirit of Wine. 15. Philosophick Spirit of Wine. 16. Raisins, or dried Grapes. 17. Honey of Raisins. 18. A Decoction of Grape or Raisin Stones. 19. A Powder of the Stones. 20. Vinegar. 21. Spirit of Vinegar. 22. Wine Artificial. 23. Hippocras. 24. Gum of the Vine. 25. Wine Lees. 26. Tartar or Argol. 27. Cream of Tartar. 28. Tartar Emetick. 29. Spirit of Tartar. 30. Oil of Tartar Distilled. 31. Mixture Simplex. 32. Salt of Tartar Pare. 33. Salt of Tartar Nitroed. 34. Oil of Tartar per deliquium. 35. Sal Tartari Foliatum. 36. Cremor Tartari Solubile. 37. Soluble Emetick Tartar. 38. Sal Tartari Viriolatum. 39. Sal Tartari Volatile. 40. Liguor of Tartar. 41. Spirit of Tartar Compound. 42. Diatessaron, or Punch.

The Virtues.

XXIX. *The Juice of the Leaves and Tendrels.* It is Cooling, Drying, Astringent and Healing. Mixt with Honey, it makes a good Lotion for a sore Mouth or Throat, or Sores in the Privy parts, to wash, gargle, and bath therewith, it also stops Vomiting, Fluxes, Spitting of Blood, and Womens Courfes.

XXX. *The Decoction of the same.* If a little Roch Alum be dissolved in it, and it be then sweetned with Honey, it has all the former Virtues of the Juice; but drank (without the mixture of the Alum and Honey) it is of good use against Fevers.

XXXI. *The Tears of the Vine.* These are droppings of the Branches of the Vine, when cut out of due time, or too late in the Spring; drank, it is good either to dissolve a greasy Stone in the Reins or Bladder, or to expel and drive out Sand, Tartarous matter, Gravel, and small Stones out of those parts; and possibly it may be more effectual in this case, if it be taken when sweetned with Honey; for that Honey has not only a power of Dissolving and Cleansing, but also of making the Passages smooth and slippery.

XXXII. *The Lye made of the Ashes of Vine Branches.* It is very effectual against the Gravel

and Stone in the Reins, being drank either simply of it self, or mixt with White Port Wine. The Lye mixed with a little Vinegar, and used as a Bath, allays Inflammations and pains, and consumes Warts of the *Anus* or Fundament, eases the Pains thereof, and dissolves the Piles, and other Tumors. The said Lye is good to wash places out of Joint, or burnt with Fire; and mixt with Juice of *Rue* and Vinegar, it is good against the swelling of the Spleen, and helps Frettings and Gallings in any place. And mixed with Wine, it is good against *Anthones* Fire.

XXXIII. *The Ashes of Vine Branches.* Made into an Ointment with Hogs Lard, it is good against hard Tumors, cleanses Fittula's and hollow Ulcers, and heals them; helps Pains, Cramps, and shrinking of the Nerves. If they are mixed with Oil, and applied, it dissolves Simple Contusions, cures the Bitings of Mad Dogs, and the Wounds of Scorpions. And made into a Cataplasin with Nitre and Vinegar, and applied, it consumes or wastes Wens, and other Excrecences of the Flesh.

XXXIV. *The Ointment of the Ashes.* Take well Calcind Vine Ashes 4 Ounces; Sal Nitre in fine Powder 1 Ounce; Tobacco in fine Powder half an Ounce; Golden Colored Palm-Oil, (not Old, or inclining to be Ranc) 12 Ounces; Oil of Rhodium 3 Drams: The Palm Oil being melted in the heat of a Bath, put in the other Ingredients, and mix them well together. It dissolves hard Tumors, and dissolves even Callous hardneses; eases pains in the Nerves and Joints, and is profitable against Gouts, Sciatica's, simple Contusions, old Sores, Ulcers, Fittula's, Tetters, Ring-Worms, Herpes, Impetigo, Worms in the Face and Skin, and other like rebellious Maladies.

XXXV. *The Lotion or Wash.* Take of the Juice of the Leaves 6 Ounces; Red Port Wine 10 Ounces; Honey 4 Ounces, mix and make a Lotion. It is good to Wash and Gargle, and heal Sore and Ulcerated Mouths and Throats; and also to cleanse and heal Ulcers in other parts. Put into the Eyes, it stops Defluxions, clears the Sight, and heals Sores and Ulcers therein.

XXXVI. *The Grapes.* The fresh gathered full ripe Grapes being eaten, strengthen the Stomach, refresh the Vital Powers, cause a good Appetite, and cool in Fevers: Those of a Blood-red Juice, are said to stop Spitting of Blood, and other inward Bleedings, because of their Styptick quality, but almost all sorts of Grapes, if eaten in too great a plenty, are apt to cause Fluxes, and to do other Prejudices to the Body, not easily to be retrieved; whereas moderately eaten, they are otherwise a singular advantage to it.

XXXVII. *The Verjuice.* It is a Juice pressed out of any unripe Grapes, but more especially out of that kind of Grape which will not ripen with us, being a very fair large Grape, and making very large Bunches. It is called *Omphacium*, also *Succus Omphacinus*. It is a pleasing sort of tart Juice, fit to be used in Broths, Meats and Sawces, to acuate and strengthen the Appetite, also to resist Vomiting, and to refresh and accelerate the fainting Spirits. Made into a Syrup with White Sugar, it is very grateful to the Stomach, quenches Thirst, and extinguishes the heat of Fevers. Mixt with Honey, and used as a Lotion or Gargle, it cures Sores and Ulcers in the Mouth and Throat, &c.

XXXVIII. *The Must, or New Wine.* It is pleasing to the Palate, but not so wholesome as that which has Age upon it, and is very fine. Several sorts of Must are apt to loosen the Belly, but particularly *New Canary*, creates Obstructions

in the Reins, and many times causes a Strangury, or a kind of stoppage and heat of Urine: But according to the Variety of Grapes, and the Climates and Soils in which they grow, such are the Qualities of the Must; some are Laxative, some Astringent, some Styptick, &c. and according to those Qualities or Properties, varieties of Preparations may be made of them.

XXXIX. *Rob. or Sapa, Syrup of Must, or New Wine.* Take Wine newly press'd from ripe Grapes, White or Red, boil it over a gentle Fire, or rather in Balneo, to the thickness of Honey. It is of use for queasie and ill Stomachs, for Faintings, Vomittings, and want of Appetite; it is also good for Sores and Ulcers in the Gums, Mouth and Throat, because it is not only Absterfiv and Healing, but also represses the Flux of Humors, having a Styptick quality in it, (but is more or less Styptick, according to the kind and Qualities of the Grape it is press'd from;) you may take it Morning, Noon and Night, as much as a Walnut at a time, alone by it self, to strengthen the Stomach, provoke Appetite, &c. This you are also to Note, That in what Medical Author so ever you read *Rob* or *Sapa*, without any other Epithite, but simply Written, without any relation of what it should be made, that this *Rob* or *Sapa*, is the thing which is always intended.

XL. *Wine Fermented or Perfected.* All Wines whatsoever strengthen the Stomach, cheer the Heart, revive the Spirits, and exilerate whole Nature; Strong Wines strengthen most, but many of them are heady, and being drank in too great a measure, are apt to enflame the Blood and Spirits, and cause Fevers. Weak Wines cleanse much, and that by Urine, but being too plentifully drank, are apt to cause Rheumatisms, Gouts, &c. The middle sort of Wines (being very fine) are wholesomest, and fittest for our Bodies. All sorts of French Wines breed Gouts, Rheumatisms, Sand, Gravel, Stone, and Tartarous humors in the Urinary parts. All Styptick Red Wines, as *Alicant*, *Barabar*, &c. stop the over-great Flux of Urine, and are prevalent against a *Diabetes*. Choice Canary, as *Palm Wine*, *Madera Wines* White and Red, *Sherry*, *White and Red Port Wines*, and *Lisbon Wines*, *White and Red Florence Wines*, and such other like strong and Generous Wines, are great Cordials, and ought to be choien when used in Cordial Compositions, because they add Life and Spirit to the Medicament, and make it more Grateful to the Stomach and other Bowels.

XLI. *Brandy, or Common Spirit of Wine.* It is made of well Fermented, and sometimes of Prick'd Wines, in a Copper Vesica Tinn'd within, with its Head and Refrigeratory, or Worm, drawing it off so long, till it becomes of such a Consistency as to be but just Proof, which may be again rectified in Balneo, if you so please. This Spirit being old, when the Fire is as it were out of it, is much better than when new drawn; and then a small Dram being taken of it now and then by it self, (or mixed with white Sugar, or some Syrup, as some will have it) is a singular Cordial, a strengthener of the Stomach, a reviver of the Spirits, a cheerer of the Heart, an exciter of Natural heat, and a causer of Digestion; warming of the Body, and a quickner of the Circulation of the Blood. With this is made *Black-berry*, or *Bramble-berry Brandy*, *Mal-berry Brandy*, *Rasperry Brandy*, *Morella Cherry-Brandy*, *Black Cherry Brandy*, &c. and with it several Tinctures are drawn out of particular Simples, as from *Cutcheu*, *Cochinele*, *Saffron*, &c. much better than can be done with the best rectified Spirit of Wine.

XLII. *Spiritus Vini, Spirit of Wine.* It is made from Brandy, by Distillation in a Copper Vesica, with its Head Tinn'd well within, fitted to its proper Worm and Receiver; continuing the Work till the subtillest and finest parts are ascended, (which you may know by the Taste;) after which, it may be several times rectified in Balneo, drawing off the half, third, or fourth parts, till the Spirit is high, and no Humidity remain which will flame. Where Note, that the Orifice of the Still being cover'd with a four fold thin Paper, or thick Cloth, the Spirituous parts will only penetrate, and the Watery fall back again. It is a singular Menstruum to make Extracts, Tinctures and Elixirs with, and performs many other Admirable things in Chymistry, as all Learned Physicians abundantly know.

XLIII. *Philosophick Spirit of Wine.* Take Pure Flowers of Sal Armoniack, or Sal Armoniack twice or thrice Sublimed from common Salt, 4 Ounces; affuse thereon the best Alcoholiz'd Spirit of Wine, or Spirit of Wine perfectly deflegmated, or that Distilled from Salt of Tartar till it is free from Elegg, so much as to cover top it 2 or 4 Inches; being in a Glass Vial close stopp'd with Wax, let it stand only in a Blood warm Digestion, 14, or 20, or 30 days, that the Spirit of Wine may fully imbibe, and be impregnated with the Fire or Sulphur of the Sal Armoniack, to wit, with its Volatile Particles or Salt; which keep for use. But Kirkringius advises, after this, to Distill off the Spirit from the remaining Salt, Cohobating and Distilling off the Spirit three times. This Philosophick Spirit of Wine, is a Menstruum vastly beyond the best Simple rectified Spirit, for extracting all sorts of Vegetable or Mineral Tinctures, making of Elixirs, Potestates, &c. One of its uses is to extract a Blood-red Tincture from the Glass of Antimony, and from other Mineral and Metalick Bodies. It is not much unlike, and possibly not inferior to that of *Basil Valentines*, mentioned in our Pharm. Lond. lib. 1. cap. 9. sect. 22. having indeed all those Virtues. It is probably used in Rheumatisms, Gout, Stone, Jaundice, Dropsie, and all inward Obstructions: They that please to use it may possibly give me Thanks, for communicating the Secret use of this most Excellent Spirit; some few Drops (from 15, to 30 or 40,) may be given in a Glass of Generous Wine.

XLIV. *Raisons or Dried Grapes.* They are Grateful to the Stomach, strengthen the Bowels, good against Coughs, Colds, Catarrhs, Asthma's, Wheezings, and restore in Consumptions, being often eaten alone, or every Morning and Night, with choice Old Cheshire Cheese, and White Ship-Biscake, by which way of eating them, they stop old and inveterate Fluxes of the Bowels, and Fortifie as it were the whole Body: The *Damascio-Raisons* have a little Tartness in them, and are very pleasing to the Stomach: The *Malaga Raisons* are also of singular good use; but the *Raisons of the Sun* exceed all others for all the purposes already mentioned.

XLV. *Honey of Raisons.* Mel Passulatum. Take Raisons of the Sun stoned, and bruised in a Marble Mortar, 2 Pounds; warm Water 6 Pounds; infuse 24 Hours, then boil in Balneo to the Consumption of the half, and press out the Liquor strongly, which with Clarified Honey a Pound and a half, boil to its due Consistency: If instead of the Water, you take Canary, Malaga or Tent, the Medicine will be so much the better. It is a choice thing against Asthma's, Colds, Coughs, Catarrhs, Consumptions, Hoarseness, Wheezing, and other like Diseases of the Brest and Lungs.

Act

Mel de Pissalis Compositum, or a Compound Honey of Raisons, is thus made. Take Juices of Male Peony Roots, of Liquorice, of Baton, of Harts-Tongue, of Hyssop, of each an Ounce; of the Pulp of Raisons made with Malaga Wine or Canary, a Pound; Double Refined Sugar a Pound and a quarter; mix them, and boil to a Consistency. It has all the former Virtues, besides which, it is peculiar for Children against Convulsions, the Falling Sicknes, Chin-cough, and the Rickets.

XLVI. *Decoction of Grape, or Raison Stones.* It is good to stop Fluxes of Blood in any part, as Bleeding at Nose, Spitting and Vomiting Blood, inward Bleedings, Bloody Flux, and Pissing of Blood. It stops all sorts of Fluxes of the Belly, strengthens the Stomach, and prevails against a Diabeter.

XLVII. *The Powder of the Grape or Raison Stones.* It has all the former Virtues, and may be given from half a Dram to a Dram in a little Honey of Raisons, and then wash down with a Draught of the Decoction of the Stones. The Powder outwardly applied, is a good Styptick in stopping of Blood.

XLVIII. *Acetum, Vinegar.* How our Distillers make Vinegar, we have taught at large in our *Doron Medium*, lib. 1. cap. 24. sect. 36. so that it would be *Adum agere*, to repeat that again here. But for such as cannot go that way to work, for want of Necessaries, it may be done another way, after the following manner. Make a Paste of Wheat Meal and White Wine, adding to every Pound and half thereof, half an Ounce of dried Salt, reduced in a very hot Mortar to a fine Powder; let all be wrought very well together, and lye in Digestion 24 Hours, then make it all out into little Loaves, which Bake in an Oven with a soft heat: Take these Loaves and steep them in the strongest Wine Vinegar, (in every Gallon of which, 4 Ounces or more of fine Powdered Salt is added,) with which make a Paste again, and make into little Loaves, and Bake as before. This Work so often repeat, till the Loaves will be no more dissolved in the Vinegar, or rather receive no more Acidity from it; which done, put a sufficient quantity of this Bread, into 4, 6, or 10 Gallons, or what Quantity you please of Strong Wine, (especially such of it as is prickt, or begins to grow acid) and it will in a very short time be converted into good Vinegar. Vinegar if it is good, and very acute or sharp, is an excellent Stomackick, and therefore it is almost always an Ingredient in the most excellent Sawces. It is a most singular thing to quench Thirst, abate the heat of the most violent Fevers, resist Poison, and is generally an Ingredient in most Liquid Compositions against the Spotted Fever, Malign Fevers, Measles, Small Pox, and the Plague or Pestilence it self; and all sorts of Contagious Infections, and Pestilential Diseases. It is Styptick, and good to stop all sorts of Fluxes of Blood, whether inward or outward.

XLIX. *Spirit of Vinegar.* Spiritus Aceti, Acetum Distillatum, 1. Take of the best Wine Vinegar, put it into a Glass Still, and with a gentle Fire in Balneo Mariæ, or in Ashes, draw off the Flegm without Taste, which will be near a quarter part; change the Receiver, and force over the Spirit. If the Spirit is for Physical uses, you must take heed of Burning, lest your Preparation smell of the same. If it is for a Metaline use, draw off the Flegm in Balneo, and in Sand Distill violently, till a red Spirit ascends, and all be come over. II. Or thus, according to Clossæus. Take 6 Quarts of Vinegar, and Distill in a lukewarm Balneo M. till but one Quart remains; then in Sand or Ashes,

draw off the remainder to dryness, Cohobating two or three times upon the Residue. III. Or thus, which is yet stronger. Inspissate Vinegar to the thickness of Honey, and set it to Crystallize, which Crystals purifie, by dissolving them in the Flegm of the Vinegar, and Crystallize again; Take these Crystals, and make them into Balls with Bole, and then drive the Spirit thro' a Retort, which after rediffie, so will it be fiery and Corrosive. IV. Spiritus Aceti Sennerti. Take Faces of Distilled Vinegar, Calcine them dry, add to the same Spirit of Vinegar, and draw it off again in Sand, Cohobating so often till all its common or fixt Salt ascend with the Spirit. This is Radicated or Alkali'd Vinegar. V. Or thus. Take Faces or Lees of Vinegar, Distill in a Vesicatory with its Refrigeratory, so will you have a fiery Spirit, which will dissolve Metals Stones and Minerals. VI. Spiritus Aceti Terebinthiatus. It is made of Vinegar and Turpentine, Distilling them in a Retort, then separating the Oil and Spirit from the Flegm, or Water. VII. Dr. Antonie's Spirit of Vinegar, with which he made his Aurum Potabile. Get three or four Glass Stills, which will hold a Gallon or two apiece, and about 6 Gallons of the strongest Red Wine Vinegar, (Vinegar of White Wine or Claret, will be too weak) made of Red Wine, or of Canary, or Muscadine. Put the Vinegar into the Stills, and set as many a going as the Balneum will hold, (which Balneum ought to be two Feet and a half Square, to hold many Glasses:) take a Pint of that which runs first, and put it away as weak, and not fit for use; then Distill the rest to dryness: Wash the Stills with a little of the Flegm or first running; Distill again, and put away the first Pint; this Work repeat four or five times; so of a Gallon of Vinegar, you will have three Pints of Spirit; and of your six Gallons nearly 10 Pints. If your Spirit is yet too weak, you must Distill it oftner; this Spirit keep in a Glass close stop'd with a Glass Stopple. For a Quart of this Menstruum, Bishop Billon gave Dr. Anthony Thirty Shillings. VIII. Radicate, Spirit of Vinegar, according to Marggrave. Take Spirit of Vinegar, or the former Radicated Vinegar, and Distill it a new from Sal Armoniack, so will it be much more potent. Spirit of Vinegar attenuates, incides, diffuses, represses, cools, and has all the Properties of Vinegar, but much more intense and strong. It is used as a Menstruum, to perform Chymical Extractions with. The Terebinthinated or Radicated Vinegar, is for the dissolution of Stones of all sorts, chiefly of Gems or Pretious Stones, of which Crollius and Hartman make much mention; and it is used by Paracelsus against Diseases of the Stone, by giving it in a proper or Specifick Vehicle. These Authors say, that it will dissolve Hints and other Stones, without any Previous Calcination, and is also profitable for many other uses: Now if it has a Power of Dissolving such hard Substances without Calcination, it must certainly have much more power to do the same, after such a Preparatory Operation of the Fire. Dr. Antonies Spirit of Vinegar, may without doubt have all the same Virtues and uses with other Spirits, but what he applied it to, was chiefly to make his Menstruum, with which he prepared his Aurum Potabile, that Medicine so much Fam'd throughout almost the whole World.

L. *Wine Artificial.* Take Malaga Raisons freed from their Stalks an hundred Weight, fair Rain-Water 30 Gallons; put the boiling Water upon the Raisons, stirring them well together, which let stand 48 Hours or more, till the Water has drawn forth all the Sweetness and Strength out of the Raisons; then draw off the Water from the Fruit into a Wooden

Wooden Vat, where let it stand till it begins to Ferment; Barrel it up, keeping it upon the Lees till the Fermentation is over, and the Wine is absolutely Fine, which then may if you so please, be Bottled up. This is nor inferior in Strength to any French Wine, and much more pleasant, drinking a great deal more Acute and Brisk. It has the Virtues of other strong Wines, and may be drank ordinarily as other Wines. If you please, you may alter its White or Pale color, and make it of a Red color, by putting into it *Alkanet-Roots*, which will give it a Glorious Red, and thereby make it much more taking to some sort of People. When *Malaga Raisins* are Cheap, or at the ordinary Price, this Wine will (your Labour being set aside) scarcely stand you in Three Pence a Quart.

LII. Hippocras, or Spiced Wine, Vinum Hippocraticum. I. *Dr. Bates Hippocras.* Take *Ginger, Cloves, of each one Ounce, Cinnamon, Nutmegs, of each two Ounces; Spanish Wine or Canary, six Quarts; double refined Sugar 3 Pounds and a half, mixt with New Milk a Quart and half a Pint; let them stand 24 Hours, then strain off, to which add one Limon thin sliced, and two tender Sprigs of Rosemary, often passing it thro' Hippocrates's Strieve, till it becomes clear.* Dose 3 or 4 Ounces in Languors or Faintings. II. The common Hippocras of the Shops. Take *Ginger 3 Drams, Cloves, Nutmegs, of each 2 Drams, Mace two Scruples, White Pepper, Cardamoms of each a Scruple; Cinnamon 6 Drams, Marsh-Mallow Seed, one Ounce; Canary, or White Lisbon, or pure Red Port Wine 6 Quarts: Let all the Ingredients be bruised, and put into a thin Milk Cloth bag, with a Stone in it to make it sink, then put in the Wine, and let all infuse for a Quarter of a Year, then draw it off, and Bottle it up. Where Note, that some boil the Spices in the Wine, which they sweeten with Double Refined Sugar, and then let it pass thro' a Hippocras Bag, Bottling it up afterwards: But if you would have this, or any other Liquor purely clear, you must use a Tripple Hippocras Bag, made of White Cotton or Linnen, so what keeces passes the first Bag will stay in the second, and what passes the second, will stop in the third and last: You must order them so, that the Point or Corner of the one may hang in the Mouth of the other, and the Corner or Point of the third and last, in the Mouth of the Cup or Vessel to receive the Wine. III. Hippocras Extremoporee. Hippocras made in an Instant. Take *white Pepper a Dram, Cloves an Ounce, Nutmegs, Mace, Ginger, of each two Ounces; Cinnamon 8 Ounces, Spirit of Wine three Pints: the Ingredients being all sufficiently bruised, mix with the Spirit, and digest 14 days close stopt in a cold place, shaking the Vessel twice a day, then press out the Tincture very hard: To the Magma or Exces, affuse fresh Spirit of Wine a Pint and a half, mix, digest, and shake as before for 14 other days, then press out the Tincture very hard; put this latter Tincture to the former, mix them, and let them settle for 4 or 5 days, then decant the clear, and filter it thro' brown Paper, which keep for use. Take of your intended Wine you will make your Hippocras of, a Quart, of the aforesaid Tincture three large Spoonfuls, more or less, (as you would have it in Strength) mix them together, and you will have good Hippocras in a Moment. Where Note, That if the Wine be of it self harsh, it ought to be beforehand Dulcified with Double Refined Sugar, by which it will be made more grateful to the Palate, and then letting it stand till it is Pure and Fine, it may be Bottled up. *Dr. Bates* says, that if you add White Pepper half a Dram, to his Recipe, it will make the Composition more**

Grateful to the Stomach; and for such as love Perfumes, he says you may add half an Ounce of Musk Seed. All these several Preparations are very Cordial, strengthen and fortify the Head, Heart and Stomach, support the Animal and Vital Powers, recreate the Spirits, dry up Humidities, and refresh the Body over wearied with much Labour: They cause Appetite and a good Digestion, are good against Fainting and Swooning, and admirably expel Wind, whether in the Stomach or Bowels, which trouble them with fowle Belchings, Heart burnings, Gripings, Colicks, and the like.

LIII. Gum of the Vine. The Gum which issues out of the Vine of it self, sticking to the Bark, (which it emits in hot Climates, but very rarely in ours) being taken from half a Dram to a Dram, dissolved in White Port, or Lisbon Wine, is of good use in the Stragury, and to expel Sand, Gravel, and Tartarous Mucilage out of the Urinary Passages: Being bathed on the Skin, it takes away Scurf, Morpew, Scabs, Tettars, Ringworms, and such like Deformities thereof; as also the Leprous Scurf, if the places be first washt with a Dissolution of Nitre in Water, or the Gum be dissolved in the said Nitrated Water, and so used. When the Green Branches of the Vine are burnt, a Gummy Water will drop from their ends: this being saved, will perform the same things as the aforesaid Gum, having one and the same Nature and Qualities. They say, being mixed with Oil and used, it will take away Hair, and consume Warts; this, tho' I know nothing of by Experience, yet I much doubt it, because of its soft, and almost insipid Qualities.

LIII. Wine Lees. From the Lees of Wine, a Volatile Salt of Tartar may be Distilled, or Extracted after this manner. Take Lees of Wine dried with a gentle Fire, put them into a large Earthen or Glass Retort, so as to fill it about two third parts full. Put it into a Reverberatory Furnace, with a large Receiver: make at first but a small Fire, so as to heat the Cornute by degrees, that the insipid Flegm may be drawn forth. When Fumes or Vapors begin to arise, empty the Flegm out of the Receiver, and join it to the Beak of the Retort again, Luting it well. Encrease the Fire by Degrees, till the Recipient is filled with white Clouds; continue the Fire at that height, till the Recipient begins to cool, then increase the Fire to the bright, which continue so long till no more Vapors will ascend. The Vessel being grown cold, unlute the Receiver, and shake it well about, to cause the Volatile Salt which sticks to it, to fall to the bottom. Then put all into a Bolt-head with a long Neck, fitted with a proper Head and a small Receiver, which lute well in the Joints. Put it into a Sand bath, with a soft or small Fire, so will the Volatile Salt arise, and stick to the head and top of the Bolt-head. Take off this Head, and apply another in its stead, gather your Salt, and close it up immediately, for otherwise it will presently dissolve into Liquor: Continue now the Fire, and continually gather up the Salt as you see it ascend. When no more will arise, you may Distil a small Quantity of Liquor, and then put out the Fire. This Liquor is a quantity of Flegm, joined with some Volatile Salt, and may be called Volatile Spirit of Tartar, having the same Virtues with the Salt, and may be given from 8 Drops to 24. in any proper Vehicle. You may also make this Volatile Salt of Tartar after this manner. Take Wine Lees what quantity you please, separate by Straining, and pressing the Wine contained in them. From this Wine draw a very Subtil, Volatile, and Inflammable Spirit, which reserve. The Magma remain-

ing, dry in the Sun, or in a gentle Sand heat. Powder it, and sprinkle it with the afore-ferrowed Spirit, or with other well Rectified Spirit of Wine, making it moderately moist. Let the whole Mass dry of it self, as you dry'd it before : then fill with it two thirds of a large Retort of Potters Earth, place it in a large Reverberatory Furnace, fitted and well Luted to a large Recipient. Distil first with a gentle Fire, increasing it by degrees for about 12 Hours, till the Fire comes to the utmost violence : After which, the Vessels being cold, unlute them, and you will have in the Receiver, the Volatile Salt of Tartar, mixed with the Oily part, and much Flegm. Empty both together into a large Matras, with a long Neck, which place in a Sand heat, covering it with its Head, well luted to a Receiver. Distil with a moderate Fire, as in the Rectification of other Volatile Salts ; so will the Volatile Salt of Tartar ascend first, and stick to the inside of the Head, in a White and Crystalline Form, which gather with what Dexterity and Speed you can, that it may be perfectly separated from the Oily parts, which will ascend next to this Volatile Salt. Where Note, that the Rectified Spirit of Wine is not absolutely necessary in this Work, but there is this in it, that by embracing some part of the Acid of the Lees, and taking it along with it in its Distillation, it frees the Volatile Salt, so as that you will have it in greater quantity, than otherwise without it. In these Operations, the Acid Substance of the Juice of the Grape, unites it self with a great part of the Volatile Salt, to make the Composition of the Tartar : Whence it is, that Tartar yields not so much Volatile Salt as the Moist Lees at the bottom of the Cask do, which mightily abound in a Volatile Salt, and a Sulphurous Spirit. And hence it is, that the Volatile Salt of Tartar, is more easily, and more plentifully drawn from the Lees, than from the more Solid, and Stony Tartar. The Virtues. This Volatile Salt of Tartar is said to purifie the whole Mass of Blood, both by Sweat and Urine, and sometimes by Stool, whereby the Mass of Putrefactive Humors and Matter is carried off. It is good against the Palsie, Apoplexy, Epilepsy, Lethargy, and other like Diseases of Head, Brain and Nerves ; resists all intermitting Fevers, chiefly Tertians and Quartans, opens all Obstructions of Stomach, Liver, Spleen, Mesentery, Gall, Reins and Womb ; cures Cachexies, Dropsies, Jaundice, Scurvy, and other stubborn Diseases. Dose from 10 Grains to a Scruple, in any fit Vehicle. A Cataplasm of Wine Lees. It is made by mixing them with Rye Flower or Meal, till they come to a Consistency. Being applied, it is accounted an excellent thing to ease the pains of the Gout.

LIV. Tartar or Argol. It is that hard part of the Lees of Wine, which shooting it self to the sides of the Cask, sticks to the same, and becomes hard almost like a Stone. That which is taken from Rhenish, and other White Wines, is the best to be prepared into Medicines : But the Red Tartar, which proceeds from Red Wines, as it yields nothing near so much Salt, so it is much inferior to the former, but serves well enough for Dyers, in fixing their Colors, and for Gold-Smiths to boil their Silver in to whiten it. The White Tartar is many times given unprepared, being reduced into a Fine and Subtil Powder, from 2 Drams to half an Ounce, in half a Pint or more, of boiling hot Water-Gruel. It purges the Bowels, and cleanses them, as also the Urinary parts, of Slimy and Watery Humors, and is profitable against Cachexies, Dropsies, Obstructions of the Reins, Bladder and Womb, &c. But this Crude unprepared Tar-

tar is seldom given, for that the Purified Tartar, as also the Cream of Tartar, is common enough to be had, and at an easie price : Purified Tartar is thus made. Take pure white Crystalline Tartar 10 Pounds, beat it into fine Powder, and dissolve it in 6 Gallons of boiling Spring Water, and continue the boiling till it is dissolved ; then presently strain hot thro' an Hippocras Bag : The strained Liquor continually stir round with a Wooden Slice, till it is cold, then let it rest, and in 2 or 3 hours after, the pure fine Tartar will sink to the bottom of the Vessel, in form of an impalpable and shining white Powder, which is Tartar Purified, and is equal with either Cream or Crystals of Tartar. The Virtues, Dose and Use is as the former, and the same with Cream or Crystals of Tartar next following. See our Sepalsium, or Druggists-Shop, lib. 2. cap. 10.

LV. Cream and Crystals of Tartar. Dissolve what quantity of White Tartar you please, in a large quantity of boiling Water, which done, pass it thro' an Hippocras Bag, into a large Earthen Vessel, or Bell Glass underneath : Evaporate about half away, and set it to Crystallize for 2 or 3 days, (saving what swims a top, as well as the Crystals ;) Evaporate again half away, and set it to Crystallize, doing this so long till you have gotten all the Tartar. What swims on the top is called Cremor Tartari, The Cream of Tartar ; and that which shoots on the sides and bottom, is called the Crystals of Tartar. Where Note, that in dissolving and boiling the Tartar in the Water, it ought to be done rather in an Earthen Pot, than in an Iron one, lest it should draw a Tincture from the Iron. The Virtues of both these Preparations are one and the same, and the same with the Purified Tartar in the former Section, being Aperitive, Purgative, good for Cachectical, Hydropical and Asthmatick Persons ; and excellent against Tertian and Quartan Agues. The Dose is from 2 Drams to half an Ounce, mote or less, which being reduced to very fine Powder, ought to be given in the Vehicle boiling hot, that it may dissolve therein, and not fall to the bottom.

LVI. Tartar Emetick. Take Cream or Crystals of Tartar in fine Powder, Crocus Metallorum in Subtil Powder, of each 4 Ounces ; mix them, and dissolve in boiling Water, then filter, and evaporate to dryness. It is the best of all Emeticks, Operating with much Gentleness and Safety, Purging both upwards and downwards, and may be given from gr. ij. to viij. It may be given in hot Water-Gruel, or in some Conserve or Electuary, or the Pulp of a roasted Apple, washing it down with a little warm Posset-Drink, or Water-Gruel. It is good against Frenzy, Madness, Carus, Lethargy, Epilepsy, Vertigo, Melancholy, Sickness and Wind in the Stomach, pains of the Sides, Jaundice, Dropsie, Gout, Rheumatism, Putrid and Malign Fevers, Tertian and Quartan Agues ; inveterate Obstructions of Liver, Spleen, Reins, Womb and Mesentery ; and is profitable against a Dysentery, and the malignity of the Plague or Pestilence it self. Emetick Tartar may be made by several other Prescripts, as you may see more at large in our Sepalsium, or Druggists Shop, lib. 2. cap. 10. sect. 15, & 16. and in Our Pharm. Bateana, lib. 1. cap. 10. sect. 48. to which we refer you.

LVII. Spirit of Tartar. Take White Tartar in Powder as much as you please, put it into a large Earthen Retort Luted all over, so large as that it may not fill it above half or $\frac{2}{3}$ parts full, which place in a close Furnace of Reverberation : Make first a gentle Fire, which continue so long till nearly all the Flegm is come off : Then change the Receiver,

and

and fit to the Retort a large Glass Recipient. Increase the Fire Gradatim, till it comes to the utmost degree, and so great that the Recipient be filled wholly with white Clouds, for a pretty long season: Continue this degree of Fire, till the Recipient becomes clear again; at what time put out the Fire, and stop up the Registers of the Furnace, letting the Retort cool. Then unlute the Joint of the Recipient, and put the Liquor into a large Matrafs with a long Neck, fixing to it a fit Head, and in a gentle Sand heat draw off the Spirit (leaving the Oil at the bottom) repleat with a great deal of the Volatile Salt of Tartar, and some seto Particles of its fine and purer Oil, which keep in a Glass close stopp'd. This Spirit is a great Sudorifick, expelling from the Center to the Circumference, all Sharp, Corrosive, Malign, Poisonous, and Pestilential Humors; and all such unnatural or corrupted Juices, which are the cause of inveterate Leprosies, Scabs, Scurf, Morpew, Erisipelas, Herpes, Ring-worms, Tettars, Impetigo, and the like. It is powerful against all sorts of Colicks, Rheumatifms, Gouts, Quinies, Inflammations of the Throat and Tonfils, Pleurifies, French Pox, &c. It also opens all Obstructions of the Stomach, Liver, Spleen, Reins, Mefentery and Womb; and is prevalent against Cachexies, Green Sicknefs, Dropfie, Jaundice, Obstructions of the Terms, &c. Dose from a Scruple to a Dram, or two Drams in any fit Vehicle. See more hereof in *Our Pharmacopæia Londinensis*, lib. 1. cap. 8. sect. 7, §. 4. and in *Our Pharmacopæia Bateana*, lib. 1. cap. 3. sect. 20. where you may receive abundant Satisfaction.

LXVIII. *Oleum Tartari Distillatum*. The Distilled Oil of Tartar. This Oil is drawn with the Spirit, in the former Process just now declared, and in the separation of the Spirit is left behind in the Cucurbit or Matrafs. This Oil may be rectified from its more Empyreumatick and gross parts, after this manner. Take of the aforesaid Oil, and add to it four or five times its weight of Colcothar, and in a Glass Retort draw off the Oil by a gentle Sand heat. This Oil when rectified, will still be stinking, tho' nothing like that before Rectification; but it will yet sink less, if it be two or three times thus Rectified. It may be given thus Rectified, from gut. ij. ad viij. drop'd into fine Powder-Sugar, and so given in some fit Vehicle, against Fits of the Mother. It also expels Wind, and gives ease in the Colick. It generally cures Vapors by merely Smelling to; but by reason of its exceeding Fetidnefs, is not much used inwardly: 'Tis true, that being Rectified from the Calcin'd Vitriol, 'tis something better. It cannot be any ways made pleasant to the Smell, but be Elixirating of it, first with Rectified Spirit of Nitre, and then mixing it with threetimes its quantity of Rectified Spirit of Wine, then it may be given inwardly from 10 Drops to 40. in any fit Vehicle, against Diseases of the Head, Brain, Nerves, Womb and Joints.

LIX. *Mixtura Simplex*, or *Spiritus Diatriæ*. Take Rectified Spirit of Tartar, six Ounces: Volatile Spirit of Vitriol (which ascends next and immediately after the Flegm) 2 Ounces: Spiritus Theriacalis Camphorated, 10 Ounces; mix, and digest in a Phial Hermetically Sealed for a Month, that they may be perfectly united according to Art. This Mixture attenuates, opens, and by the Subtlety of its Particles, penetrates through the whole Body without any trouble: According to Paracelsus, it is a potent thing in curing the Epilepsy, gives immediate relief in the Pleurisie, and removes all Obstructions of the Viscera. It is a potent thing against burning, malign and Pestilential Fevers, expelling the Malignity by Sweat, and is a singular

Preparation against Hypochondriack Distempers and Melancholy; as also against Vapors, and Hysterick Fits. Dose one Dram, more or less, in Canary, or Canary mixt with Cinnamon-Water. See more hereof in my *Pharmacopæia Bateana*, lib. 1. cap. 2. sect. 12.

LX. *Sal Tartari*: Salt of Tartar Pure. It is made of White Tartar being Calcin'd in a Naked Fire, in a Reverberatry, or other Furnace of Calcination; after which, the Salt is Extratted with fair Water by Elxiviation, Filtration and Desiccation, after the manner of making all other fixed Salts. Or you may prepare it from the Caput Mortuum, remaining after the Distillation of the former Spirit and Oil of Tartar, after it has been again Calcin'd to Whiteness, by the former manner of Elxiviation, Filtration and Desiccation. This Salt is an admirable thing against the Stone, Sand, Gravel, and tartarous matter in the Reins and Bladder; it opens all Obstructions of the Viscera, provokes Urine powerfully, and is an excellent thing against the Scurvy, Dropfie, Jaundice, and Gout; and outwardly prevails against Scurff, Morpew, Scabs, Leprosie, Ulcers, Serpignes, Tettars, Herpes, Scald Heads, Tanning, Sun-burning, and all other Deformities of the Skin. It absorbs Acidities in the Stomach and other Bowels, and is an immediate thing against Heart-burning, Dose from half a Scruple to a Scruple, in Ale, Beer, Water, or White Wine, &c.

LXI. *Sal Tartari cum Nitro*, Salt of Tartar with Nitre. Take Crude white Tartar, Sal Nitre, of each (in Powder) equal parts; mix, and in a Crucible Calcine to Whiteness, by stirring the same with a red hot Iron, till the Nitre is wholly consumed, which is known by the ceasing of the Flagation and Burning. Thus the Tartar being Calcin'd as white as Snow, is yet the same in Weight with the Tartar at first, by which it appears, that the Tartar is nearly all Salt. If you mix this Salt with an equal quantity of Sulphur, and Calcine again, you will take away the nauseous Lixiviate Taste of the Salt, by which it will become not only more pleasant, but also in a great measure resist the Intromission of the Air, so that it will not so easily melt or dissolve. It is Diuretick, is a Famous Opener of Obstructions, and has all the Virtues of the former pure Salt. It takes away stoppages of the Lungs, Stomach and Bowels, provokes the Terms, and is prevalent against Asthma's, Coughs, Colds, Consumptions, Pleurifies, Cachexies, Dropfies, Jaundice, &c. Dose from half a Dram to a Dram, in Ale, Beer, Broth, Wine, &c. See our *Pharm. Londinensis*, lib. 3. cap. 11. sect. 99. And our *Pharm. Bateana*, lib. 1. cap. 10. sect. 42.

LXII. *Oleum Tartari per deliquium*: Oil of Tartar by Dissolution. Put pure Salt of Tartar upon a Polish'd Marble, which place shelving in a Cellar, over an Earthen Glaz'd Pot or Pan, or broad Glass Vessel, in a moist Cellar, so will the Salt dissolve into an Oil, and fall down into the Receiver. Or put it into a Hippocras Bag, which hang up in a moist Cellar, with a Glass, or Earthen Glaz'd Receiver under it, to receive the dripping Oil, which Filter and Evaporate to a Consistency. But if you would have immediately Oil of Tartar per deliquium, then put one Ounce of pure fine white Salt of Tartar, into two Ounces of Water, and it will all dissolve into Liquor, which if you please, you may filter thro' brown Paper, and keep for use. It has all the Virtues of the Salt, and may be given from half a Dram to a Dram, in any proper Liquor.

LXIII. *Sal Tartari Foliatum*; Foliated Salt of Tartar. Take Pure Salt of Tartar as much as you please

please, put it into a large Glass Cucurbit, and gently pour on it as much Spirit of Vinegar as the Salt can suck up, so that they may be satiated with each other, and no Effervescency at all remains, so will the Work be done at once: Some part of the Humidity of the Spirit, evaporate by a gentle Sand heat, so will a black substance remain at bottom of the Glass. Being cold, dissolve it in good Spirit of Wine, Filter thro' brown Paper, and in a Glass Cucurbit in a Sand heat, Evaporate to dryness. Dissolve again in Spirit of Wine, Filterate and Evaporate as before. This Work repeat, till the Salt is white, dry, and in distinct Leaves at bottom of the Vessel. It is of singular use to purifie or cleanse the whole Mass of Blood and Humors, and to resolve and carry off all manner of Tartarous Mucilage, (which is the cause of many Chronic and rebellious Diseases,) whether in the Viscera, or any other parts of the body. It keeps the Belly soluble, and purges by Urine all the Filth of the Reins, Ureters and Bladder. Dose from 10 Grains to 20, in Broth, or some other proper Vehicle.

LXIV. *Cremor Tartari Solubilis*, Soluble Cream of Tartar. Take Cream of Tartar, dissolve it in a sufficient quantity of warm or boiling Water; then drop in Oil of Tartar per deliquium, till the Ebullition ceases, after which Evaporate the humidity to dryness. It will readily dissolve in any warm Broth, Gruel, or Liquor, and may be given from half a Dram to a Dram. It gently loosens the Belly, abates the heat of Fevers, strengthens the Stomach, and opens Obstructions.

LXV. *Soluble Emetick Tartar*. Take of the former Soluble Cremor Tartari, Crocus Metallorum levigated, of each two Ounces; Spring Water three Pints; digest a Week, or in a gentle Sand heat, often shaking the Glass; then boil gently for an hour or more, after which Filterate, and Evaporate to dryness. This has all the Virtues of the former Emetick Tartar, but is more fit for use in many Patients, because it will readily dissolve in any cold Liquor, and may be given in the same manner and dose.

LXVI. *Sal Tartari Vitriolatum*; Salt of Tartar Vitriolated. Take of the aforesaid Oil of Tartar per deliquium, a Pound, more or less; drop upon it Spirit (or Oil) of Vitriol or Sulphur, so much till it makes no noise; when the Ebullition ceases, Evaporate with a gentle heat to dryness. It purges very well in one or two Drams, with much ease, and cleanses the Body admirably. It kills Worms in Children, being given from 10 Grains to a Scruple or more, in warm Broth or Gruel: It cleanses and strengthens the Stomach, cuts and dissolves tough and clammy humors in the Viscera; causes a good Appetite and Digestion, quenches Thirst, and extinguishes the heat of the most burning and malignant Fevers; dissolves Tartar in the Body, and opens all manner of Obstructions; it provokes the Terms, and is good against the Rickets in Children, and Green Sickness in Virgins; and is said to cure also Tertian and Quartan Agues.

LXVII. *Sal Tartari Volatile*; Volatile Salt of Tartar. Take white Tartar Calcined to blackness, or rather somewhat more, viz. till it is grey, three Pounds; put it into a great Iron Pot, upon which put fair Water, so much as to over-top it an Inch or two: Put the Pot over a gentle Fire, which when the Calcined Tartar is fully Embodied with the Water, and is become Blood-warm, strew upon it by degrees, a handful of Crude Tartar in fine Powder, so will an Effervescence arise: Continue to strew more Powder of Tartar upon it gradatim, so will the Fermentation increase, and the Bubbles grow

larger and more numerous, gathering together not much unlike a Bunch of Grapes: Mean while, let not the Fire exceed in heat such as is commonly used for Fermentations; still strewing in more Powder of Crude Tartar, not too much at a time, lest the Ebullition should run over the sides of the Vessel. When you see the Ebullition ceases, you must cease to strew in any more Crude Powder of Tartar. Put this whole matter into a very large Iron Gourd, with a very long Neck, which cover with its Head and Receiver: Lute well the Juntures, and Distil in a Sand heat, first with a very gentle fire, (applying continually cold wet Cloths about the Gourd, to stop a little the boiling of the matter) at last augment the Fire, so will the Volatile Salt ascend. The Distilled Liquor rectify again, as much as is fit for the Separation of the Salt, which you will have in Whiteness and Purity. This Volatilization is made by reason of the Fermentation, made by mixing of Crude Tartar with the fixed Salt of Tartar, whereby a perfect Separation of the Salt is made, (as well from the Calcined as Crude parts) and so Volatilized; that after Distillation there is not to be found in the Feces any Salt at all, either Volatile or Fixed. But there is another way of making this Volatile Salt of Tartar, from the pure fixed Salt thus: Take pure fine Salt of Tartar 2 Pounds, of the black distilled Oil of Tartar a Pound, mix them well together, and put them into a Glass Retort, which stop very close, and place it in a gentle Sand heat for 6 Months; then open the Mouth, and fix thereto a large Receiver well Luted, and place it in a Sand heat. Distil with a gradual Fire, so will a great quantity of Volatile Salt come forth, smelling like Urine, but white and Crystalline, of a very penetrating Smell, with a Liquor also, which contains in it a small quantity of the same Salt and a little Oil, almost as penetrating as the white Crystalline Salt. In this Preparation, by reason of the long Digestion, there is a secret Fermentation between the Distilled Oil and the Fixed Salt; and tho' the said Oil contains much Volatile Salt, yet the Volatile Salt here ascending, proceeds chiefly from the Fixed Salt of Tartar itself, which in this Operation quitting its Chains, immediately becomes Volatile, and manifests itself with all the Properties and Qualities of a Volatile Salt. The reason is, because the Volatile Salt here ascending, is in a very great quantity, and much more than the weight of the Oil; and the Feces remaining (which are only a black Oily Coal) weigh very much less than the Salt of Tartar made use of. The Virtues, Uses and Doses of this Volatile Salt, prepared by either of these ways, are fully and exactly the same, with Volatile Salt extracted from the Lees of Wine, at Sect. LIII. foregoing.

LXVIII. *Liquor of Tartar*. Take Calcined Tartar, and Common Salt, of each a Pound, fair Water 2 Quarts; mix, and digest in a gentle Sand heat for a Week, stirring it every day; strain, and add thereto pure White Tartar in fine Powder, a Pound: digest in a moderate Sand heat for a Month; then strain out thro' a Hippocras Bag, and afterwards filter the strained out Liquor thro' a brown Paper, and keep it for use. It will gently purge the Belly of Viscous and Watery humors, being given from one Spoonful to two, (more or less) in Broth, Gruel, or Rhenish Wine and Mead. It excellently opens all Obstructions of Liver, Spleen, Mesentery, Reins and Womb, provokes Urine, and cleanses the Urinary parts; is good against Melancholy, the Scurvy, Droptie, Jaundice, Gout, Obstructions of the Terms, Vapors and Giddiness of the Head, Green Sickness, &c.

LXIX. Spirit of Tartar Compound. Extract a fine white Salt of Tartar from the Caput Mortuum, left after the Distilling of the Spirit and Oil of Tartar, at Sect. LVII. and LVIII. foregoing, which mix with the said Flegm, Spirit and Oil: digest in Balneo, in a close Vessel, till the Salt is dissolved; then make Balls thereof with dry Clay, and distil them by Retort, in a naked Fire, and all the Salt will come over with the Spirit and Oil, perfectly united to the Spirit; from which separate the Fetid Oil according to Art. It has all the Virtues of the former Spirit of Tartar (at Sect. LVII. above), exalted, and therefore is much more powerful, but may be given in the same Dose, and after the same manner.

LXX. Diatesaron; Punch, or a Mixture of four things. Take choice Brandy, fair Water, of each a Quart; pure Lime Juice a Pint; Double Refin'd Sugar a Pound; mix altogether, and stir the Mixture till the Sugar is all dissolved. For a Conclusion to the Fruit of the Vine, or the Juice of the Grape, we thought it fitting to add this wonderful Reviving Cordial, this Charming Liquor of Consolation, which gives relief to the Miserable, removes Grief, cheers the Sorrowful, elevates the Dejected, gives admittable Satisfaction to the Discontented, and a plenary Release to the Slave, of what Kindred or Nation so ever; making every one seem happy to himself, who has the free Liberty of drinking it plentifully, and oft as he thinks it convenient. It truly cheats the Heart, revives the Spirits, strengthens Universal Nature, and makes the Patient Pleasant and Sprightly, if moderately taken. I know it to be a true Restorative, and to have Cured such as have been in deep Consumptions, by drinking it every Day for about 5, 6, or 7 Months together, half a Pint every Morning fasting, eating with it a White Ship Bisket, toasted, and soaked in the same; half a Pint half an Hour before Dinner; half a Pint about 5 in the Afternoon, and half a Pint at going to Bed. This Quantity may do well enough for Men, but the Female Sex, may (if they please) a little diminish the Dose, as their Reason and Experience shall direct them.

C H A P. DCCXXV.

Of VIOLETS

GARDEN and WILD.

I. **THE Names.** It is called in Atabick, *Senefge*, *Sonofrigi*, and *Benefsegi*: in Greek, *ἰώ*; in Latine *Viola*, and in English *Viola*.

II. **The Kinds.** We have first, *ἰώ ποικίλη*, *Viola Purpurea Dioscoridis*; *ἰώ ὡκεαν*, vel *purpurea*, *Viola nigra Theophrasti*; *Viola Hortensis*, and *Viola Martia*, *Viola purpurea*, Garden or March Violets. 2. *Viola Martia vel purpurea flore Multiplici*, Double March Violets. 3. *Viola surrecta purpurea*, *Viola Arborescens Matthioli*; *Viola fruticosa Gesneri*; *Viola Elatior Clusii*; *Viola Martia Cauliculis surrectis Lobelij*; *Viola assurgens tricolor Dodonaei*; *Violarum mater Lugdunensis*, Upright Wild Violet. 4. *Viola Sylvestris vulgaris*, Common Wild Violet. 5. *Viola laciniata folio*, *Viola Montana laciniata Clusii*, *Viola laciniata folio Caroliniana*, The Wild Jagged Leav'd Violet, or Wild Carolinian Violet.

The Descriptions.

III. The first, or single Garden Violet, spreads its Root in the Ground both deep and wide, taking strong hold thereof. From whence come forth many Branches of round green Leaves, finely smpt or dented about the edges, growing upon several small Footstalks, set at divers places of the many creeping Branches, which as they run, do here and there take Root in the Ground, bearing thereon many Flow'ers, severally at the Joins with the Leaves, which consist of five small Leaves, with a short round Tail, Heel or Spur behind, of a per-

Violet Garden Purple.

fect blew purple color, and of a very fragrant sweet Smell: After which, come forth round Seed Vessels, standing likewise upon their small Footstalks, in which is contained round white Seed: but these Heads rise not from the Footstalks on which the Flowers grew (as is usual in all other Plants) but apart by themselves; and being Sown, will produce others like unto it self, whereby there may be made a more speedy increase to Plant a Garden, than by Slipping, as is the usual manner. Of this kind, there is a sort which bears white single Flowers, not differing in Smell or any thing else. And another sort which bears a dead, or sad reddish color'd Flower, with a weaker Smell, but in all other particulars alike.

IV. The second, or Double March Violet. There is no difference between this kind and the former, but in the Duplicity of the Flowers, which have so many Leaves set and thrust together, that they are like unto hard Buttons. Of this Double kind, there are both Purple and White, as in the Single, but the White sort is seldom so thick and Double as the Purple.

V. The third, or common Wild Violet. This is altogether like the first single Garden Violet, but that its Leaves are fewer in number, somewhat thinner, and a little longer, or not fully so round. The Flowers are also larger, and of a very pale Purplish blew color, near unto a Watchet, some of which

Violet Wild Common.

which have the Smell of the Garden Kind, but much weaker; and some of them have almost no Smell at all. Of this Wild kind, there is the Purple sort, and the yellowish white. I am apt to believe, that the Garden kind is only this Wild kind Transplanted into Gardens, where having a better Soil to grow in, it becomes more perfect in its Color and Smell.

VI. The fourth, or Upright Wild Violet. Its Root consists of Strings, which abide not after Seed time, but preserves its Species by Sowing it self every Year. It grows to be about a Foot high or more, with hard upright Stalks, which yet bend down again their tops, having two Leaves somewhat round, set at each Joint, but longer, and more dented about the edges than those of the Garden kinds; at which Joints, with the Leaves on both sides of the Stalks, comes forth a larger Flower, and more spread open than it, being more like a Hearts-ease, or Panicle, but of a pale purplish color, which as Matthioli says, is almost as sweet as the Garden Violet; but as Lobel says, is without any Smell at all. After the Flowers are past, follow the Seed Vessels, (which are longer than those either of Violets or Hearts-ease) in which is contained a small Seed as that of Hearts-ease, but whitish.

VII. The fifth, or Wild Jagged Violet, or Carolinian Violet. It has a spreading fibrous Root, and rises up with Stalks about a Foot or more high, but so weak as that they can scarcely keep themselves upright, but bend towards the Ground, unless they have some Shrubs, Buses, or other matter to lean against. There first Spring from the Root several Leaves, upon a pretty long Footstalk, which are long, and cut in on the edges on both sides, into several Divisions, which some will have to re-

semble the longer sort of Crowfoot Leaves, others an Anemone Leaf; but those which I saw and gathered with my own Hands, were jagged, and shaped more like a Vervain-Leaf, setting aside the color. Between these Leaves rise up several small Stalks, with like Leaves, but lesser upon them, which grow lesser and lesser up to their tops, which have Flowers upon them, of a pale Purple color, very like in form to our common Garden kinds, but not so deep shaded, but some of them of a pale Purple, and some of a whitish yellow, and some of these last with a little reddishness towards the bottom of their Leaves; some of these Flowers had a very faint or Languid Smell of our common Garden Violets, and others had no Smell at all: The Stalks bore also round Heads or Seed Vessels, (which contained the Seed) like to the Seed Vessels of Violets.

VIII. The Places. The first and second grow in Gardens; the third Wild in Fields and Woods, under Hedge Sides; the fourth grows wild in warm Climates, as Spain, Italy, Greece, Asia, &c. but with us in Gardens; the fifth grows Wild in several parts of America. I found it growing plentifully in South Carolina, in the Woods not far from Charles Town.

IX. The Times. They all Flower in March, and if the Season is mild, sometimes earlier. The Double Violets Flower later than the Single, and hold their Flowers longer; and some of them have been observed to Flower again in Autumn, if the Weather be temperate and mild.

X. Observat. The Culture of the Single Garden Violet, is what every body knows, which delights it self in shady places, and such as are least exposed to the Sun. The Double Violet grows in any sort of Ground, upon the edges of Borders in Gardens, which when it blows, its Flower is very agreeable to both Eye and Smell: To make it thrive, it ought to be Re-planted every three Years, and so kept clear from Weeds, which is all the trouble it requires.

XI. The Qualities. Garden Violets while fresh and green, are cold and moist in the first degree, Aperitive, and gently Absterfve, or opening the Bowels by Purging.

XII. The Specification. Violets cool the heat of Fevers, allay Inflammations in the Throat and Lungs, are profitable in the beginning of a Quinsie and Pleurisie, and are said to help the Falling-Sickness in Children.

XIII. The Preparations. You may have therefore, 1. A Juice both of the Leaves and Flowers. 2. An Infusion of the Flowers. 3. A Syrup of the Flowers. 4. A Powder of the Leaves. 5. A Powder of the Flowers. 6. A Powder of the Seed. 7. A Cataplasm of the Leaves, as also of the Flowers of the White Violet. 8. A Julep. 9. Oil of Violets.

The Virtues.

XIV. The Juices. 1. Of the Leaves. It cools any heat or distemperature of the Body, whether inward or outward; abates Inflammations in the Eyes, also in the Womb, and in the Fundament, by being used as a Topick. And being drank to 2, 3, or 4 Ounces, it gently opens and purges the Bowels, and is good against Quinsies and Pleurisies. 2. Juice of the Flowers. It has the same Virtues, and is good against the Pleurisie and Obstructions of the Lungs, hot and sharp Rheums, hoarseness and wheezing.

XV. *The Infusion of the Flowers, fresh or dry.* It has all the former Virtues, but not full out so effectual, and therefore may be drank to half a Pint or more. Being made pleasant with the Syrup of Violets, and sharp with a little Oil of Sulphur, it is an excellent Gargle for a sore Throat, is profitable against a Quinsie and Pleurisie, and cures the most malignant burning Fever.

XVI. *The Syrup of the Flowers.* It is made 1. With the Juice of the Flowers thus. Take Juice of the Flowers of Violets a Quart; double refined Sugar 4 Pounds, mix and melt in the heat of a Bath without Boiling. It cools, moistens, allays the heat of Fevers, quenches Thirst, comforts the Stomach, cheers the Heart, and resists Putrefaction. Dose from one to two Ounces, given to four Ounces, it purges Choler admirably. 2. With an Infusion in Water. Take fresh Flowers of Violets a Pound, fair Water boiling hot a Quart; stop them close up in a Glass Matraass or Vesica for a day, then strain out by pressing; in the strained Liquor two Pounds, dissolve of Double Refined Sugar, four Pounds, by the heat of a Bath, and taking off the Scum, make it into a Syrup without Boiling. It has all the former Virtues, but less powerful, and therefore may be given in double the quantity. Either of these Syrups will be much more effectual in hot, burning, malign and pestilential Fevers, if they be made a little Acid (when given) with some few Drops of the Spirits or Oils of Sulphur or Vitriol, by which they will be made of a Claret Wine color, and of a fine tart Relish, pleasing the Palate, and so more potent in cooling all preternatural heats, and quenching Thirst, &c.

XVII. *The Powder of the Leaves.* Taken to a Dram in Veal Broth, or White Wine Mull'd, it allays inward Inflammations, and purges the Body of Cholerick Humors.

XVIII. *The Powder of the Purple Violet Flowers.* Given to a Dram as the former, it has the same Virtues and Effects, but Purges not altogether so strongly: It is also said to be good against the Quinsie, and the Falling Sickness in Children, especially in the beginning of the Disease.

XIX. *The Powder of the Seed.* It is good against the Stinging of Scorpions, is Pectoral, and good against Fevers, Quinsies, Pleurisies, and Epilepsy; heat and scalding of Urine, and all pains in the Reins and Back, the Strangury, or Obstructions of the Urinary parts. Dose one Dram, in any convenient Diuretick, and cooling Vehicle.

XX. *The Cataplasme.* It is made of the green Leaves, being fryed with Yolks of Eggs. It being applied, eases pains, and dissolves Swellings in the Fundament, and in a short time is said to cure the Piles. Made with Oil of Roses, it dissolves Tumors, abates Inflammations in any part, and eases pains of the Head caused thro' want of Sleep.

XXI. *Julepum Violarum.* Julep of Violets. It is made of the Water or Infusion of Violet Flowers and Sugar, a Pound of Double Refined Sugar to two Quarts of the Water or Infusion. The Virtues are the same with the Syrup, and may be used to all the same purposes and intentions.

XXII. *Oleum Violaceum.* Oil of Violets. Take Purple Violet Flowers, which bruise in a Stone Mortar with a wooden Pestle, 12 Ounces; Oil of Omphacine several times washed, 3 Pounds; mix, and expose them in a Glass close stop'd, to hot Sun for a Week, shaking them every day; then boil them gently in a Bath, press them out, and put in fresh Flowers, doing in like manner, which repeat a third time, and keep the Oil upon three Pounds of Juice of Violets, shaking them together twice a day for a Month at least. It is Cooling and Moistning,

Opening and Anodyn, good against Inflammations, Phlegmons, burning Fevers, Hoiccicks, Frenies, and Atrophies; it also eases pains of the Brest and Lungs.

C H A P. DCCXXVI.

of VIOLETS Corn and Dames.

I. **T**HE Names. Tho' these are properly no Violets, nor in the least of kin to them, yet since Custom has obtain'd that they should be so called, we were obliged to rank them in order of the Alphabet, and in this place where you now find them. The first I suppose was unknown to the Ancient Greeks and Latines, and therefore we have no Greek, nor Ancient Latine Name for them. The first is called in Latine, *Viola arvensis*, *Viola Segetum*, *Caryophyllus Segetum*; in English, *Corn Violet*, or *Venus Looking-Glass*, by Gerard. The second is called in Latine, *Viola Matronalis*, and in English, *Dames Violet*.

II. *The Kinds.* Of the first or Corn Violet, there are two sorts, viz. 1. *Viola arvensis major Dodonæi*, *Viola pentagonia major Tabernamontani*, *Viola Segetum major*; *Onobrychis* & *Campanula arvensis Lugdunensis*, The greater Corn Violet. 2. *Viola arvensis minor*, *Viola Segetum minor*, The lesser Corn Violet.

III. Of the second or Dames-Violet, we have 1. *Hesperis vulgaris*, sive *Viola Matronalis communis*; *Viola Hyemalis*, *Damascena* & *Muscharella*; in English, Common Single Flower'd Dames Violets, Queens Gilliflower, and Winter-Gilliflower. 2. *Hesperis Pannonica*, *Viola Matronalis Pannonica*; Hungarian Dames Violet. 3. *Hesperis*, sive *Viola Matronalis flore albo pleno*, *Viola alba Tragi*, *Persica Hermolai*, supposed to be the *Lucoium Fuschij*; *Viola Matronalis flore pleno Dodonæi* & *Lugdunensis*; *Viola Damascena flore pleno Lobelij*; *Viola Hyberna* sive *Hyemalis*; *Hesperis flore pleno albo*, White double Dames Violets. 4. *Hesperis flore pleno Purpurante*, *Viola Matronalis flore pleno Purpurante*; Double Purple Dames Violets.

The Descriptions.

First, Of the CORN-VIOLETS.

IV. The first, or *Viola Segetum major*, *Viola pentagonia major*, *Speculum Veneris majus*, The Greater Corn Violet. Its Root is small, Fibrous and Annual, which sends forth several slender, weak, trailing Stalks lying on the Ground, divided and subdivided from every Joint into Branches, so plentifully, that one Plant growing in a good Garden, would hardly be covered by a Half Bushel Measure: the Branches are thick set without order, with small and somewhat long Leaves, slightly dented, or rather waved on the edges: at every Leaf from the middle of the Stalk upwards, comes forth a Flower, of the bigness of a Two-Pence, so (that five hundred Flowers almost, will be seen open at once, which is indeed a Noble Sign;))

Sight;) set in a fine pointed green Husk, of a fair purplish blew color, made of one whole Leaf, plaited into five round pointed ends, white at the

Violet Corn Greater.

bottom, with a white Pointel in the middle, closing up every Night, and opening in the Day time only, the Seed is small and yellow, and contained in small long Heads.

V. The second, or *Viola Segetum minor*, *Speculum Veneris minus*, Codded or small Corn Violet. Its Root is small and Annual, also not much unlike the former, which sends up Stalks more upright, like unto the little Centory, with stiffer and fewer Branches, more harsh or tough also in handling. The Leaves are like unto the former, but something less. At every Joint almost, come forth two or three Flowers, standing at the ends of long Cods, like unto *Lythimachia Siliquosa*, of the same fashion and color as the former, but so small as the Eye of a little Bird, never rising above the Husk it stands in, and not but in the heat of the day to be seen, which then only lays it self open. The Seed is small and yellow also as the former.

VII. The Places. The first grows in Corn-fields, between Greenhithe and Dartford in Kent; as also in the Corn-fields about Lilly, a Town in the furthestmost parts of Hartfordshire, towards Bedford; and for its pleasant Aspect, is also brought into, and Planted in Gardens. The second is found about Hatfield, in Hartfordshire, and in several other places of this Land. Parkinson says, it is much more frequent than the other.

VII. The Times. They both Flower in June and July, even to the end of August, the Seed ripening in the mean time.

Secondly, Of the DAMES-VIOLETS.

VIII. The first, or Common Single Flower'd Dames Violets. Its Root is wholly composed of Strings or Fibres, which abide many Years, sending up fresh Stalks every Year, the Leaves abiding all the Winter. Its Leaves are broader, greener, and sharper pointed than the Stock Gilliflowers, and a little indented about the edges. The Stalks grow to be about two Feet high, bearing many green Leaves upon them, smaller than those at the bottom, and branched at the top, bearing many Flowers, in fashion much like to those of Stock-Gilliflowers, consisting of four Leaves in like manner, but not

Violet Dames, Single Common.

so large, of a faint purplish color in some, and in others white, having a pretty sweet Smell, especially towards Night, (whence came as is supposed, the Name *Hesperis*.) but in the Day time little or none all. After the Flowers are past, come small, long, and round Pods, in which are contained two rows of small and long black Seed.

IX. The second, or Hungarian Dames Violets. Its Root is Fibrous, and its Leaves very like the former, but smoother and thicker, and not at all cut in or indented about the edges. The Flowers are like the former also, but of a dull pale color, turning themselves, and seldom lying plain open, having many Purple Veins and Streaks, running thro' the Leaves of the Flowers, of little or no Smell in the Day time, but of a very sweet Scent in the Evening and Morning. The Seed is like also, but a little browner.

X. The third, or Double White Dames Violets. It grows not so great in any part thereof, nor so high as the Single does, except in the Flowers, which

which being very thick of Leaves, of a pure white color, and many standing in a Cluster, sweeter also than the Garden Single Kind, and longer abiding, causes it to be had in some esteem. Its Leaves are something lesser, and of a fresher green color, little or nothing snipp'd about the edges, and more tender; but its branches are more plentiful, and more easie to be slip't to be Planted again, than those of the Single Kind, but gives no Seed, as many other Double Flower'd Plants do in like manner. It is also more tender to be kept in Winter time than the Single Kind.

XI. The fourth, or Double Purple Dames Violets. These differ little or nothing from the former, saving in the color of the Flowers, which in this is of a fine pale Purplish color, and not full out so double as they, nor so many clustering together.

XII. The Places. They all grow in Gardens for Ornament sake in a great measure; and the two Double Kinds in many Gardens in the West parts of England.

XIII. The Times. They all Flower in May, June, and July chiefly, and the White Double abides longest in Flower, if it grows not too much in the Sun.

XIV. As to the Qualities, Specification, Preparations and Virtues of these Corn and Dames Violets, Authors are totally silent; nor have we learn'd any thing of them by Experience: yet we did not think it fit that they should want a place in this Our Herbal, since the most General Florists, and all Lovers of Flowers, for their Beauty sake, allow them a room in their Gardens.

CHAP. DCCXXVII.

Of VIPERS Grafs.

I. **THE Names.** It has no Arabick nor Greek Names that we know of, nor any Ancient Latin Name, being a Plant of modern Invention, and therefore is called by our modern Physicians, *Serpentaria*, *Viperaria*, *Viperina*, (from its Virtues in curing the Bitings of that Serpent) and *Scorzonera*, (from the Spaniards, being equivalent to *Viperaria*) and in English *Vipers Grafs*, and also *Scorzonera*.

