**THESE** bulbous plants comprise many species and varieties of great beauty, are natives of the East and West Indies. They require a rather high temperature, moist and shady position, to grow them well, say a stove heat of 70° in summer and 60° in winter should be the minimum. They can be flowered twice a year, at least a few of the species, such as *P. fragrans*, *P. zeylanicum*, and *P. rotatum*; but if large specimens are to be obtained in as short a time as possible they should only be allowed to flower once a year, and that at their natural period, which is July or August. Young plants should be pushed on by repeated shifting as soon as they fill their pots with roots. When the specimens are as large as required they should only receive a shift every four years. Our largest specimens are in 18-inch pots; in these they were placed five years ago, and last July each threw up eleven scapes, with from eight to ten flowers on each. The soil used is two parts fibry loam, one part charcoal, and one part silver sand and sheep droppings. The loam is broken into pieces about the size of pigeon's eggs, the charcoal the same; when all has been turned two or three times it should then be run through a half-inch riddle, and what remains in the riddle put in the pots. In potting the soil should be rammed very firmly. In the stove they should be close to the glass where there is plenty of light, but shaded from the direct rays of the sun, and they should receive a bountiful supply of water in the summer time, both from the watering can and syringe. Even during the winter the syringe must be more freely employed than for most stove plants, particularly so if the stove in which they are placed is not furnished with vapour appliances. They are

benefited by being turned into a cool conservatory when in flower, and supplied with a little stimulant; it prolongs their flowering season, and also imparts a much finer waxy appearance to the flowers—moreover, they last much longer in a cut state when subjected to this treatment previous.—H. E.

#### AUTUMN-BLOOMING ROSES.

As a free flowering hardy Tea for buttonholes Madame Berard never fails with me. The buds are not large it is true, but they are good in shape and colour and nicely scented, while the bright bronzy foliage is all that can be wished to show up the deep yellow buds. I have been cutting at the third crop of blooms this season from a standard in the open (a mop head if you like) for nearly a month, and since the frost and snow last week I cut on one day three dozen blooms and buds, besides leaving about six dozen buds, which look promising with open weather.

Catherine Mermet I cut at the same time in perfection, fit for any show in July. Souvenir de la Malmaison is too well known as a good autumn bloomer to need any praise. In summer the blooms are often spoiled in colour, and become a dirty whitish colour, from thrips being partial to them; why I could never understand, unless it is its rather peculiar scent. My plan to save them is to take the buds in the left hand with the point outward between the thumb and forefinger, and gently squeeze them from the base upwards, when the thrips run up and out on to the hand, when they are killed. The buds are then tied up loosely in a piece of newspaper, and on developing the colour is most delicate and the shape kept closer than when allowed to throw themselves so wide open. This Rose never fails with me at the shows on this account, whereas others say they cannot grow it. Gloire de Dijon, everybody knows, needs only mention. Général Jacqueminot has lately produced some of the best blooms of the season on the ends of the strong shoots from own root bushes. Annie Wood has produced some splendid buds, and is still in bloom.—J. HAM, *Astwood Bank, Worcestershire.*

#### "AMATEUR" ROSE GROWERS.

I READ with a great deal of interest the letter of "An Exhibitor" *re* above in your issue of October 16th, because I knew from experience the reception which would be accorded to his remarks. The Journal of October 23rd fully bears out my expectations, and yet, although your three correspondents of that date are on the Committee of the National Rose Society, and in the very front rank of exhibitors, I venture to think that they are considerably in the dark as to the real grievance, or difficulty, at issue.

I think it lies perhaps rather in the question of aid in the work of cultivation than in the mere matter of numbers grown. There are scores of earnest, ardent cultivators of the Rose, who from lack of means are entirely unable to employ any help in the tending of their stock, and who, in addition, are themselves engaged in business, and so only able to bestow a limited amount of time upon their favourites, and for such men I maintain there is no provision specially made in the schedules of the National and other great shows. The importance of the difficulty again is not as to whether the help is that of a regular gardener or not (for I suppose no grower would entrust the main culture of his Roses to an assistant), but the point is that when need arises one man is able to command help while another is not, and yet the two are placed together in the exhibition. Let me mention one or two cases in point. In his review of the Rose season, in the very number in which "An Exhibitor's" letter appears, "D., Deal," speaks of one large grower being plagued with the aphid, and putting on half a dozen men to cope with it. Exactly! But the poorer man could not possibly command such help, and so his Roses would suffer accordingly. Again, we all know the value of some slight protection, especially for Teas, in hard weather, and the equal importance of not applying that protection until the frost actually appears. Now the man of means can leave his plants till the last moment, as it were, and then, with the assistance which he can command, quickly make all safe, while the other man, perhaps away at his business for a couple of days, when hard frost sets in, has no one to set at work, and his stock is left unprotected. Once more. Either of your three correspondents would laugh aloud at the idea of getting up early in the darkness of a December morning, and by the light of a candle planting a choice new Rose, before hurrying off to his daily work, and yet that is how I planted my first Earl of Dufferin. And so I might go on. Manuring is only half done, digging is sadly neglected all from the same cause, and such men as these, while eminently qualified for membership in the National Rose Society, are kept outside its ranks, because (while no "pot-hunters") they cannot rightly afford to pay the subscription without some reasonable chance of regaining it in the shape of prize money, and no provision is made for them to do this.

One of your correspondents refers to the divisions of classes in the National schedule; but I would point out that that only protects one division from another, and that there is nothing to prevent the

strongest grower entering in the smallest classes if for any reason, such as a bad season, &c., he does not find his blooms up to their usual form. If I am told that good taste would forbid, I can only say that, having attended every show since St. James's Hall, I know that good taste does not always prevent, has not always prevented in the past; and if I am asked for proof of this assertion I cannot do better than refer to Mr. D'Ombra's vigorous and well deserved remarks as to what he termed "ungenerous showing" in the "Rosarian's Year Book" of two years ago.

No, sir, the National Rose Society, instead of showing the way, is behind the age in this matter. Many of the leading provincial shows provide classes for amateurs employing no gardener, and find them answer well. The National Chrysanthemum Society provides (I think it is) eight classes for such growers, and in reply to my inquiry, the late esteemed Mr. Wm. Holmes assured me that they have no more difficulty, and no more complaints of unqualified growers making use of such classes, than with reference to any others. And I feel strongly that if the "National" Rose Society is to continue to be worthy of its title, it must make provision for such men; and then in point of numbers, as well as in quality, it will be national indeed. For let me say that in my own district only I know of at least ten growers who would join the Society to-morrow if classes such as I and "An Exhibitor" have instanced were provided.

Apologising for the length of this letter, and pleading the importance of the subject as my excuse.—J. B.

#### SLOPES AND TERRACES.

THE usual accompaniment of a terrace—viz., "the slope," is sometimes dispensed with when a wall is adopted, but it is common where there is a number of descents made to have the top one only as a wall with balustrade or parapet, and the others constituting a series of slopes, which may either be of turf or shrubs as desired. As such works usually come under the management of the resident gardener, a few hints may be of service. Let us take a common case as an example. A residence occupies a rather elevated position, and the ground descends from the base of the building in the direction in which it is proposed to form dressed grounds. In such a case it is not unusual to cut the slope into a series of terraces, and at the bottom to form a panel, which to the eye appears to be level, but which in reality is not so; nevertheless, the whole work is of such a nature that without some judgment at the commencement, as well as in the process of the work, some great error may be run into which may render the ultimate completion of the work both difficult and needlessly costly. To obviate this, let us take a survey of the whole before a spade is put in. By the exercise of some of the rules of geometry, aided by what is still more serviceable—the judgment of the eye, a rough idea may be formed of what number of slopes and their elevation, as well as the number and widths of the terraces or landings, the ground may be conveniently formed into. The hard-and-fast lines of the architect in all cases that I have witnessed means a larger outlay than the prudent gardener would recommend; as when material has to be brought, or it may be taken away, in order that a precise width of terrace or height of panel to an inch may be complied with; whereas a little discretionary power given to the operator will usually save a large outlay, and the appearance be really the same.

Taking into consideration the ultimate effect that is looked for in a place carried out in slopes and levels, especially when viewed from the top, we may say that where the builder's work does not dictate the forms the gardener has to work to, a certain amount of conformity to the existing grounds may be made with great advantage, and even mechanical works, as steps and landings, ought to be made to act in like manner. The advisability of this is not for mere appearance only, but for the more imperative object of utility. Many years ago we remodelled some slopes that form the garden front, and added a flight of steps of about 15 feet wide and forty-seven in number, in a series of flights and landings, and each step inclined outwards about one-eighth of an inch, while the landings had likewise an inclination of about one in thirty or thereabouts, the groundwork partaking of the same character, while the slopes which corresponded with the easy and comfortable flight of steps were formed on the gradient of about  $2\frac{1}{4}$  base to 1 in perpendicular, or about  $20^\circ$ —a slope for grass quite steep enough in a district like this where the summer drought tells so seriously on glass slopes. A moist soil and north aspect may allow a steeper incline perhaps, but we would not advise a less incline than what mechanics call two to one in ordinary cases, as it is not easy to walk up a steeper one. Many other reasons might be put forth for not having a steeper incline than that, not the least being the frequency the turf gets broken and destroyed when it is too steep, and unless some important reason renders it necessary to be so, it had better have the easy and agreeable form which the gradient above gives it than it would have if it were more upright. I may here add that em-

bankments for roads or other purposes ought to be even more than that. A base of three to one perpendicular is not unusual where the material is of a very loose kind, but a cutting may be steeper, and our railways afford examples of all gradients from 60° or more down to 15°, and some of the embankments also present a diversity of angles, all, doubtless, guided by the character of the material of which it is composed and of other matters bearing on the case.

We now come to what are called levels, but which in reality had better be inclines also, not, of course, to appear to be so, but by appearing to conform to the surrounding objects they look level. A panel we have here at the base of the flight of steps alluded to has a length and width of about 160 feet, and there being a farther fall in the ground beyond the distance alluded to a decline in that distance was necessary. Partly to give the effect alluded to, as well as to obviate the necessity of a needless amount of wheelbarrow work, the descent of the 160 feet was quite 6 feet, and less would certainly not have looked so well. As viewed from the top it appears level, which it would not have done if really so, as in that case it would have looked as if it leaned inwards. This deception of the eye ought to be studied by those having such works in view, and a very good example may be met with in winter when a pond by the side of some hill is frozen over, and perhaps covered with snow. Perfectly level as we all know such an object must be, its appearance when looked at from above is anything but pleasing, and certainly the reverse of level, looking as if it pitched in towards the hill. It is to obviate this that I recommend the incline above spoken of or some near approach to it.

I may here add that the incline recommended for the steps and landing enables the water to run off, which it would not do if each portion were level, and the rain backed perhaps by a wind blowing in the direction to keep it there. This matter is well worth consideration, and each step ought to "weather," as masons have it, not less than the eighth of an inch, and the landings accordingly.

I have not said anything on the propriety of keeping the best soil to the top, as I conclude this will be sufficiently well understood if the works be in the hands of gardeners. On another occasion I may, nevertheless, add a little more on this head, on which not a little of the ultimate effect depends if the ground operated upon has to form a series of flower beds or to be otherwise planted.—J.

#### DEATH OF MR. JAMES MCINTOSH.

By the death of this gentleman, which occurred on Wednesday evening, the 5th inst., at his residence, Duneevan, Oatlands Park, Weybridge, horticulture loses one of its greatest patrons, and all who enjoyed his friendship will mourn the loss of one of the kindest and best of men. Mr. McIntosh, when in health, was one of the most regular attendants at the meetings of the Royal Horticultural Society, had a seat on the Council, and was a most useful member of the Floral Committee. He was a ready and good supporter of all that was intended to be beneficial in horticulture, and of charities connected therewith. A few years ago his health failed, and he was unable to take an active part in public matters, and could seldom leave his home. Subsequently he was better for a time, but about two months ago was stricken down with congestion of the lungs, and no skill or care could avert the fatal termination.

Mr. McIntosh was born in London in 1814, and was consequently in the seventy-seventh year of his age. In early life he was much interested in engineering and surveying, and was engaged with his uncle in the construction of large Government works, including, we think, the Plymouth Breakwater and Portsmouth Docks, as well as large portions of the Midland, Great Western, and other railways. He, however, retired from business many years ago, and spent most of his time in the pursuit he loved—gardening. He was always fond of raising seedlings, propagating, making experiments, and having trials of many varieties of different kinds of plants, and he derived pleasure from such engagements to the last. Before he purchased Duneevan he used to grow Hyacinths in glasses extensively in London, and in his various trials for keeping the water pure discovered the plan now so generally adopted of placing charcoal in the glasses.

He was a great admirer of all kinds of flowers, but especially Rhododendrons, Roses, Chrysanthemums, Zonal Pelargoniums, Hyacinths, and Lilliums. Of these he had large and choice collections, and few men knew the varieties better than he did. He was seldom at a loss to name them at a glance, and was quick to note their merits and peculiarities. Having acquired Duneevan he may be said to have spent the last quarter of a century in improving it, and during Lily and Rhododendron time not many gardens were more beautiful than his. He planted all the new Rhododendrons as they were obtainable, and Lilliums among them. Rhododendrons that he planted when 15 to 20 inches high he lived to see attain heights of nearly as many feet. He was very proud, as he might be, of his *Lilium auratum*, 11 feet 2 inches high, and of his *L. Krameri* with nine flowers on a stem; also among his Conifers, of a handsome *Abies Albertiana*, and the finest specimen in existence of

*Cupressus Lawsoniana erecta viridis*. He enjoyed his picturesque and beautifully kept grounds greatly, and liked others to enjoy them too.

A few ago years he bought additional land and made a new kitchen garden, in which he planted the best varieties of hardy fruits he could select, also erected excellent ranges of glass, planted several varieties of Grapes, and every year he had trials of all the more promising Melons. He was most observant and methodical; and in Mr. T. Taylor, his head gardener, he had a man after his own heart—capable, trustworthy, and devoted to his duties and to his master. It sounded a little unusual to hear Mr. McIntosh speak, not of "my gardener," but of "my friend Taylor," for as such he regarded him. As may be imagined, Mr. Taylor is in great grief by the loss of his master, and says he can never hope to see his like again.

The portrait of Mr. McIntosh is from a photograph taken about seven years ago when he attended the meetings in London, and spent most of his time at home in tending his flowers, and taming, by gentleness, patience, and kindness, the wild birds in his garden. We have seen thrushes run after him like chickens, and cluster round his feet for the biscuit that never failed them, a chaffinch that used to follow him from garden to garden, but most wonderful of all a robin that had no hesitation in flying up and resting in his beard to pick the crumbs from his mouth; but visitors had to stand aside to see the confidence the

FIG. 55.—MR. JAMES MCINTOSH.

birds had in the friend that they knew so well. A kind, thoughtful, good man, and great amateur gardener has been taken from the world by the death of Mr. McIntosh, who leaves a widow but no family. He was interred in the Woking Cemetery yesterday (Wednesday) deeply mourned by relatives and friends.

By the death of my excellent and much-valued friend, Mr. James McIntosh of Duneevan, horticulture has lost one of its brightest ornaments, most generous patrons, and the world one whom it could ill afford to lose. All who have ever had the privilege of knowing him, and seeing him in the home he so much loved, can bear witness to his worth and his love for everything connected with a garden, and how his refined taste, backed by ample means, enabled him to make Duneevan a classic spot for all who shared the affection he had for everything connected with a garden, and yet by one of those inscrutable dealings of God, which we are so unable to decipher, during the latter years of his life he was greatly, if not altogether, debarred from the enjoyment of the beauties wherewith he had surrounded himself. When anything connected with horticulture was to be encouraged his generous disposition led him to aid it liberally and kindly. Himself a man of the simplest taste, plain and unostentatious in his mode of living, his happiness was to minister to others. No case of real distress ever came before him without drawing out his sympathy and ready help. One of the kindest, most single-minded, and tender-hearted of men, he seemed never to be so happy as when enabled to lighten the burden of others, but always did so quietly. He was one of those who

"Do good by stealth, and blush to find it fame."

Every society connected with horticulture that ever sought his help found it cheerfully given, and he leaves a gap which it will be impossible to fill. For many years he has been missed owing to ill health from

those gatherings of horticulturists he was once ever so pleased to be present at. We hoped against hope that he might one day be enabled to appear amongst us; but now all is over, we shall never again see his genial and striking face or listen to his kind and pleasant words, and I, amongst many others, shall miss a true and genuine friend. He has left behind him few to equal him and none to excel him in all those qualities which helped to make a good man and a sincere Christian. — D, Deal.

**THE FRUITERERS' COMPANY.**—At the last court of this Company Mr. John Eagleton was unanimously elected Clerk in place of his father, who resigned after worthily occupying the position for thirty years. Mr. John Eagleton worked with great zeal in connection with the Guildhall fruit show, and contributed not a little by his good judgment and activity to the success that was achieved.

— **CHISWICK GARDENERS' ASSOCIATION.**—We are pleased to learn that as a result of the recent concert held under the auspices of this useful body, four life members will be added in due course to the Gardeners' Orphan Fund. The profits, after paying all expenses, amounting to about £20.

— AT the next annual meeting, on the 15th of January next, of the GARDENERS' ROYAL BENEVOLENT INSTITUTION, there is no doubt that Mr. E. R. Cutler will be re-elected Secretary of the Institution for the fiftieth time. This has been considered a fitting opportunity for presenting him with some acknowledgement of his long and efficient services, and of the esteem in which he is held by all who have the welfare of the Institution at heart. Mr. Harry J. Veitch of the Royal Exotic Nursery, Chelsea, has undertaken the office of Secretary, and Mr. N. N. Sherwood, of Messrs. Hurst & Son of Houndsditch, that of Treasurer, and either of these gentlemen will be happy to receive subscriptions.

— **MR. F. W. BURBIDGE**, Trinity College Botanic Gardens, Dublin, sends us specimens of the hybrid *Calceolaria Burbidgei*, from *C. Pavoni* crossed with *C. fuchsiae* folia, also the curious parasitic *Cuscuta reflexa*. This, Mr. Burbidge says, is "now growing and flowering against a wall out of doors, on *Jasminum revolutum* as a host-plant; 5° of frost is fatal to it. The *Calceolaria* is planted out in a greenhouse up a pillar, and is 10 feet high, and has been in bloom since August, and will flower till June next." [The *Calceolaria* is an extremely attractive and floriferous plant, with pale yellow flowers, but unfortunately the specimens were much damaged in transit. At Dublin last August it was one of the most showy plants flowering under glass.]

— **MESSRS. J. R. PEARSON & SONS, CHILWELL.**—In consequence of the great extension of their bulb and seed business in Nottingham, these well-known nurserymen and seedsmen are compelled to relinquish the premises in Exchange Row which they have occupied for more than half a century, and their town address henceforth will be Chapel Bars, Nottingham.

— AS an evidence of the comparative MILDNESS OF THE SEA COAST, even so far north as here. Dahlias were not destroyed by frost until the night of October 26th, while a short distance inland they were quite blackened about a fortnight previously. The weather is again mild, and Gladioli are still in flower.—S. ARNOTT, *Kirkcudbrightshire*.

— **GARDENING APPOINTMENT.**—Mr. John Smith has been appointed head gardener to Bernard Beer, Esq., Elmwood, Bickley, Kent.

— **THE DITTONS HORTICULTURAL AND INDUSTRIAL SOCIETY.**—The annual meeting took place recently, W. Whiteley, Esq., in the chair, when Mr. W. Palmer, gardener to W. F. Hume Dick, Esq., Thames Ditton House, was re-elected Secretary, and Mr. A. W. Cousins Treasurer. Interest attached to the meeting from the fact that the members made a presentation to Mr. Palmer of a handsome marble timepiece, which bore the following inscription:—"Presented to Mr

W. Palmer, in recognition of his efforts on behalf of the Dittons Horticultural and Industrial Society."

— **ANTHRACITE COAL.**—I notice you have drawn attention to the Hendreforgan Co.'s anthracite coal, and I should esteem it a favour if you would kindly do a similar kindness for my coal in your next week's issue.—J. T. PASCOE, *Swansea*. [Certainly; we try to be equally fair to all advertisers, and the testimony of good gardeners, including Mr. A. F. Barron, Chiswick, show that the coal in question has given them great satisfaction.]

— **STRAWBERRIES IN OCTOBER.**—In regard to my note on the above, I regret to say that what I expected duly came to pass. On the night of October 27th we had the severe frost, and next morning in inspecting my Strawberry quarters I found all the fruit frosted, and now there is quite a bushel of green fruit—I ought rather to say black now—all spoilt, and which but for that frost being so severe would for the most part have been ripe, or nearly so, the first week in November. Three fruits escaped, so I shall, after all, indulge in "Strawberries in November."—H. S. EASTY.

— **OCTOBER STRAWBERRIES.**—Your correspondent Mr. H. S. Easty, page 379, calls attention to the above, and which no doubt have been as plentiful as the proverbial Blackberries; but still these things are well worth recording for those who come after, and as an evidence of the beautiful autumn weather we have recently passed through, my experience is a confirmation of that related by Mr. Easty. The variety that was truly floriferous was *Vicomtesse Hericart de Thury*. Of *Gariibaldi* we have one piece facing south-east containing ninety plants, 2 feet apart. Seventy of those plants showed a good second crop of fruit, so much so that on October 13th I netted them for the second time, and from them I picked three nice little dishes of fruit, but the frosts of October 27th and 28th, 8° on the latter date, spoilt the remainder of a good fair crop of all sizes. *La Grosse Sucrée* showed a few flowers, but *Vicomtesse Hericart de Thury* was the only variety that produced autumn flowers and fruits in abundance. But I do not apprehend a bad summer crop in consequence of the present autumnal one when the time comes round. All being well, I will take notice and record the same.—R. MAHER, *Yattendon Court*.

— **THE WEATHER LAST MONTH.**—October was remarkable for the bright dry weather up to the 15th, with only one exception, the 7th. We had fourteen bright sunny days during the month, eight of which were clear. The first snow of the season fell on the 26th. Wind was in a westerly direction twenty-nine days. Total rainfall was 1.24 inch, which fell on ten days; the greatest daily fall was 0.20 inch on the 16th. Fog on two days amounted to 0.01 each day. Highest shade temperature was 69° on 4th and 14th; lowest, 22° on the 28th; lowest on grass, 17° on the 28th. Barometer was very variable, especially at the end of the month; highest was 30.53 at noon on the 22nd; lowest, 29.38 at 9 A.M. on 26th. The garden spring ran 15 gallons per minute on the 31st. Mean temperature of the month was 49.87°.—W. H. DIVERS, *Ketton Hall Gardens, Stamford*.

— **THE WEATHER DURING OCTOBER** has been all one could desire—beautiful days with an abundance of sunshine. Rain fell, as one might say, as it was required for all purposes. The nights for the most part being very genial and mild many of our summer-flowering plants remaining in bloom up to the end of the month, when a very sharp night or two ended summer. On the 31st one might have expected winter had begun, as a sharp snowstorm came unexpectedly upon us. The weather since has again become mild. The October of 1890 resembles in many respects the October of 1886, for during the autumn of 1886 I had not had sufficient frost by November 17th to kill either Dahlias or French Beans. Amount of rainfall for the past month as follows:—Number of days upon which rain fell are ten, against nineteen of 1889; maximum in any twenty-four hours being 0.67 on the 7th; minimum in any twenty-four hours being 0.04 on the 24th; total for the month being 1.87, against 3.66 of 1889.—E. WALLIS, *The Gardens, Hamels Park, Buntingford*.

— **BULLFINCHES.**—It may be as well to remind readers that these birds may be easily caught during the months of November and December, instead of allowing them to clear off every bud in some cases which have come under my notice, in January and February. They could be disposed of through the advertising columns of *Poultry*, and would pay better than shooting, besides damaging trees. Thirty-four have so far placed themselves under my care this autumn in my orchard and

garden in trap cages, against forty-two last winter, and some fruit growers will understand what that represents in buds saved to somebody. A pair in spring will clear a moderate sized Plum tree in a few minutes. If ladies are determined to have birds for trimmings for hats why not have bullfinches? I saw a row hung up with vermin in Witley Gardens last summer, which might have been used instead of hanging by the neck.—J. HIAM.

— THE ROYAL HORTICULTURAL SOCIETY'S meeting on Tuesday last was not well attended, owing to the number of shows elsewhere on the same day. Messrs. Sutton & Sons, Reading, had a fine collection of Primulas (silver medal); and Messrs. Rivers & Son, Sawbridgeworth, sent a large collection of Apples and Pears (silver-gilt medal). Orchids were shown by Messrs. Sander & Co., St. Albans; Linden of Brussels; and Cookson of Wylam-on-Tyne. Mr. A. Waterer had first-class certificates for Knap Hill Scarlet Oak, and *Vaccinium pennsylvanicum*, both very effective, with bright red leaves.

— URCEOLINA AUREA PENDULA.—This is a plant both useful and beautiful, but not generally met with. It produces its flowers on scapes, from the top of which they hang in a very graceful manner, so that each can be removed as it opens to be used for bouquets or glasses in rooms, so that each scape produces a supply of newly opened flowers for a considerable time. The colour is also an uncommon one, being a mixture of green and yellow; it contrasts with most colours, and the flowers last well when cut. As plants in pots they are highly decorative for rooms or halls. They are a little shy to cultivate. We have seen them kept in a greenhouse all the year round with considerable success, but we keep ours in the stove in company with the *Paneratiums* and *Eucharises*. Diminish the supply of water to a greater extent than for most stove-flowering bulbs; in fact, I have found aurea to flower better when completely dried off like *Amaryllises*. The soil used for potting them should be lumpy, say one-half fibry turf and the other half charcoal, sheep droppings, or cow manure, and plenty of sand, and potted very firmly in well drained pots. They like plenty of light, but no direct sunshine.—H. E.

— THE NATIONAL SOCIETY'S CATALOGUE.—We have received a copy of this useful work of upwards of 100 pages. It is something more than a catalogue, for it contains a condensed history of the Chrysanthemum, and a list of books, pamphlets, lectures, &c., which have been published from time to time respecting the "Golden Flower." Several of these are out of print, and the addresses of the authors or proprietors of some are omitted, but not all. A few good hints are given to exhibitors of new varieties. Beauty of Hull is stated to be so similar to H. Shoesmith, under certain conditions, that it would not be safe to exhibit them in the same stand as distinct varieties. Similar advice is given in respect to John Lambert and Emily Dale (or Golden Queen of England), also John Doughty and Bronze Queen. John Doughty is considered to be a superior form of Bronze Queen, and John Lambert the best type of Golden Queen, but the differences are not always sufficiently marked to ensure against disqualification if either of the two pairs are staged together as distinct. Prudent exhibitors will not run the risk suggested. The list of varieties given is very comprehensive, and the catalogue is a good guide to exhibitors and framers of schedules. It can be obtained from the Secretary, Frampton Park Nurseries, Hackney, at the usual price.

— LIVERPOOL HORTICULTURAL ASSOCIATION.—The first meeting of the session was held in the Museum, William Brown Street, last Saturday evening. Mr. Thomas White, Chairman, presided, and he was supported by Mr. Powell (Vice-Chairman), Mr. Blackmore (Sub-Treasurer), and Mr. Edward Bridge (Secretary), and a fair attendance of members only, owing to the very wet weather. In his opening remarks the Chairman spoke of the excellent results of such meetings, and the great knowledge that was spread in all directions. He regretted very much that many more young men did not try for the certificates offered by the Association for articles on various horticultural subjects, and went on to mention that Mr. Ker of the Aigburth Nursery had very generously offered three guineas for papers on the following subjects—viz., "Cool Orchids, and their Cultivation," "Calecolarias Cinerarias, and Primulas," and "Vegetables." The Judges selected a paper written by Mr. Atkins, foreman in the gardens at Ketton, Aigburth, which had for its title "The Culture of Vegetables for Use November to May, and the Most Profitable for a Garden of One Statute Acre." The paper, which was a really good one, was read in a clear style by Mr. Atkins, who was accorded a hearty vote of thanks.—R. P. R.

## THE NATIONAL CHRYSANTHEMUM SOCIETY.

CENTENARY FESTIVAL.—NOV. 11TH, 12TH, 13TH, AND 14TH.

THE long anticipated Exhibition at the Royal Aquarium, Westminster, in celebration of the Chrysanthemum Centenary, was opened on Tuesday last by Lady Brooke, the President, Lord Brooke, being unavoidably absent. In the number and quality of the exhibits the Show fully equalled the expectations of the most sanguine, and far exceeded what the majority anticipated would be the result of such a peculiar season. Such numbers of eut blooms and specimen plants have never been provided before at any show in this country, and in a more convenient building an extraordinary effect could have been secured. The whole of the large hall on the basement was filled with groups, plants, and cut flowers. St. Stephen's Hall was similarly occupied, as well as including the floral decorations, an extremely beautiful feature, while one of the galleries the whole length of the building was devoted to vegetables and fruit. Upon the ground floor the effect was necessarily broken and crowded, a good general view of the Show being impossible from any one point. These were defects that were practically unavoidable under existing arrangements, but they were none the less deplorable because they detracted from a show of remarkable magnitude and great excellence.

### THE CUT BLOOMS.

The great attraction in this section was the Centenary class for twenty-four incurved and twenty-four Japanese, distinct, open to all competitors, the prizes being £25, £20, £15, £10, and £5. In this there were eighteen competitors, and the exhibits constituted a show in themselves. The premier award was easily won by Messrs. W. & G. Drover, Fareham, Hants, who had wonderfully fine, deep, solid, well built, clear, and fresh incurved blooms, the best seen this year; the Japanese also were fresh and bright, but they were not so weighty as the incurved, several blooms being decidedly weak. The varieties were as follows. *Incurved*.—Beauty, Mrs. Heale, Prince Alfred, Lord Leicester, Alfred Salter, Mrs. N. Davis, a grand bloom; Emily Dale, Princess of Wales, Alfred Lyne, John Doughty, Violet Tomlin, Lady Dorothy, Empress of India, Empress Eugénie, Mrs. W. Shipman, Queen of England, Nil Desperandum, Jeanne d'Arc, Golden Empress, Miss M. A. Haggas, Lady Hardinge, Mrs. Coleman, C. Gibson, and Princess of Teck.

*Japanese*.—Mrs. C. H. Clarke, Sunflower, Madame Baco, Pelican, Baronne de Prailly, Comte de Germiny, Mrs. C. W. Wheeler, Ralph Brocklebank, Mrs. Alpheus Hardy, very fine; Avalanche, M. Bernard, Criterion, E. Molyneux, Stanstead White, Jeanne Délaux, Boule d'Or, Mrs. F. Jameson, M. E. A. Carrière, Etoile de Lyon, Lady T. Lawrence, Sarah Owen, Meg Merrilies, Gloriosum, and Condor. Mr. Richard Parker, gardener to J. Corbett, Esq., Impney, Droitwich, was second with a good back row of incurved and twenty-four fine Japanese very close in merit to the first.

Mr. Charles Gibson, gardener to J. Wormald, Esq., was placed third with compact neat incurved of moderate size, but fresh, his Japanese being very even and bright. Mr. John Lambert, gardener to Col. Wingfield, Onslow, Shrewsbury, was fourth, his best blooms being a good Lord Leicester and Sunflower. Mr. James Myers, gardener to the Earl of Sandwich, Henehingbrooke, Huntingdon, was fifth.

The Society's challenge vase class for forty-eight blooms, twenty-four incurved in not less than eighteen varieties, and twenty-four Japanese, distinct, was also a good one, but it was a surprise to many that the St. Neots Society proved successful in gaining the coveted honour with creditable blooms in both stands, the following varieties being represented.

*Incurved*.—Lord Wolseley, Mrs. S. Coleman, Lord Wolseley, Miss Haggas, Queen of England, Emily Dale, Alfred Salter, Golden Empress, Miss Haggas, Empress Eugénie, Mrs. Heale, Prince Alfred, Lord Leicester, Mrs. S. Coleman, Jeanne d'Arc, Violet Tomlin, Princess of Wales, Mabel Ward, Mrs. Shipman, Novelty, Violet Tomlin, Prince of Wales, Eve, Queen of England.

*Japanese*.—Madame C. Audiguier, Mrs. H. Cannell, Sunflower, Etoile de Lyon, Avalanche, Geo. Daniels, Stanstead White, Madame Baco, Meg Merrilies, E. Molyneux, W. G. Drover, Criterion, Lady T. Lawrence, Triomphe de la rue des Châlets, Ralph Brocklebank, Val d'Andorre, Sarah Owen, Maiden's Blush, Jeanne Délaux, Thunberg, Mons. Bernard, Madlle. Laeroix, Volunteer, and Gloriosum. The Wimbledon Horticultural Society was second, and the Cheshunt Chrysanthemum Society third. The Hayes Horticultural Society also competed, the blooms good but smaller.

The most important class for incurved was for forty-eight blooms, in not less than twenty-four varieties, and a very fine display of blooms was in competition. Mr. Ray, Mount Pleasant Nursery, Teynham, near Sittingbourne, was first with a stand of considerable merit. There were few blooms of exceptional quality, but the collection was a smooth, even, and excellent one. The varieties were as follows—Back row: Empress of India (three), Lord Wolseley, Golden Empress (three), Emily Dale (three), Lord Leicester (three), Alfred Salter, Queen of England, and Alfred Salter. Middle row: Mr. Brunlees, Jeanne d'Arc (two), Violet Tomlin (two), Mrs. Heale, John Salter, Empress Eugénie (two), Miss M. A. Haggas (two), Hero of Stoke Newington, Princess of Wales (two), Lord Wolseley, and Guernsey Nugget. Front row: Lady Hardinge (two), Chas. Gibson (two), Princess Beatrice, Barbara (two),

Princess Teck (two), Mrs. N. Davis, Lady Dorothy (two), Mrs. Shipman (two), Hero of Stoke Newington, and Mr. Brunlees. The second prize went to Mr. R. Parker, gardener to J. Corbett, Esq., Impney, Droitwich, for a very fine, but somewhat uneven stand, Golden Empress, Lord Alcester, and Violet Tomlin being among the best examples. The third prize went to Mr. H. Shoesmith, gardener to M. Hodgson, Esq., Shirley, Croydon, for fresh but somewhat small flowers.

Mr. M. Sullivan, gardener to D. B. Chapman, Esq., Roehampton, showed in his usual good form in the class for twenty-four incurved, and was placed first. His flowers were not noteworthy for size, but were very smooth and admirably finished, Jeanne d'Arc, Beauty, Miss Haggas, Princess of Wales, and Violet Tomlin being capital examples. E. Sanderson, Esq., Harlesden, was a close and very meritorious second, his blooms closely corresponding in character with those of Mr. Sullivan, being medium in size, bright, fresh, and well coloured. Mr. Ives, gardener to E. C. Jukes, Esq., was third. Incurved, staged with foliage for the Veitch Memorial award and other prizes were best shown by Mr. Blick, gardener to Martin R. Smith, Esq., Hayes Common, but they were too stiff to be very attractive. For decorative effect the flowers are best in bunches. Mr. Sullivan was second.

In class 6, for eighteen incurved, excluding the Queen family, the first prize was presented by the proprietor of the *Journal of Horticulture*, neatness and symmetry to be considered rather than size. It brought some very beautiful blooms. Messrs. W. & G. Drover, Fareham, were placed first for a collection of great beauty, the flowers being perfect in smoothness, freshness, and finish. Mr. M. Sullivan was second, and Mr. M. Russell third. Mr. E. Brown, gardener to E. E. Barclay, Esq., Raydon, Essex, was first with twelve incurved blooms in class 8, a fairly smooth and even display of flowers, and very fresh. It included a fine Empress of India and a very neat example of Barbara. Mr. H. A. Page, gardener to T. Crisp, Esq., New Southgate, was second, Lord Alcester and Lord Wolseley being the two best blooms, though Violet Tomlin was also good. Mr. C. Edwards, gardener to W. Owen, Esq., Ealing, was third. In the other class for twelve incurved, Mr. Lees, gardener to the Duchess of Montrose, Sefton Lodge, Newmarket, won with a very pleasing stand, the flowers being very even in excellence, though perhaps Lord Wolseley, Alfred Salter, and Emily Dale were the best. Mr. J. Cox, gardener to J. Trotter, Esq., Hertford, was second, Alfred Salter and Violet Tomlin being very good. Mr. Calvert, gardener to J. Areher Houblon, Esq., Great Hallingbury, was third. Mr. Cox improved on his position with six blooms of one variety, and won Mr. Colechester's first prize with a neat stand of Golden Empress, not large, but fresh and well coloured. Mr. Calvert was second with a very meritorious stand of Princess of Wales, and Mr. W. Collins, gardener to J. W. Carlisle, Esq., Hertford, was third with Miss M. A. Haggas. In class 10, for six blooms of the incurved Mrs. S. Colman, the silver Centenary medal was won by Mr. Russell, gardener to Dr. Lewis, Henfield, with a beautiful lot of flowers, large, and well finished. Mr. R. Owen's prize and the silver Centenary medal for the six best blooms of John Lambert, were won by Mr. J. Lambert, gardener to Colonel Wingfield, Shrewsbury, with a grand lot of flowers, 100 per cent. in advance of the others.

Japanese, forty-eight blooms, produced a large number of excellent stands. The first prize went to Mr. Hawkins, gardener to W. H. Fowler, Esq., Claremont, Taunton, whose flowers were more noteworthy for freshness and finish than mere size. The varieties were as follows:—Back row—Etoile de Lyon (two), Fair Maid of Guernsey, Stanstead Surprise, Japonais, Ralph Brocklebank (two), Fimbriatum, Mrs. H. Cannell, Carew Underwood, Puritan, Baronne de Prailly, Stanstead White, Boule d'Or, E. Molyneux, and Sunflower. Middle row: Mrs. Falconer Jameson, Madame Baco, Album Fimbriatum (two), Meg Merrilies, Madame C. Audiguier, Avalanche, Soleil Levant, Mlle. Blanche Pigny, Stanstead Surprise, Puritan, Sunflower, Mrs. J. Laing, Stanstead White, Japonais, and Avalanche. Front row: Mr. H. Cannell (two), Lady Lawrence (two), L'Or du Japon, Val d'Andorre, Sarah Owen, La Vanité, Mrs. Wheeler, Moonlight, Mons. Freeman, Geo. Daniels, Mons. H. Elliott, Mons. Bernard, Golden Dragon, and Mrs. J. Laing. Messrs. W. & G. Drover followed very closely, indeed there could have been very few points between the two. Messrs. Drover had a very fine and richly coloured collection. Mr. G. King, gardener to W. Macfarlane, Esq., Rickmansworth, was third with smaller flowers. The first prize for twenty-four blooms also went to Mr. Hawkins, this stand containing fine examples of Sunflower, E. Molyneux, Baronne de Prailly, and Mr. H. Cannell amongst others. Mr. C. J. Waite, gardener to Col. the Hon. W. P. Talbot, Esher, was second with a fair stand, and Mr. B. Calvert third.

Mr. H. Brown won with twelve in class 15, having large and handsome flowers. Mr. T. Bettesworth, gardener to R. Ewing, Esq., Cheshunt, was second, and Mr. G. Hawkins third. With twelves in class 16, Mr. Doughty, gardener to Mrs. Tomlin, Cranbrook, Kent, was a good first. He had fine blooms of Sunflower, Etoile de Lyon, Mrs. E. W. Clark, and Mons. Bernard. Mr. W. H. Lees was second, and Mr. J. Myers, gardener to the Earl of Sandwich, Huntingdon, third, both neat stands. With six white Japanese, one variety, Mr. Bettesworth won, having a neat lot of Avalanche. Mr. Hewitt, gardener to H. P. Mackeson, Esq., Hythe, was second with a fine stand of Stanstead White, and Mr. H. Brown third with Meg Merrilies. For six of any other colour, Mr. Myers was first with a grand lot of Etoile de Lyon, Mr. C. Cox second with Mrs. Wheeler, and Mr. Calvert third with Mr. H. Cannell. Mr. Neville, gardener to F. W. Flight, Esq., Winchester, appeared to be the only exhibitor for Messrs. Laing's special prizes, and the first was awarded to him, the varieties shown being Stanstead White, Stanstead

Surprise, Album Fimbriatum, Mrs. J. Wright, and Bertha Flight. Japanese with foliage were more attractive than the incurved in a similar class. Mr. Arthur Payne, gardener to Mrs. Smith, Emsworth, won with a very attractive stand; Mr. M. Sullivan being second, and Mr. C. Blick third.

The best stand of twelve reflexed came from Mr. Russell, his King of Crimsons, Cullingfordi, Cloth of Gold, and Pink Christine being very fine. Mr. R. C. Nottcutt, Ipswich, was second, his best examples being Cloth of Gold, of which he had a good pair of flowers, and White Christine. Mr. F. Moore, gardener to W. C. Pickersgill, Esq., Bexley, was third.

C. E. Shea, Esq., Fooks Cray, Kent, won with Japanese reflexed, his varieties being La Triomphante, J. Délaux, Mons. Astorg, Val d'Andorre, Criterion, Maiden's Blush, and L'Adorable. Mr. Hill, gardener to F. D. Brockman, Esq., Hythe, was second, and both had good and interesting stands.

Mr. Sullivan, gardener to D. B. Chapman, Esq., Roehampton, was first with twelve Japanese Anemone-flowered, a very good stand, comprising a beautiful Mlle. Cabrol, while Madame Blanche, Dame Nelson, Sabine, and Fabian de Mediana were also excellent. Mr. Ives, gardener to E. C. Jukes, Esq., was a good second, though his flowers were much smaller. He did better with large-flowered Anemones, winning with a meritorious stand, in which Grande Alveole, Lady Margaret, and Miss Annie Lowe were conspicuously good. Mr. C. J. Salter, gardener to T. B. Haywood, Esq., Reigate, was second. He had a very good Lady Margaret, Ruhe Toulousain, and Grande Alvéole. Mr. M. Sullivan was third, and Mr. M. Russell was commended.

Mr. Shea was first for twelve Japanese incurved, his excellent stand being composed of Pelican, Japonais, H. Cannell, Boule d'Or, E. Molyneux, Mrs. H. Cannell, Mrs. Wheeler, and Golden Dragon. Mr. Turner, gardener to E. P. Monckton, Esq., Stamford, was second. Mr. W. B. Carpenter, Gravesend, won with Anemone Pompons in threes, very neat and attractive, Messrs. Salter and Cornish of Enfield following. The best lot of Pompons came from Mr. M. Russell, and they were unquestionably a very fine stand; Rubrum Perfectum, Mons. Hoste, Elise Dordan, and President were particularly good. Mr. Neary, gardener to the Rev. H. Powell, was a good second, and Mr. J. Agate, Havant, third.

Tables of bouquets, wreaths, &c., illustrating the decorative value of Chrysanthemums, made a magnificent display, the class being far and away the most beautiful feature of the whole Exhibition. Several grand exhibits were arranged, and it was only after a close struggle that the premier award could be made. It went to Messrs. Perkins and Sons of Coventry, whose display was a most beautiful one. At the back was an enormous wreath of white Chrysanthemums and mirrors with sprays of flowers upon them. In the front were large bouquets and stands of flowers, smaller ones being placed amongst them, and sprays laid upon the cloth. It would not be easy to imagine a more charming table of flowers than this. The second prize arrangement of Mr. J. R. Chard, Brunswick Nursery, Stoke Newington, was little less attractive. A heart and an anchor of flowers, with baskets, epergnes, and arches composed a splendid exhibit. Mr. G. Newman, Bromley, Kent, was third, also with an admirable arrangement, and Mr. S. Edwards was highly commended. For the best vase or epergne Mr. Chard was placed first; Mr. Chadwick, gardener to E. M. Nelson, Esq., Ealing, second; and Mr. Edwards third. Mr. D. B. Crane, Highgate, was first for three bouquets, a trio that did him very much credit as an amateur; Mr. Chard was second, and Mr. Chadwick third.

#### PLANTS.

These can only be briefly referred to here, but it must be said that they were of remarkable merit throughout, and a great improvement was manifest in all the classes. The date fixed seemed to suit them admirably, and this was taken into consideration when the second week was selected. Mr. G. Stevens of Putney repeated his success at the local Show by winning the premier prize with excellent plants, well arranged. Messrs. J. Laing & Sons, Forest Hill, were second, also with a handsome group; Mr. J. Townsend, Putney, was third; and Mr. H. J. Jones, Camberwell, Ryecroft Nursery, Lewisham, fourth, all showing well.

In the class for a group under 5 feet in height Messrs. Reid and Bornemann were first with dwarf even plants and good blooms well arranged. Mrs. W. Holmes, Frampton Park Nursery, was a capital second, the plants being even dwarfer than the first prize lot and flowers of good quality. For twelve bush specimens Mr. E. Easey, gardener to J. W. Jones, Esq., The Grange, Highbury New Park, was first with rather rough plants and inferior blooms. Mr. Vinee was second.

In the class for four trained specimens Mr. Clark, gardener to W. H. Lile, Esq., Brixton Hill, was first with large well-bloomed plants, including a good example of Etoile de Lyon. Second, Mr. W. Davey, gardener to C. C. Paine, Esq., Stamford Hill, with clean bright plants trained in a bush form. Third, Mr. Donald, whose group contained a fine coloured La Triumphant. With six standard trained specimens Mr. D. Donald won first place and the Veitch medal with grand well-trained, well-flowered plants, very fresh and bright in colour. The varieties were E. Molyneux, Chinaman, Stanstead Surprise, and Mad. E. Audiguier. Mr. Davy was second with a good Bertier Rendatler. Third, Mr. T. Richardson, gardener to Sir Jas. Ferguson, Bart., with good plants, the blooms standing out more naturally than the others. In the class for four trained standards, Mr. Donald first with clean fresh plants. Second,

Mr. Richardson. Third, Mr. Clark. In the class for six trained Pompons Mr. J. Weston was placed second, and Mr. Clark third.

In the class for nine trained specimens Mr. J. Brooks, gardener to Walter Reynolds, Esq., The Grove, Highgate, won the first prize and the silver cup offered by Messrs. Wood & Son of Wood Green, London. This group of nine plants were truly magnificent specimens, some of the plants measuring 6 feet in diameter and covered with flowers. Chinaman, Miss Gorton, Bertier Rendatler, and W. Robinson were the best. Mr. D. Donald, Leyton Green, Essex, was second with good plants, the great objection being the white sticks used in training. Mr. Weston, gardener to D. Martineau, Esq., Clapham Park, was third with fresh even plants, the best being L'Isle des Plaisirs. For six trained specimens Mr. W. Clark was first with six evenly trained and well bloomed, Jupiter, Source d'Or, and La Triumphant, very fine. Second, Mr. Walker, gardener to A. Heaver, Esq., with three good incurved varieties Mr. Rundle, Mrs. Dixon, and Prince of Wales, good. Third, Mr. Davey, with a nice highly trained bush-shaped W. Robinson.

*Miscellaneous.*—One of the most extensive and varied of the miscellaneous exhibits was the collection of flowers from Messrs. H. Cannell and Sons of Swanley. It comprised a large number of their fine Zonal Pelargoniums, bunches of their charming pure white double Begonia Octavia loosely arranged in bunches with their own foliage, forming one of the most delightful exhibits in the Exhibition; and a fine display of Chrysanthemums, many of the best varieties being represented by several flowers instead of by one bloom. There was also a large stand of their new bronzy incurved variety Robert Cannell. Messrs. W. Wood and Son had a large stand of horticultural sundries, including various soils, fertilisers, insecticides, &c.; a well arranged and interesting display. Messrs. R. Beale & Co., New Southgate, exhibited plants of Chrysanthemums struck from leaves last November, and also horticultural sundries. Mr. R. Owen, Maidenhead, exhibited stands of English seedling Chrysanthemums, amongst them being a large and beautiful pure white single variety named Miss A. H. Bates, and a Pompon with orange flowers hardly larger than those of Ranunculus aconitifolius fl. pl. A Japanese named Eugène Giat was very telling in colour, rich warm crimson. Mr. G. Wythes, gardener to the Duke of Northumberland, Syon House, Brentford, had a stand of cut blooms arranged for effect with Ferns, small Dracaenas, &c., and they were extremely attractive. Mr. W. Colchester, Ipswich, exhibited a stand of his Ichthemic guano. Mr. H. George, Putney, had a stand of horticultural sundries, also some fine bunches of Gros Colman Grape grown with Thomson's Vine manure.

A charming lot of Chrysanthemums also came from Mr. E. Molyneux, gardener to W. H. Myers, Esq., Bishops Waltham. They were chiefly composed of Pompons and singles, and were clustered loosely in vases with their own foliage, making a very pretty and pleasing arrangement.

The amateurs' and metropolitan classes were well filled, but we cannot refer to them this week. The fruit and vegetable classes, which also formed so important a portion of the Show, must be passed for a similar reason—insufficient space.

#### KINGSTON-ON-THAMES.—NOVEMBER 11TH AND 12TH.

WHEN it was found that the National Chrysanthemum Society's Show was fixed on the Kingston date some fears were entertained that the last named exhibition would be weakened in consequence. Such has not been the case, for never has a finer display been seen in the Drill Hall of the old town on the banks of the Thames. Specimen plants and groups were both more numerous and finer than usual, and the cut bloom classes were admirably filled. The blooms, moreover, were marked by an uniformity of excellence that is not often seen, and the general quality of all sections was very high indeed. The winners well won their honours, and the losers are to be complimented in running them so closely. Only the briefest report can be given of this excellent Show, to which variety was imparted by superior floral decorations and very fine fruit.

Primary attention naturally centred in the cut bloom classes, and especially in the 25-guinea cup competition. For this trophy and good prizes offered five exhibitors staged forty-eight blooms in distinct varieties, the winners being placed in the following order:—First, Mr. C. Beckett, gardener to F. H. Bryant, Esq., Juniper Hill, Dorking; second, Mr. G. Carpenter, gardener to Major Collis Browne, Broad Oaks, Byfleet; third, Mr. W. Mease, gardener to A. Tate, Esq., Downside, Leatherhead; fourth, Mr. J. Quarterman, gardener to C. E. Smith, Esq., Silvermere, Cobham. The blooms in the winning stands were as follows:—Incurved, back row: John Lambert, Lord Alcester, John Salter, Empress of India, Golden Empress, Alfred Salter, Mrs. S. Coleman, and Queen of England. Middle row: Mrs. Heale, Violet Tomlin, Miss Haggas, Prince Alfred, Princess of Wales, John Doughty, Jeanne d'Arc, and Lord Wolseley. Front row: Mrs. W. Shipman, Eve, Beauty, Barbara, Refulgence, Mrs. Brunlees, Mrs. N. Davis, and Lady Hardinge. Japanese:—Back row: Condor, M. C. Audiguier, E. Molyneux, Boule d'Or, Stanstead Surprise, Stanstead White, Val d'Andorre, and Etoile de Lyon. Middle row: Jeanne Délaux, Sunflower, Lady Penzance, Madame Baco, G. Daniels, Mons. H. Elliot, Mr. R. Brocklebank, and Avalanche. Front row: Sarah Owen, Mdle. Blanche Pigny, Mons. Bernard, Belle Paule, Marguerite Marrouch, Fimbriatum, Balmoreau, and Soleil Levant.

In the class for twenty-four incurved varieties, distinct, the prizes were adjudged—First to Mr. W. Mease. Second, Mr. E. Coombs, gar-

dener to W. Furze, Esq., Roselands, Teddington. Third, Mr. C. Beckett, gardener to T. H. Bryant, Esq., Juniper Hill, Dorking. Fourth, Mr. G. Woodgate. The blooms in the first prize stands comprised—Back row: Lord Alcester, Jeanne d'Arc, John Salter, Queen of England, Golden Empress, Violet Tomlin, Emily Dale, and Princess of Wales. Middle row: Mrs. S. Coleman, Mrs. W. Shipman, Mrs. Heale, Mrs. Norman Davis, Empress of India, Miss M. A. Haggas, Hero of Stoke Newington, and Lady Dorothy. Front row: Princess of Teck, Lord Wolseley, Princess Beatrice, Cherub, Jardine Yellow, Charles Gibson, Mr. Brunlees, and Empress Eugénie. In the corresponding class for twenty-four Japanese, the winners were—First, Mr. R. Cawte, gardener to J. P. Robinson, Esq., Brookleigh, Esher. Second, Mr. W. Mease. Third, Mr. G. Holden, gardener to C. W. Izod, Esq., The Lammas, Esher. Fourth, Mr. C. Beckett. The varieties in Mr. Cawte's first prize stand consisted of—Back row: E. Molyneux, Japonais, Stanstead White, Val d'Andorre, Sunflower, Mrs. C. Wheeler, R. Brocklebank, and Etoile de Lyon. Middle row: Mr. Cannell, Baronne de Prailly, Criterion, Condor, Stanstead Surprise, Avalanche, Jeanne Délaux, and Lady Lawrence. Front row: Sarah Owen, Mrs. J. Wright, M. Marrouch, Album Fimbriatum, Golden Dragon, Mrs. F. Jameson, Volunteer, and Maiden's Blush.

In the class for twelve incurved varieties the winners were—first Mr. R. Cawte; second Mr. W. Higgs, gardener to Mrs. Bryant, Woodlands Park, Leatherhead; third Mr. A. Felgate, gardener to Duchess of Wellington, Burhill, Walton-on-Thames; fourth Mr. C. Slade, gardener to Lady Bowater, Richmond Park. The successful exhibitors of twelve were—first Mr. W. Higgs; second Mr. A. Felgate; third Mr. W. Sutton, gardener to J. S. Sassoon, Esq., Ashley Park, Walton; fourth Mr. A. Turner, gardener to C. T. Murray, Esq., of Woodcote Hall, Epsom. The competition in these classes was extremely keen, and the stand good throughout.

The reflexed class of twelve blooms, not more than two of any one variety, was well filled, and many splendid blooms were staged. The winners were:—First, Mr. G. Carpenter. Second, Mr. R. Cawte. Third, Mr. W. Mease. The varieties in first prize stand were:—Back row: Amy Furze, Cloth of Gold, Amy Furze, Cloth of Gold. Middle row: King of the Crimson, Pink Christine, Cullingfordi, Pink Christine. Front row: Mrs. Forsyth, Cullingfordi, Peach Christine, and Golden Christine. In the twelve Anemone flowered class the honours fell:—First to Mr. G. Carpenter; second, Mr. E. Coombs, gardener to W. Furze, Esq., Roselands, Teddington; third, Mr. C. Slade, for stands of nearly equal merit. The varieties in the first prize stand were:—Back row: Lady Margaret, Nouvelle Alvéole, Lady Margaret, Nouvelle Alvéole. Middle row: Mrs. Taylor, Miss Ann Lowe, Laing's Anemone, Miss Ann Lowe. Front row: Grande Alvéole, Fleur de Marie, J. Thorpe, jun., and La Marguerite.

Twelve Japanese, Anemone flowered.—First, Mr. G. Woodgate, gardener to Lady Wolverton, Coombe Wood, Kingston. Second, Mr. G. Carpenter. The varieties in first prize stand were—Back row: Fabian de Mediana, Jeanne Marty, Fabian de Mediana, Jeanne Marty. Middle row: Margaret Villageoise, Fabian de Mediana, Jeanne Marty, M. Cabrol. Front row: M. Lebecqz, F. Clos, M. Lebecqz, and M. Villageoise. Twelve bunches Anemone Pompons.—First, Mr. W. E. Clark, gardener to A. Nagle, Esq., Bijou Cottage, Kingston. Second, Mr. G. Woodgate. Third, Mr. C. Slade. With twelve Pompons Mr. Woodgate secured the chief position with splendid triplets.

In the six blooms of one variety class, incurved, Mr. Carpenter was first with Golden Queen of England; Mr. J. W. Reed second with Empress of India; and Mr. Felgate third with Princess of Wales. In the corresponding Japanese class Mr. Felgate first with Etoile de Lyon; Mr. Carpenter second with the same variety; and Mr. Cawte third with E. Molyneux. The special prizes given by Mr. Sisson Hyde for twenty-four blooms (eight Jap, eight incurved, eight reflexed) were won as follows:—First Mr. W. Mease, second Mr. A. Felgate, third Mr. G. Woodgate; all with excellent contributions. Three prizes, given by Major Collis Browne for twenty-four blooms (twelve incurved, twelve Japanese) were won by—first Mr. R. Cawte; second Mr. A. Felgate; third Mr. W. Palmer, gardener to Right Hon. Hume Dick, Thames Ditton House, Surrey; all of them staging very well indeed.

Both the premier blooms in the Show were found in Mr. Mease's stand—namely, Lord Alcester and Etoile de Lyon.

Three splendid blooms of Mrs. Jameson and three of the new reddish-purple large Anemone W. G. Drover, exhibited by Mr. E. Molyneux, were certificated.

Groups and specimens were the best that have been arranged in the Drill Hall, and that is saying a good deal. In the group class Mr. H. W. Pitcher, gardener to Mrs. Dunnage, Albury House, Surbiton, was first; Mr. A. H. Rickwood, gardener to Dowager Lady Freake, Fulwell Park, Twickenham, second; and Mr. Dorset, gardener to Mrs. Welsh, West Cross, Kingston Hill, third. For three trained Japanese specimens Mr. R. Cawte was first with magnificent examples; Mr. W. Skeets, gardener to J. T. W. Ponsford, Esq., Lillesworth, Esher, also with fine specimens, second; and Mr. G. Sallows, Twickenham, third. For three trained incurved Mr. Cawte was first with grand specimens, Mr. Sallows second. Mr. Cawte was also first with Pompons, large free bushes, healthy and floriferous. Standards were never seen finer anywhere, Mr. Higgs securing the chief prize, but closely followed by Mr. Cawte.

