The ASB BULLETIN

Volume 5, Number 1 March, 1958

Contents

The Official Quarterly Publication of The Association of Southeastern Biologists

THE ASB BULLETIN

The ASB BULLETIN is the official quarterly publication of the Association of Southeastern Biologists and is published at Chapel Hill, N. C. in March, June, September and December. Letters, news items, other contributions, and all communications about editorial matters should be addressed to the Editor, Department of Botany, University of North Carolina, Chapel Hill, N. C. Changes of address should be sent promptly to the Secretary of the ASB, Dr. J. C. Dickinson, Dept. of Biology, University of Florida, Gainesville. Subscription orders from libraries and other institutions should be sent to the circulation manager at the Department of Biology, Woman's College, UNC, Greensboro, N. C. Subscription rate for non-members of ASB: $2.00 per year. Printing and typography by the Orange Printshop, Chapel Hill, N. C.

VICTOR A. GREULACH, EDITOR

J. C. DICKINSON, ASSOCIATE EDITOR

A. W. JONES, BUSINESS MANAGER

HOLLIS J. ROGERS, CIRCULATION MANAGER

ANN FOSTER BLEVINS, ASSISTANT CIRCULATION MANAGER

STATE CORRESPONDENTS

Alabama—H. A. McCullough, Howard College

Florida—Arthur W. Ziegler, Florida State University

Georgia—Netta E. Gray, Agnes Scott College

Kentucky—J. M. Carpenter, University of Kentucky

Louisiana—G. C. Kent, Jr., Louisiana State University

Maryland—Wm. E. Bickley, University of Maryland

Mississippi—Robert A. Woodmansee, Mississippi Southern College

North Carolina—T. W. Johnson, Jr., Duke University

South Carolina—Margaret Hess, Winthrop College

Tennessee—Helen L. Ward, University of Tennessee

Virginia—Jacques J. Rappaport, University of Virginia

West Virginia—Earl L. Core, West Virginia University

OFFICERS OF THE ASB

President—Howard K. Wallace, University of Florida

Retiring President—George C. Kent, Jr., Louisiana State University

President-elect — Mary Esther Gaulden, Biology Division, Oak Ridge National Laboratories

Vice-President—Horton H. Hobbs, University of Virginia

Secretary—J. C. Dickinson, University of Florida

Treasurer—A. W. Jones, University of Tennessee

Executive Committee—Robert T. Brumfield, Longwood College; J. Gordon Carlson, University of Tennessee; W. S. Flory, University of Virginia; I. C. Kitchen, University of Mississippi; D. C. Scott, University of Georgia; Harry E. Wheeler, Louisiana State University. All officers are *ex officio* members of the executive committee.

ASSOCIATION AFFAIRS

Nominations for ASB Officers

The Nominating Committee, composed of George C. Kent, Jr., Chairman, Wanda S. Hunter, and E. Ruffin Jones has made the following slate of nominations, to be acted upon by the members at the Tallahassee meeting: President-elect—J. Gordon Carlson, University of Tennessee and Horton H. Hobbs, University of Virginia; Vice President—Victor A. Greulach, University of North Carolina and Thelma Howell, Wesleyan College; Secretary — Harold Humm, Duke University and Ralph Yerger, Florida State University; Executive Committee—William Burbank, Emory University, William Mengebier, Madison College, E. Lowe Pierce, University of Florida, Elsie Quarterman, Vanderbilt University, and George Wharton, University of Maryland. Two members of the Executive Committee are to be elected.

●

Proposed Amendment to the By-Laws

At its interim meeting in Atlanta in November the Executive Committee of the ASB authorized D. C. Scott to prepare an amendment to Article I of the By-Laws of the Association Constitution with the goal of simplifying the election of new members to ASB. The amended Article I as proposed by Dr. Scott is as follows:

Article I. Membership

Section 1. Membership shall be granted any person recommended and approved as being eligible by two active members in good standing.

Section 2. Such recommendations shall be submitted to the treasurer of the Association and the new member shall achieve active status in the Association with all the rights and privileges pertaining thereto when his dues for the current year have been received by the treasurer of the Association.

The following analysis of the proposed amendment has been prepared by Dr. Scott:

The purpose of this amendment to the by-laws of the Constitution of the Association of Southeastern Biologists (ASB BULLETIN 2(2):-32) is to simplify the election of new members. As things now stand, a prospective member must be recommended to the Executive Committee by two members in good standing. The Executive Committee in turn nominates the prospective member to the Society as a whole and a vote is taken at its annual meeting. In practice both the Executive Committee and the membership at large have accepted proposed members without question on the basis of the original recommendations. Thus, the two latter steps in the election of members have only been formalities which encumbered the meetings of the bodies involved. These steps are eliminated by the proposed amendment to the by-laws.

It should be noted that in the proposed amendment the treasurer, rather than the secretary, is charged with receiving new members. This change is suggested for two reasons. (1) The treasurer must, in effect, keep the master list of members in good standing. He is in the best position to know whether or not a recommender is actually a member in good standing in the Society. (2) This change removes a part of the burden of correspondence now borne by the secretary and distributes it to the office of the treasurer.

Two important points should be considered by the membership of the Society in voting on this amendment. (1) Is it wise for us to remove from the Executive Committee and the membership at large the power to reject prospective members, even though this power has never been exercised? (2) Do we wish to include new members of the year in the competition for the Meritorious Research Award? By action of the Executive Committee (July 14, 1956) persons could not enter this competition until they had been formally elected to membership. Elimination of a formal annual membership election would throw the competition open to newly acquired members. All members of the Society are urged to consider the various aspects of this proposal and be prepared to decide upon it at the Tallahassee meetings.

Abstracts of Papers Presented at The Nineteenth Annual Meeting of the Association of Southeastern Biologists

All but two of the 82 papers presented at the Nineteenth Annual Meeting of the Association of Southeastern Biologists and cooperating societies at Tallahassee, Florida are abstracted here. Reprints of abstracts marked with an asterisk are available from the authors.

A Virgin Forest Remnant in Berkely County, S. C.

WADE T. BATSON, WILLIAM E. HOY, WILLIAM R. KELLEY and JAMES T. PENNEY, *University of South Carolina*

A tract of virgin forest exists in Berkely County. This report deals with our areas of original vegetation, the discovery of this tract, the results of a floristic analysis including the species present as well as their abundance and role in the community, timber production figures on a recently harvested portion, and comments on the future of the still-existing forest.

The Effect of Sodium Iodoacetate Under Anoxia on Chromosome Aberration Frequency

A. V. BEATTY and JEANNE W. BEATTY, *Emory University*

The energy for chromosome rejoining following radiation-induced chromosome breaks in an oxygen-free atmosphere appears to come from an anaerobic respiratory system. To find more specifically the source of this energy anaerobic inhibitors are being used. In order to interrupt the glycolytic system before any energy is given up, the system was inhibited at the step where 1,3-diphosphoglyceraldehyde is changed to 1,3-diphosphoglyceric acid by the action of triosephosphate dehydrogenase. This enzyme is inhibited by sodium iodoacetate. *Tradescantia* inflorescences were treated in a M/1000 solution for 1, 5, 10 and 24 hours and irradiated with a total dose of 400 r. One hour had no effect while 5, 10 and 24 hours gave a 100-fold increase in aberrations over the controls.

The Anatomy of the Blister Gall Caused by *Asteromyia carbonifera* on *Solidago* Leaves

EDWIN G. BECK, *University of Georgia*

The larva of the midge *Asteromyia carbonifera* and an unidentified fungus are involved in the formation of a blister gall on *Solidago* leaves. The gall first appears as a dark spot on the surface of the leaf. As it matures it becomes white and thickens to form a blister with a dark margin. Histological examination reveals that the blister is composed of a fungus which attacks the mesophyll tissues of the leaf. The larva feeds upon the fungus which grows about it. The hyphae which grow along the outer regions of the mesophyll secrete a black, friable material which is responsible for the blackening of the leaf tissues in the early stages of the development of the blister and also the black margin about the edge of the blister. The fungus has been grown in pure culture on several different media but has never been identified.

A Biotic Factor Influencing the Gastropod *Urosalpinx cinerea* in Its Choice of Prey*

JOHN W. BLAKE, *University of North Carolina*

The relative attractiveness of two pelecypods as prey of *Urosalpinx* was stuied to determine whether metabolic rate of prey influenced selection by a predator. *Urosalpinx* were exposed to two currents, one from each of two aquaria in which various prey and experimental substances were placed. Comparisons within and between the prey species (*Crassostrea virginica* and *Modiolus demissus*) demonstrated a direct correlation between metabolic rate (measured as oxygen uptake) and number of *Urosalpinx* attracted. Four factors affecting metabolic rate were studied: species, age, growth rate, and feeding. Younger and more rapidly growing individuals attracted more *Urosalpinx*, *Crassostrea* being more attractive than similar *Modiolus*. Starvation of prey resulted in a decreased attractiveness. In every case the more attractive animals had a proportionately higher metabolic rate. *Urosalpinx* responded in equal numbers to groups of prey of different individual, but equal group metabolic rates. Thus this work supports the hypothesis that it is a metabolic product which mediates the predator's choice of a particular individual within a group of prey. Selection is independent of concentration of dissolved oxygen or carbon dioxide. Further work is planned toward the characterization of the attractant substance.

A Preliminary Study of Chromosome Numbers and Karyotypes in *Sprekelia formosissima* Herbert*

S. BOSE, *Blandy Experimental Farm, University of Virginia*

Several workers (Sato, Snoad, Mookerjea) have reported chromosome numbers, approximate in the first two cases, of from 116 to 121 for *Sprekelia formosissima* Herbert. We have studied chromosomes in many bulbs of *Sprekelia* from several locations.

Plants collected near Cuernavaca, Mexico usually have 60 somatic chomosomes. Cells having 58, 59, 61 and 62 chromosomes were also observed in this type. A majority of the bulbs secured from different places have higher chromosome numbers however. Somatic metaphases with well spread chromosomes have been observed with approximately 114, 115-18, 117, 118, 118-122, 119, 121, 127, 136, 141, 144-148, 149, 150, 153-156, 160, 162, 164, 169, 172 and 175 chromosomes. Of these, exact counts were possible in cells with 117, 118(3 cells), 119, 127, 149, 150(2), 172 and 175(2) chromosomes. The peak frequencies in number were between 118-122, 148-154 and 164-175. Four different types of chromosomes occur in karyotypes of 2n=60 taxa, and of taxa with higher numbers: (1) long, median-submedian centromere; (2) short submedian; (3) subterminal; and (4) subterminal, satellited on shorter arm. Two other accessions recorded as *Sprekelia* had 2n numbers of 22 and 33 respectively. These have not flowered; both leaves and karotypes suggest these to be *Amaryllis* taxa.

Some Amebas of Warm Mineral Springs, near Venice, Florida

EUGENE C. BOVEE, *University of Florida*

Warm Mineral Springs, 12 miles southeast of Venice, Florida, pours its waters to the surface from an estimated depth of 18,000 feet at a rate of some 6,000 gallons per minute. Hence, any fauna associated with it have most likely entered overland, or from the air. Its waters have about half the sodium content of sea water, and about half the magnesium content, but nearly two-thirds the sulfate content of sea water. Hence some rather special osmotic conditions are imposed on microscopic forms which enter it, yet some protozoans have become adapted to its mineralized, fast-flowing waters, amongst them several amebas. These resemble known species, and are assignable to described genera. Two forms may be identical to *Flabellula mira* Schaeffer, and *Flabellula* (Rugipes) *vivax* (Schaeffer). The others are a *Trichamoeba* sp., somewhat similar to *Trichamoeba sphaeraraum* Schaeffer; and a *Vexillifera* sp. resembling *Vexillifera telmathalassa* Bovee. There is also a *Hylaodiscus* sp. In general, these amebas are, or closely resemble, marine species.

Correlation of Sexual Cycles and Breeding Behavior of the Gray Squirrel, *Scirurus carolinensis*, Gemlin

ALFRED BRAUER and ALBERT DUSING, *University of Kentucky*

By means of trapping and retrapping wild Gray Squirrels the biannual cycles of male and female squirrels were determined. For the adult male the testicular positions of abdomen, inguinum, and scrotum, are found to be valid criteria when related to the histological pictures of cryptorchism and recovery. In the female the vaginal smear is the best method of determining stages of the cycle. When cycles so determined are compared with observations of mating chases and other breeding behavior, curves showing correlation can be constructed. Sixty five adult males and 53 females were trapped a total of 285 times.

X Radiation of Stages in the Life-Cycle of the Rat Tapeworm, *Hymenolepis diminuta*

WILLIAM E. BRILLHART, *Emory University*

Three stages in the life-cycle of *Hymenolepis diminuta* were each exposed to 5, 10, 15, 20, and 30 thousand roentgens of X radiation. The first phase of the investigation has attempted to determine the minimum lethal dose of X radiation for each stage. Cysticercoids were not recovered from 30 beetles which were fed irradiated eggs exposed to doses of 15,000r and above. Four cysticercoids, two each from two of 30 challenged hosts, were recovered from eggs exposed to 10,000r; these larvae were abnormal in appearance. No tapeworms were recovered from 5 rats that had been fed 30 cysticercoids irradiated with 15,000r. Sixty cysticercoids given 10,000r failed to establish normal infection in 10 rats; only about one half as many worms were recovered from challenged rats. At the present time adult tapeworms are being exposed to various doses of X radiation and transplanted surgically into recipient rats to establish the M.L.D. for this stage of the life history.

Mutant Analysis of Amino Acid-Keto Acid Relationships in *Neurospora crassa**

H. E. BROCKMAN and A. GIB DEBUSK, *Florida State University*

DeBusk and Wagner (1953) reported that the growth of a tyrosine-requiring mutant of *Neurospora crassa* could be inhibited competitively by any one of a wide range of naturally occurring amino acids. This mutant grows equally well on the keto analogue of tyrosine, p-OH-phenylpyruvic acid. Furthermore, the amino acid inhibitions can be relieved noncompetitively by p-OH-phenylpyruvic acid. Recent work has shown that a phenylalanine requiring mutant responds in a similar way. It is inhibited by various amino acids and the inhibitions can be noncompetitively relieved by the keto analogue of phenyalanine, phenylpyruvate. If either of the above mentioned mutants is given the keto acid as its required growth factor, it can be inhibited by a second keto acid. This inhibition is relieved by the amino analogue of the required keto acid. The inhibition is modified by temperatures, pH, and purines and pyrimidines. The inhibition can be affected only in the early stages of growth. Results of respiration studies, growth assays, and enzyme studies are given.

Dispersal of the Gelatinous Coat Material of *Mellita quinquiesperforata* Eggs by Homologous Sperm and Sperm Extracts

JOHN W. BROOKBANK, *University of Florida*

Homologous sperm and frozen-thawed sperm extracts of *M. quinquiesperforata* have been found to disperse the gelatinous coat material (fertilizin) of the eggs of this species. The dispersing factor most probably acts by depolymerization of the fertilizin gel to sol, and was not found to impair the sperm aggultinating properties of fertilizin in solution. The factor was shown to be acid labile (pH 4 for four minutes) and heat labile (70°C. for two

minutes), and therefore distinct from sperm antifertilizin. Antifertilizin is stable for at least 10 minutes at 70° C, and is not destroyed by acid treatment. Extracts which contained the dispersing factor were also able to dissolve precipitation membranes formed by antifertilizin on the surface of the gelatinous coat.

This investigation was supported in part by a research grant from the National Institutes of Health of the Public Health Service.

A Taxonomic Study of the Genus *Aletris* L. (Liliaceae)*

EDWARD T. BROWNE, JR., *Alabama Polytechnic Institute*

Chromosome numbers of n=13 are reported here for the first time for *Aletris farinosa* L., *A. aurea* Walt., and *A. obovata* Nash. The only previously reported number in the genus was 2n=52 for *A. foliata*, an eastern Asiatic species, and there is some question as to the retention of this species in the genus. For all these species there is a basic chromosome number of x=13. Since *Aletris* has been placed in the Liliaceae, Amaryllidaceae, and Haemodoraceae by various authorities, a search of the cytological literature of these families was undertaken. Examples of plant species with the basic number x=13 were located, but in these cases, e.g. species of *Narcissus*, *Fritillaria*, and *Lachenalia*, this number was derived from some other basic number which was found in the majority of the other investigated species in these genera. Of the cytologically investigated species in the previously mentioned families, only in the Liliaceae tribe Narthecieae of the Hutchinson system were there chromosomes which were like those of *Aletris* in basic number and size. On the basis of this cytological information, it is recommended that *Aletris* be placed near the genera *Narthecium* and *Metanarthecium* in future systematic treatments of the family Liliaceae.

A Method for Determining the Effects of Varied Environmental Conditions on Cell Growth in *Phleum* Roots

ROBERT T. BRUMFIELD, *Longwood College and Oak Ridge National Laboratory*

Cell development can be studied directly from photographs taken at successive time intervals of growing roots of *Phleum pratense*. The length of each cell and its distance from the root apex are continually increasing with time. If the logarithm of cell lengths (ordinate) at successive time intervals by plotted against their distances from the apex (abscissa), a family of curves is obtained which have essentially the same slope at the same distance from the apex. If the photographs are taken over a period of 2 to 4 hours (depending on the rate of growth) the curves will overlap along the abscissi. This is so since cells near the tip will be displaced to a position formerly occupied by cells basal to them. The curves can be "stacked" into a composite curve by shifting the ordinate which is logarithmic. The resulting composite curve represents the increase in length that any cell along the root axis is expected to undergo under uniform conditions. This curve thus affords a "base line" whereby the relative effect of any environmental change on individual cells can be determined. The use of the method is illustrated by an experiment with applied IAA.

Additional Information on the Mechanical-Chemical Nature of Drilling by the Gastropods *Urosalpinx* and *Eupleura**

MELBOURNE R. CARRIKER, *University of North Carolina*

A comparative study of the functional morphology and ecological significance of drilling mechanisms in muricid gastropods is in progress. It was found earlier that in drilling through shell of prey, *Urosalpinx cinerea* alternates short periods (a few minutes) of radular rasping with longer ones of "softening" by a glandular accessory proboscis in the foot. Current studies confirm this for *Urosalpinx*, and disclose for the first time the presence in *Eupleura caudata* of a drilling mechanism structurally and functionally similar to that of *Urosalpinx*. Regeneration was complete in five out of seven snails of both species whose proboscides were amputated. Drilling was resumed in 14 to 39 days. The accessory proboscis was excised from 12 other drills. Three completely regenerated this gland and resumed drilling in 21 to 61 days. The remainder lived 21 to 61 days, then died. Excised accessory proboscides, especially those from actively drilling snails, when placed on smooth shell in moist chambers for 24 hours, effected definite, though faint, erosion of shell, not observed in controls. Resumption of drilling in proboscisectomized and accessory-proboscisectomized oyster drills appeared to parallel regeneration, and occurred only when radula and accessory proboscis functioned alternately. Neither organ penetrated shell alone. These data support a mechanical-chemical hypothesis of penetration.

These studies are being supported by a U. S. Fish and Wildlife Service grant.

The Effects of X-radiation on the Early Cleavage Stages of the Snail, *Ilyanassa obsoleta*

JAMES N. CATHER, *Emory University*

The duration and character of the meiotic and mitotic stages were determined through the third cleavage and correlated with the external morphology of the cells. Doses of radiation ranging from 1000 to 10,000r at 1000r per minute were used. A dose of 4000r produced the maximum cleavage delay with minimum lethality prior to the formation of blastulae. This dose was delivered at known mitotic stages prior to the second cleavage, and the cleavage delay of the first three cleavages was studied. A sharp rise in radiation effect occurred when the eggs were treated near mid-interphase. Treatment from mid-prophase to the next cleavage had little effect on that cleavage, but the cleavage delay of the later cleavages increased as the time of irradiation approached the cleavage. Treatment during mid-telophase, shortly after the first cleavage, produced the greatest delay of the second cleavage. The delay of prophase accounted for a major part of the cleavage delay.

The Plumose-bristled Species of *Rhynchospora* (Cyperaceae)

R. B. CHANNELL, *Vanderbilt University*

This report represents the results of a recent re-evaluation of the nomenclature, taxonomy and distribution of the species comprising Series Plumosae of the genus *Rhynchospora*. It contains a number of changes and corrections for the group necessitated by the revisional study.

The Natural Vegetation of English Mountain, Tennessee

JOE A. CHAPMAN, *Carson Newman College*

The vegetation of English Mountain, an uplift of the Chilhowee series of eastern Tennessee, is described as it is related to geology, topography and soil types. Steep slopes with rocky outcrops are characteristic. The few basic soil types are derived from shale and conglomerate rock. Many variations of site exposure occur. The description and analysis of the thirteen major forest types are drawn from data secured by use of the plotless sampling method of Grosenbaugh. Density, frequency, size class and basal area data are given for all types. The pattern of vegetation is most closely related to site exposure, while altitudinal, soil and geological differences are of secondary importance.

Flagellation and the "Pseudoflagellum" in the Swarmcells of the Myxomycete, *Didymium nigripes**

ARTHUR L. COHEN, *Oglethorpe University*

Living, flagellate swarmcells (gametes) of the Myxomycetes show a single anterior flagellum under ordinary illumination. In stained preparations, two flagella are often seen. Contemporary workers are of the opinion that this biflagellate condition is typical and that the second flagellum is often curved back, closely appressed to the body of the swarmcell, and hence ordinarily invisible. The author's observations of the living swarmcells of *Didymium nigripes* under phase contrast illumination disclosed the presence of the known flagellum and also a short process which could be seen to grow from the cell at the region of insertion of the known flagellum, but which then migrated over the surface of the body to the rear and became indistinguishable from the trailing, fine, posterior pseudopodia typical of swarmcells. Electron photomicrographs of shadowed swarmcells showed the extended flagellum, the fine pseudopodial process here called a "pseudoflagellum," and a second true flagellum recurved and closely appressed to the cell.

Fluorescence Microscopy of Living *Tetrahymena pyriformis**

MARION T. COLEMAN and CHARLES RAY, JR., *Emory University*

Intra-vital staining of nuclei and cytoplasmic inclusions in *Tetrahymena pyriformis* using basic fluorochromes has been observed by fluorescence microscopy. The light source was a GE AH-4 mercury lamp. The filter system consisted of a Corning glass filter #5113 (3.85 mm thickness) between the light source and the specimen, and a Wratten G filter in the ocular. Aqueous solutions of several diaminoacridine compounds were found to be satisfactory, non-toxic, vital fluorochromes. Proflavine hydrochloride, acriflavine hydrochloride, acridine yellow and acridine orange produced yellow-green fluorescence in both micronucleus and macronucleus of *Tetrahymena*. When general cytoplasmic fluorescence was observed, the low intensity of this fluorescence did not interfere with nuclear differentiation. Acridine orange was unique; this dye simultaneously produced orange-red fluorescence of some cytoplasmic inclusions and yellow-green fluorescence of nuclei. Fluorescence persisted throughout conjugation and has been observed as long as twenty-four hours following application of the dye. The diaminoacridines are useful as vital stains because low concentrations (1:50,000 to 1:100,000) give bright fluorescence; visual contrast is excellent; and nuclear structures are easily stained by this method.

This study was supported in part by a grant from the National Science Foundation.

Studies on the Ecological Life History of *Portulaca smallii**

DAVID J. COTTER, *Emory University*

Portulaca smallii P. Wilson is a small succulent plant, endemic to the granite outcrops of the Piedmont section of southeastern United States. Field studies have dealt with its habitat, phenology, distribution, and morphological variability. Life history stages have been studied in the field and laboratory. Responses of the plant to many phases of the environment including biota, light, temperature, moisture, pH, and soil have been determined through controlled laboratory experiments. *P smallii* is able to survive innundation or severe desiccation. The amount of available water is the major factor controlling growth. *P. smallii* is photoperiodic and also exhibits marked responses to light intensity, such as phototropism, nystic movements, and photocleistogamy. The principle reasons for its endemism are its inability to withstand competition and its physiological adaptations to the severe environment of the outcrops.

Observations on *Chlorosarcina* (Gerneck) Vischer

TEMD R. DEASON and WALTER R. HERNDON, *University of Alabama*

Among numerous chlorophycean isolates from the soil of the Alabama (Greene County) Black belt, was one alga of the genus *Chlorosarcina*. This genus, originally described by Gerneck in 1907, was emended by Vischer to include those Chlorosphaeracean algae with cup-like plastids and lacking pyrenoids although he called it a *genus imperfecte notum*. This organism has been maintained in cultivation in a variety of media including Bold's inorganic salt medium and has been studied in many phases of its life history over a period of several months. Cells of this plant are characterized by the ability to divide vegetatively, a cup-like plastid without pyrenoids, and the production of zoospores of the *Protosiphon* type. Recent studies of related genera indicate that zoospore type should probably

be included among the generic attributes of *Chlorosarcina*. It is hoped that a detailed description of this organism, which is apparently new to science, as well as its availability in culture, will provide a basis for a clearer understanding of this genus, which has been rarely studied.

Gravel Bars and Flood Control*

ROBERT A. DIETZ, *Troy State College*

Some rivers evolve their own flood control systems. One such river in Missouri has been studied in detail. The Meramec River is characterized by gravel deposits along the banks, known locally as gravel bars. These bars are ideal for the study of succession leading to a stable river bed and channeled flood waters. Alternate deposition ridges and scour canals, initiated by willows, tend to mitigate the effects of slight and moderate flooding. Through percolation, runoff is decreased. The effect of the system upon severe floods is proportionately less. The downstream landowner, however, is more or less at the mercy of the watershed management practices of his upstream neighbors, and whatever he can do to moderate floods is to his advantage. The natural principles herein studied lend support to certain downstream management practices.

Analysis of Egg Color Variation in *Cyclops vernalis**

ERNEST J. DUPRAW, JR., *University of Florida*

In populations of the fresh-water copepod, *Cyclops vernalis*, different females may be observed carrying egg sacs of widely different colors, including blues, blacks, purples, browns, grays and greens. The frequencies of the different egg colors occurring in one, fairly dense population of *C. vernalis* have been recorded periodically for over a year, and slight correlations with algal concentration noted. The light-absorption curves of variously-colored eggs have also been determined, using a microspectrophotometer. From an analysis of these curves, it has been inferred that apparent egg color depends on the relationship between only two carotenoid materials, one an unmodified red-orange carotenoid, possibly astaxanthin, the other a typical, blue carotenoid-protein. By maintaining female *Cyclops* in isolation cultures during successive egg layings, it has been shown that egg color is not related to the individual female, but that any female may lay successive egg sacs of widely different colors. More precise culture experiments, in which two groups of females were maintained on entirely separate diets, have shown that differences in feeding are accompanied by profound differences in the colors of eggs produced. Various speculative physiological and optical mechanisms have been proposed.

Multi-periods of Branch Elongation In Pines

WILLIS A. EGGLER, *Newcomb College, Tulane University*

Multi-periods of stem elongation during a season (sometimes called multi-nodal growth) have been recognized for main stems of pine trees, but the fact that branches may elongate multi-periodically is less well known. Multi-period elongation of branches of longleaf pine in Louisiana and Mississippi has been reported earlier. Similar growth habits of branches of shortleaf, loblolly, and slash pine have been observed in Louisiana. Investigations are in progress to determine possible relationships between periods of branch elongation and main stem elongation, diameter increase, temperature, and soil moisture.

Cytotaxonomical Studies on a *Zephyranthes* Complex*

W. S. FLORY, JR., *Blandy Experimental Farm, University of Virginia*

Zephyranthes insularum (2n=28), *Z. nervosa* (2n=24?), *Z. puertoricensis* (2n=25) and *Z. tubispatha* (?) (2n=25), from the West Indies or South America, are taxa which have been variously confused. Traub (1958, in press) discusses the nomenclature of these in some detail. *Zephyranthes commersoniana* is another member of this complex; material of this was not available for the present work. Detailed karyotype analyses were made of the several taxa, and complement comparisons presented in some detail. Group relationships, distinctions, and possible origins are considered on the basis of cytological and morphological data and observations.

Influence of Carbonic Anhydrase Inhibitors on Shell Growth of a Freshwater Snail, *Physa heterostropha*

JOHN A. FREEMAN, *Winthrop College*

Carbonic anhydrase, an enzyme which on theoretical grounds is expected to influence mollusc shell growth, has been reported in the mantle tissue of most but not all molluscs examined for its presence and two drugs inhibiting the enzyme have been reported to decrease calcium deposit in the oyster. *Physa heterostropha* have been grown in solutions of various concentrations of five carbonic anhydrase inhibitors, sulfanilamide, benzenesulfonylamide, p-toluenesulfonamide, Diamox, and 2-benzothiazole-sulfonamide, and the growth rates of the individual snails have been determined. The last-named drug is lethal at concentrations above 0.5 mg per liter, an effect not reversed by PABA. The other drugs decreased the growth rates by a third to a half in experiments in which the snails were fed for maximum growth. The drugs did not influence growth rates in experiments in which growth was maintained at a low level by dietary restrictions. The results are consistent with the theory that carbonic anhydrase is necessary for rapid but not for slow growth of the snail shell.

Relation of the Nucleolus to Mitotic Activity as Revealed by Ultraviolet Microbeam Irradiation*

MARY ESTHER GAULDEN and ROBERT P. PERRY, *Oak Ridge National Laboratory*

Circumstantial evidence obtained in several organisms has suggested that the nucleolus controls to some unknown extent the division of a cell. This idea has been tested in living grasshopper neuroblasts by irradiating the nucleolus with a high-intensity

ultraviolet microbeam less than 3 μ in diameter at the focal point. The nucleolus is 3 μ in diameter. Cells in telophase, interphase, and prophase were irradiated; in some, the microbeam was focused on a nucleolus and in others on a non-nucleolar portion of the nucleus. These cells and unirradiated ones were observed until they divided or for at least 24 hours. Irradiation of one nucleolus for 3 seconds is sufficient to stop mitosis of cells irradiated in stages from late telophase to the middle of middle prophase. During the latter half of middle prophase, the nucleolus becomes less sensitive to ultraviolet radiation and by late prophase is completely insensitive to it, as determined by the ability of the cell to divide. Microspot irradiation of a non-nucleolar region of the nucleus causes mitotic delay but does not usually prevent cell division. These observations are consistent with the hypothesis that the nucleolus has an intimate functional relation to the mitotic process.

Distribution of Estuarine Ascomycetes and Deuteromycetes

HARVEY S. GOLD and T. W. JOHNSON, JR.,
Duke University

Estuarine Ascomycetes and Deuteromycetes were studied to determine if distributional patterns for these organisms exist and if these patterns are affected by temperature and salinity. Both lignicolous and caulogenous forms were investigated. Four basic fungal distributional types were observed: fresh water, mesohaline, stenohaline, and those that occur in all salinities, the euryhaline fungi. Salinity, as affected by temperature, influenced fungal distribution, and temperature was a limiting factor. Laboratory salinity tolerance experiments combined with field data show that mesohaline fungi possess a high degree of physiological adaptability to function vegetatively and reproductively in the fluctuating salinity and temperature of their aquatic environment.

Effect of Gibberellic Acid on Cell Division and Cell Elongation in *Phaseolus vulgaris**

VICTOR A. GREULACH and JOHN G. HAESLOOP,
University of North Carolina

Four weeks after treatment the third internodes of bean (*Phaseolus vulgaris* L.) plants supplied with 0.346 mg of gibberellic acid each and of the control plants were fixed for sectioning and anatomical measurements. The third internode was selected for study because it both initiated and completed its growth during the experiment. Though the treated plants grew 1.96 times as tall as the controls and had third internodes averaging 2.28 times as long the mean longitudinal, radial, and tangential diameters of cells from both the pith and cortex were almost identical with those of the controls, the slight differences being highly insignificant statistically. Gibberellic acid had no effect on the mean thickness of the tissues outside the pith, but the pith of the treated plants averaged only 0.86 the diameter of the controls, a highly significant difference resulting in significantly thinner stems of the treated plants. The volume of the pith of the treated plants was, however, 1.68 times that of the controls and the volume of the entire third internodes of the treated plants averaged 1.70 times that of the controls. In this experiment the growth promotion by gibberellic acid was obviously due entirely to increased cell division. The data also suggest that in the pith gibberellic acid influenced the plane as well as the rate of cell division. These results, along with other recent reports of stimulation of cell division by gibberellic acid, suggest that the generally-accepted belief that gibberellic acid promotes growth largely through an effect on cell enlargement requires re-evaluation.

Biospeciation in the Lichen *Cetraria ciliaris*

MASON E. HALE, *Smithsonian Institution*

The common conifer lichen *Cetraria ciliaris* Ach. in North America consists of three chemical populations. One with olivetoric acid (C+ red) is centered in the central and southern Appalachian Mountains and in the Piedmont. The second with alectoronic acid (KC+ red, C–) is centered in the Great Lakes area eastward to New Brunswick and southward into the Shenandoah and Cumberland Mountains. Where these two strains converge in the central Appalachians, the plants with olivetoric acid occur predominantly in pine woods on soils derived from sandstones, whereas those with alectoronic acid occur more frequently on trees in the shale barrens of the Shenandoah Mountains. A third strain with protolichesteric acid occurs exclusively in the far western states, but ranges eastward as a rarer strain with alectoronic acid plants. Since these strains are geographically distinct elements of a single species, it is proposed that they be ranked as subspecies, as commonly defined by biosystematists.

A Contribution to the History of Mendelism*

ROLAND M. HARPER, *University of Alabama*

In the 1860's Gregor Mendel, experimenting with peas in his garden, discovered that second-generation hybrids reproduced the characters of their ancestors in a pretty definite ratio. He published his findings in an obscure journal in 1866, but that seems to have attracted little attention, and was soon forgotten, the world simply not being ready for it. In 1900 Mendel's work was re-discovered almost simultaneously by three or four European geneticists, and then its fundamental importance was immediately recognized, for the time was ripe for it. Numerous magazine articles and books were soon written about it, and it was found to apply to the animal kingdom also, and incorporated into many biological text-books.

Recent delvings in old magazines by the writer have shown that some French scientists had essentially the same idea as Mendel a few years before he did, but did not push it quite so far. It is possible that he knew of their work and was inspired by it. It also appears that Mendel's work was known to a few American botanists around 1882, but it was rather out of their field (taxonomy), and they were not particularly impressed by it.

Cytological Demonstration of Cleavage Anaphase Bridges in *Drosophila melanogaster*

CLAUDE W. HINTON, *University of Georgia*

The behavior of an unstable ring-X chromosome called w^{vc} of *Drosophila melanogaster* has been explained by anaphase bridge formation during cleavage mitoses followed by breakage of the bridge to cause dominant lethality or by loss of the bridge to produce either gynandromorphs or XO males. An attempt to confirm this model consisted of cytological examination of Feulgen whole mount preparations of third through eighth cleavage eggs derived from rod-X females crossed either to w^{vc} males or to males carrying the stable X^{c2} ring chromosome. The frequency of late anaphase and telophase figures with bridges was 1.94 percent (N = 2516) and 0.28 percent (N = 1084) for the two groups, respectively; these frequencies are not corrected for the fact that approximately one-half of the embryos carry the Y chromosome rather than a ring-X. Studies of other mitotic abnormalities found in this material are in progress.

This work was supported by U. S. Public Health Service Research Grant C-3000.

A New Marine Aporocotylid Cercaria from *Donax variabilis* Say*

RHODES B. HOLLIMAN, *Florida State University*

This constitutes a preliminary report on a new cercaria of a blood fluke of fishes (Family Aporocotylidae) from the marine pelecypod *Donax variabilis* Say. The cercaria is typical for the family in being apharyngeal and brevifurcate, with a dorsal fin fold on the body. The body measures 112 microns long and the tail stem 236 microns long. The flame cells, located in the posterior third of the body, are arranged in the pattern of 2(2). This cercaria is peculiar in that it has an asymmetrical tail. One tail furca is approximately 10 microns long and the other is about 33 microns long. Another interesting feature is a longitudinal row of spines on each lateral surface of the cercarial body. These spines are arranged in 22-24 groups of 3 or 4, with the anterior attached ends of each group converging. The cephalic region of the body is surrounded by parallel bands of minute spines. There are seven penetration glands and ducts.

Notes on the Helminths of Mammals in the Mountain Lake Region. IV. The Life Cycle of *Hydatigera lyncis* Skinker*

HARRY L. HOLLOWAY, *Roanoke College*

Strobilocerci of *Hydatigera lyncis* recovered from *Neotoma magister* were fed to young *Felis domestica*. One cat, autopsied 61 days after feeding, yielded a mature specimen 34 cm long with a maximum width of 4mm. Another cat died 88 hours after being fed five strobilocerci and five tapeworms were recovered. Two additional cats began to pass proglottids 71-77 days after receiving strobilocerci. Seventeen terminal proglottids and two detached proglottids, recovered from the colon of the first cat were retained in 0.75% physiological saline at room temperature for 36 hours and fed to young white laboratory rats (Holtzman Strain). The rats were sacrificed 32-61 days after experimental feeding and all were negative for hepatic strobilocerci. Proglottids recovered from the latter two cats 1-24 hours after passage were placed on moist filter paper and incubated for 24-120 hours at 37.5 degrees centigrade. Six rats were fed two proglottids each. As the dye used to mark the animals was not permanent it was not always possible to correlate the number of strobilocerci recovered with the incubation period. The largest number of strobilocerci (5) were recovered from the rat fed proglottids incubated for 120 hours, three were recovered from each of two rats, and one was recovered from each of three rats. A control rat was not infected. In the experimental life cycle of *Hydatigera lyncis*, *Felis domestica* serves as the definitive host and *Mus norvegicus albinus* as the intermediate host.

Galactose Utilization in Yeast and Other Fungi*

G. LEON HOWELL, *University of Alabama*

Galactose utilization by *Saccharomyces cerevisiae* isolates from "Fleischmann's Active Dry Yeast for Baking" and by other fungi has been studied utilizing galactose and glucose containing carbon-14. The yeast and other fungi were placed under aerobic conditions in solutions containing various mixtures of radioactive and non-radioactive sugars. A gas train was set up to collect the carbon dioxide produced. Comparisons of specific activities of carbon dioxide produced by metabolizing fungi with the specific activities of carbon dioxide produced from oxidizing the sugar mixtures employed permitted the study of galactose utilization in the presence of glucose and other sugars which may be metabolized at the same time.

Hybridization and Allotriploidy in *Triturus viridescens*

NORMAN HUGHES, *Emory University*

The relative importance of the nucleus and the cytoplasm in development may be studied by altering the normal nuclear-cytoplasmic relationship through hybridization, through polyploidy, or by combining hybridization with polyploidy. Reciprocal diploid and triploid hybrids between *Triturus viridescens viridescens* and *T. v. louisianensis* were produced through heterospermic insemination followed by a heat shock (10 minutes at 36°C). The early development was essentially unchanged, but differences were manifested in the pigment pattern and in the time of appearance of the hind limb bud. Triploids have larger and fewer cells than do diploids. The pigment patterns of reciprocal diploid hybrids are not significantly different, but are more nearly like that of *T. v. louisianensis* than that of the other parent. Allotriploids with two *T. v. louisianensis* genomes are essentially the same as diploid hybrids, but allotriploids with two sets of *T. v. viridescens* chromosomes are about intermediate between diploid hybrids and the *T. v. viridescens* parent. The hind limb bud appears earlier in *T. v. viridescens* than in *T. v. louisianensis*, and the times of appearance in the hybrid classes is between the two extremes, with some indication of a maternal effect.

The Oviducal Environment and Normal Blockage of Meiosis in Oocytes of the Newt, *Triturus viridescens**...

A. A. HUMPHRIES, JR., *Emory University*

The oocyte of *Triturus viridescens* is normally in metaphase of the first meiotic division when released from the ovary, and the first polar body is usually extruded as the egg passes through the anterior one-third of the oviduct. Meiosis then quickly progresses to metaphase II and is blocked at that stage until the egg is activated at fertilization. Earlier (Humphries, 1955) it was shown that a significant percentage of eggs retained for forty-eight or seventy-two hours in the coelom or the extreme anterior (non-jelly-secreting) parts of the oviducts progressed past the block at metaphase II. In the light of these results, it was desirable to determine whether the same effect would be observed in eggs retained for similar periods in the jelly-secreting portions of the oviducts. Thus far, over 200 such eggs, all with at least one jelly coat, have been examined. None of these has shown advance past the normal block. Some aspect of the oviducal environment, therefore, probably associated with the secretion of jelly or with the jelly itself, seems to be responsible for the normal blockage of meiosis at metaphase of the second division.

Schooling Behavior in the Marine Snail, *Nassarius obsoletus**

CHARLES E. JENNER, *University of North Carolina*

In Barnstable Harbor, Massachusetts, it has been found that populations of the mud snail, *Nassarius obsoletus*, show annually a seasonal change in distribution pattern—from a dispersed distribution, in which the snails are present over extensive areas of the flat, to an aggregated distribution, with snails occurring in massive aggregations. This change occurs abruptly and is related to the reproductive state of the population, coming at the close of the reproductive period. Once the aggregations are formed the snails display a striking schooling behavior, snails in any one part of the aggregation often moving in mass in the same direction. If the position of a snail in such a group is experimentally changed, it will immediately reorient to its former position. Physical contact is not required in this reorientation. Thus, a unique opportunity is afforded for the experimental analysis of schooling behavior.

Aided by grants from the National Institutes of Health, U. S. Public Health Service (E-356) and from the University Research Fund, University of North Carolina.

Histological Observations on the Male Reproductive System of the Crayfish*

TOM L. JOHNSON, *University of Virginia*

In the subfamily Cambarinae a cyclic dimorphism is demonstrated by the male crayfish and these two forms have been designated as Form I and Form II, the former known to be capable of transmitting sperm to the annulus ventralis of the female. It is questionable that the male, Form II, is capable of accomplishing this transfer. A histological study of the male reproductive tract of these two forms was initiated to determine whether or not there exist cyclic alterations which might be correlated with the external anatomical differences which distinguish the two forms. Three distinct regions are recognized: the proximal sperm duct; the muscular "ejaculatory duct"; and the distal cuticularized "shaper" located within the penis papilla on the coxopodite of the fifth walking leg. These three regions are described in some detail as they exist in the male, Form I, and data are presented which substantiate the belief that the male, Form II, is incapable of transferring sperm to the annulus ventralis of the female.

A Fungus Parasite in Ova of the Barnacle *Chthamalus fragilis denticulata*

T. W. JOHNSON, JR., *Duke University*

Lagenidium chthamalophilum is described as an invader of the ova of a barnacle species. The fungus is characterized by the formation of a vesicle which appears before sporangial protoplasm migration, and by highly vacuolate, stout vegetative hyphae. Thirty-four percent of all lamellae examined were invaded. The fungus can invade and destroy the ova at any time between late gastrulation and emergence of the nauplii. Cross-inoculation experiments in an attempt to transfer the fungus to ova of the associated barnacle, *Balanus amphitrite*, were unsuccessful.

A New Moss for North America

Z. IWATSUKI and A. J. SHARP, *University of Tennessee*

Molendoa sendtneriana has been found in Tennessee and North Carolina. It is probably already represented in U. S. herbaria under the names *Trichostomum cylindricum* and *Gymnostomum aeruginosum* with which it might be confused.

Microsporidiosis in Shrimp

E. E. JONES, *Georgia State College*, and *Duke University Marine Laboratory*

Shrimp fishermen of the East and Gulf Coasts have for the past ten years been finding in their catches shrimp which are blue-black in color. The abdominal musculature of these animals is white in appearance and lacks the firmness of healthy muscle. These shrimp are called "cotton shrimp," "blue shrimp," "black shrimp" and "he shrimp." *Nosema pulvis* Perez 1905 and *Thelohania hunterae*, n. sp. Jones 1957 are the etiological agents. *Nosema pulvis* is a histozoic parasite of striated muscle, cardiac muscle, ovary and digestive gland. *Thelohania hunterae* is primarily coelozoic, however, invasions of the ovary and nerve cord have been encountered. Infected animals show marked physical debility and are unable to compete successfully with healthy animals.

The Seasonal Effect of Ecological Factors on *Drosophila* Populations

J. F. JONES and J. M. CARPENTER, *University of Kentucky*

A study of seasonal fluctuations among *Drosophila* species was started in June 1946 with the assumption that various ecological factors could be correlated to explain such fluctuations. The procedure consisted of bi-weekly collections from an isolated field station located along the Kentucky River near Lexington. Weekly frequencies were kept for each

species caught and recorded along with precipitation and temperature data. The above procedure was followed throughout the summers of '56 and '57 with a total collection of more than 50,000 flies. Analysis of this data has shown that a definite correlation exists between the fluctuations of certain species and the ratio between rainfall and temperature. Food is being studied as another ecological factor.

Plasmodium floridense in Georgia Lizards

HELEN B. JORDAN, *Georgia State College, Atlanta*

Plasmodium floridense (Thompson and Huff, 1944) was studied in two Georgia lizards, *Sceloporus undulatus* and *Anolis carolinensis* and discussed with respect to occurrence and host regulation of development. The incidence is about 10 per cent in *Anolis;* 4 per cent in *Sceloporus*. Requiring from two to four months for the infection to run its course in *Sceloporus*, it is characterized by an acute rise, a definite peak of parasitemia, and a rapid decline. The same parasite developing in *Anolis* does not show any of these, but continues as an irregularly developing low-grade infection which may persist for as long as two years. The peak of parasitemia often reaches 15,000 per 10,000 red cells in *Sceloporus*, while in *Anolis* the highest peak observed was 1,750 and it is usually much less. The average number of merozoites per segmenter in *Sceloporus* is 10.60 with an obvious inhibition of reproduction in the late stages of the infection; in *Anolis* it is only 9.28. These variations in development of *P. floridense* are thought to be due to differences in natural and acquired immunity of the hosts and are discussed from that point of view.

The Adaptive Significance of Variation in Response to Daylength in *Ipomoea**

ROBERT J. KNIGHT, JR., *Blandy Experimental Farm, University of Virginia*

Four species of *Ipomoea* and one artificially produced amphiploid, assembled from a number of locations at differing latitudes in the Northern Hemisphere, were grown in northern Virginia, at 39° north latitude, under conditions of natural daylength. In the short days of winter or of early spring or the shortening days of midsummer, those from the northernmost sources began blooming before those originating farther south. There was a trend of declining sensitivity to shortening days, demonstrated by a tendency to remain longer in vegetative growth, as parent stocks originated at lower latitudes. Hybrids between "long-day" and "short-day" taxa in two species appeared to demonstrate the genetic dominance of "short-day" to "long-day" bloom response. Small F_2 populations appeared to show segregation for flowering behavior when grown in an artificial light period of 14 hours. In *Ipomoea*, populations which have invaded relatively high latitudes, or have been cultivated at northerly latitudes, initiate bloom under longer daylengths than populations of the same species derived from locations nearer the equator. Genetic dominance of the "short-day" plant, along with subsequent appearance and selection (either natural or artificial) of "long-day" genotypes, are considered to be factors of evolutionary significance in adapting the species to occupy higher latitudes.

Yeasts Isolated from the Crops of Seasonally Fluctuating *Drosophila* Populations

J. K. KOMATSU and J. M. CARPENTER, *University of Kentucky*

A number of different types of yeasts were isolated from the crops of *D. affinis*, *D. melanogaster*, and *D. immigrans* populations during bi-weekly collections from the early spring through the late fall of 1957. Approximately 18 wild yeast species have been identified by morphological and physiological tests according to the procedure of Lodder and Kreger—Van Rij. Two of the three *Drosophila* species studied exhibited characteristic population curves during the collecting period. *D. affinis* dropped from a figure comprising approximately 62% of the population in April to a figure of 1% in November. *D. melanogaster* increased from a frequency of 3% in April to a frequency of 45% in November. *D. immigrans* showed a fairly constant population picture during the same period. Present studies indicate that some pattern of correlation exists between the yeast species isolated during the various seasons and the frequency of the three *Drosophila* species found during these seasons.

A New Species of *Cruzia* (Nematoda: Cruziidae) from *Didelphis virginiana*

DWAYNE N. KRUSE, *Florida State University*

This nematode was found in great numbers in the large intestine of *Didelphis virginiana* collected in the vicinity of Tallahassee, Florida. In general appearance and in some of its anatomical details it is similar to *Cruzia tentaculata* Travassos (1922) from South American opossums and to *Cruzia americana* Canavan (1929) found in North American opossums. The present specimens differ, however, from the other species of the genus *Cruzia* in number of teeth; shape, number and position of anal papillae; and other anatomical details. The differences appear sufficient to separate this nematode from the other species in the genus, and the author plans to propose it as a new species. The description will be based on about 50 worms; some were cleared in a lactophenol, picric acid, methyl green mixture and mounted in Hoyer's medium, others were stained with Semichon's aceto-carmine and mounted in damar.

Biochemical Investigations of the Developing Slime Mold, *Dictyostelium discoideum* Raper*

JEROME O. KRIVANEK, *Newcomb College, Tulane University*

Histochemical, spectrophotometric, and chromatographic methods were employed to investigate four stages in the life cycle of the slime mold, *Dictyostelium discoideum* Raper. The histochemical study utilized thirteen techniques to investigate as many biochemical intermediates and enzymes. Of the thirteen biochemical entities, two—peroxidase and acid phosphatase—were not demonstrable in any stage of the life cycle. The eleven remaining enzymes and intermediates—lipase, RNA, DNA, 5-nucleotidase, protein, acid polysaccharides, mucopolysaccharides, tyrosinase, cytochrome oxidase, amine oxidase, non-specific dehydrogenases—were

demonstrated in all or nearly all of the stages investigated. The pre-stalk area, which gives rise to the stalk cells as well as to the sorophore sheath, exhibited generally the highest degree of biochemical activity. An area of intense lipase, 5-nucleotidase, amine oxidase, and non-specific dehydrogenase activity was noted in the lower-most portion of the rising sorogen of the culmination stage. DNA content was also studied spectrophotometrically. By ascending paper chromatography the amino acid constitution of the slime mold was determined. In addition to peptides, alanine, threonine, glycine, serine, and glutamic acid were present in unhydrolysed tissue. These five plus the leucines, phenylalanine, methionine, proline, tyrosine, aspartic acid, asparagine, histidine, and cystine occurred in hydrolysed tissue. The chromatographic picture was similar in all stages.

Taxonomic Studies on the Gastrotricha of Louisiana*

ROBIN C. KRIVANEK and JEROME O. KRIVANEK, *Newcomb College, Tulane University*

During 1957, studies were begun on the Gastrotricha of Louisiana with concentration on an exceptionally rich locality, the fresh-water roadside ditches near Boutte, St. Charles Parish. This paper presents our conclusions on the genera *Stylochaeta* and *Neogossea*, with some preliminary remarks on the genus *Kijanebalola*. A new species of *Stylochaeta, S. curviseta,* is described. It is closely similar to the one other American species of the genus but bears a long, curved bristle on each of the short caudal appendages. The genus *Neogossea* is recorded for the first time in this country with two representatives. *N. sexiseta*, a new species, has six caudal spines on each side. *N. fasciculata* (Daday) is redescribed. The genus *Kijanebalola*, heretofore recorded only from East Africa, is represented by two forms in this area. These are the first observations on living specimens of this genus. Also presented is an excellent method for viewing gastrotrichs under oil immersion.

Morphology and Biology of a Species of *Proterospongia*

JAMES B. LACKEY, *University of Florida*

A bloom of *Proterospongia* consisted mainly of small colonies, usually less than 25 zooids each. They were studied alive and their method of feeding, colony, and zooid structure were noted. This is a redescription of an organism whose status has been questioned.

The Occurrence and Characterization of Ascorbic Acid Oxidase in Certain Bacteria*

DWIGHT W. LAMBE and LORETTA C. ELLIAS, *Florida State University*

This paper describes a procedure, based on the Warburg-Barcroft manometric technique, for the detection of ascorbic acid oxidase in cell suspensions and in cellular extracts of bacteria. Ascorbic acid oxidase was demonstrated in cell suspensions of *Escherichia coli* and *Aerobacter aerogenes* and in cellular extracts of *Escherichia coli, Aerobacter aerogenes, Streptococcus fecalis,* and *Proteus morgani.* A pH of 6.4 was established as the optimum for assay of cellular suspensions. Storage of the enzyme at −70° C. for 34 days resulted in only an 18% loss in activity. A study of the factors influencing enzyme production showed that a slight increase in production resulted when cultures were incubated at 35° C as compared to incubation at 30° C and that a 108% increase in enzyme occurred when ascorbic acid was added to the culture medium. The enzyme did not show a dialysable co-factor after eight and one-half hours dialysis at 4° C. After centrifugation of the enzyme at 140,000 x g for one hour at 4° C, 31% of the activity remained absorbed on the particulate material.

Photosynthetic Studies of Three Granite Outcrop Endemics: *Amphianthus pucillus* Torr., *Isoetes melanospora* Englem, and *Diamorpha cymosa* (Nutt.) Britton

WM. T. LAMMERS, *Emory University*

The unusual flora of the Atlanta area granite outcrops has attracted attention since this area was settled. The rate of CO_2 uptake by the subject plants was determined in a modified Heinicke-Hoffman apparatus. As was predicted, the plants all have (1) a high rate of respiration (2) a high photosynthetic compensation point, and (3) a more or less even increase in the rate of CO_2 fixation up to the maximum light intensity used. Probably *Amphianthus* and *Isoetes* reach their maximum rate of photosynthesis at or just above 10,000 foot candles. *Diamorpha* appears to have a higher maximum probably about 12,000 foot candles. Both *Amphianthus* and *Isoetes* are usually submerged in water. It may be assumed that the water surrounding these plants absorbs some of the light and reduces the actual intensity of light reaching the plants. This may be indicated by the lower saturation point (10,000 fc) of these two compared with the terrestial *Diamorpha*. *Diamorpha*, growing in full sunlight, seems to have adapted itself to the higher light intensity it receives. The above results seem to indicate that a photosynthetic adaptation is at least part of the means of successful survival of these endemic plants of the granite outcrops.

Meningeal Tumors of the Newt, *Triturus viridescens,* as Correlated with Trematode Infection of the Brain and Brain Case*

EDWARD W. LAUTENSCHLAGER, *University of Virginia*

Observations made of brains of newts infected with the metacercaria, *Diplostomulum* sp., have shown macroscopic masses on the dorsal and dorsolateral aspect of the brain, generally in the region of the cerebral hemispheres. Microscopic examination discloses these tissue masses to be meningeal tumors, comparable to human mengioma. While over 200 animals have been examined, the tumor has been found in only those animals which are infected by the parasite. Although an apparent correlation exists between parasitism and tumor formation in the newt, as yet there is no correlation between the presence of the tumor and degree of infestation. Sufficient information is not yet available to correlate the age of infection and tumor occurence, nor to suggest the causative mechanism of tumor formation.

A Monograph of the Genus *Rosa* in North America: *R. blanda*

WALTER H. LEWIS, *University of Virginia* and *Stephen F. Austin State College*

Although a conspicuous species in the flora of the northeast, *Rosa blanda* Ait. has never been thoroughly investigated. The variability of the complex from interspecific hybridizations and intraspecific variations (including heritable and environmental factors) is emphasized by the fifty odd taxa found in the literature and applying to various biotypes. Using the disciplines of gross and micro morphology, phytogeography, cytology, ecology, and taxonomy, an analysis of the species and its hybrid populations has been possible giving a nomenclatural conclusion to the investigation.

Synopsis of Louisiana Polypores

BERNARD LOWY, *Louisiana State University* and ARTHUR A. WELDON, *Tulane University*

A summary is presented of all the species of polypores that have been reported from Louisiana since the publication of Langlois' *Catalogue Provisoire* in 1887. There are keys to the species studied by the authors, an annotated list of collections and photographs of the more interesting specimens.

Phenylthiourea and Iodine Binding in the Tadpole*

W. GARDNER LYNN and JAMES NORMAN DENT, *Oak Ridge National Laboratory and The Catholic University of America and University of Virginia*

It was shown (Dent and Hunt, '52) that radioiodine becomes localized not only in the thyroid of the tadpole but also in the thymus, the horny teeth and in pigmented regions. It was shown by others that deriviations of thiourea inhibit melanin formation. To study the effects of phenylthiourea on iodine binding in regions of iodine localization autoradiograms were prepared from sectioned tadpoles of *Hyla versicolor* after various periods of treatment with phenylthiourea and injection with radioiodine. It was demonstrated that phenylthiourea completely inhibits binding of iodine in the thymus and in melanophores and partially inhibits binding in the horny teeth. Evidence was found to show that iodine becomes associated with regions where melanogenesis is taking place but not with melanin that is already formed.

This work was supported in part by AEC Contract AT (40-1)-2000.

Interspecific Gene Exchange Between Two Southeastern Tree Frogs

JOHN S. MECHAM, *Alabama Polytechnic Institute*

Morphological evidence is presented for introgressive hybridization between populations of *Hyla gratiosa* and *Hyla cinerea* in the vicinity of Auburn, Alabama. Some six characters which distinguish the two forms are used in the analysis, permitting tentative recognition of F_1 hybrids and offspring produced by backcrossing to both parent species. The data demonstrates exchange or hereditary material between the two forms, particularly from *cinerea* to *gratiosa*. Evidence from laboratory crosses, although incomplete, indicates a high level of fertility in interspecific crosses and in hybrid offspring. Factors leading to breakdown of the species barriers and the significance of interspecific gene exchange are discussed.

Pachytene Morphology and the Evolution of Non-Homology in Chromosomes*

MARGARET Y. MENZEL, *Florida State University and U.S.D.A.*

Data from the literature and from a study of pachytene morphology of heteromorphic pairs of sex chromosomes in the blood fluke *Schistosomatium douthitti* and the hemp plant *Cannabis sativa* will be presented in connection with the following hypothesis: In addition to point mutations and structural rearrangements, chromosomes are capable of a third class of change which affects the cycle of chromosome contraction and DNA deposition. This cycle is to some extent autonomously controlled within given chromosome segments, each segment thus being capable of a degree of independent evolution in this respect. Changes in chromatic cycle are often undetectable at pachytene and may not interfere with perfect synapsis, even though they may be very striking at other stages. In this respect pachytene is a conservative stage. A difference in cycle between two synapsed partners, however, does interfere with chiasma formation in its vicinity. Chiasma formation is therefore a better criterion of similarity or homology between partially differentiated chromosomes than the ability to synapse. Alteration of the chromatin cycle between segments still capable of synapsis seems to occur in a rather wide range of plant and animal material, and is probably a basic and widespread evolutionary mechanism in chromosomes.

This work was supported in part by grant E-1142(C) from the National Institutes of Health, Public Health Service.

Zoosporangia of *Sorosphaera veronicae**

CHARLES E. MILLER, *University of North Carolina*

Zoosporangia of *Sorosphaera veronicae* are described for the first time. The zoosporangia develop from plasmodia and are located in subepidermal and epidermal tissues, root hairs excepted, of the roots only; the cystosori are found only in the shoot system. Experimental and control host plants, *Veronica persica*, were grown from seeds in pots of sterilized soil and sand with nutrient solution in the algal culture room at temperatures and light intensities and durations which simulated natural environmental conditions. When solutions of zoospores were poured in pots of host plants as cultured above, zoosporangia in the root systems and cystosori in the shoot systems were produced. When finely ground host plant cystosoral galls which had been dried for 6-12 months were sprinkled in pots of host plants cultured as described above, zoosporangia were found in roots. Control plants showed no evidence of zoosporangia or cystosori. Zoospres are biflagellate and heterocont; the anterior flagellum is shorter than the posterior one. Zoospores stained using the Löffler technique show that both laterally attached flagella end in a whip-lash. The whip-lash on the posterior flagellum is longer than the whip-lash on the anterior one. Cruciform nuclear division occurs in zoosporangial plasmodia.

Studies on the Genus *Homalometron* Stafford, 1904 (Trematoda; Lepocreadiidae) with a Redescription of *H. armatum* (MacCallum, 1895)

GROVER C. MILLER, *North Carolina State College*

During recent studies on parasites of Louisiana fresh-water fishes, a large series of trematodes belonging to the genus *Homalometron* were collected. These flukes were collected from the following hosts: *Aplodinotus grunniens*, the fresh-water drum; *Lepomis humilis*, the pumpkin-seed sunfish and *Lepomis microlophus*, the red-ear sunfish. A survey of the literature revealed that the original description for *H. armatum* is very brief and this condition has led to some confusion regarding other members of the genus. Also certain discrepancies regarding other species in the genus had added to this confusion. The study of abundant material in the writer's collection has shown that *H. armatum* is a highly variable form and that *Homalometron pearsei* (Hunter and Bangham, 1932) should be considered a synonym of *H. armatum*. The other species of the genus are discussed and the available knowledge on life-histories is summarized. The taxonomic position of the genus *Homalometron* is also discussed.

Studies of Oyster Mortality in Alligator Harbor, Florida*

F. E. NICHY and R. W. MENZEL, *Florida State University*

Alligator Harbor, on the northwest coast of Florida, has a normal salinity range between 28 and 36 parts per thousand. Dense oyster reefs occur in the Harbor, but all are intertidal. Mortality is high on the tops of the reefs, which are from 25 to 45 cm above mean low water. Live oysters are scattered on the lower edges of the reefs, which are from 5 to 10 cm above mean low water. The majority of the live oysters occur in the zone of the sides of the reefs, 15 to 30 cm above mean low water. Observations showed that oysters on the tops of the reefs are subjected to extreme temperatures at low water, with resulting mortality. Oysters planted about 15 cm below mean low water had a very high mortality, due mainly to the action of predators, especially whelks, *Busycon contrarium* Conrad, and stone crabs, *Menippe mercenaria* Say.

Radiation Ecology Research Program at the Lockheed Reactor Site*

ROBERT B. PLATT, *Emory University*

A radiation ecology research program has been established jointly between Emory University and Lockheed Aircraft Corporation at the site of an atomic reactor under construction by Lockheed through an Air Force Contract. The reactor is in the center of a wooded 10,000 acre reservation, located in the Appalachian foothills of North Georgia near Dawsonville, some 50 miles from Atlanta. Since the reactor is to be only partially shielded, a field of 2,000 to 3,000 feet radius will be developed, having both neutron and gamma radiation. Thus not only the direct effects but also the indirect effects resulting from the transfer and accumulation of radioactivity can be investigated. Long term studies now underway are basically concerned with radiation as an ecological factor. Special aspects of these studies are food chains, including those in which man and his domestic animals represent end links, genetical and cytogenetical effects, and physiological effects, especially on tolerances of individual organisms to both physical and biotic factors, and the ultimate effects of these on populations and communities. Base lines for experimental procedures are being established prior to operation of the reactor.

A Progress Report on Studies of Mixed Hardwood Stands in the Southeastern Coastal Plain

ELSIE QUARTERMAN, *Vanderbilt University* and CATHERINE KEEVER, *Millersville State College, Pennsylvania*

In studiyng hardwood stands on mesic habitats in the Southeastern Coastal Plain (essentially the region described by Braun as the Southeastern Evergreen Forest Region), floristic lists were made of 63 stands in the states of South Carolina, Georgia, Florida, Alabama, Mississippi, Louisiana, and Texas. A comparison of these lists indicates that the composition of the stands is very similar throughout the area.

Micronuclear Abnormalities Associated with Non-Lethal High Temperatures during Fission of *Tetrahymena pyriformis**

CHARLES RAY, JR., *Emory University*

The strains of *Tetrachymena pyriformis* being studied by us normally contain a single macronucleus. Cytokinesis of an individual at fission is immediately preceded by mitosis of the micronucleus. The micronucleus becomes oriented antero-posteriorly. The anaphase figure stretches nearly the length of the animal; thus transverse cytokinesis separates the sister nuclei so that the two daughter animals each have a single micronucleus. This behavior is observed through a temperature range of 15°C to 27°C. However, cultures of these strains at sublethal temperatures of 34°C to 36°C contain individuals with different numbers of micronuclei—some with as many as 10, most with 3 or 4. This condition appears as soon as 48 hours after transfer from 23°C to 34°C. Microscopic examination within 24 hours after such transfer reveals micronuclei oriented other than antero-posteriorly and also some anaphase figures not stretched the length of the animal. In such cases one of the two daughter animals receives all the micronuclei and the other receives none. However, few amicronucleate animals are recovered subsequently, indicating that the amicronucleates are at a disadvantage—either in survival or rate of fission.

This work was supported by a research grant from the National Science Foundation.

Comparison of Tissue Metabolic Rates of a Shrew and Some Other Small Animals*

JAMES R. REDMOND and JAMES N. LAYNE,
University of Florida

Respiration rates of tissues of the shrew (*Cryptotis parva*), mole (*Scalopus aquaticus*), harvest mouse (*Reithrodontomys humulis*), white mouse, white rat, and domestic rabbit were compared on a weight specific basis. Metabolic rates of liver, kidney, lung, and diaphragm of white mouse, rat, and rabbit showed the same general correlation with body size as does the metabolism of the intact animal. Of the shrew tissues, only kidney respired at a rate expected on a weight basis, liver, lung, and diaphragm exhibiting lower than expected rates. These data suggest that the characteristically high metabolism of the intact shrew is due to factors other than high intrinsic cellular metabolic rates. The relatively low respiratory rates observed for three of the tissues investigated may represent either a primitive condition or a secondary adaptation to reduce energy expenditure during sleep or periods of inactivity. Kidney rates of the harvest mouse, which approximates *Cryptotis* in weight, corresponded with those of the shrew, while liver showed a depression similar to that of the shrew though less pronounced. These relationships may be typical of very small mammals. Oxygen consumption of tissues from a single mole fell markedly below expected rates. This suggests the possibility that relatively low tissue metabolism may be a general insectivore condition.

Polyploidy in the Aloineae*

HERBERT PARKES RILEY, *University of Kentucky*

The basic haploid chromosome number in the Aloineae is 7 and polyploidy is uncommon except in the Coarctatae Section of *Haworthia*. The problem is of interest in view of Darlington's theory that there is little chromosome variation in long-lived plants. Except for one South African study all plants previously studied had been growing for many years in botanical gardens on other continents and no observations on wild populations had been made. The writer studied two wild populations in South Africa, other plants collected there, and some plants raised from seeds received from there. All were diploids except the hexaploid *Aloe ciliaris*. They include 40 plants of *Aloe Davyana* collected at de Wildt, Transvaal, 119 plants of 32 other species of *Aloe*, 16 plants of ten species of *Haworthia*, 50 plants resembling *Gasteria Zeyheri* from the Bushman's River Poort near Grahamstown, Cape Province, eight plants of *Gasteria Beckeri* from that region, 44 plants of 21 other *Gasteria* species and 48 unidentified *Gasterias*. Chromosome counts were obtained from twelve *Aloe*, three *Haworthia* and ten *Gasteria* species never previously studied.

Cytological Studies of the Vernal Species of *Helenium*

HOWARD F. L. ROCK, *University of Tennessee*

Cytological data concerning the spring-flowering species of *Helenium* (Compositae) are presented. The data includes the number and behaviour of the chromosomes as observed during microsporogenesis. Correlations between chromosome number, morphological-taxonomic disposition, geographical distribution and generic affinities are also presented.

Dicyemid Mesozoans from the Northern Gulf Coast of Florida and the Florida Keys*

ROBERT B. SHORT and RAYMOND T. DAMIAN,
Florida State University

Seventeen octopuses (12 *Octopus vulgaris*, 5 *O. joubini*) from the northern Gulf Coast of Florida have been examined for dicyemid mesozoans. All specimens of *O. vulgaris* and three of the *O. joubini* were infected. The *O. vulgaris* harbored *Dicyema aegira* McConnaughey and Kritzler, 1952, previously reported only from the northeast coast of Florida. Three of the *O. joubini* were infected with a different, and as yet undescribed, species of *Dicyema*. This species will be discussed in detail. Two of sixteen specimens of *Octopus briareus* from the Florida Keys were infected with an undetermined species of *Dicyema*, now under study. Nine individuals of the neritic squid, *Lolliguncula brevis*, from the northern Gulf Coast of Florida were negative for mesozoans.

This work was supported by The National Science Foundation.

Nitrogen Excretion in the Aquatic Snail *Ceratodes cornuarietis* (L.)

WILLIAM C. SLOAN, *University of Florida*

Rates of excretion of 1) ammonia, 2) urea 3) uric acid and 4) total soluble non-protein nitrogen have been investigated using 1) micro-diffusion, 2) enzymatic and micro-diffusion, 3) enzymatic and spectrophotometric and 4) micro-Kjeldahl techniques. Adult snails excrete on the order of 10 to 20 gammas ammonia-nitrogen per hour per gram dry tissue. This appears to be approximately 100% of the total soluble non-protein nitrogen excreted. In addition, small amounts of uric acid have been detected in fecal material.

Trichopelma sp., a Trichostome Ciliate with Adoral Membranelles

JESSE C. THOMPSON, JR., *Hollins College*

Trichopelmidae, a family of ciliates in the order Trichostomatida, has been noted for its lack of adoral membranelles. In recent studies with phase microscopy and silver impregnation of the infraciliature, *Trichopelma* sp. has been found to possess two or possibly three adoral membranelles.

The Effects of Temporary Anticancer Agents on Certain Transplantable Tumors and Their Drug-Resistant Sublines Implanted in the Same Host*

J. RICHARD THOMSON and BONNIE M. JONES,
Southern Research Institute

Antimetabolites such as 6-mercaptopurine, A-methopterin, 8-azaguanine, and antibiotics such as 6-diazo-5-oxo-norleucine (*DON*) and azaserine have repeatedly been shown to be temporarily effeutive in inhibiting the growth of neoplasms both in experimental animals and in man. The problem of

drug-resistance in cancer cells, similar to drug-resistance in bacteria, presents an ever present stumbling block to the successful chemotherapy of neoplastic growths. No small effort has been expended in recent years in attempts to reveal the mechanism of resistance formation and of means to circumvent metabolic processes characterizing resistant cells.

We have employed a unique method of studying the effects of various antimetabolites on populations of resistant cells in an effort to demonstrate differences between cancer and normal cells and simultaneously test certain rationally-selected agents for activity against their resistant forms. By implanting both the resistant and parent lines of certain tumors on opposite flanks of the host, we are able to demonstrate differential effects of these agents on the two tumor types. We thereby can select in a more rational manner combinations of agents most likely to show potentiation or synergism against experimental neoplasms. Experimental data will be presented to demonstrate this technique followed by a discussion of how the results might be interpreted.

Significance of Virulence and Viability as Related to Quantitative Immunogenic Properties of Several Antituberculosis Vaccines

H. M. VANDIVIERE and MARGARET R. VANDIVIERE,
North Carolina State Sanatorium System

Standardization for potency and viability in suspensions of *Mycobacteria* has long been an enigma of import, both requiring prolonged periods and measurable in retrospect only. Cord-formation titration, omental index (potency) and formazan curve interpolation (viability) are described as standardization methods. Several vaccines have been so standardized and their immunogenic capacities quantitatively investigated. "Degree of protection" has challenge of "protected subjects" as the final critique. Thus, 3000 guinea pigs were randomly vaccinated with standardized inocula of one of the vaccines. Experimental groups were so characterized that statistical significance could evolve. Tuberculin testing of experimental and control allocates with volume of allergic response ($v = 1/6 \text{ pi } h (h^2+3r^2)$) and duration of allergy calculations were periodic. Ultimately quantitative challenge was accomplished. Evaluation of disease was based on Feldman's index and comprehensive pathological evaluations from coded gross and microscopic preperations. Short-term vaccination reveals negligible differences in protection, whereas groups challenged at 12 to 30 months present significant differences between strains. The weakest BCG afforded little protection, whereas R_1Rv afforded protection significantly higher than the best BCG. Prevaccination cord-formation titer and omental index with post-vaccination volume and duration of allergy and degree of protection stand in comport for each strain. The weakest vaccine gives the least response, the most potent evokes greatest response and the intermeiates between, each having its own specific level. Beginning human studies (2500) are presented on high-incidence groups.

Stereum and Its Segregates in Jamaica*

ARTHUR L. WELDEN, *Tulane University*

Applying technics of hyphal analysis developed over the past several years to the *Stereum*—complex in Jamaica, we find some realignment of species is necessary to show more clearly the lines of relationship. These fungi, instead of being grouped together into *Stereum*, can better be distributed amongst the following genera: *Stereum*, eleven species, one species being reduced to synonymy, *Cymatoderma* (*Cladoderris*), one species, *Podoscypha*, one species, and *Laxitextum*, two species, one being transferred from *Stereum*. *S. magnisporum* Burt is moved to *Cytidia*, an unrelated genus. Four additional species collected by the author have not been hitherto reported from Jamaica. These include two species of *Stereum*, one of *Cymatoderma*, and one of *Podoscypha*. These newly-reported species bring the total number of species of *Stereum* and its segregates in Jamaica to 21. The study of this complex is still in progress and some additional realinement and new methods may come to light before its completion.

A Chromatographic Investigation of Three Strains of *Tetrahymena pyriformis**

CAROLYN WELLS, *Emory University*

The technique of paper chromatography has been employed to investigate possible biochemical differences among three strains of *Tetrahymena pyriformis*. The strains under examinations are members of variety 6, mating types I, II, and III. Amino acid patterns were obtained for each strain after hydrolysis of the organisms for 48 hours at 110°C in 5N HCl. In addition, samples of each strain were submitted to chromatographic analysis without prior hydrolysis, and the resulting free amino acid patterns were established. A comparison of the bound and free amino acid patterns obtained from each strain will be presented.

Diploid Males and Triploid Females in *Habrobracon* and *Mormoniella**

P. W. WHITING, *The University of Pennsylvania*

In *Habrobracon* sex is determined by a series of multiple alleles, the heterozygotes being female, the azygotes and homozygotes male. The last are diploid males and are regularly produced from fertilized eggs in "two-allele crosses" after inbreeding. They are very low in viability and are near-sterile. Their sperm are diploid, their few daughters triploid. In *Mormoniella* male diploidy results only from mutation, increasing chomosome number. Diploid males develop from unfertilized eggs laid by triploid females. They are highly viable and very fertile. Their sperm are diploid, their numerous daughters triploid. Triploid females in both genera lay numerous eggs, but very few of these hatch. Of those hatching many fail to mature. Nevertheless, in *Mormoniella* it is possible to obtain many hundreds, even thousands, of F_2 males from a single diploid male because of his numerous daughters. Unfertilized eggs of triploid females with triple alleles, *A a a'*, produce six kinds of males,—three haploid, *A*, *a*, *a'*, and three diploid, *Aa*, *Aa'*, *aa'*. Nothing is known of sex determination in *Mormoniella* except that it is different from that in *Habrobracon*.

Intra-clonal Mating in Strains of Variety 6, *Tetrahymena pyriformis**

CAROLYN WELLS, *Emory University*

The mating system of *Tetrahymena pyriformis* is composed of nine non-interbreeding varieties to date. Each variety contains two or more mating types. Members of any two mating types within a variety will pair when mixed under appropriate conditions; nuclear reorganization subsequently occurs in each pair member. Strains of mating types I, II, and III, variety 6, have been maintained in this laboratory since September 1955. Within the past year, intra-clonal mating (selfing) has been observed repeatedly in all three strains of this variety. Prior to the summer of 1957, pairing within a clone had never been observed in this laboratory in any of these three strains. Isolations of single organisms from each strain gave rise to sub-clones which exhibit intra-clonal mating in every observed instance. The viability of exconjugant clones from intra-clonal pairs is being investigated.

A Cytochemical Study of Macronuclear Bodies of *Tetrahymena pyriformis**

MARGARET M. WELLS and CHARLES RAY, JR., *Emory University*

During conjugation, the macronucleus of *Tetrahymena pyriformis* exhibits clusters of centrally located bodies; the macronucleus of vegetative individuals is surrounded by similar bodies. Using stains, extraction techniques, and phase microscopy on living animals, whole mounts and ultra-thin sections, a cytochemical study was made of these macronuclear bodies. An aqueous mixture of methyl green-pyronin gave satisfactory staining results. In animals undergoing conjugation, bodies which stain red with pyronin are visible within a clear area in the control region of a methyl green stained macronucleus. In vegetative animals, bodies of similar size and staining affinity are seen only at the periphery of the macronucleus. These bodies are darkly stained with Estable-Sotelo's technique for nucleolonema. Changes during conjugation and mitosis were studied using the phase microscope on living animals. The changes in staining affinity were studied following ribonuclease, trichloroacetic and perchloric acid treatments in an attempt to determine the chemical nature of these bodies.

This study was supported in part by a grant from The National Science Foundation.

Chemical Nature of the Photoreceptor Pigment Inducing Fruiting of Plasmodia of *Physarum polycephalum*

FREDERICK T. WOLF, *Vanderbilt University*

Plasmodia of *Physarum polysephalum*, grown either under alternate light and darkness, or in constant darkness, contain two yellow fluorescent pigments, which disappear upon fruiting. The two pigments are separable by paper chromatography or column chromatography. Absorption spectra of these compounds in the ultra-violet, visible, and infra-red regions, and the fluorescence spectra of these compounds have been studied. Both pigments have been identified as pteridines. The spectral properties of one pigment, and the shifts in its spectrum with pH are such as to offer an explanation of the effectiveness of low pH and blue light in bringing about the morphogenetic response of fruiting.

The Time Intervals between Successive Generations in the Celanoid Copepod, *Acartia tonsa*

ROBERT A. WOODMANSEE, *Mississippi Southern College*

A method is described for estimating the time intervals between successive generations of copepods which have been collected in a time series of plankton samples. The basis for the method is the existence of a sexual difference in longevity, which permits one to establish the times at which broods of copepods become adults. The application of the method to *Acartia tonsa* collected from Biscayne Bay, Florida, has indicated that this species produces about eleven generations per year and that the time interval between successive generations varies from four to seven weeks and varies inversely with temperature in accordance with van't Hoff's Law. The four-week intervals between successive generations occur during the summer months when the water temperatures are 30°C or over, and the seven-week interval occurs in mid-winter when the water temperatures average 21.6°C.

The Experimental Development and Significance of Pyrimethamine Resistance in Human Malaria*

MARTIN D. YOUNG and ROBERT W. BURGESS, *Laboratory of Tropical Diseases, USPHS, Columbia, S. C.*

After the chance observation that maralia parasites responded less well to a second dose of pyrimethamine than to the first, a series of experiments was planned to elucidate this phenomenon. It was found that the three most prevalent species of human malaria reacted similarly in this respect. The first contact with the drug gave prompt schizontocidal and sporontocidal effects. The clinical symptoms disappeared and the infection could not be transmitted by the mosquito vectors. The cycle of *Plasmodium vivax* and *P. falciparum* in the mosquito was interrupted at the first growth stage on the gut wall, normally occurring a day or two following ingestion of the malarious blood.

Upon relapsing, the parasites were resistant to the second and subsequent doses of the drug. The parasitemias were virtually unaffected. The clinical symptoms in the patient were poorly or not modified. Mosquitoes biting the patient were able to transmit the infection normally. The subsequent infection was also as resistant as the infection in the donor host. Increasing the drug dosage as much as four times did not overcome the resistance. Preserving the parasites at –78° C did not alter the resistant character. Further research on the resistance phenomena with this combination of parasites and drug should yield valuable information applicable not only to this parasite but perhaps to many other infectious organisms where resistance has appeared.

Program of the 19th Annual Meeting Association of Southeastern Biologists

Florida State University, Tallahassee, Fla., April 17-19, 1958

A Joint Meeting with the Southeastern Section of the Botanical Society of America, the Southern Appalachian Botanical Club, the District Convention of the Beta Beta Beta Biological Society and the Southeastern Division of the American Society of Ichthyologists and Herpetologists

SESSION SCHEDULE

Thursday, April 17

1:00-5:00 p.m. Meeting of the Executive Committee, Room 103 Conradi Building
6:30-8:30 p.m. Registration, Room 232 Conradi
8:15 p.m. General Session, Lecture Hall, The University Library

Friday, April 18

8:00-12:00 a.m. Registration, Room 232 Conradi
8:00-9:00 a.m. Southern Appalachian Botanical Club Breakfast. Each person will obtain his own breakfast in the cafeteria line at the Student Center and take his tray to the Trophy Room.
8:00 a.m. Commercial Exhibits, 239 and 242 Conradi Building
9:00 a.m. Contributed Papers
General Session, 228 Conradi Building
Plant Taxonomy, 115 Conradi Building
Plant Physiology, 107 Conradi Building
Invertebrate Zoology, 222 Conradi Building
Ichthyology and Herpetology, 319 Conradi
11:00-12:00 a.m. Business Meeting, Association of Southeastern Biologists, Lecture Hall, The University Library
12:00 Lunch, the Suwannee Room
1:00 p.m. Business Meeting, Southeastern Section, Botanical Society of America, Lecture Hall, The University Library
1:45 p.m. Contributed Papers
Protozoology, 107 Conradi Building
Animal Physiology, 319 Conradi Building
Parasitology and Bacteriology, 222 Conradi
Ecology, 228 Conradi Building
Cryptogamic Botany, 115 Conradi Building
6:30 p.m. Dinner, Beta Beta Beta Society, South Seminole Dining Room
8:15 p.m. General Session, Lecture Hall, The University Library. Smoker, Second Floor, Conradi Building, following the General Session

Saturday, April 19

8:00 a.m. Field Trips:
1. Chipola Experimental Forest, 2. St. Marks Wild Life Refuge, 3. Alligator Harbor Marine Laboratory
8:30-12:00 a.m. Student papers, Beta Beta Beta Society, Lecture Hall, The University Library
9:00-10:00 a.m. Genetics Session, 228 Conradi
10:15-12:00 a.m. Genetics Symposium, 228 Conradi
12:00-1:00 p.m. Business meeting, Beta Beta Beta Society, Lecture Hall, The University Library

GENERAL SESSIONS

THURSDAY, APRIL 17th, 8:15 p.m.
Lecture Hall, The University Library
Presiding: Dr. H. K. Wallace

Chemical Control of Sexual Maturation in Hydra, W. F. LOOMIS, Loomis Laboratory, Greenwich, Connecticut.

FRIDAY, APRIL 18th, 9:00 a.m.
Room 228 Conradi
Presiding: Ruth M. Jones, Winthrop College

9:00 The Oviducal Environment and Normal Blockage of Meiosis in Oocytes of the Newt, *Triturus viridescens*. A. A. HUMPHRIES, JR., Emory University
9:13 Polyploidy in the Aloineae. HERBERT PARKS RILEY, University of Kentucky
9:26 A Preliminary Study of Chromosome Numbers and Karyotypes in *Sprekelia formosissima* Herbert. S. BOSE, Blandy Experimental Farm, University of Virginia
9:39 Cytological Studies of the Vernal Species of *Helenium*. HOWARD F. L. ROCK, University of Tennessee
9:52 Pachytene Morphology and the Evolution of Non-Homology in Chromosomes. MARGARET Y. MENZEL, Florida State University
10:06 Histological Observations on the Male Reproductive Systems of the Crayfish. THOMAS L. JOHNSON, University of Virginia
10:19 Hybridization and Allotriploidy in *Triturus viridescens*. NORMAN HUGHES, Emory University
10:32 Interspecific Gene Exchange between Two Southeastern Tree Frogs. JOHN S. MEACHAM, Alabama Polytechnic Institute
10:45 A Contribhtion to the History of Mendelism. R. M. HARPER, University of Alabama

PLANT TAXONOMY SESSION

FRIDAY, APRIL 18th, 9:00 a.m.
Room 115 Conradi
Presiding: R. K. Godfrey, Florida State University

9:00 Multi-periods of Branch Elongation in Pines. WILLIS A. EGGLER, Newcomb College of Tulane University
9:13 The Plumose-bristled Species of *Rhynchospora* (Cyperaceae). ROBERT B. CHANNEL,Vanderbilt University
9:26 A Monograph of the Genus *Rosa* in North

America: *R. blanda.* WALTER H. LEWIS, Blandy Experimental Farm and Stephen F. Austin State College

9:39 Cytotaxonomical Studies on a *Zephyranthes* Complex. W. S. FLORY, JR., Blandy Experimental Farm

9:52 A Cytotaxonomic Study of the Genus *Aletris* L. (Liliaceae). EDWARD T. BROWNE, JR., Alabama Polytechnic Institute

10:06 Biospeciation in the Lichen *Cetraria ciliaris.* MASON E. HALE, Smithsonian Institution

10:19 A New Moss for North America. Z. IWATSUKI and A. J. SHARP, University of Tennessee.

PLANT PHYSIOLOGY SESSION

FRIDAY, APRIL 18th, 9:00 a.m.
Room 107 Conradi

Presiding: Victor A. Greulach, University of North Carolina

9:00 The Adaptive Significance of Variation in Response to Day Length in *Ipomoea.* ROBERT J. KNIGHT, JR., Blandy Experimental Farm, University of Virginia

9:13 Chemical Nature of the Photoreceptor Pigment Inducing Fruiting of Plasmodia of *Physarum polycephalum.* FREDERICK T. WOLF, Vanderbilt University

9:26 Effect of Gibberellic Acid on Cell Division and Cell Elongation in *Phaseolus vulgaris.* VICTOR A. GREULACH and JOHN G. HAESLOOP, University of North Carolina

9:39 A Method for Determining the Effects of Varied Environmental Conditions on Cell Growth in *Phleum* Roots. ROBERT T. BRUMFIELD, Longwood College and Oak Ridge National Laboratories

9:52 Galactose Utilization in Yeast and Other Fungi, G. LEON HOWELL, University of Alabama

10:06 Biochemical Investigations of the Developing Slime Mold, *Dictyostelium discoideum* Raper. JEROME O. KRIVANEK, Newcomb College of Tulane University

INVERTEBRATE ZOOLOGY SESSION

FRIDAY, APRIL 18th, 9:00 a.m.
Room 222 Conradi

Presiding: Ralph W. Yerger, Florida State University

9:00 Studies of Oyster Mortality in Alligator Harbor, Florida. F. E. NICHY and R. W. MENZEL, Florida State University Oceanographic Institute

9:13 A Biotic Factor Influencing the Gastropod *Urosalpinx cinerea* in its Choice of Prey. JOHN W. BLAKE, University of North Carolina

9:26 Additional Information on the Mechanical-Chemical Nature of Drilling by the Gastropods *Urosalpinx* and *Eupleura.* MELBOURNE R. CARRIKER, University of North Carolina

9:39 Schooling Behavior in the Marine Snail, *Nassarius obsoletus.* CHARLES E. JENNER, University of North Carolina

9:52 Analysis of Egg Color Variation in *Cyclops vernalis.* ERNEST J. DUPAW, JR., Columbia University and the University of Florida

10:06 The Time Intervals between Successive Generations in the Calanoid Copepod, *Acartia tonsa.* ROBERT A. WOODMANSEE, Mississippi Southern College

10:19 Microsporidiosis in Shrimp, a Preliminary Report. E. E. JONES, Georgia State College

10:32 Taxonomic Studies on the Gastrotricha of Louisiana. ROBIN C. KRIVANEK and JEROME O. KRIVANEK, Newcomb College of Tulane University

PROTOZOOLOGY SESSION

FRIDAY, APRIL 18th, 1:45 p.m.
Room 107 Conradi

Presiding: I. C. Kitchin, University of Mississippi

1:45 A Chromatographic Investigation of Three Strains of *Tetrahymena pyriformis.* CAROLYN WELLS, Emory University

1:58 A Cytochemical Study of Macronuclear Bodies of *Tetrahymena pyriformis.* MARGARET M. WELLS and CHARLES RAY, JR., Emory University

2:11 Fluorescence Microscopy of Living *Tetrahymena pyriformis.* MARION T. COLEMAN and CHARLES RAY, JR., Emory University

2:24 Micronuclear Abnormalities Associated with Non-lethal High Temperatures during Fission of *Tetrahymena pyriformis.* CHARLES RAY, JR., Emory University

2:37 Intra-clonal Mating in Strains of Variety 6, *Tetrahymena pyriformis.* CAROLYN WELLS, Emory University

2:50 Some Amebas of Warm Mineral Springs, near Venice, Florida. EUGENE C. BOVEE, University of Florida

3:03 *Trichopelma* sp., a Trichostome Ciliate with Adoral Membranelles. JESSE C. THOMPSON, JR., Hollins College

3:16 Morphology and Biology of a Species of *Proterosponiga.* JAMES B. LACKEY, University of Florida

ANIMAL PHYSIOLOGY SESSION

FRIDAY, APRIL 18th, 1:45 p.m.
Room 319 Conradi

Presiding: J. Gordon Carlson, University of Tennessee

1:45 Dispersal of the Gelatinous Coat Material of *Mellita quinquiesperforata* Eggs by Homologus Sperm and Sperm Extracts. JOHN W. BROOKBANK, University of Florida

1:58 Influence of Carbonic Anhydrase Inhibitors on Shell Growth of a Freshwater Snail, *Physa heterostropha.* JOHN A. FREEMAN, Winthrop College

2:11 The Effects of Temporary Anticancer Agents on Certain Transplantable Tumors and Their Drug-Resistant Sublines Implanted in the Same Host. J. RICHARD THOMSON and BONNIE M. JONES, Kettering-Meyer Laboratory, Southern Research Institute

2:24 Nitrogen Excretion in the Aquatic Operculate Snail *Ceratodes cornuarietis*. WILLIAM C. SLOAN, University of Florida

2:50 A Comparison of Tissue Metabolic Rates of a Shrew and Some Other Small Mammals. JAMES R. REDMOND and JAMES N. LAYNE, University of Florida

3:03 The Effects of X-radiation on the Early Cleavage Stages of the Snail *Ilyanassa obsoleta*. JAMES N. CATHER, Emory University

3:16 Phenylthiourea and Iodine Binding in the Tadpole. W. GARDNER and JAMES NORMAN DENT, Oak Ridge National Laboratory, Catholic University of America and University of Virginia

3:29 Correlation of Sexual Cycles and Breeding Behavior of the Gray Squirrel, *Sciurus carolinensis*, Gemlin. ALFRED BRAUER and ALBERT DUSING, University of Kentucky.

PARASITOLOGY AND BACTERIOLOGY SESSION

FRIDAY, APRIL 18th, 1:45 p.m.
Room 222 Conradi

Presiding: Robert B. Short, Florida State University

1:45 Studies on the Genus *Homalometron* Stafford, 1904 (Trematoda; Leprocreadiidae) with a Redescription of *H. armatum* (MacCallum, 1895). GROVER C. MILLER, North Carolina State College

1:58 *Plasmodium floridense* in Georgia Lizards. HELEN B. JORDAN, Georgia State College

2:11 Meningeal Tumors of the Newt, Triturus viridescens, as Correlated with Trematode Infection of the Brain and Brain Case. EDWARD W. LAUTENSCHLAGER, University of Virginia

2:24 Notes on the Helminths of Mammals in the Mountain Lake Region. IV. The Life Cycle of *Hydatigera lyncis* Skinker. HARRY L. HOLLOWAY, Roanoke College

2:37 A New Marine Aporocotylid Cercaria from *Donax variabilis* Say. RHODES B. HOLLIMAN, Florida State University

2:50 Dicvemid Mesozoans from the Northern Gulf Coast of Florida and the Florida Keys. ROBERT B. SHORT and RAYMOND T. DAMIAN, Florida State University

3:03 A New Species of *Cruzia* (Nematoda: Cruziidae) from *Didelphis virginiana*. DWAYNE NATHANIEL KRUSE, Florida State University

3:16 Association of Encephalitis Virus with *Nippostrongylus muris* in Mice. GEOFFREY M. JEFFREY, Laboratory of Tropical Disease, U. S. Public Health Service

3:29 The Experimental Development and Significance of Pyrimethamine Resistance in Human Malaria. MARTIN D. YOUNG and ROBERT W. BURGESS, Laboratory of Tropical Diseases, U. S. Public Health Service

3:42 X-Radiation of Stages in the Life-Cycle of the Rat Tapeworm, *Hymenolepis diminuta*. WILLIAM E. BRILLHART, Emory University

3:55 The Occurrence and Characterization of Ascorbic Acid Oxidase in Certain Bacteria. DWIGHT W. LAMBE and LORETTA C. ELLIAS, Florida State University

4:08 Significance of Virulence and Viability as Related to Quantitative Immunigenic Properties of Several Antituberculosis Vaccines. H. M. VANDIVIERE and MARGARET R. VANDIVIERE, North Carolina Sanatorium System

ECOLOGY SESSION

FRIDAY, APRIL 18th, 1:45 p.m.
Room 228 Conradi

Presiding: W. S. Flory, University of Virginia

1:45 A Virgin Forest Remnant in Berkely County, South Carolina. W. T. BATSON, WILLIAM E. HOY, WILLIAM R. KELLEY and J. T. PENNEY, University of South Carolina

1:58 The Natural Vegetation of English Mountain, Tennessee. JOE A. CHAPMAN, Carson Newman College

2:11 Radiation Ecology Research Program at the Lockheed Reactor Site. ROBERT B. PLATT, Emory University

2:24 Photosynthetic Studies of Three Granite Outcrop Endemics: *Amphianthus pucillus* Torr., *Isoetes melanospora* Englem., and *Diamorpha cymosa* (Nutt.) Britton. WILLIAM T. LAMMERS, Emory University

2:37 A Progress Report on Studies of Mixed Hardwood Stands in the Southeastern Coastal Plain. ELSIE QUARTERMAN and CATHERINE KEEVER, Vanderbilt University and Millersville State College

2:50 Studies on the Ecological Life History of *Portulaca smallii*. DAVID J. COTTER, Emory University

3:03 The Seasonal Effect of Ecological Factors on *Drosophila* Populations, JAMES F. JONES and J. M. CARPENTER, University of Kentucky

3:16 Yeasts Isolated from the Crops of Seasonally Fluctuating *Drosophila* Populations. JAMES K. KOMATSU and J. M. CARPENTER, University of Kentucky

3:29 Gravel Bars and Flood Control. ROBERT A. DIETZ, Troy State College

CRYPTOGAMIC BOTANY SESSION

FRIDAY, APRIL 18th, 1:45 p.m.
Room 115 Conradi

Presiding: Harold Humm, Duke University

1:45 The Anatomy of the Blister Gall Caused by *Asteromyia carbonifera* on *Solidago* Leaves. EDWIN G. BECK, University of Georgia

1:58 Synopsis of Louisiana Polypores. BERNARD LOWY and ARTHUR L. WELDEN, Louisiana State University, Tulane University

2:11 Flagellation and the "pseudoflagellum" in the swarmcells of the Myxomycete, *Didymium nigripes*. ARTHUR L. COHEN, Oglethorpe University

2:24 *Stereum* and its Segregates in Jamaica. ARTHUR L. WELDEN, Tulane University

2:37 Zoosporangia of *Sorosphaera veronicae*. CHARLES E. MILLER, University of North Carolina

2:50 A Fungus Parasite of Barnacle Ova. T. W. JOHNSON, JR., Duke University

3:03 Distribution of Some Estuarine Fungi. HARVEY S. GOLD and T. W. JOHNSON, JR., Duke University

3:16 A Marine *Labyrinthula* in *Rhizoclonium riparium*. DIANE TESTRAKE, Duke University

3:29 Observations on *Chlorosarcina* (Gerneck) Vischer, TEMD R. DEASON and WALTER R. HERNDON, University of Alabama

GENERAL SESSION

FRIDAY, APRIL 18th, 8:15 p.m.

Lecture Hall, The University Library

Presiding: Howard K. Wallace, President of the ASB, University of Florida

1. Address of Welcome: Dr. Charles S. Davis, Dean of the Faculties, Florida State University
2. Presentation of Awards
3. Address: The Search for Competence. George C. Kent, Jr., Immediate Past President of ASB, Louisiana State University
4. Smoker: Following the Friday Evening Session, Second Floor, Conradi Building

GENETICS SESSION

SATURDAY, APRIL 19th, 9:00 a.m.

Room 228 Conradi

Presiding: C. W. Edington, Florida State University

9:00 Diploid Males and Triploid Females in *Habrobracon and Mormoniella*. P. W. WHITING, University of Pennsylvania

9:13 Relation of the Nucleolus to Mitotic Activity as Revealed by Ultraviolet Microbeam Irradiation. MARY E. GAULDEN and ROBERT P. PERRY, Oak Ridge National Laboratory

9:26 Cytological Demonstration of Cleavage Anaphase Bridges in *Drosophila melanogaster*. CLAUDE W. HINTON, University of Georgia

9:39 Mutant Analysis of Amino Acid-Keto Acid Relationships in *Neurospora crassa*. H. E. BROCKMAN and A. GIB DEBUSK, Florida State University

9:52 The Effect of Sodium Iodoacetate Under Anoxia on Chromosome Aberration Frequency. A. V. BEATTY and JEANNE W. BEATTY, Emory University

GENETICS SYMPOSIUM

SATURDAY, APRIL 19th, 10:15 a.m.

Room 228 Conradi

Presiding: A. Gib DeBusk, Florida State University

"Metabolic Aspects of the Mutation Mechanism"

The influence of respiration, protein synthesis and nucleic acid synthesis on mutation will be discussed by four speakers whose names will be announced later.

NOTES ABOUT THE MEETING

Lodging and Meals. A partial list of hotels and motels was published in the December Bulletin. A complete list may be obtained from Dr. A. W. Ziegler, Dept. of Biological Sciences at FSU. Reservations should be made *directly with the management as early as possible*. A section of the University Dining Hall will be reserved for the noon meal on Friday. Those white patrons registered for the meeting, and their families, may use the facilities of the dining halls (cafeterias) during their stay. A list of local restaurants and several nearby which specialize in sea food was published in the December 1957 ASB BULLETIN.

Registration. Registration for attendance at the meeting will be held from 6:30-8:30 on Thursday and 8-12 on Friday in room 232 Conradi (Biological Sciences) Building. A registration fee of $1.00 will be charged. At registration, badges will be issued and programs and field trip reservations may be obtained. Sight-seeing brochures and campus maps will be available. The registration desk will be open as an information center during the meeting.

Placement Service. In room 207, Conradi Building, a do-it-yourself placement service will be available. Bulletin boards will be provided and applicants and employers may post notices of availability and position vacancies.

Commercial Exhibits. Rooms 239 and 242 of the Conradi building will house commercial exhibits. These rooms are located at the east end of the second floor. Exhibits will be open all day Friday.

Field Trips. Three field trips are scheduled by private car. Those interested should register for the trips at the registration desk by Friday noon. The trips will begin propmtly at 8 a.m. Saturday and will return by 1:30 p.m. See the December ASB BULLETIN for details.

1. Chipola Experimental Forest, Drs. Frank Woods and R. K. Godfrey
2. St. Marks Wild Life Refuge, Dr. Henry Stevenson
3. Alligator Harbor Marine Laboratory, Dr. Winston Menzel

Sight Seeing. The Friday night meeting has been set at a late hour to allow time for sightseeing. Points of interest include FSU campus, City of Tallahassee, Killearn Gardens, and Wakulla Springs. Brochures are available in the registration room. At Wakulla Springs, the registrant should inform the ticket office that he and his family are eligible for a reduced rate.

General Remarks. The north and south parking lots at the Conradi building will be reserved for ASB members. A windshield card will be issued at registration. The months of April and May are usually dry months at Tallahassee. The average temperatures for April 17-19 are 80-81 maximum, and 55-56 minimum.

Local Arrangements Committee: Irene Boliek, Ruth Breen, Leland Shanor, Robert Short and A. W. Ziegler, Chairman.

NEWS OF BIOLOGY IN THE SOUTHEAST

About People

In the December ASB Bulletin **Robert L. Wilbur** was erroneously reported as having moved from North Carolina State College to Florida State University. Dr. Wilbur is actually now a member of the Botany Department at Duke University.

I. D. Wilson retired from his position as head of the Biology Department at Virginia Polytechnic Institute, which he had held since 1923, on December 31. Dr. Wilson has accepted a two year contract from the International Cooperation Administration to be a consultant to universities in India.

Samuel P. Meyers is now with the Marine Laboratory, 1 Rickenbacker Causeway, Virginia Key, Miami, Florida.

L. R. Hesler of the Department of Botany at the University of Tennessee will retire at the end of the current academic year. Dr. Hesler has been professor of botany since 1919 and dean of the College of Liberal Arts since 1934.

Howard F. L. Rock, formerly of the Gray Herbarium, Harvard University, is now an instructor in botany at the University of Tennessee.

Karl M. Wilbur of Duke University has accepted an appointment by the Board of Directors of the AAAS to serve as secretary of Section F (Zoological Sciences) for a four-year term beginning January 1, 1958.

Elizabeth F. Sprague, after a two-year leave of absence to complete her doctorate at the Rancho Santa Ana Botanic Garden, Claremont, California, has resumed her teaching in the Department of Biology at Sweet Briar College.

F. A. Wolf, James B. Duke Professor, retired, Department of Botany, Duke University, was honored by the Cigar Manufacturers Association, at a recent meeting in Atlantic City, New Jersey. Dr. Wolf received a plaque and a cash award in recognition of his services to the tobacco industry through his contributions in tobacco breeding and pathology of tobacco.

Hugo L. Blomquist, Professor of Botany, retired, Duke University, has accepted the invitation to serve as visiting professor at the Marine Laboratory, Puerto Rico. Professor Blomquist will spend six months in Puerto Rico, studying the marine algae of the coastal areas.

James R. Dugger, Associate Entomologist, North Carolina State College, Raleigh, has resigned to accept the position as head of the department, North Dakota State College.

Merl Mizell, Ph.D., University of Illinois (Embryology) and **John L. Laurie,** Ph.D., Johns Hopkins University (Experimental Embryology) have been appointed to the faculty in zoology, Tulane University.

Fred R. Cagle has been elected Executive Secretary of the editors of biological journals. This organization is concerned with the problems of communication in the biological sciences. He has also been appointed editor of the sections on Amphibians and Reptiles of Biological Abstracts.

The long term study of bird life of British Honduras under the direction of **George H. Lowery,** Department of Zoology, Physiology and Entomology at Louisiana State University is being continued by two graduate students this semester. **Douglas Lancaster,** now on this third expedition, having spent some eight months in Honduras, is investigating the life histories of three species of *Tinamous* in the interior of the country. **Jared Verner** is studying the biology of Pink-footed Booby on Half Moon Cay, which is 50 miles off the coast of British Honduras.

George H. Mickey, Chairman of the Department of Zoology, Physiology, and Entomology at Louisiana State University was elected national president of Beta Beta Beta, honorary biological society, at its biennial meeting which was held in conjunction with that of the American Association for the Advancement of Science in Indianapolis during the Christmas holidays.

H. J. Roberts, Department of Zoology, Physiology and Entomology at Louisiana State University, was elected president of the Louisiana Ornithological Society for 1958.

The University of Kentucky, through a contract with the International Cooperation Administration, has given two staff members in zoology and one in botany teaching assignments in Indonesia. **R. W. Barbour,** Department of Zoology, is teaching at the University of Indonesia at Bandung, **J. M. Edney,** Department of Zoology, and **J. A. B. Garner,** Department of Botany, are teaching at the University of Indonesia at Bogor. The staff members will be in Indonesia for a two year period.

R. C. Dugdale has joined the Zoology Department at the University of Kentucky. A graduate of the University of Wisconsin, Dr. Dugdale will do research and teaching in the field of limnology.

The University of Kentucky, Department of Zoology, has recently added **E. G. Burcham** to its staff. A graduate of the Ohio State University, Dr. Burcham will do teaching and research in the field of entomology and parasitology.

Staff changes at the Biology Division, Oak Ridge National Laboratory, include the following: **Daniel Billen** of the Mammalian Recovery Group has resigned to accept a position with the M. D. Anderson Hospital and Tumor Institute in Houston. **Alan K. Bruce** of the Microbial Protection and Recovery Group has resigned to accept a position on the staff of the Department of Biology of the University of Buffalo. **C. W. Edington** of the Cytology and Genetics Group has resigned to join the staff of the Department of Biological Sciences, Florida State University, Tallahassee. **Palmer Rogers, Jr.** has joined the Enzymology and Photosynthesis Group for a period of two years under an American Cancer Society fellowship. **Miguel Patetta-Queirolo** has completed a four-months' International Cooperation Administration fellowship in the Pathology and Physiology Section and has returned to the Uni-

versity of Montevideo, Uruguay. **Kamla Kant Pandey**, of India, joined the Cytology and Genetics Group in October. Dr. Pandey holds a fellowship from the Ohio State University to continue research at ORNL. **Robert P. Perry** has left the Division for Philadelphia where he will work with the Johnson Foundation for Medical Physics at the University of Pennsylania. **Melvin P. Stulberg** has joined the Enzymology and Photosynthesis Group for a period of approximately one year as a Research Associate. **Charlotte Auerbach**, of Great Britain, has joined the Cytology and Genetics Group as a visiting investigator. Dr. Auerbach completed her undergraduate study in Germany, following which she received the Ph.D. and D.Sc. in geneties from the University of Edinburgh. Since that time she has been at the University of Edinburgh on the faculty of the Institute of Animal Genetics. Dr. Auerbach is a Fellow of the Royal Society. **Raymond Shapira**, who has been associated with the Biochemistry Group, left the Division December 31, 1957. Dr. Shapira has accepted a position on the staff of Emory University. **Sohei Kondo**, of Japan, has joined the Biophysics Section as a visiting investigator. Dr. Kondo has been in charge of radiation faclities at the National Institute of Genetics in Misima, Japan.

Institutions and Organizations

The Eighth Annual Wildflower Pilgrimage will be held in the Great Smokies, April 24, 25, 26, 1958. It is sponsored jointly by the Department of Botany of the **University of Tennessee** and the Gatlinburg Chamber of Commerce in cooperation with the Naturalist Service of the Great Smoky Mountains. The program includes short and long hikes, motorcades, photographic trips and illustrated evening lectures. Details can be obtained by writing the Chamber of Commerce, Gatlinburg, Tennessee.

The Photoperidism Subcommittee of the Committee on Photobiology of the **National Research Council** held an International Symposium on "Photoperiodism in Plants and Animals and Related Phenomena" in Gatlinburg, Tennessee, October 29 through November 2, 1957. This conference was supported by the National Science Foundation. N. E. Tolbert of the Biology Division, Oak Ridge National Laboratory, is secretary of the Symposium Committee.

Ground was broken on December 10th for the multimillion dollar medical center at the **University of Kentucky**. The center will be known as the Albert B. Chandler Medical Center. Construction of the first unit, a Medical Sciences Building, which will cost $5,247,000.00, will begin within a few weeks. Cost of the entire center has been estimated at between 26 and 27 million dollars. The College of Pharmacy has been moved from Louisville to the Campus at Lexington, where it is occuying a new $670,000 building.

The Southern Section of the **American Society of Plant Physiologists** met with the **Association of Southern Agricultural Research Workers** at Little Rock, Arkansas, in February 1958. The attendance was one of the largest in the history of the Section with a two day program of interesting papers followed by the Annual Plant Physiologist's breakfast at which Dr. L. M. Rohrbaugh, University of Oklahoma, spoke on "Effect of Growth Regulators on Plant Metabolism." Symposiums on "Gibberellins" and "Recent Research on the Nutrition of Plants" highlighted the programs. S. B. Hendricks, Vice President of ASPP was leading speaker of the latter. The new officers are Chairman, Aubrey W. Naylor, Duke University; Vice Chairman; Howard J. Teas, University of Florida; Secretary-Treasurer, Robert E. Burns, USDA, ARS., Experiment, Georgia.

A Metropolitan Branch of **Louisiana State University**, to be known as L.S.U.N.O., will commence operations in New Orleans beginning with the fall semester. Commencing initially as a single college of a modified liberal arts type, the branch is expected to develop rapidly into an institution offering a large variety of subjects in many technical and liberal arts fields. A well-equipped department of biology will be established as soon as facilities can be readied. It is anticipated that the New Orleans Branch will ultimately rival the Baton Rouge Campus in number of students enrolled. Present plans envision the institution as a commuter's college serving Greater New Orleans and its environs.

The **Louisiana Mosquito Control Association** was organized and incorporated in December, 1957 for the purpose of promoting in every feasible way the abatement and control of mosquitoes and other arthropods directly injurious to man or to domestic animals. The following officers were elected: President, Charlie S. Wilkins; Executive Vice President, George H. Mickey; and Secretary-Treasurer, A. B. Ritter. The Board of Directors includes Fred G. Deiler, Edw. P. Marshall Jr., Guillermo Vasques and E. S. Hathaway. Dr. Hathaway is also chairman of the Technical Advisory Committee.

A radioisotope laboratory for the study of animal nutrition, physiology and disease is being constructed at **Louisiana State University**. The project involves the renovation of the zoology research laboratory with addition of a 40-foot wing, and will cost $62,000. Scientists in five departments will use the new facility; these are animal industry, poultry, dairy, veterinary science and zoology.

The twenty-first session of the **Duke University** Marine Laboratory, Beaufort, North Carolina, will open on June 10, 1958. During the first term (June 10-July 16) Harold J. Humm will offer a course in Marine algae and I. E. Gray will give Marine Ecology. The second term (July 18-August 23) course offerings are Marine Parasitology, Wanda S. Hunter, and Marine Invertebrate Zoology, C. G. Bookhout. In addition to the marine algae course, the Department of Botany, Duke University, will offer research and special problems, both terms, on marine mycology.

Grants in Aid

Ernest L. Hunt of Emory University has received a grant from the **U. S. Public Health Service** for a study of the effects of induced diabetes on the reproductive cycle and pregnancy of rats.

Norman C. Negus of the Louisiana State University is studying cyclic changes in mammalian populations on Breton Island, the research being supported by a grant of $18,000 from the **Atomic Energy Commission.**

Research grants awarded during 1957 to members of the Department of Zoology at Duke University include; **E. W. Horn,** studies on cytotoxic antisera, and characterization of nucleoproteins, **National In-**

stitutes of Health; Calvin Ward, genetic sensitivity of gametogenesis to radiation, **National Institutes of Health; Knut Schmidt-Nielsen,** factors affecting the rates of oxygen supply to tissues, **National Science Foundation; C. G. Bookhout,** larval development of acorn barnacles, **National Science Foundation; J. D. Costlow, Jr.,** factors controlling growth and molting of acorn barnacles; **Donald J. Fluke,** funds for the purchase of a one MEV der Graaff accelerator for use in studies on active sites on enzymes, **National Institute of Health.**

Recent **National Science Foundation** grants include the following: University of Arkansas: **Herndon G. Dowling,** Department of Zoology, "American Species of Elaphe (Reptilia)," two years, $9000.

University of Florida. **Howard J. Teas,** Department of Zoology, "A Study of Alaskan Lakes," "Biosynthesis of Lysine and Tryptophan," two years, $14,000.

Florida State University: **Robert K. Godfrey,** Department of Biological Sciences, "Vascular Plants of Aquatic Marsh Habitats of Western Florida," two years, $6000. **R. B. Short,** Department of Biological Sciences, "Taxonomic Studies of Dicyemid Mesozoa," two years, $6300. **A. W. Ziegler,** Department of Biological Sciences, "Factors Influencing Seasonal Occurrence of Water Fungi," two years, $9500.

Emory University: **Elliot Juni,** Department of Bacteriology and Immunology, "Bacterial Oxidation of Simple Aliphatic Alchols," three years, $17,000.

Duke University: **C. G. Bookhout,** Department of Zoology, "Environmental Influences in the Development of *Balanus Nauplii*," three years, $26-000.

University of Kentucky: **R. C. Dugdale,** Department of Zoology, "A Study of Alaskan Lakes," $8,100.

University of North Carolina: **Albert E. Radford,** Department of Botany, "Flora of North and South Carolina," two years, $16,000.

North Carolina State College: **Ernest Ball,** Division of Biological Sciences, "Growth *In Vitro* of the Shoot Apex of Certain Seed Plants," three years, $23,000.

University of Tennessee: **Aaron J. Sharp,** Department of Botany, "Vascular Plants of Tennessee," three years, $15,000.

University of Virginia: **Horton H. Hobbs, Jr.,** "Improvement of Research Facilities at the Mountain Lake Biological Station," one year, $5200. **Donald W. Kupke,** Department of Biochemistry, "Protein Component Involved in the Photochemical Transformation of Protochlorophyll to Chlorophyll-a," three years, $23,000.

Virginia Polytechnic Institute: **Perry C. Holt** Biology Department, "Systematic Studies of Branchiobdellidae," two years, $5800.

Velma Dare Matthews

Velma Dare Matthews, Professor of Biology and head of department at Coker College since 1934, died in Duke University Hospital on January 7, 1958 after a prolonged illness. Born in Burlington, North Carolina on August 3, 1904, the daughter of the late J. Marvin and Cora Moore Matthews, she grew up in High Point where she finished high school in 1921.

In May 1925 she graduated with the B.A. degree from the Woman's College of The University of North Carolina and in the following September entered the University at Chapel Hill for graduate study in the Department of Botany. Here she won the M.A. in 1927 and the Ph.D. in 1930 under the guidance of the late Dr. W. C. Coker. During her graduate study, she was working part time as a student assistant in botany.

For the year 1930-31 Doctor Matthews was Professor of Biology in the Agricultural and Mechanical College at Monticello, Arkansas, a position which she gave up during the serious illness and death of her mother. For the years 1931-1934 she served as Research Assistant in the Department of Botany at Chapel Hill. In September 1934 she became Professor of Biology and head of the Department of Biology of Coker College, Hartsville, South Carolina, a position which she filled with distinction until her death. The Coker students praise her as an inspiring, patient teacher, always willing to explain difficult exercises over and over.

At Coker she soon assumed responsibility for beautification of the campus, on which there now bloom something like seventy varieties of camellias, many azaleas, other shrubs, flowering bulbs, and annuals which she planted. She frequently entered her choice varieties in camellia shows over the state and took many prizes. Dr. Matthews found time in a busy schedule to assist with community planning for beautification of the town of Hartsville and its environs. Many lovely trees of the town are still living because of her emphatic protests against cutting any more than were absolutely essential for safety.

Her twenty-two publications include seven in the field of mycology, three in the taxonomy of the higher plants, and nine on horticultural topics. She was an active member of several scientific societies including the A.A.A.S. (Fellow), Sigma Xi, Association of Southeastern Biologists, South Carolina Academy of Science (past president), Mycological Society, North Carolina Academy of Science, American Fern Society, Torrey Botanical Club, and the Botanical Society of America. We honor Dr. Velma D. Matthews as an able scientist, an earnest teacher, and a sincere friend.—EZDA M. DEVINEY,
Coker College

The ASB BULLETIN

Volume 5, Number 2 June, 1958

Contents

The Official Quarterly Publication of
The Association of Southeastern Biologists

THE ASB BULLETIN

The ASB BULLETIN is the official quarterly publication of the Association of Southeastern Biologists and is published at Chapel Hill, N. C. in March, June, September and December. Letters, news items, other contributions, and all communications about editorial matters should be addressed to the Editor, Department of Botany, University of North Carolina, Chapel Hill, N. C. Changes of address should be sent promptly to the Secretary of the ASB, Dr. Harold H. Humm, Department of Botany, Duke University, Durham, N.C. Subscription orders from libraries and other institutions should be sent to the circulation manager at the Department of Biology, Woman's College, UNC, Greensboro, N. C. Subscription rate for non-members of ASB: $2.00 per year. Printing and typography by the Orange Printshop, Chapel Hill, N. C.

VICTOR A. GREULACH, EDITOR

HAROLD H. HUMM, ASSOCIATE EDITOR

A. W. JONES, BUSINESS MANAGER

HOLLIS J. ROGERS, CIRCULATION MANAGER

ANN FOSTER BLEVINS, ASSISTANT CIRCULATION MANAGER

STATE CORRESPONDENTS

Alabama—H. A. McCullough, Howard College

Florida—Arthur W. Ziegler, Florida State University

Georgia—Netta E. Gray, Agnes Scott College

Kentucky—J. M. Carpenter, University of Kentucky

Louisiana—G. C. Kent, Jr., Louisiana State University

Maryland—Wm. E. Bickley, University of Maryland

Mississippi—Robert A. Woodmansee, Mississippi Southern College

North Carolina—T. W. Johnson, Jr., Duke University

South Carolina—Margaret Hess, Winthrop College

Tennessee—Helen L. Ward, University of Tennessee

Virginia—Jacques J. Rappaport, University of Virginia

West Virginia—Earl L. Core, West Virginia University

OFFICERS OF THE ASB

President—Mary Esther Gaulden, Biology Division, ORNL

Retiring President—Howard K. Wallace, University of Florida

President-elect—Horton H. Hobbs, University of Virginia

Vice-President—Victor A. Greulach, University of North Carolina

Secretary—Harold H. Humm, Duke University

Executive Committee—William Burbanck, Emory University; W. S. Flory, University of Virginia; I. C. Kitchen, University of Mississippi; Elsie Quarterman, Vanderbilt University; D. C. Scott, University of Georgia; Harry E. Wheeler, Louisiana State University. All officers are *ex officio* members of the executive committee.

ASSOCIATION AFFAIRS

Emeritus Members

The following were elected to emeritus membership in the ASB at the Tallahassee meeting: H. L. Blomquist, Duke University, G. L. Carver, Mercer University, Ezda Deviny. Florida State University, and Ivey F. Lewis, University of Virginia. Any ASB member who knows of a person qualified for emeritus membership either now or by next year is urged to submit his name to the secretary.

●

Goethe Awards

The recipients of Mary Gilde Goethe stipends for financial assistance in attending the Tallahassee meetings were John Blake of zoology and Charles E. Miller of botany at the University of North Carolina, James F. Jones of zoology at the University of Kentucky, and Smritiomy Bose of the Blandy Experimental Farm, University of Virginia. All recipients were authors or co-authors of papers presented at the meetings. Professors are urged to advise their graduate students of the availability of the Goethe funds in ample time so that those who may wish to prepare a paper and apply for a stipend for the Knoxville meeting may do so.

●

Executive Committee Actions

At its meeting in Tallahassee the Executive Committee of the ASB discussed many matters and took action on a number of them. Among the actions of general interest to the members of the Association are the following:

The proposed constitutional revision printed in the March issue of the ASB Bulletin was approved. The invitation of the AAAS to participate in its Washington meeting in December and to co-sponsor the symposia being planned by the Society of Systematic Zoologists was accepted with the provision that there would be no cost to the ASB. The invitation of the University of Tennessee to hold the 1959 meeting in Knoxville was accepted. The resignations of Victor A. Greulach as editor and of Hollis J. Rogers as circulation manager of the ASB Bulletin, effective December 31, 1958, were accepted. G. M. Jeffery of the USPHS in Charleston was appointed as editor of the BULLETIN for a three year term. The committee decided to accept the suggestion of the Mountain Lake Biological Station that its new Bruce D. Reynolds Memorial Scholarship be awarded by the ASB Research and Awards Committee in consultation with the director of the Station. All the actions of the Executive Committee were later approved by the members in the business meeting.

Treasurer's Report

Receipts

Balance on hand April 1, 1957	1462.92
Dues and subscriptions collected	1204.50
Interest on savings	12.50
Gifts, The Mary Glide Goethe Fund	300.00
Total Receipts	2979.92

Expenses

Bulletin (mailing costs, printing, circulation, AIBS service, etc.)	787.08
Meritorious Teaching Award to Ezda Deviny	100.00
Awards from the Mary Glide Goethe Fund	39.00
Miscellaneous expenses	226.58
Total Expenses	$1152.66
Balance on hand March 31, 1958	
in savings account	1012.50
in checking account	814.76
	1827.26

Respectfully submitted,
ARTHUR W. JONES,
Treasurer, ASB

The Search for Competence

GEORGE C. KENT, JR.

Dr. Kent is professor of zoology at the Louisiana State University and is well known to members of the Association of Southeastern Biologists as the able and energetic president of the Association during 1956-57. The following article is his address as immediate past president, delivered at the annual meeting of the ASB in Tallahassee on April 18. It illustrates his interests in biological education and in the problems of education in general. Dr. Kent has long been interested and active in the ASB, having been a member of the executive committee in one capacity or another for many years, and vice president in 1950-51. Dr. Kent secured his bachelor's degree at Maryville College and did his graduate work at Vanderbilt University, receiving his Ph.D. in 1942. Since that time he has been a member of the zoology staff at Louisiana State. His field of specialization is vertebrate anatomy and he has also been interested in the physiology of reproduction of hamsters.

I have selected for discussion tonight a consideration of a phenomenon known as competence. Ironically, had it not been for the achievement of a dictatorial communistic state the question of competence in democratic America might still remain unexplored. Recent public utterances by national figures have evoked among the American people a realization that they must examine the competence of the public educational services to which they subscribe. Since the Russian satellite there has emerged, I believe, a realization that there have been factors in the American scene which militate against competence; or, perhaps, I should say there has been a lack of positive factors which might have militated in favor of competence. There has been restored, also, at least to some degree, the prestige of the intellectual. No longer, at least, do we hear derogatory references to the "egg head."

But these new attitudes are in the nature of only a slight stirring of the heretofore sleeping national organism. The stimuli have not yet succeeded in awakening it fully. Unless we shake the public body violently, and again and again, it will most certainly revert, like the ground hog that saw its shadow, to peaceful slumber.

With reference to competence in secondary education, a problem on which I shall not dwell, the professional educators have already developed conditioned responses to outside criticism. Almost to a man, they refer to scientists who concern themselves with high school operations as "subject matter specialists." This phrase is designed to disqualify, as incompetent observers, those who are not "education generalists." In my first draft of this discussion I had a definition of an education generalist. My better judgment told me to delete it. There is another conditioned response which you will hear more and more if, as scientists, you decide to enter the struggle for competence in the secondary school. This is the assertion that, "Some of the worst teaching is going on in the colleges." This assertion is a diversionary defensive tactic, for which there is a very effective, and surprising, countermove. That is, to admit forthrightly that it is true, indeed, that some mighty poor teaching is going on in the colleges. This countermove demoralizes the attack. To capitalize on the advantage a new offensive maneuver is launched: The proclaimation that two wrongs do not make a right.

And with these whimsical observations, I will abandon (but for tonight only) the role of critic of super-progressive education and its effects on competence. I wish to consider, instead, certain factors which, I believe, militate against greater competence in the higher education of biological scientists. We shall not concern ourselves wth obvious barriers such as heavy teaching loads, lack of qualified instructors, low salaries, or shortages of graduate students, which are like chariot names on the educational merry-go-round. I would like, instead, to examine two matters which we might be able, in certain instances, to take steps to rectify. These two

factors are: 1) inadequate undergraduate preparation in the fundamentals of the several fields of biology; and 2) the fragmentation of higher educational facilities. Concerning the latter, I shall have more to say shortly.

The general public hears little criticism of college curricula and there are valid explanations for this. Most parents want their children to have a college education, but have no opinion as to what the college should do for the student. They accept the college philosophy for whatever it amounts to, as they accept the Sunday supplement or television, and let it go at that. Secondly, because only a small proportion of the qualified high school graduates are attending college, this level of our educational system affects a smaller segment of the population than does secondary education. Finally, most colleges do a better job of self-evaluation than do the high schools, if only because of the necessity of meeting requirements of the forty accrediting agencies which seek to tell the faculty what specific curricula to install. It might be anticipated, therefore, that evaluation of the training of future biological scientists would originate among the biological scientists themselves, and, for the most part, would remain a matter of intra-disciplinary discussion.

It is almost axiomatic that everybody in the field of education blames any incompetence of his students on the fellows who taught them last. The first grade teacher blames the nursery, the high school blames the grammar school, the college blames the high school; and now, it appears, the graduate school blames the colleges. I suppose that the foundations, the institutes, the federal services, and industry blame the graduate schools. In the role of undergraduate instructor, which I am in part, I would like to consider, in general terms, aspects of undergraduate education which are negative factors in the competent preparation of the undergraduate biology major for graduate work. In this connection, it is interesting that some of the criticisms we have levelled at the high school are equally applicable to our colleges.

One of our principal complaints concerning secondary education has been that the student is permitted to elect a large number of inconsequential courses rather than being required to select challenging course work in fundamental subject matter. This very complaint can sometimes be leveled at the undergraduate department training future graduate students in biology. Often, these students are permitted to elect a hodge-podge of unrelated, nonsequential biology courses, or courses with a superficial approach to life sciences, instead of being required to restrict their selection to more challenging subject matter relating to fundamental principles. (See G. C. Kent, ASB Bull., 4:8, 1957.)

To suggest specific undergraduate subject matter fields for potential graduate students in the broad fields of biology would be presumptious of any single biologist. Even a conservative attempt at generalization would be in total disregard of the circumstances that exist in our diverse institutions, small and large, public and private, some of which offer graduate instruction and others of which do not. For this reason I have appropriated a technique from the Greeks, and present my ideas as an analogy.

Many college departments of biology resemble mental cafeterias. The four years the prospective graduate student spends in the undergraduate department are spent in the cafeteria line. Moving steadily past the steam tables he must select one dish, then another, and then another. Finally, at the end of the line, he looks down at his tray to see what he has accumulated. In a large cafeteria, an inexperienced patron may find that he has selected too many vegetables, too much dessert, or that he has failed to select a meat and forgot to get his bread. A little guidance from an experienced patron might prevent this and the student might end up with a well-balanced meal consisting of a selection of foods which complement one another and which provide suitable nourishment for the rest of the day. A small cafeteria with a small number of cooks, no matter how capable, should not attempt to provide the same wide selection of foods as does the large one. When they do provide such a selection, the patron may find himself with cold, stale food. A small number of cooks can prepare only a small number of nourishing dishes. On the other hand, the small cafeteria that operates under the policy of offering a narrow selection of highly palatable, and well prepared foods will provide just as excellent a meal as the large one for, obviously, the patron can consume only a limited number of courses. The meal could be of the highest quality. I think, by analogy, you will understand my point. The majority of our future graduate students dine in small cafeterias.

Undergraduate college staffs overburdened by heavy teaching loads might well consider deleting some of the supernumerary courses in the catalogue and concentrating on a core of foundation subjects leading to significant comprehension of biological principles. Such courses would have enhanced cultural values even for liberal arts students. If the genuine biology major (including premeds!) could take a single, four-year course in the morphology, physiology, genetics, and ecology of an amoeba, or of a green alga, and no other courses whatsoever in biology, he would have a better biological education than I have, to be sure, and perhaps greater biological insight than many a Ph.D. candidate.

Of course, the dean's Curriculum Committee

could never permit the introduction of a single four-year course. This would evoke prompt frustration on the part of the registrar who, of necessity, deals with education in corpuscular packets. Such a visionary program would be impracticable. Besides being radical, hence anathema, it would present problems to the department that has also to provide courses in physiology and anatomy for the nurses, courses in so-called human physiology for the education major, courses in elementary physiology for the home economics major, and courses in kinesiology for the physical education major, all of which overlap in subject matter. These courses represent the multitudinous and repetitive electives which, presenting themselves to the future graduate student, lure him from fundamental biological principles and offer an opportunity to take it easy for a semester.

In addition to the elimination of courses with overlapping subject matter and of specialized courses that might better be taught in graduate school, certain existing, supposedly fundamental, courses can sometimes profit by re-evaluation. Let us take two examples. Genetics, as a discipline, should not place chief emphasis on facility in writing capitals and small letters in boxes and deriving a series of symbols predicting whether or not the next baby will have green eyes. Genetics should be, for the most part, an introduction to the effects of enzymes, or their absence, on cell replication and differentiation. As an exercise chiefly in prediction it is an unsophisticated and unrewarding tic-tac-toe. As a study of the physiological basis for variation, which any competent college student could comprehend if similarly challenged in the previous year, it is an experience that no undergraduate liberal arts student, let alone a biologist, should miss. Such a course, because of its nature, should occupy half of a competent instructor's study and teaching time in any college; and, if certain less significant courses must be dropped to make this possible, little harm, and much good, would result. Similarly, animal physiology courses regarding primarily the number of red cells in a mm^3 of blood, the names of the bones of the wrist, a list of the digestive enzymes that reduce peptones to amino acids, and the action of the biceps muscle, are not courses in physiology. They might well be described in the catologue as, "Interesting little facts about our bodies." The student presenting himself at graduate school with such a course is in for a rude awakening when he later realizes that he has had no course in physiology at all. This situation, too, is reminiscent of something for which we criticize the high schools. We declare, that because the high school student does not achieve competence in fundamental subject matter, the college is forced to reteach that which the high school was supposed to have taught. Yet, many students who must repeat an introductory course in physiology present themselves at graduate school.

I do not maintain that the student should necessarily have had a course in physiology before he goes to graduate school. I do believe, if he has had one, he should not have to repeat it for graduate credit.

If it is necessary in the biology department to delete a few courses such as anatomy and physiology, and human physiology in order to offer a basic course in physiology, then arrangements should be made for the physiologist to offer such a course to the best of his ability. The same observation might be made with reference to other biological fields. If seems to me that the preparation of undergraduate biology students, no matter how few, for graduate study is every bit as important in a program for competence as is the servicing of other undergraduate departments.

Reducing the number of courses in the department should permit fewer course preparations for the present faculty. In certain institutions the administrators have readily agreed to such a move when it became clear that the anticipated increase of students could be handled with proportionately less increase in biology staff, and that the competence of the students would be increased.

The chief requirements for a competent curriculum in advanced biology are that it be challenging and that it seek significance in the phenomena. By challenging, I mean that each successive course should constitute a higher rung on the ladder to competence. The student should have to reach to grasp each successive rung. By seeking significance, I mean that it leads to insight and does not have as its ultimate goal the mastery of facts alone. Undergraduate education thus becomes a vertical progression toward greater insight into biological processes and not a horizontal pathway along which a student may meander to the awaited diploma.

Of the many other facets in the subject of competence in undergraduate education I would like to mention one more, very briefly. That two and two equal four is accepted in pragmatic circles as a fact. That the whole is equal to the sum of its parts proves to be a more difficult concept for some students. That the whole is equal to any of its parts appears to be good enough for half credit in some courses. The granting of half credit because the student shows he has learned some of the words is another factor which militates against competence in education at all levels.

In summary, we might agree that the role of the undergraduate department in the training of biologists for graduate school should be the presentation

of a core of foundation courses geared to the capable student, in which the student is expected to seek significance of phenomena, is challenged to reach a little higher at each successive course level, and in which credit is given only for competent performance and not for partial or compromising performance in the subject matter presented. An appropriate number of such courses, offered by a faculty with adequate time to study, realistic teaching loads, and qualified by prior training, is the best preparation for graduate study.

Important as is suitable undergraduate preparation in our search for competence, there is a far more insidious factor militating against competence in American education today. This is the ubiquitous fragmentation of graduate education. I refer to the increasing tendency on the part of the legislatures of many states indiscriminately to expand undergraduate facilities into institutions with full-fledged graduate programs. Whereas, at one time there were one or two tax-supported institutions offering graduate programs in each state, we can now count 17 independent publicly-supported graduate schools in one state adjacent to the Southeast. In our own region three, four, and six tax-supported graduate schools in each state are not uncommon. But the fragmentation has only just begun. During the next decade we may anticipate that practically every state-supported college, many having recently come to full college status via the junior college or teacher's college route, will seek to add graduate instruction. In retrospect, we may deplore our lack of concern when these schools first proposed to offer graduate instruction in educational methods. The move to graduate courses in education was only the beginning. There soon evolved among such institutions the attitude that graduate work in *subject matter fields* could be offered by the existing faculty, and at no extra cost to the taxpayer. Following Sputnik, impetus was given to this trend by interpreting, naively or with tongue in cheek, the plea for *more scientists* as a plea for *more new facilities* to teach scientists. Supporters of these institutions envisioned the situation as an opportunity to justify expansion into highly specialized fields of graduate education in the basic sciences. These supporters are confidently expecting the federal government, under the authority of either the Administration bill or the Hill-Elliott bill, to further foster the fragmentation of scientific education. The Administration bill, in particular, provides for underwriting half the cost of new graduate programs in basic sciences where no such programs now exist. Whether Federal funds will be employed in this manner may depend, in part, on the extent to which scientists are willing to make their voices heard. Regardless of the final disposition of Federal funds there is mounting evidence that the concept of the need for concentration of graduate facilities and specialized scientific programs in already established facilities has not been accepted by the majority of taxpayers of the several states. Indeed, it may not be an exaggeration to say that the concept has been repudiated in state after state and that the fragmentation of scientific education is being accelerated.

It is interesting to note that thereby there is being promoted at the graduate level a situation identical to one which we have so loudly protested in secondary education. It has been maintained that students in small high schools cannot obtain the education they might if the schools were to be consolidated. Yet, at the level of the highest educational facility we have, the graduate school, we are witnessing fragmentation whereas consolidation of our tax dollars should be our goal.

There are, I believe, three factors responsible for this fragmentation which places competent graduate scientific education in jeopardy. These are, 1) rising enrollments; 2) desire on the part of the local college to obtain a greater proportion of tax funds and thus to maintain a favorable financial position in relation to other institutions; and, 3) geographic jealousy or, more politely, local civic pride.

Just as rising enrollments have been reflected in the extension of the state college systems into more remote areas of the several states, so this factor becomes a basis for proposing additional centers for graduate education. In 1954-55 fourteen southern states had undergraduate enrollments of 600,000 students. In 1965-66 the number will be approximately 1,000,000. These are conservative estimates. Since rises in undergraduate enrollment constitute a reasonable basis for projecting future graduate enrollments, assuming the ratio of undergraduates to graduates will remain the same (which is unlikely), there should be an increase of about 50% in graduate enrollment in the Southeast in the next ten years or by 1970 at the latest. Other factors responsible for these increases are greater demands for specialized personnel on the part of new southern industry, a belief of the American people that additional education means increased subsequent earning power, the expansion of non-thesis programs, and the fact that teachers in elementary and secondary school systems are encouraged or required, in many states, to take additional courses after graduation with a bachelor's degree.

In the face of increasing enrollments, public institutions offering graduate work find it necessary to advise the citizens and their legislators of the imminent need for additional monies for increased faculty, staff, buildings, capital outlay, and operating

expenses. When these estimates are made public, a very natural phenomenon manifests itself. Administrators of the local colleges commence to wonder whether or not this increased demand for funds from one segment of the state educational system may ultimately mean insufficient money for their own institution. The institutions offering graduate work become the "haves," and the other schools describe themselves as the "have nots." They commence to think in terms of extra services they might render to attract more students and thus justify more funds. The administrators let it be known that they are willing and able to offer graduate work. Promised are additional scientists to man the new industry of the state and to protect America against Russian technological superiority. The propaganda to raise the school to graduate status rises to a crescendo.

The proposal is particularly appealing to local civic leaders. Changing the college to a university means more local homes to be built, more students to spend money in the local stores, more rooms to be rented, more business for everybody, and growth and prosperity for the home town, even in recessions. The civic leaders and the school administrators approach their local representatives in the state legislature.

In the meantime, rival institutions discover what is going on. *Their* school is not going to be left behind in the scramble for prestige! The fine people in *their* region of the state are entitled to, nay, require, graduate facilities near their homes, too! The legislators from the several communities get together and swap votes.

As a result of these three factors, one after another of the regional schools strides toward University status.

This fragmentation of graduate instruction might be thwarted if the public were cognizant of its unique nature. They do not realize, for example, that, compared with undergraduate instruction, graduate instruction is 250% more costly. Graduate instruction must be surrounded by an aura of research, and there must be money for this research. Because we are in the age of the enzyme and the ion, instrumentation costs are higher than ever before. Futhermore, to maintain competence, a graduate faculty in the sciences must have time to study recent developments. There must, therefore, be a lower student instructor ratio. This entails higher operating costs. A strong graduate program must be sustained, in part, by financial assistance to graduate students. Such assistance at one state-supported Southeastern University for the current year amounts to $612,000. Library facilities beyond the minimum requirements of an undergraduate institution are mandatory in a competent graduate program. A great proportion of the institutions eager to expand into graduate instruction have unbelieveably inadequate library facilities. The American Library Association classifies college libraries in three categories. Group III, composed of 109 schools, includes most of the institutions which, in the near future, may be expected to seek expansion. Twenty-seven institutions in this group already offer graduate instruction. These 27 institutions have an average book stock of 52,000 volumes. Several of these 27 institutions have stocks of only 22,000 volumes. The median book stock of all 109 schools in the group is 45,000. Compare these figures with the nearly 1,300,000 volumes in the Duke University Library, or the nearly 1,000,000 volumes at the Universities of Virginia or North Carolina. Schools with libraries of 45,000 volumes may graduate fifth and sixth year students who know more about science, but they will scarcely produce more scientists.

The general public are not aware of these pertinent facts. They are beguiled into believing that the same services offered by established graduate schools can be rendered more economically at the four-year schools. When the cost of instruction per student at the college is contrasted indiscriminately with that at the Universities, the latter appear in an unfavorable light. The public cannot be expected to recognize that the figures are not comparable. Sooner or later, of course, the institution with the newly-expanded program comes face to face with the financial facts of life. So do the general public, but the committment, once made, is irrevocable. The tax dollars available for higher education have been permanently diluted.

What effect does this have on established facilities? In one Southeastern state appropriations to all education increased between 1940-1955 in the same proportion as did state revenues,—nearly 700%. During the same interval the only State University received less than a 200% increase in appropriations. This despite the fact that operating costs more than doubled, enrollment doubled, and the facilities have been expanded. With continuing fragmentation all institutions must either share, and share alike in the tax dollar, or else the regional schools will indeed be "have-nots" and must curry favor of the taxpayers by making it easier to obtain advanced degrees at these institutions. The effects on educational competence in either case are self-evident.

I was in attendance by coincidence at a faculty meeting at one institution at which graduate work was being offered for the first time. The President of the institution addressed the faculty in this vein: "These men and women have made great sacrifices to come here to school this year. Many of them have families at home whom they have had to neglect while trying to better themselves as teachers. They

are all fine people. We don't want any of them to go away from here without a degree for their efforts, if we can possibly help it." I would not presume to render sweeping condemnation of this attitude. However, there were among the candidates, those seeking the degree of Master of Science in biology. Several of these had as few as eight hours of biology prior to enrolling in the graduate school. Some of these "Masters" of science will inevitably find their way into the teaching of biology in liberal arts colleges in the South. You will recall that the South will need a minimum of 37,000 new faculty members by 1965, according to estimates of the Southern Regional Education Board.

I would think that expansion to graduate study might proceed in planned stages. We plan the orderly development of our highway systems, our recreational facilities, and even our welfare programs. Should we not plan the orderly development of our tax-supported institutions of higher learning? Step one might be the financing of a five-year plan of library expansion among the petitioning institutions. This would be like dipping the taxpaying foot into the cold water of a mountan stream before plunging the body headlong in for a swim. During these five years the institutions would expand their library acquisitions at the rate of perhaps 20% per year with funds appropriated for the specific purpose. At the end of the fifth year the libraries (if group III institutions) would have approximately 90,000 volumes, and a basic subscription list of journals. There would be a gentleman's agreement between the institutions and the appropriate state authorities that, at the end of five years, funds would be waiting for the construction of a library building suitable to house twice that many volumes. If, after fulfilling these initial obligations, the taxpayers manifest a continuing interest, a second and final five-year program could be instituted. During the second stage, appropriations to the institutions would be increased in accordance with a prearranged plan, scientific equipment would be acquired, research programs on the part of the faculty would be encouraged, and teaching loads would be adjusted to permit current research, and in anticipation of graduate status. If, during the planning stages, the public should waiver in their financial committment, the graduate program should be abandoned. If we can draw any conclusion from our experience in education in the past thirty years it is that our sacrifice of quality in the anxiety to achieve quantity has been a national disgrace.

Who, among us, can insinuate our convictions into the public consciousness? Those of us in already established tax-supported graduate programs may be vociferous, but because of our affiliation our opinions are discounted. From the public viewpoint it seems evident that we are seeking our own advantage. I am convinced that the only persons who can effectively influence the general public in educational matters relating to finance are the faculty and officers of the private institutions. On these, already the guardians of academic standards, falls the role of scholarly critic of education at all levels, and especially at the higher levels. You must grasp every opportunity, nay, create opportunity, to use your unbiased position to mold public opinion in whatever direction you deem proper. If the personnel at the state institutions cannot win an audience on these matters, and if the personnel at the private institutions fail to seek an audience, then whose voice, in all America, will be raised in defense of educational competence?

The South is a region of great potential. The natural resources of the South have scarcely begun to be tapped, but the greatest resource is its fund of human talent. Nations have remained poor in the midst of abundant natural resources for the reason that they have failed to develop this human resource. Others have grown rich in the midst of poor natural resources because they have developed this human resource. Standing between servitude and the human resources of any nation are its great Universities. Here are places where "those who hate ignorance may strive to know, those who perceive truth may strive to help others see." But great Universities are the product of the vision of determined peoples who, having established them, cherish them. By their very nature they are uncommon, like cool springs in the desert, not ubiquitous, like mesquite bushes. They are strong, like the Sequoia, not disturbed by every breeze, like a reed. The more space they have in which to spread their branches, the farther will they cast their shadows. Sow them thick, make them compete for nourishment, and growth will be scrubby.

We must give the lie to the fallacy that there can be competent graduate facilities in every section of every state. Such dispersal of facilities will mean that all will be equal, none will be superior. All will be competitors, none will be competent. Somewhere in the South the people will have a vision. Inhabitants of the northern part of the state will not demand facilities equal to those in the southern part; citizens in the eastern part will not demand facilities equal to those in the western part. They must and will create additional facilities for higher education, but they will not lose the vision of superiority for the few. Thereby will they ensure the competence to keep our nation free.

Proceedings of the Tallahassee Meeting

The Nineteenth Annual Meeting of the Association of Southeastern Biologists was held at Florida State University, Tallahassee, Florida, April 17-19, 1958. Meeting with ASB were the Southeastern Section of the Botanical Society of America, the Southern Appalachian Botanical Club, the Southeast District Convention of the Beta Beta Beta Biological Society and the Southeatern Division of the American Society of Ichthyologists and Herpetologists. Total registration for the meeting was 378, the largest atendance yet recorded for an annual ASB meeting.

On Thursday evening, April 17, Dr. W. F. Loomis of the Loomis Laboratory at Greenwich, Connecticut, spoke on "Chemical Control of Sexual Maturation in Hydra." Dr. Loomis described some of his interesting experiments designed to define the chemical nature of factors controlling the process of differentiation.

On Friday and Saturday morning 95 individual contributed papers were presented in ten sessions. In addition, a symposium was held on Saturday morning entitled "Metabolic Aspects of the Mutation Mechanism." This symposium was organized by Drs. A. Gib DeBusk and Charles Edington of Florida State University with the following speakers: Sheldon Wolff of Oak Ridge National Laboratory, Dale Steffensen of Brookhaven National Laboratory, Arthur Koch of the University of Florida and C. O. Doudney and Felix L. Haas of University of Texas.

The annual business meeting of ASB was held on Friday at 11:00 a.m. with President H. K. Wallace presiding. Seventy-three persons were elected to membership in ASB and on recommendation of the Executive Committee four members were elected to emeritus membership: H. L. Blomquist, G. L. Carver, Ezda M. Deviney, and I. F. Lewis.

The following officers were elected: Horton H. Hobbs, University of Virginia, President-elect; Victor A. Greulach, University of North Carolina, Vice President; Harold H. Humm, Duke University, Secretary; William Burbanck, Emory University, and Elsie Quarterman, Vanderbilt University, members of the Executive Committee.

The reports of the Secretary, Treasurer, and Auditing Committee were presented and accepted. The Association voted to accept the invitation received from the University of Tennessee, Knoxville, Tennessee, to hold the 1959 annual meeting on its campus. Rising votes of appreciation for services rendered were given Victor A. Greulach, Editor, and Hollis Rogers, Circulating Manager, of ASB BULLETIN, who have resigned. It was announced that the Executive Committee had appointed Geoffrey M. Jeffery, U. S. Public Health Laboratory in Columbia, South Carolina, as new editor of the BULLETIN. A rising vote of appreciation was also given J. C. Dickinson, Jr., who completed his three-year term of office at this meeting.

The Association adopted an amendment to the Bylaws of the Constitution (printed in full in ASB BULLETIN, Vol. 5, No. 1, p. 2) which simplifies election of new members. Resolutions were adopted expressing thanks (1) to the Florida State University and its local committee for the cordial and pleasant arrangements that contributed to a successful meeting; (2) to Carolina Biological Supply Company, Phipps and Bird Corporation and the Will Corporation of Georgia for their generous contributions that make possible the awards offered by ASB; and (3) to Victor A. Greulach who has faithfully served as the first and only editor of the ASB Bulletin and who has established a high quality of publication. The Association also adopted a resolution to be sent to all congressmen in the southeast that urges Congress and its appropriate committees to take favorable action upon proposals for improving public education in this country that are regarded desirable by responsible scientific organizations. A resolution was also adopted expressing a deep sense of loss in the death of a charter member and former president, Bruce Dodson Reynolds.

On Friday evening the annual address by the Retiring President was given and presentation of awards was made. J. Paul Reynolds, Dean of Liberal Arts College, Florida State University, and a past officer of ASB, extended an official welcome to the Association and the organizations meeting with it. George C. Kent, Jr., gave an address entitled "The Search for Competence." Announcements of the annual awards were made: Meritorious Teaching Award to H. R. Totten, University of North Carolina; Research Award to Charles E. Jenner, University of North Carolina, and Honorable Mention to Robert J. Knight, Jr., Blandy Experimental Farm, University of Virginia; Mountain Lake Fellowship to Peggy Walton, Lynchburg, Virginia.

NEWS OF BIOLOGY IN THE SOUTHEAST

About People

A. E. Radford of the department of botany at the University of North Carolina has been given the Tanner Award for excellence in undergraduate teaching. The award is given annually to two members of the University of North Carolina faculty.

Jack C. Jones, medical entomologist of the U. S. Public Health Service, has been appointed associate professor of entomology at the University of Maryland.

Herbert P. Riley of the University of Kentucky has been appointed as one of the six members of the foreign advisory board of *The Nucleus,* a new international journal of cytology being published in Calcutta, India. The only other American on the board is B. P. Kaufmann.

L. R. Hesler, dean of the University of Tennessee College of Liberal Arts, will retire from the university at the end of the academic year, although he will continue botanical research.

Part 3 of the work "Flora of West Virginia," by **P. D. Strausbaugh** and **Earl L. Core,** has gone to press with publication expected in July. It will include descriptions and illustrations of West Virginia representatives of the families Linaceae to Plantaginaceae, inclusive, and will be a volume of about 260 pages. The fourth and final part of this work, it is hoped, may be published in 1959 or 1960. The completed work will be over 1000 pages in length. Part 1, including the Pteridophyta, Gymnospermae, and Monocotyledoneae, was published in 1952, and Part 2, including the families of Dicotyledoneae from the Saururaceae to the Leguminosae, in 1953. The work is the result of collaboration in field, herbarium, and library studies by two authors over a period of 35 years, during which time every county in the state was surveyed. Most of the pen-and-ink sketches are being made by **William A. Lunk** of the University of Michigan.

The University of South Carolina recently announced the retirement plans of **William E. Hoy.** Dr. Hoy, who has been Head of the Biology Department for thirty years, expects to retire at the end of this year. He plans to remain in the department throughout the summer to carry out contract research. **Wade T. Batson** has been appointed acting head.

Through the generosity of the Phipps and Bird Company of Richmond, Virginia the annual Jefferson Award has been given to **John L. Kice** and **Fred M. Parham** of the University of South Carolina for a meritorious paper presented at the annual meeting of the South Carolina Academy of Science.

H. G. M. Jopson of Bridgewater College and **M. J. Murray, Jr.** of Washington and Lee University each spent a number of weeks at the Oregon Institute of Marine Biology, Charleston, Oregon, during the summer of 1957.

George H. Mickey, Louisiana State University, was an invited participant in the Mid-Western Conference on Genetics and Radiobiology held in St. Louis on May 2. The conference, conducted under the auspices of the Committee of Biological Effects of Atomic Radiations of the National Academy of Sciences, was one of three in the United States at which geneticists and radiobiologists are exchanging views concerning genetic effects from the medical use of X-rays. In his capacity as National President of Beta Beta Beta, Dr. Mickey addressed the chapter at Texas Women's University at Denton, Texas, on the occasion of their annual initiation banquet, on "Methods of Protection Against Radiation Damage." On April 12 he was guest speaker at the annual meeting of the North Texas Biological Association, held at Denton, Texas.

Robert F. Smart has been named dean of Richmond College. **J. C. Strickland** has been promoted to the chairmanship of the department of biology at the University of Richmond, succeeding Dr. Smart. **J. D. Burke** of that department was appointed research fellow of the American Physiological Society for the summer of 1957 and spent the time working with **F. G. Hall** in the department of physiology at Duke University. **W. R. Tenney** formerly of West Virginia University and of Camp Detrick, Maryland, whose main interest is the physiology of fungi, has been appointed assistant professor in the department of biology at Richmond.

Longwood College has added **E. F. Stillwell,** a recent graduate in physiology from Duke University, to its staff as an assistant professor. **Robert E. Merritt** of Longwood, presently on leave at the University of Tennessee, is replaced this year by **Jacobus M. L. Lodewijks,** an exchange teacher from the Netherlands. Dr. Lodewijks was the first president of the World Federation of Aquarists. **Aaron O'Bier,** who received his master's degree from the University of Richmond is now working on the AEC project at Longwood under the direction of **R. T. Brumfield.**

At the University of Virginia **Richard D. McKinsey** has been appointed instructor in biology. Mr. McKensey will complete a doctorate in physiological mycology at Stanford University in January. **Addison E. Lee** from the biology faculty of the University of Texas is serving as visiting professor of biology. Dr. Lee is primarily responsible for the Department's contribution to the NSF-sponsored Acadmic Year Institute for High School Science Teachers being held at the University.

Jay D. Andrews of the Virginia Fisheries Laboratory has been appointed chairman of the editorial committee of the National Shellfisheries Association. **J. L. McHugh** has been named chairman of the scientific advisory committee of the Atlantic States Marine Fisheries Commission and presided at the meetings of that group in New York in September 1957.

Frederick S. Orcutt, professor of bacteriology at Virginia Polytechnic Institute, has been named acting head of the department of biology. **J. M. Grayson** of VPI attended and presented an invitation paper on insect resistances to insecticides at the Fourth International Congress of Crop Pro-

tection, held in Hamburg, Germany, September 8-15. **J. R. Rooney II,** professor of animal pathology, biology department, has returned from a twelve months leave of absence. During this period he studied in the Royal Veterinary College, Stockholm, Sweden. **W. E. Field,** a graduate of Michigan State College and Wayne University, has joined the staff of animal pathology section, department of biology as assistant professor of animal pathology. **William Van Dresser,** a Michigan State graduate in dairy science and in veterinary medicine, has joined the staff of animal pathology. **C. J. Ackerman,** associate biochemist, Virginia Agricultural Experiment Station, Blacksburg, was on leave for a 6-week period during the summer of 1957. Dr. Ackerman served as chief biochemist on a nutrition survey team in Lybia, North Africa.

George S. Ramseur, who is receiving his Ph.D. in botany at the University of North Carolina this year, has accepted a position in the biology department at the University of the South.

Max H. Hommersand, who holds his doctorate in phycology from the University of California, has been appointed instructor in botany at the University of North Carolina, Chapel Hill, effective February 1, 1959. At present Dr. Hommersand is an NSF post-doctoral fellow at Harvard University. **William Dennison** of Swarthmore College will be a visiting assistant professor of botany at Chapel Hill during the coming year. Dr. Dennison is a mycologist and is working on the Discomycetes.

Institutions and Organizations

At its annual meeting in Tallahassee the **Southeastern Section of the Botanical Society of America** elected Royal E. Shanks of the University of Tennessee as chairman, Joseph C. O'Kelley of the University of Alabama as secretary, and Robert Godfrey of Florida State University as a member of the activities committee.

The new officers of the **Southern Section of the American Society of Plant Physiologists** are Aubrey W. Naylor of Duke University, chairman; Howard Teas, University of Florida, vice chairman; and Robert Burns of the Georgia Experiment Station secretary-treasurer.

A conference of biologists teaching in the **Academic Year Institutes** for High School Science and Mathematics Teachers, which are being conducted at 18 universities under the sponsorship of the National Science Foundation, was held in Charlottesville, Va. April 14-15. Southeastern biologists who were invited to participate were Addison Lee of the University of Virginia and Victor A. Greulach and Claibourne S. Jones of the University of North Carolina. Dr. Lee served as co-chairman of the conference and Dr. Greulach was the summarizing speaker for the conference.

On May 5 the committee on biotrons of the **Botanical Society of America** met at Duke University with a group of southern biologists who might be interested in the use of such a facility to discuss its desirablity, feasibilty and possible location. The committee subsequently met with similar regional groups at Yale University, the University of Wisconsin, and the California Institute of Technology. The committee plans to advise the National Science Foundation as regards the establishment of one or more biotrons, which would be available for use by biologists on a regional basis as well as by biologists at the institution or institutions at which the biotrons would be located. The biotrons would be extensive controlled environment facilities similar to the phytotron at Cal Tech, now the only one in the country. As the change in name suggests, the proposed biotron woud be available for use by zoologists as well as botanists. The members of the committee are Sterling Hendricks, Paul J. Kramer, C. S. Pittendreigh, C. L. Prosser, A. J. Riker, and F. W. Went. Among the biologists who met with the committee were Aubrey W. Naylor, Wm. Billings and Kurt Schmidt-Nielson of Duke University, Charles E. Jenner and Victor A. Greulach of the University of North Carolina, Robert Platt of Emory University, James H. Henderson of the Tuskeege Institute, Howard Teas of the University of Florida, James Liverman of the A. & M. College of Texas, Jack E. Myers of the University of Texas, and Norman Anderson of the Biology Division, ORNL.

The annual Poteat Award of the **North Carolina Academy of Science** was given this year to an outstanding paper presented in the botany section. The paper selected by the judges and members of the section to receive the award was "Possible mechanisms of resistance in solanaceous plants to *Pseudomonas solanacearum*" by E. C. Maine and Arthur Kelman of North Carolina State College.

Two biologists are among the new officers of the **North Carolina Academy of Science** elected during its annual meeting held at Duke University May 2-3. L. A. Whitford of North Carolina State College is vice president and John A. Yarbrough of Meredith College was re-elected for a seventh year as secretary-treasurer.

The biology department of the **University of Virginia** has sponsored a rather full program of guest speakers and conferences for the winter and spring, 1958. Among the guest speakers were John Buck of the National Institutes of Health; William H. Weston and Caroll Williams of Harvard University, Thomas Hall of Washington University, and Oswald Tippo of Yale University.

At a recent meeting of the **South Carolina Academy of Science** these officers for the coming year were unanimously elected:

President: H. W. Freeman, University of South Carolina; President-elect: J. C. Aull, Jr., Medical College of South Carolina; Vice-President: J. G. Dinwiddie, Clemson College; Councilors: W. E. Anderson, The Citadel, J. C. Loftin, Wofford College, J. D. Reynolds, Coker College.

At the annual meeting of the **Louisiana Academy of Sciences** at Centenary College George C. Kent was named President-Elect. Other officers with unexpired terms include: Roland Abegg, Southeastern Louisiana College, President; Walter Moore, Loyola University, Retiring President; George Ware, Northwestern State College, Secretary; Frederick Deiler, Freeport Sulfur Company, Treasurer; B. Theodore Cole, L. S. U., Editor; Harry Bennett, L. S. U., Chairman of the Junior Academy.

A new greenhouse has been acquired by the **Hollins College** biology department. The structure

is a single span one with aluminum frame and redwood rafters.

The **Gulf Coast Research Laboratory** at Ocean Springs, Mississippi, received National Science Foundation funds for scholarships to teachers wishing to take courses in marine biology during the current summer. Gordon Gunter is director of the Laboratory. Harry J. Bennett of the Lousiaina State University is again teaching at the Laboratory this summer.

The **Louisiana Ornithological Society** held its annual spring meeting at Cameron on April 26. The president of the society is **J. H. Roberts**, professor of zoology at Louisiana State University. Considerable interest among the society members has arisen as to whether hurricane Audrey modified conditions sufficiently to affect the bird life of the area.

The radiation pit at the Blandy Experimental Farm of the **University of Virginia** was completed and the Cobalt-60 source was installed and put into operation beginning July 19, 1957. The radiation field, as well as the Orland E. White Arboretum, were open to visitors at a field day held on August 15.

The **Oak Ridge Institute of Nuclear Studies** is offering the services of 106 Oak Ridge scientists who will be available to lecture on college campuses on more than 150 topics that span every field of scientific endeavor. They will tailor their talks for either undergraduate consumption, or more technical graduate and faculty gatherings.

Eighty-nine of the lecturers are ORNL staff members; four are with the University of Tennessee-Atomic Energy Commission Agricultural Research Laboratory in Oak Ridge; seven are on the ORINS staff; and six are with the AEC Oak Ridge Operations Office.

The program is designed to serve colleges of all sizes, without cost to the requesting institution. In the interest of efficiency, substitutions of lecturers and dates must sometimes be made, so colleges are asked to give alternate choices, and to make their requests as far in advance as possible, preferably this summer or early fall. When several colleges in the same area can consolidate their needs to request the same speaker during the same general period, scheduling is greatly facilited. The brochure listing the lecturers and their topics is available from the University Relations Division, Oak Ridge Institute of Nuclear Studies, P. O. Box 117, Oak Ridge, Tennessee.

Grants in Aid

J. D. Burke of the University of Richmond has received a grant from the **National Institutes of Health** for the purchase of special equipment to continue his study of oxyhaemoglobin in fish.

At Mississippi Southern College **J. Fred Walker** has received a grant of $2,200 from the National Institutes of Health to continue his study of blackspotting in shrimp and **Robert A. Woodmansee** is continuing his study of plankton communities along a salinity gradient by virtue of a grant of $1,700 from the National Science Foundation.

Research grants have been awarded by the South Carolina Academy of Science to **Thomas R. Scott**, State Hospital, Columbia, South Carolina and **Gordon R. Thurow**, Newberry College, Newberry, South Carolina.

The recent grants from the **National Science Foundation** for biological research in southeastern universities include the following:

Duke University: H. L. Blomquist, Department of Botany, "Systematics of Sphagnum in North America," two years, $8400.

Emory University: Charles Ray, Jr., Department of Biology, "Cytogenetic Studies of *Tetrahymena pyriformis*," two years, $13,500.

Florida State University: A. G. DeBusk, Department of Biological Sciences, "Enzymes and Enzyme Systems in Mutation," one year, $9200. Sidney W. Fox, Oceanographic Institute, "Biogenesis: Thermal Prebiochemical Reactions," two years, $10,000.

North Carolina State College: D. U. Gerstel and L. L. Phillips, Department of Field Crops, "Artificial Amphidiploids in the Genera Gossypium and Nicotiana," three years, $17,000. Clyde F. Smith, Division of Biological Sciences, "Catalogue of the Homoptera of the World," one year, $6900.

University of Georgia: Robert G. Eagon, Department of Bacteriology, "Synthesis of Polysaccharide by *Pseudomonas fluorescens*," two years, $6,000. Bernard S. Martof, Department of Zoology, "Behavior of Amphibians," two years, $9300. Robert A. Ragotzkie, Marine Biology Laboratory, "Repowering and Refitting of a Vessel for Marine Biological Research," one year, $14,200.

University of Kentucky (Kentucky Research Foundation): Richard C. Dugdale, Department of Zoology, "Nutrient Supply of Certain Alaska Lakes," one year, $8100.

University of Maryland: G. W. Wharton, Department of Zoology, "Basic Research in Acarology," three years, $27,800.

University of Miami: Charlotte J. Avers, Department of Botany, "Histochemical Studies of the Differentiating Root Epidermis," two years $13,800.

Vanderbilt University: Charles R. Park, Department of Physiology, "Glucose Transport in Mammalian Cells," three years, $32,000.

Virginia Polytechnic Institute: P. C. Holt, Department of Biology, "Systematic Studies of the Branchiobdellidae," two years, $58,000.

The Division of Biological and Medical Sciences of the **National Science Foundation** announces that the next closing date for receipt of basic research proposals in the life sciences is September 15, 1958.

Samuel P. Maroney and **J. N. Dent** of the University of Virginia have been granted $8,000 by the **National Science Foundation** for the purchase of equipment for use in research involving radioisotopes.

John N. Couch of the University of North Carolina has been informed that his grant of $4,500 from the Committee on the Taxonomy of Actinomycetes of the **Society of American Bacteriologists** has been renewed for a second year. The grant is for a study of the taxonomy of the Actinoplanaceae. Charles E. Miller has been serving as research associate to Dr. Couch during the first year of the grant.

The ASB BULLETIN

Volume 5, Numbers 3 and 4 September-December, 1958

Contents

The Official Quarterly Publication of
The Association of Southeastern Biologists

THE ASB BULLETIN

The ASB BULLETIN is the official quarterly publication of the Association of Southeastern Biologists and is published at Chapel Hill, N. C. in March, June, September and December. Letters, news items, other contributions, and all communications about editorial matters should be addressed to the Editor, Department of Botany, University of North Carolina, Chapel Hill, N. C. Changes of address should be sent promptly to the Secretary of the ASB, Dr. Harold H. Humm, Department of Botany, Duke University, Durham, N.C. Subscription orders from libraries and other institutions should be sent to the circulation manager at the Department of Biology, Woman's College, UNC, Greensboro, N. C. Subscription rate for non-members of ASB: $2.00 per year. Printing and typography by the Orange Printshop, Chapel Hill, N. C.

VICTOR A. GREULACH, EDITOR

HAROLD H. HUMM, ASSOCIATE EDITOR

A. W. JONES, BUSINESS MANAGER

HOLLIS J. ROGERS, CIRCULATION MANAGER

ANN FOSTER BLEVINS, ASSISTANT CIRCULATION MANAGER

STATE CORRESPONDENTS

Alabama—H. A. McCullough, Howard College

Florida—Arthur W. Ziegler, Florida State University

Georgia—Netta E. Gray, Agnes Scott College

Kentucky—J. M. Carpenter, University of Kentucky

Louisiana—G. C. Kent, Jr., Louisiana State University

Maryland—Wm. E. Bickley, University of Maryland

Mississippi—Robert A. Woodmansee, Mississippi Southern College

North Carolina—T. W. Johnson, Jr., Duke University

South Carolina—Margaret Hess, Winthrop College

Tennessee—Helen L. Ward, University of Tennessee

Virginia—Jacques J. Rappaport, University of Virginia

West Virginia—Earl L. Core, West Virginia University

OFFICERS OF THE ASB

President—Mary Esther Gaulden, Biology Division, ORNL

Retiring President—Howard K. Wallace, University of Florida

President-elect—Horton H. Hobbs, University of Virginia

Vice-President—Victor A. Greulach, University of North Carolina

Secretary—Harold H. Humm, Duke University

Executive Committee—William Burbanck, Emory University; W. S. Flory, University of Virginia; I. C. Kitchen, University of Mississippi; Elsie Quarterman, Vanderbilt University; D. C. Scott, University of Georgia; Harry E. Wheeler, Louisiana State University. All officers are *ex officio* members of the executive committee.

ASSOCIATION AFFAIRS

About the Bulletin

Readers may wonder why this issue of the ASB BULLETIN is designated September - December. The explanation is that this has been done to permit dating of the four issues as January, April, July, and October in the future, bringing them more in line with the times when they appear (except for the July issue, which will appear in June). Despite the fact that this is a double issue no issues will be skipped, the one appearing in January simply being designated as Vol. 6, No. 1, January 1959 rather than as Vol. 5, No. 4, December 1958 as would have been the case had the change not been made.

As far as the editor is concerned the change has another advantage: it relieves him of the task of preparing another issue, since the new editor of the BULLETIN, Geoffery M. Jeffery of the USPHS, Columbia, S. C., assumes his duties with the first issue of Volume 6. The present editor wishes to thank all those who have given so generously of their time in helping get out the first five volumes of the BULLETIN, in particular the state correspondents and the circulation manager, Hollis Rogers.

The editor also wishes to acknowledge with thanks the many kind remarks about the BULLETIN made by members of ASB and others. Whether deserved or not, they have all been greatly appreciated. Though editing the BULLETIN has, at times, been rather taxing it has on the whole been a most pleasant experience and the editor regrets that the press of other duties has made it necessary for him to resign. The retiring editor extends his best wishes to the incoming editor, with the assurance that his tenure will be successful and the hope that it will be long.

●

The Knoxville Meeting

The members of ASB and the other societies which meet with it annually are reminded that the annual April meeting will be held at the University of Tennessee in Knoxville and that the call for papers will appear in the January issue of the BULLETIN. Prospective contributors to the program would do well to begin planning for the meeting now. The local arrangements committee will consist of J. G. Carlson, Chairman, A. J. Sharp, J. C. Howell, R. E. Shanks, Fred Norris, and R. Fraser. On the Thursday afternoon before the meeting begins the Biology Division of the Oak Ridge National Laboratory will conduct tours of its building for the benefit of those en route to the meeting who would like to inspect the facilities of the Division and visit with the staff.

●

ASB at AAAS

The ASB will participate in the Washington meeting of the AAAS by co-sponsoring the three-session symposium on systematics being sponsored by the Society of Systematic Zoology. G. W. Wharton of the University of Maryland, an ASB member, is program chairman for the sessions of the Society of Systematic Zoology at Washington. For further information about the Washington meetings see page 42 of this issue.

●

From Mrs. Reynolds

Dr. Mary Esther Gaulden
President, ASB
Oak Ridge, Tennessee

Dear Dr. Gaulden:

The children and I deeply appreciate the resolution adopted by the Association of Southeastern Biologists expressing sorrow over the death of my husband.

The many expressions of sympathy received from individuals and scientific organizations, all have been greatly appreciated; but none more highly than the resolution adopted by this Association which meant so much to him and for which he held a very special affection.

Please express my gratitude to the Association, and my best wishes to the many friends we valued among its members.

Sincerely,
MRS. BRUCE D. REYNOLDS

Charlottesville, Va.
June 23, 1958

Educational Activities of the Biology Division of the Oak Ridge National Laboratory

ALEXANDER HOLLAENDER

Dr. Hollaender, Director of the Biology Division since it was established in 1946, is a biophysicist who did his graduate and undergraduate work at the University of Wisconsin. Before coming to Oak Ridge, he was on the staff of the National Institutes of Health. Dr. Hollaender is a member of the National Academy of Sciences, President of the Comité International de Photobiologie, Chairman of the Committee on Photobiology of the National Research Council, Professor of Radiation Biology at The University of Tennessee, and a member of the board of editors for several journals. He was President of the International Congress of Radiation Research held in Burlington, Vermont, in August, 1958. In a previous article (AIBS Bulletin 7(1):10-14, Jan. 1957) Dr. Hollaender described the research activities of the Biology Division in some detail.

Since its beginning in 1946, the Biology Division of the Oak Ridge National Laboratory has held the view that cooperation with colleges and universities in the southeastern part of the United States is one of its important functions and one of its greatest sources of strength. With this as a focus, the educational activities of the Division now extend to include such diversified areas as the local high schools and a postdoctoral program under which recent Ph.D.'s from schools in this country and abroad spend a year here working on independent research problems. Several programs, such as the Research Participation, Traveling Lecture, and Pre-Doctoral Fellowship Programs and the Biology Student Trainee plan for undergraduates are all carried on in cooperation with the Oak Ridge Institute of Nuclear Studies, whereas others are administered entirely by the Laboratory.

Under the Research Participation Program, faculty members of colleges and universities spend from three to fifteen months in the Biology Division working on research projects. Participants work on problems of their own selection, alone or in collaboration with members of the Division. In some cases, graduate students of participants have obtained fellowships to work in this laboratory on investigations in which the professor, the student, and the laboratory have an interest.

This program has been especially effective in the southeastern region of the United States, since 80-90% of the participants have been from southern schools.

Outstanding scientists are appointed as consultants to the Division, and several investigators who have worked here as Research Participants have been appointed consultants after returning to their universities. Under this contract they visit the laboratory from time to time to consult with Division members on mutual research problems. This provides a means of exchange of information between scientists in the Biology Division and others in universities all over the country.

The Traveling Lecture Program is part of the Atomic Energy Commission's program of exchange of scientific and technical information with colleges and universities, particularly in the South. Members of this Division give approximately a hundred lectures each year to institutions located in the southeastern, midwestern, and eastern parts of the United States. Faculty members of colleges and universities often visit the Division to speak before seminars and participate in discussion groups.

Members of the Division have taught graduate courses at Duke University, the University of North Carolina, Vanderbilt University, and Florida State University while on leaves of absence granted for that purpose. Three summer courses in radiation biology have been taught at Mountain Lake Biological Station. In the summer of 1956, a Biology Division staff member assisted with the radiation biology course for high school science teachers which was held at the Duke Marine Biological Station under the joint sponsorship of the National Science Foundation and the Atomic Energy Commission.

Under a cooperative agreement between The University of Tennessee and the Oak Ridge National Laboratory, members of the Division give lectures in the formal courses of the University's Institute of Radiation Biology. Six Division members are included in the faculty of the Institute. The same agreement makes it possible for thesis research to be carried on in the Biology Division by Institute students. The Division Director has an appointment as professor at The University of Tennessee and serves on the Research Committee of The University of Tennessee Memorial Research Center and Hospital.

Biology Division personnel contribute to courses and conferences conducted by the Oak Ridge School of Reactor Technology and the Oak Ridge Institute of Nuclear Studies. The Oak Ridge Institute's recent courses in "Radiation Chemistry" and "Atomic Energy and Veterinary Medicine" included lectures by senior staff members of the Division.

The Research Associate Program, which was inaugurated in 1954, is an arrangement whereby outstanding graduates who have recently received a doctoral degree and who have demonstrated definite interest and ability in fundamental research are given temporary one-year appointments. Information concerning this program is sent to department heads of colleges and universities throughout the country, and they are asked to call it to the attention of students who qualify as applicants. Since the program started, twenty-five research associates have spent a year here.

A similar somewhat more limited program is planned to begin in the fall of 1958 for young Ph.D.'s from other countries to enable them to come to this laboratory for a year, and the Division expects to have three or four postdoctoral investigators from abroad before the end of the year.

An increasing number of young scientists from this country and abroad are coming here to work under fellowships from outside sources, such as American Cancer Society, Rockefeller Foundation, U. S. Public Health Service, and others. In addition to the United States, countries represented in this program have been France, Uruguay, Portugal, India, Chile, Belgium, Denmark, Japan, Germany, England, Scotland, and The Netherlands. The majority of these foreign investigators are connected with universities in their home countries and come here primarily for experience and training in radiation biology.

Under the predoctoral fellowship program of the Oak Ridge Institute of Nuclear Studies, students complete their Ph.D. thesis research in this Division. One Ph.D. candidate has completed his thesis research here under a grant from the U. S. Public Health Service. Regular employees are granted leaves of absence to continue work towards a graduate degree and in these cases, thesis research is usually done in the Division.

In the summer of 1958 nine undergraduate college students, eight of whom were from small southeastern colleges, came to the Division for a 10-week training course. This course was designed specifically to give students who have completed three years of college the experience of working in a laboratory devoted to full time basic research. The students were selected on the basis of scholastic records and interest in scientific research, and they were assigned to groups where the work going on was closely related to their individual interests. The course consisted of work on a specific problem, attendance at Division seminars, observation of the work of others, and frequent informal discussions with research scientists. It is too soon to evaluate this program, but the indications are that it will ontinue as one of the educational functions of the Division.

The Division's close association with educational institutions has extended to an interest in the problems that arise when students arrive at the college level without sufficient training to pursue scientific studies. On the theory that national laboratories can accept at least a small portion of the responsibility for improving this situation, three high school teachers were invited to work in the laboratory during the summer of 1956 and four in 1958. The teachers believe this is an excellent method of broadening and improving the instruction that they can offer their students.

Several members of the Biology Division are serving on a committee set up by the local school board to study the problem of improving education in the Oak Ridge schools. This committee is interested in improving, not only science education, but all subjects covered by the secondary schools.

In an effort to attract more high school students to the field of biology, a program of demonstration lectures has been initiated at the Oak Ridge High School. Biology Division investigators regularly serve as advisors to science students of the local high school who participate in the National Science Fair competition and frequently contribute articles to the high school newspaper. The Oak Ridge school system is making a serious effort to emphasize science at all grade levels, and the articles, lectures, etc., are an important part of this program.

A general seminar is held each Thursday afternoon, and the guest speaker is usually a visitor from another laboratory in this country or abroad. These seminars are an effective supplement to the literature as a means of keeping informed on work going on in other laboratories. Since the Biology Division is now in an unclassified area, scientific

personnel of educational institutions in and around Oak Ridge and Knoxville are invited to attend the regular Division seminars.

Lecture courses are given in the Division each year on such subjects as Radiological Physics, Basic Genetics, Biochemistry, Physical Tools in Biological Research, Biostatistics, Physical Chemistry, and General Pathology.

The Division holds an annual research conference on topics of biological interest. Papers are presented by outstanding scientists from the United States and abroad. The topic for the 1958 conference was "Genetic Approaches to Somatic Cell Variation," and the subject of the 1959 meeting will be "Enzyme Reaction Mechanisms." The proceedings of these conferences are published as monograph supplements to the *Journal of Cellular and Comparative Physiology* and are distributed to scientists working in the field covered by each symposium.

Other small conference are organized from time to time by the Division when people working in specific fields are invited to meet for a one-or two-day discussion. Several meetings on bone marrow transplantation have been held during the past year, and photoreactivation and photosynthesis have been the subjects of recent meetings.

A weekly bulletin is published by the Division which contains a checklist of current literature in biology, chemistry, microbiology, genetics, and physiology, compiled by the Division Library. This bulletin has a limited circulation but is now being sent to many laboratories in this country and abroad in response to specific requests by the laboratory heads. The literature checklist is the chief reason given by most scientists for requesting the weekly bulletin.

The personnel of the Biology Division numbers approximately 200, which includes about 70 investigators at the Ph.D. or M.D. level. The Biology Division is part of Oak Ridge National Laboratory, which is operated by Union Carbide Nuclear Company for the Atomic Energy Commission. Oak Ridge National Laboratory, the Atomic Energy Commission's largest nuclear center, is an outgrowth of the wartime Clinton Laboratories (a branch of the Manhattan Project's Metallurgical Laboratory) and has had a role in virtually every major scientific operation and activity of the atomic energy program.

The Division concentrates on research in fundamental biology and biochemistry with emphasis on the cytogenetic effect and the biochemical, biophysical and pathological-physiological changes produced by radiation. The different groups and sections in the laboratory are, for all practical purposes, located in one building, which makes it possible for investigators working on related or overlapping problems to maintain very close cooperation. Much of the research here is understandably oriented toward radiation biology, but the imporance of fundamenal research on other biological problems has in no sense been subordinated to the studies of radiation effects. There is a distinct relation between fundamental studies going on in some groups and radiation effects studies in others, just as there are collaboration and mutual exchange of information between groups working on related basic studies that may or may not involve radiation. For example, investigations by the biochemists of nucleic acid structure and function are of interest to the insect cytologists, who, with the aid of radioactive isotopes as tracer substances, are doing experiments on synthesis of nucleic acids and the effects of radiation on this synthesis. In the same manner, the work being done by cell physiologists on isolation of cellular organelles and their proteins is related to a biochemistry project that is receiving considerable attention at this time—amino acid activation and its relation to protein synthesis.

Communication between individual scientists and groups is facilitated by informal luncheon seminars that are held daily: Biochemistry and Genetics seminars are held three days a week; Cellular Physiology, Mammalian Radiation Recovery and Radiation Immunology seminars meet weekly on an alternating schedule. At these seminars, investigators report on their work, and all members of the laboratory are invited to attend. Some groups hold daily meetings to discuss progress on individual work or interesting journal articles.

The buildings that house the Division were designed originally for chemical processing but were never actually used for that purpose. An abundance of space has already been cleared in these buildings and there is additional room for expansion. The Division has its own facilities for electronic instrument construction and repair, and its own machine, carpentry, and glass blowing shops. Ample radiation sources and facilities are provided.

Oak Ridge is now undergoing the transition from a city owned and operated by the government to an independent municipality. Although civic affairs have been regulated to a certain extent by the Atomic Energy Commission, the city has developed into a well-rounded community. Personnel in the Biology Division have provided much of the leadership needed in civic and cultural organizations, including Town Council, Civic Music Association, Community Art Center, Children's Theatre, and similar groups. Oak Ridge is within a two-hour drive from the heart of the Great Smoky Mountains, which provide a beautiful backdrop for the Laboratory and the residential area.

The AAAS Washington Meeting

The American Association for the Advancement of Science will hold its 125th meeting in Washington, D. C. December 26-31, 1958. Most of the sessions of interest to biologists will be held in the Shoreham and Sheraton Park Hotels, which are both located just off Connecticut Avenue near Rock Creek Park. Although the ASB will not have a special event, such as the ASB breakfast at the Atlanta meeting, it is participating in the meeting by co-sponsoring the symposia on systematics being sponsored by the Society of Systematic Zoology in celebration of the bicentennial of the publication of the tenth edition of Linnaeus' *Systemma Naturae*.

Three addresses will be of particular interest to biologists: the presidential address on medical genetics by Laurence H. Snyder, the vice presidential address for Section F (Zoology) by Harold H. Plough, and the vice presidential address for Section G (Botany) by Oswald Tippo. A special feature of the Washington meeting will be a series of sectional programs, essentially teaching demonstrations, employing a new and much improved technique in closed circuit color TV using a large screen. This new research and teaching tool, to be shown publically for the first time, has been lent by Ciba Pharmaceutical Products, Inc.

Contributed papers are being accepted by the following societies: American Society of Zoologists, Ecological Society of America, Society for Industrial Microbiology, Section F (Botany) and Society of Systematic Zoology. As at other recent AAAS meetings, emphasis will be placed on symposia in which leading scientists will discuss topics of current interest and importance. The following symposia will be of particular interest to biologists:

1. Some Unsolved Problems in Biology. Dec. 30. Sponsored by Sections F & G and arranged by Karl M. Wilbur and Barry Commoner.
2. Congenital Heart Disease. Four sessions, Dec. 29-30. Sponsored by Section N (Medical Sciences).
3. Calcification in Biological Systems. Three sessions, Dec. 29. Sponsored by Section Nd (Dentistry).
4. Botanical Symposium to be announced. Sponsored by Section F and co-sponsored by the Botanical Society of America.
5. Water and Agriculture. Four sessions, Dec. 29-30. Sponsored by Section O (Agricultural Sciences).
6. Premedical and Predental Education. Sponsored by Alpha Epsilon Delta.
7. Space Medicine. Two sessions, Dec 30-31. Sponsored by the American Physiological Society.
8. Integrative Mechanisms in Biology. Sponsored by the American Society of Naturalists.
9. Vertebrate Morphology. Three sessions, Dec. 27-28. Sponsored by the American Society of Zoologists and arranged by Alfred S. Romer.
10. Peacetime Benefits from Biological Warfare Research. Three sessions, Dec. 27. Sponsored by the Society for Industrial Microbiology.
11. Microbiology in Outer Space Research. Two sessions, Dec. 27. Sponsored by the Society for Industrial Microbiology.
12. Systematics. Three sessions, Dec. 28-29. Sponsored by the Society of Systematic Zoology and co-sponsored by ASB and other societies.

The speakers at the first session of the Systematics Symposium *(Linnaeus and Nomenclatural Codes)* will be W. T. Stearn of the British Museum, who will discuss Linnaeus' work and its bearing on the present day understanding and use of the Linnaean method of recording and nomenclature, H. W. Rickett of the New York Botanical Garden, who will discuss the botanical code, R. E. Buchanan of Iowa State College, who will discuss the bacterial and viral code, and R. L. Usinger of the University of Califorina, who will present his and E. G. Linsley's joint paper on the zoological code.

At the second session (*Basic Concepts of Systematic Order*) M. R. Irwin of the University of Wisconsin will speak on interrelations of genetic characters which differentiate species of doves, H. H. Ross of the Illinois Natural History Survey will speak on the systematic significance of differential evolution in larval and adult caddisflies, and C. H. Seevers of Roosevelt University will speak on the evolution of interspecies systems: Termitophiles, Myrmecophiles and their hosts.

The third session (*Systematics, Present and Future*) is devoted to speakers who have been active in making the NSF-supported surveys of systematic botany and zoology. F. A. Stafleu of the Internation Bureau for Plant Taxonomy and Nomenclature will speak on the status of systematic botany and David D. Keck of the New York Botanical Garden on its future. Richard E. Blackwelder, secretary of the SSZ, will speak on the status of systematic zoology, and a speaker to be announced on its future.

On December 30 two panel discussions will follow the symposium: one devoted to the London Meeting on Nomenclature featuring Curtis Sabrosky and other participants in the meeting and the other to problems brought up in the symposium sessions.

Directory of ASB Members

1. Alphabetical Directory

This directory of the members of the Association of Southeastern Biologists is based on the membership files of the Secretary and the Treasurer of the Association and is, as far as known, up to date as of October 15, 1958. Any errors or omissions should be reported immediately to the Secretary of ASB, Dr. Harold Humm, Department of Botany, Duke University, Durham, N. C.

ABEGG, ROLAND, Biology Department, Southeastern Louisiana College, Hammond, La.
ADAMS, JOSEPH E., Botany Department, University of North Carolina, Chapel Hill, N. C.
ADAMS, WILLIAM H., JR., Wildlife Reserve Unit, Auburn, Ala.
AHLES, HARRY E., Botany Department, University of North Carolina Chapel Hill, N. C.
ANDERSON, DONALD B., Office of the Provost, University of North Carolina, Chapel Hill, N. C.
ANDERSON, LEWIS EDWARD, Botany Department, Duke University, Durham, N. C.
ANDERSON, MARGARET SUE, Department of Biology, Madison College, Harrisonburg, Va.
ANDERSON, NORMAN GULACK, Biology Division, Oak Ridge National Laboratory, Oak Ridge, Tenn.
ARNOLD, JOHN G., JR., Department of Medical Technology, Loyola University New Orleans 18, La.
AUFFENBERG, WALTER, Biology Department, University of Florida, Gainesville, Fla.

BACON, ISABEL W., Biology Department, Carson Newman College, Jefferson City, Tenn.
BAER, CHARLES H., Biology Department, West Virginia University, Morgantown, W. Va.
BAILEY, DONALD WYCOFF, Department of Biology, Emory University, Atlanta 22, Ga.
BAILEY, PAUL C., Biology Department, Alabama College, Montevallo, Ala.
BAKER, C. L., Biology Department, Southwestern College, Memphis, Tenn.
BAKER, W. B., Biology Department, Emory University, Atlanta 22, Ga.
BALLARD, CHARLES L., Physiology Department, School of Medicine, Tulane University, New Orleans 18, La.
BAMFORD, RONALD, Graduate Office, University of Maryland, College Park, Md.
BARCLAY, FRANK, H., P. O. Box 276, East Tennessee State College, Johnson City, Tenn.
BARNES, ROBERT D., 316 Ridge Avenue, Gettysburg, Penn.
BARRINGTON, BURNESS A., JR., Biology Department, King College, Bristol, Tenn.
BATSON, JACKIE D., Walker Junior College, Jasper, Ala.
BATSON, WADE T., Department of Biology, University of South Carolina, Columbia, S. C.
BEADLE, MARY ELIZABETH, Biology Department, Oglethorpe University, Oglethorpe, Ga.
BEARD, ELIZABETH L., Department of Biological Sciences, Loyola University, New Orleans, La.
BEATTY, ALVIN V., Biology Department, Emory University, Atlanta 22, Ga.
BEATTY, MRS. JEANNE W., Biology Department, Emory University, Atlanta 22, Ga.
BECK, EDWIN G., Botany Department, University of Georgia, Athens, Ga.
BEHRE, ELLINOR H., Black Mountain, N. C.
BELCHER, JANE C., Biology Department, Sweet Briar College, Sweet Briar, Va.
BELL, FRANCES, Biology Department, University of Alabama, Tuscaloosa, Ala.
BELL, C. RITCHIE, Botany Department, University of North Carolina, Chapel Hill, N. C.
BENNETT, HAROLD D., Department of Biology, West Virginia University, Morgantown, W. Va.
BENNETT, HARRY J., Department of Zoology, Louisiana State University, Baton Rouge, La.
BERKELEY, EDMUND, University Center in Virginia, West Main Street, Richmond, Va.
BERNARD, GEORGE R., JR., Department of Biology, University of Notre Dame, Notre Dame, Ind.
BERNER, LEWIS, Department of Biology, University of Florida, Gainesville, Fla.
BICK, GEORGE H., Southwestern Louisiana Institute, Lafayette, La.
BICKLEY, WILLIAM E., Department of Entomology, University of Maryland, College Park, Md.
BISHOP, EVERETT L., JR., P. O. Box 2047, University, Ala.
BLACK, ZOE WELLS C., Biology Department, Mary Washington College, Fredericksburg, Va.
BLAKE, JOHN W., Zoology Department, University of North Carolina, Chapel Hill, N. C.

BLANK, GRACE J., Department of Biology, William and Mary College, Williamsburg, Va.

BLOMQUIST, H. L., Botany Department, Duke University, Durham, N. C.

BOGITSH, BURTON J., Georgia Teachers College, Department of Biology, Collegeboro, Ga.

BOLIEK, MILDRED I., Box 994, Florida State University, Tallahassee, Fla.

BOLINGER, ANITA I., Department of Biology, Union College, Barbourville, Ky.

BOOKHOUT, CAZLYN G., Department of Zoology, Duke University, Durham, N. C.

BOOLE, JOHN ALLEN, JR., Biology Department. Georgia State Teachers College, Statesboro, Ga.

BOUDREAUX, H. BRUCE, Zoology Department, Louisiana State University, Baton Rouge, La.

BOVEE, EUGENE C., Department of Biology, University of Florida, Gainesville, Fla.

BOWLING, AGNES (Mrs. W. A.), Fulton High School, Knoxville, Tenn.

BOYCE, STEVE G., 1402 W. Walnut St., Carbondale, Ill.

BOYD, G. H., Biology Department, University of Georgia, Athens, Ga.

BOYLES, JAMES, University of Alabama Mobile Center, Box 1475, Mobile, Ala.

BRADBURY, ORA C., Box 7224, Reynolds Station, Winston-Salem, N. C.

BRANNON, MARY JANE, Department of Biology, Huntingdon College, Montgomery, Ala.

BRAUER, ALFRED, 1020 Cooper Drive, Lexington, Ky.

BREEN, RUTH S., Department of Botany, Florida State University, Box 1102, Tallahassee, Fla..

BRIDGMAN, ANNA JOSEPHINE, Department of Biology, Agnes Scott College, Decatur, Ga.

BRIGGS, JOHN C., Department of Biology, University of Florida, Gainesville, Fla.

BRILLHART, W. E., Department of Biology, Emory University, Atlanta 22, Ga.

BRITT, HENRY GRADY, P. O. Box 7223, College Station, Winston-Salem, N. C.

BROOKBANK, JOHN W., Department of Biology, University of Florida, Gainesville, Fla.

BROWN, ELMER E., Biology Department, Davidson College, Davidson, N. C.

BROWN, HARRY D., Department of Biological Sciences, Loyola University, New Orleans, La.

BROWN, JOSHUA R. C., Department of Zoology, University of Maryland, College Park, Md.

BROWN, THOMAS D., Department of Biology, Erskine Collge, Due West, S. C.

BROWNE, EDWARD TANKARD, JR., Department of Botany, Alabama Polytechnic Institute, Auburn, Ala.

BRUMFIELD, ROBERT T., Biology Department, Longwood College, Farmville, Va.

BRYAN, VIRGINIA S., Department of Botany, Duke University, Durham, N. C.

BRYDEN, ROBERT R., Union College, Barbourville, Ky.

BURBANCK, WILLIAM D., Biology Department, Emory University, Atlanta 22, Ga.

BURGESS, ROBERT W., Box 717, Columbia, S. C.

BUSH, FRANCES M., Zoology Department, University of Georgia, Athens, Ga.

BYERS, FRANCIS, Division of Biological Science, University of Florida, Gainesville, Fla.

BYRD, E. E., Biology Department, University of Georgia, Athens, Ga.

BYRD, MITCHELL A., Department of Biology, College of William and Mary, Williamsburg, Va.

CAGLE, FRED R., Department of Zoology, Tulane University, New Orleans, La.

CALDWELL, DAVID K., 1226 Bates Court, Louisville, Ky.

CAPLENOR, DONALD, Department of Biology, Millsaps College, Jackson 10, Miss.

CARLSON, J. GORDON, Department of Zoology & Entomology, University of Tennessee, Knoxville, Tenn.

CARLTON, WILLIAM M., Department of Botany, University of Georgia, Athens, Ga.

CARPENTER, JOHN M., Zoology Department, University of Kentucky, Lexington, Ky.

CARRIKER, MELBOURNE R., Department of Zoology, University of North Carolina, Chapel Hill, N. C.

CARTER, MARJORIE E., Biology Department, Valdosta State College, Valdosta, Ga.

CARVER, G. L., 1348 Patterson, Macon, Ga.

CASPAR, ALAN L., Blandy Experimental Farm, University of Virginia, Boyce, Va.

CATHER, JAMES N., Department of Biology, Emory University, Atlanta 22, Ga.

CAVANNAUGH, CHARLES J., Biology Department, Louisiana College, Pineville, La.

CHADWICK, CLAUDE S., George Peabody College, Nashville 5, Tenn.

CHANNELL, R. B., Box 1501, Vanderbilt University, Nashville 5, Tenn.

CHAPMAN, JOE A., Biology Department, Carson Newman College, Jefferson City, Tenn.

CHENG, THOMAS CLEMENT, Dental School, University of Maryland, Baltimore, Md.

CHEW, MISS DOROTHY, Biology Department, St. Mary's Dominican College, New Orleans, La.

CHILTON, ST. JOHN P., Departments of Botany, Bacteriology, and Plant Pathology, Louisiana State University, Baton Rouge, La.

CHIPPEY, ARTHUR P., P. O. Box 222, South Carolina State College, Orangeburg, S. C.

CHURCHILL, HELEN M., Hollins College, Hollins College, Va.

CIORDIA, HONORICO, USDA, Animal Dis. and Parasite Res. Bur., Georgia Experiment Station Experiment, Ga.

CLARK, GORDON M., Department of Zoology, University of Toronto, Toronto 5, Ontario, Canada

CLARK, SAM L., School of Medicine, Vanderbilt University, Nashville, Tenn.

CLEMENT, ANTHONY C., Department of Biology, Emory University, Atlanta 22, Ga. (Temporary 1958-59 address; National Science Foundation, Washington 25, D. C.)

COCKE, ELTON C., College Station, Winston-Salem, N. C.

COHEN, ARTHUR L., Oglethorpe University Station, Atlanta, Ga.

COKER, ROBERT ERVIN, Biology Department, University of Puerto Rico, Mayaguez, P.R.

COLE, BENJAMIN T., Zoology Department, Louisiana State University, Baton Rouge, La.

COLE ARTHUR C., JR., Department of Biology, University of Tennessee, Knoxville, Tenn.

COLEMAN, MRS. MARION T., Department of Biology, Emory University, Atlanta 22, Ga.

COOK, ARTHUR H., Department of Biology, Peabody College, Nashville, Tenn.

COOK, EUGENE W., Biology Department, Centre College, Danville, Ky.

COOPER, KENNETH W., Depatrment of Biology, University of Florida, Gainesville, Fla.

CORE, EARL L., Department of Botany, West Virginia University, Morgantown, W. Va.

CORT, WILLIAM W., School of Public Health, University of North Carolina, Chapel Hill, N. C.

COSTELLO, DONALD P., The Biological Bulletin, P. O. Box 429, Chapel Hill, N. C.

COTTER, DAVID JAMES, Department of Biology, Alabama College, Montevallo, Ala.

COUCH, J. N., Botany Department, University of North Carolina, Chapel Hill, N. C.

COWDEN, RONALD REED, Department of Biology, John Hopkins University, Baltimore 18, Md.

COWIE, LILLIAN MATHESON, Department of Biology, Wesleyan College, Macon, Ga.

CRANDALL, DOROTHY L., Department of Biology, Randolph Macon Woman's College, Lynchburg, Va.

CRAWFORD, EDWARD A., JR., Biology Department, Limestone College, Gaffney, S. C.

CREASY, WILLIAM D., Biology Department, Fairmont State College, Fairmont, W. Va.

CUTTER, VICTOR M., JR., Department of Biology, The Woman's College, U.N.C., Greensboro, N. C.

DAGGY, TOM, Box 767, Davidson, N. C.

DALY, EDWARD F., 4819 Dorset Avenue, Chevy Chase 15, Md.

DAMIAN, RAYMOND T., Department of Biological Science, Florida State University, Tallahassee, Fla.

DARDEN, EDGAR B., Biology Division, Oak Ridge National Laboratory, Oak Ridge, Tenn.

DARLINGTON, JULIAN T., Department of Biology, Shorter College, Rome, Ga.

DAVIS, GRAHAM J., Experiment Station, Hawaiian Sugar Planters's Association, Honolulu, T. H.

DAVIS, HERBERT L., JR., Biology Department, Emory University, Atlanta 22, Ga.

DAVIS, JOHN H. JR., Department of Botany, University of Florida, Gainesville, Fla. (Temporary 1958-59 address; University of Mandalay, Mandalay, Burma.)

DAWLEY, CHARLOTTE W., Biology Department, Woman's College, UNC, Greensboro, N. C.

DE BUSK, A. GIB, Department of Biological Science, Florida State University, Tallahassee, Fla.

DECK, JAMES DAVID, Department of Anatomy, University of Virginia, Charlottesville, Va.

DENT, JAMES N., Department of Biology, University of Virginia, Charlottesville, Va.

DENTON, JAMES F., JR., School of Medicine, University of Georgia, Augusta, Ga.

DENYES, HELEN A., Biology Department, Queens University, Kingston, Ont. Canada

DE SELM, H. R., Botany Department, University of Tennessee, Knoxville, Tenn.

DEVINEY, MISS EZDA, 511 Palm Court, Tallahassee, Fla.

DEWITT, ROBERT M., Department of Biology, University of Florida, Gainesville, Fla.

DICKENSON, HENRY F., JR., Biology Department, Carson-Newman College, Jefferson City, Tenn.

DICKINSON, J. C., JR., Biology Department, University, of Florida, Gainesville, Fla.

DICKSON, WARRICK J., McNeese State College, Lake Charles, La.

DOERPINGHAUS, S. LEONARD, Biology Department, Agnes Scott College, Decatur, Ga.

DOSTER, MRS. C. S., Birmingham Southern College, Birmingham, Ala.

DUNCAN, WILBUR H., Department of Botany, University of Georgia, Athens, Ga.

DUNLAP, ELIZABETH, Lexington High School, Lexington, Va.

DUPROW, ERNEST JOSEPH, JR., Department of Biology, University of Florida, Gainesville, Fla.

DURE, LEON SEBRING, III Department of Botany, University of Texas, Austin, Tex.

EATON, THEODORE H., JR., Department of Science, East Carolina College, Greenville, N. C.

EDWARDS, BETTY F., Anatomy Department, Division of Basic Sciences, Emory University, Atlanta 22, Ga.

EGGLER, WILLIS A., Department of Biology, Newcomb College of Tulane University, New Orleans, La.

ELIASON, NANCY B., Box 8, Averett College, Danville, Va.

ELLIAS, LORETTA C., Department of Biology, Florida State University, Tallahassee, Fla.

EMERSON, FRED W., Box 483, Elon College, N. C.

EMMONS, LYMAN R., Episcopal High School, Alexandria, Va.

ERWIN, WILLIAM GRADY, Department of Biology, Box 1237, Northwestern State College, Natchitoches, La.

ESTES, MISS EDNA E., St. Mary's Seminary Jr. College, St. Mary's City, Md.

EVANS, WILLIAM G., Entomology Section, Virginia Polytechnic Institute, Blacksburg, Va.

FARRAR, LUTHER L., Georgia Agricultural Exp. Station, Experiment, Ga.

FARRELL, CHARLES E., Department of Biology, Vanderbilt University, Nashville, Tenn.

FERGUSON, EDWARD, JR., P. O. Box 352, Grambling, La.

FINCHER, EDWARD L., 5336 Greenland Road, N.E., Atlanta, Ga.

FINCHER, JNO. A., Department of Biology, Howard College, Birmingham, Ala.

FINGERMAN, MILTON, Department of Zoology, Newcomb College of Tulane University, New Orleans, La.

FLINT, FRANKLIN F., 226 Denver Avenue, Lynchburg, Va.

FLINT, LEWIS H., Botany Department, Louisiana State University, Baton Rouge, La.

FLORY, WALTER S., JR., Blandy Experiment Farm, University of Virginia, Boyce, Va.

FORD, ERNEST S., Department of Botany, Universtiy of Florida, Gainesville, Fla.

FOREMAN, CHAS. W., Pfeiffer College, Misenheimer, N. C.

FORESTER, HARRY B., Box 232, Dahlonega, Ga.

FOSTER, A. ALFRED, Box 1421, Macon, Ga.

FRASER, RONALD C., Department of Zoology and Entomology, University of Tennessee, Knoxville, Tenn.

FREEMAN, H. W., Department of Biology, University of South Carolina, Columbia, S. C.

FREEMAN, JOHN ALDERMAN, Box 97, Winthrop College, Rock Hill, S. C.

FREEMAN, OLIVER M., P. O. Box 637, Tryon, N. C.

FRIAUF, JAMES, Department of Biology, Vanderbilt University, Nashville, Tenn.

FRYE, BILLY E., Biology Department, Emory University, Atlanta 22, Ga.

FRYE, O. E., JR., Game and Fresh Water Fish Comm., 307 E. Lafayette Street, Tallahassee, Fla.

FULLER, MISS DOROTHY LANGFORD, Department of Biology, Stetson University, DeLand, Fla.

GADSDEN, EVELYN L., Childrens Cancer Research Found., 35 Binney Street Boston 15, Mass.

GANS, CARL, Biology Department, University of Florida, Gainesville, Fla.

GARTH, RICHARD E., Department of Biology, East Tennessee State College, Johnson City, Tenn.

GAULDEN, MARY ESTHER, Biology Division, Oak Ridge National Laboratory, P. O. Box Y, Oak, Ridge, Tenn.

GILBERT, MARGARET L., Department of Biological Sciences, Florida Southern College, Lakeland, Fla.

GILBERT, WILBUR A., Department of Secondary Science, Humboldt City School, Humboldt, Tenn.

GODFREY, ROBERT K., Botany Department, Florida State University, Tallahassee, Fla.

GOETHE, C. M., Crocker-Anglo Bank Building, Seventh and J Streets, Sacramento 14, Cal.

GOIN, COLEMAN J., Department of Biology, University of Florida, Gainesville, Fla.

GOODCHILD, CHAUNCEY, G., Biology Department, Emory University, Atlanta 22, Ga.

GORDON, DONALD P., 5240 Davis Road, S. Miami, Fla.

GORDON, ROBERT E., Department of Biology, University of Notre Dame, Notre Dame, Ind.

GOSS, ROBERT C., Biology Department, Loyola University,, New Orleans 18, La.

GRAY, I. E., Zoology Department, Duke University, Durham, N. C.

GRAY, MRS. NETTA E., Department of Anatomy, Emory University, Atlanta 22, Ga.

GRAY, STEPHEN W., Emory University, School of Medicine, Department of Anatomy, Emory University, Atlanta 22, Ga.

GREGG, JAMES H., Department of Biology, University of Florida, Gainesville, Fla.

GREULACH, VICTOR A., Department of Botany, University of North Carolina, Chapel Hill, N. C.

GROBMAN, ARNOLD B., Florida State Museum, Seagle Building, Gainesville, Fla.

GRODNER, ROBERT M., Zoology Department, Louisiana State University, Baton Rouge, La.

GROSECLOSE, NANCY, P., Department of Biology, Agnes Scott College, Decatur, Ga.

GUDE, WILLIAM D., Biology Division, Oak Ridge National Laboratory, Oak Ridge, Tenn.

HAESLOOP, JOHN G., Department of Botany, University of North Carolina, Chapel Hill, N. C.

HALE, MASON E., JR., Smithsonian Institution. Washington 25, D. C.

HANCOCK, KENNETH FARRELL, Department of Botany, University of Alabama, University, Ala.

HANSEN, KEITH L., Department of Biology, Stetson University, De Land, Fla.

HARDIN, JAMES W., Department of Botany, North Carolina State College, Raleigh, N. C.

HARGIS, WILLIAM J., JR., Virginia Fisheries Laboratory, Gloucester Point, Va.

HARGITT, G. T., Department of Zoology, Duke University, Durham, N. C.

HARPER, R. M., Box 0, University, Ala.

HARRIS, JOSEPH B., Coastal Plain Experiment Station, Tifton, Ga.

HARRISON, ELIZABETH ANN, Science Department, Leewood Junior High School, Leewood, W. Va.

HASSLER, WILLIAM W., Department of Biology, North Carolina State College, Raleigh, N. C.

HATHAWAY, EDWARD S., Department of Zoology, Tulane University, New Orleans 18, La.

HATHAWAY, RALPH R., Oceanographic Institute, Florida State University, Tallahassee, Fla.

HAUBRICH, ROBERT RICE, Science Department, East Carolina College, Greenville, N. C.

HAWSE, DORIS H., Biology Department, Flora MacDonald College, Red Springs, N. C.

HAYNES, CURRY T., Biology Department, Emory University, Oxford, Ga.

HECHENBLEIKNER, HERBERT, Charlotte College, Charlotte, N. C.

HENDERSON, VERNON, Department of Science, Grambling College, Grambling La.

HENRY, LAURA M., 365 Hawthorn Avenue, Palo Alto, Cal.

HENRY, NELL Q., Biology Department, Lander College, Greenwood, S. C.

HERNDON, WALTER R., Department of Biology, University of Alabama, University, Ala.

HESLER, L. R., Department of Botany, University of Tennessee, Knoxville, Tenn.

HESS, MARGARET, Winthrop College, Box 114, Rock Hill, S. C.

HETRICK, L. S., Floyd Hall, University of Florida, Gainesville, Fla.

HILL, BEN H., High Point College, High Point, N. C.,

HINTON, CLAUDE W., Department of Zoology, University of Georgia, Athens, Ga.

HOBBS, HORTON H., JR., Miller School of Biology, University of Virginia, Charlottesville, Va.

HOLLAENDER, ALEXANDER, Biology Division, Oak Ridge National Laboratory, P. O. Box Y, Oak Ridge, Tenn.

HOLLIMAN, RHODES B., Florida State University, Department of Zoology, Tallahassee, Fla.

HOLLIS, CECIL GEORGE, Biology Department, Box 36, Arkansas College, Batesville, Ark.

HOLLOWAY, HARRY L., JR., Department of Biology, Roanoke College, Salem, Va.

HOLT, MISS JANE PRICE, Peace College, Raleigh, N. C.

HOLT, PERRY C., Biology Department, Virginia Polytechnic Institute, Blacksburg, Va.

HOLT, HELEN, Department of Science, Greenbrier College, Lewisburg, W. Va.

HOOD, MARY N., Department of Biology, Florida State University, Tallahassee, Fla.

HORN, EDWARD C., Zoology Department, Duke University, Durham, N. C.

HORTON, JAMES HEATHMAN, Botany Department, University of North Carolina, Chapel Hill, N. C.

HOWDEN, HENRY FULLER, Science Service, Insect Systematics, Department of Agriculture, Ottawa, Ontario, Can.

HOWE, HENRY B., JR., Department of Biology, Wake Forest College, Winston-Salem, N. C.

HOWELL, G. LEON, Box 5187, University, Ala.

HOWELL, JOSEPH C., Department of Zoology, University of Tennessee, Knoxville, Tenn.

HOWELL, THELMA, Wesleyan College, Macon, Ga.

HUGGINS, CECILE, 2602 Blossom Street, Columbia, S. C.

HUGHES, GILBERT C., Department of Biological Science, Florida State University, Tallahassee, Fla.

HUGHES, WALTER NORMAN, Emory University, Atlanta 22, Ga.

HUMM, HAROLD JUDSON, Botany Department, Duke University, Durham, N. C.

HUMPHRIES, ASA A., JR., Department of Biology, Emory University, Atlanta 22, Ga.

HUNT, ERNEST L., Department of Zoology, Emory University, Atlanta 22, Ga.

HUNTER, GEORGE W., III, Department of Biology, University of Florida, Gainesville, Fla.

HUNTER, FRISSELL R., Department of Biology, Southern University, Baton Ronge, La.

HUNTER, WANDA S., Department of Zoology, Duke University, Durham, N. C.

HUSTED, L., Miller School of Biology, University of Virginia, Charlottesville, Va.

HYDE, CATHERINE F., Zoology Department, Louisiana State University, Baton Rouge, La.

INGLE, ROBERT M., State Board of Conservation, Tallahassee, Fla.
ISANOGLE, ISABEL T., Western Maryland College, Westminster, Md.
IVES, JUDSON D., Pinebluff, N. C.
IVEY, WM. D., Department of Biology, Alabama Polytechnic Institute, Auburn, Ala.

JACKSON, LYLE, Forestry School, University of Georgia, Athens, Ga.
JACOBS, MERLE EMMOR, Department of Biology, Bethany College, Bethany, W. Va.
JAMES, CHARLES W., Department of Botany, University of Georgia, Athens, Ga.
JEFFERS, GEO. W., Department of Biology, Longwood College, Farmville, Va.
JEFFERY, GEOFFREY M., USPHS, Box 717, Columbia, S. C.
JEFFREYS, DONALD B., Botany Department, University of North Carolina, Chapel Hill, N. C.
JENKINS, JAMES H., School of Forestry, University of Georgia, Athens, Ga.
JENNER, CHAS. E., Department of Zoology, University of North Carolina, Chapel Hill, N. C.
JOHNS, BENJAMIN IRVING, St. Stephen's School, Seminary Post Office, Alexandria, Va.
JOHNSON, MARTHA J., Department of Biology, University of Georgia (Atlanta Div.), Atlanta, Ga.
JOHNSON MELVIN A., JR., P. O. Box 245, Grambling, La.
JOHNSON, RICHARD M., Department of Biology, Tennessee Wesleyan College, Athens, Tenn.
JOHNSON, MRS. SALLY WOOD, Department of Biochemistry, Southern Research Institute Birmingham 5, Ala.
JOHNSON, TOM LEE, Department of Biology, University of Virginia, Charlottesville, Va.
JOHNSTON, DAVID W., Biology Department, Mercer University, Macon, Ga.
JONES, ARTHUR W., Department of Zoology and Entom., University of Tennessee, Knoxville, Tenn.
JONES, MRS. BONNIE M., Chemotherapy Division, Southern Research Institute, Birmingham 5, Ala.
JONES, E. E., Biology Department, Bessie Tift College, Forsyth, Ga.
JONES, EDMUND R., JR., Department of Biology, University of Florida, Gainesville, Fla.
JONES, JANET E., Southern Research Institute, Birmingham 5, Ala.
JONES, MEREDITH L., Oceanographic Institute, Florida State University, Tallahassee, Fla.
JONES, RUTH M., Department of Biology, Winthrop College, Rock Hill, S. C.

KAMINE, ABE B., Savannah Vet. Hosp. and Clinic, 5400 Waters Avenue, Savannah, Ga.
KEELER, CLYDE E., Georgia State College (Women), Milledgeville, Ga.
KELLEY, WM. R., Biology Department, University of South Carolina Columbia, S. C.
KENT, GEO. C., JR., Department of Zoology, Louisiana State University, Baton Rouge, La.
KENT, HARRY A., Department of Zoology, University of Georgia, Athens, Ga .
KERSCHNER, JEAN, Western Maryland College, Westminister, Md.
KETHLEY, THOMAS W., Eng. Exp. Station, Georgia Institute of Technology, Atlanta, Ga.
KIMBALL, RICHARD F., Biology Division, Oak Ridge National Laboratory, Oak Ridge, Tenn.
KIRK, DANIEL E., Biology Department, Furman University, Greenville, S. C.
KISER, ROY S., Department of Biology, Florida Southern College, Lakeland, Fla.
KITCHIN, IRWIN C., Department of Biology, University of Mississippi, University, Miss.
KLEWER, HERBERT L., Biology Department, Virginia Polytechnic Institute, Blacksburg, Va.
KNIGHT, ROBERT J., JR., Blandy Experimental Farm, University of Virginia, Boyce, Va.
KNISELY, WM. H., School of Medicine, Duke University, Durham, N. C.
KOCH, WILLIAM J., University of North Carolina, Department of Botany, Chapel Hill, N. C.
KRAL, ROBERT, Department of Biology, Northeastern Louisiana College, Monroe, La.
KRAMER, PAUL J., Department of Botany, Duke University, Durham, N. C.
KRIVANEK, JEROME, O., Department of Zoology, Newcomb College, Tulane University, New Orleans 18, La.
KRIVANEK, ROBIN COOLEY, Department of Zoology, Newcomb College, Tulane University, New Orleans 18, La.
KROCHMAL, ARNOLD, Department of Botany, University of Wyoming, Laramie, Wyo.
KRUSE, DWAYNE NATHANIEL, Department of Biological Science, Florida State University, Tallahassee, Fla.
KUIPERS, CARL J., Middle Georgia College, Cochran, Ga.
KURZ, HERMAN, Botany Department, Florida State University, Tallahassee, Fla.
KYZER, ELIZABETH L., Biology Department, Bridgewater College, Bridgewater, Va.

LACKEY, JAS. B., 1534 N. W. 7th Place, Gainesville, Fla.

LAESSLE, ALBERT M., Department of Biology, University of Florida, Gainesville, Fla.

LAFFODAY, SAMUEL K., Department of Biology, College of Charleston, Charleston, S. C.

LAFLEUR, ROBERT A., Box 9055, Louisiana State University, Baton Rouge, La.

LAMB, EDWARD B., American Optical Company, Box 4208-5 Plaza Way, S.W., Atlanta, Ga.

LAMMERS, WILLIAM T., Biology Building, Emory University, Atlanta 22, Ga.

LANDT, J. FRED, Apartment 23, 1766 N. Decatur Road, N.E., Atlanta 7, Ga.

LASLIE, MARY L., Department of Biology, Otterbein College, Westerville, Ohio

LAUTENSCHLAGER, EDWARD W., Biology Department, University of Virginia, Charlottesville, Va.

LAUTER, FELIX H., Department of Biology, Birmingham Southern College, Birmingham, Ala.

LAYNE, JAMES N., Department of Biology, University of Florida, Gainesville, Fla.

LEE, J. WARREN, Department of Biology, Southern University, Baton Rouge, La.