II. **The Kinds.** Authors make 7, 8 or 9 kinds, but most of them being perfect Strangers to us, and not to be seen in England in Ages, we shall only discourse here of such as are Planted and Nurst up in our Gardens, which are the four following, viz. 1. *Scorzonera*, seu *Viperaria*, *Hispanica major*, The Greater Spanish Vipers Grafs. 2. *Scorzonera minor Pannonica purpurea*, Hungarian Purple Flower'd Vipers Grafs. 3. *Scorzonera major Pannonica latifolia*, The Greater Hungarian broad leav'd Vipers Grafs. 4. *Scorzonera minima radice tuberosa Hispanica*, The smallest Spanish Vipers Grafs with a Tuberosé Root.

The Descriptions.

III. The first, or Greater Spanish Vipers Grafs. Its Root is long, thick and round, brittle and black, with a certain roughness on the outside, but very white within, yielding when broken, a Milky Li-

quor, as every other part of the Plant does besides, yet the Root more than any other part; and withal, it abides many Years without decay. It has several long Leaves, not broad, nor yet very narrow, hard and crumpled on the edges, and sometimes unevenly indented or waved on the edges, of a blewish green color. From among which, rises up one Stalk, and no more for the most part, two Feet high, or thereabouts, having here and there some narrower long Leaves thereon than those below. The top of the Stalk branches it self forth into other parts, every one bearing a long scaly Head, from out of the top whereof, rises a fair, large, double Flower, of a pale yellow color, much like to the Flower of Yellow Goats Beard, but a little less; which being past, the Seed comes, being long, whitish and rough, inclosed in much Down, and among them many other long smooth Seeds, which are limber and fruitless, but are all carried away with the Wind.

IV. The second, or Purple Hungarian Vipers-Grafs. Its Root is like the former, and it has long and narrow Leaves, of the same blewish green color with the former. The Stalk rises up to be about a Foot and half high, with a few such like Leaves, but shorter thereon, spreading out at the top into 2 or 3 parts, bearing on each of them one Flower fashion'd like the former, and standing in the like scaly Knob or Head, but of a blewish purple color, and not fully so large, which has the sweetest Smell of any of the Species, or Kinds of Vipers-Grafs, not much inferior to the most delicate Perfume.

V. The third, or Greatest Hungarian broad leav'd Vipers-Grafs. Its Root is long and great,

Vipers Grafs, { *Yellow* } Flowered.
 { *Purple* }

Sect. III. and IV.

Vipers Grafs Tuberosé Rooted, Sect. VI.

thrusing

thrusting it self out into many Branches or Heads, from the upper part thereof; blackish on the outside, but white and pleasant within as the other, yielding Milk in every part of the same, in like manner also, abiding many Years, and not perishing after Seed time, as the Goats Beards do, whereof the Vipers Grasses are accounted as kinds. It is very like to the first Spanish Kind, almost in all things, but the Leaves hereof are more in number, which rise from the head of the Root, and as broad and as long as they, but not crumpled about the edges, nor of that grayish green color, but smooth, and of a dark or dead green color. It has two or three Stalks rising up among the Leaves, and sometimes but one, according as the Root has increased into several Heads, having some lesser Leaves upon them, and at the top a scaly, and somewhat long green head, from the middle whereof, grows the like double yellow Flower, as in the Spanish Kind, and the like Seed also, lying in the like Downy Substance; neither of them to be well discerned the one from the other, after they have grown any time in the Garden together.

VI. The fourth, or smallest Spanish Vipers-Grass with a Tuberosc Root. Its Root is as thick as three Fingers or more, but shorter than the other Kinds, Tuberosc at the end, blackish without, and whitish within, yielding but little Milk when it is broken, but abides the Winter almost as well as any of the former. It has divers Leaves very small and narrow, lying on the Ground, some Roots giving smooth Leaves, and others crumpled or waved about the edges. The Stalk or Stalks are very small, scarcely rising half a Foot high, bearing a long, small, scaly Head, with a small and single pale yellow Flower, in which grow smaller black Seeds, and enclosed in far lesser Down than in any of the others.

VII. The Places. The Native places of these Plants, are declared in their Titles or Names, but now they are made Free Denizens of our Country, and are found nurst up, and growing in many of our Gardens.

VIII. The Times. They all Flower from the beginning of May, and their Seed is ripe before the end of June; after which, the Stalks wither and dye away, new Springing from the Root again before Winter.

IX. The Qualities. They are temperate in respect of heat or cold, driness or moisture; Cordial or Cardiack, and Alexipharmick, or resisters of Poyson.

X. The Specification. As they are said to strengthen the Heart and Vital Spirits, so also Monardus says they are a Counter Poison, and have been found to cure the bitings of Vipers, or other like Venomous Serpents.

XI. The Preparations. 1. The Boiled, Roasted, or Baked Roots. 2. The Liquid Juice. 3. An Ophthalmick. 4. A Conditio or Preserve. 5. A Distilled Water.

The Virtues.

XII. The Boiled, Roasted, or Baked Roots. They are sweet in Taste, almost like a Parsnep, and may be eaten in the same manner; without doubt they cheer the Heart, strengthen the Animal Spirits, and restore in Consumptions.

XIII. The Liquid Juice. According to Monardus, it is a good Cordial and Counter-Poison, and does not only help, or cure the biting of the Viper, but of any other Poisonous Creature; it is good

against Burning and Contagious Fevers, and induces Sweating, thereby expelling thro' the Pores, Pestilential Infection. It is good against Passions and Tremblings of the Heart, Sadness, Melancholy, and Swooning Fits. It opens Obstructions of Liver, Spleen, Mesentery and Womb, provokes the Courses, is good against Hysterick Fits, and other Distaffections of the Womb, and prevails against the Head-ach, Vertigo, and other Diseases of the Head and Brain; strengthening after an admirable manner, the Animal and Vital Powers. This Juice may be taken not only from the Roots, but also from the Leaves and the whole Plant.

XIV. The Ophthalmick. Take of the Clarified Juice a Pint, Clarified Honey two Ounces, mix and dissolve. Dropped into the Eyes, it is good against Inflammation and Blood-shot, takes away Clouds, Spots and Blemishes in them, and heals them if Sore or Ulcerated, strengthening the Sight withal.

XV. The Conditio or Preserved Root. They are pleasant to be eaten as a Sweet Meat, not inferior to Eringo Roots, and may have in some small measure the Virtues of the Liquid Juice.

XVI. The Distilled Water. Authors give it the Virtues of the Liquid Juice, but I am confident it is nothing near so strong or effectual; but they give it against hot, burning and malign Fevers, and the Infection of the Plague, and all sorts of Contagious, Infectious and Pestilential Diseases, Faintings, Swoonings, and other Passions of the Heart.

CHAP. DCCXXXVIII.

Of the VIRGINIA Creeper:

OR,

CLIMBER.

THE Names. It is a Plant of Noval Invention, being brought to us from Virginia, and other parts of the West-Indies; and therefore has no Ancient Greek or Latin Name; but it is called in Latin by our Moderns, *Vitis Virginensis*, or rather *Hedera Virginiana*, and in English, the Virginia Creeper, or Climber.

II. The Kinds. Parkinson makes two sorts hereof, viz. The Five Leav'd Creeper, and the Three Leav'd Creeper. Mr. Rea, in his *Pomona*, pag. 227. makes but one Species; but for Satisfaction sake, we will give you all that they have both said.

The Descriptions.

III. The first, or *Hedera Quinquifolia Virginiana*, Five Leav'd Creeper. Its Root spreads here and there under the Ground, not very deep: It is a slender Vine, Ivy, or Plant, tall and climbing, and rises out of the Earth with several Stems, none much bigger than a Mans Thumb, but many less. From whence shoot forth many long weak Branches, not able to stand upright, unless they be sustained; yet Planted next to a Wall or high Pales, Poles, Trees or the like, the Branches at several distances of the Leaves, will shoot forth small short Tendrels, not twining themselves about any thing, but ending in four, five, six, or more

more short, and something broad Claws, which will stick to, and fasten like a Hand with Fingers, so close thereunto, that if pulled off, or forc'd away from the Wall, or thing it sticks to, it will bring part of the Wall, Bricks, Stone, Board, or other matter it is joined to, away with it: By these Claws it stays it self, and so fixes it self, as to climb up to the top of the highest Chimney of any House, or to the very top of the highest Tree, being Planted against them. The Leaves are crumpled, or rather folded together, at the first coming forth, and very red, which alter in growing large, and are very fair, large and green, divided into 4, 5, 6 or 7 Leaves, standing together upon a small rootstalk, set without Order on the Branches; at the ends whereof, as also sometimes at other places, come forth divers short Tufts or Buds for Flowers; but in our cold Climate, we scarcely ever see them open themselves, to shew what manner of Flower they would be, or what manner of Fruit would follow them.

IV. The second, or *Hedera Virginiana Trifolia*, The three Leaved Creeper. The Roots of this Plant do shoot under Ground, and send forth young woody Stalks, of which some will stand upright, others lye down, and take Root again as they spread, as also in any Wall they stand nigh to, like unto our Barren Ivy. The Leaves are broad and large, three always set together upon a long rootstalk. At the Joints with the Leaves, come forth pale Flowers, in a loose Tuft or Cluster, which turn into pale yellow Berries, with small hard round Ash color'd Seed, in a dry wrinkled Skin or Husk, without any moisture at all in them. This Plant yields a white Milk, without any Taste, being broken in any part thereof, which after it has continu'd a while, will change to be as black as Ink, and therefore held fit to color Hair, Leather, or any other things.

V. Mr. Rea's singular Description of the *Virginia Climer*, is this. Its Roots run on the top of the Ground, and by cutting some of them from the Stock, and turning up the ends, new Plants may be raised. It rises up with divers small Stems, divided into many long weak Branches, which set against a Wall, will fasten thereunto, with small Claws like unto a Birds-foot, and climb to the top of a tall Chimney. The Leaves at first are red and crumpled, but afterwards fair and green, divided into 5, 6, or more Leaves, standing together upon a small rootstalk, set without order. The Flowers with us appear only in Bud, but never are seen to open.

VI. The Places. They grow in Virginia, and other Cold parts of America, from whence they have been Transplanted to us, with whom they thrive well, being Planted in our Gardens against high Stone, or Brick Walls, or the sides of very high Houses.

VII. The Times. The particular times of their Flowering, our Authors have not Observed, but it is in the Summer Months.

VIII. Nothing has been Observed as to their Qualities, Specification, Preparations and Virtues, and therefore we are Silent concerning of them; however, being a very Beautiful Ornament, we thought not fit to over-pass them.

C H A P. DCCXXXIX.

of VIRGINIA Silk-Grafs.

I. THE Names. It is a Plant of Noval Invention, and therefore no Primary Greek or Latin Names can be given for it, but only such as have been ascribed to it by Modern Authors, by whom it is called *Periploca Virginiana*, and in English *Virginia Silk*, and *Silk Grafs*.

II. The Kinds. Mr. Rea gives us the Description of but one sort, but Parkinson of two, viz. 1. *Periploca recta*, vel major *Virginiana*, The Greater Virginia Silk-Grafs. 2. *Periploca Virginiana minor*, The Lesser Virginia Silk-Grafs. Gerard will have it to be a kind of *Asclepias* or *Swallow-wort*, but then he might have called it *Asclepias Ladan*, because this is Milky, or has a Milky Juice, whereas the true *Asclepias* has no such thing. *Alpinus* de Plant. Egypt. cap. 25. has a Plant called *Beidelfar*, *Honorius Bellus*, in Epist. 3. & 4. to *Clusius*, has *Ossar Frutex*, and *Clusius* in the same Book another Plant, which he calls *Apocynum Syriacum*, *Palestinum* & *Aegyptiacum*: These, some will have to be this *Silk-Grafs*, but this they cannot be; for either of them is a *Frutex* or *Shrub*, whereas this is not, but looses its Leaves and Stalks, they dying down to the Ground every Year. Again, the Milk of those Plants is *Cautick*, as *Alpinus* and *Bellus* say, whereas the Milk of our *Virginia Silk-Grafs* is not. Also the Cods of those of *Alpinus*, *Bellus*, and *Clusius*, are nearly straight, whereas those of our *Silk-Grafs* are crooked, almost like Hooks, and yet they grow perfectly upright.

The Descriptions.

III. Mr. Rea's Description, which I take to be of the Greater kind, is this. *Virginian Silk* is a Plant more respected for being a Stranger, than for the Beauty of its Flowers: Its Root is big, long and white, running far under Ground, and springing up again in many places. It rises up with one or more round Stalks, almost four feet high, set at several Joints with two long, broad, veined, round pointed green Leaves. At the top of the Stalk, out of a Skinny Hosc, comes forth a great Tuft of Flowers, to the number of thirty or forty, hanging down on long Footstalks, each Flower consisting of five small hollow Leaves, of a pale purplish color, neither fair nor pleasant. After they are past, come long crooked Cods, standing upright, containing flat brown Seeds, wrapped within a great deal of fine soft whitish brown Silk. This I take to be Parkinson's Greater Virginia Silk.

IV. The first, or Parkinson's Greater Virginia Silk-Grafs. Its Root is long and white, of the bigness of a Mans thumb, running under Ground very far, and shooting up in divers places, the Heads being set full of small white Grumes or Knots, yielding forth many Branches or Stalks, if it stands any time in a place. It rises up with one or more strong and round Stalks, 3 or 4 Feet high, on which are set at the several Joints, two fair, long and broad Leaves, round pointed, with many Veins therein, growing close to the Stem, without any Footstalk. At the tops of the Stalks, and sometimes at the Joints with the Leaves, comes forth a great

great Bush of Flowers, out of a thin Skin, to the number of 20, sometimes of 30 or 40, every one upon a long Footstalk, hanging down their Heads for the most part, especially those which are outwardmost, each standing within a Husk of green Leaves turned to the Stalkward, like to the Virginia Lyfimachia Flower, and each of them consisting of five small Leaves, of a pale Purplish color on the upper side, and of a pale yellowish Purple underneath, both sides of each Leaf being as it were folded together, making them seem hollow and pointed, with a few short Chives in the middle: After which, come long and crooked Cods, standing upright and sharp pointed, in which are contained flat brownish Seed, dispersedly lying within a great deal of fine soft and whitish brown Silk, very like unto Cods, Seed, and Silk of *Aclepias* or Swallow-wort, but that the Cods are greater, more crooked, and harder also in the outward Shell. This so Beautiful a Plant, (as Parkinson calls it) even the whole Plant, Leaves and Stalks being broken, yields a pale Milk.

V. The second, or *Periploca Virginiana minor*, five *Apocynum Virginianum minus*, or lesser Virginia Silk-Grass. This creeps not with its Roots in the Ground, like the former, but from many long Fibres shoots forth a round brown Stalk about half a Turd high, having at each joint a pair of long narrow Leaves, and at top such a large Tuft of Flowers as in the first, but of a deeper Purple color, which have a certain clamminess on them, that will detain Flies, or other light things which happen to fall thereon; after which, come long and straight Cods, (not Crooked like the Greater sort) with flat brown Seed lying therein, in a white kind of Silk or Down, like unto *Aclepias* or Swallow-wort: This yields a Milky Sap or Juice like the other, which some think to be dangerous, tho' Experience has declar'd no such thing; and therefore must be left to a farther Scrutiny, by Tryals hereafter to be made.

VI. The Places. They both are Natives of Virginia, and other places of the West-Indies, where they grow abundantly. They have been often raised by Seeds which have come from thence, and altho' the Stalks dye to the Ground every Winter, yet the Root is of long continuance, and will send forth new at the Spring, especially if the place where it grows be covered with Horfe-Dung in the Winter, to defend it from the Frosts.

VII. The Times. They Flower in July, but not every Year, and their Silk and Seeds are ripe in August, but it scarcely ever brings forth its Cods with us, by reason of the coldness of our Climate.

VIII. Observat. Gerard says, (of the larger Species) that the Cods are stuffed full of a most pure Silk, of a shining white color, among which Silk is the Seed. These Cods are not only full of Silk, but every Nerve or Sinew, wherewith the Leaves are Ribbed, are likewise most pure Silk; as also the Peelings of the Stems, Stalks, or Branches, which come from them, even as Flax or Hemp from their Stalks. 'Tis admirable to think, how God has Blessed those Countries with a Substantial matter (which they daily tread under Foot) by which they may be both well and Honourably Cloathed, and which is sufficient to Apparel or Cloath many Kingdoms, if carefully Manured and Manufactured. But Parkinson says concerning it, That he knows there is another Plant growing in Virginia, called *Silk-Grass*, which is much differing from this.

IX. As to its Qualities, Specification, Preparations and Virtues, Authors have said nothing, nor

do we say any thing concerning the same. The Natives make Ropes and Cords of it, but nothing else, being much stronger than either Hemp or Silk; but was it Manufactured as it might be, it would make Super-fine Cloathing of all sorts, much exceeding any thing made of Flax, Hemp, or Cotton, and possibly not much inferior (if any thing at all) to what is made of the finest and best Silk.

C H A P. DCCXXX.

Of WAKE-ROBIN:

O R,

Cuckow - Point.

I. THE Names. It is called in Arabick *Farus* and *Sara*, in Greek *'Αγριον*: and in Latine *Arum*: some call it *Pes Vituli*, from the Form of its Leaf; and some from the Figure of its Pettle, in the middle of the Hots, call it *Sacerdotis Penis*, and *Canis Priapus*: some call it *Dracontea minor*, and *Serpentaria minor*, but we in English call it *Wake-Robin* and *Cuckow-Point*, or *Starch-Wort*.

II. The Kinds. There are many Species of it, but only two which are frequent with us, viz.

1. *Arum vulgare non Maculatum*, Our common Wake-Robin without Spots. 2. *Arum vulgare Maculatum*, Our Common Spotted Wake-Robin. Some will have *Arisarum*, or *Friers-Cowle*, to be a kind of Wake-Robin, and call it Hooded Wake-Robin, but of this we have already treated in its proper place.

The Descriptions.

III. The first, or Common Wake-Robin without Spots. Its Root is Tuberosus, and about the bigness of a Walnut Green and all, if it grows in good Ground, is brown without, and white within, very Succulent, with some Fibrous additions to it. If chewed between the Teeth, it has a vehement Heat, and Burning sharpness with it, almost beyond expression, so that if a bit of it, not so big as a small Bean, should be Chewed in the Mouth but for a Minute, it would so inflame the Mouth, Tongue and Throat, that possibly the Inflammation would scarcely be allayed in 48 Hours; and I have known some who out of Wantonness, have Chewed it, who have (by reason of its Violence) been in danger of their Lives, nor in more than a Weeks time could recover themselves: And yet this is manifest by daily Experience, that the dried Root (tho' it may be as hot as Pepper) is void of all these Dangerous Accidents. Its Juice, or fine Powder, has a very strange Clamminess in it, stiffening Linnen or any other thing on which it is laid, no less than Starch; and in former days, when the

making

making of our Ordinary Starch, which is made of Wheat-Flower, was not known, or in frequent use, the Roots hereof were used to starch their Linnen, which would so Sting and Chap the Skin of the Servants Hands that used it, that they could scarcely get them smooth and whole, by the next time of using again. It shoots forth 3, 4, or 5 Leaves at most from one Root, one of which is something large

loose, another being grown under it which is solid and firm, with many Fibres or small Threads hanging thereto, which in the beginning of the Year, when the Leaves begin to spring, being broken, yields a Milky Sapor Juice, which is violently hot and biting. The whole Plant has the same sharp and biting Taste, vehemently pricking, burn-

Wake-Robin not Spotted;
Or Greater.

and long, broad at the bottom next the Stalk, and forked like unto a Wild Sorrel Leaf, but ending in a Point, without Dent or Cut on the edges, of a sad green color, each standing upon a thick round Stalk, of an Hand Breadth or more. Among which, (after they have been up two or three Months, and begin to wither,) rises up a bare Naked round whitish green Stalk, something Spotted and streaked with Purple, like the Stalk of Dragons, which grows somewhat higher than the Leaves; at the top whereof stands a long hollow Hufe or Husk, close at the bottom, but open from the middle upwards, ending in a Point: In the middle of which, grows a small long Pestle or Pointel, smaller at the bottom than at the top, of a dark Purplish color, as the Hufe or Husk is on the inside, tho' green without; which after it has so remain'd for some time, the Hufe or Husk decays with its Pestle, and the Foot or bottom thereof grows to be a small long Bunch of Berries, green at the first, and each of them when they are ripe, of a yellowish red color, of the bigness of a Hasle-Nut Kernel, which abide thereon almost till Winter. In the time when this Plant bears its Berries, its Root (which is Tuberous and somewhat long, not growing down right, but for the most part lying along; its Leaves shooting forth at its bigger end,) is somewhat shrivelled and

Wake-Robin not Spotted;
Or Greater.

ing, and inflaming the Tongue upon the Tasting thereof, which violent Heat continues a great while, without any diminution or alteration.

Wake-Robin Spotted, or lesser.

IV. The second, or Spotted Wake-Robin. *This in its Root, Stalks, Leaves, Cod, Fruit and manner of growing, differs nothing from the former, saving that both Roots and Leaves are more violently sharp and biting; and that the Leaves hereof are somewhat harder in feeling, sharper pointed, and have some blackish Spots thereon, like the Spotted Arimart, which for the most part, abide in the Summer longer green than those of the first do.*

V. *The Places.* They grow frequently in many parts of *England*, in Woods, and near unto Ditches, and by Ditch-fides under Hedges, in shadowy places.

VI. *The Times.* The Leaves appear presently after Winter, early in the Spring, and continue but to the middle of Summer, or some small time longer. The Pistle shews it self out of its Huse or Husk in *June*, appearing before the Leaves fall away, whilst they are yet in Withering; and when they are gone, the Bunch or Clufter of Berries, viz. its Fruit, becomes ripe towards the end of *July*, or in *August*.

VII. *The Qualities.* It is hot and dry in the fourth degree, Aperitive, Absterfive, Diuretick and Digestive, Pectoral, Cardiack and Hyfterick, Antialthmatick, Emmenagogick, and Alexipharmick.

VIII. *The Specification.* It is prevalent against Asthma's, Coughs, Colds, Obstructions of Lungs, Liver, Spleen, Mesentery, Reins and Womb, provokes the Terms and After-birth, is good against Disury and Strangury, gives ease in the Piles, and is a potent remedy against the Plague or Pestilence, and Poison.

IX. *The Preparations.* You may have therefrom, 1. *The Green Leaves.* 2. *A Juice of Herb or Berries.* 3. *A Juice of the Root.* 4. *A Decoction in Water.* 5. *A Milk.* 6. *A Powder of Roots, Berries or Leaves.* 7. *An Oil.* 8. *A Cataplasm.* 9. *A Distilled Water.* 10. *The Fœcula or Starch.*

The Virtues.

X. *The Green Leaves.* Being bruised and laid upon any place pained with *Sciatica* or Gout, it draws out the Morbifick matter, and eases the pain: And applied to the Bittings of Mad Dogs, Vipers, or Plague Sores, it draws out the Poison and Malignity, and secures the Patient from Danger.

XI. *The Juice of the Herb or Berries.* Taken to the quantity of a Spoonful in any fit Vehicle, it prevails against both Poison and Plague; and if a little *Vinegar* or *Juice of Limons* be added to it, it somewhat allays the sharp biting Taste thereof: *The Juice of the Berries* given in White Wine, provokes the Terms in Women, provokes Urine, and prevails against Disury and Strangury, brings away the After-birth, and cleanses effectually after Child bearing; and taken with *Sheeps Milk*, it heals inward Ulcers of the Bowels.

XII. *The Juice of the Root.* It has all the Virtues of the Juice of the Herb, but is much stronger, and therefore must be given with Caution; mixt with some other proper Vehicle, it cleanses all manner of rotten filthy Ulcers in what part of the Body soever, and heals the stinking Ulcers in the Nostrils, called *Ozena* and the *Polipus*.

XIII. *The Decoction of the Herb, Root or Berries, in Water.* It has all the Virtues of the Juices, but very much safer, and may be given to half a Pint at a time. Dropt into the Eyes, it cleanses them from any Film or Skin, Clouds, Mists, or other things which obfuscate the Sight; is good against an *Ophthalmia*, helps their watering and redness, and when by chance they become black and blew.

XIV. *The Milk.* It is made by boiling the Root therein: It has all the Virtues of *Juice* and *Decoction*, and is good to heal internal Ulcers: Dose 3 or 4 Spoonfulls or more.

XV. *The Powder of Roots, Berries or Leaves.* Taken to a Dram, it is a most present and certain Remedy against the Plague, Poison, and the bitings of Serpents or Mad Dogs: The same taken mixed with *Clarified Honey*, or *Sugar*, (in form of an *Electuary*) is admirably good against Asthma's, Coughs, Colds, Hoarseness, Wheezing, and shortness of Breath: It is Stomatick, expels Wind, Digests, and Absterges the Stomach, Lungs, and other Bowels, from tough Salt Flegm; and has all the other Virtues of both Juices and Decoction: It provokes Urine and the Terms, and admirably cleanses after Delivery.

XVI. *The Oil of Roots, Berries, or Leaves.* Anointed on pained places it gives ease, and is good against the Pallie: Dropt into the Ears, it eases their pain, and helps against Deafness; gives ease also in the Piles or Hemorrhoids, and is profitable against the Falling down of the Fundament.

XVII. *The Cataplasm.* The Root mixed with *Bean-flower* into a *Pulvis*, and applied to the Throat or Jaws which are Inflamed, helps them. *The Roots or Berries made into a Pulvis with Oung*, and applied, gives ease in the pains of the *Sciatica* and Gout.

XVIII. *The Distilled Water of Roots or Leaves, or both.* It is good for all the purposes aforesaid. An Ounce or more taken at a time, is said to cure Ruptures, and to prevail against the Itch. If the fresh Roots are bruised, and distilled with Milk, they yield a most excellent Water to cleanse the Skin from Scurf, Morpew, Freckles, Spots, or any other Defilements whatsoever.

XIX. *The Fœcula or Starch.* It is made 1. *Of the Powder of the Dried Root.* 2. *From the Green Root, as you make the Fœcula of Briony Roots.* Besides its use for Starching of Linnen, it has all the former Virtues of the Powder, and may be given to a Dram in any proper Vehicle.

XX. *A Caution.* By reason of the Vehemency of the Green Root, its Juice ought to be used very cautiously, and only to be administered by a Wise Hand. The Powder is an hundred times more safe.

CHAP. DCCXXXI.

Of WALL-FLOWERS Single and Double.

I. **T**HE Names. This Plant is called by the Arabians *Keiri*, or *Cheri*; in Greek, *Ανθός κενυάδης*; in Latin, *Leucoium Luteum*; and in English *Wall-Flower*.

II. *The Kinds.* There are two special sorts of Wall-Flowers, viz. 1. *The Single Kind.* 2. *The Double Flowered.* Of the Single Kind, we have, 1. *Keiri*, five, *Leucoium luteum simplex vulgare*, Our Common Single Wall-Flower. 2. *Keiri*, five, *Leucoium luteum simplex majus*, The Great Single Wall-Flower. 3. *Keiri simplex flore albo*, The White Single Wall-Flower.

III. Of the Double Kind, we have, 1. *Keiri*, five, *Leucoium luteum flore pleno vulgare*, Our Common Double Wall-Flower. 2. *Keiri* five, *Leucoium luteum flore pleno alterum*. Pale Double Wall-Flower. 3. *Keiri*, five, *Leucoium luteum majus flore pleno ferrugineo*, The Double

reddish yellow Wall-Flower. 4. Keiri, five Leucum Luteum flore pleno maximum, The Greatest Double Yellow Wall-Flower.

The Descriptions.

IV. The first, or our Common Single Wall-Flower. Its Root is white, hard, and fibrous, has several small, narrow, long, and dark green Leaves, set without order, upon round, whitish woody Stalks,

Wall-Flower Single, Common.

which bear at the tops many Single yellow Flowers one above another, each of them having four Leaves apiece, and a very sweet Smell: After which, come long Pods, containing reddish Seed.

V. The second, or Great Single Wall-Flower. Its Root is like the former, and will perish in Winter, if not defended from hard Frosts. Its Leaves as well as Flowers, are much larger than the former. The Leaves are of a darker, and of a shining green color, and the Flowers of a very deep Gold yellow color, and commonly as broad as a Half-Crown piece of Silver. The Spike or top of Flowers is also much longer, and it abides much longer in Flowering, and is much sweeter in its Scent or Smell. The Pods for Seed are thicker and shorter, with a small point at the end. This Plant is slower in spreading it self out into Branches, and more tender to be preserved, and is increased by Planting its Branches, being slipt off.

VI. The third, or White Single Wall-Flower. It has a Root like the former, and its Leaves are as green as the Great kind, but nothing so large. The Flowers stand at the top, but not in so long a Spike, but rather in a Tuft, and each Flower is composed of 4. Leaves, of a white color, not much larger than the Common Kind, but of a weaker Smell. The Pods are not so great as those of the former greater one. This is more easie to be propagated or increased, but requires some care in defending it from the Cold of Winter.

Wall-Flower Single, Great.

Belonging to SECT. V.

VII. The first of the Double Kind, or Our Common Double Wall-Flower. This in its Roots, Leaves and Stalks, are very like unto the first

Wall-Flower Double Common.

Single

Single Kind, *saving that the Leaves hereof are not of so deep a green color. The Flowers stand at the top of the Stalks, one above another, as it were a long Spike, which Flower by degrees, the lowest first, and so upwards, by which means it is a long time in Flowering, the Flowers being very Double, of a Gold yellow color, and very sweet.*

VIII. The second, or Pale Double Wall-Flower. *The Flowers in this stand not Spike Fashion as the former, but more open spread, and do all of them blow open almost at one time, and not by degrees as the others do. They are of a paler yellow color, and differ in nothing else, saving that the green Leaves hereof are also of a paler green.*

IX. The third, or Double reddish yellow Wall-Flower. *Its Leaves are as green, and almost as large as the Great Single Yellow kind, or full as big as the Leaves of the White Wall-Flower. The Flowers are not much larger than the ordinary, but are of a darker yellow color than the Great Single kind, and of a more brownish or red color on the underside of the Leaves, being as it were striped.*

X. The fourth, or Greatest Double yellow Wall-Flower. *Its Leaves are as green and as large, if not larger than those of the Great Single kind. The Flowers are also of the same deep Gold yellow color, but much larger than any of the former Double kinds, and as sweet in smelling to, as any of them.*

XI. *The Places.* The first grows upon old Stone and Brick-Walls, and sides of very old Stone-Buildings, in many places through the whole Kingdom; but has of late been brought into, and Planted in Gardens, where the other six kinds are also kept and Nurst up.

XII. *The Times.* All the Single Kinds do Flower often in the end of Autumn, and if the Winter is mild, all the Winter long; but especially in the Months of February, March and April, even till the heat of the Spring stops them. The Double Kinds Flower sometimes very early, and sometimes very late in the Year, but do not continue Flowering in that manner the Year throughout.

OBSERVATIONS.

XIII. 1. *As to the Single Flowers.* Their Seed should be Sown in September, in the Earth just as you find it, without any previous Preparation; for it is the Nature of this Flower to grow upon Walls, and even amongst Rubbish.

XIV. 2. When they are Cultivated, more Care is to be taken of them, that they may serve as Ornaments in a Garden, for Borders of Beds and Plats, where they look very agreeably.

XV. 3. Having managed them as you do Flowers for Transplantation, as soon as you think them strong enough to change their places, put them in one that agrees with them, and Water them daily, to facilitate their taking Root.

XVI. 4. Be also very mindful to clear them of Weeds; for this, as well as the Double Flower, being Vivacious Plants, they will then grow to your satisfaction; the rest of their Culture is to be done as in the Double Flower.

XVII. 5. *Of the Double Flower you must be more Careful;* and it is to be multiplied by Layers, or by Slips: If by Layers, chuse the best, and lay them in the Earth; and that they may not rise too fast, drive a Hook down upon them, and let

the Earth upon your Layers, be of the same Ground in which they are laid.

XVIII. 6. Then Water them daily, that they may the better take Root, and sooner fasten themselves in the Earth, and let them be laid as soon as they have lost their Flowers, viz. in the end of May, or beginning of June; and leave them till September or October, at which time take them up, and put them either in Open Ground, or in Pots.

XIX. 7. If you place them in Borders of Plots, &c. the Garden Earth will do well enough; but if in Pots, take two thirds of Sifted Kitchen-Garden Earth, and one third of Mould, with which (being mixed) fill your Pots, putting your Layers into it according to Art.

XX. 8. And since these Flowers are apt to be injured by Cold, you must House your Pots in time, lest the Earth should Freeze and break your Pots, and so hurt your Plants: But as for those in the Open Grounds, you have no farther care to take of them, for they will always bear the Weather.

XXI. 9. If you multiply them by Slips, let them not be kept dry, that they may be Nourished so as to extend their Fibrous Roots round about to attract the nourishing Sap, or Juice of the Earth.

XXII. 10. Let your Slips be well chosen, and put into Pots or Pans filled with Sifted Garden-Earth, with some Mould thinly spread upon it, into which set your Slips half their length; put the Earth gently down upon them with your hand, to help to fasten them the sooner; Water them, and put them in a shady place till they begin to spring, after which, remove them into the Sun.

XXIII. 11. Let them be Planted at the same time you do the Layers, and when they have taken good Root, let them be Transplanted into the places you design for them, not forgetting to Water and Weed them, as often as occasion requires it.

XXIV. *The Qualities.* They are hot and dry in the first degree, Absterfive, Resolutive, Vulnerary, of thin parts, Neurotick, Hylterick, and Emenagogick.

XXV. *The Specification.* They heal Wounds, provoke the Terms, expel the Dead Child, and are good against Agues, Apoplexies and Palthes.

XXVI. *The Preparations.* 1. A Juice from the Heads of Flowers. 2. A Decolion of the Heads of Flowers in Wine. 3. A Decolion of the Roots in Vinegar. 4. A Gargarism. 5. An Ophthalmick. 6. A Powder of the Seed. 7. Oleum Cheirinum, five Keirinum, Oil of the Flowers. 8. A Bath to Sit in. 9. A Cataplasm. 10. A Distilled Water. 11. A Conserve of the Flowers.

The Virtues.

XXVII. *The Juice from the Heads of the Flowers.* It provokes the Terms in Women, expels the Dead Child, and forces away the After-birth; opens Obstructions of Liver, Spleen and Reins; cleanses the Stomach, Bowels and Womb, and is good against Vapors, Paralytick and Apoplectick Fits. Dose 3 or 4 Spoonfuls in Wine, or the Distilled Water, or other fit Vehicle; mixt with Spirit of Wine, it cleanses Wounds and Ulcers, and heals them.

XXVIII. *The Decolion of the Heads of Flowers in Wine.* If it is made strong, it has all the former Virtues of the Juice, and therefore ought not to be taken of Women with Child, for fear of causing Miscarriage. Dose half a Pint at a time. It strengthens the whole Body, or any Member of it
grown

grown loose and weak, by reason of Paralytick and Convulsive Distempers.

XXIX. *The Decoction of the Roots in Vinegar.* Being taken inwardly, it softens the hardness of the Liver, Spleen, Mesentery and Womb.

XXX. *The Gargarism.* Take of the Juice 6 Ounces, of the Distilled Water 3 Ounces, Roch-Alum 2 Drams; Spirit of Wine an Ounce and half; Honey 2 Ounces; mix and dissolve. It cleanses and heals Ulcers and Sores of the Mouth, Gums and Throat, and other parts of the Body, the parts being daily Gargariz'd or wash'd therewith warm.

XXXI. *The Ophthalmick.* Take of the Juice 4 Ounces; Spirit of Wine or Brandy, 2 Ounces; Honey an Ounce and half; strong Tincture of Aloes Succotrina, half an Ounce; mix and dissolve. Drop into the Eyes it cleanses them from Clouds, Mists, and other things which obfuscate the Sight; heals Sores and Ulcers in the Eyes, strengthens them, and stops a Flux of Rheum falling into them.

XXXII. *The Powder of the Seed.* It may be given to a Dram in any proper Vehicle. It has all the Virtues of the Juice and Decoction, and may be used Morning and Night, as long as need requires. It has been given with Success against the Rickets in Children.

XXXIII. *The Oil of the Flowers.* It is Diffusive and Anodyn, gives ease in pains of the Brest, Reins, Joints, Nerves, &c. and is a very good thing against the Gout.

XXXIV. *The Bath.* It is made of the whole Plant when in Flower, boil'd in fair Water with a proportional quantity of Genoa Soap. It is good for Women to Sit in, who have a Stoppage of their Courses, or are not well cleansed after Delivery, because it induces the Menstrua, and cleanses the Womb of putrid Recrements.

XXXV. *The Cataplasm.* It is made of the Heads of Flowers beaten in a Mortar, adding some Salt. Bound hard to the Wrists, it is used as a Remedy to cure Agues. But if made by boiling the same in Vinegar, with the addition of Barley Flower, and then applied warm to places pained with the Gout, it gives ease in the pain, dissolves the Tumor, cures the Disease, and admirably strengthens the part.

XXXVI. *The Distilled Water from the Heads of Flowers.* It has the Virtues of the Juice and Decoction, but nothing near so efficacious: mixt with a quarter part of Spirit of Wine, and dulcified with white Sugar, it is said to cleanse the Blood, comfort the inward part, ease pain, and cause Cheerfulness.

XXXVII. *The Conserve of the Flowers.* It is given to the quantity of a large Chestnut or Wall-nut, Morning, Noon and Night, against Convulsive and Paralytick Distempers, and Weaknesses of the Mesentery, Womb, and other Bowels.

WALL-PENNY-WORT, see Navel-wort, Ch.
WALL-RUF, see Maiden-Hair White, Chap.
WART-TURNSOLE, see Turnsole, Chap. 717.
(Sect. 5.)
WART-WORT, see Succory Bastard, Chap. 674.

The Cutt of the following Plant was overlooked in that its proper place, and therefore we thought good to place it here, rather than to leave it out.

Succory Wartwort.

Belonging to CHAP. 674. SECT. 8.

CHAP. DCCXXXII.

OF WHEAT, Buck and Cow.

I. **THE Names.** The first of these is generally taken to be the *Erysimum* Theophrasti, which Gaza translates *Trionum*; but some put a difference between this *Erysimum* and the other, calling this *Erysimum Cereale*. It is also called in Greek by some *ἑρυσίμη*; in Latin *Egotriticum*, and by Matthiolus and Lugdunensis, *Fruentum Sarafenicum*: Dodonaus calls it *Egopyrum*, *Tragopyrum* and *Tragotriticum*: Tragus calls it *Ocyum Veterum*; but Clusius and Tabernemontanus, *Ocyum Cereale*; and in English *Buck-Wheat*.

II. **The Kinds.** This Plant is *Singularis sui Generis*, and therefore not being manifold, can admit but of one Denomination.

The Descriptions.

III. The Root of Buck-Wheat is small and thready, and rises up with several round, hollow, brittle, reddish Stalks, a Yard or more high, set with divers Leaves, each by it self on a Foot-stalk, which is broad and round, and biforked at the bottom, small and pointed at the end, somewhat resembling an Ivy-Leaf, but softer in handling. At the tops of the Stalks come forth several Clusters of small White Flowers, which turn into small Triangular blackish Seed, (serving to the same use of other Eatable Grains) not much unlike

unlike to a Beach-Nut, but very much lesser, which contains a white Pulp within.

IV. Gerard describes it after this manner. Its Root is small and thready, which sends up a round fat Stalk, somewhat crested, smooth and reddish,

Wheat Buck.

Wheat Buck.

which is spread out into many Arms or Branches, on which do grow smooth and soft Leaves, in shape like to Ivy-Leaves, or one of the Bindweed,s

or not much unlike to Basil, (whence Tabernamontanus's Name of *Ocymum Cereale*.) The Flowers are small, white, and cluster'd together in one or more Tufts or Umbels, slightly dash'd over here and there with a light Carnation color. The Seed is of a dark blackish color, and Triangular, like the Seed of Black Bindweed, which is used (in places where it grows plentifully) in times of Scarcity to make Bread of, or to be mixed with other Corn for that purpose.

V. *The Places.* It is thought to be first brought out of Africa, but now is generally Sown in most of our Northern Countries, where for the Use and Profit is made of it, whole Fields are Sown therewith. It prospers well in any Ground, be it never so dry or barren, and is many times Sown, to serve as it were instead of a Dunging. It quickly comes up, and is soon ripe, and is very common about Nantwich in Cheshire, where they Sow it as well for Food for their Cattel and Poultry, as for the use of making Bread aforesaid. It grows likewise in Lancashire, and in some of the Southern parts of England, in Essex, Kent and Middlesex.

VI. *The Times.* It is Sown in April, and beginning of May, and will be ripe in August following.

VII. *The Qualities.* It is hot and dry in the first degree, Absterive and Nutritive, but Nourishes less than Wheat, Rye, Oats or Barley; but more than Miller or Panick: And Bread which is made of the Meal thereof, is easie of Digestion, and soon passes through the Stomach and Belly; for which reason, it becomes very cleaning to the Bowels.

VIII. *The Specification.* It keeps the Body open, and prevents the growing too Fleishy or Fat, but is a little Flatulent or Windy.

IX. *The Preparations.* The Meal of it for Mans use, is by the Country People in Germany, Italy, and some other places, made into Bread, Cakes, Puddings and the like, which are pleasant enough to eat.

The Virtues.

X. *Bread, Cakes, Puddings, &c.* made hereof, make those People very Strong, and able for Labour, who daily feed on them. The Pottage thereof provokes Urine, increases Milk, loosens the Belly; and being eaten mixt with Wine (as you do Flummery,) it is good against Melancholy. The whole Grain, as also the Meal, is used generally to Fatten Cattel and Poultry of all sorts; and it is observed, that they are quickly made Fat therewith; and so Fat, that if they be not Kill'd in a short time after, they will Dye of themselves, being Suffocated therewith.

of COW-WHEAT.

XI. *The Names.* It is called in Greek *Κερατίνος* and *Μελανύριον*, (*Triticum nigrum*) see *Theophrastus*, lib. 8. cap. 5. and *Dioscorides*, lib. 4. cap. 17. in Latin *Triticum Vaccinum*, vel *Bovinum*: *Cratægonum* Lobelij: *Melanopyrum* Camerarij, Bauhij: & Thalij: *Milium Sylvaticum* Tragi; and in English Cow-Wheat.

XII. *The Kinds.* There are many kinds of this Plant, but most of them are absolutely Strangers with us, so that we shall only take notice of two the most common, viz. 1. *Cratægonum vulgare* Lobelij;

bellij; *Satureia lutea* Dalechampij; *Milium Sylvaticum* Tabernemontani; *Melampyrum Baubini* & *Tbalij*; Our Common Cow-Wheat. 2. *Cratæogonum Flore vario*; *Melampyrum Camerarij*; *Triticum Vaccinum* Dodonæi; *Lugdunensis* & *Trogi*; *Melampyrum Cæruleum* Gerardi, Party colored, or Blew Cow-Wheat.

The Descriptions.

XIII. The first, or our Common Cow-Wheat, has a Root composed of small Threads, which sends up an Hairy square Stalk, branched almost from the bottom, half a Yard high or more, very weak and slender, and sustained by the Bushes among which it grows, having two long and narrow Leaves set at each Joint, broadest next to the Stalk, a little dented sometimes about the edges, and pretty sharp pointed at the end, somewhat rough also on the under-side, if it be drawn downwards. The

Wheat Cow.

tops of the Stalks and Branches are set with Tufts of Leaves and Flowers together, which being grown, are separated, two Flowers only standing at a Joint, with the like Leaves set with them, but shorter and smaller. The Flowers are long, round and hollow, gaping open at the end, almost like those of a Dead Nettle, and stand all looking one way, of a pale yellow color and white together, but grow yellower in time; yet in some of a blewish or purplish color, either deeper or paler, each standing in a small green Husk, wherein afterwards, grow round Cups or Vessels, containing brownish Seed, not much unlike to Wheat.

XIV. The second, or Party-colored, or Blew Cow-Wheat. This grows like the former, but the Stalk is more reddish, and so are the Leaves also, and more finely dented upwards, where the Spikes or Tufts of Flowers, are in some of a reddish or bluish color before they spread open, and then shew the Flowers to be of a yellowish Purple, sometimes about the Mouth or Gaping place, and the other parts of a Purplish red: but in some others they are Blew, or of a Purplish Blew.

XV. The Places. They grow among Bushes, Brakes and the like, upon Barren Heaths, as at Hampstead near London; also in Fertile Pastures, Bushy Copse, and low Woods, and such like places in many parts of this Land. But the first of them Gerard says, grows upon Hampstead Heath, among the Juniper Bushes and Bilberry Bushes, in all parts of the said Heath, and in every part of England he found it where he Travelled.

XVI. The Times. They Flower from the beginning of May, thro' June and July, and their Seed ripens in July and August.

XVII. The Qualities. They, viz. the Grains, are hot and dry in the first or second degree, of thin and subtil parts, and abound with a great quantity of Volatile Salt. They are Hysterick, Spermatogenetic, and excite to Venery.

The Virtues.

XVIII. Authors have said little or nothing of their Virtues, but some small matter of their Vices, as that the Seed being taken inwardly, will affect the Head and Brain, as Darnel will, troubling them, and causing a kind of Drunkenness, Vertigo, or Giddiness. The Seed in fine Powder, being given to half a Dram or more, for some space of time, in strong Broth or Wine, is said to provoke Lust.

XIX. As Cow-Wheats generally in all places where they grow among Corn thrive; so if they be not Weeded out, but suffer'd to grow till the Corn is Reaped, their Seed mixes with the Wheat in Thrashing, whereby when Ground, the Meal is browner or darker colored; and so the Bread which is made thereof, will be blacker than otherwise it would be.

C H A P. DCCXXXIII.

OF W H E A T Common;
Red, White, & Grey.

I. THE Names. It is called by the Arabians *Hema*, and *Hencha*; in Greek *νῆμα*; also *σιτόν*, (*Fruentum à Fruendo*;) in Latin *Triticum*, (*quod tritum ex Spicis fit, ut dicit Varro*;) also *Siligo*, which is the Name of the finest and most pure Wheat; and in English *Wheat*.

II. The Kinds. Wheat if we respect the Ear only, is either Naked and not Bearded; or Bearded; but if we respect the color chiefly, it is threefold, viz. 1. *Triticum aristâ rubrâ*, vel *Spicis rubris*, Red Wheat, which is accounted the finest and best of all Wheat, and this is twofold, viz. either *aristâ spicatâ*, with Bearded Ears; or *Triticum muticum*, *Triticum rubrum spicâ muticâ*, or Wheat

Wheat Naked without Beard or Awns. 2. *Triticum album*, *Triticum aristis albis*; *Siligo*, White Wheat; and this is also twofold, viz. *Triticum album Aristis Munitum* vel *Aristis Spicatis*, White Wheat with Bearded Ears, or Ears with Awns; or *Triticum album muticum*; *Siligo*, vel *Triticum album Spica mutica*, or White Wheat without Beard or Awns; and these white Wheats some think to be as fine a Grain as the former, and some will have them to be the finest and best Wheat of all; without doubt, the difference in Goodness between them is so little as not to be discerned. 3. *Triticum Griseum*, vel *Cinereum*, *Triticum Griseum aristis munitum*, and this is that which I take to be the *Zea*, or *Zea Zea* of the Ancients, which they called *Spelta* or *Spelt-Corn*; and *Adonum*, also *Adon*, which the Ancient Romans made to be a kind of *Far*, or *Bread-Corn*, being a counterfort of Wheat: This with us, is generally through the Nation called *Gray Wheat*, and is a very good and profitable sort of Grain, tho' not so absolutely fine and choice as the former *Red and White Wheats*. To these let me add, 4. *Triticum Spica multiplici*, *Triticum ramosum*, the Branched, or manifold Eared Wheat, which *Tabernemontanus* calls *Triticum Tiphinum Spica multiplici*, which for all that I know may be a Species of the *Tipha*, or *Tipha Cerealis* of *Dodonæus*, their Descriptions are so nearly alike.

The Descriptions.

III. The first, or Red Wheat, Its Root is very Fibrous, and towards its Head as it were jointed,

Wheat Red or White, Bearded.

from whence rise 3, 4, 6, more or less Stalks, with fair long and green Grass-like Leaves, and

as the Stalks grow up higher, at every Joint one Leaf, and at the fourth Joint usually comes forth the long Ear, or Spiked Head, one on a Stalk, without any Branches, which while the Head stands upright, blooming small yellow Aglets, which when it is ripe, a little bows down or bends its Head, by reason of its weight, which is set with two double rows of Grain or Corn, within several Chaffy Coats

Wheat White or Red, not Bearded.

or Husks, which when it is cleansed from them, is of a firm compact Substance, which is of a Dun reddish color; and the whole Ear is of a kind of reddish color when it is perfectly ripe; which is either Bearded with Awns, or not Bearded, but plain and smooth, that being all the difference, which yet makes no Difference in the Goodness of the Corn.

IV. The second, or White Wheat. This in its Roots, Leaves, Stalks, Ears, Flowers, Corn, Magnitude, and manner of growing, differs nothing from the former or Red Wheat, but only in the color, the Stalks and Ears being whiter, and the Grain or Corn of a clear yellowish white color. This is also twofold, viz. either Bearded with Awns, or plain and smooth without Awns, in like manner as the Red Kind. Some, and the Generality of Farmers, maintain the Red Wheat to be the finest and best Wheat, and to make the Sweetest and Whitest Bread: Whilst others again maintain this White Wheat to be the chiefest of all, and to make truly the Best and Whitest Bread. I indeed know them both very well, and have eaten Bread, Cakes, and other things made of the fine Flower of them both; yet I must say, by all that I could observe, that I could find no difference between the Sweetness, Whiteness and Goodness of the one and the other; but that to me, the one appeared as good as the other; and

Wheat White Bearded.

without doubt, the difference is little or none; or if there be any, it would puzzle the Wisest of Men to find on which side the Whitest and best would fall.

V. The third, or Gray Wheat. This in its Roots, Leaves, Stalks, and manner of growing, is like the former, but the Stalk is larger and stronger, higher,

Wheat Gray; Zea, or Spelt Corn.

and of a brown color; and the Head or Ear hereof, is much larger, of a brown color also, with four Sides or Rows of Grains or Corn, so that it seems to be four square, which is contained in double brown Husks, all which are Armed with Awns; so that the whole makes a large Bearded Ear; and

Wheat Gray, or Greek Wheat.

the color of the Grain within, is almost of the color of the Red Wheat, but much paler, the Corn it self being much of the same fashion, but plumper, or fuller and larger. The Meal or Flower of this, makes admirable good White Bread, Cakes, &c. but it is scarcely so White as the others, nor yet so Sweet.

VI. The fourth, or Branched, or manifold Eared Wheat. This in its external form of Roots, Leaves and Stalks, is much like the Red Wheat, saving that the Stalk seems to be shorter, and the Ear in color, with its Husks or Chaff, Awns and Grain within it, is exactly like to the Ear of the Red Wheat, saving that the Ear of this has several other smaller Ears, as 2, 4, 6, or more, growing out of the sides thereof. This seems to be a Species of Dodonæus's Tiphia, or Triticum Tiphinum, which by the Description thereof, can be no other than our Bearded Red Wheat. It is thus Described. Tiphia rises up with a single and slender Stalk or Straw, the Ear is long and round, Bearded with long, hard, sharp Awns, somewhat closely set together, and the Grain is small and light, but hard, and of a redder color than other Wheat, enclosed in divers Chaffy Husks. This seems to me to be Our Red Wheat before Described.

VII. Some may Object against me, That Our Gray Wheat is not, nor can be the Zea, or Spelta, of the Ancient Greeks and Romans, because say they, that Zea, Spelta, or Greek-Wheat, had its Ear Naked, without Beard or Awns, in proof (of which, they bring the Testimonies of Camera-

rius,

rus, Gerard, Lobel and *Tragus*;) whereas our *Gray Wheat* has a Bearded or Awned Ear, to which I answer, that *Lugdunensis* has Described and set forth his *Zea* with a Bearded Ear; and *Marthiolus* has given us his *Spelta* with Awns, or a Bearded Ear also: 'Tis true that *Theophrastus*, from whom the *Zea* or *Spelta* is taken, in his Description has said nothing of the Awns or Beard of the Ear; but let us take all the rest of his Description, as it is in his *Historia Plantarum*, lib. 8. cap. 9. and compare it with *Camerarius* and *Tragus* their *Zea Spica mutica*, or any others who maintain the same, and you will find that they are none of *Theophrastus's* Plant: That of *Theophrastus* is thus described. *Its Roots are many, or bushy, and strongly fastned in the Ground, out of which they draw much Nourishment, and it rises up with many strong, jointed, and high Stalks, with Leaves on them most like to Wheat; the Ear is plentiful in Corn or Grain, which are enclosed in many Chaffy Husks, being the lightest of others, and not so easily beaten out, as out of other Wheat; and is very pleasant to every one.* Now setting aside the Awns of the Ear, which are here omitted, Our *Gray Wheat* is the most like it of any thing in the World, and if that be not the *Zea* or *Spelta* of the Ancients, I can find no other Grain in the World to which it will, or can agree. As for *Camerarius* and *Tragus*, their *Zea* or *Spelta*, can be none of this of *Theophrastus*; for theirs has no such Bushy Root, no such strong nor tall Stalks, nor yet so many growing from one and the same Root: And as the Stalks of theirs are low, and fewer, so the Ears are smaller, and not orderly set in Rows; by all which it is evident, that they had no true Knowledge of *Zea*, or *Greek Wheat*, which is without doubt, what we call *Gray Wheat* here in *England*.

VIII. *The Places.* All these Grains are not only Sown almost in all Counties through all the Islands of *Great Britain*, but also in most parts of the Habitable World. 'Tis true, that not long since they were Strangers in *America*, but since our *English* have Planted and Inhabited almost all the Eastern Coast of *Florida*, from the North of *Nova-Scotia*, to the South of *Carolina*, they have been made Denizons of those Countries, and are now become Natives of the same, and prosper with the same increase and goodness, which they have here with us.

IX. *The Times.* They are Sowed after Harvest in *Autumn*, before Winter, and tho' they presently Spring up, are so hardy as to endure the sharpest Seasons, and the Ears come to their ripeness in *July* and *August* following.

X. *The Qualities.* All these sorts of Wheat are temperate in respect of heat or cold, driness or moisture, are Astringent, Vulnerary and Nutritive.

XI. *The Specification.* They stop Fluxes of the Bowels, Nourish much, and restore in deep Consumptions.

XII. *The Preparations.* You may have therefore, 1. Pollen & Siligo, Meal and Flower. 2. *Alica* vel *Chondrus*, *Pultage*. 3. Bread and Cakes. 4. Puddings. 5. *Athera*, *Panada*, or *Pap*. 6. *Far*, or Boiled Wheat. 7. *Tragus*, or *Flummary*. 8. *Amylum*, *Starch*. 9. *Fermentum*, *Leven*. 10. *Mault*. 11. *Sweetmeat Wafers*. 12. *A Gelly*. 13. *Sanguis*, *Extractum Tritici*, *Blood of Wheat*. 14. *A Cosmetick*. 15. *A Balsam*. 16. *A Cataplasma*. 17. An Oil by Expression. 18. *A Clyster*. 19. *Mum*, or Strong Drink. 20. *A Spirit*. 21. *Frumety*, or *Frumenty*.

The Virtues.

XIII. *Pollen & Siligo, Meal and Flower.* Tho' *Siligo* be the Name of the finest and best Wheat, and of the *White Wheat* in particular; yet *Siligo* with them did also signify the purest and finest Wheat-Flower. These are of use to make Bread, Cakes, Puddings, Pultage, *Panada*, *Flummary*, *Starch*, *Leven*, *Wafers*, *Gelly*, *Cataplasma*, &c. Outwardly applied to Simple Wounds newly made, in a large quantity, it presently stops the Flux of Blood, and a Spoonful of them mixed with a Glass of fair Water, and swallowed down, is good against Heart-burnings, and Acidities of the Stomach.

XIV. *Pultage.* It is called *Alica*, ab *Alendo*, from Nourishing, and so all *Latin* Authors have Translated *Chondrus*, which is taken to be the most excellent Pultage used in those Ancient times: If made of Milk only, or Milk and Water, it is properly a thick Milk; if of Water only, it is Pultage. It is good to strengthen the Stomach and Bowels; it nourishes very well, and stops Fluxes of the Belly.

XV. *Bread and Cakes.* These are as it were the Staff of Life; for with Bread and Water alone, a Man may live many Years. If the Paste be Fermented with *Leven* or *Yeast*, the Bread or Cakes, will be much more wholesom, and more easie of digestion; and with Bread, the *Panada* or *Pap* for Children, and new Born Infants is made, and for them it is better to be made with Water, than with Milk, because then it is not Stuffing. If eaten dry, or alone, it absorbs the Watery humor in the Stomach and Bowels, and is prevalent against Fluxes of the Belly.

XVI. *Paddings.* They have the Virtues of Bread, are good against Weaknesses and Fluxes of the Bowels, and if made with Milk and Eggs, strengthen much, and restore in deep Consumptions, being also very easie of Digestion: If they are made of pure White Bread, they will be yet pleasanter, lighter of Digestion, more Nourishing, and better for the Stomach; by reason the Bread is a Fermented Substance.

XVII. *Panada, or Pap.* It is made with Water, Milk and Water, and sometimes with Milk alone, of the purest and finest White Bread, and chiefly for Infants and Children, and such Elder People as have been long Sick, and have such weak Stomachs as that they can scarcely digest any thing. It is easie of digestion, nourishes much, and may be made very grateful to the Stomach, by the addition of White Sugar, Wine, Juice of Oranges, as the Sick likes best, and may most quadrare with the nature of the Disease.

XVIII. *Far, or Boiled Wheat.* I know *Far* has been thought to be a peculiar Grain, or a mixture of several kinds of Corn among the Ancients; but what particular Corn, or Corns it should be, I know no Author has determined. But *Archigenes* in *Aetius*, gives us the Artificial matter, viz. *The Wheat is steeped a while in Water, and being taken from thence, is put into a Mortar, where it is cleansed from the Husks, by gentle beating with a wooden Pestle, afterwards it is laid in the Sun, and then rubbed with the Hands till it is fully cleansed; which done, it is broken a little grossly, and being dried, is kept for use, to be Boiled upon occasion in Water.* *Parkinson* is of opinion, that this well resembles our Boiled Wheat, which, after it is freed from the Husks as just now declared, it is boiled in Water till it breaks, and becomes

Pretty thick, which Country People while it is hot, do put into Wooden Dishes, and so bring it to London, to be Sold in the Markets, by the Name of Dish-Wheat and Bowl-Wheat.

XIX. Tragus, or Flummery. *It is made of the finest of the Flower, mixed with fair Water in a due proportion, and Boil'd up to such a thickness, as being cold, it will cut with a Knife, which whilst hot, is put into small, flat, white Earthen Dishes, in which it is kept till it is eaten. They commonly mix with it at Eating, Wine and Sugar, and so it cheers the Heart, revives the Spirits, comforts Nature, and restores in Consumptions. Some that are great Lovers of Milk, use that instead of the Wine.*

XX. Amylum, White Starch. *It is made of the finest Flower of the Wheat, by the means of fair Water. Made into a Loboch with Honey, it is good against Coughs, Colds, Rheums, and Spitting of Blood, and causes an easie expectoration of Flegm.*

XXI. Fermentum, Leven. *It is made of some Paste or Dough of the Bread after Fermentation, and being made up into a round flat Ball, it is kept in a heap of Table or Bay-Salt powdered, till it grows fowre, which you may know both by the Smell and Taste. It has a power to draw and digest that which is far off; and therefore is good to be put into Drawing Cataplasms, to cause Suppuration in Tumors. Applied to places affected with the Gout, it in a short time eases the pain: It is good also against Warts, and hard Knots or Kernels in the Flesh, being applied with some Salt.*

XXII. Mault. *It is made altogether in the same manner as you make the Mault of Barley. The Flower of it being mixed with Turpentine, Honey, and the Yolk of an Egg, makes a good Digestive; mixed with Ammoniacum, Leven, and a little Vinegar, it dissolves and softens hard Tumors; but its chief use is for making that sort of Strong Drink called Mum.*

XXIII. Sweet-Meat Wafers. *They are Sold at the Confectioners, made up into small white Rouls. Being eaten, they singularly gratifie the Stomach, and strengthen it, stop Fluxes of the Bowels, and restore in Consumptions. As they are made of the purest and finest Flower, with a small addition of Milk, Eggs and Sugar, so put into Water and drunk, they cure the Bloody Flux, and are good against Ruptures in Children.*

XXIV. The Gelly. *It is made of the former Wafers boiled in a sufficient quantity of Water, to the Consistency of a Gelly; or it may be made of the Dish-Wheat, at Sect. XVIII. by adding a little Water to it, and straining it very hot thro' a Cheese Cloth. It is good against Spitting of Blood, Coughs, Colds, Hoarseness and the like, being daily eaten.*

XXV. Sanguis seu Extractum Triticum, Blood of Wheat. *It is made as you make the Sanguis Satyrionis, Consolida majoris, Potatoes, Parsneps, &c. It is an admirable thing to cheer the Heart, revive the Spirits, refresh the Bowels, comfort Nature, restore in Consumptions, and recreate Languishing Nature. The finest White Bread is best to make it of.*

XXVI. The Cosmetick. *Take of the Flower 4 Ounces, Honey 1 Ounce, Vinegar a Quart; boil them gently together, so long till the Flower will not easily settle. It is said to be good against Scurff, Morpew, Sun-burning, Tanning, Freckles, Spots and Pimples in the Face.*

XXVII. The Balsam. *Take Turpentine 2 Ounces; Yolks of three Eggs, mix them till the Turpentine is perfectly dissolved in the Yolks, then add*

Honey, Balsam of Petu, of each two Ounces; fine Wheat flower enough to give it the Consistency of a Balsam. It is Digestive, Absterfiv and Healing, a good Vulnerary in all Simple Green Wounds, Plague Sores, running putrid Sores, and Old Ulcers.

XXVIII. The Oil by Expression. *It is Pressed in an Almond Press out of the whole Wheat, between two thick Iron or Copper Plates, being beat very hot. It heals all inveterate Ring-worms, Tetters, Scabs, Herpes, &c. on the Face or Chin, or other parts of the Body, being laid on warm; and hereby says Galen, we have known many to be Cured. Matthiolus commends the same to be put into hollow Ulcers to heal them. The same is also used for Chaps in the Hands or Feet, by reason of Cold, as also to make a rugged Skin smooth.*

XXIX. The Cataplasim. *It may be made of the Leven alone, mixed with a little Vinegar; being applied, it is good against the Gout, and the hard Tumors in Womens Breasts. A Cataplasim made of New Wheat Chewed in the Mouth, applied to a place bitten by a mad Dog, cures it. A Cataplasim of Bread made with red Rose-Water, applied to the Eyes which are hot, red, and inflamed, or are Blood-shot, heals them. A Cataplasim made of Bread Fried in a Frying-Pan, with Wine Vinegar, being applied very hot for an Hour at a time, for 12 or 14 Days together, to Kings-Evil Kernels in Neck and Throat, is said perfectly to dissolve and cure them. A Cataplasim made of Wheat-Flower, with Juice of Henbane, being applied, will stop a Flux of Humors to the Joints. A Cataplasim of Wheat Meal Boil'd in Vinegar, being applied, will help the Contraction of the Nerves, or Shrinking of the Sinews, as Pliny says. A Cataplasim of the Bran, with a little Flower, made by Boiling it in the sharpest Wine Vinegar, being applied, softens and dissolves the Swellings of Womens Breasts; and applied presently to the Biting of a Viper, draws forth the Poison.*

XXX. The Clyster. *It is made by boiling the Bran (not too near Sifted) in the Broth made of a Sheeps Head and Gathers; which being exhibited, does open and cleanse the Body of sharp and crude Humors, and to ease the Gripping pain of the Bowels; and all this it will more effectually do, if to every Pint thereof, you add four Ounces of Brown Sugar, and a little Salt.*

XXXI. Mum, or very Strong Drink. *It is made in the same manner as you make very Strong Beer of Barley Mault. It comforts the Stomach and Bowels, strengthens the Back, and is a Restorative to such as are in a Pining and Languishing Condition; fortifying all the Natural Faculties of the Microcosm.*

XXXII. The Spirit. *It is drawn off from Old or Stale Mum in an Alembick, in the very same manner as you draw off the Maulted Spirits of Barley; or as you draw Spirit of Wine. Unless it be very carefully drawn, it will not taste very pleasantly, by reason it is apt to be loaded with an Empyreuma; but if it is drawn neat and clean, or is made so by Rectification, it will answer all the ends of Spirit of Wine, and perform the same things.*

XXXIII. Frumety, or Frumenty; *it is so called from Frumentum, an old Name for Wheat or Corn. It is made of Boiled Wheat, which is that which is Sold in Wooden Dishes or Bowls, in the Markets in London, and called Dish-Wheat (at Sect. XVIII. foregoing,) by Boiling it up with a sufficient quantity of Milk, to make a Pultage thereof, of a due thickness. It is Stomackick, strengthens the Bowels, stops Fluxes, and restorative in Consumptions.*

C H A P.

C H A P. DCCXXXIV.

Of WHEAT Indian:

OR,

MAIZE.

I. **THE Names.** We know no Greek Name for it; but it is called in Latin, *Frumentum Turcicum*, Turkey Wheat; *Frumentum Indicum aliquid*, & *Milium Indicum maximum*: in English, Turkey Wheat, Indian Wheat, Indian Corn, and Maize, as the West-Indians call it.

II. **The Kinds.** We have but One Species thereof, but some may account them Two, by reason of their Magnitude, which I take to be rather from the Nature of the Soil; a rich Soil affording a very large fort; whereas a poor Soil gives you only a Dwarf kind of Plant: But there is a great Variety in the Colors of the Ears, some being all White, some all Yellow, some all Red, and some Blew. And again, some Ears have Grains of all those Colors at once; but this difference, we account makes no differing Species of the Plant.

The Descriptions.

III. **Its Root is Thick and Bushy, full of gross Fibres or Strings, from whence spring up several strong and tall Stalks, six or eight feet high, as thick as a Girls Wrist, if it grows in any rank Ground, full of great Joints, with a white Spongy Pith in the middle. The Leaves are long, twice as**

VVheat Indian: Or, Maize.

large as those of Millet. At the Tops come forth many Flowers in Feather-like Sprigs, bending downwards, like as the Tops of Millet, which are either

White, Yellow, Red or Blew, as the Grains in the Ears will prove. These Flowers fall away without any thing of an Ear succeeding them: But whilst this Flowering is, come forth the Ears at the joints of the Stalks with the Leaves, from which in two or three of the lower Joints up, towards the Tops of the Stalks, One at a Joint, which have many Leaves enclosing them, and are smallest at the Top, with a small long Bush of Hairs or Threads, hanging down at the Ends; which when they are Ripe, are to be gathered. The Leaves enclosing the Ear being taken away, the Head or Ear appears, much like to a long Cylinder (not a Cone) set with 6, 8, or 10 rows of Grains, as large almost as Pease, and sometimes larger; not fully round, but flat on the sides which join one to another, orderly and very closely set together, of the same Color on the outside as the Blooming were, viz. either White, Yellow, Red or Blew only, or of some or all of those Colors together; the whole Grain is hard and brittle, its external Husk being very hard almost like a Shell, but its inward Pulp, when ground into Meal or Flower, almost as white as Snow; which Grains when Chewed, are somewhat dry, and not clammy in the Mouth, as our Wheat is.

IV. **The Places.** It is said to grow in Turkey, and that it was first brought from thence: It is true, that it is now universally Planted almost all over the West Indies; but it is certain, that it was not an aborigine of those Countries; but was first carried thither by Europeans. It requires to be Planted in a rich and fat Ground, as Millet does; for a poor lean Soil, makes but a poor fort of Corn. It has been Planted in our Gardens in England, and in very hot Summers has come to perfection with us.