It is quite impossible to give the awards in other classes, including those for fruit, table plants, epergnes, &c., and it must suffice to say that the productions were of marked excellence, and that the Show in its entirety was a credit to exhibitors, officials, and the town of Kingston.

## THE NATIONAL CHRYSANTHEMUM SOCIETY.

MAY I be allowed to express the desirability (which is very generally felt among the patrons of the National Chrysanthemum Society) of obtaining a more fitting place to represent them in their annual Exhibition? The associations connected with the Aquarium are such as to debar very many of the supporters of the N.C.S. from taking part in it there. I feel sure that any loss that might be sustained through the removal would be more than fully made up elsewhere to the amount contributed by the Aquarium Company. Should there be any doubt about this, I should be pleased to contribute with others to meet any reasonable deficiency, and would offer £5 as a first instalment.—JAMES L. WOOD, *Wood Green*.

## CHRYSANTHEMUMS—EXHIBITORS' MISTAKES.

I WAS interested in Mr. Molyneux's article on the above in last week's Journal, and I hope it may have the desired effect of causing some intending exhibitors to go about their preparations, &c., in a more steady and careful manner. There is another "Exhibitors' mistake" I should like to add to those mentioned by the above esteemed authority—namely, allowing themselves to be interrupted during their preparations by so many visitors. It is a common practice when an exhibitor of any note is known to be dressing his flowers for a number of gardeners to call upon him "to see how they look now they are cut." And when they have seen they still linger discussing the merits of this or the demerits of that, which distracts the operator's attention from his work when the time is very valuable to him. An exhibitor of experience knows that the shorter the interval which elapses between his flowers being dressed and placed before the judges the fresher they appear. Therefore he allows himself the time which he knows to be requisite to do the work well, and it is very annoying to be continually interrupted by callers. I forward this to you on the eve of the show season, hoping, should you publish it, that it may be the means of causing some of these wanderers to nurse their inquisitiveness until they can see them on the show day, and thus let the intending candidate for Chrysanthemum honours get through his work in peace and quietness.—J. TUNNINGTON, *Ripley Castle*.

## CHRYSANTHEMUM JOHN DOUGHTY.

IN reply to your correspondent I would advise him not to stage John Doughty in the same stand as Bronze Queen of England, or John Lambert with Golden Queen. I think it has not been claimed for the newcomers that they were distinct, but only superior in build, and that recommendation I shall be able to endorse. I have never grown a bloom of Bronze Queen fit to put on a stand, or Golden Queen approaching any of the other members of the family, but John Doughty, I think, will reward my effort after another season, and nothing could be more satisfactory than the manner blooms of John Lambert are developing.—S.

## CHRYSANTHEMUMS AT THE PUBLIC PARKS.

HAVING a few hours' leisure I proceeded on Saturday, November 1st, to make an inspection of the various Chrysanthemum Shows open to the public in the metropolitan district. Commencing with the Temple Show, I was agreeably surprised to find such a fine show of blooms, especially after the late foggy weather. A few of the most noteworthy old varieties were Avalanche, Mrs. J. Wright, Stanstead Surprise, Maiden's Blush, Edwin Molyneux, La Triomphante, Hamlet, Elaine, and W. Holmes; whilst of new varieties Albert Victor, Madame Louise Leroy, and Mrs. Stephenson Clarke were most worthy of notice. Incurved varieties were not so good, the petals having a tendency to reflex, most noticeable in the Queen family, the reasons for which are, that the house being unheated and open at the sides to all weathers, it contains an atmosphere charged with excessive moisture, which is exceedingly detrimental to the perfect opening of incurved blooms.

At Battersea Park the large Palm house is entirely filled with a very good collection, effectively arranged with a quantity of Palms, which add much to the beauty of the flowers, and takes off that heaviness so noticeable in large groups of Chrysanthemums. In such a large collection, containing about 1500 well grown plants of the best varieties, it was difficult to make a selection. The most conspicuous were Edwin Molyneux, Avalanche, Sunflower, Cullingfordi, M. Weick fils, W. Holmes, Mrs. G. Rundle, George Glenny, and Mrs. Dixon, which are grown in quantity and massed, a system of staging that shows them to the best advantage. There were also good blooms of Prince Alfred, Lord Wolseley, Princess Beatrice, Prince of Wales, Queen of England, Empress of India, and Lord Leicester. The whole of the flowers were very fresh, and with careful attention will last in good condition for a considerable time.

Calling at Southwark on my return journey I saw a very creditable group, arranged in a span-roofed house. It contained some very good

specimens of Fair Maid of Guernsey, E. Audiguier, Edwin Molyneux, and W. Holmes, the last-named variety being grown in quantity. This collection is later than the others, and will be seen at its best in a week or ten days' time.

I regret that through pressure of business I was unable to visit Finsbury Park, where, from information received, there is an excellent display of bloom.—H. P.

## CHRYSANTHEMUMS AT FROYLE PARK, ALTON.

FROYLE PARK, the residence of J. Murray Robertson, Esq., has become during the last few years famous for its Chrysanthemums, and there is just now in the conservatory such a display as is seldom seen. The plants are grown on the large bloom system, four to six blooms on a plant, very dwarf, and arranged as they are in a long sloping group, with the Japanese and incurved varieties mixed, and the colours artistically blended, few plants could equal the Chrysanthemum for effect. The plants to be seen at Froyle are strong, well furnished, with healthy dark green foliage, and the buds were evidently taken at what is usually termed in gardening language "the right time." Among the Japanese varieties I noticed superb blooms of Etoile de Lyon, Avalanche, Stanstead Surprise, Edwin Molyneux, Mr. Orchard, Marsa, Phœbus, Mr. J. M. Pigny, Boule d'Or, Golden Dragon, &c., and although all are good, the best of the incurved are represented by Queen of England, extra good; the Empress family, Princess of Wales, Violet Tomlin, Jeanne d'Arc, Prince Alfred, and Lord Wolseley. Mr. Coster evidently thoroughly understands the culture of the Chrysanthemum, but attributes his success in a great measure to the kindness and liberality of Mr. Robertson. Damping, the great enemy of the grower of specimen Chry-anthemum blooms, is almost absent from Froyle Park this season, and Mr. Coster thinks his preventive has been the use of Thomson's manure instead of the usual farmyard liquid. The side stages in this conservatory are filled with fine plants of Bouvardias in all the best known varieties blooming very freely.—G. TRINDER, *Dogmersfield Gardens, Winchfield*.

## NOTES IN IRELAND.

CONDOR.—This will probably go into the reflexed Japanese class, judging from a magnificent specimen before me (kindly sent by Mr. Crawford, Kilternagh Gardens, near Waterford), where so many of the best splendid varieties are already classed. He sends it to me to see how some of his largest blooms are damping off to illustrate the accuracy of Mr. Wright's propositions on that subject last issue. First as to its size. I have carefully measured the bloom before me, and find it 9½ inches in diameter, and when spread out nearly 20 inches around. I mention that to show the size this variety can be grown to. The petals are five-eighths of an inch across and wonderfully numerous in the centre. The outer petals are all white, while the centre ones have a rich shade of pinkish lilac very effective and telling.

DAMPING.—I have some fine blooms of Etoile de Lyon, Mrs. Falconer Jameson, Avalanche, Fair Maid, M. Freeman, Mr. and Mrs. H. Cannell, C. Orchard, Elaine, Criterion, and so on, besides a sport I shall immediately refer to, in my greenhouse, and none show signs of damping. This has set me thinking, as growers are not at all satisfied of the cause in each individual case. The worst cases I have always found where the feeding was most marked and continuous, especially with sulphate of ammonia. This does not refer to my friend above named, as I am unaware if he used liquid feeding of any kind. I have recommended another grower to use fire heat who apprehended damping, but he told me this might "rush" his exhibition blooms prematurely before the show. This there was no gainsaying, and thus the exhibitor is between two misfortunes. I have found keeping the temperature not much above 50° Fabr. did not cause my blooms to come prematurely on, and there has been no damping, but it is only fair to say I only grow as an amateur for my own amusement and information. I thoroughly agree with Mr. Wright in his contention that the time to take thought of damping is not now, when it is visible, but to take precautions beforehand. Thorough exposure to light and air in the summer and autumn, proper soil, manure and potting, and repotting, just at the right time, and so on as pointed out by Mr. Molyneux, are the real antidotes.

Since writing the above I have received a further note from Mr. Crawford, who is a large grower and cultivator, saying it was remarkable that those Chrysanthemums he had put into the houses, no matter how dry and how airy (and he had a few degrees of fire heat in the greenhouse) they continued to damp, while an extra collection for which he had not room indoors were placed under a temporary structure of sashes placed against a south wall not one had damped. They were fully open in front and the ends, and on those he says he must mainly depend. This is certainly suggestive.

LADY CAMILLA.—At the Waterford Show last year I noticed seemingly a new variety in the stand of Hon. Dudley Fortescue, Summerville, as shown by Mr. J. A. Calthorpe. I procured one of the blooms and forwarded it to Mr. Wright for his opinion. He only saw it several days after being cut, and could only say it much resembled Etoile de Lyon (Cannell). At present I have a plant of both growing side by side in my garden, and though the colour of the blooms somewhat resemble, they are otherwise wholly different—the colour of the blooms in Lady Camilla even being a much deeper lilac tint. The height of the latter, too, is twice that of the former. Mr. Calthorpe cannot account for this ardent sport further than that it grew in the same pot with Mrs. Beale he had from Messrs. Carter.—W. J. MURPHY, *Clonmel*.

LADY BROOKE.

LORD BROOKE, M.P.

SIR W. GUYER HUNTER, M.P., K.C.M.G.

SIR EDWIN SAUNDERS, F.R.C.S.

MR. E. C. JUKES.

MR. R. BALLANTINE.

FIG. 56.—CHRYSANTHEMUM FESTIVAL PORTRAITS.

FOR the photograph of Lady Brooke represented above we are indebted to the courtesy of Walery of Regent Street, and Lord Brooke's portrait was kindly supplied by the London Stereoscopic Company. The others have been obligingly forwarded by their respective owners.

**LADY BROOKE.**—The consent of Lady Brooke to officiate at the opening of the National Society's Festival on Tuesday last contributed materially to its success, and the little ceremonial was most fitting for such an important occasion. Lady Brooke takes a great interest in horticulture, and possesses exquisite taste in floral arrangement and garden design, which is well displayed at her Essex residence, Easton Lodge, Dunmow. Roses and Chrysanthemums have long been cherished there, several cups and valuable prizes having been won by the products of those gardens.

**LORD BROOKE, M.P.**—As the honoured President of the National Society Lord Brooke deserves prominent notice here, and though he was unable to be present at the opening ceremony he has promised to preside at the banquet, and last year's experience at the annual dinner proved to everyone's satisfaction how admirably he can fill that office. Lord Brooke is an ardent horticulturist, and possesses a critical practical knowledge in all departments of an exceptional character.

**SIR GUYER HUNTER, M.P., K.C.M.G.**—Sir Guyer Hunter is one of the Members of Parliament for Central Hackney, and we believe it was due to his intimate acquaintance with and respect for the late Honorary Secretary, Mr. William Holmes, that he became connected with the National Chrysanthemum Society, first as a member, and then as a Vice-President. He was elected Chairman of the Conference to be held on Thursday, November 13th (to-day), and is also Chairman of the Holmes' Memorial Fund Committee.

**SIR EDWIN SAUNDERS, F.R.C.S.**—At Fairlawn, Wimbledon Common, Sir Edwin Saunders has amply proved how great a love he has for a beautiful garden, for it has the reputation of being one of the best kept and most picturesque of its size in the neighbourhood of London. To floriculture he is especially devoted, but he is also interested in fruit culture, having become a Vice-President of the British Fruit Growers' Association. The local societies owe much to his support, with several of which he is connected as patron or Vice-President. He was elected Vice-President of the N.C.S. a year or two ago, and was unanimously appointed Chairman of the Conference on Tuesday, November 11th.

**MR. R. BALLANTINE.**—None of the National Society's officials has performed so much useful and unassuming work in the past and present years as the Chairman of Committees, Mr. R. Ballantine. For many years he was the close friend of Mr. Holmes, was familiar with every detail, and within the past two months he has laboured incessantly to promote the object which his friend had in view, the success of the Centenary Festival. He has had the satisfaction of seeing his best wishes realised in the magnificent Show at Westminster, and it is to be hoped he will long give the Society the benefit of his experience and aptitude for business. He has been appointed Treasurer of the Holmes' Memorial Fund.

**MR. E. C. JUKES.**—The Vice-President of Committees is a very popular officer. He possesses remarkable adroitness in Committee work, and knows exactly how to turn a troublesome contention into the right channel. As an amateur cultivator of Chrysanthemums he has especially applied himself to the large and Japanese Anemones with considerable success, and at the Centenary Show he obtained a first prize for a stand of the former in a good competition.

## CHRYSANTHEMUM SOCIETIES AND SHOWS.

THE following list has been prepared at the request of numerous correspondents, who have supplied us with the particulars here given, and it will, no doubt, be found useful by many who are concerned with exhibitions during November. The name of the society, date of show, with the Secretary's name and address are given in that order.

- Banbury, 19th Nov. ; H. F. Bennett, 46, High Street, Banbury  
 Bath, November 12th and 13th ; B. Pearson, 14, Neilson Street  
 Batley and District, Nov. 22nd ; John T. Booth, Batley  
 Bedford, Nov. 19th and 20th ; J. Sanders Clarke, 49, Linden Road  
 Bedford and Bedfordshire Chrysanthemum Society, Nov. 19th and 20th ; Oliver C. Coombs, 28, Mill Street, Bedford  
 Birmingham and Midland Counties, Nov. 12th and 13th ; J. Hughes, Northwood Villas, Metchley Lane, Harborne, Birmingham  
 Bournemouth, Nov. 12th and 13th ; Charles Brown Carnarvon, Cavendish Road  
 Bristol, Nov. 13th and 14th ; F. Wilford Jones, Hill Avenue, Totterdown, Bristol  
 Cardiff and District, Nov. 18th and 19th ; C. R. Waldron, 96, St. Mary Street, Cardiff  
 Chelmsford, Nov. 12th and 13th ; P. Edwards, 100 High Street  
 Cheshunt, Nov. 14th and 15th ; R. Archer, Hatton Road  
 Chorley, Nov. 21st and 22nd ; James Sargeant, 64, Market Street, Chorley  
 Cornwall Royal Polytechnic, Nov. 12th, 13th and 14th ; John P. Cregoe, 7, Tehidy Terrace, Falmouth  
 Cranbrook and Weald of Kent, Nov. 13th and 14th ; Albert Baker, The Hill, Cranbrook, Kent  
 Crediton, Nov. 13th ; G. Lock, Belle Parade Cottage, Crediton  
 Dawlish, Nov. 13th ; H. L. Friend, 3, Priory Terrace, Dawlish  
 Derby, Nov. 14th and 15th ; G. Sutherland, Arboretum Square  
 Devon and Exeter, November 7th ; G. D. Cann, 16, Queen Street, Exeter  
 Diss (Norfolk), Nov. 18th ; Rev. F. Page Roberts, Scole Rectory  
 Eccles, Patricroft, and Pendleton, Nov. 14th and 15th ; H. Huber, 183, Worsley Road, Winton, Patricroft  
 Green Street and District, Nov. 19th and 20th ; W. G. Ray, Mount Pleasant Nursery, Green Street, near Sittingbourne  
 Guildford, Nov. 12th and 13th ; Arthur Jupp, Greencroft, Stoke, Guildford.  
 Hampstead, Nov. 12th and 13th ; Robert Frisby, 47, Flask Walk, Hampstead, N.W.  
 Hartlepool, Nov. 18th and 19th ; B. C. Laycock, 147, Studley Road, West Hartlepool  
 Hitchin, Nov. 14th and 18th ; Pearson T. Harris  
 Hull and East Riding, Nov. 19th and 20th ; Edward Harland and James Dixon, Manor Street, Hull and 2, County Buildings, Hull  
 Kettering, November 14th and 15th ; H. T. Favell, 8, Mill Road, Kettering  
 Kingston-on-Thames, Nov. 11th and 12th ; G. Woodgate, Warren House Gardens  
 Leicester and Midland, Nov. 14th and 15th ; H. F. Anthony and E. E. Waite, Knighton Church Road, South Knighton, and 12, Diseworth Street, Melbourne Road, Leicester  
 Liverpool, Nov. 18th and 19th ; E. Bridge, 3, Cedar Terrace, Tarbock Road, Huyton  
 National Society.—Great Festival, Nov. 11th, 12th, 13th, and 14th ; R. Dean, Frampton Park Nurseries, Hackney  
 Norfolk and Norwich, Nov. 20th and 21st ; John E. T. Pollard, 7, Lady's Lane, Norwich  
 Northamptonshire, Nov. 12th and 13th ; E. Draper, 2, Primrose Hill, Northampton  
 Ramsbottom, Nov. 15th ; H. H. Nutter, 14, Crow Lane, Ramsbottom, near Manchester  
 Rugby, Nov. 19th and 20th ; William Bryant  
 Scarborough, Dec. 2nd and 3rd ; Thomas Henry Pexton, 136, North Marine Road, Scarborough  
 Scottish Horticultural, Nov. 20th, 21st, and 22nd ; R. B. Ferguson, 6, South St. Andrew Street, Edinburgh  
 Southend-on-Sea, Nov. 13th and 14th ; John Brown, Recko House, Hamlet, Southend-on-Sea, Essex  
 Street, Nov. 14th and 15th ; A. D. Porter, Street, Somerset  
 Swansea, Nov. 19th and 20th ; Messrs. T. Kneath and W. Roberts  
 Taunton, Nov. 13th ; Edgar Poynter, Castle Green, Taunton  
 Teddington, Nov. 13th and 14th ; David Anderson, The Nursery  
 Tiverton, Nov. 20th ; R. P. Cosway, Lime Cottage, Tiverton  
 Tunbridge Wells, Mid-Kent, and East Sussex, Nov. 12th and 13th ; Ernest Charlton, 37, Ye Pantiles, Tunbridge Wells  
 Twickenham, Nov. 18th and 19th ; J. J. G. Pugh, 2, Heath Road  
 Wellington (Somerset), Nov. 14th ; Charles Tite, Shutes House, Wellington, Somerset  
 Westerham, Nov. 19th and 20th ; Frank George Remnant, High Street  
 Wimbledon and District, Nov. 13th and 14th ; Dr. Geo. Walker, 12, Lingfield Road, and W. W. Thomson, The Nurseries, Hill Road, Wimbledon

Winchester, Nov. 13th and 14th ; Chaloner Shenton, 74, High Street, Winchester

Yeovil, Nov. 19th ; E. H. Oakley, Eason Terrace, Yeovil  
 York, Nov. 19th, 20th, and 21st ; J. Lazenby, 8, Spurriergate

## THE CHRYSANTHEMUM IN TASMANIA.

[A Paper by Mrs. Marian Thrower, Representative of the Northern Horticultural Society of Tasmania, read at the National Chrysanthemum Society's Conference, Royal Aquarium, Westminster, November 11th, 1890.]

TASMANIA is so small a speck upon the surface of the globe, and is so remote from the British Islands, that it is perhaps not very surprising that a great many persons in England know nothing more about it than that such a place actually exists, and some have vague ideas that the inhabitants thereof are still aboriginals, with little or no civilisation. It is a matter for no little surprise when such individuals learn that Tasmanians keep pace as far as possible with all movements which interest their fellow subjects in England, and I can safely assert that in no part of the Australasian group is the culture of the Chrysanthemum carried on with so much zeal and success as it is in the colony, one of whose leading horticultural societies I have the honour to represent at this Centenary Festival.

Tasmania possesses a climate which appears to be especially favourable to the growth of the Chrysanthemum, being devoid of great extremes of heat and cold, and when the knowledge of its culture shall have been as completely mastered there as it has been by the growers in England, I do not think I am over-sanguine in predicting that it is there it will yet be seen to the greatest perfection. And as it can only be by experience extending over some years that this knowledge can be acquired, it will naturally be some time before our happiest results can be achieved.

You in England are celebrating the centenary of the Chrysanthemum, whilst we, as a colony, have not yet reached so venerable an age. It cannot, therefore, be expected that we have arrived very far beyond the initiatory stages of Chrysanthemum lore, but that we are progressing with rapid strides must be acknowledged by anyone who could compare notes between the position occupied by the flower in the year 1886 and that to which it has attained in 1890. It is only four years ago since the first actual Chrysanthemum exhibition was held in Northern Tasmania. It is true that for many years previously the flowers held a subordinate position in the schedule at the autumn flower shows, when very frequently no entries at all were made, for there was never any competition in this class among amateurs, and our professional gardeners held it so little in esteem that when at length the tide of popular favour set in so strongly that they could no longer ignore it, the result was that they found themselves quite or nearly as much in the dark as to the best method of culture to be adopted in our far off land as were the most inexperienced amateurs. Then recourse was had by both professionals and amateurs to the best English authorities upon Chrysanthemum culture, and although much light was thus obtained it may easily be understood that the rules which apply to the English seasons and climate are not applicable to those of Tasmania.

In the year 1886, as I have mentioned, our first Chrysanthemum show was held in Launceston, it having been rather hastily improvised by Mr. Ernest Whitfield, who must be regarded as the founder of our now flourishing autumn exhibitions ; this gentleman is now President and Honorary Secretary of the Society represented by me upon the present occasion. The flowers which were exhibited at this initial Show were not grown upon the principles since followed with exhibition plants, having been allowed to grow in the natural way ; but as most of those who contributed specimens upon that occasion were amateurs who, learning through the English horticultural press of the successful results which rewarded the efforts of growers of the Chrysanthemum "at home," as England is always known by us, had imported many fine varieties which had until then been quite unknown in Tasmania, it was seen that a wide and interesting field was open to those who would venture to explore it. The immediate consequence of our first Chrysanthemum show was an increased desire upon the part of amateurs to improve their collections and to learn something of the methods which would ensure successful culture ; at that time less than 100 varieties had found their way to Tasmania, now there is no colony in Australasia which grows so many. Quickly succeeding the establishment of Chrysanthemum shows in Launceston the kindred associations in all the northern provincial towns followed our lead, so that the "queen of autumn flowers" may now be said to have a very firm footing in our island. The affiliation of the Northern Horticultural Society of Tasmania with the National Chrysanthemum Society may be considered as marking a new era in its history, and that its future will be a prosperous and eventful one can scarcely be doubted.

The culture of the Chrysanthemum in Tasmania can scarcely be followed upon the lines which obtain in England. With us pot-grown plants find little favour, except as bush specimens or for decorative purposes ; the great interest of our exhibitions always centres around the cut specimens. For this purpose we have found that culture in the open ground gives the most satisfactory results. It may not be altogether uninteresting to learn how Tasmanian growers proceed when raising plants. Many strike the cuttings which are taken from the first young growth which arises from the stools of plants which are left in the ground after they have been cut down, and these, when the certainty of having propagated sufficiently is assured, are then removed and thrown away. Some growers strike their cuttings in small pots, keeping them in a cool, close frame for ten days or a fortnight, while

others again plant them straight into the open ground, where they remain until they bloom; but the latter method is not common, although I know it is adopted by one of our most extensive growers, who is a very successful exhibitor. As soon as the cuttings are quite established, at whatever season they are taken, they are generally transplanted to the ground, where they make very rapid growth—so rapid, indeed, that it is always necessary to make successional plantings to insure having certain varieties at exhibition time. The period for the general planting out is the month of October, which is early spring with us in Tasmania; but cuttings which are inserted even in November frequently furnish flowers for the show which takes place in April. When the plants have attained a height of about 10 inches it is usual to top them, and the three branches which are thus produced are, as soon as they are of sufficient height, tied to separate stakes, the axillary growths being removed as they appear. Each plant thus produces three large blooms, instead of one, as grown upon the single stem mode, and we have found that the blooms are quite as fine, while the more dwarf growth is better suited for garden culture. The plants do not appear to require nearly so long a period for ripening the wood as seems to be necessary in England, the latest plants being generally quite as mature as those which were put out earlier. The rapidity with which the Chrysanthemum grows in our climate in most instances precludes us from taking the crown bud, which develops too quickly to be of any use for exhibition purposes. The greater heat of our late summer has probably something to do with this; therefore it is the custom to select the terminal bud, which gives us far more satisfactory results. Much difficulty was experienced by those who at first adopted the single stem plan of growing, for so many of the varieties grew to so great a height as to render it almost impracticable to give them sufficient support, and to protect them from the high winds which often prevail in our autumn season; so that as it was evident that results quite as satisfactory were obtained from topping once in the early stage, that plan is most generally adopted.

As our climate is very much drier than that of England it goes without saying that a great deal of labour is necessary as soon as the summer sets in, so that the plants may suffer no check, and it is therefore indispensable to mulch all the ground upon which Chrysanthemums are grown very heavily with well-decayed manure before the spring rains have quite ceased; by this means a good stock of moisture is stored up to meet future needs. Then, when all disbudding is over and the season of bloom is approaching, all those who are growing for exhibition purposes set about giving the plants copious doses of liquid manure; but as each grower in our locality seems to have some pet liquid for this purpose it would be rather difficult to say which is most in demand. Some use chemical manures, others soot water, stable manure liquid, bone dust, or guano liquid.

We have many enemies to contend against during the whole period of the growth of our favourite flower. To begin with, the mildness of our climate permits such midnight marauders as slugs to play deadly havoc among the tender foliage of newly rooted cuttings, necessitating much watchfulness. Scarcely have these foes left the field than many growers who have plants and cuttings which have been imported from England find that they have imported with them a black fly, which haunts the newly unfolded leaves, and is very difficult to dislodge. Later we have unwelcome visitors in the form of small green worms and caterpillars, which do much harm to the bud shoots; then, when all appears to be smooth sailing, mildew makes its appearance, and sometimes a small green fly follows this; but what is more objectionable than any of these is the sudden damping of the blooms just when success seems most certain. With regard to the latter trouble, however, I have seldom seen it affect the Japanese varieties, and only certain of the incurved, those which generally suffer most being the Empress of India, the Queen family, Alfred Salter, and some others—for, strange to say, many varieties which grow in the same bed, within a few feet of those named, do not suffer at all.

The drawback to the system we pursue of growing exhibition blooms entirely out of doors, is the liability to which they are exposed of being injured by early frosts which occasionally visit us in the autumn, so that it is sometimes necessary to have a kind of elevated frame over which light canvas may be drawn to avert injury to the flowers. In addition to all the best known and esteemed varieties of incurved and Japanese, good collections of reflexed, Anemone flowered, Pompons, and fimbriated varieties may be seen at our exhibitions, but there is no question that Japanese varieties are preferred by the majority of our growers, probably on account of the greater difficulty which exists in producing perfect types of the incurved varieties, as well as the greater adaptability of the former for all decorative purposes. Our exhibitors have yet much to learn from the old country in the matter of staging, arrangement of colours, and other matters which have to be considered, as well as the production of flowers which are fit for exhibition. Exhibitors, too, are not always satisfied with the decision of the judges, who are sometimes not as experienced as could be wished, but this is a difficulty which time will remove, as men of home experience find their way to our shores and introduce some of their ideas among us.

The competition among both professional and amateur Chrysanthemum growers is very keen, and the contests are always very close ones, many of the exhibitors travelling as far as from Hobart to Launceston, and *vice versa*, a distance of 130 miles by train, with their exhibits. Tasmania is destined to occupy a premier position among the Australias with regard to Chrysanthemum culture, owing to the great superiority of its climate, the scorching hot winds of the summer upon the main-

land having a most deleterious effect upon the plants, while the water supply of the colonies adjoining Tasmania is not at that period adequate to the demands made upon it. I feel that it is a matter for congratulation that our Society is privileged to be represented among the affiliated societies of the National Chrysanthemum Society upon this most auspicious occasion, although I consider it is to be regretted that a member no better qualified than myself to speak upon Chrysanthemum culture should have undertaken the task, but I trust that my endeavours to throw some little light upon matters as they exist at the Antipodes will be received in a spirit of indulgence and toleration of my shortcomings.

I cannot conclude without expressing a deep regret, not only on behalf of the Northern Horticultural Society of Tasmania, but also upon my own, at the untimely decease of the late Honorary Secretary of the

FIG. 57.—MRS. MARIAN THROWER.

National Chrysanthemum Society, Mr. William Holmes, whom I had the pleasure of meeting, and to whom I am indebted for many acts of kindness and courtesy.

#### ROBERTS' IDEAL VINERY.

I READ with much pleasure in your issue of September 18th the interesting reprint of a paper read by Mr. T. Roberts at the meeting of the British Fruit Growers' Association at Brighton, on September 11th, and I have been hoping that some amateur other than myself, thirsting for knowledge, would have made further inquiries through the medium of your columns as to the full structural details of these vineries that Mr. Roberts so strongly recommends, and in which it appears he has been so successful, whereby we amateurs could profitably undertake the cultivation of the Grape at popular prices.

I have just erected a Tomato house under the superintendence of a friend, from mutually devised plans, 100 feet long, 32 feet wide, in two arcades, not spans, if you please (what a much brighter picture arcade presents to the mind's eye than span), heated with 1000 feet of glazed earthenware piping. I am no believer in houses cheaply run up, without regard to permanence, constantly wanting repair, and in a very few years becoming quite tumbledown. Grape growing could not be properly or successfully carried on in such houses as these I am sure on Mr. Roberts' system. Would he kindly say whether his houses are iron or wood, and also give any other useful information to assist me in erecting a similar structure to his own, but of more modest dimensions? The one I propose would be 100 feet long, 25 feet wide, 10 feet high at the sides; also would he deem two flows and a return up each side sufficient for heating purposes, or would he suggest in addition a flow and return on each side of the pathway?—T. W. S.

#### CHRYSANTHEMUM SHOWS.

FINCHLEY.—NOVEMBER 4TH AND 5TH.

THAT two societies working for the same object in such close proximity as Finchley and Highgate could both make grand exhibitions on the same day shows that there must be a large number of cultivators in the immediate neighbourhoods. The Woodside Hall, in which the fifth annual Exhibition was held, was not large enough to contain the various exhibits. Cut blooms were excellent throughout all the classes, the chief honour being awarded to Mr. Grey, gardener to W. B. Brand, Esq., Finchley, for thirty-six blooms, eighteen Japanese and eighteen incurved, for which a large silver challenge cup was offered; there were four competitors, and the first prize collection comprised fine blooms. Japanese: Avalanche, Baronne de Prailly, Gloriosum, Etoile du Lyon, Mons. H. Elliott, Mrs. Cannell, Edwin Molyneux, Ralph Brocklebank, Sunflower, Madame C. Audiguier, Maiden's Blush, Madame

Baco, Elaine, Madame J. Laing. Incurved: Queen of England, Lord Wolseley, Golden Empress of India, Alfred Salter, Lord Alcester, Violet Tomlin, Prince Alfred, Mrs. Heale, Mr. Brunlees, Jeanne d'Arc, Refulgence, Princess Beatrice, White Venus, Mr. G. Glenn, Beverley, Mr. Bunn, Mrs. G. Rundle, and Nil Desperandum. The other collections ran very close, Mr. W. Beval, gardener to J. H. Smith, Esq., Mill Hill, took second honours, and Mr. James Rutson, gardener to A. W. Newman, Esq., the third. Mr. Rutson was a very good first with twenty-four blooms distinct, twelve Japanese and twelve incurved. His Japanese comprised massive blooms of Condor, Sarah Owen, Avalanche, Edwin Molyneux, Sunflower, Meg Merrilies, Val d'Andorre, Ralph Brocklebank, Madame J. Laing, Mrs. C. Wheeler and Criterion, and among his incurved Lord Alcester, Empress of India, Jardin des Plantes, Empress Eugénie, Lady Dorothy, Princess Teck, Barbara, and Princess Beatrice were fine. The Centenary medal of the National Chrysanthemum Society was awarded to Mr. Grey for the largest bloom of Japanese, with Etoile de Lyon, a very highly coloured flower and of great substance. Several stands of Lady Margaret were staged, and the awards were made to H. Raven, gardener to G. J. Morris, Esq.; W. King, gardener to J. Leeds, Esq., and W. Burch, gardener to J. Smith, Esq., in the order of their names. For six blooms of Elaine the competition was keen, Messrs. Grey, Salter and Raven were placed first, second, and third respectively. In another class for three pairs of cut blooms there were ten collections staged, Mr. Grey being awarded first with Lord Wolseley, Jeanne d'Arc and Refulgence. The second award went to Mr. Burch for Golden Empress, Empress of India, and Princess of Wales, and the third to Mr. H. A. Page with Golden Empress, Violet Tomlin and Princess Teck.

The competition was close in the class for incurved, there being six exhibitors. Mr. H. A. Page, gardener to F. Crisp, Esq., New Southgate, had a magnificent board of Alfred Salter, Queen of England, Empress of India, Golden Empress, Miss Haggas, Nil Desperandum, Jardin des Plantes, Violet Tomlin, Mr. Brunlees, Princess of Wales, Baron Beust, and Princess Teck. Messrs. Grey and Walker shared the other two honours. Twelve Japanese were represented by ten competitors, Mr. Page again heading with a grand collection of Etoile de Lyon, Ralph Brocklebank, Stanstead Surprise, Snowstorm, Alba Fimbriata, Madame C. Audiguier, Condor, splendid; Madame Laing, Mrs. Beale, Belle Paule, and Soleil Levant. Mr. Grey ran close for second place, and Mr. Burch third.

Pompons, Anemone Pompons, reflexed, and Japanese Anemones were well represented, and a large number of small classes for both incurved and Japanese, which we cannot this week separately record. The groups were also good, though not numerous, Messrs. Page, Hayler, and Carter dividing the honours in the order of their names. Fruit and vegetables were also well exhibited.

#### EALING.—NOVEMBER 5TH.

THE thirteenth annual Exhibition took place in the Victoria Hall, on 5th inst., and was quite a representative display of autumn produce. The Hon. Secretaries, Messrs. Cannon and Dawes, are to be commended for their excellent arrangements. We think that the action of the executive in commencing this season to restrict the competition to Ealing will not be conducive to cultural success (one of the chief aims of such shows) in the future. For instance, at the Show under notice we missed the fine flowers sent in previous years from Chiswick and other districts.

Chrysanthemums, both plants and cut flowers, were shown in admirable condition. In the group class first honours were accorded to a capital and effective arrangement, containing some really fine flowers contributed by Mr. C. Long, gardener to E. Oakshott, Esq., Orchardene. Second, Mr. W. White, gardener to J. Curryer, Esq., Ealing Dean; third, Mr. J. Granger, gardener to Mrs. Scott-Turner; fourth, Mr. Collyer, gardener to Mrs. Murrell, Uxbridge Road. It would be an advantage (to the public and others) another season were the Committee to require that the plants comprising such groups be named. The National Chrysanthemum Society offered the special Centenary medal as an additional first prize for twelve incurved blooms; this double event was won with some fine flowers by Mr. C. Edwards, gardener to W. Owen, Esq., The Elms, Castle Bar Hill, excellent were Alfred Salter, Miss Haggas, and Refulgence. Second, Mr. C. Long. Third, Mr. H. Collyer. Twelve Japanese, first, Mr. C. Long, whose best flowers were Stanstead White, Sunflower, E. Molyneux, Ralph Brocklebank, and Avalanche. Second, Mr. C. Edwards. Third, Mr. H. Vyner, gardener R. D. Dawes, Esq., Edmondscote House.

Twelve bunches Pompons.—First, Mr. H. Collyer, who showed Rose d'Amour, Charles Dickens, and Black Douglas, well. Second, Mr. C. Edwards. Third, Mr. A. Jones, gardener to E. Hyde, Esq., Hill Crest, Castle Bar.

For nine incurved blooms the National Chrysanthemum Society's silver medal was won by Mr. H. Vyner, gardener to R. D. Dawes, Esq., particularly noticeable being Lord Wolseley, Lord Alcester, Refulgence, Golden Queen of England, Mrs. W. Shipman, Violet Tomlin, Miss Haggas, and others. A pretty class was that for six bunches of Anemone flowered. Here Mr. E. Chadwick, gardener to E. M. Nelson, Esq., Hanger Hill House, secured first prize, his best flowers being Antonius and Contrast. The same exhibitor secured the premier prizes for a stand of Chrysanthemums and for a bouquet of Chrysanthemums, both highly artistic arrangements. The premier incurved bloom Queen of England was shown by Mr. C. Edwards, gardener to W. Owen, Esq. Premier Japanese, Stanstead White, by Mr. C. Long.

Some very tastefully arranged bouquets of Chrysanthemums, not for competition, were sent by Mrs. A. B. Smith, florist, &c., Ealing (highly commended). Miss Hudson, Gunnersbury House, arranged charming stands of Chrysanthemums (highly commended). A grand bank of foliage and flowering plants, not for competition, was staged by Mr. Reynolds, Gunnersbury Park Gardens; the Bouvardias were extremely well flowered (highly commended). Collection of vegetables, six kinds, distinct.—First, Mr. C. Edwards, gardener to W. Owen, Esq., a very meritorious lot, closely followed by Mr. E. Chadwick, gardener to E. M. Nelson, Esq. Third, Mr. C. Long, gardener to E. Oakshott, Esq. Grapes, three bunches.—First, Mr. Davis, gardener to E. Tautz, Esq., Castle Bar Hill, very good examples of Gros Colman. Second, Mr. S. Wigmore, gardener to F. Hicks, Esq., Oakhurst. Third, Mr. E. Chadwick. Apples and Pears were shown very successfully by Mr. E. Chadwick, Mr. J. Granger, gardener to Mrs. Scott-Turner, and Mr. C. Long. Good non-competitive collections of Apples were sent by Mr. G. Reynolds, Gunnersbury Park, and Mr. E. Chadwick, Hanger Hill House, the latter exhibitor taking first prize in the class for four dishes of Potatoes in a remarkably keen competition, the varieties consisting of Reading Russet, Schoolmaster, Beauty of Hebron, and Duke of Albany. The cottagers made a very good display of vegetables, some of the samples comparing very favourably with the produce from the professional growers.

#### TOOTING.—NOVEMBER 5TH.

THE baths at Balham constitute when duly prepared, as on this occasion, an admirable place for a Chrysanthemum show, ample space being provided both for exhibits and visitors. A bright and effective Show was opened there on Wednesday last week by the Tooting Society, which is evidently making good progress in the neighbourhood, and performing a useful service. The Committee and the hardworking Secretary, Mr. Brown, may be congratulated upon the advance accomplished, and it is to be hoped that they will continue their good work in the same spirit.

The exhibits cannot be noted in detail; only the leading features can be indicated, and turning first to the cut blooms, the finest contribution was that which gained Mr. Fullick the premier award for twenty-four blooms, twelve incurved and the same number of Japanese. His blooms were not large, but fairly neat and fresh, the varieties being as follows. Japanese: Avalanche, E. Molyneux, Elaine, Comte de Germiny, Jeanne Délaux, Paul Dutour, Charlie Sharman, Maiden's Blush, M. Desbrieux, Madame C. Audiguier, Hamlet, and Gloriosum. The incurved were Queen of England, Prince of Wales, Mrs. G. Rundle, very fine; Alfred Salter, Jeanne d'Arc, Baron Beust, Empress of India, John Salter, Mr. Bunn, Lord Wolseley, Golden Empress, and Princess Beatrice. The second place was taken by Mr. T. Parrott, gardener to H. Russell, Esq.; and the third by Mr. F. Ball, gardener to Sir H. Doulton.

Mr. Parrott had the best twelve Japanese, fresh fine blooms of Etoile de Lyon, Ralph Brocklebank, Stanstead White, E. Molyneux, Avalanche, Madame C. Audiguier, Gloriosum, Fernand Feral, Soleil Levant, Stanstead Surprise, Japonais, and Elaine. The same exhibitor was first for six Japanese, the varieties being Etoile de Lyon, Val d'Andorre, Madame C. Audiguier, Edwin Molyneux, Avalanche, and Japonais; for these the National Society's Centenary medal was awarded as the best Japanese blooms in the show. The principal exhibitors of plants were Messrs. Fullick and Weskar, the former showing standards, the latter dwarf plants. Both were good, and Mr. Weskar's three plants of the Rundle family were excellent, but a plant of Bronze Queen quite out of character lost him the premier award. Grapes, fruit, and vegetables were also well shown.

#### TORQUAY.—NOVEMBER 5TH AND 6TH.

A CAPITAL autumn Exhibition was provided in the Bath Saloons, a most suitable place, the competition being exceedingly keen. The groups of Chrysanthemums and miscellaneous plants were arranged in circles on the floor of the large hall with plenty of promenading space between. So numerous were the exhibits in the cut bloom classes that a special room had to be set apart for them. The greatest interest was centered in the class for thirty-six blooms distinct, half incurved and the remainder Japanese, for which a silver cup was given. Mr. W. Dolling, gardener to Mrs. Wild, Newton Abbott, was first with large, solid, and fresh incurved, and bright Japanese. The varieties were—Incurved, back row: Alfred Salter, Golden Empress (to which was awarded the prize for the premier incurved bloom of the Show), Queen of England, Empress of India, Lord Wolseley, Lord Alcester. Middle row: Mrs. W. Shipman, Princess of Wales, Miss M. A. Haggas, Prince Alfred, Jeanne l'Arc, Violet Tomlin, extra. Front row: Refulgence, Barbara, Lady Hardinge, Mrs. Heale, Baron Beust, Mrs. N. Davis. Japanese, back row: Comte de Germiny, Mrs. Beale, Sunflower, Etoile de Lyon, Edwin Molyneux, Avalanche. Middle row: Belle Paule, Mons. Bernard, Mr. Cannell, Sarah Owen, Album Fimbriatum, Madame C. Audiguier. Front row: Grandiflorum, Meg Merrilies, Madame J. Laing, Jeanne Delaux, Stanstead Surprise, and Mr. Ralph Brocklebank. Second, Mr. G. Foster, gardener to H. Hammond Spencer, Esq., Teignmouth, who had larger incurved, but much weaker Japanese; third, Mr. A. Searle, gardener to J. N. Whitehead, Esq., Gnaton, Torquay.

For twelve incurved blooms, distinct, Mr. Foster was first, having large and well-finished flowers; Mr. J. Stiles, gardener to Miss Fripp, Teignmouth, second; Mr. W. B. Small, Torre Park Nursery, third. In the class for twelve Japanese, distinct, Mr. Dolling with a superior collection of popular kinds was well to the front, Messrs. Stiles and

Searle following closely as second and third in the order named. Mr. Dolling followed up his previous successes by securing the premier award for six distinct reflexed blooms, Cloth of Gold King of Crimson, Golden Christine, Cullingfordi, and Felicity. Mr. Searle was a close second. Mr. Stiles occupied the leading place for six large Anemone-flowered with substantial blooms of Miss Annie Lowe, Lady Margaret, and Gluck. Mr. Searle and Mr. G. Foster were second and third respectively. For six Japanese Anemone blooms Mr. W. Satterly, gardener to A. Matthew, Esq., Braddon Villa, Torquay, easily won the first place; second, Mr. Searle. For six blooms, any one variety of reflexed, Messrs. Dolling and Searle were first and second, both staging Cullingfordi. Mr. Foster with Empress of India, and Mr. Stiles with Golden Empress, took first and second for six blooms of any one variety of incurved. For the same number of any white variety of Japanese Mr. Dolling won with superb Avalanche; Mr. Searle second, showing the same sort. Very good specimens of Boule d'Or secured for Mr. Foster the first prize. For six of any one yellow variety, Mr. Searle, following with Mr. Ralph Brocklebank. Mr. G. Cox, gardener to W. Fitzherbert, Esq., was first for the same number of any other colour in the Japanese section with grand Etoile de Lyon, one of which was selected as the premier Japanese bloom.

For a group of not less than eighteen varieties of Chrysanthemums in pots, arranged for effect in a circle of 8 feet diameter, Mr. Searle was placed first with dwarf healthy well grown plants, carrying good flowers. Mr. F. Ferris, gardener to J. W. Kimber, Esq., Cockington, second. For the best miscellaneous group Mr. W. Satterly was first with a bright arrangement, and Mr. F. Ferris second. Mr. C. H. Alder, gardener to W. B. Fortescue, Esq., Octon, with a well grown plant of Val d'Andorre, secured first place for the best specimen Japanese. Mr. G. Lea, gardener to W. Lavers, Esq., Upton Leigh, won the chief prize for Orchids, and Messrs. Peter Veitch & Co. with other local firms contributed to the diversity of the Exhibition.

#### HIGHGATE, FINCHLEY, AND HORNSEY.—NOV. 5TH AND 6TH.

THE Exhibition held by this Society on Wednesday and Thursday last week afforded abundant proof that there is no decline in the activity of Chrysanthemum growing in the above neighbourhood, for a more satisfactory display could not well have been desired. The arrangement was well carried out by Mr. Theobald. The Northfield Hall, a spacious lofty building, in which the more important classes were staged, was filled to overflowing, and a spacious marquee was also literally crammed. The long list of special prizes numbering thirty offered by residents, and thirty-two classes in the schedule proper, will show at a glance the great interest and attention shown, to the satisfaction of all concerned.

Groups and trained specimen plants were magnificent. Mr. J. Brittain, gardener to F. Reckitt, Esq., Highgate, received the highest award for a group in a space of 60 square feet, the prizes being offered by the President to the Society, and the silver medal of the National Chrysanthemum Society. In this collection all classes of the Chrysanthemum were represented, the foliage being excellent and the front plants very dwarf. The second prize was awarded to Mr. Vince, the London Cemetery Company. For six Pompons Mr. H. Eason, gardener to B. Noaks, Esq., secured first honours with evenly balanced and well flowered plants, Marie Stuart, Eynsford Gem, and Sœur Melanie being noteworthy. For a single specimen plant of W. Robinson fully 5 feet in diameter, and carrying several hundred good blooms, Mr. J. Brook, gardener to W. Reynolds, Esq., The Grove, was deservedly awarded the first prize. The same exhibitor was again to the front with six trained Japanese, perfect specimens of cultural skill, and comprised Miss Gorton, Madame Baco, Margot, Bertie Rendatler, Avalanche, and Chinaman. Mr. G. Sanders, gardener to Mrs. Dawson, occupied the second place, and Mr. Eason the third, all exhibiting well.

*Cut Blooms.*—A silver challenge vase, value £10 10s., but which from its appearance we should have thought was of greater value, was offered by the President, Vice-Presidents, and patrons, for twenty-four cut blooms, distinct, twelve incurved and twelve Japanese. Mr. J. Brittain won this coveted trophy with the following:—Incurved: Lord Alcester, Lord Wolseley, Emily Dale, Queen of England, Alfred Salter, Golden Empress, Empress of India, Violet Tomlin, good; Princess of Wales, a grand built flower; Lady Harding, Mrs. Shipman, Miss Haggas. Japanese: George Daniels, E. Molyneux, Condor, Sunflower, fine; Marguerite Marrouch, Gloriosum, Stanstead Surprise, Carew Underwood, good; Criterion, W. Holmes, Etoile de Lyon, grand; and Avalanche—a very even and solid collection. Mr. W. Hodges, gardener to Mrs. Crossely, Cholmondeley Park, second, with a fine Japanese stand, and conspicuous blooms of Empress of India, John Salter, Princess of Wales, and Miss Haggas. Mr. Bushby, gardener to D. C. Thomas, Esq., was placed third for a good collection. In the class for twelve Japanese Mr. Hodges was first with good blooms of Edwin Molyneux, Avalanche, Mons. Bernard, Etoile de Lyon, Madame C. Audiguier, Val d'Andorre, Sunflower, a well built flower of Mr. C. Wheeler, Criterion, Mdle. Lacroix, J. Delaux, and Madame Laing. Mr. G. Quelch, gardener to W. W. Howard, Esq., Sheppard's Hill, was a very good second, Alba fimbriata in his stand was lovely, and Mr. E. Rowbottom, gardener to H. R. Williams, Esq. (the President), third, among others Etoile de Lyon, Stanstead White, Condor, and Belle Paule were highly finished blooms.

For twenty-four Japanese Mr. E. Rowbottom secured premier honours with beautiful examples of Etoile de Lyon, Val d'Andorre, Boule d'Or, Edwin Molyneux, Stanstead White, Comte de Germiny,

Hamlet, Condor, Golden Thread, Avalanche, Belle Paule, G. Daniels, Madame C. Audiguier, Volunteer, Sunflower, Charlie Charman, Mons. Tarin W. Holmes, Mdle. Lacroix, Edward Audiguier, Maiden's Blush, and a new variety named Feu Melusche. Mr. J. Brooks received second honours. No third prize offered.

For thirty-six, eighteen Japanese and eighteen incurved, Mr. T. Caryer, gardener to A. G. Meissner, Esq., Weybridge, was placed first for the following—Miss Haggas, Violet Tomlin, Lord Alcester, John Salter, Princess of Wales, Mrs. Heale, Prince Alfred, Jeanne d'Arc, Lady Hardinge, Mrs. Coleman, Jardin des Plantes, Lord Wolseley, Mrs. Shipman, Barbara, Perle Precieux, Princess Beatrice, Nil Desperandum, Mrs. Dixon, Edwin Molyneux, Mrs. J. Wright, Marsa, Soleil Levant, Val d'Andorre, Florence Percy, Madame C. Audiguier, Sunflower, Louise Leroy, Madame Laing, Stanstead White, Madame Baco, Criterion, Belle Paule, Mr. C. Orchard, J. Delaux, J. R. Pearson, and L'Or du Japon. Mr. R. Aitken, gardener to M. Goodall, Esq., Highgate Road, was placed second for a good collection.

Several good boards of six, one variety, were staged; the best came from Mr. W. R. Hodges with Empress of India, Messrs. Brittain and Bushby being second and third respectively with Queen of England and Empress of India. Mrs. B. D. Crane offered prizes for six blooms any of the Queen family, which made an interesting class, Messrs. Brittain, Bushby, and Clement being placed in the order of their names. For twelve incurved in the members' class the relative positions of first, second, and third awards was made to Messrs. Brittain, Brooks, and Hodges for collections very fresh and clean. Six Japanese one variety was well contested, and Messrs. Rowbottom, Bushby, and Brooks were placed in order of their names, all exhibiting Avalanche in fine condition. Pompons were extremely well shown, a long stage being occupied with selections of disbudded sorts. A silver challenge cup, value £5, was offered, open to amateurs only, for eighteen cut blooms, distinct, nine incurved and nine Japanese. Mr. D. B. Crane was deservedly awarded this trophy for a neat and beautiful collection, consisting of Jeanne Delaux, Sunflower, La Triomphante, Madame Audiguier, Mons. Bernard, Avalanche, Stanstead White, Edwin Molyneux, and Val d'Andorre, Prince Alfred, Empress of India, Violet Tomlin, Mrs. Dixon, Lady Hardinge, and H. Shoesmith. Mr. J. Sears was placed second, and Mr. E. Linfield third. For twelve Japanese and twelve incurved in separate classes (amateurs) Mr. Crane secured both first prizes, Messrs. Sears, Shorten, and Rundle sharing the other awards.

Anemones and reflexed were well shown, Messrs. Neary, Quelch, Aitken, and Bushby being the principal successful exhibitors. Bouquets, buttonholes, and cpergnes were numerous exhibited, and many tasteful arrangements received their share of admiration. The National Chrysanthemum Society's bronze medal we observed was awarded to Mr. D. Crane for a fine stand of Avalanche against six competitors. Space will not allow us to particularise further notable features of this well-managed Exhibition.

#### RYDE, ISLE OF WIGHT.—NOVEMBER 5TH AND 6TH.

THE Exhibition held on the above dates proved a very great success. The plants were better than usual, and the cut blooms from the amateurs showed immense progress. The gardeners' classes also showed great improvement. The Chairman, J. O. Brook, Esq., C.C., and the Secretary, Mr. Jas. Eley, are to be congratulated on the excellent display and the increased interest taken in the Society. The first prize group came from Mr. Tamplin, florist, whose plants were dwarfer than the second from Mr. Attrill, gardener to Mrs. Ratcliff, although the latter had some very fine flowers. The third prize went to Mr. F. Sutton. The first prize for six plants went to Mr. G. Wilkins, gardener to W. S. Ridley, Esq., The Castle, St. Helens, for fine bushes bearing good blooms; Mr. A. Tolby, gardener to S. E. Ridley, Esq., St. Helens, was second. For three plants of incurved varieties Mr. Wilkins was again first, and for three plants of Japanese Mr. A. Tolby was first with some good plants; Mr. Quinton, gardener to W. Woods, Esq., second; Mr. Wilkins third.

*Cut Blooms.*—The chief prize in the open class was offered for thirty-six cut blooms, eighteen incurved and eighteen Japanese, distinct. This was secured by Mr. J. Agate, Havant, with some very fine blooms, Mr. Wilkins being a very good second, Mr. J. Woods third. Mr. Winter, gardener to Mrs. Harvey, Shanklin, was first for Anemones, Mr. Agate second, Mr. J. O. Brook third. The prize for six of any one incurved brought out some of the best blooms in the Show, Mr. Wilkins being first with Lord Alcester, Mr. Agate second, Mr. J. O. Brook third. First prize in the corresponding class for Japanese was won by Mr. Winter; second, Mr. Gatrell; third, Mr. Taplin.

The large class limited to the Island consisted of forty-eight cut blooms, twenty-four incurved and twenty-four Japanese. Mr. Wilkins was again first, Mr. Harrington second, Mr. Winter third. For twenty-four varieties, twelve incurved and twelve Japanese, Mr. Winter was first and Mr. Wilkins second. For twelve incurved, distinct, Mr. Wilkins was first, Mr. Winter second, Lady Harper Crewe third. For twelve Japanese, Mr. R. Solly, gardener to Lady Oglander, Nunwell, was a good first, with fine blooms; Mr. Wilkins second, Lady Crewe third. The chief prizes for Anemones and reflexed were won by Mr. Winter, Mr. J. Woods, Mr. J. O. Brook, and Mr. Taplin. For six white Japanese Mr. R. Solly was first, Avalanche being good; Mr. J. Woods second, Mr. Winter third.

The class for forty-five blooms, set up in triplets, decorated with Fern or other foliage, brought six collections, and made a good display. Mr. J. O. Brooks was first, Mr. Taplin second, Mr. A. Tolly third, Mr. Winter

fourth. The flowers shown by the amateurs deserve especial mention. The blooms from Mr. Wheeler, Brading, Mr. F. Cooper, Brading, Mr. Matthews, Ryde, and Mr. W. Simmonds, Brading, who took the principal prizes, in some cases eclipsed the gardeners. The floral designs, baskets of Chrysanthemum blooms, and the splendid baskets of autumn foliage and berries, made quite an exhibition in themselves. Fruit was limited but good, a dish of Pitmaston Duchess Pears from the ex-Mayor of Ryde, Mr. R. Colenutt, being extraordinary, one fruit alone weighing 1 lb. 10 ozs., the whole weighing 16½ lbs., being quite a feature in a very pretty and interesting Exhibition—C. O.

PORTSMOUTH.—NOVEMBER 5TH, 6TH, AND 7TH.

THE Portsmouth Chrysanthemum Society has earned the reputation of producing one of the best autumn Exhibitions in the kingdom. Perhaps in the present instance it was the most remarkable Show yet held, no less than 2340 blooms being staged in competition. Trained plants and groups, a feature at this Show, also vegetables and hardy fruit, were admirably represented. One feature adopted by the Committee of this Society is specially to be noted, the low charge of admission, which makes the Society immensely popular, and the arrangements always reflect the utmost credit upon the esteemed Honorary Secretary, Mr. F. Power, and his assistant. The staging was effectually carried out by Mr. J. Collins.

Taking the exhibits in the order of the schedule, we first note the plants, prizes for eight specimens being £10, £6, £4, and £2. Mr. J. Busby, gardener to Capt. Long, Blendworth Lodge, Horndean, was an easy first with neatly trained plants, fully 3 feet in diameter, freely flowered and very fresh. The most noticeable varieties were Chevalier Domage, Hiver Fleuri, Margot, Madame B. Rendatler, Dr. Sharpe, and Mrs. Dixon. Second, Mr. C. Penford, gardener to Sir F. Fitz-Wygram, M.P., Leigh Park, Havant, Mrs. Horrie, a reflexed sport from George Glenny, and Elsie being the most noticeable. Third, Mr. G. Lambert, Gordon Terrace, Chichester. For eight specimen Pompons, distinct, Mr. P. Hawkins, gardener to Mr. E. Laphorne, Fairthorne, Gosport, was an easy first with plants about 4 feet high, as much through, loosely trained and profusely bloomed. Mr. J. Lambert second; Mr. Hatch, gardener to the Victoria Park Committee, Portsmouth, third. For the best group of Chrysanthemums arranged in a space of 50 square feet, Mr. Gate, gardener to G. Cook, Esq., Langton House, Gosport, led the way with a very well arranged collection, consisting of incurved and Japanese varieties of good quality; Mr. Hatch was a good second; third, no name. Mr. J. Burrige, North End Nursery, Portsmouth, secured leading honours for a group of Chrysanthemums interspersed with foliage plants. Table plants were an especial feature, twelve, in not less than eight varieties, being required, and for which the sum of £2 was offered as first prize. Much the best came from Mr. A. Abrahams, gardener to T. H. Wilson, Esq., Hazelholt, Bishop's Waltham, being light and graceful. Mr. E. Wills, gardener to Mrs. Pearce, The Firs, Bassett, Southampton, second; Mr. J. Agate, nurseryman, Havant, third.