LEIGH, W. HENRY, Zoology Department, Box 488, University of Miami, Coral Gables, Fla.

LEISNER, ROBERT S., AIBS, 2000 P St., N. W., Washington, D. C.

LEWIS, IVEY F., Department of Biology, University of Virginia, Charlottesville, Va .

LEWIS, WALTER H., Department of Biology, Stephen F. Austin State College, Nacogdoches, Texas

LILES, JAMES N., Department of Biology, University of South Carolina, Columbia, S. C.

LINER, ERNEST, 2017 Jackson, Apartment 7, Alexandria 6, Va.

LIPPS, EMMA L., Department of Biology, Shorter College, Rome, Ga.

LIVINGSTONE, DANIEL, Zoology Department, Duke University, Durham, N. C.

LOVELACE, ROBERTA, Department of Biology, University of South Carolina. Columbia, S. C.

LOVELL, HARVEY, B., Biology Department, University of Louisville, Louisville, Ky.

LOWERY, GEORGE H., Director, Museum of Zoology, Louisiana State University, Baton Rouge 3, La.

LOWRY, EDWARD MACLEAN, Box 5215, Zoology Department, State College Station, Raleigh, N. C.

LOWY, BERNARD, Escuela Nacional de Agricultura, La Molina, Lima, Peru

LUND, H. O., Zoology Department, University of Georgia, Athens, Ga.

LUNZ, ROBERT G., J., Bears Bluff Laboratories, Wadmalaw Island, S. C.

LUTZ, PAUL E., 101 Maxwell Rd., Chapel Hill, N. C.

MacDOUGALL, MARY S., Mt. Vernon Apartments, 423 Clairmont Avenue, Decatur, Ga.

McCRADY, EDW., University of the South, Sewanee, Tenn.

McCRAY, ELMO M., JR., Department of Biology, Armstrong College, Savannah, Ga.

McCRONE, JOSEPHINE, Biology Division, Oak Ridge National Laboratory, Oak Ridge, Tenn.

McCULLOUGH, HERBERT A., Department of Biology, Howard College, Birmingham, Ala.

McFADDEN, SAMUEL E., JR., Agric. Expt. Sation, Department of Ornamental Horticulture, Gainesville, Fla.

McGAHA, Y. JOHN, Biology Department, University of Mississippi, University, Miss.

McGHEE, R. BARCLAY, Zoology Department, University of Georgia, Athens, Ga.

McGILLIARD, ELEANOR, University of Chattanooga, Chattanooga, Tenn.

McGINNIS, JOHN T., Department of Biology, Emory University, Atlanta 22, Ga.

McLAUGHLIN, WOODROW D., Department of Science, Troy State Teachers College, Troy, Ala.

McMASTER, MARY C., Dreher High School, Columbia, S. C.

McMILLAN, ROSAMUND, Biochemistry Department, Louisiana State University, Baton Rouge, La.

McNULTY, JOHN K., Marine Laboratory, University of Miami, Coral Gables 46, Fla.

McVEIGH, ILDA, Box 1549, Substation B, Vanderbilt University, Nashville, Tenn.

MADSEN, GRACE C., Department of Biology, Florida State University, Tallahassee, Fla.

MANKIN, W. D., Herndon, Va.

MANLY, JETHRO D., Division of Natural Sciences, Pfeiffer College, Misenheimer, N. C.

MARKEE, JOSEPH E., Department of Anatomy, Duke University, Durham, N. C.

MARONEY, SAMUEL PATTERSON, JR., Department of Biology, University of Virginia, Charlottesville, Va.

MASSEY, A. B., Box 95, Blacksburg, Va.

MATHEWS, ANDREW C., 113 Riggs Drive, Clemson, S. C.

MEADE, JANE McLESTER, Department of Biochemistry, Southern Research Institute, Birmingham, Ala.

MECHAM, JOHN S., Department of Zoology-Entomology, Alabama Polytechnic Institute, Auburn, Ala.

MENGEBIER, Wm. L., Biology Department, Madison College, Harrisonburg, Va.

MENZEL, MARGARET Y., Department of Biol. Sciences, Fla. State University, Tallahassee, Fla.

MENZEL, ROBERT W., Oceanographic Institute, Florida State University, Tallahassee, Fla.

METCALF, ISAAC S. H., The Citadel, Charleston, S. C.

MEYER, SAMUEL L., College of the Pacific, Stockton 4, Calif.

MEYERS, SAMUEL P., The Marine Laboratory, No. 1 Rickenbacker Causeway, Virginia Key, Miami 49, Fla.

MICKEY, GEORGE H., Biology Department, Louisiana State University, Baton Rouge, La.

MILLER, CHARLES E., Department of Biology, Emory University, Atlanta 22, Ga.

MILLER, EDWIN D., Department of Biology, Madison College, Harrisonburg, Va.

MILLER, FAITH S., Basic Science Building, Emory University, Atlanta 22, Ga.

MILLER, GROVER C., Box 5215, Zoology Department, North Carolina State College, State College Station, Raleigh, N. C.

MILLER, JAMES A., JR., Department of Anatomy, Emory University, Atlanta 22, Ga.

MILLER, TONY J., Zoology Department, University of Tennessee, Knoxville, Tenn.

MITCHELL, RODGER D., Biology Department, University of Florida, Gainesville, Fla.

MONTGOMERY, JOSEPH G., 1777 Alta Vista, Sarasota, Fla.

MOON, ELVIN D., Biology Department, N. Greenville Jr. College, Tigerville, S. C.

MOORE, JACK HORTON, Chemotherapy Division, Southern Research Institute, Birmingham, Ala.

MOORE, JEWEL E., Box 56, Arkansas State Teachers College, Conway, Ark.

MOORE, JOSEPH C., Department of Mammals, American Museum of Natural History, Central Park West, 79th Street, New York, N. Y.

MOORE, WALTER G., Department of Biological Sciences, Loyola University, New Orleans 18, La.

MOORHEAD, MRS. MARGARET DEMPSEY, Department of Science, Blacksburg High School, Blacksburg, S. C.

MORGAN, WALTER C., JR., South Dakota State College, College Station, S. D.

MORRIS, ELLA D., Biology Department, Spring Hill College, Spring Hill, Ala.

MULLAHY, REV. JOHN H. (S. J.), Biology Department, Loyola University, New Orleans 18, La.

MULLINS, JOHN THOMAS, Department of Botany, University of North Carolina, Chapel Hill, N. C.

MYLES, MARION RICHARD, Fort Valley State College, Fort Valley, Ga.

NACE, GEORGE W., Zoology Department, University of Michigan, Ann Arbor, Mich.

NEELY, PEGGY A., Department of Biology, University of Mississippi, University, Miss.

NEVINS, BEATRICE, Valdosta State College, Valdosta, Ga.

NEWMAN, ROBERT J., Zoology Museum, Louisiana State University, Baton Rouge, La.

NEYLANS, OSCAR SHELBY, JR., 1320 Kite Drive, Forest Park, Ga.

NEZ, MARTHA M., Biology Department, Pensacola Junior College, Pensacola, Fla.

NIELSEN, CHESTER S., Department of Botany, Florida State University, Tallahassee, Fla.

NOGGLE, GLENN R., Department of Botany, Agricultural Experiment Station, University of Florida, Gainesville, Fla.

NORBY, DARWIN E., Department of Biology, Virginia Polytechnic Institute, Blacksburg, Va.

NORRIS, FRED H., Department of Botany, University of Tennessee, Knoxville, Tenn.

NORRIS, WILLIAM W., 14 Ash Street, Park Forest, Ill.

NUTTYCOMBE, J. W., Biology Department, University, of Georgia, Athens, Ga.

OAKERSON, MISS DIANE MARIE, Department of Biology, Emory University, Atlanta 22, Ga.

ODELL, THEODORE T., JR., Biology Division, Oak Ridge National Laboratary, Oak Ridge, Tenn.

ODUM, EUGENE P., Zoology Department, University of Georgia, Athens, Ga.

ODUM, HOWARD T., Institute of Marine Science, University of Texas, Port Arkansas, Texas

O'KELLEY, JOSEPH CHARLES, P. O. Box 1927, Biology Department, University of Alabama, University, Ala.

OLSON, MRS. FRANK, Navy Mine Defense Lab., Pensacola, Fla.

OOSTING, HENRY J., Botany Department, Duke University, Durham, N. C.

OSBORNE, PAUL J., Biology Department, Lynchburg College, Lynchburg, Va.

OTTIS, KENNETH, Department of Zoology, Alabama Polytechnic Institute, Auburn, Ala.

OUTLAND, RODERICK H., Department of Biology, Northwestern State College, Natchitoches, La.

OVERCASH, HINTON B., Department of Biology, Hampden-Sydney College, Hampden-Sydney, Va.

PARKER, DEAN R., Division of Life Sciences, University of California, Riverside, Calif.

PARRISH, FRED K., Biology Department, Emory University, Atlanta 22, Ga.

PARRISH, JOANNA WOODSON, Biology Department, Emory University, Atlanta 22, Ga.

PARRISH, MARY J., Bology Department, Mary Washington College, Fredericksburg, Va.

PATES, ANNE L., Department of Bacteriology, Florida State University, Tallahassee, Fla.

PATTERSON, PAUL M., Biology Department, Hollins College, Hollins, Va.

PATTON, ERNEST GIBBES, Box 1927, University of Alabama, University, Ala.

PEDIGO, ROBERT A., Biology Department, Emory University, Atlanta 22, Ga.

PENN, GEORGE H., Department of Zoology, Tulane University, New Orleans 18, La.

PERRY, RACHEL B., Biology Department, Emory University at Oxford, Oxford, Ga.

PHILLIPS, H. M., Alabama College, Montevallo, Ala.

PHILPOTT, JANE, Department of Botany, Duke University, Durham, N. C.

PIERCE, E. LOWE, Biology Department, University of Florida, Gainesville, Fla.

PLATT, ROBT. B., Biology Department, Emory University, Atlanta 22, Ga.

PLEASANTS, BEVERLEY, A., Zoology Department, Louisiana State University, Baton Rouge, La.

POTTER, ISABEL, Winthrop College, Rock Hill, S. C.

PRICHARD, ELMER C., Biology Department, Stetson University, De Land, Fla.

PROVO, MARVIN M., Department of Biology, Young Harris College, Young Harris, Ga.

QUARTERMAN, ELSIE, Box 1616, Vanderbilt University, Nashville 5, Tenn.

QUAY, THOS. L., Zoology Department, North Carolina State College, Raleigh, N. C.

RADFORD, ALBERT E., Botany Department, University of North Carolina, Chapel Hill, N. C.

RAMSEY, RALPH L., 1578 N. Decatur Road, Atlanta, Ga.

RAPPAPORT, JACQUES J., Department of Biology, University of Virginia, Charlottesville, Va.

RAWLS, JOHN M., Zoology Department, University of Florida, Gainesville, Fla.

RAY, CHARLES, JR., Department of Biology, Emory University, Atlanta 22, Ga.

REAMS, WILLIE M., JR., Anatomy Department, Medical College of Virginia, Richmond, Va.

REBUCK, ALLEN, Biology Department, Emory University, Atlanta 22, Ga.

REDDISH, PAUL S., Department of Biology, Elon College, N. C.

REDFEARN, PAUL L., JR., Department of Biology, Southwest Missouri, State College, Springfield, Mo.

REDMOND, JAMES R., Department of Biology, University of Florida, Gainesville, Fla.

REDMOND, WILLIAM B., Box 534, Emory University, Atlanta 22, Ga.

REED, CLYDE T., Biology Department, University of Tampa, Tampa, Fla.

REESE, W. D., Department of Biology, Southwest Louisiana Inst., Lafayette, La.

REIBER, ROBERT J., University System of Georgia Center, 24 Ivy Street, S.E., Atlanta, Ga.

REYNOLDS, J. PAUL, Florida State University, Tallahassee, Fla.

REYNOLDS, ORR E., Biol. Sci. Division, Office of Naval Research, Washington 25, D. C.

RICE, LUCILE A., Department of Biology, East Carolina College, Greenville, N. C.

RICE, NOLAN E., Biology Department, University of Richmond, Richmond, Va.

RICHARDS, WALTER L., 4915 Chamberlayne Avenue, Richmond, Va.

RICHARDSON, GLADYS M., 5280 Emory Circle, Jacksonville, Fla.

RIEMER, WILLIAM J., Florida State Museum, University of Florida, Gainesville, Fla.

RILEY, HERBERT P., Department of Botany, University, of Kentucky, Lexington, Ky.

ROACHE, LEWIE C., Biology Department, South Carolina State College, Orangeburg, S. C.

ROBERTSON, CLYDE H., Pfeiffer College, Box 23, Misenheimer, N. C.

ROCK, HOWARD F. L., Botany Department, University of Tennessee, Knoxville, Tenn.

RODGERS, CHARLES L., Biology Department, Furman University, Greenville, S. C.

ROEDER, MARTIN, Chemistry Department, Woman's College, University of North Carolina, Greensboro, N. C.

ROGERS, HOLLIS J., Biology Department, Woman's College, University of North Carolina, Greensboro, N. C.

ROSS, JAMES B., College Department, Reinhold Book Division, 430 Park Avenue, New York 22, N. Y.

ROSSO, SAMUEL WILFORD, Division of Biological Sciences, Mississippi Southern College, Hattiesburg, Miss.

ROACH, LOU E., Dept. of Biol. Sci., Bryan University, Dayton, Tenn.

RUNK, BENJAMIN F. D., Department of Biology, University of Virginia, Charlottesville, Va.

RUSSELL, LIANE BRAUCH, Biology Division, Oak Ridge National Laboratory, Box Y, Oak Ridge, Tenn.

RUSSELL, WILLIAM L., Biology Division, Oak Ridge, National Laboratory, Box Y, Oak Ridge, Tenn.

RUTLEDGE, RAY W., Clemson Agricultural College, Clemson, S. C.

SALIH, MOHAMMAD SALIN, Department of Zoology, Louisiana State University, Baton Rouge, La.

SALYERDS, ANNE M., Department of Biology, Agnes Scott College, Decatur, Ga.

SAWYER, ELIZABETH L., Department of Biology, Piedmont College, Demorest, Ga.

SCHEU, CHARLES C., 6205 Pine Summit Drive, Jacksonville 11, Fla.

SCHWARTZ, ALBERT, Albright College, Reading, Penn.

SCOTT, DONALD C., Zoology Department, University of Georgia, Athens, Ga.

SETO, FRANK, Biology Department, Berea College, Berea, Ky.

SHADOWEN, HERBERT E., Walnut Ave., Route 2, Ruston, La.

SHAFTESBURY, ARCHIE, Woman's College, University of North Carolina, Greensboro, N. C.

SHANKS, ROYAL E., Department of Botany, University of Tennessee, Knoxville 16, Tenn.

SHANOR, LELAND, Department of Biological Sciences, Florida State University, Tallahassee, Fla.

SHARP, AARON J., Department of Botany, University of Tennessee, Knoxville, Tenn.

SHAVER, JESSE M., Geo. Peabody College for Teachers, Nashville, Tenn.

SHAW, EDW. I., Biophysics Department, University of Kansas, Lawrence, Kan.

SHEARER, JOE ANN, Department of Biology, University of Mississippi, University, Miss.

SHERMAN, HARLEY B., 410 West Howry Avenue. De Land, Fla.

SHIBLEY, JOHN L., Biology Department, La Grange College, La Grange, Ga.

SHIELDS, A. RANDOLPH, Biology Department, Emory and Henry College, Emory, Va.

SHORT, ROBERT B., Department of Zoology, Florida State University, Tallahassee, Fla.

SHOUP, CHARLES S., Biology Branch, Research and Development Divi., Oak Ridge Operations, Atomic Energy Commission, Oak Ridge, Tenn.

SHOWALTER, AMOS M., 310 Paul Street, Harrisonburg, Va.

SILLIMAN, FRANCES E., Department of Biology, Bridgewater College, Bridgewater, Va.

SINGLETON, W., RALPH, Department of Biology, University of Virginia, Charlottesville, Va.

SIVIK, FRANK PHILIP, Department of Biology, Armstrong College, Savannah, Ga.

SLENTZ, RUTH B., Biology Department, Wesleyan College, Macon, Ga.

SMART, ROBERT F., Dean's Office, University of Richmond, Richmond, Va.

SMITH, ARLO I., Southwestern College, Memphis, Tenn.

SMITH, BEN W., Department of Genetics, North Carolina State College, Raleigh, N. C.

SMITH, BUDD E., Wingate Junior College, Wingate, N. C.

SMITH, F. G. WALTON, Marine Laboratory, University of Miami, Coral Gables, Fla.

SMITH, SEPTIMA, Box 1446, University, Ala.

SMITHERS, DONALD, Department of Cancer Biochemistry, Southern Research Institute, Birmingham, Ala.

SOMERVILLE, AUSTIN M., JR., 9th and Perry Streets, Richmond, Va.

SPOONER, J. D., South Georgia College, Douglas, Ga.

SPRAGUE, ELIZABETH F., Sweet Briar College, Sweet Briar, Va.

SPRUGEL, GEORGE, JR., 3729 South 13th Street, Arlington, Va.

ST. AMAND, MRS. GEORGIA SIMS, Dept. of Biology, Univ. of Mississippi, University, Miss.

ST. AMAND, WILBROD, JR., Dept. of Biology University of Mississippi, University, Miss.

STEVENS, KENNETH P., 404 E. Nelson Street, Lexington, Va.

STEVENS, RUSSELL B., Department of Botany, George Washington University, Washington 6, D. C.

STEVENSON, HENRY M., Biology Department, Florida State University, Tallahassee, Fla.

STIFF, HENRY L., III, Box 545, Lafayette, La.

STIREWALT, HARVEY L., Department of Biology, University of Mississippi, University, Miss.

STONE, WILLIAM M., JR., 1403 N. W. 12th Road, Gainesville, Fla.

STRAWN, ROBERT K., Department of Biological Science, Lamar State College of Technology, Beaumont, Texas.

STRICKLAND, JOHN C., JR., Department of Biology, University of Richmond, Richmond, Va.

STUMP, ALEXANDER B., Biology Department, Presbyterian College, Clinton, S. C.

STURDIVANT, H. P., Department of Biology, Western Maryland College, Westminster, Md.

SUTTKUS, ROYAL D., Zoology Department, Tulane University, New Orleans 18, La.

SUTTON, MRS. JOYCE B., Department of Biology Northwest High School, Winston-Salem, N. C.

SWAILS, LAWRENCE F., JR., Bears Bluff Laboratory, Wadmalaw Island, S. C.

SWINDELL, DAVID E., JR., Williston, Fla.

TANNER, JAS. T., Department of Zoology, University of Tennessee, Knoxville, Tenn.

TARBOX, FRANK G., Brookgreen Gardens, Georgetown, S. C.

TARBOX, GORDON L., JR., Brookgreen Gardens, Georgetown, S. C.

TAYLOR, RAYMOND L., 1515 Massachusetts Ave., N.W., Washington 5, D. C.

TAYLOR, MRS. SYLVIA EARLE, 309 N.E. Duval St., Live Oak, Fla.

TEAS, HOWARD J., Botany Department, University of Florida, Gainesville, Fla.

TEMPLE, LOUIS C., Department of Biology, University of Mississippi, University, Miss.

TERRELL, EDWARD E., Department of Biology, Guilford College, Guilford College, N. C.

THIEL, ALBERT F., 116 McIver, Greensboro, N. C.

THOMAS, GRACE JEAN, Department of Zoology, University of Georgia, Athens, Ga.

THOMPSON, E. FONTELLE, JR., Department of Zoology, University of Georgia, Athens, Ga.

THOMPSON, JESSE C., JR., Biology Department, Hollins College, Hollins College, Va.

THOMSON, J. RICHARD, Southern Research Institute, Birmingham, Ala.

THORNE, ROBERT F., Department of Botany, State University of Iowa, Iowa City, Iowa

THRELKELD, WM. L., Virginia Agricultural Experiment Station, Blacksburg, Va.

TINGLEY, ALICE, Winthrop College, Rock Hill, S. C.

TIPTON, SAMUEL R., Dept. of Zoology and Entomology, University of Tennessee, Knoxville, Tenn.

TOTTEN, HENRY R., Botany Department, University of North Carolina, Box 247, Chapel Hill, N. C.

TOWNES, GEORGE F., 209 Masonic Building, Greenville, S. C.

TOWNSEND, J. IVES, Zoology Department, University of Tennessee, Knoxville, Tenn.

TRUSSELL, MALVINA, Department of Science Education, Florida State University, Tallahassee, Fla.

TURNER, HENRY FORD, Dept. of Zoology and Entomology, Alabama Polytechnic Institute, Auburn, Ala.

TYLER, DOROTHY LOUISE, Department of Biochemistry, Southern Research Institute, Birmingham, Ala.

VANDIVIERE, H. MAC, Gravely Sanatorium, Chapel Hill, N. C.

VANDIVIERE, MRS. MARGARET R., Gravely Sanatorium, Chapel Hill, N. C.

VAN ESELTINE, Wm. P., School of Veterinary Medicine, University of Georgia, Athens, Ga.

VAN PELT, ARNOLD F., JR., Tusculum College, Greenville, Tenn.

VERNARD, G. HASKELL, 3959 N. Stratford Road, N.E., Atlanta, Ga.

VERNBERG, FRANK J., Duke Marine Lab., Beaufort, N. C.

VERNON, EUGENE H., Iberia Livestock Experiment Station, Jeanerette, La.

VILAR-ALVAREZ, C. M., Department of Biology, Emory University, Atlanta 22, Ga.

VOIGT, CARROLL A., 229 Chelsea Drive, Decatur, Ga.

VOLPE, E. PETER, Department of Biology, Newcomb College of Tulane University, New Orleans 18, La.

WAGNER, ALVIN, Department of Biology, Florida State University, Tallahassee, Fla.

WAGNER, KENNETH A., Biology Department, William and Mary College, Norfolk Division, Norfolk, Va.

WALDORF, GRAY W., Pensacola Junior College, Pensacola, Fla.

WALKER, ALLEN A., Department of Biology, University of Dallas, Dallas 21, Texas

WALKER, PAUL A., 339 Woodland Avenue, Lynchburg, Va.

WALL, ROSSER, Department of Biology, University of Mississippi, University, Miss.

WALLACE, H. K., Biology Department, University of Florida, Gainesville, Fla.

WALDORF, BESSIE, Asbury College, Wilmore, Ky.

WALTON, DENVER L., Department of Biology, Emory University, Atlanta 22, Ga.

WARD, HELEN L., Zoology Department, University of Tennessee, Knoxville, Tenn.

WARD, ROBERT P., Biology Department, Millsaps College, Jackson, Miss.

WARE, ETHAN E., 2024 Broad Street, Tallahassee, Fla.

WARTERS, MARY, Biology Department, Centenary College, Shreveport, La.

WATKINS, JOE H., Chemistry Department, The Citadel, Charleston, S. C.

WEEKS, LEO, Biology Department, Berry College, Mt. Berry Ga.

WEILER, HAROLD F., Box 36, Fairfax, Va.

WEIMER, BERNAL R., Biology Department, Bethany College, Bethany, W. Va.

WEINMANN, DR. CLARENCE JACOB, Department of Microbiology, College of Medicine, University of Florida, Gainesville, Fla.

WELCH, WILLIAM, Biology Department, McNeese State College, Lake Charles, La.

WELDEN, ARTHUR LUNA, Botany Department, College of Arts and Sciences, Tulane University, New Orleans 18, La.

WELLS, MARGARET M., Department of Biology, Emory University, Atlanta 22, Ga.

WELLS, O. CAROLYN, Biology Division, Oak Ridge National Laboratory, Oak Ridge, Tenn.

WEST, ERDMAN, Botany Department, Florida Agr. Experiment Station, University of Florida, Gainesville, Fla.

WEST, W. R., JR., Department of Biology, University of Richmond, Richmond, Va.

WESTFALL, JONATHAN J., Biology Department, University of Georgia, Athens, Ga.

WESTFALL, MINTER J., JR., Department of Biology, University of Florida, Gainesville, Fla.

WHARTON, GEORGE W., Zoology Department, University of Maryland, College Park, Md.

WHARTON, MARY E., Georgetown College, Georgetown, Ky.

WHEELER, HARRY E., Department of Botany, Louisiana State University, Baton Rouge 3, La.

WHITE, GEORGE V. S., Box 113, McNeese State College, Lake Charles, La.

WHITE, JESSE S., Delta State Teachers College, Cleveland, Miss.

WHITE, ORLAND E., 1708 Jefferson Park Road, Charlottesville, Va.

WHITING, PHINEAS WESCOTT, Zoology Department, University of Pennsylvania, Philadelphia 4, Penn.

WHITTINGHILL, MAURICE, Zoology Department, University of North Carolina, Chapel Hill, N. C.

WIDDOWSON, DAVID CARL, Department of Science, Troy State College, Troy, Ala.

WIGGS, DEEMS N., Science Department, Columbia College, Columbia, S. C.

WILEY, DORA, P., Department of Biology, Berkeley High School, Moncks Corner, S. C.

WILKES, JAMES C., JR., 2009 Commodore, Montgomery 6, Ala.

WILLIAMS, DONALD B., Biology Department. Emory University, Atlanta 22, Ga.

WILLIAMS, LOUIS G., Taft Engineering Center, 4676 Columbia Parkway, Cincinnati 26, Ohio

WILLIAMS, ROBERT H., Botany Department, University of Miami, Coral Gables 46, Fla.

WILLIAMSON, MRS. DOUGLAS, Department of Biology, Oglethorpe University, Oglethorpe University, Ga.

WILLS, CAMILLA L., 1601 Grady Avenue, Charlottesville, Va.

WIRT, H. WILLIS, Tobacco Research Station Chatham, Va.

WILSON, H. R., Box 642, College Station, Hammond, La.

WILSON, IRL DONAKER, Department of Biology, Virginia Polytechnic Institute, Blacksburg, Va.

WILSON, JAMES, Department of Biology, Belmont College, Nashville, Tenn.

WILTON, CHRISTINE, East Carolina College, Greenville, N. C.

WILTSHIRE, MRS. GRACE T., Biology Department, Randolph-Macon Woman's College, Lynchburg, Va.

WINCHESTER, ALBERT M., Biology Department, Stetson University, De Land, Fla.

WISER, CYRUS W., Department of Biology, Middle Tennessee State College, Murfreesboro, Tenn.

WOLCOTT, GORDON B., Biology Department, Southwestern University, Georgetown, Texas.

WOLF, F. A., Botany Department, Duke University, Durham, N. C.

WOLF, FREDERICK T. Department of Biology, Vanderbilt University, Nashville, Tenn.

WOLFSON, ALFRED M., Box 115, College Station, Murray, Ky.

WOOD, CARROLL E., JR., Arnold Arboretum, Harvard University, Cambridge 38, Mass.

WOOD, FORREST G., JR., Marine Studios, Marineland, Fla.

WOOD, JOHN THORNTON, Veterans Administration Hospital, Roanoke, Va.

WOODMANSEE, ROBERT A., Biology Department, Box 217, Mississippi Southern College, Hattiesburg, Miss.

WOODS, FRANK W., Southern Forest, Experiment Station, Box 900, Mariana, Fla.

WOOLEVER, JOHN DOUGLAS, 2250 Worrington St., Sarasota, Fla.

WYANT, KATHLEEN D., Dept. of Zoology and Entomology, University of Tennessee, Knoxville 16, Tenn.

YANCEY, PATRICK H., Biology Department, Spring Hill College, Mobile, Ala.

YARBROUGH, JOHN A., Meredith College, Raleigh, N. C.

YATES, BERNARD H., 262 Techwood Dr., Atlanta 13, Ga.

YERBY, ELEANOR G., Southern Research Institute, Birmingham, Ala.

YERGER, RALPH W., Department of Zoology, Florida State University, Tallahassee, Fla.

YODER, M. C., Lenoir-Ryne College, Hickory, N. C.

YOUNG, MARTIN D., P. O. Box 717, U. S. Public Health Service, Columbia, S. C.

YOUNT, JAMES L., Department of Biology, University, of Florida, Gainesville, Fla.

YOW, FRANCIS WAGONER, Department of Science, Western Carolina College, Cullowhee, N. C.

ZIEGLER, ARTHUR W., Botany Department, Florida State University, Tallahassee, Fla.

Directory of ASB Members

2. Geographical Directory

ALABAMA: J. D. Batson, J. C. Wilkes, Jr. **Alabama College:** P. C. Bailey, D. J. Cotter, H. M. Phillips. **Alabama Polytechnic Institute:** E. T. Browne, Jr., W. D. Ivey, J. S. Mecham, K. Ottis, H. F. Turner. **Birmingham Southern College:** C. S. Doster, F. H. Lauter. **Howard College:** J. A. Fincher, H. A. McCullough. **Huntington College:** M. J. Brannon. **Southern Research Institute:** S. W. Johnson, B. M. Jones, J. E. Jones, J. M. Meade, J. H. Moore, D. Smithers, J. R. Thomson, D. L. Tyler, E. G. Yerby. **Spring Hill College:** E. D. Morris, P. H. Yancy. **Troy State Teachers College:** W. D. McLaughlin, D. C. Widdowson. **University of Alabama:** F. Bell, E. L. Bishop, Jr., K. F. Hancock, R. M. Harper, W. R. Herndon, G. L. Howell, J. C. O'Kelley, E. G. Patton, S. Smith. **University of Alabama Mobile Center:** J. Boyles. **Wildlife Reserve Unit:** W. H. Adams, Jr.

ARKANSAS: Arkansas College: C. G. Hollis. **Arkansas State Teachers College:** J. E. Moore.

CALIFORNIA: C. M. Goethe, L. M. Henry, D. R. Parker. **College of the Pacific:** S. L. Meyer.

CANADA: Department of Agriculture: H. F. Howden. **Queen's University:** H. A. Denyes. **University of Toronto:** G. M. Clark.

DISTRICT OF COLUMBIA: R. S. Leisner, O. E. Reynolds, R. L. Taylor. **George Washington University:** R. B. Stevens, **Smithsonian Institution:** M. E. Hale, Jr.

FLORIDA: E. Deviney, D. P. Gordon, R. M. Ingle, J. B. Lackey, J. G. Montgomery, Mrs. F. Olson, G. M. Richardson, C. C. Scheu, H. B. Sherman, W. M. Stone, Jr., D. E. Swindell, Jr., S. E. Taylor, E. E. Ware, F. W. Woods, J. D. Woolever. **Agricultural Experimental Station:** S. E. McFadden, Jr. **Florida Southern College:** M. L. Gilbert, R. S. Kiser. **Florida State Museum:** A. B. Grobman. **Florida State University:** M. I. Boliek, R. S. Breen, R. T. Damian, A. G. De Busk, L. C. Ellias, R. K. Godfrey, R. R. Hathaway, R. B. Holliman, M. N. Hood, G. C. Hughes, M. L. Jones, D. N. Kruse, H. Kurz, G. C. Madsen, M. Y. Menzel, R. W. Menzel, C. S. Nielsen, A. L. Pates, J. P. Reynolds, L. Shanor, R. B. Short, H. M. Stevenson, M. Trussell, A. Wagner, R. W. Yerger, A. W. Ziegler. **Game and Fresh Water Fish Commission:** O. E. Frye, Jr., **Marine Laboratory.** S. P. Meyers. **Marine Studios:** F. G. Wood, Jr. **Pensacola Junior College:** M. M. Nez, G. W. Waldorf. **Stetson University:** D. L. Fuller, K. L. Hansen, E. C. Prichard, A. M. Winchester. **University of Florida:** W. Auffenberg, L. Berner, E. C. Bovee, J. C. Briggs, J. W. Brookbank, F. Byers, K. W. Cooper, J. H. Davis, Jr., R. M. De Witt, J. C. Dickinson, Jr., E. J. Dupraw, Jr., E. S. Ford, C. Gans, C. J. Goin, J. H. Gregg, L. S. Hetrick, G. W. Hunter, III, E. R. Jones, Jr., A. M. Laessle, J. N. Layne, R. D. Mitchell, G. R. Noggle, E. L. Pierce, J. M. Rawls, J. R. Redmond, W. J. Riemer, H. J. Teas, H. K. Wallace, C. J. Weinmann, E. West, M. J. Westfall, Jr., J. L. Yount. **University of Miami:** W. H. Leigh, J. K. McNulty, F. G. W. Smith, R. H. Williams. **University of Tampa:** C. T. Reed.

GEORGIA: G. L. Carver, E. L. Fincher, H. B. Forester, A. A. Foster, A. B. Kamine, E. B. Lamb, J. F. Landt, M. S. MacDougall, O. S. Neylans, Jr., R. L. Ramsey, R. J. Reiber, G. H. Vernard, C. A. Voigt, B. H. Yates. **Agnes Scott College:** A. J. Bridgman, S. L. Doerpinghaus, N. P. Groseclose, A. M. Salyerds. **Armstrong College:** E. M. McCray, Jr., F. P. Sivak. **Berry College:** L. Weeks. **Bessie Tift College:** E. E. Jones. **Coastal Plain Experiment Station:** J. B. Harris. **Emory University:** D. W. Bailey, W. B. Baker, A. V. Beatty, J. W. Beatty, W. E. Brillhart, W. D. Burbanck, J. N. Cather, A. C. Clement, M. T. Coleman, H. L. Davis, Jr., B. F. Edwards, B. E. Frye, C. G. Goodchild, N. E. Gray, S. W. Gray, C. T. Haynes, W. N. Hughes, A. A. Humphries, Jr., E. L. Hunt, W. T. Lammers, J. T. McGinnis, C. E. Miller, F. S. Miller, J. A. Miller, Jr., D. M. Oakerson, F. K. Parrish, J. W. Parrish, R. A. Pedigo, R. B. Perry, R. B. Platt, C. Ray, Jr., A. Rebuck, W. B. Redmond, C. M. Vilar-Alvarez, D. L. Walton, M. M. Wells, D. B. Williams. **Fort Valley State College:** M. R. Myles. **Georgia Agricultural Experiment Station:** H. Ciordia, L. L. Farrar. **Georgia State Teachers College:** J. A. Boole, Jr. **Georgia Teachers College:**

B. J. Bogitsh. **Georgia Institute of Technology:** T. W. Kethley. **Georgia State College:** C. E. Keeler. **La Grange College:** J. L. Shibley. **Mercer University:** D. W. Johnston. **Middle Georgia College:** C. J. Kuipers. **Oglethorpe University:** M. E. Beadle, A. L. Cohen, Mrs. D. Williamson. **Piedmont College:** E. L. Sawyer. **Shorter College:** J. T. Darlington, E. L. Lipps. **South Georgia College:** J. D. Spooner. **University of Georgia:** E. G. Beck, G. H. Boyd, F. M. Bush, E. E. Byrd, W. M. Carlton, J. F. Denton, Jr., W. H. Duncan, W. P. WYOMING: University of Wyoming: A. Krochmal.

The Southeast as a Source of Botanists

Two reports (1, 3) on the academic origins of botanists provide information as to the contribution of the southeastern colleges and universities to the supply of American botanists. As Table I indicates, our region does not rate high in this respect at either the bachelor's or doctor's level, either in absolute numbers or in proportion to the total number of college students or the number of colleges and universities.

The data in columns 1 through 3 are from the earlier of the two studies, and are based on a tabulation of the botanists listed in the seventh edition of American Men of Science (1944). The data in column 4 are from the later study (3) and are derived from the ninth edition of AMS (1955).

TABLE I. REGIONAL DISTRIBUTION OF DEGREES IN BOTANY

Region	1. No. graduates in AMS, Ed. 7		2. Graduates/10,000 students, AMS, Ed. 7		3. Graduates/institution[1]		4. No. graduates in AMS, Ed. 9		5. Bachelors as % of total		6. Doctors as % of total	
	Bach.	Ph.D.	Bach.	Ph.D.	Bach.	Ph.D.	Bach.	Ph.D.	Ed. 7	Ed. 9	Ed. 7	Ed. 9
Northeast	501	562	14.7	16.5	2.2	17.6	342	660	25.8	22.8	34.3	29.2
Midwest	697	805	24.4	28.2	3.1	40.3	638	1116	35.9	42.5	49.1	49.3
Northwest	218	36	32.9	5.4	3.2	7.2	127	45	11.2	8.6	2.2	2.0
West Coast	187	146	21.2	16.5	4.0	18.3	239	265	9.6	16.0	8.9	11.7
Southwest	52	11	8.4	1.8	1.0	2.8	32	21	2.7	2.1	0.7	0.9
Southeast	160	38	12.5	2.9	1.0	4.2	35	99	8.3	2.3	2.3	4.4
Canada	124	42	30.0	10.2	5.0	6.0	84	57	6.5	5.7	2.5	2.5
Total	1939	1640	19.1	16.2	2.4	19.3	1497	2263	100.0	100.0	100.0	100.0

1 For bachelors, all colleges and universities in region used as the base. For Ph.D., institutions in region granting this degree used as the base. Data based on AMS, Ed. 7.

Columns 5 and 6 convert the number of students from each region to per cents of the total, to permit more ready comparison between the two sets of data representing an eleven year interval. The comparisons are interesting but must be made with caution at the bachelor's level since the two samples are different. In the earlier study the data are based on the entire listing, while in the latter one they include only the graduates of the 50 most productive institutions, who constituted only 55 per cent of the total of 2711 botanists listed. For the Ph.D graduates the data are more comparable, since the 66 universities listed in the later study produced all but 25 of the graduates tabulated.

Both sets of data reveal the Midwest as by far the most productive of all the regions and the Southwest as the least productive, with the Southeast not too far ahead of it. During the eleven year interval the West Coast and the Southeast gained in the per cent of the total doctorates granted, while the Northeast lost and the other regions remained essentially stable. The percentage changes at the bachelor's level probably lack significance for the reason mentioned above. The marked drop for the Southeast is probably due to the fact that graduates in our region are widely dispersed, only three institutions having enough graduates in botany to be included in the list of the fifty most productive colleges and universities. That the type of regional distribution secured for botany is not unique, but rather characteristic for science as a whole, is indicated by other studies such as that of Knapp and Goodrich (2).

In the earlier study the most productive Southeastern institutions, with their ranks and number of graduates, were 26. Clemson (20), 36. West Virginia (15), 46. Maryland (12), and Mississippi A. & M. (12). At the Ph.D. level the ranked institutions were 14. Maryland (28), 26. Virginia (13), 27. Duke (12), 38. North Carolina (6), 42. Louisiana State (4), and 46. West Virginia (3). Eleven years later only three southeastern institutions ranked among the top fifty at the undergraduate level: 32. Clemson (19), 42. North Carolina (16), and 48. West Virginia (15). At the Ph.D. level the southeastern list increased to eight: 19. Duke (34), 20. Maryland (31), 27. North Carolina (21), 31. Virginia (16), 33. Louisiana State (11), 40. North Carolina State (7), 44. West Virginia (6), and 54. Vanderbilt (4).

Although many possible reasons for the regional differences in the productivity of botanists come to mind, it is difficult if not impossible to assess their importance. Regardless of the reasons, the South is not producing its fair share of botanists and we should make every effort to improve our standing in this respect. Indications are that improvement is already underway, at least at the graduate level, and it is likely that a similar survey based on the next edition of AMS would reveal considerably increased productivity in our region, with a number of additional colleges and universities added to the ranking list of most productive institutions.

VICTOR A. GREULACH, *University of North Carolina.*

NEWS OF BIOLOGY IN THE SOUTHEAST

About People

K. W. Cooper, research professor of biology at the University of Florida, has been appointed an associate editor of *Evolution* for a three year term.

Wilbrod St. Amand, until recently with the Biology Division, ORNL, has accepted a professorship of biology at the University of Mississippi.

Ouida Carolyn Wells, who recently received her Ph.D. in biology from Emory University, has accepted a position with the cytology and genetics group at the Biology Division, ORNL.

A. C. Clement of Emory University has been named program director for developmental biology in the Division of Biological and Medical Sciences, National Science Foundation. Dr. Clement is on leave from Emory.

The following biologists have returned to their academic duties after being associated for the summer in the indicated capacities with the Biology Division, ORNL: **George C. Royal, Jr.** of the A. & T. College of North Carolina, research participant: **James N. Dent,** University of Virginia, consultant; **Robert T. Brumfield,** Longwood College, consultant; and **A. H. O'Bier, Jr.,** Longwood College, assistant to Dr. Brumfield.

Donald B. Anderson has been named provost and vice president of the University of North Carolina and will assume his duties in Chapel Hill November 1. For many years Dr. Anderson has been professor of botany, chairman of the division of biological sciences, and dean of the graduate school at the North Carolina State College division of the University, and during the past several years has been on leave of absence to serve as program director in the scientific personnel and education division of the National Science Foundation.

Robert S. Leisner, who recently received his Ph.D. in botany from the University of North Carolina has accepted a position as assistant to the executive director of the American Institute of Biological Sciences.

Memorials to the late **Arthur Sperry Pearse,** formerly professor of zoology, Duke University, have been erected at the Duke Marine Laboratory, to honor the man who was largely responsible for establishment of the Laboratory. The A. S. Pearse Memorial Scholarship in Marine Biology was awarded to **George H. Rees,** graduate student in zoology, Duke University.

James H. Eads, Jr., formerly of Middle Tennessee State College, Murphresboro, is now assistant professor of biology, Meredith College, Raleigh, N. C.

John A. Yarbrough, Meredith College, is now chairman of the Collegiate Academy Conference of the AAAS.

Rolf Siepmann, Christian Albrechts University, Kiel, Germany, is research associate in mycology, Duke University.

The first annual Pearse Memorial Lecture was given in July by **H. L. Blomquist,** Duke University. Dr. Blomquist spoke on his travels in Puerto Rico.

Wm. Burbanck has resumed his duties in the Emory Biology Department after a year leave spent in study and research at the Woods Hole Biological Station.

Rosamond McMillan, who has been a visiting professor in the department of biology at Agnes Scott College is now in the department of agricultural chemistry and biochemistry at Louisiana State University in Baton Rouge, where she will do research on the lipid metabolism in *Ankistrodesmus.*

S. Leonard Doerpinghaus has accepted a position as assistant professor in the department of biology at Agnes Scott College. He comes from the department of botany at Louisiana State University.

John Davis of the University of Florida is now at the University of Mandalay, Mandalay, Burma. He left July 1, 1958 and will be there for 3 years on a grant with the University of Florida and the Ford Foundation. Dr. Davis is teaching botany and zoology and will also have an opportunity to do some ecological field work and some work in phytogeography.

Lillian Arnold retired after 30 years service as curator of the herbarium, Agricultural Experiment Station, University of Florida. **Daniel Ward,** a recent Ph.D. graduate of Cornell, is to replace Miss Arnold. He will also teach taxonomy in the botany department.

Alan Conger, formerly of the Oak Ridge National Laboratory, has joined the staff of the botany and biology Department at the University of Florida as professor of radiation biology. He will develop a teaching and research program in radiation biology.

Yoneo Sagawa, assistant professor of botany at

the University of Florida, spent the summer as guest collaborator at the Brookhaven National Laboratory.

Three members of the department of zoology of the University of North Carolina attended intersational congresses during the summer: **Maurice Whittinghill, Donald P. Costello**, and **Melbourne R. Carriker.** Dr. Whittinghill presented the paper "Distribution of Rheumatoid Arthritis and Spondylitis and Still's Disease in a Single Large Kindred" at the Xth International Congress of Genetics at Montreal, Canada, in August. His grant from the U. S. Atomic Energy Commission has been extended for another term, and concerns the relation between spontaneous and induced mutations and crossovers. Drs. Costello and Carriker attended the XVth International Congress of Zoology in London, England. Dr. Carriker spoke on "Comparative Functional Morphology and Evolution of the Drilling Mechanism in *Urosalpinx* and *Eupleura*". After the Congress he visited marine laboratories at Burnham-on-Crouch and Plymouth, England; Millport, Scotland; and Menai Bridge and Conway, Wales. His grant for research on oyster drills has been extended for another period by the U. S. Fish and Wildlife Service, and he was re-elected president of the National Shellfisheries Association.

Charles E. Jenner, Chairman of the department of zoology at the University of North Carolina, spent the latter half of the summer at the Marine Biological Laboratory, Woods Hole, Massachusetts, continuing studies of aggregation and schooling behavior in the mud snail. **C. D. Beers** of the department spent the summer at Mt. Desert Island Biological Laboratory, Maine, studying ciliates of the foot and mantle cavity of *Mytilus*. **H. E. Lehman** officiated as chairman of one of the sessions of metings of the Society for the Study and Growth and Development in Massachusetts in June.

Lillian Lehman (formerly Lillian Youngs) has accepted an appointment as assistant professor in the department of zoology at the University of North Carolina for the current school year. Dr. Lehman did her graduate work at Chapel Hill.

William A. Arnold of the Biology Division, ORNL, spent the summer months working with Albert Szent-Gyorgyi at the Institute for Muscle Research, Woods Hole, Massachusetts. Dr. Arnold's studies concern energy transfer in biological systems, particularly in muscles.

John S. Kirby-Smith has returned to the Biology Division ORNL, from a one year's leave of absence spent at St. Bartholomew's Hospital, London, England. Dr. Kirby-Smith is head of the biophysics group.

Karl Bruce Jacobson has reported to work in the Nucleic Acid Chemistry Group at the Biology Division, ORNL. Dr. Jacobson received the Ph.D. degree from the McCollum-Pratt Institute of the Johns Hopkins University and for the past two years has been associated with Dr. Linus Pauling at California Institute of Technology, Pasadena.

N. E. Tolbert, who has been head of the plant biochemistry group of the Biology Division, ORNL, has accepted a position as professor of agricultural chemistry at Michigan State University, East Lansing.

A. C. Cole of the University of Tennessee department of zoology and entomology spent the summer in Mexico studying the "harvesting" ant. This work was supported by a National Science Foundation grant. Dr. Cole's work includes collecting specimens and accumulating field data on distribution, habitats, populations, and life histories.

Four members of the University of Tennessee botany department spent the summer studying plant life in the tundra of northern Alaska for the Arctic Institute of North America. The project was directed by **Royal E. Shanks** who has spent the previous three summers in Alaska. Other botanists participating in ths project are **John Koranda, Harry Sherman,** and **A. J. Sharp,** head of the botany department at Tennessee.

Warren M. Deacon retired in the spring from the chairmanship of the department of biology at Vanderbilt University. Prof. Deacon, who was recently honored by the 1958 graduating class as Yearbook Sponsor and by the Highlands Biological Laboratory in having one of the newly erected buildings named the Deacon Cottage, will continue to teach bacteriology. No appointment to the chairmanship of the department has yet been made.

R. B. Channell of Vanderbilt University taught a course in marine botany at the Gulf Coast Marine Lab, Ocean Springs, Miss., during the summer. For the last term of the summer session, **J. J. Friauf** taught at the Mountain Lake, Va. Biological Station. Among the Vanderbilt personnel assisting with the NSF Institute for Science Teachers at Murray State College, Murray, Ky., were **Ilda McVeigh** and **Elsie Quarterman.**

James T. Blackwell, a recent Vanderbilt University graduate in bacteriology, has accepted a position as assistant professor at Pensacola Junior College.

Wm. C. Sloan has been appointed instructor in zoology at Vanderbilt University.

Ronald C. Rustad, who received his doctor's degree from the University of California, is now an instructor in physiology in the department of biological sciences at Florida State University. Dr. Rustad spent last semester as a research associate at the University of Edinburgh.

Robert Kral, formerly of Florida State University, is now instructor in biology at North East Louisiana College, Monroe, Louisiana.

James Hardin, assistant professor of botany at North Carolina State College won the Cooley Award for the best published paper of the preceding calendar year dealing with the flora of the southeastern U. S. The award was made at the AIBS meetings in Bloomington.

A. M. Winchester, head of the biology department at Stetson University, attended the International Congress of Zoology in London, England from July 16 to July 26.

E. C. Prichard of the biology department at Stetson University spent the past summer at Camp Rockmont near Black Mountain, N. C. as associate director in charge of nature study for the camp.

Adrian W. Poitras joined the faculty of the department of biological sciences at Florida State University in September. He was formerly associate professor of botany and plant pathology at Alabama Polytechnic Institute, Auburn.

Relis B. Brown, formerly visiting associate professor at Vanderbilt University, is this year a research associate at Florida State University.

Leland Shanor, head of the department of biological sciences at Florida State University, participated in a National Science Foundation Summer Institute at Illinois Weslyan University, July 28-August 7.

Neil C. Hulings, who received his Ph.D. in biological oceanography from the Florida State University Oceanographic Institute in August, is now assistant professor in the department of biology and geology at Texas Christian University. **George Grice**, former Oceanographic Institute student, has received a Guggenheim Fellowship to study copepods of the Pacific. He is located in Hawaii.

John B. Morrill has returned from six months at the Hubrecht Laboratory, University of Utrecht, where he participated in the third International Embryology Teamwork session, and is now with the department of biology, Weslyan University. Dr. Morrill received his Ph.D. in zoology from Florida State University in February, 1958.

Sidney W. Fox, director of the Florida State University Oceanographic Institute, attended the International Seaweed Symposium in Galway, Ireland, this summer and was chairman of a scientific session at the meeting. He also attended the International Union of Biochemistry meeting in Vienna and was a delegate of the NAS-NRC to the general assembly.

Kurt Köhler of the Max-Planck-Institut für Meeresbiologie is a research associate with the Florida State University Oceanographic Institute working with **Charles B. Metz** in the experimental embryology laboratory. Dr. Köhler joined the Institute staff in February, 1958.

Alan J. Kohn, formerly of Yale University, is now assistant professor of zoology at Florida State University.

The extensive refresher course in protozoology given jointly by the American Society of Zoologists and the Society of Protozoologists at the recent AIBS meetings at Indiana University at Bloomington included amongst the demonstrations a display of over 200 models representing 50 species of amebas, prepared by **Eugene C. Bovee**, associate professor of biology at the University of Florida.

Allen L. Steinhauer has joined the staff of the department of entomology, Agricultural Experiment Station, University of Maryland. Dr. Steinhauer is a native of Canada and a graduate of the University of Manitoba. He recently received his Ph.D degree at Oregon State College. His research experience has been in the field of forage crop insects, fruit insects, insect physiology and toxicology. His principal duties at College Park will involve research on insects affecting alfalfa, clover, and other forage crops.

Gordon B. Wolcott formerly of the USPHS, Columbia, S. C. has accepted a position as professor of biology at Southwestern University, Georgetown, Texas. Dr. Wolcott had been at Southwestern for a number of years before going to Columbia, and has been active in ASB affairs while in the southeast.

A new manual of winter botany, "Woody Plants in Winter," by **Earl L. Core** and **Nelle Ammons** of West Virginia University has ben published by the Boxwood Press of Pittsburgh. The book contains keys to genera and species, and brief descriptions of the winter features, with sketches of buds and twig characters. About 300 species are included, representing the more common trees and shrubs of the northeastern United States and southeastern Canada ("Gray's Manual range").

R. F. Kimball has returned to the Biology Division, ORNL, after a nine months' leave of absence

spent at the Karolinska Institutet, Stockholm, Sweden. Dr. Kimball is head of the Cytology and Genetics Section.

Alexander Hollaender attended the Second United Nations International Conference on the Peaceful Uses of Atomic Energy in Geneva, Switzerland, September 1-13, as a member of the United States Delegation to serve as technical advisor. Dr. Hollaender then went to Milan, Italy, to consult with members of the Italian Radiobiology Committee in regard to the organization of a radiobiology program in Italy.

William L. Russell of the Biology Division, ORNL, also attended the International Conference on the Peaceful Uses of Atomic Energy in Geneva. Dr. Russell then went to Great Britain to confer with personnel concerning subjects having a bearing on the genetic hazards of radiation in man at University College, London, and the Chester Beatty Research Institute in London; Institute of Animal Genetics, Edinburgh; and the University, Glasgow, Scotland.

William C. Massey has been appointed associate professor of biology at the University of Florida. An archeologist and anthropologist, he holds A.B. (1940) and Ph.D. (1955) degrees from the University of California.

Frank J. S. Maturo has been appointed assistant professor of biology at the University of Florida. He comes to Florida from the University of North Carolina where he has been an assistant professor of zoology. He is a specialist on the marine bryozoa.

William J. Riemer assistant professor of biology at the University of Florida, and assistant curator of biology at the Florida State Museum, left in September for Tel Aviv, Israel where he will be on Fulbright Fellowship at the University of Israel for the academic year 1958-59. While at the University of Israel he will do research in herpetology and will teach classes in herpetology and zoogeography.

Coleman J. Goin, professor of biology at the University of Florida, was the principal speaker at the annual banquet of the American Society of Icthyologists and Herpetologists at the recent AIBS meetings at Indiana University in Bloomington. His topic was "The Evolution of Amphibian Life Histories."

Three biologists who recently received their Ph.D. degrees from the University of Florida have accepted positions in the Southeast. **Robert G. Weigel** is now assistant professor of biology at Howard College, Birmingham, **William C. Sloan** is interim assistant professor of biology at Vanderbilt University, and **William Jennings** is in the rabies control division of the Florida Fish and Game Commission.

Frances E. Silliman, recently of the University of North Carolina, has accepted a position in the biology department at Bridgewater College, Bridgewater, Va.

John Herr, who received his Ph.D. in botany from the University of North Carolina in 1957 and spent last year in India studying on a Fulbright Scholarship, has accepted a position at Pfeiffer College. Other botanists who received their degrees from the University of North Carolina and have accepted positions beginning this fall are **Charles E. Miller** at Emory University and **George Ramseur** at the University of the South.

Beatrice Exner has joined the staff in botany at Louisiana State Universty. Dr. Exner was previously associated with Francis T. Nichols College, Thibodeaux, Louisiana.

Richard E. Garth has been appointed assistant professor of biology at Northwestern State College (Louisiana). Dr. Grath comes from East Tennessee State College.

Robert E. Gordon has resigned from Northeast State College (Louisiana) to join the staff in the department of biology at Notre Dame. Dr. Gordon has been replaced at Northeast State by **Robert Kral.**

Harold A. Dundee, from University of Michigan (herpetology), and **Robert A. Norris,** from University of California (ornithology), have been appointed to the faculty of the department of zoology at Tulane University. Dr. Norris for the past three years has worked with the University of Georgia Ecological Studies Projects of the Atomic Energy Commission Savannah River Plant Area.

Fred R. Cagle, Tulane University, has just returned from a 40-day tour of the USSR as an official representative of the AIBS. The tour was arranged by the Soviet Academy of Sciences. Dr. Cagle visited 14 scattered sectors from Leningrad to Siberia. Among his assignments was that of exploring the possibility of expanding the inflow of Russian biological literature to the U. S. Following the Russian tour, Dr. Cagle visited research institutes in India, Hong Kong, and Japan.

Stuart S. Bamforth represented Tulane University this summer at the 15th International Zoological Congress in London.

René J. Bienvenu, Northwestern State College (Louisiana), served as visiting professor of bacteriology at the University of Texas during the second summer term.

Institutions and Organizations

The **Second Alligator Harbor Embryology Conference** was held at the **Florida State University** Oceanographic Institute's marine laboratory in March. Scientists from ten southeastern universities and institutions attended the informal meetings. The conference was jointly organized by C. B. Metz, FSU Oceanographic Institute; J. R. Fisher, FSU chemistry department; and J. W. Brookbank and James Gregg of the University of Florida biology department.

Twelve full weeks of coursework were offered at the **Florida State University** Alligator Harbor Marine Laboratory summer session this year, as the beginning of a fuller summer instruction program for the laboratroy. **Meredith L. Jones** taught Survey of Marine Science from June 9 to July 18 and **R. W. Menzel** offered a course in experimental marine biology from July 21 to August 29.

Facilities of the **Florida State University** Oceanographic Institute are available throughout the year for qualified visiting investigators. On the Tallahassee campus laboratory and office space are provided, along with standard research equipment. At the Alligator Harbor Marine Laboratory research cubicles, living accommodations, boats, collecting gear, and standard equipment are available without charge to visiting investigators. Any person desiring to use the facilities of the Institute is invited to apply to the office of the director, outlining his proposed research, probable length of his visit, and needs in space and equipment. The request preferably should be made at least two months before the proposed visit.

Duke University is constructing a new 3.5 million dollar biology-forestry building. The building, which wil be of brick and adjacent to the physics building, will provide much improved and enlarged facilities.

The department of biology at the **Woman's College of the University of North Carolina,** Greensboro, is conducting an NSF In-Service Training Institute for high school biology teachers under the direction of Hollis J. Rogers.

At the formal reopening of the **Highlands Biological Station** in June, Stanley A. Cain, University of Michigan, gave the address, "The Role of the Biological Station." On June 29 ceremonies dedicating the William Chambers Coker laboratory building, the Margaret Cannon Howell Cottage, the Henry Wright Cottage, and the Warren M. Deacon Cottage were held. These buildings were made possible by a grant from the National Science Foundation. The dedicatory address was made by Lewis E. Anderson, Duke University. New officers elected at the 31st Annual Meeting of the Station included: President, Leland Shanor, Florida State University; Vice-President, H. J. Oosting, Duke University; and Robert K. Godfrey, Florida State University, member Board of Managers. Florida State University is the ninth institution to become a Subscribing Institutional Member of the Station. The National Science Foundation has made a grant of $17,400 over the next three years to the Station for research grants-in-aid for work in the Southern Appalachians. Central heating of a part of the new laboratory building and the Margaret Cannon Howell Cottage will make the station available throughout the year for research.

A 6000 curie cobalt-60 source has been placed in operation by the Agricultural Experiment Station of the **University of Florida.** This facility was planned and built under the supervision of Howard Teas.

A series of popular lectures in the humanities and sciences was held at **Mississippi Southern College** during the summer. Representing the biological sciences, A. E. Harrises, Mississippi Southern, discussed "Parasitemias in Domestic Animals and Man in Mississippi"; George C. Kent, Jr., L. S. U., spoke on "Hormones in the Flux of Life."

The new Biological Sciences building at **Northwestern State College** (Louisiana) has been completed and classes were held in it for the first time during the summer session. A N.S.C. summer institute for 53 high school science teachers was conducted at the college. W. G. Erwin served as director.

Grants in Aid

During recent months the biology department at Emory University has been awarded research grants totaling almost $150,000. Three grants are from the Atomic Energy Commission: $7,000 to **A. V. Beatty** for a one year study of the biological effects of radiation, $12,708 to **Robert B. Platt** for a one year study of the long range effects of radiation on natural plant and animal populations, and $26,863 to Dr. Platt for a one year study on the ecological effects of radiation at the Lockheed reactor site. **A. A. Humphries** has a grant of $2,638 from the American Cancer Society for further studies on the influence of the oviduct on amphibian eggs, while **E. L. Hunt** has a $23,987 grant from the Public Health Service for a three year study of estrus cycle and gestation in diabetic rats. During the summer **W. D. Burbanck** studied the ecology of estuarine isopods on a $1,000 grant from the Office of Naval Research. The National Science Foundation has awarded two grants: $5,000 to **W. B. Baker** for a one year study of the biology cur-

ricula of the Atlanta area and the improvement of biology instruction, and $13,000 to **C. Ray, Jr.** for a two year study on the cytogenetics of *Tetrahymena pyriformis.*

Jack D. Burke of the University of Richmond has been granted $375 by the Society of the Sigma Xi to assist in the study of blood volume, oxygen capacity, and oxy-hemoglobin affinity of blood in armadillos.

Among the recent National Science Foundation grants are $34,000 to **T. B. Mitchell** of North Carolina State College for a three year study of native bees of the eastern U. S., $5,300 to **S. P. Myers** of the University of Miami for a one year study of the marine yeasts of Biscayne Bay, and $6,000 to **Arthur C. Cole, Jr.** of the University of Tennessee for a two year study of the ant genus *Pogonomyrmex.*

John M. Woodward, professor of bacteriology at the University of Tennessee, has received a grant of $15,960 from the Office of Naval Research to continue studies on tularemia.

D. Frank Holtman, head of the University of Tennessee bacteriology department, has received a National Science Foundation grant of $11,700 to continue studies on the effects of typhoid-type organisms on protein metabolism of laboratory animals.

Guy T. Barry of the University of Tennessee Memorial Research Center has received a grant of $84,000 from the National Institutes of Health to investigate the chemical nature of substances frequently found on the surface of bacteria.

New research grants to biologists at the University of Florida from the National Institutes of Health include $18,800 to **Henry M. Wallbrunn** for a two year period to study "Mutation Rates in Homozygotes and Heterozygotes"; $42,000 to **John W. Brookbank** over a five year period to study "Antigen Distribution in Developing Sea Urchin Embryos"; $60,000 to **James H. Gregg** to investigate "Physiology of Growth and Aggregation in the Slime Mold, *Dictyostelium*" through a five year term; and $20,500 to **Eugene C. Bovee** for a three-year "Study of the naked, lobose Amoebida."

C. W. Edington of Florida State University has received a grant of $15,000 from the Atomic Energy Commission for studies on gene and chromosome changes induced by ionizing radiations in *Drosophila melanogaster.*

The department of botany of the University of Florida received a $10,000 grant from the Atomic Energy Commission to purchase equipment to be used in teaching the use of radioisotopes in life sciences. The grant is under the supervision of **G. Ray Noggle.**

Robert B. Platt of Emory University has received a Guggenheim Fellowship for "Ecological Studies of communities with reference to their microenvironment." The work will be carried out at Emory through the fall and will be continued in northern Europe and the Scandinavian countries for seven months, beginning in February 1959.

A two-year grant of $1400 has been awarded **R. J. Neff** of the University of Tennessee by the National Institutes of Health to be used in studies on the nuclear physiology of a soil amoeba.

Norman C. Negus of Tulane University has received a renewal grant of $15,000 from the Atomic Energy Commission to continue his studies on cyclic changes in small mammal populations of Breton Island, Louisiana.

John S. Laurie, also of Tulane, has received a grant of $10,000 from the National Institutes of Health for studies on the comparative physiology of parasitic helminths.

Milton Fingerman of Tulane has received a renewal grant of $40,000 from the National Institutes of Health to continue his studies on the hormone systems of crustaceans.

René J. Bienvenu (Northwestern La. State) has received a renewal grant of $18,788 to continue his studies on Haptenes in immunity to Brucellosis.

As a result of the expansion of its budget from $40 to $130 million the **National Science Foundation** is now in a position to make more extensive grants in its research, fellowship, institute and other established programs and to establish new programs, particularly in science education. Among the latter for which proposals are now being invited are summer training programs for secondary school students, science projects of state academies of science, traveling science demonstration lectures, undergraduate research training, research participation program for training of high school teachers, specialized short courses in the sciences for teachers in high schools and small colleges, undergraduate science honors programs, work conferences on science teaching, and development of home study laboratory courses for high school science teachers. Information about these programs can be secured from Dr. W. J. Peterson, Head, Special Projects in Science Education, National Science Foundation, Washington 25, D. C. Two new fellowships programs have also been established: summer fellowships for high school teachers and summer study fellowships for graduate assistants. Information may be secured from the Fellowships Section of the NSF.

The ASB BULLETIN

Volume 6, Number 1 January, 1959

CONTENTS

The Official Quarterly Publication of
The Association of Southeastern Biologists

THE ASB BULLETIN

The ASB BULLETIN is the official quarterly publication of the Association of Southeastern Biologists and is published at Columbia, S. C., in January, April, July and October. Letters, news items, other contributions, and all communications about editorial matters should be addressed to the Editor, U.S.P.H.S., P. O. Box 717, Columbia, S. C. Changes of address should be sent promptly to the Secretary of the ASB, Dr. Harold J. Humm, Department of Botany, Duke University, Durham, N. C. Subscription orders from libraries and other institutions should be sent to the Business Manager, A. W. Jones, Department of Zoology, University of Tennessee, Knoxville, Tenn. Subscription rate for nonmembers of ASB: $2.00 per year. Printing and typography by the Cary Printing Co., Columbia, S. C.

GEOFFREY M. JEFFERY, EDITOR

HAROLD J. HUMM, ASSOCIATE EDITOR
A. W. JONES, BUSINESS MANAGER

ASSOCIATION AFFAIRS

The BULLETIN

The incoming editor views with some misgivings the prospect of continuing the ASB BULLETIN at the high level of quality established and maintained by the retiring editor, Victor A. Greulach. The good wishes and the assistance of the retiring editor are gratefully acknowledged. The editor is confident that the same cooperation from the officers of the ASB and from the State Correspondents which has been enjoyed in the past will continue in the future. Certainly without their encouragement and assistance the editor could hope for little success.

A change in editors implies no change in policy, format or size of the BULLETIN. The BULLETIN remains an instrument of the Association, and the editor welcomes suggestions and helpful criticisms from the members.

It will be noted that with this volume a new printer has been engaged. The change in printers was entirely a matter of convenience, that of having the printer in the same city as the editor. The Association is grateful to the Orange Print Shop, Chapel Hill, N. C., for faithful service through the early years of the BULLETIN. It is probable that an issue or two will be required before our present printer becomes accustomed to the BULLETIN, and the understanding of the members in this regard is solicited.

●

The Knoxville Meeting

Attention of members is called to the announcement of the annual meeting of the Association, April 16 to 18, at the University of Tennessee in Knoxville appearing in this issue of the BULLETIN. The center insert section is provided, as usual, for the convenience of members in the submission of nominees, papers for presentation, *etcetera*. The deadlines given on the first page of this section are of particular importance.

●

ASB Meeting Places

The president has appointed a committee to arrange for future meeting places and solicits suggestions from the membership. To aid in these suggestions the following list of former meeting places of ASB is provided:

1937 University of Georgia.
1938 University of Georgia.
1939 Duke University.
1940 Vanderbilt University.
1941 Alabama Polytechnic Institute.
1942 University of Miami.
1946 University of South Carolina.
1947 Emory University.
1948 University of Florida.
1949 University of Tennessee.
1950 University of Virginia.
1951 University of Alabama.
1952 Agnes Scott College.
1953 University of North Carolina.
1954 Louisiana State University.
1955 The Citadel.
1956 Duke University.
1957 University of Georgia.
1958 Florida State University.
1959 University of Tennessee.

●

Suggested Nominees

Every member has the opportunity to give careful consideration to the matter of selection of candidates for the various offices to be filled at the annual meetings and to indicate his preferences for those positions. All you have to do is fill out the Blank 1 from the insert in this issue and mail to H. K. Wallace, Chairman, Nominating Committee, Department of Biology, University of Florida, Gainesville. The other members of the Nominating Committee are Harry J. Bennett, Zoology, Louisiana State University, and Chauncey G. Goodchild, Biology, Emory.

The Role of the Oak Ridge Institute of Nuclear Studies (ORINS) in Biological Education and Research

ARTHUR L. SCHIPPER

Dr. Schipper holds the B.S. degree from Coe College and the M.S. and Ph.D. degrees from the State University of Iowa. He served in the Department of Biology at A. & M. College of Texas from 1937 to 1948; with the U. S. National Park Service during the summers of 1940-1941; and with the U.S.A.A.F. as an Aviation Physiologist 1943-45. From 1948 to 1957 he was in the Biology Department of the University of Notre Dame, and was Editor of the American Midland Naturalist, 1954-57. Since 1957 Dr. Schipper has been associated with the University Relations Division of the Oak Ridge Institute of Nuclear Studies. The following is the second in the series of articles describing the significant contributions of Oak Ridge installations to biological research and education in the southeast.

At the termination of World War II, there existed at Oak Ridge an extensive installation for the production of nuclear energy. With the transition to a peacetime status there was the possibility that a dispersion both of personnel and facilities would follow. The assemblage in this area of scientific manpower, if retained, represented a source which would serve to complement the expanding prominence of science on the campuses of southern colleges and universities.

The existing condition afforded a challenge of considerable magnitude, and one that could not be circumvented. The issue demanded prompt and vigorous action. Concerted effort by several colleges and universities was considered to be the most efficacious method for achieving the coveted goal. These then were the circumstances influencing the deliberations that were to lead to the ensuing organization of the Oak Ridge Institute of Nuclear Studies, a nonprofit educational corporation of southern universities.

The development of ORINS has been manifested, not only by an increase in the number of sponsoring colleges and universities, but also by the number and magnitude of the programs administered and conducted for the Atomic Energy Commission.

ORINS sponsoring universities, now numbering thirty-seven, are distributed among fifteen southern states and the District of Columbia. Although the Institute is regional in organization the programs administered are often national and, not infrequently, international in scope. Benefiting through these programs are colleges, universities, secondary schools, and professional people in science, agriculture, engineering, and medicine.

The major portion of the work of ORINS is conducted under contract with the United States Atomic Energy Commission. Approximately one-half of the Institute's programs are those which ORINS has petitioned the Atomic Energy Commission to carry out in behalf of universities. Additionally the Commission has called on the Institute to carry out programs which are of direct AEC concern.

Most of the Institute programs are carried out in cooperation with Union Carbide Nuclear Company, the major AEC contractor in Oak Ridge. This company has made available to universities the outstanding staff and research equipment at the Oak Ridge National Laboratory for those programs carried out jointly by the Institute and the Laboratory.

Numerous faculty members, under the Oak Ridge Research Participation Program, have made significant contributions to science as a result of being able to engage in research at Oak Ridge laboratories. As most appointments are made for the summer months, this program enables the university scientist to be actively engaged in research at a time when there is a minimum of interference with teaching commitments. The benefits obtained from research participation are numerous. Notable are the opportunities to associate with eminent research scientists, to utilize new and unusual types

of research facilities, and to become familiar with the most recently developed techniques.

The stimulus provided by research participation has been an important factor in the development of many research programs on the campus. Former participants often return to Oak Ridge for the purpose of consulting with laboratory scientists concerning research, either projected or in progress. The benefits accruing to the laboratory and to the participant ultimately extend to the campus and to the students as a natural consequence of more effective teaching and more productive research.

Most of the research participants receive appointments to the Oak Ridge National Laboratory and the remainder enjoy similar opportunities at the Oak Ridge Institute of Nuclear Studies and the University of Tennessee-Atomic Energy Commission Agricultural Research Laboratory. Areas of research which have attracted biologists include all phases of radiation biology. Since 1948, approximately 600 research participation appointments have been made. Of this number more than one hundred were in the ORNL Biology Division and ninety were divided equally among the ORNL Health Physics Division, the UT-AEC Agricultural Research Laboratory, and ORINS.

Similar opportunities are available to doctoral candidates who have completed all requirements for graduation except thesis research. The training and experience gained as an Oak Ridge Graduate Fellow contributes immeasurably to the future outlook of the individual who is beginning to fashion a career in teaching and/or research. This program may be regarded as one which provides the university with expanded research facilities, since most universities would assume a great financial burden were they to attempt to duplicate them. Since the inception of this program, more than fifty graduate students have completed their thesis research in Oak Ridge Laboratories, ten of whom were biology majors.

Bringing Oak Ridge to the campus is achieved by the Oak Ridge Traveling Lecture Program. Scientists from Oak Ridge National Laboratory, UT-AEC Agricultural Research Laboratory, ORINS, and Atomic Energy Commission lecture before seminars, colloquia, and assemblies. In addition to presenting results of his research, the speaker considers also recent developments in similar fields. Not infrequently the visitor consults with faculty members regarding campus research projects. Conferences with students are sources of inspiration and encouragement. This is another example of cooperation with southern colleges and contributes considerably to the scientific atmosphere of campuses.

The employment of isotopes has proven to be one of the most beneficial aspects of the peaceful uses of atomic energy. The Basic Radioisotope Techniques Course, conducted by ORINS for AEC, has provided training for persons from each of the forty-nine states as well as from a number of foreign countries. These courses, presented several times each year, continue to attract applicants in such numbers that registration is often completed many months in advance. The techniques learned are invaluable to physicians, veterinarians, agricultural scientists, and biologists as well as to those in physical sciences, industry, and engineering. Appropriately enough, these courses, by providing a comprehensive and basic knowledge regarding the use of isotopes, have contributed notably to research. As a consequence of this program, scientific research will continue to benefit, not only in the southern region, but also nationally and internationally. More than 3,500 persons have received training in the basic and advanced courses given by ORINS.

ORINS has been active in medical research and training. Among the research programs are those concerned with thyroid uptake of iodine-131, total-body irradiation and bone-marrow transplantation, dosimetry, rare-earth studies, alkaline-earth metabolism, and protein metabolism. Research is conducted by staff scientists, research participants, and visiting personnel. The latter includes foreign scientists and also those from various parts of the United States. Training in the use of radioisotopes is offered to physicians who wish to spend from three months to one year in residence.

ORINS has cooperated in the presentation of a number of symposia, among which were Cancer Therapy with Radioisotopes, The Role of Atomic Energy in Agriculture, and Radiation in Plant Breeding.

Among the AEC Special Fellowships of interest to biologists are those in Radiological Physics. The purpose of these fellowships is to provide training for persons who can become competent in the study, evaluation, and control of radiation hazards. Fellows are appointed for one year, nine months being spent in residence at a university campus and the remaining three months at a national laboratory.

The Oak Ridge Traveling Science Demonstration Lecture Program (popularly known as Traveling Science Teachers) is supported by the National Science Foundation in cooperation with the Atomic Energy Commission. The traveling teacher program, initiated less than three years ago, has been extremely successful. During the first two years all teachers were NSF-supported. More recently several of the states supplied teachers for this program. Currently there are seven NSF-supported and twelve state-supported teachers.

Selected high school teachers spend the summer months in Oak Ridge during which period they receive intensive training in biology, chemistry, mathematics, and physics. Each teacher builds much of the equipment which he will use in presenting lectures and demonstrations. After the completion of the training period, the teachers visit high schools throughout the country (state teachers remain within their respective states), spending one week at each school visited, giving lectures and demonstrations. Administrators and teachers alike, of the schools visited, have commented on the immense value of the program. It has not been possible to visit more than a small percentage of the schools requesting a visit from a traveling teacher, so great has been the demand for this program.

Nine undergraduate biology majors from small colleges were appointed, as student trainees, to ORNL Biology Division for a period of ten weeks during the past summer. The experience gained provided them with a better insight into the various facets of a research project.

The Museum Division of ORINS has been very active in public presentations of the uses of atomic energy. Part of this is accomplished by the American Museum of Atomic Energy located at Oak Ridge. In addition there are a number of traveling exhibits which are available to schools, colleges, academies of science, and science fairs. Illustrations and descriptions in the panels accurately depict many important uses of radioisotopes including those in agriculture, biology, and medicine.

Construction of a new ORINS administration building is scheduled for 1959. Concomitant with this physical development will be a continuation and strengthening of present programs of service in atomic energy, and the assumption of operating responsibility for programs, not only in this field, but in others as well.

As The President Sees It

Six years ago Victor A. Greulach agreed to serve as editor of a first publication for ASB. It was a memorable decision for the organization. I do not have the records at hand but as well as I can remember the only specific instructions handed Greulach by the executive committee, with Association approval, concerned the name (The ASB BULLETIN), how much money could be spent (a very small sum), and the kind of publication that was *not* wanted (a scientific journal). With this meager guidance, and, I might add, a goodly bit of pessimism not to mention outright disapproval by some members of a formal ASB publication, Greulach dug into the job. The results of his thought, planning and industry are five excellent volumes of The ASB BULLETIN, each of which has evoked the praise and thanks of the Association. With the publication of an index of these volumes Greulach asked that his tenure as editor be ended, and the executive committee regretfully accepted his resignation.

On behalf of the 700 members of ASB I want to extend to Dr. Greulach our heartfelt gratitude for the terrific job he has done in organizing and getting out the BULLETIN. It has served not only as an informative and unifying force within ASB and brought added dignity to the Association's activities, but it has also gained for ASB recognition from outside the Southeastern United States. We all wish for Dr. Greulach a happy "retirement."

We give a hearty welcome to our new editor, Geoffrey M. Jeffery of the U. S. Public Health Laboratory of Tropical Diseases in Columbia, South Carolina. A native of Dundee, New York, Dr. Jeffery received an A.B. from Hobart College, an M.A. from the University of Syracuse, and an Sc.D. from Johns Hopkins University. The past twelve years he has spent in Alabama, Georgia, and South Carolina doing field and laboratory research in parasitology and entomology, his main interest being human and avian malaria. Jef-

fery has been an interested and active member of ASB and thus assumes his duties with real awareness of the purposes and accomplishments of the Association. Your officers are most pleased with the enthusiastic and level-headed way in which he has tackled his new job and wish to assure you that The ASB BULLETIN is in good hands. We all appreciate Dr. Jeffery's willingness to take on the duties of editor and pledge him our support and help.

Please note the announcements on another page about the annual meeting of ASB to be held in Knoxville at the University of Tennessee in April. It promises to be a good meeting. I hope that you will plan to bring some of your students, *both graduate and undergraduate*, to Knoxville. As George Kent pointed out to us last spring, these young people are our greatest asset.

The Awards made available by some of the biological supply companies in the region will again be offered this year as well as the Mary Glide Goethe Awards made possible through the generosity of Mr. C. M. Goethe of California. I would like to ask you to call the attention of your gradute students to the Goethe Awards. This is the second year they have been offered to help some graduate students meet the expenses of going to an ASB meeting. Let's have lots of applications.

The executive committee had planned to hold its interim meeting in Washington right after Christmas during the meetings of the American Association for the Advancement of Science. Since this trip for some members of the committee would be a very expensive one, I did not feel it could be justified unless pressing matters required decisions. Consultation with the other officers revealed no such items so I cancelled the meeting. Most of the interim decisions have been and can be made by mail this year, and the committee will plan an extra long session in Knoxville.

A committee has been appointed to arrange for future meeting places of ASB; its members are Donald Scott (University of Georgia), chairman, Walter Herndon (University of Alabama), and Elsie Quarterman (Vanderbilt University). This committee would appreciate having your ideas and suggestions.

The Goethe Awards will be administered by Walter S. Flory (University of Virginia), chairman, William Burbanck (Emory University), and John Carpenter (University of Kentucky). The nominating committee will consist of H. K. Wallace (University of Florida), chairman, Harry Bennett (Louisiana State University), and Chauncey G. Goodchild (Emory University). Appointed to the program committee are S. R. Tipton, chairman, Fred Norris, Royal Shanks, and James Tanner (all of the University of Tennessee). Accepting 3-year appointments to the Meritorious Awards Committee and the Research Awards Committee are Roberta Lovelace (University of South Carolina) and Ralph Yerger (Florida State University) respectively.

Several plans designed to help and encourage high school and college teachers as well as undergraduate science students have been announced that may be of interest to some of you. The summer institutes for high school and college teachers of science and mathematics will again be sponsored by NSF during the summer of 1959. Of the 350 institutes planned, 65 or about 19 percent will be held in the Southeast. NSF is also inviting proposals from colleges, universities and nonprofit research institutions for grants "to provide, on an experimental basis, opportunities for properly qualified undergraduates majoring in the physical, biological, mathematical, and engineering sciences to participate in research projects currently being conducted by experienced scientific investigators. This experimental program may operate either during the academic year or during the summer; summer programs in particular may extend the benefits to students from other colleges." (From NSF News Release, October 24, 1958). Here is an excellent opportunity for us to get undergraduates interested in biological research. Inquiries about these programs should be addressed to the National Science Foundation, Washington 25, D. C. The American Physiological Society will offer awards to college teachers in the summer of 1959 for research training with research groups in various laboratories throughout the country. Inquiries should be sent to the Society at 9650 Wisconsin Avenue, Washington 14, D. C. All of these programs offer stipends for the participants.

MARY ESTHER GAULDEN

IMPORTANT DEADLINES

Please note the following deadlines, all of which are to be met by the time of our Twentieth Annual Meeting at University of Tennessee, Knoxville, Tennessee, April 16-18, 1959. You can help facilitate plans for the meeting by sending in all requested material as far in advance of the deadline dates as possible.

February 9—Suggestions for nominations for ASB officers and executive committee members (Blank 1).

February 20—Titles and abstracts of papers to be presented at the Knoxville meeting (Blank 4).

March 1—Applications for Goethe awards to graduate students (See Page 9).

March 1—Papers to be considered for the Association Research Prize (See Page 9).

April 1—Applications for Phipps and Bird Research Fellowship at Mountain Lake (See Page 9).

April 1—Nomination letters for the Meritorious Service Award (See Page 8).

THE ASSOCIATION OF SOUTHEASTERN BIOLOGISTS

(Founded 1937)

Purposes

The Association of Southeastern Biologists was organized " . . . to encourage research and instruction in the fields of the biological sciences; to foster a spirit of cooperation among the membership; to emphasize the relation of fundamental knowledge in biology to the solution of biological problems; to strive toward the preservation of biological resources; and to serve as a medium for professional contacts among the membership."

Eligibility for Membership

Any person is eligible for membership who is engaged in (a) biological research, (b) the teaching of biological subjects, (c) graduate study in the biological sciences, or (d) work in various fields of applied biology. Members, in general, shall be residents of the Southeast. Membership shall be granted any person recommended and approved as eligible by two active members in good standing. Such recommendations shall be submitted to the treasurer of ASB and the new member shall achieve active status on the payment of the dues for the current year. Annual dues are $2.00, which includes a subscription to the ASB BULLETIN.

Activities

1. Annual meetings at which the results of investigations are presented for discussion, and at which appropriate symposia may be conducted. 2. Quarterly publication of the ASB BULLETIN containing programs of annual meetings and abstracts of papers presented, news of science and scientists in the Southeast, a record of Association affairs, and articles of regional or timely interest. The BULLETIN promotes personal and professional contacts among the members of the Association. 3. The discussion of subjects of general interest to biologists of the Southeast and the formulation of policies and plans of action in relation to such subjects. 4. Encouragement of research through research prizes awarded for especially meritorious papers presented at the annual meetings. 5. Presentation of a Meritorious Award for outstanding contribution to biology, especially in service to young people through teaching. 6. Awarding annually a research fellowship at Mountain Lake Biological Station. 7. Representation on the Council of the AAAS. 8. Affiliation with the AIBS.

1. Deadline: February 9

SUGGESTED NOMINEES FOR ASB OFFICES AND EXECUTIVE COMMITTEE POSITIONS

To the members of the Nominating Committee:

I wish to suggest that you consider the following ASB members in selecting nominees for offices and executive committee positions:

President-Elect_____ Vice-President_____

Treasurer_____ Executive Committee Members (2)_____

_____

Mail to: DR. H. K. WALLACE
Dept. of Biology
University of Florida
Gainesville, Fla.

---

2. STATEMENT OF ASB DUES FOR 1959

Your ASB dues of $2.00 for 1959 are now payable. This sum includes your subscription to the ASB BULLETIN for 1959. Please make your check payable to *The Association of Southeastern Biologists*, and mail to the treasurer with this statement at the address given below. Please be sure to write your name and correct mailing address on this statement. If you still owe dues for 1958 you will receive a separate statement from the Treasurer, but you may add this amount to your check for your 1959 dues if you wish. The ASB constitution provides that members whose dues are in arrears two years will automatically be dropped from membership.

Name_____

Address_____

City_____ State_____

Check here if you are also enclosing your 1958 dues_____.

If retired, check here _____
If retiring within a year, check here _____

DR. ARTHUR W. JONES, Treasurer ASB
Department of Zoology
University of Tennessee
Knoxville, Tennessee

3. ASSOCIATION OF SOUTHEASTERN BIOLOGISTS

Application for Membership

NAME (in full)_____ Date_____

DEGREES (institutions and dates)_____

_____

PRESENT POSITION: (1) Title_____ (2) Department_____

(3) Institution_____ (4) City, State_____

SPECIALTY (e.g., physiology)_____

SPECIFIC INTERESTS (e.g., respiration)_____

RECOMMENDED BY (1)_____ (2)_____

Fill out this blank, enclose check (or money order) for $2.00 as dues for one year and mail to:

DR. ARTHUR W. JONES, Treasurer ASB
Department of Zoology
University of Tennessee
Knoxville, Tennessee

4. **Deadline: February 20**

CALL FOR PAPERS FOR THE KNOXVILLE MEETING

This form and *two* typewritten copies of the abstract must reach the secretary, Dr. Harold J. Humm, Botany Department, Duke University, Durham, North Carolina, not later than Friday, February 20, if the abstract is to be included among the abstracts to be published in the April issue of the ASB BULLETIN. Papers to be submitted for the Research Prize must be included in the program. Please type or print the following information. All papers are limited to 10 minutes, with 3 minutes for discussion.

1. Author(s):_____

2. Title of paper:_____

_____

3. Institution(s) represented:_____

4. Check organizations to which author(s) belong:

_____ _____ Association of Southeastern Biologists.

_____ _____ Southeastern Section, Botanical Society of America.

_____ _____ Southern Appalachian Botanical Club.

_____ _____ American Society of Ichthyologists and Herpetologists.

5. Projection equipment needed:_____ 2x2 slide projector; _____ 3¼x4 slide projector; other equipment:

6. If your paper is being submitted for the Association Research Prize please check here:_____.

7. This form must be accompanied by *two* double-spaced typewritten copies of an abstract, not to exceed 200 words. Longer abstracts are subject to cutting by the editor without approval of the author. Please use the following form in typing the heading of the abstract in order to avoid unnecessary editing:

Dimorphism of Embryonic Hooks of *Hymenolepis nana.*
Arthur W. Jones, *University of Tennessee*

Start the text of the abstract here, on a separate line with paragraph indentation. In general, the abstract should appear as a single paragraph, though two paragraphs are acceptable if really needed.

8. *Reprints.* Reprints of individual abstracts are available at the rate of $2.00 for the first 100 and 75 cents for each additional 100, postpaid. In order to secure this price it is necessary to attach your check for the proper amount to this form and send it along with the form and the two copies of the abstract. Checks should be made payable to the Cary Printing Company.

Indicate here how many reprints of your abstract you want:_____.

University Center, University of Tennessee, Knoxville

About The Knoxville Meeting

The Twentieth Annual Meeting of the Association of Southeastern Biologists will be held at the University of Tennessee, Knoxville, April 16-18, 1959. Four organizations will meet with ASB: The Southeastern Section of the Botanical Society of America, Southern Appalachian Botanical Club, Southeastern Division of the American Society of Ichthyologists and Herpetologists, and the Southeastern Regional Beta Beta Beta.

The meeting will begin on Thursday afternoon, April 16, with a tour of the Biology Division of the Oak Ridge National Laboratory. Arrangements are being made for an address by an outstanding biologist on Thursday evening followed by a Smoker. On Friday there will be several sessions of contributed papers and the annual business meeting. Presentation of awards and an address by the retiring president of ASB will take place Friday evening. Two field trips are scheduled for Saturday morning.

Registration and all ASB sessions on the University of Tennessee campus will be held in the University Center.

Members of the committee on local arrangements at the University are J. Gordon Carlson, Chairman, Ronald Fraser, Joseph Howell, Fred Norris, Royal E. Shanks, A. J. Sharp, and James T. Tanner.

Transportation

Knoxville is served by the Southern and L and N railroads, Greyhound and Trailways bus lines, and American, Capitol, Delta, Piedmont, and Southeast Airlines.

Meals

All the University dining facilities will be open to persons attending the meeting and their families. These include the cafeteria and grill in the University Center, where the different sessions will meet, and the University Cafeteria in Sophronia Strong Hall within a block of the Center. In addition, there are a number of privately run eating places near the campus, and the downtown area with many cafeterias, restaurants, and hotel dining rooms is within five minutes driving time or fifteen minutes walking time from the University Center. The downtown area can also be reached by bus.

Housing Facilities

Knoxville is a tourist center and so has large numbers of motels and tourist courts on most main highways outside the city. Those handiest to the University campus are located on Chapman Highway (U. S. 441) southeast of Knoxville, Kingston Pike (U. S. 11 and 70) west of the city, and Alcoa Highway (State 73) south of the city. The downtown hotels are within fifteen minutes walking distance of the campus. All reservations should be made directly with the management. The list below is by no means complete, but includes the better and larger establishments. Additional names of accommodations can be obtained from the Knoxville Tourist Bureau, 811 Henley Street, S.W., Knoxville, Tennessee.

Hotels

Andrew Johnson—Gay Street and Hill Avenue. Single $5.25 up; double $8.50 up.
Arnold—Locust Street and Church Avenue. Single $4.50 up; double $6.00 up.
Farragut—Gay Street and Clinch Avenue. Single $5.00 up; double $9.00 up.
YMCA—Clinch Avenue and Locust Street. Single $1.75-$2.50; double $3.00 (double-decker bed).

Courts and Motels

On Kingston Pike (U. S. 11 and 70 approximately 3-5 miles west of the campus)
- Alhambra Court—Single $3.50; double $4.00 up.
- Biltmore Tourist Court—Single $3.00; double $4.00; family $6.00; 2-room unit $8.00.
- Colony Tourist Court—Single $4.00 up; double $5.00 up.
- County Squire Motel—Single $6.00 up; double $8.00 up.
- Delrose Motel—Single $4.00 up; double $6.00 up.
- 11-70 Motor Court—Single $5.00; double $6.00 up.
- Highland Court—Single $4.00 up; double $5.00 up.
- McKee Motel—Single $4.00 up; double $6.00 up.
- Mt. Vernon Motel — Single $6.00 up; double $7.00 up.
- Sequoyah Motel—Single $5.00; double $5.00 up.
- Sharp's Motel—Double $6.00 up; family unit rates.
- Terrace View Motel—Single $6.00 up; double $7.00 up.
- Vol Motel—Single $5.00 up; double $7.00 up.
- White City Court—Single $5.00 up; double $6.00 up.

On Chapman Highway (U. S. 441 approximately 2-8 miles to the southeast of campus)
- Smoky Mountain Tourist Court—Double $5.00 up.
- Sunset Motel—Single $5.00; double $6.00 up.
- Town Lodge Motel—Single $8.00; double $10 up.
- Way-oma Motel—Double $5.00 up.

On Alcoa Highway (State 73 south about 2 miles)
- Dean Motel—Single $5.00; double $7.00.

Field Trips

Three trips are scheduled for the annual meeting. Full information about them will be available at the registration desk.

Thursday, April 16

A tour of the Biology Division of Oak Ridge National Laboratory is scheduled for Thursday afternoon. *All persons interested in taking this trip should submit their intention before April 11.* Those taking this trip will leave the Knoxville campus at 1:15 p.m. on Thursday, April 16. Arrangements for transportation and for the tour of the Division at this early time during the meeting makes it highly desirable for the local committee to have previous knowledge of the number of interested members. Transportation for the field trip will be by bus and/or private conveyance, and will be determined by the demand. Round trip from Knoxville is about 45 miles.

If you plan to take this trip, please inform: Ronald C. Fraser, Department of Zoology and Entomology, University of Tennessee, Knoxville, Tennessee.

Saturday, April 18

Botany field trip: Observation of the vegetation pattern in the Great Smoky Mountains National Park will begin at 9:00 a.m. at Headquarters in the Park and will terminate at 12:30 p.m. at Clingmans Dome (6,300 ft.). Transportation will be by private cars. The trip will include short excursions into representative vegetation areas along the way. Opportunities for photography will be provided but plant collecting will not be permitted in the National Park. Round trip mileage from Knoxville is about 125 miles; those participants returning home to the east or south may proceed directly from the Smokies rather than return to Knoxville.

Additional afternoon field trips can be arranged to meet special interests.

Inquiries should be addressed to Royal E. Shanks, Botany Department, University of Tennessee, Knoxville, Tennessee.

Bird field trip: Saturday, April 18, a field trip for observing birds will be made to the Great Smoky Mountains. Private cars will meet at the National Park Headquarters, two miles above Gatlinburg, at 9:00 a.m. Observations will be made there and along the way at varying elevations, and in the spruce-fir forest above Newfound Gap. This trip will be completed about noon, and those wishing to do so can leave from there. Others who wish to observe the birds in the lowlands in the afternoon can return to Gatlinburg for lunch, after which these areas will be visited.

If enough people are interested in a field trip on Saturday to see the birds of the Knox County area, such a trip will be arranged.

Inquiries should be addressed to James T. Tanner, Department of Zoology and Entomology, University of Tennessee, Knoxville, Tennessee.

Sight-Seeing

Great Smoky Mountains National Park with a relatively large area and several peaks above the 6,000-foot level is situated 40 miles to the southeast of Knoxville. It contains many trails for hiking, camp grounds, and picnic areas.

Norris Dam lies about 25 miles north of Knoxville. An overlook affords a good view of the dam and Norris Lake. The powerhouse with its generators at the base of the dam is open to the public.

The *Museum of Atomic Energy* in Oak Ridge, 25 miles northwest of Knoxville, is open to the public. There are guided tours of the museum with demonstrations of many interesting facts about atomic energy.

General Information

1. Registration will be at a desk in the University Center on Cumberland Avenue (U. S. 11 and 70) and 15th Street.
2. A fee of $1.00 will be charged for registration.
3. Knox County is dry.

Call for Meritorious Award Nominations

The Committee on the Meritorious Award for Teaching asks that nominations and supporting material be sent to them as soon as possible. The regulations governing the award are as follows:

"The recipient must be a member of the ASB in good standing. He should have taught biology in a southern institution for at least ten years, and must be currently teaching. He must not be a dean or have regular administrative duties beyond the departmental level (this particular criterion requiring interpretation in individual cases). Among evidences of his qualifications is the progress of the candidate as indicated by recognition in his own institution (important assignments and other contributions specifically related to good teaching); and the number and quality of students for whom he provided primarily the inspiration to continue in biology, especially those who later received advanced degrees."

The recipient receives, in addition to the honor of being named, an honorarium of $100.00 provided by the Will Corporation of Georgia. Members of the ASB are urged to make nominations and send the needed supporting materials to Robert F. Smart, Dean's Office, University of Richmond, Va.; or to Fred T. Wolf, Department of Botany, Vanderbilt University, Nashville, Tennessee; or to Roberta Lovelace, Department of Biology, University of South Carolina, Columbia, S. C.

Association Research Prize

The rules and regulations governing the annual Association Research Prize of $100.00, sponsored by the Carolina Biological Supply Company, Elon College, North Carolina, are as follows:

1. The Research Prize is to be awarded for an especially meritorious paper actually presented at the annual meeting.

2. Only members are eligible to submit papers in competition for the Research Prize. This applies to *all* names on the submitted paper. Applicants for membership are *not* eligible to submit papers for the Research Prize.

3. Papers submitted in competition may be in press but must not have been published prior to March 1 of the year of the current competition.

4. Judges will be eminent biologists outside the Southeast. They will set their own criteria, and may withhold the award if no paper is judged to have sufficient merit.

5. Papers must be submitted in *triplicate* and in their entirety not later than *March 1, 1959,* to J. N. Dent, Department of Biology, University of Virginia, Charlottesville, Virginia. One copy of the prize-winning paper will remain in the ASB files, but all other copies will be returned to the authors as soon as possible.

6. Announcement of the winner of the Research Prize will be made at the annual meeting.

Phipps and Bird Research Fellowship

A Research Fellowship of $150.00 for summer research at Mountain Lake Biological Station of the University of Virginia has been continued through the generosity of the Phipps and Bird Company of Richmond, Virginia. Any member of the Association may submit an application. The application should be accompanied by a summary of the planned work, by a list of important publications, and, especially in the case of younger workers, by references and educational data. Applications should be sent to J. N. Dent, Department of Biology, University of Virginia, Charlottesville, Virginia, not later than *April 1, 1959.* The selection will be made by the Research and Awards Committee of the ASB in consultation with the Director of the Mountain Lake Biological Station. The announcement of the recipient will be made at the annual meeting of the ASB.

Mary Glide Goethe Travel Awards

Through the generosity and interest of Mr. C. M. Goethe funds are available to assist graduate students of merit and ability with their expenses to the ASB annual meeting in Knoxville, Tennessee, April 16-18, 1959. It is anticipated that most awards will be for maintenance (lodging and meals) since students can often travel with staff members in institutionally owned vehicles. Maintenance awards will be made on the basis of $8.00 per day. Travel allowance will also be awarded in exceptional cases.

Preference will be given advanced graduate students presenting papers at the April meetings. Any graduate student needing financial assistance in order to attend the 1959 meeting is eligible, however, and applications are invited from graduate students whether or not they are presenting papers at the meeting.

Staff members are requested to call the availability of these awards to the attention of qualified students in their respective institutions.

Rules to follow in making application for the Goethe Awards are as follows:

1. Indicate if application is being made for maintenance or travel or both. Give details, such as how many nights and days are involved, how much travel allowance is requested, the number of miles involved, the proposed method of transportation (rail, bus, etc.) and other pertinent information.

2. Give information as to whether or not a paper is being presented.

3. In a paragraph give a brief history of your education to date, of how many years you have been—and plan to be—in graduate school, of your major field or fields of interest, of any publications which have appeared or which may be in preparation, and any other pertinent professional details.

4. Grants will be made on the basis of financial need. Give information on factors concerning this, as marital status, family responsibilities, etc.

5. Have at least one sponsor write a letter supporting your application.

6. Have applications and supporting letters, in triplicate if at all possible, in the hands of W. S. Flory, The Blandy Experimental Farm, Boyce, Va., by March 1, 1959. Applicants will be notified of the decision of the Committee during March.

COMMITTEE
W. D. BURBANCK
J. M. CARPENTER
W. S. FLORY, *Chairman*

Final Report: Horn Island Committee

News of major importance was received by the committee to promote the establishment of Horn Island, Mississippi Sound, as a nature preserve on June 10, 1958, in a letter from Mr. George B. Fell, Executive Secretary of the Nature Conservancy. Mr. Fell advised the committee that Secretary of the Interior Fred A. Seaton announced on May 26 that Horn Island National Wildlife Refuge was established by withdrawal of 2,431 acres of public land.

Creation of this new refuge was the direct result of a request by the Bureau of Sport Fisheries and Wildlife, U. S. Fish and Wildlife Service, to the Bureau of Land Management.

The first person to take action toward this goal was Dr. Hurst Shoemaker, formerly of the University of Illinois and the Gulf Coast Research Laboratory, now Chairman of the Department of Biology of the American University of Beirut, Lebanon. Dr. Shoemaker saw the need for a nature preserve on Horn Island as a result of his work at the Gulf Coast Research Laboratory and suggested this as a worthy project to the Nature Conservancy. The proposal was favorably received and the Nature Conservancy made application to the Bureau of Land Management for 640 acres to be set aside as a natural reservation, the maximum area that could be requested by a non-governmental agency.

Several months later, Past President of ASB George C. Kent appointed the Horn Island committee to help promote the project. Both the Nature Conservancy and the Horn Island committee contacted the Fish and Wildlife Service in an effort to interest them in establishing a wildlife reservation on Horn Island. Fish and Wildlife responded favorably and Nature Conservancy then withdrew its request to the Bureau of Land Management in favor of a request by the Fish and Wildlife Service. After contending with mining claims of private individuals and other obstacles to the proposal, the Bureau of Sport Fisheries and Wildlife succeeded in obtaining their request in the spring of this year.

Horn Island is one of the islands forming Mississippi Sound in the northern Gulf of Mexico and is an important feeding and resting area for migratory waterfowl, water birds and shore birds. The island is approximately 13 miles long and up to three-quarters of a mile wide. It is composed mainly of sand and supports a 500-acre pine forest as some of the island is 10 to 20 feet above sea level. There are about 700 acres of salt and fresh water marshes and several ponds on the island, some of them of fresh water. In total area Horn Island is 3,700 acres of which 1,269 are privately owned.

The island was surveyed in 1846 and again in 1939. During this period it lost 170 acres at the east end and gained 550 acres at the west end, a process that is characteristic of sand islands of the northern Gulf coast at the present time.

Except for the remains of a barracks-like building, used by the Army during World War II, there are no buildings on the island.

Petit Bois National Wildlife Refuge is located a few miles eastward near the Alabama boundary.

REV. P. H. YANCEY, S. J.
GORDON GUNTER
HURST H. SHOEMAKER, *Consultant*
HAROLD J. HUMM, *Chairman*

NEWS OF BIOLOGY IN THE SOUTHEAST

About People

George H. Mickey, Louisiana State University, was invited to prepare a part of the *Drosophila* exhibit at the Tenth International Congress of Genetics held in Montreal in August. Dr. Mickey also presented a paper at the Congress.

G. Robert Lunz, Director, Bears Bluff Laboratories (South Carolina), was re-elected Vice-Chairman of the Atlantic States Marine Fisheries Commission. Dr. Lunz was awarded an honorary Doctor of Science degree by Clemson College last June.

G. Leon Howell, who completed requirements for the Ph.D. degree in the Biology Department of the University of Alabama in September, 1958, has been appointed Assistant Professor of Biology at High Point College, High Point, N. C.

Walter Herndon, Biology Department, University of Alabama, will join the staff of the Marine Botany Course at the Marine Biological Laboratory at Woods Hole, Mass., during the summer of 1959.

Herbert T. Boschung, Biology Department, University of Alabama, will join the staff of the Gulf Coast Research Laboratory at Ocean Springs, Miss., during the summer of 1959 to teach Marine Vertebrate Zoology and Ichthyology and to do research.

Temd R. Deason has completed the requirements for the M.S. degree in the Biology Department of the University of Alabama and is now studying

for the doctorate at the University of Texas with Professor Harold Bold.

Ben Q. Ward has rejoined the Biology Department at Mississippi Southern College after having completed his Ph.D. in Bacteriology at the University of Texas.

F. A. Varrelman has retired after being with the Biology Department at Mississippi Southern College for ten years.

Erwin Goldberg joined the staff of the Department of Biology, West Virginia University, as assistant professor at the beginning of the 1958-59 term. Dr. Goldberg, a graduate of the State University of Iowa, has his training in the field of animal physiology.

S. Benton Talbott, head of the Department of Biology at Davis and Elkins College, Elkins, West Virginia, died on July 16, 1958, at the age of 56. Dr. Talbott was a former dean of the college and a president of the West Virginia Academy of Science.

Martin D. Young and **Geoffrey M. Jeffery,** Laboratory of Tropical Diseases, U.S.P.H.S. (Columbia, S. C.) attended the Sixth International Congresses of Tropical Medicine and Malaria in Lisbon in September; both presented invited papers and Dr. Young served as co-chairman of the Clinical Section of the Malaria Division.

Huseyin Gokcora, Associate Professor, University of Ankara, Turkey, and **Josip Gotlin,** Associate Professor, Zagreb University, Yugoslavia, worked with **W. Ralph Singleton,** learning new techniques and methods, at the corn breeding radiation laboratory at The Blandy Experimental Farm, University of Virginia, during the summer of 1958. Drs. Gokcora and Gotlin were Fellows of the International Cooperation Administration.

There have been three new appointments made in the Biology Department, Madison College: **Doris Poole** and **W. F. Jones** were named Assistant Professors of Biology and **James K. Grimm,** Instructor of Biology.

Edwin Betts, Professor of Botany, University of Virginia, died on September 27, 1958. He was an authority on the gardening and farming practices of Thomas Jefferson.

Robert E. Merritt, Longwood College, has been awarded a grant by the Research Council of the Richmond Area University Center to support his research on avian competition for nesting sites.

George W. Jeffers, Longwood College, spent last summer touring Europe.

Franklin F. Flint, Randolph-Macon Woman's College, Lynchburg, was promoted to Associate Professor of Biology at the beginning of the present academic year. Dr. Flint was on sabbatical leave last session working with Dr. Donald Johanson, Pomona, California, on problems concerned with gametogenesis and sporogenesis in higher plants.

Paul A. Walker, who is an ordained Episcopal priest in addition to serving as Professor and Chairman of Biology at Randolph-Macon Woman's College, is one of twelve nationally selected teacher-priests to participate in a special conference at the Institute for Advanced Pastoral Studies, to be held at Cranbrook House, Bloomfield Hills, Michigan, from December 11th to 14th, 1958.

Charlotte Lyle, Emory and Henry College, Emory, Virginia, spent part of the past summer studying at Virginia Polytechnic Institute.

Lee Douglas, Chairman of Biology Department, Emory and Henry College, spent the past summer studying the embryology of tetraphyllid cestodes at the Oregon Institute of Marine Biology. His current research project, which is concerned with the osmotic properties of cestode germ cells, is supported by a grant of $5,895 from the United States Public Health Service.

W. L. Threlkeld, Virginia Polytechnic Institute, recently announced the personal publication of his book, "Some Nematode Parasites of Domestic Animals".

Frances S. Silliman has returned to the Biology Department, Bridgewater College after completing doctoral studies and receiving her degree at the University of North Carolina.

Harry G. M. Jopson, Bridgewater College, participated in the National Science Foundation Institute for College Teachers of Biology held at Oregon State College, Corvallis, Oregon, during the past summer.

Paul J. Osborne, Lynchburg College, spent the past summer at the Duke Marine Laboratory, working on the energy cycles of marine invertebrates. Dr. Osborne's work was made possible by a research grant from the American Physiological Society.

John G. Mahan, Lynchburg College, was a member of a team from that college which participated in the Danforth Foundation College Community Workshop, Colorado Springs, Colorado, for three weeks last summer. The theme of the Workshop was the place of the small college in modern education.

Harry L. Holloway has been promoted to Professor of Biology at Roanoke College. He has recently received a grant-in-aid from the Sigma Xi-RESA Research Fund for the purchase of equipment for studies on the helminths of wild mammals in Virginia.

J. L. Lodewijks who substituted for **Robert E. Merritt** last session at Longwood College has returned to his home country, The Netherlands.

Mary E. Picinich, Aaron H. O'Bier, and **Robert T. Brumfield,** of Longwood College spent the past summer at the Biology Division, ORNL conducting research on the control of growth in the roots of higher plants.

Recent additions to the staff of the Department of Botany of the University of Maryland include **Richard Rhode** in Plant Nematology and **Raymond Galloway** in Plant Physiology.

Harris J. Linder has joined the staff of the Department of Zoology, University of Maryland, as an assistant professor. Dr. Linder was formerly with the Biology and Medical Division of the Argonne National Laboratory.

H. F. Robinson has been appointed head of the newly organized Department of Genetics at North Carolina State College. **S. G. Stephens,** previously in charge of the genetics faculty, has been awarded a Guggenheim travel grant to collect and study species in Central America.

T. William Schneider, professor of horticulture at North Carolina State College, has been appointed as chairman of the Horticulture Department at the University of Kentucky.

Kimball C. Atwood, formerly with the Biology Division of the Oak Ridge National Laboratory, now heads the work in medical genetics at the University of Chicago.

Panel members at a discussion of Junior Academies at the Academy Conference (AAAS, Washington, 1958) included **Harry Bennett** (LSU), **Robert Boyer** (Ky.), **Clyde Reed** (Tampa), and **Karlem Riess** (Tulane). **A. M. Winchester** (Stetson) is President of the Conference; **John Arnold** (Loyola) is Secretary.

New staff members in the Biology Department, University of South Carolina, include Assistant Professors **B. C. Smith** and **W. H. Norman.** Dr. Smith has his Ph.D. from the University of Georgia and is working in invertebrate zoology and ecology. Mr. Norman is a candidate for the Ph.D. degree at the University of Texas and works in the fields of physiology and microtechnique. Appointed as Instructor in the same department was **Sara B. Eggleston.**

Institutions and Organizations

The **Mississippi Institute of Microbiology** has recently been established as a Unit of the Department of Biology of Mississippi Southern College. Dr. B. Q. Ward, Bacteriologist and Associate Professor of Biology, has been designated as Director of the Institute. The Institute of Microbiology is essentially a research establishment and is empowered to accept and administer pertinent grants found acceptable to the college. The staff of the Institute also has the duty of preparing an annual report of its opinions and suggestions relative to teaching and course work within the academic department. The members of the Institute for the coming year and their specialty fields are as follows: J. F. Walker (Chairman, Department of Biology) Physiology and Histology; B. Q. Ward (Director of the Institute) Bacteriology and Microbotany; R. A. Woodmansee, Ecology and Marine Plankton; A. E. Harrises, Parasitology; C. R. Ball, Embryology; S. W. Rosso, Malacology. Further information regarding the Institute can be obtained from the director, Box 264, Station A, Hattiesburg, Mississippi.

The **New Orleans Branch of Louisiana State University** (LSUNO) opened in the fall of 1958 with 1,500 students. The science staff includes biologists Dolores Dundee, Rosamond McMillan and Stephan Russell.

A "classified directory" of research opportunities available to college and university scientists, to be carried out in Oak Ridge, Tennessee, has been issued by the **Oak Ridge Institute of Nuclear Studies.** The "directory" is a brochure describing the Oak Ridge Participation program, now in its tenth year, that the Institute administers for the U. S. Atomic Energy Commission. It outlines the numerous opportunities for research involving the application of nuclear energy to basic sciences, agriculture engineering and medicine, utilizing facilities not generally available to any single university or college. Copies are available on request from the University Relations Division, Oak Ridge Institute of Nuclear Studies, P. O. Box 117, Oak Ridge, Tennessee.

Seven ASB members were registered participants in the annual meeting of the **American Society of Tropical Medicine and Hygiene** in Miami Beach, November 5 to 8. These included J. Fred Denton, C. G. Goodchild, George W. Hunter, III, G. M. Jeffery, J. Fred Landt, Clarence J. Weinman, and Martin D. Young.

The Biology Departments of **Lynchburg College, Randolph-Macon Woman's College** and **Sweet Briar College** inaugurated this fall a series of Tri-College Biology Seminars. The topic of the October meeting at Randolph-Macon Woman's College was "Teleology in Biological Science". At the November meeting, held at Lynchburg College, Dr. John Tyler Bonner of Princeton University led the group in a discussion of "Animal Communication". The December meeting, at Sweet Briar College, had as its subject the question, "What is Life?".

At the meeting of the Eastern Branch of the **Entomological Society of America** in Baltimore the latter part of November, nine papers were presented by staff members of the Department of Entomology of the University of Maryland.

Grants in Aid

Robert A. Woodmansee of Mississippi Southern College has received a renewal grant of $4,630 from the **Atomic Energy Commission** to continue his studies on the plankton communities occurring along a salinity gradient.

J. David Deck, Department of Anatomy, School of Medicine, University of Virginia, recently received a 3-year grant of $17,500 from the **National Science Foundation** for "A Study of Limb Regeneration in Larval and Adult Amphibians". The grant includes money to continue studies on the role of nerves in larval amphibian limb regeneration and a study of experimentally induced limb regeneration in adult frogs.

A new course entitled, "Techniques of Handling Radioisotopes" was made possible at Emory and Henry College by equipment grants totaling $26,000 from the **Atomic Energy Commission** and **The Methodist Church.**

The Mountain Lake Biological Station has recently been advised by the **National Science Foundation** that its grant of $18,000 for three years has been renewed (1959-1961). This grant has made available funds for the establishment of awards for research and study at the Station. Three types of awards are available: Post-Doctorates, for research; Pre-Doctorates, for supervised research; and Post-Graduates, for training in field or laboratory research techniques, thus permitting course work. Application blanks for these awards may be secured from the Director, Mountain Lake Biological Station; Department of Biology; University of Virginia, and must be submitted by April 1, 1959.

The Biology Department at Emory University has received a grant of $100,000 from the **U. S. Public Health Service** for the addition of a wing to the present biology building.

The Department of Entomology of the University of Maryland has recently contracted with the **Fish and Wildlife Service** of the Department of Interior for Studies on the Effect of Changes in Water Level on Mosquito and Wildlife Populations in Maryland Salt Marshes. The principal investigator is William E. Bickley.

W. R. Kelley, Associate Professor of Biology at the University of South Carolina, has been granted $8,756.50 by the **Atomic Energy Commission** to make an ecological study of the vascular shore plants of a reservoir site on the Savannah River Plant. The contract runs for one year.

Harry W. Freeman, Associate Professor of Biology at the University of South Carolina, has received a one year contract renewal of $15,426 from the **Atomic Energy Commission** for an ecological study of the fishes of the Savannah River Drainage.

CONTENTS

The Official Quarterly Publication of
The Association of Southeastern Biologists

THE ASB BULLETIN

The ASB BULLETIN is the official quarterly publication of the Association of Southeastern Biologists and is published at Columbia, S. C., in January, April, July and October. Letters, news items, other contributions, and all communications about editorial matters should be addressed to the Editor, U.S.P.H.S., P. O. Box 717, Columbia, S. C. Changes of address should be sent promptly to the Secretary of the ASB, Dr. Harold J. Humm, Department of Botany, Duke University, Durbam, N. C. Subscription orders from libraries and other institutions should be sent to the Business Manager, A. W. Jones, Department of Zoology, University of Tennessee, Knoxville, Tenn. Subscription rate for nonmembers of ASB: $2.00 per year. Printing and typography by the Cary Printing Co., Columbia, S. C.

GEOFFREY M. JEFFERY, EDITOR

HAROLD J. HUMM, ASSOCIATE EDITOR
A. W. JONES, BUSINESS MANAGER

STATE CORRESPONDENTS

Alabama — H. A. McCullough, Howard College

Florida — Arthur W. Ziegler, Florida State University

Georgia—Netta E. Gray, Agnes Scott College

Kentucky—J. M. Carpenter, University of Kentucky

Louisiana—G. C. Kent, Jr., Louisiana State University

Maryland — Wm. E. Bickley, University of Maryland

Mississippi—Robert A. Woodmansee, Mississippi Southern College

North Carolina — T. W. Johnson, Jr., Duke University

South Carolina — Margaret Hess, Winthrop College

Tennessee—Helen L. Ward, University of Tennessee

Virginia—Harry L. Holloway, Roanoke College

West Virginia—Earl L. Core, West Virginia University

OFFICERS OF THE ASB

President—Mary Esther Gaulden, Biology Division, ORNL

Retiring President—Howard K. Wallace, University of Florida

President-Elect—Horton H. Hobbs, University of Virginia

Vice-President—Victor A. Greulach, University of North Carolina

Secretary—Harold J. Humm, Duke University

Treasurer—A. W. Jones, University of Tennessee

Executive Committee — William Burbanck, Emory University; W. S. Flory, University of Virginia; I. C. Kitchen, University of Mississippi; Elsie Quarterman, Vanderbilt University; D. C. Scott, University of Georgia; Harry E. Wheeler, Louisiana State University. All officers are *ex officio* members of the executive committee.

ASSOCIATION AFFAIRS

Nominations for ASB Officers

The Nominating Committee, composed of H. K. Wallace, Chairman, Harry J. Bennett and Chauncey G. Goodchild, has submitted the following slate of officers to be acted on by the members at the Knoxville meeting:

President-Elect—Earl L. Core, West Virginia University, and Victor A. Greulach, University of North Carolina.

Vice President—Thelma Howell, Wesleyan College, and Royal E. Shanks, University of Tennessee.

Treasurer—Asa A. Humphries, Jr., Emory University, and Elsie Quarterman, Vanderbilt University.

Executive Committee (two to be elected) — Robert B. Short, Florida State University, Robert T. Brumfield, Longwood College, Glenn R. Noggle, University of Florida, and Eugene P. Odum, University of Georgia.

The Annual Meeting

Attention is called to the program and notes of the Annual Meeting in Knoxville, April 16-18, 1959. The committee on local arrangements has, as usual, done an excellent job. They wish to have particular attention called to the deadline of April 11 for those wishing to participate in the Thursday afternoon (April 16) field trip to the Oak Ridge National Laboratory. It will be noted that the Smoker is to be held following the Thursday evening General Session, rather than the usual Friday evening Session. Dr. Karl Sax, noted botanist and geneticist, will be the guest speaker at the Thursday evening Session.

A record 378 registrants attended the meeting in Tallahassee last year; it is to be hoped that this trend will be continued and that a new record will be established at Knoxville.

ASB Guest Speaker

Dr. Karl Sax, noted botanist and Professor of the Arnold Arboretum, Harvard University, will be guest speaker at the evening session of the ASB meeting in Knoxville on Thursday, April 16th. His address "The Population Explosion" will deal with the timely topic of human populations and their associated problems.

Dr. Sax is for the spring semester Visiting Professor of Forestry at the University of Florida. He is widely known for his research in cytology, genetics, and horticulture and is this year President of the Genetics Society of America. In recent years his interest in the problems of rapidly increasing populations has found expression in two excellent publications: the book "Standing Room Only" and the booklet "The Population Explosion." Not content merely to call attention to the problem, Dr. Sax became active in the Planned Parenthood League of Massachusetts and is currently president of that organization. Dr. Sax is a member of the National Academy of Science and an honorary member of the Japanese Genetics Society and the French Academy of Agriculture.

As The President Sees It

Should ASB concern itself with undergraduate students? If so, in what way can it serve them and their teachers?

These are questions I have been pondering and that I feel should be seriously studied. Undergraduates represent a group of individuals vital to the future of biology. I recently visited biology departments in several of the many small liberal arts colleges in the Southeast and was tremendously impressed with the interest and enthusiasm of the students and professors.

In the past no special effort has been made by ASB to attract undergraduates. Last year a small group of them attended the Tallahassee meeting as representatives of the 26 Southeastern chapters of Beta Beta Beta, a National Biological Society. Tri Beta will again meet with ASB in Knoxville and will open its meetings to all undergraduates. I would like to urge those who have promising students to bring them to the Knoxville meeting.

Please think about the above questions and give expression to your opinions.

MARY ESTHER GAULDEN

Program of the 20th Annual Meeting Association of Southeastern Biologists

University of Tennessee, Knoxville, Tennessee, April 16-18, 1959

A Joint Meeting with the Southeastern Section of the Botanical Society of America, the Southern Appalachian Botanical Club, the Southeastern Division of the American Society of Ichthyologists and Herpetologists and the Southeastern Region of the Beta Beta Beta National Honor Biological Society.

SESSION SCHEDULE

Thursday, April 16

9:30 a.m. Meeting of the Executive Committee, Room 218, University Center.

1:15 p.m. Tour of the Biology Division, Oak Ridge National Laboratory.

2:00-8:15 p.m. Registration, Lobby, University Center.

8:20 p.m. General Session followed by Smoker, Ballroom, University Center.

Friday, April 17

8:00-12:00 noon. Registration, Lobby, University Center.

8:00-9:00 a.m. Southern Appalachian Botanical Club Breakfast, University Cafeteria, Sophronia Strong Hall. Members will go through the cafeteria line and take their trays to an adjoining private dining room.

8:00 a.m. Commercial Exhibits, Lobby, University Center.

9:00 a.m. Contributed Papers.
Vertebrate Zoology, Ballroom, University Center
Cytology and Genetics, 112 University Center
Invertebrate Zoology, 113 University Center
General Botany, 114 University Center
Plant Physiology, 115 University Center

11:15 a.m.-12:15 p.m. Business Meeting, Association of Southeastern Biologists, Ballroom, University Center.

1:15 p.m. Business Meeting, Southeastern Section, Botanical Society of America, Ballroom, University Center.

1:45 p.m. Contributed Papers.
Animal and General Ecology, Ballroom, University Center
Animal Physiology, 112 University Center
Parasitology, 113 University Center
Cryptogamic Botany, 114 University Center
Ichthyologists and Herpetologists, 115 University Center

5:45 p.m. Special Registration for Beta Beta Beta Members, University Cafeteria, Sophronia Strong Hall.

6:00 p.m. Dinner, Beta Beta Beta Society, University Cafeteria, Sophronia Strong Hall. Members will go through the cafeteria line and take their trays to the adjoining private dining room.

8:30 p.m. General Session, Ballroom, University Center.

Saturday, April 18

8:00 a.m. Field Trips. Members should leave Knoxville in private cars on route U.S. 441 at 8:00 a.m., in order to meet at National Park Headquarters two miles above Gatlinburg at 9:00 a.m.

8:30-12:00 noon. Student Papers, Beta Beta Beta Society; Eastern District, 54 Biology Building; Western District, 317 Biology Building.

12:00-1:00 p.m. Business Meeting, Beta Beta Beta Society; Eastern District, 54 Biology Building; Western District, 317 Biology Building.

GENERAL SESSION

THURSDAY, APRIL 16, 8:20 p.m.
Ballroom, University Center
Presiding: Mary Esther Gaulden

Address of Welcome: C. E. BREHM, President of The University of Tennessee.
Address: The Population Explosion, KARL SAX, Harvard University and University of Florida.
Smoker following address.

VERTEBRATE ZOOLOGY SESSION

FRIDAY, APRIL 17, 9:00 a.m.
Ballroom, University Center
Presiding: Donald C. Scott, University of Georgia

9:00 Polysaccharide Histochemistry of the Oviduct of the Newt, *Triturus viridescens*. A. A. HUMPHRIES, JR. and W. N. HUGHES, Emory University.

9:13 Experimental Morphogenesis of Adrenal Glands. LAURA G. ANDERTON, University of North Carolina.

9:26 Minimum Light Values Needed for Schooling in the Minnows, *Rhinichthys* and *Semotilus*. ROBERT A. KUEHNE, University of Kentucky.

9:39 Factors Affecting the Return of Stranded *Fundulus similis* to Water. JOE ANN SHEARER, University of Mississippi.

9:52 *Intermission.*

10:02 An Analysis of Small-Mammal Population Trends and Movements. H. E. SHADOWEN, Louisiana Polytechnic Institute.

10:15 Relationships of *Mus musculus* and *Peromyscus polionotus* in an outdoor enclosure. LARRY D. CALDWELL, University of Georgia.

10:28 The Vertebral Column of the Golden Hamster. MOHAMMED S. SALIH, Louisiana State University.

10:41 Hematological Observations in the Orders Insectivora, Rodentia and Carnivora. S. S. KILGORE, Louisiana Polytechnic Institute.

CYTOLOGY AND GENETICS SESSION

FRIDAY, APRIL 17, 9:00 a.m.
Room 112, University Center
Presiding: J. Gordon Carlson, University of Tennessee

9:00 A Cytological Study of the Genus *Habranthus.* W. S. FLORY and R. O. FLAGG, The Blandy Experimental Farm, University of Virginia.

9:13 Cytotaxonomic Relations among some Species of *Sansevieria* Thunb. (Liliaceae). M. Y. MENZEL, J. B. PATE and F. D. WILSON, Crops Research Div., Agr. Res. Service, USDA.

9:26 Chromosomes in Parthenogenetic Miracidia and Embryonic Cercariae of *Schistosomatium douthitti.* ROBERT B. SHORT and MARGARET Y. MENZEL, Florida State University.

9:39 A Cytochemical and Quantitative Study of Protein-Bound Sulfhydryl and Disulfide Groups of Sea Urchin Eggs. NAOKO KAWAMURA, University of Tennessee.

9:52 *Intermission.*

10:02 The Effects of Radiation on Mitotic Rate of Individual Stages of Mitosis in the Grasshopper Neuroblast. JEAN STEVENS and MARY ESTHER GAULDEN, Biology Division, Oak Ridge National Laboratory.

10:15 Formation and Behavior of Spindle Body in Neuroblast of Grasshopper, *Chortophaga viridifasciata.* KEN-YA KAWAMURA, University of Tennessee.

10:28 Chromosome Assortment in Oogenesis of Triploid *Mormoniella* Females. P. W. WHITING, University of Pennsylvania.

10:41 The Detection and Interaction of Body Size Factors Among Ranch-Bred Mink. CLYDE KEELER, Georgia State College for Women.

10:54 Posttreatment Effects on Radiation-induced Chromosomal Breaks. ALVIN V. BEATTY, Emory University.

INVERTEBRATE ZOOLOGY SESSION

FRIDAY, APRIL 17, 9:00 a.m.
Room 113, University Center
Presiding: Horton Hobbs, University of Virginia

9:00 A New Dysterian Ciliate from Warm Mineral Springs, Fla. EUGENE C. BOVEE, University of Florida.

9:13 Some "Spunkwater" Protozoa, including a Previously Unnamed Amoeba. ROBERT H. MOUNT and EUGENE C. BOVEE, University of Florida.

9:26 The Ultrastructure of the Tail of *Himasthla quissetensis.* ROBERT R. CARDELL, JR. and DELBERT E. PHILPOTT, University of Virginia and Marine Biological Lab., Woods Hole, Mass.

9:39 Observations on the Structure and Ultrastructure of the Cheliped Muscle of the Crayfish (*Cambarus longulus*). ROBERT R. CARDELL, JR. and LARRY L. FARMER, University of Virginia.

9:52 *Intermission.*

10:02 A Report on the Study of the Tardigrada in the United States. G. T. RIGGIN, JR., Virginia Polytechnic Institute.

10:15 Studies on the Attraction of Plant Nematodes to Roots. MARVIN L. CHILTON, University of Kentucky.

10:28 Notes on the Distribution and Ecology of *Cyathura* sp., an Estuarine Isopod. W. D. BURBANCK, Emory University.

10:41 Studying Nymphs of the Odonate Genus *Argia* in the Southwestern United States. MINTER J. WESTFALL, JR., University of Florida.

GENERAL BOTANY SESSION

FRIDAY, APRIL 17, 9:00 a.m.
Room 114, University Center
Presiding: Elsie Quarterman, Vanderbilt University

9:00 Weeks Island, a Botanically Interesting Area in the Louisiana Marshes. WILLIAM D. REESE, Southwestern Louisiana Institute.

9:13 Composition of an Alabama Forest in 1821. ROBERT A. DIETZ, Troy State College.

9:26 Preliminary Notes on a Region of Floristic Overlap Between the Upper and Lower Austral Zones in Northeastern Alabama. WILLIAM H. ADAMS, JR., Wildlife Research Unit, Alabama Polytechnic Institute.

9:39 Progress Report on the Flora of the Carolinas. ALBERT E. RADFORD, University of North Carolina.

9:52 *Intermission.*

10:02 Recent Plant Records in Virginia. A. B. MASSEY, Virginia Polytechnic Institute.

10:15 Blade Tissue Structure of some Species of *Atriplex* from the Southern California Deserts. JANE PHILPOTT, Duke University.

10:28 The Systematic Embryology of *Aletris aurea* Walt. EDWARD T. BROWNE, JR., University of North Carolina and Alabama Polytechnic Institute.

10:41 Better Trained High School Science Teachers — A Desperate Need. ELTON C. COCKE, Wake Forest College.

PLANT PHYSIOLOGY SESSION

FRIDAY, APRIL 17, 9:00 a.m.
Room 115, University Center
Presiding: Victor A. Greulach, University of North Carolina

9:00 Acetate Dependence for Sexuality in *Polytoma uvella.* FRANZ MOEWUS, Applied Research Laboratories, Miami Springs, Florida.

9:13 The Effect of Kinetin and Red Light on Growth and Cell Size. MILDRED M. GRIFFITH and ROBERT D. POWELL, University of Florida.

9:26 Chromatographic Studies of some Alcohol-Soluble Materials in Male and Female Papaya (*Carica papaya*) Plants. M. P. SINGH and G. RAY NOGGLE, University of Florida.

9:39 An Evaluation of the Andreae Chromatographic Technique for the Determination of Maleic Hydrazide. JOHN G. HAESLOOP and VICTOR A. GREULACH, University of North Carolina.

9:52 *Intermission.*

10:02 A Substance Controlling Growth in Timothy Roots. ROBERT T. BRUMFIELD, Longwood College and Oak Ridge National Laboratory.

10:15 The Production of Indole Acetic Acid by *Taphrina deformans* and *Dibotryon morbosum*. EVELYN E. CRADY and FREDERICK T. WOLF, Vanderbilt University.

10:28 Nonrespiratory Gas Released from Seeds During Moistening. NANCY BRASSINGTON and ALAN H. HABER, Winthrop College and Oak Ridge National Laboratory.

10:41 Respiratory Patterns in Diseased Plants. HARRY WHEELER and ROBERT GRIMM, Louisiana State University.

10:54 Influence of Respiratory Inhibitors on Absorption of Sugars by Plant Cells. THERESA PARTLOW and JOSEPH C. O'KELLEY, University of Alabama.

ANIMAL AND GENERAL ECOLOGY SESSION

FRIDAY, APRIL 17, 1:45 p.m.

Ballroom, University Center

Presiding: W. D. Burbanck, Emory University

1:45 Organic Production and Turnover during the First Seven Years of Old Field Succession on the AEC Savannah River Area. EUGENE P. ODUM, University of Georgia.

1:58 Concentrations of Radionuclides in the Natural Vegetation of a Contaminated Area. H. R. DeSELM and R. E. SHANKS, University of Tennessee.

2:11 Avian Uptake of Fission Products. WILLIAM K. WILLARD, University of Georgia and Oak Ridge National Laboratory.

2:24 Seasonal Lipid Levels in Key Population Groups of an Old Field Ecosystem. CLYDE E. CONNELL, University of Georgia and Valdosta State College.

2:37 Energy Flow in Two Salt Marsh Animals. ALFRED E. SMALLEY, University of Kentucky.

2:50 *Intermission.*

3:00 Trophic Relations within the *Zostera* "Community". EDWIN B. JOSEPH, Birmingham-Southern College.

3:13 Food Habits of the Canada Goose at Lake Mattamuskeet, North Carolina. THOMAS L. QUAY and CARL S. YELVERTON, North Carolina State College.

3:26 The Effect of Photoperiod on the Duration of Nymphal Development in Several Species of Odonata. CHARLES E. JENNER, University of North Carolina.

3:39 Studies of Yeasts Ingested by *Drosophila* Populations. JOHN M. CARPENTER and JAMES K. KOMATSU, University of Kentucky.

3:52 Comparative Tolerance of some *Drosophila* Species to Low Temperature. WALLACE D. DAWSON, JR., University of Kentucky.

ANIMAL PHYSIOLOGY SESSION

FRIDAY, APRIL 17, 1:45 p.m.

Room 112, University Center

Presiding: I. C. Kitchin, University of Mississippi

1:45 The Effects of pH and Viscosity on Surface Membranes in *Paramecium multimicronucleatum*. J. WARREN LEE and WILLIAM McCALL, Southern University.

1:58 Studies on the Metabolism of *Astasia longa* (Jahn). FRISSELL R. HUNTER and J. WARREN LEE, Southern University.

2:11 The Effect of Na L-thyroxine on Viability and Regeneration of *Planaria maculata*. WILLIAM L. MENGEBIER, Madison College.

2:24 The Effect of Sodium Fluoroacetate on Blood Glucose Levels in the Bullfrog (*Rana catesbeiana*). B. THEODORE COLE, Louisiana State University.

2:37 Fractionation of Peptides from Serum Albumin and Microsomes. N. G. ANDERSON and J. A. LEVINSON, Oak Ridge National Laboratory.

2:50 *Intermission.*

3:00 A New Approach to the Detection of Synergistic Doses in Combination Chemotherapy. JACK H. MOORE and J. RICHARD THOMSON, Southern Research Institute.

3:13 Antibiotic Beers as a Source of Anticancer Agents. J. RICHARD THOMSON and W. RUSSELL LASTER, JR., Southern Research Institute and Kettering-Meyer Laboratory.

3:26 Energy Flow through the Cotton Rat, *Sigmodon hispidus*. FRANK BENJAMIN GOLLEY, University of Georgia.

3:39 An Analysis of Factors Contributing to the Successful Reanimation of Mice from Less than 1° C. JAMES A. MILLER, JR. and FAITH S. MILLER, Emory University.

3:52 Uptake, Tissue Concentration, and Loss of Cesium-137 and Strontium-85 in the Common Prawn *Palaemonetes pugio* Holthuis. FRED K. PARRISH, Emory University.

PARASITOLOGY SESSION

FRIDAY, APRIL 17, 1:45 p.m.

Room 113, University Center

Presiding: Arthur W. Jones, University of Tennessee

1:45 Parasites of Commercial Shrimp. DWAYNE N. KRUSE, Florida State University.

1:58 "Swimmer's Itch" in Colorado. GEORGE W. HUNTER III, University of Florida and the Rocky Mountain Biological Laboratory.

2:11 The Initiation of Penetration of *Schistosomatium douthitti* Cercariae. ALVIN WAGNER, Florida State University.

2:24 A New Strigeid Trematode (*Diplostomatidae: Alariinae*) from the Pancreatic Duct of the Raccoon. REINARD HARKEMA and GROVER C. MILLER, North Carolina State College.

2:37 Observations on the Structure and Distribution of the Metacercaria, *Diplostomulum trituri* (Trematoda: Strigeida). EDWARD W. LAUTENSCHLAGER and ROBERT R. CARDELL, JR., University of Virginia.

2:50 *Intermission.*

3:00 Studies on the Survival of Trophozoites of *Plasmodium berghei* in Glycerolized Whole Blood at Low Temperatures. GEOFFREY M. JEFFERY, U. S. Public Health Service.

3:13 The Effect of Alloxan Diabetes on *Plasmodium berghei* Infections in Albino Rats. M.

GUTHRIE TOLBERT and R. BARCLAY McGHEE, University of Georgia.

3:26 Effect of Cobalt-60 Gamma Radiation on the Development of Acquired Immunity in the Rat to Larval *Hydatigera taeniaeformis*. KATHLEEN D. WYANT, HAROLD H-K. LEE, and ARTHUR W. JONES, University of Tennessee.

3:39 Chromosomal Abnormalities in the Embryos of Gamma-Irradiated *Hymenolepis diminuta*. RAYMOND L. KISNER, University of Tennessee.

3:52 Development of the Taeniid Embryophore. HAROLD H-K. LEE, University of Tennessee.

CRYPTOGAMIC BOTANY SESSION

FRIDAY, APRIL 17, 1:45 p.m.

Room 114, University Center

Presiding: Lewis E. Anderson, Duke University

1:45 Studies on the Development of Chlortetracycline-resistant Staphylococci in Chlortetracycline-treated Beef. JAMES M. JAY and J. WARREN LEE, Southern University.

1:58 Studies on *Ligniera verrucosa*, a plasmodiophoraceous parasite. CHARLES E. MILLER, Emory University.

2:11 The Rediscovery of the Chytrid, *Pringsheimiella dioica*. J. THOMAS MULLINS, University of North Carolina.

2:24 Aquatic Phycomycetes of the Highlands Region. WILLIAM J. KOCH, University of North Carolina.

2:37 Benthic Algae of Phosphorescent Bay, Puerto Rico. LUIS R. ALMODOVAR and H. L. BLOMQUIST, Institute of Marine Biology, University of Puerto Rico and Duke University.

2:50 *Intermission.*

3:00 Marine Chlorophyta of the Upper West Coast of Florida. H. J. HUMM and SYLVIA EARLE TAYLOR, Duke University.

3:13 The Concentration of Growth Promoting Substances in Certain Bryophytes. PAUL M. PATTERSON, CAROLYN BOLTON, and JENNIE JOE LAWRENCE, Hollins College.

3:26 Life History of *Rhodobryum roseum* (Weis) Limpr. NARINDER CHOPRA, University of Tennessee.

GENERAL SESSION

FRIDAY, APRIL 17, 8:30 p.m.

Ballroom, University Center

Presiding: Mary Esther Gaulden

Presentation of Awards: Mt. Lake Biological Station Fellowship offered by Phipps and Bird, Inc.
Research Awards offered by Carolina Biological Supply Company
Meritorious Teaching Award offered by Will Corporation of Georgia

Address: Spiders, HOWARD K. WALLACE, Immediate Past President of ASB, University of Florida.

Program for the Meeting of the Southeastern Region, Beta Beta Beta National Honor Biological Society

GENERAL SESSION

FRIDAY, APRIL 17

6:00 p.m. Dinner, University Cafeteria in Sophronia Strong Hall. Members will go through the cafeteria line and take their trays to the adjoining private dining room.

7:00 p.m. Address, University Cafeteria in Sophronia Strong Hall. Some Effects of Radiations on Cells, Dr. J. Gordon Carlson, University of Tennessee.

EASTERN DISTRICT SESSION

SATURDAY, APRIL 18

Room 54, Hessler Biology Building

8:30 a.m. to 12:00 noon. Contributed papers.
12:00 noon to 1:00 p.m. Business meeting.

WESTERN DISTRICT SESSION

Room 317, Hessler Biology Building

8:30 a.m. to 12:00 noon. Contributed papers.
12:00 noon to 1:00 p.m. Business meeting.

MEETING NOTES

Lodging and meals. A partial list of hotels and motels was published in the January issue of the BULLETIN. More complete lists may be obtained from the Knoxville Tourist Bureau, 811 Henley Street, S.W., Knoxville. The University dining facilities will be open to persons attending the meeting and their families. These include the cafeterias in the University Center and in Sophronia Strong Hall.

Registration. Registration will be in the Lobby of the University Center and will be held 2:00 to 8:15 p.m. on April 16 and 8:00 to 12:00 noon on April 17. A fee of $1.00 will be charged for registration.

Placement Service. A do-it-yourself type of placement service will be located in Room 202 of the University Center. Space will be provided for posting of available positions and personnel.

Directory. A directory of persons attending the meeting will be located in Room 202, University Center.

Commercial Exhibits. These exhibits will be in the Lobby of the University Center.

Field Trips. The three scheduled field trips were described in detail in the January issue of the BULLETIN. The Thursday afternoon (April 16) tour of the Biology Division of Oak Ridge National Laboratory will leave the Knoxville Campus at 1:15 p.m. It is of utmost importance that all persons interested in taking this trip inform Ronald C. Fraser, Department of Zoology and Entomology, University of Tennessee, before April 11. The two Saturday morning field trips include a botany trip and a bird trip, both in the Great Smoky Mountains National Park area. These trips will leave at 9:00 a.m.; full information will be available at the registration desk.

Local Arrangements Committee. J. Gordon Carlson, Chairman, Ronald Fraser, Joseph Howell, Fred Norris, Royal E. Shanks, A. J. Sharp and James T. Tanner.

Items of Interest: Knoxville Meeting

Biological Sciences at the Host Institutions

Biological sciences at the University of Tennessee are divided between three departments of the College of Liberal Arts and various divisions of the College of Agriculture. The Departments of Bacteriology, Botany, and Zoology and Entomology are located in one building on the Liberal Arts campus. This building was completed in 1935, after the previous biology building was destroyed by fire in January 1934. The present building was named Hesler Hall in honor of L. R. Hesler, botanist, on his retiring from the position of Dean of the College of Liberal Arts last June. In addition to the three departments named above, the building houses the Department of Anthropology and the Biological Sciences Library.

The Department of Bacteriology occupies one floor of Hesler Hall with its offices, laboratories, and classrooms. Major research projects are the study of host-parasite relations in tularemia in rodents by Dr. J. M. Woodward and in *Salmonella pullorum* infections in chicks by Dr. D. F. Holtman, head of the department. Dr. J. O. Mundt is working on the implications of streptococci found in foods to agriculture and the food industry. In the department is also a branch of the State testing laboratory for brucellosis and leptospirosis in cattle.

The Department of Botany and its herbarium are located on one floor of the building with additional space in the basement and greenhouses which are behind the building. In the basement is a newly constructed laboratory, planned by Dr. G. E. Hunt, to be used for instruction in the use of radioisotopes in plant physiology. Members of this department have been working for several years under Dr. A. J. Sharp, head of the department, on a definitive "Flora of Tennessee". Dr. L. R. Hesler and Dr. T. H. Campbell are continuing their study of the fungi of the southeastern states. Dr. R. E. Shanks and his students are working on the flora and plant ecology of the arctic slope of Alaska and also on the plant ecology of an area at Oak Ridge which has been contaminated with radioactive deposits.

The Department of Zoology and Entomology occupies all or parts of three different floors of Hesler Hall. Some of the research activities in this department have resulted in laboratories for special purposes. Dr. J. G. Carlson, department head, has assembled equipment for research on radiation effects on mitosis and other cellular activities. Dr. S. R. Tipton, studying hormone effects on mammalian respiration, and Dr. R. C. Fraser, studying biochemical aspects of embryology, have both recently received grants which aided in equipping laboratories for their research. The first air-conditioned laboratory in the building was constructed for the rearing and study of *Drosophila* and is now used by Dr. J. I. Townsend. Drs. A. W. Jones and Kathleen Wyant are conducting research on the effects of radiation on the host-parasite relation between helminths and mammals. Collections have been assembled, largely from Tennessee, of helminths by Dr. A. W. Jones, of insects by Dr. A. C. Cole who has also made extensive collections of ants of western North America, and of vertebrates by Drs. J. C. Howell and J. T. Tanner.

The proximity of Oak Ridge to the University of Tennessee has stimulated research at the University on the biological effects of radiation and on the use of radioactive isotopes and has resulted in fruitful cooperation between agencies and individuals at both places. An example of this is the establishment of the UT-AEC Agricultural Research Laboratory at Oak Ridge. Lying on the other side of Knoxville from Oak Ridge are the Great Smoky Mountains, and their accessibility has enabled both botanical and zoological research in ecology. JAMES T. TANNER

The Participating Societies

The ASB is honored again in 1959 to have four other organizations join in the annual meeting. While the Southeastern Section of the Botanical Society of America and the Southern Appalachian Botanical Club have been participating in these joint meetings for a number of years and are well known to the members, the Ichthyologists and Herpetologists and the Beta Beta Beta Societies are relative newcomers. Although space problems prohibit it in this issue, it is hoped to include descriptive information about these societies in an early issue of the BULLETIN.

Program reprints

Reprints of the program will be available to registrants at Knoxville, but reprints of the abstract section will not be provided. Those wishing to have access to the abstracts are reminded to take along the April issue of the BULLETIN.

Abstracts of Papers Presented at the Twentieth Annual Meeting of the Association of Southeastern Biologists

All except one of the 80 papers submitted for presentation at the Twentieth Annual Meeting of the Association of Southeastern Biologists in Knoxville, Tennessee, April 16-18, 1959, are abstracted here. Reprints of abstracts marked with an asterisk are available from the authors.

Preliminary Notes on a Region of Floristic Overlap Between the Upper and Lower Austral Zones in Northeastern Alabama*

WILLIAM H. ADAMS, *Alabama Polytechnic Institute*

The region described is the Ashland Plateau, a higher topographic division of the Piedmont Upland, and represents the southernmost outlier of the Appalachian chain of mountains in Alabama. This mountainous region is peculiar in that it was originally a longleaf pine forest even though it is some distance removed from the extensive longleaf belt of the Coastal Plain. This dominance has since been replaced by other pines and hardwoods through repeated cutting and complete fire protection. According to some authors, the area studied lies within Merriam's humid Upper Zone of the transcontinental Austral Region or Carolinian Life Zone. Results of this study indicate that this area more accurately represents a point of transition between the Upper and Lower Austral Zones. This contention is based on the large number of plants characteristic of both Zones that occur here thereby swelling its total number of plant species far above that of either of the separate Zones considered alone. Typical Upper Austral species reaching their southward limits here include *Juglans cinerea, Calycanthus fertilis, Stewartia ovata, Chimaphila maculata, Galax aphylla, Pycanthemum pycanthemoides* and *Solidago bicolor.* Typical Lower Austral species reaching their northward limits here include *Persea borbonia, Crotalaria purshii, Pilostaxis nana* and *Angelica dentata.*

Benthic Algae of Phosphorescent Bay, Puerto Rico

LUIS R. ALMODOVAR, *Institute of Marine Biology, University of Puerto Rico*
and
H. L. BLOMQUIST, *Duke University*

A small embayment (45 acres) on the southwestern coast of Puerto Rico has become famous for its spectacular luminescence. According to Margalef (1957), this is due to an unusual concentration of dinoflagellates. This phenomenon has led to several investigations on the biota present and its ecological aspects, compared with surrounding areas where the luminescence is not so striking. However, no investigation has been done previously on the benthic marine algae. On the basis of substrata and the algae present, this area may be divided into three more or less distinct zones. In this investigation, carried out during February, 1958, and from December, 1958, to January, 1959, 47 entities of marine algae were identified. Their distribution among the algal divisions are: Chlorophyta, 20; Phaeophyta, 6; Cyanophyta, 2; Rhodophyta, 19.

Fractionation of Peptides from Serum Albumin and Microsomes

N. G. ANDERSON and J. A. LEVINSON
Biology Division, Oak Ridge National Laboratory, Oak Ridge, Tennessee

Microsomal peptides (Anderson and Albright, Federation Proc., 17:9, 1950) and peptides obtained from hydrolysis of proteins synthesized on the microsomes must be fractionated if we are to determine whether the microsomal peptides are incorporated intact into the protein. To avoid loss of material in analysis, we perfected a chromatographic technique monitored by far-UV peptide bond absorption. Serum albumin tryptic peptides are chromatographed on XE64 resin at pH 8.5 using a sodium phosphate buffer. Peptides which move rapidly through the column are rechromatographed at pH 7.5. This procedure is repeated at successively lower pH's until resin in the acid form is reached. A fraction of the effluent is used for paper chromatography, butanol-propionic acid being used to determine whether more than one peptide was eluted with each peak. Separation of microsomal peptides by this method was initially unsatisfactory since a large number of amino acids were also present. A countercurrent dialyzer having seven dialysis stages effectively separates the peptides and amino acids before chromatography. Application of these methods to the problem of peptide intermediates in protein synthesis will be discussed.

Experimental Morphogenesis of Adrenal Glands*

LAURA G. ANDERTON, *University of North Carolina*

A specific type of adrenal gland occurs normally in each of the vertebrate classes but cases of anomalies which resemble adrenals of another class are also found. The adrenal anomaly in man of accessory adrenal tissue has recently attracted medical interest. This type of gland abnormal in mammals, normally occurs in urodeles. The purpose of this investigation was to study factors which affect the origin and union of the widely separated adrenal components of different germ layer origin into various morphological types of adrenal glands. The trunk neural crest was extirpated bilaterally from 100 *Amblystoma punctatum* neurulae. A second series of experiments involved the transplantation of neural crest mid-ventrally on embryos deprived of trunk neural crest. In the first experiment, sympathetic ganglia and adrenal medullary cells developed in late larval life but did not replace the normal cell complement. In the second experiment, it was found that normal pathways of neural crest migration are not essential for the development of sympathoblasts and adrenal medullary cells. The morphogenesis of normal adrenals in urodeles and of accessory adrenals in man is described in terms of intrinsic migratory powers of the neural crest, chronological determination, tissue affinities, and hormonal stimulation via the blood stream.

Posttreatment Effects on Radiation-induced Chromosomal Breaks

ALVIN V. BEATTY, *Emory University*

Since oxygen, through oxidative metabolism, has been found to influence the rejoining process in X-radiation-induced chromosome breaks, several experiments involving post-X-irradiative treatment of material have been carried out. Material irradiated in helium has been posttreated in helium and in oxygen while material irradiated in oxygen has been posttreated in oxygen, helium and carbon monoxide. Total doses of 200r and 400r, different intensities and temperatures have been used. Post-X-irradiative effects were found and can be explained and predicted on an energy-supplying basis.

A New Dysterian Ciliate from Warm Mineral Springs, Florida

EUGENE C. BOVEE, *University of Florida*

Amongst a varied and multitudinous fauna of ciliates in the Warm Mineral Springs, Florida, the majority are identical with or similar to marine ciliates, due in part to the brackish nature of the waters, approximately half as "salty" as sea water.

This ciliated assemblage includes a *Dysteria* sp. which resembles in size and general contours the type species, *Dysteria armata* Huxley, but in some specific characters more closely resembles *Dysteria pectinata* Nowlin and *Dysteria navicula* Kahl. A flattened ciliate, distribution of cilia upon it is limited to an adoral, anterior groove, and a postoral, marginal groove which is continuous with the former. At the rear of the marginal groove there projects a spine-like structure which houses a group of five or six "anal" cilia (perhaps cirri). When the *Dysteria* sp. from the Warm Mineral Springs is compared to its above mentioned relatives there are differences in the morphology relative to the anterior and marginal grooves, the posterior "spine", the cytostome and gullet, and the general shape of the body and its pellicular striations sufficient to warrant its consideration as a separate species.

Nonrespiratory Gas Released from Seeds During Moistening

NANCY BRASSINGTON and ALAN H. HABER
Winthrop College and *Biology Division, Oak Ridge National Laboratory*

When seeds were wetted in Warburg flasks, there was an immediate output of gas. Since this gas was not absorbed by alkali, it was not respiratory. Seeds killed by heating or freezing, as well as other dried plant material, also released gas when moistened. Thus the gas released upon moistening dry seeds was a physical phenomenon having no relation to viability. From considerations of the amounts of gas released and the temperature dependence of the effect, we concluded that the gas was probably air adsorbed on surfaces within the seeds. The duration of nonrespiratory gas production was prolonged for several hours by moistening lettuce seeds slowly, although the total amount of gas so produced was unaltered. If unrecognized, such release of air during water imbibition would lead to calculation of mistakenly high values of the respiratory quotient (R. Q.). This may explain the observations of several investigators who reported that many kinds of seeds have a relatively high R. Q. soon after they begin to take up water, and that the R. Q. decreases and finally levels off with increasing time during imbibition.

The Systematic Embryology of *Aletris aurea* Walt.*

EDWARD T. BROWNE, JR., *University of North Carolina*[1]

The systematic position of *Aletris* is widely disputed since there are both primitive and advanced characteristics in the genus. Only Hutchinson has recognized a relationship of *Aletris* with the other genera of the Liliaceae-Narthecieae. This relationship was substantiated by cytological evidence (Browne, ASB BULL. 5:5, 1958). Positive evidence of a similar nature was obtained from comparative embryology. Embryological development of *A. aurea* is very similar to that of *A. foliata* (Ono, 1929), and species of *Tofieldia, Heloniopsis, Narthecium* and *Metanarthecium*. The ovules are anatropous (as in *Pleea, Tofieldia, Narthecium*), crassinucellate, and bitegmic (*Pleea, Tofieldia*), and the cover cells (*Pleea, Tofieldia, Heloniopsis, Narthecium, Metanarthecium*) and MMC are formed from a single archesporial cell. Embryo sac development is of the Polygonum (Normal) type (*Tofieldia, Heloniopsis, Narthecium, Metanarthecium, A. foliata*). The long-persisting antipodals are small (*Narthecium, Metanarthecium*), and the mature embryo sac is narrowly constricted at the chalazal end (*Pleea, Tofieldia, Heloniopsis, Narthecium, Metanarthecium*). Microspore delimitation is of the successive type (*Narthecium*), and the anthers are introrse in all genera of the tribe except *Heloniopsis*. Capsule dehiscence is loculicidal (*Heloniopsis, Narthecium, Metanarthecium*). Where genera are not indicated for a particular embryological feature, this information is not known other than for *Aletris*. Both embryological and cytological similarities indicate a close relationship between *Aletris* and the other genera of the Liliaceae-Narthecieae.

A Substance Controlling Growth in Timothy Roots

ROBERT T. BRUMFIELD, *Longwood College* and *Oak Ridge National Laboratory*

A transparent, colorless, gelatinous substance covers the root cap and distal growing point of the timothy seedling root. The substance is especially apparent on air-grown roots when immersed in water and varies considerably in quantity in individual roots. Ultraviolet radiation stimulates growth of meristematic cells near the tip and individual roots vary in degree of response. A nonirradiated root is stimulated by the transfer of material from an irradiated one, but transfer from a nonirradiated root is inhibitory. The substance is apparently digested by RNase (50 mg/1) which is stimulatory to some roots and inhibitory to others. The rate of digestion by RNase is enhanced by the presence of 2,4,6-trichlorophenoxyacetic acid (30 mg/1) a compound inhibiting growth effects of UV as well as geotropism. IAA inhibits the digestion but does not influence the UV effects or geotropism. The biochemical nature of the substance is unknown but there is circumstantial evidence that RNA is a component.

Notes on the Distribution and Ecology of *Cyathura* sp., an Estuarine Isopod*[1]

W. D. Burbanck, *Emory University*

In contemporary literature on the isopod *Cyathura carinata* (Kryer), the geographical distribution given includes the coasts of eastern North America, Greenland, western Europe, the Mediterranean, West Africa, South Africa, China, and Asiatic Russia. Recent unpublished work by Dr. Milton A. Miller, University of California (Davis), and collections by the author indicate that the *Cyathura* which occurs from Lake Ponchartrain, Louisiana, to Chewonki Creek, Maine, is not the same as the *C. carinata* (K.) originally described from Denmark, but a new species. Associated with a characteristic annelid and crustacean fauna, it is a member of a community with a recognizable habitat. As observed in some sixty estuaries and tidal marshes in nine states, *Cyathura* sp. (Maximum length, 27 mm.), lives only where fresh and salt water mix. The water covering the substrate where they are found is in motion due to the slope of the land, tide, or wave action. They live to a depth of 3-4 inches in simple unlined tubes of their own construction or possibly in worm burrows. Some sand, variable in amount, is always present in the substrate which also contains an admixture of vegetable debris and at times, particularly in New Hampshire and Maine, blue clay.

Relationships of *Mus musculus* and *Peromyscus polionotus* in an Outdoor Enclosure

Larry Caldwell, *University of Georgia*

Following a two year intensive field study of relationships of *Mus musculus* and *Peromyscus polionotus* in old field succession on the AEC Savannah River Area, a one-acre enclosure was stocked with two pair of each species. Both species have occurred naturally for the past 7 years at the site of the enclosure. A live trapping program is being used to keep track of the mice and their breeding activities. Nest boxes have also proved useful in locating the mice.

The study so far has shown that: (1) the activity ranges of individuals of both species may overlap and sometimes almost coincide, (2) in nature the two species do not share the same burrow but laboratory observations show that under crowded conditions they will sometimes use the same nest box, (3) *Mus* is the more excitable and far ranging of the two species and maintains a less stable population density, (4) there is a high rate of disappearance of young of both species after they leave the nest.

Observations on the Structure and Ultrastructure of the Cheliped Muscle of the Crayfish (*Cambarus longulus*)*

Robert R. Cardell, Jr., and Larry L. Farmer, *University of Virginia*

Muscle tissue from the cheliped of the crayfish was removed and immediately fixed in Bouin's, formalin or FAA. Studies were made with the light microscope on the tissue. Other tissue was fixed *in situ* with buffered formalin, stained with 1% osmic acid and the ultrastructures were studied by means of the electron microscope. Further observations were made with the phase microscope utilizing material neither fixed nor stained. The results of these studies reveal that the striated muscle is composed of A and I bands that measure approximately one and 1.5 micra, respectively. The Z membrane in the I band is not evident but more studies with the electron microscope are needed to clarify this point. In longitudinal section the myofibrils are relatively large and appear to be continuous throughout the muscle fibril. In cross section the fibrils are loosely arranged in the fiber, and the filaments, composing the fibrils, are arranged in an hexagonal pattern. Nuclei are embedded in the fibrils of the muscle; therefore, it is believed the nuclei are scattered throughout the muscle fiber.

The Ultrastructure of the Tail of *Himasthla quissetensis**

Robert R. Cardell, Jr., *University of Virginia*
and
Delbert E. Philpott, *Marine Biological Laboratory*

The following observations were made in the tail region of the free swimming cercarial form of *Himasthla quissetensis* (fixed in 1% osmic acid) by means of an electron microscope. The cuticle of the tail was found to be one micron thick, possessing an outer single membrane with many indentations and a smooth double basement membrane. Within the cuticle were found many osmiophilic bodies that appeared to be small mitochondria. These bodies were scattered throughout the cuticle but were concentrated near its inner surface adjacent to its basement membrane. Layers of smooth muscle, forming concentric bands approximately 0.5 micron in thickness, were apparent beneath the basement membrane. A layer of striated muscle approximately three micra thick was located internal to the smooth muscle. The fibers of the striated muscle were found to run obliquely around the tail and many large mitochondria were found concentrated in the sarcoplasm below the myofibrils of the muscle. A study of the ultrastructure of the muscle did not reveal the A and I band arrangement characteristic of vertebrate muscle. Z membranes approximately 0.8 micron apart were evident in otherwise homogeneous cytoplasm. The central portion of the tail was found to be composed of parenchyma cells.

Studies of Yeasts Ingested by *Drosophila* Populations*

John M. Carpenter and James K. Komatsu, *University of Kentucky*

During the last three years over 500 wild yeast strains have been isolated from the crops of several species of *Drosophila*. Of the 145 strains thus far identified to species, 26 were taken from *D. melanogaster*, 21 from *putrida*, 40 from *affinis*, and 58 from *robusta*. Of these strains, 100 (69%) were of four yeast genera — *Candida*, *Kloeckera*, *Pichia*, and *Saccharomyces*. Fourteen species were represented in these genera. On the basis of crop dissections, *Drosophila affinis* shows a "preference" for *Kloeckera* and *Candida*, *robusta* and *putrida* for *Pichia* and *Saccharomyces*, and *melanogaster* for *Candida* and *Pichia*. In some cases there appears to be a correlation of such yeast "preferences" with the seasonal distribution of some *Drosophila* species, e.g. *Candida* and *Kloeckera* species are more frequent in the cool months when *D. affinis* is highest in frequency, *Pichia* or *Saccharomyces* is frequent throughout the entire collection period — as is

robusta. Decisive information of these trends awaits the analysis of the remaining yeast strains and certain environmental data.

Studies on the Attraction of Plant Nematodes to Roots*

MARVIN L. CHILTON, *University of Kentucky*

It has been taken for granted by most workers in the field of plant nematology that there is some substance which roots secrete that has an attraction for parasitic plant nematodes from the surrounding soil. The presence of this hypothetical substance has not been shown conclusively by experimentation.

This report is an attempt to further the knowledge in this area by presenting revised techniques and methods. Nematodes were placed on various media made to simulate soil conditions. Experimentation was done under sterile conditions. Various conditions studied included: (1) distance of nematodes from roots, (2) age of roots, (3) nutrient, and (4) physical constitution of media. Aqueous solutions in which seeds had been germinating for various lengths of time were also tested for attractiveness.

A medium containing only agar in a 2% concentration appears to be most satisfactory. Distance from roots, and age of roots were both found to be concerned in attraction. Tentative results indicate the presence of an attractive substance in the aqueous solutions.

Life History of *Rhodobryum roseum* (Weis.) Limpr.

NARINDER CHOPRA, *University of Tennessee*

Rhodobryum roseum (Weis.) Limpr. is strictly dioicous. Its spore germination is typical of true mosses. The spore germinates into ordinary green protonema, some branches of which are transformed into rhizoidal filaments. Bud origin and its transformation into a gametophore is found to be very similar to that in *Funaria hygrometrica* (Brown, 1919), *Bryum argenteum* and *Tortula indica* (Chopra, 1957) except in a few minor details. The apical cell of the gametophore is three-sided, which cuts off segments in regular succession, while the apical cell of the leaf is two-sided. The development of the leaf, the stem, the antheridia and archegonia is described in detail, and is similar to that in *Funaria hygrometrica* (Campbell, 1918), *Physcomitrellopsis indica* (Pandé and Chopra, 1957), *Tortula indica* (Pandé and Chopra, 1958a), *Pogonatum* (Chopra and Sharma, 1958), and *Pogonatum stevensii* (Pandé and Chopra, 1958b). The apical cell of the antheridium has two cutting faces, while in the archegonium the apical cell has two cutting faces initially, but changes into a three-sided apical cell after cutting a few segments. Spermatogenesis is very similar to that in *Mnium hornum* (Wilson, 1910) and *Mnium affine* (Woodburn, 1915). The development of the sporophyte from the fertilized egg is also described. The archesporium arises from the outermost layer of the endothecium. The peristome teeth develop from endothecial cells. The chromosome number of this species is $n = 10$ (Chopra, 1957).

Better Trained High School Science Teachers — A Desperate Need

ELTON C. COCKE, *Wake Forest College*

A study of applications submitted for participation in National Science Foundation Summer Institute for High School Teachers of Science and Mathematics indicate that many of our high school science and mathematic teachers are very poorly trained. Some have had little or no training in the subject which they are teaching, while others have had no training in the last twenty years and are not keeping up with the progress in their fields. The high schools of the Southeast are desperately in need of better trained teachers. The colleges have a real opportunity and responsibility in this matter.

The Effect of Sodium Fluroacetate on Blood Glucose Levels in the Bullfrog (*Rana catesbeiana*)*

B. THEODORE COLE, *Louisiana State University*[1]

Sodium fluoroacetate (SFA) is a metabolic poison which varies in toxicity with various warm blooded animals. Man appears to be most resistant, the dog most sensitive and the rat intermediately so. The lethal dose is some 1,000 times greater for cold blooded animals than for the rat. Bullfrogs which ranged in weight from 300-600 grams were maintained in a fasted condition at a temperature of 25 degrees for a period of 2-6 days prior to experimentation. Twelve animals were anesthetized by an intra-sinus injection of 3-5 mgms nembutal per 100 grams body weight. Surgery was performed to expose the heart and control blood drawn by cardiac puncture. Animals were then injected i.s., with 100 mgms SFA. Subsequent blood samples were drawn at intervals of 1, 2, 4, and 6 hours. The animals remained anesthetized during the entire period and were kept under cool, dripping water. The wound was closed to prevent loss of body fluids with wound clips. Blood filtrates were prepared and analyzed for glucose by a modified Somogyi method. Optical densities were read on the Spectronic 20 colorimeter (Bausch and Lomb). The data shows a steady hyperglycemia from a control level of 30 mgms% to 48, 66 and 90 mgms% at 1, 2, and 4 hours respectively. The blood sugar above 4 hours remained constant with a value of 89% at 6 hours.

1. This research supported in part by a grant from the University Research Council, Louisiana State University.

Seasonal Lipid Levels in Key Population Groups of an Old Field Ecosystem*

CLYDE E. CONNELL, *University of Georgia and Valdosta State College*

Samples of three of the key population components of an old field ecosystem were collected at seasonal intervals and extracted for total lipid content. This work was done in connection with the University of Georgia's Program for Ecological Studies at the Savannah River Plant of the Atomic Energy Commission. Population groups sampled were: (1) the Savannah Sparrow (*Passerculus sandwichensis*), (2) the Old Field Mouse (*Peromyscus polionotus*), and (3) the grasshopper, *Schistocerca americana*. The animals were dried in a vacuum oven, macerated, and total lipids were extracted; ethyl alcohol and petroleum were used as solvents. Fat was expressed as per cent of the weight (wet and dry) of the individual animals. Savannah sparrows show three fairly distinct seasonal fluctuations in fat content. Peak periods for this group were: (1) early fall, during actual migratory flight, (2) mid-winter, and (3) immediately prior to migration in spring. *Peromyscus* has two

peak periods, one in winter and another in midsummer. *Schistocerca* has one fairly distinct peak, in autumn. Only adults of this group were extracted.

The Production of Indole Acetic Acid by *Taphrina deformans* and *Dibotryon morbosum*

EVELYN E. CRADY and FREDERICK T. WOLF,
Vanderbilt University

Taphrina deformans and *Dibotryon morbosum*, when grown in media containing tryptophane, produce indole acetic acid as a metabolic product. The highest concentrations of indole acetic acid found by colorimetric tests were 20.5 ugm./ml. in the case of *D. morbosum* and 81.2 ugm./ml. in the case of *T. deformans*. The rate of synthesis, as well as the total quantity synthesized, is greater for *T. deformans* than for *D. morbosum*, and is greater in shake cultures than in stationary cultures. For both organisms, the available evidence strongly favors tryptamine as the probable intermediate in the conversion of tryptophane to indole acetic acid.

Comparative Tolerance of Some *Drosophila* Species to Cold Temperature*

WALLACE D. DAWSON, *University of Kentucky*

In order to learn the possible effect of cold temperature on *Drosophila* species with a view to understanding their overwintering capabilities, several lines of study were initiated. (1) Weekly collections were made during the months of December through March, 1957-58 and 1958-59 at Dry Branch Station near Lexington, Kentucky. Adult flies of three species, *D. affinis, putrida* and *tripunctata*, were obtained in these collections. Of these, *affinis* was the most frequent during both winters. (2) Winter collections of material which might contain eggs or pupae did not prove fruitful. (3) A series of direct cold temperature response experiments in the laboratory, using the species *affinis, robusta* and *melanogaster*, indicated that *affinis* is more tolerant of cold at all levels than either *robusta* or *melanogaster*, and that *robusta* is more tolerant than *melanogaster*. This is consistent with previous populations studied during other seasons which suggest that *D. affinis* may overwinter in the wild in greater numbers than many other species, and that *D. melanogaster* probably survives the winter only in protected domestic situations.

Concentrations of Radionuclides in the Natural Vegetation of a Contaminated Area

H. R. DESELM and R. E. SHANKS,
The University of Tennessee

Recent estimates of future nuclear power use suggest that radioactive wastes will be produced in great quantity and that a certain proportion of them will be released into natural ecosystems.

The fate of nuclides released into the White Oak Lake at Oak Ridge is under study and is of particular interest as the lake is now drained and the radioactive surface exposed to invasion by plants.

The dispersion and absorption of variable amounts of radiocesium in parts of the ecosystem are discussed.

The Composition of an Alabama Forest in 1821

ROBERT A. DIETZ, *Troy State College*

A previous study of the original vegetation of Pike County, Alabama, has been extended to include an analysis of tree size and forest composition by forest types. Four of these have been recognized, as follows: pine forest, pine-hardwood forest, upland hardwood forest and bottomland forest. The analyses are based upon surveyor's records.

A Cytological Study of the Genus *Habranthus**

W. S. FLORY and R. O. FLAGG,
The Blandy Experimental Farm, University of Virginia

Until recently *Habranthus* has been considered as essentially a South American genus, with species having either 12 or 24 comparatively large chromosomes, or aneuploid or hybrid numbers derived from these.

This report gives chromosome numbers for fifteen taxa involving 8 described and 3 undescribed species, 3 varieties of some of the 11 species, and a hybrid between two of them. New somatic numbers reported are: *H. immaculatus* - 22, *H. cardenasiana* - 24, *H. concolor* - 36, *H. incaica* - 54, *Habranthus* sp. (S13281-55) - ca. 48 and *Habranthus* sp. (13462-56) - 108. Species with 22, 36 and 108 chromosomes are from Mexico. Numbers now known for the genus are 12, 14, 18, 22, 24, 36, 48, 54 and 108, most falling in the euploid series based on 6. An exceptional species, in addition to *H. immaculatus*, is *H. juncifolius* ($2n = 14$). The predominant somatic number encountered is 24. Four species and three of the minor taxa, have this number. In addition one species has half the number (12), a hybrid traces from one of the 24 chromosome species, and the two aneuploids may be explained as originating from taxa with either 12 or 24 chromosomes. Descriptions are given for the karyotypes of most taxa; in some cases these are detailed, and in others preliminary. Factors concerning evolution of karyotypes, as well as taxonomic relationships, are discussed where suggestions seem warranted by the data. (*Research supported by National Science Foundation Grant G2716.*)

Energy Flow Through the Cotton Rat, *Sigmodon hispidus**

FRANK B. GOLLEY, *University of Georgia*

As part of a broad study of energy flow through the broom-sedge ecosystem, energy intake and loss in individual cotton rats was investigated in the laboratory. Preliminary results from two experiments indicate that the technique of confining wild rats and measuring their food intake and feces and urine output, and their maintenance metabolism provides adequate information for calculation of an energy flow chart for each individual. In these studies the cotton rat consumed an average of 43.7 kg.cal., and lost an average of 4.4 kg.cal. in feces, 5.1 kg.cal. in urine, and 27.8 kg.cal. in respiration per 24 hours. Weight gain or production during the experiments was minimal - 2.98 kg.cal. Energy intake should equal outgo, any discrepancy between these indicating experimental error. Here, the discrepancy between intake and outgo ranged from —11.2 to +2.46 kg.cal. and averaged 14 percent of the energy intake.

The Effect of Kinetin and Red Light on Growth and Cell Size*

MILDRED M. GRIFFITH and ROBERT D. POWELL,
University of Florida

Disks of uniform size were cut from the first foliage leaves of etiolated bean seedlings. One sam-

ple of disks was treated with solutions of kinetin of several concentrations; the second was exposed to red light; the third was treated both with kinetin and exposed to red light. A control was maintained. After forty-eight hours, all disks were measured and histological preparations were made. Overall growth and palisade cell size for each treatment were determined. The results indicated: (1) treatment with kinetin or exposure to red light increases growth; (2) treatment with kinetin stimulates cell enlargement; (3) exposure to red light increases the number of cells. From these results, it appears that kinetin and exposure to red light affect growth through different biological mechanisms.

An Evaluation of the Andreae Chromatographic Technique for the Determination of Maleic Hydrazide*

JOHN G. HAESLOOP and VICTOR A. GREULACH,
University of North Carolina

Andreae (*Can. Jour. Biochem. Physiol.* 36:71, 1958) devised a two-dimensional paper chromatographic technique for identifying maleic hydrazide (MH), using a ferric chloride-potassium ferricyanide developer that gives royal blue spots. The only other substance he tested was indole acetic acid. Since we were interested in using the method with plant extracts we determined the color reactions of 58 metabolites including sugars, amino acids, vitamins, hormones, purines, pyrimadines, and Krebs cycle acids, and 75 chemicals (including 31 hydrazides) assembled for a study of their effects on plant growth. In spot tests 21 metabolites, including some amino acids, sugars, vitamins, and Krebs cycle acids gave the blue reaction, as did all the hydrazides (but few other compounds) in the second group. IAA, IBA, 2,4-D, a-naphthaleneacetic acid, and gibberellic acid failed to give a blue spot. Bases give a distinct white spot. Rf values of compounds giving a blue color were determined. Since sugars, amino acids and other organic acids differ in color reaction the method may also be useful as a supplement to other developers for these groups of compounds. The technique is useful for class demonstrations of chromatography since no heat is required to bring out the blue spots.

A New Strigeid Trematode (*Diplostomatidae: Alariinae*) from the Pancreatic Duct of the Raccoon

REINARD HARKEMA and GROVER C. MILLER,
North Carolina State College

Examination of a raccoon on December 15, 1957, revealed the presence of 86 specimens of a trematode in the pancreatic duct. These worms had caused marked hypertrophy of the pancreatic duct and consequent swelling of the pancreas. The specimens proved to be a strigeid which is sufficiently different from any known form to constitute a new genus. This trematode is characterized by the presence of a very large, elongated holdfast organ contained within an elongated pouch of the ventral body wall. In this respect it is similar to the genus *Duboisiella*, but differs from it in the structure of the holdfast, which is not lobed; testes side by side; the absence of an ejaculatory pouch; and the presence of pseudosuckers. It also shows similarity to *Pharyngostomum* and *Pharyngostomoides* in the arrangement of the testes. However, the distinctive holdfast and ventral pouch separate it from these genera.

Marine Chlorophyta of the Upper West Coast of Florida

H. J. HUMM and SYLVIA EARLE TAYLOR,
Duke University

A study was made of the marine green algae (*Chlorophyta*) of the upper west coast of Florida from Tampa Bay to Pensacola, based upon numerous collections by the authors and others and upon herbarium records and literature. Fifty-eight species are recorded, 27 of which are newly reported for the area north of Tampa Bay.

In general, species found as far north as Tampa Bay may be expected to have a continuous distribution northward around the Gulf to Texas and Mexico, as minimum winter temperatures of the water seem to be sufficiently similar at intermediate depths offshore to permit development where salinity fluctuations are not great. The algal flora of the northern Gulf is not limited to those species characteristic of brackish waters and salt marshes. While these types are conspicuous along shore, a wide variety of stenohaline and tropical species occurs at depths of 15 to 100 feet or more throughout the area wherever the bottom provides a suitable substrate.

An artificial key, illustrations of nearly all species, and a systematic list of species with descriptions and habitat notes have been prepared for the area involved.

Polysaccharide Histochemistry of the Oviduct of the Newt, *Triturus viridescens**

A. A. HUMPHRIES, JR. and W. N. HUGHES,
Emory University

As one phase of an investigation of the nature of the jelly layers surrounding the amphibian egg and the way in which they are secreted by the oviduct, the polysaccharide histochemistry of the secretory epithelium of the oviduct of the newt was studied. The oviduct is grossly divisible into five secreting regions, called here A through E. There is a corresponding histological and histochemical differentiation. All regions gave a positive PAS reaction which was unaffected by glycogen digestion. Regions A, B, and D were metachromatic with toluidine blue and gave a positive reaction with alcian blue. The other regions responded negatively. Region A gave a strong violet metachromasia distinctly different from that of regions B and D. Treatment with hyaluronidase did not alter the metachromasia of region A or the reactions of B, C, or D. Treatment with ribonuclease failed to change the reactions of regions A or B. Other regions were not tested. The most probable explanation of the differences in staining reactions seems to be that regions A, B, and D contain acid polysaccharide, probably heparin-like, while regions C and E do not. There is evidence that the differentiation is of significance in certain aspects of the physiology of the maturing oocyte.

Studies on the Metabolism of *Astasia longa* (*Jahn*)*

FRISSELL R. HUNTER and J. WARREN LEE,
Southern University

Previous studies have demonstrated that "Kreb's Cycle" intermediates stimulate the oxygen consumption of *Astasia longa* (*Jahn*). The present report is concerned with enzymatic mechanisms underlying the previously observed oxidations. Colorimetrically or spectrophotometrically, numerous enzymes have

been demonstrated. Colorimetrically, the condensing enzymes have been demonstrated directly; pyruvic oxidase, acetic-thiokinase, and oxalacetic carboxylase indirectly. Aconitase, TPN - isocitric dehydrogenase and succinic dehydrogenase have been spectrophotometrically demonstrated, and preliminary experiments suggest the presence of fumarase and malic dehydrogenase. The results suggest the "Tricarboxylic Acid" cycle as a metabolic pathway in this species.

"Swimmer's Itch" in Colorado*

GEORGE W. HUNTER III, *University of Florida and the Rocky Mountain Biological Laboratory*

Reports received in the summer of 1957 suggested an outbreak the previous year of schistosome dermatitis among bathers at an elevation of nearly 9,000 feet. Investigations in 1957 revealed the presence of two families of mallard ducks. An examination of snails yielded brevifurcate cercariae from seven specimens of *Physa propinqua* Tryon. These parasites were identified as *Trichobilharzia physellae* (Talbot 1936), a bird schistosome found in mallard ducks. Exposure of six human volunteers yielded minimal responses in four persons and a hypersensitive reaction in one, thus indicating that the cercariae penetrated the skin of five of the six individuals.

This is believed to be the first record of schistosome dermatitis from Colorado.

Studies on the Development of Chlortetracycline - resistant Staphylococci in Chlortetracycline-treated Beef

JAMES M. JAY and J. WARREN LEE, *Southern University*

Various strains of *Staphylococcus aureus* were exposed serially to low concentrations of chlortetracycline (Aureomycin) in beef held at 28 C. The organisms were inoculated into twenty-gram samples of beef using needle and syringe. The antibiotic was administered in a similar manner. The samples were incubated at the above temperature for four days and homogenized in a Waring blendor. Additional samples of beef were inoculated with the homogenate. Aliquots of the homogenate were streaked onto the surface of 7.5% salt agar plates. Staphylococci were picked from these plates and their antibiotic sensitivity was determined using the tube dilution method.

Chlortetracycline-resistant strains of the original sensitive organisms have been demonstrated after as few as three beef-to-beef passages. Similar resistant strains could not be demonstrated as frequently when the organisms were passed from beef-to-agar-to broth-to beef.

A thirty-fold increase in resistance has been demonstrated after six passages by the beef-to-beef technique. Mannitol fermentation, coagulase production, and bacteriophage sensitivity were determined on the organisms and the results will be reported.

Studies on the Survival of Trophozoites of *Plasmodium berghei* in Glycerolized Whole Blood at Low Temperatures

GEOFFREY M. JEFFERY, *U. S. Public Health Service*

The preservation of viable mammalian and avian malaria parasites in the frozen state has been of inestimable value during recent years in the maintenance of experimental strains of *Plasmodium* without continual passage through the vertebrate hosts. Although good results have been obtained using parasites in whole citrated blood, it is known that freezing and thawing causes extensive parasite and red cell destruction. The prior successful use of glycerine as an additive in the preservation of sperm cells, red blood cells and other living materials dictated trials with similar preservation of malaria parasites. Using *Plasmodium berghei* in mice as the experimental parasite, varying amounts of glycerine were added to blood samples prior to freezing. Final concentrations of glycerine varying from 4.2 to 16.6 per cent proved to be protective to the red blood cells and parasites, regardless of the temperature of freezing or maintenance (—20 or —70° C.), of whether the freezing was slow or rapid, or of variation of temperature during maintenance. Maximum protection was usually achieved by the use of a buffered glycerine additive rather than glycerine-saline or glycerine-water solutions.

The Effect of Photoperiod on the Duration of Nymphal Development in Several Species of Odonata*

CHARLES E. JENNER, *University of North Carolina*

In experiments conducted at approximately 22° C., photoperiodism was demonstrated in the dragonfly *Tetragoneuria cynosura* and in the damselflies *Ischnura posita, Enallagma signatum, Enallagma basidens, Enallagma divagans,* and *Enallagma traviatum.* Long photoperiods of 13 or 14 hours duration promoted nymphal development; 11-hour photoperiods prolonged development, but the degree of influence differed with the different species. Thus development in *I. posita* was delayed only slightly on an 11-hour photoperiod, compared with those on a 14-hour photoperiod; in contrast, development was very greatly retarded on an 11-hour photoperiod in both *E. divagans* and *E. traviatum.* The responses of *T. cynosura, E. signatum* and *E. basidens* were intermediate between the two extremes. Diapause appears to occur only in the last nymphal instar in *T. cynosura* and *I. posita,* in both the last and penultimate instar in *E. signatum* and *E. basidens,* in the penultimate in *E. divagans* and in several instars in *E. traviatum.* These preliminary experiments make it clear that photoperiodism is an important factor in the control of seasonal attunement in the Odonata. The group offers extremely favorable material for the experimental investigation of photoperiodism, especially with regard to the opportunity for comparative studies of different species of varying degrees of relatedness.

Trophic Relations within the *Zostera* "Community"

EDWIN B. JOSEPH, *Birmingham-Southern College*

During the summer of 1958, community composition and trophic relations within the *Zostera* "community" were investigated. A specific aim was to determine the degree of competition among closely related species of fishes occupying this habitat. Community composition was determined by sampling all levels, including quantitative bottom samples, of the community. Well over 100 species were identified as members of the community; however, less than half were considered significant in the total trophic relations. The pipefishes, *Syngnathus floridae* and *Syngnathus fuscus,* appear to compete directly for food and, in addition, compete with the juveniles of several other species.

A Cytochemical and Quantitative Study of Protein-bound Sulfhydryl and Disulfide Groups of Sea Urchin Eggs*

NAOKO KAWAMURA, *University of Tennessee*

By a new method with colored sulfhydryl reagent, 1-(4-chloromercuriphenylazo)-naphthol-2, protein-bound sulfhydryl and disulfide groups in the eggs of *Arbacia punctulata* during the first cleavage were studied cytochemically and quantitatively. The amount of sulfhydryl groups decreased after the syngamy stage and then increased up to the original level at the cleavage stage. Changes in the amount of disulfide groups were the reverse of sulfhydryl groups, that is, the amount increased at the streak stage and decreased at the cleavage stage. A cytochemical observation showed that before the mitotic stage sulfhydryl groups localized in the cytoplasm uniformly but not in the nucleus. At the mitotic stage the spindle and astral fibers were rich in sulfhydryl groups. Disulfide groups were present in eggs except for the nucleus at all stages, and for the centrosphere at the mitotic stage. The results suggest that the spindle and astral fibers are composed of proteins rich in sulfhydryl groups which arise from disulfide groups in the region of the centrosphere.

Formation and Behavior of the Spindle Body in Neuroblasts of the Grasshopper, *Chortophaga viridifasciata**

KEN-YA KAWAMURA, *University of Tennessee*

From observations of both living and stained cells, it is clear that the formation of the spindle body begins in the cytoplasm, and after disappearance of the nuclear membrane its further development depends principally on the nuclear substances. The shift of the spindle body toward the side of the neuroblast where the ganglion cell will eventually form occurs during anaphase with elongation of the spindle body. It seems probable that this shift is induced by the asynchronous development in the asters, and by the spindle elongation. During telophase, attachment of the furrow region of the cell surface to the middle part of the spindle body is followed by a remarkable decrease in the spindle volume. Reconstruction of the nuclear membrane occurs at the same time. These findings suggest that the formation of the cleavage furrow, the decrease in the spindle volume, and the reconstruction of the daughter nuclei may be a closely related phenomena.

The Detection and Interaction of Body Size Factors Among Ranch-Bred Mink

CLYDE KEELER, *Georgia State College for Women*

Annually expanded populations of colorphase and standard Dark ranch-bred mink totalling 108,717 individuals were studied throughout twelve years. Presence of Moyle Buff, Silverblu, and Pastel in males and females tended to produce animals larger than normal; Breath of Spring, Aleutian, Palomino, Black Cross, and Ambergold animals were smaller than normal. (Mutants are listed in descending order of body weight.) Associated size tendencies are probably due to color genes themselves rather than to linked genes because size effects did not change radically in amount or direction, suggesting that no cross-overs occurred. Moyle Buff, Palomino, and Ambergold manifest their size tendencies in both homozygotes and heterozygotes. Two large size genes in an individual make it still larger; two small size genes together in an individual make it still smaller; a large size gene and a small size gene in an individual tend to cancel each other's size effects. One hundred and sixty comparisons between mean weights of populations are listed. Vector models drawn to scale for forty comparisons were found in keeping with our analysis. Body length studies revealed correlated size tendencies, although certain alterations in bodily proportions were also characteristic of some colorphase types.

Hematological Observations in the Orders Insectivora, Rodentia, and Carnivora

S. S. KILGORE, *Louisiana Polytechnic Institute*

This study deals with the red blood count, hemoglobin, hematocrit, mean corpuscular volume, mean corpuscular hemaglobin, concentration, diameter, white blood count and differential leucocyte count. The families included are Sciuridae, Soricidiae, Cricetidae, Zapodiae, and Mustellidae. A total of 73 animals was studied after being live-trapped at altitudes ranging between 300 feet and 9,500 feet.

Chromosomal Abnormalities in the Embryos of Gamma-Irradiated *Hymenolepis diminuta**

RAYMOND L. KISNER, *The University of Tennessee*

Adults of the rat tapeworm, *Hymenolepis diminuta*, were subjected to either 400 or 800 r of gamma rays (8.35 r per minute by whole-body irradiation of hosts). Worms were removed from rats and fixed in Carnoy's fluid eight to forty-eight hours after irradiation. Observation of aceto-orcein squashes revealed abnormal chromosomes in a number of cells of embryos at early cleavage. There are normally six pairs of chromosomes, all acrocentric, and ranging in length from three to seven microns. Abnormal cells contained one to several strands of nuclear material in the interzonal region of late anaphases and early telophases. These resembled typical bridges described from other irradiated material. Most of these were found in worms fixed eight hours after irradiation. Some cells contained abnormally long chromosomes observable in metaphase plates and at anaphase, suggesting possible earlier translocations. Work is presently in progress to determine more fully the nature and extent of these changes. This study is being supported in part by the U. S. Atomic Energy Commission under Contract AT(40-1)1749.

Aquatic Phycomycetes of the Highlands Region*

WILLIAM J. KOCH, *University of North Carolina*[1]

The last two summers have been spent at the Highlands Biological Station, North Carolina, in a study of the aquatic Phycomycetes of that region. A general survey and certain special studies were begun. The latter involved descriptive and culture work of algal parasites and various saprophytes, many of which were grown in the laboratory on pollen, hemp seed, cooked *Paspalum* leaves, cellophane, filter paper, hair, cow horn, or shrimp exoskeleton and some of which were cultured on agar media. Seventy-three species in forty-two genera

1. National Science Foundation Grant-in-aids administered by the Highlands Biological Station are gratefully acknowledged.

are known from our studies at Highlands. Among these are several apparently undescribed species of *Catenochytridium*, *Chytridium*, *Entophlyctis*, *Mitochytridium*, *Phlyctochytrium*, *Rhizidiomyces*, *Rhizophydium*, and *Rozella*. Species of *Phlyctochytrium*, old as well as new, are especially abundant and exhibit a wide variety of morphological types. The most interesting finds were two chytrids. One has a thallus like *Catenaria* of the Blastocladiales, and the other is a Cladochytriaceous species with an unusual type of sporangial proliferation. Pure culture studies revealed sexuality for the first time in *Chytriomyces hyalinus* Karling. Knowledge of the sexual mechanism in *Chytriomyces* permits a more definitive diagnosis of this perplexing genus.

Parasites of Commercial Shrimp

DWAYNE N. KRUSE, *Florida State University*

Three species of commercial shrimp (*Penaeus aztecus* Ives, *P. duorarum* Burkenroad and *P. setiferus* Linnaeus) were examined for parasites. The shrimp were collected in the summer and fall of 1958 from the northwest Gulf coast of Florida. The following parasites were recovered: metacercariae of *Opecoeloides* encysted in the tissue surrounding the stomach and digestive gland; three new species of trypanorhynchan larvae encysted in the digestive gland; unidentified cestode larvae from the lining of the mid-intestine; immature nematodes of the genus *Contracaecum* in the digestive gland and tissue surrounding the stomach; two gregarines, *Nematopsis penaeus* Sprague and a representative of a new genus, from the intestine and stomach respectively; and a microsporidian of the genus *Thelohania* in the musculature. The taxonomy, morphology, incidence and biology of these parasites will be discussed.

Minimum Light Values Needed for Schooling in the Minnows, *Rhinichthys* and *Semotilus**

ROBERT A. KUEHNE, *University of Kentucky*

There is good reason to accept the view that vision is the primary sense involved in the schooling of *Semotilus atromaculatus* (Mitchill) and *Rhinichthys atratulus* (Hermann). It follows that light intensity is the critical factor controlling aggregating behavior. Groups of three fish were tested using an apparatus in which light intensity could be varied between zero and 107.6 luxes (1 lux = 0.0929 foot candles) at the water surface. Threshold values for schooling were found to be about 1.35 luxes for *Rhinichthys* and 1.79 luxes for *Semotilus*. Performance improved up to 6.7 luxes but not beyond that point. Below the threshold values fish swam slowly, as did blinded specimens. Swimming speed increased over the same light intensity range in which schooling performance improved.

Observations on the Structure and Distribution of the Metacercaria, *Diplostomulum trituri* (Trematoda: Strigeida)*

EDWARD W. LAUTENSCHLAGER and ROBERT R. CARDELL, JR., *University of Virginia*

Diplostomulum trituri Kelley, 1934, is found as a parasite of the brain case, brain, and eyes of the newt, *Triturus v. viridescens*, which serves as an intermediate host of this trematode. Further information regarding diagnostic characteristics and structural details are added to the description of this form. Observations on the ultrastructure of selected organs are considered. The range of *D. trituri*, previously limited in the literature to western Pennsylvania and possibly Ohio, is extended to central Virginia.

Development of the Taeniid Embryophore*

HAROLD H-K. LEE, *The University of Tennessee*

Development of the striated embryophore surrounding the onchosphere was studied by histochemical techniques with the use of apochromatic and phased contrast microscopes. Embryos were examined unstained, or stained with methyl-green pyronin or dilute haematoxylin. The striation of the mature embryophore is due to hexagonal, radially arranged rods cemented together by pepsin-trypsin digestible material. During early cleavage the onchosphere is surrounded by 4 to 6 large nuclei with compact chromatin. As the onchosphere differentiates a thin embryophoral primordium forms outside the region of the giant nuclei. Immediately underlying the primordium are DNA positive granules which form a gradually thickening layer. The granules form groups, which become more compact as development proceeds, eventually comprising the rods of the completed embryophore. The giant nuclei meanwhile disappear. On the basis of the observed changes, the presence of DNA positive material, the reported polyploidy of the giant cells, and the opinions of other workers, it may be concluded that the formation of the embryophore is largely a function of DNA and protein synthesis by the giant nuclei.

The Effects of pH and Viscosity on Surface Membranes in *Paramecium multimicronucleatum**

J. WARREN LEE and WILLIAM MCCALL, *Southern University*

Paramecium multimicronucleatum grown in a buffered desiccated lettuce medium maintained at pH 7.5, with *Aerobactor aerogenes* the main bacterial source. The maximum expansion in length and width at pH 8.5. The paramecia were usually stouter at pH levels 7.0 except at pH 5.5 and generally more slender at pH 7.0.

The pH of the medium affected the size of food vacuoles as indicated by the fact that the maximum food vacuolar diameter was at pH 6.0, the minimum at pH 7.0.

The fastest and greatest expansion of food vacuoles diameter was at a relative viscosity of 8; the minimum food vacuolar diameter was in controls (without gum arabic) having a viscosity of 1.3.

Recent Plant Records in Virginia

A. B. MASSEY, *Virginia Polytechnic Institute*

As investigations of the flora in Virginia progress species new to the State are found, from time to time. Fernald during his survey of the flora in the southeastern corner of the State recorded a number of plant species which had not been previously recorded in the State. The writer and another State worker have recently reported new additions to the flora. *Alternanthera philoxeroides*, Griseb; *Aegilops cylindrica*, Host.; *Bunias erucago*, L.; *Calepina irregularis*, (Asso.) Thell. (= *C. corvini*, Desv.) have been found to occur naturally in the State. The occurrence of these will be discussed.

The Effect of Na L-thyroxine on Viability and Regeneration of *Planaria maculata*

WILLIAM L. MENGEBIER, *Madison College*

Recent reports (Gilbert and Schneiderman) indicate that contrary to general opinion, vertebrate hormones may have a specific effect on invertebrate growth. To study the effect of thyroxine derivatives on regeneration of *Planaria maculata*, animals were transversely cut at the region of the pharynx and each half placed in 100 ml. of distilled water. Experimental fragments received 0.25 ml. of 1% Na L-thyroxine during each 24 hour period. Over a 4 day experimental period, treated fragments had a mortality of 30%; control fragments over the same interval had an 84% mortality. Complete regeneration of tail fragments was measured by the appearance of fully formed eye spots. Experimental tail fragments reached this stage 24-48 hours earlier than parallel control fragments.

Cytotaxonomic Relations Among Some Species of *Sansevieria* Thunb. (Liliaceae)

MARGARET Y. MENZEL, *Agric. Res. Service, U.S.D.A.*, JAMES B. PATE, *U.S. Cotton Field Station, Knoxville*, and F. DOUGLAS WILSON, *Everglades Experiment Station*

In connection with breeding of cordage fiber plants for Florida, chromosomes and hybridization of sansevierias in the collection at the Everglades Experiment Station are being studied. Assuming that $x = 20$ in *Sansevieria* (forms with $2n = 40$ form only bivalents), 13 diploid, 3 tetraploid and 6 hexaploid taxa have been investigated. Mitotic karyotypes of all species examined are similar except for differences in ploidy. Morphological and cytological evidence from diploid species and from five diploid interspecific hybrids suggests that little chromosome differentiation has accompanied speciation. Data from the polyploids appear to conflict with this conclusion: (1) Morphology of most of the polyploid forms suggests amphiploid origin, though amphiploidy usually is not prominent in genera lacking chromosome differentiation. (2) While all the polyploids form multivalents, the average number of chromosomes associated in multivalents ranges from 9% in *S. canaliculata* to over 35% in *S. stuckyi*, suggesting origin from diploids with various degrees of chromosome non-homology. (3) Pachytene chromosomes in the polyploids differ from those of the diploids in having pronounced proximal chromatic regions. Possible ways of reconciling evidence from diploids and polyploids will be discussed.

Studies on *Ligniera verrucosa*, a Plasmodiophoraceous Parasite*

CHARLES E. MILLER, *Emory University*

A study of the roots of *Veronica persica* and *V. hederaefolia*, host plants of *Sorosphaera veronicae* (another plasmodiophoraceous parasite), revealed intracellular cystosori and zoosporangiosori of *Ligniera verrucosa*. The zoosporangial phase of this species has been heretofore unknown. The plasmodia of *L. verrucosa* are found in root hairs, other epidermal and sub-epidermal cells of the roots. Zoosporangial and cystosoral plasmodia are indistinguishable until cleavage has started. It is thought that plasmodia produced during early infection develop into zoosporangia, while those produced later develop into resting spores. No evidence for any sexual process was observed. The spherical-shaped zoosporangia making up a single zoosporangiosorus are interconnected; a single discharge pore may serve to liberate zoospores from different zoosporangia.

In the Plasmodiophorales the classical basis for generic distinction has been the arrangement of the cysts in the sorus. *Ligniera*, because of the supposedly uncharacteristic nature of its cystosori, has been suggested as a host-variety of *Sorosphaera*. Because the parasites can be distinguished while growing in the same host species, both in nature and under laboratory controlled host-parasite experiments, they should be considered as distinct taxa.

An Analysis of Factors Contributing to the Successful Reanimation of Mice from Less Than 1° C*

JAMES A. MILLER, JR. and FAITH S. MILLER, *Emory University*

Hypothermia protects newborn and adult mammals from experimental asphyxia and recently has been successfully tried for asphyxia pallida in human babies (Westin, Miller, Nyberg, Wedenberg, '59). By contrast, a simple and very effective method for cooling animals to 0°C with subsequent recovery utilizes partial asphyxiation during the first stage of cooling. Experiments were designed to resolve this apparent paradox using mice cooled by the Goldzveig-Smith method. After one hour in sealed vessels the 0_2 content was 6%, CO_2 was 11%, deep colonic temperature approximately 15°C. The relative importance of hypoxia, hypercapnia and high humidity was tested by the addition of soda lime, silica gel, or both. Hypercapnia proved most beneficial, hypoxia next, and increased humidity of least value for recovery of postural reflexes, prevention of hind limb weakness and indefinite survival. Tests of the efficacy of air, 100% 0_2, 95% 0_2 + 5% CO_2, and 90% 0_2 + 10% CO_2 for artificial respiration during rewarming demonstrated the superiority of 95% 0_2 + 5% CO_2, whether the hypothermia was of short duration (15 min. below 5°C) or of long (30 or 60 min.). X-ray studies on mice injected with "Micropaque" suggested that vasodilation produced by the sealed vessel technique may be the mechanism behind the success of the method.

Acetate Dependance for Sexuality in *Polytoma uvella**

FRANZ MOEWUS, *Applied Research Laboratories, Miami Springs, Florida*

Strain WH of *Polytoma uvella* can be grown in the presence and absence of acetate. With acetate the asexual growth phase is separated from the sexual phase by a transitory stationary phase, which is expressed by a bisegmented growth curve. The graph resembles to so-called "diauxie-graphs" which indicate that two different metabolic systems are involved. Without acetate only the asexual phase is exhibited. If acetate is added to stationary cultures, grown without acetate, about 30% of the cells are directly transformed into gametes (sex induction), while the remaining cells undergo gametogenesis. Finally 90% of all cells have mated and formed zygotes. Butyrate leads to gametogenesis, propionate has no effect. Induction of sexuality and gametogenesis are not due to pH changes. It is obvious, that during the transitory stationary phase the acetate-independent metabolism is replaced by an acetate-requiring metabolism. The addition of

a coenzyme A inhibitor, liosol (= d — (4-diphenylyl—)—butyric acid), to different stages of the cultures demonstrated, that the "asexual" metabolism is not affected, while 1 g/ml liosol prevents sex induction and gametogenesis. These data indicate that in *Polytoma* sexuality is linked to an acetate requiring pathway.

A New Approach to the Detection of Synergistic Doses in Combination Chemotherapy

JACK H. MOORE and J. RICHARD THOMSON,
Southern Research Institute, Birmingham, Alabama

The problem of drug-resistance in cancer cells, similar to drug-resistance in bacteria, presents an ever-present stumbling block to the successful chemotherapy of leukemia. For several years the striking but temporary antileukemic activity of the folic acid antagonists and the purine antagonists has been reported in experimental neoplasms as well as in clinical use. It is generally suspected that the existence of drug-resistant mutants in populations of leukemic cells is at least one limiting factor preventing successful chemotherapy.

We have previously reported (ASB BULLETIN 2(1), 1955, p. 11) combinations of agents demonstrating potentiating antitumor activity. This synergistic activity was noted by combining equal fractional doses of two drugs. In an effort to determine the most effective combination of two drugs, we have recently employed a better selective method by combining drugs with dosages arranged in a uniformly-graded manner. In such a selection of dosages, certain potentiating combinations which show the effect of a major dose of one drug aided by a minor dose of another become immediately apparent. The same scheduling will also show the effects of combinations of equal fractional doses. Data will be presented demonstrating the potentiation of activity of such agents as azaserine and 6-mercaptopurine using mouse leukemia L1210.

Some "Spunkwater" Protozoa, Including a Previously Unnamed Amoeba

ROBERT H. MOUNT and EUGENE C. BOVEE,
University of Florida

A literature search, during a protozoology course taken by RHM and taught by ECB, revealed nothing about protozoa in water-filled tree cavities. In such water from the laurel oak, *Quercus laurifolia*, 28 species of protozoa were found, including an amoeba depicted by Leidy in 1879 as "an amoeba of uncertain reference," determined by us to be assignable to Schaeffer's *Mayorellidae*, genus *Mayorella*. Ten species of flagellates were found; eight sarcodina; and ten ciliophora, including: Flagellates; *Chilomonas paramecium, Astasia longa, Astasia* sp., *Distigma* sp., *Heteronema acus, Peranema trichophorum, Peranema* sp., *Bodo edax, Cercomonas crassicauda,* and *Mastigamoeba* sp. Sarcodinids; *Actinophrys vesiculata, Mayorella* sp. #1, *Mayorella* sp. #2, *Arcella* sp. #1, *Arcella* sp. #2, *Cochliopodium vestitum, Centropyxis constricta,* and *Difflugia* sp. Ciliates; *Spathidium serpens, Cyclidium* sp. *Tetrahymena pyriformis, Tetrahymena* (Leucophrys) *patula, Tetrahymena* sp., *Spirozona caudata, Oxytricha hymenostoma, Parauroleptus musculus* var. *minor, Vorticella microstoma,* and *Epistylis* sp. A water sample taken from a sweet gum tree stump, *Liquidambar styraciflua,* yielded only one protozoan, the zooflagellate, *Bodo edax*. Only two protozoans were found in more than one sample; *Bodo edax* from one oak cavity and from the sweetgum hole; and *Tetrahymena pyriformis* from two different oak tree cavities.

The Rediscovery of the Chytrid, *Pringsheimiella dioica**

J. THOMAS MULLINS, *University of North Carolina*

Pringsheimiella dioica Couch, an endobiotic holocarpic chytrid parasitic in *Achlya flagellata,* was collected from Mirror Lake at Highlands, North Carolina. Isolates were obtained on three dates, July 30, August 7 and October 11, 1958. This proved to be a significant find in that *Pringsheimiella* had not been seen since it was originally described by Couch in 1939. Laboratory crosses between the isolates have shown that the collections include two mating strains which produce abundant resting bodies.

Organic Production and Turnover During the First Seven Years of Old-field Succession on the AEC Savannah River Area*

EUGENE P. ODUM, *University of Georgia*

Annual net production and heterotrophic utilization in croplands abandoned in 1951 have been estimated from harvest samples taken at monthly intervals during the growing season for the past seven years when shallow-rooted, short-lived forbs and grasses have dominated the vegetation. Rainfall appears to be most important single physical factor influencing annual variations, while clay-silt fraction of the subsoil has been key factor controlling local or horizontal differences. When these major limiting factors are ruled out (as, for example, calculating gms/M^2/ unit of rainfall on the same soil) it was found that: (1) net primary production declined during the first two years and remained virtually constant for next five years; (2) species diversity increased greatly along with the expected changes in species composition; (3) production became spread out over the season with result that terminal autumn standing crop declined; (4) surface litter increased but reached an equilibrium after only three years; (5) soil organic matter and certain macronutrients (P & Ca) leached (decreased in topsoil, increased in subsoil). These results suggest that from the functional standpoint secondary succession may involve a series of temporary steady-states rather than a continuous change as is usually postulated. Also, it is evident that an increase in number of species and successional changes in species composition within the same life form do not automatically result in an increase in productivity.

Influence of Respiratory Inhibitors on Absorption of Sugars by Plant Cells

THERESA PARTLOW and JOSEPH C. O'KELLEY,
University of Alabama

Sugar absorption by germinating pollen and by other plant cells is inhibited when these cells are supplied respiratory inhibitors. A study of the effect of 2,4 - dinitrophenol (DNP) on sugar absorption reveals that at molar concentrations of 5×10^{-5} and lower, oxygen consumption is not depressed. In contrast, at levels of DNP of 5×10^{-5} and 2×10^{-5} M glucose absorption is strongly depressed. At these concentrations of DNP phosphorylation in plant cells is reported to be uncoupled from oxidation. Results of this study suggest the presence of an absorption process dependent upon the formation of "high energy" phosphate bonds in respiration.

The Concentration of Growth Promoting Substances in Certain Bryophytes

PAUL M. PATTERSON, CAROLYN BOLTON, and JENNIE JOE LAWRENCE, *Hollins College*

By the pea-root growth inhibition method, tests were run on bryophytes during the fall and winter while they were in their seasonal dormant period. The growth inhibiting extractives, in terms of their IAA equivalents, varied from undetectable amounts (IAA at 10^{-12}) to 5 or less micrograms per gram of desiccator-dry bryophyte tissue. Tests are now being run on these same plants as they resume growth to test for expected increases.

Blade Tissue Structure of Some Species of *Atriplex* from the Southern California Deserts

JANE PHILPOTT, *Duke University*

There are thirteen species of saltbush in the alkaline and gravelly regions of the California deserts. Most of the shrubs are erect and intricately branched with gray or yellowish brown branches. The leaves are numerous, evergreen, and silvery white with a dense persisting scurf. Although the size and shape of the leaves vary from species to species, there are characteristic features of internal blade anatomy. The epidermis is two cells thick; vesicular hairs account for the scurfy appearance of the leaf surface. The mesophyll consists of palisade parenchyma which encompasses the well developed border parenchyma of the vascular bundles. Although there are chloroplasts distributed throughout the palisade, the chief chloroplast bearing cells are those of the border parenchyma.

Food Habits of the Canada Goose at Lake Mattamuskeet, North Carolina

THOMAS L. QUAY and CARL S. YELVERTON, *North Carolina State College*

The food habits of the Canada goose (*Branta canadensis*) at Lake Mattamuskeet were studied by the analysis of 263 gizzards and 31 crops collected primarily in the hunting seasons of 1951-52 and 1953-54. Of the ten major habitats on the refuge, the most important to geese as feeding grounds were the *Eleocharis* drawdown flats, *Eleocharis-Scirpus* low marsh, *Salix-Myrica* low marsh, *Andropogon*-Compositae upland, and farmland. Sedges (Cyperaceae) constituted 63% of the total food volume, and grasses (Gramineae) 33%. The remaining 4% was distributed among 31 other families. Animal matter totaled only 0.01%. The most important species, and the principal parts eaten, were: (1) *Eleocharis olivacea* and *E. parvula* (dwarf spike-rushes) — roots and culms; (2) *Scirpus americanus* (three-square) — roots and rhizomes; (3) *Zea mays* (corn) — grains. Other species and genera measuring at least 1% of the total food volume were: *Typha* (pistillate flowers), *Paspalum boscianum* (florets), *Spartina patens* (roots and rhizomes), *Eleocharis quadrangulata* (achenes more than vegetative parts), *Cyperus* (roots and tubers), and *Fimbristylis* (roots and basal culms). Leaves (mostly blades) and stems of grasses not identified to genus amounted to 8.23%. The vast beds of Characeae (17,000 acres) in the lake were practically unused by the geese.

Progress Report on the Flora of the Carolinas, January 1, 1956-December 31, 1958

ALBERT E. RADFORD, *University of North Carolina*

Initially the flora project was organized into three major work phases: (1) the general collection of vascular specimens for distribution and descriptive data in the physiographic provinces of the two states, (2) the identification of field collections, study of herbarium specimens, and the plotting of distribution data, and (3) the preparation of a manuscript, including diagnostic illustrations and keys. The first phase has been completed. Collections and field observations have been made in all 146 counties of the two states. Over 120,000 miles have been traveled while collecting approximately 175,000 specimens in the Carolinas during the last three growing seasons. In the second phase nearly sixty-five percent of the collections have been identified and plotted on distribution maps. Progress has been made on the third phase. Some keys and descriptions have been written. Diagnostic illustrations have been made of 110 genera. Completion date of the manuscript should be 1962.

Weeks Island, a Botanically Interesting Area in the Louisiana Marsh

WILLIAM D. REESE, *Southwestern Louisiana Institute*

Weeks Island, a salt dome formation rising about 150 feet from the coastal marshes of south-central Louisiana, offers a sharp contrast to the surrounding brackish marsh-lands, and provides a variety of habitats for plants not otherwise found in the area. The island, several hundred acres in area, is covered mostly by dense woods and is cut by numerous, deep ravines. Among the more interesting plants so far discovered there are the following mosses: *Callicostella pallida*, otherwise known in the U. S. only from peninsular Florida; *Syrrhopodon parasiticus*, the second collection from west of the Mississippi river; *Solmsiella kurzii*, otherwise known only from the type locality in northern Florida.

A Report on the Study of the Tardigrada in the United States

G. T. RIGGIN, JR., *Virginia Polytechnic Institute*

Although this group has been extensively studied in Europe, the publication of only five short papers indicates the neglect accorded the Tardigrada in this country. To date sixteen species of Tardigrades included in seven genera have been reported from the confines of this country. The present study has been carried out primarily on the tardigrades of mosses from the eastern United States. Techniques of collection and mounting in Hoyer's medium are modifications of procedures employed by previous workers. One new genus, *Itaquascon*, previously collected only in Brazil has been collected in several moss samples. Studies of specimens collected indicate the presence of twenty species not previously reported from the United States including two undescribed species.

The Vertebral Column of the Golden Hamster*

MOHAMMED S. SALIH, *Louisiana State University*

The vertebral formula is: C-7, T-13, L-6, S-4, Cd-13/14. Foramina transversaria may be lacking on one or both sides in C7. The transverse processes

of C6 always, and C5 occasionally, exhibit inferior laminae. Those of C7 are in contact with those of C6. Those of T1-T4 exhibit apical facets for articulation with the tubercula of the first four ribs. Homologous facets on T5-T10 occur on definitive diapophyses. T11-T13 exhibit demifacets for capitular heads only. A ventral hypapophysis occasionally occurs on L2. The four sacrals are united by their centra, and the first three are also united by their transverse processes. Only S1 articulates with the ilium. Centra and processes are reduced caudal to Cd5. Cd9-13/14 lack pedicles. Cd6-8 may exhibit incomplete pedicles on one or both sides, or the pedicles may be lacking. Cd7-13/14 lack neural spines. Cd11-13/14 lack prezygapophyses. Cd6-13/14 lack postzygapophyses.

An Analysis of Small-mammal Population Trends and Movements

H. E. Shadowen, *Louisiana Polytechnic Institute*

Small-mammal populations were studied in two uncultivated fields near Baton Rouge, Louisiana, for a period of one year. The quadrants were 1.67 acres and 2.98 acres in size, and 100 live traps, placed in rows of ten, were used on each plot. The trapping periods varied from two to sixteen days with an average of eight days. The sex of all trapped mammals was determined, and the animals were weighed, marked for later identification, and released. The total number of mammals taken was 1,488. The species trapped were: *Sigmodon hispidus*, 669; *Reithrodontomys fulvescens*, 491; *Reithrodontomys humulis*, 185; *Cryptotis parva*, 67; *Oryzomys palustris*, 55; *Mus musculus*, 18; *Peromyscus leucopus*, 1; *Peromyscus gossypinus*, 1; and *Blarina brevicauda*, 1. Frequency of recapture varied from one to 36 times with no pattern of consequence as to species. Immature Cotton Rats were trapped throughout the year with the peak occurring from April through June. The sex ratio of *Sigmodon hispidus*, based on the entire study, was 50:50, but from March through September 75 per cent of all initial captures on both plots consisted of females. Trapping reached its low point in late summer and fall when only 77 Cotton Rats were trapped from July to November.

Factors Affecting the Return of Stranded *Fundulus similis* to Water

Joe Ann Shearer, *University of Mississippi*

The flipping of *Fundulus similis* stranded on a beach is remarkably successful in returning the fish to the water. Experiments with a simulated beach of controlled slope at water edge showed that greatest movement was down slope whether slope was toward or away from water. View of the water (or of the lighter horizon formed by water) also affects the movements. An opaque screen between stranded fish and water results in a lessened degree of movement toward water. In night experiments using an open box with removable sides movement was enhanced if the side closest to the water was removed. With all sides in place, flipping was random in direction. Experiments using artificially brightened horizons have not been completed.

Chromosomes in Parthenogenetic Miracidia and Embryonic Cercariae of *Schistosomatium douthitti*

Robert B. Short and Margaret Y. Menzel, *Florida State University*

This paper presents final results, part of which have been reported (Short and Menzel, 1955, *J. Parasitol. 41: Sect. 2, 24-25.*). Herein we shall use X and Y for the sex chromosomes instead of Z and W as in previous reports.

In 168 parthenogenetic miracidial embryos from unisexual mammalian infections a haploid X set of chromosomes occurred in 160 and a diploid XX set in three; an additional five were probably diploids. In 153 miracidial embryos from bisexual infections there were the following constitutions: haploid X in four embryos, diploid XX in 69, diploid XY in 78, triploid XXY in one and triploid XYY in one.

Chromosomes analyses from cercarial embryos derived from parthenogenetic miracidia gave the following results: of ten male infections, three were haploid X, six were normal diploid XX, and in embryos from one snail both haploid X and diploid XX cells were observed. All seven female infections were XY diploids. It is believed that haploid individuals developed from reduced eggs, and the absence of the haploid Y constitution indicated that the X chromosome is necessary for viability. Possible methods of origin of XX and XY constitutions from parthenogenetic eggs are considered briefly and it is suggested that diploids arose as a result of meiotic irregularities.

Chromatographic Studies of Some Alcohol-Soluble Materials in Male and Female Papaya (*Carica Papaya*) Plants

M. P. Singh and G. Ray Noggle, *University of Florida*

The papaya (*Carica papaya*) is generally dioecious but some plants bear perfect flowers. There are also all gradations and variations, sometimes on the same tree, between these two conditions. It would be of value to be able to determine the sex of a plant before it is set out in the orchard. We have used chromatographic techniques in an attempt to find some chemical differences between male and female plants. The leaves of flower-bearing plants were extracted with ethanol and the alcohol-soluble constituents were separated by paper chromatography and by paper electrophoresis. No striking differences were found in the kinds or amounts of amino acids or sugars found in the extracts. A number of fluorescing spots showed up on the chromatograms when they were examined under ultraviolet light. Several yellow fluorescing spots have tentatively been identified as flavonoids but no differences were noted between the extracts of the male or female plants. A blue fluorescing material, as yet unidentified, was noted in a number of the extracts from the leaves of male plants. This material was either absent or present in very low concentrations in the extracts from female plants.