V. **The Times.** It is Sown in the Spring, in March and April; and the Grain is for the most part ripe in July and August.

VI. **The Qualities.** It is Temperate in respect to Heat or Cold, and dry in the first Degree, Absterfve, and very nourishing.

VII. **The Specification.** It cleanses the Stomach, Bowels, Reins, and Urinary Passages of Tartarous Mucilage; inasmuch, that it is said to be very effectual to hinder the breeding of the Stone. It also nourishes well, with a thin and Absterfve Nutrient, and restores in Consumptions.

VIII. **The Preparations.** In the West Indies there is made thereof, 1. The boiled Grain or Maize. 2. Pottage. 3. Homine. 4. Bread, Cakes, Puddings. 5. Parched Corn. 6. A Cataplasm. 7. The whole Grain.

The Virtues.

IX. **The boiled Grain or Maize.** The Corn is first steeped a little in warm Water, then beaten in a wooden Mortar with a wooden Pistle, till all the external hard Hull is beaten off; then it is boiled in Water till the Grain is perfectly soft and burst in the boiling, and becomes almost like to our boiled Dish Wheat. They Eat it being seasoned with Salt, by mixing with it Butter, or Milk, Cream or Wine, and Sugar, it admirably nourishes and strengthens, and makes the Country Man able to go thro' Labour and Business.

X. **Pottage.** The Grain is freed from the external hard Hull as aforesaid: then being dried in the Sun, it is ground in a Mill to Meal, which being Sifted, and boiled in Water till it is soft, is yet more boiled, till it becomes of the consistence of a thin Hasty Pudding. It is Eaten as the former boiled Grain, with Butter, Salt, Milk, Cream, or Wine and Sugar, and has the same Effects in nourishing and strengthening those that Eat it.

XI. *Homine.*

XI. *Homine*. This answers to the *Frumenty*, made of our boiled Wheat. They take either of the former boiled Maize, or of the *Pultage*, what quantity they please: to which they add a sufficient quantity of Milk, which being boiled, may make it of the thickness of our English *Frumenty*; and some put in so much Milk as to make it a little thinner, according as every one likes. They generally eat it, being made Savory with Salt and Butter, and some put Sugar to it. It has all the former Virtues and Effects, besides it cleanses the Bowels, and always keeps them Soluble, at least from being Costive.

XII. *Bread, Cakes, Puddings*. They are made of the *Flower*, with Water or Milk. This Bread whilst New, is wonderful Sweet, beyond any that can be made of *European Wheat*; but being Stale, it eats something harsh, and more unpleasant: After one is used to it, it is then Eaten with a Gratefulness to the Stomach. Some make the Bread, &c. with half *Flower of Maize*, and half *Flower of Wheat*; and some add to the *Flower of Maize*, *Eldo Roots* boiled soft, which makes the Bread keep moist a good while.

XIII. *Parched Corn*. This whether it be of the dried Corn, or before it is ripe, is much eaten by the *Indians*, because of its easy Preparation, and its exceeding Gratefulness to the Palate.

XIV. *The Cataplasim*. The *Flower* mixed with *Levon*, and brought to a Consistency with Oil of the Seeds *Ricinus* or *Palma Christi*, or fresh Butter; being applied, is said to ripen Abscesses.

XV. *The whole Grain*. It is given to Cows, Oxen, Horses, Hogs, Poultry, &c. to Nourish and make them Strong, and also to Fatten them.

Whitlow-Grass Common.

Whitlow-Grass Common.

C H A P. DCCXXXV.

Of WHITLOW-GRASS:

O R, NAIL-WORT.

I. **T**HE Names. It is called in Greek *Παρω-
νυχία*: in Latin *Paronychia*; and in English
Whitlow-Grass, or *Nail-Wort*.

II. The Kinds. There are 1. *Paronychia vulga-
ris* *Dodonei*, *Paronychia communis* *folio Alfinis*
Lobelij, *Lugdunensis*, & *Camerarij*; *Thlaspi*
minima *species Thalij*; *Mysoris altera species Lugdu-
nensis*; *Burfa Pastoris loculo oblongo Bauhini*;
Our Common Whitlow-Grass. 2. *Paronychia fo-
lio rutaceo Lobelij*; *Paronychia folijs incis*, *Pa-
ronychia altera Dodonei*; *Paronychia tertia Taber-
nemontani*; Jagged, or Rue like Whitlow-Grass.
3. *Paronychia major*; *Pilosella Siliquata major*
Thalij; *Aizoon Telephium Delechampi* *Lugdu-
nensi*; The Greater Whitlow-Grass. 4. *Parony-
chia altera minor*, *Pilosella Siliquata minor Thalij*;
Paronychia altera folijs Myagri Gesneri; The
Lesser Whitlow-Grass.

The Descriptions.

III. The first, or our Common Whitlow-Grass.
Its Root consists of a Bunch of small Fibres;
from whence proceed many small and long Leaves
lying next to the Ground, somewhat like to those
of Chickweed, but something longer and whiter;

from among which, several slender naked Stalks,
not above 4, 5, or 6 Inches high, bearing many
white Flowers one above another, exceeding small;
after which, come small flat Pouches, lesser than
any of *Thlaspi*; in which is contained very small
Seed, of a sharp Taste.

IV. The second, or Jagged, or Rue-like Whitlow-
Grass. Its Root is small and Fibrous like the
former, which sends forth some pale or reddish
green Leaves, cut in on the edges into 2 or 3
small parts, almost in fashion like to the Leaves
of Rue; from among which, grow up divers al-
most

Whitlow - Grafs Jagged.

most naked Stalks, each spread out into several Branches, all of which, have at every Joint, one single but smaller Leaf, much like the former; which Stalks towards the tops, bend a little downwards, with some white Flowers at the tops, greater than the former, and Husks which hold the Seed, which is greater also.

V. The third, or Greater Whitlow-Grass. This from a small Fibrous Root, has very many Leaves springing forth, and lying on the Ground in a round Compass, one by another, about 3 Inches long, and an Inch broad apiece, rough, hairy, of a dark green color, and a little dented about the edges, growing on short Footstalks; from the middle of which, rise up one or two, rarely three, small round naked Stalks, with few, or rather no Leaves thereon, so weak as scarcely to stand upright, but bending downwards; at their tops come forth several small white Flowers, after which, come small long Pods, containing small reddish Seed, but nothing so hot or sharp as the Seed of the first.

VI. The fourth, or Lesser Whitlow-Grass. It has a Root which is small, hard and woody, the Plant is smaller than the former, having divers Leaves lying on the Ground, lesser than the Greater foregoing, like unto the lesser Mouse-Ear, called Cats-Foot, but not so hoary, yet a little hairy, of a yellowish green color; from among which, grow up several small, stout, and crested Stalks, 6 Inches or more high, branching forth at the tops, where come forth several white Flowers, after which follow very slender long Pods, like those of Elixweed, full of small reddish Seed, as sharp and hot in Taste as Cresses.

VII. The Places. The two first are often found to grow upon Brick and Stone Walls, and upon old Tiled Houses which are come to have much Moss upon them; and sometimes they are found growing upon shadowy and dry Mud Walls. The two last are found growing upon Open Hills, and other like dry Grounds.

VIII. The Times. They Flower very early in the Spring, sometimes in January and February, if the Weather be mild; for about the end of April, when the Weather begins to grow warm,

they dye away, and are no more to be seen all the Year after.

IX. The Qualities. They are all of them hot and dry in the third or fourth degree, Attractive and Suppurative.

X. The Preparations. You may make, 1. A Balsam or Ointment of the whole Herb. 2. A Cataplasim thereof.

The Virtues.

XI. The Balsam, Ointment or Cataplasim, are applied to those Apoftems at the Fingers ends, called Felons, and by the Roots of the Nails called Whitlows, which it is said they effectually cure.

C H A P. DCCXXXVI.

of WHORTLE-BERRIES:

O R,

BILLBERRIES Heath and Marsh.

I. THE Names. It is called in Greek *ἄμυρα* *Amura*: in Latine *Vitis Ida*; i. e. *ex parte Ida quam vocant Phalacras*; *Vitis Ida Theophrasti*: in Latine *Vaccinia*, *Vaccinium Frutex*; and in English Whorts, Whortle-Berries, and Bilberries.

II. The Kinds. Authors make 9 or 10 Species of them, or more; we shall describe those only which are most known and common to us, which are the four following, viz. 1. *Myrtillus exiguus Lugdunensis*, Matthioli, & Tragi, (but certainly it is no Myrtle, nor Species of a Myrtle.) *Vitis Ida vulgaris baccis nigris*, Camerarij, Clusij, & Gesneri; (but it is not the *Vitis Ida* which hears Currans, for that Noble Vine grows not on so high, or Snowy Mountains, but in the Plains and Open Hills, being a Cultivated Vine.) *Vaccinia nigra*, Dodonaei & Lobelij; *Bagola primum genus Celsij*; Our Common Black Whorts or Bilberries. 2. *Vitis Ida rubra* (by all Writers thereof) *Vitis Ida folijs buxeis Clusij*, *Radix Ida fructu rubro Anguilare*, (as he called the other *Radix Ida fructu nigro*;) *Radix Ida Dioscoridis Lugdunensi*; and *Vaccinia rubra* by almost all Authors; Our Red Whorts, or Bilberries with Box-Leaves. 3. *Vitis Ida tertia Clusij*; *Myrtomalis*, *Petromelis*, *Pyrus Cervina*, *Pyraster Ida Gesneri*, Sweet Whorts or Bilberries. 4. *Vaccinia palustris Dodonaei & Lobelij*; *Acinnaria palustris Gesneri in hortis*; *Oxyccoccum Cordi Vitis Ida palustris Baubini*; *Vitis Ida tertia Clusij*; *Vaccinium palustre*, Marsh Whorts, or Bilberries.

The Descriptions.

III. The first, or Our Common Black Whorts, or Bilberries. Its Root grows alope under Ground, shooting forth in several places as it runs. It is a small Bush, which creeps as it were upon the Ground, scarce rising a Foot and half high, with several small dark green Leaves, set on the green Branches, which it spreads broad on both sides, but

but not always one against another, somewhat like unto the smaller Myrtle Leaves, yet not so hard, and a little dented about the edges. At the Foot of the Leaves come forth small, hollow, pale, bluish colored Flowers, the Brims ending in five points, with a reddish Thread in the middle, which pass

are somewhat long with their roundness, and a little dented about the edges, of a sad green color above, and very hoary underneath. At the Joints with the Leaves, come forth many white Flowers, consisting of five Leaves apiece, after which, come small round Berries, somewhat bigger

V Whortle - Berries:

O R,

Billberries Black.

into small round Berries, of the bigness and color of Juniper-Berries, but full of a purple Sweetish Sharp, or sowre Juice, which does give a sad purplish color to their Hands and Lips who handle and eat them, if breaking them, containing within them several small Seeds. This abides all Winter, but looses its Leaves.

IV. The second, or our Red Whorts, or Billberries. Its Root runs under Ground like the former, and rises up to a small Bush in the same manner, but has harder Leaves, in form and shape almost like to those of the Box-Tree, green and round pointed, standing on its several Branches, at the tops whereof only, and not from the sides (as in the former) come forth several round, and somewhat long hollow Flowers, of a pale red color. After which, succeed round reddish sappy Berries, when they are ripe, of an acid Astringent Taste. Its Leaves fall not away (as the former do) in Winter.

V. The third, or Sweet Whorts, or Billberries, (which some call French Whortle-berries.) This rises up with several thick, smooth, woody Stems or Stalks, to 5, 6, or 7 Feet high, their lower parts being something rough, and covered with a blackish Bark, the upper Branches being green, stored with many Leaves thereon, set without order, which

V Whortle - Berries:

O R,

Billberries Sweet.

than Haws of the Haw-Thorn, and black when they are ripe, having a small Crown as it were of five small points, and are sappy, of a sweet Taste, containing blackish Seed within them.

Whortle-Berries, or Bilberries Marsh.

VI. The

VI. *The fourth, or Marsh-Whorts, or Billberries.* Its Root is long and white, running aslope under the Earth, and not down right; whence spring up several slender brownish Branches, like unto Strings, scarcely exceeding a Foot in length, creeping upon the Ground, beset with many small Leaves like unto those of Thyme, at certain distances, green on the upper side, and oftentimes hoary underneath. The Flowers come forth at the tops, growing upon long shreddy Footstalks, consisting of five reddish Leaves, with an Umbone or Pointle in the middle, which turn into round reddish Berries, having a sowerish Astringent Taste.

VII. *The Places.* The first grows on many Heaths, and in Woods, and on Barren Hilly places in many parts of England. It has been found on Hampstead-Heath, Finchley-Common, and St. Johns Wood, not far from London. It prospers best in a Lean Barren Soil, and in Untill'd Woody places; and are now and then found on high Hills subject to the Wind, and upon Mountains. They grow in many other parts of England, as on the Hills in Cheshire, called Broxen-Hills, near Beeston-Castle; and several other places. The second in the North-parts of this Land, as in Lancashire and Yorkshire; on the Hills in Lancashire, upon Pendle-Hills; and in Westmoreland, at Crosby Ravenswaith, &c. The third grows as Lobel says, on every Hill in Provence; and some say they have found it growing in the Southern part of our Island. The fourth grows only in Moorish places, which are often covered over with Moss; in Bogs, Watery and Fenny places, especially in Cheshire and Staffordshire, where it is found in great plenty.

VIII. *The Times.* The first three Flower in March and April, and sometimes in May, and the Fruit of the Black is ripe in June and July, but of the other two later. The Marsh kind Flower in July, and their Fruit is ripe in August.

IX. *The Qualities.* The Berries of them all are cold and dry in the second degree, Astringent, and Anti-Emmenagogick.

X. *The Specification.* The Juice of the Berries stop Womens Courfes, and all sorts of Bleedings; and are good against all Fluxes of the Belly. It quenches Thirst, stops Vomiting, extinguishes the heat of Burning Fevers; stops Coughs; and is good against a Phthisis, and other Dileases of the Lungs.

XI. *The Preparations.* You may have, 1. *The ripe Berries.* 2. *A Rob, or Syrup of their Juice.* 3. *A Conserve.* 4. *A Purple Blew Dye.* 5. *A Crimson color or Dye.*

The Virtues.

XII. *The ripe Berries.* The Black Whorts are eaten in the Countries where they grow, with Cream or Milk, and sometimes with Wine, as we eat Strawberries, and so they cool and refresh the Stomach, stop Vomiting, allay the heat of Choler, and bind the Belly.

XIII. *The Rob, or Syrup.* They are good against the Heat of burning Fevers, cool a hot Stomach and Liver, resist Vomiting and Nauuseousness, quench Thirst, are good against the Bloody-Flux, and stop all other Fluxes of the Belly, as also Cholerick Fluxes in particular; and are good to cure all inward Fluxes of Blood, as Spitting and Vomiting Blood, Pissing Blood, Bloody Stools, or Hepatick Flux; the overflowing of the Loches, as also of the Terms in Women, &c. and are profitable for such as are troubled with an old Cough, and Ob-

structions of the Lungs; and are said to be good against a Phthisis, or an Ulceration of that Bowel.

XIV. *The Conserve of the Berries.* It has all the Virtues of the Rob and Syrup, and may be given Morning, Noon and Night, to the quantity of a large Chestnut.

XV. *The Purple color'd Dye.* Tragus says, that the Country People take a Pot full of the Juice of the black Berries strained, into which they put 4. Spoonfuls of good Wine Vinegar; an Ounce of Alum, and a quarter of an Ounce of Copper Filings, or Forgings, or Scales of Copper; which they boil altogether, and make a Dye thereof. Into this Dye or Liquor, they put Cloth, Wool, Thread, Yarn, &c. letting them lye in it for a good while, which afterwards they take out and dry, and then wash them with cold Water, so will they have a Turkey Blew color; and if they would have it deeper, they put into it an Ounce of broken Galls. Also with the Juice of the Berries, Painters color Cards, Paper, Maps of Countries, of a Purple blew color, putting thereto some Alam and Galls, by which they make it lighter or deeper, as they please.

XVI. *The Crimson Dye.* It is made of the Juice of the Red Whortle-berry, by adding thereto a little Alum. The Juice of these Red Whortle-berries, when of an excellent red color, and the Berries are full of Juice, is of so Orient and Beautiful a Purple to Limne withal, that Indian Lacca is not to be compared to it; especially when this Juice is prepared with Alum according to Art, as I my self (says my Author) have proved by Experience.

C H A P. DCCXXXVII.

Of WILLIAMS and JOHNS Sweet, Garden and Wild.

I. *THE Names.* They have no known Greek Name, but are called by this general Name in Latin, *Armerius*: Of some *Superba*, and *Caryophyllus Sylvestris*: In English, *Sweet Williams* and *Sweet Johns*.

II. *The Kinds.* They are either *Latifolius*, broad Leav'd, which are called *Sweet Williams*; or *Angustifolius*, narrow Leav'd, which are called *Sweet Johns*. Of these there are these following Varieties, viz. 1. *Armerius latifolius simplex flore albo*, single white Sweet Williams. 2. *Armerius latifolius simplex flore rubro*, single red Sweet Williams. 3. *Armerius latifolius simplex variegatus*, single speckled Sweet Williams, or London Pride. 4. *Armerius latifolius simplex flore rubro saturo holosericeo*, single deep red, or Murry colored Sweet Williams, or Velvet Williams. 5. *Armerius latifolius flore rubro multiplici*, double red Sweet Williams. 6. *Armerius angustifolius rubens simplex*, single red Sweet Johns, or single red narrow leav'd Sweet Williams. 7. *Armerius angustifolius albus simplex*, single white Sweet Johns, or narrow leav'd white Sweet Williams. 8. *Armerius angustifolius duplex*, double Sweet Johns, or double narrow leav'd Sweet Williams. Gerard says, that doubtless Sweet Williams are a kind of wild Gilliflower.

The Descriptions.

III. The first or single white Sweet Williams. From a small Fibrous Root, spring up many long trailing or weak Stalks, with Leaves lying on the Ground, broader than those of the Sweet Johns, of a fresh green color, the Leaves not being Brown at all; at the tops of the Stalks or Branches, are tufts of single white Flowers, growing pretty thick and close together, and in good numbers, having many small pointed Leaves among them.

IV. The second, or single red Sweet Williams. They all of them spread into many trailing Branches, with long broad Leaves lying upon the Ground, in the same manner that the Sweet Johns following do. The chief differences between them are, that these

Williams Sweet Red.

have broader and darker green Leaves, somewhat brownish, especially towards the points; and that the Flowers stand thicker and closer, and a great many more in number together in the Head or Tuft, having small pointed Leaves among them, but with prickles unhurtful. The color of the Flower is of a deep red, without any mixture or spot at all.

V. The third, or single speckled Sweet Williams, or London Pride. The Roots are some long, and some small and thready, running under the uppermost crust of the Earth. These spotted Williams are very like the former red Williams, in their form and manner of growing, having Leaves as broad and brown, sometimes as they: The Flowers stand as thick or thicker, clustering together, but of very variable colors; for some Flowers will be of a fine delayed Red, with a few marks or spots upon them; others will be full speckled or sprinkled, with white or Silver spots, circlewise about the middle of the

Flowers: And some will have many specks or spots dispersed upon them. All these Flowers do not blow at one time, but some will be flowering, when others are decaying: so that abiding long in their Pride, they become flowers of some value and respect. The Seed is black, as is all the rest, and not to be distinguished one kind from another.

VI. The fourth, or single deep red, or Murry color'd Sweet Williams, or Velvet William. The Leaves of this seem to be a little larger, and the Joints a little redder than the former; but in the Flower consists the chief difference, which is of a deep red, or Murry Purple color, like unto Velvet of that color, without any spots, but smooth and soft as Velvet in handling, having an Eye or Circle in the middle at the bottom of the Leaves.

VII. The fifth, or double red Sweet Williams. This double kind differs nothing from the single kind, of the same color (at Sect. IV. foregoing) but in the duplicity, or doubleness of the Flowers, which are with two rows of Leaves in every Flower.

VIII. The sixth, or single red Sweet Johns, or single red narrow Leav'd Sweet Williams. Its Root is dispersed several ways, with many small Fibres adjoining to it. Its Leaves are broader, shorter and greener, than any of the Gilliflowers, but narrower than the Sweet Williams afore described, set by pairs at the Joints of the Stalks, which are shorter than most of the Gilliflowers, or Pinks, and not above a foot and a half high. At the tops whereof grow many small Flowers, like unto small Pinks, but standing closer together, and in shorter hose or husks, consisting of 5 Leaves, smaller than most of the Pinks, and more deeply jagged than the Williams; of a red color in the middle, and white

Johns White and Red Double.

Belonging to Sect. 10.

at the edges, having but a small scent or smell, and not all flowering at once, but by degrees. The Seed is black, something like to the Seed of Pinks.

IX. The seventh, or single white Sweet Johns, or single white narrow Leav'd Sweet Williams. This differs not in any thing from the former, but only that its Leaves do never change brownish, and that the Flower is of a fair white color, without any mixture.

X. The Eighth, or double Sweet Johns, or double narrow Leav'd Sweet Williams. These double Johns are both of the red kind, and of the white kind, and in their form and manner of growing, are exactly like the single red and white kinds, there being no difference between them, but in the duplicity of the Flowers, some consisting of two rows of Leaves, and some of three, the edges of which Leaves of the Flowers are not so deeply jagged, as are the single kinds.

XI. The Places. These grow wild for the most part in Italy, and other warmer Climates; but they are only Nurst up in Gardens with us, for their Beautiful variety.

XII. The Times. They flourish or bring forth their Flowers in April or May, before the Gilliflowers and Pinks, and bear their Flowers a great part of the Summer, their Seed being ripe in June and July. They are hardy Plants, and will endure the extremity of our Coldest Winters.

XIII. Note. From the sowing of their Seed many pretty Varieties are raised; but every slip of them set in the Spring, will grow and abide the Winter. The Velvet Williams, and the Double Johns, are worthy the respect of the greatest Ladies, who are Lovers of Flowers. They who have room enough, and are pleased with, may by sowing their Seeds, have great and fine Diversities, even of double Flowers.

XIV. As to their Qualities, Specifications, Preparations, or Virtues, Authors have said nothing, and having Experimented nothing concerning them, we are Silent. Their great use with us in England is, to entertain them as an Ornament to our Gardens, for their Variety and Beauty sake.

WILLIAMS Wild :

O R,

CROW-FLOWER.

XV. The Names. It is called in Latin, *Armeria Armeracia*, *Armoraria Sylvestris*, *Armerius flos primus Dodonai*, *Tunix*, *Cariophyllus minor Sylvestris foliis latioribus*, *Flos Cuculi*, *Flos Cornici* : In English, *Wild Williams Crow-Flowers*, and *Marsh Gilliflowers*.

XVI. The Kinds. Gerard says these are a Species of the Gilliflowers, or of the Sweet Williams, and are taken by some to be the true *Flos Cuculi*; but he esteems it to be a kind of *Wild Gilliflower*: Of these we have, 1. The Male Wild William, or Crow-Flower. 2. The Female Wild William, or Crow-Flower. 3. The Double Wild William, or Crow-Flower.

The Descriptions.

XVII. The First, or Male Wild William, or Crow-Flower. It has Stalks of 9, 10, or 12, Inches high, with Leaves thereon by couples at every joint, which are small and bluntly pointed, very rough and hairy. The Flowers are at the tops of

the Stalks many in one Tuft, finely and curiously snipt on the Edges, lesser than those of Gilliflowers, but well resembling Sweet Williams, which are of a light Red or Scarlet color.

WILLIAMS Wild :

O R,

Crow-Flower.

XVIII. The Second, or Female Wild William, or Crow-Flower. It differs not from the former Male, but in its Magnitude this being lesser, and the Flowers more finely jagged, like the feathered Pinks, of which this is said to be a kind.

XIX. The Third, or Double Wild Williams, or Crow-Flower. This differs nothing from the first Crow-Flower, saving that that is single Flowered, whereas this is double flowered, having many fair double Flowers.

XX. The Places. They grow all about in Meadows and Pastures, and in low Moist Grounds: but the double kind has been brought into Gardens, where it grows very fair and pleasant; I suppose from the goodness of the Soil.

XXI. The Times. They begin to flower in May, and continue flowering till towards the latter end of June.

XXII. Of their Virtues. Authors are silent; they only serve as Ornaments for Gardens, Walks, Houses, and other places.

C H A P. DCCXXXVIII.

of WIND - FLOWERS :

O R,

ANEMONES.

I. **THE Names.** This Plant is called in Greek *Ἀνεμών, ἀνὶ τῷ ἀνεμῷ, quasi Herba Venti* : in Latin *Anemone* ; also *Herba Venti*, and *Flos Venti* ; and in English we call them *Anemones* and *Wind-flowers*.

We have already in Chap. 12. and 14. of this Work aforegoing, briefly discoursed of the *Garden and Wild Kinds* of this Plant, not then intending to make this our *Herbal a Florilegium* ; but afterwards upon second Thoughts, considering how acceptable it might be to *Florists*, to *Persons of Quality, Gentlemen and Ladies*, whose Curiosity might lead them that way, and were very inclinable and Industrious in improving themselves in the *Knowledge and Culture of Flowers*, we then resolved to make it as useful to them as we could ; and therefore in all the following Discourses, where we have treated of *Flowers*, we have been very careful to give the Curious and Industrious that way, if not a plenary Satisfaction ; yet such an *Introduction to the Knowledge and Culture of them*, as we hope may gratifie all the Lovers of those admirable Curiosities. And so in order to the same Resolutions, seeing we had been so brief in the said Chap. 12. and 14. under the Title of *Anemones*, we shall now plentifully supply here, what we were defective in there.

II. **The Kinds.** There are 1. *The Wild Kinds*, of which we have already treated in Chap. 12. and Chap. 543. aforegoing, of which we shall say no more. 2. *The Garden or Manured Kinds*, of which we shall treat more fully in this Chapter, and they are, 1. *Anemone latifolia flore simplici*, Broad Leav'd Anemone Single Flower'd. 2. *Anemone latifolia flore multiplici, five flore pleno*, Broad Leav'd Anemone double Flower'd. 3. *Anemone tenuifolia flore simplici*, Narrow Leav'd Anemone Single Flower'd. 4. *Anemone tenuifolia flore duplici, vel flore pleno*, Narrow Leav'd Anemone double Flower'd ; of all which in order. Of each of these principal kinds, there are a great number of Varieties, too many to be specified in this *Section* ; and therefore avoiding that trouble here, we will give you their several and various, or particular Appellations in Course, as they shall be Described.

The Descriptions.

I. Of Broad Leav'd Single
ANEMONES.

III. 1. *Anemone latifolia flore simplici* ; Broad Leav'd Anemones with Single Flowers. Its Root is tuberous, with some Fibres adjoining to it. Its Flowers are all Single, with one row of Leaves, and a hairy Head in the middle, of a color differing from that of the Leaves. It is of divers sorts and

colors, some bigger, others lesser, some taller, others lower ; and the Flowers are of divers Reds, Purples, Scarlets, deeper or paler, even to *Pink*, or *Peach* color, white, Silver, or *Ash* color ; some

Wind-Flower Garden Single.

of the best sorts of which, are kept by *Florists* for their Seed sake, from whence many diversities are raised, and some Double Flowers as well as Single ; and of differing colors, as well plain as striped. In all these Single Flowers, and some of those less Double, than the Double kinds, the Head in the middle, after the Flowers are fallen, grows bigger and full of Down, in which the Seed is enclosed, which must be carefully gathered as soon as it is ripe, else it will be all blown away with the Wind. These Single kinds are to be Sown and ordered after the same manner as those with the narrow Leaves.

IV. 2. *Anemone latifolia flore luteo simplici Hortensis* : The Garden broad Leav'd Single yellow Anemone, or Wind-Flower. Its Root grows downward into the Ground, diversly spread with Branches here and there, of a brownish yellow on the outside, and whitish within, so brittle that it can hardly be touch'd without breaking. It has divers broad round Leaves, somewhat divided, and indented withal on the edges, brownish at the first rising out of the Ground, and almost folded together ; and after, of a sad green on the upper side, and reddish underneath. Among which, rise up small slender Stalks, beset at their middle with two or three Leaves, more cut and divided than those below, with small yellow Flowers at their tops, consisting of ten or twelve Leaves apiece, having a few yellow Threads in the middle, standing round a small green Head, which in time growing ripe, contains small flat Seed, enclosed in a soft Wooll or Down, which is easily blown away with the Wind.

V. 3. *An-*

V. 3. *Anemone latifolia Purpurea Stellata*, five *Papaveracea flore simplici*; The broad Leaved Single Purple Star *Anemone*, or VVind-Flower. Its tuberous Root is blackish on the outside, and white within, knobby, with many Fibres growing from it. Its first Leaves, which always spring up before VVinter, (if the Root be not kept too long out of the Ground,) are something like the Leaves of *Sanicle*, or *Self-Heal*; but the rest which follow, are more deeply cut in or jagged. Among which, rise up divers round Stalks, beset with jagged Leaves, (as all other *Anemones* are,) above which Leaves, the Stalks rise up about 2 or 3 Inches, bearing one Flower a piece, composed of 12 Leaves or more, narrow and pointed, of a bleak Purple, or whitish Ash color, somewhat shining on the outside, and of a fine Purple color tending to a Murry, on the inside, with many blackish blew Threads or Thrums in the middle of the Flower, set about a Head, in which grows the Seed, which is small and black, inclosed in soft VVool or Down, which flies away with the VVind, carrying the Seed with it, if not carefully gathered.

VI. 4. *Anemone latifolia flore purpurea Stellata altera simplici*; another broad Leav'd fingle Star Flower'd Purple *Anemone* or VVind-Flower. This differs not from the former in Leaf or Flower, saving that this is of a more pale or dull color on the outside, and of a paler purple color on the inside.

VII. 5. *Anemone latifolia Viola purpurea flore simplici*; broad Leav'd fingle Violet colored *Anemone* or VVind-Flower. This has but 8 Leaves, (as many of them which follow have) and is of a Violet Purple color, whence its Name: Of these 3 last sorts, there are some which differ only in having white bottoms, some smaller and some larger.

VIII. 6. *Anemone latifolia flore simplici, purpurea striata*; Broad Leav'd fingle, purple, striped *Anemone*, or Wind-Flower. The Purple is the same with the former, but a little paler, rendering more to redness, whose Flowers have many white Lines and Stripes thro' the Leaves.

IX. 7. *Anemone latifolia flore simplici Carnea vivacissima*; Broad Leav'd fingle Flower'd, flesh bluish colored Wind-Flower. Its green Leaves are something larger, and so is the Flower likewise, consisting of 8 Leaves, and sometimes of more, of the color of *Carnation Silk*, sometimes pale, and sometimes deeper, with a whitish Circle about the bottom of the Leaves; which Circle in some is larger, and more to be seen than in others, when the Flower lays it self open with the heat of the Sun; having blewish Threads in the middle. This may be called the *Carnation Anemone*, or Wind-Flower.

X. 8. *Anemone latifolia flore simplici Persici Violacea*; The broad Leav'd Gredeline color'd fingle Wind-Flower. This Gredeline color is between a Peach color and a Violet.

XI. 9. *Anemone latifolia flore simplici Cochinele*; Broad Leav'd fingle Cochinele Wind-Flower. This is of a fine reddish Violet, or Purple, or Cochinele color.

XII. 10. *Anemone latifolia flore simplici Cardinalis*; Broad Leav'd fingle Flower'd Cardinal Wind-Flower. It is of a rich Crimfon red color. There is another sort of it which is deeper, called *Sanguinea*, or *Blood red Anemone*, but it is not of so lively a color: And another called *Craefina*, called the *Crimfon Anemone*, which is of an ordinary Crimfon color.

XIII. 11. *Anemone latifolia flore simplici Cocinea*; Broad Leav'd fingle Stamel colored Wind-Flower. This is near unto a Scarlet color.

XIV. 12. *Anemone latifolia flore simplici incarnata*; Broad Leav'd fingle incarnate Wind-Flower. It is of a fine delay'd red, or Flesh color. There is another called *Incarnata Hispanica*, or Spanish Incarnate Wind-Flower, which is of a lively Flesh color, shadowed with yellow: And another called *Rubescens*, or *Blush Anemone*, of a fair whitish red.

XV. 13. *Anemone latifolia flore simplici Moschatella striata*; Broad Leav'd fingle Nutmeg Wind-Flower. This consists of 8 Leaves of a dark whitish color, striped all over with Veins of a fine bluish color, the bottoms being white.

XVI. 14. *Anemone latifolia flore simplici Enfumata*; Broad Leav'd fingle, smoaky Wind-Flower. It is of a pale whitish color, tending to gray, and is called *Monks Gray Wind-Flower*.

XVII. 15. *Anemone latifolia flore simplici, five Pavo major*; The greater Peacock Wind-Flower, or greater fingle Orange Tawney *Anemone*. Its Leaf is somewhat broader than many, or most of the *Anemones*, coming near unto the Leaf of the Great double Orange color'd *Anemone*, consisting of 8 large or broad Leaves, very near unto the same Orange color which is in the Double Flower, but somewhat deeper. There is also *Pavo minor*, or lesser Orange Tawney *Anemone*, whose Flower is lesser.

XVIII. *Nota*. There are besides these expressed, so great Varieties of mixt colors in the Flowers of this Broad Leav'd Single kind, arising every Year from Sowing of the Seed of some of the choicest for that purpose, that it is admirable to observe as well in the great Variety of Simple colors, where there is but one only, as in the mixture of two or three colors in one Flower; besides the diversity of the bottoms of the Flowers, some having white or yellowish bottoms, some having none, and yet both of the same color or colors; and likewise in the Thrums or Threads in the middle. But the most admirable Beauty is in the Double Flowers, which arise from the Seed of the other Single ones, some having two or three rows of Leaves in their Flowers; and some as thick of Leaves as a *Double Marigold*, or *Double Crow-foot*; and of the same several colors as are in the Single Flowers; so that it would be almost impossible to express them all severally, some falling out to be Double in one Year, which may prove less Double or Single in another; yet very many abiding constantly Double as at first.

II. Of Broad Leav'd Double Flower'd ANEMONES.

XIX. 1. *Anemone latifolia maxima versicolor vulgaris*, *Anemone Chalcidonica maxima versicolor*. The common broad Leav'd double variable *Anemone* or Wind-flower, or greatest double Wind-flower of *Constantinople*, by some called the *Spanish Marigold*. Its Root is tuberous, large and thick, of a blackish color on the outside and yellowish within, not shooting out any long slender Roots as others do. It springs up before Winter, with broader and greener Leaves than any of the former kinds, not so much divided or cut in on the edges, yet so cut in, as that the edges are folding, seldom lying smooth and plain, of a fresher green color than many which follow, and a little hard in handling, and therefore called by some Hard-Leaf: From among these Leaves rise up one or two Stalks (sceldom more from one Root) having some Leaves as about their middles jagged (as all the *Anemones* have)

have) each Stalk bearing at its top one large Flower apiece, which is large and double; consisting of many narrow, long, sharp pointed Leaves, the outmolt of which, are broadest and greenish at first, but afterwards reddish, with some stripes of Orange Tawney; the middle Leaves within these are smaller, and of a red color, or of an Orange Tawney; the innermolt being smallest, are wholly of the same color, but turned somewhat inward, covering the Head or Button, which is usual in the midst of the Flowers of molt of this kind; these having no Thrums or Threads in the middle as the former have, nor bearing any Seed

XX. 2. *Anemone latifolia Chalcedonica altera, five Pavo major flore duplici.* The great broad Leav'd double Orange Tawney Wind-flower. The Root of this is like the former, and its large Leaves are so like the last, that one can hardly distinguish them asunder: The Stalk also has such like Leaves upon it, bearing at the top a fair large Flower, consisting of many Leaves, set in two or three of large round pointed Leaves, of a light Scarlet Orange Tawney color. These Leaves stand not so thick or double as the former, seeming to be but one thick row, of many small long Leaves, of an excellent Crimson color, wherein some yellow is mixed, which makes that color we call an Orange Tawny. The bottoms of the Leaves are red, with a whitish Circle; the thrummy Head in the middle, being beset with many dark blackish Hairs or Threads. This Flower and the former, are most common, and best known of all the sorts of double broad Leav'd Anemones.

XXI. 3. *Anemone latifolia flore pleno coccineo variegata Anemone Cyparissia:* The broad Leav'd double Anemone, with a Scarlet Flower; the double Cyprus Anemone or VVind-flower. Its Root differs not from either of the former, and has Leaves very like the last double Anemone, but not altogether so large; the Flower consists of smaller Leaves, and of color very near unto the last Double Orange Anemone, but richer of Leaves, full as double as the first, altho' not so great a Flower, without any head in the middle, or thrums about it, as in the last. Mr. Rea says, that the Stalk is tall, and that it bears a gallant large double Flower, of a rich Scarlet color, and every Leaf thereof finely striped and variegated with white; and that it far surpasses any of the former.

XXII. 4. *Anemone latifolia Cucumerni Margini, five Persica:* The broad Leav'd double Persian VVind-flower. It came out of Persia to Constantinople, and from thence to us. In its Root and Leaf, it is very like to the former double Anemones; only the Flower hereof, is rather like unto the second great double Orange colored Anemone, at Sect. XX. above, usually called *Pavo major flore pleno*; being composed of three rows of Leaves, the outermolt row consisting of 10 or 12 larger Leaves; and those more inward, lesser and more in number, but all of them variably marked with white, red, and yellow, having their bottoms white. But instead of a middle Head with Thrums about it, as the other has; this has a few narrow Leaves, of a deep yellow color in the middle, the Flower standing upright.

XXIII. 5. *Anemone latifolia flore luteo duplici:* The broad Leav'd double yellow Wind-flower. Its Root is Tuberous, and like the Root of the single; and has such broad round Leaves as the single, but somewhat larger or ranker. The Stalks are beset with larger Leaves, more deeply cut in on the edges. The Flowers are of a more pale yellow, with some purplish Veins on the outside, and a little round pointed: but they are all on the inside of a fair

yellow color, consisting of two rows of Leaves, of which the innermolt is the narrowest, with a small green Head in the middle, encompassed with yellow Threads, as in the single. This has little or no Smell, and springs up and flowers later than the single kind.

XXIV. 6. *Anemone latifolia flore pleno Coccineo:* The broad Leav'd double Scarlet colored Wind-flower. The Leaves are green, but smaller than those of *Pavo major*, at Sect. XX. the Flower is thick and double, consisting of many round pointed narrow long Leaves, which are wholly of rich Scarlet color. There is *Coccinea altera*; another of this sort of double Scarlet Flowers, the Leaves whereof are narrow, sharp pointed, and of a light Scarlet color. And this is that sort, which is called *Super-Rich*. There is also another which bears double Flowers, almost as large as the first, which are of the color of *Minium*, or *Red Lead*.

XXV. 7. *Anemone latifolia flore pleno rubro:* The broad Leav'd double red Wind-flower. It has dark green Leaves, and a small double blood-red Flower, consisting of many narrow Leaves. And of this kind there is another like unto it, only the Leaves of the Flowers are tipped, and a little edged with white.

XXVI. 8. *Anemone latifolia flore pleno purpureo variegata:* The broad Leav'd double purple variegated Wind-flower. It differs from the next following, chiefly in Nobleness of the Flower, which is very large, thick, and double, of an excellent reddish Purple color; and every Leaf thereof, lifted about with white.

XXVII. 9. *Anemone latifolia flore pleno purpureo:* The broad Leav'd double Purple Wind-flower. It has broader Leaves than the 7th foregoing, and of a brownish green color. The Flower is something larger, and the Leaves thereof not so numerous, but broader, of a Murry Purple color. There are divers sorts like unto this, which only differ in the color of the Flowers; some being deeper, some lighter, and some of a pale Purple, which by long standing before they fall, almost seem white.

XXVIII. 10. *Anemone latifolia flore duplici variegata:* The broad Leav'd double variously colored Wind-flower. This is almost like to the first, at Sect. XIX. foregoing; but lesser, whose Flowers are very thick and double, some being white, or whitish, some purple, deeper or paler, some of a bluish or flesh color, and some of a reddish color tending to Scarlet, or Carnation, with several other varieties not easy to be Named, which all of them continue constant in their several appearances or colors.

III. Of Narrow Leav'd Single ANEMONES.

XXIX. The Single narrow Leav'd Anemones are of greater rarity, variety and esteem, than the *Latifolia's*. Formerly we had but few of these Flowers, and such as were little worth, but now of late Years we are become Masters of a great Variety of them, admirable in their kinds, of divers colors, plain, edged, striped or marked, Reds, Scarlets, Purples, Whites, Peach color'd, Rose color'd, simple and variegated with White. And some others raised from the Seeds of these, which produce gallant Double Flowers of several colors, as Red, Scarlet, Purple, &c. both plain and striped, which have more resembled the Flowers of the *Double Latifolia's*, than those with narrow Leaves; these

these confisting of many something broad Leaves, having no Bruh or Thrum of Leaves, but a small Head or Button in the middle, some having but two rows of Leaves, some three, and some so thick and double, that the Head in the middle is not to be seen, until the Flowers fall. And yet these kinds, (especially the thinner sorts) perfect their Seeds, from whence many fine Flowers may be produced. These are called *Hermaphrodites*; for that they partake of both kinds, as having the Roots and Leaves of the Narrow, and the Flowers of the Broad *Leav'd Anemones*.

XXX. In the handling and ordering of the rarer sorts of these excellent Flowers, some particular care is to be taken, for if the Soil, Scituation, Time, and *Modus* of Planting and taking up, be not exactly observed, the Flowers will neither be fair, nor will the Roots prosper and increase; but on the contrary rot and consume; more especially all the best Double kinds with narrow Leaves; but the ordinary, and those with Single Flowers, are more hardy.

XXXI. 1. *Anemone tenuifolia flore simplici vulgaris*; The Common Narrow Leav'd Single Wind-Flower. Its Root is much bigger than the Double kind, and apter to increase, and the green Leaves are larger, ranker, and more in number than in the Double kinds. The Stalks are tall, and bear plentifully fair large bluish colored Flowers, commonly confisting of one row of broad Leaves, with a hairy Head or Button in the middle, which after the Flowers are past, grow big and long, yielding store of small flat brown Seed, involved in Down.

XXXII. 2. *Anemone angustifolia, five Geraniifolia cerulea flore simplici*: Narrow Leav'd blew single Flower'd Anemone or Wind-Flower. The Root is blackish without, and extends it self in long tuberous pieces, somewhat like to those of the Broad *Anemones*. It springs not out of the Ground, till the great Winter Frosts be past, viz. about the middle of February, when thin cut Leaves come forth, somewhat brownish at their first appearing; but afterwards spread out into winged green Leaves, something broader than the rest which follow, divided into three parts, and each part into three Leaves, every one cut in about the edges, one standing against another upon a long slender Foot-stalk, and the end-Leaf by it self. Among these, rise up two or three green Stalks, garnished with such like rhin Leaves as ate set at the bottom; from above which rise the Flowers, but upon one Stalk, confisting of 14 or 15 small pale watchet, or blew Leaves, lesser than any of the Single Kinds which follow, which encompass many whitish Threads, and a small green Head in the middle, something like the Head of the *Wild Crowsfoot*, in which is contained such like Seed.

XXXIII. 3. *Anemone angustifolia flore simplici alba*; Narrow Leav'd white Single Flower Anemone. This is a Species of the last described, but with this difference, That the Leaves of this are not brown at their first rising, but green; and that the Flowers in this are white, in that blew.

XXXIV. 4. *Anemone angustifolia purpurea vulgaris*; The common narrow Leav'd Single Purple Wind-Flower. Its Root is smaller, and more spreading every way into small, long, flat, Tuberous parts, than any other kinds of *Single or Double Anemones*. This is one of the most common Wind-Flowers, and therefore least regarded; it has many winged Leaves standing upon several Stalks, cut and divided into divers Leaves, much like unto the Leaves of a *Carrot*. Among which, rise up Stalks with some Leaves thereon, (as is

usual to the whole Family of the *Anemones*, both *Wild and Manured*.) at the tops of which stand the Flowers, confisting of six Leaves commonly, but sometimes they will have 7 or 8, being very large, and of a perfect Purple Violet color, very fair and lively. The middle Head has many blackish Thrums or Threads about it; but I never heard that it was ever found to bear Seed.

XXXV. 5. *Anemone angustifolia flore simplici, Carnea pallida*: Narrow Leav'd Single, pale Bluish colored VVind-Flower. This in its Root and Leaf is like the former, but the Flower is nothing so large, but is whitish tending to a Bluish color, and of a deeper Bluish towards the bottom of the Flower, with blackish blew Thrums in the middle, never being observed to give Seed.

XXXVI. 6. *Anemone tenuifolia flore simplici, Carnea virida unguibusque albis*: Narrow Leav'd Single lively Bluish colored Wind-Flower, with white bottoms. This is like the last in Leaf and Flower, but that the Flower of this is larger, and its Nails or bottoms are white.

XXXVII. 7. *Anemone angustifolia flore simplici, alba venis purpuris*: Narrow Leav'd Single white Anemone, with Purple Veins. This is a lesser Flower than the other, and being white, has Purple colored Veins and Stripes running through every Leaf.

XXXVIII. 8. *Anemone tenuifolia Coccinea simplex*; thin Leav'd single Scarlet Anemone. Its Root is tuberous, but confisting of thicker pieces, somewhat like unto the Roots of the broad *Leav'd Anemones*, but somewhat brown, and not so black, most like unto the Root of the *Double Scarlet Anemone*. The Leaves are something like unto the former, but a little broader, and not so finely cut and divided; the Flower consists of six reasonably large Leaves, of an excellent bright Red or Scarlet color: the bottoms of the Leaves are large and white, and the Thrums or Threads in the middle, of a blackish Purple color.

XXXIX. 9. *Anemone tenuifolia simplex Coccinea absque unguibus*; Narrow, or thin Leav'd single Scarlet colored Wind-Flower. This is very near to the color of the last described, and without any white bottom in its Leaves.

XL. 10. *Anemone tenuifolia simplex flore Holosericeo*: rhin Leav'd single Crimson Velvet VVind-Flower. This has as large a Flower as any of the Single Kinds, and is of an Orient deep red Crimson Velvet color.

XLI. 11. *Anemone tenuifolia simplex flore Sanguinea*; thin Leav'd single Blood red Wind-Flower. This is of a deeper red color than the former, to wit of a deep Blood red. And there is *flore rubra fundo luteo*, another sort of the Same Blood red, with a yellow bottom.

XLII. 12. *Anemone tenuifolia simplex Coccinea dilutior*; thin Leav'd single bright Crimson colored VVind-Flower. Its Flower has some Leaves round pointed, and others sharp pointed; and it is of a perfect Crimson color, some lighter or more diluted, some more red than others.

XLIII. 13. *Anemone tenuifolia simplex alba Staminibus purpureis*; thin Leav'd single white Flower'd Anemone. Its Flower is pure white, with blewish Purple Thrums in the middle. And there is one of this kind *flore alba venis Carneis*, which has bluish Veins running through every one of its white Leaves. Also another white Flower'd, *unguibus purpureis*, which has the bottoms of all its white Leaves of a purple color.

XLIV. 14. *Anemone tenuifolia simplex flore Carnea Hispanica*; Thin Leav'd single Spanish bluish VVind-Flower. This has a very great Flower, of a
kind

kind of dead, dull, or sullen bluish color, but yet pleasant, with blewish Thrums or Threads in the middle.

XLV. 15. *Anemone tenuifolia simplex purpurea*: thin Leav'd fingle pale Purple colored Wind-Flower. This consists of many small narrow Leaves, of a pale Purple or Bluish color on the outside, and somewhat deeper on the inside.

XLVI. 16. *Anemone tenuifolia simplex Facie Pomi florum*: thin Leav'd fingle Apple Flower'd Anemone. This in its Root and Leaf is like unto the first *Scarlet Anemone*, but its Flower consists of seven large Leaves, without any bottoms, of a white color, having edges, and some large Stripes also of a Carnation or Flesh color to be seen in them, marked somewhat like an Apple Blossom, and thereupon it is called in Latine, *Anemone tenuifolia simplex alba inflar facie Pomi florum*.

IV. Thin or narrow Leav'd double flower'd ANEMONES.

XLVII. 1. *Anemone tenuifolia flore pleno rubro vulgaris*: Common narrow Leav'd double red Wind-flower. Its Roots are thick and tuberous, something resembling small Races of Ginger, of a yellowish brown color, and neither so big nor so black, as those of the other kind with broad Leaves. It has many winged Leaves, divided into many and several Branches, each Leaf being cut and parted into many divisions, smaller, and more divided than those of Parilly, and some of them like those of a Carrot. Among which rises up one, two, or more Stalks, according to the bigness of the Root, with some small green Leaves about the middle of each of them, and bearing at the top, one great double Flower, consisting of 6 or 7, and sometimes of more, broad outer Leaves, of a deep red color, having in the middle a large Thrum of small Leaves, of a lighter and much paler red color. Out of the middle of which, comes many larger and broader Leaves, of a lighter red than the outward Leaves, and deeper than those of the Thrum, which warmed by the Sun, spread themselves over it.

XLVIII. 2. *Anemone tenuifolia flore Coccineo pleno vulgaris*: Common narrow Leav'd double Scarlet Wind-flower. Its Root is tuberous and thick, very like to the Root of fingle Scarlet Anemone: And its Leaves are very like to the same, but not so small cut and divided, as that with the purple Flower. The Flower when it first opens it self, consists of 6, and sometimes of 7 or 8 broad Leaves, of a deep red, or excellent Scarlet color, the middle head being thick closed, and of a greenish color, which after the Flower has stood blown some time, does gather colors, and opens it self into many small Leaves, very thick, of a more pale red color, and more *Stammel* like than the Leaves.

XLIX. 3. *Anemone tenuifolia flore pleno varicolor*: The narrow Leav'd double variable Wind-flower, or double Apple-blossom. It is in all things like the first (at Sect. 47.) but only in the color of the Flowers, which in this, will be of a pale bluish color, the tops of the Leaves almost white, and the bottoms Peach color. And sometimes the Flower will be red like the first, but striped and variegated, with pale bluish, almost white, and sometimes without any marking at all. All these diversities are found in this one kind, all proceeding from one Root.

L. 4. *Anemone tenuifolia flore Coccineo saturo pleno*: The Double Carnation Velvet Wind-Flower. Its Flower is of a deep Orange Tawney Crimfon, near unto the color of the outer Leaves of the *French or African Marigold*, and not differing from the next following in any thing else.

L.I. 5. *Anemone tenuifolia flore Coccineo pleno variegata*: the Parti-colored Double Crimfon Wind-Flower. This varies not neither in its Root, Leaf, or form of its Flower, from the second at (Sect. XLVIII.) but in the color, in that this will have sometimes the outer broad Leaves parti-colored, with whitish or bluish colored great Streaks in the red Leaves both infide and outside; as also divers of the middle or inner Leaves, striped in the same manner. Its Root gives fairer Flowers in some Years than in others; and sometimes gives Flowers all red again.

L.II. 6. *Anemone tenuifolia Elegantior flore pleno rubro*. Narrow Leav'd more Elegant Double red Wind-Flower. Its Root is as great and thick as that of the *Common Red*, but flatter, and more spreading than it. It has narrower and more divided Leaves than any of the former; the Stalk is taller, and the outer Leaves of the Flower more in number, and sharper pointed, of a good Crimfon color; the Thrum in the middle is of a pale red, out of whose middle comes other Leaves, large and spreading themselves almost quite over the Flower, of a deeper color than the Thrum. Many times two Flowers will be joined together on one Stalk, which happens more frequently than in any other.

L.III. 7. *Anemone tenuifolia flore pleno suave rubente*: The Greater Double Bluish Wind-Flower. There is almost no difference in the Roots or Leaves of this, from the *Common Double Scarlet Anemone*, (at Sect. XLVIII.) saving that the Leaves hereof are a little broader, and seem to be of a little fresher green color. The Flower of this is as large almost, and as double; and the inner Leaves likewise almost as large as they, being of a whitish or flesh color at their first opening; but afterwards become of a most lively bluish color: the bottoms of the Leaves abiding of a deeper bluish; and with long standing, the tops of the Leaves will turn almost white again.

L.IV. 8. *Anemone tenuifolia flore pleno Coccineo*. Narrow leav'd double Scarlet Anemone, or Wind-Flower. This is like that at Sect. L.I. above, but that the Stalks grow not so high, and the Flowers are something smaller, which are thick and double, and of an excellent rich Scarlet color, usually called the *Incarnadine de Spain*.

L.V. 9. *Anemone tenuifolia flore pleno Coccineo variegata coma albescens*: Narrow leav'd double Scarlet variegated Wind-Flower, with a whitish middle or thrum. This is in all things like the last, but only in the color of the Flower, which in this is of the same Scarlet color, but finely striped and marked with white; and the Thrum seeming to be almost all white. Sometimes also, the broader Leaves will come out of the middle thereof, of a bright Scarlet striped with white, like unto the outer leaves.

L.VI. 10. *Anemone tenuifolia flore pleno coma Scarlato*: Narrow leav'd double Scarlet thrummed Wind-flower. This differs from the last, in that the outer leaves hereof are white, and the Thrum is of a Scarlet color.

L.VII. 11. *Anemone tenuifolia flore pleno, dida Nacara*: Narrow leav'd double Wind-flower, called *Nacara*. This is like unto the Scarlet; saving that the Flower is of a deeper and yellower Scarlet color, resembling that of the lesser *French*,
c3

or *African Marigold*, but not so deep: the Thrum is inclining to an Orange color.

LXIII. 12. *Anemone flore pleno Sulphureo*: Narrow leav'd double Sulphur colored Wind-flower. This differs from the last, in that the outer leaves of the Flower are of a pale greenish yellow, or Brimstone-like color; and the Thrum more green.

LXIV. 13. *Anemone tenuifolia flore pleno viridante*: Narrow leav'd double green Wind-flower. This is like the last, saving that the outer leaves are of a greenish Orange tawney color, and the middle Thrum of a yellowish green.

LXV. 14. *Anemone tenuifolia flore pleno albo major*: Greater narrow leav'd double white Wind-flower. This differs little either in the green leaves, or fashion of the Flower, from the former; being as large and double as any of them, and of a Milk white color.

LXVI. 15. *Anemone tenuifolia flore pleno albo maxima*: the Greatest Narrow leav'd double white Wind-flower. This in fashion is like the first, but much larger, and fairer, and of a pure white color.

LXVII. 16. *Anemone tenuifolia flore pleno albo minor*: The lesser narrow leav'd double white Wind-Flower. It bears a small double Snow white Flower, having six outer leaves, and a thrum in the middle made of small hairy leaves, standing even at the top, as if they had been clipt with a pair of Scissars.

LXVIII. 17. *Anemone tenuifolia flore pleno albicante*: Narrow leav'd double bluish Wind-flower. This differs very little from the last, but only in the color of the Flower; for they are both much about the same bigness; the middle Thrum likewise being as small and short, and as even above, as if it was thorn so; only the Flower at first opening is almost white; but afterwards the outer leaves have a more shew of bluish in them, and the middle part a little deeper than they.

LXIX. 18. *Anemone tenuifolia flore pleno purpureo Violaceo*: Narrow leav'd double Purple Wind-flower. This double Purple *Anemone*, is of the same kindred with the Double Scarlet, at Sect. XLVIII. foregoing, having the same form and doubleness of the Flower, consisting but of six or seven leaves at the most (in our Country, tho' in the hotter Climates, it has 10, 12, or more as large leaves) for the outer Border, and as large small leaves for the inner and middle also, and almost as double, but of a deep Purple, tending to a Violet color; the outer leaves being not so deep as the inner. Its Root and Leaf comes near to the Single Purple *Anemone* before described, but its Root spreads not so much.

LXX. 19. *Anemone tenuifolia flore pleno purpureo Ceruleo*: Narrow leav'd double blew Wind-Flower. This differs not in any thing from the former double Purple; but only that this Flower is paler, and more tending to a blew color.

LXXI. 20. *Anemone tenuifolia flore pleno Columbina*: Narrow leav'd double bluish Columbine Wind-flower. It has a larger Flower than any of the former, the outer Leaves being long and broad; the Thrum is composed of short narrow Leaves, putting forth a great Tuft of longer and broader Leaves, which spread over the Flower, almost to the points of the outer Leaves. The whole Flower is of a bluish or flesh color, like to that which is seen in the Flowers Columbines, whence came the Name.

LXXII. 21. *Anemone tenuifolia flore pleno Roseo*: Narrow leav'd double Rose colored Wind-flower. It has smaller Flowers than the last, but very thick and double, of a more lively color, like that of a new blown Damask Rose. It differs in

nothing from the Columbine *Anemone*, at Sect. 66. above, but only in the Flower, which is something smaller, and not so thick and double as that is; this being of a reddish color, near to the color of a pale red Rose, or of a deep colored Damask.

LXXIII. 22. *Anemone tenuifolia flore pleno Roseo variegata*: Narrow leav'd double variegated Rose colored Wind-flower. This differs from the last only in this, that the Flowers hereof are striped and variegated with white, especially in the outward Leaves.

LXXIV. 23. *Anemone tenuifolia flore pleno Carneis Vivacissimo*: Narrow leav'd double Carnation Wind-flower. This in its Root, Leaf and Flower, comes nearest to the former double white *Anemone*, at Sect. 62. above: in respect to the magnitude and duplicity of the Flower; and in the smallness of the middle Thrums, and their evenness at the Tops: it is not so large and great a Flower as the Double Purple, at Sect. 64. either in its inner or outer Leaves, but yet it is very fair, thick and double, and of a most lively Carnation Silk color, very deep both the outer Leaves, and middle Thrums; and withal so bright, that as well as it delights the Mind of the beholder, so it fills it with a kind of amazement, by reason of its excellent appearance: Yet by long standing in the Sun, it grows paler, and so passes away, as do all the other Beauties of this kind.

LXXV. 24. *Anemone tenuifolia flore pleno rubante maculato*: Narrow leav'd double spotted bluish colored Wind-flower. It rises up with a tall Stalk bearing a large Flower: the outer Leaves whereof are almost white, marked with small reddish spots and marks, especially on the outer side. The Thrum is large and thick, composed of many long narrow, sharp pointed Leaves, of a reddish or Peach color, powdered with small specks of a deeper red color. This is called by those who brought it out of Flanders, *The Perfect Courtisan*.

LXXVI. 25. *Anemone tenuifolia flore rubro fusco pleno coma Amarantina*: Narrow leav'd double purple Velvet Flower. It is in all things like to the double Carnation, at Sect. 69. above, but something larger. The difference consists chiefly in the color of the Flower; which in this is of a deep or sad Crimson red color, for the outer Leaves; and of a deep purple Velvet color in the middle Thrums, resembling the color of the lesser *Amaranthus purpureus*, or purple Flower-Gentle, (from whence it took its Name;) which middle Thrum is as fine and small, and as even at its top, as the double white or Carnation *Anemones*, at Sect. 62. and 69. foregoing.

LXXVII. 26. *Anemone tenuifolia flore pleno tricolor*: Narrow leav'd double three colored Velvet Wind-flower. This is very like the last described; saving, that in the middle of the purple Thrums, there comes forth a tuft of Threads or Leaves, of a more light Crimson color.

LXXVIII. 27. *Anemone tenuifolia flore pleno purpureo*: Narrow leav'd double purple Wind-flower. It comes up with green Leaves commonly before Winter, and many times with Flowers; and therefore for the prevention of such forwardness, the Roots are to be kept out of the Ground, and not to be set till November, which causes them to bear the fairer Flowers in the Spring following, which will be very large, thick, and double, of a sad dark Violet purple color.

LXXIX. 28. *Anemone tenuifolia flore pleno Lavendula colore*: Narrow leav'd double Lavender colored Wind-flower. It is in all things like the last, but the Flower is lesser, and of a pale heavy

blew color, like unto the Flowers of *Lavender*: there is also another of this fort, which is striped with white, especially the outer Leaves of the Flower.

LXXXV. 29. *Anemone tenuifolia flore pleno Ceruleo*: Narrow leav'd double blew Wind-flower. It is in its fashion or form like the last, differing only in the color of the Flower, which in this, is of a fine bright blew color, more delightful to the Eye than any of the *Purple Anemones*.

LXXXVI. 30. *Anemone tenuifolia flore pleno coma Purpureo*: Narrow leav'd double Wind-flower, with a *Purple Thrum*. This differs chiefly from the other *Purples* in the color of the Flower, the outer leaves of this being white, and the Plush or Thrum, of a beautiful *Purple*: this Flower by reason of its excellency, is called *The Perfect in Beauty*.

LXXXVII. 31. *Anemone tenuifolia flore pleno coma Amarantina*: Narrow leav'd double Wind-flower with a dark *Purple Thrum*, called *Amarant*. It has broad green leaves as the first common Red, (at Sect. XLVII.) and the Flower is of the same fashion; the outer leaves of such a red color, and the middle Thrum of a dark Murry *Purple* color, like the Flower of the lesser *Amaranthus Purpureus*, and therefore called the *Amarant Anemone*. Sometimes there will come a Tuft of bright red Leaves out of the middle of the *Purple Thrum*, and then some have called such Flowers *Amaranthus tricolor*, as if it were a distinct Kind, which in some Years happens in most Flowers, and in other Years few or none.

LXXXVIII. 32. *Anemone tenuifolia flore pleno coma Amarantina variegata*: Narrow leav'd double variegated *Amarant Wind-flower*. This is in all things like the last, save only the outer leaves, and those which come out of the middle of the *Purple Thrum*, are variegated with white, much fairer in some Years than in others. There are two sorts of this Flower, one from *Flanders*, another from *Paris*, the latter being the better, as more constantly marked, and more distinctly than the *Flemish*.

LXXXIX. 33. *Anemone tenuifolia flore pleno quinque coloris*: Narrow leav'd double Wind-flower of five colors. It is like the *Amarant*, but that the Stalk is taller, and the Flower larger: the outer leaves are red, the Thrum of a deep Murry *Purple*, out of whose middle comes one or two rows of leaves, of a light *Crimson* color from the ends half way, and the rest a pale yellow: in the middle of these leaves, comes forth a small Tuft of shorter leaves, of a pale *Silver* color. This is an uncertain Flower, and does not often come well.

LXXX. 34. *Anemone tenuifolia flore pleno Purpureo nigrescente*: Narrow leav'd double dark *Purple Wind-flower*. It has fair large Flowers, of a dark *Purplish* color, finely striped with white, its Roots are tender, and apt to perish, unless the Soil be very agreeable, as all the other *Narrow Leav'd striped Anemones* are.

Besides these Thirty Four, Mr. Rea has given us brief Notices of Distinction of half a Hundred more, called by particular Names, and that in an Alphabetical Order, which that you might not want the Knowledge of, we shall here exhibit them to you in the following Eighteen Sections.

LXXXI. *Albanoise*: white, with a little Carnation in the bottoms of the Leaves and Thrum. *Albertine*, or *Pafs Scala*, *Flesh* color with Carnation. *Angelica*, white Leaves, and a pale gredeline Thrum. *Asian*, white and Carnation Leaves, with a *Scarlet* and white Thrum. *Astrea*, white and Carnation. *Augustine*, white and Carnation Leaves, with a *Scarlet Thrum*.

LXXXII. *Boulonoise*: white leaves with Carnation bottoms; the Thrum white Carnation and Limon. *Briote*, white and Carnation leaves, the Thrum all Carnation. *Bugie*, it is an ill White, mixt with Carnation.

LXXXIII. *Candiot*: Gray leaves with Carnation bottoms, and Thrum Carnation tipt with a greenish Hair color. *Cazertuen*, the leaves *Crimson*, bordered with a yellow *Brimstone* color, and the Thrum deep *Scarlet*. *Celestine*, the leaves white, and the Thrum white tipt with Limon. *Celide*, the leaves white and Carnation, the Thrum *Rose* color. *Citria*, it consists of Blush, or *Flesh* color and Carnation.

LXXXIV. *Damafne*: Carnation and White perfectly marked. *Dorismene*, the leaves are Carnation and white, and the Thrum of a reddish color.

LXXXV. *Extravagant*: Its Leaf is variegated with white, red and green colors; its Thrum being of a strange form.

LXXXVI. *Gabriel*: It has white leaves, and a Thrum green, mixed with White and Carnation. *Gallipoli* of *Iboulaze*, the whole Flower is all *Scarlet* and White. *Gayetane*, the first Flowers are white and *Purple*, the latter Dove color and *Peach*.

LXXXVII. *Herefsee*: Its leaves are of a *Crimson* color, sometimes marked with white, and the Thrum is *Scarlet*.

LXXXVIII. *Jolivet*, the leaves are *Flesh* color and *Crimson*, and the Thrum of a *Brick* color. *Judique*, the leaves are of a Blush or *Flesh* color and Carnation, and the Thrum reddish. *Juliane*, the leaves are a Carnation and White, and the Thrum Carnation color only.

LXXXIX. *Limosine*, it is very much like to the *Extravagant*, at Sect. LXXXV. atoregoing. *Lidnoise*, the outer leaves and the Kuff within, are of a whitish Gray, with Dove-colored bottoms; and the Thrum is Dove color tipt with green.

XC. *Mantuane*, the leaves are Limon color, with Carnation bottoms. *Melidore*, the leaves are a deep *Scarlet* with white bottoms. *Meteline*, the leaves are all of a dirty Gray, mixt with Green and Carnation. *Moresque*, the Flower is all gray, mixt with Carnation. *Morette*, the leaves are of a Blush or *Flesh* color, and the Thrum white tipt with red.

XCI. *Natolia*, the leaves are Carnation and White, and the Thrum the same. *Noiron*, its leaves are of a *Crimson* color, and the Thrum *Crimson* and almost black.

XCII. *Oriental*, its leaves are of an unusual color, viz. a blew Gray, much like the color of our Common *Slates* with which they cover Houses.

XCIII. *Parifien*, It has white leaves with red bottoms, and the Thrum is Limon color, which at last is almost white. *Parmesan*, its leaves are white with red bottoms, and the Thrum is a mixture of *Rose* color, Carnation, and light Hair color. *Picard* or *Juno*, the Flower is all white, and *Peach* color. *Provinfallée*, the whole Flower throughout is Green and *Peach* color.

XCIV. *Quatri Color*, or *Amarante Regale*, it is of four sorts, viz. 1. One with *Crimson* leaves striped with White, and its Thrum a sad Murry, with a red Tuft in the middle. 2. One with *Crimson* leaves, a sad Murry Thrum, and a *Scarlet* Tuft tipt with white. 3. One with white leaves, mixt with some *Crimson*, its Thrum Murry, and its Tuft in the middle Carnation. 4. One with *Crimson* leaves well striped with white, the Thrum Murry, and the Tuft Carnation.

XCv. *Regate*:

XC. *Regate*, the whole, both Leaves and Thrum, are a well mark'd Flower with Crimson and White.

XCVI. *Saint Charles*, the Leaves are of an ill or poor white, with red bottoms. *Scala*, its Leaves are also of a dirty white, and its Thrum Scarlet. *Sermonetta*, the whole Flower is all Scarlet and a pale yellow. *Scirien*, its Leaves are a pale *Isabella*, clouded with Bluff or Flesh color, and the Thrum is a light Green so clouded.

XCVII. *Tofcana*; The whole Flower is of a faded Red, sometimes mixed with a little Hair color. *Torquoise*; The whole Flower, both its Leaves and Thrum are White, but the bottoms of the Leaves are Carnation.