*Cut Blooms.*—The classes for these were the best filled in the Show. The principal class was that for forty-eight blooms, half to be incurved and the remainder Japanese, not less than eighteen varieties. As was stated last week, Messrs. W. & G. Drover secured the chief position with blooms remarkable for the high quality of both incurved and Japanese varieties. The names were:—Japanese, back row: Pelican, Mr. Falconer Jameson (two), Mons. Bernard, Sunflower (two), Etoile de Lyon, Avalanche. Middle row: Gloriosum, Mrs. C. Wheeler (very fine, two), Mrs. A. Hardy (superb), Edwin Molyneux, Comte de Germiny, Mons. Bernard, Stanstead White. Front row: Stanstead White, Ralph Brocklebank, Madame Baco, Condor, Gloriosum, Baronne de Prailly, Meg Merrilies, and J. Délaux. Incurved, back row: Golden Empress (two), Empress of India (to this was awarded the prize for the premier incurved bloom of the Show), Lord Alcester, Golden Queen of England (two), Empress of India, Queen of England. Middle row: Lord Alcester, Mrs. Coleman, Lord Wolseley, Jeanne d'Arc, Alfred Salter, Alfred Lyne, Miss M. A. Haggas, Princess of Wales. Front row: Novelty, Violet Tomlin, Jeanne d'Arc, Lady Hardinge, Violet Tomlin, Mrs. Shipman, Prince Alfred, and Nil Desperandum. Mr. N. Molyneux, gardener to J. C. Garnier, Esq., Rooksbury Park, Wickham, Fareham, was a good second, losing only by the greater weight of the first prize blooms. The incurved in this exhibit were models of neatness. The principal varieties were Mr. D. Mudie, Empress of India, Lord Alcester, Mrs. S. Coleman, and Miss M. A. Haggas. Japanese: Etoile de Lyon, Puritan, E. Molyneux, and Boule d'Or. Mr. C. Penford third. Mr. A. Payne, gardener to Mr. Ernald Smith, The Oaks, Emsworth, fourth.

In the class for twelve incurved and twelve Japanese, all to be distinct, there were five competitors, making a good display. Mr. N. Molyneux easily outdistanced his opponents with perfectly formed blooms of the former section, and fresh ones of Japanese, all well staged. The varieties were:—Incurved: Lord Alcester, Golden Queen of England, Queen of England, Empress of India, Miss M. A. Haggas, Alfred Salter, Golden Empress, Bronze Queen, Lord Wolseley, Princess of Wales, Violet Tomlin, and Princess Teck. Japanese: Etoile de Lyon, Avalanche, Boule d'Or, E. Molyneux, Stanstead White, Madame J. Laing, Puritan, Madame C. Audiguier, Madame Baco, Sunflower, Sarah Owen, and M. J. M. Pigny. Mr. G. Inglefield, gardener to Sir J. Kelk, Bart., Tedworth, Marlborough, was second, the Japanese being very fine, but the incurved lacked both size and finish. Third, Mr. Russell, gardener to Dr. Lewis, Henfield, Sussex. For twelve Japanese, distinct, Mr. Inglefield secured leading position with large, fully deve-

loped blooms of Madame C. Audiguier, Sunflower, Etoile de Lyon, Stanstead White, M. J. M. Pigny, Baronne de Prailly, extra fine; Carew Underwood, Stanstead Surprise, E. Molyneux, Avalanche, Boule d'Or, and Volunteer. Mr. A. Payne, second; Mr. H. Osman, gardener to Mrs. Strong, Harefield, Romsey, third. For twelve incurved, Mr. Inglefield and Mr. Penford was first and second respectively. Mr. Russell took leading honours in the class for reflexed, twelve blooms in not less than eight varieties, with medium-sized flowers of popular kinds. Second, Mr. Woodfine, gardener to E. P. Boyd, Esq., Emsworth; third, Mr. Penford. The last-named took premier position for twelve show Anemones, not less than six varieties, Gluck, Lady Margaret, Nelson, and Miss Annie Lowe being the best; Mr. Payne second, and Mr. Russell third. Mr. Penford also took first honour for Japanese Anemones, twelve blooms, not less than six varieties, Jeanne Marty, Dame Blanche, and Minnie Chate being the best. Pompons were a strong class, ten staging twelve bunches in not less than eight varieties, nor more than three bunches of one variety. Mr. J. Agate was easy first with capitally developed blooms of Mdlle. Elise Dordan, Golden, and Madame Martha. Mr. G. Hawkins second, and Mr. Russell third. For the same number of fimbriated varieties, in bunches of three blooms to a bunch, Mr. J. Hawkins was first. Chardonnet, Croesus, Massange and Scapin were the best. Mr. Agate second. Single varieties were very attractive, seven growers competing. Mr. Hatch led the way with an even stand of large fully developed blooms of Nelly, Jane, Admiral Symonds, and Queen of Yellows as the most conspicuous. Mr. Agate was second, Golden Star shining brightly in the stand. Mr. Hawkins third. For six Japanese, any one variety, there were twelve competitors. Mr. N. Molyneux, with E. Molyneux, large, solid, and highly coloured blooms, led the way, Mr. Abrahams, with Avalanche, of good quality, following. Mr. Agate third with the same variety. In the class for six blooms of any one incurved variety Mr. N. Molyneux secured the leading position with Miss M. A. Haggas. He also took the premier award for two blooms, one Japanese and the other incurved, shown in glasses. Mr. Agate second.

Bouquets of Chrysanthemums and Fern made a rich display. Messrs. Perkins & Sons were first, with one of their usual arrangements. Mr. Agate second. For an epergne dressed with berries and autumn foliage Mrs. Conway was a good winner with a cheerful yet judicious arrangement. The same exhibitor took first honours for a glass stand or epergne dressed with Chrysanthemums and other flowers and Ferns, with a light and harmonious arrangement.

Fruit made an imposing display. For three bunches of black Grapes, Messrs. A. Questier & Co., Fordingbridge (manager, Mr. S. Castle) was first with Alicante, extra large berries of good colour. Mr. T. Hall, gardener to S. Montagu, Esq., M.P., South Stoneham House, Southampton, second, with the same variety. For three bunches any white Grape, Mr. Inglefield was first with fairly good Muscat of Alexandria. In the classes for two bunches of black and the same of white Grapes, Mr. Chalk, gardener to G. Read, Esq., Westwood, Salisbury, was first in both cases. Mr. N. Molyneux and Messrs. Questier & Co. followed in the order of their names. For fifty dishes of Apples and Pears, Messrs. G. Bunyard & Co., Maidstone, were easily first with splendid fruit all through, but especially such as Bismarck, Belle Dubois, Warner's King, Gascoigne's Seedling, Wealthy, The Queen, Belle Pontoise, and Reinette de Canada. Mr. John Watkins, Pomona Nurseries, Withington, Hereford, was a good second; Messrs. J. Cheal & Son third. For twenty-four dishes of Apples and Pears, Mrs. Evans, Moreton Court, Hereford, was first; Mr. T. Hall second.

Vegetables were excellent. For nine and six distinct varieties, Mr. Inglefield was first, staging good examples of leading kinds. The best collection of salading came from Mr. Abrahams. Messrs. Bunyard staged fifty dishes of Apples, "not for competition," consisting of leading varieties of excellent quality. We are unable to give a more detailed report of this large and admirable Exhibition.

CHISWICK.—NOVEMBER 6TH.

THE fifth annual Exhibition may be fairly described as a success, the Vestry Hall, in which it was held, presenting a gay appearance with the groups and cut blooms of Chrysanthemums. For a group arranged in a space not exceeding 60 square feet, Mr. A. Wright, gardener to E. H. Watts, Esq., Downhurst, Chiswick, secured first honours with admirable plants, well flowered. Some of his best flowers were—Incurved: Golden Queen of England, Mrs. J. Crossfield, Lord Wolseley, Jeanne d'Arc, Empress Eugénie, Barbara, and Mr. Bunn. Japanese: Edwin Molyneux, Elaine, Sunflower, Mons. Tarin, Mr. H. Willan, Pelican, and Maiden's Blush. Second, Messrs. W. Fromow & Sons, Sutton Court Nurseries, with a creditable collection. Twelve untrained plants, not exceeding 4 feet in height.—First, Mr. F. Mears, gardener to J. T. Thornycroft, Esq., Eyot Villa, Chiswick, with freely flowered attractive plants; second, Mr. J. R. Wood, gardener to Mrs. Sanderson, Chiswick. One trained specimen.—First, Mr. A. Wright, with a well flowered plant. Group of miscellaneous plants, to include Chrysanthemums, arranged for effect.—First, Messrs. W. Fromow & Sons, with a very tasteful display of Palms, Ferns, Orchids, &c.; second, Mr. A. Wright, who had some capital examples of *Pancreatium fragrans* in flower.

*Cut Blooms.*—Twenty-four blooms of Chrysanthemums, twelve Japanese and twelve incurved, distinct.—Here the leading position was taken by Mr. C. J. Waite, gardener to Col. Talbot, Glenhurst, Esher. Noticeable amongst his Japanese were Stanstead Surprise, Sunflower, Golden Dragon, and Florence Percy. Incurved: Empress of India, Emily Dale, Golden Empress, Prince Alfred, and Princess of Wales;

second, having some good blooms, Mr. C. Long, gardener to E. P. Oakshott, Esq., Ealing. Third, Mr. W. Palmer, gardener to W. F. Hume Dick, Esq., Thames Ditton; a creditable display. For twelve incurved, first, Mr. William Palmer. The following were shown in grand condition:—Lord Alcester, Lord Wolseley, Cherub, Golden Empress, and John Salter. Second, Mr. H. Collyer, gardener to Mrs. Murrell, The Elms, Ealing. Of six incurved some fine flowers secured first prize for Mr. H. Head, gardener to W. Daniels, Esq., Inglewood, Kew. Second, Mr. C. J. Waite. Twelve Japanese.—First, Mr. C. J. Waite. Good in this stand were Fair Maid of Guernsey, Etoile de Lyon, and Boule d'Or. Second, F. Davis, gardener to E. Tautz, Esq., Castle Bar, Ealing. Third, Mr. W. Palmer. Six incurved, white.—First, Mr. H. Head, with Empress of India; second, Mr. R. Wood. Six incurved, coloured.—First, H. Head, with Golden Empress of India; second, Mr. W. Palmer, with Mr. Bunn; third, Mr. C. J. Waite, with Lady Hardinge. Six Japanese, coloured.—First, Mr. H. Head, with Madame C. Audiguier; second, Mr. C. J. Waite for Sunflower; third, Mr. W. Palmer for Val d'Andorre. Pompons and singles were well and successfully shown by Mr. H. Collyer, Mr. C. J. Waite, and Mr. E. Chadwick, gardener to E. M. Nelson, Esq., Hanger Hill House, Ealing; the last named exhibitor taking the premier position for a very handsome stand of Chrysanthemums gracefully interspersed with elegant Grasses and Ferns.

In the amateurs' classes (those not employing a regular gardener) the most successful exhibitors showing fine blooms were Mr. W. G. P. Clark, Hitchin, Mr. W. S. Larcomb, station master (Turnham Green station), and Mr. John A. Avey, Sutton Lane, Chiswick. In the cottagers' classes for Chrysanthemums very creditable flowers were staged by Mr. J. Bromley, 17, Miles Street, Hammersmith, and Mr. C. Garrod, 4, Vine Cottages, Chiswick.

Specimen stove or greenhouse plants in flower, first, Mr. F. Mears, with a finely flowered example (fifteen flowers) of *Cypripedium insigne*; second, Mr. A. Wright, with *Azalea narcissiflora* perfectly wreathed with flowers. Six Chinese Primulas, first, Mr. C. J. Waite, with beautifully fresh, well flowered plants; second, Mr. J. Huckelsby, gardener to B. Hardy, Esq., Gordon House, Chiswick. Six table plants, first, Mr. A. Wright, fine stuff; second, Mr. E. Chadwick. In the classes for Apples and Pears the most successful exhibitors were Mr. C. J. Waite, Mr. A. Wright, Mr. E. Chadwick, and Mr. C. Long. Three bunches of Grapes, first, Mr. F. Davis, with good Gros Colman; second, Mr. C. J. Waite.

#### ASCOT.—NOVEMBER 6TH AND 7TH.

THE autumn Exhibition of this Society took place as usual in the grand stand, and was quite equal to any of its predecessors. Groups of Chrysanthemums are always remarkable here for their excellence. The spirit of emulation appears to be very strong in the minds of the growers in this neighbourhood, hence the splendid competition and good quality of the exhibits, especially in the cut bloom classes, amongst which there could not be found a bad stand. The most important class was that for eighteen Japanese and the same number of incurved, all to be distinct, and for which a first prize of £3 and a silver cup were given, to be won three times. Great interest was attached to this class by the reason that the last two years Mr. Page, gardener to H. P. Leschallas, Esq., Windlesham, had succeeded in winning the coveted award; but this year the winner was Mr. W. Lane, gardener to Miss Dunning Smith, Ascot, who won by the superiority of both his incurved and Japanese, but especially the former, and though not quite so large as those of his opponent gained in finish, the whole being neatly staged and very fresh. The incurved were—Back row: Alfred Salter, Lord Alcester, Queen of England, Golden Empress, Empress of India, Golden Queen of England. Middle row: John Salter, Princess of Wales, Lord Wolseley, Jeanne d'Arc, Nil Desperandum, Prince Alfred. Front row: Violet Tomlin, Charles Gibson, Mr. Brunlees, Miss M. A. Haggas, Mrs. J. Coleman, Refulgens. Japanese.—Back row: Edwin Molyneux, Avalanche, Etoile de Lyon, Marguerite Marrouch, Madame Baco, M. E. A. Carrière. Middle row: Madame J. Laing, Condor, Stanstead Surprise, Mr. A. H. Neve, Mr. Cannell. Front row: Thunberg, Bertha Flight, Carew Underwood, Belle Paule, Criterion, Volunteer. The Japanese from Mr. Page were of excellent quality and well staged. Mr. J. Hughes, gardener to H. F. De Paravicini, Esq., Bracknell, took third place with a capital lot. Four competed.

In the class for twenty-four incurved distinct varieties there were six competitors. Mr. Page led the way with a very even collection of medium-sized blooms, the following being a few of the most noteworthy:—Violet Tomlin, Princess of Wales, Mrs. S. Coleman, Princess Beatrice, Barbara, Miss M. A. Haggas, Mrs. Heale, Lord Alcester. Mr. Hughes second. Third Mr. Tomlin, gardener to F. Ashley, Esq., Sunninghill. For twenty-four Japanese, distinct varieties, six again competed, the best coming from Mr. Page—large, good colour, and great breadth of florets. The names were—Back row: Avalanche, E. Molyneux, Stanstead White, Sunflower, Madame Baco, Bertha Flight, Val d'Andorre, Madame B. Pigny. Middle row: Etoile de Lyon, Condor, Madame C. Audiguier, Marguerite Marrouch, Maiden's Blush, Ralph Brocklebank, Alba Fimbriata, Madame J. Laing. Front row: Criterion, Mons. Bernard, Hamlet, Marsa, Sarah Owen, Jeanne Delaux, Gloriosum, and Mrs. W. K. Harris. Mr. H. Tomlinson, gardener to F. Ricardo, Esq., Old Windsor, was a very close second; and Mr. Cole, gardener to E. Hamilton, Esq., Sunningdale, third. In the class for twelve incurved varieties, distinct, amongst five competitors Mr. Poppel, gardener to Lady Cowell Stepney, Sunninghill, took leading position with medium sized, well finished, fresh blooms. Mr. Bullimore, gardener to A. Southard, Esq., Bracknell, was a good second, in whose stand the

premier incurved bloom was found—a very fine one of Princess of Wales. For six varieties the winners were Mr. Cowie, gardener to K. Oliver, Esq., good in all respects; Mr. Richards, gardener to the Rev. R. Macdonald, Ascot; Mr. Bird, gardener to C. J. Barnett, Esq., Sunninghill. In the class for six incurved, one variety, excellent blooms were staged. With Queen of England, symmetrical and fresh examples, Mr. Lane led the way, followed by Messrs. Page and Godfrey, Bagshot, both staging Lord Wolseley in good condition. For twelve Japanese varieties, distinct, Mr. Bullimore led the way, followed by Mr. Poppel, and Mr. Hawthorne, gardener to the Rev. R. Kerr Pearce, Ascot, was third, all staging fine and well finished blooms. For six Japanese, distinct, Mr. Cowie was first. With six Japanese, one variety, Mr. Godfrey was an easy first with magnificent examples of Avalanche, one of which was chosen as the premier bloom in the Japanese section. Mr. Page was second with good Stanstead White; Mr. Hughes third with Stanstead Surprise.

Much encouragement was offered in the reflexed section, the first prize being a silver cup along with a money prize for twelve distinct varieties, which Mr. Page succeeded in carrying off with a capital stand of blooms, not extra large but deep, well coloured and developed. King of Crimson, Felicity, Mrs. Forsyth, Dr. Sharpe, Cloth of Gold, Phidias, Golden Christine, Cullingfordi, Temple of Salomon, Fred Hart, Pink Christine, and James Carter. Mr. Cole was second; and Mr. Godfrey third. For six Anemone flowered varieties Mr. Richards took premier honours with large substantial blooms with well developed centres, of Miss Annie Lowe, Lady Margaret, Empress, Fleur de Marie, G. Sand, Prince of Anemones. Mr. Guyett, gardener to C. D. Kemp-Welch, Sunningdale, second. To Mr. Lane was also awarded the bronze medal of the N.C.S. for the most meritorious exhibit of Chrysanthemums—viz., the cup class blooms previously noted.

For the best collection of Chrysanthemums in pots, arranged in a semi-circular space, there were six competitors, Mr. Cowie being well ahead by the superiority of the blooms, many of the incurved section being good enough for the stands. The plants were dwarf, well clothed with foliage, and evenly arranged. Mr. W. Lane was second, also staging well. Mr. May, gardener to General the Hon. H. F. Keane, C.B., Rosemount, Sunninghill, third. A class was provided for bush grown plants in six distinct varieties. Mr. Richards' Pompon varieties, averaging 3 feet across, and freely flowered, being the most noteworthy. The best group of miscellaneous plants arranged for effect was staged by Mr. Hughes.

Vegetables were contributed by eight competitors, Mr. Lane being first with good produce. Mr. C. Cooper, florist, Sunninghill, secured the chief prize for black Grapes—Alicante; and Mr. Page for white Grapes—Muscat of Alexandria. Mr. Godfrey was the most successful exhibitor of culinary and dessert Apples, and had large, highly coloured fruit.

#### PUTNEY.—NOVEMBER 6TH AND 7TH.

OF the thirteen exhibitions held in Putney by this Society that on Thursday and Friday last week was entitled to a place amongst the best, both as regards the groups and cut blooms. The Assembly Rooms devoted to it are unfortunately too small, though the prominent position they occupy in the town renders the site an important one for a Show of this description. There was not, however, sufficient space to display the numerous exhibits to the fullest advantage, and but little room was left for the visitors, who crowded the Show on the evening of each day. The Society had the satisfaction of finding their efforts well appreciated, and to accomplish these results the Committee and Secretary, Mr. J. Moore, have worked together well.

The groups were uncommonly good, by far the best that we have seen this season, especially that with which Mr. G. Stevens, St. John's Nursery, Putney, succeeded in winning the silver cup that has cost him so many years' struggle. This time he won easily, the plants, blooms, and arrangement being all that could be desired, and far exceeding the character of average groups at shows. Many of the blooms were fitted for cutting and showing in competition, the Japanese being unusually fine, Avalanche, Etoile de Lyon, Sunflower, Golden Dragon, and Edwin Molyneux standing out most conspicuously, while the leading varieties of the Queen type in the incurved were also well represented. Mr. Springthorpe, gardener to R. H. Alexander, Esq., Gifford House, was a good second, Messrs. Portebury and Dail following. Specimen plants were numerous, those shown by Mr. Knowles, gardener to Mrs. Egerton Solner, Roehampton, being the best; while amongst amateurs, Mr. W. B. Faulkner, Fairholm, Worple Road, Wimbledon, was deservedly first for a group of plants bearing remarkably fine blooms. Mr. Sullivan, gardener to D. B. Chapman, Esq., Downshire House, took the lead as usual for very neat plants; Mr. Portebury being second for rather heavier, but well-grown plants. For stands of flowers, Mr. Newell, gardener to Sir Edwin Saunders, Fairlawn, Wimbledon, won first honours for a tasteful and effective arrangement. Bouquets, fruit, and vegetables were also well represented.

The cut flower classes were an important feature in the Show, a considerable portion of the space at the disposal of the Committee being occupied with the tables devoted to these. Three stands of twenty-four incurved in not less than eighteen varieties were shown, Mr. Sullivan taking the first place for excellent, solid, clean examples arranged in the following order:—Back row: Golden Empress, Prince Alfred, Emily Dale, Alfred Salter, Emily Dale, Queen of England, John Doughty, and Lord Alcester. Middle row: John Salter, Miss Haggas, Jeanne d'Arc, Golden Empress, John Doughty, Violet Tomlin, John Salter, and another variety. Front row: Princess of Wales, Nil Desperandum, Mrs. Heale

Refulgence, Hero of Stoke Newington, Jardin des Plantes, Mr. Brunlees, and Princess Beatrice. Messrs. Knowles and J. Bentley, gardener to Sir T. Gabriel, Bart., Edgecumbe House, Wimbledon Park, following. Mr. Knowles had the best twelve incurved; handsome flowers of Empress of India, Alfred Salter, Queen of England, Lord Wolseley, Prince Alfred Lord Alcester, Violet Tomlin, Princess of Wales, Emily Dale, Lady Hardinge, Jeanne d'Arc, and Miss Haggas. Mr. W. Burnes, gardener to Sir J. Brunlees, Argyle Lodge, Wimbledon, took the second place with fresh flowers. Mr. Knowles was also first with twelve Japanese, capital examples of Sunflower, Condor, Val d'Andorre, Stanstead Surprise, Belle Paule, Triomphe de la rue des Châlets, Mrs. Wright, Gloriosum, M. Elliott, Etoile de Lyon, Edwin Molyneux, and Avalanche. Mr. Sullivan was second in this class; and these two exhibitors held the same relative positions for twenty-four Japanese. Mr. C. Bentley, Cedar Court Gardens, was first for twelve Pompons, neat examples of Sœur Melanie, Orange Beauty, Aglaia, Mr. Astie, Miss Stuart, Bob, St. Michael, Mdle. Marthe, Black Douglas, President, and Golden Madame Marthe. In smaller classes Messrs. Bradford, Knowles, and Sullivan were the prizetakers, Mr. W. F. Faulkner having the finest six incurved, wonderful blooms for an amateur grower, including a Queen of England, which was selected as the premier in the Exhibition.

#### TOTTENHAM AND EDMONTON.—NOVEMBER 6TH AND 7TH.

A FAVOURABLE schedule of sixty classes did not fail to bring about a good Exhibition. For twenty-four blooms twelve incurved and twelve Japanese, distinct varieties, Messrs. Prickett & Sons, St. Ann's Road, Stamford Hill, were placed first with a fairly good collection, consisting of Japanese: Elaine, Madame C. Audiguier, Avalanche, Aurantium, Madame Baco, Sunflower, Belle Paule, Mrs. J. Wright, Lady Lawrence, Mons. Bernard, Ralph Brocklebank, and Edward Délaux. Incurved: Lord Wolseley, Empress of India, Violet Tomlin, Mrs. Heale, George Glenny, Miss Haggas, Jardin des Plantes, Princess of Wales, Mrs. G. Rundle, Nil Desperandum, G. Glenny, and Princess Beatrice. For twelve blooms of Japanese, distinct, Messrs. Prickett were again first with Gloriosum, Avalanche, Sunflower, Stanstead White, Elaine, Mons. Bernard, Belle Paule, good; Sarah Owen, Stanstead Surprise, Mrs. J. Wright, Ralph Brocklebank, and Val d'Andorre. For twelve blooms, incurved, Mr. G. Chalkley, gardener to J. A. Drop, Esq., gained the first award with neat but small flowers. The next class was for Anemones, which, as exhibited by Mr. Henderson, gardener to J. Speiers, Esq., were very good, and consisted of Gluck, Empress, George Sand (two), Cincinnati (two), perfect; Grande Alvéole, J. Thorpe, jun. (two), La Marguerite, highly coloured; Fleur de Marie, and Nouvelle Alvéole. Mr. Chalkley was second, and Mr. Ives, gardener to H. J. Chalkley, Esq., was third. Mr. Henderson also staged six magnificent blooms of Japanese Anemones, the best we have seen for the season: Jeanne Martz (two), Marguerite Souille (two), Sœur Dorothee Souille, and a variety named La Duele.

For twenty-four blooms, twelve incurved and twelve Japanese, distinct varieties, Mr. Henderson was again the most successful exhibitor, with good blooms of Avalanche, Etoile de Lyon, Ralph Brocklebank, a seedling after Baronne de Prailly, Criterion, Edwin Molyneux, La Triomphante, Sarah Owen, Val d'Andorre, Maiden's Blush, Mdle. Lacroix, Marguerite Marrouch. Incurved: Queen of England, Lord Alcester, Lord Wolseley, Emily Dale, Mrs. Heale, Beverley, Golden Empress, Empress of India, Mr. Bunn, Prince Alfred, Jeanne d'Arc, and Venus; and for twelve incurved Mr. Henderson gained another first prize. In the class for twelve Japanese, Mr. W. Welfare, gardener to Mrs. Hodgson, Mr. Henderson, and Mr. Elliott, gardener to Mrs. Wolstenholme, were placed in the order of their names. Pompons and Anemone Pompons were also well represented by several attractive stands.

Plants were grandly shown. Mr. Thompson, gardener to A. Sanders, Esq., was first for two with Bouquet Fait and Bertier Rendatler. Mr. Davey, gardener to C. Pain, Esq., was a very good second, showing W. Robinson and Le Chinois; Mr. Ives third. For four plants Mr. Paine was first with splendid examples of Dr. Sharpe, La Triomphante, Tokio, and Christine, each plant carrying fully sixty good flowers. Mr. Thompson was placed second. For four standards, Messrs. Davey, Hudson, and Thompson again shared the honours in the order of their names. Several groups were staged, the best coming from Messrs. Hudson, Elliott, and Ives. There were numerous classes for both amateurs and cottagers.

#### CRYSTAL PALACE.—NOVEMBER 7TH AND 8TH.

IN unpropitious weather the last of the series of 1890 floral exhibitions of the Crystal Palace Company was opened on Friday last. The exhibits were arranged throughout the eastern transept. In the largest class for twenty-four incurved and twenty-four Japanese, there were 624 blooms staged by thirteen competitors. Mr. C. J. Salter, gardener to T. B. Haywood, Esq., Woodhatch, Reigate, won the premier position with excellent stands of blooms, comprising the following varieties. Incurved—Back row: Queen of England, Empress of India, Golden Empress, Violet Tomlin, Empress of India, Queen of England, Lord Alcester, Prince of Wales. Middle row: Miss Haggas, John Doughty, fine; Jeanne d'Arc, good; Prince Alfred, Mrs. Heale, Golden Empress, John Salter, Princess of Wales. Front row: Mrs. Heale, Barbara, Jardin des Plantes, Empress Eugénie, White Venus, Mrs. Coleman, very good; Barbara, and Princess of Wales, grand. Japanese—Back row: Carew Underwood, Stanstead White, Edwin Molyneux, Comte de Germiny, Madame J. M. Pigny, Edwin Molyneux, Puritan, Fair Maid of Guernsey. Middle row: Puritan, Val d'Andorre, Boule d'Or, Condor, Carew Underwood, Sunflower, Avalanche, Stanstead Surprise. Front row: Sunflower, Mrs. J. Laing, Avalanche, Marsa, Maiden's Blush, Val

d'Andorre, Lady Lawrence, and Sarah Owen. The blooms in both sections were large and of high finish. Mr. Gibson, gardener to J. Wormald, Esq., Morden Park, was a close second with a fine collection, his Japanese being magnificent, and incurved very good, but weaker than the first prize collection. Mr. J. Blackburne, gardener to John Scott, Esq., Elmstead Grange, Chislehurst, was placed third, and Mr. Alpin, gardener to W. Meath Baker, Esq., Harfield Court, Gloucester, fourth. Mr. Blackburne's Japanese were very good, and he had fine blooms of Empress of India and Golden Empress. The fourth prize collection contained, besides a magnificent bloom of Mrs. Alpheus Hardy, fine examples of Miss Haggas, Princess of Wales, and a sport from Lord Alcester.

In the class for eighteen incurved varieties, distinct, there were seven collections. Mr. Salter was again to the front with Lord Wolseley, Golden Empress, Queen of England, Mrs. Heale, John Salter, Empress of India, Jeanne d'Arc, Violet Tomlin, John Doughty, Prince Alfred, Miss Haggas, Princess of Wales, Baron Beust, Princess Teck, Mrs. Coleman, Jardin des Plantes, Empress Eugénie, and Barbara. Mr. H. Shoemith, gardener to M. Hodgson, Esq., Shirley Cottage, Croydon, took the second prize with an even and neat collection; Princess of Wales, Violet Tomlin, and Mrs. Heale were very conspicuous and fine. Mr. C. Cox, gardener to John Trotter, Esq., Brickenden Grange, Hertford, was placed third. There were nine collections staged in the class for twelve incurved varieties, and Mr. G. Carpenter, gardener to Major C. Browne, Broad Oaks, Byfleet, Surrey, secured first honours with fine Lord Alcester, Lord Wolseley, Empress of India, Prince Alfred, Alfred Salter, Jeanne d'Arc, Queen of England, Golden Queen, Princess of Wales, John Salter, Princess Teck, and another. A magnificent stand, Mr. A. Falgate, gardener to Her Grace the Duchess of Wellington, was placed second; his blooms were large, but lacked refinement, being too old. Mr. A. Turner, gardener to C. F. Murray, Esq., Woodcote Hall-Epsom, was third. For six incurved, one variety, Mr. J. Richard, Woodbine Nursery, Wanstead, Essex, was awarded first place with very solid and clean Empress of India; Mr. John Snow, gardener to C. & A. De Murrieta, Esqs., Wadhurst Park, Sussex, was second for perfect highly coloured Violet Tomlin; and Mr. Turner, with Empress of India third. Nine collections were staged.

The class for eighteen Japanese, distinct, brought eight competitors, and Mr. Glen, Worth Park, Crawley, outdistanced the others with large bright substantial blooms of the following:—Stanstead White, very fine; Stanstead Surprise, Ralph Brocklebank, Mrs. F. Jameson, Meg Merrilies, Etoile de Lyon, Thunberg, good; Comte de Germiny, Baronne de Prailly, Avalanche, grand; Edwin Molyneux, Sunflower, good; Mons. Bernard, Mdle. Lacroix, Gold Dragon, Maiden's Blush, Martha Harding, and Madame Baco. Mr. J. Blackburne secured the second place, and C. E. Shea, Esq., The Elms, Foots Cray, the third, both exhibiting grandly. There were no less than fifteen collections competing in the class for twelve varieties, distinct, and the first prize was awarded to Mr. J. Harker, gardener to H. Shindler, Esq., Oakwood Lodge, Epsom, for the following:—Stanstead White, Stanstead Surprise, Mons. W. Holmes, Sunflower, Madame C. Audiguier, Val d'Andorre, M. Pigny, Japonaise, Edwin Molyneux, Maiden's Blush, Mons. Bernard, Avalanche. The second award was made to E. Mawley, Esq., Rosebank, Berkhamstead, for a very smart stand. Mr. G. Carpenter was third. The class for six Japanese, one variety, produced sixteen grand collections. Messrs. Glen, Howe, and Mawley were placed in order of their names, Avalanche winning the premier award, followed very closely with six wonderfully bright blooms of Edwin Molyneux, Avalanche winning the third position.

Reflexed and Anemone varieties appear to be regaining favour. For twelve reflexed, not less than eight varieties or more than two of one sort, there were ten stands presented in capital condition. The first prize was awarded to Mr. Carpenter, who had two Peach Christine, two Cloth of Gold, two Pink Christine, Golden Christine, two Mrs. Forsyth, Dr. Sharp, Cullingfordi, and King of Crimson. Mr. A. Coomber, gardener to the Earl of Dudley, Hinly Hall, Dudley; and Mr. A. Felgate were placed second and third respectively. A similar class was organised for large Anemones (Japanese not admissible). A large number competed, and the Judges first made their awards as follows:—First, Mr. Carpenter; second, Mr. Salter; third, Mr. Coomber, but as most of the boards contained one or more Japanese varieties, or closely allied, a readjustment was made, and after considerable argument the first prize was awarded to Mr. Sullivan, Roehampton; Mr. Coomber being placed second; and Mr. Searing third. Messrs. Carpenter's and Salter's collections were disqualified. The best Pompons were staged by Mr. Chadwick, gardener to E. M. Nelson, Esq., Hanger Hill House, Ealing. Mr. Salter was placed second; and Mr. C. S. Bowman, London Road, Croydon, third. The collections of Anemone Pompons were very attractive. Mr. Slade, gardener to Lady Bowater, Richmond Park, was a very good first; and Messrs. Chadwick and Ballard the other prizes in the order of their names. Mr. Carpenter secured first place in the class for six Japanese Anemones with two Madame Cabrot, two Souvenir de Madame Blandinieres, and two Mons. Pankoucke; and Messrs. Sullivan and Coomber the second and third places. Messrs. Chadwick and Ballard were the only exhibitors for twelve singles, distinct, and were placed in the order of their names.

Groups.—Three classes were provided for decorative groups, which formed pleasing and attractive objects, and were arranged on each side of the cut bloom tables, amateurs showing in great force. The premier award was gained by Mr. J. Gravett, gardener to Dr. Heckley, Upper Norwood, for a very beautiful group, admirably arranged. Mr. T. R. Wells,

gardener to — Ralph, Esq., Cranbrook Villa, Fox Lane, Upper Norwood, was a very good second; and Mr. Ford, gardener to Sir C. Pigot, Bart., Wrexham Park, Slough, was placed third for a light arrangement and good flowers. There were only four collections in the large size groups, 100 square feet, Messrs. Laing & Son, Forest Hill, securing the two first prizes, and Messrs. J. Moby & Son, 147, Mowflat Road, Thornton Heath, the second in the incurved varieties; and Messrs. Carter & Co., High Holborn, the second prize in the class for Japanese varieties. Both the first and second prize collections restricted to the Japanese forms were far the most attractive, and included all the new and popular kinds.

**Plants.**—Specimen trained plants have seldom been so well represented as on the present occasion. For six trained specimens, incurved varieties, Mr. Wesker, gardener to A. Heaver, Esq., Streatham Elms, Tooting, was deservedly awarded the first prize for neatly trained and well-bloomed examples of Lord Alcester, Baron Beust, Lord Wolseley, Mrs. G. Rundle, Prince of Wales, and Mrs. Dixon. Mr. Cherry, gardener to Mrs. Gabriel, Norfolk House, Streatham, was a very good second. In the class for four specimens, Mr. W. Clark, gardener to J. H. Lile, Esq., Devon House, Brixton, was first with Mrs. Rundle, Mrs. Dixon, Lady Hardinge, and Guernsey Nugget. Mr. Weston, gardener to D. Martineau, Esq., Clapham, took the second place. For six Japanese, Mr. W. Clark again gained first honours with attractive plants of Elaine, Margot, Source d'Or, Dr. Macary, Jupiter, La Triomphante (very good). Messrs. Wesker and Cooper were the other prizewinners in the order of their names; and for four Japanese Messrs. Cherry, Weston, and R. Clark secured the first, second, and third prizes respectively. A very strong class was the trained Pompons. Mr. James Hinglis, gardener to Mrs. Longsdon, South Norwood, had beautiful plants of Lilac Cedo Nulli, Aurore Boreale, Maroon Model, White Cedo Nulli, A. Justine, and Golden Cedo Nulli. Messrs. Clarke and Weston also staged good plants, and were placed in order of their names. Several collections of Primulas were staged, but they do not call for any special reference. Messrs. Carter, Bateman, and Edwards were the principal exhibitors.

Among the miscellaneous exhibits Messrs. Cheal & Sons, Crawley, contributed about sixty dishes of Apples and Pears in fine condition; and Messrs. Smith, Worcester, a like number. A very large and fine collection of Potatoes was sent by Messrs. Sutton and Sons, and for the special prizes offered by them for six dishes Messrs. Hughes, Friend, Wiles, Hazell, Howard, and Cherry shared the six prizes in the order of their names. Messrs. Peed & Son staged a group of cut Chrysanthemum flowers intermixed with Maidenhair Ferns. The following Chrysanthemums were recognised by the Judges:—Mons. Charles Lebocqz (Mr. G. Stevens, Putney), Mrs. F. Jameson (Messrs. Reid and Borneman, Sydenham), Mrs. C. Wheeler, Madame Marie Hoste, Vivian Morel (Messrs. J. Laing & Son, Forest Hill). The Exhibition was admirably arranged by Mr. Head.

#### ST. NEOTS (HUNTS).—NOVEMBER 10TH.

THOUGH the Society located in the quiet but pleasant little country town, St. Neots, has only held seven Exhibitions of Chrysanthemums, a considerable improvement has been effected in the cultivation of these plants, both in the immediate district, and for a long distance around. At this year's Show the advance in the quality was still more marked than usual, and thus afforded ample compensation for the moderate competition in most of the classes. A bright, varied, and attractive display was provided, and the Committee, with their energetic and admirably business-like Secretary, Mr. Ratchelous, have every reason to be satisfied with the result of their year's labours.

The Corn Exchange was devoted to the exhibits, the large hall and a smaller room being filled with cut blooms, plants, groups, fruit, vegetable, and floral decorations. Upon a long central table the principal stands of cut blooms were staged in competition, and one class filled the whole length on one side, presenting a capital array of well-developed blooms. Three years the St. Neots Society decided to provide an open class, with a challenge cup as the first prize offered under the following conditions:—

Thirty-six blooms of Chrysanthemums, eighteen to be incurved in not less than twelve varieties, eighteen to be Japanese in not less than twelve varieties, not more than two blooms of any variety allowed.—First prize, a silver challenge cup, value ten guineas, and 60s. in money. Second prize, 30s. Third, 20s. Fourth, 10s. The challenge cup must be won by the same exhibitor twice in succession or three times in all before it becomes his property, but on giving a written acknowledgment for the same, the winner for the year (except it be finally won) may hold it up to fourteen days of the next Show, when it must be returned to the Society in perfect condition. The first challenge cup having been won twice in succession by Mr. R. Adams, gardener to G. B. Hudson, Esq., Frogmore Hall, Hertford, it became his property, and another was therefore provided this year, which attracted five competitor. The cup was well won by Mr. R. Petfield, gardener to A. J. Thornhill, Esq., Diddington Hall, Huntingdon, who also secured the National Society's Centenary medal for the best incurved blooms in the Show, and the same Society's certificate for the best Japanese. His blooms were most meritorious, the incurved being especially well finished, clean, bright, fresh blooms. The Japanese were also of good substance, and rich and pure in colour. The varieties were as follows:—Incurved, back row: Queen of England, Lord Wolseley, Miss Haggas, Violet Tomlin, Queen of England, and Lord Wolseley. Middle row:

Prince Alfred, Mrs. Coleman, Alfred Salter, Jeanne d'Arc, Prince Alfred, and Miss Haggas. Front row: Lord Alcester, Princess of Wales, Mrs. Heale, Violet Tomlin, Mrs. Coleman, and Novelty. The Japanese were, in the back row: Avalanche, Madame C. Audiguier, Sunflower, Etoile de Lyon, Mrs. Cannell, and Madame C. Audiguier. Middle row: Etoile de Lyon, Meg Merrilies, Edwin Molyneux, Avalanche, Sarah Owen, and Meg Merrilies. Front row: Mdlle. Lacroix, M. Bernard, Ralph Brocklebank, Madame J. Laing, Stanstead White, and Criterion. The second place was taken by Mr. Myers, gardener to the Earl of Sandwich, who had very handsome Japanese and clean, neat incurved. Mr. A. Hornett, gardener to G. B. Hudson, Esq., Frogmore Hall, Walton, Hertford, was third with smaller but neat fresh blooms, and Mr. F. H. Anthony, Leicester, was fourth.

The best twelve incurved blooms were also staged by Mr. Petfield, who had fine examples of Lord Wolseley, Jeanne d'Arc, Le Grand, Miss Haggas, Violet Tomlin, Eve, Prince Alfred, Lord Alcester, Mrs. Coleman, Princess of Wales, Alfred Salter, and Queen of England. Mr. Myers secured similar honours for twelve Japanese, capital blooms of Etoile de Lyon, Sunflower, Madame Baco, Gloriosum, Maiden's Blush, Triomphe de la rue des Châlets, Madame C. Audiguier, Mrs. Beale, Thunberg, W. G. Drover, and Jeanne Délaux. The same exhibitor was first for twelve Pompons, charming blooms of good varieties.

The best four specimen plants were shown by Mr. Redman, gardener to J. H. Goodgames, Esq., who was adjudged the first prize and the National Society's certificate for the best plants in the Show. Mr. Redman was also first for a group of Chrysanthemums, being closely followed by Mr. Myers. These two exhibitors were also the principal prizetakers for bouquets and floral decorations, Mr. Stevens leading with vegetables.

#### COPPIN'S TREE PRUNER.

MESSRS. G. COPPIN & SONS, Addington, Surrey, having sent us one of their tree pruners for trial, and this having proved highly satisfactory, we direct attention to the implement at a seasonable time. It is light, strong, cuts cleanly and easily, only one action being needed, drawing the handle down, a spring making all ready in a moment for the next cut. The hooked end of the implement is simply placed over the branch, the handle pressed down, and the circular knife cuts downwards, severing any branch that is not too large for the hook, about as easily as cutting a Carrot with a knife. Pruners of trees in town and country have found this implement to give great satisfaction, and we found that it did all that was claimed for it by the inventors and patentees. Where very tall trees require lopping, "Coppin" will lop them as fast as it is hooked over the parts to be removed.

FIG. 58.

#### FRUIT FORCING.

PEACHES AND NECTARINES.—*Earliest Houses.*—Where it is required to have fruit ripe in April or early May the houses should be put in order without delay, and the lights put on and closed by the middle of this month, fire heat not being applied until the beginning of December. Alexander and Waterloo Peaches are the earliest to ripen, and very desirable for forcing to afford early dishes of ripe fruit, but they are not equal in quality to Hale's Early, Royal George, or its fine form Stirling Castle. These, however, will not ripen so early by some weeks, but they afford an excellent succession. The house may be kept close, but admitting air freely above 50°, employing fire heat only to prevent the temperature falling below 35°. The more slowly the trees are excited the stronger will be the blossom and the better chance of a good set, about which there need be no anxiety, only the wood is well ripened and the trees are duly supplied with water at the roots. A thorough soaking of water should be given the inside borders, and if the trees are weakly a soaking of liquid manure, not too strong, will tend to a more vigorous break. Sprinkle the trees in afternoon of fine days, but in dull weather morning syringing and sprinkling in the afternoon will be sufficient, it not being desirable to keep the trees constantly dripping with moisture. The outside border must be well protected with litter or dry fern, and if wooden shutters are available they will be advantageous in throwing off excessive wet.

*Succession Houses.*—Except in the latest house all the leaves are off, and from these they must not be forcibly removed until they part readily from the trees. The trellis may be lightly shaken, or the trees brushed over lightly with a broom, but there must not be any attempt at forcibly removing them with the hand or other means. When the leaves are all down unfasten the trees from the trellis, prune them, thoroughly cleanse them and the house, and if need be paint the wood-work and trellis. Tie the trees to the trellis, not too tightly, as abrasions of the bark are prolific of gumming. Remove the surface soil and supply fresh, give a good watering to the inside borders, thereby having all in readiness for a start when required. If the lights are not removed admit air to the fullest possible extent so as to keep the trees as cool as possible, but it is better to remove the roof lights.

*Lifting.—Planting Fresh Trees.*—Any trees that do not bear satisfactorily should be lifted, have their long bare roots shortened, and those retained laid in fresh material nearer the surface. Where the soil is light it should be well firmed about the roots; but this will not compensate for more substantial material and steady supplies of nutriment. Lifting should always be attended to as soon as the leaves give indication of falling, and with a moderately moist condition of the soil the roots will push fresh rootlets, and be able to cater for blossom and young fruit, whereby a good set is assured, lifted trees stoning the fruit well. Trees for planting in houses are best trained to walls three or four years, lifted annually, or prepared for removal by digging round them a year previously. Such trees move with abundance of fibres, and being carefully planted they force well the first season; but they must not be brought on too quickly, and must not be overcropped. Such trees are preferable to planting young ones, which in rich borders are apt to grow too freely and fall a prey to gum, or they require time to become furnished with bearing wood, not fruiting much in the first two or three years, hence the advantage of planting trees in an already bearing state.

*STRAWBERRIES IN POTS.*—All plants for early forcing should be in frames, with a view to protect them from heavy rains only. They cannot have too much air, therefore tilt the lights in mild wet weather, and remove them altogether when it is fair and warm, keeping close only when frost prevails. Do not place them in Peach or other houses where they will be subjected to drying currents of air. Evaporation in such is constant and excessive, wastes the energies of the plants, and not infrequently so dries the soil at the sides of the pots as to destroy the active feeders. Drought is the greatest bane of the Strawberry; those in frames must have water as required, always keeping the soil properly moist. Plants for midseason and late forcing are just as well stood on ashes, and plunged over the rims of the pots in that material or cocoa refuse, the situation being sheltered, but not shaded.

Batches of *La Grosse Sucrée*, *Vicomtesse Hericart de Thury*, or other early sorts must be held in readiness for starting next month where early fruit is required. There is no question that a Strawberry house is the most suitable, as the wants of the plants can be furnished according to their advantageous requirements, which is not always the case when the plants have to be forced in vineries or Peach houses, but they are grown successfully in such structures, the chief point being not to bring them on too rapidly. An early Peach house takes a good batch and is particularly suited to such varieties as *Noble* and *Auguste Nicaise*, as they do not bear as much heat in the early stages of forcing as *La Grosse Sucrée*. In the case of plants having well developed crowns and abundant roots there is nothing to fear as regards a satisfactory issue, but in a late season there is little prospect of satisfactory early crops, and the plants should be started later or be brought on very gradually. That, however, is not applicable in places where ripe fruit must be had by a given time. When the plants are late, as they are this year, their starting satisfactorily may be enhanced by making up a bed of leaves about 2 feet in height, and place the plants in a frame upon it, bringing up the plants so as to be just clear of the glass, packing the spaces between the pots with damp leaves. The bottom heat at the base of the pots must not exceed 65°, the top being kept cool, air being freely admitted, 50° of top heat not being exceeded, and when mild withdraw the lights. Activity at the roots by the means of the warmth is promoted and the crowns will plump, the trusses being advanced considerably in embryo. In three weeks to a month of this treatment the pots must be withdrawn (but it is better if the bed has cooled), raising them gradually so as to insure the plants bearing the temperature of the Strawberry house or other structure without check. If taken direct from the bed the roots at the sides of the pots would in all probability get chilled, therefore they must not be taken direct from the warm bed to the shelves. Very careful treatment is required to secure a satisfactory result with very early forced plants in seasons like the present.

with improperly prepared syrup is the result of advisers having copied from the American method. The proportions of sugar and water being "20 lbs. of the former to 8 of the latter," a syrup far too thick and clammy for bees to store, and when stored becomes candied in the cells, bees often dying from want, with an abundance of candied syrup in the hive. By making the proportions of the best cane sugar and soft water equal, a syrup is formed congenial to the bees, and is a sure and safe food for them at any time. When sugar is properly dissolved with its weight of water there is little fear of its being burned into caramel, which is injurious to bees, nor of killing those those that get smeared with it. On page 413, eighth line from the top, I was represented as using "beet" sugar; it should have been best sugar. I do not use beet sugar for anything.

#### THE BEST FEEDER.

The best feeders are those from which the bees take food the most readily, and which give the least trouble to the bee-keeper to supply. All top feeders are liable to cause a draught, and is at the best a troublesome way of feeding. It is more natural for the bees to carry up than to carry down, and as a rule bees carry up syrup from under feeders when it is untouched in upper ones. It is a very old axiom in bee-keeping, "Keep the crowns of your hives warm, and there is no fear of the bees." The frame feeder is an exception to all upper feeders, as there is practically little or no space to create a draught, and is specially and well adapted for nursing weak hives. This year my hives took up 6 lbs. of syrup from bottom feeders in less time than they took down 2 lbs. from upper ones, and the Punic bees took that quantity up in seven hours, being as fast again as any of the other varieties did. The above quantity is about the average I allowed each hive that was at the Heather and had been deprived of their surplus. Most of them required nothing, but when supplied with sugar abdominal distension seldom appears.

#### QUANTITY OF HONEY.

Each hive gave us 22 lbs. of drained honey, 1 lb. of wax, and four bottles of mead. This season, owing to the mildness of the weather, our mead stood only twelve hours until fermentation was visible, and at the end of twenty-four hours active; the cask was kept filled for other three days, and then bunged closely up. At the end of from eight to twelve months it will have fermented gradually and thoroughly, and will be bottled off. A sample of 1887 mead was sent to a chemist, who said "that it was superior to nine-tenths of wines imported into this country, containing just sufficient alcohol as a safe stimulant and refreshing beverage."—A LANARKSHIRE BEE-KEEPER.

#### TRADE CATALOGUES RECEIVED.

Little & Ballantyne, Carlisle.—*Catalogue of Trees and Shrubs.*  
Gilbert Davidson, Ammanford, South Wales.—*List of Selected Fancy Pansies, 1890.*

\* \* \* All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

**Pears and Apples (W. S. E.).**—If you desire a very large Pear that is not in your list you may plant Pitmaston Duchess. It is not of high quality, but one of the most profitable for market. A grower of a few tons this year sold the fruits for 4d. to 6d. each. *Maréchal de Cour*, *Emile d'Heyst*, *Glou Morceau*, and the very late *Olivier des Serres* are

## THE BEE-KEEPER.

### APIARIAN NOTES.

#### PREPARING SYRUP.

SEVERAL correspondents "have been bothered by their bees not taking the syrup supplied to them; they get messed with it, and being unable to fly, creep out of the hive and die." Feeding bees

good varieties not in your list. Of dessert Apples you do not appear to have Cox's Orange Pippin, Claygate Pearmain, or Braddick's Nonparcil, which are all good for winter use. Of culinary Apples you may add Small's Admirable, Bramley's Seedling, and New Northern Greening. The fruit you send is, we think, Warner's King, though it is not named in your list.

**Figs—Pears (F. Smith).**—Your question about the Figs cannot be answered from an examination of the leaves alone. Restrict the root action of the trees to expedite their bearing, then send us fruit and foliage as well. They would probably bear the sooner if grown in pots. Easter Beurré is an uncertain Pear, succeeding well in some localities and not in others. If it bears and ripens well in your district you may safely plant it. Bergamotte Esperen and Olivier des Serres are good late Pears. The most profitable example of Pear culture we have seen this year was in the form of large freely grown open bushes of Pitmaston Duchess on the Pear stock. The handsome fruits, of which there were a few tons, were sold in Covent Garden at from 4s. to 6s. a dozen. Trees of the same variety planted at the same time on Quince stocks were practically worthless.

**Culture of Cassia corymbosa (C. D. R.).**—The plant of which you sent a spray is a native of Buenos Ayres, and was introduced to this country at the close of the last century. It is a member of the natural order Leguminosæ, and bears the name given above. It succeeds well in a greenhouse or other cool house, and also does well out of doors in the summer; but it is not hardy, and it would not be safe in a border during the winter unless the situation is very warm and sheltered. A compost of turfy loam, a little well-decayed manure, leaf soil, and sand meet its requirements; but it will grow fairly well in almost any ordinary garden soil. Your plant is in excellent health, the foliage being remarkably vigorous. The best plan would be to transfer it to a conservatory, where it could be trained to a wall, pillar, or roof.

**Potting Lilliums (S. T.).**—A compost of two-thirds of turfy loam and one-third of turfy peat with sufficient sand and crushed charcoal to keep the soil porous will be suitable. The bulbs may be potted now, surrounding them with sand, and covering them an inch or more deep. If you place them at once in the pots in which they are intended to flower the pots should not be quite filled with soil, but space should be allowed for top dressings. If the pots can be buried in moist cocoa-nut fibre refuse or ashes there will be less danger of the bulbs being injured by mistakes in watering. A cold frame or the floor of a greenhouse will be suitable for accommodating the pots until the plants commence growing, when they must have a light position and abundance of air. They thrive well plunged in ashes in the open air in summer—better indeed than in a greenhouse, unless the structure is very light.

**Myrsiphyllum asparagoides (M. T.).**—It is a useful, easily grown plant, and one of our correspondents especially commends it for covering the back walls of vineries. He says:—"I planted it along the back wall of a vinery here last season, and trained it up by simply tying small strings to the bottom and top wires. The shoots soon took to these, and no more attention was required in the way of training. It is astonishing how closely the shoots keep twining themselves round the string, though resting against the intermediate wires. In no case did a shoot get behind a wire or twist itself round one, so that I cut any number of shoots up to 11 feet in length beautifully covered from top to bottom with its glossy foliage. The strings can be easily drawn out when the shoot is cut. These long sprays are simply invaluable in table decoration, as they can be twisted about in any form desired. I am just now preparing sufficient plants for five or six other houses in the same way. The plant is easily raised from seed. After it is established it keeps throwing up young shoots year after year. I cut twenty dozens of those long sprays during the Christmas week. Anyone who has much house and table decoration to do can easily understand what the value of those would be at such a time."

**Manure for Orchids (O. R. N.).**—The following, which describes the experience of an old Orchid grower, will answer your question. It is no new thing to use manure in the compost for terrestrial Orchids. It has been recommended and practised in gardens for many years and with the best results for Calanthes, Bletias, Phajus, Cypripediums, and others. Cow manure carefully prepared and added to the compost is a decided advantage with such plants as Cypripediums of a strong growing nature. It is best to use it near the surface, so that at the end of each season any that remains can be readily removed. Manure in a liquid state, made from steeping cow manure in water, has been repeatedly given to these plants with the most beneficial results. Soot water in a clear state is stimulating also. A bag of soot steeped in a tank with cow manure and used in a weak state is a splendid stimulant. We have tried its effects, not only on Calanthes, Bletias, and Phajus, but frequently on Cypripedium insigne. With the latter, plants as nearly equal in all respects as possible were selected, and some watered with the liquid during the season of growth, and the others with pure water only. The stimulant had the effect of producing finer growth of a deeper colour and larger flowers. The liquid is also good for Cœlogynes, Lycastes, and strong-growing Zygopetalums. Suitable artificial manures might also be beneficial to these plants. Some have been tried, but the manure and solution referred to were preferred. Artificial manures are not used in the compost for epiphytal Orchids. A weak liquid from cow manure syringed amongst the pots and about the floors of the house, to be evaporated and taken up by the plants from the atmosphere. Use manure and liquid most cautiously. When we look at the excellent results attained by good culture without manure or liquid in the case of

epiphytal Orchids we have grave doubts of any improvement to warrant the risk. In some cases, Dendrobiums for instance, larger pseudo-bulbs and foliage may have resulted, but whether this is an advantage remains to be proved. It is wise to experiment in this matter, for by so doing only can reliable knowledge be obtained. But before the practice is taken up generally it is necessary to know whether strong growths and bold foliage made under pressure by the aid of forcing artificials are likely to prolong or shorten the life of the plant.

**Names of Fruits.**—The names and addresses of senders of fruit to be named must in all cases be enclosed with the specimens, whether letters referring to the fruit are sent by post or not. The names are not necessarily required for publication, initials sufficing for that. Only six specimens can be named at once, and any beyond that number cannot be preserved. (H. J. Williams).—The Apple is Reinette de Canada. "Botany for Beginners," by Dr. Masters, will suit you. (W. E. X.).—We believe the Apple to be the old Foxwhelp, a noted Herefordshire Cider Apple. (Thomas Hine).—1, Comte de Lamy Pear; 2, Ribston Pippin; 3, Northern Greening; 4, Fearn's Pippin; 5, Benoni; 6, Court Pendû Plat. (R. C. Appleton).—1, Beurré Capiaumont; 2, Duchesse d'Angoulême; 3, Beurré Diel. (F. Jellico).—Verulam. The cracking is due to the soil. Is it light and sandy?

**Names of Plants.**—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (J. H. York).—The box was received, but as you had not secured the numbers to the specimens enclosed we cannot name them so that you could recognise them. (B.).—1, Adiantum trapeziforme; 2, Adiantum cuneatum; 3, Adiantum macrophyllum.

HOME FARM

SEWAGE.