Energy Flow in Two Salt Marsh Animals*

Alfred E. Smalley, *University of Kentucky*

The utilization of energy by two animals living in a salt marsh near Sapelo Island, Georgia, was studied. *Littorina irrorata*, a snail, is a detritus-aufwuchs feeder; *Orchelimum fidicinium*, a grasshopper, is a primary consumer, living exclusively on *Spartina alterniflora*. Population densities were measured on a seasonal basis, and converted to standing crop in Calories per meter square per year. Ingestion, respiration and growth were determined and expressed in the same units. Energy flow in the grasshoppers was not as variable seasonally as was biomass or numbers. The entire growth period of the grasshoppers occurred during the spring and summer when *Spartina* was growing at a maximum rate. Energy flow of the *Littorina* population showed

little seasonal variation which correlated well with the relatively constant supply of detritus available in the tidal waters which flush the marsh. The more rapidly growing, shorter-lived *Orchelimum* population tended to assimilate a smaller proportion of ingested food, but was more efficient in converting the assimilated food into protoplasm, than the slow-growing, longer-lived *Littorina* population. These differences in efficiency are correlated with the food available to the two species.

The Effects of Radiation on Mitotic Rate of Individual Stages of Mitosis in the Grasshopper Neuroblast

JEAN STEVENS and MARY ESTHER GAULDEN,
Biology Division, Oak Ridge National Laboratory

The effects of radiation on mitotic rate have been studied by determining the inhibition produced in the individual phases of the mitotic cycle. The stages of mitosis as observed in the living neuroblast of the grasshopper embryo can be subdivided, on the basis of morphological characteristics of cell structures, into 14 distinct phases. Thus it is possible to analyze in considerable detail the mitotic processes in this cell. Neuroblasts in known phases were located in culture preparations of embryos. Some served as unirradiated controls; others were irradiated with 8, 32, or 64 r of X rays. The time required by cells irradiated in a given phase to reach the next metaphase was compared with that required by unirradiated cells of the same phase to reach this point. All cultures were kept at 38° C during observations. Metaphase was chosen as the end point because it is an easily identifiable stage and because cells reaching this stage usually complete division. The mitotic inhibition of the neuroblast to X rays varied greatly with the stage of mitosis at the time of treatment and with the dose of X rays. The data suggest that the effects of radiation on mitosis will not be found to be explicable in terms of a single phenomenon.

Antibiotic Beers as a Source of Anticancer Agents

J. RICHARD THOMSON and W. RUSSELL LASTER, JR.,
Southern Research Institute,
Birmingham, Alabama

The Cancer Chemotherapy National Service Center, an agency of the National Institutes of Health, has recently enlarged its primary screening for anticancer agents to include very large numbers of crude antibiotic beers. These beers are isolated as the metabolic by-products of molds and other microorganisms collected throughout the world. These organisms are grown in different media, and the end products of fermentation are first screened to eliminate any known antibiotics. If the crude beer shows anticancer activity, that lot is refermented. If the anticancer activity of the original is present in the referment, a larger sample of the beer is prepared, and the active fraction is isolated for more intensive study.

Data will be presented to demonstrate the unequivocal anticancer activity of certain of these new antibiotic preparations against solid mouse and rat tumors, as well as experimental mouse leukemias. Certain of the crystalline material isolated from beers are active against neoplasms resistant to known antimetabolites. The significance of these findings will be discussed. The screening data suggest that there are statistically more active agents found in random samples of antibiotic beers than in an equal number of synthetic compounds selected at random.

The Effect of Alloxan Diabetes on *Plasmodium berghei* Infections in Albino Rats

M. GUTHRIE TOLBERT[1] and R. BARCLAY MCGHEE,
University of Georgia

Earlier workers reported that hyperglycemic canaries showed higher levels of parasitemia when infected with *Plasmodium cathemerium* than nonhyperglycemic canaries. In the present study, albino rats were rendered diabetic by alloxan monohydrate treatment to determine the effect of hyperglycemia on *P. berghei* infections. All rats were infected by intracardial injection of blood from another heavily infected rat. The control group received no alloxan treatment. A second group were those in which the alloxan dose was ineffective in producing diabetes. The third group were the animals which became diabetic in response to alloxan treatment. The course of infection was followed by parasite counts made from blood films stained with Giemsa's stain, erythrocyte counts, and blood sugar determinations. The first two groups showed courses of infection not significantly different from each other and very similar to those reported by other workers. The diabetic group, however, showed levels of infection significantly lower than those of the other two groups. Apparently diabetes in the rat produces conditions unsuitable for normal growth and reproduction of the malaria parasite, *P. berghei.* This is in contrast to the findings of the effect of hyperglycemia in canaries on *P. cathemerium* infections.

The Initiation of Penetration of *Schistosomatium douthitti* Cercariae*

ALVIN WAGNER, *Florida State University*

In 98% of the observed cases cercariae of *S. douthitti* penetrated into ears of adult white mice within 10 minutes after being placed on the surface. Cercariae placed on ears that had been extracted with ether for several days were not stimulated to penetrate. Cercariae, when exposed to the residue obtained by evaporation of ether extracts of whole mouse skins, made "penetrating movements", shed their tails and discharged the contents of their penetration glands. Ether extracted ears rubbed with this residue stimulated cercariae to penetrate. Cercariae were exposed to various chemical substances which are soluble in ether and believed to be present in skin. Free fatty acids elicited reactions similar to those observed when cercariae were exposed to the residue from ether extracts of skins. Ether extracted ears when rubbed with fatty acids in a lanolin base stimulated cercariae to penetrate.

The presence of free fatty acids has been reported in the lipid surface layer of the skin, and in the keratinized layer of the epidermis. From this fact, and from the experimental results given above, it is suggested that free fatty acids are partially, perhaps entirely, responsible for the stimulation of *S. douthitti* cercariae to penetrate into the definitive host.

This work was supported by the National Science Foundation, and by grant E-1142 (C2) from the U. S. Public Health Service.

Studying Nymphs of the Odonate Genus *Argia* in the Southwestern United States

MINTER J. WESTFALL, JR., *University of Florida*

During the summers of 1956 and 1958 I made trips to the Southwestern United States to collect Odonata with the aid of grants from the National Science Foundation and the Penrose Fund of the American Philosophical Society. A special effort was made to obtain life history material in the genus *Argia* for inclusion in the Manual of the Zygoptera of North America now in preparation. Twelve species of this genus were reared, most of them species whose nymphs are undescribed. Adults of five other species were collected and studied. Interesting observations were made regarding habits, and different ecological niches occupied by several species in the same stream. Studies of the nymphs of this genus, as in other genera, throw much helpful light on the problem of species relationships. Several adults which had been described as subspecies were found to have distinct nymphs and should be accorded full specific rank. Likewise in establishing genera the nymphal characters should be considered. After collecting many nymphs of *Hyponeura lugens* (Hagen) I have still not found any good characters to separate it from *Argia*, thus showing its very close relationship to this genus.

Respiratory Patterns in Diseased Plants

HARRY WHEELER and ROBERT GRIMM, *Louisiana State University*

Augmented respiration, a characteristic feature of infected plant tissues, has been induced by treatment with victorin, a toxic product of the fungus *Helminthosporium victoriae*. Moreover, treatment with victorin rendered plants insensitive to 2,4-dinitrophenol, an uncoupler of oxidative phosphorylation, and caused a marked increase in the rate of ascorbic acid oxidation. These effects of victorin were restricted to one group of oat varieties susceptible to the pathogen, *H. victoriae*. Studies of susceptible oats, artificially infected with *H. victoriae*, have revealed a similar series of effects. Three days after inoculation the respiratory rate of infected tissue was nearly twice that of controls and this high rate was maintained until the tenth day when the rate dropped. During this period of high respiratory activity, infected tissues failed to respond to treatment with 2,4-dinitrophenol. In homogenates of infected tissues, ascorbic acid oxidation was increased 2-4 times. Further work is required to determine the relation of these effects to the nature of susceptibility and resistance to this disease.

Chromosome Assortment in Oogenesis of Triploid Mormoniella Females*

P. W. WHITING, *University of Pennsylvania*

Triploid females lay many eggs but, due presumably to aneuploidy, very few develop. All offspring of an unmated triploid are euploid and male, — haploid and diploid, the latter developing more slowly and being only half as numerous. This deficiency may be due, not to lower viability, but to loss of one of the three chromosomes of the hexads in oocyte-I division so that only one reaches each pole. When the three chromosomes derived from a single hexad were marked by triple alleles, it was shown that their distribution was not random among the reduced eggs. Each of the two homologous paternal chromosomes (from the diploid sperm of the diploid father) was only two-thirds as frequent as the single maternal chromosome. This was shown by relative frequency of the three genotypes of equally viable haploid males. A method is now being devised for measuring the relative frequency of the three diploid male genotypes. *(Research aided by U. S. Atomic Energy Commission contract AT(30-1)-1471.)*

Avian Uptake of Fission Products*

WILLIAM K. WILLARD, *University of Georgia and Oak Ridge National Laboratory*

White Oak Lake bed at the Oak Ridge National Laboratory is contaminated by low-level wastes containing a variety of radioactive isotopes. The lake bed supports a productive natural community of pioneer vegetation which, in 1958, exhibited two zones, a bushy zone of shrubs, sedges, forbs and grasses on the lake bed proper and a thicket zone of willows and alders along the old shore line. The bushy zone was inhabited by such birds as Song Sparrows, Yellowthroats and Field Sparrows while the thicket zone included Catbirds, Yellow-breasted Chats, White-eyed Vireos, etc. Goldfinches and Indigo Buntings were collected frequently in both zones. During the summer of 1958 radioassays of bird tissues, content of bird stomachs and major food items (insects, berries) were carried out. Gross beta activity and also Sr^{90} and Cs^{137} levels were determined. In general, bird species living in the bush zone had about twice the body burden of isotopes as did species living in thickets or those using both thickets and bushes, although there was wide individual variation. Sr^{90} and Cs^{137} occurred together in approximately equal amounts in food items (insects, berries) but in birds, the specific activity of Sr^{90} in bone was greater than that of Cs^{137} in muscle. There was an unexplained high activity in the eyes of one species, the Yellow-breasted Chat. Observed isotope levels are considered in terms of possible effects on the birds, and also in terms of the role that birds may play in the distribution of radioactivity in the ecosystem.

The Effect of Cobalt-60 Gamma Radiation on the Development of Acquired Immunity in the Rat to Larval *Hydatigera taeniaeformis**

KATHLEEN D. WYANT, HAROLD H-K. LEE, and ARTHUR W. JONES, *University of Tennessee*

Rats were immunized by intraperitoneal injections of larval *Hydatigera taeniaeformis* homogenate, irradiated one to five weeks later, and infected with *H. taeniaeformis* eggs one day thereafter. Development of the "early" immune response (decrease in total number cysts) in rats receiving 480r one week after immunization was not affected, probably because preformed "early" antibody was present at the time of irradiation. Results in rats receiving 240r, 480r, and 720r five weeks after immunization were not conclusive because the control, immunized rats did not develop the expected "early" immunity; no irradiation effects were noted. The "late" immune reaction (increase in dead cysts) normally elicited by immunization, and present in the controls, was completely suppressed in rats receiving 480r one week after immunization, and in rats receiving 240r, 480r, and 720r five weeks after immunization. Perhaps "late" antibody formation, elicited by the growing parasite, and/or the inflammatory response of lymphatic origin were depressed by irradiation. This study is being supported in part by the U. S. Atomic Energy Commission under Contract AT(40-1)-1749.

NEWS OF BIOLOGY IN THE SOUTHEAST

About People

James N. Dent, Biology Department of the University of Virginia, was invited to Atlanta on the Visiting Scholars Program by the University Center in Georgia, February 17 and 18. One day was spent at Oglethorpe University and the other at Emory University and Agnes Scott College. Dr. Dent presented a lecture, "The relations of the thyroid and pituitary glands," at a joint Agnes Scott-Emory Seminar.

Robert Weigel has joined the Department of Biology of Howard College as Assistant Professor. Dr. Weigel is a recent graduate of the University of Florida and has special interests in vertebrate zoology and paleontology.

The following new personnel have recently joined the staff of the Biology Division of the Oak Ridge National Laboratory: **Roderick K. Clayton** (Microbiology Group) — Dr. Clayton, who has been at Oxford University and Trondheim, Norway, under a National Science Foundation Fellowship, received the Ph.D. degree in Physics and Biology from the California Institute of Technology; **Manfred S. Engel** (Microbial Protection and Recovery Group) — Dr. Engel received the Ph.D. in Microbiology from Cornell University; **Jean Maisin** (Mammalian Recovery Group) — Dr. Maisin received degrees in Pathology and Electroradiology from Louvain University, Belgium; **Johan H. Stuy** (Microbial Protection and Recovery Group) — Mr. Stuy, who received the Doctorondus degree in Chemistry from the University of Utrecht, Netherlands, has been associated with the Department of Biology at Brandeis University for the past year; **Otto Vos** (Mammalian Recovery Group) — Dr. Vos received the Ph.D. from the State University of Groningen and has been employed as a histologist with the Medical Biological Laboratory, National Defense Research Council, Rijswijk, Netherlands.

A. J. Speece has joined the faculty at Northeast Louisiana State College at Monroe. Dr. Speece received his training in cytology at the University of Texas.

Bernard Lowy has returned to the Botany Department at Louisiana State University after an extended trip to South America.

Jack R. Collier has resigned from the Zoology Department at Louisiana State University to take a research position.

George H. Mickey, Louisiana State University, will deliver the annual Mendel Lecture at the initiation banquet at Beta Alpha chapter of Beta Beta Beta at Spring Hill College, Alabama, on March 19. The title of Dr. Mickey's lecture will be "Opportunities for Research in Cytogenetics." On April 2 he will address the chapter at Northwestern State College (Louisiana).

C. M. Loveless and **Edwin L. Tyson** of the Florida Game and Fresh-Water Fish Commission attended the North American Wildlife Conference in New York in early March. Both presented papers to the Conference.

Charles B. Metz, Professor and Associate Director of the Florida State University Oceanographic Institute, has been named Secretary of the recently organized Section of Developmental Biology of the American Society of Zoologists.

Sidney W. Fox, Professor and Director of the Florida State University Oceanographic Institute, has been elected Chairman of the Division of Biological Chemistry of the American Chemical Society.

A. Gib DeBusk, Assistant Professor of Biology at Florida State University, has been named as a member of the National Science Foundation Panel on Undergraduate Research Programs.

Henry Stevenson of Florida State University will participate in the study of the imported fire ant and its effect on wildlife. Dr. Stevenson will be a representative of the Department of Game and Fresh Water Fish.

Fred R. Cagle, Professor of Zoology at Tulane University, has been relieved of his duties as Chairman of the Arts and Sciences Department of Zoology and has been promoted to the position of University Coordinator of Research. **George H. Penn,** Professor of Zoology, is handling the affairs of the Department as Acting Chairman.

G. R. Lunz, Director, Bears Bluff Laboratories (South Carolina) is now Chairman of the Atlantic States Marine Fisheries Commission.

Alan Conger, formerly of the Oak Ridge National Laboratory, has joined the staff of The Botany and Biology Department at the University of Florida as Professor of Radiation Biology.

Warren M. Deacon has recently retired as Chairman of the Department of Biology at Vanderbilt University.

Donald B. Anderson, formerly Professor of Botany, Chairman of the Division of Biological Sciences and Dean of the Graduate School at North Carolina State College, has been appointed Provost and Vice President of the University of North Carolina at Chapel Hill.

John Tyler Bonner, Princeton University, delivered a series of lectures at Virginia colleges on November 4-6, as a University Center in Virginia Visiting Scholar.

J. L. McHugh, Director of Virginia Fisheries Laboratory since 1931, has resigned to accept an appointment as Chief of the Division of Biological Research, Bureau of Fisheries, U. S. Fish and Wildlife Service. **William J. Hargis** has been appointed Acting Director of the Laboratory.

Morris L. Brehmer, a recent graduate of Michigan State University, has assumed duties as shellfish investigator at the Virginia Fisheries Laboratory.

Evelyn Clare Wells, formerly with the Academy of Natural Sciences in Philadelphia, has been appointed as the first full-time Librarian at the Virginia Fisheries Laboratory.

B. F. D. Runk has been appointed Dean of the University of Virginia, effective March 1, 1959. Dr. Runk will continue to teach some courses in the Department of Biology.

A. Randolph Shields, a candidate for the Ph.D. degree in Botany at the University of Tennessee, has been appointed Assistant Professor of Biology at Roanoke College, effective September 1, 1959.

A. B. Massey, Professor of Botany, Virginia Polytechnic Institute, will retire at the end of the 1958-59 academic session. He has been granted

the privilege of continuing his work on the State flora as Emeritus Professor of Botany and Curator of the Herbarium. Dr. Massey is one of three faculty members at V.P.I. honored by the Alumni Association with the Wine Award for excellency as teachers.

Rose Mary Johnson, a candidate for the Ph.D. degree in Biology at the University of Virginia, will replace **Jane Belcher** at Sweet Briar College during the academic session 1959-60. Miss Belcher will visit Nigeria on a sabbatical leave.

Louis G. Williams, formerly at Furman University, is now at the Taft Sanitary Engineering Center in Cincinnati as an Aquatic Biologist in charge of plankton analysis.

Institutions and Organizations

The **Ninth Annual Spring Wildflower Pilgrimage** will be held in Gatlinburg, Tennessee, and the Great Smoky Mountains National Park April 23 to 25, under the sponsorship of the Botany Department of the University of Tennessee, the Great Smoky Mountains National Park and the Gatlinburg Garden Club and Chamber of Commerce. Motorcades, trail hikes, bird walks, photographic tours and evening programs feature this year's pilgrimage. Registration opens at 9:00 a.m., April 23, in the Gatlinburg Civic Auditorium.

Florida State University will sponsor two summer institutes for teachers in the 1959 summer session. One of these is an Institute for High School Teachers of Science and Mathematics, with one of four sections devoted to work in Biology. The second is an Institute for Junior College Teachers, also with a separate section for Biology teachers.

The **University of North Carolina** has received a grant from the National Science Foundation for support of a Botany Conference for teachers of general biology and general botany in colleges. The Conference will be held from July 27 through August 14 and is under the direction of Victor A. Greulach, Professor of Botany at the University. Application forms may be obtained by writing him at P. O. Box 1268, Chapel Hill, and must be completed no later than April 18.

The Annual Meeting of the **Georgia Academy of Science** will be held at Mercer University, April 24-25.

The **Louisiana Academy of Science** will hold its annual meeting at Louisiana Polytechnic Institute on April 24-25.

A tract of approximately sixty acres has been set aside by the Board of Trustees of **Howard College** to be used by the Department of Biology as a natural area for teaching and research.

The National Science Foundation will again support a Summer Institute for Secondary School Teachers of Mathematics and Science at **Randolph Macon Woman's College**. Paul A. Walker, Professor and Chairman of the Biology Department, will serve as director.

Three new departments will be formed from the present Biology Department at **Virginia Polytechnic Institute**, effective about July 1. The new departments to be formed are Forestry and Wildlife Conservation, Veterinary Science, and Entomology. They will be in the School of Agriculture and heads of the new departments will be announced later. The present Biology Department will be in the School of Applied Science and Business Administration and will offer work in general biology, zoology, botany, genetics and microbiology. The Biochemistry and Nutrition Department will be enlarged in the area of graduate study.

Grants in Aid

E. Peter Volpe, Associate Professor of Zoology at Newcomb College of Tulane University, has received a grant of $12,000 from the **National Science Foundation** to continue his studies for an additional two years on the genetics and systematics of anurans.

Merle Mizell, Instructor in Zoology at Tulane University, has received grants of $2,000 each from the **National Institutes of Health** and the **Louisiana Division of the American Cancer Society** for studies on the effects of amino acid analogs on newt limb regeneration and to test whether the factors responsible for normal tissue dedifferentiation can also cause adrenal adenocarcinoma to dedifferentiate.

Herbert P. Riley, Professor and Head of the Department of Botany, University of Kentucky, has received a grant of $6,000 for two years from the **National Science Foundation** for a project entitled "Cytology and Evolution in South African Plants". **Dale M. Smith**, Assistant Professor in the same Department, has received a **National Science Foundation** grant of $12,000 for a three-year project entitled "A Study of the Origin of the Polyploid Sunflowers with Particular Reference to *Helianthus decapetalus*".

H. E. Shadowen, Louisiana Polytechnic Institute, has received a grant from the **Southern Forest Experiment Station** of the U. S. Department of Agriculture for a study of small mammal populations.

A three-year grant of $30,000 from the **National Science Foundation** and a grant of $4,000 from **General Foods, Inc.**, have been received by **Sidney W. Fox**, Director of the Florida State University Oceanographic Institute, in support of his investigations of biochemical origins.

Ralph W. Yerger, Associate Professor at Florida State University, has received a **National Science Foundation** grant for a two-year study of the distribution and ecology of the freshwater fishes of Florida.

President Colgate W. Darden, Jr., of the **University of Virginia** recently announced that an anonymous donor has given $535,276 to strengthen biology teaching and research. Simultaneously he announced that the **National Institutes of Health** will grant $612,000 for research facilities in the planned Life Science Building for which the General Assembly has appropriated $2 million.

Kenneth Wagner, Chairman of the Biology Department, College of William and Mary in Norfolk, has received a **National Science Foundation** Science Faculty Fellowship to study marine biology. He will spend two summers at the Marine Biological Laboratory, Woods Hole, and one summer at the University of Miami Marine Laboratory.

Bernard Robert Woodson, Jr., Associate Professor of Biology, Virginia State College, has received a grant of $340.00 from the **Research Council of the University Center in Virginia** for expenses incurred in his field collections and studies.

Jack Colvard Jones, Department of Entomology, University of Maryland, has received a grant for the calendar year 1959 in the amount of $28,456 from the **Public Health Service, National Institutes of Health**, to facilitate research on the physiology of insect reproduction.

The ASB BULLETIN

Volume 6, Number 3 July, 1959

CONTENTS

The Official Quarterly Publication of
The Association of Southeastern Biologists

THE ASB BULLETIN

The ASB BULLETIN is the official quarterly publication of the Association of Southeastern Biologists and is published at Columbia, S. C., in January, April, July and October. Letters, news items, other contributions, and all communications about editorial matters should be addressed to the Editor, U.S.P.H.S., P. O. Box 717, Columbia, S. C. Changes of address should be sent promptly to the Secretary of the ASB, Dr. Harold J. Humm, Department of Botany, Duke University, Durham, N. C. Subscription orders from libraries and other institutions should be sent to the Business Manager, Dr. Elsie Quarterman, Department of Biology, Vanderbilt University, Nashville, Tenn. Subscription rate for non-members of ASB: $2.00 per year. Printing and typography by the Cary Printing Company, Columbia, S. C.

ASSOCIATION AFFAIRS

Income Tax

On May 13, 1959, Past-President Mary Esther Gaulden, President Horton H. Hobbs and Mr. Calvin H. Cobb, member of a law firm that represents AAAS, met in Washington, D. C., with two representatives of the Internal Revenue Service, Mr. John A. Barber and Mr. J. A. Tedesco. This conference was requested in connection with our protest of a ruling made by the Internal Revenue Service that ASB is not organized and operated exclusively for scientific and educational purposes but that its activities and objectives are characteristic of a business league or professional association. Contributions made to a scientific-educational organization are deductible while those to a business league are not.

Drs. Gaulden and Hobbs were given a courteous and helpful hearing. The Internal Revenue Service must make its ruling on exempt status on the basis of an organization's constitution. Several of the reasons ASB's constitution falls short of being satisfactory for exemption as a scientific - educational organization are as follows: Sections B and E of Article II (Purposes) would apply to a business league or professional organization; the purposes of the organization are amendable; and no provision is made for disposition of funds should the organization be dissolved.

Two alternatives for action were open to us. We could accept a ruling that ASB is a business league. This was rejected because your officers felt that such a ruling would not be accurate and that it might prejudice a later application for exemption as a scientific - educational organization. Instead, it was decided that the constitution of ASB should be revised and that a new application for exemption as a scientific-educational organization under section 501 (c) 3 of the 1954 revenue code should be submitted.

Mr. Cobb is now preparing a draft of a revised constitution. This will be presented by President Hobbs to the Executive Committee for approval at its interim meeting and to the membership for adoption next April, after which a new application can be submitted to the Internal Revenue Service.

●

New Officers

Attention of the members is called to our new officers elected at the Knoxville meeting. The very able handling of the tax problem (above) assures us, were such assurances necessary, that the Association will continue to be in good hands through the presidency of Dr. Horton Hobbs. Other new officers include President-Elect Victor Greulach, Treasurer Elsie Quarterman, and Executive Committee members Eugene P. Odum and Robert B. Short. The election of Dr. Quarterman leaves a vacancy on the Executive Committee in one of the 1958-61 terms. The president, with the approval of the executive committee, has appointed J. C. O'Kelley of the University of Alabama to fill this unexpired term.

●

Committee Appointments

The president, with the approval of the executive committee, has made the following appointments for the year 1959-60:

Auditing Committee: C. S. Chadwick, Chairman; C. E. Farrell, J. J. Friauf.

Nominating Committee: M. E. Gaulden, Chairman; Leland Shanor, G. Robert Lunz.

Resolutions Committee: Fr. P. H. Yancey, Chairman; V. M. Cutter, Jr., Ruth McClung Jones.

The Program Committee is not as yet complete but Father John H. Mullahy of Loyola has agreed to serve as chairman.

New appointments on the awards committees are:

Meritorious Teaching Award: C. G. Goodchild.

Association Research Prize: C. E. Jenner.

Goethe Awards: R. B. Short.

TAXONOMY: ONE KIND, OR MANY?

C. Ritchie Bell

Dr. Bell received the A.B. and M.A. degrees from the University of North Carolina in 1947 and 1949, the Ph.D. degree from the University of California at Berkeley in 1953, and was with the U. S. Army Air Force from 1942 to 1945. He was employed as Instructor in Botany at the University of Illinois, 1953-1955, and as Assistant Professor at the University of North Carolina from 1955 to the present. Dr. Bell is a member of the Botanical Society of America, the Society for the Study of Evolution, the International Society of Plant Taxonomists, and others. He is the newly elected secretary of the American Society of Plant Taxonomists. Dr. Bell's current research is on the flora of the Carolinas and on the cytology of the Umbelliferae. The latter project will involve a four-month trip this summer and fall to Central America for collections in this group.

For the purposes of teaching, taxonomy can be, and usually is, divided into several sub-categories, each of which deals with a particular aspect of taxonomy. Often an entire course is devoted to a single one of these specialized aspects. Thus there are courses dealing primarily with the morphology of flowers and other plant parts, with plant evolution, with phylogeny, with the identification of plants — usually the plants of a small geographic area at one season of the year, or with the nomenclature of plants. So vast is the recorded knowledge and detail of each of these categories that no course, or series of courses, could cover in entirety all of the pertinent material within its scope. Thus there is always more to learn, and each of these individual courses tends to become an end in itself. Furthermore, some of these courses often come to be called "Taxonomy" courses, with the expected result that some people may be prone to regard the subject matter of any *one* of these courses *as* taxonomy. Soon after, we begin to hear of *kinds* of taxonomy and, of course, *kinds* of taxonomists.

Gross morphology (the standard phrase, "anything visible with a hand lens of no more than 10X power", can well serve for a definition here) is the very foundation of plant classification; it is only slightly less important in the study of plant relationships. But certainly it is not to be assumed that morphology, regardless of its basic nature in many areas of biological study, is synonymous with taxonomy. Nor can such special subjects as evolution, phylogeny, plant identification, or nomenclature be considered as synonyms for taxonomy. These are all subjects which, to some, may be complete within themselves; they are also subjects which serve collectively as the tools of taxonomy. These individual tools should not be equated with the science in which they are used.

However, unlike the teaching of taxonomy, taxonomy in practice cannot be subdivided into kinds of taxonomy. If every available tool is not used in the solution of a taxonomic problem, the taxonomist's work is incomplete and open to questions other than those of interpretation. In some cases involving plants from inaccessible areas of the globe, adequate material for definitive work may not be physically available to the taxonomist. In such cases one must do the best job possible with the material available and should acknowledge the relatively incomplete nature of the work. Taxonomists who realize the difficulty of such necessary pioneer work can make allowance for future revision. No allowance should be made, however, for work that is incomplete because certain ideas or taxonomic methods are, either from training or preference, unacceptable or mentally unavailable to the taxonomist.

Taxonomy, in practice, *can* be divided into steps, but to say that the first step — Morphological Taxonomy, Classical Taxonomy, Traditional Taxonomy, or Alpha Taxonomy — is also the last is just as wrong as saying that the second step — Biosystematics, Cytotaxonomy, Chromosome Botany, or Beta Taxonomy — is both the alpha and omega of taxonomy.

Ideally, the result of the taxonomist's work serves two purposes: it facilitates plant identification and indicates relationships. The "Classical Taxonomist" who today uses only gross morphological features in problems of identification and relation-

ship is only half a taxonomist. His work will usually enable one to place a name on a particular specimen, but in many cases data from hybridization or cytological studies can give a far more definite answer to questions of supposed close relationship than could be had from an endless amount of petal measuring or stamen counting. Conversely, the "Biosystematist" who uses only such things as chromosome behavior and statistical studies in taxonomic problems is only half a taxonomist. His work may indicate relationships but without permitting the necessary identification of individual plants. No amount of chromosome counting and statistical analysis will yield as accurate and useful a species description, or identification, as can be had from critical morphological studies.

Taxonomy is a single phase of biology. It cannot be divided into *kinds*, but it can be divided into *steps*. Thus there cannot be two kinds of taxonomists. It is to be hoped that all taxonomists will take all steps in their work whenever possible.

THE PARTICIPATING SOCIETIES: KNOXVILLE, 1959

The ASB was honored again in 1959 to have four other organizations join in the annual meeting. While the Southeastern Section of the Botanical Society of America and the Southern Appalachian Botanical Club have been participating in these joint meetings for a number of years and are well known to the members, the Ichthyologists and Herpetologists and the Beta Beta Beta Societies are relative newcomers. For this reason, so that ASB members may be better acquainted with all of these groups, the following information is offered:

The American Society of Ichthyologists and Herpetologists was officially organized in 1916, three years after the appearance of the first number of Copeia, a journal which had been founded and edited by John T. Nichols "to advance the Science of cold-blooded vertebrates." The society which was thus fostered by a journal took over its publication in 1923 as the society's official organ. Both society and journal have flourished, expanding from a publication committee of three to a membership of over a thousand and journal circulation of over 1,500.

In 1951, at the annual meeting of the ASIH in Gainesville, Florida, members from the southeastern states got together informally to organize the Southeastern Division within the structure of the national organization. The regional society has held annual meetings since 1951, although separate meetings are not held in years when the national organization meets in the southeast which is defined as all states south of and including Virginia (and the District of Columbia) and Kentucky and east of and including Arkansas and Louisiana. There are approximately 180 members in the Southeastern Division of the ASIH.

Beta Beta Beta is a National Biological Society which was founded in 1922 and which now has one hundred twenty-seven chapters distributed over the United States and Puerto Rico. Since 1930 the society has published a journal, BIOS, which serves as a medium for publication of scientific papers by student members as well as mature scientists.

The purpose of Tri-Beta is clearly expressed in its official booklet of information as follows:

> "Beta Beta Beta is a society for students of the biological sciences. It seeks to encourage scholarly attainment in this field of learning by reserving its membership for those who achieve superior academic records and who indicate special aptitude for the subject of biology. It desires to cultivate intellectual interest in the natural sciences and to promote a better appreciation of the value of biological study. It aims to advance the general objectives of education by making a noteworthy contribution to the curricular program of the life sciences. Beta Beta Beta endeavors, also, to extend the boundaries of man's knowledge of nature by encouraging new discoveries through scientific investigation. It emphasizes, therefore, a threefold program: stimulation of sound scholarship; dissemination of scientific knowledge; and promotion of biological research."

Beta Beta Beta is an affiliated society of the American Association for the Advancement of Science.

PROCEEDINGS OF THE KNOXVILLE MEETING

The University of Tennessee at Knoxville was host at the twentieth annual meeting of the Association of Southeastern Biologists which was held April 16 to 18, 1959, in the excellent facilities of the University Center. Meeting jointly with ASB was the Southeastern Section of the Botanical Society of America, the Southern Appalachian Botanical Club, the Southeastern Division of the American Society of Ichthyologists and Herpetologists, and the Southeastern Region of Beta Beta Beta, national biological honor society.

Again this year, the registration broke all previous records with a total of 387 (254 of whom were ASB members), nine more than the record-breaking Tallahassee meeting of 1958.

Thursday, April 16

The meetings began Thursday afternoon at 1:15 with a guided tour of the Biology Division of the Oak Ridge National Laboratory. At the traditional Thursday evening general session, President C. E. Brehm of the University of Tennessee gave an address of welcome. Dr. Karl Sax of Harvard and the University of Florida, who was introduced by President Mary Esther Gaulden, gave the address of the evening, "The Population Explosion". Dr. Sax' incisive analysis of his subject matter and his manner of presentation were received with obvious enthusiasm. The annual smoker, with its renewal of acquaintances, followed the address.

Friday, April 17

On Friday from 9 a.m. to about 4 p.m. 80 contributed papers were presented in nine sessions.

At the Friday evening general session three awards were made:

Dr. Margaret Hess of Winthrop College received the Meritorious Teaching Award, presented on behalf of the Will Corporation of Georgia by Manager Charles E. Waits.

Drs. James A. and Faith S. Miller of Emory University received the Research Award, presented annually by the Carolina Biological Supply Company of Elon College, N. C., for their paper, "An Analysis of Factors Contributing to the Successful Reanimation of Mice from Less than 1° C." Honorable Mention was given Dr. Charles E. Jenner of the University of North Carolina for his paper, "The Effect of Photoperiod on the Duration of Nymphal Development in Several Species of Odonata".

The $150 Research Fellowship at the Mountain Lake Biological Station, presented annually by the Phipps and Bird Company of Richmond, Va., was presented to Lucille Walton, Danville, Virginia.

In addition to the three major awards, 13 graduate students and one undergraduate representing six institutions received Mary Glide Goethe Travel Awards which defrayed at least part of their expenses in attending the meeting. The total amount awarded was $457. Each student received travel funds of 4 cents per mile (if requested) and a per diem of $7.50 if he were not on the program, $9.00 if he were presenting a paper. Two days per diem were allowed if the distance was less than 300 miles, three days if the distance exceeded 300 miles. Graduate students from the following institutions received the awards: Emory University 1, University of Florida 7, University of Kentucky 2, University of North Carolina 2, University of Virginia 1; the one undergraduate was from Winthrop College.

Following presentations of the awards, President Mary Esther Gaulden presented Immediate Past President H. K. Wallace whose address to the membership was entitled "Spiders". Dr. Wallace took the audience back, by means of excellent Kodachromes, to one of his summers in Michigan spent collecting the jumping spiders and showed enlarged views of various members of the group and characters used in separating the subgroups.

Saturday, April 18

The two field trips into the Great Smoky Mountains National Park scheduled for Saturday morning met with rain so that the groups were small. A group of botanists under the leadership of Dr. A. J. Sharp and ornithologists and others interested in bird life, led by Dr. J. T. Tanner, departed in rain coats.

Annual Business Meeting

President Mary Esther Gaulden called the annual business meeting to order at 11:15 a.m. Friday in the ballroom of the University Center. Election of officers was the first item of business. Since there were no nominations from the floor for any of the vacancies to be filled, the slate presented

by the Nominating Committee was voted on with the following results:

President-Elect, Dr. Victor A. Greulach, University of North Carolina.

Vice-President, Dr. Royal E. Shanks, University of Tennessee.

Treasurer, Dr. Elsie Quarterman, Vanderbilt University.

Executive Committee Members, Dr. Eugene P. Odum, University of Georgia; Dr. Robert B. Short, Florida State University.

Tellers for the election were W. G. Erwin, Robert R. Bryden, and Jean Kerschner.

The Secretary's report was a resume of the Executive Committee meeting held the previous day. Dr. Horton H. Hobbs was appointed as ASB representative on the AAAS Council replacing Dr. Mary Esther Gaulden. As of 10 a.m. Friday, 125 new members had joined since the Tallahassee meeting, bringing the total membership to 727. It was decided that members who do not pay dues for the current year by the last day of the annual meeting will not continue to receive the ASB Bulletin, although they will be retained on the membership list until they are two years in arrears, as provided by the constitution.

It was recommended that the Treasurer add to the savings account five percent of the total funds collected each year from dues and subscriptions if he feels that this is feasible.

Dr. Geoffrey M. Jeffery, new editor of the ASB Bulletin, reported that 900 copies of each issue were now being run off and that this number would probably be adequate if it were no longer sent to members delinquent in dues. He requested that undelivered copies, back numbers or volumes of the Bulletin be returned to him by any member who does not wish to keep them as the files are low. The Executive Committee commended Dr. Jeffery for the effective manner in which he has taken over the editor's duties.

A letter from the Exempt Organizations Branch of the Internal Revenue Service was read in part. This letter advised ASB of a ruling that it is not exempt from income tax under section 501(c)(3) of the internal revenue code because it is "an association of persons having a common business interest and your principal objective is the advancement of that common interest rather than an association organized and operated exclusively for one or more of the purposes specified" in the section of the code mentioned above. A protest to this ruling was filed and a meeting of representatives of the ASB with internal revenue officials was scheduled to be held in Washington early in May. For a report of the results of this meeting, see "Association Affairs", page 38.

The report of the Auditing Committee, presented by Dr. Ernest L. Hunt, and of the Treasurer by Dr. Arthur W. Jones, retiring Treasurer, followed the Secretary's report. Both were approved.

Dr. Donald C. Scott of the University of Georgia, Chairman of the Meeting Places Committee, announced the receipt of an invitation to meet on the campus of Loyola University, New Orleans, from Father John H. Mullahy of that institution. The invitation was accepted for the 1960 meeting which will be on April 21-23.

The Chairman of the Resolutions Committee, Margaret Y. Menzel of Florida State University, presented the resolutions of her committee. They were approved and are given below in summary form.

1. The membership of ASB expresses its sincere appreciation to President C. E. Brehm of the University of Tennessee for the invitation to meet on its campus, for the cordial welcome extended, and for the use of the fine campus facilities; and that special thanks be extended to the Local Arrangements Committee, Drs. J. Gordon Carlson (chairman), Ronald Fraser, Joseph Howell, Fred Norris, Royal Shanks, A. J. Sharp, and James Tanner.

2. Sincere appreciation was expressed to Thomas E. Powell, President of the Carolina Biological Supply Company (and ASB member) for the donation of $100 as a Research Prize.

3. and to Manager Charles E. Waits and the Will Corporation of Georgia for the $100 meritorious teaching award.

4. and to Lloyd Bird and the Phipps and Bird Corporation for the $150 Mountain Lake Fellowship.

5. Special recognition and sincere thanks of the membership were extended to Dr. George H. Boyd of the University of Georgia whose activities in 1937 and 1938 led to the establishment of the Association of Southeastern Biologists and who was a charter member and its first president. This recognition is accorded Dr. Boyd upon his retirement from academic duties at the end of this school year and includes a volume of testimonial letters, one of which was written by President-Elect Horton H. Hobbs.

ANNUAL AWARDS

Reflecting the views of the Executive Committee expressed at the recent Knoxville meeting that more attention be directed to the recipients of the annual Meritorious Award for Teaching and other Awards of the Association, the BULLETIN will in future issues present brief biographical accounts of previous recipients of the Meritorious Teaching Award. Nominations for next year's award will be solicited in a later issue; these may be made by any member and, together with supporting data, may be sent to any member of the Meritorious Award Committee, which currently consists of Dr. Roberta Lovelace (University of South Carolina), Dr. C. G. Goodchild (Emory University) and Dr. Frederick T. Wolf (Vanderbilt University) Chairman. The following biographical sketch of the current recipient has been prepared by this committee, as will be the biographies in future issues.

The Meritorious Award for Teaching

The Committee chose as the 1959 recipient of the ASB Meritorious Award for Teaching Dr. Margaret Hess, Professor of Biology and Head of the Department at Winthrop College, Rock Hill, South Carolina. As in former years, the award consists of a certificate and an honorarium of one hundred dollars contributed by the Will Corporation of Georgia.

Dr. Hess was born in Chesterfield, Virginia, November 15, 1899, and began her teaching career in high schools, in which she taught at various times from 1919 to 1927. Her academic training was received at the University of Virginia, from which she received the B.S. degree in 1929, M.S. in 1930, and Ph.D. in 1934. Upon completion of her doctorate, she accepted a position as associate professor and head of the department at Judson College, Alabama. In 1936 she was promoted to professor, and in 1938 received a further promotion to the chairmanship of the Science Division in that institution. In 1939 she became Professor of Biology and head of the Department at Winthrop College, which position she has held continuously for twenty years.

Miss Hess is a member of a number of professional organizations. In addition to ASB, in which she is a charter member and which she served as President in 1952, she is a fellow of the American Association for the Advancement of Science, is a member of the Society of Zoologists, the Genetics Society, the Association of Biology Teachers, and the South Carolina Academy of Science. She is a former Secretary-Treasurer of the latter organization and is currently Vice-President. Her research activities have in-

Dr. Margaret Hess, Professor of Biology
Winthrop College
Rock Hill, South Carolina

volved studies on the morphology and physiology of the Turbellaria.

Of a total of 239 students who majored in Biology at Winthrop in 1940-1956, and have thus been subjected to Miss Hess' influence, 107 have continued their studies in graduate or professional schools after graduation. This figure, which is equivalent to 45 per cent, is impressive by any standard. Four of her former students have gone on to attain the Ph.D. degree, ten have received the M.D., and 44 have attained the Masters degree. Others are now attending graduate schools, medical schools, schools of medical or X-ray technology, nursing, or physical therapy. At least six have obtained Masters degrees in fields other than Biology.

But mere statistics fall far short of giving a complete picture of Miss Hess as a gracious lady, and it is difficult if not impossible to evaluate the influence she has had upon her students. To quote from a letter from one of them: "It is certainly no overstatement to say that she has devoted her life for the last twenty years to her students. Her office and her home doors are always open to them. She has spent many, many hours in and out of college listening to our problems of all kinds, giving us understanding advice and help, and always encouraging us to better ourselves for good personal and professional lives. We all consider her a real personal friend."

The Association Research Prize

The Association Research Prize, made possible through the generosity of the Carolina Biological Supply Company, is awarded annually to the member or members presenting an especially meritorious paper at the annual meeting, and consists of a $100.00 honorarium. This year the prize was awarded to Drs. James A. and Faith S. Miller of Emory University for their paper, "An Analysis of Factors Contributing to the Reanimation of Mice from Less than 1° C.". Honorable mention was given Dr. Charles E. Jenner of the University of North Carolina for his paper, "The Effect of Photoperiod on the Duration of Nymphal Development in Several Species of Odonata". The abstract of the winning paper is reprinted below:

AN ANALYSIS OF FACTORS CONTRIBUTING TO THE SUCCESSFUL REANIMATION OF MICE FROM LESS THAN 1° C.

JAMES A. MILLER, JR. and FAITH S. MILLER,
Emory University

Hypothermia protects newborn and adult mammals from experimental asphyxia and recently has been successfully tried for asphyxia pallida in human babies (Westin, Miller, Nyberg, Wedenberg, '59). By contrast, a simple and very effective method for cooling animals to 0° C. with subsequent recovery utilizes partial asphyxiation during the first stage of cooling. Experiments were designed to resolve this apparent paradox using mice cooled by the Goldzveig-Smith method. After one hour in sealed vessels the 0_2 content was 6%, CO_2 was 11%, deep colonic temperature approximately 15° C. The relative importance of hypoxia, hypercapnia and high humidity was tested by the addition of soda lime, silica gel, or both. Hypercapnia proved most beneficial, hypoxia next, and increased humidity of least value for recovery of postural reflexes, prevention of hind limb weakness and indefinite survival. Tests of the efficacy of air, 100% 0_2, 95% 0_2 + 5% CO_2, and 90% 0_2 + 10% CO_2 for artificial respiration during rewarming demonstrated the superiority of 95% 0_2 + 5% CO_2, whether the hypothermia was of short duration (15 min. below 5° C.) or of long (30 or 60 min.). X-ray studies on mice injected with "Micropaque" suggested that vasodilation produced by the sealed vessel technique may be the mechanism behind the success of the method.

Research Fellowship

The Research Fellowship, made possible by the generosity of the Phipps and Bird Company was awarded to Lucille Walton of Danville, Virginia. This fellowship consists of an honorarium of $150 for use in summer research at the Mountain Lake Biological Station of the University of Virginia. The recipient is selected from applicants on the basis of planned work, references, education and other supporting data submitted.

NEWS OF BIOLOGY IN THE SOUTHEAST

About People

Dr. A. A. Humphries has been elected President of the Emory University chapter of Sigma Xi for the coming year.

Dr. Charles E. Miller of the Emory University Department of Biology has accepted a position of Assistant Professor of Biology at the A. & M. College of Texas.

Mrs. Marion T. Coleman of the Biology Department at Emory University has received a National Science Foundation Cooperative Graduate Fellowship for 1959-60.

Robert A. Pedigo of Emory University has been awarded a National Science Foundation Cooperative Fellowship for the year 1959-60. He will study the effects of low-level chronic radiation on physiological processes with special reference to photosynthesis and respiration rates at the Georgia Nuclear Laboratories at Dawsonville and the cobalt radiation field at Emory University.

William H. Adams, Wildlife Research Unit, Auburn, Alabama, has been accorded an Honorarium for Young Mammalogists based on an abstract of his dissertation presented at the annual meeting of the American Society of Mammalogists held at the U. S. National Museum, Washington, D. C., June 22-24.

Drs. Alexander Hollaender, W. L. Russell, and **Drew Schwartz** of the Oak Ridge National Laboratory attended the ninety-sixth annual meeting of the National Academy of Sciences in Washington, D. C., April 27-29. Dr. Russell attended a Symposium on Molecular Genetics and Human Disease at the State University of New York Upstate Medical Center in Syracuse, April 23-24 and presented a lecture on recent advances in genetics in mice. Dr. Hollaender attended a meeting of the Biological Effects of Atomic Radiation Committee on genetic effects of radiation at the Rockefeller Institute in New York on May 13.

Dr. Arthur C. Upton, ORNL, attended meetings of the Pathology Study Section of the U. S. Public Health Service, May 7-10.

Jean Moutschen of Belgium has completed a one-year period of research in the Biology Division, ORNL, and has returned to the University of Liege.

Dr. Howard I. Adler, ORNL, departed May 29 on a visit to European Laboratories. His itinerary includes attendance at the Symposium on Immediate and Low Level Effects of Ionizing Radiations at Venice, Italy, June 21-27, and participation in discussions concerning mechanisms of radiation damage to living cells with scientific investigators in Italy, Denmark and Sweden.

Dr. William Arnold, ORNL, will be at the Institute for Muscle Research, Woods Hole, Mass., from June 1 to September 7, where he will do collaborative research with Dr. Albert Szent-Gyorgyi.

Dr. Francis T. Kenney has joined the Enzymology Group at ORNL. Dr. Kenney received a B.S. degree in Biology from St. Michaels College, and M.S. degree in Zoology from the University of Notre Dame, and a Ph.D. degree in Biochemistry from the Johns Hopkins University. He has been associated with the Cornell University School of Medicine for the past two years.

Michael D. Coe has recently been appointed Assistant Professor of Anthropology at the University of Tennessee. He will soon receive his Ph.D. from Harvard University for work conducted in ancient Guatemalan ruins where he studied traces of early North and South American cultures.

Dr. Royal E. Shanks, University of Tennessee, is continuing his Alaskan studies for the fifth consecutive summer. For the first time Dr. Shanks is accompanied by his wife and two daughters, who will occupy quarters at the University of Alaska near Fairbanks while he conducts research farther north. Dr. Shanks, accompanied by **John J. Koranda**, University of Tennessee field and laboratory assistant, will continue studies in the Brooks Mountains during the early part of the summer, with emphasis on the soils and vegetation at elevations of 2,000 feet and above on the north side of the mountains. For the remainder of the summer studies will be continued using the facilities of the Biology Department at the University of Alaska.

Dr. A. M. Winchester, Head of the Biology Department at Stetson University, is spending the summer at the University of Michigan Medical School where he is participating in the Institute of Radiation Biology sponsored by the National Science Foundation. Dr. Winchester was one of twenty chosen for intensive advanced study in this field.

Dr. E. C. Prichard, Professor of Biology at Stetson University, will spend the greater part of the summer as chief Nature Counsellor at Camp Rockmont for Boys at Black Mountain, North Carolina.

Dr. Keith Hansen, Biology Department, Stetson University, will spend the summer in special research on the use of the Southern Toad and the Southern Leopard Frog as test animals for human pregnancy diagnosis.

Dr. William Preston Adams, who has recently received the Ph.D. degree from Harvard University joined the Biological Sciences Department, Florida State University on June 1 as Research Associate.

Dr. Lloyd M. Beidler, Professor of Physiology, Florida State University, has been selected to deliver the annual Bowditch Lecture at the fall meetings of the American Physiological Society at the University of Illinois. This lectureship was established to recognize and reward preeminence among the physiologists under 40 years of age and represents a signal honor of the Society. In addition to this recognition, Dr. Beidler has also been selected to receive a travel grant from the U. S. Committee on the International Union of Physiological Societies to attend the 21st International Congress of Physiological Societies to be held in Buenos Aires in August. At this Congress, Dr. Beidler will present the results of his research on sensory receptors that respond to chemical stimulation.

Dr. Charles F. Byers, long-term chairman of the Biological Sciences Department of the University College, ranking professor of Biology and Assistant Dean of the Graduate School, announced his retirement as a member of the staff and faculty of the University of Florida, February 1, 1959. He had joined the staff of the University of Florida as a member of the Biology Department in 1927,

and served the University from that time until his retirement. Dr. Lewis Berner was appointed Interim-Chairman of the Biological Sciences Department at the beginning of the spring semester following the retirement of Dr. Byers.

Dr. Arnold B. Grobman has been given a leave of absence from his dual posts in the Biology Department of the University of Florida and as Director of the Florida State Museum to head up the study group for AIBS on Biological Sciences Curricula. The study group is based at the University of Colorado and will spend two to three years developing suggested curricula for high schools and junior colleges in particular, but also for other educational levels. **Dr. Walter Auffenberg** will be on leave of absence from his post at Florida to assist Dr. Grobman during 1959-60. Dr. J. C. Dickinson, Jr., has been appointed acting director of the Florida State Museum while Dr. Grobman is on leave.

Dr. Kenneth Backhouse of the Anatomy Department, Charing Cross Hospital Medical School, London, England, has been at the University of Florida from October until May as a visiting associate with the Florida State Museum and the Anatomy Department of the J. Hillis Miller Medical Center. Dr. Backhouse is a specialist in the biology of marine mammals.

At the annual meeting of the Florida Academy of Sciences in December **Dr. E. Ruffin Jones**, Biology Department, University of Florida, was installed as President and Chairman of the Executive Council. Others from that Department elected to office include **Dr. J. B. Lackey**, secretary, **Dr. J. C. Dickinson, Jr.**, to continue as editor of the Quarterly Journal, and **Dr. Eugene C. Bovee**, chairman of the biology section. At the annual meeting of the Academy Conference of the AAAS, Washington, D. C., in December, Dr. Jones was elected secretary-treasurer of that group.

Dr. G. M. Armstrong retired on February 1, 1959, at the compulsory retirement age of 65 as Head of the Botany and Bacteriology Department at Clemson College, a post which he had held for 28 years. Dr. Armstrong earned his graduate degrees at the University of Wisconsin and the Henry Shaw School of Botany, Washington University, St. Louis. He has served as Chairman of the Southern Division of the American Phytopathological Society, as Chairman of the Tobacco Workers Conference, as first Chairman of the Cotton Disease Council and recently as President of the South Carolina Academy of Science. Dr. Armstrong's investigations have included studies of the wilt fusaria and some early work on the downy mildew disease of tobacco.

A recent addition to the staff of Clemson Agricultural College is **Dr. James E. Halpin**, who joined the Department of Botany and Bacteriology as Associate Plant Pathologist, to work on the diseases of white clover. Dr. Halpin obtained his Ph.D. degree from Wisconsin in 1955 and has been previously employed by the Rockefeller Foundation Agricultural Programs in Latin America working on forage crops improvements in Mexico, Colombia and Chile.

G. Robert Lunz, Director of the Bears Bluff Fish Laboratories in South Carolina, has been named acting director of the Division of Commercial Fisheries of the State Wildlife Commission as of June 1, and will continue his work at the laboratories in addition to the new post.

Dr. George C. Kent, Louisiana State University, is serving as a Visiting Lecturer at the National Science Foundation Summer Institutes for Teachers at Baylor University, Northwestern State College (Louisiana), Mississippi Southern College, and at the University of Mississippi during the current summer.

Dr. Howell V. Daly has accepted a position as Instructor in the Department of Zoology, Physiology and Entomology at LSU, commencing in the fall semester. Dr. Daly, an entomologist, is a graduate of Southern Methodist University and the University of Kansas.

Dr. George H. Mickey has resigned as Chairman of the Department of Zoology, Physiology and Entomology at LSU to assume the Deanship of the LSU Graduate School.

Dr. James Norman Dent will be on leave from the University of Virginia during the academic year 1959-60. He has been awarded a Guggenheim Fellowship and will carry out research at the Gatty Marine Laboratory of the University of St. Andrews, St. Andrews, Scotland.

Dr. Edward Lautenschlager, Instructor of Biology, has been named Registrar of the University of Virginia.

Dr. John G. Barker, Virginia Polytechnic Institute, has been promoted to Professor of Biology and Chairman of the Department at Radford College. He will teach the biology course in the National Science Foundation Summer Institute for high school science teachers this summer.

Donald H. Messersmith, Radford College, has received a faculty fellowship to continue graduate studies in entomology at Virginia Polytechnic Institute.

Dr. John L. Wood of the University of Cincinnati will join the staff of the Virginia Fisheries Laboratory in July to conduct research in fungus diseases of marine organisms.

Dr. W. J. Hargis, Jr., was appointed Director of the Virginia Fisheries Laboratory in May, 1959.

Dorothy Crandall was recently promoted to Associate Professor of Biology at Randolph Macon Woman's College. Professor Crandall received the J. Shelton Horsley Research Award at the 37th annual meeting of the Virginia Academy of Science for her work on ground vegetation patterns of the spruce-fir area in the Smoky Mountains National Park.

Dr. S. Bose, who received the Ph.D. degree in June from the University of Virginia, has accepted a position with the Baltimore Dental College. Another June graduate, **Dr. Te-Hsiu Ma**, has been appointed Assistant Professor of Biology at Emory and Henry College.

For the past two years **Dr. and Mrs. Orland E. White** have been conducting investigations on the flora of Central America and western South America, particularly Bolivia and Chile. They have recently embarked on a collection trip through Texas, New Mexico, and Arizona.

Vivian Bennet, Associate Professor of Biology, Sweet Briar College, will continue the study of rhythmicity in fiddler crabs at Woods Hole during the summer.

Helen Churchill, Associate Professor, Hollins College, attended the semicentennial celebration of the University of Michigan Biological Station, June 16-19.

Charlene McClanahan and **Virginia Yeatts**, June graduates of Radford College, have received National Science Foundation Fellowships to study genetics at Ohio State University. **Helen Floege**, also a June graduate, has received a graduate assistantship to study physiology at the University of Maryland.

Dr. C. Ritchie Bell and **Mr. James A. Duke** of the Department of Botany, University of North Carolina, will leave in July for a four months collecting trip though Mexico and Central America. The trip is in connection with a N. S. F. sponsored research program on the cytology of the Umbelliferae.

Dr. Robert Leisner, who received his Ph.D. in botany from U. N. C., is now assistant to the Executive Director of the A.I.B.S.

Dr. William C. Dennison, visiting professor at the U. N. C. Department of Botany, is returning to Swarthmore College.

Carol Ann Padgett, who holds the M.S. degree from A.P.I., has joined the faculty of Huntingdon College as Instructor in the Biology Department.

Dr. Mary Jane Brannon, Huntingdon College, recently completed a course in Laboratory Methods in the Diagnosis of Viral and Rickettsial Diseases held at the Communicable Disease Center Laboratories at Montgomery, Alabama.

Dr. James C. Wilkes, Jr., will attend a summer workshop in Field Biology which will be held in Wyoming. Dr. Wilkes has been appointed the permanent counsellor *pro tem* for the Junior Academy of Science in Alabama.

Dr. Leonard Doerpinghaus, Agnes Scott College, will attend the Institute for College Botany Teachers at Indiana State University during June and July.

Mrs. Netta Gray, Agnes Scott College, will present a paper at the IXth International Botanical Congress in Montreal in August.

Dr. A. A. Humphries was recently elected Chairman of the University Center (Georgia) Biology Group for the year 1959-60. **Dr. W. B. Cosgrove**, Department of Zoology, University of Georgia, was elected co-chairman. The University Center Group includes biologists from the University of Georgia, Emory University, Georgia Institute of Technology, Agnes Scott College, and Oglethorpe University.

Dr. Harold J. Humm, Duke University, is engaged in teaching during the summer months. Until July 25 he will teach "Survey in the Marine Sciences" at the Alligator Harbor Laboratory of the Oceanographic Institute, Florida State University. Following this he will teach in the Marine Ecology course at the Marine Biological Laboratory, Woods Hole, Massachusetts. On September 1, Dr. Humm will begin a one-year appointment as "Jacques Loeb Associate" in Marine Biology, a Rockefeller Institute — ONR fellowship; he will spend two months at the Rockefeller Institute in New York and the rest of the year at the Marine Biological Laboratory, Woods Hole.

The following new personnel will join the faculty of the Department of Zoology of Tulane University in September: **Dr. D. Eugene Copeland**, formerly Executive Secretary of the Cell Biology Studies Section, Division of Research Grants of the National Institutes of Health, will succeed Dr. Fred Cagle as Chairman of the Department; **Dr. William F. Brandom**, who received his Ph.D. degree from Stanford and who has been doing post-doctoral work in experimental embryology at Princeton, as Instructor; **Dr. Gerald E. Gunning**, who received his Ph.D. from Indiana University, as Instructor; **Dr. Guy Marlow**, who received his Ph.D. from Tulane, as Instructor; and **Dr. Alfred E. Smalley**, who received his Ph.D. from the University of Georgia, as Instructor.

Dr. Joseph H. Young, Assistant Professor, has resigned from the Department of Zoology at Tulane to accept a position on the faculty at San Jose State College, California.

Dr. Royal D. Suttkus, Associate Professor of Zoology at Tulane, has been granted a year leave of absence, during which he will travel to Europe to examine type specimens and to Mexico and Central America to collect gars in connection with a revisionary study of the group.

Dr. Milton Fingerman, Assistant Professor of Zoology at Tulane, will spend the summer at Woods Hole Oceanographic Institute where he will continue his research on crustacean hormone systems and teach the section on Mollusca in the Invertebrate Zoology course.

Dr. William E. Collins, formerly New Jersey State Extension Entomologist at Rutgers University, has accepted a position as Medical Biologist at the Laboratory of Parasite Chemotherapy, U. S. Public Health Service, Columbia, South Carolina.

Dr. Martin D. Young, Head of the Section on Epidemiology of the Laboratory of Parasite Chemotherapy in Columbia, S. C., will present a series of lectures on the Chemotherapy of Malaria at the W.H.O. course in Malaria Eradication in Jamaica, B. W. I., in August.

Two new books were published during 1958 by members of the staff of the Department of Biology of West Virginia University: *Woody Plants in Winter* by **Earl L. Core** and **Nelle Ammons**, and *Part 3, Flora of West Virginia* by **P. D. Strausbaugh** and **Earl L. Core.**

Dr. Nelle P. Ammons, Professor of Botany at West Virginia University, retires at the end of the 1958-59 school year. Dr. Ammons has been associated with the University as a member of the faculty since 1920 and has held the rank of Professor since 1953. She is known particularly for her work with the bryophytes and published in 1940 a "Manual of the Liverworts of West Virginia", which has been used as a textbook throughout the Appalachian region.

Institutions and Organizations

The **Florida Academy of Science** will hold its annual meeting in February of 1960 at Florida Southern College, Lakeland, Florida.

The **Georgia Academy of Science** had its annual meeting at Mercer University, Macon, April 24-25. Of interest to biologists was the election of Dr. J. J. Westfall, Botany Department, University of Georgia, as President for 1960-61. Officers of the Biology Section for next year are: Chairman, Dr. L. S. Luttrell, Experiment; and Secretary, Mr. William Brillhart, Emory University.

At **Limestone College**, Gaffney, South Carolina, a program of remodeling and enlarging the Hall of Science is being undertaken this summer. For the Department of Biology this will mean renovation of the present laboratories, an additional newly equipped laboratory for bacteriology, and a more adequate space for research in the department.

The Research Conference on "Enzyme Reaction Mechanisms" of the **Biology Division, Oak Ridge National Laboratory**, was held in Gatlinburg, Ten-

nessee, April 1-4. Dr. Alvin M. Weinberg, Director of the Oak Ridge National Laboratory, presented the welcoming address.

Eight members of the **University of North Carolina Department of Botany** plan to attend the International Botanical Congress at Montreal. They are J. N. Couch, A. E. Radford, V. A. Greulach, W. J. Koch, H. E. Ahles, J. E. Adams, J. G. Haesloop and J. T. Mullins.

A Botany Conference for College Teachers of General Botany and General Biology, directed by Dr. Victor A. Greulach and sponsored by the N. S. F., will be held at the **University of North Carolina** July 27 through August 14.

New officers of the **Louisiana Academy of Sciences** for 1959-60 include G. C. Kent (LSU), President; G. H. Bick (SLI), President-Elect; G. H. Ware (NSC), Secretary; Frederick Deiler (Freeport Sulphur Co.), Treasurer; B. T. Cole (LSU), Editor; C. J. Cavanaugh (Louisiana College), Chairman, Division of Biology; and H. J. Bennett (LSU), Chairman, Junior Academy.

Grants in Aid

Dr. A. A. Humphries, Emory University, was recently awarded a grant of $21,000 by the **United States Public Health Service** for support of a three-year program entitled, "Natural inhibition of meiosis in oocytes of Amphibia".

Dr. W. D. Burbanck, Professor of Biology, Emory University, received a three-year grant of $23,600 from the **National Science Foundation** to make a study of "the ecology and geographical distribution of the Estuarine Isopod, *Cyathura*".

Dr. Ernest L. Hunt, Professor in the Biology Department at Emory University, has received a three-year renewal in the amount of $26,000 of his grant from the **U. S. Public Health Service** for "Studies on the estrus and gestation in diabetic rats".

Dr. Arthur W. Jones, Associate Professor of Zoology at the University of Tennessee, is in charge of a new plan for qualified undergraduates majoring in science to participate in current research projects. The plan is being supported by a $7,140 **National Science Foundation** grant. Participants will be paid $1.50 an hour for up to 400 hours; the research includes current projects in Botany, Chemistry and Zoology.

In a study being aided by a $9,900 **National Science Foundation** grant, **Dr. Howard F. L. Rock** of the University of Tennessee Botany Department is directing a study on the revision of the Tetrodus section of Helenium, a genus of American herbs. Specimens will be collected in Mexico and the Southwestern United States.

Three grants totaling $99,625 for medical research have been awarded **Dr. McChesney Goodall** of the University of Tennessee Memorial Research Center at Knoxville by the **U. S. Public Health Service.** Dr. Goodall, who specializes in neurophysiology, joined the U. T. Memorial Research Center staff last October as research professor and assistant director, coming to U. T. from the Duke University School of Medicine.

The Division of General Medical Sciences, **National Institutes of Health**, has awarded $86,940 to **Dr. Robert K. Godfrey**, Department of Biological Sciences, Florida State University, for a five-year study of the Marsh Plants of Florida and adjacent areas.

The **Research Council** of the University Center in Virginia has recently announced a grant of $300 to **Elizabeth Fern Sprague**, Sweet Briar College, for expenses incurred in her study of, "Ecology and Anatomy of Species of California *Pedicularis*".

The **Science Division**, Hollins College, recently received a grant from the **National Science Foundation** which will permit superior students to participate in faculty research programs during the session 1959-60. The students will receive $1.00 per hour for up to 400 hours.

The **Blandy Experimental Farm**, University of Virginia, has recently been notified that its research contract with the **Atomic Energy Commission** for the study of radiation effects on growing plants has been continued for another year.

Dr. Harry Freeman, Department of Biology, University of South Carolina, has received an $11,000 contract from the **Atomic Energy Commission** to study the ecology of fishes in the Savannah River Plant area. The work this year will be mostly on the effects of high temperatures on stream fish.

The **Louisiana Academy of Sciences** has been granted the sum of $16,310 by the **National Science Foundation** for support of a program of the Junior Academy designed to increase interest and participation in science among high school students in Louisiana. Dr. Harry J. Bennett is director of the project. Louisiana State University is serving as fiscal agent.

Dr. James H. Barrow, Jr., formerly Head of the Department of Biology at Huntingdon College and now at Hiram College in Ohio, received a three-year grant from the **U. S. Public Health Service** in the amount of $30,000. His investigations will concern the immunological aspects of diseases under crowded environmental conditions.

The **National Science Foundation** has awarded grants to two in the Zoology Department at Tulane: **Dr. Royal D. Suttkus**, Associate Professor — $20,000 for revisionary study of the garfishes of the world (three years) and **Jerome O. Krivanek**, Assistant Professor — $24,600 for a study of the chemical analysis of the developing slime mold (three years). In the same department, **Merle Mizell**, Instructor, has received a grant of $15,679 from the **National Institutes of Health** for continued studies on the effects of regenerating anuran appendages on an anuran tumor (two years); and Assistant Professor **Norm C. Negus** has received a renewal of his grant ($7,345) from the **Atomic Energy Commission** to continue studies on cyclic changes in small mammal populations of Breton Island (one year).

Tulane University is among a number of other southeastern schools to receive grants from the **National Science Foundation** for "Undergraduate Research Participation Program." Under the terms of this grant, each participating advanced undergraduate student will receive a maximum of $600 per year and will be required to actually participate in the research program of some faculty member.

Dr. Michael Klein, Assistant Professor of Anatomy at the University of Tennessee Medical Unit in Memphis, has been awarded a $69,000 grant by the **U. S. Public Health Service** to investigate means of altering the course of skin cancer in mice.

The **University of Tennessee College of Medicine** has received a $1,000,000 research grant for a five-year study on the prevention of brain damage. The grant was made by the National Institute of Neurological Disease and Blindness of the **U. S. Public Health Service**, and funds will be made available at the rate of $200,000 per year.

The ASB BULLETIN

Volume 6, Number 4 October, 1959

CONTENTS

The Official Quarterly Publication of
The Association of Southeastern Biologists

THE ASB BULLETIN

The ASB BULLETIN is the official quarterly publication of the Association of Southeastern Biologists and is published at Columbia, S. C., in January, April, July and October. Letters, news items, other contributions, and all communications about editorial matters should be addressed to the Editor, U.S.P.H.S., P. O. Box 717, Columbia, S. C. Changes of address should be sent promptly to the Secretary of the ASB, Dr. Harold J. Humm, Department of Botany, Duke University, Durham, N. C. Subscription orders from libraries and other institutions should be sent to the Business Manager, Dr. Elsie Quarterman, Department of Biology, Vanderbilt University, Nashville, Tenn. Subscription rate for non-members of ASB: $2.00 per year. Printing and typography by the Cary Printing Company, Columbia, S. C.

GEOFFREY M. JEFFERY
EDITOR

HAROLD J. HUMM, ASSOCIATE EDITOR
ELSIE QUARTERMAN, BUSINESS MANAGER

ASSOCIATION AFFAIRS

1960 Annual Meeting

The next issue of the BULLETIN (Volume 7, Number 1) will carry the usual announcements of the 1960 Annual Meeting of the Association at Loyola University in New Orleans, Louisiana. However, since this announcement generally proclaims deadlines for the submission of award nominations, papers for presentation, et cetera, which follow the receipt of the announcement rather closely, a few reminders may be in order at this early date. Members are urged to be considering nominations and applications for the Meritorious Award for Teaching, the Association Research Prize, the Research Fellowship at Mountain Lake, and the Goethe Travel Awards for students. The deadline for papers for the program cannot be set as yet, but is generally only about a month after the announcement is received; the Editor urges the members to give some thought to these papers somewhat earlier, since it appears to be necessary to adopt a rather arbitrary attitude toward acceptance of papers after the deadline. The deadline is usually set at the latest possible time for ensuring the printing of the issue containing the abstracts prior to the meeting date.

The Program Committee for the meeting now consists of the following: Father John H. Mullahy (Chairman), Dr. Walter G. Moore, Miss Letitia Beard, Dr. Harry D. Brown, Dr. Robert C. Goss and Dr. Richard T. Jackson, all of Loyola University; Dr. Rosamond McMillan of L.S.U. (New Orleans); Dr. George Penn and Dr. Arthur Weldon of Tulane University.

●

The BULLETIN

The Editor herewith completes the first volume of the BULLETIN with which he has been associated and is hopeful that it approaches the standard of quality previously established by his predecessor. Certainly any failure to do so cannot be due to any lack of cooperation and assistance of the officers and members of the Association. The assistance of the State Correspondents and of the contributors of feature articles is especially appreciated.

The problem of feature articles is a particularly difficult one for the Editor. We intend to continue the series on Biological Field Stations, including Marine Stations, similar to the one on the Highlands Station appearing in this issue, and have several scheduled for subsequent issues. However, it is hoped to have other types of articles which might be of interest to members. These would include points of view on various problems of interest to biologists, technical articles of a general or review nature, possible biographical sketches of biologists from our area, description of biology departments and studies at various colleges and universities in our area, and other subjects of interest. Suggestions for these articles are solicited, as are contributors, from the membership of the Association. All articles submitted will be given consideration by the Editor and by consultants familiar with the particular field. Restrictions as to size exist; two to four pages of the BULLETIN (about 2500 to 5000 words) is the usual length acceptable, although shorter and longer articles will be considered. The Editor at all times welcomes suggestions or expressions of opinion from members as to the content or organization of the BULLETIN.

●

State Correspondents

Beginning with the next issue (Vol. 7, No. 1) the new correspondent for North Carolina will be Dr. William J. Koch, Botany Department, University of North Carolina. The Editor expresses his appreciation to the former correspondent, Dr. T. W. Johnson, Jr., and regrets that he finds it necessary to resign. The job of the state correspondents is a difficult one and it is hoped that all members will aid them by sending them news items.

●

AIBS Meeting

The annual meetings of the Biological Societies affiliated with the American Institute of Biological Sciences were held at the Pennsylvania State University, August 30 to September 3. A number of these meetings were of interest to and attended by ASB members. A total of 37 ASB members were listed as authors of contributed papers in the programs of 10 of the participating societies.

THE HIGHLANDS BIOLOGICAL STATION

THELMA HOWELL

Professor Howell's association with the Highlands Biological Station dates to 1938 when she began researches there on the blood of plethodontid salamanders. In 1946 she was made Executive Director of the Station, serving in residence during the summer months. In a special resolution of appreciation passed by the Board of Trustees of the Station in 1958, Miss Howell was highly commended for her part in the progress and development of the Station. In April 1959, Miss Howell resigned as Professor of Biology, Chairman of the Biology Department, and Chairman of the Division of Natural Science and Mathematics at Wesleyan College in Macon, Georgia, to become full-time, in-residence Executive Director of the Highlands Biological Station. She holds the A.B. and A.M. degrees from Duke University and is a member of Sigma Xi. Her memberships in professional organizations include the ASB, the Academies of Science in Georgia, North Carolina and Tennessee, the Society of Ichthyologists and Herpetologists, Ecological Society, and others.

THE HIGHLANDS BIOLOGICAL STATION is situated in the town of Highlands, North Carolina, in the southwestern part of the State near the South Carolina and Georgia boundary lines. It is not in a valley nor on a mountain but on a plateau of several thousand acres, commonly called the *Highlands Plateau*. The town itself is 3,823 feet at the town square, being the highest incorporated town east of the Rockies. The average elevation within the town limits is 4,119 feet. Some of the surrounding peaks reach elevations of over 5,000 feet. A few miles to the east of Highlands is the continuation of the Blue Ridge; to the north are the Cowee Mountains and beyond them the Plott Balsams; to the northwest are the Great Smokies; and to the west the Nantahalas.

The area available for those whose researches bring them to the Highlands Biological Station is the southern section of the Blue Ridge Province, commonly called the Southern Appalachians. This area offers more opportunities than any other comparable area in Eastern North America for the student of bio-geography. The region is one of great antiquity, for the Appalachians represent an ancient land mass repeatedly raised into mountains and continuously eroded before the newer Appalachians were born. During periods of peneplanation, the vast mountain area became a refuge for plants and animals which were unable to find suitable habitats on the vast peneplain. As early as 1842 the great botanist, Asa Gray, called attention to many of the rare plants of the area, and again in 1884 emphasized the age of the flora and pointed out their Asiatic relationships. Recent investigators have likewise directed attention to many of the native species of plants which are thought to represent survivals from early geologic time and to many species and genera which have their nearest relatives at the present time in eastern Asia. Situated on the Blue Ridge Escarpment, the Station affords access to the Piedmont as well as mountains, so that, within a radius of 20 miles of the Station, one is near Oak - Hickory - Pine, Oak - Chestnut, Beech-Maple, Mixed Mesophytic, Hemlock-Hardwood, and Spruce-Fir communities.

The Highlands area also includes such remarkable escarpment gorges as those formed by the Whitewater, Chattooga, Thompson, Estatoe, Horsepasture, and Toxaway Rivers. Here, studies in relict species can be made, and these gorges harbor species which cannot be found elsewhere. There is a wealth of bird life and small mammals, while among the salamanders, insects, spiders, and snails are many forms that do not occur elsewhere, or are the unique southern representatives of groups living far to the north.

A few examples of more recent research problems conducted at the Station will indicate the wide variety of problems that may be pursued in the Southern Blue Ridge Province. As a group of distinguished biologists who evaluated the Station for a national agency pointed out, the ruggedness of the terrain of the mountainous region and its comparative inaccessibility have so retard-

ed biological exploration "that many years' work lie ahead before biologists who work in the area will be in a position to confine their efforts to more intensive, long term laboratory projects with full confidence that the natural environment is adequately understood". Some of the recent problems, therefore, may be classified as field exploration. Individuals working on the state floras of the Carolinas, Georgia, and Tennessee have used the Station as a base of operations. This work has resulted in new distributional records and the description of new varieties and species. Taxonomic problems and life history studies on the insects have included such groups as the fungus gnats, beetles, moths and butterflies, caddisflies, stone flies, craneflies, and mayflies. The ecological studies have been most interesting. They have included studies of the grass balds, and an investigation of the ecotone between deciduous and boreal coniferous forests. Some microclimatic studies have been conducted in the Whitewater Gorge. The most intensive work has been done on the fungi, liverworts, mosses, salamanders, birds, and mammals. The problems in these groups have included taxonomic, life history, and ecological studies.

In this day of almost frenzied attention to the promotion of basic research and training in the sciences, the story of the founding of the Highlands Biological Station over thirty years ago is of great interest. The parent organization of the Station was the Highlands Museum of Natural History, founded in 1927 for the purpose of preserving some of the private collections of the first settlers of the region. Impressed with the urgent need of promoting biological research in the South, and realizing that the Southern Appalachians offered unexcelled opportunities for the student of bio-geography, the Trustees of the Highlands Museum of Natural History invited the late Dr. Edwin E. Reinke of Vanderbilt University to serve as Director of the Museum for 1929. Dr. Reinke was also charged with the responsibility of preparing a report on the advisability of establishing a laboratory in connection with the Museum. Dr. Reinke's formal report, "Report on the Necessity of a Mountain Biological Research Station in the South", published in 1930, became Publication Number 1 of the Station.

As a result of the report, the Trustees of the Museum sponsored a conference of biologists in Highlands from June 20-22, 1930, for the purpose of discussing the feasibility of establishing a biological station in the Southern Appalachians. Those registered for the conference and their institutions were: Miss Laura Bragg, Director Charleston Museum; E. B. Chamberlin, Charleston Museum; E. G. Conklin, Princeton University; E. S. Hathaway, Tulane University; L. R. Hesler, University of Tennessee; W. E. Hoy, University of South Carolina; B. P. Kaufman, University of Alabama; I. F. Lewis, University of Virginia; Clifford Pope, American Museum of Natural History; J. M. Reade, University of Georgia; E. E. Reinke, Vanderbilt University; R. C. Rhodes, Emory University; J. S. Rogers, University of Florida. Mr. A. H. Howell and Mr. F. S. Burleigh of the U. S. Biological Survey were present on the last day of the conference.

Out of the conference came a motion offered by Dr. J. M. Reade that a committee be appointed to recommend the proper procedure for establishing a biological station in the Southern Appalachians. The motion was passed unanimously and on this committee were appointed the following: Reade, Hathaway, Hesler, Hoy, and Kaufman. This committee recommended to the Trustees of the Museum that incorporation of the "Highlands Museum and Biological Laboratory" under the laws of the state be effected immediately. On July 31, 1930, the Highlands Museum and Biological Laboratory was incorporated. On September 30, 1949, the Charter was amended and the name of the organization changed to THE HIGHLANDS BIOLOGICAL STATION, INC.

The corporation purchased tracts of land and Lake Ravenel (formerly called Lindenwood Lake). In 1931 a laboratory was built on the shore of the lake and dedicated as The Sam T. Weyman Memorial Laboratory Building. In 1940 there was constructed a Museum of Natural History Building. This building is a handsome and spacious stone building. It is in this building that an educational program for the layman is conducted through exhibits, nature study classes for children, and an illustrated lecture series for adults. Important collections of the Museum include the Cleaveland Collection of local Cherokee artifacts and a portion of the valuable Burnham S. Colburn Collection of North Carolina Minerals.

A new research laboratory, made possible by a grant from THE NATIONAL SCIENCE FOUNDATION, was completed in May 1958. It is named for the late distin-

guished botanist, William Chambers Coker, a former Station president and director. The Coker Building contains research cubicles for 18 investigators, the Reinke Library, executive offices, plant drying room, and store room. *Central heating permits use of the laboratory throughout the year.* The original laboratory building was remodeled in 1958 and converted into a dining hall which will seat 50 people. The kitchen is furnished with the most modern equipment.

Four cottages are available for housing of investigators. The Illges Cottage contains a living room with fireplace, five bedrooms, and two baths. In 1958, through a grant from the NATIONAL SCIENCE FOUNDATION, three cottages were built: the Henry M. Wright Cottage, the Warren McAllister Deacon Cottage, and the Margaret Cannon Howell Cottage. The last named cottage has central heating, permitting use throughout the year.

In addition to the land surrounding the lake, approximately six miles from town the Station owns the Margaret Cannon Howell Wildlife Refuge, an undisturbed tract of primeval forest, given the Station in 1948 by Mrs. Clark Howell, Senior, of Highlands and Atlanta, Georgia. In 1954, Mrs. W. C. Coker, Chapel Hill, North Carolina, gave the Station the William Chambers Coker Rhododendron Trail in memory of her husband.

The corporate powers of the Station are vested in a Board of Trustees. Twenty members of the Board are divided into four classes of five members, with staggered terms of four years. The President, Vice-President, the Treasurer, and the Executive Director are trustees *ex officio*. In addition, there are Honorary Trustees, individuals who may be elected from the Board of Trustees after having attained the age of seventy years. The President, Vice-President, and Executive Director must be biologists. At the present time, twelve additional biologists are serving on the Board of Trustees.

The Administrative Body of the Station is a Board of Managers composed of a representative of each of the Subscribing Institutional Members, the Executive Director, and the President of the Corporation who is a member *ex officio*. The Board of Managers, subject to the approval of the Board of Trustees, formulates the research and educational programs of the Station, recommends to the Board of Trustees the members of the staff, recommends a yearly budget, extends Subscribing Institutions Memberships, and awards research grants-in-aid. Currently, the Subscribing Institutional Members are, in the order of their applications and election to membership: Vanderbilt University, University of North Carolina, Duke University, Wesleyan College, University of Georgia, University of Tennessee, North Carolina State College, University of Florida, Florida State University, and Emory University. Biologists serving in official capacities at the Station are: Leland Shanor, *President*; H. J. Oosting, *Vice-President*; Thelma Howell, *Executive Director*; *Board of Trustees*: H. L. Blomquist, Lewis Anderson, H. R. Totten, A. J. Sharp, Elon E. Byrd, J. W. Hardin, R. B. Platt, J. R. Bailey, Warren McA. Deacon, Lewis Berner; *Board of Managers*: J. R. Bailey, Warren McA. Deacon, Lewis Berner, Robert K. Godfrey, James W. Hardin, Lillian M. Cowie, Eugene P. Odum, W. D. Burbanck, Royal Shanks, H. R. Totten.

At the Annual Meeting of the Corporation on June 28, 1959, President Leland Shanor made several announcements which reflect continued progress of the Station. On behalf of the Board of Trustees, he stated that the Station would be open throughout the year with the Executive Director serving on a year-round, full time basis. Dr. Shanor also reported that the North Carolina General Assembly had appropriated $7,500 to the Station in recognition of the important role the Station plays in higher education in North Carolina. Another important announcement was that 15 biologists had worked at the Station for varying lengths of time during the past year *on grants other than those provided by the Station* from funds it received from the National Science Foundation. Agencies which supported the work of the investigators indicated above included the American Philosophical Society, the National Institutes of Health, the Atomic Energy Commission, the National Science Foundation, and the institutions which the investigators represented.

The spirit which motivated the founding of the Station lives today. The principle upon which it was organized—primarily for investigation and dissemination of knowledge—has proved to be a sound one. In the years to come the path will be the same, modified to meet new conditions as they arise. The Station will continue its role of distinguished service as a regional biological research station in the Southern Appalachians.

SHOULD WE TEACH HUMAN EVOLUTION?

ARTHUR W. JONES

Dr. Jones received the B.A. (1934), the LL.B. (1936), the M.A. (1941) and the Ph.D. (1943) degrees from the University of Virginia. He served as Assistant Professor of Biology at Southwestern University, 1943-45, and since 1945 has been Associate Professor of Zoology at the University of Tennessee. Since 1953 he has been Principal Investigator in an A.E.C. Contract to study effects of radiation on host-parasite relationships. During the recent summer Dr. Jones has taken charge of the National Science Foundation Undergraduate Research Participation Program at the University of Tennessee. He is a member of a number of professional societies, including the American Society of Parasitologists, the National Association of Biology Teachers, the Society for the Study of Evolution, and the ASB, of which he is the retiring Treasurer. Dr. Jones' interests are much broader than those obvious from his more than 30 publications, most of which concern cestodes and other parasites, and include much interest and activity in community problems (especially education and human relations), church work and work with student organizations. The accompanying article was prompted by a desire for at least passing observance of the Darwinian Centennial; it represents a point of view for which the author must take credit, but which the BULLETIN is glad to present for the readers' consideration.

In 1871 Darwin wrote that although the fossil evidence for the descent of man was as yet scanty, the indirect evidence—comparative anatomy, human variability and embryology—"declare in the plainest manner, that man is descended from some lower form---." Since Darwin's time, fossil evidence has come to light which connects modern man through a dated series of preceding forms with ancestral primates which gave rise to man and apes (Clark, 1959). This evidence completes in a satisfactory way the data that Darwin lacked. Man is descended from some lower form.

This fact is now unquestioned by biologists. Yet it is not taught, or is still referred to as a theory or hypothesis, in high school and even college biology courses in many parts of the United States. Why is the teaching of human evolution neglected and suppressed? Riddle (1955) has written a long, well-documented answer. Very briefly, the teaching of evolution is suppressed because evolutionary thinking is considered offensive, sacrilegious and dangerous to custom.

Offensively, this teaching questions the characteristically human idea that man has a special place in nature, apart from all other living things. Just as each remote tribe calls itself "the people", and despises "the others", strangers and enemies, as different and inferior, so the human animal himself exhibits prejudice that sets his species apart and makes man the self-styled apex of creation. Recognizing our kinship with the other animals would be like a respectable family's recognizing kinship with criminals or paupers; poor relations are, if possible, disowned. It offends our human family pride to call attention to man's uncouth relations or undistinguished ancestors.

Sacrilegiously, evolutionary thinking questions the divine origin of man and the divinely ordered laws which the Bible gives for man's eternal governance. And this sacrilege extends, necessarily, to all the fragments of theological doctrine; each sect, each chosen people, cannot easily justify its peculiar rightness against the background of a common animal origin for all mankind. By substituting history for eternity in the human past, evolution insists upon the reality of change, and questions deeply the cherished belief in the permanence of revealed truth.

Dangerously, evolutionary thinking challenges not only the permanence of religious ideas but also the value of established custom. The origin of man has involved a very large number of chance events, through which a particular animal acquired the bi-

ological equipment to achieve culture. Culture has painfully developed through ages of trial, conflict, and synthesis. This fact exposes the absurdity of pretending that present truth is final, or that any human institution is either permanent or perfect. Evolutionary thinking is revolutionary.

Thus evolution is seen as a radical doctrine, unpopular, dangerous, and subversive. Most teachers, understandably, hesitate to teach the facts of human evolution, since by doing so they would antagonize the more powerful forces in society, and would risk the loss of their jobs. Yet some teachers have always come forward, risking unpopularity or dismissal, to teach a fact they believe is important, a truth that holds value for pupils and their society.

Is the evolution of man this kind of truth, a fact worth teaching even at some risk?

The arguments against teaching evolution deny that it has value. These arguments are emotionally based on the unpopularity of evolutionary ideas; their content, however, may appear to be rational.

For example, some argue that knowledge of the descent of man destroys human Faith. Faith in a Creator whose special plan is for man — his sin and his salvation — seems incompatible with the fact that man descended, imperceptibly becoming human through millions of years, from non-human ancestors. Faith in the Bible as a literal description of the nature of God and of the origin of man would indeed be shaken by an understanding of human evolution. If faith in a personal or tribal God, and faith in the literal meaning of the Bible would be destroyed by the knowledge of human evolution, it is argued that this knowledge should be withheld or suppressed.

Somewhat less naively, some insist that the effect of teaching the facts of human evolution would be to encourage a materialistic view of the world and man. The story of man's origin from lower animals seems to devalue the human spirit, in this view, since man's descent implies that man is merely an animal. As an animal, it is said, man cannot have conscience or soul, a sense either of sin or of responsibility. A simple ethic of material well-being would be justified as "rational" to man. Spirit, and idealistic yearnings, would be foreign to his animal nature. "Godless Communism" would fulfill whatever dreams the human animal might have.

If the above arguments, and others like them, are valid, then indeed the descent of man (like certain facts about the worst in human nature, demonic and psychopathic acts in historic times, the evils of man's nature revealed in crude pornography or elegant perversions) should be concealed from view. The "Origin of Species", with a hundred other works on evolution, should be kept in locked library rooms, with the writings of the Marquis de Sade and Edmund Wilson. Human evolution would seem a fact too strong for the childish mind, too dangerous for the common man.

But the arguments sampled above, that say human evolution destroys faith, encourages materialism, and devalues Man, are not valid. They can be easily answered.

Every important discovery destroys a certain kind of faith. Although faith, "the evidence of things unseen", may rest upon deep human need, springing as it does from fear of the unknown and from the hopeful poetry of prophetic souls, still it cannot stand against the evidence of fact clearly established. Faith that attempts to stand against reason can do little good, even for those whom it apparently nourishes and comforts. Those who cling in fear and ignorance to superstitious beliefs are weaker than they need to be. One of the great values of scientific discovery is that such discovery removes some of the need for superstition, cures some of the sickness of man's ignorance and fear. The faith that cannot stand in the light of scientific truth is best destroyed.

Evolution encourages another kind of faith. That man is part of the Universe, by his history as well as by his presence; that man shares with all living things a real relationship; that the world, with other worlds in which life probably arose, is much greater than man, who is yet a part of it; these ideas are close to the perennial philosophy that ennobles all religion, the great thought that man and God are in some manner one. Also, the fact of man's emergence from the distant time of his animal origin lends hope that is like the hope of resurrection; the promise of man's future is worthy of great faith indeed. If faith in a universal God, and faith in a human future where the dreams of poets and prophets may be realized, are valid substitutes for parochial beliefs the literal meaning of which is shaken by evolutionary truth, then the effect of teaching evolution is to encourage Faith, not to destroy it.

Is the effect of teaching evolution to encourage materialism? In the first place, materialism has had so much encouragement already that it is hard to see how one could encourage it more. Materialism is the ethic of Americans (and doubtless of Russians, Englishmen, and any other Western man one might name). The belief in goods, the worship of prosperity, the faith in material achievement by science and industry — these are American ideals, much as philosophers may wish otherwise. If a scientific truth is opposed because it encourages materialism, the American Way of Life itself should be opposed. And materialism is not necessarily bad. Galbraith (1959) has suggested that the proper use of prosperity is for human good; this is the new economic responsibility. Supporting this economic idea with great force is the evolutionary truth of man's emergence from his animal origin. Man has inherited, biologically, the brains to plan for his future. His cultural inheritance, including a knowledge of economics, makes it possible for him to use wealth for his own benefit. Whether the use will in fact be harmful or beneficial depends on man himself, not upon a set of unchanging laws, whether Biblical or Economic. Evolutionary thought, the knowledge of the descent of man, thus makes it reasonable for man to control and direct the material wealth that he himself has created.

Responsibility for economic destiny is not the only responsibility placed on the shoulders of modern man by the fact of his descent. It is the peculiar value of evolutionary thinking that it leads to a view of man which implies general responsibility — for the use of wealth, for the control of population, for peace, for education, in short for the future itself. Man evolved, together with the whole world of living things. But man alone has the brain and hands that make culture possible; culture is, and continues to be the product of human nature.

Why teach the evolution of man? No teaching can be more valuable, in these most troubled times, than the idea of man's responsibility, the duty and burden and crown he assumed when he became human during the evolutionary ages. Defenders of old and orthodox beliefs try to obscure, belittle and deny this truth. Beneficiaries of conservative and established political or economic structures fear the effect of evolutionary thought upon their vested interest. These actions and attitudes are understandable, but they lie across the path of human progress. If mankind is to emerge from the present age of terrible potentialities, neither sinking into a sub-human misery after nuclear war, nor settling into a rigid pattern of controlled and regimented behavior (due to the mutual imitation which great rival systems even now engage in), then we must recognize and use the power that evolution has given us. We must teach human evolution, in order that humanity may survive.

THE AAAS MEETING, CHICAGO, DEC. 26-31, 1959

The 126th meeting of the American Association for the Advancement of Science will include sessions of 18 AAAS sections and of some 83 participating organizations. Many of the sections and organizations will have programs of contributed papers, but the emphasis again will be on symposia sponsored or cosponsored by various societies and sections, featuring discussions of subjects of current interest and importance by leading authorities in the various fields. Some of the symposia of particular interest to biologists are as follows:

1. Moving Frontiers of Science IV. December 26 and 27. A general symposium sponsored by the AAAS.
2. A symposium sponsored by the AAAS Committee on Science and the Promotion of Human Welfare. December 30.
3. Biochemistry of the Collagen. Sponsored by Section C (Chemistry) and arranged by Sidney Udenfriend.
4. Unsolved Problems in Biology. December 28 and 29; cosponsored by Section F (Zoological Sciences) and Section G (Botanical Sciences); principally on the cell and genetics; arranged by Norman G. Anderson and Barry Commoner.
5. The Impact of Electron Microscopy on Biology. Cosponsored by Section F

(Zoological Sciences) and the Argonne National Laboratory; arranged by E. L. Powers.

6. Aging Facts and Theories. December 29 and 30; cosponsored by Section N (Medical Sciences), Gerontological Society, and others; arranged by N. W. Shock.
7. Germ Plasm Resources in Agriculture: Development and Protection. December 28-31; cosponsored by Section O (Agriculture), Genetics Society of America, American Society for Horticultural Science, and others; arranged by R. E. Hodgson.
8. Space Medicine III. December 28; cosponsored by American Physiological Society and the American Astronautical Society; arranged by Fred A. Hitchcock.
9. The Roots of Behavior. December 28 and 29; sponsored by the American Psychiatric Association; arranged by Eugene L. Bliss.
10. Interactions in Nature. December 27 and 28; cosponsored by the Ecological Society of America and the American Society of Limnology and Oceanography; arranged by Arthur D. Hasler.
11. Physiology of Reproduction in Birds. December 30 and 31; sponsored by the Chicago Academy of Sciences; arranged by Richard A. Edgren.
12. Dune Ecology. December 29; sponsored by the Ecological Society of America; arranged by Jerry S. Olson.
13. Speciation and Raciation in Cavernicoles. December 28; sponsored by the National Speliological Society; arranged by Thomas C. Barr, Jr.

Other symposia of interest will be presented by the Mycological Society of America, The American Society of Plant Taxonomists, and the American Association of Clinical Chemists.

The AAAS Annual Exposition of Science and Industry (about 100 booths) and the AAAS Science Theater, with recent foreign and domestic films, will be prominent features of the meeting. The usual Biologists Smoker for all registrants will be held during the evening of December 30.

NEWS OF BIOLOGY IN THE SOUTHEAST

About People

Dr. Ruth S. Breen of the Department of Biological Sciences, Florida State University, has been elected chairman for 1959-60 of the Southeastern Section of the American Botanical Society.

Dr. Alvin Wagner, who received his Ph.D. degree in Zoology from Florida State University in August, is now at Harvard University as a U. S. Public Health Service post-doctoral fellow where he is working with Dr. Thomas Weller. At Florida State, Dr. Wagner studied under Dr. Robert B. Short, Department of Biological Sciences.

Dr. Anne Pates of the Department of Biological Sciences, Florida State University, has been elected a member of the Board of Directors of the Florida Society of Medical Technologists.

Dr. William D. Fisher, Department of Biological Sciences, Florida State University, was a summer research participant with the Biological Division, Oak Ridge National Laboratory, working on nucleoproteins and nucleic acids.

Dr. George W. Keitt, Jr., from the University of Michigan, and **Dr. Relis B. Brown**, from Vanderbilt University, have joined the staff of the Department of Biological Sciences, Florida State University. Dr. Keitt, a plant physiologist, will be Assistant Professor in the Division of Botany; Dr. Brown, Associate Professor in the Division of Zoology.

Dr. Maxwell Mozell, who received his Ph.D. from Brown University, has National Institutes of Health post-doctoral fellowship, studying with Dr. Lloyd M. Beidler at the Department of Biological Sciences, Florida State University.

New appointments in the Biology department of Furman University include **Dr. Julian T. Darlington**, Professor, and **Dr. G. Thomas Riggin, Jr.**, Assistant Professor. The special field of interest of both of these staff members is invertebrate zoology.

Dr. Kathleen D. Wyant has left the University of Tennessee where she has been Research Associate in Parasitology to accept a position as Assistant Professor of Biology at the Florence center of the University of South Carolina.

Madison E. Pryor, graduate student in Entomology at the University of Tennessee, has begun a study of insect life at the South Pole with the newly completed U. S. Antarctic Biological Research Laboratory as his home base. He is a member of the expedition financed by the National Science Foundation to study plant and animal life at the South Pole. Mr. Pryor's work is under the direction of Dr. A. C. Cole, Professor of Entomology at U. T. and director of the N. S. F. survey of land invertebrates in Antarctica.

New members of the staff of the Biology Division of the Oak Ridge National Laboratory include the following: **Mitzi L. Gwyn** (Biophysics Group), a graduate of Memphis State University; **Cynthia K. Myers** (Chemical Protection and Proteolytic Enzyme Studies Group), from Peabody College, Nashville, Tennessee; **Mary Lou Rekemeyer** (Drosophila Cytology and Genetics Group), University of Tennessee; **Catherine C. Hyde** (Cytology and Genetics

Group) a graduate of Louisiana State University; **Dr. Peter Mazur** (Cell Physiology Group), a graduate in Biology from Harvard University, and formerly with the Department of Biology, Princeton University; **Dr. Carl J. Wust** (Enzymology Group), a graduate in Microbiology from Indiana University; and **Dr. Rusty J. Mans** (Enzymology Group), a graduate in Biochemistry from the University of Florida.

Dr. B. Theodore Cole, Associate Professor of Zoology, Louisiana State University, has joined the staff of the Cell Physiology Group, ORNL, for a period of one year as a Research Participant.

Dora M. Furr has joined the Plant Physiology and Photosynthesis Group, ORNL, as an ORINS Postdoctoral Fellow. Mrs. Furr has been doing graduate work at Duke University for the past year.

Drs. Michael A. Bender and **John S. Kirby-Smith**, Biology Division, ORNL, presented papers at the Symposium on Intermediate and Low Level Effects of Ionizing Radiations in Venice, Italy, June 21-27. **Dr. Alexander Hollaender**, ORNL, was a member of the Organizing Committee of this Symposium and served as Chairman of the first session. While in Europe Dr. Hollaender visited a number of laboratories and, as President of the Comite International de Photobiologie, attended a meeting of the Executive Committee in Copenhagen to make plans for the Third International Congress of Photobiology which will be held in Copenhagen in 1960.

Drs. William L. and **Liane B. Russell** attended and presented papers at the Symposium in Venice, June 21-27 and the Ninth International Congress of Radiology in Munich July 23-30. While in Europe they visited universities in Rome, Edinburgh, Glasgow, Vienna and London.

Drs. Alexander Hollaender and **Charles C. Congdon** attended the XXI International Congress of Physiological Sciences in Buenos Aires, August 9-15. Dr. Hollaender was Chairman of the Symposium on Radiation Protection and Recovery.

Dr. R.C. von Borstel, Biology Division, ORNL, left in September for a one year stay in Italy. He has been awarded a National Science Foundation Senior Postdoctoral Fellowship for research and study at the Instituto di Genetica, Universita di Pavia, Pavia, Italy. He also plans to spend some time at the Stazione Zoologica, Naples.

Leaving the Biology Division, ORNL, are **Captain James A. Sproul, Jr.**, Pathology and Physiology Section, who has been assigned to the School of Aviation Medicine, Brooks AFB, Texas, and **Dr. Richard A. Goff**, Mammalian Genetics and Development Section, who returns to the University of Oklahoma after serving as a Research Participant.

Dr. Paul J. Kramer, Duke University, has been elected Vice-President of the Botanical Society of America.

Dr. Joseph R. Bailey, Duke University, and **Dr. James W. Hardin**, North Carolina State College, have been elected to the Board of Trustees of the Highlands Biological Station.

Dr. John Allen Boole, Jr., Professor of Biology at Georgia Teachers College, participated in the National Science Foundation sponsored botany conference held at the University of North Carolina, July 27 - August 14.

Dr. Samuel L. Meyer, President of the ASB in 1948-49 and now the Academic Vice-President of the College of the Pacific, Stockton, California, was named the outstanding faculty member of the academic year 1958-59 by the Pacific Student Association at the Awards Convocation on May 28, 1959. As the recipient of the Tully C. Knoles plaque, Dr. Meyer became the first first-year faculty member to be so honored.

Dr. George H. Bick, Associate Professor of Biology at Southwestern Louisiana Institute, has resigned to accept a position as Professor of Biology at Clarion State College, Clarion, Pennsylvania.

New members of the staff of the Department of Biology, West Virginia University, for the 1959-60 term are **Robert J. Tolbert** (Botany), **Leah Ann Williams** (Comparative Anatomy) and **Arnold Benson** (Aquatic Biology).

Dr. William E. Werner, Jr., Department of Biology, Blackburn College, Carlinville, Illinois, was a visiting professor for the summer term at West Virginia University.

Dr. J. T. Penney has been appointed head of the Department of Biology at the University of South Carolina.

New staff members in the Department of Biology at the University of South Carolina include **Dr. John M. Herr, Jr.**, Assistant Professor, and **Dr. Eric F. Thompson**, Instructor.

Dr. Martin D. Young, U. S. Public Health Service, Columbia, S. C., has been named Editor **pro tem** of the American Journal of Tropical Medicine and Hygiene. Dr. Young, formerly Chairman of the Editorial Board, will fill the position until a successor is appointed to replace the Editor, Dr. Martin Frobisher, who resigned because of illness.

Among Bryologists who have been in residence at the Highlands Biological Station to work with **Dr. Henry S. Conrad** are: **Dr. F. J. Hermann**, U.S.D.A., Beltsville; **Dr. F. J. Hilferty**, State Teachers College, Bridgewater, Massachusetts; **Mr. Robert E. Ireland**, Smithsonian Institution.

The Department of Zoology at Louisiana State University announces the following additional faculty: **Dr. Beryl Franklin**, from Del Mar College; **Dr. Mark Goldie**, embryology, from Brown University; **Dr. Robert A. Norris**, ecology, from Tulane University; **Dr. Shanta V. Iyengar Ellis**, genetics, from Texas University for Women.

Blanche Jackson, Department of Zoology at LSU, was a Research Associate in the Division of Biology and Medicine at the Argonne National Laboratory this past summer.

Dr. Aaron Seamster, formerly at Del Mar College, has joined the faculty in Biology at Northeast State College, Monroe, Louisiana.

George H. Lowery, Director of the Museum of Natural Science at LSU, has been elected 27th president of the American Ornithologists' Union.

Dr. Kenneth O. Phifer, a recent graduate of the Johns Hopkins University School of Hygiene and Public Health, has been commissioned in the U. S. Public Health Service and has joined the staff of the Laboratory of Parasite Chemotherapy in Columbia, S. C. Dr. Phifer's field of interest is in parasite physiology.

Dr. Dietrich Bodenstein of the Gerontology Branch of the Baltimore City Hospital will assume the Chairmanship of the Department of Biology, University of Virginia in February. Dr. Horton H. Hobbs, Jr., is presently serving as Acting Chairman.

Dr. James H. Starling, Professor of Biology, Washington and Lee University, served as Consultant in a National Science Foundation sponsored Science Institute at Appalachian State Teachers College in July. Later, he attended as a participant the N.S.F. sponsored Botany Conference held at the University of North Carolina.

Dr. Harry L. Holloway, Jr., Professor of Biology, Roanoke College, has been appointed Head of the Department of Biology.

The following appointments have been made in the Biology Department of Emory and Henry College: **Dr. Jack S. Brown**, Chairman and Professor; **Dr. Te-Hsui Ma**, Assistant Professor; and **Mr. Alvin Ciccone**, Assistant in Biology.

The following persons have recently joined the research staff of the Virginia Fisheries Laboratory: **Dr. E. B. Joseph**, formerly with Birmingham-Southern College, Head of the Ichthyology Research Section; **Dr. Bernard L. Patten**, formerly of Rutgers University, will study the plankton of Chesapeake Bay; **Mr. John J. Norcross**, formerly with Michigan State University, will work on fishes of Chesapeake Bay; and **Mr. H. D. Hoese**, formerly with the Texas Fish and Game Commission, will study population problems of Atlantic Ocean oysters.

Dr. Edwin M. Weller, Biology Department, Randolph-Macon Woman's College, has resigned to accept a position with the Utah Medical College.

Dr. Paul A. Walker, Department of Biology, Randolph-Macon Woman's College, attended a National Science Foundation sponsored Conference of Recent Advances in Genetics, held at Cold Spring Harbor Biological Laboratories August 2 through August 22.

Mr. James E. Perham has been appointed Assistant Professor of Biology, Randolph-Macon Woman's College. He received the M.S. degree from Northwestern University and has completed requirements for the Ph.D. degree at Florida State University.

Mr. A. Randolph Shields, Assistant Professor of Biology, Roanoke College, will be the principle Instructor in a National Science Foundation sponsored In-Service Institute to be offered through the Roanoke Extension of the University of Virginia. **Dr. Horton H. Hobbs, Jr.**, University of Virginia, is the Director of the Institute, which will meet in the Biological Laboratories of Roanoke College.

Effective January 1, 1960, **Dr. William R. Jenkins**, presently Assistant Professor, Department of Botany, University of Maryland, will accept a position as Associate Professor, Department of Entomology, Rutgers University. He will direct the work in nematology in teaching and research at Rutgers.

Dr. Lorin R. Krusberg will replace Dr. Jenkins at the University of Maryland. Dr. Krusberg is a graduate of the University of Delaware and N. C. State College. He is presently located at the Rothamsted Experimental Station, Harpenden, Herts., England, where he has been working on a one-year Post-Doctorate National Science Foundation Fellowship.

During the past year two new assistant professors have been added to the staff of the Department of Zoology, University of Maryland. They are **Dr. Harris J. Linder** who specializes in Invertebrate Zoology and **Dr. Raymond G. Stross** who specializes in Ecology.

Dr. William Burbanck of the Biology Department at Emory University attended the XIV International Limnological Congress in Vienna in August. He received a travel award from the Am. Soc. of Limnology and Oceanography to attend this Congress.

Dr. William Burbanck, Emory University, had the opportunity to do some special work on his **Cyathura** problem this summer when he investigated the estuaries near Plymouth, England, and of South Harbor, Copenhagen.

Dr. William H. Murdy has joined the Biology Department at Emory University as an instructor in Botany. He comes from Washington University in St. Louis.

Mr. William Brillhart has received a grant from the National Science Foundation to continue his graduate studies for his Ph.D. He is working at Emory University and is not teaching this fall.

Dr. Ronald A. Pursell has left the Department of Botany, University of Tennessee, to accept a position at the Penn State School of Forestry at Mont Alto, Pennsylvania.

Dr. Sinske Hattori, Japan's leading hepaticologist, of Nichinan, Miyazaki, spent most of September, 1959, at the University of Tennessee collecting hepatics in the Southern Appalachians and exchanging ideas with the staff.

New staff members of the Botany Department of the University of Tennessee include: **Dr. Donald Foard** from North Carolina State College, who has been appointed Assistant Professor; **Dr. Raymond Hatcher** from the University of Cincinnati, Instructor; and **Mr. Dan Morris**, Instructor.

Institutions and Organizations

A new $1,150,000 Animal Science Building on the Agricultural Campus at the **University of Tennessee**, Knoxville, was dedicated July 9, with Governor Buford Ellington and President O. S. William of Oklahoma State University as principal speakers.

The **University of Texas** Board of Regents, following action by the Legislature, have authorized construction and appropriated $250,000 for a research building at the Institute of Marine Science, Port Aransas, Texas.

The **University of South Florida** is being built and organized at Tampa; the first class is planned for September of 1960.

The **Virginia Fisheries Laboratory** and the **College of William and Mary** have cooperated in establishing the Department of Marine Science of the College. The faculty is as follows: Head of the Department — W. J. Hargis, Jr., Ph.D., Director of the Virginia Fisheries Laboratory; Professors — J. D. Andrews, Ph.D., and W. J. Hargis, Jr.; Associate Professors — M. L. Brehemer, Ph.D., D. S. Haven, M.A., E. B. Joseph, Ph.D., B. L. Patten, Ph.D., W. A. VanEnget, Ph.M., and J. L. Wood, Ph.D.; Assistant Professor — R. S. Bailey, M.A.; and Lecturers — W. H. Massmann, M.A., and J. J. Norcross, M.S.

The **Virginia Fisheries Laboratory** announces the establishment of its Eastern Shore Branch in temporary quarters at Wachapreaque on the Virginia peninsula. It is hoped that permanent quarters will be made available to the Laboratory and the College of William and Mary in the near future.

Randolph-Macon Woman's College held its second annual National Science Foundation sponsored Institute for Secondary School Teachers of Science and Mathematics, with 67 participants from widely scattered areas in the United States. Dr. Paul A.

Walker, Department of Biology, again served as Director, with Dr. Franklin F. Flint and Dr. Edwin M. Weller of the same Department participating.

The Laboratory Experiments subcommittee of the Education Committee of the **American Physiological Society** has just completed the preparation of a list of about 35 experiments for use in the laboratory of General Physiology at the junior-senior level. The list gives the title of the individual experiments along with a short abstract describing the contents, and is being circulated widely among college departments of Biology by Dr. Ray Daggs, secretary of the APS. The experiments have been tested in the laboratory, revised, and in many cases completely rewritten by the subcommittee under the chairmanship of Samuel R. Tipton. The detailed procedures will be made available shortly at a nominal cost and may be obtained from Dr. Daggs on request by title accompanied by appropriate funds to cover the cost. Further inquiries should be directed to Dr. Ray Daggs, Executive Secretary, The American Physiological Society, 9650 Wisconsin Ave., Washington 14, D. C.

Grants in Aid

The following grants have been awarded to members of the Department of Biological Sciences, Florida State University, Tallahassee, Florida:

Dr. Ruth S. Breen, a grant of $7,100 from the **National Science Foundation** in support of completion of a manual, **An Illustrated Guide to the Mosses of Florida; Dr. A. W. Ziegler,** an additional grant of $10,700 from the **National Science Foundation** toward a study of the effects of temperature on the distribution of non-saprolegniaceous aquatic fungi; **Dr. A. Gib DeBusk,** a two-year grant of $40,000 from the **U. S. Air Force** for a study of the genetics of space radiation; **Dr. Adrian W. Poitras,** a grant from the **Florida State University Research Council** for investigations on aquatic ascomycetes; **Dr. Dexter M. Easton,** a year's renewal, grant of $11,500 from the **U. S. Public Health Service** for investigations on spinal motorneuron intracellular potentials; **Dr. John Davison,** a three year grant of $11,000 from the **U. S. Public Health Service** for studies on the form of the elliptical red blood cells; **Dr. Harry Lipner,** a renewal grant of $6,800 from the **U. S. Public Health Service** for work on the effect of hormones on minimal content of tissues; **Dr. Lloyd M. Beidler,** a three year grant from the **National Institutes of Health** of $145,800 for a Sensory Physiology Post-doctoral Training Program.

Drs. Charles Norman and **Erwin Goldberg** of the Department of Biology, West Virginia University, have received a grant of $39,221 from the **U. S. Public Health Service** for a two-year investigation of the life and aging processes of living cells.

Roy B. Clarkson, Instructor in Biology at West Virginia University, was awarded an **NSF Summer Fellowship** in support of his investigations of the flora of the Monongahela National Forest.

Dr. Robert L. Amy, Associate Professor of Biology, Southwestern at Memphis, has been renamed principal investigator for a **U. S. Public Health Service** research grant ($20,000 — three years) awarded to the Southwestern Research Institute.

Southwestern at Memphis recently received a grant from the **National Science Foundation** to support an undergraduate research participation program.

Dr. Burton J. Bogitsh, Associate Professor of Biology at Georgia Teachers College, was recently awarded a grant-in-aid from **Sigma Xi** of $700 for further investigations pertaining to host-parasite relationships in fresh water fishes.

The **North Carolina Academy of Science** has received a grant from the **National Science Foundation** to conduct a NSF-Academy Institute of Science for high school teachers. The program is one of lectures-demonstrations on fundamental biological, chemical and physical concepts. **Dr. Herbert E. Speece,** North Carolina State College, directs the program.

Through funds granted by the **National Science Foundation** the **Duke University Marine Laboratory** will erect a new research laboratory on Piver's Island, Beaufort, North Carolina.

Recipients of **National Science Foundation** grants-in-aid for research at the Highlands Biological Station for 1959 are: **Dr. Robert E. Gordon,** University of Notre Dame; **Dr. Wesley Whitesides,** Florida State University; **Dr. Albert E. Reynolds,** DePauw University; **Dr. Henry S. Conard,** Lake Hamilton, Florida; **Dr. Lewis E. Anderson,** Duke University; **Mr. Fred Clifford Johnson,** University of Texas; **Mr. Julian R. Harrison,** Duke University; **Mr. Arthur R. Shields,** University of Tennessee. Biologists working under the NSF Research Participation Program for Teachers Training conducted at the Highlands Biological Station are: **Miss Jane P. Holt,** Catawba College; **Mrs. Ruth B. Slentz,** Wesleyan College; **Mr. Melvin Conrad,** Emory-at-Oxford.

Dr. Samuel R. Tipton, Professor of Zoology and Entomology at the University of Tennessee, has received a **National Science Foundation** grant of $15,000 to continue studies on the influence of thyroid hormones on mitochondria.

Dr. J. Gordon Carlson, Head of the Department of Zoology and Entomology at the University of Tennessee, has received a one-year contract for $9,057 from the **Atomic Energy Commission** for ***in vitro*** studies on the immediate effects of X-radiation on chromosome morphology and mitotic activity.

Dr. Ronald C. Fraser of the U T Department of Zoology and Entomology has received a **National Science Foundation** grant of $6,500 for a one-year study on changes in hepatic cells of chick embryos on stimulation of the liver by embryonic extracts. Dr. Fraser has also received a grant of $11,460 from the **American Cancer Society** for a 20 month study of immunization of mice against sarcoma by using sarcoma cells pre-treated by passing through embryonic chick tissue.

A study of the effects of radiation on cestodes and their hosts is being conducted at the University of Tennessee Department of Zoology and Entomology under the direction of **Dr. Arthur W. Jones.** This study is being supported by the fifth renewal of an **Atomic Energy Commission** grant of $10,915, and Raymond L. Kisner is replacing Dr. Kathleen D. Wyant as principal investigator.

Dr. Billy E. Frye, Visiting Assistant Professor of Biology, University of Virginia, has received a one-year grant from the **National Science Foundation** for the study of development of function in the islets of Langerhan.

Dr. Jacques Rappaport, Associate Professor of Biology, University of Virginia, has been advised that grants from the **Office of Naval Research** and the **U. S. Public Health Service** for the study of ovular tumors in interspecific plant crosses have been renewed for three years.

The A.S.B. BULLETIN

Volume 7, Number 1 January, 1960

CONTENTS

The Official Quarterly Publication of
The Association of Southeastern Biologists

THE A. S. B. BULLETIN

The ASB BULLETIN is the official quarterly publication of the Association of Southeastern Biologists and is published at Columbia, S. C., in January, April, July and October. Letters, news items, other contributions, and all communications about editorial matters should be addressed to the Editor, U.S.P.H.S., P. O. Box 717, Columbia, S. C. Changes of address should be sent promptly to the Secretary of the ASB, Dr. Harold J. Humm, Department of Botany, Duke University, Durham, N. C. Subscription orders from libraries and other institutions should be sent to the Business Manager, Dr. Elsie Quarterman, Department of Biology, Vanderbilt University, Nashville, Tenn. Subscription rate for non-members of ASB: $2.00 per year. Printing and typography by the Cary Printing Co., Columbia, S. C.

GEOFFREY M. JEFFERY, EDITOR

HAROLD J. HUMM, ASSOCIATE EDITOR
ELSIE QUARTERMAN, BUSINESS MANAGER

ASSOCIATION AFFAIRS

The New Orleans Meeting

Attention of members is called to the announcement of the annual meeting of the Association, April 21-23, at Loyola University in New Orleans appearing in this issue of the BULLETIN. The center insert section is provided, as usual, for the convenience of members. The particular attention of members is called to the deadlines for submission of nominations, titles and abstracts, given on the first page of this section.

Society of General Physiologists

A new group will be meeting with the ASB in New Orleans. The Council of the Society of General Physiologists plans to arrange yearly regional meetings of members to be held separately from the annual meeting. Samuel R. Tipton, University of Tennessee, chairman of the South Central Region, and Douglas Humm, University of North Carolina, chairman of the South Atlantic Region, are organizing a regional meeting of physiologists of the southeast which will be held with the ASB in New Orleans. Papers are invited from all plant and animal physiologists interested in topics of general physiology. Titles should be submitted to the ASB Program Committee in the regular manner and by the regular deadline dates given for all submitted titles.

Call for Nominees

The Nominating Committee is asking all members to give careful thought to selection of nominees for offices to be filled at the New Orleans meeting and to suggest nominees by filling out Blank 1 in the insert of this issue and mailing to Mary Esther Gaulden, Biology Division, Oak Ridge National Laboratory, Oak Ridge, Tennessee, who is chairman of the Committee. Other members are Leland Shanor, Division of Biology, Florida State University, Tallahassee, Florida, and G. Robert Lunz, Bears Bluff Laboratories, Wadmalaw Island, South Carolina. Attention is called to the fact that we must elect 3 members to the Executive Committee, 2 for three-year terms and 1 for a one-year term. The latter is necessary because Elsie Quarterman was elected Treasurer at the 1959 annual meeting at the end of her first year on the Executive Committee. The Executive Committee elected Dr. J. C. O'Kelley of the University of Alabama to serve in Dr. Quarterman's place until the annual election in 1960.

A Note from the President

It was almost a year ago that the officers and members of the Executive Committee of the Association became aware of the fact that the Association had been denied tax exemption under Section 501 (c) (3) of the Internal Revenue Code of 1954 (as amended). Since that time we have concentrated our efforts on investigating what must have appeared to the Internal Revenue Service to have been Business - League overtones in our Constitution. With the able assistance of Mr. Calvin H. Cobb, Jr., and the hard work of our President-Elect, Dr. Victor Greulach, a revision of our Constitution and By-Laws was prepared. An interim meeting of the Executive Committee was held in Atlanta on November 21 at which time the Committee spent a number of hours in studying the proposed revisions. On page 10 of this issue is a copy of the proposed revision of our Constitution and By-Laws that will be submitted to the membership for adoption by the Executive Committee at our Annual Meeting at Loyola in April. For your convenience, all proposed modifications and additions are set in capital and small capital letters, for purpose of ready comparison with the Constitution under which we are now operating; the latter appears in Volume 2, Number 2 of the Bulletin. A few amendments may be found in subsequent issues.

We hope to have definite recommendations concerning incorporation for proposal by April. If you are aware of matters which should come to the attention of the Executive Committee, I shall appreciate your advising me of them.

Plans for the Loyola Meetings are beginning to take shape, and I anticipate these meetings being among the best in the history of the Association.

Horton H. Hobbs, Jr.

VIRGINIA'S MARINE RESEARCH LABORATORY
THE VIRGINIA FISHERIES LABORATORY

WILLIAM J. HARGIS, JR., *Director*

Dr. Hargis is a native of Lebanon, Virginia. His B.A. degree was received from the University of Richmond, and his M.A. and Ph.D. degrees from Florida State University. After a year as Assistant Professor of Biology and Chemistry at The Citadel, Dr. Hargis became associated with the College of William and Mary and the Virginia Fisheries Laboratory. He is at present Director of the Virginia Fisheries Laboratory and Professor and Head of the Department of Marine Science of the Laboratory and of the College of William and Mary. Some of Dr. Hargis' society affiliations are the Society of Systematic Zoologists, American Society of Parasitologists, Atlantic Estuarine Research Society, ASB, Sigma Xi, Beta Beta Beta, and others. His research interests include the biology of the oyster drills and of the monogenetic trematodes of marine and fresh waters.

The Laboratory is situated on the lower York River, directly across from historic Yorktown and 13 miles from Colonial Williamsburg. Chesapeake Bay is within sight of the campus and the inshore reaches of the Atlantic are but a few hours away. The main Laboratory is located on a great estuary in the center of one of America's most important fishing and commercial regions with freshwater, estuarine, and strictly marine environments within easy reach. The Eastern Shore field station at Wachapreague, Virginia, offers access to barrier islands, salt bays, and marshes. Thus, a wide variety of aquatic habitats are available to researchers and students.

The Laboratory performs broader functions than its official name, the Virginia Fisheries Laboratory, implies. As Virginia's only marine research station it is active in research, teaching and public education. The research program encompasses so-called basic and applied problems; the teaching program is designed for advanced undergraduates and graduate students; and the public education program involves lectures and demonstrations to public school and civic groups and a system of educational displays and news releases.

Established in 1940 as an independent state agency, the Laboratory is affiliated with the College of William and Mary, the Commission of Fisheries, and the seafood industry through a Board of Administration composed of representatives of each group. Since 1940 the responsibilities, personnel, and facilities have evolved and enlarged until today the program is one of general marine and fisheries research.

At first the group was located on the campus of the College of William and Mary at Williamsburg. Later it was moved to Yorktown, and in 1950 to the present permanent site at Gloucester Point on the north bank of the York River opposite the Victory Monument at Yorktown. Since 1949 the staff has grown from a total of nine persons to one containing seventeen biologists, six at the doctoral, eight at the master's, and three at the baccalaureate level of academic training; an administrative assistant; a research librarian; a microtechnician; seven laboratory aides; five secretaries; and a maintenance group of four full-time and three part-time persons. Thus at present 37 full-time, 2 part-time, and 4 graduate assistants make up the personnel. In summer the staff is increased by four or five professors and 20 to 25 students.

Demands for increasing research efforts into the effects of industrial and domestic pollution, engineering projects, insecticides and herbicides, and agricultural pollution on the marine environment will necessitate several additions to the staff in the very near future.

At present, the research group is organized into sections each with its chief scientist and other major and minor biologists and their aides. Thus a vertical and horizontal arrangement of research responsibility and autonomy is possible within the sections even though one scientist acts as a coordinator for each. The sections are:

Crustacea Research, Ichthyology Research, Mollusk Research, Pathology Research, Basic Ecology (Pollution), and Parasitology.

The main building, built in 1950, contains the administrative offices, a student laboratory, an embryology research laboratory, a darkroom, and the Public Education Department on the first floor; and the Mollusk, Pathology and Parasitology sections, a basic ecology laboratory, chemistry laboratory, a cold room, and the library on the second. The annex building, completed in 1958, houses the Ichthyology and Crustacea research units, the second student laboratory, a plankton and productivity laboratory, the illustration - photography laboratory and darkroom, seven dormitory rooms, and the dining room, galley and lounge on two floors.

A two-story workshop, wet laboratory and storage loft is located at the foot of the large pier which bears a tide-gauge station and the continuously - running, centrifugal salt-water pumps which supply the main building and the five outside tanks.

The present buildings are inadequate for housing the rapidly growing staff and student body, but plans are underway for construction which will alleviate the crowded conditions. The research and teaching programs will be greatly accelerated when these facilities are acquired.

The floating equipment includes a specially designed 55-foot diesel-powered research vessel, the PATHFINDER, five outboard powered skiffs and two row boats.

Close cooperation is maintained with other laboratories in the region, especially the Chesapeake Bay Institute of The Johns Hopkins University, the Chesapeake Biological Laboratory of the Maryland Department of Research and Education, and the Annapolis Shellfish Laboratory of the U. S. Bureau of Commercial Fisheries. The services of the Chesapeake Bay Institute are available in connection with problems involving the physical or chemical variables in the environment, and the two laboratories also exchange graduate students for brief training in Physical and Chemical Oceanography and Biological Oceanography respectively.

The research program encompasses studies of oyster spawning, setting, growth, and mortality, including work on diseases and predators; along with the distribution, spawning, growth, mortality and availability of the blue crab; and distribution, spawning, growth, aging, migration, and availability of fishes. Studies of the biology of mollusks, crustacea, fouling organisms, trematodes, micropathogens, periphyton and plankton are also underway.

In addition, invertebrate embryology, the physiology of fish muscles, primary productivity, and tropic levels, estuarine hydrography and water conditions are regular subjects for research. The scientific staff is enlarged in summer by four or five visiting professors who spend half their time in teaching and half in research in their special fields of interest. Plans are being made to increase the number of summer researchers to a total of six or eight.

A Master's degree in Marine Science is offered by the Department of Marine Science, a joint venture of the Virginia Fisheries Laboratory and the College of William and Mary. To participate the students usually take up residence at or near the Laboratory about 13 miles from the main campus. Most of the courses are offered at the Laboratory, though some may be conducted on the main campus at Williamsburg. Four or five halftime assistantships are available. Plans call for the establishment of three or four more. Course offerings include Invertebrate Ecology, Ichthyology, Biometry, Population Dynamics, Physiology of Marine Organisms, General Oceanography and Limnology, Theoretical Biology, Biology of Plankton, Marine Pollution, Radiobiology, and Invertebrate Embryology. Students can get training in both Marine Science and Fisheries Biology. Field work and research are emphasized and students are encouraged to participate in all phases of the regular research program of the Laboratory. A low teacher-student ratio, and the facts that the full facilities of the main campus are a mere half-hour away, and the station is in full operation the year-round makes the Laboratory somewhat unusual among marine stations and most attractive to prospective students.

The public education program includes visits by elementary and high school classes for a day's introduction to marine science and fisheries. Talks and demonstrations are also given to schools, teacher's groups, service clubs, sportsmen's and commercial fishermen's groups. Television programs and public exhibits are also prepared and presented and a public exhibit room with live and static demonstrations is maintained.

(Continued on Page 6)

INSTITUTE OF FISHERIES RESEARCH UNIVERSITY OF NORTH CAROLINA

A. F. CHESTNUT, *Director*

Dr. Chestnut is a native of Stoughton, Massachusetts. He received the B.S. degree from the College of William and Mary, and the M.S. and Ph.D. degrees from Rutgers University. He was Research Associate in charge of the Oyster Research Laboratory at Rutgers University from 1943 to 1948. He joined the Institute of Fisheries Research in June of 1948 and has been director since 1955. Dr. Chestnut holds the rank of Professor in the University of North Carolina. Some of his research interests are in the ecology of mollusks, feeding mechanisms of lamellibranchs and behavior of oyster larvae. He is a member of a number of societies, including Sigma Xi, American Society of Limnology and Oceanography, Ecological Society, National Shellfisheries Association (Pres., 1953-55) and Atlantic Estuarine Research Society (Sec.-Treas., 1952-53).

The Institute of Fisheries Research was established as a branch of the University of North Carolina on September 29, 1947, from the cumulative effort of several divergent activities. The proposal of an Institute resulted from a request in October, 1944, by President Frank Graham of the University for a project in marine biology. Early in 1946 a "Survey of Marine Fisheries of North Carolina" was organized with Dr. Robert E. Coker as Chairman and Dr. Harden F. Taylor as Executive Director to compile available information with respect to the status of marine resources in North Carolina. The survey was intended to serve as a background for the projected Institute. In 1947 the General Assembly of North Carolina created a Shrimp Commission and appropriated $50,000 for a survey of the shrimp fisheries and scientific studies of shrimp in North Carolina. Dr. Harden F. Taylor was appointed Scientific Director of the Shrimp Survey on August 27, 1947. Thus the two surveys were brought together in close collaboration.

In mid-1947 the Knapp Foundation, Inc., offered a grant to the University for a fisheries research project on condition that the state match the contribution. The grant from the Knapp Foundation was "A tribute to Joseph P. Knapp's lifelong interest in the betterment of mankind". By agreement the survey of marine fisheries and shrimp survey were joined under the leadership of the established Institute. An additional sum of money was diverted to the Institute from another appropriation by the General Assembly of 1947 for a shellfish rehabilitation project, to be used for research on economic mollusks. Dr. Robert E. Coker was appointed as Director of the Institute on September 30, 1947. With cooperation of the Department of Conservation and Development a hospital building and other accessories of a former Marine Section Base in Morehead City, N. C., were made available for a laboratory and headquarters of a permanent Institute under the leadership of the University. The building, located along the north shore of Bogue Sound, nearly five miles west of Beaufort Inlet, was formally occupied in June, 1948.

The purpose of the Institute is to endeavor, through research, to arrive at a better understanding of the complex problems of marine science. Four interrelated phases were envisioned in the operations of the Institute: biological, oceanographic, economic and educational. During the formative period emphasis was placed on practical applications of research to fisheries problems. This was necessary in part because of the nature of funds from the state appropriations. It became evident that applications of scientific findings in one area do not imply the same degree of success in another area. The need for basic or fundamental research in local areas was apparent and research activity was modified. With the limited staff and funds studies were concentrated on biological and oceanographic aspects.

The present full-time research staff consists of A. F. Chestnut, Ph.D. (Director and Malacologist), Earl E. Deubler, Ph.D. (Ichthyologist), William E. Fahy, Ph.D. (Ich-

thyologist), Hugh J. Porter, M.Sc. (Malacologist), Gerald S. Posner, Ph.D. (Oceanographer) and Austin B. Williams, Ph.D. (Carcinologist). Temporary research assistants and technicians assist the staff on occasions. Four full-time personnel are concerned with maintenance and operations of the vessel and buildings. Five of the research staff are members of the Graduate Faculty of the University. No formal courses are given at the Institute but research programs of graduate students are directed in cooperation with various departments of the University.

Each staff member is responsible for the initiation and development of his own program of research. Current research in progress includes: life-history studies of crustaceans, fishes and mollusks; oceanographic studies and plankton ecology of North Carolina sounds; ecological studies of shrimp, flounders and oysters; laboratory studies on the influence of environmental factors upon meristic structures in developing fishes; taxonomic studies of fishes, crustaceans and mollusks.

The Institute's staff cooperates through lectures and guidance in the graduate program of the University. Studies of socio-economic aspects of the fishing industry are conducted in cooperation with the Department of Conservation and Development. Advice and technical assistance are provided on request to the industry, agencies and individuals with interests in marine resources.

The Institute functions in an advisory capacity to the Department of Conservation and Development on proposed regulatory measures and problems relating to marine and estuarine resources. Through a memorandum of agreement between the University and Department of Conservation and Development the Institute serves the state as an agency for scientific research and endeavors to serve the needs of the Department, within the limits of its staff and facilities, in respect to immediate problems that may arise. Contributions to the general welfare of the fishing industry have resulted from basic research on various commercial species. Ecological and life history studies have shown the potentialities of resources present and have resulted in programs of management and development.

A one-story, wood-frame building with approximately 7,700 square feet of space, houses the laboratories, offices, and library. The building contains standard equipment, a running salt-water system, constant-temperature room, histology laboratory, photographic dark room, and research collections of fish, crustaceans and mollusks. A research library contains approximately 350 volumes, 80 current periodicals relating to marine biology and over 10,000 reprints and separates. In a nearby building, a two-story wing of 12,000 square feet contains a shop with power tools, a net loft and some dormitory space.

The Institute has a 47-foot, diesel-powered research vessel, "Machapunga", equipped with a hydraulic power winch for trawling and dredging. Outboard motors and aluminum skiffs are available for shallow-water collecting.

The immediate coastal and estuarine areas afford a variety of habitats with rich fauna and flora. Wharf piling, stone jetties, extensive sand flats and mud flats, ocean beaches, sand dunes, oyster reefs and marshes are among the habitats available for study of crawling, sessile and burrowing animals. The open sea, sounds, rivers, canals, and creeks abound in swimming and drifting forms.

There are limited facilities for visiting investigators and graduate students. Requests for additional information concerning the Institute should be addressed to: Director, Institute of Fisheries Research, Morehead City, North Carolina.

(Continued from Page 4)

VIRGINIA'S MARINE RESEARCH LABORATORY, THE VIRGINIA FISHERIES LABORATORY

Scientific articles, designated as contributions from the Virginia Fisheries Laboratory, are published in existing journals. Bound Contribution series are available for distribution to libraries. Individual reprints are available on request. The Special Scientific Reports, an Educational Series, and a Biennial Report are also published.

In summary, Virginia's marine laboratory, the Virginia Fisheries Laboratory, is carrying out research and teaching activities in the tradition established early in the history of the Commonwealth by Thomas Jefferson and in the spirit of Matthew Fontaine Maury (Pathfinder of the Seas), Virginia's first great marine scientist.

IMPORTANT DEADLINES

Please note the following deadlines, all of which are to be met by the time of our Twenty-first Annual Meeting at Loyola University, New Orleans, Louisiana, April 21-23, 1960. Members can help facilitate plans for the meeting by sending in all requested material as far in advance of the deadlines as possible. Because the time available for preparation of the program and publication of abstracts is already at a minimum it will be necessary for the program committee and the editor to adhere strictly to the deadline set; no titles can be accepted thereafter.

February 12—Suggestions for nominations for ASB officers and executive committee members (Blank 1).

February 20—Titles and abstracts of papers to be presented at the New Orleans meeting (Blank 4).

March 1—Applications for Goethe Awards to graduate students (See Page 9).

March 1—Papers to be considered for the Association Research Prize (See Page 8).

April 1—Applications for Phipps and Bird Research Fellowship at Mountain Lake (See Page 9).

April 1—Nomination letters for the Meritorious Award for Teaching (See Page 8).

THE ASSOCIATION OF SOUTHEASTERN BIOLOGISTS

(Founded 1937)

Purposes

The Association of Southeastern Biologists was organized " . . . to encourage research and instruction in the fields of the biological sciences; to foster a spirit of cooperation among the membership; to emphasize the relation of fundamental knowledge in biology to the solution of biological problems; to strive toward the preservation of biological resources; and to serve as a medium for professional contacts among the membership."

Eligibility for Membership

Any person is eligible for membership who is engaged in (a) biological research, (b) the teaching of biological subjects, (c) graduate study in the biological sciences, or (d) work in various fields of applied biology. Members, in general, shall be residents of the Southeast. Membership shall be granted any person recommended and approved as eligible by two active members in good standing. Such recommendations shall be submitted to the treasurer of ASB and the new member shall achieve active status on the payment of the dues for the current year. Annual dues are $2.00, which includes a subscription to the ASB BULLETIN.

Activities

1. Annual meetings at which the results of investigations are presented for discussion, and at which appropriate symposia may be conducted. 2. Quarterly publication of the ASB BULLETIN containing programs of annual meetings and abstracts of papers presented, news of science and scientists in the Southeast, a record of Association affairs, and articles of regional or timely interest. The BULLETIN promotes personal and professional contacts among the members of the Association. 3. The discussion of subjects of general interest to biologists of the Southeast and the formulation of policies and plans of action in relation to such subjects. 4. Encouragement of research through research prizes awarded for especially meritorious papers presented at the annual meetings. 5. Presentation of a Meritorious Award for outstanding contribution to biology, especially in service to young people through teaching. 6. Awarding annually a research fellowship at Mountain Lake Biological Station. 7. Representation on the Council of the AAAS. 8. Affiliation with the AIBS.

1. Deadline: February 12

SUGGESTED NOMINEES FOR ASB OFFICES AND EXECUTIVE COMMITTEE POSITIONS

To the members of the Nominating Committee:

I wish to suggest that you consider the following ASB members in selecting nominees for offices and executive committee positions:

President-Elect_____ Vice-President_____

Executive Committee Members (2 for 3-year terms and 1 for one-year term)_____

_____

Mail to: DR. MARY ESTHER GAULDEN
Biology Division
Oak Ridge National Laboratory
P. O. Box Y
Oak Ridge, Tennessee

---

2. STATEMENT OF ASB DUES FOR 1959

Your ASB dues of $2.00 for 1960 are now payable. This sum includes your subscription to the ASB BULLETIN for 1960. Please make your checks payable to the *Association of Southeastern Biologists*, and mail to the treasurer with this statement at the address given below. Please be sure to write your name and correct mailing address on this statement. The ASB constitution provides that members whose dues are in arrears two years will automatically be dropped from membership. The Executive Committee has ruled that members who are in arrears at the close of the annual meeting will not receive subsequent issues of the BULLETIN until dues are paid.

Name_____

Address_____

City_____ State_____

If retired, check here _____
If retiring within a year, check here _____

DR. ELSIE QUARTERMAN
Department of Biology
Vanderbilt University
Nashville 5, Tennessee

---

3. APPLICATION FOR MEMBERSHIP ASSOCIATION OF SOUTHEASTERN BIOLOGISTS

NAME (in full)_____ Date_____

DEGREES (institutions and dates)_____

_____

PRESENT POSITION: (1) Title_____ (2) Department_____

(3) Institution_____ (4) City, State_____

SPECIALTY (e.g., physiology)_____

SPECIFIC INTERESTS (e.g., respiration)_____

RECOMMENDED BY (1)_____ (2)_____

Fill out this blank, enclose check (or money order) for $2.00 as dues for one year and mail to:

DR. ELSIE QUARTERMAN, Treasurer ASB
Department of Biology
Vanderbilt University
Nashville 5, Tennessee

4. Deadline: February 20

CALL FOR PAPERS FOR THE NEW ORLEANS MEETING

This form and *two* typewritten copies of the abstract must reach the Chairman of the Program Committee, Father John H. Mullahy, Department of Biological Sciences, Loyola University, New Orleans 18, Louisiana, not later than Saturday, February 20, if the title is to appear on the program or the abstract included among those published in the April issue of the BULLETIN. Papers to be submitted for the Research Prize must be included in the program. Please type or print the following information. All papers are limited to 10 minutes, with three minutes for discussion.

1. Author(s): _____

2. Title of paper: _____

_____

3. Institution(s) represented: _____

4. Check organizations to which author(s) belong:

_____ Association of Southeastern Biologists.

_____ Southeastern Section, Botanical Society of America.

_____ Southern Appalachian Botanical Club.

_____ Society of General Physiologists, South Central and South Atlantic Regions.

5. Projection equipment needed: _____ 2x2 slide projector; _____ 3x4 slide projector; other equipment:

6. If your paper is being submitted for the Association Research Prize please check here: _____.

7. This form must be accompanied by *two double-spaced* typewritten copies of an abstract, not to exceed 200 words. Longer abstracts are subject to cutting by the editor without the approval of the author. Please use the following form in typing the heading of the abstract in order to avoid excessive editing:

Dimorphism of Embryonic Hooks of *Hymenolepis nana*
Arthur W. Jones, *University of Tennessee*

Start the text of the abstract here, on a separate line with paragraph indentation. In general the abstract should appear as a single paragraph, though two paragraphs are acceptable, if really needed.

8. *Reprints*: Reprints of individual abstracts are available at the rate of $2.25 for the first 100 and 75 cents for each additional 100, postpaid. In order to secure this price it is necessary to attach a check for the proper amount to this form and send it along with the form and the two copies of the abstract. Checks should be made payable to the Cary Printing Company. *Orders for abstracts will not be entered unless payment accompanies the order.*

Indicate here how many reprints of your abstract you want: _____.

Marquette Hall, Administration Building, Loyola University, New Orleans, Louisiana

ABOUT THE NEW ORLEANS MEETING

The twenty-first annual meeting of the Association of Southeastern Biologists will be held at Loyola University, New Orleans, April 21-23, 1960. Four organizations will meet with ASB: The Southeastern Section of the Botanical Society of America, Southern Appalachian Botanical Club, the Southeastern Regional Beta Beta Beta, and the Society of General Physiologists (South Central and South Atlantic Regions).

The meeting will begin on Thursday afternoon, April 21st, with a tour of the U. S. Southern Regional Research and Development Laboratory on Robert E. Lee Blvd. Arrangements are being made for an address by an outstanding biologist on Thursday evening followed by a Smoker. On Friday there will be several sessions of contributed papers and the annual business meeting. Presentation of awards will take place Friday evening. Two field trips are scheduled for Saturday morning.

Registration and all general ASB sessions will take place in the Loyola Field House. Sessions of contributed papers will be held in Marquette and Bobet Halls.

Members of the committee on local arrangements at Loyola are: Dr. Rosamond McMillan (L.S.U., N.O.), Dr. George H. Penn (Tulane), Dr. Arthur Welden (Tulane), and Miss E. L. Beard, Dr. Harry D. Brown, Dr. Robert C. Goss, Dr. Richard T. Jackson, Dr. Walter G. Moore, Father John H. Mullahy, Chairman (all of Loyola University).

Meals

Dining facilities will be available to all persons attending the meeting and their families at the Loyola University cafeteria on the campus, also at the nearby Tulane University Center. Since New Orleans is so noteworthy for its many world famous restaurants, it is felt that most of the members will avail themselves of this opportunity to visit them.

Housing Facilities

New Orleans has a large selection of hotels, motels and tourist courts, of which the following are but a few examples:

Hotels

Roosevelt—123 Baronne St. (first block off Canal St., in town); single $9.00 up, double $11.00 up.

Monteleone—214 Royal St. (in French Quarter section); single $5.00 up, double $10.00 up.

Sheraton-Charles (old St. Charles Hotel)—211 St. Charles Ave. (2nd block off Canal St.); single $6.50 - 9.00, double $9.50 - 12.00, twin $13.00 - 16.00.

Jung—1500 Canal St. (in town); single $8.00-10.00, double $12.00-15.00.

New Orleans—1300 Canal St. (in town); single $6.50-8.00, double $8.50-10.00, twin $12.00.

Motels

On Highway 61:

Fontainebleau—4000 Tulane Ave. (about 2 miles from University); single $9.50-14.50, double $13.50-18.50.

Hilton Inn—P. O. Box 338—Kenner (opposite Moisant Airport — about 10 miles from town); single $9.00-15.00, double $12.00-18.00.

Motel de Ville—3800 Tulane Ave. (about 2 miles from University); single $8.50-11.50, double $12.50-16.50.

Town & Country—1225 Airline Hwy. (about 3 miles from University); single $7.00, double or twin $12.00.

Town House—9419 Airline Hwy. (3 miles from town); single $7.00-8.00, double or twin $10.00-11.00.

On Highway 90:

Bellaire Motel—4100 Chef Menteur Hwy.; single $7.00, double $9.00-10.00, twin $9.50-11.00.

Cedar Park—5001 Chef Menteur Hwy.; single $7.50, double $7.50-8.50, twin $8.50.

Park Plaza—4460 Chef Menteur Hwy.; single $7.00-8.00, double $9.50, 2 double beds (4 people) $11.00-12.00.

Alamo Plaza—7300 Chef Menteur Hwy. (baby sitters); single $7.00, double $8.00, twin $10.00.

Le Baron — 4861 Chef Menteur Hwy.; single $7.00, double $9.00, twin $10.00.

Additional names of accommodations can be obtained from the Visitor's Bureau, 315 Camp Street, New Orleans.

Field Trips

Three field trips are scheduled for the Annual Meeting. Full information about them will be available at the Registration Desk.

Thursday, April 21

A tour of the U. S. Southern Regional Research and Development Laboratory on Robert E. Lee Blvd. is scheduled for Thursday afternoon. All persons interested in taking this trip should submit their intention before April 9th. Transportation for this trip will be by bus and/or private conveyance and will be determined by demand. Since the number of people that can be accommodated is limited, you are urged to make an early reservation, if you plan to take it. Reservations should be made with Dr. Harry D. Brown, Department of Biological Sciences, Loyola University.

Saturday, April 23

A field and collecting trip to the Gulf Coast Research Laboratory at Ocean Springs, Mississippi, will begin at 8:30 A.M. in front of the Loyola Field House. The laboratory is about 95 miles from New Orleans, and is reached by Highway 90, along the very beautiful Gulf Coast route. Dr. Gordon Gunter, Director of the Laboratory, will conduct a tour of the facilities of the laboratory and arrange for some collecting in the Mississippi Sound area aboard the laboratory research boat. It is felt that persons interested in this trip will probably wish to spend the night in the vicinity of Biloxi, Mississippi, and return thence to their respective homes. Since no more than 25 persons can be accommodated on the research boat, all persons interested in exploring the flora and fauna of the laboratory region should make their reservation at a very early date with Dr. Walter G. Moore, Department of Biological Sciences, Loyola University.

A Trip to a Sulphur Well

On Saturday, April 23rd, a field trip to a sulphur well in the Gulf is offered to the members of the Association by the Freeport Sulphur Company. This trip will also be limited to about 25 persons. It will consist of transportation by bus (leaving the Loyola Field House at 9 o'clock on Saturday, April 23) to Port Sulphur, Louisiana. A company boat will transport the party to the sulphur well in the Gulf, and provide a box lunch. The inspection of the well will require about 2 hours. The party will return to New Orleans by bus about 2 o'clock. Reservations for this trip should be made with Dr. Robert C. Goss, Department of Biological Sciences, Loyola University.

Sight-Seeing

Sight-Seeing Tours of New Orleans, and especially of the Vieux Carre, are available at almost all hours of the day and night for a reasonable fare.

The biology staffs of Dillard University, L.S.U.-N.O., Tulane University, Xavier University, and Loyola University will be on hand and happy to conduct all interested parties through their facilities. It is felt that members will not want to miss the Audubon Zoo in Audubon Park across St. Charles Avenue from Loyola, as well as the Green House facilities and Rose Gardens in City Park near the lake front.

General Information

1. Registration will be at a desk in the Loyola University Field House on Freret Street.
2. A fee of $1.00 will be charged for registration.
3. New Orleans is not dry.

Meritorious Award Nominations

As in previous years, an honorarium of $100 has been made available by the Will Corporation of Georgia, to be used as an award for the recognition of especially meritorious teaching by a member of the ASB. The regulations governing the award are as follows:

"The recipient must be a member of the ASB in good standing. He should have taught biology in a southern institution for at least ten years, and must be currently teaching. He must not be a dean or have regular administrative duties beyond the departmental level (this particular criterion requiring interpretation in individual cases). Among evidences of his qualifications is the progress of the candidate as indicated by recognition in his own institution (important assignments and other contributions specifically related to good teaching); and the number and quality of students for whom he provided primarily the inspiration to continue in biology, especially those who later received advanced degrees."

Past recipients of the Meritorious Award for Teaching are as follows:

1952. Dr. Mary Stuart MacDougall (Agnes Scott)
1953. Dr. Orland E. White (Univ. of Virginia)
1954. Dr. Woolford B. Baker (Emory)
1955. Dr. John N. Couch (Univ. of North Carolina)
1956. Dr. Hugo L. Blomquist (Duke)
1957. Dr. Edza Deviney (Florida State)
1958. Dr. Henry R. Totten (Univ. of North Carolina)
1959. Dr. Margaret Hess (Winthrop College)

In these times in which so much is heard about teaching, it would appear to be particularly important that excellence in teaching should be rewarded and publicized in every way possible. Members of the ASB are urged to make nominations and send the needed supporting materials to C. G. Goodchild, Emory University; Roberta Lovelace, University of South Carolina; or Frederick T. Wolf, Vanderbilt University.

Association Research Prize

The rules and regulations governing the

annual Association Research Prize of $100.00, sponsored by the Carolina Biological Supply Company, Elon College, North Carolina, are as follows:

1. The Research Prize is to be awarded for an especially meritorious paper actually presented at the annual meeting.

2. Only members are eligible to submit papers in competition for the Research Prize. This applies to *all* names on the submitted paper. Applicants for membership are *not* eligible to submit papers for the Research Prize.

3. Papers submitted in competition may be in press but must not have been published prior to March 1 of the year of the current competition.

4. Judges will be eminent biologists outside the Southeast. They will set their own criteria, and may withhold the award if no paper is judged to have sufficient merit.

5. Papers must be submitted in *triplicate* and in their entirety not later than *March 1, 1960*, to P. M. Patterson, Hollins College, Va. One copy of the prize-winning paper will remain in the ASB files, but all other copies will be returned to the authors as soon as possible.

6. Announcement of the winner of the Research Prize will be made at the annual meeting.

Phipps and Bird Research Fellowship

A Research Fellowship of $150.00 for summer research at Mountain Lake Biological Station of the University of Virginia has been continued through the generosity of the Phipps and Bird Company of Richmond, Virginia. Any member of the Association may submit an application. The application should be accompanied by a summary of the planned work, by a list of important publications, and, especially in the case of younger workers, by references and educational data. Applications should be sent to P. M. Patterson, Hollins College, Va., not later than *April 1, 1960*. The selection will be made by the Research and Awards Committee of the ASB in consultation with the Director of the Mountain Lake Biological Station. The announcement of the recipient will be made at the annual meeting of the ASB.

COMMITTEE
CHARLES E. JENNER
RALPH W. YERGER
P. M. PATTERSON, *Chairman*

Mary Glide Goethe Travel Awards

For the third year there will be funds available through the generosity of Mr. C. M. Goethe for assistance to graduate students for expenses in connection with the annual ASB meetings, to be held this year in New Orleans, Louisiana, April 21-23. It is anticipated that most of the awards will be for maintenance (lodging and meals), and departments are urged to provide travel allowances for their graduate students or to invite them to travel in cars with staff members. Some travel allowances may be awarded by the committee to those living most distant from New Orleans.

Staff members are requested to call to the attention of qualified students in their respective institutions the availability of these awards. If there is more than one applicant from a department, the Goethe committee may request the department to aid the committee's selection by ranking the applicants.

Any graduate student *needing financial assistance* in order to attend the 1960 meeting of the Southeastern Biologists is eligible. Rules for making application for the Goethe Awards are as follows:

1. Give information on marital status and number of children.

2. Indicate if application is being made for maintenance or travel or both. Give details, such as total sum requested, how many nights and days are involved, if travel allowance is requested, the number of miles involved and the proposed method of transportation, and any other pertinent information.

3. Give information as to whether or not a paper is being presented by the applicant.

4. In a paragraph, give a brief history of your education to date, of how many years you have been — and plan to be — in graduate school, of your major field or fields of interest, of any publications which have appeared or which may be in preparation, and any other pertinent professional details.

5. Give your source or sources of support while in graduate school such as G.I. Bill, N.S.F., N.I.H., teaching assistantship, etc.

6. Have your major professor or departmental head write a letter supporting your application.

7. Applications and supporting letters, *both in triplicate*, should be in the hands of W. D. Burbanck, Department of Biology, Emory University, Atlanta 22, Georgia, by March 1, 1960. Applicants will be notified of the decision of the Committee during March.

COMMITTEE
J. M. CARPENTER
R. B. SHORT
W. D. BURBANCK, *Chairman*

PROPOSED REVISION OF THE CONSTITUTION AND BY-LAWS OF THE ASSOCIATION OF SOUTHEASTERN BIOLOGISTS

(Additions and modifications are set in CAPITAL AND SMALL CAPITAL letters for comparison with present Constitution — See ASB BULLETIN, Vol. 2, No. 2)

CONSTITUTION

ARTICLE I. *Name*

The organization shall be known as the ASSOCIATION OF SOUTHEASTERN BIOLOGISTS.

ARTICLE II. *Objectives*

THE OBJECTIVES OF THE ASSOCIATION SHALL BE TO ENCOURAGE IN THE BROADEST AND MOST LIBERAL MANNER THE ADVANCEMENT OF BIOLOGY AS A SCIENCE BY THE PROMOTION OF RESEARCH IN BIOLOGY; BY THE INCREASE AND DIFFUSION OF KNOWLEDGE OF BIOLOGY TO THE SOLUTION OF BIOLOGICAL PROBLEMS; BY THE PRESERVATION OF BIOLOGICAL RESOURCES; AND BY ITS MEETINGS, REPORTS, DISCUSSIONS AND PUBLICATIONS TO PROMOTE SCIENTIFIC INTERESTS AND INQUIRY, THEREBY ADDING TO THE HEALTH, HAPPINESS AND KNOWLEDGE OF ALL PEOPLES.

ARTICLE III. *Eligibility*

Section 1. Members, in general, shall be residents of the Southeastern States and shall be known as (A) Active Members and (B) Emeritus Members.

Section 2. Any person is eligible for active membership in the Association who is engaged in (A) biological research, (B) the teaching of biological subjects, (C) graduate study in the biological sciences, or (D) work in the various fields of applied biology.

Section 3. Any member may be elected as Emeritus Member who has been a member of the Association for ten (10) or more years and who has retired from professional duties. An Emeritus Member shall have the same rights and privileges as an Active Member.

Section 4. Any individual or organization contributing one hundred (100) dollars or more per annum to the support of the Association shall be known as a Patron. Patrons will receive the publications and notices of the Association and may attend the annual meetings but shall not have the right to vote.

ARTICLE IV. *Officers*

The officers of the Association shall be (A) President, (B) President-Elect, (C) Vice-President, (D) Secretary, and (E) Treasurer.

ARTICLE V. *Annual Meeting*

Section 1. The annual meeting of the Association shall BE HELD IN APRIL at such place as may be recommended by the Executive Committee and approved by the membership at an annual business meeting. THE DATE OF THE MEETING SHALL BE DETERMINED BY THE EXECUTIVE COMMITTEE.

Section 2. In case of an emergency, the Executive Committee may change the time and place of the annual meeting or may call a special meeting.

ARTICLE VI. *Quorum*

Fifty (50) members of the Association shall constitute a quorum for the transaction of business.

ARTICLE VII. *Disposition of Property*

IN THE EVENT OF THE DISSOLUTION OR TERMINATION OF THE ASSOCIATION, TITLE TO AND POSSESSION OF ALL THE PROPERTY OF THE ASSOCIATION SHALL PASS FORTHWITH TO THE AMERICAN INSTITUTE OF BIOLOGICAL SCIENCES, WASHINGTON, D. C., IF THEN IN EXISTENCE AND QUALIFIED FOR EXEMPTION UNDER THE INTERNAL REVENUE CODE OF 1954 AS AMENDED, AND OTHERWISE TO THE AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE, WASHINGTON, D. C.

ARTICLE VIII. *Incorporation*

THE EXECUTIVE COMMITTEE, WITH THE APPROVAL OF THE MEMBERSHIP IN A VOTE AT AN ANNUAL MEETING, MAY APPLY FOR INCORPORATION OF THE ASSOCIATION AS A NON-PROFIT SCIENTIFIC AND EDUCATIONAL ORGANIZATION WITHOUT CAPITAL STOCK UNDER THE LAWS OF ANY OF THE SOUTHEASTERN STATES WITHIN ITS AREA.

ARTICLE IX. *Amendments*

Section 1. This Constitution may be amended at any annual meeting by a three-fourths majority of those present, provided due notice of said amendment has been sent by the Secretary to each member at least thirty (30) days in advance of the meeting, and provided the amendment has been proposed by the Executive Committee or by a committee authorized by the Association at a previous annual meeting, provided that so long as the Association shall be or remain an organization exempt under Section 501 (c) (3) of the Internal Revenue Code of 1954, as amended, no amendment shall be made to Article II or Article VII of this Constitution without consent having been obtained from the Internal Revenue Service.

Section 2. Amendments to this Constitution shall become effective at the close of the annual meeting at which they were adopted.

BY-LAWS

ARTICLE I. *Membership*

Section 1. Membership shall be granted any person recommended and approved as being eligible by two active members in good standing.

Section 2. Such recommendations shall be submitted to the treasurer of the Association and the new member shall achieve active status in the Association with all the rights and privileges pertaining thereto when his dues for the current year have been received by the treasurer of the Association.

ARTICLE II. *Election of Officers*

Section 1. (A) Annually the nominating committee shall prepare a multiple slate of nominees for each office or vacancy to be filled. Members are privileged to recommend to the nominating committee persons for any or all offices.

(B) The slate of the nominating committee shall be presented to the membership on or before Thursday evening of the Annual Meeting, and the election shall be held at the following business session when nominations will be called for from the floor.

(C) The Secretary shall prepare ballots for distribution. These ballots shall be distributed and collected by three tellers appointed by the President. A majority vote will constitute election to office. Where more than one person is to be elected to a position (e.g., members of the Executive Committee) the two or more receiving the highest number of votes shall be declared elected.

(D) The results of the election shall be announced as soon as possible after the tellers have counted the ballots, and the successful candidates shall be presented to the membership. ALL BALLOTS SHALL BE DEPOSITED WITH THE SECRETARY WHO SHALL RETAIN THEM FOR ONE YEAR.

Section 2. (A) A President-Elect shall be elected annually and shall become President at the close of the next annual meeting following election.

(B) A Vice-President shall be elected annually. Neither the President nor the Vice-President shall be immediately eligible for re-election.

Section 3. (A) A Secretary and (B) A Treasurer shall be elected for a term of three (3) years each, and they shall be eligible for immediate re-election to additional terms. The Secretary and Treasurer shall not be elected to office in the same year except to fill an unexpired term.

Section 4. Should an office other than that of President and that of President-Elect become vacant during the year, the Executive Committee shall appoint a member to fill that office until the next election.

Section 5. Newly elected officers shall assume the duties of their offices at the close of the annual meeting in which they were elected.

ARTICLE III. *Duties of Officers*

Section 1. The PRESIDENT shall be the directing officer of the Association, shall perform the duties usual to that office, and shall appoint, with the advice of the Executive Committee, regular committees, special committees authorized by the Executive Committee, and a representative to the American Association for the Advancement of Science. Also, he shall appoint such other special committees as may be required.

Section 2. THE PRESIDENT-ELECT SHALL BE RESPONSIBLE FOR ORGANIZING THE PROGRAM FOR THE FIRST EVENING SESSION, AND SHALL BE RESPONSIBLE FOR PROMOTING MEMBERSHIP IN THE ASSOCIATION. IN THE EVENT OF THE RESIGNATION, DEATH OR INCAPACITY OF THE PRESIDENT-ELECT DURING HIS TERM OF OFFICE THE EXECUTIVE COMMITTEE SHALL DECLARE THE PERSON WHO RECEIVED THE NEXT HIGHEST NUMBER OF VOTES FOR THE OFFICE TO BE PRESIDENT-ELECT. IF THIS INDIVIDUAL IS UNABLE TO ACCEPT, THE EXECUTIVE COMMITTEE SHALL NOMINATE TWO MEMBERS FOR THE OFFICE, TO BE VOTED UPON BY THE MEMBERSHIP BY MAIL BALLOTS.

Section 3. THE VICE-PRESIDENT SHALL BE THE PUBLIC RELATIONS OFFICER OF THE ASSOCIATION. IN THE ABSENCE OF THE PRESIDENT FROM ANY MEETING THE VICE-PRESIDENT SHALL DISCHARGE THE DUTIES OF THAT OFFICE. IN THE EVENT OF THE DEATH OR RESIGNATION OF THE PRESIDENT, THE VICE-PRESIDENT SHALL BECOME PRESIDENT OF THE ASSOCIATION.

Section 4. The Secretary shall keep records of the meetings of the Association and of the Executive Committee, conduct the routine business of the Association pertaining to that office, maintain a roster of the membership, issue a call for suggestions for nominations stating the time during which these suggestions will be received and listing names and addresses of all members of the Nominating Committee, issue a call for papers for the program and work with the Program Committee in arranging the program, attend to the preparation and distribution of ballots at elections, report the activities of his office to the Association at the annual meeting, notify Emeritus Members of their election, and give proper recognition to Patron Members. THE SECRETARY OF THE ASSOCIATION SHALL BE EX-OFFICIO ASSOCIATE EDITOR OF THE *A. S. B. Bulletin* AND SHALL BE RESPONSIBLE FOR PROVIDING THE EDITOR WITH ALL OFFICIAL ANNOUNCEMENTS, DOCUMENTS, PROGRAMS AND ABSTRACTS OF PAPERS TO BE PUBLISHED IN THE *Bulletin.*

Section 5. The Treasurer shall receive and disburse all funds of the Association, keeping the necessary records of dues and funds expended. He shall at all times coordinate the efforts of his office with those of the offices of the Secretary AND OF THE EDITOR, and shall report annually all receipts and expenditures to the membership. He is authorized to reimburse the Secretary for expenses incurred in attending the annual meeting of the Association and interim meetings of the Executive Committee. The Executive Committee may by special action also authorize the Treasurer to reimburse other officers of the Association for all or a portion of expenses incurred in attending interim meetings of the Executive Committee, not to exceed one per year. THE TREASURER OF THE ASSOCIATION SHALL BE EX-OFFICIO BUSINESS MANAGER OF THE *A. S. B. Bulletin.*

ARTICLE IV. *Dues and Fees*

Section 1. The annual dues of the Association for Active Members shall be two dollars ($2.00), payable in advance. Emeritus Members shall be exempt from dues.

Section 2. The fiscal year of the Association shall be from March sixteenth to March fifteenth.

Section 3. Any member in arrears in the payment of dues for two (2) years as of the close of the fiscal year shall be dropped from the membership roster at the close of the annual meeting for that calendar year.

Section 4. Delinquent members who desire reinstatement to membership shall pay a reinstatement fee of two dollars ($2.00) in addition to the regular dues for the current fiscal year.

ARTICLE V. *The A.S.B. Bulletin*

Section 1. THE *A.S.B. Bulletin* SHALL BE THE OFFICIAL PUBLICATION OF THE ASSOCIATION, AND SHALL BE PUBLISHED QUARTERLY OR AT SUCH OTHER REGULAR INTERVALS AS MAY BE DETERMINED BY A VOTE OF THE MEMBERSHIP UPON RECOMMENDATION BY THE EXECUTIVE COMMITTEE.

Section 2. THE EDITOR OF THE *A.S.B. Bulletin* SHALL BE A MEMBER OF THE ASSOCIATION, RESPONSIBLE FOR THE EDITING AND PUBLICATION OF THE *Bulletin*, AND SHALL BE SELECTED AND APPOINTED BY THE EXECUTIVE COMMITTEE FOR A TERM OF THREE YEARS. THE EDITOR SHALL BE ELIGIBLE FOR REAPPOINTMENT FOR ANY NUMBER OF SUCCESSIVE THREE-YEAR TERMS. UPON THE RECOMMENDATION OF THE EDITOR, THE EXECUTIVE COMMITTEE MAY APPOINT A CIRCULATION MANAGER FOR THE *Bulletin*.

Section 3. THE *A.S.B. Bulletin* SHALL BE SUPPLIED TO ALL MEMBERS OF THE ASSOCIATION WITHOUT CHARGE BEYOND THE STATED ANNUAL DUES. ORGANIZATIONS MAY SUBSCRIBE TO THE *A.S.B. Bulletin* AT A RATE EQUAL TO THE ANNUAL DUES, BUT SUCH SUBSCRIPTIONS WILL NOT CARRY THE PRIVILEGES OF MEMBERSHIP IN THE ASSOCIATION. THE EXECUTIVE COMMITTEE, UPON THE RECOMMENDATION OF THE EDITOR, MAY ESTABLISH SPECIAL PRICES FOR BACK ISSUES OR VOLUMES OF THE *Bulletin*.

Section 4. ANY MAJOR CHANGE IN EDITORIAL POLICY PROPOSED BY THE EDITOR SHALL BE SUBJECT TO THE APPROVAL OF THE EDITORIAL BOARD.

ARTICLE VI. *Executive Committee*

Section 1. (A) The Executive Committee shall be in charge of the affairs of the Association between the Annual Meetings. (B) This Committee shall be composed of the officers of the Association, the immediate Past President, and six (6) members elected from the membership.

Section 2. The six members of the Executive Committee elected as such shall serve for a term of three (3) years, two members being elected each year. These members are eligible for re-election to the Executive Committee. SHOULD A VACANCY OCCUR AMONG THESE SIX MEMBERS, THE EXECUTIVE COMMITTEE SHALL APPOINT A MEMBER TO SERVE UNTIL THE NEXT ELECTION.

Section 3. The Editor of the *A.S.B. Bulletin* shall be an Ex-Officio Member of the Executive Committee with the power of discussion and privilege of proposing motions but shall not have the right to vote.

Section 4. THE EXECUTIVE COMMITTEE SHALL SERVE AS AN EX-OFFICIO EDITORIAL BOARD FOR THE *Bulletin* AND SHALL BE RESPONSIBLE FOR DETERMINING THE MAJOR EDITORIAL POLICIES OF THE *Bulletin* IN CONSULTATION WITH THE EDITOR.

Section 5. A majority of the Executive Committee shall constitute a quorum, provided all members have been notified of the proposed meeting.

ARTICLE VII. *Regular Committees*

Section 1. The following regular committees shall be appointed by the President upon the approval of the Executive Committee:

(A) Auditing Committee
(B) Nominating Committee
(C) Program Committee
(D) Resolutions Committee

Section 2. The duties of the regular committees shall be as follows:

(A) The Auditing Committee shall examine the records of the Treasurer prior to the annual business meeting of the Association and shall report the condition of the accounts to the membership at this meeting.

(B) The Nominating Committee shall, with due consideration of suggestions received from the membership, prepare a multiple slate of nominees for each office or vacancy to be filled.

(C) The Program Committee shall have the power to accept or to reject papers for the program, and shall work with the Secretary in arranging the program.

(D) The Resolutions Committee shall formulate and present to the Association such resolutions as may be considered worthy of action by the Association.

Section 3. THE EXECUTIVE COMMITTEE MAY FROM TIME TO TIME ESTABLISH SPECIAL *ad hoc* COMMITTEES AS NEEDED. THE MEMBERS OF ALL SUCH COMMITTEES SHALL BE APPOINTED BY THE PRESIDENT.

ARTICLE VIII. *Papers*

Section 1. All titles of papers submitted for the program shall be in the hands of the Secretary two (2) months before the date set for the annual meeting.

Section 2. Each title submitted shall be accompanied by two (2) copies of an abstract of not more than two hundred (200) words.

Section 3. Except by special action of the Program Committee the maximum time allowed for the presentation of a paper shall be ten (10) minutes. The presiding officer will enforce this rule.

Section 4. Papers presented before the Association at the annual meeting shall be read only by members or by persons introduced by members.

ARTICLE IX. *Amendments*

Section 1. These By-Laws may be amended at any annual meeting of the Association by a two-thirds majority vote of those present.

Section 2. Amendments to these By-Laws shall take effect at the close of the meeting at which they were adopted.

NEWS OF BIOLOGY IN THE SOUTHEAST

Receipt of news for this issue was sparse. The inclusion of the revised Constitution required more space than anticipated and the news available did not warrant elimination of one of the articles or expansion of the issue to 16 pages. News received will be included in the April issue.

The A.S.B. BULLETIN

Volume 7, Number 2 April, 1960

CONTENTS

The Official Quarterly Publication of
The Association of Southeastern Biologists

THE A. S. B. BULLETIN

The ASB BULLETIN is the official quarterly publication of the Association of Southeastern Biologists and is published at Columbia, S. C., in January, April, July and October. Letters, news items, other contributions, and all communications about editorial matters should be addressed to the Editor, U.S.P.H.S., P. O. Box 717, Columbia, S. C. Changes of address should be sent promptly to the Secretary of the ASB, Dr. Harold J. Humm, Department of Botany, Duke University, Durham, N. C. Subscription orders from libraries and other institutions should be sent to the Business Manager, Dr. Elsie Quarterman, Department of Biology, Vanderbilt University, Nashville, Tenn. Subscription rate for non-members of ASB: $2.00 per year. Printing and typography by the Cary Printing Co., Columbia, S. C.

GEOFFREY M. JEFFERY, EDITOR

HAROLD J. HUMM, ASSOCIATE EDITOR
ELSIE QUARTERMAN, BUSINESS MANAGER

ASSOCIATION AFFAIRS

Nominations for ASB Officers

The Nominating Committee, composed of Mary Esther Gaulden, Chairman, G. Robert Lunz, and Leland Shanor, has submitted the following slate of officers to be acted on by members at the New Orleans meeting:

President-Elect — Paul M. Patterson, Hollins College; Royal E. Shanks, University of Tennessee; and Harry E. Wheeler, Louisiana State University.

Vice-President — Ruth S. Breen, Florida State University; Walter S. Flory, Jr., University of Virginia; and Donald C. Scott, University of Georgia.

Executive Committee —

One to be elected for one-year term — John M. Carpenter, University of Kentucky; James H. Gregg, University of Florida; and Joseph C. O'Kelley, University of Alabama.

Two to be elected for three-year term — Robert R. Bryden, Union College; B. Theodore Cole, University of South Carolina; David J. Cotter, Alabama College; Charles E. Jenner, University of North Carolina; Jean Kerschner, Western Maryland College; and Paul A. Walker, Randolph Macon Women's College.

A call for nominations from the floor will be made at the business meeting.

The Annual Meeting

The forthcoming meeting at Loyola University in New Orleans will undoubtedly continue the trend of bigger and better meetings. The number of papers to be presented far exceeds any meeting in the past. The Program and Local Arrangements Committees have done an outstanding job.

Three distinguished guest speakers have been obtained for the Thursday and Friday evening General Sessions. On Thursday Drs. Arnold B. Grobman and Hiden T. Cox of A.I.B.S. will discuss two topics of much interest to biologists. On Friday Dr. F. C. Steward, Professor of Botany, Cornell University, will deliver an address with the intriguing title, "Carrots and Coconuts — Some Adventures in the Study of Growth".

Attention is called to the field trips to be offered during the meetings. Those intending to visit the U. S. Southern Regional Research and Development Laboratory should make their intentions known as early as possible, as suggested in the Meeting Notes. Of special note is the change in date of the trip to the Sulphur Well. This was originally announced for Saturday, April 23, but has been changed to Thursday, April 21, 9:00 A.M. - 4:00 P.M. (See Meeting Notes). Reservations for this trip should be made in advance.

Copies of the program will be available at the Meeting but those desiring to have abstracts should take along their own copy of the BULLETIN. Action on the revised Constitution and By-laws will be taken at the Business Meeting. It is not known at this time if copies of the revised Constitution will be available and those who wish to do so should bring along the copy printed in the January, 1960 issue (Vol. 7, No. 1).

A Message from the President

Horn Island, shall it remain a nature preserve? It has been called to my attention that there is a move underway to have Horn Island changed from a Nature Preserve to a Recreation Area. A Committee of A.S.B., consisting of Father P. M. Yancey, Gordon Gunter, Hurst H. Shoemaker, and Harold J. Humm, Chairman, as well as many other members of the Association, contributed a considerable amount of effort into having Horn Island set aside as a natural area (See ASB BULL., 4(3): 43 and 6(1): 30), and it is my feeling that we should, as individuals, do everything in our power to prevent its being ravaged and converted to a picnic park or something even less desirable. I hope that every member of ASB will write to his Congressman and Senator protesting any change in the present status of the Island.

From all reports which have reached me from Father Mullahy and Dr. Jeffery, the Meetings at Loyola promise to be among the best in the history of the Association. An interesting program of papers and addresses, and the thoughtful and careful planning of the Local Arrangements Committee can but add to the other appeals and charms of Loyola and New Orleans!

HORTON H. HOBBS, JR.

Program of the 21st Annual Meeting Association of Southeastern Biologists

Loyola University, New Orleans, Louisiana, April 21-23, 1960

A Joint Meeting with the Southeastern Section of the Botanical Society of America, Southern Appalachian Botanical Club, the South Central and South Atlantic Regions of the Society of General Physiologists, and the Southeastern Region of Beta Beta Beta National Honor Biological Society.

SESSION SCHEDULE

Thursday, April 21

9:00 a.m.-4 p.m. Field Trip to Sulphur Well in the Gulf. Bus leaves from Loyola Field House.

10:00 a.m. Meeting of the Executive Committee of the A.S.B. Student Lounge, Marquette Hall.

1:15 p.m. Tour of the U. S. Southern Regional Research & Development Laboratory on Robert E. Lee Boulevard.

2:00-8:15 p.m. Registration, Lobby, Loyola Field House.

8:20 p.m. General Session followed by Smoker, Loyola Field House.

Friday, April 22

8:00-12:00 noon. Registration, Lobby, Loyola Field House.

8:30-11:30 a.m. Showing of the A.I.B.S. Biological Sciences Film Series. Trophy Room, West End, Loyola Field House.

8:00 a.m. Commercial Exhibits, Loyola Field House.

8:30 a.m. Contributed Papers.
Animal Physiology, Auditorium, Marquette Hall.
Plant Physiology, Student Lounge, Marquette Hall.
Vertebrate Zoology, Room 207, Bobet Hall.
Parasitology, Room 212, Bobet Hall.
Cryptogamic Botany, Room 304, Bobet Hall.

11:30 a.m.-12:30 p.m. Business Meeting, Association of Southeastern Biologists, Main Auditorium, Loyola Field House.

1:15 p.m. Business Meeting, Southeastern Section, Botanical Society of America, Room 304, Bobet Hall.

2:00-5:00 p.m. Showing of the A.I.B.S. Biological Sciences Film Series. Trophy Room, West End, Loyola Field House.

2:00 p.m. Contributed Papers.
Animal Physiology, Auditorium, Marquette Hall.
Cytology and Genetics, Student Lounge, Marquette Hall.
Invertebrate Zoology, Room 207, Bobet Hall.
General Botany, Room 212, Bobet Hall.
Plant Ecology, Room 304, Bobet Hall.

5:45 p.m. Special Registration for Beta Beta Beta Members, Loyola University Cafeteria.

6:00 p.m. Dinner, Beta Beta Beta Society, Loyola University Cafeteria. Members will go through the cafeteria line.

7:00 p.m. Address to Beta Beta Beta Members, Marquette Auditorium.

8:30 p.m. General Session, Loyola Field House.

Saturday, April 23

8:30 a.m. Field Trip to the Gulf Coast Research Laboratory, Ocean Springs, Mississippi. Members will leave in private cars from the Loyola Field House.

8:30-12:00 noon. Student Papers, Beta Beta Beta Society. Eastern District, Room 212, Bobet Hall; Western District, Room 304, Bobet Hall.

12:00-1:00 p.m. Business Meeting, Beta Beta Beta Society; Eastern District, Room 212, Bobet Hall; Western District, Room 304, Bobet Hall.

GENERAL SESSION

THURSDAY, APRIL 21, 8:20 p.m.

Loyola Field House

Presiding: Horton H. Hobbs, Jr.

Address of Welcome: VERY REVEREND W. PATRICK DONNELLY, S. J., President of Loyola University.

Response: Horton H. Hobbs, University of Virginia, President of A.S.B.

Address: *The Biological Sciences Curriculum Study* — Dr. Arnold B. Grobman, Director, Biological Sciences Curriculum Study of the A.I.B.S., Boulder, Colorado.

Address: *The A.I.B.S. Biological Sciences Film Series* — Dr. Hiden T. Cox, Executive Director, American Institute of Biological Sciences.

Smoker following the Addresses.

ANIMAL PHYSIOLOGY SESSION I

FRIDAY, APRIL 22, 8:30 a.m.

Marquette Auditorium

Presiding: Douglas Humm, Univ. of North Carolina

8:30 Differentiation of Transplanted Pancreatic Rudiments. B. E. FRYE, Univ. of Virginia.

8:43 The Action of Thyroxine on the Mitochondria of the Liver of the Albino Rat. SAMUEL R. TIPTON, Univ. of Tennessee.

8:56 The Preservation of Experimental Neoplasms by a Frozen-Tissue Bank at —78° C. J. RICHARD THOMSON and DANIEL R. FARNELL, Southern Research Inst., Birmingham.

9:09 Shape Changes and Hemolysis of Frog Erythrocytes Following Treatment with Various Hemolysins. S. P. MARONEY, JR., Univ. of Virginia.

9:22 Differentiation of Chromatophorotropins and Retinal Pigment Light-adapting Hormone from the Eyestalk of the Dwarf Crayfish, *Cambarellus shufeldti*. MILTON FINGERMAN and WILLIAM C. MOBBERLY, JR., Newcomb Coll. of Tulane Univ.

9:35 *Intermission.*

9:45 A Study of the Sickling Phenomenon. ANNA L. CHERRIE, Loyola Univ.

9:58 Electromigration Properties of Mammalian Hemoglobins as Taxonomic Criteria. CHARLES W. FOREMAN, Pfeiffer Coll.

10:11 Differentiation of the Toads, *Bufo valliceps*, *Bufo fowleri*, and their Natural Hybrid by Electrophoresis of Blood Proteins. HERBERT C. DESSAUER, WADE FOX, and E. PETER VOLPE, L.S.U. School of Medicine and Newcomb Coll., Tulane Univ.

10:24 The Respiratory Properties of Chiton Hemocyanins. JAMES R. REDMOND, Univ. of Florida.

PLANT PHYSIOLOGY SESSION

FRIDAY, APRIL 22, 8:30 a.m.

Student Lounge, Marquette Hall

Presiding: Victor A. Greulach, Univ. of North Carolina

8:30 A New Method of Investigating the Daily Course of Oxygen Tension of an Aquatic Population. WILLIAM T. LAMMERS, Davidson Coll.

8:43 A Comparison of the Water Content of Insect Galls with that of Contiguous Tissues and Normal Organs of the Same Host Plant. EDWIN G. BECK, Univ. of Georgia.

8:56 Surface Antigen Dynamics in the Slime Mold, *Dictyostelium discoideum*. JAMES H. GREGG, Univ. of Florida.

9:09 The Use of Tetrazolium Chloride on Barley Meristems. PATRICIA A. SARVELLA, Mississippi State Univ.

9:22 The Effects of Selected Antibiotics on Pure Cultures of Algae. EDWARD O. HUNTER, JR. and ILDA McVEIGH, Vanderbilt Univ.

9:35 *Intermission.*

9:45 Effects of IAA and 2, 4, 6 — T on Timothy Root Growth. ROBERT T. BRUMFIELD, Longwood College and Oak Ridge Nat. Lab.

9:58 The Separation of Chloroplast Pigments by Countercurrent Distribution. FREDERICK T. WOLF and JOHN G. CONIGLIO, Vanderbilt Univ.

10:11 Responses of Selected Granite Outcrop Communities to Chronic Low-level Gamma Irradiation. J. FRANKLIN McCORMICK, Emory Univ.

10:24 A Growth Response by Two Sedges Inhabiting a Radiation Field. GAYTHER L. PLUMMER, Univ. of Georgia.

10:37 The Isolation of the Amino Acid, Canavanine, by Ion Exchange Methods. GORDON E. HUNT and JOHN F. THOMPSON, Univ. of Tennessee.

10:50 Effects of Ionizing Radiation on Tree Growth. JOHN T. McGINNIS, Emory Univ.

VERTEBRATE ZOOLOGY SESSION

FRIDAY, APRIL 22, 9:09 a.m.

Room 207, Bobet Hall

Presiding: Donald C. Scott, Univ. of Georgia

9:09 Aspects of Melanism in *Gambusia affinis* (Baird and Girard). JAMES D. REGAN, Florida State Univ.

9:22 *Etheostoma okaloosae* (Fowler), a Percid Fish Endemic in Northwest Florida. RALPH W. YERGER, Florida State Univ.

9:35 Growth and Development of the Golden Mouse, *Ochrotomys nuttalli*. JAMES N. LAYNE, Univ. of Florida.

9:48 Induction of Limb Regeneration in Postmetamorphic Frogs by Xenoplastic Adrenal Transplants. MERLE MIZELL, Tulane Univ.

10:00 *Intermission.*

10:10 Live-trap Induced Stress in *Sigmodon hispidus*. FRANK B. GOLLEY, Univ. of Georgia.

10:23 Influence of Nerves in Lizard Regeneration. SIDNEY B. SIMPSON, JR., Tulane Univ.

10:36 The Stimuli for the Start of the Reproductive Season in Juncos. JAMES T. TANNER, Univ. of Tennessee.

10:49 Taxonomic Status of the Florida Pine Vole, *Pitymys parvulus*. ANDREW A. ARATA, Univ. of Florida.

PARASITOLOGY SESSION

FRIDAY, APRIL 22, 8:30 a.m.

Room 212, Bobet Hall

Presiding: Horton H. Hobbs, Jr., Univ. of Virginia

8:30 The Genus *Entocythere*, an Ostracod Epizooic on Crayfishes. EDWARD A. CRAWFORD, JR., Erskine Coll.

8:43 Swift Tapeworms; the Genus *Notopentorchis* Burt in Ceylonese and American Trochilids. ARTHUR W. JONES, Univ. of Tennessee.

8:56 The Comparative Efficacy of Bephenium Hydroxynaphthoate and Tetrachloroethylene against Hookworm and other Parasites of Man. MARTIN D. YOUNG and GEOFFREY M. JEFFERY, U.S.P.H.S., Columbia, S. C.

9:09 Cortisone and Resistance to Infection with *Hymenolepsis nana*. CLARENCE J. WEINMANN, Univ. of Florida.

9:22 The Comparative Anthelmintic Effects of Dithiazanine and Tetrachloroethylene Individually and in Combination. GEOFFREY M. JEFFERY and MARTIN D. YOUNG, U.S.P.H.S., Columbia, S. C.

9:35 A Preliminary Report on the Helminth Parasites of Nutria in Louisiana. BERT B. BABERO and J. WARREN LEE, Southern Univ.

9:48 A New Species of *Macravestibulum* (Trematoda: Pronocephalidae) from the Florida Terrapin. RAYMOND T. DAMIAN, Florida State Univ.

10:00 *Intermission.*

10:10 Activity Suppression in the Golden Hamster (*Cricetus auratus*) Caused by *Trichinella spiralis* Infection. CHAUNCEY G. GOODCHILD and DIRK FRANKENBERG, Emory Univ.

10:23 Ovoviviparity in the monogenetic trematode *Polystomoidella oblonga*. LARRY C. OGLESBY, Florida State Univ.

10:36 Further Observations on the Structure of the Cyst of *Neoechinorhynchus cylindratus*. BURTON J. BOGITSH, Georgia Southern Coll.

10:49 Some Digenetic Trematodes from Birds from the Northwest Gulf Coast of Florida. AUSTIN J. MacINNIS, Florida State Univ.

11:02 Marine Trematode Cercariae from the Apalachee Bay Area. RHODES B. HOLLIMAN, Florida State Univ.

11:15 Observations on the Life Cycle of *Parorchis acanthus* Nicoll. PAUL D. LEWIS, JR., Florida State Univ.

11:28 Some Effects of Radiation on the Growth Rate of *Hymenolepis microstoma*. H. H. KUHLMAN, Univ. of Tennessee.

CRYPTOGAMIC BOTANY SESSION

FRIDAY, APRIL 22, 8:30 a.m.

Room 304, Bobet Hall

Presiding: Harold J. Humm, Duke Univ.

8:30 Aceto-carmine Staining of Nuclear Bodies in *Oscillatoria*. D. E. NORBY, Virginia Polytechnic Inst.

8:43 Factors Affecting Zoosporogenesis in Five Chlorococcacean Algae. KENNETH F. HANCOCK, Univ. of Alabama.

8:56 A Preliminary Host Range Study of the Chytrid, *Pringsheimiella*. J. THOMAS MULLINS, Univ. of Florida.

9:09 Current Effects and Growth of Freshwater Algae. L. A. WHITFORD, North Carolina State Coll.

9:22 An Axenic Culture of *Puccinia malvacearum*. VICTOR M. CUTTER, JR., Woman's Coll. of the Univ. of North Carolina.

9:35 *Intermission.*

9:45 The Effects of the Alkaloid Drug Colchicine upon the Alga, *chlorella pyrenoidosa*. ALAN D. REX, Virginia Polytechnic Inst.

9:58 Changes in Development of *Protosiphon botryoides* (Kütz) Klebs in Culture upon Replacement of Calcium with Strontium. J. C. O'KELLEY, W. R. HERNDON, and R. E. DANIEL, Univ. of Alabama.

10:11 Strontium Replacement for Calcium in the Growth of Four Volvocalean Algae. H. W. NICHOLS, W. R. HERNDON, and J. C. O'KELLEY, Univ. of Alabama.

10:24 Occurrence of *Beggiatoa* Species Relative to Pollution. JAMES B. LACKEY, Univ. of Florida.

10:37 What is *Riccia fluitans* L.? RUTH SCHORNHERST BREEN, Florida State Univ.

10:50 Sporophyte Production in Antarctic Mosses. ELMER G. WORTHLEY, Harvard Univ.

ANIMAL PHYSIOLOGY SESSION II

FRIDAY, APRIL 22, 2:00 p.m.

Marquette Auditorium

Presiding: Samuel R. Tipton, Univ. of Tennessee

2:00 Ascorbic Acid Metabolism and the Adrenal Glands. DON W. STUBBS and KENNETH OTTIS, Auburn Univ.

2:13 Narcosis, Hypothermia, and Resistance to Asphyxia in Newborn Guinea Pigs. JAMES A. MILLER, JR. and FAITH S. MILLER, Emory Univ.

2:26 Mechanism of Nitrogen Narcosis. D. F. SEARS, Tulane Univ.

2:39 Patterns of Oxidative Enzyme Formation in the Bruchid (Coleoptera) Embryo during Early Development. ALFRED BRAUER, Univ. of Kentucky.

2:52 Studies on the Balance between Lactic Acid Formation and Pyruvic Acid Oxidation in Normal Platyfish Pigment Cells and Platyfish — Swordtail Hybrid Tumors. DOUGLAS G. and JANE H. HUMM, Univ. of North Carolina.

3:05 *Intermission.*

3:15 Interrelation between Triiodothyronine and Adrenaline in Regulation of Oxygen Consumption. KENNETH OTTIS, Auburn Univ.

3:28 Reanimation of Anesthetized Mice from Body Temperatures below 1°C. FAITH S. MILLER and JAMES A. MILLER, JR., Emory Univ. and Nat. Inst. for Med. Res. (London).

3:40 Olfactory Nerve Degeneration. IRVING R. MARTINEZ, JR. and RICHARD T. JACKSON, Loyola Univ. and L.S.U. of New Orleans.

3:53 The Neurophysiological Effect of 3 cm. Microwave Radiation. R. D. McAFEE, Tulane Univ. and V. A. Hospital.

4:06 Measurement of the Effect of Sympathetic Stimulation on Nasal Blood Shunt. RICHARD T. JACKSON and HUNTER C. LEAKE, III, Loyola Univ. and L.S.U. Medical School.

4:19 Preliminary Studies of the Winter Fauna of a Small Artificial Lake at an Altitude of 2400 Feet. ELLINOR H. BEHRE, EMESE SOOS, Y. E. STYLES, ANN BEDDINGFIELD, BARBARA RIDDLE and PIROSKA SOOS, Louisiana State Univ.

4:32 Factors Influencing Contractions of Transplanted Ovarian Follicles. BARRY A. MAXWELL and H. J. LIPNER, Florida State Univ.

CYTOLOGY AND GENETICS SESSION

FRIDAY, APRIL 22, 2:00 p.m.

Student Lounge, Marquette Hall

Presiding: Mary Esther Gaulden, Oak Ridge National Laboratory

2:00 Cytological Studies in the Genus *Fissideus*. NARINDER CHOPRA, Univ. of Tennessee.

2:13 Effect of AET and MEA on X-ray Induced Genetic Damage in *Neurospora crassa*. EDGAR BARNETT, C. W. EDINGTON, and A. GIB DeBUSK, Florida State Univ.

2:26 Postirradiative Effects on Chromosomal Aberrations. A. V. BEATTY and JEANNE W. BEATTY, Emory Univ.

2:39 The Induction of Position Effect Lethals in *Drosophila* by X-rays. E. W. EDINGTON and J. D. REGAN, Florida State Univ.

2:52 Studies on the Role of Wild Yeasts in Fluctuating Populations of Drosophila. JOHN M. CARPENTER, Univ. of Kentucky.

3:05 Radiobiology of *Tetrahymena pyriformis*. CAROLYN WELLS, Oak Ridge Nat. Lab.

3:15 Relationships between Sparing and Inhibition in a Tryptophan-deficient Mutant of *Neurospora crassa*. H. E. BROCKMAN and A. GIB DeBUSK, Florida State Univ.

3:30 *Intermission.*

3:40 Genetic Analysis of Variant Pigmentary Patterns in the Leopard Frog, *Rana pipiens*. E. PETER VOLPE, Newcomb Coll. of Tulane Univ.

3:53 Colchicine Induction of Polyploidy in *Rhodobryum roseum* (Weis.) Limpr. and *Bryum nitens* Hedw. NARINDER CHOPRA, Univ. of Tennessee.

4:06 The Stage of the Female Germ Cell at Fertilization in Relation to Natural Selection. J. GORDON CARLSON, Univ. of Tennessee.

4:19 The Influence of Postirradiative ATP Treatment on Chromosome Aberration Yield. A. V. BEATTY and ELIZABETH DENNIS, Emory Univ.

4:32 Chromosome Breakage Frequency Induced by 3r of X-rays in Grasshopper Neuroblasts. CATHERINE C. HYDE and MARY ESTHER GAULDEN, Oak Ridge Nat. Lab.

4:45 Behavior of the Spindle Body in Neuroblasts of the Grasshopper, *Chortophaga viridifasciata* (De Geer). KEN-YA KAWAMURA, Univ. of Tennessee.

4:58 Nucleolar Activity in the Megasporocyte of *Lilium*. FRANKLIN F. FLINT, Randolph-Macon Woman's Coll.

INVERTEBRATE ZOOLOGY SESSION

FRIDAY, APRIL 22, 2:00 p.m.

Room 207, Bobet Hall

Presiding: Walter G. Moore, Loyola Univ.

2:00 The Fresh-water Shrimps of Jamaica, W. I. C. W. HART, JR., Acad. of Natural Sciences of Philadelphia.

2:13 Growth and Mortality of the Northern Hard Clam in Florida Waters. R. W. MENZEL, Oceanographic Inst., Florida State Univ.

2:26 Some Aspects of the Ecology of Two Psammolittoral Nematode Populations. CHARLES E. KING, Florida State Univ.

2:39 Protozoa from the New Orleans Area. STUART S. BAMFORTH, Newcomb Coll. of Tulane Univ.

2:52 Sub-lethal Effects of Co-60 Gamma Radiation on *Entosiphon sulcatum.* CARRIE F. BENNETT, Univ. of Florida.

3:05 *Intermission.*

3:15 Some Little Known Protozoa from Rock-pools of the Bald Knob, Salt Pond Mountain, Virginia. EUGENE C. BOVEE, Univ. of Florida.

3:28 A Critique of Gause's Experiments on the Destruction of One Species by Another. W. D. BURBANCK and JAMES D. EISEN, Emory Univ.

3:41 Gastotricha of the New Orleans Area. ROBIN C. KRIVANEK and JEROME O. KRIVANEK, Newcomb Coll. of Tulane Univ.

3:54 New Genera of Branchiobdellidae. PERRY C. HOLT, Virginia Polytechnic Inst.

4:07 Studies on the Role of Photoperiod on the Termination of Larval Diapause in Various Dipterous Insects. JAMES E. JENNER, Univ. of North Carolina.

4:20 The Vertical Diel Migrations of a Cyclopoid in a Mississippi Lake. ROBERT A. WOODMANSEE and BILLY J. GRANTHAM, Mississippi Southern Coll. and Mississippi Game and Fish Comm.

GENERAL BOTANY SESSION

FRIDAY, APRIL 22, 2:00 p.m.

Room 212, Bobet Hall

Presiding: Arthur Welden, Tulane Univ.

2:00 A New Technique for Dissecting the Endosperm and Embryo from Seed of *Ilex opaca* Ait. J. M. HERR, JR., Univ. of South Carolina.

2:13 The Problem of Morphological Variation in *Phacelia Purshii* (Hydrophyllaceae). M. D. BAKER, Vanderbilt Univ.

2:26 Additions to the Virginia Flora and Gray's Manual. A. B. MASSEY, Virginia Polytechnic Inst.

2:39 The Wood Anatomy of *Delopyrum, Dentoceras, Polygonella,* and *Thysanella* (Polygonaceae). JAMES H. HORTON, Univ. of North Carolina.

2:52 Geographical Affinities of the Southern Appalachian High Mountain Flora. GEORGE S. RAMSEUR, The Univ. of the South.

3:05 *Intermission.*

3:15 The Chromosomes of *Iris verna.* R. B. CHANNELL, Vanderbilt Univ.

3:28 Chromosome numbers in *Eryngium* Species of the Southern United States. C. RITCHIE BELL, Univ. of North Carolina.

3:41 The Nature of the Species, *Pachysandra procumbens* (Buxaceae). HERBERT C. ROBBINS, Vanderbilt Univ.

3:54 Typifying Species. ROLAND M. HARPER, Geological Survey of Alabama.

4:07 Some Preliminary Studies Contributing to a Cyto-taxonomic Investigation of the Genus, *Schoenolirion* (Liliaceae). HARRY L. SHERMAN, Vanderbilt Univ.

4:20 Foliar Origin and Development of *Tropaeolum majus* L. JEAN L. SMITH, Florida State Univ.

PLANT ECOLOGY SESSION

FRIDAY, APRIL 22, 2:00 p.m.

Room 304, Bobet Hall

Presiding: Elsie Quarterman, Vanderbilt Univ.

2:00 Autecological Studies on *Leavenworthia stylosa* (Cruciferae). RHONA ZAGER, Vanderbilt Univ.

2:13 Effects of Radiation on the Ecology of *Pinus taeda.* ROBERT A. PEDIGO, Emory Univ.

2:26 A Preliminary Report on Some Aspects of the Autecology of *Helenium amarum* (Raf.) H. Rock. DONALD CAPLENOR, LUCILLE PILLOW, WILLIAM RUSHING, and DAVID WEAVER, Millsaps Coll.

2:39 Changes in Dominance in Old Field Succession under Gamma Radiation. CHARLES P. DANIEL, Emory Univ.

2:52 Age and Development of Coastal Marshes in Southwestern Louisiana. CHARLES L. CHAMBERLAIN, Randolph-Macon Woman's Coll.

3:05 *Intermission.*

3:15 Is Sea-oats sterile? FLETCHER D. HARVEY, III and HARRIS OLIVER YATES, Vanderbilt Univ.

3:28 Floristic Changes on White Oak Lake Bed, 1956-1959. H. R. DeSELM and R. E. SHANKS, Univ. of Tennessee.

3:41 Studies on the Distribution and Life History of Two Species of Lesquerella (Cruciferae). ELSIE QUARTERMAN, Vanderbilt Univ.

3:54 A Preliminary Study on the Relationship between the Vegetation of a Mesic Hammock Community and a Sandhill Community. CARL D. MONK, Univ. of Florida.

4:07 The Origin of Relict and Disjunctive Species in Florida. C. W. JAMES, Univ. of Georgia.

4:20 An Evaluation of Three Hybrid-containing Oak Populations on the North Carolina Coast. C. JOHN BURK, Univ. of North Carolina.

GENERAL SESSION

FRIDAY, APRIL 22, 8:30 p.m.

Loyola Field House

Presiding: Horton H. Hobbs, Jr.

Presentation of Awards: Mt. Lake Biological Station Fellowship offered by Phipps and Bird, Inc.; Research Award offered by Carolina Biological Supply Company; Meritorious Teaching Award offered by Will Corporation of Georgia.

Address: "Carrots and Coconuts — Some Adventures in the Study of Growth", DR. F. C. STEWARD, Professor of Botany, Cornell University.

Items of Interest: New Orleans Meeting

Program
Beta Beta Beta Society

GENERAL SESSION

FRIDAY, APRIL 22

5:45 p.m. Special Registration for Beta Beta Beta Members, Loyola University Cafeteria.

6:00 p.m. Dinner, Loyola University Cafeteria. Members will go through the cafeteria line.

7:00 p.m. Address, Marquette Auditorium "Biology in Russia", Dr. Fred R. Cagle, Tulane University.

EASTERN DISTRICT SESSION

SATURDAY, APRIL 23
Room 212, Bobet Hall

8:30 a.m. to 12:00 noon. Contributed Papers.

12:00 noon to 1:00 p.m. Business Meeting.

WESTERN DISTRICT SESSION

SATURDAY, APRIL 23
Room 304, Bobet Hall

8:30 a.m. to 12:00 noon. Contributed Papers.

12:00 noon to 1:00 p.m. Business Meeting.

Meeting Notes

Lodging and Meals

A partial list of hotels and motels was published in the January issue of the BULLETIN. More complete lists are available from the Visitor's Bureau, 315 Camp Street, New Orleans. The Loyola University Cafeteria will be open to all persons attending the meeting. The newly opened Tulane University Center has excellent dining facilities and is just a few steps from the Loyola Field House. Since New Orleans is famous for its many world renowned restaurants, it is felt that most of those attending the meeting will avail themselves of this opportunity to visit them.

Registration

Registration will take place in the Lobby of the Loyola Field House on Freret Street on April 21 from 2:00 to 8:15 P.M. and on April 22 from 8:00 to 12:00 noon. A fee of $1.00 will be charged for registration; undergraduate members of Beta Beta Beta will not be charged the registration fee, but they are urged to register.

Directory

A directory of persons attending the meeting will be located in the Lobby of the Loyola Field House.

Placement Service

A do-it-yourself type of placement service will be located in the Lobby of the Field House. Space will be provided for posting of available positions and personnel.

Commercial Exhibits

These exhibits will be located on the main floor of the Field House.

A.I.B.S. Theatre

Recently completed films of the A.I.B.S. series will be shown in the Trophy Room, West End, Loyola Field House on Friday, April 22, from 8:30 to 11:30 A.M. and from 2:00 to 5:00 P.M. A program of the films to be shown will be posted about the campus.

Parking

The host institution is apologetic for the parking problem on its campus. However, in an effort to provide ASB members with the best available facilities, a placard will be provided each person requesting it at the registration desk. This placard, when displayed inside the car, will permit parking in the quadrangle in the front of the University on St. Charles Avenue.

Field Trips

Three field trips are scheduled for the 21st Annual Meeting. *Preregistration for each trip is imperative.*

Trip #1

Visit to an operating Sulphur Well in the Gulf is offered to members by the Freeport Sulphur Company. It has been found more convenient to offer this trip on Thursday, April 21, rather than on Saturday, April 23, as previously announced in the January issue of the BULLETIN. A bus will leave the Freret St. entrance of the Loyola Field House on April 21, at 9:00 A.M. and return at 4:00 P.M. the same day. A box lunch will be provided by the Freeport Sulphur Company. Reservations must be made with Dr.

Robert C. Goss, Department of Biological Sciences, Loyola University, before April 9th.

Trip #2

A tour of the U. S. Southern Regional Research and Development Laboratory on Robert E. Lee Blvd. is scheduled for Thursday afternoon, April 21, at 1:15 P.M. Registration should be made with Dr. Harry D. Brown, Department of Biological Sciences, Loyola University, before April 9th.

Trip #3

On Saturday, April 23, a field and collecting trip to the Gulf Coast Research Laboratory at Ocean Springs, Mississippi, will begin at 8:30 A.M. in front of the Loyola Field House. Dr. Gordon Gunter, Director of the Laboratory has arranged for collecting to be done in Mississippi Sound aboard the laboratory research boat. This part of the trip is limited to twenty persons; first to register will be accommodated. Dr. Gunter also offers free lodgings for twenty people on the night of April 23. Travel will be on a share-the-expenses basis. Interested persons should register with Dr. Walter G. Moore, Department of Biological Sciences, Loyola University, no later than April 16th.

Local Arrangements Committee

Dr. George H. Penn (Tulane), Dr. Arthur Welden (Tulane) and Miss E. L. Beard, Dr. Harry D. Brown, Dr. Robert C. Goss, Dr. Richard T. Jackson, Dr. Walter G. Moore, and Father John H. Mullahy, Chairman (all of Loyola University).

The Host Institution

Loyola University is a Catholic Institution conducted by members of the Society of Jesus (the Jesuits). The French Jesuits who founded it in 1849 in downtown New Orleans patterned its administration and curriculum along the lines of the Colleges they still maintain in France. In 1904 the high school divisions and college divisions were separated and moved to different parts of the city; the high school division became the present Jesuit High School on Carrollton Avenue and the College division became Loyola University on its present site in 1912. Besides the College of Arts and Sciences with small graduate divisions in Education and Biology, Loyola maintains schools of Business Administration, Music, Dentistry, Pharmacy, and Law. Its present enrollment is 3000.

Biological Sciences at the Host Institution

Loyola has a single department of biological sciences with a staff of eight members. It is housed in Bobet Hall on the St. Charles Avenue campus. The chairman of the department, Father John H. Mullahy (Vanderbilt) is engaged in an algal survey of the Chandaleur Islands, but freshwater Rhodophyceae are his main interest. Dr. Harry D. Brown (Columbia) is doing physiological work on secretion and secretory structures in plants. Plant pathology and the physiology of microorganisms is the interest of Dr. Robert C. Goss (Purdue), whereas Dr. Richard T. Jackson (Florida State) was recently awarded a N.I.H. grant to study the electrophysiology of the special senses. Dr. John G. Arnold (N.Y.U.) is interested in the parasites of the freshwater fishes of Louisiana. Dr. Walter G. Moore (Minnesota) has published extensively on the limnology of Louisiana lakes as well as on the sponges and anostraca of the South. Mr. Timothy L. Duggan (Loyola) is studying effects of salivary secretion on dental placques, and Miss Elizabeth L. Beard (T.C.U.) has just recently reported on her study of serum proteolytic activity.

Five years ago the department initiated a graduate program which is limited to the Master's degree.

The Participating Societies

Officers of some of the Societies participating in the meetings at New Orleans are as follows:

Association of Southeastern Biologists

President—Dr. Horton H. Hobbs, Jr., University of Virginia

Retiring President—Dr. Mary Esther Gaulden, ORNL

President-Elect—Dr. Victor A. Greulach, University of North Carolina

Vice-President—Dr. Royal E. Shanks, University of Tennessee

Secretary—Dr. Harold J. Humm, Duke University

Treasurer—Dr. Elsie Quarterman, Vanderbilt University

(Continued on Page 41)

Abstracts of Papers Presented at the 21st Annual Meeting of the Association of Southeastern Biologists

All except one of the 112 papers submitted for presentation at the Twenty-first Annual Meeting of the Association are abstracted here. Reprints of abstracts marked with an asterisk are available from the authors.

Taxonomic Status of the Florida Pine Vole, *Pitymys parvulus*

ANDREW A. ARATA, *University of Florida*

Audubon and Bachman in 1851 reported the pine vole from Florida, assigning it to *Arvicola pinetorum*. This name was subsequently changed to *Pitymys pinetorum*. The animal was not again reported from the state until 1916 when A. H. Howell described 4 specimens from Lynn (near Ocala), Marion Co., as a distinct species, *P. parvulus*. Acquisition of more material from Florida, Georgia, Alabama, Mississippi and Louisiana make a reappraisal possible. The descriptive characters (size and color) are found to overlap considerably with *P. pinetorum* to the north and west. Variation is apparent in all characters tested: size, color, molar patterns, etc. The amount of variation existing between, and within, populations is described. Clines running from the west and north, converging in peninsular Florida are evident. Molar patterns of *P. pinetorum* from the Pleistocene of peninsular Florida are described, and found to be more similar to populations living at present further north than to the modern peninsular populations. Extant populations from north Florida are more similar to populations from Georgia than to modern peninsular forms. A revaluation of the taxonomic status of this vole is made upon the evidence presented.

A Preliminary Report on the Helminth Parasites of Nutria in Louisiana*

BERT B. BABERO and J. WARREN LEE, *Southern University* and *A. & M. College, Baton Rouge, Louisiana*

A study on helminth parasitism of feral nutria or coypu in Louisiana is in progress. To date, approximately twenty-nine of these hosts have been examined. Although several helminth species have been recovered, generally, in each instance infections have been light. Morphological studies of the parasites recovered have not been completed. Tentative identifications of helminths and the number of hosts infected are as follows: NEMATODA — *Dipetalonema* sp. (12), *Heligmosomum* sp. (15), *Longistriata* sp. (15), and *Trichuris* sp. (13); TREMATODA — unknown monogenetic fluke, (1), unknown metacercaria (7), and unknown digenetic fluke (3); CESTODA — *Hymenolepis* sp. (1); ACANTHOCEPHALA — unknown species (3). The present report apparently is the first published record of an Acnathophala from nutria.

Trichurids and members of the subfamily Heligmosominae have been observed to be more prevalent in Louisiana nutria than any other helminth. Considerable variation in the spicular sheath of *Trichuris* has been observed.

Although certain of the helminths genera recovered are known to produce apthological conditions in other hosts groups, such pathogenicites have not been observed in animals necropsied during this study.

The Problem of Morphological Variation in *Phacelia Purshii* (Hydrophyllaceae)

M. D. BAKER, *Vanderbilt University*

This paper presents the problem of, and preliminary results concerning, the source of variation in *Phacelia Purshii* Buckl. in middle Tennessee. This species is allied to *P. fimbriata* Michx., and now includes *P. Boykinii* (A. Gray) Small and *P. Bicknellii* Small. The relationships of these taxa are treated. Particular attention is given to the problem in *P. Purshii* of small-flowered plants, pollen and anther sterility, etc., as understood through preliminary experimentation.

Protozoa from the New Orleans Area*

STUART S. BAMFORTH, *Newcomb College* of *Tulane University*

Mild climate and the alluvial soil of the Mississippi Delta provide a variety of hard water mesosaprobic and polysaprobic environments in the swamps, ponds, and ditches of the 50 mile area surrounding New Orleans. *Trachelomonas volvocina, T. hispida,* several species of *Euglena* and *Phacus, Cryptomonas erosa* and *C. compressa* are dominant flagellates. *Chlamydomonas* and colonial phytomonads are sparsely represented, although they may predominate in particular habitats. *Synura uvella* is prominent in the cooler portions of the year but other chrysomonads are relatively rare. *Actinophrys sol,* several small Heliozoan genera, *Arcella vulgaris,* and *Difflugia* appear more numerous than Amoebidae. *Coleps* is the most abundant ciliate genus. *Loxodes, Monochilium, Lembadion, Urocentrum turbo, Halteria grandinella, Strobilidium gyrans, Euplotes eurystomus* and a variety of Oxytrichidae are common. The distribution of many other ciliates depends upon the particular ecological characteristics of individual bodies of water.

Effect of AET and MEA on X Ray Induced Genetic Damage in *Neurospora crassa**

EDGAR BARNETT, C. W. EDINGTON, and A. GIB DEBUSK, *Florida State University*

In view of the number of investigations, past and present, concerned with the chemical protection of organisms against radiation death, surprisingly few studies have been reported which deal with the effectiveness of such compounds against radiation induced genetic changes. Experiments have been conducted in our laboratory with two such compounds, B-mercaptoethylamine (MEA) and S, 2 aminoethylisothiuronium (AET), to determine whether they protect against X ray induced genetic back mutation in *Neurospora crassa*. Our methods for deter-

mining rates of reversion are similar to those of Giles (1951) in which revertants from nutritional auxotrophy to prototrophy are detected by colony formation on basal unsupplemented agar medium plates and survival by colony formation on nutritionally complete agar medium plates. The results of our experiments show that AET when present at the time of irradiation, increases the level of back mutation produced by a standard dose of radiation at the ad-3 locus of Neurospora. MEA, on the other hand, shows a protective action against X ray mutagenicity.

Postirradiative Effects on Chromosomal Aberrations

A. V. Beatty and Jeanne W. Beatty,
Emory University

Investigations dealing with chromosomal aberrations in *Tradescantia* microspores have revealed that a total dose of 400r of X radiation, in combination with various environmental factors during or after irradiation, yielded in five percent oxygen an average low of 0.48 and a high of 0.88 aberrations per cell, while in helium a low of 0.14 and a high of 0.66 was found. In those experimental procedures in which a total dose of 400r yielded less than the highest yield of aberrations, a yield up to but not greater than this high could be obtained by modifying the experimental setup so as to influence the rejoining of broken chromosome ends. This idea of constancy in the number of recoverable breaks and the role which available energy plays in radiation recovery, form the basic premises upon which the present work was carried out. Irradiation was performed in both oxygen and oxygen-free atmospheres. In the oxygen-free experiments some of the material was pretreated in chemicals which presumably contributed in some way in supplying additional energy for repair. Postirradiative treatments for mass doses as well as in the fractionation experiments were given in either helium or air. Any treatment which supposedly increased the supply of energy in the cell, decreased the aberration yield, while a decrease in available energy increased the aberration yield.

The Influence of Postirradiative ATP Treatment on Chromosome Aberration Yield

A. V. Beatty and Elizabeth Dennis,
Emory University

In all experiments the *Tradescantia* inflorescences were exposed to 400r of X radiation in an oxygen-free atmosphere at 30° C. The molecular concentration of ATP used was 2×10^{-3}. The controls with no ATP treatment yielded 0.24 aberrations per cell. With pretreatment periods from 1-9 hours, the aberration yield was approximately 0.14 per cell. Postirradiative treatment for 1½ hours gave 0.17 aberrations per cell indicating biological activity. The use of tagged ATP to indicate absorption of the chemical showed radioactivity in the microspores after two hours of treatment. Biological activity was thus indicated in the microspores before radioactivity was measurable.

A Comparison of the Water Content of Insect Galls with that of Contiguous Tissues and Normal Organs of the Same Host Plant

Edwin G. Beck, *University of Georgia*

Seven leaf galls and one stem gall were examined in this study. The water content of each of the leaf galls was compared with that of the contiguous tissues of the leaf on which it occurred as well as with that of normal leaves from the host plant. The water content of the galls produced by different species of insects varied considerably in water content, but, in all of the cases studied, it was higher than that of the contiguous tissues or the normal leaves of the host plant. In all but one of the host plants, the leaf tissues adjacent to the gall contained more water than did the uninfected leaves from the same plant. A similar study was made of the *Solidago* stem gall caused by the larva of *Gnorimoschema gallaesolidaginis* in which the water content of the galls was compared with that of the stem segments above and below them. It was found that the galls had a greater water content than the stems.

Studies of the Winter Fauna of a Small Artificial Lake, Altitude 2400 Feet, Under Natural and Artificial Conditions: Temperature Changes*

E. H. Behre, Emese Soos, M. E. Styles, Ann Beddingfield, Barbara Riddle, and Piroska Soos,
Louisiana State University

Several species of trichopteran larvae, two of crayfish, one of frog tadpole, and one of salamander were studied; and incidental observations were made on other winter forms. Included were experiments on the effect of indoor temperatures on these species. Outdoor temperatures ranged from freezing (low) to 50 Fahrenheit; indoor temperatures, between 65 and 70.

Indoor temperatures speed up all processes studied. Trichopteran larvae build more rapidly, both initially and after damage or destruction of nests. Tadpoles not usually altering visibly here in the early or midwinter show measurable changes in body proportions, tail length (shortening) and leg length (increase). Tadpoles, salamanders, even crayfish, become very restless when kept indoors. The vertebrates feed vigorously indoors, hardly at all outdoors. Induced wounds heal, and operated appendages regenerate much more rapidly indoors than in outdoor temperatures. How much of this last effect is directly correlated with the amount of food consumed is still to be determined.

Chromosome Numbers in *Eryngium* Species of the Southern United States

C. Ritchie Bell, *University of North Carolina*

Among the species of the umbelliferous genus *Eryngium* which are native to the southern United States, diploid and aneuploid plants are found to represent equal numbers of species while plants of only one species are found to be polyploid. Similar aneuploid series are found in different phylogenetic lines and thus must have had independent origins.

Sub-lethal Effects of Co-60 Gamma Radiation on *Entosiphon sulcatum*

CARRIE F. BENNETT, *University of Florida*

The saprozoic colorless flagellate, *Entosiphon sulcatum*, was exposed to various dosages of gamma radiation using a Co-60 irradiating source. After observing no detectable morphological sub-lethal effects, division rates were studied. Seventy-two lines of irradiated isolates were examined daily for a duration of 50 generations and no striking drop in the division rate occurred. It seems that either the organisms are killed or they are not affected. Culture methods, graphs and charts on data for the experiments are available information contained in the paper.

Further Observations on the Structure of the Cyst of *Neoechinorhynchus cylindratus*

BURTON J. BOGITSH, *Georgia Southern College*

Cysts of juvenile forms of the acanthocephalan *N. cylindratus* were subjected to various histochemical and histological techniques. The evidence accumulated indicates that the cyst wall is made up of two portions, an inner connective tissue layer and an outer cellular layer. The outer, cellular layer is chemically different from the inner layer as well as from the surrounding cells of the host's liver.