XCVIII. *Vilorus*; Its Leaves are of a Bluff or Flesh color mixt with Carnation; and its Thrum Hair color and Carnation. These *Anemones*, with many others not here named, are all fine *Narrow Leav'd Double Flowers*, notably differing from each other, and thrive very well in our Gardens.

Besides all these, many more Varieties may be produced by the Sowing the Seed of some of the best Single ones, not possible to be accounted for, of which any one may make Tryals at pleasure; what we have further to do, is to shew the manner and way of Sowing and Planting them, and the managing and ordering them to the best advantage.

The CULTURE.

I. Of the Preparing the Earth.

XCIX. In the managing of the rarer sorts of these Beautiful Flowers, very great Care is to be taken, that the Soil or Earth, Situation or Place, Time or Season, and the way and manner of their Planting and taking up, be exactly observed; otherwise your Flowers will neither be fait, nor the Roots prosper and increase, but rather rot and consume away; especially all the best *Double Kinds* of the *Tenuifolia's*; the ordinary Flowers, and Single Flower'd, are more hardy.

C. The Soil is then first to be considered, which must be Fat and Rich, and not too light; a Rich Sandy Loam Earth is said to be best, in which some Neats and Sheeps Dung, with a little Lime has been tempered, and lain long on a heap, and often turn'd over, so that the Dung be fully rotted, and well mixed with the Earth; which being first Sifted thro' a Wier Sieve or Skreen, you may then make a Bed thereof half a Yard deep at least, in some place which is not in too hot a Sun, but a little shadowed.

CI. Or, make five equal Heaps of yellow Sand, three others as large of Kitchen Garden Earth, and four others of Bed-Mould well mellowed; then mix them altogether with a Shovel; make as much of this Earth as you shall have occasion for, which let be a Year old before you use it; during which time, pass it once every Month thro' a Skreen, that it may thereby be thoroughly mixed and perfected, lest its too Subtil parts (which might hurt the Beauty of your Flowers) should be retained, which by this means will in some measure vanish.

CII. But if you cannot well stay so long as a Year for the well fitting your Earth or Mould, you may then provide the Earth as in the former *Settion*, and after a Months time use it for the first time; but then you ought always to have a good quantity more of it in reserve, ready prepared as aforesaid, a Year before hand. The more this

Earth passes thro' the Skreen, the lighter it will be, and more agreeable to the Nature of *Anemones*.

CIII. Before this Artificial or made Earth be laid upon the Natural Soil of your Garden, the Ground ought to be before-hand prepared. If the Earth of your Garden be naturally light and sandy, or Gravelly, you need do no more but dig it up, and cover it about half a Foot thick with this your Artificial Mould; but if your Garden Ground is Wet or Moist, (both which are Inimical to these Flowers) you must dig the Bed you design for these Flowers, and take out about a Foot and half deep of the Earth, and then fill up the hollow Capacity thereof, with a Compound of half Sand and half Artificial Mould; in which you shall Plant your *Anemones* as shall anon be directed.

CIV. Instead of Mould, you may make your Beds of rotten Herbs, Leaves and the like, which mixed as is before directed, and past several times thro' the Skreen, will make a *Compost* or Earth, as fit for *Anemones* as can be desired; which you may lay upon your *Compartments* or Beds, after it has been well Sifted or Skreen'd.

II. Of the Times of Planting of ANEMONES.

CV. The best Season for Planting *Anemones*, is from the middle of *September* to the middle of *October*; but if you have a mind to have them in Flower a great part of the Year, you must Plant them in *March* and *April*, but you are not to expect such fair Productions from these last as from the first, where the Sap has had a primary advantage.

CVI. And this seems to be *Parkinson's* Secret, to teach us how we may so order *Anemones*, that after all others are commonly past, we may have them in Flower for 2 or 3 Months longer than they are otherwise to be seen. The ordinary time (says he) to Plant *Anemones*, is in *August*, which will have Flowers, some per chance before Winter, but most commonly in *February*, *March* and *April*, few or none of them abiding until *May*; but if you will keep some Roots out of the Ground unplanted, until *February*, *March* and *April*, Planting some at one time, some at another, you will have them bear Flowers according to their Planting.

CVII. Those (says he) which you Plant in *February*, will Flower about the middle or end of *May*, and so the rest accordingly after that manner. And thus you may have the pleasure of those Plants out of their Natural Seasons, which is not permitted to be enjoyed in any other Flower that I know of; Nature being not so prone to be furthered by Art in other Plants as in this.

CVIII. But this is to be observed, that when you keep your Roots out of the Ground for this purpose, that you must be very careful in laying them up and preserving them; that you keep them neither too dry nor too moist, that they may neither sprout nor rot; and then in Planting them, that you set them not in too open or Sunny a Place, but where they may be a little shadowed.

CIX. The *Latifolia's* are generally Planted earliest or first, as in *August* and in *September*. The *Angustifolia's* or *Tenuifolia's*, are ever Planted after them, later in the Year, being kept out of the Ground (in some proper dry place) till the end of *October*, and the Purples a Month longer, and then set in the same manner as the others. The *Latifolia's* or Broad Leav'd, will come up before Winter. The *Angustifolia's* or *Tenuifolia's*, the Nar-

row Leav'd, about the end of *February* or sooner, if the *Winter* is mild, otherwise in *March* or *April*. If the Season is dry, they ought to be Watered, which will cause them to thrive much the better, and to bear the fairer Flowers.

III. Of the manner of Planting ANEMONES.

CX. The Beds or other places being prepared, and made even and smooth with the Rake, take a Cord, and extending it long-ways, draw a Rill, or little hollow Line or Gutter, from one end of the Bed to the other: This done, extend your Cord, and do in like manner again, a second, third, and a fourth time, or more, according to the breadth of your Bed, at 5 Inches distance, (Mr. *Rea* says 6 or 8 Inches) asunder from each other.

CXI. This done, take up your Cord again, and place it in like manner, to draw Rills or Gutters cross all these Beds from one end to the other, and all of them equally at the aforementioned distance, of 5, 6, or 8 Inches, by which means you will form a regular oblong Parallelogram; 'In which, either in the middle of each Square, or in the points where the Lines cross one another, you are to Plant your Anemone Roots, which being at an equal distance; they will when they come to blow give you a singular pleasure, which will arise from their great variety of colors, and their regular order of Planting.

CXII. When you are a going to Plant the Roots, make a hole for every one of them with your Finger, or an Iron made for that purpose; which let not be above 3 Inches deep in the Ground, and place the Root always upon the largest side of it, with the flur downwards, to the end that the *Pabulum*, or nourishing Juice, may rise directly into the Root, to cause it to spring, so as to answer your Expectations.

CXIII. Or as Mr. *Rea* says, put the Root into the hole with that side of it upwards, where you perceive small Eminences to put forth Leaves. The *Latifolia's* and *Angustifolia's*, or *Tenuifolia's*, are all of them to be handled in the same manner, only differing, in the Times of their Setting or Planting, as we have shewn in *Self*. 109. foregoing.

CXIV. Anemones are not Planted in open Grounds, but they are sometimes put into Pots, one or two or more Roots into each Pot, (according to the magnitude of the Pot) and this because, that if any of the Roots should chance to fail, there may be found in these Pots wherewithal to fill up the vacancies.

CXV. This failure (if any be) will be perceived about three Weeks after you have put your Roots into the Ground, and which does not always proceed from a corrupted Root; but sometimes is occasioned by the *Pabulum* or Sap's not rising so kindly as it ought: You are ever to look for such a Root in less than a Month; and you will sometimes find them in your Pots also, as well as in your Beds.

CXVI. The Flowers require to be Planted in an open place, and by no means in a shady: because, sending forth a great many fibrous Threads or Strings, and large rusts of Leaves, they would be apt to spend themselves too much, if so placed; and so cause a weakness in their Stems, and hazard their proving Abortive, or otherwise to yield but a very few Flowers. And the Stalk being thus

tender, would certainly be killed by the Cold, which they would be too susceptible of in this case; or else be broken with the Wind, which would do a great damage to the Root it self.

CXVII. If the Autumn be dry, you must take care to Water them well: but contrariwise, if it Rains very much, you must then defend them from too much moisture, (which agrees not with them) with skreens of Straw. They may be water'd from the Month of *February*, to the times of their Flowering, which how much, or how often it is to be done, experience only must tell you.

CXVIII. Tho' Cold is no mortal Enemy to them; yet when it happens to be very severe, the Plants ought to be covered with long dry Dung, or long Straw: and your Pots ought to be also Planted or Placed, where they may be most safe from the Weather.

CXIX. Then again when the Weather grows mild, you may uncover them; but withal, you must be sure to cover them again, if it changes to be Cold again. In sum, your prudence and experience must excite your industry, and direct you, when, how often, and long, you must bestow this trouble upon them.

CXX. If at any Season of Planting or Setting your Roots, you put a little Willow Earth under and over the Roots, it will cause them soon to put forth Fibres; and thereby make them able to abide or endure the Winter. Yet in Frost and hard Weather, it will be good to cover them which are sprung up (as aforesaid) with Mats or Pease Straw, which you may rake off for two or three hours, every other day, (if fair, and the Sun shines, and there be no nipping North, North-East, or Eastwardly Winds) to give them Air, and prevent Mouldiness (which is apt to happen to them, and) which has been the ruin and destruction of many a fine Plant, from which you might have expected very admirable Flowers.

IV. Of Choosing Plants for Seed.

CXXI. There is some special choice to be made of such Flowers whose Seed is fittest to be taken: of the *Latifolia's*, the double Orange Tawny Seed being Sown, yield many pleasant varieties; but the Purples, Reds, or Crimsons, whether *Latifolia's* or *Tenuifolia's*, yield small or few varieties, but such chiefly as draw nearest their Original, tho' it may chance that some may be a little deeper or lighter than others.

CXXII. But the light colors are those, which are to be chosen for this purpose; as White, Ash-color, Blush or Carnation, light Orange, simple or parti-colored, single or double, (if they bear Seed, as sometimes they do.) These are they whose Seed you are carefully to gather, but not before it is thoroughly ripe, which you may know by the head.

CXXIII. For when the Seed with its Wooliness begins to rise a little of it self at the lower end, it must then be quickly gathered, lest the Wind carry it all away. After it is thus carefully saved, it must be laid to dry for a Week or more, which then being gently rubbed with a little dry Sand or Earth, it will cause the Seed to be somewhat better separated, altho' not thoroughly, from the Wooliness or Down which encompasses it.

CXXIV. If there remains any Wooliness in the Seed, pull it asunder as well as you can, that they may be perfectly separated; for unless this be done, it will be impossible to Sow them in that due

due order, which the Nature and Quality of this Plant requires.

CXXV. For the raising of new Varieties of *Anemones* from Seed, choice must be made of the Flowers (as Mr. *Rea* says) as in *Tulips*; some of the *Double Latifolia's* bring Seeds, the richest Scarlets, palest Purples, Pink colored, White and Sky colored are the best.

CXXVI. But in the Single *Angustifolia's*, or *Tenuifolia's*, there is more choice; as Red and Scarlets with deep white edges; all that are variegated or striped with White; and in these, the deepest Velvet Purples are the best: But above all others, those which have 2 or 3 Rows of Leaves, and that excellent Single Velvet Blue, are chiefly to be preferred.

CXXVII. In short, to have good Seed, you ought to pitch upon Single *Anemones* which have strong Stalks, and proportioned in height to the largeness of the Flower, and which have long and round Leaves, for these kinds of Flowers never degenerate; and therefore it may be in a manner certain, that if Nature, the Season, and the Soil favour us, they will give us a produce of very fine Flowers.

V. Of Sowing the Seed.

CXXVIII. The Seeds of these Flowers will be ready to be gathered in May, which must be done as the Down rises, else they will be all blown away; and having gathered all your Seed, dried and cleared them from their Down, as directed at *Self*. CXXIII. above, or by mixing with them a sufficient quantity of dry fine Sifted Earth, and in a Bowl, Tray or Basin, stirring and mixing them with your Fingers so long, till none of the white Down appears; you are then (not to stay till August as some French Gardiners direct,) but to Sow them about a Month after as *Parkinson* advises, or not exceeding 6 Weeks, or the middle of July at most, as Mr. *Rea* lays.

CXXIX. Then be sure the Earth in which you Sow them be good, and finely Sifted, and let the Ground be made into Beds as before directed, or put into Boxes or Pots, if you design them: This Ground must not be a too stiff Clay, nor too light a Sand; but if not fit for the purpose, it must be prepared, and may be compounded thus. The Clay Earth is to be mixed with Brook Sand and Pearl Sand, and good fresh fat Earth, taken from next under the Turf of some good Pasture, which with some old Neats Dung well rotted to Earth, and some Lime, are to be well mixed together, and being dry, to be often Sifted or Screen'd over, that the Mould may be made very fine.

CXXX. With this Mould thus prepared, you may make Beds, &c. as aforesaid; upon which you are to Sow your Seed reasonably thin, and not too thick; (so also in Boxes or Pots,) let the top of the Bed, &c. be first made very plain and smooth, then your Seed being Sown upon the same, gently strew or Sift over them, some fine good fresh Mould, covering them about an Inch thick at most for the first time.

CXXXI. About a Month after their first Springing up, strew or Sift over them again another Inch thickness of fine Earth; and in the mean time, if the Weather proves dry, you must Water them gently and often, but not to overglut them with moisture. And thus doing, you will have them Spring up before Winter, and grow pretty strong, able to abide the sharp Season in this their so tender Age; especially if you take a little care to cover

them loosely with some Fearn, Straw, Pease-Straw, Hay or the like, which must not lie close upon them, nor yet too far off, being laid over them upon Sticks.

CXXXII. But in your Sowing the Seed, tho' you are not to Sow them too thick, yet you ought not to err on the other Hand neither, in Sowing them too thin, because many of them may miscarry, and never Spring up, which being covered as aforesaid, about an Inch thick with fine Sifted rich Earth, and so to be farther ordered as in the former Section, will not fail to answer your Expectations.

CXXXIII. Some in Sowing the Seed, do it after this manner, (the Bed being before hand prepared) they rake the Seed and put it into a Leather Bag, and closing up the whole, so as only three Fingers may enter in, you may press the Bag with one Hand, and Jerk, or a little shake it with the other, so will the Seed spring out; in such a manner as it ought to be Sown, moving the Bag up and down over the Bed, both long ways and cross ways, that each part may have its share of Seed.

CXXXIV. Which done, and fine Earth being Sifted over it as aforesaid, immediately strew the whole Bed thinly over with long Straw, and forthwith Water it with a Watering-Pot, which let be pretty considerable, but afterwards less; because too great a Quantity of Water would rot the Seed, and so totally destroy it.

CXXXV. After 15 or 20 days, take off this thin strewed Straw. It may be the Seed may begin to sprout in that space of time, or sooner; but if they shoot not for 5 or 6 Weeks time, be not concern'd, for they may yet grow well enough.

CXXXVI. The French Gardiners say, that if the Seed be well Sown, and great care be taken in Cultivating it, that you will not fail of Flowers in March following, or in April at farthest; because in June, when the Stalks begin to wither, and their Roots are dispianted, the Bed where they are is to be digg'd thro' three Inches deep, and the Earth as soon as it is cast up, to be laid upon a Linnen Cloth or Canvas, till such time as the hole be dug, which is then to be crumbled, and sifted, or sear'd on a hollow Bed, till such time as there remains above Ground only the Fangs of these young *Anemones*, which are then called Peas, because they resemble that Pulse in form and magnitude.

CXXXVII. *Parkinson* says, the Seed being thus ordered, that the Plants will bear Flowers the second Year after Sowing; and most or all of them the third Year, if the place where you Sow them be not annoy'd with Smoak of Brewers, Dyers, Malt Kilns, or other inconveniences, which if they be, they will never thrive well.

CXXXVIII. Mr. *Rea* in his *Flora*, page. 128. says, that some report that they have had *Anemones* bear Flowers the next Year, and others, the second Year after Sowing. But I (says he) can expect few or none that are good before the third Year, and many will not bear until the fourth Year. But the agreeableness and goodness of the Earth and Air, for bringing them forwards is most considerable; therefore you ought to be sure to make it as rich (for the kind) and as good as you can, raking heed of not putting or mixing with the Mould too much Dung.

CXXXIX. These Pease aforesaid, at *Self*. 136. above, being gathered, are to be carried and kept in a dry place, as carefully as possibly may be till September next, when (new Beds being made for Planting *Anemony* Roots) they are to be

be Replanted, after the method before prescribed.

CLX. This way of *Multiplying Anemones*, is as it were a Nursery, where Nature from single Flowers which were Sown, gives double ones, according as she is pleased to Act. When the favourable chance does so happen, you ought to set a mark of distinction on such as deserve it; to the end, that in the third Year when you take them up, you may put them in Beds by themselves.

VI. Of the taking up the Roots.

CXLI. *Parkinson* says, that the next Spring after Sowing, you may if you will remove them; but he also says, that it is better to stay till *August*, and then make the Remove, when you may set them in order by Rows, with sufficient distance one from another, as is before directed; where they may abide until you see what manner of Flower each Plant will have, which you may afterwards better dispose of according to your Mind.

CXLII. As to the *Anemones* raised from the Planting of their Roots, if they like their Entertainment grow Strong, bear fair Flowers on tall Stalks, and prosper well, you may forbear to take up their Roots until the end of *June* or *July*. But on the contrary, if the green Leaves are few, the Stalks short, and the Flowers small, it is a manifest sign of their dislike, and that the Soil is too cold and poor, or else too hot and rank, which is far more dangerous.

CXLIII. In this case, they must be taken up as soon as the green Leaves turn yellow, and the Roots are to be put into Sand, and so kept in some dry place for a Month at least, and then taken out and put into Papers, in some cool dry place, until the time of Re-planting: For should they remain in the Ground any time after they have lost their Fibres, the Earth being unsuitable, they would all or most of them rot and consume away, especially if any store of Rain should fall upon them.

CXLIV. In taking up their Roots, you must take care that they be not broken, especially the *Latifolia's*; which must not be divided nor broken, until they part of themselves. The *Angustifolia's* or *Tenuifolia's*, may be broken or parted with less prejudice; but the wholer they are kept, the better they will thrive.

CXLV. And tho' the Times mentioned in some of the former Sections, be best for planting or setting these Roots, of both kinds of the more excellent and rare of these Flowers, yet the more ordinary kinds, may be kept out of the Ground till the end of *February*, which some do, to cause them to flower late, after the other finer and rarer kinds are gone.

CXLVI. In this case, it will be good to steep these long kept Roots 24 hours in warm Water, before you Plant or Set them: and then to Plant them with some Willow Earth under and over them, and in a more shady place than ordinary; because the heat of the Sun, in the time of their flowering, will much diminish their beautiful appearance.

CXLVII. If then you have two Beds stored with choice varieties of *Anemones*, let the latter which are Set, be more shady than the first; and so gradually as they are later in Planting; and then if the aforementioned Rules be observed, you will be sure to have admirable Flowers in part of *March*, and all *April*, and the greatest part of *May*; unless your Garden stand in some Smoaky

or ill natured place, where neither *Art* nor *Industry* can make them prosper; unless they be Set in a hot Bed, as some in and about *London* commonly do.

VII. Of the Choice of Plants and Flowers.

CXLVIII. The Beauty of this Flower consists in its largeness, roundness, and fine colors, to which in the double kind add its duplicity of complexion; especially with its great Leaves, exceeding a little the bigness of its Tuft: and the extremities of its largest Leaves are round, as well as those of its Stalks, which ought to be large and not narrow.

CXLIX. That is a fine Plant whose Stem is proportioned in height to the largeness of its Flower, and is strong enough to bear it up without bending: also when its Leaves are curl'd, its Tuft low and bushy, representing a kind of Cupulo; and which has a great many Stalks or Flowers.

CL. Its Pointel in the middle ought to appear a little, and be as it were upon a level, with Leaves of the Flower, of an indifferent thickness, for if it is too thick it is a defect; and it ought to be also of something a different color, from the great Leaves and the Tuft.

CLI. There are some *Anemones* which are apt to shoot up into height, so that instead of Flowers, they only produce Leaves; and this comes from having such a great number of productions on every side, which draw away the succulent and nutritive Juices and Salt of the Earth. This great abundance of Leaves you must rectify, by clearing the Plants of such as are superfluous, whereby the rest of the Plant receiving so much the more of that succulent Nutrient, will make it the better to produce its Flowers.

CLII. If the *Anemones* should grow mouldy at that part of the Root from which they shoot, (which is their Oldest part) give them a fillip with your Finger on that part, and if they found hollow, or have little holes therein; then you may take a Knife and pare away that decayed part to the quick, smoothing the place where you make the Incision, for fear that if any hole should remain, some of the putridity may lurk behind, which may make the Root fall into the same Disease again; which when the decayed part is cut quite away, new Roots will shoot forth, which will give you Flowers in great abundance.

CLIII. In doing this work, many Roots or segments of Roots you may cut off; these you ought not to throw away, but to Re-plant them again; for many times those off cuts being Re-planted, will admirably revive, grow strong, and bear very good Flowers.

CLIV. But in the Roots where you have made the Incision, so soon as ever they are dry, you must rub them in the wounded place with a mixture of melted Rosin and Wax, which being well fixed on them, will hinder them from farther corrupting.

CLV. And as it is to be observ'd, that the Seed only, or chiefly of the *Single Anemones*, bring forth Double ones; so the *Double Anemones* seldom or never multiply, but by the Fangs of their Roots, which are constant in their production, and never found to degenerate.

CLVI. We have given you the Names of the principal kinds of above four score various sorts of these Flowers; and 'tis possible, there are an hundred other sorts, with Names imposed upon them,

them, which indeed can signify very little to infer here, being given them purely from Whimfie, Fancy, and Fantasticalness, many of which, when the Flowers Die, their Names Die with them: for which reason we forbear, thinking it sufficient what is already said, and that we have given you enough Signs and Manifestos to discover and know all such, as you are to set a good value and estimation upon.

CLVII. What remains, has relation to their Qualities, Specification, Preparations and Virtues; but they being the same with the most vulgar and Common Anemones, of which we have treated in Chap. XIII. and Chap. XIV. foregoing, we shall say no more in this place, but will refer you thither.

C H A P. DCCXXXIX.

of WINTER-GREEN.

I. THE Names. It was unknown to the Greeks; and is called by the Latines *Pyrola* (à *foliorum Pyri arboris*, & *florum citiam similitudine*;) from its likeness to the Leaves and Flowers also of the Pear-Tree: in English, *Winter-Green*.

II. The Kinds. Authors have made many Species of this Plant, most of which are perfect Strangers to us, we shall only take notice of these two, viz. 1. *Pyrola nostras vulgaris*; *Pyrola vulgarior*: Our common Winter-Green. 2. *Pyrola Europea Alpinæ flore*; *Herba Trientalis Cordi*; *Alpine Alpina Schwentfeldij*; *Alsinambemos Thalij*, i.e. *Alpinæ Flos*: European Winter-Green with Chickweed Flowers.

Winter-Green.

The Descriptions.

III. The First, or our Common Winter-Green. Its Root is slender, small, creeping, compass of many small Fibres, or thready Strings; from which shoot forth 7 or 8, or 9 Leaves, standing on a long foot Stalk, which are almost as broad as long, round pointed, of a sad green color, hard in handling, and something like to a Pear-Tree Leaf, (whence the Name) or as some will have it like to the small Leaves of Wild Beets; whence comes forth for the most part but one (but sometimes two) slender weak Stalks, yet standing upright, bearing at the Top many small white flowers, smelling as sweet as those of the Lilly Convolv, laid open like a Star, consisting of 5 round pointed Leaves, with many yellowish Threads in the middle about a green head, and a long stile with them, which in time grows to be the Seed Vessel, which when it is ripe, is quinquangular, or five sided, with a small point at it, in which is contained Seed as small as dust it self.

IV. The Second, or Winter-Green with Chickweed Flowers: Its Root is made of many small Fibres, proceeding from a small round head. It rises up with one or more, strait round Stalks, 6, 7, or 8 inches high, almost bare of Leaves for a space next to the Root; or at most with but 2 or 3 very small Leaves, set one a little above another: but at the top thereof, grows 5, 6, 7, or 8 Leaves, something long, and pointed at their ends, something like to a Pear Tree Leaf, but longer and not so round; being many of them an Inch and half long or more, tender, smooth, green, having one middle Rib, with divers Veins in the Leaf, finely dented about the edges: From among which Leaves, rise up weak foot Stalks, rather than Stalks, about 3 inches long, sustaining 3 or 4 flowers, each by it self, made of six white pointed Leaves apiece, Star fashion, something like a Chickweed Flower, but larger; with several small yellowish Threads in the middle; which bring past, there comes in place a small round head, smaller than a Coriander Seed, containing within it divers small black Seed, covered with a thin white Skin.

V. The Places. The first grows in several of the Northern Parts of England, as Lancashire, Yorkshire, and in other places farther North, and in a place called Crag-Close; and in the Woods in Scotland, almost every where, but rarely in Fields. The second in the Woods in Germany, in divers places; as also in the Beechwood in Scotland, as Bauhinus says, and likewise on the Mountains in Wales.

VI. The Times. They both grow Winter and Summer, and Flower in the Months of June and July.

VII. The Qualities. They are Cold in the second degree, and dry in the third; Absterfve, Afringent, and Vulnerary.

VIII. The Specification. The first which is only or chiefly used, as it is exceedingly Afringent and Glutinous withal, so it is a speedy Cure for Green Wounds; as also for all Inward Wounds and Bleedings: it stops all Fluxes of the Belly, whether of Blood or Humors, the Bleeding of Wounds, and the overflowing of the Terms in Women: It also Cures old running Sores, putrid Ulcers, Fistula's, and the like.

IX. The Preparations. You may have therefrom, 1. A Liquid Juice. 2. A Decoction in Wine and Water. 3. A Balsam or Ointment. 4. A Cataplasm of the Green Herb. 5. A Distilled Water. 6. The Powder of the Herb.

The

The Virtues.

X. *The Liquid Juice.* It consolidates Green Wounds, uniting their Lips speedily together; and taken inwardly 2 or 3 Spoonfuls at a time in Wine and Water, it stops inward Fluxes of Blood, and Cures inward Wounds: it stops the overflowing of the Terms in Women, Cures Spitting and Vomiting of Blood, the Hepatick Flux, Bloody Flux, and all other Fluxes of the Bowels. It is said to Cure Ulcers and Wounds in the Reins and Bladder, Womb, and other secret parts, as also Ulcers and Fistula's in any other part of the Body, being inwardly taken and outwardly applied: not being inferior to *Agrimony*, *Avens*, *Betony*, *Burnet*, *Comfrey*, *Daisies*, *Golden Rod*, *Horsetail*, *Knot-grass*, *Ladies Mantle*, *Mouse Ear*, *Madder Roots*, *Periwinkle*, *Sanicle*, *Tormentil*, or other Herbs of like kind.

XI. *The Decoction in Wine and Water.* It has all the former Virtues, but not altogether so powerful; and may be given Morning and Night, from 3 Ounces to 6, sweetened with Syrup of the Juice of the same. It heals inward Ulcers in the Reins and Bladder, and hinders Inflammations, being fomented upon any part affected.

XII. *The Balsam or Ointment.* It is made with Hogs Lard, or with Oil Olive, Bees Wax, and a little Turpentine. It heals all manner of Wounds, and Sores: the *Germans* use it very much, and extol it beyond any other Balsam made of a simple Herb. It is no less helpful for foul Ulcers and Fistula's, hard to be Cured in what part of the Body soever, and heals Cankers of the Mouth and Gums.

XIII. *The Cataplasm of the Green Herb.* It is Astringent and Glutinous withal, and a singular remedy to be presently applied to simple Green Wounds, to consolidate them. It also gives ease in the Gout, and abates the Tumor.

XIV. *The Distilled Water.* It has all the Virtues of the Juice and Decoction, but much inferior in Virtues and Effects; and therefore may be used as a Vehicle to convey the other Medicines down in. But it may be given of it self for the same purposes from 4 to 6 Ounces, sweetened with Syrup of Comfrey, or Syrup of some of the other Consolidatives.

XV. *The Powder of the Herb and Flowers.* It may be given for all the same purposes in the Decoction, Distilled Water, or some proper Syrup, or in Honey, from 2 Scruples to a Dram, or Dram and half, Morning and Night.

C H A P. DCCXL.

of WOAD, Garden and Wild.

I. *THE Names.* It is called in *Greek*, *ΐωδισ*: in *Latin*, *Glastrum* and *Isatis* also; and by some *Guadum*: and in *English*, *Woad*.

II. *The Kinds.* We have but two Kinds hereof, viz. 1. *ΐωδισ ἡμεζ*: *Glastrum sativum*, *Isatis sativa*: Our Manured Woad. 2. *ΐωδισ ἀγρία*: *Glastrum sylvestre*, *Isatis agria*: Wild Woad.

The Descriptions.

III. *The First, or our Common Manured Woad.* Its Root is white and long, growing downwards: it

Woad Garden.

Woad Garden.

has divers large, long, and something broad Leaves, not much unlike to those of Ribwort Plantane, but larger, thicker, and of a darker blewish green color. From among which rise up, one or two strong Stalks 3 or 4 Feet high, and sometimes more, with divers such Leaves set thereon, but smaller as they approach up to the top; where they spread themselves out into many Branches: at the ends whereof grow small yellow Flowers; in whose places come long flattish Cods or Pods like Tongues, black when they are ripe, and pendulous, or hanging downwards, wherein lye the Seed, which if it be a little chewed or broken with moisture, will give a blew color.

IV. The Second, or Wild Woad. It is very like unto the former, in its Root, Stalks, Leaves, manner and fashion of growing, saving that the Stalk is

Woad Wild.

slenderer, tenderer, and browner, the Leaves lesser, and the Husks or Cods not so great, and narrower, and the whole Plant smaller.

V. The Places. The Manured Woad is Sown in Gardens, and whole Fields are Sown with it in England, France, Germany, Italy, and Spain, as also in the Islands of Terceras, belonging to Spain. The Wild in Fields and Untill'd Places in England, Germany, &c. where the Manured has been Sown.

VI. The Times. They Flower in June and July, and the Seed is late Ripe, viz. in September or October.

VII. The Qualities. The Manured Woad is hot in the first Degree, and dry in the second, bitter withal, but not sharp. The Wild is as hot, but more drying, viz. in the third Degree, and is more sharp and biting, exceeding the Manured in all its properties: they are Absterfiv, Astringent, and Vulnerary.

VIII. The Specification. It is good against the Obstruction, Pain, and Tumor of the Spleen; and is proper for the Cure of simple Green Wounds, and Ulcers.

IX. The Preparations. You may have therefrom, viz. from the Herb, 1. A Liquid Juice. 2. A Decoction in Wine or Water. 3. A Balsam. 4. A Distilled Water. 5. A Powder of the Herb.

The Virtues.

X. The Liquid Juice. It is binding and very drying, resists Putrefaction, stops Bleedings of all sorts, whether inward or outward, by the Mouth, Nose, Fundament, or private Parts; and therefore is profitable to stop the overflowing of the Terms and Loches in Women: used to Green Wounds, it foddors up their Lips and quickly heals them; and is no less profitable to cleanse and correct the putridity and malignity of old running Sores, and eating Ulcers, rebellious Fistula's, pernicious Cancers, and the like, being outwardly applyed and inwardly taken, from 1 Spoonful to 6, (according to the Advice of the Physician) Morning and Nighr, mixt with a little Wine, or Wine and Water, or other fit Vehicle; and so taken, it is good to open the Spleen, ease its Pain, and to dissolve all hot Tumors thereof.

XI. The Decoction in Wine. It has all the former Virtues, tho' not altogether so powerful, and therefore may be taken Morning and Night, from 2 to 6 Ounces; and outwardly applyed to simple Green Wounds, old running Sores, foul Ulcers and Fistula's, to wash and foment them therewith, it Absterges or cleanses, and induces their healing: but particularly helps the hardness of the Spleen being Drank, and the Region thereof being also fomented therewith.

XII. The Balsam. It is of singular use (being applyed) for the Curing of simple Green Wounds, and cleansing, incarnating, drying and healing, of old running Sores, malign and putrid Ulcers, and rebellious Fistula's, &c.

XIII. The Distilled Water. It has all the Virtues of the Juice or Decoction; but as it is much weaker, so it must be taken in much greater quantities, and is best to be used mixed with either the Juice or Decoction.

XIV. The Powder of the Herb. It may be given from half a Dram to a Dram, Morning and Evening in a Glas of Wine, or Wine mixed with the Distilled Water, or in the Decoction aforementioned, to all the purposes said. It is good against the Bloody-Flux, as also all other Fluxes of the Belly, or Defluxions of Humors upon any part, vehement Catarrhs, and the like.

XV. The Decoction in Water. It is used by Dyers to Dye Cloth, Wooll, Yarn, &c. of a blew color, by Boiling the matter to be Dyed therein.

C H A P. DCCXLI.

of WOODROOF:

OR,

WOODROWEL; Common,
Blew, and Break-Stone.

I. THE Names. It has no known Greek Name, but in Latine it is called *Asperula*, and *Aspergula*; and in English *Woodroof*.

7 Z

II. The

II. The Kinds. Those which are most known to us, are the three following, viz. 1. *Asperula Dodonæi* & *Lobelij*; *Asperula odorata* Clusij; *Aspergula odorata nostras* Pome; *Aparine Sylvestris* quædam Cordi; *Rubia Sylvestris* alia minor Gesneri *Aleutica Stellata* *Tabernemontani*; Our Common Woodroof. 2. *Asperula Flore Cerulea* Dodonæi, *Camerarij*; *Lobelij* & *Lugdunensis*; *Asperula Cerulea arvensis* Bauhini; Woodroof with a Blew Flower. 3. *Asperula repens*, *Juncaria Salmaticensis* Clusij; *Synanchia* Species *Lugdunensis*; *Juncaria Tabernemontani*; *Rubia linifolia aspera* Bauhini, Small Break-Stone Woodroof, or Woodroof Stone-Break.

The Descriptions.

III. The first, or our Common Woodroof. Its Root runs and creeps under Ground, and shoots up new Stalks round about it every where. It sends forth several square Stalks half a Foot high or more,

Woodroof Common.

full of Joints, and every Joint, 7 or 8 fair green shining Leaves, broader than those of Clavets or Goose-Grass, in a manner smooth, or but little rough at all. At the tops of the Stalks, stand 4 or 5 white sweet Smelling Flowers, made of 5 Leaves apiece, laid open like a Star; after which, comes small round Seed, a little rough, or cleaving to whatsoever it touches.

IV. The second, or Woodroof with a blew Flower. Its Root is small, somewhat yellowish and Fibrous, perishing every Year. It has seldom more than one round Stalk arising from its Root, set full of Joints, at every one of which stand several small and something long green Leaves encompassing it, not so smooth and green as the former; which spreads it self out into small Branches, from the bottom almost up to the top, set with the like Leaves, but smaller; where the Flowers stand 3 or 4 toge-

ther, each upon a small Footstalk, which are of the same Magnitude with the former, or rather something less, and of a fair blewish Purple color,

V Woodroof Blew Flower'd.

without any Smell at all. After they are past, in their places grow small round brownish Seed, not rough at all. From this Seed when it falls, spring up fresh Plants the next Year.

VV Woodroof Break-Stone.

V. The

V. The third, or small Stone-Break Woodroof. Its Root is white and thready: It is a very small Plant, growing upright, with square, rough, rush-like Branches, spreading it self out into many small Divisions, almost like unto an Horse-Tail, full of Joints, with two Leaves, and sometimes more at a Joint, somewhat long and narrow, like unto Line or Flax, but rough. At the tops of the Branches come forth many small white Flowers, set in Spikes, and 4 or 5 standing upon a short Foot-stalk together, which stand in rough Husks, in which is contained the Seed, which is black and small.

VI. The Places. The first is found growing Wild in the Woods in Germany; but both first and second are Planted and Nurst up with us in Gardens. The third *Clusius* says grows about *Salamantica* in Spain, but *Parkinson* says he found it on the right hand of *Bradford-Bridge*, at the lower end of *Grays-Inn Lane*, near London, by the Water Course which passes along there; and for that reason, may possibly be found in many other parts of this Kingdom besides.

VII. The Times. The two first Flower about May, and their Seed ripens in the mean Season, while they are in Flower, or presently after. The third Flowers in the end of Summer, the Seed ripening in some small time following.

VIII. The Qualities. Woodroof is temperate in respect of heat or cold, dryness or moisture; and is very like in Qualities to our *Ladies-Bedstraw*. They are Aperitive, Absterfivè and Vulnerary, Cardiac and Hepatick, clearing the Heart, and making it merry. The *Break-Stone Woodroof* is temperate also, hot and dry in the first degree, Aperitive, Absterfivè, opens Obstructions of the Bowels, is Diuretick and Nephritick.

IX. The Specification. The Woodroofs clear the Heart, resist Melancholy, make a Man light-foot and pleasant, and induce the Curing of Wounds. The *Breakstone* opens Obstructions of the Urinary Passages, provokes Urine powerfully, and gives ease in the Strangury, and is an excellent thing for that Disease in the Throat called a *Quinsie*.

X. The Preparations. From the Woodroof you may have, 1. A Liquid Juice. 2. An Infusion or Decoction in Wine. 3. A Cataplasim. 4. A Distilled Water. From the *Break-Stone* you have, 1. A Liquid Juice. 2. A Decoction in Water or Wine; where Note, that of the Woodroofs, the first is only or chiefly used.

The Virtues.

XI. The Liquid Juice of Woodroof. If it be Clarified, it may be given from 1 Spoonful to 2 or 3 at a time, against Hypochondriack Melancholy, and Passions of the Heart, for it very much clears the Heart, and revives both Vital and Animal Spirits, making the Patient merry. It strengthens the Stomach, and rectifies its depraved Tone; causes Appetite, and is good against Nauuseousness and Vomiting. It is both a Preservative and Curative of the Plague, and is good against all kinds of Malign and Pettilential Diseases.

XII. The Infusion or Decoction of Woodroof in Wine. They have all the former Virtues, but not altogether so powerful, but admirably open Obstructions of Liver, Spleen and Mesentery; preserving the Vital and Animal Spirits from Infection, and the power of any Contagious Disease.

XIII. The Cataplasim of Woodroof. It is made of the green Herb bruised. Being applied, it is

said to disperse hard Tumors, and to heal Simple green Wounds in any part.

XIV. The Distilled Water of Woodroof. It is effectual for all the purposes aforesaid, and may be given alone, (Dulcified with Syrup of Citrons, either of Juice or Peels) from 4 Ounces to 8; or it may be used as a Vehicle for other things.

XV. The Liquid Juice of Break-Stone. Given from an Ounce to 3 Ounces, in White Port Wine, or mixt with Parsley or Hydropiper Water, it potently opens all Obstructions of the Urinary passages, expels Sand, Gravel, Stones, and Tartarous Mucilage out of the Reins and Bladder. And being used vehemently hot, it helps such as are troubled with the *Quinsie*, the Throat being gargled therewith, and outwardly Bathed very hot upon the afflicted parts; Stuphs also wet therein being applied very hot thereto.

XVI. The Decoction of Break-Stone in Wine. It has all the Virtues of the Juice, but by reason it is not full out so strong, it must be taken in a larger Dose, as from a quarter of a Pint, to half a Pint, against Diseases of the Urinary parts. And *Quinsies* must be often Gargarised therewith, as hot as can well be endured.

C H A P. DCCXLII.

Of WOLFS-BANE Deadly.

I. THE Names. The Arabians call it *Chanach Adip*, or *Adib*, (i.e. *Stranglatorem Lupi*;) in Greek *Αδύρα*: in Latin *Aconitum*, *Luparia*; as also, *Lycottonon*, and *Cynottonon*, (because it kills both Woolves and Dogs;) in English *Woolfs-Bane*.

II. The Kinds. Authors make many sorts of this Plant, we shall treat only of the Principal, such as we Plant and Nurse up in our Gardens, viz. 1. *Aconitum Hymale*: The Winter Woolfs-bane. 2. *Aconitum Hymale flore pallido*: Pale Flower'd Winter Woolfs-bane. 3. *Aconitum luteum ponticum præcox*: The earlier whitish Woolfs-bane. 4. *Aconitum flore albedo ferotinum Ponticum*, *Aconitum primum flore albedo Gesneri*: Late Flowering Woolfs-bane. 5. *Aconitum Lycottonum flore Delphinij majus Silestiacum Clusij*; *Aconitum flore Delphinij Camerarij*; *Aconitum Ceruleum aliud Gesneri*; *Aconitum Ceruleum hirsutum, flore Consolide regalis Baubini*: The greater Woolfs-bane with Larks heel Flowers. 6. *Aconitum flore Delphinij minus, Dodonei & Lobelij*; *Aconitum Lycottonum Ceruleum majus Dalechampij*; *Aconitum quartum Matthioli*; *Aconitum Ceruleum glabrum flore consolide regalis Baubini*: The finer Leav'd, or lesser Woolfs-bane, with Larks heel Flowers.

The Descriptions.

III. The First, or Winter Woolfs-bane. Its Root is Tuberos, so like both for shape and color unto *Anemone* Roots, that they may easily deceive One not well vers'd in them; but that this is browner and smoother without, and yellow within, if it is cut or broken. This little Plant thrusts up divers Leaves oftentimes in the deep of Winter in January, if the weather is any thing mild, but most commonly after the deep and long Frosts, bearing up many

times the Snow upon the heads of the Leaves; which, like unto the Anemones, do every Leaf rise from the Root, upon several short foot Stalks, not above 4 Fingers high, some having flowers in the middle of them, (which most commonly come up first) and some none: which Leaves stand as it were round, the Stalk rising up under the middle of the Leaf, deeply cut in, and gash almost to the middle Stalk, of a very fair deep green color: in the middle whereof, close unto the Leaf, stands a small yellow flower, consisting of 5 or 6 Leaves, very like a Crow-foot, with yellow Threads in the middle. After the flower is fallen, there rise up divers small Horns or Cods set together, in which are contained whitish round yellow Seed.

IV. The Second, or Pale Flower'd Winter Woolfs-bane. This in its Root, Stalks, Leaves, flowers and Seed, manner and form of growing, is in all respects like the former, saving only, that the flowers of this are of a pale yellow color, and in some Plants almost white.

V. The Third, or earlier whitish Woolfs-bane. Its Root consists of a number of dark brown Strings, which spread and fasten themselves strongly in the Ground. It springs not out of the Earth till the Spring is well begun, and then it sends forth great broad green Leaves, deeply cut in about the Edges, and not much unlike the Leaves of the great Wild

VWoolfs-bane whitish early.

Crow-foot, but much greater: From among which Leaves, rises up a strong stiff Stalk 2 Feet high, having here and there Leaves set upon it, like unto them which are lower, but smaller. The Top of the Stalk is divided into 3 or 4 Branches, on which grow several pale yellow flowers, which turn at last to be almost white; in fashion almost like the Fielmei flower, but much smaller, and not gaping so wide open: which being past, divers short Pods come up in their place, in which is contained black Seed.

VI. The Fourth, or late Flowering Woolfs-bane. Its Root differs not from the former: it has as large

Leaves as the other last described, and as much divided, cut also on the Edges somewhat deeply, but of a fresher green color, and not rising or springing out of the Ground, for almost a Month after the former is come up. The Stalk with Leaves thereon rises to be 4 or 5 Feet high, and with a long Branched head, of pale yellow color'd flowers, almost whitish, but flowers later almost by a Month than the third foregoing. The Cods and Seeds are like the former.

VII. The Fifth, or greater Woolfs-bane, with Larks heel flowers. Its Root is something thick, long, and blackish, with several fibres and long Strings adjoining to it, by which it takes strong hold in the Ground: From which shoot forth several green Leaves, of a very sad or dark green color, standing upon pretty long foot Stalks, cut in on the Edges into 5 deep divisions or parts, even to the Stalk, and somewhat rough or hairy; each part whereof is also dented about the Edges: From among which rises up a reasonable great and strong round hairy Stalk, about 2 feet high, having some such Leaves thereon as grow below; at the Top whereof is growing many flowers Spike fashion, one above another, which are fashioned something like those of Larks heels, but larger and thicker, with a short thick crooked heel behind them, of a very dead or sad blewish purple color, seeming as if they were rugged or crumpled withal, which adds a greater ill-favor'dness to them on the outside; but of a little fresher or more lively blew color, and smooth on the inside. After which come several small rough Cods standing together, like as other Aconites and Columbines also do, in which is contained a rugged black Seed.

VWoolfs-bane Larks heel'd, Greater and Lesser.

VIII. The Sixth, or lesser Woolfs-bane, with Larks heels. Its Root differs from the last, this having 3 or 4 thick short blackish Roots, ending in small long points, fastned together at the head. It has

has divers smooth green Leaves, upon very long foot Stalks, but not altogether so large, or of so sad a green color, much more finely cut in and divided, in many jags or parts than the former. The Stalk also rises not up so high, and bears some smaller and finer Leaves thereon, which ends in a small spike or head, of almost as large Flowers, with a short spur or beel behind as the other bus, but of a fairer blewish purple color, and more lively, as well on the outside as inside. The Cods and Seed are also like the former.

IX. *The Places.* They all grow Wild in Germany, Italy, and other Countries, in Woods and shady places: but with us they are only Nurft up in Gardens.

X. *The Times.* The two first sorts bring forth their Flowers with their green Leaves, commonly in January, for which they are only esteemed. The others Flower later, as in May and June, and the Seed is ripe commonly in the following Months. The Roots of the two first may be Set in any of the Summer Months, and almost in any place, for they are hardy Plants, and will thrive almost any where.

XI. *The Qualities.* They are all hot and dry in the extremity of the fourth degree, burning and deleterious, or deadly, and therefore are not to be given inwardly. The Heads of Arrows being dipt into the Juice thereof, so Empoysons them, that they kill all Living things who are Wounded therewith.

XII. *The Specification.* Woolfs-bane is profitable to kill Lice and Vermin in Childrens Heads, and to cleanse them from Scurf, &c. to consume dead Flesh in Ulcers and Sores; and to clear the Eye-sight from any Haw, Pin and Web, Cloud or Film, &c. which may obfuscate the Sight.

XIII. *The Preparations.* You may have therefrom, 1. A Powder of the Roots and whole Plant. 2. A Decoction of the same. 3. A Distilled Water from the whole Plant.

The Virtues.

XIV. *The Powder.* Either alone, or made into an Ointment with Hogs Lard, and applyed to Childrens Heads troubled with Lice, Scurf, Morpew, Dandriff, running Sores, &c. it kills the Lice, and cures the Head of the other Maladies.

XV. *The Decoction of Roots, Leaves, Seed in Water.* It is good for all the purposes aforesaid. Both Decoction and Powder are used, as Galen says, in foul Sores and putrid Ulcers, to consume the dead Flesh, and cleanse them; but they are not to be applyed to Sores in the Mouth or Privities, which are too tender Parts for any such violent Medicaments.

XVI. *The Distilled Water.* Being dropt into the Eyes, it is good to take away the Inflammation, as also Specks, Spots, Haws, Clouds, Films, &c. which may grow in them, or trouble the Eye-sight.

XVII. *Nota.* If any one should by accident be Poisoned, by taking inwardly Woolfs-bane, he ought immediately to seek for Cure, the method of which, we have laid down in the Cure of Poison by *Helmet-Flower* or *Monks-Hood*; which (to avoid Tautology or vain Repetition) be pleased to have Recourse to Chap. CCCLIII. Sect. XVI. foregoing of this Work, where it is plainly expressed.

CHAP. DCCXLIII.

Of WOOLFSBANE Antidote:

O R,

DORONICUM.

I. *THE Names.* The Arabians call it (as is supposed) *Doronigi* or *Durungi*, (whence the Name *Doronicum* is supposed to be derived, because it is not to be found in any of the Ancient Greek or Latine Writers:) Our Modern Authors call it in Latine *Doronicum*: and we in English *Woolfs-bane Antidote*, *Wholfson Woolfs-bane*, and *Doronicum*.

II. *The Kinds.* Authors have made eleven or twelve Species hereof, many of which may not in some Ages be seen by us: we shall therefore take notice only of 4 or 5 sorts, which are either Nurft up in our Gardens, or grow Wild in our Country, or the Roots of which are Sold in the Druggists-Shops. 1. *Doronicum Vulgare*, *Doronicum Romanum*; by all Writers, our common Woolfs-bane Antidote or *Doronicum*: I call it ours, because it is common as well in our Gardens in England, as in the Gardens of other Countries. 2. *Doronicum minus Clusij aliorumque*; *Doronicum Plantaginis folio Bauhini*: The lesser Woolfs-bane Antidote, or *Doronicum*. 3. *Doronicum brachista radice penae & Lobelij*; *Doronicum austriacum secundum Clusij*: The Scorpion Rooted *Doronicum*, or Woolfs-bane Antidote. 4. *Doronicum Germanicum Clusij*; *Alisma seu Damasonium Matthioli & Dioscoridis*; *Caltha Alpina Gesneri*; *Nardus Celtica altera Penae, Lobelij, Rondeletij, Ptarmica montana Lugdunensis*; *Doronicum Pannonicum*, & *Doronicum sextum Clusij*: German, or our English Woolfs-bane Antidote. 5. *Doronicum officinarum*; *Radices Doronici*, *Radices Meehini*; *Doronicum antiquorum Penae*: *Doronicum* of the Shops. 6. *Doronicum Arabum genuinum*: The true Arabian *Doronicum*.

The Descriptions.

III. The first, or our common Woolfs-bane Antidote, or *Doronicum*; (so called ours, because it has been longest known unto us, and kept in our Gardens.) Its Roots are Tuberous, small, thick and short, creeping or lying under the upper crust of the Earth, with divers small Fibres shooting from them down into the Ground, and encreasing divers such like tuberous Roots round about it, which are tender and not hard, somewhat whitish, with some joints therein, and greenish on the upper side next to the upper face of the Ground. Some would make these Roots to resemble a Dead Scorpion, because of the joints, which are like Scales thereon: The former part next the Leaves, being thick, to be the Body, and the other parts being small to be the Tail, which is something sweet in Taste, and a little bitter, and a little austere clamminess withal. From this Root spring up divers Leaves, each standing by it self upon a long foot Stalk, which are somewhat round, greater than the Roman Sowbread Leaves, soft and gentle in handling, something hairy, and of a fresh green color. From among which rises up several green roundish Stalks, about a Yard high or more, parted at the Top, sometimes into one or two Branches, every one carrying a large Flower, somewhat like the Corn Marigold, but much larger, having many narrow long yellow Leaves,

VVoolfs-bane Antidote :

OR,
Doronicum.

Leaves, as a Border set about a middle Thrum, somewhat yellower; which when it falls away, turns into small whitish Down, with very small blackish Seed, which is carried away with the Wind.

IV. The second, or lesser Woolfs-bane Antidote, or Doronicum. Its Root is small, not like the former, being without those Joints so plain in them. It has divers Leaves longer and narrower than the first, somewhat like unto Ribwort Plantane, but hairy, and of a yellowish green color. The Stalks are slender, and rise nothing so high, nor are much Branched, but carrying the like yellow Flowers as the former, but somewhat paler.

V. The third, or the Scorpion Rooted Doronicum, or Woolfs-bane Antidote. Its Root creeps not so much, but is something longer thrust down into the Ground, with Joints growing upwards, Branched (as it were) on each side, with young Roots, and ending in a small point, having divers long Fibres adjoining to them. It has large round hairy Leaves like the first, somewhat waved or unevenly dented about the Edges, of a sadder green color, and something bigger: the Stalks have divers narrow Leaves thereon. The Flowers are yellow, and their Leaves dented at their ends; and the Seed is like unto the other.

VI. The fourth, or German, or our English Woolfs-bane Antidote. Its Root is small, yet jointed whitish, not much unlike the first, but not so plainly to be discerned, of a sweet Smell, and a bitter biting Taste, having many Fibres underneath it, giving many off-sets, by which it is increased. It has several broad hairy Leaves, of a yellowish green color on the upper side, but whitish and smooth underneath, lying on the Ground, something like unto broad Plantane Leaves, or rather like unto the Cross-wort Gentian, having some long Ribs

therein. Among these Leaves rises up a Stalk, and sometimes many, bearing long Leaves at every Joint. At the Top, it Branches forth into 2 or 3, or more parts sometimes, bearing every one a fair large Flower, set as it were in a rough Cup, which consists of many pale yellow Leaves, dented at their ends, as a pale or border about the middle; which is made up of many small Flowers of 4 Leaves a piece, of a deep yellow color, as it were the Thrum, which being past, the head turns into Down, which with the small black Seed therein, is carried away with the Wind.

VII. The fifth, or Doronicum of the Shops. That which is Sold in the Shops, is the Doronicum quantum Clusij, vel Stiriacum; Doronicum latifolium flore magno Bauhini: The broad Leav'd Doronicum with a large Flower. Its Root is somewhat long, blackish on the outside and jointed, but not so plainly to be discerned, the Joints rising upwards, and not downwards, (as they do in most of the rest) spreading it self, by means of certain strings, very far about, with other tuberous Roots of like form, many in number, each Tuber having many long white Fibres underneath it. It is a low Plant, but has many large, and somewhat longish round Leaves, dented about the Edges, like unto the third sort before Described, standing upon high foot Stalks. The Stalk has some Leaves thereon, longer and narrower than those below; and at its Top (not having any Branches) one Flower, larger than any of the former, but else like unto them, having many long yellow Leaves, set about a middle brownish yellow Thrum. The Root of this is all that we have in the Shops, which is Sold for the True Arabian Doronicum, but truly is not it: however, our Modern Physicians generally agree, that it Answers the End, and has the Virtues of the True Arabian Kind, tho' it has no agreement therewith in form.

VIII. The sixth, or True Arabian Doronicum. Avicen Lib. II. Cap. CC. and Serapio in his Book of Simples, Cap. CCCXXV. have Described it to be, A Root of the bigness of ones Thumb, of a hard and heavy Substance, of a yellow color on the outside, and brown within, with some white Veins, and that it is hot and dry in the third Degree. Parkinson seems to be of Opinion, that it is a kind of American Mechinus, (often found among the Mechinus, or Black Ginger) brought chiefly from Brazil, which Lobel calls Mechini rara varietas, which has divers circular knotted Lines, as it were like Joints on the outside, is firm and heavy, and full of white Veins when it is broken, is also very sharp, quick, and biting, and Aromatic in Taste. This says he, having all the Notes of the Arabian Kind, can be no other than the Legitimate and True Doronicum; however he says, he leaves it for every one to judge as his reason shall direct him.

IX. The Places. The first grows on the Mountains in Savoy, beyond the Lake Lemán, and in other places in France and Germany; but with us only in Gardens. The second grows in France. The third on the Woody Mountains in Austria, and about Trent; as Clusius says: but both of them with us, only in Gardens. The fourth in many places in Germany, in Meadows and elsewhere; and with us on the Hilly Grounds in Northumberland. The fifth, Clusius says, grows near Newberg in Stiria; the Root of which is brought to us dyed, and Sold at the Druggists-Shops. The sixth, is an absolute Stranger with us, and unless the American Mechinus be it, which by Accident as it were, is now and then brought hither, we know nothing at all of it.

X. The

X. *The Times.* They all Flower early for the most part, viz. in May, and their Seed is Ripe in some short time after.

XI. *Nota.* *Cortusius* of Padua, and *Matthiolus*, calls that which is Sold in the Shops, *Pardaliancher*, and refer it to the *Poisonous Aconites*, defaming and railing against it, as a Poison not fit to be used inwardly in Mans Body; and that those Physicians who put it into Cordial Medicines, as *Elect. de gemmis*, *Elect. ex Aromatibus*, *Diamoschum Dulce*, and other *Cordial Compositions*, do very ill, and have little respect to the Life or Health of Man; because they both upon Tryal found it to be true, and that being mixed with Flesh and given to Dogs, it killed them: to which it is answered, that many things which will kill Fowls, Dogs, and other Beasts, may notwithstanding be safely given to Mankind: And many things which are wholsom to Man, and are often used without Scruple, or the least danger, will yet quickly kill other Creatures. So *Aloes* and *Bitter Almonds*, given to Dughil Fowls, or to Foxes, will quickly kill them; and the *Chameleon Thistle*, will kill Dogs and Swine, whilst all these things being given to Man, are not only innocent, and absolutely free from any deleterious or deadly quality, but are even Antidotes against Poison, and Sovereign Cordials; and the Root of the *Chameleon* being Drank in Wine, is good against the *Poisonous Bittings* of Vipers, and other Venomous Creatures. But on the contrary, some other Physicians say and affirm, that this *Doronicum* of the Shops, is a perfectly innocent thing, and without the least danger in it. *Gesner* says, that he had taken much of it, and oftentimes a good quantity, even to 2 Drains in Powder, that he might find the Operation of it, yet found no harm thereby; and that he had given it to others, without any danger or hurt. And *Pena* and *Lobel* report, that *John de Vrode*, did Eat many Roots thereof without any danger, or Sense of ill thereby; and therefore they advise others, not to abdicate the use of this Plant to Mankind. *Dodonaeus* was once of the same mind with *Cortusius* and *Matthiolus*, but afterwards he found his Error, and reclaimed it. By what has been said on this matter, I think it is manifest, that the dangerous Qualities said to be in this Plant, are raised only from Ignorance of Fact, Scruples and Suppositions, and not from any real Grounds; forasmuch as Experience has sufficiently proved the contrary.

XII. *The Qualities.* *Doronicum* of the Shops, is hot and dry in the end of the second Degree; Cardiack, Sudorifick, and Alexipharmick.

XIII. *The Specification.* It is a peculiar Antidote against the Poison of *Woolfs-bane*, and *Helmet-flower* or *Monks-hood*: It also resists the Poison caused by the Bittings of venomous Creatures, opens Obstructions of the Lungs, and stops the Defluxions of Humors into the Throat and Eyes, easing their pain, and taking away the Inflammation of the Parts.

XIV. *The Preparations.* Our Discourse now, and presently of the Virtues, has chiefly respect to the fifth Species foregoing; tho' some Authors think that the same may be said and applied to all the other Kinds, seeing that they are all in Form, and places of growing one so like to another; and possibly if Tryal be made, would perform the same Effects. You may have therefrom, when fresh Gather'd, 1. A Juice from the Roots and Leaves. 2. A Decoction of the Root. 3. A Powder of the Root. 4. A Decoction of the English or German *Woolfs-bane Antidote*, (at Sect. 6.) 5. A Powder of the Root and Herb of the same Plant.

The Virtues.

XV. *The Liquid Juice of the Roots and Leaves.* It is said to be found good to be put into Eyes which are hot, red, and inflamed, to take away their prickings and ease their pain.

XVI. *The Decoction of the Root in Wine or Water.* It is an excellent Cordial, refills and Cures the Poison of *Aconitum*, *Monks-hood*, and other poisonous Plants; as also the poisonous Bittings of Vipers, Mad Dogs, and other venomous Creatures; it cleanses the Breast and Lungs of thick tough Humors, stops the Cough, and gives ease in Pleuritic Pains and Stitches in the Sides, Head-achs, Vertigo's, &c. Dose half a Pint at a time Morning and Evening, a little Dulcified with Sugar.

XVII. *The Powder of the Root.* It has all the Virtues of the Decoction, and may be given Morning and Night, from 2 Scruples to 2 Drains, made up into an Electuary with some proper Syrup, or Conserve; or mixed in Syrup of Citron Peels, or of Juice of Citrons, and so given in a Glass of Canary, Sherry, or Madera Wines, &c.

XVIII. *The Decoction of the English or German Woolfs-bane Antidote in Wine.* It provokes the Terms in Women, eases the Pains and Diseases of the Womb, is effectual against Poison, especially the Poison of the Fish called *Lupus Marinus*, as also the venomous Biting of Shrew Mice and Toads. It resists the mighty Potency of *Opium*, in such as have taken too much of it: and is given with good success to those who have a Bloody-Flux, or any other Pains, or Gripings in the Stomach or other Bowels, by reason of sharp Humors offending them. It is profitable against Convulsions, Cramps, Weaknesses, and other pains and disaffections of the Nerves, Tendons, and Joints: and if it is given with the fine Powder of *Carrot Seed*, or rather of *Daucus Seed*, it potently expels Gravel, small Stones, and Tartarous Slime, from the Reins, Ureters and Bladder. It is applied also outwardly to ease Inflammations, and take away the pains of old running Sores, putrid and eating Ulcers, and the like.

XIX. *The Powder of the Root of the same Plant.* It may be given Morning and Night, from a Dram to two Drains, mixt with some proper Syrup, and then to be swallowed down with some of the former Decoction; or with a Glass of Canary, Sherry, or some other like generous Wine, for all the purposes and intentions the aforesaid Decoction is appropriated to. It is used also as an Erthine, or rather a Sternutatory, by which way it cleanses the Head and Brain of cold and moist Recrements, which cause Dullness, Drowsiness, and other ill habits of those Parts.

C H A P. DCCXLIV.

Of WORMWOOD Common.

1. *THE Names.* It is called by the *Arabians* *Asinthium*; by the *Greeks* *Asithon*; and in Latin *Asinthium*: and in English *Wormwood*. *Dioscorides* calls it *Babimayn*, a profundo amarare; from its exceeding Bitterness.

II. *The Kinds.* Authors make a great many Kinds of this Plant; we shall take Notice of four several sorts, viz. 1. *Asinthium vulgare*, *Asinthium*

thium latifolium, & *Latifolium vulgare*: Our common Wormwood, of which we shall Treat in this present Chapter. 2. *Abfinthium Romanum*, *Abfinthium Ponticum*, of which in the next Chapter DCCXLV. 3. *Abfinthium marinum*, *Abfinthium Belgicum*; *Abfinthium Anglicanum*; *Abfinthium Seriphium*, *free Maritimum Anglicum*: Marsh or Sea Wormwood; of which in Chap. DCCXLVI. 4. *Abfinthium santonicum*; *Abfinthium fementina*: Wormfeed Wormwood; of which in Chap. DCCXLVII. following.

The Descriptions.

III. The Root of our common Wormwood is hard and Woody, with many Strings adjoining to it. It has many large whitish green Leaves, somewhat more hoary underneath, much divided or cut into many parts; from among which, rise up several hard, woody, and hoary Stalks, two or three

V Wormwood Common.

Feet high, beset with the like Leaves as grow below, but smaller, divided at the Tops into many smaller Branches, whereon grow many small Buttons, with pale yellow Flowers in them; wherein afterwards is contained small Seed. The Stalks hereof Die down every Year, but the Root holds a Taste of green Leaves all the Winter, shooting forth anew again; which are of a strong but pleasing Smell, and of a very bitter Taste.

IV. There is in hot Countries, nearer the Tropick of Cancer, a Tree Wormwood, very like to this our Common Wormwood, which grows considerably greater and higher, and seems to be a kind of *krutex*, but it will not thrive in our Colder Climates.

V. The Places. It grows plentifully Wild almost throughout the whole Kingdom; and is besides often found in Gardens, coming up of its own accord.

VI. The Times. It Flowers and Seeds in July and August, which when it is in the height of its Flowering, ought to be gathered, dried, and carefully laid up for Medical uses.

VII. The Qualities. It is hot and dry in the third Degree; Aperitive, Absterfivè, Astringent, Stomackick, Nephritick, Hyfterick, and Cathartick.

VIII. The Specification. It Cures the Scurvy in a cold Constitution; rectifies the Tone of the Stomach and Bowels, is good against nauſeousness, stops Vomiting, strengthens the Ventricle, provokes Urine and the Terms, Cures Surfeits, and helps against the hard Swellings of the Belly; causes a good Appetite, and a strong Digestion, and is profitable against the Yellow Jaundice. It is also an Antidote against many Vegetable Poisons, dissolves Quinsies or Tumors in the Throat, and is a good Cosmectick, taking away Wheals, Pimples, Worms, Roughness, and other deformities of the Skin: It helps the dimness of the Eyes, sore and running Ears, and eases their Pains: It is good against the swelling and hardness of the Spleen; it purges Cholerick Humors downwards, both by Stool and Urine. It also kills Worms in Children being inwardly taken, and outwardly applied; it is good against the Colick, Bloody-Flux, and all other Fluxes of the Belly: And being constantly used, it is said to Cure a stinking Breath. It is commended against Tertian and other lingering Agues, by opening Obstructions, purging by Urine, strengthening the Stomach and Liver, and altering the whole habit of the Body.

IX. The Preparations. From Common Wormwood you may have these, 1. A Liquid Juice, 2. An Essence, 3. A Decoction, 4. Wormwood Beer, 5. An Infusion in Wine, 6. A Powder, 7. An Essential Salt, 8. Camerarius's mixture, 9. Syrup of Wormwood Simple, 10. Syrup Compound, 11. An Insolated Oil, 12. A Cataplasm, 13. Troches, 14. A Simple Distilled Water, 15. A Simple Spirit, 16. A Water and Spirit Compound, 17. A Distilled Oil, 18. Potestates or Powers, 19. A Spirituous Tincture, 20. An Acid Tincture, 21. An Oily Tincture, 22. A fixed Salt.

The Virtues.

X. The Liquid Juice. If it be given to 2, 3, 4, or 5 Spoonfuls, according to Age and Strength, it is Cathartick, and Purges the Body of Cholerick and Pituitous Humors, strengthening the Bowels at the same time; and snuff'd up the Nostrils as an Errhine, it purges the Head and Brain of Pituitous Recrements. If it is inspissated and made up into Pills, 10 Grains being taken at a time, admirably strengthens the Stomach.

XI. The Essence. If taken in due Dose in Broth or Wine, it gently Purges the Viscera of Cholerick and Flegmatick Humors, kills Worms in the Stomach and Belly, provokes Urine and the Terms, opens Obstructions of Stomach, Liver, Spleen, Mesentery, Reins and Womb; is good against the Jaundice, Dropie, Gout, and Scurvy, creates a good Appetite and Digestion, strengthens the Stomach and Bowels, Cures Fluxes of the Belly, and is good against Tertian Agues, and other like Chronick Diseases: It stops Vomiting, is good against a Stinking Breath and Loathings, and restores the Tone of the Stomach. Dose from a quarter to half a Spoonful in Canary, or other generous Wine, Mornings, Noon, and Night: but if it is to Purge withal, it may be taken from a Spoonful to 2 or 3, or more, in any proper Vehicle.

XII. The

XII. *The Decolion in Water or Wine.* It has all the former Virtues, and may be given Morning and Night a quarter of a Pint at a time, in any proper Vehicle. It is said to be peculiarly good against the Yellow Jaundice.

XIII. *Wormwood Beer.* It is Stomack, comforts and warms a cold Stomach, takes away loathing of Meat, and causes a good Appetite and Digestion; it alters a Cold habit of Body by long taking it, and purifies the Blood.

XIV. *An Infusion in Wine, or Wormwood Wine.* Take Choice Rhenish Wine a Gallon; dried Wormwood Leaves and Tops of Flowers, a good handful: mix them, and stop them up close for a Month or more, shaking the Vessel once or twice a Day; and all the while it is used, let it remain upon the Herb or Faces. It is taken at any time mixt with choice Canary; it warms a Cold Stomach, causes a good Appetite and Digestion, expels Wind, kills Worms, and being Drank alone without mixture, Cures the Green-Sickness, being taken in the Morning Fasting; and frequently used, it prevents the Cachexia and Dropsy.

XV. *The Powder of the Herb and Heads of Flowers.* It heats, cleanses, dries, and strengthens the Viscera: It has all the Virtues of the Essence, and kills Worms in Children, being taken from 10 Grains to a Dram, (according to Age and other Accidents) mixt with Honey, or Pulp of an Apple, or some such like, and washt down with a Glass of Canary, Morning and Evening; it is good against Surfeiting and Drunkenness, and the Puritury of the Stomach, and helps against a stinking Breath.