To the very natural inquiry, What have the managers of home farms to do with sewage? we answer that many a home farm might derive much benefit from the homestead drainage, as well as from that of the landlord's house. The matter is very simple, and is thus managed:—Construct cisterns at farm and mansion in such a position that no offensive odours can reach any part of the premises or the approaches to them. Procure a couple of pumps from the Bon Accord Works, Aberdeen, which cost from 30s. to 50s., the latter being a 3-inch pump admirably adapted to the work, and distribute the sewage of both places over any of the grass land. Do this persistently, and you will have ample reason to thank us for the hint. Or try the sewage upon Rye Grass or Maize, and realise something of the marvellous crops obtained by this means at the Croydon sewage farm. Every application of the sewage must be a thorough soaking, and not a mere surface wetting, for most sewage is so much diluted with water that its fertilising powers are low, and it is only by a liberal use of it that real good is done to the crops upon which it is used.

Sewage contains all the essential elements of plant food, and therefore we have only to use enough of it to ensure good results. It is most suitable for growing crops, and at this season of the year its use is confined to old pastures where it is certain to be turned to good account, and our especial motive in calling attention to its value now is that advantage may be taken of this quiet period of the year to make provision for its storage and accumulation for another season. Where works exist for the precipitation of sewage the sludge may of course be carted upon the land as it can be had, using 8 or 10 tons of it upon the space of land for which a hundred-weight of pure nitrogenous and mineral manure is sufficient. Let any companies which may be formed for the sale of precipitated sewage in any form remember this, and they will find that until a method is discovered to concentrate the fertiliser very much more than has been done in any of the samples sent to us for trial it will not answer to send it any distance by rail.

That the present waste of the sewage of most large towns is a shame and scandal there can be no doubt, and the Board of Agriculture would, indeed, be doing good work in trying to grapple with this evil. If it requires precedent and data upon which to base action it need not be at a loss. In this country Croydon has shown fully what can be done with the sewage of a large town, and its example has been followed by a few other towns. But London, with its 150 million gallons flowing daily into the Thames at Barking and Crossness, is content to continue the pollution of the Thames, while the poor land in Essex has fallen so much in value that plenty of it has been on sale at £10 and £12 per acre. In every discussion of this enormous waste of a valuable fertiliser some part of this land is pointed out as in a most suitable position for taking the London sewage. A trial farm has been suggested, but we submit that it would prove a mere waste of time when the thing is an accomplished fact. Berlin, with its sewage farms of 19,000 acres in extent, affords a striking example of what is possible on a large scale in this direction. There are 2000 hands constantly employed upon the sewage land, and the crops are highly satisfactory. There is a movement in France in the same wise direction, which at present is confined to a more limited area. Its extension is certain among so thrifty a people as the French, for the fact is before them of the land at Gennevilliers under sewage yielding crops worth from £60 to £160 per acre. It would, of course, be a gigantic business to turn the London sewage to account in this way; but it is certain to be done sooner or later, and it will

then probably be utilised partly as sludge and partly in its crude state where the land is suitable for it.

The quantity of sludge we mention as requisite to produce full crops should be taken as a guide to price. So far as our experience goes the price asked hitherto for precipitated sewage has been altogether prohibitive to farmers at a distance from the works. Those who have ventured to purchase some, and have sent samples for analysis to Dr. Vöelcker, have been told that its fertilising power was so low that it could only answer for use upon farms to which it could be carted direct, and not when sent to a distance by rail. The only really profitable use of sewage up to the present time has been as we have explained, and upon sewage farms by irrigation. At a recent conference on this subject, held at St. James's Hall, Colonel Jones of Wrexham told how he had half a million gallons of sewage flowing on his farm of 19 acres night and day, and it was so profitable that he was able to pay a rent, inclusive of taxes and tithes, of £5 an acre. This farm gained a prize of £100 in 1879 as the best sewage farm, and the trial of sewage irrigation upon it has been long and thorough.

WORK ON THE HOME FARM.

Now that the land cleaning and corn sowing is pretty well over, many of the farming implements are being laid aside for some time. Preparatory to this they should be thoroughly overhauled, cleaned, oiled, and painted, and all necessary repairs done. Duplicate parts in stock should be looked up, and a thorough stock-taking gone through and checked off upon the inventory. It is a good rule always to have repairs done at this season of the year, so as to have the tools in readiness for use when the busy time come round again; not only is this ensured and much time saved when it is most valuable, but everything is kept in good order and premature decay prevented.

Since writing our last work note we have been over a large home farm in Northamptonshire, where we found the store cattle still out upon the pastures. Feed was plentiful enough, and the cattle were lusty and thriving, and we could not but deplore the total absence of shelter of any sort for them. Exposure to cold and wet always causes a falling off in condition, and often brings disease among cattle. Really, to see valuable beasts left out in the open in all weather, one would suppose the owner had never heard of bronchitis, pneumonia, and pleurisy among cattle, or abortion among cows. In Leicestershire, where cattle are so much exposed, losses from hoose, or catarrh, are common, especially among young stock. It must be owned, too, that there are losses from the same cause among cattle in yards, especially where they are much crowded. Hardly ever are the younger or weak beasts allowed to eat their food in peace, for they are driven by the stronger ones out of the lodges, and away from the racks, till they become so reduced by cold, wet, and hunger as to become easy victims to hoose, all which might be avoided by an adequate provision of shelter and a careful separation of the beasts.

Another important point requiring special attention now is the daily clearance of all foul litter from every shed and lodge. See to this, and that the animals always have a comfortable bed of fresh dry litter upon a clean hard floor. Foul bedding and close overheated cowhouses are both causes of disease. Wholesome food, pure air and water, plenty of fresh litter, with shelter from rain and cold cutting winds, are the essentials now, and with careful supervision they go far to insure immunity from disease, and the maintenance of that lusty condition, without which early maturity and profitable results cannot be had.

REMARKS.

- 2nd.—Wet from 6 A.M. to 11 A.M., and a shower at 2 P.M.; the afternoon generally fine, with some sunshine.
  - 3rd.—Brilliant early; generally overcast after 10 A.M.; rain in the evening.
  - 4th.—Cloudy early; bright sunshine from 10 A.M. to sunset; spots of rain about 5 P.M.; fair night.
  - 5th.—Wet from 1 A.M. to 5 A.M.; almost cloudless from 9 A.M.
  - 6th.—Slightly foggy early; sunshine all day; gale and rain in evening and night.
  - 7th.—Overcast and squally in morning; gale, with showers, in afternoon; wet evening.
  - 8th.—Brilliant early; a little fog in morning; bright from 11 A.M. to sunset.
- Cloudy, with occasional bright sun; frequent rain, chiefly at night; temperature near the average.—G. J. SYMONS.

AFTER travelling 900 miles on behalf of the Chrysanthemum, and adjudicating upon upwards of 5000 blooms, it may be readily imagined that it was a pleasant relief last Saturday to turn aside for a few hours to another favourite flower—the Carnation. To my friend, Mr. Harry Turner of Slough, I owe the opportunity of inspecting a wonderful collection of Carnations at Ascott, near Leighton Buzzard, the residence of Leopold de Rothschild, Esq., whose courtesy, with the kind attention of his excellent gardener, Mr. Jennings, rendered my hurried visit most agreeable.

Much could be written respecting Ascott and its garden, and a long description would be needed to do full justice to such an establishment. It is beautifully situated on a considerable elevation overlooking the Vale of Aylesbury with stately Mentmore and the Chiltern Hills in the distance, while the garden has been designed and planted with most commendable taste. A November day, even with a bright sun lighting up the landscape, is not, however, the most suitable time for appreciating the attractions of such a scene, and the pleasure of another visit is therefore reserved. In the present notes attention will be confined to the chief object of my visit—the Carnations.

Conversing with an experienced cultivator and thorough florist of the modern school a few days since “dressing,” as applied to flowers for exhibition, became the subject, and my friend, who holds strong opinions upon the point, expressed himself somewhat in the following terms:—“The florists’ or exhibition Carnations are being killed in popular estimation by the excessive artificiality with which they are displayed at shows. The incurved Chrysanthemums, for which this preparation is deemed essential, are being gradually ousted by the Japanese varieties that do not need it; and even the Rose is suffering from the same cause, and the public are turning to the old garden Roses for natural grace of form and usefulness.” There is a large measure of truth in these remarks, and especially as applied to the Carnation. For example, take the increasing popularity of the so-called border varieties, which do not possess sufficient symmetry of form to satisfy the more exacting florists, and yet are highly valued in gardens where bright fragrant flowers are required by basketfuls. Then, too, there is another section of Carnations, comprising some of the most useful in cultivation—namely, the tree, winter, and spring-flowering varieties for culture under glass, which are advancing in public favour, as they well deserve. These flowers can be had in such numbers, over so long a period when they are sure to be most in request, and the expense and trouble incurred in their production are of a much more moderate character than many other plants demand at that time of year.

At Ascott the great feature at the present time is a houseful of the well known beautiful variety Miss Joliffe, and as a floricultural display and example of cultural success this is remarkable in the highest degree. About 1500 plants are grown, two-thirds of which are now in the house, and as the plants bear from fifty to sixty fine flowers each there is a total exceeding 50,000 fully open or expanding. The effect produced by such large numbers of delicately tinted, elegant, but not too rigidly symmetrical flowers in combination with healthy foliage is charming in the extreme, and we have in addition the exquisite fragrance, not too powerful for the most sensitive in these matters. The sterling usefulness of

such Carnations as these is apparent at a glance. The plants themselves can be employed for any form of decoration, in groups, on tables, or elsewhere, and the flowers are equally well adapted for vases, stands, bouquets, buttonholes, baskets, or indeed for any of the almost innumerable purposes to which flowers are now applied. It is not merely a case of growing flowers as a hobby or to gratify fantastic desires, but they perform a substantial service that must be appreciated in any garden at this time of year.

The house in which the plants are growing is a handsome, well-constructed, substantial span-roofed erection in Messrs. Foster and Pearson’s best style. It is 70 feet long in two divisions, 18 feet wide, and about 18 feet high to the lantern, with neat central and side stages of iron, and it is provided with a simple but efficient system of ventilation in the roof also above and below the stages. The latter is a very important matter, as Carnations at all times require plenty of air, and yet cold draughts are most injurious, causing a check that the best after-treatment can seldom overcome entirely. For the admission of air in severe weather the ventilators beneath the stages are covered inside with thin perforated metal plates, so placed that the current of air strikes directly upon the hot-water pipes, and is thus slightly warmed before reaching the plants. This may seem a small matter, but success depends largely upon the details in all departments of industry, and especially in horticulture. In fine weather air is admitted as freely as possible, an even temperature of about 55° being maintained from now onwards. Higher temperatures and a moist atmosphere seem to suit Carnations of this class, inducing a rapid growth; but the results are often disastrous when this treatment is adopted, as I have seen in many cases. The plants really become weakened, the flowers are small, wanting in substance, and of less duration than when developed under cooler and more airy conditions. The paths are formed of iron gratings, beneath which is a layer of clean shingle, the same material being employed upon the stages and beneath the pipes. Near the edge of the paths a narrow border is formed and planted with small Ferns, all these arrangements helping to preserve a sweet atmosphere, exactly what the Carnation requires.

An outline of the system so successfully adopted by Mr. J. Jennings will no doubt be interesting and useful to some readers, and it can be compressed into a few words. In the first place cuttings are inserted during February in light sandy soil, the pots being plunged in slight heat. When rooted the young plants are transferred to small or large 60-pots, according to their size, and when sufficiently advanced placed into 48’s, and subsequently into 32’s or 21’s, regard being paid to the strength of the plants and the condition of their roots. They are first removed to frames outside, and in June are plunged in ashes out of doors in an open but not too exposed position, where they remain until September in ordinary seasons, or later, according to the weather, when they are placed in the house where they are to flower. A good turfy loam is used as the basis of the soil, with sufficient sand to insure good drainage and avoid stagnation at the roots, a fatal condition. Very little manure is employed, but some of the advertised artificial preparations have been found advantageous in small quantities, though it would be invidious to mention them here, but one simple fertiliser has been proved to be of great service—namely, soot, and though this is not new to cultivators, its value is often ignored.

The earliest plants commence flowering in October, and a succession is obtained until February or March. Some are cut in then to make fresh growth and produce a fresh supply of flowers, and these are often followed by another crop, so that three distinct supplies are usually had from one series of plants in a year. Old plants are, however, either placed out in beds or thrown away, fresh stock being raised every year as young vigorous plants give the best return. The smaller flower buds are removed freely, and this throws much additional strength into those retained, and they are found to last longer. In the new house these Carnations have not a sign of mildew, and aphides are not tolerated, the fine healthy

condition of the plants plainly showing how well they are attended in all respects.

The preceding remarks apply more especially to the variety already named (Miss Joliffe), which has now been before the public for nineteen years, as the Royal Horticultural Society awarded Mr. Masters a first-class certificate for it in 1871; they are, however, equally applicable to other varieties grown for winter flowering. Of these a good general collection is grown at Ascott, including all the best varieties in cultivation, and amongst the newer forms is one that appears to be of a most promising character—this is named Winter Cheer, and was sent out by Messrs. J. Veitch & Sons. It possesses very rich deep red flowers, is of good habit, similarly floriferous to Miss Joliffe, and as the plants become stronger it is likely to make a first-rate companion for that variety. The present time is not the best for seeing the Souvenir de la Malmaison, though some plants are bearing grand flowers; but it can be imagined what a display 3000 bushy specimens would produce. The various forms of this type are all grown. Princess of Wales, Lady Middleton, the crimson, the rose, and the old form are included. Madame Warocqué is there much finer, richer in colour, and more satisfactory than I have yet seen it, and is evidently worth a place in collections.

Concerning the brilliant Zonal Pelargoniums, the plentiful stock of Roses, and the attractions of the garden generally something will be said on another occasion, and with this promise I must conclude my notes for the present week.—LEWIS CASTLE.

### RENOVATING ORCHARDS.

[A Paper by Mr. JOHN WRIGHT, read on behalf of the British Fruit Growers' Association, at a meeting of the Falmouth Horticultural Society, November 12th, 1890.]

I HAVE pleasure in complying with the wish of the Secretary of the British Fruit Growers' Association in writing a paper on the subject in question in the hope of its being of service to those for whom it is intended.

There are no doubt thousands of orchard fruit trees, not only in the kingdom, but almost in every county, which are little less than cumberers of the ground. Some of these trees cannot be profitably restored, but unquestionably many of them may be materially improved.

The one great fundamental error which appears to have taken possession of the minds of the majority of men who have planted orchards is in apparently supposing that the trees would go on growing and bearing good fruit year after year, from generation to generation, without the soil having restored to it such mineral constituents as have been abstracted from it by the wood, leaves, and fruit of preceding years. It is well known and recognised that all crops of a much more ephemeral character than fruiting trees cannot be reproduced on the same ground year after year without returning to the soil in the form of manure the constituents removed by those crops, or in so arranging successional crops in farms and gardens that require in the main either different foods, or at least widely differing proportions of the same kinds. All farmers know that they cannot obtain even half crops of grain, Clover, or roots from the same field for half a generation if they put nothing into it; and it is the same with garden crops. They can only be produced year after year in a satisfactory manner when the ingredients necessary for their production are in the soil.

Everything that grows in the vegetable, as well as in the animal kingdom, needs appropriate food, and just in proportion as the supply fails in the same proportion is the debility of animal, plant, or tree manifested. The same principle governs all. Food is the motive power in the growth and productiveness of fruit trees, and is as essential to them as heat is as supplied by coal for the generation of steam to enable our engines to do the work for which they are intended. And not only must the supply of fuel be adequate for the object in view, but the machinery must be kept in clean, smooth, free-working order, or the fuel would be wasted. It is the same with fruit trees. The parts above ground must be clean, the branches bright and clear, the leaves stout by direct exposure to light and air, or whatever food there may be in the soil for the roots to imbibe will avail little in the production of fruit. This is plainly seen in the case of young trees growing in over-rich soil, and where the knife is freely used in cutting back the luxuriant growths yearly. They become mere thickets of sappy growths and flabby leaves, few or no blossom buds forming. This is mentioned for showing the necessity of light and air acting directly on the foliage of fruit trees for maintaining them in a healthy fruit-

ful state. Good leaves, thick in texture, deep green in colour, and clean, are manufacturers of fruit. They are the machinery, so to say, of trees, but differ from mechanical productions, inasmuch as they are formed in a large measure of matter supplied by the roots. Produce good leaves by good food from the soil, and full exposure to the air for breathing and benefiting by the atmospherical gasses, then will the trees be healthy and productive.

Now let us turn to orchard trees that need renovation. The first question that naturally arises is this, What is the cause of their unsatisfactory condition? It is only when the cause of an evil is determined that the best remedy can be directly applied. After what has been said on the necessity for adding fertility to the soil for annual or biennial crops, it will be seen how utterly impossible it is for trees that have been draining the soil of its virtues for half a century more or less to be otherwise than in a debilitated state. They are struggling for existence in famine-stricken soil. The fruit they produce is small, hard, juiceless, or more notorious for core, kernels, and skin than for thick, tender flesh and the red or rosy flush on the clear and speckless cheek. These are the fruits that are so much coveted, and they can only be produced by good sustenance or an adequate supply of suitable, well-digested food. If the fruit food, which consists mainly of lime, potash, phosphorus, and soda, is in the soil with sufficient moisture the roots will imbibe it in solution and good leaves digest it, then there can only be one result—healthier growth and better fruit, and it may be as good as the variety is capable of producing.

Some orchards are unproductive through the roots having passed deep down into water-logged soil. They first seized the food that was nearest, then sought for more further afield so to say, just as sheep do in pastures; but if they get into a bog they perish. Water is the first necessity of fruit trees, but if it is stagnant it is the reverse of nourishing, and may even be poisonous, the effects of this being seen in the form of gangrenous swellings, canker, gum, mildew, and a horde of insects that find suitable conditions in which to thrive. Orchards that are failing through the roots of the trees being in a quagmire can seldom be restored to health, and the only way of improving them is by fresh soil and manure placed in actual contact with the upper roots, from which new rootlets may be tempted to form, as they will when surrounded with a suitable medium. It is better to plant new orchards than to spend much money in the form of labour and material on old under those circumstances. Those who have established or inherited such orchards are now paying the penalty of the mistake that was made of planting the trees in the wrong places, or for not having kept the roots near the surface by periodical applications of food. In years of long ago any site appeared to be thought good enough for an orchard, and trees seem to have been planted in places that were too wet for growing Potatoes. We can only hope that the errors of the past may be taken as lessons that will teach the present generation wisdom in the cultivation of fruit. When an orchard is in a low wet site that cannot be drained perhaps the best thing to do is to plant it with Osiers. These give a fair return, draw much water out of the land, and the myriads of leaves that fall from them gradually enrich the surface soil and encourage the production of fibrous roots there, which never fail to benefit fruit trees. Osiers established in extensive orchards where the land is wet realise sufficient for paying a good rent and something more, while the trees above them bear excellent crops of valuable fruit.

But where one acre of orchard fruit trees needs renovating through excessive wetness of site, twenty and more, probably fifty, if not a hundred, acres of trees have been rendered comparatively effete from an exactly opposite cause—namely, soil so dry and poor that there is little to be imbibed from it by the roots of the trees, and certainly not half so much as is needed for enabling them to yield even moderate crops of scarcely marketable fruit. In such case the trees, if not too old and canker-eaten, are amenable to improvement, and they may give, as many have given, a good return for the assistance that has been rendered than in feeding the roots and thinning and cleaning the branches, also by grafting better and free growing varieties on the inferior, for it should always be remembered that a tree of a bad variety takes up as much room as a good one, and, moreover, a tree that neither bears good fruit nor makes little beyond cankered growth, may be transformed into a healthy specimen and bear fine fruit by putting a new head on old shoulders in the form of a number of grafts of a strong growing hardy sort, always provided there is nutriment in the soil for the roots to appropriate. Strong growing Apples and other fruit trees established on weak stocks increase the root-action of those stocks, and if these can find the requisite support for the growths new layers of bark form on the old stems and a new lease of life is thus given to the trees.

(To be continued.)

### DEATH OF MR. SHIRLEY HIBBERD.

DEATH has been busy in the ranks of horticulturists during the present year, but the announcement we have to make with the deepest regret this week will come as a painful surprise to a large number of our readers. Few of those who assembled at the

He appears to have been somewhat better the following day and on Saturday, but on Sunday morning he became rapidly worse and died in a few hours.

Our old friend and fellow worker was born in the year 1825 in what was then the rural village of Stepney—the son of an old sailor. In early life he was intended for a bookseller, but he soon

FIG. 59.—MR. SHIRLEY HIBBERD.

National Chrysanthemum Society's banquet on Thursday evening last, and who listened to Mr. Shirley Hibberd's eloquent speech, could have imagined that it was the last time his clear and ringing voice would be heard in public. It was, however, remarked that he seemed unwell, that he did not speak with his usual fluency, and that he left early in the evening; beyond this no one thought there was anything of a serious nature. It was said he had contracted a cold at the Chrysanthemum Conference held in one of the rooms at the Aquarium on Tuesday, but though feeling unwell he fulfilled his engagement at the banquet to the satisfaction of all present.

embarked upon a literary career, and contributed short essays and pieces of poetry to some of the periodicals which appeared during the mental and political ferment which followed the revolutionary period of 1848, 1849, and 1850. They display something of the originality and intellectual vigour which characterised him in after life. At the early age of twenty-five he became the editor of a weekly newspaper, and in this he published the essays he afterwards gave in the volume termed "Brambles and Bayleaves." In these rural subjects were illustrated from a sentimental rather than from a practical point of view.

At this time Mr. Shirley Hibberd was a man of great versatility of character, taking part in meetings and lecturing on social and moral topics in many parts of the metropolis. It is said that he once went to Newcastle-on-Tyne and delivered a series of lectures in the room of a friend announced to deliver the same, but who was laid aside by illness. Having married, and taken up his residence at Pentonville, he commenced a series of experiments bearing upon urban gardening, seeking the truest principles upon which it could be successfully carried out, his wife sympathising with him in his work and assisting him in many ways. The experience so gained and his recorded observations on plant culture in the midst of houses formed a book on town gardening, the first edition of which appeared in 1855. Probably at this time he experienced something like a struggle for existence, for he appeared for a time as delivering descriptive lectures on the Crimean war in what was originally Wyld's *Globe* in Leicester Square, illustrating his narrative by references to pictures, and proving a most able and successful expositor.

From Pentonville he went to reside at Stoke Newington, and while there closely identified himself with practical horticulture, and entered upon a series of experiments, which led to advantageous results. He developed and warmly advocated the plunging system in garden decoration while resident for some twelve years in Lordship Terrace. This system provides for a display all the year round by cultivating in pots certain plants and plunging them in the soil in their pots, arranging them in groups or otherwise, according to the fancy of the operator, but removing some and replacing them by others, according to the season of the year or the effect sought to be produced. Ivies, Hollies, many evergreens, &c., were cultivated in pots for this purpose—indeed, anything likely to be useful was turned to account for pot culture. At that time there existed in the City of London a Central Horticultural Association, of which Mr. George Gordon, Mr. George Glenny, and others were active members, and at one of the meetings Mr. S. Hibberd produced a group of berry-bearing plants all grown in pots, and all prepared for grouping, which proved extremely interesting and instructive. While at Stoke Newington he started several gardens for experimental purposes, but had to relinquish them one by one as they were required for building purposes. Trials of Potatoes, Peas, and other vegetables were carried out by him, and the results of these appeared in various gardening publications. It was while at Stoke Newington that, with the help of systematic fertilisation and persistent selection, he succeeded in obtaining Hibberd's Prolific Vegetable Marrow.

Experiments in fruit culture also engaged his attention, and one of his chief fruit gardens afterwards became Oubridge's nursery. Here he pursued various systems of training, grafting, pruning, &c., and it was while there he obtained those practical results which became the substance of the fruit lecture he delivered before the Society of Arts in 1876. One result was that the excessive pruning of fruit trees was curtailed to a considerable extent. It was while at Stoke Newington that he commenced the raising of Zonal Pelargoniums, which was eventually succeeded to and carried on with so much success by the late Dr. Denny. He also took up Rose growing, and made many experiments; the results of his culture were afterwards published in his "Amateurs' Rose Book," and in the course of his practice he was led to discover the immense value of plants on their own roots.

He afterwards removed to a rural spot situate between Muswell Hill and Tottenham, and having a large sized garden at his command he developed his taste for Potato culture, and in the course of a series of trials discovered the value of the Magnum Bonum Potato which had been sent to him for trial by the late Mr. James Clark of Christchurch. He also originated the method of growing Watercresses in pans, and exhibited a number of them on one occasion at one of the meetings of the Royal Horticultural Society. Meanwhile he had issued various small works on several aspects of gardening intended principally for amateurs, which were afterwards gathered up into one complete work—the "Amateur's Flower Garden." About 1870 he published his book on "Beautiful Leaved Plants," and also on "Rustic Adornments for Homes of Taste;" and in 1872 appeared his valuable work on "The Ivy, its History and Uses." In order to obtain the material for this book he cultivated a large number of Ivies and made himself acquainted with collections grown by others, placing them in appropriate groups and carefully describing them.

In 1858 he became a contributor to, and subsequently the Editor of the "Floral World," an illustrated monthly publication, published by Groombridge & Son, and retired from it in 1875, and some little time after it ceased to exist. He became the Editor of the "Gardener's Weekly Magazine and Floricultural Cabinet." In 1865 this was enlarged, and became known as the "Gardener's Magazine," of which he remained Editor till the day of his death. On the completion of the twenty-first year of his

editorship in 1879 the proprietors invited the principal contributors to a dinner at the Albion in Aldersgate, and a suitable presentation was made to Mr. Hibberd by them.

He closely identified himself with many suburban horticultural societies, and was one of the principal promoters of the great Fruit and Flower Show held by the United Horticultural Society (which appears to have been formed a year or so previously) in the Guildhall of the City of London, on November 14th and 15th, 1865. Out of this grew the United Horticultural Provident and Benefit Society. From the first he was an energetic supporter of the various international Potato exhibitions held at the Alexandra Palace, and subsequently at the Crystal Palace. At the time of his death he was President of the National Auricula Society, and one of the Vice-Presidents of the National Carnation and Picotee Society, and his support was always forthcoming for any movement having for its object the promotion of the cultivation of florists' flowers. Mr. Hibberd invariably took part in the Conferences arranged by the Royal Horticultural Society; also in that promoted by the National Dublin Society, and he read a paper on the "Origin of the Florists' Chrysanthemum" at the Conference, held on August 11th, in connection with the Centenary festival of the National Chrysanthemum Society, of which he was a member. He was a member of the Floral Committee of the Royal Horticultural Society, and was seldom absent from its meetings. Mr. Hibberd was one of the Vice-Presidents of the British Fruit-Growers' Association, and in June of the present year delivered an exhaustive address on the history of Strawberries at the Westminster Conference. As a Judge at flower shows his services were in much request; and occasionally he would deliver a lecture in connection with some provincial exhibition. As an after dinner speaker at festive gatherings of horticulturists he was perhaps without a rival.

It is practically impossible to fill in all the details of his horticultural life, for they are voluminous. He will be greatly missed.

We are informed that the funeral will take place at Abney Park Cemetery on Saturday next, about three o'clock. The cortège will leave Priory Road, Kew, about noon, and the first part of the service will be read in All Saints' Church, Aden Grove, Stoke Newington.

## IMPORTED ORCHIDS.

(Continued from page 398.)

ANSELLIA.—Provided Ansellias are collected at the proper season and are packed safely there will be no difficulty in establishing them. They may be potted as soon as convenient after they have arrived in crocks, peat, and sphagnum. They will require to be watered rather cautiously till they begin to make fresh roots, after which time they may be watered more liberally and removed to the warmest end of the stove.

CALANTHE.—Calanthes of the *vestita* type are so well known that nothing need be said here with regard to imported pseudo-bulbs, for they are propagated so readily in this country that they are not frequently imported now-a-days. This section of Calanthes is the most useful of any Orchids, Dendrobiums excepted; they are easily grown, and what makes them more valuable is that they flower at a time when choice flowers are scarce. Many gardeners imagine that they are difficult to cultivate and require some special treatment, but they grow well in any ordinary stove temperature provided they are favoured with a good light position during the season of growth.

CATLEYA.—These are often received in poor, and in some cases almost worthless condition. It sometimes happens that the collectors cannot always find them at the proper time, and are sometimes delayed in transit; the consequence is that the young growths are too far advanced. When this is the case they seldom do much good the first year; owing to the growths being made in total darkness they are very weak. After a short time it will soon be visible if they intend to grow or damp off. When the growths are in such a stage they may be greatly assisted by placing them in a very shady place for a few days, gradually introducing them to more light. The young growths will then gain strength provided there is not too much heat and moisture in the house, after which time they may be potted in a very light compost, using crocks or charcoal freely. Very little water will be required till they have fresh roots. When Cattleyas are received in good condition they are by no means difficult to establish.

CÆLOGYNE.—There are many species in this genus that are of no real value to the horticulturist. *C. cristata* may be regarded as the most handsome and useful; indeed, it is a plant that ought to be more extensively grown. This is not difficult to import, owing to the fact that it has large pseudo-bulbs. Even if they lose their leading growth they invariably break back from the second pseudo-

bulb, making rather small growths the first year. They may be potted as soon as convenient, keeping them rather cool and dry for a time.

**CYPRIPEDIUM.**—This is another useful genus and a general favourite with all. The common species, such as *C. insigne*, *C. barbatum*, and *C. venustum*, are very easily managed; the choicer kinds require a little more attention. I find that some of the species, such as *C. caudatum*, *C. Stonei*, and *C. villosum*, do well potted in crocks and a little moss till they commence growing, when they may be surfaced with moss and peat, watering them liberally as root action advances.—L. C.

(To be continued.)

THE following Papers were read at the National Chrysanthemum Society's Conference, November 11th and 13th last, at the Royal Aquarium, Westminster. An interesting Paper on "Chrysanthemums in Art," by Mr. Haité, is, however, crowded out for the present. Sir Edwin Saunders presided on the first day, and Sir Guyer Hunter on the second.

### EXPERIMENTS IN CHRYSANTHEMUM CULTURE.

By Mr. H. BRISCOE-IRONSIDE.

THE text of my paper affords, as you will observe, considerable latitude, of which I propose to take full advantage. There exists amongst us a considerable divergence of opinion as to the cultivation of our favourite flower, and it seems to me that on this point we are never likely to agree fully. The varied conditions under which we work, such as those of aspect, soil, water, &c., must so considerably affect the growth as to render results, attributed to the culture, inconclusive; moreover, we adopt many and dissimilar methods, and nevertheless attain fairly equal achievements—one grower being successful one season, and his opponent the next. Hence, with the view of improving our plants we resort to experiments, and some of my own experiments in this direction I shall now have the honour of briefly describing.

I have pursued various systems of cultivating the Chrysanthemum, such as striking in cold and heated frames, and have obtained more satisfactory results when the cuttings have been struck in frames placed in a moderately heated glass house, and removed when rooted to cold frames. I have found deep pots preferable for blooming in, as better drainage can be secured, the plants are safer against saturation during heavy rains, and are more easily top-dressed.

Last year I experimented with fifty small plants flowered in 32-size pots. They were fed with various chemicals and manures, both singly and in combination. To express an opinion on the result is a most difficult task, as I found it impossible to adhere strictly to one chemical or one manure, except in the case of horse manure. I came to the conclusion, however, that half-a-dozen plants which were successively given liquid horse manure, soot water, Peruvian guano, and fish manure, and occasionally carbonate of ammonia, showed the most satisfactory results. I would here mention, more as a curious circumstance than of any practical importance, that in the case of two plants which had occasional waterings of dissolved sugar, greatly diluted, a portion of the sugar reappeared upon the foliage. This I collected and dried, and on tasting it I could detect no alteration. At the same time, the leaves on which the sugar appeared changed to a deep red, resembling in colour the foliage of an *Ampelopsis Veitchi* in autumn.

I particularly observed the effects of the following forms of ammonia given to plants—viz., sulphate, phosphate, nitrate, muriate, and carbonate, and it seemed to me that although the colour of the foliage was considerably deepened, especially by carbonate of ammonia, the blooms did not last so long, and the petals were not so crisp nor firm, a condition of things greatly militating against successful exhibition. The last result was most noticeable when the plants were liberally supplied with ammonia during the flowering period. I have found, however, when the buds are fixed, and rainy weather sets in, thus preventing the usual waterings for some time, that carbonate of ammonia, at the rate of an ounce to 3 gallons of water, giving half a pint of the mixture to each pot, has maintained a healthy tone in the foliage; nevertheless, at such a time, when the air is moist and the light limited, I venture to think that it is advisable to avoid as much as possible forcing the growth. The application of carbonate of ammonia produces an almost instantaneous result, which may be readily observed in the following manner:—A plant (say Golden Dragon), the foliage of which has a tendency to turn yellow, is selected, one or two leaves removed, and placed in water to keep fresh; carbonate of ammonia is now given to the plant, and the leaves thereon compared a few hours afterwards with those which were previously cut off, when there will be found a conspicuous difference in their colour.

My experience has not led me to consider top-dressings of dry manures advantageous, as it has seemed to me that the surface roots are

damaged thereby, and the manurial contents not evenly distributed. As witness of this I daresay that some of you have noticed that after top-dressings of artificial manures have been applied, and suckers immediately under the soil have become soft and pulpy, which in conjunction with the constant pinching of the suckers up to the blooming period has resulted in the formation of a compact, unnatural mass at the most vulnerable part of the plant. I suspect this is a cause for a scarcity of root cuttings later on. We are doubtless all alive to the fact that it is advisable to feed moderately plants having small and thin leaves, and that is a safe guide to generally consider all such plants as belonging to the category of weak varieties. I have observed that the life of the leaves of this section when fully exposed to the sun's rays has been of comparatively short duration, and that the blooms have been considerably improved when these plants have been placed in a partially shaded position.

Continually watching the foliage has been the most useful guide to me in the cultivation of the Chrysanthemum. We know that when the cuttings are rooted a yellow appearance invariably denotes insufficient pot room, and after the plants have been finally potted that a similar condition betokens insufficient nourishment; also that when the midrib of the leaves becomes contracted and the foliage curls a too generous treatment has probably been the cause. This last feature I have frequently observed in cut-back plants, which, as might be expected, will not stand the same amount of feeding as those naturally grown.

One of the most difficult problems in the culture of the Chrysanthemum, and that which requires a vast amount of experience, is, I suppose, "the timing of the blooms" for exhibition. The following system has enabled me to exhibit blooms in fairly fresh condition three, and in some cases four, weeks after they have fully developed. Take a plant, the flowers on which are three-fourths expanded, remove it to a dark room or shed, and when a bloom has fully opened cut it off with, say, about 18 inches of stem; immerse immediately in a jar or tumbler of water, and cut off underneath the water about 2 inches of the stem. I imagine that in this way the air is prevented from penetrating the stem, and hence the access of the water to the bloom is unimpeded. A small quantity of charcoal placed in the water obviates the necessity of continually changing the same. I should mention that I afterwards take off a small piece of the stem occasionally, this operation being likewise performed underneath the water.

With regard to mildew, I have found that sulphide of potassium, at the rate of two ounces to a gallon of water, syringed on the plants, has been the most effectual remedy, but when housed I consider dry flowers of sulphur dusted on the foliage preferable. Mildew generally begins during the months of August and September, sometimes in the latter part of July, and I have reasons for concluding that it originates from the varying temperatures for which these months are conspicuous, the days frequently being extremely hot and the nights cold and misty. To confirm, in my own mind, my conjecture on this point, I housed half the plants of *Val d'Andorre*, *Triomphe de la Rue des Châlets*, *Meg Merrilies*, and *Mr. Ralph Brocklebank*, which are notoriously subject to this disease, at the end of July, the other half being housed at the end of September. No trace of mildew appeared on those first housed, while the others suffered in the usual manner. It will be found on taking two leaves of equal length (they can of course be cut to weigh the same), the one being healthy and the other showing signs of mildew, and burning them separately, that the ash of the former is heavy. This, I imagine, proves that the mildewed leaf contained more liquid matter than the other. It is not inconsistent, therefore, to conclude that defective or checked transpiration is the cause of mildew.

To a similar cause I venture to attribute damping in blooms, as a like result is obtained from the last experiment if blooms be substituted for leaves. The fact of the petals giving off water in the same way as leaves, though, of course, in a smaller degree, must not be overlooked. Damping, I have observed, is generally confined to blooms grown for size, on plants which have lost a great deal of their foliage from a too early ripening. I am inclined to think that overfeeding has little or nothing to do with damping, inasmuch as I have experienced from overfeeding exactly the opposite result—viz., the bud displaying a dry rot, and refusing to develop at all. I suppose a too early ripening of the plants is due to an exposed position, where they have practically no shade and no shelter from the summer sun. I placed some plants so as to be shaded from the sun between the hours of 11 A.M. and 2 P.M. during the months of June and July, and I fed them twice as liberally as those fully exposed. The former when housed were ripened about halfway up the stem, and the result appeared to afford weighty testimony to the validity of my conjecture. This was especially noticeable amongst the weak varieties. Bearing on this point, in conclusion, I would draw your attention to the fact that whereas warmer countries easily ripen seed, in which we practically fail, they cannot produce blooms such as those exhibited by the National Chrysanthemum Society.

### CHRYSANTHEMUMS FOR EXHIBITION.

By Mr. CHARLES GIBSON.

ONE of the first things an intending exhibitor has to do is to ascertain how many plants can be properly housed, and also how many can be well grown through the summer. Better results will be secured from 300 well attended plants than from double that number partially neglected. Selection of varieties is another important matter; but with

the valuable additions we have of recent years it is much more easy to obtain a good selection than formerly. The beautiful new Japanese seedlings have so enriched the collections that it makes us wish for new incurved seedlings besides the valuable sports we have in that class. Perhaps the most convenient way to ascertain which are the best varieties for exhibition is to take the National Chrysanthemum Society's catalogue for a guide, and then note the varieties in the winning stands at the exhibitions. Good novelties possess much interest, and should be added when possible. Directly the exhibitions are over, when the varieties seen are fresh in the memory, compare the list for the following season, marking against each variety the number of plants you intend to grow. Additional cuttings should be inserted to allow for losses and weak plants. It is much better to have a choice of plants in the spring, and be able to reject any that are weak or not quite satisfactory. The strong competition of the present time should induce the exhibitor to grow specially for the classes in which he has a chance to win. It is much better for him and for the exhibition too. A grower who has a small number of plants stands little chance of winning a prize in a large class; but by growing a few plants each of the best varieties, and entering the smaller classes, he is much more likely to be successful. Large exhibitors, too, are more successful in the end by not attempting to do too much.

Having determined the numbers and varieties to be grown, and so commenced for the season, make due provision to protect the plants from checks of all kinds. The Chrysanthemum is subject to so many checks that constant attention is required throughout the year. Injury arises through suddenly exposing them to cold draughts, especially if struck in heat, by allowing them to become root-bound before repotting, and by the soil becoming dry at any period of their growth, or by excessive use of chemical manure. I will detail a few points of the system of culture I have followed with a fair amount of success.

#### CUTTINGS.

These are inserted at the end of November and the beginning of December, and are placed in a cold pit. I have inserted cuttings much later with good results, but it is convenient to have them early, and to be able to clear out the large pots. I prefer strong and sturdy cuttings about 3 inches long taken off level with the soil in the pot in preference to those dug out of the soil or stem cuttings, although stem cuttings are used occasionally when others are not to be had. Small 60-sized pots are used, placing one cutting in each pot. A crock is placed over the hole of each pot, and the pot is filled with soil, consisting of half loam, half leaf mould, and a fair amount of sand. The base of the cutting resting on a little silver sand, the soil is made moderately firm, and is then ready for the pit. Any good varieties that have deteriorated for more than a season are obtained from a fresh source, where they can be depended on being true to name. A change of stock is always desirable where good exchanges can be made. The cuttings are placed in a cold pit, or with only such heat as is desired from a Melon bed made the previous spring, and are arranged a few inches from the glass. The cold pit has an inconvenience in the covering it requires, but I think the cuttings are improved in constitution by the cool treatment, though it would be injurious to cuttings taken out of heat to place them in a cold pit. Where large blooms are grown it is necessary to use fire heat for two or three weeks to protect them from damp, and in my opinion a cool after treatment is beneficial to them when the cuttings are hardy and vigorous. As the cuttings are rooted we remove them to an adjoining pit, where they are gradually inured to air, and when well rooted they are ready for

#### POTTING.

The strong growing varieties are placed in 6-inch pots, the weak growers in 4-inch pots. The following I consider weak varieties:—In the incurved, Empress Eugénie, Barbara, Mrs. Heale, Mrs. W. Shipman, Lady Hardinge, Nil Desperandum, Princess Beatrice, Cherub, Princess of Wales, Miss M. A. Haggas, Violet Tomlin, and Mrs. S. Coleman; in the Japanese, Meg Merrilies, Ralph Brocklebank, Japonais, Madame John Laing, L'Adorable, Criterion, and Jeanne Délaux. The shift into 6-inch pots is a large one, but it succeeds well with me. The plants are well watered before potting, and the soil being in a moist condition they do not require water for some time, and the roots quickly take to the new soil. The pit is kept rather close for a few days; the plants are damped over the foliage occasionally of bright mornings. When the soil is becoming rather dry they are given one good watering, after which the plants are separately watered as required. There is danger of the weak varieties not rooting quickly into the 6-inch pots, the soil becoming heavy and possibly dry, and that is why the smaller pots are used, but they are transferred into the 6-inch pots as soon as they are fairly rooted, and not allowed to become root-bound.

The soil at this potting consists of two-thirds loam, one-third of leaf mould, a free addition of sand, and a 6-inch potful of bone dust to each two bushels of soil. The pots are carefully crocked, and a little rough turf placed over the crocks. As the plants are established in their pots they are gradually hardened, until the lights are left off night and day. The final shift is given from the last week in May until the second week in June, placing the strongest growers into 10-inch pots, and the others in 9-inch pots. The soil is made up of two parts loam, medium for stiffness, half part of well decayed cow manure, half part leaf mould from Oak leaves, a liberal amount of sand, and a 6-inch pot of bone dust to every barrowful of soil. A little soot and wood ashes is added, the whole well mixed together and placed under cover for use.

No detail in connection with the growth of this plant is considered of more importance than draining the pots, and it is quite equal in importance to the composition of the soil. Well crocked pots allow all superfluous water to escape; the free passage of air keeps the soil sweet, and assists the formation of healthy roots, capable of assimilating liberal supplies of liquid manure at a later stage. The soil is well rammed as potting proceeds, and the pots are then wheeled out to a sheltered position open to the sun, but sheltered from high winds. They are placed in rows 8 feet apart, to allow plenty of sun and air to reach them to assist in ripening the wood, and they are arranged on boards to prevent worms entering.

#### MANURES.

Many artificial manures are recommended for application. For the use of amateurs, and where the use of natural manures are objectionable, they afford valuable aid when used with care. For those unable to get a good supply of natural manures, and for application during a long spell of wet weather, they are beneficial. I have had the best results from natural manures obtained from a cesspool with the drainings from cowhouses and piggeries, to which is added a little soot. After an extended practice I am convinced a continued excessive use of artificial manures is one of the causes of damping in the lower florets of light coloured blooms.

(To be continued.)

#### THE NATIONAL CHRYSANTHEMUM SOCIETY.

THE Centenary Festival Banquet of this Society took place on Thursday evening, November 13th, at St. Stephen's Hall, Westminster. Lord Brooke, M.P., President of the Society, occupied the chair, and the presence of ladies proved to be a very pleasing innovation, and one which will undoubtedly be repeated in the future. Among those who sat down to dinner were:—

Sir Guyer Hunter, M.P., Major Isaacs, M.P., the Hon. Captain Greville, Sir Walter De Souza, Lady Bouche, Mr. Shirley Hibberd, Mr. R. Ballantine, Mr. E. C. Jukes, Mr. J. R. Starling, Mr. Richard Dean, Mr. C. H. Payne, Mr. Lewis Castle, Mr. G. Gordon, Mr. Brian Wynne, Messrs. Cates and Wilkinson, Captain Molesworth, Major Cresswell, Mr. Gladding, Dr. Spink, Mrs. Thrower (of Tasmania), Mr. and Mrs. Cannell, Mr. Glendinning, Mr. R. B. Laird (Scottish Horticultural Society), Mr. Sanderson, Mr. Daniels (Norwich), Mr. and Mrs. J. Wills, Mr. and Mrs. Segar, Mr. and Miss Barron, Mr. Bevan, Mr. Kemp, Mr. Williams, Mr. and Mrs. Laing, Mr. Stevens, Mr. Veitch, Mr. H. Turner, Mr. Jay, Mr. Nye, Mr. Dawes, Mr. Crute, and Mr. Addison.

The large hall was tastefully decorated with choice specimens of Chrysanthemums and other flowers, and the *tout ensemble* reflected great credit upon those responsible for the arrangements.

After dinner the usual loyal toasts were proposed and duly honoured, and the President next rose, amid cheers, to propose the toast of the evening, "The National Chrysanthemum Society." He said he felt very much the great honour of occupying the position of Chairman on that important and interesting occasion. (Hear.) It was a matter of very deep regret to him that he was unable to be present on the opening day of the Show, owing to the death of a very old friend, but his wife was present—(cheers)—and she was very much pleased with the beautiful exhibits, and the hearty welcome she received from all. (Cheers.) Yesterday he had the opportunity of going the round of the Show with Mr. Dean, and he thought he had never seen an exhibition of such beautiful flowers. (Hear.) It was needless for him to recount the history of the Chrysanthemum. It was one which went back 2000 years, and even before that time in China and also in Japan this most charming flower was cultivated. It was in Japan looked upon almost as a royal flower, because it was, he thought, an emblem of the Mikados of that country. Although it was known so early it was not until the year 1790 that the large flowering Chrysanthemum was introduced into England, when it first made its appearance in the Botanical Gardens at Kew. Since that time there had been many growers and lovers of the flower who had taken a deep interest in the Chrysanthemum, and brought it to the perfection in which they now saw it. He believed that in 1820 there were only about twelve different varieties of the flower, and now if they looked through the catalogue of the National Chrysanthemum Society they would be perfectly astounded at the number of varieties. (Hear, hear.) The Chrysanthemum was a very satisfactory flower whichever way it was looked at. If they looked at the reverse side there was some lovely colour to enhance the beauty of the petals. It was beautiful in every shape and form, and many growers in the country had brought it to such perfection that it was worthy to adorn any palace in the kingdom or in the world—(cheers)—and the great merit of the flower was that it could be as successfully cultivated by the small as well as the great growers. (Hear, hear.) With regard to the exhibitors, of course it was not possible for everyone to be successful, but the unsuccessful exhibitors knew that by competing they stood a chance of being, to use an apt expression, "quite at the top of the tree," and to occupy such a position on an occasion like the present must fill every other grower with deepest envy. (Laughter.) There had been many additions to their ranks since last year. He had the honour of taking the chair at their dinner last year. The members then numbered 615, but they had now increased to 734. (Cheers.) It was satisfactory to feel that not only the number of growers was increasing, but that the number of those who took an interest in the flower was also increasing—(hear, hear)—and he trusted that the Show

had been a benefit, not only to the Society, but to the proprietors of the important establishment in which they had met. (Hear, hear.) It was only right that it should be so because of the generous manner in which the management had met the Chrysanthemum Society. (Hear, hear.) The subject was one that he could dwell on at considerable length as he was very fond of flowers. He could not imagine anything more beautiful than the snow white Avalanche or the lovely Stanstead White, and it was most pleasing to know that in their efforts to cultivate this beautiful flower they had the sympathy and support of their fellow countrymen in all parts of the world. (Cheers.) In conclusion he thanked them for giving him the opportunity of occupying that proud position that evening, and he felt sure that though the flowers they had been exhibiting were fading, the memories of the hundredth anniversary of the introduction of the flower into this country would be long before they faded from their recollection. (Cheers.)

Mr. SHIRLEY HIBBERD then proposed the toast, "To the eternal glory of the golden flower that claims and obtains the constant homage and service of the National Chrysanthemum Society." He said it was his duty to recommend to their favourable consideration the flower that had brought them together that night. He was quite incapable of doing so, and it seemed to him the wiser course to leave the flower to commend itself—(cheers)—for if they were not all of one mind the persuasion of the flower would heal their differences. (Cheers.) It seemed to him, however, that it was impossible that they could be otherwise than of one mind on that happy occasion. (Hear, hear.) The Chrysanthemum had been cultivated in China for more than 3000 years, probably 5000 years, and had been with us in England 100 years. He asked them to consider, in all that time, how much strength of generations of men had been bestowed on that beautiful object—their time, their means, their patience, and their thoughts by day and by night—and yet they had never obtained from it a loaf of bread or a medicine. It almost approached the impossible to obtain a walking stick from the Chrysanthemum. He had seen that done, but the stick was of no use. (Laughter.) And that applied to flowers in general. Our Roses, Dahlias, Carnations—they ministered in no way to our material necessities, but they were spiritual food for the soul of man, and sustained him amidst his trials. (Hear, hear.) Flowers were symbols. Roses were the symbol of strife in the dark days of English history; the Lily was associated with the history of France; then the simple Primrose reminded them of the sudden removal from among them of a great genius at a time when his country needed his wise guidance. But the Chrysanthemum was emblematic of all that was pleasant. It came at a time of the year when the world was preparing for the Christmas festivities. It was essentially a joyous flower, it was suitable for the palace, and it was suitable for the cottage. (Hear, hear.) Our flowers commemorated not only philosophers, poets, divines, scholars, but men who were not statesmen and philosophers, but only plain, good, simple English florists, who loved their flowers and laboured for them. (Hear, hear.) The catalogue of their Society brought to his mind memories—recalled the faces of George Taylor, Samuel Broom, John Salter, Robert Fortune, and Wm. Holmes—(cheers)—and it was the flower that enabled him to know the nature of their fine humanity. (Cheers.) He sometimes imagined that when John Keats sat down to write his sweetly dreaming poem, "Endymion," he must have had before him the Chrysanthemum when he penned the line,

"A thing of beauty and a joy for ever."

(Hear, hear.) He trusted if there was anything more to be said for the flower they would let it speak for itself, and he would ask them to drink to "The eternal glory of the golden flower. May the Chrysanthemum live and flourish for ever." (Loud cheers.)

Major L. H. ISAACS, M.P., proposed "The President of the National Chrysanthemum Society." He said there were many things in which Lord Brooke claimed their gratitude. There were many things about which, of course, he could not speak, but he thought he might safely say that Lord Brooke had shown a great desire, as President of the Society, to undertake his duties in an excellent and careful way. (Cheers.) Without further words he would ask them to drink the health of their President and Chairman. (Cheers.)

The PRESIDENT, in acknowledging the toast, said that among Englishmen no society of mark ever got on well without its dinner, and their Society was one of mark, as they would all admit. (Hear, hear.) There were, however, many things which would come across their minds. There was their dear friend Mr. Holmes, who was so recently Secretary of the Show, and who took such a deep interest in the Society. (Hear, hear.) On going round the Exhibition there were many things to bring to the mind touching recollections of Mr. Holmes, and he had on the present occasion very great pleasure in bearing testimony to the very good work which he did for the Society. (Hear, hear.)

Mr. E. C. JUKES proposed "The Lady Patronesses and Vice-Presidents," and Sir Guyer Hunter, M.P., in responding said he had that day had the pleasure of listening to two interesting papers read by members of the Society. When going round that magnificent display of Chrysanthemums he had wondered how it had all been brought to such perfection (hear, hear); but those papers had explained the matter to him. It was simply by attention to details—a course which always ensured success. If the Chrysanthemum had attained such perfection at its first centenary, what might it not be at its second? (Hear, hear.)

Mr. C. H. PAYNE proposed "The Affiliated and Kindred Societies." Mrs. MARIAN THROWER (Tasmania), on rising to respond, was

received with loud cheering. She said she would carry away with her pleasant recollections of that evening and of the Exhibition. She was very glad that ladies were present, and hoped that the custom would be continued. (Hear, hear.) Although they in the Colony could never hope to emulate the old country in the matter of flowers, yet she thought they would be able to imitate us at a very humble distance. (Hear, hear.) Mr. D. P. LAIRD (representing Scotland) also responded.

Sir W. DE SOUZA (L.C.C.) proposed "the Royal Aquarium and Summer and Winter Garden Society." He said he was present to testify—and he was sure they would all join with him in so doing—to the usefulness of that establishment, not only for amusements, but for shows like the present one and for mental culture. (Hear, hear.)

Captain MOLESWORTH responded.

Mr. BALLANTINE proposed "The Exhibitors and Judges." He said the Committee of the Society did their utmost, at this Centenary Festival, to lay their net carefully to catch all the fish they could. They prepared an elaborate schedule, and they had the gratification of knowing that the exhibitors took the bait, and came in shoals to the Centenary Festival. (Laughter and Cheers.) The character of the exhibits reflected credit, not only upon them, but upon the National Chrysanthemum Society—(hear, hear)—and in no part of England, in his opinion, had such a Show ever been held. (Cheers.) This was due to the noble way in which the exhibitors had come forward, not only to support the Society, but to pay a tribute of respect to one who had been removed from them. (Hear, hear.) It was Mr. Holmes' aim to make this festival such a success as would be worthy of the National Chrysanthemum Society to which he had devoted the best years of his life, and it would have been a pride to him to have seen the exhibits last Tuesday. (Hear, hear.) It was an extraordinary thing to say in connection with a show of such magnitude, but they had no protest against the awards of the Judges. (Cheers.) He believed such a thing was almost unprecedented, and it spoke well for the wisdom and tact displayed by the Judges, that even the exhibitors who had not been successful had not been able to find fault with the awards which had been made. (Hear, hear.) He would couple with the toast the names of Mr. John Laing and Mr. H. Turner of Slough, to both of whom the best thanks of the Society were due. (Cheers.)

Mr. JOHN LAING, in responding, said the exhibitors deserved great praise for the way they came forward, and he incidentally mentioned that thirty-five years ago Chrysanthemums were well grown in Scotland, blooms of the Queen of England being 6 inches in diameter.

Mr. H. TURNER, in also acknowledging the toast, said the task of the Judges was not a sinecure. In most of the classes the competition was very close and keen, and the number of stands in some of the larger classes compelled the Judges to walk up and down the tables many times until they must have accomplished miles of walking before they had finished their task. The class for the Centennial prize of twenty-four Japanese and twenty-four incurved had eighteen entries, and the class for twenty-four Japanese had sixteen entries. It was a pleasure for the Judges to have such grand specimens of this noble flower placed before them, and he and his brother Judges used their best endeavours to award their judgments to the most meritorious exhibits.

Mr. H. JAY proposed "The Officers of the Society." Mr. BALLANTINE said although the duties of the Society's officials had been no sinecure, they had been amply rewarded by the results achieved. He expressed the opinion that it was to the tact and judgment of Mr. Holmes, "the Prince of Secretaries," that in a great measure the success of that festival was due. (Hear, hear.)

Mr. J. R. STARLING also replied, and, as Treasurer of the Society, suggested that they should subscribe to a fund, part of which is to go to the assisting the technical education of the eldest son of the late Mr. Holmes. There were many other officers of the Society worthy of reward, but he felt that that evening had been marked to a certain extent by the loss of an officer they could never replace. (Hear.)

Mr. RICHARD DEAN (the Secretary) proposed "The Horticultural Press." He said that the life of institutions of that kind depended very largely upon the publicity given to them, and with regard to the Centenary he thought he might safely say that the Press generally had done them full justice.

Mr. GEORGE GORDON responded, and humorously remarked that if the horticultural press increased at the same rate as it had done during the last fifty years, by the second centenary of the Chrysanthemum he should think every type of that flower would have its own special paper. (Laughter.)

This concluded the toast list, and before the company separated the President announced that the proprietors of the Aquarium had promised to give a benefit for the "Holmes Fund," and he expressed the hope that they would all follow so good an example. (Cheers.)

During the evening some excellent instrumental and vocal music was given, under the direction of Mr. Richard Mackway, and Mr. F. Valentine Goddard made a faultless toastmaster.

## HELENIUMS.

SOMETIMES we meet with some of our neglected border flowers quite unexpectedly, and on the question being asked, "What have you here?" a common reply is, "Oh, it is an old plant we take no notice of. We don't care about such plants here." But these

plants ought to be cared for, for nearly all our border flowers possess attractions rendering them worthy of cultivation. Seldom do we meet with any of this family of plants in our fashionable gardens; a few of them may be seen in choice private collections, and can only be looked on as rarities. They are a race of plants that will thrive in any ordinary garden soil, but are all the better for being liberally treated. Loam and well-decomposed vegetable matter, and coarse sand mixed with the soil where they are intended to grow (and the ground should be broken up to the depth of 18 or 20 inches), will afford them the sustenance they need. They should have thorough drainage, and be supplied with water when required. Some of them, growing from 2 to 3 feet high, require staking to keep them from being broken by the wind. They may be increased by division in spring or autumn, and they flower towards the latter end of summer and in autumn.