Some Little-known Protozoa from Rock-pools of the Bald Knob, on Salt Pond Mountain, Virginia

EUGENE C. BOVEE, *University of Florida*

From water samples collected from rainwater pools on barren granitic rock at the Bald Knob, at the summit of Salt Pond Mountain, Giles County, Virginia, over 30 species of protozoan organisms were identified to genus or to species. The collections were made August 20, 1959, water temperature in the pools being 71° F. Amongst those identified were the green flagellates *Chloromeson* sp., *Olithodiscus luteus, Gonyostomum latum, Chlamydomonas* sp., *Haematococcus pluvialis, Stephanosphaera pluvialis, Mallomonas* sp., *Cryptomonas obvoidea*, and *Cryptomonas erosa*; the colorless flagellates *Astasia* sp., *Bodo minimus, Bodo variabilis, Bodo ovatus, Phyllomitus amylophagus*, and *Tetramitus decissus;* holotrichous ciliates *Spathidium muscicola, Enchelys pupa, Tetrahymena* sp., and *Colpoda* sp.; spirotrichous ciliates *Metopus* sp., and *Pleurotricha* sp.; suctorian *Podophyra* sp.; shelled amebas *Lesquereusia* sp., *Heleopora rosea, Crytodifflugia* sp., and *Gromia* sp.; and naked amebas *Hartmannella* sp., *Mayorella* sp., *Acanthamoeba hyalina, Thecamoeba striata*, and *Mastigamoeba* sp. Special attention will be directed to the green algae *Haematococcus pluvialis* and *Stephanosphaera pluvialis;* and to the ciliate, *Pleurotricha* sp.; because the two algae are found only in rock-pools at high altitudes or cold latitudes, and the ciliate is perhaps a new species, and is perhaps found only in such pools.

Patterns of Oxidative Enzyme Formation in the Bruchid (Coleoptera) Embryo During Early Development*

ALFRED BRAUER, *University of Kentucky*

In previous studies physiological patterns of development in early stages of the bruchid embryo have been studied through their differential susceptibility and recovery after treatment with such agents as KCN., phynylalanine, tyrosine, and Ultraviolet irradiation. The susceptibility patterns for the first three are very similar in that treatment during hours 1 to 7, results in reduplication (twinning), or at least in partial duplicity of the primary axis. In hours 7 to 12, treatment produced great elongation of embryos but no duplicity. Treatment at 12 to 16 hours again has its particular pattern. Ultraviolet irradiation in measured doses is likewise differentially effective in modifying development but for this the patterns differ somewhat from those of the solutions.

The modifications are analyzed in terms of appearance and distribution of the oxydative enzymes glutathione and cytochrome oxydase which are set forth in this study. The conclusion is drawn that the enumerated effects are due directly, and/or indirectly, by incapacitation of the oxydative mechanism. Ultraviolet has the double possibility of acting through this mechanism or by its direct effect on the chromosomes, notably DNA.

What is *Riccia fluitans* L.?

RUTH SCHORNHERST BREEN,
Florida State University

Finding what is usually known as *Riccia fluitans* with sporophytes on both free floating and stranded thalli has raised the question as to the identity of this liverwort. K. Müller (1940) stated that *R. fluitans* is always sterile, while stranded fertile plants represent a distinct species, *R. canaliculata* Hoffman. In October of 1959 abundant fertile material of the following was found in Wakulla County, Florida: (1) floating, (2) submerged and attached to the soil under some six inches of water, and (3) attached to moist soil. Observations have been made of the plants at this station at frequent intervals since its discovery. There seems to be no reason to doubt that all these forms, growing in an area about 200' x 25', are the same organism, merely showing response to a fluctuating water situation. Certain morphological differences are noted between the Florida material and previously published figures and descriptions.

Relationships Between Sparing and Inhibition in a Tryptophan-Deficient Mutant of *Neurospora crassa**

H. E. BROCKMAN and A. GIB DEBUSK,
Florida State University

Certain naturally occurring amino acids inhibit utilization of the required amino acid competitively in a tyrosine-deficient (DeBusk and Wagner, 1953) and in a phenylalanine-deficient (Brockman, DeBusk, and Wagner, 1959) mutant of *Neurospora crassa*. Similar inhibition studies have been extended to a third mutant, FS-108, which requires either indole or tryptophan for growth. Fourteen natural amino acids were found to inhibit competitively the utilization of tryptophan for growth in FS-108, but growth of the mutant was stimulated by the inhibitory amino acids when they were present in concentrations below those needed for inhibition. Added amino acids neither inhibited nor spared growth of the mutant in the presence of indole. Results of growth assays and tryptophan uptake studies support the conclusion that amino acids elicit both the sparing and the inhibition response by interfering with tryptophan uptake into the cell.

Effects of IAA and 2, 4, 6-T on Timothy Root Growth

ROBERT T. BRUMFIELD, *Longwood College* and *Oak Ridge National Laboratory*[1]

When the primary roots of timothy (*Phleum pratense*) seedlings germinated in moist air are immersed in water, a colorless, transparent, gelatinous substance swells out from the root cap and the distal portion of the meristem. RNase dissolves the substance and the process is inhibited by the presence of IAA and stimulated by 2, 4, 6-trichlorophenoxyacetic acid (2, 4, 6-T). IAA inhibits growth but does not alter the geotropic response or the growth effects of UV. Geotropism and growth effects of UV are inhibited by 2, 4, 6-T which also stimulates growth. The absorbance of water extracts of root tips bearing the gelatinous substance is high at 210 mμ, low at 240 mμ, with a "bulge" at 260 mμ. Extracts in 10^{-4} M IAA exhibit a sharp peak at *ca.* 227 mμ indicating the formation of a new complex. Extracts in 10^{-4} M 2,4,6-T show a new peak at *ca.* 224 mμ. When roots treated with IAA are exposed to UV, the absorbance of water extracts at 227 mμ varies with the UV dose. With 2, 4, 6-T, which inhibits the growth effects of UV, the absorbance at 224 mμ is not affected by UV. The peak at 227 mμ is higher in successive extracts in IAA while the peak at 244 mμ is lower in successive extracts in 2, 4, 6-T. Thus it appears that the two compounds form complexes with different components of the mixture.

A Critique of Gause's Experiments on the Destruction of One Species by Another*

W. D. BURBANCK and JAMES D. EISEN, *Emory University*

In Gause's *Didinium-Paramecium* experiments which attempted to produce predator-prey oscillations in laboratory cultures, the didinia died regularly after 3-4 days regardless of how many paramecia were present. This atypical death of the didinia necessitated "immigrations" of *Didinium* to complete the cyclic predator-prey oscillations. It is our intention to explain the death rather than the cyclic phenomenon and typical encystment of *Didinium.*

In our experiments, sterile *D. nasutum* were fed starved *P. aurelia* and paramecia which had been grown on monofloral cultures of five different bacterial species and a mixed culture of wild bacteria. After several generations, produced in 3-4 days, all didinia except those on wild-bacteria-fed paramecia yielded aberrant forms and died. It is suggested that the statistically different fission rates and subsequent death of didinia were due to nutritional deficiencies in the monoflorally-fed paramecia. A *Didinium* requirement, perhaps dipeptidase, may be lacking or insufficient in the monoflorally-fed or starved paramecia, but present in paramecia grown on a mixed bacterial culture. The inadequacy of paramecia fed on a monofloral culture of *Bacillus pyocyaneus* or *B. subtilis* as used by Gause may have accounted for the death of *Didinium* rather than cyclic oscillations of *Didinium-Paramecium* populations and eventual encystment of the didinia.

An Evaluation of Three Hybrid-containing Oak Populations on the North Carolina Coast*

CARL JOHN BURK, *University of North Carolina*

Three populations containing both hybrids and typical specimens of *Quercus phellos* L., *Q. nigra* L., and *Q. laurifolia* Michx. were found on barrier islands at Nagshead, Buxton, and on Bogue Barrier, North Carolina. These populations appeared to occupy a definite successional niche, replacing the salt-spray resistant dominants of the maritime forest, *Quercus virginiana* and *Juniperus*, outside the immediate influence of salt spray, as precursors of an open-canopied, rather mesic "coastal forest" in which they, in association with *Pinus taeda, Quercus falcata, Liquidambar,* and several species of *Carya,* formed a major part of the canopy.

A comparison of specimens taken from the hybrid-containing populations, by the use of Anderson's hybrid index, with specimens of *Q. phellos* and *Q. nigra* taken from the North Carolina piedmont, revealed that the entire range of variation found in the coastal populations, including specimens referable to *Q. laurifolia,* was no greater than that which could be expected from a cross between *Q. phellos* and *Q. nigra,* allowing for segregation and backcrossing with either parent.

A Preliminary Report on some Aspects of the Autecology of *Helenium amarum* (Raf.) H. Rock*

DONALD CAPLENOR, LUCILLE PILLOW, WILLIAM RUSHING and DAVID WEAVER, *Millsaps College*

A program of autecological research dealing with the species *Helenium amarum* (Raf.) H. Rock was initiated by the senior author in the summer of 1959 and has continued through the school year, 1959-1960, under the impetus of the NSF Undergraduate Research Participation Program. Specific phases of the research have been concerned with gross light requirements, requirements for seed germination, and photoperiodic responses.

The species has been found to have a relatively high gross light requirement, especially in seedling stages, but outdoor experiments carried on during the winter of 1959-1960 indicate that the general protection afforded by shading devices may more than offset the effect of shading itself. Germination experiments have shown that the seeds require a short exposure (30 min. or less) to a temperature slightly below 70 degrees F. for germination to occur, and that, after such induction germination is inhibited by a constant temperature of 85 degrees F. or higher. *H. amarum* is a long-day plant, growing throughout the winter in rosette form, and being induced to produce a vertical stem when length of day reaches 13 hours (depending somewhat upon maturity of the plant). Rate of growth of the rosette is also dependent upon length of day. Under present conditions of research, potassium salt of gibberelic acid will substitute for long light period in inducing the production of the vertical shoot.

The Stage of the Female Germ Cell at Fertilization in Relation to Natural Selection*

J. GORDON CARLSON, *The University of Tennessee*

In nearly all animals, if those about which we have information constitute a random sample, fertilization involves a female germ cell that has not

completed meiosis and that usually lacks the capacity to complete meiosis until fertilization has occurred. The particular meiotic stage that the female germ cell attains before it is fertilizable, and beyond which it will not normally proceed until fertilized, differs from species to species but appears to be constant for a given species. If it is assumed that this is a species characteristic that has become established, not by chance, but through natural selection, how might it have survival value? Among the possibilities are: (1) decrease in the time between the completion of meiosis in the female and the beginning of cleavage, (2) decrease in the length of time the eggs need to be retained in the body of the female, (3) simultaneous development and hatching of all the eggs laid at one time by a single female, and (4) protection of the ovum or the secondary oocyte and ovum from the cell lethal effects of recessive lethal genes.

Studies on the Role of Wild Yeasts in Fluctuating Populations of *Drosophila*

JOHN M. CARPENTER, *University of Kentucky*

Drosophila species are commonly known to be yeast feeders. Studies to investigate the feeding habits of the naturally occurring *Drosophila* species, *affinis*, *putrida*, and *robusta* indicate that they feed on 26 yeast species in 10 genera, as indicated by weekly analyses of crop contents. However, 7 yeast species represented 87% of the crop isolates. All yeast species were found consistently throughout the collecting period (May through October), although two, *Pichia fermentans* and *P. membranfaciens*, appeared to show a seasonal preference in growth. Preliminary studies indicate a possible seasonal correlation of certain of these *Drosophila* species with certain yeast species.

Age and Development of Coastal Marshes in Southwestern Louisiana*

JAMES L. CHAMBERLAIN,
Randolph-Macon Woman's College

A series of ridges paralleling the coastline provided an opportunity to interpret development of adjacent marshlands. The marsh area inland of the present beach shows distinct zonation of vegetation whereas marshes further inland do not exhibit such an arrangement. Carbon-14 dating of shell material from the ridges (cheniers) was used to indicate the interval of time during which various marshes developed. The oldest marsh began formation about 2800 years ago; the youngest marsh began formation only 1175 years ago. A vegetational sequence in relation to events in chenier formation is discussed.

The Chromosomes of *Iris verna*

R. B. CHANNELL, *Vanderbilt University*

Iris verna L. consists of two morphologic-taxonomic varieties: Var. *verna* occurs on the Atlantic and Gulf Coastal Plain, being represented to some extent also in adjacent provinces; var. *Smalliana* Fernald occurs in the uplands of the Appalachian system. Comparisons were made of mitotic chromosome number and morphology as a possible source of evidence for the evolutionary relationship and derivation of these two taxa.

A Study of the Sickling Phenomenon*

ANNA L. CHERRIE, *Loyola University*

Sickle Cell Anemia (SCA) and Sickle Cell Thalassemia (trait) are diseases associated with the pressure of abnormal hemoglobins and are thought to be the consequence of the inheritance of a genetic trait. No relationship linking the presence of S-hemoglobin with a particular blood group or Rh factor has been shown in the literature; nor is it believed that the sex has a prominent bearing on its presence. The incidence is high in younger years and the survival rate is low, above the age of fifteen years.

Hematological and electrophoretical studies are presented on one hundred and thiry-four blood samples on Negro students of a southern college population. The relationship of age, sex, blood group and Rh factor to the S-hemoglobin incidence is discussed.

Hemoglobin-S appears to be related in incidence to blood group AB and perhaps in lesser degree to blood group O. No such affinity is shown to blood group A or B.

Colchicine Induction of Polyploidy in *Rhodobryum roseum* (Weis.) Limpr. and *Bryum nitens* Hedw.

NARINDER CHOPRA, *University of Tennessee*

The spores and gametophores of *Rhodobryum roseum* (Weis.) Limpr. and *Bryum nitens* Hedw. were treated with colchicine solution: .0001 ppm, .001 ppm, .01 ppm, 1 ppm, 10 ppm, 50 ppm for 8 hours before sowing on sterilized tap water, ½ normal strength of knops solution, neutral agar, sucrose agar. The spores treated with a colchicine solution, a concentration of 50 ppm, did not germinate and the gametophores also did not show any sign of regeneration in any of the culture media. The other colchicine solutions of less concentration did not inhibit spore germination or gametophore regeneration. Two and a half months were required from spore germination to gametophore formation, but only a month was required for the completion of regeneration process. Concentrations of .01, 1 ppm, 10 ppm of colchicine solution induced polyploidy in both *Rhodobryum roseum* and *Bryum nitens* as 20 chromosomes were counted in aceto-carmine apex squashes of the gametophores, while the lower concentrations of .0001 ppm, .001 ppm of colchicine solution did not have any effect as 10 chromosomes were counted in aceto-carmine apex squashes of the gametophore in both *Rhodobryum roseum* and *Bryum nitens* and the same number, n=10 was reported earlier in both *Rhodobryum roseum* (Chopra 1957) and *Bryum nitens* (Pande and Chopra 1959).

Cytological Studies in Genus *Fissidens*

NARINDER CHOPRA, *University of Tennessee*

Fissidens is a large moss genus composed of nearly 700 species of which only ten species have been cytologically investigated. The cytology of seven other species of *Fissidens* are here reported: *F. grandifrons* Brid. (n=16), *F. minutulus* Sull. (n=5), *F. obtusifolius* Wils. (n=6), *F. osmundioides* Hedw. (n=16), *F. polypodioides* Hedw. (n=16), *F. subbasilaris* Hedw. (n=8) and *F. taxifolius* Hedw. (n=12).

The Genus *Entocythere*, an Ostracod Epizooic on Crayfishes

EDWARD A. CRAWFORD, JR., *Erskine College*

Insofar as is known the entire life cycle of these organisms is spent on the body of the host. This apparently is an obligate association. In no instance has there been demonstrated any degree of "host specificity". This genus appears to be limited in its distribution to the continent of North America and neighboring islands. So meager is the knowledge of their biology, that not even the feeding habits or the range of a single species has been determined. During the course of a study of this genus in Richland County, South Carolina, five new species were encountered and described. Only one of the species was found in all types of habitats investigated, the remaining four showing more precise ecological preference. A brief summary of the morphology of these new species is presented along with a resume of the known natural history of the group.

An Axenic Culture of *Puccinia malvacearum**

VICTOR M. CUTTER, JR.,
The Woman's College, University of North Carolina

During experiments on the growth of *Puccinia malvacearum* in tissue cultures of *Althea rosea* a fungus was isolated which, in general appearance and behavior, resembled strains of *Gymnosporangium* and *Uromyces* previously isolated in axenic culture. After several transfers on synthetic media in the absence of host cells this fungus proved capable of infecting tissue cultures of *Althea* and forming rust sori containing viable teliospores indistinguishable from those of *P. malvacearum*. On Gautheret's medium the isolated fungus formed very slow growing, pale tan, rugose colonies with uninucleate mycelial cells. Unlike other strains of plant rusts isolated by this technique which always developed directly from intercellular mycelium in the host tissue this fungus was obtained from a colony which formed on the culture medium at some distance from the infected host tissue mass and showed no direct mycelial connection with the host cells. Evidence is presented to show that this culture probably resulted from the direct germination of a basidiospore of the rust. This strain was maintained for four months in axenic culture on synthetic media after which transfers failed to grow. Further attempts to obtain axenic cultures of *P. malvacearum* by the direct germination of basidiospores have been unsuccessful to date.

A New Species of *Macravestibulum* (Trematoda: Pronocephalidae) from the Florida Terrapin

RAYMOND T. DAMIAN, *Florida State University*

Two specimens of a pronocephalid fluke were recovered from the small intestine of a turtle, *Pseudemys floridana* (Le Conte), taken from the St. Mark's River in Northern Florida. These trematodes appear to represent a new species in the genus *Macravestibulum* Mackin, 1930. This genus is unique in its possession of a large, posterior, bifurcated, eversible vestibular cavity connecting the excretory bladder proper with the exterior. The present species is similar to *M. kepneri* Jones, Mounts, and Wolcott, 1945 and *M. obtusicaudum* Mackin, 1930 in having accessory vesicles and ducts in the cirrus pouch. It differs from *M. obtusicaudum* chiefly in details in the structure of the cirrus pouch and in the possession of a well-defined pore connecting the excretory bladder and the vestibular cavity. It is distinguished from *M. kepneri* by the presence of a well-developed Laurer's canal, body shape, and details in the structure of the cirrus pouch. It differs from *M. eversum* Hsu, 1937 mainly in body shape, size, possession of accessory ducts in the cirrus pouch, and lack of a heavily muscularized metraterm.

Changes in Dominance in Old Field Succession under Gamma Radiation*

CHARLES P. DANIEL, *Emory University*

Old field succession communities of the first and second year after abandonment, were transplanted to wooden boxes 18 feet long and 3 feet wide. Each box with respective community was placed with one end 4 feet from a Co^{60} gamma radiation source. Chronic radiation was maintained during the spring and early summer during the period of growth and maturity. A gradient of radiation of from 5,000 r to 130,000 r was given as a total dose. Relative biomass was used to determine dominancy. In first year succession the dominants were *Oenothera lasciniata, Erigeron canadensis, Digitaria sanguinalis,* and *Ambrosia artemisiifolia.* All dominants were adversely affected by radiation. In proximity to the source *Digitaria* dominated, while *Erigeron* showed a definite decline. *Ambrosia* showed marked damage close to the source, and where damage was severe, died in late summer during the recovery period. *Oenothera,* while growing well in all areas of radiation, had reduced flower production with increased radiation. In the second year of succession, *Aster pilosa* dominated in the entire gradient of radiation, but showed fasciation and stunting with no flowers close to source.

Floristic Changes on White Oak Lake Bed 1956-1959

H. R. DESELM and R. E. SHANKS,
University of Tennessee

Collection of plant taxa on White Oak Lake Bed began in 1956 following its emergence after lake drainage and has continued in each growing season since. Each year the cumulative flora increases in number although the annual totals in 1958 and 1959 are the same. Percentage increases in numbers of woody taxa, shrubs, and climbers are evident while the herb percentage decreases. Non-indigenous taxa are increasing in numbers at a rate proportional to the logarithm of the total cumulative flora. The proportion of taxa whose propogules are animal disseminated are apparently increasing with time.

Differentiation of the Toads *Bufo valliceps, Bufo fowleri* and Their Natural Hybrid by Electrophoresis of Blood Proteins[1]*

HERBERT C. DESSAUER, WADE FOX,
Louisiana State University School of Medicine,
and E. PETER VOLPE, *Newcomb College,*
Tulane University

Paper electrophoresis of plasma revealed that the two species of *Bufo* and their naturally occurring hybrid could be differentiated by patterns of their

fast moving protein fractions (i. e. migrated faster than human B-globulins). These included two major fractions in both species. In *valliceps* these fractions were resolved less clearly and the lead fraction migrated slower than that of *fowleri*. The second fraction was of high concentration in both species but was broader in *valliceps*. The pattern of the hybrid appeared to be a poorly resolved composite of the parent patterns. By use of starch gel electrophoresis a clearer differentiation between the species was obtained. The lead fraction of *fowleri* again migrated faster than that of *valliceps*. The hybrid lead fraction overlapped the positions of that of the two parental species. Protein present in the fraction which migrated second on paper resolved into three narrow bands on starch gel. In *valliceps* all three bands were pronounced, in *fowleri* only the middle of these three bands was pronounced, and the hybrid pattern was variable. The hemoglobin of *valliceps* migrated faster on paper than that of *fowleri*. Hemoglobin of the hybrid appeared to be a mixture of hemoglobins of the parents.

[1]Supported in part by the National Science Foundation.

The Induction of Position Effect Lethals in *Drosophila* by X Rays*

C. W. Edington and J. D. Regan,
Florida State University

Position effects have been shown to be associated with chromosome aberrations in which one break of the aberration is in heterochromatin. In some cases, the expression of position effects can be suppressed by the addition of extra heterochromatin to the chromosome complement. In other position effects the expression may be enhanced by addition of extra heterochromatin. It has been known for some time that some recessive lethals may have their lethal expression suppressed by addition of an extra Y chromosome; however, no effort was ever made to measure the frequency with which such genetic changes were induced by radiation. Using a modified Muller-5 technique (Lindsley and Edington, 1957) it has been possible to recover sex-linked recessive lethals normally detected in lethal experiments and in addition to recover exceptional lethals (lethals that behave as position effects) that by the usual techniques have been discarded as non-lethals. Evidence to be presented will, for the first time, provide information concerning the frequency of total sex-linked recessive lethals induced by different doses of X rays. It will also be shown that the exceptional lethals recovered in these experiments behave as position effect lethals.

Differentiation of Chromatophorotropins and Retinal Pigment Light-adapting Hormone from the Eyestalk of the Dwarf Crayfish, *Cambarellus shufeldti**

Milton Fingerman and William C. Mobberly, Jr.,
Newcomb College of Tulane University

The eyestalks of *Cambarellus* contain chromatophorotropins for dispersing and concentrating red pigment as well as a hormone that causes light-adaptation of the distal retinal pigment. One of these chromatophorotropins and the light-adapting hormone could presumably be the same substance. The object of this investigation was to learn if these substances could be differentiated. Filter paper electrophoresis revealed that at pH 7.5-7.8 the pigment-dispersing hormone and the light-adapting substance were electropositive whereas the pigment-concentrating hormone was electronegative and, therefore, must be different from the retinal pigment activator. In this pH range the pigment dispersing hormone and the light-adapting substance were electrophoretically indistinguishable. However, when electrophoresis was performed at pH 9.0 the charge on some of the molecules of red pigment-dispersing hormone reversed with the result that some of this substance was found on the anodal portion of the filter paper strip. However, no significant quantity of light-adapting material had become electronegative. The only conclusion one can arrive at, therefore, is that the light-adapting hormone is not the same as either of the chromatophorotropins in the eyestalk.

This investigation was supported by Grant No. B-838 from the National Institutes of Health.

Nucleolar Activity in the Megasporocyte of *Lilium**

Franklin F. Flint,
Randolph-Macon Woman's College

In the megasporocyte there are initiated several small nucleoli which soon coalesce into a single large one. From this large nucleolus extrusions emerge which are of two kinds, an homogeneous substance and a small globular body. It seems probable that it is only after coalescence of all nucleolar elements within a cell that the extrusions are produced. The small globule stains well with safranin during extrusion but within the nucleoplasm it gradually disappears. Therefore it is presently not known whether only one body is formed or whether several are formed at various intervals of time. Concurrently with this extrusion or soon thereafter the nucleolus shows an invagination on one side. This invagination seems likely to be only the result of the extrusion of a certain amount of the contents of the nucleolus, leaving it in a more or less collapsed condition. It probably has no specific function unless it in some way is a factor in the extrusion process. The function of the extruded globule(s) cannot be stated with any certainty although it is released from the nucleolus just as the chromosomes are becoming distinct for Meiosis I, hence this timing may be a factor in determining its role.

Electromigration Properties of Mammalian Hemoglobins as Taxonomic Criteria*

Charles Foreman, *Pfeiffer College*

Results are presented of electrophoretic analyses of the hemoglobins of 161 individuals representing 21 species of mammals chosen carefully so that distantly related species might be compared with closely related ones. The following conclusions are demonstrated and discussed. 1. Individuals of the same species may, with very few exceptions, exhibit characteristic hemoglobin ionograms that do not vary appreciably even though these individuals are taken from collecting stations separated by hundreds of miles. 2. Closely related species usually show striking similarities of hemoglobin electrophoretic patterns, while distantly related species may or may not show such similarities. 3. Since it is shown that member species of a single genus may often be readily distinguished by definite, though slight, differences between the electromigration properties of

their hemoglobins, it is proposed that hemoglobin ionograms may sometimes serve as useful taxonomic criteria with which to identify species that are morphologically very similar. 4. Somewhat rarely certain individuals may show hemoglobin ionograms that are markedly atypical for their species. 5. By comparing the hemoglobin ionograms of nine of the above species with the oxygen dissociation curves that the author had previously established, it was concluded that no correlation exists between hemoglobin electromigration properties and oxygen affinity.

Differentiation of Transplanted Pancreatic Rudiments*

B. E. Frye, *University of Virginia*

The dorsal and the (single) ventral pancreatic rudiments of young larvae of *Ambystoma punctatum* have been transplanted independently to heterotopic sites in host larvae of the same species. The rudiments are dissected from the larvae (Harrison's stages 41 - 43) into Urodele operating solution, freed of adherring tissue and transplanted onto the posterior level of the yolk mass (intracoelomically) by means of a Spemann-type mouth pipette. The stage of transplantation precedes differentiation of the pancreatic cells into recognizable histological components. In this series of experiments hosts were of the same stage as the donors. Under these conditions the dorsal rudiments usually differentiate into recognizable pancreatic tissue containing ducts (which often open into the colon), centroacinar cells, acini and islets of Langerhans. The better cases are histologically indistinguishable from the normal host dorsal pancreas. Grafts of the ventral rudiment likewise differentiate into recognizable pancreatic tissue, but islet tissue is never present. The grafts have only slight — probably insignificant — effects upon the growth and size of the host pancreas.

Live-trap Induced Stress in *Sigmodon Hispidus*

Frank B. Golley, *University of Georgia*

Ecologists commonly use live-traps to determine mammal population density, assuming that trapping does not alter the behavior or physiology of the captive animal. The hypothesis tested here is that live-trapping induces stress in the captive cotton rat. The activity of the adrenal cortex is a measure of stress conditions. Weight of the fresh adrenal gland, width of the *zona fasciculata*, and intensity of staining in adrenal sections stained with Sudan III were used to indicate adrenal activity. It was found that (1) the weight of adrenals from live-trapped *Sigmodon* were higher than those from non-live-trapped *Sigmodon*. (2) The width of the *zona fasciculata* was greater in adrenals of trapped animals. And (3), adrenal sections stained with Sudan III were darker, indicating more steroid hormone, in trapped rats. The combined evidence supports the hypothesis that live-trapping induces stress in the cotton rat.

Activity Suppression in the Golden Hamster (*Cricetus auratus*) caused by *Trichinella spiralis* Infection

Chauncey G. Goodchild and Dirk Frankenberg, *Emory University*

Trichinella spiralis is a nematode parasite which encysts in the muscles of the infected host. It appears that such encystment must result in the impairment of muscle action. The object of this experiment was to test the effect of varying doses of *Trichinella spiralis* infection on the work capacity of golden hamsters (*Cricetus auratus*). To this end a device was designed in which the activity of the animals could be measured, by an hourly recording of the number of revolutions made by an exercise wheel. This device had the advantage of allowing the animals to exercise only as much as they desired. A total of 14 hamsters were run for 3 periods of 24 hours each on two machines. This served both to train the animals and to compile control data. The group was then halved according to the machine upon which each had run. Six animals were selected randomly, 3 from each half; five of these were infected with *T. spiralis* juveniles *per os*, in doses ranging from 75 to 600 per animal; the sixth served as a control.

Preliminary experiments showed that a significant decrease in activity occurred. Further experiments, now in progress, should elucidate the nature of this decrease.

Surface Antigen Dynamics in the Slime Mold, *Dictyostelium discoideum*

James H. Gregg, *University of Florida*

Methods are described whereby antigenic material of the slime mold, *D. discoideum*, effective in antibody production is prepared. Such antisera produced in response to migrating pseudoplasmodia, mature spores and mature spore surface antigens effected maximal agglutination of amoebae. Such antisera effected only minimal agglutination of spores. Absorption of the various types of antisera with amoebae and spores revealed the presence of a surface antigen(s) on the spores which could not be detected on amoebae from early aggregates or migrating pseudoplasmodia. It has been observed that spore cells have poor adhesion to each other as compared to the adhesion between the amoebae composing a migrating pseudoplasmodia. It has been suggested, therefore, that a relationship exists between the adhesive properties of the amoebae and the spores and their agglutinating properties in the presence of antisera.

Some Factors Affecting Zoosporogenesis in Five Chlorococcacean Algae

Kenneth F. Hancock, *University of Alabama*

The production of motile cells by *Neochloris gelatinosa* Herndon, *N. terrestris* Herndon, *Chlorococcum echinozygotum* Starr, *C. hypnosporum* Starr, and *Bracteococcus minor* (Chodat) Petrova has been studied in culture. The lower pH limits for zoosporogenesis were between 3.4 and 3.8 in all cases; the upper limits were above 8.9. Upon transfer from stationary cultures, zoospores were produced in distilled water and in NaCl solutions with osmotic concentrations up to between 1/40 and 1/10 molar. Actively growing cultures 20 to 40 days old gave zoospore percentages equal to those of older stationary cultures. Cultures grown in liquid media gave percentages comparable to those grown on agar slants. Cells from stationary liquid cultures transferred to their centrifugate diluted with distilled water in a graded series yielded a sharply graded series of zoospore percentages in *C. hypnosporum* and *N. terrestris* and a less sharply graded series in the others. A high percentage of zoospores was obtained from cultures grown in media having various equivalent nitrogen sources except in those having

the ammonium ion, but reduction of the concentration of the ammonium ion to ½ the basal medium gave comparable numbers of motile cells. Large numbers of zoospores were obtained from cultures having macromineral deficiencies.

Typifying Species*

ROLAND M. HARPER, *University of Alabama*

Many species of plants (and animals) are so variable, or their original descriptions so indefinite, that it is hard to decide just what is a typical specimen. Some old descriptions are broad enough to cover two or more species as now understood, and when different parts of the aggregate were split off and given new names, it was formerly customary to retain the old name for whatever was left, though that in some cases might be something quite different from the conception of the original describer.

In recent years this problem has often been met by designating a particular specimen, such as the one first collected, as type, and comparing all the others with it. But that was not entirely satisfactory, for often the type specimen is unknown or no longer in existence. And even when readily accessible, it may lack some parts later found to be essential for distinguishing it from closely related forms, such as roots, lower leaves, or fruit.

Occasionally a good type specimen is wrongly labeled, or its locality is not specified, so that the author may attribute it to a locality where the species is unknown, which could be confusing.

The Fresh-water Shrimps of Jamaica, W. I.*

C. W. HART, JR., *The Academy of Natural Sciences of Philadelphia*

Fresh-water shrimps of the families Atyidae and Palaemonidae were collected extensively in Jamaica during April, 1959, and January, 1960. This paper summarizes the work-in-progress on their taxonomy and distribution. The study was supported in part by the American Philosophical Society (grant no. 2623 from the Penrose Fund) and was carried out in cooperation with the Institute of Jamaica, Kingston.

Is Sea-oats Sterile?

FLETCHER D. HARVEY, III and HARRIS OLIVER YATES, *Vanderbilt University*

Uniola paniculata L. is regarded as a sterile species, although it is known ecologically as a pioneer on coarse sand dunes of the South Atlantic and Gulf Coasts. This paper consists of a report of the results obtained in preliminary investigations designed to clarify this matter.

A New Technique for Dissecting the Endosperm and Embryo from Seeds of *Ilex opaca* Ait.

J. M. HERR, JR., *University of South Carolina*

The preparation of serial sections from whole seeds has proved somewhat inadequate for the study of embryogeny in *Ilex opaca* Ait. Stone cells in the apex of the integument surrounded only by parenchyma are easily displaced during sectioning and result in ruinous furrowing of the endosperm and developing embryo. Furthermore, the required longitudinal sections of the embryo cannot be produced at a practical frequency from any specific section plane of the seed. Both difficulties, which obviously interfere with the observations, can be eliminated by removing the endosperm from the seed. Seeds are first treated for approximately forty minutes in basic alcohol (70% ethyl alcohol/2% NaOH) and then are transferred to 70% ethyl alcohol (neutral) for dissection. In seeds so treated, the integument including the lignified area is readily separated from the endosperm. Preparation of the endosperm for longitudinal sections is easily achieved and with practical frequency produces the required longitudinal sections of the embryo.

Whole mounts of young embryos have been prepared by a new technique, *viz.*, the dissection of prestained endosperms embedded in petroleum jelly. The petroleum jelly holds the endosperm in place during dissection and then serves as a semipermanent mounting medium.

Marine Trematode Cercariae from the Apalachee Bay Area*

RHODES B. HOLLIMAN, *Florida State University*

This investigation constitutes the first major effort to study the cercariae of the Gulf of Mexico. The mollusks examined were collected along the coast of Apalachee Bay from St. Marks Lighthouse to St. Teresa, Florida. A total of 69 collections was made from September 1956 to September 1959. A total of 16,577 individual mollusks were examined, encompassing 29 species: 10 species of pelecypods and 19 species of gastropods. From this total, 2622 individuals, or 15.2%, were found infected with trematode larvae. Thirty-one species of cercariae were discovered, of which 28 were studied in detail. Of these, 23 species are new to science. The following families were represented and contained the number of species indicated: 1 cyathocotylid, 1 avian schistosome, 2 aporocotylids, 4 fork-tailed gymnophallids (Fellodistomatidae), 1 tailless gymnophallid, 1 bucephalid, 6 echinostomes, 1 monostome microphallid xiphidiocercaria, 1 plagiorchioid distome xiphidiocercaria, 1 microcercous monorchid, 1 cotylocercous monorchid, 2 cotylocercous opecoelids or allocreadids, 1 leptocercous allocreadid, 3 heterophyids, 1 magnacercous opisthorchioid, and 1 cystophorous hemiurid.

New Genera of Branchiobdellidae

PERRY C. HOLT, *Virginia Polytechnic Institute*

Two newly established genera of branchiobdellids are briefly discussed and diagnostic characters illustrated. Problems of affinities among the genera of the branchiobdellids are posed and the significance of possible solutions of these problems discussed. In this connection, the knowledge, presently being gathered, of geographical distribution of the worms is shown to be of importance.

The Wood Anatomy of *Delopyrum, Dentoceras, Polygonella,* and *Thysanella* (Polygonaceae)

JAMES H. HORTON, *University of North Carolina*

In connection with a monograph of these four genera, a study of their wood anatomy has been undertaken. Plants of these genera share the anatomical peculiarity of branches which appear to be internodal in origin. They are annual or perennial,

suffrutescent or woody, herbs or shrubs. Even the suffrutescent herbs produce considerable amounts of secondary wood. The fourteen species are centered in Florida, but one, *Delopyrum articulatum* (L.) Small occurs as far north as southern Canada; another, *Polygonella americana* (Fisch. and Mey.) Small, ranges west to Texas; and a third, *Polygonella parksii* Cory, is endemic to Texas. In this comparative study, emphasis has been placed on length, length/diameter ratio, and end wall angle of the vessel elements. Structural relationships of stem tissues have also been investigated. Although the vessel elements of all these plants have simple alternate pits and simple perforations, there is considerable variation in the length, width, and end wall angles of vessel elements, even those from a single specimen. Because of this variability, it appears that these anatomical characteristics cannot be brought to bear on the problem of combining or separating these taxonomically confusing species, but they may be suggestive of phylogenetic trends within the group.

Studies on the Balance between Lactic Acid Formation and Pyruvic Acid Oxidation in Normal Platyfish Pigment Cells and Platyfish-Swordtail Hybrid Tumors

DOUGLAS G. HUMM and JANE H. HUMM,
University of North Carolina

One of the basic differences between normal and atypical cells is the capacity of the latter to produce lactic acid in the presence of air. This capacity for aerobic glycolysis, absent in most normal adult tissues is indicative of a fundamental difference in the tumor cells in the glycolytic mechanism. Three possible explanations for the observed difference between tumor and normal cells exist.

1. A quantitative change in the amount of one or more of the glycolytic enzymes.
2. A qualitative change in the activity constants of one or more of the glycolytic enzymes.
3. A factor (such as inorganic phosphate) in the oxidation of pyruvate, nonlimiting in normal cells, becomes limiting in tumor cells.

The experiments reported here are a preliminary series designed to estimate the relative values of the equilibria constants concerned with the conversion of pyruvate to lactate on the one hand and pyruvate to acetyl CO_a on the other in normal and atypical cells obtained from platyfish and tumor bearing swordtail-platyfish hybrids.

The Isolation of the Amino Acid, Canavanine, by Ion Exchange Methods*

GORDON E. HUNT, *The University of Tennessee*
and JOHN F. THOMPSON, *U.S.D.A.*

Thirty years ago Kitagawa discovered canavanine and described a method for its isolation. Since then ion-exchange resins have simplified amino acid preparation; they were used to prepare canavanine in the following manner. 350 g. of Jackbean meal was extracted by shaking for six hours in five times its volume of 75% ethanol. The mixture was allowed to settle and the supernatant decanted. The extraction was repeated two additional times, the supernates pooled, and reduced to 30 ml. volume of syrup. This was neutralized with HCl and placed on a batch prepared column of Dowex-50 (4% X), 200-400 mesh in the ammonium form. The column was 40 by 600 mm. and contained 200 ml. of resin. It was then washed by three times the column volume with distilled water which left only the basic amino acids on the resin. Remaining traces of histidine and other neutrals were removed with a wash of one column volume of N/100 ammonium hydroxide. Three column volumns of N/10 ammonium hydroxide quantitatively removed the canavanine and a quantity of yellow pigment from the resin. The pigment was removed with activated charcoal, a few ml. 0.1 N HCl added, and the decolorized eluate evaporated, first in a Roto-Vac, then *in vacuo* in a desiccator, until white crystals of canavanine chloride precipitated out. These were filtered and washed with cold absolute alcohol. The yield was 0.6%, low compared with literature citations. The low yield may have been due to poor original seed quality.

The Effects of Selected Antibiotics on Pure Cultures of Algae*

EDWARD O. HUNTER, JR. and ILDA MCVEIGH,
Vanderbilt University

A determination was made of the inhibitory effects of actidione, nystatin, amphotericin-A, sulfocidin, and anisomycin, antibiotics, active primarily against fungi, on pure cultures of members of the Myxophyceae, the Chlorophyceae, the Bacillariophyceae, the Xanthophyceae, and the Euglenophyceae. Similar investigations were made of the effects of polymyxin-B sulfate and bacitracin, antibiotics inhibitory to certain bacteria, on the pure cultures of algae. Concentrations of 1.0, 2.0, 20.0, 50.0, 100.0, and 200.0 p.p.m. of each antibiotic were used. Anisomycin, actidione, and nystatin at concentrations up to 200 p.p.m. had little or no detectable effect on the Myxophyceae but were toxic to members of the Chlorophyceae, and the Bacillariophyceae. Thus, these three antibiotics are of potential value as inhibitors of the green algae and diatom contaminants of the Myxophyceae. Of the antibiotics tested, amphotericin-A and sulfocidin were the least toxic to the algae. Hence, these agents may be of value in eliminating fungal contaminants of cultures of algae. Polymyxin-B sulfate and bacitracin were found to be too toxic to the algae to be used as aids in eradicating bacterial contaminants of cultures of algae. Microscopic examination of the algae indicated that various morphological changes accompanied exposure to each of the antibiotics. The principal changes were lysis of vegetative and reproductive cells and bleaching of chloroplasts.

Chromosome Breakage Frequency Induced by 3 r of X Rays in Grasshopper Neuroblasts

CATHERINE C. HYDE and MARY ESTHER GAULDEN,
Biology Division, Oak Ridge National Laboratory

The effects of low doses of radiation can be readily detected in the rapidly and continuously dividing neuroblasts of the grasshopper embryo. The mitotic rate of these cells is temporarily reduced 75% by 3 r and 25% by 1 r of X rays. Chromosome fragments are found in 2% of the neuroblasts after exposure to 3 r of X rays; this represents breakage of 0.1% of the total number of chromosomes treated (males have 23 and females 24 chromosomes in neuroblasts). Chromosome fragments have never been observed in unirradiated neuroblasts. Experiments are now in progress to determine the frequency of chromosome fragments induced by 1 r of X rays.

Measurement of Effect of Synthetic Stimulation on Nasal Blood Shunt*

RICHARD T. JACKSON, *Loyola University* and HUNTER C. LEAKE, III, *Louisiana State University*

If one arouses the sympathetic nervous system of an animal, considerable increases in olfactory acuity can be measured. The increase in acuity coincides with a visible shunting of blood from the ethmoturbinates to large nasal arteries such as the anterior ethmoidal. Measurements were made of the rate and extent of this nasal blood shunt resultant upon electrical stimulation of the cervical sympathetic nerve. A photoelectric cell mounted in the eyepiece of a microscope was the measuring device. The rate of bleaching of the tissue depended upon the strength of stimulation. All strengths of stimulation above threshold evoked a measurable bleaching within 5 seconds. With mild intensities (10 volts, 60 cps) the maximum bleaching was observed in 70-80 seconds. With moderate intensity (30 volts) the peak effect was reached within 50 seconds. The shortest maximum bleaching time was reached within 30-40 seconds. Other workers have shown that olfactory acuity can be affected by mental depression and by the estrous cycle. The authors feel that the increased acuity is probably caused by the impingement of the odorous stimulus upon a relatively untouched receptor field. The reflex is rapid enough to be of some value to the animal in natural situations.

The Origin of Relict and Disjunctive Species in Florida

C. W. JAMES, *University of Georgia*

The presence of relict and disjunctive species in Florida has attracted the attention of botanists since the writings of Croom, Chapman, and Cowles. The typically northern species represented as disjuncts in Florida have generally been assumed to have migrated there during the Pleistocene in response to a lowering of the temperatures and to have since remained in those habitats most nearly providing the conditions of more northerly latitudes. Evidence indicates, however, that a pre-Pleistocene origin for these disjuncts is also possible. The relict species have been postulated to have survived on and since dispersed from an "Orange Island" refugium of Oligocene time. There is no justification for the supposition of such a refugium nor that the origin of such relicts dates prior to late Miocene. There is considerable geological evidence for the existence of land areas in Florida during the Pleistocene. It is suggested that these areas (some of which were insular) have been a major factor in the survival and account of the present day relicts and disjuncts and that they may have also functioned in providing or increasing the effectiveness of isolating mechanisms and as centers of post Pleistocene dispersal of species or segments of species.

The Comparative Anthelmintic Effects of Dithiazanine and Tetrachloroethylene Individually and in Combination

GEOFFREY M. JEFFERY and MARTIN D. YOUNG, *U. S. Public Health Service*

Dithiazanine iodide and tetrachloroethylene were given to five groups of mental patients both alone and combined in varying amounts to determine possible efficacy against hookworm, *Trichuris trichiura* and other helminths of man. Dithiazanine alone, 200 mg. t.i.d. for five days, reduced the *T. trichiura* by 85 per cent with 22 of 43 infections eliminated, but had no effect on the hookworm. Tetrachloroethylene, 1 cc. per day for five days, had no effect on *T. trichiura* and reduced hookworm by only 19 per cent. Combining the two regimens produced no improvement in the effect on *T. trichiura*, but moderately improved the anti-hookworm effect (34 per cent reduction). Comparable combined doses for only one and three days resulted in a proportional decrease in effect against *T. trichiura*, but the effect against hookworm appeared not to decrease greatly. In another test, using the five day regimen of dithiazanine in the treatment of 89 patients, 66 of the *T. trichiura* infections were eliminated. In this group 10 of 35 cases of hookworm were cured. Dithiazanine seems to be an effective drug against *T. trichiura* under conditions prevailing at a mental hospital. Addition of tetrachloroethylene to the regimen does not at present seem justified.

Studies on the Role of Photoperiod on the Termination of Larval Diapause in Various Dipterous Insects*

CHARLES E. JENNER, *University of North Carolina*

Special study has been given to the photoperiodic control of larval diapause in the pitcher-plant midge, *Metriocnemus knabi* (Paris and Jenner, 1959). Further research has given attention to determining the following: (1) the threshold light intensity for this response; this was found to be below .000025 f. c. (2) the critical high temperature range for inhibition of the response; 27.5° C. permitted the response but 30° C. prevented it. (3) The critical short-photoperiod range separating inhibitory short-photoperiods from those even shorter (specifically continuous darkness) which are inductive; photoperiods of 5 and 15 minutes per day were equivalent in effect to total darkness but a 3-hour photoperiod simulated a non-inductive photoperiod of 11 hours; results on a 1-hour photoperiod were intermediate.

Larval diapause in the exceedingly large 4th. stage larva of *Megarhinus septentrionalis* has also been shown to be controlled by daylength. The critical range for the response lies between 12 and 13 hours; 6 to 9 consecutive inductive cycles are required for pupation; food was shown not to be critical; the threshold light intensity for the response also seems to be exceedingly low. Other experiments have demonstrated photoperiodism in the pitcher-plant mosquito *Wyeomyia smithii*, *Aedes triseriatus*, and in a species of the family Ceratopogonidae.

Swift Tapeworms: the Genus *Notopentorchis* Burt in Ceylonese and American Trochilids*

ARTHUR W. JONES, *University of Tennessee*

Specimens of a tapeworm, probably representing a new species of *Notopentorchis*, were recovered from one of three immature chimney swifts in Knoxville, Tennessee. This genus, originally erected for certain tapeworms of the edible-nest swiftlet, *Collocalia unicolor*, in Ceylon, has apparently not been reported heretofore in North America. The hypothesis of cestode speciation by host-determined isolation receives additional support from this occurrence.

Behavior of the Spindle Body in Neuroblasts of the Grasshopper, *Chortophaga viridifasciata* (De Geer)*

KEN-YA KAWAMURA, *University of Tennessee*

From measurements of the drawings of neuroblasts fixed in picro-formal-acetic solution and stained with mercuric bromphenol blue, the following results were obtained:

The length of spindle body continues to elongate throughout mitosis. After early anaphase the speed of elongation is approximately twice as much as before. This suggests that spindle elongation as well as shortening of chromosomal fibers is responsible for the anaphase movement of chromosomes.

The spindle volume also increases continuously into late anaphase. After which attachment of the furrow region of the cell surface to the middle part of the spindle body is followed by a remarkable decrease in spindle volume.

The shift of the whole spindle body toward the side of the neuroblast where the ganglion cell will eventually form occurs gradually after metaphase.

Some Aspects of the Ecology of Two Psammolittoral Nematode Populations

CHARLES E. KING, *Florida State University*

In order to investigate different psammolittoral nematode populations, two intertidal stations were selected facing the Gulf of Mexico in the Alligator Peninsula, Florida, area. The selected localities differed in average grain size of the sand, amount of wave action and degree of beach slope. From each locality, five qualitative and quantitative collections of nematodes, representing the entire range of tidal variation, were made. Hydrographic and physiographic data were taken with each collection.

At the station most exposed to wave action, it was found that the predator species were most abundant; however, deposit feeders formed a much higher proportion of the population than might be expected in an area with considerable wave action. The second station, which was largely sheltered from wave action and current, showed an increase in the percentage of deposit feeders in both numbers of species and individuals. A test for the MacArthur distribution of individuals and species was made through employment of the quantitative results.

Gastrotricha of the New Orleans Area

ROBIN C. KRIVANEK and JEROME O. KRIVANEK, *Newcomb College, Tulane University*

For several years random collecting of freshwater gastrotrichs has been undertaken by the authors in the vicinity of New Orleans, Louisiana. Certain general conclusions have been reached concerning the seasonal fluctuations and environmental requirements of this group. Although a few species of the genera *Chaetonotus* and *Lepidodermella* are obtainable during the winter months, most gastrotrichs are restricted to the warmer months of the year. In this region, the high summer temperatures appear to encourage the occurrence of several of the less common genera, not only in numbers of individuals but also in variety of species. The annual population composition will be discussed and unpublished data on new and previously-described species of *Polymerurus, Neogossea, Kijanebalola, Dasydytes,* and *Stylochaeta* will be presented.

Some Effects of Radiation on the Growth Rate of *Hymenolepis microstoma**

H. H. KUHLMAN, *University of Tennessee*

In September of 1959 the tapeworm *Hymenolepis microstoma* Dujardin was recovered from *Mus musculus* near Chattanooga, Tennessee. An infection of the cestode has been established, and is being maintained in white laboratory mice. The effects of radiation are being studied. Cysticercoids have been exposed to gamma radiation ranging from 2000 r to 50,000 r and the results are at present being tabulated. It has been found that exposure to radiation of 25,000 r and over has lethal effects on the cysticercoids of the tapeworm while lower radiation doses cause definite variation in growth rate as well as numerous morphological variations.

This work was supported in part by the U. S. Atomic Energy Commission under Contract AT(40-1)1749.

Occurrence of *Beggiatoa* Species Relative to Pollution

JAMES B. LACKEY, *University of Florida*

There are six listed species of the sulfur bacterium *Beggiatoa*. Two are marine, four cosmopolitan. Numbers and distribution have been investigated in many places to determine whether or not any of the six species might be used to indicate pollution or organic contamination of natural waters. The conclusion reached is that any source of hydrogen sulfide favors occurrence and growth, but that a toxic level of H_2S is soon reached. Disappearance of H_2S by oxygenation is sharply limiting. No use of any one of these species as a pollution indicator is possible despite the fact that H_2S is usually a product of organic contamination. Other conditions of occurrence are noted.

A New Method of Investigating the Daily Course of Oxygen Tension of an Aquatic Population

WM. T. LAMMERS, *Davidson College*

A means has been devised of making continuous in vivo and in vitro measurements of the oxygen tension of an aquatic population. This is done with a silver-oxide/platinum electrode connected to a recording polarograph. During the past summer this instrument was used in a laboratory study of the photosynthesis + respiration/respiration ratio of an aquatic population, chiefly *Leptodictyum*, sp., taken from the South Holston River.

A series of experiments was conducted at 10°, 15°, and 20°C with the light intensity varied from 0 to 910 foot-candles in 30 minute steps during an experiment. Respiratory rates were determined in the dark.

A P+R/R ratio, independent of population size but dependent upon the overall efficiency of the population, was calculated for each light intensity used at 10°, 15°, and 20°C.

Growth and Development of the Golden Mouse, *Ochrotomys nuttalli*

JAMES N. LAYNE, *University of Florida*

Breeding of the golden mouse in Florida apparently extends over at least an 8-month period, and mean litter size based on ten records is 2.8. The

newborn young has well developed vibrissae and scattered hairs on the dorsum. The juvenile pelage is nearly fully developed by 2 weeks of age, and the post-juvenile molt may begin about the 4th week. The pinnae of the ears normally unfold on the 1st or 2nd day, the incisors erupt between the 4th and 6th day, and the eyes open about the 11th or 12th day. The young are apparently weaned at about 3 weeks of age. Growth in weight and several linear measurements exhibits a marked leveling off at or before 5 weeks of age. Compared to seven species of the related genus *Peromyscus* for which data on growth and development are available, the golden mouse appears to be precocious in both physical and behavioral development. It is suggested that this relatively accelerated post-natal development plus certain specific behavioral patterns observed may be correlated with the semiarboreal habits of the species.

Observations on the Life Cycle of *Parorchis acanthus* Nicoll*

PAUL D. LEWIS, JR., *Florida State University*

Cercariae very closely resembling *Cercaria purpurae* Lebour, 1914, were collected from marine snails (*Cerithidea scalariformis* Say) from Shell Point, Wakulla County, Florida. These cercariae encysted on glass containers and the resulting metacercariae were fed to young chicks. The experimental hosts were autopsied at intervals of 7, 13, and 29 days after feeding. Young and adult flukes of the species *Parorchis acanthus* Nicoll, 1907 were recovered from the cloaca of the experimental hosts. Although the adult agrees in morphology with earlier descriptions, the cercaria differs from the typical *Parorchis acanthus* cercaria as described by Rees (1937, Proc. Zool. Soc. London, Ser. B., part 1, pp. 65-73) in that the excretory stem does not extend into the tail and the primary excretory tubes contain concretions throughout only part of their lengths.

This is the first report of the cercaria of *Parorchis acanthus* from snails of the genus *Cerithidea*, and the first account of the use of chicks as experimental hosts for studies on these flukes. The use of the chick as an experimental host for *Parorchis acanthus* may prove to be of use in elucidating taxonomic relationships in the genus *Parorchis*.

The Neurophysiological Effect of 3 cm Microwave Radiation*

R. D. MCAFEE, *Veterans Administration Hospital and Tulane University, New Orleans, Louisiana*

Neurological effects from microwave radiation (radar) have been reported and it has been indicated that these effects arise from some electromagnetic coupling between neurons and microwaves rather than from microwave heating. This report demonstrates, however, that the neurophysiological effect of 3 cm microwave radiation is caused by preferential heating of nerve branches lying within the tela subcutania. The preferential heating results from the penetrating characteristic of microwaves, the dielectric constant of neural tissue, and the limited ability of those neural fibers to lose heat because of their poor vascularization. Of particular interest is the observation that when irradiated nerves reach 45°C, and rarely before, a nociceptive response is elicited in decerebrated or anesthetized cats which includes withdrawal movements, elevation of blood pressure, and respiratory changes. Motor fiber stimulation does not occur and it is thought that only the C and delta fibers are affected by radar as a result of their specific thermal sensitivity.

Responses of Selected Granite Outcrop Communities to Chronic Low-Level Gamma Irradiation*

J. FRANKLIN MCCORMICK, *Emory University*

An investigation of selected granite outcrop communities was made in order to determine their composition, organization, and the reciprocal relationships between the communities and their environment. This study served as a base-line for the interpretation of the effects of chronic low-level gamma radiation upon individual species and community structure. Low-level chronic gamma irradiation of natural plant communities induced changes in community organization by selective elimination of a particular species and the subsequent positive selective pressure toward more radio-resistant species. Each of the several criteria by which species variation was measured illustrated increased variation upon accumulation of higher total doses of chronic gamma radiation regardless of dose rate. Response of plant species to irradiation normally followed a definite predictable pattern of growth inhibition. However, doses of radiation near or below 10,000 r often induced unusual and unpredictable effects. Among these unusual effects were the acceleration of the life cycle, variation of the flowering period, and sporadic irregularities in growth processes.

The granite outcrops represent an environment of abnormally high background radiation in which a particular species was found to be an accumulator of radioactivity. A similarity was found between the responses of a plant to ionizing radiation and the responses that the plant makes to particular plant growth substances. This similarity suggests a selective inactivation of specific plant growth substances resulting in the inhibited and abnormal growth which is typical of irradiated plants.

Effects of Ionizing Radiation on Tree Growth*

JOHN T. MCGINNIS, *Emory University*

Studies on *Quercus alba* L., *Carya tomentosa* Nutt., and *Pinus Taeda* L. are presented and illustrated in which daily radial growth is measured by means of continuously recording "Fritts" dendrographs. The experimental trees were selected in such positions as to receive a gradient in radiation emitted from the partially-shielded reactor at the Air Force Plant at Dawsonville, Georgia. The increase in radial size of trees is related to the radiation dose received and compared with tree growth in the control area. The deciduous trees show very marked physiological response to radiation in cambial activity but they appear outwardly as if radiation had no effect. However, near the reactor, leaf fall was initiated approximately 30 days before that of the trees in the control areas. The irradiated pine trees very early showed much morphological damage to needles but continued to enlarge radially although at a much reduced rate as compared to the control pines in a non-radiation area. It is suggested that the pine may occupy a much reduced place in forest stands which are subjected to chronic low-level radiation.

Some Digenetic Trematodes from Birds from the Northwest Gulf Coast of Florida

AUSTIN J. MACINNIS, *Florida State University*

Six species of digenetic trematodes have been recovered from the examination of 13 birds in the order Charadriiformes collected during the summer and fall of 1958 at Alligator Harbor, Franklin County, Florida. The parasites have been identified as: *Pachytrema sanguineus* (Linton 1928) Purvis, family Pachytrematidae, from the gall bladder of *Thalasseus maximus; Galactosomum spinetum* Braun, family Heterophyidae, from the coelom of *Gelochelidon nilotica; Gynaecotyla riggini* Dery, family Microphallidae, from the liver of *Catoptrophus semipalmatus; Renicola glandoloba* Witenberg, family Renicolidae, from the kidney tubules of *Larus atricilla* and *Sterna hirundo; Cyclocoelum obscurum* Leidy, family Cyclocoelidae, from the air sacs of *C. semipalmatus; Cardiocephalus medioconiger* Dubois and Perez Viguerez, family Strigeidae, from the small intestine of *Sterna forsteri, L. atricilla,* and *T. maximus. P. sanguineus* and *C. medioconiger* are redescribed. This report constitutes new host records for *P. sanguineus, G. spinetum, G. riggini,* and *C. medioconiger.* A new locality is reported for *P. sanguineus, C. medioconiger, R. glandoloba, C. obscurum* and *G. spinetum.* Six of the 13 birds examined were infected with *Renicola,* a genus of parasites which may cause pathology of the kidney (Wright, 1954), however all of the birds examined appeared normal prior to collection. The taxonomy and morphology of these parasites will be discussed.

Shape Changes and Hemolysis of Frog Erythrocytes Following Treatment with Various Hemolysins*

S. P. MARONEY, JR., *University of Virginia*

Frog erythrocytes suspended in Ringers Solution were treated with ultraviolet radiation, *n*-butyl alcohol and saponin. Individual cells were followed in camera-lucida drawings to hemolysis. With all treatments, cells were essentially spherical at hemolysis, although the shape changes leading to this condition differed from one hemolysin to the next. The critical volumes following ultraviolet and butal alcohol were 1.87 and 1.55 respectively, while cells treated with saponin hemolysed without volume increase.

Olfactory Nerve Degeneration*

IRVING R. MARTINEZ, JR.,
Louisiana State University—New Orleans
and RICHARD T. JACKSON, *Loyola University*

It has been reported by Le Gros Clark that if one olfactory bulb is removed 50% of the receptors on the affected side degenerate. In view of Gasser's electron microscope studies of the olfactory nerve fibers, which concluded a one-to-one relationship between olfactory receptors and axons until their delivery into the glia of the olfactory bulb, the above results seemed incongruous. Due to their one-to-one relationship, and absence of synapses, it appeared that none or all of the receptors should degenerate.

In order to determine if there was any interrelationship between receptors and bulbs of the opposite side, Le Gros Clark's experiments were reduplicated by this investigator and in addition bilateral ablations of the bulbs were performed. Approximately 50% of the receptors remained in both cases. No regeneration was observed even after one month. Similar results were obtained by Abercrombie using the abdominal vagus nerve.

The present author's work supports the notion that no interrelation exists between receptors and bulbs of opposite sides.

Preliminary experimentation with colchicine was undertaken by this investigator to note any degenerative effect and possible cell turnover in the olfactory epithelium.

Additions to the Virginia Flora and Gray's Manual

A. B. MASSEY, *Virginia Polytechnic Institute*

Work on the flora of Virginia has lead to the discovery of 6 species new to the State and not included in Gray's Manual 8th Ed. *Bunias erucago,* L., Prince Edward County; *Calepina irregularis,* (Asso.) Thell. Caroline and Prince Edward Counties, (Blake, S. F. 1957. Rhodora 59:278-280); *Aegilops cylindrica,* Host., Page, Clark, Nelson and Campbell Counties; *Acanthospermum hispidum,* DC., Northampton County; *Cynosurus echinatus,* L., Goochland County; *Alternanthera philoxeroides,* Griseb. City of Hampton, Princess Anne and Isle of Wight Counties. (Massey, A. B. 1957. Rhodora 59:239.)

Factors Influencing Contractions of Transplanted Ovarian Follicles*

BARRY A. MAXWELL and H. J. LIPNER,
Florida State University

Ovarian tissue autotransplanted to the eye of the rabbit very quickly becomes vascularized. The follicles composing the implant grow, become distended with fluid, and remain intact in the eye for months. Microscopic examination of the follicles reveals no observable activity, however, the administration of urine obtained from pregnant women is followed in from 8 minutes to 3 hours by changes in the form of individual follicles. The follicles change from spheres to oblate spheroids. The frequency of form change ranges from 1 to 5 minutes. These changes in form, which we interpret as being due to contractions of the smooth muscle fibers of the theca externa, are also induced 9 - 10 hours after cervical stimulation.

Epinephrine, acetylcholine and posterior pituitary extract were ineffective in inducing follicular contractions.

Growth and Mortality of Northern Hard Clam in Florida Waters*

R. W. MENZEL, *Florida State University*

Since March 1958, when several thousand small laboratory-reared hard clams (*Mercenaria mercenaria*) were secured from the U. S. Fish and Wildlife Laboratory at Milford, Connecticut, observations have been made on their growth and mortality under a variety of conditions on the northwestern Gulf Coast of Florida. Growth has been excellent, some of the clams reaching commercial size in eighteen months. Growth was best during the fall and spring months, was less during the winter, and almost ceased during the summer, especially the second year when the clams were larger. Mortality was very low when the clams were protected from preda-

tors (mainly blue, stone and mud crabs and the lightening whelk) but reached 100% in a very short time without protection. Limited observations have been made comparing the seasonal growth of the native clam (*M. campechiensis*) with the northern clam.

Reanimation of Anesthetized Mice from Body Temperatures Below 1°C*[1]

FAITH S. MILLER and JAMES A. MILLER, JR.,
Emory University, and *National Institute for Medical Research, London*

Mice can be successfully reanimated from colonic temperatures near zero by rewarming and artificial respiration. The method of cooling and the respiratory gas mixture influence the percentage of recoveries. After cooling to below 1°C with the closed vessel technique, employing slowly developing hypoxia and hypercapnia in addition to cold, 100% of mice were resuscitated by ventilation with air. However, only 36% recovered postural reflexes and all had weak or paralyzed hind legs when lightly anesthetized with a variety of agents and cooled rapidly in ice. Because tests had demonstrated the superiority of 95% O_2 + 5% CO_2 over air this was used for resuscitation of a second series. Nearly 100% recovered and remained alive and incidence of hind limb damage was low. Electrocardiograms as well as recovery rates were recorded. Anesthesia by inhalation of ether, chloroform, or nitrous-oxide-oxygen was more easily controlled than by intraperitoneal injections of pentothal or avertin. Chloroformed animals survived cooling well but died of toxic effects within two days, as also did uncooled chloroformed controls. None of the rapidly cooled anesthetized groups recovered as well as the closed vessel controls.

Narcosis, Hypothermia and Resistance to Asphyxia in Newborn Guinea Pigs*[1]

JAMES A. MILLER, JR. and FAITH S. MILLER,
Emory University

Hypothermia postpones death from asphyxia and permits complete, spontaneous recovery from lethal exposures in newborn guinea pigs, rabbits, puppies and humans (Miller, Chapt. VIII in "*Influence of Temperature on Biological Systems.*" Am. Physiol. Soc. 1957; Westin, Miller, Nyberg, Wedenberg, Surgery 45: 868, 1959.) Contrariwise, narcosis induced by hypoxia-hypercapnia protects against deleterious secondary effects of hypothermia (Miller and Miller, Am. J. Physiol. 196: 1218, 1959.) Newborn guinea pigs sedated with sodium pentobarbital lived longer than littermate controls at all temperatures tested but the increase was greatest at the lowest temperature. At 40°C it was 117%, at 15.5°C it was 201%. When sedated animals were removed from the gas at the last gasp of the control the majority at 42°C and 38°C and all at 19°C and 15°C recovered. Likewise, the majority at 19°C and 14°C recovered from 2X the lethal exposure for normothermic controls. Animals sedated before cooling lived no longer than animals sedated after, showing that struggling and shivering had no influence on their resistance when subsequently asphyxiated. EKG records gave no indication of improved heart action in sedated animals. Since O_2 uptake studies showed a 17% depression in requirements at 40°C and a 49.7% reduction at 21°C it is suggested that the benefits of sedation are due largely, if not entirely, to the depression in metabolic requirements. Since many babies are apneic at birth because of oversedation the experiments provide further argument for the use of hypothermia in the treatment of asphyxia.

Induction of Limb Regeneration in Post-metamorphic Frogs by Xenoplastic Adrenal Transplants*

MERLE MIZELL, *Tulane University*

The role of nerves in amphibian limb regeneration is well substantiated. The role of the endocrines is first being appreciated (Schotté and coworkers). Adrenal tissue from the newt, *Triturus* (*Diemictylus*) *viridescens*, was transplanted to recently metamorphosed *Rana pipiens*. A few days after transplantation the forelimb of the frog was amputated below the wrist. Control limbs exhibited the usual lack of regeneration and resulted in limb stumps with typical connective tissue callus formation. The adrenal transplant series exhibited various degrees of regenerative responses. The epidermis migrated over the cut surface and was markedly thickened. Moreover, the dermis did not accompany the epidermis and therefore the epidermis was in contact with the underlying mound of accumulating mesenchymal cells. A significant amount of *de*differentiation occurred and several cases of histologically verified blastema formation were obtained. Regenerates that were allowed to develop further underwent a great deal of *re*differentiation after blastema formation. These regenerates were capable of reforming digits; although most of these regenerates were heteromorphic, they represent a regenerative capacity which is not normally found in post-metamorphic frogs.

A Preliminary Study on the Relationships Between the Vegetation of a Mesic Hammock Community and a Sandhill Community

CARL D. MONK, *University of Florida*

The presence of periodic fires normally prohibit the invasion of hammock species into sandhill communities. The sandhill community involved in this study has been free of fire for 5 years and as a result the hammock community is beginning to encroach onto the sandhill community through the transition zone. It appears that the differential response of the species involved to fire, soil moisture, and light control the invasion of hammock species into sandhill communities.

A Preliminary Host Range Study of the Chytrid *Pringsheimiella**

J. THOMAS MULLINS, *University of Florida*

Couch (1939) described *Pringsheimiella* as an obligate endobiotic parasite on the Saprolegniaceae. However the only host indicated for it was *Achlya flagellata*. To determine whether or not *Pringsheimiella* is limited to *A. flagellata* a preliminary host range study within the Saprolegniaceae has been

carried out. It has been possible to parasitize isolates E2, E16, E28, J1, 141, 181, 182, and 290 of *A. flagellata;* isolates E4 and E22 of *A. americana;* isolate E15 of *A. conspicua;* and *Thraustotheca clavata.* Successful infection has not been obtained with isolates D1 and G1 of *A. flagellata; A. caroliniana; A. glomerata; Saprolegnia diclina; Dictyuchus* sp.; and *Isoachlya unispora.* It appears that *Pringsheimiella* can distinguish between certain isolates of *A. flagellata.* The reaction to parasitism by *Pringsheimiella* does not seem to add any additional evidence to show a more definite relationship among members of Coker's Prolifera group. From the reaction of *Thraustotheca* it would seem to be closer to *Achlya* than either *Saprolegnia* or *Dictyuchus.*

Strontium Replacement for Calcium in the Growth of Four Volvocalean Algae*

H. W. Nichols, W. R. Herndon and J. C. O'Kelley, *University of Alabama*

Stephanosphaera pluvialis, Haematococcus droebakensis, Gonium sociale, and *Pandorina morum* were grown in culture media in which ionic equivalents of strontium were substituted for calcium in a graded series and compared with sodium substituted controls. Growth of cultures was measured turbidimetrically and each culture was studied microscopically to determine effects of the substitution upon the morphology of the organisms. The results of these experiments may be summarized as follows: (1) Strontium substituted, but only in part, for calcium in the growth of *Stephanosphaera, Gonium,* and *Haematococcus* whereas, under the same conditions, sodium did not substitute. (2) Growth of *Pandorina* was sustained when the calcium of the basal medium was replaced entirely by strontium although it was markedly reduced; in sodium substituted controls there was no measurable growth. (3) In each of the organisms a loss of motility was evident at one or more levels of calcium concentration when strontium was substituted for calcium in the basal medium. (4) Numerous morphological peculiarities were found among the cells and colonies of the cultures in which strontium had been substituted for calcium in the culture medium. Among these, an apparent loss, or an extreme reduction in extent of the gelatinous sheath was observed in *Pandorina.*

Permission to use the facilities for culture of algae provided by the University of Alabama Research Committee for Project Number 333 is gratefully acknowledged.

Aceto-carmine Staining of Nuclear Bodies in *Oscillatoria*

D. E. Norby, *Virginia Polytechnic Institute*

The nuclear material of *Oscillatoria* and other Cyanophyceae stains readily after overnight fixation in Johansen's *Volvox* fixative. For permanent preparations, G. B. Wilson's Venetian turpentine technique has proven satisfactory. This provides a simple method for classroom demonstrations and for investigations of the division cycle.

Ovoviviparity in the Monogenetic Trematode *Polystomoidella oblonga**

Larry C. Oglesby, *Florida State University*

Thirty adult specimens of *Polystomoidella oblonga* (Trematoda: Monogenea) were recovered from the urinary bladder of the stink turtle *Sternotherus odoratus.* Seventeen carried, *in utero,* immature individuals in various stages of development from gyrodactyloid larvae to juveniles with opisthaptors and digestive systems characteristic of adults as well as rather well developed reproductive organs. An empty egg shell was also present within each parental uterus. Non-ciliated gyrodactyloid larvae hatch and develop to an advanced stage *in utero,* and are released as fully formed, though sexually immature, adults. Ovoviviparity, which apparently has not been recorded before in the Monogenea, makes possible the completion of the life cycle of *Polystomoidella oblonga* within the bladder of the turtle, with no obligate free-living stage.

This work was done during the tenure of a National Science Foundation Cooperative Fellowship.

Changes in Development of *Protosiphon botryoides* (Kütz) Klebs in Culture Upon Replacement of Calcium with Strontium*

J. C. O'Kelley, W. R. Herndon and R. E. Daniel, *University of Alabama*

Protosiphon has a calcium requirement of more than trace magnitude; growth occurs when strontium, but neither barium nor any one of 5 monovalent nor of 4 other divalent cations, is substituted for calcium. The replacement of calcium by strontium gives rise to only slightly decreased amounts of growth, but is responsible for significant morphological changes in liquid cultures. Sacs form in strontium, but do not develop in length to as great an extent as do those formed in calcium cultures of equivalent age. Cells in general are larger and fewer in number in strontium, however, and cultures have a higher proportion of vacuolated cells than cultures in calcium. Wet and dry weight determinations reveal, as expected from direct microscopic observation, that the water content of the alga grown in strontium is higher than that of the alga in calcium. In strontium, cells possess relatively dark green chloroplasts in comparison to those in calcium. The most striking change, however, is the loss of zoospore production when calcium is replaced by strontium; aplanospores are produced instead.

Permission to use the facilities for culture of algae provided by the University of Alabama Research Committee for Project Number 333 is gratefully acknowledged.

Interrelation Between Triiodothyronine and Adrenaline in Regulation of Oxygen Consumption*[1]

Kenneth Ottis, *Auburn University*

A total of 80 sixty-day-old white rats of the Holtzman strain were used in this investigation. After acclimatization in air-conditioned quarters, 60 were thyroidectomized and placed on one per cent calcium gluconate drinking fluid for the two-week convalescent period. The operated animals were then grouped and treated daily as follows: Group I received no T_3, Group II received 5 *ug.* of T_3, and Group III received 10 *ug.* of T_3. Group IV was composed of the twenty unoperated, control animals.

After fifteen days of treatment, oxygen consumption rates were determined by a standard accepted technique. Determinations were run at regularly stated intervals as follows: A pre-adrenaline control determination, at twenty minutes post-adrena-

line, at seventy minutes post-adrenaline, followed by determinations at hourly intervals thereafter for three hours.

Results: The untreated-thyroidectomized group showed no increase in oxygen consumption post adrenaline. In ascending order, the intact-control group, the 5 *ug.* group and the 10 *ug.* group showed increased response to adrenaline in that order.

Effects of Radiation on the Ecology of *Pinus taeda**

ROBERT A. PEDIGO, *Emory University*

A study on the effects of ionizing radiation on *Pinus taeda* was begun in June of 1959 as part of Emory University's radiation research program at the Lockheed Aircraft Corporation reactor site near Dawsonville, Georgia. Obvious morphological effects have occurred after exposure to approximately 10,000 rem of combined gamma and neutron radiation while doses of about 25,000 rem apparently cause death. Morphological effects in the reactor radiation field are being mapped at three month intervals. Early results with experimental seedlings grown in a known soil and under semicontrolled environmental conditions indicate that physiology is disrupted and that irradiated plants develop more slowly. Survival of seedlings exposed to Co^{60} gamma radiation during the cotyledon stage of development has been better than that for seedlings one to several years old exposed to mixed gamma and neutron radiation from the reactor. However, radiation from the reactor is equilibrated to Co^{60} radiation by using an RBE of 10 for neutrons. Since a broad spectrum of neutrons is present in the reactor field, this may be an inherent error in calculating dosages for pine. Finally, differential effects on *Pinus taeda* and its usual ecological associates when exposed to chronic radiation suggest that the role of pine in secondary succession may be changed.

A Growth Response by Two Sedges Inhabiting a Radiation Field*

GAYTHER L. PLUMMER, *University of Georgia*

Carex Frankii and *C. vulpinoidea* are associated on White Oak Lake bed on the reservation at the Oak Ridge National Laboratory. They occur on sites having gamma radiation fields of 40, 20, 10, and 0 mr/hr. The lengths of the pistillate flowering structures were measured and the data were treated statistically for the purpose of using these features as indicators of a growth response to site quality and to radiation.

Lengths varied with dose rate but these appear to be independent of the radiation and more closely associated with other soil factors. Each sedge responds differently under similar moisture conditions, fertility, and soil reaction.

Observations suggest that these pioneers may not show obvious biological disturbances before they are replaced by succeeding species.

Studies on the Distribution and Life History of Two Species of *Lesquerella* (Cruciferae)

ELSIE QUARTERMAN, *Vanderbilt University*

Lesquerella Lescurii (A. Gray) S. Wats. and *L. densipila* Rollins, both endemic to the Central Basin of Tennessee, are apparently young species that originated allopatrically and have remained so until the recent past (Rollins 1957). *Lesquerella densipila* has migrated into the margin of the range of *L. Lescurii*, and there is evidence that *L. Lescurii* may be migrating out of the Basin. In an effort to clarify this situation, careful records are being kept of the location of *L. Lescurii* populations at the margin of the species' range. Special attention has been given, in the life history studies, to conditions necessary for seed dispersal and germination. The relationship of these factors to possible migration is reported.

Geographical Affinities of the Southern Appalachian High Mountain Flora*

GEORGE S. RAMSEUR, *The University of the South*

In the southern Appalachians there are ten isolated mountain areas which extend to elevations above 5500 feet. A catalog of vascular plants was compiled from collections made throughout the region in 1956 and 1957. By using manuals, floras, and other taxonomic literature the range of each species was established and plotted. The flora is represented by the following geographical range patterns: 1. Southern Appalachian species, 2. Appalachian species, 3. Northern species which extend southward only along the mountains, 4. Northern species near their southern limit, 5. Southern species near their northern limit, 6. Species wide-spread through eastern North America, and 7. Introduced species. The climax community of the region is the spruce-fir (*Picea rubens* Sarg.— *Abies fraseri* (Pursh) Poir.) forest, but most of it has been destroyed by logging and fire. The disturbed areas are now dominated by fire cherry (*Prunus pensylvanica* L.f.). A small percentage of the total area is occupied by several anomalous communities including: grass bald, heath bald, shrub bald, and beech forest. Most of the dominant species of the major communities belong to the group of plants with Northern ranges extending southward only along the mountains.

The Respiratory Properties of Chiton Hemocyanins*

JAMES R. REDMOND, *University of Florida*

At the present the only published information concerning the blood respiratory pigments of chitons consists of a measurement of the sedimentation rate of the blood protein of *Tonicella* (Svedberg and Pedersen, 1940) and an oxygen dissociation curve for the hemocyanin of *Cryptochiton stelleri* (Manwell, 1958). The present studies, carried out at the Zoology Department of the University College of the West Indies, Jamaica, and the Univ. of Washington Friday Harbor Laboratories, confirm hemocyanin as the blood respiratory pigment of chitons, describe certain of the characteristics of this material from four species of chitons, and comment on its function. Oxygen dissociation curves showed these pigments to have relatively high half saturation pressures. The effect of pH on the dissociation curve varied with the species, examples of both normal and inverse Bohr effects being found. Observations on the magnitude of the Bohr effect, the oxygen capacities of the bloods, and the habitats of the animals indicate that the Bohr effect is probably not of significance in gas exchange. It is further suggested that the principal role of the hemocyanins of most animals is not that of increas-

ing the oxygen capacity of the blood, but rather is a means of maintaining a high oxygen diffusion gradient across the gills.

Supported by research grant RG-5080 from the National Institutes of Health, U.S.P.H.S.

Aspects of Melanism in *Gambusia affinis* (Baird and Girard)*

JAMES D. REGAN, *Florida State University*

Melanistic individuals occasionally occur in collections of the top-minnow, *Gambusia affinis* (Baird and Girard). This condition is apparently confined to males of the species. Normally-pigmented *Gambusia* have scale melanophores in the epidermis and stellate micromelanophores in the dermis. In addition to these, melanistic *Gambusia* have dermal macromelanophores which are approximately twice the size of the micromelanophores and which have a different morphology. The degree of melanism varies greatly; specimens having only six macromelanophores, and others almost totally black have been collected. Collections totaling 3002 fish from three localities in southern Florida contained significantly different percentages of melanistic individuals among the mature males. In an area where approximately 7% of the mature males were melanistic, 153 females were collected and treated with 17-methyl testosterone for 12 days. 139 showed some degree of anal fin differentiation, indicating action of the hormone, but none showed any pigmentary changes. Two matings of melanistic males with normal females produced six F_1 males which were reared to sexual maturity. All were normally-pigmented. These results do not necessarily nullify a genetic hypothesis of holandric inheritance for melanism as ecological conditions, particularly temperature, may possibly affect expression of the melanistic phenotype.

The Effects of the Alkaloid Drug Colchicine upon the Alga, *Chlorella pyrenoidosa*

ALAN REX, *Virginia Polytechnic Institute*

Randomly growing cells of the green alga, *Chlorella pyrenoidosa* were grown in liquid modified Meyer's media containing colchicine in concentrations of 2.0%, 1.0%, 0.5%, 0.1% and 0.0%. It was found that colchicine in concentrations greater than 0.1% exhibited increasing degrees of inhibition to the normal logarithmic growth function of randomly growing *C. pyrenoidosa*. In the cultures treated with 2.0% colchicine nearly all the cells observed were as large as mature mother cells in the non-colchicine treated controls. Many of the cells observed in the 2.0% group had no crosswall formation. Division figures similar to the colchicine-metaphase types, demonstrated in other organisms, were observed. Current investigations using synchronized cells of *C. pyrenoidosa* are designed to determine the time of action of colchicine in respect to nuclear division, and to determine its effect on various metabolic systems.

The Nature of the Species, *Pachysandra procumbens* (Buxaceae)

HERBERT C. ROBBINS, *Vanderbilt University*

As one phase of the revisional study of the genus *Pachysandra*, a detailed study has been made of the single American species, *Pachysandra procumbens* Michx. Information concerning the distribution, biology, cytology and reproductive behavior of this species is presented.

The Use of Tetrazolium Chloride on Barley Meristems*

PATRICIA SARVELLA, *Mississippi State University* and *Washington State University*

Tetrazolium chloride is a vital stain and is reduced by living tissues to a red color. It has been used on dissected barley primordia to determine whether the apical and axillary buds were alive after irradiation. In the presence of living tissue the buds which stained red were assumed to be alive whereas the white buds were assumed dead. The seedlings were grown for 16 days under continuous fluorescent lights. Hoagland's nutrient solution was added to the water to insure continuous growth. All leaves were removed from the axillary buds and apical meristems. The meristems were then put into the stain at 40°C and remained for a minimum of 15 minutes. The most effective stain was a 0.1% solution of tri-phenyl tetrazolium chloride. The buds were then observed under a dissecting microscope and scored for coloration.

Mechanism of Nitrogen Narcosis*

D. F. SEARS, *Tulane University*

Nitrogen narcosis has been demonstrated in man, in animals and in spinal preparations of animals. The synapse seems to be the sensitive site. Synaptic transmission represents movement of electrolytes or other water-soluble materials across a water continuous junction. G. H. A. Clowes showed chemically inactive narcotics would reverse emulsions of oil dispersed in water to make the oil phase continuous. A similarity exists between emulsions and synapses; both contain lipid-water interfaces. It is the action of the narcotic at such interfaces which reverses emulsions. This same action may produce a decrease in water content of synaptic membranes and decrease movement of ions and water soluble materials necessary for synaptic transmission. We measured resistance to flow of an electrical current through emulsions subjected to high pressure of nitrogen, argon, and helium. Resistance increases as the oil phase of the emulsion becomes continuous. Resistance to electric current increased due to pressures of nitrogen and argon, but not helium. Narcosis results from pressures of nitrogen and argon, but not helium. The striking parallel suggests that it is this interfacial activity of nitrogen which causes narcosis.

Some Preliminary Studies Contributing to the Cyto-Taxonomic Investigation of the Genus *Schoenolirion* (Liliaceae)

HARRY L. SHERMAN, *Vanderbilt University*

The genus *Schoenolirion* (*Oxytria*) consists of five taxonomic species of local occurrence. Three of the species are represented on the Atlantic and Gulf Coastal Plain, one of which also occurs in adjacent provinces. The other two species are endemic to northern California and southern Oregon, where they occur in bogs. Preliminary work includes a study of the mitotic chromosome morphology of *S. croceum* (Michx.) Gray, utilizing 8-Hydroxyquinoline treatment of root-tips.

Influence of Nerves in Lizard Regeneration*

S. B. Simpson, Jr., *Tulane University*

The spinal cord of the brown skink, *Lygosoma laterale*, was deviated from the tail into the rear limb. This was done on the assumption that the nerve fibers of the spinal cord would augment the normal nerve supply of the limb, and by doing so, induce the limb to regenerate. In those cases where the deviated cord retained its integrity and actually increased the nerve complement of the limb, a limited regenerative response occurred. These results give added support to the importance of nerves in regeneration.

The influence of the spinal cord on tail regeneration was also studied. It was found that if the spinal cord was removed from the terminal portion of an amputated tail, no regeneration occurred. Also, if the spinal cord was deflected and positioned beneath a dorsal wound, heteromorphic tails regenerated from the dorsal surface of the tail.

Foliar Origin and Development of *Tropaeolum Majus* L. var. Golden Gleam

Jean L. Smith, *Florida State University*

An anatomic comparison of embryonic juvenile leaves is made with mature adult leaves of *Tropaeolum majus* L. var. Golden Gleam. Origin of the leaves within the shoot apex is considered as well as the ontogeny of the leaf primordia. Stipules, which occur only with the juvenile leaves, are included in this foliar analysis.

Ascorbic Acid Metabolism and the Adrenal Glands*

Don W. Stubbs and Kenneth Ottis, *Auburn University*

The effects of thiamine deficiency on the ascorbic acid content of the adrenals, livers, and kidneys of rats were studied. The rats were separated into two groups. The experimental group was fed, ad libitum, a diet deficient in vitamins B_1 and C. The controls were pair-fed on a complete diet. The experimental animals and their controls were periodically sacrificed and comparisons of the ascorbic acid contents of their adrenals, livers, and kidneys made. The livers and kidneys of the experimental rats showed a great initial decrease in ascorbic acid while that of the adrenals was only moderate. A close correspondence between the changes in renal and hepatic ascorbic acid was found.

It was concluded that both the adrenals and the kidneys depend upon the ability of the liver to synthesize and supply ascorbic acid. The adrenals appear to be superior to the kidneys in their ability to accumulate the vitamin. While thiamine appears to exert some influence on the ability of the liver to synthesize and supply ascorbic acid, the vitamin does not seem to play an essential role in this respect.

The Stimuli for the Start of the Reproductive Season in Juncos

James T. Tanner, *University of Tennessee*

Juncos (*Junco hyemalis*) nesting in the Great Smoky Mountains begin reproduction later at the higher and colder elevations compared with the lower elevations. Over fifty first-egg dates from nests at different elevations were obtained and these data were used to determine the sensitivity of the egg-laying process to environmental temperature. Several hypotheses have been proposed for the mechanism of this sensitivity. One of these is that higher temperatures stimulate singing and courtship by the male Junco, and that these activities are the direct stimuli which determine the first-egg date. A test of this hypothesis was made; the results did not support the hypothesis.

The Preservation of Experimental Neoplasms by a Frozen-Tissue Bank at −78° C

J. Richard Thomson and Daniel R. Farnell, *Southern Research Institute, Birmingham, Alabama*

Certain risks are inevitable when employing serially-transplanted experimental neoplasms in screening compounds for anticancer activity. These risks include infections by viruses or bacteria, cross-contamination by other cell strains, genetic drift, stromal tissue invasion, and accidental loss by faulty or careless scheduling. For a long-term screening program to be effective, the work done at any specified time should be comparable to similar work performed several years earlier. A frozen-tumor bank which, in effect, "stops time" for these particular cells can be used to considerable advantage in this type of research. A possible disadvantage might be an artificial selection of cold-resistant cells.

Using a method developed by Hauschka, et al., (Cancer Research 19 p. 643, 1959), we have frozen some thirty-five neoplasms of mice, rats, and hamsters. Selected tumor fragments were frozen in sealed glass ampules with 9-10% glycerol at a rate of 0.5-1.0° C/min. At intervals, samples were rapidly thawed to 37° C and transplanted to the proper host animal. Data will be presented to show the spectrum of tumors and leukemias employed, length of time in the frozen state, and viability results. The biological implication and significance will be discussed.

The Action of Thyroxine on Mitochondria of the Liver of the Albino Rat

Samuel R. Tipton, *University of Tennessee*

The enzymes, succinic dehydrogenase, glutamic dehydrogenase, and cytochrome oxidase, which are localized in the mitochondria, showed a greater activity in the mitochondrial fraction isolated from the liver of thyroidectomized rats that were treated with thyroid powder, or thyroxine, than that from untreated animals. The increase was significant on the basis of mg. dry weight, per mg. nitrogen, or per million mitochondria. Mitochondria isolated from regenerating liver within 48 hours after partial hepatectomy, were more sensitive to thyroxine than were those from the livers of control animals. Other changes indicating a change in properties of the mitochondria during regeneration are presented. (Supported in part by NSF Grant No. 8969.)

Genetic Analysis of Variant Pigmentary Patterns in the Leopard Frog, *Rana pipiens**

E. Peter Volpe, *Newcomb College of Tulane University*

Two pattern variants, kandiyohi and burnsi, are simple dominants to the common leopard frog, *Rana pipiens*, but lack dominance with respect to each other. Hitherto, the double dominant frog, designated "mottled burnsi", had been recovered only from laboratory cultures; it apparently had eluded naturalists in the past. The query as to whether the kandiyohi and burnsi genes arose as mutations at the same locus or at different loci would be answered by appropriate matings utilizing the "mottled burnsi" frog. The recent uncovering of two "mottled burnsi" adult frogs in nature and subsequent test-crossings to wild-type, recessive *pipiens* frogs revealed that the mutant genes do not constitute a multiple allelic series. The kandiyohi and burnsi genes are located at different loci, but independent assortment of the mutant loci has not been unequivocably demonstrated. Widely separated loci on the same chromosome (hypothetical linkage of 46%) would simulate independent assortment.

Cortisone and Resistance to Infection with *Hymenolepis nana**

Clarence J. Weinmann, *University of Florida*

Cortisone acetate, administered daily for one week in 0.5 - 1.0 mgm. dosages, depressed the natural resistance of mice to *H. nana* as measured by percentage development of 92-94 hour cysticercoids following egg infection. Daily hormone treatment for two and three weeks before infection resulted in a degree of recovery of natural resistance to this parasite.

Cortisone treatment for a week prior to an immunizing egg infection did not appear to influence the development of acquired resistance to challenge egg infections administered six days after immunization since parasites failed to complete larval development in immunized mice, whether or not treated with hormone. When cortisone was administered during the period of active immunization (i.e., first six days of infection), the degree of acquired resistance to reinfection on the last day of treatment was reduced although a heightened resistance was still evident. With an interval of eight days between an immunizing egg infection and the initiation of cortisone administration (daily for one week), the majority of hormone-treated mice suffered massive reinfection when challenged on the last day of treatment. Reinfection is believed to have been abetted by auto-infection.

Radiobiology of *Tetrahymena pyriformis*

Carolyn Wells, *Biology Division, Oak Ridge National Laboratory*

It is well known that the sensitivity of organisms to the lethal action of ionizing radiation varies from species to species. Some intraspecific strain differences in radiosensitivity have been reported. The following experiments have shown that such radiosensitivity differences also occur among strains of the holotrich, *Tetrahymena pyriformis*. Several micronucleate strains of this ciliate were X-irradiated with doses ranging from 48 to 380 kr, at a rate of 9.5 ± 0.4 kr/minute. Immediately after treatment, numerous single-cell isolations were made from irradiated and control populations into small petri dishes containing axenic medium. Survival was measured as the ability of such isolates to establish self-perpetuating clones.

It was found by this technique that, in some strains, more animals die than in other strains after a given X-ray dose. These strain-specific radiosensitivities are not correlative with either the ploidy of the micronucleus or the total DNA content of the strains. Radiation-induced micronuclear abnormalities were examined cytologically. Irradiated micronuclei, instead of being typically compact, were often enlarged spheres of intertwined strands. Micronuclear disorganization was frequently so severe that amicronucleate sister fission products occurred. However, amicronucleate clones were rarely found among the surviving fraction of at least some strains.

Current Effects and Growth of Freshwater Algae

L. A. Whitford, *North Carolina State College*

(No abstract submitted)

The Separation of Chloroplast Pigments by Countercurrent Distribution*

Frederick T. Wolf and John G. Coniglio, *Vanderbilt University*

Separations of chloroplast pigments are customarily made by partition between immiscible solvents, by paper chromatography, or by column chromatography. Lancaster *et al.* (J. Amer. Oil Chemists Soc. *27*: 386, 1950) effected a partial separation of a test mixture of chlorophyll *a*, chlorophyll *b*, and carotene with a 25-tube countercurrent distribution apparatus. In the present work, the chloroplast pigments from spinach were separated in a 100-tube machine, using 90 per cent aqueous ethanol and petroleum ether as the solvent system. After 100 transfers, upper layer was collected in a fraction collector, and the separations were continued to 310-425 transfers. In the petroleum ether layer were found two peaks corresponding to carotenes and chlorophyll *b*: in the ethanolic layer three peaks were separated, corresponding to chlorophyll *a* and two different xanthophyll components.

The Vertical Diel Migrations of a Cyclopoid in a Mississippi Lake

Robert A. Woodmansee, *Mississippi Southern College* and
Billy J. Grantham, *Mississippi Game and Fish Commission*

The vertical movements of *Mesocyclops edax* are described for a twenty-four hour period. A marked nocturnal increase in planktonic numbers is recorded for this species with the extent of the nocturnal increase varying with the sex and with the presence or absence of ovisacs. Two hypotheses have appeared in the literature to explain nocturnal increases in planktonic numbers: (1) that the animals see and evade the net or trap during the day and (2) that the animals are either benthic or hypoplanktonic during the day. Evidence is herein presented in support of the second hypothesis, which appears to be the more widely accepted one. An assumption of the second hypothesis requires a modification of the quartile curve method of illustrating diel vertical migrations.

Sporophyte Production in Antarctic Mosses

ELMER G. WORTHLEY, *Harvard University*

The extent of sporophyte production among various species of antarctic mosses will be discussed and the relative sporophyte production in mosses of certain temperate or warmer climates will be compared.

Reasons for the evolution of mosses with modified (or elimination of the) sporophyte stage seem to include: 1. Effect of terrific winds. 2. Sandblasting effect of snow at low temperatures. 3. Destructive effects of pebbles, rock fragments and particles hurled about during storms.

The occurrence of these unfavorable conditions has served to aid in the direction of the disappearance of the sporophyte stage in the antarctic mosses.

Etheostoma okaloosae (Fowler), A Percid Fish Endemic in Northwest Florida*

RALPH W. YERGER, *Florida State University*

In 1941, Henry W. Fowler described a new darter, *Villora okaloosae*, from a single specimen collected near Niceville, Florida. Bailey, Winn, and Smith (1954, Proc. Acad. Nat. Sci. Phila., 106:109-164) subsequently placed this name in the synonomy of *Etheostoma swaini* (Jordan). Recent studies of seven series of 140 specimens establish the validity of *Etheostoma okaloosae*. It was correctly assigned to the subgenus *Villora*, which is characterized by an arched lateral line, and the replacement of the genital papilla in the female by a marginal ring of matted villi. In recent years *Villora* has been included as one of many subgenera in the expanded genus *Etheostoma*.

Etheostoma okaloosae is differentiated from *E. edwini* (Hubbs and Cannon), the only other member of the subgenus, by scale counts, markings, and coloration, most noticeably the absence of red spots over the body. It is restricted to several clear, sandy, moderately swift streams which empty into a bayou at the western end of Choctawhatchee Bay. The origin of this species probably dates from the late Pleistocene, at a period when sea level was lower than at present, and all of the streams presently inhabited by *E. okaloosae* were conjoined. Rising sea level during the recent interglacial stage has now divided the population in several isolated small streams.

(Research supported by National Science Foundation Grant G6260, and by the Research Council of the Florida State University.)

The Comparative Efficacy of Bephenium Hydroxynaphthoate and Tetrachloroethylene Against Hookworm and Other Parasites of Man

MARTIN D. YOUNG and GEOFFREY M. JEFFERY, *U. S. Public Health Service*

The hydroxynaphthoate salt of bephenium, one of a series of new quaternary ammonium compounds, was tested against worm infections in 168 mental patients. Tetrachloroethylene was tried 41 times for comparison. Bephenium was more effective than tetrachloroethylene against hookworm infections. Single doses of 5.0 grams of base daily for 3 to 5 consecutive days reduced heavy hookworm infections by 95 per cent or more, with about 55 per cent of the infections cured. Five gram doses for 1 or 2 days greatly reduced the hookworm burden but the cure rate was low. The drug was highly effective against *Ascaris lumbricoides*, curing 12 of 13 infections and reducing the overall egg count by over 99 per cent. Bephenium was also moderately effective against *Trichuris trichiura* infections. Dosages totaling 15 or more grams resulted in a substantial reduction in worm burden and produced some cures. Side effects, principally vomiting, occurred in about 7 per cent of the patients, but in only one patient was it necessary to discontinue treatment. When tetrachloroethylene was given in 3 or 4 cc. single doses hookworm burdens were reduced by 49 to 58 per cent; there was no significant reduction in 37 *T. trichiura* infections treated.

Autecological Studies on *Leavenworthia stylosa* (Cruciferae)

RHONA D. ZAGER, *Vanderbilt University*

Leavenworthia stylosa A. Gray, a winter annual in the family Cruciferae, is restricted to the cedar glade areas in the Central Basin of Tennessee. Certain aspects of the causes of its narrow endemism may now be reported. Field observations on the degree of restriction to specific habitats, analyses of certain habitat factors, and general life history studies have been carried out. Particular attention has been given to conditions required for germination, tolerance of mineral deficiencies, tolerance of moisture extremes, and competition in field and experimental situations.

THE PARTICIPATING SOCIETIES

(Continued from Page 20)

Southeastern Section, Botanical Society of America

President—Dr. Ruth S. Breen, Florida State University

Secretary—Dr. Joseph C. O'Kelley, University of Alabama

Activities Committee—Dr. Ernest S. Ford, University of Florida

Dr. Robert Godfrey, Florida State University

Dr. C. Ritchie Bell, University of North Carolina

Southern Appalachian Botanical Club

President—Dr. Donovan S. Correll, Texas Research Foundation

Vice-President—Dr. Erdman West, University of Florida

Secretary—Elizabeth Ann Bartholomew, West Virginia University

Treasurer—Roy B. Clarkson, West Virginia University

The participation in the Annual Meeting by the Society of General Physiologists is most welcome.

NEWS OF BIOLOGY IN THE SOUTHEAST

About People

Dr. Roland H. Alden, chief of the Division of Anatomy at the University of Tennessee Medical Units in Memphis since 1949, has been named to the newly created position of associate dean of the graduate school for medical sciences. Dr. Alden will begin his new duties January 1, retaining his position as chief of the division of anatomy. Dr. Alden will be taking over a portion of the duties performed by **Dr. T. P. Nash, Jr.,** dean of the School of Biological Sciences. Dr. Nash will continue in his position as dean of the School of Biological Sciences.

The following personnel changes are from the Biology Division, Oak Ridge National Laboratory:

Dr. Franco Celada, a United States Public Health Service Fellow, joined the Radiation Immunology Group in October. Dr. Celada received the M.D. degree from the University of Milan, Italy, in 1956, and since that time has served in the Italian Army. **Dr. Valerio C. Monesi,** also a United States Public Health Service Fellow, has joined the Mammalian Genetics and Development Section. Dr. Monesi received the M.D. degree from the University of Pavia, Italy, and comes to the Division from the National Division for Nuclear Researches, Frascati, Italy. **Charlotte R. Lea** is spending this year with the Enzymology Group as a Research Associate. Miss Lea expects to receive the Ph.D. in Biochemistry from Emory University in December. **Dr. Gustavo Cudkowicz,** under a grant from the International Cooperation Administration, has joined the Pathology and Physiology Section for a period of one year. Dr. Cudkowicz received his M.D. from the Medical School of the State University of Milan, Italy, in 1952, and comes to the Division from the National Cancer Institute and the Institute of Pharmacological Research in Milan. **Dr. Donald F. Parsons** has joined the Pathology and Physiology Section. Dr. Parsons received the Ph.D. in Physical Chemistry from Imperial College, London, England, and the M.D. from St. Bartholomew's Medical College, London. He comes to the Division from Duke University. **Dr. Otto Vos,** a Public Health Service Fellow, who has been associated with the Mammalian Recovery Section for the past year has left the Biology Division. Dr. Vos has returned to the Medical Biological Laboratory, Rijswijk, The Netherlands. **Dr. Johan Harrie Stuy** has completed a year of research in the Radiation Protection - Living Cells Section and left the Division to go to Yale University, New Haven, Connecticut. Dr. Stuy will be affiliated with the Biophysics Department at Yale. **Dr. Udo H. Ehling,** a Public Health Service Fellow, has joined the Pathology and Physiology Section. Dr. Ehling received the Ph.D. in Zoology from the Free University of Berlin, Germany, and for the past four years has been associated with the Max Planck Institut fur Vergleichende Erbbiologie und Erbpathologie, Berlin-Dahlem, Germany. **Dr. Menachem B. Lion,** who received the Ph.D. in Organic Chemistry from the Hebrew University, Jerusalem, Israel, in June, 1959, will be associated with the Mammalian Recovery Group for the coming year.

Dr. Wm. C. Sloan, Instructor in Biology, leaves Vanderbilt University in January to accept a 12-month research Post-Doctoral Fellowship from the National Institutes of Health. He will be located at the University of California, Berkeley, where he will carry out an investigation of the end-products of nitrogen metabolism in terrestrial invertebrates.

Dr. J. J. Friauf represented Vanderbilt University at the Darwin Centennial Celebration in Chicago, November 24-27.

Dr. Zane B. Carothers, formerly Instructor in the Department of Botany at the University of Kentucky, has resigned to accept an Assistant Professorship at the University of Illinois. **Mr. John C. Warden,** formerly a graduate student at the University of Chicago, has been appointed Instructor in Botany.

Drs. Herbert P. Riley and **Dale M. Smith** of the Department of Botany of the University of Kentucky, attended and presented papers at the IX International Botanical Congress in Montreal in August, 1959.

Mr. T. R. Bryant has received a National Science Cooperative Fellowship and is carrying out his work in the Department of Botany of the University of Kentucky.

Birmingham Southern College has two new Associate Professors in the Department of Biology. **Dr. William R. Montgomery,** a parasitologist with a Ph.D. degree from the University of Nebraska, came from Morningside College, Sioux City, Iowa; **Dr. Alvin A. Peters,** who holds a Doctor of Science degree from Munich, is a bacteriologist and comes from Texas A. and M. College.

At Howard College the Department of Biology has added **Miss Lynn Raulerson** as Instructor in Biology. Miss Raulerson comes to the College on the completion of her Master's degree at Emory University in Atlanta. Her field is in Vertebrate Ecology.

Dr. Herbert A. McCullough, Head of the Department of Biology at Howard College, has recently been appointed Coordinator of the North Central Alabama Regional Science Fair. He was also recently elected Chairman of the Alabama Council of Conservation.

Dr. G. M. Jeffery, Public Health Service, Columbia, S. C., received the Bailey K. Ashford Award at the annual meeting of the American Society of Tropical Medicine and Hygiene in Indianapolis on October 30. The award is provided bi-annually by the Eli Lilly Company and is for research in tropical diseases.

Dr. Paul C. Beaver, Professor of Tropical Diseases and Hygiene at the Tulane University School of Medicine, has been named Editor of the American Journal of Tropical Medicine and Hygiene. Dr. Beaver succeeds **Dr. Martin D. Young,** who has been acting as Editor pro tem.

Dr. Hans Gaffron, University of Chicago, has been appointed as Research Professor of Plant Physiology and Biochemistry at Florida State University. **Dr. Norman I. Bishop,** also of the University of Chicago, joins the faculty as assistant professor of Botany and research associate with Dr. Gaffron in their work on photosynthesis.

Dr. Sidney Fox of the Oceanographic Institute of Florida State University spoke on "How Did Life Begin?" in the General Symposium of AAAS on Moving Frontiers of Science at Chicago on December 26. Dr. Fox was also invited to speak

on "Self-Organizing Phenomena and the First Life" at the symposium on Synthesis of Organization sponsored by the Society for General Systems Research to be held during the same week.

Dr. Sidney Fox was an invited speaker in September at the AIBS symposium on Embryology and Evolution, and at the International Oceanographic Congress in New York.

Dr. A. M. Winchester, head of the Department of Biology at Stetson University, has been asked to serve on an NSF panel for the evaluation of research proposals.

Dr. Henry Stevenson, Department of Biological Sciences, Florida State University, has been granted a Faculty Summer Research Appointment to continue his studies on bird migration problems.

Dr. Fred S. Orcutt, acting head of the Biology Department at Virginia Polytechnic Institute, was appointed head of the department effective January 1, 1960.

The following items were received from the Department of Botany, University of Florida: **Dr. Alan Conger** recently spent a week in Puerto Rico taking part in a symposium on the comparative effects of various kinds of radiation; **Dr. R. D. Powell** has been elected secretary of the Southern Section of the American Society of Plant Pathologists; **Dr. W. M. Dugger, Jr.,** has accepted a position as Research Physiologist at the Riverside Experiment Station of the University of California; **Mr. Ted Holmsen** has been awarded the $5,000.00 General Biological Supply House scholarship for 1960-61. He recently was awarded one of the two prizes given to graduate students for presenting a Meritorious Paper before the American Society of Plant Physiologists at Birmingham, Alabama.

An addition to the staff of the Department of Biology, University of Alabama, is **Assistant Professor William C. Guest,** cytogeneticist, from the University of Texas.

Dr. C. Ritchie Bell, University of North Carolina, is the Secretary of the American Society of Plant Taxonomists for 1960.

Institutions and Organizations

A Symposium on Eastern Equine Encephalomyelitis was held at the **University of Maryland** in College Park on November 18, 1959. This meeting was under the auspices of the Departments of Entomology and Veterinary Science of the College of Agriculture and the Department of Medicine of the School of Medicine. Discussions dealt with infection in vertebrates, laboratory diagnosis, epidemiology, experimental studies and prophylaxis and control. More than 200 biologists attended.

The National Science Foundation has recently approved support of a proposal of the **American Institute of Biological Sciences** for a program of Foreign Visiting Lecturers in Biology. This proposal was suggested by the success of the AIBS program of visiting biologists to liberal arts colleges and smaller universities established over three years ago. This program has recently been extended to secondary schools, and now will be enlarged to include foreign lecturers. The operation of this new program will follow essentially that of the college program but will begin on a somewhat smaller scale until experience necessary for future successful full scale operation is acquired. The AIBS will schedule speakers and will handle all travel arrangements. A small panel of speakers will be initially selected from suggestions of the various societies representing the biological sciences; these selections will be made by the AIBS Committee on Education and Professional Recruitment, which meets in Chicago on December 29, 1959. Details of the program and inquiries concerning the availability of the lecturers can be obtained from Dr. Robert S. Leisner, Director of Educational Activities, AIBS, 2000 P Street, N.W., Washington 6, D. C.

The Department of Botany, **University of Florida,** is now authorized to conduct programs of study leading to the Ph.D. degree. The Department has been awarded four graduate fellowships by the Department of Health, Education and Welfare which are to be made available to doctoral candidates.

The Florida Academy of Sciences held their Annual Meeting at Florida Southern College, Feb. 18-20.

Florida Southern College has completed work on their Planetarium and will soon open it for public visitation.

The Department of Botany of the **University of Tennessee** announces that the Tenth Annual Spring Wildflower Pilgrimage will be held in the Great Smoky Mountains at Gatlinburg, Tennessee, April 28-30. Wildflower and fern hikes, bird walks, and motorcades led by competent botanists and naturalists, and illustrated lectures are available to the public. Those wishing further information should write to Dept. W. P., P. O. Box 208, Gatlinburg.

On February 1-3 the **Southern Section of the American Society of Plant Physiologists** met with the **Association of Southern Agricultural Workers** at Birmingham, Alabama. Two symposia were held: "Physiological Genetics" and "The Chemical Control of Plant Growth". Newly elected officers are: Chairman — **Dr. Robert E. Burns,** U.S.D.A.; Vice-Chairman — **Dr. Howard E. Joham,** Texas Experiment Station; Secretary-Treasurer — **Dr. Robert D. Powell,** University of Florida; Executive Committee — **Dr. Howard Teas,** University of Florida; **Dr. Aubrey Naylor,** Duke University; **Dr. Wayne C. Hall,** Texas Experiment Station.

A School of Applied Biology has been established at **Georgia Institute of Technology,** Atlanta. **Dr. Robert S. Ingols,** who has headed the Biology Department for the past several years has been named director of the new school. Beginning with the 1960 fall quarter the School will offer work toward a degree of Bachelor of Science in Applied Biology.

The **A.I.B.S.** has announced the establishment of the Biology News Bureau as a new activity to serve biologists and professional organizations in the biological sciences. This Bureau has the assignment of smoothing the flow of information between the biological professions and the public and has offices at AIBS headquarters, 2000 P St., N.W., Washington 6, D. C.

Grants in Aid

Dr. A. E. Harrises of Mississippi Southern College has received a grant of $3,710 from the **National Institutes of Health** to study the freshwater Tetraonchinae (Monogenea) of southern Mississippi.

Dr. Herbert P. Riley, Head of the Department of Botany of the University of Kentucky, has received a two-year grant of $13,600 from the **National Science Foundation** to study species of South

African plants by the method of paper chromatography.

Dr. R. B. Channell has been awarded a grant of $18,000 from the **National Science Foundation** for a taxonomic revision of the Eurhynchospora portion of the genus **Rhynchospora** (Cyperaceae). This project will cover a three-year period.

Drs. R. J. and **Ruth Neff** recently received a research grant of $50,000 from the **National Institutes of Health** for a three-year study of nuclear functions and growth synchrony in amoeba.

Dr. J. Orvin Mundt of the University of Tennessee Bacteriology Department has been awarded a $5,500 **National Science Foundation** grant to continue studies on streptococci. Recent studies by Dr. Mundt have shown that the Group D streptococci do not necessarily indicate the pollution of food, and future studies will deal with the distribution of these organisms under natural conditions.

Dr. R. Winston Menzel of the Oceanographic Institute, Florida State University, has received a three-year grant from the **Public Health Service** for a total of $19,952.00 to work on the control of **Dermocystidium** disease in oysters.

The **Florida State University** has been awarded a grant by the **National Science Foundation** and the **Atomic Energy Commission** for a Summer Institute in Radiation Biology for the summer of 1960. Participants will be selected from among the high school and junior and senior college teachers in the Southeast. Two four-week courses will be given—one in Radiation Science and the other in Radiation Biology. Students will be expected to take both courses, which will be conducted by the Department of Biological Sciences. A brochure will be distributed throughout the southeast soon. Additional information may be obtained from the Director, Dr. Charles Edington, Department of Biological Sciences, Florida State University.

Dr. Burton J. Bogitsh, Associate Professor of Biology at Georgia Southern College, has received a grant of $2,945 from the **National Institutes of Health** for studies on the nature of an acanthocephalan cyst in fishes.

Florida State University has been granted an award of 3 million dollars over a period of 5-7 years by the **Atomic Energy Commission.** This award will support a program in the development of biophysics sponsored jointly by the Departments of Biological Sciences and Chemistry.

Dr. B. T. Cole, Louisiana State University, has received a grant of $2,300 from the **National Institutes of Health** for continuing work on the characteristics of impulse formation in the aortic depressor nerve of rabbits.

Dr. Yoneo Sagawa, Department of Botany, University of Florida, recently received a grant from the **American Orchid Society** for the investigation of basic problems in the Orchidaceae. In connection with this project, **Dr. Dorothy Niimoto** has joined the Department as a post-doctoral fellow. In this same Department, **Dr. Carl Monk** has received a grant from the **National Science Foundation** for a study of radial tree growth.

The Department of Biological Sciences of **Florida State University** has received a grant of $40,000 from the **National Science Foundation** for the purchase of an electron microscope. This instrument will be housed in the Conradi (Biology) Building in space already prepared and should be in operation by the fall of 1960.

The **National Science Foundation** has granted $8,530 to the **Louisiana State University** to enable 40 high school students to attend the Gulf Coast Research Laboratory at Ocean Springs, Mississippi. High school teachers in Mississippi, Louisiana, Alabama, and Arkansas whose students might be interested should contact **Dr. Harry J. Bennett,** Zoology Department, L. S. U., Baton Rouge.

The **National Science Foundation** has granted the **University of North Carolina** a three-week summer Botany Conference for College Teachers of General Botany and General Biology. The Conference will be held in Chapel Hill, August 1-19. A brochure of information about the Conference and application forms may be secured from the Director, **Dr. Victor A. Greulach,** Box 1268, Chapel Hill, N. C.

National Science Foundation grants to staff members of the Biology Department, **University of Florida** include: $29,000 for a 3-year continuation of studies on the green turtle by **Dr. Archie F. Carr;** $9,000 to **Dr. R. M. DeWitt** to study metabolism of clams during drought and starvation; and $12,000 for a 2-year period to **Dr. John D. Kilby** to study the genetics of melanism in gambusid fish. From the **National Institutes of Health, Dr. G. W. Hunter, III,** received a grant of $23,000 to continue his work on schistosomiasis.

State of the BULLETIN

Members will note a new high in number of pages for a single issue of the BULLETIN in the April issue. This, of course, is due to the enthusiastic response to the call for papers for the Annual Meeting and the resulting larger requirements for space for abstracts and program.

The Editor would like to call to the attention of members a ruling of the Executive Committee which eliminates from the BULLETIN mailing list all members delinquent in dues at the close of the Annual Meeting each year. This ruling has resulted in a considerable saving to the Association and has avoided, for the present at least, another increase in the number of copies printed.

One of the thorniest problems of the Secretary and the Editor is in keeping up with the changes of address of members. The 10 to 20 copies which are returned each mailing not only produce a tripling of mailing costs, but also a doubling of the time consumed in all other mailing procedures. It would be of considerable help if individuals who move would promptly notify the Secretary of the new address. It would also be of help if institutions or departments, noting receipt of BULLETINS by departed personnel, would note the new address on the envelope prior to its return.

The Editor is, as ever, most grateful to the State Correspondents for their efforts in securing news for the BULLETIN. Many of these correspondents have served for extended periods, and, while it is the hope of the Editor that all will continue, it is quite understandable that some may wish to retire from this somewhat arduous and thankless task. The Editor would certainly welcome volunteers to fill these positions, or nominations by members of others who might be willing to serve. The Editor is always receptive to suggestions as to other methods of securing news which would work as well or better than that which we now have — especially a method which would be less of a chore to a small number of individuals.

The A.S.B. BULLETIN

Volume 7, Number 3 July, 1960

CONTENTS

The Official Quarterly Publication of
The Association of Southeastern Biologists

THE A.S.B. BULLETIN

The A.S.B. BULLETIN is the official quarterly publication of the Association of Southeastern Biologists and is published at Columbia, S. C., in January, April, July and October. Letters, news items, other contributions, and all communications about editorial matters should be addressed to the Editor, U.S.P.H.S., P. O. Box 717, Columbia, S. C. Changes of address should be sent promptly to the Secretary of the A.S.B., Dr. Harold J. Humm, Department of Botany, Duke University, Durham, N. C. Subscription orders from libraries and other institutions should be sent to the Business Manager, Dr. Elsie Quarterman, Department of Biology, Vanderbilt University, Nashville, Tenn. Subscription rate for non-members of A.S.B.: $2.00 per year. Printing and typography by the Cary Printing Co., Columbia, S. C.

GEOFFREY M. JEFFERY

ASSOCIATION AFFAIRS

President's Message

I enjoyed seeing so many A.S.B. members at the New Orleans meeting. Those of you who were not able to attend missed an unusually good meeting in an unusually interesting and pleasant environment. I hope that many of you who did not get to New Orleans will be able to join the many who did at our next meeting at the University of Kentucky in Lexington, April 20-22, 1961. We are anticipating another excellent meeting in pleasant surroundings. I want to take this opportunity to thank Father Mullahy and his Committee once more for the very good job they did in making arrangements for the meeting at Loyola.

As I take over the presidency of A.S.B. I hope that I shall be able to do as good a job as our presidents have done in the past, and I am pleased with the excellent group of officers and Executive Committee members who will be working with me during the year. We will be happy to have any suggestions any of you may have for the continued improvement of the Association and you can be sure that we shall give all suggestions serious consideration. In addition to submitting any suggestions or ideas you may have, you can help by sending news items and articles to the BULLETIN, by keeping the Secretary informed promptly of any address change, and by submitting nominations for new members, emeritus members and the Meritorious Teaching Award.

At present we are faced with three main problems: Securing tax exempt status as a non-profit scientific and educational organization; incorporating as a non-profit organization; and selecting a new editor for the A.S.B. Bulletin. The Executive Committee was very reluctant to accept Geoffrey M. Jeffery's resignation as editor since he has been doing such a fine job but felt it could not do otherwise since Dr. Jeffery will be on leave of absence outside the region. A new editor will be appointed by the Executive Committee within the next month or so and I hope that any of you who would be interested in the editorship will not hesitate to send your application to me. Or, if you know of another member who would make a good editor please write me about him.

Our efforts to secure tax exempt status are continuing and since we have adopted our new constitution we anticipate favorable action on our next application to the Internal Revenue Bureau. Professor M. S. Breckenridge of the University of North Carolina School of Law, a specialist in corporation and tax law, has agreed to assist the Association both in its efforts to secure tax exempt status and in incorporating. It appears that the process of incorporating will not involve any undue difficulty or expense.

I think we can look forward with confidence to the continued growth and improvement of our Association and trust that it will keep on meriting the compliment that has been paid by many members: that A.S.B. is a favorite among the various organizations in which they hold membership.

Victor A. Greulach

●

New Officers

Officers newly elected at the recent annual meeting are as follows:

President-Elect: Dr. Royal E. Shanks, University of Tennessee.

Vice-President: Dr. Walter S. Flory, Jr., University of Virginia.

Executive Committee: (3-year terms) Dr. B. Theodore Cole, University of South Carolina; Dr. Charles E. Jenner, University of North Carolina; (1-year term, to fill the unexpired term of Treasurer Elsie Quarterman) Dr. James H. Gregg, University of Florida.

●

New Constitution

Members should note that the revision of the Constitution and By-Laws of the Association as published in the January, 1960 issue of the BULLETIN was approved by the members at the Annual Meeting and became effective at the close of the regular meeting.

●

Amendment to the By-Laws

In a special session called after the adjournment of the regular

(Continued on Page 56)

Biological Research at Southern Research Institute

J. Richard Thomson

Mr. Thomson received his BS (1948) and MS (1949) degrees from Emory University. He served in the U. S. Navy at the Naval Medical Research Institute (1945-46), has been employed by the Communicable Disease Center (1949), University of Chattanooga, as Instructor in Biology (1950), the Oak Ridge National Laboratory (1951) and, since 1952, has held a position as Research Biologist in the Chemotherapy Division of Southern Research Institute, Birmingham, Alabama. His particular area of interest lies in the investigation of drug-resistant neoplasms, antimetabolite studies on tumor-bearing animals held on synthetic diets deficient in normal metabolites, and in combination chemotherapy of experimental cancer. He has been author or co-author of twenty-six publications in the field of cancer biology, and is a member of Sigma Xi, A.S.B., and the American Society of Professional Biologists.

Organization and Operating Policies

Southern Research Institute was established in 1941 as a means of providing research services for use by industry, government, foundations, and individuals. Shortages of material, equipment, and scientific personnel during World War II delayed actual operations until 1945. From its inception the Institute has operated as an independent, nonprofit corporation, governed by a board of trustees. Its financial needs are met by a capital fund derived from contributions from industry and individuals who are interested in furthering the ideals and objectives of the Institute as well as from operating revenues charged to sponsors for research services rendered. The capital fund is used only for acquiring real estate, buildings, and permanent equipment, whereas the operational costs are met from the project charges paid by the sponsors.

The operating policies provided for by its standard research contract place the Institute in a position which is virtually identical to a technical division of the sponsor's company. The contract provides that all information, discoveries, and patents resulting from the research become the exclusive property of the sponsor. Any degree of confidence desired by the sponsor is maintained at all times, and no publication or disclosure regarding the work is released without the sponsor's permission. Each sponsor is kept fully informed of the progress of the research at regular intervals, and the Institute encourages active participation, visits, and discussions by the sponsor's personnel.

Although Southern Research Institute was established with the interests of the Southern region uppermost in the founders' minds, the Institute has accepted research projects from all sponsors without regard to their location. Much of the research has indeed been sponsored by Southern industry; however, many of the largest and most significant projects have been sponsored by national concerns, the Federal Government, and other agencies outside the South.

The many research projects can be grouped into those having to do with applied chemistry and physics, engineering, metallurgy, and those of a biological and biochemical nature. Briefly listed, some of the more interesting projects concern the radiation preservation of foods, low-temperature carbonization of coal, atomization of liquids, utilization of industrial wastes, demineralization of water, disinfectants, protective coating for teeth, analytical services, mechanical design, electronic instrument development, high temperature evaluation of metals, and research in textiles, wood, and paper.

Biochemistry

The work of the Biochemistry Division is devoted almost entirely to the cancer problem. The nature of this work entails fundamental cellular biochemistry as a tool for investigating exploitable differences between normal and neoplastic cells. Once such differences can be demonstrated, a more rational approach to successful cancer chemotherapy will be made possible. The prime interest in such a program is to discover biochemical events, either anabolic or catabolic,

which are vital to the cancer cell, but unimportant to the normal cell. Antimetabolites, which may inhibit or retard such biochemical processes, then, may be used to block or to completely inactivate such a system, the net result being that the cancer cells are killed and the normal cells remain unharmed. Successful application of this phenomenon has been shown by the action of sulfanilamide and its various analogs which inhibit certain bacterial growth by blocking the utilization of p-aminobenzoic acid (PABA), an essential vitamin for these bacteria while, at the same time, not affecting the hosts' cells since they do not require PABA as a substrate to build folic acid.

For the past several years an intensive effort has been directed to the role of purines in the biosynthesis of nucleic acids. Since the nucleic acids occupy such a prominent position in the mitotic process, it is generally believed that the purine and pyrimidine antimetabolites should be particularly promising agents to use as growth inhibitors. It now appears that cancer cells have many specific deficiencies. Among these are enzymes that degrade certain purine derivatives, and enzymes which are involved in the metabolism of pyrimidine derivatives, carbohydrates, and amino acids. Although these differences have been found, no means have as yet been devised to exploit them to the detriment of the cancer cell.

Synthesis of Antimetabolites

The Organic Division is principally concerned with the synthesis of new agents to be screened for inhibition of transplantable neoplasms. This research group proceeds in its syntheses along rational lines suggested by the Biochemistry and Chemotherapy Divisions. Thus, there are integrated efforts of the three divisions, the chemotherapy of cancer being the common goal. When an effective antimetabolite is found, the Organic Division synthesizes the same basic molecule with various substitutions which are submitted for further tests to determine if a more inhibitory molecule will be produced by the molecular change. Through several years of research in this field it has been ascertained that certain radicals tend to negate the anticancer activity of selected basic compounds, and other radicals sometimes render the basic compound more active.

Chemotherapy

The Chemotherapy Division is primarily concerned with the empirical screening of new agents for anticancer and antiviral activity. More than 12,000 new synthetic drugs and antibiotic preparations are evaluated by this group yearly, and approximately 10,000 mice, hamsters, and rats are used in the overall program each week. Three mouse neoplasms are used in this primary screen: a sarcoma, an adenocarcinoma, and a leukemia representing each of the major classifications of neoplastic growth. The disease known to the general public as "cancer" is actually not a specific designation but a collective term given to include any group of cells manifesting abnormal or ungoverned growth. Since there are more than 300 cell types, each having different functions (and *a priori* different metabolic requirements), it is unreasonable to believe that any "panacea" or cure-all will be found. It is much more logical to expect that certain agents especially inhibit particular cell types but do not inhibit others. This, indeed, has been proved to be true in experimental chemotherapeutic attempts; hence we find the "spectrum of tumors" in any broad tumor-screening program.

When a compound has demonstrated anticancer activity in the "primary" screen, additional tests are made by the "secondary" screening group to determine its effectiveness on a much larger spectrum of tumors, e.g., 20 hamster tumors, 2 rat tumors, and several lines of drug-resistant mouse neoplasms. Certain of these active agents, whose chemical structure or mode of action would suggest that they might be additionally inhibitory to cancer cells if used in combination with known metabolic antagonists, are tested in a combination chemotherapy experiment. Those which show a potentiating or synergistic activity are studied in more detail by the Biochemistry Division. Other agents, the molecular structure of which suggests activity in antagonizing normal nutritional substances are tested in tumor-bearing animals which are held on a synthetic diet deficient in the corresponding nutritional component.

Some drugs are interesting in that they inhibit cell growth through mechanisms not readily defined *in vivo*; in such cases, tissue culture techniques are utilized to evaluate this inhibitory action *in vitro* in a chemically-defined media. Some of the more complicated enzyme systems are studied in tissue cell cultures, for example, in bacterial cultures where chromatographic and radioautographic techniques are employed.

The Chemotherapy Division of Southern Research Institute also maintains an exten-

sive virus chemotherapy program in which tissue cultures are infected by viruses; large numbers of new synthetic agents and antibiotics are then screened for activity against these viruses. There are several reasons to believe that the same agents that inhibit neoplastic growth may also inhibit virus multiplication. A popular, current theory holds that cells that are in a more rapid metabolic state require greater amounts of nucleic acids (and their precursors) than do normal, resting cells. Since virus particles also require large amounts of nucleic acids and their precursors, it is reasonable to assume that substances that block nucleic-acid formation or the use of nucleic acid may show similar activity in the chemotherapy of cancer and viral diseases. With such objectives in mind, several of the major pharmaceutical manufacturers have sponsored virus chemotherapy and hormone research projects at the Institute.

The biological laboratories of the Institute use a large portion of the total Institute employees, who currently number approximately 325; some sixty of these hold advanced degrees. To maintain its broad cancer research program, Southern Research Institute employs approximately 55 biologists, 40 chemists and biochemists, and 25 animal keepers. Among these are 13 PhD's, 2 DVM's, and 10 MS degrees. With few exceptions, all technical personnel have bachelor's degrees in either biology or chemistry and, for the most part, have received their education in the Southeast. Several of the Southeastern colleges and universities are very well represented, viz., Auburn University, Birmingham-Southern College, Alabama College, University of Alabama, Emory University, University of North Carolina, Vanderbilt University, Florida State University, and Howard College.

The funds to support the cancer screening programs are obtained by grants from such agencies as the American Cancer Society and various foundations, and through research contracts with the Federal Government's Cancer Chemotherapy National Service Center. The Institute does well over a million dollars' worth of cancer research each year. Smaller contracts with industrial, chemical, and pharmaceutical companies are performed in such general areas as preclinical pharmacology, special toxicities, endocrine preparation assays, and nutritional studies. All such activities are conducted on a research basis; no routine assays or analytical determinations are done.

Southern Research Institute is a rapidly-growing research center, and there is every reason to believe that this growth will continue in the future. Its aim to provide the Southeastern region with varied research services and to provide research opportunities for our biologists, chemists, physicists, and engineers has already been realized.

PROCEEDINGS OF THE NEW ORLEANS MEETING

Loyola University of New Orleans, Louisiana, was host at the twenty-first annual meeting of the Association of Southeastern Biologists, April 21 to 23, 1960. Meeting jointly with the A.S.B. were the Southeastern Section of the Botanical Society of America, the Southern Appalachian Botanical Club, the South Central and South Atlantic Regions of the Society of General Physiologists, and the Southeastern Region of Beta Beta Beta National Honor Biological Society.

A number of interesting field trips were scheduled for April 21 and April 23. On Friday, April 22, the ten Scientific Sessions had a full schedule which included 112 contributed papers, something of a record for an annual meeting of the Association. The General Sessions on Thursday and Friday evenings were highlighted by the speakers, Dr. Arnold Grobman, Dr. Hiden T. Cox, and Dr. F. C. Steward.

The following account of the Executive Committee Meetings and of the General Sessions is submitted by the Secretary, Dr. Harold J. Humm:

April 21, 1960. Meeting of the Executive Committee

The Executive Committee of the Association of Southeastern Biologists met in regular session at 10 a.m., April 21, 1960, in the student lounge of Marquette Hall, Loyola University, New Orleans, Louisiana. The following officers and committee members were present: President Horton H. Hobbs, Retiring President Mary Esther Gaulden, President-Elect Victor A. Greulach, Vice-President Royal E. Shanks, Secretary Harold J. Humm, Treasurer Elsie Quarterman, Editor Geoffrey M. Jeffery, William D. Burbanck, Joseph C. O'Kelley, Donald C. Scott, Robert B. Short, and Harry E. Wheeler.

Father J. H. Mullahy, S. J., Chairman of the Committee on Local Arrangements, reported on the work of his committee.

President Hobbs reported that progress toward settlement of the income tax matter seemed very favorable.

At the request of President Hobbs, Mary Esther Gaulden agreed to represent the Association of Southeastern Biologists at the inauguration of the new President of the University of Tennessee in May, 1960.

The Secretary proposed a resolution urging the continuation of the present status of Horn Island as a wildlife reservation, in view of an announcement that efforts would be made by the government of the State of Mississippi to convert it to a recreational area. A motion was made and seconded that the resolution be presented to the membership for adoption. The motion carried.

The question of the time of receipt of dues from new members and the year for which they would apply was brought up. Donald Scott moved that a by-law be prepared for inclusion in Section 2, Article IV of the constitution which would establish the fiscal year as corresponding to the calendar year, instead of a fiscal year from March 16 to March 15 as heretofore. The motion was seconded and passed. It was pointed out that with this change the Treasurer's report at each annual meeting would be an interim rather than an end-of-the-year report.

The annual report of the Treasurer was presented and approved by motion.

Editor G. M. Jeffery reported that the 32-page April issue of the BULLETIN was the largest yet and contained 111 abstracts. Nine hundred copies were printed at a cost of $357 and 664 were mailed. He pointed out a need for a backlog of lead articles for the BULLETIN and requested that members of the association be urged to prepare and submit them for future use. He also discussed the problem faced by the editor just before the April issue of proofreading the many abstracts submitted and of the necessity of editing or altering a considerable portion of them because the authors had not conformed to the rules for submitting abstracts published in the January BULLETIN. He expressed the opinion that it may be necessary in the future to reject all abstracts that fail to conform to the rules in order to reduce the editorial task of the annual April number.

Editor Jeffery announced that he was obliged to resign this position following completion of the October, 1960, issue of the BULLETIN for two reasons: He would be away during the academic year of 1960-61; the U. S. Public Health Service has adopted a policy severely restricting editorial activities of its employees.

Several possible candidates for editor were mentioned in the discussion that followed. Victor A. Greulach moved and Mary Esther Gaulden seconded that the association sponsor the membership of the editor in the Conference of Biological Editors.

Harry E. Wheeler moved and Victor A. Greulach seconded a unanimously-approved rising vote of thanks for the excellent work done by G. M. Jeffery as Editor of the BULLETIN.

W. D. Burbanck, Chairman, Mary Glide Goethe Travel Awards Committee, reported that a total of $353 was awarded graduate students for travel expenses in attending the New Orleans meeting.

Invitations received for a 1961 meeting place were presented by Donald C. Scott, Chairman of the Meeting Place Committee, and discussed at length. Mary Esther Gaulden suggested that serious consideration be given to holding the 1962 meeting at the University of Georgia as this would be the twenty-fifth anniversary meeting of the Association, the first of which was held at the University of Georgia as a result of the efforts of George H. Boyd.

Reports of the Nominating and Auditing Committees were received and approved.

Mary Esther Gaulden moved and Robert B. Short seconded that the Association become incorporated. The motion passed and President-Elect Greulach indicated that he would take action in this direction during the summer of 1960.

Donald C. Scott moved and W. D. Burbanck seconded the motion that the following qualified members be elected to the category of Emeritus Membership: George H. Boyd, Roland Harper, L. R. Hesler, A. B. Massey, and A. D. Shaftsbury.

The meeting was adjourned at 11:45 a.m.

April 22, 1960. Morning General Session

President Horton H. Hobbs called the general session business meeting to order at 11 a.m. Friday, April 22, 1960, in the Field House auditorium of Loyola University.

Election of new officers was the first order of business, with the following positions to be filled: president-elect, vice-president, two regular members of the Executive Committee for three-year terms, and one member to fill the unexpired term of Elsie Quarterman. Terms of office of the Secre-

tary and Treasurer did not expire this year.

The slate of the Nominating Committee was officially presented and nominations from the floor were called for for each vacancy. William D. Burbanck was nominated for the position of vice-president as the only nomination from the floor. Ballots were distributed and were later submitted to the committee of tellers appointed by President Hobbs: W. G. Erwin (chairman), Julian Darlington, and C. W. Hart, Jr.

Reports of the Treasurer and Auditing Committee were heard and both were accepted. The Secretary gave a resumé of the proceedings of the Executive Committee meeting held the previous morning and announced a total of 117 new members since the Knoxville meetings a year previous.

Donald C. Scott, Chairman of the Committee on Meeting Places, listed the invitations received for holding the 1961 meeting. John W. Carpenter added to the cordiality of the invitation from the University of Kentucky. A motion was made, seconded, and passed that the 1961 meeting be held at the University of Kentucky in Lexington. The dates will be April 20-22.

The proposed revisions of the Constitution as published in the January, 1960, issue of the BULLETIN were considered. A motion and second were made that they be approved, and the motion passed.

The Secretary read the following resolution concerning Horn Island:

"Be it resolved that the membership of the Association of Southeastern Biologists go on record as being strongly opposed to the proposed conversion of Horn Island, Mississippi Sound, from its present status as a wildlife reservation under the U. S. Fish and Wildlife Service to a recreational area under the jurisdiction of the State of Mississippi.

"The Association of Southeastern Biologists, through a Committee on Horn Island, was instrumental in the establishment of Horn Island as a wildlife reservation only two years ago. Because of the limited number of natural areas of the type of Horn Island, we feel that it is to the best interests of the people of Mississippi as well as to the people of all other southeastern states that Horn Island remain a wildlife reservation in perpetuity."

A motion was made, seconded, and passed that this resolution be adopted.

The meeting was adjourned at noon.

April 22, 1960. Evening General Session

President Horton H. Hobbs called to order the evening business meeting at 8:30 p.m. on Friday, April 22, 1960, in the Field House auditorium of Loyola University.

Results of the election were announced as follows:

President-Elect: Royal E. Shanks.

Vice-President: Walter S. Flory.

Executive Committee, three-year terms: B. Theodore Cole and Charles E. Jenner; to fill the unexpired term of Elsie Quarterman, James H. Gregg.

Dr. O. C. Bradbury of Wake Forest College received the Meritorious Award for Teaching and the honorarium of $100, made available by the Will Corporation of Atlanta, Georgia. Frederick T. Wolf, Chairman of the Meritorious Award for Teaching Committee, made the presentation. The other committee members were C. G. Goodchild and Roberta Lovelace.

The Association Research Prize, made possible by the Carolina Biological Supply Company, was awarded to Drs. A. V. and Jeanne W. Beatty of Emory University for their paper, "Postirradiative Effects on Chromosomal Aberrations". The prize consists of an honorarium of $100.00.

The $150 Research Fellowship at the Mountain Lake Biological Station, presented annually by the Phipps and Bird Company of Richmond, Virginia, was presented to Miss Jean Elizabeth Pugh, Assistant Professor of Biology, Norfolk Division of the College of William and Mary.

The meeting was adjourned at 9:00 p.m.

April 22, 1960. Special Business Session of the Association

Immediately following adjournment of the business meeting dealing with matters of the current meeting, a meeting was called to order to conduct some business pertaining to the 1961 meeting. Past-President Horton H. Hobbs explained that the newly-adopted revision of the Constitution could not take effect until after adjournment of the meeting at which this revision was approved.

President Victor A. Greulach presided.

A motion was made and seconded that Article IV, Section 2 of the by-laws of the Constitution be amended to read that the fiscal year of the Association shall coincide with the calendar year. The motion passed.

Past-President Hobbs expressed the opinion that the Association should become incorporated. A motion was made and seconded authorizing the President and Secretary to start incorporation procedures immediately.

The meeting was adjourned at 9:15 p.m.

ANNUAL AWARDS

The Meritorious Award for Teaching

The Committee chose as the 1960 recipient of the A.S.B. Meritorious Award for Teaching Dr. Ora C. Bradbury of Wake Forest College. This coveted award consists of a certificate and an honorarium of one hundred dollars provided through the generosity of the Will Corporation of Georgia.

Dr. Ora C. Bradbury

For 35 years Wake Forest College students have been exposed to the sometimes relentless, sometimes wryly humorous, presence of Biologist Ora C. Bradbury. Dr. Bradbury favors his students with the same intensity he applies to a problem of science. Hard, they say, but carefully and objectively fair; a man with a passion for imparting knowledge to young people and with it a desire that they learn that knowledge is a tool to understanding.

Dr. Bradbury is a native of Kansas and received the Bachelor of Science degree at Ottawa University. He received the Master's and Ph.D. degrees at the University of Nebraska. He taught zoology at Baylor University from 1917 until 1923 and at the University of Denver from 1923 until 1925. He has been at Wake Forest since 1925. He is married and has two sons, Max G. of Clinton, Ohio, and Kenneth R. of Raleigh, N. C.

Dr. Bradbury has written various laboratory manuals and has done research on termites. He is a former president of the North Carolina Academy of Science and a member of the American Institute of Biological Sciences, the Association of Southeastern Biologists, the American Society of Parasitologists and the American Association for the Advancement of Science.

His fellow faculty members know him as a dedicated man anxious that each person be given a chance to express his opinions. His students know him as a man who respects excellence.

The Association Research Prize

The Association Research Prize, made possible through the generosity of the Carolina Biological Supply Company, is awarded annually to the member or members presenting an especially meritorious paper at the annual meeting, and consists of a $100.00 honorarium. This year the prize was awarded to Drs. A. V. and Jeanne W. Beatty of Emory University for their paper, "Post-irradiative Effects on Chromosomal Aberrations". The abstract of the winning paper is reprinted below:

POSTIRRADIATIVE EFFECTS ON CHROMOSOMAL ABERRATIONS

A. V. BEATTY and JEANNE W. BEATTY
Emory University

Investigations dealing with chromosomal aberrations in Tradescantia microspores have revealed that a total dose of 400r of X radiation, in combination with various environmental factors during or after irradiation, yielded in five percent oxygen an average low of 0.48 and a high of 0.88 aberrations per cell, while in helium a low of 0.14 and a high of 0.66 was found. In those experimental procedures in which a total dose of 400r yielded less than the highest yield of aberrations, a yield up to but not greater than this high could be obtained by modifying the experimental setup so as to influence the rejoining of broken chromosome ends. This idea of constancy in the number of recoverable breaks and the role which available energy plays in radiation recovery, form the basic premises upon which the present

work was carried out. Irradiation was performed in both oxygen and oxygen-free atmospheres. In the oxygen-free experiments some of the material was pretreated in chemicals which presumably contributed in some way in supplying additional energy for repair. Postirradiative treatments for mass doses as well as in the fractionation experiments were given in either helium or air. Any treatment which supposedly increased the supply of energy in the cell, decreased the aberration yield while a decrease in available energy increased the aberration yield.

Research Fellowship

The Research Fellowship, made possible by the generosity of the Phipps and Bird Company, was awarded to Miss Jean Elizabeth Pugh, Assistant Professor of Biology, Norfolk Division of the College of William and Mary. This fellowship consists of an honorarium of $150.00 for use in summer research at the Mountain Lake Biological Station of the University of Virginia. The recipient is selected from applicants on the basis of planned work, references, education and other supporting data submitted. Miss Pugh is a graduate of Madison College and the University of Virginia and is working toward the Ph.D. degree at the latter. This summer she will be engaged in a study of the morphology and histology of the alimentary tract of the fiddler crab.

NEWS OF BIOLOGY IN THE SOUTHEAST

About People

Dr. C. S. Shoup, Chief, Biology Branch, AEC, Oak Ridge, visited the Puerto Rico Nuclear Center of AEC on February 17th, and spoke to the radiobiology class of the University of Puerto Rico, Mayaguez. The Puerto Rico Nuclear Center is the newly-established nuclear science training center of the AEC for Latin America.

Dr. Claude L. Yarbro, instructor of biochemistry and nutrition at the University of North Carolina School of Medicine since 1955, has joined the Oak Ridge Operations of AEC. Dr. Yarbro is assigned to the Biology Branch, Research & Development Division, and a part of his duties will be that of staff coordinator for education and training programs administered from Oak Ridge.

Dr. James D. Eisen of Emory University has recently received a postdoctoral fellowship from the National Cancer Institute of the NIH for two years of research at the University of Uppsala, Sweden.

The University of Georgia Marine Institute, located on Sapelo Island, Georgia, announces the appointment of **Dr. George H. Lauff** as Director of the Institute, effective April, 1960. Dr. Lauff, who is secretary-treasurer of the American Society of Limnology and Oceanography, comes to the Institute from the University of Michigan where he has been associated with the Great Lakes Research Institute and the Department of Zoology. **Dr. Lawrence R. Pomeroy,** who has served as Acting Director at Sapelo for the past year will remain with the Institute and the University of Georgia to devote full time to research and teaching.

Dr. Jane Belcher, Sweet Briar College, is studying the embryology of *Xenapus* at University College, Ihadan, Nigeria.

Dr. Ruskin S. Freer, Chairman, Division of Science and Mathematics, Lynchburg College, was recently awarded an honorary Doctor of Science Degree by Culver-Stockton College in Missouri.

Dr. Miriam F. Bennett will be on sabbatical leave from Sweet Briar College during 1960-61 to study biological rhythmicity at the Max-Plank Institute fur Verhalten-physiologie at Tubingen, Germany. **Miss Rose Mary Johnson,** University of Virginia, will replace Miss Bennett during the session.

Dr. Dietrich Bodenstein, formerly with the Gerontology Branch of the National Institute of Health, assumed the Chairmanship of the Department of Biology at the University of Virginia in February 1960. His primary interests are invertebrate endocrinology and developmental physiology of vertebrates and invertebrates.

Dr. James L. Riopel, a recent graduate of Harvard University will join the staff of the University of Virginia Biology Department in September 1960. His major field of interest is plant anatomy and morphologenesis.

Dr. James N. Dent who has spent the past academic year at the Gaddy Marine Laboratory, St. Andrews, Scotland, will resume his duties at the University of Virginia in the fall of 1960.

Dr. B. Theodore Cole has accepted an appointment as Associate Professor of Biology, Department of Biology, University of South Carolina effective September, 1960. Dr. Cole is presently on a one year appointment as Research Participant, Cell Physiology Section, Biology Division, Oak Ridge National Laboratory.

Dr. L. R. Hesler, Dean Emeritus of the College of Liberal Arts of the University of Tennessee, is the author of a new book, MUSHROOMS OF THE GREAT SMOKIES, which is being published by the University of Tennessee Press. The book, which will be of interest to the layman as well as the biologist, deals with the interesting species of mushrooms in the Great Smoky Mountains and contains approximately 200 black and white illustrations. The book will be available in July, 1960.

Dr. James A. Miller, Professor of Anatomy at Emory University, has accepted the Chairmanship of the Department of Anatomy of Tulane University. He and **Dr. Faith S. Miller,** a research team which has been studying the use of hypothermia for the treatment of asphyxia neonatorum, will move their laboratory to New Orleans this summer.

Dr. S. Leonard Doerpinghaus, Assistant Professor of Biology at Agnes Scott College, will attend the National Science Foundation Institute in Desert Biology, June 27 to Aug. 6, at Arizona State University.

Several Florida State University faculty and students attended the Federated Societies of Experimental Biologists meetings in Chicago in April. Among the participants were **Mr. Edgar Barnett** and

Drs. Gib DeBusk, Lloyd Beidler, Harry Lipner, and **Dexter Easton.**

Dr. A. Gib DeBusk of the Department of Biological Sciences at Florida State University was an invited lecturer at the School of Aviation Medicine in May. He spoke on the "Genetic Effects of Primary Cosmic Radiation". He also attended and presented a paper to the Aerospace Medical Meeting held in Miami in May.

Dr. Sidney Fox of the Oceanographic Institute at Florida State University and **Dr. Gib DeBusk,** Florida State University, participated in a conference on "Biological Experiments in the Space Environment" sponsored by the National Aeronautics and Space Administration in Washington on June 20, 1960. This conference will establish the overall objectives of space biology.

Dr. Margaret Y. Menzel, Research Geneticist with the USDA, will be a visiting assistant professor in the Department of Biological Sciences, Florida State University this summer. Dr. Menzel will teach genetics.

Dr. A. W. Ziegler, Department of Biological Sciences, Florida State University, was invited to participate in the AIBS Film Series Review, June 20-30 in Santa Barbara and Pasadena, California. The conference was being sponsored by the State Department of Education of California.

Dr. Norman I. Bishop of the Department of Biological Sciences, Florida State University, gave a paper entitled "A Phylloquinone in the Electron Transport System of Photosynthesis" at a Ciba Foundation Symposium in London, England. The subject of the symposium was "Quinones in Electron Transport".

Dr. William Gueston Carter, Jr., instructor of biology, Washington and Lee University, received the Doctor of Philosophy degree in June from Duke University.

Mr. James E. Perham, Biology Department, Randolph-Macon Woman's College will work this summer on problems in the genetics and biochemistry of molds in the Department of Biological Sciences, Florida State University.

Dr. Paul A. Walker will be on sabbatical leave next semester from Randolph-Macon Woman's College to work with Dr. George W. Beadle, recent Nobel Prize winner in Genetics. Dr. Walker plans to conduct investigations in the field of mold genetics. He will leave early in August for the California Institute of Technology, spending a short time at the Biology Division, Oak Ridge Institute of Nuclear Studies en route.

Dr. Michael D. Coe, Assistant Professor of Anthropology at the University of Tennessee, spent the winter quarter in Costa Rica on an archaeological expedition for the Institute of Andean Research, Inc., New York City.

Dr. Chauncey Goodchild, Chairman of the Biology Department, Emory University, has been awarded one of 12 Charles Howard Candler Professorships presented at Emory recently.

The following items were received from the Department of Biology, Wake Forest College: **Dr. Charles M. Allen** will attend a National Science Foundation Institute in Marine Biology of the University of Oregon at Coos Bay from June 20 through August 12; **Dr. John E. Davis, Jr.** will attend the National Science Foundation Summer Institute of Genetics at N. C. State College from June 14 through July 21; **Dr. Elton C. Cocke** attended a conference on the History of Science at the University of Tennessee in June, and later in the summer will attend a similar conference at Colorado State University; **Dr. David W. Johnson** is spending the three summer months working with the U. S. Public Health Service at Cape Thompson, Alaska, on "Project Chariot." Dr. Johnson's work will entail preliminary surveys of vertebrate populations and productivity prior to underwater atomic blasting to create harbors. Dr. Johnson's book, "Biosystematics of North American Crows" will be published next year by the University of Washington Press.

Louisiana State University announces the following additions to the staff in Zoology: **Dr. Willie Mathews Reams, Jr.,** experimental embryologist, a graduate of University of Richmond, Richmond, Virginia and The Johns Hopkins University, comes to L. S. U. from the Department of Anatomy at the Medical College of Virginia. Dr. Reams has a grant of $13,000 from the National Science Foundation for the study of developmental biology; **Dr. John A. Davison,** physiologist, a graduate of the University of Wisconsin and the University of Minnesota comes to L. S. U. from the Department of Biology at Florida State University. Dr. Davison has a grant of $3,-800 from the NIH for the study of red cell form; **Mr. Fred Cauthron,** Associate in Zoology, comes to L. S. U. from the Texas A & M Research Foundation at Grand Isle, Louisiana, and from Douglas Aircraft. Mr. Cauthron will be responsible for the care and maintenance of Departmental instruments and equipment.

Dr. Douglas Lancaster has joined the staff in biology at Northwestern State College, Natchitoches, Louisiana, where he will teach ornithology and mammalogy. Dr. Lancaster is a graduate of Virginia Polytechnic Institute and holds the Ph.D. degree from Louisiana State University.

Dr. Beryl C. Franklin has joined the staff of Northeastern State College at Monroe, Louisiana. Dr. Franklin had occupied a temporary appointment in Zoology at Louisiana State University for the 1959-1960 school year.

Dr. George C. Kent, Jr. has been named Chairman of the Department of Zoology at Louisiana State University.

Mr. Earle A. Cross, Research Associate in Entomology, University of Kansas, will join the staff of Northwestern State College of Louisiana in the fall, replacing **Dr. James E. Sublette** who has accepted a position in the Department of Biology at Texas Western University, El Paso, Texas. Mr. Cross will receive the Ph.D. degree from the University of Kansas at the end of the summer.

Dr. Margaret E. Gilbert (Department of Biology, Florida Southern College, Lakeland, Florida), **Dr. Ralph Bangham** (Head of the Department of Biology, Wooster College, Wooster, Ohio), and **Mr. Stuart Warter** (graduate student in Zoology, Louisiana State University, Baton Rouge) are visiting members of the summer staff of Northwestern State College of Louisiana.

Dr. Victor A. Greulach is now Chairman of the Botany Department at the University of North Carolina. **Dr. John Couch** will devote full time to teaching and research in the Department.

The following personnel changes are from the Biology Division, Oak Ridge National Laboratory:

Dr. Masashide Asano, under the sponsorship of the Japanese Atomic Energy Bureau, has joined the Pathology and Physiology Section. Dr. Asano received the M.D. degree from Shinshu University School of Medicine, Matsumoto, Japan, in 1952 and since 1956 has been with the National Institute of Health, Tokyo, Japan. **Dr. Gino Doria,** a citizen of Italy, has joined the Mammalian Recovery Section. Dr. Doria,

who is on leave from the University of Pavia, was associated with the Centre D'Etudes Nucleaires, Saclay, France, for one year and with the Institut du Radium in Paris from 1958 to November, 1959. **Dr. Juergen Hans Fraenz** has joined the Microbial Protection and Recovery Group. Dr. Fraenz received the Ph.D. degree from the University of Muenster, Germany, in 1958. He comes to the Biology Division from the Radiologisches Institut der Universitaet, Freiburg, Germany and his stay here is sponsored by the German Ministry of Atomic Energy. **Dr. Cezar Antonio Elias,** a Fulbright Fellow, has joined the Biophysics and Microbial Protection and Recovery Groups. Dr. Elias received the M.D. degree from the University of Brazil in 1952, and is now Associate Professor of Physics at the University of Brazil in Rio de Janeiro. **Elena R. Monesi** has joined the Mammalian Cytogenetics Group of the Mammalian Genetics and Development Section. Mrs. Monesi was formerly associated with the University of Pavia, Italy. **Blanca A. Ramos-Ceballos** of the Institute of Biology "Juan Noe", School of Medicine of the University of Chile, has joined the Radiation Immunology Group. Miss Ramos will be here for one month of special training under the sponsorship of the United States Atomic Energy Commission and the University of Chile. **Dr. Tran Phan,** who has been associated with the Mammalian Recovery Group for the past year, has returned to Saigon, Viet Nam. Dr. Phan is a Radiobiologist with the Vietnamese Office of Atomic Energy, and his stay here was sponsored by that agency.

Drs. Alexander Hollaender and **John S. Kirby-Smith** attended a conference on "Comparative Effects of Various Radiations" at the University of Puerto Rico, San Juan in February. The conference was organized by the Committee on Photobiology, Division of Biology and Agriculture, National Research Council, and supported by the National Science Foundation and the Atomic Energy Commission. Dr. Hollaender is Chairman of the Committee on Photobiology; and Dr. Kirby-Smith is Secretary of the Conference.

Institutions and Organizations

Randolph-Macon Woman's College will hold its third **Summer Institute for Secondary School Teachers of Science and Mathematics** from June 22 to August 2. Dr. Paul A. Walker will serve as Director and have charge of the course, Interdepartmental Science S501, Topics in Contemporary Science, taken by all institute participants. Dr. Franklin F. Flint, Associate Professor of Biology, will teach the course, Man and his Organic Environment, and Dr. James L. Chamberlain, Jr., Assistant Professor of Biology, will direct the laboratory work for this course.

Virginia's marine laboratory at Gloucester Point announces several vacancies for graduate assistants desiring to qualify for the M.A. degree in Marine Science in the **Department of Marine Science of the College of William and Mary.** Qualified candidates will take up residence at the Laboratory and will be eligible for monthly stipends of $200 for half-time work as research assistants to staff members. Quarters are available at nominal cost.

Ground has been broken for the new $1.25 million Life Sciences Building at **Wake Forest College.** The Biology Department will occupy approximately 70 per cent of the building which is to be shared with psychology. Occupancy is anticipated by fall of 1961.

Grants in Aid

Dr. Charles Edington, Department of Biological Sciences, Florida State University, has received a continuation of a grant from the **Atomic Energy Commission** for work on gene and chromosome changes in Drosophila due to radiation effects.

The photobiology project in the Department of Biological Sciences, Florida State University, has received a grant of $26,100 from the **National Science Foundation** for the purchase of instruments.

Dr. Ronald C. Rustad, Assistant Professor of Physiology at Florida State University has received an **Atomic Energy Commission** contract for $15,000 to investigate radiation-induced mitotic delay. The **Florida Division of the American Cancer Society** has awarded a $2,000 grant to support one aspect of this study. Dr. Rustad has also received a travel grant from the **National Academy of Sciences** to attend the International Congress for Cell Biology in Paris.

Dr. Mitchell A. Byrd, Associate Professor, College of William and Mary has recently received a three year grant of $13,397 from the **National Institutes of Health** to study the Ecology of Digenetic Trematodes of Marine Fishes of the Atlantic Coast.

Dr. William Murdy of the Biology Department at Emory University has received a **National Science Foundation** grant of $7,000 for two years for the study of the morphology, development and cytology of *Mays.*

Dr. Charles Ray of the Biology Department at Emory University has received a **National Science Foundation** grant of $15,000 for two years for the study of the cytogenetics of *Tetrahymena pyraformis* by means of fluorescent microscopy.

Dr. Amoz I. Chernoff of the University of Tennessee Memorial Research Center has received a grant of $23,725 from the **National Institutes of Health** to continue studies of abnormal hemoglobins and myoglobins. At present Dr. Chernoff is engaged in studies of muscle myoglobin on persons suffering from muscular dystrophy, as well as certain other types of hereditary diseases.

Dr. Stanfield Rogers, director of the University of Tennessee Memorial Research Center, has received a grant of $282,130 from the **Public Health Service** to further his studies of virus-induced tumors. Dr. Rogers will study the mechanism of action of the Shope papilloma virus.

Dr. A. C. Cole, Professor of Entomology at the University of Tennessee, has received a **National Science Foundation** grant of $3,700 for a continuation of revisionary studies of the ant genus *Pogonomyrmex.* Dr. Cole has been elected Chairman of the Teaching Section of the Entomological Society of America.

Dr. Sidney A. Cohn, Associate Professor of Anatomy at the University of Tennessee Medical Units in Memphis, has been awarded a $39,000 research grant by the Dental Section of the **United States Public Health Service.** The grant will support studies on the incidence and severity of disease of the supportive tissues of teeth which have lost contact and function due to the extraction of the corresponding teeth in the opposite jaw.

Dr. Roger T. Sherman, Assistant Professor of Surgery at the University of Tennessee College of Medicine at Memphis, has been awarded a $33,000 research grant by the Medical Research and Development Command of the **U. S. Army.** Dr. Sherman is investigating the response of the body to artificial internal organs constructed from plastic materials.

Dr. Ernest Daigneault, Instructor in Pharmacology at the University of Tennessee Medical Units in Memphis, is making a study of yttrium, a derivative of

strontium, under a $10,082 research grant from the **Atomic Energy Commission.** He is investigating methods of making the tissues of the body release the radioactive element so that it can be safely excreted without damage to the tissues.

Dr. Paul J. Osborne, Lynchburg College, has been awarded a grant-in-aid by the **American Physiological Society** for fifteen weeks study in cell membrane and ionic transfers, as affected by certain drugs. The work is to be done with Dr. D. R. H. Gourley, Pharmacology Department, Medical School, University of Virginia.

Dr. Harry L. Holloway, Jr., Roanoke College, has received a grant-in-aid of $1,252 from the **American Physiological Society** to study for eight weeks with Dr. G. W. Nace, Department of Zoology, University of Michigan.

Dr. B. E. Frye, University of Virginia, received a one-year grant in the amount of $5,647 from the **U. S. Public Health Service** and a grant for $3,400 from the **National Science Foundation** for studying the function of the embryonic islands of Langerhans.

Mr. E. W. Lautenschlager, University of Virginia, received a $1,575 summer research grant from the **American Cancer Society.**

Mr. L. R. Emmons, University of Virginia, received a research grant from the **American Cancer Society** in the amount of $3,000.

Dr. Thomas C. Cheng, who received his Ph.D. degree in biology from the University of Virginia last year, has received a four-year grant of $15,851 from the **National Institutes of Health** to continue his study on "Development and Enzyme Studies on Endoparasitic Trematodes." Dr. Cheng has also received a teaching grant of $9,403 from the **Atomic Energy Commission,** for the 1960-1961 session.

The **Louisiana Academy of Sciences** has been awarded a **National Science Foundation** grant of $27,000 for 1960-61 for a continuation of the Junior Academy of Sciences program. **Dr. Harry J. Bennett** is director of the project and Louisiana State University serves as the fiscal agent.

A grant-in-aid for $24,300 has been made to the **Highlands Biological Station** by the **National Science Foundation** to support a three year study of locomotor periodicity in plethodontid salamanders. The principal investigator is Dr. Robert E. Gordon, University of Notre Dame. Co-investigator is Thelma Howell, Executive Director of the Station.

Under a grant-in-aid from the **National Science Foundation,** the **Highlands Biological Station** has supported the research of the following during the summer: Dr. M. W. Dick, University of Michigan; Dr. R. M. Schuster, University of Massachusetts; Dr. and Mrs. Stanley B. Mulaik, University of Utah; Dr. James W. Hardin and Dr. J. T. Mullins, University of Florida; and Ronald Peterson, Columbia University.

Recipients of grants-in-aid in the **Research Participation Program for Teacher Training,** sponsored by the **National Science Foundation** at the Highlands Biological Station are: Mr. Curry T. Haynes and Mr. Melvin Conrad, Emory-at-Oxford; Mr. John A. Cheek, Lambuth College; Mr. J. D. Spooner, South Georgia College.

Drs. Reinhard Harkema and **Grover C. Miller,** Zoology Department, N. C. State College, have recently received a $38,000 grant from the **National Institutes of Health** for studies on "Helminth Parasites in Wild Mammals in the Southeastern States".

The **Genetics Department** at N. C. State College has received a $41,000 grant from the **National Science Foundation** for the purpose of sponsoring a "Summer Institute of Genetics for College Teachers". The program is June 14 - July 21, 1960.

The National Science Foundation will accept applications for fellowships under the **Senior Postdoctoral and Science Faculty Fellowship** programs through October 10, 1960. Fellowships will be awarded in the mathematical, physical, medical, biological, and engineering sciences. Information, forms, etcetera may be obtained from the Fellowships Section, Division of Scientific Personnel and Education, National Science Foundation, Washington 25, D. C.

ASSOCIATION AFFAIRS

annual meeting an amendment of one of the By-Laws of the Association was proposed and approved. The amendment concerns Article IV, Section 2, and now reads that the fiscal year of the Association shall coincide with the calendar year.

This amendment may clarify the question of applicable date of dues paid by the members. There appears to be a large number of members who are one year in arrears in dues. These members will be notified by an inclusion with this issue of the BULLETIN; according to action of the Executive Committee, members delinquent in dues at the close of the annual meeting will receive no further issues of the BULLETIN.

The A.S.B. BULLETIN

Volume 7, Number 4 October, 1960

CONTENTS

The Official Quarterly Publication of
The Association of Southeastern Biologists

THE A.S.B. BULLETIN

The A.S.B. BULLETIN is the official quarterly publication of the Association of Southeastern Biologists and is published at Columbia, S. C., in January, April, July and October. Letters, news items, other contributions, and all communications about editorial matters should be addressed to the Editor, U.S.P.H.S., P. O. Box 717, Columbia, S. C. Changes of address should be sent promptly to the Secretary of the A.S.B., Dr. Harold J. Humm, Department of Botany, Duke University, Durham, N. C. Subscription orders from libraries and other institutions should be sent to the Business Manager, Dr. Elsie Quarterman, Department of Biology, Vanderbilt University, Nashville, Tenn. Subscription rate for non-members of A.S.B.: $2.00 per year. Printing and typography by the Cary Printing Co., Columbia, S. C.

EDITOR

HAROLD J. HUMM, ASSOCIATE EDITOR
ELSIE QUARTERMAN, BUSINESS MANAGER

ASSOCIATION AFFAIRS

President's Message

I am pleased to report that the Executive Committee has appointed Mr. C. W. Hart, Jr. to be editor of the A.S.B. BULLETIN for a three-year term. Mr. Hart, who is a member of A.S.B. and has done graduate work at the University of Virginia under Dr. Horton Hobbs, is particularly well qualified and equipped to serve as editor, since he is editor of the publications of the Academy of Natural Sciences of Philadelphia. We thus have the unusually happy situation of obtaining the services of a professional editor on a volunteer basis. You will be glad to know that he can get the BULLETIN printed in Philadelphia at a cost somewhat lower than the present one. While certain members of the Executive Committee raised the question as to whether the BULLETIN should be published outside the southeast, it was decided that the advantages of having Mr. Hart as editor far outweighed this factor.

On behalf of the Executive Committee, as well as myself, I wish to thank Dr. Geoffrey M. Jeffery for the excellent work he has done as editor of the BULLETIN during the past several years. This issue is Dr. Jeffery's last, Mr. Hart taking over with the first issue of Volume 8 in January.

Progress is being made in the incorporation of A.S.B. and it is likely that the procedure will have been completed by the time this is in print. As soon as incorporation is completed negotiations for tax exempt status as a non-profit scientific and educational organization will be resumed. The Executive Committee will hold an interim meeting in Chapel Hill some time in October and will for the first time be functioning as the board of directors of A.S.B., Incorporated.

Let me suggest once more that you cooperate with your state correspondent for the BULLETIN by providing him with all the news of biology you may have. Best wishes for a good year.

Victor A. Greulach

●

The BULLETIN

With this issue the editor regretfully completes his tenure with the A.S.B. BULLETIN. I particularly regret that it did not seem feasible for me to complete the full term of office of three years, but one of the characteristics of federal government service is the possibility of transfer. While these transfers are frequently advantageous, as is the case with my current assignment, they may also necessitate cessation of activities which one might otherwise be pleased to continue. I am hopeful that the BULLETIN has not deteriorated during my term; maintaining the standards established by its first editor has not been an easy task. Certainly any success which the BULLETIN has enjoyed during my association with it could not have been achieved without the unfailing help and encouragement of the officers and executive committee of the Association. While all have been indispensable, I shall always be most grateful to our Secretary, Dr. Harold J. Humm, for the tremendous amount of work which he has expended on behalf of the BULLETIN. Without the faithful performance of his duties — and much of the time he was also working away from his usual position and home — the BULLETIN certainly could not have been possible. My thanks also go to the state correspondents, whose job I am sure is tedious and thankless, but nevertheless of extreme importance to the BULLETIN.

I wish also to express my gratitude to Mr. Charles Moore and Mr. William Cartledge of the Cary Printing Company for their extreme patience in dealing with an inexperienced and amateur editor. Certainly the BULLETIN could never have been technically acceptable or on time without their advice and efforts.

As our president has mentioned above, the Association is most fortunate in the qualifications of our new editor. I am certain that he will continue to benefit from the same fine cooperation of the officers, executive committee, state correspondents and membership that I have received during my term. While there are times when getting out the BULLETIN can seem a thankless, if not impossible, task, I can commend to our new editor the feeling of satisfaction when the issue is complete, and even more the feeling of pride when a member or two very kindly extends a word of encouragement.

(Continued on Page 61)

Concepts Regarding Fungi — Then and Now

FREDERICK A. WOLF

Dr. Wolf is Professor Emeritus of Botany at Duke University where he joined the faculty in 1927 and retired in 1954. A native of Nebraska, he received the A.B. and A.M. degrees from the University of Nebraska in 1907 and 1908, respectively, and the Ph.D. degree in 1911 from Cornell University. Prior to going to Duke, Dr. Wolf spent a number of years working in plant pathology at experiment stations at Alabama Polytechnic Institute and North Carolina State College. His botanical interests have been centered in the fields of mycology and plant pathology. Additionally he has become widely known for his researches involving tobacco, especially aromatic or oriental kinds.

One is seldom admonished to look backward or to be retrospective. I am asking your indulgence for a few minutes to look backward with me, knowing full well that to reminisce is generally regarded as one of the pleasures in which only the aged are supposed to indulge. However retrospection can serve as an excellent means of orienting one's self, and thus of charting his "where do we go from here?" I have traveled the mycological road for a distance of more than 50 years, during all of which time I have maintained a more or less lively interest in fungi. Moreover some of the beliefs and concepts early instilled into me in the classroom and laboratory relative to the nature of fungi have continued to be regarded as widely accepted credos, as witnessed by the fact that they are still being included in current botanical and mycological treatises and are generally accepted among mycologists. For my own part, however, I have found it increasingly difficult, with the passage of the years, to regard as factual certain of these widely accepted concepts. Instead I have come to regard them as obstacles that have impeded progress along the mycological road. The present purpose is to account in small measure for my skepticism by directing attention to a few of these obstacles, in the hope that the course of others through the mycologic field will be made more scenic and more fruitful, and, that the true nature of fungi eventually may come to be appreciated.

I was taught, that the fungi have almost certainly evolved from algal stock. This is said to have come about by a loss of chlorophyll, and, in consequence, members of this group of plants were compelled to feed either as saprophytes on decaying organic matter, or as parasites at the expense of other living plants or animals. Let it be appreciated that wide accord remains that such *was* their origin and such *is* their food habit. But on what evidence or on what basis are such beliefs founded? It appears to me that the answer is related basically to the teachings regarding biologic evolution and on the belief that the systems of classification that have been devised are natural, thus indicating phyletic relationships. Indeed the evolutionary concept has played a continuously dominant role in biological teaching. Morphologists and taxonomists have exerted Herculean efforts to show relationship of all living things. In doing so, when the tracing of ancestries became difficult for them, their imaginations created the hypothetical missing links. Relationships between species, genera, families, orders, and classes were and continue to be graphically portrayed by use of phyletic trees. Some of these trees are monstrosities, lopsided, storm-tossed, with branches broken away or sometimes left suspended in midair, in defiance of the laws of gravity. Structural resemblance, as proof of affinity long has been accepted as the *sine qua non* upon which to base relationship. Even Plato, who may have been wholly unacquainted with fungi, stated that a cautious man should ever be on guard against similarities because they are tricky things. I desire merely to point out that even though morphology admittedly is invaluable in tracing natural relationships, perhaps the time is overdue to de-emphasize morphology and to stress more vigorously the development of other areas of knowledge or disciplines for the purpose of bringing them to bear in attempts to learn more of the nature of fungi or other organisms.

To me it is, however, exceedingly difficult to conceive that the simple expedient of depriving an alga of its chlorophyll would

transform it into a fungus or start it on the pathway leading to its eventually becoming a fungus. The main reason resides in the chemosynthetic potentialities possessed by fungi, many of which potentialities are not known to be possessed by any alga. How can one explain that certain species of yeast, for example, assuming they are transformed algae, have acquired the ability to employ a substratum consisting of the essential mineral elements, a nitrate salt, and sucrose, and are able to elaborate therefrom, glycogen, fats, alcohol, essentially all the known amino acids, and all the B-complex vitamins and other accessory growth factors. Or how can the ergot fungus, *Claviceps purpurea*, growing in the ovarian tissues of certain grasses elaborate the alkaloid ergotine? And how can *Omphalia flavida*, pathogenic on the leaves of coffee, elaborate luciferin and the enzyme luciferase, and cause the leaf lesions, on a dark night, to glow like tiny candles? Or yet how does the fly agaric, *Amanita muscaria*, growing on humus on the forest floor, produce the toxin muscarin, or how does the green mold, *Penicillium chrysogenum*, using corn steep liquor as a substratum, synthesize the antibiotic penicillin? And finally how does the mushroom *Lactarius* synthesize rubber as cis-polyisoprene? There are those who maintain that these foregoing products and hundreds of other organic substances synthesized by fungi arise as waste products. Nothing could be farther from the truth and moreover no species of alga is known to be capable of elaborating any of the compounds just mentioned. It must be admitted that too little is known about the physiology of algae, but it is generally assumed that their physiologic activities are like those of seed plants. This may not prove to be entirely true. However, a beginning in algal physiology has been made by such investigators as Fogg, Haas, and Pringsheim in England, and Colin in France.

If it were asked how fungi acquired such abilities, why should this have taken place, and why should such compounds accumulate within the bodies of fungi or in their immediate environment, it can only be said that these matters remain essentially unknown. But certainly it is not in any sense a direct consequence of loss of chlorophyll by any algal ancestor. In the face of the plethora of facts established in recent years in regard to the synthesizing potential of fungi we are forced to concede that no evidence is at hand to indicate that the fungi were derived from algae or from any other group of living organisms. Any opinion regarding their origin remains purely speculative and conjectural, and proof of origin must be admitted to be entirely lacking.

So long as the food habits of fungi are discussed by use of the terms saprophyte and parasite all understanding of this feature remains impossible. It is conceded by all that one and the same species of fungus may be both parasitic and saprophytic. If these terms have real significance how is such a situation brought about? Also food habits and pathogenic potential are commonly confused, or are regarded as synonymous. A so-called saprophyte may cause disease and some parasites are non-pathogenic, in other words, pathogenic saprophytes and non-pathogenic parasites exist. Is an organism capable of change in its food habits or its pathogenic potential? The answer is that some species are exceedingly adaptable. What evidence can be marshalled to show that a given saprophyte uses only a given nonliving substrate as food and is totally incapable of elaborating substances and storing them as reserve food? By the same token, what evidence can be employed to establish that a given parasite uses as food only materials contained in living tissues, and is unable, of itself, to make and to store reserve food? If one reflects upon the evidence in hand on the food habits of fungi, he will readily discern that the terms saprophyte and parasite add nothing except confusion to our understanding of the food habits of fungi. Speed the day when these terms will be discarded!

Some mycologists place the fungi in a separate phylum, Mycophyta (fungus plants). Three of the groups within this phylum bear the names Phycomycetes (alga-like fungi), Ascomycetes (ascus-bearing fungi), and Basidomycetes (basidium-bearing fungi). The first of these groups derives its name in a way to indicate evolution from algae and the other two in a way to indicate their characteristic type of reproductive structures. If one were to concede that fungi, all of them, were derived from algae, then the name of the phylum should properly become Phycomycophyta. If one were to concede that the characteristic type of reproduction is basic in separating these fungi into the three above-named groups, then the so-called Phycomycetes would properly become the Sporangiomycetes, because all of them produce sporangia. But why be logical when it is easier to be a mycologist?

Members of several orders of the so-called Phycomycetes form reproductive units that are provided either with one or two organelles of locomotion enabling these elements to swim. Such elements are commonly termed zoospores to designate motile spores of fungi. If accuracy is sought, and it is a desideratum in science, then all motile spores could be better spoken of as planospores and all non-motile spores as aplanospores. The use of such designations is certainly long overdue.

Mycologists continue to place great emphasis upon whether a given fungus is homothallic or heterothallic, that is whether the thallus arising from the development of a single spore is capable of producing both sperms and eggs (or their equivalents) that may fuse to form zygotes, or whether two thalli arising from different spores are required for the formation of zygotes. Actually these two sexuality patterns belong to the same spectrum in the light of the fact that certain species of fungi are found to be both homothallic and heterothallic. When sexuality is properly interpreted it is apparent that all fungus cells, including vegetative cells, so-called asexual spores, and gametes contain both mating potentials, that is they contain femaleness and maleness. Such potentials are innate, omnipresent characteristics or features of the living protoplasm itself. They are never acquired *de novo*, are never lost, and are never separated completely. When viewed in this manner sexuality has not evolved in any different sense than that in which respiration or any other function has evolved.

Ecological terminology, as applied to fungi has a distinctly limited value and may, in fact, be quite misleading. We are accustomed to speak of soil fungi, fresh water fungi, marine fungi, coprophilous fungi, lignicolous fungi, dermatophilous fungi, etc. Just because fungi can be isolated from dung or from the ocean, for example, does not entitle one to classify them as coprophilous or marine, respectively. As a matter of fact one and the same species may be found in different habitats or may be capable of growing on a variety of substrata. Furthermore it seems very improbable that any so-called lignicolous fungus requires wood and wood alone as a source of food. It is admitted however, that certain pathogenic fungi are well-known to have a very restricted suscept range, and in any consideration of them, specific habitat becomes of enormous importance.

In consequence of the enactment of new laws regarding the naming of fungi their names are being changed. It becomes questionable that such activity adds to new knowledge. Instead it would appear that greater efforts devoted to studies of fungal development, physiology, and biochemistry would be a more profitable means of acquiring an understanding of the nature of fungi as related to other living organisms.

ASSOCIATION AFFAIRS

Address of the New Editor

For the convenience of those who may wish to communicate with the new editor prior to the next issue of the BULLETIN the address is as follows:

C. W. Hart, Jr., Editor
Scientific Publications
The Academy of Natural Sciences
Nineteenth and the Parkway
Philadelphia 3, Pennsylvania.

●

The 1960 Annual Meeting

The next issue of the BULLETIN (Volume 8, Number 1) will carry the usual announcements for the annual meeting of the Association. The 1961 meeting will be held at the University of Kentucky, Lexington, Kentucky, April 20-22. The members are reminded that the announcements generally contain deadlines for the submission of abstracts, nominations for officers and awards, etcetera, which usually follow the receipt of the January issue quite closely. The deadline for acceptance of papers for the program has not of course been set as yet, but past experience has shown that it is often too soon for many of those wishing to present papers. Because of the growing number of papers being submitted for presentation at our annual meeting, it will undoubtedly be necessary to adhere rather strictly to a deadline which is usually set at the latest date possible for insuring the printing of the abstracts prior to the meeting date. Members will perhaps wish to give thought to these papers before the announcements arrive; members are also urged to be considering nominations for the Meritorious Award for Teaching and applications for the Association Research Prize and the Research Fellowship at Mountain Lake. The Program Committee and the Committee on Local Arrangements will be listed in the January issue of the BULLETIN.

●

New Emeritus Members

The following qualified members were elected to Emeritus Membership at the last annual meeting: Dr. George H. Boyd, University of Georgia; Dr. Roland M. Harper, University of Alabama; Dr. L. R. Hexler, University of Tennessee; Dr. A. B. Massey, Virginia Polytechnic Institute; Dr. A. D. Shaftesbury, Lenoir Rhyne College.

NEWS OF BIOLOGY IN THE SOUTHEAST

About People

Two new staff members have joined the Department of Biology at the University of Virginia: **Dr. James L. Riopel,** Assistant Professor of Biology, received his doctorate in June 1960 from Harvard University where his research was concerned with the morphology and development of banana roots under the direction of Professor Ralph H. Witmore. He will be teaching courses in plant anatomy and plant morphogenesis; **Dr. Allison L. Burnett,** also Assistant Professor of Biology, received his Ph.D. from Cornell University in 1959 and spent the academic year 1959-60 at the University of Brussels, Brussels, Belgium working on the general problem of growth and cell differentiation in Hydra as N.S.F. Postdoctoral Fellow. His basic teaching responsibility will be in general biology.

Professor James Norman Dent, University of Virginia, has returned from a year in Europe as a Guggenheim Fellow. He visited a number of laboratories but worked mostly at the Gatty Marine Laboratory, St. Andrews University, Scotland. He conducted studies in amphibian limb regeneration and thyroid physiology.

Mrs. Te-Hsiu Ma (nee Peggy Rayburn) has been appointed Laboratory Assistant in Biology at Emory and Henry College.

Appointments in the Biology Department at Madison College include the following: **Dr. James Ferry,** formerly Senior Life Science Editor for McGraw-Hill, Professor of Biology; **Mr. Elwood Fisher,** formerly of Ohio University, Assistant Professor of Biology; **Mr. Duvall Jones,** formerly of the University of Maryland, Instructor of Biology; and **Mr. Robert Graves,** Instructor of Biology.

Dr. J. Warren Lee, Professor and Chairman of the Department of Biology at Southern University in Louisiana, passed away suddenly on April 1, 1960, in Baton Rouge, Louisiana.

Dr. George H. Mickey of Louisiana State University has accepted a position as cytogeneticist at the New England Institute for Medical Research, at Ridgefield, Connecticut. His duties commenced in August, 1960.

Dr. John P. Woodring, entomologist, has joined the Zoology faculty at Louisiana State University. Dr. Woodring, a specialist in soil mites, is a graduate of Pennsylvania State University and the University of Minnesota. He succeeded **Dr. Howell V. Daly,** who has joined the faculty in entomology at the University of California.

Dr. James H. Horton has been appointed as an instructor in the Department of Botany, University of North Carolina for the 1960-61 school year. He replaces **Dr. John Haesloop** who has accepted a position as assistant professor at Pfeiffer College.

During the past summer **Miss Anne Davidson** and **Mr. Edward Bostick,** both of the University of Alabama, and **Mr. C. B. O'Neal** of Valdosta State College worked as National Science Foundation Undergraduate Research Assistants at the Department of Botany at the University of North Carolina. Miss Davidson worked in mycology under the direction of Dr. W. J. Koch; Mr. O'Neal worked in mycology under the direction of Dr. John N. Couch; and Mr. Bostick worked in cytology under the direction of Dr. C. R. Bell.

J. Allan Holman, who has completed work for his Ph.D. degree, has joined the staff of Howard College as associate professor of Biology. Dr. Holman is a herpetologist.

Jerry Hunter, a recent M.S. graduate of Texas A. & M., has joined the staff of the Biology Department at Howard College as an instructor.

Dr. Alexander Hollaender attended the Third International Congress on Photobiology in Copenhagen, Denmark, July 31-August 5. Dr. Hollaender is President of the International Committee on Photobiology, and he gave the opening plenary session lecture which was entitled "Finsen and Basic Research".

Dr. William J. Cliburn has joined the Biology Department at Mississippi Southern College after receiving his Ph.D. degree in herpetology from the University of Alabama.

Dr. C. Leland Rodgers, Professor of Biology, Furman University, attended the Institute of Desert Biology at Arizona State University, Tempe, Arizona during the past summer.

Dr. Joseph B. Harris has been named professor of biology and head of department at Coker College, Hartsville, S. C. Now with the Georgia Experimental Station as Plant Physiologist, Dr. Harris will assume his new duties in January. Prior to receiving his Ph.D. at Duke University in 1958, he was an instructor in biology and chemistry at Young Harris College in Georgia.

Dr. Walter N. Hess, formerly head of the Biology Department of Hamilton College, has accepted a position as Visiting Professor at Winthrop College. Dr. Hess has a $12,000 U. S. Public Health Service grant for a three year study of the salt glands of marine vertebrate animals.

Dr. Samuel R. Tipton, Department of Zoology and Entomology, University of Tennessee, attended a Workshop for Teachers of Undergraduate Physiology at Carleton College, Northfield, Minnesota, August 8-20. These workshops are sponsored by the American Physiological Society with funds principally from the National Science Foundation. Dr. Tipton attended the workshop as a discussion leader and in his capacity as a member of the Education Committee of the Society.

At the recent meeting of the American Society of Plant Taxonomists **Dr. C. Ritchie Bell** of the University of North Carolina was re-elected as Secretary for the year 1961. **Dr. A. E. Radford,** also of the University of North Carolina, was appointed as the Society's representative on the editorial board of the American Journal of Botany.

Dr. J. Gordon Carlson, head of the Department of Zoology and Entomology at the University of Tennessee, spent July 31 through August 5 in Copenhagen, Denmark, where he had been invited to present a paper at a symposium of the Third International Congress on Photobiology. The title of his paper was "Mitotic Effects of Monochromatic Ultraviolet Microbeam Irradiation of the Nucleolus". While abroad, Dr. Carlson visited laboratories in Paris, Heidelberg, Lund, Stockholm, and Edinburgh, and gave a seminar at the University of Heidelberg.

Dr. James N. Liles is a new member of the staff of the Department of Zoology and Entomology at the University of Tennessee. Dr. Liles received his Ph.D. in Entomology at Ohio State University and has taught at the University of South Carolina. For the

past two years he has been engaged in research on insect physiology at Ohio State with the aid of a grant from the National Institutes of Health.

Dr. J. Ives Townsend, Assistant Professor of Zoology at the University of Tennessee, has left to accept a position in the Department of Biology and Genetics at the Medical College of Virginia, Richmond.

Dr. Takashi Makinodan of the Biology Division, Oak Ridge National Laboratory, attended the Eighth International Congress of Hematology in Tokyo, Japan, September 4-10, and presented an invited paper on "An Immunological Approach to Study Radiation-Induced Blood Chimeras". While in Japan Dr. Makinodan will consult with scientists on problems related to radiation effects on hematopoietic tissues, genetic aspects of antibody formation, and other problems at Hiroshima University, National Institute of Genetics at Mishima, Shinshu University at Matsumoto-shi, the National Institute of Health in Tokyo, and the Biochemistry Laboratory of the National Institutes of Radiological Sciences in Chiba. On his return, Dr. Makinodan will confer with scientific investigators at the University of Hawaii in Honolulu. He returns to Oak Ridge October 4.

Dr. David M. Prescott, Biology Division, Oak Ridge National Laboratory, attended the Tenth Congress of the International Society for Cell Biology in Paris, France, September 4-9. Dr. Prescott also attended the first Symposium on Macromolecular Structure and Biological Function held at Wenner-Gren Institute in Stockholm, Sweden, September 12-16, presenting an invited paper entitled "Function of the Nucleus in the Synthesis of Ribonucleic Acid and Protein." The Stockholm symposium is jointly sponsored by the International Union of Biological Science and the International Union of Biochemistry.

Dr. Sheldon Wolff, Biology Division, Oak Ridge National Laboratory, attended the Third International Congress on Photobiology in Copenhagen, Denmark, July 31-August 5, and presented a paper "On the Apparent Synergistic Effect of Infra-red and X rays in the Production of Intergenic Mutations (Chromatid Aberrations)." Dr. Wolff also attended the International Atomic Energy Agency Symposium on the Effect of Ionizing Radiation on Seeds and Its Significance for Crop Improvement, in Karlsruhe, Germany, August 6-13, and presented an invited paper entitled "The Effect of Postirradiation Storage on Seedling Height." While abroad, Dr. Wolff visited several European laboratories.

Dr. Gerald E. Cosgrove, Biology Division, Oak Ridge National Laboratory, presented a series of lectures before the National Science Foundation — Atomic Energy Commission Summer Institute of Radiation Biology at Florida State University, Tallahassee, July 30-August 7.

Several staff members of the Biology Division, Oak Ridge National Laboratory, participated in the Summer Institute in Radiation Biology at Tulane University in New Orleans, during August. **Arthur C. Upton** lectured on the subjects: Effects on prenatal development in mammals; pathophysiology in mammals; and relative biological effectiveness. **David G. Doherty** lectured on chemical protection against ionizing radiation. **Lawton H. Smith** lectured on effects of radiation on cell morphology and viability, and also on protection against ionizing radiation other than chemical.

The Biology Division, Oak Ridge National Laboratory, announces the following new staff members: **Evelyn Clark** has joined the Mammalian Genetics and Development Section. Miss Clark received the A.B. degree in Zoology from Winthrop College and the M.S. degree in Zoology from Oberlin College; **James C. Copeland,** a graduate of the University of Illinois, is a new member of the Radiation Protection-Living Cells Group; **Thomas C. Detwiler,** a Ph.D. in animal nutrition from the University of Illinois, will be with the Pathology and Physiology Section as a Research Associate; **Paul E. Eide,** who received the B.S. degree in Biology from Florida State University, has joined the Cell Growth and Reproduction Group; **William T. Lipscomb** will be with the Cell Physiology Group, and is a B.S. graduate in Biology from the University of Florida; and **Bobbie J. Scandlyn,** a graduate of Tennessee Polytechnic Institute, has joined the Mammalian Cytogenetics Group of the Mammalian Genetics and Development Section.

Dr. Gordon D. Braithwaite, Research Associate at the Fort Johnson Marine Biological Laboratory in South Carolina, returned to England on September 21, 1960, after completing two years tenure at the Laboratory. Dr. Braithwaite came to the laboratory from the University of Liverpool.

Dr. Harry W. Freeman has resigned from the Biology Department of the University of South Carolina to accept the position of Professor of Biology at the College of Charleston, Charleston, S. C.

Dr. Sherwood M. Reichard has been appointed as assistant professor of physiology in the Department of Biological Sciences at Florida State University. Dr. Reichard has been an Advanced Research Fellow of the American Heart Association at Johns Hopkins University for the past 2 years. His main interests are in the fields of endocrine physiology and enzyme biochemistry.

Dr. A. M. Winchester, head of the biology department at Stetson University, attended the International Congress of Photobiology held at the Medical Institute in Copenhagen, Denmark during the early part of August. Also, while in Europe he spent several weeks at the Institute of Human Genetics at the University of Munich in Germany.

Dr. Herman E. Brockman, recently at Florida State University, has joined the Genetics Section of the Biology Division at the Oak Ridge National Laboratory.

Drs. Gib DeBusk, Adrian Poitras, Norman Bishop, Leland Shanor, George Keitt, Edgar Barnett, of the Department of Biological Sciences at Florida State University attended the AIBS meeting at Stillwater, Oklahoma. Dr. DeBusk also attended the International Symposium on Growth held at Purdue University in June.

Dr. Leland Shanor has been appointed to the editorial board of Mycologia for a 5 year term by the Mycological Society of America at its recent meeting in Stillwater.

The University of Georgia Marine Institute at Sapelo Island, Georgia, announces the appointment of three biologists and two geologists to its staff. **Dr. Kenneth L. Webb,** having recently held a postdoctoral fellowship in plant physiology at Ohio State University, joined the staff in October, 1960, as a Research Associate with the associated rank of Assistant Professor of Botany. **Mr. Claire L. Schelske,** who completed his doctoral work in limnology at the University of Michigan in October 1960, joined the Institute staff as a Research Associate. **Mr. Frederick C. Duerr** expects to complete his doctoral work in animal physiology at the University of Minnesota in February, 1961, and has accepted appointment as Research Associate and Instructor of

Zoology at that time. **Dr. John H. Hoyt,** Assistant Professor of Geology, received his degree from the University of Colorado, and joined the staff in March, 1960, and **Mr. Vernon J. Henry** who completed his work for the Ph.D. degree at the Texas A. & M. College in October, 1960, has joined the Institute staff as a Research Associate on a half-time basis. He is also an Instructor of Geology at the Athens campus. The latter two staff members are interested in aspects of marine sedimentation.

Institutions and Organizations

Dr. Raymond C. Jackson of the **Department of Botany, University of Kansas,** Lawrence, Kansas, is establishing a card file on all research problems in the field of plant taxonomy that are currently and actively underway in North America. All botanists involved in taxonomic work are earnestly requested to support this project, which is under the sponsorship of the American Society of Plant Taxonomists, by sending information on your current research and the research of your students. Such information should identify the taxon or taxa under investigation, the primary trend or emphasis of the project (morphological, ecological, cytological, etc.) and the name and address of the person or persons actually doing the research. If the project is being supported by N.S.F. or other funds this information might be included, as might any tentative schedule for completion of the project. The object of the file is to eliminate duplication of taxonomic effort and to foster cooperation between those who might be working on a common problem from different approaches. Please address information and inquiries to Dr. Jackson.

At **Emory and Henry College** two tracts of land on the campus, approximately 20 acres each, are to be developed as biological study areas. One, to be known as "The Woods", is an oak-hickory woods in which mammal studies will be done. The second is a low, marshy area traversed by a permanent stream and will be referred to as "The Swamp". Basins will be excavated and established as permanent ponds for life history and experimental studies in ichthyology and herpetology. These areas will also provide students with the opportunity for research in a number of other fields.

The **Department of Botany of the University of North Carolina** has set up a new and expanded offering of graduate courses in botany to be given during the two six-weeks terms of the Summer Session. The courses will be given in a three-year sequence and will include all the basic graduate courses offered by the Department. The summer program will be of particular interest to high school teachers applying for NSF Summer Fellowships, to college teachers of biology on NSF Science Faculty Fellowships for the summers, and to graduate students in biology at colleges and universities with limited graduate offerings in this field. The sequential course offerings will make possible the completion of required courses for an M.A. in Botany during three summers, and it should be possible to complete all requirements for the degree in four summers if work on the thesis is in progress during the intervening years. Further information concerning the course offerings, expenses, department facilities, etcetera, may be obtained from the Chairman, Department of Botany, University of North Carolina, Chapel Hill, North Carolina.

Grants in Aid

Assistant Professor **Samuel P. Maroney, Jr.,** of the University of Virginia has been awarded a grant of $2,300 by the **U. S. Public Health Service** for research on comparative aspects of ultra-violet induced hemolysis.

The Department of Health, Education and Welfare, upon recommendation of the National Advisory Council on Health Research Facilities has approved a **Public Health Service** grant of $475,000 to **Florida State University.** This grant, initiated by Dr. Leland Shanor of the Department of Biological Sciences will, with matching funds, be used for the construction of a building which will house portions of the new AEC Molecular Biophysics Institute and relieve space shortage in the present building occupied by the Department of Biological Sciences at Tallahassee.

A grant of $166,000 has been awarded to **Dr. A. Gib DeBusk** of the Department of Biological Sciences at Florida State University. This grant, from the **National Aeronautics and Space Administration** is in support of a program of research in space genetics.

The **Department of Botany,** University of North Carolina, has been awarded a grant of $306,000 from the **National Institutes of Health** for use in construction and equipping of health oriented research space in the new botany building at Chapel Hill. Construction is expected to start early in 1961.

Dr. C. Ritchie Bell, University of North Carolina, has been awarded a **National Science Foundation** grant in the amount of $12,300 for a three year project dealing with isolating mechanisms in the Umbelliferae.

Dr. Max H. Hommersand has been awarded a **National Science Foundation** grant in the amount of $24,300 for a two year project on cellular differentiation in *Chlamydomonas.*

Dr. A. E. Harrises of Mississippi Southern College has received a grant renewal from the **National Institutes of Health** to continue his work on the monogenetic trematodes of south Mississippi.

Dr. John Freeman of Winthrop College has been awarded a **National Science Foundation** research grant for a two year study of guppies.

Dr. G. Thomas Riggin, Jr., Assistant Professor of Biology, Furman University, received a grant from the **Southern Fellowships Fund** during the summer of 1960.

Dr. Frederic C. Chang, professor of chemistry and research associate in pathology and microbiology at the University of Tennessee Medical Units in Memphis, has been awarded a $28,951 grant by the **U. S. Public Health Service** for research on the synthesis of steroid hormones.

Dr. Clark E. Grosvenor, assistant professor of physiology at the University of Tennessee College of Medicine, has been awarded a $37,706 grant by the **U. S. Public Health Service.** The grant is to be used over a three-year period to support basic studies concerning hormonal factors responsible for mammary gland function during lactation.

Dr. Donald W. Dery, Department of Biology, College of Charleston, Charleston, S. C., recently received a research grant of $14,500 for three years from the **National Science Foundation** to study the life cycle of *Bucephalus cuculus,* a larval trematode.

The **College of Charleston** received a grant from the **National Science Foundation** to conduct an Undergraduate Research Participation Program at the Fort Johnson Marine Biological Laboratory. The program began on June 6, 1960, and will continue to May 31, 1961.

The ASB BULLETIN

Volume 8, Number 1 January, 1961

THE LABORATORY BUILDING—MOUNTAIN LAKE BIOLOGICAL STATION

The Official Quarterly Publication of
The Association of Southeastern Biologists

THE ASB BULLETIN

The ASB Bulletin is the official quarterly publication of the Association of Southeastern Biologists, Inc., and is published at Philadelphia, Penna., in January, April, July and October. Letters, news items, other contributions, and all communications about editorial matters should be addressed to C. W. Hart, Jr., Editor, The Academy of Natural Sciences of Philadelphia, 19th and The Parkway, Philadelphia, Penna. Changes of address should be sent promptly to the Secretary of the ASB, Dr. Harold J. Humm, Department of Botany, Duke University, Durham, N. C. Subscription orders from libraries and other institutions should be sent to the Business Manager, Dr. Elsie Quarterman, Department of Biology, Vanderbilt University, Nashville, Tenn. Subscription rate for non-members of the ASB: $2.00 per year. Printing and typography by the Wickersham Printing Co., Lancaster, Penna.

C. Willard Hart, Jr.
Editor

Harold J. Humm, Associate Editor
Elsie Quarterman, Business Manager

ASSOCIATION AFFAIRS

A Note from the President

On October 28 the Association of Southeastern Biologists was issued a North Carolina charter as a nonprofit scientific and educational corporation. At the meeting of the Executive Committee in Chapel Hill on October 29 formal action was taken transferring all members, officers, assets and the constitution and by-laws of ASB to the new Corporation, the Association of Southeastern Biologists, Inc. Just subsequent to the incorporation the State of North Carolina declared ASB, Inc. to be exempt from state taxes. We are now making a new application to the Bureau of Internal Revenue for federal tax-exempt status. In view of the revision of our constitution and by-laws made at New Orleans, our incorporation, and our tax-exempt status in North Carolina we anticipate favorable action on our new application to the federal government.

Since a corporation must have a resident agent who deals with the State in corporate matters, the Executive Committee has appointed Dr. William J. Koch, associate professor of botany at the University of North Carolina as agent for an indefinite term. The position carries no compensation, very little in the way of duties, and no authority regarding the internal affairs of ASB. The Executive Committee now constitutes the Board of Directors of the new corporation and will continue to function as in the past.

Professor M. S. Breckenridge of the School of Law at the University of North Carolina has been of very great help in accomplishing our incorporation and in securing our state tax-exempt status. I wish to thank him here for his valuable services. personally as well as in behalf of ASB and its Executive Committee, particularly since Prof. Breckenridge has refused any compensation for his work for us.

The Executive Committee considered a number of other matters at its Chapel Hill meeting, but I shall not discuss them here since our Secretary is reporting on the meeting elsewhere in this issue.

We are looking forward to another excellent meeting this April in Lexington. John Carpenter informs me that it is essential to make motel and hotel reservations as early as possible since our meeting comes at the time of the racing season in Lexington, and I am passing this advice on to you.

I want to remind you of a few of the things you can do as a member of ASB to help keep our organization operating efficiently and effectively: 1. Don't forget to pay your dues, 2. Be sure to give our Secretary any address change promptly, 3. Submit a paper for the Lexington meeting, 4. Don't hesitate to submit appropriate manuscripts to the ASB Bulletin, 5. Keep your state correspondent informed regarding news about yourself and your institution for publication in the Bulletin, 6. Nominate for membership your colleagues who want to become members or who should be members, 7. Respond to the calls for nominations for officers, recipients of awards, and emeritus members.

Victor A. Greulach

Executive Committee Meeting

An interim meeting of the Executive Committee of the Association of Southeastern Biologists was held on Octover 30, 1960, at the University of North Carolina. Those in attendance were President Victor A. Greulach, Past-President Horton H. Hobbs, President-Elect Royal E. Shanks, Vice-President Walter S. Flory, Secretary Harold J. Humm, Editor C. Willard Hart, Jr., Committeemen B. Theodore Cole, Charles E. Jenner, and Robert B. Short.

President Greulach announced the appointment of the new editor, C. Willard Hart, Jr., and of the following committees—**Auditing:** Fred Wolf, *Chairman*, Ilda McVeigh, and C. S. Chadwick; **Nominating:** Horton Hobbs, *Chairman*, J. G. Carlson, and George H. Boyd; **Resolutions:** Ruffin Jones, *Chairman*, Thelma Howell, and Edmund Berkeley; **Research Awards:** Ralph Yerger, *Chairman*, Charles Jenner, and Victor Cutter; **Meritorious Awards:** Roberta Lovelace, *Chairman*, C. C. Goodchild, and William J. Koch; **Goethe Awards:** John Carpenter, *Chairman*, Robert B. Short, and Joseph O'Kelley; **Meeting Places:** Donald Scott, *Chairman*, Paul Walker, and Walter Herndon; **Program:** John Carpenter, *Chairman*, Harold Humm, and C. W. Hart, Jr., **Local Arrangements:** John Carpenter, *Chairman*.

President-Elect Shanks reported that he had tentative plans for a Thursday night speaker for the Lexington meetings in the field of ecology, perhaps conservation oriented.

Secretary Harold J. Humm reported that efforts to keep the addresses of members up-to-date were

(*continued on next page*)

ASB BULLETIN Volume 8, Number 1—January 1961

CONTENTS

(*continued from page 2*)

rather disappointing as so many members change address without notification and it is sometimes necessary to write to the chairman of their former department to find out where they are.

Treasurer Elsie Quarterman sent a report for the period April 1 to September 28, 1960, together with a letter commenting on current problems. She pointed out that during April it was not possible to meet the bills received and that while dues will be coming in during January, the total receipts may not exceed the cost of the BULLETIN. She asked for suggestions for reducing expenses. Changing the fiscal year to coincide with the calendar year has deferred receipt of many dues payments for about six months.

Vice-President Flory moved that a sufficient amount be shifted from the savings account to the checking account to pay all outstanding bills. President-Elect Shanks seconded and the motion passed.

Dr. Jenner moved that we budget $150 per year for travel and honorarium for a visiting speaker, the fund to accumulate if not used. The motion passed.

There was a discussion concerning the possibility of increasing patron memberships and President Greulach appointed Dr. B. Theodore Cole as Chairman of a Patron Membership Committee.

Editor Hart reported that printing costs of the BULLETIN in Philadelphia (He is Editor of Scientific Publications for the Academy of Natural Sciences of Philadelphia) will be similar to the costs in Columbia, S. C., and perhaps less in some respects. He submitted a new cover page design and this was approved as a result of a motion by Past-President Hobbs, seconded by Flory, and passed without dissent.

Mr. M. S. Breckenridge of the University of North Carolina School of Law brought into the meeting the official document attesting to incorporation of the Association of Southeastern Biologists in the State of North Carolina, effective October 29, 1960. All incorporation procedures were handled by Mr. Breckenridge, and expedited so that this meeting of the Executive Committee might also be a meeting of the Board of Directors, as the twelve officers and members of the Executive Committee are designated as the Board of Directors. Greulach, Hobbs, and Humm were named as incorporators and Dr. William Koch agreed to serve as the initial registered agent for the corporation.

Mr. Breckenridge refused a fee for his services so that the only cost of incorporation was the state charge of $25 and a charge of less than $5 for recording. Past-President Hobbs moved that a letter of appreciation be written Mr. Breckenridge. The motion was seconded by Dr. Short and passed unanimously.

Dr. Douglas Humm, representing the Southeastern and South Central Sections of the Society of General Physiologists, joined the meeting to advise the Executive Committee of the interest of this group in meeting with ASB at Lexington and of arranging a symposium on invertebrate physiology. Dr. Cole moved that they be invited to meet with ASB and to present the symposium. The motion, seconded by Humm, was passed.

President Greulaeh reminded the committee that the term of Dr. Ray Noggle as AAAS representative expires on December 31, 1960, and that Dr. James H. Gregg, Department of Botany, University of Florida, has been appointed to succeed him. Dr. Greulach also read a letter from the Centennial Office of the American Association of Land Grant Colleges advising ASB of their centennial observance of next year. It was agreed that the letter be answered to the effect that we are interested in cooperating with them in this observance.

The author, Dr. Ivey F. Lewis, is an Emeritus Professor of Biology at the University of Virginia, a former Dean of the University, and a founder and former director of Mountain Lake Biological Station. Dr. Lewis's long career has also included work in the fields of red algae and in the development of plant galls.

BY IVEY F. LEWIS

Mountain Lake Biological Station

The need for a summer biological station had long been felt, and the reasons for the need were strongly stated in a notable address by William M. Wheeler before the American Society of Naturalists. The address was entitled, "The Dry Rot of Academic Biology." In the college training of the young biologists there are three factors that prevent him from seeing animals and plants as they actually are in a natural state. One is the fact that class instruction in the winter months comes at a time when living material is not readily available, so that most of the material used in the customary "general biology" courses must come in bottles or jars put up by one of the excellent biological supply houses. A second factor is the disappearance of natural habitats in the path of urbanization. A third factor is the social complexity of life at the usual summer school.

In the early 1920's a good deal of thought and discussion were given to the problem. Professor Bruce D. Reynolds and I inspected possible sites around the Chesapeake Bay and decided that another marine station, in spite of the wealth of animal and, to a lesser extent, plant life, did not fill the need as we saw it. The Marine Biological Laboratory at Woods Hole was supplemented by facilities along the coast from Maine to Florida. Furthermore, most of our advanced students were going into teaching, and the colleges and schools where they would serve were inland. This seemed a compelling reason why they should become familiar with the sort of things that they would encounter where they lived.

When the Virginia Academy of Science met at Blacksburg in 1925, Professor William Day Smith, who had taught at nearby Radford College Summer School, suggested that Mountain Lake would be a good location. Our colleagues at the Virginia Polytechnic Institute arranged a field trip to Mountain Lake, where under the leadership of Professor A. B. Massey we saw the natural advantages of the place. There was the interesting lake itself, the limitless unspoiled mixed deciduous forest, the mountain streams, dry rocky ridges, and deep valleys with great hemlocks, the open grassy areas, the bogs, and the nearby New River. In sum, nearly all types of habitats.

The mountains there form the divide between the Mississippi and Atlantic drainage areas, and the summer climate is always cool and has less rainfall than some other mountain areas. The presence of the hotel, roads whieh were passable and later very good, and the highway and the Norfolk and Western Railroad at the foot of the mountain were also favorable factors.

Meanwhile, the advantages of the Highlands Museum in North Carolina came to our attention. It was our intention to have a station which would serve the southeastern states, and in hopes of enlisting cooperative support from universities in this area, letters were written to all. The response was disappointing. Only one (Vanderbilt) showed any interest or possibility of support.

When the possibility of developing an inland biological station at Highlands was presented to the General Education Board, the success of the Marine Biological Laboratory was cited as a pattern of cooperative endeavour. I was told, however, that this success was not due to the cooperative feature, but to strong support from *one* institution and the generous endowment of *one* individual. The Board might therefore be interested in a station for which *one* institution was willing to assume responsibility.

It was then decided to make a trial run at Mountain Lake. The Mountain Lake Biological Station of the University of Virginia was established in 1930. Professor Bruce D. Reynolds served as Director, with Ivey F. Lewis as Associate Director. The Thompson Cottage at the Mountain Lake Hotel was fitted up as a temporary laboratory and served as such for the period 1930-1933.

Several decisions as to policy were made: (1) The courses given were to be at the graduate level, (2) The faculty was to be selected on a broad basis--one member from the University of Virginia, two from elsewhere in Virginia, two from Southern institutions, two from institutions outside the South (usually from Eastern or Midwestern universities), and, when possible, one top-flight man of national prestige, (3) A varied curriculum was to be arranged in such a way that in a three year period a graduate student would be able to get instruction in subjects not covered in usual college curricula, and (5) Emphasis was to be placed on subjects for which live material would be locally available; preserved material was to be used only when necessary.

On the whole the policy as outlined has proved its worth. Faculty and students have come from most of the states east of the Mississippi River; the resulting contacts and exchange of ideas serving to broaden the horizon of students and faculty alike.

An intensive course of five weeks length to which the student, under competent direction, gives his entire attention has resulted in better work than where the student, for a longer time, divides his interest among several subjects.

The disadvantages of rented and inadequate quarters became increasingly obvious and it was realized that a better physical plant was a necessity. Dean Charles G. Maphis initiated steps which led to placing the Station on a sound basis. Through a friend in West Virginia, he interested Mr. John B. Laing in the work of the Station, and the result was that Mr. Laing presented, on a long term and renewable lease, a well located tract of 83 acres one mile north of the lake on the old Salt Sulphur Turnpike. Dean Maphis then approached the General Education Board, which has done so much for education in the South. After inspection of the Station's program the Board, in December, 1933, appropriated $30,000 for buildings and an additional sum for scholarships.

At this time Ivey F. Lewis succeeded Dr. Reynolds as Director. In the planning of construction, the energy and skill of the latter made possible the erection of a laboratory, dining hall, four student dormitories, four small cottages, a service building, and a caretaker's cottage. Water was piped by gravity from a spring high up on the mountain side. A power line was constructed to connect the Station with the Appalachian Power Company's line to the hotel. Connection was also made with the Pembroke Telephone Company.

This seems a great deal to have been done with the available funds. It was possible because the spring of 1934 was at the depth of the great depression and the services of two competent builders were available along with an abundance of less skilled local labor. Hardwood and coniferous timber was immediately at hand. Though the time was short the buildings were ready for the opening in June. On July 4 dedicatory exercises were held, with the principal address by Dean Price of the Virginia Polytechnic Institute.

The increasing proportion of married students pointed up the need for more small cottages, and in 1936 an additional appropriation from the General Education Board made such construction possible.

At about the same time Mr. Laing enlarged his gift of land by 600 acres. A little over ten years later Mr. and Mrs. James W. Wiltshire of Lynchburg added 600 acres to the Station's holdings. Finally, Professor Horton H. Hobbs, Director, succeeded in 1959 in having 1500 acres in the Jefferson National Forest adjoining the Station property designated a Scenic Area, which will be kept in its natural state undisturbed by cutting of timber or other development.

In 1939 the General Education Board appropriated $55,000 for constructing and equipping a larger and more solid laboratory (see cover photograph). This handsome building of native stone has been in use since 1940. It contains the usual classrooms and laboratory facilities as well as a number of research rooms and offiees.

The objective of the Station has always been to combine a teaching with a research program. The presence, therefore, of serious students and experienced investigators living in a compact group far removed from distractions has proved to furnish a favorable atmosphere for the stimulation and growth of serious interest in fundamental biological problems.

About The Lexington Meeting

The twenty-second Annual Meeting of the Association of Southeastern Biologists will be held at the University of Kentucky, Lexington, Kentucky, April 20-22, 1961. Three organizations will meet with the ASB: The Southeastern Section of the Botanical Society of America, The Southern Appalachian Botanical Club, and the Society of General Physiologists (South Central and South Atlantic Regions).

The meeting will begin on Thursday afternoon, April 20, with registration in the lobby of Memorial Hall on the campus of the University of Kentucky. On Thursday night the Society of General Physiologists will sponsor a symposium entitled *Hormonal Control in Crustacea;* the panel will consist of Dr. Milton Fingerman of Tulane University, Dr. Deitrich Bodenstein of the University of Virginia, and Dr. Theodore Bulloch of the University of California. Several sessions of contributed papers and the annual business meeting will be held on Friday, and the presentation of awards will take place on Friday night. Three field trips are scheduled for Saturday.

Local Arrangements Committee

Members of the committee on local arrangements at the University of Kentucky are: Dr. Roger W. Barbour; Dr. Alfred Brauer; Dr. E. T. Browne; Dr. J. M. Carpenter, *chairman;* Prof. J. M. Edney; Dr. C. E. Henrickson; Dr. R. A. Kuehne; Dr. H. P. Riley; Dr. J. A. Wallwork, and Prof. J. C. Warden.

Meals

Dining facilities will be available at two University cafeterias. There are also several grills on campus and restaurants in the vicinity of the University.

Housing Facilities

Housing facilities will be somewhat difficult since the ASB meeting falls during the Keeneland racing season. However, the **Phoenix** and **Lafayette** hotels are holding 200 rooms for those attending the meetings. Both hotels are about 15 minutes walking distance from the University. The distance is approximately 1 mile. **Reservations must be made before April 1, 1961.**

Hotels

Lafayette, 100 rooms reserved, single $6.00-$7.00; double $8.50-$9.50; twin $9.50-$11.00. **Phoenix,** 100 rooms reserved, single $6.00-$10.00, predominately $8.00; double $8.50-$11.00; twin $11.00-$14.00.

Parking is free at the Phoenix; there is a charge at the Lafayette at present, but the possibility of free parking by April. Most people will probably find it most convenient to stay at these hotels.

Motels

First class motels within 10 minutes car distance from the University are:

Howard Johnson (Highway 27, South)
Single: $8.24
Twin: $12.36
Each additional person $1.00

Springs Motel (2020 Harrodsburg Road)
Single: $6.00
Double: $8.00
Twin: $10.00

Downtowner Motel (347 East Main)
Single: $7.00
Double: $10.00
Twin: $12.00

Campbell House (Harrodsburg Pike)
Single: $8.00
Double: $12.00

Town House Motel (1912 South Lime)
Single: $6.00
Double: $7.00
Twin: $8.00

It should be stressed that *reservations must be obtained early* since the meetings occur during the racing season and many racing fans obtain reservations 4 to 8 months in advance. *When writing for hotel reservations please mention the conference or use the blank supplied in this issue.*

Regarding Segregation: Negroes may stay at the Phoenix Hotel but the dining room is segregated. Other hotels and motels are segregated both as to rooms and dining. However, there is no segregation in dining facilities on campus, where members are invited to take most of their meals.

Field Trips

One all day and two morning field trips for Saturday are planned.

The all day trip will be an ecological and collecting tour through 150 miles of the area adjacent to Lexington. It will cover three of the physiographic regions of Kentucky including visits to Natural Bridge State Park and Red River Gorge.

The two morning trips will give a choice between a visit to the United States Public Health

IMPORTANT DEADLINES

Please note the following deadlines, all of which are to be met before our Twenty-second Annual Meeting at the University of Kentucky, Lexington, Kentucky, April 20-22, 1961. Members can help facilitate plans for the meeting by sending in all requested material as far in advance of the deadlines as possible. Because the time available for preparation of the program and publication of abstracts is already at a minimum it will be necessary for the program committee and the editor to adhere strictly to the deadline set; NO TITLES CAN BE ACCEPTED THEREAFTER.

February 11—Suggestions for nominations for ASB officers and executive committee members (Blank 1).

February 18—Titles and abstracts of papers to be presented at the Lexington, Kentucky, meeting (Blank 4).

March 1—Applications for Goethe Awards to graduate students (See Page 8).

March 1—Papers to be considered for the Association Research Prize (See Page 7).

April 1—Applications for Phipps and Bird Research Fellowship at Mountain Lake (See Page 8).

April 1—Nomination letters for the Meritorious Award for Teaching (See Page 7).

THE ASSOCIATION OF SOUTHEASTERN BIOLOGISTS

(Founded 1937)

Purposes

The Association of Southeastern Biologists was organized ". . . to encourage in the broadest and most liberal manner the advancement of biology as a science by the promotion of research in biology; by the increase and diffusion of knowledge of biology; by emphasis of the relation of fundamental knowledge of biology to the solution of biological problems; by the preservation of biological resources; and by its meetings, reports, discussions and publications to promote scientific interests and inquiry, thereby adding to the health, happiness and knowledge of all peoples."

Eligibility for Membership

Any person is eligible for membership who is engaged in (a) biological research, (b) the teaching of biological subjects, (c) graduate study in the biological sciences, or (d) work in the various fields of applied biology. Members, in general, shall be residents of the Southeastern States. Any eligible person recommended by two or more members in good standing may become a member upon payment of the annual dues of two dollars and completion of this form. The annual dues include a subscription to the *ASB Bulletin*.

Activities

1. Annual meetings in April at which the results of investigations are presented for discussion, and at which appropriate symposia may be conducted.
2. Quarterly publication of the *ASB Bulletin* containing programs of annual meetings and abstracts of papers presented, news of science and scientists in the Southeast, a record of Association affairs and articles of regional or general timely interest.
3. The discussion of subjects of general interest to biologists of the Southeast and the formulation of policies and plans of action in relation to such subjects.
4. Encouragement of research through research prizes awarded for especially meritorious papers presented at the annual meetings.
5. Presentation of a Meritorious Award for an outstanding contribution to biology, especially in service to young people through teaching.
6. The annual award of a research fellowship at the Mountain Lake Biological Station.
7. Representation on the Council of the AAAS.
8. Affiliation with the AIBS, which entitles all members to receive the *AIBS Bulletin*.