XVI. *The Essential Salt.* It has all the Virtues of the Liquid Juice, Essence, Decoction, Wine and Pouder, and that in an exalted measure. It may be given against all those Diseases, as also the Green-Sickness in Virgins; from a Scruple to a Dram, every Morning Fasting, and at Bed time, in a Glass of White Port or Lisbon Wines, or in Canary, with a Continuando, till the Patient grows well.

XVII. *Camerarius's mixture.* Take the Tops or Flowers of Wormwood, Flowers of Rosemary, and Flowers of Black Thorn, or Sloe-Bush, of each 4 Ounces; Saffron 2 Ounces; Rhenish Wine 4 or 5 Quarts, mix them, and in a Vessel close covered, simmer them over the Fire for an hour or more, then Strain out and keep it for use. It is commended for the Cure of the Yellow Jaundice, a small draught of it being taken in the Morning fasting, (the Body being prepared beforehand by Purging) and so taken, it brings down also the Terms in Women; and if a little Wine Vinegar be added to it, it is said to help those who are Poisoned or almost Strangled, by eating Poisonous Mushrooms; and being taken mixed with Wine, it is good against the Poison of the black Chamæleon Root, Hemlock, Shrew-Mouse, and Draco Marinus, which is called a Quaviver.

XVIII. *The Simple Syrup.* Take Clarified Juice of Wormwood, Clarified Sugar, or the double Refined, of each 4 Pounds; mix, and in the heat of a Bath make a Syrup. It has all the Virtues of the Juice, Essence, and Decoction, and may be given from one Spoonful to two, in a Glass of Wine: If Nitre be dissolved in it, it is then good against the Quinsey, and Inflammations of the Throat and Almonds, to Gargle with it. Dropt into the Eyes, it is good against the dimness of Sight, Clouds, Spots Films, &c. And dropt into the Ears, it eases their Pain, and heals running Sores therein.

XIX. *The Compound Syrup.* Take dried Wormwood, a pound; Red Roses, 4 Ounces; Indian Spicknard, an Ounce; Old White Port or Lisbon

Wine, Juice of Quinces, of each 5 Pints: steep them a whole Day in a close Earthen Vessel, then Boil very gently, and Strain out without pressing; and with 4 Pounds of double refined Sugar, make it into a Syrup in the heat of a Bath. It is good for a cold and flegmatick Stomach, eases its Pain, and strengthens it, as also the Liver and Concoctive Faculty; causes a good Appetite, expels Wind, provokes Urine, and prevails against the Yellow Jaundice. Dose from one to two Spoonfuls Morning and Night, in a Glass of generous Wine.

XX. *Oleum Abfinbiacum; Infolated Oil of Wormwood.* Take Flowers or Tops of Wormwood, 4 Ounces; choice Oil Olive, 3 Pounds: mix, and set them in a hot Sun in a Glass close stopt a whole Week, shaking them every Day then boil in a Bath; press out the Oil, and put in fresh Wormwood as before, which boil and press out: then a second and third time, adding 4 Ounces more of fresh Wormwood, put to it also 4 Ounces of Juice of Wormwood; which boil again in a Bath, till the humidity of the Juice is evaporated, then press out and keep it for use. It heats and strengthens the Stomach, being Anointed thereon, Anointed on the Stomach and Belly, it kills Worms, the Pouder being given also at the same time: Anointed on the Back bone, it abates the shaking Fits of Agues, if done the whole length thereof, for half an hour before the coming of the Fit: Anointed on Stomach, Sides and Belly, it strengthens all the Bowels, chiefly Liver and Spleen; and is good against Cachexies and Dropsies, and Diseases arising from Coldness and Weakness of those Parts: it causes also Appetite, helps Digestion, and dissipates Wind, for which reason it is good against the Colick.

XXI. *The Cataplasm.* It is made of the green Herb, by beating it in a wooden Mortar with a wooden Pestle, adding a little Ox Gall to it. Applying it to the Stomach, it kills Worms in those parts, and strengthens them, giving ease also to pains of the Liver and Spleen.

XXII. *Troches of Wormwood Compound.* & Wormwood Leaves and Flower's in fine Powder, Red Roses in Powder, Anise-Seed in Powder, of each 2 Ounces: Roots of Asarabacca, Rhubarb, Spicknard, Smallage-Seed, Mace, Mastick, each in fine Powder, one Ounce: Almonds bitter, Infusate Juice of Maudlin, of each an Ounce also: Juice of Succory, enough to make all into a Mass for Troches. It is a very bitter Medicament, and scarcely ever taken alone, but with some proper Vehicle. They strengthen the Stomach, Liver, Spleen, Mesentery, and other Bowels, kill Worms in the Body, opens Obstructions of the Viscera, and are profitable against the Yellow Jaundice. Dose a Dram Morning and Night, in Syrup of Citron Peels.

XXIII. *The Simple Distilled Water.* It heats and comforts the Stomach, is good against Loathing, stops Vomiting, expels Wind, helps Digestion and causes a good Appetite; and is said to give, ease in the Tooth-ach. It has all the Virtues of the Juice and Essence, but much weaker: Dropt into the Eyes, it clears the Eye-sight; and bathed upon the Temples, it eases the Head-ach.

XXIV. *The Simple Spirit.* It is made from the fermented Juice, by Distilling it in a Copper Alembick Tinn'd within, with its Worm or Refrigeratory. Or, Take Leaves and Tops of dried Wormwood, 4 Pounds; small Wines, 6 Gallons, digest 24 hours, then Distil in an Alembick as before, adding to every Pint of the Distilled Water, 100 Ounces of double refined Sugar: The first quart you may call Simple Spirit of Wormwood; what follows after, save for Wormwood Water. These

have the Virtues of Wormwood, but more fit for Ancient People, whose Natural heat is abated; it warms and comforts the Stomach, and helps Digestion, and is good for such as are troubled with Cachexy, Dropsy, and jaundice, &c.

XXV. *Water and Spirit of Wormwood Compound.* Take *Tops and Leaves of dried Wormwood*, 2 Pounds; *Anniseeds*, half a Pound; 6 Gallons of *small Wines*: mix, and digest all together for 24 hours, then distil them in an Alembick as aforesaid, adding 2 Ounces of double refined Sugar to every Pint of the distilled Liquor. The first Quart keep for *Spirit of Wormwood Compound*: and all the rest for *Wormwood Water Compound*. It has all the former Virtues, but more agreeable to such as have got Coughs, Cold, Wheezing, or any Stiffness in the Stomach and Lungs, or troubled with the Colick.

XXVI. *Oil of Wormwood Distilled.* It has all the Specifick Virtues ascribed to Wormwood, at *Self. VIII.* aforesaid. A Drop, or 2, or 3, of this Oil, mixt first with a little white Sugar, and then drank in a Glass of *White Port* or *Lisbon Wine*, or *Canary*, makes an excellent draught to strengthen the Stomach, Liver, and other Viscera; to help against a Cachexia, cause a good Appetite and Digestion, and make a good color in the Face: It expels Wind, provokes Urine, and is good against Hypochondriack Melancholy, and universally strengthens the whole Body.

XXVII. *Potestates Absinthij, or Powers of Wormwood.* They have all the Virtues of the Oil exalted, and so more subtil, and are also much more pleasant to be taken: you may take Morning, Noon and Night, 40 or 50 Drops in a Glass of generous Wine.

XXVIII. *The Spirituous Tincture.* 'Tis a Noble Medicament, and has all the Specifick Virtues enumerated, at *Self. VIII.* aforesaid; it resists Vomiting and Nauseousness, and strengthens the Stomach above all other Preparations of Wormwood. You may take 20, 30, or 40 Drops, or more at a time, in a Glass of *Canary*; the more the Wine is, the greater number of Drops may be given at a time.

XXIX. *The Acid Tincture.* It is an Antidote against all hot, burning, and malign Fevers, and is an excellent thing against the Plague or Pestilence it self, and all other Contagious and Pestilential Diseases: it provokes Urine and the Terms, and carries off the Morbifick cause of Internal distaffections, by the Urinary passages.

XXX. *The Oily Tincture.* It is good to provoke Urine, and cleanse the Urinary passages from Sand, Gravel, Stones, and Slimy and Tartarous matter infesting those Parts: it is an excellent thing against the Colick, Palsy, Convulsions of the Bowels, and Gout affecting the Stomach. Dose from 8 to 16 or 20 Drops, first Dropt into and mixt with Sugar, and then to be taken in a Glass of *White Port* or *Lisbon Wine*: outwardly, it is good to Anoint parts afflicted with the Gout, Sciatica, Rheumatism, &c. As also to help the Headach, proceeding from a cold and moist cause, being Anointed upon the Part. And applied to the Piles or Hemorrhoids, it gives present ease, and in a short time after Cures them.

XXXI. *The Fixed or Elementary Salt, made by Incineration and Elxiviation.* Taken from 10 Grains to a Scruple, or half a Dram, it is an Antidote against the Scurvy, and purifies the whole Mass of Blood and Lympha, effectually carrying off the Recrements of those Fluids by Urine. It may be given in Wine, in a cold and moist habit of Body: but in a hot and dry Constitution,

it ought to be given in a thin sort of Water Gruel. If a Scruple or half a Dram of it be mixt with a large Spoonful of Juice of Limons, and so given to one that is affected with an extream Vomiting, it stops it upon the spot: It gives ease in the Strangury, provokes Urine potently, and expels Sand, Gravel, and Tartarous Mucilage, from the Reins, Ureters, and Bladder.

CHAP. DCCXLV.

Of WORMWOOD Roman:

OR,

PONTICK.

I. **THE Names.** It is called in Greek *Ἀλθύον* *althyon*; in Latin *Absinthium Romanum*; *Absinthium Ponticum*, by almost all Writers. In English, *Roman Wormwood*, and *Pontick Wormwood*.

II. **The Kinds.** We observe but three Species, viz. 1. *Absinthium Romanum vulgare*; *Absinthium Ponticum commune*: Our common Roman, or Pontick Wormwood. This by many is judged to be the true *Absinthium of Pontus*, which *Di-scorides* and *Galen* do so much commend. 2. *Absinthium Ponticum verum*, *Absinthium Ponticum Montanum Bauhini*; *Absinthium Montanum Camerarij & Tabernemontani*: who also calls it *Romanum Absinthium commune*, *sive Alpinum Gernerij*, *Absinthium tenuifolium Ponticum Galeni Gerardo*: The true Roman Wormwood. 3. *Absinthium tenuifolium Austriacum Clusij*, & *Italicum*, (because it has been found to grow in several Parts in Italy.) *Absinthium Ponticum Tridentinum Herbariorum Lobelio & Lugdunensi*: Fine Leav'd Pontick Wormwood, or Austrian Wormwood.

The Descriptions.

III. The first, or our common Roman or Pontick Wormwood. The Root from a short Head, shoots forth many long Fibres into the Earth, by which it is nourished; and sends forth divers Sprouts round about it, by which it much encreases. It is a small low Herb, with much more slender and short Stalks than the next: on which grow very small and fine short hoary white Leaves, smaller and finer than those of the fine Southernwood; which grow at several Joints, many coming forth together: at the tops of the Stalks grow small yellowish Flowers, neither so many nor so great, as those of the next. The smell hereof is faint, and far weaker than in the next to be Described; and the Taste thereof much less bitter.

IV. The second, or true Roman Wormwood. Its Roots are smaller, less Woody, and fuller of Fibres, than those of our Common Wormwood in the last Chapter: It has also more slender and shorter Stalks, by a Foot at least, than that of our Common Wormwood, and reasonable large Leaves, yet smaller, and more finely cut in and divided than it, but as white and hoary both Leaves and Stalks. The Flowers are also of a pale yellow color, standing upon the small Branches in the same manner: so that excepting it is smaller every way, and in each part, it is altogether like to our Common broad

Wormwood { Roman: } true.
 { Or, }
 { Pontick }

broad Leav'd Wormwood. Its smell is something Aromatical sweet, and its bitterness is not so great.
V. The third, or fine Leav'd Pontick, or Austrian Wormwood. It has a long slender, and Fibrous

Wormwood Pontick fine Leav'd.

Root, spreading it self under Ground, which sends up many small, hard, stiff, and hoary Stalks, on which are set, without order, small and somewhat long, and hoary Leaves, very like to the Leaves of Marsh Wormwood; which Stalks are divided towards their tops, into many other small and slender Branches, rising from the Joints where the Leaves do grow, with many small Heads, which give forth many small whitish Flowers.

VI. The Places. They are Italian, Austrian, and Hungarian Plants; but for their excellent Virtues sake, have been Transplanted into our Country, where now they are Nurst up in Gardens.

VII. The Times. They all Flower in July and August; in which Times they ought to be Gathered, and carefully laid up for Medical uses.

VIII. As to their Qualities, Specification, Preparations and Virtues, they are the same with those of our Common Wormwood, in the former Chapter; and therefore no more need be said of them here. But this is to be Observed, that our Common sort in the former Chapter, is the most Potent and Effectual to all the Purposes to which any of those may be applied.

C H A P. DCCXLVI.

OF WORMWOOD, Sea or Marsh.

I. THE Names. It is called in Greek *Ἀλφίθιον* *Alphithion*; *Ἀλφίθιον* *Alphithion*, & *Σερπίθιον*: in Latine *Absinthium Scaberrimum*, and *Scripium*; *Absinthium Maritimum*, & *Marinum*: in English, *Marsh Wormwood*, and *Sea Wormwood*.

II. The Kinds. Authors give us 4 or 5 sorts of this Plant, but not being Common with us, we shall only Treat of such as Grow in our Salt Marshes, or are Nurst up in our Gardens, viz.
1. *Scripium Anglicum*, *Absinthium Scripium*; *Absinthium Maritimum* vel *Marinum*: Our common English Marsh Wormwood. 2. *Scripium album*, *Absinthium Marinum album*: White Marsh Wormwood.

The Descriptions.

III. The first, or our English Marsh Wormwood. Its Root runs something deep, yet spreads it self in the Ground, being composed of many large Strings and small Fibres. It rises up with many hoary round woody Stalks, two Feet or more high, being well furnished and repleat with a vast number of white hoary long and narrow Leaves, rather broader and longer than any Southernwood Leaves, having a small bitterish Taste, and a very pleasing strong Smell. The Flowers are small and yellow, standing at the tops of the Leaves and Branches, which afterwards give very small Seed.

IV. The second, or white Marsh Wormwood. Its Root is tough, woody and stringy, creeping far abroad, by which means it very much encreases. It has tough hoary white Stalks 2 or 3 Feet high, which a little spread out into Branches. The Leaves are winged, several small narrow ones (not very long) set upon one middle Rib, which seem to be divided as it were into many jags, not altogether so large as the True Roman Wormwood, of a bitter Taste and pleasant Smell, of a very white

8 A 2 hoariness:

Wormwood Marsh.

Belonging to Sect. III.

hoariness: on the tops of these Stalks and Branches, grow small yellow Flowers not much unlike the former.

Wormwood Sea or Marsh, white.

V. *The Places.* The first grows in the Salt Marshes in many places of England. I found it growing in the Salt Marsh by the Rivers side, running along the South side of the Town of Lyn Regis in Norfolk, on the South of that Field called the Fryers; and in several other Salt Marshes near that Town. And is plentifully found in the Salt Marshes in Holland, Flanders, and other of the Low Countries. The other is found on the Sea Coasts of Germany and Italy; and in some of the Salt Marshes of England: Those Salt Soils overflowed by the Sea, are their Native places of growth; but being Transplanted into our Gardens, they thrive as well as if they were Natural to them.

VI. *The Times.* They Flower and Seed in the same Times, in which all the other Wormwoods do.

VII. *The Qualities.* They are hot and dry in the second degree, Aperitive, Absterfve, Stomackick and Alexipharmick.

VIII. *The Specification.* They have all the Virtues of the Common and Roman Wormwoods, but not half their strength and force in their Effects. But by reason they are not altogether so bitter, they are more acceptable to the Nicer sort of Palates. They resist and expel Poison, and gently Purge the Belly.

IX. *The Preparations.* All the Preparations which are made of Common Wormwood, may be made of the Marsh Kinds; yet these three are the most usual, viz. 1. A Liquid Juice. 2. A Decoction in Wine. 3. A Cataplasim.

The Virtues.

X. *The Liquid Juice.* Taken to 2 or 3 Ounces in Veal Broth in the Morning, it gently loosens the Belly, and kills small Worms in the Stomach and Guts.

XI. *The Decoction in Wine.* Taken from a quarter of a Pint to half a Pint, it resists and expels Poison, chiefly that of Hemlock: but the Juice given in Wine for that purpose, much exceeds the Decoction: But the Decoction is good against all Pains of the Stomach and Liver; for which purposes the Marsh, exceeds even the Common Wormwood.

XII. *The Cataplasim.* The green Leaves made into a Pultise by beating them with Figs, Nitre finely powdered, and Darnel Flower; and applied to the Belly, Sides, and Flanks, are said to be good for such as are Splenetick, or are troubled with the Dropsy.

C H A P. DCCXLVII.

of W O R M S E E D.

I. *THE Names.* I find not by what Greek Name it has been called; but in Latin it is called *Sementina*, *Semen ad Lumbricos*, *Semen Lumbricorum*; and in English Wormseed.

II. *The Kinds.* We make two sorts hereof, viz. 1. *Semen Transmarinum*, Foreign Wormseed, and this is called *Santonicum*; *Semen Santum*; *Semen Santonicum*; *Abstinij Santonici Semen*; *Sementina*; *Abstinium Santonicum Alexandrinum*; *Abstinij peregrini Semen*, Shop Wormseed, and Wormseed Wormwood. 2. *Sementina Anglica*; *Semen ad Lumbricos Anglicum*; *Camelina*; *Myagrum alterum amarum*, English Wormseed. To these

these I think good to add, 3. *Myagrum Sylvestre*, *Pseudomyagrum*; *Linaria quinta Tragi*; *Sesuma Tragi*, Wild Gold of Pleasure, or Oily Seed. The Seed of this 'tis true, when perfectly ripe and dry, has no Bitterness in it, but is Sweet and very pleasant, and a most acceptable Food to small Birds, as *Finches*, *Linnets*, and the like; but both Herb and Seed while they are green, have an unaccountable Bitterness beyond Expression, and therefore whilst it is Green, it is used as *Wormseed*, and will indeed do the same thing.

The Descriptions.

III. The first, or Shop Wormseed. It has a plentiful Stringy and Fibrous Root, spreading it self far and deep in the Ground; from whence rises up a little short Stock, which afterwards spreads it self out into many Stalks, and smaller

Wormseed Transmarine: Or, *Santonicum*.

Ramifications, insomuch that it is very full of Branches, but with very few Leaves, and those very small, and finely cut at the bottom, of an Ash color; but stored so plentifully with Seed upwards, that it seems to be there without Leaves, and wholly to consist of Seed, which as *Rauwolfius* says, are somewhat bitter in their Natural Places, and of a reasonable lively and quick Smell with us, especially if they be fresh and not old; but are indeed much stronger where they grow, and are but newly gathered.

IV. The second, or English Wormseed, (which *Gerard* calls Treacle Wormseed.) Its Root is small and Woody, perishing every Year after Seed time, and then rising again of its own Seed. It grows with pretty tall upright Stalks, branching themselves out towards the top, and thicker set with long narrow green Leaves than the next, somewhat like to those of the Single Wall-flower, but smaller, and of a whiter green color, and at the tops of the Stalks and Branches, come forth many very small

Wormseed English.

pale yellow Flowers, consisting of 4 Leaves apiece, very like to those of *Leucoium Sylvestre*, or Wild Single Wall-flower, but much smaller, even by more than half; which being past away, after them come small long Cods, containing within them a very pale colored Seed, of a very bitter Taste.

The other Wormseed English.

V. The

V. The third, or Wild Gold of Pleasure, the other English Wormseed. It has a long slender Root, with some Strings and Fibres adjoining to it. It comes up with but one round Stalk almost a Yard high, which spreads it self out into Branches or Arms, which have long and somewhat narrow Leaves, yet almost twice as broad as the former, sharp pointed, something resembling those of Woad, but that these are longer, and broad at bottom, where they compass the Stalk about, with two points sticking out on either side, at whose tops come forth several whitish Flowers, very like to those of Flax, after which come forth small round Heads, with a small point at the top, very like in fashion to the Myagrum with one Seed; but these are full of small yellowish Seed, like to that of Cresses, which whilst it is green and fresh, is exceeding bitter, tho' not so after it is full ripe and dry.

VI. The Places. The first grows in Arabia, Syria and Palestina, from which places the Seed is brought to us. The second grows Wild in many places of England, which being brought into a Garden, and there suttred to Sow its Seed, it will come up again Yearly of its self. The third grows in Germany, and is much found in all their Flax-Fields and Grounds, which being in Stalk like it, is accounted a Weed, and cast away; but some save the Seed to give to small Birds, on which they will feed when it is perfectly ripe, and peck it from the Stalk.

VII. The Times. The first Flowers late in the Year, but I think the certain time is not set down by any Author: The other two Flower in June and July, and their Seed is ripe in August and September.

VIII. The Qualities. They are all hot and dry as Authors say, in the third degree.

IX. The Specification. They are only, or chiefly used to kill Worms in the Belly, for which they have been found very effectual.

X. The Preparations. The Seeds of these Plants are only used, being taken either whole, or a little bruised.

The Virtues.

XI. The Seed of the Santonicum. It is given a Scruple at a time Evening and Morning to Children, either in a few Raisins stoned, or in the Pulp of a Roasted Apple or Pear, or in a Stew'd Prune, or in Honey. It kills Worms in the Stomach and Belly; but if a little Aloes or Rhubarb be mixed with it, the Worms will then not only be killed, but they will likewise be expelled withal. And if the Seed be mixed with Aloes, and brought to the form of an Emplaster with Ox-Gall, and applied to the Stomach and Navel, it is said to do the same thing.

XII. The English Wormseed. If it is bruised, and given from a Scruple to a Dram, Night and Morning as the former, in any proper Vehicle, and then wash'd down with a Draught of Water-Gruel, Broth or Posset-Drink, it is said effectually to kill Worms in the Stomach and Entrails, of what kind soever, it being often enough repeated.

XIII. The other English Wormseed, or Seed of the Wild Gold of Pleasure. This is to be taken bruised whilst it is Green, and whilst its inherent Bitterness is yet with it. It may be given from a Scruple to a Dram, as the former are given, and is much more effectual than them both, being continued Morning and Night for some time. This by reason of its exceeding Bitterness, I am afraid few Children can be obliged to take it.

C H A P. DCCXLVIII.

of WOUNDWORT.

I. THE Names. All the Woundworts being All-heals, they have one and the same common Greek Name, which is Πάραξ, & Παράξι; in Latin Panax, or Panaces; and in English All-heal, or Woundwort.

II. The Kinds. There are several sorts of these Woundworts, many of which we have already treated of in Chap. IX, X, and XI. CL. and CLI. foregoing of this Work; there are some few remaining, which we shall discourse of in this Chapter, and they are, 1. Πάραξ ἑρκυλίου ἀλκήος: παράξις ἑρκυλίου ἀλκήος: Panax Heracleum verum, Panaces Heraclea vera, The true All-heal or Woundwort of Hercules. 2. Πάραξ τοῦ Χείρου, Panaces Chironis; Panax Chironis: Panax Aureum, Panaces Aurea, Panax Chironium Theophrasti, Herba Doria vulgaris, (from one Doria a General of an Army, who ordered it to be applied to the Cure of his Soldiers Wounds;) All-heal, or Woundwort of Chiron. 3. Panax Chironium Americanum minor, Herba Doria Americana minor, The lesser American Woundwort. 4. Panax Aureum Nemorum, Panaces Aurea Nemorum; Consolida Aurea Nemorum; The Golden All-heal or Woundwort.

The Descriptions.

III. The first, or true Hercules All-heal or Woundwort. Its Root is very thick, fat, and full of Juice, of a white color, ramified into several great or considerable Branches. It has many broad green Leaves

Woundwort, or All-heal of HERCULES.

Spread

spread upon the Ground, or growing near to it, very rough and hairy, but of an over-worn green color, deeply cut in, into 3 or more parts, not much unlike a Fig-Leaf, or those of the Cow-Parshiep, each standing on a long Footstalk, which as well as the Leaf is somewhat rough or rugged. From among which, rises up a very strong Stalk, covered over with a rough hairiness, 4 or 5 Feet high, (Gerard says 4 or 5 Cubits high, which may be in a Rich Soil, and its Native Climate,) having upon it such like Leaves as grow below, but lesser and lesser. It is divided (in some Plants) into several Branches, and sometimes it has only but one Head, the tops or top of which Branches or Stalk, have upon them one large Tuft or Umbel of yellow Flowers, set together in a Rundle, like those of Dill, which turn into Seed, large, flat, and of a Straw color, sharp and hot in Taste, and of a pleasing Flavour. From this Plant being Wounded, it is probable that that valuable Gum called Opopanax, does proceed, which is brought to us out of Syria, and the Parts adjacent, to their Mart Towns, as Alexandria, Cairo, Damasco, and some others. But others say, that the Gum Opopanax, is produced from the Panax Heracleum alterum, described in Chap. X. of this Book foregoing. I will not dispute the contrary, 'tis probable that they may both produce a like Gum, difficult to be known asunder, (because their Juices seem to be of one and the same color,) and both called by the same Name.

IV. The second, or All-heal, or Woundwort of Chiron, called also Doria's Woundwort. The Root is not so great as the Plant would seem to have, but with its larger Branches has many Fibres proceeding from its Head, which together take strong hold of the Earth, not dying in the Winter, but

Woundwort, or All-heal of Chiron Common.

coming up fresh again every Spring. It has many great, thick, fleshy, long, deep green Leaves, almost as long as Dock Leaves, but thicker, sharper at the points, smaller at the lower ends, and broader in the middle, somewhat harsh or hard in handling. From among which, rises up but one great furrowed Stalk for the most part, about a Mans height, on which grow very sparingly, two or three such Leaves as grow below, but smaller. At the tops of which, and of its Branches, come forth a great many yellow Flowers, in green scaly Heads, like those of Knapweed, greener than those of Golden Rod, or of Saracens Confound, which when they are ripe, are blown away with the Wind.

V. The third, or lesser American Woundwort. Its Root is composed of many blackish Fibres, long and spreading in the Ground. This Plant is so like the former in appearance, that it cannot but be ac-

Woundwort American.

counted a Species thereof: It abides green all the Winter, (as the former does.) Its Leaves are thick, somewhat long and narrow, but not half so great as the former, and of a paler green color, else for the Fashion, very like them. The Stalks which are many, not rising to half that height, are round, and for the most part lean a little on one side, not being able, by reason of the multitude of Flowers to stand upright; which Flowers stand upon longer and greater green scaly Heads, than those of Chirons foregoing, and are also greater, and more laid open, with many small, long, narrow Leaves, which turn into a white Mossy Down, and are carried away with the Wind.

VI. The fourth, or Golden All-heal, or Woundwort. Its Roots are many small white Fibres, like unto the Daisies, whose Taste is somewhat sharp and Aromatical, and Astringent or Binding withal.

This

This Golden Herb, has several long, narrow, and sharp pointed Leaves, coming forth from the top of the Root, very like to Chirons, or Doria's Woundwort, but not so great, yet thick like them, and of a darker green color. The Stalks rise not so much above a foot high, having here and there narrower long Leaves on them than below. The Flowers which stand at the tops, are larger than those of the former, having many narrow, long, yellow Leaves, and when open, like a Star-Flower, with Thrums in their middles.

VII. *The Places.* The first is a Native of Syria, and was brought from thence to Italy: It grows in the Kingdom of Naples as Matthioli says, on the Alpine Hills, and on the Sea Coast of Siena, but with us is Nurst up in Gardens. The second grows as Lobel says, near the Banks of Rivers in Provence, and Narbone in France. The third in some parts of Florida in America. The fourth in thick Woods near Orleans in France; but with us, these three last are Garden Plants.

VIII. *The Times.* The first Flowers in September, and sometimes towards the end of that Month. The second and fourth Flower in June and July, and the third in August, none of them much earlier or later.

Hercules's Woundwort, or All-heal.

IX. This Plant, as to its *Qualities, Specification, Preparations and Virtues*, as also the *Opopanax* proceeding therefrom, have the same with those of the other *Hercules's All-heals*, discoursed of at large in Chap. X. of this *History of PLANTS* aforegoing; so that the *Properties* being every way the same, we shall say no more of them here, but refer you thither.

Of Chirons, and Golden Woundwort, or All-heals.

X. *The Qualities.* It is hot and dry in the third degree, Absterfve, Astringent, Vulnerary and Alexipharmick.

XI. *The Specification.* Its chief use is for the curing of Green Wounds, and to expel the Poison, and cure such as are bitten by Vipers, Mad Dogs, and the Spider *Phalangium*, and other Venomous Creatures.

XII. *The Preparations.* You may have therefrom, 1. A Liquid Juice. 2. A Decoction in Wine or Water. 3. An Insolated or Decolled Oil. 4. A Balsam. 5. A Powder. Parkinson says, that this is in a Medium between the *Confound*s, as *Saracens Confound*, and the *Golden Rod*, and therefore that this needed no farther Repetition or Amplification of its *Virtues*. However, we think fit for the Publick Good, to add the following *Sectiō*ns.

The Virtues.

XIII. *The Liquid Juice.* Given inwardly, from 2 Spoonfuls to 4, or more, in a Glass of Red Sypprick Wine, it is good against inward Bleedings, Bruises, or Ulcers in the Bowels, Reins or Bladder; and continued for some time Morning and Night, it contributes to the healing of all recent Wounds, running Sores and Ulcers; as also the Bitings of Vipers, Mad Dogs, *Phalangium*, or of any other Venomous Creature, in what part of

the Body soever. It is profitable against Spitting and Pissing of Blood, the Bloody Flux, and all other Fluxes of the Bowels whatsoever.

XIV. *The Decoction in Water or Wine.* It has all the former *Virtues*, but as it is weaker, so it may be given Dulcified from a quarter of a Pint to half a Pint. Injected into Fistula's, it cleanses them, and induces their healing. Sweetened with Honey, and injected into the Yard, it cures a Gonorrhoea in Men, &c.

XV. *The Insolated or Decolled Oil.* Anointed upon the Bitings of Vipers, Mad Dogs, the *Phalangium*, or other Venomous Creatures, it cures them, provided the Patient at the same time, takes the Liquid Juice, or Decoction inwardly.

XVI. *The Balsam.* It heals simple green Wounds many times at once dressing; it also digests old Sores and eating Ulcers, cleansing, incarnating, and drying them, thereby inducing a speedy healing.

XVII. *The Powder of the Herb.* It has all the *Virtues* of the Juice and Decoction, and may be given from 2 Scruples to 2 Drams, Morning and Night, in a Glass of the Decoction, for all the purposes afore said. Outwardly applied in a plentiful manner, upon old running Sores or Ulcers, it cleanses them, dries up the Flux of Humors, incarnates, and causes a speedy healing.

C H A P. DCCXLIX.

Of WRACK-SEA:

O R,

ALGA MARINA.

I. *THE Names.* It is called in Greek *φύκος θαλάσσιον*; in Latin *Phycor*, or *Phucus*; and *Fucus marinus*, to distinguish it from *Fucus verba*, which is *Anchusa*, or *Alkanet*; and *Alga marina*: in English *Sea Wrack*, or *Sea Weed*.

II. *The Kinds.* Tho' Authors make near 20 sorts of these Plants; yet we shall Discourse only of these 6 following, viz. 1. *Fucus marinus gramineus*, *Alga marina graminea*; *Fucus marinus alter Dodonei*; *Palea marina* by those of Montpellier, being used by them for Litter for their Cattle, and the best sort of Dung for their Fields; *Alga angustifolia vitrariorum Baubini*: (because in the Levant or Mediterranean, they Burn it for Pot-ashes, whereof they make Glass.) *Grafs Wrack* or *Sea Weed*. There is also a broader sort of it, called *Fucus giganteus*, and *Palmifolium giganteum*, by Imperatus. 2. *Fucus marinus Crassus latifolius*: Broad thick Sea Wrack or Girdle. 3. *Fucus marinus latissimus tenuifolius*: Broad and thin Sea Wrack, or Girdle. 4. *Fucus marinus angustifolius, vel secundus Dodonei*; *Alga marina angustifolia*; *Fucus Zoster Lugdunensis*; *Fucus longo Angusto* & *Crasso Folio Baubini*: Narrow long and thick Sea Wrack, or Girdles. 5. *Fucus marinus Ferulaceus Lobelii*; *Muscus marinus Ferulaceus*, *Alga marina Ferulacea*: Long Fennel-like Sea Wrack, or Sea Moss. 6. *Alga tintoria Lugdunensis*, *Fucus marinus tintorius Lugdunensis*; *Muscus marinus tintorius*: Dying Sea Wrack, red Dying Sea Moss; the Dyers Wrack, with which they Dye deep Crimson, or reddish Purple, which will last long.

The

The Descriptions.

III. The first, or Grass Wrack, or Sea Weed. Its Roots are roundish and hairy, and blackish on the outside: From whence rise up small round and white hairy Heads, breaking out at the sides as it were into Branches; on the tops whereof, stand 3 or 4 very long and narrow soft green Leaves, some

WRACK-SEA Grass:
O R,
Sea Weed Grass.

being 4 or 5 Feet or more long, and about an Inch more or less broad. It has neither Stalk nor Seed, but lies on the Ground till the Tide raise it on the top of the Water; which being broken off by the force of the Waves, is carried to the Shore, where it is Gather'd, and kept for many things.

IV. The second, or broad thick Sea Wrack, or Girdle. This differs from the former, in that the Root is wholly Fibrous; the Stalk rising from thence thick and round, 2 or 3 Inches high, and the Leaf, which is sometimes but one, (very seldom two) of a very great length, sometimes 6, 8, or 10 Feet, or divers Ells long, and above 4 Inches broad; equal from a little above the setting on to the end, but somewhat waved or crumpled on the edges, being thick, and of a deep green color: so soft or moist whilst it is fresh, that it is almost like to soft Glew; and will hardly dry, unless it lies long in the Sun, and will not be fit to be kept, till after many Days drying.

V. The third, or broad and thin Sea Wrack, or Girdle. This is in all things like the last, saving that the Leaves are thinner, broader, and shorter; yet crumpled or waved on the edges, and of a paler green color; which when dried, is almost like unto thin Parchment.

VI. The fourth, or narrow long and thick Sea Wrack, or Girdles. Its Root is round and flat, from whence spring 2 or 3 narrow thick Leaves, about a Foot and half long, divided into several flat, thick Thongs like Leather, some long, and some shorter; and they again divided into other smaller and longer ones, almost like a Bush.

VII. The fifth, or long Fennel like Sea Wrack, or Sea Moss. The Leaves hereof are very long and fine, like to those of the Ferula, or Fennel Giant, growing from Stalks near a Foot long, which

Wrack or Moss Sea Fennel like.

are divided into many Branches, at whose tops, white Flowers and the said Fennel like Leaves grow. Its Root is manifold, sometimes a Yard, 2, or 3 long, and slender, extending and creeping much about.

VIII. The sixth, or Dying Sea Wrack, or red Dying Sea Moss or Alga; the Dyers Sea Wrack. It rises up with 4, 5, 6, or more Stalks, 4, 5, or 6 Inches high, each Stalk spread out into some few Branches, each of which are well repleat with a sort of fine Leaves on them, not much unlike to Fennel, of a reddish color, but with some whiteness mixed together. This is used by divers sorts of Mechanics, to strike a deep Crimson color, or reddish Purple Dye; which will not quickly nor easily decay, but last long.

IX. The Places. Most of these are found on our English and Scotch Coast; but they are also found in the Levant or Mediterranean Seas; and Coasts of other warmer Climates.

X. The Times. They perish not in Winter, but their chiefest time of Beauty, Use, and Gathering, is in the Summer Season, and latter end of Summer.

XI. The Qualities. Sea Wrack is cold in the first Degree, and dry in the second; Astringent, and Anodyn.

XII. *The Specification.* Being Applied whilst they are fresh, they allay Heat and Inflammations, ease the Gout, stop Vomiting, and strengthen the Stomach; and to cleanse, dry, and heal, old running Sores, and old Ulcers.

XIII. *The Preparations.* You have, 1. *The Sea Wrack in substance, either green or dried.* 2. *A Decoction of the Dying Sea Wrack.* 3. *A Powder of the same.*

The Virtues.

XIV. *The Sea Wrack in substance of the first five Kinds.* Whilst fresh and green, being Applied as a Cataplasm to the Gout, they abate the Inflammation, ease the Pain, and remove the Dis-ease, and whilst strengthen the Part; but when dry, their chief use, by the *Venetians*, our Selves, and others, is, instead of Hay or Straw, to pack up Glasses, and other tender Vvares, to keep them from breaking: they are also used as Litter for Horses. And being made into a Compost, are an excellent good Manure for Barren and worn out Lands. *The first of them*, which is found in the *Mediterranean Sea*, is also of use to make a kind of *Pot Ashes*, of which *Glass* is made in those Countries; as also *Soap*: But the same *Wrack*, found in our *Northern Seas*, will do no such thing; as not containing so excellent a Salt, nor so large a quantity of it, as that does which is Gathered in the *Levant*.

XV. *The Decoction of the red Dying Sea Wrack, or Sea Moss.* It strengthens the Stomach, is good against the Poison of Vipers, mad Dogs, and other venomous Creatures, and to resist the Longings of Women with Child: It cools, dries, binds, and is good against all Fluxes of the Belly, and also kills Worms in Children: and in the Gout, being fomented therewith hot, it eases the Pain: dropt into the Eyes, it eases their Pain, and allays their heat and inflammation. If it is made with Wine, it stops Vomiting, and admirably strengthens the Stomach. Injected up the Womb, it is good against the Overflowing of the Terms, and the Whites in Women; and after due Purgings, cures a *Gonorrhœa* in Men; and injected into the Bladder in Men, it is good to cleanse and heal Ulcers in the Neck thereof: dose from a quarter to half a Pint, Morning and Evening. *The Decoction in Water*, makes an admirable Dye, whereby Silk, Linnen, Leather, and many other things, may be Dyed and Stained of a most glorious deep Crimson, or a singular reddish Purple, which will not easily fade, or become dull, but abide in its Beauty for a long time.

XVI. *The Powder of the red Dying Sea Wrack, or Sea Moss.* It has all the Virtues of the foregoing Decoction, being taken inwardly Morning and Night, from half a Dram to 2 Drams; mixed first with a little Syrup of *Clove Gilliflowers*, or of *Citron Peels*, or some such like, and then mixed with a Glass of *Red Port Wine*, and so drank. Taken also with Wine mixed with Vinegar, or Syrup of Limons, it is a singular thing against Vomiting, Loathing of Food, and weakness of that Bowel, for it strengthens it after a singular manner: Applied also outwardly, to old running Sores and purid Ulcers, it cleanses them, dries up the Afflux of Humors, and induces their healing. And given in VVine, it is said to be good against the Stone in the Reins: Injected with *Red Port Wine* into the Yard and Bladder, it is good to heal Ulcers in the Neck thereof, and to cure a virulent *Gonorrhœa*, Universals being first Premised.

C H A P. DCCL.

Of YARROW Land, or Milfoil.

I. **T**HE Names. The *Arabians* call it *Ëgilos*: but in Greek it is called *Στεφανίτης* & *Χαρί-φύλλα* &c, *Stratiotes Chiliophyllus*: *Ἀγαλλία* & *ανδρακίς* *Dioscoridis*; *Achillea Sideritis* of *Dioscorides*: in Latine, *Millefolium*; *Millefolium Militaris*; *Achillea*, *Achillea Sideritis*: and in English, *Yarrow*, *Milfoil*, and *Achilles Woundwort*. Many Authors say that *Millefolium* and *Achillea*, are one and the same Plant, and the same Herb which one Author calls *Millefolium*, another calls *Achillea*: Others say, that *Chiliophyllum*, or *Millefolium*, is the general Name, and that *Achillea* is the proper Name to one of the particular Species; but be that how it will, it is certain that all the *Yarrows* have been called by many Authors, by both the Names indifferently; tho' the Name *Achillea*, has by late Writers, been chiefly applied to our *fifth Species* following.

II. *The Kinds.* It is not our business here, to enumerate all the Kinds of *Yarrows*, entreated of by Authors, for as much as the greater part of them are perfect Strangers here, we shall only discourse of such as are familiar with us, most known, and which are only or chiefly used in Physick, which are the five following, viz. 1. *Millefolium album vulgare*, *Millefolium album minor*; *Stratiotes Millefolia*, *Stratiotes terrestris*, *Achillea*, *Achillea Militaris*: Our Common White Yarrow. 2. *Millefolium album majus Bauhini*, *Lugdunensis* & *Matthioli*: The Greater White Yarrow. 3. *Millefolium rubrum vulgare*, Our Common Red Flowered Yarrow. 4. *Millefolium Flore rubro maximum Clusii*; *Millefolium maximum*; The Great Red Yarrow. 5. *Millefolium Nobile Tragi*; *Stratiotes vera*; *Stratiotes*, & *Stratiotes Millefolia Gesneri*; *Millefolium Nobile*, & *Achillea Tabernemontani*; *Achillea Cordi*, *Lacuna*, *Matthioli*, *Achillea Nobilis odorata*; *Achilles's Noble Woundwort*, so called from *Achilles* the General of an Army, who applied it for the Curing of his Soldiers Wounds.

The Descriptions.

III. The first, or our Common White Flower'd Yarrow. Its Root consists of many long white Fibres or Strings, spreading far about and deep. It has many Leaves spread upon the Ground, which are long and winged, finely cut into many small parts, exceeding the fine Leaves of Tansie. From among which, rise up 2 or 3 round green Stalks, with such like winged Leaves upon them as grow below, but smaller and finer as they approach up to the tops; where come forth many small Flowers which are white, and set in a Tuft or Umbel close together, each Flower consisting of 5 small round pointed Leaves, with a little yellowish Thrum in the middle, smelling somewhat strong being rubbed in the Hand, but not unpleasant. Where Note, That there is some Varieties observed in the Flowers, some being more white than others; some also thicker set together; and some either greater or smaller than others.

IV. The

Yarrow Common.

IV. The second, or Greater White Yarrow. This in its Roots, form of the Leaves and Flowers, and manner of growing, differs not much from the

Yarrow White, Great.

former; saving that the Stalks and Leaves of this are larger, its green Leaves being as large almost as those of Tanfie; the Flowers also being greater, and standing in a larger Umbel; the Smell of which is a little stronger than ordinary.

V. The third, or our common Red Flower'd Yarrow. This differs in nothing, neither in Root, Stalks, Leaves, Flowers, nor manner of growing from the first, or our Common White sort, but only in the color of the Flowers, these being of a deeper or paler red, or almost of a bluish color, the Thrum in the middle being yellow.

VI. The fourth, or Great Red Yarrow. It has as great, and as large Winged Leaves, as the great White Yarrow, (at Sect. IV. above,) but more finely cut in on the sides. The Stalks are as great and as high, Branching forth at their tops, and stored with large Umbels of red Flowers like unto them, saving that they are of a fair, bright, reddish color, and in some paler, with pale yellow Thrums in their middles, which have a pleasing, but small Smell.

VII. The fifth, or Achilles's Noble Woundwort. This Woundwort, or Yarrow of Achilles, has a long, thick, and creeping Root under Ground, which perishes every Year after Seed time. It has many large, thin, or fine cut Leaves lying next the Ground, more finely and deeply cut in, into the middle Rib, and each part divided also, which makes it so differ something from our first Common Yarrow. From among these Leaves, rise up more and taller Stalks, with divers finer Leaves set thereon; and at their tops many Flowers in Tufts together, being both more in number, and larger than our first Common Yarrow, of a whitish or reddish color, with a yellow Thrum in the middle. The whole Plant Smells very sweet.

VIII. The Places. The four first grow all in England; the first and third of which, are very common. The fifth is a Stranger with us, being only Nurst up in Gardens, and requires a fat Ground and rich Soil.

IX. The Times. They all Flower from the beginning of June, to the end of Summer, viz. till near Bartholomew-Tide.

X. The Qualities. They are cold in the first degree, and dry in the end of the second, or beginning of the third, Altringent, Glutinative, Anodyn, and Vulnerary.

XI. The Specification. They stop Bleeding at Nose or other parts; the Bleeding of Wounds, Pissing Blood, Bloody Flux, and all other Fluxes of Blood, inward or outward. Stop the Courses in Women, and are good to Cure all Simple Green Wounds in a very short time, by drying them, and consolidating their Lips. They ease the Tooth-ach, give help in the Colick, and cure the Gonorrhoea in Men, and Whites in Women, Universals being premised.

XII. The Preparations. You may have therefrom, 1. The Cleansed Green Root, or Green Leaves. 2. A Liquid Juice. 3. An Essence. 4. A Decolion in Wine or Water. 5. A Powder of Leaves and Heads of Flowers. 6. An Oil by Insolation. 7. A Balsam. 8. A Cataplasm. 9. A Distilled Water.

The Virtues.

XIII. The Cleansed Green Root, or green Leaves. Being chewed in the Mouth, and held against the Teeth for some time, it is said to give ease in the Tooth-ach.

XIV. *The Liquid Juice.* It stops all inward Bleedings what ever, as Spitting and Vomiting Blood, Bloody Flux, Pissing of Blood, the Overflowing of the *Loches* and Terms in Women; and all Fluxes of the Belly whatsoever, being taken from 1, to 3 or 4 Spoonfuls at a time, Morning and Night, in a Glas of Red Spanish or Port-Wine. Outwardly also applied, it stops the Bleeding at Nose, and Bleedings of Wounds. Taken to the quantity aforesaid, in some of the *Distilled Water*, (Universals being premised,) it cures a *Gonorrhæa* in Men, and the Whites in Women, and other Weaknesses of the Womb. If dropt into the Eyes, it takes away their Inflammation, eases their Pain, and cures their Redness, being Blood-shot. Injected into *Fistula's*, it cleanses them, and induces their healing. Taken to three or four Ounces in Wine, it is a good Remedy against Agues, and for such as are troubled with Nauseousness or Vomiting, and cannot retain their Food in the Stomach: It ought to be given 2 or 3 Hours before the Fit, to be continued till the Ague is gone, and yet still to be repeated for 5, 6 or 7 times afterwards: It stops Bleeding at Nose also, being Snuffed or Injected up.

XV. *The Effence.* It has all the Virtues of the Juice exalted, and therefore may be given in a lesser Dose, viz. from 1 to 2 Ounces, or two Ounces and a half, Morning and Night, in any proper Vehicle. If given in a *Gonorrhæa*, or the Whites, a little Powder of Amber, or *Catechu*, or both of them may be added; and so it may be given against Pissing of Blood, and the Overflowing of the Terms in Women.

XVI. *The Decoction in Wine or Water.* It has all the Virtues of the Juice or Effence, and therefore may be given from a quarter to half a Pint. It is a good Lotion for old running Sores, putrid Ulcers, and inveterate *Fistula's*.

XVII. *The Powder of the Leaves, and Heads of Flowers.* It has the Virtues of the Juice, Effence and Decoction. Dose from half a Dram, to a Dram and half, in some proper Vehicle, as *Mithridate*, *Venice Treacle*, &c. Outwardly applied, it presently stops the Bleeding of Wounds, &c. If the Powder inwardly given, be mixed with half a Dram or 2 Scruples, of fine *Bole* or *Catechu*, it will be so much the more effectual against inward Bleedings, &c.

XVIII. *The Insolated Oil.* It gives ease in the Gour, and other Neutrick pains; and anointed upon the Head, comforts the Roots of the Hair, and hinders its shedding or falling.

XIX. *The Balsam.* It digests, cleanses, incarnates, glutinates and dries, and therefore is of singular use, not only to heal and cure simple Green Wounds, but also old running Sores, putrid Ulcers, and rebellious *Fistula's*, being seasonably and Artfully applied.

XX. *The Cataplasim.* Applied immediately upon a simple recent Contusion, it discauses it, and presently eases the pain. Applied to a Bleeding new Wound, it stops the Flux of Blood; and in the Gout of Hands or Feet, it presently gives ease.

XXI. *The Distilled Water.* It has the Virtues of the Juice, Effence and Powder, but nothing near so effectual; and tho' it may be used in all those cases alone, or Dulcified, yet it is more often used as a Vehicle, to convey some of the other Preparations in down the Throat. Mixt with Honey, it is a good Ophthalmick, helps redness and Inflammations in the Eyes, and cures Sores or Ulcers in the same.

C H A P. DCCLI.

of Y A R R O W Water.

I. *THE Names.* It is called in Greek *Μυριόφυλλον*, *Muriophyllon*, from the vast abundance of Leaves which it has, as it were a *Mulion*. as the word imports: in Latin *Myriophyllum*, and *Millefolium Aquaticum*: in English *Water Yarrow*, and by some *Water Fennel*.

II. *The Kinds.* Authors have made near a dozen Species of this Plant; but we shall only present you with what are Common to us, which are, 1. *Μυριόφυλλον* *Dioscoridis* & *Galenis*; *Millefolium aquaticum vulgatus*; *Millefolium aquatile Dodonæi*; *Millefolium aquaticum umbellatum Capillaceo brevique folio Bauhini*: Our common *Water Yarrow*. 2. *Millefolium aquaticum Violare*; *Myriophyllum alterum Matthioli* & *Lugdunensis*; *Myriophyllum equisetifolium fluviatile Lobelij*; *Viola aquatilis Dodonæi*: The Violet *Water Yarrow*, (by some the *Water Gillflower*, and *Water Violet*.) 3. *Millefolium aquaticum flore albo Clusij*; *Millefolium aquaticum feniculatum*, vel *feniculifolio*; *Millefolium aquaticum Ranunculi flore* & *Capitulo*; *Millefolium Maratriphyllum flore* & *semine Ranunculi aquatici Hepaticæ facie Lobelij*: *Crow-foot*, or *Fennel Leav'd Water Yarrow*.

The Descriptions.

III. The first, or our Common *Water Yarrow*. Its Root is somewhat long, white, and slender, with divers fibres adjoining to it. It rises up with a round straight Stalk, having divers long winged

Yarrow Water, Common.

Leaves.

Leaves at the bottom of it, cut and divided into many fine small Leaves, set on both sides of a middle Rib, like unto the Land Yarrow, but much tenderer, and with as fine Leaves almost as Fennel it self. At the Stalk likewise grow such fine Leaves up to the top, where stand on Branches, large tufts of small white Flowers set close together.

IV. The second, or the Violet VWater Yarrow. Its Root is very small and creeping, shooting forth Fibres in many places, and a Bunch of Fibres at its end: From which rise up several long winged Leaves, consisting of many small Leaves, set on each side of a middle Rib, which are larger and greater than those of the former, of a sad green color. The Stalk, or Stalks, which rise up among them, are bare of Leaves from the bottom to the upper joints,

Yarrow Water Violet.

whereabout grow divers small whitish and sweet Flowers, something like to Stock Gilliflowers, or Violets, of 5 Leaves apiece, one row above another, with yellowish Threads in the middle. There is another sort hereof very like it, but that it has larger Wings, and finer jagged Leaves.

V. The third, or Crowfoot, or Fennel Leav'd VWater Yarrow. It has a long slender Root, with a Fibrous bush or tuft at its end. It is a lesser Herb than any of the former, growing only in shallow Waters, where it seldom rises above an handfull high, with very many, and very fine short Leaves, as small as Camomil, and of a yellowish green color. The short Stalks among them, bear single small white Flowers, resembling the VWater Crowfoot, both in the Flowers, and in the finer Leaves, but has no broad Leaves at bottom, as the VWater Crowfoot has: it bears also a head of Seed after the Flower is past, very like to those of Crowfoot, viz. a small bunch of Seeds set close together.

VI. The Places. The first grows very plentifully about London, even in the VWater, and in

Yarrow Water Crowfoot.

Belonging to Sect. 5.

many other Parts of England: and so do the other two, in Plafhy and VWater places; but the last grows only in the VWater, especially being shallow.

VII. The Times. They all Flower from the middle of Summer to the end, viz. from the middle of June to the middle of September, if the Season is warm.

VIII. The Qualities. They are all cold in the first Degree, and dry in the end of the second, Astringent, Glutinative, and Vulnerary.

IX. The Specification. They cool, allay inflammations in VVounds and Ulcers, are good against inward Falls and Bruises, help the Strangury, and give ease in the Tooth-ach.

X. The Preparations. You may have therefrom,

1. A Liquid Juice. 2. A Decoction in Wine. 3. A Mixture. 4. A Balsam. 5. A Cataplasm.

The Virtues.

XI. The Liquid Juice. Given from a Spoonful to 2 Spoonfuls or more, mixt with a little Vinegar, it is good against inward Bruises coming by a fall from some high place; and so mixt, being held in the Mouth, it eases the Tooth-ach.

XII. The Decoction in Wine. It has the Virtues of the Juice; and fomented upon inflamed VVounds, it abates the Inflammation, and eases the Pain: Taken with a Scruple, or half a Dram of Salt of Tartar, it opens Obstructions of the Urinary Passages, and gives ease in the Strangury.

XIII. The Mixture. Take of the Decoction 8 Ounces; Spirit of VVine, an Ounce and half; Nitre in fine Pouder, 3 Drams: mix and dissolve. Used as a fomentation, and as a Wash, or Lotion, it gives

gives ease in old painful running Sores and Ulcers, allays their Inflammations, digests, cleanses, incarnates, and heals them.

XIV. *The Balsam.* It digests and cleanses admirably all running, putrid or filthy, and foul running Sores and Ulcers; and with the Mixture foregoing, quickly incarnates and heals them.

XV. *The Cataplas.* Beaten up with Nitre in fine Powder, adding thereto a little Wine Vinegar, and bringing it to a consistency with Barley flower, and to applied to a Simple recent Contusion, it discusses it, hinders the Inflammation, and takes away a hot Fluxion if present: It discusses hot Tumors also, eases Pain, and is truly profitable against the Gout.

CHAP. DCCII.

of YUCCA; HIUCCA;

OR,

CAZAVI.

I. *THE Names.* It being to us a Plant of new Invention, it cannot be supposed to have any Greek or Latine Name, but it is called by the Indians *Hiucca*, *Jucca* and *Yucca*; also *Mandioca*, *Manibot*, and *Cazavi*; many, or all of which Names, are brought into the Roman Tongue; and the last, viz. *Cazavi*, or *Casavi*, is made English.

II. *The Kinds.* It is divided into the True and Supposititious. The True *Yucca*, or *Cazavi*, is 1. *Hiucca*, five *Yucca*, five *Mandioca Genuina Mexicana*, *folijs Cannabinis*, The True Indian *Cazavi* or *Yucca*, Hemp-Leav'd. 2. *Hiucca*, five *Yucca*, five *Hetich Americanum*; The Mallow-Leav'd Indian *Cazavi*, or Potatoe-like *Cazavi*. 3. *Yucca*, *folijs Aloes*, five *Yucca India putata*, The Supposititious Indian *Cazavi*: This is not the True *Yucca*, or *Cazavi* of *Oviedus*, *Thevet*, and others, of which the Bread *Casavi* is made, as *Monardus* has plainly demonstrated; for the True *Yucca* is the Hemp-Leav'd *Yucca*, first Named, its Leaves being divided into 7, 8, or 9 parts, standing on long Footstalks, as immediately will be declared.

The Descriptions.

III. The first, or True Indian *Yucca*, or *Cazavi*. It has a pretty great long Root, as great as that of a large Carrot, brown on the outside, and very white within, also Sappy, and full of a juicy fleshy Substance. This Root is Planted every Year, or every other Year, and quickly grows to be very great or large, and long withal. From this Root Springs forth one or more woody Stalks, of 4, 5, or more Feet high, growing up to be as it were a small Shrub. Upon the Stalks grow many fair broad Leaves, each upon a long Footstalk, and divided into 5, 6, 7, or more parts, or single Leaves as it were, not much unlike to Helleboraster, or Hemp-Leaves, (whence it has part of its Name,) which Leaves are about 6 Inches long, two Inches or more broad, not indented, but even about the edges, and abiding always Green. The Stalk is divided into divers unequal Branches, bearing many pretty large Flowers, Spotted a little; they are narrow at their bottoms, long and sharp pointed, and are in number six, white on the inside, but of a dead brownish white color on the outside; so that it is a Flower of no great Beauty, and is only to be esteemed as an Exotic rarity.

IV. The second, or Mallow-Leav'd Indian *Cazavi*, or Potato-like *Casavi*, or *Yucca*. This has a Root 5, 6, 7, 8, or 9 Inches long, and sometimes longer, great and thick at its top, and sharp pointed at the bottom, very like to those of the great long Turneps: This Plant is of two sorts, viz. one which is yellowish, and another which is white, when they are Boiled or Baked into Bread. From the top of this Root, springs forth many long, slender, tender weak Branches of Leaves, some of them being very long, and some much shorter; some not a half, and some not a third part of the length of the longer Stalks of Leaves. These Stalks have each of them at their extremities, one large Leaf, much larger than those which grow below them, about the middle, or other parts of the Stalk, which are not a quarter part, and many times not an eighth part, or tenth part of the Magnitude of the great Leaf at the end of the Stalk; all which, both greater and smaller, are roundish, with some resemblance of a Mallow-Leaf, whence come part of the Name. These Stalks of Leaves are so weak, that the longer of them never grow upright, but always trail upon the Ground, and the very shortest of them lean much, never growing perfectly upright, but in a declining posture.

V. The third, or Supposititious Indian *Casavi*. It has a great thick, and withal long tuberous Root, spreading it self out in time, into many other Tuberous Heads, from whence shoot forth many long, bard, and hollow, or narrow guttered Leaves, of a

Yucca Supposititious.

thick Substance, sharp edged, and sharp pointed, encompassing one another at the bottom, of a grayish green color, abiding fresh continually, or seldom falling away, with several hard Threads running in or thro' them length-ways, which when withered, become pliant withal, to bind things up with. From the middle of this Bunch of Leaves, springs up a strong round Stalk, and that every Year,

Tear, in the Native Places of its Growth, (but not every *Tear* with us, in our Colder Climates;) which Stalk spreads its self out into several Branches, on which grow divers Flowers, somewhat large, and hanging downwards, consisting of six Leaves, with divers Veins, of a weak reddish or bluish color, spread on the back of the three outward Leaves, from the middle to the bottom, but not reaching to the edge of any Leaf. These Flowers abide not long, but quickly fall away, without bearing any Seed in our Cold Countries.

VI. This Plant is thus described by Gerard. It has a great Root, thick and Tuberous, very knotty, and full of Juice, which is somewhat sweet in Taste, but of a Pernicious Quality. From which Root, rises up immediately very many Leaves round the head thereof, the Stalks of which are about a Cubit long, hollowed like a Gutter or Trough, very smooth, and of a green color, like unto that of Woad. The edges of the Leaves are sharp, like the edge of a Knife, and of a brown color. The point of the Leaf is a Prickle, as sharp as a Needle; and the whole thereof being well viewed, is not much unlike to a Wherry, or some such like Boat. These Leaves are also very tough, hard to break, and not easie to be cut, except the Knife be very sharp. To this Description, Johnson upon Gerard also farther adds, In some Tears (says he,) it puts forth a pretty stiff, round Stalk, some three Cubits high, divided into divers unequal Branches, carrying very many pretty large Flowers, shaped somewhat like those of Eritrillaria, but that they are narrower at their bottoms; the Leaves of the Flower are six in number, which are of a white color on their inside, but on the outside, of an over-worn reddish color, from the Footstalk to the midst of the Leaf; so that it is a Flower of no great Beauty, but is only esteemed for its rarity.

VII. The Places. The two first grow in moist places of America, from Florida to Peru, and about the Straights of Magellan, as also in the Islands of the Ocean, as in Jamaica, Barbadoes, and others of the Caribbee and Leeward Islands, even in those places where they had Maize, or Indian Wheat. The third or last of them, grows also in all, or most places in the West-Indies, where the two former grow, from the Southern parts of Brazil and Chili, to the Cape of Florida; and in most of the Canabal Islands, and other Countries near adjacent to them; as likewise in our English Plantations, as in Virginia, Maryland, New-England, &c. as it is constantly affirmed.

VIII. The Times. The Seasons wherein the first and second Flower and Seed are uncertain, and thereof Authors have said nothing. The third or last, Flowers about the middle or latter end of July, the Flowers falling away within a little time after they have been blown open; but as for its Seed, it has never been observed to come to perfection with us. As to its Leaves, Gerard says that they kept Green both Winter and Summer, in his Garden, without any covering upon them to defend them, notwithstanding the injury or infelicity of our cold Climate.

IX. The Qualities. Of these sorts of Plants, the Roots are only of use. The Juice of the first is hot and dry in the fourth degree; Volatile in the highest degree, and Deleterious or Poisonous; and so is the Root it self, if eaten whilst it is fresh and moist; but when dry, or reduced into Flower, it is temperate in respect to heat or coldness, dryness or moisture, being perfectly free from any Venene or malign Quality, and fit for Food and Nourishment of the Body. The Juice of the

second, is affirmed by some to be free from any Poisonous or hurtful Qualities, whereas others say, it has the same Deleterious Qualities with the first. I know nothing of it by Experience, but if the Root is of the nature of Spanish Potatoes, as is affirmed, it must be Innocent enough; and the Root it self, answers to all the Intentions of the first Plant. The raw Juice of the third, is said to be Deadly, or very dangerous, like to the Juice of the first. Aldinus relates, that a Wound made in his Hand by the sharp Prickle or point at the Leaf's end, gave him such intolerable Pains as almost Distracted him, (which shews the Malignity of its Subtil and Volatile parts,) and that he could have no ease till he applied his own Balsam thereto, which cured it. But the dried Root, or the Flower thereof, is innocent, temperate as to heat or cold, and dry in the first degree, fit to make Food of, in like manner as the former.

X. The Specification. Authors have ascribed no Virtues to these Plants; but if we may make an Estimate of them, from the consideration of their Roots being received as Food, and nourishing Mankind, making him to increase in Substance and Strength; it is rational to believe that they are restorative in Consumptions, comfort and refresh weak and decayed Nature, accordingly as they may be applied to those purposes: And as they are of a drying Quality, so they may be Afringent, and so be profitable to stop Fluxes of the Bowels; this we speak as to the Root it self. And as to the Juice, when it is well prepared, so as to be divested of its Deleterious and Poisonous Qualities, it may be of excellent use to allay the heat of Fevers, quench Thirst, cure sore Mouths and Throats, and the like; as also to cheer and refresh the Vital Spirits, when opprest and weakened thro' Cares, Afflictions, Melancholy, Perturbations of the Mind, or any present Heterogene matter depressing them.

XI. The Preparations. You may prepare from the Juices of all these Plants, but especially from the Juice of the first of them, 1. A Drink. 2. A Vinogar. 3. A Rob or Sapa. And from the dried Root, 1. A Flower. 2. Cazavi, or a Fine White sort of Bread; the like of which may be prepared from both the second and third sorts also.

XII. An Observation. That the Juice of the first of these Plants, (if not of the other two) is an Egregious Poison, Experience, as well as the Testimony of Authors, has sufficiently ascertain'd; and that it is a Poison of that indubitable Efficacy, that it certainly Kills in a very short time after the taking of it; whilst the Root it self when dried, and the Juice when sufficiently boiled, have not the least of any such Qualities in them; the daily Eating and Drinking of them for many scores of Years, have assur'd us that they have no malign or hurtful Qualities in them, but absolutely on the contrary, are Conservatory to the Health, Strength and Life of Mankind, which seems to be a kind of Paradox, since other Poisons, neither drying, boiling, nor even burning, can alter their innate Properties. The like is to be said of Opium, that the Powder of that Succulent Gum being gradually dried, has not the least Deleterious property in it, (what ever it had before) but on the contrary, instead of making Sick at Stomach, causing Vomittings, Convulsions, Faintings and Swoonings (as it has done in multitudes of People,) does restore and comfort the Tone of the Stomach, cheer and enliven the Patient, and profligates the present Evil beyond all that possibly it could do, whilst it retained within it, its Native Deleterious humidity; this is a Note worthy of Observation.

XIII. It may then be demanded how these things come to be freed from those their Deadly Qualities? To which I answer, That their Poisons are Volatile, highly Volatile, Volatile even in the highest degree; which by the means of the heat of the Fire, or Subtil Attractive properties of the Air, are made to evaporate, and fly away, and so clear the remaining parts of the matter, and make it absolutely free from any hurtful or evil Quality; whereas had that Poison been fixt, and essentially incorporated into the substance of the matter, every Particle thereof would have had the same Properties, nor could any Evaporation, drying, or even burning it self, have alter'd it, but that it would have been inviolably the same, as long as it could conserve it self in the World; of which Truth, 2nd matter of Fact, many Examples are easse to be given.

The Virtues.

XIV. *The Drink.* It is made of the expressed Juice of the Root; which when it is new press'd out, has an evil Smell, and of such hurtful Qualities, that whosoever should taste of it, whether Man or Beast, dies without Remedy, and that quickly. The rind of the Root is first pared away, then the Root it self is either scraped, or broken into small bits, and bruised; after which, it is put into a Hair Cloth or Bag, or some other proper Strainer, and is expressed by the help of a Press, &c. This Juice they take, and boil it half away, which afterwards by a very gentle Fermentation, becomes a good, wholesome, and pleasant Drink, like to a middle sort of Ale. It quenches Thirst admirably, cools in Fevers, more especially if the Juice of a Limon or Orange is squeez'd into it: It clears the Spirits, refreshes the Viscera, and resists the malignity of putrid and pestilential Diseases. If made very sweet with Honey, it makes an excellent Gargarism for a sore Mouth or Throat, and to cleanse and heal Ulcers in those parts.

XV. *The Vinegar.* It is made of the expressed Juice, by setting it in the Sun till it becomes acid, and as sharp as the best Wine Vinegar. Authors say, that the Vinegar made hereof, is full as good as that which is made of Wine. It cools in Fevers, and quenches Thirst, and is admirable against malign and pestilential Diseases. It may be made into a Syrup with Honey, or double refined Sugar, which drank mixt with Water, or other proper Liquid, cools singularly, any heat or Inflammation of the Viscera, opens Obstructions of the Lungs, and causes free breathing. It likewise heals all sorts of Sores, Cankers, and Ulcers of the Mouth and Throat, cleansing and drying them; and also alleviating any Inflammation in those places.

XVI. *The Rob or Sapa.* It is made of the Juice boiled to the thickness of new Honey. When it is so Boiled, to such a Consistency of a Quiddeny, it is (as Authors say) as sweet as Honey. Of this, a kind of Mead may be made, by mixing it with Water in the same proportion, as you use of Honey, when you make Mead thereof. But if the quantity of this Rob or Sapa, be half as much more, it will make the Drink so much the stronger, and more pleasant withall. It is a pleasing sort of Liqueur, to

drink in hot Weather, to refrigerate or cool, and quench Thirst.

XVII. *The Flower of the Root.* It is made by expressing the Juice, and then drying the remainder; after which, it is reduced to a fine and Subtil Flower, either by Grinding it in a proper Mill, or by beating it in a Mortar, and continually Sifting it, till the whole Mass is reduced to such a Subtil Consistency. Some only slice the Root into very thin Slices, which they set edge-ways, so that the Juice may drain out of its own accord, and continue it so standing till it is thro' dry; after which, they break it into small bits with their fingers, and then either by a proper Mill, or by beating in a Mortar, reduce it to fine Flower as aforesaid. Of this Flower with Milk, Eggs, &c. they make Cakes, Pan-Cakes, Puddings, Cheese-cakes, &c. as 'tis usually done with Wheat Flower, which are very sweet, Palatable, good and nourishing, and very suitable to the Bodies of Human kind.