*Helenium pumilum* is the dwarfest of the tribe, and is a good border plant, having bright yellow flowers, which make a fine display when well established. *H. Hooperi* is decidedly the best of the family. This plant is so seldom seen that it cannot be much known to cultivators of herbaceous plants, or I am inclined to think it would be more frequently seen. When planted in open spaces in the shrubbery in good soil it is extremely effective. To see it in all its beauty the weakest growth should be thinned out, and the plants be supplied with liquid manure occasionally. It is excellent for exhibition purposes, and continues long in bloom. *H. autumnale* is a fine autumn-flowering plant of taller growth than the preceding, and is well adapted for border or shrubbery decoration, producing large flower heads, which continue until they are destroyed by frost, and it has been unusually attractive this season.—V.

WE have to thank several correspondents for reports of Shows and various communications, which are unavoidably withheld until our next issue.

— THE weather in the metropolitan district has been unusually mild for several days, with slight showers and occasional fogs. It is favourable for planting operations and other outdoor work.

— THE CENTENARY SHOW AT WESTMINSTER.—Mr. E. Mawley informs us that the total number of cut flowers staged in competition at the Centenary Exhibition recently held at the Royal Aquarium by the National Chrysanthemum Society amounted to 3837, and that there were in all 145 trained specimen plants.

— THE HOLMES' MEMORIAL FUND.—A FLORAL FÊTE AND BAZAAR.—The Directors of the Royal Aquarium having generously offered to give a special benefit in aid of the above Fund, it is proposed also to have a Floral Fête and Bazaar, the proceeds of which are to be devoted to the same object. A meeting of the Committee will be held in the Board Room at the Aquarium to-day (Thursday), November 20th, at 5 P.M., when it is hoped there will be a good attendance of all interested in the matter, so that arrangements can be at once made to carry the proposal into effect. Members of the National Chrysanthemum Society will be admitted on production of their passes at the staff entrance. Suggestions from those who cannot attend may be sent to the Hon. Secretary, Mr. Lewis Castle, Hotham House, Merton, Surrey.

— EXHIBITION OF HORTICULTURAL APPLIANCES AT THE CRYSTAL PALACE.—Arrangements are being made to hold an Exhibition in the Crystal Palace of the numerous and diversified articles required in the various branches of horticulture, Tuesday, March 3rd, to Saturday, March 21st, 1891. The entire length of the nave of the Palace will be apportioned to the several exhibitors. There will be two special competitions of exceptional interest, the arrangements and regulations for which will be sent on application. The first, a lawn mowing competition, to take place in the Crystal Palace grounds, and the second for the best spraying apparatus. Medals or certificates will be awarded for the above. All correspondence and inquiries to be addressed to Messrs. J. F. Peasgood and William Brooks, Crystal Palace, London, S.E.

— DURING the past fortnight CHRYSANTHEMUMS AT THE GRANGE, CARSHALTON, have constituted one of the best of the periodical displays which Mr. A. H. Smee throws open to the residents in the district. That this privilege is very highly appreciated is proved by the fact that nearly 3000 visitors have inspected the plants within the time named, and by means of the collecting boxes about £4 have been secured for the Gardeners' Orphan Fund. The 700 Chrysanthemum plants in 400 varieties are arranged in a long narrow bank sloping to the door of the Peach house, and have a capital effect, the plants being in excellent health, and in many cases, especially as regards the Anemones, the blooms are quite up to an exhibition standard. Mr. G. W. Cummins is an indefatigable worker in a good cause, and the result of the stall for the sale of fruit and flowers at the Croydon Show is a balance of over £7 for the Fund already named.

— HARDY FRUITS.—It has been arranged that Mr. Joseph Cheal of Crawley, as a representative of the British Fruit Growers' Association, shall read a paper on Hardy Fruits at the next meeting of the Croydon Gardeners' and Amateurs' Mutual Improvement Society, of which Mr. Stanley B. Baxter, Woodside Road, is the Hon. Secretary. The meeting will be held in the County Tavern, West Croydon, on Tuesday, November 25th, at 8 P.M. It is hoped that Mr. Philip Crowley will take the chair, and a large attendance is expected.

— LAMBETH AND SOUTHWARK CHRYSANTHEMUM AMATEURS.—The sixteenth Exhibition of these pioneers who endeavour to grow Chrysanthemums in the very heart of our metropolis was held at the Horns, Kennington, last week, and, considering the difficulties under which the exhibitors labour, it was a very creditable show. Trained plants and groups were alike very creditable, while the several classes, numbering forty-five, were nearly all filled. Though the cut blooms were not large they displayed throughout a keenness for neatness and variety. In one stand we observed a fairly good bloom of Mrs. Alpheus Hardy. Messrs. Filmont and Williams were the principal exhibitors of trained plants, and Davidson, Roberts, Williams, Sharpe, and Hillier in the cut bloom classes.—M.

— MR. W. J. GODFREY, Exmouth, writes:—"Herewith I beg to send a bloom of JAPANESE CHRYSANTHEMUM *Lucrèce*. I regret I did not send it before, but I exhibited a stand of these at our local show and Exeter, and the bloom has been knocked about. I may say that I do not "go in" for large blooms generally, but this is a very good one for the purpose, as it makes large leathery leaves, very robust, and about the same height as *Avalanche*. It is a French variety (1888), and I had it under the name given above. We grow from five to eight blooms on a plant." [The bloom sent had evidently been a very handsome one, but it suffered in transit; the variety must be well worth growing.]

— HAMMERSMITH HORTICULTURAL SOCIETY.—The fifth annual Exhibition was held on the 13th inst. In the group class for Chrysanthemums, first honours were awarded to a bright collection staged by Mr. Hodge, gardener to J. J. Ford, Esq., Park Side, Ravenscourt Park, W., who also showed cut blooms successfully, as did Mr. J. R. Wood, gardener to Mrs. Sanderson, Duke's Avenue, Chiswick. The premier position for Apples and Pears was taken for excellent samples exhibited by Mr. J. Addison, gardener to Mrs. Lloyd, Merton Lodge, Chiswick. Good non-competitive groups of Chrysanthemums were contributed by Mr. May, gardener to the Marquis of Bute, Chiswick; and Mr. Chadwick, gardener to E. M. Nelson, Esq., Ealing.

— GRAPE GROWING AND GRAPE KEEPING.—Under this heading (see page 400) Mr. Scott relates his practice, which he especially recommends to those who have lately taken upon themselves the responsibility of a head place. It will be equally as interesting to those who took a similar charge forty years ago, if Mr. Scott would kindly explain to us the utility of those nostrums he prescribes for Vines infested with insects. To me the prescription is very familiar, and readily recalls to my mind the days long since passed, when I was a practiser of the fine art, commonly termed a Vine smudger. My experience in the use of it on Vines is that what remains on the Vines which has not been bespattered on to the glass, and may be a fresh painted house, by the use of the syringe forms a warm protection to the surviving insects, and should they be the mealy bug, they perfectly revel under it in the minute crannies into which such a compound could not possibly enter, and that I think should be sufficient reasons for its discontinuance. Until Mr. Scott can produce to gardeners, both young and old, some counterbalancing influences which are not generally understood, the policy of cleanliness is the best to be trusted.—RICHARD WESTCOTT.

— HULL CHRYSANTHEMUM SHOW, as we learn by a telegram on the eve of going to press, is in every respect a great one. The 25-guinea cup has been finally won by Mr. P. Blair, gardener to the Duke of Sutherland, Trentham.

— RUNNER BEANS.—Of all vegetables I firmly believe that the Scarlet Runner Bean is the most popular among the labouring classes, and I think that they have reason on their side, for without doubt it is the most nutritious vegetable grown. It is so easy of culture and so ornamental that no wonder every cottager delights in his rows of Beans. There are so many new varieties come out lately that large pods are now the rule instead of the exception. I tried two varieties in addition to the old scarlet; No Plus Ultra, with very long somewhat narrow pods and smooth skin, a Bean which for quality cannot be approached, and which has high cropping qualities, combined with earliness in addition. Titan is very appropriately named, for the pods are truly immense, which will make it a great favourite for the exhibition table. In addition to being very long the pods are broad, but the skin is somewhat rough. It did not have quite such a good chance as the others, but it was a long way in front for size, and was also a very good cropper. I grow both my main crop and late Peas and my Runner Beans where I have the previous year grown Celery, and for that purpose plant my Celery at intervals running north to south all over the garden, which I find suits my crops of Peas and Beans admirably later on. I never grow them at less than 12 feet apart from row to row, which I believe enables me to grow more crops in a given space with a better return from the Peas and Beans than if I grew them in quarters by themselves.—H. S. EASTY.

— MR. WM. FALCONER contributes the three following notes to the *American Florist*:—*DESMODIUM PENDULIFLORUM* was at its best in September. Although of sub-shrubby nature we cut over ours close to the ground every year as one would a Phlox or Larkspur, and this treatment suits it best. The clumps are now 6 feet high, more than this across, and a solid shower of reddish purple Pea flowers. It is of no use for cut flowers, but very desirable as a garden plant. The white flowering form is commonly known as *D. japonicum*, and although beautiful and desirable in its way is not as free and airy as is *D. penduliflorum*. Botanists give us *Lespedeza bicolor* var. as the proper name of these *Desmodiums*.

— *HELIANTHUS MAXIMILIANI* flowered well throughout October. In moderately mild localities, as this is, it is a very desirable and showy plant, and especially valuable for its late blooming character. It grows from 7 to 10 feet high, and its long stems are terminated for 2 or 3 feet with bright golden yellow flowers set in close to the stem. The species is a native of the plains and prairies west and south-west of the Mississippi, and although not generally regarded as being perfectly hardy in the north we find it hardy enough here. It is very easily increased by division and root sprouts in the same way as is *H. multiflorus*.

— *ROSA NITIDA* is a wild Rose indigenous to swamps from Newfoundland to Massachusetts, and rare in cultivation. It grows from 2 to 3 feet high, has very glossy leaves and mossy prickly stems. It is now laden with round bright scarlet fruit, which is very ornamental, and so persistent as to remain upon the bushes over winter and till next spring. It keeps its foliage late into the fall, and the leaves colour up very brightly in autumn. Although it is an inhabitant of swamps it takes readily to garden cultivation and spreads considerably at the root. This, together with *Rosa rugosa* and *R. rubrifolia*, have now the fullest and brightest crop of ornamental fruit. A little later on *R. lucida* will also show up prettily, and so too will the *Polyantha* Roses, especially the one called Simplex.

— *HYMENOCALLIS MACROSTEPHANA* is the most robust as well as the most beautiful and fragrant of all the species of the genus. The large, pure white, deliciously scented flowers are arranged in dense umbels raised well above the leaves, which are about 2 or 2½ inches long, oblanceolate, bright green, and in themselves exceedingly decorative, even when the plant is not in flower. My plant, received a few years ago from B. S. Williams of London, blooms regularly every year in September. The bulb has attained a large size, but as yet has made no offsets. It is grown in a compost consisting of equal parts of well rotted stable manure, leaf mould and sand. All the *Hymenocallis* in my possession—namely, *H. speciosa*, *H. ovata*, *H. littoralis*, *H. caribœa*, *H. expansa*, *H. crassifolia*, and *H. galvestonensis*, grow and flower in a living room as freely as *Pelargoniums*. *H. macrostephana* exceeds them all in vigour and in ease of management. The flower stem, which is

thrown up from the heart of the bulb, reached this year the height of 17 inches, and produced an umbel consisting of seven flowers, each 8½ inches long, with a cup 3 inches broad and segments ½ inches long. Their Vanilla-like perfume is so strong that one flower scents a large room, and a flowering umbel an entire house. No one seems to know where this species, the best of the genus, comes from. Mr. Baker, of the Kew Herbarium, who has devoted a great deal of attention to the study of these plants, is of opinion that it may prove a hybrid between *H. speciosa* and *H. (Ismene) calathina*. I grow my plant in summer in the open in a half shady situation, and bury the pot to the rim in coal ashes.—H. NEHRING, *Milwaukee* (in *American Garden and Forest*).

## ROYAL HORTICULTURAL SOCIETY.

NOVEMBER 11TH.

SCIENTIFIC COMMITTEE.—Present: Dr. M. T. Masters (in the chair), Mr. McLachlan, Mr. Pascoe, Dr. Scott, Dr. Oliver, Dr. Müller, Mr. Blandford, and Rev. G. Henslow, Hon. Sec.

*Grapes Attacked by Larvæ*.—With reference to the Grapes brought to the last meeting Mr. McLachlan remarked that the larvæ might very probably prove to be those of *Tortrix botrana*. It was a well-known pest on continental Vines, and had been exported to America. He recommended that the Grapes infested should be covered with a fine gauze net, and that the larvæ should be watched to discover their further stages.

*Endogenous (?) bud*.—Dr. Masters exhibited a drawing of what appeared to be an endogenous bud in the axil of a leaf of *Actinida*, embedded in the cortical tissue. Dr. Oliver remarked that the buds which arise from the roots of *Anemone japonica* are also endogenous. Similar buds on the roots of germinating plants are well known and described—*e.g.*, by Van Tieghem.

*Bull. Soc. de Bot. Fr.*, 1886, page 40; Irmisch, *Bot. Zeit.*, 1857, page 48, with pl.—The interpretation appears to be that in roots the pericycle is the most active layer, and such buds as arise from roots are developed exactly as lateral roots are from this generative tissue. On the other hand, in stems the pericycle is more often in abeyance, while it is from the cambium from which ordinary buds and adventitious roots arise.

*Translucent Apple*.—Professor M. Ward reported upon the specimen sent to the last meeting as follows:—"The Apple sent for my inspection was affected with a disease known as 'Glassiness,' and was totally free from fungi in the interior. The parts affected by this disease are distinguished by the cells being very full of sugar and singularly poor in acids. The intercellular spaces are filled with water, whereas in the healthy parts they contain air. This season, a wet one, has been somewhat prolific in such Apples. A condition not unlike this is produced by frost, and by any changes which cause the intercellular spaces to fill with water."

*Chrysanthemum "Hen and Chicken" Form*.—Mr. Gooding of the Manor House, Hayes, sent a remarkable specimen of a yellow variety with a large circle of small heads springing from the base of the central one. The latter was arrested in its growth, and dead. The florets had a tendency to be pedicellate, especially the outer ones. It is difficult to assign a cause, but possibly it received a check through frost, as no trace of insect attacks was discoverable.

*Lycaste Skinneri, Monstrous*.—Dr. Martin exhibited drawings of this plant received from Mr. Linden of Brussels, in which the flowers were aborted and replaced by petaloid bracts.

*Leucadendron argenteum*.—He also showed drawings of germinating plants of the Silver Tree of Africa, which showed a curious cavity at the base of cotyledons concircling the plumule.

## TREE MOVING AT CANFORD MANOR.

A DISCUSSION upon tree moving, initiated by "D." in the pages of the *Journal of Horticulture*, has proved interesting and instructive to numerous readers, and although it is not my intention to take any part in this, I may be able to communicate a few facts having an important bearing upon the subject. It has been my good fortune to meet with many instances of what can be done in the way of moving large trees, and have known cases where eight men and as many horses have been a whole week in shifting single specimens about ten miles. That such proceedings are very costly must be admitted, but there is no gainsaying the remarkable effect they create, a few transplanted trees doing more to relieve the nakedness of new places, or to shut out unsightly objects, than can be accomplished in twenty years by other means. Naturally very much depends upon circumstances. Unless the work is done thoroughly, no reasonable expense or labour being spared, it is better left alone. Badly moved, the trees either perish or remain in a stunted state for many years, and in this case quite young trees planted at the same time would, and very frequently do, surpass them in every way in the course of a few years.

So much for my own views on the matter, and now for what my readers were led to expect from the heading of this article. Learning that tree moving on a large scale was being carried out by Mr. T. H. Crasp at Canford Manor, I made it my business to pay him a visit, and to take particular note of the methods of procedure

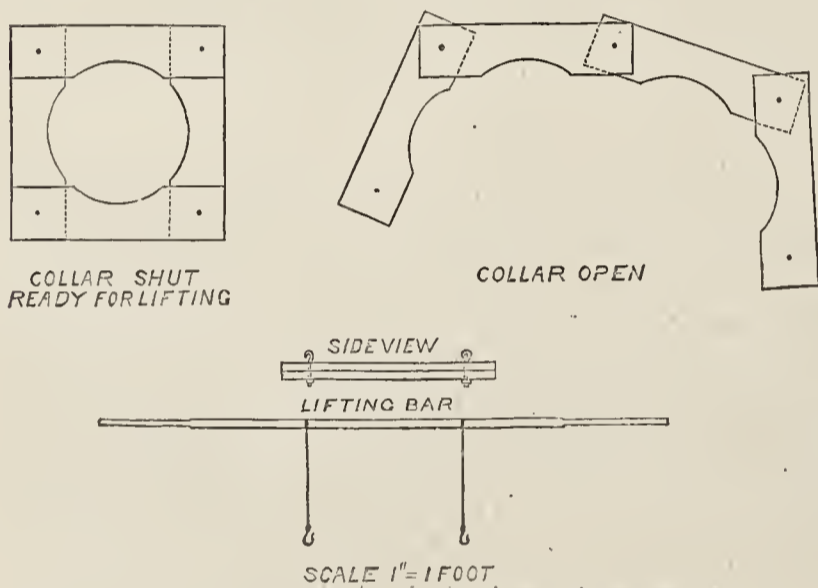

FIG. 60.—DIAGRAMS OF CRASP'S TREE-LIFTING COLLAR.

adopted. As has been previously stated in these pages, there are 50 acres of pleasure grounds at Canford, and to these are now being added 15 acres more. This entailed the removal of some old buildings, and the blotting out of more, and seeing that there are many thousands of shrubs, Conifers, and deciduous trees on the place so crowded together as to spoil each other, it was decided to at once create the desired effect with some of these. Mr. Crasp being a firm believer in doing such important work as early in the planting season as possible, commenced operations in September, several trees having been moved and much other good work done by the end of the month. Various deciduous trees, notably Horse Chestnuts and Limes, were moved when in full leaf and quite green, and when I saw them they were as fresh in appearance as they could be, and doubtless would form many fresh root fibres before the cold weather. Moving these, however, was child's play compared with what had to be done in the case of transplanting a grand specimen of *Thuja Lobbi* or *gigantea* a distance of about two miles. This fine tree, of which a sketch has been submitted to the Editor, is 50 feet high and 28 feet through near the ground, and knowing how well the work was done, and the subsequent attention bestowed upon the tree, I have no doubt whatever about the success of the operation.

Among other trees to be moved or already shifted are handsome specimens of *Picea nobilis* from 20 feet to 30 feet in height, *Picea cephalonica* of about the same height, *Taxodium sempervirens* somewhat larger, *Picea Pinsapo* also good specimens, handsome trees of *Cupressus elegans*, and some of the finest *Retinosporas* and *Thujaopsis dolabrata* I have yet seen. In addition several hundred smaller specimen Conifers and various large shrubs are to be, or have already been moved, and in all probability this kind of work, for reasons already given, will have to be continued several seasons.

At Canford the subsoil is of a very gravelly nature, the top

spits being also full of pebbles. It is not, therefore, the worst of soils to deal with, nor is it the best, looseness and dryness having both to be contended with. Not a tree has been previously prepared in any way for moving, but in spite of this the necessary large balls of soil are well preserved about the roots. These masses of soil vary in weight from 5 cwt. to as many tons in weight, and it was estimated that fully 6 tons of earth was moved with the *Thuja Lobbi* already alluded to. In each case the methods adopted are much the same, the size of balls and apparatus for moving them necessarily varying. If, therefore, I describe the operation of shifting the handsome *Picea nobilis*, of which a photograph was taken when on the trolley, and a copy of which has been sent with these notes, this will suffice.

The first proceeding was to dig a wide, square, and deep trench so as to leave a ball rather more than 8 feet square, nearly the whole of which was preserved intact to a depth of 30 inches. Being well below the latter depth, the next step was to undermine the centre with crowbars sufficiently to admit of a stout plank 8 feet in length being thrust under, and this was duly blocked up lightly with the aid of piers formed with loose bricks. Four feet away from this on each side two other planks were similarly worked underneath the ball, and these being propped up with brick piers supported the edge of the ball when this was reduced to the desired width. The tree was then gradually undermined both ways, and planks added and bricked up as the work went on, these eventually supporting the whole weight of the tree, when the remaining subsoil was picked out. Good care being taken to build these brick piers on a solid foundation, and all of one height, or about 2 feet, the tree settled down on this without a hitch of any kind. While all this was being done by handy labourers, others were preparing a way out for the tree, an easy slope being needed.

Everything being thus well done, it was a comparatively easy matter to run a low strong trolley well under and close up to planks, the trolley being extra strong, capable of bearing 8 tons or more in weight, and constructed much after the pattern of the flat four-wheeled trolleys used for carrying luggage at railway stations. The bricks being knocked away the planks settle on the trolley, and the tree is ready for removal. Planks were laid for the trolley wheels to run smoothly over, but even with this aid it is not considered advisable to employ horses for drawing such heavy trees out, snatching and straining being bad for both the tackle and the trees. Instead of horses a strong "crab," or portable windlass, is used, and with this powerful aid the trolley is drawn out steadily and easily, scotches, however, being handy for stopping running back in case of either the ropes or chains snapping, as they sometimes do under the strain. Being once on the hard road planks were dispensed with, and four powerful horses managed to draw the tree to its destination.

Once more both planks and "crab" were brought into requisition. Being drawn with the aid of the latter into the exact position in which it was to remain, brick piers were once more formed under all the planks, and these supported the tree after the trolley was undermined and then drawn out. Fresh good soil was then banked well up to the central plank, which was removed, and more soil very firmly pressed under so as to be well up to the old ball. This process was continued from the centre till all the planks were knocked away, and the tree was once more resting on the ground. Four days altogether were expended on the transplanting of this tree at a cost probably of less than £6, including horse labour.

For moving smaller trees, or any that two or four men can lift when duly prepared, Mr. Crasp has a handy invention of his own, and which is well worthy of being generally used. It consists of four elm boards each 3 feet long, 9 inches wide, and 1½ inch in thickness, all being hollowed out somewhat so as to form a circular hole in the centre when put together, without, however, impairing the strength of the boards. They are bolted together, a loop end being formed on the upper side of each bolt, and either being removed, the collar can be placed round the ball of a tree and again connected. First, however, a square trench is cut round the tree, so as to leave a ball 3 feet each way, the latter being then undermined sufficiently to admit of the collar being placed in position and connected. Each corner of this is then blocked up with bricks, and these, when the tree is undermined, support the collar and the tree. Occasionally a strong two-wheeled stone trolley with long powerful handle is run under the tree, and, the bricks being taken away, all is ready for removal. More often, though, strong cord loops are placed to each iron crook at the corners, and strong poles being passed through these two or four men lift the tree out of the hole and on to the trolley. The fresh site being duly prepared, four brick piers are again formed, the tree is lifted off the trolley on to these, soil being then firmly packed

under the centre and well up to the sides, after which the collar is disconnected at one corner, the piers removed, and the tree is resting on the ground as before.

It will be seen, that is if I have succeeded in plainly describing each of the processes, that there is no heeling over nor sliding. At no period is any portion of them called upon to bear its own weight, and altogether the soil must be very loose indeed or the opposite, and therefore given to break away in masses, if anything

syringing is frequently resorted to. Special manures will also be washed in, and during the next season abundance of water will be supplied to all requiring it. Instead, therefore, of a severe check being administered the probability is most of the trees will grow away more strongly than previously, and in any case will not lose any limbs.

Last February a pruned specimen Portugal Laurel, not less than 16 feet through, and known to have been undisturbed for a

FIG. 61.—TREE LIFTING AT CANFORD MANOR—*PICEA NOBILIS*, HEIGHT 40 FEET.

approaching failure occurs. At Canford most of the trees are moved from much impoverished ground, comparatively large and deep balls of soil and roots are preserved, and these are made perfectly flat and of the same squareness as the boards or collars. They are conveyed to ground well prepared and much richer than that from which they are taken, are planted rather high to allow for settlement and to give the roots the benefit of the best of the surface soil, and are placed on and surrounded by good soil. Nor is this considered all that is necessary. They all receive a thorough soaking of water at the roots, pointed iron rods being thrust through the balls the better to accomplish this, and overhead

period of not less than 100 years, was successfully moved by Mr. Crasp. The principal portion of the roots were in a solid pathway, and the tree was moved from where it was much in the way to a prominent yet by no means a favourable position among forest trees. Without much further attention it has already improved in health and appearance, and such will prove the case with other choicer trees being moved now. These extensive tree movings and alterations were largely instigated by Lady Wimborne, who takes a keen and intelligent interest in all that is done, and what is also worthy of note it will provide regular work to many men who would otherwise be unemployed.—I. M. H.

## CHRYSANTHEMUM SHOWS.

WESTON-SUPER-MARE.—NOVEMBER 11TH.

THE sixth Exhibition of this Society, held in the Victoria Hall, was in nearly every department distinctly ahead of any of its predecessors, and proved to be in every respect an unqualified success. At few shows will better trained plants have been shown, and these certainly have scarcely been equalled in the south-western district. Cut flowers were also good and numerous, and various other classes were well filled. The arrangements generally were most satisfactory, and creditable alike to the Honorary Secretaries, Messrs. W. H. Vanes and S. Lewis, and the hard-working Committee, of which Mr. F. Farington is the Chairman. In the class for six trained specimens of large flowering Chrysanthemums Messrs. W. Brooks & Son were well first, having perfect examples of Mrs. J. Rundle, Mrs. Forsyth, Prince Alfred, Gloria Mundi, Guernsey Nugget, and Venus. Mr. C. Holland, gardener to W. Ash, Esq., was a good second, and Mr. W. Brown, gardener to the Rev. W. A. Aldridge, third. With four specimens, Mr. W. Daffurn, gardener to Donald Cox, Esq., was first and Mr. N. Lambert second. Equally fine were the trained specimens of Japanese varieties. Mr. Holland was first for six plants, these consisting of Bouquet Fait, Fair Maid of Guernsey, Source d'Or, Margot, Hiver Fleuri, and Bertier Rendatler, Mr. W. Brooks was a close second, and the foregoing exhibitors were the principal prize-winners in several other classes for Chrysanthemums. The best group was arranged by Mr. A. Whitehead, gardener to R. W. Gibbs, Esq., this being much superior to those arranged by four other competitors. Mr. Daffurn was first for a group of miscellaneous plants, being closely followed by Mr. Brooks, a third prize going to Mr. W. P. Emerton.

There were five competitors in the class for twenty-four blooms of incurved varieties, not less than eighteen to be distinct; but Mr. Wilkinson, gardener to C. C. Tudway, Esq., Wells, was easily first with massive and fairly fresh blooms. The back row consisted of Lord Alcester, Empress of India (two), Golden Empress (two), Bronze Queen of England, Lord Alcester, and Golden Queen of England. Middle row: Prince Alfred, Jeanne d'Arc (two), Violet Tomlin (two), Miss Haggas (two), and Hero of Stoke Newington. Front row: Princess Beatrice, Jardin des Plantes, Lord Eversley, Mr. N. Davis, Princess of Wales, Mrs. Heale, Lady Hardinge, and Barbara. Mr. W. Carpenter, gardener to A. Cole, Esq., Clifton, was second; and Mr. J. Tucker, gardener to Major Clarke, Trowbridge, third. The competition with twelve varieties was close. Mr. W. Daffurn was first, Golden Empress and Miss Haggas being his best; and was closely followed by Mr. W. Strugnell, gardener to A. R. Baily, Esq., Frome. Mr. R. Phillips, gardener to John Baily, Esq., Frome, was well first for six blooms; and Miss Charrington second. Japanese varieties made quite an imposing display, each class being very well filled. The best twenty-four varieties, distinct, were shown by Mr. T. Wilkinson, who had grand blooms throughout. The back row consisted of Mons. Bernard, Meg Merrilies, Etoile de Lyon, Sunflower, Avalanche, Baronne de Prailly, E. Molyneux, and Mr. Brocklebank. Second row: Gloriosum, Carew Underwood, Volunteer, Mrs. F. Jamieson, Mrs. Wheeler, Fair Maid of Guernsey, Golden Dragon, and Marguerite Marrouch. Front row: J. Delaux, Florence Percy, Madame Baco, Val d'Andorre, Madame Laing, Holborn Beauty, Lady Lawrence, and Sarah Owen. Mr. Carpenter was again second, and Mr. Tucker third.

There were several excellent stands of twelve varieties, and in this instance Mr. W. Strugnell was well first, having fine fresh blooms of Stanstead White, E. Molyneux, R. Brocklebank, Sarah Owen, Condor, Beauty of Castlewood, G. Daniels, Avalanche, Duchess of Albany, Mrs. J. Wright, and Val d'Andorre. Mr. C. Holland was a good second. Mr. Phillips was first for six varieties and Miss Charrington second. Mr. T. Wilkinson took the first prize for twelve blooms of Anemone flowered varieties, and was closely followed by Mr. Tucker, the last named taking the lead in the class for reflexed varieties, Mr. W. Brooks being second. Mr. Brooks was the principal prizewinner with vases, bouquets, and baskets of flowers, foliage and fruit, his exhibits in each instance being considerably above the average. There was a fairly good display of fruit, Apples being especially well shown.

BRIGHTON AND HOVE.—NOVEMBER 11TH AND 12TH.

THIS annual Exhibition was held, as in former years, in the Dome and Corn Exchange, near to the Royal Pavilion. Plants.—For years past groups have been remarkably well done at these Shows, being in their arrangement so distinct from what is generally seen in the neighbourhood of London. The banking up in an uniform and formal manner so often seen does not here meet with any favour. In most instances the arrangement is broken up by grouping colours, or by utilising well-grown plants surrounded by smaller ones. Thus, each has its distinctive features without any formality. The finish, too, of the groups is brought about by using dwarf plants of Pompons, and in most cases all of the outer pots within view are covered with moss. On this occasion three classes were provided for groups. The cup class for a group not to exceed 100 square feet was won by Mr. John Miles, Bristol Nursery, Kemp Town. Good selections of colours and extra fine blooms were here the chief points. Mr. George House, gardener to F. Mowatt, Esq., Withdean, a good second. In the next or smaller group, Mr. Fairs, gardener to R. Clowes, Esq., Hassocks, was first; and Mr. Collis, gardener to J. Barnes, Esq., Brighton, second. In the third, for a group of twelve plants, each one to stand upon the ground with a groundwork of Fern or other material, with one stake only to each plant, Mr. Spottiswood, gardener to Mr. Duddell, Queen's Park, was an

excellent first; and Mr. Geo. Miles, Victoria Nursery, Brighton, a good second. This was a pleasing style of grouping. With four plants in 8-inch pots, dwarf grown, Mr. Scutt was first with good examples of the style.

For four standards (always a very strong class at this Show) Mr. Hill was awarded first to four plants that would be hard to surpass, all being in good condition. Mr. Scutt was second in this class; a plant of Roseum superbum was exceedingly fine. With four pyramids, likewise a feature here, Mr. Meachen was first, staging good plants; Mr. Hill in this case being second, but again to the front with a well-done specimen of pyramid form. For four dwarfs, well-grown medium-sized plants, Mr. Scutt, gardener to Mr. Jenkins, Burgess Hill, was first, taking also the bronze Centenary medal, N.C.S., for the best-grown plant of all forms. Mr. Jas. Hill, gardener to M. Wallis, Esq., Withdean, second. A class for twelve plants in 6-inch pots always fills well. Mr. John Mills took the first with excellent plants, carrying good blooms. With six Pompons Mr. Scutt was easily first with plants not formally trained, but well bloomed and in good condition, Mr. Jas. Hill coming second with smaller plants.

*Cut Blooms.*—The challenge cup class for forty eight, twenty-four incurved and twenty-four Japanese, produced a moderate competition, Mr. F. H. Flight, Cornstiles, Winchester, winning with exceedingly fine blooms both of Japanese and incurved, the best flowers, Princess of Wales, Violet Tomlin, Golden Empress, Mrs. Heale, Jeanne d'Arc, Mr. Brunlees, Nil Desperandum, Mrs. Shipman, and Princess Teck amongst incurveds, and Edwin Molyneux, Etoile de Lyon, Japonais, Album Fimbriatum, and Sunflower amongst the Japanese. For twenty-four incurved only Mr. Philips, gardener to Dr. Baber of Meopham, Kent, was first, staging very good blooms—Miss M. A. Haggas, Lady Dorothy, and Barbara were amongst his best flowers. For twenty-four Japanese Mr. Glen, gardener to Mrs. Montefiore, Worth Park, Crawley, was a superb first—Stanstead White, Condor, Comte de Germiny, Etoile de Lyon being extra fine. With twelve incurved Mr. Jupp, gardener to G. Boulton, Esq., Eastbourne, was first with neat blooms of Bronze Queen, and others of the same family, and in the corresponding class for Japanese Mr. Hodges, gardener to S. C. Gibbons, Esq., Great Walstead, Lindfield, was first in a very strong competition of seven good stands. Six Anemone flowered brought Mr. Philips again to the front with fine flowers of Nelson, Mrs. Pethers, Dame Blanche, and others. Six incurved, one variety, Mr. Jupp was first with fine flowers of Miss Haggas, and Mr. Glen second with Queen of England. Six Japanese, one variety, was an extra strong class, Mr. Glen winning with extra fine blooms of Stanstead White, taking also the certificate of the N.C.S. for this exhibit. Mr. Hopkins, gardener to the High Sheriff of Sussex, was a good second with extra blooms of Thunberg.

*Fruit.*—Grapes were shown in good numbers. With blacks Mr. Philips was first amongst twelve entries with Gros Colman, and Mr. Hodges, gardener to S. Gibbons, Esq., Lindfield, second. For whites Mr. Glen was very strong with Muscat of Alexandria, fine in colour; Mr. Kemp, Coolhurst, Horsham, second. Dessert Pears were present in good numbers. Mr. Glen was first with Doyenné du Comice and others, Mr. Howell, gardener to H. Young, Esq., Withdeane, second, and Mr. Spottiswood a good third. Stewing Pears were represented by Catillac from Mr. Bunney, being extra fine samples, Mr. Fowler coming second with Uvedale's St. Germain. Apples of superior quality, both culinary and dessert, were staged. For the former Mr. Goldsmith, gardener to Sir E. G. Loder, Bart, Horsham, was first, showing extra fine fruits of Warner's King and others, Mr. Philips being second. For the latter Mr. Goldsmith was also first. Blenheim Pippin, Cox's Pippin, and Ribston Pippin were here finely coloured. Mr. Glen second. Four classes were provided for collections of vegetables. Messrs. Sutton's prizes were contested by seven exhibitors. Mr. Manton, gardener to Mrs. Clifford Brown, Bolney, took first, Mr. Philips second, and Mr. Bunney third. There were many other excellent classes to which we cannot refer in detail.

A word of commendation is due to the energetic Secretary, Mr. Mark Longhurst, who, with Mr. Rupert Miller and the hard working Committee, have been the means of rendering this now well known Society so successful.

LEEDS PAXTON SOCIETY.—NOVEMBER 11TH AND 12TH.

THE second annual Chrysanthemum Show promoted by the above Society was held on the above dates in the Leeds Town Hall, and was formally opened to the public at 1.30 P.M. on the 11th by the newly elected Mayor of Leeds, Mr. Alfred Cooke, supported by a considerable gathering of the most influential ladies and gentlemen of the town and district. The general appearance of the spacious hall was very fine. Down the centre were arranged three large groups of miscellaneous plants for effect; against the wall all round, except at the side occupied by the orchestra and platform, groups of Chrysanthemums and specimen plants were arranged, the quality of both these being far in advance of the exhibits in the same classes at last year's show. The orchestra was effectively furnished by a grand bank, Tree Ferns, Palms, and evergreen shrubs. A broad table across the front on the floor of the hall being attractively and effectively occupied with a fine collection of flowers made up as wreaths, crosses, bouquets, epergnes, &c., for competition and otherwise. Across the further end of the hall from the orchestra were arranged the tables for cut flowers, whilst up the sides were tables of fruit, vegetables, and table plants. An ante-room opening out of the lower end of the large hall was devoted to a class for dessert tables, each 8 feet by 4 feet, completely laid for six persons,

which brought three competitors, and proved, to the ladies at least, a most attractive portion of the Show.

**Cut Blooms.**—The principal class was one for thirty-six blooms, "not less than sixteen incurved and sixteen Japanese, distinct varieties." first prize a silver challenge cup, value 15 guineas and £9 cash. Second prize £6. Third £3. Fourth 30s. These prizes drew seven competitors, the first prize being awarded to Mr. Carlton, gardener to Mrs. Cope, Woolton, Liverpool, whose stands contained neat, medium sized, well finished incurved and large highly coloured Japanese. The varieties were as follows. Incurved: Back row—Empress of India, Golden Empress, Violet Tomlin, Lord Alcester, Emily Dale, Lord Alcester. Middle row—Miss Haggas (very fine), Princess of Wales, Queen of England, John Salter, Miss Haggas, and Prince Alfred. Front row—Mrs. Coleman (extra fine), Princess Teck, Hero of Stoke Newington, Mrs. Heale, Lady Hardinge, and Mr. Bunn. Japanese: Back row—Etoile de Lyon, Condor (fine), Ralph Brocklebank, E. Molyneux (very good), Madame C. Audiguier, and Etoile de Lyon. Middle row—Mons. Bernard, Val d'Andorre, Sarah Owen, Marguerite Marrouch, Criterion and Avalanche. Front row—Sunflower, Sarah Owen, Puritan, Mrs. F. Jameson, Stanstead White and Sunflower. The second prize in this class went to Mr. P. Leadbetter, gardener to Mr. A. Wilson, Tranby Croft, Hull. Third, Mr. Folkard, gardener to Sir J. R. Walker, Bart., Sand Hutton, York. Fourth, Mr. Bell, gardener to Mrs. Rowdell, Skipton.

For twelve incurved, distinct, open, Mr. Falkard was placed first, his varieties being Empress of India, Queen of England, Prince Alfred, Lord Alcester, Golden Queen, Lord Wolseley, Golden Empress, Alfred Salter, Princess of Wales, Violet Tomlin, and John Salter. Second, Messrs. Clark & Sons, Rodley. Third, W. Jackson. For twelve Japanese, distinct, open, first Mr. Jeal, gardener to Mr. W. J. Cheetham, showing Condor, G. H. Elliott, Belle Paule, Madame C. Audiguier, La Triomphante, Marsa, Charlie Sharman, Madame Baco, Mrs. J. Wright, Jeanne Délaux, Meg Merrilies, and Marguerite Marrouch. Second, Mr. J. H. Wood. Third, Mr. Pearson, gardener to Mr. W. Jackson. In a class for twelve Chrysanthemums, three incurved, three Japanese, three reflexed, and three large Anemones, Mr. W. Grix, gardener to Sir James Kitson, Bart., Gledhow Hall, Leeds, was first.

In the district class, limited to gentlemen's gardeners and amateurs residing within seven miles of the Town Hall, Mr. T. Newbould, Cragg Road Gardens, Rawdon, was placed first for twenty-four blooms (twelve incurved and twelve Japanese), winning a silver challenge cup, value ten guineas, and 100s. cash, his varieties being incurved, back row: Lord Alcester, Queen of England, Alfred Salter, and Empress of India. Middle row: Lord Wolseley, Miss Haggas, Princess of Wales, John Salter. Front row: Mrs. Heale, Golden Empress, Violet Tomlin, Jardin des Plantes. Japanese, back row: Etoile de Lyon, M. Bernard, Sunflower, and Condor. Middle row: George Daniels, Stanstead White, Madame Baco, and Madame Audiguier. Front row: E. Molyneux, Ralph Brocklebank, Belle Paule, and M. H. Elliott. Second Mr. J. Eastwood, gardener to Mrs. Tetley, Weetwood, Leeds. Third Mr. W. Grix. In other classes the most successful competitors were Mr. John Gordon, gardener to Mr. Bottomley; Mr. Newbould, Mr. Grix, and Mr. John Gordon.

Specimen plants were shown of very high quality, greatly in advance of those shown last year, Mr. J. Eastwood, gardener to Mrs. Tetley, taking the first prizes throughout the classes. The groups also were much better than last year, especially the Chrysanthemum groups. Mr. Teal won first honours for these, Mr. Eastwood taking second prize, Mr. Moore, gardener to Mr. Bowring, Allerton Hall, being placed third. For the miscellaneous groups Mr. Frankland, gardener to J. Barran, Esq., M.P., Chapel Allerton Hall, was first; Mr. Townsend, gardener to Mr. E. B. Faber, Stray Lee, Harrogate, second; Mr. J. Smiley, Monk Fryston, South Milford, third.

The prizes offered for the best arranged dessert table were won as follows:—First, Mrs. West, The Grange, Moortown; second, Mr. Ombler, The Green Dragon Hotel; third, Mr. G. Cooper, gardener to E. W. Beckett, Esq., M.P. Grapes were shown in excellent condition by Mr. Eastwood and Mr. Grix, the latter taking the first prizes in several classes. The same exhibitor being the successful winner of a prize offered for groups of natural flowers in vase or stand, his exhibit being a skilfully arranged large basket of flowers.

Bouquets were numerous shown and mostly good. Especially admired was a spray bouquet of new design, to be carried suspended in front of the wearer, exhibited, not for competition, by Messrs. Shaw Bros. of Knostrop, who had also a very fine exhibit of bouquets in variety and a handsome memorial cross. Table plants and vegetables were numerous and good, but space prevents further particularising in their case. The Show during the first day appeared to be quite a success from all points of view, and was well attended. Much credit is due to the energetic and hard-working Committee, and especially to Mr. W. Grix (President), and to Mr. J. Smith (Secretary) for having brought this Show in such a very short period of time to rank as one of the best amongst provincial Chrysanthemum Shows.

#### WATFORD.—NOVEMBER 11TH AND 12TH.

THE fifth Exhibition of the Watford Chrysanthemum Society was held in the Agricultural Hall of that town. The building is well adapted for the purpose, but with the increase of exhibits and growth of the Society, is now scarcely large enough to accommodate all comfortably. The Exhibition itself was the best yet brought together by the Society, the cut blooms, groups, and other exhibits being of the

highest excellence. Several contributions not for competition also added much to the attractiveness of the Show, especially the large central group put up by Mr. Myers, gardener to the Earl of Clarendon, President of the Society. This consisted of tall Palms and foliage plants, with Chrysanthemums carrying grand flowers, freely intermixed, and finished off with Bouvardias and Ferns, altogether forming a splendid group, which attracted much attention from visitors.

In class 2 (open) for the best group of Chrysanthemums (in which the bronze Certenary medal of the N.C.S. was added to the first prize), Mr. Ashdown, gardener to C. R. Humbert, Esq., Watford, was first with a very nice lot of dwarf plants with good blooms, the colours well balanced, and consisting of a fair proportion of Japanese and incurved varieties. Mr. Higgins, gardener to A. G. Lucas, Esq., Ashlyns, Berkhamstead, was a good second, having in the centre of his group a fine flower of Mrs. A. Hardy. Third, Mr. Davis, gardener to E. A. Woolley, Esq., Abbots Langley. Several other classes were devoted to groups of Chrysanthemums open to members of the Society, fourteen other collections being put up, and not a bad one among them. Groups of miscellaneous plants were also well done, the first prize going to Mr. Beckett, and the second to Mr. Neve, gardener to C. Van Raalte, Esq., Aldenham Abbey.

**Cut Blooms.**—These were staged in large numbers, the quality throughout being good and the competition keen, especially in the Japanese classes. Mr. Beckett, gardener to H. H. Gibbs, Esq., Aldenham House, Elstree, well upheld the leading position he has taken in the past, although a decided improvement is noticeable with other exhibitors both in the size and quality of their flowers. In class 3, for twenty-four incurved varieties, distinct, Mr. Beckett was a long way ahead of other competitors, having large solid flowers of Empress of India, John Doughty, Lord Alcester, Prince Alfred, Golden Empress, Alfred Salter, John Salter, Queen of England, Mrs. Coleman, good; Miss Haggas, Mrs. Heale, Mrs. Shipman, Lord Wolseley, Golden Queen, Violet Tomlin, Nil Desperandum, Lady Hardinge, Mr. Brunlees, Re-fulgence, Mr. Bunn, Princess of Wales, Lady Dorothy, Beauty, and Barbara. Second, Mr. Malcolm, gardener to J. Tomlinson, Esq., Tarporley, Cheshire. Third, Mr. Brown, gardener to R. Henty, Esq., Abbots Langley.

For the same number of Japanese, distinct, Mr. Beckett was again first among seven competitors, having very superior blooms. They were—Back row: Stanstead White (very fine), W. H. Lincoln (beautiful yellow), W. G. Drover, E. Molyneux, Boule d'Or, G. Daniels, Marguerite Marrouch, Etoile de Lyon. Middle row: Northern Light, Mrs. F. Jameson, Baron de Prailly, Holborn Beauty, M. Baco, M. Bernard, Marsa, Sarah Owen. Front row: Fimbriatum, Beauty of Castlewood, Sunflower, Avalanche, Val d'Andorre, Ralph Brocklebank, Mrs. E. W. Clark, and Volunteer; a very good stand. Mr. Dinsmore, gardener to T. F. Blackwell, Esq., The Cedars, Harrow Weald, was second. Mr. Malcolm third; an extra third also being awarded to Mr. Sturman, an enthusiastic Watford amateur grower, who had a very bright stand of flowers. For twelve incurved Mr. Vincent, gardener to W. B. Davies, Esq., was first; Mr. T. Lansley, Watford, second; Mr. Dinsmore third; and for twelve Japanese, first Mr. Folkes, gardener to T. F. Halsey, Esq., Gaddesden Piae; second, Mr. Lansley; third, Mr. Mundell, gardener to Lord Ebury, Moor Park, Rickmansworth. The competition was strong in the six of one variety classes, very fine flowers being staged. Six white Japanese.—First, Mr. Beckett with grand blooms of Stanstead White; second, Mr. Mundell with Avalanche; third, Mr. Malcolm with the same variety. With six of any other colour Mr. Beckett was again first with splendid flowers of E. Molyneux; second, Mr. Davis, gardener to W. Schrieber, Esq., Dalton House, Watford, with Etoile de Lyon; third Mr. Layzell, gardener to the Rev. K. F. Gibbs, Aldenham, with Sun flower.

A class was also provided for twelve Japanese staged with not less than 8 inches of stem, the prizes given by Messrs. Wood & Son, and here Mr. Beckett was again first, followed by Mr. Tidy, Stanmore Hall. In division 2, open to members only, Mr. Beckett was a good first with blooms very similar to those already mentioned, and for the same number of Japanese he was again invincible, having excellent flowers; Mr. Dinsmore being again second. For twelve Japanese in this division Mr. Mundell was first, having some fine flowers. With Anemone and Pompon varieties Messrs. Beckett and Brown were the chief prize-takers, and many other classes were provided for amateurs and cottagers, each exhibiting strongly. The cut flowers throughout the Show were well set up, the majority using the Beckett cup and tube. Miscellaneous groups were contributed by several local nursery and seedsmen, also Mr. Smith, gardener to Jones Lloyd, Esq., Langleybury. There was a large display of fruit and vegetables, the principal prize-winners being Messrs. Beckett, Brown, and Cox. The Show was admirably arranged, and much credit is due to the Hon. Sec., Mr. Humbert, and his Committee, and we are pleased to learn it was a great success financially.

#### BIRMINGHAM.—NOVEMBER 12TH AND 13TH.

THE Town Hall was the site selected for the thirteenth annual Exhibition of Chrysanthemums, fruit, &c., and the one under notice was the best of all both in extent and general quality of the exhibits. The arrangements were, as usual, perfect, the staging being completed in good time, reflecting great credit on all concerned. Mr. Lathom, Chairman of Committee; Mr. Jones, the Treasurer; and the Secretary, Mr. Hughes, laboured hard to make this Exhibition what it was—a great success.

Cut blooms form, perhaps, the most important part of the Exhibi-

tion, the greatest interest being centred in them by growers and the public alike. The principal class was that for forty-eight distinct varieties, half to be incurved and the remainder Japanese, and it may be stated that no less than eighteen competed for the handsome prizes of £20, £15, £10, £5, £3, £2. Mr. J. Lambert, gardener to Colonel Wingfield, Onslow Hall, Shrewsbury, was distinctly ahead, the incurved being very fresh, of large size, and well staged. The varieties were—Back row: Golden Empress, Alfred Salter, Mrs. Heale, Queen of England, Lord Alcester, Golden Queen of England, Princess of Wales, Empress of India. Middle row: Cherub, Lady Dorothy, Jeanne d'Arc, Prince Alfred, Hero of Stoke Newington, Mrs. Coleman, Violet Tomlin, Miss M. A. Haggas. Front row: Barbara, Lady Hardinge, Charles Gibson, Lord Wolseley, Refulgence, Mabel Ward, Princess Teck, Mr. Brunlees. The Japanese were large, heavy, and especially fresh. Back row: Mrs. Falconer Jameson, Sunflower, Avalanche, Etoile de Lyon, E. Molyneux, Madame B. Pigny, Bou'e d'Or, Belle Paule. Middle row: Madame J. Laing, Meg Merrilies, Sarah Owen, Jeanne Délaux, Eynsford White, Madame C. Audiguier, Thomas Stephenson, George Daniels. Front row: Golden Dragon, W. W. Coles, Mrs. C. Wheeler, Ralph Brocklebank, Criterion, Val d'Andorre, Mdle. Lacroix, Madame Baco. Mr. P. Blair, gardener to the Duke of Sutherland, Trentham, was second with heavy and fresh Japanese, smaller incurved, the most notable among the former being Sunflower, Mrs. Falconer Jameson, Etoile de Lyon, Stanstead White, Puritan, Holborn Beauty, W. W. Coles, and Gloriosum. Mr. J. Gould, gardener to P. N. Dale, Esq., Bromborough Hall, Cheshire, was a close third with neat incurved blooms, the Japanese being lighter. Mr. A. H. Cox, gardener to W. H. Watts, Esq., Elm Hall, Wavertree, Liverpool, fourth.

For twenty-four distinct varieties, half to be incurved and the remainder Japanese, there was a strong competition, Mr. J. Gould winning the first prize of £4 with even, large, and fresh blooms. Incurved: Golden Queen of England, Empress of India, Alfred Salter, Queen of England, Lord Alcester, Lord Wolseley, Golden Empress, Jeanne d'Arc, Mrs. Heale, Princess of Wales, Violet Tomlin, Miss M. A. Haggas. Japanese: Etoile de Lyon, Avalanche, Mrs. Falconer Jameson, Stanstead White, Boule d'Or, E. Molyneux, Condor, Mrs. C. Wheeler, Mons. Bernard, Criterion, Jeanne Délaux, Sunflower. Mr. Cox was an exceedingly close second, Japanese very large, especially Sunflower, Avalanche, and Belle Paule. The incurved were a little stale in one or two instances, Violet Tomlin and Mrs. Coleman being very fine. Mr. S. Bremmell, gardener to H. H. France, Esq., Hayhurst, Overley, Wellington, Salop, was third. Eleven competed.

For eighteen incurved, distinct, three entered, the best coming from Mr. J. Austin, gardener to the Earl of Dudley, Witley Court, Stourbridge, of good quality in every respect, comprising Jeanne d'Arc, Golden Empress, Queen of England, Golden Queen of England, Empress of India, Lord Alcester, Miss M. A. Haggas, Prince Alfred, Mrs. Heale, Violet Tomlin, Mrs. Coleman, Princess of Wales, Princess Beatrice, Lord Eversley, Hero of Stoke Newington, Cherub. Mr. A. Haggart, gardener to Mrs. J. Foster, Moor Park, Ludlow, was second with smaller but neat blooms. Third, Mr. J. Gould, larger but coarser. For twelve Japanese, distinct, nine competed. Mr. A. Coombes, gardener to Earl Dudley, Himley Hall, Dudley, was a good first, with large blooms very fresh, Mons. Bernard, Stanstead White, Japonais, E. Molyneux, Thunberg, Etoile de Lyon, Avalanche, Sunflower, Madame J. Laing, M. A. Deleau, Gloriosum, Madame Baco. Second, Mr. Cox, very close. Third, Mr. W. Comfort, gardener to G. A. Everett, Esq., Knowle Hall, Knowle. There was a strong competition in the class for twelve Anemone varieties, not less than six kinds, some excellent stands being staged among twelve competitors, Mr. J. Justice, gardener to C. S. Howitt, Esq., Norton, Worcester, having splendidly developed blooms of Mdle. Cabrol. Jeanne Marty, Lady Margaret, Dame Blanche, Miss Annie Lowe, Ruche Toulousaine, Fleur de Marie, and Sabine. Mr. W. Comfort was an exceedingly close second, Mr. Cox third, also staging well. Four classes were provided for growers residing within four miles of Stephenson Place, for which there were numerous entries, the blooms being of capital quality. Space forbids of a detailed account being given.

Groups of Chrysanthemums received much encouragement from the Committee on this occasion, prizes of £10, £6, £4, £2 being offered for a group not exceeding 80 square feet, quality of bloom being the leading feature. Four competed. After much deliberation the Judges eventually awarded first honours to Mr. E. Cooper, gardener to the Rt. Hon. J. Chamberlain, Highbury, Birmingham, who had very fine blooms of both Japanese and incurved varieties, but a deficient front arrangement, which somewhat spoilt the effect of an otherwise excellent group. Mr. W. H. Dyer, gardener to Mrs. Marigold, Park House, Edgbaston, was a good second with very large incurved blooms, but somewhat past their best; this and a defective front line of plants much marred this group. Mr. C. Thomas, gardener to F. A. Walton, Esq., The Friary, Handsworth, was third with plants carrying smaller blooms, but much the best arrangement. For a group of Chrysanthemums arranged with Ferns and foliage plants for effect, in a space not exceeding 40 square feet, Mr. F. Andry, gardener to J. Breedon, Esq., Park Road, Moseley, was an easy first with an arrangement possessing both lightness and quality of flowers. Mr. W. A. Powell, gardener to G. H. Kendrick, Esq., Somerset Road, Edgbaston, was second. Third Mr. S. Gibbs, gardener to J. B. Mawley, Esq., The Oaklands, Harborne.

Specimen plants are always well staged at this Show, the present being no exception. For nine large flowered varieties, Japanese excluded, Mr. E. Cooper was first with plants 3 feet to 4 feet in diameter, well clothed with foliage, not too formally trained, each plant carrying

on an average fifty well developed blooms, Queen of England, Venus, Golden Empress, Barbara, and Baron Beust being the best. Mr. C. Brazier, gardener to Sir T. Martineau, West Hill, Edgbaston, second. Mr. F. Cooper, gardener to H. Showell, Esq., Park Vale, Edgbaston, third. For six large flowered varieties, Japanese excluded, Mr. E. Cooper first; second, Mr. C. Brazier, both showing well. Primulas, bouquets, and fruit also constituted special features.

#### NORTHAMPTON.—NOVEMBER 12TH AND 13TH.

THE nineteenth annual Exhibition of the Northampton Chrysanthemum Society, held on Wednesday last, was a very great success, the large hall of the Corn Exchange being well filled with the various exhibits, the specimen plants decorating the sides, the groups in front of the orchestra, and the cut blooms on three tables extending down the centre, the whole being a very effective display.

*Plants.*—Prizes were offered for trained and untrained specimen plants to gardeners, amateurs, and cottagers, the productions of the amateurs and cottagers, who are mostly engaged in the boot and shoe trade, for which the town of Northampton is famous, comparing very favourably with the professionals. The trained plants were only of moderate size, but very well finished, the first prize for six going to Mr. Gwillam, gardener to Mr. Sheppard, Billing Road, Northampton, the second to Mr. T. Manning. Mr. Gwillam was also first for four untrained incurved; Mr. Birch, gardener to the Marquis of Northampton, second; Mr. Alexander, gardener to Messrs. Westley and Sons, Blisworth, third. The first prize for six Japanese, untrained, was also won by Mr. Gwillam, who had good bushes with flowers of excellent quality. Mr. Alexander was second, Mr. Reeve third. Mr. Gwillam, Mr. Birch, and Mr. Manning also won the prizes for Pompons.

*Groups.*—The groups were the chief feature in the Show, being well grown, dwarf, with flowers of excellent quality, such as are rarely seen at exhibitions. They were also well arranged, and the leading ones so close in the order of merit that there were but few points between them. The first prize for a 50 feet group was taken by Mr. Underwood, gardener to J. S. Bouverie, Esq., Northampton, which contained some very heavy blooms of Avalanche, Edwin Molyneux, and other leading varieties, with a good assortment of incurved blooms. Mr. Reeve, gardener to W. Coulson, Esq., was second with good plants, including some good incurved blooms; and Mr. Birch followed closely with an excellently arranged group, some dwarf plants of Val d'Andorre in the front, not more than a foot high, being very effective; but the incurved were very weak compared with the others. The groups from the amateurs were not so satisfactory. Some very good plants and blooms were shown, but the arrangements were bad, many of the plants being laid down and twisted to try and form a slope; whereas if they had been stood up in a natural manner the result would have been a much better effect. Mr. Hemmings was awarded first prize, Mr. Arnsby second, and Mr. Richardson third. The same exhibitors, with Mr. H. Dunkley, Mr. Seaton, Mr. Henman, Mr. P. Jeffery, and Mr. Law were very successful in the plant classes, all showing very creditable specimens.