1. SUGGESTED NOMINEES FOR ASB OFFICES AND EXECUTIVE COMMITTEE POSITIONS

To the members of the Nominating Committee:

I wish to suggest that you consider the following ASB members in selecting nominees for offices and executive committee positions:

PRESIDENT-ELECT ..... VICE-PRESIDENT .....

SECRETARY .....

EXECUTIVE COMMITTEE MEMBERS (2 for 3-year terms) .....

.....

Deadline: February 11

Mail to: DR. HORTON H. HOBBS, JR.
Department of Biology
University of Virginia
Charlottesville, Va.

---

2. STATEMENT OF ASB DUES FOR 1961

Your ASB dues of $2.00 for 1961 are now payable. This sum includes your subscription to the ASB BULLETIN for 1961. Please make your checks payable to the Association of Southeastern Biologists, and mail to the treasurer with this statement at the address given below. Please be sure to write your name and correct mailing address on this statement. The ASB constitution provides that members whose dues are in arrears two years will automatically be dropped from membership. The Executive Committee has ruled that members who are in arrears will not receive subsequent issues of the BULLETIN until dues are paid.

NAME .....

ADDRESS .....

CITY ..... STATE .....

If retired, check here .....
If retiring within a year, check here .....

DR. ELSIE QUARTERMAN
Department of Biology
Vanderbilt University
Nashville 5, Tennessee

---

3. APPLICATION FOR MEMBERSHIP ASSOCIATION OF SOUTHEASTERN BIOLOGISTS

NAME (in full) ..... Date .....

DEGREES (institutions and dates) .....

.....

PRESENT POSITION: (1) Title ..... (2) Department .....

(3) Institution ..... (4) City, State .....

PREFERRED MAILING ADDRESS .....

SPECIALTY (e.g., physiology) .....

SPECIFIC INTEREST (e.g., respiration) .....

RECOMMENDED BY (1) ..... (2) .....

Fill out this blank, enclose check (or money order) for $2.00 as dues for one year, and mail to:

DR. ELSIE QUARTERMAN, Treasurer ASB, Dept. of Biology, Vanderbilt Univ., Nashville 5, Tenn.

4. Deadline: February 18 CALL FOR PAPERS FOR THE LEXINGTON MEETING

This form and two typewritten copies of the abstract must reach the Chairman of the Program Committee, Dr. John M. Carpenter, Department of Zoology, University of Kentucky, Lexington, Kentucky, not later than Saturday, February 18, if the title is to appear on the program or the abstract included among those published in the April issue of the BULLETIN. Papers to be submitted for the Research Prize must be included in the program. Please type or print the following information. All papers are limited to 10 minutes, with three minutes for discussion.

1. AUTHOR(S): .....

2. TITLE OF PAPER: .....

.....

2. INSTITUTION(S) REPRESENTED: .....

4. Cheek organizations to which author(s) belong:

..... Association of Southeastern Biologists.

..... Southeastern Section, Botanical Society of America.

..... Southern Appalachian Botanical Club.

..... Society of General Physiologists, South Central and South Atlantic Regions.

5. Projection equipment needed: ..... 2 x 2 slide projector; ..... 3 x 4 slide projector; other equipment: .....

6. If your paper is being submitted for the Association Research Prize, please check here: .....

7. This form must be accompanied by two double-spaced typewritten copies of an abstract, not to exceed 150 words. Longer abstracts are subject to cutting by the editor without the approval of the author. **Please use the following form in typing the heading in order to avoid excessive editing:**

Dimorphism of Embryonic Hooks of *Hymenolepis nana*
Arthur W. Jones, *University of Tennessee*

Start the text of the abstract here, on a separate line with paragraph indentation. In general the abstract should appear as a single paragraph, although two paragraphs are aeceptable if really needed.

8. *Reprints:* Reprints of individual abstracts are available at the rate of $3.00 for the first 200 and $1.00 for each additional 100, postpaid. It is necessary to attach a check for the proper amount to this form and send it along with the form and the two copies of the abstract. Checks should be made payable to the Association of Southeastern Biologists. **Orders for abstracts will not be entered unless payment accompanies the order.**

Indicate here how many reprints of your abstract you want: ..... .

HOUSING RESERVATION COUPON

(Fill in and mail to hotel or motel of your choice, see page 6)

Please reserve the following accommodations for the 22nd Annual Meeting of the Association of Southeastern Biologists, in Lexington 20-22 April 1961.

Single Room ....., Double-Bed Room ....., Twin-Bed Room ....., Rate ....., Number in Party ....., Date of Arrival ....., Departure Date .....
(Give approximate hour, A.M. or P.M.)

Name .....
Please Print

Address .....

Because of the racing season, please make reservations early! !

The Funkhouser Biological Sciences Building
University of Kentucky

The Funkhouser Biological Sciences Building houses the departments of Anatomy and Physiology, Botany, Microbiology, and Zoology. It also contains the biology library, the electron microscope, and the W. R. Allen Museum of Zoology. Most of the papers at the Lexington Meeting will be scheduled in this building.

Service Narcotics Hospital on the outskirts of Lexington or a visit to one of the local thoroughbred farms.

The U.S.P.H. Service Hospital in Lexington is unique as a free federal hospital for the treatment of drug addiction and for research in this field. It is the largest hospital of this type in the world and one of two in the United States.

The famous Blue Grass Region surrounding Lexington houses over 300 horse farms of which many are world famous. A trip to one of the famous breeding farms is scheduled.

General Information

1. Registration will be Thursday afternoon, April 20, in the lobby of Memorial Hall on the University campus and on Friday morning, April 21, in the lobby of the Funkhouser Biological Sciences Building.

2. A fee of $1.00 will be charged for registration.

3. Plans are being made to hold all paper sessions in the Funkhouser Biological Sciences Building.

4. Lexington is not dry.

5. Lexington is served by three airlines: *Delta* from Atlanta; *Eastern* from Louisville, and *Piedmont*, directly, from Charlotte, Charlottesville, Raleigh-Durham, Richmond, Roanoke, Tri-City, and Winston-Salem. The airport is 4½ miles west of town.

Two railroads also serve Lexington: The *Chesapeake and Ohio* and the *Southern*. The *Greyhound Bus Line* also services Lexington.

6. Inasmuch as the meeting occurs during the local racing season, a section has been reserved at the Keenland Race Course for those who may desire to attend.

7. Free campus parking for ASB members will be available at the Rose Street parking lot, which is quite convenient to meeting activities.

Points of interest around Lexington

1. Ashland, home of Henry Clay.

2. Hunt Morgan Home, home of Thomas Hunt Morgan, noted geneticist and Nobel Prize winner.

3. Home of Mary Todd, wife of Abraham Lincoln.

4. I. B. M. electric typewriter plant.

5. James E. Pepper Distillery.

6. Transylvania University, oldest institution of higher learning west of the Alleganies.

7. Statue of Man O' War, most famous thoroughbred in history.

8. Shrine Crippled Children's Hospital.

9. Tobacco warehouses.

Meritorious Award Nominations

As in previous years, an honorarium of $100 has been made available by the Will Corporation of Georgia, to be used as an award for the recognition of especially meritorious teaching by a member of the ASB. The regulations governing the award are as follows:

"The recipient must be a member of the ASB in good standing. He should have taught biology in a southern institution for at least ten years, and must be currently teaching. He must not be a dean or have regular administrative duties beyond the department level (this particular criterion requiring interpretation in individual cases). Among evidences of his qualifications is the progress of the candidate as indicated by recognition in his own institution (important assignments and other contributions specifically related to good teaching); and the number and quality of students for whom he provided primarily the inspiration to continue in biology, especially those who later received advanced degrees."

Past recipients of the Meritorious Award for Teaching are as follows:

1952. Dr. Mary Stuart MacDougall (Agnes Scott)
1953. Dr. Orland E. White (Univ. of Virginia)
1954. Dr. Woolford B. Baker (Emory)
1955. Dr. John N. Couch (Univ. of North Carolina)
1956. Dr. Hugo L. Blomquist (Duke)
1957. Dr. Ezda Deviney (Florida State)
1958. Dr. Henry R. Totten (Univ. of North Carolina)
1959. Dr. Margaret Hess (Winthrop College)
1960. Dr. Ora C. Bradbury (Wake Forest College)

In these times in which so much is heard about teaching, it is particularly important that excellence in teaching should be rewarded and publicized in every way possible. Members of the ASB are urged to make nominations and send the needed supporting materials to *Roberta Lovelace, Department of Zoology, University of South Carolina, Columbia, S. C.*

COMMITTEE
C. C. Goodchild
William J. Koch
Roberta Lovelace, *Chairman*

Association Research Prize

The rules and regulations governing the annual Association Research Prize of $100.00, sponsored by the Carolina Biological Supply Company, Elon College, North Carolina, are as follows:

1. The Research Prize is to be awarded for an especially meritorious paper actually presented at the annual meeting.

2. Only members are eligible to submit papers in competition for the Research Prize. This ap-

plies to all names on the submitted paper. Applicants for membership are not eligible to submit papers for the Research Prize.

3. Papers submitted in competition may be in press but must not have been published prior to March 1 of the year of the current competition.

4. Judges will be eminent biologists outside the Southeast. They will set their own criteria, and may withhold the award if no paper is judged to have sufficient merit.

5. Papers must be submitted *in triplicate* and in their entirety not later than March 1, 1961, to *Ralph Yerger, Department of Zoology, Florida State University, Tallahassee, Fla.* One copy of the prize-winning paper will remain in the ASB files, but all other copies will be returned to the authors as soon as possible.

6. Announcement of the winner of the Research Prize will be made at the annual meeting.

Phipps and Bird Research Fellowship

A Research Fellowship of $150.00 for summer research at Mountain Lake Biological Station of the University of Virginia has been continued through the generosity of the Phipps and Bird Company of Richmond, Virginia. Any member of the Association may submit an application. The application should be accompanied by a summary of the planned work, by a list of important publications, and, especially in the case of younger workers, by references and educational data. Applications should be sent to *Ralph Yerger, Department of Zoology, Florida State University, Tallahassee, Fla.*, not later than April 1, 1961. The selection will be made by the Research and Awards Committee of the ASB in consultation with the Director of the Mountain Lake Biological Station. The announcement of the recipient will be made at the annual meeting of the ASB.

COMMITTEE

Charles Jenner
Victor Cutter
Ralph Yerger, *Chairman*

Mary Glide Goethe Travel Awards

For the fourth year there will be funds available through the generosity of Mr. C. M. Goethe for assistance to graduate students for expenses in connection with the annual ASB meetings, to be held this year in Lexington, Kentucky, April 20-22. It is anticipated that most of the awards will be for maintenance (lodging and meals), and departments are urged to provide travel allowances for their graduate students or to invite them to travel in cars with staff members. Some travel allowances may be awarded by the committee to those living most distant from Lexington.

Staff members are requested to eall to the attention of qualified students in their respective institutions the availability of these awards. If there is more than one applicant from a department, the Goethe committee may request the department to aid the committee's selection by ranking the applicants.

Any graduate student needing financial assistance in order to attend the 1961 meeting of the Southeastern Biologists is eligible. Rules for making application for the Goethe Awards are as follows:

1. Indicate if application is being made for maintenanee or travel or both. Give details, such as total sum requested, how many nights and days are involved, if travel allowance is requested, the number of miles involved and the proposed method of transportation, and any other pertinent information.

2. Give information as to whether or not a paper is being presented by the applicant.

3. In a paragraph, give a brief history of your education to date, of how many years you have been—and plan to be—in graduate school, of your major field or fields of interest, of any publications which have appeared or which may be in preparation, and any other pertinent professional details. Give information on marital status and number of children.

4. Give your source or sources of support while in graduate school such as G.I. Bill, N.S.F., N.I.H., teaching assistantship, etc.

5. Have your major professor or departmental head write a letter supporting your application.

6. Applieations and supporting letters, both in triplicate, should be in the hands of *J. M. Carpenter, Department of Zoology, University of Kentucky, Lexington, Kentucky,* by March 1, 1961. Applicants will be notified of the decision of the Committee during March.

COMMITTEE

R. B. Short
Joseph O'Kelly
J. M. Carpenter, *Chairman*

News of Biology in the Southeast

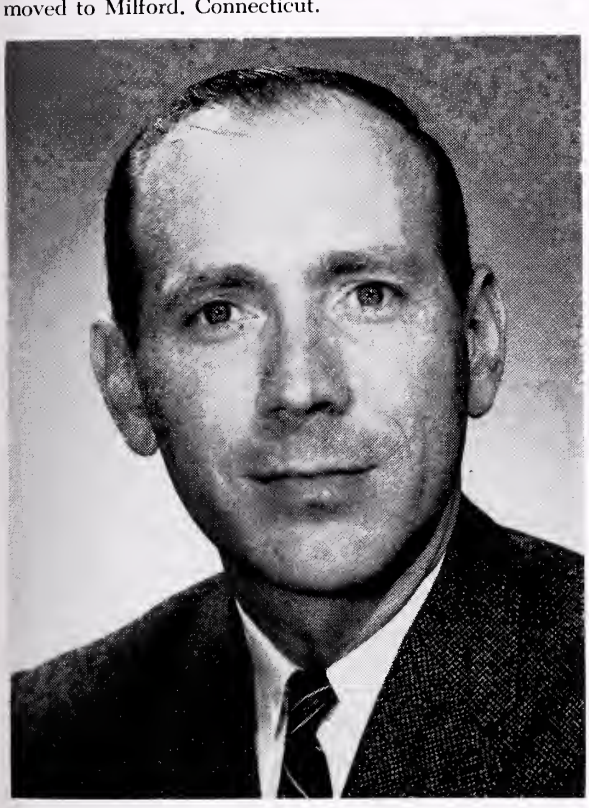
About People

Dr. William Burbanck, Professor of Biology at Emory University, spent the fall working on his research at Woods Hole, Massachusetts.

Dr. Lee Weeks, Professor of Biology at The Berry Schools, Mount Berry, Georgia, attended the NSF Institute of Genetics at North Carolina State College, June 14-July 21, 1960.

Dr. Kenneth Hancock, who received his Ph.D. in Botany from the University of Alabama in June, 1960, has joined the staff of the Biology Department of the Berry Schools, Mount Berry, Georgia.

Dr. Geoffrey M. Jeffery, former Editor of the ASB BULLETIN, was awarded the Bailey K. Ashford Award in Tropical Medicine in 1959. The work for which Dr. Jeffery was given the award involved no specific project, but a paper presented in response to the award was published last year in the *American Journal of Tropical Medicine and Hygiene.* When he received the award, Dr. Jeffery was associated with the U. S. Public Health Service Laboratory at Columbia, S. C. He has recently moved to Milford. Connecticut.



GEOFFREY M. JEFFERY

The Bailey K. Ashford Award in Tropical Medicine is sponsored by Eli Lilly and Company for presentation to young scientists who have distinguished themselves by their contributions to fundamental research and who have shown originality and independence of thought. The award is named in honor of Bailey K. Ashford (1873-1934), an officer in the Medical Corps of the U. S. Army who contributed to the advance of public health by his work on hookworm.

Dr. John Allen Boole, Jr., Chairman, Division of Science and Mathematics, Georgia Southern College, Statesboro, Ga., recently attended the NSF sponsored Conference for College Teachers of Genetics at Colorado State University.

Dr. Burton J. Bogitsh, Associate Professor of Biology, Georgia Southern College, Statesboro, Ga., has received $3,400 from the National Institutes of Health to continue his work on the histochemistry of parasitic cysts.

Dr. Wade T. Batson, Department of Biology, University of South Carolina, has received a grant of $3,000 from the South Carolina State Water Pollution Authority to study the algae in disposal lagoons.

Mr. Donald Dobbs of the Wofford College Biology Department is on a two-year leave to complete his Ph.D. He is working in parasitology at Emory University.

Dr. Harold Robinson recently joined the staff of the Wofford College Biology Department in a temporary capacity during the absence of Mr. Dobbs.

Dr. Hugo Ferchau of Wofford College has recently received a grant of $14,400 from the National Science Foundation to work on the mycorrhizae of pine. Dr. Ferehau will be joined by two European botanists in the summer of 1961.

Mr. Edward Tyson, a graduate student in the Department of Biological Sciences at Florida State University, and his co-author Mr. Dick Harlow, presented a paper at the 13th annual meeting of The Wildlife Society in Baltimore. The paper, "A Preliminary Report on the Effect of Mast Abundance on the Weight and Reproduction of Deer in Central Florida," has been judged first place. A certificate of award will be presented to the authors by the society.

Professor Clyde T. Reed, Head of the Department of Biology at the University of Tampa, retired from the position in September, 1960. Professor Reed will remain on the teaching staff. **Dr. Charles R. Walker, Jr.** has succeeded Professor Reed as head.

Mr. Elmer A. Youngman has resigned his position as assistant professor of Biology at the University of Tampa to become Curator of Mammals in the Canadian National Museum at Ottawa, Canada.

Dr. William Jennings has recently resigned from the U.S. Fish and Wildlife Service to accept employment with the Florida State Board of Health. Dr. Jennings will be working throughout Florida on wildlife diseases, particularly rabies.

Game management personnel of the Florida Game and Fresh Water Fish Commission have recently won five of the first six annual awards for "best publications" offered by the Southeastern Section of the Wildlife Society. Among these award winners were: **Richard F. Harlow,** for his publication "An Evaluation of White-tailed Deer Habitat in Florida"; **James A. Powell** as co-author with **J. L. Sincock,** for publication entitled "An Ecological Study of Waterfowl Areas in Central Florida"; and **C. M. Loveless,** for best paper entitled "Clipping Study Techniques in Marsh Ecology Investigations."

Miss **Charlotte Bebb,** formerly of the University of Alabama Medical Center in Birmingham, Alabama, will join the staff of the Department of Biological Sciences at Florida State University as Electron Microscopist in January, 1961.

Dr. A. Gib DeBusk of the Department of Biological Sciences at Florida State University has received a one year contract from the AEC, for studies on the molecular basis of "forward and back" mutation. Cultures of *Neurospora* from Dr. DeBusk's laboratory were exposed and recovered from a 1200 mile flight for 26 minutes into the lower Van Allen radiation belt. Dr. DeBusk also attended a meeting on "Biological and Medical Aspects of the Energies of Space" recently held at the School of Aviation Medicine in San Antonio, Texas.

F. P. Aldridge, Instructor of Biology at Florence State College, Florence, Ala., participated in the Summer Institute for College Teachers Research Participation program at Vanderbilt University in 1960. He assisted **Dr. R. B. Channell** in research on a taxonomic revision of the sedges.

Dr. A. L. Hershey, Professor of Biology at Florence State College, Florence, Ala., served as president of the Alabama Wildlife Federation during 1960.

Dr. F. S. Arant, head of the Zoology-Entomology Department of Auburn University School of Agriculture, was elected president of the Entomologieal Society of America at its rccent meeting in Atlantic City, N. J.

Dr. B. Wayne Arthur of Auburn University is one of the five scientists invited to represent the United States at an international symposium on radioisotopes and radiation in entomology held in Bombay, India, last December. The symposium was sponsored by the International Atomic Energy Commission.

Dr. James L. Riopel, Assistant Professor of Biology at the University of Virginia, has been named Direetor of Mountain Lake Biological Station of the University of Virginia.

Ella D. Morris, Assistant Professor of Biology, Spring Hill College, was elected national secretary of Lambda Tau Medical Technology Society at its Atlantic City N. J. meeting last June. Mrs. Morris was also elected the first honorary member of the Alabama Association of Medical Technologists at their October 1960 meeting in Birmingham, Ala.

Father Patriek H. Yaneey, chairman of the Department of Biology at Spring Hill Collegc, served on a panel of the National Science Foundation for screening proposals for undergraduate research. He has also been appointed to the Committee on Undergraduate Research of the AAAS.

Dr. A. Frederiek Hemphill, Assistant Professor of Biology at Spring Hill College, received his doctorate from the University of Alabama in June.

Dr. Hansell F. Cross is the new head of the Huntingdon College Biology Department. Dr. Cross comes from Northeast Louisiana State College where he was Associate Professor of Biology. He received the Ph.D. degree from the Universitv of Maryland, and is the recipient of a grant of $18.000 from the National Institutes of Health for work on the secretion of the chigger, *Trombicula splendens.*

Dr. Paul A. Walker of the Department of Biology, Randolph-Macon Women's College, Lynchburg, Virginia, has spent the first semester of the 1960-61 aeademic year on sabbatical leave at the Athenaeum of the University of California at Pasadena working with Drs. Beadle and Horowitz on a problem in *Neurospora* geneties. He will return to his home institution in mid-January of 1961.

Dr. Brooke B. Webber is a new member of the staff of the Department of Zoology and Entomology at the University of Tennessee. Dr. Webber received his Ph.D. at Yale and has come to U.T. from the Oak Ridge National Laboratory where he was a member of the Biology Division.

Dr. Matti Al-Aish, Dr. Sandra L. Bell, Dr. Alan S. Heilman, and **Dr. Edward Clebsch** have recently joined the staff of the Botany Department of the University of Tennessee.

Mr. Marvin Seott has been appointed research assistant to **Robert T. Brumfield** at Longwood College. Mr. Scott is a graduate of Hampden-Sydney College and is on leave of absence from the public schools of Lynchburg, Virginia.

Dr. L. R. Hesler, Emeritus Dean of the College of Liberal Arts and Professor of Botany, University of Tennessee, spent several weeks in September and October, 1960, visiting mycologists and mycological herbaria in Europe.

Dr. A. J. Sharp, head of the Botany Department of the University of Tennessee, taught Bryology and Liehenology at the University of Michigan Biological Station. In October he attended the First Botanical Congress in Mexico City, where he presented an invited paper on the migration of plants from eastern Asia to North America in the Tertiary Era.

Dr. Charles Norman and **Dr. Erwin Goldberg,** Department of Biology, West Virginia University, and **Dr. I. D. Porter,** Department of Dairy Husbandry, West Virginia University, have received three grants totaling $23.500 for two research projects. The National Institutes of Health contributed $18.549 and the National Association of Artificial Breeders, $1,800, for a continuation of a study of the physiology and biochemistry of mammalian germ cells. The National Institutes of Health also eontributed $4.870 for a second investigation on the elimination of vibrio fetus from frozen bovine semen.

Dr. R. L. Hoffman has joined the Biology Department of Radford College as associate professor. He was formerly research assoeiate with the U. S. National Museum, serving in Washington, D. C. and Europe.

Mr. D. H. Messersmith, assistant professor, has rejoined the Biology Department, Radford College, after a one-year leave of absence spent in candidacy for the Ph.D at V.P.I. Mr. Messersmith is studying the biology and distribution of *Culicoides* in Virginia and the relationship of *Culicoides* to infectious synovitis in poultry.

Dr. Carolyn Wells, formerly of Oak Ridge National Laboratory, has been appointed assistant professor of biology at Longwood College. Dr. Wells assumed her duties in September, 1960, giving courses in genetics, embryology, and physiology. Her research, supported by the Atomic Energy Commission, is in the field of radiation biology, using *Tetrahymena* as the test object.

Dr. and Mrs. Orland E. White returned to Charlottesville, Virginia, on October 12 from a twelve-week biological expedition involving more than 6,000 miles of travel in Tanganyika, Kenya, and Uganda, British East Africa. Most of the mountain masses and animal parks were visited and over 800 kodachromes were taken.

Dr. Miriam F. Bennett is on sabbatical leave from Sweet Briar College during the current session. She is studying biological rhythmicity at the Max-Plank Institute for Verhaltenphysiologie at Tübingen, Germany.

Dr. Jane Belcher has resumed her work at Sweet Briar College after a sabbatical leave during which she studied the embryology of *Xerapus* at University College, Ibadan, Nigeria.

Professor Miser Richmond has been made Acting Head of the Department of Biology at Tennessee Polytechnic Institute. He is replacing **Dr. G. B. Pennebaker,** who will devote full time to his duties as Director of the School of Arts and Sciences.

Dr. John Warren has been appointed Associate Professor of Biology at Tennessee Polytechnic Institute. He received his Ph.D. in Microbiology and Botany at Ohio State University in 1950 and was on the faculty at Duke University for six years. He has done extensive research on plant diseases in the tropics for the past four years.

Dr. William J. Koch, Department of Botany, University of North Carolina, attended the Phillips Electron Microscope School in New York last November.

Dr. Francis Byers, formerly Chairman of the Biological Sciences Department and Professor of Biology at the University of Florida, is now Chairman of the Division of Natural Sciences at Elmira College, Elmira, N. Y.

Institutions and Organizations

A summer institute for college teachers in the form of a course entitled *Survey in the Marine Sciences* will be held at the **Duke Marine Laboratory** during the second summer session of 1961, July 19 to August 23. The institute is sponsored by the National Science Foundation. Any college teacher interested in taking part in this institute should write *Dr. F. John Vernberg, Duke Marine Laboratory, Beaufort, N. C. or Dr. Harold J. Humm, Department of Botany, Duke University, Durham.*

Construction began on a new Science Building for **Troy State Teachers College,** Troy, Alabama, in October of this year. The new building will house facilities for biology, chemistry, physics, and science education. It is a three-story building of approximately 35,000 square feet of floor space. In addition to classrooms and laboratories, the building includes office space for twelve science department staff members, a small auditorium-classroom which will seat one hundred and twenty persons, exhibit areas, storage space and research, study, and reference rooms. Present plans call for completion of the building by August and installation of equipment by September, 1961. Upon completion of the building, the science department will increase its offerings, particularly in the field of physics and chemistry. The Alabama Academy of Science is scheduled to meet in the new building in the Spring of 1962.

As part of a continent-wide cooperative effort to acquire greater knowledge of the marine mammals of North American waters, four southeastern biologists are investigating and identifying whales, dolphins, porpoises, seals, and manatees which become stranded on coasts of southeastern states. The program, which was established recently, is being carried on by the *Committee on Marine Mammals of the American Society of Mammalogists.* The four participants from the southeast are: **Dr. Norman C. Negus,** Assistant Professor of Zoology at Tulane University, who is responsible for the coastal sector including all of the Gulf of Mexico except Florida; **Dr. James N. Layne,** Assistant Professor of Biology at the University of Florida, who is garnering records from the entire coast of Florida; **Dr. Frank B. Golley,** Assistant Professor of Zoology at the University of Georgia, who has the coastal sector from Georgia to Cape Hatteras; and **Mr. John L. Paradiso,** Systematic Zoologist, U. S. Fish and Wildlife Service, U. S. National Museum, who is responsible for the coastal area from Cape Hatteras through Maryland.

The Biology Department of Wofford College, along with the Chemistry and Physics Departments, has recently moved into a new science building. This building, to be dedicated on February 7, 1961, will be named the *Millikan Science Building* in honor of Mr. Roger Millikan, textile executive.

Georgia Southern College will hold its first *Summer Institute for High School Teachers of Science and Mathematics* from June 12 to July 20, 1961. **Dr. Burton J. Bogitsh** will serve as Director and have charge of the course in zoology. **Dr. John Allen Boole, Jr.,** Professor of Biology, will teach the course in botany.

The Department of Biological Sciences of Florida State University will hold a Summer Institute for teachers of high school and junior college biology during the summer of 1961. The institute, sponsored by the National Science Foundation, will be administered by Dr. Grace Madsen of the Department.

The Biology Department of the University of Alabama has signed a contract with the Alabama Department of Conservation to operate the Marine Laboratory at Cedar Point. The facilities will be used to conduct both basic and applied research in Marine Biology, and will also be used in the academic program of the Biology Department. **Mr. Jack Mallory,** is the resident biologist assigned to the laboratory. **Professor Everett L. Bishop** will conduct coursework in Marine biology during the summer of 1961.

Vanderbilt University has received a grant of $4 000.000 from the Ford Foundation and is beginning a public campaign for a total of $30.000 000 to be raised over the next three years. One of the projects for which funds are sought is a new science center to house several of the science departments of the university.

A Summer Institute in Radiation Biology for High School Teachers of the sciences will be held at Florida State University during the 1961 Summer Session. **Dr. Charles W. Edington** of the Department of Biological Sciences will be in charge of the program. The Institute is jointly sponsored by the Atomic Energy Commission and the National Science Foundation.

The Division of Physiology of the Department of Biological Sciences at **Florida State University** has received a Graduate Student Training Grant for $83,750 from the National Institutes of Health. **Dr. Harry J. Lipner** of the department will be in charge.

The Department of Botany of the University of North Carolina has received a grant of $5,200 from the Atomic Energy Commission to set up an isotope teaching laboratory. **Dr. Max H. Hommersand** will offer a course in Radioisotope Tracer Techniques this spring.

The American Society of Plant Taxonomy has announced the election of **Dr. A. J. Sharp**, University of Tennessee, as President and of **Dr. R. F. Thorne**, University of Iowa, to the Council.

Grants in Aid

The **Division of Biological and Medical Sciences of the National Science Foundation** announces that the next closing date for receipt of basic research proposals in the Life Sciences is January 15, 1961. Proposals received prior to that date will be reviewed at the spring meetings of the Foundation's advisory panels and disposition will be made approximately four months following the closing date. Proposals received after the January 15, 1961, closing date will be reviewed following the summer closing date of May 15, 1961. The next closing date for submission of proposals for specialized biological facilities is March 1, 1961.

The NSF has two programs for support of facilities, one for general graduate level university laboratories and the other for specialized biological facilities. The latter are defined as discrete research installations which are unique, one-of-a-kind, or at least less than ordinary in that they are not a usual part of a university department and may represent either new ventures or the more traditional establishments. Inquiries should be addressed to the *National Science Foundation, Washington 25, D. C.*

The Mountain Lake Biological Station has available, from the National Science Foundation, three types of awards for research and study at the Station: Post-Doctorates, for research; Pre-Doctorates, for supervised research; and Post-Graduates, for training in field or laboratory research techniques, thus permitting course work. Application blanks for these awards may be secured from the Director, Mountain Lake Biological Station, Department of Biology, University of Virginia, and must be submitted by April 1, 1961.

The National Science Foundation announces that March 1, 1961, is the next closing date for the receipt of proposals in the *Graduate Laboratory Development Program.* Proposals received after March 1 will be reviewed following the next closing date, September 1, 1961. This program requires at least 50% participation by the institution with funds derived from non-Federal sources. The purpose of the grants is to aid institutions of higher education in modernizing, renovating, or expanding graduate-level basic research laboratories used by staff members and graduate students. Only departments having an on-going graduate training program leading to the doctoral degree in science at the time of the proposal submission are eligible at present. Proposals and additional information should be addressed to *Office of Institutional Programs, National Science Foundation, Washington 25, D. C.*

The ASB BULLETIN

Volume 8, Number 2 April, 1961

MEMORIAL HALL—UNIVERSITY OF KENTUCKY

The Official Quarterly Publication of
The Association of Southeastern Biologists

ASB BULLETIN *Volume 8, Number 2—April 1961*

CONTENTS

COVER PHOTOGRAPH: *Memorial Hall, University of Kentucky. This building is the University Auditorium. It seats about 1100 persons, and is equipped with a pipe organ and a carillon. Registration on Thursday, April 20, will be held in the lobby. The photograph was supplied by the Public Relations Department of the University of Kentucky.*

THE ASB BULLETIN

The ASB BULLETIN is the official quarterly publication of the Association of Southeastern Biologists, Inc., and is published at Philadelphia, Penna., in January, April, July and October. Letters, news items, other contributions, and all communications about editorial matters should be addressed to C. W. Hart, Jr., Editor, The Academy of Natural Sciences of Philadelphia, 19th and The Parkway, Philadelphia, Penna. Changes of address should be sent promptly to the Secretary of the ASB, Dr. Harold J. Humm, Department of Botany, Duke University, Durham, N. C. Subscription orders from libraries and other institutions should be sent to the Business Manager, Dr. Elsie Quarterman, Department of Biology, Vanderbilt University, Nashville, Tenn. Subscription rate for non-members of the ASB: $2.00 per year. Printing and typography by the Wickersham Printing Co., Lancaster, Penna.

Application to mail at second-class postage rates is pending at Philadelphia, Pa.

C. WILLARD HART, JR.
EDITOR

HAROLD J. HUMM, Associate Editor
ELSIE QUARTERMAN, Business Manager

Program of the 22nd Annual Meeting of the Association of Southeastern Biologists

A Joint Meeting with the Southeastern Section of the Botanical Society of America, Southern Appalachian Botanical Club, the South Central and South Atlantic Regions of the Society of General Physiologists, the Southeastern Section of the Society of Ichthyologists and Herpetologists, and the Southeastern Region of Beta Beta Beta National Honorary Biological Society—held at the University of Kentucky, Lexington, Kentucky, April 20-22, 1961.

THURSDAY, APRIL 20

2:00 p.m.-7:45 p.m. REGISTRATION. Lobby of Memorial Hall.

8:00 p.m.-9:30 p.m. GENERAL SESSION. Auditorium, Memorial Hall. Victor A. Greulach, Presiding.

Address of Welcome: Frank G. Dickey, President, University of Kentucky.

Response: Victor A. Greulach, University of North Carolina, President of Association of Southeastern Biologists.

Symposium: *"Control Mechanisms in Invertebrates."* Sponsored by the Society of General Physiologists and the Association of Southeastern Biologists.

Introduction

Samuel R. Tipton, University of Tennessee

"Control of Pigmentary Effectors"

Milton Fingerman, Tulane University

"Some Recent Advances in Insect Endocrinology"

Dietrich Bodenstein, University of Virginia

"Invertebrate Contributions to the Analysis of Organized Systems of Neurons"

Theodore H. Bulloch, University of California at Los Angeles

The symposium will be followed by a *smoker at the new University of Kentucky Medical Center.* Tours of the Center will be available for those interested. Medical students and members of Alpha Epsilon Delta (premedical honor society) will serve as guides.

FRIDAY, APRIL 21

FRIDAY MORNING

8:00 a.m.-12:00 noon. REGISTRATION. Lobby of Funkhouser Biological Sciences Building.

8:00 a.m.-12:00 noon. EXHIBITS. Room 12, Funkhouser Biological Sciences Building.

8:30 a.m.-11:20 a.m. PAPER SESSIONS.

Animal Ecology.—Room B-3, Funkhouser Biological Seiences Building.

Animal Physiology and Development.—Room B-8, Funkhouser Biological Sciences Building.

Algology-Mycology.—Room 211, Funkhouser Biological Sciences Building.

Plant Physiology.—Room 319, Funkhouser Biological Sciences Building.

11:30 a.m.-12:30 p.m. BUSINESS MEETING. Association of Southeastern Biologists. Room 200, Funkhouser Biological Sciences Building.

FRIDAY AFTERNOON

1:00 p.m.-5:00 p.m. EXHIBITS. Room 12, Funkhouser Biological Sciences Building.

2:00 p.m.-4:30 p.m. PAPER SESSIONS.

General Ecology.—Room B-3, Funkhouser Biological Sciences Building.

Animal Physiology and Development.—Room 8, Funkhouser Biological Sciences Building.

Cytogenetics.—Room 211, Funkhouser Biological Sciences Building.

Systematic Botany.—Room 319, Funkhouser Biological Sciences Building.

FRIDAY EVENING

5:00 p.m.-6:30 p.m. OPEN HOUSE. Spindletop Mansion.

7:00 p.m.-8:00 p.m. BUFFET. Spindletop Mansion.

8:00 p.m. GENERAL SESSION. Spindletop Mansion.

Presiding: Dr. Victor A. Greulach, President, Association of Southeastern Biologists.

Address: "Functional Organization of Primitive Nervous Systems." Theodore H. Bulloch, UCLA.

Presentation of Awards:

Mt. Lake Biological Station Fellowship.
Sponsored by Phipps and Bird, Inc.

Association Research Prize.
Sponsored by Carolina Biological Supply Co.

Meritorious Teaching Award.
Sponsored by Will Corp. of Georgia.

SATURDAY, APRIL 22

SATURDAY MORNING

8:30 a.m. FIELD TRIPS.

Botanical Field Trip to Raven Run, 10 mi. southeast of Lexington on U. S. Highway 25.

Zoological Field Trip to Red River Gorge, 120 miles round trip.

8:00 a.m.-12:00 noon. BETA BETA BETA GENERAL MEETING AND PAPER SESSIONS.

8:00 a.m. *General Meeting*—Room 125, Funkhouser Biological Sciences Building.

Paper Sessions—Room 125 and Room 211, Funkhouser Biological Sciences Building, following the General Meeting.

9:00 a.m. GUIDED TOURS.

Tours will be available, for those interested, to the following points:

1. Thoroughbred Horse Farms.
2. U. S. Public Health Service Narcotics Hospital.

SCHEDULE OF PAPER SESSIONS

FRIDAY MORNING—APRIL 21, 8:30 A.M.

Animal Ecology

Room B-3 Funkhouser Biological Sciences Building

Presiding: John A. Wallwork, University of Kentucky

8:30 1. Kuehne, Robert A. (Univ. of Kentucky). Fish Distribution in a Small Stream System of Eastern Kentucky.

8:43 2. Freeman, John A. (Winthrop College). Observations of Temperature Adaptation of Goldfish and P-32 Distribution.

8:56 3. Lautenschlager, E. W. (Univ. of Virginia). Uptake of P-32 by the Snail, *Australorbis glabratus.*

9:09 4. Pierce, E. Lowe (Univ. of Florida). The Distribution, Growth and Reproduction of Lancelets in the Cedar Key Area.

9:22 5. Gordon, Robert E. (Univ. of Notre Dame and the Highlands Biol. Sta.). Comparative Studies of Locomotive Activity in Appalachian Salamanders.

9:35 6. Hamon, J. Hill (Jacksonville Univ.). Bird Remains from a Sioux Indian Midden.

9:48 7. Edney, J. M. (Univ. of Kentucky). The Life History of *Fasciola indica.*

10:01 8. Holliman, Rhodes B. and Robert B. Short (Florida State Univ.). Studies on a New Avian Schistome in the *Austrobilharzia.*

10:14 9. Harkima, Reinard and Grover C. Miller (North Carolina State Coll.). A New Strigoid Trematode, *Diplostomidae alariinae.*

10:27 10. Barr, Thomas C. (Tennessee Polytechnic Institute). The Fauna of Mammoth Cave.

10:40 11. Wallwork, John A. (Univ. of Kentucky). Oribatid Mites and the Soil Community.

10:53 12. Westfall, Minter J., Jr. and Richard P. Trogdon (Univ. of Florida and Judson College). The True *Consanguis* Selys (Odonata: Gomphidae).

11:06 13. McCrone, John D. (Univ. of Florida). A Study of the *Geolycosa*, Pike Complex in the Southeastern U. S.

Animal Physiology and Development

Room B-8 Funkhouser Biological Sciences Building

Presiding: Douglas G. Humm

8:30 14. Yarbrough, James D. and Joseph C. O'Kelley (Univ. of Alabama). Alkaline Earth Elements and Their Avoidance.

8:45 15. Young, Martin D. (Parasite Chemotherapy Laboratory, Columbia, South Carolina). Chloroquine Resistance in *Plasmodium falciparum.*

9:00 16. Cole, B. Theodore and N. G. Anderson (Biol. Div. Oak Ridge National Laboratory). Fatty Acids from Lipids of Rat Liver.

9:15 17. Goss, Robert C. (Loyola Univ.). The Use of Plants in Cancer Research.

9:30 18. Foreman, Charles W. (Pfeiffer College). Comparative Aspects of Tryptic Peptides of Several Mammalian Hemoglobins.

9:45 19. Parrish, Fred K. and Joanna W. Parrish (Emory Univ.). The Developmental Effects of Lithium Chloride Applied to Selected Surface Regions of the Eggs of *Nussarius vibex* and *N. obsoleta.*

10:00 20. Moore, Jack H., Richard Thomson, and Charles A. Kelly (Southern Reserve Institute). The Utilization of Transplantable Hamster Tumors as Experimental Tools.

10:15 21. Cardell, Robert R., Jr. (Henry Ford Hospital, Detroit, Michigan). Observations of Structures and Ultrastructures of the Pituitary Glands of the Salamander, *Triturus viridescens.*

10:30 22. Nagabushanam, R. and Milton Fingerman (Newcomb College and Tulane Univ. Marine Laboratory). Physiology of the Proximal Retinal Pigment of the Shrimp, *Crangon septemspinosus.*

10:45 23. Rawls, John M. (Univ. of Florida). A Partial Characterization of the Jellyfish Splitting Enzyme of Sand Dollar Spermatozoa.

11:00 24. Thomson, Richard (Southern Research Institute, Birmingham, Alabama). Isocaloric Synthetic Diets as Inhibitors of Experimental Neoplasms.

Algology-Mycology

Room 211 Funkhouser Biological Seiences Building

Presiding: Frederick T. Wolf, Vanderbilt University

8:30 25. Wolf, Frederick T. (Vanderbilt Univ.). Growth Inhibition of *Chlorella* Induced by 3-Amino-1,2,4-Triazole and Its Reversal by Purines.

9:00 26. Umphlett, Clyde J. and John Couch (Univ. of North Carolina). Germination of the Resting Sporangium of *Coelomyces.*

9:15 27. McDonald, James C. and John E. Peterson (Wake Forest). Fruiting Body Germination and Formation in the Genus *Archangium.*

9:30 28. Miller, Charles E. (Texas A & M). Aquatic Phycomycetes of Lake Texoma.

9:45 29. Koch, William J. (Univ. of North Carolina). Fungus Motile Cells.

10:00 30. Frederick, Lafayette (Southern Univ.). Studies of Leaf Fungi from Louisiana.

10:15 31. Mullins, Thomas (Univ. of Florida). The Chytrid *Pringsheimiella* Is *Dictyomorpha.*

10:30 32. Williams, Louis G. (R. A. Taft Engr. Center, Cincinnati, Ohio). Composition of the Phytoplankton Populations of Major Waterways.

10:45 33. Humm, Harold J. (Duke Univ.). The Marine Algae of Bimini, Bahamas.

11:00 34. Edwards, Jackie and Walter Herndon (Univ. of Alabama). A New Ulotrichacean Alga.

Plant Physiology

Room 319 Funkhouser Biological Sciences Building

Presiding: Carl E. Henrickson

8:30 35. Burk, Carl John (Univ. of North Carolina). Environmental Aeration in *Heterotheca subaxillaris.*

8:45 36. Queen, William H. and Joseph B. O'Kelley (Univ. of Alabama). Influence upon Root Development in Maize Seedlings of a Strontium Replacement for Calcium in the Nutrient Solution.

9:00 37. Brumfield, Robert T. and Marvin W. Scott (Longwood College). The Effect of Nucleic Acid Components on Root Growth and Geotropism.

9:15 38. Caplenor, Donald (Millsaps). Competition between *Helenium amarum* Raf., H. Rock and Certain Grasses at Various Levels of Mineral Nutrition.

9:30 39. Griffith, Mildred M. and Robert D. Powell (Univ. of Florida). The Time Course of Cell Enlargement and Leaf Growth as Affected by Kinetin and Red Light.

9:45 40. Plummer, Gayther L. (Univ. of Georgia). Aspects of the Physiological Tolerance of Some Clovers to Gamma Radiation of the Seeds.

10:00 41. Beck, Edwin G. (Univ. of Georgia). The Percentage Distribution of Mineral Elements in Certain Leaf Cells.

10:15 42. Won Kyum Kim and Victor A. Greulach (Univ. of North Carolina). Influence of Maleic Hydrazide on the Growth and Metabolism of *Chlorella.*

10:30 43. Lammers, William T. (Davidson College). Accumulation of Radioisotopes by *Justicia americana* L. in the Clinch River.

10:45 44. Coleman, Marion T. and Charles Ray (Emory Univ.). Studies of *Tetrahymena* Serotypes of Fluorescent Counterstaining.

11:00 45. Wells, Margaret M. and Charles Ray (Emory Univ.). Potentiation of X-ray by Near-infrared Pretreatment of *Tetrahymena.*

FRIDAY AFTERNOON—APRIL 21, 2:00 P.M.

General Ecology

Room B-3 Funkhouser Biological Sciences Building

Presiding: Alfred C. Brauer, University of Kentucky

2:00 46. Borror, Arthur C. (Florida State Univ.). Feeding Apparatus of the Ciliate *Cohnilembus vermihus* Muller.

2:15 47. Bovee, Eugene C. and David E. Wilson (Univ. of Florida). Polymorphism of a Marine Amoeba in Laboratory Culture.

2:30 48. King, Charles E. (Florida State Univ.). On MacArthur's Model of the Relative Abundance of Species.

2:45 49. Burbanck, W. D. (Emory Univ.). The Distribution and Ecology of *Cyathura polita.*

3:00 50. Clebsch, Edward E. C. and R. E. Shanks (Univ. of Tennessee). Weight and Volume Characteristics of Selected Species of Southern Trees.

3:15 51. Hart, C. W. and Horton H. Hobbs, Jr. (Univ. of Virginia). Observations on the Distribution and Relationships of the Troglobitic Entocytherid Ostracods of N. A.

3:30 52. Hunter, George W. III and Richard B. Crandall (Univ. of Florida). Experiments on Some Factors Affecting Resistance to Schistosome Infections in Mice.

3:45 53. Dvorak, James A., Arthur W. Jones and H. H. Kuhlman (Univ. of Tennessee). The Life History of *Hymenolepis microstomum.*

4:00 54. Huffman, Joan L. (Univ. of Tennessee). Studies on Hatchability and Infectivity Using the Cat Tapeworm, *Hydatigera taeniectoformis.*

4:15 55. DeSelm, H. R. and R. E. Shanks (Univ. of Tennessee). Organic Matter Accumulation During a Primary Succession.

Animal Physiology and Development

Room B-8 Funkhouser Biological Sciences Building

Presiding: Samuel R. Tipton, University of Tennessee

2:00 56. Reams, W. M. and T. C. Mayer (Louisiana State Univ.). Pipment Cell Behavior in the hind limb musculature of pet mice.

2:15 57. Smothers, James L. and S. R. Tipton (Univ. of Tennessee). Spontaneous and Thyroxin-Induced Swelling of Liver Mitochondria from Riboflavin Deficient Rats.

2:30 58. Pryor, Marilyn Zirk and Samuel R. Tipton (Univ. of Tennessee). The Influence of Certain Factors on the Respiratory Metabolism of Amphibia.

2:45 59. Hutchins, Carolyn R. (Univ. of Tennessee). Immunological Studies of *Hymenolepis microstoma* Dujardin.

3:00 60. Brannon, Marvin H. (Univ. of Tennessee). Survival of Heavily Irradiated Cestode Larvae.

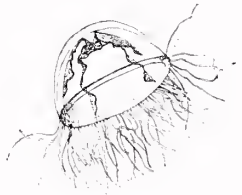
3:15 61. Johnston, David W. (Wake Forest College). Gonadal Reerudescence and Lipid Deposition in Response to Different Photoperiods in the Slate-colored Junco.

3:30 62. Bush, Frances M. (Univ. of Georgia). Seasonal Change in the Quantity of Fat and Glycogen in *Bufo fowleri.*

3:45 63. Newcomer, Richard J. (Univ. of Kentucky). Investigation into the Status of *Gyrinophilus lutescens* Raf.

4:00 64. Page, Sara Leak and C. J. Wust (Oak Ridge National Laboratory). Primary Immune Response of Mice to an Enzyme, Triose Phosphate Dehydrogenase.

4:15 65. Bamforth, Stuart S. (Newcomb College). A Simple Mechanical Model to Teach Energy Flow.



Cytogenetics

Room 211 Funkhouser Biologieal Sciences Building

Presiding: Herbert P. Riley, University of Kentucky

2:00 66. Lewis, Walter H. and Royce L. Oliver (Austin State College). Cytogeography and Phylogeny of the North American Verbenas.

2:15 67. Flory, W. S. and R. O. Flagg (Blandy Exp. Farm, Univ. of Virginia). The Chromosomes of *Zephyranthes albiella.*

2:30 68. Alamuddeen, M. Admen (Appalachian State College). Locus of Genes for Rust Resistance in Two Varieties of *Hordeum vulgare.*

2:45 69. Grogan, C. O. and Patricia Sarvella (Mississippi State Univ.). Morphological Differentiation Between Cytoplasmic Male-Sterile and Normal Strains of Maize.

3:00 70. Mukerjee, Debdas and H. P. Riley (Univ. of Kentucky). The Cytological Behavior of Supernumerary Chromosomes in Two Speeies of *Agapanthus.*

3:15 71. Singleton, W. Ralph, in collaboration with W. E. Castle (Univ. of California). Genetics of Coat Color in Horses.

3:30 72. Ray, Charles, Jr. and W. D. Fattig (Emory Univ.). A New Radiation Induced Oyster-Eye Mutant in *Marmoniella.*

3:45 73. Whiting, P. W. and Doris J. Bush (Univ. of Pennsylvania). The Problem of Sex Determination in *Marmoniella.*

4:00 74. Sagawa, Yoneo and D. H. Nimoto (Univ. of Florida). Ovule Development in *Dendrobium.*

Systematic Botany

Room 319 Funkhouser Biological Sciences Building

Presiding: Edward T. Browne, University of Kentucky

2:00 75. Browne, Edward T., Jr. (Univ. of Kentucky). A Preliminary Report on the Liliaceae of Kentucky.

2:15 76. Isbell, Charles J. and H. P. Riley (Univ. of Kentucky). Chromatographic Studies in the Coarctatae Section of the Genus *Haworthia.*

2:30 77. Hopkins, Jerome D. and H. P. Riley (Univ. of Kentucky). The Use of Paper Chromatography as an Aid in Studying Several South African Species of Aloinae.

2:45 78. Duncan, Wilbur H. (Univ. of Georgia). Studies of *Lyonia lucida* (Lam.) K. Koeh.

3:00 79. Sharp, Aaron J. (Univ. of Tennessee). The Asiatic Element in the Flora of Mexico.

3:15 80. James, Charles W. (Univ. of Georgia). Preliminary Studies of the Taxonomic Status of *Erigeron pusillus.*

3:30 81. Ramseur, George S. (Univ. of the South). A Hybrid Index for the Mid-Appalachian *Abies* (Fir of Balsam).

3:45 82. Horton, James H. (Univ. of North Carolina). Phylogenetic Relationships in the Genus *Polygonella.*

4:00 83. Hardin, James W. (North Carolina State). The Variation in *Aconitum uncinatum.*

4:15 84. Flagg, R. O. and W. S. Flory (Blandy Exp. Farm, Univ. of Virginia). Concepts of the Genus *Zephyranthes* and the Confounding of Herbert's *Hippeastriformes.*

Items of Interest: Lexington Meeting

Local Arrangements Committee

Members of the Committee of local arrangements at the University of Kentucky are Dr. Roger W. Barbour, Dr. Alfred C. Brauer, Dr. E. T. Browne, Dr. J. M. Carpenter, *Chairman*, Prof. J. M. Edney, Dr. C. E. Henrickson, Dr. R. A. Kuehne, Dr. H. P. Riley, Dr. J. A. Wallwork, and Prof. J. C. Warden.

Lodging

A partial list of hotels and motels was published in the January issue of the *Bulletin*. More complete lists are available from the Lexington Chamber of Commeree. *It has recently been learned that there are a few dormitory rooms available for men at $2.00 per night.* Any men wishing reservations should write Dr. J. M. Carpenter, Chairman Arrangements Committee, Department of Zoology, Univ. of Kentucky, by April 12.

Meals

Dining facilities are available at two University cafeterias. There are, in addition, several grills on campus, and several grills and restaurants in the immediate vicinity of the campus.

Parking Facilities

As on most College campuses, parking facilities are inadequate at the University of Kentucky. However the Rose Street Parking Lot, convenient to the meetings, is being made available to ASB members. Cars may not be needed by all members, since hotels are only 15 minutes walking distance from the university. Good bus service is also available.

Registration

Registration will bc held Thursday afternoon in the Lobby of Memorial Hall from 2:00 p.m. to 7:45 p.m. and on Friday from 8:00 a.m. to 12:00 noon in the Lobby of the Funkhouser Biological Sciences Building. A fee of $1.00 will be charged for registration. Undergraduate members of Beta Beta Beta will not be charged the fee but are expected to register.

Ichthyologists and Herpetologists; Beta Beta Beta

The Southeastern Seetion of the Society of Ichthyologists and the Southeastern Region of Beta Beta Beta, National Honorary Biological Society, whieh are meeting jointly with the Association of Southeastern Biologists, will print their own programs. Those persons desiring copies may obtain them at registration.

Directory, Placement Service, Commercial Exhibits

These facilities will all be located in Room 12 of the Funkhouser Biological Sciences Building. The Directory will contain the names of all persons attending the meeting. The Placement Service will be of the do-it-yourself type and space will be provided for posting of available positions and for consultation. A number of eommercial firms will have exhibits for your interest and information.

Field Trips

Two field trips are planned for Saturday, April 22. One is a short trip under the auspices of the Botany Department of the University, the other a longer trip under the auspices of the Zoology Department. Both field trip areas have been selected for their local ecological uniqueness. Information about these trips may be obtained at the time of registration, at which time you are urged to sign up for the trips, if interested.

Tours

Arrangements are being made for two tours. One will be to a well known horse farm, the other to the United States Public Health Service Narcotics Hospital. If you are interested in one of these tours, please indicate this at registration. Other tours to interesting Lexington points can be arranged personally.

Smoker

This year's S*moker* will be held Thursday night following the Symposium sponsored by the Society of General Physiologists and ASB. It will be held in the University's new Medical Center and will give ASB members an opportunity to visit with one another as well as meet the biologists at the Medical Center. Tours of the Medical Center will be arranged for those interested.

National Science Foundation Exhibits

The National Science Foundation has made available two educational exhibits for the meetings. The first is entitled, "*Lost, One Third of the World's Scientific Literature*," and is concerned with the problems of language barrier as it affects the availability of foreign science information to U. S. Scientists. The second, entitled, "*Progress in Information Processing*," is concerned in depicting the historical development of eleetronic eomputers. Members and guests are invited to view these exhibits which will be located in the lobby of the Funkhouser Biological Sciences Building.

Refreshments

Beta Beta Beta Honorary Biological Society will serve free coffee during the paper sessions on Friday. Arrangements are also being made for a free "Coke" stand for those who prefer a cold drink. These refreshments will be served in Room 12, Funkhouser Biological Sciences Building, which houses the Commercial Exhibits, Placement Service, and Directory.

Spindletop Mansion

The Friday evening meeting will be held at Spindletop Mansion on Spindletop Horse Farm. This mansion, valued at close to $1,000,000, was recently acquired by the University of Kentucky along with its many acres of valuable bluegrass land. The land is now being used by the College of Agriculture. The Spindletop Research Institute is also under construction on a portion of the land.

Open house will be held by the University for ASB members and guests at the Mansion from 5:00 p.m. to 6:30 p.m. preceding the buffet. The Mansion, with over 40 rooms, 8 elaborately designed baths and 6 half baths, contains over 300,000 cubic feet of room. There is an English Library, which formerly contained 7,000 volumes and bedrooms of the Louis XV and XVI period. An Elizabethan Room contains century old tapestries valued at $150,000; a French Room and a Music Room hold Arbusson rugs valued at $8,000 and $25,000 respectively. The Grand Hall contains a rug, matching the overhead elaborate ceiling decoration, which was woven in Scotland at a cost of $40,000. In the Music Room is a $50,000 organ on which rolls can be played automatically from 7 different stations in the Mansion. The basement floor is informal and contains, among other things, a Kentucky Tavern and a ballroom representing a Louisiana courtyard with stars overhead. Outside is a swimming pool with bathhouse, tennis courts, a lake, and an aviary. A carriage house contains over 30 carriages valued at $150,000 and dating back to 1820. These and many other interesting sights at Spindletop should appeal to ASB members.

Buffet

A buffet is being planned for the evening meal on Friday. This will be held at Spindletop Mansion following the open house. Cost of the buffet will be $2.50 per person and, since facilities at Spindletop are somewhat limited, no more than about 250 persons can be accommodated. For this reason you are urged to reserve your place at the time of registration. Wives of ASB members are welcome.

Keeneland Races

Since the ASB Meetings are being held during the local racing season at Keeneland Race Course, some members may be interested in attending the races on Saturday. Races start at 2:00 p.m. but, on Saturdays, it is advisable to arrive shortly after 12:00 noon. Lunch may be obtained at the track. General admission is $1.35.

The Host Institution

The University of Kentucky was established in 1865 under the name of Kentucky Agriculture and Mechanical College. The name was changed in 1908 to State University and again in 1916 to its present name, "University of Kentucky." The University of made up of ten colleges, all located on the Lexington campus: College of Agriculture and Home Economics, College of Arts & Sciences, College of Commerce, College of Dentistry, College of Education, College of Engineering, College of Law, College of Medicine, College of Nursing, and College of Pharmacy. There is also a well recognized Graduate School and an Extended Programs Division dealing with adult education courses and programs at five off-campus centers.

There are 74 major buildings on the 706 acre main campus at Lexington. Total fixed assets of the University, including land, buildings and equipment amount to approximately $78,000,000. The University's total staff includes approximately 2,000 persons. Of this number about 900 are on the teaching, research, and administrative staff. Students enrolled for credit currently on the main campus, at the five two-year centers, and in evening and extension classes for college credit total 10,157. The students are from all of Kentucky's 120 counties, 43 states, the District of Columbia, and 38 foreign countries and U. S. possessions. The University Libraries contain over 900,000 volumes and are as strong qualitatively as any collection in the southern states.

Biological Sciences at the University of Kentucky

The Biological Sciences are represented at the University by the departments of Botany, Microbiology, and Zoology in the College of Arts & Sciences and by the departments of Anatomy and Physiology in the College of Medicine. These departments contain a total of 30 members, all of whom are engaged in teaching and research and most of whom hold research grants either from the University of Kentucky Faculty Research Fund or from national research organizations. Work toward the Master's and the Ph.D. is offered by these departments in a number of areas represented by the special training of the faculties of these departments.

Abstracts of Papers Presented at the 22nd Annual Meeting of the Association of Southeastern Biologists

Investigations into the Status of *Gyrinophilus lutescens* (Rafinesque)

Richard J. Newcomer, *University of Kentucky*

The Kentucky cave salamander, *Gyrinophilus lutescens* (Rafinesque), has been a controversial species since its redescription by M. B. Mittleman in 1942. It was interpreted by him to be a presumably neotenic cave species found in the waters of Bat Cave, Carter Caves State Park, Olive Hill, Kentucky. It has been held by later authors that these larval salamanders are simply the larvae of the Kentucky spring salamander, *Gyrinophilus porphyriticus duryi* Weller, found in the springs and streams of eastern Kentucky, western West Virginia, and southern Ohio.

Extensive field work during the summer and autumn of 1960 and spring of 1961 shows that some of the original assumptions about the isolation of Bat Cave were erroneous. Experiments with thyroxin-induced metamorphosis and x-ray photographs of vertebrae add weight to the theory that *G. lutescens* is in reality the larva of *G. porphyriticus duryi*.

Feeding Apparatus of the ciliate *Cohnilembus verminus* (Müller)

Arthur C. Borror, *Florida State University*

Feeding in this hymenostome ciliate is accomplished by means of a complex arrangement of buccal ciliature which in the past has been considered a double undulating membrane. Photomicrographs of living individuals and individuals prepared according to the Chatton-Lwoff technic are presented, and the buccal membranelles of this species are shown to be arranged fundamentally in a tetrahymenal pattern. There is a short undulating membrane (M_1), and three elongate, highly modified buccal membranelles (M_2, M_3, M_4). The apparent "double undulating membrane" is composed of M_2 and M_3 on the right, and on the left by the secondarily modified anterior part of somatic meridian #1. The importance of this morphological detail in the systematics of hymenostome ciliates is discussed.

Studies in the Life History of *Hymenolepis microstoma* (DuJardin, 1845)

James A. Dvorak and Arthur W. Jones, *University of Tennessee*, and H. H. Kuhlman, *Southern Missionary College*

Cestodes were successfully reared from eggs in several species of grain bettles. Known numbers of cysticercoids were given to mice *via* stomach tube, and the mice were examined serially at intervals. For 24 hours after ingestion the worms moved freely about the upper 25% of the small intestine, but by 48 hours they became concentrated in the duodenum, and by 96 hours many had entered the bile duct (the normal habitat of the mature cestode of this species.). Worms in the bile duct were three to five times the length of the intestinal forms; the latter had increased very little above their initial length. Worms grew to their mature size in about two weeks after being acquired by the mice, and began shedding gravid segments. Adult worms lived in mice for 5 to 6 months. The entire cycle under optimum conditions may require no more than three weeks for completion. This study was supported in part by AEC Contract AT (40-1) 1749.

Survival of Heavily Irradiated Cestode Larvae

Marvin H. Brannon, *University of Tennessee*

Fully developed cysticercoids of *Hymenolepis microstoma* Dujardin in beetle hosts (*Tribolium* spp.) were subjected to gamma irradiation from a cobalt source at the rate of 500 roentgens per minute until total doses were 30,000 r and 200,000 r, respectively. *In vitro* survival of the excysted larvae after the lower dose equalled but did not exceed the survival of untreated larvae. *In vitro* survival of the more heavily irradiated larvae exceeded that of untreated and less heavily irradiated larvae exceeded that of untreated and less heavily irradiated larvae. Explanation of this unexpected result may be found in the relative low motility of the highly irradiated larvae; their survival may be a function of their slow utilization of stored nutrients. This study was supported in part by AEC Contract AT (40-1) 1749.

Studies on Hatchability and Infectivity Using the Cat Tapeworm, *Hydatigera taeniaeformis*

Joan L. Huffman, *University of Tennessee*

Eggs of *Hydatigera taeniaeformis* were tested *in vitro* for hatchability in an effort to predict *in vivo* results in laboratory animals. Hatching was accomplished in solutions containing cholesterol, trypsin, pancreatin, bile and sodium tauroglycholate. Twelve hatching solutions were used. Each differed from the others in either bile concentration, pancreatin concentration or hydrogen ion concentration. The hatching medium containing five per cent bile concentrations gave the largest percentage of hatched eggs. There were no apprciable effects of changes in pancreatin concentrations and hydrogen ion concentrations.

In vivo tests were made using the best hatching medium. The per cent eggs hatched were compared to the per cent infectivity in the rat. The correlation coefficient was 0.73 for the results obtained.

Although this was not a high correlation, it is thought that this method of determining infectivities should be further investigated.

This study was supported in part by AEC Contract AT (40-1) 1749.

Immunological Studies of *Hymenolepis microstoma* Dujardin

Carolyn P. Hutchins, *University of Tennessee*

Precipitin reaction and complement fixation tests demonstrate a positive response of mice to infestations with *Hymenolepis microstoma*, an inhabitant of the bile duct. Since this cestode, unlike *Hymenolepis nana*, a closely related form which has been studied immunologically, does not at any stage in its life cycle invade the tissues of its host, the immunological response observed seems to be unusual. It may be due to some host-parasite exchange such as might be expected when a parasite lives in very close contact with host tissue. This study was supported in part by AEC Contract AT (40-1) 1749.

The Life History of *Fasciola indica*. Trematoda: Fasciolidae

J. M. Edney, *University of Kentucky*

Fasciola indica adults were obtained from naturally infected water buffalo, *Bos bubalus* Lin. Eggs taken from these worms hatched in 15 days at room temperature. Miracidia thus obtained were used to infect laboratory reared snails, *Lymnaea rubiqinosa* (Michelin, 1831). Emergent cercariae encysted on debris and vegetation in the snail isolation dishes. These metacercariae were fed to guinea pigs and sheep.

Juvenile worms were found in hosts examined 60-90 days later. Sexually mature specimens were recovered four months after infection.

Oribatid Mites and the Soil Community

John A. Wallwork, *University of Kentucky*

Mites belonging to the Oribatei represent a very large numerical proportion of the mesofauna of many grassland and forest soils. Studies on the feeding habits indicate relationships between this group and other components of the soil community. Such studies reveal that the Oribatei are almost exclusively herbivorous, necrophagous, or coprophagous, and as such are important consumer organisms. Their significance lies in the fact that they accumulate, in their bodies, energy derived from the dead and decaying plant and animal material eaten. A large part of this energy would otherwise be dissipated by reducer organisms. The net effect of the consumers is to slow down the flow of energy through the community and also to distribute it more widely. The coprophagous habit is of especial importance, for by this feeding habit bound energy which passes out of the body in the faecal material may be acquired and accumulated in the bodies of the mites by repeated passage through the gut.

Fish Distribution in a Small Stream System of Eastern Kentucky

Robert A. Kuehne, *University of Kentucky*

Downstream increase in numbers of fish species in a river has been demonstrated repeatedly in stream studies. Buckhorn Creek, Breathitt and Knott counties, Kentucky, is a short, dendritic stream, which remarkably parallels the situation found in rivers. Twenty seven species were taken in 22 collections. Three species were characteristic of the extreme headwaters; nine to 17 species occurred in the middle region; and, 24 species were found in the lower reaches. The stream is 12 miles from source to mouth.

The Use of Paper Chromatography as a Taxonomic Aid in Studying Several South African Species and Varieties of the Aloineae

Jerome D. Hopkins and H. P. Riley,
University of Kentucky

Chromatographic patterns, or biochemical profiles, were obtained from a number of species of the tribe Aloineae (Liliaceae) to learn whether they might be of use in a taxonomic study. The species and varieties studied included those of several sections other than the Coarctatae section of *Haworthia*, several species of *Astroloba*, and the sole species of the monotypic genus *Poellnitzia*. Plants of several related genera were selected to obtain an estimate of the value of this method in distinguishing related genera, species of the same genus, and varieties of the same species. Pieces of leaves were smeared on to the filter paper and butanol, water, and acetic acid in a 4:5:1 proportion were used to develop the chromatogram. After they were dry, the chromatograms were examined under ultraviolet light and the spots were outlined with a pencil. The colors were noted, the R_f values were calculated, and the profiles of the various species were compared. Ninhydrin-positive patterns were also obtained and were compared with the patterns revealed by ultraviolet light. A series of other developers and many other different solvents were tried to determine the best method to use with these genera.

The Cytological Behavior of Supernumerary Chromosomes in Two Species of Agapanthus

Debdas Mukerjee and H. P. Riley,
University of Kentucky

Cytological studies of eight different species of *Agapanthus*, a genus of the Amaryllidaceae, showed that in addition to the normal sixteen and fifteen pairs of chromosomes found respectively in *Agapanthus orientalis* and *A.* sp. 148/55 there are two supernumerary chromosomes in each. In somatic metaphase plates these supernumeraries are stained more intensely than other chromosomes and in the early anaphase stage they are found separating earlier than the other chromosomes. The two supernumeraries of *A. orientalis* are quite prominent in the emerging radical but are not present in older root tips from seeds or in the root tips obtained from bulbs, but in *A.* sp. 148/55 they are present in old and young root tips from seeds and also in root tips from bulbs.

Weight and Volume Characteristics of Selected Species of Southeastern Trees

Edward E. C. Clebsch, *The University of Tennessee*

In studies of mineral cycling in forest ecosystems, it becomes necessary to measure or estimate the dry weight of the standing crop of forest trees. Reasonable estimating parameters for weight of leaves and weight of bark and wood in boles and branches are desirable. Measurements of volume, weight, length, diameter, and other characteristics in oak, hickory, spruce, fir, birch, and willow in Tennessee and North Carolina have been used to derive estimating equations through regression analysis. The diameter of a tree at breast height is the best single measurement for estimating the total weight of bark and wood in a tree.

Organic Matter Accumulation During a Primary Succession

H. R. DeSelm and R. E. Shanks,
The University of Tennessee

The winter of 1955, The White Oak Lake, a hold-up basin for low-level radioactive wastes on the Oak Ridge Reservation, was drained. Since that time two vegetation sampling programs have been pursued by the writers. One relates to mineral composition of the vegetation and radionuclide cycling; the other to composition and mass of the vegetation itself.

Annual amounts, relation of amounts to physical site factors, litter accumulation and decay in herbaceous communities are reported; as are increments of organic matter accumulation in a willow thicket.

A Preliminary Report on the Liliaceae of Kentucky

Edward T. Browne, Jr., *University of Kentucky*

Although much work has been done on the taxonomy of vascular plants of Kentucky, there are large areas of the state which are apparently botanically unknown. As a preliminary study to biosystematic researeh in the Liliaceae, a taxonomic monograph has been undertaken of this, the third largest monocotyledonous family in the state with a total of 50-52 spp., vars. and forms reported by McFarland (1942) and Braun (1943). Many counties do not have even one species reported. There are indications that at least 8 species in 8 different genera of this family have never been reported from the state although distribution records from adjacent states suggest their probable occurrence. It is quite apparent that much field work will be required before the presence and distribution of all the species of this family in Kentucky will be known.

Chromatographic Studies in the Coarctatae Seetion of the Genus Haworthia. A Chemo-Taxonomic Study

Charles J. Isbell and H. P. Riley, *University of Kentucky*

Five species of the genus Haworthia and seven varieties of *H. reinwardtii* have been studied taxonomically by the use of one-dimensional descending paper chromatography. The solvent system adopted was: 4 parts butanol, 5 parts distilled water, 1 part glacial acetic acid. After development, the chromatograms were studied under ultra-violet light. Each species and variety studied gave a constant and characteristic "biochemical profile" and was readily identified by its profile alone. The closer the taxonomic relationship, the more similar were the profiles and the more distant the taxonomic relationship the more dissimilar the profiles. It is suggested that the correlation of "biochemical profiles" with data from morphological studies and cytogenetics will make for a closer approach to phyletic classification.

Accumulation of Radioisotopes by *Justica americana* L. in the Clinch River

Wm. T. Lammers, *Davidson College*

Radioisotopes discharged into the Clinch River from White Oak Creek appear to have 2 principal fates. These are: (1) sorbed by clay particles or (2) sorbed by aquatic organisms whieh they contact. These two should be antagonistic to one another.

In an investigation of this hypothesis collections of *J. americana* were made at 30 sites between CRM 4.6 and 21.7. Gross gamma counts of dried ground aliquots were made and counts per minute plotted against river miles (CRM).

If the original curve were adjusted for scouring and sedimentation due to differences in velocity and for thermal overflows from tributary creeks, the curve took on a satisfactory sigmoid shape.

When account is taken of the increased sorption of radioisotopes by clay with time of contact, the pattern of radioisotope distribution in *J. americana* appears to fit the hypothesis that there is a progressively decreased plant accumulation downstream due to increased unavailability of radioisotopes as they are sorbed by the clay.

The Asiatic Element in the Flora of Mexico

A. J. Sharp, *University of Tennessee*

The rich and varied flora of Mexico shows affinities with those of many parts of the world, but the element least appreciated is that with plants in it which are related to Asiatic species. Probably many genera and species migrated from Asia to North America and became widely distributed before the Late Tertiary and their ranges were bisected or trisected in the Pleiocene and/or Pleistocene. It is difficult to explain on any other basis the present distribution of such taxa as *Mitrastemon, Ilex montana, Rozea bourgeana, Cladonia formosana,* and many others.

Influences of Maleic Hydrazide on the Growth and Metabolism of Chlorella

Won Kyun Kim and Victor A. Greulach, *University of North Carolina*

Though the few studies on the effects of maleic hydrazide (MH) on algae have provided little evidence that it has growth-inhibiting effects on algae similar to those on vascular plants, in this study MH markedly and significantly inhibited the growth of *Chlorella pyrenoidosa* at 5, 10 and 25 ppm, but not at 1 ppm. Growth inhibition as based on cell counts was most marked (36% of the controls) at pH 5.5. At pH 6.5 growth was 65% of the controls, at pH 7.5 it was 75%, while at pH 8.5 and above growth inhibition was minor. IAA counteracted MH growth inhibition on the basis of cell counts and dry weight, but not on the basis of optical density. GA did not influence MH growth inhibition, while kinetin counteracted MH inhibition partially but significantly. Respiration was not reduced by 10, 50 or 100 ppm MH, but 500 ppm reduced respiration to 52% that of the controls at pH 7.5 while the reduction with 1000 ppm was to 23%. At pH 5.5 and pH 9.5 500 ppm did not reduce respiration significantly. The amino acid and DNA content of Chlorella were both reduced significantly by 10 and 50 ppm MH. MH reduced the intake of P^{32} by Chlorella to 81% of the controls, the TCA soluble fraction to 87%, the ethanol soluble fraction to 72%, the RNA and polyphosphate fraction to 78%, and the DNA and residue fraction to 84%.

These and similar data on three other species of algae show that MH is a growth inhibitor for at least some algae as well as for higher plants, and suggest that MH may antagonize IAA and perhaps kinetin, but not GA. Growth inhibition by MH apparently is not brought about by a decrease in respiration, but protein and nucleic acid metabolism may be involved.

Aspects of the Physiological Tolerances of Some Species of *Trifolium* to Gamma Irradiation of the Seeds

Gayther L. Plummer, *University of Georgia*

Clovers have responded to irradiation in ways typical for such treatments. The embryos germinate following exposure dosages up to 280 Kr, but the shoots failed to develop. However, shoots grew following 175 Kr. In some instances growth was more vigerous. In other cases growth was inhibited with wide degrees of variability up to about 100 Kr. Generally, *T. subterranean, T. pratense,* and *T. nigrescens* appear to be quite tolerant to gamma irradiation. The lethal radiation absorbed dosages will be suggested.

The Percentage Distribution of Mineral Elements in Certain Leaf Galls, Their Contiguous Tissues and the Normal Leaves of Their Host Plants

Edwin G. Beck, *University of Georgia*

Leaf galls caused by *Contraria canadensis* on *Fraxinus*, those caused by *Contraria negundifolia* on Acer negundo and the galls caused by *Pachypsylla venusta* on the leaves of *Celtis* were analysed for the elements nitrogen, phosphorous, calcium, magnesium and iron. Contiguous leaf tissues about the galls and normal leaves of the host plants were also analysed for the same elements. In the cases studied the galls contained less nitrogen and more of the other nutrient elements than did the normal leaves. Galls which contained relatively large amounts of vascular tissue were lower in nitrogen than those which contained a large amount of parenchyma tissue.

The Time Course of Cell Enlargement and Leaf Growth as Affected by Kinetin and Red Light

Mildred M. Griffith and Robert D. Powell, *University of Florida*

Disks, cut from the leaves of etiolated seedlings of bean plants, were placed on filter paper saturated with a nutrient solution. Treatments involved additions of kinetin to the medium, exposure to red light and to far-red light. Disks were grown in the dark for varied periods of time. At the end of each experiment the disks were measured and prepared for histological study. The growth of disks and comparisons of cell size indicated the following conclusions. Both red light and kinetin stimulated the initial rate of growth. Kinetin was more effective than red light in increasing the rate of growth. Varying the length of time of exposure to red light did not change the growth rate, but with longer exposures the increased growth rate was maintained for a longer time. The first phase of disk growth appeared to be due to cell enlargement in the presence or absence of kinetin.

Competition Between *Helenium amarum* (Raf.) H. Rock and Certain Grasses at Various Levels of Mineral Nutrition

Donald Caplenor, *Millsaps College*

Experiments were performed during two separate summers to gather data concerning the relative capacity of *Helenium amarum* to compete with various grasses at different levels of inorganic nutrition. Plants of *Helenium amarum* (3/pot) were grown in washed quartz sand in 2-quart porcelain culture pots, and given fractional dilutions of Hoagland and Arnon's Solution #1 three times weekly to run-through. Replicates were prepared and maintained in the same manner, but were planted to excess with a lawn mixture and with Bermuda grass, respectively. Various growth criteria were used.

The grasses used were relatively better competitors than *H. amarum* at all concentrations of nutrient used, the degree of relative inhibition of *H. amarum* being directly proportional to the concentration of nutrient salts. When growth of *H. amarum* with competition was compared with its growth without competition in the various concentrations of nutrient solutions, it was found that *H. amarum* competed most successfully at a concentration of mineral nutrients equalling 1/10th Hoagland and Arnon's solution #1.

The Effect of Nucleic Acid Components on Root Growth and Geotropism

Robert T. Brumfield and Marvin W. Scott, *Longwood College*

Ribonuclease (50 mg/L) stimulates the growth of timothy roots and modifies the geotropic response in terms of curvature per unit of growth. The enzyme also digests an extracellular, gelatinous substance which covers the root cap and distal portion of the meristem. The components of the mixture have not been identified since such a minute quantity is present. The effects of purines, pyrimidines, and their compounds on growth and geotropism are being tested in concentrations of 2×10^{-3} m. The purines and pyrimidines stimulate; uracil giving the greatest effect. The nucleosides are also stimulatory but the nucleotides so far tested are inhibitory. The stimulations induced are accompanied by a greater geotropic curvature per unit of growth than in water treated controls. This is in contrast to 2,4,6-trichlorophenoxyacetic acid which stimulates growth but inhibits the curvature. It is pertinent that the latter compound stimulates the RNase digestion of the material covering the root.

Influence Upon Root Development in Maize Seedlings of a Strontium Replacement for Calcium in the Nutrient Solution

William H. Queen and Joseph C. O'Kelley, *University of Alabama*

Root development was observed in nutrient solutions prepared so that there was a stepwise replacement of calcium by sodium, calcium by strontium, and strontium by sodium. In calcium growth continued normally up to 21 days; in a sodium replacement most seedings died within 4 days; in strontium growth was normal for about 3 days after which a marked reduction was observed. Plants in strontium remained alive for the 21 day period. Roots in sodium turned brown and died soon; in strontium they showed decreased elongation after 3 days but branching was not inhibited; in calcium elongation continued throughout the 21 days. Cell length was much less in strontium than in calcium; development of side root primordia and differentiation of vascular elements occurred nearer the meristem in strontium; mitosis observed in both strontium and calcium treatments appeared normal. This research was supported by grant A-3680 from the National Institute of Arthritis and Metabolic Diseases.

Environmental Variation in *Heterotheca subaxillaris*

Carl John Burk, *University of North Carolina*

Variation in *Heterotheca subaxillaris* (Lam.) Britt. & Rusby was studied on Bogue Barrier, an island off the North Carolina coast. Low-growing prostrate forms referable to *H. subaxillaris* var. *procumbens* Wagenknecht were found in the dune-grass community. Taller, more erect plants referable to typical *H. subaxillaris* were found in the pine-oak-hickory forest. Established plants from the dunes and from the forest, when transplanted to alternating rows in an experimental plot at Chapel Hill, North Carolina, flowered at virtually identical heights. There were no morphological differences between the two sets of plants; therefore the variation observed on Bogue Barrier was interpreted as the response of a common genotype to differing environmental conditions.

A winter-blooming variant referable to *H. subaxillaris* var. *petiolaris* Benke was found at several sites. Transplants of typical *H. subaxillaris* developed the characteristic heavier pubescence of *H. subaxillaris* var. *petiolaris* but would not flower on short day in the greenhouse.

Polymorphism of a Marine Amoeba in Laboratory Culture

Eugene C. Bovee and David E. Wilson,

The marine helio-flagellate, *Dimorpha floridanis* Bovee 1960, when grown in the laboratory in liquid medium or on an agar medium, demonstrates not only the already known bi-flagellated swimming stage in an overlay of salt water, but will also adopt an amoeboid feeding stage when the small flagellates (probably *Ochromonas*) on which it feeds are abundant. Feeding movements are also amoeboid, whether feeding occurs in the heliozoan or the amoeboid phase. So far as the authors are aware no other organism is known with such a wide range of protoplasmic transmogrification.

The Use of Plants in Cancer Research

Robert C. Goss, *Loyola University*

A program of research has been initiated to perform exploratory experiments to determine if a correlation exists between animal carcinogenie chemicals and their action on germinating seeds or young growing seedlings. The prime interest is to discover biochemical events, either anabolic or catabolic, which are important to the normal germinating seed. Specific phases of the investigation have been concerned with establishing criteria for botanical carcinogenesis through laboratory and greenhouse studies.

Germination screening of approximately 50 different seed varieties indicates that rice reacts most favorable to the test procedures. Morphological differences have been noted under both laboratory and greenhouse conditions. The stem-root ratio has been used to theoretically study the translocation of native chemicals in the plant as affected by the chemical treatment. A formula to determine the chemical activity of the test material has been devised. Products of microbial degradation decreased or increased the elongation rate of rice varieties under greenhouse conditions.

This work was supported under a grant in Cancer Research from the American Cancer Society, Louisiana Division, Inc.

Experiments on Some Factors Affecting Resistance to *Schistosoma Mansoni* Infections in Mice

George W. Hunter, III and Richard B. Crandall,
University of Florida

Inconsistent results have been obtained by various workers when challenging with *Schistosoma mansoni* experimental animals which were "immunized" by the homologous parasite. Consequently a series of experiments were designed, with mice in which the principal variables were: (1) the number of "immunizing" exposures, (2) the time interval between "immunization" and challenge, and (3) the size of the challenge exposure. The results indicate that the number of "immunizing" exposures is not important nor is the size of the challenge dose. However, an interval of at least 60 days is necessary if evidence of resistance is to be found following challenge.

Observations on the Distribution and Relationships of the Troglobitic Entocytherid Ostracods of North America

C. W. Hart, Jr.,
Academy of Natural Sciences of Philadelphia
Horton H. Hobbs, Jr., *University of Virginia*

Troglobitic crayfishes are known to inhabit four distinct regions--*Procambarus* and *Troglocambarus* in the Florida peninsula, *Cambarus* in the Florida panhandle, *Orconectes* and *Cambarus* in the limestone region stretching from northern Alabama into Indiana, and *Cambarus* in the Ozark region. Associated with these crayfishes are entocytherid ostracods representing the Columbia Group in the Florida peninsula, the Runki and Humesi groups in the Alabama-Indiana region, and the Columbia Group in the Ozarks. No entocytherid ostracods are known to be associated with troglobitic crayfishes in the Florida panhandle.

Comparative Studies of Locomotive Activity in Appalachian Salamanders

Robert E. Gordon, *University of Notre Dame*
and *Highlands Biological Station*

The temporal pattern of locomotive activity in sympatric species, representing potential competitors in a given community, is compared. A brief explanation of the methods employed and some preliminary results are given for *Aneides aeneus* and *Plethodon jordani*.

(Research supported by National Science Foundation Grant 13327.)

A Simple Mechanical Model to Teach Energy Flow

Stuart S. Bamforth,
Newcomb College of Tulane University

H. T. Odum's analogue of an electrical computer to demonstrate energy flow for an ecosystem may be translated into a simple mechanical model for teaching purposes. Six pendulums are suspended from a beam, and labeled from left to right, plants, plant respiration, herbivores, carnivores, decomposers, and organic matter. Cross bars connect those pendulums where energy flows from one entity on the left to one on the right. For example, cross bars connect plants to plant respiration, herbivores, decomposers and organic matter; carnivores connect to decomposers and organic matter. The model can be adjusted to special situations; *e.g.*, for Lake Pontchartrain, additional organic matter and decomposer pendulums are placed between plant respiration and herbivores, to represent the energy source supplied by rivers draining into the lake. For heterotrophic waters, plants and plant respiration would be eliminated. Students can eonstruct ecological situations with the model to learn energy relationships.

On MacArthur's Model of the Relative Abundance of Species

Charles E. King, *Florida State University*

In an attempt to analyze species abundance from a biological view, Robert H. MacArthur has formulated a mathematical model which predicts the relative abundance of any species in a community with nonoverlapping and continuous niches. Discrepancies between predicated and observed abundances are negligible for tested birds and members of the gastropod genus *Conus* but not for soil arthropods. Data are presented in the current paper on tests of free-living marine nematodes and ciliates. Both of these groups display a poor fit.

In all cases of poor fit it is observed that (1) the members of the respective communities have different periods of reproduction resulting in asynchronous peak populations, (2) the life span is relatively short, and (3) reproduction occurs two or more times each year so that environmental conditions differ for every generation. It is suggested that these factors should be considered in application of the MacArthur model.

Seasonal Changes in the Quantity of Fat and Glycogen of *Bufo fowleri*

Francis M. Bush, *University of Georgia*

About 10 male and 10 female adult Fowler's toads were collected from the field each month from April to October, 1960, at Athens, Georgia. The total weight was ascertained, fat-bodies, livers, and ovaries were ablated and weighed. The fats were extracted (method of Bloor) and analyses of liver glycogen (method of Montgomery) were made.

The results showed that from spring to autumn, total dry weight increased (males, 23-28%, females, 24-28%) and water decreased (males, 77-72%, females 76-72%). The fat of the total body (mg fat/g fat-free dry wt), liver fat (mg fat/g fat-free liver wt) and carcass fat (mg fat/g fat-free carcass wt) increased on the average nearly two and one half fold in the male and slightly over four in the female. The fat of the fat-bodies (mg fat/100 g fat-free total wt) increased 23 fold in the male. The female had only a trace of fat in the fat-bodies in April, from May to October, a 54 fold increase occurred. Ovary fat (mg fat/g fat-free ovary wt) did not vary seasonally, but relative ovary fat (mg fat/100 g fat-free total wt) was twice as abundant in the spring. Apparently the fat of the fat-bodies shifts to maintain the ovary fat during the spawning period. In April, liver glycogen represented 2.2% dry fat-free liver weight in both sexes. At the peak of the breeding season, this declined to 1.5% males, 0.6% females. In July, it increased to a maximum, 3.2% males, 3.3% females, and then dropped off slightly in September, 3.1% males, 2.6% females. Increased daylength and ambient temperature, both associated with abundance of food in summer, appear to be two factors directly related to the seasonal changes.

Gonadal Recrudescence and Lipid Deposition in Response to Different Photoperiods in the Slate-colored Junco

David W. Johnson, *Wake Forest College*

Wintering Slate-colored Juncos were trapped and housed in outdoor cages at Winston-Salem, N. C. from February to May. One group was exposed to a daily photoperiod of 16 hours of daylight and 8 hours of darkness; another received 6 hours of light; and another was kept as a control, receiving natural light. Other birds were captured from the wild state periodically. Samples were taken from each group for gonad examination and lipid extraction. Most wild juncos migrated by the end of March when their gonads were undeveloped and average lipid content was 4% of body weight. Caged controls in April had large testes and 18% lipids. Deceased light birds had small gonads and 8% lipids. Males on increased light had large testes with sperm by April 8 and by May 4 had 17% lipids.

Bird Remains from a Sioux Indian Midden

J. Hill Hamon, *Jacksonville University*

Thirty-seven species of birds comprise the avifauna unearthed at a midden located at Mill Creek Indian Village, near Cherokee, Iowa. The presence of the rough-legged hawk, a winter resident, suggests that the site was occupied during the winter. Because of the absence of bones of young birds it is doubtful that Indians lived here in the middle of summer. Woodland birds comprised 31 percent of identified remains, raptorial and scavenging birds 28.4 percent, prairie dwellers 16.2 percent, marsh-dwellers 13.5 percent, and aquatic species 10.9 percent. Judging from the avifauna, the area surrounding the midden was probably mostly deciduous woodland with nearby prairie and marshes. The passenger pigeon is the only extinct bird found here.

The Influence of Certain Factors on the Respiratory Metabolism of Amphibia

Marilyn Zirk Pryor and Samuel R. Tipton, *University of Tennessee*

The influence of dietary factors and hormones of the thyroid and pituitary glands on the metabolism of larval and adult amphibia, primarily *Rana pipiens* and *R. catesbeiana*, is being studied to relate the whole body respiration to the respiration of slices of liver and to the oxidative enzymes of isolated liver mitochondria. The respiration of *R. pipiens* adults at 22° C averages 125 μl O_2/gm fresh weight/hr; liver slice Q_{O_2} and SDHase of the isolated liver mitochondria are 3.0 μl O_2/mg dry weight/hr and 52.7 μl O_2/mg N/hr, respectively. The scarcity of data on the respiratory metabolism of cold blooded forms, tissues and subcellular enzymatic systems and their response to various factors, makes such a study urgent.

Spontaneous and Thyroxin-induced Swelling of Liver Mitochondria from Riboflavin Deficient and Normal Rats

James L. Smothers and S. R. Tipton, *University of Tennessee*

Mitochondria isolated from livers of rats kept on riboflavin deficient diet for a period of 8-10 weeks exhibit a slower rate of spontaneous swelling in 0.3 M sucrose than do mitochondria from livers of pair fed controls. After 30 minutes observation, the decrease in optical density of mitochondria from riboflavin deficient rats was approximately one-third that of mitochondria from controls. The swelling of mitochondria from both groups occurred at a faster rate in the presence of 1×10^{-5} M to 1×10^{-7} M thyroxin. The change in rate of swelling at any thyroxin level (especially at the lower concentrations) was roughly the same in both. Changes in the osmotic behavior of isolated mitochondria are usually considered to reflect changes in the functional morphology of the mitochondrial membrane. On this basis, these data are interpreted as indicating that thyroxin and riboflavin deficiency differ in the fundamental nature of their action on the mitochondrial membrane.

Pigment Cell Behaviour in the Hind Limb Musculature of PET Mice [1]

Willie M. Reams, Jr. and Thomas C. Mayer,[2] *Louisiana State University*

Mice of the PET strain contain Pigmented Extracpidermal Tissues. Since the establishment of this strain in 1958, there has been an isolation of several substrains, each being distinguished by the specific location of melanocytes in the connective tissues. The present investigation is concerned only with the presence and differentiation of pigment cells in the hind limb musculature. In this respect, mice of the original PET strain are noted to possess melanocytes between the fibres of all

the muscles of the limb. However, melanocytes are limited primarily to the muscles of the posterior and lateral compartments and to the hip in the recently developed PET/LSU mice, and are even more restricted in present PET/MCV groups. The question arises regarding the factors involved which affect their appearance in the substrains. In the absence of reliable staining methods for early melanoblasts, their presence can be shown only by suitable grafting experiments into the coelom of host chick embryos. This method is being utilized to determine whether melanoblasts are unable to migrate into certain areas, or whether their differentiation is prevented by the chemical environment within the muscle. These studies of the pigmentary pattern and behaviour in the limb muscles entice speculation on the possible role of genetically influenced pathways for melanoblast migration and changes in the tissue milieu for differentiation.

Preliminary Studies of Isocaloric Synthetic Diets as Inhibitors of Experimental Neoplasms

J. Richard Thompson,
Chemotherapy Seetion, Southern Researeh Institute

The evaluation of experimental cancer chemotherapy data is not a quick and easy task. Proper evaluation and interpretation of such data are dependent upon full cognizance of each of the parameters of the experiment, keeping always in mind the effects and possible interactions of each of the parameters. It is well known that in certain tumor systems simple caloric restriction will significantly inhibit tumor growth. In certain experiments, nonlethal drug toxicity and associated reduction of food intake (and host inanition) can easily be mistaken for specific and meaningful drug "activity." These "weight-loss false positives" are one of the many stumbling blocks encountered in a cancer chemotherapy program.

In an effort to elucidate this problem, experiments have been designed to determine the tumor-inhibiting effects of specific weight loss caused by caloric restriction in the animal diet. Similarly, tumor-bearing mice have been held on isocaloric-synthetic diets in an effort to determine the effects on tumor growth of protein-free, fat-free, and carbonhydrate-free diets. It is possible that the source of calories (protein, fat, or carbohydrate) or the percentage distribution thereof, may be of importance in establishing tumor inhibition.

Data will be presented showing composition of diets and their antitumor effects in mice bearing Sarcoma 180 and Adenocarcinoma 755.

A Partial Characterization of the Jelly-Splitting Enzyme of Sand Dollar Spermatozoa

John M. Rawls, *University of Florida*

Extracts of sperm from the sand dollar, *Mellita quinquiesperforata* contain a substance, distinct from antifertilizin, which causes dispersal of the gelatinous coat surrounding the eggs of this species. The substance under study is apparently an enzyme. It has optimum lytic activity at pH 8.0, at 25 to 30° C. From the optimum, activity decreases with increase in pH up to 9.6. At higher pH values irreversible inactivation occurs. At pH 6.0 partial inactivation occurs. There is a decrease in lytic activity after treatment for two minutes at various temperatures up to 45° C. at which temperature the enzyme is irreversibly inactivated. Kinctic studies indicate that a zero-order reaction is approached at saturation. Preliminary studies reveal that the jelly-splitting enzyme may be separated from antifertilizin by means of absorption of the extract with fertilizin.

This work was done during tenures of a National Science Foundation Science Faculty Fellowship and a fellowship from Southern Fellowships, Inc.

Physiology of the Proximal Retinal Pigment of the Shrimp *Crangon septemspinosus*

R. Nagabhushanam and Milton Fingerman,
Neweomb College of Tulane University, and
Marine Biologieal Laboratory, Woods Hole, Massaehusetts

To observe the position of the proximal pigment the eyestalks had to be sectioned. The shrimp were rapidly killed in boiling water. Both eyestalks were then removed and fixed. After having been dehydrated and embedded, the eyestalks were sectioned at 20 μ. With the aid of an ocular micrometer two measurements were made: (1) cornea to distal edge of proximal pigment and (2) cornea to basement membrane. Changes in the ratio of measurements 1 to measurement 2 indicated the direction and extent of pigment migration. A graded response to illumination between zero and 17 ft. c. was found. The proximal pigment of specimens in darkness lay completely below the basement membrane. At 22-24° C, maximal dark-adaptation occurred 45 minutes after transfer from light to darkness. Light-adaptation required 30 minutes. Eyestalk extract injected into animals maintained under an illumination of 2 ft. c. caused a statistically significant proximal migration, dark-adaptation, of the proximal pigment.

This investigation was supported in part by Grant No. B-838 from the National Institutes of Health.

Observations on the Structure and Ultrastructure of the Pituitary Gland of the Salamander (*Triturus Viridescens*)

Robert R. Cardell, Jr.,
Edsel B. Ford Institute for Medical Researeh,
Henry Ford Hospital

Pituitary glands of *Triturus virideseens* were exposed and fixed *in situ* with nine parts of Susa solution plus one part saturated aqueous solution of picric acid and studies were made with the light microscope. Other glands were exposed and fixed *in situ* with buffered 1% osmium tetraoxide (pH 7.4) and either dehydrated with ethyl alcohol and embedded in a 3:1 mixture of butyl to methyl methacrylate, or dehydrated with acetone and embedded in Vestopal W. In either case ultrathin sections were cut and studies were made with the electron microscope. The advantage of the technique utilizing acetone and vestopal are pointed out. Details of the vascular organization of the pituitary are presented which includes the ultrastructure of the sinusoids, perisinusoidal spaces and the relationship of the pituitary cells to the vascular system. The ultrastructure of the acidophilic and basophilic cells is discussed and this is correlated with light microscopy studies.

The Utilization of Transplantable Hamster Tumors as Experimental Tools for Evaluating Potential Anticancer Agents

Jack H. Moore, Charles A. Kelley, and
J. Richard Thompson,
Chemotherapy Seetion, Southern Research Institute

We have used eighteen hamster tumors isolated and established by Dr. Joseph Fortner of Sloan-Kettering Institute in a secondary screening program to evaluate the

effects of a group of selected anticancer agents. These tumors represent a wide variety of neoplasms with regard to site of origin and morphology. Most of these tumors metastasize to lymph nodes, liver, heart, lung, etc., following subcutaneous implant. Through the use of these, a double criterion of judging the effectiveness of new drugs is possible: 1) their inhibitory action on the primary tumor implant and, 2) their inhibitory action or retardation of metastatic spread of the tumor.

Slides which show normal tumor growth and sites of metastatic spread will be presented. Data will be presented which show the inhibition of some of these tumors by certain classes of drugs which are effective against animal neoplasms.

The Developmental Effects of Lithium Chloride Applied to Selected Surface Regions of the Eggs of *Nassarius vibex* and *N. obsoleta*

Fred K. Parrish, *Agnes Scott College*
Joanna W. Parrish, *Emory University*

In preliminary experiments to test for regional differences in plasma membrane permeability, an apparatus was constructed which allowed a selected region of a living cell to be bathed in one solution while the rest of the cell remained in an entirely different environment. Eggs of *Nassarius vibex* and *N. obsoleta* were irrigated at the animal and vegetal poles with a concentration of lithium chloride sufficient to produce cytolysis or severely anomalous development. It was found that when the whole egg and the animal pole were exposed to lithium, cytolysis and anomalous development resulted. When the vegetal poles of the eggs were exposed to the same concentrations of lithium, however, the resulting embryos were normal. Data from other sources indicate that the time and concentration of lithium used in these experiments were ample for an effective dosage of lithium to be established in the egg from either pole. These preliminary data can be interpreted, then, as showing that different concentrations of lithium are established throughout the egg depending upon the pole irrigated. The literature states that the establishment of these concentrations is not a function of the cytoplasm (endoplasm) or the yolk.

Comparative Aspects of Tryptic Peptides of Several Mammalian Hemoglobins

Charles W. Foreman, *Pfeiffer College*

Peptide patterns obtained by two dimensional paper chromatographic and electrophoretic analysis of hemoglobin tryptic hydrolysates will be presented and discussed for the following: two genetically different hemoglobins from the cotton rat (*Sigmodon hispidus*), and one hemoglobin each from the golden mouse (*Peromyscus nuttalli*), cotton mouse (*P. gossypinus*), bob cat (*Lynx rufus*), and opossum (*Didelphis virginiana*). The tryptic peptide chromatograms of hemoglobins from closely related species are much more similar than those of hemoglobins from distantly related species.

(This work was done in the Biology Division of the Oak Ridge National Laboratory under the provisions of S-Contract number 776.)

Studies of *Tetrahumena* Serotypes by Fluorescent Counterstaining

Marion T. Coleman [1] and Charles Ray, Jr., *Emory University*

Immunological reactions of S-I and S-II strains (mating types I and II) of *Tetrahymena pyriformis*, variety 1, have been investigated by the direct fluorescent antibody method of staining suspensions of methanol-fixed ciliates. Difficulties relating to nonspecific fluorescence were resolved by using rhodamine conjugates as counterstains with immunospccific flourescein-labeled antiglobulins. Normal serum fractions labeled with rhodamine B isothiocyanate served to limit fluorescein staining reactions to the homologous strains of Protozoa and to provide an effective color contrast in heterologous organisms. Mating reactions and serotype fluorescence of different strains of variety 1 were compared. Studies were made of populations of conjugating ciliates at intervals during a period of 18 hours after mating began. Evidence indicated that a significant number of co-conjugants had undergone a change in serotype expression between 10 and 12 hours following onset of conjugation.

This work was supported in part by grants from the National Science Foundation and from the National Institutes of Health.

Fatty Acids from Lipids of Rat Liver Microsomes

B. T. Cole and N. G. Anderson,
Biology Division, Oak Ridge National Laboratory, and University of South Carolina

Gravimetric determination of total lipids extractable from lyopholized microsomes from brain, kidney, liver, and testis of rats showed them to be 20.8, 10.4, 14.6 and 17.5% respectively.

A 332.5-mg sample of lipid, extracted from rat liver microsomes with chloroform-methanol (2:1) at room temperature, was taken up in hexane, placed on a silicic acid column, and eluted in accordance with a scheme devised by E. C. Horning, modified by D. A. Turner *et al.* (personal communication). Eleven peaks were obtained, and by various quantitative tests on each peak fraction, total cholesterol, phosphorus, total nitrogen, glycerol, ester linkages, and total lipid were determined. Analysis showed the lipid to be 17.5% cholesterol, 7.75% triglyceride, 6.98 diglyceride, 5.43% monoglyceride, and 62.7% phospholipid. The phospholipid fraction was eluted as six separate peaks. Specific identification of the phospholipid classes has not been made.

Two-milliliter samples of each peak were taken to dryness under nitrogen and hydrolyzed. Constituent fattly acids were methylated by a procedure described by Turner *et al.* Qualitative fatty acid analysis was made by gas liquid chromatography. Suitable standards are being formulated for fatty acid identification and quantitative analysis. Gas chromatography revealed the presence of 9 different fatty acids esterified with cholesterol, 10 associated with triglycerides, 15 with diglycerides, and 10, 14, 22 and 22 fatty acids with phospholipid peaks 6 through 9, respectively. Phospholipid peak 10 was inadvertently destroyed, and peak 11 gave evidence of containing only 6 fatty acid moieties. Gas liquid chromatography of fatty acids from peak 5 (monoglyceride) gave a single, large peak with a retention time of 1.11 min, height of 55 mm, and width at half height of 12 mm. The peak was badly "tailed" and repetitive analysis altered neither the peak shape characteristics nor its retention time. Other analysis revealed this peak to contain 5.34% of the total lipid, 0.30 mg of cholesterol, 219 mg of phosphorus, no nitrogen, 3.088 mg of glycerol and 3.32 microequivalents of ester.

Chloroquine Resistance in *Plasmodium falciparum*

Martin D. Young, *Laboratory of Parasite Chemotherapy, Columbia, South Carolina*

A strain of *Plasmodium falciparum* originating in Colombia, South Ameriea, was induced in neurosyphilitic

patients. The response of this strain of malaria to normal or above-normal doses of chloroquine, hydroxychloroquine, and amodiaquine was very poor, the parasitemias either being slowly reduced or not reduced at all. The parasitemias, if cleared, usually relapsed shortly thereafter. Urines and blood plasma showed presence of the chloroquine. Normally susceptible strains of *P. falciparum* are usually eliminated within several days and seldom relapse after normal doses of drug. The Colombia strain continued to show a normal response to quinine and mepacrine. As the 4-aminoquinoline group represents the most important drugs for the treatment and suppression of clinical malaria, it is felt that this development of resistance to the drug is of importance. At present millions of people take these drugs in areas where malaria eradication programs are in progress.

Alkaline Earth Elements and the Avoidance Reaction in *Paramecium multimicronucleatum*

James D. Yarbrough and Joseph C. O'Kelley

In a solution containing calcium, *Paramecium* behavior was normal; only occasional directional changes were observed. In a medium wherein strontium replaced calcium, *Paramecium* exhibited almost continuous classical avoidanee reaction, initiated upon exposure to strontium and continuing apparently indefinitely. When barium replaced calcium, organisms showed disorientation, with a rotation of the anterior end around the posterior; evidence of toxicity by barium existed. Replacement by sodium produced a slow circular swimming pattern; organisms died within five minutes. Strontium, barium and sodium chlorides alone produced the same general reactions and other elements of the original mineral solution sensitized the organism. Two types of sterilized cultures of *Protosiphon botryoides* were supplied as nutrient media for *Paramecium;* one consisted of the alga grown in calcium, the other type contained the alga grown with a strontium replacement. Paramecia inoculated into the medium, along with bacteria; were alive in both culture media after thirty days. In strontium after this time period avoidance reactions were noted. This research was supported by a grant, no. A-3680. from the National Institute of Arthritis and Metabolic Diseases.

The Distribution, Growth and Reproduction of Lancelets in the Cedar Key Area

E. Lowe Pierce, *University of Florida*

One species of lancelet, *Branchiostoma caribaeum*, occurs in many locations along the Gulf coast of Florida. Periodic bottom samples were taken with a dredge in a variety of habitats in the Cedar Key area. Lancelets were screened from dredged materials. The preferred habitat was coarse sand and shell fragments in channels where tidal currents were swift. Sand mixed with mud yielded few specimens. Lancelets with developing gonads were found frequently during late winter and spring. Breeding appeared to extend over a period of several months. (Research supported by National Science Foundation Grant G-13252.)

A Study of the *Geolycosa pikei* Complex in the Southeastern United States

John D. McCrone, *University of Florida*

The *pikei* complex of the burrowing wolf spider genus *Geolycosa* consists of a group of closely related allopatric populations. These are confined to sandy beaches along the northern Atlantic seaboard and inland dune-like areas in South Carolina, Georgia, and Florida. A combined taxonomic, ecologic, and zoogeographic study resulted in the recognition of three species and two subspecies. Two of the species, *G. pikei* (Marx) and *G. patellonigra* Wallace, have been previously described and their status is confirmed. The new species and its two subspecies will be discussed. The range of *pikei* extends from Massachusetts south to northern Georgia, while *patellonigra* and the new species are confined to Florida. The extent of speciation in the southern part of the range is striking in view of the relatively uniform topography of the southeastern Coastal Plain. An attempt is made to explain this speciation by a consideration of the Pleistocene history of the area.

A portion of this work was done during the tenure of a fellowship from the Southern Fellowships Fund.

The True *Gomphus consanguis* Selys (Odonata: Gomphidae)

Minter J. Westfall, Jr., *University of Florida*
Richard P. Trogdon, *Judson College*

In 1879 Edmond de Selys-Longchamps described *Gomphus consanguis* from North Carolina. Leonora K. Gloyd in 1936 made an unsuccessful attempt to have the type located in connection with her description of *Gomphus rogersi*. In 1944 Elsie B. Klots placed *G. rogersi* as a synonym of *G. consanguis*. Needham and Westfall followed Klots' option in 1955 in the *Manual of the Dragonflies of North America*. One of us has now collected a series of more than 30 specimens, including one female, in Tennessee. The males fit perfectly Sely's description of *consanguis* and the female can be made known for the first time. This species is quite different from *G. rogersi* Gloyd and the specimens allow us to reinstate *rogersi* as a valid species. Further study of the two species, as shown by the adults and also the nymph of *rogersi* which has been reared, indieates they are to be included in the subgenus *Gomphurus*.

The Fauna of Mammoth Cave

Thomas C. Barr, *Tennessee Polytechnic Institute*

Mammoth Cave, in Edmonson and Barren Counties, Kentucky, together with genetically associated limestone caverns in Mammoth Cave National Park, is the most extensive known linear cave system in the world. Its rich cavernicolous fauna has been sporadically investigated by biologists since about 1840, and approximately 40 species have their type loealities within the region. The system is inhabited by 108 species (or more) of animals, of which 43 are troglobites (obligatory cavernicoles). The troglobites include turbellarians, gastropods, pseudoscorpions, opilionids, spiders, mites, millipedes, copepods, ostracods, amphipods, isopods, crayfishes, shrimps, collembolans, diplurans, bettles (Carabidae, Catopidae, Pselaphidae), and teleosts. The faunal affinities of the Mammoth Cave community indicate multiple invasions in the past from two probably subterranean avenues of dispersal: (1) from the north and southwest, along the margins of the Western Kentucky coal basin, and (2) from the upper Cumberland basin of Tennessee.

The Distribution and Ecology of *Cyathura polita* (Stimpson) in Tidal Marshes of Cape Cod, Massachusetts, and Its Vicinity

W. D. Burbanck, *Emory University*

The isopod *Cyathura polita* (Stimpson) was found in 40 of te 62 marshes studied in the Cape Cod area. Cyathurans occurred at a depth of from 5–8 cm. in a stable substrate with some sand present and covered by a mixture of salt and fresh water in motion and under tidal influence. Populations were relatively stable as to

location and density over a period of five years with a range in density of from 108/m² to 1080/m² with the exception of two much larger populations. No species of macroseopic animals were regularly associated with *C. polita,* but those most frequently recorded were *Scolecolepides, Heteromastus,* nereids, and gammarids. *C. polita* is essentially euryokous but appears to tolerate only slight reductions in dissolved oxygen, is chiefly a detritus feeder, and is eaten by winter flounder, sea-run trout, and black duek. After three years, a transplanted population of cyathurans is well established at Mill Creek, Sandwich, where none occurred naturally. Possible reasons for the nonoccurrence of *C. polita* in certain marshes are discussed and related to the problem of the prescrvation of natural estuarine habitats.

This work was supported by National Science Foundation Grant G-7138 and the McCandless Fund of Emory University.

A New Strigeoid Trematode (*Diplostomatidae: Alariinae*) from Florida Raccoons

Reinard Harkema and Grover C. Miller,
North Carolina State College

Examination of 19 raceoons from Glades County, Florida, in September, 1960, revealed the presence of an unknown strigeoid trematode. Five of the 19 raceoons had light to moderate infections of this parasite in the small intestine. These specimens are sufficiently different from any known form to constitute a new genus. They are characterized by an elongated bi-lobed holdfast organ which extends to or beyond the oral sucker. There is similarity to the genus *Pharyngostomoides* Harkema, 1942, in the parallel position of the testes and in general body form. The major features which separate this strigeoid trematode are the position and structure of the holdfast organ, the forward loeation of the testes, the large reeess in the genital atrium, and the much larger size.

Studies on the Life Cycle of a New Avian Schistosome in the Genus *Austrobilharzia*

Rhodes B. Holliman, *Jacksonville University*
Robert B. Short, *Florida State University*

An examination for larval trematodes has been made on 10,510 specimens of *Cerithidea scalariformis,* a marine gastropod from the salt marshes of Apalaehee Bay, Wakulla County, Florida. Of this number, 24 specimens were found infected with a new schistosome. Parakeets, pigeons and chicks were exposed to cercariae and adult worms were recovered from the livers and mesenteric veins of these laboratory animals. White mice, exposed to eercariae, failed to produce worms. Eggs, deposited in the tissues of the avian hosts, have also been studied. Examination of both sexes of adult worms revealed that they are a new species in the genus *Austrobilharzia.* The produetion of dermatitis in man by this cercaria has been demonstrated.

Potentiation of X-ray Damage by Near Infrared Pretreatment of *Tetrahymena*

Margaret M. Wells [1] and Charles Ray, Jr.,
Emory University

Exposures of *Tetrahymena pyriformis* to 4, 6, 8, 16, or 24 hours of near infrared preeeded exposures of 150 kr or 300 kr x-radiation (at 1 kr per minute). Log phase cultures of variety 1, mating type I were mixed with the irradiated mating type II cultures. Analysis of the effects of near infrared pretreatment involved the examination of anlagen stage in hematoxylin stained conjugants. The experimental cultures differed in the frequency of reeovered micro- and macronuclear combinations. Pretreatment with 6, 8, or 16 hours of near infrared resulted in a significant increase of abnormal nuelear conditions. Pretreatment of 150 kr x-rays with 6 hours of near infrared produeed the same number of recoverable abnormalities as produeed by twice the x-radiation does without infrared pretreatment.

This work was supported in part by grants from the National Institutes of Health, the Atomic Energy Commission, and the National Science Foundation.

[1] Present address: Science Department, Ball State Teachers College.

Uptake of P^{32} by the Snail, *Australorbis glabratus*

E. W. Lautenschlager, *University of Virginia*

Both uninfected control snails and snails infected with *Schistosoma mansoni* were exposed to $P^{32}(PO_4)$ in a concentration of 5 microcuries per milliliter of water for varying times ranging from less than 1 minute to 3 hours. For quantitative measurement of uptake snails were washed, the shell removed, the tissue dried on planchets, and radioactivity determined by direct count. To determine the loss of isotope, snails were exposed to the same concentration for a uniform time, returned to nonradioactive water for varying times, after which a direct count of radioactivity was made on dried tissue. To determine the localization of the isotope, other snails were fixed and sectioned for autoradiography. Quantitative uptake of thc isotope, loss of isotope, and localization by both infected and uninfected snails will be diseussed.

Preliminary Observations on Temperature Adaptation of Goldfish and P-32 Distribution

John A. Freeman, *Winthrop College*

Several changes involving an increase in activity during low temperature adaptation have been observed in goldfish. In view of the roles of phosphorus compounds in bioenergetic processes a study of its distribution in organisms adapted to different temperatures appears worthwhile. Goldfish adapted to 10° and 23° C have been injected with tracer doses of P-32 and the concentrations of the isotopes eompared in brain, muscle and visceral breis removed four hours after injection. Radiophosphorus was determined on trichloroacetate precipitates and on supernates. Activity in soluble fractions was significantly higher in brain and in visceral breis of cold-adapted fish as compared with warm-adapted fish. It was also significantly higher in precipitates from the eombined viscera of cold-adapted fish. Muscle showed no signifieant differences when cold- and warm-adapted fish were compared.

Concepts of the Genus *Zephyranthes* and the Confounding of Herbert's Hippeastriformes [1]

R. O. Flagg and W. S. Flory,
The Blandy Experimental Farm

Major changes in coneepts of the genus *Zephyranthes* Herb. (1821) have occurred four times. Synonymy of *Zephyranthes* binomials involves at least 17 other generic names, prominently: *Amaryllis* (*Hippeastrum*), *Rhodophiala, Habranthus, Atamosco, Cooperia, Pyrolirion* and *Haylockia,* i.e. Herbert's 1837 section Hippeastriformes except for *Sprekelia* and *Phycella.* The results of Pax's

1888 wide separation of certain of those taxa (following enlargements of *Zephyranthes* and *Hippeastrum* by Bentham and Hooker) have not been totally rectified. Consideration of morphological and distributional similarities, and cytological reports suggests that the genera *Amaryllis, Worsleya, Placea, Sprekelia, Rhodophiala, Habranthus, Zephyranthes, Cooperia, Pyrolirion* and *Haylockia* comprise a bifurcate phyletic branch in the Amarylloideae and should be united as a tribe, Amaryllleae-a-re-incarnation of Herbert's section Hippeastriformes. A phyletic key to generic synonymy of *Zephyranthes* binomials is presented and evolutionary trends within the proposed tribe are discussed.

[1] Work supported by N.S.F. Grant G-11080.

The Variation in *Aconitum uncinatum*

James W. Hardin, *North Carolina State College*

A preliminary study of *A. uncinatum* indicates that a thorough taxonomic revision of the eastern Aconitums is needed to answer all the questions that have arisen. The study of variation in pubescence and leaf shape already indicates (1) the necessity of revising the current descriptions and keys, (2) that Fernald's variety *acutidens* is probably not distinct, and (3) the doubtful distinctness of *A. novebaracense* at least as a separate species. The pattern of variation and the characteristics which have been used to distinguish these entities, are discussed.

Phylogenetic Relationships in the Genus *Polygonella* (Polygonaceae)

James H. Horton, *University of North Carolina*

Polygonella, as treated here, includes *Delopyrum* Small *Dentoceras* Small, and *Thysanella* Gray. These plants are low subherbaceous or suffrutescent annuals or perennials, most of which inhabit southeastern coastal or scrubland sands. Despite variations in chromosome number and other minor differences, the plants should be placed in a single genus, as evidenced by similarities in morphology and floral and foliar anatomy. Plants of two taxa constitute an evolutionary dead end, and are placed in a separate subgenus. Subherbaceous annuals of *Polygonella articulata* are judged to be the most primitive plants of the group on the basis of chromosome number, wood anatomy, floral morphology, and distribution. Two lines—subherbaceous and suffrutescent—seem to diverge from the common ancestor of the group, and lead, through plants producing hermaphroditic and pistillate flowers, to suffrutescent perennials (*P. polygama*) and subherbaceous annuals (*P. gracilis*) in which the apparently bisexual flowers are functionally staminate, the plants dioecious.

A Hybrid Index for the Mid-Appalachian *Abies* (Fir or Balsam)

George S. Ramseur, *The University of the South*

The mid-Appalachian *Abies* seems to be limited to seven small stands in West Virginia and northern Virginia. The variation, especially in cone bracts, of specimens from these stands has led various workers to refer to this *Abies* as either *A. fraseri* (Pursh) Poir., *A. balsamea* (L.) Mill., or a new intermediate species. These stands are generally well isolated from each other, and are certainly well separated from the modern ranges of *A. fraseri* and *A. balsamea.* There may have been overlapping during the Ice Ages.

Cone scales, bracts, and seeds of specimens from five mid-Appalaehian stands were compared with specimens of *A. balsamea* from Michigan and *A. fraseri* from the Smokies. Evaluation by the hybrid index method of Anderson shows the variations to fall within the limits which could be expected for hybrids with segregation and back crossing with the parental species.

Preliminary Studies of the Taxonomic Status of *Erigeron pusillus*

C. W. James, *University of Georgia*

Until 1947, *Erigeron pusillus* Nutt. had been consistently referred to specific rank. At that time and since, it has often been considered a var. of *Erigeron canadensis L.*—primary because of the presence of plants intermediate in form between the two. Observations on the distribution, frequency, and form of these plants in the Piedmont and Coastal Plain of Georgia, indicate that if hybridization does occur it is infrequent in the field and some isolating barrier is presumably operative. Plants intermediate in form, as well as typical plants of each species, were self-pollinated to determine if self-pollination effected a partial barrier to free hybridization. At the same time it was thought that observations on the phenotypes of the progeny might indicate the hybrid nature of the "intermediate" parents. The results of these studies and progress in others are discussed.

Studies of *Lyonia lucida* (Lam.) K. Koch (Ericaceae)

Wilbur H. Duncan, *University of Georgia*

This species, previously known only in the Coastal Plain from southeastern Virginia to southeastern Louisiana, was discovered in the Ridge and Valley, and Cumberland Provinces in northwest Georgia. Study of herbarium specimens sought evidence to show or deny that these colonies might be relic. Although plants from dry sandy habitats of Trail Ridge east of the Okefinokee Swamp show consistent differences in flower form from those growing in the wet habitats of the swamp, these differences appear not to be correlated with edaphic conditions when analyzed over a broad geographic area. Only sepal length seems to vary on a regional basis. The disjunct northwest Georgia colonies are not in any of the dozen characters studied significantly different from the Coastal Plain population. Flower measurement data from 116 widely distributed collections when analyzed independently of habitat show that the two flower form types of the Okefinokee region may be partly segregated genetically. Heterostyle is not involved.

Growth Inhibition of *Chlorella* Induced by 3-Amino-1,2,4-Triazole, and its Reversal by Purines

Frederick T. Wolf, *Vanderbilt University*

The growth of *Chlorella pyrenoidosa* is inhibited by amino triazole. In cultures in Bristol's solution, approximately 50 percent inhibition of growth is induced by amino triazole at a concentration of 0.5 mg. per 100 ml. This inhibition may be reversed by adenine, quanine, hypoxanthine, uric acid, or xanthine in concentrations approximately twice as great, but is not reversed by riboflavin. It is concluded that amino triazole functions as an inhibitor of purine synthesis. Since purines are constituents of the ribonucleic acid present in chloroplasts, the interference of amino triazole with chloroplast development may be explained on this basis.

A New Ulotriehacean Alga

Jackie Edwards and Walter Herndon,
University of Alabama

An apparently unique ulotriehacean alga has been isolated from grassland soil from Baldwin County, Alabama, and its morphology and life history studied in unialgal and baeteria-free eultures. The plant grows profusely in soil-water eultures and in both liquid and agar inorganie nutrient eultures. Its most striking eharacteristie is its tightly spiraled unbranched filamentous body which strongly resembles that of the cyanophyeean *Spirulina*. Further, as the filaments approaeh maturity, individual cells of the filaments undergo repeated divisions produeing *Sarcina*-like paekets along the spiraled filament. Cellular morphology is eharaeteristically ulotriehaeean. Asexual reproduetion is by quadriflagellate zoospores, aplanospores produeed within the paekets, and by fragmentation. Sexual reproduetion has not been observed. The characteristic elose spiraling and the regular produetion of *Sarcina*-like paekets are eonsidered to merit generic distinetion from *Ulothrix* to whieh it is considered to be most elosely related.

The Marine Algae of Bimini, Bahamas. I. *Cyanophyta*

Harold J. Humm, *Duke University*

Fifty eight speeies (25 genera) of bluegreen algae from marine habitats are listed from the Bahamas Arehipelago, all but 12 of whieh have been found around the Bimini Islands. Nine of these speeies are coeeoid bluegreens and 49 are filamentous species.

The known distribution in the western North Atlantie, habitat notes for the Bahamas reeords, and an extensive bibliography are given. As an aid to identification, a key to the genera, speeies keys, and descriptions are ineluded.

Composition of the Phytoplankton Populations of the Major Waterways of the United States

Louis G. Williams,
R. A. Taft Sanitary Engineering Center, Cincinnati, Ohio

A report of the oeeurrence and distribution of the most abundant plankters of the National Water Quality Network of some 70 stations located on the major waterways of the United States to show proportional abundance, seasonal variation, and population density and their effeets on water quality, and their eomposition as indieators of water quality, with speeial emphasis on diatoms.

The Chytrid *Pringsheimiella* is now *Dictyomorpha Gen. Nov.*

J. Thomas Mullins, *University of Florida*

The ehytrid, *Pringsheimiella*, originally described by Coueh (1939), is re-named *Dictyomorpha*, beeause of the previous use of the name *Pringsheimiella* for an alga. It seemed appropriate, in using *Dictyomorpha*, to emphasize the distinetive zoosporangial elusters whieh bear a strieking resemblanee to the dictyoid sporangia formed by *Dictyuchus*. *Dictyomorpha* is of great interest because Couch (1939) suggested that it exhibited the first known case of heterothallism in the Chytridiales, an order of the aquatie fungi.

Studies on Leaf Fungi from Louisiana

Lafayette Frederick, *Southern University*

Preliminary studies of fungi parasitic on leaves of Louisiana plants, exeluding eereals and grasses, have revealed the oeeurrence of genera and speeies hitherto unreported from the state. Those leaf fungi studied oeeur on host plants eollected mostly within the parish of East Baton Rouge. Genera and speeies of imperfect fungi are the predominant organisms assoeiated with the leaf spots in the collection studied. Noteworthy among the fungi determined are speeies belonging to the genera *Amerosporium*, *Discosia*, *Piggottia*, *Actinopelte*, *Robillarda*, *Pestalotia*, *Phyllosticta*, *Septoria*, and *Cercospora*. Most of the speeies thus far determined represent new host reeords for the state and in some instanees for the eountry. Morphologieal studies of the fungus tentatively plaeed in the genus *Robillarda* suggest that it may represent a new speeies. Furthermore, when this fungus is compared with speeimens representing other speeies in the genus, it beeomes apparent that a critieal review of the genus is needed. This aspect of the projeet is already underway.

Types of Fungus Motile Cells

William J. Koch, *University of North Carolina*

Long range studies of the strueture and aetion of the motile eell in eaeh of the four major developmental lines of the lower fungi are proposed. Within the posteriorly uniflagellate line, the chytrid type of motile eell is seen to be heterogeneous. The six major types of chytrid motile eell presently reeognized among the eighteen speeies studied are diagnosed on the basis of the internal parts present and their appearances and arrangement. The phylogenetic and practical taxonomie value of information about motile cell strueture and activity is diseussed.

Aquatic Phycomycetes of Lake Texoma

Charles E. Miller, *Texas A. & M.*[1]

Part of the summer of 1960 was spent at The University of Oklahoma Biologieal Station, Willis, Oklahoma, surveying the aquatie Phycomycetes of Lake Texoma. This initial investigation involved life-history, identification, and description of parasites and saprophytes of algae, other fungi, and pollen grains. Collections of lake water were "baited" with sweet gum (*Liquidambar styraciflua* L.) and pine (*Pinus taeda* L.) pollens. Observations were recorded photographieally and with the aid of a camera lueida. In *Spirogyra: Olpidium entophytum* (Braun) Rabenhorst, *Rhizophydium minutum* Atkinson, *R. sphaerocarpum* (Zopf) Fiseher, *Phlyctochytrium hallii* Coueh, *Myzocytium proliferum* Schenk; in *Closterium: Lagenidium rabenhorstii* Zopf; in *Aphanomyces: Olpidiopsis luxurians* Barrett; on sweet gum and/or pine pollen: *Olpidum pendulum* Zopf, *Phlyctidium megastomum* Sparrow, *Rhizophydium sphaerotheca* Zopf, *R. pollinis-pini* (Braun) Zopf, *Phlyctochytrium hallii* Couch, *P. sanchytrii* Köhler, *Rhizidiomyces hansonii* Karling, *Aphanomycopsis bacillariacearum* Scherffel, *Lagenidium pygmaeum* Zopf. In addition, apparently undeseribed species of *Phlyctidium*, *Phlyctochytrium*, and *Chytridium* were found.

[1] Supported by a National Seience Foundation Grant-in-aid administered by The University of Oklahoma Biologieal Station.

Fruiting Body Germination and Formation in the Genus *Archangium* (Myxobacterales)

James C. McDonald, *Wake Forest College*
John E. Peterson, *University of Missouri*

Archangium species possess fruiting bodies devoid of encasing membranes. Therefore, fruiting body germination does not require the bursting of a cyst membrane typical of some myxobacterial species. Upon germination in a hanging drop, single, shortened, cells within a fruiting body activate, elongate, and move to its surface. The rods assume a position perpendicular to the fruiting body surface which, as the number of upright rods increases, resembles a procupine back. Eventually, many cells swarm away from the fruiting body out into the medium.

Fruiting body formation in a hanging drop begins with the clustering of several vegetative rods; more nearby cells join the cluster, shorten, and finally form small, atypical aggregates. On agar media, a vegetative rod "psuedoplasmodium" appears to circle a common focal point. Additional waves of rods, streaming from different directions, surge onto those cells already within the focal point amassment. Subsequently, small, typical, mounded, fruiting bodies form.

Germination of the Resting Sporangium of *Coelomomyces*

Clyde J. Umphlett and John N. Couch,[1]
University of North Carolina

The process of formation and liberation of the zoospores produced by the resting sporangium of an undescribed variety of *Coelomomyces psorophorae* Couch, parasitic in mosquito larvae, is described. Zoospores have been cleaved by the time of the expulsion of the sporangial contents. Release of the zoospores is accomplished by the gradual extrusion of the zoospore mass through a germination slit in the sporangium wall. The mass of spores is covered during the extrusion process by two membranaceous structures, the outer of which is a portion of the inner layer of the sporangium wall, the inner of which is a cytoplasmic membrane. The outer layer of the covering separates from the sporangium, thus exposing the cytoplasmic membrane around the spore mass. The spores begin to move about in the extrusion, and soon are a seething mass. A rupture of the cytoplasmic membrane brings about the liberation of the zoospores which swim rapidly away.

[1] A grant from National Institutes of Health which supported this work is gratefully acknowledged.

Ovule Development in *Dendrobium phalaenopsis*

Yoneo Sagawa and D. H. Nimoto,
University of Florida

In *Dendrobium phalaenopsis*, pollination and pollen tube growth stimulate further development of the rudimentary placenta and subsequent formation of the ovules. During the first 35 to 40 days after pollination, the placenta grows rapidly, forming many branching projections. The ovules are formed at the tips of the ultimate branches where a few terminal cells differentiate into a nucellus consisting of a single column of several cells surrounded by a layer of epidermis. The topmost nucellar cell becomes the archesporial cell which functions directly as the megaspore-mother-cell. Meiosis occurs between 45 to 50 days after pollination and an 8-nucleate embryo sac is formed by three successive divisions of the chalazal megaspore. The embryo sac is completely organized and ready for fertilization in approximately 55 to 65 days after pollination. The first two divisions of the zygote are transverse, cutting off a suspensor initial, a middle cell and a terminal cell. A multicellular, undifferentiated embryo is formed by divisions of the middle and terminal cells. Experiments with the aseptic culture of ovules at various stages of development indicate that further growth and formation of seedlings will occur in ovules with zygotes but not in stages prior to fertilization.

The Problem of Sex Determination in *Mormoniella*

P. W. Whiting and Doris J. Bush,
University of Pennsylvania

Sex determination by complementary allelism has been suggested for all groups with haploid males. *Multiple* sex alleles are proven for *Habrobracon* and the honey bee, normally outbreeding. For species like *Melittobia* having much natural inbreeding, multiple alleles cannot apply without involving waste of many eggs. It is now suggested that in such species females are heterozygous for two sex alleles which may be similar or different in different populations. Reproductive economy may be effected by differential maturation which becomes stabilized after inbreeding but is unstabilized by outcrossing. Egg hatchability, very high in inbred lines of *Melittobia*, is radically reduced by outcrossing. *Mormoniella* is intermediate between *Melittobia* and *Habrobracon* respecting inbreeding in nature. The attempt is being made with highly inbred lines to locate the sex alleles in *Mormoniella* by linkage with mutant genes in different chromosomes.

A New Radiation-Induced Oyster-Eye Mutant in *Mormoniella*

Charles Ray, Jr., and W. D. Fattig,
Emory University

During experiments designed to induce mutations by radiation in a scarlet-152 eye-color stock of *Mormoniella vitiripennis* (Walker), a mutant with oyster-eye was recovered. The new mutant, which carried the st-152 gene, was crossed with the st-152 stock and with wild (brown) stock. The oyster x st-152 cross gave F_2 males in a ratio of 1 scarlet : 1 oyster. The oyster x wild (brown) cross gave F_2 males in a ratio of 2 brown : 1 scarlet : 1 oyster, indicating that the mutant was not allelic with the st-152 locus and, in fact, segregated independently of it. When both st-152 and oyster are present in hemizygous males, oyster is epistatic to scarlet. A stock of the oyster mutant free of the st-152 gene has been recovered and is being used to determine the action of oyster with other eye-color mutants in *Mormoniella*.

Genetics of Coat Color in Horses

W. Ralph Singleton, *Blandy Experimental Farm, University of Virginia, Boyce, Virginia—in collaboration with* W. E. Castle, *University of California*

The commonest color types of horses are those known as bay, black, brown, and chestnut. These are produced by various combinations of alleles of three basic color genes; A for color pattern, B for black pigment and E for the extended or restricted distribution of black pigment in the coat. There are four alleles of the A locus

A^L (wild), A (bay), a^t (brown), and a (black). Two alleles are present at the B locus, B (black pigment) and b the reddish color of chestnuts and sorrels. These are three alleles at the E locus, E^D (dominant black), E (sooty bay) and e (red bay with A and B). A dilution gene D is found in horses, another S in Shetland ponies. D/d produces Palominos, S/s silver dapple Shetland ponies. Interactions of these different alleles will be discussed with new information on lack of penetrance of the D allele.

Morphological Differences Between Cytoplasmic Male-Sterile and Normal Strains of Maize

C. O. Grogan and Patricia Sarvella,
Miss. State Univ. and U.S.D.A. cooperating

Comparisons were made at Mississippi State University to determine if morphological differences existed between normal and cytoplasmic male-sterile strains of maize. Differences were observed in the extrusion of the tassels above the terminal leaf sheath of normal and male-sterile counterparts of a single cross. The normal plants were found to extrude more than the steriles. Subsequent examination of the parental lines revealed a similar relationship but of less magnitude, indicating the condition was heritable. Examinations of the normal and sterile counterparts of other lines showed similar differences. Measurements of the culm revealed that the internodes of the steriles, beginning with the fourth to the sixth internode above the ear, were shorter than the normal versions. This reduction was especially noticeable in that part of the culm bearing the tassel. Limited information indicates that height differences between normal and sterile strains are associated with differences in the culm lengths above the ear.

Locus of Genes for Rust Resistance in Two Varieties of *Hordeum vulgare* by Means of Translocation Stocks

M. Adnan Alamuddeen,
Appalachian State Teachers College

Nine translocation stocks were crossed with Sudan and Reka. The F_1 plants from crosses of Sudan with all translocations and Reka with all translocations were tested for rust reaction and found to be resistant. Examination of the mature pollen showed that the F_1's were partially sterile. In the crosses involving the variety Sudan with translocation stocks having interchanges of chromosomes a with e and c with e, the F_2 data indicated complete linkage. The common chromosome e must carry the gene for resistance. This is substantiated by crosses involving translocations of a with other chromosomes and c with others which showed independent assortment. In the crosses involving the variety Reka with translocation stocks having interchanges of chromosomes b with f and e with f, the F_2 data indicate that in Reka the gene for resistance is linked with chromosome f. This is substantiated by crosses involving translocations of b with other chromosomes and e with others which showed independent assortment. The results obtained from the crosses studied and from the F_2 data agree with previous conclusions that the factors for resistance in Sudan and Reka are independent.

The Chromosomes of *Zephyranthes albiella* [1]

W. S. Flory and R. O. Flagg,
The Blandy Experimental Farm, University of Virginia

This species has 18 somatic chromosomes, the lowest number known for the genus. Chromosomes range from 6 to 14 microns in length, following colchicine pretreatment. Three pairs—the two longest, and the shortest have approximately median centromeres. The other 6 pairs would be classed as having sub-median constrictions; two of the shorter of these are near-median, while a third approaches the sub-terminal condition. A short near-median pair bears terminal satellites on the longer arms.

Most plants studied derive from Colombia, where the species is indigenous. One accession, also appearing to be Z. *albiella*, traces from Panama. There are taxonomic similarities between Z. *albiella* and Z. *rosea* ($2n = 24$). The latter species occurs in the West Indies and also in Central America. An undescribed accession from Panama, with characters somewhat intermediate between *albiella* and *rosea*, has 21 chromosomes and fails to set seed.

[1] Work supported by N.S.F. Grant G-11080.

Cytogeography and Phylogeny of the North American *Verbena*

Walter H. Lewis and Royce L. Oliver,
Stephen F. Austin State College

Chromosome numbers of twenty-six *Verbena* species in North America separable into two series are reported. The $x = 5$ series has no diploid representative, few tetraploids, and numerous widespread hexaploid species, while the $x = 7$ series has many pandemic diploid species, and few tetraploid and hexaploid taxa. When compared with the data available for the South American *Verbena*, these frequencies and distributions were found to be almost opposite. The origin of the two groups from a $x = 6$ prototype followed by ascending and descending aneuploidy is suggested. Migration via tropical land bridges is proposed to explain the occurence of both groups in the two continents.

Primary Immune Response of Mice to an Enzyme, Triose Phosphate Dehydrogenase

Sara L. Page, *Winthrop College*
C. J. Wust, *Biology Division,*
Oak Ridge National Laboratory

Triose phosphate dehydrogenase (TPD) was crystallized from rabbit muscle and injected into mice in an aqueous vehicle. In the animals that received an intramuscular or intravenous injection, no significant increase in weight was observed in the lungs, liver, spleen, and lymph nodes. Other mice that received the antigen intraperitoneally emulsified with Freund's Adjuvant showed a spleen weight increase up to 4-fold. No other tissue weight was increased significantly. The relative titer of antibody remained high through the 20th day. This correlation of spleen weight and appearance of antibody seems to indicate a prior production, storage, and release phenomenon.

News of Biology in the Southeast

About People

Dr. W. Preston Adams has accepted an appointment as Assistant Professor of Botany, DePauw University, Greencastle, Indiana, effective September 1961. Dr. Adams has been a Research Associate in botany at Florida State University since being graduated from Harvard University in 1959.

Dr. Harry Lipner of the department of Biological Sciences of Florida State University was elected Chairman of the Medical Section of the Florida Academy of Sciences for 1961.

Dr. Dexter Easton, Associate Professor of Physiology at Florida State University, presented a paper, "Interpretations of Electric Potentials Recorded at the End of a Nerve" at the February meeting of the Florida Academy of Sciences.

Dr. E. Ruffin Jones, Professor of Biology at the University of Florida, was named president-elect of the Academy Conference of the American Association for the Advancement of Scienee at the annual meetings of the group December 26-27, 1960, in New York City. The Academy Conference is composed of two delegates from and representing each of the state Academies of Science and their affiliated organizations, as well as the Canadian Academies of Science. It meets each year with the parent organization, the American Association for the Advancement of Science, providing speeches by invited speakers, panel discussions, and informal discussions, giving opportunity for the various academies to exchange ideas. The Academy Conference was organized in 1950. Dr. Jones, who is immediate past-president of the Florida Academy of Science, which he represents in the Academy Conference, will step up to the president's post next year, moving to the position of president-elect this year after two years of serving the Academy Conference as its secretary-treasurer.

Dr. A. Gib DeBusk of Florida State University left February 27, 1961, to attend the First Neurospora Conference at La Jolla, California. En route he visited the School of Aviation Medicine at Brooks Air Force Base, Texas, for consultation, and the Radiation Laboratory at Berkeley for a seminar.

Dr. Norman Giles, Head, Department of Botany at Yale, **Dr. Max Delbruck,** California Institute of Technology, **Dr. E. L. Powers,** Argonne National Laboratory, **Dr. William J. Clench,** Museum of Comparative Zoology at Harvard University, and **Dr. George W. Hunter,** Department of Microbiology of the Medical Center at the University of Florida, gave seminars recently at Florida State University in Tallahassee.

Dr. Orland E. White was appointed "Lecturer in Residence for Economic Botany" at the College of William and Mary during February and March, 1961.

Dr. A. C. Cole, Professor of Entomology at the University of Tennessee, has been awarded a two year National Science Foundation grant of $5,200 to continue investigations on the harvesting ant. Dr. Cole will spend part of summer in western United States and western Mexico making additional collections of these ants.

Dr. J. Gordon Carlson, head of the Department of Zoology and Entomology at the University of Tennessee, was one of the session chairman at a conference on "The Use of Animal Cell, Tissue, and Organ Cultures in Radiobiology," sponsored by the New York Academy of Sciences in February.

Dr. Melbourne R. Carriker, formerly of the University of North Carolina, is now employed by the U. S. Fish and Wildlife Service, Bureau of Commercial Fisheries, as Supervisory Fishery Research Biologist, Chief, Oyster Mortality Program, with headquarters at the new Bureau Laboratory in Oxford, Maryland. He will continue his research on boring mechanisms in boring gastropods and other aspects of oyster drill biology—and in addition will supervise research on other predators, parasites, and disease organisms of oysters and other commercial bivalves. This research will be done in cooperation with the research groups at the University of Delaware, Rutgers University, the Maryland Department of Research and Education, and the Virginia Fisheries Laboratory, where similar research programs are under way.

Dr. George Moskovits has recently been added to the staff of the Virginia Fisheries Laboratory at Gloucester Point. He will assist Dr. John L. Wood in the microbiology-pathology division, and will conduct experiments to determine the bacterial flora in the digestive system of oysters.

1st Lt. Gordon Bradshaw has been made Assistant Professor of Biology and Chemistry at the Citadel.

Dr. J. T. Penney of the Department of Biology of the University of South Carolina has received a two year grant of $7,000 from the National Science Foundation for a taxonomic study of the subfamily meyeniinae.

Dr. Fontelle Thompson of the Department of Biology of the University of South Carolina has been awarded $4,928 for an institute for undergraduate research participation to be held in the summer of 1961.

Mr. Richard Mulford has joined the staff of the Virginia Fisheries Laboratory and is working in the microbiology-pathology division with **Dr. John L. Wood** and **Dr. George Moskovits.**

Dr. Morris L. Brehmer and **Mr. Dexter S. Haveen** of the Virginia Fisheries Laboratory have been awarded $20,000 by the Atomic Energy Commission to study the role of filter-feeding marine organisms in removing radioactive wastes from the water and depositing them as bottom sediments. In addition to his research, Dr. Brehmer is giving a course to graduate students and advanced undergraduates in radiobiology.

Dr. Leon Howell of High Point College and **Dr. Douglas Dean** of Abilene Christian College will be visiting Assistant Professors in the Biology Department, University of Alabama, during the summer of 1961.

Dr. Everett L. Bishop of the Biology Department, University of Alabama, will serve again as Instructor in Marine Biology at the Alabama Conservation Department Marine Laboratory at Cedar Point, Alabama, July 13 to August 13, 1961.

Mr. R. E. Smith and **Dr. Ralph L. Chermoek** will travel to the American Fruit Company Plantation near Limon, Costa Riea, during the summer of 1961. Mr. Smith will spend about 3 months studying the herpetology of the area and Dr. Chermock about 5 weeks collecting Lepidoptera and conducting ecological and zoogeographical studies.

Dr. Herbert Boschung, Biology Department, University of Alabama, will serve again as Instructor of the course in Marine Vertebrate Zoology and Ichthyology, and do research, at the Gulf Coast Research Laboratory, Ocean Springs, Mississippi, during the summer of 1961.

Dr. William Guest, Biology Department, University of Alabama, will be a research participant in mammalian cytogenetics at the Oak Ridge National Laboratories during the summer of 1961.

Dr. Walter Herndon, Biology Department, University of Alabama, will participate again as Instructor for the Marine Botany Course, and do research, at the Marine Biological Laboratories, Woods Hole, Massachusetts, during the summer of 1961.

Drs. Walter Herndon and **Charles O'Kelley,** Biology Department, University of Alabama, received a grant of $9,930 for 1961 from the National Institute of Arthritis and Metabolic Diseases for continuation of a study of the replacement of calcium by strontium in living organisms.

Dr. Howard M. Phillips, President of Alabama College, has recently been appointed a member of two National Science Foundation Panels and will serve as a special consultant for both Panels. The Panels to which he has been appointed include the Life Sciences Facilities Panel and the Panel on Special Projects in Science Education.

Dr. John N. Couch has accepted an assignment in India to serve this spring as a consultant with the Review Committee of the Indian University Grants Commission regarding the revising and modernizing of the curriculum in the field of Botany. Also, he will give seminars on various aspects of mycology at different universities. He will return to the United States in June, 1961.

Dr. C. C. Hall, Biology Department, Howard College, has recently been made Associate Professor.

Dr. Herbert P. Riley served in February on a National Academy of Sciences-National Research Council Screening Panel to screen applications for National Science Foundation Cooperative Fellowships.

Dr. Dale M. Smith, Associate Professor of Botany, University of Kentucky, resigned during the summer to accept a position at the University of Illinois.

Dr. Edward T. Browne, Jr., Assistant Professor of Botany at the University of Kentucky, has received a research grant from the University of Kentucky Faculty Research Fund to study the Liliaceae of Kentucky.

Dr. John M. Carpenter, Head of the Department of Zoology at the University of Kentucky, was in Washington, D.C. for several days in January to serve on an NSF Screening Panel considering NSF Summer Fellowships for Secondary School Teachers of Science and Mathematics.

Dr. Herbert P. Riley, Head of the Department of Botany, University of Kentucky, served last October on a National Science Foundation Screening Panel to screen undergraduate research participation program participants.

Dr. Roger W. Barbour of the Department of Zoology, University of Kentucky, recently received a research grant of $8,533 from the National Institutes of Health for the study of a traffic survey of *Microtus ochrogaster* runways.

Institutions and Organizations

The 1961 Florida State Science Fair will be held at Florida Southern College, Lakeland, Florida, April 6, 7, 8, 1961. A total of 310 exhibits are expected at this State Science Fair. A total of 30 Committees are working diligently to make this State Science Fair a success.

The Virginia Fisheries Laboratory at Gloucester Point is offering, in cooperation with the National Science Foundation, a research participation for college teachers program which will run for twelve weeks beginning about 12 June 1961. Both predoctoral and postdoctoral teachers are being considered, and each applicant should specify the field of research in which he will engage and specify the equipment and space needed. Applications will be accepted as long as research space is available.

The Virginia Fisheries Laboratory is offering, in cooperation with the National Science Foundation, an undergraduate research participation program supplying research experience to biology majors. Preference will be given to students interested in marine biology as a profession and who have had two or more years of college training. The program will be in operation for twelve weeks beginning 12 June 1961, and applications will be accepted until the full quota of participants has been selected.

The eleventh annual wildflower pilgrimage, sponsored by the Department of Botany of the University of Tennessee, will be held 27 through 29 April 1961 in cooperation with the Naturalists Service of the National Park Service in the Great Smoky Mountains National Park. This program will consist of hikes and automobile trips under the direction of trained botanists, ranger naturalists, and expert photographers. Illustrated evening lectures and morning bird trips are scheduled. Further information may be obtained from the Department of Botany of the University of Tennessee, the Great Smoky Mountains National Park Naturalists Service, the Gatlinburg Chamber of Commerce, or the Gatlinburg Garden Club—joint sponsors of the event.

The Third Summer Botany Conference at the University of North Carolina, supported by the National Science Foundation, will be held July 31 through August 18, 1961. Like the previous Botany Conferences, the 1961 Conference is designed for teachers of general botany and general biology in liberal arts colleges, teachers colleges and junior colleges from all parts of the country. Recent developments in plant physiology and cytology will be discussed in six one-week lecture series by leading botanists. The principal lecturers will be Dr. C. Ritchie Bell of the University of North Carolina, Dr. Lindsay S. Olive of Columbia University, Dr. Aubrey W. Naylor of Duke University, Dr. N. E. Tolbert of Michigan State University, and Dr. John M. Clark, Jr. of the University of Illinois. In addition, evening lectures will be given on recent developments in other areas of botany by Dr. John M. Couch and Dr. Max H. Hommersand of the University of North Carolina and Dr. W. C. Gregory of the North Carolina State College. Two field trips to areas of taxonomic and ecological interest will be conducted by Dr. A. E. Radford of the University of North Carolina. Stipends of $200 each, plus a travel allowance, will be awarded to 30 applicants by the selection committee. The stipend will be more than adequate to cover all essential expenses of attending the three-weeks Conference. Application blanks and a brochure deserib-ing the Conference may be obtained from the Director of the Conference, Dr. Victor A. Greulach, Box 1268, Chapel Hill, N. C. Completed applications must be received not later than May 10, 1961 to be assured of consideration.

The ASB BULLETIN

Volume 8, Number 3 July, 1961

THE INSTITUTE OF MARINE SCIENCE—UNIVERSITY OF MIAMI

The Official Quarterly Publication of
The Association of Southeastern Biologists

ASB BULLETIN

Volume 8, Number 3—July 1961

The ASB Bulletin is the official quarterly publication of the Association of Southeastern Biologists, Inc., and is published at Philadelphia, Penna., in January, April, July and October. Letters, news items, other contributions, and all communications about editorial matters should be addressed to C. W. Hart, Jr., Editor, The Academy of Natural Sciences of Philadelphia, 19th and The Parkway, Philadelphia, Penna. Changes of address should be sent promptly to the Secretary of the ASB, Dr. Harry J. Bennett, Department of Zoology, Louisiana State University, Baton Rouge, La. Subscription orders from libraries and other institutions should be sent to the Business Manager, Dr. Elsie Quarterman, Department of Biology, Vanderbilt University, Nashville, Tenn. Subscription rate for non-members of the ASB: $2.00 per year. Printing and typography by the Wickersham Printing Co., Lancaster, Penna.

Second-class postage paid at Philadelphia, Pennsylvania.

ASSOCIATION AFFAIRS

A Message from the President

It is hard to believe that the Association of Southeastern Biologists is already in its 25th year. Not only have the eventful years passed rapidly for those of us who have been in the region all or most of this time, but the organization is still youthful in many respects.

It has certainly not accumulated much dead wood. How many of the other organizations to which you belong can boast an attendance of over half of the membership at the annual meetings, even when they are held at the periphery of the region? This may well be related to the fact that it is a working organization, not just a prestige organization, or a license to practise in the region, and very few join just to have their names on the roll.

The ASB is still the best visiting organization I know. The circle of friends it comprises is just about the right size for effective and stimulating informal communication. It complements the state academies by bringing together a larger group in each field of specialty, while still favoring cross-disciplinary contact, and has been particularly effective in bringing graduate students into contact with staff members from other institutions. It is neither so large, nor so far away from home, nor so formal, as to be formidable, or inaccessible, or unfriendly.

It has also held on to another of the fine characteristics of the academies. In contrast to the usual tendency at the national meetings, a commendably high proportion of our specialists have addressed themselves to a general audience, rather than primarily to the specially tuned ears of their fellows, to the mutual benefit of speaker and audience.

Of such an Association we may well be proud—now long established as an effective regional instrument of stimulating communication, both within and across disciplinary boundaries. It has been regional without being provincial, and broad without losing professional character. May it continue to fulfill its objectives as well in its second quarter century.

—Royal E. Shanks

The Executive Committee would appreciate receiving nominations for emeritus members of the ASB. These nominations should be made according to Article III, Section 3, of the Constitution and Bylaws, which states that . . . "Any member may be elected as Emeritus Member who has been a member of the Association for ten (10) or more years and who has retired from professional duties. An Emeritus Member shall have the same rights and privileges as an Active Member."

Nominations should be sent to *Dr. Harry Bennett, Dept. of Zoology, Louisiana State University, Baton Rouge, La.*

Second-Class Mailing

I am happy to report that the Post Office Department in Washington has seen fit to extend second-class mailing privileges to the ASB Bulletin. This will result in a tremendous saving in our mailing costs—reducing them from 3-4½¢ per copy to ⅛¢ per copy.

—C. W. Hart, Jr.

Dr. F. G. Walton Smith, the Director of the University of Miami's Institute of Marine Science since 1943, was born in England. Since coming to this country he has been associated with Princeton University, the U. S. Fisheries Laboratory at Beaufort, N. C., and the Hopkins Marine Station at Stanford. His interests lie in the fields of marine invertebrates and in the problems of commercial fisheries.

This is another in a series of articles on marine stations of the southeast scheduled to appear in the ASB Bulletin.

The Institute Of Marine Science

Of The University Of Miami

F. G. Walton Smith

Marine laboratories differ considerably in their objectives. Some are essentially *biological* rather than *marine* stations, although located so as to take advantage of the rich marine fauna and flora. Other stations are primarily *marine*, with the various scientific disciplines directed towards problems peculiar to the ocean. There are also stations which are concerned with the applieations of a number of sciences, especially biology, to the problems of the fisheries. These are usually, but not exclusively, under state or federal government auspices. Some of these varied types of stations are staffed to undertake institutional programs of directed research, others are organized mainly to provide facilities for independent visiting investigators.

The teaching of marine sciences is equally diverse. Some stations offer no formal training. Others offer courses directed primarily at broadening the education of students from inland colleges during summer vacations. A very small number of stations, which are essentially oceanographic departments of universities, offer complete year-round graduate curricula leading to professional degrees in oceanography—with opportunity for speeialization in the geophysieal, geochemical, biological, physical, or meteorological aspects.

The Institute of Marine Science was established in 1943 as The Marine Laboratory because none of the foregoing functions was being exercised in tropical waters, except at considerable distances from the mainland. Miami, although geographically in latitude 27°N, is faunistically within the West Indian region. It is thus the only station in the continental United States where the tropical marine enviroment is now being studied. A further advantage is that deep water and a major ocean current, part of the Gulf Stream system, are within a short distance of the Laboratory. Since no other tropical marine stations exist under similar favorable conditions, the Laboratory has developed a comprehensive program which includes the functions of an oceanographic institute, a fisheries laboratory, and a marine biological institute. In addition, as part of a University it is able to combine research with specialized graduate and undergraduate study throughout the year.

This combination of functions has been stimulating, both to teaching and research. Students are trained partially on an internship basis in an atmosphere of original investigation. Staff scientists are constantly exposed to the stimulation of ideas and techniques developed in cognate disciplines by visiting investigators. Equally well, the academic program is enriched by outstanding visiting investigators who contribute lectures to it.

The value of the unique location and this concentration of objectives is reflected in the growth of the staff from one or two to over 100 graduate scientists in a period of about 15 years.

The tropical conditions, unique among stations in the United States, make it possible to offer training in an aspect of biology which is a valuable part of the education of all botanists and zoologists. The climate also permits the study of chemical and physical oeeanography and submarine geology under favorable year-round conditions.

The terrific competition for food and space on the coral reefs and the enormous variety of species, of adaptations, feeding habits, and of methods of attack and defense, provide a living classroom and workshop for the study of funda-

mental branches of biology. Furthermore, the physiologist, behaviorist, ecologist, embryologist, or biochemist who uses marine animals and plants merely because of their convenience and not because of an interest in the ocean is immensely benefited by being able to work at a tropical station where the organisms are active for twelve months every year.

There are two buildings with seawater circulation—in addition to a three story air-conditioned main laboratory building, a workshop and storage building, and a radar meteorology antenna tower. These buildings have a total floor space of about 42,000 square feet.

An additional saltwater circulation building for experimental ecology and behavior of fishes and invertebrates will shortly be erected, with floor space of about 6000 square feet. In addition to indoor aquaria, large outdoor concrete tanks are provided. Seagoing vessels and shallow draft craft are docked at the Laboratory. The entire 5-acre tract is on an entrance to Biscayne Bay, within easy reach of the Gulf Stream and deep water.

Efficiency apartments for students and visiting investigators have been erected. Additional units are planned for the near future.

Apparatus and equipment is available for a wide range of investigation, and includes a mass spectrometer, X-ray and emission spectrometry, alpha and beta radiation laboratories, physiology, biochemistry, chemistry and submarine sound laboratories. The facilities of the Engineering School, Medical School and College of Arts and Sciences are also available. These include animal colony maintenance and electron microscopes. Immediately adjacent is a large aquarium which cooperates fully in experimental behavior and other studies. The library is first rate and the systematic biology laboratories maintain a reference museum of the flora and fauna of the area.

For administrative and academic purposes the staff is organized as three Divisions, comprising Fisheries, Physical Sciences, and Biological Sciences.

The research staff acts as the faculty of the Department of Marine Sciences of the University of Miami—which offers the Ph.D. in the various disciplines of marine science. A special summer High School program is provided and courses are offered to graduate and undergraduate summer school students.

The Marine Laboratory operates a number of research vessels. Mostly, these vessels work in local inshore and near-shore waters, but the largest vessel, *R/V GERDA*, regularly works in the Florida Straits and eastern Bahama Islands and in the Caribbean and the Gulf of Mexico.

A recent addition is the 35-foot twin hulled motor vessel *ARIUS* experimentally designed and equipped for research on shallow banks with a cruising range of 500 miles. Hydraulic winches and ample deck and laboratory space with good cruising range and excellent seagoing qualities are unusual accompaniments to a shoal draft to about 15 inches. This vessel conforms to coastguard regulations for transporting classes of twenty-five students.

The Institute publishes quarterly *The Bulletin of Marine Science of the Gulf and Caribbean*. Papers concerning physical, chemical, and biological oceanography in relation to the region extending in the western Atlantic from Brazil to the southern United States are considered for publication.

The Institute is a fishery research agency for the State of Florida, and publishes two sets of publications for the State Board of Conservation. The Educational Series is devoted to reports on subjects of wide public interest, and is distributed by the Board. It is available upon enquiry. Other publications are The Annual Proceedings of the Gulf and Caribbean Fisheries Institute and the Technical Series.

The Institute is headquarters for the International Oceanographic Foundation which publishes the illustrated popular science quarterly, Sea Frontiers. It also provides office and laboratory space for units of the U. S. Fish and Wildlife service.

The cover photograph of the Institute of Marine Science of the University of Miami was very kindly supplied by the Institute.—Ed.

Dr. Wolf, Emeritus Professor of Botany at Duke University, is no stranger to ASB Bulletin *readers. Only last fall his paper,* Concepts Regarding Fungi—Then and Now, *appeared in the* ASB Bulletin *(Vol. 7, No. 4). We now have the pleasure of presenting another paper by Dr. Wolf—on the somewhat controversial topic of sex reversal.*

Frederick A. Wolf

Sex Reversal In Plants?

Sex reversal in animals is a subject around which much discussion has been centered and about which much has been published by many investigators. This matter as understood by zoologists was brought into perspeetive recently by Witschi (1960). Certain botanists, in dealing with dioecious seed plants have spoken of the existence of sex reversal in such species. Their interpretations, however, have been largely disregarded or held to be without significance—or else sex reversal has been deemed to be of such rare occurrence as to be unworthy of serious consideration. This situation may be accounted for partly because morphologic sex characters or sex structures among plants that are comparable to secondary or accessory sex characters in animals are almost entirely wanting. It may also be due in part to the fact that complementary gametes or equivalent units of many species of lower organisms, as of slime molds, and of many species of algae and fungi are morphologically alike. It may be interjected that morphologic similarity of gametes among lower groups of animals, as among protozoa, is well known to exist. Since lack of morphologic differences between complementary gametes of lower organisms is of sueh wide occurrenee it may eventually come to be appreeiated that structural differences involving sex expression are really not fundamental in any organism for the reason that sex is functional, not structural, and therefore can be regarded as basically alike in all organisms. Nevertheless one must be realistic, since accord in this belief has not been reached, and he must not dismiss lightly the fact that morphologic sex characters or structures have remained the criteria among biologists generally for determination of what is regarded as fundamental in sex expression.

One reason for emphasis on structural sex may be that, from the beginning, the approach in the teaching of biology has been by way of morphology. As a consequence, special attention in accounting for sexual differences and patterns of behavior have been directed to the morphologic features of sex cells, sex nuclei, sex chromosomes, and sex-determining genes, either singly or in combination with autosomes or other cell structures or constituents. Using this approach, fertilization is generally defined in a way to include only the conventional pattern of sequential events, namely differentiation of haplophase gametes, the fusion of such gametes, including both cytogamy and caryogamy, with resultant doubling of the number of chromosomes, and finally the undoubling at meiosis. Such definition, however, appears to require modification in the light of events regarding fusion in bacteria and hyphal anastomoses among certain fungi, espeeially the Fungi Imperfecti. The fact that the morphologic features associated with fertilization are so strongly emphasized appears to preclude the possibility of appreciating that sex-behavior is basically a physiological or functional phenomenon in which structural features are not the causes but instead the effects, hence are secondary and accessory.

The present discussion is concerned primarily not with morphologic sex characters in plants but with functional activities of gametes or of their equivalent structures as bearing on an interpretation of "so-called" sex reversal. It will contain nothing that is really novel, but will be an attempt to reinterpret certain published data from the observations of others. A plethora of supportive data is available in the many publications dealing with fungi, algae, mosses, ferns, and seed plants that could be employed as corroborative evidence for lack of sex reversal in plants. To save time and space, only a few, selected from the many relevant ones, however, will be diseussed. These will deal with certain species of fungi and seed plants. In each example cited the faets will be stated, after which certain pertinent questions that could occur to anyone will be propounded. The answers may

be supplied immediately by the reader from his own point of view but the writer has elected to reserve his own answers and interpretations for the final general discussion. By so doing repetition will be avoided, basic similarities of sexuality among all plants will become apparent, and so-called sex reversal will appear in its true perspective.

Patterns of Sexual Behavior

Consideration will be given, in turn, to the behavior of one member of each of the orders of fungi, Chytridiales, Blastocladiales, Monoblepharidales, Saprolegniales, Peronosporales, and Mucorales and to three dioecious species of seed plants, *Mercurialis annua*, *Cannabis sativa*, and *Cucumis sativus*.

Among Chytridiales.—In *Synchytrium fulgens* from 12 to 20 planospores are formed within each sporangium. At an early stage each sporangial initial is uninucleate and, before the sporangial protoplast is cleaved, a sufficient number of nuclei is formed mitotically to provide a single nucleus for each planospore. Since all the nuclei arise from the parent nucleus or its proximate progeny one may assume that all the resultant planospores are potentially alike. But on emergence some behave as asexual elements and can develop directly into multinucleate thalli. Others fuse in pairs, hence somehow must have become "male" cells or else "female" cells. The sporangia therefore produce both asexual and sexual spores, as these terms are commonly employed. Since both kinds have the same origin how can one account for asexuality on the one hand, and sexuality on the other, or by what process did certain planospores become asexual whereas others became sexual? Could it be that all of them were sexual from the beginning? If all were not sexual from the beginning how was sexuality acquired?

Among Mucorales.—In 1904, Blakeslee (1920) established that the black mold, *Mucor mucedo*, is dioecious and designated one member of the pair required for production of zygospores as + and the other member as –. Each fused nucleus within the zygospore therefore contained the factors for + and –. But zygospores failed to form when he attempted to mate certain other isolates of *M. mucedo* with each of the two isolates of known mating potential. He therefore termed the strains which failed to mate with one or the other of known potentials as neutrals. But by cultivation of neutral strains at higher temperatures he found that certain of them could be mated either with the + strain or with the – strain. Did the neutral strain acquire sexuality and if so from what source or by what process? Moreover he established that all spores produced within the germ sporangium at germination of a given zygospore were of the same mating potential, i.e., all were either + or else all were –. How is it possible at meiosis to lose all of one mating potential and conserve all of the other? Surely it is naive to believe, as several investigators have maintained, that either all of the "male" nuclei degenerated during germination of certain zygospores or that all "female" nuclei degenerated in others.

Among Blastocladiales.—Emerson (1950) found that *Blastocladiella variabilis* is dioecious and that if its "female" gametes remain unmated some may develop to become thalli which bear only antheridia (male structures), and others only oogonia (female structures). One may inquire appropriately how femaleness became maleness in the first instance and how femaleness was retained in the second instance. Does lack of segregation of the "sex-determiners" at meiosis provide an adequate explanation for the behavior of Blastocladiella? Is sex a morphologic entity that can be partitioned at meiosis in this organism?

Among Monoblepharidales.—In *Monoblepharis polymorpha* the antheridium arises as a protrusion or branch from the oogonium. At an early stage of development the protoplasts of the two structures are not separated and the "male" and "female" nuclei must therefore be intermingled. Since the formation of the oogonium is well advanced before the antheridium begins to form as a protrusion from the oogonial wall should one assume that the "female" nuclei give rise mitotically to "male" nuclei which are to migrate into the antheridium? Eventually a septum is formed between the antheridium and oogonium. Before closure of the opening between the two sex structures is a signal given to the male nuclei to scurry into the antheridium? Such assumptions are patently absurd yet the fact remains that the antheridia arise from the oogonia in this species, and the cells liberated from the antheridium are motile sperms.

Among Saprolegniales.—Studies of the water mold, *Sapromyces elongatus*, led Bishop (1940) to conclude that this fungus consists of the following strains: (1) pure males (2) pure females, (3) neutrals, (4) sterile hermaphrodites, (5) females that can be mated with females, (6) males that can be mated with males. By what process did the females become males in the fifth category and the males become females in the sixth category? How can one explain the incidence of neutrals in the third category if sex is divisible? What difference in nuclear behavior, sex chromosome behavior, or in controls by sex-determining genes can be postulated to account for the production of spores of six strain categories within any single sporangium?

Among Peronosporales.—The investigation of Galindo and Gallegly (1960) that deal with *Phytophthora infestans* emphasize the influence exerted by nutrition on expression of sexual reactivity. They found that "when one of two isolates of opposite compatibility type and equal sexual strength are purposely starved, the starved isolate acted as a pure male. When the second isolate was starved, the first acted as a pure female. In a few cases studied the starved isolate always supplied the antheridia whereas the vigorously growing isolate penetrated the antheridium and formed the oogonium." How could change in nutritional level occasion reversal of sex if sex depends upon the complement of sex chromosomes, of gene determiners of sex, or of any other morphologie feature? Again, if sex is divided at meiosis or at any subsequent mitotic division, how can one explain sex reversal in this fungus?

Among Seed Plants.—The phenomenon of so-called "sex-reversal" has long been known to occur within seed plants but to date it remains without adequate explanation. These matters may be brought into focus by citation of results of three representative studies, one by Yampolsky (1919), one by Schaffner (1920), and a recent one by Galun and Atsmon (1960).

Yampolsky (1919) found that *Mercurialis annua* is both monoecious and dioecious. He noted among the flowers of female plants the existence of all intergradations from pure female to those with numerous male flowers. Moreover some male plants bore female flowers from which seed were matured. These observations led him to conclude that sex is not fixed in this species. If sex is determined by Mendelian factors and if *M. annua* has sex nuclei and sex chromosomes, how can one explain that this species is monoecious, dioecious, and of mixed sexual expression? At what stage or with what proeess did some plants become pure males, others pure females, and in others maleness and femaleness were not separated? Were any plants actually pure as to maleness or femaleness?

Schaffner (1920) observed that when seed of hemp, *Cannabis sativa,* are sown in the open, in spring, the ratio of pure carpellate to pure staminate plants that develop will be 1:1. If however, the seed were sown in the greenhouse, in winter, approximately 80% of the carpellate plants bore stamens and an equal proportion of the staminate plants bore carpels, the remaining 20% in each instance being pure carpellate or else pure staminate individuals. He also noted that when the apical inflorescences of carpellate plants were removed lateral axillary inflorescences developed having both carpels and stamens. Conversely when staminate plants were decapitated the lateral inflorescences which developed were composed of both staminate and carpellate flowers. These results compelled him to conclude that each staminate and each carpellate individual contains all the factors or potentials of both sexes. Moreover sex reversal (so-called) in hemp must take place in response to interaction of both external and internal factors. What more logical conclusion could be drawn, as was done by Schaffner, than that the Mendelian hypothesis of sex is not only wholly untenable but is extremely absurd. Surely change of environment from being grown in the open to being grown in the greenhouse did not eliminate the complement of chromosomes or genes as sex determiners, or inhibit their ability to function. Likewise the sex-chromosomes and gene sex-determining factors did not reside only in the inflorescences, making possible their eradication by decapitation. Rather it would appear that the potential for differentiation of expression of both maleness and femaleness exists in all of the cells of which the hemp plants are composed.

As regards the ratio of 1:1 of carpellate to pistillate plants, when hemp is grown in the open, such incidence may be anticipated from chance alone, as is the ratio of heads and tails when a eoin is tossed.

Galun and Atsmon (1960) considered the influence of age of leaves upon the sex expression of proximate floral buds of cucumber, *Cucumis sativus.* They concluded that every flower bud is potentially hermaphrodite. But when the floral buds arise near young leaves the content of growth substances in the young leaves induces a shift in sexual expression in the developing flowers toward becoming carpellate whereas when developing floral buds are near mature leaves the shift is toward becoming staminate. How can one aseribe differences in production of sex determiners to genetic mechanisms in cucumber? What relationship could meiosis have to postulated hermaphroditism? How can one employ the activities of nuclear structures to account for hermaphroditism and for the shifts toward sexual expression herein?

Interpretational Discussion

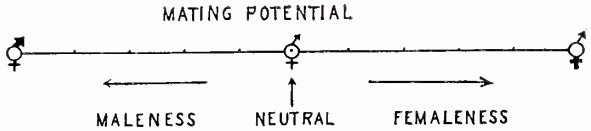
A clarification of concepts relative to the nature of sexuality and sex reversal in plants or the reappraisal of current credos for the purpose of trying to explain these phenomena will be impossible, regardless of the kind of answers that readers may have given to the various questions propounded herein, if one takes the all too common position that "My mind is already made up, so don't confuse me with facts." Nevertheless

an attempt is being made to bring unity out of the foregoing apparent contradictions and state of chaos.

If higher organisms have evolved from lower ones, a fundamental tenet in biology, attention may reasonably be directed to the fact that structural sex-differences are wholly lacking among many species of lower organisms, i.e. those which are universally regarded as primitive. Among lower organisms morphological differentiation of maleness and femaleness was antedated by expressions of sexual behavior. Could one conclude that sexuality must have evolved at several different times in the course of evolution of living organisms and that morphologic sexuality among higher organisms is therefore basically different from functional sexuality among lower organisms? The writer's answer to both parts of this question is an emphatic "No."

Further it is being asserted that sexuality basically is an ever-present, intrinsic, innate property of all living protoplasm that manifests itself by sexual behavior, as was previously indicated by the writer (Wolf, 1954) in his interpretation of sexuality in fungi. It is not structural because sexual structures, all of them, are the results not the causes of sexuality. Sexuality did not evolve but is a property which was possessed by the first bit of living protoplasm. Sexual structures however, have evolved. Sexuality is never lost by any living organism or is never acquired *de novo* by any process or as the result of the presence of any structure. From this it follows that living cells or organisms are never asexual. They may not express at all times their sexuality but they possess the potential for sex expression.

If sexuality is functional it is indivisible either at meiosis or at any mitosis. It does not consist of two entities, but rather of two complementary moieties. These moieties should be designated two mating potentials or compatibility types, as they express degree of imbalance between maleness and femaleness. This interpretation of sexuality is portrayed in the graph below. This



graph indicates the unity of sexuality with gradual increase of male potential and concomitant decrease of female potential in one direction and with gradual increase in female potential and decrease in male potential in the opposite direction. Such interpretation eliminates the existence of pure males and pure females, but indicates that there may be graduated degrees of complementary potentials from very strong to very weak in opposite directions.

Mating between gametes can occur only if there is a sufficient gradient or magnitude of imbalance in the potential for maleness and femaleness between a given pair of gametes. If, for example, the potentials are equal the gametes are neutral, and therefore they will not mate unless, through the operation of external or internal factors, the mating potential of one or both gametes becomes changed. The activity of hormonal growth controlling substances may be established eventually to be the internal factor. External factors, in turn, influence the internal factors.

Sexuality, as interpreted herein, cannot be Mendelian and is not heritable in any sense different from that of inheritance of any other property of living protoplasms, such as ability to respire, to photosynthesize, to synthesize any of the many products elaborated by plants, or to respond in metabolic activity to external environmental stimuli.

Whether a given gamete is able to mate with another gamete is determined by the degree of mating imbalance between them or by the relative strength of potential of the one to the other. This makes it possible for a given gamete to react as a male in one mating and as a female in another mating. But the fact remains, as stated by Snyder (1940) that "the fertilized egg cell, although it reacts normally in a way to manifest only maleness or femaleness yet these characteristics are only specific degrees of a continuous series of stages." This statement argues for the unity of sexuality but at the same time allows for lack of fixity of this property or characteristic.

Sexual patterns of behavior, as interpreted herein, cannot be attributed solely to the presence or the functioning of any single cellular component or structure. All of the structural elements of the cell interact interdependently in conditioning expression of sexuality as well as in controlling other activities. Unless all operate synchronously and harmoniously aberration and malfunction result.

The final chapter remains to be written that will adequately explain how external and internal factors are interrelated in the determination of differentiation of gametes and of shift in their expression of sexuality or mating potential. The solution of this problem, in relation to the entire problem of functional cell differentiation, is being earnestly sought. It is suggested that eventually functional differentiation may be found to be correlated with the configuration of the peptide chains composing the nucleoproteins.

Summary

Sex reversal, so-called, in plants is given consideration by a review of certain selected publications that deal with this phenomenon among fungi and seed plants. The data supplied by these publications are reinterpreted in an effort to harmonize differences among the interpretations.

Reinterpretation to indicate that sex is not reversed is based upon the credo that sexuality is a fundamental property possessed by all living protoplasm. It has existed since life began. Sexuality basically is not morphological or structural but is functional or physiological. Sex structures thus are not regarded as causal in sexuality but as resultant features.

Sexuality is an indivisible entity with binary potentials called mating potentials, having different gradations of maleness and femaleness. From this it follows that there are no pure males or pure females. Thus there can be no reversal of sex but only a shift in imbalance between the potentials. Such shift may be induced by internal factors (hormones) or by external or environmental factors.

Control Mechanisms in Invertebrates

At the 22nd meeting of the Association of Southeastern Biologists, held in Lexington, Kentucky, 20-22 April 1961, a symposium on control mechanisms in invertebrates was sponsored jointly by the Society of General Physiologists and the ASB. The following are outlines of the three papers presented at the symposium.

Control of Pigmentary Effectors

Milton Fingerman
Newcomb College, Tulane University
New Orleans, Louisiana

The two types of pigmentary effectors occur in crustaceans, retinal pigment cells in the compound eye and chromatophores primarily in the integument underlying the exoskeleton. The retinal pigments are involved in photomechanical adaptation of the compound eye in response to changes in illumination. The major function of chromatophoral pigments is to provide protective coloration.

Migration of the pigments in both types of effector is mediated by substances produced in neurosecretory cells. The distribution of these cells has been determined in the dwarf crayfish, *Cambarellus shufeldti*. Five groups of neurosecretory cells were identified in the supraesophagieal ganglia alone.

The role of endocrines in regulating the distal retinal pigment has been investigated in recent years. It had been known that migration of this pigment toward the fully light-adapted position was mediated by a substance in the sinus gland and central nervous organs. Only recently, however, has direct evidence been adduced for a principle that causes the distal pigment to migrate toward the fully dark-adapted position. Injection of eyestalk extracts into the crayfishes *Orconectes clypeatus* and *Cambarellus shufeldti* and into the prawn *Palaemonetes vulgaris*, all of which were in a darkroom, resulted in immediate migration of the distal pigment toward the fully light-adapted position. However, if throughout the experiment the assay animals were exposed to an intensity of illumination which would maintain the distal pigment in a state approximately midway between the fully light-adapted and dark-adapted positions, then after the light-adaptational response had run its course, a dark-adaptational response would be observed. Through the use of filter paper electrophoresis, these antagonistic light-adapting and dark-adapting principles have been separated from one another.

Investigations in which the same crustaceans, *Cambarellus, Orconectes,* and *Palaemonetes,* as well as the grapsoid crab *Sesarma reticulatum* were utilized, have revealed that the chromatophores of these animals are also regulated by antagonistic substances. In each of these animals it has been shown that migration of their chromatophoral pigments is mediated by pigment-concentrating and pigment-dispersing principles. An attempt was made to determine the effects of long-term adaptation to a specific background upon the chromatophores and neurosecretory cells. It was found that the rate of pigment migration gradually decreased during the

period of adaptation and futhermore, that the hormone in the circumesophageal connectives not needed by the animals during the period of adaptation, e.g. darkening hormone in animals on a white background, was present in greater quantity in them than in animals that needed the hormone for background adaptation. This experiment (1) showed what happens to the target organ and the endocrine sources when animals are exposed to the same background for a long period of time and (2) provided the first direct evidence that chromatophorotropins outside the eyestalk play a normal role in control of color changes. No chromatophorotropin is chemically the same as either of the retinal pigment activating principles. This conclusion is based upon differences in the electrophoretic behavior of the hormone.

Invertebrate Contributions to the Analysis of Organized Systems of Neurons

THEODORE H. BULLOCK
University of California, Los Angeles

Analysis of mechanisms of control proceeds at several levels from the integrative properties of the single neuron to the organizational features of the brain.

The neuron has been shown to include a variety of differentiated types of membrane and correspondingly different kinds of response. Only one of these is the all or none spike or nerve impulse, specialized for long distance propagation, in axons. The others are graded, labile and local and may give rise to a spike if they depolarize enough and at the right place. The spike initiating locus, generator synaptic, pacemaker and local potentials each occur in limited regions of dendrites or soma. Integrative flexibility comes from their gradation, their spread which is local and decrementol, the anatomy of the cell and its opportunities for convergence and the timing of the several labile prepotentials, which can sum facilitate or defacilitate. Much of this has been worked out with intracellular electrodes in lobster cardiac ganglion, crayfish stretch receptor, squid and gastropod giant cells among other invertebrates.

Evidence of increasingly complex integration in groups of neurons includes such recent observations as the following. Some cells require a convergence of certain presynaptic elements to fire. This reaches considerable complexity as exemplified in 3rd or 4th order cells of the visual system only to moving objects of small radius.

Another set of possibilities for control is represented by the cases of centrogenic pattern. Some actions like a lobster heart beat, swimming in the leech and feeding rhythms in lugworms are probably due to rhythms arising in the central nervous system and requiring no timing cues from sense organs but only an adequate steady state. Even more actions depend on a sensory trigger but are formulated by pre-existent central patterns of command as in sneezing, coughing, and ordinary reflexes.

Besides the analysis of nervous organization by methods of electrical recording and of stimulation and ablation of parts, significant contributions are being made by the methods of control systems engineer observing the whole animal's reaction while interrupting some feedback link permits useful and quantitative statements of minimal connections time constants and components of the system controlling that reaction.

Some Recent Advances in Insect Endocrinology

DIETRICH BODENSTEIN
University of Virginia

Growth in insects finds its visual expression in molting. It is a cyclic process, in which periods of rest alternate with those of active growth. Because of this peculiar organization, molting is a feature of cardinal importance to insects and all physiological and metabolic functions are adapted to serve an aid its progress. Molting involves not only growth but also differentiation; it is a highly complicated process in which a precise integration of all the component parts involved is prerequisite. This integration is under the control of hormones, the great biological co-ordinators. In the last two decades, we have learned a great deal about insect hormone activities, and recently impressive progress has been made in the analysis of the chemical components of some of these hormones. And yet, our understanding of the mechanism by which these substances exert their effects on the target systems is almost nil. Great difficulties are further encountered in appraising the role played by each gland of internal secretion in the humoral system. Far too little is known concerning the factors humoral, nervous, or other that activate, enhance, or depress the secretory activity of specifie glands or hormone systems. In some instances, we are not even certain as to which hormone is responsible for a specific task. With so much uncertain, it is timely to discuss briefly how these and other difficulties affect the interpretative accuracy of the physiology of action of insect hormones.

News of Biology in the Southeast

About People

Dr. Harry Bennett, Secretary of the ASB Bulletin, is Director of a program of summer training sponsored by the NSF. This program is for high school students who wish to work in Marine Biology at the Gulf Coast Research Laboratory, and will be run in three separate periods of three weeks duration. Ten boys will be selected to attend each session. Dr. Bennett was also recently elected President of the Louisiana Science Teachers Association.

Dr. Ronald C. Fraser of the University of Tennessee Department of Zoology and Entomology has received a one-year grant of $7,417 from the American Cancer Society to continue studies on immunization against tumors in mice.

C. W. Hart, Jr., Editor of the ASB Bulletin, has received a grant from the American Philosophical Society to continue his work on the freshwater shrimps of the Caribbean islands. In 1962 he will collect shrimps on Guadeloupe, Martinique, Dominica, and Barbados.

Dr. S. Leonard Doerpinghaus of the Biology Department at Agnes Scott College has been promoted to Associate Professor.

Dr. Nancy Groseclose, long a member of the Biology teaching staff at Agnes Scott College, received her Ph.D. degree from the University of Virginia this June; she has been promoted to Associate Professor.

Mr. Fred Parrish, Instructor of Invertebrate Zoology at Agnes Scott College, has received a Danforth grant to continue his research.

Dr. S. Leonard Doerpinghaus, Associate Professor of Botany at Agnes Scott College, is attending the National Science Foundation Institute for Marine Biology this summer in Oregon.

Mr. Francis M. Bush, who will complete all of his requirements for the Ph.D. in August at the University of Georgia, has accepted a positioin as Assistant Professor of Biology at Howard College, beginning September, 1961.

Dr. C. C. Hall of the Department of Biology at Howard College is teaching in the Summer Science Institute in the Department of Biology held at Stephen F. Austin State College, Nacogdoches, Texas.

Mr. Bruce Dowling, Assistant Executive Director of the Nature Conservancy, Washington, D. C., visited the State of Alabama and observed various natural areas with Mr. Gibbs Patton of the University of Alabama Department of Biology, who is Alabama State Representative for the Nature Conservancy.

Dr. B. Theodore Cole, Associate Professor of Biology at the University of South Carolina has recently received a two year grant of $25,000 from the National Science Foundation. Dr. Cole is undertaking a comparative study of lipid constituents and changes therein, of normal, adult, embryonic and pathological cells and cell fractions.

Three graduate students in Zoology at L. S. U.—**Delwyn G. Berrett, Laurence C. Binford,** and **Edward Armstrong**—have just returned from southern Mexico, where they pursued problems in avian biology. This was Mr. Berrett's second 4-month expedition to Mexico.

George C. Kent, Jr., L. S. U., appeared on the Lecturers and Artists Series at Maryville College in April. The lecture, designed for a general audience, was entitled "The Biologist's Entelechy," and was concerned with the charaeteristics of life as presently understood at the molecular level.

Professor J. T. Penney at the University of South Carolina is anxious to obtain specimens of Spongillidae from many areas. It would be appreciated if Louisiana biologist who are in the field would find it possible to collect small pieces and send them to Dr. Penney. The specimens may be preserved dry or in any of the conventional fluids. Dr. B. T. Cole, former editor of the *Proceedings*, is now a colleague of Dr. Penney's.

Norman Negus, Tulane University, is spending a sabbatical working on mammal population dynamics at Jackson Hole, Massachusetts.

Dr. George Penn, Tulane University, is on leave to work on hybridization and in specific competition of dwarf crayfishes in Louisiana.

Dr. A. J. Sharp, head of the Department of Botany at the University of Tennessee, will relinquish his administrative duties in September, 1961, in order to devote full time to teaching and research. Since coming to the University of Tennessee in 1929, Dr. Sharp has made many studies of the plants in the Southern Appalachians. and has also studied the flora of Guatemala and Mexico where he spent two years as a Guggenheim fellow. Dr. Sharp has held offices in numerous botanical societies and is now President of the American Society of Plant Taxonomy. Succeeding Dr. Sharp as head of the Botany Department will be **Dr. Walter R. Herndon, Jr.** of the University of Alabama. Dr. Herndon received his B.S. and M.S. degrees from the University of Alabama and the Ph.D. from Vanderbilt University. He has taught at Vanderbilt and Middle Tennessee State College, and is now associate professor of botany at the University of Alabama. He has spent several summers at Woods Hole, Mass., studying marine algae and is now engaged in studies on radioactive effects on algae.

Charles DePoe who will receive his Ph.D. from the Department of Botany at North Carolina State College, Raleigh has accepted a position as Assistant Professor of Biology at Northeast Louisiana State College in Monroe, La. and will begin his duties September 1.

Dr. R. W. Menzel of Florida State University has received a grant from the Fire Island Sea Clam Company of New York to conduct research on clam mericulture. Clams will be planted on a semi-commercial basis to determine what precautions will be needed to grow clams commercially in Florida. The results of the investigation will be available to anyone interested in such a venture.

Dr. Beryl C. Franklin, formerly Assistant Professor of Zoology at L. S. U., and **Dr. Herbert S. Wallace,** formerly Professor of Biology at Franklin College in Indiana, have joined the staff of the Biology Dept. at Northeast Louisana State College.

E. B. Chamberlain, Jr., left employ of Florida Game and Fresh Water Fish Commission May 1, 1961, to accept employment with the U. S. Fish and Wildlife Serviee in Atlanta, where he will serve as Assistant Federal Aid Supervisor. He was employed by the Florida Game

and Fresh Water Fish Commission for 13 years during which time he served as Assistant Federal Aid Coordinator, Federal Aid Coordinator and Chief of Game Management.

E. T. Heinen left employ of Florida Game and Fresh Water Fish Commission March 19 to accept employment with the International Cooperation Administration for assignment in Sudan working on a hyacinth control project in the Nile River. He was employed by the Florida Game and Fresh Water Fish Commission for 12 years during which time he served as Fish Management Technician, Division Director and Chief of Fish Management.

Dr. William H. Adams, Jr. Associate Professor of Biology at Tennessee Wesleyan College, has received two NSF grants for this summer—one as an independent investigator at the Highlands Biological Station conducting research on the ecology of mammals in the gorges of the southeastern escarpment of the Blue Ridge Mountains, and another for participation in the ORINS Radiation Biology Institute at Oak Ridge.

Mary Warters, Centenary College of Louisiana, has received a grant of $3,478.00 from the Atomic Energy Commission to continue studies on X-autosomal translocations of *Drosophila melanogaster*.

Institutions and Organizations

Northeast Louisiana State College at Monroe has under construction a new Biology-Geology building which is scheduled for completion January 1, 1962. The two story air conditioned structure will house laboratories and classrooms for both biology and geology. Faculty offices are provided with research areas. A dark room, animal room, constant temperature room, walk-in-freezer, and herbarium are also provided in the new structure. A uniquely designed, circular museum area will provide display space for both departments and will be made available for public viewing.

The Highlands Biologieal Station has been awarded a grant of $91,500 by the National Science Foundation to support research in the gorges of the southeastern escarpment of the Blue Ridge Mountains over a 3-year period. Two types of grants are provided: (1) Post- and Pre-doctoral grants for independent investigators, and (2) Post- and Pre-doctoral grants for Research Participants. Dr. H. J. Oosting, Duke University, is the Coordinator of the Project. Full details and application blanks may be secured from the Director, Highlands Biological Station, Highlands, N. C.

The Biology Department of Spring Hill College was awarded a grant of $1000 by the Esso Foundation for the support of research by staff members.

The University of Kentucky has recently opened new 2-year University Centers, and dedicated new buildings, at Henderson (Northwest Center), Covington (Northern Center), and Cumberland (Southeast Center). The University now has a total of 5 off-campus centers; the other two being at Ashland and at Fort Knox.

The Department of Botany, University of Kentucky, recently added **Dr. Edward T. Browne, Jr.** to its staff as an Assistant Professor. Dr. Browne came to Kentucky from the University of Georgia and received his Ph.D. from the University of North Carolina. Dr. Browne's speciality is in systematic botany. He has been appointed Curator of the Herbarium.

The Gamma Rafinesque Chapter of Phi Epsilon Phi, the National Botanical Honorary Fraternity, has been reactivated at the University of Kentucky. Faculty advisor of the group is Dr. Carl E. Henrickson.

A chapter of **Alpha Epsilon Delta,** International Premedical Honor Society has been installed at the University of Kentucky. It will be known as the Kentucky Beta Chapter. Faculty advisor is Dr. Robert A. Kuehne, Assistant Professor of Zoology.

The new Medical Center at the University of Kentucky began operations last fall with the admission of its first class of 40 students. Total cost of the Center will be $27,000,000. The Medical Science Building ($5,300,000.) is already completed, and the Hospital ($9,100,000.) and Dental Science Building ($2,300,000.) are scheduled for completion by the end of the year.

The University of Kentucky is scheduled to start or complete within the next two years buildings totalling approximately $16.000,000. These include a Chemistry-Physics building ($5,600,000.), Library addition ($2,000,000.), Woman's Dormitory and Central Dining Unit ($1,750,000.), College of Commerce ($1,800,000.), four Fraternity Houses ($600,000.), Addition to Student Union ($2.000,000.), Spindletop Research Institute ($1,300,000.), and an Agricultural Research Center ($1,000,000.).

The Department of Zoology, University of Kentucky, recently added **Dr. John A. Wallwork** to its staff as an Assistant Professor. Dr. Wallwork is an acarologist and soil zoologist, a graduate of the University of Wales, United Kingdom. He received his Ph.D. from the University of Michigan and has been teaching the last three years in the University College of Ghana at Legon, Accra, Ghana.

The University of North Carolina Department of Botany has been awarded a $24,200-grant by the National Science Foundation. The money will be used to purchase an electron microscope and other instruments.

The Biology Department of Alabama College recently received a grant of $9.200 from the Atomic Energy Commission for the purchase of teaching equipment to be used with radioisotopes. A new laboratory has been prepared for this equipment in which a Radiation Biology course will be taught. The equipment will also be used for demonstration purposes in the introductory courses.

The ASB BULLETIN

Volume 8, Number 4 October, 1961

NIH Laboratory—Williams Building, South Carolina State Hospital, Columbia

The Official Quarterly Publication of
The Association of Southeastern Biologists

ASB BULLETIN

Volume 8, Number 4—October 1961

The ASB Bulletin is the official quarterly publication of the Association of Southeastern Biologists, Inc., and is published at Philadelphia, Penna., in January, April, July and October. Letters, news items, other contributions, and all communications about editorial matters should be addressed to C. W. Hart, Jr., Editor, The Academy of Natural Sciences of Philadelphia, 19th and The Parkway, Philadelphia, Penna. Changes of address should be sent promptly to the Secretary of the ASB, Dr. Harry J. Bennett, Department of Zoology, Louisiana State University, Baton Rouge, La. Subscription orders from libraries and other institutions should be sent to the Business Manager, Dr. Elsie Quarterman, Department of Biology, Vanderbilt University, Nashville, Tenn. Subscription rate for non-members of the ASB: $2.00 per year. Printing and typography by the Wickersham Printing Co., Lancaster, Penna.

Second-class postage paid at Philadelphia, Pennsylvania.

C. Willard Hart, Jr.

Wake Forest Coll.
Winston-Salem, N. C.

To enable the nominating committee to function more effectively this year, nominations for persons to fill the following positions should be made at this time: **President elect, Vice-president, Treasurer, and two Executive Committee members.** Please mail your nominations to *Dr. Victor A. Greulach, Department of Botany, University of North Carolina, Chapel Hill, N. C.*

The National Institutes of Health Laboratory at Columbia, South Carolina

By MARTIN D. YOUNG[1, 2]

In 1831 the Office of Malaria Investigations, National Institute of Health, U.S. Public Health Service, under the direction of Dr. L. L. Williams, Jr., Washington, D. C., decided to establish a field station for the purposes of perfecting methods of the use of malaria in the treatment of neurosyphilis and of studying the biology of malaria.

After a survey, Dr. Bruce Mayne selected the South Carolina State Hospital on May 26, 1931.

During the first years, the work was on the epidemiology of malaria, using as an investigational method the inducing of malaria in neurosyphilitic patients. Particular interest was placed on the transmission of malaria by injecting sporozoites. On June 16, 1937, the writer joined the staff for the purpose of enlarging the work in parasitology. In March of 1938, Dr. G. Robert Coatney joined the laboratory staff for the main purpose of working on pigeon malaria, which he had discovered some years previously. Dr. Coatney remained until January 1941 when he transferred to Washington to devote his time to the development of new drugs for malaria.

Dr. Bruce Mayne died April 30, 1941. The writer was placed in charge of the laboratory. On January 28, 1942, Dr. Robert W. Burgess joined the laboratory as entomologist. His immediate objective was to establish an insectary of anopheline mosquitoes and to produce large quantities of these insects infected with malaria.

Upon the outbreak of World War II, it became obvious that foreign malarias were being returned in troops from the South Pacific and that we had inadequate knowledge of the ability of these malarias to be transmitted by native mosquitoes and to establish themselves in this country. At the request of the Army and Navy, the U. S. Public Health Service through the National Institute of Health and the Malaria Control in War Areas Office established the "Imported Malaria Studies Program." This special study was activated in November 1943 with headquarters in the NIH laboratory in Columbia. A branch laboratory was set up in Letterman General Laboratory in San Francisco, California, in December 1943. The object of this laboratory was to study the vectorial ability of the California mosquitoes. During the one year that this laboratory operated, it was found that the mosquitoes of the west coast were efficient vectors of foreign malarias. The work led to the colonization for the first time of *Anopheles freeborni* which has proven by comparative studies to be the best malaria vector in the United States. Because of this charaeteristic, it has been used extensively in experimental work with human and simian malarias.

Other laboratories were established at the Harmon General Hospital in Longview, Texas, and the Moore General Hospital in Swannanoa, North Carolina, for the purpose of studying relapsing malaria in returned troops. In addition to these IMS operated laboratories, foreign malaria were studied in several other military hospitals. There were eight cooperating state, Veterans, and private hospitals who used the

1 Department of Health, Education and Welfare, Public Health Service, National Institutes of Health, National Institute of Allergy and Infectious Diseases, Laboratory of Parasite Chemotherapy, P.O. Box 717, Columbia, South Carolina.

2 Now Assistant Chief, Laboratory of Parasite Chemotherapy National Institutes of Health, Bethesda, Maryland.

foreign malarias for the treatment of neurosyphilis, thus adding to the information.

Over 1000 military personnel with relapsing malaria were observed to collect various data. Approximately another 1000 patients, either neurosyphilitic patients or volunteers, were given the foreign malarias.

The biology of the foreign malarias was extensively studied. The *vivax* malarias were shown to be similar in many respects to the domestic malarias but are more virulent. The Chesson strain of *Plasmodium vivax* from the Pacific, because of its characteristic of early and frequent relapses, was isolated and has become the standard for the testing of potential antimalarial drugs. The foreign malarias, although varying in their ability to infect native mosquitoes, could be transmitted by them under usual malariogenic conditions. The malarias were infective to mosquitoes during both symptomatic and asymptomatic parasite relapses.

The IMS group at Swannanoa also did a detailed study on returned cases of infections of *Wuchereria bancrofti* which showed a diurnal periodicity of microfilariae in the blood stream rather than a non-periodic or aperiodic periodicity formerly ascribed to filariasis from the South Pacific. Further, it was shown that 10 American mosquito species could transmit this worm but epidemiologically probably only two, namely, *Culex pipiens* and *C. quinquefasciatus,* were potentially dangerous.

The Imported Malaria Studies accomplished its objectives and upon recommendation of its Director officially discontinued its work on June 30, 1945. At this time the laboratory at Swannanoa became a part of the National Institute of Health, as a branch of the Columbia laboratory.

On November 29, 1944, the laboratories entered into a cooperative drug experiment with the Division of Chemotherapy under the direction of Dr. Coatney. Prisoner volunteers in Atlanta, Georgia, and at Seagoville, Texas, were given malaria against which new drugs were tried.

Shortly after the Atlanta prison work was started a similar cooperative drug experiment was begun with Dr. Alf S. Alving at Chicago, wherein we infected his prisoner volunteers at the Illinois State Prison, Statesville, Illinois. First the Columbia and later the Milledgeville laboratory cooperated in this project.

In June 1945 a field laboratory for a short time (11 months) study of the ability of native mosquitoes to transmit indigenous malaria was established at Manning, South Carolina. The study showed that in an area of low endemicity the asymptomatic malaria carrier, often with very low parasitemia, is the important factor in the transmission and maintenance of the malaria. This helped explain some puzzling epidemiological problems in other parts of the world.

We had been requested several times by the superintendent to establish a laboratory at the Milledegeville, Georgia, State Hospital. The work with relapsing malaria in returned soldiers being completed at Swannanoa, that laboratory, with its personnel, was moved to Milledgeville, Georgia, on March 8, 1946. The principal objectives were to study the biology of foreign malarias induced in neurosyphilitic patients and to continue the participation in the cooperative drug studies by producing infected mosquitoes and infecting prisoner volunteers. Dr. Geoffrey M. Jeffery joined the Milledgeville staff on June 3, 1948, and assumed charge of the laboratory when Dr. Eyles left for post-graduate study.

During the summers of 1944, 1945, and 1946, Dr. Mary Stuart MacDougal, head of the Biology Department of Agnes Scott College and an internationally known cytologist, worked at Columbia on the eytology of the malaria parasite. In June 1948, Dr. Gordon B. Wolcott joined the staff to conduct research in the cytology of malaria and other parasites.

During the first twenty years the main emphasis was on malaria in the areas of host-parasite relationships, biology and cytology of the parasites, chemotherapy, use of malaria in the treatment of neurosyphilis, and the biology, colonization, hybridization, and vectorial abilities of anopheline mosquitoes. Much basic information was obtained.

In addition to the internal programs, the laboratory was the principal supplier of human malaria for the large seale programs for the development of new and better antimalarial drugs. This was made possible by techniques perfected here for the mass production of mosquitoes infected with human malaria. Out of the cooperative chemotherapy program came the superior drugs now standard for the treatment of malaria. At the same time, independent researches in the laboratory developed the chemotherapy of *P. malariae* (quartan) malaria, which type was not included in the large cooperative studies.

Other researches were performed in the field of parasitology, especially the particular problems related to patients in mental hospitals, such as the high rate and intensity of infections. Investigation of some patients with severe dysentery revealed *Balantidium coli* infections, the first time this parasite had been described from South Carolina. Several cases were found, representing about twenty per cent of all found to that date in the United States. Treatment with carbarsone was successful, proved by a ten-year follow-up.

On June 15, 1950, the Columbia laboratory became the headquarters for the Section on Epidemiology consisting of laboratories at Columbia, South Carolina, Memphis, Tennessee, Milledgeville, Georgia, and Seagoville, Texas.

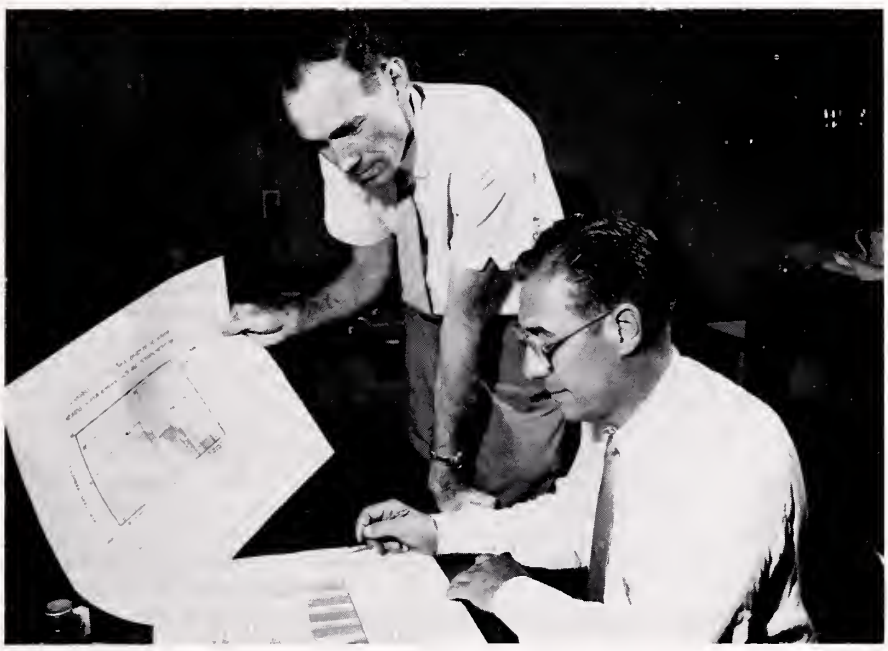
The Memphis laboratory was changed completely from malaria to the study of toxoplasmosis and the epidemiology of intestinal parasites, with Dr. Don E. Eyles in charge.

The Milledgeville laboratory continued to do basic research in malaria, as well as the cooperative malaria chemotherapy study with Dr. Coatney. The epidemiological study of intestinal parasites in a mental hospital population was begun. The laboratory at the Federal Correctional Institution at Seagoville, Texas, was for the study of the transmission of parasites using prisoner volunteers, under the direction of Dr. Robert C. Rendtorff.

The Columbia laboratory, in addition to its malaria studies, began an experimental chemotherapeutic program on intestinal parasites in mental patients. Also started was a study of virusparasite relationships and the relationship of toxoplasmosis to mental conditions.

Malaria work being further de-emphasized, the Milledgeville laboratory was closed on August 15, 1954. Dr. Jeffery and two staff members were transferred to the Columbia laboratory. Dr. Jeffery started a program studying the epidemiology of intestinal parasites in the mental patients and later, upon departure of Dr. Rendtorff in September 1955, undertook the investigation of the transmission of viruses by parasites.

During these years, despite the reduction in the amount of malaria research, there were nevertheless some significant findings. The tissue phases of *Plasmodium falciparum* were found in the liver following careful and detailed experiments. The discovery in a return veteran of *P. ovale,* which species had not been reported previously in the United States, resulted in an epidemiological study elucidating the factors which might contribute to its transmission and establishment in this country. Cooperative work on malaria drugs continued with other groups resulting in much additional knowledge in this field.



Dr. Geoffrey M. Jeffery, former Editor of the ASB Bulletin, and the author, Dr. Martin D. Young, examine charts showing the results of tests with a new hookworm drug.

Basic studies in malaria elucidated for the first time the chromosome patterns for all of the human malarias. Experimentally induced malaria infections observed throughout the complete life history added valuable epidemiological information which became of immediate value in predicting the course and transmissibility of malaria infections. This information was of special value for the evaluation of malaria eradication programs. Hybridization of two important malaria vectors established a new approach in research, which was readily adopted by other laboratories. Research by a summer investigator showed that four anophelines could transmit bird malaria, thus contributing to the revision of the long-held opinion that anophelines were vector specific for human malaria and culicines for avian malaria.

The rapid appearance of resistance to pyrimethamine by *P. vivax, P. falciparum,* and *P.*

The ovaries of caterpillars are removed and transferred to tissue culture slides by Dr. William E. Collins, Biologist.

malariae was shown experimentally. The resistance was evident in the first relapse usually within several weeks, after treatment with the drug. Both the schizogonic forms and the gametocytes were resistant to the drug, the resistance factor was maintained after mosquito transmission and after preservation at low temperatures.

A study of the sporontocidal effects of drugs showed that pyrimethamine was very rapid in its action against susceptible parasites in the mosquito, being effective usually in less than one day. After resistance appeared, the sporontocidal effect was lost. Primaquine was an effective sporontocide but sterilization of the gametocytes required a day or so longer. However, very small doses, as low as 1.5 mg. daily, were sporontocidal. So far no resistance to primaquine has been demonstrated. Chloroquine has no sporontocidal effect. Recently the first documented resistance of human malaria to chloroquine was demonstrated.

In a cooperative experiment with Dr. Coatney at the Atlanta Federal Penitentiary, it was shown that 25 mg. of pyrimethamine or 300 mg. of chloroquine consumed weekly in table salt suppresses malaria.

Phase contrast and cinephotomicrographic studies of living malaria parasites revealed new information about the life cycle, especially fertilization, and about the relationships of the parasites to the host red blood.

Considerable information was obtained on the infectivity of human malarias to mosquitoes. It was shown that in addition to being infectious during the primary attack, malarias might infect mosquitoes during the chronic asymptomatic periods and for a much longer time than had been generally thought.

The development of methods for preserving human malaria parasites at about – 78° C has resulted in the maintenance of virulent strains for over four years and perhaps longer. Many of the important standard strains of malaria are being preserved in the laboratory.

An expansion of the epidemiological work on the heavy parasitic infections in some mental patients revealed valuable basie epidemiological information. It was shown that *Trichuris* and hookworm parasites can exist for at least six years in infected patients without much reduction even when there is no transmission or acquisition of new infections. The interruption of transmission of these two parasites was obtained with improved housing and striet hygienic measures but the transmission of protozoan parasites continued.

For the first time, infeetions of *Isospora* were found in South Carolina. This new parasite apparently was responsible for otherwise unexplained epidemics of diarrhea in a home for mental defectives. So far no treatment is known.

Another parasite new to the State was found, that is, *Gongylonema*. It was actively migrating in the lip mucosa of a rural woman and the most logical source of infection was the contamination of the drinking water. This brought to three the parasites new to the State described by members of the Columbia laboratory.

The Seagoville experimental transmission of intestinal protozoa revealed the infective dosages and duration of the certain parasitic infections as well as other biologieal information.

Field epidemiological studies by the Memphis laboratory related the incidence of intestinal parasitic infections to the various economic and hygienie conditions.

The study of toxoplasmosis at the Memphis laboratory was intensively directed toward therapy following a fatal infection in one of the technicians. This resulted in the development of the first and only known treatment of the disease which is a eombination of sulfas and pyrimethamine. The efficacy of the treatment was demonstrated dramatically by the quick recovery of a second laboratory technician who developed the disease. This therapy has been found useful in other *Toxoplasma* infections in adults.

Also, certain eye conditions respond to this therapy. As the reeognition of the pathogenic

effects of toxoplasmosis grows, the discovery is becoming of inercasing value.

By extensive field and laboratory studies much information was obtained on the epidemiology of toxoplasmosis in man and animals and the possibility of the latter being a reservoir for human infections.

Puromycin, an antibiotic, was found to be curative of symptomatic and asymptomatic *Entamoeba histolytica* infections. Given at weekly doses it appeared to be prophylactic against intestinal parasitic protozoa even on wards where a high degree of risk was involved.

Dithiazanine, a cyanine dye, was shown to be effective with the first treatment against the heavy infections of *Trichuris trichiura* often found in mental patients. However, subsequent treatments were less effective. Regular weekly and quarterly administration of the drug given to the occupants of one entire building did not prevent the transmission of these parasites nor greatly reduce the incidence after the initial dose.

Four salts of bephenium, a quaternary ammonium compound, were shown to be effective against hookworm, the hydroxynaphthoate and chloride salts being about twice as effective as tetrachloroethylene, the standard, albeit comparatively ineffective, hookworm drug.

Diphyllobothrium uris, a tapeworm infecting bears and man in Alaska, was found to have a haploid chromosome number of nine.

The new project on viruses showed that parasite larva entry into the skin could simultaneously inoculate papilloma viruses which were present. Some associations were shown between intestinal parasites and viruses.

Improvements were made steadily in the technique of inducing and handling malaria for the treatment of neurosyphilis. The laboratory acts as the national center for strains of therapeutic malaria, having supplied some 3000 inocula to other hospitals and physicians for therapy of neurosyphilis, nephrosis, and arthritis. About 2000 neurosyphilitic patients at the South Carolina State Hospital have been inoculated and followed during the course of the disease as a eooperative program with the hospital. It is estimated that some 20,000 neurosyphilitic patients have been inoculated or subinoculated with strains of malaria maintained and furnished by this laboratory.

In January 1959, in a reorganization, the Laboratory of Tropical Diseases was dissolved and four new laboratories organized. The Columbia laboratory was placed in the new Laboratory of Parasite Chemotherapy as the Section on Epidemiology and the Memphis Laboratory also became a separate Section on Cytology, thus severing its administrative connection with Columbia.

With the reorganization, malaria research was again emphasized, especially as related to problems concerned with eradication programs in various countries. Basic information was sought on the life histories, response to drugs, infectivity to mosquitoes during all phases of the life cycle, etc., as these factors are important in understanding the epidemiology of the disease, especially in evaluating its disappearance.

The result of the above researches at the Columbia and associated laboratories have been published in over 200 papers.

Many foreign scientists have visited the laboratory for short periods, and in some cases for several months to do research. The laboratory has frequently given training courses in malaria for Public Health Service personnel.

As the laboratory enters its thirtieth year, the field of investigation is much broadened. In addition to the malaria investigations, study continues on the problem of the heavy parasitism found in patients of mental institutions with particular emphasis on epidemiology and improved therapy. The association of viruses with protozoan and worm parasites as well as with mosquito larva is being investigated. Attempts are being made to culture insect tissues. A study of parasite physiology is directed toward elucidating drug action, especially against malaria and intestinal worms. Drug resistance in these parasites and ways to avoid or overcome resistance are of particular interest.

Margaret Jean Westbrook, Medical Biology Technician, removes a baby chick from a cage containing mosquitos infected with malaria.

Items of Interest: The Denver AAAS Meeting

The 128th meeting of the American Association for the Advancement of Science, which will be held at Denver, Colorado, 26-31 December 1961, will include sessions of 18 AAAS sections and of some 75 participating organizations. The following programs may be of interest to members of the ASB who plan to attend this meeting.

Sectional Programs

AAAS Section C—Chemistry and cosponsors. Among the sessions will be a two-session symposium, "Extraterrestrial Biochemistry and Biology," arranged by Charles R. Phillips, Dec. 27. Titles and speakers at the morning session will be: "Factors Limiting the Long Term Viability of Organisms," Philip H. Abelson; "The Borders of Biochemical Evolution," Sidney W. Fox; "Life Spectra," Harry C. Stubbs; and "Studies of Microorganisms under Extraterrestrial Environment," Richard Ehrlich and Ervin J. Hawrylewicz. Titles and speakers at the afternoon session: "Biological Profile of Mars," Hubertus Strughold; "Interstellar Panspermia," Carl Sagan; "Concerning the Entry and Survival of Microorganisms in Meteorites," Frederick D. Sisler and Walter L. Newton; and "Safety Practices Applicable to Exobiological Research," Charles R. Phillips and Arnold G. Wedum.

AAAS Section N—Medical Sciences and cosponsors. Four-session symposium, "Physiological and Biochemical Aspects of Human Genetics," arranged by Alexander G. Bearn and Oscar Touster, Dec. 29, 30. Topics and speakers will be:

A. Structure and Specific Action of DNA—J. Marmur, R. L. Sinsheimer, J. Hurwitz, A. E. Mirsky;
B. Gene-Protein Relationships, Part I—C. Baglioni, David M. Bonner, G. D. Novelli, O. Smithies;
C. Gene-Protein Relationships, Part II—R. Ceppelini, H. N. Kirkman, A. G. Motulsky, A. G. Steinberg;
D. Tissue Culture and Immunological and Evolutionary Aspects—C. L. Markert, R. D. Owen, T. T. Puck.

Societal Programs

Alpha Epsilon Delta. Annual symposium, "Career Opportunities in the Health Professions," arranged by Maurice L. Moore; annual luncheon and address; Dec. 28.

American Nature Study Society. Among the sessions: "Molecular Biology," Alfred Novak presiding, Dec. 27; "Nature Study Around the World," Richard L. Weaver presiding, Dec. 27; "Outdoor Nature Interpretation," Dec. 28; joint program with the National Association of Biology Teachers, "Conservation and International Resource Department," Dec. 28; joint field trip with NABT, Dec. 29; motion-picture film, *Nature Adventure Around the World*, Dec. 29; sessions on "Natural History of the Rocky Mountains," Ruth Hopson presiding, Dec. 30.

American Physiological Society. Session, "Physiological Factors in Manned Lunar Space Flight," arranged by Robert E. Smith, with Loren D. Carlson presiding, Dec. 29. Included will be: "Neurophysiological Aspects," W. Ross Adey; and "Hemodynamic Evaluation at Null Gravity," Nello Pace; and a panel discussion, "Space Physiologists: Their Role, Availability, and Training."

American Psychiatric Association, Committee on Research. Two-session symposium, "Genetics and Evolution in Relation to Human Behavior," arranged by David A. Hamburg, Dec. 27. Among the titles and speakers will be: "An Outline of Human Evolution," S. L. Washburn; "Baboon Behavior," S. L. Washburn and Irven DeVore; "Evolution of Primate Social Behavior," Irven DeVore; "Evolution of Culture in Africa," J. Desmond Clark; "Selective Forces in the Evolution of Man," Ernst W. Caspari; Theodosius Dobzhansky.

American Society of Naturalists. Annual national meeting, arranged by Ernst W. Caspari, will feature the presidential address of Marston Bates, "Man's Ecological Niche," Dec. 27, morn. The business meeting of the society will follow.

American Society of Zoologists. Final program of the national meeting of the Society, arranged by Ray L. Watterson, with more than 30 sessions, includes 15 sessions for contributed papers, sponsored by all six divisions of the Society, throughout the meeting period; business meetings of five divisions; and a series of symposia. Symposia are as follows: "Neurosecretion," three sessions, arranged by Nancy S. Milburn, Dec. 28, 29; "Vertebrate Locomotion," arranged by D. Dwight Davis, Dec. 29; "Evolutionary Changes in the Hormonal and Neural Bases of Reproductive Behavior," arranged by William C. Young, Dec. 29, and "Cellular Endocrinology," arranged by Paul A. Wright, Dec. 30. The annual business meeting of the ASZ as a whole is planned for Dec. 29.

Beta Beta Beta Biological Society. The biennial meeting of the Society, arranged by Mrs. Frank G. Brooks, will be held Dec. 27, morn. It will be followed by the biennial luncheon and address, arranged by H. P. Sturdivant, at which Martin W. Fleck will speak.

Biomedical Information-Processing Organization. Session for invited papers, arranged by Robert S. Ledley, Dec. 27.

Biometric Society, Western North American Region. Three-session program, arranged by Franklin A. Graybill, Dec. 28.

Ecological Society of America. Two-session symposium, Dec. 26; other symposia and some six sessions for contributed papers on plant ecology, animal ecology, human ecology, and aquatic ecology, and a series of sessions jointly sponsored by the Section on Animal Behavior and Sociobiology and with the Division of Animal Behavior and Sociobiology of the American Society of Zoologists, arranged by Martin W. Schein; Dec. 27, 28.

Mountain Lake Biological Station. Annual breakfast with the AAAS, arranged by Horton H. Hobbs, Jr., for all persons who have been students, investigators, or staff members at the station, Dec. 29.

National Association of Biology Teachers. Annual national meeting, Dec. 26-30. Included in the program will be the NABT annual luncheon, Dec. 27, presidential address, Dec. 28, and a series of separate sessions, Dec. 27, 28, and 30, with the theme "Accent on Investigating."

Nature Conservancy. Meeting of the Conservancy's National Committee for Natural Areas for Schools, arranged by John W. Brainerd.

Sigma Delta Epsilon. Regional meeting, arranged by Ernestine B. Thurman, will include a tea for all women in science.