XVIII. *Cazavi, or the Bread.* It is made of the foregoing fine Flower with Water, or rather New Milk, either alone, or adding Yeast, Eggs, or whatever may make the Bread light and pleasant; which they form into little, thin, small Loaves at Pleasure, and so gently Bake them; which Bread seems to be almost as white as Snow. This whilst it is New, is very pleasant, palatable, and agreeable to the Stomach, and what the nicest Appetite will not refuse. And when Stale, very good and pleasant, tho' not so taking as when it is New: But I have eaten of it when Stale, (being about 5 or 6 Months old,) and to me it seemed to be full as good as any of our Wheat-Flower Bread, of four or five days old. This Bread Authors say, will abide and keep good for a very long time. Some make their Bread thus. They take the Mass of the Root, from whence the Juice is press'd, which they put into an Earthen Pan, and set it over the Fire to make it grow thick; then being dry, they beat it into Powder: This Powder they moisten with Water, and form it into small Cakes or Loaves, which they dry in the Sun, and then keep them for use. These little Cakes or Loaves, will keep good for a long season, even twenty Years without corrupting, and give good Nourishment to the Body.

XIX. Of this Root, the Americans, or West-Indians in many places, (tho' they had Maiz, or Indian-Wheat in great plenty,) did make their Bread, on which they Lived, after the former manner, and that (as they say,) for some hundreds of Years; which Bread was used by all the People of America, from the most Southern parts of Chili and Peru, even to the Northern parts of Florida, or New-England.

XX. *The way and manner of Planting and Propagating it, is this.* Of the first sort or kind, they cut off a Stalk about a Foot long, which they put more than half way into the Ground, where it suddenly takes Root, and within a Year or little more, the Root comes to be sufficiently great, and fit to be taken up for the uses aforesaid. The second kind is Planted from the Root cut into many pieces, each piece having some of the outside thereon: These pieces they put each into a hole in the Earth, made fit for them, which in a Years time or less, grow to their just Magnitude, and are fit for taking up, and to be prepared for Food.

Finis, 25 Decemb. 1708.

THE END.

Index PLANTARUM.

Note, The Number denotes the Chapter.

A.

Acorus true, Flag Sweet Smelling, *Acorus verus*, *Acorum*, Chap. 265.

 Drop-wort, *Filipendula, Oenanthe*, 231.
 Narrow Leav'd, ——— *Angustifolia, Oenanthe Apij folijs*, 232.
 Hemlock-like, ——— *Cicutæ facie, Oenanthe Cicutæ facie*, 233.
 Water, *Filipendula Aquatica, Oenanthe Aquatica*, 234.
 Ducks-Meat, *Lens Palustris, Lenticula Aquatica*, 235.
 Dwale, Nightshade Deadly, *Solanum Letale, Solanum Deleterium*, 521.
 Dyers-Weed, Weld, Wold, *Herba Lutea, Luteum Vitruvij, Lutea Plinii, Luteola*, 236.
 Dyers Green Weed, *Genista tinctoria, Genistella Infectoria, vel tinctoria*, 237.

E.

- Earh-Balls, *Tuber, vel Tubera Terre*, 238.
 Deers, *Tuber Cervinum*.
 Earth-Nuts, Ground-Nuts, *Agriocastanum, Balbo-castanum, Nucula Terrestris*, 239.
 Pease, *Pseudoapios, Terra Glans, pl. Glandes; Glandes Terrestris, vel Pisane*, 240.
 Wood, *Lathyrus Sylvestris, Astragalus Sylvaticus*.
 Eddo of Carolina, *Aron Aegyptium, Pseudocolocasia*, 241.
 Elder Dwarf, Danewort, *Ebulus, Chamæadæ, Sambucus Humilis*, 242.
 Elecampane, *Enula, Enula Campana, Helenium*, 243.
 Endive Garden, *Intubus, Endivia, Endivia Hortensis*, 244.
 Wild, ——— *Sylvestris*, 245.
 Broad Leav'd, — *Campesfris latifolia*.
 Eryngo, Sea-Holly, *Eryngium, Centum Capita*, 246.
 Eyebright, *Eufragia, Eufrafia, Ocularia, Ophthalmica*, 247.
 Woody, ——— *Lignosa, — Pratenfis rubra*, 248.

F.

- Featherfew, *Febrifuga, Matricaria, Parthenium*, 249.
 Wild, — *Agrestis, — Sylvestris*, 250.
 Fel-wort, Gentian, Bitterwort, *Gentiana*, 251.
 Fenny-Stones, Marsh-Palms, *Serapias, Orchis Palmata, Orchis Palmata palustris*, 251.
 Fennel Common, *Feniculum, Marathrum*, 252.
 Sweet, ——— *Dulce*, 253.
 Wild, Horse-Fennel, ——— *Sylvestre*, ——— *Agrestis, Hippomarathrum*, 254.
 Sea, *Crithmum Feniculum Marinum*, 616.
 Hogs Sulphur-wort, ——— *Porcinum, Pen-cedannum*, 255.
 Fennel Flower, *Gith, Nigella, Melanthium*, 410, 519.
 Fœnugreek, *Fœnum Græcum, Siliqua, Silicula Varionis*, 256.
 Wild, — *Sylvestre*, 257.

Fern

Index Plantarum.

- Fern Male, *Filix mas*, 278.
 Female, Brake, ——— *Femina, Nymphaeopteris*, 279.
 Oak, — *Quercus*, vel *Quercinus*, 260.
 Oak Creeping ——— *Repens*, *Dryopteris repens*.
 White, *Dryopteris alba*.
 Black, *Onopteris mas*.
 Rock or Stone, ——— *Saxatilis, Chamaefilix Filix pumila*, 261.
 Water, Osmundroyal, *Filix florida, Filix Aquatica*, vel *palustris*; *Osmunda Regalis*; *Filicestrum*, 262.
 Fig Bean, Lupine, *Lupinus*, 459.
 Field Cypress, Ground Pine; *Chamaepitys*, *Iva Arthritica*, *Abigo*, 330.
 Figwort, *Scrophularia*, *Ficaria*, *Millemorbia*, 263.
 Great Foreign, ——— *major peregrina*.
 ——— *absque Tuberculis*, 264.
 Filipendula, Dropwort, *Filipendula*, *Oenanthe*, 231.
 Finger Orchis, Serapias Stones, *Orchis Serapias*, 298.
 Fitch, Vetch, Tare, *Alhuc*, *Vicia*, 683, 732.
 Five Leav'd Grass, Cuckfoil, *Pentaphyllum*, *Quinquefolium*, 130.
 Flag, Corn Flag, *Gladiolus Segetalis*, *Vilforalis rotundus*, 154.
 Flag Sweet Smelling, True Acorus, *Acorus verus*, *Acorum*, 265.
 Water, Skeg, *Acorus palustris*, *Pseudoiris*; *Iris lutea palustris*; *Acorus Adulterinus* vel *notus*; *Gladiolus luteus*, 266.
 Flax, Line Manured, *Linum*, *Linum Sativum*, 267.
 Wild, — *Agræstis*, — *Sylvestris*, 268.
 Purging, Mil Mountain, *Linum Catharticum*, — *Catharticum Anglieum*.
 Flax-Weed, Toad-Flax, *Linaria*, *Pseudolinum*, 269.
 Besom, *Oxyris*, vel *Scoparia Italorum*.
 Bastard, *Pseudolinaria*.
 Broad Leav'd, *Linaria*, vel *Oxyris Latifolia*, 270.
 Creeping, *Pseudolinum repens*; *Linaria pumila*, 271.
 Fleabane Greater, *Conyza major*, 272.
 Lesser, *Conyza minor*, — *Femina*, 273.
 Dwarf, *Conyza pumila*, *Chamaconiza*, 274.
 Water, ——— *palustris*, ——— *Aquatica*, *Consolida palustris*, 275.
 Fleawort, *Psyllium*, *Pulicaria*, *Herba-pulicaris*, 276.
 Flixweed, *Sophia Chirurgeonum*, — *Paracelsi*, *Thalictrum*, 277.
 Flower of Constantinople, *Lychnis Byzantina*, — *Chalcedonica*, — *Constantinopolitana*, 280.
 Flower Gentle Great, Velvet-Flower Great, *Amaranthus magnus*, 278.
 Small, ——— *parvus*, 279.
 Variable, ——— *Tricolor*, *Gelofia*.
 Golden, *Chrysocome*, *Stachas Citrina*.
 Flower-de-Luce Bulbous unmatchable; *Iris Bulbosa impar*, 281.
 Bulbous English, *Iris Bulbosa Anglica*, 282.
 Bulbous broad Leav'd, ——— *Bulbosa Latifolia*, 283.
 Bulbous Narrow Leav'd greater, *Iris Bulbosa Angustifolia major*, 284.
 Bulbous Narrow Leav'd small, ——— *Bulbosa Angustifolia minor*, 285.
 Flower-de-Luce Tuberos Turkey, *Iris Tuberosa Chalcedonica*, 286.
 Tuberos white Florentine, Florentine Orrice, *Iris Tuberosa Florentina*; *Iris alba Florentina*, 287, 533.
 Tuberosus broad Leav'd — *album*; Flag-Flower-de-Luce broad Leav'd, *Iris Tuberosa latifolia*, 288.
 Tuberosus Narrow Leav'd Greater; *Iris Tuberosa Angustifolia major*, 289.
 Tuberosus Narrow Leav'd smaller, *Iris Tuberosa minor*, 290.
 Dwarf Greater, *Chamaeiris major*; *Iris pumila major*, 291.
 Dwarf Lesser, *Chamaeiris minor*; *Iris pumila minor*, 292.
 Dwarf Grass, or Narrow Leav'd, *Chamaeiris Angustifolia*, 293.
 Flower-de-Luce Wild, Stinking Gladwin; *Ayris Iris Agrestis*, *Spathula Fœtida*; *Gladium Fœtidum*, 294.
 Fluelin, Speedwell Female, *Elatine*, *Veronica femina*, 295.
 Fly-Bane, Catch-Fly, *Muscipula*, *Viscaria*, 112.
 Fly-Stones, Fly Orchis, Bee-Flower, *Orchis Muscaria*, 296.

 Quinquenerve, Ribwort, Plantane Narrow Leav'd, *Plantago Angustifolia*, — *Quinquenervia*, 566.

R.

Radish Garden, *Raphanus* — *bortenfis*, 584.
 Wild, — *Sylvestris*, — *agrestis, Armoracia, Rapastrum album*, 585.
 Horfe, — *Rusticanus, Armoracia Plinij, Thlaspi magnum & majus Cordi, Thlaspi alterum Dioscoridis*, 586.
 Ragwort, James-wort, *Jacobaea, Herba Jacobi, Jacobaea Senecio Lobelij*, 587.
 Sea, *Marina, Cineraria Dodonzi*.
 Rampion, *Rapuntium, Rapunculus*, 588.
 Great, — *Spicatus*, — *Alopecuroides*.
 Wood, — *Nemorosus*.
 Horned, — *Corniculatus*.
 Wild, — *Sylvestris, Campanula minor*.
 Ramson, Bears Garlick, *Allium Ursinum, Allium latifolium, Moly Hippocraticum*, 589.
 Ramson Snake, *Allium anguinum, Ophioscoridon Lobelij, Allium montanum*, 589.
 Raket, Rocket, *Eruca*, 598.
 Rampe, Wake Robin, Cuckow-pint, *Arum*, 730.
 Rape, Turnep Garden, *Rapum, pl. Rapa*.
 — *Hortense*, 715.
 Wild, — *Sylvestre, Rapastrum*, 716.
 Rape-Seed, Cole Rape Garden, *Rapo Caulis, Caulo — Rapum*, 590.
 Wild, *Brassica Sylvestris*.
 Raspberry Plant, Hind-Berry, *Rubus Ideus*, 591.
 Field, or Dew-Berry, *Rubus Tricoccus*.
 Rattle Grass red, Red Loufe-wort, Red Cockscorb, *Pedicularis, Crifsa Galli, vel Gallinacea rubra, Pedicularis pratensis rubra*, 592.
 Reed-Burr, Sedge, *Xiphidion, Sparganium, Carex, Carex Ramosa, Sparganium Ramosum, Enscutellus, Gladiolus Ramosus*, 593.
 Reed-Grass, Bur-Reed, Sedge, *idem*.
 Reed Common, Reed Pool, *Calamus, Arundo*, 594.
 Cane, Cane Reed, *Arundo Donax, Calamus vel Arundo major*.
 Reed Mace, Cats-Tail, *Typha Aquatica*, 113.
 Red Ray, Darnel, *Lolium rubrum*, 211.
 Red Rot, Sun-Dew, *Ros Solis, Rosa Solis, Rorella, Salsifera, Rorida Lobelij*, 676.
 Rest-Harrow, Cammock; *Anonis, Arestia bovis, Remorum Aratri*, 109.
 Ribwort, Plantane long Leav'd; Quinquenerve, *Plantago angustifolia*, — *Quinquenervia*, 566.
 Rheubarb True, *Rba, Rhubarbarum verum, Rba Indicum*, 595.
 Pontick, *Rba Ponticum*.
 Bastard, *Pseudo Rba, Hippolapathum rotundifolium*.
 Rice, *Oryza*, 596.
 River-wort, Pond-weed, Water-spice; *Potamogeton, Fontalis*, — *Spicata*, 572.

Rie, Secale, Furrago, 597.
 Rocket Garden, *Eruca Sativa*, — *bortenfis*, 598.
 Roman, — *Sativa alba, Erucula major*.
 Of Florida, — *Floridana*.
 Wild, — *Sylvestris*.
 Wild Bastard, — *Sylvestris notha*.
 Water, *Eruca Aquatica*, 599.
 Sea, — *Marina*, — *palustris*.
 Roman Beans, Beans Kidney; *Phaseolus similis bortenfis*, 56.
 Roman Pease, Pease Rouncival; *Pisum Sativum magnum*, 548.
 Rose-Water, Water-Lilly, *Nymphaea alba, Nenuphar*, 542.
 Yellow, *Nymphaea lutea*, 543.
 Rose Winter, Hollyhock, *Malva arborea*, — *Rosa*, — *bortenfis*, — *major*, 569.
 Rose Rubie, Adonis Flower; *Eranthemum, flos Adonis, Adonis flore rubro*, 2.
 Rose-wort, Rose-Root, *Rhodia radix, Radix Rosea*, 600.
 Rose Bush Garden, *Rosa bortenfis*, 601.
 Sweet Briar, *Rosa Eglenetia*.
 Wild, or Briar Bush, *Rosa Canina*, 602.
 Rosmary, *Rosmarinus, Rosmarinum, Libanotis Coronaria*, 603.
 Rue Garden, Herb Grace, *Ruta bortenfis, Pegannum*, 604.
 Wild, — *Sylvestris*.
 Meadow, *Ruta pratensis, Ruta palustris, Thalictrum, Thalictrum*, 605.
 Goats, *Galega, Ruta Capraria*, 606.
 Rupture-wort, Burst-wort, *Herniaria, Herniola, Millegrana, Empetron Trogi*, 607.
 Rushes, *Juncus, pl. Junci*, 608.
 Common hard, *Juncus acutus vulgator, Oxycheneas*.
 Water, — *Aquaticus*.
 Bull Great, *Holofcheneas, Juncus grandis holofcheneas*.
 Bull Smaller, *Juncus levis panicula sparsa minor*.
 Rush-Nut, *Cyperus Edible; Trasi dulce, Cyperus dulcis esculentus, Cyperus esculentus, Cyperus nucens, Juncus nucens*, 609.

S.

Saffron Garden, *Crocus bortenfis & verus*, 610.
 Wild, *Crocus, Crocus Sylvestris*, 611.
 Vernal, or of the Spring, — *Vernus*.
 Autumnal, — *Autumnalis*.
 Saffron Meadow, *Colchicum, Ephemerum, Colchicum*, 612.
 English, *Colchicum Anglicum*.
 Greek, — *Illyricum*.
 Indian or Assyrian, — *Indicum, Syriacum*.
 Spring, — *Vernum*.
 Saffron Bastard, Saff Flower, *Carthamus, Cnicus, Carthamus*, 613.
 Garden, *Cnicus vel Carthamus Sativus*.
 Wild, Distaff-Thistle; *Cnicus, vel Carthamus Sylvestris, Atrachylis*.
 Sage Garden, *Salvia bortenfis*, 614.
 Green, — *major alba vulgaris*.
 Red, — *major rubra vulgaris*.
 Of Virtue, — *Virtutis, Salvia minor, Salvia nobilis*, — *angustifolia*.
 Wormwood, or Roman, *Salvia Absinthites, Salvia minor altera*. — *Romana*.
 Party colored, *Salvia variegata*.
 Sage Wild, *Salvia agrestis*, — *Sylvestris, Scordonia, Scordonia*, 615.
 Wood, or Garlick Sage, *idem*.

Accipitrino, *Hieracium*, Hawkweed.
— *rara*, — *incommunis*, Hawkweed rare.
Acedula, *Acetofa*, Sorrel.
Sylveftris, Field Sorrel.
Nemorialis, Wood Sorrel.
Acetabulum, *Cotyledon*, *Umbilicus Veneris*, Pennywort, Venus Navel-wort.
Acetofa, Sorrel, Garden Sorrel.
Acetofella, *Trifolium Acetofum*, Wood Sorrel.
Achillea, *Millefolium Nobile*, *Achillea Nobilis Odorata*, Yarrow Noble, *Achillea's* Wound-wort.
Acinaria paluftris, *Vaccinia paluftris*, Marsh Bilberries, Marsh Whortle Berries.

Acinus, *Clinopodium*, VVild Basil.
Acinus, *Ocimum Sylveftris*, VVild Basil.
Aconitum, *Luparia*, *Lycclonon*, VVols-Bane.
Hyemale, VVinter VVols-Bane.
Aconitum Bacciferum, Herb Chriftopher.
Acorus verus, Reed Aromatic, Sweet Smelling Flag.
Ale, *Sambucus*, Elder.
Alca Phniji, *Chameadde*, *Ebulus*, Dwarf Elder.
Aculeata, *Carduus Aculeofus*, *Polyacantha*, Thistle upon Thistle.
Acus Paftoris, *Scandix*, *Acus Veneris*, *Pellen Veneris*, Shepherds Needle.
Acus Mofchata, *Geranium Mofchatum*, Herb Musk, Muskcd Cranes Bill.
Acutela, *Arefa Bovis*, *Anonis*, *Remorum Aratri*, Reft Harrow.
Alar, *Erucentum*, *Zea*, *Spelta*, Gray VVheat, Spelt, Bread Corn.
Alantium, *Trichomanes*, *Capillus Veneris*, Maiden-Hair black.
Alantium Aureum, Golden Maiden-Hair, Golden Locks.
Agilops, *Felluca*, VVild Oats, Great VVild Oat-Grass.
Eginochus Plinij, *Lithofpermum*, *Milium Solis*, Gromell.
Ethiopis, Ethiopian Clary.
Agulochum, *Lignum Aloes*, *Xyloaloes*, VVood of Aloes.
Azuricus, *Agarick*, Mushroom of the Larch Tree.
Ageratum, *Eupatorium Mefses*, *Balfamita femina* Maudlin. 8 E *Agnus*

Index Latinus.

- Agnus Castus*, Chast Tree.
Agrifolium, Holly.
Agricolum, *Cardamine*, Cuckow - Flower,
 Ladies Smock.
Agrimonia, *Eupatorium*, Agrimony.
Agrimonioides, Agrimony Ballard.
Agrionanum, *Marjorana Sylvestris*, VVild Marjor.
Ajuga, *Chamaepitys*, Ground Pine.
 — *Maritima*, *Anthyllis altera*, Sea Ground Pine.
Aithales, *Sedum minus*, Lesser House-Leek.
Azoon, *Sedum*, *semper vivum*, House-Leek.
Atternus, Evergreen Privet.
Albinum, *Gnaphalium*, Cudweed.
 — *Impium*, VVicked Herb, VVicked Cudweed.
 — *Marinum*, Sea Cudweed.
 — *Americanum*, American Cudweed.
Albacum, *Aphodelus*, Afpodel.
Alcanna, *Anchusa*, Alkanet.
 Minor — *altera*, Lesser Alkanet.
Alcea, *Malva Verbenaca*, Vervain Mallow.
Alchymilla, *Stellaria Matthioli*, *Sanicula major*,
 Pes Leonis, Ladies Mantle.
Aga Marina, *Fucus Marinus*, *Muscus Marinus*,
 Sea VVrack.
Aga Tinctoria, *Fucus Marinus Tinctorius*, Dying
 Sea VVrack.
Alica, *Far*, *Zea*, *Spelta*, Gray VVheat; also a
 Pultage made thereof, called Frumety.
Alisna, *Primula veris major*, *Paralytis Herba*,
 Cowslip.
Alimonia, *Acetofella Nemoralis*, *Trifolium Aceto-*
 sium, VVood Sorrel.
Alkakengi, *Solanum Vesticarium* VVinter Cherry.
 — *Albi*, Carolinian VVinter Cherry.
Alkali, *Kali*, *Salicornia*, *Salsicornia*, Glass-wort.
Alcanna, *Phillyrea*, Mock Privet.
Alkermes, *Chermes*, *Kermes*, the Juice of the
 Chermes-Berries.
Allelaja, *Trifolium Acetosum*, *Acetosum Nemoralis*,
 Oxytriphylum, *Luzula*, VVood Sorrel.
Allaria, *Aluistrum*, Jack by Hedge, Sawcealone.
Allium, *Allium Hortense*, Garlick.
 — *Viperinum*, *Ophioscoridum*, Vipers Garlick.
 — *Sylvestre*, VVild Garlick.
Alnus, Alder.
 — *Niger*, Black Alder.
Aloe, *Aloes*, the Gum.
 — *Succotrina*, Succotrine or Fine Aloes.
 — *Hepatica*, Courfe or Ordinary Aloes.
Alopecurus, *Cauda Vulpis*, Foxtail Grass.
Alpine, Chickweed.
 — *Aquatica*, VVater Chickweed.
 — *Notha*, Ballard Chickweed.
Althea, *Malva palustris*, Marsh Mallow.
Alypum Monspelienfum, *Alypiaz*, *Herba Terribilis*,
 Herb Terrible, Gut-wort.
Alyssum, Mad-wort.
Anara Dulcis, *Dulcamara*, *Solanum Arborefcens*,
 Bitter Sweet, VVooddy Nightshade.
Amaranthus, Flower Gentle.
 — *Magnus*, Great Flower Gentle.
 — *Parvus*, Small Flower Gentle.
 — *Tricolor*, *Gelosia*, Variable.
 — *Aureus*, *Chrysocome*, *Stachas Citrina*,
 Golden Flower Gentle, Yellow Stachas.
Anarus, *Sampfucum*, Sweet Marjoram.
Amuracus, *Marjorana*, Sweet Marjoram.
 — *Latifolius*, Pot Marjoram.
 — *Sylvestris*, VVild Marjoram.
Ambrosia Hortensis, Oak of Cappadocia.
Ambrosia vera, idem.
Ambubeia, *Cichorea*, *Cichorium*, Succory.
Ameos, *Ammi*, Bishops-weed.
 — *Aromaticum*, Aromatick Bishops-weed.
 — *Alienum*, *Caminum Regium*, Foreign
 Bishops-weed.
- Amellus*, *Cultha palustris*, Marsh Marigold.
Ammi, *Ameos*, Bishops-weed.
Ammoniacum Gammii, Gum Ammoniac.
Anomum quorundam, the Fruit of the Cleve-
 Berry Tree.
Ampeloprasium, *Porrum Vitium*, Vine Leek.
Amgdalum, An Almond.
Anylum, White Starch made of Wheat.
Amyrberis, *Berberis*, Barbary Bush.
Anagallis, Pimpernel.
 — *Aquatica*, Water Pimpernel.
 — *Marina*, *Anthyllis latifolia*, Sea Pimpernel.
Anagallis aquatica, Brooklime.
Anagyris, *Laburnum*, Bean Trefoil.
Anacardium, *Elephantis*, Bean of Malacca.
Anchusa, *Alcanna*, Alkanet.
 — *altera*, Lesser Alkanet.
Andrachne, *Portulaca*, Puslain.
Androsamum, *Chymenum Italorum*, *Herba Siciliana*,
 Tutian, Park-Leaves.
 — *Hypericoides*, Tutian Johns-wort.
Androsace, *Fungus Marinus*, Sea Nivewort.
Anemone, *Herba Venti*, Anemomy, Wind-Flower.
Anethum, *Anetum*, Dill.
 — *Sylvestre*, Wild Dill.
Anctum Vaccinium, *Oculus Bovis*, *Buphibalmum*,
 Ox Eye.
Angelica Hortensis, Angelica.
 — *Aquatica*, *Archangelica*, Water Angelica.
 — *Sylvestris*, Wild Angelica.
Anguria, *Citrullus*, Citruls, Water Melon.
 — *Amara*, *Colocynthis*, Bitter Gourd.
Anisum, *Matabala*, Anise.
Anonis, *Aresta Bovis*, *Remorum Aratri*, *Aculeata*,
 Rest-Harrow.
Anserina, *Argentina*, *Tanacetum Sylvestre*, *Arge-*
 mona, *Argemonia*, *Potentilla*, Wild Tanche,
 Silverweed. (mil.)
Anthemis, *Chamaemelum*, *Chamomilla*, *Camomilla*, *Cam-*
 ambora, *Antithora*, *Napellus Alexipharmicus*, Hel-
 met Flower Antidote.
Antbos, *Flos vel flores Rosmarini*, Rosmary Flowers.
Anthyllis, *Leguminosa vulgaris*, — *lentifolius*
 Lobelij, Kidney Tare or Vetch.
Antirrhinum, *Oronchum*, Calves-Snout, Snap Dragon.
 — *Sylvestre*, Wild Snap Dragon.
Antithora, *Napellus Antivenificus*, Helmet Flower
 Antidote.
Aparine, *Aperugo*, Cliver, Goose Grass.
Aphaca, Small Yellow Vetch.
Aphace, *Vicia Sylvestris*, Wild Vetch.
Apios, *Raphanus Sylvestris*, Wild Radish.
Apiastrum, *Apiafellum*, *Melissophyllum*, *Aclutes*,
 Melissa, Bawm.
Apium Suxatile, *Petroelinum*, Parsly, Stone or
 Rock Parsly.
Apium Sylvestre, *Smyrnum*, *Hippocelinum*, Alex-
 anders, Horfe Parsly.
Apium, *Apium palustre*, Smallage, formerly Parsly.
 — *Aquaticum*, Smallage.
Apium Rifus, *Ranunculus Aquaticus*, Water Crow-
 foot, Laughing Parsly.
Apocynum, *Periploca*, Dogs-Bane.
 — *repens*, Climing Dogs-Bane.
 — *non repens*, *latifolium*, not Climing,
 Broad Leaved.
Aperonia, *Vitis nigra*, *Bryonia nigra*, Black Bryony.
Aquifolium, *Agrifolium*, Holly.
Aquolina, } *Columbine*.
Aquilegia, }
Arabis, *Draba*, Arabian Mustard.
Arachis, Great Wild Vetch.
Aralda, *Digitalis*, Fox-Glove.
Arantium, pl. *Arantia*, Orange, Oranges.
Archangelica, *Angelica Aquatica*, Water Angelica.
Arbutus, Strawberry-Tree. Arest.

Index Latinus.

Arestia Bovis, *Anonis*, *Remorum Aratri*, Rest-Harrow, Cammock.
Argemone, Bastard Wild Poppy, some take it for Wild Tanfie.
Argentina, *Potentilla*, Wild Tanfie.
Arifarum, Friars Cowle, Hooded Wake Robin, or Cuckow Pint.
Aristolochia, Birth-wort.
Arizo, *Oryza*, Rice, Carolina Rice is accounted the best in the World.
Armeria, *Armerius*, *Caryophyllus Sylvestris*, Sweet VWilliams.
Armoraria, VVild VWilliams.
Armoracia, *Raphanus Sylvestris*, VVild Radish.
Arnoglossum, *Plantago*, *Multinervia*, Plantane, — *Angustifolium*, Rib-wort Plantane.
Artemisia, Mug-wort.
Marina, Sea Mug-wort.
Arthanita, *Panis Porcinus*, *Cyclamen*, *Cyclaminus*, Sow-bread.
Arthritica, *Primula Veris*, *Paralytis Herba minor*, *Alisma Sylvestris*, Primrose.
Arum, *Sacerdotis Penis*, Wake Robin, Cuckow-pint.
Arum Egyptianum, Eddo of Carolina.
Arundo, *Calamus*, Reed, Pool Reed.
 — *Major*, *Calamus major*, *Arundo Donax*, Cane, or Cane Reed.
Asarum, *Perperis*, *Nardus Rustica*, Asarabacca.
 — *Sylvestre*, *Asarina*, VVild Asarabacca.
Ascalonitis, Scallions, One of the Kinds of Onions.
Asclepias Vincetoxicum, *Hirundinaria antiqua*, Swallow-wort.
Ascyrum, Peters-wort, Square Johns Grass.
Aspalathus, *Lignum Rhodium*, Rose VWood.
Asparagus Hortensis, Asparagus Garden.
 — *Sylvestris*, VVild Asparagus.
 — *Palustris* — *Marinus*, Marsh Asparagus.
Asperugo, *Aparine*, Clivers.
Asperula, *Apergula communis*, Woodroof.
 — *Flore Carulea*, Blew Flowered VWoodroof.
 — *Repens* — *Juncaria*, *Rubia linifolia aspera*, VWoodroof, Break-stone.
Asphodelus, Asphodel.
Asphodelus luteus, *Hastula Regia*, Kings Spear.
 — *Bulbosus*, *Hyacinthinus*, Onion Asphodel.
 — *Paluster*, *Pseudo Asphodelus*, VVild or Marsh.
Asplenium, *Ceterach*, Spleen-wort, Milt-waste.
 — *Verum*, *Ceterach*, True Spleen-wort, or Milt-waste.
Aster, *Eubonium*, *Inguinalis*, Star-wort.
Aster Atticus Italorum, Purple Italian Star-wort, or Purple Marigold.
Astragalus nothus, Milk Vetch.
Astragaloides Herbariorum, idem.
Astragaloides, Bastard Milk Vetch.
Astrantia, *Imperatoria*, Master-wort.
Asterion, *Aster Atticus*, Greek Star-wort, True or Yellow Star-wort.
Aster Conizoides, Flea-bane Star-wort.
Astoea, *Stachas*, *Stachados*, Cassidony, French Lavender.
Athanasia hortensis, *Tanacetum Sativum*, Tanfie.
 — *Sativum crispum*, Crisped Tanfie.
 — *Lanuginosum*, VVoolly Tanfie.
 — *Versicolor*, Party colored Tanfie.
Athara, A Putlage or Frummety made of Zea, or our Gray VVheat.
Atrachylis, *Cnicus vel Cartamus Sylvestris*, VVild Bastard Saffron.
Atraphaxis, *Atriplex*, Arach, or Orach.
Atriplex Hortensis, Garden Arach.
 — *Sylvestris*, VVild Arach, All-feed.
 — *Fetida*, Hinking Arach.
 — *Marina*, Sea Arach.
Avellana, Filberd Tree.
 — *Sylvestris*, Hasle Tree.

Avena, Oats.
 — *Sylvestris*, VVild Oats.
Avornus, *Anus nigra*, Black Alder.
Aurantium, pl. *Aurantia*, Orange, Oranges.
Aureum Olus, *Atriplex hortensis*, Garden Arach.
Auricomum, *Amaranthus aureus*, *Stachas Citrina*, Yellow Stachas, Gold Locks, Golden Flower Gentle.
Auricula Urfs, *Sanicula Ursina*, Bears Ear.
Auricula Muris, *Pileolla Myotis*, Mouse Ear.
Auricula Leporis, *Bupleurum*, Hares Ears.
 B.
Baccharis officin, *Asarum*, Asarabacca.
Baccharis Monspeliensis, Plowmans Spick-nard.
Balaustium, Pomgranate Flower.
Ballote, *Marrubium nigrum*, Black Horehound.
Balsamina mas, *Balsamina Cucumerina*, Balsam Apple.
Balsamita major, *Mentha Græca vel Romana*, Costmary.
Balsamum, Balsam.
Barba Aren, *Sempervivum*, *Sedum*, Houfleeck, also VWake Robin, or Cuckow-pint.
Barba Hirci, *Trogopogon*, Goats Beard, Noon Flower.
Barba Jovis, *Sempervivum Sedum*, Great Houfleeck.
Barbarea, *Nasturtium Hybernium*, Bank Cress, VVinter Cress.
Bardana, *Lappa major*, *Perfonata*, Bur-dock Great.
Basilica, *Gentiana*, Gentian or Fell-wort.
Basilicum Hortense, *Ocymum*, Basil Garden.
 — *Citratum*, Citron Basil.
 — *Caryophyllatum*, Clove Basil.
 — *Sylvestre*, VVild Basil.
Batrachion, *Ranunculus*, Crow-foot.
 — *Hortensis*, Garden.
 — *Arvus vel arvorum*, Field Crow-foot.
 — *Nemorialis*, VWood Crow-foot.
 — *Aquaticus* — *Palustris*, VWater Crow-foot.
Batus, *Rubus Sylvestris*, Bramble-bush.
Battata, *Pappa Anglicana vel Hiberniana*, *Battatas*, Potatoes English or Irish.
 — *Hispaniarum*, Spanish Potatoes.
 — *Virginiana*, Virginia Potatoes.
Becabunga, *Anagalis aquatica*, Brook-lime.
Becbium, *Farfara*, *Tussilago*, Colts-Foot.
Bedeguar, *Rosa Egleteria*, *Rosa Sylvestris*, Briar-bush.
Behen album, *Papaver spumeum*, Spatling Poppy.
Bellis — *Hortensis*, Daisy Garden.
 — *Sylvestris minor*, small VVild Daisy.
 — *Sylvestris major*, Greater VVild.
 — *Magna vel maxima*, Great Daisy or Maudlin-wort.
Benzoin, Benjamin.
Berberis, Barbery-bush.
Betulla, *Becabunga*, *Anagalis aquatica*, Brook-lime.
Beta alba, *Sicla*, Beet VWhite.
 — *rubra vel nigra*, Red Beet.
 — *Romana*, Roman Beet.
Betonica, Betony.
 — *Aquatica*, VWater Betony.
Betonica Pauli, *Veronica mas*, Pauls Betony, Speedwell.
Betula, Birch Tree.
Bisolum, *Ophris*, Twa-blade, or Bifoil.
 — *Palustre*, Marsh Twa-blade.
Bipinella, *Pimpinella*, Bumer.
 — *Saxifraga*, Bumer Saxifrage.
Bifacuta, *Gingidium*, Tooth-pick Charvil.
Bislingua, *Hippoglossum*, Horse Tongue.
Bisaria, *Dracunculus*, Dragons.
 — *Aquatica*, VWater Dragons.

Index Latinus.

Blattaria, Moth Mullein.

Caprifolium, *Periclymenum*, VWood-bind.
Capsella, *Thlaspi*, Treacle Mustard.
Capiscum, — *Americanum*, — *Indicum*,
Guinny or Indian Pepper.
Caput Gallinaceum, *Onobrychis*, Cocks-head.
Capillaris, *Capillus Veneris*, Maiden-hair.
Capnis, } *Fumaria*, Fumitory.
Capnos, }
Caput Aquila Baubini, *Nasturtium*, Cress.
Cardamum, *Pseudobunium*, *Barbarea*, VVinter Cress.
Cardamine, *Agriocardamum*, Cuckow-flower, La-
dies-smock.
Cardamomum, Cardamom.
Majus, Grains of Paradise.
Cardiaca, Mother-wort.
Cardus benedictus, Blessed Thistle.
Carduus, Thistle.
Fullonum, *Dipsacus*, Fullers Teale.
Carex, *Sparganium*, *Xiphidion*, *Ensculas*, Sedge, Bur
Reed.
Carica, *Ficus arida*, Dried Figs.
Carlina, Carlina Thistle.
Carobe, *Ceratonia*, Johns Bread.
Carthamus, *Cnicus*, Bastard Saffron.
Carum, *Careum*, Carraways.
Caryophyllata, *Herba benedicta*, Avena.
Caryophyllus Hortensis, *Herba Tunica*, Carnations,
Gilliflowers.
Sylvestris, Pinks.
Ruber profunde, Clove-gilliflowers.
Caryophyllus Indicus, Clove-tree; also the Clove
it self.
Caryon, *Nux*, A Nut.
Cassebar, *Coriandrum*, Coriander.
Cassia solutiva, vel *sistula*, Purging Cassia.
Cassignete, *Pimpinella*, *Sanguisorba*, Burnet.
Cassutha, *Cuscuta*, Dodder.
Castanea, Chestnut.

Castoris

Index Latinus.

Castoris Trifolium, — *Bituminosum*, Stinking Trefoil.
Castrengula, *Scrophularia*, Fig-wort.
Cataputia, *Tithymalus*, *Lathyrus*, *Ladaria*, Spurge.
Catanance, *Ervum Sylvestris*, Crimson Grass Vetch.
Cataria, *Nepeta*, *Mentha Cataria*, Nep or Cat Mint.
Cathsum, *Abrotonum*, Southern-wood.
Caucalis, Hedge Parsly.
Caucason, *Moly Indicum*, Indian Moly.
Cauda Muris, *Holosteum Loniceri*, Mouse Tail.
Caulorapum, Cole Rape, Rape Seed Cole.
Cauda Equina, *Equisetum*, Horse Tail.
Caucan Plini, idem.
Cauda Vulpium, *vel Vulpinum*, *Alepecuros*, Fox Tail.
Caulis, *Brassica*, *Crambe*, Cole-wort, Cabbage.
Caulis capitulatus, Cabbage.
Cazavi, *Cusavi*, *Iucca*, *Iucca*, Indian Bread.
Cedrus, Cedar Tree.
Centaurium majus, Centory.
Minus, Lesser Centory.
Centimorbia, *Nannularia*, Money-wort.
Centinervia, *Plantago major*, Greater Plantain.
Cenchrus, *Milium*, Millet.
Centromyrrhine, *Acaron*, *Bruscus*, *Ruscus*, Butchers Broom.
Centrum Galli, *Horminum*, *Sclarea*, Clary.
Centumnodia, *Polygonum*, Knot-grass.
Minor, Knawell.
Centunculus, *Gnaphalium*, Cud-weed.
Impius, — *midus*, VVicked Cudweed.
Marinus, Sea Cud-weed.
Americanum, *Argyrocome*, American Cud-weed.
Cepa, *Capa*, *Cape*, Onion.
Afcalonica, *Afcalonitis*, Scallions.
Cepa, *Telephium*, *Crassula*, Orpine of Matthiolus.
Cerasus, Cherry.
Cerantonia, *Carobe*, Johns Bread.
Cerefolium, — *Hortense*, Chervil.
Magnum, *Myrrhis*, Sweet Cissley.
Sylvestris, *Cherophyllum*, VVild Chervil.
Bisacutum, *Gingidium*, Tooth-pick Chervil.
Cerinth, *Herba maru*, Hony-wort.
Cerantia, *Crassula*, *Telephium*, *Fabaria*, Orpine.
Celis, *Daucus*, Candy VVild Carrot.
Cervicaria, *Trachelium*, *Campanula solis Urtica*, Throat-wort.
Major, *Campanula major*, Canterbury Bells.
Cerva major, *Cherva*, *Cici*, *Croton*, *Picinus*, *Ricinus*, *Palma Christi*, Great Spurge.
Cestron, *Betonica*, Betony.
Aquaticum, VVater Betony.
Cestrum morion, *Typha*, *Typha aquatica*, Cats Tail, Reed Mice.
Ceterach, *Asplenium*, True Spleen-wort, Milt VVatte.
Scolopendrium, True Spleen-wort.
Chamaelle, *Ebulus*, Dwarf Elder, Dane-wort.
Chamecistus, Dwarf Cistus, English Cistus.
Chamedrys, *Trixago*, *Teucrium*, *Quercula* — *minor*, Germander.
Sylvestris, VVild Germander.
Aquatica, *Scordium*, VVater Germander.
Chamagistis, *Genista humilis*, Common Broom; a Dwarf Kind.
Chameiris major, Dwarf Flower-de-luce Greater.
Minor, Dwarf Flower-de-luce Lesser.
Chamanelium, *Chamomilla*, *Anthemis*, Camomil.
Chamela Germanica, *Thymelea*, *Mezereon*, *Meze-reon*, or *Shruh* Spurge Olive, VVidow VVail.
Chamaea triccocor, *Coccus cindus*, *Oleago*, *Olea-fellus*, VVidow VVail, Spurge Olive.
Chamalimum, *Linaria Pumila*, Dwarf Flax.
Repens, *Pseudolimum repens*, Flax-weed Creeping.

Chamamorus, *Rubus Tricoccus*, Knot Berry Briar, Dew-berry.
Chamancerium, *Lysimachia filiquosa*, Coddled Loof-strife, or VVillow Herb.
Chamepitys, *Iva arthritica*, *Abiga*, Ground Pine.
Maritima, Sea Ground Pine.
Chamerbodendros, Dwarf Rose Bay.
Chamaeboxus, Dwarf Box.
Chamecissus, *Hedera terrestris*, Ground Ivy, Ale-hoof.
Minor, Small Ale-hoof.
Montana, Mountain Ale hoof.
Chamaelaphne, *Laureola*, Lawrel, Balfard Bay.
Chamaeleuce, *Farfara*, *Bechium*, *Tussilago*, Colts foot.
Chamaeagnus, *Myrtus Brabantica*, *Rhus Sylvestris*, Sweet Gaul.
Cheraphyllum, *Cerefolium Sylvestris*, Chervil VVild.
Chamaphium, *Erysimum*, *Sinapi alterum*, Hedge Mustard.
Verum, True Hedge Mustard.
Chamomilla, *Chamamelum*, *Anthemis*, Camomil.
Charta, *Papyrus*, Paper Reed.
Chathe, *Cucumis*, *Cucumber*, Cucumber.
Chelidonium, *Hirundinaria*, Celandine.
Cheiri, *Luccium Luteum*, VVall-flower.
Flore Simplicis, Single VVall-flower.
Flore Pleno, Double VVall-flower.
Cherva, *Ricinus*, *Palma Christi*, Great Spurge.
Chironia, *Sigillum sancte marie*, *Pitis nigra*, *Bryonia nigra*, Black Bryony.
Chocolate, Chocolate made of the Nut *Cacao*; that made of the *Caracca* Nuts is the best.
Chitini, *Althaa*, *Malva Palustris*, Marsh-mallow.
Chondrilla, Gum Succory.
Vera, — *Graca*, True Gum Succory.
Christophoriana Herba, *Herba christophori*, Herb Christopher.
Chrysanthemum Segetum, Corn Marigold.
Chrysogonon, *Leontopetalon*, Oaken black Turnep, Lions Foot, 446.
Chrysolachanon, *Atriplex sativa*, Garden Arach.
Chrysomelon, *Malus Armeniaca*, Apricock.
Cicerbita, *Sonchus levis*, Smooth Sow Thistle.
Cici, *Ricinus*, *Kerva*, *Cherva*, *Croton*, *Picinus*, *Palma Christi*, Great Spurge.
Cicer, *Cicer Sativum*, Chick-pease or Chiches.
Sylvestris, VVild Chick Pease.
Cichoreum, *Cichorium*, *Cichorea*, Succory.
Hortense, Garden Succory.
Sylvestris, VVild Succory.
Notium, Balfard Succory.
Cichoreum Verrucarium, VVart Succory.
Porcinum, Swines Succory.
Gummsum, *Chondrilla*, Gum Succory.
Cicla, *Beta*, Beet.
Alba, VVhite Beet.
Rubra, Red Beet.
Cicuta, *Conion*, Hemlock.
Minor, — *fatua*, — *Apij folia*, Parsly Leiv'd Hemlock.
Aquatica Palustris, VVater Hemlock.
Cicutaria, *Smyrrhiza*, *Smyrnium*, *Myrrhis*, Cicely.
Major, Greater Sweet Cicely.
Minor, Lesser Sweet Cicely.
Cidromela, *Mahon Medicum*, *Citrangulum*, Citron.
Turcica, Great Round Headed Citron, the Shaddock.
Criminalis, *Gentiana*, Felwort or Gentian.
Major, Greater Gentian.
Minor Gentianella, Lesser Gentian.
Minor cuncta, Cross-wort Gentian.
Cincinallis, *Capillus Veneris*, Maiden-hair.
Nigra, *Trichomanes*, Black Maiden-hair.
Album, VVhite Maiden-hair.
Aurea, *Polytricum aureum*, Golden Maiden-hair.
Cinamomum, Cinamon. Cinara,

Index Latinus.

inara, Cynara, Scolymus, Artichoke.

Sylvestris, Scolymus Sylvestris, Wild Artichoke.

Cineraria Dolonai, Jacobaea marina, Sea Rag-wort.

Circea, Solanum Circeum, Inchanters Nightshade.

Cirsium, Carduus mollis, Melancholy Thistle, Single

Headed Thistle.

Cissampelos, Helxine, Bind-weed.

Altera, Small black Bind-weed.

Nigra, Black Bind-weed.

Cissus, Hedera, Ivy.

Arborea, Tree Ivy.

Muralis, Wall Ivy.

Cistus, Cistus mas, Holy Rose.

Sylvestris, Rosa Sylvestica, Holy Rose Wild.

Citrangulum, Citrio, Citrium, A Citron.

Citrago, Melissa, Melies, Melisophyllum, Bawm.

Notha, Bastard Bawm.

Turcica, Turkey Bawm.

Citrium, Citreum, Citrio, A Citron.

Citrullus, Anguria, Citrul, Water Melon.

Clavicula, Hedera helix, Hederula, Barren Ivy.

Clavum Veneris, Nymphaea, Water Lilly.

Album, alba, Nenuphar, White Water Lilly.

Luteum, lutea, Yellow Water Lilly.

Clavus, Caryophyllus hortenfis, A Clove Gilli-

flower.

Indicus, Clove, the Spice.

Clematis Daphnoides, Chamedaphne Plinij, Vinca-

pervinca, Perwinkle.

Clematis, Ladies or Virgins Bower, also Perwinkle.

Clinopodium, Ocimum Sylvestre, Wild Basil.

Chymenum, Androsamum, Tutsan, Park-Leaves.

Chymenon, Betonica aquatica, Water Betony.

Cnicus, Carthamus, Bastard Saffron.

Cnicus Sylvestris, Atractilis, Wild Bastard Saffron.

Coagulum terrae, Nidus avis, Orchis abortiva,

Birds Nest.

Coccus Cnidus, Berries or Grains of Mezeron,

Widow Wail, or Spurge Olive.

Coccygia, Rhus, Sumach.

Cocus Nux, The Cocus Nut, which is good Food

and Drink.

Cochlearia, Cochleariam, Telephium quorundam,

Scurvy Grafs.

Hortenfis, Garden Scurvy Grafs.

Anglicana, — marina, English Scurvy-Grafs.

Cochenele, The Grain Cochenele.

Cocculus Indi, Indian Nur.

Colchicum, Ephemerum, Meadow Saffron.

Anglicum, English Med-Saffron.

Illyricum, Greek Med-Saffron.

Indian, Indian or Syrian Med-Saffron.

Colocyntis, Coloquintida, Bitter Gourd.

Colus Jovis, Sclarea lutea, Horminum luteum, Ju-

piters Distaff, Yellow Clary.

Colutea, Bastard Sena.

Columnaris, Campanulla lactescens, Campanula ma-

ior sive Pyramidalis, The great Pyramidal

Bell-flower, or greater Milky Bell-flower;

some will have it to be Garden Rampion.

Colubrina, Arum Aegyptium, Pseudocolocasia, Eddo

of Carolina.

Coriandrum, Corianum, Coriandrum, Coriander.

Coloquintida, Colocyntis, Bitter Gourd or Citrul.

Colombaris, Columbina, Verbena, Verbenaca, He-

cularia Matricalis, Vervain.

Coniolum, Conita, Cicutaria, Myrrhis, Smyrnum,

Cicely.

Condis, Struthium, Viola agrestis Tragi, Sapon-

aria, Soap-wort.

Condrilla, Chondrilla, Gum Succory.

Vera, True Gum Succory.

Conion, Cicuta, Hemlock.

Palustre — aquatica, Water Hemlock.

Consolida minor, Prunella, Self-heal.

Consolida quinquefolia, Butter-wort.

Consolida Jaraenica vel aurea, Solidago Jaraenica,

Confound Saracens.

Consolida major, Symphytum, Solidago, Osteocollon,

Comfrey.

Consolida media, Bugula, Bugle.

Consolida Regalis Sylvestris, Flos calcaris, Delphi-

num, Larks Spur or Heel, Knights-spur,

Convolvulus, Volubilis, Bind-weed.

Minor, Lesser Bind-weed.

Volubilis nigra, Black Bind-weed.

Morinus, Soldanella, Sea Bind-weed.

Coniza major, Fleabane Greater.

Minor, Lesser.

Pumila, Chamaconiza, Dwarf-Fleabane.

Palustris — aquatica, Consolida palustris,

Water Fleabane.

Copayba, Cupayba, Balsim Capivi.

Cophy, Coffee, the Powder of which makes a Va-

uable Stomatick Liquor or Drink.

Corallina, Coralline Moss.

Corallium, Coral.

Album, White.

Rubrum, Red Coral.

Cor Indicum, Pisum cordatum, Heart Pease.

Coriandrum, Coriander.

Corcoras Plinij, Anagalis, Pimpernel.

Corianum, Coriandrum, Coriander.

Coris, Fair Heath Ground Pine.

Cornu Cervinum vel Cervi, Coronopus, Harts-horn

Plantain, Bucks-horn.

Corona Monachi, Dens Leonis, Taraxicon, Dan-

delion, Piss-a-bed.

Corona Regia, Pomum Spinofum, Thorny Apple.

Coroncola, Lythmabchia, Loofe-strife, Willow-Herb,

Spicata, Spiked Loofe-strife.

Non spicata, Loofe-strife not Spik'd.

Siliquosa, Codded.

Corrigiola, Sanguinaria, Centumnodia, Polygonum,

Knot-grafs.

Corrago, Borago, Borage.

Cortex Winteranum, Cinamomum Winteranum,

Winters Cinamon.

Cortex Peruvianus, sive Jesuiticus, Jesuits Bark.

Coridialium, Calchocrum, Capnos Plinij, Fumaria,

Fumitory.

Corydalis, Radix cava, Hollow Root, a Kind of

Fumitory.

Coronopus, Sanguinalis, Bucks-horn.

Marinus, Sea Bucks-horn.

Corona Imperialis, Crown Imperial Lilly.

Cortusa, Auricula Urfi, Santicula Urfina, Bears

Ear Sinicle.

Corylus, Avellana, Nux Heracleotica, Filbert.

Sylvestris, Hasle-Nut.

Costus Hortorum, Balsamita major, Mentha Græca

vel Romana, Costmary.

Costa canina, Quinquenervia, Plantago minor,

Rib-wort Plantane.

Cotinus Plinij, Rhus, Sumach.

Cotula, Cotula fatida, May Weed.

Cotyledon, Acetabulum, Umbilicus Veneris, Herba

Coxendicum, Navel-wort, Penny-wort.

Cotonaria, Gnaphalium, Cud-weed.

Aurea vel aureum, Golden Cud-weed.

Cotoneum, A Quince.

Cotonaster, Wild Quince.

Cotum, Xylum, Bombax, Gossipium, Cotton-plant.

Cracca, Aracus, Great Wild Vetch.

Crassula, Telephium, Fabaria, Ceraunia, Orpine.

Cratægonum, Triticum vaccinum, Cow-Wheat.

Sylvestre, Alium sylvaticum, Wild Cow-

Wheat.

Crambe, Brassica, Cabbage, Cole-wort.

Crambe Thalassia, Soldanella, Convolvulus marinus,

Sea Bind-weed,

Crepa-

Index Latinus.

Crepanella, *Dentillaria*, *Molybdena*, *Plumbago* Plinij,
Lead-wort.

Diospyron, *Milium solis*, *Lithospermum*, Grom-
well.
Majus, Greater Gromwell.
Minus, Lesser Gromwell.
Repens, Creeping Gromwell.
Dipcedi, *Musca ri*, *Bullus Vomitorius*, Masked Great
Flower Jacinth.
Botroides — *Moscatus luteus*, Yellow.
Hyacinthus moschatus griseus, Ash-colored.
Dipsacus hortensis, Fullers Teasle.
Sylvestris, Wild Teasle.

Distichon,

Index Latinus.

Distichon, Hordeum, Polystichon, Barley.
Agreste, Wild Barley.
Spurium — *Murinum*, Way or Wall Barley.
Doehon, Panicum, Panick.
Indicum, Indian Panick.
Doronicum, Wolfs-bane Antidote.
Romanum vulgare, Common Roman Wolfs-bane.
Minus, Lesser Wolfs-bane Antidote.
Brachiata radice, Scorpion Rooted.
Draba, Arabis, Nasturtium Orientale, Arabian or Turkey Mustard.
Repens, Creeping Arabian Mustard.
Dracanthium, Dracunculus, Dragons.
Aquaticum — *Palustre*, Water Dragons.
Minus, Lesser Dragons.
Draco herba, Dracunculus bortenfis, Tragum vulgare Clusij, Tarragon.
Dracontia, Dracontium majus, Dragons.
Minor, Lesser Dragons.
Palustris — *Aquatica*, Water Dragons.
Dracunculus, idem.
Draco sylvestris, Sternutamentaria, Tarcon, Piar-mica, Sneezewort.
Drobian cordi, Alchimilla, Sanicula major, Stellaria Matthioli, Ladies Mantle.
Drus, Drys, Quercus, An Oak.
Dryopteris, Filix querna vel quercina, Oak Fern.
Repens, Creeping Oak Fern.
Dryis Loniceri, Carduus avenarius, — arvenfis — Moschatus, Musk or Oat Thistle.
Dulcis radix, Glycyrrhiza, Liquorice.
Hortensis, Garden Liquorice.
Sylvestris, Wild Liquorice.
Dulcisfida, Peonia, Peony.
Mas, Male Peony.
Femina, Female Peony.
Dulcamara, Amara Dulcis, Solanum arboreseens, Bitter-sweet, Woody Nightshade.
Dutroa, Datura, Stramonium minus, Dutroa or Dutory.

E.

E*Bulus, Chamaeæste, Sambucus humilis*, Dane-wort, Dwarf-Elder.
Echium, Buglossum Viperinum, Vipers Bugloss.
Elaphoglossum, Pastinaca sylvestris, Sphondylium, Wild Parsnep.
Hortense, Garden Parsnep.
Elæagnus Cordi, Myrtus Brabantica, Sweet Gaul.
Elatine, Veronica famina, Female Speed-well, Fleuellin.
Elæoselinum, Paludapium, Apium, Apium aquaticum, Smallage.
Elatarium, Cucumis agrestis vel asininus, Wild Cucumber; also the Gum, dried Juice, or Fœcula of the same.
Elleborus, Helleborus albus, Veratrum album, Hellebor White.
Niger verus, True Black Hellebor.
Norbus, Bears-foot, Bastard black Hellebor.
Niger sylvestris, Wild black Hellebor.
Albus agrestis, Wild white Hellebor.
Elleborastrum, Helleboraster, Helleborus nothus, Bastard Hellebor or Bears-foot.
Elleborine alba agrestis, Wild white Hellebor.
Elenium, Helenium, Enula, Enula campana, Elecampane, Scab-wort.
Elephantis, Anacardium, Bean of Malaca.
Ellochryson, Gnaphalium aureum, Golden Cudweed.
Emblice, Myrobolani emblice, Emblick Myrobolans.
Empetrum Tragi, Herniola, Herniaria, Millegrana, Rupture-wort or Bursten-wort.

Endivia bortenfis, Endive Garden.
Sylvestris, Wild Endive.
Eneacphyllon, Monophyllum, Unifolium, One Blade.
Enula, Enula campana, Helenium, Elecampane or Scab-wort.
Ephæthium, Ranunculus, Crow-foot.
Ephibryon, Dodder of Hops.
Epibatou, Dodder of Brambles.
Epichameæste, Dodder of Dane-wort.
Epichamedry, Dodder of Germaner.
Epicanubis, Dodder of Hemp.
Epiaphæce, Dodder of Tares.
Epaphanthion, Dodder of Wormwood.
Epidilamnus, Dodder of Dittany.
Epigeniston, Dodder of Broom.
Eperygium, Dodder of Eryngo.
Ephyssopus, Dodder of Hyflor.
Epilbanotis, Dodder of Herb Frankincense.
Epilnum, Dodder of Flax.
Epimaracon, Dodder of Marjoram.
Epimarum, Dodder of Herb Maltich.
Epipolium, Dodder of Polimountain.
Epilabe, Dodder of Knapweed.
Epithymalus, Dodder of Spurge.
Epithymra, Dodder of Savory.
Epithymum, Dodder of Thyme.
Epiurtica, Dodder of Nettles.
Epimetrum, Barren-wort.
Epimedium, idem.
Epipellron, idem.
Equapium, Hippocelinum, Smyrnum vulgare, Alexander, Horse Parly.
Equisetum pratense, Hippuris pratensis, Horse-tail Meadow, Shave-grass.
Nudum, Hippuris nuda, Naked Horse-tail.
Palustre, Hippuris vel Cauda equina aquatica, Sanguinalis, Marsh Horse-tail, Shave-grass.
Eranthemum, Flos Adonis, Adonis Flower, Wind-flower.
Flore rubro, Red Flowered.
Flore lateo, Yellow Flowered.
Erebintus, Cicer, Chiches, Chic Pease.
Arietinus, Black Chiches.
Erica, Tetralix veterum, Sifera varronis, Heath, that of Jericho is called *Rosa Maria*.
Ericoides, Euphrasia lutea, Yellow Eye-bright.
Lignosa, — pratensis rubra, Woody Eye-bright.
Erigerum, Senecio, Groundfel.
Tomentosum, Senecio Tragi, Cotton Ground-fel.
Erinus Caprificus, Wild Fig Tree.
Ervangina, Cauda Leonis, Leimodoron, Orobanche, Broom Rape.
Eruca sativa, Rocket Garden.
Romana, Erucula major, sativa alba, Roman.
Aquatica, Water Rocket.
Sylvestris, Wild Rocket.
Sylvestris notha, Bastard Wild Rocket.
Ervilia Dodonæi, Ochrus, Winged Wild Pease.
Eruum, Vicia amara, Orobus, Bitter Vetch or Orobus.
Sylvestre, Catenance Gesneri, Wild Bitter Vetch.
Sylvarum — Sylvaticas, — Nemorale, Woody Orobus.
Eruum rubens sylvestre, Orobus rubens graminens, Catenance, Crimson Grass Vetch.
Eryngium, Centum capita, Sea Holly, Eryngo.
Eryngium trifolium, Trefoil Thistle, Trefoil Eryngo.
Erysimum, Irio Plinii, Sinapi alterum — Sylvestre, Hedge Mustard.
Verrum, The true Hedge Mustard.

Eryth-

Index Latinus.

Erysimum Theophrasti, *Tragopogon*, *Barba Hirci*, Goats-beard, Noon-flower.
Erythrodanum, *Rubia tinctorum*, Dying Madder.
Efula, *Efula minor*, *Ezula*, *Pityusa*, Small Garden Spurge.
Eupatorium Mcfues, *Ageratum*, Maudlin.
Eupatorium, *Agrimonia*, Agrimony.
Aquaticum, Water Agrimony.
Nothum, *Agrimonoidea*, Bastard Agrimony.
Euphorbium, The Gum Euphorbium.
Euphragia, Eye-bright.
Euphrasia, idem.
Lignosa — *pratensis rubra*, Woody Eye-bright.
Euphrosine, *Buglossum*, Buglofs.
Sylvestris, *Sylvestre*, *Lingula bubula*, Wild Buglofs.
Marina, *Limonium*, Sea Buglofs.
Muralis, *Lycopsis*, Wall Buglofs.
Viperina, *Echium*, Nipers Buglofs.
Exupera, *Verbena*, *Verbenaca*, Vervain.
Ezula, *Efula*, Small Garden Spurge.

F

Faba hortensis, Bean Garden.
Coccina, *Phaseolus coccinus*, Scarlet Bean.
Minor, — *Equina*, — *Agria*, Field Bean.
Hortensis minor, *Smilax hortensis*, *Phaseolus*, Kidney Bean.
Faba veterum vel Græcorum, Black Bean.
Fabaria, *Crasula*, *Telephium*, Orpine, or Live-long.
Fagopyrum, *Fagotriticum*, *Fruementum Sarafenicum*, *Tragopyrum*, *Tragotriticum*, Buck Wheat.
Fagus, Beech Tree.
Faranum, *Tussilago*, Colts-foot.
Farfara, idem.
Faragium, idem.
Farfarus, *Populus alba*, White Poplar.
Farfrugum, *Caltha palustris*, Marsh Marigold.
Farrago, *Secale*, Rie.
Fur, *Spelta*, *Zea*, *Triticum Griseum*, — *Cinereum aristis munitum*, Spelt, our Gray Wheat.
Fascolus, *Phaseolus*, *Smilax hortensis*, Kidney Bean.
Faselus hortensis, *Faba*, Bean Garden.
Equinus, — *minor*, Field or Horse Bean.
Febrefuga, *Matricaria*, *Parthenium*, Feverfew, Fetherfew.
Sylvestris — *agrestis*, Wild Feverfew.
Fegopyrum, *Tragopyrum*, *Tragotriticum*, *Ocyum Cereale*, Buck Wheat.
Fel terra, *Centaurium minus*, Lesser Centory.
Feraria, *Eupatoria*, *Agrimonia*, Agrimony.
Notha, *Agrimonoidea*, Bastard Agrimony.
Ferulacoli, *Thapsia*, Great Scorching Fennel.
Ferrum Equinum, *Solea Equina*, Horse-shoe Vetch.
Ferula, Fennel Giant.
Ferulago, *Ferula minor*, Small Fennel Giant.
Ferula Galbanifera, *Ferula* yielding Galbanum.
Ferula Sagapenifera, *Ferula* yielding Sagapenum.
Festuca, *Bromus sterilis*, *Ægilops*, Wild Oats.
Festuca Italica, Haver-grass.
Ficaria, *Chelidonium minus*, *Scrophularia*, Pilewort, called also the Lesser Celandine.
Ficus, A Fig, also a Fig Tree.
Ficus humilis, *Chameficus*, Dwarf Fig Tree.
Filago, *Tomentum*, *Centuncularis*, *Gnaphalium*, Cud-weed.
Aurea, — *aureum*, Golden Cud-weed.
Marina, Sea Cud-weed.
Impia, — *minor*, Wicked Herb or Cud-weed.
Argentea, — *Americana*, Silver Cud-weed or American.
Filipendula, *Oenanthe*, Drop-wort.
Aquatica, Water Drop-wort.
Angustifolia, *Apij foliis*, Narrow Leav'd.
Cicuta facie, Hemlock like Drop-wort.

Filicula, *Polypodium*, Polypody.
Quercina, Polypody of the Oak.
Marina, Polypody of the Wall.
Terrea, Ground Polypody.
Filius ante Patrem, *Colchicum*, Meadow Saffron.
Filix mas, *Bleibron*, *Pteris*, Fern Male.
Femina, *Nymphaopteris*, Female Fern, Brake.
Quercina, Oak Fern.
Alba, *Dryopteris*, White Oak Fern.
Filicistrum, *Osmunda regalis*, *Filix aquatica*, Water Fern, Osmund Royal.
Filix florida, *Filix palustris*, idem.
Fistularia, *Pedicularis*, *Crista Galli*, Cocks-comb, Coxcomb, Loufe-wort, Yellow Rattle.
Flammula, *Ranunculus flammæus*, Spear-wort.
Flammula Jovis, *Clematis urens*, Virgins Bower.
Surrecta, Upright Virgins Bower.
Flos Adonis, *Erantibemum*, Adonis Flower.
Flore Rubre, Red Flowered Adonis.
Flore luteo, Yellow Flower'd Adonis.
Flos Affricanæ, *Caltha Affricana*, *Flos Indicus*, African Marigold, French Marigold.
Flos ambræalis, *Amarella Gesneri*, *Polygala recentiorum*, Milk-wort Common.
Maritimus, *Glaux*, Sea Milk-wort.
Flos Cardinalis, *Trachelium Americanum*, Cardinal Flower.
Flos Crucis Gesneri, *Polygala*, Milk-wort.
Flos solis, *Corona solis*, *Sol Indianus*, *Chrysanthemum Peruvianum*, Sun Flower.
Major, *maximus Peruvianus*, The great Sun Flower.
Minor, *Chrysanthemum peruvianum minus*, The smaller Peru Sun Flower.
Flos Cuculi, *Cardamine*, Cuckow Flower, Ladies Smocks.
Flos Frumenti, *Cyanus*, Blew Bottle, Corn Flower.
Multifloras, Double Flowered.
Flos Meleagris, *Fritillaria*, Chequer'd Daffodil.
Flos Regius, *Consolida Regalis*, *Delphinium*, *Flos Calcaris*, Larks Spur, Larks Heel, Knights Spur.
Fluida Gaze, *Rhus*, Sumach.
Fœnum Græcum, *Silvica Columelle*, *Corphos Plinij*, *Silicula Varronis*, Fenugreek.
Fœnum Burgundicum, *Medica legitima*, *Trifolium Cochlearium*, Medick Fodder, St. Foin, Snail-Claver.
Fœniculum, *Marathrum*, Common Fennel.
Giganteum, *Ferula*, Fennel Giant.
Porcinus, *Pencedannum*, Hogs Fennel, Sulphur-wort.
Folium Indum, Indian Leaf.
Fontalis, *Potamogeton*, Pond-weed.
Fragaria, *Fraga*, Strawberry.
Alba, — *hortensis*, White Strawberry.
Rubra, — *Nemoralis*, Red or Wood Strawberry.
Fraxinella, *Pseudodittamnus*, Bastard Dittany, Fraxinel.
Fraxinus malia, Ash Tree, its Keys are called *Lingua Avis*.
Sylvestre, *Ornus*, Wild Ash, or Quicken Tree.
Frangula, *Alnus nigra*, *Avornus*, Black Alder.
Fritillaria, *Lilium variegatum*, *Flos Meleagris*, Chequer'd Daffodil, Fritillary.
Fruementum, *Far*, *Spelta*, *Zea*, Our Gray Wheat or Spelt Corn; also a Pultage, called Frumety.
Fucus, *Fucus marinus*, Sea Wrack.
Fucus herba, *Anchusa*, Alkanet.
Euga Damonum, *Perforata*, *Sol terrestris* *Paracelsi*, *Hypericum*, Johns-wort.
Fuligo, Soot.

Index Latinus.

Eumaria, *Capnos* Plinij, Fumitory.
Bulbosa, *Radix Cava*, *Corydalis*, Hollow Root.
Fumus Terræ, idem.
Fungus, *Svongiolu*, Mushroom, Toad-stool.
Fungus Sambacinus, *Auricule Jude*, Jews Ears.
Fungus Laricea, *Agaricum*, Agarick; a Mushroom of the Larch Tree.
Fusus, *Attractylis*, Wild Bastard Saffron.

G.