*Cut Blooms.*—The classes for cut blooms were well filled, the incurved as a whole being well finished and very fresh, and the Japanese of good substance, three or four blooms of Mrs. Alpheus Hardy being shown. The chief class was for eighteen incurved, distinct varieties. In this Mr. Fyfe, gardener to Lord Wantage, near Northampton, formerly a member and exhibitor of the Kingston Society, exhibited well, and took the first prize with a stand of the leading exhibition varieties. Mr. Underwood was second, with Messrs. Plowman & Sons, Market Harborough, third. In the class for twelve incurved Mr. Fyfe was again first, Mr. J. Kightley, gardener to Sir Hereward Wake, Bart., second, Messrs. Plowman & Son third. For six incurved, distinct, Mr. Kightley was first, Mr. Fyfe second, and Mr. Underwood third. For six incurved, one variety, Mr. Fyfe was first with a good stand of Lord Alcester, Mr. Kightley second with a very fine stand of the highly coloured Jardin des Plantes, a variety generally well grown here, Messrs. Plowman & Sons third with Violet Tomlin.

In the class for eighteen Japanese, distinct, Mr. Fyfe was again first with a good stand of fresh flowers; Mr. Underwood second; Messrs. Plowman & Sons third. For twelve Japanese introduced since 1886 Mr. Underwood was first, Mr. Fyfe second, Mr. Alexander third. For six Japs, one variety, Mr. Alexander was first with finely developed blooms of Avalanche; Mr. Kightley second with a very even stand of Mrs. J. Wright; Mr. H. Birch third with Avalanche. Messrs. Gulliver, Plowman & Sons, and Alexander took the chief prizes for reflexed and Anemone flowered; and Mr. J. Holland, Mr. Manning, Mr. G. Coles (gardener to Earl Spencer), and Mr. Burrows were the chief prizetakers for table decorations and bouquets of Chrysanthemums. In the amateurs' division Mr. G. Stephens, Gt. Houghton, was first for eighteen incurved blooms with a very good stand; Mr. T. Mayes, Kettering, second; and Mr. Hemmings third. For twelve incurved Mr. Mayes was first; Mr. Warner, Pychley, second; Mr. Stephens third; the same exhibitors being also successful in the remaining classes of incurved. For twelve Japs Mr. Stephens was first, Mr. Mayes second, Mr. Dalby third. In the classes for six Japs distinct and six Japs one variety Mr. Stephens, Mr. Mayes, and Mr. Warner were successful. Mr. Stephens was also first for a table decoration. The prizes for fruits and vegetables were well contested, and made a good display. Messrs. Perkins & Son, Northampton, also exhibited a fine collection not for competition. Mr. E. Draper, the experienced Hon. Sec., and his working Committee are to be congratulated on the excellent Exhibition and the business-like method in which the details are carried out.

## BOURNEMOUTH.—NOVEMBER 12TH AND 13TH.

THE fourth annual Exhibition of this Society was held in the Winter Garden adjoining the Hotel Mont Dore on the above dates, and proved to be both in the number of exhibits and quality far in advance of any that have preceded it. Bournemouth as a favourite watering place is becoming more popular every year, and the Chrysanthemum Show is certainly making rapid strides to the first rank of kindred societies in the kingdom. The weather during the earlier part of the first day was favourable to visitors, who attended the Exhibition in large numbers.

In the following notes on the Show we are indebted to Mr. Garner for help in all classes except those in which he competed.

In class 1, a silver challenge cup, value £8 8s., offered by the President, C. E. Baring Young, Esq., M.P., was won by Messrs. W. & G. Drover last year, consequently great interest was taken in the result of the contest for it this year. The cup must be won twice in succession or three times in all to become the absolute property of the winner. It was well won this year by Mr. Garner, gardener to Mrs. Braddyll, Amberwood, Christchurch, with an even stand of fresh incurved and highly coloured Japanese. Messrs. W. & G. Drover were second, their incurved being somewhat weaker. H. N. Middleton, Esq. (gardener, Mr. Gallop), was third. Five collections were staged in this class. A first-class certificate of the N.C.S. was awarded to the blooms in the winning stand, which included eighteen incurved and eighteen Japanese, not more than two of one variety. Class 1.—First prize, cup value £8 8s., and £3; second prize, £2; third prize, £1. The first prize stand comprised the following. Incurved, back row: Queen of England, Empress of India, Queen of England, Empress of India, Lord Alcester, Golden Empress. Middle row: Lord Wolseley, Miss M. A. Haggas, Princess of Wales, Miss M. A. Haggas, Princess of Wales, Lord Wolseley. Front row: Violet Tomlin, Princess Teek, Mr. Brunlees, Princess Teek, Mr. Brunlees, and Mrs. Heale. Japanese, back row: Sunflower, E. Molyneux, Carew Underwood, E. Molyneux, Baronne de Prailly, Sunflower. Middle row: M. Bernard, M. J. M. Pigny, Maiden's Blush, Thunberg, M. J. M. Pigny, Mr. Bernard. Front row: Mrs. J. Wright, Japonais, Thunberg, Avalanche, Japonais, and Mrs. J. Wright.

Class 2.—Twelve Japanese, distinct. First, Messrs. Elcombe & Sons, Romsey; second, Messrs. Drover; third, Mr. T. K. Ingram. The first prize stand contained—Back row: E. Molyneux, Baronne de Prailly, Meg Merrilies, Etoile de Lyon. Middle row: R. Brocklebank, Triomphe de la rue des Châlets, Madame C. Audiguier, Carew Underwood. Front row: Stanstead White, Mrs. C. H. Wheeler, Gloriosum, and Lady T. Lawrence. Class 3, also open, twelve incurved.—First, Mr. Garner; second, Messrs. Watts & Sons, nurserymen; third, Mr. Osborne, gardener to Rev. F. Hopkins. The blooms in the first prize stand were—Back row: Queen of England, Lord Alcester, Empress of India, Golden Empress. Middle row: Alfred Salter, Violet Tomlin, Miss Haggas, Princess of Wales. Front row: Prince Alfred, Jeanne d'Arc, Hero of Stoke Newington, and Princess Beatrice. The prize for the premier Japanese bloom, separately staged, was won by Messrs. Elcombe & Son, a grand Etoile de Lyon being selected. Messrs. Drover staged Golden Empress as the premier incurved.

In the second division, local, a N.C.S. bronze medal was given with the first prize for twelve incurved. Mr. Garner was first; Mr. Gould, gardener to Mrs. Dawson Damer, second; and Mr. Osborne third. In the same division for twelve Japanese, a similar medal was offered with the first prize, which also was won by Mr. Garner, Messrs. Osborne and Gould being second and third respectively. Seven staged in each class.

In the open class, a silver cup was offered for the best group of Chrysanthemums arranged in a space of 60 square feet. The cup has to be won once only. Mr. T. K. Ingram, nurseryman, was the winner. His group contained excellent blooms on very dwarf plants, carrying their foliage down to the rims of the pots. Messrs. G. Watts & Sons, the winners of the cup last year, were second this time with a group faultlessly arranged; but the quality of the blooms was not so good on the front of his group, and the plants were not quite so good in the foliage. Mr. T. H. Crasp, gardener to Lord Wimborne, was third. The blooms on his plants were past their best; a week earlier he would have stood in a better position, but some of the blooms at the back of the group were so fine that the National Chrysanthemum Society's certificate was awarded to Mr. Crasp for them.

The first prize for a smaller group, arranged in a space of 50 square feet, went to Mr. F. J. Ellis, gardener to Mr. Forbes, for a very prettily arranged group. Mr. C. Phillips, gardener to Mr. Hankinson, secured first place for best specimen plant.

The N.C.S.'s silver medal and £1 5s. for a group in the single-handed gardeners' division was won by Mr. Kettle, gardener to E. Terry, Esq. In the same division Messrs. Wood & Sons, Wood Green, London, presented a silver medal for twelve incurved cut blooms, not less than eight varieties; it was won by Mr. Shave, gardener to Mr. W. Moore. For twelve Japanese the N.C.S.'s bronze medal went to Mr. Kettle. Table plants and Primulas were exhibited in goodly numbers, and were a decided addition to the attractiveness of the Exhibition as a whole.

Grapes and vegetables formed an important feature of the Show. The principal prizewinners were Messrs. Garner, Read, and Bond. Both dessert and culinary Apples were very good, especially for this season. Dr. Hitchcock was first for dessert, and Mr. Boote, gardener to F. Ricardo, Esq., for culinary Apples. Some very pretty arrangements were exhibited in flowers, both for sprays, buttonholes, and bouquets. The cottagers, as usual, had some very fine exhibits. Honey in comb and

bottles was very good, and also the wax. Great credit is due to the Secretaries and others responsible for the arrangement of the Show; it was perfect in every way.

## BATH.—NOVEMBER 12TH AND 13TH.

ALL things considered the Chrysanthemum Shows held at Bath are in advance of any others in the south-western counties. There may have been better cut blooms to be seen elsewhere, but at Bath the plants generally are very superior, and a grand show of fruit is always attracted. The Show under notice was certainly no exception to the rule, or either better or inferior to those preceding it, and it should be added, it is doubtful if any great improvement is possible in years to come. Messrs. Pearson and W. Jeffery are the joint Secretaries, and the work was, as usual, very well done.

Trained plants were scarcely so good as sometimes seen at Bath, but the classes were well filled. The best six specimens of large-flowered varieties were shown by Mr. J. Kerlake, gardener to W. J. Brown, Esq.; Mr. S. Kerlake, gardener to the Rev. E. Handley, being a good second, and Dr. Budd third. With six Japanese varieties Mr. S. Kerlake took the lead, showing remarkably well, Mr. J. Kerlake following closely. Mr. A. Hawkins, gardener to Mrs. Jolly, was also a successful exhibitor of plants, and R. B. Cater, Esq., exhibited well, though not so strongly as in previous years. Standards were poor, but the plants for conservatory decoration were good, and with these Miss Maitland was well first. The Centenary medal of the National Chrysanthemum Society was awarded to Mr. J. Kerlake, the exhibitor of the best six trained plants, and a silver medal was also given to the exhibitor of the best single specimen, a very well-flowered plant, 5 feet through, of Mrs. G. Rundle, and staged by Mr. A. Hawkins, being selected for this distinction. Four large groups of Chrysanthemums were arranged, but the Judges had no difficulty in making their awards, Mr. S. Kerlake being well first with a grand display, all the plants having good foliage and large fresh blooms. Mr. J. Kerlake was second, and Mr. A. J. C. Biss third. There were a considerable number of classes for miscellaneous plants, all being well filled.

Cut blooms were fairly numerous, and in some instances of great merit. There were four exhibitors of twenty-four large flowering varieties, distinct, and with these a very old exhibitor, Mr. J. Baylis, was easily first, having a fine fresh lot of blooms of the following varieties:—Back row: Lord Alcester, Beauty, Empress of India, Empress Eugénie, Queen of England, Golden Queen of England, Princess of Wales, Golden Empress, and Empress of India. Middle row: Princess of Teek, Lord Wolseley, Mrs. Heale, Bronze Jardin des Plantes, Jeanne d'Arc, Miss Haggas, Prince Alfred, and Bronze Queen of England. Front row: Barbara, Mr. N. Davis, Prince of Wales, Baron Beust, Mrs. Shipman, John Salter, Jardin des Plantes, and Mr. Brunlees. Mr. G. Tucker, gardener to Major Clarke, was second; and Mr. P. Mann, gardener to W. H. Laverton, Esq., Westbury, third. Mr. J. Baylis was also first for twelve incurved varieties, having very fine blooms of Empress of India (awarded silver medal for best bloom in the Show), Golden Queen of England, Lord Alcester, Golden Empress, Jardin des Plantes, Jeanne d'Arc, John Salter, Princess of Wales, Prince of Wales, Mrs. Shipman, Princess of Teek, and Mr. Brunlees. Mr. Wilkinson, gardener to C. C. Tudway, Esq., Wells, was second; and Mr. W. Robinson third. With six varieties Mr. W. Strugnell was well first and Mr. H. Pocock second.

Japanese varieties were more extensively shown, but some of the finest blooms gave evidence of being cut for some time, freshness being wanted. The latter remark does not apply to the first prize stands of twenty-four distinct varieties shown by Mr. P. Mann. The back row of these consisted of Comte de Germiny, Madame Baco, Avalanche, Golden Dragon, Etoile de Lyon, E. Molyneux, Stanstead White, and Sunflower. Middle row: Mons. Brunet, R. Brocklebank, Baronne de Prailly, Condor, Carew Underwood, Thunberg, W. W. Coles, and Madame C. Audiguier. Front row: Mons. Bernard, Duchess of Albany, M. J. Pigny, Japonaise, Mrs. F. Jameson, Stanstead Surprise, and J. Délaux. Mr. T. Wilkinson was second, and Mr. Carpenter, gardener to A. Cole, Esq., Clifton, third, the latter having the smallest but freshest blooms. Mr. Carpenter was well first for twelve varieties, having Triomphe des Châlets, Etoile de Lyon, E. Molyneux, Fair Maid of Guernsey, Sunflower, Condor, Mons. Freeman, and Sceptre Toulousain in good condition. Mr. J. Atwell, gardener to J. B. Brain, Esq., was second; and Mr. J. Tucker third. The best six varieties were shown by Mr. W. Robinson, Mr. W. Strugnell being a close second. Anemone-flowered varieties, though not numerous, were exceptionally good. For twelve blooms Mr. W. Robinson was first, the varieties being Nelson, Fabian de Mediana, Madame Clos, Jeanne Marty, John Thorpe, jun., Minnie Chate, Marginata, Mrs. Pithers, and Reine des Alvéoles. Mr. Tucker was second, and Mr. Wilkinson third. Six stands containing equal numbers of Japanese and incurved varieties were shown, not for competition, by Messrs. Garaway & Co., Clifton, among these being many of the best old varieties and several good novelties. Bouquets, vases, and wreaths were well shown by several exhibitors. The fruit, which quite filled one large room, was well worthy of being reported at length, but this we are unable to do in the present issue.

## STAINES AND DISTRICT.—NOVEMBER 13TH.

ALTHOUGH the present is the first meeting of this Society under the above title (the Staines contingent having separated from Egham) the promoters are to be congratulated on the excellence of the exhibits throughout. Cut blooms were staged in considerable numbers and in

fine condition, while trained specimens and groups were alike good. There was a very large display of fruit and vegetables, the arrangements being well carried out by Mr. Bates, the courteous and painstaking Secretary.

*Groups.*—There were five collections arranged, and the best came from Mr. Orchard, gardener to Major-General Arbutnot, Thorpe, whose plants were of the highest quality, the flowers being exceptionally fresh and massive. Mr. E. J. Sims, gardener to J. M. Pimm, Esq., High Street, Staines, gained second honours for a well-arranged collection, the plants being dwarfed, but the quality was not so good. Mr. Thos. Cox, gardener to W. Hackwood, Esq., Herne House, and Mr. Hutchins, gardener to C. Ashby, Esq., Cambridge House, were placed third and fourth respectively, both exhibiting well. In the several classes for trained standards and dwarf plants, Messrs. Cox, Atherby, Sims, and Orchard took the principal prizes.

*CUT BLOOMS.*—In the class for twenty-four incurved, not less than eighteen varieties, Mr. J. Tomlin, gardener to E. Ashby, Esq., was placed first for a very even collection, consisting of Queen of England, Golden Empress of India, Lord Wolseley, Empress of India, Lord Alcester, Violet Tomlin, Golden Empress, Empress of India, Prince Alfred, Princess of Wales, Lord Alcester, Violet Tomlin, Miss Haggas, Charles Gibson, Hero of Stoke Newington, Princess Teck, Jardin des Plantes, Empress Eugénie, Norman Davis, Jeanne d'Arc, Lady Hardinge, Mrs. Heale, Hero of Stoke Newington. Mr. Sturt, gardener to L. L. Cohen, Esq., Englefield, was a very close second, and Mr. Ager third. For the best twenty-four incurved, not less than twelve varieties, Mr. Orchard secured the first award with Queen of England, Lord Alcester, Alfred Salter, Golden Empress, Queen of England, Emily Dale, Alfred Salter, Emily Dale, Venus, Refulgence, Miss Haggas, Princess Teck, Mrs. Heale, Mr. Brunlees, Jeanne d'Arc, Refulgence, Cherub, Mrs. Heale, Hero of Stoke Newington, Mr. Brunlees, Princess Teck, Miss Haggas, Mrs. Heale, and Mrs. Shipman. Messrs. Atherly and Bubb were placed in the order of their names. For twelve incurved Mr. T. Cox was to the front with good blooms of Jeanne d'Arc, Mr. Brunlees, Mabel Ward, Violet Tomlin, Mabel Ward, Princess of Wales, Mr. Brunlees, Jeanne d'Arc, Mr. Brunlees, White Venus, Antonelli, and Mrs. Dickson. Mr. W. Markham, gardener to Mrs. Hall, and Mr. Collings were awarded the second and third prizes.

Similar classes were provided for Japanese; all the stands were composed of fresh, large, and bright blooms. In the open class of twenty-four the competition was very keen, and Mr. J. Tomlin was placed first with Avalanche, Mr. C. Wheeler, Mons. Bernard, Stanstead White, Sunflower, Madame C. Audiguier, Edwin Molyneux, Avalanche, Madame Baco, Gloriosum, Etoile de Lyon, Mons. Freeman, grand; Carew Underwood, Fair Maid of Guernsey, J. H. Laing, Sunflower, Bertha Flight, Val d'Andorre, Mr. H. Cannell, Mrs. H. Cannell, Belle Paule, Criterion, Condor, and Marsa; a superb collection. Mr. A. Short secured second honours, being only a very few points behind the first prize stand; and Mr. Hutchins was third, both exhibiting in good form.

In the gardeners' class for twenty-four Japanese Messrs. Markham, Bubb, and Orchard received the awards in the order of their names, all running each other closely. Mr. Markham's collection consisted of Baronne de Prailly, Thunberg, Edwin Molyneux, George Daniels, Thunberg, Marguerite Marrouch, Avalanche, Baronne de Prailly, Mdle. Lacroix, Madame C. Audiguier, Avalanche, Yellow Dragon, Madame C. Audiguier, Roi des Japonais, fine; Criterion, Yellow Dragon, Jeanne Delaux, Triomphe de la rue des Chalets, Florence Percy, Val d'Andorre, Mr. H. Cannell, Balmoreau, and Jeanne d'Arc. For twelve blooms Mr. Ridley, gardener to F. Melville, Esq., gained the first prize, Mr. Cox the second, and Mr. Proudfoot, gardener to H. L. Manning, Esq., the third. The class for large Anemones brought several collections, the best coming from Mr. Orchard; it consisted of two Lady Margaret, two Jeanne Marty, Gluck, George Sand, Sabine, Marguerite Villageoise, Miss Annie Lowe, Mdle. Cabrol, and Mrs. Pethers. Mr. Ager was second and Mr. Hutchings third. Reflexed blooms were also remarkably fine, the prizes falling to Messrs. Orchard, Collings, and Ager in the order here given, and for Pompons, Messrs. Orchard, Hutchings and Proudfoot were first, second and third respectively.

Primulas, table plants, Cyclamens, and Zonal Pelargoniums, were plentifully exhibited, and received their share of admiration. Bouquets were fairly good, but the first and second prize exhibits for a floral ornament composed of Chrysanthemums and Ferns were very tastefully done indeed. Mrs. Mievill was first with a light and pretty arrangement, Mrs. Harris second, and Miss Jessie Mievill third. Very fine Pears were exhibited by Messrs. Ager, Hutchings, and Sims, who secured the awards; the dish of Pitmaston Duchess sent by Mr. Ager were good indeed. Messrs. Bradley, Whitman and Orchard were the prizetakers in the order of their names for good collections of vegetables, of which there were numerous contributions.

#### TEDDINGTON.—NOVEMBER 13TH AND 14TH.

AN earnest horticultural enthusiasm has for some years distinguished the amateurs at Teddington, and to this Mr. W. Furze of The Roselands, Mr. Howard, and Mr. Douet have very materially contributed. Mr. Furze, in particular, has helped very greatly in the development of the Chrysanthemum Society and Show, both by his personal influence amongst the residents in the district, and by contributing liberally from his garden handsome examples of all the leading Chrysanthemums. Mr. Douet has also worked well in the same interest, and they have been supported by a good Committee, so that it was not surprising last

week that the Show proved one of the best the Society has yet held, both in the number and quality of the exhibits, all the space available in the Town Hall being taken advantage of for groups, specimen plants, and tables of cut blooms, fruit, vegetables, and floral decorations. The arrangements were well managed by Mr. Anderson, the Secretary, assisted by several members of the Committee.

The principal class was that for twenty-four incurved and twenty-four Japanese, the first prize being a five-guinea challenge cup. This was won by Mr. E. Coombs, gardener to W. Furze, Esq., with handsome blooms in both sections, deep clean incurved and bright fresh Japanese. Mr. T. Higginson, gardener to Lieutenant-General Vialls, Teddington House, and Mr. W. Cave, gardener to Mrs. Holberton, The Cedars, were second and third respectively, both showing capital blooms. With twenty-four incurved and the same number of Japanese Mr. Coombs was first in both classes, the varieties being as follows:—Incurved: Emily Dale, Princess Teck, Violet Tomlin, Lord Wolseley, Beauty, Barbara, Queen of England, Alfred Lyne, Perle Précieuse, Lord Alcester, Mrs. Heale, Golden Empress of India, Ada Spaulding, Prince Alfred, Hero of Stoke Newington, Miss Haggas, Princess of Wales, Mrs. Shipman, Jeanne d'Arc, John Salter, Empress Eugénie, Mrs. Coleman, Empress of India, Refulgence. The Japanese were Etoile de Lyon, Stanstead Surprise, Sunflower, Florence Percy, Val d'Andorre, M. Délaux, Stanstead White, W. W. Coles, Mr. Wellam, E. Molyneux, Volunteer, Marsa, Gloriosum, Mrs. Wright, Hamlet, Madame C. Audiguier, M. Bernard, Album Fimbriatum, M. Elliott, Belle Paule, and Japonais. The three prizes in these classes were gained by Messrs. Cave, Fitcher, and W. Davis, gardener to T. P. Chappell, Esq., Weir Bank. In a number of smaller classes the same exhibitors also had good stands of blooms.

In the group and plant classes the principal prizes were won by Messrs. Rickwood, gardener to Lady Freake, Fulwell Park, Twickenham; T. Gregory, gardener to F. Weymouth, Esq., Bushey Park; Higginson, and Sallows. The fruit and vegetables were good, the floral decorations as usual being very tasteful.

#### WIMBLEDON.—NOVEMBER 13TH AND 14TH.

THE Drill Hall is an excellent place to hold an Exhibition, and the one here noticed had a good effect, the groups of plants being around the sides of the hall with tables running the whole length of the building, on which were placed the cut blooms and fruit. The boxes of blooms on each side of the table were divided by a row of table plants, Primulas and Cyclamens, which had a pretty effect. The arrangements were carried out in an efficient manner by the Hon. Secretary, Dr. Walker.

For a group of Chrysanthemums in pots, to cover a space not exceeding 40 feet super, for which a silver cup was offered as first prize, Mr. W. Ware, gardener to L. Walters, Esq., Woodhayes, succeeded in winning easily, the plants being exceedingly tall, but carrying blooms which were remarkable for high quality. Mr. W. Springthorpe, gardener to N. H. Alexander, Esq., Roehampton, was a good second; Mr. W. Luff, gardener to J. T. Schwann, Esq., Oakfield, Wimbledon Common, third. Mr. W. Thornton, gardener to T. E. Crocker, Esq., Draymont, with a capital plant of Golden Circle, won premier honours for a specimen Pompon. For a miscellaneous group of plants, not to exceed 40 feet super, Mr. Bradford, gardener to H. B. Wallace, Esq., was an easy first; Mr. W. Ware second.

Cut blooms were the most important feature of the Exhibition. The principal class was that for forty-eight blooms (twenty-four incurved in not less than eighteen varieties, and twenty-four Japanese, distinct), a challenge cup value fifteen guineas being offered for the first prize, for which five competed. Mr. Mease, gardener to F. Tate, Esq., Downside, Leatherhead, was placed first with superior incurved blossoms and good Japanese, the varieties being as follows:—Back row: Princess of Wales, Lord Alcester, Golden Queen of England, Jeanne d'Arc, Lord Alcester, Bronze Queen, Golden Queen of England, Golden Empress. Middle row: Mrs. S. Coleman, Violet Tomlin, Princess of Wales, Miss M. A. Haggas, Mrs. S. Coleman, Golden Empress, Mrs. Heale, John Salter. Front row: Mrs. W. Shipman, Mrs. N. Davis, Cherub, Violet Tomlin, Empress Eugénie, Lady Dorothy, Hero of Stoke Newington, C. Gibson. The Japanese were—Back row: Edwin Molyneux, Stanstead White, Madame J. Laing, R. Brocklebank, T. de la rue des Chalets, Mrs. W. Clark, Puritan, Etoile de Lyon. Middle row: Saran Owen, W. W. Coles, Mrs. Cannell, W. Wheeler, Condor, H. Cannell, Mrs. Irving Clark, Gloriosum. Front row: G. Daniels, M. Marrouch, Mons. H. Elliott, Sunflower, Meg Merrilies, Thunberg, Avalanche, Stanstead Surprise. Second, Mr. C. Beckett, gardener to C. H. Bryant, Esq., Twickenham, with larger incurved but somewhat stale, the Japanese being of superior quality. Mr. C. Gibson, gardener to J. Wormald, Esq., Morden Park, Mitcham, third.

For twelve incurved and twelve Japanese, distinct, Mr. C. Gibson was an easy first, staging flowers of good quality, the varieties being Miss Haggas, Golden Empress, John Salter, Golden Queen of England, Cherub, Princess of Wales, Princess of Teck, Mrs. S. Coleman, Empress Eugénie, Princess Beatrice, Nil Desperandum, and Violet Tomlin. Japanese: E. Molyneux, Boule d'Or, Val d'Andorre, Etoile de Lyon, Lady Lawrence, Mrs. F. Jameson, Maiden's Blush, Meg Merrilies, Sarah Owen, Mrs. C. Wheeler, Grandiflorum, and J. Délaux. Second, Mr. Alderman, gardener to G. Hatfield, Esq., Morden Hall, Mitcham, somewhat smaller; the last named succeeded in winning premier honours for twelve incurved, distinct, with medium sized neat blooms. Second, Mr. W. Palmer, gardener to the Right Hon. Humc-Dick, Thames Ditton House. The same two exhibitors occupied similar positions for twelve

Japanese, distinct. For six incurved, Mr. J. Portbury, gardener to W. M. Fry, Esq., Ripon House, Putney Heath, was first with a neat lot. Mr. F. Bentley, gardener to Sir T. Gabriel, Bart., Wimbledon Park, second. For six blooms of reflexed varieties, Mr. C. Gibson was distinctly first, having substantial blooms of Golden and Pink Christine, and Cloth of Gold. Mr. G. Woodgate, gardener to Lady Wolverton, Warren House, Kingston-on-Thames, was a close second. The last named was placed first for six large Anemones. Mr. C. Gibson second.

Table plants, Cyclamens and berried plants, fruits and vegetables, made up a good Show.

#### LEICESTER AND MIDLAND.—NOVEMBER 14TH AND 15TH.

THE fourth annual Show of this young and flourishing Society was held on the above dates in the Temperance Hall, Leicester, and proved to be the best yet seen in the town of Leicester.

Groups of Chrysanthemums arranged for effect were not numerous, there being three competitors only, and unfortunately two of these lost all chances of success, and were disqualified by the Judges for having used cut flowers and stems to enhance the effect of those growing in pots. The first prize was, however, awarded to a very tastefully arranged group, containing good flowers and well grown plants, exhibited by Messrs. J. & H. Hickling, nurserymen, Loughborough, which was much admired by visitors. Four specimen plants of white-flowered Chrysanthemums occupied a conspicuous position in the centre of the orchestra, one of them being a very large example upwards of 6 feet in diameter, these being shown, not for competition, by Mr. John Mawby, Humberstone Road Nurseries.

*Cut Blooms.*—In the open class for forty-eight cut blooms, twenty-four incurved and twenty-four Japanese, not less than eighteen varieties in each class, first prize £10 and a silver challenge cup value £10, second prize £5, third £2 10s., Mr. John Lambert was placed first in an exceedingly close competition with very fine and even stands, containing, of incurved—Back row: J. Lambert, extra good; Queen of England, Golden Empress, fine; Empress of India, Alfred Salter, Golden Empress, Lord Alcester, and John Lambert. Middle row: Mrs. Coleman, Princess of Wales, Violet Tomlin, Queen of England, Lord Wolseley, Jeanne d'Arc, Mrs. Heale, and Empress of India. Front row: Refulgence, Princess Teck, Barbara, John Salter, Miss Haggas, Hero of Stoke Newington, Lady Dorothy, and Lady Hardinge. Japanese.—Back row: Etoile de Lyon, fine; Criterion, Belle Paule, Mrs. Wheeler, Sunflower, E. Molyneux, Mons. Bernard, and Etoile de Lyon. Middle row: Val d'Andorre, Condor, Gloriosum, Thos. Stevenson, Madame J. Laing, Eynsford White, Mrs. Jameson, and Boule d'Or. Front row: R. Brocklebank, Sarah Owen, Madame Baco, Avalanche, J. Délaux, Golden Dragon, Mons. Brunet, and W. W. Coles. In this class Mr. P. Blair, Trentham Gardens, was placed second; and Mr. J. Myers, Huntingdon, third.

For twenty-four blooms, open class, twelve incurved and twelve Japanese, distinct varieties, Messrs. E. Plowman & Sons were deservedly placed first with exceedingly fine stands, the Japanese especially being fine highly coloured flowers of great size and depth, the varieties being—Incurved: Queen of England, Golden Queen, very fine; Violet Tomlin, fine; Lord Alcester, Empress Eugénie, Princess of Wales, Miss Haggas, fine; Prince Alfred, Mrs. Coleman, Nil Desperandum, Mrs. Shipman, John Salter, fine. Japanese: Etoile de Lyon, fine colour; Stanstead White, Madame Baco, Edwin Molyneux, Mrs. Wheeler, Jeanne Délaux, Avalanche, Mr. H. Cannell, Sunflower, Meg Merrilies, Mons. Bernard, and Belle Paule. Second, Mr. A. Coombes, gardener to Earl Dudley, Himley Hall. Third, Messrs. J. & H. Hickling.

In the district class for twenty-four blooms, twelve incurved and twelve Japanese, distinct (silver cup value £5), Mr. J. Read, Aylestone Park, was first with even and good blooms, his varieties being—Incurved: John Lambert, Golden Empress, Queen of England, Lord Alcester, Princess of Wales, Lord Wolseley, Empress of India, Jeanne d'Arc, John Salter, Princess of Teck, Nil Desperandum, and Mrs. Coleman. Japanese: Sunflower, Val d'Andorre, Boule d'Or, Etoile de Lyon, Madame C. Audiguier, Avalanche, Mons. Bernard, Gloriosum, Mdlle. Lacroix, Jeanne Délaux, Ralph Brocklebank, and Belle Paule. Mr. F. H. Anthony, Hon. Sec., was placed second, and had a very fine stand of Japanese, in which the following were most remarkable: Etoile de Lyon, a fine deep coloured flower; W. W. Coles, very fine; Mrs. Alpheus Hardy, not quite up, but a large deep flower, showing well its hairy character, one of the finest yet seen of it; and Sokoto, a good flower of a bright yellow American variety. Mr. Johnson, gardener to Mr. W. Billson, Berkley, was third.

For twelve blooms, incurved (amateurs residing within five miles of Leicester).—First, J. Read. Second, G. A. Jayes. Third, J. Whit. Fourth, C. Day. Six blooms, incurved (first prize £1 and silver Centenary medal).—First, Mr. F. H. Anthony, with fine flowers of John Lambert, Alfred Salter, Lord Alcester, Mrs. Coleman, Golden Empress, and Princess of Wales. A corresponding class for six Japanese was also won by Mr. Anthony with splendid flowers of Etoile de Lyon, large, finely coloured, best in the Show; Meg Merrilies, E. Molyneux, Boule d'Or, Sunflower, and Avalanche. A new and valued feature in this season's Exhibition was the spirited competition for a series of working men's prizes given by Thos. Brookes, Esq., Barkby Hall, for competition for working men residing within five miles of the Clock Tower, Leicester. Some very good flowers were shown by exhibitors in this class.

There was a fine display of baskets of flowers, bouquets, &c., Messrs.

Perkins & Sons, Coventry, being the principal prizewinners. Much prize is due to the Hon. Sec., Mr. Anthony, for his admirable arrangement of the Show, and to his colleagues upon the Committee for so ably seconding his efforts.

#### WINCHESTER.—NOVEMBER 13TH AND 14TH.

THE Guildhall in this city where the autumn Exhibition of Chrysanthemums, fruit, and vegetables was held is especially adapted for the purpose, the large hall being well lighted, which adds to the appearance of the flowers considerably, and the place is easy of access. The Exhibition under notice was above the average of previous displays, the competition in nearly all classes being keen, and the quality of the leading exhibits highly creditable. The arrangements were, as usual, under the direction of Mr. Chaloner Shenton, the Hon. Secretary, and it is needless to say that anything better could not be desired. Mr. Shenton has worked well in the interest of this society, and is moreover a successful amateur cultivator, and we have much pleasure in giving his portrait (fig. 62).

The principal interest centred in the cut bloom classes, as many as 850 blooms being staged, the chief class being that for forty-eight, half

FIG. 62.—MR. CHALONER SHENTON.

the number to be incurved in not less than eighteen varieties, or not more than two of one sort, the same conditions applying to the Japanese section, the first prize being the challenge cup, given by the ladies of Winchester, to which is added a money prize of £5, and for which five entered. Mr. N. Molyneux, gardener to J. C. Garnier, Esq., Rooksbury Park, Wickham, Fareham, was placed first with good sized, even, and fresh incurved blooms, admirably finished. The Japanese were lighter, but wonderfully fresh and bright, the varieties being as follows:—Incurved.—Back row: Golden Empress (two), Empress of India (two), Queen of England (two), Lord Alcester, Golden Queen of England. Middle row: Empress Eugénie, John Doughty, Golden Queen of England, Hero of Stoke Newington (two), Lord Alcester, Lord Wolseley, Jeanne d'Arc. Front row: Prince Alfred, Mrs. Norman Davis, Lady Carey, Miss M. A. Haggas, Lady Dorothy, Princess Teck, Alfred Salter, Barbara. Japanese.—Back row: Etoile de Lyon (two), Eynsford White, E. Molyneux (two), Carew Underwood, Mrs. F. Thompson, Stanstead White. Middle row: Stanstead White, Mrs. F. Jameson, M. E. A. Carrière (two), J. Délaux, Belle Paule, Mrs. C. Wheeler, Mons. Bernard. Front row: Boule d'Or (two), Mdlle. Lacroix, Mons. Bernard, Ralph Brocklebank, Sarah Owen, Sunflower, Meg Merrilies. Messrs. W. & G. Drover, The Nurseries, Fareham, were second, the incurved being smaller and not so fresh, the Japanese being heavy. Mr. G. Trinder, gardener to Sir H. Mildmay, Dogmersfield Park, Winchfield, third.

For twenty-four Japanese, not less than twelve varieties, seven competed. Mr. Trinder, who won first honours, put up very strong blooms remarkable for their freshness and brightness of colour, the most important sorts being Mrs. C. Wheeler, Etoile de Lyon, Sunflower, M. H. Elliott, Stanstead Surprise, and Madame J. Laing. Mr. J. Inglefield, gardener to Sir J. Kelk, Bart., Tedworth, Marlborough, second, very close; Messrs. Drover third. For twelve incurved, distinct, Mr. N. Molyneux easily secured the premier award with blooms possessing much quality and superiority in finish, the sorts being Golden Empress, Queen of England, Golden Queen of England, Empress of India, Hero of Stoke Newington, Lord Alcester, Lord Wolseley, Empress Eugénie, Lady Dorothy, Baron Beust, Princess Teck, and Barbara. Messrs. Inglefield and Trinder followed in the order of their names.

For twelve Japanese, distinct, Mr. Budd, gardener to F. Dalgety, Esq., Lockerby Hall, Romsey, was an easy first with fairly good blooms in each case. For twelve Anemone sorts Mr. Neville, gardener to F. W. Flight, Esq., Cornstiles, Twyford, Winchester, was placed first with even, large, well-centred flowers. For twelve reflexed, in not less

than eight varieties, Mr. Allen, gardener to Capt. the Hon. Victor Montague, Wherwell Priory, Andover, with an even stand of blooms secured leading position—Cloth of Gold, Golden Christine, Distinction, and Callingfordi. Mr. Neville second, and Mr. Budd third. For twenty-four blooms, irrespective of distinctness of kinds, Mr. E. Wills, gardener to Mrs. E. Pearce, The Firs, Bassett, took premier award, followed by Mr. T. Annalls, gardener to C. Shenton, Esq., Golden Common, Winchester. The same two exhibitors maintained the same position in the class for twelve blooms.

Groups of Chrysanthemums arranged in a space 8 feet by 7 feet made a good display around the sides of the hall, and manifested a great improvement in the quality of the plants during the last two or three years. Mr. F. Smith, gardener to Lady Wodehouse, Mayfield, Winchester, with plants carrying well-developed blooms, and neatness of arrangement having been well considered, was a good first. Second, Mr. J. Wareham, gardener to Mrs. Gunner, Winchester; Mr. E. Carr, gardener to W. A. Gillett, Esq., Fair Oak Lodge, Bishopstoke. Five competed. Specimens trained showed a falling off in point of numbers and quality as compared with other years. In the present case Mr. J. Kaines, Winchester, was easily first. For a single specimen Japanese Mr. Wills, with Stanstead Surprise, a neat plant; and with Dr. Sharpe in the incurved or reflexed class Mr. Wills was again successful. Mr. G. Best, gardener to C. W. Chute, Esq., Basingstoke, had the best table plants, a neat lot. Mr. Carr had the best arranged group of miscellaneous plants. The most tastefully arranged stand of Chrysanthemums and other flowers with grasses, suitable for table decoration, Miss Agnes Flight, Cornstiles, Twyford, Winchester, was distinctly first with a light yet choice arrangement. In a similar class with hardy shrubs, Ferns, and grasses of outdoor growth, Miss Flight was awarded principal honours with a rich but not a heavy arrangement. Miss N. Owen, Basingstoke, second in both classes. Primulas made a good show, many well-grown plants being staged. For twelve plants, any variety, Mr. F. Munt was placed first; Mr. T. Lowndes, gardener to F. C. Burch, Esq., Winchester, second. Fruit also constituted a good display, the principal prizetakers being Mr. C. Warden, gardener to Sir F. Bathurst, Clarendon Park, Salisbury; Mr. S. Hall, gardener to S. Montagu, Esq., South Stoneham House, Southampton; Mr. Budd; Mr. F. Cawte, gardener to W. Cotesworth, Esq., Winchester; Mr. Inglefield; Mr. J. Amys, gardener to the Hon. Mr. Yorke, Hamble Cliff, Southampton. Vegetables formed a strong display. Mr. Inglefield was first among seven others, Mr. G. Best second, and Mr. Allen third.

#### SHEFFIELD, HALLAMSHIRE, AND WEST RIDING.

NOVEMBER 14TH AND 15TH.

THIS Exhibition proved to be the most successful yet held in Sheffield. For many previous seasons there have been two Societies, each holding a separate Show within a few days of the other. Early, however, in the present year the two Committees met together and resolved to combine, and hold one large Show instead of two as formerly. The result has been more satisfactory than could have been expected, and the Show, in the quantity and high quality of the exhibits, was a surprise to all. The spacious floor of the Corn Exchange, which has in previous years been found larger than was required, was this year totally inadequate to contain all the exhibits, many of which had to be staged in adjoining rooms. In several of the numerous classes provided for six and three blooms (amateurs' and cottagers' classes) there were from twenty-five to thirty competing for the eight prizes offered, and as the competition was very close the work of judging, especially after the visitors were admitted, proved to be no sinecure.

In the open class for twenty-four incurved blooms, eighteen varieties, there were seven competitors. Mr. J. Lambert, gardener to Col. Wingfield, Onslow Hall, Shrewsbury, was first, his flowers being—Back row: Lord Alcester, Golden Empress, Alfred Salter, John Lambert, Queen of England, Empress of India, Alfred Salter, John Lambert. Middle row: Mrs. Heale, Hero of Stoke Newington, Mrs. Heale, Lady Dorothy, Miss Haggas, John Salter, Jeanne d'Arc, Violet Tomlin. Front row: Lady Dorothy, Miss Haggas, Princess of Teck, Prince Alfred, Barbara, Prince Alfred, Mrs. Coleman, Cherub. Mr. P. Blair, Trentham Gardens, was placed second, his back row blooms being very fine, but he had several small and inferior flowers in his front rows. Mr. J. Hathaway, gardener to the Earl of Latham, Ormskirk, was third, and Mr. C. Green, gardener to Sir H. E. Watson, Shirecliffe Hall, Sheffield, fourth.

In the corresponding open class for twenty-four Japanese, eighteen varieties, there were eleven collections staged, all of very high merit, making a wonderfully fine display. Mr. A. Coombes, gardener to the Earl of Dudley, Himley Hall, Dudley, was placed first with a fine lot of large solid blooms, very bright in colour and fresh. The varieties were—Back row: Mons. Bernard, Mdlle. Lacroix, E. Molyneux, Sunflower, E. Molyneux, Thunberg, Avalanche, M. Bernard. Middle row: Stanstead White, Mrs. Jameson, Avalanche, Etoile de Lyon, Mdlle. Blanche Pigny, Etoile de Lyon, Puritan, Sunflower. Front row: Madame J. Laing, Thunberg, W. W. Coles, Gloriosum, Mr. J. Laing, Mrs. J. Wright, Sarah Owen, Madame Baco.

For twelve incurved (open class), Mr. J. Lambert was again first, his varieties being—Lord Alcester, Alfred Salter, Empress of India, John Lambert, Princess of Wales, Mrs. Coleman, Charles Gibson, Queen of England, Mabel Ward, Princess Teck, Jeanne d'Arc, Violet Tomlin.

For twelve Japanese, open class, Mr. W. Welton, gardener to Mr. G. A. Green, Marsham Lane, Grimsby, was first, his varieties being Stan-

stead White, E. Molyneux, Sunflower, Condor, Val d'Andorre, Mons. Astorg, Comtesse de Beauregard, Mons. J. M. Pigny, Gloriosum, Criterion, W. Holmes, and Japonais.

In the district class for twelve incurved, Mr. S. Gilbey, gardener to B. B. Bootle, Esq., Page Hall, Sheffield, was first with fine plants, comprising Golden Empress, Lord Alcester, Golden Queen, Empress of India, Princess of Wales, Mrs. Heale, Queen of England, Miss Haggas, Prince Alfred, J. Salter, Refulgence, Guernsey Nugget. Twelve Japanese, district class.—First, Mr. C. Scott, gardener to Mr. J. Colley, Sharrow House, Sheffield. Varieties: Etoile de Lyon, Ralph Brocklebank, E. Molyneux, Boule d'Or, Sunflower, Mrs. Wheeler, Avalanche, Belle Paule, C. Wagstaff (?), Jeanne D'Alaux, Criterion, Mr. Jno. Laing.

In the amateur classes for cut flowers all the first prizes were taken by Mr. Jas. Harrison, 107, Hoole Street, Walkley, who exhibited throughout remarkably fine large blooms, fully equalling in size, depth, and solidity those in the open classes. The same exhibitor was placed fourth in the open class for twenty-four Japanese, with what were probably the largest and heaviest blooms in the Show, but which lacked brightness of colour and general freshness. Groups of Chrysanthemums and of miscellaneous plants were numerous and generally good, especially those of the latter character. The first prize group of Chrysanthemums, shown by Mr. Redmill, gardener to Mr. Lowood, Five Oaks, Sheffield, was tastefully arranged, very bright, and greatly admired.

The classes for miscellaneous plants and Ferns were numerous and well filled. Especially fine were British Ferns from Mr. Jno. Eadon and Mr. Newsham, trained Chrysanthemums from Mr. Scott and Mr. Green, Filmy Ferns from Mr. Newsham, Primulas from Messrs. Redmill and C. Scott, Epiphyllums and Selaginellas from Mr. Speight, Mignonette from Messrs. W. Collier, C. Scott, and W. Redmill. There were twelve competitors for the prizes offered for Grapes, black and white, the result being a long table filled with a fine display of fruit, the quality throughout being very good. The general arrangements and working of the Show were most efficiently and satisfactorily carried out by the Secretaries, Messrs. W. Housely and W. Marshall.

#### HARDY FRUIT GARDEN.

**NECESSITY FOR PLANTING YOUNG TREES.**—Those who defer planting young trees till the old ones give signs of failing health frequently make a great mistake. It is true much may be done in the way of renovating the borders and root-lifting towards restoring the apparently worn out old ones to a healthy profitable state, but on some soils whole limbs are liable to die off quickly, the rest of the tree not unfrequently following. This leaves a great blank, which it takes several seasons to refill, and unless therefore young trees are planted in anticipation of these failures much valuable time may be lost and good space wasted. Apricots, and next to these Plums, Cherries, Peaches and Nectarines, are the most liable to fail, and a few young trees of these might well be prepared between the old ones ready to take their place if need be.

**CHANGE OF VARIETIES.**—In all cases where the selection of varieties is not a good one or unsuitable to the requirements or peculiarities of the place, a change ought gradually to be made. To a certain extent this might be accomplished by re-grafting the trees, but as a rule the better plan is to purchase a stock of young trees, these being planted between the old ones, and the latter cut away according as the young trees require more room. The change will, in this manner, be accomplished without the loss of a season. It is not merely Apples and Pears that in very many cases are in need of improvement as regards variety, but a better selection of Peaches, Nectarines, Apricots, Plums, Cherries, Gooseberries, Currants, and Raspberries might well be made, some of the older forms of the three latter especially scarcely being worth garden room.

**WHAT TO AVOID.**—Admirable selections have of late years been frequently given in the pages of the *Journal of Horticulture*, and intending planters will do well to carefully refer to their back numbers. An unlimited number of varieties is not to be recommended, and if several or many trees of a few of the best sorts are planted these will most probably give far greater satisfaction than fewer trees each of a long list of varieties. Nor are cheap trees to be commended, these very frequently being much the dearest in the long run. Large numbers of fruit trees are annually exported from Holland, Belgium, and France to this country, many of them finding their way into the open markets of provincial towns, and are sold surprisingly cheap. Still more are cleared out from the home nurseries, these being bought up by hawkers and sold for very low prices. These, being varieties for which there is no demand, are dear at any price. All are fine strong trees, but a long exposure to cold drying winds, coupled with the loss of many strong roots when they were dragged out of the ground, gives a very severe check, from which they are a long time recovering from, many perishing outright.

**WHAT TO ORDER.**—Intending planters ought to decide early what

they require, and to order the trees before the best of the favoured nurseryman's stock is already sold. The sooner, too, the trees are lifted and replanted after the leaves are fallen the better. Supposing a good number of trees are required the gardener ought to pay a visit to the nurseries and select for himself. If he is wise it is not the strongest trees that will be selected, but rather those of medium strength and vigour, the wood being well ripened. Such recover the most quickly from the check of removal, and are the first to attain a fruitful state, and eventually form the best trees. These should also be asked for by those sending their orders to nurserymen, and will be sent by the latter if they have them in stock. Maidens, or those that have had one clear season's growth from the time the stocks were either budded or grafted, are the cheapest, and from these the healthiest and best trees are grown; but trained trees, or those that have been cut back two or three times, are naturally the first to reach a fruitful state. Some varieties naturally commence bearing much sooner than others, but the precocity of Apples and Pears in particular is largely effected by the stock on which they are worked. For dwarf or bush trees of the former experts give the preference to those on the Broad-leaved Paradise stock, these growing well in spite of their early productiveness. Standards or orchard trees are best on the common or Crab stock. Pears are principally grown on either the Quince or the natural or Pear stock. The former is best for shallow soils, and in all cases where early productiveness rather than large trees is desired. With a moderately deep and good root run those on the Pear stock develop into fine productive trees in the course of a few years, and these should be planted against high walls or wherever there is plenty of head room. In respect to the other fruit trees there is not much choice in the matter, the Musclem Plum being largely used as the stock for Plums, Peaches, Nectarines, and Apricots, and either the Mahaleb stock or seedlings for Cherries.

**REPLANTING YOUNG TREES.**—Those nurserymen who study the interests of their customers, and therefore their own as well, will see that the trees are not dragged from the ground in a reckless manner, and that the roots are not either long exposed to drying winds or are badly bruised in any way before they leave the packing sheds. Much depends upon this little attention, and careless labourers ought not to be employed in such important work. The roots of the trees packed in bales should be well surrounded and mixed with moist strawy manure, this keeping them plump and fresh till they are once more in the ground. Any not so treated, and the roots of which give signs of having been unduly exposed, might with advantage be immersed in a tank or pool of water for a few hours prior to planting. Never attempt planting if the soil is in a wet pasty state. Better by far to lay the trees in by the heels till the work can be done properly. Never prepare the stations far in advance of planting time, or they are liable to become badly saturated by rain. Fresh loamy soil, turfy if possible, suits all kinds of fruit trees well, and it is advisable to plant rather above the ordinary garden level.

#### FRUIT FORCING.

**VINES.**—*Earliest Forced Vines in Pots.*—The earliest started will now be showing signs of growth, so that the temperature may be slightly increased—55° minimum, and 65° maximum from fire heat, with 10° more from sun heat, proportionately increasing the atmospheric moisture. Very little ventilation will be required, and what is given should be at the top of the house; if side ventilation be given the cold air should pass over the heating surface so as to become warmed.

*Houses Cleared of Grapes.*—When the Vines are leafless and the Grapes cut attend to the pruning. If the Vines are strong, having stout short-jointed wood, they may safely be pruned to a couple of eyes. If, however, the base buds are small, and the Vines from similar buds in previous years gave as large bunches as desired, the laterals may be left a little longer, but it is necessary that a round, not flat bud, well developed, be selected for pruning to, aiming at a close compact bunch of well set berries with a stout footstalk in preference to a large uneven bunch, which usually follows large flat buds on long-jointed wood, the foliage supporting such being large, thin, and incapable of elaborating the food and concentrating it in the buds at their base. Avoid pointed buds, they usually are not productive of bunches, and if they are the bunches have a tendency to revert into tendrils. Wash the house thoroughly and cleanse the glass. Remove only the loose bark, avoiding the usual scraping. Tepid soapy water, soft soap 4 ozs. to the gallon of water, is unquestionably the best means of cleansing the Vines, using a brush with care and judgment, following with an approved insecticide. Remove the mulching or loose surface material down to the roots, and place on a couple of inches of fresh loam mixed with some old mortar rubbish passed through a three-quarter-inch sieve, night soil, and wood ashes. If the loam be light add some clay marl dried and reduced to powder. Of turfy loam, cut 3 inches thick and chopped moderately small have 20 bushels, of sifted old mortar rubbish add 2 bushels, of night soil 1 bushel, soot half a bushel, wood ashes 1 bushel, clay marl (if the loam be light) 2 bushels, and 1 bushel steamed bonemeal. Charcoal dust may be added to the extent of 4 bushels, together forming a chaldron, when thoroughly incorporated, of dressing for Vine borders, good alike as a rooting and feeding area. The early watering will wash the assimilated matter down to the roots, and fresh feeders encouraged into it can be kept there by surface dressings or mulching with manure after the Grapes are set, feeding with liquid as necessary. If the houses must be used for plants they should be kept cool, admitting air freely, not exceeding 40° to 45° by artificial means. It is best, however, to dispense with the plants, admitting air freely in all but very severe weather, a few degrees of frost doing the Vines no harm, but insuring more complete rest.

*Houses of Thin-skinned Grapes.*—Black Hamburgs damp in a close confined atmosphere, which should be avoided by judicious ventilation. Madresfield Court keeps well until the end of November or later, but it loses colour perhaps more than Black Hamburg. Black Hamburgs well ripened will keep until January, particularly when ripened in late August or early September, the flesh being firmer, rich, and sugary, Foster's Seedling being a good companion white sweet Grape, both keeping wonderfully well. These early ripened thin-skinned Grapes are not so juicy as those ripening in September, which still have foliage, and keep the colour of the Grapes better than early ripened. They will also keep sounder with more moisture than those ripened in August, and a moderate amount of air moisture is necessary to prevent undue evaporation, the shrinking of the Grapes, it not being so much air moisture as a stagnant atmosphere that is fatal to the keeping of Grapes. Slight heat in the pipes will be required constantly to maintain an equable temperature, but this must not be high, or it will cause the berries to shrivel prematurely, 50° not being exceeded by artificial means, ventilating freely and early in bright weather, so as to prevent moisture being condensed by the berries. The outside borders must be protected from rains by shutters or other material, inside borders being covered with clean dry straw to prevent moisture rising, and it prevents the soil cracking.

**MELONS.**—Fruits on the latest plants are beginning to rot, and will be ripe in December. To swell them off they require a rather moist genial condition of the atmosphere, damping the house in the morning and early afternoon, admitting a little air early in the forenoon to insure the dispersion of moisture and induce evaporation from the foliage. Maintain the night temperature at 60° to 65°, 70° to 75° by day artificially, advancing as much as can be had after the sun passes the meridian. The plants should have liquid manure about once a week. Plants that set their fruit early in September are ripening. The house should have air constantly and a temperature of 70° to 75°, with as much more as can be accorded by day, husbanding the sun heat, but not closing the house, withholding water from the atmosphere and roots. Fruit though not of high flavour proves acceptable from variety at Christmas or even later.

**CUCUMBERS.**—Continued firing dries the atmosphere more than is good for their foliage, the fruits becoming stunted and swelling indifferently, and when the pipes are close to the roots the soil is dried too much for healthy growth. Be careful in ventilating, providing it, however, whenever a favourable opportunity offers, but exclude air when the external atmosphere is sharp and cold. In bright but cold weather turn off the top heat when the sun is powerful and likely to raise the temperature above 80° in such weather, damping the house morning and afternoon, closing early. Care must be taken in damping so as not to wet the embryo fruits, as they will damp off if water remain on them or hang from their points for any little time. Water will be required at the roots about twice a week. Maintain a temperature of 60° to 65° at night and 70° to 75° by day.

Winter fruiters, or plants from August or September sowings, having grown to the extent of the trellis, should not be allowed to fruit for a few weeks unless they are unduly vigorous and there is a pressing demand for fruit. Attend frequently to stopping and tying, thinning, avoiding overcrowding and overcropping as the two greatest evils, subduing canker at the collar with quicklime well rubbed into the affected parts, removing every decayed leaf and bad growth promptly. If mildew appear, dust with flowers of sulphur, it being well to dust some over the plants with a view to its prevention. Aphides should be destroyed by fumigation with tobacco, being careful not to give too much. It is best to fumigate on two or three consecutive evenings, or preferably follow the evening with early morning fumigation.

\* All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

**Sonerilas (J. II.).**—To have pans and pots of these in good condition cuttings may be inserted in succession. They root freely in the

propagating frame in sandy soil, or, better still, all sand. They may be inserted thickly together in pots or pans, and transplanted into others when rooted. They flourish in any stove where the atmosphere is close and moist, if a shady position is found for them. They are effective growing amongst the moss in pots of Vandas, Acridas, and other Orchids of a similar nature.

**Fittonias** (*Idem*).—A few good pans of these are effective in the stove, and should find a place where the object is to maintain this structure attractive throughout the season. For this purpose insert cuttings at once. They root freely in any close, moist, and shady position if placed amongst chopped sphagnum moss and sand. When well rooted plant them in the pans in which they are to grow. They are most effective when well elevated in the centre. They grow luxuriantly in the compost advised for Bertolonias. Where small plants for various forms of decoration are in demand few surpass these in beauty when mixed with Mosses and small Ferns.

**Thrips on Ferns** (*E. F. C.*).—You cannot smoke too soon. Do it gently, yet fill the house with smoke. Do this two nights in succession, syringing the plants the morning after each smoking. You must have the foliage dry before smoking, though you may and ought to sprinkle every available surface with tepid water twice daily, taking care not to wet the fronds. This will surcharge the atmosphere with humidity or moisture, and that is what Ferns require.

**Heating Power of Conical Boiler** (*J., Old Subscriber*).—The heating power of a boiler the size you name is equal to about 120 feet of 1-inch piping, but as you only require it to exclude frost or maintain a temperature of 45° we think it will be sufficiently powerful to heat both structures; but you say nothing as to the size of the houses. If ordinary lean-to's of 10 to 12 feet width the water will not require to be kept very hot in a flow and return pipe running the whole length of the structure to maintain the temperature required in severe weather, and in that case your boiler will answer, not otherwise. There is no occasion whatever to move the boiler, as the water will circulate as freely one way as another. The sideways may be used in the manner you propose, making sure that one is a flow and the other a return socket. Keep the piping in both houses as near as possible on the same level to insure the water circulating uniformly.