Society for Industrial and Applied Mathematics. Session, arranged by D. L. Thomsen, Jr., "Biology and Mathematics," Dec. 29, aft.

Society of Protozoologists. Fourteenth annual meeting, arranged by Norman D. Levine, includes four sessions for contributed papers, Dec. 27-30, and a round-table symposium, "Biochemical Phyletic Markers Among the Protozoa," arranged by Seymour H. Hutner. Among the titles and speakers at the symposium will be: "Are There Biochemical Boundaries to a Phylum Protozoa?", Ellsworth C. Dougherty; "Which Protozoa (if any) Should Be Called Humanoid?", S. H. Hutner; "Biochemical Intimations of the Phylogenetic Position of the Ciliates," G. G. Holz, Jr.; and "Biochemical Taxonomy of Trichomonads," John J. Lee. Annual luncheon and business meeting, Dec. 29.

Society of Systematic Zoology. Annual meeting will include sessions for contributed papers, annual breakfast and business meeting, Dec. 30; three-session symposium, "The Data of Classification," arranged by R. E. Blackwelder, Dec. 27, 28; and a two-session symposium, "The Biogeography of the Philippine Islands," arranged by Walter C. Brown, Dec. 29.

Society of the Sigma Xi. Sixty-second annual Convention, joint luncheon with the Scientific Research Society of America, and joint address with Phi Beta Kappa, "Science and Government," by Harrison Brown; Dec. 29.

The AAAS Exposition of Science and Industry and the AAAS Science Theatre, with recent foreign and domestic films, will be prominent features of the meeting. Coupons for sleeping accommodations and advance registration will be found in *Science.*

News of Biology in the Southeast

About People

Dr. Rene J. Bienvenu, head of the Department of Bacteriology of Northwestern State College, Natchitoches, Louisiana, has received an NIH grant of $40,000 to continue studies on the natural resistance to brucellosis.

Dr. Edward K. Sobers, Assistant Professor of Bacteriology, Northwestern State College, Natchitoches, Louisiana, is directing an undergraduate research project under a Louisiana Heart Association grant recently awarded to Miss Clydell Davenport. Miss Davenport also received a fellowship stipend from the same source.

Dr. Richard E. Garth, Assistant Professor of Biology, Northwestern State College, Natchitoches, Louisiana, will be director for the undergraduate research program sponsored by NSF for the academic year 1961-1962. Fourteen students in five areas of research will participate in the program. He will also direct a summer institute for twenty high-ability high school students.

Dr. George Ware, Associate Professor of Biology, Northwestern State College, Natchitoches, Louisiana, will teach plant ecology at the University of Oklahoma Biological station at Lake Texoma during the summer of 1962. He plans to continue his study of cottonwood groves and sand bar plants on the Red River.

The Atomic Energy Commission announced a grant of $28,000 to **Dr. Alan Conger,** Professor Radiation Biology (Botany-Zoology) at the University of Florida. This grant is to be used in the Radiation Biology program that has been in operation since 1958. Most of the money will be used to purchase a new X-ray machine capable of producing about one-half million roentgens per minute. This powerful and versatile machine will be used to irradiate biological materials as part of Dr. Conger's work on the biological after-effect and long-lived free radicals in irradiated seeds. The Atomic Energy Commission also awarded $12,500 to **Dr. George Fritz,** Assistant Plant Physiologist, Department of Botany, Agriculture Experiment Station, University of Florida, to support his studies on the metabolism of molecular oxygen by plants.

Dr. Leland Shanor, head of the Department of Biological Seiences at Florida State University, was awarded an honorary Doctor of Science degree by Illinois Wesleyan University at the 1961 June Commencement. Dr. Shanor was also appointed as chairman of the Mycologia Memoirs Committee of the Mycological Society of America by the Council of the society at its meeting at Purdue University.

Dr. A. M. Winchester, head of the Biology Department at Stetson University, has accepted an appointment as visiting professor of biology at the University of South Carolina. He will be on leave of absence from his position at Stetson during the tenure of his appointment at South Carolina.

Dr. J. Thomas Mullins, Assistant Professor of Botany at the University of Florida, was awarded $25,200 by the National Institutes of Health for a project "The Ge-

nctical Basis of Heterothallism in *Dictyomorpha.*" *Dictyomorpha* is an aquatic fungi that is a particularly favorable organism for genetical studies and mutational analyses.

A $45,683 research grant was awarded to **Dr. Warren S. Silver,** Department of Bacteriology and **Dr. Robert D. Powell,** Department of Botany at the University of Florida, by the National Institutes of Health to aid a three-year study of interrelationships between certain trees and the microbes living within their roots. Two of the trees under study, Southern waxmyrtle and Australian pine, are widely used in Florida for reforestation and soil erosion control.

Dr. Henry Stevenson, Department of Biological Sciences at Florida State University, was awarded a three year research grant by the NIH for a study on the "Abundance of Neotropical Birds in Florida." Studies of migration dates and pathways are also included in the proposal.

Dr. Dorothy Crandall and **Dr. James Chamberlain,** Biology Department, Randolph-Macon Woman's College, have been working during the past summer on a three year forest ecological study of the piedmont area. Particular attention is being directed toward plant succession and small mammal populations.

Dr. Kirtley Mather, Geology Department, Harvard University, will be at Randolph-Macon Woman's College November 13 and 14 to participate in two seminars and to give a public lecture.

Dr. Franklin F. Flint has been appointed Acting Chairman of the Biology Department at Randolph-Macon Woman's College.

Dr. Lyman R. Emmons, a graduate of Trinity College, who received his Ph.D. from the University of Virginia, has been appointed Assistant Professor of Biology at Washington and Lee University.

Mr. Joe E. Coggins, formerly with the Educational Division, Virginia Commission of Game and Inland Fisheries, and later conducting research for the same agency, has been appointed to the staff of the Biology Department, Hampden-Sydney College.

Dr. D. H. Messersmith, Biology Department, Radford College, completed the requirements for the Ph.D. degree in entomology at Virginia Polytechnic Institute during the past summer.

Dr. R. H. Hoffman, Biology Department, Radford College, conducted studies during the past summer on the millipede fauna of the southeastern appalachians under a grant from the National Science Foundation administered by the Highlands Biological Station.

Dr. John G. Barker, Head, Biology Department, Radford College, has recently been named chairman of the Committee on Science Teaching, Virginia Academy of Science.

Dr. Willie M. Reams, Zoology Department, Louisiana State University, participated in the 5th International Pigment Cell Conference sponsored by the New York Academy of Sciences in New York, October 11-14, 1961.

Dr. Harry Wheeler, Department of Botany and Plant Pathology, Louisiana State University, has received a grant of $59.000 over a five year period from the USPHS for research in phytopathogenic toxins.

Dr. John P. Hollis, Department of Botany and Plant Pathology, Louisiana State University, has received a Fulbright grant to study plant parasitic nematodes in Kenya, Africa.

Dr. Robert W. Kelley, Assistant Professor of Biology, Southeastern Louisiana College, attended the Tulane University Institute of Radiation Biology sponsored by the AEC and NSF from 3 July through 24 August.

Dr. Rosamond Killigrew and **Dr. Bernard Carrier** has recently joined the faculty of the Department of Biological Sciences of the Southeastern Louisiana College.

Dr. Temd R. Deason has joined the staff of the Biology Department of the University of Alabama as Assistant Professor. Dr. Deason, a phycologist, receives his Ph.D. under Professor Harold Bold at the University of Texas. He has been Assistant Professor of Biology at the University of Delaware.

Dr. Joab L. Thomas has joined the staff of the Biology Department of the University of Alabama as Assistant Professor. Dr. Thomas, a plant taxonomist, received his Ph.D. under Professor Reed C. Rollins at Harvard. He has been associated with Arnold Arboretum.

Dr. J. Gordon Carlson, Head of the Department of Zoology and Entomology at the University of Tennessee, gave two lectures on the effects of radiation on cell division at the Institute for Seeondary School and College Science Teachers held at East Tennessee State College, Johnson City, June 12-August 4.

Dr. James N. Liles of the University of Tennessee Department of Zoology and Entomology has received a renewal one-year grant of $9,300 from the U. S. Army Biological Laboratories to continue studies of longevity, aging, and productivity in *Aedes aegypti.*

Mr. George Conner, Instructor of Biology at the University of Southwestern Louisiana from 1959 to 1961, has entered the graduate school at the University of Arizona, Tucson, to continue his graduate work.

Dr. Matt Dakin, Instructor of Biology at the University of Southwestern Louisiana during 1960-1961, has entered Auburn University to continue his graduate work.

Additions to the staff of the Department of Biology, at the University of Southwestern Louisiana include: **Dr. M. J. Fouquette,** who recently received his Ph.D. in Zoology (Herpetology) from the University of Florida, Gainesville, and **Mr. L. V. Davis,** who has been working toward the doctorate at Vanderbilt University in the field of entomology. Both have received appointments to the rank of Assistant Professor.

Dr. Joseph M. Sobek, who recently received his Ph.D. in microbiology from Stanford University, has been appointed to the position of Assistant Professor in the Department of Bacteriology at the University of Southwestern Louisiana.

Dr. William D. Reese, Department of Biology, University of Southwestern Louisiana, spent 6 weeks during the summer in Mexico collecting bryophytes along the Gulf Coast. The work was done in connection with an N.S.F. Grant.

Dr. Jurgen H. Franz has returned to the Radiologisches Institut der Universitat, Freiburg, Germany, after spending a year in the Radiation Microbiology group of the Oak Ridge National Laboratory.

Dr. Tuneo Yamada, formerly of Nagoya University, Nagoya, Japan, has joined the staff of the Cell Growth and Reproduetion Group of the Oak Ridge National Laboratory.

Dr. Frank J. Finamore has retuned to Southern Illinois University, Carbondale, Illinois, after spending a year in the Nucleic Acid Enzymology Group at Oak Ridge under a grant from the U. S. Public Health Service.

Dr. Forrest C. Grimm, who has just completed a two-year Research Associateship in the Biology Division at Oak Ridge, has accepted a position with The Rockefeller Institute, New York.

Dr. Rea Marie Fulkerson, who has been associated with the Maize and Phage Group in the Cytology and Genetics Section at Oak Ridge, has accepted a position with the University of Hawaii, Agriculture Experiment Station, Honolulu, Hawaii.

Dr. Douglas Davidson, who has been associated with the Cytology and Genetics Section at Oak Ridge for the past three years, left the Division on August 18. Dr. Davidson has aecepted a position with the Department of Botany, University of St. Andrew's, Fife, Seotland.

Dr. Edwin Powell Puckett, who has been assoeiated with the Experimental Animal Facility at Oak Ridge during the summer months, left the Division August 18. Mr. Puckett will resume his teaching duties with the Oak Ridge Public School System this fall.

Dr. Alexander Hollaender of Oak Ridge attended the International Symposium on Tissue Transplantation at the Universidad de Chile, Santiago, August 30-September 2, and presented a paper on "Recent developments in the border fields of basie biology." From Septemher 3-9, he was in Lima, Peru, to consult with scientific investigators at the Universiry of Peru, the Laboratorio de Investigacion de Cancer, and the Universidad Nacional Mayor de San Marcos.

Dr. Arthur C. Upton of the Oak Ridge National Laboratory was in Lawrence, Kansas, September 5-9, to attend the International Symposium on The Effects of Ionizing Radiation on Immune Processes and to chair the session on antibody formation, genotypes, bone marrow, and irradiation. The Symposium was sponsored by the University of Kansas and the U. S. Atomic Energy Commission.

Dr. G. David Novelli of the Oak Ridge National Laboratory also attended the Symposium at Lawrence, Kansas, and presented a paper on entitled, "The Effect of Ultraviolet and X-Irradiation on the Induced Synthesis of Beta-galactosidase in *E. coli* and the Relationship to antibody Synthesis."

Dr. Charles C. Congdon of the Oak Ridge National Laboratory was in Santiago, Chile, August 30-September 2, to attend the Symposium on Tissue Transplantation Problems at the Universidad de Chile and to present a paper entitled, "Changes in Lymphatic Tissues During Foreign Tissue Transplantation." On September 3 and 4 he visited the Laboratorio de Investigacion de Cancer and the National University of San Marcos, Facultad de medicina, Lima Peru.

Dr. Ernest H. Y. Chu of the Oak Ridge National Laboratory attended the Second International Conference on Human Genetics in Rome, Italy, September 7-12, and presented a paper entitled, "Chromosome Studies in a Family with Four Cases of Atypical Mongolism." Dr. Chu was in France September 14-16 visiting the University of Paris and Laboratoire de Genetique Physiologique du CNRS, Gif-sur-Yvette. From September 18-20 he was in England visiting the following institutions: Medical Research Council, Radiobiological Research Unit, Harwell; Population Genetics Unit, Medical Research Council, Oxford; and Galton Laboratory, University College, London. Dr. Chu visited in Scotland from September 22-26 at the Institute of Animal Genetics, University of Edinburgh, and the Western General Hospital, Edinburgh.

Dr. Eugene C. Bovee, Associate Professor of Biology, University of Florida, has been appointed associate research professor, also, and associate professor of sanitary science. He will continue to serve on the graduate staff of the biology department, will serve on the graduate staff of civil engineering, sanitary engineering section, and will conduct research in biological problems of sanitary engineering for the Engineering and Industrial Experiment Station at the University of Florida.

Dr. Warren Deacon, Consulting Bacteriologist and Vanderbilt University Biology Professor for 42 years, received the Meritorious Award for Teaching from the Association of Southeastern Biologists at the annual meeting last April. Dr. Deaeon joined the Vanderbilt Biology Faculty in 1919, served from 1946 to 1958 as Chairman of the Biology Department, and then resigned the Chairmanship to devote his whole time to teaching and research. He is a past president of the Association of Southeastern Biologists, the Tennessee Academy of Science, and the Kentucky-Tennessee Branch of the Society of American Bacteriologists.

Dr. Warren Deacon—Recipient of the 1961 meritorious teaching award.

Dr. Carter Gilbert, who received his Ph.D. at the University of Michigan, and has this past year served as an associate with the Florida State Museum, has been appointed interim Assistant Professor of Biological Sciences at the University of Florida. His *forte* is ichthyology.

Dr. F. G. Nordlie, who recently received his Ph.D. in ecology and limnology from the University of Minnesota, has joined the staff of the biology department at the University of Florida as assistant professor.

Dr. Eileen M. Otis, Ph.D. in genetics, University of Rochester, has been appointed interim Assistant Professor of Biological Sciences at the University of Florida. Her husband, **Dr. Arthur B. Otis,** is head professor of the physiology department in the medical school, J. Hillis Miller Health Center at the University of Florida.

Mr. Brian McNab, who will receive his Ph.D. from the University of Wisconsin in February, has been appointed interim Assistant Professor of Biological sciences at the University of Florida. His research field is physiological ecology.

Dr. Donald A. Jenni, who received his Ph.D. in biology from the University of Florida last June, has been appointed interim Assistant Professor of Biology there. He is a vertebrate ecologist.

Mr. Dale Birkenholz, who has his M.S. degree from Iowa State University and is a doctoral candidate in biology at the University of Florida, has been appointed

there as interim Assistant Professor of Biology. His area of research is vertebrate biology.

Dr. George W. Hunter, III, is on leave of absence from his post as lecturer in medical parasitology and biological sciences at the University of Florida to serve with the University of Costa Rica on a developmental program in medical parasitology.

Dr. William C. Massey, Associate Professor of Biological Sciences and Anthropology at the University of Florida, will take a leave of absence during the spring semester 1962 to teach graduate courses in anthropology at Louisiana State University.

Dr. E. Ruffin Jones, Professor of Biology at the University of Florida, has been appointed Assistant Dean of the graduate school at the University of Florida. He will head a program designed to direct superior prospects for the teaching profession toward a master's degree, the program being planned from the beginning of the students' junior year in college.

Dr. Lewis Berner spent two weeks in August at the University of California, Davis, California; he was there in the capacity of a reserve officer of Army Medical Service Corps (he was recently promoted to the rank of Colonel), representing the 355th Reserve and Development Unit which is based in Gainesville, Florida.

Dr. E. G. F. Sauer, internationally known for his studies on celestial navigation by birds, will join the staff of the biology department at the University of Florida in February 1962. He is presently on a research fellowship at the University of California. He studied at the Universities of Freiburg and Heidelberg, and has served as *dozent* at the University of Freiburg.

Dr. Rodger D. Mitchell has been promoted to the rank of Associate Professor of Biology at the University of Florida. He joined the staff in 1957, having previously taught at the University of Vermont, after taking his Ph.D. degree at the University of Michigan, and is well known for his studies on water mites.

Institutions and Organizations

An Institute of Radiation Ecology has been established at the University of Georgia for the purpose of coordinating and extending the regional ecological program which has been developing during the past ten years on the campus of the University, at the Savannah River Plant, and at the Marine Institute at Sapelo. Dr. Eugene P. Odum will serve as the Director of the new Institute, which will have headquarters in the new 13 million dollar Science Center at Athens, while Dr. Frank B. Golley has been appointed Resident Director of The University of Georgia facilities on the Savannah River Plant located at Aiken, South Carolina. A permanent laboratory building to replace the present field quarters is being provided to increase the effectiveness of the field research on the 250,000 acre Savannah River reservation.

The Institute will stress research, graduate and postdoctoral training in modern functional ecology, especially in the fields of energy flow, nutrient cycling, and population dynamics where radio-isotopes have extremely important applications. The direct effects of atomic energy in nature will be a secondary emphasis, but nonetheless important consideration in the program. The present close coordination with the radio-ecology program at the Oak Ridge National Laboratory will be maintained.

One of the main functions of the Institute-type of organization is to provide a convenient mechanism whereby post-doctoral students and investigators from other institutions can apply for NIH, NSF, AEC or other fellowships to pursue research or study for which the unique regional facilities of the University of Georgia Institute offer special advantages. Ecologists who may be interested in possibilities along these lines for 1962-63 should correspond with Dr. Odum.

The International Conference on Opportunistic (Secondary) Fungus Infections will be held in Durham, N. C., 28-30 June 1962. Information regarding this conference may be obtained from *Dr. Ernst W. Chick, Veterans Administration Hospital, Durham, N. C.*

A Public Health Service graduate training grant of $80-000 for the year 1961-2, and an additional $50,000 annually for the four succeeding years has been awarded to the University of Tennessee Institute of Radiation Biology. The Director of the Institute is Dr. J. Gordon Carlson, who is also Head of the Department of Zoology and Entomology. This grant provides for the training of five predoctoral candidates the first year and eight predoctoral and one postdoctoral trainee each of the four succeeding years. In addition to stipends for trainees, the grant includes funds for visiting professors and research and teaching equipment.

The Louisiana Wildlife and Fisheries Commission has opened a new marine biological laboratory on Grand Terre Island, about one mile east of Grand Isle, Louisiana. The laboratory, consisting of 7410 square feet of space, includes the following facilities: a complete microscopy laboratory, a limited chemical and bacteriology laboratory, a running sea water system, compressed air, bottled gas, photographic dark room, holding cages at dock-side, and a library. The laboratory is completely air-conditioned. The staff of the laboratory includes five biologists, one geologist, scientific aides, boat captains, and maintenance staff. Scientific studies are aimed at the commercial species inhabiting the Louisiana coast and at the ecology of the area. Boats include one 38′, 480 HP cruiser, one 28′, 350 HP cruiser, and two 23′, 180 HP cruisers. Plans for increasing the biological staff have been approved pending the availability of personnel. Visiting investigators are invited, pending approval of the Director. Address inquiries to *Dr. L. S. St. Amant, Chief Marine Biologist, Louisiana Wildlife and Fisheries Commission, Marine Laboratory, Box 37, Grand Isle, Louisiana.*

The Department of Biology, Randolph-Macon Woman's College, has recently acquired 50 acres of forested land to be known as the William Buford Russell and Robert Achilles Russell Nature Preserve. The tract, obtained by partial purchase from and donation by Mr. W. B. Russell is located 12 miles from the Campus and will be used for student and faculty study and research. The Preserve contains two small streams and one or more ponds will be constructed in the near future. A departmental station wagon has been purchased for transportation to and from the new facility as well as for other uses of the department.

The Genetics Training Program at the University of North Carolina at Chapel Hill is a cooperative effort involving the departments of Zoology, Anatomy, Biochemistry, and Pathology in Chapel Hill, and includes the opportunity to participate in the courses taught in the Department of Genetics at North Carolina State College in Raleigh. Applications will be entertained from persons with varied backgrounds and goals, and the training programs will be designed to fit the needs of the individual. The training committee is committed to the principle that knowledge of genetics is fundamental in all areas of biological science including medicine, and to this end, a one year sequence of courses in genetics has been arranged which is available to all fellows. Prior training in genetics, biochemistry, or mathematics will permit applicants to enter the program at more advanced levels. Inquiries regarding more detailed information or requests for applications should be directed to: *Dr. John B. Graham, Department of Pathology, University of North Carolina, Chapel Hill, N. C.*

The ASB BULLETIN

Volume 9, Number 1 January, 1962

New Laboratory for Delphinid Research—St. Thomas, Virgin Islands

The Official Quarterly Publication of
The Association of Southeastern Biologists

ASB BULLETIN

Volume 9, Number 1—January 1962

The ASB Bulletin is the official quarterly publication of the Association of Southeastern Biologists, Inc., and is published at Philadelphia, Penna., in January, April, July and October. Letters, news items, other contributions, and all communications about editorial matters should be addressed to C. W. Hart, Jr., Editor, The Academy of Natural Sciences of Philadelphia, 19th and The Parkway, Philadelphia, Penna. Changes of address should be sent promptly to the Secretary of the ASB, Dr. Harry J. Bennett, Department of Zoology, Louisiana State University, Baton Rouge, La. Subscription orders from libraries and other institutions should be sent to the Business Manager, Dr. Elsie Quarterman, Department of Biology, Vanderbilt University, Nashville, Tenn. Subscription rate for non-members of the ASB: $2.00 per year. Printing and typography by the Wickersham Printing Co., Lancaster, Penna.

Second-class postage paid at Philadelphia, Pennsylvania.

C. Willard Hart, Jr.
Editor

Harry J. Bennett, Associate Editor
Elsie Quarterman, Business Manager

ASSOCIATION AFFAIRS

Library subscriptions . . .

In the call for papers and list of important deadlines mailed out earlier this month, a tabulation, by states, of the number of library subscriptions to the ASB Bulletin was published. A list of these libraries appears on page 21 of this issue.

But it is not these libraries that should concern us. It is, instead, the *absence* from this list of many of the major southeastern libraries that should be our concern. Indeed, the absence of three entire states supposedly represented by us is not a thing to be proud of.

In the past year, two libraries have purchased complete runs of the Bulletin, and another has asked for a quotation on a complete run—but these libraries were not in the southeast. Sadly enough, there are now fewer than ten complete sets still available. They should logically find their way to southeastern libraries.

It is up to you to see that they do.

C. W. H., Jr.

October ASB Bulletins sent to the following addresses were returned because the addressees had moved without leaving forwarding information.

BALL, CARROLL RAYBOURNE, Dept. of Biology, Mississippi Southern Coll., Hattiesburg, Miss.

BUSH, FRANCIS M., Dept. of Zoology, Univ. of Georgia, Athens, Ga.

LAWSON, JAMES E., Box 2306, East Tennessee State Coll., Johnson City, Tenn.

RICE, LUCILE A., East Carolina Teachers Coll., Greenville, N. C.

WELLS, MARGARET, 200 Ridge Road, Muncie, Ind.

If anyone knows the whereabouts of any of these people, please communicate with *Dr. Harry J. Bennett, Secretary, Dept. of Zoology, Louisiana State University, Baton Rouge, La.*

A New Laboratory

For Research On Delphinids

Dr. Lilly—whose controversial book, Man and Dolphin, *was recently published by Doubleday —is the Director of the Communication Research Institute of St. Thomas. He was graduated from the California Institute of Technology in 1938; received his M.D. from the University of Pennsylvania in 1942; and has worked in the fields of electrophysiological amplifiers, perception, and reward and punishment systems within the brain of delphinids.*

—John C. Lilly

Of all of the cetacea, those which are available for proper experimental seientific research are the smaller members of the delphinid group. Some limited experimental work has been done on *Phocoena communis* (the harbor porpoise), on *Delphinus delphis* (the common dolphin), *Stenella plagiodon* (the spotted dolphin), *Lagenorhynchus obliquidens* (the striped dolphin), *Tursiops truncatus* (the bottlenose dolphin) and *Globicephala scamonni* (the pilot whale). The suitability of these various species for experimental work in captivity varies greatly between the species. Their reactions to capture, to captivity, and to the personnel maintaining them are also different.

One factor of importance in setting up facilities for research on these animals is cost. In general, one can say that the larger the animal the higher the cost of the facilities and of the maintenance. The smaller animals eat less than do the larger ones. The tanks can be smaller for certain species than for others, depending not only upon size, but on the adaptability of the animals to a confined situation. The cost of the water supply for the larger tank can be considerable and, to date, prohibitively expensive for a purely scientific organization. (Pumping a million gallons of sea water a day through tanks 12 feet deep and 75 feet in diameter—as in certain oceanaria—adds considerably to the overhead.)

Surprisingly enough the smallest of the delphinids, *Phocoena,* has not yet been shown to be adaptable to a captive situation. Several investigators have reported deaths within a few days or weeks of capture. Generally these deaths are associated with descriptions of very high speed swimming behavior continuing to exhaustion and/or impact damage against the walls of the container. It is not known yet whether this is characteristic of the animal or is caused by unknown factors in the catching procedures.

Delphinus delphis and *Stenella plagiodon* have been maintained successfully for several months in fairly large tanks. However, they are reported to be hyperexcitable and much more diffieult to deal with than other speeies.

Lagenorhinchus obliquidens, Tursiops truncatus, and *Globicephala scamonni* have all been maintained for many, many months in captivity. *Lagenorhyncus* and *Globicephala* both need fairly large tanks: *Lagenorhynchus,* because of its tendency to swim at high speeds and to jump to great heights, and *Globicephala* because of its very large body length. Deep sea techniques of capture are used with both of these species. For ease of continued work with any one of the delphinids, the warm-water species are preferable for research for 12 months of the year.

This leaves *Tursiops truncatus* as the present choice for the least expensive and most convenient experimental animal. More is known of this species than of any other of the delphinids. It is available in shallow water in the southeastern United States. Capture by netting in shoal water is the usual technique. If properly caught and maintained, it can live for years in captivity and it survives extremely well in very small tanks. It does not become inordinately large: individuals can be carried by two to four men quite easily. The cost of feeding such animals is not as great as it is for the pilot whale. Experience shows that 10 to 20 pounds of whole frozen fish per animal, on the average, per day is adequate. The diet includes butterfish, blue-runner, thread-herring, and mullet. In our experience, animals can be maintained for months on butterfish alone.

Tursiops truncatus functions very well in water from 60° to about 88° F. At the upper end of this range the animals become extremely sluggish and at the lower end extremely active: an optimal temperature range lies between about 76°

and 84 . In this range the animals are interested and curious and actively participate in any program set up for them, whether in the laboratory or in a "circus" setting.

The Communication Research Institute of St. Thomas has started an organization for delphinid research. Two laboratories are being established, one in Miami, Florida, and one at St. Thomas in the United States Virgin Islands. The animal chosen as the current experimental one in these two laboratories is *Tursiops truncatus* for the reasons given above. Insofar as is known by the author, this is the first organization in the world to be founded for research exclusively on these interesting marine mammals.

The facilities at Miami include three holding tanks constructed of fiberglas and plexiglas, with observation and photographic windows. These tanks are fed continuously with new sea water pumped from a sea-water well (62 feet deep) at the rate of 100 gallons per minute. The water from the well runs 76° F. in the winter and 78° F. in the summer. Each tank is 7×8 feet and 30 inches deep. We have shown that *Tursiops* can be kept at least a year in water no deeper than 22 inches. Associated with these tanks are two plexiglas arms into which the animals can be conducted for detailed observations and experimental procedures. These transparent tanks allow observation of the whole body of the animal, and confine it for the collection of urine, measurement of body temperatures, measurement of respiration, etc. By means of a removable gate between two of the tanks, animals can be transferred back and forth without removing them from the water. Various shipping boxes to allow the animals to be carried in water while on a truck or in an airplane or on board a ship are also available. Various slings, confinement apparatus, and so forth are also available in this laboratory. Facilities also include several tape recorders, hydrophones, air microphones, underwater loud speakers, air loud speakers, amplifiers, and graphical recorders needed in research on the vocalization and the brain activity of these animals. In addition there are rooms for analyses of data, photographic dark room, and so forth. This laboratory also has a small school bus for the transportation of captured animals and for carrying the equipment for field studies in the waters of southeastern Florida.

The laboratory in St. Thomas is larger and more elaborate and its sea water facilities are unique. The island of St. Thomas is in the trade winds belt; the location of the laboratory was chosen so that a constant supply of waves approaches the coast at that point from the southeast. These waves are piled up on a reef outboard from a wave ramp up which the water travels and falls through a gate into a pool. This pool is the residence pool for a future colony of *Tursiops*. It is about 70 feet long, 20 feet wide, and 10 feet deep. The laboratory is built partly over this pool. An elevator carries a water box containing a given animal from the pool into the laboratory. In the dolphin laboratory room it is planned to construct an octagonal tank 8 feet in diameter with plexiglas sides for isolation of an individual or a pair of animals. In addition plexiglas confinement boxes as used in Miami are planned for this laboratory. This laboratory has a large wide aluminum door through which a truck can be backed for delivering of animals directly to the octagonal pool. The carrying boxes will be lifted off the truek, transported across the laboratory on an overhead trolley system for delivery into the main tank outside or for confinement in the dolphin lab. Immediately to the south of this dolphin laboratory is an observation roof from which the behavior of the animals in the pool below can be photographed. Beside this roof there is an eleetronies laboratory and immediately to the south there is a photographic dark room. To the north of the dolphin lab is the immediately adjacent store room and chemistry laboratory. Beside the chemistry laboratory is the histology lab, a shower room, and ward room.

The building is so constructed that several stories can be added at future dates. The present second floor consists of one large room for record analysis and office space. There are three large cisterns for the storage of fresh water and sea water pumps for supplying water to the laboratories upstairs. There is sufficient land owned by the Institute around the laboratory for future expansion and for the construction of housing for the scientific personnel in the future. Immediately southeast of the laboratory is Jersey Bay and south of that the Caribbean Sea. Nearby there are shallow lagoons, reefs, keys, and deep ocean. St. John Island is about 3 miles from the laboratory.

The island of St. Thomas has deep water port facilities and an airport. The town on the island is Charlotte Amalie, the capital of the U. S. Territory of the Virgin Islands.

It is expected that the St. Thomas Laboratory will be in full operation by December 1961.

This laboratory is built with funds from a grant from the National Science Foundation in cooperation with the Office of Naval Research and the Department of Defense. It will be used primarily for research and teaching purposes. Summer student programs have been run for two summers and are expected to continue in 1962. A limited number of graduate students are desired as the staff is expanded. Currently there are 12 employees of the Institute. The Scientific Staff has room for several additional investigators.

THE WAKE FOREST COLLEGE CAMPUS

1.—Reynolda Hall 2.—Library 3.—Wait Chapel 4.—Wingate Hall

Winston and Salem Halls are in the background to the right of the library.

About the Winston-Salem Meeting

The Association of Southeastern Biologists will hold its twenty-third annual meeting April 12-14, 1962, at Wake Forest College, Winston-Salem, North Carolina. This meeting has special significance, since it is the 25th anniversary of the association's founding. Meeting with the ASB this year will be three other organizations: the *Southern Appalachian Botanical Club,* a regional section of *Beta, Beta, Beta,* and the *National Association of Biology Teachers* regional group.

The meetings will commence on Thursday afternoon, April 12, with registration in the lobby of Winston Hall on the Wake Forest College campus. The first general meeting will be held on Thursday night in Wait Chapel, located at the head of the campus plaza, and plans for this program will be announced later.

At the conclusion of this evening meeting, members and guests are invited to the Smoker to be held in the main lounge of Reynolda Hall at the opposite end of the campus plaza. Paper sessions and the annual business meeting will occupy Friday. Friday night's activities include a banquet, retiring presidential address, and presentation of awards. Tentative plans have been made for a joint botanical-zoological field trip Saturday, April 14.

Accommodations

Ample housing space has been reserved at the **Robert E. Lee Hotel**, which is about four miles from the college. Since Winston-Salem is near the heart of the North Carolina furniture industry—and furniture fairs, conventions, etc., are scheduled for this area the week following the ASB meeting, it will be advisable to make reservations before the end of March, 1962. No rooms have been reserved at the other hotel and motels. When writing, use the blank provided or *mention the association.*

Hotels

Robert E. Lee (Cherry and 5th, PA 2-6161, 4 m. South of Campus), 225 rooms reserved, single $5.50-8.75, double $8.00-11.00, twin $9.75-12.50, extra person $2.00.

Carolina—no rooms reserved (407 W. 4th, PA 2-1181, 4 m. South), single $4.00-5.00, double $6.50-7.50, twin $8.00, extra person $2.00.

Motels

Beacon Hill (17 units, 3618 Reynolda Road, Jct. Hwy. 421 and 67, WA 4-2151, 5 m. NW.), single $6.00-7.00, double $10.00, extra person $1.00.

Blue Bird (22 units, Hwy. 52 North, PA 3-9691, 5 m. NE.), single $5.00-6.00, double $9.00, twin $7.00-8.00, extra person $1.00.

Green Valley (16 units, Hwy. 52 North, PA 5-0615, 4 m. NE.), single $7.00, double $12.00, twin $10.00, extra person $1.00.

Howard Johnson's Motor Lodge (82 units, 150 Stratford Rd., Hwy. 158 on the Interstate Expressway, PA 5-7501, 4 m. SW.), single $7.00-9.50, double $12.00, twin $8.50-11.00.

Kembly Inn (82 units, Cloverdale Avenue, Hwy. 158-Interstate Expressway, P.O. Box 5231, PA 5-1305, 4 m. SW.), single $7.00-9.00, double, $9.00, twin $10.00, extra person $1.50.

The Myer-Lee (New Greensboro Rd., Hwy. 421 E.), and Salem Manor (2500 Greensboro Rd. Jct. Hwys. 158-421 E.) are available but are considerable distance from the college. Rates are slightly lower than those quoted above. The Parkway Chalet will be completed by spring (Peters Creek Expressway) and will be five miles south of the campus.

Parking.—The Robert E. Lee Hotel has free overnight parking from 5 p.m. to 9 a.m. A large parking lot adjacent to Winston Hall will be reserved for organizational use, and an extremely large parking area is located behind Wait Chapel and is available to members.

Regarding segregation.—Howard Johnson's Motor Lodge will accommodate Negroes. Other establishments are segregated. It is the policy of the Robert E. Lee Hotel to arrange housing for any Negro requesting it.

Dining.—The Robert E. Lee Hotel and Howard Johnson's Restaurant are non-segregated. K and W Cafeteria near the Robert E. Lee is segregated. There are cafeteria and dining room facilities located in Reynolda Hall on the Wake Forest campus open to all persons; members are invited to dine on the campus if they so desire.

General Information

1. Registration will be Thursday afternoon, April 12, and Friday morning, April 13, in the lobby of Winston Hall.

2. A $1.00 registration fee will be charged.

3. Paper sessions will be scheduled in Winston Hall and nearby Salem Hall.

4. Tickets to the banquet Friday evening, April 13, are to be purchased at the time of registration. The price will be near $3.50.

5. Smith Reynolds Airport is five miles west of the Wake Forest campus and is served by Piedmont Airlines. Better connections may be made, perhaps, using the Greensboro, North Carolina Friendship Airport which is served by a number of major airlines. However, this airport is some 30 miles east of Winston-Salem. Piedmont flies the Greensboro–Winston-Salem route.

Winston-Salem is served by the Southern Railway Co. However, service is admittedly bad or slow except from the northeast. Several bus lines also serve the city.

6. Arrangements are being made to provide guided tours of local points of interest Friday morning and afternoon, April 13, for the wives and families of attending members.

Points of Interest

1. Old Salem—A number of the buildings from this old Moravian settlement have been restored. A fee of $1.50 is charged.

2. Whitaker Park—The world's largest single cigarette factory was completed this fall; tours through the factory are given Monday through Friday. No admission charge.

3. Tanglewood Park.

4. Reynolda Gardens—Lovely gardens on the Reynolda Estate, home of the late R. J. Reynolds. The cherry trees are considered the finest in the country.

Local Arrangements Committee

Members of the local arrangements committee at Wake Forest College are: Dr. C. M. Allen; Dr. H. G. Britt; Dr. E. C. Cocke; Dr. J. E. Davis; Dr. J. F. Dimmick; Dr. R. P. Higgins; Dr. D. W. Johnston; Dr. J. C. McDonald, *Chairman;* Dr. A. T. Olive; and Dr. R. L. Wyatt.

Mary Glide Goethe Travel Awards

For the fifth year there will be funds available through the generosity of Mr. C. M. Goethe for assistance to graduate students for expenses in connection with the annual ASB meetings, to be held this year in Winston-Salem, North Carolina. It is anticipated that most of the awards will be for maintenance (lodging and meals), and departments are urged to provide travel allowances for their graduate students or to invite them to travel in cars with staff members. Some travel allowances may be awarded by the committee to those living most distant from Winston-Salem.

Staff members are requested to call to the attention of qualified students in their respective institutions the availability of these awards. If there is more than one applicant from a department, the Goethe committee may request the department to aid the committee's selection by ranking the applicants.

Any graduate student needing financial assistance in order to attend the 1962 meeting of the Southeastern Biologists is eligible. Rules for making application for the Goethe Awards are as follows:

1. Indicate if application is being made for maintenance or travel or both. Give details, such as total sum requested, how many nights and days are involved, if travel allowance is requested, the number of miles involved and the proposed method of transportation, and any other pertinent information.

2. Give information as to whether or not a paper is being presented by the applicant.

3. In a paragraph, give a brief history of your education to date, of how many years you have been—and plan to be—in graduate school, of your major field or fields of interest, of any publications which have appeared or which may be in preparation, and any other pertinent professional details. Give information on marital status and number of children.

4. Give your source or sources of support while in graduate school such as G.I. Bill, N.S.F., N.I.H., teaching assistantship, etc.

5. Have your major professor or departmental head write a letter supporting your application.

6. Applications and supporting letters, both in triplicate, should be in the hands of *R. B. Short, Dept. of Biological Sciences, Florida State University, Tallahassee, Florida,* by March 1, 1962. Applicants will be notified of the decision of the Committee during March.

COMMITTEE
E. C. Cocke
Joseph O'Kelly
R. B. Short, *Chairman*

Meritorious Award Nominations

As in previous years, an honorarium of $100 has been made available by the Will Corporation of Georgia, to be used as an award for the recognition of especially meritorious teaching by a member of the ASB. The regulations governing the award are as follows:

The recipient must be a member of the ASB in good standing. He should have taught biology in a southern institution for at least ten years, and must be currently teaching. He must not be a dean or have regular administrative duties beyond the department level (this particular criterion requiring interpretation in individual cases). Among evidences of his qualifications is the progress of the candidate as indicated by recognition in his own institution (important assignments and other contributions specifically related to good teaching); and the number and quality of students for whom he provided primarily the inspiration to continue in biology, especially those who later received advanced degrees.

Past recipients of the Meritorious Award for Teaching are as follows:

1952. Dr. Mary Stuart MacDougall (Agnes Scott)
1953. Dr. Orland E. White (Univ. of Virginia)
1954. Dr. Woolford B. Baker (Emory)
1955. Dr. John N. Couch (Univ. of North Carolina)
1956. Dr. Hugo L. Blomquist (Duke)
1957. Dr. Ezda Deviney (Florida State)
1958. Dr. Henry R. Totten (Univ. of North Carolina)
1959. Dr. Margaret Hess (Winthrop College)
1960. Dr. Ora C. Bradbury (Wake Forest College)
1961. Dr. Warren Deacon (Vanderbilt)

In these times in which so much is heard about teaching, it is particularly important that excellence in teaching should be rewarded and publicized in every way possible. Members of the ASB are urged to make nominations and send the needed supporting materials to *C. C. Goodchild, Dept. of Biology, Emory University, Atlanta 22, Georgia,* by April 1, 1962.

COMMITTEE
Harry Wheeler
William J. Koch
C. C. Goodchild, *Chairman*

Association Research Prize

The rules and regulations governing the annual Association Research Prize of $100.00, sponsored by the Carolina Biological Supply Company, Elon College, North Carolina, are as follows:

1. The Research Prize is to be awarded for an especially meritorious paper actually presented at the annual meeting.

2. Only members are eligible to submit papers in competition for the Research Prize. This applies to all names on the submitted paper.

3. Papers submitted in competition may be in press but must not have been published prior to March 1 of the year of the current competition.

4. Judges will be eminent biologists outside the Southeast. They will set their own criteria, and may withhold the award if no paper is judged to have sufficient merit.

5. Papers must be submitted *in triplicate* and in their entirety not later than March 1, 1962, to *Charles Jenner, Dept. of Zoology, University of North Carolina, Chapel Hill, N. C.* One copy of the prize-winning paper will remain in the ASB files, but all other copies will be returned to the authors as soon as possible.

6. Announcement of the winner of the Research Prize will be made at the annual meeting.

Phipps and Bird Research Fellowship

A Research Fellowship of $150.00 for summer research at Mountain Lake Biological Station of the University of Virginia has been continued through the generosity of the Phipps and Bird Company of Richmond, Virginia.. Any member of the Association may submit an application. The application should be accompanied by a summary of the planned work, by a list of important publications, and, especially in the case of younger workers, by references and educational data. Applications should be sent to *Charles Jenner, Dept. of Zoology, University of North Carolina, Chapel Hill, N. C.*, not later than April 1, 1962. The selection will be made by the Research and Awards Committee of the ASB in consultation with the Director of the Mountain Lake Biological Station. The announcement of the recipient will be made at the annual meeting of the ASB.

COMMITTEE
Alan Conger
Victor Cutter
Charles Jenner, *Chairman*

IMPORTANT DEADLINES

Please note the following deadlines, all of which are to be met before our Twenty-third Annual Meeting at Wake Forest College, Winston-Salem, N. C., April 12-14, 1962. Members can help facilitate plans for the meeting by sending in all requested material as far in advance of the deadlines as possible. Because the time available for preparation of the program and publication of abstracts is already at a minimum it will be necessary for the program committee and the editor to adhere strictly to the deadline set; NO TITLES CAN BE ACCEPTED THEREAFTER.

January 15—Suggestions for nominations for ASB officers and executive committee members.

February 10—Titles and abstracts of papers to be presented at the Wake Forest meeting.

March 1—Applications for Goethe Awards to graduate students.

March 1—Papers to be considered for the Association Research Prize.

April 1—Applications for Phipps and Bird Research Fellowship at Mountain Lake.

April 1—Nomination letters for the Meritorious Award for Teaching.

Because of certain restrictions placed on applications and forms mailed at second-class postage rates, those forms usually included in the January ASB Bulletin that pertain to the April meeting were mailed to ASB members early in January. For your convenience, however, the deadlines which must be met before the April meeting are reprinted above.

DIRECTORY OF ASB MEMBERS

The following directory is, to the best of our knowledge, correct as of 1 November 1961. Because some mistakes invariably find their way into listings such as this, the Editor would greatly appreciate it if members who note omissions and mistakes would call them to his attention.

Alphabetical List

A

ABEGG, ROLAND, Dept. of Zoology, Louisiana Polytechnic Institute, Ruston, La.

ADAMS, JOSEPH E., Dept. of Botany, Univ. of Narth Carolina, Chapel Hill, N. C.

ADAMS, WILLIAM H., JR., Rt. 2, Box 26, Madisonville, Tenn.

ADLER, HOWARD I., Biolagy Div., Oak Ridge National Laboratory, Box Y, Oak Ridge, Tenn.

AHLES, HARRY E., Dept. af Batany, Univ. of North Carolina, Chapel Hill, N. C.

ALAMUDDEEN, M. ADNAN, Dept. of Biology, Appalachian State Teachers College, Boone, N. C.

ALAMUDDEEN, MOHAMMED ADNEN, Dept. of Biology, Virginia Polytechnic Institute, Blacksburg, Va.

ALLEN, J. FRANCES, 5702 Queens Chapel Rd., West Hyattsville, Md.

AMBROSE, III, HARRISON W., Dept. of Zoology, Univ. of Kentucky, Lexington, Ky.

AMY, ROBERT L., Dept. of Biology, Southwestern Univ., Memphis 12, Tenn.

ANDERSON, DONALD BENTON, Consolidated University Bldg., Chapel Hill, N. C.

ANDERSON, LEWIS EDWARD, Dept. of Botany, Duke Univ., Durham, N. C.

ANDERSON, NORMAN GULACK, Biology Div., Oak Ridge National Lab., Oak Ridge, Tenn.

ANDERSON, JR., WILLIAM D., Dept. of Biology, Univ. of South Carolina, Columbia, S. C.

ANDERTON, LAURA G., Dept. af Biology, Woman's College, Univ. af North Carolina, Greensbora, N. C.

ARATA, ANDREW A., Dept. of Biology, Univ. of Florida, Gainesville, Fla.

ARNETT, GUSSIE, Southern Research Institute, 2000 Ninth Ave., S., Birmingham 5. Ala.

ARNOLD, JOHN G., Dept. of Med. Technology, Loyola Univ., New Orleans 18, La.

ASHBY, WILLIAM C., Dept. of Botany, Southern Illinois Univ., Carbondale, Ill.

ASHWORTH, RALPH P., Dept. of Botany, Clemson College, Clemson, S. C.

AUFFENBERG, WALTER, AIBS Biol. Sciences Curriculum Study, Univ. of Colorado, Boulder, Colo.

B

BABCOCK, MURIEL B., Dept. of Biology, Univ. of Virginia, Charlottesville, Va.

BADENHOP, KATHLEEN W., 1-B Lavelle Rd., Bangalore 1, India

BAER, CHARLES H., Dept. of Biology, West Virginia Univ.. Morgantown, W. Va.

BAGDON, VINCENT J., 405 Wellington Rd., Hollin Hall Village, Alexandria, Va.

BAILEY, DONALD WYCOFF, Tift College, Forsyth, Ga.

BAILEY, PAUL C., Dept. of Biology, Alabama College, Montevallo, Ala.

BAKER, CLINTON L., Dept. of Biolagy, Southwestern Coll., Memphis 12, Tenn.

BAKER, MARJORIE DILLMAN, Box 369, Sub-Sta. B, Vanderbilt Univ., Nashville 5, Tenn.

BAKER, WOOLFORD B., Dept. of Biology, Emory Univ., Atlanta 22, Ga.

BALL, CARROLL RAYBOURNE, Dept. of Biology, Mississippi Southern College, Hattiesburg, Miss.

BALLARD, CHARLES L., Dept. of Biolagy, Xavier Univ., New Orleans 25, La.

BALL, ERNEST, Dept. of Batany, North Carolina State College, Raleigh, N. C.

BAMFORD, RONALD, Graduate Office, Univ. of Maryland, College Park, Md.

BAMFORTH, STUART S., Dept. of Zoalogy, Newcomb College, Tulane University, New Orleans 18, La.

BARBOUR, ROGER W., Dept. of Zaalogy, Univ. of Kentucky, Lexington 29, Ky.

BARCLAY, FRANK H., Dept. of Biology, East Tennessee State College, Johnson City, Tenn.

BARKER, JOHN G., Dept. of Biology, Radford College, Radford, Va.

BARNES, ROBERT L., Dept. of Botany, Duke Univ., Durham, N. C.

BARR, JR., THOMAS C., Dept. of Zoology, Univ. of Kentucky, Lexington, Ky.

BARRINGTON, JR., BURNESS A., Dept. of Biology, King College, Bristol, Tenn.

BATSON, JACKIE D., Birmingham-Southern College, Birmingham 4, Ala.

BATSON, WADE T., Dept. of Biology, Univ. of South Carolina, Columbia, S. C.

BEAL, ERNEST O., Dept. of Batany, North Carolina State College, Raleigh, N. C.

BEARD, ELIZABETH L., Dept. af Biology, Loyola Univ., New Orleans, La.

BEARDEN, MARY W., Claiborn Towers, Apt. 822, New Orleans, La.

BEATTY, ALVIN V., Dept. of Biology, Emory Univ., Atlanta 22, Ga.

BEATTY, JEANNE W., Bax 22, Emory Univ., Atlanta 22, Ga.

BECK, EDWIN G., Dept. of Botany, Univ. af Georgia, Athens, Ga.

BEHRE, ELLINOR H., Black Mauntain, N. C.

BELCHER, JANE C., Sweet Briar College, Sweet Briar, Va.

BELL, C. RITCHIE, Dept. of Botany, Univ. of North Carolina, Chapel Hill, N. C.

BELL, FRANCES, Dept. of Bialogy, Univ. of Alabama, Tuscaloosa, Ala.

BENNETT, CARRIE F., 625 N. E. 1st St., Gainesville, Fla.

BENNETT, HARRY J., Dept. of Zoalogy, Louisiana State Univ., Baton Rouge 3, La.

BENNETT, HERALD D., West Virginia Univ., Margantown, W. Va.

BERKELEY, EDMUND, 500 Waadland Drive, Greensboro, N. C.

BERNER, LEWIS, Dept. af Bialogy, Univ. of Florida, Gainesville, Fla.

BICKLEY, WILLIAM E., Dept. of Entomology, Univ. of Maryland, College Park, Md.

BISHOP, JR., EVERETT L., Box 2047, University, Ala.

BLACK, ZOE WELLS C., 1202 Prince Edward Street, Fredericksburg, Va.

BLAIR, JR., CHARLES B., Dept. of Anatomy, Emory Univ., Atlanta 22, Ga.

BLAKE, JOHN WILSON, 223 Norfalk St., Wollaston 70, Mass.

BLANK, GRACE J., 416 W. Franklin St., Richmond 20, Va.

BLOMQUIST, HUGO L., Dept. of Botany, Duke Univ., Durham, N. C.

BOATMAN, ANITA B., Dept. af Biology, Emory Univ., Atlanta 22, Ga.

BODENSTEIN, DIETRICH H. F. A., Dept. of Biology, Univ. of Virginia, Charlottesville, Va.

BOEHMS, CHARLES N., Dept. af Biology, Austin Peay State College, Clarksville, Tenn.

BOGITSH, BURTON J., Dept. of Biology, Georgia Southern College, Collegeboro, Ga.

BOLIEK, MILDRED I., Box 994, Florida State Univ., Tallahassee, Fla.

BOND, LORA, Dept. of Biology, Drury College, Springfield 2, Mo.

BOOKHOUT, CAZLYN G., Dept. of Zoology, Duke Univ., Durham, N. C.

BOOLE, JR., JOHN ALLEN, Div. of Science & Mathematics, Georgia Southern College, Statesboro, Ga.

BORROR, ARTHUR C., Audubon Camp, Medomak, Maine.

BOSCHUNG, JR., HERBERT T., Dept. af Biology, Univ. of Alabama, University, Ala.

BOUDREAUX, H. BRUCE, Dept. of Zoolagy, Louisiana State Univ., Baton Rouge, La.

BOVEE, EUGENE C., Dept. of Biology, Univ. of Florida, Gainesville, Fla.

BOWLING, AGNES, Futlon High School, Knoxville, Tenn.

BOYCE, STEPHEN G., 1402 W. Walnut St., Carbondale, Ill.

BOYD, GEORGE H., Dept. of Zoology, Univ. of Georgia, Athens, Ga.

BOYLES, JAMES, Univ. of Alabama Mobile Center, Mobile, Ala.

BOZEMAN, J. R., Dept. of Botany, Univ. of N. C., Chapel Hill, N. C.

BRADBURY, ORA C., Box 7224, Reynalds Station, Winston-Salem, N. C.

BRITT, HENRY GRADY, Box 7223, College Sta., Winston-Salem, N. C.

BRANDOM, WILLIAM FRANKLIN, Dept. of Zoalogy, Newcomb Callege, Tulane Univ., New Orleans 18, La.

BRANNON, MARY JANE, Dept. of Biolagy, Huntingdon Callege, Montgamery, Ala.

BRAUER, ALFRED, Dept. af Zaology, Univ. af Kentucky, Lexington, Ky.

BREEN, RUTH S., Dept. af Bialogical Sciences, Flarida State Univ., Tallahassee, Fla.

BRIDGMAN, ANNA JOSEPHINE, Dept. of Biology, Agnes Scott Callege, Decatur, Ga.

BRILLHART, W. E., Dept. of Biology, Emary Univ., Atlanta 22, Ga.

BROOKBANK, JOHN W., Dept. of Biology, Univ. of Flarida, Gainesville, Fla.

BROWN, ELMER E., Dept. of Biolagy, Davidson College, Davidson, N. C.

BROWN, GEORGE G., Dept. of Biology, Virginia Polytechnic Institute, Blacksburg, Va.

BROWN, HARRY DARROW, 1501 North Main St., Edwardsville, Ill.

BROWN, JACK S., Dept. af Biolagy, Emory & Henry College, Emory, Va.

BROWN, JOSHUA R. C., Dept. of Zoalogy, Univ. of Maryland, College Park, Md.

BROWN, RELIS B., Dept. af Biological Sciences, Florida State Univ., Tallahassee, Fla.

BROWN, THOMAS D., Dept. of Bialogy, Erskine College, Due West, S. C.

BROWN, JR., EDWARD T., Dept. of Botany, Univ. of Kentucky, Lexingtan, Ky.

BRUMFIELD, ROBERT T., Dept. of Biology, Longwood College, Farmville, Va.

BRYAN, VIRGINIA S., 2118 W. Club Blvd., Durham, N. C.

BRYDEN, ROBERT R., Guilford College, N. C.

BURBANCK, WILLIAM D., Box 834, Emory Univ., Atlanta 22, Ga.

BURK, CARL JOHN, Dept. of Botany, Smith College, Northampton, Mass.

BURLINGHAM, GEORGE KENNETH, 304B Chemistry Bldg., Univ. of South Florida, Tampa, Fla.

BURNS, ROBERT E., Georgia Experiment Station, Experiment, Ga.

BUSH, FRANCIS M., Dept. of Biolagy, Howard College, Birmingham, Ala.

BYRD, ELON E., Dept. of Zoology, Univ. of Georgia, Athens, Ga.

BYRD, MITCHELL A., Dept. of Biology, College of William and Mary, Williamsburg, Va.

WILLIAMSON, DOUGLAS, Dept. of Biology, Oglethorpe Univ., Ga.

WILLIS, JEANNE, Dept. of Biology, Otterbein College, Westerville, Ohio

WILLS, CAMILLA L., 1601 Grady Ave., Charlottesville, Va.

WILLS, WIRT H., Box 430, Chatham, Va.

WILSON, H. ROOMIE, Box 642, College Station, Hammond, La.

WILSON, IRL DONAKER, Dept. of Biology, Virginia Polytechnic Institute, Blacksburg, Va.

WILSON, JAMES LESTER, Div. of Science & Mathematics, Belmont College, Nashville 5, Tenn.

WILSON, W., Dept. of Science, Troy Stote College, Troy, Ala.

WILTON, CHRISTINE, East Carolina College, Greenville, N. C.

WILTSHIRE, GRACE T., Dept. of Biolagy, Randolph-Macon Woman's College, Lynchburg, Va.

WINCHESTER, ALBERT M., Dept. of Biology, Stetson Univ., DeLand, Fla.

WISER, CYRUS W., Dept. of Biology, Midde Tennessee State Coll., Murfreesboro, Tenn.

WITHERSPOON, JR., JOHN P., Dept. of Botany, Univ. of Tennessee, Knoxville, Tenn.

WOLCOTT, GORDON B., Dept., of Biology, Southwestern Univ., Georgetown, Tex.

WOLF, F. A., Dept. of Botany, Duke Univ., Durham, N. C.

WOLF, FREDERICK T., Dept. of Biology, Vanderbilt Univ., Nashville, Tenn.

WOLFSON, ALFRED M., Box 1229, College Station, Murroy, Ky.

WOOD, JR., CARROLL E., Harvard University Herbarium, 22 Divinity Avenue, Cambridge 38, Mass.

WOOD, JR., FORREST G., Marine Studios, Marineland, St. Augustine, Fla.

WOOD, JOHN THORNTON, 1528 Greenview Dr., Ann Arbor, Mich.

WOODMANSEE, ROBERT A., Dept. of Biology, Mississippi Southern College, Hottiesburg, Miss.

WOODS, FRANK W., School of Forestry, Duke Univ., Durham, N. C.

WOOLEVER, JOHN DOUGLAS, 2250 Worthington Dr., Sarasota, Fla.

Y

YOW, FRANCIS WAGONER, Dept. of Biology, Kenyon College, Gambier, Ohio

YANCEY, PATRICK H., Dept. of Biology, Spring Hill College, Mobile, Ala.

YARBROUGH, JAMES D., Univ. of Alabama, University, Ala.

YARBROUGH, JOHN A., Meredith College, Raleigh, N. C.

YATES, BERNARD H., 262 Techwood Dr., Atlanta 13, Ga.

YATES, HARRIS OLIVER, 1824 Shackleford Rd., Nashville, Tenn.

YERBY, ELEANOR GAIL, Southern Research Institute, 2000 Ninth Ave., S., Birmingham 5, Alo.

YERGER, RALPH, Dept. of Biological Sciences, Florida State Univ., Tallahassee, Flo.

YOKLEY, JR., PAUL, Dept. of Biology, Florence State University, Florence, Ala.

YOUNG, MARTIN D., Lab. of Parasitic Chemotherapy, NIAID, National Institutes of Health, Bethesda 14, Md.

Z

ZAGER, RHONA D., Dept. of Biology, Vanderbilt Univ., Nashville 5, Tenn.

ZIEGLER, ARTHUR W., Dept. of Botany, Florida State Univ., Tallahassee, Fla.

ZIPF, ELIZABETH M., 316 Kingston Ave., Barrington, N. J.

ZIRK, MARILYN, Dept. of Zool. & Entomology, Univ. of Tennessee, Knoxville, Tenn.

Geographical List

Alabama: Arnett, G.; Bailey, P. C.; Batson, J. D.; Bell, F.; Bishop, Jr., E.; Boschung, Jr., H. T.; Boyles, J.; Brannon, M. J.; Cantrell, J. W.; Cotter, D. J.; Diener, U. L.; Dietz, R. B.; Doster, C. S.; Dykes, D. J.; Edwards, J.; Fincher, J. A.; Fleming, H. W.; Guest, W. C.; Harper, R. M.; Holland, Jr., J. W.; Ivey, W. D.; Johnson, E. I.; Kangelos, M.; Kelley, C.; Krizek, D. T.; Londe, R. L.; McCullough, H. A.; McLaughlin, W. D.; Mechan, J. S.; Maore, J. H.; Morris, E. D.; Mount, R. H.; O'Kelley, J. C.; Ottis, K.; Padgett, C. A.; Patton, E. G.; Raulerson, C. L.; Smith, S.; Swagler, M. J.; Taylor, L. W.; Thomson, R.; Trogdon, R. P.; Turner, H. F.; Tyler, D. L.; Viccars, M.; Waldrep, M. J.; Widdowson, D. C.; Wilson, W.; Yancey, P. H.; Yarbrough, J. D.; Yerby, E. G.; Yokley, Jr., P.

Arkansos: Moore, J. E.

California: Caldwell, D. K.; Goethe, C. M.; Henry, L. M.; Jones, W. H.; Lee, H.; Meyer, S. L.; Powell, Jr., R. W.

Colorado: Auffenberg, W.; Grobman, A. B.

Connecticut: Mickey, G. H.; Rex, A. D.

District of Columbia: Cherrie, A. L.; Dowling, P. B.; Hale, Jr., M. E.; Leisner, R. S.; Parker, D. R.; Reynolds, O. E.; Stevens, R. B.; Taylor, R. L.

Florida: Arata, A. A.; Bennett, C. F.; Berner, L.; Boliek, M. I.; Bovee, E. C.; Breen, R. S.; Brookbank, J. W.; Brown, R. B.; Burlingham, G. K.; Cole, C. F.; Conger, A. D.; Damian, R. T.; Davis, Jr., J. H.; De Busk, A. G.; DeWitt, R. M.; Dickinson, Jr., J. C.; Easton, D. M.; Edington, C. W.; Ellias, L. C.; Field, H. M.; Ford, E. S.; Friedl, F. E.; Frye, Jr., O. E.; Fuller, D. L.; Funderburg, Jr., J. B.; Gilbert, M. L.; Gilman, L. C.; Godfrey, R. K.; Goin, C. J.; Gordon, D. P.; Gregg, J. H.; Hetrick, L. A.; Holliman, R. B.; Hood, M. N.; Ingie, R. M.; Jackson, Jr., C. G.; Jones, Jr., E. R.; Keitt, Jr., G. W.; Kilby, J. D.; Kiser, R. S.; Krivanek, R. C.; Kruse, D. N.; Kurz, H.; Lackey, J. B.; Laessle, A. M.; Latina, A. A.; Layne, J. N.; Leigh, W. H.; Liston, R. H.; MacInnis, A. J.; Madsen, G. C.; Martin, E. P.; McCoy, J. J.; McCrone, J. D.; McFadden, S. E.; McNulty, J. K.; Menzel, M. Y.; Menzel, R. W.; Meyers, S. P.; Mitchill, R. D.; Moewus, L.; Monk, C. D.; Montgamery, J. G.; Mullins, J. T.; Nelson, Jr., G. E.; Nez, M. M.; Noggle, G. R.; Oglesby, L. C.; Pates, A L.; Perry, R.; Phillips, R. C.; Pierce, E. L.; Poitras, A. W.; Powell, R. D.; Prichard, E. C.; Redmond, J. R.; Reed, C. T.; Reid, Jr., G. K.; Reynolds, J. P.; Richardson, G. M.; Riemer, W. J.; Sagawa, Y.; Schwartz, A.; Shanor, L.; Sherman, H. B.; Short, R. B.; Sivik, F. P.; Smith, F. G. W.; Stone, Jr., W. M.; Summerlin, II, L. R.; Taylor, J. L.; Taylor, S. E.; Vestal, P. A.;

Vilar-Alvarez, C. M.; Waldarf, G. W.; Wallace, H. K.; West, E.; Westfall, Jr., M. J.; Williams, R. H.; Winchester, A. M.; Waad, Jr., F. G.; Waalever, J. D.; Yerger, R.; Ziegler, A. W.

Geargia: Bailey, D. W.; Baker, W. B.; Beatty, A. V.; Beatty, J. W.; Beck, E. G.; Blair, Jr., C. B.; Baatman, A. B.; Bagitsh, B. J.; Baale, Jr., J. A.; Bayd, G. H.; Bridgman, A. J.; Brillhart, W. E.; Burbanck, W. D.; Burns, R. E.; Bush, F. M.; Byrd, E. E.; Carlyan, W. M.; Carter, M. E.; Carver, G. L.; Ciardia, H.; Clement, A. C.; Cahen, A. L.; Caleman, M. T.; Cannell, C. E.; Casgrave, W. B.; Cawie, L. M.; Daniel, C. P.; Davis, Jr., H. L.; Dennis, E. S.; Dentan, J. F.; Daerpinghaus, S. L.; Duncan, W. H.; Edwards, B. F.; Farrar, L. L.; Fattig, W. D.; Fincher, E. L.; Forester, H. B.; Foster, A. A.; Galley, F. B.; Gaadchild, C. G.; Gray, S.; Gray, S. W.; Graseclase, N. P.; Hancack, K. F.; Harry, M. F. S.; Haynes, C. T.; Hintan, C. W.; Hawe, Jr., H. B.; Humphries, Jr., A. A.; Hunt, E. L.; James, C. W.; Jahnsan, Jr., J. R.; Jahnson, M. J.; Jahnsan, R. M.; Kamine, A. B.; Keeler, C. E.; Kethley, T. W.; Kimsey, B. A.; Kuipers, C. J.; Landt, J. F.; Lipps, E. L.; Lund, H. O.; MacDaugall, M. S.; Matthews, J. F.; McCarmick, J. F.; McGhee, R. B.; McGinnis, J. T.; Michel, B. E.; Murdy, W. H.; Nevins, B.; Nunan, R. W.; Nuttycambe, J. W.; Oakersan, D. M.; Odum, E. P.; Parrish, F. K.; Parrish, J. W.; Plummer, G. L.; Platt, R. B.; Prava, M. M.; Ramsey, R. L.; Ray, Jr., C.; Redmand, W. B.; Reed, Jr., H. B.; Reiber, R. J.; Sawyer, E. L.; Schelske, C. L.; Scatt, D. C.; Shibley, J. L.; Slentz, R. B.; Spaaner, J. D.; Stirewalt, H. L.; Thamas, G. J.; Totter, J. R.; Van Eseltine, W. P.; Vaigt, C. A.; Webb, K. L.; Weeks, L.; Westfall, J. J.; Williamsan, D.; Yates, B. H.

Hawaii: Regan, J. D.; Tratt, L. B.

Illinais: Ashby, W. C.; Bayce, S. G.; Brawn, H. D.; Lauter, F. H.; Smith, D. M.; Stern, D. H.; Whiteside, W. C.

Indiana: Gardan, R. E.; Haman, J. H.; Wells, M. M.

Iawa: Tharne, R. F.

Kansas: Hughes, III, G. C.; Hughes, M. R.; Shaw, E. I.

Kentucky: Ambrase, III, H. W.; Barbaur, R. W.; Barr, Jr., T. C.; Brauer, A.; Brawne, Jr., E. T.; Carpenter, J. M.; Caok, E. W.; Henricksan, C. E.; Knisely, W.; Kuehne, R. A.; Narris, W. W.; Riley, H. P.; Seta, F.; Shadawen, H. E.; Wallwark, J. A.; Whartan, M. E.; Walfsan, A. M.

Lauisiana: Abegg, R.; Arnald, J. G.; Ballard, C. L.; Bamfarth, S. S.; Beard, E. L.; Bearden, M. W.; Bennett, H. J.; Baudreaux, H. B.; Brandam, W. F.; Cagle, F. R.; Cavanaugh, C. J.; Chiltan, S. J. P.; Cambs, R. M.; Canner, G. W.; Capeland, D. E.; Davis, L. V.; Deiler, F. G.; Dicksan, W.; Dundee, D. S.; Dundee, H. A.; Eggler, W. A.; English, D.; Erwin, W. G.; Faust, III, C. C.; Fingerman, M.; Fitzpatrick, Jr., J. F.; Flint, L. H.; Franklin, B. C.; Frederick, L.; Gallagher, J. J.; Garth, R. E.; Genavese, M. A.; Gass, R. C.; Gaugh, B. J.; Gawland, W. D.; Graham, L. T.; Gunning, G. E.; Harrisan, J. L.; Hathaway, E. S.; Hendersan, V.; Hunter, F. R.; Iglinsky, Jr., W.; Jacksan, R. T.; Jones, C. L.; Kelly, R. W.; Kent, Jr., G. C.; Kilgare, S. S.; King, M. M.; Kordisch, M. F.; Lafleur, R. A.; Levy, H. N.; Lewis, L. I.; Lawery, G. H.; Lawy, B.; Marlaw, G.; Martinez, Jr., I. R.; Mayer, T. C.; McAlister, L. A.; McCrane, J.; Miller, F. S.; Miller, Jr., J. A.; Mizell, M.; Mabberly, Jr., W. C.; Maare, W. G.; Mareland, C. F.; Mullahy, J. H.; Nagabhushanam, R.; Nesam, R. Y.; Newman, R. J.; Narden, C. R.; Outland, R. H.; Palmer, M. E.; Penn, G. H.; Reese, W. D.; Raddy, L. R.; Sacca, P.; Sawyer, R. L.; Scheu, C. C.; Seamster, A. P.; Sears, D. F.; Simmons, S.; Simpsan, Jr., S. B.; Sims, Jr., A. C.; Smalley, A. E.; Sagandares-Besnal, F.; Stiff, III, H. L.; Stane, D. E.; Suttkus, R. D.; Valpe, E. P.; Ware, G. H.; Warters, M.; Wascam, E. R.; Weathersby, S. M.; Welden, A. L.; Wheeler, H. E.; White, G. V. S.; Wilsan, H. R.

Maine: Barrar, A. C.

Maryland: Allen, J. F.; Bamford, R.; Bickley, W. E.; Brawn, J. R. C.; Carriker, M. R.; Estes, E. E.; Isanagle, I. T.; Kerschner, J.; Knight, Jr., R. J.; Mahler, J. D.; Pravenza, D. V.; Schipper, A. L.; Sturdivant, H. P.; Terrell, E. E.; Walker, A. A.; Yaung, M. D.

Massachusetts: Blake, J. W.; Burk, C. J.; Smith, J. L.; Wagner, A.; Waad, Jr., C. E.

L.; Runk, B. F. D.; Scott, W. W.; Shields, A. R.; Shawalter, A. M.; Siegel, P. B.; Silliman, F. E.; Singletan, W. R.; Smart, R. F.; Somerville, Jr., A. M.; Sprague, E. F.; Sprugel, Jr., G.; Starling, J. H.; Stewart, B. J.; Stevens, K. P.; Strickand, Jr., J. C.; Thampson, Jr., J. C.; Townsend, J. I.; Walker, P. A.; Waltan, L.; Wass, M. L.; Weiler, H. F.; Wells, O. C.; West, W. R.; White, O. E.; Wills, C. L.; Wills, W. H.; Wilson, I. D.; Wiltshire, G. T.

Washington: King, C. E.; Lewis, Jr., P. D.; Narby, D. E.

West Virginia: Baer, C. H.; Bennett, H. D.; Clarkson, R. B.; Care, E. L.; Creasy, W. D.; McNeill, E. M.; Mantiebel, E. C.; Weimer, B. R.

Foreign: *Canada*—Clark, G. M.; Evans, W. G.; Hawden, H. F.; Rebuck, A. *Costa Rica*—Hunter, III, G. W. *England*—Hathaway, R. R. *Ghana*—Whatley, B. T. *India*—Badenhap, K. W. *Puerto Rico*—Behre, E. H.; Cochran, A. B. *Sweden*—Eisen, J. D.

Libraries: Alabama Palytech Institute, Auburn, Ala.; Clemson College, Clemsan, S. C.; Duke Univ., Durham, N. C.; Emory Univ., Atlonta, Ga.; Florida State Univ., Tallahassee, Fla.; Highland Bialagical Labaratary, Highlands, N. C.; Iawa State College, Ames, Iawa; Louisiana State Univ., Baton Rauge, La.; Mauntain Lake Biolagical Statian, Mauntain Lake, Va.; Narth Carolina State College, Raleigh, N. C.; Ohia State Univ., Columbus, Ohia; Sauthern Methadist Univ., Dallas, Tex.; Univ. af Alabama, University, Ala.; Univ. af Florida, Gainesville, Fla.; Univ. af Haustan, Haustan 4, Tex.; Univ. af Illinois, Urbana, Ill.; Univ. af Kentucky, Lexington, Ky.; Univ. af Miami, Coral Gables, Fla.; Univ. of Texas, Austin, Tex.; U. S. Atomic Energy Commissian, Oak Ridge, Tenn.; U. S. Dept. af Agriculture, Washingtan, D. C.

Miscellaneous: Carolina Bialagical Supply Co., Elan College, N. C.; Lindstahls Lilla Baklada, Birgen Jarlsgatan 102, Stackholm, Sweden; Oak Ridge Institute af Nuclear Studies, Midway Warehause Na. 2, Oak Ridge, Tenn.; Walter Drey Assaciates, 257 Faurth Ave., New York 10, N. Y.; Will Corp. of Geargia, Atlanta, Ga.

PERCY VIOSCA, JR.

1892-1961

Percy Viasca, Jr., internatianally known Lauisiana naturalist, died Sunday, August 29, 1961, fallawing a pralanged illness. At the time af his death he was marine bialagist far the Lauisiana Wildlife and Fisheries Cammissian.

Viasca really started his bialagical career as a bay, but made it farmal when he received the B.S. and M.S. degrees fram Tulane University in 1913 and 1915 respectively.

His interests and varied contributions ta bialagical science easily rank him as ane af America's last great naturalists. He was widely recagnized as an authority an amphibians, reptiles, shrimp, crawfish, aysters, fish, masquitaes, and wild flawers (particularly Lauisiana irises). His publicatians, bath technical and popular, numbering close to 100, not only mirror his knawledge and abservations of his "special" animals and plants, but alsa diverse other animals and situatians such as millipedes, water pallution, snails, spontaneaus combustion in marshes, freshwater medusae, biageagraphy, leaf-cutting ants, crabs, and teaching af bialagy. In additian he wrate twa baaks: *Louisiana Out-of-Doors* (1933) and *Pondfish Culture* (1937).

In the caurse af his life Viasca was emplayed in many capacities; perhaps this diversity stimulated his curiasity with such a vast array of organisms. Priar ta, and during his callege years, he was a cammercial fisherman. At Tulane he was an undergraduate assistant and then graduate assistant (1911-

1916). In 1915 he organized and became president of the Southern Biological Supply Co.; also, in the same year he was appointed curator of reptiles, amphibians, and fishes at the Louisiana State Museum. In 1917 he added to these activities the duties of biologist for the Louisiana Department of Conservation. This association with the state lasted until his death, although it was never permanent; he was in-and-out depending upon the turbulence of Louisiana politics. From 1923 to 1926 he was an instructor at Tulane, and overlapping this period he was entomologist for the New Orleans Board of Health. In 1939 he conceived, organized, and directed his second commercial venture, Ganivory Crafts, in which costume jewelry was manufactured using garfish scales. For a few years he was an independent consulting biologist working mostly for industries in Louisiana having water pollution problems.

His ability was acclaimed a number of times, starting with initiation into Phi Beta Kappa at Tulane. Viosca was elected a Fellow of the AAAS (1924); vice-president of the American Society of Ichthyologists and Herpetologists in 1939; vice-president (1947) and president (1948) of the Louisiana Academy of Sciences; and, president of the New Orleans Botanical Society in 1955. His latest honors came in 1961 when he was named "Conservationist of the Year" by the Louisiana Outdoors Writing Association, and shortly before his death "Tulane Biologist of the Year."

To commemorate this great, kindly, and unassuming man, a special issue of *Tulane Studies in Zoology* will be dedicated shortly to Percy Viosca, Jr.—naturalist. He will long be remembered.

PERCY VIOSCA, JR.

News of Biology in the Southeast

About People

George Ware, Northwestern State College, Natchitoches, Louisiana, taught a course in plant ecology at the University of Oklahoma Biological Station during the summer. He also collected plants on numerous sandbars of the Red River westward to its headwaters.

Marilyn Stewart and **Billie Slatten**, undergraduates in the Department of Bacteriology, Northwestern State College, Natchitoches, Louisiana, have received an undergraduate research grant from the Louisiana Heart Association to study the serum and glycoprotein fractions of bovine serum during gestation. Dr. E. K. Sobers will direct the project.

Rene J. Bienvenu, Northwestern State College, Natchitoches, Louisiana, has received a Senior Research Grant from the Louisiana Heart Association to study the rate of magnesium absorption into the circulatory system, and its effect upon brucellacidal activity in serum.

Glenda Jo Walters, Northwestern State College, Natchitoches, Louisiana, undergraduate biology major, received an undergraduate research grant from the Louisiana Heart Association to study the effects of activity on sarcosome size in house flies.

Jesse C. Thompson, Jr., Department of Biology, Hollins College, spent ten weeks at the Virginia Fisheries Laboratory, Gloucester Point, Virginia, doing research on marine ciliates, under a grant from the NSF. In August, Dr. Thompson presented a paper at the First International Conference on Protozoology in Prague, Czechoslovakia. Afterwards, he visited laboratories in Hungary, Italy, France, and England.

The honorary degree of Doctor of Science was conferred on **Thelma Howell**, Executive Director, Highlands Biological Station, by North Carolina State College at its May Commencement.

William H. Adams, Jr., Associate Professor of Biology since joining the faculty in 1960, has been appointed Chairman of the Department and Professor of Biology at Tennessee Wesleyan College effective September 1, 1961.

Thomas C. Barr, Jr. and **Robert A. Kuehne** of the Department of Zoology, University of Kentucky, recently

received a 2-year grant of $31,300 from the National Science Foundation for support of research entitled "Ecology of the Cave Community."

J. M. Carpenter, Head, Department of Zoology, University of Kentucky has received a one year grant of $2,300 from the National Institutes of Health for a study of the "Nutritive Effects of Various Yeast Species on Reproductive Potential in *Drosophila*."

Roger W. Barbour recently received $6,590 for a renewal of his research contract with the National Institutes of Health for "A Traffic Survey of *Microtus ochrogaster* Runways."

A. C. Clement, Department of Biology, Emory University, has been named to the American Tables Committee for the Naples Zoological Section.

John E. Simmons has been appointed Assistant Professor of Biology at Emory University.

W. B. Baker has retired from the Department of Biology at Emory University, but continues with the University as Director of the Museum. Dr. Baker is a former recipient of the ASB's Meritorious Award for Teaching.

Charles Ray, Jr. and **W. D. Burbanck,** Department of Biology, Emory University, presented papers at the First International Conference on Protozoology in Prague, Czechoslovakia, which met from August 21-31, 1961.

C. G. Goodchild, Department of Biology, Emory University, has been elected a member of a Committee for International Centers of Medical Research and Training, National Institutes of Health.

Robert B. Platt and a group of graduate students of the Department of Biology at Emory University presented papers on their research in radiation effects on ecological systems to the First National Symposium in Radioecology at Ft. Collins, Colorado, in September, 1961.

Robert B. Platt, Emory University, has received an AEC grant of $143,000 for studies in radiation ecology.

O. Henry has recently rejoined the faculty of Newberry College as Assistant Professor of Biology after a year's absence for continued graduate work. He expects to complete his doctorate in the near future.

B. L. Ridley has joined the staff of Louisiana Polytechnic Institute as Associate Professor of Zoology.

James M. Walker has been appointed Acting Assistant Professor of Zoology at Louisiana Polytechnic Institute.

Robert F. Thorne, Dept. of Botany, State University of Iowa, Iowa City, Iowa, has returned to this country after two years of travel through Australia, Java, Singapore, Ceylon, India, Iran, and London. Dr. Thorne, who specializes in the phylogeny of angiosperms, was in Australia on a Fulbright Research Fellowship, and for the last year has studied under an NSF Postdoctral Fellowship.

Thomas Barr, Jr., has joined the faculty of the University of Kentucky as Assistant Professor of Zoology.

J. M. Herr of the Dept. of Biology of the University of South Carolina has received an NSF grant for a study of the rearrangement of nuclei in the megagametophyte of *Oxalis*.

Cecile Huggins of the Dept. of Biology of the University of South Carolina has received a renewal of her NIH grant for the study of bacteria in *Gambusia affinis*.

Grants and Fellowships

The National Science Foundation announces that final proposals for Antarctic research for the 1962-63 field season should be submitted by February 15, 1962, in order to allow the necessary time for scientific review and field planning. Proposals should be addressed to the *Director, National Science Foundation, Washington 25, D. C., Attention: Office of Antarctic Programs.* Proposals will be accepted for aurora and airglow, biology and medicine, cosmic rays, geodesy and cartography, geology, geomagnetism, glaciology, gravity, ionospheric physics, meteorology, oceanography, seismology, and for such other research as may be pertinent to Antarctica. The staff of the Office of Antarctic Programs of the National Science Foundation will be pleased to discuss ideas for proposals informally prior to their final submission or to answer questions regarding the preparation of proposals and problems of research in the Antarctic.

Applications are now being received for grants-in-aid to conduct research on the ecology of the escarpment gorges of the Blue Ridge Mountains. The program is supported and financed by the National Science Foundation at the Highlands Biological Station. For information and blanks write *Executive Director, Highlands Biological Station, Highlands, N. C.*

Institutions and Organizations

The Departments of Bacteriology and Biological Sciences, Northwestern State College, Natchitoches, Louisiana, conducted an NSF sponsored institute for superior high school students this past summer. They are currently conducting an institute involving undergraduate research participation for 14 students who are working on five separate projects. **Dr. R. E. Garth** served as director in both.

The Department of Zoology of the University of Kentucky has received a grant of $12,500 from the Atomic Energy Commission to give a course in Radiation Biology. The course is scheduled to start the second semester of the 1961-62 school year.

The Haitian-American Tuberculosis Institute has been established under the sponsorship of the North Carolina Tuberculosis Institute for the purpose of conducting a cooperative tuberculosis control and vaccine field evaluation program involving scientists associated with the N.C. Sanatorium System, Duke University, University of

North Carolina, The Research Triangle, and the Ministry of Health in Haiti, as well as the MEDICO unit stationed there. **Dr. H. M. Vandiviere** will serve as Director of the new Institute which has its headquarters in Chapel Hill, while **Dr. Turgot Cintellus** will serve as Co-Director in Haiti. The program is designed: first, to evaluate two well standardized antitubercuIosis vaccines, one of which (R_1) was developed in the N.C. Sanatorium System Research Dept., the other being one of the better BCG strains; and secondly, to abate one of the two major health problems of Haiti-tuberculosis. Haiti, with a very high incidence of tuberculosis and a death rate of approximately 60 times that in the United States, provides the perfect locale for evaluation of the effectiveness of the vaccine, as well as a population in dire need of medical service. The U.S. Navy has donated a 85-foot YP boat to the Institute for use in this project. It will be equipped with a laboratory for the sterile handling of biologicals, provide partial housing for the personnel, and serve for medical supply and provision transportation. Also, a tuberculosis pavillion is being constructed in the district of Jeremie where the program is to be instituted. The program is being financed by voluntary contributions at the present.

The Biology Department at Emory University expects to occupy a new wing in the building shortly after the first of the year.

Under an NSF grant, an **Emory University Biological Field Laboratory** is being constructed on nearby, recently acquired, land. Besides woodland, a lake and two small streams will provide facilities for varied studies in the Biology Department.

Expanded activities in the field of health protection have resulted in recent additions to the **Biology Branch of the Atomic Energy Commission's Oak Ridge Operations.** New personnel include **Raymond L. Hervin,** health physicist, formerly of the Lockland Area, AEC, Cincinnati; **William Thornton,** health physicist, and **Howard Heacker,** health physicist, both formerly of the Health Physics Division, Oak Ridge National Laboratory; and **William A. Pryor** and **Wiley A. Johnson,** nuclear safety specialists. Mr. Pryor was formerly on the staff of General Electric's nuclear propulsion program, Cincinnati, and Mr. Johnson was formerly at the Oak Ridge Gaseous Diffusion Plant. These personnel work under direction of **C. S. Shoup,** Chief, Biology Branch, which also includes **Joseph A. Lenhard,** principal health physicist, and **Claude L. Yarbro,** education and training coordinator, operates in the areas of health protection, life science administration, and the national training programs. Oak Ridge Operations include not only major facilities in Oak Ridge, Tennessee, but also research, development, production, and training facilities in four other States and Puerto Rico.

The Dept. of Biology of the University of South Carolina has received a $15,200 grant from the NSF for the purchase of research equipment and for new research quarters.

Before the academic year 1962-1963, the **Biology Dept. of the University of South Carolina** will move into its portion of the new Life Science Building. The building will be occupied jointly with the School of Pharmacy.

Reprinted below is a comic strip sequence from the New York *Herald Tribune* of 18 February 1961. It seems fitting to reproduce it here because it so well depicts the biologist confronting the layman—and the frustrations so often met with on such occasions. As far as I know, the author of this comic strip is no relation to your editor.—C. W. H., Jr.

WINSTON HALL—WAKE FOREST COLLEGE

The Official Quarterly Publication of
The Association of Southeastern Biologists

ASB BULLETIN

Volume 9, Number 2—April 1962

The ASB Bulletin is the official quarterly publication of the Association of Southeastern Biologists, Inc., and is published at Philadelphia, Penna., in January, April, July and October. Letters, news items, other contributions, and all communications about editorial matters should be addressed to C. W. Hart, Jr., Editor, The Academy of Natural Sciences of Philadelphia, 19th and The Parkway, Philadelphia, Penna. Changes of address should be sent promptly to the Secretary of the ASB, Dr. Harry J. Bennett, Department of Zoology, Louisiana State University, Baton Rouge, La. Subscription orders from libraries and other institutions should be sent to the Business Manager, Dr. Elsie Quarterman, Department of Biology, Vanderbilt University, Nashville, Tenn. Subscription rate for non-members of the ASB: $2.00 per year. Printing and typography by the Wickersham Printing Co., Lancaster, Penna.

Second-class postage paid at Philadelphia, Pennsylvania.

Program of the 23rd Annual Meeting of the Association of Southeastern Biologists

A Joint Meeting with the Southeastern Section of the Botanical Society of America, Southern Appalachian Botanical Club, Regional Section of the National Association of Biology Teachers, and the Southeastern Region of Beta Beta Beta National Honorary Biological Society—held at Wake Forest College, Winston-Salem, North Carolina, April 12-14, 1962.

THURSDAY, APRIL 12

10:00 a.m. **Executive Committee Meeting:** Robert E. Lee Hotel, ASB suite.
2:00 p.m.-7:45 p.m. **Registration:** Lobby of Winston Hall.
8:00 p.m. **General Session:** Wait Chapel, Royal E. Shanks, Presiding.
Address of Welcome: Harold Tribble, President, Wake Forest College.
Reponse: Royal E. Shanks, University of Tennessee, President of the Association of Southeastern Biologists.
Invitational Address: *Counter-Currents in Biology,* Norman G. Anderson, Oak Ridge National Laboratory.

The invitational address will be followed by a smoker to be held in the main reception lounge of Reynolda Hall on the campus. Refreshments will be served.

FRIDAY, APRIL 13

MORNING

8:00 a.m.-11:00 a.m. **Registration:** Lobby of Winston Hall.
8:00 a.m.-12:00 noon **Exhibits:** Rooms 101, 102, 103, 104, 107, 112.
8:30 a.m.-11:30 a.m. **Paper Sessions:**
Plant Ecology—Room A, Winston Hall.
Cytogenetics and Plant Physiology—Room B, Winston Hall.
Invertebrate Zoology—Room C, Winston Hall.
Parasitology—Room 223, Winston Hall.
11:45 a.m.-12:30 p.m. **Business Meeting:** Association of Southeastern Biologists. Wait Chapel.

AFTERNOON

1:00 p.m.-5:00 p.m. **Exhibits:**
2:00 p.m.-4:30 p.m. **Paper Sessions:**
Animal Physiology—Room A, Winston Hall.
Endocrinology and Animal Ecology—Room B, Winston Hall.
Systematic Botany—Room C, Winston Hall.
Cryptogamic Botany—Room 223, Winston Hall.
2:00 p.m.-5:00 p.m. **Registration, Beta Beta Beta:** Lobby of Winston Hall.
4:45 p.m.-5:15 p.m. **Business Meeting:** Southeastern Section of the Botanical Society of America—Room A, Winston Hall.

EVENING

7:00 p.m.-8:15 p.m. **Banquet:** Main Ballroom, Robert E. Lee Hotel.
8:15 p.m. **General Session:*** Royal E. Shanks, presiding, President of the Association of Southeastern Biologists.
Past-Presidential Address: Victor A. Greulach.

* This is a program commemorating the 25th anniversary of the ASB, and it will be held in the Main Ballroom immediately following the banquet. A special printed program will be distributed, and the Presentation of Awards will take place at this time. Members are urged to come whether or not they attend the banquet.

SATURDAY, APRIL 14

8:30 a.m. **Field Trip:** The Combined Botanical and Zoological field trips will be to nearby Hanging Rock State Park and surrounding areas.
8:00 a.m.-12:00 noon **Beta Beta Beta General Meeting and Paper Session:** Room A, Winston Hall.
9:30 a.m. **Tours** will be available for those interested in seeing Old Salem, Reynolda Gardens, and the R. J. Reynold's Cigarette Plant.

SCHEDULE OF PAPER SESSIONS

FRIDAY MORNING—APRIL 13, 8:30 A.M.

Plant Ecology

Room A—Winston Hall

Presiding: Albert E. Radford

8:30 1. McCormick, Franklin J. and Robert B. Platt (Vanderbilt Univ.). Ecotypic Differentiation in Southeastern *Juniperus.*
8:43 2. Woods, Frank W., Maxwell L. McCormack, and Mitchell D. Ferrill, (Duke Univ.). A technique for "forcing" absorption of isotopes by trees for ecological studies.
8:56 3. Eggler, Willis A. (Newcomb College of Tulane Univ.). Nitrogen in Ash and Cinders from Paricutin Volcano, Mexico.

9:09 4. Farmer, Joe A., (Univ. of Alabama). The Two Populations of a Narrowly Endemic Shrub, *Croton alabamensis* E. A. Smith.

9:22 5. Plummer, Gayther L. and Catherine Keever, (Univ. of Georgia). Dispersal and Distribution of *Heterotheca latifolia* in the Georgia Piedmont since 1954.

9:35 6. Clebsch, Edward E. C. and Royal E. Shanks, (Univ. of Tennessee). Computer Programs for the Estimation of Forest Stand Weight and Mineral Pool.

9:48 7. Shanks, Royal E., Edward E. C. Clebsch, H. R. DeSelm, (Univ. of Tennessee). Estimates of Weight, Mineral Pool, and Flux of Material in Appalachian Ecosystems.

10:01 8. DeSelm, H. R. and R. E. Shanks, (Univ. of Tennessee). Organic Accumulation and Decay in some Natural Systems.

10:14 9. Ritchie, Jerry C., (Univ. of Tennessee). Distribution of Fallout Cesium-137 in the Great Smoky Mountains.

10:27 10. Caplenor, Donald, Judy Brook, and Anne Regan, (Millsaps College). Plant Communities on Deep Loess, Shallow Loess, and Clay Soils in West-Central Mississippi.

10:40 11. Daniel, Charles P., (Emory Univ.). Photoperiod Control in Plant Succession.

10:53 12. Woodmansee, Robert A., (Mississippi Southern College). The Distribution of the Planktonic Diatom Genus *Rhizosolenia* in Biloxi Bay and Mississippi Sound.

10:06 13. Edmisten, Joe A., (Univ. of Florida). The Ecology of Florida Pine Flatwoods.

11:19 14. McGinnis, John T., (Emory Univ.). Ionizing Radiation Effects in Litter Production of White Oaks.

Cytogenetics and Plant Physiology

Room B—Winston Hall

Presiding: Elton C. Cocke

8:30 15. Sarvella, Patricia, (Mississippi State Univ.). Male Sterility in Cotton.

8:45 16. Beatty, A. V. and J. W. Beatty, (Emory Univ.). Biochemical Modification of Radiation Recovery.

9:00 17. Whiting, P. W., (Univ. of Pennsylvania). Genes as Units of Segregation.

9:15 18. Yeagers, Edward K., (Emory Univ.). The Effect of Centrifugation upon X-Ray-Induced Chromosome Aberrations in Microspores of *Tradescantia paludosa*.

9:30 19. Herr, J. M., Jr. Maturation of the Embryo in *Ilex crenata* Thunbg.

9:45 20. Brumfield, Robert T., (Longwood College). A photographic instrument for determining cellular growth rates in roots of small-seeded grasses.

10:00 21. Wolf, F. T., G. W. Koehne and E. A. Jones, (Vanderbilt Univ.). The Pigments of *Microsperum cookei*.

10:15 22. Plummer, Gayther L. and John Kethley, (Univ. of Georgia). On the Uptake of Nutrients by the Leaves of the Pitcher Plant, *Sarracenia flava*.

10:30 23. Keitt, George W., Jr., (Florida State Univ.). Interaction of Benzoic acid Derivatives and Kinetin on Cultured Tobacco Pith Tissue.

10:45 24. Parchman, L. Gerald, (Emory Univ.). The Effect of Certain Growth Substances Upon the Stamen Hair Cells of *Tradescantia paludosa* in Artificial Culture.

Invertebrate Zoology

Room C—Winston Hall

Presiding: Charles M. Allen

8:30 25. Hopkins, Thomas S., (Univ. of Florida). Sexual Dichromatism in the Chelae of *Callinectes sapidus*.

8:45 26. Darlington, Julian T., (Furman Univ.). A Survey of the Triclad Turbellaria in a Section of Northwest Georgia.

9:00 27. Bovee, E. C. and S. R. Telford, Jr., (Univ. of Florida). Some New Inqulinic Flagellated Protozoa From Endmic Florida Reptiles.

9:15 28. Holt, Perry C., (Virginia Polytechnic Institute). Geminate Species of Branchiobdellids: A Problem in Zoogeography.

9:30 29. Bamforth, Stuart S., (Newcomb College of Tulane Univ.). Anatomy and Ecology of Hypotrichous Protozoa.

9:45 30. Porter, Evan Dwain, (Emory Univ.). Effect of Mechanical Pressure on *Paramecium aurelia* during Stomatogenesis.

10:00 31. Menzel, R. Winston, (Florida State Univ.). Seasonal Growth of Northern and Southern Quahaugs and Their Hybrids.

10:15 32. Cole, Arthur C., Jr., (Univ of Tennessee). The harvesting ant *Pogonomyrmex comanche* Wheeler.

10:30 33. Schmitz, Eugene H., (Louisiana State Univ.). Anatomical Studies of the Alimentary Tract of *Gammarus lacustris lacustris* Sars (Crustacea: Amphipoda).

10:45 34. Wells, Carolyn and Lindy Hatch, (Longwood College). Possible Breeding Systems for the Study of Recessive Mutations in *Tetrahymena pyriformis*.

Parasitology

Room 223—Winston Hall

Presiding: H. Grady Britt

8:30 35. Miller, Grover C. and Reinard Harkems, (N. C. State College). Parasitic Helminths of the Raccoon.

8:45 36. Phifer, Kenneth O., (U. S. Public Health Service). A Comparative Study of the Aldolase Systems of *Aedes aegypti, Anopheles quadrimaculatus,* and *Culex quinquefasciatus*.

9:00 37. Bogitsh, Burton J., (Georgia Southern *College*). The Chemical Nature of Metacercarial Cysts I. Histological and Histochemical Observations on the Cyst of *Posthodiplostomum minimum*.

9:15 38. Kirk, Daniel E., (Catawba College). *Trichinella spiralis* in Humans in Piedmont North Carolina.

9:30 39. Jeffery, Geoffrey M., and Kenneth O. Phifer, (U. S. Public Health Service). Investigations on Intestinal Helminth Infections in a Coastal South Carolina Area.

9:45 40. Bogitsh, Burton J. and Robert R. Cardell, Jr., (Georgia Southern College). Observations on the Ultrastructure of the Cyst of *Posthodiplostomum Minimum*.

10:00 41. Vandiviere, H. M., (N. C. Tuberculosis Assoc.). Epidemiologic Investigations of Tuberculosis in Haiti.

10:15 42. Collins, William H., (U. S. Public Health Service). Experimental Transmission of Semliki Forest Virus by Anophelinc Mosquitoes.

10:30 43. Greene, Nathan D., (N. C. State Collcge). Thc Life History of *Heterobilharzia americana* Price, 1929.

FRIDAY AFTERNOON—APRIL 13, 2:00 P.M.

Animal Physiology

Room A—Winston Hall

Presiding: Samuel R. Tipton

2:00 44. Bush, Francis M., (Howard College). Effects of Exposure to Light and to Temperature on the Annual Cycle for Fat and Lean Weight of *Bufo fowleri*.

2:15 45. Stidham, James D., (Univ. of Tennessee). The Effects of Various Larval Diets on Biting Rate and Longevity in the Mosquito *Aedes aegypti* (L.).

2:30 46. Bell, Rondal E., (Millsaps College). Electrophoretic Analysis of the Serum Proteins of *Citellus* Species: Taxonomic Implications.

2:45 47. Thomson, J. Richard, (Chemotherapy Division—Southern Research Institute). A Hypothesis for Eventual Failure of Antileukemic Agents Against Experimental Mouse Leukemia.

3:00 48. Baker, Clinton L., (Southwestern College). Spermatozoa of Amphiumae: Spermateleosis, Morphology, Helical Motility and Reversibility.

3:15 49. Martinez, Irving R., Jr., (Louisiana State Univ.). The Effects of Colchicine Upon the Olfactory Epithelium.

3:30 50. Reams, Willie M. and Thomas C. Mayer, (Louisiana State Univ.). Migratory Behavior of Pigment Cells in the PET Mouse.

3:45 51. Moore, Jack H., (Southern Research Institute). The Drug Response Correlation of Some Experimental Animal Tumors and Certain Classes of Human Cancer.

4:00 52. Cole, B. Theodore, (Univ. of South Carolina). Comparison of Electrocardiographic Characteristics in Vertebrates.

4:15 53. Leonard, Martha R., (Oak Ridge National Laboratory). Capacity of Spleen Cells to Respond to Antigen and to Proliferate after Sublethal Irradiation.

Endocrinology and Animal Ecology

Room B—Winston Hall

Presiding: Frank B. Golley

2:00 54. Turnball, John G. and George C. Kent, Jr., (Louisiana State Univ.). Chronological Study of Deciduomata in Hamsters.

2:15 55. Cardell, Robert R., Jr., (Edsel B. Ford Institute). Observations on the Formation and Release of Secretory Cranules in the Pituitary Cland of the Salamander (*Triturus Viridescens*).

2:30 56. Daugaard, Allen T. and George C. Kent, Jr., (Louisiana State Univ.). Failure to Maintain Deciduomata with Progesterone in Hamsters.

2:45 57. Tanner, James T., (Univ. of Tennessee). Effect of Food Supply on the Egg-laying Date of Juncos (*Junco hyemalis*).

3:00 58. Raulerson, Lynn and W. D. Burbanck, (Howard College). The Life-Cycle and Ecology of *Elliptio hopetonensis* Lea.

3:15 59. Parrish, Fred K., (Agnes Scott College). Comparative Observations on the Behavior of Marine and Fresh Water Turtles.

3:30 60. Lackey, James B., (Univ of Florida). Ecology of the Microbiota of Mission Bay.

3:45 61. Shadowen, H. E., (Western Kentucky State College). A Live-trap Study of Seed-eating Mammals.

4:00 52. Pelt, Arnold Van, (Tusculum College). Crater density and Above-ground Activity of Two Dominant Old Field Ants.

4:15 63. Colley, Frank B., (Univ of Georgia). Energy Flow in an Old Field Ant Population.

Systematic Botany

Room C—Winston Hall

Presiding: R. L. Wyatt

2:00 64. Bell, C. Ritchie, (Univ. of North Carolina). Taxonomic Characteristics of Some Species of *Matelea* (Asclepiadaceae).

2:15 65. Radford, Albert E., (Univ. of North Carolina). Vascular Flora of the Carolinas.

2:30 66. Matthews, James F., (Emory Univ.). Paper Chromatographic Studies of the Biochemical Profiles of *Tradescantia* Species.

2:45 67. Wagner, W. H., Jr., (Univ. of Michigan). The Endemic Botrychiums of the Southeastern United States.

3:00 68. Aiuto, Russell, (University of North Carolina). Experimental Approaches of Taxonomic Problems in Southeastern *Phlox*.

3:15 69. Morzenti, Virginia M. and W. H. Wagner, Jr., (Univ. of Michigan). Southeastern American "Blackstem Spleenworts" of the *Asplenium Heterochroum-Resiliens* Complex.

3:30 70. Flagg, R. O. and W. S. Flory, (Univ. of Virginia). Origins of the Yellow-Flowered Cooperias and of *Zephyranthes refugiensis*.

3:45 71. Guhardja, Edi and E. T. Browne, Jr., (Univ. of Kentucky). The Flora of Bourbon County, Kentucky.

4:00 72. Flory, W. S. and R. O. Flagg, (Univ. of Virginia). *Zephyranthes atamasco* and Z. *treatiae*.

Cryptogamic Botany

Room 223—Winston Hall

Presiding: William J. Koch

2:00 73. Nichols, Wayne and Walter Herndon, (Univ. of Tennessee). Observations on the structure and development of the fresh-water red alga, *Boldia.*

2:15 74. Frederick, Lafayette, (Southern Univ.). Differences in Spore Appendage Formation Among Species in the Genus *Robillarda.*

2:30 75. Sharp, A. J., (Univ. of Tennessee). Some Interesting Mosses in Tennessee.

2:45 76. Herndon, Walter, Delbert Philpot, and Charles O'Kelley, (Univ. of Tennessee). Observations on the fine structure of *Protosiphon.*

3:00 77. Miller, Charles E., (Texas A&M). Some Fungal Parasites of *Pythium* from Texas Soils.

3:15 78. McCullough, Herbert A., (Howard College). The Non-Crustose Lichens of Two Localities in Alabama.

3:30 79. Nichols, H. Wayne, (Univ. of Alabama). Cytology and Development of *Compsopogon Coeruleus* in Culture.

3:45 80. Miller, Charles E., (Texas A&M). Some Aquatic Phycomycetes of the Mountain Lake Locale.

Abstracts of Papers Presented at the 23rd Annual Meeting of the Association of Southeastern Biologists

Ecotypic Differentiation in Southeastern *Juniperus*

J. Franklin McCormick, *Vanderbilt University*
Robert B. Platt, *Emory University*

The chief objective of the present study is to relate genetic variability in selected populations of *Juniperus virginiana* to the contrasting environments in which these populations exist. Evidence indicates that southeastern *Juniperus* is a hetrogeneous gene pool containing introgressant genes from *J. ashei;* and that the granite outcrops of the Southeastern United States present an ecological opportunity, actually a selective agent, for segregation of genes from *J. ashei.* The products of evolutionary progress in southeastern *Juniperus* are described as disjunct, discordantly variable populations which are at the ecotypic state of differentiation within the midst of an otherwise heterogeneous but concordantly variable gene pool.

A Technique for "Forcing" Absorption of Isotopes by Trees for Ecological Studies

Frank W. Woods, *Duke University*
Maxwell L. McCormack, *University of Southern Illinois*
Mitchell D. Ferrill, *Duke University*

For radio-ecological investigations, applications of gamma-emitting isotopes are sometimes made in forest stands to either small spots on the soil surface or at selected depths. However, such materials may not be absorbed in sufficient quantities to permit detection in trunks and leaves of trees, even though present. Increased absorption of radioiodine by roots can be forced by (1) local sterilization of the soil with methyl bromide at the point or depth of application immediately prior to application of the isotopes, and (2) application of liberal quantities of water immediately following application of isotope solutions. Several things seem to contribute to increased absorption: (1) roots are killed and the differential permeability of root cells destroyed; (2) bacteria and fungi, which normally absorb minerals biologically, are destroyed; (3) cation exchange capacity of soil micelles is filled by bromine at the expense of the iodine; and (4) water, absorbed freely by dead roots, floods radioactive materials into the vascular elements.

Nitrogen in Ash and Cinders from Paricutin Volcano, Mexico

Willis A. Eggler,
Newcomb College of Tulane University

Nitrogen content in ash and cinders from Paricutin Volcano, as determined by the Kjeldahl method, ranged from about 20 ppm to 350 ppm. Content varied greatly from place to place and often between samples similar in appearance and only a few feet apart. Where plant life was absent nitrogen content increased rather uniformly with depth, and was about ten times as great at 3 feet as at 3 inches. It is concluded that this is the result of concentration by percolating water. Where plants are present upper zones have as high nitrogen concentration as lower, and it is concluded that plants concentrate nitrogen in the upper zones. It is believed that most of the nitrogen is derived from the original magmatic material.

The Two Populations of a Narrowly Endemic Shrub, *Croton alabamensis* E. A. Smith

Joe A. Farmer, *University of Alabama*

Croton alabamensis E. A. Smith, a small, semi-evergreen, monoecious shrub, is found localized in the Cahaba River drainage in Bibb County, Alabama, and in the Warrior River drainage in Tuscaloosa County, Alabama. Separated by approximately thirty miles, these areas support two distinct populations which differ in morphology, physiology, and cytology.

The morphological differences include (1) overall plant size and appearance; (2) leaf size, shape, and color; (3) trichome color; (4) intrapopulational variation; (5) seed size and dispersal range; (6) flower size and sex distribution; and (7) fruit size.

Physiologically the populations differ with regard to: (1) flowering and fruiting time; (2) seed viability and germinability; (3) susceptibility to "damping-off" fungi; (4) seedling and transplant survival; (5) drought-induced wilting; (6) calcium-deficiency symptoms; and (7) frequency of albino seedlings.

Cytologically the populations differ in chromosome number. The roles of heredity and environment in differentiating these populations are presently being analyzed.

Dispersal and Distribution of *Heterotheca latifolia* in the Georgia Piedmont since 1954

Gayther L. Plummer, *University of Georgia*
Catherine Keever, *Millersville State College*

Keever outlined the ecological relationships as well as the distribution of camphor weed in Georgia and South Carolina until 1954. Since then this autumnal weed has spread from an area of about 1500 sq. mi. to cover an area of 8000 sq. mi. around Athens. Dispersal has been followed biennially. The greatest movements have been toward the south and southeast where it is approaching the northern range of the Coastal Plain species, *H. subaxillaris*. Convergence of the two populations occurs in an area near Augusta and Sandersville within a north-south distance of 10-20 miles. The two populations are of heterogeneous morphology in this area of convergence. It is presumed that some hybridization has occurred.

Dispersal of *H. latifolia* follows patterns of the direction of prevailing winds. Autumnal weather patterns will be presented and associated with present distribution.

Computer Programs for the Estimation of Forest Stand Weight and Mineral Pool

Edward E. C. Clebsch and Royal E. Shanks,
University of Tennessee

A series of programs has been developed by the authors for the IBM-1620 for use in processing the voluminous data required in the computation of estimates of stand weight and chemistry. The programs and the flow of information through them are discussed. They combine compilation, computation, and statistical manipulation in various ways. The key program is one for simple linear regression. The others are: bole weight, branch weight, tree weight, tree height and form factor, tree growth, tree chemistry, and stand weight and chemistry.

Estimates of Weight, Mineral Pool, and Flux of Material in Appalachian Ecosystems

Royal E. Shanks, Edward E. C. Clebsch,
H. R. DeSelm, *University of Tennessee*

The above-ground biomass of a high altitude spruce-fir forest was twice that of the mountain beech forest sampled, and 13 times as great as that of a heath bald. The mineral content of evergreen and deciduous forests differed less than their weight, differing least in P, and successively more in K, Mg, and Ca. The heath bald is notably low in mineral content. The litter and humus compartment of the heath bald is 3 times as great as that under spruce-fir and 40 times as great as that under beech. These systems are chemically as well as physically differentiated, and it is probable that mineral poverty is a factor in maintenance of heath balds. This study. supported by the AEC, provides a frame of reference for studies of the distribution of radioactive fallout materials.

Organic Accumulation and Decay in Some Natural Systems

H. R. DeSelm and R. E. Shanks,
University of Tennessee

Production rates and rates of litter accumulation and decay are discussed from data obtained during the study of vegetation on The White Oak Lake bed, Oak Ridge, Tennessee. A statement is derived in which accumulation is related to time. This generalized statement is then applied to the cycling of calcium and radiostrontium on the lake bed. It is further used to calculate decay parameters for litter of other local vegetation types.

Distribution of Fallout Cesium-137 in the Great Smoky Mountains

Jerry C. Ritchie

Estimates of the total amount of fallout cesium-137 prior to the 1961 Soviet test series in the organic horizons and the upper four and one-half inches of mineral soil in the Great Smoky Mountains have been made. The distribution of the fallout cesium-137 between altitudes and cover types differs. As in other studies, this relationship appears to be most closely related to annual rainfall.

Plant Communities on Deep Loess, Shallow Loess, and Clay Soils in West-Central Mississippi

Donald Caplenor, Judy Brook, and Anne Regan,
Millsaps College

Four forest communities in west-central Mississippi have been sampled by a modified point centered quarter method. These communities are located along a line running almost due east-west just north of Morton, Jackson, and Vicksburg (lat. 32°25′). The obvious variable in the environment of these communities is presence or absence of a surface deposit of loess. Of the four communities, two were on deep loess (45-115 ft.), one on shallow loess (0-8 ft.), and one on clay soil without loess. Species composition of the forests on the different soils was distinctive. Sorensen's Quotient of Similarity for the various conditions of soil was as follows: Deep loess—shallow loess, 41.6; shallow loess—no loess, 29.5. The most obvious differences in species composition noted thus far are the near-absence of pines and the predominance of certain highly mesophytic species on the deep loess.

Photoperiod Control in Plant Succession

Charles P. Daniel, *Emory University*

Aster pilosus and *Erigeron canadensis* germinated in greenhouse flats in February. Aster rosettes became shoots about March twentieth. Erigeron rosettes became shoots after May first when day length was 14 hours.

Erigeron and Aster germinated in July in soil containing horseweed roots, horseweed tops, and controls were divided into 12 and 14 hour day length groups. No Aster germinated at 12 hours but gave 96 per cent shoots at 14 hours. Erigeron seed germinating at 12 hours yielded 3 per cent and at 14 hours 20 per cent shoots. Erigeron roots in the soil culture lowered dry weight production significantly at 12 hours but not at 14 hours. Horseweed tops did not cause a significant difference at either photoperiod. This suggests that Aster assumes successional dominance by earlier stem and root development than photoperiod retarded Erigeron.

The Distribution of the Planktonic Diatom Genus *Rhizosolenia* in Biloxi Bay and Mississippi Sound

Robert A. Woodmansee, *Mississippi Southern College and Gulf Coast Research Laboratory*

Plankton samples were collected during June and July along a salinity gradient off the Mississippi coast extending from Davis Bayou through Biloxi Bay and into Mississippi Sound. The temperature was recorded and the salinity, dissolved oxygen and phosphate were determined and compared to fresh-water discharge. *Rhizosolenia alata* was the most numerous species and was found to increase in abundance as the salinity increased. *R. setigera* and *R. stolterfothii* were fairly numerous and both showed maximum concentrations in the intermediate salinities of the Bay. An attempt to trace the dispersal of *R. alata* indicated that this diatom is being transported toward the sea in the surface layer and toward the land in the bottom layer.

The Ecology of Florida Pine Flatwoods

Joe A. Edmisten, *University of Florida*

Quantitative analysis of the vegetation of relatively undisturbed pine forests was accomplished with the quarter system. These fifteen stands of flatwoods, located in a ten-county area in north central Florida, were predominantly located on the Leon series of soils which are somewhat poorly drained. Soils were tested from each stand at four or five horizons in the profile. The soils were checked for pH, bulk density, soil separates, major nutrients, organic matter, depth of litter, and moisture equivalence. Importance values for the species of plants encountered were plotted against the above edaphic factors. Preliminary data indicate that, when protected from fire and grazing, these pine forests tend to be replaced by hardwood species. The succession seems to be accompanied by edaphic changes such as a raising of the pH, lowering of bulk density, incorporation of ground litter, and increasing of major nutrients.

Ionizing Radiation Effects on Litter Production of White Oaks

John T. McGinnis, *Emory University*

This paper is a continuation of previously published studies on ionizing radiation effects on forest litter production. White oak components of the oak-hickory-pine stands surrounding the air shielded ten megawatt radiation effects reactor on Air Force Plant 67 Reservation in north Georgia includes *Quercus alba* and *Quercus stellata*. Litter was collected from 1/10 milacre screen wire bottom frames and sorted into species groups. These collections were made over a two year period from four irradiated forest stands and one control. Sub-lethal doses of radiation (3-15,000 rads) to the trees caused early leaf fall in the summer of irradiation, followed by great reduction in the number of leaves produced the next spring. However, leaves produced were much heavier than non-irradiated leaves, and this reduced the apparent radiation effects on a weight basis. Equations are presented and illustrated concerning these effects.

(This project was supported in part by A.E.C. Contract AT-(40-1)-2412.)

Male Sterility in Cotton

Patricia Sarvella, *Mississippi State University*

In a cytological study of two genetic partially male-sterile stocks of cotton, differences in degree of sterility corresponded to plant age. These stocks, Western Stormproof (*ms-1 ms-1*) and Roux (*ms-3 ms-3*), were studied in the summer of 1960 at Mississippi State University. Throughout the season the young plants were more sterile than one-year-old plants. The sterility decreased as the season progressed. In 1961, the studies were repeated at two locations, Stoneville, Mississippi and Mississippi State University. The plants at Stoneville were more sterile than those at Mississippi State University. Young plants were more sterile than one-year plants except for (ms_1 ms_1) seedlings at Mississippi State University. Two-year-old plants of both stocks grown at Mississippi State University were more sterile than one-year-old plants. A stock containing cytoplasmic male sterility also became more fertile as the season progressed. The influence of various environmental factors are being investigated.

Biochemical Modification of Radiation Recovery

A. V. Beatty and J. W. Beatty, *Emory University*

Chromosomal aberrations observed in the microspores of Tradescantia after treatment with 400 r of X-rays, administered at 50 r per minute at 30°C in a helium atmosphere, were used as a measure of radiation damage. The control experiments yielded 0.24 aberrations per cell. The experimental material was pretreated for 1½ hours in chemical solutions. Some reduetion in aberration yield was found in material treated with citrulline, histidine, proline, glycine, phenylalanine, eysteine, isoleucine, alanine, threonine and serine. The other amino acids had little or no effect. Material treated with chloramphenicol and dinitrophenol exhibited considerable recovery.

Genes as Units of Segregation

P. W. Whiting, *University of Pennsylvania*

If genes be defined as units of heredity, it is conceivable that they may exist strung along the chromonemata in definite number or floating free in the cytoplasm. If they be defined as units of meiotic segregation, they are produced in indefinite numbers by mutation. A series of multiple allelic pleiotropic genes has been formed by mutation of different factors at the *R* locus of the wasp Mormoniella. As yet no limit appears to the number of these factors and some at least have many alternative states. It is probable that any other locus would mutate similarly to *R* could its possibilities be similarly explored. Locus *R* is exceptionally convenient for such exploration in having two factors, *O* and *S*, which mutate with relatively high frequency to the marker eye colors oyster white and scarlet.

The Effect of Centrifugation upon X-Ray-Induced Chromosome Aberrations in Microspores of *Tradescantia paludosa*

Edward K. Yeargers, *Emory University*

Inflorescences of *Tradescantia paludosa,* removed from plants growing in a greenhouse, were given 400 r of X-radiation at 50 r per minute. Simultaneously, by means of a specially built centrifuge, the inflorescences were subjected to constant forces ranging from 0 to $10{,}000 \times g$ in a series of 17 experiments. Ninety-six hours after irradiation acetocarmine smears of the anthers in the first microspore division were made and the number of two-hit aberrations was scored from the metaphase configurations. In a graph of aberrations vs. force, a threshold for increase at $800 \times g$ can be seen followed by an exponential rise, a parabolic decrease and a second exponential rise with slope identical to the first. An explanation for these results is postulated in terms of varying distances of separation of broken ends. (Supported in part by A.E.C. Contract No. AT-(40-1)-2669.)

Maturation of the Embryo in *Ilex crenata* Thunbg.

J. M. Herr, Jr.

Mature seeds of *Ilex* L. bear rudimentary, heart-shaped embryos which undergo maturation after dispersal but prior to germination. Seeds of *I. crenata* separated from their endocarps and placed in culture on moist cotton at room temperature or at 31°C. were fixed at 3-7 day intervals in Carnoy's #1 fluid for one hour. The embryos were removed, and measurements were taken of cotyledon junction. Associated cellular changes were recorded and hypocotyl length and of the width at the hypocotyl-cotyledon junction. Associated cellular changes were recorded from squash preparations or serial sections of the embryo. Embryo maturation may be initiated by growth either in the hypocotyl or cotyledons. The cotyledons may elongate uniformly or unevenly and often become lobed at the apices. The epicotyl develops at a later time during germination. The rate of maturation is usually increased in seeds initially subjected to a 5%

glucose solution for 24 hours. Maturation is directly correlated with cell enlargement, but cell divisions are conspicuously absent. The pattern of maturation is controlled by the manner in which water enters the seed.

The report is based on work performed under Contract No. AT (38-1)-153 between the U. S. Atomic Energy Commission and the University of South Carolina, Columbia, South Carolina.

A Photographic Instrument for Determining Cellular Growth Rates in Roots of Small-Seeded Grasses *

Robert T. Brumfield, *Longwood College and Oak Ridge National Laboratory*

The growth and division of the surface cells of the small-seeded grasses can be studied from photographic records taken at successive intervals of time. Since the growing point is long and narrow, a series of overlapping frames is necessary when conventional methods of photomicrography are used. The labor involved in reconstructing the whole length of the growing point from the separate frames seriously limits the number of experimental observations. A special camera has been developed which records the whole length of the growing point on a single 38-cm. length of 35 mm. film at a magnification of 175×. The root is transported from tip to base of the growing point through the objective field and its moving image is projected onto a moving film; the motions of the image and film are synchronous. Increments in cell lengths or displacement of points from the apex are measured directly by superimposing two of the transparent strips.

* Supported by National Science Foundation grant G-8763.

The Pigments of *Microsporum cookei*

F. T. Wolf, G. W. Koehne, and E. A. Jones, *Vanderbilt University*

The dermatophyte, *Microsporum cookei*, produces a purple pigment on Sabouraud's agar. By paper chromatography it was found that this is a mixture which included a purple component and a yellow component, both of which are pH indicators and redox indicators. Quantities of these pigments, separated by means of column chromatography, were prepared in solid form. From evidence derived from infrared absorption spectra, it is shown that both are polyhydroxy methyl anthraquinones. Both pigments must have at least one beta substituent on each of the lateral rings, and must have at least one alpha hydroxyl and one beta hydroxyl. The yellow pigment is fluorescent, and must have two alpha hydroxyls in the 1,4 positions.

On the Uptake of Nutrients by the Leaves of the Pitcher Plant, *Sarracenia flava*

Gayther L. Plummer, *University of Georgia*
John Kethley, *University of Georgia*

Both radioisotopes and amino acids were delivered to the sarcophageal region of this plant. Absorption by the leaves was determined by means of autoradiograms and paper chromatographs. Four kinds of digestive processes in the sarcophagus have been recognized: acid hydrolysis, liquor hydrolysis, bacterial enzymatic activities, and possibly autolytic processes within the insects. It is not known exactly what nutrients are available to the plants or how much of the few that have been recognized. Nevertheless, some field studies have shown that those plants with flower buds in the autumn had fewer insect carcasses in the trumpets than did those plants without flower buds.

Interaction of Benzoic Acid Derivatives and Kinetin on Cultured Tobacco Pith Tissue

George W. Keitt, Jr., *Florida State University*

Uniform sections of tobacco (*Nicotiana tabacum* L. var. Wis. 38) pith, a tissue requiring exogenous factors for growth in culture, were placed on media containing four concentrations of the benzoic derivative ± kinetin (K). Fresh and dry weights were taken after 30 days. Basal, indoleacetic acid (IAA), K, and IAA + K media were used as checks. By itself, 2,3,6-trichlorobenzoic acid caused modest cell enlargement, and with K, growth. Inactive in both tests were 2,3,5-triiodobenzoic acid (TIBA), 2,3,5-trichlorobenzoic acid, 2,4,5-trichlorobenzoic, and 3,4,5-triiodobenzoic acids were inactive in both cases. More active than 2,3,6-trichlorobenzoic in both tests was 3-amino-2,5-dichlorobenzoic. The 2,5-dichloro-3-nitro- analog was inactive in both tests. These results, and those of dichlorinated derivatives thus far tested, indicate that stimulation of enlargement alone is correlated with growth in the presence of K. The failure of TIBA to show "co-kinin" activity suggests that it causes callus redistribution on stem explants by transport inhibition, while the other compounds causing redistribution may do so by acting as auxins. This work was supported by NSF Grant No. C14545.

The Effect of Certain Growth Substances upon the Stamen Hair Cells of *Tradescantia paludosa* in Artificial Culture

L. Gerald Parchman, *Emory University*

The culture of the stamens of *Tradescantia paludosa* in a sucrose-agar medium supplemented with various plant growth factors allows microscopic observation of living stamen hair cells under various physiological conditions. The stamen hair cells live in artificial culture for some weeks but do not undergo mitosis *de novo*. Indole acetic acid, kinetin, gibberellic acid, and certain amino acids have been added to White's tissue culture medium in various concentrations in an attempt to induce division. The early stages of prophase are inhibited by light as well as the lack of an available supply of precursors to division. The cell wall of the hair cells appears to be rather impermeable to larger molecules so that nutrients must diffuse up the column of cells from the stamen. This process is apparently inhibited or halted after several hours in culture because of the death of the wounded, basal cells. Cell elongation and division depend upon the osmotic pressure as well as a ready supply of oxygen, nutrients, and growth hormones, and the proper balance of these is probably critical in the culture medium if further growth is to take place. (Supported in part by A.E.C. grant AT-(40-1)-2669.)

Sexual Dichromatism in the Chelae of of the *Asplenium heterochroum-*

Thomas S. Hopkins, *University of Florida*

The blue crab, *Callinectes sapidus* Rathbun, exhibits a striking case of sexual dichromatism in the orange colored carotenoid-protein complex in the terminal portions of the chelae. The female displays four distinct colors in her general appearance while the male exhibits only three. Green or brown carapace, blue or blue-green appendages with the orange "fingered" chelae terminating in purple tips characterize the female, but the male lacks the orange in the chelae. Since the carotenoid astaxanthin appears to be the only pigment present in the tissues considered, the color difference of the female is presumably due to the nature of the carotenoid-protein link or to the structure of the protein involved. This trait appeared consistently in several populations investigated.

A Survey of the Triclad Turbellaria in a Section of Northwest Georgia

Julian T. Darlington, *Furman University*

Collections within an approximate twenty mile radius of Rome, Georgia during the interval 1955-1960 have shown this area to have an unusually rich and varied fauna of aquatic, epigean triclad turbellaria. The family Planariidae is represented by one species each of *Dugesia, Curtisia,* and *Planaria,* and by two species of *Phagocata.* The family Dendrocoelidae is represented by one species of *Procotyla.*

Some New Inqulinic Flagellated Protozoa from Endemic Florida Reptiles

E. C. Bovee and S. R. Telford, Jr.,*
University of Florida

The sand skink, *Ncoseps reynoldsi,* and the short-tailed snake, *Stilosoma extenuatum arenicolor,* are both endemic to Florida, and restricted to dry scrub and sandhill habitats; and the Florida variety of the crowned snake, *Tantilla coronata,* is similarly restricted. It is no surprise to find that some of their cloacal flagellated protozoa are different from species of the same genera in the more vagile reptiles, and those of moister habitats.

The sand skink harbors *Monocercomonas* sp. different from the more common species in other reptiles, *Monocercomonas colubrorum;* and it also contains *Rigidomastix* sp. different from *Rigidomastix coprocola* from the horse.

The crowned snake yielded still another *Monocercomonas* sp.

The short-tailed snake produced a coprozoic flagellate, *Cercobodo* sp., which differs from any other species of that genus which we can find described in the literature.

* Present address: University of California, Los Angeles.

Geminate Species of Branchiobdellids: a Problem in Zoogeography

Perry C. Holt, *Virginia Polytechnic Institute*

Several species of branchiobdellids epizoic on crawfish of the suborder Cambarinae have as their closest relative species from the Pacific area of North America where the host animals are members of the subfamily Astacinae. Several hypotheses which might explain these peculiar facts of distribution are discussed and rejected due to the paucity of data. The hope is expressed that collecting of representatives of the presently unknown Mexican fauna will at least partially resolve this problem.

Anatomy and Ecology of Hypotrichous Protozoa

Stuart S. Bamforth, *Newcomb College* of
Tulane University

Three anatomical features—adoral zone of membranelles (AZM), dorso-ventral body flattening, and cirri differentiation—influence hypotrich distribution. The large AZM of most forms serves swimming and ingestive functions. Planktonic types (*Hypotrichidium*) and sessile forms (*Stichotricha, Chaetospira*) have bodies round in cross section, but most hypotrichs have flattened bodies, well adapted for interface locomotion. Lower Oxytrichidae (e.g., *Uroleptus, Epiclintes, Urostyla*), with many uniform ventral cirri, and Paraeuplotidae, lacking ventral but possessing caudal cirri, crawl over surfaces. *Oxytricha* and *Stylonychia,* with small groups of well-developed cirri, walk; and Euplotidae with longer cirri move more agilely. The reduced AZM of Aspidiscidae restricts their diet to bacteria and detritus; their squarish highly flattened bodies and few prominent cirri enable them to maneuver rapidly. These last four taxonomic groups are the most cosmopolitan hypotrichs.

Effect of Mechanical Pressure on *Paramecium aurelia* during Stomatogenesis *

Evan Dwain Porter, *Emory University*

If paramecia are compressed during stomatogenesis, the new buccal area will evert and the new buccal organelles will develop externally. If the pressure is too great fission will be inhibited and the cortex between the two mouths will form large bulges which often burst. If the pressure is released enough for movement of the animal but still maintaining it in a flattened condition, fission occurs. As the old mouth migrates forward, the buccal aperture is stretched and the buccal cavity is opened along its length. The buccal organelles are forced to the surface of the body and lie fully exposed. They will remain on the surface if the pressure is maintained until the cortex is no longer plastic. If the pressure is released early the old organelles will sink into the cytoplasm and assume a normal appearance. The new buccal organelles remain everted. The opisthe then cannot feed and does not divide.

* This investigation was carried out during the tenure of a predoctoral fellowship from the Division of General Medical Sciences, United States Public Health Service.

Seasonal Growth of Northern and Southern Quahaugs and Their Hybrids

R. Winston Menzel, *Florida State University*

Monthly measurements of growth have been made of the northern quahaug, *Mercenaria mercenaria,* the southern quahaug, *M. campechiensis* and their reciprocal hybrids for fifteen months in Alligator Harbor, Florida. The fastest growth for the four groups of clams occurs during the spring and fall. The northern quahaug has the least overall growth and shows least growth during the hottest period of the year. The southern quahaug has the best overall growth and has the least growth during the coldest period. The growth of the hybrids is between the two parents but is closer to the southern parent than to the northern parent. The growth rate of the hybrids is better than either of the parents in late spring and early fall.

The Harvesting Ant *Pogonomyrmex comanche* Wheeler

Arthur C. Cole, Jr., *University of Tennessee*

Pogonomyrmex comanche Wheeler is a valid species in the Maricopa Complex of the subgenus *Pogonomyrmex.* It has previously been considered generally as a subspecies of *occidentalis* (Cresson) but it possessses no characteristics in any caste which could place it in the Occidentalis Complex and there is no evidence of subspeciation. The species is limited to sand areas, where it constructs crater nests, in parts of Texas, Oklahoma, Kansas, and Louisiana. The known eastern extent of its range is in northwestern Louisiana east of which it is replaced by *badius* (Latreille). The ant described by Olsen in 1934 as *occidentalis var. utahensis* is not a synonym of *comanche* but is a minor variant synonymous with *occidentalis.* The species *occidentalis* and *comanche* are considerably divergent in structure, behavior, and distribution.

Anatomical Studies of the Alimentary Tract of *Gammarus lacustris lacustris* Sars (Crustacea: Amphipoda)

EUGENE H. SCHMITZ, *Louisiana State University at Alexandria*

The alimentary tract of the western North American amphipod, *Gammarus lacustris lacustris* Sars consists of three main divisions: fore-gut, mid-gut, and hind-gut. A dorsal median caecum and two pairs of hepatopancreatic caeca join the mid-gut near its anterior end. A pair of rectal caeca join the mid-gut near its posterior end. A complex gastric mill and a pyloric filter apparatus characterize the cardiac stomach and pyloric stomach, respectively. The walls of the fore-gut and hind-gut consist of a chitinous intima, columnar epithelium, tunica propria, circular and sometimes longitudinal muscle, and a discontinuous "serosa." The mid-gut wall is composed of a syncytium, basement membrane, circular and longitudinal muscle, and a "tunica externa." The columnar cells of the dorsal median caecum and rectal caeca are thought to function in salt resorption. The columnar cells of the hepatopancreatic caeca are mostly vacuolated and function in enzyme secretion and absorption. The function of the tegmental glands remains unknown.

Possible Breeding Systems for the Study of Recessive Mutations in *Tetrahymena pyriformis* *

CAROLYN WELLS AND LINDY HATCH, *Longwood College*

In order to study recessive mutations in the ciliate, *Tetrahymena pyroformis,* it is desirable to establish either a close inbreeding system such as selfing, or a reliable micronucleate x amicronucleate conjugation resulting in haploid progeny. Many attempts to discover such a system in several strains of this species have been fruitless. Recently it was found that certain cultures of strain EU 6010, a member of variety 6, mating type III, will undergo selfing conjugation when washed in distilled water. Micronuclear reorganization appears normal in about 30% of the washed cells. On the other hand, when cells of this strain are washed in Dryl salt solution, they do not self, but conjugate with complementary mating types. A strain (EU 6525) of mating type I is amicronucleate. Other instances of selfing and of amicronucleate x micronucleate pairing are known in *T. pyriformis.* The latter type of mating has been aberrant in other strains; true nuclear reorganization fails. In selfing matings, the progeny from other strains are usually inviable. Often the selfing phenomenon is not reproducible. It is not known at present whether EU 6010 will be free of these difficulties.

* Work supported by United States Atomic Energy Commission Contract No. AT-(40-1)-2793.

Parasitic Helminths of the Raccoon

GROVER C. MILLER AND REINARD HARKEMA, *North Carolina State College*

From 1957 to 1962 a total of 285 raccoons from the Southeastern states was examined for parasitic helminths. One hundred and eighty-four of the host animals were taken from 17 counties in N. C.; 54 from S. C.; 22 from Georgia; 19 from Florida; and 6 from Virginia. Most of the hosts in N. C. were taken in the vicinity of Raleigh. The majority of the parasites have been indentified to species and grouped as follows: NEMATODA—9 species; TREMATODA—21 species; CESTODA—3 species and ACANTHOCEPHALA—1 species. A significant difference was noted in the parasites of coastal animals and those of inland habitats.

A Comparative Study of the Aldolase Systems of *Aedes aegypti, Anopheles quadrimaculatus,* and *Culex quinquefasciatus*

KENNETH O. PHIFER, *U. S. Public Health Service**

Homogenates of the mosquitoes, *Aedes aeqypti, Anopheles quadrimaculatus,* and *Culex quinquefasciatus,* contain aldolase systems which are quite similar in physical characteristics. The apparent Michaelis-Menten constants ranged from 3.2×10^{-3} M; to 3.6×10^{-3}; the optimal pH's lay between pH 7.4 and pH 8.2. The two culicine species differed in small degree with respect to linearity of enzyme activity with time and to effect of temperature on activity. The sex of the mosquito had no effect upon the aldolase activity. The enzyme activity was enhanced by ethylenediaminetetraacetate and was inhibited by the cations magnesium, manganese, and calcium. The data are related to those of other aldolase systems and the relation of these studies to the closer definition of host-parasite interaction is discussed.

The Chemical Nature of Metacercarial Cysts. I. Histological and Histochemical Observations on the Cyst of *Posthodiplostomum minimum* *

BURTON J. BOGITSH, *Georgia Southern College*

On the basis of histological and histochemical tests, the cyst walls of metacercariae of *Posthodiplostomum minimum* are found to be composed of two distinct layers. The outermost layer is fibroblastic and is apparently elaborated by the host. The innermost layer is non-cellular. Chemically it is composed of carbohydrate-protein complexes that are similar to the ground substance of vertebrate tissue.

* Supported in part by research grant (E-2738 C_1) from the National Institutes of Health, Department of Health, Education and Welfare.

Trichinella spiralis in Humans in Piedmont North Carolina

DANIEL E. KIRK, *Catawba College*

In four years, 167 muscle samples from routine autopsies have been examined for larvae of *Trichinella spiralis.* All subjects were adults and most were residents of Rowan County. Inspection was by microscopic examination of six to twelve square inches of pressed diaphragm. Two massive infections were found and six lighter ones, an incidence of 4.7 per cent of the total to date.

Investigations on Intestinal Helminth Infections in a Coastal South Carolina Area

GEOFFREY M. JEFFERY AND KENNETH O. PHIFER, *U. S. Public Health Service*

In a group of 212 residents of a coastal area of South Carolina *Ascaris lumbricoides* infection was found in 64% and *Trichuris trichiura in* 37%, representing one of the highest prevalences ever reported from the continental United States. Highest prevalence and intensity of infection were found in the younger age groups. Hookworm was found in only 4% of the population. Blood studies revealed a high eosinophilia which could be correlated with the presence of *Ascaris* in the younger

individuals. With a view toward possible control of these infections in the absence of improved sanitation, treatments with single doses of piperazine were given. Approximately 60% of *Ascaris* infections treated were cured, and there was an overall worm reduction of about 92%.

* Department of Health, Education, and Welfare, Public Health Service, National Institute of Allergy and Infectious Diseases, Laboratory of Parasite Chemotherapy, Section on Epidemiology, P. O. Box 717, Columbia, South Carolina.

Observations on the Ultrastructure of the Cyst of *Posthodiplostomum minimum* *

Burton J. Bogitsh and Robert R. Cardell, Jr., *Georgia Southern College and Edsel B. Ford Institute for Medical Research, Henry Ford Hospital*

Encysted metacercariae of *Posthodiplostomum minimum* were taken from fresh-water fish. Portions of the cyst wall, as well as the enclosed parasite, were fixed in Palade's buffered osmium at pH 8.4 and embedded in Vestopal W. Ultra-thin sections were cut and subsequently examined with an R.C.A. EMU-II electron microscope. The dual nature of the cyst wall is illustrated. Comparisons are made with light microscopy slides and previous chemical studies.

Epidemiologic Investigations of Tuberculosis in Haiti

H. M. Vandiviere, *N. C. Tuberculosis Association*

Epidemiologic investigations of the status of tuberculosis in the republic of Haiti are reported. These studies are preliminary to large scale field trials of two antituberculosis vaccines, a BCG and a human variant R_1. Haiti where tuberculosis thrives in its undoctored, natural state was chosen as an ideal locale for the evaluation of these well standardized vaccines. Results of preliminary tuberculin testing indicate almost 100% of the population to be tuberculin reactors by the time they are 25 years of age. The percent of reactors during the early school years range between 20-30%, suggesting that this may prove to be an excellent group for the vaccine evaluation. If this trend holds true the 1st grade ages will be the most scientifically productive from the standpoint of money and effort expended.

Experimental Transmisison of Semliki Forest Virus by Anopheline Mosquitoes

William E. Collins, *U. S. Public Health Service* *

Semliki Forest Virus has been reported by other workers to be transmissible in the laboratory by *Aedes aegypti* L. and by *Aedes togoi* Theo. Transmissions have been obtained in this laboratory by the use of anopheline mosquitoes. The virus titers, infection rates, and transmission rates reported for *Anopheles quadrimaculatus* and A. *albimanus*. The significance of transmission of this virus by anopheline mosquitoes is discussed.

The Life History of *Heterobilharzia americana* Price, 1929

Nathan D. Greene, *N. C. State College*

Heterobilharzia americana (Trematoda: Schistosomatidae) is a common parasite of raccoons in the Coastal Plain of North Carolina. The adult flukes live in the hepatic sinuses, hepatic portal vein and branches of the superior mensenteric vein. Eggs pass through the intestinal wall and out of the body with the feces. In water, they hatch immediately into ciliated miracidia characterized by 2 pairs of flame cells and an epidermal plate pattern of 6:8:4:3. The intermediate host in *Lymnaea columella,* in which there are two generations of sporocysts. Cercariae are produced 31 to 39 39 days following exposure. The cercaria is of the apharyngeal, brevifurcate distome type with a flame cell formula of 2(3+2)(1), 5 pairs of penetration glands, spinose body and tail stem, a pair of eyespots, and furcal fin folds. Cercariae enter the final host by direct penetration. The prepatent period in raccoons is 77 days, and in dogs, 66 days.

Effects of Exposure to Light and to Temperature on the Annual Cycle for Fat and Lean Weight of *Bufo fowleri*

Francis M. Bush, *Howard College*

During the annual cycle a 1½ to 2-fold increase occurred in the average quantity of fat (% dry wt) in 258 toads (14.1-28.0), their livers (22.6-32.8) and their carcasses (11.7-19.8). The amount of ovarian fat remained about the same (27.1) despite the relative ovarian weight decreased significantly from March (26.6% live wt) to June (6.6) and to September (9.0). Absolute fat in the dry fat-bodies increased 28-fold (23-650 mg) and the dry weight of the lean livers more than 3-fold (71-266 mg).

Toads (13-33) were kept in boxes for 60 days (May-July, 1960; April-June, 1961) at 21 ± 1° C on 4 light/24 hrs (average amount of fat = 26.5% dry wt), 8L (29.5), 12L (31.8), 16L (33.6), 20L (31.3) and at 31 ± 1° C on 4L (33.3), 12L (28.1) and 20L (29.6). Toads on all photoperiods at 31° C and those on 12L, 16L, and 20L at 21° C possessed absolute dry weights for total fat, the fat of the liver and the fat-bodies larger than September toads whose weights were still larger than those on 4L and 8L at 21° C. All toads at 31° C had larger absolute dry weights of the lean bodies, the lean livers and the lean ovaries than the September toads and those at 21° C. Additional support was given to these results once the initial weights of the toads were equated by an analysis of variance and least-square means computed for the components were subjected to a range test.

The data suggest that increased temperature, rather than increased light, caused the enlargements, particularly in the lean dry weights, while exposure to increased light caused primarily the storage of fat and then enlargements in the lean dry weights.

The Effects of Various Larval Diets on Biting Rate and Longevity in the Mosquito *Aedes aegypti* (L.)

James D. Stidham, *University of Tennessee*

Larvae of the yellow fever mosquito *Aedes aegypti* (L.) were given various diets ranging from a high protein diet on the one extreme to a low-intake partial starvation diet on the other. The differences in amount of food given in the several diets caused a wide variation in larval life span and consequently in emergence of adults. Both mated and unmated females were used from each

larval diet and biting rate, longevity, egg production and individual weight of the adults were obtained. All experiments were carried out under uniform conditions, the adults being reared in a constant temperature laboratory at 80° F and 80% humidity. The results of the above will be given.

Electrophoretic Analysis of the Serum Proteins of *Citellus* Species: Taxonomic Implications

Rondal E. Bell, *Millsaps College*

Filter paper electrophoresis yields results that seem to have value for taxonomic studies. Electrophoretic patterns of serum from four species representing three subgenera of the genus *Citellus* were compared. Although individual variations exist, the electrophoretic patterns show distinct species variations in mobility, relative proportions of electrophoretic fractions, and failure to show good resolution of the components. In general, similarities of the patterns tend to verify existing taxonomic relationships.

A Hypothesis for Eventual Failure of Antileukemic Agents Against Experimental Mouse Leukemia *

J. Richard Thomson, *Southern Research Institute*

A quantitative bioassay for L1210 leukemic cells in mouse tissues and fluids has been developed in our laboratories, (Cancer Research 21 (9) pp 1154-64, 1961). There appears to be a direct relationship between the number of leukemic cells inoculated into appropriate inbred mice and their respective life spans.

The usual experimental inoculum of L1210 leukemic cells (1×10^5 to 1×10^6) given intraperitoneally in mice will uniformly kill the animals in six to eight days and small numbers of these cells can be detected by bioassay methods in various tissues and organs shortly after inoculation. Detectable numbers of leukemic cells appear in the brain in two to four days after intraperitoneal inoculation. The rate of appearance in the brain appears to be associated with the size of inoculum employed.

Amethopterin (an antimetabolite of folic acid) will effectively increase average life span of these animals to greater than 100% above untreated controls. If treatment is delayed until intracerebral infiltration has occurred, only slight life span increases are observed. In addition, if as few as 100-1,000 cells were inoculated intracerebrally and intraperitoneal therapy begun twenty-four hours later, Amethopterin (and other agents which uniformly markedly increase life span if the leukemic cells were inoculated intraperitoneally or intravenously) failed to show significant life span increase in the mice so inoculated. The ultimate failure of presently known anticancer agents may be related to the inability of these effective agents to cross the so called "blood brain barrier" thereby leaving growing (enlarging) foci of leukemic cells in the brain which are unaffected by antileukemic drugs and serve as a persistent source of peripheral leukemic cells which materially contribute to the death of the animals.

* This work was supported by a grant from the American Cancer Society.

Spermatozoa of Amphiumae: Spermateleosis, Morphology, Helical Motility and Reversibility

Clinton L. Baker, *Southwestern College*

Acrosome is an elongated cone fitting over anterior extension of the nuclear membrane (perforatorium); observed best after treatment with periodic-acid Schiff method. A granule and ring (proximal and distal centrioles of others) appear in spermatid independent of meiotic centrioles. Axial filament arises from granule and is not homologous in structure, origin or function to flagellar filament of non-urodelean sperm. Neck piece anlage forms from nucleus and remains within nuclear membrane. The ring encircles the axial filament in the spermatid, never divides, and elongates down middle piece. Flagellum is margin of undulating membrane. Mitochondria of middle piece are observed after tetrazolium salt reaction. Motility results from flagellar planar wave movement, yet helical shape of sperm causes helical motility. Reverse waves of flagellar movement, observed by motion pictures, result in reverse motility that may be as rapid and as directive as normal forward movement.

The Effects of Colchicine upon the Olfactory Epithelium

Irving Ricardo Martinez, Jr.,
Louisiana State University School of Medicine

It has been reported by LeGros Clark that if one olfactory bulb is removed, 50% of the receptors on the affected side degenerate after three days. Similar results were reported by Martinez, removing both bulbs in order to determine if there was any interrelationship between receptors and bulbs of the opposite side.

If 0.123 mg/kg of colchicine is injected intraperitoneally into a rabbit, striking degeneration of the olfactory epithelium occurs within 24 hours. Within three days one finds that there now remains in the epithelium less than half of the normal population of receptors. Progressive degeneration occurs until the fourteenth day, and now the receptors are no longer visible, except in the form of granular lines.

It is apparent from the results that some of the receptors undergo immediate degeneration, and some are residual at least up to ten days. These results are similar to those of LeGros Clark, following removal of one bulb, and Martinez, following removal of both bulbs.

The above information contributes to the suggestion that functional differences reflected in the biophysical structure or biochemical constitution may be an important factor in determining the degrees of selective degeneration of the olfactory receptors.

Migratory Behavior of Pigment Cells in the PET Mouse [1]

Willie M. Reams and Thomas C. Mayer,[2]
Louisiana State University

In an attempt to correlate the occurrence of melanocytes in the musculature of the posterior compartment of the leg with their interfollicular occurrence in the skin over the same region, autoplastic exchanges of skin were made in newborn PET mice. Since melanocytes are lacking interfollicularly in the skin and in the muscles of the abdomen, skin from the belly was exchanged with the pigment cell laden skin from the posterior surface of the leg in the hope that there might be an invasion of pigment cells into the belly muscles. Although no such invasion occurred, the behavior of pigment cells in the skin of the graft areas was of interest. It was noted that there was an invasion of belly skin by pigment cells from a graft of leg skin. However, no migration of pigment cells occurred into a graft of belly skin when made into the pigment cell rich posterior leg skin. These data with those from previous investigations seem to indicate that although the overlying skin may possess a reservoir of pigment cells capable of migration, the invasion of muscle by pigment cells occurs at a specific

stage in embryonic development. The factors involved in the differential migratory behavior of pigment cells in the skin grafts and the localized occurrence of melanocytes in the leg muscles will be discussed.

The Drug Response Correlation of Some Experimental Animal Tumors and Certain Classes of Human Cancer

Jack H. Moore, *Southern Researeh Institute*

There is evidence (Cancer Research Vol. 21, No. 6, Part 2, pp. 235-339) that some experimental animal tumor screening systems will select classes of drugs which are temporarily useful in the treatment of some chronic and acute leukemias and a small number of other types of human cancer. There are also animal tumors which, like some important forms of human cancer, respond to no known drug at tolerated doses, so it would appear of considerable importance to study carefully the compiled data correlating the drug response of "animal cancer" and "human cancer."

A brief review of the sensitivity of certain "human" and "animal" neoplasms, which respond to various classes of drugs, will be given.

Comparison of Electrocardiographic Characteristics in Vertebrates

B. Theodore Cole, *University of South Carolina*

Electrocardiographic studies have been made on the bullfrog and necturus among amphibians; turtle (including *Terripinnen carolina*, *Chrysemys* sp., and *Trionyx ferox spinitera*) horned toad, glass snake and *Natrix* sp. among the reptiles; rabbit, rat, muskrat, and man among mammals.

All animals included in this report, except man, were anesthetized with nembutal and electrodes placed either directly on various parts of the heart or on the surface of the body. Two active electrodes from the beating heart, or right and left arms and a ground lead on the left hind leg were used. Signals were amplified, sounds recorded on tape and simultaneous photographic record made from the screen of a Tektronix dual beam oscilloscope.

Heart rate in beats/min. in Poikiliotherms (26°-30° ambient temperature) ranged from 25 in the horned toad and glass snake to 107 in the glass snake. Magnitude of positive deflection measured directly from the heart, "R" wave from 0.286 millivolts in *R. catesbeiana* to 4.27 millivolts in *Trionyx*. Negative "Q" and "S" wave deflections ranged from zero in *R. catesbeiana* to 1.41 millivolts in *Natrix* and zero in *Natrix* to 2.11 millivolts in *Trionyx* respectively. The Q-R-S interval in Poikiliotherms as a group ranged from .004 seconds in *Phgrnosoma* to 0.016 seconds in Trionyx, as compared to a low of 0.019 sec. in the muskrat to 0.082 sec. in man among Homiotherms.

Heart rate in beats/min. in Homiotherms ranged from a high of 290 and 316 in rabbit and rat respectively to a low of 62 in man. The muskrat was intermediate with a rate of 172 beats/min.

Capacity of Spleen Cells to Respond to Antigen and to Proliferate after Sublethal Irradiation

Martha R. Leonard, *Oak Ridge National Laboratory*

Following sublethal X irradiation, the immune mechanism of mice is suppressed. The degree of suppression is dose-dependent. To investigate the antibody-forming capacity of cells during secondary response following irradiation, an *in vivo* tissue culture technique was used. At regular intervals a constant number of spleen cells from preimmunized irradiated mice was transferred intravenously into lethally irradiated, isologous, recipients and the secondary antigenic stimulus given simultaneously. Five days later the antibody titers were determined. The greatest rate of recovery in antibody synthesis following 150, 300 and 500 r occurred during the first 7 days after irradiation. Proliferation of the spleen cells during recovery from 500 r was studied by means of tritiated thymidine. When sublethally (500 r) irradiated mice were secondarily stimulated with the test antigen immediately after irradiation and labeled either immediately before or after exposure, the proliferation of spleen cells was depressed. However, the capacity of cells labeled 2 or 4 days after irradiation was normal. It can be concluded that the rate of recovery of the immune mechanism is greatest during the first 7 days after irradiation, during which time there is also the greatest change in spleen cell proliferation.

Chronological Study of Deciduomata in Hamsters

John G. Turnbull and George C. Kent, Jr.,
Louisiana State University

Day 1 is herein defined as the first twenty-four hours after sterile mating, Day 2 as the second twenty-four hours, etc. In hamsters traumatized at the end of Day 2 the initial decidual cell response (DCR) is evident near the middle of Day 4. The maximal DCR is exhibited during Day 7 and part of Day 8. Necrosis is evident in the periphery before the end of Day 8. By the end of Day 9 the necrotic decidual mass has been extensively undercut by the regenerating uterine epithelium. Four days elapse between the first observable DCR and the first observable necrosis. Fifty hamsters were traumatized. Not all evinced an observable DCR.

Observations on the Formation and Release of Secretory Granules in the Pituitary Gland of the Salamander (*Triturus viridescens*)

Robert R. Cardell, Jr.,
Edsel B. Ford Institute for Medical Research

Electronmicroscopic evidence is presented which indicates that the secretory granules of the pituitary parenchyma cells are formed within the Golgi apparatus and are stored in the cytoplasm of the cell until they are discharged into the blood stream. The discharge of the granules is accomplished by the formation of a cytoplasmic bud, which contains one or more secretory granules, from a parenchyma cell. This cytoplasmic bud protrudes into a pericapillary cell and eventually is pinched off to form a vacuole within the pericapillary cytoplasm. The author proposes that the secretory granules are dissolved while within the vacuole thus releasing the hormone into the pericapillary cytoplasm. The hormone diffuses from the pericapillary cytoplasm into the pericapillary space and finally reaches the blood stream by way of the endothelial cells of the capillary wall. No evidence has been obtained of secretory granules being present within the capillaries, as proposed by previous investigators of the salamander pituitary.

Failure to Maintain Deciduomata with Progesterone in Hamsters

Allen T. Daugaard and George C. Kent, Jr.,
Louisiana State University

Sixty young pseudopregnant female golden hamsters were traumatized on the second day following sterile mating and injected with varying amounts of progesterone

commencing on different days. Twenty-four animals were injected with 1.0 mg, on the day of trauma and daily thereafter until killed on Days 7, 8, 9, 10, 11, or 12. Twelve animals were injected with 1.0 mg, starting on the fourth day after trauma and daily thereafter until killed on Days 9, 10, 11. Twelve animals were injected with 0.5 mg. on the day of trauma and daily thereafter until killed on Days 7, 8, or 9. Twelve animals were injected with 0.5 mg. on the fourth day after trauma and daily thereafter until killed on Days 9, 10, or 11. Subsequent histological examination of the uteri indicated that the life span of the deciduomata (cf. Turnbull and Kent in this issue) was not prolonged by progesterone as herein administered.

Effect of Food Supply on the Egg-laying Date of Junco (*Junco hyemalis*)

James T. Tanner, *University of Tennessee*

Juncos nest in the Great Smoky Mountains at progressively later dates with increasing elevation. This could be a result of temperature affecting the birds, or of temperature affecting their food supply and the availability of food determining the time of nesting. At this season, Juncos feed almost entirely on ground-inhabiting arthropods. The abundance of this kind of food was measured before and during the egg-laying dates at four different elevations. There were very significant differences between the amount of food available at the different elevations at the time egg-laying was initiated at each elevation. This indicates that the food supply is not the factor determining the time of egg-laying.

The Life-Cycle and Ecology of *Elliptio hopetonensis* Lea

Lynn Raulerson, *Howard College*
W. D. Burbanck, *Emory University*

The fresh-water mussel, *Elliptio hopetonensis* Lea, is one of the major faunal forms of Lake Creek, a tributary of the Altamaha River system. The life-cycle of this species is characterized by the development of gametes and fertilization in late summer, an overwintering of developing larvae in marsupial gills, and emergence of hookless glochidia in late spring. Parasitism of fish by glochidia does not appear to be host-specific. The period of parasitism is approximately thirty days, after which glochidia leave the fish to develop as juveniles. Dispersal of this mussel may be accounted for by the movements of infected fish. Adults probably live for a few years, and except for those carried by flood waters, tend to remain in a limited area characterized by a rocky substrate and a abundance of plankton. Usually associated with *Elliptio hopetonensis* is the commensal ciliate *Conchophthirius anodontae* (Ehrenberg).

Comparative Observations on the Behavior of Marine and Fresh Water Turtles

Fred K. Parrish, *Agnes Scott College*

The observations reported below were made as a frame of reference for projected physiological studies to explain certain aspects of turtle behavior. These observations were made on 29 marine turtles (4 species) at Marineland, Florida, and on 11 fresh water turtles (4 species) maintained in a greenhouse tank 1 meter × 3.4 meters with a depth of from 2.5 cm. to 54 cm. Only occasionally did one turtle bite another at Marineland, females being more prone to this activity. The fresh water turtles have ignored each other, despite a wide difference in size. Sea turtles use their foreflippers as "wings" to "fly" through the water; the hind flippers normally serve only as elevators or rudders (when turning). Fresh water turtles use all four feet as paddles held square to the line of motion; fore and hind feet on opposite sides move sychronously. Scratching, which is so characteristic of sea turtles, has been observed in the fresh water forms. The respiratory patterns of sea turtles reported by Parrish, 1958, have been undetectable in fresh water chelonians.

Ecology of the Microbiota of Mission Bay, California, in the Summer of 1961

James B. Lackey, *University of Florida*

Mission Bay and adjacent waters were studied, June-August 1961. The microbiota showed qualitative differences varying from distinctly different poulations in small isolated baylets to a few species in the main bay which were different from the oceanic outer waters. The Bay had its own blooms, some of which were synchronous, but was subject to invasion by oceanic species. Many of these failed to maintain themselves in the Bay. It is evident that many differences exist between Bay and Ocean habitats, but some ubiquitous species are equally at home in either.

A Live-Trap Study of Seed-Eating Mammals

H. E. Shadowen, *Western Kentucky State College*

A 27-month study of small mammals was made in a cutover, shortleaf-loblolly pine-hardwood forest in north Louisiana. Two plots were established, one of which was burned to study the effect of controlled burning on small mammals. One hundred live traps were used on each plot. Animals were trapped, marked, and released. Length of trapping periods varied from five to six days. Species trapped included *Peromyscus nuttalli*, *Peromyscus gossypinus*, *Reithrodontomys fulvescens*, *Pitymys pintorum*, and *Blarina brevicauda*. The two species of *Peromyscus* were retrapped in sufficient numbers to calculate home range and density. The mean home range of *Peromyscus nuttalli* was 1.31 acres, and the highest trap-revealed density was 2.79 mice per acre. The mean home range of *Peromyscus gossypinus* was 1.12 acres, and the highest trap-revealed density was 1.22 mice per acre. The controlled burning of one plot had a negligible effect on the small-mammal population.

Crater Density and Above-Ground Activity of Two Dominant Old Field Ants

Arnold Van Pelt, *Tusculum College*

For the past twelve years investigators associated with the University of Georgia Ecological Research Team have been intensively studying and analyzing the dynamics of abandoned crop fields on the Savannah River Plant, South Carolina. Ants are a dominant animal form in these old field situations. To learn more of the role of ants in the old field community dynamics, the present investigations were carried out during the summer and fall. Density of one of the two dominant ant species, *Dorymyrmex pyramicus*, as expressed by the number of craters present, increased to a maximum in September. The greatest density of *Dorymyrmex* craters was in a portion of a field in which the *Andropogon* clumps were discrete and well-spaced. *Pogonomyrmex badius*, the other dominant ant, maintained fewer nests; the most favorable areas for the mounds were well-drained slopes. *Dorymyrmex* averaged one crater per 2.7 square meters, and in contrast, there was a *Pogonomyrmex* nest for approximately every 820 square meters.

In *Dorymyrex*, optimum temperature for above-ground activity was 40° C., while 57° C. caused a diminution or cessation of activity. These ants remained active

at night, but driving rain sometimes caused activity to stop. *Pogonomyrmex* will cease their activity at temperatures above 50° C., and at night.

Taxonomic Characters of Some Species of *Matelea* (Asclepiadaceae)

C. Ritchie Bell, *University of North Carolina*

The ten currently recognized species of *Matelea* found in the southeastern United States have been variously treated by Small, Fernald, Alexander, and others, as components of five different genera: *Gonolobus, Cyclodon, Edisonia, Odontostephana* and *Vincetoxicum.* Plants of two of the ten species have smooth, angled follicles; plants of the other eight species all have muricate follicles and present an interesting pattern of centrifugal variation centering on the polymorphic *Metelea carolinensis.* Plants of four of the eight species, *M. carolinensis, M. floridana, M. flavidula,* and *M. alabamensis,* have few-flowered inflorescences and spreading petals under 10 mm. long; plants of *M. obliqua, M. decipiens, M. Shortii* and *M. Baldwyniana* have many-flowered inflorescences and erect petals over 10 mm. long. *M. flavidula, M. alabamensis,* and *M. Baldwyniana* are yellow flowered, *M. obliqua* rose flowered, and the others have maroon flowers. No cytological information is yet available.

Vascular Flora of the Carolinas

Albert E. Radford, *University of North Carolina*

Of the 175,000 specimens collected in the field exploration phase of the flora project 140,000 are now mounted and filed in the herbarium. The identification and mapping of the Carolina Flora is essentially complete. Over 900 genera have been illustrated. The keys are now being tested by students for manual publication. About 30% of the descriptions of the 3,000 species have beeen written. Ranges, habitats and synonymy have been worked out for over 50% of the species. The edited manuscript should be ready for the publisher by August 1, 1963.

Paper Chromatographic Studies of the Biochemical Profiles of *Tradescantia* Species

James F. Matthews, *Emory University*

Recent studies of the biochemical components of related species as determined by the application of paper chromatographic methods have demonstrated many chemical similarities, as well as some differences. Such a study of four North Central Georgia species of Tradescantia has been carried out. These exhibit morphological and physiological differences. Chromatograms of these species have shown many similarities as well as some differences in the biochemical makeup of the plants. Acid ethanol extracts of leaves and roots, spotted on Whatman No. 1 filter paper and developed in descending manner with a water saturated phenol-ammonia solvent has proved to be the most satisfactory method. Detection of the biochemical profiles was best accomplished by the use of ultra-violet light and by dipping in ninhydrin-pyridine. Ninhydrin reacting components (amino acids and indoles) and fluorescent components ("secondary substances") have proven more suitable in the biochemical taxonomy of *Tradescantia* than have the phenols, sugars, or organic acids. This work was supported in part by AEC Contract AT-(40-1)-2669.

The Endemic Botrychiums of the Southeastern United States

W. H. Wagner, Jr.,* *University of Michigan*

Three species of grapeferns (Botrychium) in Sect. Sceptridium are especially characteristic of the southeastern United States—*B. alabamense, B. biternatum* (syn. *B. tenuifolium*), and *B. lunarioides* (syn. "*B. biternatum*" by misapplication of name). The traditional problems concerning them have been (a) whether *B. biternatum* is a species distinct from the wide-ranging *B. dissectum;* and (b) whether *B. alabamense* is distinct from *B. lunarioides.* Both of these problems have been investigated in field work in Maryland, Indiana, Kentucky, Tennessee, South Carolina, and Alabama, as well in herbarium and laboratory studies. The new evidence, especially from mass collections of local populations, indicates that *B. dissectum* and *B. biternatum* are distinct, though closely allied, species which grow sympatrically nearly throughout the area. *Botrychium lunarioides* is the most peculiar species in the group; it is rare and little-collected. *Botrychium alabamense* is a valid and distinct species. However, it is intermediate between *B. lunarioides* and *B. biternatum* morphologically; and cytological evidence supports the view that *B. alabamense* may be an allotetraploid that arose from hybridization.

* Research supported by National Science Foundation-Grant G-10846, and field cooperation of Paul Biebel, John L. Frierson, G. S. Jones, D. E. Rawlings, Dale M. Smith, R. H. Wiley especially.

Experimental Approaches to Taxonomic Problems in Southeastern *Phlox*

Russell Aiuto, *University of North Carolina*

Within the genus *Phlox,* the subsection *Ovatae* has three taxonomically difficult species (*P. carolina, P. glaberrima, P. maculata*) forming a complex in the Southeastern United States. Wherry (1955) admits the extent of the problem by recognizing 12 taxa and 20 variants within the six species of the subsection, while rejecting 23 names as synonyms. In all cases purely morphological criteria appear to break down in the presence of the many intermediates found in nature. Thus preliminary considerations indicate the possible existence and taxonomic value of more subtle differences, or lack of differences, due to hybridization, polyploidy, and/or ecotypic responses, areas all apparently unexamined in this genus. Therefore, some of the aspects which are under study in an effort to determine the paths of evolution and speciation of the *Phlox carolina* complex are pollen morphology and viability, chromosome number, ecotypic responses, crossability, statistical relationships, and biochemical differences.

Southeastern American "Blackstem Spleenworts" of the *Asplenium heterochroum-resiliens* Complex

Virginia M. Morzenti and W. H. Wagner, Jr., *Northeastern Michigan College and University of Michigan*

Asplenium heterochroum has been commonly confused with *A. resiliens* but they are distinct species. Research on them, as they occur in the southern United States, especially Florida, indicates that there are actually at least four different elements in the complex. *Asplenium resiliens* is an apogamous fern, with a sporophytic chromosome number of 108 and a gametophytic number of 108, and lacks sexual fertilization. *Asplenium heterochroum,* on the contrary, is a sexual species; but there are two types—one of them, a plant generally small in stature, which is tetraploid ($2n = 144$); and the other, larger, which is hexaploid ($2n = 216$). No evidence, thus far, of the existence of diploid forms of *A. heterochroum* has been found in Florida, but spores of certain collections from the islands of the Caribbean suggest that diploids may exist there. The most peculiar plant of the four Floridian representatives of this complex is a pentaploid apogamous spleenwort (in which both "$2n$" and "n" = 180) which is morphologically intermediate between *A. heterochroum* and *A. resiliens,* and which

probably represents a new species, heretofore unrecognized in North America.

* Research supported by National Science Foundation G-10846 and based upon materials supplied by Thomas Darling, Jr. and E. S. Ford.

Origins of the Yellow-Flowered Cooperias and of *Zephyranthes refugiensis*

R. O. Flagg and W. S. Flory
The Blandy Experimental Farm, University of Virginia

The first yellow-flowered *Cooperia* was described from Brownsville, Texas, in 1939. In 1950 another was described from the Texas coastal bend. Morphological, cytological, ecological, distributional and genetical data indicate that these two clearly distinct and quite fertile "species" arose as natural hybrids between different forms of *C. drummondii* Herb. and *Zephyranthes aurea* Wats. Variation in the Brownsville complex has been somewhat limited by apomixis producing the illusion of well defined "specific" boundaries. Some backcrossing has complicated the history of the coastal bend complex. Outcrossing to *C. traubii* Hayw. has given it reticulation. It is now apparent that three nothomorphs were described as species: *C. smallii* Alex. (1939), *C. jonesii* Cory (1950) and Z. *refugiensis* F. B. Jones (1961). The existence of fertile hybrids, both natural and artificial, is interpreted as supporting the inclusion of *Cooperia* in *Zephyranthes*. Synonymy and necessary nomenclatural changes are presented. The work was supported by N.S.F. Grant G-11080.

The Flora of Bourbon County, Kentucky

Edi Guhardja and E. T. Browne, Jr.,
University of Kentucky

Bourbon County lies in the "Blue-grass" region of Kentucky. There are several reasons for the study of this county: It is a fertile region, it lies near the University of Kentucky, and very little is known about its vegetation. The climate is temperate, with moderate sunlight, heat, moisture, and wind, regular rainfall, and long growing season. The geologic materials of the county belong to the Ordovician Period and contain limestones, calcareous shales and siltstones. In the western part the maior soil association is the "Inner Bluegrass" with undulating to gently rolling topography, whereas the northern part is the "Hills of the Bluegrass," with hilly, winding ridges and valleys, and steep topography.

The natural vegetation is primarily deciduous forest and grassland. A study of earlier and recent collections shows many species of: Aceraceae, Asclepiadaceae, Caprifoliaceae, Compositae, Cruciferae, Euphorbiaceae, Fagaceae Gramineae, Juglandaceae, Labiatae, Leguminosae, Moraceae, Oleaceae, Rosaceae, Salicaceae, Scrophulariaceae, Solanaceae, and Vitaceae.

Zephyranthes atamasco and Z. *treatiae*

W. S. Flory and R. O. Flagg,
The Blandy Experimental Farm, University of Virginia

No floral character has been found which separates *Zephyranthes atamasco* and Z. *treatiae*. The two are cytologically indistinguishable. Their characters vary with environmental conditions. The question is raised and discussed as to whether the differences encountered in the two taxa are not nutritional and ecological, rather than genetical. (Work supported by N.S.F. Grant G-11080.)

Observations on the Structure and Development of the Fresh-Water Red Alga, *Boldia*

Wayne Nichols and Walter Herndon,
University of Tennessee

Boldia, a recently discovered bangiodean alga, develops from monostromatic discs of branching filaments united in a common matrix which become cushion-like and ultimately produce saccate thalli up to 20 cm. in length. Monospores are produced from narrow branching filaments (derived from vegetative cells) which form a reticulate pattern in the intercellular matrix at the juncture between groups of vegetative cells. After liberation, monospores produce small prostrate branching filaments with occasional erect branches (which may liberate additional spores and reproduce this phase) or they develop directly into the monostromatic discs which produce the saccate thallus. In monospores (liberated from the mature thalli in prophase) the chromosome number was determined as 8 ± 1. While certain features of *Boldia* are comparable to *Prophyra* and other bangiodean algae, in structure and life cycle it is unique among the Rhodophyta.

Differences in Spore Appendage Formation Among Species in the Genus *Robillarda*

Lafayette Frederick, *Southern University*

Critical studies of spores representing species of *Robillarda* reveal a basic difference in the the manner of appendage development. In some species appendage formation results from protrusive outgrowths at the apical end of the spore. During the early stages of development appendages of this type are filled with cytoplasm. At maturity a septum forms at the base of the pedicel of the appendage and the three, long, tapering branches lose their cytoplasm. In other species of *Robillarda* appendages are not the result of apical protrusions. Instead, appendages appear to represent recurved strips of the wall of the conidiophore in which the spore forms. As the spore develops it appears to remain attached at its apical and to a point inside the tip of the conidiophore. Upon discharge, 3 long, slender, translucent strips of the conidiophore wall remain permanently affixed to the spore apex and become extended as tri-radiate branches. As a result of the differences in appendage formation, in combination with other concommitant morphologic variations, it is clear that certain species presently assigned to *Robillarda* are not congeneric.

Some Interesting Mosses in Tennessee

A. J. Sharp, *University of Tennessee*

Archidium ohioense previously reported from limestone in Middle Tennessee has been collected in Knox County. Two new records for Tennessee include *Physcomitrium collenchymatum* collected by Mr. Alfred Clebsch in Montgomery County and *P. kellermanii* from Meigs County.

Observations on the Fine Structure of *Protosiphon* *

Walter Herndon, *University of Tennessee*,
Delbert Philpot, *Boston University*
and Charles O' Kelley, *University of Alabama*

Cells of *Protosiphon botryoides* grown in an inorganic medium were killed and fixed in 2% $KMnO_4$, embedded in Vestapol, sectioned and examined with the electron microscope. Young cells are in many respects similar in fine structure to *Chlamydomonas*. The chloroplast is

surrounded by a double envelope and comprised of lamellar discs some of which partially or completely traverse the pyrenoids at the junctures of starch plates. The nuclear membrane is perforate and double; nuclear cysternae are apparently continuous with an endoplasmic reticulum. The golgi complex is prominent and is replicated as the cells become multinucleate. The lamellar discs of plastids of larger vacuolate cells penetrate narrow cytoplasmic strands but even when one or few in number are bounded by the double envelope. Preliminary comparisons of the morphology of cells grown under similar conditions but with Sr replacing Ca in the medium indicate that, the lamellar discs are more widely separated (and frequently serpentine), the mitochondria are enlarged and the walls, of different structure.

* This research supported in part by grant A-3680 of the National Institute of Arthritis and Metabolic Diseases.

Some Fungal Parasites of *Pythium* from Texas Soils *

Charles E. Miller, *Texas A & M*

During early summer, 1961, a search for two plasmodiophoraceous parasites of *Pythium* was made. Dry soil collections from fields and pastures from many localities in the State of Texas were "baited" with organic substrates; these substrates were searched for host and parasitic fungi. Isolates of *Pythium* were found in 43% of collections examined. One species, *P. pulchrum* von Minden, was isolated several times. Other species collected are still being identified. Both plasmodiophoraceous parasites sought were found, *Woronina pythii* Goldie-Smith and *Sorodiscus cokeri* Goldie-Smith. *Pythium* parasites, *Olpidiopsis pythii* (Butler) Karling and *O. gracile* (Butler) Karling, were also collected. An isolate of the genus *Petersenia*, an infrequently found parasite of water fungi and marine algae, was found parasitizing *Pythium intermedium* de Bary. This isolate is new to science and is presently being described.

* Supported by a grant from the Texas A & M Research Fund.

The Non-Crustose Lichens of Two Localities in Alabama

Herbert A. McCullough, *Howard College*

The foliose and fruticose lichens of the Yellowleaf Narrows in Shelby County and the Howard College Natural Area in Jefferson County were studied as a preliminary to a survey of the lichen distribution and ecology in the state of Alabama. The Yellowleaf Narrows, a gorge cutting through rocks of the Pottsville formation, shows thirty species distributed in thirteen genera with the rocks of the area being covered chiefly with *Parmelia isidiata* and *Parmelia caparata*. The vertical cliffs of the area are most frequently covered with the crustose form *Crocynia membranacea*. The Howard College Natural Area is a region of oak-hickory forest covering rocks of the Parkwood formation. In this sixty-acre tract, forty-three species distributed in fourteen genera have been located. The predominate genus in the area is *Parmelia*.

Cytology and Development of *Compsopogon Coeruleus* in Culture

H. Wayne Nichols, *Univ. of Alabama*

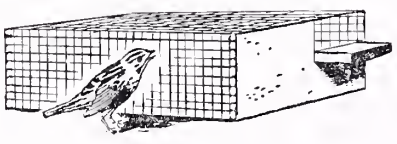
In *Compsopogen coeruleus* variations embracing several species has been observed in clonal cultures. Cells of the thalli are typically uninuclcate but may be multinucleate when forming sori. The chromosome number was determined as 6 ± 1. Soral spores (microaplanaspores) originate from a vegetative cell by progressive cleavage, other monospores originate singly. The spores in either case develop into morphologically indistinguishable plantlets. On the basis of the variation observed in sporangia, Drew-Baker's classification of sporangial types seems impractical. Germination processes also vary in this single species and most probably depends on the substrate on which the spores germinate. New cell walls are formed centripetally and when incomplete appear as pits; however, these are not homologous to pits commonly found in the Floridiophycidae. Chromatophores vary with the age of the cells; younger cells have a sheet-like parietal chromatophore and successive divisions result in discoid plastids connected by cytoplasmic strands.

Some Aquatic Phycomycetes of the Mountain Lake Locale *

Charles E. Miller, *Texas A&M*

The latter part of the summer, 1961 was spent at Mountain Lake Biological Station, Virginia studying some aquatic Phycomycetes of that region. Twenty-five species, collected by "baiting" water and soil collections with sweet gum, pine and corn pollen, hemp seeds, shrimp exoskeleton and human skin were identified and studied. Also found during this study are what appear to be new species of *Rhizidium*, *Chytridium* and *Rhizophydium*. In addition, several very interesting collections of a dentigerate *Rhizophydium*, with the sporangial ornamentation varying in number from none to a great many and in form from a simple pointed enation to a bipartite tooth-like structure, were found. This fungus, growing on pollen and skin, resembles *R. keratinophilum* Karling. Other interesting species identified include *Cladochytrium tenue* Nowakowski, *C. replicatum* Karling, *Chytridium rhizophydii* Karling, *Septosperma rhizophidii* Whiffen, *Phlyctidium mycetophagum* Karling, *Pythium carolinianum* Matthews, *Zoophagus insidians* Sommerstorff and *Rhizidiomyces hirsutus* Karling.

* Supported by a National Science Foundation Grant-in-aid administered by the Mountain Lake Biological Station.



Items of Interest: The Winston-Salem Meeting

The Host Institution

Wake Forest College, a Baptist affiliated college, was formally chartered in December, 1833, by the North Carolina State Legislature as Wake Forest Institute. Sixteen students attended the opening classes. In 1838 the institution was rechartered Wake Forest College, and the first four degrees were conferred in June, 1839.

The College was exclusively a college of liberal arts until 1894 when the School of Law was established; the School of Medicine was added in 1902, the School of Business Administration in 1948, the Division of Evening Classes in 1957, and the Division of Graduate Studies in 1961. In 1942 the College became co-educational.

Wake Forest College was located in Wake Forest, North Carolina until June, 1956. In 1946 the Trustees of the College accepted an offer of $350,000 annual perpetuity made by the Z. Smith Reynolds Foundation on the condition that the College be relocated in Winston-Salem, North Carolina. Friends of the College donated time, money, and land toward establishment of the College. In October, 1951, groundbreaking ceremonies were held with the President of the United States delivering the principal address. Construction started the following spring. The actual move from Wake Forest to Winston-Salem took place in May and June of 1956. It attracted national interest. The Bowman-Gray School of Medicine of the College had been moved to Winston-Salem in 1941. The old campus and buildings now house the Southeastern Baptist Theological Seminary.

Winston Hall, the most recently completed addition to the campus, was dedicated in November, 1961. The building, completely air-conditioned, is equipped with conduit, control room and studio for the addition of closed-circuit television facilities, constant temperature rooms, a walk-in incubator, a radiology room, wet and dry animal preparation rooms, and a small, holding greenhouse. Thematic aspects of Biology and Psychology have been used in the building decor, such as the fossiliferous stone facing of the foyer.

Lodging

The January issue of the Bulletin contained a partial listing of hotels and motels situated in the Wake Forest area. If your reservations are still not made, write or call the Local Arrangements Chairman, and the necessary arrangements will be made. The majority of the members will probably stay at the Robert E. Lee Hotel. We understand that ample space remains.

Registration

Registration will be held Thursday, April 12, from 2:00 p.m. to 7:45 p.m. and on Friday, April 13, from 8:00 a.m. to 11:00 a.m. in the lobby of Winston Hall. A $1.00 registration fee will be charged. Beta Beta Beta representatives will register Friday, April 13, from 2:00 p.m. to 5:00 p.m. in the lobby of Winston Hall.

Families Attending

Special thought has been given to an agenda of interest to families of members attending the meeting. A chartered bus will be provided to transport this party to restored Old Salem, Reynolda Gardens, and the newly completed R. J. Reynolds Cigarette Plant. Luncheon will be available in the Magnolia Room of Reynolda Hall, at nominal cost, and time permitted for a tour of the Wake Forest campus. Those interested will be requested to meet and register in the Robert E. Lee Hotel lobby, leaving by bus at 9:30 a.m. and returning around 3:30 p.m.

Exhibits

We are extremely pleased with the exhibits this year. Eighteen or more firms will be represented, and we anticipate an outstanding display of books and equipment. The exhibits will be located in six rooms on the main floor. To further aid your enjoyment of the exhibits, coffee and soft drinks will be provided.

Banquet

The Friday night ASB banquet will be held in the main ballroom of the Robert E. Lee Hotel. Tickets for the dinner will be available only during registration at a cost of $4.25 per person. Wives of members are welcome. Since this is the 25th anniversary of the ASB founding, we are anticipating an interesting general session following the dinner.

Field Trip and Tours

A combined zoological-botanical field trip is planned for Saturday, April 14. The group will visit Hanging Rock State Park and surrounding areas. Members are requested to sign up for this trip at the time of registration.

For parties interested in seeing Old Salem, Reynolda Gardens, and the new Reynolds Cigarette Plant, the open hours are as follows:

Old Salem, Mon.-Sat., 9:30 a.m. to 4:30 p.m., admission $1.50

Reynolds Plant, Mon.-Fri., 8:00 a.m. to 3:00 p.m., 6:00 p.m. to 10:00 p.m., no charge

Reynolda Gardens, daily, all hours, no charge

Parking Facilities

Free overnight parking (5:00 p.m. to 9:00 a.m.) is accorded guests of the Robert E. Lee Hotel. There will be a day-time charge. Large parking areas will be available to ASB members on the Wake Forest campus. One lot adjacent to Winston Hall will be reserved for member use. Bus service is poor.

Local Arrangements Committee

Members of the Committee of local arrangements at Wake Forest College are Dr. C. M. Allen; Dr. H. G. Britt; Dr. E. C. Cocke; Dr. J. E. Davis; Dr. J. F. Dimmick; Dr. R. P. Higgins; Dr. D. W. Johnston; Dr. J. C. McDonald, chairman; Dr. A. T. Olive; and Dr. R. L. Wyatt.

Map of the Winston-Salem area, showing Wake Forest College and other points of interest to ASB members.

Terra Alta Biological Station

Earl L. Core

West Virginia University plans to open for its first season during the summer of 1962 a new instructional and research facility, The Terra Alta Biological Station. The name *Terra Alta* has a double significance, indicating the location of the Station (elev. 2,575 ft.) on "high land" atop the Allegheny Mountains, as well as designating the post office address. Terra Alta, a town with a population of 1,504 (1960 census), is within two miles of the Station.

The first session of the new Station is scheduled to begin July 23 and end August 24, 1962. Dr. Herald D. Bennett, professor of biology at the Univerity, will be the first director of the Station and will offer courses in Plant Communities and Taxonomy of Vascular Plants. Robert L. Birch, instructor in biology, will give courses in field zoology. In addition, there will be opportunities to study special topics or to pursue research. Abbreviated sessions will be held during the first few years but later it is expected that the Station will remain open throughout the summer months.

Transportation facilities providing access to the Station are excellent. While the Station itself is hidden from view in the center of a 60-acre tract of wooded land, the property borders on a paved road and is only one mile from a main state highway, W. Va. Route 7, with through bus service. The main line of the Baltimore & Ohio Railroad passes through the town of Terra Alta and a passenger depot is located only two miles from the Biological Station. Scheduled plane service is available at the Morgantown airport, an hour's drive away, and a small airport for private planes is located at Terra Alta itself.

Although to a considerable extent the Station's facilities are of a temporary nature, its basic utilities, including water, sanitation, electricity, gas, and telephone service, have already been installed and the educational unit is a "going" concern. Faculty and students will be subjected to some inconveniences for a few seasons, but modern laboratories and residences are being planned to replace temporary buildings now available. The location of the Station, only an hour's drive from the main campus of West Virginia University, renders the libraries, medical center, and other services of the University readily accessible.

Terra Alta Biological Station is virtually ideally located with respect to the diversified plant and animal habitats of the mid-Appalachian region. Its high Allegheny Mountain situation is less than an hour's drive from forests of spruce and northern hardwoods. The western slopes of the Appalachians, with an annual rainfall up to 65 inches, provide ample opportunities to investigate cove hardwoods and other mixed hardwood forest types. The eastern slopes, with annual rainfall as low as 30 inches, support the more sparse oak-pine forests of the Ridge and Valley province. Fascinating shale barrens, with endemic species, are less than 50 miles away. Aquatic life may be studied in Terra Alta Lake, a 5-minute walk from the Station, or in Deep Creek Lake, 20 miles away in Garrett County, Maryland. For stream studies there is Cheat River, 10 miles to the west, or the Potomac River, with numerous large tributaries, only a few miles

to the east. Interesting bog communities are in Cranesville Swamp Nature Sanctuary, 8 miles from the Station, where an "island" of northern life exists as a relict colony in a southern latitude. Spruce Knob (elev. 4,860 ft.), the highest point in West Virginia, is about 75 miles by road south of the Station. Intriguing grassy balds, as yet inexplicable, and desolate heath barrens, on the high Appalachian summits, are accessible by automobile. Mt. Davis (elev. 3,213 ft.), the highest point in Pennsylvania, is about 50 miles away, while the highest point in Maryland, Backbone Mountain (elev. 3,340 ft.) is within 30 miles.

Numerous publicly owned and protected areas are conveniently located. The northern boundary of the Monongahela National Forest is less than 15 miles away. Coopers Rock State Forest and Mont Chateau State Park are 25-30 miles away, Blackwater Falls State Park is 30 miles away; Cathedral State Park, with a stand of virgin hemlock, is 12 miles away. Just across the state line, in Garrett County, Maryland, are Swallow Falls State Forest, Potomac State Forest, Deep Creek State Park, and Savage River State Forest. Laurel Hill State Forest, in Pennsylvania, is within easy reach of the Station by automobile.

Interesting geological outcrops, from Cambrian to Permian, provide habitats for wide diversification of plant and animal life. Limestone, sandstone, and shale formations are abundant, while more unusual quartzite and other formations are available for study. Natural features of biological as well as general interest within relatively short distances from the Station include Blackwater Falls, Canaan Valley, Sinks of Gandy, Blister Swamp, Bald Knob, Roaring Plains, Dolly Sods, Seneca Rocks, Seneca Caverns, the Smoke Hole, the Trough, Ice Mountain, and Greenland Gap. Elevations that may be reached within a 3-hour drive from the Station range from 240 feet above sea level at Harpers Ferry National Monument to 4,860 feet on the summit of Spruce Knob.

Inquiries concerning Terra Alta Biological Station should be sent to Dr. Herald D. Bennett, Director, addressed to Terra Alta, W. Va., during periods while the Station is in session, and to Morgantown during the remainder of the year.

VICTOR MACOMBER CUTTER, JR.

Dr. Victor Macomber Cutter, Jr., 45, Head of the Department of Biology at The Woman's College of the University of North Carolina, died on February 26 at Moses Cone Hospital, Greensboro, North Carolina.

Born in Quiriqua, Guatemala, of American parents, Dr. Cutter received his A.B. degree from Dartmouth College in 1938, and his doctorate from Cornell University in 1941. He came to the Woman's College in 1952 as professor of biology and head of the department. Previously he had been Associate Professor of Microbiology at Yale University, Instructor of Botany at Cornell University, and Lecturer in Botany at the University of Minnesota.

Dr. Cutter's special interest was in the cytology, genetics, physiology, and taxonomy of the fungi. He held successive grants from the National Science Foundation for research on the genetics of fungi, and other grants from the American Cancer Society. Alone and in collaboration with others, he published a number of research papers in his field. He spoke frequently on scientific topics to professional, conservationist, and nature study groups. He was a pioneer in North Carolina in the teaching of science by television.

He was a member of Sigma Xi and Phi Kappa Phi honorary scientific societies, and the Botanical Society of America, Mycological Society of America, Torrey Botanical Club, American Institute of Biological Sciences, and New Hampshire, New York and North Carolina Academies of Science. He was a member of the Executive Committee of the Association of Southeastern Biologists.

Surviving are his wife; daughter, Ann; a son, Victor M. Cutter, III, a brother, Donald Cutter, of Hanover, New Hampshire; and a sister, Mrs. Harold Levenberger, of Falls Church, Virginia. The Cutter's home address is 3225 Forsythe Drive, Sedgefield, Greensboro, North Carolina.

News of Biology in the Southeast

About People

A. A. Humphries, Jr., of the Department of Biology at Emory University, has been awarded a National Science Foundation Senior Postdoctoral Fellowship for the year 1962-63. Dr. Humphries will spend the year working at the Université Libre de Bruxelles, Belgium in biochemical embryology with Dr. Jean Brachet.

W. D. Burbanck of the Department of Biology at Emory University has received a National Science Foundation grant of $31,200 to continue for three years his work on various aspects of the biology of the estuarine isopod, *Cyathura polita* (Stimpson, 1855) (Miller and Burbanck, 1961).

Bernard Fried is now in the Department of Biology at Emory University where he is an NIH postdoctoral fellow in parasitology under Dr. C. G. Goodchild, his specific problem being studies on the bionomics of turtle blood flukes. Dr. Fried comes to Emory University from the Parasitology Department at the University of Connecticut where he studied *Philophthalmus* sp., an ocular trematode, under Dr. L. R. Penner.

W. Ralph Singleton, Miller Professor of Biology and Director of the Blandy Experimental Farm has completed a textbook entitled *Elementary Genetics,* which will appear in publication next May. Its chief illustrator is Dr. Te-Hsiu Ma, Assistant Professor of Biology at Emory and Henry College.

T. M. Harris has joined the faculty at the University of Richmond as an Assistant Professor of Biology. Mr. Harris will teach courses in histology and cytology.

Jack D. Burke, Associate Professor of Biology at the University of Richmond, has received from N.I.H. the terminal part of a three-year grant which enables him to continue an investigation of the blood of fishes.

Dorothy L. Crandall and **James L. Chamberlain** have received a grant from the U. S. Forest Service to continue their research on Forest Ecology of the Virginia Piedmont Region this summer.

James H. Starling will teach at Western Maryland College, Westminster, Maryland, during the summer session.

Lyman R. Emmons is the recipient of a Glenn Grant to continue his research in cytogenetics at a marine laboratory during the summer.

Daniel E. Sonenshine, Assistant Professor, Norfolk College of William and Mary has a Public Health grant for identification of larval ticks. He is also studying the behavioral patterns of ticks. Dr. Sonenshine came here from the University of Akron, Akron, Ohio.

Rose Mary Johnson, Assistant Professor, Norfolk College of William and Mary, has completed her work for the Ph.D. degree to be awarded in June, 1962, from the University of Virginia. Miss Johnson came to us from Sweet Briar College.

F. C. Brewer, Assistant Professor, Norfolk College of William and Mary is moving to Christopher Newport Junior College, Newport News, Va.

John H. Richardson, Instructor, Norfolk College of William and Mary, came to us this year from the Norfolk County Public Schools.

Jacques S. Zaneveld, Professor and Chairman of the Department of Biology, Norfolk College of William and Mary, has two National Science Foundation grants. One, which began last year and continued for two years for the study of the taxonomic, ecological, and distribution of algae from Cape May to Cape Hatteras. The second is the National Science Foundation undergraduate science grant for work in marine biology—mainly in the field of intertidal zonation.

Institutions and Organizations

A $500 grant has been awarded to the **Harwell G. Davis Library** at Howard College in Birmingham by the Association of College and Research Libraries, a division of the American Library Association.

Chosen from 348 applications, the Howard Library is one of 78 libraries in the nation and the only library in Alabama to receive a grant from the ACRL this year.

The money will be used to buy books relating to the field of Biology, said Head Librarian F. Wilbur Helmbold. Dr. Herbert A. McCullough, head of Howard's Biology Department is aiding the library in selecting the books to be added.

The ACRL Grants Program was made possible this year by several companies and corporation foundations: McGraw-Hill Publishing Company, Micro-card Foundation, Microx Photo, Inc., National Biscuit Company, Olin Mathieson Chemical Corporation, Pitney Bowes, Inc., Reader's Digest, Time, Inc., and the United States Steel Foundation, Inc.

Begun in 1955 with a grant of $30,000 from U. S. Steel Foundation, the Grants Program is directed to the general needs of all colleges and universities. It is designed to improve the quality of library service to higher education through fundamental research in librarianship and otherwise to aid in the best use of the most modern teaching and learning.

This is the second time in four years that the Howard College Library has received a grant of this kind, said Mr. Helmbold.

Containing more than 121,714 volumes for the use of students and faculty, the Howard Library has also served as a depository of government documents and publications since 1884.

In addition to the books, Howard's library contains 90,000 microfilmed volumes and a collection of phonograph recordings, particularly classical and foreign language records.

The Biology department at **Randolph-Macon Woman's College** is undertaking a series of seminars to acquaint biology majors with the research in progress by Biologists in or near the State of Virginia. Dr. John Mahan of Lynchburg College and Dr. Nolan E. Rice of the University of Richmond have been the first two speakers.

The Southern Section of the American Society of Plant Physiologists met with the Association of Southern Agricultural Workers at Jacksonville, Florida, February 5-7. In addition to 34 contributed papers, there was a symposium on the culture of cells and tissues of higher plants. Dr. A. C. Hildebrandt was chairman of the symposium; participants included Dr. Gene Guinn, Dr. Walter Tulecke, and Dr. Ernest Ball. Officers for 1962 are Chairman, Dr. Robert D. Powell; Vice-Chairman,

Dr. Joseph C. O'Kelley; Secretary-Treasurer, Dr. Frederick T. Wolf; Executive Committee Members, Dr. Howard J. Teas, Dr. Robert E. Burns and Dr. Howard E. Joham; Southern Section representative to the American Society of Plant Physiologists, Dr. Wayne C. Hall.

Officers of the **American Society of Plant Taxonomists** for 1962 are: Arthur Cronquist (New York Botanical Garden), President; Mildred E. Mathias (University of California at Los Angeles), Chairman of the Council; Lawrence R. Heckard (University of California, Berkeley), Secretary; Richard W. Pohl (Iowa State University), Treasurer; C. Ritchie Bell (University of North Carolina) new Council Member.

Other appointments made by the Council are: Richard S. Cowan (Smithsonian Institution) and A. C. Smith (U. S. National Museum) to serve as representatives of the Society on the Council of the A.A.A.S.; Reed C. Rollins (Harvard University) as representative on the Governing Board of the A.I.B.S.; David D. Keck (National Science Foundation) as representative of the Society on the National Research Council; Albert E. Radford (University of North Carolina) to represent the Society on the Editorial Board of the American Journal of Botany.

Rogers McVaugh (University of Michigan) will continue as Editor-in-Chief of *Brittonia.* Duane Isely (Iowa State University) and George F. Papenfuss (University of California, Berkeley) were appointed to serve four year terms on the editorial board of *Brittonia.*

Wallace R. Ernst (Stanford University) received the Cooley Award for the best paper presented at the last annual meeting of the Society at Purdue University. His paper was entitled, "On the family status of the Fumariaceae."

In July, 1961, the **Department of Marine Science** became, by resolution of the Board of Visitors, the **School of Marine Science of the Colleges of William and Mary.** Along with this the marine science training program, which has been operated at the marine laboratory at Gloucester Point since 1940, has been enlarged to include majors in biological oceanography (marine biology) general oceanography and fisheries biology. The degree offered is the Master of Arts in Marine Science. A doctoral program is being planned. The curriculum, consisting of over twenty courses in different fields of marine science, is designed mostly for graduate students; however, qualified advanced undergraduates may enroll in summer courses and some of those offered throughout the academic year.

Dr. William J. Hargis, Jr., Director of the **Virginia Institute of Marine Science,** recently announced the advancement of Dr. Morris L. Brehmer, Dr. Edwin B. Joseph, Mr. Willard A. Van Engel and Dr. John L. Wood to the grade of Senior Marine Scientists. Mr. Dexter S. Haven and Mr. William H. Massmann were advanced from Assistant Marine Scientists to Associate Marine Scientists.

Messers. Maynard M. Nichols, Langley H. Wood, Dana Eldridge and Ernest Warinner have been added to the research staff at Virginia's marine laboratory making a total of twenty-nine scientists engaged in research. Staff vacancies in physical oceanography and physiology remain to be filled. Seventeen staff members are also members of the faculty of the School of Marine Seience.

Grants and Fellowships

The **Mountain Lake Biological Station** has available from the National Science Foundation three types of awards for summer research and study at Mountain Lake: (1) Postdoctorate for research, stipend $900; (2) Predoctorate for supervised research, stipend $400; and (3) Postgraduate for training in field biology, stipend $300. Preference is given for studies concerned with the biota of the region. Application blanks for these awards may be secured from *Dr. James L. Riopel,* Department of Biology, University of Virginia, and must be submitted before April 12, 1962.

For the past three summers, the **Virginia Institute of Marine Science at Gloucester Point** has conducted research programs sponsored by the National Science Foundation. The current programs for the summer of 1962 are:

Research Participation for College Teachers, designed to assist college teachers throughout the United States to do personal research at a marine station.

Undergraduate Research Participation Program, designed to give a selected number of undergraduates an opportunity to explore the possibilities of marine science as a vocation.

College teachers and undergraduates interested in applying for either of these programs should direct their correspondence to: *Mr. Robert S. Bailey, Director, NSF Programs, Virginia Institute of Marine Science,* Gloucester Point, Virginia.

The ASB BULLETIN

Volume 9, Number 3 July, 1962

Photo by Harry Steeves, Jr.

PSEUDOSCORPION

The Official Quarterly Publication of
The Association of Southeastern Biologists

ASB BULLETIN

Volume 9, Number 3—July 1962

The ASB Bulletin is the official quarterly publication of the Association of Southeastern Biologists, Inc., and is published at Philadelphia, Penna., in January, April, July and October. Letters, news items, other contributions, and all communications about editorial matters should be addressed to C. W. Hart, Jr., Editor, The Academy of Natural Sciences of Philadelphia, 19th and The Parkway, Philadelphia, Penna. Changes of address should be sent promptly to the Secretary of the ASB, Dr. Harry J. Bennett, Department of Zoology, Louisiana State University, Baton Rouge, La. Subscription orders from libraries and other institutions should be sent to the Business Manager, Dr. Leland Shanor, Department of Biological Sciences, Florida State University, Tallahassee, Florida. Subscription rate for nonmembers of the ASB: $2.00 per year. Printing and typography by the Wickersham Printing Co., Lancaster, Penna.

Second-class postage paid at Philadelphia, Pennsylvania.

ASSOCIATION AFFAIRS

MINUTES OF THE ANNUAL BUSINESS MEETING

Wake Forest College—Winston-Salem, N. C.
April 13, 1962

President Royal D. Shanks called the meeting to order at 11:45 A.M. and announced that the election of officers would be held at the end of the meeting and that the results would be announced at the banquet in the evening.

Report of the Secretary. Dr. Harry J. Bennett, Secretary, reported that the membership was now 885 and that it had increased approximately 10% over that of the previous year. He discussed briefly the difficulties of keeping an accurate list of the members because of the failure of so many to pay their dues promptly, and mentioned that he had recently notified 85 members, who had last paid their dues in 1959, that the constitution required that members be dropped from the rolls when they were two years in arrears. He stated that others who had last paid their dues in 1960 and 1961 would be notified of that fact as rapidly as feasible. He mentioned that the early records of the Association were such that it was not possible to determine who the Founders of the Association were and that the same was true for those who were Charter Members.

Report of the Treasurer. Dr. Elsie Quarterman, Treasurer, presented a detailed report, and pointed out that it was an interim one now that the fiscal year of the Association had been changed to coincide with the calendar year. She stated that the Association was usually overdrawn, and that for the first time money had to be withdrawn from the savings account of the Association. She stated that the Association was not paying its way and suggested that dues might have to be raised.

Dr. Shanks commented on the Treasurer's suggestion that dues might be raised to the effect that it would not be necessary to raise dues immediately. He stated that the drawing upon the savings account was due to the unusual expenses associated with the Twenty Fifth Anniversary program.

(*Continued on page 55*)

Septima C. Smith, 1962 Meritorious Teacher

The Meritorious Award Committee of the Association of Southeastern Biologists considered it a great pleasure to designate as Meritorious Teacher for this 25th Anniversary Year, Dr. Septima Cecilia Smith of the University of Alabama.

The winner is a native of Texas with A.B. and M.A. degrees from the University of Texas, and a Ph.D. degree conferred by the School of Hygiene and Public Health of the Johns Hopkins University in 1927.

The same year she began a distinguished teaching carrer in the Biology Department of the University of Alabama, where she has remained in active and continuous service ever since. In 1944 Dr. Smith was appointed Professor of Biology, the first woman to attain this rank in that College of Arts and Science. This appointment was cited at a special convocation of the women students of the University.

In addition to devoted and stimulating teaching at the undergraduate and graduate levels, she has had heavy responsibilities in extracurricular activities and has continued a productive research career. Many of her students have been led by her personalized encouragement to pursue studies for the PhD., M.D., D.D.M. and other degrees, and many now hold prominent positions in academic circles and in professional life.

Dr. Smith is a member of numerous professional societies, a fellow of the American Association for the Advancement of Science, an honorary member of Alpha Epsilon Delta, an honorary member of the Medical and Dental Society of the University, and its advisor since 1955. She is a charter member and first president of the local chapter of the American Association of University Women. She is listed in Who's Who in America and other select biographical publications.

More than 2000 professional and vocational biologists have been inspired during her 35 years of continuous efforts and dedication to Biology. Few college teachers in the southeast, or for that matter elsewhere in the nation, have exerted greater influence on the hearts and minds of the fortunate young men and women who have universally been charmed by her wit, impressed by her brilliance, warmed by her friendliness, and comforted by her counsel.

W. W. SCOTT TO CONTINUE AS DIRECTOR OF THE VJAS PROGRAM

Dr. Jackson J. Taylor, President of the Virginia Academy of Science, announced at the 40th annual meeting of the VAS the reappointment of Dr. William W. Scott, Associate Professor of Botany at Virginia Tech, as Director of the Virginia Junior Academy of Seience program.

Dr. Scott has served in this position for the past four years. During this time the Junior Academy has grown to a membership of over 3000 students affiliated with more than 55 high school and community science clubs. Over 325 members attended the annual meeting held May 9-11th in Norfolk, Virginia.

For the first time VJAS members presented thc results of their scientific research in the form of formal papers read before the academy membership. Over 130 papers were given in biology, chemistry, biochemistry, physics, engineering, mathematics, astronomy, and earth sciences. Awards totalling $900.00 were made to the outstanding young scientists and their teaeher-sponsors.

Award winning papers presented by southwestern Virginia students included: Hazel Hatcher, Floyd High School, $50.00 first place award in biology; Bill MacAfee, Patrick Henry High School of Roanoke, honorable mention in biology; David Leach, Bedford High School, $20.00 third place award in earth sciences; Jo Ann Jamison, William Fleming High School of Roanoke, 30.00 second place award in chemistry and biochemistry; Robert L. Williams, William Fleming High School of Roanoke, $50.00 first place award in physics and engineering; Aubrey Strode, Bedford High School, $30.00 second place award in physics and engineering.

Mr. Max Thomas of Floyd High School was awarded a Teacher-Sponsor Scholarship to the College of William and Mary for the summer of 1962. The S.O.S. Science Club of Bedford High School received an honorable mention as one of the outstanding high school science clubs in Virginia. Mrs. J. J. Thaxton is sponsor of the Bedford club and Mr. David Leach of Bedford is the student president of the VJAS for 1962-63.

News of Biology in the Southeast

Institutions and Organizations

The Department of Biology, College of William and Mary, received a $10,000 grant from the NSF under the Undergraduate Instructional Scientific Equipment Program.

The Department of Biology, College of William and Mary, received a grant of $2,220 from the Atomic Energy Commission for the acquisition of equipment.

The Biology Department of Washington and Lee University expects to occupy its new quarters in the recently completed Science Building before the fall opening of the university

Eastern Mennonite College, Harrisonburg, Va. has been granted $17,250.00 from The NIH for support of research on melanism in *Drosophila.* **Dr. M. E. Jacobs,** Professor of Biology, is the principal investigator.

The Department of Biology, Emory and Henry College, has been awarded a grant from the National Science Foundation for a five-week summer program in Physiology and Radiation Biology for superior high school students. **Dr. Jack S. Brown,** Professor and Chairman of the Department, and **Dr. Te-Hsiu Ma,** Assistant Professor, will instruct the program.

The Institute of Marine Science, University of Miami, has established a program of visiting professorships in all branches of oceanography. Each visitor will offer special lectures and provide instruction and advice to graduate students, for periods ranging from six months to a year. Visiting professors will not be limited to United States citizens, but will include distinguished scientists from overseas. The program is partially supported by the National Science Foundation.

Advance notion will be provided, giving information as to the names of visiting professors and the special fields of study in which they will lecture. Students from other institutes and universities will be invited to engage in the research and to study under the supervision of the visiting professors.

Present incumbents of the international visiting professorships are Dr. Pierre Welander, Institute of Meteorology, University of Stockholm, on meteorology and physical oceanography; Dr. Harold Humm, Duke University, on marine botany; Dr. Michael Reeve, University of Southampton, England, on plankton ecology; and Dr. John Steele, Marine Laboratory, Aberdeen, Scotland, on physical oceanography. Participants in the program during 1963-1964 will include Dr. Gunnar Thorson, Marine Biological Laboratory, Elsinore, Denmark, on marine invertebrates; Dr. Ferguson Wood, CSIRO Marine Laboratory, Cronulla, New South Wales, on marine microbiology; Dr. Alexander Ivanoff, Labotoire de Physique Appliquée aux Sciences Naturelles, Paris, on Physical oceanography; and Dr. James A. Crutchfield, University of Washington, Seattle, on fishery economics. Dates will be announced later.

The Virginia Institute of Marine Science, (Virginia Fisheries Laboratory), is participating in a Cooperative Menhaden Program with the U. S. Fish and Wildlife Service Laboratory at Beaufort, North Carolina. Dr. William J. Hargis, Jr. is the project leader from the Institute.

The Virginia Institute of Marine Science is also cooperating with the Hampton Roads Sanitation District under a small grant to study the Surface and Subsurface Currents of the near-shore Atlantic off Virginia Beach. Dr. Morris L. Brehmer is the project leader from this Institute.

Grants and Fellowships

The National Seience Foundation announces that the next closing date for receipt of basic research proposals in the life sciences is September 15, 1962. Proposals received prior to that date will be reviewed at a meeting of the Foundation's advisory panels, and disposition will be made approximately four months following the closing date. Proposals received after the September 15, 1962, deadline will be reviewed following the winter closing date of January 15, 1963. Inquiries should be addressed to the *Biological and Medical Sciences Division, National Science Foundation, Washington 25, D. C.*

About People

Teruo Nishida, Chief, Research Section, National Gamma Feld, Tokyo, Japan, recently spent five months in the United States studying especially the use of irradiation in the treatment of horticultural seeds and plant breeding purposes. Short periods were spent at Beltsville, Md.; Raleigh, N. C.; Oak Ridge, Tennessee; Gainesville, Fla.; Geneva, N. Y.; and Davis, California. Mr. Nishida worked for several months with W. S. Flory at the University of Virginia's Blandy Experimental Farm.

James H. Starling will teach at the Summer School of Western Maryland College, Westminister, Maryland.

Lyman R. Emmons Will participate in the College Teachers Research Program of the NSF at the Virginia Institute for Marine Science. He plans to study marine invertebrate cutogenetics.

Mitchell A. Byrd has been appointed Head of the Department of Biology, College of William and Mary, Williamsburg, Virginia. Dr. Byrd has served as Acting Head of the Department since December, 1961.

Miriam F. Bennett, Associate Professor of Biology,

Sweet Briar College, plans to continue work on rhythms of activity in honey bees in the Institute of Zoology, University of Munich, Germany during the summer, 1962.

Elizabeth F. Sprague, Associate Professor of Biology, Sweet Briar College is attending the N.S.F. Seminar in Tropical Biology in Costa Rica during July and August. She will continue her research on floral evolution as affected by specific pollinators.

James D. Eisen will be Assistant Professor of Human Genetics at the University of Nebraska College of Medicine in Omaha where his principal duties will be the establishment of a human cytogenetics laboratory and research at the new Mental Retardation Clinical Research Center. He has just completed spending a year at the University of Uppsala and another at the University of Lund on an NIH postdoctoral fellowship. His duties begin September 1, 1962.

Paul J. Osborne, Associate Professor of biology at Lynchburg College, returns to that institution after a sabbatical year at the University of North Carolina, where he has been working on the cytology and histoehemistry of the Turbellaria, with special reference to the use of hydrolytic enzyme patterns as a key to ontogenetic and phylogenetic correlation.

John G. Mahan, Professor of Biology at Lynchburg College, will devote the next three summers to developing a teaching collection for his course in entomology.

C. W. Hart, Jr., Editor of the ASB Bulletin, and his wife, Dabney, spent a month this summer collecting freshwater shrimp and conducting water analyses in Jamaica, Puerto Rico, and Trinidad, W. I. This was a continuation of work begun three years ago by Mr. Hart, and the present work was partially supported by the American Philosophical Society. During the trip, Mr. and Mrs. Hart were the first investigators to use the new research station in the rain forest at El Yunque, P. R., operated by the Biology Department of the University of Puerto Rico.

William H. Adams, Professor of Biology at Tennessee Wesleyan College, has been selected as a participant in the 1962 Summer Institute in Comparative Anatomy at Harvard University. In addition, Dr. Adams is the recipient of the first Tennessee Wesleyan College Faculty Award of one thousand dollars. Dr. Adams will use the award for visiting numerous univesities, museums, research centers and government agencies after completion of the Summer Institute. The dual purpose of the visits will be to establish a graduate school guidance and placement program for biology majors at TWC and to establish an undergraduate research program in ecology at TWC upon completion of the proposed science building.

H. P. Riley, University of Kentucky, received an $8,000 NSF grant for a continuation of his chromatographic studies on *Haworthia*. In February, Dr. Riley served on an NSF screening panel for Cooperative Fellowships, and gave two lectures at Ohio University, Athens, Ohio, on paper chromatographic studies in *Haworthia* and on the vegetation of Southern Africa.

C. W. Hart, Jr., Editor of the ASB Bulletin, will participate this fall in an NSF sponsored elementary teacher education program at Temple University. Mr. Hart will conduct the course and laboratory work in botany.

Samuel R. Tipton, University of Tennessee Department of Zoology and Entomology, has received a NSF grant of $20,000 to continue studies on the binding and transport of thyroid hormones in serum and tissue fluids of rats after partial hepatectomy. Dr. and Mrs. Tipton will attend and present papers at the XXII International Physiological Congress at Leiden, The Netherlands, in September, 1962.

Joseph C. Howell, University of Tennessee Department of Zoology and Entomology, will present a paper, "The 1950-59 Breeding Populations of Certain Tennessee Birds," at the Thirteenth Ornithological Congress at Ithaca, New York, in June, 1962.

James T. Tanner, University of Tennessee Department of Zoology and Entomology, will spend the summer of 1962 in Mexico studying the status, habits, and requirements of the Imperial Woodpecker of Mexico . This study is being supported by grants from the Frank M. Chapman Fund, American Museum of Natural History, and the International Committee for Bird Preservation.

Arthur C. Cole, Professor of Entomology at the University of Tennessee, will spend the summer of 1962 at the Nevada Test Site studying ants as a staff member of the Brigham Young University. The study is part of an Atomic Energy Commission project entitled "Comparative ecological studiees of animals at the Nevada Test Site with special referenee to their reaction to exposure of nuclear effects." This will be followed by a two weeks' trip into California and Arizona to complete the field work pertaining to revisionary studies of the harvesting ant genus *Pogonomyrmex.*

Ronald C. Fraser, University of Tennessee Department of Zoology and Entomology, has been awarded a Public Health Service grant of $85,135 to continue studies on the synthesis of hemoglobins in the developing chiek embryo. The grant is to cover a five year period. Dr. Fraser presented a paper, "Serum protein ontogeny in the chick embryo," at the Developmental Biology Conference in New Orleans.

A. J. Sharp, University of Tennessee Department of Botany, will assist in the First Annual West Virginia Wildflower Pilgrimage to be held at Blackwater Falls State Park, Davis, W. Va., May 15-18, 1962. Dr. Sharp will again teach Bryology and Lichenology at the University of Michigan Biological Station during the summer of 1962, and will then attend the AIBS meetings at Corvallis, Oregon.

Amos I. Chernoff, University of Tennessee Memorial Research Center, has received a *career award* from the National Institutes of Health. The initial five-year grant totals $122,488 and will provide $24,000 annually; the

grant will be renewable every five years. Dr. Chernoff is conducting researeh dealing with abnormal hemoglobins in the blood.

P. S. Job, a member of the staff of Ewing Christian College, Allahabad, India, has been on leave of absenee for the past two years as a Danforth Foundation Fellow working under the direction of Dr. Arthur W. Jones, Professor of Zoology, University of Tennessee. Mr. Job's work has been on the effeets of sueeessively irradiating cestodes; he will reeeive the Ph. D. in June, 1962, and will then return to India.

Thomas M. Harris, Assistant Professor in Biology, University of Richmond, will reeeive the Ph.D. Degree from the Department of Zoology at the University of North Carolina in June, 1962. His speeialty is developmental biology.

William S. Woolcott, Assoeiate Professor in Biology, University of Richmond, will participate in the NSF sponsored program at Highlands Biologieal Station, North Carolina. His research will include a survey of the fishes present in the gorges near Highlands.

James Norman Dent and **W. Ralph Singleton,** Department of Biology, University of Virginia, have received funds from the Atomie Energy Commission for the continuation of their researches. Professor Dent received $10,000 for 12 months and Professor Singleton $18,000 for 21½ months.

W. Ralph Singleton, Miller Professor of Biology and Director of the Blandy Experimental Farm of the University of Virginia, was the guest of EUCARPIA, the Association of Plant Breeders of Western Europe, at their meetings in Paris on 21-24 May. Professor Singleton lectured on *Mutation Breeding.* He and Mrs. Singleton also visited London and Amsterdam while they were in Europe.

William J. Hargis, Jr., Direetor of the Virginia Institute of Marine Science at Glouester Point, has reeently received a copy of "Monogenetic Trematodes" from his publisher. Hargis is the editor of this English translation of a 627-page monograph on little-known flatworms written by the Russian seientist, B. E. Bychowsky. In the translation of the Russian monograph Hargis worked with Pierre C. Oustinoff, ehairman of the department of modern languages, who did the basie translation. Mrs. Reinaldo Morales of the Virginia Institute of Marine Seience transeribed, typed, and assembled the manuseript.

Competition For Design Of A Seal For The ASB

Over a period of several years the Executive Committee of the ASB has diseussed the matter of adopting an official seal for the Association, but delayed making any recommendations to the members. A seal appeared to be desirable, but not essential, for use on letterheads, certificates, and publications. With the incorporation of the ASB, however, a seal became essential for use on various official documents. While a standard legal embossing seal with nothing but the name of the Association on it would serve for this purpose, the decision was reached at the Winston-Salem meeting that a decorative seal with an appropriate design would be more suitable, since it could be used in a variety of ways as well as for legal documents. The Committee reeommended that the Association acquire a seal and that a competition for its design be set up. The recommendation was also made that a prize of five years paid-up membership in the ASB be awarded to the designer of the winning seal, to supplement the honor of having his design accepted. These recommendations were approved by the members at the business meeting at Winston-Salem.

It is hoped that many members of the ASB will submit designs, from among which a suitable one can be selected. The rules for the design competition follow:

Rules

1. The design shall be enclosed within a circle, and may consist of a suitable monogram, illustration or illustrations, or escutcheon or combinations of these.

2. The design submitted shall be on heavy white drawing paper or cardboard 8×10 inches in size and the circle shall be 6 inches in diameter. The design shall be drawn with black India ink and in a finished form for direct reproduction and use. It shall be packed for mailing in such a way as to avoid bending or other damage in transit.

3. Criteria to be used in judging will include appropriateness for the Association of Southeast-

ern Biologists, artistic merit and attractiveness, and freedom from fine detail that could not be successfully incorporated in an embossing seal.

4. A contestant may submit any number of designs he wishes, but his name and address must appear on the back of each entry.

5. Entries must be postmarked no later than October 1, 1962, and should be sent to the Secretary of the ASB, Dr. Harry J. Bennett, Department of Zoology, Louisiana State University, Baton Rouge, La.

6. The winning entry will be selected by the Executive Committee of the ASB, subject to approval by the membership at the 1963 Annual Meeting. The Executive Committee may, at its discretion, appoint a special panel of qualified judges to advise it on selection of the best design. The Executive Committee reserves the right to reject all entries in the event that none is deemed suitable. The winning design will be announced at the 1963 Annual Meeting.

(*Continued from page 50*)

Report of the Editor. Mr. Hart stated that no unusual problems had arisen with the Bulletin. He discussed at some length the need for articles of scientific interest for the Bulletin, and appealed to the membership for such articles or suggestions as to whom he might contact for articles of interest to the membership.