G *Alanga*, *Cyperus*, *Funcus quadratus*, *Aspalathum*, *Galingal*.
Galbanum gummi, Gum Galbanum.
Galega, *Ruta Capraria*, Goats Rue.
Galle arbor, Nut-Gall Tree.
Galeopsis, *Urtica iners fetida*, *Lamium fetidum*, Stinking Dead Nettle.
Gallitricum, *Horminum*, *Scalaria*, Garden Clary.
Sylvestris, *Oculus Christi*, Wild Clary.
Garofinos, *Atriplex olida*, — *fatida*, Sinking Arach.
Gariophyllata, *Caryophyllata*, *Avens*.
Gariophyllus, *Caryophyllus hortensis*, Clove Gilliflower.
Indicus, Clove, the Spice.
Geminalis, *Horminum*, *Gallitricum*, *Centrum Galli*, *Scalaria*, Garden Clary.
Sylvestris, *Oculus Christi*, Wild Clary.
Genicularis, *Lychnis fativa*, — *hortensis*, Garden Campion.
Sylvestris multiflora, Bachelors Buttons.
Genista, *Spartum*, Broom.
Genista spinosa, *Genistella spinosa*, Furze Bush, Petty Whyn.
Geniste Rapum, Broom Rape.
Genistella, *Genista tinctoria*, *Genistella infectoria*, Bafe Broom, Dyers Green Weed.
Gelseminum Indicum, *Mirabilia Peruana*, *Admirabilis Peruviana*, Peru Flower, Marvel of Peru.
Genicularis, *Phu magnum*, *Valeriana magna vel hortensis*, Great Garden Valerian.
Genecanthé, *Bryonia nigra*, *Sigillum sanctæ marie*, *Vitis nigra*, Black Bryony.
Genitura, *Anethum*, *Anetum*, Dill.
Gentiana major, Greater Gentian or Fell-wort.
Minor, *Gentianella*, Small Gentian.
Minor Cruciata, — *Cruciata*, Cross-wort Gentian.
Autumnalis, *Gentianella autumnalis*, *Pneumonanthe*, Small Autumn Gentian, Autumn Bell-flower or Calathian Violet.
Gentianella, *Gentiana notha*, Bastard Gentian.
Gerontopagon, *Tragopogon*, *Barba Hirci*, Goats Beard.
Geranium, *Rostrum Gruinum*, *Gruis vel Ciconia*, *Gruinalis*, Cranes-Bill.
Moschatum, Muskcd Cranes-bill.
Columbinum, Doves-foot.
Batrachoides, Crow-foot Cranes-bill.
Geum, *Caryophyllata*, *Avens*.
Gingidium, *Bisacuta*, Tooth-pick Chervil.
Gith, *Melanthium*, *Nigella*, Fennel Flower.
Romanum vel Romana, Katherine Flower.
Githago, *Lychnis segetum*, *Pseudomelanthium*, *Nigellastrum*, Cockle or Corn Wild Campion.
Gladiolus, *Gladiolus segetalis*, *Victoralis rotundus*, Corn Flag.
Aquaticus, — *luteus*, Water Flag, Skeg.
Glans Terræ, *Agriocastanum*, *Bulbocastanum*, *Nucula terrestris*, Ground Nut, Earth Nut.
Glastrum sativum, *Isatis sativa*, Garden Woad.
Sylvestre, *Isatis agria*, Wild Woad.

Glans sardiana, — *Castanea*, Chest-Nut.
Glans unguetaria, The Nut Ben.
Glaucium, *Pomum amoris*, Apples of Love.
Glaux, *Astragalus*, *Polygala genus*, Milk Tare or Vetch.
Glechon, *Pulegium*, Penny-Royal.
Glycyron, *Dulcamara*, *Amara dulcis*, *Solanum Arborefcens*, Bitter-sweet, Woody Nightshade.
Glycyrrhiza hortensis, *Liquoritia*, Garden Liquorice.
Sylvestris, Wild Liquorice.
Glycissida, *Dulcissida*, *Pæonia*, Peony.
Mas, Male Peony.
Fæmina, Female Peony.
Gnaphalium, *Centunculus*, *Tomentitia*, *Cottonaria*, Cud-weed.
Impium — *minus*, Wicked Herb or Cud-weed.
Marinum, *Elicbrysum sylvestre*, Sea Cud-weed.
Aureum, *Elicbryson*, Golden Cud-weed.
Americaunum, — *argenteum* — *sempervivum*, *Argyrocome*, American Cud-weed, Silver Cud-weed.
Gordilion, *Tordilium*, *Seseli Cretense*, Candy Hartwort.
Gossipium, *Xylum*, *Cotum*, *Bombax*, Cotton-Plant.
Gramen, *Agrostis*, Grass.
Alopecuros, Fox-tail Grass.
Arvorum, Bent Grass.
Avenaceum, Oat Grass.
Arundinaceum, Reed Grass.
Argenteum, Silver Grass.
Aquaticum, Water Grass.
Bromoides, Hairy Oat Grass.
Bufonum, Toad Grass.
Bombycinum, Woolly Grass.
Cristatum, Cocks Comb or Crested.
Cyperoides, *Cyperus* Grass.
Caninum, Dogs Grass, Quitch Grass.
Cauda Vulpis, Fox-tail Grass.
Calamagrostis, Reed Grass.
Dactyloides, Cocks-foot Grass.
Echinatum, Hedge-Hog Grass.
Filiceum, Fern Grass.
Festuca, Haver Grass.
Geniculatum, Knee'd or Jointed Grass.
Hirsutum, Hairy Grass.
Hirsutum Nemorale, Hairy Wood Grass.
Holostium, Stitch-wort, also Sea Thrift.
Ischemon, Cocks-foot Grass.
Funceum, Rush Grass.
Funceum parvum, Toad Grass.
Lanatum, Woolly Grass.
Leucanthemum, Stitch-wort Grass.
Murorum, Capons Tail.
Montanum, Mountain Grass.
Miliaceum, Millet Grass.
Miliare, idem.
Melinoides, Panick Grass.
Marinum, Sea Grass.
Maritimum, idem.
Muriale, Wall Grass.
Nanum, Dwarf Grass.
Nemorale, Wood Grass.
Nemorosum, idem.
Oculus Caprinus, Haver Grass.
Phalaris, Canary Grass.
Phalaroides, idem.
Pheniceum, Darnel Grass.
Phænix Graminea, idem.
Pumilum, Dwarf Grass.
Plumosum, Feather Grass.
Plumarium, idem.
Polyarabum, Fern Grass.

Pratenfe,

Index. Latinus.

Pratense, Meadow Grass.
Paniculatum, Mountain Grass.
Panicum, Panick Grass.
Scopula, Bent Grass.
Segetum, Corn or Wheat Grass.
Schænegrostris, Rush Grass.
Spicatum, Spiked or Eared Grass.
Spicatis foliis, Spiked Leav'd.
Statice, Sea Thrift.
Semiale, Way or Wall Grass.
Typhinum, Cats-tail Grass.
Triticum, Wheat Grass.
Tomentosum, Cotton Grass.
Tomentarium, idem.
Tremulum, Quaking Grass.
Grana Paradisi, Cardamom majus, Grains of Paradise.
Gratiola communis, Common Hedge Hyssop.
Vera, True Hedge Hyssop.
Latifolia —, Broad Leav'd Hedge Hyssop.
Graminea, Grass Hedge Hyssop.
Grossularia, *Uva crissa*, Gooseberry.
Grossularia ultra marina, Ribes, Currants.
Grossi, *Ficus aridi*, Dry Figs.
Gruanalis, *Geranium*, *Restrum Gruinum*, *Gruis* *aut Ciconia*, Cranes-Bill.
Guajacum, *Lignum Vite*, Pock-wood.
Gummi Amoniacum, The Gum Amoniacum.
Gummi Anims, Gum Anima.
Gummi Arabicum, Gum Arabick.
Gummi Copal, The Gum Copal, A Resolutive.
Gummi Elemi, The Gum Elemni; an admirable Vulnerary.
Gummi Cambogia, Cambogie or Cambogium.
Gutta Gamanda, or *Gemou*, idem.

H.

H *Alicacabum*, *Alkakengi*, *Solanum Vescarium*, Winter Cherry.
Americanum, Carolina Winter Cherry.
Halicacabum peregrinum, *Pisum Cordatum*, Heart Pease.
Halimus, *Portulaca Marina*, Sea Purslain.
Harmala, *Ruta Sylvestris*, *Ruta Syriaca*, Wild Rue.
Haralia, *Cucurbita*, Gourd.
Harbatum, *Pucedanum*, *Feniculum Porcinum*, Hogs Fennel, Sulphur Wort.
Harenaria, *Cornu Cervi vel Cervinum*, Bucks-horn.
Hafce, *Thymus*, Thyme.
Hastula regia, *Asphodelus albus*, White Asphodel.
Harundo, *Arundo*, Reed or Cane.
Haronigi, *Doronicum*, Woolfs-bane Antidote.
Hebiscus, *Althæa minor*, Lesser Marsh Mallow.
Hedera arborea, Ivy Tree or Wall.
Terrestis, Ground Ivy, Ale-hoof.
Hedera aquatica, *Hedera aquatica*, *Ranunculus* *Hederaceus*, Water Ivy, Water Starwort.
Hedera spinosa, *Smilax aspera*, Prickly Bind-weed.
Hedypnotis, *Cichoreum luteum*, Yellow Succory.
Hedysorum, Hony Suckle.
Hedysomus, *Mentha*, Mint.
Sylvestris, *Mentastum*, Wild Mint.
Equinus, *Sisymbrium Sylvestre*, Horse Mint.
Aquaticus, *Sisymbrium*, Water Mint.
Helice, *Hedera helix*, Barren Ivy.
Helenium, *Enula*, *Enula campana*, Elecampane.
Helianthemum, *Flos Solis Anglicus*, English Yellow Cists, or Sun Flower.
Heliochrysum, *Gnaphalium aureum*, Golden Cud-weed.
Heliotropium, Turn-sole.
Helleborus niger, *Elleborus*, *Veratrum nigrum*, Hellebor Black.
Nothus, Bears-foot.
Niger Sylvestris, Wild Black Hellebor.
Albus, *Veratrum album*, White Hellebor.

Helleborine, Wild White Hellebor.
Helleborine nigra, Wild Black Hellebor.
Alba agrestis, Wild White Hellebor.
Helleborastrum, Wild Black Hellebor.
Helleboraster, Bastard Black Hellebor, Bears-foot.
Helopus, *Heliotropium*, Turn-sole.
Hemerocallis Clusii, *Martagon*, *Lilago*, *Lilæstrum*, *Lilium non Bulbosum*, The Day Lilly.
Heman, *Serpillam*, Wild Thyme.
Hemonitis, *Phyllitis*, *Lingua Cervina*, Moon Fern, Harts Tongue.
Hepatica vulgaris, *Lieben major*, *Jecoraria*, Liverwort Common or Greater.
Minor, Liverwort Lesser.
Nobilis, —, *Trifolia nobilis*, Herb Trinity.
Arborea, *Pulmonaria fungosa*, Wood Liverwort, Oak Lungs.
Helxine, *Parietaria*, Pellitory of the Wall.
Herba Ambonij, *Dentillaria Rondoletij*, Lead-wort.
Herba Benedicte, *Caryophyllata*, Avens.
Herba Bifluga, Horse Tongue.
Herba Casta, *Peonia*, Peony.
Herba Catti, *Mentha Cataria*, Nep or Cat Mint.
Herba Caustica, *Ranunculus*, Crow-foot.
Herba Cancris, *Heliotropium*, Turn-sole.
Herba Coxendicum, *Cotyledon*, *Acetabularia*, Pennywort.
Herba Clavellata, *Viola Tricolor*, Hearts Ease.
Herba Doria, *Doria's* or *Chiron's* Wound-wort.
Herba Dineotilia, *Confolia Regalis*, Larks-spur.
Herba fortis, *Solidago Sarafenica*, Confound.
Herba Gerardi, *Podagraria*, Gout-wort.
Herba Gallica, *Gallega*, *Ruta Capraria*, Goats Rue.
Herba Hippoglossum, Horse Tongue the Herb.
Herba humilis, Humble Plant.
Herba Hungarica, *Dodonei*, *Alcea*, Nervain Mallow.
Herba Jacobi, *Jacobæa*, Rag-wort, James-wort.
Herba impatiens, *Perficaria filiquosa*, Wild Mercury.
Herba impia, *Filago*, *Gnaphalium impium*, Wicked Herb, Wicked Cud-weed.
Herba impetiginaria, *Chelidonium majus*, Celandine.
Herba Jovis Barba, Our Common Houfleeke.
Herba Leo, *Antirrhinum*, Snap Dragon, Calves-Snout.
Herba Lucis, *Chelidonium majus*, Celandine.
Herba Lalloria, Sea Spurge.
Herba Lassulata, *Balsamita major*, *Cassia hortensis*, Costmary.
Herba Lotus, Trefoil Pease.
Herba Lutea, Wold, Weld, Dyers Weed.
Herba minosa, —, *sensibilis*, The Sensible Plant.
Herba Maralis, Pellitory of the Wall.
Herba Paris, *Triphyllos*, True Love, one Berry.
Herba Paralysis major, Cowslip.
Herba Paralysis minor, Pimrose.
Herba Pinnula, *Hyoscyamus*, Henbane.
Herba rutinalis, *Sphondilium*, Cow Parsnep.
Herba stella, *Coronopus*, Bucks-horn.
Herba sacra, *Tabacum*, *Petum*, *Nicotiana*, Tobacco.
Herba Scythica, *Glycyrrhiza*, Liquorice.
Herba seclerata, *Ranunculus*, Crow-foot.
Herba sardo, *Ranunculus aquaticus*, Water Crow-foot.
Herba sinaconis, *Alcea*, Vervain Mallow.
Herba Tunica, *Caryophyllas Hortensis*, Clove Gil-liflower.
Herba Turca, *Herniaria*, Rupture wort.
Herba Viva, Herh of Life.
Herba Venti, *Anemone*, Anemony, Wind-flower.
Herba Vulcani, *Ranunculus*, Crow-foot.
Herba Ulceraria, idem.
Herba Urbana, *Acanthus*, *Branca Ursina*, Bears Breech.
Herbena, *Verbena*, *Hercularia*, *Matricalis*, Vervain.
Herculana, *Verbena*, *Verbenaca*, idem.
Hermolattylus, The Hermodact. Some Authors will have it to be a Kind of *Colchicum*; but

Index Latinus.

if it is, it is a Kind unknown to us. The *Colchicum Hermodactylum*, is not the True *Hermodactylus*, yet by some is used for it.

Herniaria, *Herniola*, *Millegrana*, *Herba Turca*, Rupture-wort.

Herpacanthæ, *Acanthus sativus*, *Branca Ursina*, Bears-Breech.

Hesperis, *Viola Matronalis*, — *Hyemalis* — *Damascena*, Single Dames Violets.

Hesperis flore pleno purpurante, Double Purple Dames Violets.

Hieracium, *Accipiter*, *Accipitrina*, *Porcellia Gazæ*, Hawk weed.

Rarum — *incommune*, Rare or uncommon Hawk-weed.

Hippago, *Hippia*, *Alfene*, Chickweed.

Aquatica, Water Chickweed.

Notha, Bastard Chickweed.

Hippolapathum folij rotundis, Bastard Rheubarb.

Hippocelinum, *Smyrniun vulgare*, *Equapium*, *Alexander*, Horse Parsly.

Creticum, Cretick or Candy Alexander.

Hippocelinon, *Olusatrum*, idem.

Hippoglossum, *Bonifacia*, *Biflingua*, Horse Tongue Bay.

Hippuris, *Equisetum*, *Cauda Equina*, *Asprella*, *Ephedra*, Horse Tail, Shave-grass.

Palustris, Marsh or Water.

Nuda, Naked Horse-tail.

Pratenfis, Meadow Horse-tail.

Hirculus veterum Clusij, A Kind of Celtick Nard.

Hirundinaria, *Chelidonium majus*, Celandine.

Hispidula, *Hedera terrestris*, *Pes Catii*, *Corona Terræ*, *Chamaecissus*, Ale-hoof, Ground Ivy.

Terrestris, *Hedera terrestris communis*, Common Alehoof.

Minor, Small Ale-hoof.

Montana, Mountain Ale-hoof.

Saxatilis, Stone or Rock Ale-hoof.

Huicca, *Yucca*, *Cassavi* or *Cazavi*, Indian Bread.

Vera, *Cassavi*, *Mandiocha*, True Yucca.

Hetich americanum, Potato-like Yucca.

Folij Aloeæ, Supposititious, or Aloe Leav'd Yucca.

Holoschanos, Great Bull Rush.

Holostium, *Gramen Leucanthemum*, Stitch-wort.

Holostium petreum, *Vilix saxatilis*, Rock Fern.

Holostium angustifolium, *Plantago Marina*, Sea Plantain, also Sea Thrift.

Holostium Loniceri, Mouffe Tail.

Hordeum, *Commune sativum* — *Critbe*, *Distichon*, *Polystichon*, Barley.

Agreste, Wild Barley.

Spurium, — *murinum*, Way or Wall Barley.

Horminum Hortense, *Sclarea*, *Gallitricum*, *Geminatis*, Clary.

Sylvestre, *Oculus Christi*, Wild Clary.

Horminum tridantinum, — *luteum*, *Colus Jovis*, *Jupitets Distaff*, Garden Clary.

Huniure, *Urtica*, Nettle.

Romana, — *Hortensis*, Roman Nettle.

Acuta, — *minor*, Small Stinging Nettle.

Hycinthus, *Jacinth*.

Americanus, American Jacinth.

Orientalis, Oriental Jacinth.

Botroides, Grape-flower'd Jacinth.

Hydropiper, *Periscaria acris*, *Periscaria non maculata*, Arsmart Biting.

Hydroselinum, *Paludapium*, *Apium aquaticum*, Smallege.

Hypecoun, *Cuminum Sylvestre*, Wild Cumin.

Hypericum, *Perforata*, Johns Wort.

Hypocheris, *Porcellia*, *Hyoseris*, *Hieracium asperum*, Swines Hawkweed, or Succory.

Hyoseris, *Hieracium minimum Clusij*, idem.

Hypocistis, The Juice of Cistus or Holy Rose, also the Extinction or Rape.

Hypegeson, *Barba Jovis*, *Sedum majus*, *Semprevivum majus*, The Great Houfleeck.

Hyoscyamus vulgaris — *niger*, Henbane Common or Black.

Albus, White Henbane.

Hyophthalmen, *After Atticus*, Greek Star-wort.

Hyoscyamus Peruvianus, *Petum*, *Nicotiana*, Tobacco.

Anglicus, English.

Virginianus, Virginian.

Hispanicus, Spanish Tobacco.

Hyssopus — *Hyssopum*, Hyssop.

Incelibris, — *infrequens*, Rare or Strange Hyssop.

Sylvestris, *Gratiola vera*, True Hedge Hyssop.

Sylvestris nothus, *Gratiola notha*, Bastard Hedge Hyssop.

J.

Jacea nigra, *Materfillon*, Black Knap weed, Mat-fellon.

Argentea, *Stabe notha vel spuria*, Silver Knap-weed.

Jacobæ, *Flos Jacobi*, *Herba Jacobi*, *Jacobi Senecio Lobelij*, James Wort, Rag-wort.

Marina, *Cineraria Dodonæi*, Sea Rag-wort.

Jalappa, *Jalap*, an American Species of Bryony.

Jasminum, *Jeseminum*, *Gesminum*, *Jessamy*, Gelsamy.

Jasione, *Campanula magna*, Bell-flower Great.

Minor — *parva*, Bell-flower Small.

Jarus, *Arum*, *Penis Sacerdotis*, Wake Robin, Cuckow-pint.

Maculatus — *um*, Spotted Wake Robin.

Non maculatus, — *um*, not Spotted.

Cucullatus — *um*, *Arisarum*, Hooded Wake Robin or Fryers Cowl.

Iberis, *Lepidium*, *Piperitis*, Dittander.

Monspeliaca, *Flamula Gesneri*, *Dentillaria Lobelij*, French Dittander, Scar-wort.

Ibga, *Abiga*, *Iva arthritica*, *Chamapitys*, Ground Pine, Gout Ivy.

Maritima, *Anthyllis herbariorum*, Sea Ground Pine.

Ibiscus, *Althea*, *Malva Palustris*, — *aquatica*, Marsh Mallow.

Illecebra minor acris, *Vermicularis*, Stone Crop Biting, Wall Pepper.

Inspida, Stone Crop not Biting.

Ilex, The Holm Oak.

Imperitoria, *Astrantia*, Master-wort.

Impatiens herba Dodonæi, *Noli me tangere*, *Periscaria filiquosa*, Wild Mercury called Quick in hand; Codded Arsmart, also Shrinking Shrub.

Imperatrix, *Aibumanticum*, *Anethum Sylvestre*, *Meum antiquorum*, *Meum*, Spignel.

Indico, *Fœcula Glasti Indici*, The Fœcula or Settlings of the Indian Woad or Glastum.

Inguinalis, *Bubonium*, *After atticus*, Greek Starwort.

Inula, *Helenium*, *Enula*, *Enula campana*, Elecampane.

Iaturis, *Capparis*, Capers.

Intybus, *Cichorium*, Succory.

Sylvestris, V Wild Succory.

Ion, *Viola*, Violet.

Hortensis, Garden Violet.

Sylvestris, V Wild Violet.

Nemoralis, V Wild, Jagged or Carolinian Violet.

Jovis arbor, *Quercus*, The Oak.

Jovis barba herba, *Semprevivum majus vulgare*, Our common Houfleeck.

Jovis,

Index Latinus.

Jovis Faba, *Hyoscyamus*, Henbane.
Alba, White Henbane.
Nigra, Black Henbane.
Jovis Flos, *Dios Anthos*, *Lychnis coronaria sativa*,
 Campions, or Rose Campions.
Sylvestris, Wild Campion.
Segetum, Corn Campion.
Ipidium Theophrasti, *Petasites*, Butter Bur.
Iris Bulbosa, Bulbous Flower-de-luce.
Tuberosa, Tuberous Flower-de-luce.
Tuberosa Florentina, Florentine Orrice.
Tuberosa Latifolia, Yellow Flower-de-luce,
 VWater Flower-de-luce, Skeg.
Iris humilis, *Chamæiris*, Dwarf Flower-de-luce.
Major, Greater Dwarf Flower-de-luce.
Minor, Smaller Dwarf Flower-de-luce.
Angustifolia, Narrow Leav'd Dwarf Flower-
 de-luce.
Iris bulbosa angustifolia major, Greater narrow
 Leav'd Iris, or Flower-de-luce.
Angustifolia minor, The Lesser narrow Leav'd
 Iris.
Iris agrestis, *Spathula fetida*, *Gladium fetidum*,
 Wild Flower-de-luce, Stinking Gladwin.
Isatis, *Gladium*, Wood.
Ischæmon vulgare, Cocks-foot Grafts.
Itea, *Salix*, Willow.
Iva arbutrica, *Abiga*, *Ibga*, *Chamæpitrys*, Ground
 Pine.
Iva moschata, idem.
Iucca, *Yucca*, *Cassavi*, *Cazavi*, Indian Bread.
Juglans, *Nux jugulans*, Wall-Nut.
Jujube, *Zizypha*, *Fujuba*, *Ziziphus*, *Jujubes*.
Juncus, *Scirpus*, *Schenos*, Rush.
Acutus vulgator, *Oxyfchenos*, Common
 small hard Rush.
Grandis, *Holofchenos*, Great Bull Rush.
Levis minor, Small Bull Rush.
Aquaticus, Common Water Rush.
Juncus odoratus rotundus, *Schenanthum*, Camels
 Hay.
Nothus, *Nothum*, Bastard Camels Hay.
Juniperus, Juniper.
Fusquiamus, *Hyoscyamus*, *Fabafuilla*, Henbane.
Albus, White Henbane.
Niger, black Henbane.
Funquillas, *Funquiles*, Rush Daffodil.

K.

K *Ali*, *Salsicornia*, *Salsicornia*, Glass-wort, Herb
 Kali.
Kebikengi, *Ranunculus*, Crowfoot.
Keiri, *Leucoium lateum*, Wall-flower.
Kemum, *Cuminum*, Cumin.
Kenne, *Ligustrum*, Privet.
Kermes, The Juice Alkermes, from the Berry
 Chermes or Kermes.
Kerva, *Ricinus*, *Palma Christi*, Great Spurge.
Kulb, *Milium folis*, *Lithospermum*, Gromwell.
Kusbor, *Coriandrum*, Coriander.

L.

L *Ablab*, *Phaseolus*, Kidney Bean.
Labrum Veneris, *Dipsacus*, *Carduus Vene-*
ris, Teale.
Fullonum, The Fullers or Garden Teale.
Sylvestre, Wild Teale.
Laburnum majus, *Anagris*, The Greater less Stink-
 ing Trefoil, or Bean Trefoil.
Minus, The Lesser, which by some is
 thought to be the *Coletea* of Theophrastus.
Labrusca, *Vitis Sylvestris*, Wild Vine.

Lactaria, *Tithymalus*, Spurge.
Hortensis, Garden Spurge.
Minor, *Efula minor*, Small Spurge.
Nemoralis, *Tithymalus Vallaris*, Wood
 Spurge.
Marina, *Herba Lactaria*, *Tithymalus para-*
licis, Sea Spurge.
Laureola, *Daphnoides*, Spurge Lawrel.
Lactuca Leporina, *Sonchus*, Sow Thistle.
Lactucella, idem.
Lactuca bortenfis, Garden Lettice.
Sylvestris, Wild Lettice.
Subaudica, Savoy Lettice.
Agnina, Lambs Lettice, Corn Sallet.
Ladanum, *Labdanum*, Gum of the Cistus Shrub.
Ladanum Segetum, *Sideritis arvensis*, Meadow
 Iron-wort.
Lagopus, *Lagopodium*, *Pes Leporis*, *Trifolium hu-*
mile, *Trifolium Triticum*, Hares-foot, or
 Spiked Trefoil.
Lagopyrus, idem.
Lampatan, *China radix*, China.
Lanium, *Archangelica*, *Galiopsis*, *Urtica iners*,
 ——— *mortua*, Dead Nettle, Archangel.
Album, VWhite Dead Nettle.
Rubrum, Red Dead Nettle.
Fetidum, Stinking Dead Nettle.
Lampsana, Dock Cress.
Linaria, *Pseudolinum*, Flax-weed, Toad Flax.
Scoparia, Broom Flax-weed.
Noiba, *Pseudolinaria*, Bastard Flax-weed.
Lancea Christi, *Ophinglossum*, *Lingua serpentis*, Ad-
 ders Tongue.
Lanceola, *Quinquenervia*, *Plantago minor*, Rib-
 wort, and Rib-wort Plantain.
Lantana, *Viburnum*, VWayfaring Tree.
Lapathum, *Rumex*, Common Field Dock.
Sanguineum sativum, Bloodwort Dock.
Acutum, *Rumex acutus*, Sharp-pointed Dock.
Aquaticum, *Hydrolopathum*, VWater Dock.
Maritimum, Sea or Marsh Dock.
Equinum, *Hippolopathum sativum*, Monks
 Rhubarb Dock.
Lappa major, *Bardana*, *Archeon*, *Profopis*, *Per-*
sonata, Greater Bur-Dock.
Minor, Lesser Bur-Dock.
Lapathum unctuosum, *Bonus Henricus*, English Herb
 Mercury.
Laferpitium, Lafer-wort, the Herb which Yields
 Lafer Gummi, The Gum Lafer.
Larix, Larch Tree; that which as some say,
 Yields our Common Turpentine.
Lathyrus perennis, *Cicerculum perennis*, *Ervum-*
Sylvestre, Pease Everlasting.
Perennis Sylvestre, VWild Pease Everlasting,
 or Tare Everlasting.
Lathyrus, *Cataputia minor*, *Efula*, Lesser Spurge.
Lavendula, *Lavandula*, *Pseudonardus*, *Nardus I-*
talica, Spike, Lavender.
Laudanum, A Medicine easing Pain.
Opiatum, An Opiate Laudanum.
Volatile, Volatile Laudanum.
Specificum, A Specifick Laudanum.
Catharticum, Cathartick or Purging Laudanum.
Laudata nobilium, *Veronica*, Speed-well.
Laulea veterum, *Laurus*, Bay Tree.
Laver, *Lavacrum*, *Dipsacus*, Teale.
Laurentina, *Bugula*, *Consolida media*, Bugle.
Laurus, *Lawea*, *Daphne*, The Bay Tree.
Laurustinus, The VWild Bay.
Laurocerassus, The Cherry Bay.
Laurus Alexandrinus, *Hippoglossum*, Alexandrian
 Bay, Horle Tongue Bay.
Laurus Rosea, *Oleander*, *Nerium*, Rose Bay.
Laurcol,

Index Latinus.

- Laurcola*, *Chamaelaphne*, *Daphnoides*, *Peplion*,
 Laurel, also Laurel Dwarf.
Leptites, *Clinopodium*, Wild Basil.
Legamen pallidum, Chickling Pease.
Lens, *Phaco*, *Phacor*, Lentils.
Lenticula, idem.
 Mirina, Sea Lentil.
Lens palustris, Ducks-meat.
Lenticula aquatica, idem.
Lentiscus, Lentisk or Mastich Tree.
Leontopetalon, *Pes Leoninus*, *Bramaria*, Lions-
 foot, Lions-leaf, Black Tutnep.
Lepidium, *Iberis*, *Piperitis*, Dittander.
Leptocaryon, *Nux avellana*, Filberd.
 Sylvestre, Hasle Nut.
Leucacantha, *Carlina alba*, White Flower'd Car-
 line Thistle.
Leucanthemis, *Leucanthemum*, *Chamamelum*, *Cha-*
momilla, Camonil.
Leucapiper, *Piper album*, VWhite Pepper.
Leucocium luteum, *Keiri*, *Cheiri*, VWall-Flower.
 Flore simplici, Single VWall-flower.
 Flore duplici vel pleno, Double VWall-flower.
Levisticum vulgare, *Laserpitium tertium Dodonæi*,
Smyrniun Fuchsij, Our Common Garden
 Lovage.
 Germanicum, German Lovage.
Ligustum, *Libysicum*, *Ligusticum*, *Siler Monta-*
num Tragi, *Ser montanum*, Ligustick or
 Bastard Lovage.
Ligusticum verum, — *latifolium*, — *commu-*
ne, *Siler montanum*, *Siselius*, The true
 Ligustick or Bastard Lovage broad Leav'd.
Astracium, — *angustifolium*, *Siler mon-*
tanum angustifolium, Ligustick or Bastard
 Lovage narrow Leav'd.
Libanotis, *Cervina alba*, Herb Frankincense.
Lichen, *Hepatica vulgaris vel major*, *Jecoraria*,
 Common or Ground Liverwort.
 Minor, *Hepatica minor*, Small Liverwort.
 Marinus, *Fucus marinus Ostraceus*, *Lalluca*
 marina, Oyster Green.
 Arborea, *Pulmonaria fungosa*, VWood Liver-
 wort; and by some Oak Lungs.
Lignum Vita, *Guajacum*, Pockwood or Guajacum.
Ligustrum, *Mabaleb*, *Phillirea*, Privet, Prim-print.
 Noibum, *Macaleb*, Bastard Privet.
Lignum Aloes, *Xyloaloes*, VWood of Aloes.
Lignum Colubrinum, Snake-wood.
Lignum Juniperinum, Juniper-wood.
Lignum Nephriticum, Nephritick VWood.
Lignum Rhodium, *Aspalathus*, Rose or Rhodium
 VWood.
Lilach, *Syringa*, Lilack, Pipe Shrub.
Lilium, *Crinon*, *Crinonia*, *Lirion*, Lilly.
 Album, VWhite Lilly.
 Americanum, American Lilly.
 Agreste, VWild Lilly.
 Angustifolium, Narrow Leav'd Lilly.
 Byzantinum, — *Corona Imperialis*, Lilly of
 Constantinople.
 Convallium, Lilly Convally, or of the Vally.
 Floridianum, Floridian Lilly.
 Hemerocallis, Bastard or Day Lilly.
 Imperiale, Imperial Lilly.
 Luteum, Yellow or Orange Tawny Lilly.
 Martagon, Mountain Lilly.
 Montanum, idem.
 Noibum, Bastard Lilly.
 Nympha alba, *Nenuphar*, VWater Lilly
 VWhite.
 Nympha lutea, VWater Lilly Yellow.
 Perficum, Persian Lilly.
 Rubrum, Red or Orange Tawny Lilly
 Rubrum praecon, Early Red Lilly.
- Turcicum*, Turkey Lilly.
Vernum, Lilly Convally or Spring Lilly.
Variegatum, Fritillary, Checquer'd Lilly.
Liliasphodelus, Asphodil or Day Lilly.
Lilioracissus, *Tulipa*, The Tulip or true Satyrion.
Limodorum, *Orobanche*, *Cauda Leonis*, Broom Rape.
Limonium, pl. *Limonia*, Limon, Limons.
Limonium, *Baglossum maritimum*, Mirth Bugloss.
Lingua Cervina, *Phyllitis*, Harts or Deers Tongue.
 Laciniata, Fingred Harts Tongue.
 Notha, *Hermionitis*, *Splenium*, Bastard
 Harts Tongue, or Mules Fern.
Linaria, *Pseudolinum*, Flax-weed, Toad flax.
Latifolia, Broad Leav'd.
Scoparia, *Italarum*, Besom Flax-weed.
Repens, *Pseudolinum repens*, Creeping Flax-
 weed.
 Notha, *Pseudolinaria*, Bastard Flax-weed,
Lingua asæ, *Fraxini semen*, Ath-Keys.
Lingua Bovis, *Baglossum Sylvestre*, Ox Tongue.
Lingua Bubula, idem.
Lingua Pugana, *Hippoglossum*, *Bislingua*, *Uvularia*,
 Horfe Tongue the Herb.
Lingua Serpentis, *Lancea Christi*, *Ophibglossum*,
 Adders Tongue.
Lingua Vulneraria, idem.
Linum satium, Flax Manured.
 Sylvestre, VWild Flax.
 Catharticum, Purging Flax, Mill Mountain.
Liquiritia, *Glycyrrhiza bortenfis*, Manured or true
 Liquorice.
 Sylvestris, VWild Liquorice.
Lirion, *Lilium*, *Crinon*, Lilly.
Liriosphodelus, *Liliasphodelus*, Asphodil Lilly.
Lirionarcissus, *Lilioracissus*, Tulip, Satyrion.
Lisen, *Plantago*, Plantain.
Lithospermum, *Milium solis majus*, Gromwell.
 Minus — *Sylvestre*, Lesser or VWild
 Gromwell.
 Repens, Creeping Gromwell.
Lolium, *Æra Plinij*, *Triticum satium*, Darnel.
 Rubrum, *Phœnix*, Red Darnel.
Lonchitis, *Asplenium*, Spleenwort.
 Vera, *Cetetach*, True Spleenwort.
 Aspera, *Pseudelonchitis*, Rough or Bastard
 Spleenwort.
Longina, *Lonchitis*, Spleenwort.
Lopina, *Castanea*, Chestnut.
Lotus arbor, Nettle Tree.
Lotus Herba, Trefoil Pease.
Luciola, *Lingua Serpentis vel Serpentina*, Adders
 Tongue.
Lunaria Arithritica, *Auricula Urfi*, *Sanicula*, Bears
 Ear, A VVound Wort.
Lutea Plinij, *Luteum Vitruvij*, *Luteola*, *Herba*
Lutea, *Pseudofruthium* Matth. Dyers
 Weed.
Luzula, *Oxys*, *Trifolium acetosum*, Wood Sorrel.
 Flore albo, Wood Sorrel white Flowered.
 Flore luteo, Yellow flower'd.
Lunaria minor, *Selenitis*, Moon-wort.
Lupinus, Lupine, Flat Bean, Fig Bean.
Lupulus, *Lupus salutaris*, *Vitis salutaris*, Hops.
 Sylvestris, — *Fœmina*, — *Septentri-*
 onalis, Wild Hops.
Luteola, *Lutea*, Dyers Weed, Wold, Weld.
Lybica Plinij, *Populus*, The Poplar.
Lycbnis sativa, Campions Manured.
 Segetum, Corn Campions.
 Plumaria, Feathered Campions.
 Sylvestris, VWild Campions.
 Hortensis, — *multiflora*, Batchelors But-
 tons.
 Chalcedonica, *Byzantina*, Flower of Con-
 stantinople.

Lycium,

Index Latinus!

Lycium, *Pyxantha*, *Spina Buxea*, Box Thorn.
Lycoperficum, *Malum aureum*, *Pomum amoris*,
 Love Apples.
Lycopsis, *Echium alterum*, VVall Buglofs.
Lysimachia lutea, Loofe-ftirfe or VVillow-herb.
Spicata, Spiked Loofe-ftirfe.
Non spicata, Loofe-ftirfe not spiked.
Siliquosa, Loofe-ftirfe Codded.

M.

M *Actis*, Mace; the Spice.
Macropiper, *Piper longum*, Long Pepper.
Magopistana, *Sagittaria*; *Saguta*, Arrow-head.
Mabaleb, *Phylliree species*, Privet, Prim-print.
Macaleb, *Ligustrum notum*, Bastard Privet.
Majorana, *Amaracus*, *Sampficum*, Marjoram.
Hortenfis, Sweet Marjoram.
Latifolia, Pot Marjoram.
Sylvestris, *Canila bubula*, VVild Marjoram.
Hircina, *Tragoriganum*, Goats Marjoram.

Mala infana, Mad Apples.
Malabathrum, *Folium Indum*, Indian Leaf.
Malucocifus, *Hedera terrestris*, Ale-hoof.
Maluche, *Malva*, Mallow.
Malva communis, Common Mallow.
Pulstris, *Althea*, Marsh Mallow.
Verbenaca, *Aleca*, Vervain Mallow.
Arborea, — *Rosea*, *Althea Frutex*, Shrub Mallow.
Arborescens, Hollihocks.
Major, Garden Mallow, Hollihock.

Matocavicum, *Malva ibifens*, *Althea*, Marsh Mal-
 low.

Malum, pl. *Mala*, An Apple, Apples.
Malum Amoris, Love Apple.
Malum Armeniacum, An Apricock.
Malum Adami vel Musae, Adams Apple.
Malum aureum, — *Hespericum*, An Orange.
Malum aurantium, idem.
Malum Caninum, *Malum Mandragora*, Mandrake Apple.

Malum Claudianum, Queen Apple.
Malum Citrium, A Citron.
Malum Cotonum, A Quince.
Malum Cydonium, idem.
Malum Granatum, Pomgranate.
Malum Hespericum, An Orange.
Malum insanum, Mad Apple.
Malum Limonium, A Limon.
Malum Mori, Mulberry.
Malum Medicum, *Citrium*, A Citron.
Malum Mespilum, A Medlar.
Malum Nettareum, A Nectarine.
Malum Persicum, A Peach.
Malum Punicum, A Pomgranate.
Malum Sanguineum, Summer Goldings.
Malum Sylvestre, The Crab Apple.
Malum Terre, Round Birchwort Root.
Malum Terre Porcinum, Sowbread Root.
Malum Turcicum, Great round Citron, Shaddock.
Manibot, *Jucca*, *Yucca*, *Huacca*, Indian Bread.
Manna, Calabrian or Purging Manna.
Manus Martis, *Quinquifolium*, Cinkfoil.
Mandragora Atis, Male Mandrake.
Femina, Female Mandrake.
Matriphyllum, *Jacea nigra*, Black Knapweed.
Marrabium, *Prassium*, Horehound.
Album vulgare, Common White Horehound.
Nigrum, — *Hispanicum*, Black Hore-
 hound.
Aquaticum, — *Aquatile*, Water Horeh.
Notum Spurium, *Stachys*, Wild Horehound.
Maragon, *Lilium Montanum*, Mountain Lilly.
Marum, *Clyopodium Dioscorid*, Herb Maltich.
Repens, Creeping Herb Maltich.
Syriacum, Assyrian Herb Maltich.

Marathrum, *Feniculum*, Fennel.
Dulce, Sweet Fennel.
Agreste, — *Sylvestre*, *Hippomarathrum*,
 Horse Fennel, Wild Fennel.
Marinum, *Cribbium*, Sea Fennel.
Porcinum, *Pucedonum*, Hog Fennel.
Marana, *Stramonia*, *Stramonium*, Thorn Apple.
Minor, *Datura*, Dutery.
Marinella, *Pbu magnum*, Great Valerian.
Marmorites, *Fumaria*, Fumitory.
Marmorella, *Eupatorium*, *Agrimonia*, Agrimony.
Mastiche, *Lentiscus*, Maltich Tree.
Mastiches, *Laferpitium*, Lafer-wort.
Matrefillon, *Jacea nigra*, Common Knapweed.
Matricalis, *Verbena*, *Verbenaca*, Vervain.
Matricaria, *Febriifuga*, Feverfew.
Matrifylvia, *Periclymenum*, Woodbind.
Matrifalvia, *Scalaria*, *Horminum*, Clary.
Matibatna, *Anisum*, Anife.
Materfillon, *Jacea nigra*, Common Knapweed.
Mater Herbarum, *Artemifia*, Mug wort.
Meconium, *Succus Papaveris*, Expressed Juice of
 Poppies, Meconium.
Mecoacanna, *Mechacana*, Bryony of Mexico and
 Peru.
Melica, *Trifolium Cochlearium*, Claver Grass, Me-
 dick Fodder, St. Foin.
Melampyrum, *Cratagonum*, Cow Wheat.
Melampodium, *Helleborus niger*, Black Hellebor.
Melampyhyllus, *Branca Urfina laevis*, Smooth Bears
 Breech.
Melosperrum, *Melanthium*, *Nigella*, Gith, Ka-
 tharine Flower, Roman Nigella.
Melanthium, *Nigella Romana*, idem.
Melanospermum, *Piper nigrum*, Black Pepper.
Meleagris flor, *Fritillaria*, Chetquered Daffodil,
 Fritillary.
Melocasta, *Melocardium Echinatus*, Melon Thistle
 of America.
Melopepo, *Melopepon*, *Melo Mofchatus*, Musk
 Melon.
Melissophyllum, *Melites*, *Melissa*, *Citrage*, Bawm.
Meliandrum Plimj, *Lychnis Sylvestris*, Wild Cam-
 pion.
Melilotus, *Corona Regia*, *Trifolium odoratum*, Mo-
 lilote.
Melicha, *Sorgum*, Turkey Millet.
Meline, *Panicum*, Panick, Guinny Corn.
Meline Varronis, *Milium*, Millet.
Melissa, *Melissophyllum*, *Citrage*, *Melites*, Bawm.
Melo, *Pepo hortensis*, Melon or Pompon.
Memecyllon, *Fructus Arbuti*, Berries of the Straw-
 berry Tree.
Memithe, *Glucium*, *Pomum Amoris*, Apples of
 Love.
Menianthes Theophrasti, *Trifolium Paludosum*, Wa-
 ter Trefoil, Buck Bean.
Menogonion, *Peonia*, Peony.
Meniba fellina, *Cattaria*, *Nepeta*, Nep or Cat
 Mint.
Mentha, *Cattaria*, idem.
Meniba Saracenic, *Balsamita major*, *Meniba*
Græca vel Romana, Costmary.
Mentastrum, *Symbrium*, *Sylvestre*, Horse Mint.
Mentastrum aquaticum, Water Mint, Fen Mint.
Mercurialis Anglica, *Bonus Henricus*, English Mer-
 cury.
Mercurialis Gallica, French Mercury.
Canina, — *Sylvestris*, *Cynocrambe*, Dogs
 Mercury.
Merzenia, *Majorana*, Marjoram.
Mespilus, Medlar Tree.
Meum, *Arbunaticum*, *Anethum sylvestre*, *Meum*
Antiquorum, Spignel.
Meu, *Meum*, idem.

Mesereon,

Index Latinus.

Mezereon, Chamaelea Germanica, Spurge Olive, Mezereon.
Militaris, Sedum aquaticum minus, Small Water Sengreen, or Water Soldier.
Milium, Cenchrus, Meline varronis, Millet.
Millum folis, Lithospermum majus, The Common or Greater Gromwell.
Minus, — *Sylvestre*, Small or Lesser.
Repens, Creeping Gromwell.
Millefolium, Militaris, Stratiotes, Chylophyllus, Achillea, Yarrow.
Achilleum, Achilleas, Achilles or Noble Yarrow or VVound-wort.
Luteum, Yellow Yarrow.
Aquaticum, — *Paludosum*, VVater Yarrow.
Feniculatum, Fennel Leav'd Yarrow.
Millegrana, Herniaria, Herniola, Empetron Tragi, Rupture-wort.
Millemorbia, Scrophularia, Ficaria, Fig-wort.
Mimulus, Nummulus Plinij, Nummularia, Money-wort, Herb Twopence.
Mirabile Peruvianum, Jasminum Mexicanum, Marvel of Peru.
Molybdena, Dentillaria Rondoletij, Plumbago Plinij, Plinies Lead-wort.
Mollugo, Rubia notha, Bastard Madder.
Mollugo vulgarior, Gallium album, VVhite Flower'd Ladies Bedstraw.
Moly, Allium Cepeum, Moly, Onion Garlick.
Momordica, Balsamita mas & major, Costmary.
Monophyllum, Unifolium, One Blade.
Morella, Solanum hortense, Solatrum, Garden Nightshade.
Letbalis, Dwale, Deadly Nightshade.
Somnifera, Sleepy Nightshade.
Circea, Inchanters Nightshade.
Arborefcens, Shrubby Nightshade.
Morion, Anthropomorphos, Circea, Mandragora mas, Male Mandrake.
Femina, Female Mandrake.
Morfus Diaboli, Succisa, Nigina Plinij, Geum antiquorum quorundam, Devils Bit.
Morfus Gallinae, Alfine Hederacea vel Hederula, Hen-bit, Chickweed Ivy Leav'd.
Morfus Ranae, Nymphaea parva, Nymphaea alba minima, Frog-bit.
Morus, Sacaminos, Mulberry Tree.
Mula Herba, Ceterach, True Splenwort.
Multi radix, Centaurium minus, The Lesser Centorty.
Multi Bona, Petroselinum, Parsly.
Muscari, Hyacinthus Boiroides Moschatas, Musk'd Grape Flower'd Jacinth.
Muscipula, Viscaria, Catch Fly.
Muscus, Bryon Plinij, Mofs.
Terrestris, Ground Mofs.
Arboreus, Tree Mofs.
Pulmonarius, Lungwort Mofs.
Quernus, Quercinus, Oak Mofs.
Marinus, Sea Mofs.
Myrrum, Melampyrum, Gold of Pleasure.
Noibum, Pseudomyrsinum, VVild Gold of Pleasure.
Myacantha, Asparagus, Asparagus.
Myofotis, Auricula Muris, Piosella, Moufe Ear.
Myofuros, Canda Muris, Holoftcum Loniceri, Moufe Tail.
Myrtillus, Myrsine, Myrtle.
Myrtus no'ilis, Noble Myrtle.
Myroalanum, A Myrobalane.
Myrris Smyrrhiza, Smyrrium, Conilows, Cifley, Sweet Cifley.
Myrica, Tamariscus, Tamarix, Tamarisk.
Myrsanon, Doroncum, VVoolfsbane Antidote.
Myrolyllon, Millefolium, Yarrow.
Myrrha, Myrrh, the Rofin.

Myrtus Brabantica, Rhus Sylvestris, Myrtus Anglicana, Sweet Gaul.
Myrtus notha, Pseudomyrsine, Eleagnus Cordi, idem.
Myxarion, Sebesten, The Fruit Sebesten.

N.

Napellus, Thora, Cappa Monachi, Luparia, Monks-hood, Helmet-flower.
Napus, Bunias, Garden Navew Gentle.
Sylvestris, — *Agrestis, Bunium*, Wild Navew.
Nana Bauhini, Ananas, Pine Apple.
Narcissus latifolius, Daffodil broad Leav'd.
Flore simplici, Single Flower'd Daffodil.
Flore multiplici, Double Flower'd Daffodil.
Narcissus angustifolius, Daffodil narrow Leav'd.
Simplex, Single Flower'd Daffodil.
Flore pleno, Double Flower'd Daffodil.
Narcissus, Juncifolius, Rush Daffodil, Junquile.
Flore simplici, Bulbus Vomitorius, Single Flower'd.
Flore pleno, Bulbus Vomitorius flore pleno, Double Flower'd.
Marinus, — *Littoralis*, Sea Junquile.
Narcissus nothus latifolius, Pseudo narcissus latifolius, Broad Leav'd Bastard Daffodil.
Flore simplici, Single Flower'd.
Flore multiplici, Double Flower'd.
Narcissus nothus angustifolius, Bastard Daffodil narrow Leav'd.
Flore simplici, Single Flower'd.
Flore pleno, Double Flower'd.
Juncifolius, Rush Leav'd Bastard Daffodil.
Narcissus marinus, Sea Daffodil.
Lilio variegatus, Checquer'd Sea Daffodil, Fritillary Daffodil.
Nardus Indica, Indian Spicknard.
Celtica, Celtick Nard or Spicknard.
Cretica, Phu magnum, Great Valerian.
Ruffica, Afarum, Afarabacca.
Naronica radix, Iris, Flower-de-luce Root.
Narthax, Ferula, Fennel Giant.
Nasturtium Hybernium, Barbarea, Winter Crefs.
Nasturtium hortense, Garden Crefs.
Aquaticum, Sysymbrium aquaticum, VVater Crefs.
Arabis, Draba, Turkey or Arabian Crefs.
Agreste, — *Sylvestre*, VVild Crefs.
Barbarea, Winter Crefs.
Cardamantica, Iberis, Lepidium Campestre, Scitica, Crefs.
Cardamine flore pleno, Double Flower'd Meadow Crefs.
Hybernium, Winter Crefs.
Indicum, Indian Crefs.
Impatiens, Noli me tangere, Impatient Crefs.
Pratenfe flore simplici, Sysymbrium alterum, Meadow Crefs fingle Flower'd.
Petraeum, Stone or Rock Crefs.
Saxatile, idem.
Natrix Plinij, Ononis vel Anonis, Lutea non spinosa, Arestia Bovis, Restharrow, Cammock.
Nenuphar, Nymphaea alba, White Water Lilly.
Neotia, Nidus avis, Orchis abortiva, Birds Nest.
Nephriticum Lignum, Nephritick Wood.
Nepeta, Catarrha, Mentha Catarrha, — *Fellina*, Nep or Cat Mint.
Nerium, Neris, Oleander, Rose Bay.
Nicotiana, Petum, Tobaccum, Tobacco.
Hispanica, Spanish Tobacco.
Virginiana, Virginian Tobacco.
Anglica, Hyoscyamus luteus, English Tobacco.

Nidus

Index Latinus.

Nidus avis, *Orchis abortiva*, *Neottia*, Birds Nest.
Nigella, *Melanthium*, Gith, Fennel Flower.
Nigella Romana, *Flos divi Catharinae*, Katharin's Flower.
Nigellastrum, *Pseudomelanthium*, Cockle.
Nilifer, *Nymphaea*, Water Lilly.
Noli me tangere, *Periscaria filiquosa*, Codded Arsmart.
Nasturtium impatiens, Impatient Cress.
Cucumis agrestis, Wild Cucumber.
Nummularia, *Alimulus*, *Centumvorbia*, Money Wort, Herb Twopence.
Nucula terrestris, *Bulbocastanum*, Ground Nut, Earth Nut.
Nucleus Pineus, *Fructus Pini*, A Pine Nut.
Nux, pl. *Nuces*, Nut, Nuts.
Nux Græca, pl. *Nuces Græca*, *Amygdala*, a, Almond, Almonds.
Nux Heracleotica, — *Prenestina*, *Avellana*, Filbert Nut.
Sylvestris, *Corylus*, Hasle Nut.
Nux Indica, *Coccus ferens*, Cocar Nut.
Nux Indica, *Nucula Indica*, Indian Nut.
Nux Jugulans, Wall Nut.
Nux Moschata, Nutmeg.
Nux Vesicaria, Bladder Nut.
Nux Vomica, Vomiting Nut.
Nymphaea minima, *Morsus Ranae*, Frog Bit.
Nymphaea alba, *Nenuphar*, White Water Lilly.
Nymphaea rubra lutea, Red or Yellow Water Lilly.

O.

Ocellus *Damoecenus*, *Caryophyllus hortensis*, Carnations, Clovegilliflowers.
Ocbrus Lugdunensis, *Ervilia*, Winged VWild Pease.
Ocymastrum Valerianthor, *Dodonæus's* Red Valerian, Basil Valerian.
Ocymum vel Basilicum hortense, Garden Basil.
Caryophyllatum, Clove Basil.
Citratum, Citron Basil.
Petraum, *Acinus*, *Clinopodium*, Stone Basil.
Americanum, American Basil.
Sylvestre, VWild Basil.
Ocularia, *Eufragia*, *Euphrasia*, Eyebright.
Oculus Bovis, *Bupthbalmum*, *Chrysanthemum Gefneri*, Ox Eye.
Verum, The True Ox Eye.
Album, VWhite Flower'd Ox Eye.
Oculus Christi, *Horminum Sylvestre*, VWild Clary.
Odontis, *Dentillaria Rondoletij*, *Plumbago Plinij*, Pliny's Leadwort.
Oenochora Theophrasti, *Onagra veterum*, *Chamænerium*, *Lyfimachia filiquosa*, Codded Loofe-ftife.
Oenanthe, *Filipendula*, Dropwort.
Angustifolia, — *Folij Apii*, Nartow Leav'd Dropwort.
Cicuta facie, Hemlock Leav'd Dropwort.
Aquatica, VWater Dropwort.
Olea, *Oliva*, An Olive Tree.
Oleaster, VWild Olive Tree.
Oleagnus, *Chamelæa*, VVidow VVail.
Oleum, Oil.
Olivarum, Oil of Olives.
Oleander, *Nerium*, Rose Bay.
Oliva, pl. *Oliva*, An Olive, Olives.
Olus Indiacum, *Corcoras*, *Anagallis*, Pimpernel.
Olusatrum, *Hippocelinum*, Alexander.
Olibanum, *Thus*, The true Frankincense.
Olivum, Oil of Olives.
Olivella, *Oleostellus*, A Dwarf Olive Tree.
Ovalidia, *Chamæmelum*, Camomil.
Omphacium, An unripe thing, whether Grapes or Olives, their Juice or Oil.

Onagra, *Chamænerium*, *Lyfimachia filiquosa*, Codded Loofe-ftife.
Onoclea, *Anchusa*, *Alcanna*, Alkanet.
Onobrychis, *Campanula arvensis*, *Speculum Veneris*, *Caryophyllus Segetum*, Corn Gilliflower, Corn Pink, Ladys Looking Glas.
Onobrychis, *Caput Gallinaceum*, *Glaux Gefneri*, Cocks Head, Red Fitching, Muttick Fitch.
Onofma, *Buglossum Sylvestre*, *Ecbioides*, VWild Buglofs.
Onocordon, *Gramen Phalaroides*, Canary Grass.
Ononis, *Anonis*, *Arestia Bovis*, *Remora Atri*, Redtharow.
Onopordum, *Acanthium*, *Carduus Tomentosum*, VVoolly or Cotton Thistle.
Onopryxus, *Carduus Astinurus*, — *Sylvestris*, Affes or Highway Thistle.
Ophioglossum, *Lingua Serpentis*, Adders Tongue.
Ophioscorodon, *Allium Viperinum*, Vipers Garlic.
Ophris, *Bisolum*, *Pseudorchis*, *Elleborine quorundam*, Twa Blade.
Palustris, *Mirrh Twa-Blade*.
Opium, *Papaveris succus condensatus*, Opium or the condensed Juice of Poppies.
Opobalsamum, The Finest sort of Balm.
Opopanax Gummi, The Gum Opopanax, proceeding from Panax or All-heal.
Opsago, *Solanum somniferum*, Sleepy Nightshade.
Opuntia Plinij, *Ficus Indica*, Indian Fig, which Eaten, colors the Urine Red.
Orbicularis, *Artanita*, *Panis Porcinus*, *Cyclamen*, *Cyclaminus*, Sow-bread.
Orchis, *Cynorchis*, *Testiculus*, *Testiculi Canis*, Dogs Stones.
Orchis abortiva, *Orobanchæ Gefneri*, *Neottia*, *Coagulum Terra*, Birds Nest.
Orchis Hircina, *Tragorchis*, Goats Stones.
Orchis Morio, Fools Stones.
Orchis Palmata, Fenny or Handed Stones.
Orchis Serapias, Serapias Stones.
Oreoselinum, *Petroelinum*, Garden Parsly.
Origanum, *Cunila*, *Cunila Bubula*, *Majorana nobis vel sylvestris*, *Origanum*.
Orminum, *Horminum*, *Sclarea*, Clary.
Orneoglossum, *Fraxinus*, Alh Tree.
Ornus, *Malva*, *Fraxinus*, idem.
Sylvestris, VWild Ash or Quicken Tree.
Ornithogalum, Star of Bethlehem.
Album, *Bulbus Leucanthemum minor*, VWhite Star of Bethlehem.
Ornithopodium, *Per Avis*, *Polygalum Dioscoridis quorundam*, Birds Foot.
Nodefum, *Herniaria*, Knotted Birds Foot, a Kind of Vetch.
Orobanche, Broom Rape.
Gefneri, *Nidus Avis*, *Orchis abortiva*, *Neottia*, Birds Nest.
Orobellon, *Pæonia*, Peony.
Mis, Male Peony.
Fæmina, Female Peony.
Orobis, *Ervum*, *Vicia amara*, Orobis or Bitter Vetch.
Hortensis, — *vulgaris*, *Mochus*, Garden Orobis.
Sylvestris, *Ervum Sylvestre*, *Ctenance Gefneri*, *Lathyrus Sylvestris minor*, VWild Orobis or Bitter Vetch.
Sylvaticus, *Sylvarum*, VWood Orobis.
Gramineus rubens, *Lathyrus Sylvestris Gramineus ruber*, Crimfon Flower'd, Scarlet Grass Vetch.
Creticus, Candy Orobis or Bitter Vetch.
Orontium, *Os Leonis*, *Leo Herba*, *Canis Cerebrum*, *Antirrhinum*, Calves Snout.

Index Latinus.

- Orvalla, Sclarea, Horminum, Clary.*
Sylvestris, Oculis Christi, Wild Clary.
Oryza, Oryzon, Arzi, Rice.
Osteocollon, Consolida major, Symphytum, Comfrey.
Os Leonis, Antirrhinum, Orontium, Leo Herba,
Canis Cerebrum, Calves-Snout.
Ossris, Linaria, Pseudolinaria, Flaxweed, or Toad-
Rax.
Notha, Pseudolinaria, Bastard Flaxweed.
Latifolia, Broad Leav'd Flaxweed.
Repens, Pumila, Creeping Flaxweed.
Scopae, Scoparia Italorum, Beefom Flaxweed,
or Toadflax.
Ostrutium, Imperatoria, Asprantia, Masterwort.
Osmunda Regalis, Filix florida, — Aquatica,
Flowering Fern, Water Fern, Osmund Royal.
Oribonna Rondoletij, Anemone, Herba venti, Ane-
mony, Wind Flower.
Oxalis, Accioka Hortensis, Lophanthum acidum, Ru-
mex acidus, Garden Sorrel.
Sylvestris, — minor, Accetofella, Lapa-
tholum acidum, Field Sorrel.
Nemoralis, Oxytriphylum, Trifolium aceto-
sium, Alleluja, Lujula, Oxy, Wood
Sorrel.
Oxys, Lujula alba, Oxytriphylum album, White
Wood Sorrel.
Lutea, Yellow flower'd Wood Sorrel.
Oxya, Fagus, Beech Tree.
Oxyacantha, Amyrbis Seraponis, Haw Thorn.
Oxymyrsine, Ruscus, Bruscus, Scopae Regia, Butch-
ers Broom, Knee Holm.
Oxycedrus, Prickly Dwarf Cedar.
Oxyacanthus, Pyracantha, Evergreen Thorn.
Oxycheilus, Juncus acutus, Common hard sharp-
pointed Rush.
Oxyphenix, Tamarindus, Tamarind Tree.
- P.
- P** *Aedrota, Acanthus, Bears Breech.*
Peonia, Panbiceraton, Glacyside, Dulcisida,
Aglaophotis, Herba casta, Peony.
Mex, Mile Peony.
Femina, Female Peony.
Flore duplici, Double Flower'd Peony.
Palatia, Cyclamen, Cyclaminus, Panis Porcinus, Ar-
tanita, Sow Bread.
Palma, Phoenix, Date Tree.
Palma Christus, Ricinus, Great Spurge.
Paliurus, Rhamnus terius Dioscoridis, Jews Thorn,
that with which, as it is said, Christ was
Crowned.
Panaratium Marinum, Hemerocallis Valentina, Pan-
cratium flore Lilij, Scilla Marina, The
Poisonous Sea Squill.
Panava, Lignum Molucense, Moluccas Tree.
Panax magna, Panaces magnum, Allheal Great.
Herculea, Hercules's Woundwort, Allheal.
Herculea altera, Hercules's other Allheal
Common.
Coloni, Stachys Palustris, — aquatica,
Clowns Woundwort, Allheal.
Asclepia, Esculapius's Allheal.
Americana, American Allheal, or Wound-
wort.
Paludapian, Apium, Apium palustre, — aqua-
ricum, Smallage, Water Parsly.
Hortense, Apium Hortense, — crispum,
Garden Smallage, or Sallary.
Dulce, Apium dulce, Sweet Smallage.
Panicum, Meline, Melinus, Dochon, Panick.
Paris Cuculi, Lujula, Alleluja, Trifolium aceto-
sium, Oxy, Oxytriphylum, Wood Sorrel.
Panis Porcinus, Artanita, Cyclamen, Cyclaminus,
Palatia, Sow Bread.
- Poppai, Battata Anglicana, English Potatoes.*
Hispianum, Spanish Potatoes.
Virginiana, Virginian or American Potatoes.
Papaver Hortense, — sativum, Alecon, Garden
Poppy.
Album sativum simplex, White single Poppy.
Album multiplex, White double Poppy.
Nigrum sativum simplex, Black single Poppy.
Nigrum vel purpureum multiplex, Double
Black Poppy.
Rubrum sativum simplex, Red single Poppy.
Rubrum multiplex, Double Red Poppy.
Rheas flore multiplici, Double Corn Pop-
py.
Spinosum, Thorney Poppy.
Papaver sylvestre, — Sagenum, — Erraticum,
Papaver Rheas, Wild or Corn Poppy.
Nothum, Argemone, Argemone, Bastard
Wild Poppy.
Cornutum, — Cerniculatum, Horned
Wild Poppy.
Spumeum, Spattling Poppy.
Papaverculum, Leontopetalon, Pes Leoninus, Bru-
maria, Lions Leaf, Lions Foot, Oaken
Turnep, Black Turnep.
Papillaris, Lampsana, Dock Cress.
Papyrus, Papyrus Nilotica, — Aegyptica, Paper
Reed.
Paralytica alpina, Auricula Ursti, Sanicula Ursina,
Bears Ear.
Parabysis Herba major, Primula veris major Arthri-
tica, Cowllip.
Minor, Primula veris minor, Primrose.
Parietaria muralis, Helxine, Herba muralis, Pel-
litory of the Wall.
Hispatica, Pyrethrum, Pellitory of Spain.
Notha, Imperatoria, Masterwort.
Paronychia, Whitlow Grass, Nailwort.
Folio rutaceo, Whitlow Grass Rue Leav'd.
Parthenium, Matricaria, Febrifuga, Featherfew.
Pastinaca latifolia sativa, Staphylinus latifolius,
Garden Parsnep.
Sylvestris, Elaphoboscum Plinij, Wild Pars-
nep.
Infusa, Mad Parsnep, Madnep.
Vaccina, Spondilium, Spondilium, Cow
Parsnep.
Aquatica latifolia, Sium, Broad Leav'd VVa-
ter Parsnep.
Aquatica angustifolia, Narrow Leav'd VVa-
ter Parsnep.
Pastinaca tenuifolia sativa, Garden Carrot.
Sylvestris, Daucus, VWild Carrot.
Cretica, Daucus Creticus, Candy VWild Car-
rot.
Pollen Veneris, Scandix, Acus Veneris, Acula Scen-
aria, Shepherds Needle.
Pollon, Consolida major, Symphytum, Comfrey.
Pedicularis, Pedicularia, Christa Galli, Loufe-wort,
Red Rattle Grass.
Pegonum, Ruta sylvestris, VWild Rue.
Pratense, — palustre, Thalictrum, Tha-
lictrum, Meadow Rue.
Pentadactylon, Ricinus, Palma Christi, Great
Spurge.
Pentaphyllum, Quinquifolium, Cinkfoil.
Peplis maritima, Lactaria, Thymalus paralicis,
Herba Lactaria, Small Purple Sea Spurge.
Pepo, Melo, The Great Pompon or, Melon.
Sylvestris, VWild Pompon.
Melopepon, Musk Melon.
Peplus Dodonaei, Peplus, Efula rotunda, Round
Efula, or Spurge.
Percepier Anglorum, Scandix minor, Parsly Break
Stone.
- Perdi-

Index Latinus.

Perdicaria, Parietaria, Herba Muralis, Pellitory of the Wall.
Perdicium, idem.
Perdicia, Helxine, idem.
Perforata, Hypericum, *Fuga Demonum*, Johnswort.
Minor, Hypericum minus, Lesser Johnswort.
Peristerium, Verbena, Vervain.
Perfoliata, Perfoliatum, Diaphyllum, Through Wax.
Perichyemenum, Volucrum majus, Caprifolium Martisifolium, Woodbind.
Periploca, Apocynum, Dogs Bane.
Relia — *major*, Greater or Upright Dogs Bane.
Virginiana, Virginia Silk Grass.
Virginiana minor, Lesser Virginia Silk Grass.
Perficaria maculata, Spotted or Mild Arsmart.
Non maculata, Hydropiper, Biting Arsmart.
Siliquosa, Noli me tangere, Codded Arsmart.
Perpensa, Asarum, Nardus Rustica, Afarabacca.
Sylvestris, Asarina, Wild Afarabacca.
Perfolata Plinii, Petasitis, Pestifuga, Butter Bur.
Personata, Lappa major, Bardana major, Greater Bur Dock.
Minor, Lappa minor, Xanthium, Bardana minor, Lesser Bur Dock.
Pes Anserinus, Arripex sylvestris latifolia, Goose Foot.
Pes Avis, Ornithopodium, Polygalum Dioscoridis quorundam, Birds Foot.
Pes Galli, Ranunculus, Crowfoot.
Pes Leonis, Sanicula major, Stellaria Matthioli, Alchimilla, Ladies Mantle.
Pes Leporinus, Lagopus, Lagopodium, Trifolium humile, Trifolium triticeum, Hares Foot.
Pes Vituli, Arum, Wake Robin, Cuckow Pint.
Pestifuga, Petasites, Perfolata, Butter Bur.
Petasites, idem.
Petrofelinum, Apium Hortense, Garden Parsly.
Sylvestre, Selinum, Sifum vulgare, Wild Parsly.
Macedonicum, Orofelinum, Stone Parsly.
Petrofelinum maceum, Hippofelinum, Smyrnum, Equapium, Alexander.
Creticum, Cretick Alexander.
Petrapium, Petrofelinum Macedonic, Stone Parsly.
Petilius flos, Flos Africanus, African Marigold.
Petum, Nicotiana, Herba Regina, Tabacca, Tobacco.
Anglicum, Hyofcyamus luteus, English Tobacco.
Hispanicum, Spanish Tobacco.
Americanum, American or Virginian Tobacco.
Peucedanum, Pinastella, Feniculum Porcinum, Hog or Sow Fennel, or Sulphur-wort.
Majus, Great Hog Fennel.
Commune, The Common Hog Fennel.
Pumile, Dwarf Hog Fennel, or Sulphur-wort.
Phacos, Lens, Lenticula, Lentils.
Phalangitis, Phalangium, Spider-wort.
Phafganum, Gladiolus Segetalis, Vidoralis rotundus, Corn Flag.
Luteum, Yellow Water Flag, Skeg.
Phalaris pratensis, Quaking or Trembling Grass.
Phalangium, Phalangitis, Spider-wort.
Phafeolus, Smilax Hortensis, Kidney Bean.
Coccinus, Scarlet Bean.
Pheilandrinum, Cicuta Palustris, — *Aquatica*, Water Hemlock.
Pheiodrys, Sabur, Cork Oak.
Philanthropus, Agrimonia, Agrimony.
Ptilacerrion, Aparine, Goose Grass, or Clivers.
Philateria, Polemonium, Shrubby Trefoil.