**Fuchsias from Seed** (*S. T. R.*).—We have raised many hundreds of plants from seed, but few of them on flowering proved equal to existing varieties; still the pursuit is interesting to amateurs who desire to have something new of their own raising. The pods should be carefully gathered when ripe. As the seeds are enveloped in a pulp it is necessary, in order to preserve them, to cleanse them effectually. This is done by washing; bruise the berries with the hand, and mix them with water; as soon as the pulp is all washed off pass the liquor through a hair-sieve fine enough to catch the seed, wash it repeatedly till it is quite clean, then dry it gradually; put it up in brown paper, and keep it in a dry room till spring. Sow now in a mixture of light sandy loam and peat, cover slightly, and place the pots in a gentle hotbed. When the seedlings are half an inch high transplant them in rows across pots 3 inches wide—these will hold about twenty or thirty plants each—and then replace them in the hotbed. In these pots they may remain for a month or six weeks, and then they will require placing singly into 3-inch pots. Place them for a few days in a cold frame, and keep pretty close and shaded till fresh roots are formed, and then they are then able to bear the full light, and a moderate admission of air. Give plenty of the latter as they acquire strength, and when the pots are full of roots give another shift into 4-inch pots, and let them remain in these till they flower. Many of them will flower the first year, and then is the time to make a selection. The selected ones should be repotted, and grown to the end of the season to prove them. Cuttings of the best may be inserted, and the whole kept in the coolest part of the greenhouse during the winter.

**Profitable Flowers** (*J. T.*).—There is a good demand for Bouvardias, but by far the best prices are obtained in provincial towns. The London markets would appear to be well supplied with them, large quantities being grown in Kent and Sussex especially, and as a consequence prices are low, from 3d. to 6d. per dozen sprays being all that can be obtained. Unless exceptionally well grown, whole houses being given up to them for a few weeks, they do not pay well at the London prices, but in the principal provincial towns it not unfrequently happens the prices range from 1s. to 2s. per dozen, and in this case Bouvardias are decidedly profitable. The doubles are the best for the purpose, as although the singles are the most beautiful they are not serviceable enough for the markets. The two favourites are A. Neuner (white) and President Garfield (pink), and a trial might well be given to Thomas Meehan (double scarlet) and Victor Lemoine (bright scarlet), this also being a double-flowering variety. For local purposes we can recommend Vreelandi (pure white), Candidissima (an improved Jasminoides), Dazzler (rich scarlet), and the newer President Cleveland (bright scarlet), these being very floriferous single varieties. If not unduly shaded by the Maréchal Niel Rose, an intermediate temperature being maintained, the Bouvardias would succeed far better than semi-double Zonal Pelargoniums, the latter, though flowering freely in heat, being most impatient of shade. For the markets you cannot have any better Pelargoniums than F. V. Raspail and La Cygne, the demand being greatest for these at Christmas, any scarlet and white flowers selling well at that time.

**Barilla** (*G. B.*).—The plant to which you refer bears the name of Salsola or Halogeton sativus, which was grown extensively at one time

for the production of soda salts. "In the cultivation of the plant the seed is sown in January and February in the same manner as other ordinary seeds, and requires no special care. The seed becomes worthless if not sown the season following its collection. The plant is gathered in August. It is pulled up by the root, spread for two or three days, and then collected in small conical shaped piles, so that in case of rain the water may not penetrate so much into the interior and rot the plant. It is left thus about a month to thoroughly dry. If not then required to be burnt it is stacked and covered with esparto or rush to preserve it. The manufacture of Barilla is carried out as follows:—A hole is dug out in the form of a large round earthenware pot, about 1½ foot in diameter at the mouth, about 4 feet at the bottom, and depth about 3½ feet, the inner part of which is well beaten, and then covered with a slight smooth coating of mud. A small quantity of wood is then burnt to ashes in this hole to dry and heat it, when it is cleaned out and a couple of iron rods or bars are placed across the mouth, over which bars a quantity of the plant is placed and fired, more being added continually as it is consumed for about twelve hours. Then the bars are removed by means of a large, bent, two-prodded, wooden fork, the boiling substance in the hole is thoroughly stirred, till it becomes even and smooth on surface like molten lead; then the bars are replaced, and the same operation repeated until the hole is filled, when the entire mass is finally stirred as described. The mouth of the hole is then closed up, and the Barilla is left about a week to cool thoroughly, during which time it hardens and cracks into pieces. The hole has then merely to be dug around and the Barilla taken out."

**Cannas in Pots** (*B. D.*).—*C. iridiflora*, broadly acuminate leaves, the whole plant attaining to a height of 6 feet or more. Its flowers are Iris-like, large, rose coloured with a yellow spot on the lip; the spikes droop gracefully, several emanating from the same spathe. *C. iridiflora hybrida* has large blood red flowers, very effective, the foliage green and bold. It also attains to a height of 6 feet or more. *C. iridiflora Ehemanni*, immense foliage of an attractive reddish hue, flowers bright crimson, perhaps the noblest of all Cannas. *C. Bihorelli*, leaves red in a young state, changing to deep bronze with age, flowers deep crimson, very freely produced, height 5 to 6 feet. *C. gigantea major*, leaves green, petioles having a velvety down covering, flowers large, orange red or scarlet, very ornamental, height 6 feet. *C. nigricans*, dark bronze stems and foliage, red flowers, one of the finest, height 4 to 6 feet. *C. Annæi*, green glaucous foliage, flowers salmon. This is perhaps the most glaucous of all the kinds; height 6 feet. *C. Prémices de Nice*, an exact counterpart in foliage of *C. Annæi*, of which it may be a variety, flower large, bright yellow, height 6 feet. *C. zebrina*, fine deep green foliage, passing into dark red rayed with purple, stems dark violet red, in foliage very effective, flowers small, orange, height 6 feet. *C. musæfolia maxima*, fine large green Musa-like foliage with dark petioles, stately in contour, flowers orange red, height 4 feet. *C. grandiflora floribunda*, foliage dark, flowers large, red, freely produced, height 3 to 4 feet. *C. Van Houttei*, foliage green, rayed and margined purplish red, flowers large, scarlet, and very freely produced; height 3 to 4 feet. *C. Chatei sanguinea*, leaves ovate elliptic, deeply tinged purple, red flowers, height 3 to 4 feet. *C. nobilis*, leaves rayed and margined red, flowers red, height 3 to 4 feet. The two last are undoubtedly varieties of *C. Warseewiezi*, dark foliage, blood red flowers, height 3 feet. There are many other fine species and varieties, but commencing with *C. iridiflora Ehemanni*, probably thirteen choicer varieties do not exist for decorative purposes outdoors, being in respect of foliage and flowers highly effective. Cannas, however, need improvement in the direction of the flower in form, substance, and size; indeed, there is no reason why they should not be as remarkable for the beauty of their flowers as they are now for their unique grandeur of foliage and habit.

**The Movements of Leaves** (*J. J. R.*).—Spontaneous movements of leaves, or those in response to some direct irritation, are interesting. They have been subjected to close scientific study in the case of such as the *Dionæa* and *Droseras* with surprising results, the carnivorous plants having enjoyed a notoriety far exceeding the "Weather Plant." The infolding of the leaf lobes in the *Dionæa* when some substance is introduced is familiar to many now, as also is the rapid drooping of the Sensitive Plant leaves when touched. There is, however, an occupant of the stoves in some botanic gardens which displays a still more remarkable phenomenon in its leaves, and which is not nearly so well known. This is the Telegraph Plant, *Desmodium gyrans*, a member of the Leguminosæ, and a native of the East Indies, and by no means a novelty. Though Mr. Darwin and others have determined that most plants have a spontaneous motion in their growing stems and roots, these are so extremely gradual that they are not readily observed, and can only be tested by careful experiment. In the *Desmodium*, however, we have a spontaneous movement that is visible and strongly marked. The leaves consist of three leaflets, the centre one large, oblong, or elliptical, and at the base on each side is a small narrow leaflet, which possesses a peculiar property. When the plant is healthy and growing these leaflets rise alternately by a series of little jerks until they are nearly perpendicular, and then descend in a similar way, to resume their action when the other leaflet has gone through a similar process. This takes place without the application of external stimulant beyond that afforded by light or heat; the rapidity of the movement varies greatly, however, and in dull weather it is much reduced or ceases altogether, as it does when the plant becomes unhealthy or old. Sometimes the motion is confined to a few leaves, but it seems to depend chiefly on the age of the plant, the weather, or the conditions under which it is grown. In cold or a dry house it is much lessened, and does not continue so long.

**Names of Fruits.**—The names and addresses of senders of fruit to be named must in all cases be enclosed with the specimens, whether letters referring to the fruit are sent by post or not. The names are not necessarily required for publication, initials sufficing for that. Only six specimens can be named at once, and any beyond that number cannot be preserved. —(John Callaghan).—Pear Van Mons Léon Leclerc. Apples: 1, Royal Russet; 2, Blenheim Pippin. *James Grant*—1, Catillac; 2, Spanish Warden; 3, Marie Louise; 4, Not known; 5, Catshead; 6, Blenheim Pippin. (*J. M.*)—1, Court Pendù Plat; 2, Adams' Pearmain; 3, Lemon Pippin (true). The others we cannot identify; we suspect they are local varieties. (*Mrs. Drinkwater*).—Pears: No. 1, Beurré Diel; 3, Easter Beurré; 4, Beurré Superfin. Apples: A, Ribston Pippin; B, Not known. There was no No. 2 Pear. (*C. H. H.*).—The Pear is Gilogil.

**Names of Plants.**—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (*A Reader*).—We do not undertake to name florists' flowers, and if we did, the Chrysanthemum sent is not in sufficiently good condition to be recognisable. No. 1 is *Vinca rosea*; No. 2 is apparently an *Acalypha* leaf. (*J. R.*)—1, *Dendrobium nobile*; 2, *Cypripedium insigne*; 3, *Masdevallia Harryana*.

COVENT GARDEN MARKET.—NOVEMBER 19TH.

BUSINESS steady, with scarcely any alteration in prices.

SWINE.

THAT everybody cannot manage swine, otherwise pigs, to their satisfaction we have recently had evidence in inquiries upon matters of detail, which to an old practitioner are so simple that reference to them in the Journal would appear to be altogether superfluous. It certainly is difficult to remember always that beginners require prompting in the most trivial matters, even of pig management, and that minute explanation always, though tedious to the some, is highly valued by many. Some point over which they have been puzzled is made clear, the reason why it is important is explained, and that diffusion of useful knowledge which is the special aim of the Journal is accomplished.

Turning first of all to pig feeding, it may be said generally that they will consume all kinds of corn, pulse, roots, and green crops; but there must be some discretion in the selection and use of food so that waste may be avoided. No pig that is worth having should be suffered to sink into a condition of semi-starvation. From the first young pigs should be assisted, for they will drink milk when only a few days old, and it may gradually be thickened with meal till at weaning they will eat very much the same food as the older animals. Fine middlings is what we prefer using for young pigs, and after weaning, some coarse bran mixed with it occasionally does good. If the pigs are to be kept for jointers or bacon hogs, coarse middlings mixed thinly with water, or preferably with buttermilk, is the principal food, and in addition there may be given some maize, peas, or beans slightly broken by a kibbling mill as they gain size.

Prices fluctuate, but there can be no question that porkers of from 50 to 70 lbs. answer best for the markets of London and other large towns. Under a regimen of milk and meal they quickly reach that weight, but much depends upon the manner in which they are prepared and packed for market. They may of course be disposed of to a dealer alive, but if they are intended for Smithfield they must be well dressed, carefully packed, and dispatched so as to reach market in time for the early sales. If they arrive late in the day they often remain unsold till the following morning, and if not unpacked till then there is apt to be a want of freshness about them, which is at once detected by the keen eyes of a clever buyer, with the inevitable result of a low price.

It is sometimes advised that young pigs should have plenty of food to run to at will always. No doubt they require food frequently, but they should often be made to clear all up, and the feeding vessels should be kept free from any accumulation of filth. A watchful eye must be kept upon everything connected with the pig and its food; only keep it warm, clean, and comfortable, with as much food as it can consume, and it is quite certain to fatten quickly. But too often filth is allowed to accumulate to such an extent that the pigs become diseased, and there is a serious loss. All this may be avoided by the exercise of ordinary care. At this season of the year they suffer much from cold, and absolutely revel in plenty of dry litter, under which they can burrow and sleep in comfort. By all means let them have it; only take care that it is clean as well as dry, and then nothing but good can follow.

Meal and milk is the very best diet for porkers, and the pork is certain to be both wholesome and delicate, without any tinge of coarseness. Butter factory companies should bear this in mind, and endeavour to make the breeding and feeding of porkers for market a much more prominent feature than they have done

hitherto. The one difficulty of such factories is the disposal of separated milk; that difficulty is at once overcome if only they breed plenty of porkers and dispose of them to the best advantage. To do this our advice to send a really first-class article to market must be acted upon. Commission salesmen are much abused, and not altogether undeservedly, but there can be no question that much inferior produce is sent to them for sale which they have to get rid of in some way or other.

A little watchfulness is the best guide as to the quantity of food used. In this matter breed tells wonderfully, a really well-bred pig requiring much less food than an inferior animal. We have now some well-bred black Suffolk sows with young litters of pigs, which while pregnant were repeatedly said to be too fat. In point of fact they were not fat at all, but their compact square frames always gave them a lusty appearance; while some Essex sows having the same amount of food were thin enough in all conscience, with their long tapering snouts and long thin bodies. Curious indeed is it with what dogged persistence breeders will continue breeding such unprofitable animals. Certainly they have no excuse for doing so when there are so many ways open to them to obtain really well-bred pigs. Most remarkable upon the progeny is the effect of only one parent being well bred, and to breeders in a small way who cannot afford to keep a boar we say, Take all care to obtain good sows and you are quite certain to breed useful pigs, but if possible always have select parents of both sexes.

#### WORK ON THE HOME FARM.

With such frequent changes of weather, of rains, storms, frosts, and dense fogs, we cannot be too careful to afford shelter to all animals. Even sheep are the better for it, and, as we have urged so frequently, a dry hard floor and a fairly snug open shed are most desirable for sheep during winter. Ewes that were run with the tups towards the end of August must now have especial care. They must have very few Turnips, and be kept altogether out of muddy folds. With an abundance of feed upon pastures they will require nothing else while the weather continues open, but due provision should be made against hard frost and snow. A stack of Pea or Oat straw—the former preferably—plenty of sweet wholesome chaff, crushed Oats, and some bran should all be stored in readiness, so that there may be no want of food at any time. We decidedly object to having pregnant ewes burrowing for food upon a snow-covered pasture. The food so obtained does them very little good, and they are liable to become much exhausted when driven to do this by hunger. Let not the evil effects of a Turnip dietary upon ewes at this season of the year be forgotten. They may not suffer if the weather continues mild; on the other hand they may, and there may be a serious loss of many valuable animals.

Some hoggets folded upon white and yellow hybrid Turnips are so forward in condition that we shall soon begin drafting the best for sale. Younger and more backward hoggets are also in similar folds at night, with a run upon grass by day. The high price of sheep has the usual effect of leading folks to pay extravagant prices for inferior animals. We saw some hoggets sold recently at 45s. that were terribly low in condition, and several of them were suffering from foot rot. Certainly the buyer was a rash speculator, whose bargain was a very questionable one.

All roots intended for storing in heaps should at once be carted off the land. Nothing is gained by leaving them out so late in November, yet we have seen much of this work only just begun since writing our last note. The late Wheat sowing is being done in better style than usual, the mellow soil not being too wet admits of a thorough finish being given to the work. Never was autumn weather more favourable to good practice on all arable land; it is true the long spell of dry weather made some heavy land so hard that winter corn sowing has been delayed, but that little trouble is now ended.

#### THE ENGLISH SEED HARVEST.

RED CLOVER (*Trifolium pratense*, *perenne*).—This proves to be a very irregular crop, the Continental harvests are reported to be unsatisfactory generally, excepting in more southern districts, and a considerable proportion of the new seed is weather-stained. On the other hand, the American crop has been to a large extent reduced in quantity by extreme drought, and the grain from this district is again small, more or less sickly, and wanting in colour. There is also reason to believe a smaller area has been grown in Europe during the past year in consequence of the low prices that then prevailed. The small quantity of English seed produced is expected to compare favourably with the imported samples, the fine weather throughout September in England having been favourable to its development.

White Clover (*Trifolium repens*).—We cannot in any way modify the

unsatisfactory reports that we have already published of this crop. In some districts the crop is a failure, both as to quality and quantity. In all parts of Europe the samples are greatly damaged in colour by rain, and the average germination will be found to be lower than that for several years past. American seed is small and deficient in colour.

Alsike (*Trifolium hybridum*).—Earlier European reports of this crop were generally satisfactory, but the late rains on the Continent appear to have greatly damaged what previously promised to be a good harvest. At this moment exceptionally high prices are asked, both in Canada, United States, and Europe, whilst it is impossible to match the bright samples we have been accustomed to see during the past few seasons.

Trefoil (*Medicago lupulina*).—Is very short in quantity and inferior in average quality, as a consequence prices have, during the past two or three months, jumped from 21s. to 36s.

Lucerne (*Medicago sativa*).—This is only a moderate crop, and values may be expected to have an upward tendency.

Timothy (*Phleum pratense*).—The quality of the new deliveries of this seed is satisfactory, but the American reports point to a shorter crop than last year. This is accounted for by the decrease in the acreage under cultivation. At the present moment prices of Timothy are favourable to buyers; it is not expected it will touch a lower figure.

Rape.—Reliable samples of Rape have been scarce for some time; the crop generally is certainly limited in extent, and for the present somewhat high average prices may be expected to continue.

White Mustard.—Is a fair average crop, the quantity under cultivation appears to have been smaller than usual, and good samples are offered at the time this report is written.

Swedes and White Turnips.—These crops were harvested in excellent condition, but no important variations in values may be expected for some time to come. Purple-top Scotch Yellows are very scarce, and the acreage under cultivation being again limited, high prices are expected to rule.

Rye Grasses (*Lolium perenne* and *italicum*).—The crops of these are reported to be generally inferior, whilst in consequence of the abnormal prices that have ruled for the last two or three seasons, a much smaller acreage than usual has been under cultivation. At the present time values of fine samples of Perennial Rye Grass have advanced 50 per cent. on last year's price, but it is not expected that this extreme advance will be fully maintained.

Natural Grasses.—*Agrostis stolonifera* (Fiorin).—The home crop will be comparatively good, and an average quantity harvested. American reports speak of a very limited crop only.

*Alopecurus pratensis* (Meadow Foxtail).—Average harvest and quality is satisfactory, through rather light. Prices favourable to buyers.

*Cynosurus cristatus* (Crested Dogstail).—Fair average crop, but the colour of the seed is poorer than anticipated.

*Festuca Duriuscula* (Hard Fescue).—Crop harvested splendidly, but seed on the average rather discoloured, bright samples will command higher prices.

*Festuca pratensis* (Meadow Fescue).—The crop is reported much shorter than last year, and higher prices are being asked.

*Poa pratensis* (Smooth Stalked Meadow Grass).—Crop very short indeed, even smaller than last season's. American reports state that the crop is almost a failure, and therefore high prices are expected to rule.

*Poa nemoralis* (Wood Meadow Grass).—Crop rather short, dark coloured, and prices rule high.

*Poa trivialis* (Rough Stalked Meadow Grass).—Crop favourable; prices will not rule above those of former seasons.—JAMES CARTER & CO., High Holborn, London, and Mark Lane.

#### REMARKS.

- 9th.—Rain in small hours; bright day; a little mist in the evening.  
 10th.—More or less fog till 2 P.M., lights necessary at times; a little mist in afternoon.  
 11th.—Dull and drizzly till 10 A.M., gradually improving, and bright sunshine from noon to 3 P.M.; fair evening and night.  
 12th.—Sun shining through slight fog in morning; brilliant afternoon; rain in evening and night.  
 13th.—Overcast and mild; practically free from fog.  
 14th.—Fog till noon; bright sun from 0.15 to about 2.30 P.M., then cloudy.  
 15th.—Wet from 2 A.M. to 7 A.M.; bright and fine from 10 A.M.

A very ordinary November week, temperature slightly below average.—G. J. SYMONS.

MAKING USELESS PEAR  
TREES USEFUL.

I HAVE a number of Pear trees on walls, some of which have been planted for twenty years or more, others about half that time, but all are practically useless. They bear small fruit sometimes, rarely large clean specimens which I hope for. Occasionally they are crowded with blossom, and they grow a forest of breastwood. Cut as I may it is all the same—one crop of shoots removed making way for another. I am told the trees are worn out, but cannot quite understand how ten and twenty-year-old trees can be worn out at the same time. I ask for information, and if I may be excused for saying so, would like it from someone who has really done himself what he would teach others to do in making useless Pear trees useful, if this problem has ever been solved." Thus writes a correspondent who is disappointed with his trees. Some of his observations are rather trite, and the subject on which he writes is of considerable importance, as there are Pear trees very similar to his own in many gardens.

We have the satisfaction of knowing that the problem suggested has been solved in several gardens. One of the most successful examples of improving Pear trees on walls that has come under our notice was at Impney by Mr. R. Parker, and the method he adopted has been described in the *Journal of Horticulture*. A Kentish fruit grower, Mr. R. Smith of Yalding, has also made useless Pear trees useful, and in a paper which he read at one of the meetings of the British Fruit Growers' Association he has told how he changed the character of his trees and fruit in the following words:—

There is an increasing interest in the culture of these most noble fruits, and much more fruit could be grown on large Pear trees on walls if the knowledge of how to induce more fruitfulness were possessed by the cultivator. Many large and well-trained Pear trees are to be seen throughout England. But it is not often one sees a crop of Pears on these good looking trained trees. Why is it? This is the question I have set myself to answer. Now let us examine carefully how these trees are pruned. In nearly every case the spring shoots are pinched in May or cut off in June, consequently more shoots appear; these, in like manner, are cut away to make the trees look neat. This is all very well as regards appearance, but it only pleases the eye for awhile. The owner soon becomes tired of seeing no fruit from year to year, and begins to inquire why they fail. The answer is not very difficult to find. Where large Pear trees produce a large quantity of breastwood they require root-pruning.

Root-pruning is well understood by some cultivators, others can learn from the frequent instructions in the gardening papers. One word, Root pruning must be done thoroughly. Assuming, then, that root-pruning is adopted as a means to induce fruitfulness for Pear trees on walls, in taking out the soil have it wheeled away during the operation, it will give more room for the work. I strongly recommend fresh soil to be used for filling up after the trees are root-pruned, as this is very essential. A good maiden loam is the best. Root-pruning induces fibrous roots, and fibrous roots well fed give good fruit. Coarse roots give a quantity of breastwood. After the Pear trees have been root-pruned and fresh soil given, farmyard manure should be placed over the fresh soil and then watered, giving a sufficient quantity over the mulch to reach every root of the tree operated upon. I have found the

end of October or the beginning of November a good time for root-pruning. Probably the trees will require looking after the following year in watering, particularly if a dry spring follows.

Pear trees very often have a crowd of blossom buds the second year after root-pruning, these should be reduced very much in number, leaving on a few evenly over the trees. This work is best done early in March, and if a large crop of fruit sets, thin the Pears, leaving only one or two to a bunch, one only if large Pears are required.

We have large trained Pear trees on walls that were root-pruned eight years ago, and fresh soil given, that have borne good crops of fine clean fruit. But before root-pruning they produced no fruit fit for table or market. Young Pear trees, say up to ten years old, I would lift, shortening all large coarse roots, and replant in fresh soil on the same site, or any other part of the garden, according to requirements or conveniences. The west wall is the best situation for the general collection of Pears. A few varieties succeed on the south wall, and a few on the east. I find the north wall aspect is too cold for Pears.

Much difference of opinion exists in regard to pruning wall Pear trees, and much depends upon the vigour of the trees, when to prune and how to prune. If the trees are old and have a good spread of branches, and a quantity of old spurs on those branches, I recommend the summer growth to be left until August, and instead of cutting the shoots off, as is the ordinary practice, I pull them out, or wrench them away from the old spurs, which admits light and air to the remaining buds or spurs. I am speaking of where there is an abundance of spurs upon the branches, as is often the case with old trees. If Pear trees are pruned before or at midsummer, much more growth will occur before autumn if the season is a favourable one, and this second growth is waste which should be avoided. I have found wrenching away the summer shoots instead of cutting answer all my expectations, and can confidently recommend it.

I find it good practice to shorten a few spurs every year. About the middle of September is a good time to do this work, because the wounds made by cutting off these spurs soon heal at the end of summer. Some of our old trees that were spur-pruned rather severely a few years ago have formed fresh spurs close to the branch and wall; upon these we have our best fruits. I endeavour to keep the spurs as close to the brick wall as possible, and do not allow one spur to shade another. Let every branch of the trained tree upon the walls have sufficient light and air, and also every spur upon the branch, remembering always that the more sun, light, and air the cultivator can admit between the branches and the spurs, the more heat he has from the wall. Cultivators very often overlook this all-important matter in wall trained Pear trees. Better have half the number of branches than the branches to be crowded; again, better have half a crop of good fruit than a full crop of inferior fruit. Our Pear trees thus pruned a few years ago looked younger instead of older, and are much neater than before. I do not recommend a great quantity of spurs to be cut off every branch at one time, better do the work a little every year until the whole is complete; by so doing there is no risk of losing a crop of fruit.

I have been dwelling upon the old trained Pear trees upon walls, knowing that there are many well trained trees that would be objects of beauty if they bore crops of good fruit. My aim is to point out how this can be brought about. First, root-prune to check excessive growth, giving fresh soil to the roots, then mulch with decayed farmyard manure; give water freely in dry hot weather; thin the spurs, and keep them as close as possible to the wall; thin the blossom buds if too numerous, also the fruit when set in bunches. Never aim at a large crop in any one year, but rather a moderate crop yearly.

The trees should be relieved at flowering time by rubbing off half or more of the blossom buds. I feel sure if this were adopted

more generally it would help very much to prevent exhaustion of the Pear trees in the spring months. If this disbudding were carried out systematically great benefit would accrue to the trees, and probably they would flower more regularly every year. It is a well known fact that when Pear trees have large numbers of flower buds one year they have few, if any, the next.

I do not propose to say much about stocks further than I find some varieties do not like the Quince stock with us, others thrive upon it. My opinion is the Pear stock suits the majority of soils better than the Quince stock. However, cultivators would do well to consult the fruit tree growers in their own districts, and further find out from a few gardens where Pears are well grown what stocks suit the district—that is, the soil and situation. Soil has a great deal to do with Pear growing in any district.

The wall Pear trees have the same protection during winter and spring as the Peaches and Nectarines—namely, 11-inch wide boards at the top, fastened to iron brackets or bolts. These boards are put up in November, and taken down about the end of May. They are all the protection the Peach, Nectarine, and Pear receive during the spring months, and we grow these fruits very successfully, and have done so every year for twelve years past. My twelve years' successive crops of Pears should tempt others to become cultivators, and those who have only been partially successful should persevere until they attain still better results, procuring with wall Pear trees crops of fruit every year. This is better than blaming the weather for failures, which is too often done undeservedly.

In the above practical notes by a cultivator who has "done what he teaches" we hope our correspondent will find the information he seeks.

### SYRINGING AND WATERING PLANTS.

As a supplement to the remarks of "M. D." on syringing, page 397, perhaps it would not be out of place to say a few words on watering plants in pots, especially at this time of year, when water should be supplied cautiously.

In the first place let it be said that there is a right and a wrong way of watering plants, and depend upon it if a person is not of a thoughtful and observant nature the wrong way will present itself, and perhaps be adopted first. Not a few gardeners suppose that it is positively essential to water a plant as soon as it is fresh potted, and if their method is opposed they will bring various worthless arguments to support it, the most common one being "that a good watering settles the soil." There is no doubt that it does "settle the soil," and it is my opinion that in a good many cases it also goes a long way to "settle" the plant.

To prove the error of this practice let us take for example a plant that is recently potted, say from a 5-inch into an 8-inch pot. The root action of that plant is suspended for a time, and if the potting soil is in proper condition—that is, neither too wet nor too dry—no water will be required until the young roots have fairly commenced to move. But suppose that plant is watered, the old roots and the new soil are saturated, and the young rootlets on pushing out feel this cold wet soil, and as a natural consequence turn black and wither, and the plant struggles out a weary existence until the soil becomes in a suitable condition for the roots to penetrate. Hardwooded plants, particularly Roses in pots, are most susceptible to this treatment on account of their root action being slow. Pelargoniums, if watered as soon as potted, never come away so freely as they would were they left eight or ten days, or even longer in dull weather.

Another erroneous way of watering plants in pots is giving them a little drop every day. The watering is done one day, and if a plant is not dry enough to water thoroughly, it is given a little drop "just to prevent it becoming dry." The next day the plant is in a similar condition and a little drop more is given, and so on from day to day. Some plants will stand this kind of treatment longer than others, but all must sooner or later become a prey to sour soil, for the roots are never properly dry nor thoroughly wet.

An evil arising from this continual dribbling is that the plant in time becomes waterlogged. How is this? Because enough is not given to pass straight through the pot and keep the crocks clear. So it follows that the right way to water a plant is to first let the soil get dry enough, not too dry mind, and then to fill the pot from the surface of the soil to the level of the rim. This will be

enough to pass through, wetting the whole thoroughly, and clearing the drainage as it passes out.

One more point, and that is in watering plants in houses take care to have the water as near the temperature of the house as possible; evil results cannot help but follow the application of very cold or very warm water.—F. A., Kelton, Aigburth.

### DAVALLIA PARVULA.

THIS charming little Fern is a native of Borneo, and is deserving of a place in every fernery, although at present it is not so frequently met with as might be expected. The rhizome is slender and creeping, as in the other species, but the fronds are very diminutive, finely divided, and dark green, while the height of the entire plant rarely exceeds 3 or 4 inches. It may be grown in a Wardian case or under a large bellglass, and requires a small portion of the stem of a Tree Fern to cling to. Over this the rhizomes will run freely, producing delicate and pretty little fronds. Any approach to stagnation in the soil or on the fronds must be carefully avoided or they will speedily damp off, but at the same time a deficiency of moisture is equally fatal. For this reason a Wardian case is especially adapted to its requirements, as the suitable degree of moisture can easily be maintained. The pan must be well drained with clean potsherds, the largest at the bottom and a layer of smaller pieces over them. The soil should consist of fine fibrous peat, with a good proportion of silver sand. If the Fern stem intended to support the plant is placed in an erect position the water may be applied at the top, and allowed to trickle down the sides. Sprinkling water over the fronds too freely is not advisable. A temperature of 60° to 76° is necessary to obtain it in good condition.—F.

### STRAWBERRIES IN POTS.

THE weather during July and August encouraged rapid growth in plants that had been layered early in their fruiting pots from vigorous young plantations. The weather during September could not have been better for the development and maturation of the crowns. Throughout the plants should be in the best possible condition, and judging from our own stock good results may be anticipated during the forcing season. Cultivators will act wisely in leaving their plants outside for some time to come. Nothing is gained by rushing them under glass to protect them from early frosts and heavy rains. The plants do not start into growth earlier by this treatment, but the reverse. They are often stubborn and refuse to start freely when required to do so. This is reasonable, and only what may be expected. The protection of frames keeps the plants slowly moving and prevents their going to rest as early as they would if given natural treatment outside. If success in early forcing is anticipated it is important that the growth of the plants be brought to a complete standstill before starting them again into growth. Cessation of growth, if only for a brief period, is essential if the plants are to start when introduced into the forcing house strongly and quickly. It was a common practice at one time when closing early vineries and Peach houses in November to fill the shelves with Strawberries, and this often took place before the plants had completed their growth, and failure or partial failure was the result, plants started a month or six weeks later generally surpassing them and giving more than double the weight of fruit. Drying the plants and thus forcing rest upon them is ruinous in its results. No artificial system of inducing the plants to rest can be compared with the low temperatures and frost to which the plants are exposed when left outside. Once the plants have been thoroughly frozen and are allowed to rest for a short time afterwards they may be introduced to the forcing house with certainty of success. If the pots have been well drained and are standing upon ashes heavy rains will do them no harm.

When hard frosts commence, and heavy falls of snow may be anticipated, the plants may be placed in cold frames closely together if they can be spared for them. But in few gardening establishments can frames be devoted to them where large quantities are grown. They are not necessary, the plants are perfectly safe outside if the pots are plunged to the rim amongst ashes or leaves to protect them from frost. Long spells of severe frost are liable, however, to damage the rims of the pots even when plunged. Perhaps the best of all methods of protecting them is to plunge the pots in beds of ashes facing the south, and place boards round them, secured into position by driving a few stakes into the ground, to which the boards are nailed. Corrugated zinc sheets or rough shutters made to throw off rain and snow is all the protection they need. Further protection can be afforded the pots when the weather is very severe by scattering over them a little dry bracken or dry straw. For the next month or six weeks the plants will be

better unplunged, but all can be provided ready, and the plants placed close to where they will be wintered. When plunging takes place the plants must be placed close together, and in their present stage they are better standing sufficiently far apart, so that air can have free access to them.

Much feeding during the spring will be saved by top-dressing the plants before they are introduced into the forcing house, or in the case of late batches before they begin to grow. For this purpose fibry loam should be broken up moderately fine, and mixed with equal quantities of cow manure. Failing to obtain the latter, fresh horse droppings rubbed through a half-inch sieve will answer the same purpose. One 10-inch potful of soot may be added to each barrowful of the compost. Wood ashes may be used in place of the soot where the latter cannot be obtained good, or equal quantities of both may with advantage be used. If the loam is deficient in lime a 5-inch potful to each barrowful may be incorporated as the work of top-dressing proceeds.—WM. BARDNEY.

#### "AMATEUR" ROSE GROWERS.

IN brief answer to "J. B.," I would say first of all that I am sure I for one would not laugh at his planting a choice Rose by candlelight, but should heartily admire his enthusiasm. At the same time I would suggest that it would have been better to have "laid it in" by candlelight, and to have waited, even three months if necessary, for a spare quarter of an hour of daylight, in which to plant it at less disadvantage.

Again, I think he is mistaken in thinking that "a man of means can leave his Tea Roses unprotected from frost till the last moment as it were." I should expect to find such a one caught unawares, and for myself, if I had help, I should cover them up earlier than I do. With regard to his main contention, I still think there is no grievance. As was well stated a year or two ago in the Journal by a leading amateur in response to a similar complaint, it is "pluck, not protection," that is wanted. "An Exhibitor" and "J. B." should bring their views before the annual meeting of the N.R.S., and I think they will find no disposition to stifle discussion or to neglect the prospects of small growers; but they should be prepared to propose something definite themselves.

The suggestion of "An Exhibitor," if I rightly understood him, was that there should be a general numbering of plants among amateurs, and that we should show in classes according to our returns. When I stated in answer to this that victory did not by any means necessarily rest with big battalions, and added a private opinion that a man with 1000 Roses might at his best show as good a twenty-four as the man with 2000, I was told "any schoolboy" could refute such reasoning. It was not meant as reasoning, and still less as arithmetic; but if he could see the statistics of the National Shows he would find that it has not seldom been proved. I did not answer at once, as I gave "An Exhibitor" considerable credit for standing to his guns in response to an unexpectedly heavy volley, and he admitted he had been mistaken as to the 3-acre business.

But even "J. B." does not uphold "An Exhibitor" in his proposal. It is not the number of plants grown, but the number of men employed that he objects to; but, although no doubt "D., Deal," was right in the exceptional case that he recorded because it was exceptional, I have no hesitation in saying that among leading amateurs "six men" are even more visionary than "3 acres." Apparently his suggestion is for classes for amateurs "employing no regular gardener;" and although he is quite wrong in placing me "in the very front rank of exhibitors," this protection would not shut me out, and neither would it exclude, unless I am much mistaken, two or three at least to whom this position could not be denied. No, I am wrong; he does not like the usual formula "not employing a regular gardener," but apparently wants protection for those who cannot afford even occasional help. I do not quite see how this is to be managed; he should formulate his requirements. A class "for those who allow no one else to touch their Roses or Rose beds" might not be satisfactory, and "for those who do not pay income tax" might be invidious.

It is true that a business man who cannot give daylight to his Roses when necessary is very seriously handicapped in show competitions; but I fear a class "for those who can only attend to their Roses by candlelight" would not answer.

Seriously, I would heartily support any proposition that would encourage such true amateurs and take away any real grievance, but I think that limitations as to space, plants, and men would not be successful.—W. R. RAILLEM.

#### LOCAL ROSE EXHIBITIONS AND THE AMATEUR CLASS.

I MUST confess I feel highly gratified to think that there are others besides myself who feel the smart of so great a monopoly at our Rose shows. Remembering it is by discussion that knowledge is gained and grievances redressed. It cannot be denied that the schedules of the National and many of the provincial and affiliated societies as at present

constituted are a monopoly, inasmuch as there is every facility and encouragement provided for the larger growers, but none for the smaller.

I venture to quote a passage from the "Rosarian's Year Book," 1890, at page 16, commencing at line 16, by the Rev. H. T. Frere, who says we want more Rose growers and exhibitors, as they are the feeders of the National, and the young ones are either timid or wanting in energy, and adds: "We ring changes of the prize list on too small a peal year after year. A, B, C, D, &c., never an E or F." I must say I thoroughly endorse his sentiments, but what chance is there for any small grower to exhibit at any of the large shows as matters stand now? Is there any wonder at timidity, or even lack of energy, seeing that the schedules are framed in such a manner as to obstruct the smaller growers? What inducement or encouragement is there? None.

I think it is quite time that the peal of changes were extended. Why should not the Committee of the National uphold its dignity worthy of the title it now holds, by making it thoroughly national, setting a good example, and preventing any infringement in the classes? But so long as the smaller growers are open to such ungenerous treatment, how can they expect the young exhibitor to join their ranks with any degree of success? Let the Committee make fair distinctions between the classes of growers, giving each according to his class a chance of honourable merit, perchance realising his ambition to win a prize. I think it would be the means of putting an end to a grievance of long standing, and induce more persons to join the Society. The influx would be greater at the turnstiles, more friends of the exhibitors, besides an increased following of the general public? Taking all this into consideration the affair would undoubtedly be more remunerative, decidedly more national, and give greater satisfaction and more encouragement to the young and rising exhibitor, stimulating him to greater exertions, knowing that he is honourably handicapped, and justice and fair play meted out to him.—AN EXHIBITOR.

#### IN MEMORIAM.

##### THE LATE MR. SHIRLEY HIBBERD.

WE shall all be the poorer for the loss of this genial friend and gifted comrade in the gentle art. Leaving to others to estimate or measure up if they can his distinguished services to horticulture, I would pay grateful tribute to his social and philanthropic labours on behalf of gardeners. To see, hear, and converse with Shirley Hibberd was like a draught of cold water to many hungry, thirsty, provincial gardeners. He had also in a special degree the rare merit of clothing the dry bones of horticultural theory and practice with an alluring light and a cultured sweetness that won and kept for him a wide circle of readers and hearers to the last. Peace be to his memory, and may his words and deeds live after him in a race of young botanists, gardeners, and writers, whose works shall show that they have sat at the feet and learned of Shirley Hibberd.—D. T. FISH.

OUR late good friend and fellow worker in a common cause has left a blank that can never be filled in his own unique way. Only one Shirley Hibberd can be produced in a generation. He was a man of generous impulse and vivid imagination. I sat by his side at the Strawberry Conference, where we both read papers in the miserable St. Stephen's Hall of the Royal Aquarium last July. When Mr. Hibberd stood up to read his paper I felt the draught from the open window at the back, and observed its effect on his hair. Very quietly, but immediately, I had the window closed. After reading for about half an hour he sat down, placed his hand behind his head, and in tones of the deepest concern whispered to me, "The draught has been terrible. All the time it has been cutting my head off, and my neck is like ice. I *must* take a severe cold." I assured him the draught did not reach him for more than one minute, as the moment he stood up I had the window closed. "Very well, then," was his emphatic response; "if that is so I shall *not* take cold. It is all imagination. A wonderful thing is imagination; I don't know how I should live without it. I thought my neck was as cold as ice, when all the time it was as warm as toast. Thank God I shall not take cold, so that matter's settled." Nor did he. I should like to say more about him, but the shows of the "golden flower" he loved, and which was the theme of his last public discourse, block the way.—J. WRIGHT.

THE remains of Mr. Shirley Hibberd were interred in the Abney Park Cemetery on Saturday last, in the presence of about 200 of his friends and admirers. He had no relatives, except his bright little motherless daughter "Nellie," about five years old, who has for some time been under the loving care of Mrs. A. F. Barron, and we are glad to hear her future is provided for. Mr. Hibberd's coffin was covered in wreaths and floral offerings from Mr. and Mrs. Barron, Mr. E. Charlton, Messrs. Cannell & Sons, Mrs. Fitch, Mr. and Mrs. Knighton, Mrs. Charles Turner and family, Mrs. Dixon, Mr. G. Bunyard, B. S. Williams & Son, Mr. and Mrs. G. Gordon, Messrs. W. H. and L. Collingridge, Mr. G. Stanton (Ivy), Mr. James Crute, Mr. and Mrs. Jackson, Dr. Hogg, Messrs. Sutton & Sons, the United Horticultural Provident and Benefit Society (an anchor), Miss Roberts, Mr. and Mrs. Mitchell, and there was a basket of flowers from his child.

Among those present in the cemetery we noticed Rev. W. Wilks, the representative of the Royal Horticultural Society; Dr. Maxwell T. Masters, Mr. H. J. Veitch, Mr. and Mrs. Barron, Mr. G. Gordon (Mr. Hibberd's able assistant for more than twenty years), also Messrs. J.

Crute, H. Cannell, E. Hill, Tring; C. Warden, Clarendon Park; R. Ballantine, W. H. Collingridge, C. T. Drury, H. Balderson, W. Jordan, Regent's Park; E. Sanderson, T. S. Ware, Henry Williams, P. McKinlay, J. Weeks, A. Turner, G. W. Cummins, J. Cochrane, Finsbury Park; F. Fitch and W. Watson, Kew; F. Q. Lanc, J. H. Laing; Col. Mackenzie, Epping Forest; J. R. Chard, J. Willard, and the representatives of Messrs. Sutton & Sons, of Mr. W. H. Pollett, and of most of the gardening papers, besides many private friends of the deceased gentleman, who was a shining light in the horticultural world.

FROST IN OCTOBER.

IN Mr. G. J. Symons's "Meteorological Magazine" for November, the following particulars are given respecting the "Sharpest Frost in October for Half a Century."

Whole winters pass sometimes without a frost as sharp as that of October 28th, 1890; we therefore give a few particulars of it.

The following table gives in column 1 the date of every year since 1840 in which the temperature at Greenwich has in October fallen below 30°; column 2 gives the lowest air temperature in those Octobers; and column 3 the date on which it was recorded. The last two columns refer to Camden Square, London, and give the minima for the same months and years as were characterised by exceptional frosts at Greenwich.

It will be noticed that occasionally the dates are very different.

LOWEST TEMPERATURE IN OCTOBER.

YEAR.	GREENWICH.		CAMDEN SQUARE.	
	Temperature.	Date.	Temperature.	Date.
1842	28.3	20	No observations.	
1843	28.5	18	"	"
1859	26.5	24	26.6	24
1862	28.5	30	31.8	30
1868	29.3	20	27.8	19
1869	27.9	28	26.6	28
1872	29.1	14	31.8	13
1873	26.7	29	26.2	30
1877	28.2	18	30.9	19
1880	29.2	30	29.6	30
1881	26.2	17	27.3	17
1887	25.3	13	25.4	26
1888	27.9	8	28.2	8
1890	24.7	28	23.8	28

It is remarkable that instead of the last twenty-five years including, as theoretically it should have done, half of the instances of low temperature, it contains ten out of fourteen: moreover, the lowest, and the lowest but one, have both occurred in the last four years. This last October gives the absolute lowest both for Greenwich and for Camden Square.

But it was still colder in the more central parts of England. We cannot vouch for all the following readings being from verified thermometers, with no spirit at the top of the tubes, and duly hung in Stevenson's screens, but their general consistency shows that there is not much the matter. We give the readings in the order of temperature, starting with the lowest, and in order to keep the table within reasonable length, stopping at 22°: but we may add that in the greater portion of Scotland and Ireland the weather was not at all severe.

LOWEST TEMPERATURE ON 27TH—28TH OCT., 1890.

SEMI-EARLY OR OCTOBER FLOWERING CHRYSANTHEMUMS.

IT appears that there are so many new good semi-early varieties of this season that I think it well to say a little of them. It seems indeed that what has been desirable for some time—viz., that an October exhibition should be held for them to show their merits not possible either in September or November, and when I entered the Aquarium at Westminster on the 15th of that month was pleasingly surprised to see that the thing was accomplished; for although it was a fruit and flower show the Chrysanthemums were such a large feature that they were sufficient to make a show of themselves. Many of those exhibited were hardly such as could be considered October flowerers, but then the blooms looked so fresh in their not fully developed beauties that there was a delicious charm about them not belonging to the blooms of similar sorts kept so long under glass as is necessary in November. It was a new sensation.

The main feature of this Show was two large groups in fine order containing many old favourites, as well as several new sorts. One group was from Messrs. J. Laing & Sons of Forest Hill, London, S.E., and the other was from Mr. H. J. Jones of the Ryecroft Nursery, Hither Green Lane, Lewisham, London, S.E., and we have to thank these exhibitors especially, as there were no prizes for these fine masses of flowers, except the credit and publicity.

As for the novelties of this Show perhaps the exhibit of Mr. R. Owen of Maidenhead of a large number of seedlings raised in his nursery was the greatest. The seed grown by him was not produced in the way I grew mine, that is naturally as far as regards fertilisation, but regularly crossed one upon another, as Dr. Walcot of New York raised Sam Henshaw from Viceroy of Egypt and Comte de Germiny. Mr. T. H. Spaulding, of Orange, New Jersey, U.S.A., does the same thing. He says that a much larger percentage of good sorts come that way, and this season's experience of Mr. R. Owen seems to justify this opinion; indeed it is quite in accordance with very much experience or perhaps the law, that all breeding in-and-in tends to retard the development of a species; while breeding outwards, although often producing a reversion backwards, is one of the great openings to advance by selection, seeming one of the main keys to unbounded progress. The seedlings exhibited contained many very good varieties, but the greatest novelty was a good Japanese, which he has named Coral Queen, and a good name too, for it is more the colour of pink coral than aught else. It seems to me a new colour. This is the result of a direct cross between the Japanese varieties William Holmes and Pynaert Van Geert. I think it will be a very acceptable colour if not among Chrysanthemum growers, that it will be in the cut flower trade, and the ladies who are so great a factor there.

The most striking exhibits at this Show were some very fine blooms of a newly discovered white of most superb merit. It is named Bouquet des Dames, exhibited by Mr. N. Davis. How such a beauty has not been shown before is a wonder. It is a large bloom of great body; the blooms shown were, of course, from disbudded plants, grown in the best style, but it is likely such a powerful plant is fit for many other uses. Mr. Davis also exhibited a plant of the new American incurved variety, Miss Anna Hartzhorn, for which he received a certificate. This is another beautiful white, which will at once make itself a place in many collections. It is not so tall a plant as Bouquet des Dames, but very white and exquisitely delicate, probably fit for many decorative purposes if it should not prove large enough to satisfy the craving for size.

Mr. A. J. Manda, of the United States Nursery, Hextable, Swanley, Kent, showed a small board of Chrysanthemum blooms, among which was one of Mrs. Hicks Arnold. This is a new American variety, the first time exhibited. It is a very stout bushy sort. The plant grows not more than about 2 feet high, bearing a pale magenta to white flower, 4 inches across, very flat, reflexed near the middle, and incurved at the end of the petals, blooming this month or at the end of September. It is a very good grower, and quite a novelty in shape for any season, especially in October. It can be grown without sticks, and must command attention at once. He also had on this same board some flowers of Clarence Bryant, a new good American yellow. I have grown this, and it seems a very good sort. It is not too tall; a Pompon in size.

Harvest Queen, not yet exhibited in England as far as I know, is another American variety, said to be a sport from October Beauty, but is larger and better in its flowers than that. It is an excellent plant, good grower and robust; height, 3 feet. Bushy habit and a profuse bloomer. Flowers reflexed, very white, 2 to 3 inches across. It will be very good for cut flowers. We have nothing in the style at the time.

Cameleon is another October flowerer, 2 feet 6 inches high, of stout close growth. Blooms reflexed 3 inches across; colour, primrose. Its bloom is so thick a mass on the top of the plant as to form a solid table of flowers. It is one of the most profuse flowerers I ever grew. Very striking indeed in appearance.

Souvenir de M. Menier is a new crimson. It will probably bloom in

September next year. Grows 4 to 5 feet high. Blooms 4 to 5 inches across; of globular form with straight florets.

Mons. H. de Fortanier is rather a slender plant, 4 to 5 feet high, the flowers being about 5 inches across, of a bright purple crimson colour. This, as it has bloomed this season, is a thin flower showing a white disc, but as it is likely to come better next season if it be not valuable for anything else, will probably furnish seed with the capacity of descendants of a colour much wanted among the early sorts.

Madame Dolobel.—This is another useful semi-early, quite a new style in the forward sorts; 3 feet high. Flowers 3 inches across, incurved, red crimson in colour.

M. Hilliot is very similar to the above in colour and form of flower. About 2 feet 6 inches high. The flowers are rather larger than Dolobel.

Madame Ernest Bergmann.—A profuse bloomer. It is a pink Japanese, somewhat like Pink Lacroix, and will most probably be one of the early sorts next season. Grows 4 to 5 feet high.

Madame Ferdinand Bergman is a dwarf white, with straight petals, wide and stout.

Mons. Ernest Bergman is a thin growing plant, with fimbriated crimson flowers.

The following are all semi-early, and some of them probably early next season:—Mons. Robert Owen, Mons. Harry Laing, Rose Laing, M. Jules Humbert, M. Ulrich Brunner, H. Faisant Lamotte, and Mons. E. Barrillion.—W. PIERCY.

## CHRYSANTHEMUM SHOWS.

### LIVERPOOL HORTICULTURAL ASSOCIATION.

ON Tuesday and Wednesday, November 18th and 19th, the eleventh Chrysanthemum, fruit, and plant Show was held in St. George's Hall. The cut blooms, fruit, and plants had been arranged very satisfactorily by members of the Committee, and the hall looked at its best, not only from the ground floor, but from the spacious galleries on each side. The weather on the first day was very bad, but it is very gratifying to be able to announce that the attendance was excellent on both days. The greatest interest centred in the class for cut blooms. There were over 1700 blooms staged, all of the highest quality, and those in the losing stands need not feel discouraged, for many worse stands have been seen at Liverpool. For twenty-four incurved and twenty-four Japanese there were eight lots staged. Mr. C. Osborne, gardener to H. J. Robinson, Esq., Aymestry Court, Woolton, Liverpool, was well accorded the premier position. His stand contained grand massive flowers in both sections, and all very fresh, and Mr. Osborne must be congratulated on his success. The incurved in the back row were Golden Empress (two), Emily Dale (two), Lord Leicester (two), Queen of England (two). Second row: Lord Wolseley, Miss Haggas (two), Jeanne d'Arc, Violet Tomlin (two), Empress of India, Princess of Wales. Front row: Hero of Stoke Newington, Barbara, Mrs. Heale, John Salter, Jardin des Plantes, Empress Eugénie, Cherub, Mrs. Norman Davis. Japanese, back row: Mrs. Falconer Jameson (two), Etoile de Lyon (two), Sunflower, Condor, Madame Laing, and Edwin Molyneux, very fine. Second row: Stanstead Surprise, C. H. Wheeler, W. W. Coles, Yellow Dragon, Hamlet, F. A. Davis, Stanstead White, and Mons. Bernard, both superb. Front row: Avalanche (two), Boule d'Or, Stanstead White, Mons. Bernard, Marsa, and Sarah Owen. The second position was worthily taken by Mr. G. Burden, gardener to G. Cockburn, Esq., Lingdale Lodge, Oxton, Cheshire, who had an excellent stand. Particularly striking in the Japanese were Etoile de Lyon, without doubt the best bloom of the variety in the Show, and Condor. Mr. A. R. Cox, gardener to H. W. Watts, Esq., Elm Hall, Wavertree, Liverpool, was a good third, and Mr. J. Edwards, gardener to Henry Tate, Esq., jun., Allerton, Liverpool, fourth.

For eighteen incurved Mr. J. Brantingham, gardener to W. Radeliffe, Esq., Roselands, Aigburth, was first, being closely followed by Mr. G. Eaton, gardener to W. H. Shirley, Esq., Allerton House, Allerton; third Mr. G. Burden. For the same number of Japanese Mr. G. Eaton was placed first with a very fine stand of fresh blooms; second Mr. A. R. Cox, who had also a very good stand; third Mr. J. Harrison, gardener to Mrs. W. G. Bateson, New Heys, Allerton. There were two classes for twelve incurved, and the competition was keen in these, as in all the smaller classes. In Class 12, for twelve incurved, Mr. C. Osborne was first; Mr. T. Leadbetter, gardener to T. B. Hall, Esq., Larch Wood, Rock Ferry, second; Mr. W. Broadey, gardener to W. H. Jones, Esq., The Grange, Hooton, third. Class 13, for the same number, first Mr. P. Green, gardener to T. Gee, Esq., Greenhill, Allerton; second Mr. C. Smith, gardener to D. Wilson, Esq., Devonshire Place, Claughton; third Mr. F. J. Hartless, gardener to R. T. Wilson, Esq., Newlands, Hitchin. In the corresponding number of Japanese, Class 16, Mr. J. Wilson, gardener to H. Cunningham, Esq., Gorsey Cop, Gateacre, was first; Mr. T. Leadbetter second; Mr. W. Broadey third. Class 17, for the same number.—First Mr. G. Lyon, gardener to J. H. Kenion, Esq., Rock Ferry; second Mr. P. Green; third Mr. F. J. Hartless. For six incurved, first Mr. J. Watson, gardener to F. S. Hannay, Esq., Upton, Chester; second C. E. Terry, Esq., Otterspool Cottage, Aigburth; third Mr. T. Eaton, gardener to John Parrington, Esq., Roby Mount, Roby. For six Japanese first Mr. J. Watson; equal second Mr. T. Eaton and

Mr. H. McFall, gardener to E. C. Leventon, Esq., Oakfield, Roby; third Mr. J. Breen, gardener to J. Mosford, Esq., Tattenhall, Chester. In the class for six incurved and six Japanese for those who have never won a prize, first Mr. H. McFall; second Mr. T. Elsworthy, gardener to A. R. Gladstone, Esq., Court Hey, Roby; third Mr. F. J. Hartless. Six Anemones.—Mr. W. Wilson; second Mr. J. Wilson, gardener to J. E. Reynolds, Esq., Landfield Park, West Derby; third Mr. A. R. Cox. Six reflexed.—First Mr. W. Wilson, second Mr. G. Eaton, third Mr. A. R. Cox. Twelve Pompons, in bunches of three.—First Mr. J. Watson; second Mr. D. McKellar, gardener to A. G. Steel, Esq., Bark Hill Road, Aigburth.

Chrysanthemums in pots were not shown in such quantity as in former years. Four large flowered, there was only one competitor—viz., Mr. T. Wilson, gardener to D. H. Williams, Esq., Fulwood Park, Aigburth. Four Pompons, first, Mr. H. Shone, gardener to R. Bennett, Esq., Weston House, Halewood. One Pompon, first, Mr. T. Wilson with a splendid trained plant of Marie Stuart. Second, Mr. Shone. One standard, first, Mr. T. Gowen, gardener to J. A. Bartlett, Esq., Lynton Lodge, Mossley Hill, with a grand plant of Mr. G. Glenny. Second, Mr. T. Learmont, gardener to Thomas Harding, Esq., Rydal House, Huyton; third, Mr. D. H. Johns, gardener to J. Revill, Esq., Hill Side, Wavertree. One pyramid, Mr. T. Wilson with a capital plant of Mrs. G. Rundle. Six untrained, first, Mr. D. McKellar, who showed an excellent six. Second, Mr. T. Gowen; third, Mr. T. Wilson. One untrained, first, Mr. D. McKellar with a fine plant of Prince of Wales. Second, Mr. T. Gowen; third, Mr. Quirk, gardener to W. Porter, Esq., Thingwall Hall, Birkenhead. Groups of Chrysanthemums, not to exceed 60 feet, were poorly represented, and with the exception of the first prize group (which was really a good one), call for no comment. First, Mr. J. Harrison; second, D. H. Johns; third extra, Mr. H. Shone. Miscellaneous plants were fairly well shown. For six stove and greenhouse plants, Mr. J. Jellicoe was first with a good coloured plants of Croton montfontainensis, and a well flowered plant of Anthurium Andreanum. Second, Mr. T. Healey, gardener to Colonel Wilson, Hill Side, Wavertree, who had fine pieces of Crotons I. aureus and Queen Victoria. Third, Mr. A. R. Cox. We have no space for the prize list in other plant classes.