Report of the Auditing Committee. The Chairman, Dr. Claude S. Chadwick, reported that his committee had examined the books of the Association and found them in order.

Dr. Shanks reported on the decision of the Executive Committee to accept the invitation of the University of Florida to meet there in 1963. He stated that the Executive Committee, at a meeting on April 26, 1961, had tentatively accepted the invitation and that he had written to Dr. J. Wayne Reitz, President of the University of Florida, on June 27, 1961, stating that the invitation could not be formally accepted until acted upon at the annual business meeting of the Association in April of 1962. Dr. George C. Kent, Jr., asked that the third week-end in April be made the meeting date, and Dr. B. Theodore Cole reminded the membership that the constitution states that the meetings of the Association will be held on that week-end. He also reminded the membership that a special vote was taken to change the date of the meeting for 1962. Dr. Mary Esther Gaulden suggested that the constitution probably should be amended to provide for more freedom in the selection of a date for the meeting of the Association. She recommended that the Executive Committee be empowered to set the date for the meeting in 1963. Dr. E. Ruffin Jones said that the calendar at the University of Florida would have some bearing on the date of the meeting for 1963. Dr. Shanks called for a show of hands expressing a preference for the date of the meeting, and a majority voted to hold the meeting on the third week-end in April. A motion was made to accept the invitation of the University of Florida, it was seconded, and passed.

Dr. Shanks then called upon Retiring President Greulach to discuss the need for a corporate seal by the Association. Dr. Greulach discussed the Executive Committee's proposal that a member be given remission of dues for five years for submission of a winning design. He stressed that the seal should be more decorative than those designed for commercial purposes. He then discussed briefly the plans for the celebration of the Twenty Fifth Anniversary and announced that Dr. Martin D. Young would speak at the banquet that evening. He reminded the members that those persons who attended the 1937, 1938, and 1939 meetings of the Association, and had paid their dues, were eligible for Charter Membership and asked for the submission of names of those who were eligible for such recognition. A motion to the effect that the Association should have a seal and that the member submitting the winning design would receive an award of five years dues was made, seconded, and passed.

Report of the Chairman of the Nominations Committee. Dr. Greulach placed the following names in nomination: Drs. Harold J. Humm and E. Ruffin Jones for President-Elect; Drs. Robert T. Brumfield and Harry E. Wheeler for Vice President; Drs. William D. Burbanck and Leland Shanor for Treasurer; and Drs. C. Ritchie Bell, John H. Carpenter, Claude S. Chadwick, Glenn R. Noggle, Grace T. Wiltshire and Father Patrick H. Yancey for the Executive Committee. He explained that the three members to the Executive Council were to be elected and that the two receiving the highest number of votes would be elected to regular terms of office, and that the third highest would be elected to fill the unexpired term of Dr. Victor M. Cutter, Jr., deceased. President Shanks then ordered the prepared ballots to be distributed and called for nominations from the floor. There were no additional nominations and a motion was made, seconded and passed that the nominations be closed. Drs. Clint L. Baker, Alvin V. Beatty, and Willis A. Eggler were appointed as tellers.

Report of the Chairman of the Mary Glide Goethe Travel Award Committee. Dr. Robert B. Short reported that there were 13 applicants and that 12 awards were made. A

motion was made, seconded, and passed to accept his report.

Report of the Chairman of the Constitution Committee. Dr. E. Ruffin Jones reported that an amendment to Article III to provide for affiliation of interested organizations with the Association was recommended by his committee. Dr. Shanks explained that the amendment was broadly designed so that no specific restrictions should be placed on affiliate organizations. A motion to adopt the amendment was made, seconded, and passed. The amendment is given below:

Article III Eligibility
change title to read
Article III Eligibility and Affiliation
Sections 1-4 remain unchanged
add Section 5

Section 5. Any organized group which is interested in biology may become an affiliate of the Association of Southeastern Biologists upon approval of the Executive Committee.

or alternative reading

Section 5. Any organized group which is interested in biology may become an affiliate of the Association of Southeastern Biologists upon recommmendation of the Executive Committee and approval of the Association at its annual business meeting. The purpose of affiliation is to promote communication and cooperation among the Societies involved but such affiliation does not confer the privileges of individual membership in the Association of Southeastern Biologists upon members of affiliated Societies. The terms of affiliation shall be arranged between the Executive Committee of the Association of Southeastern Biologists.

Dr. Shanks then called for new business. Dr. Elon T. Bird suggested that the records relative to the early years of the Association be placed in an archives. No action was taken by the Association on his suggestion.

Dr. Mary Esther Gaulden submitted a motion to the effect that President Shanks send greetings and an expression of regret from the Association to the following members who were not able to attend the Twenty-Fifth Anniversay meeting: Dr. George H. Boyd, Dr. Mary Stuart MacDougall, and Dr. Elton Cocke. A motion was made, seconded and passed unanimously.

Dr. Shanks then called for the report of the Resolutions Committee. The Chairman of the Committee, Dr. Dorothy Crandall, read the report of the committee, which follows:

The Committee presents the following resolutions:

WHEREAS, the Association of Southeastern Biologists, the Southeastern Section of the Botanical Society of America, Southern Appalachian Botanical Club, Regional Section of the National Association of Biology Teachers, and the Southeastern Region of the Beta Beta Beta National Honorary Biological Society are successfully holding meetings on the beautiful new campus of Wake Forest College, Winston-Salem, North Carolina, April 12-14, 1962; and

WHEREAS, every possible convenience has been made available to all members attending these meetings; therefore

Be it resolved, a. that these groups express sincere appreciation to President Harold Tribble for the cordial invitation to meet here, for the gracious welcome extended, and for the use of campus facilities for these meetings, and

b. that special thanks be expressed to C. M. Allen, H. G. Britt, E. C. Cocke, J. E. Davis, J. F. Dimmick, R. P. Higgins, D. W. Johnston, A. T. Olive, R. L. Wyatt, and Chairman J. C. McDonald of the Local Arrangements Committee who have so carefully arranged for the very adequate space, excellent equipment and general comfort for all in attendance.

WHEREAS, this being the 25th anniversary of the Association of Southeastern Biologists

Be it resolved that the sincere appreciation and gratitude of the Association be expressed to Dr. George H. Boyd and the founders for their part in establishing this organization.

WHEREAS, the Carolina Biological Supply Company has continued to contribute $100.00 each year as a research award; therefore

Be it resolved, that the sincere appreciation of the Association be expressed to Dr. Thomas E. Powell, President of the Company, for his contribution.

WHEREAS, the Will Corporation of Georgia has continued to contribute $100.00 each year as an award for meritorius teaching, now therefore

Be it resolved, that the genuine appreciation of the Association be expressed to Mr. Charles Waite of that Corporation for this contribution.

WHEREAS, the Phipps and Bird Corporation has continued to award the Mountain Lake Research Fellowship, now therefore

Be it resolved, that the sincere thanks of the Association be expressed to Dr. Lloyd Bird, President of the Corporation, for this contribution.

Dr. Shanks called for a motion to adjourn. Such a motion was made, seconded, and passed. The meeting adjourned at 12:30 P.M.

Respectfully submitted,
HARRY J. BENNETT
Secretary

The Teaching Program

In 1936, Dr. R. L. Caylor brought students on summer field trips to the coast from Delta State College, at Cleveland, Mississippi. The movement grew and in the summers of 1947 and 1948 formal courses in marine biology were taught at Magnolia State Park on Davis Bayou by the Mississippi Academy of Scienees. The various teachers volunteered their services without pay. In 1949 the State Legislature formally established the Laboratory by charter and placed it under the Board of Trustees of the Institutions of Higher Learning, the Board which controls all public colleges of Mississippi. In the same year a forty acre plot of ground was purchased on Davis Bay and surplus property buildings were moved to the new site.

Under the terms of the charter the Laboratory does formal teaching in the marine sciences for the colleges of the State, both private and public. However, the Laboratory is responsible to the Board of Trustees and is not under any individual college or university. State of Mississippi institutions which send students to the Laboratory are the University of Mississippi, Mississippi State University, the University of Southern Mississippi and Delta State College. The following private institutions, Belhaven College, Millsaps College and William Carey College also send students to the Laboratory under the same arrangement. These institutions list the various courses in their own catalogue under their individual numbers, and the student's grade cards are sent to the respective registrars. Additionally, five out-of-state institutions are affiliated with the Laboratory for teaching purposes by special contract with the Board of Trustees. They also list the courses, register their own students, and pay a fee depending upon the number of students registering. Louisiana State University has a special contract in that it furnishes one summer instructor and contributes a nominal sum for support. The other out-of-state institutions are: Louisiana Northwestern State College, Louisiana Polytechnic Institute, Louisiana Northeastern State College and Missouri Northwestern State College.

All courses are taught at an advanced level suitable for senior or graduate credit and most courses require eonsiderable background as prerequisites. Courses given are Physical Marine Geology, 3 semester hours, Chemical Marine Geology, 3 semester hours, and Problems in Geology; Introduction to Marine Botany, 4 semester hours, Introduction to Marine Zoology, 4 semester hours, Marine Invertebrate Zoology, 6 semester hours, Marine Vertebrate Zoology and Ichthyology, 6 semester hours, and Problems in Zoology. Marine Fisheries Biology is taught during years when there is sufficient demand. A service course in physical oceanography for students in geology and biology will be taught in the near future and it is expected that professional courses in oceanography and in marine microbiology will be established in the future years.

During the 1962 session seventy-one students were registered in the various courses at the Laboratory.

Two of the regular staff members of the Laboratory engage in teaching. Additionally, summer teachers come from Hamline University, Louisiana State University, Millsaps College, the University of Alabama, the University of Southern Mississippi and Vanderbilt University.

All formal teaching is done in the summer, but students who wish to work out their master's or doctor's thesis may work during the whole year. Living and working quarters are furnished free to professionals who are visiting or carrying on research at the Laboratory.

In addition to the college teaching program, for the past three years a Summer Institute for highly selected high school students and high school teachers from all over the country has been given at the Laboratory by Louisiana State University, with support from the National Science Foundation.

College field trip groups in geology and biology visit the Laboratory over the week-end in considerable numbers. During the 1961-62 college year forty-six groups from Kansas, Tennessee, Alabama, Arkansas and Louisiana visited the Laboratory and made collecting trips by boat into the Gulf of Mexico. Quarters and the boat trips are provided free. Laboratory staff members go on the trips to help the students identify the organisms caught and to explain some of the features of the marine environment.

Permanent Staff and Research Activities

A research staff of seven people and a nontechnical staff of six people, three of them half-

time workers, remain at the Laboratory all the year round. The technical staff eonsists of one geologist, two physical oceanographers, and four biologists.

The physical oceanographers have been studying distribution of water of the Mississippi River after it reaches the Gulf of Mexico. During the past three years they liberated 25,000 drift bottles off the mouth of the Mississippi and have studied current patterns in the Gulf in other ways. This work has been supported by the Office of Naval Research and a series of interesting results have accumulated, some of which have already been published. For one thing, the influx of tropical animals into the northeastern Gulf has been explained on the basis of currents and wind patterns, and it has been shown that about twenty-five per cent of Mississippi water goes to the eastward while the remainder goes west.

The geologist has been concerned with the movements of the sand spits, the ends of the islands, which move about like a snake's tongue over a period of a few weeks time, depending upon the forces of the winds, currents and tides.

One staff biologist is also a member of the Mississippi Marine Conservation Commission and is biologist for that Commission. He spends full time working with the oyster reefs and shrimp populations. The reefs are shelled, seeded, and sometimes transplanted and the shrimp and oyster seasons are opened and closed and otherwise regulated by acts of the Commission. The biologist carries six votes on biological matters within the ten man Commission, and it may be said that the Mississippi marinc fishery regulations are unique in being based almost solely upon biological considerations. During the fiscal years 1959-60 and 60-61 the Mississippi oyster production was the largest in its history.

Two of the biologists have been concerned with thc racial studies of the menhaden, whieh supports the largest fishery on the Gulf coast and which yielded one billion pounds in 1961. The life history of this fish has also been studied and the catch data of the commercial fishery has been examined. It has been shown that the fishery itself is of an estuarine nature. No catches are made in full sea water. The gonadal cycle of the menhaden has also been studied as well as the geographic distribution of the three Gulf species. A bibliography of the menhaden literature and a review of menhaden biology have been published. This work was supported by U. S. Fish & Wildlife Service through funds made available by the Saltonsall-Kennedy Bill. One of the biologists conducted a two year quantitative faunistic study of the waters of Grand Isle, Louisiana. Collections were made by trawls, dredges, plankton nets and bottom grabs. Several species new to the northern Gulf and some new to the Gulf, and one new species of fish was discovered. Several reports on these minor components have been published. The major portion of these data will not be utilized because of strictures imposed by the industrial company which supported the work. Another biologist has been concerned with fish which survive extreme injuries caused by predators, and a second step in this work is the description of the many specimens of fishes which develop abnormalities, many of which grow up and survive as virtual monstrosities. A bibliography of 750 papers on this subject has been gathered and specimens, photographs and records of all kinds are being collected and solicited from all available sources. A taxonomic revision of the scaleless naked, broad soles has been carried out by a grant from the Society of the Sigma Xi.

During the summer ten to fifteen research people come to the Laboratory and are given small grants through support from the National Science Foundation. These people are given a

Exterior of the teaching laboratory building. This building, completed in 1956, houses two teaching laboratories—both of which are equipped with running fresh and salt water, compressed air, and aquariums.

One of the teaching laboratories. Although spacious and seemingly adequate, they are over-crowded with researchers in the summer months. Only this year, the Mississippi Legislature voted a bond issue to build a new research building within the next two years.

place to work free of charge. They have worked upon sueh diverse matters as catelepsy in the toadfish, the effeet of various degrees of heat upon histological and cytological fixatives, parasites in tuna, the biology of the mouth breeding catfishes in whieh the male carries the eggs in his mouth until they hatch, light production in the midshipman, new rapid chemical tests for nitrate and nitrite in brackish waters, and new tests for sulphate, calcium and magnesium ions in the same waters. Various parasitic crustaceans on fishes and various other animals in the Gulf have been described. The mixed populations of fresh water and salt water fishes in low salinity water have been studied. With help of oil company geologists who made corings and bottom sediment studies of Mississippi Sound and the adjacent Gulf, a relatively thorough study of the distribution of Amphioxus in the area was made. Meristic studies of the population were made. It was estimated that a few hundred million, or possibly even a few billion, Amphioxus live in Mississippi Sound around the barrier islands. Sometimes a few thousand are collected at one time by student groups. All in all 150 papers and notes have been published by Laboratory staff members during the past eleven years.

People with their own grants visit the Laboratory and are given a place to work. In the past specialists on mushrooms, lichens and the Compositaceae have used the station as headquarters. During the past four summers a team of biochemists from the University of Mississippi School of Medicine have worked at Ocean Springs on fishes blood. They have found that the plasma proteins of fishes show a trend of increasing complexity from the generalized to more specialized species; the total cholesterol is 10 times higher in the plasma of some fishes than in man; the relations of cholesterol and plasma proteins in the blood of fishes resemble pathological conditions in man.

The Laboratory has established its own journal, Gulf Research Reports, and three issues have been printed. The first one covers the mollusks in the salt waters of Mississippi. The second one gives the history and lists the known flora and fauna of Horn Island, most of which is now a wildlife preserve. This paper includes insects.

The Laboratory has a small but rapidly growing library in which the greatest emphasis is placed upon the reprint collection. Modern texts in the various fields are bought for the use of the students.

The Laboratory also has a museum into which most of the common animals of the northern Gulf of Mexico have already been aceessioned. In the future examples of all animals and plants of the northern Gulf of Mexico and finally the whole Gulf will be acquired.

Plant and Equipment

The Laboratory property consists of forty aeres of woodland on which a large summer home and two small buildings were present when it was acquired. Three wooden buildings, which were Surplus Property from the various Armed Services, were moved on to the property in 1951, and they are still in use. One of these was the caretakers cottage. One was made into a kitchen and dining hall, and another was made into a rough but fully equipped marine laboratory for teaching, with water tables, sinks, etc. They are all still in use. The laboratory building now houses the museum and a modernized midsection is used as a teaching laboratory for geologists. It also now contains a modern darkroom and one office.

The botany laboratory. This laboratory contains four work tables with room for 16 students. In past years, specialists in mushrooms, lichens, and the Compositaceae have used the station as their headquarters.

The downstairs part of the summer home houses offices for the oceanographers and the geologist, and one room is a classroom. The upstairs part of this building has been turned into dormitories for men. Two other dormitories, one for men and one for women, were built of wood and asbestos shingles. Each one will house 20 people. One of the small wooden buildings which went with the big house is used for a shop and storeroom, and the other has been turned into a chemistry laboratory. A brick research building was constructed on the grounds in 1952 at a cost of $20,000. It contains six work tables and four water tables for running seawater, and also houses the administrative offices. A teaching laboratory was completed in the spring of 1956. It consists of two large rooms which between them contain eight water tables and eighteen work tables. A smaller room is used as a botany laboratory and contains four work tables. Each one of the tables has space for four students. The water tables are equipped with running fresh water, salt water, compressed air and aquariums.

During the summer the Laboratory has been over-crowded with research people. Fortunately, the 1962 Session of the Legislature voted a bond issue for a $400,000 research building which is to be erected within the next two years.

The Laboratory has a 38-foot all steel trawler named the Hermes which is powered with a diesel motor. It has passed Coast Guard certification, but is too small and will not handle all of the field trips and class groups which use the boat. Therefore, a T-boat, 65 feet long, was recently acquired through the Surplus Property Agency, and is being renovated at a cost of approximately $20,000.

Since 1955 to the end of the fiscal year 1961 Laboratory support was about fifty-fifty from outside contracts and the State of Mississippi. State appropriations come through the State Legislature and the Board of Trustees. The State Building Commission also helps through special allotments from time to time. In 1962 the Session of the Legislature also granted the Laboratory ten per cent of the future sales of dead reef shell from the buried oyster reefs along the coast. The Laboratory expenditures have quadrupled sinee 1955.

Doctor E. Gibbes Patton, Director of the University Arboretum, University of Alabama, has written that a mimeographed extract from Charles Mohr's *Plant Life of Alabama,* is available upon request from the University Arboretum.

Charles Mohr's *Plant Life of Alabama* was published over 60 years ago. The book needs revision; it is out of print; and many extant copies are brittle-paged, deteriorating rapidly with use. Mohr's work nevertheless still serves as a treasury of thorough, masterfully-organized information on the flora and the plant geography of the state.

The extract from *Plant Life of Alabama* is temporarily reproduced with the principal objective of making this part of the book more widely available to teachers, researchers, and amateurs of natural history in the Southeastern United States. An important secondary objective is to obtain an estimate of the demand for verbatim printed copies of the 137 pages of Mohr's work which is partially represented by this mimeographed extract. *Expressions of interest in, and need for, a formal reprinting of this material are needed by the University Arboretum.*

A mimeographed check list of Alabama woody plants, both native and naturalized, is also available upon request from the University of Alabama.

ROYAL E. SHANKS (1912-1962)

Royal E. Shanks was born in Ada, Ohio, November 11, 1912. He lost his life on August 4, 1962, while swimming and studying coral reef in a bay of the Caribbean Sea, at Porte Limon, Costa Rica. His early schooling was in the public schools of Ada. While in college he at one time considered the ministry as a calling, but toward the end of his undergraduate days at Ohio Northern University he became interested in ecological botany and this interest became his career. After graduating from Ohio Northern, with an A.B. in 1933, he taught in the North Bloomfield, Ohio, school system. Here he was the principal of a consolidated school where he taught in the primary and senior high school and coached baseball and basketball. He was married to Betty Morris in 1935. During the summer he attended Ohio State University and in 1936 he was appointed a graduate assistant at the university and matriculated for graduate study there as a full time student. Under the influence of the strong group headed by Dr. Transeau in ecology, he completed his M.S. in 1937 and Ph.D. degree in 1938.

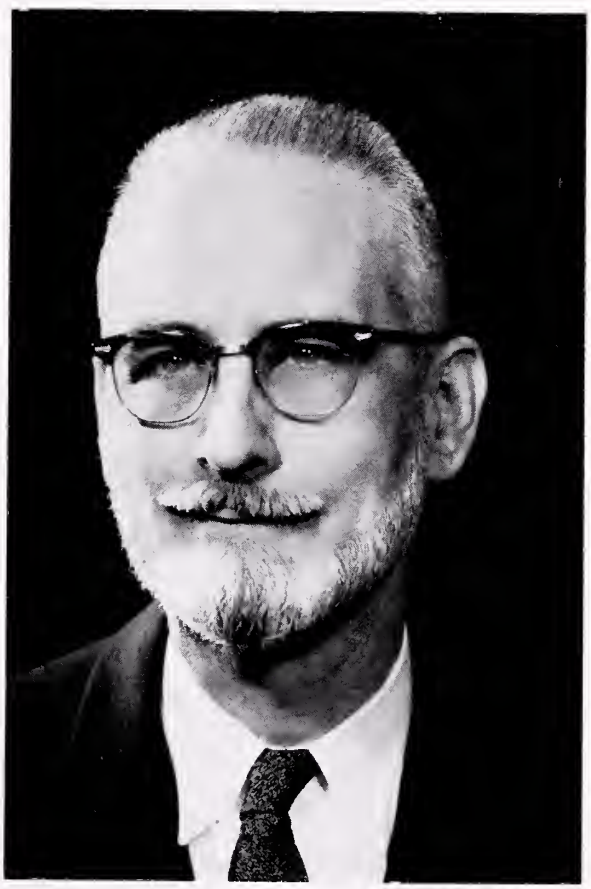
A temporary appointment at the University of Tennessee, 1940-41, brought him to this state for the first time, and he remained in Tennessee as a Professor of Biology at Austin Peay State College from 1941 to 1946. During some of these war years he was on leave and served briefly in the Army and finally in the Navy as a navigation instructor. In 1947 he was asked to come to the State University to succeed Dr. Stanley Cain as an Associate Professor of Botany. He became a Professor two years later.

In 1955, a concern with environmental aspects of ecosystems led him to propose some fundamental studies in the most simple environments, those of the Arctic region. The Arctic Institute supported five summers of study at Point Barrow, Alaska, and scientific exploration on the north shore of Alaska eastward nearly to the Canadian border and south to the mountains and forest.

At the end of the summer of 1955, White Oak Lake in Oak Ridge, the lake below the old graphite reactor, was drained, exposing a relatively flat bottom which had absorbed low-level radioactive wastes for years. Here was a challenge to study the ecology of a large radioactive area on a field rather than a laboratory basis. The AEC supported his proposal for such a study. For the last six years a substantial portion of the graduate research in eeology involved problems such as the evaluation of isotope movement in plants and soils and accumulation in plant materials.

Those students and colleagues of Royal Shanks speak from the heart when they describe him as an unusual man. His recreations, for which he had too little time, were likely to be bus-man's holidays. He had been an active member of the Smoky Mountains Hiking Club, and was keenly interested in the preservation of wilderness areas. Scarcely secondary was his love of music. His early years in Ohio were colored by the influence of many Welsh settlers and their eisteddfods, or musical competitions. Not only is his wife a good pianist, but his two adopted girls, Emily, 13, and Harriet, 15, are gifted instrumentalists—and one of their happiest diversions is with home musical groups. This interest carried into community choral music as well and he sang in the Knoxville Men's Chorus and for a time led the choir of the Lake Forest Presbyterian Church, of which he was a devoted member. Many students and staff will remember his leading and participating in the singing on trips and around camp fires on the nights of hikes and field trips.

He was a member of numerous scientific societies and his ability had been recognized by his election to offiees of responsibility in several. Only this year, he retired as president of the Assoeiation of Southeastern Biologists. His manner was gentle, his activity great, his enthusiasm



Royal E. Shanks

contagious. When a matter of principle was involved he did not compromise. He built not only a large working laboratory but did much for his field at Tennessee by bringing research associates and students to the University. He was the first biologist at Tennessee to begin to make use of the modern computing technology and strongly backed the establishment of the university as a computing center.

In the year before he died he made eighteen talks through the state of Tennessee. In all, he supervised thirteen master's and nine doctoral theses from 1949 to 1962. His students found him a constructive critie and a warm friend.

Though not always obvious, his human interests were strong. One year, returning from national meetings, a colleague commented, "We have some good laboratories to come back to now." "I come back to the people in this building," said Royal, "these are what I return to!" His loss will be an irreplaceable one to those who were associated with him in any way.

The AAAS Philadelphia Meeting

DECEMBER 26-30, 1962

THE 129TH MEETING of the American Association for the Advancement of Science will include sessions of 20 AAAS sections and of some 86 participating organizations. Programs of particular interest to biologists are:

AAAS General Sessions. Moving Frontiers of Science I: Sterling B. Hendricks whose topic will be "Biological Timing," Dec. 26, eve; and Sydney Brenner, Cambridge University, who will speak on "Perspectives in Molecular Biology," Dec. 28, aft.

AAAS Committee on Desert and Arid Zones Research. A two-session symposium arranged by Harold E. Dregne, Dec. 27.

AAAS Interdisciplinary Symposia, Dec. 28, morn. One of three will be "Biochemistry of Genetic Transcription," arranged by Severo Ochoa and Philip H. Abelson. Speakers: Sol Spiegelman, University of Illinois; William Jones and Marshall W. Nierenberg, National Institutes of Health; Severo Ochoa, Joseph Speyer and associates, New York University; Sydney Brenner, Cambridge University.

AAAS Presidential Address and Reception, Dec. 28, eve. Retiring president Thomas Park will speak on "Beetles, Competition, and Populations."

AAAS Section C—Chemistry. Papers in organic chemistry, Dec. 26, aft. Two-session symposium on "Mechanisms of Organic Chemistry," arranged by Paul Schleyer, Dec. 27.

AAAS Section F—Zoological Sciences. Zoologists' Dinner and vice presidential address by Ernst W. Caspari, Dec. 29, eve., "Genes and the Study of Behavior."

AAAS Section G—Botanical Sciences. Two-session symposium, "Plant Biology Today," a continuation of the series of basic papers for teachers, Dec. 27. Speakers: Bruce A. Bonner, Harvard University; Herbert Stern, University of Illinois; John G. Torrey, Harvard University. This year's papers will be on structure and function. The Botanists' Luncheon, also Dec. 27, will be followed by the vice presidential address by John N. Couch, "Are Bacteria and Fungi Related?"

AAAS Section N—Medical Sciences. Four-session symposium, "New Concepts Regarding Biological Control Mechanisms," arranged by DeWitt Stetten, Jr. and Oscar Touster, and cosponsored by Section F—Zoological Sciences, and the American Society of Zoologists. Dec. 27, 29. Topics and speakers:

A. *Repression Mechanisms*—Boris Magasanik (Chm.); Bruce Ames; Luigi Gorini; Hans Kornberg; University of Leicester, England;
B. *Feedback Control of Enzyme Action*—H. E. Umbarger (Chm.); Georges Cohen, Centre National de la Recherche Scientifique, Gif-Sur-Yvette, France; H. S. Moyed; A. B. Pardee; J. C. Gerhart;
C. *Hormonal Phenomena*—E. W. Sutherland, Jr. (Chm), O. H. Lowry, Theodore Rall, G. M. Tomkins;
D. *Transport Across Cell Membranes*—C. R. Park (Chm.), Alexander Leaf, D. O. Rudin, J. Skou.

DeWitt Stetten, Jr. will give the vice presidential address for Section N, "Forecasts in Medical Education."

AAAS Section Nd—Dentistry. Four-session symposium, "Mechanisms of Hard Tissue Destruction," arranged by Ned B. Williams and Reidar F. Sognnaes, Dec. 29, 30. Topics include rock-boring by mollusks and other animals, bone-remodeling, antler-shedding, biochemistry of bone destruction, and dental caries. Speakers: M. R. Carriker; David B. Scott; C. M. Yonge, Glasgow, Scotland; Thomas F. Goreau, University College of West Indies; Franklin C. McLean; Robert E. Rowland; S. N. Bhaskar; Richard J. Goss; Marshall Urist; Jenifer Jowsey; Norman M. Hancox, Liverpool, England; James Irving; Richard W. Young; George Nichols, Jr.; Bernard Forscher; Paul Goldhaber; A. I. Darling, Bristol, England; Erling Johansen; David Francis; John Gray; Reidar F. Sognnaes; Willard D. Hartman, Peabody Museum, Yale University; Ingjald Reichborn-Kjennerud, University of Oslo, Norway; C. S. Handelman, Harvard University;

L. F. Belanger and B. B. Migicovsky, University of Ottawa; Harold Copp, University of British Columbia; Jacques Vincent, Belgian Congo; C. M. Lapiere J. Gross, Massachusetts General Hospital; G. N. Jenkins, King's College, England; C. Dawes, Harvard University; Paul Keyes and Harold Jordan, National Institute for Dental Research; C. R. Barnicoat, New Zealand; W. V. Mayer, Wayne State University; David Cameron, Johns Hopkins Hospital; J. Robichon, University of Ottawa.

AAAS Section O—Agriculture. Five-session symposium, "Food Quality as Affected by Production and Processing," arranged by George W. Irving, cosponsored by four AAAS sections and ten societies. Individual sessions will be on genetic and environmental factors, protection of food crops against insects and diseases, processing factors, quality evaluation and measurement, and food-grading and standardization. Considered in this symposium will be cereals, fruits, vegetables, meats, dairy products, poultry, and eggs.

There will be a **Biologists' Smoker,** jointly sponsored by Sections F and G and all biological societies, Dec. 27, at the Academy of Natural Sciences.

SOCIETAL PROGRAMS

Aeademy of Psychoanalysis. Four sessions on the general topic of "Violence," arranged by Sandor Rado. Areas include neurophysiology and ethnology, anthropology and sociology, psychoanalysis, and large-group relationship, Dec. 28-30.

Alpha Epsilon Delta. Annual luncheon, Dec. 28.

American Association of Clinical Chemists. Symposia on instrumentalism and biological analysis, and on endocrine function; contributed papers. Dec. 26, 27. Speakers: D. A. Turner, Sinai Hospital of Baltimore; S. R. Gambino, Englewood Hospital; S. Udenfriend, National Heart Institute; S. Raymond, University of Pennsylvania.

American Nature Study Society. Annual meeting. Whole period includes sessions on nature study movement, early naturalists of the region, nature photography, nature instruction, and use of areas for nature study.

American Physiological Society and NASA. Joint two-session symposium on "Space Biology and Life Support Problems of Manned Space Missions," arranged by Orr Reynolds and Robert E. Smith, Dec. 30. Speakers: Ernest C. Pollard, Carl Sagan, Sidney Fox, C. S. Pittendrigh, Cornelius A. Tobias, W. A. Lee, R. S. Johnston, J. Correale, J. A. Conner, E. J. McLaughlin.

American Psychiatric Association, Committee on Research. Five-session program on "Human Reactions to Unknown or Impending Disaster," arranged by Milton Greenblatt, George H. Grosser and Henry Wechsler. Topics will be "General approach," "Psychological reaction to arbitrary authority and power," "Emotional reactions to the threat of nuclear war," "Reaction to natural catastrophe," and "Political reactions in the face of uncertainty." Dec. 27, 28.

American Society of Naturalists. Annual national meeting will include a two-session symposium, "Principles and Methods of Phylogeny," arranged by William K. Baker, Dec. 27; the presidential address of Ernst Mayr, "What Is a Fauna?", and the business meeting, Dec. 28, morn. Symposium Speakers: Ernst Caspari, Howard Sanders, Walter Bock, Robert F. Thorne, Arnold W. Ravin, Seymour S. Cohen, Edwin H. Colbert, Marvin Wasserman, Colin S. Pittendrigh.

American Society of Zoologists. The tentative program of the national meeting of the Society, arranged by Ray L. Watterson, with more than 30 sessions, includes 23 sessions for contributed papers sponsored by all six divisions of the Society, throughout the meeting period; business meetings of the divisions; and a series of symposia. The two-session symposium, "Growth," arranged by Lawrence I. Gilbert, is Dec. 28. Speakers: Allison L. Burnett, Dorothy E. Bliss, Howard A. Schneiderman, William Etkin, Dorothy Price, Ernst Knobil, Richard A. Edgren, K. France Baker-Cohen, Jane Coffer Kaltenbach, Bruce B. Stowe.

The two-session symposium, "The Evolution of Behavior," arranged by William C. Dilger, is Dec. 27. Speakers: William C. Dilger, Richard D. Alexander, George W. Barlow, John F. Eisengerg, Richard J. Andrew, Peter Marler, Robert W. Ficken. The two-session symposium, "Energetics," arranged by L. R. Slobodkin, is Dec. 30. Speakers: T. R. Punnett, W. Vishniac, J. J. Blum, K. F. Guthe, L. R. Slobodkin, I. Prigogine. The two-session symposium, "The Regulation and Function of Heterosynthetic and Autosynthetic Molecules in Developmental Processes," arranged by George W. Nace, is Dec. 30. Speakers: Albert Tyler, Laurel E. Glass, Ole Arne Schjeide, William H. Telfer, George W. Nace, Reed A. Flickinger, C. P. Dagg, James D. Ebert.

Biomedical Information-Processing Organization. Session, on computers to aid biology and medicine, arranged by Robert S. Ledley, Dec. 28, aft.

Biometric Society, Eastern North American Region. Session on high speed computers in statistics, arranged by T. A. Bancroft, Dec. 27, morn. Speakers: H. O. Hartley, Max A. Woodbury, Martin Lipkin, Lee D. Cady, and Murray Eden. In the concurrent session on problems of mathematical biology, arranged by H. L. Lucas, the speakers are: H. R. van der Vaart and W. S. McCulloch. The session in genetics, jointly with Sections U—Statistics and G—Botanical Sciences and cosponsored by the Society for the Study of Evolution, Dec. 27, aft., will have papers by S. Karlin, Howard Levene, and Sewall Wright. The session on sampling for zoologists, arranged by E. Fred Schultz, Jr., Dec. 30, morn., will have as speakers: L. L. Eberhardt, D. S. Robson, E. L. Atwood, and D. G. Chapman.

Ecological Society of America. Program, arranged by Robert B. Platt, Dec. 26-30, includes several symposia, some six sessions for contributed papers on plant ecology, animal ecology, and aquatic ecology, and a series of sessions jointly sponsored by the Section on Animal Behavior and Sociobiology and the Division of Animal Behavior and Sociobiology of the American Society of Zoologists.

Herpetologist's League. Session for contributed papers, a business meeting, and a visit to the Philadelphia Zoological Gardens, Dec. 27-29.

Mountain Lake Biological Station. Annual breakfast with the AAAS, arranged by C. W. Hart, Jr.; Horton H. Hobbs, Jr. presiding; for all persons who have been students, investigators, or staff members at the station, Dec. 29.

National Association of Biology Teachers. Annual national meeting, Dec. 26-30. Included in the program will be a luncheon, Dec. 28, with an address by Severo Ochoa, and a series of separate sessions, Dec. 27, 29, and 30, with the theme "Manning the Frontiers."

National Speleological Society. Session on "Cave Biology," Dec. 29, morn.

Sigma Delta Epsilon. National meeting, arranged by Dorothy Quiggle, will include a luncheon for all women in science, with Sue C. Stevens, Veterans Administration Hospital, Lincoln, Nebraska, speaker, Dec. 28.

Society of Systematic Zoology. Annual meeting will include sessions for contributed papers; a symposium, "U. S. and International Programs in Biological Oceanography," cosponsored by the American Society of Zoologists, AAAS Section F, and the American Society of Limnology and Oceanography, Dec. 29; and the annual breakfast and business meeting, Dec. 30. Symposium Speakers: Eugene Wallen, John H. Ryther, Vernon E. Broek, Melbourne R. Carriker, Dixy L. Ray, Rolf L. Bolin, Robert L. Menzies.

Society of the Sigma Xi. Sixty-third annual convention, joint luncheon with the Scientific Research Society of America, and joint address with Phi Beta Kappa, by Loren C. Eiseley, "Man: The Lethal Factor," Dec. 29.

The AAAS Exposition of Science and Industry—131 booths—and the AAAS Science Theatre, with recent foreign and domestic films, will be prominent features of the meeting. Coupons for sleeping accommodations and advance registration will be found in *Science* beginning July 20.

News of Biology in the Southeast

Institutions and Organizations

Mary Washington College of the University of Virginia was the recipient of a substantial fund from an anonymous donor in the fall of 1960 for Scholarships to aid students majoring in Biology. Awards may be made to worthy undergraduate students as well as to students continuing in graduate school. About $1200 was awarded from this fund to assist four students in the 1961-62 session, and similar grants have been made for the 1962-63 session. The conditions of the grant specify that both principal and income of the fund are to be expended over a fixed period of years.

The Science Division of Rollins College was one of the recipients of the Undergraduate Instructional Equipment Grants from the National Science Foundation for $23,160. This was matched with $25,000 from Rollins College to be expended for the equipment and instrumentation needed to modernize the biology offerings to give them a more physiological-biochemical orientation.

About People

Bernard C. Patten has been invited to participate in the 10th annual symposium of the Houston Neurological Society. The subject of the symposium is "Information Storage and Neural Control." Dr. Patten will speak on information storage and transfer in ecological systems.

Harold J. Humm, Department of Botany, Duke University, was a visiting professor at the Virginia Institute of Marine Science this summer and taught the course in Marine Botany.

John N. Couch and **Walton C. Gregory** have been appointed members of the Scientific Advisory Committee to the Governor of North Carolina, Terry Sanford. The committee, appointed in December, 1961, consists of approximately 40 representatives of all disciplines with the responsibility of helping to implement the scientific and industrial development of North Carolina.

Robert K. Burns will join the faculty of Bridgewater College as Interim Professor of Biology in the session of 1962-63, following his retirement from the staff of the Laboratory of Embryology of the Carnegie Institution of Washington.

William W. Scott, Associate Professor of Botany at Virginia Tech, was honored at the 40th Annual Meeting of the Virginia Academy of Science with an Honorable Mention Award and a check for $50.00 for meritorious and original research in competition for the J. Shelton Horsley Award. Dr. Scott presented a paper entitled "A Monograph of the Genus *Aphanomyces*." The award winning paper was one of 205 papers presented at this year's meeting. More than 700 senior scientists and 325 junior scientists attended concurrent sessions during the 5-day meeting.

Dr. Scott and his students presented four additional papers before the Biology Section of the VAS. These were: "A Preliminary Report of Fungi Associated with Diseased Fish," by W. W. Scott, Aaron H. O'Bier, and James Powell; "The Life-cycle of a Keratinophilic Fungus *Leptolegniella keratinophilum*," by Roland Seymour and W. W. Scott; "Some New and Unusual Fungi from Virginia," by W. W. Scott and Charles Warren; and "The Genus *Calostoma* Zeller in Virginia," by Mary Virginia Charlton.

George H. Lauff, director of the University of Georgia Marine Institute at Sapelo Island, and associate professor of Zoology at the University of Michigan, has been elected to the Board of Trustees of the Sapelo Island Research Foundation and has accepted the position of research coordinator for the Foundation supported activities, effective July 1, 1962.

J. Gordon Carlson, Head of the University of Tennessee Department of Zoology and Entomology, spent several weeks of the summer attending meetings in Europe. In the early part of August he presented a paper entitled "Mitotic Effeet of Monochromatic Irradiation of the Nucleolus" at a Symposium on Partial and Microbeam Irradiation of Cells at the University of Cambridge, England. Later he attended the sessions of the Second International Congress of Radiation Research at Harrogate, England. He then attended a Symposium on "Repair from Genetic Radiation Damage and Differential Radiosensitivity in Germ Cells" at the University of Leiden, Holland.

Albert Collier will become Director of the Oceanographic Institute at Florida State University on November 1, 1962. Prof. Collier is now directing the Marine Laboratory of the A. & M. College of Texas at Galveston.

Winston Menzel of the Oceanographic Institute and Department of Biological Sciences at FSU has received a 3 year renewal of a grant from the National Science Foundation to continue his study of *Dermacystidium marinum* in oysters.

Margaret Menzel, Research Associate in the Department of Biological Sciences at FSU, will be a guest investigator in the Institute of Space Biosciences at the University.

Charles Metz, former Assoeiate Director of the Oceanographic Institute at Florida State University, is now working full time in the Institute for Space Biosciences at FSU.

Two new instructors have been added to the Department of Biological Sciences at Florida State University. **William H. Heard,** Ph.D., University of Michigan, will teach general biology and continue his research in malacology. **Andre Clewell,** who is working for his Ph.D. degree at the University of Indiana, will teach ecology and plant taxonomy.

Leland Shanor resigned as Head of the Department of Biological Sciences at Florida State University on July 1, 1962. He is now on a leave-of-absenee from the University as Dean of Advanced Studies in the Florida Institute for Continuing Studies, Tallahassee. **Robert K. Godfey** is the acting head of the department at present.

Paul B. Sears, Professor Emeritus of Yale University, where he directed the Conservation Program, has joined the Wake Forest College staff as Mary Reynolds Babcock Professor of Botany. In addition to Dr. Sears, **Ralph D. Amen,** plant physiologist, from the University of Colorado and **Robert L. Sullivan,** geneticist at Washburn University, have also recently joined the Wake Forest staff.

G. Ray Noggle, Chairman, Department of Botany, University of Florida, took part in the Advanced Seminar in Tropical Biology in Costa Rico during the summer. This is one of his many visits to Central America where he is planning to extend the work and facilities for studies of tropical botany by University of Florida students and staff, and for others interested in the region.

Alan D. Conger, Research Professor in Radiation Biology, University of Florida, worked at the Brookhaven Laboratory in August this summer and then attended meetings of the International Congress of Radiation Research at Harrogate, England, and a Symposium in radiation genetics at the University of Leiden, Leiden, The Netherlands.

W. L. Selser spent five weeks during the summer at the Inter-American University of Puerto Rico teaching teachers how to use the B.S.C.S. materials in High School teaching.

Paul A. Vestal, Rollins College, is directing the Visiting Scientist Program for the secondary schools of Florida. It is a project of the Florida Academy of Sciences sponsored by a grant from the National Research Foundation.

Rose Mary Johnson, Department of Biology of the Norfolk Division of William and Mary, was awarded her Ph.D. at the June Commencement at the University of Virginia. In September she joined the staff of Mary Washington College of the University of Virginia as Assistant Professor of Biology.

After two years leave of absence at Duke University and the University of Wisconsin, **Anna Scott Hoye** received her Ph.D. in Physiology from the University of Wisconsin in June. In September she returned to Mary Washington College of the University of Virginia as Associate Professor of Biology.

Thomas Johnson is on leave from the Department of Biology of Mary Washington College for the 1962-63 session. After a summer spent touring in Europe, he is pursuing studies toward the doctorate at the University of Virginia.

Nancy S. LePrade of Richmond, Va. has spent the summer as a trainee in the Division of Radiobiology at Oak Ridge, Tennessee. The summer of 1961 was spent at the University of Tennessee under the National Science Foundation's Undergraduate Research Participation Program. She returned to Mary Washington College in September as Senior Major in the Department of Biology.

Bruce L. Welch has joined the faculty of the College of William and Mary as an Assistant Professor of Biology.

Garnett R. Brooks, Jr. has joined the staff of the College of William and Mary as an Instructor in Biology. Mr. Brooks will complete his Ph.D. degree requirements at the University of Florida in December.

Marie Jenkins has been appointed Associate Professor of Biology and **Beverly Pleasants** has been appointed Instructor of Biology at Madison College. Dr. Jenkins was formerly on the staff of the University of Oklahoma, and Miss Pleasants on the staff of Richard Bland College.

Dorothy Crandall will be on Sabbatical Leave from Randolph-Macon Woman's College next year. The first semester she will be at North Carolina State College studying forest soils; the second semester at University of Tennessee.

William S. Hooks of Illinois Northern University will join the faculty of Randolph-Macon Woman's College in September, replacing Dr. Crandall while she is on sabbatical leave.

Alvin H. Nielsen, Head of the University of Tennessee Department of Physics, is succeeding Dr. Kenneth L. Knickerbocker as Dean of the College of Liberal Arts. Dr. Nielsen received his degrees from the University of Michigan and was on the staff of Ohio State University before coming to the University of Tennessee in 1935. He is recognized as a leading authority on infrared spectroscopy in this country and abroad.

NEWS FROM THE BIOLOGY DIVISION— OAK RIDGE NATIONAL LABORATORY

Robert T. Brumfield, Biology Division Consultant, has returned to Longwood College, Farmville, Virginia, after spending the summer months in the Cytology and Genetics section.

Roderick K. Clayton, Microbiology Group, is taking a leave of absence for one year; Dr. Clayton will be on the faculty of Dartmouth College during the coming year.

Piero Cammarano of the Institute of General Pathology, University of Milan, Milan, Italy, has joined the Enzymology Group for one year under the sponsorship of the Comitato Nazionale Energia Nucleare. Dr. Cammarano received the M.D. degree from the University of Rome, Italy.

William Robert Finnerty, who has been with the Enzymology Group, under the sponsorship of the United States Public Health Service, has accepted a position with the Department of Biology, Indiana University Medical School, Indianapolis, Indiana.

Akira Kaji, Department of Microbiology, Vanderbilt University School of Medicine, Nashville, has joined the Enzymology Group for one year under a grant from the Helen Hay Whitney Foundation. Dr. Kaji received the B.S. degree from Tokyo University, Tokyo, Japan, and the Ph.D. degree from the Johns Hopkins University, Baltimore, Maryland.

Frank Seto of the Department of Biology, Berea College, Kentucky, has joined the Radiation Immunology Group for the coming year under a grant from the U. S. Public Health Service.

Michael Hanna, Jr., an ORINS Fellow, has joined the Mammalian Recovery Group. Mr. Hanna received the M.S. degree in Zoology from the University of Notre Dame, Indiana.

Robert R. Becker, who has been associated with the Cell Physiology Group, has accepted a position with the Department of Chemistry, Oregon State University, Corvallis, Oregon.

James C. Copeland, who has been with the Radiation Microbiology Group for the past two years, left the Division August 24. Mr. Copeland received a U. S. Public Health Service Traineeship for graduate work leading to the Ph.D. at the Institute of Microbiology, Rutgers University, New Brunswick, New Jersey.

Alexander Hollaender attended the Second International Congress of Radiation Research at Harrogate, England, in August; Dr. Hollaender chaired the session on Linear Energy Transfer. The Second International Congress was also attended by A. C. Upton, Raymond A. Popp, Gustavo Cudkowicz, Howard I. Adler, M. A. Bender, George F. Stapleton, Elmo E. Capalbo, R. F. Kimball and Joan Wright Goodman. Dr. Upton chaired the session on Metabolic Disturbances III and gave a paper entitled, "Relative biological effectiveness of fast neutrons for production of late somatic effects in mice." Dr. Popp chaired the session on Radiation Immunology. Dr. Cudkowicz presented an invited paper entitled "Suppression of the foreign marrow reaction in mouse chimeras by preirradiation of donor cells." Dr. Adler presented an invited paper entitled "Genetic analysis of radiation sensitivity of Escherichia coli." Dr. Bender presented a paper, co-authored by P. C. Gooch, "Persistent irradiation-induced aberrations in human somatic chromosomes." Dr. Capalbo presented an invited paper, co-authored by M. R. Leonard and T. Makinodan, entitled "Proliferation of lymphoid cells after X-irradiation." Dr. Kimball presented a paper entitled "Fractionation of dose and radiation intensity in the induction of recessive lethal mutations by X-rays in Paramecium aurelia." Dr. Goodman presented an invited paper, "Transplantation of white blood cells in irradiated mice."

The ASB BULLETIN

Volume 10, Number 1 January, 1963

THE *Anton Bruun*—ONE OF THE INDIAN OCEAN EXPEDITION RESEARCH VESSELS

The Official Quarterly Publication of
The Association of Southeastern Biologists

COVER PHOTOGRAPH: The *Anton Bruun*, formerly the presidential yacht *Williamsburg*, was recently outfitted as an oceanographic vessel—and left the United States shortly after Christmas for the Indian Ocean. Most of the investigators will fly to the area and meet her at pre-determined places for their respective cruises.

CONTENTS

ASB BULLETIN

The ASB BULLETIN is the official quarterly publication of the Association of Southeastern Biologists, Inc., and is published at Philadelphia, Penna., in January, April, July and October. Letters, news items, other contributions, and all communications about editorial matters should be addressed to C. W. Hart, Jr., Editor, The Academy of Natural Sciences of Philadelphia, 19th and The Parkway, Philadelphia, Penna. Changes of address should be sent promptly to the Secretary of the ASB, Dr. Harry J. Bennett, Department of Zoology, Louisiana State University, Baton Rouge, La. Subscription orders from libraries and other institutions should be sent to the Business Manager, Dr. Leland Shanor, Department of Biological Sciences, Florida State University, Tallahassee, Florida. Subscription rate for nonmembers of the ASB: $2.00 per year. Printing and typography by the Wickersham Printing Co., Lancaster, Penna.

Second-class postage paid at Philadelphia, Pennsylvania.

C. WILLARD HART, JR.
EDITOR

HARRY J. BENNETT, Associate Editor
LELAND SHANOR, Business Manager

The following invited address was given by Dr. Martin D. Young at the 25th anniversary dinner meeting of the Association of Southeastern Biologists, Winston-Salem, N. C., April 27, 1962.

Founding and Early Days of the Association of Southeastern Biologists

by Martin D. Young

A description of the founding and early days of the Association of Southeastern Biologists appropriately should be given by the man who originated the idea, who was instrumental in the initial organization, who was the first President, and who has been most important in guiding its destinies, Dr. George Hugh Boyd. However, circumstances prevented his preparing such a report and, therefore, I have the distinct honor of talking on this subject.

A historical note of the Assoeiation was published in October 1940 (J. Tenn. Acad. Sci. 15: 406-407). In 1946, Dr. Boyd presented a short history at the annual meeting. Following the 20th anniversary meeting in 1957, he published a factual and interesting history. There is little that I could add of a major nature to the 1957 report concerning the early days of the Association. I shall endeavor to add some sidelights.

Much of this material has been furnished by Dr. Boyd and by Dr. Harry Bennett.

As early as 1932, there was an interest in a general organization that would bring together from time to time the scientists of the South. It seemed that closer contacts within the Southern region would aid materially the progress of the scientific endeavor in the South.

In the effort to do something to overcome the existing isolation, Dr. Boyd wrote letters to a number of persons engaged in scientific activity in this region in an attempt to arouse an interest in the establishment of a Southeastern Section of the American Association for the Advancement of Science. In 1936, the Georgia Academy of Science invited representatives of the neighboring academies to be its guests at its annual meeting in Athens, Georgia, on April 3 and 4, with the purpose of considering such an organization. Enthusiasm was shown at the meeting but there did not appear to be enough general interest to insure the success of a regional organization involving different branches of science. Consequently, it appeared that probably the best approach to this problem would be that of bringing together the biologists of this region at meetings comparable to those already being held by the Southern Society for Philosophy and Psychology, the Southeastern Section of the American Mathematical Association, and the Southern Section of the American Physical Society. The one step necessary, then, for the establishment of a section of the American Association for the Advancement of Science would be that of getting the regional organizations to meet at one place simultaneously and agree to a general over-all organization. These things are mentioned in order to point out the fact that the Southeastern Association of Biologists was organized as an outgrowth of the desire to have a larger science organization in which the various sciences would participate jointly.

Under date of February 20, 1937, Dr. Boyd wrote a letter to all the biologists of Georgia and the bordering states, as far as the names of such persons could be found, inviting them to "a meeting of Southeastern biologists" at the University of Georgia on May 7 and 8 of that year. In this communication, it was stated that the meeting was not being called for the purpose of initiating an organization of biologists; but, if such an organization seemed desirable to the group, opportunity would be afforded for its consideration. A majority of the replies were favorable.

The records indicate that 69 persons attended this meeting and 20 papers, based upon specific research, were read. In addition to these reports on research in progress, a paper on "New Views in Plant Virus Disease Research" was read at the evening session by Dr. L. O. Kunkel of the Rockefeller Institute at Princeton, New Jersey, and a paper was read by Dr. Pearse on Saturday morning on the subject of "The Caves of Yucatan."

At the Saturday morning session, a business meeting of the group was held which resulted in the initiation of an organization to be known as the "Association of Southeastern Biologists." The officers chosen for this organization were G. H. Boyd, president; H. L. Blomquist, vice-president; and J. T. Penney, secretary-treasurer. Members of the official executive committee chosen at that time were Margaret N. Hess, Mary S. MacDougall, E. E. Reinke, and J. S. Rogers.

At the initial business meeting, a committee was appointed to draw up a constitution and report a year later. In the months that followed, such a constitution was drawn up and it was approved at the first annual meeting of the Association. This constitution stated that the organization should be called "The Association of Southeastern Biologists." Why it should not have been called "The Southeastern Association of Biologists" has always been puzzling.

It is interesting to note that the purposes of this Association were stated as follows:

1. To promote scientific research.
2. To provide personal and professional contacts among those engaged in biological work in the Southeast and thus to promote greater unity and cooperation among its members.
3. To promote the development of a sound biological point of view and a realization of the relation of fundamental knowledge in this field to the solution of problems peculiar to the Southeast.
4. To promote study of the biological resources of this region and efforts for their preservation.

After an unsuccessful effort to meet with other regional scientific groups, it was finally decided to hold the first regular meeting at the University of Georgia on April 15-16, 1938. Seventy-six persons attended this meeting and twenty-one research papers were read. The guest speaker on this occasion was Dr. Otis W. Caldwell, General Secretary of the American Association for the Advancement of Science.

The Treasurer's report was as follows:

Collections	None
Expenditures	$5.70

The Treasurer's report was approved, but the minutes do not reveal whose money the Association approved to be spent.

For those of you who are making more money and having less left, the rates for the hotel rooms for the 1937 meeting may be of interest. They were: Single rooms, $1.50-$3.00; double rooms, $2.50-$5.00.

The 1939 meeting was at Duke University. An increase in membership was reported. In his report, the Secretary-Treasurer said, "one or two members have already paid dues for 1940. The Secretary-Treasurer points with pride to this phenomenon, and passes on this news to fellow members of the Association who may have despaired of ever getting close to prosperity again." Note: the dues were $1.00 per year.

During the 1940 meeting at Vanderbilt University in Nashville, Tennessee, the arrangement was made to publish certain material, principally the proceedings and abstracts of the meetings in the Journal of the Tennessee Academy of Science. This arrangement continued in a very satisfactory manner until the Association started its own Bulletin in 1954.

In 1941, the meeting was at the Alabama Polytechnic Institute, known by most football enthusiasts as Auburn. A pertinent discussion arose concerning the meeting place for the following year. One line of discussion emphasized the desirability of meeting in conjunction with such groups as the newly organized Southern Association for the Advancement of Science and the host state academy. The other view was that large meetings result in too much overlapping and a superstructure in the form of a large all-science organization would be a handicap to the ASB. It was decided that just ASB would meet at Miami University the following year.

Subsequent to the meeting in API, a member of the host organization sent the following accounting to the Secretary-Treasurer.

> I sent you a statement regarding the $4.50 deficit incurred by inviting nine guests to the banquet of the Association of Southeastern Biologists. Since then I have received a phone call from the Secretary's office asking that this remittance be made in order to balance the books. I am relaying the information to you. During my correspondence in connection with the meetings, I have written 52 letters requiring three cents postage on each, and I have had to return a pair of shoes to Dr. ——— of Vanderbilt, costing a total of 25 cents express charges. In addition to that, I spent 25 cents for penny postcards which were sent out ot colleges in Mississippi, Louisiana, and Oklahoma requesting bulletins for the Association's use. These last two items I paid out of my own pocket. The postage for the letters I have written amounting to $1.56 was paid by the Department. When these charges are paid, all the details relative to our recent meetings will have been cleared up.

At the University of Miami meeting in 1942, there was 17 inches of rain within 48 hours, per-

haps a portend of dismal news for the next few war years. In spite of this, the meeting was very successful. To cooperate with the botanical interests, it was decided to invite the Southeastern Section of the Botanical Society of America to meet jointly with the Association in Columbia, South Carolina, scheduled for 1943. However, no meeting was to occur for the next four years.

The Secretary-Treasurer, Dr. D. C. Boughton, left to go to Washington, and the speaker was elected to take his place. Due to the war emergency, no meetings were held during the years 1943-1945. The President, Dr. Mary S. MacDougall, and the Secretary endeavored to keep in touch with the membership during this period. The expenses during these years were met by the payment of a single annual membership dues of $1.00 total, perhaps establishing somewhat of a record in modern times of 25 cents per year for dues. During this time, newsletters and announcements were sent out giving the available information on the activities of members, especially those in uniform.

Our members contributed to the war efforts by their services and especially by personal participation. It was disheartening, however, to see some highly trained scientists put into lowly or misfitted positions by the Armed Forces resulting in a tremendous waste of training and intellect. This is a situation from which biologists in general have not been able or perhaps have been unwilling to extricate themselves. It is believed that biologists can better serve humanity by a more realistic appraisal of their relative abilities and worth to their fellow beings and to society.

Annual meetings were resumed in 1946 at the University of South Carolina, Columbia, S. C. A resolution was passed to the effect that each hour of laboratory instruction should have a credit value of 1 hour in determining the teaching load of the instructor. President MacDougall had gathered much information on this point during the war years. Another resolution supported the founding of a National Science Foundation.

The Eighth Annual Meeting was at Emory University, Georgia, in 1947 in association with the Southeastern Section of the Botanical Society and the Southern Appalachian Botanical Club. Ninety-nine new members were elected. The annual awarding of a research prize, underwritten by the Carolina Biological Supply Co., was instituted. It was announced that ASB had become a affiliate of the American Association for the Advancement of Science.

In 1948, a joint meeting with the Southeastern Section of the Botanical Society was held at the University of Florida at Gainesville. In addition to the regular meeting, an interesting field trip was arranged during which the members partook of alligator meat. On the last day, a visit was made to Marineland on the East Coast.

The Tenth Annual Meeting at the University of Tennessee, Knoxville, in 1949 was marked by an attendance of 331, undoubtedly setting a new high.

In 1950, the Eleventh Meeting was held at the University of Virginia in Charlottesville and the award of the Phipps and Bird fellowship for summer research at Mountain Lake, Virginia, was begun. In 1952, the Meritorious Teaching Award supported by the Will Corporation was instituted.

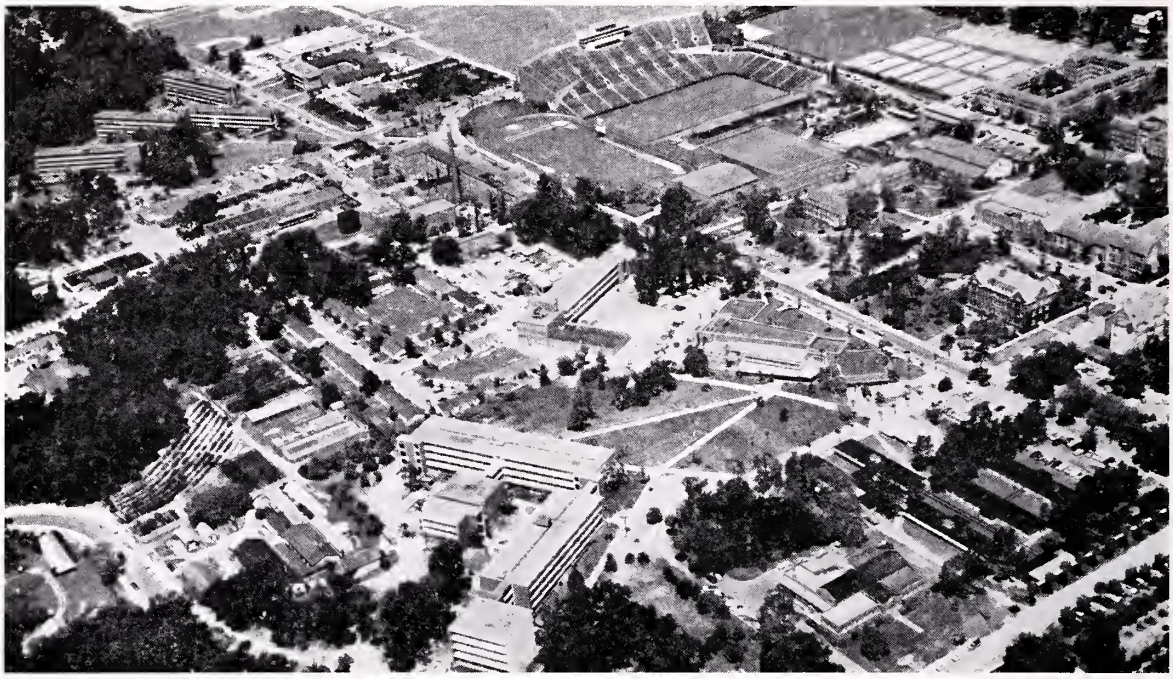
The functions and the pattern of the Association appeared to have been formed by 1950. The annual meetings were informative and had the very friendly atmosphere that has always characterized this organization. Awards of significance had been established. Abstracts and meeting proceedings were published regularly. There had been a steady growth of the membership and the attendance at the meetings was relatively good.

Women biologists have played an important role in this organization since its formative days. Dr. MacDougall of Agnes Scott was one of the original group concerned with the initial organization. She and Dr. Margaret Hess composed 50% of the first executive committee. Dr. MacDougall has been on the executive committee for 3 different terms as well as serving as Vice-President and President. Between the years 1937 and 1951, she held one or other of the above offices for a total of 8 years, which is probably a record for officeholding in this organization. Later, in 1952, she received the Meritorious Teaching Award. Dr. Margaret Hess was a member of the Executive Committee 5 of these 13 years and Vice-President for one, making a total of 6 years of office holding. She was President in 1952-53 and she received the Meritorious Teaching Award later in 1959.

Other women who have held principal offices are: Drs. Gaulden, Bridgemen, Howell, Jones, and Quarterman. In addition, women have served on various important committees and in general have had a prominent voice in the operation of the society.

Various regions, including our own country, have organizations to study the status of women. Perhaps they should take note of the important part women have played in the ASB as a guide and, in our own country, as a shining example of integration.

In the 25th year of its existence, the Association is the lengthened shadow of Dr. Boyd and of those who thought and believed as he did. It obviously is adequately filling a need of biologists in the Southeast and should continue to prosper.



The University of Florida Campus

About The Gainesville Meeting

The Association of Southeastern Biologists will hold its twenty-fourth annual meeting April 18-20, 1963, at the University of Florida, Gainesville, Florida. Meeting with the ASB this year will be five other organizations: the Southern Appalachian Botanical Club, the S.E. Section of Beta Beta Beta, the Southeastern Section of the Botanical Society of America, a regional group of the National Association of Biology Teachers, and the Southeastern Division of the American Society of Ichthyologists and Herpetologists.

The meetings will commence on Thursday afternoon, April 18, with a meeting of the Executive Committee at 1:00 p.m. in Room 208 of the Florida Union on the University campus. Activities of the meeting will take place in the Florida Union unless specified otherwise in the program. Registration will begin at 4:00 p.m. Thursday in Bryan Lounge, the exhibits will be in the adjoining social room and the Thursday evening program, to be announced later, will be held upstairs in the Auditorium.

At the conclusion of the Thursday evening meeting, members and guests are invited to the Smoker to be held in the Bryan Lounge and adjoining Social Room where the exhibits will be on display.

Paper sessions and the annual business meeting will occupy Friday. Friday night's activities include a banquet, the retiring presidential address, and presentation of awards, to be held in the University Cafeteria; further details will be published in the Program of the Annual Meeting. Plans are being made for three field trips, for special rates at some of the Florida tourist attractions, and for activities to include wives and children.

Accommodations

Fifteen air-conditioned rooms are available in the Florida Union to members and guests of the Association. Nine have private baths and six include a lavatory in the room and a connecting toilet and shower. Nine of the rooms have twin beds and six are equipped wtih double beds. Rollaway beds are available for use in ten of the rooms at a slight additional charge. Send requests for reservations to Dr. G. Ray Noggle, Department of Botany, University of Florida, Gainesville. Please indicate whether or not double bed is acceptable. If more than 15 requests for rooms in the Union are received reservations will be made in a nearby motel.

Rates in Florida Union

Room			*Single*	*Double*
401	DB	PB	$6.00	$8.00
402	TB	CB	5.00	8.00
403	DB	CB	5.00	7.00

404	DB	CB	5.00	7.00
405	TB	CB	5.00	8.00
406	DB	CB	5.00	7.00
408	DB	CB	5.00	7.00
409	TB	PB	6.00	9.00

415	DB	PB	6.00	8.00
416	TB	PB	6.00	9.00
417	TB	PB	6.00	9.00

Please write direct to hotels and motels for reservations. When you write please state that you are coming to the ASB meeting and request the commercial rates.

Hotel

Hotel Thomas 615 N.E. 2nd Street Phone FR 2-9501	One person Two persons	$4.00-7.00 $7.00-12.00

Motels

The following rate schedule has been compiled by the Gainesville Motel Association. The rate structure, as shown below, represents the prices which prevail generally throughout the year. The rates listed do not necessarily apply at times of special events such as football games, etc.

Bambi Motel 2119 S.W. 13th St. Phone FR 6-2622	One person Two persons Two bedroom suite (connecting bath)	$6.50-7.50 $8.50-9.50 $14.00-18.00
Casa Loma Lodge 2120 S.W. 13th St. Phone FR 2-8971	One person Two persons, two beds	$7.00-8.00 $8.00-9.00
Florida Motel 2603 S.W. 13th St. Phone FR 6-3742	One person Two persons, two beds Two persons, one bed	$6.00 $8.00 $7.00
Francisco Motel 2307 S.W. 13th St. Phone FR 2-2045	One person Two persons, one bed Two persons, two beds	$6.00 $7.00 $8.00
Gator Court 4170 S.W. 13th St. Phone FR 6-4667	One person Two persons, one bed Two persons, two beds	$6.00 $7.00 $8.00
Hil-Top Motor Court 3103 N.W. 13th St. Phone FR 2-4319	One person Two persons, one bed Two persons, two beds	$5.00-6.00 $6.00-7.00 $7.00-8.00
Holiday Inn 1900 S.W. 13th St. Phone FR 2-3311	One person Two persons	$8.00-12.50 $9.50-12.50
Howard Johnson Motor Lodge 2820 N.W. 13th St. Phone FR 6-1211	One person Two persons	$8.50-11.00 $10.50-13.50
Manor Motel 2325 N.W. 13th St. Phone FR 6-5212	Single Double, one bed Double, twin beds Extra person, each	$6.00-8.00 $8.00-9.00 $9.00-10.00 $21.00
Richland Heights Motor Court 4155 N.W. 13th St. Phone FR 6-4368	One person Two persons, one bed Two persons, two beds	$5.00-6.00 $7.00 $7.00-8.00
Travelodge Motel 413 W. University Ave. Phone FR 6-1224	One person Two persons, one bed Two persons, two beds	$7.00-9.00 $9.00-11.00 $10.00-12.00
Tom Sawyer Motor Inn 3335 S.W. 13th St. Phone FR 2-1463	Single Double, two beds	$6.50-7.50 $8.50-9.50
University Inn U.S. 441 South 1901 S.W. 13th St. Phone FR 2-6333	One person Two persons	$8.50-10.50 $10.50-12.50
Tabor Motel 4041 S.W. 13th St. Phone FR 6-4423	Single Double	$6.00-7.00 $7.00-8.00

Parking.—Permits to park in restricted areas on campus will not be required; however, *No Parking* signs should be respected. Plenty of parking spaces should be available within one or two blocks of the Florida Union where the meetings will be held.

Regarding Segregation.—Housing in Gainesville is segregated. Howard Johnson's Motor Lodge Restaurant will accommodate Negroes. The facilities of the Florida Union are available to all members and guests of the Association as are any of the cafeterias on campus. Reservations for rooms in the Florida Union should be made as soon as possible as the number is limited (see Accommodations).

Dining.—Gainesville and the campus of the University abound in dining facilities. Members of the Association and their guests will find it convenient to eat on campus. The most convenient place will be the main cafeteria located in the same building complex with the Florida Union. Some of the dormitories also have cafeteries and these will be available.

Field Trips.—Three field trips are planned:

1. Post-meeting trip to Everglades and southern Florida regions for three days, beginning noon, Friday, April 19, and April 20, 21. This trip will not be made unless 30 or more persons apply before March 1 to Dr. John H. Davis, Department of Botany, University of Florida. A deposit of ten dollars ($10.00) is needed to make housing and other arrangements. The full itinerary will be sent to those who apply or inquire.

2. Plant ecology and taxonomy field trip to the Ocala National Forest region Saturday, April 20. Group will leave Flint Hall on campus at 8:00 a.m. with stops at excellent examples of most of central Florida's major terrestrial plant communities. Loblolly bays over twice the size recorded by Charles S. Sargent, the most southern station for eastern white cedar, blue crabs living 100 miles from salt water, etc., will be seen. Group will break up about 3:00 p.m. in the Forest about 70 miles from Gainesville. Private cars will be used. Arrangements for box lunches and

rides (for those without cars) will be made at the Registration desk. Dr. A. M. Laessle and Dr. E. S. Ford in charge.

3. Trip to Sea Horse Key Marine Laboratory. Group will leave Flint Hall on campus at 9:00 a.m., Saturday, April 20. The marine laboratory on Sea Horse Key is on an island two miles off the Gulf coast near Cedar Key. This island, nearly a mile long and 60 feet high is heavily wooded and it is formed from an old sand dune. The distance from Gainesville to Cedar Key is 57 miles. At the Laboratory visitors will have an opportunity to go on a short collecting trip in the laboratory boat. During this trip a small trawl will be used to collect samples of marine life. Birds are abundant in the area and those wishing to do so may take a conducted tour along a trail through the island.

Please bring your car if available. Those without a car may request transportation at the Registration desk. Arrangements can be made at this desk to secure a packaged lunch for the trip. We shall leave Sea Horse Key on the return trip about 3:00 p.m. Persons living north or west of Cedar Key may wish to depart directly from there for their return trip home. Dr. E. Lowe Pierce, in charge.

General Information

1. Registration will begin Thursday, April 18, at 4:00 p.m. and continue through Friday, in Bryan Lounge in the Florida Union.

2. A $1.00 registration fee will be charged.

3. Paper sessions will be scheduled in the Florida Union.

4. Tickets to the banquet Friday evening, April 19, are to be purchased by Friday noon at the Registration desk. The price will be near $3.50.

5. Plane connections with Gainesville are not good. There is only one flight daily into Gainesville (Eastern Air Lines). The nearest big airport is 90 miles away, north of Jacksonville. Bus connections from Jaeksonville are possible. The Atlantic Coast Line Railroad and several bus lines serve Gainesville. The Seaboard Airline Railroad has passenger service to Waldo about 12 miles away. Anyone desiring transportation from the Gainesville Airport, from Waldo, or from the A.C.L. or bus terminals in Gainesville should write to Dr. J. L. Nation, Department of Biology, and give him expected time of arrival.

6. Gainesville is in a "dry" county.

Local Arrangements Committee

Mary Glide Goethe Travel Awards

For the sixth year there will be funds available through the generosity of Mr. C. M. Goethe for assistance to graduate students for expenses in connection with the annual ASB meetings, to be held this year in Gainesville, Florida. It is anticipated that most of the awards will be for maintenance (lodging and meals), and departments are urged to provide travel allowances for their graduate students or to invite them to travel in cars with staff members. Some travel allowances may be awarded by the committee to those living most distant from Gainesville.

Staff members are requested to call to the attention of qualified students in their respective institutions the availability of these awards. If there is more than one applicant from a department, the Goethe committee may request the department to aid the committee's selection by ranking the applicants.

Any graduate student needing financial assistance in order to attend the 1963 meeting of the Southeastern Biologists is eligible. Rules for making application for the Goethe Awards are as follows:

1. Indicate if application is being made for maintenance or travel or both. Give details, such as total sum requested, how many nights and days are involved, if travel allowance is requested, the number of miles involved and the proposed method of transportation, and any other pertinent information.

2. Give information as to whether or not a paper is being presented by the applicant.

3. In a paragraph, give a brief history of your education, of how many years you have been—and plan to be—in graduate school, of your major field or fields of interest, of any publications which have appeared or which may be in preparation, and any other pertinent professional details. Give information on marital status and number of children.

4. Give your source or sources of support while in graduate school such as G.I. Bill, N.S.F., N.I.H., teaching assistantship, etc.

5. Have your major professor or departmental head write a letter supporting your application.

6. Applications and supporting letters, both in triplicate, should be in the hands of *J. C. O'Kelley, Biology Department, P. O. 1927, University, Alabama,* by March 1, 1963. Applicants will be notified of the decision of the Committee during March.

COMMITTEE

Margaret Menzel
E. C. Cocke
J. C. O'Kelley, *Chairman*

Meritorious Award Nominations

As in previous years, an honorarium of $100 has been made available by the Will Corporation of Georgia, to be used as an award for the recognition of especially meritorious teaching by a member of the ASB. The regulations governing the award are as follows:

The recipient must be a member of the ASB in good standing. He should have taught biology in a southern institution for at least ten years, and must be currently teaching. He must not be a dean or have regular administrative duties beyond the department level (this particular criterion requiring interpretation in individual cases). Among evidences of his qualifications is the progress of the candidate as indicated by recognition in his own institution (important assignments and other contributions specifically related to good teaching); and the number and quality of students for whom he provided primarily the inspiration to continue in biology, especially those who later received advanced degrees.

Past recipients of the Meritorious Award for Teaching are as follows:

1952. Dr. Mary Stuart MacDougall (Agnes Scott)
1953. Dr. Orland E. White (Univ. of Virginia)
1954. Dr. Woolford B. Baker (Emory)
1955. Dr. John N. Couch (Univ. of North Carolina)
1956. Dr. Hugo L. Blomquist (Duke)
1957. Dr. Ezda Deviney (Florida State)
1958. Dr. Henry R. Totten (Univ. of North Carolina)
1959. Dr. Margaret Hess (Winthrop College)
1960. Dr. Ora C. Bradbury (Wake Forest College)
1961. Dr. Warren Deacon (Vanderbilt)
1962. Dr. Septima C. Smith (Univ. of Alabama)

In these times in which so much is heard about teaching, it is particularly important that excellence in teaching should be rewarded and publicized in every way possible. Members of the ASB are urged to make nominations and send the needed supporting materials to *Dr. William J. Koch, Dept. of Botany, University of North Carolina, Chapel Hill, N. C.,* by April 1, 1963.

COMMITTEE

A. J. Sharp
Harry Wheeler
William J. Koch, *Chairman*

Association Research Prize

The rules and regulations governing the annual Association Research Prize of $100.00, sponsored by the Carolina Biological Supply Company, Elon College, North Carolina, are as follows:

1. The Research Prize is to be awarded for an especially meritorious paper actually presented at the annual meeting.

2. Only members are eligible to submit papers in competition for the Research Prize. This applies to all names on the submitted paper.

3. Papers submitted in competition may be in press but must not have been published prior to March 1 of the year of the current competition.

4. Judges will be eminent biologists outside the Southeast. They will set their own criteria, and may withhold the award if no paper is judged to have sufficient merit.

5. Papers must be submitted *in triplicate* and in their entirety not later than March, 1963, to *Herbert P. Riley, Department of Botany, University of Kentucky, Lexington, Kentucky.* One copy of the prize-winning paper will remain in the ASB files, but all other copies will be returned to the authors as soon as possible.

6. Announcement of the winner of the Research Prize will be made at the annual meeting.

Phipps and Bird Research Fellowship

A Research Fellowship of $150.00 for summer research at Mountain Lake Biological Station of the University of Virginia has been continued through the generosity of the Phipps and Bird Company of Richmond, Virginia. Any member of the Association may submit an application. The application should be accompanied by a summary of the planned work, by a list of important publications, and especially in the case of younger workers, by references and educational data. Applications should be sent to *Herbert P. Riley, Department of Botany, University of Kentucky, Lexington, Kentucky,* not later than April 1, 1963. The selection will be made by the Research and Awards Committee of the ASB in consultation with the Director of the Mountain Lake Biological Station. The announcement of the recipient will be made at the annual meeting of the ASB.

COMMITTEE

Alan Conger
Burton J. Bogitsh
Herbert P. Riley, *Chairman*

IMPORTANT DEADLINES

Please note the following deadlines, all of which are to be met before our Twenty-fourth Annual Meeting at the University of Florida, Gainesville, Fla., 18-20 April 1963. Members can help facilitate plans for the meeting by sending in all requested material as far in advance of the deadlines as possible. Because the time available for preparation of the program and publication of abstracts is already at a minimum it will be necessary for the program committee and the editor to adhere strictly to the deadline set; NO TITLES CAN BE ACCEPTED THEREAFTER.

January 15—Suggestions for nominations for ASB officers and executive committee members.

February 13—Titles and abstracts of papers to be presented at the Gainesville meeting.

March 1—Applications for Goethe Awards to graduate students.

March 1—Papers to be considered for the Association Research Prize.

April 1—Applications for Phipps and Bird Research Fellowship at Mountain Lake.

April 1—Nomination letters for the Meritorious Award for Teaching.

Because of certain restrictions placed on applications and forms mailed at second-class postage rates, those forms usually included in the January ASB Bulletin that pertain to the April meeting were mailed to ASB members early in January. For your convenience, however, the deadlines which must be met before the April meeting are reprinted above.

News of Biology in the Southeast

About People and Places

Bruce MacLean Eberhart, Department of Biology at Princeton University, has accepted the headship of the Biology Department at the Woman's College of the University of North Carolina at Greensboro and will assume his duties there in February, 1963.

Dr. Eberhart did his graduate work with Dr. E. L. Tatum at Stanford University in the Field of Biochemical Genetics.

Helen L. Ward has resigned from the Department of Zoology and Entomology, University of Tennessee, to accept a position with the Division of Technical Information of the Atomic Energy Commission at Oak Ridge. She will continue her research on the Acanthocephala at the University. She is relinquishing the editorship of the *Journal* of the Tennessee Academy of Science after the January issue, and the next Editor will be Dr. James J. Friauf of the Department of Biology, Vanderbilt University.

Margaret Hess, formerly of Winthrop College, is now head of the Department of Biology, Richard Bland College, Petersburg, Virginia.

Noye Johnson and eleven of his senior students from Dartmouth College were guests of the **Virginia Institute of Marine Science** from October 28-30. The group spent Sunday night at the laboratory, toured the laboratories on Monday and on Tuesday went out on the *Pathfinder* for field work in geology. Dr. **Maynard Nichols** of the School of Marine Science acted as host for this group.

The first meeting of the new Board of Administration appointed by Governor Harrison met at the Virginia Institute of Marine Science Wednesday, October 31. Members of the Board now are: **Mr. Frank Miles, Mr. James E. Mays, Dr. Robert W. Ramsey, Mr. Donald A. Holden, Dr. Edgar F. Shannon, Dr. Davis Y. Paschall, Mr. Marvin Minter, Mr. Fred Garrett, Mr. Milton T. Hiekman.**

The Virginia Institute of Marine Science has received a grant from the National Science Foundation for another Research Participation for College Teachers Program during the summer of 1963. Thirty-one requests for information about the program have been received to date.

New members of the staff of the Department of Biology, West Virginia University, include **Dr. W. Newman Bradshaw,** who had his training at the University of Texas in mammalogy and general ecology, and **Dr. Albert G. Canaris,** with his training in parasitology at Oregon State University.

An interesting new phase of biological teaching and research at **West Virginia University** involves cooperation in the staffing of colleges in East Africa already in operation or in the process of development in connection with the Area Development Administration. Staff members and graduate students will be given the opportunity of spending varying amounts of time in Kenya and later. perhaps, in Tanganyika and Uganda. The beginning of this program was made in the fall semester of the 1962-63 term, when Dr. Albert G. Canaris took up his duties as zoologist at Egerton College, Njoro, Kenya.

Old Dominion College, formerly The Norfolk College of William and Mary, has three new teachers. **Mr. Paul J. Homsher,** assistant professor; who came to us from Pennsylvania State. His interests are in general and cytogenetics. **Dr. Edward G. Corbett,** assistant professor; from the University of New Hampshire, whose field is plant breeding. Also, **Mr. John P. McKinlay,** assistant professor; from the University of Wisconsin, whose major interests are neurophysiology and pharmacology.

Daniel E. Sonenshine, Old Dominion College, has a NIH grant and is continuing his work on the taxonomy of larval Argasid ticks. He is also working in cooperation with the Virginia State Department of Health on the ecology of Rocky Mountain Spotted Fever in Virginia.

J. S. Zaneveld recently attended the Gulf-Caribbean Fisheries Institute in Galveston, Texas. He is preparing a manuscript on the distribution, taxonomy and ecology of marine algae of the Atlantic Coast between Cape May and Cape Hatteras.

The staff of the Department of Biology at the **University of Virginia** has been joined by Assistant Professor **J. J. Murray, Jr.** Dr. Murray has received degrees from Davidson College in 1951 and Oxford University in 1962. He taught at Washington and Lee University during the academic years of '56-'57 and '57-'58. His field of interest is ecological genetics, and he has worked primarily with land snails of the genus **Picepaea.** During the last summer, he made extensive collections on the Society Islands in Polynesia, under the auspices of the Royal Society of London.

A gift of $3500 from Smith, Kline and French Laboratories to **Sweet Briar College** has made possible a new autoclave of large size, a Sholander respirometer, a thermostatically controlled sterilizing oven and several recording thermometers, all of which increase efficiency in the laboratory and make possible physiological and ecological work impossible or impractical previous to the arrival of these gifts. Another gift of $4318 from the AEC has made possible several counters, scalers, and associated equipment for the Biology and Chemistry departments, which enable work with isotopes not only for research by faculty and advanced students but introduction to the use of tracers in plant and animal biology in the freshman Biology course.

Edward B. Cutler, who received his master's degree from the University of Michigan in June, has joined the biology staff of Lynchburg College. Mr. Cutler has been selected as a member of the International Indian Ocean Expedition for the summer of 1964, to collect and study the new animal phylum, Pogonophora. Following the Indian Ocean cruise, the expedition will spend two months at a marine laboratory in Madagascar. Mr. Cutler also plans a trip for the summer of 1963 along our northwest Pacific coast to Alaska for collecting Pogonophora.

Paul J. Osborne, Biology Department of Lynchburg College, has resumed teaching duties after a very fruitful sabbatical year spent in the Physiology Department of the University of North Carolina. Currently he is extending his research in cytology and histochemistry to include animal phyla both above and below Platyhelminthes, which he has already investigated. Lynchburg College has been awarded a National Science Foundation grant of $15,000 with which he is to do this work in a period of two years, in collaboration with **Dr. A. T. Miller, Jr.,** and **Dr. Werner Straus,** of the University of North Carolina. Enzyme distribution as related to subcellular particles, especially phagosomes and lyosomes, will be of particular interest.

Dorothy Crandall is on sabbatical leave from Randolph Macon Woman's College. She is working in the Soil Science Department at North Carolina State College in Raleigh. **Mr. William Hooks** has an interim appointment to teach botany in the department. He comes to us from Illinois Northern University.

Jack D. Burke, Biology Department, University of Richmond, received from NIH a continuation of grant for $26,000 to work for the next three years on oxyhemoglobin affinity in the blood of fishes.

William S. Woolcott, Biology Department, University of Richmond, spent six weeks of the summer 1962 at the Highlands Biological Station in Highlands, North Carolina, where he studied the distribution of fishes in the headwater streams of the Savannah and Tennessee Rivers. The work was supported by an NSF grant.

O. E. Frye, Jim Clugston, and **John W. Woods** of the Florida Game and Fresh Water Fish Commission attended the Southeastern Association of Game and Fish Commissioners meeting held at Jackson Hole, Wyoming, on September 10-14, 1962. Jim Clugston presented a paper entitled, "Periodicity of Growth of the Florida Large-mouth Bass, *Micropterus salmoides floridanus* (Le Sueur), and the Northern Large-mouth Bass, *Micropterus salmoides salmoides* (Lacepede), in subtropical Florida."

Melvin T. Huish, Jim Barkuloo, Edward Crittenden, J. B. Copeland, Clayton Phillippy, Bob Klant, and **F. G. Banks** attended the Southern Division of the American Fisheries Society meeting, held in Charleston, South Carolina, on October 15-17, 1962. Papers presented were as follows: "A Comparison of Returns of Jaw Tags and Peterson Tags," by Melvin T. Huish; "A Description and Some Results of a Florida Statewide Fish Tagging Program," by J. B. Copeland; "The Status of *Tilapia nilotica* in Florida," by Edward Crittenden; "Self-Contained Underwater Breathing Apparatus "SCUBA" As an Aid in Fisheries Work," by Jim Barkuloo and Keith Byrd.

Aaron H. O'Bier, Assistant Professor of Biology at Stetson University, spent three months at the University of California, Berkeley, where he began a study of gene linkage in the Basidiomycete, **Schizophyllum commune.** The work was supported by NSF.

Wilson B. Bell, formerly a member of the Biology Department at Virginia Polytechnic Institute and a recent Past-President of the Virginia Academy of Science, on October 1, 1962 became Dean of the College of Agriculture, V.P.I.

The following new staff members joined the Department of Biology at Virginia Tech: **Robert E. Benoit,** assistant professor of bacteriology, B.S., Vermont, 1956, M.S., Rutgers, 1959, Ph.D., Rutgers, 1962; **Rhodes B. Holliman,** assistant professor of zoology, B.S., Howard, 1950, M.S., Miami, 1953, Ph.D., Florida State, 1960; **Duncan T. Patten,** assistant professor of botany, A.B., Amherst, 1956, M.S., Massachusetts, 1959, Ph.D., Duke, 1962; **Richard E. Phillips,** assistant professor of zoology, B.S., Purdue, 1952, M.S., Oregon State, 1954, Ph.D., Cornell, 1959; **David A. West,** assistant professor of zoology, B.A., Cornell, 1955, Ph.D., Cornell, 1959; **Cleo D. Wilder, Jr.,** assistant professor of zoology, A.B., North Carolina, 1948, M.S., Tennessee, 1951, Ph.D., Florida, 1962.

William W. Scott, Associate Professor of Botany at Virginia Tech, was one of eight teachers from various colleges and universities throughout the U.S.A. selected to participate in the NSF sponsored summer research program at the Virginia Institute of Marine Science, Gloucester Point, Virginia. Dr. Scott conducted an investigation dealing with the occurrence and distribution of aquatic fungi in the York River system.

From June 25 to August 4, **Dr. Duke Wilder,** Assistant Professor of Zoology, attended the Institute of Desert Biology at Arizona State University, Tempe, conducted under the sponsorship of the National Science Foundation.

Duncan Patten, Assistant Professor of Botany at Virginia Tech attended the A.I.B.S. meetings in Corvallis, Oregon as a member of the Ecological Society of America. He presented a paper on the results of his recent research entitled "The Vegetation Pattern in Relation to Environments in the Madison Mountains of Montana."

Perry C. Holt, Associate Professor of Zoology in the Department of Biology of VPI, concluded the field work connected with his study of the systematics of the family Branchiobdellidae this summer with a collecting expedition to Mexico. Previous field work from 1958 through 1961 has been done in, or collections received from other collectors from 41 of the states of the Continental United States. The results of the Mexican trip, therefore, complete a fairly thorough survey of North America. This work has been supported since 1957 by the National Science Foundation.

S. E. Neff, Department of Biology, VPI, has returned to Blacksburg after attending the NSF-sponsored Institute of Comparative Anatomy at Harvard University this summer. He also attended the XVth International Congress of Limnology at Madison, Wisconsin, August 19-26, and presented a paper on the use of fly larvae in the biological control of medically important snails. Dr. Neff will conduct a three-year study supported by the National Science Foundation on the immature stages of the Scatomyzinae. This subfamily of flies is poorly known. Contrary to belief, most of the species do not breed in excrement, but they are associated with aquatic and semi-acquatic vegetation. The investigation will be carried out as a part of the Limnology Program at VPI.

William W. Scott, Associate Professor of Botany at Virginia Tech is the recipient of a $13,500 grant from the NSF for the study of "The Degradation of Submerged Organic Debris by Aquatic Fungi." This is the second major research project being conducted by Dr. Scott and his students. He is also directing a project supported by a grant of $15,600 from the NSF for the study of "Aquatic Fungi Associated with Diseased Fish and Fish Eggs."

Perry C. Holt, Associate Professor of Zoology at Virginia Tech has been awarded a renewal grant for a three-year period in the sum of $11,300 from the National Science Foundation. This grant will enable Dr. Holt to continue his research on the "Systematic Studies of the Family Branchiobdellidae."

William H. Adams, Professor of Biology, has been appointed Chairman of the Division of Natural Sciences at Tennessee Wesleyan College.

The **Highlands Biological Station** announces that applications are now being received for grants to conduct research in the area of the Southern Appalachians served by the Station. Attention is called to two programs; (1) participation in the long-term and comprehensive field studies concentrated in the gorges of the southeastern escarpment of the Blue Ridge Mountains now being conducted by the station, and (2) participation in a program outside the gorge areas for significant research projects which require modest sums for support and the station as a base of operations for the field studies and laboratory work involved. Both programs are supported by funds available to the station from the National Science Foundation. For information and blanks write Executive Director, Highlands Biological Station, Highlands, North Carolina.

The Association of Southeastern Biologists

ASB BULLETIN

Volume 10, Number 2—April 1963

The ASB Bulletin is the official quarterly publication of the Association of Southeastern Biologists, Inc., and is published at Philadelphia, Penna., in January, April, July and October. Letters, news items, other contributions, and all communications about editorial matters should be addressed to C. W. Hart, Jr., Editor, The Academy of Natural Sciences of Philadelphia, 19tb and The Parkway, Philadelphia, Penna. Changes of address should be sent promptly to the Secretary of the ASB, Dr. Harry J. Bennett, Department of Zoology, Louisiana State University, Baton Rouge, La. Subscription orders from lihraries and other institutions should be sent to the Business Manager, Dr. Leland Shanor, Department of Biological Sciences, Florida State University, Tallahassee, Florida. Suhscription rate for nonmemhers of the ASB: $2.00 per year. Printing and typography by the Wickersham Printing Co., Lancaster, Penna.

Second-class postage paid at Philadelphia, Pennsylvania.

THE NEW TAXONOMY?

A Note on the First International Conference on Taxonomic Biochemistry, Serology, and Physiology Held at Lawrence, Kansas, September 4, 5, 6, 1962

Perry C. Holt
VIRGINIA POLYTECHNIC INSTITUTE

It is twenty years or more now since the "New Systematics" did much to restore the good repute of taxonomists as scientists. The "New Systematics" was, of course, not new, as Ernst Mayr pointed out at the meeting reported on here, but it did result in taxonomists more widely utilizing biological data of all types. The Association of Southeastern Biologists numbers many taxonomists among its ranks, and since few of them attended the meeting on Taxonomic Biochemistry, Serology, and Physiology that was arranged by Charles A. Leone of the University of Kansas and supported by the National Science Foundation, it seems appropriate to call the meeting to the attention of the members of the Association.

There were approximately 250 in attendance. Seventy-two papers were presented. There were representatives from Canada, England, Belgium, Germany, France, Spain, and Ireland. Seven sessions were devoted to "Principles of Systematics," "Perspectives in Molecular Taxonomy," "Comparative Biochemistry," "Comparative Serology" (2), "Comparative Physiology and Biochemistry," and "Comparative Biochemistry of Proteins."

Obviously all of these cannot be reviewed here. A few comments about the sections devoted to the stated aims of the conference--the application of the results of molecular biology to taxonomy--will be followed by some remarks about the most controversial topic discussed—"Numerical Taxonomy"—which in concept has nothing to do with molecular taxonomy.

Alan Boyden's work in systematic serology is too well known to be discussed here, although he presented an interesting review of it, but it should be noted that he was speeially honored by the conference. And many of the better papers were reports of serologieal or immunological work and of work using the techniques of electrophoresis and chromatography. Outstanding among the latter was that of Charles Sibley with birds. But there is little controversy of a fundamental nature here, though it seems to me that these methods are to be used only for carefully selected problems in areas of study well worked by the traditional methods. It is this that gives significance to Sibley's work. The value of a meeting of workers in these fields lies primarily in uncovering and discussing the tricky and difficult problems of technique and interpretation. The basic concepts are well integrated into the "New Systematics," that is, the taxonomy of today.

I am not sure of the distinction between biochemistry and physiology, and neither, from the titles given the various seetions, is Dr. Leone. But to deal with biochemistry first: Marcel Florkin, with an encyclopedic and scholarly grasp of all of biology, alerted biochemists to the meaning that evolution can give their work. Alan Fox warned of the dangers that a neglect of the concepts of parallelism and convergence can produce. Comparative biochemistry, he says, is now at the descriptive level of mid-nineteenth century anatomy. There were examples of comparative studies of biochemical pathways, exemplified by the work of Konrad Bloch of Harvard. But these studies, potentially of great value for systematics, have largely ignored the evolutionary implications.

Comparative physiology (and perhaps I err) seemed to have little to offer and hardly at all to be integrated into the main body of the conference.

Many of the papers were short progress reports, but the interesting ones on the whole were the longer ones of a synthetic nature. If the Sec-

(*Continued on page 21*)

Report on 1963 Meeting of Southern Section of American Society of Plant Physiologists

On February 4 to 6 the Southern Section of the American Society of Plant Physiologists met with the Association of Southern Agricultural Workers at Memphis, Tennessee. All sessions were well attended. The program included 32 contributed papers and a symposium on photomorphogenesis.

The Symposium was chaired by Dr. Warren L. Butler, A.M.S., U.S.D.A., Beltsville, Maryland. The participants in the symposium were Dr. Leonard Price, Smithsonian Institution, Dr. Solon A. Gordon, Argonne National Laboratory, and Dr. Warren L. Butler. The symposium will be published and copies will be available from Scholars Library Publishers.

The annual Plant Physiologists Breakfast was held on the morning of February 6. An award of $25 for the best paper given by a graduate student was made to Mr. Frank E. Bendana, of the University of Florida for his paper with Dr. Robert D. Powell and Dr. Warren S. Silver, "Localization of Exogenous Auxin in Nodules and Roots of Non-legumes." Another award of a copy of the Annual Review of Plant Physiology, Volume 13, was presented to Mr. Lawrence S. Baum of the University of Alabama for his paper with Dr. Joseph C. O'Kelley, "Preliminary Studies on the Replacement of Potassium by Rubidium in Selected Green Algae." The annual breakfast address was given by Dr. Folke Skoog, University of Wisconsin on "Certain Aspects of Kinetin Research."

Officers elected for 1963 were Chairman, Dr. Joseph C. O'Kelley, University of Alabama; Vice-chairman, Dr. Frederick T. Wolf, Vanderbilt University; Secretary-Treasurer, Dr. Joseph Hacskaylo, A.R.S., U.S.D.A., College Station, Texas. Elected for membership on the Executive Committee was Dr. Robert D. Powell, University of Florida, to serve with Dr. Howard E. Joham, Texas A and M College and Dr. Robert Burns, A.R.S., U.S.D.A., Experiment, Georgia. Dr. Wayne C. Hall, Texas A and M College, represents the Southern Section on the National Executive Committee.

The 1964 meeting is scheduled to be held jointly with the Association of Southeastern Biologists; the time and place to be decided.

Who Needs Instruction?

As has been the custom for some years, this year's annual call for papers again clearly spelled out in Item 7 the format that should be used in preparing abstracts for the April *ASB Bulletin*. Yet, 83% of the abstracts submitted were not prepared according to the instructions.

Not all of the improperly prepared abstracts showed a complete disregard for the instructions, but each one that needed attention added to the job of getting the *Bulletin* out on time—and, more important, pointed up the fact that students are not the only ones who find it difficult to follow instructions.

A breakdown of the improperly prepared abstracts follows:

Abstract not double spaced	3
Abstract not on standard sized typewriter paper	2
Title all in capital letters	19
Title with only first word capitalized	13

University of Virginia Announces 1963 Mountain Lake Program

The University of Virginia has announced the program of graduate biology courses to be offered this summer at the Mountain Lake Biological Station on southwestern Virginia. They are as follows:

First Term

Bryology, Dr. Rudolf M. Schuster, University of Massachusetts

Comparative Endocrinology, Dr. B. E. Frye, University of Michigan

Ichthyology, Dr. William S. Woolcott, University of Richmond

Ornithology, Mr. Maurice G. Brooks, West Virginia University

Second Term

Mycology, Dr. Charles E. Miller, University of Maine

(*Continued on page 39*)

Program of the 24th Annual Meeting of the Association of Southeastern Biologists

A Joint Meeting with the Southeastern Section of the Botanical Society of America, the Southern Appalachian Botanical Club, the Regional Section of the National Association of Biology Teachers, the Southeastern Region of Beta Beta Beta National Honorary Biological Society, and the Southeastern Division of the American Society of Ichthyologists and Herpetologists—held at the University of Florida, Gainesville, April 18-20, 1963.

THURSDAY, APRIL 18

1:00 p.m. **Executive Committee Meeting:** Room 208, Florida Union.
1:00-5:00 p.m. **Opening of Reptile Exhibit:** Florida State Museum, Open House.
4:00-7:45 p.m. **Registration:** Bryan Lounge, Florida Union.
8:00 p.m. **General Session:** Auditorium, Florida Union, Walter Flory, Presiding.
Address of Welcome: Dr. J. Wayne Rietz, President, University of Florida.
Response: Walter S. Flory, Blandy Experimental Farm, President, The Association of Southeastern Biologists.

Invitational Address: *Orientation in Animals,* Dr. E. G. Franz Sauer, University of Florida.

The invitational address will be followed by a smoker, to be held in the Social Room where the exhibits will be on display. Bryan Lounge, across the hall, will also be open. Refreshments will be served.

FRIDAY, APRIL 19

MORNING

8:00 a.m.-11:00 a.m. **Registration:** Bryan Lounge, Florida Union.
8:00 a.m.-12:00 noon. **Open House:** Florida State Museum.
8:00 a.m.-12:00 noon. **Exhibits:** Social Room, Florida Union.
8:30 a.m.-11:30 a.m. **Paper Sessions:**
Systematic Botany—Auditorium, Florida Union.
Plant Ecology—Room 324, Florida Union.
Cytology and Cytogenetics—Room 215, Florida Union.
Invertebrate and Vertebrate Biology—Room 212, Florida Union.
Parasitology—Room 218, Florida Union.
Ichthyology and Herpetology—Johnson Lounge, Florida Union.
11:45 a.m.-12:30 p.m. **Business Meeting:** Association of Southeastern Biologists. Auditorium, Florida Union.
1:30 p.m. **Field Trip to Everglades and other regions in Southern Florida.** Details at registration desk. Dr. John M. Davis in charge.

AFTERNOON

12:00 noon-5:00 p.m. **Open House:** Florida State Museum.
1:00 p.m.-5:00 p.m. **Exhibits:** Social Room, Florida Union.
2:00 p.m.-4:36 p.m. **Paper Sessions:**
Plant Physiology—Auditorium, Florida Union.
Cryptogamic Botany—Room 324, Florida Union.
Animal Ecology—Room 215, Florida Union.
Animal Development and Animal Physiology—Room 212, Florida Union.
Botany and Systematic Botany (cont'd)—Room 218, Florida Union.
Ichthyology and Herpetology—Johnson Lounge, Florida Union.
2:00 p.m.-5:00 p.m. **Registration,** Beta Beta Beta: Bryan Lounge, Florida Union.
4:45 p.m.-5:15 p.m. **Business Meeting:** Southeastern Section of the Botanical Society of America. Florida Union Auditorium.
4:45 p.m.-5:15 p.m. **Informal Meeting:** Southern Appalachian Botanical Club. Room 215, Florida Union.

EVENING

7:00 p.m. **Banquet:** University Cafeteria.
After the Banquet: **Beta Beta Beta Program.** McCarty Auditorium.
ASB Evening Program. Banquet Hall:
REVIEWS OF ECOLOGICAL RESEARCH DEDICATED TO THE MEMORY OF DR. ROYAL E. SHANKS
Introduction, A. J. Sharp, University of Tennessee.
Radiation Ecology and Mineral Cycling, John Witherspoon, Oak Ridge National Laboratory.
Ecological Studies in the Great Smoky Mountains, Dorothy Crandall, Randolph-Macon Women's College.
Ecological Studies in Arctic Alaska, Edward Clebsch, University of Tennessee.

SATURDAY, APRIL 20

8:00 a.m. **Field Trip:** Plant ecology and taxonomy field trip to Ocala National Forest. Drs. A. M. Laessle and E. S. Ford in charge. Details at registration desk.
9:00 a.m. **Field Trip:** To Sea Horse Key Marine Laboratory. Dr. E. L. Pierce in charge. Details at registration desk.
9:00 a.m.-12:00 noon. **Beta Beta Beta General Meeting and Paper Sessions.** Rooms 128 and 133 Dan McCarty Hall.

SCHEDULE OF PAPER SESSIONS

FRIDAY MORNING—APRIL 19, 8:30 A.M.

Systematic Botany

Auditorium—Florida Union

Presiding: R. K. Godfrey

8:30 1. Jones, Samuel B., Jr. (University of Georgia). Studies in the Narrow Leaved *Veronia* (Compositae) of the Southeast.

8:43 2. Fryar, William R. (Florida State University). Evidence on Hybridization of Two Species of *Eupatorium* (Compositae).

8:56 3. Myint, Tin (University of Florida). A Monographic Study of *Stylisma* and a Revision of North American *Bonamia*, North of Mexico.

9:09 4. Sarvella, Patricia and Borislav Stojanovic (Mississippi State University). Amino Acid Analyses in Male-Sterile Cottons.

9:22 5. Pringle, James S. (University of Tennessee). *Gentiana*, Section Pneumonanthae, in the Southeast.

9:35 6. Riley, Herbert P. (University of Kentucky). Some Characteristic Families of Flowering Plants of Southern Africa.

9:48 7. Sharp, Aaron J. (University of Tennessee). Further Observations on Vascular Epiphytes in the Smoky Mountains.

10:01 8. Aiuto, Russell (University of North Carolina). Using Rank-Order Correlation Coefficients in Determining Species Relationships.

10:14 9. Radford, Albert E. (University of North Carolina). A Graduate Program in Plant Taxonomy.

10:27 10. Yates, Harris O. (Vanderbilt University). Taxonomic Status of *Uniola* (Gramineae).

10:40 11. Mulcahy, David L. (Vanderbilt University). Floral Modifications in *Oxalis Priceae*.

10:53 12. Sherman, Harry L. (Vanderbilt University). A Comparison of Southeastern and Western Species of *Schoenolirion* (Liliaceae).

11:06 13. Pinson, Joseph N., Jr. (Vanderbilt University). Morphological and Physiological Differences in Southeastern *Heterotheca* Grown under Uniform Conditions.

11:19 14. Kozuka, Yoshimichi (Vanderbilt University). Preliminary investigation of Floral Color Variation in *Trillium* (Liliaceae).

Plant Ecology

Room 324—Florida Union

Presiding: Margaret Gilbert

8:30 15. Whitford, L. A. and G. J. Schumacher (N. C. State College, and State University of New York). Effect of a Current on Respiration and Mineral Uptake in Species of *Spirogyra* and *Oedogonium*.

8:43 16. McGinnis, John T. (Emory University). Some Environmental Changes in Forest Stands Following Exposures to Radiation.

8:56 17. Faulkner, Bebe Jo (Emory University). Radiation Effects and Population Variability in *Isoetes melanospora*.

9:09 18. Laessle, Albert M. (University of Florida). Spacing in Even Aged Stands of Sand Pine Showing Maximal Competition.

9:22 19. McCormick, J. Frank and Robert B. Platt (Vanderbilt University and Emory University). Ecotypic Differentiation in *Diamorpha eymosa* Nutt.

9:35 20. Woodmansee, Robert A. (University of Southern Mississippi). The Dispersal of the Planktonic Diatom *Rhizosolenia alata* Inferred from Cell-Diameter Frequency Distributions.

9:48 21. DeSelm, H. R. (University of Tennessee). Production in a High Elevation Stand Near Richland Balsam Mountain, North Carolina.

10:01 22. Burbanck, Madeline P. and Robert B. Platt (Emory University). Granite Outcrop Communities of the Piedmont Plateau in Georgia.

10:14 23. Cooper, Arthur W. (North Carolina State College). Establishment of Permanent Plots to Study Effects of Aphid Infestation in Southern Fir Forest.

10:27 24. Cooper, Arthur W. (North Carolina State College). Observations on the Vegetation of the Toxaway River Gorge, Transylvania County, N. C.

10:40 25. Jones, Alice S. (University of Alabama; Livingston State Col.). Correlation of Forest and "Prairie" with Soils in the Black Belt of Sumter County, Alabama, in 1832.

10:53 26. Edmisten, Joe Allen (University of Florida). Ecological Aspects of Florida Pine Flatwoods.

11:06 27. Williams, James E. (Laboratory of Radiation Ecology, Aiken, S. C.). Primary Production on a Moisture Gradient.

11:19 28. Eggler, Willis A. (Newcomb College of Tulane University). Tree Rings as a Means for Dating Volcanic Eruptions.

Cytology and Cytogenetics

Room 215—Florida Union

Presiding: A. W. Ziegler

8:30 29. Hatch, Lindy and Carolyn Wells (Longwood College). A Cytological Study of Tripling Conjugation in *Tetrahymena pyriformis*.

8:43 30. Cardell, Robert R., Jr. (Edsel B. Ford Institute for Medical Research, Henry Ford Hospital). Secretory Cycle of Pituitary Cells.

8:56 31. Hu, Funan and Robert R. Cardell, Jr. (Edsel B. Ford Institute for Medical Research, Henry Ford Hospital). Electron Microscopy of Human Skin.

9:09 32. Sagawa, Yoneo (University of Florida). Cytological Studies of the Genus *Phalaenopsis* (Orchidaceae).

9:22 33. Alvarez, Marvin R. (University of Florida). Studies on the Ontogeny of *Vanda*.

9:35 34. Israel, Herbert W. (University of Florida). Megasporogenesis in *Dendrobium* (Orchidaceae) -- An Electron Microscope Study.

9:48 35. Te-Hsiu, Ma (Emory & Henry College, Emory, Virginia). Chimera in Maize.

10:01 36. Menzel, Margaret Y. (Agricultural Research Service, USDA). Nature of Preferential Pairing in an Intergeneric Allotetraploid.

10:14 37. Wells, Carolyn (Longwood College). An Atypical Conjugation in *Tetrahymena pyriformis*.

10:27 38. Griffin, Dana G., III (University of Tennessee). Oospore Variation in *Chara*.

10:40 39. Herr, J. M., Jr. and M. E. Borom (University of South Carolina). The Use of Centrifugal Force to Rearrange the Nuclei in the Developing Megagametophyte of *Oxalis corniculata* L.

10:53 40. Howe, H. Branch, Jr. (University of Georgia). Nuclear Loss in the Ascospores of *Neurospora tetrasperma*.

11:06 41. Leach, William M. (University of Tennessee). Thymidine "Pool" in Grasshopper Neuroblasts.

11:19 42. Mathen, O. M. and Dr. C. R. Bell (University of North Carolina). Chromosome Number and Behaviour in *Gerardia* and *Aureolaria*.

Invertebrate and Vertebrate Biology

Room 212--Florida Union

Presiding: P. J. Osborne

8:30 43. Damian, Raymond T. and Robert B. Short America.

8:43 44. Cole, Arthur C. (University of Tennessee). A Synopsis of the Harvester Ants of the Genus *Pogonomyrmex* Mary in North

8:56 45. Rinaldi, Robert Arthur (University of Tennessee). Velocity Profiles of Amoeboid Movement.

9:09 46. Hetrick, L. A. (University of Florida). Some Insect Associates of Southern Pine Trees.

9:22 47. Osborne, Paul J. and A. T. Miller, Jr. (Lynchburg College and University of North Carolina). Acid and Alkaline Phosphatase Changes Associated with Feeding, Starvation, and Regeneration in Planarians.

9:35 48. Hassell, M. D. (University of Kentucky). Homing in *Myotis sodalis*.

9:48 49. Davis, Wayne H. (University of Kentucky). Sex Ratios of Hibernating Bats.

10:01 50. Barbour, Roger W. (University of Kentucky). The Behavior of *Plethodon glutinosus* as Influenced by Light.

10:14 51. Jones, Duvall A. (Ferrum Junior College, Ferrum, Va.). Massive Polymorphism, Reflexive Selection, and the Toad, *Bufo typhonius*.

10:27 52. Bush, Francis M. (Howard College). Water, Lean, and Lipid Weights of Five Species of Colubridae.

10:40 53. Funderburg, John B. and Margaret L. Gilbert (Florida Southern College). Observations on a Probable New Race of the Bowfin, *Amia calva*, from Central Florida.

10:53 54. Parsons, Jonathan and Robert R. Cardell, Jr. (Edsel B. Ford Institute for Medical Research). Identification of Statoliths by X-Ray Diffraction.

Parasitology

Room 218--Florida Union

Presiding: B. J. Bogitsh

9:00 55. Miller, Grover C. and Reinard Harkema (North Carolina State College). Parasitic Helminths of Mink.

9:13 56. Bogitsh, Burton J. (Georgia Southern College). Histochemical Observations on *Hymenolepis microstoma*.

9:26 57. Byrd, Elon E. and William P. Maples (University of Georgia). The Egg and Miracidium of *Dasymetra conferta* Nicoll, 1911 (Trematoda: Ochetosomatinae).

9:39 58. Dvorak, J. A. and A. W. Jones (University of Tennessee). The *in Vivo* Incorporation of Tritiated Cytidine and Tritiated Thymidine by the Cestode, *Hymenolepis microstoma*.

9:52 59. Parrish, Fred K., Mary Mead Andrew, and Joanna W. Parrish (Agnes Scott College). The Spontaneous Recovery of the Cricket *Gryllus assimilis* from Gregarine Infections.

10:05 60. Kruse, Dwayne N. (Northwestern State College). Infection of Commercial Shrimps with Spores of the Gregarine *Nematopsis* from Pelecypods.

10:18 61. Jeffery, Geoffrey M. and William E. Collins (DHEW, PHS, NIAID, LPC, Section on Epidemiology, Columbia, S. C.). Fluorescent Antibody Studies in Human Malaria.

Plant Physiology

Auditorium—Florida Union

Presiding: Ray Noggle

2:00 62. McKinsey, Richard D. (University of Virginia). Intra-Cellular Localization of the Pentose Phosphate Cycle in *Ustilago maydis.*

2:13 63. Wheeler, Harry and Homer S. Black (Louisiana State University). Effects of *Helminthosporium victoriae* and Victorin upon Permeability.

2:26 64. Broughton, William S. and K. L. Webb (University of Georgia, Marine Institute, Sapelo Island, Georgia). Investigations on Certain Factors Affecting Growth and Productivity of *Spartina alterniflora* Loisel.

2:39 65. Cabler, John F. (University of Florida). Growth Retarding Chemicals as Substitutes for High Light Intensity.

2:52 66. Barnes, Robert L. (Southeastern Forest Experiment Station, U. S. Forest Service). Nitrogen Metabolism in Relation to Flowering in Pine.

3:05 67. Beatty, Alvin B. (Emory University). The Enhancement of Radiation Recovery Through the Use of Protein Inhibitors and Amino Acids.

3:18 68. Walker, Alma Toevs (University of Georgia). Fluorescing Compounds in Lichens.

3:31 69. Tontz, Joanne C. (Woman's College, University of North Carolina). A Chromatographic Comparison of Luminescing and Non-luminescing Cultures of *Panus stypticus.*

3:44 70. Wolf, Frederick T. (Vanderbilt University). Effects of Light and Darkness on the Biosynthesis of Carotenoid Pigments in Wheat Seedlings.

3:57 71. Henderson, James H. M. (Tuskegee Institute). Characterization of an Unknown Auxin in a Sample of C-14 Labelled IAA.

4:10 72. Plummer, Gayther L. (University of Georgia). Radioactive Fallout and Vegetation in the Georgia Piedmont.

Cryptogamic Botany

Room 324—Florida Union

Presiding: Walter Herndon

2:00 73. McCullough, Herbert A. (Howard College). Foliose and Fruticose Lichens of the Piedmont Upland of Alabama.

2:13 74. Miller, Charles E. (University of Maine). Aquatic Phycomycetes of the Mountain Lake Region.

2:26 75. Rhodes, Russell G. and Walter Herndon (University of Tennessee). Growth and Development of *Gloecodendron* Korsh.

2:39 76. Groover, Robert D. and Temd R. Deason (University of Tennessee and University of Alabama). Growth Studies on *Microthamnion kuetzingianum* Naegeli.

2:52 77. Groover, Robert D. and Walter R. Herndon (University of Tennessee). Zoospores of *Prasinocladus lubricus* Kuckuck.

3:05 78. Hickman, D. W. and W. W. Scott (Virginia Polytechnic Institute). Mineral Requirements of Selected Species of Aquatic Hyphomycetes.

3:18 79. Morrison, Ralph Michael (Woman's College of the University of North Carolina). Factors Affecting the Germination of Conidiospores of *Erysiphe cichoracearum.*

3:31 80. Cocke, Elton C. (Wake Forest College). The Myxophyceae of North Carolina.

3:44 81. O'Kelley, Joseph C. and Temd R. Deason (University of Alabama). Continuous Culture of *Protosiphon botryoides* in Ca- and Sr-media with CO_2-Enriched Atmosphere.

3:57 82. Blackwell, Will H. and Temd R. Deason (University of Alabama). Observations on Alabama Soil Algae.

4:10 83. Ballal, S. K. (University of Tennessee). A Comparative Study of Five Isolates of *Uromyces phaseoli* (Rebent.) Wint. var. *vignae* Arth.

4:23 84. Cowie, Lillian M. (Wesleyan College). Recurring Variations in the Structure of the Thallus of a Lichen of the Genus *Umbilicaria.*

Animal Ecology

Room 215—Florida Union

Presiding: J. M. Carpenter

2:00 85. Eldridge, David W. and John R. Warren (Tennessee Polytechnic Institute). A Comparison of Netted Phytoplankton from Surface Samples in the Littoral and Limnetic Zones of Monterey Lake.

2:13 86. Harvey, Michael J. (University of Kentucky). The Effect of *Sigmodon hispidus* on the Regeneration of Southern Pine Seedlings.

2:26 87. Gresson, Phillip E. (University of Kentucky). Stream Classification and Fish Distribution: Dix River System, Kentucky.

2:39 88. Kuehne, Robert A. (University of Kentucky). Some Limnological Aspects of the Waters in Mammoth Cave, Kentucky.

2:52 89. Hoss, Donald E. (Bureau of Commereial Fisheries, Beaufort, N. C.). Accumulation of Radioactive Gold by Estuarine Animals.

3:05 90. Gray, I. E. and M. J. Cerame-Vivas (Duke University). Circulation in Raleigh Bay, North Carolina, and Its Relation to the Barrier at Cape Hatteras.

3:18 91. Lutz, Paul E. (Woman's College, University of North Carolina). Life Cycle and

Seasonal Differences in Photoperiodic Response by Nymphs of *Tetragoneuria cynosura* (Odonata).

3:31 92. Odum, Eugene P., Timothy Marples, and Shirley Marshall (University of Georgia). Energy Storage in Migrating Birds.

3:44 93. Burbanck, W. D., Robert Grabske, and J. R. Comer (Emory University and University of Kansas). Recovery, After One Year in Natural Habitat, of *Cyathura polita* Labeled with Zn^{65}.

3:57 94. Carpenter, J. M., W. L. Jinks, and B. A. Semp (University of Kentucky). Studies on the Reproductive Potential of *Drosophila affinis* on Various Yeasts.

4:10 95. Pierce, E. Lowe (University of Florida). The Distribution of Lancelets along the East and West Coasts of Florida.

4:23 96. Colley, Frank B. and Richard G. Wiegert (Institute of Radiation Ecology, University of Georgia). Retention of Zinc-65 in Wild Small Mammals.

Animal Development and Animal Physiology

Room 212—Florida Union

Presiding: To be announced

2:00 97. Browder, Leon W. and Willie M. Reams, Jr. (Louisiana State University). A Microchemical Analysis of Mammalian Myogenesis.

2:13 98. Rovee, David T. and Willie M. Reams, Jr. (Louisiana State University). Augmentation of Interfollicular Melanocytes Induced by Trauma in Mouse Skin.

2:26 99. Hollyfield, Joe G. and Willie M. Reams, Jr. (Louisiana State University). Influence of Mysial Architecture on Pigment Cell Morphogenesis in the Mouse.

2:39 100. Reams, Willie M., Jr. (Louisiana State University). Pigment Cell Branching as Triggered by the Tissue Milieu.

2:52 100. Fraser, Ronald C. (University of Tennessee). Acid and Alkaline Denaturation of Chick Embryo Hemoglobins as Determined by Changes in Spectral Characteristics in the Soret Region.

3:05 102. Cowden, Ronald R. (University of Florida). Some Comparative Cytochemical Studies on Blood Cells of Lower Vertebrates.

3:18 103. Dent, James Norman and J. F. Fitzpatrick, Jr. (University of Virginia). Wound Healing in the Crawfish.

3:31 104. Garth, R. E. and R. L. Culpepper (Northwestern State College of Louisiana). Preliminary Study of a Light-induced Hypothalamus Secretion.

3:44 105. Bernard, George R. and Gail G. Wynn (Medical College of Georgia). Phosphatase Activity of the Secretory Cells of Some Vertebrate "Salt Glands."

3:57 106. Roeder, Martin and Rachel H. Roeder (Woman's College of University of North Carolina). The Respiration of Small Whole Fishes.

4:10 107. Thomson, J. Richard, Jack H. Moore, and Frank M. Schabel, Jr. (Southern Research Institute, Birmingham, Ala.). Combination Chemotherapy of Experimental Mouse Leukemia.

Systematic Botany

Room 218—Florida Union

Presiding: Dan Ward

2:00 108. Oosting, H. J. and P. J. Kramer (Duke University). A Phytotron for the Southeast.

2:13 109. Reinert, Grady W. and R. K. Godfrey (Florida State University). Vegetative Characteristics of *Utricularia foliosa* (Lentibulariaceae).

2:26 110. Godfrey, R. K. and Preston Adams (Florida State University and DePauw University). The Identity of *Sagittaria isoetiformis* (Alismataceae).

2:39 111. Hardin, James W. and Clifford R. Parks North Carolina State College). The Eastern Yellow Erythroniums.

2:52 112. Humm, Harold J. (Duke University). The Marine Algae of Virginia.

(*Continued from page 15*—Taxonomy)

ond International Conference on Taxonomie Biochemistry, Serology, and Physiology is held, I would suggest: (1) that it be called Molecular Taxonomy, (2) that the number of papers be reduced and the time for each increased, (3) that these papers be primarily review papers by senior workers in the field, (4) that if there is, and there is, a need for discussion of numerical taxonomy and other questions of a controversial and theoretical nature, a separate symposium should deal with them, and (5) that wider publicity and an increased attendance should be sought. The proceedings of the conference are to be published, and I recommend them to all taxonomists. In the meantime, Bulletin No. 28, November, 1962, of the Serological Museum, Rutgers University, has evaluations of the conference by several of the participants.

———————

The first background session was entitled "Principles of Systematics." Arthur Cronquist, speaking on "Systematics: the Classical Foundation," and Ernst Mayr, on "The New Systematics," presented scholarly reviews of the nature of systematics that were to serve, and did quite well, as the theoretical background into which

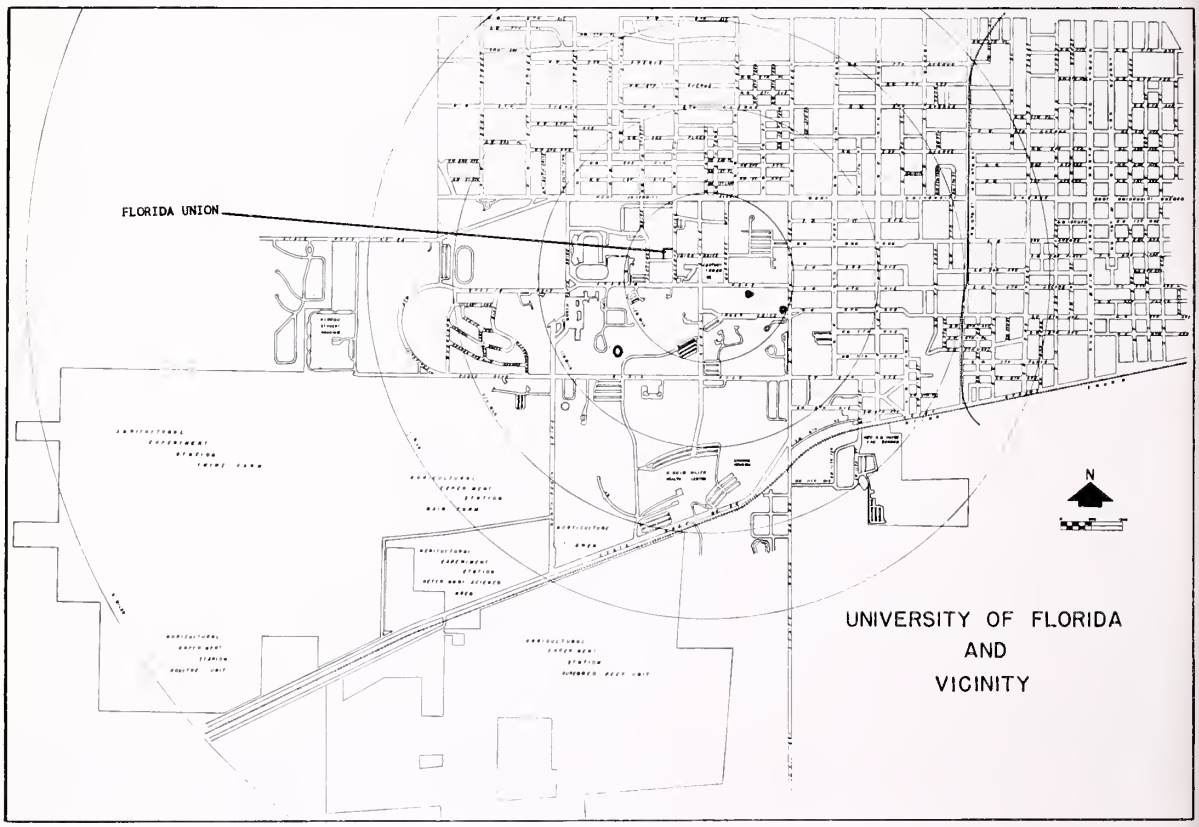
the results of investigations in molecular biology might be integrated.

But, the conference was rather abruptly jostled from its clear course by Robert Sokal's paper entitled "The Future Systematics." As is well known, Sokal proposes that taxonomy, defined as the description, classification, and naming of organized nature, be divorced from systematics which is an attempt to seek causal and historical explanations. Having, thereby, removed taxonomy from the realm of science which can be neither more *nor less* than a search for explanations, Sokal seeks to make taxonomy as an art, i.e., a praetice, scientific by requiring exactness. No one quarrels with the use of quantitative data when it can be obtained, with the use of mathematics, of technical advances such as electronic computers: the quarrel is with an approach to taxonomy that deprives it of much interest or meaning. Taxonomy, however, is scientific precisely to the extent that it operates in the theoretical framework of the science of systematics. To regard, as Sokal seems to do, taxonomy as a science when removed from this framework of theory and to consider many of the concepts of systematics, e.g., homology, as myths, is to accept a Philistine definition of science.

The use of numerieal (quantitative) data is desirable where possible. Advances in mathematical sophistication and technical contraptions (computers) are great boons to all scientists. To be bedazzled by these technical advances into reviving the medieval rationalist dream of absolute truth (exactness, "empirical taxonomy") is to ignore the most significant intellectual results of the twentieth century, namely, the insights into the nature of mathematics and scientific statements deriving from the work of Russell and Gödel. Exaetness is a prized part of the methodology of science: it is redundant to say that it is of value only as it strengthens our conceptual schemes.

Taxonomy and systematics will grow and change. The emphasis upon higher categories that is developing is an example. I don't, however, foresee a "New Taxonomy" that is different either in objectives or basic methodology from the old.

The writer's travel expenses were supplied by NSF grant G-9828.



Abstracts of Papers Presented at the 24th Annual Meeting of the Association of Southeastern Biologists

Using Rank-Order Correlation Coefficients in Determining Species Relationships

Russell Aiuto, *University of North Carolina*

A statistical technique employed by behavioral seientists is the "Rank-Order Correlation Coefficient." Its usefulness as a taxonomie tool has been tested in the analysis of closely related taxa of the genus *Phlox*, and found to give implications of genetic similarities and differences. Although a great number of measurements of a large sampling of plants were involved in this study, this measure of the degree of association between two variables is independent of sample size, and its own size is dependent solely on the extent to which two sets of measurements are related. The technique requires the organization of data into comparative columns of rank, the differences then squared, totaled, and used in the formula

$$r_r = \frac{6\Sigma d^2}{n(n^2-1)}$$

It is suggested that this technique might prove equally effective with other plant groups.

Studies on the Ontogeny of *Vanda*

Marvin R. Alvarez, *University of Florida*

Studies of the embryology and early development of plants are a valuable tool for furnishing an insight of the processes which control the growth and ultimate morphology of higher plants. The Orchidaceae are particularly suited for investigations of this type because of the relative lack of differentiation in the embryo and the absence of endosperm from the seed. A detailed description of the normal sequence of development of *Vanda* was given and abnormal modes were discussed. The role of prominent intracellular lipid inclusions was speculated upon. In addition a study of the effect of light intensity on the morphogenesis of the embryo was made.

As a result of this investigation is was concluded that the embryo differentiates early in its development into a parenchymatous, meristematic, and suspensor region. The suspensor was found to degenerate early in the sequence and the parenchymatous region serves as nutritive tissue for the meristem which differentiates leaves and stems. In addition is was concluded that the inhibitory effects of light intensity on the *Vanda* embryo are directly proportional to its intensity; optimum growth and differentiation being obtained in total darkness.

A Comparative Study of Five Isolates of *Uromyces phaseoli* (Rebent.) Wint. var. *vignae* Arth.

S. K. Ballal, *University of Tennessee*

The results of a preliminary investigation on *Uromyces phaseoli* var. *vignae*, the fungus causing the rust disease of *Vigna sinensis* Endl. are reported. The urediospores remained viable for forty days at 5°C. and at a relative humidity of approximately 50-60%. The urediospores of five isolates consistently differed in size, shape, color, thickness of epispore and echinulations. The reactions of five isolates towards four ions showed that the toxicity fell in the following order Hg > Cu > Ni > Pb. The LD50 value of each ion varied slightly for the five isolates. Nickel acted as a stimulant for the germination of urediospores at extremely low concentrations and was phytotoxic at 100 ppm. The five isolates varied in their pathogenicity towards the four varieties of *Vigna sinensis* tested.

The Behavior of *Plethodon glutinosus* as Influenced by Light

Roger W. Barbour, *University of Kentucky*

Under conditions of 12 hours constant artificial light and 12 hours constant dark, captive *P. glutinosus* exhibited a marked daily activity rhythm. In constant darkness, the peaks of activity were suppressed, but the rhythm was still well marked. In constant light, more marked suppression of the peaks was noted. After the above sequence of light and dark periods, lights were again placed on a 12 hour on, 12 hour off cycle, but with the periods reversed in relation to the normal day. Under these conditions, the animals were most active during the lightless period, which was 12 hours out of phase with their earlier activity period.

Nitrogen Metabolism in Relation to Flowering in Pine

Robert L. Barnes, *U. S. Forest Service*

Nitrogen composition, metabolism, and translocation have been studied in relation to flowering and fruiting in loblolly pine (*Pinus taeda* L.). Arginine is the main free amino acid found in the reproductive structures and young twigs. Arginine synthesis apparently takes place mainly *via* the Krebs-Henseleit urea cycle. Pathways of arginine degradation are not clear; no arginase activity has been found, and utilization *via* γ-guanidinobutyric acid may be an important pathway. Nitrogen translocation in the xylem takes place mainly in the form of amino acids, with glutamine predominating. Glutamine synthesis in sterile roots and seedlings is increased by adding ammonium or urea to the medium. Growing seedlings in sand culture with either ammonium or urea nitrogen increased the free amino acid content in comparison with nitrate-grown seedlings. Arginine level was affected greatly by nitrogen source; ammonium seedlings contained about 20 times more free arginine than nitrate-grown seedlings.

The Enhancement of Radiation Recovery Through the Use of Protein Inhibitors and Amino Acids

Alvin V. Beatty, *Emory University*

Tradescantia inflorescences which were preirradiatively treated for 1½ hours in protein inhibitors dihydrostreptomycin, puromycin or chloramphenicol and irradiated in helium gave lower chromosomal aberration yields than did the chemically untreated controls indicating that, in these experiments, protein synthesis was not necessary for chromosome rejoining and that material treated with these antibiotics showed more recovery from radiation damage than the controls. The recovery is thought to be due to the presence of additional ATP brought about by the inhibition of protein synthesis and through the addition of amino acids in the pool. The amino acids could provide additional ATP through inhibitory feed-

back mechanisms and the catabolism of amino acids. The exogenous use of citrulline, histidine, proline, glycine, phenylalanine, cysteine, isoleucine, alanine, threonine and serine reduced the aberration yield to a value approximating that obtained with the antibiotics.

Phosphatase Activity of the Secretory Cells of Some Vertebrate "Salt Glands"

George R. Bernard and Gail G. Wynn,
Medical College of Georgia

The rectal glands of 2 stingray species (*Dasyatis sabina, D. say*) and 4 shark species (*Negaprion brevirostris, Carcharinus acronotus, C. limbatus,* and *C. maculipinnis*), and the orbital glands of 3 turtle species (*Caretta caretta, Lepidochelys kempi, Malachlemys terrapine*), 2 gull species (*Larus atricilla, L. delawarensis*) and 3 tern species (*Thalasseus maximus maximus, T. sandvicensis acuflavida,* and *Gelochelidon nilotina aranea*) were studied. Azo dye and cobalt sulfide deposition techniques were used to demonstrate alkaline phosphatase activity (ALP) histochemically in the secretory cells; lead sulfide deposition, for acid phosphatase activity (ACP). ALP is most marked in *Caretta* and *L. kempi* orbital glands. ALP is confined to the connective tissues of the glands of captive terrapins. The elasmobranchs and birds show no ALP. ACP could not be demonstrated in the turtle, bird, or shark salt-secretory cells. *D. say* did show ACP. The significance of the findings will be discussed.

Observations on Alabama Soil Algae

Will H. Blackwell and Temd R. Deason,
University of Alabama

In the course of an investigation of the distribution and ecology of the soil algae of Alabama, it became necessary to describe organisms previously unknown. These organisms were isolated into uni-algal cultures by means of the standard bacteriological techniques. They have been maintained for study on modified Bristol's agar slants under constant conditions of temperature and light. The life cycles and morphology of these organisms, including new species of *Spongiococcum* and *Chlamydomonas*, are described.

Histochemical Observations on *Hymenolepis microstoma* *

Burton J. Bogitsh, *Georgia Southern College*

Adult forms of *Hymenolepis microstoma* were recovered from the bile ducts of laboratory infected mice and fixed by the freeze-drying technique. The cuticle of the parasite was found to possess both types of phosphatases (pH 5.0 and pH 9.0), mucoprotein and small quantities of acid mucopolysaccharides. The major polysaccharide of the parenchyma was found to be glycogen. Preliminary observations on the formation of the egg-shell tend to support the premise that the vitelline cells supply the protein necessary for the elaboration of the structure.

* Supported, in part, by a research grant (E-2738 C-3) from the National Institutes of Health, Department of Health, Education and Welfare.

Investigations on Certain Factors Affecting Growth and Productivity of *Spartina alterniflora* Loisel

William S. Broughton and K. L. Webb, *University of Georgia Marine Institute, Sapelo Island, Georgia*

Considerable morphological variation is exhibited by *Spartina alterniflora* Loisel growing on the salt marshes of coastal Georgia. These differences are best exemplified by the height of the flowering culms which vary from about 3.0 meters along the marsh stream edges, to 0.3 meters in the depressions behind the streamside levees landward. Studies have revealed that genetical differences are probably correlated with form variation, but that environmental conditions often result in similar natural variations. Of a number of environmental factors examined, it appears that degree of tidal submergence and the availability of certain nutrients are the most important in affecting the vigor and form of these plants in nature. These findings are taken into account in investigations of carbon dioxide fixation and net production.

A Microchemical Analysis of Mammalian Myogenesis *

Leon W. Browder and Willie M. Reams, Jr.,
Louisiana State University

An analysis of myogenesis is in progress utilizing the techniques of chemical microscopy. The development of muscles is being characterized by studies of muscle protein extraction at various stages in development. The determination of refractive indices, optical sign, optic axial angle, dispersion, fusion properties, etc., are being used to distinguish differentiation of the tissue. Correlations between the chemical microscopic characterization of differentiation and histogenesis indicate ehanges of the tissue substrate properties which influence invasion of muscle by migratory eells.

* Supported in part by Grant #502-62 of Cancer Association Research, New Orleans.

Granite Outcrop Communities of the Piedmont Plateau in Georgia

Madeline P. Burbanck and Robert B. Platt,
Emory University

During one calendar year, the vegetation of 40 island communities (depressions containing soil and surrounded by naturally exposed rock) located on three outcroppings of granitie gneiss near Lithonia, Georgia, were studied intensively to obtain data on seasonal aspect and relative abundance of species, types of communities present, and the role of succession in their floral composition. Four types of communities were recognized based on characteristic flora correlated with maximum soil depth: Diamorpha communities, 2-6 cm.; Lichen-annual herb communities, 7-15 cm.; Annual-perennial herb communities, 14-36 cm.; Herb-shrub communities, 40-50 cm. These types of communities are suggestive of successional stages from a primary bare area to a sub-climax; the climatic forest climax is not reached because of adverse edaphic conditions. Although 76 species of plants, including lichens and mosses, were recorded, only 39 occurred in five or more communities and were considered typical of island communities. There are two main growing and flowering seasons, early spring and late summer.

Recovery, After One Year in Natural Habitat, of *Cyathura polita* Labeled with Zn^{65} *

W. D. Burbanck, *Emory University*
Robert Grabske, *University of Kansas*
J. R. Comer, *University of Kansas School of Medicine*

During July, 1961, 300 cyathurans were collected from a tidal marsh at Pocasset River, Massachusetts, exposed for one hour in groups of 100 to the radioisotope Zn^{65} (as the chloride) in the Radiation Laboratory of the Marine Biological Laboratory, Woods Hole, and then returned to the Pocasset marsh. Approximately one year

later cyathurans recovered from the deposition site were measurably radioactive. Determination of the radioactivity of cyathurans collected at varying distances from the original deposition site showed that there had been relatively little population movement, and those animals that did migrate did not go farther than about 110 cm. The successful labeling of *Cyathura polita* and the recovery of labeled animals from the field will make possible more precise population studies of this estuarine isopod.

* Supported by National Science Foundation Grant G-21145.

Water, Lean, and Lipid Weights of Five Species of Colubridae

Francis M. Bush, *Howard College*

Studies on the body composition of Reptilia have included chiefly *Chelonia, Sauria,* and *Crocodilia.* Accordingly, any comparable quantitative data on the Serpentes are worthwhile.

The following results were obtained and expressed as g./100 g. body weight. Three specimens of *Storeria d. wrightorum* (Apr.) showed: total water, 64.0, total lean, 24.6, total lipid, 11.4; liver water, 3.4, liver lean, 1.0, liver lipid, 0.2; 62.1, 30.7, 7.2; 3.1, 1.4, 0.2; and 68.6, 28.9, 2.5; 3.7, 1.3, 0.8. Three specimens of *Carphophis a. amoenus* (Sept.), 73.8, 22.2, 4.0; 69.7, 27.0, 3.3; and 69.9, 28.5, 1.6. Two *Diadophis p. punctatus* (Oct.), 72.5, 22.4, 5.1; 1.5, 1.0, 0.1; and 70.0, 26.6, 3.4; 3.2, 1.2, 0.1. One *Diadophis p. punctatus* (Nov.), 72.8, 24.6, 2.6; 1.8, 0.6, 0.3. One *Natrix s. pleuralis* (Nov.), 76.0, 21.8, 2.2; 1.8, 0.6, 0.3; and one *Elaphe o. spiloides* (Nov.), 76.3 21.7, 2.0; 2.1, 0.4, 0.1.

When values are compared for all species, apparently some water is stored in the autumn. Proportionally these species contained about the same quantity of lipid in the liver as other Reptilia. Storage of lipid may be associated with the type of diet and the ability of snakes to catch prey.

The Egg and Miracidium of *Dasymetra conferta* Nicoll, 1911 (Trematoda: Ochetosomatinae)

Elon E. Byrd and William P. Maples, *University of Georgia*

The egg of *Dasymetra conferta* is fully mature when oviposited naturally and hatches only after it is ingested by the snail host, *Physa* spp. Hatching appears to be in response to some stimulus supplied by the living snail and this stimulus acts in an undetermined way to cause the larva to exercise a characteristic series of body movements as it liberates a granular substance from the larger pair of its cephalic glands. This substance reacts with the vitelline fluid in such a way as to create pressure within the egg capsule, and with the cement of the operculum in allowing that part of the capsule to be lifted away. The internal pressure aids the squirming larva to escape the shell.

The hatched larva consists of a membranous body wall which supports six epidermal plates, organized into two tiers of three plates each, an apical papilla, two penetration glands and a central matrix, the presumptive brood mass. The larva lives for about half an hour and during this time it completely reorganizes itself through a condensation of the central matrix into a syncytium, in which are six nuclei and two cells, and a miracidial case. The miracidial case ultimately ruptures to liberate the brood mass, which penetrates into the snail host.

Growth Retarding Chemicals as Substitutes for High Light Intensity

John F. Cabler, *University of Florida*

The morphological effects of the growth retarding chemicals CCC (2-chloroethyltrimethylammonium chloride) and phosfon (2,4-dichlorobenzyltributylphosphonium chloride) are known to be similar to those caused by high light intensity. Previous work by this laboratory indicated that CCC and phosfon were successful in retarding growth of *Cynodon dactylon* "tifgreen" (tifton-328 bermudagrass). An experiment was set up to determine if these chemical compounds could, when applied to this economically important turfgrass, increase the shade tolerance of this plant. The experiment showed that these compounds are successful in substituting for high light intensities. It also showed that the effects of CCC and phosfon may differ. While CCC acts as a retardant of the bermudagrass in full sunlight, it may actually promote growth under lower light intensities. The etiolation phenomenon characteristic of low light intensities was absent on grass treated with CCC and phosfon.

A technique to establish the mode of action of growth retardants is being investigated.

The Secretory Cycle of Pituitary Cells

Robert R. Cardell, Jr., *Department of Physics, Edsel B. Ford Institute for Medical Research, Detroit 2, Michigan*

The pituitary secretory cells may be differentiated on the basis of staining properties, characteristic of the secretory granules, and location within the gland. There is considerable variation in the ultrastructure of different cells of the same cell type. It is proposed that this variation in structure is due to the cell being at a different phase of the secretory cycle. The most abundant cell of any cell type is characterized by the cytoplasm being almost filled with secretory granules. This cell has little endoplasmic reticulum and few mitochondria scattered throughout the cytoplasm. The Golgi complex is not well developed. It is proposed that this is the storage stage of the secretory cycle. A cell in the active stage of secretion is characterized by the presence of fewer secretory granules, development of the granular endoplasmic reticulum, extensive development of the Golgi complex, and increase in the size and number of mitochondria. Intermediate stages between these two cells are presented.

Studies on the Reproductive Potential of *Drosophila affinis* on Various Yeasts

J. M. Carpenter, W. L. Jinks and B. A. Semp, *University of Kentucky*

In natural populations of *Drosophila affinis* the yeasts *Pichia fermentans* and *Kloeckera apiculata* are commonly found upon dissection of the crop of this insect species. In the laboratory, a series of experiments was performed to determine a figure for the reproductive potential of *affinis* using these two yeast species as nutritional sources. Preliminary results indicate only minor differences in the figure for reproductive potential using the yeasts indicated.

The Myxophyceae of North Carolina

Elton C. Cocke, *Wake Forest College*

The algal flora of North Carolina is abundant and diverse. This is to be expected since the climate ranges from almost tropical on Smith Island to much cooler con-

ditions in the high mountains. A wide variety of algal habitats is also found in North Carolina. During the past twenty-five years I have collected and identified about three hundred species of blue-green algae from the state; these plus those reported by other workers brings the total recorded number of species of Myxophyceae to approximately three hundred fifty. These species will be described and illustrated in a book which I hope will be published within one year. Several rarer and less known forms of blue-greens are described in this report.

A Synopsis of the Harvester Ants of the Genus *Pogonomyrmex* Mayr in North America

Arthur C. Cole, *University of Tennessee*

The genus *Pogonomyrmex* Mayr in North America is divisible into two subgenera, *Pogonomyrmex* Mayr and *Ephebomyrmex* Wheeler. The subgenus *Pogonomyrmex* comprises the *barbatus, occidentalis, maricopa,* and *badius* complexes. Only a single species, *badius* (Latreille), which is unique in having polymorphic workers, ranges east of Louisiana. There is no evidence of subspeciation in the genus, but some of the species hybridize introgressively with variable degrees of gene flow.

Establishment of Permanent Plots to Study Effects of Aphid Infestation in Southern Fir Forest

Arthur W. Cooper, *North Carolina State*

During 1957 the balsam woolly aphid (*Chermes piceae* Ratz.) was discovered on Mt. Mitchell, North Carolina. Since this time large numbers of fraser firs (*Abies fraseri* (Pursh) Poir.) have been killed and in some areas on Mt. Mitchell 100% mortality has occurred. In view of this potential catastrophe, it seemed desirable to take steps to study the effects of the aphid infestation on fir forests. Therefore, permanent sample plots have been established in several undisturbed fir forest types on Mt. Mitchell. These plots have been surveyed once and these data will be used as a standard by means of which any changes in vegetation due to insect infestation can be determined.

Observations on the Vegetation of the Toxaway River Gorge, Transylvania County, N. C.

Arthur W. Cooper, *North Carolina State*

A general study of the vegetation of the Toxaway River Gorge, Transylvania County, N. C., was made during portions of the summers of 1960 and 1961. Emphasis was placed on floristics and on major vegetation types occurring within the gorges and on the surrounding uplands. Five major vegetation types were recognized. A shrub zone occurred along river and stream banks throughout. Virginia pine stands occurred on gravelly disturbed sites along the river bottom. A mixed mesophytic forest, with three phases, occurred on river slopes, in coves, and on gentle slopes up to about 2100 feet along the river. Oak forests of varying composition covered the uplands and river slopes over 2100 feet. Pine dominated the leads and ridges of the uplands over the gorge. A close parallel seemed to exist between the vegetation types of the Toxaway Gorge and those of low elevations in the Great Smoky Mountains.

Some Cytochemical Observations on the Blood Cells of Lower Vertebrates

Ronald R. Cowden, *University of Florida*

During the past year some preliminary investigations have been undertaken on the cytochemistry of blood cells, their precursors and hemopoietic organs in some of the lower vertebrates. The basophils of Amphibia were of special interest. While blood basophils and peritoneal mast cells were encountered in the newt, an extensive examination of *Amphiuma* failed to disclose any tissue mast cells or peritoneal mast cells. The *Amphiuma* basophils were of a varying diameter and contained round nuclei of varying diameters. The granules exhibited positive metachromatic reactions with toluidin blue, were stained with the copper pthalocyanin dye Astrablau at pH 0.3, were periodic acid-Schiff positive, and were negligibly stained by the paraldehyde-fuchsin reaction. Blood basophils in the newt were apparently identical to those in the *Amphiuma*. The peritoneal mast cells of the newt, however, formed two distinct classes: those which were apparently identical with the blood basophils and those which contained irregular metachromatic inclusion granules of considerably larger size than those encountered in the blood basophils. Transitional stages between the usual basophil granules and the large granules were observed.

Recurring Variations in the Structure of the Thallus of a Lichen of the Genus *Umbilicaria*

Lillian M. Cowie, *Department of Biology, Wesleyan College, Macon, Georgia*

An apparatus is described by which can be identified variations in the structure of the foliose lichen thallus. The principle consists of determining the density of the thallus to a beam of light. Data are presented on the variations so detected. These data display a periodicity, certain implications of which will be discussed.

Development of the Infusoriform Stage of *Dicyema aegira*

Raymond T. Damian and Robert B. Short, *Florida State University*

The infusoriform is morphologically the most complex of the known stages in the life cycle of the dicyemid Mesozoa. Knowledge of the embryogeny of this stage could give a clue to the phylogenetic position of the phylum Mesozoa. The development and cell lineage of the infusoriform of *Dicyema aegira* McConnaughey and Kritzler, 1952 was elucidated from fixed and stained material, and will be presented. In the first five cleavages, the spindles tend to be oblique and, after seven cleavages, the embryo is formed of six quartets of blastomeres, indicating a similarity to spiral cleavage. These results suggest relationship of the Mesozoa to the protostomate Metazoa, thus supporting arguments favoring a closer affinity to the Platyhelminthes than to the Protozoa.

Sex Ratios of Hibernating Bats

Wayne H. Davis, *University of Kentucky*

Among the *Eptesicus fuscus* and *Myotis lucifugus* hibernating in certain mines in New York, the males have a tendency to cluster whereas the females tend to hang singly. Also, females tend to seek the warmer regions of the mine.

Wound Healing in Crawfish *

James Norman Dent and J. F. Fitzpatrick, Jr., *Department of Biology, University of Virginia*

In members of the genus *Cambarus* wounds approximately 1 mm. × 2.5 mm. were made in the dorsal region

of the carapace, plugged with Gelfoam, and then covered over with collodion. These animals were maintained at 18.5° ± 0.5°C. and were killed at various intervals up to 180 days after operation. Histological observations revealed that in the healing process a blood clot formed immediately in and about the Gelfoam. After approximately two months, the blood clot was invaded with epidermal cells that formed a stratum and then laid down, at about 80 days, an external covering of protochitin. The protochitin within a few days was converted to chitin. Irregularities in the healed wounds interfered with moulting, but five experimental animals completed successfully the moulting process. These findings are of particular interest in view of B. G. Anderson's ('33) report that in another crustacean (*Daphnia*) wounds of proportionate size were not healed within one instar.

* Work supported in part by AEC grant #AT-(40-1)-2978 and in part by an institutional grant of the American Cancer Society.

Production in a High Elevation Forest Stand Near Richland Balsam Mountain, North Carolina

H. R. DeSelm, *University of Tennessee*

During the summer of 1959 spruce, fir, and yellow birch trees were cut, mensurational data and specific gravity cores were obtained from the boles, and branches were sent for processing to Knoxville.

Computation of tree weights, when combined with stand data, permits calculation of net productivity. Other stand data were used to calculate a rate of production which assumes temporality.

The *in Vivo* Incorporation of Tritiated Cytidine and Tritiated Thymidine by the Cestode, *Hymenolepis microstoma* *

James A. Dvorak and Arthur W. Jones, *University of Tennessee*

The mouse bile duct cestode, *Hymenolepis microstoma*, was exposed *in vivo* in separate experiments to tritiated cytidine and tritiated thymidine, respectively. Nucleolar and nuelear labelling, by cytidine, and nuclear labelling, by thymidine, as revealed by autoradiographic methods occurred in both host and cestode tissues. As expected, only mitotically or synthetically active nuclei were labelled, those of the neck, developing organs and embryos of the cestode. Bile-duct epithelium and pancreatic acinar cells, autoradiographed as a control, showed the same degree and localization of cytidine labelling as the active cells of the cestode. The assimilation of cytidine and thymidine by direct absorption from the fluid contents of the bile duct implies that cestodes can absorb such materials from their immediate environment.

* This study was supported in part by AEC Contract AT-(40-1)-1749.

Ecological Aspects of the Florida Pine Flatwoods

Joe Allen Edmisten, *University of Florida*

Quantitative analysis of fire-free pine flatwoods and associated soils of northcentral Florida show signifieant vegetation and edaphic changes. With only 5-10 years of protection, the seedling size class was strongly dominated by such hardwood species as sweet gum, red maple, live oak, red bay, water oak, and wax myrtle. Data indicate that between ten and fifteen years of site preparation is required for hardwood domination to reach the sapling size. In cases where 15-35 years of protection were known, significant amounts of hardwood species were sampled in the tree size. The species which shared the canopy with pines included live oak, laurel oak, and ten other hardwood species. Associated edaphic changes ineluded increased bulk density, more even profiles of hydrolic conductivity, increased moisture equivalents, and more calcium in the upper six inches with protection. An increase of available NO_3 was correlated with wax myrtle. A peak of mycorrhizal infections of pine roots was observed to precede hardwood invasion at about twelve years of protection. Increases of bacteria and actinomycetes were observed with time of protection.

Tree Rings as a Means for Dating Volcanic Eruptions

Willis A. Eggler, *Newcomb College of Tulane University*

Accumulations of volcanic ash more than four to five feet deep usually resulted in the killing of pine trees near Paricutin Volcano, Mexico. To find the effect of ash accumulation and proximity to lava flows on trees which did survive four pine trees growing under what appeared to be most austere conditions were cut. Sections taken at four-foot intervals from the tree trunks have been examined for changes in growth rate. Even though the trees had grown within 200 feet of each other, under apparently similar conditions, they did not respond identically. Responses included: retarded followed by increased growth, and no significant change in growth rate.

A Comparison of Netted Phytoplankton from Surface Samples in the Littoral and Limnetic Zones of Monterey Lake

David W. Eldridge and John R. Warren, *Department of Biology, Tennessee Polytechnic Institute*

Comparative quantitative and qualitative investigations were conducted on the phytoplankton of the littoral and limnetic zones of Monterey Lake, Putnam County, Tennessee. Water samples of 1 liter each were collected from the two zones in areas free of floating and emergent vegetation. These samples were passed through a plankton net, and the organisms were examined microscopieally with a counting cell. A taxonomic comparison of phytoplankton between the zones was made. The total number of phytoplankton per liter in each zone was estimated. The investigations and findings of the littoral and limnetic zones are discussed and compared.

Radiation Effects and Population Variability in *Isoetes melanospora* *

Bebe Jo Faulkner, *Emory University*

Isoetes melanospora is a small herbaceous perennial, strictly endemic to certain weather pools on the granite outcrops of the Atlanta area. The plant body consists of an underground perennial corm from which new roots and sporophylls originate each growing season. The rigorous environmental conditions include intense heat and often prolonged drought in the summer and cold in the winter, with a pH range of 4.5 to 5.0. Population variability studies made on the velum, arrangement of sporophylls on the corm, and shape of the ligule have demonstrated marked differences between four outcrop populations, separated from each other by five to twenty-five miles. Plants from one population have been used to study response to ionizing radiation vary-

ing from 1,000 to 40,000 r. Preliminary results show that the median lethal dose is surprisingly low, being in the range of 2,000 to 4,000 r. Radiation effects are analyzed with respect to height, number of sporophylls produced, drought tolerance, and photosynthetic compensation point.

* This project is supported in part by AEC Contract No. AT-(40-1)-2412.

Acid and Alkaline Denaturation of Chick Embryo Hemoglobins as Determined by Changes in Spectral Characteristics in the Soret Region

Ronald C. Fraser, *University of Tennessee*

Two hemoglobin fractions prepared by partition chromatography at low pH have remarkably similar acid and alkaline denaturation characteristics. There is no recognizable shift in the absorption spectrum in the Soret region (413 μ) with either acid or alkaline denaturation in either hemoglobin. The "embryonic" fraction is somewhat more labile than the "adult" fraction at low pH. In both fractions denaturation is accompanied by a quenching of the optical density of the heme component. This reduction in O.D. is progressive with time, and is grossly temperature dependent in the alkaline range, but not in the acid range. There is a recovery in absorbance in the Soret region when the fractions are returned to neutral pH by dialysis. This suggests a recombination of subunits of the molecules or a restoration of molecular structure with return to neutrality. The former explanation is preferred, because of the recognition of a third electrophoretically distinct hemoglobin in such a reconstituted system.

Evidence of Hybridization of Two Species of *Eupatorium* (Compositae)

William R. Fryar, *Florida State University*

Field observations indicate the frequent occurrence of hybridization between *Eupatorium capillifolium* and *E. perfoliatum* (Compositae) under certain ecological conditions. Putative hybrid individuals match descriptions of two or three other named species. Experimental studies being conducted are designed to give more definitive evidence of this hybrid phenomenon.

Observations on a Probable New Race of the Bowfin, *Amia calva*, from Central Florida

John B. Funderburg and Margaret L. Gilbert, *Florida Southern College*

The bowfin of the Kissimmee drainage of central Florida differs from the typical form in being uniformly greenish-gray on the dorsum with no reticulated pattern or markings of any kind. The venter is white, or yellowish-white. The black spot at the base of the caudal is lacking in both sexes and there is no ocellus in the male. Bowfins from the Peace River drainage have the same coloration, but a faint black spot is present at the base of the caudal. Studies on the distribution, ecology, and breeding behavior of this color phase are in progress.

Preliminary Study of a Light-Induced Hypothalamus Secretion

R. E. Garth and R. L. Culpepper, *Northwestern State College of Louisiana*

The phenomenon of photoperiodism as a physiological trigger in the seasonal sexual development of certain birds and the necessity of the hypophysis with its tropins are well documented. Within the past decade the role of the hypothalamus as a mediator between the two has been shown, primarily by the use of hypothalamic lesions; however, the mechanism of the communication is unknown.

We have attempted to demonstrate the presence of a secretory activator originating in the hypothalamus which stimulates, directly or indirectly, the testes in male Bobwhite (*Colinus virginianus*). Entire hypothalami homogenates taken from light-developed birds were injected I.P. into non-light developed birds and the recipients showed a response in one week. Testicular weights increased from 0.05 g. to 0.75 g. which compares favorably to weights of light-developed birds.

The Identity of *Sagittaria isoetiformis* (Alismataceae)

R. K. Godfrey and Preston Adams, *Florida State University and DePauw University*

Relatively recently authors have considered *Sagittaria isoetiformis* J. G. Sm. either as an ecological form of *S. graminea* Michx. or as conspecific with *S. teres* S. Wats. Investigations of the morphological variations exhibited in numerous populations of plants of this complex in relation to varying ecological sites and fluctuating water depths indicate that *S. isoetiformis* is not an ecological form of *S. graminea*. Study of herbarium material of *S. teres* from New England and *S. isoetiformis* from the southeastern United States indicates that these are not conspecific. The conclusion is that there are three species.

Retention of Zinc-65 in Wild Small Mammals *

Frank B. Golley and Richard G. Wiegert, *Institute of Radiation Ecology, University of Georgia*

Experiments on the retention of Zinc-65 in two common small mammals, the cotton rat (*Sigmodon hispidus*) and the meadow vole (*Microtus pennsylvanicus*) are reported. In addition to the species comparison, the effect of a high fiber diet and the result of release into a natural enclosure on zinc retention in the cotton rat are considered.

* Supported by the Contract between the AEC and the University of Georgia, AT-(38-1)-310.

Circulation in Raleigh Bay, North Carolina, and Its Relation to the Barrier at Cape Hatteras

I. E. Gray and M. J. Cerame-Vivas, *Duke University*

Cape Hatteras and Diamond Shoals form a boundary between different marine sub-provinces, Virginian and Carolinian. Returns from drift bottles released over Diamond Shoals (1) revealed a definite southwesterly-flowing coastal current south of Cape Hatteras; (2) presented evidence that the Virginian Coastal Current, normally diverted seaward as it approaches Diamond Shoals, crosses the Hatteras barrier more frequently than has been suspected; and (3) prompted a revision in postulated patterns of circulation in Raleigh Bay. Influenced by moderate northeast winds, coastal flow in Raleigh Bay was more pronounced in late summer than in spring, some drift bottles rounding Cape Lookout. Recovery of bottles from as far south as Onslow Bay and Bogue Sound lends strong support to the theory that temporary winter populations of distinctly northern species in the Carolinian sub-province develop from planktonic larvae that have been liberated from permanent populations north of Hatteras and transported around the capes under favorable conditions.

Stream Classification and Fish Distribution: Dix River System, Kentucky

PHILLIP E. GREESON, *University of Kentucky*

Weaknesses in the classification of freshwater streams present handicaps in the explanation of aquatic ecological studies. Through the incorporation of the Horton (1945) system of stream classification as modified by Strahler (1954, 1957), this handicap may be overcome. By this system, extreme headwaters are considered to be Order 1 and the union of two such units constitutes an Order 2. When two streams of equal order unite, they form a stream of the next highest order. Patterns of fish distribution within the Dix River System, located in the southern portion of the Bluegrass region of Kentucky, illustrate this system of stream classification. Sixty species of fishes, representing thirteen families, were collected and distribution patterns did correlate with stream order.

Oospore Variation in *Chara*

DANA G. GRIFFIN III, *University of Tennessee*

In order to evaluate the reliability of variation in length to width ratios of oospores as a taxonomic character in *Chara*, oospores from clones of six species growing in four different soil-water culture treatments were compared.

One hundred oospores from each culture were measured, and a length to width ratio calculated. Statistical analysis of the ranges of variation by comparing means and standard deviations suggests two conclusions: 1) within clonal material oospore shape variation exceeds that now used in distinguishing taxa, and 2) this variation appears to be random with regard to the physical factors of the environment under which the cultures were maintained. The oospore may still be useful as a key character within the group, but a better understanding of the potential for variation and a more precise definition of range of variation is needed.

Growth Studies on *Microthamnion kuetzingianum* Naegeli

ROBERT D. GROOVER AND TEMID R. DEASON, *University of Tennessee and University of Alabama*

Growth (measured turbidimetrically) and development (evaluated microscopically) of *Microthamnion kuetzingianum* in a basal medium was compared to that in experimental media with mineral element substitution, variation in sources of nitrogen, addition of selected organic compounds, and at varying pH levels. These studies indicate that: (1) *Microthamnion kuetzingianum* has a low calcium requirement for which no other element tested will entirely substitute. (2) Growth with casein hydrolysate and peptone as nitrogen sources surpasses growth in the basal medium. Other sources support growth, but morphological peculiarities are common. (3) Added peptone, yeast extract and dextrose stimulate growth and morphology is normal. (4) Basal medium plus 0.2% dextrose supports growth in the dark for at least 21 days and the culture remains composed of only motile cells and germlings. (5) The optimum pH for rapid growth is 5.85 to 6.05. The ability to produce motile cells in abundance ceases between a pH of 6.65 and 7.15. Abnormal morphology is frequent above a pH of 7.15.

Zoospores of *Prasinocladus lubricus* Kuckuck

ROBERT D. GROOVER AND WALTER R. HERNDON, *University of Tennessee*

Phycologists differ widely in their systematic placement of *Prasinocladus lubricus*, a small branched marine, green alga, in which the protoplasts are largely limited to the terminal cells. In hope of clarifying its taxonomic position, zoospore production, release and development have been followed in a unialgal strain isolated from Great Harbor, Woods Hole, Massachusetts and maintained in Erdschreibers medium.

The four lobed zoospores have a prominent depression or gullet at the anterior end and the four flagella of each are deeply inserted. At cessation of motility a conspicuous wall is formed within minutes with the flagella still protruding. Light and electron microscope studies indicate that subsequent development of the wall is not uniform; it is broader at the anterior end, multilayered and transversed by pits. The outline of the gullet is evident in the wall as the organism develops. With respect to the gullet, motile cells of *Prasinocladus* are similar to those of *Pyraminomonas* and support systematic placement as suggested by Christensen (1962).

The Eastern Yellow Erythroniums

JAMES W. HARDIN AND CLIFFORD R. PARKS, *North Carolina State College*

Detailed morphological and cytological studies indicate five entities within the yellow Erythroniums of eastern United States. This study substantiates the observations and writings of Harper and Wolf made ten to twenty years ago. Evidence indicates that the northern tetraploid *E. americanum* possibly arose through reticulate evolution from two southern diploid species. Subsequent selection pressures and possibly a second reticulation has given rise to two additional taxa.

The Effect of *Sigmodon hispidus* on the Regeneration of Southern Pine Seedlings

MICHAEL J. HARVEY, *University of Kentucky*

A study was made to determine whether or not cotton rats cause damage to southern pine seedlings. The study was conducted during the months February to August, 1962, in the Stephen F. Austin Experimental Forest, Angelina National Forest, Nacogdoches County, Texas. A total of 1,296 loblolly, shortleaf and slash pine seedlings were planted on a one acre plot. The area was enclosed and divided into four equal subdivisions by fence. Known numbers of cotton rats were released on three subdivisions; the fourth was a control. No seedling damage by cotton rats was detected.

Homing in *Myotis sodalis*

M. D. HASSELL, *University of Kentucky*

Seven hundred *M. sodalis* were taken from Carter Caves, Kentucky. These were released at 12 air mile intervals, the farthest release point being 144 miles. One hundred and one bats were recaptured at the cave. Return percentage diminished with distance from the cave.

A Cytological Study of Tripling Conjugation in *Tetrahymena pyriformis* *

LINDY HATCH AND CAROLYN WELLS, *Longwood College*

A cytological study of the conjugation of three organisms was conducted using the ciliate, *Tetrahymena pyriformis, strains* EU 6010 (variety 6, mating type III) and EU 6525 (variety 6, mating type I). The amicronueleate strain EU 6525 was used as a marker in following the events of micronuclear reorganization in this unusual conjugation. A high frequency of homopolar doublets in strain EU 6525 resulted in the union of three organisms at conjugation, i.e., two micronucleate EU 6010 cells fused to one amicronucleate EU 6525 cell at the oral region. Conjugating pairs and triples

were stained with Gomori's hematoxylin, mounted temporarily in 45% acetic acid, and studied under an AO phase microscope. The results indicate that triples undergo normal nuclear reorganization up to the second postzygotic division; after this point, no evidence for completed reorganization has been obtained. In pairs, normal micronuclear reorganization has been observed in many cells.

Characterization of an Unknown Auxin in a Sample of C-14 Labelled IAA

J. H. M. Henderson

An unkown auxin has been isolated from a sample of radioactive, C-14 labelled IAA synthesized by Pichat *et al.* in 1960. The substance is active in bioassay tests for both straight growth and *Avena* curvature. It is a neutral substance and has indolic characteristics. Radioactivity and biological activity do not fully coincide, so that the auxin appears not to possess the originally incorporated C-14. There also is very little IAA remaining in the sample. Comparisons have been made by R_f values and biological activity with other known and some unknown neutral substances, but to date similarity of identity has not been established. Its exact identity is pending.

The Use of Centrifugal Force to Rearrange the Nuclei in the Developing Megagametophyte of *Oxalis corniculata* L.*

J. M. Herr, Jr., and M. E. Borom

Stages in the development of the megagametophyte of *Oxalis corniculata* L. are characterized by a very precise location of their nuclei. In order to determine the effect nuclear position exerts on the pattern of megagametogenesis, a method has been designed utilizing centrifugal force to rearrange the nuclei during the early stages of development and allowing ontogeny to continue *in vitro*. Finding an effecitve level of centrifugal force constitutes an important step in the development of this method. Floral buds excised during megasporogenesis were mounted vertically in centrifuge tubes and subjected to 213 gravities for ten minutes. The buds were then fixed and sectioned at 10 μ to determine the effect of this force on the megasporocytes, daughter cells, and megaspores. In cases where centrifugal force passed exactly parallel to the long axes of the cells, the nuclei were moved to the end walls. Force from any other direction was totally ineffective in altering the position of the nuclei. Therefore, the cytoplasmic forces which hold the nuclei in their characteristic positions were weakest along the long axes of the cells.

Some Insect Associates of Southern Pine Trees

L. A. Hetrick, *University of Florida*

The southern pine type of woodland extends from eastern Maryland and Virginia to the Gulf of Mexico and westward to Arkansas, Oklahoma, and eastern Texas. Insect associates of the trees are essentially the same species throughout this extensive geographical range. Southern pine beetle, black turpentine beetle, species of *Ips* bark beetles, pine weevils, ambrosia beetles, turpentine borer, cone moths, shoot moths, sawyers, defoliators, and subterranean termites are a few of the more important associates of the trees. Although frightening outbreaks of some insects do occur periodically, it is remarkable that more trouble does not result from such large numbers of pine trees growing on so many thousands of square miles of land area.

Mineral Requirements of Selected Species of Aquatic Hyphomycetes

D. W. Hickman and W. W. Scott,
Virginia Polytechnic Institute

Four species of aquatic Hyphomycetes were selected on the bases of rapidity and reproducibility of growth These were grown in liquid culture on a rotary shaker at constant temperature. The morphological responses and amounts of mycelium produced in media of different mineral compositions were determined. Glucose was the only organic constituent required. Macro-elements were varied from zero to concentrations in excess of those yielding maximum mycelial dry weight.

It was found that variation in mineral concentrations can significantly alter the apparent morphology and physiology of these organisms. Therefore such investigations are prerequisite not only to a reliable taxonomic study of these species, but to examinations of their organic nutrition as well.

Influence of Mysial Architecture on Pigment Cell Morphogenesis in the Mouse *

Joe G. Hollyfield and Willie M. Reams, Jr.,
Louisiana State University

Methods of autoplastic and homoplastic transplantation of melanoblastrich embryonic and newborn tissues into pigment cell deficient muscles of PET mice were employed to determine the role of the tissue structure in the morphogenesis of pigment cells. The data gathered from a study of the recovered graft sites indicate that the extent of invasion of musculature by melanoblasts is governed by the state of mysial differentiation. Furthermore, the greater the degree of mysial differentiation, the greater the density of the tissue fabric. Consequently, older mysial tissue resulted in a restriction of dendrite formation by the included pigment cells due to the resistance imposed upon the cells by the mechanical properties of the environment. Thus the morphology of melanocytes of a given genotype may serve as an index to the time of pigment cell morphogenesis in differentiating mouse muscles.

Accumulation of Radioactive Gold by Estuarine Animals

Donald E. Hoss, *Bureau of Commercial Fisheries, Biological Laboratory, Beaufort, North Carolina*

The accumulation of radioactive gold by estuarine animals was investigated in conjunction with a sediment tracing study conducted in the Cape Fear River, N. C. by the Corps of Engineers. Test animals, ineluding blue crabs (*Callinectes sapidus*), oysters (*Crassostrea virginica*), mummichogs (*Fundulus heteroclitus*), and croaker (*Micropogon undulatus*), were placed in cages at 6 stations in the river. Samples of animals, water, and sediments were taken 1, 17, 41, and 144 hours after the release of sediment, labeled with radioactive gold, into the river. All samples contained low levels of radioactivity, including those taken directly from the drop zone. Currents and wave action quickly dispersed labeled sediment particles from the area so that the only detectable radioaetivity associated with natural sediment occurred at station 2 in the drop zone. Oysters accumulated the most radioactivity followed by crabs and fish. No measurable amounts of activity were detected in the animals, sediment and water samples after

144 hours. It was concluded that the amount of radioactive gold used did not constitute a hazard to the marine community.

Nuclear Loss in the Ascospores of *Neurospora tetrasperma*

H. Branch Howe, Jr., *University of Georgia*

Genetic analysis using randomly selected normal size ascospores of *Neurospora tetrasperma* is subject to error, if one of the two nuclei initially present should fail to survive. The homokaryosis resulting could be incorrectly scored as having arisen from crossing over during ascus development. Using the mating type locus as a marker and comparing samples of randomly isolated normal size ascospores with samples from whole asci, an event interpretable as nuclear lethality was occasionally found. The loss seemed to be of sufficient frequency to warrant the use of properly located genetic markers to permit detection and exclusion of the event from experimental data.

Electron Microscopy of Human Skin

Funan Hu and Robert R. Cardell, Jr.,
Henry Ford Hospital and Edsel B. Ford Institute for Medical Research, Detroit 2, Michigan

Split thickness biopsies of human skin were obtained and fixed in 1% buffered osmium tetroxide for electron microscopy studies. The dermis of the skin is composed of bundles of collagen fibers randomly oriented and intimately related to fibroblasts. A basement membrane separates the dermis from the epidermis. The basement membrane is 35 μ thick and is adjacent to the plasma membrane of the epidermal basal cells.

The epidermis is composed of basal cells which are characterized by their palisading arrangement and the presence of melanin granules of varying size. The prickle cells have irregular and highly folded cell membranes and many desmosomes between adjacent cells. The granular cells are elongated with their long axis parallel to the surface of the skin, and have irregular shaped electron dense keratohyaline granules. The cells of the stratum corneum are highly modified, possessing neither nucleus nor the usual cytoplasmic constituents.

The Marine Algae of Virginia

Harold J. Humm, *Duke University*

The State of Virginia is still a complete hiatus with reference to our knowledge of the distribution of marine algae of the Atlantic coast of the United States. Neither of the two major compilations of the algae of this region mentions Virginia.

The writer began to make collections of marine algae along the coast of Virginia in 1942, and at infrequent intervals since that time. The opportunity to spend the summer of 1962 at the Virginia Institute of Marine Science as Visiting Scientist has brought the work to the point where a manuscript is now in preparation. Although many additions will be made to the list in the future, the present records include approximately 165 species distributed as follows: Cyanophyceae, 42; Rhodophyceae, 43; Phaeophyceae, 50; Chlorophyceae, 30. The paper will include keys, descriptions, and illustrations.

Megasporogenesis in *Dendrobium* (Orchidaceae)—an Electron Microscope Study

Herbert W. Israel, *University of Florida*

Four successive stages—nucellar phase, sporogenic phase, prophase, metaphase—of megasporogenesis in six hybrids of *Dendrobium* have been studied by electron microscopy. A megaspore mother cell is developed at the subapex of each papillar extension of the initially undifferentiated placenta following a 30-day mitotic period induced by pollination. Except for its distal position in the nucellar row, the potential megaspore mother cell exhibits no unique morphological properties. It is proposed that the marked multiplication of organelles accompanying cytoplasmic growth in the sporogenic phase is facilitated through macromolecular resorption of cytoplasm from surrounding cells by the megaspore mother cell. Evidence for this is presented by a concomitant loss of plasmodesmata and initiation of rhopheocytosis between the megaspore mother cell and its nucellar envelope; the eventual disappearance of the nucellar epidermis; and the marked decrease in ribosome concentration within the megaspore mother cell. The significance of the non-porous nature of the enlarged early prophase nuclear envelope remains obscure. Rudimentary Golgi-bodies within the prophase cytoplasm of the megaspore mother cell are assumed incapable of elaborating the extensive network seen in the endoplasm. The reappearance of pores in the early metaphase nuclear envelope marks the onset of its breakdown. It is proposed that the sharp decrease in organelles during the metaphase accounts for the increase in phragmosomes, which may readily be degraded forms of lysed organelles. It is finally suggested that the supporting tissues of the meiotic system examined may regulate both the initiation and maintenance of the developmental transformations observed.

Fluorescent Antibody Studies in Human Malaria

Geoffrey M. Jeffery and William E. Collins,
U. S. Public Health Service *

Using the indirect fluorescent antibody method, the production and persistence of specific antibody were demonstrated in patients inoculated with *Plasmodium malariae* and *Plasmodium falciparum*. Rapid development of significant antibody levels was seen in all cases. In *P. malariae* the persistence of high titers was associated with persistence of low parasitemias; termination of the infection produced a gradual decline in antibody levels, but detectable antibody remained for extended periods following the elimination of parasites. In *P. falciparum* development of antibody was usually somewhat slower than in *P. malariae*, and the antibody titers fluctuated considerably in relation to fluctuation of parasite densities. Significant and relatively stable antibody levels persisted for extended periods after the termination of the parasite infection.

Correlation of Forest and "Prairie" with Soils in the Black Belt of Sumter County, Alabama, in 1832

Alice Simms Jones, *University of Alabama*

In this study, the field notes and plats of the original land survey of Sumter County, Alabama (1832) were used to reconstruct the vegetation of the 287,093 acres of Black Belt in this county. The Sumter County Black Belt in 1832 included 65,074 acres (23.4%) which supported no trees or less than 10 trees per acre and thus can be considered naturally open land. Four hundred twenty-four section corners were used as sampling points. When these points are located on a modern soil map, 257 are associated with acid soils, 167 with alkaline soils; 203 are located in loam or sand, 221 in

clay. A strong correlation exists between the sample points which had low tree density and the points which have alkaline soils and clay soils. The degree of affinity between the acid loam soils and high-density points is not as high. Thus for Sumter County, Alabama the patches of open land were associated with alkaline clay soils and were a distinctive part of the landscape. Tree densities were mostly below normal forest density at all sampling points.

Massive Polymorphism, Reflexive Selection, and the Toad, *Bufo typhonius*

DUVALL A. JONES, *Ferrum Junior College*

Extensive variation of color and form within populations of invertebrate species has been described and referred to as massive polymorphism. It was suggested that such polymorphism is an adaptation which decreases selection pressure by predators with color vision. The responsible mechanism was termed reflexive selection. Two genetic models were proposed to account for the sustained variation. One model is based on predator selection of the more frequent phenotypes; the other is based upon higher selection value of heterozygotes. The toad, *Bufo typhonius*, of the American tropics, exhibits a wide variety of color patterns. A series of fifty-one specimens collected from Barro Colorado Island, Canal Zone, displayed numerous combinations of body patterns and colors. Additional series from Panama, Colombia, and Brazil show wide pattern variation. This appears to be an example of massive polymorphism and possibly reflexive selection.

Studies in the Narrow Leaved *Vernonia* (Compositae) of the Southeast

SAMUEL B. JONES, JR., *University of Georgia*

The narrow leaved *Vernonia* species (*V. pulchella* Small, *V. recurva* Gleason, *V. scaberrima* Nutt., *V. angustifolia* Michx., *V. dissimilis* Gleason, *V. concinna* Gleason, and *V. blodgettii* Small) are especially characteristic of the sandy areas of the Coastal Plain from North Carolina to Florida and Mississippi. Field work, studies of literature, and of herbarium specimens indicate that these taxa are not well defined. In particular, there are many natural variants which cannot be classified with the present criteria given for these taxa. A solution to these and other problems is being attempted through transplant studies, determination of chromosome numbers, distributional studies, and an analysis of mass collections for evidence of introgression and other relationships. The results to date will be discussed.

Preliminary Investigation of Floral Color Variation in *Trillium* (Liliaceae)

YOSHIMICHI KOZUKA, *Vanderbilt University*

Six species of *Trillium*, including four Japanese and two American, were analyzed qualitatively by means of paper chromatography in an attempt to determine whether or not observed color variations were due to different anthocyanin pigments. The Rf values of anthocyanin extracts from petals and ovary walls revealed no significant differences among the species examined.

Infection of Commercial Shrimps with Spores of the Gregarine *Nematopsis* from Pelecypods *

DWAYNE N. KRUSE, *Northwestern State College*

Nematopsis spores from the gills of *Aequipectin irradians*, *Chione cancellata*, *Macrocallista nimbosa*, and *Cardita floridana* produced mature gregarines that encysted and formed infective gymnospores when fed to uninfected *Penaesus duorarum*. The same *Nematopsis* spores did not produce infective gymnspores when fed to the two other main species of commercial shrimps, *P. aztecus* and *P. setiferus*.

It was also shown by experiments in the field and laboratory that *P. duorarum* need not ingest the pelecypod tissues to become infected. The pelecypods are capable of shedding the *Nematopsis* spores and the spores may be carried into the marine environment via the mucous and fecal excrements. The shrimps ingest the excrements and thus become infected.

* This investigation was carried out at Florida State University during the tenure of a Predoctoral Fellowship from the Division of General Medical Sciences, United States Public Health Service.

Some Limnological Aspects of the Waters in Mammoth Cave, Kentucky

ROBERT A. KUEHNE, *University of Kentucky*

Mammoth Cave is still in the process of formation and alteration through water action. Two river systems, the Styx and Echo, lie at the deepest level, and small streams bringing surface waters downward are found at higher cave levels. Bodies of perched water, such as Crystal Lake, are also known. A detrital food chain of surprising complexity is present. Some of the physical, chemical and biological characteristics of these aquatic habitats are given, and a few initial interpretations are presented.

Spacing in Even-Aged Stands of Sand Pine Showing Maximal Competition

ALBERT M. LAESSLE, *University of Florida*

Thirteen stands that had regenerated naturally after crown fires were studied. Nearest neighbor distances were measured in stands varying from 12 to 65 years old and departures from random spacing calculated. In an aggregated stand, these distances were measured in the same sample strips both at ground level and at 1.5 m., giving very significantly different results due to the divergence of trunks away from the aggregation center. In 8 stands nearest neighbor distances were measured twice, once using all trees both dead and alive, again using only live trees. Live only samples showed consistently greater departures toward even spacing, demonstrating that the denser portions of the stands have the higher casualty rates. A marked difference in the density of ground cover in two parts of the same stand, is demonstrated by dead and live vs. live only studies, to be due to a much longer period of maximal pine competition in the portion having sparser undergrowth.

Thymidine "Pool" in Grasshopper Neuroblasts *

WILLIAM M. LEACH, *University of Tennessee*

Embryos of the grasshopper (*Chortophaga viridifasciata* (De Geer) were incubated in tritiated thymidine (H^3T) and successively rinsed in three solutions. Observation of living neuroblasts and reidentification of the same cells in autoradiograms revealed that (1) corresponding portions of sister chromatids were labeled in the first division following incubation in H^3T; (2) some sister chromatids were labeled in complementary portions and some were labeled in corresponding portions in the second division following incubation in H^3T; and (3) neuroblasts that were not in deoxyribonucleic acid (DNA) synthesis during incubation in H^3T incorporated H^3T into DNA during the succeeding DNA synthetic period. Results are interpreted as evidence of intra-

cellular persistence of thymidine derivatives between periods of DNA synthesis.

* This study was supported in part by the Atomic Energy Commission under Contract No. AT-(40-1)-2575.

Life Cycle and Seasonal Differences in Photoperiodic Response by Nymphs of *Tetragoneuria cynosura* (Odonata)

Paul E. Lutz, *Woman's College, University of North Carolina*

To determine the pattern of nymphal development, extensive collections were made throughout one complete year. Most nymphs had a life cycle of one year; by October the ultimate instar was reached and served as the overwintering stage. A small percentage of the population exhibited retarded growth and required two years to eomplete their development. Their first winter was spent in stages other than the final and their second winter in the final stage.

Striking differences occurred in seasonal responses to photoperiods of 11 and 14 hours. For nymphs collected in August and early September, final instar durations were much greater on the longer photoperiod. In subsequent collections, however, the longer photoperiod induced more rapid development. This abrupt reversal in response coincided with the fall equinox. Differences in rate of response by nymphs maintained on the two photoperiods became progressively less as time of emergenee approached.

Chimera in Maize

Te-Hsiu Ma, *Emory & Henry College*

A corn plant possessing chimerical branches on its tassel was studied. The normal diploid branches had $2n$ number 20 chromosomes. Chimerical branches were tetraploid, having 40 chromosomes in their pollen mother cells. A detailed meiotic study disclosed tetravalents in form of rings, chains, or figures-of-8; hexavalents, octavalents in form of chains. These multivalent formations indicated that a reciprocal translocation was involved. Morphological eomparison between this plant and its sister plants showed no pronounced difference, although the spikelets and florets of tetraploid branches were slightly larger than those of the diploid. Cytological study of 15 sister plants and 3 selfing progeny of this plant showed that all had $2n$ number 20 in their somatic cells.

Chromosome Number and Behaviour in *Gerardia* and *Aureolaria*

O. M. Mathen * and C. R. Bell

The present study deals with a cytological analysis of few species belonging to the genera *Gerardia* L. and *Aureolaria* Raf. of the family Scrophulariaceae. The basic haploid number of chromosomes of all the species of *Gerardia* and *Aureolaria* so far worked out is 13. However, in one population of *Gerardia purpurea* and in two populations of *Aureolaria virginica* the chromosome number was found to be higher than 13 due to the presence of supernumerary chromosomes. These were found to be smaller than the members of the regular set. The number of these supernumeraries varied from 1 to 3. Even within members of the same population the number was found to be differing. The sequence of events in the behaviour of these were observed at different stages of meiosis. They were seen at metaphase I, anaphase I, metaphase II and anaphase II of meiosis. At anaphase I the supernumeraries, instead of moving to the poles of the cell, remain at the equatorial plane and they occupy this position till the end of anaphase II. Presumably these singled chromosomes may degenerate before the tetrads are formed. The origin and the evolutionary implications of the supernumerary chromosomes is worth studying. The genetic effect of these if any is to be understood.

* Danforth Fellow from India at the University of North Carolina.

Ecotypic Differentiation in *Diamorpha cymosa* Nutt.

J. Frank McCormick, *Vanderbilt University*
Robert B. Platt, *Emory University*

In the winter of 1959 population samples of *Diamorpha* were transplanted from numerous granite and sandstone outcrops to a simulated outcrop in an experimental garden on the Emory University campus. Population samples from a centrally loeated outcrop were reciprocally transplanted to each outcrop visited. Phenological observations were recorded during the following three years and population samples of the second filial generation (1961) were subjected to analyses of comparative physiological tolerances and comparative morphology.

Population phenology varies in a northeast to southwest clinal pattern and coincides with moisture and temperature gradients. Population physiological tolerances also vary in a clinal pattern, but in a different direction. Marginal populations are most tolerant and centrally loeated populations are least tolerant to cnvironmental stresses. No significant morphological variations were resolved. The two discordant patterns of elinal variability indicate that *Diamorpha* is undergoing ecotypic differentiation. Each population is genetically adapted to the individually variable environments of the numerous well-isolated habitats.

Foliose and Fruticose Lichens of the Piedmont Upland of Alabama

Herbert A. McCullough, *Howard College*

Collections of foliose and fruticose lichens have been made during 1962 and 1963 in the counties occupying the Piedmont Upland of Alabama. In general, the lichen flora resembles that of the eastern deciduous forest area with the frequent presence of a few forms typical of the southern Coastal Plain. The most common genus is *Parmelia,* represented by a variety of species. Others frequently collected include species of *Cladonia, Anaptychia, Physcia, Pelligera, Usnea,* and less frequently a number of other forms.

Some Environmental Changes in Forest Stands Following Exposures to Radiation *

John T. McGinnis, *Emory University*

Observations were made on soil temperature, soil moisture and forest floor light intensities in oak-hickory-pine stands which surround the air-shielded reactor on the Air Force Plant 67 Reservation in north Georgia, as part of a long range study on radiation effects on forest productivity. Following a total accumulated exposure of 10,000 rads with a 43 per eent reduction in canopy cover, the average 6-inch depth soil temperature differed significantly from the control during the growing season by an increase of 2.1°F., while complete defoliation following exposures of 15,000 rads resulted in an increase of 3.1°F., significant at the .01 level. Soil moisture, on the other hand, showed little response due to change in canopy density. Forest floor light intensities differed at the .01 level from the non-irradiated stand by a ratio of 3.2 and 4.8 to one following exposures of 10,000 and 35,000 rads respectively.

* This project is supported in part by AEC Contract No. AT-(40-1)-2412.

Intra-Cellular Localization of the Pentose Phosphate Cycle in *Ustilago maydis* *

Richard D. McKinsey, *University of Virginia*

The relation of the operation of the pentose phosphate cycle to cellular particles of *Ustilago maydis* was investigated. Results obtained indicate that extracts from which all microscopically visible particles had been removed could oxidize glucose through the pentose phosphate cycle. By tracer techniques it was found that all or almost all released CO_2 was obtained from the number one carbon of glucose. Spectrophotometric studies demonstrated the presence of glucose-6-phosphate dehydrogenase and 6-phosphogluconic acid dehydrogenase. Radio chromatographic studies indicated the formation from glucose by extracts of glucose-6-phosphate, 6 phosphogluconic acid and possibly ribose-5-phosphate. Extracts treated so as to remove all microscopically visible particles could metabolise glucose with oxygen uptake. It was concluded that in this fungus the pentose phosphate cycle could operate with the uptake of 0_2 in the absence of mitochondria and possibly other known enzyme-containing electron-transporting particles.

Nature of Preferential Pairing in an Intergeneric Allotetraploid

Margaret Y. Menzel,
Agricultural Research Service, U.S.D.A.

Pollen mother cells in sterile F_1 hybrids of *Lycopersicon esculentum* × *Solanum lycopersicoides* showed virtually complete chromosome synapsis at pachytene and no visible differences between pairs of homologues except differences in length in 4 proximal heterochromatic regions, although evidence of partial chromosome nonhomology appeared at later stages of meiosis. In contrast, a colchicine-induced allotetraploid showed a very high degree of preferential pairing as evidenced by very low frequency of pairs with unequal regions at pachytene and absence of unequal pairs and low quadrivalent frequency at metaphase I. Preferential pairing is due to highly non-random *synapsis* rather than to preferential chiasma formation in this material.—*S. lycopersicoides* has a higher metaphase chiasma frequency than *L. esculentum*. The higher frequency is dominant in the allotetraploid, so that pairs of tomato chromosomes form more chiasmata in the allotetraploid than they do in the species.

Aquatic Phycomycetes of the Mountain Lake Region *

Charles E. Miller, *University of Maine*

Part of the last two summers have been spent at the Mountain Lake Biological Station, Virginia, surveying the lower aquatic Phycomycetes of that region. Sixty-six species in twenty-nine genera representing members of fifteen families and seven orders of the aquatic Phycomycetes are known from these studies. Seven taxa apparently new to science were found. These include species of *Rhizidium* and *Rhizophydium* saprophytic on pollen, chitin and snake skin, two species of *Chytridium* on sweet gum pollen, a very large *Lagenidium* in corn pollen, one *Lagenidium*-like parasite of a desmid, and an unidentified spiny chytrid on sweet gum pollen. Sexual reproduction in *Gonapodya polymorpha* Thaxter, the true nature of which was first described by Johns and Benjamin (*Mycologia* 46: p. 201, 1954) was confirmed during this survey.

* Supported by a National Science Foundation Grant-in-aid administered by the Mountain Lake Biological Station.

Parasitic Helminths of Mink *

Grover C. Miller and Reinard Harkema,
North Carolina State College

During the last three years a total of 115 mink, *Mustela vison*, from the coastal and piedmont areas of N. C. has been examined for helminth parasites. Most of the hosts were taken in the vicinity of Raleigh, N. C. The majority of parasites have been identified to species and grouped as follows: Trematoda—10 species; Cestoda—1 species; Nematoda—9 species; Acanthocephala—2 species. The presence of the trematodes, *Enhydridiplostomum alaroides*, *Baschkirovitrema incrassatum*, and *Procyotrema marsupiformis* constitute new host and new locality records. The common lungworm of mustelids, *Filaroides martis*, was the most prevalent parasite. The kidney worm, *Dioctophyma renale*, was found only in mink from the coastal areas. The mink from N. C. show a low incidence of infection.

* Supported in part by research grant E-3209 from the National Institutes of Health, U. S. Public Health Service.

Factors Affecting the Germination of Conidiospores of *Erysiphe cichoracearum*

Ralph M. Morrison,
The Women's College of the University of North Carolina

Several aspects of the physical environment were studied with reference to the germination of conidiospores of the powdery mildew, *Erysiphe cichoracearum*. It was found that unilateral illumination had no effect on the direction of growth of the conidial germ tubes. Light stimulated conidiospore germination at low temperatures. The highest percentages of conidial germination were obtained at 18 to 24 degrees centigrade. There was little germination of conidia below 10 degrees and no germination at 32 degrees centigrade. High relative humidities increased conidiospore germination when compared with lower germination percentages of spores maintained in dry atmospheres. *In situ* germination of conidia occurred in leaf disk culture.

Floral Modifications in *Oxalis Priceae*

David L. Mulcahy, *Vanderbilt University*

The genus *Oxalis* is largely tristylous. However, within some species and/or subspecies, one or two of the three flower forms may be missing. This paper represents an attempt to correlate changes in flower structure of *Oxalis Priceae* with the fact that the mid length style is absent from some subspecies.

A Monographic Study of *Stylisma* and a Revision of North American *Bonamia*, North of Mexico

Tin Myint, *University of Florida*

Stylisma, a small genus of the southeastern United States, is represented by six species and four subspecific entities. Its members have been commonly treated as belonging to *Breweria* or, recently, to *Bonamia*, a conserved name. The present problem concerning *Stylisma* is whether it is generically distinct from *Bonamia*, a pantropical genus of about 45 species and represented

in this country by two indigenous species. *Stylisma* has been drawn into *Bonamia* because of certain common features, especially the nature of styles which are free or partially fused. However, the present study has disclosed certain additional morphological features by which they may be distinctly separated. The most significant of the newly observed features are found in the cotyledons. In *Bonamia* the cotyledons are oval, oboval or broadly bilobed, frequently with emarginate apices. Those of *Stylisma* are invariably narrowly linear, deeply bifurcated and folded twice against their petioles. This character, supported by striking differences in texture of leaves, sizes of seeds and fruits, number of seeds per capsule, and number of flowers per inflorescence, strongly suggests that *Stylisma* is best treated as a distinct genus.

Energy Storage in Migrating Birds

Eugene P. Odum, Timothy Marples, and Shirley Marshall, *University of Georgia*

Slobodkin and Richman (*Nature* 191: 299, 1961) and Golley (*Ecology* 42: 581, 1961) have reviewed data on Calories/gm. ash-free dry weight in wild populations finding that animal biomass is consistently between 5.4 and 6.1, except where fat storage occurs as adaptation to special needs. The highest caloric values reported by the former authors approached 7 Cal/ash-free gm. in arthropods which go through fasting periods. Trans-Gulf migratory birds apparently store the maximum amount of fat possible in an active animal, but the actual whole body caloric value has not been previously determined. Two methods were used: (1) Entire specimens killed during southward migration at a Tallahassee, Florida TV tower were burned in a bomb calorimeter, and (2) the caloric value of fat and fat-free material were determined separately after extraction of the fat from such birds. Both methods gave similar results. Cal/ash-free dry gm. of trans-Gulf migrant thrushes and warblers at peak fat deposition was 7.4 and 8.1, indicating remarkable energy storage in individuals that must remain extremely active physically. (Research supported by Grants NIH H-4844 and NSF G-9955.)

Continuous Culture of *Protosiphon botryoides* in Ca- and Sr-Media with CO_2-Enriched Atmosphere

Joseph C. O'Kelley and Temd R. Deason, *University of Alabama*

Protosiphon botryoides Klebs was grown in continuous culture in an atmosphere enriched with CO_2 (5% in O_2), both in Ca-containing medium and in medium with a Sr replacement for Ca. A 10-liter culture with Ca gave a daily yield of 4.48 ml. algal cell volume and a 0.601 g. dry wt.; with Sr replacement the daily yield was 3.84 ml. cell volume and 0.452 g. dry wt. The ratio of yield in Ca over yield in Sr was essentially the same as yield ratios previously obtained in slower-growing standing liquid cultures not enriched with CO_2. The continuous culture apparatus was constructed of readily available and inexpensive parts, including the glassware.

A Phytotron for the Southeast

H. J. Oosting and Paul J. Kramer, *Duke University*

A study is in progress to determine the feasibility of constructing a two-unit phytotron for the southeastern states. The study is being made by a committee from Duke University and North Carolina State College with financial support from the National Science Foundation. If the plan materializes the unit at Duke University will concentrate on facilities for ecologieal or environmental physiology and the study of the effects of various environmental factors on specific physiological and biochemical processes. The unit at North Carolina State College will be developed for work in genetics, population dynamics, diseases and insect resistance, and mineral nutrition research.

Investigators who are interested in the use of controlled environment facilities are invited to discuss their needs with the chairman of the phytotron committee, Paul J. Kramer of Duke University.

Phosphatase Changes in Planarians

Paul J. Osborne, *Lynchburg College*
A. T. Miller, Jr., *University of North Carolina*

This represents a further attempt to determine the *in vivo* functions of acid and alkaline phosphatases. It is the first in a series of phylogenetic and ontogenetic studies which is currently under way. Planarians were initially selected because they introduce the organ-system level and can reconstitute any parts lost due to injury or starvation. Flatworms were fed, starved, pharyngectomized and transected. They were fixed at appropriate intervals, sectioned in a cryostat, and subjected to phosphate substrates according to the method of Gomori. Acid phosphatase activity was evident in phagocytic cells after a feeding, waning by the third day, and appeared in neoblasts of structures being either degraded or reconstituted. Alkaline phosphatase appeared under similar circumstances except that it lingered for nine to ten days in gut cells and persisted indefinitely in essential structures which themselves persisted, with no apparent change induced by starvation.

The Spontaneous Recovery of the Cricket *Gryllus assimilis* from Gregarine Infections

Fred K. Parrish, *Agnes Scott College*
Mary M. Andrew, *Agnes Scott College*
Joanna W. Parrish, *Emory University*

Parrish and Parrish, 1962, reported that populations of crickets cultured under certain conditions showed a several hundredfold increase in their gregarine populations. The number of gregarines present, as determined by the number of cysts in the crickets' fecal pellets, rises over a period of about 6 weeks until one finds about 4-10 cysts per fecal pellet. Then within about a week the number of gregarines diminishes until only an occasional cyst can be found. Populations of crickets that have undergone a gregarine population cycle appear to be resistant to immediate re-infection. The mechanisms for these phenomena are being studied.

Identification of Statoliths by X-Ray Diffraction

Jonathan Parsons and Robert R. Cardell, Jr., *Department of Physics, Edsel B. Ford Institute for Medical Research, Detroit 2, Michigan*

There is evidence that the crystalline bodies of vertebrate static organs exhibit variation in structure and composition. By techniques appropriate to x-ray powder diffraction the structure and composition of statoliths from the cat, rat, dog, chicken, pigeon, frog, turtle, salamander, fish, and selected invertebrates have been analyzed. Statoliths from the mammals and birds which were analyzed were composed of calcium carbonate in the crystalline form of calcite. Statoliths from the reptiles and amphibians were composed of calcium carbonate in the crystalline form of aragonite. X-ray powder diffraction patterns are presented as evidence for these conclusions.

Tentaculocysts from *Aurelia* were removed and analyzed by emission spectrography. Preliminary results indicate that there is a higher percentage of silicon in the tentaculocysts than in control samples. Statocysts from the crayfish were removed and analyzed by x-ray powder diffraction. The statoliths are composed of silicon dioxide in the form of quartz.

The Distribution of Lancelets Along the East and West Coasts of Florida

E. Lowe Pierce, *University of Florida*

Collections of lancelets were made in shallow water along the entire coast of Florida. Individuals in bottom samples were counted to determine their relative abundance. In areas of abundance environmental factors were measured in an attempt to define the optimum habitat. The west coast of Florida provides in many places suitable habitats for large populations of the lancelet, *Branchiostoma caribaeum*.

Morphological and Physiological Differences in Southeastern *Heterotheca* Grown under Uniform Conditions

Joseph N. Pinson, Jr., *Vanderbilt University*

Seed samples from five southeastern states were obtained in the fall of 1962. Disk and ray achenes were planted separately. Germination of the pappose, disk achenes occurred within three to six days. Epappose, ray achenes required from six to ten days for germination to occur. Time of flower initiation was found to vary markedly among the different population samples and to some extent within the samples. Based upon leaf shape, texture, and indument, three distinct morphological types were evident among the samples tested. This study furnishes information which suggests the need for several adjustments in the recent revision of *Heterotheca* by Wagenknecht, 1960, in respect to the taxonomic treatment of *Heterotheca subaxillaris* and *Heterotheca latifolia*.

Radioactive Fallout and Vegetation in the Georgia Piedmont

Gayther L. Plummer, *University of Georgia*

Various plant species in different habitats have been assayed by gamma spectrometry to determine the relative amounts of certain fallout radionuclides that are concurrent with each species. Fission products contaminate vegetation by direct deposition from airborne particles and by the physiological processes of bioaccumulation.

The net gamma spectrum differs for each species and for each micro-habitat within a mutual area. The abundance of one radionuclide may vary as much as 30 times from one plant to another. A radionuclide in conjunction with a plant species varies in abundance with the season. Fallout fission products are transported by runoff rain water from one micro-habitat to another, and bioaccumulation is indicative of the input or output in the respective habitats.

Gentiana, Section Pneumonanthae, in the Southeast

James S. Pringle, *University of Tennessee*

Eleven species of *Gentiana*, section Pneumonanthae, are native to the Southeast. *G. alba*, *G. andrewsii*, and *G. puberula* are prairie species, confined to a few relict colonies. *G. clausa* and *G. linearis* are northern species with their southern limits in the Blue Ridge. *G. villosa* and *G. saponaria* are of general distribution. *G. cherokeensis* is considered synonymous with *G. saponaria*. *G. decora* is endemic to the southern highlands. Occasional cases of introgression are encountered in some species. An undescribed variety of *G. clausa* in the Blue Ridge, now essentially breeding true, may thus have originated.

A Graduate Program in Plant Taxonomy

Albert E. Radford, *University of North Carolina*

A graduate program in plant taxonomy should include the floristic, experimental, and phylogenetic aspects with work in the field, herbarium, laboratory, garden and library as integral parts of the study. The problem approach should be basic to each major aspect so that the taxonomy student will have research experience in the major divisions of the field regardless of the dissertation subject.

Pigment Cell Maturation as Triggered by the Tissue Milieu *

Willie M. Reams, Jr., *Louisiana State University*

Pigment cells introduced into the relatively neutral environment of the coelomic lining of White Leghorn chick embryos can follow their intrinsic mode of maturation free of extrinsic influences until late in development. A comparative study has been made wherein melanoblast-laden embryonic tissues of the mouse and of Silver Campine fowl were grafted intracoelomically into three-day White Leghorn embryo hosts. Following recovery of the graft sites after day 13 of incubation, an analysis of the pigment cell forms was made. It was noted that the morphogenesis of a pigment cell in one tissue as compared to that of another tissue was not directly related to the arrival time of the migratory melanoblasts into the respective regions. Further, the onset of morphogenesis of a pigment cell is triggered by the basic capacity of the tissue community at a specific time in ontogeny. Pigment eells will continue to proliferate until their maturation of shape is initiated by the tissue milieu. Once triggered, although removed from the initiating site, the morphogenesis of a pigment cell proceeds to termination.

* Supported by N. S. F. grant G-14153-GB271.

Vegetative Characteristics of *Utricularia foliosa* (Lentibulariaceae)

Grady W. Reinert and R. K. Godfrey, *Florida State University*

Vegetative characteristics of Utricularias (bladderworts) are highly modified. Species occurring in eastern North America are distinguished by a few salient characters with emphasis on reproductive structures. Descriptions of vegetative characters are incomplete or almost lacking. Preliminary studies reveal constellations of vegetative characteristics for the several species sufficiently diagnostic as to be of much taxonomic value. This paper summarizes results of observations on detailed gross vegetative structures of *Utricularia foliosa* L., a large, handsome, submersed, non-attached aquatic species occurring from Florida to Louisiana and in the West Indies. It is particularly abundant in the Florida Everglades. The body of *U. foliosa* is comprised of five principal parts, the principal axes, two very different lateral, determinate, "foliar" branch systems (one is much more bladder-bearing than the other), an "air shoot," and an inflorescence branch. Conspicuous glands occur on surfaces of various of the parts and these secrete an abundance of colorless mucilage which envelops the submersed organs. A feature unique to *U. foliosa* is a conspicuously flattened axis.

Growth and Development of *Gloeodendron*, Korsh. (1916)

Russell G. Rhodes and Walter Herndon,
University of Tennessee

Studies of cultures of a freshwater chlorophycean alga from Nonnamessett Island, Mass., indicate that it is *Gloedendron*, previously unknown in this hemisphere. The mature thallus is a reticulum of palmelloid threads which arise from individual cells by longitudinal, transverse, and tetrasporine divisions. Vegetative cells are chlamydomonad, but lack flagella and frequently lack an eyespot. External to the thin cellulose wall is a broad pectinaceous stratified sheath; the stratifications are persistent and cell lineages within the reticulate segments may be traced. Reproduction is by fragmentation, zoospores and akinetes. Zoospores are surrounded by flexible eellulose walls and are spherical at quieseence. Initial studies indicate that, at 21°C. and 12-hour light/dark cycle, length of the motile period is a function of light intenisty; at an intensity of 10 ft. candles the zoospores do not produce a reticulate thallus but reproduce themselves; at 60 ft. candles intensity, the reticulate thallus is formed.

Some Characteristic Families of Flowering Plants of Southern Africa

Herbert P. Riley, *University of Kentucky*

Some of the interesting and typical families of flowering plants found south of the Zambezi River are described and illustrated. Among the more characteristic are the Caesalpiniaceae, Mimosaceae, Papilionaceae, Proteaceae, Bombacaceae, Euphorbiaceae, Asclepiadaceae, Ficoidaceae (Aizoaceae), Compositae, Geraniaceae, Strelitziaceae, Liliaceae (especially the Tribe Aloineae), Amaryllidaceae, Iridaceae, Restionaceae, and Gramineae. The various vegetation regions are pointed out and located geographically and the characteristic families of each are noted.

Velocity Profiles of Amoeboid Movement

Robert A. Rinaldi, *University of Tennessee*

Previously, a technique, "pictograph technique," was developed by this author to plot movements of granules in *Amoebe proteus*. One does not follow individual granules through consecutive frames of a motion picture film, but one takes a single, time-exposure photograph of an amoeba illuminated by darkfield microscopy. Those granules that are moving rapidly record as long streaks, some will appear as shorter streaks, and granules that are not moving will register as dots. One can obtain accurate velocity profiles of protoplasmic movement. These amoeba pictographs have revealed: (1) Regions of the gel are moving at different rates; (2) There exists greater granular movement at the anterior and posterior regions of the amoeba; (3) There exists a forward flow of protoplasmic granules through the interstices of the gel; (4) There is a uniform flow in the central region from tip to tail of the advancing amoeba.

The Respiration of Small Whole Fishes

Martin Roeder and Rachel H. Roeder,
The Woman's College of the University of North Carolina

The respiration of several types of small fishes has been measured in order to establish a base-line for comparison between normal and cancerous fishes. Data will be presented on measurements made on normal fishes before and after treatment with various minerals and biochemical additives. Comparison will be made between these data and those found in the literature, in view of the wide discrepancies between the present report and the literature. All data will be reported in terms of oxygen consumption per hour per milligram Kjeldahl nitrogen.

Augmentation of Interfollicular Melanocytes Induced by Trauma in Mouse Skin *

David T. Rovee and Willie M. Reams, Jr.,
Louisiana State University

Although melanocytes are limited to the hair follicles of adult belly skin of the mouse, they are found throughout the integument of the newborn. Trauma applied to the belly skin of newborn mice results in the maintenance of the melanocytes within the skin, even after the formation and growth of hair. The area immediately surrounding the site of trauma shows an increase in the number of melanocytes, undoubtedly due to the disruption of the developing follicles and the consequent release of their pigment cells to the skin. The significance of the maintenance and augmentation of melanocytes from the newborn into the adult as related to the U-V induction of melanocytes in adult mouse skin will be discussed.

* Supported by N. S. F. grant G-14153-GB271.

Cytological Studies of the Genus *Phalaenopsis* (Orchidaceae)

Yoneo Sagawa, *University of Florida*

Although the significance of chromosome numbers in hybridization and development of superior forms in such groups as *Cattleya, Paphiopedilum, Cymbidium, Dendrobium,* and *Vanda* have been well documented, only limited information is available on the genus *Phalaenopsis.*

Cytological studies of the genus *Phalaenopsis* indicate that most of the species are diploid with a chromosome number of 38 ($x = 19$). Hybrids derived by use of pink-flowered species only are generally diploid. The Euphalaenopsis section includes many polyploid forms. The exceptional modern white-flowered hybrids are mostly tetraploids or pentaploids. The results of use of pentaploids in further development of the modern white-flowered forms are still to be seen.

The information on chromosome numbers by other investigators is summarized together with data derived from this current study in order to establish the nature and degree of polyploidy extant in the genus.

Amino Acid Analyses in Male-Sterile Cottons

Patricia Sarvella and Borislav Stojanovic,
Mississippi State University

Descending two-way paper chromatography was used to determine differences in amino acids between normal and male-sterile cottons. One genetic male sterile, two partial genetic male steriles, and two cytoplasmic sterile stocks were used. Flowers, buds, and leaves were studied. Buds were collected five (M + 5) and ten (M + 10) days after meiosis. Most amino acids studied were present in all the papers. Leaves from stocks with complete sterility appeared not to have tyrosine and cysteine (or cystine) in the acid hydrolysis fraction. Valine, two unknowns, and a high concentration of gamma amino butyric acid were usually present in alcohol-soluble fraction. Amino acid differences between normal and sterile flowers and buds in various stages of devclopment were more quantitative instead of qualitative. Several amino acids were present in the mature flowers, sometimes in the M + 10 buds, and absent in the M + 5 buds.

Further Observations on Vascular Epiphytes in the Smoky Mountains

A. J. Sharp, *University of Tennessee*

Dryopteris marginalis (L.) Gray and *Heuchera villosa* Michx. have been found growing on a trunk of a large basswood, *Tilia heterophylla* Vent.

A Comparison of the Southeastern and Western Species of *Schoenolirion* (Liliaceae)

Harry L. Sherman, *Vanderbilt University*

Five taxonomic species comprise the genus *Schoenolirion* Durand, three native to the southeastern United States and two restricted to the mountainous region of northern California and southern Oregon.

Since the first of the western species was described by Durand in 1855, controversy has developed concerning the question of generic limits. Durand (1855), Torrey (1859), and Gray (1876) treated the two species groups as a single genus, although certain differences in floral characters were pointed out. In synoptical treatments by Watson (1879) and Gates (1918), the two groups were recognized as different genera, mainly on the basis of floral differences already known.

A more general comparison of the southeastern and western species, based upon results of recent cytological, morphological, and anatomical studies of both groups, suggests that the present taxonomic treatment of *Schoenolirion* may not be consistent with that afforded other genera within the tribe Chlorogalinae.

Combination Chemotherapy of Experimental Mouse Leukemia

J. Richard Thompson, Jack H. Moore, and Frank M. Schabel, Jr., *Southern Research Institute, Birmingham 5, Alabama*

An effort is being made to find combinations of anticancer drugs which are potentiating or synergistic in action against experimental neoplasms. In order to investigate combinations of drugs, we have considered the combination as a new drug and before concluding that the combination is better than either drug alone, we have demanded greater therapeutic activity by the combination of drugs than that which can be demonstrated by either drug alone, irrespective of dose, route or schedule.

Theoretical considerations, based on studies (1) of biochemical mechanism of action of active drugs and (2) on experimental neoplasms with acquired resistance to these agents, make it appear logical to conclude that a combination of agents which inhibit essential metabolic activity (separate or sequential) might be more effective than single-drug therapy. A further stimulus to the consideration of combination chemotherapy results from the fact that intensive empirical screening has turned up few new agents and these are not outstandingly active; hence the interest in improving known active agents. Synergism is often inferred where no therapeutic potentiation has been produced; this protocol will simplify execution and interpretation of combination chemotherapy trials.

A Chromatographic Comparison of Luminescing and Non-Luminescing Cultures of *Panus stypticus*

Joanne C. Tontz
Woman's College of the University of North Carolina

Surface grown cultures of the North American strain of *Panus stypticus* have the ability to luminesce. The same strain grown in a submerged culture lacks luminescence. Thin-layer chromatography was utilized to determine chemical differences between these two cultures. While the specific components of fungal luminescent systems remain enigmatic, it is hoped that this study will aid in understanding the origins of luminescing systems.

Fluorescing Compounds in Lichens *

Alma Toevs Walker, *University of Georgia*

Cladonia subtenuis and *Usnea strigosa* are fruticose lichens under study for fluorescing compounds. The dried lichens are homogenized in acetone or aqueous methanol and then successively extracted with petroleum ether, ethyl ether, and ethyl acetate at neutral and acid pH from water suspensions. The respective extracts undergo further separation by ascending paper chromatography using petroleum ether-methanol-water, n-propanol-ammonia-water, and n-butanol-pyridine-water solvents. Components are detected by distinctive fluorescence and location on the chromatogram under ultraviolet light. A magnesium acetate-methanol spray followed by heating intensifies some fluorescence. Aqueous ferric chloride–potassium ferricyanide identify phenolic compounds. A crystalline compound precipitating from petroleum ether and ethyl ether fractions is being purified to determine its composition. Color slides will illustrate the fungus-alga association, crystal formations, and chromatographic separations.

* This work is supported in part by a grant from the Elizabeth Thompson Science Fund of the American Academy of Arts and Sciences.

An Atypical Conjugation in *Tetrahymena pyriformis* *

Carolyn Wells, *Longwood College*

Members of the breeding system of the ciliate, *Tetrahymena pyriformis,* are usually micronucleate strains, since amicronucleate cells will not ordinarily unite with cells of other strains to form conjugating pairs. There are two exceptions to the observation that mating type strains are always micronucleate. One strain, 1/I am. is a radiation-produced amicronucleate strain of variety 1, mating type I; the other strain, EU 6525 (variety 6, mating type I) is also an amicronucleate product of irradiation. Cells of both of these strains will conjugate with cells of appropriate complementary mating types. Conjugation between micronucleate and amicronucleate cells could produce haploid progeny. If so, the system would be a useful method for the detection of recessive mutations in one generation. The reorganization of the micronucleus during conjugation between 1/I am. × 1/II (micronucleate) has been investigated cytologically. Nuclear divisions proceed normally through second prezygotic division; succeeding nuclear events are usually abnormal. The pattern of this atypical reorganization will be discussed.

* Research supported by USAEC Contract No. AT-(40-1)-2793.

Effects of *Helminthosporium victoriae* and Victorin upon Permeability

Harry Wheeler and Homer S. Black, *Louisiana State University*

Victorin, a potent toxin produced by *Helminthosporium victoriae,* eauses marked changes in respiration and cellular permeability in oat tissues susceptible to Victoria blight. This paper is concerned with the nature of the permeability changes and the possible relationship to changes in respiration. Victorin-treated and naturally

infected susceptible tissues lost electrolytes more rapidly than control tissues when bathed in distilled water. The rate of electrolyte loss from treated tissue had a low temperature coefficient typical of a physical process and was not dependent upon oxygen tension. Furthermore, electrolyte loss was induced with concentrations of the toxin 50-fold less than that required to produce significant respiratory increases and were detected within five minutes whereas respiratory changes were not clearly evident until after 30 minutes. These results indicate that if a causal relationship between these two phenomena exists, changes in permeability precede and are responsible for changes in respiratory activity.