Philipendula, Filipendula, Cenanthe, Drop-wort.
Angustifolia, Apii foliis, Narrow Leav'd Drop-wort.
Cicuta facie, Hemlock like Drop-wort.
Aquatica, Water Drop-wort.
Philomelum, Chelidonium majus, Celandine.
Phanix herba vel Jegetum, Lolium rubrum, Red Darnel.
Phillyrea, Mock Privet.
Phibisis, Paeonia, Mas & Faminis, Peony Male and Female.
Phibirion, Pedicularis, Crista Galli, Loufe-wort, Red Rattle Grass.
Pbu majus, Valeriana hortensis, Valeriana major hortensis, Terdina Paracelsi, Garden Valerian, or Setwall.
Minus hortense, Valeriana minor hortense, Lesser Garden Valerian, or Setwall.
Peregrinum, — rubrum, Valerianthon, O-cimastrum Lobelij, Red Valerian.
Sylvestre, Valeriana sylvestris, — Palustris, Wild Valerian, or Setwall.
Creticum Tuberosum, Candy Valerian.
Phyllitis, Lingua Cervina, Harts Tongue.
Lacinata, Finger Harts Tongue.
Notha, Hermonitis, Splenium, Bastard Harts Tongue, Mules Fern.
Picea arbor, Abies mas Baubini, Pitch Tree.
Communis, Common Pitch Tree.
Humilis, Dwarf Pitch Tree.
Pienocamum Anquil, Eruca notha sylvestris, Rhededa, Wild Bastard Rocket.
Pilosella, Mysotis, Auricula Maris, Mouse Ear.
Pimpinella, Bipinella, Sanguiforba, Burnet.
Pinastella, Peucedanum, Feniculum Porcinum, Hog or Sow Fennel, Sulphur-wort.
Pinus, Peuce, Pine Tree.
Pityides, The Kernels of the Pine Cones.
Pinguicula, Sanicula Eboracensis, Cucullata, Butter-wort.
Piper agreffe, Vitex, Agnus Castus, Chaste Tree.
Piper aquaticum, Hydropiper, Perficaria non maculata, Biting Arsmart.
Piper nigrum commune, Common Black Pepper.
Album, White Pepper.
Longum, Long Pepper.
Indicum, Capsicum, Capsicum Americanum vel Africanum, Red Codded Pepper.
Murale, Illecebra minor, Sedum tertium Dioscoridis, Wall Pepper, Small Stone Crop.
Piperitis, Lepidium, Dittander.
Pistachia, Pistacia, Nux Vesicaria, Bladder Nut, The Pittach Nut.
Pistana, Sagittaria, Sagitta, Arrow-head.
Pistolochia, Aristolochia, Birth-wort.
Longa, Long Birth-wort.
Rotunda, Round Birth-wort.
Repens, Creeping Birth-wort.
Virginiana, Virginia Snakeroot.
Pisum, Pisum cultatum, Pease Minured.
Sylvestre, Wild Pease.
Album hortense, White Garden Pease.
Griseum hortense, Rouncival Pease.
Griseum commune, Common Field Pease.
Marinum, Sea Pease.
Cordatum, Heart Pease.
Perenne, Pease Everlasting.
Pityusa major, Esula major, Tithymalus minor, Esula, or the Lesser Spurge.
Minor, The Lesser Esula.
Pix, Pitch, the Resin of the Pitch Tree.
Plantago latifolia, Common Broad Leav'd Plantain.
Angustifolia, quinquenervia, Rib-wort, or Long Narrow Leav'd Plantain.

8 G 2 Ceronia,

Index Latinus.

- Cervina*, *Cornu Cervina*, Buck-horn Plantain.

Cotoncum, A Quince.
Cydonium, A Quince.
Granatum, A Pomgranate.
Hespericum, An Orange.
Hierosolomita, Bassam Apple.
Insanum, Mad Apple.
Limonium, A Limon.
Medicum, A Citron.
Mespilum, A Medlar.
Mori, A Mulberry.
Nectarum, A Nectarine.
Persicum, A Peach.
Panicum, A Pomgranate.
Sanguincum, Summer Goldings.
Sylvestre, The Crab Apple, Cyder Apple.
Terre, Round Birth-wort Root.
Terre Porcinum, Sow-bread Root.
Turcium, Shaddock, Great Round Citron, or Limon.
Populus, Aspen or Popular Tree.
Albus, White Aspen, or Popular.
Niger, Black Aspen, or Popular.
Populago, *Tussilago*, *Beechium*, *Farfara*, Colts-foot.
Porrago, *Borago*, Borage.
Porrum, Leeks.
Sylvestre, Wild Leek.
Vitium, Vine Leek.
Portulaca horticensis, Garden Purslane.
Aurea, Golden Leav'd Purslane.
Viridis communis, Common Green Leav'd Purslane.
Sylvestris, — *Cepæa*, Wild Purslane.
Aquatica, Water Purslane.
Marina, *Halimus*, Sea Purslane.
Potamogeton, Pond-weed.
Fontalis, River Pondweed.
Spicata, Spiked Pond-weed.
Potentilla, *Argentina*, *Tanacetum sylvestre*, *Argemone*, *Argemone*, Wild Tansie, or Silver-weed.
Poterium, *Tragacanthum*, Goats Thorn.
Potentilla major, *Ulmaria*, *Regina prati*, Mead Sweet, Queen of the Meadows.
Poibos, *Aquilegia*, *Aquilina*, Columbine.
Præcoxia, *Malum Armeniacum*, An Apricock.
Prasium, *Marrubium*, Horehound.
Album, — *Vulgare*, Common White Horehound.
Nigrum, — *Hispanicum*, Black Horehound.
Aquaticum, — *aquatile*, Water Horehound.
Nothum, — *spurium*, *Stachys*, Bassard Horehound.
Primula veris major, Cowslips.
Minor, Primrose.
Pratenfis, Oxflips.
Proserpina herba, *Chamelum*, Camomil.
Protopis, *Protopis*, *Perfonata major*, Bur Dock.
Protomedea, *Pimpinella*, *Bipinella*, Burnet.
Prunella, *Consolida minor*, *Solidago minor*, Self-heal.
Prunum, A Plum, or Prune.
Prunum sylvestre, A Bulleis.
Prunellum, A Prunella.
Pseudocapsicum, *Strichnodendron*, *Amara dulcis*, *Dulcamara*, Bitter Sweet, Woody Nightshade.
Pseudoasphodelus, *Asphodelus aquaticus*, Water, or Bastard Asphodel.
Pseudobunium, *Barbarea*, *Nasturtium Hybernium*, Bank, or Winter Cress.
Pseudorechis, *Bifolium*, *Ophris*, Twa-blade.
Pseudo distamnus, Bastard Outlandish Dittany.
Pseudo narcissus, Bastard Daffodil.
Latifolius flore simplici, Broad Leav'd Single Flower'd Daffodil.
Latifolius flore multiplici, Broad Leav'd Double Flower'd Daffodil.
Angustifolius flore simplici, Narrow Leav'd Single Daffodil.
Angustifolius, flore pleno, Narrow Leav'd Double Flower'd Daffodil.
Junifolius, Rush Leav'd, Junquile.
Marinus, Bastard Sea Daffodil.
Psyllium, *Pulicaria*, *Herba pulicaris*, Flea-wort.
Parmica sylvestris, *Sternutamentaria*, Sneez-wort.
Pteris, *Filix*, Fern.
Mas, Male Fern.
Femina, *Nymphæopteris*, Brake, Female Fern.
Querna, — *Quercina*, Oak Fern.
Repens, *Dryopteris repens*, Creeping Oak Fern.
Pulicaria,

Index Latinus.

Pulicaria major, *Coniza major*, *Amellus montanus*
Columelle, The Greater Flea-bane.
Minor — *Femina*, Lesser Flea-bane.
Pumila, *Chameconica*, Dwarf Flea-bane.
Aquatica — *Palustris*, *Consolida palustris*,
 Water Flea-bane.
Pulegium, *Glechum*, Pennyroyal.
Vulgare, Common Pennyroyal.
Surrectum, Upright Pennyroyal.
Angustifolium, Narrow Leav'd Pennyroyal.
Pulmonaria, *Lichen*, Lung-wort.
Aurea, *Cherchorus Dalechampi*, — *Gallor-*
um, Golden Lung-wort.

gosa, Tree Lung-wort.
Maculosa, *Symphitum Maculosum*, Spotted
 Lung-wort, Spotted Cowslip.
Pulsatilla, *Apium rifus*, *Herba Sardo*, Pasque
 Flower.
Alba, White Pasque Flower.
Rubra, Red Pasque Flower.
Purpurea, Purple Pasque Flower, or Parsly
 Laughing
Pyracantha, Evergreen Thorn.
Pyrethrum, *Ptarctica*, Pellitory of Spain.
Pyrethrum sylvestre, *Ptarctica sylvestris*, Sneez-
 wort.
Pyrola, *Tintinnabulum Terræ*, *Limonium Cordi*,
 Winter Green.
Pyrus, pl. *Pyri*, A Pear, Pears.
Pyrus, Pear Tree.
Pyxacantha, *Lycium*, Box Thorn.

Q.

Quemi, *Nigella*, *Melanthium*, Fennel Flower,
 Gith, or Nigella.
Quercus, *Robor*, *Robur Nigella*, *Drys*, *Fovis arbor*,
 An Oak.
Quadrifolium, *Lotus herba*, Pease Trefoil.
Quingefolium, *Pentaphyllum*, Cinkfoil.
Quinquenervia, *Plantago minor*, Rib-wort lesser,
 Long Leav'd Plantane.

R.

Radiolus, *Phyllitis*, *Lingua Cervina*, Harts
 Tongue, Deers Tongue.
Radix Cava, *Eumoria Radice Cava*, Hollow Root,
 Caveous Fumitory.
Radix dulcis, *Glycyrrhiza*, *Liquiritia*, Liquorice.
Radix Helene, *Zizipha*, Bead Tree.
Radix naronica, *Iris*, Flower-de-luce Root.
Radix spiritus sancti, *Angelica*, Angelica Root.
Raginidi, *Feniculum*, Fennel.
Ranunculus communis, *Pes Cervinus*, Common
 Crowfoot.
Arvas vel arvorum, Field Crowfoot.
Aquaticus, — *Palustris*, Water Crowfoot.
Nemorialis, — *Nemorosus*, Wood Crow-
 foot.
Globosus, Globe Crowfoot.
Pratenfis dulcis, Sweet Meadow Crowfoot.
Tuberosus, Knotted or Tuberosus Crowfoot.
Repens, Creeping Crowfoot.
Sativus, — *hortensis flore simplici*,
 Single Flower'd Garden Crowfoot.
Sativus flore duplici, Double Flower'd Garden
 Crowfoot.
Sylvarum, *Anemone*, Wind-flower, or Anem-
 ony.
Rapbanus hortensis, Garden Radish.
Agrestis — *Sylvestris*, Wild Radish.
Rusticanus, *Armoracij Plinii*, *Thlaspi mag-*
num & *majus Cordi*, *Thlaspi alterum Di-*
scoridis, Horfe Radish.

Rapeum, *Leontopetalon*, Lions-foot, Turnep Oken.
Rapistrum Segetum, Charlock.
Albus arvorum Lampfana, White Field
 Charlock.
Aquaticum, Water Charlock.
Rapum hortense, Garden Turnep.
Album rotundum, White Round Turnep.
Rubrum rotundum, Red Round Turnep.
Longum vulgare, Common long Turnep.
Luteum, Yellow Turnep.
Rapum Sylvestre, *Rapistrum*, *Lampfane Matthioli*,
 Wild Turnep.
Majus, *Rapum non bulbosum*, Cole Rape.
Minus, *Rapistrum minus*, Small Wild Turnep.
Rapum Geniste, *Orobanch*, Broom Rape.
Rapum Terræ, *Cyclamen*, *Cyclaminas*, *Artanisa*,
 Sow Bread.
Rapum Antonij, Double Batchelors Buttons.
Rapunculus, Rampions.
Spicatus, *Alopecuroides*, Great Rampion.
Nemorosus, Wood Rampion.
Corniculatus, Horned Rampion.
Sylvestris, *Campanula minor*, Wild Rampion.
Rapuntium, *Rapunculus*, idem.
Reseda, *Eruea Sylvestris Notha*, Baffard Wild
 Rocket.
Regina Prati, *Ulmaria*, Mead Sweet, Queen of
 the Meadows.
Remora aratri, *Arestia bovis*, *Anonis*, Rest-harrow.
Resina, *Rofin*.
Pini, *Rofin* of the Pine Tree.
Terebinthi, *Rofin* of the Turpentine Tree.
Piceæ, *Rofin* of the Pitch Tree.
Cedri, *Rofin* of the Cedar Tree.
Abietis, *Rofin* of the Fir Tree.
Cupressi, *Rofin* of the Cypress Tree.
Laricis, *Rofin* of the Larch Tree.
Resia bovis, *Arestia bovis*, *Anonis*, *Remora aratri*,
 Rest-harrow.
Rhabarbarum, *Rha*, *Rheon*, *Rhu*, *Rheubarb*.
Indicum vel Turcicum, Indian Rheubarb.
Ponticum, Pontick Rheubarb.
Notham, *Pseudo Rha*, *Hippolapathum rotun-*
difolium, Baffard Rheubarb.
Monachorum, Monks Rheubarb, Garden Pa-
 tience.
Rhodia radix, Rose Root, Rhodium.
Rhodium Lignum, idem.
Rhus, *Rhus*, *Fluida Gazæ*, Sumach.
Coriaria, Carriers Sumach.
Sylvestris, VVild Sumach.
Rhododaphne, *Oleander*, *Nerium*, Rose Bay.
Rhododendron, idem.
Ribes, *Ribesum*, Currans.
Ricinus, *Palmæ Christi*, Great Spurge.
Rima Maria, *Alliaria*, *Alliastrum*, Jack by Hedge.
Rincus marinus, *Cribbium*, *Feniculum marinum*,
 Sampire.
Spinofus, Thorney Sampire, Sea Parsnep.
Aureus, *Chrysanthemum litorum*, *Antyll-*
is major Cordi, *Antyllis prima Discori-*
dis, Golden Flowered Sampire.
Robertiana, *Herba Roberti*, *Geranium Robertianum*
 Herb Robert.
Robor, *Robur*, *Quercus*, An Oak.
Rocella Tinctorum, *Eucus marinus*, Sea VVrack.
Rorastrum, *Bryonia*, Bryony.
Rorella, *Ros Solis*, *Rosa Solis*, *Rorida*, Sun Dew.
Rosa hortensis, Garden Rose Bush.
Eglenteria, Sweet Briar.
Conina, VVild Briar Bush.
Alba, VVhite Rose.
Rubra, Red Rose.
Damascena, Damask Rose.
Mofchata, Musk'd Rose.

Rofin.

Index Latinus.

- Rosmarinus*, *Rosmarinum*, *Libanotis Coronaria*, Common Rosemary.
Angustifolius, Narrow Leav'd Rosemary.
Latifolius, Broad Leav'd Rosemary.
Rosa fatiua, *Paeonia*, Peony Male and Female.
Rosa Junonis, *Crinon*, *Lilium*, The Lilly.
Rosrum Gruinum, *Grais* aut *Ciconia*, *Geranium*, Cranes Bill.
Rubeola, Field Madder.
Rubia, *Rubia Tinctorum*, Great Madder.
Synanchia, Quinsey Madder, Crop Madder.
Minor, — *parva*, Small Madder.
Rubus, *Rubus sylvestris*, *Sentis*, *Veperes*, *Batus*, *Cynosbatus*, Bramble Berry Bush.
Rubus Cervinus, *Smilax aspera*, Prickly Bindweed.
Rubus Idæus, Raspberries.
Rubus monacoccus, *Chamæmorus*, Knotberry Bush.
Rubus triccoccos, *Rubus segetum*, Dewberry.
Rumex, *Lapathum*, Dock.
Acutus, *Oxylapathum*, Sharp Pointed Dock.
Folio rotundo, *Hippolapathum*, Battard Rheubarb.
Aquaticus major, *Britanica*, Britany.
Ruscus, *Oxymir sine Bruscus*, *Scopa Regia*, *Centromyrrhine*, Butchers Broom, Knee Holm.
Ruta hortenſis, *Peganum*, Garden Rue.
Sylvestris, Wild Rue.
Pratenſis, — *Palustris*, *Thalidrum*, *Thaliolum*, Meadow Rue.
Capraria, *Galega*, Goats Rue.
Ruta montana, Mountain Rue.
Rutula, idem.
- S.
- Sabdariffa*, *Alcea Americana*, American Vervain Mallow.
Sabina hortenſis, — *vulgaris*, Garden Savin.
Baccifera, Berry bearing Savin.
Sabaler, *Satureia*, Savory.
Sabeteregi, *Fumaria*, Fumiterry.
Saccharum, Sugar.
Saccharina Arundo, The Sugar Cane.
Sacra herba, *Verbena*, *Verbenaca*, Vervain.
Sadeb, *Ruta*, *Peganum*, Rue.
Saffiangel, *Malum Cydonium*, Quince.
Safferberamon, *Sparganium*, *Carex*, Sedge.
Sagapenum Gummi, *Ferula succus*, Fennel Giant Gum Sagapenum.
Sagina, *Asperula*, *Spergula*, Great Spurry.
Sagitta, *Pistana*, *Magopistana*, Arrow Head.
Sagittaria, idem.
Salicaftrum Plinij, *Amara dulcis*, *Dulcamara*, *Solanum arboreſcens*, Bitter Sweet, or Woody Nightshade.
Salicaria, *Lyſimachia*, Loofestiffe, Willow Herb.
Salicornia, *Kali majus*, Greater Glaſs-wort.
Salix, *Itea*, *Vincus*, Willow Tree.
Pumila, Dwarf Willow.
Americana, — *humilis*, idem.
Salix marina, *Agnus Caſtus*, Chaſte Tree.
Salvuaris, *Pyrethrum*, Pellitory of Spain.
Saluunca, *Nodus Celtica*, Celtick Nard.
Salvia Romana, *Baſamita major*, Coſtmary.
Salvia hortenſis, Garden Sage.
Major, *Alba vulgaris*, Common Green Sage.
Major, *Rubra vulgaris*, Common Red Sage.
Minor, — *Virtutis*, — *nobilis* — *angustifolia*, Sage of Virtue.
Minor, *altera*, — *Romana*, — *Absinthites*, Wormwood Sage.
Variegata, Party colour'd Sage.
- Salvia ſylveſtris*, — *agreſtis*, *Scordium alterum*, *Scordonia*, Wild Sage.
Nemoraliſ, Wood or Garlick Sage, idem.
Latifolia latea, *Verbosum ſylveſtre* — *fruticoſa*, *Lutea*, VVild Yellow Sage.
Angustifolia fruticoſa, *Phlomis*, VVild narrow Leav'd Yellow Sage.
Salufandra, *Nigella*, Fennel Flower, Gith.
Salſifora, *Rorella*, *Ros ſolis*, *Rosa ſolis*, San Dew.
Salſaparilla, *Sanjaparilla*, *Volubilis Indica*, Indian Bindweed, Saria, Sarſaparilla.
Salvia Vicia, *Rata muraria*, *Adiantum candidum*, Wall Rue, or White Maiden-hair.
Sambac, *Jafoninum*, Jeſſamy or Geſſamy.
Sambſum Creſcentii, *Brasſica Capitata*, Cabbage.
Sampſucum, *Amaracus*, *Majorana*, Sweet Marjoram.
Latifolium, Pot Marjoram.
Sylveſtre, *Canila bubula*, Wild Marjoram.
Hircinum, *Tragoriganum*, Goats Marjoram.
Sambucus, *Aſe*, Elder.
Santalum album, *Sandalum*, White Sanders.
Rubrum, Red Sanders.
Luteum, Yellow Sanders.
Sanguis Herculii, *Helleborus albus*, White Hellebor.
Sanguis Draconis, The Gum Dragons Blood.
Sanguis Draconis Herba, *Lapathum ſativum ſanguineum*, Blood Wort.
Sanguinaria, *Cornu Cervi vel Cervinum*, Bucks Horn.
Sanicula vulgaris, *Diapenſia conſolida quinquefolia*, Sanicle, Heal-wort.
Magna, *Alchimilla*, Ladies Mantle, Great Sanicle.
Guttata, Spotted Sanicle, London Pride.
Urfina, Bears Ear'd Sanicle, Bears Ears.
Angustifolia, Narrow Leav'd Sanicle.
Sanguisorba, *Pimpinella*, *Bipinnella*, Burnet.
Magna, Great Burnet.
Parva, Small Meadow Burnet.
Sanamunda, Heath Spurge.
Sanicula Eboracenſis, *Pinguicula*, *Cucullata*, Butter Wort.
Saponaria, *Struthium*, *Viola agreſtis*, *Tragi*, Soapwort.
Sarcocolla Gummi, Gum Sarcocol.
Sarax, *Felix*, Fern.
Sarſaparilla, *Salſaparilla*, *Volubilis Indica*, Indian Bindweed, Saria.
Sassafras Lignum vel Radix, The Root or Wood of the Sassafras Tree.
Satureia, *Thymbra*, Savory.
Æſtiva, Summer Savory.
Hyberna, — *vulgaris*, Winter Savory.
Cretica, — *Cretenſis*, Candy Savory.
Spicata, *Saxatilis vel Rupis*, Rock Savory.
Sauab, *Malum Perſicum*, A Peach.
Savina, *Sabina hortenſis*, Garden Savin.
Baccifera, Berry bearing Savin.
Satyrinum, *Tulipa*, Satyrion, the Tulip.
Saxifraga anglica, — *pratensis noſtra*, Our English Saxifrage.
Palustris, Maſh Saxifrage.
Alba vulgaris, Common White Saxifrage.
Aurea, *Lichenis ſacie*, *Chryſosplenium*, *Hepatica paluſtris*, Golden Saxifrage.
Pimpinella, Burnet Saxifrage.
Rubra, *Filipendula*, Dropwort.
Scala Cæli, *Polygonatum*, Solomons Seal.
Scammonium reſina, Scammony.
Scariola, *Endivia*, *Imybus*, Endive.
Sylveſtris, Wild or Field Endive.
Scandix, *Acus Veneris*, *Pecten Veneris*, *Scanaria*, Shepherds Needle.
Scabioſa, *Pſora Ætj*, Scabious.
- Scabioſa

Index Latinus.

Scabiosa pratensis, Meadow Scabious.
Campestris — *Segetum*, Corn Scabious.
Ovella, Sheeps Scabious.
Hortensis vulgaris, Common Garden Scabious.
Schœnanthum, *Schœnus aromaticus*, *Juncus odoratus*, Unguentarius, Camels Hay.
Schœnoprassum, Rush Leek, or Clives.
Scilla, *Squilla*, Sea Onion, or Squill.
Scissima, Fagus, Beech Tree.
Scleara, *Horminum*, *Gallitricum*, *Centrum Galli*, *Geminalis*, Chary.
Scolymus Dioscoridis, Gnera, Hartchoke.
Scoparia, *Osyris*, *Pseudolinum*, *Linaria*, Flax-weed, Toad-flax.
Italarum, *Osyris*, Befom Flax-weed.
Latifolia, *Osyris latifolia*, Broad Leav'd Flax-weed.
Repens, *Linaria pumila*, *Pseudolinum repens*, Creeping Flax-weed.
Natha, *Pseudolinaria*, Bastard Flax-weed.
Scopa regia, *Bruscus*, *Ruscus*, Butchers Broom, Knee Holm.
Scorodonia, *Salva sylvestris*, — *Nemoralis*, Wild Sage, Wood Sage, Garlick Sage.
Scordania, idem.
Scordatus, *Scordium falvia folium*, Sage Leav'd Scordium, or Water Germander.
Scordium, *Scordium*, Water Germander, Scordium.
Scorpio Theophrasti, *Genista spinosa*, Furze Bush.
Seolopendria, *Ceterach*, True Spicewort, or Ceterach.
Scorodoprassum, Great Mountain Leek Garlick.
Scorpioides, Scorpion Herb, Catterpillars.
Scorpiurum, *Heliotropium*, Turnsole.
Scutellaria, *Lamium peregrinum*, Strange Archangel, or Dead Nettle.
Scorzonera, *Viperaria*, *Viperina*, *Serpentina*, *Vipers* Grals.
Scrophularia, *Millemorbia*, *Ficaria*, *Chelidonium minus*, Fig-wort.
Secale, *Briza*, *Bryza*, *Farrago*, *Siligo veterum*, Rye.
Securidica, *Hedysarum*, Hatchet Vetch.
Seracul Monardi, *Sigillum Salomonis*, *Polygonatum*, *Scala Celi*, Solomons Seal.
Sebesten, *Alyxos*, The Sebesten.
Seigar, *Nux moschata*, Nutmeg.
Selago Plinij, *Sabina sylvestris Tragi*, Wild Savin.
Seliam, *Rapum*, Turnep.
Seligonion, *Pavonia*, Peony.
Selanion, *Crocus Vernus*, Spring Crocus's.
Seminalis, *Equisetum*, Horle Tail.
Semos, *Betula*, *Becabungi*, *Angelica aquatica*, Brook Lime.
Sempervivum major, *Sedum major*, *Athiales*, *Semperstorum*, *Herba Jovis*, Houfleeck.
Minor, Lesser Houfleeck.
Semefigi, *Viola Martia*, Our Common March Violet.
Semuda Theophrasti, *Betula*, Brook Lime.
Senis, *Rubus sylvestris*, Bramble Berry Bush.
Sena Alexandrina, Alexandrian Sena.
Alepponis, Aleppo Sena.
Notha, *Colutea*, Bastard Sena.
Sedum major, *Sempervivum major*, *Herba Jovis*, Great Houfleeck.
Minor, Lesser Houfleeck.
Seliga, *Saltunca*, *Nardus Celtica*, Celtick Nard.
Selinum Sij folijs, *Sium terrestre* Goodyeri, *Selinum Segetale*, Hone-wort, Corn Parsly.
Senecio, *Erigerum*, Groundfel.
Tragi, *Erigerum tomentosum*, Cotton Groundfel.
Serapias, *Orchis Serapias*, *Serapias* Stones.

Serpillum, *Serpyllum*, *Thymus sylvestris*, Mother Thyme, or Wild Time.
Seriphium, *Abstinum maritimum*, Sea Wormwood.
Serpentaria, *Holosteum angustifolium*, Grals Plantane, Sea Plantane.
Serata, *Ceretta*.
Serratula, *Centauroides*. } Saw-wort.
Serretta, idem.
Sertula Campana, *Melilotus*, Melilote.
Sesama.
Sesamum. } Oily Pulse.
Sisamum.
Sesamoides, *Muscipula*, *Viscaria*, *Is-cayllum*, Catchfly.
Seseli, *Sile*, *Seseli Creticum* & *Æthiopicum*, Hartwort.
Anglicanum, English Hart wort, or English Green Saxifrage.
Sicla, *Beta alba*. } White Beet. (Mallow.
Sicula, *Beta alba*. }
Sida Theophrasti, *Althea Palustris*, Meadow Marsh
Sigillum Marie, *Bryonia nigra*, *Vitis nigra*, Black Bryony.
Sigillum Salomonis, *Polygonatum*, *Scala Celi*, Solomons Seal.
Sideritis, *Stratiotes*, *Militaris*, Iron-wort, Soldiers Herb.
Silybum, *Cardus Maria*, Ladies Thistle.
Siligo, *Secale*, *Briza*, *Farrago*, Rye.
Siligua dulcis, *Ceratia siligua*, Carbe, Johns Bread.
Siliquastrum Plinij, *Capficum*, Guinny Pepper, Indian Coddled Pepper.
Silpicium, *Lasertium*, Laser-wort.
Sinapi, *Tblaspi Plinij*, *Sinapis*, Mustard.
Sativum — *hortensis*, Garden Mustard.
Sativum Rapi folio, Broad Leav'd Mustard.
Sativum album, White Garden Mustard.
Rusticum, *Nasturtium Testorum*, *Tblaspi*, Mithridate Mustard.
Rusticum, *Tblaspi minus*, Lesser Mithridate.
Mithridaticum verum, *Tblaspi verum*, True Mithridate Mustard.
Agrese — *Sylvestre*, Wild Mustard.
Alterum sylvestre — *Erysimum*, *Iris Plinij*, Hedge Mustard.
Alterum latifolium, *Erysimum latifolium alterum*, Broad Leav'd Hedge Mustard.
Sylvestre verum, *Erysimum verum*, True Hedge Mustard.
Turritis vulgarior, *Turrita Lobelij*, Common Towers Mustard.
Orientale, *Nasturtium Orientale*, *Arabis*, *Draba*, Arabian or Turkey Mustard.
Sinapi Persicum, *Tblaspi*, Treacle, or Mithridate Mustard.
Sile, *Seseli*, Hart wort.
Silaus Plinij, *Thyssetum*, *Apium sylvestre*, *Hippocselinum*, *Smyrnum vulgare*, Alexander.
Sinasbarium, *Mentha aquatica*, Water Mint.
Sifer.
Sifarum. } Skirrets.
Sifon, Bastard Stone Parsly.
Sifon Syriacum, *Ammi*, *Ammeos*, Bishops-weed.
Sithim, *Larix*, Larch Tree.
Sium, *Pastinaca latifolia aquatica*, Water Parsnep.
Sisymbrium, *Mentha aquatica*, Water Mint.
Smilax, *Convolvulus*, *Volubilis*, Bind-weed.
Smilax aspera, *Rubus Cervinus*, Rough or Prickly Bind-weed.
Smyrnum, *Hippocselinum*, *Apium sylvestre*, Alexander, Horle Parsly.
Smyrribiza, *Myrrhis*, Cistley.
Solanum holicacabum, *Solanum Vescarium*, *Alkakenki*, Winter Cherry.
Carolinianum, *Carolina* Winter Cherry.
Solanum

Index Latinus.

- Solanum rubrum*, *Capicum*, Guinny Pepper.
Solanum Tetraphyllum, *Herba Paris*, True Love, or One Berry.
Solanum Vesicarium, *Alkakeny*, Winter Cherry.
Solanum hortense, *Morelle*, *Solatrium*, Garden Nightshade.
Somniferum, Sleepy Nightshade.
Circum, Inchanters Nightshade.
Arborescens, Shrubby Nightshade.
Deleterium, — *Lethiferum* — *Lethale*, Deadly Nightshade, or Dwele.
Solanum arborescens dulce, *Amara dulcis*, *Dulcamara*, Bitter Sweet, Woody Nightshade.
Solatrium, *Solanum hortense*, Garden Nightshade.
Soldana, *Volubilis*, *Convolvulus*, Bind-weed.
Soldanella, idem.
Solanum Lignosum, *Amara dulcis*, Bitter Sweet, Woody Nightshade.
Soler, *Milium solis*, *Lithospermum*, Gromwel.
Solidago, *Consolida minor*, *Prunella*, Self-heal.
Solidago minor, *Bugula*, Bugle.
Solidago saracenic, *Consolida aurea*, *Herba fortis*, Confound.
Solisequium, *Heliotropium*, Turn-sole.
Sonchus, *Cicerbita*, *Lactuca Leporina*, *Lactucella*, Sow Thistle.
Levis, Smooth Sow Thistle.
Asper, Prickly Sow Thistle.
Sophia Chirurgorum, *Pseudonasturtium sylvestre*, *Sophia Paracelsi*, *Thalictrum*, Flix-weed.
Sorbastella, *Sanguisorba*, *Pimpinella*, Burnet.
Sorbus, Service Tree.
Sorbus accuparia, *Sorbus sylvestris*, *Fraxinus bubula*, Wild Ash Tree, Quicken Tree.
Sorghum, *Meline Varronis*, *Cenras*, *Pospale*, Millet.
Sparganium, *Platanaria*, *Butamos Theoph.* *Curcx Dodonci*, Sedge, Bur Reed.
Spartum, *Genista*, Broom.
Spinosum, *Genista Spinosa*, Furze Bush.
Spartum Herba, Mat-weed.
Spatula fatida, *Ayris*, Stinking Gladdon, Spurge Wort.
Speculum veneris, *Viola segetum vel arvensis*, *Onobrychis*, *Campanula arvensis*, *Caryophyllus segetum*, Venus Looking Glass.
Sparagus, *Asparagus hortensis*, Garden Asparagus.
Sylvestris, Wild Asparagus.
Marinus — *palustris*, Marsh Asparagus.
Spelta, *Zea*, Ador, *Triticum cinereum vel Griseum aristis munitum*, Gray Wheat, Spelt, or Spelt Corn.
Spicata, *Potamogetum*, *Fontalis*, Pond-weed.
Spergula Cordialis, *Asperula*, *Stellaria*, Woodroof.
Spurry, Frank Spurry.
Odorata nostras, Our Common Woodroof.
Flore Cerulea — *Cerulea arvensis*, Biew Flowered Woodroof, or Spurry.
Repens, *Juncaria Taberna mont.* *Rubra linifolia aspera*, Woodroof Breakstone.
Sphondylium, *Spondylium*, Cow Parsnep.
Spinachia, *Spanachia*, *Olus Hispanicum*, Spinage.
Spina infectoria, *Spina Cervi* — *Cervina*, *Burgispina*, *Rhamnus*, Buckthorn.
Spinus, *Oxyacantha*, Haw Thorn, White Thorn.
Spinus niger, *Spina styptica*, Slow Thorn, Black Thorn.
Spina acuta, *Oxyacanthus*, *Oxyacantha*, *Amyrberis feraponis*, Haw Thorn, White Thorn.
Spina Hirci, — *Hircina*, *Tragacantha*, Goats Thorn.
Spina Cervina, *Rhamnus*, Buck Thorn.
Spina Judaica, *Palurus*, Jews Thorn.
Spina Burgi, *Spina Cervi* — *vel Cervina*, *Rhamnus*, Buck Thorn.
Spinamerula, idem.
- Spiraea Theophrasti*, *Viburnum*, *Viorna Ruellij*, *Viorna vulgi*, Wayfaring Tree.
Spongia, Sponge.
Splyte, *Radix cava*, *Eumaria cavosa*, Hollow Root, Caveous Fumiterry.
Sponfa solis, *Ros vel Rosa solis*, *Rorella*, *Salsi rosa*, Sun Dew.
Squamaria, *Dentaria major*, *Orobancha*, *Radix squamata*, *Anblatum Cordi*, Tooth-wort.
Squilla, *Scilla*, Sea Onion, or Squill.
Squinanthum, *Schœnambur*, *Juncus odoratus rotundus*, Camels Hay.
Stachys palustris — *aquatica*, *Clowns All-heal*.
Stachys Fuchsj — *notha* — *spuria*, Base Horehound.
Stache, *Myrrha*, Myrrh.
Statice quibufdam, *Gramen marinum majus*, Great Sea Thrift, or Sea Grass.
Staphilodendron, *Nux Vesicaria* *Pistachia*, Pistick or Fiftick Nuts, Pittaches.
Staphis agria, *Herba pedicularis*, *Peduncularia*, *Pituitaria*, Staves-acre.
Stebe, *Facea*, Knap-weed.
Notha, — *spuria*, Silver Knap-weed.
Stachas, *Stachados*, *Cassidony*, French Lavender, *Stæchas*.
Stella Leguminosa, *Ornithopodium*, Birds-foot.
Stellaria, *Spergula*, *Asperula*, Woodroof.
Stellaria inguinalis, Star-wort.
Aquatica, Water Star-wort.
Stratistes, *Militaris*, *Millefolium militaris*, *Millefolium*, *Achillea sideritis*, Common Land Yarrow.
Achileus, *Achillea nobilis odorata*, *Millefolium nobile*, Noble Yarrow Land, Achilles Noble Wound-wort.
Aquaticus, *Millefolium aquaticum* — *vulgatus*, *Myriophyllum*, Water Yarrow.
Aquaticus violartus, Violet Yarrow.
Fœniculatus, — *aquaticus* *Ranunculi flore & Capitulo*, Fennel Leav'd Yarrow.
Succisa, *Morsus Diaboli*, Devils Bit.
Stramonium, *Stramonia*, *Pomum spinosum*, Thorn Apple.
Struthium, *Sapponaria*, *Viola agrestis Tragi*, Soapwort, Bruise-wort.
Strychnodendron, *Solanum Lignosum vel Erutescens*, *Amara dulcis*, *Dulcamara*, Bitter-sweet, Woody Nightshade.
Strychnos, *Solatrium*, *Solanum*, *Morella*, *Uva Lupina*, Nightshade.
Styrax Gummi vel Resina, *Styrax*, or Storax.
Styrax arbor, Storax Tree.
Suber, *Quercus suberrens*, Cork, and Cork Oak.
Sucram, *Cicuta*, Hemlock.
Succolata, *Chocolata*, Chocolet.
Supercilium Veneris, *Viola aquatilis*, Water Violet.
Sycomorus Italica, *Zizipha*, Bead Tree.
Sycomorus communis, *Sycamore* Tree.
Symphoniaca, *Hyoscyamus*, Henbane.
Syfyrrichion majus, *Syfyrrichum majus*, *Bulbi esculenti genus*, Great Spanish Nut.
Alnus, small Spanish Nut, Bulbed Bastard Flower-de-luce.
Syringa, *Flos Philadelphos*, *Lilach*, The Lilach, *Lelach*, or Pipe Tree.
Synanchice Dodonci, *Rubia Synanchica* *Dalechampi*, Quinsey Madder.
Symphytum, *Consolida major*, *Solidago major*, *Osteocollum*, Comfrey.

Index Latinus.

T.

T *Abacum*, *Petum*, *Nicotiana*, Tobacco.
Anglicum, *Hyoscyamus luteus*, English Tobacco.
Hispanicum, Spanish Tobacco.
Virginianum, Virginia Tobacco.

Teliphano, *Doronicum*, Wolfs-bane Antidote.
Temulum, *Folium Indi vel Indum*, Indian Leaf.
Terebinthus, Turpentine Tree.
Terebinthum, Turpentine.
Abietis, Turpentine of the Fir Tree.
Laricis, Of the Larch Tree.
Pini, Of the Pine Tree.
Terebinthi, Of the Turpentine Tree.
Cyprium, Cyprus Turpentine.
Chio, Chio or Scio Turpentine.
Strasburgense, Strasburg Turpentine.
Venetie, Venice Turpentine.
Terminatus, The Turpentine Tree.
Terramerita, *Curtuma*, Turmeric.
Turpentaria, *Betonica aquatica*, Water Betony.
Tertiola, *Panax*, All-heal, Wound-wort.
Tertianaria Bauhini, *Lysimachia Galerica*, The Greater Blew Flowered, or Broad Leaved Hedge Hyssop.
Tessiculus odoratus, *Orchies odoratus*, Sweet Cullions, or Ladies Traces.
Tetrabit, *Sideritis*, Iron-wort.
Teucrium, *Quercula major*, *Chamedrys major*, Tree or Shrub Germaner.
Tetragonia, *Evonymus*, Prick-wood, Spindle Tree.
Thalictum, *Thalictum*, *Ruta pratensis*, *Ruta palustris*, Meadow Rue.
Thalictum majus & minus, Bastard Rheubarb, both Great and Small.
Thalictum, *Ruta pratensis*, Meadow Rue.
Thapsia latifolia, Great Spanish scorching Fennel.
Thea, *Thee*, Tea, Thea, or Thee.
Tbina, *Larix*, Larch Tree.

Tblassi, *Sinapi rusticum*, *Nasturtium testorum*, Treacle Mustard.
Mithridaticum verum, True Mithridate Mustard.
Mithridaticum minus, Lesser Mithridate Mustard.
Thora, *Aconitum latifolium & montanum*, The most Poisonous Wolfs-bane.
Thur, *Arbor Tharifera*, Frankincense Tree.
Thus Refina, Incense, or Frankincense.
Thut, *Morus*, Mulberry.
Thymama, *Syrax*, Storax, also Storax Tree.
Thymbra, *Satureia*, Savory.
Æstiva, Summer Savory.
Hyberna — *vulgaris*, Common Winter Savory.
Cretica — *Cretensis*, Candy Savory.
Saxatilis — *spicata*, Rock or Spiked Savory.
Thymum, *Thymus hortensis*, Garden Thyme.
Masticinum, — *latifolium*, Mastic Thyme.
Citratum — *Limonatum*, Citron or Limon Thyme.
Sylvestre, *Serpillum*, *Serpyllum*, Wild Thyme, Mother Thyme.
Thesselum, *Apium sylvestre*, Wild Parsly, also Smallage.
Thymelæa, *Chamelea*, Spurge Olive, Widow-wail.
Tilia, *Philyra*, *Tela*, Line, or Linden Tree, Tile Tree.
Tithymalus, *Tithymalus Characias*, i. e. *Vallaris*, Wood Spurge.
Palustris, *Efula major Germanica*, Marsh Spurge.
Paralysia, *Lactaria*, *Herba Lactaria*, Sea Spurge.
Tintinnabulum Terræ, *Pyrolis*, Winter Green.
Tomentum, *Gnaphalium*, *Centuncularis*, Cud-weed.
Tomentitia, idem.
Topiaria, *Acanthus*, *Branca Ursina*, Bears Breech.
Tordylium, *Seseli Cretense*, Hart-wort of Candy.
Tormentilla, *Septifolium*, *Heptraphyllum*, *Consolida rubra*, Tormentil, Set-toil.
Tornsole, *Heliotropium*, *Scorpiurum*, *Herba cancri Ruellii*, Turn-sole.
Tota bona, *Bonus Henricus*, *Lapathum unduosum*, English Mercury.
Tragacantha, Goats Thorn.
Tragacanthum Gummi, Gum Tragacanth.
Trachelium, *Cervicaria*, *Uvularia*, Throat-wort.
Tragium, *Fraxinella*, *Pseudodillamnus*, White Bastard Dittany.
Tragium Germanicum, *Atriplex olida*, Stinking Arach.
Tragon, *Kali spinosum*, Prickly Glas-wort.
Tragopogon, *Barba Hirci*, — *Hircina*, Goats Beard.
Tragopyrum, *Tragotriticum*, *Egotriticum*, *Egopyrum*, *Fruentum sarsenicum*, *Ocymum cereale*, Buck Wheat.
Tragoriganum, *Origanum hircinum*, Goats Marjoram.
Trapezantica Dactylus, *Laurocerasus*, Cherry Bay.
Tribulus terrestris, *Saligor*, Land Caltrop.
Aquaticus, — *Lacustris*, Water Caltrop.
Trichomanes, *Adiantum nigrum*, *Capillus veneris niger*, Black Maiden-hair.
Trifolium, *Triphyllum*, *Triaphillon*, Trefoil.
Pratense, Meadow Trefoil.
Album vulgare, Common White Trefoil.
Purpureum vulgare, Common Purple Trefoil.
Purpureum magnum, Great Purple Trefoil.
Album magnum, Great White Trefoil.
Purpureum minus, Small Purple Trefoil.
Album minus, small White Trefoil.

Index Latinus.

- Cordatum*, Heart Trefoil.
Luteum minus, small Yellow Trefoil.
Luteum minimum, smallest Yellow Trefoil.
Siliquesum, Codded, or Claver Trefoil.
Triticum — *humile*, *Lagopus*, Hare Trefoil.
Pisatum, *Lotus Pisatus*, *Lotus Sylvestris*,
Lecopisum, *Lotus siliquesus*, Pease Trefoil.
Odonatum, *Lotus urbana vel hortensis*, Sweet
 Trefoil, Garden Claver. (toil.)
Fragiferum, — *Vesicarium*, Strawberry Tre-
stellatum, — *Capitulis stellatis*, Starry
 Trefoil.
Asphaltites — *Bituminosum*, strong scent-
 ed Trefoil.
Arborescens, *Cytisus verus*, Right Tree
 Trefoil.
Arborescens vulgare, Common Tree Trefoil.
Palustre — *Paludosum* — *Hircinum*,
 Marsh Trefoil, Buck Bean.
Cochleatum, *Medica*, Snail Trefoil, St. Foin,
 Medick Fodder, Claver.
Acetosum, *Alleluja*, *Lajula*, Wood Sorrel.
Fruticans, *Polemonium*, Shrubby Trefoil.
Tripodium, Sea Star-wort.
Trifolium, *Chamedrys*, *Iva Arthritica*, *Abiga*, Ground
 Pine, Gout Ivy, Field Cypress.
Maritima, *Anthyllis Herbariorum*, Sea
 Ground Pine.
Triticum, *Siligo*, Wheat.
Album — *aristis albis*, *Siligo aristis mu-
 nitum*, White Wheat.
Rubrum aristum — *spicis rubris*, Red
 Wheat Awned.
Rubrum, *Spica mutica*, Red not Awned.
Album muticum, *Siligo spica mutica*, White
 Wheat not Awned.
Griseum, — *Cinereum*, *Aristis muni-
 tum*, Ador, Spelta, Gray Wheat, Spelt,
 or Spelt Corn.
Rameum, — *spicis multiplicis*, Many
 Eard Wheat.
Indicum, *Fruementum Indicum*, Maize Wheat.
Vaccinum, *Cratægonum*, Cow Wheat.
Triticum amyllum, White Starch of Wheat.
Triphyllon, *Trifolium*, Trefoil.
Tuber terra, *Cyclamen*, *Cyclaminus*, *Panis porci-
 nus*, Sow Bread.
Tulipa Satyrium verum, The Tulip, or True Satyrion.
Tulipa præcox alba, Early White Tulip.
Præcox purpurea, Early Purple Tulip.
Præcox rubra, Early Red Tulip.
Præcox lutea, Early Yellow Tulip.
Media alba, Mean White Tulip.
Media purpurea, Mean Purple Tulip.
Media rubra, Mean Red Tulip.
Media lutea, Mean Yellow Tulip.
Media viridis, Mean Green Tulip.
Scrotina, Late Flowering Tulip.
Notha, Bastard or Dwarf Tulip.
Turbith, *Herba Lactaria Mesues*, *Alypum Aduarij*,
 Turbith.
Turpetum, idem.
Turritis, — *vulgator*, *Turrita Lobelij*, Tow-
 ers Mustard.
Tussilago, *Farfara*, *Farugium*, *Faranum*, *Bechium*,
Ungula Cabalina, *Populago*, Colts-foot.
Tynus, *Tinus*, *Laurustinus*, Wild Bay, Dwarf Bay.
Typba, *Typba aquatica*, Cats Tail, Reed Mace.
Typbium Theophrasti, *Tussilago*, Colts-foot.
- V.
- Vaccaria*, Cow Basil.
Vaccinia nigra, *Vitis Idea Theophrasti*,
 Black Whorts, or Bilberry.
Palustris, *Vaccinium palustre*, Marsh Whorts,
 or Bilberries.
- Vaccinia Nabis*, *Rubus Monococcus*, *Chamæmoris*,
 Cloud-berry, Briar.
Valeriana hortensis, *Phu mojus hortense*, *Valeriana
 major hortensis*, *Terdina Paracelsi*, Garden
 Valerian, or Set-wall.
Minor hortensis, *Phu minus hortense*, Lesser
 Garden Valerian.
Græca — *Peregrina* — *Crulea*, Greek
 Valerian.
Cretica — *Tuberosa*, Candy Valerian.
Indica — *Mexicana*, *Tripodium Diofro-
 ridis*, Indian Valerian.
Rubra, *Phu peregrinum*, *Ocinostrium Lobelij*,
 Red Valerian.
Sylvestris — *palustris*, Wild Valerian.
Venerca, *Acorus*, Reed Aromatick, Flag Sweet
 Smelling.
Vepres, *Rubus sylvestris*, Bramble Berry.
Veratrum, *Helleborus*, Hellebor.
Album, White Hellebor.
Nigrum, Black Hellebor.
Nothum, *Helleboraster*, Bastard Hellebor.
Verengena, *Malum insonum*, Mad Apple.
Verbascum, *Thapsus*, *Thapsus barbatus*, *Candelia
 Regia*, Mullein.
Nothum, — *Vile*, Bastard or Base Mullein.
Tinearium, — *Blattarium*, Moth Mul-
 lein.
Verbasculum, *Primula veris minor*, *Alisma sylvestre*,
 Primrose.
Verbena, *Verbenaca*, *Herculana*, *Matricalis*, *Ex-
 upera*, *Heria sacra*, Vervain.
Vermicularis, *Illecebra*, Stone Crop, Wall Pepper.
Veronica mar, *Veronica Pauli*, *Betonica Pauli* —
Paulina, Speed-well, or Pauls Betony.
Veronica Pauli, idem.
Vesicaria, *Alkakengi*, *Solanum Vesicarium*, Winter
 Cherry.
Alba vel Caroliniana, *Carolina* Winter Cherry.
Vesicaria peregrina, — *Pisum Cordatum*, Heart
 Pease.
Vernix, *Jupiperi Resina*, *Sandaracha Arabum*, Ju-
 niper Gum.
Vetonica, *Betonica*, Betony.
Agatica, Water Betony.
Viburnum, Wayfaring Tree.
Vicia, pl. *Vicia non amare*, Tare, or Vetch not Bitter.
Sativa — *vulgaris*, Common Tare or Vetch.
Sylvestris, *Cracca magna*, *Arachis*, *Vicia
 magna*, — *Dumetorum*, Great Wild
 Vetch.
Sylvestris minor, *Arachis minor*, *Cracca mi-
 nor*, Lesser V Wild Tare or Vetch.
Sylvestris alba, *Flore albo*, — *Nemorum*,
Galega altera Dodonæi, — *Onobrychidis
 flore*, Wild V White Tare.
Perennis, *Lathyrus perennis flore luteo*, Tare
 Everlasting.
Lutea foliis Convolvuli, *Aphaca*, *Aphaca syl-
 vestris*, *Orobanchæ Theophrasti*, Yellow
 V Wild Vetch.
Lactea, *Astragalus*, *Astragalus nothus*, *Astra-
 galoides*, Milk Vetch.
Equina, *Solea equina*, *Ferrum equinum*, Horse
 Shoe Vetch.
Securidaca, *Hedysarum*, Hatcher Vetch.
Avitia, *Ornithopodium*, *Pes avis major &
 minor*, Birds-foot Vetch.
Lentissimilis, *Anthyllis Leguminosa*, Common
 Kidney Vetch.
Glycyrrhizata, Liquorice like Vetch.
Vicia amara, *Orobus*, *Eroum*, Bitter Vetch, or
 Orobus.
Hortensis, — *vulgaris*, Common Orobus.
Cretica, — *ur*, Candy Orobus or Bitter Vetch.
Sylvestris,

Index Latinus.

Sylvestris, *Lathyrus sylvestris minor*, VVild Orobus, or Bitter Vetch.
Sylvarum — *sylvatica*, VVood Orobus.
Sylvarum latifolia, *Physcolus sylvarum*, *A-rachus Dodonei*, Broad Leav'd VVood Orobus, or Bitter Vetch.
Sylvarum angustifolia, Narrow Leav'd Orobus.
Graminea rubens, *Orobis Gramineus ruber*, Scarlet Grass Vetch.
Vidiorialis mas, *Allium Anguinum*, Vipers Garlic.
Victoriola, *Hippoglossum*, Horse Tongue.
Vinea peruvina, *Clematis Daphnoides*, *Chamaedaphne Plinii*, Periwinkle.
Vincibosum, *Periclymenum*, Wood-bind.
Vinctotoxicum, *Asclepias*, *Hirundinaria antiqua*, Swallow-wort.
Vinum, Wine.
Hispanicum, Spanish Wine.
Canariense, Canary Wine.
Album & rubrum, White and Red Wine.
Viola hortensis, *Viola Martia*, Ion, March Violet.
Surrella — *fruticosa*, Wild Upright Violet.
Sylvestris vulgaris, Common Wild Violet.
Laciniato folio Caroliniana, Wild Jagged or Carolinian Violet.
Dentaria, *Coralloides*, Toothed Violet.
Arvensis — *Segetum*, *Campanula arvensis*, Corn Violet.
Matronalis, *Hesperis*, Dames Violet.
Flammea — *Tricolor*, *Herba trinitatis*, Flame Violet, or Hearts Ease.
Viola Lunaris, — *Lunaria*, *Bolbonach*, *Lunaria odorata*, Sattin Flower.
Mariana, Coventry Bells.
Matronalis, *Hesperis*, Dames Violet.
Nigra, — *Martia*, March Violet.
Tricolor, *Herba trinitatis*, Hearts Ease.
Viorna, *Clematis altera Matthioli*, *Vitalba Dodonei*, Travellers Joy.
Virga aurea, *Leucographis Plinii*, Golden Rod.
Viperaria, *Scorzonera*, Vipers Grass.
Virga Sanguinaria, *Cornus*, Cornel Tree.
Virga Pastoris, *Dipfacus major*, Wild Teasle.
Vitis, *Vitis Vinifera*, — *fativa*, Manured Vine.
Folius Lacinialis, Parsly Vine.
Sylvestris — *Sterilis*, Wild Barren Vine.
Vitis alba, — *Sylvestris alba*, VVhite Bryony.
Nigra, *Sylvestris nigra*, Black Bryony.
Vismaga, *Gingidium*, Tooth-pick Chevill.
Viscum, *Ixos*, *Ixia Renealmi*, Mistleto.
Viscum, Birdlime.
Viscaria Dodonei, *Muscipula*, Catch Fly.
Vitalis, *Crassula*, *Telephium*, *Ceraunia*, Orpine.
Vitex, *Agnus Castus*, *Salix Marina*, Chaste Tree.
Viticella, *Balsamina*, Balm Apple.
Vitis Idea, *Vaccinia*, VVhorts or Billberries.
Vittraria, *Paricaria*, Pellitory of the Wall.
Vitrum, *Glastum*, Woad.
Viurna, *Viorna*, *Clematis altera*, Travellers Joy.
Ulpicum, *Allium hortense*, Garlic.
Ulmaria, *Barba Capri & Hirci*, *Regina prati*, Mede Sweet, Meadow Sweet.
Ulmus, Elm Tree.
Ulticana, *Solanum somniferum*, Sleepy Nightshade.
Ungula Cabalina, *Tussilago*, *Farfara*, *Becbium*, Colts-foot.
Unedo, *Arbutus*, Strawberry Tree.
Unifolium, *Monophyllum*, *Cotyledon sylvestre*, One Blade.
Umbellicus Veneris, *Cotyledon*, *Acetabulum Herba Coxendicum*, Navel-wort, Penny-wort.

Volemus, VVarden Tree.
Volubilis, *Convolvulus*, *Smilax*, Bind-weed.
Urinaria, *Dens Leonis*, *Dandelion*, Piss-a-Bed.
Urtica iners — *mortua*, *Lamium*, Archangel.
Purpurea, Red Archangel, or Dead Nettle.
Alba, VVhite Archangel, or Dead Nettle.
Fetida, *Galeopsis*, Stinking Dead Nettle.
Lutea, Yellow Archangel.
Urtica Urens, Stinging Nettle.
Major, Great Stinging Nettle.
Minor, The Lesser or most Stinging Nettle.
Romana — *hortensis*, Roman or Garden Nettle.
Ustilago, Burnt VVheat or Corn.
Usnea, *Muscus*, Bryon *Plinii*, Moss.
Terrestis, Earth or Ground Moss.
Arboreus, Tree Moss.
Pulmonarius, Lung-wort.
Marinus, Sea Moss.
Uva Crispina, *Berberis*, Barberries.
Uva Crispa, *Grossularia*, Gooseberry.
Uva Lupina, *Sambucus aquatilis*, VVater Elder.
Uva Marina, *Traganos*, *Trogos Matthioli*, Sea Cluster, Sea Grape.
Uvularia, *Laurus Alexandrinus*, *Hippoglossum*, Horse Tongue Bay.
Vulgago, *Asarum*, Asarabacca.
Vulvaria, *Atriplex olida*, Stinking Arach.

X.

X *Anthium*, *Bardana minor*, *Lappa Minor*, Lesser Bur Dock.
Xanum, *Melanthium*, *Nigella Romana*, Katherine Flower, Roman Nigella.
Xyloaloes, *Lignum Aloes*, VVood of Aloes.
Xylobalsamum, Balsam VVood.
Xyphium, *Gladiolus*, *Ensis*, *Segetalis*, *Vidiorialis rotundus*, Corn Flag.
Xylosteum, *Periclymenum*, VVood-bind.
Xyris, *Spatula fetida*, Stinking Gladden, Spurge VVort.
Xylum, *Bombax*, *Gossypium*, *Cotum*, Cotton Plant.
Xyphidion, *Sparganium*, *Platanaria*, *Carex*, Sedge, Bur Reed.

Y.

Y *Ebet*, *Anetum*, Dill.
Yucca, *Huucca*, *Yucca*, *Cazavi*, *Casavi*, Indian Bread.
Yucca vera, *Mandiocba*, *Cazavi verum*, True Indian Bread.
Yucca malva foliis, *Hetieb Americanum*, Mallow Leav'd or Potato-like Yucca, or Indian Bread.
Yucca foliis Aloes, Aloe Leav'd, or Suppositious Yucca or Indian Bread.

Z.

Z *Acintha*, *Cichorea Verrucaria*, VVart Succory.
Zaraparilla, *Saraparilla*, Common Sarfa.
Zambac, *Jasminum*, Gessamy.
Zarunda, *Aristolochia*, Birth-wort.
Zedoaria, Zedoary.
Zea, *Spelta*, Ear, *Triticum Griseum*, Spelt Corn, Our Gray VVheat.
Zerumbeth, *Zedoaria*, Zedoary.
Zinziber, *Gingiber*, Ginger.
Zizania, *Lolium*, Darnel.
Zizipha, *Ziziphus*, Bead Tree.
Zizypha, *Jujube*, Jujube.

THE
SCENERY AND POETRY
OF THE
ENGLISH LAKES;

A Summer Ramble.

BY CHARLES MACKAY, Esq.,

AUTHOR OF "LEGENDS OF THE ISLES," "THE SALMANDRINE," "THE THAMES AND ITS TRIBUTARIES,"
ETC., ETC., ETC.

PROFUSELY ILLUSTRATED WITH SUPERIOR WOOD ENGRAVINGS,

FROM ORIGINAL SKETCHES TAKEN EXPRESSLY FOR THIS WORK,

AND DRAWN ON WOOD BY

HARVEY, MCKEWN, D. COX, JUN., W. C. SMITH, GREY. FENNELL,
DICKES, W. P. SMITH, EDW. GILKS, ETC.

ENGRAVED BY

THOMAS GILKS.

THE object of this work is to narrate the romantic history, and cull the poetry, of a district which is among the most celebrated, and which all travellers allow to be the most beautiful in Great Britain; to describe every scene that has claims upon the admiration or attention of the visitor, either for its own loveliness or for the reminiscences attached to it. As in "The Thames and its Tributaries" the Author has undertaken to dwell upon romantic and remarkable events, "in the very spots where they occurred, to jog his reader's memory, and to act the part of a gossiping, not a prosy fellow-traveller," making it apparent that, wherever he went, "he could not but remember," and that he never passed unheeding over any ground "that had been dignified by wisdom, bravery, or virtue," or had charms for the lover of nature.

THE
FALLS, LAKES, AND MOUNTAINS
OF
NORTH WALES;

BEING A

PICTORIAL TOUR THROUGH THE MOST INTERESTING PARTS OF THE COUNTRY.

BY MISS LOUISA STUART COSTELLO,

AUTHOR OF "A SUMMER AMONG THE BOGAGES AND THE VINES," "A PILGRIMAGE
TO AUVERGNE," "BEARN, AND THE PYRENEES," ETC.

ILLUSTRATED WITH UPWARDS OF SEVENTY VIEWS

OF ALL THOSE ROMANTIC SPOTS WHICH ATTRACT THE ADMIRATION OF THE TOURIST.

FROM ORIGINAL SKETCHES BY

D. H. M'KEWAN,

ENGRAVED ON WOOD AND LITHOGRAPHED BY

THOMAS AND EDWARD GILKS.

N the present Work the object has been to present to the Traveller, and the lover of the Picturesque, in a portable form, a graphic and correct portraiture of this beautiful and historically important portion of Great Britain; to give to every site its legends and poetical associations, revive the recollections attached to it, and to do for the region of the Harp and the Bard what has been done for its brother-land of Brittany; to beguile the fatigues of travel, and to supply information on the spot, without the necessity of extensive research; and also to amuse the leisure of those who may desire to become acquainted with the most alluring scenes of Nature without seeking for them abroad.

THE
FALLS, LAKES, AND MOUNTAINS
OF
NORTH WALES.

Extracts from Opinions of the Press.

"The Tourist through North Wales has long been in want of a volume of this description, which combines every requisite needed in a travelling companion. It indicates the most picturesque features of some of the most beautiful scenery in Europe; it tells the history and traditions of the most remarkable sites; and, independently of painting the charms of this romantic region, in language full of harmony and color, it presents to the eye a profusion of sketches whose truth and vigor and delicacy of execution are worthy of the highest commendation. * * *

"To those who are fond of legends, we especially commend the tradition 'Cilmin of the Black Fort,' the story of 'Nesta, and the Wicked Owain,' that of 'Hugh Lloyd' and his magical staff, and the legend of the 'Lovely Ladies,' amongst others. In every page, indeed, we find matter for agreeable extract; but as the volume is very portable, and adapted to every traveller's wallet, we would advise tourists to possess themselves of the whole, that they may test its merits beside the 'Lakes and Falls,' and beneath the shadow of the 'Mountains' which are described in it. * * *

"A word more in parting in regard to the illustrations, of which there are upwards of seventy—Mr. M'Kewan has well performed the task allotted to him, and his sketches have been admirably interpreted through the lithographic and wood engravings of Thomas and Edward Gilks."—*Morning Chronicle*.

"Every lover of the sublime and picturesque, be he a tourist or stay-at-home traveller, will thank Miss Costello for this delightful pocket quarto; it is, from first to last, a pleasant narrative, interspersed with just enough antiquarianism to prevent the reader being misled; a poetic appreciation of the celebrated localities in his route; and very charming descriptions of its most sublime scenes and objects. The pages are crowded with attractions and associations of the higher class of thought. Meanwhile, in the work before us, authoress and artist have worked in a kindred spirit. It is illustrated with sixteen admirable lithographic sketches, and some fifty exquisite vignettes on wood, the whole executed by Thomas and Edward Gilks, from original drawings by D. H. M'Kewan. The vignettes especially have an artistic spirit which is rarely attained in wood engraving."—*The Illustrated London News*.

"We have visited many of the places here written of by Miss Costello, and can bear good testimony to the excellence of her work—to its usefulness as a 'hand-book' for travellers in Wales—and to the truthful sketches it contains, literary and pictorial."—*Atlas*.

"A pleasant and lively description of the scenery and antiquities of North Wales, indicating the picturesque beauties, and historical and legendary associations of the most attractive spots. The number of capital wood-cuts, and slight but effective lithographic sketches, render it attractive as a picture book; and the traditions and anecdotes introduced make it readable at home."—*Spectator*.

"Miss Costello is, indeed, a patriot, thus to devote her talents for description to the much neglected beauties of North Wales. Where in all Europe can more lovely spots be found than amongst the lakes of Cumberland, or the mountains and falls of North Wales? And yet these gems of natural beauty are comparatively unvisited."—*Pictorial Times*.

"There is no cabining of the desires when so pleasant a temptress as Miss Costello invites us northward to look at the Eagle Tower, Caernarvon, St. Winifred's Well, Fall of the Swallow, and we know not what beside. * * * Miss Costello is diligent in her collection of legends, and paints landscapes, as all the world knows, well—ride her picture of Bodolwyddao, near St. Asaph's. The book is handsomely got up, and liberally illustrated with beautiful wood-cuts, and spirited tinted lithographs."—*Athenæum*.

"Just such a pretty, picturesque, and flowery book, as so inviting, varied, and sweet a subject demands."—*Literary Gazette*.

"Miss Costello has this month presented a charming contribution to home tourists. It is gratifying to find that she has brought her exquisite sense of the picturesque, and vivid appreciation of local historical association, always simple and unpretending in their enunciation, to bear upon a portion of Great Britain. * * * The work is profusely illustrated by sketches taken on the spot, by Mr. D. H. M'Kewan, and by wood-cuts, beautifully executed by Gilks, one of our best wood-engravers; and not only is it the most inviting guide-book hitherto presented to tourists, but the existence of so attractive a volume is likely to allure many to become acquainted with the beauties of our own land without going to seek for them abroad."—*Ainsworth's Magazine*.

"Miss Costello has presented her readers with a very delightful volume, whether we regard the lively and interesting descriptions of the various natural objects and relics of antiquity which are under her notice, or the pleasing and well-executed illustrations which embellish the book."—*Gentleman's Magazine*.

"The thanks of the public are due to the author, the artist, and the engraver, whose talents and skill have been united to bring out this beautiful publication. * * * There are seventy illustrations, being views of all those romantic spots which attract the admiration of the tourist. The engravings and lithographs are admirable specimens of the art, and are sufficient to establish the reputation of Thomas and Edward Gilks, from whose hands they have proceeded."—*Hood's Magazine*.

"The book before us is a new proof of the increasing taste for archaeology, and is well calculated to draw popular attention not only to the beautiful scenery, but to the interesting monuments and traditions of Wales. It is written in a pleasing style; and the text does no less credit to its fair authoress, than the illustrations to her artists and engravers."—*Journal of the British Archaeological Association*.

"Innumerable as are the illustrated works having for their object the guidance of the tourist through the most beautiful and picturesque scenery, their appearance is always hailed with gratification, and generally rewarded with liberal patronage. The work before us is entitled to both. The pen is made to jog along in pleasant companionship with the pencil; and, as we have them here, two more agreeable associates it is impossible to conceive. Miss Costello alludes most pleasantly to 'aged mote,' and 'ivy-mantled tower;' and there is an artistic character about her descriptions which we rarely find in such works. * * * D. H. M'Kewan represents the crayon, and wields it in a manner which argues for him a fast coming fame. * * * The translation of the vignettes reflects great credit upon Thomas and Edward Gilks, the wood-engravers, who have caught the fervor of the artist, and followed it out in a sympathetic and quite unmechanical spirit."—*Glasgow Argus*.

"This volume is well got up in drawing-room attire, and is evidently intended as an intellectual companion in such quarters. If that spirit of pride which ought to animate the mind of a nation be still extant in Wales, it must feel grateful to Miss Costello. The style is simple and elegant. But it must be confessed that others share with Miss Costello much of the merit of the book—these are the artists. Whoever reads it must feel indebted to the talents of Messrs. Gilks and M'Kewan. There are 16 lithographic sketches, and 55 illustrations on wood—all by these gentlemen, who have made it a perfect panorama in miniature."—*Inverness Journal*.