Effect of a Current on Respiration and Mineral Uptake in Species of *Spirogyra* and *Oedogonium*

L. A. Whitford and G. J. Schumacher

All species tested respond to a current with increased respiration and mineral uptake, but lotic (current inhabiting species show a significantly greater response than do lenitic species. Response seems to be directly proportional to speed of current between 6 and 40 cm./sec. The experimental set-up is briefly described.

Primary Production on a Moisture Gradient

James E. Williams

During the summer of 1962, on the upper Coastal Plain of South Carolina, primary productivity was studied on an ectone between an upland old-field and a Carolina Bay. The ectone consisted of two terminal plant communities mixed. Net and gross production of the dominant species were determined in the field with an infrared gas analyzer. Experiments show that increases in standing crop can be predicted for points on the gradient from clip-quadrat and gas analysis data.

Effects of Light and Darkness on the Biosynthesis of Carotenoid Pigments in Wheat Seedlings

Frederick T. Wolf, *Vanderbilt University*

Carotenoid biosynthesis in higher plants can occur in total darkness, but is increased by light. The carotenoids of ungerminated wheat grains, and of dark grown and light grown wheat seedlings 7-10 days of age have been examined by a combination of spectrophotometric and paper chromatographic methods. Only lutein, lutein epoxide and carotenes are present in the grain; the total quantity of carotenoids averaged 4.2 μgm./gm. fresh weight. Dark grown seedlings contained 91.7 μgm./gm. of carotenoids, including lutein, an unidentified component, neoxanthin, lutein epoxide, neozeaxanthin, violaxanthin, and carotenes, with lutein as the principal component. Light grown seedlings of equal age contained 180.5 μgm./gm. of carotenoids. No change occurred in the levels of violaxanthin and the unidentified xanthophyll, while lutein and lutein epoxide doubled and the carotenes increased 9-fold on illumination. The significance of these findings in relation to the role of light (photochemical) and dark (enzymatic) reactions in carotenoid biosynthesis is discussed.

The Dispersal of the Planktonic Diatom *Rhizosolenia alata* Inferred from Cell-Diameter Frequency Distributions

Robert A. Woodmansee, *University of Southern Mississippi and Gulf Coast Research Laboratory*

The dispersal of *Rhizosolenia alata* is inferred by comparing the cell-diameter frequency distributions of populations sampled at various times in Biloxi Bay and Mississippi Sound during post-bloom conditions. The chi-square test is used as an objective means of determining whether or not two given cell-diameter frequency distributions represent samples taken from the same or from different populations. This approach indicates (1) that the diatoms are being transported toward the sea in the surface layer and toward the land in the bottom layer and (2) that the narrower cells are sinking more rapidly. Therefore, the wider cells tend to remain at the surface and to be transported seaward and the narrower cells tend to sink and be transported landward.

Taxonomic Status of *Unicola* (Gramineae)

Harris O. Yates, *Vanderbilt University*

Results of a comparative study of the North American species of the Linnean genus *Uniola* suggest that the group is composed of discordant taxonomic elements. Data obtained from analyses of epidermal pattern, chromosome number and size, embryo structure, form of seedling leaf and vascular anatomy are presented in support of this hypothesis.

(*Continued from page 16*—Mountain Lake)

Lichenology, Dr. William L. Culberson, Duke University

Invertebrate Zoology, Dr. Robert P. Higgins, Wake Forest College

Helminthology, Dr. Martin J. Ulmer, Iowa State University

A limited number of National Science Foundation scholarships are available for research and study: (1) Post-doctorate for research, stipend $900; (2) Pre-doctorate for supervised research, stipend $400; and (3) Post-graduate for training in field biology, stipend $300. Preference is given for studies coneerned with the biota of the region. Application blanks for these awards may be secured from Dr. James L. Riopel, Department of Biology, University of Virginia, and must be submitted before April 12, 1963.

Now editorial instructions are not spelled out for the sheer perversity of telling people what to do, nor are they intended to demand conformity for the sake of conformity. They are there for the simple reason that without them chaos would exist in the editorial field just as it would on the highway were there no traffic regulations.—C.W.H., Jr.

Commercial Exhibits at the Gainesville Meeting

The Social Room of the Florida Union will be the site of the commercial exhibits. They will be open all day on Thursday and Friday and until noon on Saturday. All members are urged to visit the exhibits. Exhibitors will also be available during the smoker, on Thursday evening.

American Optical Company will have on demonstration a series of both compound and stereomicroscopes. These will range from student to advanced research models. Mr. James Lyon, Florida representative, will be present.

Bausch and Lomb Optical Company will show a range of microscopes which can be used in the elementary class as well as research models. Mr. Russell M. Smith, southeastern representative, will be present.

The Bendix Corporation offers three Bendix/Akashi Electron Microscopes which vary in both performance (10 Å to 20 Å resolution) and price ($14,900 to $26,000). However, they have one thing in common. Unique column design permits uncomplicated operation and greater reliability. A Bendix representative will be present to answer questions. Micrographs and literature will be displayed.

Cardinal Products, Inc. will have an array of scientific supplies and equipment. Items of interest will be microscopes, micro-projectors, and photomicrographic equipment.

W. H. Curtin & Company was founded in 1922 in Houston, Texas by Mr. W. H. Curtin. The company is one of the largest in the South and one of the major suppliers of scientific equipment and supplies. Thirteen locations to serve the scientific needs are located in Houston, Jacksonville, Miami, Atlanta, New Orleans, Birmingham, Memphis, Dallas, Corpus Christi, San Antonio, Tulsa, Albuquerque, and Mexico City. Resident sales personnel are strategically based in other locations to provide additional personal assistance to customers throughout the area served. One of these men, David W. Fouts, resides in Gainesville. "Curtin" carries comprehensive stocks of equipment and supplies in their seven warehouses and some representative supplies in most of their Sales Offices. "Curtin" publishes their own catalogs (general and specialty) and supplements these catalogs quarterly with their "Labnotes."

HALCO Scientific Instrument Company in Atlanta, Georgia, began selling and servicing optical equipment 13 years ago. Representatives from HALCO now make frequent calls on customers in all the Southeastern States, as far North as Washington, D. C., and as far West as Texas. This company is franchised dealer for Carl Zeiss, E. Leitz, Reichert, Wild-Heerbrugg, and Graf-Apsco microscopes; Photovolt and Labline equipment; the Sartorius Balances; and Brinkmann Instruments. Carl Heard, Assistant Manager at HALCO, will be at the exhibit booth to demonstrate: Bright-field Microscopy, Phase Microscopy, Photomicrography, and Micro-projection.

Holt, Rinehart and Winston, Inc. will feature the Modern Biology Series . . . a fresh and imaginative look at life science in ten beautifully written paperbacks: Loewy, *Cell Structure and Function;* Levine, *Genetics;* Ebert, *Development;* Savage, *Evolution;* Odum, *Ecology;* Sistrom, *Microbial Life;* Griffin, *Animal Structure;* Burnett, *Animal Adaptation;* Ray, *The Living Plant;* Wagner, *Plant Diversification.* Other titles to be featured: Fuller-Carothers: *The Plant World,* 4th ed.; Best-Taylor: *The Human Body,* 4th ed.; Jellinck: Boolootian-Heyneman: *An Illustrated Laboratory Text in Zoology.* The Biology Studies Series will also be featured: Carlquist: *Comparative Plant Anatomy;* Crafts: *Translocation of Solutes in Plants;* Slobodkin: *Growth and Regulation of Population;* Sutton: *Genes, Enzymes and Inherited Diseases.*

McGraw-Hill Book Company, Inc. will have on exhibit their complete line of books for instruction in Biology. Featured will be the second edition of Weisz's *The Science of Biology.* Mr. W. Kenneth Mathew, manager of the southern district, will be at the display.

Scientific Products will have on demonstration many of the new instruments and laboratory equipment which are essential items in any well-equipped laboratory. There will be a representative on hand to demonstrate.

D. Van Nostrand Company, Inc. will have on display their latest textbooks in the fields of Biology, Botany, Bacteriology and Zoology. There will be many books which ought to be considered by those looking for textbooks for fall classes.

Ward's Natural Science Establishment, Inc. will feature the latest in teaching aids in Biology. These will include plastic mounts, charts, and models which are essential in any modern biology laboratory. Mr. Jerome Schott, Florida representative, will be present at the booth.

Will Scientific, Inc. (Ga.) will feature the Bronwill Biosonik Cell Fracturing Apparatus as well as the latest Bioloid Biological Specialties. Other equipment will also be demonstrated by a representative.

News of Biology in the Southeast

About People

Robert E. L. Black of the School of Marine Science of the Virginia Institute of Marine Science, Gloucester Point, Virginia has received a National Science Foundation research grant in the amount of $28,200 for support of work entitled "Enzymes Systems in Marine Embryos." This grant will provide summer salaries and equipment for a continuation of the studies on the bio-chemistry of developing embryos. Dr. Black will use a part of this research money to undertake research at the Bermuda Biological Laboratory during part of the coming summer.

Morris L. Brehmer and **Dexter S. Haven** of the Virginia Institute of Marine Science, Gloucester Point, Virginia have received a third grant of $20,000 from the Atomic Energy Commission to continue studies on the accumulation of radionuclides and the deposition of these fission products by filter feeding organisms. In addition to the work on the AEC grant Haven will be testing molluskicides on Eastern Shore this summer.

Thomas L. Johnson of the University of Virginia has been obtaining specimens of male decapod crustaceans from the Crustaceaology Department of the Virginia Institute of Marine Science for the past two years. He is studying the histology of the male reproductive system of these decapods in his doctoral research.

Clayton R. Kyte from Antioch College is an exchange student working as an aide at the Institute for this term. He replaced **Thomas K. Newbury** from Antioch who worked the first term and has now returned to Antioch to class room studies during the winter term.

Bernard C. Patten, Head, Planktology Department of the Virginia Institute of Marine Science has recently received a grant from ONR for studying energetics and organization in plankton communities. He will employ two assistants, one at the Ph.D. and the other at the M.A. level to assist with this investigation.

James S. Sterling, Virginia Institute of Marine Science, left March 1, 1963, for the Indian Ocean where he will collect fish parasites during the next three months. He will be a member of the first cruise of the International Indian Ocean Expedition, which is being sponsored and coordinated by UNESCO. All expenses, including scientists' salaries, are being paid by the National Science Foundation. This is a project directed by William J. Hargis, Jr., Director of the Virginia Institute of Marine Science, furthering his world-wide studies of host-specificity of fish parasites.

Jesse C. Thompson, Jr., Hollins College, will leave April 15, 1963 to participate in the International Indian Ocean Expedition. He will spend ten weeks at Mandapam Camp in Southern India investigating the ciliated protozoa of the Indian Ocean. Dr. Thompson has accepted a professorship of Biology at Hampden-Sydney College and will occupy this position in September 1963.

Lyman Randlett Emmons, Assistant Professor of Biology, was awarded a John M. Glenn Grant-in-aid by Washington & Lee University to continue work in the field of human cytogenetics.

Howard J. Teas, Head of the Agricultural Bio-Sciences Division of the University of Puerto Rico Nuclear Center, is on leave to serve as Program Director for Metabolic Biology in the Division of Biological and Medical Sciences of the National Science Foundation.

Tulane University has appointed **Dr. Fred R. Cagle** as vice-president of the university. Dr. Cagle, who previously served as chairman of the department of zoology and coordinator of research, will be responsible for coordinating the expanding research activities of Tulane. Dr. Cagle joined the Tulane faculty in 1946. He received his bachelor's degree from Southern Illinois University, and his masters and doctor of philosophy degrees from the University of Michigan. As vice-president, Dr. Cagle will guide the expanding research activities of Tulane, and will coordinate such recently established projects as the International Center for Medical Research and Training in Colombia, the Biomedical Computer Center, the Center for Latin American Studies, the Inter-American Institute for Medical Research, and the Delta Regional Primate Researeh Center.

John J. Gallagher, Research Associate at Northeast Louisiana State College, edited the Rotifer section of the just published Needham & Needham "A Guide to the Study of Fresh-Water Biology," 5th Edition (Holden-Day, Inc., San Francisco, Calif., $2.25). This extremely well illustrated manual covers the field taxonomically from plankton algae to fishes and includes sections on methods.

Leta Jane Holman and **Billy S. Batts** are new additions to the biology staff at Longwood College. Dr. Holman holds the B.S. degree from Texas Technological College, M.S. from the University of Michigan and the Ph.D. from the University of Maryland. Her research interest is in the field of acarology. Mr. Batts did his undergraduate work at the University of North Carolina and has the M.S. degree from the University of Washington. Mr. Batt's research is in the field of taxonomy, ecology, and physiology of the cold-blood vertebrates.

Robert E. Black, Associate Professor of Biology at the College of William and Mary, has been awarded a renewal grant of $28,100 from the National Science Foundation to continue for two years his studies of the distribution and activity of enzymes in subcellular fractions obtained from eggs and early developmental stages of marine invertebrates. Dr. Black will spend the summer of 1963 at the Bermuda Biological Laboratory.

Lillian C. Thomsen, Professor of Biology at Mary Baldwin College, is retiring in June, 1963. After June her address will be 414 Boyce Ave., Farmington, Missouri.

Institutions and Organizations

A facility for use in the study of population physiology has been completed at the **College of William and Mary** and will be put into operation in April, 1963. The building will provide facilities for the work of **Dr. Bruce Welch,** Assistant Professor of Biology, one additional investigator, and graduate students.

The National Science Foundation has just published a guide to the scientific and technical literature of Albania, Bulgaria, Czechoslovakia, Hungary, Poland, Rumania, and Yugoslavia. It is intended for use by scientists, librarians, and students, and contains information of the announcement, availability, procurement, and translation of Eastern European publications in the physical, biological, and certain of the social sciences. Entitled "A Guide to the Scientific and Technical Literature of Eastern Europe," it is the first U. S. attempt to provide such a guide. Major chapter titles include, "How to Obtain East European Publications," and "East European Scientific Information Available in English." A 50-page appendix contains an annotated list, by scientific discipline, of 440 East European scientific and technical periodicals. The guide was compiled, with NSF support, by Battele Memorial Institute, and is available without cost from the Printing and Publications Office of the National Science Foundation, 1951 Constitution Avenue, Washington 25, D. C.

Tulane University has established a new program of graduate study leading to the doctor of philosophy degree in biostatistics. The doctoral program in biostatistics is designed to train students in the application of mathematics and statistics to the fields of biology, medicine, and public health. Tulane has offered the master's degree in biostatistics since 1956, and is one of the few universities in the country and the only one in the Deep South offering graduate level degrees in this field. The new graduate program will be headed by **Dr. Robert F. Lewis,** professor of biostatistics in the Tulane school of medicine.

The National Science Foundation announces the next series of closing dates for receipt of proposals for basic research in *Life Sciences*—May 15, 1963, *Social Sciences* May 1, 1963. Proposals received prior to these dates will be reviewed and notification of the Foundation's action will be made within four months. Proposals received after these dates will be reviewed following the fall closing dates (Life Sciences, September 15; Social Sciences, October 1; Graduate-level Research Facilities, August 1). Inquiries or proposals requesting support should be addressed to the National Science Foundation, Washington 25, D. C.

The Biology Department of **Old Dominion College,** Norfolk, Virginia, has received a matching National Science Foundation Equipment Grant. This $12,400 grant is for advanced equipment such as several constant temperature rooms, a Warburg respirometer, a spectrophotometer, microbalances, etc.

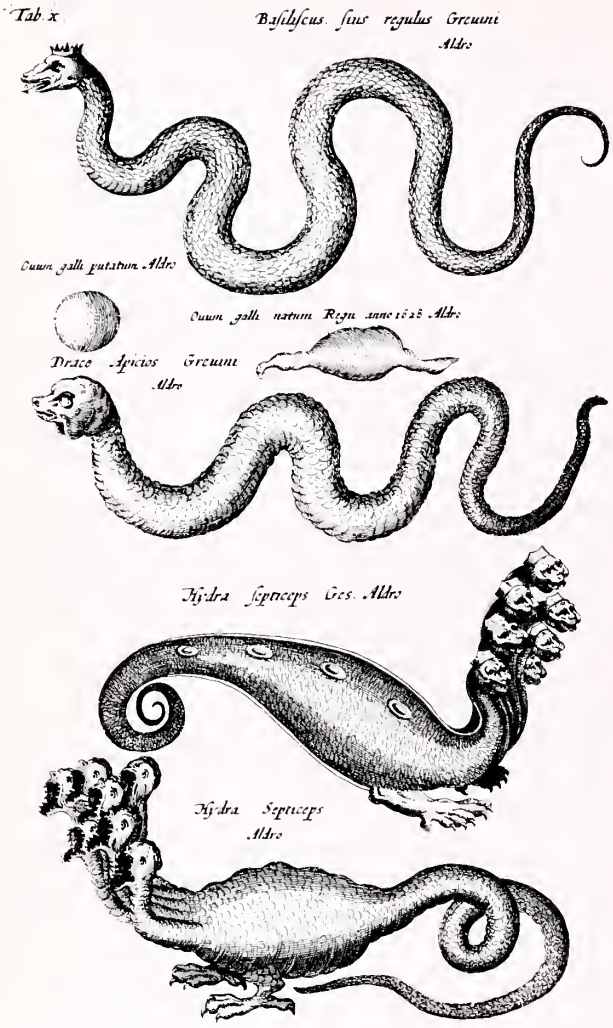
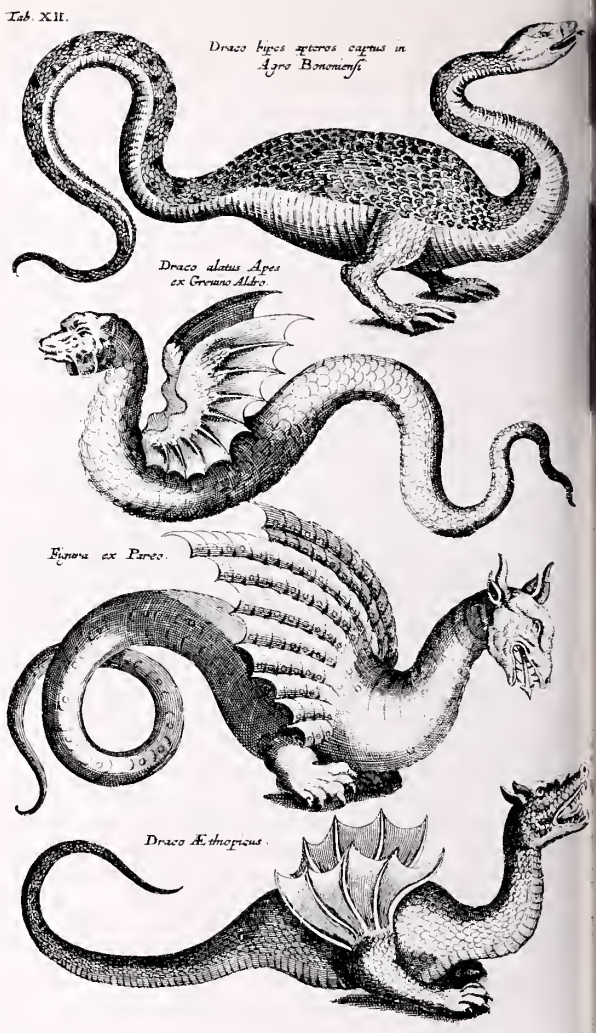
NOTES





The cover picture is from Joannes Jonstonus' *Historiae Naturalis de Quadrupedis,* published in Amsterdam in 1657. This magnificent griffin is one of many beasts illustrated in the volume—some reasonably true to life, some even more fanciful than this.

The illustrations above are from the same volume, in the *Historiae Naturalis de Serpentibus.* The drawing of the *Hydra Septiceps* Ges. Aldro. is apparently taken from the *Historia de Serpentibus* of Conradi Gesneri—published in 1587.

These illustrations are from the Pre-Linnean Book Collection of the Academy of Natural Sciences of Philadelphia, and were made available through the courtesy of Miss Margaret Greenwald, Librarian, Academy of Natural Sciences.—C. W. H., Jr.

ASB BULLETIN

Volume 10, Number 3—July 1963

The ASB Bulletin is the official quarterly publication of the Association of Southeastern Biologists, Inc., and is published at Philadelphia, Penna., in January, April, July and October. Letters, news items, other contributions, and all communications about editorial matters should be addressed to C. W. Hart, Jr., Editor, The Academy of Natural Sciences of Philadelphia, 19th and The Parkway, Philadelphia, Penna. Changes of address should be sent promptly to the Secretary of the ASB, Dr. Harry J. Bennett, Department of Zoology, Louisiana State University, Baton Rouge, La. Subscription orders from libraries and other institutions should be sent to the Business Manager, Dr. Leland Shanor, Department of Biological Sciences, Florida State University, Tallahassee, Florida. Subscription rate for nonmembers of the ASB: $2.00 per year. Printing and typography by the Wickersham Printing Co., Lancaster, Penna.

Second-class postage paid at Philadelphia, Pennsylvania.

ASSOCIATION AFFAIRS

BUSINESS MEETING
Room 208, Union Building
University of Florida
April 19, 1963

President Flory called the meeting to order at 11:45 A.M. and after his introductory remarks asked the Secretary, the Treasurer and the Auditing Committee for their reports.

Secretary's Report. The Secretary stated that the total active membership was 985 including 77 individuals who had joined the Association since the previous business meeting, and that 33 states and 7 foreign countries were represented by the membership. He then presented the names of Emeritus Members and asked the membership to assist him in compiling a more accurate roll of such members. He also reported that only one design had been submitted for the Association Seal and that the Executive Committee had recommended that the contest be continued for another year. A motion to accept the report was made, seconded and passed.

Treasurer's Report. The Treasurer presented an Interim Report and expressed his appreciation for the cooperation given him by the membership over the past year. A motion to accept the report was made, seconded and passed.

Auditor's Report. The Chairman of the Auditing Committee stated that the books of the Association had been audited and found to be in order. A motion to aeeept the report was made, seconded and passed.

President Flory then presented Dr. Frank S. Jamison who discussed the financial situation of AIBS and appealed to the ASB to give its support to AIBS. He reported that 4,000 AIBS members had contributed $114,000 to alleviate the situation and that the amount owed by AIBS to the National Science Foundation was $190,000 as revealed by the most recent audit. He assumed that subsequent audits would show that still more was due NSF. He concluded his remarks by stating that the blame for the financial condition in which AIBS finds itself rests on all the officers of AIBS and all affiliated organizations.

THE NATURALIST AS AN ART CRITIC *was presented as a Distinguished Scientists Lecture at the Annual Meeting of the Academy of Natural Sciences of Philadelphia on 29 April 1963 by Dr. G. Evelyn Hutchinson, Sterling Professor of Zoology at Yale University. The address is being printed simultaneously here and in the Proceedings of the Academy of Natural Sciences.*

The Naturalist As An Art Critic

BY G. EVELYN HUTCHINSON, Department of Biology, Yale University

DURING THE EARLY period of the formation of those large collections which ultimately became the bases of the public museums of Europe, such virtuosi and cognoscenti as collected objects of natural origin also usually collected human artifacts, both for their intrinsic value, beauty, and on account of their historic associations.

In the earliest inventory[1] of a great princely collection in Western Europe, that of the Duc de Berry, brother of Charles V of France, who was born in 1340 and died in 1416, there were a few odd natural history specimens mentioned, ostrich eggs, probably an elephant molar, tusks of wild boars, a bird's bone remarkable for its lightness, a porcupine quill and various pebbles which seem odd in a collection made up of an unbelievable number of precious stones, pearls, jewels, vessels and images of gold and silver and relics of the saints, almost all of which have disappeared, and of manuscripts, some of which are still among the glories of mediaeval French art.

Later collections, in the 16th century, were richer in natural history, and in fact almost exclusively biological collections were first made at that time. However, a number of the most famous were very mixed even at a much later date. The most striking examples are those of Elias Ashmole, actually largely assembled by his friend John Tradescant whom we commemorate in *Tradescantia,* which enriched the University of Oxford, and of Sir Hans Sloan, in part based on the cabinets of other collectors, which formed the basis of the British Museum in both its branches. Perhaps even in the 17th century such collections may have raised philosophical or moral problems. Jan van Kessel's painting (see cover) in Florence now called "Lo studio di un naturalista," though certainly amusing, must also have allegorical roots that I am not expert enough to excavate.[2] The naturalist whose study is depicted by van Kessel seems to have been interested in birds, caterpillars, strange and mythological plants such as the mandragora or mandrake, surveying instruments, telescopes, and coins. I would call your attention to the amount of jewellery that he amassed; this seems to have been one of the classes of object most favored by early collectors, partly no doubt as an investment as well as for its beauty.

Since we are celebrating the close of the hundred and fiftieth anniversary year of the oldest natural history museum in the United States, in a city that is also famous for its art collection, it has seemed appropriate to consider some aspects of the dichotomy between natural history and art museums, and to ask why some objects are put into one and some into the other. If at first the answers seem obvious, there will, I think, prove to be enough difficulties to lead us into interesting if obscure regions of the human mind.

Initially the objects in a collection were assembled to be looked at. They are to arouse admiration and pleasure in their beauty, wonder at their strangeness or history, envy or awe at their costliness or rarity. The simple reactions of the unlearned to the strange or marvellous give some idea of the primary reactions to objects in a collection, reactions which most of us have forgotten. A peasant woman enquires if the *pala d'oro,* the great gold and enamelled Byzantine altar frontal in San Marco in Venice, is really

[2] In a very curious painting said to be the only known work of Giuseppe Crespi the younger, reproduced (Plate L) and discussed (p. 306-307) by H. W. Janson (*Apes and Ape Lore in the Middle Ages and the Renaissance,* London, Warburg Institute 1952, 384 pp.), a monkey is depicted holding what looks like a shell to his ear, surrounded by a fantastic assemblage of instruments, natural history specimens and antiquities. Janson connects this picture from the late 18th century with the *Tractatus secundus de Naturae Simia* of Robert Fludd, 1618. Ian van Kessel's painting perhaps belongs in the same obscure tradition, though he also painted less problematic *singeries.*

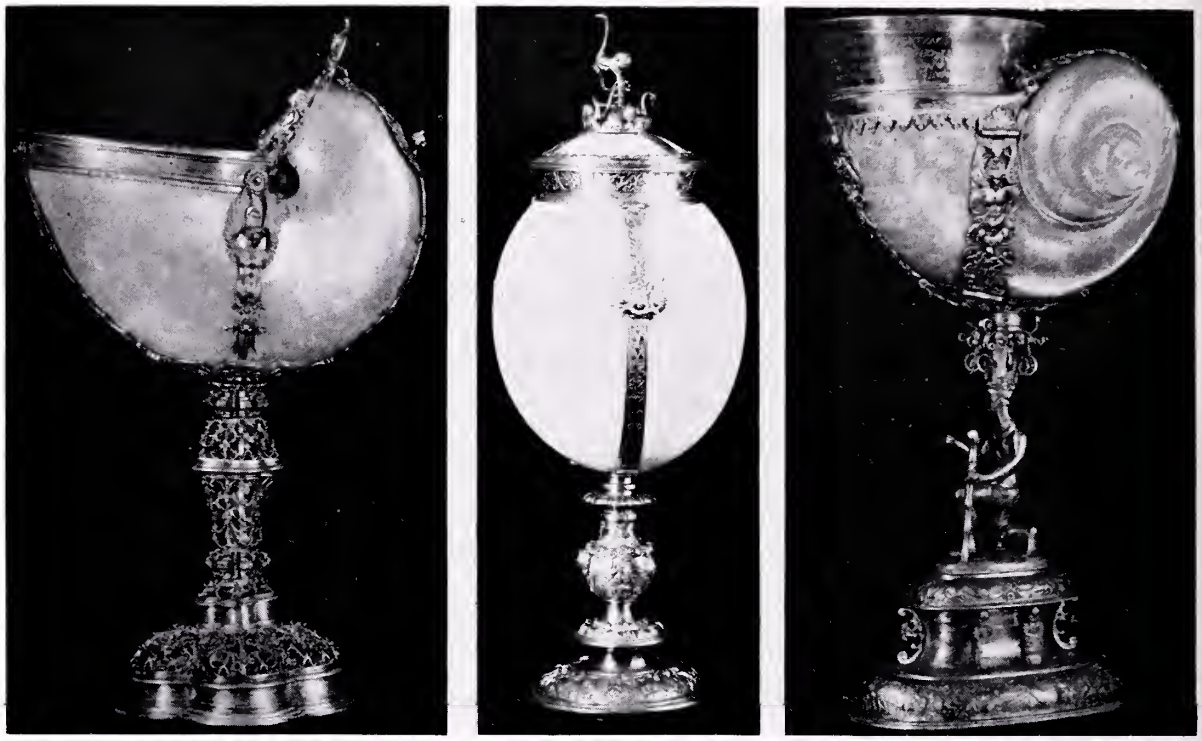

Figure 1. **Left:** *Nautilus* cup, Augsberg 17th century; **center:** Ostrich-egg goblet, Leipzig 1560-80; **right:** *Turbo marmoratus* cup, ?Nürnberg, 16th century (Vienna, Kunsthistorisches Museum no. 62, 95, and 116; E. Kris Publ. Kunsthist. Samml. Wien: Goldschmiedearbeiten I, Tafeln 5 and 67). By kind permission.

made of gold. Napoleon or his officials are said to have been persuaded that it was much too big to be really golden, and so left it unconfiscated and unmolested.

In the crypt of the Basilica of Sant' Ambrogio in Milan, the great Saint Ambrose lies between two somewhat undocumented martyrs, San Gervasio and San Protasio; another peasant woman exclaims "che nomi" at hearing the unfamiliar names attached to venerable skeletons in a sacred place. In a secular context many people entering a natural history museum for the first time must wonder, if only for a momen, whether a pterodactyl or a dinosaur really could have lived, and how they got their names.

We can begin to get some insight into our problem by considering a group of rare and strange objects, that achieved their greatest popularity during the period just about the time that collections were beginning to become differentiated, in which the properties of some natural object play a very great part in the decorative qualities of an *objet d'art*. Some of these composite objects, such as richly mounted bezoar stones or the nuts of the mysterious coco-de-mer *Lodoicea maldivica* (Gmelin) Pers, were treasured for their fancied alexipharmic properties. Most however are purely decorative and we can divide these into two more or less discrete classes. In the one which we will call *self-theorising objects* the natural structure that provides the decorative form, also displays, or would if we fully understood it, the deterministic laws by which it came into being. Here we have as examples of the effects of rotation during translation down the oviduct, in the form of an ostrich egg, mounted as a goblet (Figure 1, center). On a much smaller scale rotation of pearls against some more resistant part of a mollusk's foot or mantle can make an acorn pearl. This probably most often happens in mobile pearl-producing mollusks, such as the freshwater *Margaritifera* (Figure 2, top right). Crystals, which proclaim at least part of their atomic structure in their macroscopic shape, can be mounted in their natural condition to make jewels (Figure 2, top center). The banding of an agate, presumably exemplifying Liesegang phenomena of diffusion in a colloid, can be used in conjunction with the form of the bezel (Figure 2, below) of a ring or any other mount. The example illustrated, a ring dating from the 16th century, is of interest in that the concentrically circular agate was often regarded as a toadstone and as such protective or magical properties were ascribed to it; this ring moreover also came through Sir Francis Cook from the Marlborough Collection, which was largely formed from the jewellery of

the great 17th century Arundell collection. This identical ring may therefore have been in a cabinet of a great aristocratic virtuoso at the time when J. van Kessel painted the picture we have just examined. Horns, very early made into drinking vessels, exhibit a form clearly dependent on the mode of their growth, and shells of *Nautilus* (Figure 1, left) and *Turbo* (Figure 1, right), used to form magnificent cups, specifically display the logarithmic spiral characteristic of the growth processes of many mollusks and some other animals.

At least in the use of shells and possibly also of more perishable materials, the employment of actual organic objects for their decorative properties and of copies of them in various workable media must have grown up side by side giving the huge range of phytomorphic and zoomorphic forms known to art. At a more recent time wax flowers were doubtless valued for looking natural before they were valued for looking artificial.

In direct antithesis to the *self-theorising object*, may be set the *elegant ink blot,* the baroque pearl mounted to bring out its imagined resemblance to the torso of a mythological figure (Figure 3), or on a less princely scale the driftwood or other *objets trouvés* of the surrealists and some later schools. In these, stochastic processes dominate the form, the selection and appreciation of which obviously involves some sort of psychological projection.

In the recent history of museums the various attitudes expected to arise in the minds of the observers have been sorted out, purified or perhaps merely divided into categories convenient in administration. We see the mixed objects that I have just described primarily as artifacts; if we happen to be interested in the pure natural history of the natural part, the artificial part is regarded as an exeresence that gets in the way of scientific vision.

Today we enter an art gallery expecting to be delighted by the beauty of certain works of man; we enter a natural history museum expecting to be instructed in the workings of nature. There are also museums in which archaeological or ethnographical material is displayed to illustrate something about man that is akin to natural history, and indeed the same point of view is apparent in the grouping of works of art in any modern art gallery, where the pictures are placed by schools and periods, i.e. geographically and chronologically, just like fossils in a palaeontological collection. What seems often to be lacking, at least explicitly on the part of the intelligent public, is the realization that a number of objects in the natural history museum are of extraordinary natural beauty and that they should be valued quite simply as such, as well as for their scientific connotations. In practice in any good museum such as this one, the public displays are largely implicitly based on such aesthetic considerations. The question however of the nature of the beauty of the natural world and its relation to human art deserves more consideration than it is customarily given, and deserves such consideration quite specifically in the context of the natural history museum.

If we enquire why we make a distinction between the work of art and the object of natural beauty, which enquiry is a partial rephrasing of our original question, I suppose that at the present time the essential difference would usually be described in terms of communication or expression. What is valued in the work of art is supposedly not the sort of intrinsic beauty that we find in nature, but some evidence of a message from, or expression of, the personality of another human being, the artist who made the work. This concept however leads us into very considerable difficulties. The late Bernard Berenson said at the end of his life, of which seventy odd years had been largely spent in problems of attribution, that it did not matter who painted a picture as long as it was a real picture. This obvious truth, coming from him, carries non-obvious overtones. In the more limited modern vocabulary that we are using, it may be rephrased that it does not matter who painted a picture as long the picture is a genuine expression. In the light of such a statement let us look at an oil study of a mulatto lady (Figure 4)

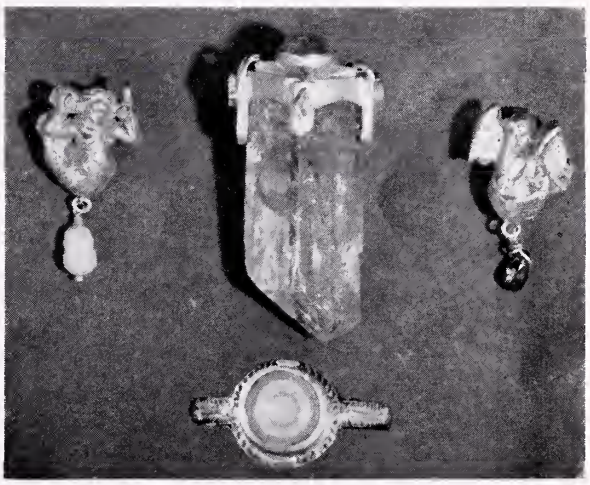

Figure 2. **Above:** Sah Oved: contemporary English; topaz crystal mounted as a pin, between earrings, Mermaid in her Vanity, and Pelican in her Piety, the former with acorn pearl. **Below:** Ring, 16th century (Yale Univ. Art Gallery 1959-43-24; *ex. coll.* Margaret Hutchinson, Sir Francis Cook, Marlborough and quite possibly Thomas Howard, 2nd Earl of Arundel, the greatest collector in 17th century England).

wearing only a red and green turban and holding a long bamboo cane, first deciding, without asking about its history, if it is a real picture genuinely expressing something to the observer.

The painting is known to have been among the effects of Eugène Delacroix, sold at auction in Paris in 1864.[3] It was apparently included in a miscellaneous lot of seventeen studies supposedly by the painter himself, which were not described individually in the sale catalogue. It passed into the Cheramy collection, and was sold, as by Delacroix, in 1908, though not listed as by him in the Cheramy catalogue published in that year. In 1954 it appeared, as by Delacroix, in an exhibition of 19th and 20th century French painting at the Lefèvre Gallery in London. At this time it evidently generated much excitement; it was reproduced in two art journals; the *Art News*, published in New York, wrote of it as "one of the chief pleasures" of the exhibition, "amazingly forceful though only 22 inches high." It was bought from the exhibition by a leading English museum, with a subvention from the National Art Collections Fund, and at the time of the purchase was hailed as of outstanding quality, and was praised for its distinction of vision and surety and sensitivity of handling. It evidently gave great satisfaction to all concerned, as it did to me when I saw it in 1958 and again in 1963. Later, however, the painting was regarded, as compared to certainly authenticated works of Delacroix's early years, "as mannered and timid in character and superficial in draughtsmanship and anatomical structure." It has indeed been suggested that it was probably the production of a dilettante called Jules-Robert Auguste, who for a time knew Delacroix; on at least one occasion they both worked from the same model. Auguste's known works, in pastel rather than oil paint, are said to possess a "preciosity of vision and metieulousness of style quite in conformity" with the picture we are considering. It is very hard to avoid the feeling that

[3] Goodison, J. W. and Denys Sutton, in Fitzwilliam Museum Catalogue of Paintings. Volume I. French, German and Spanish. pp. 172-174 for full discussion; also *Art News*, New York 53, p. 47, 1954; *Connoisseur*, London, 133, p. 260, 1954; *Fitzwilliam Museum Annual Report* 1954. Pl. IV, pp. 5-6, 1955. Mr. Goodison kindly writes that there can be little doubt that the attribution to Delacroix was mistaken, but that at present the evidence is quite insufficient that the painting is by Auguste.

Figure 3. **Left:** Mermaid; **right:** Triton, baroque pearls, jewelled and enamelled gold, Italian 16th century (Widener Coll. National Gallery of Art, Washington, D. C.). By kind permission.

great subjectivity is involved in the appreciation of sueh a work; so long as it comes from the brush of M. Delacroix its virtues arc emphasized, when his authorship is suspected all the faults suddenly become aparent, perhaps indeed overapparent. This leaves us in a very difficult, though admittedly honest, position in the face of the majority of the works of art in the world, whose makers are unknown. In the case of the painting we have been considering, without being able to express any real expert opinion, I have no difficulty in believing that it is not by Delacroix, but if, as seems rather unlikely, it is by a really weak painter, as Auguste seems to have been, he must have been so much under the influence of a better painter when he painted the work, that some of the virtues of the greater artist could be borrowed and incorporated into the work of the lesser man. It is worth noting that sometimes supposedly most characteristic works of major masters have turned out, as scholarship progresses, to be copies, studio pieces, or even works of fairly independent pupils. Since in some cases only the more obvious qualities of the master may be caught and transferred to the derivative work, the latter may become a sort of elementary introduction to the subtilties of the master, with an immediatc appeal leading in the right direction. The painting which first gave me insight into Zurburan, for instance, is a Santa Rufina now believed to emanate from his studio but not from his hand. At any rate all of us who have frequented art collections for any length of time must realize that we have almost certainly got what seems to be pleasure of the very highest order out of works of suspeet attribution. The exact origin of the message conveyed is perhaps of less importance than is often believed.

We may now as naturalists raise a still morc awkward problem, one that was adumbrated by the *singerie* painters of the 17th century,[4] the problem of the ape as artist. Unfortunately a certain amount of inevitable commereialism and humor has tended to obscure the extraordinary significance of the work that was started fifty years ago by Kohts in Russia and which has been reeently greatly developed by many workers, of whose studies Desmond Morris has provided an illuminating synthesis.[5]

The great apes and some other primates, notably capuchin monkeys, when put into an experimental environment in which they can exhibit it, have a sense of symmetry in design, which is most easily demonstrated by giving the animal a paper, blank except for a square set eccentrically. In a highly significant number of cases the animal will tend to mark the paper in such a way as to balance the design. Rensch moreover in experiments in which animals can make choiee of ready-made designs, finds that balanced patterns pleasing to ourselves also seem to please many other vertebrates. When the animal is given more elaborate opportunities for

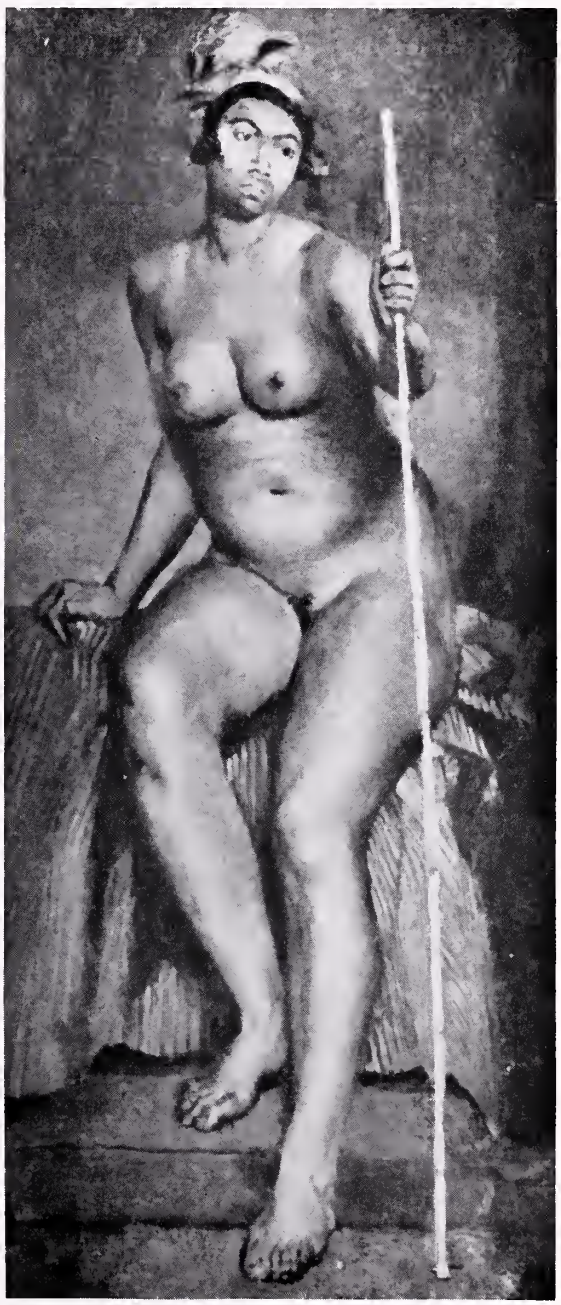

Figure 4. Study of a Mulatto Woman, French School 1820-25. (Fitzwilliam Museum, Cambridge.) By kind permission.

[4] For a series of 17th and 18th century satiric paintings of the ape as artist see H. W. Janson, *op. cit.*, chap. X.

[5] Morris, Desmond. The Biology of Art. 176 pp. London 1961.

artistic expression, Morris concludes that in all cases, there is, as well as compositional control of balance, an attempt at calligraphic differentiation of line; thematic variation within an individual style appears when paintings of the same animal are compared. There is also an attempt to achieve a degree of optimum heterogeneity giving a sense that a painting is complete. At least in young apes the activity is highly self-rewarding or autotelic. Any intrusion is resented more than if the animal had for instance been disturbed when eating. Providing the young apes with paints, brushes and canvas gives it, for the first time in its life, something very important to do.

The general level of achievement, though compared to action painting or abstract expressionism by some critics, appears to be that of a three year old child just prior to the development of diagrammatic representation of the human face.

What these studies show clearly is that the desire and capacity to engage in some sort of self-expressive autotelic activity exists in animals that have diverged from the human line many millions of years ago, and do not have the intellectual capacity to invent the mechanisms to provide the sort of satisfaction that is within their intellectual range.

Other examples of animals being able to gain satisfaction from far more complicated types of behavior than they can invent in nature could be multiplied, though none I think are more interesting than the artistic activities of primates. The capacity of seals to learn to perform on musical instruments and in some cases to get enjoyment from doing so, is perhaps another example; here we may suspect that an interest in the rhythmical sounds of breaking waves on the rocks or beaches of a shoreline has some initial adaptive value. It is evident that in a sense the more highly developed mammals are preadapted to inventions that for most of them have not become available.

It is reasonably certain that a large part of human intellectual evolution must have consisted in the rare invention of such activities, painting, dancing, music, games, counting and elaboration of language, which once they had been achieved accidentally or by exceptional insight of a genius, caught on with a large part of, if not the whole, population.

Whatever the expressiveness that is required to put an object in an art gallery may be, it is clearly not quite confined to the genus *Homo;* as the evolutionist would expect, it has a history and this history can be traced outside our own genus or family.

If we are prepared to grant that at least some of the qualities present in a human painting are also present in a very rudimentary form in those of the great apes, we may legitimately inquire about certain other kinds of animal activity which seem to us to have aesthetic properties. Most conspicuous are the songs and displays of many birds, the latter perhaps culminating in the extraordinary activities of bower birds in collecting and arranging decorative objects.

We may in the present state of knowledge make the following statements about such activities.

They are all parts of adaptive behavior directed to ends that are significant in the life of the animal, notably the holding of territory, retention of interest in a mate and the like. The significance always implies some sort of social interaction. Though usualy both innate and learnt behavior are involved, in many cases the behavior has a stereotyped innate component that is largely lacking when a human being sings, dances or paints, and for that matter when an ape is given the chance to do the last named. There is often a great discharge of neuromuscular activity which is reasonably regarded as comparable to what we know subjectively as emotion.

In a very large number of cases structures or activities used as social signals of a visual or auditory kind are found to be aesthetically significant to human beings. Apart from the fact that in many cases the aetivities involved are largely innate, which allies them perhaps more to elaborately grown structure than to learnt activity, the social and emotional aspects of animal display and the activities involved in the production of much so-called primitive art appear to be comparable. In both cases the aesthetic elements which we value are originally seeondary to the social functions subsumed by displays or rituals. If we compare the voice of a peacock with his tail we get a clear hint that what is needed to produce the secondary aesthetic effect, is a considerable degree of elaboration. In all structures used in display, the elaboration is no doubt correlated with the need for quite specific signals different from anything else. The greater the elaboration of two structures the less the probability that they will resemble each other. Moreover, if we look at all the organisms which we at first sight would regard as strikingly beautiful in a decorative rather than a purely functional way, or for that matter inanimate structures which give the same sort of impression, we find that nearly all the extraordinary cases are the product of some sort of differentiation in a relatively free environment, in water, or growing up into the air or at least moving about above the ground, rather than burrowing in sand or mud. I give no examples on the screen; being within a major natural history museum, *si exemplum vis, circumspice.* Wherever there is a

physical possibility of developing in a spacially unrestricted way in a context which either calls for or merely permits elaboration, we get natural beauty. Moreover in all cases we have more than a hint of what I initially referred to as a self-theorising property. The elaborate form tends to express deterministic laws that brought it into being, though often we may not know what they are but merely feel that the symmetry and elegance of the object before us implies a symmetry and elegance in the theory describing its genesis.

We have seen how the random irregularities of what I have called elegant ink blots are the vehicles for certain sorts of psychological projection, entirely irrelevant to the nature of the object, yet capable of giving considerable satisfaction under certain circumstances. We have seen also how in looking at an entirely conventional human work of art there can be an enormous subjective element in evaluation; a study of either forgeries or fashions in appreciation no less than over-enthusiastic attributions would lead to a comparable conclusion. We have to go out to meet the work of art on some ground between it and ourselves to receive its message; the place where we stand may make all the difference.

We have further seen that there is apparently a continuum from conscious human works of art, through immensely beautiful but in purpose only secondarily artistic works of primitive art, to animal activities and structures employed socially and then to those that are not so employed, and so finally to inanimate structures which we recognize as beautiful. As we get further from the human work, we find that what we see as beautiful comes into being largely as elaboration in a relatively unrestricted space, whatever the actual mechanisms of its development. This happens because there are orderly processes occurring in nature and when they get a chance to show what they can do, they produce elaborate works in which symmetry and elegance in the external world suggest that, even if we cannot explain the process yet, and we often can, the explanation would involve elegant theory, which it often does.

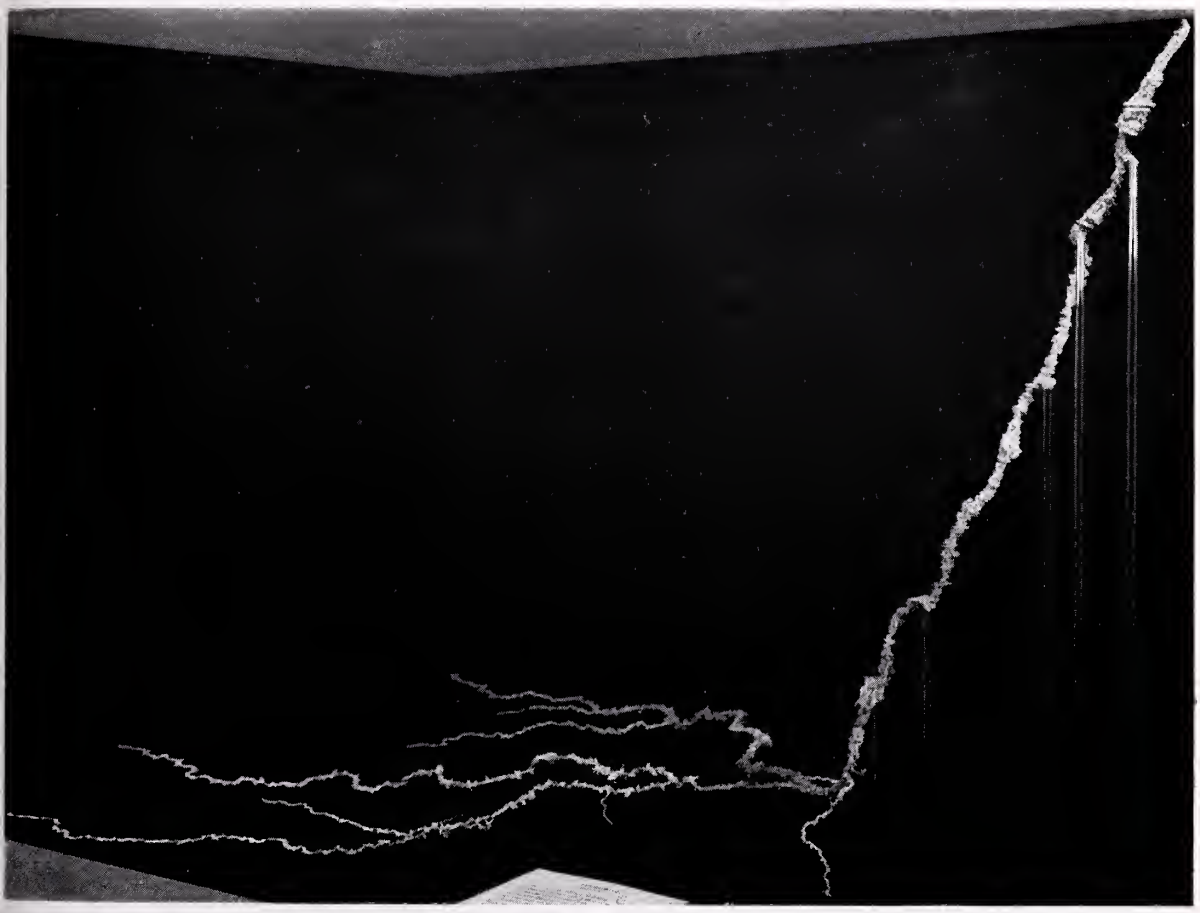

Figure 5. Fulgurite from Santa Rosa Island, near Fort Walton, Florida. (Academy of Natural Sciences, Philadelphia. Collected and mounted by Josephine Henry.)

Again as with human works, our viewpoint makes a considerable difference. An unforced feeling for how a form may arise can enhance its natural beauty. Some people may be willing to stop at this point, as every philosophical position, or lack of position, implies enormous difficulties. Others may want to go on further, feeling themselves in the presence of a message from nature or the external world which they go out to meet with their understanding. To be meaningful such a position would have, I think, to be theistic. It does not involve any logically compelling argument for the existence of God, but like each of the arguments on this matter, it makes its point if one is prepared to accept some of the others.

Meanwhile I think if the general trend of my line of thought makes at least partial sense, we can agree that in large measure the public exhibits in a good natural history museum are in some ways the modern counterparts of the nautilus cups and ostrich egg goblets of the Renaissance, constructed of both natural objects and a highly skilled kind of applied art. Yet they are far more important, because they are made to contain not wine, which anyway would be hard to drink from such objects, but scientific truths, made plain by the art with which the self-theorising properties of the specimens are exhibited. If the whole aspects of the work of a natural history museum is considered in this light, a taxonomically arranged set of diatom slides or drawer of insects, no less than a habitat group or your magnificent fulgurite (Figure 5), are seen to have some of the properties of works of arts. Although I think there are good reasons for separating art galleries and natural history museums, they still, even after more than a century and a half of autonomous development, may have much in common.

Acknowledgments. I am much indebted to the Soprintendenza alle Gallerie, Florence, to Dr. Erwin M. Auer, Director of the Kunsthistorisches Museum, Vienna, to Mr. J. W. Goodison of the Fitzwilliam Museum, Cambridge, and the Director of the National Gallery of Art, Washington, for permission to publish the photographs reproduced in figures 1, 2, 4 and 5; to Mr. Emiddio DeCusati and the Yale Art Gallery for figure 3, and to Dr. Ruth Patrick and the Philadelphia Academy for figure 6. I am most grateful to Mrs. Sah Oved and Professor Charles Seymour, Jr., for assistance and information about several objects discussed, to Miss Yemaiel Oved for one of the ideas that I have used, and to my wife for much help.

GEORGE HENRY PENN

1918-1963

Doctor George Henry Penn, Professor of Zoology at Tulane University and editor and founder of *Tulane Studies in Zoology* died after a short illness on May 10, 1963.

He was born on November 20, 1918, to George Henry Penn and Lydia Leroy Penn, in New Orleans, Louisiana. He attended Tulane University, earning his Bachelor of Science (major in zoology, minor in botany) and Master of Science (major in zoology, minor in parasitology) degrees in 1939 and 1941 respectively. His studies were interrupted by World War II in which he served in a U.S. Navy malaria control unit in the Southwest Pacific. He emerged from World War II as a Lieutenant. Upon his separation from the U.S. Navy he attended Cornell University where in 1947 he earned his Doctor of Philosophy degree in Medical Entomology with a minor in invertebrate zoology.

Professor Penn's interest in zoology was an early one cultivated by his tutor and beloved friend, a notable Louisiana naturalist, the late Percy Viosca. On many occasions he reminisced

George Henry Penn

of his early days as Percy's "assistant." Following his own background, he often gave encouragement to youngsters interested in animals. In his college days at Tulane he came under the able tutelage of such notable biologists as Professors E. S. Hathaway, and W. T. Penfound. His major professor at Cornell was Robert Matheson.

Upon his graduation from Cornell University, Doctor Penn was employed as Assistant Professor of Zoology at Tulane University. He rose to Associate Professor in 1952, and to Professor in 1957. At the time of his death he was Assistant Head of the Tulane University Department of Zoology, and had served as Acting Head during 1958-1959. His campus activities were wide and varied, having served on many important University committees. At the beginning of each academic year he and his wife were the gracious hosts to graduate students in the Department of Zoology, for he felt strongly about making personal social contact with all student in the department. Students were always welcome to discuss their problems with Professor Penn.

Doctor Penn published at least 68 authoritative papers on parasites, molluscs, branchiobdellids, crustaceans, porocephalids, mosquitoes, reptiles, and birds. He was probably best known for his work on fresh-water crustaceans, particularly the crawfishes. It has been said that he and his colleague and accomplice in his study of crawfishes, Doctor Horton Hobbs whom he regarded most highly, had divided the United States into two sectors for purposes of studying crawfishes! In spite of his interest in crawfishes, Professor Penn liked to regard himself as a general biologist rather than a specialist. He was a serious teacher who led scores of undergraduates into useful and productive careers in biology and medicine. His graduate students are many, and their theses are primarily on invertebrate animals.

Professor Penn was a member of 11 learned societies at the time of his death: Louisiana Academy of Sciences, Tennessee Academy of Sciences, Entomological Soeiety of America, American Society of Limnology and Oceanography, Society of Systematic Zoology, American Institute of Biological Sciences, Association of Southeastern Biologists, American Society of Zoologists, Ecological Society of America, American Association of the Advancement of Science, and the Society of the Sigma Xi. He is listed in *American Men of Science, Who's Who in the South and Southwest*, and *Leaders in American Sciences.*

Doctor Penn is survived by his wife, Mrs. Mary Elizabeth Harry Penn, a son George Hugh Penn, and a daughter Sylvia Celine Penn, who reside at 818 Fern Street, New Orleans, Louisiana.

The Association of Southeastern Biologists extends sympathy to his widow, daughter, son, and students.—FRANKLIN SOGANDARES-BERNAL

Patrick H. Yancey Receives ASB's Meritorious Teaching Award

The Meritorious Award Committee designated as Meritorious Teacher for 1963 Reverend Patrick H. Yancey of Spring Hill College, Mobile, Alabama. This award carries with it an honorarium of $100.00 from the Will Scientific Co.

Father Yancey was born in Tampa, Florida, and took his formal education at Gonzaga, Fordham, Barcelona, Woodstoek, and St. Louis, receiving his Ph.D. in biology in 1931.

He began and has continued his distinguished teaching career at Spring Hill College. His record of achievement in teaching is reflected in the *Mendelian,* a publication which he has moderated during the last 33 years, in the lists of medical teachers and practitioners, and especially in the professional biologists whom he has trained at Spring Hill and who are now teaching and doing research in all parts of the world.

Dr. Yancey has been a very active members of the Alabama Academy of Sciences, which he has served as president as well as a long standing representative of it on the Council of the AAAS. As regional Vice-President of Beta Beta Beta National Honorary Biological Society he has rendered great service to the cause of biology in our region during his tenure in office. Over a dozen new chapters were established in various colleges of the Southeast, and the high standards which he has exhibited in his own teaching at Spring Hill have been instilled into the various chapters of this region through his diligence and good example.

Martin Young Honored With Darling Foundation Medal And Honorary Degree From Emory University

For his outstanding contributions to research in malaria, Dr. Martin D. Young, Associate Director of the National Institute of Allergy and Infectious Diseases, received the Darling Foundation Medal and Prize at the plenary session of the 16th Annual Assembly of the World Health Organization in Geneva on May 9.

The bronze medal and the prize of 1,000 Swiss francs is awarded intermittently by WHO in memory of Dr. Samuel T. Darling, a U.S. member of the League of Nations Malaria Commission. Dr. Young is the second NIH scientist to receive the Darling Prize. Dr. G. Robert Coatney, Chief of the Laboratory of Parasite Chemotherapy, NIAID, received the award in 1954.

In accepting the prize Dr. Young said, "For a malariologist it (the Darling Prize) symbolizes the summit of professional recognition. I am aware that this award carries with it an extra measure of distinction and significance because it is administered by an international agency with the well-defined objective of attaining the highest possible level of health for people everywhere."

On June 10, Dr. Young was further honored with an honorary Doctor of Science degree from Emory University during the spring commencement exercises. The degree was awarded by University President Sidney W. Martin in recognition of Dr. Young's contribution to world health.

Dr. Young did most of his research on malaria at Columbia, S. C., where he was head of the field station of the Laboratory of Parasite Chemotherapy before coming to Bethesda in 1961. His research has been concerned with practically all phases of malaria, with particular emphasis on use of malaria parasites in the treatment of neurosyphilis, host-parasite relationships, biology and cytology of the parasites, chemotherapy, and the relative vectoral abilities of mosquitoes.

Most recently he has documented cases of resistance of certain strains of malaria parasites to two antimalarials, chloroquine and amodiaquine, which have been among the most effective drugs to suppress and cure malaria.

A native of Moreland, Georgia, Dr. Young has been an NIH staff member since 1937 and a member of the PHS Commissioned Corps since 1944. He holds an Sc.D. from Johns Hopkins and is a graduate of Emory University. In 1953 Dr. Young became the first NIH staff member to receive the Rockefeller Public Service Award. Dr. Young, his wife, and two children live at 5610 Durbin Road in Bethesda, Md.

Martin D. Young

The Duke University Marine Laboratory, Beaufort, North Carolina, is the site for a nine day conference on "The Biology of Estuarine Animals" to be held August 28 to September 5, 1963. The Conference, co-sponsored by the American Society of Zoologists and supported by the National Science Foundation, is designed to give college teachers of biology and zoology, actively engaged in teaching or research in this field, an opportunity to familiarize themselves with recent advances and exchange ideas with outstanding American and foreign workers. Inquiries on the details of the Conference should be directed to: Dr. F. J. Vernberg, Duke University Marine Laboratory, Beaufort, North Carolina.

(*Continued from page 46*)

President Flory then asked for reports from the Goethe Travel Awards Committee, The Constitution Committee, Committee on Meeting Places and The Nominating Committee.

Goethe Travel Awards. The Chairman reported that 16 applications for financial assistanee were received and that all were supported to some extent out of the $364.00 available. The Committee elected to support subsistence costs rather than those for travel. A motion to accept was made, seconded and passed.

Constitution Committee. The Chairman discussed the eonstitutional amendment presented at the 1962 Business Meeting, and as circulated in the Bulletin. He moved the adoption of the amendment, the motion received a second, and was passed by a show of hands.

He then presented a motion to modify the dues of the Association under Article 4, Section 1 of the By-Laws, with such modification to go into effect in 1964, as follows:

1. Undergraduate and Graduate dues	$ 2.00
2. Regular Members	3.50
3. Contributing Members	5.00
4. Sustaining Members	25.00

A motion was made and seconded to accept the modification. Dr. Robert W. Menzel proposed an amendment to the motion that would raise the dues of Regular Members to $4.00. The amendment was seconded and passed. The original motion was then brought to a vote and President Flory ruled that the necessary two-thirds vote in favor of the motion had been given and declared it approved by the Assoeiation.

The Chairman of the Constitution Committee then moved that the fiscal year of the Assoeiation be changed to January 1-December 31. The motion received a second and was passed by the Association.

Committee on Meeting Places. The Chairman reported that an invitation for the Association to hold its 1964 meeting at Emory University had been received from that University. A motion that the invitation be accepted was made, seconded and passed. The Chairman then reported that Dr. Shannon, President of the University of Virginia had invited the Association to meet at that University in 1965. A motion to accept the University of Virginia's invitation was made, seconded, and passed.

Nominating Committee. The Chairman of the Committee presented the recommendations of the Committee.

President Flory called for nominations from the floor and there being none he declared the nominations closed. Ballots were then distributed and Drs. Walter R. Herndon, Alvin V. Beatty and Robert W. Menzel were appointed as tellers. Dr. Herndon was appointed as Chairman of the Committe. President Flory announced that the results of the election, the report of the Meritorious Teaching Award Committee and that of the Resolutions Committee would be presented at the banquet.

Dr. Raymond L. Taylor, Associate Administrative Secretary, AAAS was introduced by President Flory and Dr. Taylor expressed his pleasure at being able to be present and extended the best wishes of the AAAS to the Assoeiation.

There being no further business President Flory declared the meeting adjourned at 12:45 P.M.

Submitted by:
Harry J. Bennett
Seeretary—ASB

REPORT OF THE RESOLUTIONS COMMITTEE

The committee presents the following resolutions:

Whereas, the Association of Southeastern Biologists, together with the Southeastern Section of the Botanical Society of America, the Southern Appalachian Botanical Club, the Regional Section of Beta Beta Beta National Honorary Biological Society, and the Southeastern Division of the American Society of Ichthyologists and Herpetologists, is suecessfully holding meetings on the campus of the University of Florida, Gainesville, Florida, April 18-20, 1962;

and, Whereas, every possible convenience has been made available for our use, therefore:

Be it resolved,

first, that these groups express sincere appreciation to the President J. Wayne Reitz for the invitation to meet here, for the graeious welcome extended, and for the use of the university facilities for these meetings, and

second, that special thanks be expressed to Co-Chairman J. C. Dickinson and H. K. Wallaee and to each member of their committee on local arrangements, for the excellent provision of space, equipment and general comfort for all in attendance.

Whereas the Carolina Biological Supply Company has continued to contribute $100.00 each year as a research award; therefore

Be it resolved, that the sincere appreciation of the Association be expressed to Dr. Thomas E. Powell, President of the Company, for this contribution.

Whereas, the Will Corporation of Georgia has continued to contribute $100.00 each year as an award for meritorious teaching, now therefore

Be it resolved, that the genuine appreciation of the Assoeiation be expressed to Mr. Charles Waite of that corporation for this contribution.

Whereas, Mr. C. M. Goethe has continued to provide funds for the Mary Glide Goethe Travel Awards, and generously contributed an extra amount this year so that all applicants eould reeeive awards,

Be it resolved, that the sincere appreeiation of the Association be expressed to Mr. Goethe for his continuing interest and support.

Whereas, Dr. Royal E. Shanks was a long-standing member of the Association of Southeastern Biologists, serving it in many capacities and was its immediate past president at the time of his death on August 4, 1962; and

Whereas, through his broad training, wide interests, unusual abilities in teaching and research, his services were invaluable not only to the southeastern region of the United States but to the whole field of biological scienees,

Be it resolved, that the members of the Association of Southeastern

Biologists hereby express their grief at the loss of a beloved colleague, and instruct the Secretary of the association to convey their deep sympathy to his family.

Respectfully submitted,
E. C. Cocke
A. J. Sharpe

RESUMÉ OF EXECUTIVE COMMITTEE MEETINGS

Items of General Interest

November 10, 1962.
Emory University

1. The Committee decided that the evening meeting, April 19, 1963, should be dedicated to the memory of Dr. Royal D. Shanks.
2. The Treasurer recommended that the membership be asked to approve an increase in dues at the 1963 Business Meeting.
3. The Committee approved the appointment of an Advisory Committee to assist the Editor in the establishing of policies relative to the Bulletin.
4. The Committee recommended the publication of the Constitutional Amendment relative to affiliates in the January, 1963 issue of the Bulletin.
5. Various types of membership were discussed with the discussion centering around the fact that the Association is now tax exempt and that this should make the obtaining of Patron Members much less difficult.

April 18 and 20, 1963.
University of Florida

1. It was decided that a permanent Advisory Committe should be appointed to assist the Editor on problems associated with the Bulletin.
2. The Treasurer reported that the response of the membership to dues notices had been excellent.
3. The Committee decided to submit a modification of Article IV, Section 1 of the Constitution calling for an increase in dues to the membership at the 1963 Business Meeting for its consideration.
4. The Committee decided that the membership should be asked to consider changing the fiscal year to January 1-December 31 at the 1963 Business Meeting.
5. The President suggested that the Constitution be published in the first issue of the Bulletin issued in each year divisible by 5. The suggestion was approved.
6. Dr. John M. Carpenter suggested that the Association should have a symposium of general interest as a part of its annual program. The suggestion was discussed at length but no action was taken.
7. The Editor recommended that the membership be sent a questionnaire asking what it would like to have appear in the Bulletin, and was of the opinion that more articles of general interest should be submitted for publication. The Committee agreed that the questionnaire should be sent and discussed ways and means of obtaining articles of interest for the Bulletin.
8. The Treasurer suggested that a central office to be managed by a Secretary-Treasurer should be established but the Committee was of the opinion that this should not be done at the present time.
9. The Secretary reported that only one design for an Association seal had been submitted and the Committee recommended that the contest be continued for another year.
10. The Secretary was instructed by the Committee to contact the membership to determine its interest in having a symposium as a part of its annual program and the most suitable time for it.

The National Science Foundation announces opportunities for U. S. scientists to participate in the Antarctic expeditions of foreign countries as Exchange Scientists from the U. S. Antarctic Research Program. Nations other than the United States with active Antarctic scientific programs include Argentina, Chile, France, New Zealand, the Union of South Africa, the United Kingdom, and the Soviet Union.

Research possibilities exist in the fields of atmospheric physics, biology, geology, glaciology, meteorology, and the marine sciences. The research program could be planned for a four-to-six month austral summer or for a fourteen-month period, including the Antarctic winter of 1964. Departure from the U. S. would probably be late in 1963.

Salary and expenses for travel, equipment, etc., associated with the exchange would be included in a grant to the investigator's institution. If necessary, assistance can be provided for acquiring a working proficiency in the appropriate foreign language before departure for the Antarctic.

Interested scientists are requested to transmit an outline of their proposed program with a specific foreign expedition to the Chief Scientist, Office of Antarctic Programs, National Science Foundation, Washington 25, D. C.

News of Biology in the Southeast

About People

Beginning with the 1963-1964 session, **Walter S. Flory** will be Mary Reynolds Babcock Professor of Botany at Wake Forest College. In addition to teaching duties he will be in charge of Reynolda Gardens. Dr. Flory will follow Dr. Paul B. Sears who has been the visiting Babcock Professor during the first year of its establishment. Since 1947 Flory has been Professor of Experimental Horticulture at the University of Virginia and Vice-Director and Manager of The Blandy Experimental Farm. In addition, since 1955, he has been Curator of The Orland E. White Research Arboretum. Dr. Sears is Professor Emeritus of Yale University, where he directed the Conservation Program before his retirement.

George W. Hunter, III (Ret.) has been in San Jose, Costa Rica since October, 1961. Dr. Hunter returns to the Department of Microbiology, College of Medicine and Biological Sciences, University College, University of Florida, Gainesville, in Otober, 1963. During his leave of absence he has served as Research Professor of Medical Parasitology of the Faculty of the LSU School of Medicine. He has been stationed with the LSU—International Center for Medical Research and Training (ICMRT) in San Jose where he has served as Resident Coordinator, Chief of the Administrative Section and Chief of the Section of Parasitology. Besides the administrative responsibilities that are inevitably associated with a new program Dr. Hunter has been active in research on various parasitological problems.

George K. Reid, Professor of Biology at Florida Presbyterian College, has been named president-elect of the Florida Academy of Sciences, and will assume his post next year. President of the Academy for the current year is **Alex G. Smith,** professor of physics at the University of Florida. Dr. Reid has recently received a grant from the Explorers Club of New York to go to Haiti to study the chemistry-temperature relationships and animal life of the island lakes. This is part of a larger project—a study of Florida lakes under the National Science Foundation which he received in 1961.

The Society of the Sigma Xi and its associated organization, the Scientific Research Society of America (RESA), announced today through the chairman of their Grants-in-Aid of Research Committee, Dr. Harlow Shapley, an award to **Francis M. Bush,** Department of Biology, Howard College, Birmingham, Alabama, to assist in his study of the plasma proteins on an ABO-like blood group in natural populations of *Passer domesticus domesticus.*

The National Science Foundation has awarded a $37,900 grant to Virginia Polytechnic Institute for a study of the functions of the striatum of the avian brain and its role in the stereotyped "instinctive" behavior characteristic of birds as a class. The long-time project will be under the direction of **Dr. Richard E. Phillips,** Assistant Professor of Zoology.

Harold A. Dundee, Assistant Professor of Zoology in the College of Arts and Sciences at Tulane University, has been elected president of the Southeastern section of the American Society of Icthyologists and Herpetologists. Presently serving as secretary-treasurer of the society, Dr. Dundee has been a Tulane faculty member since 1958.

James Rex Baird has accepted an instructorship in botany at Washington and Lee University. Mr. Baird is finishing his doctorate at the University of North Carolina.

Jaek S. Brown, Emory and Henry College, has accepted appointment as Professor of Biology, Parsons College, Fairfield, Iowa, effective in June, 1963.

John G. Mahan of the Lynchburg College biology staff has received a National Science Foundation fellowship for the summer institute in Marine Biology for college teachers at the Duke University Marine Laboratory at Beaufort, North Carolina.

Edward B. Cutler of the Lynchburg College biology staff has received a grant from the National Science Foundation for graduate work at the University of Washington Marine Laboratory at Friday Harbor for the first part of the summer, and from the Old Dominion Foundation for transportation to the Arctic Research Laboratory at Point Barrow, Alaska, for the second part of the summer. There he will work on the phylum Pogonophora with the English marine biologists, Drs. Alan and Eve Southward.

Warwick R. West and **William S. Wooleott,** Biology Department, University of Richmond, received a grant from the University of Richmond Research Fund to study the graduate research program offered by the Biology Department.

William S. Woolcott, Associate Professor of Biology at the University of Richmond, will teach a course in ichthyology at Mt. Lake Biological Station during the first term of the 1963 session.

Thomas M. Harris, Assistant Professor of Biology at the University of Richmond, received a grant from the University of Richmond Research Fund to complete his studies on certain phases of amphibian embryology.

William J. Hargis, Jr., Dean of the School of Marine Science attended a meeting of the Steering Committee of the Society of Exploration of the Atlantic Shelf in Miami on May 5, 1963.

Jesse C. Thompson, Jr., of Hollins College has named two new species of protozoa honoring William J. Hargis, Jr., and Marvin L. Wass of the Virginia Institute of Marine Science. One species is *Paratetrahymena hargisi* and *Paratetrahymena wassi*. Dr. Thompson discovered these two protozoa while working under a NSF-RPCT program at the Institute in 1961.

William J. Hargis, Jr., and **Bernard C. Patten** have recently been elected Fellows of the American Association for the Advancement of Science. Dr. Hargis efforts have been in parasites of marine fishes and marine ecology and Dr. Patten is concerned with marine productivity studies.

William J. Hargis, Jr., and **Marvin Wass** attended a short course and conference on Marine Borers and Fouling Organisms at the William C. Clapp Laboratory in Duxbury, Massachusetts on May 13-15.

C. Richard Terman has joined the staff of the College of William and Mary as an Assistant Professor of Biology. Dr. Terman received his Ph.D. degree from Michigan State University and completed two years as an N.I.H. Postdoctoral Fellow at the Penrose Zoological Laboratories. Dr. Terman has been awarded a three year grant of $35,000 from the N.I.H. to study early social experience and population asymptote in mammal populations.

Gustav W. Hall has joined the staff of the College of William and Mary as Assistant Professor of Biology. Hall will receive his Ph.D. degree in August from Indiana University.

Institutions and Organizations

Victor A. Greulach, chairman of the Department of Botany at the **University of North Carolina** at Chapel Hill, has announced that the department is now located in William C. Coker Hall, the new 68,000 square foot building constructed for exclusive occupancy by the department. The building is named in honor of Dr. W. C. Coker, who established the department in 1908, six years after he joined the faculty of the University, and who served as chairman between 1908 and 1944. Funds for the construction of the building were provided by the State of North Carolina, the National Institutes of Health, and the National Science Foundation. The building will be dedicated in the fall of 1963.

The first floor of the building is occupied by the plant physiology and ecology laboratories, the second floor (which is at ground level in the front) by lecture rooms and undergraduate laboratories, the third floor by mycology, microbial genetics and the departmental library, and the fourth floor by plant taxonomy, anatomy and cytology as well as the herbarium. A research greenhouse is attached to the building. A grenhouse has also recently been completed at the North Carolina Botanical Garden, which is operated under the supervision of the Department of Botany. This greenhouse was the gift of Mr. and Mrs. St. Pierre DuBose of Chapel Hill.

The National Science Foundation will accept, through October 7, 1963, applications for fellowships under the Senior Postdoctoral and Science Faculty Fellowship Programs.

Awards will be made in the mathematical, physical, medical, biological, and engineering sciences, and anthropology, geography, psychology (excluding clinical psychology), sociology (not including social work), economics (excluding business administration), and the history and philosophy of science. Also included are overlapping fields, such as oceanography, meteorology, biochemistry, biophysics, and geochemistry.

Applicants for Senior Postdoctoral Fellowships must be citizens or nationals of the United States, possess special aptitude for advanced training, and must have held the doctoral degree for at least 5 years or have equivalent education and experience. Senior Postdoctoral Fellows will be selected on the basis of ability as indicated by letters of recommendation and other evidence of scientific attainment. Applicants' qualifications will be evaluated by panels of scientists appointed by the National Academy of Sciences-National Research Council. Selection of approximately 100 Fellows will be made by the National Science Foundation.

Science Faculty Fellowships are for college teachers of science, mathematics, or engineering. Fellowships are open to citizens or nationals of the United States who hold a baccalaureate degree or its equivalent, have demonstrated ability and special aptitude for science teaching and advanced training, and who have taught at the college level as full-time faculty members for not less than three academic years and intend to continue teaching. Selection will be based on letters of recommendation, academic records, and other evidence of professional and scientific attainment and competence. Applicants' qualifications will be evaluated by panels appointed by the Association of American Colleges. Selection of approximately 400 Fellows will be made by the National Science Foundation.

Stipends for successful applicants in both fellowship programs will be individually computed on a salary-matching basis, but the maximum support from the Foundation will be limited to $15,000.00 for a 12-month tenure.

Fellows may engage in study and/or research at any appropriate United States or foreign nonprofit institution. A limited travel allowance for Fellows and dependents will be available.

Application materials may be obtained from the Fellowships Section, Division of Scientific Personnel and Education, National Science Foundation, Washington 25, D. C. Completed applications must be received not later than October 7, 1963. All applicants will be notified by letter on December 9, 1963, of the disposition of their applications.

The Association of Southeastern Biologists

ASB BULLETIN

Volume 10, Number 4—October 1963

The ASB Bulletin is the official quarterly publication of the Association of Southeastern Biologists, Inc., and is published at Philadelphia, Penna., in January, April, July and October. Letters, news items, other contributions, and all communications about editorial matters should be addressed to C. W. Hart, Jr., Editor, The Academy of Natural Sciences of Philadelphia, 19th and The Parkway, Philadelphia, Penna. Changes of address should be sent promptly to the Secretary of the ASB, Dr. Harry J. Bennett, Department of Zoology, Louisiana State University, Baton Rouge, La. Subscription orders from libraries and other institutions should be sent to the Business Manager, Dr. Leland Shanor, Department of Biological Sciences, Florida State University, Tallahassee, Florida. Subscription rate for nonmembers of the ASB: $2.00 per year. Printing and typography by the Wickersham Printing Co., Lancaster, Penna.

Second-class postage paid at Philadelphia, Pennsylvania.

CONTENTS

By ARNOLD GROBMAN

Last month the new biology curriculums developed over the past three years by research scientists and high school teachers became generally available to the schools. Here Arnold Grobman, director of the Biological Sciences Curriculum Study, which developed and tested these curriculums, offers a critique of past practices and indicates the changes that portend at every level from elementary school through college.

This article appeared in the Saturday Review *on 21 September 1963, and is reprinted here with the permission of the Saturday Review and the author.*

Biology Is Changing, Too

WITH some very striking exceptions, the present biology curriculum in American schools has fallen far behind the physical sciences in adapting to contemporary demands. Most of the school books make for dull, unexciting courses; although their illustrations are eolorful their texts are not. Too many teachers give courses with virtually no laboratory work or, at most, with a few demonstrations. This kind of biology becomes something the student reads about rather than something he does; it is not a study of science but rather a narrative about science.

Most children, when they start school, already know a good deal about living things. They are familiar with common plants and animals, have a rudimentary knowledge of anatomy and physiology, and understand something of the genetic relationships among animals. And they have a driving curiosity about living things.

Do our schools build on these spontaneous beginnings? Do they sustain and encourage natural curiosity about living things? Do they develop notions of scientific inquiry? Unfortunately, no.

At the elementary level (grades 1-6), with some exciting exceptions, biology teaching is uneven and disorganized. Seience instruction of all kinds rarely amounts to more than half an hour per day, and biology, of course, occupies only part of that time. Elementary science books do seem superior to those available for the higher grades and the growing number of well-written and well-illustrated supplementary books that can be obtained at low cost help to make the teaehing materials reasonably adequate.

But the elementary teacher in a self-contained classroom must, of necessity, be a generalist expected to teach the sciences in addition to reading, spelling, social studies, arithmetic, and other subjects and skills. He must work with youngsters possessing widely varying knowledge, aptitudes, and attitudes toward learning. Some of these children are notably sophisticated in science and, in many instances, have a fairly detailed knowledge in specific areas. Unfortunately the sciencc preparation of most of our teachers is sadly inadequate for effective work in such elassrooms.

In a few school systems specially prepared teachers, with a strong background in science, assist those classroom teachers who lack such a background. Cooperative arrangements of this kind deserve to be more widely introduced. Certainly it is reasonable for elementary schools, especially in the upper grades, to utilize specialized teachers in basic subject matter areas such as science, as well as in art, music, and physieal education, where they have been employed for many years.

But if science instruction in the elementary schools is uneven and disorganized, the junior high school program can only be characterized as hopelessly inadequate. It is my belief that, in general, American youngsters receive their poorest formal science education at the junior high level—and it is here also that their curiosity and interest in science largely disappear. The reasons are many.

The junior high years are particularly difficult ones for children. In addition, science classes at this level are frequently staffed by teachers with virtually no seience training who have "moved up" from the lower grades—or by teachers who are marking time until they can complete the course work that will certify them for senior high school positions.

Some educators feel that science in the junior high (grades 7-9) should, as in elementary school, be general science, including topics from both the physical and the life sciences. Also

current is the idea that general science in the junior high should touch upon *all* the sciences to some small degree (without offering an opportunity to develop any one in depth). These ideas, although popular with some observers and teachers, are not very intriguing to most students.

It would appear promising to experiment with a good stratified program for these grades. The sequence could be arranged in various ways; one possibility might be to offer the earth sciences in the seventh grade, life sciences (descriptive aspects of biology) in the eighth grade, and physical sciences (with special attention to matter and energy) in the ninth grade. With careful consideration of their backgrounds in science, followed by judicious assignment of teachers to the appropriate grade level, such a program could take better advantage of the academic strengths each teacher brings from his collegiate training. Such a curriculum would provide an effective transitional stage between the general elementary and departmentalized senior high school science programs. Unfortunately, modern textbooks for such a curriculum are not now available. I must hasten to add that within the framework of either a general science program or a stratified science program, a competent teacher with good materials can develop an excellent course of study for junior high students. But, given present conditions of departmentalized teacher training in our colleges, the stratified program would seem to offer competent teachers greater opportunities for success.

More broadly, two general observations may be made about both elementary and junior high teaching of the biological sciences. First, and of primary importance, most students are being exposed to courses *about* science rather than *in science*. They need far more opportunity to do field and laboratory work—and this does not simply mean going through routine motions with a laboratory workbook. Questions should be posed that form the starting points for experiments and observations that lead to analysis and interpretation. It is this total package of study and laboratory-related activities that comprises science education in the modern sense. And, as a dividend, many "slow" students with verbal problems will be found to do remarkably well in a laboratory atmosphere.

Second, science is too often equated with technology. Our present courses devote too much time to steam engines, radios, automobile motors, radar, hygiene, and other applications of science that are essentially utilitarian and environmental. Far too little emphasis is placed upon basic principles and concepts underlying these applications. Technology has an important role to play in education. But it would be disastrous for our society if our students were to regard science as the search for the design for a better refrigerator rather than as a continuing investigation into the behavior of gases under pressure.

Science in the schools should be concerned with the great ideas that contribute to our understanding of how the world functions: genetic continuity, evolution, and conservation of matter and energy, for example. True, an understanding of these principles leads to the production of better corn, better hogs, better fertilizer, and better refrigerators; but far more significant educationally is the fact that they lead to a conceptual knowledge of the biological and physical world that is our home.

At the high school level, again with a few encouraging exceptions, biology teaching is far from satisfactory. This is especially important because 80 per cent of our American high school students take biology and only a third of these ever complete another science course. For more than half of the nation's high school graduates, in fact, high school biology is the last formal study of science.

Most of the two dozen or so textbooks available today are dull and unexciting. They are usually "encyclopedic" in nature and place a premium on memorization of vocabulary. It has been estimated that in some biology courses the student must memorize more new "foreign" words than he does in a first-year French or German class. Very often in high school courses, as in the earlier grades, there is little or no laboratory work. Also, essential biological topics such as reproduction and evolution are often avoided to forestall the possible criticism of an occasional parent or school board member. In one state it is actually illegal for the teacher to discuss evolution if reference is made to human beings, and in some biology classes the study of reproduction is limited to plants.

Most of today's high school courses are organized around tissues and organs. That is, facts about the structure and function of stomachs, muscles, lungs, hearts, nerves, and kidneys are presented by the text and teacher and memorized by the student. The interesting cellular organization of these structures and exciting excursions into their molecular mechanics are underemphasized. Also rarely included are studies of animal and plant populations and communities and comparative considerations of animal behavior, both of which comprise fascinating and thought-provoking topics for teen-age students.

In a significant number of American high schools the laboratory and field program—when there is one—consists primarily in following a recipe in order to verify a relationship well known to both the student and teacher long be-

fore the exercise was begun. Too few teachers—in part because adequate instructional materials have not been available—bring discovery and open-ended investigations into the classroom laboratory. For too many of our students, biology is not the study of life but a deadly and monotonous routine.

About four years ago the American Institute of Biological Sciences, with financial support from the National Science Foundation, established the Biological Sciences Curriculum Study at the University of Colorado for the improvement of secondary-school biological education. Under the able chairmanship of Dr. Bentley Glass of Johns Hopkins University, and with the active participation of hundreds of high school biology teachers and hundreds of university biologists, the BSCS designed new high school biology courses and a wealth of supplementary materials. For three consecutive years, beginning in 1960-61, experimental editions of BSCS Biology courses have been extensively tested and evaluated in forty-six states, with the lively participation of 165,000 students and 1,000 teachers. These new courses have increasingly captured the imagination and enthusiasm of scientists, teachers, students, educators, and parents because they do several unique things:

1. They contain a wealth of interesting student laboratory exercises and experiments. Many of these investigations are "open-ended"; that is, they may lead the student into unexplored areas rather than direct him along time-worn traditional paths. Teachers involved in these new courses find themselves devoting proportionately more than twice as much class time to laboratory work as they had previously.

2. The major direction of these new courses is to emphasize science as a process of investigation or, to put it another way, to acquaint students with the art of scientific inquiry. Students not only learn to solve problems in biology; more important, they learn how to design experiments and interpret evidenee that will provide answers to questions in science. And they learn how to evaluate the answers they obtain.

3. The new biologies include suitable scientific and straight-forward information in the "sensitive" areas of reproduction and evolution.

4. There is some evidence (not complete, however) that the problem-solving ability that students develop in the BSCS Biology classroom carries over to problem-solving in the chemistry class. (It will take more time to learn whether this ability sustains itself in still other classes and, more important, in post-school life.)

5. The new courses are modern biology. They deal with topics recent and exciting enough to be in today's newspapers while developing the appropriate historical perspectives for these topics.

6. The several courses are quite flexible so that a teacher can modify the basic materials in order to tailor his own course to fit the local situation.

7. They demonstrate that average American high school youngsters are capable of far more sophisticated intellectual attainment in biology than educators had previously believed possible.

8. The courses have been thoroughly student-tested in classrooms throughout America. They have been designed eooperatively by experts (research biologists) who are at the frontiers of knowledge in their fields and by high school biology teachers who face the day-to-day responsibilities of working with students in the biology classrooms. Never before has so much productive effort by so many competent persons been brought to bear on a single high sehool course.

After three years of experimental development, the new BSCS courses will become generally available this month. They promise a revolution in biological education at the secondary school level. It is hoped that, in addition, these materials will serve as working models for others interested in designing still further improvements for high school biology.

Because of these current changes in high school biology programs, a tremendous upheaval is clearly anticipated for higher education. Even now, a number of universities and colleges (examples: MIT, Johns Hopkins, the University of California at Riverside, and the Kansas State Teachers College at Emporia) are eliminating or drastically altering their introductory biology courses for students who have successfully completed a modern biology course in high school. Many other colleges are also considering such moves and it seems obvious that there will be a considerable revision of undergraduate biology during the next decade. To provide models for the colleges during this transition period, the American Institute of Biological Sciences initiated the formation of a Commission on Undergraduate Education in the Biological Sciences with headquarters at Washington University (St. Louis).

At present there are two major types of introductory biology courses in American colleges and universities. One of these, a "general education" course, is designed for virtually all students in the institution regardless of their intended areas of specialization. Because of the wide diversity

of student objectives, and the fact that these general education courses are often compulsory, student motivation is frequently low. Unfortunately, also, the more talented members of the biology faculties often shun these courses. Since a great many students are involved, many universities attempt to adjust to this weight of numbers by offering these courses without laboratory instruction. Despite these difficult problems, the potentialities are promising for such general education courses to play a significant role in the education of non-science majors. The other major type is an introductory biology course (or, in some colleges, introductory botany and zoology courses) designed to be elected by students with more than a casual interest in the biological sciences. Presumably considerable attention will be given to both types of courses by the new commission.

In the 1870s the great British biologist, T. H. Huxley, introduced a zoology course that used a phylogenetic approach, that is, a description of the anatomy and physiology of animals, proceeding from the lower animals to the higher animals in a linear fashion along evolutionary lines. Although it is on the wane today, this phylogenetic type of course has been dominant for many years. At the University of Michigan during the 1920s, a course was developed that was devoted primarily to principles of zoology: a consideration of broad biological topics, using appropriate animals as examples of the particular principle under review. Biological "principles" courses of this nature have spread rapidly and now serve as the standard introductory courses in colleges today. Many of them, unfortunately, tend to be fundamentally descriptive; some of their protagonists do not seem to appreciate that the memorization of the formula for an organic chemical compound is no more experimental, and no less static, than the memorization of the names of the parts of the crayfish appendages.

A further problem facing college biology is that instructional modernization will have to accommodate the rapid expansion of biological knowledge, which is currently doubling about every ten years. It is obvious that selection of material will become more and more critical. Perhaps the direction of the next big change in our college biology programs will be toward an experimental approach to science in which students investigate questions of "why" and "how" rather than questions of "what."

For the colleges, the preparation of secondary school teachers is a difficult and special case. For the most part, potential high school biology teachers and junior high school teachers receive their biological training in the departments of biology in our colleges and universities. When we observe that their preparation in biology is less than adequate, we cannot simply castigate the education departments of the colleges, fashionable as such complaints are today. If we are to be honest in our criticisms, the finger should be pointed at the biology departments in the liberal arts colleges since 80 per cent of the teachers with a major in biology are the products of liberal arts colleges or universities—not of teachers' colleges or education departments. (This does not include the teachers in biology classrooms—about 50 per cent of those currently teaching—who have not been formally prepared for their present assignments and are in them by administrative fiat, rather than through choice and certification.)

The crux of the teacher training problem seems to be that the college biology departments are staffed by professional biologists whose bread-and-butter courses are designed for pre-medical students and future research biologists, the latter being the *alter egos* of the professors. When prospective secondary school teachers come to these departments and request programs planned for their own specific needs, the biology departments frequently reply that the teachers should take the "standard" courses and not ask for "watered-down" courses. But the opposite of "standard," obviously, need not necessarily be "watered-down." A more relevant consideration would seem to be that future secondary school teachers of biology will serve society primarily as *interpreters* of biological research rather than *users* or *producers* of biological research. The needs of such prospective interpreters might conceivably be better met with a quite different array of courses—courses that could be just as demanding, and with just as much "meat" as those designed for potential research men. Some of the smaller colleges seem to be more keenly aware of this situation than many of the larger universities.

The overall prognosis for biological education in the United States in the next decade is very exciting. During recent years a solid and productive cooperation has been developing between school people and subject-matter experts in biology, as well as in mathematics and other sciences, and this bodes well for American education. Without doubt the new secondary school biology courses will have an ever-increasing impact on biological education at all levels of instruction for years to come.

Robert W. Hull Named Department Head At Florida State University

Dr. Robert W. Hull, 39, of Northwestern University, assumed the chairmanship of Florida State University's Department of Biological Sciences on September 1.

Dr. Hull has worked in protozoology and in parasitology and is Secretary of the Society of Protozoologists. He has served as vice-president of the Chicago Academy of Science, and has been active in the National Science Foundation. He is on the Governing Board of the American Institute of Biological Sciences.

Dr. Hull's speaking sehedule this year includes talks at the Second Plenary Session of the International Conference on Parasitology at Rio de Janeiro, the Internation Zoology Congress in Washington, D. C., and American Institute of Biological Sciences.

The new FSU departmental head was born April 3, 1924, in LaCrosse, Indiana. He attended grammar and high schools in Illinois and took one year of electrical engineering at the University of Kansas before entering the Air Force in 1943. He received wartime recognition for developmental work in radio control systems at Wright Field, Ohio.

Dr. Hull received his bachelor of science degree from the University of Illinois in 1949, majoring in chemistry and minoring in zoology. In 1953 he was awarded the Ph.D. in zoology, biochemistry, and physiology by the university. Since that time he has served on the faeulty of Northwestern University and has received wide recognition in protozoology and parasitology and for his modern approaches to biology.

Bernie Studio of Evanston

ROBERT W. HULL

He is married to the former Marie Houf. They have three children, Bradford, 11, Sandra, 9, and Penna, 8.

Dr. Leland Shanor headed the department for several years until leaving a year ago to become dean of the division of advanced studies of the Florida Institute of Continuing University Studies. Dr. Robert Godfrey has served meanwhile as acting chairman.

Sam Aronoff Appointed Molecular Biology Program Director at NSF

Dr. Sam Aronoff has been appointed Program Direetor, Molecular Biology at the National Science Foundation. For the past fifteen years, Dr. Aronoff has been on the faculty at Iowa State University where he was Professor of Biochemistry and Biophysics. Prior to this assignment, he served at the Radiation Laboratory, University of California, 1946-48; research instructor at the University of Chicago, 1944-46; chemistry instructor at Boston University, 1943-44; research fellow at the University of California, Berkeley, 1942-43; and research assistant at the University of California, Los Angeles, 1938-42.

He was born in Brooklyn, New York on February 27, 1915. He received his A.B. in geology from the University of California in 1936 and was

awarded his Ph.D. in physico-chemical biology by the University of California, Berkeley in 1942. He was a National Science Foundation Senior Postdoctoral Fellow, 1957-58.

Dr. Aronoff has more than 60 publications to his credit. He is a member of the American Society of Biological Chemists, American Chemical Society, American Society of Plant Physiology, American Association for the Advancement of Seience, Sigma Xi, Gamma Alpha, and Phi Lambda Upsilon.

Dr. and Mrs. Aronoff, the former Edith E. Moyer, have two daughters, Zena and Elizabeth. His Washington address is 3040 Idaho Avenue, N.W.

AIBS Revises Constitution At Amherst Meeting

The following actions were taken by the AIBS Governing Board at its meeting on August 25th in Amherst, Massachusetts.

1. A revised Constitution and ByLaws were approved for submission to Member Societies for ratification. Approval is necessary by three-fourths (21 societies) vote of the Member Societies. As of September 16, 1963, ten societies had ratified the recommended revisions. For your information, I am enclosing a copy of the Amended Constitution and ByLaws.
2. As of January 1, 1964, there will no longer be Member and Affiliate Societies. Instead, there will be one class of membership for all biological societies which elect to join the AIBS. Under the new structure, each society will pay dues according to a sliding scale based upon the total membership of the society (see page 4, Article III(A) of the ByLaws). For such token membership dues, each Adherent Society will have a representative on the AIBS Governing Board and the society's membership list will be maintained by the AIBS.
3. Membership in an Adherent Society, beginning in 1964, will no longer convey automatic membership on an individual basis in the AIBS. Individuals must join as direct members of the Institute to derive any of the benefits from membership.
4. Member Societies for 1964 were asked to pay dues at the new sliding scale and also to contribute a sum, hopefully not less than the sum paid in 1963, to help establish a sound financial base for the Institute.

   The Ecological Society of America was the first society to contribute $2,000 to the Institute.
5. Direct members of the AIBS will be represented on the AIBS Governing Board by selection of members-at-large to the Board. Members-at-large will be elected by mail ballot on the basis of one member for every 1,000 direct members.
6. The following were elected as officers of the Institute for 1964.

   President—Dr. Paul Kramer, Duke University
   Vice President—Dr. Kenneth Thimann, Harvard University
   Secretary-Treasurer—Dr. Robert Krauss, University of Maryland

ASB To Institute New Placement Service For Ph.D. Candidates

The executive committee of the Association of Southeastern Biologists decided last spring to institute a further service to biologists throughout the southeast through the *ASB Bulletin*. Accordingly, in the January issue each year data concerning prospective Ph.D. candidates will be published. This will be devoted entirely to these people expecting their degrees *one year from the following June,* so that degree candidates and department heads who expect openings to develop a year or more from that time can meet and get to know one another at the April meetings.

Students expecting to receive Ph.D.'s in June of 1965 should therefore submit pertinent data to the editor of the *ASB Bulletin* no later than December 20, 1963. These data should include name, address, institution, permanent address, field of specialization, and whether he or she prefers teaching and/or research.

If it is felt that such a program will aid in the placement of those people expecting to receive master's degrees, comments and suggestions along these lines will be appreciated by the executive committee.

Early in November a reminder will be sent to those departments throughout the southeast that offer Ph.D. degrees. Cooperation from both department heads and students will be appreciated.

The AAAS Cleveland Meeting

DECEMBER 26-30, 1963

THE 130TH MEETING of the American Association for the Advancement of Science will include sessions of 20 AAAS sections and of some 80 participating organizations. Programs of particular interest to biologists are:

Moving Frontiers of Scienee II. One of two speakers the afternoon of Dec. 28 will be Vincent G. Dethier, whose topic will be "Microscopic Brains." Bentley Glass will preside.

Fourth George Sarton Memorial Lecture by Hudson Hoagland, with Chauncey D. Leake presiding, will immediately follow Dethier. Subject: "Science and the New Humanism."

AAAS and Science Council of Japan. During the three sessions on the Sciences in Japan, the afternoon of Dec. 26 and all day Dec. 27, there will be papers by eminent authorities in botany, chemistry, ecology, genetics, microbiology, and medicine. Two-channel simultaneous translation will facilitate discussions.

AAAS Committee on Meetings. A symposium, "Chemical Control of Inheritance," the morning of Dec. 27. A joint program with the Committee on Science and the Promotion of Human Welfare, arranged by Barry Commoner and David R. Goddard.

AAAS Committee on Desert and Arid Zones Research. A two-session symposium on problems of the arid lands of Latin America has been arranged by W. G. McGinnies for Dec. 27.

AAAS Committee on Science in the Promotion of Human Welfare. The report of the Air Conservation Commission is scheduled for the afternoon of Dec. 29.

AAAS Interdisciplinary Symposia. Three of the five interdisciplinary symposia, all on the morning of Dec. 28, are:

1. "Federal Government, Science, and the Universities," arranged by John T. Wilson. Speakers: A. Hunter Dupree, Delphis C. Goldberg, William D. Carey, and Paul M. Gross.
2. "Developmental Aspects of Immunity," arranged by David W. Bishop and Jonathan W. Uhr. Topics and speakers are: Introduction by James D. Ebert, who will preside; Sequential Nature of the Immune Response, Jonathan W. Uhr; The Relationship of the Thymus to the Development of Immunologic Responsiveness, J. F. A. P. Miller (Chester Beatty Research Institute, London); Phylogeny of the Immune Response, Robert A. Good; and Ontogeny of the Immune Response, Arthur M. Silverstein.
3. "Biological and Sociological Research on the Effects of Human Reproduction Control," arranged by Ithiel de Sola Pool and Kingsley Davis, will have as speakers M. Jean Bourgeois-Pinchat (Institut National d'Etudes Demographiques, Paris), W. Lee Hansen (University of California, Los Angeles), Christopher Tietze (National Committee on Maternal Health, New York), Arthur G. Steinberg (Western Reserve University), and Kingsley Davis (University of California, Berkeley).

AAAS Section F—Zoological Sciences. Zoologists' Dinner and vice presidential address by Dietrich Bodenstein, Dec. 29, evening, "Diffieulties in the Interpretation of Organ Multiplications in Insects."

AAAS Section G—Botanical Sciences. Sessions for contributed papers, Dec. 27. The two-session symposium "Plant Biology Today," Dec. 30, is a continuation of the three-year series of basie papers for teachers. Luncheon and vice presidential address by A. J. Sharp will be Dec. 30. His subject is "The Compleat Botanist."

AAAS Section N—Medical Sciences. Four-session symposium, "Chemical Suppression of Cellular Synthesis and Mitosis," arranged by Francis D. Moore and Oscar Touster (in collaboration with session chairmen), and cosponsored by Section F—Zoological Sciences, Dec. 29, 30. Topics and speakers are:

A. *Biochemical and Pharmacological Considerations. Part I*—December 29, morning, Thomas H. Jukes (California) presiding: Thomas H. Jukes (California); Vincent G. Allfrey (Rockefeller Institute); Ernest Borek (Columbia); Sheldon Penman (M.I.T.); Henry C. Pitot (Wisconsin).

B. *Biochemical and Pharmacological Considerations. Part II*—December 29, afternoon, Charles Heidelberger (Wisconsin) presiding: B. R. Baker (Buffalo); Charles Heidelberger (Wisconsin); Waclaw Szybalski (Wisconsin); Edward Reich (Rockefeller Institute); R. W. Brockman (Southern Research Institute).

C. *Cancer Chemotherapy*—December 30, morning, Arnold D. Welch (Yale) presiding: V. H. Reynolds (Vanderbilt); Paul Calabresi (Yale); J. P. Kriss (Stanford); Joseph Bertino (Yale); Roy Hertz (National Cancer Institute).

D. *Immunosuppression in Transplantation*—December 30, afternoon, Rupert E. Billingham (Wistar Institute) presiding: George H. Hitchings (Burroughs Wellcome & Co.); Robert S. Schwartz (Tufts); Joseph Murray (Harvard); E. D. Thomas (University of Washington).

Dr. Francis D. Moore (Harvard) will give the Section N vice-presidential address December 30, afternoon, on "New Surgical Problems in an Era of Nuclear Chemistry."

AAAS Section Nd—Dentistry. Four-session symposium, cosponsored by Section H—Anthropology, on "Growth and Development of the Face, Teeth, and Jaws," arranged by Stanley M. Garn, Dec. 26, 27. Speakers:

A. B. Holly Broadbent (Chm.), Stanley M. Garn, Albert A. Dahlberg, Richard Osborne, Coenraad F. A. Moorrees;
B. Carl J. Witkop (Chm.), Uwe Stave, M. Michael Cohen, Frederic N. Silverman, Arthur Lewis;
C. Seymour J. Kreshover (Chm.), Stanley M. Garn, Arthur Lewis, Robert Blizzard, Lawrence R. Fess, Robert J. Gorlin, Daris R. Schwindler;
D. Sholem Pearlman (Chm.), Richard C. Greulich, Harold Kalter, Wilton M. Krogman, Edward E. Hunt.

AAAS Section O—Agriculture. Four-session symposium, "Agricultural Sciences for the New Nations," cosponsored by the American Society for Microbiology, arranged by A. H. Moseman, Dec. 29, 30.

AAAS Section U—Statistics and Biometric Society ENAR. Two groups of jointly sponsored invited papers which include "Models in Biology," Dec. 29, morn., and "Microbiological Genetics," Dec. 29, aft.

Biologists' Smoker. The smoker, jointly sponsored by AAAS Sections F and G and all participating biological societies, will be at the Natural Science Museum (enlarged facilities on new site, since previous Cleveland meeting), University Circle. Buses will leave the Sheraton-Cleveland Hotel at 9 p.m., Dec. 27, immediately after the Galbraith lecture.

SOCIETAL PROGRAMS

American Association of Clinical Chemists. Contributed papers and symposia, Dec. 27, 28, arranged by Willard R. Faulkner.

American Astronautical Society. Two-session symposium on Bioastronautics, Dec. 30.

American Nature Study Society. Annual meeting. Whole period, Dec. 27-30, includes sessions on observing nature, recording nature, and "Ohio Landscapes."

American Physiological Society and Bioscience Programs, Office of Space Sciences, NASA. Two-session joint symposium on space biology and medicine, arranged by Robert E. Smith and Orr Reynolds, Dec. 29.

American Society of Naturalists. Annual meeting will include a two-session symposium, Dec. 27, and the presidential address, "Paramutation and the Control of Gene Action," of R. Alexander Brink and business meeting, Dec. 28. Speakers in the symposium, "The Time Measurement in Photoperiodic Phenomena," are Colin S. Pittendrigh (Princeton University), H. A. Borthwick (USDA, Beltsville, Md.), Karl Hamner (University of California, Los Angeles), W. F. Hillman (Brookhaven National Laboratory), D. S. Farner, (Washington State College), F. D. Beck (University of Wisconsin), P. L. Adkisson (Texas A & M University), and D. M. Minis (Princeton University).

American Society of Zoologists. The program of the national meeting of the Society, arranged by A. Glenn Richards, with more than 40 sessions, will have some 25 sessions for contributed papers sponsored by all six divisions of the Society; business meetings of the ASZ and of the divisions; three-session "Refresher Course: Genetics of Behavior," a series of symposia, notably Osmoregulation (3 sessions), Evolution of External Construction, Behavior of Arachnids, Evoution and Composition of Vertebrate Hard Tissues, and a two-session panel on Teaching Vertebrate Morphology.

Beta Beta Beta Biological Society. Biennial meeting, Dec. 27, 28, includes a business meeting and a luncheon and an address by John M. Allen (University of Michigan), "Cellular Structure and Function: A Modern Gordian Knot."

Biomedical Information-Processing Organization. Session on computers to aid biology and medicine, arranged by Robert S. Ledley, afternoon of Dec. 28.

Ecological Society of America. Program, arranged by Robert B. Platt, Dec. 26-30, includes seevral symposia, sessions for contributed papers on plant and animal ecology, and five-sessions jointly sponsored by the Section on Animal Behavior and Sociobiology and the Division of Animal Behavior and Sociobiology of the American Society of Zoologists. See below.

Herpetologists League. Two sessions for contributed papers and a business meeting, Dec. 27-29.

Mountain Lake Biological Station "Alumni." Annual breakfast for all persons who have been students, investigators, or staff members at the station, Dec. 29. Horton H. Hobbs will preside.

National Association of Biology Teachers. The annual national meeting, Dec. 26-29, will be a Silver Jubilee celebration. There will be consecutive sessions on Recent Developments in Cellular Biology, Organismal Biology and Ecosystems, as well as on teaching innovations and research. A reception, banquet and reunion, on the evening of Dec. 29, and a joint field trip with ANSS, Dec. 30, will conclude the week's events.

Sigma Delta Epsilon. National meeting, arranged by Ernestine Thurman, will include a luncheon for all women in science, Dec. 27, at which Prof. Agnes Hansen will speak on "A Study of the Atmospheric Pollen of the Minneapolis Area," and the annual society dinner meeting, Dec. 29.

Society of Systematic Zoology. Annual meeting, Dec. 27-30, will include sessions for contributed papers, a panel on "The Classification of Animals," a symposium, "Zoogeography of Invertebrates, Marine Forms," and the annual business meeting.

Soeiety of the Sigma Xi. Sixty-fourth annual convention, joint luncheon with the Scientific Research Society

of America and joint address with Phi Beta Kappa, by Paul B. Sears, Dec. 29. His title, "Telltale Dust."

The AAAS Exposition of Science and Industry—120 booths—and the **AAAS Science Theatre,** with recent foreign and domestic films, will be prominent features of the meeting. Coupons for sleeping accommodations and advance registration will be found in *Science* from July 19 on.

Symposium: The Evolution of External Constructions by Animals.

Program of the Section of Animal Behavior and Sociobiology of the Ecological Society of America, cosponsored by the American Society of Zoologists.

Arranged by NICHOLAS E. COLLIAS

Symposium: Recent Trends in Ecological Research in the Great Lakes.

Program of the Section of Animal Behavior and Sociobiology of the Ecological Society of America.

Arranged by CHARLES C. DAVIS and F. E. J. FRY, University of Toronto.

1. Backgrounds of Ecological Researeh in the Great Lakes. T. H. LANGLOIS, The Ohio State University.
2. Recent Discoveries on the Geology and Sediments of the Great Lakes. HOWARD J. PINCUS, The Ohio State University.
3. Recent Studies of Water Circulation in the Great Lakes. JOHN C. AYERS, University of Michigan.
4. The Physical and Chemieal Environment in the Great Lakes. D. W. ANDERSON and G. K. RODGERS, University of Toronto.
5. Recent Studies of the Bottom-Living Organisms in the Great Lakes. E. BENNETTE HENSON, U. S. Public Health Service, Cincinnati, Ohio.
6. Plankton Studies in the Great Lakes. CHARLES C. DAVIS, Western Reserve University.
7. Recent Studies of the Dynamics of Fish Populations in the Great Lakes. HENRY A. REGIER, Ontario Dept. of Lands and Forests, Maple, Ontario.
8. Great Lakes Studies of Primary Production. GEORGE W. SAUNDERS, University of Michigan.
9. The Direct Effects of Pollution in the Great Lakes. G. S. HUNT, University of Michigan.
10. The Eutrophication of the Great Lakes. ALFRED M. BEETON, U. S. Fish and Wildlife Service, University of Miehigan.
11. Forum on Future Needs and Plans.
    a. DAVID C. CHANDLER, University of Michigan.
    b. G. B. LANGFORD or R. E. DEANE, University of Toronto.
    c. THEODORE A. OLSON, University of Minnesota.
    d. LOREN PUTNAM or CHARLES A. DAMBACH, F. T. Stone Laboratory, Put-in-Bay, Ohio.
    e. J. W. MOFFETT, U. S. Fish and Wildlife Service, Ann Arbor, Michigan.
    f. An as yet un-named representative of the South Bay, Manitoulin Island Laboratory of the University of Toronto.
    g. G. F. M. SMITH, Fisheries Research Board of Canada, Biological Station, London, Ontario.

Field Trips

FRIDAY, DEC. 26—Field Trip to the Baldwin Filtration Plant and the Easterly Sewage Disposal Plant in Cleveland.

Dr. Charles C. Davis, Department of Biology, Western Reserve University, Cleveland 6, Ohio, is in charge of the arrangements for this trip. Inquiries and arrangements should be made with Dr. Davis before December 1, 1963.

SATURDAY, DEC. 28, 8:30 a.m.; Lobby, Sheraton-Cleveland—Field Trip to a Beech-Maple Climax Forest.

Reservations must be made by December 1 and must be accompanied by a check for $1.50 to cover cost of transportation. Checks will be returned in case the trip must be canceled for any reason. Send reservation and check to:

Dr. Lowell P. Orr
Department of Biological Sciences
Kent State University
Kent, Ohio.

Invited Papers: Cave Ecology.

1. The Fauna of Mammoth Cave. THOMAS C. BARR, JR., University of Kentucky.
2. Limnological Studies in Mammoth Cave. ROBERT A. KUEHNE, University of Kentucky.
3. Biology and Ecology of the Cave Cricket, *Hadenoecus subterraneus.* ORLANDO PARK, Northwestern University.
4. Experimental Analysis of Activity in the Cave Cricket, *Hadenoecus subterraneus.* DAVID REICHLE, Northwestern University.
5. Some Biological Effects of Basc-Level Fluctuation in the Mammoth Cave Region. THOMAS L. POULSON, Yale University, and PHILIP M. SMITH, Cave Research Foundation.
6. Molting and Reproductive Periods in a Cave Crayfish. THOMAS C. JEGIA, University of Minnesota, Morris.
7. Aspects of Bat Hibernation in the Mammoth Cave Region. JOHN S. HALL, Albright College.
8. Behavior of Bats at Carter Caves, Kentucky. WAYNE H. DAVIS, University of Kentucky.

Symposium: The Use of Morphological and Autecological Characteristics of Plants in Community Gradient Analysis.

Arranged by O. L. LOUCKS, University of Wisconsin.

G. COTTAM, Presiding

1. Coordinate Methods in Construction of Submodels of Minnesota Forest Ecosystems. EGOLFS V. BAKUZIS, University of Minnesota.

2. Gradient Analysis by Synecological Indices Compared with Synthetic Environmental Scalars. O. L. Loucks, University of Wisconsin.
3. A Physiological Approach to Alignment of Vegetation Along Environmental Gradients. R. H. Waring, Oregon State University.
4. An Analysis of Wisconsin Vegetation on the Basis of Plant Structure and Function. Dennis H. Knight, University of Wisconsin.
5. Some Patterns of Multidimensional Analysis in Plant Communities. Pierre Dansereau, New York Botanical Garden.

Books and Periodicals

The first of a series of papers designed to further the knowledge of the vascular flora of Florida by the presentation of keys, nomenclature, and distribution of those species native or naturalized with the state has been published in *Castanea* 28: 1-10, 1963. The series is being prepared by the staff and students of the Herbarium of the Agricultural Experiment Station and Department of Botany of the University of Florida, together with the cooperation of outside specialists. The first paper is on *Pinus*.

Florida Flora Newsletter is also published regularly by the Herbarium. It is edited by Dr. D. B. Ward, and is for communication among persons interested in the flora of Florida.

MOSSES OF FLORIDA. AN ILLUSTRATED MANUAL. vii-xliv, 1-134. 133 plates (all drawn by the author from Florida specimens). University of Florida Press, Gainesville, Fla., 1963. $8.50. Contains keys to and descriptions of all genera and species of Florida mosses.

FRESHWATER FISHES OF THE WORLD. By Günther Sterba. Translated and revised by Denys W. Tucker. The Viking Press, New York 22, N. Y. $17.50. Longacre Press, London. 3 pounds, 10 shillings.

Originally published in Leipzig, where Dr. Sterba is Director of the Zoological Institute of the University, as *Süsswasserfische aus aller Welt* in 1959, this exemplary aquarium book rapidly became the leader in its field in Germany, a country whose enthusiastic aquarists have a history of expertise and the best of aquarium journals. The English edition is fortunate to have Dr. Tucker, a respected ichthyologist formerly of the British Museum, as its translator. Besides a fine job of translation, Dr. Tucker has revised and updated (even in three years there are many changes in the actively expanding aquarium world!) much of the book, especially that on African fresh-water fishes, for which task he had the help of Dr. Trewavas and Dr. Greenwood, both of the British Museum and the most knowledgeable persons on that ichthyofauna. With such authoritative help, and with that of a few others, it is not surprising that Dr. Sterba's four-pound tome is one of the best on aquarium fishes, and perhaps the best.

Its 878 pages include brief descriptions of about 1300 species of freshwater fishes, with notes on behavior, breeding, and water condition preference when known. A general account is given for each of the approximately 70 families to which these fishes belong, along with a map of the distribution of each of the families. Accurate scientific names of the individual species are given, as is their distribution, and the authors have mostly avoided the temptation to invent "common" names for species not so endowed previously. Nearly all of the species are well illustrated, some by color photographs (102), others by black and white photographs (423) or stippled drawings (668).

An interesting feature not found in other aquarium books is the conclusion of each species description with the year in which the species was first imported into central Europe, for, in the vast majority of cases, this will be the year that the species first entered the aquarium trade anywhere, so voracious is the German appetite for new and unusual forms.

Especially since this work will undoubtedly become a standard of reference, it is unfortunate that Dr. Sterba did not follow the precedent set in Dr. Innes' now classic *Exotic Aquarium Fishes* of giving the phonetic pronunciation of scientific names and their meanings in English. Scientific names are so mispronounced even by professional ichthyologists that there seems to be little hope for the amateur without this aid. And how much more fun is the learning of scientific names of fishes when one knows, for instance, that *Anostomus* means turned up mouth, *Gasteropelecus* hatchet belly, *Gambusia* worthless, or the meaning of *Scatophagus*?

Considering the international flavor of the authorship, places of publication, and expected sales, it is surprising to find such a provincialism as "in our waters" (i.e., Europe's, especially Germany's) used distractingly often. Another discordant note along these lines is that the London publishers state that the printing was done in Leipzig, while the New York publishers state "Printed in East Germany, U.S.S.R. occupied." Except for this slight difference, the two editions are identical, and it is well worth the prospective buyer's mental effort to convert the shilling price for comparison with that in dollars.

With well over a thousand species (ineluding some, such as the lampreys, salmons, and trouts that are rarely mentioned in aquarium books) described, even the ad-

vanced aquarist is unlikely to see even half of them in a lifetime. But if it can be found in an aquarium shop, the odds are very much in favor of it being also found in Dr. Sterba's *magnum opus.*

James C. Tyler

GUIDE TO THE MANUSCRIPT COLLECTIONS IN THE ACADEMY OF NATURAL SCIENCES OF PHILADELPHIA. By V. T. and M .E. Phillips. A.N.S.P. Special Publ. No. 5, XXVI, 553 pp. Litho. Edwards Bros., Ann Arbor, Mich. Bound. $7.50.

The Academy of Natural Sciences of Philadelphia in its 150 years of existence has, as any institution of like age, accumulated a mountainous mass of documents, letters, and manuscripts related to the institution and its personnel. Unless this type of material is systematically arranged, finding the papers relating to a particular person or event can approximate the proverbial search for the needle in the haystack. The excellent and painstaking work of the Phillips' in systematically arranging the material of the Academy as well as preparing the catalogue assures future workers that they will be able to find the documents listed and gives the first comprehensive pieture of the breadth and composition of the material available in the archives.

The book is concerned with listing the over 185,000 items in the Academy's archives. It consists of an alphabetical list of the 970 numbered collections, the listing and descriptions of the collections, a subject index to the information contained in the manuscript documents, and an author index of signers of letters and documents. This extensive indexing system greatly extends the usefulness of this work to bibliographie and biographic researchers.

News of Biology in the Southeast

About People

J. Richard Thomson has been elected treasurer of the Alabama Academy of Science for 1963-1966. He was formerly chairman of the Biological Sciences Section and Vice-President.

Robert E. Wean, Chairman of the Biology Department at the University of Tampa, has been awarded a grant of $1,670 by the NSF. This fund plus a matching sum from the university will be used to purchase equipment for a course in physiology.

Carolyn P. Hutchins has accepted an appointment as Assistant Professor of Biology, Charlotte College, Charlotte, North Carolina. Miss Hutchins received her Ph.D. in Zoology in August from the University of Tennessee.

Aelita Pinter, a recent graduate of Tulane University, has received the 1963 award of the American Society of Mammalogists for outstanding research by a young mammalogist during the past year. Her work was directed by **Dr. Norman C. Negus.**

Scott M. Weathersby, Professor of Zoology, Louisiana Polytechnic Institute, has been elected Secretary of the Louisiana Academy of Sciences for a two-year term.

The Department of Plant Sciences, Texas A&M University, announces the appointments of **Dr. Howard G. Applegate** as Associate Professor of Plant Sciences and **Dr. Robert D. Powell** as Associate Professor of Plant Physiology. Dr. Applegate was formerly with the University of Arizona, and Dr. Powell was with the University of Florida.

James A. Miller, Chairman of the Department of Anatomy of Tulane University, has just been awarded a supplement of $36,949 a year to the Training Grant which the department has from the National Institutes of Health. The department presently has nineteen Ph.D. candidates in its program.

John E. Pauly, formerly of the Chicago Medical College, has joined the Department of Anatomy of Tulane University at the rank of Associate Professor.

Howard L. Hamilton, who has been serving as Visiting Professor of Biology at the University of Virginia, has been appointed Professor of Biology effective September, 1963.

DeForest Mellon, Jr., Robert L. Searls, and **David S. Smith** are new additions to the biology department at the University of Virginia. Dr. Mellon received his undergraduate training at Yale University and his doctorate from John Hopkins University. His research interest is in electrophysiological studies on invertebrate nervous systems. Dr. Searls received his undergraduate training at the University of Wisconsin and his doctorate at the University of California, Berkeley. He is doing research on metabolic control of development. Dr. Smith received his undergraduate training and doctorate at the University of Cambridge, England. His research interest is in structure development and function of striated muscles.

Richard E. Garth is on a leave of absence from Northwestern State College, Natchitoches, Louisiana and is working for the National Science Foundation as Assistant Program Director of Secondary School Programs. His particular area responsibility deals with the State Academies of Science programs.

Jack W. Clark, William N. Pafford, and **David J. Moore** have joined the staff of the Department of Biology at Radford College. Mr. Clark has a B.A. from Los

Angeles State College and an M.A. from San Fernando State College. He attended the University of Maryland on an NSF fellowship in entomology. Mr. Pafford received his B.S. and M.S. from Peabody College. He has done some graduate work in radiation biology. Mr. Moore received his B.S.Ed. from Clarion State Teachers College and his M.S. from Ohio State University. His research involves the study of minimum energy requirements in the green pheasant.

L. H. Flint retired on 30 June and plans to work on the freshwater red algae of North America. He will welcome any assistance in conjunction with this project.

Sherwood M. Reichard, Assistant Professor, Department of Biological Science, Florida State University, was elected a Fellow of the AAAS in June, 1963. Dr. Reichard was granted $150,000 by the NSF and the AEC over the past four years to hold a Radiation Biology Institute during the summer months. He is also the recipient of a $50,000 grant for a three-year study on the Reticuloendothelial System.

Lloyd M. Beidler, Professor, Biological Sciences, Florida State University, spent the summer at Stanford University attending a writing conference of the AAAS, designed toward selection of equipment and the training of children in experimental science in the grade schools.

Lutz Wiese, University of Tübingen, Tübingen, Germany, will work with **Dr. Charles Metz,** Institute for Space Biosciences, Florida State University, for the next two years as a visiting investigator. Dr. Wiese will carry on a program of research on *Chlamydomonas*. His wife, Woltrand Wiese, will work as his assistant. Dr. Wiese received his Ph.D. in Biology at the University of Tübingen in 1952 and has been a Research Associate in the Department of Biology at Princeton University since 1961.

Dexter M. Easton, Associate Professor, Biological Science, Florida State University, was elected a Fellow of the AAAS in June, 1963.

Robert H. Reeve has joined the staff of Florida State University as Instructor in the General Biology program. Mr. Reeve will receive his Ph.D. in Science Education in December, 1963. He received a B.S. in pre-medical sciences from Maryville College, Maryville, Tennessee and an M.S. in bacteriology from Lehigh University, Bethlehem, Penna. Mr. Reeve has conducted three In-Service Institutes, sponsored by the NSF, for the Department of Science Education during the past two years.

John D. McCrone, Assistant Professor of Biology, Florida Presbyterian College, has received a two-year NIH grant of $24,533 to support his research on the comparative biochemistry and toxicology of *Latrodectus* venoms. Dr. McCrone also has received a one-year grant of $4500 from the Florida Heart Association for this research.

John C. Ferguson has joined the faculty of Florida Presbyterian College as Assistant Professor of Biology. Dr. Ferguson recently received his Ph.D. from Cornell University. His research interests are in echinoderm biology and physiology.

C. W. Hart, Jr., Editor of the *ASB Bulletin*, has received a two-year NSF grant of $13,400 to support research on the entocytherid ostracods of North America. Mr. Hart also received a grant of $650 from Sigma Xi to support an ecological study of the cave shrimp, *Palaemonias ganteri*, in Mammoth Cave, Kentucky.

Jesse C. Thompson, Jr., has resigned as Associate Professor of Biology at Hollins College and is now Professor of Biology at Hampden-Sydney College.

Marilyn S. Darling has accepted the position of Instructor of Biology at Hollins College. Her husband is Instructor of Biology at Roanoke College. They are graduates of the Departments of Botany and Zoology at Duke University.

Burton J. Bogitsh, Professor of Biology at Georgia Southern College has been granted a one-year leave of absence to assume a position with the Institutes Section of the NSF in Washington, D. C.

Grace T. Wiltshire is retiring as Associate Professor of Biology at Randolph-Macon Woman's College. She has been a member of the faculty since 1928. Mrs. Wiltshire has been active in many professional organizations, particularly the Virginia Academy of Sciences, and is the current president of the Virginia Society of Ornithology.

Dorothy Fry of Mt. Holyoke College has been appointed Assistant Professor of Biology at Randolph-Macon for the current year.

James E. Perham, Assistant Professor of Biology at Randolph-Macon attended the meeting of the International Genetics Congress at The Hague, Netherlands.

Dorothy L. Crandall, Associate Professor of Biology at Randolph-Macon attended the annual meeting of the AIBS at the University of Massachusetts. She presented a paper on the ferns of Rhode Island.

James L. Chamberlain, Assistant Professor of Biology at Randolph-Macon Woman's College, attended the NSF Institute for College Teachers held at Williams College.

Willis A. Eggler, Newcomb College of Tulane University, will be on leave-of-absence for the year 1963-64 to continue studies of the manner of invasion of volcanic deposits by plants, in Mexico, Guatemala, and El Salvador.

W. Jackson Davis and **Dean P. Owens** have been added to the staff at the Virginia Institute of Marine Science. Dr. Davis will work on fish larvae and fishery research with **Edwin B. Joseph, John Norcross** and **C. E. Richards.** Mr. Owens will work in the Microbiology-Pathology Department.

Bernard C. Patten, Frank Wojcik, Willard A. Van Engel, and **William J. Davis** of the Virginia Institute of Marine Science attended meetings of the AIBS at the University of Massachusetts this summer. Dr. Patten presented a paper on "Some Experimental Characteristics of Dark and Light Bottles" and Dr. Davis a paper on "Reliability of Fish Sampling Methods."

Alan D. Conger, Professor of Radiation Biology at the University of Florida, is currently serving as chairman of the project site visit committee for radiation biology for the U. S. Department of Health, Education and Welfare, Public Health Service. He has also recently been elected to the Counеil of the Radiation Research Society.

Some grant projects currently in progress in the Botany Department, **University of Florida,** include:

Metabolism of molecular oxygen by plants (AEC), **Dr. G. S. Fritz**

Effects of ionizing radiation on ovule development (AEC), **Dr. Y. Sagawa**

Studies in plant material of radiation after effects and long-lived free radicals (AEC), **Dr. A. D. Conger**

Absorption of sugars by corn scutellom slices (NIH), **Dr. T. J. Humphreys**

Genetical basis of heterothallism in *Dictyomorpha* (NIH), **Dr. T. J. Mullins**

Compositional relationships between broadleaf evergreen and deciduous forests (NSF), **Dr. C. D. Monk**

Plant community dynamics (NSF), **Dr. C. D. Monk**

Anatomy and histogenesis in conifers (NSF), **Dr. M. M. Griffith**

Studies in the Orehidaceae (AOS, SFOS), **Dr. Y. Sagawa**

Plant growth facilities for radiation botany and biology (NSF), **Dr. A. D. Conger**

Asa G. Sims, Jr., Department of Biology, Southern University, Baton Rouge, Louisiana, has received a $20,000 NIH grant to study pectic enzymes and toxins of *Pellicularia filamentosa.*

Leon Roddy, Department of Biology, Southern University, Baton Rouge, Louisiana, has received a $9,000 NSF grant to study the spider family Clupeonidae.

Institutions and Organizations

The Department of Anatomy of **Tulane University** will soon move into its new quarters on the downtown campus. The new facilities will be located on the third floor of a nine-story building which is nearing completion.

The Departments of Biology and Psychology are occupying the new Life Scienees Building at the **University of Virginia.** Formal opening exercises will be held at a later date.

The Biology Department of **Radford College,** Woman's Division of **Virginia Polytechnic Institute,** has received a matching NSF equipment grant under the direction of **Dr. Floyd E. Jarvis, Jr.,** Chairman. The $16,000 will be used to completely equip a controlled temperature genetics instructional and research laboratory. In addition, a number of calculators will be purchased for a small statistical laboratory to be used jointly with the Department of Mathematies in support of the genetics program.

The Training Branch of the Office of Resource Development, U. S. Public Health Service, has awarded a training grant to the zoology department of **Tulane University.** The award of $142,431 will support the training of graduate students in environmental biology for a five-year period. Sites in the states of Florida, Louisiana, Texas, and New Mexico were visited during the first summer's work. **Dr. Royal D. Suttkus** is directing the program.

The **Tulane Zoology Seminar** for fall, 1963, will include the following speakers: Oct. 15, Dr. M. C. Niu (Temple University); Oct. 22, Dr. Oliver P. Pearson (University of California, Berkeley); Nov. 5, Dr. Dietrich Bodenstein (University of Virginia); Nov. 19, Dr. Walter Auffenberg (University of Florida); Dec. 3, Dr. James Kezer (University of Oregon); Jan. 7, Dr. James Layne (Cornell University).

The death of the founding editor of *Tulane Studies in Zoology,* has resulted in changes in the editorial staff. **Dr. George H. Penn**'s successor as editor is **Dr. Harold A. Dundee,** with **Dr. Gerald E. Gunning** serving as Associate Editor.

The Department of Biological Science, **Florida State University,** has received renewal of an NIH Training Grant in Physiology for the third straight year.

Beginning September, 1964, the Botany Department of **Tulane University** will offer work leading to the Ph.D. degree. The department has had a graduate program offering the M.S. degree since 1917.

The NSF sponsored three programs this summer at the **Virginia Institute of Marine Science.** Students under the Research Participation for College Teachers program worked on individual research for twelve weeks and students and staff members worked for eight weeks on the Undergraduate Science Education program. Conducted

for the first time this summer was a Cooperative College–School Science program at Norview High School, Norfolk, Virginia. Fifteen high ability students and three teachers participated.

The Botany Department, **University of Florida,** is sponsoring at three (3) off-campus centers (Jacksonville, Deland, Sebring) a course for teachers to instruct the BSCS Biology Course. **Dr. G. Ray Noggle** and **Dr. W. Selser** are directing the program which is supported by the National Science Foundation. This is the third year for this program, which has previously been offered at centers in Melbourne, Orlando, Tampa, Jacksonville, and Gainesville.

New laboratory facilities for the Radiation Biology Program, **University of Florida,** will be completed in the winter of 1963. These will be located in the Nuclear Science Building. Various radiation sources as well as greenhouses and controlled environment chambers will be some of the new facilities available.

A $200,000 Health Researeh wing has been completed at **Southern University,** Baton Rouge, La. This 2-story building houses 13 research laboratories plus rooms for equipment and supplies and washing and autoclaving glassware. Money for this building was provided by NIH and matching funds from the State of Louisiana.

The ASB Bulletin

Geoffrey M. Jeffery, Editor, Volumes 6-7
C. Willard Hart, Jr., Editor, Volumes 8-10

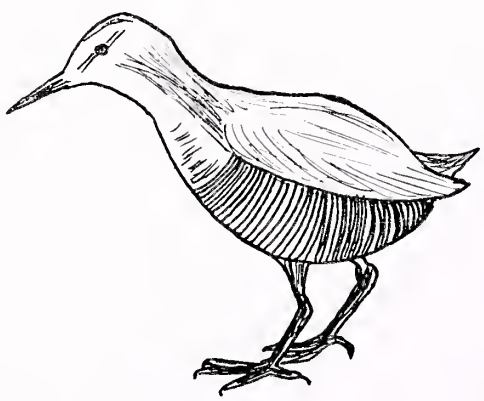
Published by
The Association of Southeastern Biologists

Index to Volumes 6-10, 1959-1963

This is the second of a series of five-year indices planned for the *ASB Bulletin*. The author index includes authors of abstracts and articles, but the subject index does not include abstract titles or subjects. Those who plan to bind the *Bulletin* should note that this index can be removed and bound at the end of the volume without disturbing the sequence of pages.

Subject Index

Author Index



On the next page are six designs that have been submitted in the ASB's competition for a seal. As the competition is still open, additional designs or comments on the ones shown here are welcome. Please communicate with Dr. Harry Bennett, Dept. of Biology, Louisiana State University, Baton Rouge, Louisiana.

The Association of Southeastern Biologists

ASB BULLETIN

Volume 11, Number 1—January 1964

The ASB Bulletin is the official quarterly publication of the Association of Southeastern Biologists, Inc., and is published at Philadelphia, Penna., in January, April, July and October. Letters, news items, other contributions, and all communications about editorial matters should be addressed to C. W. Hart, Jr., Editor, The Academy of Natural Sciences of Philadelphia, 19th and The Parkway, Philadelphia, Penna. Changes of address should be sent promptly to the Secretary of the ASB, Dr. Harry J. Bennett, Department of Zoology, Louisiana State University, Baton Rouge, La. Subscription orders from libraries and other institutions should he sent to the Business Manager, Dr. Leland Shanor, Department of Biological Sciences, Florida State University, Tallahassee, Florida. Suhscription rate for nonmembers of the ASB: $4.00 per year. Printing and typography by the Wickersham Printing Co., Lancaster, Penna.

Second-class postage paid at Philadelphia, Pennsylvania.

CONTENTS

The cover photo of a little brown bat (*Myotis lucifugus*) was taken during a netting operation at Mammoth Cave National Park, Kentucky. This study, which involved the capture and banding of over 12,000 migrating bats during August and September, 1963, is one of several projects going on at the recently established Institute of Speleology at the University of Kentucky.

Other work with bats includes studies of homing, migration patterns, sex ratios, and winter waking cycles at Carter Cave State Park, Ky. Faculty and graduate students involved with these projects include Dr. Wayne H. Davis, Dr. Roger W. Barbour, Marion D. Hassell, Charles L. Rippy, and Raymond McAdams.

ASSOCIATION AFFAIRS

INTERIM EXECUTIVE COMMITTEE MEETING

Emory University

October 5, 1963

The meeting was called to order by President Jones at 9:00 A.M. Present were: President E. Ruffin Jones, President-Elect William D. Burbanck, Retiring President Walter L. Flory, Treasurer Leland Shanor, Editor C. Willard Hart, Jr., Executive Committee members Walter R. Herndon, Patrick H. Yancey, John H. Carpenter, Wilbur H. Duncan, C. Ritchie Bell and Secretary Harry J. Bennett.

The minutes of the meeting of the Executive Committee for April 20, 1963 were approved.

President Jones called for a number of reports:

Secretary's Report: The Secretary reported that the results of a questionnaire sent to the membership indicated that the third week-end in April was the preferred time for the annual meeting in 1964. The replies as to the type of program preferred on Thursday evening showed that the majority thought that a symposium should be substituted for a single speaker. He submitted a let-

(*continued on page 21*)

Fig. 1. Experimental cage. Overall view with plexiglass cover in place. Instead of this cover we also used chicken wire painted with flat black. At its lower end each pedal is supported by a lever which is adjustable by a spring and connected to a microcounter. The cage measures on top 35 inches in diameter.

Orientation In Animals [1]

by

E. G. FRANZ SAUER

University of Florida

For any organism continuously exposed to changing environmental influenees, oriented locomotion is the behavioral act that ultimately deeides success or failure of the individual or, at a higher level, the survival or extinction of the species.

The *taxis,* that is the orienting movement of an animal capable of free locomotion, is one element of complex behavior patterns. The analysis of the complex organie structures and functions that underlie a given taxis has become a matter of increasingly sophisticated research.

Animals are oriented toward or away from environmental stimuli, or at certain angles to them. The orienting act may consist of instinctive patterns, that is species-specific behavior, and adjusted instinctively to specific environmental signals, that is without being learned. Or it may be manifest as an individual-specific act entirely learned. Intermediate forms exist between these two extremes where instinct and experience combine in various degrees. Learning itself may be established in that special form called "imprinting," which indeed seems to be different from any associative learning. This old and controversial ethological point of view is supported by recent biochemical analyses.

In general, orienting movements have an enormous adaptive value and are thus of great biological significance. We can be sure that in most organisms that have uniformly selected, specifically oriented locomotion instead of random movement, the selective pressure must have been severe.

Structural and functional differentiations, anatomical, morphological, neurological changes, and modifications of biochemical systems for greater and better efficiencies account for the development and the evolutionary success of adaptive orientation. The development and the secular shifts of the universe, accompanied by the radiation of the animal kingdom, the occupancy of new ecological niches, and the struggle for existence between competitors, the differen-

[1] This paper was presented as the invitational address at the Gainesville, Florida, meeting of the ASB in April 1963.

tiation and destruction, maturation and aging of the individual, the social community, and the many species are only a few of the many external and internal factors that continuously challenge the organisms to orientate for better adjustments and survival. Exposed to such severe selection pressure, it is not at all surprising that animals are known to orient instinctively to supernormal or supernatural stimuli, thereby disregarding the natural specific releasers of their normal intra- and interspecific environments. From a phylogenetical point of view this must be the most desirable condition, which means that the orienting mechanisms of organisms are "open to one side," enabling the animal not only to meet severe selection pressure but to escape it and to aim for a new evolutionary level. For the same reason it has been formulated from philosophical viewpoints that animals have a potential knowledge of "supernatural ideas." For us this fact is of enormous importance when we design an experiment to let the animal orient to an artificial model of the natural stimulus.

The forms and functions of short- and long-range orientation are manifold. With respect to the peripheral afference, every available sensory system is utilized for orientation, including chemo-, mechano-, electro-, optical and ultra-optical receptors. For instance, thresholds for olfactory orientation in the eel *Anguilla anguilla* range into dilutions of $(1 : 2.8) \cdot 10^{-18}$. Rhinolophid bats can locate with their sonar system, from distances up to about 10 metres, echoes of their own supersonic sounds reflected by nylon strings only 100 microns in diameter.

Individual animals are oriented with respect to their own bodies, to the substrate they live on, to water and food sources, to social partners and to enemies. Orientation to a "home" means shelter, to a territory existence, and during expansions of their home ranges animals orient to the unknown extraterritorial space.

In the course of evolution the "home" of a species may have become split into summer and winter residences. We have solid evidence that during the Pleistocene glaciations many animals ventured into the unknown to establish new homes where they survived and further evolved, but yet maintained some contact with their ancestral homes. Bound to the new and the old homes by instinct and successful learning, some species retained their drives to migrate between these seasonal goals over pathways leading in their extremes nearly from one end of the globe to the other. Other species may have become nomads and migrants without exposure to glacial forces, simply as a result of population pressure and their continuous search for new sources of food. Many of these are no less astounding with respect to the distances they travel.

Studies of American sea turtles by A. Carr brought direct proof that these reptiles cross the oceans of the world, goal-directed and not at random.

Bird migration has fascinated mankind ever since ancient times. The flight pattern of the Arctic Tern, *Sterna paradisea*, remains the favored example of the ornithologists the world over. This bird covers about 20,000 miles per year, migrating along subspecifically different routes from as far as 82°N to as far as 66°S and back again.

Even among heterothermic invertebrates we find long-distance migrants of remarkable abilities. The Monarch Butterfly, *Danaus plexippus*, travels between its seasonal goals located north in the North American Arctic and south in California, Mexico, and eastward to Florida. This butterfly migrates close to 3,000 miles to survive for a winter and to return to its original home, just to reproduce and then to die.

It is this topic of space orientation over long distances with which I want to conclude this invitational address, and I want to refer to one kind of long distance migration in which celestial bodies are used by animals as reference system. It was only in 1911 that the Italian zoologist F. Santschi discovered celestial orientation in the animal kingdom through his observations and studies of sun-orientation in ants. During the past decades it became established that many animals use the sun, moon, and stars instead of topographical features for reference systems of orientation. K. v. Frisch and the late G. Kramer are the two outstanding scientists who pioneered in the field of sun-orientation in honey-bees and in birds. F. Papi discovered the

moon-orientation in a small amphipod crustacean. F. Sauer and E. Sauer found stellar orientation in nocturnally migrating birds. Most impressive has been the discovery that animals utilize their endogenous circadian and annual rhythms as time measuring devices to account for the relative movements of the celestial bodies across the sky and for the seasonal shifts.

Our recent subject is the Siberian Golden Plover, *Pluvialis dominica fulva*. This bird, which migrates across the vast Pacific Ocean, has provided us with new information and insight on how a migrant can master a goal-directed flight lasting continuously for days and nights across a vast hostile area of some 3,000 to 5,000 miles. We raised 10 birds by hand on St. Lawrence Island, Bering Sea, a location as close as possible to the Siberian ancestral home of the Golden Plovers. Now three years of age, these ten birds have shown migration restlessness, reproductive activities, and molt in natural sequence. The experimental work has been greatly favored by their tameness; they readily display their motivation-specific behaviors with a minimum amount of disturbing activation. One can rely, therefore, on the quality of their migration restlessness much more than on that of wild-caught adult birds in a similar experiment. The latter often display fear and escape tendencies which interfere with their migratory activity, and this can condemn an experiment to failure. The second reason for using hand-raised birds is the need for a clear experimental situation. These ten birds had never experienced natural migration. Thus, if learning were involved in their migration, one could test this by experimental geographical displacements or by an experimental arbitrary setting of their internal clocks, provided that these exist, that they could be shifted, and that they were used for migration orientation. At their birthplace, Boxer Bay on St. Lawrence Island, the birds were exposed to the natural sky, and one could cxpeet that their internal clocks were in phase with the loeal time. Before they had reached their first migratory period, they were flown by airplane to Madison, Wisconsin; during their travels the birds were prevented from seeing the sky. The birds stayed in Madison from the end of August 1960 to Fcbruary 1961; then they were flown out to San Francisco.

For the purpose of a comparative study 6 of the birds (in San Francisco, 4) were kept in light-controlled rooms with and without climatic controls. The daily light cycles acting upon these birds were kept in phase with those that would have influenced the birds during the corresponding seasons at Boxer Bay, during their migration across the Pacific Ocean, and at Honolulu, Hawaii. The 4 remaining birds (in San Francisco, 6) were exposed to the local conditions of Madison, and later of San Francisco, and could see at least part of the sky during day and night.

During their migratory periods the birds were tested individually in a circular cage designed to record the migration restlessness and directional tendencies of these non-perching waders (Fig. 1). Aecording to the 16 meehanically pressure-sensitized, radially arranged recording pedals, the birds themselves counted their take-offs and landings in 16 compass sectors. These counts are shown in the diagrams. Since Golden Plovers normally migrate in flocks and give flight notes, a loudspeaker was installed in the center underneath the cage through which we played flight notes of migrating Golden Plovers. As a result of this acoustical stimulation, the individual bird in the experimental cage showed increased migratory activity.

A few typical examples of the 1961 test series, including 159 experiments with a total recording time of $249^{h}\ 52^{m}$, may be given here. Not knowing what flight courses the birds would take from San Francisco, we selected as our reference system the great circle tracks that connect Boxer Bay, Madison, San Francisco, and Honolulu (Fig. 2).

The internal clocks of the birds of the first experimental group were, to various degrees, as much as $3^{h}\ 16^{m}\ 40^{s}$ slow compared to San Francisco local time. Despite these various time shifts, the modes of their undisturbed spring migration oricntation approached the initial bearing of the great circle route from San Francisco to Boxer Bay (Fig. 2 a). This mean was

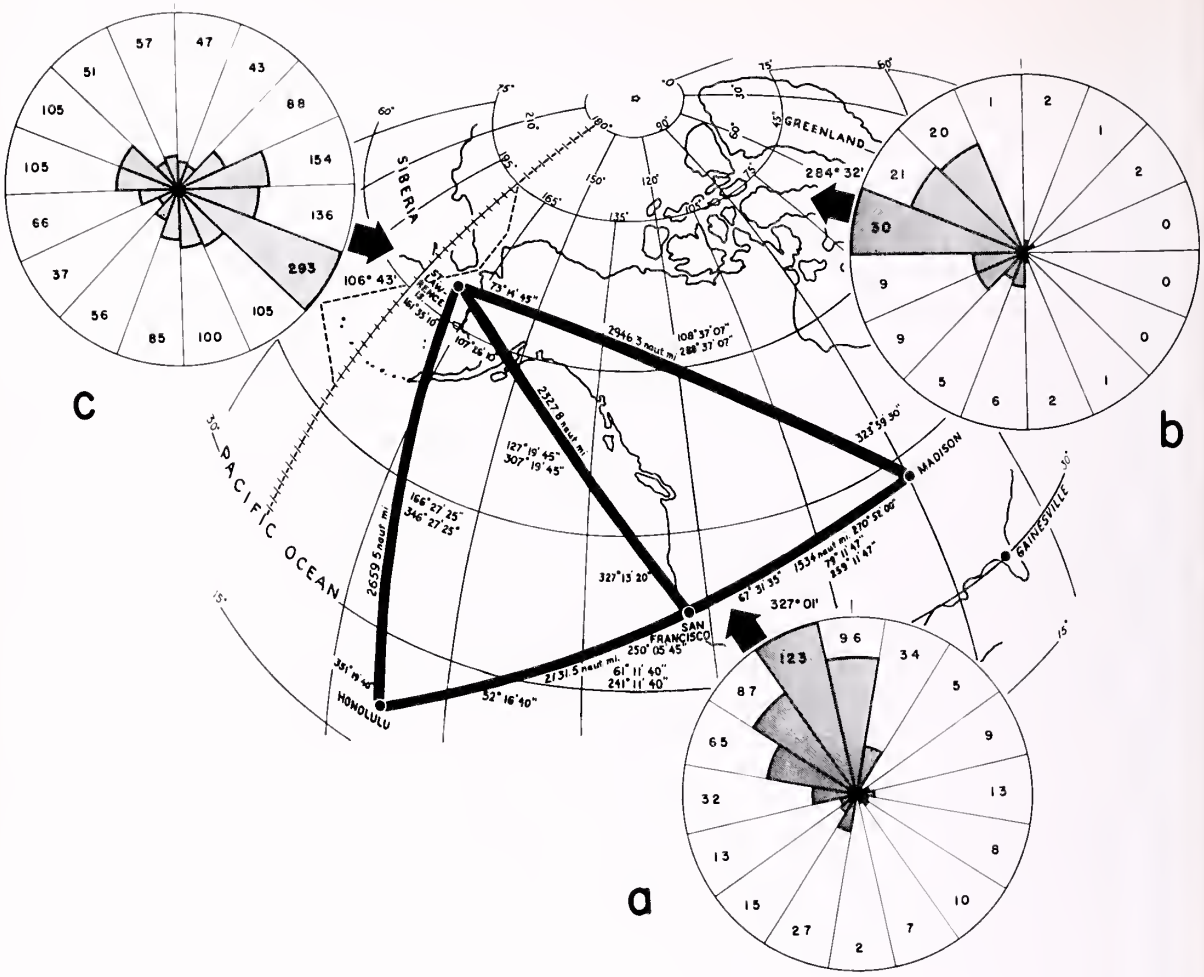

Fig. 2. Great Circle tracks Boxer Bay (St. Lawrence Island), Madison, San Francisco, Honolulu, Gainesville. Three examples of spring (a, b) and fall migration (c) at San Francisco in 1961. Explanations: Time in San Francisco Local Mean Time. C = recorded counts; TC = total counts; dt– = difference of the setting of the internal clocks lagging behind Local Mean Time. Clouds: ACu = altocumulus; Ci = cirrus; CiCu = cirrocumulus; Cu = cumulus; St = stratus; cloud cover from 1/10 to 10/10; compass bearings mark directions of wind; wind speed is indicated in knots; occ. = occasionally.

also maintained under complete overcast that left the position of the sun invisible. Winds exceeding 22 knots from W to NW frequently blew birds off their course in the apparatus. The birds compensated for this drift and maintained a close approximation of the typical mean course. Only under heavily overcast skies the birds were disoriented and then interrupted their migration restlessness. Under an increased cloudy sky that obscured the sun to such an extent that a human observer could at best only roughly estimate its approximate position, the birds of this group lost their initial orientation toward their seasonal goal. Their bearings indicated an orientation based on an assumed azimuth position of the sun according to the setting of the birds' internal clocks, that is, the birds drifted clockwise according to the degree of the time difference between the setting of their internal clocks and local time of San Francisco. The birds obviously showed that they failed to navigate in this situation, i.e., were unable to perform bi-coordinate celestial orientation. One can interpret their reaction as an azimuth orientation in which they neglected the altitudinal eomponent of the veiled sun.

The birds of the second group, which were exposed to the Madison sky in the fall and winter of 1960, had their internal clocks in phase with San Francisco local time. Their spring orientation at San Francisco approached the great circle track leading from Madison rather than from San Francisco to Boxer Bay (Fig. 2 b). This indicates that these birds had not compensated for their geographical displacement from Madison to San Francisco, or that they were no longer able to compensate for it since their internal clock had been adjusted to San Francisco time. Further, these experiments demonstrate that the birds hand-raised at Boxer Bay must have gone through two sensitive phases during which they had learned the geographical position of their prospective breeding area (in this case identical with their birth place) in relation to the geographical position of their first reached wintering grounds (Madison, Wisconsin). That they established by learning a definite pattern of migration related to these two positions is suggested by their display of it after their displacement to San Francisco. The fall experiments in San Francisco showed, however, that the birds were not irreversibly imprinted on this experimentally determined course. Their learned pattern was influenced by their time spent in San Francisco. While some of the birds in fall showed a preference for a course which would have brought them from Boxer Bay to San Francisco (Fig. 2 c), others selected a direction toward Madison or oscillated between these two goals, and there was no correlation between these decisions and the grouping of the birds into two experimental units.

Comparable results were obtained in tests under the natural night sky and in the planetarium.

The results indicate that the Golden Plovers do not possess an "inborn" knowledge of their birthplace nor a mystical inertial ability for homing under any condition. Nor is it reasonable to think that they would have a rigid, genetically fixed flight pattern between their breeding and wintering grounds. These patterns are more likely learned during sensitive periods prior to their migratory periods and after their migrations. It is most probable that under natural conditions a genetically determined, species-specific migratory range is individually modified and conditioned by external environmental influences. As small as the hereditarily determined range for possible modifications may be, it seems to be a factor of enormous adaptive value in these transoceanic migrants.

To summarize the facts of celestial orientation in the Golden Plover, obtained from these initial experiments, we can say: The birds are able to migrate both day and night by means of visual cclestial orientation, the information obtained from the visible sun and the stars. Their internal clocks enable them to compensate for the relative movement of the celestial bodies and to compensate for geographical displacements, provided the birds can detect a difference in time between the setting of their internal clocks and the local time. As long as the celestial bodies are clearly visible or their positions

can be accurately located under an overcast, the birds navigate, i.e., refer to a bi-coordinate celestial grid. When the sun is veiled to a certain degree, the birds do not navigate but fall back to a mere azimuth orientation, thereby neglecting the altitudinal component of the sun. When the celestial bodies are invisible, the birds fail to display their seasonal migration orientations, they are disoriented and, under the experimental conditions, interrupt their migration restlessness.

Our 10 Golden Plovers have gone through two sensitive periods during their first year of life during which they became imprinted on their breeding and wintering areas. They show an ability to modify their species-specific pattern of migration by individual learning, thereby reaching a level of efficiency beyond that of pure instinct. The biological significance of this is its great adaptive value, and it is probably the evolutionary key to the birds' mastery of their marvelous flight across the vast, trackless Pacific Ocean.

ASB's January Placement Service

In the October 1963 ASB Bulletin, a new placement service for biologists in the southeast was announced. This service, to be included in each *January* ASB Bulletin, is aimed primarily at those people who expect to receive their doctorates *one year from the following June.* Other candidates are welcome, however.

In response to this announcement, five resumes were received—and these are printed below. Reactions to this program, whether favorable or not, will be welcomed by the ASB Bulletin.

Name.—**Gary Eugene Dillard**
Address.—McKimmon Village, Apt. F-21; Raleigh, North Carolina.
Institution.—N. C. State of the University of North Carolina at Raleigh.
Permanent address.—McKimmon Village, Apt. F-21; Raleigh, North Carolina.
Specialization.—Phycology-Ecology.
Occupational preference.—Teaching and research.

Name.—**Paul Wheeler Kirk, Jr.**
Mailing address.—820 Louise Circle, Durham, N. C.
Institutions and specialization.—B.S. in Chemistry, University of Richmond, Va.; M.S. in Biology, University of Richmond, Va.; Ph.D. in Botany, specialization in mycology, Duke University.

I wish to develop courses in bacteriology and mycology and to conduct research in the general areas of pure and applied microbiology; in particular, the ecology of salt water or estuarine fungi.

Age and status.—32, married, one child, military service completed.
Practical experience.—5 years as medical laboratory technician and public health bacteriologist; 2 years as high shool biology and general science teacher; one semester as general botany instructor at Duke University; several graduate teaching assistantships for courses in general botany, general and medical bacteriology, and general mycology; 3 years of experience in researches on salt water fungi, including work at a marine station.

Name.—**John A. Martin**
Address.—Department of Botany, University of Tennessee, Knoxville, Tennessee 37916.
Institution.—Department of Botany, University of Tennessee, Knoxville, Tennessee 37916.
Permanent address.—Locust Hill Road, Albany, New York 12203.
Field.—Theoretical and Mathematical Aspects of Ecology; Silvies and Silviculture.
Degree expected.—Ph.D. in Botany.
Preference.—1) Teaching and research, 2) Research.

Name.—**Brent B. Nickol**
Permanent address.—2551 Northland Street, Cuyahoga Falls, Ohio.
Present address.—P.O. Box 5870 University Station, Baton Rouge 3, Louisiana.
Present institution.—Louisiana State University at Baton Rouge.
Field of specialization.—Invertebrate zoology. Particular interest in parasitology. M.S. and Ph.D. research done on Acanthocephala.
Degrees.—B.A. from the College of Wooster, 1962; M.S. from L.S.U., 1963; Ph.D. from L.S.U., hopefully 1965.
Preference.—Teaching and research.

Name.—**James Doyle Stidham**
Address.—1730 White Avenue, Knoxville, Tennessee.
Institution.—Department of Zoology and Entomology, University of Tennessee, Knoxville.
Permanent address.—576 Dogwood Drive, Kingsport, Tenn.
Specialization.—Invertebrate Zoology.
Preference.—Teaching and research.

A Study Of The Graduate Program In Biology At The University Of Richmond [1]

WARWICK R. WEST, JR. and WILLIAM S. WOOLCOTT
University of Richmond

The University of Richmond is a private institution of medium size located in Richmond, Virginia, with the primary purpose of providing undergraduate training in the liberal arts. Since 1920 the graduate program has provided training for a large number of students in several departments. In the training of graduate students in biology the contributions made by large graduate schools are obvious; however, those of biology departments in the small and intermediate-sized liberal arts colleges are often overlooked. To this date there has not been a serious evaluation of the graduate program at the University of Richmond. It is the objective of this paper to show how the program at Richmond contributes to the graduate study of biology; to the training of graduate students; and how it contributes to the over-all program of the University.

Data used in this study were collected from permanent record files of students who received Master's Degrees between 1940 and 1962 from the University of Richmond. Additional information came from questionnaires that were returned by these same graduates. Response was exceptionally good as approximately 75% were returned and many of these contained unsolicited comments that were of special interest to this study.

In order to maintain the proper perspective it should be kept in mind that the organization of the Department of Biology is primarily for the training of undergraduate students and that the graduate program is relegated to a secondary role. During the period represented in this study the staff has grown from 3 to 7 full time teachers, each of whom carries 3 four-credit hour classes of teaching responsibility (18 contact hours). The participation of all the staff members in a senior-graduate student seminar each week increases the contact load to 19 hours. Research courses and thesis direction for graduate students involves from 3 to 10 additional hours a week on the part of the faculty members involved. At present all full-time members of the staff hold the Ph.D. Degree, are graduates of six different graduate schools, and represent seven different areas of interest.

Further, it should be considered that the academic average of many of the graduate students would not have allowed them to qualify for finaneial support in larger institutions, or their undergraduate program was inadequate to qualify them for more specialized work. In some cases the general immaturity of the students directed them to a smaller institution. Many of the better students have been those who came back into fundamental biology after being exposed to a period of training in medical school.

It should be mentioned that the University does offer financial assistance, but it is not competitive with the support offered by larger institutions. For example, many fellowships are not large enough to cover tuition charges, and the largest has never exceeded $1,200.00. Students who do not qualify for fellowships are able to defray some of their costs by working on an hourly basis in the Biology Department.

The Master's Degree in Biology has been awarded to 34 people during the period covered by this study. Half of these obtained their undergraduate degrees at the University of Richmond, while the remainder were graduates of ten other institutions (Table 1). The basic policy for admission at present is determined by a majority vote of the staff, while in the past the selection was primarily the responsibility of the departmental chairman. Criteria for admission are flexible but are essentially based on the student meeting the requirements for an undergraduate major in the Biology Department and with some good evidence of potential as a graduate student. Quite often personal reeommendations have been of major importance in the acceptance of students for graduate study. Although the over-all academic average is given consideration, more significance is attached to grades in biology and to the senior average. The over-all grade range of accepted applicants has been from C– to B+ with the average C+.

[1] This work was supported by a Faculty Research Grant from the University of Richmond.

Table 1. Institutions that have contributed to the education of University of Richmond master's graduates in biology (1940-1962) with the number of individuals indicated after the name of the institution

* Medicine.

The last year average is B– with the range from a very low D+ to A. In biology the range was from C– to A– with the average B– (Table 2). Selection of students as degree candidates is not made until after they have completed one or not more than two successful semesters of graduate work. The usual time required for the completion of the degree is four semesters with the accumulation of a minimum of 32 semester hours of graduate biology, including the preparation and defense of a thesis.

As stated above, the areas of subject interest of the faculty are varied and this has allowed the research of the graduate students to be directed into a variety of fields. Although each research problem has been unique, by lumping them into general categories there are nine areas represented, with physiology and ecology leading the list (Table 3). The influence of the training received at Richmond has carried over into the post-master's work of the Richmond graduates. This is especially evident since 1952, as 13 of 16 students who have sought advanced degrees continued in fundamental biology, while prior to that date most who obtained advanced degrees did so in the field of medicine (Table 4). Students who have entered the area of medicine trained at only four schools while those entering basic biology have attended 14 different institutions (Table 1). Admission to these schools has been influenced by the improvement of academic performance while at Richmond (Table 2).

A summary of the present professional status of the Richmond graduates shows that 11 are practicing medicine, three are in biological research, six are teaching biology, two are in biological administrative work, one is a missionary, eight are students working toward the Ph.D. degree, and one is seeking the D.M.V. degree. Only one is unaccounted for in this survey as his present status could not be determined.

Table 2. Academic record for students taking masters program in biology at the University of Richmond (1940-1962). Based on 4.0 system

	UNDERGRADUATE POINT AVERAGE			GRADUATE POINT AVERAGE
	Over-all	Last year	Biology	Biology
Low	1.64	1.22	1.57	2.00
High	3.10	4.00	3.55	4.00
Average	2.30	2.62	2.81	3.58

Twelve of these Richmond graduates have contributed over 125 scientific publications, many of which are significant in their field. In some instances the publications were direct outgrowths of research done while at Richmond.

Obviously the master's graduates have benefited professionally by their experience at Richmond, and in their own words have expressed various items of evaluation of their training with most of their comments favorable. Special mention of the following points was made with the frequency as indicated by percentages: personal attention (74%); breadth of background (52%); application of biology to living (40%); training more

Table 3. Number of Richmond graduates (1940-1962) in the various subject areas of biology at the master's and post-master's levels

SUBJECT AREA	MASTER'S	POST-MASTER'S
Bacteriology	2	2
Cytology	1	–
Ecology	7	4
Histology	2	–
Morphology	6	1
Parasitology	6	3
Physiology	7	6
Protozoology	1	–
Taxonomy	2	3
Medicine	–	12

Table 4. A comparison of the professional direction of students who received Master's Degrees in Biology from Richmond before and after 1953

DATES	MEDICINE	PH.D.	TERMINAL	UNKNOWN
1940-1952	9 (69%)	4 (31%)	2	1
1953-1962	3 (19%)	13 (81%)	2	–

than adequate (32%); and freedom of investigation (32%). In addition, several were impressed by the ability of the staff to motivate. Not all comments were favorable as some criticized the inability of the University to offer more financial assistance and several felt handicapped that the curriculum at Richmond did not include courses in the areas of biophysics, biochemistry and molecular biology.

A graduate program in biology of such small magnitude as that at Richmond would not be worth the effort were it not for the impact it has on other areas of the school. The first and most important area influenced by the graduate program is in the training of undergraduates, as the level of performance and leadership of graduate students in classes stimulates the undergraduates to improve the quality of their work. This same influence can be seen in the presentation of papers in the senior-graduate seminar, in undergraduate research and in the use of the library. Undergraduates have an opportunity to develop a realistic concept of graduate study through their contact with graduate students, and many are influenced through this association to enter graduate work. Last but not least of the influences of the graduate student on the undergraduate student is the personal contact that allows for scholarly exchange and enables the Richmond undergraduate to compare his training with that of other schools.

The interest of the faculty in the role of the graduate program in biology is evidenced by the undertaking of this study; for, to put it bluntly, the graduate program is their main outlet for creative research. This contact with research not only helps to keep the faculty abreast of the literature in their own fields but also makes them aware of progress in other areas. The heavy teaching load and numerous extracurricular responsibilities so limit the research time that independent work of any significance cannot be carried on during the regular school year. However, through close supervision by the staff the graduate students profit as their master's research is usually far more extensive than that required by larger institutions. More up to date equipment and better library facilities are maintained for faculty use because of the special needs of the graduate research programs. The mechanics of running the department are facilitated by the graduates, thus freeing the staff of some of their many menial tasks. This figures prominently in enabling the staff to plan and present up to date material in their classes. Even after these graduates leave Richmond, they serve as a means of communication between Richmond and the schools that they attend for further study. This program is a source of professional pride for the biology staff at Richmond and is one avenue through which the rewards of teaching are directly felt.

It can be concluded that a graduate program not only adds prestige, it is essential to a modern university of any size. Without it qualified faculty members are difficult to attract and retain. This is especially true of the younger people in science who have studied in the more research-oriented institutions. Therefore, if the smaller schools are to compete for capable faculty and offer realistic programs in biology, certain requirements have to be met. These include an adequate fellowship program, more funds for up to date equipment and library, more support of faculty research, smaller teaching loads, and more space for research.

American Society of Plant Taxonomists Elects New Officers and Gives Cooley Award for Work on Southeastern Flora

Mildred E. Mathias of the University of California, Los Angeles has been elected President of the American Society of Plant Taxonomists for 1964 and **Richard S. Cowan** of the Smithsonian Institution, Washington, D. C. has been elected to serve a seven-year term on the Council of the Society.

Other officers appointed by the Council are: Charles B. Heiser, Jr. (Indiana University), Chairman of the Council; Lawrence R. Heckard (University of California, Berkeley), Secretary; Richard W. Pohl (Iowa State University), Treasurer.

Other appointments made by the Council are: **Peter H. Raven** (Stanford University), Editor-in-Chief of *Brittonia;* **Mason E. Hale** (Smithsonian Institution) and **James W. Hardin** (North Carolina State College) to serve on the editorial board of *Brittonia;* **Henry J. Thompson** (University of California, Los Angeles), Representative of the Society on the Editorial Board of the *American Journal of Botany;* **Robert B. Channell** (Vanderbilt University) and **Robert K. Godfrey** (Florida State University), Representatives of the Society on the Council of the American

Association for the Advancement of Scienee; **Reed C. Rollins** (Harvard University), Representative of the Society on the Governing Board of the American Institute of Biological Sciences; **David D. Keck** (National Seience Foundation), Representative of the Society on the National Research Council.

The George R. Cooley Award for the best paper presented at the annual meeting of the American Society of Plant Taxonomists at the University of Massachusetts, Amherst, in August, went to the authors of three papers: to Willard W. Payne, University of Michigan, Ann Arbor, for his research, "A re-evaluation of the genus *Ambrosia* (Compositae)"; to Henry J. Thompson, University of California, Los Angeles and Wallace R. Ernst, Harvard University, Cambridge, for their paper, "Contrasting patterns of variation in *Eucnide* and *Sympetaleia* (Loasaceae)"; to Dale M. Smith and Donald A. Levin, University of Illinois, Urbana for their work, "A chromatographic study of reticulate evolution in the Appalachian *Asplenium* complex."

The Cooley Award for meritorious work published on the flora of the Southeastern United States was made to two authors. Preston Adams, DePauw University, Greencastle, Indiana was presented $500 for his 1962 paper, "Studies in the Guttiferae. I. A synopsis of *Hypericum* sect. *Myriandra*. James A. Duke, United States Department of Agriculture, Beltsville, Maryland was awarded $500 for his 1961 paper, "The psammophytes of the Carolina fall-line sandhills."

Cooperative Project Between Cape Haze And Riverview High School Laboratories Sponsored By NSF

The National Science Foundation recently announced the grant of $11,765 for a eooperative project between the Cape Haze Marine Laboratory and the Riverview High Sehool Marine Laboratory, Sarasota Board of Public Instruction, during the summer of 1964. This is to be a special program for high ability high sehool students and biology teachers who are interested in teaching Marine Biology and Oceanography.

Participants who are to be seleeted from all parts of the United States will work with instructors and scientists at both laboratories for a period of eight weeks. They will center their activities around specially selected marine subjects, field trips and research projects, some of which are presently supported by the National Science Foundation and the Office of Naval Research. They will devote a full day and some evenings, at least five days a week to this special program.

Named by the National Scienee Foundation as Director of the special program was John D. Woolever, Riverview biology teacher and Educational Assoeiate of the Cape Haze Laboratory. Participant selection will be made by a committee which will include Dr. Eugenie Clark, Director, Cape Haze Laboratory representing the C.H. Laboratory, and Dr. Russel Wiley, Superintendent of Sarasota Public Schools.

A key figure in the instructional program will be Dr. Harold J. Humm, Botany Department, Duke University. Dr. Humm is an internationally known botanist and researeher specializing in marine algae. Dr. Humm is a former Director of the Duke University Marine Laboratory and the Florida Oceanographic Institute. He has had wide experience with both teachers and high school students. Some of his research has been done at the Cape Haze Laboratory in the field of marine algae.

The cosponsoring institutions are to supplement the financial grant by supplying certain equipment, laboratory facilities and some personnel services including transportation on field trips. Some of these trips will be made aboard the newly constructed boat which the National Science Foundation acquired for the Cape Haze Laboratory. The C.H. Laboratory is well known for its cooperative educational and research services to exceptional students. The Riverview laboratory was recently featured in a leading illustrated article published by the National Seience Teachers Association which devoted a special issue to unique laboratory facilities in modern science edueation in the United States.

Personnel members of this program are exceptionally well pleased over the news of the grant inasmuch as very few grants of this nature are made. Usually they are made to large universities and research institutes.

Inquiries are to be made at the Cape Haze Laboratory regarding program participation. Deadline for formal applications will be about April 1, 1964. Details will be announced in a special brochure published by the National Science Foundation.

Emory University Campus. (1) Biology Building; (2) Alumni Memorial Building; (3) Cox Hall; and (4) Lullwater Field Biology Laboratory.

About The Atlanta Meeting

The Association of Southeastern Biologists will hold its 25th annual meeting April 16-18, 1964 at Emory University, Atlanta, Georgia. Meeting with ASB this year will be five other organizations: The Southern Appalachian Botanical Club, the Southeastern Section of Beta Beta Beta, the Southeastern Section of the Botanical Society of America, a regional group of National Association of Biology Teachers, and the Southern Section of the American Society of Plant Physiologists. The meeting will commence on Thursday afternoon, April 16 with a meeting of the Executive Committee at 1:00 o'clock in Room 216 of the Biology Building. Activities will be centered in the Alumni Memorial Building (student center)—registration, exhibits, and smoker; the Biology Building—evening programs and some paper sessions; and Cox Hall—food services. Other paper sessions will be scheduled in near-by buildings.

Registration will be from 4:00 P.M. until 7:15 P.M. on Thursday, and from 8:00 A.M. until 11:00 A.M. Friday in the lobby of the Alumni Memorial Building. The program Thursday evening will begin at 7:30 in the auditorium of the Biology Building, to be followed by the smoker to be held in the lobby of the Alumni Memorial Building. Exhibits will be on display in an adjoining wing of the same building. Paper sessions and the annual business meeting will occupy Friday. Friday night activities include a banquet, the retiring President's address, and presentation of awards.

GENERAL INFORMATION AND ACCOMMODATIONS

Atlanta is in the foothills of the southern Appalachian Mountains on the Chattahoochee River about 950 to 1200 feet above sea level. Cool winters alternate with mild summers, the daily summer maximum for the most part being in the high eighties or low nineties. April weather is usually delightful, with flowering trees and shrubs at the height of bloom. Druid Hills, the residential area in which the University is located, is widely known for its massed flowers of dogwood and azaleas. Information on Atlanta and its various attractions, especially for wives and families, will be distributed at time of registration.

Emory University is located in a "dry" county, DeKalb. Most of metropolitan Atlanta, however, is in adjoining Fulton County, which is "wet."

Travel to Atlanta

Those not familiar with Atlanta may find it helpful to secure a city map from a service station on entering the city, if arriving by car. All of the major gasoline companies provide maps of metropolitan Atlanta. The Druid Hills residential section and Emory University are six miles northeast of downtown Atlanta. None of the major highways pass the campus.

Plane connections into Atlanta are excellent. The airport is south of the city, and is a 30 to 45 minute drive from the campus. Limousine service is provided to the downtown area at $1.35. Taxi fare from downtown Atlanta to the campus is approximately $3.00. Those desiring to come directly from the airport to the Emory University campus should take a cab directly, the fixed fare being $5.15. Bus and rail terminals are in downtown Atlanta, with the exception of a Bus Station at Decatur, some three miles from the campus, which provides service to the east.

Parking

Parking on the Emory University campus will be difficult, since normal use overtaxes the facilities. Special parking arrangements will be made by the campus Security Office, and these arrangements will be publicized at the time of registration. Permits to park in restricted areas on the campus will not be required but an ASB sign, to be provided at the time of registration, should be clearly visible.

Dining

Members of the Association and their guests will find it convenient to use the main cafeteria in Cox Hall. However, student rush hours should be avoided.

A number of modest dining facilities immediately adjoin the University. Atlanta boasts a large number of excellent restaurants and clubs. These are all located at some distance from the campus.

Field Trips

Plans are being made for a Saturday morning field trip to the granite outcrops to examine their unique flora and fauna. Opportunity will also be provided for visiting the Lullwater Biology Field Station and the Cesium^{137} Radiation Field, both located on the campus.

Registration

Registration will begin Thursday, April 16 and continue through Friday morning in the main lobby of the Alumni Memorial Building (Student Union). A $1.00 registration fee will be charged.

Local Arrangements Committee

Co-Chairman	W. D. Burbanck
Co-Chairman	R. B. Platt
Housing	R. B. Platt
Finance	Raymond Damian
Registration	A. A. Humphries
Food Service	A. C. Clement
Smoker	C. G. Goodchild
Exhibits	W. E. Brillhart
Field Trips	W. H. Murdy
	M. P. Burbanck
Program	Burbanck and Platt
Meeting Rooms	Charles Ray
Audio-Visual	A. V. Beatty

Regarding Integration

Hotels and motels in Atlanta are predominantly segregated. Three, however, which are integrated, are so marked in those listed under "Accommodations" below. The facilities of Emory University are available to all members and guests of the Association, as are any of the cafeterias on campus. Many of the eating establishments adjacent to the campus are also integrated.

Accommodations

Sixteen rooms are available on campus, 9 being in the Alumni Memorial Building, and 6 in an adjacent dormitory. Details on these are given below. Send requests for any of these rooms to: Robert B. Platt, Department of Biology, Emory University, Atlanta 22, Georgia, indicating if a connecting bath would be acceptable. Four have private baths, and twelve have connecting baths.

ALUMNI MEMORIAL BUILDING:	Single	Double
Suite (Room 203)	$8	$10
Private Bath (2)	$6	$ 8
Connecting Bath (6)	$5	$ 7
WESLEY HALL:		
Private Bath (1)	$5	$ 7
Connecting Bath (6)	$4	$ 6

Plus 3% sales tax.

There are no hotels and motels near the campus, the nearest being two to three miles away, and downtown ones to five to seven miles away. The Chamber of Commerce lists 43 hotels and 73 motels for Metropolitan Atlanta. Those nearest the campus, and some representative ones in town are listed below. It is advisable to make reservations before the end of March. Although no large conventions have been scheduled to date in Atlanta for this week, April traditionally is a busy month for the hotels and motels in the city, and accommodations could be limited.

Please write direct to hotels and motels for reservations.

HOTELS

THE HOTEL CANDLER, 150 East Ponce De Leon Avenue, Decatur, Georgia, DR 7-6491. Can accommodate at least 50. Single $3.61; double, $5.15-9.00. Most private baths; some connecting. Parking facilities provided. Reservations should be made several days in advance. Two miles from campus.

THE BRAIRCLIFF HOTEL, 1050 Ponce De Leon Avenue, N. E., TR 4-9711. 35-40 rooms available Thursday night; up to 100 Friday night. Ample parking facilities. Reservations should be made by April 14. Single $7.00-8.00; double, $10.00; twin, $12.00. Three miles from campus.

THE ATLANTA AMERICANA, 160 Spring Street, N. W., 688-8600. Motor Hotel, free underground parking for all guests. Two restaurants within hotel; also barber shop, beauty shop, etc. Single, $11; double or twin, $14-16, suite, $32. Reservations should be made in advance. Downtown.

PEACHTREE ON PEACHTREE, 176 Peachtree Street, N. W., JA 5-1561. Single, $6, $6.50, $7; double, $8.50, $9.50, $10 and $10.50; twin, $9.50, $10, $10.50, and $11.50; suite, single, $11; double, $16. Charge of 50 cents for 24-hour storage of vehicles. Reservations should be made through William H. Martin, manager, in advance. Downtown.

THE DINKLER-PLAZA, 98 Forsyth Street, N. W., JA 4-2461. Single, $7.00, $8.00, $9.00, $10.00, and $12.50; double, $10.00, $11.00, $12.50, and $13.00; twin, $15.00, $16.00, $17.00, and $18.00. Free parking. Reservations should be made two to three weeks in advance. Downtown.

THE PIEDMONT HOTEL, 108 Peachtree Street, N. W., JA 4-2431. Single, $6.50-$10.50; double, $10.50-$13.50; twin, $12.50-$16.00. No charge for children under 14; $3 per person over 14. Free parking. Reservations should be made in advance. Downtown.

THE PEACHTREE MANOR HOTEL, 826 Peachtree Street, N. E. 874-2791. 125 rooms. Single, $6.00-$8.00; double, $9.00-$12.00; twin, $9.00-$12.00; suites, $14.00-$18.00. Five miles from Emory Campus. (Integrated.)

MOTELS

HOWARD JOHNSON MOTOR LODGE, Northeast Expressway, 7 mi. NE of downtown at Druid Hills Road entrance; three miles from campus. Phone 636-8631. Single, from $10 up; double $14.42 up. Restaurant adjacent to motel. Free parking. Reservations should be made in advance through Mr. Myers, manager.

HOWARD JOHNSON MOTOR LODGE SOUTH, 759 Washington St., S. W., 688-8665. Seven miles from campus; one mile from downtown Atlanta. Single, $9.00-$12.00; double, $11.00-$14.00; twin, $12.00-$15.00. (Integrated.)

THE HILTON INN, 1031 Virginia Avenue, Hapeville, at the Airport. Phone 767-0281. Single, $9.50-$16.00; double, $12.50-$19.00; twin, $12.50-$19.00. (Integrated.)

THE HEART OF ATLANTA MOTEL, 255 Courtland, N. E., MU 8-1682. Single, $12.36; double, $14.42; twin (two double beds), $16.48. Charge of $1 per extra person. Reservations should be made in advance through Miss Sturges, Reservation Clerk. Downtown.

HOLIDAY INN, 175 Piedmont Avenue, N. E., 688-7420. 253 rooms, $10.00 up. Downtown.

THE HOWELL HOUSE, 710 Peachtree Street., N. E., 873-4321. All rooms have been converted from apartments and have connecting kitchens. The electric stoves in these kitchens are not connected for cooking, but all other appliances including refrigerators, are connected. Free parking for all guests. Single, $8.00, $9.00, $10.00, $11.00, and $12.00; double, $12.00, $13.00, $14.00, $15.00, and $16.00. Suites also available. Reservations should be made in advance. No charge for children under 12 years of age; charge of $3 per person for those over 12. Three mi. from downtown, 5 mi. from campus.

Meritorious Award Nominations

As in previous years, an honorarium of $100 has been made available by the Will Corporation of Georgia, to be used as an award for the recognition of especially meritorious teaching by a member of the ASB. The regulations governing the award are as follows:

The recipient must be a member of the ASB in good standing. He should have taught biology in a southern institution for at least ten years, and must be currently teaching. He must not be a dean or have regular administrative duties beyond the department level (this particular criterion requiring interpretation in individual cases). Among evidences of his qualifications is the progress of the candidate as indicated by recognition in his own institution (important assignments and other contributions specifically related to good teaching); and the number and quality of students for whom he provided primarily the inspiration to continue in biology, especially those who later received advanced degrees.

Past recipients of the Meritorious Award for Teaching are as follows:

1952. Dr. Mary Stuart MacDougall (Agnes Scott)
1953. Dr. Orland E. White (Univ. of Virginia)
1954. Dr. Woolford B. Baker (Emory)
1955. Dr. John N. Couch (Univ. of North Carolina)
1956. Dr. Hugo L. Blomquist (Duke)
1957. Dr. Ezda Deviney (Florida State)
1958. Dr. Henry R. Totten (Univ. of North Carolina)
1959. Dr. Margaret Hess (Winthrop College)
1960. Dr. Ora C. Bradbury (Wake Forest College)
1961. Dr. Warren Deacon (Vanderbilt)
1962. Dr. Septima C. Smith (Univ. of Alabama)
1963. Father Patrick H. Yancey (Spring Hill College)

In these times in which so much is heard about teaching, it is particularly important that excellence in teaching should be rewarded and publicized in every way possible. Members of the ASB are urged to make nominations and send the needed supporting materials to *Dr. Harry E. Wheeler, Dept. of Botany, Louisiana State University, Baton Rouge*, La., by 1 April 1964.

COMMITTEE

W. E. Brillhart
A. J. Sharp
Harry Wheeler, *Chairman*

Mary Glide Goethe Travel Awards

For the seventh year there will be funds available through the generosity of Mr. C. M. Goethe for assistance to graduate students for expenses in connection with the annual ASB meetings, to be held this year at Emory University, Atlanta, Georgia. It is anticipated that most of the awards will be for maintenance (lodging and meals), and departments are urged to provide travel allowances for their graduate students or to invite them to travel in ears with staff members. Some travel allowances may be awarded by the committee to those living most distant from Atlanta.

Staff members are requested to call to the attention of qualified students in their respective institutions the availability of these awards. If there is more than one applicant from a department, the Goethe Committee may request the department to aid the committee's selection by ranking the applicants.

Any graduate student needing financial assistance in order to attend the 1964 meeting of the Southeastern Biologists is eligible. Rules for making application for the Goethe Awards are as follows:

1. Indieate if application is being made for maintenance or travel or both. Give details, such as total sum requested, how many nights and days are involved, if travel allowance is requested, the number of miles involved and the proposed method of transportation, and any other pertinent information.
2. Give information as to whether or not a paper is being presented by the applicant.
3. In a paragraph, give a brief history of your education to date, of how many years you have been–and plan to be–in graduate school, of your major field or fields of interest, of any publications which have appeared or which may be in preparation, and any other pertinent professional details. Give information on marital status and number of children.
4. Give your source or sources of support while in graduate school such as G.I. Bill, N.S.F., N.I.H., teaching assistantship, etc.
5. Have your major professor or departmental head write a letter supporting your application.
6. Applications and supporting letters, both in triplicate, should be in the hands of Elton C. Cocke, Department of Biology, Wake Forest College, Winston-Salem, North Carolina by March 1, 1964. Applicants will be notified of the decision of the Committee during March.

COMMITTEE

Richard E. Garth
Margaret Menzel
Elton C. Cocke, Chairman

Association Research Prize

The rules and regulations governing the annual Association Research Prize of $100.00, sponsored by the Carolina Biological Supply Company, Elon College, North Carolina, are as follows:

1. The Research Prize is to be awarded for an especially meritorious paper actually presented at the annual meeting.
2. Only members are eligible to submit papers in competition for the Research Prize. This applies to all names on the submitted paper.
3. Papers submitted in competition may be in press but must not have been published prior to March 1 of the year of the current competition.
4. Judges will be eminent biologists outside the Southeast. They will set their own criteria, and may withhold the award if no paper is judged to have sufficient merit.
5. Papers must be submitted *in triplicate* and in their entirety not later than March 1, 1964, to *Dr. S. Gordon Carlson, Dept. of Zoology, University of Tennessee, Knoxville 16, Tenn.* One copy of the prize-winning paper will remain in the ASB files, but all other copies will be returned to the authors as soon as possible.
6. Announcement of the winner of the Research Prize will be made at the annual meeting.

Phipps and Bird Research Fellowship

A Research Fellowship of $150.00 for summer research at Mountain Lake Biological Station of the University of Virginia has been continued through the generosity of the Phipps and Bird Company of Richmond, Virginia. Any member of the Association may submit an application. The application should be accompanied by a summary of the planned work, by a list of important publications, and especially in the case of younger workers, by references and educational data. Applications should be sent to *Dr. J. Gordon Carlson, Dept. of Zoology, University of Tennessee, Knoxville 16, Tenn.*, not later than April 1, 1963. The selection will be made by the Research and Awards Committee of the ASB in consultation with the Director of the Mountain Lake Biological Station. The announcement of the recipient will be made at the annual meeting of the ASB.

COMMITTEE

Raymond T. Damian
Burton J. Bogitsh
J. Gordon Carlson, *Chairman*

Books and Periodicals

SYSTEMATICS AND LIFE HISTORY OF THE GREAT BARRACUDA *SPHYRAENA BARRACUDA* (WALBAUM). By Donald P. de Sylva. Studies in Tropical Oceanography, Miami, 1: viii + 179 pp., 32 Tables, 36 Figs., October, 1963. Paper. $2.50.

"The Systematics and Life History of the Great Barracuda," by Dr. Donald P. de Sylva, is the subject of the first in a new series of publications to be issued by the Institute of Marine Science, University of Miami, under the title "Studies in Tropical Oceanography." The series will inelude reports or papers which are too lengthy and comprehensive for publication in regular scientific journals. It is designed for research covering the biology, chemistry, physics, and geology of tropical seas, their organisms and their interrelationships. Subsequent numbers of the series will deal with fishes of the Florida Keys, marine fungi, and stomatopod crustaceans of the western North Atlantic, the physical oceanography of the Florida Straits, and other subjects.

Dr. de Sylva's technical report on the barracuda is based on eight years of research and study, during which he examined thousands of specimens (in the field and in the laboratory) and, while skin diving, observed barracuda behavior and habits.

The barracuda report includes a key to identification of various species; data on their spawning periods, early growth, and feeding habits; a discussion of known attacks by barracudas upon humans; tables listing known cases of humans being poisoned by eating the flesh of barracuda, and a table showing the geographical areas where barracuda-poisoning appears most frequent.

The book can be ordered from: *Publications Office, Institute of Marine Science, University of Miami, Miami, Florida 33149.*

TISSUE RESPIRATION IN INVERTEBRATES. Dorothy E. Bliss and Dorothy M. Skinner. The American Museum of Natural History, New York, 1963.

The authors have set out to summarize the data on invertebrate tissue respiration for the period 1929 through 1959 and it must be said at the outset that they have done an excellent job. The book's nine sections are prefaced by notes setting down reasons for the selection and omission of material as well as the ground rules for the

sections that follow. This preface is a very helpful aid to the understanding of the rest of the book and the reader should not pass it over.

A short history of the study of invertebrate tissue respiration over the past thirty years serves as an introduction to the book's central theme. Several figures showing the distribution of respiratory studies among the invertebrate groups and the shifting interests over the years, e.g., continuing interest in the Crustacea and Pelecypoda, recent interest in the Insecta, sparse interest in the other groups, are very helpful in understanding the direction taken in the later sections on analysis and discussion of the data. The authors also trace the influence of various techniques on the progress of tissue respiration studies.

The second and by far the most valuable section consists of thirty-two double page tables summarizing the pertinent tissue respiration data for the thirty-year period prior to 1960. The tables are arranged in order of phyla and include both species and common name of each organism. Each entry includes the technique used and the conditions that prevailed during the study, the form and the amount of tissue used, the presence of substrates and/or inhibitors, and the oxygen uptake or enzyme activity. Footnotes provide additional information and in all cases references are given.

Section three, Analysis of Data, brings together in brief form the data appropriate to each of several variables in tissue respiration, e.g., all the references to cyanide inhibition of endogenous respiration are collected together. Several variables are considered and although this section is short it serves as a valuable cross reference to the extensive tabular listing in Section two.

A discussion section follows in which the authors attempt to present "the broader implications . . . and suggest some conclusions regarding invertebrate tissue respiration that may be drawn from them." This is in fact a discussion of tissue respiration in the molluscs and arthropods with only brief reference to the other forms. To account for this apparent disproportionate emphasis, one need only return to Section one and see that 97 of the 114 studies included in this survey are devoted to these two phyla. But even among these two phyla, tissue respiration has been studied under such diverse conditions and there are so few studies directed toward any one area that broad implications are hard to come by. The authors are to be commended for the effort and it may be hoped that the unsatisfactory state of affairs apparent in the discussion will stimulate more effort in the area of invertebrate tissue metabolism.

Sections five and six are devoted to abbreviations and a glossary for the reader's convenience. Section eight is an extensive bibliography including 308 listings, many with multiple entries, while Section seven is a guide to the literature and acts as an index to the bibliography. The ninth and final section is a thorough-going index including separate indexes for systematic group, for author, and for subject. These sections greatly increase the usefulness of the book so that the reader should have no trouble finding data relevant to his interests.

The authors' reticence to consider specific enzymes is unfortunate. This effectively eliminated material relevant to the early stages of tissue respiration, a noticeable deficiency, albeit admitted by the authors. Some of the time spent making the book convenient to use might profitably have been spent including selected data for the early stages of energy metabolism. However, it is too easy to criticize on the basis that more material should have been included. This volume is still a valuable and welcome summary for those interested in invertebrate physiology.

S. P. Maroney, Jr.

University of Virginia
Charlottesville, Virginia

The DIRECTORY OF ZOOLOGICAL TAXONOMISTS, 1961, prepared under the auspices of the Society of Systematic Zoology, has now been made available to all interested biologists for $2.00, postpaid. Previously, non-members of the Society were charged $10.00. This Directory, hardbound in a blue cover, contains the names, addresses, and zoological specialization of nearly 10,000 taxonomists throughout the world. The Directory includes both an alphabetical listing of the specialists, and a zoological listing by specialization. Orders accompanied by a check for $2.00, should be sent to: *Southern Illinois University Press, Carbondale, Illinois, U. S. A.*

Books received recently

The following books have been recently received by the ASB. Should any member of the ASB wish to review one of these books in return for the review copy, please write to *Mrs. Betty Ursomarso, Assistant Editor, Academy of Natural Sciences, 19th & The Parkway, Philadelphia 3, Penna.*

News of Biology in the Southeast

About People

William W. Scott, a member of the Department of Biology at Virginia Polytechnic Institute since 1955, has been promoted to Professor of Botany. Dr. Scott received his B.S. and M.S. degrees at the University of Vermont and doctorate at the University of Michigan.

Edward A. Crawford, Jr. has recently joined the faculty at Hampden-Sydney College as Assistant Professor of Biology.

Bruce M. Eberhart, Professor and Head of the Biology Department of the University of North Carolina at Greensboro, has received a grant of $5,000 from the Brown-Hazen Fund for a study of cellulases in neurospora. **Ralph Morrison,** Assistant Professor, has received a grant from the American Philosophical Society of $900 for his investigation on the cytology of the powdery mildews. He will teach an NSF Institute for in-service teachers in genetics this spring. **Martin Roeder,** Associate Professor, has received a grant of $19,000 from the NSF for an investigation into the effects of iron and other minerals on fish growth. This fall he taught an NSF Institute in Cellular Physiology for in-service teachers. **Edmund Berkeley,** Associate Professor, spent the summer editing the scientific writings of the Reverend John Clayton. Earlier, Dr. Berkeley published a biography of John Clayton.

Harry J. Bennett, Department of Zoology, Louisiana State University, has received a 3-year grant from the U.S. Public Health Service for a study of the effects of pesticides on fish. He will be assisted by **Bobby F. Dowden.**

Robert P. Higgins, Assistant Professor of Biology at Wake Forest, will leave for four months participation in the International Indian Ocean Expedition February 1, 1964. Dr. Higgins will be engaged in research on the Kinorhyncha and associated interstitial fauna of the coastal regions of India and Madagasgar. While traveling to and from the Indian Ocean, Dr. Higgins will visit various marine laboratories of the Mediterranean and North European coasts.

Claude S. Chadwick, formerly Professor and Head of Biology at George Peabody College, became Professor and Head of the Biology Department at Emory & Henry College.

New faculty members at High Point College, Department of Biology, are **Elizabeth Conner,** Assistant Professor in Zoology; **Halsey Miller,** Associate Professor in Zoology and Geology; and **Kay Phillips,** Instructor of Botany and Bacteriology. **William Lazaruk,** Head of the Department, was awarded a research grant by the Piedmont University Center for a study of fresh-water algae in North Carolina. The grant of $400 will be matched by the college.

Gordon P. DeWolf, Jr., Associate Professor of Biology, Georgia Southern College, has been named the recipient of a NSF Grant for $26,600 to support his research in relationships of *Ficus* and *Dorstenia* (Moraceae).

James L. Chamberlain, Assistant Professor at Randolph-Macon Woman's College, will be on sabbatical leave the second semester to work at Duke University. He is President-elect of the Virginia Society of Herpetology. **Franklin F. Flint,** Associate Professor and Chairman of the Biology Department is currently Chairman of the Biology Section of the Virginia Academy of Science.

At the University of Southwestern Louisiana, **Matt E. Dakin, Jr.** has returned to the Biology Department after a year at Auburn University to continue his doctoral studies on the orthoptera of Alabama. **William Reese** and **John Thieret** are conducting a study of the vegetation of five salt domes in south-central Louisiana with the aid of a grant from the NSF. The Biology Department is conducting an investigation of larval shrimp in Vermilion Bay under a one-year contract from the U.S. Bureau of Commercial Fisheries.

A $17,250 NIH research grant for a joint study on plasma proteolytic behavior in response to injuries has been awarded to **E. Letitia Beard,** Assistant Professor in the Department of Biological Seiences, Loyola University, and **John K. Hampton,** Associate Professor, Tulane University Medical School. **J. J. Cooney,** Assistant Professor of Bacteriology at Loyola, will investigate pigment formation in *Micrococcus roseus* under a grant of $20,000 by the NIH. The Edward G. Schlieder Education Foundation has awarded a grant of $10,400 to **Edward J. Feeley** to study the effects of selected substances against the damage caused by the EMC virus in mice. The South Central Branch of the American Society for Microbiology held its fall meeting at Loyola University. Dr. **J. J. Cooney** was general chairman. Approximately 145 microbiologists from a three-state area attended.

Recent additions to the staff at Northeast Louisiana State College are: **Wm. C. Mobberly, Jr.** (Ph.D., Tulane); **Neil H. Douglas** (Ph.D., Oklahoma State Univ.); **Rollin Reimer** (M.S., Univ. of Arkansas); and **James Culpepper** (M.S., North Texas State). **Elton Barrett** was granted leave this past summer to work on fungi in northern Louisiana. **Edward Whatley** has a year's leave of absence to work on his doctorate at Mississippi State University. **Aaron P. Seamster** has taken a year's leave to serve as Director of the Education Programs Division of NASA.

Donald E. Stone is Assistant Professor in the field of biosystematics at Duke University. He received the doctoral degree at the University of California, and for several years was on the staff at Tulane University. **Richard A. White** is Assistant Professor in anatomy-morphology. He received the doctoral degree at the University of Michigan, and spent a postdoctoral year at Manchester, England, before coming to Duke. **Jane Philpott,** Associate Professor of Botany, is Associate Dean of Undergraduate Instruction, Woman's College of Duke University. She retains teaching and research responsibilities in the department. **Paul J. Kramer,** James B. Duke Professor of Botany, is President, AIBS, 1964-65. **Robert L. Wilbur,** promoted to Associate Professor, is on sabbatical leave from Duke University. He has recently published a book on the leguminous plants of North Carolina. Staff members invited to participate in the 10th International Botanical Congress, Edinburgh, in 1964, include Professors **Billings, W. L. Culberson,** and **T. W. Johnson, Jr. Chicita Culberson,** research associate in Lichenology, will also present an invited paper. Dr. **Ralph Slayter,** CSIRO, Australia, holds a Senior Foreign Scientist Postdoctoral position in botany (plant physiology) for 1963-64. Dr. **Jan Kohlmeyer,** Botanical Museum, Berlin-Dahlem, is research associate in mycology for the same period at Duke. Three Duke University undergraduate majors in botany, **William R. Anderson, Marshall Crosby,** and **E. Lloyd Dunn,** hold NSF independent study grants for 1963-64. Mr. Anderson and Mr. Crosby are conducting taxonomic-morphologic investigations of filmy ferns; Mr. Dunn is studying bacterial leaf nodules of tropical shrubs.

Gene B. Newcomb has joined the staff of the Department of Botany, Tulane University, as Assistant Professor. He received his doctorate from the University of California and taught at the University of Nevada. Dr. Newcomb's interests are biosystematics, genetics, and cytology.

A team of two from the Biology Department of Old Dominion College, **Jacques S. Zaneveld,** Chairman, and **Willard Simmonds,** student, will take part in the U.S. Antarctic Research Project, Deep-Freeze, 1964. They will study the benthic marine algal vegetation of McMurdo Sound in the Ross Sea. Dr. Zaneveld and two students, **Robert Phillips** and **Charles Rhyne,** continued studies of algae along the Atlantic Coast from Cape May to Cape Hatteras with the renewal of an NSF Grant. An Undergraduate Science Education Grant, also from the NSF was renewed. **Harry West, Willard Simmonds, William Barnes,** and **James Curtis** continued their work on this grant during the summer and on a part-time basis during the current academic year. **Daniel E. Sonenshine** received a grant from the Department of the U.S. Army for his study on the ecology of Rocky Mountain Spotted Fever in the Eastern United States. Two new members of the Biology Department at Old Dominion College are **Harold G. Marshall** and **Robert L. Puyear.** Dr. Marshall came from Western Reserve and is interested in limnology and ecology and plankton. Mr. Puyear comes from Oregon State University and is interested in cellular physiology. The Supplementary Chair Gift sponsored by the Suburban Woman's Club of Norfolk was awarded to Dr. **Zaneveld** who is the first recipient.

Richard E. Garth, Associate Professor of Biology, Northwestern State College, has been granted a leave of absence to act as Assistant Director of the Undergraduate Science Education, Scientific Personnel and Education Division, of the NSF. **Ralph M. Combs,** Associate Professor, spent part of last summer at the Gulf Coast Research Laboratory pursuing studies of the histology of the cephalic sensory lines of the large scale menhaden. **George Ware,** Professor of Biology, taught a course in plant ecology at the University of Oklahoma Biological Station at Lake Texoma during the summer. He also worked with participants of NSF-sponsored research programs, studying coastal plain plant communities in that region. **Hugh C. Land,** Assistant Professor, led an ornithological expedition to the Pacific slope of Guatemala. Students from Northwestern State College and Marshall University in West Virginia collected bird specimens and gathered ecological information. Dr. Land plans to use the data obtained, along with information from two previous trips, in a forthcoming monograph on the birds of Guatemala. **Earle Cross,** Assistant Professor, attended the First International Conference on Acarology at Fort Collins, Colorado, in September. **Roy Buckley** has accepted a temporary appointment as Assistant Professor and **Mary Lee Gibson** is acting as temporary part-time instructor in the Biology Department.

Elinor H. Behre, Emeritus, Louisiana State University, presented a paper with several outstanding high school students, at the North Carolina Academy annual meeting in May, 1963. Last winter Dr. Behre worked in the West Indies on her climatic studies on crabs under a grant from the American Academy of Arts and Sciences.

Harold E. Pattee has been appointed Assistant Professor of Botany at North Carolina State. Dr. Pattee formerly held a post-doctoral fellowship in plant biochemistry at U.C.L.A. **Kenneth A. Nicely** received his Ph.D. in Botany in August 1963 and is now an Assistant Professor and Curator at Virginia Polytechnic Institute. **H. T. Scofield,** Professor of Botany, is on a two-year leave of absence to Universidad Agraria, La Molina, Peru. The Highlands Biological Station's new President is **James W. Hardin,** Associate Professor of Botany, at North Carolina State. **Carl S. Keener,** Assistant Professor of Biology, Eastern Mennonite College, received an NSF Fellowship to work here on his Ph.D. under Dr. Hardin. **Arthur W. Cooper,** Associate Professor of Botany, North Carolina State, has begun work on a grant from the National Park Service to determine effects of habitat manipulation on salt marsh vegetation in the Cape Hatteras National Seashore Recreation Area. The project extends work done with **Dr. D. A. Adams** under sponsorship of the ONR on the southern North Carolina coast. Other research projects here involve work in hardwood forest ecology with special reference to soils, and in dune ecol-

ogy with attention directed toward dune stabilization.

In a letter to the Editor, **Herbert P. Riley,** Professor and Head of the Botany Department at the University of Kentucky, tells of his travels in Kenya, Tanganyika, Mozambique, and South Africa, studying, collecting, and photographing plants. He attended the Golden Jubilee of the National Botanic Gardens of South Africa, in Kirstenbosch, a suburb of Cape Town, as one of 45 visiting foreign botanists from 21 different countries. After two weeks of lectures and short day trips from Cape Town, they took a 30-day tour of the Republic of South Africa, visiting the Transkei native territories, Durban, the Hlukluwe Game Reserve, Zululand, the Kruger National Park, Pretoria, Johannesburg, the eastern Orange Free State, and the Karoo. "Botanically, it was an amazing trip," he writes. While there he gave several lectures at Cape Town, and Rhodes University in Grahamstown. Dr. Riley has been interested in African plants for some time, and the University of Kentueky Press has just released his book, *Families of Flowering Plants of Southern Africa.*

New staff members in the Department of Biology at East Carolina College are: **Calvin C. Kuehner,** mycology; **John S. Laurie,** parasitology; **Thomas C. Rutherford,** mycology and marine biology; and **James R. Wells,** plant taxonomy. **Everett Simpson,** Dept. of Biology, East Carolina College, has an academic year NSF grant of $2,000 to work on the effects of estrogens, progesterone, vassopression, and relaxin within the ovarian bursa of pseudopregnant rats. **Joseph G. Boyette** has an academic year NSF grant of $2,000 to work on pine mouse behavior.

Institutions and Organizations

The newest building on the **Virginia Intermont College** campus is a Science Hall, completed and put into use during the spring of 1963. The structure houses the latest available equipment for the departments of Biology, Chemistry, Botany, Physics, Secretarial Science and Home Economics, as well as a lecture hall with elevated seats, demonstration facilities and a projection room.

The **North Carolina Academy of Science** is presently conducting a study of tenth grade high school biology in North Carolina under the auspices of an NSF Grant. A committee of more than 60 biologists in the Academy will make recommendations for improvement of high school biology teaching in final reports which are scheduled for the summer of 1964. **Dr. John A. Yarbrough,** Professor of Biology, Meredith College, Raleigh, N. C. is director of the project.

The Department of Biology of the **Richmond Professional Institute** has moved into its quarters on the second floor of the new Science Building. Construction of an additional wing, to be ready for next year, will complete this building. The new Science Building houses the departments of Biology, Chemistry, Engineering, Nursing, Physics, and Psychology.

Mississippi State College for Women has received a matching NSF Equipment Grant for $9,070 for advanced equipment, and an AEC Grant for $6,000 for equipment to be used in a new course in radiation biology.

T. T. Earle, Chairman of the Department of Botany in **Tulane University** announces that the Department will offer for the first time in 1964-65 a program leading to the Ph.D. degree. Fields of emphasis presently offered include anatomy and morphology, taxonomy, ecology, and mycology, with collateral training in physiology, cytology, genetics, and biosystematics. Assistantships, fellowships, and scholarships are available in the Graduate School of Tulane University.

A Conference on Estuaries will be held at Jekyll Island, Georgia, March 31 to April 4, 1964. The program is based on a series of plenary sessions and concurrent symposia dealing with estuarine processes; all contributions will be presented by invited foreign and U.S. participants. The Conference is being sponsored by several regional and national organizations. Pre-registration materials and program information can be obtained from **G. H. Lauff,** Sapelo Island Research Laboratory, Sapelo Island, Georgia.

The Department of Biology, **East Carolina College,** has received an $8,000 equipment grant from the AEC. Two new courses, *Fundamentals of Radiobiology* and *Isotopic Tracers in Biology* have been added.

(*continued from page 2*)

ter from Dr. John R. Olive, Executive Director, AIBS, requesting that ASB address envelopes to members of ASB in support of AIBS' campaign for membership. The Executive Committee approved the request. He reported that ASB now has 700 members in good standing; that 76 had paid dues for 1962, and that there were 28 institutional members. He displayed designs for the official seal of ASB that had been submitted in the competition. He stated that he had attended the inauguration of Dr. Foster Jay Taylor as President of Louisiana Polytechnic Institute on May 4, 1963 at the request of President Jones. A motion to accept the Seeretary's report was made, seconded and passed by the Committee.

President Jones brought up a number of details relative to the 1964 annual meeting for discussion. He stated that he had invited Dr. Dietrich Bodenstein of the University of Virginia to send a representative to the present meeting so that he could become familiar with details relative to arrangements for the annual meeting of ASB at the University of Virginia in 1965.

It was moved that Dr. James Dent of the University of Virginia be asked to serve as Chairman of the Local Arrangements Committee for 1965. The motion passed.

The President made the following committee appointments:

Research: Drs. Burton Bogitsh,

Raymond T. Damian, J. Gordon Carlson, Chairman

Nominations: Drs. Horton H. Hobbs, Jr., Elon C. Byrd, Walter L. Flory, Chairman

Meetings: Drs. Grover C. Miller, Raymond O. Flagg, Donald C. Scott, Chairman

Constitution and By-Laws: Dr. Dolores S. Dundee, Howard J. Teas, Victor L. Greulach, Chairman

Meritorious Award: Drs. A. J. Sharp, 1965, W. E. Brillhart, 1966, Harry E. Wheeler, 1964, Chairman

Goethe Awards: Drs. Margaret Menzel, 1965, Richard E. Garth, 1966, E. C. Cocke, 1964, Chairman

Local Arrangements: Drs. William D. Burbanck and Robert B. Platt, Co-chairmen.

See *About the Atlanta Meeting* for other committee members.

President Jones mentioned the desirability of having a Program Committee. After some discussion it was moved by Father Yancey and seconded by Dr. Flory that such a committee be established. The motion was passed.

President Jones suggested that official action be taken with respect to the date of the annual meeting for 1964. Dr. Burbanck moved and Dr. Herndon seconded the motion that the annual meeting for 1964 be held on April 16-18. The motion was passed.

President Jones then discussed the need for a definite policy with respect to the date of the annual meeting. He suggested that a committee should be appointed to study the matter and report to the next meeting of the Executive Committee on April 16, 1964. Father Yancey moved that the President appoint a committee to make recommendations to the Executive Committee on April 16, 1964 with respect to the date of the annual meeting of ASB. The motion was seconded by Dr. Burbanck and it was approved by the Committee.

President Jones brought up the matter of the geographic distribution of ASB membership. He was of the opinion that individuals and groups should be admitted to membership in ASB regardless of their geographic distribution. The Committee concurred in this opinion but no formal action was taken.

Treasurer's Report: The Treasurer's report covering the period January 1 to September 27, 1963 was submitted. Dr. Bell moved the acceptance of the Treasurer's report. The motion was seconded by Father Yancey and it was passed by the Committee.

President Elect's Report: Dr. Burbanck raised the question as to whether we were sufficiently active in seeking membership in our area. Because of the scientific growth within it he thought that there was a possibility of increasing our membership three-fold. Dr. Duncan suggested that because of the increase in the number of scientific societies and the fractioning of others that it would be desirable to actively encourage individuals in our smaller four-year Junior colleges to join the Association. Dr. Shanor thought that it would be of value to emphasize to Biology Departments that our meetings provided an excellent opportunity for their graduate students to present papers. Dr. Burbanck was of the opinion that the interdisciplinary nature of our meetings should be emphasized and that like AIBS the Association could readily arrange for other groups to meet with it. Dr. Bell suggested that many members of affiliated societies would be eligible for membership and that they should be encouraged to join the Association.

Dr. Burbanck suggested in view of the wishes of the membership with respect to a symposium that a symposium on the opportunities in estuarine biology would be timely. The Committee agreed with his viewpoint and authorized him to arrange such a symposium.

A motion was made to accept the President Elect's report. The motion received a second and is was passed by the Committee.

Editor's Report: The Editor stated that he would issue a call for papers in the Bulletin as in the past. He stressed again the need for articles of general interest. He brought up for diseussion the desire to advertise in the Bulletin on the part of some of the companies that have an exhibit at our annual meetings. He was opposed to such advertising because it would adversely affect certain mailing privileges now enjoyed by the Bulletin. He was of the opinion, however, that articles on the specialties of the companies would be acceptable, and that these would not affect mailing privileges.

Dr. Herndon as Chairman of a committee appointed to assist the Editor with problems relating to the Bulletin asked how the committee could be of greatest value to the Editor. President Jones suggested that the Editor compile a list of items that needed consideration and submit them to Dr. Herndon for transmissal to the members of the committee. Comment on these could be made through correspondence and the committee could discuss these items in more detail at the time of the annual meeting. Dr. Carpenter was of the opinion that the activities of members should be given more stress in the Bulletin and that requests for such information should be sent to the membership at least four times each year. Dr. Burbanck suggested that a copy of the Bulletin in which non-members were mentioned should be sent to them.

A motion was made to send a copy of the Bulletin to non-members in which they were mentioned. The motion received a second and it was passed by the Committee.

A motion to accept the Editor's report was made and seconded. The motion was passed by the Committee.

President Jones brought up for discussion the affiliation of societies with ASB and proposed a number of points with respect to such affiliation. He was of the opinion that societies interested in affiliation with ASB would like to know in some detail as to how affiliation might be accomplished. After considerable discussion the following points were agreed upon as a basis for the affiliation of societies with the Association.

1. Purposes of Affiliation
   a. To stimulate communication between societies with common interests.

b. To arrange for combined meetings.

2. Arrangements for Annual Meetings
   a. Each affiliate would have a standing invitation to meet with ASB but would be under no obligation to do so.
   b. Notification of an affiliate's wish to meet with ASB should be sent to the Secretary of ASB approximately one year in advance of the meeting date.
   c. Each affiliate would be represented on the Local Arrangements Committee.
3. Program
   a. Each affiliate could hold a separate, concurrent meeting for presentation of its papers or its program could be presented as a part of a joint program with the appropriate section(s) of ASB.
   b. Papers may be presented by non-members of ASB and/or affiliated societies provided that they are introduced by a member of ASB or the affiliate.
   c. The program of each affiliate may be published in the ASB Bulletin on a prorated cost basis.
4. Bulletin
   a. Special numbers of the ASB Bulletin may be made available to members of affiliated societies, by special arrangement with the Editor, but annual subscriptions are available only to those who have paid the appropriate fee for membership in ASB.
   b. The cost of abstracts will be paid by each affiliated society or by individual members of such societies.
   c. Reprints of all articles and abstracts may be had upon suitable notice to the Editor. The costs for these will be borne by the individuals requesting them.
   d. News items of interest to biologists in the Southeast are welcomed by the Bulletin whether they concern members or non-members and regardless of who may submit them.
   e. Dues notices and other similar items may be published in the Bulletin at cost for affiliated societies.
5. Registration at Meetings
   a. A registration fee must be paid by all participants to help defray the cost of the annual meetings.
   b. The current registration fee is $1.00.
6. Executive Committee
   a. Each affiliated society may be represented on the Executive Committee of ASB.
   b. The representatives must be members of ASB as well as of the affiliated society they represent.
   c. Representatives of affiliated societies may not exceed 40% of the membership of the Executive Committee.

A motion was made, seconded and passed by the Committee to the effect that all participants in an annual meeting of ASB pay the current registration fee.

Father Yancey moved that the By-Laws of the Association be amended to permit each affiliated society to have a representative on the Executive Committee. The motion was seconded by Dr. Bell. Dr. Duncan proposed an amendment which would limit such representation to 40% of the membership of the Executive Committee. The amended motion was acceptable to Father Yancey and Dr. Bell and it was passed by the Committee.

Dr. Bell moved that the President be empowered to handle details relative to the affiliation of societies with ASB on a pro tem basis. The motion was seconded by Dr. Flory. The motion passed.

President Jones brought up for discussion the change in status of ASB and other organizations affiliated with AIBS. Under the change ASB would become an ADHERENT of AIBS and the annual dues based on current membership would be $400. After lengthy discussion Dr. Herndon moved that ASB support AIBS in every way possible including the payment of the $400 dues as an ADHERENT in 1964. The motion was seconded by Dr. Bell. After further discussion Dr. Shanor amended the previous motion as follows: That the Executive Committee recommend to the membership of ASB at the 1964 meeting that the Association become an ADHERENT of AIBS. The amended motion was acceptable to Dr. Herndon and Bell and it was passed by the Committee.

Dr. Shanor suggested that some compensation for his secretary for the time she spent on ASB business was in order. He moved that his secretary be paid a total of $100 for her work in 1963 and 1964. The motion was seconded by Dr. Carpenter and it was passed by the Committee.

Editor Hart stated that his expenses to meetings of the Executive Committee and to annual meetings had been partially defrayed by the Philadelphia Academy of Sciences and that the Academy could no longer afford to do so. He asked that the Association assist him with these expenses. Father Yancey moved that the Association contribute $100 toward the Editor's expenses incurred through attendance of Executive Committee meetings in 1963. The motion was seconded by Dr. Burbanck and it was passed by the Committee.

There being no further business the meeting was adjourned at 3:15 P.M.

Respectfully submitted:

HARRY J. BENNETT
Secretary, ASB
Zoology Department
Louisiana State University
Baton Rouge, Louisiana

LETTERS

AT THE RISK of seeming to be a bit caustic, isn't it a bit unusual to list a book in the book section without naming the author?

Ruth S. Breen

Note: The Editor wishes to apologize for a *lapsus calami* which occurred in the last issue of the ASB Bulletin. In the note on *Mosses of Florida. An Illustrated Manual,* the author's name, Dr. Ruth S. Breen, was omitted.

NOMINATIONS FOR OFFICERS

The nominating committee seeks the help of the membership in setting up a slate of officers from which elections will be made at the 1964 meeting of the Association. Nominations for persons to fill the following positions should be made at this time: President-Elect, Vice-president, Secretary, and two Executive Committee members. Please mail your nominations, as early as possible, to Dr. Walter S. Flory, Department of Biology, Wake Forest College, Winston-Salem, N. C. 27106.

IMPORTANT DEADLINES

January 31—Suggestions for nominations for ASB officers and executive committee members.

February 14—Titles and abstracts of papers to be presented at the Atlanta meeting.

March 2—Applications for Goethe Awards to graduate students.

March 2—Papers to be considered for the Association Research Prize.