The fruit classes were, with the exception of that for six dishes of Pears, all well represented. Grapes were exceedingly good, and there were no fewer than ninety-four bunches staged for the fifteen prizes offered. In the collection for six dishes of fruit (Pines excluded), Mr. J. Bennett, gardener to Hon. C. H. Wynn, Rhûg Corwen, was first with a magnificent bunch of Gros Guillaume Grape, also a good bunch of Lady Downe's, a grand Hero of Lockinge Melon, Hacon's and Beurré Diel Pear, and a dish of finely coloured Court Pendû Plat Apples. Second, Mr. J. Barker, gardener to J. W. Raynes, Esq., Rock Ferry, who had a capital bunch each of Gros Colman and Muscat of Alexandria Grapes, the latter fine in the berry, but a little short of colour. Third, Mr. M. Quirk. Two Pine Apples.—First, Mr. J. Bennet, with splendid examples. Second, Mr. J. Wallis, gardener to Ralph Sneyd, Esq., Keele Hall, Staffordshire. Two bunches Alicante.—Mr. J. Barker was a grand first out of eleven competitors with faultless examples. Second, Mr. J. Downham, gardener to E. H. Harrison, Esq., Eastham, Cheshire. Third, Mr. J. Hollingworth, gardener to J. F. Campbell, Esq., Woodseats, Uttoxeter. Extra, Mr. T. Elsworthy. Two bunches black, any other variety.—There were ten staged, Mr. Sivess, gardener to Samuel Smith, Esq., M.P., Prince's Park, Liverpool, was first, having superb bunches of Barbarossa. Second, Mr. T. Ferguson, gardener to Mrs. Patterson, Rock Ferry, with well finished bunches of the same variety. Third, Mr. McMasters, gardener to Sir U. T. Shuttleworth, Gawthorpe Hall, Burnley. Two bunches Muscat Grapes, first, Mr. W. T. Wyton, gardener to C. H. Bird, Esq., Crookhey Hall, Garstang; with noble examples. Second, Mr. W. Wilson, with beautiful bunches. Third, Mr. G. Middleton, gardener to R. Pilkington, Esq., Rainford Hall, with shapely bunches, and fine large berries; five lots staged. Two bunches white Grapes, Mr. J. Downham, first, with large bunches of Trebbiano. Second, Mr. J. Hollingworth, with same variety. Third, Mr. Sivess. Four bunches, two black and same number white; there were six staged. First, Mr. W. T. Wyton, with Alicante, fine, Muscat, Lady Downe's, excellent, and Bowood Muscat. Second, Mr. J. Hollingworth, with Lady Downe's, very good, Mrs. Pince's Muscat, a superb bunch, Golden Queen, and Trebbiano. Third, Mr. G. Middleton, with Muscats and Lady Downe's, very fine, Golden Queen and Alicante. Pears were not (with the exception of Pit-maston Duchess and Doyenné du Comice) shown in such quantity and quality.

We are reluctantly compelled to pass the awards in other classes that have been supplied to us, and can only insert the closing remarks of our correspondent—namely, The genial Chairman, Mr. White, Mr. Bridge, the energetic Secretary, and the members of the Committee have every reason to feel proud with the grand Show, and also in the way it was supported.

HULL.—NOVEMBER 19TH AND 20TH.

UNDER energetic yet prudent management from the outset, the Hull Chrysanthemum Shows have made distinct progress yearly, and now rank amongst the largest and most important in the kingdom. Last year the National Chrysanthemum Society had its provincial Exhibition at Hull, and large and fine as it undoubtedly was, the Show of the present year was larger and finer. The entries were never so numerous, nor the competition so good, and the prizes so keenly con-

tested. In class after class only a difference of one or two points could be found, and in more than one case the pointing was equal, general freshness and colour, with good arrangement, then turning the scale in determining the awards. No less than 3311 cut blooms were staged, superior stands largely predominating; indeed, it would not be just to describe any of them as inferior, though in the mixed classes one exhibitor would be strong in incurved and relatively weak in Japanese varieties, or *vice versa*. Not only were the open classes so well filled, but the amateurs' section was highly meritorious, and many stands that would have won prizes on former occasions failed to obtain awards this year, though the best of the losers were as near the winners as losers could be. In the specimen plant classes the competition was also excellent, and as compared with the exhibits of a few years ago the advance can only be described as extraordinary. Groups are always a strong feature at Hull, and this year the arrangements were better than ever, and the prizes harder to win. The dessert table competition was probably the largest in the kingdom, and the adjudicators must have experienced some difficulty in the discharge of their duties. Altogether the Show was both great and good, but the Artillery Barracks, large as they are, were not large enough for the visitors, who crowded into the four spacious rooms or courts in which the exhibits were displayed. The number of visitors as near as can be ascertained was upwards of 11,000, including 500 charity children and their teachers free of charge. In referring to the leading classes it will be convenient to follow the order of the schedule, but anything like a detailed report of the whole Show is out of the question.

*Cut Blooms.*—The chief interest centred in the class for forty-eight blooms, half incurved and half Japanese, in not less than thirty-six varieties, in which a 15-guinea challenge cup (given by Lieut.-Colonel Gleadow) and £15 in money were offered as the first prize, the remaining prizes being £10, £5, and £2 respectively. There were six competitors, and it was necessary to point most carefully five of the collections, though two of them were distinctly in advance of the others, and between those two splendid lots no more than two points of difference could be found out of a possible 288. As was announced last week (though the telegram was inaccurate in respect to the value of the cup) Mr. Peter Blair of Trentham became its possessor, and as he won it last year it becomes his property. Mr. J. Lambert, Onslow Hall, Shrewsbury, who has defeated his rival previously, this year was second. Mr. D. Heaney, Mossley Hall, Liverpool, third; and Mr. J. P. Leadbetter, Tranby Croft, Hull, fourth in the contest. The Trentham blooms were remarkable by their uniformity of excellence; the Shrewsbury specimens being fresher, and were awarded points accordingly, and though the back row incurved were exceptionally strong, the two front rows in Mr. Blair's stands were also of unusual weight, and turned the scale in his favour. We give the names of the blooms in both these fine collections. Mr. Blair's Japanese.—Back row: Mons. Bernard, Gloriosum, Lady Lawrence, E. Molyneux, Stanstead White, M. Baco, Mrs. A. Waterer, and W. W. Coles. Centre row: Avalanche, Etoile de Lyon, T. Stevenson, R. Brocklebank, Etoile de Lyon, Mrs. A. Waterer, M. Bernard, and Avalanche. Front row: Sunflower, A. H. Neve, E. W. Clark, Mr. J. Laing, Sarah Owen, Puritan, and Sunflower. Incurved.—Back row: Golden Empress, Empress of India, Alfred Salter, John Lambert, Alfred Salter, Empress of India, Queen of England, and Golden Empress. Centre row: John Doughty, Queen of England, Violet Tomlin, Lord Alcester, John Doughty, John Salter, Mrs. Coleman, and Princess of Wales. Front row: Mrs. Heale, Mr. Brunlees, Jeanne d'Arc, Miss M. A. Haggas, Eve, White Beverley, Nil Desperandum, and Miss M. A. Haggas. Mr. Lambert's Japanese.—Etoile de Lyon, Mrs. Beale, E. Molyneux, Mr. J. Laing, Boule d'Or, Etoile de Lyon, E. Molyneux, and M. J. Pigny. Centre row: Mrs. R. F. Jameson, M. C. Audiguier, Carew Underwood, Condor, Avalanche, Mrs. Jameson, Mrs. Wheeler, and M. Bernard. Front row: W. W. Coles (champion bloom), Belle Paule, Sunflower, J. Delaux, Madame Baco, R. Brocklebank, W. W. Coles, and Sunflower. Incurved.—Back row: Empress Eugénie, Alfred Salter, Lord Alcester, J. Lambert (two), Empress of India (two), Lord Alcester (champion incurved). Centre row: Hero of Stoke Newington (two), Princess Teck, Violet Tomlin, Mrs. Heale, Jeanne d'Arc, and Miss M. A. Haggas. Front row: Mabel Ward (two), Refulgence, Mrs. N. Davis, Barbara, Lady Dorothy, C. Gibson, and Lord Eversley. It will be seen the two champion blooms were in the Shrewsbury stands, and they were the only blooms in the Show to which the maximum (six) points were awarded. The incurved was of great depth, and the Japanese fine and brilliant in colour.

In class 2 for twenty-four blooms, half Japanese and half incurved, in not less than eighteen varieties, a 5-guinea silver cup was offered by Mr. Owbridge with the first prize of £5, and this, after a close contest, was adjudged to Mr. Blair, who had apparently reserved his strength for Hull, Messrs. Leadbetter and Heaney closely following in the order named, three or four other collections failing to obtain prizes. The first prize blooms comprised of Japanese, Etoile de Lyon, E. Molyneux, Gloriosum, Mrs. A. Waterer, Lady Lawrence, Sunflower, Mrs. Wheeler, Avalanche, W. Clarke, Puritan, Neve, and Madame Baco. Incurved: Empress of India, Golden Empress, J. Lambert, Queen of England, Miss M. A. Haggas, Mrs. Heale, John Salter, Lord Alcester, Violet Tomlin, Mrs. Coleman, Princess of Wales, and Mr. Brunlees. Mr. W. Heaney received the chief prize with the following twelve incurved blooms: Queen of England, Empress of India, Golden Empress, Mrs. Heale, Violet Tomlin, Miss M. A. Haggas, Hero of Stoke Newington, and Mrs. N. Davis; Mr. Leadbetter being a close second, and Mr. G. Apple-

ton, gardener, Thorgumbald Hall, a good third out of eight competitors. The corresponding class for twelve Japanese blooms was a very heavy one of thirteen fine stands. First honours fell to Mr. W. H. Hotham, gardener to W. R. King, Esq., North Ferriby. Second, Mr. W. Wettow, gardener to G. A. Carr, Esq., Waltbam Grove, Grimsby. Third, Mr. B. Barrows, gardener to H. Bennett, Esq., Westlands, Grimsby; an extra prize being awarded to Mr. Heaney. The names of the varieties were not obtained. Excellent stands of Anemones were staged, Mr. Blair, Mr. G. Smith, Floral Cottage, Paull, and Mr. F. Mason, gardener to G. Bohn, Esq., Tranby Park, being adjudged the prizes in the order named for twelve blooms in good competition. The open reflexed class of twelve blooms, in not less than six varieties, was also excellently filled, the prizes being won respectively by Mr. R. Walker, gardener to Colonel Stacy Clithero, Hotham Hall, Brough; Mr. W. Davidson, gardener to F. W. Jameson, Esq., Estella; and Mr. J. E. Smith. Prizes offered for six blooms of Mrs. Falconer Jameson and Mrs. Alpheus Hardy only brought out one stand of each, Mr. John Browsho, Beverley, staging medium-sized blooms of the former, and Mr. P. Blair neat examples of the latter, both securing first prizes. Mr. W. Wilkinson, gardener to Mrs. Ross, Brough, was the most successful exhibitor of Pompons, and Mr. G. E. Smith of single varieties, scented varieties, and twelve sprays of any varieties for decorative purposes on stems not less than 10 inches above the board. Pompons are shown in bunches of three stems, and not less than three blooms on each.

In class 13, for exhibitors residing within twenty miles of Hull, 5-guinea silver cup was offered by Mrs. James Reckitt, with 3 guineas added by Messrs. E. P. Dixon & Sons, as the first prize for twelve blooms each of Japanese and incurved in not less than eighteen varieties, exhibitors in classes 1 and 2 not being eligible to compete. Twelve very good collections were staged, the prizes falling to Mr. W. Wettow, Grimsby, Mr. G. Wilson, gardener to James Reckitt, Esq., Swanland Manor, Brough, and Mr. J. S. Graham, gardener to G. Lawson, Esq., Newland Grove, Hull, in the order named. The first prize blooms in this class were—Japanese: Etoile de Lyon, Avalanche (two), M. C. Audiguier, Condor, Japonais, Sunflower, Sarah Owen (two), Belle Paule, Baronne de Prailly, and Mr. Matthews. Incurved: Lord Alcester (two), Golden Empress (two), Queen of England (two), Empress of India, Lord Wolseley, Barbara, Oberub, Jardin des Plantes, and Eve.

It was in this class that a case of disqualification occurred, which placed the Committee in an extremely awkward position. The first prize was at first awarded to an exhibitor who had staged in his incurved a very pale bloom of Golden Empress, which the Judges regarded as Lord Alcester, owing to a bloom of an unusually bright Golden Empress being placed in juxtaposition. It was eventually found, however, that this was staged as Golden Queen of England. This was not admitted as correct, and therefore the stand was disqualified as not containing the requisite number of varieties. In the meantime, however, the prizes were distributed, and the cup publicly handed to the disqualified exhibitor. His statement satisfied the Committee that there had been no intention to deceive, but the brilliant Golden Empress, with not a mark in its florets, was honestly shown as Golden Queen. If it had been admitted as such a protest would have been lodged, which must have been sustained, especially as an equally bright Golden Empress was shown in another stand. Admitting the honesty of the exhibitor, the Judges could not withdraw their disqualification, because they could not maintain their position against a formal protest. The difficulty arose from the public presentation of the cup before the revision, and the last we heard of the matter was a proposal to provide another cup of equal value as the most equitable way of settling a question of a very peculiar kind, that has never occurred before, and may probably never happen again. Also within the twenty mile radius prizes were offered for incurved and Japanese blooms in four classes in which there was strong competition, but all we can say is that in the first of these classes the prizes were won by Messrs. G. E. Smith, J. S. Graham, and G. Wilson; in the second by Messrs. W. Wettow, E. Wright, and J. S. Graham; in the third by Messrs. J. Hare, R. Dalby, and W. H. Clark; and in the fourth by Messrs. S. Higham, W. H. Clark, and J. Melbourne, there being nearly fifty entries in those classes.

A number of classes were provided for amateurs residing within ten miles of Hull who do not employ a gardener. The competition in all these classes was good, in some of them unusually so, and the exhibits throughout showed a very decided improvement on those of previous years. As a mark of recognition of the excellence of this section of the Show the Judges awarded one of the three certificates of the National Chrysanthemum Society to Mr. W. K. Sanderson, Thorgumbald, for his first prize stand of Anemone blooms, which were more meritorious than some staged in the open classes by professionals.

Before leaving the cut bloom department of the Show it is necessary to say that first-class certificates were awarded to the following varieties:—*E. W. Clark*, a rich bronzy crimson Japanese incurved of great merit and substance, exhibited by Mr. Blair. *Bouquet des Dames*, a large and very symmetrical white Japanese, equal to the finest bloom of Avalanche, but with shorter florets, some of them divided at the points and tinted, exhibited by Mr. Heaney. The plant is said to be very dwarf and free; the variety is not strictly new, but the blooms were very beautiful. *W. G. Drover*, a dark Anemone variety that has been previously described, exhibited by Mr. F. Mason, gardener to G. Bohn, Esq., Tranby Park, the blooms being of medium size, fresh, full, and rich in colour.

*Plants.*—Prominent in this section of the Show were the "groups of Chrysanthemums interspersed with foliage plants arranged for effect in a space of 100 square feet." When it is remembered that Mr. George Bohn, to whom the Society owes so much for his generosity, offered a 20-guinea challenge cup in this class, and the Society a prize of £6 to the winner, also £5, £4, and £2 as the remaining prizes, strong competition was naturally expected. Strong indeed it was. The Hull groups have become famous by their excellence, and those of this year surpassed all previous efforts. There were seven of them, three on each side of the hall and one at the end. They were semicircular in outline, each with a Palm rising above the blooms to a height of 10 feet or thereabouts, and all of them margined with ornamental foliage plants and Ferns. The aggregate effect of these grand groups, for grand they were, was highly imposing. The Judges scanned them over and over again, but at each round of inspection paused the longest at a free and beautiful arrangement by Mr. G. Wilson, gardener to James Beckitt, Esq.; but a noble pile of handsome blooms and good foliage plants much more formally arranged by Mr. E. Wright, gardener to D. Wilson, Esq., pulled hard against it for a time, but eventually had to yield to the superior artistic taste and superb finish displayed in Mr. Reckitt's group, and to this the chief prize was awarded. It was referred to by one of the Judges as fit for a Royal drawing-room, and the most instructive arrangement of Chrysanthemums and foliage plants that had come under his notice. Its charm consisted in the pleasing diversity of the arrangement. It was unlike all the others, while the plants were in the best of condition. It is not easy to describe this group in a few words. Briefly, the centre plant was a large Kentia, under which, and quite below the arching leaves, were arranged dwarf Chrysanthemums bearing handsome exhibition blooms. From this somewhat hollow centre rather taller plants rose towards the front, and taller still right and left of the Palm towards the back, forming bold shoulders. Very prominent at intervals in the breast of the group were large plants, with numerous inflorescent spikes, of *Eulalia japonica variegata*. Towards the front were superbly coloured Crotons and *Dracenas* standing out bold and clear, so that their full beauty could be seen. The margin was of moss, in which small plants of the silvery *Chamaepuce diaantha* and *Panicum* interspersed with small *Coleus* and other suitable plants. Not a pot was visible, nor was there the least suspicion of packing and crowding throughout the arrangement. The more the group was examined the better it was liked, and though a few persons appeared to be taken by surprise at the first by the position it won, no long time elapsed before there were scarcely any left to dispute its supremacy. It was indisputably in advance of all others, and the N.C.S. Centenary medal was awarded to it as the most strikingly meritorious exhibit in the Show. It must not be supposed, however, that the other groups were not good also, the second prize arrangement above mentioned, also the third prize group of Mr. W. R. Willey, gardener to W. Wheatley, Esq., and the fourth prize, one arranged by Mr. G. Jarvis, gardener to B. Whittaker, Esq., were such as are rarely placed in those positions, while the three which failed to obtain prizes would have obtained them at many other shows. Practically, all the fault that could be found with them was the very common one of overcrowding. Plants appeared to have been pressed in as if to hide something behind, and they certainly spoiled the effect of each other. There was very little to choose between some of the groups in merit, and critical observers would perhaps note that the greater the freedom and less the crowding the higher were the awards. It will be interesting to see the Hull groups next year. The fine cup has to be won twice to be owned, and it may be expected the present holder of it, expert as he evidently is, will have to put forth his full strength to keep it in his possession. It can only be won by superior plants, freely, yet tastefully, arranged, with an absence of huddling and a better finish than is presented by a curve of red pots.

Only a little can be said about the specimen plants, but the few words must be words of high approval of the great progress that has been made in this section. The dwarf trained plants produced by Mr. J. S. Graham, which won the chief prize and the N.C.S. certificate, were worthy of a position in any show; while those of Mr. J. Hemming and Mr. H. Taylor, who were second and third respectively, were not far behind them. Standards were also good from the two first named exhibitors, who occupied the same relative positions, Mr. W. Mason, gardener to Major Dibb, being a very good third. Bush grown, but not formally trained plants, made a fine display. They were just such plants as are suitable for many conservatories, and Messrs. Hemming, Graham, Coupland, Mason, Grant, and Thirsk well merited the prizes they won.

*Table and Floral Decorations.*—In this section there were ladies' classes for dessert tables, bouquets, sprays, and picturesque arrangements of Chrysanthemums, resulting in great competition. In addition to the first prize of 4 guineas for a dessert table, Mr. Bohn added a piece of challenge plate, which was won by Miss Kathleen Todd of Tranby Park. We are compelled to pass the other exhibits, good as many of them were, and can only note that in the special class for children for the most tasteful arrangement of Chrysanthemums, with any kind of foliage and grasses, the silver flower vases offered by Mrs. Bohn were won by Miss Gertrude Harland, daughter of one of the Honorary Secretaries, with one of the prettiest effects in the room. Messrs. E. P. Dixon & Sons, Mr. Martin, and others added to the interest of the Show by large and meritorious exhibits not for competition.

It will be seen that the Exhibition was of great magnitude and high excellence, and if a National medal were offered for good management

Hull would win it, unless something better than the following facts can be presented from elsewhere. The large hall was cleared and ready for the Judges by ten o'clock, all other parts of the Show in a quarter of an hour afterwards; and lists of all the exhibitors, classes, and prize-winners were printed in schedule form and distributed at 2.30, the awards as they were made being conveyed to the printers by bicyclists.

In recognition of the good work that has been done at Hull in the advancement of Chrysanthemum culture, we have pleasure in giving the portrait of Mr. E. Harland, who has worked zealously and successfully for four years as Honorary Secretary with his able colleague, Mr. James Dixon. Mr. Harland has been a successful exhibitor before he was officially connected with the Society, and still takes pleasure in growing Chrysanthemums well at Cottingham, but does not think it desirable now to join in public competition. The Hull Chrysanthemum

FIG. 63.—MR. EDWARD HARLAND.

Society is singularly fortunate in all its officials, and to this circumstance is mainly due the prominent position it occupies in the Chrysanthemum world.

#### SCOTTISH HORTICULTURAL SOCIETY.

THE Exhibition held in the Waverley Market, Edinburgh, on the 20th, 21st, and 22nd, was in all respects a good one. Cut blooms were very largely represented, the Japanese being particularly fine, and also among the incurred varieties many specially fine examples of high culture were staged, though the number of badly dressed blooms was very great. Plants in pots were not so good by a long way as the cut blooms, and some of the best were not grown from single stems, but were pots of made up plants. Fruit was largely shown, splendid Grapes being staged, there being also a good display of Apples and Pears. Vegetables, again, were extra good, and staged in large quantities. One of the finest exhibits was a massive group of Chrysanthemums from the nurseries of Messrs. T. Methven & Sons, Princes Street, the blooms being of large size. Messrs. Todd & Co, Maitland Street, contributed a remarkably fine decorative stand, comprising a few Palms and other plants, with grand examples of bouquets, vase decorations, and flower baskets, nearly all composed of Chrysanthemums. Messrs. J. Laing & Son, Forest Hill, with Chrysanthemums contributed groups of *Pernettyas*. Messrs. Clibran & Sons, Altrincham; Mr. Erskine, George Street; Messrs. Dickson & Sons, Hanover Street, and others, had also exhibits on exhibition. The following were the chief items in the prize list:—

*Cut Blooms.*—The City of Edinburgh prize for forty-eight blooms, Japanese (not less than thirty-six varieties), £20 and the Association medal, £10, £5, £3, and £2, brought out five, the best of which was clearly that to which the Judges awarded the first prize. This was staged by Mr. Forbes, gardener to A. Holt, Esq., Crofton, Aigburth, and included deep and massive blooms. The duplicates were *Etoile de Lyon*, Mrs. F. Jameson, Stanstead White, Condor, Avalanche, Mrs. G. Atkinson, Sunflower, all extra fine; Ralph Brocklebank, E. Molyneux, Madame J. Laing. The singles were Carew Underwood, *Fimbriatum*, *Gloriosum*, *Boule d'Or*, Madame Baco, G. Daniels, M. A. Carrière, extra good; and Fair Maid of Guernsey, Sarah Owen, Jeanne Delaux, Holborn Beauty, Belle Paule, Criterion, T. Stephenson, J. Delaux, M. Bernard, Mrs. H. Cannell, Bouquet des Dames, A. H. Neve, Maisa, Meg Merrilies, Album *Fimbriatum*, Mrs. F. C. Priece, Puritan, Pelican, and Stanstead Surprise. To Mr. J. Carruthers, gardener to Mrs. Fleming, Corstorphine, the second prize was awarded. The third prize blooms came very close to the second, Mr. McHattie, gardener to the Marquis of Lothian, Newbattle, securing this. Mr. J. Wheeler, Jesmond Towers, Newcastle; and Mr. Rae, Sunlaws, Kelso, being fourth and fifth respectively.

The next class was open to cultivators living in Scotland. Eighteen Japanese and eighteen incurred, not less than twelve varieties of each. First prize, Scottish challenge cup value fifteen guineas, with the National Chrysanthemum Society's medal and £5. Five competitors

entered for this, the first and second prize blooms being very fine, the former having the better incurved and the latter the best Japanese. The first prize was awarded to Mr. J. Clark, Bannerfield, Selkirk. The best Japanese were E. Molyneux, Avalanche, Madame Audiguier, Elaine, M. Bernard, and Gloriosum. The incurved comprised grand samples of the Queen family, Violet Tomlin, and M. A. Haggas. Second, Mr. J. Machar, Corona, Broughty Ferry; third, Mr. H. Crichton, Bellcaise, Greenock; and fourth, Mr. Grossart, Oswald Road, Edinburgh.

In the class for twelve Japanese and twelve incurved were four entries, all of which were good. Mr. J. Foster, Wellwood Park, Selkirk, secured first place with very fine Japanese, Mons. Bernard, Avalanche, Sunflower, and Stanstead White extra. Of incurved Lord Wolseley, Nil Desperandum, and the Queens were extra good. Mr. Forbes, Aigburgh, was a good second; and Mr. J. Bell, Edenhall, West Ferry, a very good third. Mr. Forbes secured the first place in the class for twenty-four Japanese, not less than eighteen varieties, with fine bold flowers; Mr. Carruthers a good second; and third Mr. A. Thorburn, Valleyfield, Penicuik. Mr. Forbes was again first in the class for twenty-four incurved, not less than twelve varieties; his blooms, though rather old, were large and of good finish. Mr. Clark was second with less even but good blooms. For twelve Japanese Mr. Forbes again secured the first place with very fine examples; Mr. Carruthers second; and Mr. Thorburn third. No fewer than fourteen lots were staged in this class. Mr. Carruthers, with fine Avalanche, secured first for six blooms of a white Japanese variety; Mr. Carruthers, with Boule d'Or, secured first in the corresponding class for six yellow blooms; and Mr. Forbes, with Etoile de Lyon, was first in the class of six blooms, purple or crimson. The six varieties Japanese brought out some twenty boxes, Mr. Geddes, Knock Castle, securing the premier place. For twelve incurved eight staged, Mr. J. Foster being first with a very fine lot; Mr. Forbes second. Mr. J. Clark, in the class for six blooms, was a good first. In the class for six of one variety some notable blooms were staged, the first prize going to Mr. J. Clark for six medium Golden Empress of fine build and beautiful finish. Mr. A. Watt, Blackhouse, Skelmorlie, second with large but rougher Empress of India. For twelve reflexed Mr. J. Short, Hummers-knot, Darlington, secured first place with large and good examples of the leading sorts. In the classes confined to amateurs Mr. A. Brydon, Tweedbank, Innerleithen, had some extra fine Japanese. Messrs. R. B. Laird & Sons, West Coates, set up good blooms in the trade class for forty-eight blooms.

*Plants.*—The best plants were the six large flowering, with which Mr. D. Jardine, Ravelston, Edinburgh, secured the chief prize. Mr. Reid, Rockfield, Dundee, with good dwarf trained plants, second, and Mr. J. Preston, Falcon Hall, third. Mr. Grossart was the only exhibitor of a group of plants, Mr. Jardine and Mr. Donaldson being first and second respectively for groups of Chrysanthemums. Some good Roman Hyacinths were shown by Mr. McIntyre, The Glen, Innerleithen, and prizes were offered for various plants in 6-inch pots.

*Fruit.*—Some extra fine Grapes were staged, prizes of the Association medal, and £10, £5, £3, and £2 bringing out grand clusters in competition for eight bunches. Here Mr. McHattie was easily first with grand examples of Alicante, Gros Maroc, Muscat of Alexandria, and Chasselas Napoléon. The second prize was awarded to Mr. Leslie, gardener to A. Coates, Esq., Pitcullie House, Perth, but great dissatisfaction was expressed over this award, the third prize lot from Mr. Murray, Polmont, Falkirk, being very much better looking in every respect. Fourth, Mr. Pottar, Whitehall, Carlisle. Mr. Leslie was first for four bunches of Grapes, and Mr. Murray second. Good examples of Muscat of Alexandria, Gros Colman, Alicante, and Lady Downe's were also shown. Mr. McIntyre, The Glen, had the two best Pine Apples. Mr. McIndoe, Hutton Hall, Yorks, second, and Mr. McKelvie, Biosmouth, Dunbar, third. Mr. McIndoe had the best Pine Apple. Mr. Hunter, Lambton Castle, Durham, second, and Mr. McKelvie third. Mr. McIndoe was the only exhibitor of orchard house fruit, and was awarded the first prize. For a collection of twenty varieties of Apples and ten varieties of Pears, Scotch grown, there were eight entries. Here Mr. Day, Galloway House, Garlieston, was first, all being highly coloured for the north. Mr. Brotherston, Tynningame, Prestonkirk, second; Mr. Lamont, Kennet House, Alloa, third; and Mr. Murray, Culzean Castle, Ayr, fourth. Mr. Day was again first for a collection of eighteen sorts of Apples and six of Pears, Mr. Cairns, The Hirsell, Coldstream, second, and Mr. Brotherston third. There was also smaller collections well contested, and a fair lot of market garden grown fruit. Mr. Smith, Prince's Street, with a table of foreign and home grown fruit secured the prize in the fruiterers' class. By Messrs. Thomson, Clovenfords, were shown some Grapes of good quality, illustrative of the beneficial effects resulting from the employment of their Vine manures.

*Vegetables.*—In the class for thirteen varieties (£5, £3, £2) eleven exhibitors staged. The first prize was awarded to Mr. Robertson, Hartrigge, for a fresh lot, in which were good Leeks, Vegetable Marrows, Tomatoes, Stadtholder Cauliflower, and Onions. Second, Mr. Harper, Tulliebolton House, Bankhead, with a fine lot. Third, Mr. Bigham, Edgerston, Jedburgh. For six sorts of vegetables Mr. Hall, Kelso, was first, Celery being extra fine, Mr. Harper second, and Mr. Potter, Seaclyffe, North Berwick, third. Of single dishes remarkably fine Tomatoes, Celery, Cauliflowers, Leeks, Mushrooms, Carrots and Onions were shown.

The Exhibition, notwithstanding, the ample promenade space left between the several ranges of tables, was oftentimes inconveniently crowded, this no doubt resulting in a great degree from the presence of Lieutenant Godfrey and the band of the Grenadier Guards.

#### YEOVIL.—NOVEMBER 19TH.

THE Exhibition of Chrysanthemums, fruits, flowers, and vegetables, which was held in the municipal building on Wednesday in last week, may be pronounced to be the best of the kind hitherto held in this important and flourishing Somersetshire town, and the Committee and Hon. Secretary (Mr. E. H. Oakley) are to be complimented for the admirable manner in which the details of the Show were arranged. The most successful exhibitor in the plant classes was Mr. Crossman, gardener to J. Brutton, Esq.; Mr. Copp, gardener to W. Erle-Drax, Esq., Holnest, Sherborne, in the cut bloom classes; Mr. James Lloyd, gardener to Vincent Stuckey, Esq., Langport, in the fruit classes; and Mr. Crossman and Mr. C. J. Bowers, gardener to T. Halford, Esq., Castle Hill, Cerne, being the most successful in the vegetable classes.

*Groups.*—Several good groups were arranged in the open class, Mr. Crossman taking first honours with a grand group. Plants, flowers, and perfect finish of arrangement were everything that could be desired. The plants forming the outline of the group were in 3-inch pots, having rich foliage and large fresh flowers for plants growing in such small pots. Mr. Gillam, gardener to J. S. Cable, Esq., Yeovil, was a good second, and Mr. Anthony, gardener to Thomas Moore, Esq., was a creditable third.

Three groups of miscellaneous plants were arranged. Mr. Biss, gardener to Jabez Bradford, Esq., Yeovil, was first—Palms, Arum Lilies, Poinsettias, Heaths, Cyripediums, Dracenas, and Crotons intermixed with well-selected plants of Chrysanthemums, and finished off with an edging of Maidenhair Fern (*Adiantum cuneatum*) and Primulas. Mr. W. Appleby, gardener to T. W. Dampier-Bide, Esq., Yeovil, was second, and had he left out one-half of the plants employed his arrangement would have been accorded a higher position. Mr. Kidley, gardener to W. E. Hall, Esq., East Coker, Yeovil, was a good third.

*Plants.*—Mr. Crossman was first for three trained plants of reflexed, with good plants of Pink Christine, Felicity, and Peach Christine; first for one reflexed with Mrs. Forsythe, first for three incurved, first for three Japanese, and first for specimen Japanese, staging good plants in all the classes. Mr. J. Allen, gardener to the Rev. W. S. Cattes, West Coker, Yeovil, had the best specimen incurved; and Mr. Anthony the best Pompons, showing nice plants.

Table plants, &c., were shown well by Mr. Lloyd, Mr. Appleby, and the Rev. M. Hankey's gardener, who took the prizes in that order. Mr. Bowers had the best two Palms (as regards their suitability for table work); and Mr. Lloyd was second for larger plants. Double white Primulas were shown in fine condition by Mr. Anthony, Mr. Allen, and Mr. Lloyd, who were respectively first, second, and third. Berried plants (*Solanums*) were shown by Mr. Biss, Mr. Kidley, and Mr. G. Troyte-Bullock, North Coker, Yeovil, to whom the prizes went in the order indicated. Mr. Hobby, gardener to the Hon. Sir Ponsonby Fane, Brymton House, Yeovil, also staged some dwarf well-berried *Solanums*, but not for competition. Violets in pots, having fine healthy foliage, and a profusion of large fresh flowers, which filled the building with their delicious fragrance, were staged by Messrs. Kidley, Troyte-Bullock, and Crossman, the latter losing a chance of gaining a higher position on account of his securing the flowers to sticks; Marie Louise was the variety grown. Two finely grown half dozen plants of Mignonette were shown by Messrs. Anthony and Crossman, who took the prizes in the order in which their names appear.

*Cut Blooms.*—Several good stands were put up in the three-guinea cup class, twenty-four blooms (twelve incurved and twelve Japanese) being required. Mr. Copp was a good first, staging Etoile de Lyon, Edwin Molyneux, Boule d'Or, Mrs. Wheeler, Gloriosum, Madame Laing, Mr. H. Cannell, Madame C. Audiguier, Thunberg, Sunflower, and Carew Underwood, all in fine condition as regards size, freshness, and colour of blooms; and the same remark applies to incurved varieties, in which Lord Alcester, Empress of India, Alfred Salter, and such like varieties showed up to advantage. Mr. Crossman was second, the Rev. M. Hankey third, and Mr. Lloyd fourth. Mr. J. S. Cable was a good first for a stand of twelve Japanese, Mr. Biss being second. Messrs. Copp and Lloyd were first and second in that order for reflexed varieties, showing, among others, fine blooms of the Christine family, King of the Crimson, and Cullingfordi. Floral ornaments were shown well by Mrs. Mitchel, North Coker, and Miss A. E. Brutton.

Fruit was well represented. Messrs. Lloyd and Crossman were respectively first and second for collections of six kinds, showing good black and white Grapes, Pears, Apples, &c. Col. Macgregor's gardener, Mapperton House, Yeovil, had the best two bunches of Black Alicante; Mr. Lloyd and Mr. Connolly, gardener to J. R. C. Talbot, Esq., Rhode, Uplyme, Lyme Regis, being second and third with the same variety. In the Any other black class Mr. Lloyd was first, showing well-coloured Gros Colman, Col. Macgregor being second with fairly well-coloured Mrs. Pince; and Mr. Hobby was third with well coloured but small bunches of Black Hamburg. Mr. Connolly was far away and ahead in the Muscat class, staging two tapering solid bunches, consisting of large, clean, fresh, even, and highly coloured berries, the bunches being about 4½ lbs. each, truly grand examples of this noble Grape for the time of year. Col. Macgregor and Mr. Crossman were second and third. In the Any other white class Col. Macgregor, Mr. Lloyd, and Mr. Crossman were the prizewinners, all staging fairly good bunches of Foster's Seedling.

*Pears.*—Captain Dymond, Charminster, had the best dish of dessert Pears, showing good examples of Beurré Diel; Mr. Lloyd had the best dish of culinary Pears, staging good fruits of Uvedale's St. Germain.

Mr. Lloyd also had the best three dishes of dessert Apples, staging good sized, clean, even, bright fruits of Ribston Pippin, King of the Pippins, and Cox's Orange Pippin; Mr. Kidley being a good second; his trio including "Coker Beauty," a very handsome and excellent Apple; Mr. Hobby being a close third. Mr. Lloyd, Mr. Crossman, and Mr. Kidley were the prize winners in the class for culinary Apples, which, like the dessert varieties, were shown well, and in goodly numbers. Messrs. Copp, Lloyd, and Kidley were first, second, and third for dishes of nine Tomatoes, showing good fruits. Messrs. Copp, Bowers, and Lloyd staged the best three dishes of Mushrooms.

*Vegetables.*—Collections of ten kinds were shown in force; the quality being good, and the exhibits neatly set up. Messrs. Crossman, and C. J. Bowers were first and second in that order for admirable produce, including Seakale, French Beans, and Asparagus, Mr. Copp being a good third; Messrs. Crossman and Bowers were the only exhibitors in the class for a collection of salad, making a grand display, including almost every known salading ingredient, which were neatly arranged and greatly admired. Non-competing exhibits: Mr. Scott, Merriott, and Messrs. Jarman, Chard, staged a grand lot of Apples, which afforded a capital opportunity for intending planters present making a selection. The exhibits were large, clean, and many of them very highly coloured, thereby greatly adding to the general effect and utility of the Show.—W.

#### WATERFORD (IRELAND).

It was unfortunate the day was so unfavourable, and this prevented a greater number admiring what was most undoubtedly the finest autumn Show the Waterford Horticultural Society has yet held. Chrysanthemums, though the *pièce de resistance*, had attention divided with a fine show of fruit, and a really good exhibition of vegetables and farm produce, especially those entered for Messrs. Sutton's of Reading, special prize. A £5 cup was presented by Raymond de la Poer, Esq., J.P., to be competed for, but the minimum number of four entries, twenty-four blooms each, not having come forward, it was withheld, first prize of £2 going to Lord Besborough, Piltoun, and second to Hon. Dudley Fortescue. It is only fair to say Mr. Crawford (Captain de la Poer's head gardener) was interdicted from winning this prize given by his master. The blooms were fair, and mostly the varieties about to be named immediately except last year's varieties, twenty-four in number, twelve distinct.

The class of six plants in pots, distinct varieties, brought six competitors, and formed a very effective floriferous bank across the side of the large Town Hall, where the Show was held. After some difficulty by the Judges in deciding where the balance of merit lay the first prize went to C. E. Denny, May Park, and second to Captain de la Poer, Kilcronagh. The last named gentleman also had first prize amongst seven entries for the best specimen plant in the Show. A new and effective departure, and that every show should have, was the introduction of prizes for groups. Twenty square feet of space was allotted, and there were three entries. It was most difficult to say where most merit existed between Mr. Goff, Grenville, and Mr. C. E. Denny, but the prizes went ultimately in that order. The plants and blooms formed a regular sloping floral bank.

*Cut Blooms.*—The Hon. Dudley Fortescue was the only competitor to enter against so formidable an opponent as Capt. de la Poer, the second and first prizes being in the order named in the great sections of incurved, Japanese, reflexed, and Anemone flowered. In Mr. Crawford's first prize incurved, and which were little short of perfection, the blooms were staged in the following order: Lord Alcester, Alfred Salter, Golden Empress of India, Alfred Salter, Lord Alcester, and Lord Wolseley. Second row: Prince Alfred, Jeanne d'Arc, Lord Wolseley, Lord Alcester, Prince Alfred and Miss M. A. Haggas. Third row: Emily Dale, Princess of Wales, Miss M. A. Haggas, Prince Alfred, Mrs. Norman Davis, and Hero of Stoke Newington. Front row: Mrs. Norman Davis, Princess of Teck, Hero of Stoke Newington, Mrs. Norman Davis, Violet Tomlin, and Princess of Teck. Mr. Crawford's Japanese were very fine, and from their immense size I suggested a large space for staging each bloom. It will be seen from the names following many of the blooms were staged for the first time. Front row: Baronne de Prailly, Volunteer, Balmoreau, Sunflower (fine), Mrs. Mahood and Mons. Bernard; next, Ralph Brocklebank, Stanstead Surprise, Thomas Stephenson, Pelican, Jeanne Délaux, George Daniels and Ralph Brocklebank. Top row: Jeanne Délaux, George Daniels, Mrs. Mahood, Sarah Owen, Madame Baco, and Sunflower. The top row was remarkable for two blooms at each end of Etoile de Lyon, simply of immense size, Japonais, Stanstead Surprise, Baronne de Prailly and Boule d'Or. Whoever beats Mr. Crawford in Dublin will have "a stubborn foe" to contend with. Last year the first stand was disqualified for having in the reflexed class the reflexed Japanese Amy Furze. Curious! Mr. C. E. Denny was disqualified this year for exactly the same reason in the second reflexed. There were three sections for zonal blooms, single and double, for fruit, vegetables and farm produce, which would require much more space than there is any chance just now to expect from you. I may say the principal prize winners were Messrs. Goff, Grenville; N. E. Power, Belview; Hon. Dudley Fortescue, Summerville; T. W. Anderson, Grace Dieu; C. P. Bolton, Galway House—the courteous and efficient Hon. Secretary; Mr. C. E. Denny, May Park; Mark de Lindre, Crown solicitor; R. T. Carew, Ballinamona Park; John and Samuel Strangman, J. H. Jones, Mullinabro', &c. Much credit is due to Messrs. C. P. Bolton and J. A. Power, the Hon. Secretaries; and the Judges were Messrs. Munro, Kilkenny; Aherne, Duke of Devonshire's, Lismore; and your correspondent.—W. J. MURPHY, *Clonmel*.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—As an example of the great good this splendid Institution is doing, we are authoritatively informed that a sum of no less than £2648 has been distributed in pensions this year, £1700 being during the same time added to the reserve fund. At the last meeting of the Committee it was decided to make an addition of twelve pensioners in January, making a total of 158. The Institution is deserving of extensive support.

— CHRYSANthemum Shows.—Reports of these have continued to flow in in unexampled numbers. We have been compelled to abridge some and hold a few over. The season, however, is drawing to a close, and we do the best with what our friends obligingly send us while it lasts.

— DAHLIA IMPERIALIS.—A beautiful spray of this handsome single Dahlia bearing twenty flowers and buds, the former 6 to 7 inches in diameter, has been submitted to us by Mr. F. Smith, gardener to R. Muir, Esq., Heathlands, Wimbledon. The plant has been grown under glass for two years.

— AT Welton House Gardens, Yorkshire, there is a fine plant of EUCHARIS GRANDIFLORA which has flowered eleven times in seventeen months. At the present time it has fourteen spikes, six to eight flowers on a spike. *Pancreatium fragrans* has been good—seven spikes, some of them with fifteen flowers on one spike.—H. P.

— THE KENT COUNTY CHRYsanthemum Society.—The third annual dinner of the above Society will be held at the Bridge House Hotel, London Bridge, S.E., on Wednesday evening, Dec. 3rd, at 6.30 for 7 o'clock. Tickets will be 3s. 6d. each. The Committee hope that members will induce as many friends as they can to attend.

— SELECTIONS OF CHRYsanthemums.—Will Mr. E. Molyneux kindly give me the names of the best twenty Japanese, twenty incurved, eight reflexed, eight Anemones (large flowered), and eight Pompons to grow as exhibition cut blooms, excluding those varieties which are uncertain or difficult to grow, as I am only in a position to grow about 150 plants altogether.—WEST RIDING, *Yorks*.

— A VERY successful CHRYsanthemum Show was held at Colchester last week, and we regret that a full report cannot be given. Lord and Lady Brooke of Easton Lodge were present, and their gardener (Mr. H. Lister) had the satisfaction of winning the premier prize for twelve incurved and twelve Japanese blooms in a strong class of eight competitors. The blooms were extremely good, and the N.C.S.'s silver medal was also accorded to Mr. Lister for a grand bloom of Etoile de Lyon as the best in the Show. Mr. Flight of Winchester also exhibited well, taking the second place in the class named.

— ROYAL VISIT TO READING.—We understand that in connection with the forthcoming Royal visit to Reading, and the ceremony of installation of H.R.H. the Duke of Clarence and Avondale as Grand Master of the newly constituted province of Berks, the question of where to serve the luncheon has been a difficulty, but Messrs. Sutton and Sons have kindly placed one, or more if required, of their large seed stores at the disposal of the Festival Stewards for this purpose. The Grand Secretary visited Messrs. Sutton's premises, and expressed himself perfectly satisfied with all the proposed arrangements, which will be carried out, subject to the Prince's approval.

— RAINFALL NEAR LANCASTER.—Having seen the amount of rainfall for the past few months, as sent by correspondents to the Journal, I send you the amount we have registered here for the past three months. August.—Total rainfall for the month, 6.75 inches, rain falling on twenty-three days; largest fall in twenty-four hours, 1.25 inch. September.—Total for the month, 5.375 inches, rain falling on seventeen days; heaviest fall in twenty-four hours, 1.375 inch. October.—Total for the month, 3.625 inches, rain falling on sixteen days; heaviest fall in twenty-four hours, 0.75 inch. November.—Total up to the 24th, 6.125 inches, rain falling on twenty-one days out of the twenty-four.—W. G.

— THE WILLIAM HOLMES' MEMORIAL FUND.—SPECIAL FLORAL FETE AND BENEFIT.—The Directors of the Royal Aquarium, Westminster, in consideration of the late Mr. William Holmes' long connection with that Institution as Hon. Secretary of the National Chrysanthemum Society, and as Manager of the flower shows, have generously offered to give a benefit performance in aid of the Holmes' Memorial Fund throughout the day of Wednesday, the 17th of December next. In order to render the occasion as attractive as possible, and with a view to augmenting the Fund, it has been arranged that a Floral Fête and Bazaar shall be held in the building on the same day. The Committee will be grateful for a few flowers to furnish the stalls, and though flowers are scarce at this time of year it is essential to the success of the Fund that it be proceeded with at once, and an earnest appeal is made for assistance in so laudable an object. Flowers may be made into sprays or buttonholes, or packed separately, and should reach the Royal Aquarium before 11 A.M., on the 17th of December, addressed to Mr. Lewis Castle. Fruit or miniature plants will also be acceptable, as the entire proceeds of the Bazaar will be devoted to the Fund. Tickets of admission are issued at 1s. each, and as those sold will afford a substantial addition to the Fund, it is especially desired that application be made at once to the Hon. Secretary—MR. LEWIS CASTLE, *Hotham House, Merton, Surrey.*

— LETTUCES.—I am rather interested in Lettuces, having to keep a continuous supply, and necessarily try new varieties when they appear worthy. A variety named Blond Blockhead is recommended on page 397. I have looked into Vilmorin's list for the current year, and fail to find any such name, as indeed I hardly expected. Is it the Blonde Géante? From the description it would appear as if it were. Perhaps the writer of the note referred to will kindly say. If so, the added synonym of Blond Neapolitan would carry its own recommendation, as there is perhaps no better summer Cabbage Lettuce than the old Neapolitan. I may add that very few varieties have escaped a trial at my hands, and though there are some large varieties I do not think there is a more useful than Hicks' Hardy for using from early summer until the next spring, and for bridging any space betwixt these periods Tom Thumb is better than anything I have ever had through my hands.

— A GOOD WINTER TURNIP.—Three years ago I had for trial a French Turnip for the winter season, and have found it so tender and good that I name it for those who may not have seen it. It is catalogued by Vilmorin as Des Vertus, and is more like an overgrown White Radish than a Turnip.—B.

— "THE HORTICULTURAL DIRECTORY" FOR 1891.—This work is now ready, and is the largest and most comprehensive issue that has yet appeared. Besides the complete register of the addresses of all the most important establishments and persons connected with horticulture in the United Kingdom and on the Continent, it contains useful information on Ground Work: A Table of the Cost of Land Draining per Acre, Average Cost of Digging Drains, Excavating and Removing Soil, Table Showing the Number of Cubic Yards of Earth in each Rod. Planting and Sowing.—Tables for Planters. Certificates Awarded by the Royal Horticultural Society from November, 1889, to October, 1890; and a copious list of garden receipts on a great variety of subjects. Though the work is much enlarged the price remains the same as before, 1s., post free 1s. 2d., from the office, 171, Fleet Street, London, E.C.

— TRANSPLANTING SHRUBS.—Reverting to this subject again it is to press the fact that properly prepared plants may be removed with comparative ease and speed, and with certainty of success. Wherever valuable shrubs, trees, or coniferous subjects are running a risk of spoiling through overcrowding, all that is necessary is to cut back the roots in a thorough manner. If twenty or thirty years of age it may be wise to cut one-half the roots one year, and go round the entire circle the next, removing either the following autumn, or even spring or summer. Where it is necessary to protect the ball thin boards of beech laced to the side of it is preferable to any other method, but as a rule no such means of securing the soil is necessary. I have looked round a number of large and old specimens removed twelve months ago, and it would have been impossible for a stranger to have pointed out the lifted specimens from those that were not interfered with. Possibly the best period for transplanting is in showery weather during summer. The shrubs go on as steadily as Pelargoniums planted out of pots.—B.

— MR. JOSEPH MALLENDER sends his usual summary of METEOROLOGICAL OBSERVATIONS AT HODSOCK PRIORY, WORKSOP,

NOTTS, in October; 50 feet above mean sea level. Mean temperature of month, 49.8°. Maximum on the 12th, 70.5°; minimum on the 28th, 22.9°. Maximum in sun on the 3rd, 118.0°; minimum on the grass on the 28th, 14.3°. Mean temperature of the air at 9 A.M., 50.4°; mean temperature of the soil 1 foot deep, 50.6°. Nights below 32°, in shade two, on grass fourteen. Total duration of sunshine 115.5 hours, or 36 per cent. of possible duration. We had six sunless days. Total rainfall, 1.01 inch. Rain fell on eleven days. Average velocity of wind, 9.6 miles per hour; velocity exceeded 400 miles on four days; velocity fell short of 100 miles on five days. Approximate averages for October: Mean temperature, 48.2°; sunshine eighty-three hours; rainfall, 2.84 inches. A very fine mild and dry month; more sunshine than in any of the previous nine years. A shower of snow fell on the 26th, and the frost on the 28th was nearly the sharpest we have ever had in October.

CATTLEYA LINDENI.

UNDER the above name M. Linden of Brussels exhibited a beautiful Cattleya at the Royal Horticultural Society's meeting on October 28th last, when the Orchid Committee accorded it a well-deserved recognition. It is one of the *C. aurea* type, but appears to have resulted from a natural cross with some other Cattleya, perhaps *C. gigas*, this view being also that adopted by Mr. R. A. Rolfe of Kew. In a letter now before me he says:—"I feel doubtful if it is a variety of *C. Dowiana aurea*, or a hybrid with *C. gigas*, in which the former preponderates, and rather incline to the latter view. I wish all hybridisers would cross the two both ways; it would surely pay them to solve the parentage of Hardyana, Maniana, and this one, for I suspect hybridism is behind these forms."

Whatever be its origin there can be no doubt respecting the attractions of the flowers on the plant as shown, the colouring being both rich and delicate in the extreme. The sepals are pale mauve nearly white, the petals suffused with soft rose and veined with white, while the lip possesses an evenly fringed intensely rich magenta apical half margined with clear bright gold, and veined with the same tint in the throat on a crimson base. The flower is of moderate size, but light and graceful contour, and probably as the plants become stronger the flowers will increase in size. I understand that it was imported early in the present year, and it will certainly take a place amongst the best forms of the group to which it belongs.—L. CASTLE.

#### IMPORTED ORCHIDS.

(Continued from page 443.)

DENDROBIUM.—The value of Dendrobiums is well known, and they may be classed amongst the most useful Orchids. The species vary greatly, some producing pseudo-bulbs only an inch or two long, whilst others attain the length of 6 or 7 feet. It is difficult to state any strict rule for Dendrobies, there being several sections, some of which grow better on blocks, others in baskets, and some in pots or pans. The same rule applies to Epidendrums as to Dendrobies. *E. erectum* grows to a height of 8 or 9 feet, and slender, and some only attain the height of so many inches.

LÆLIA.—Some species of *Lælia* are very showy and extremely fragrant. With regard to imported *Lælias* they may be placed on blocks, in baskets, or potted at once; the condition in which they have arrived will be the best guide. If the growths are advanced they will require every encouragement; if, on the other hand, they are dormant it will be most advisable to keep them quiet till they start.

LYCASTE.—The genus *Lycaste* includes two or three species that are well worth cultivating, *L. Skinneri* being the most generally useful. They will, nevertheless, require much about the same treatment, and may be potted as soon as received in a light compost, all succeeding best in pots or pans and placed in a cool stove, requiring little water till growth has commenced.

MASDEVALLIA.—Nearly all the species of *Masdevallia* are great favourites with Orchid fanciers. Some of the most showy kinds, such as *M. amabilis*, *M. Harryana*, *M. ignea*, *M. Lindenii*, *M. tovarensis*, and *M. Veitchiana* are extremely useful. They are rather difficult to import owing to the fact that they are found at high elevations, where it is naturally cool and moist; the great difficulty

is in bringing them through the hot plains, the great variation in temperature proving fatal to thousands of plants. If they reach this country alive they generally lose a quantity of their leaves. No time should be lost in having them potted and placing them in a cool house. Masdevallias should never be allowed to become dry at the roots at any time.

**ODONTOGLOSSUMS.**—Everyone that knows what an Orchid is will be familiar with at least one species—viz., *O. crispum*. This species is cultivated and imported more extensively than any other, and anyone who has been a frequent visitor to the London auction rooms could not fail to observe in what unpromising condition the importations are received. Often have paper bags of

**PHALÆNOPSIS**—Phalænopses have been imported rather extensively of late by two or three of the leading London nurserymen, and small plants were at one time offered at 5s. each. So many plants have been lost in transit to this country that it has been found advisable to establish the plants on sticks or pieces of wood before sending them home. If they are much shrivelled when received they will be greatly benefited by spreading them out on a board or something similar for a short time till their leaves have become a little more firm, after which they may be placed in baskets or shallow pans, and suspended from the roof in the warmest stove.

**PLEIONE.**—These will in all probability be imported in large

FIG. 61.—CATTLEYA LINDENI.

*O. crispum* been sold for 10s. Probably one-half of the plants that were in the bag were nearly dead when they were bought; but the purchaser is well pleased with his bargain, for he knows that if he can only induce three or four pieces to grow he will have a cheap ten shillings' worth at the expiration of a couple of years. *O. crispum* and all the other species belonging to that section may be potted as soon as convenient in a mixture of peat and sphagnum, with a little broken charcoal, and placed in a cool close house for a time till they commence growing, when more air can be admitted, for they delight in a cool moist atmosphere.

**ONCIDIUM.**—This is an extensive genus, some species of which are very showy, yellow being the predominating colour in the flowers of many species. Oncidiums are extremely variable, some species having pseudo-bulbs longer than one's fist, whilst others are quite destitute of pseudo-bulbs; *O. lanceanum* and *O. luridum* represent the latter section. It will be safe to say that all the species possessing pseudo-bulbs may be treated as advised for *Odontoglossums*, the majority of them coming from cool districts; while, on the other hand, the *luridum* section requires the temperature of the East Indian house.

masses, and should therefore be divided. There will be two or three-sized pseudo-bulbs. Each size should be potted separately and suspended near the glass in the stove or Orchid house. A mixture of fibry peat, loam, and sphagnum will suit them admirably. If the young growths are far advanced when imported great care should be taken not to injure the young roots, as they are produced with the growths.

**SACCOLABIUM.**—What has been advised in this paper for *Aerides* will apply with equal force to *Saccolabiums*, as they are very closely related to each other in general appearance. To grow *Saccolabiums* successfully they require a very high temperature.

**VANDA.**—These form noble plants in the Orchid house when not in flower, and when *V. tricolor* and *V. suavis* are well in flower they are very handsome. Imported plants may be treated like *Aerides*, and when established should be potted in sphagnum and charcoal.

I have only named a few of the most useful genera. It would be impossible to lay down any rigid rule for the guidance of amateurs, as so much depends on the condition in which Orchids arrive, also whether they are from cool or tropical regions.—L. C.

## CHRYSANTHEMUM SHOWS.

## ISLE OF WIGHT.

A CONSIDERABLE advance has been made in the cultivation of the Chrysanthemum throughout the Island since this Society held its first Exhibition in the Drill Hall, Newport, six years since. The schedule is a long and most varied one, divisions being separately made for nurserymen, gardeners, amateurs, ladies, and cottagers, while there are a few open to all. The several groups and specimen plants are arranged around the sides of the spacious building, while the cut flowers are arranged down long parallel tables running down the centre of the building. All available space was filled, and the arrangements well carried out by the Hon. Secretary, Mr. Horace Groves, Mr. Cave, and Dr. Groves, one of the many Vice-Presidents and Chairman of the Committee, who discharged their duties with unflinching courtesy and ability.

Groups and plants form an important part of this Exhibition, being numerously represented in all the divisions, and those in the cottagers' class evincing nearly as much quality and training as in the corresponding divisions. Mr. Morris, gardener to Captain Eveleigh, was prominent in the gardeners' division, and secured several first prizes for examples which displayed much cultural skill. In the nurserymen's groups the first and second awards were made to Mr. J. Sanders and Mr. R. J. Gould in the order of their names, and in the amateurs' Miss May Buckell was placed first and Mr. J. Brown second. Miss Buckell's arrangement was very tasteful and the quality superior. She was, we were informed, a close student of works written on the cultivation of this flower. The back plants were rather faulty, otherwise it was a most creditable group. Mr. Brown's was a very good group, but he had very faulty front plants. In the cottagers' class Messrs. Taplin and Webber shared the awards.

Cut blooms were well shown. The principal classes were for twenty-four blooms, incurved or reflexed, and twenty-four Japanese, not less than eighteen varieties. For twenty-four incurved Mr. A. Tillery, gardener to S. E. Ridley, Esq., was a good first with Empress of India, Prince Alfred, Guernsey Nugget, Violet Tomlin, Empress of India, Violet Tomlin, Empress Eugénie, Lord Wolseley, Norman Davis, Prince Alfred, Guernsey Nugget, Empress Eugénie, Miss M. A. Haggas, Mrs. W. Shipman, Golden Empress, Venus, Princess Teck, Mabel Ward, Hero of Stoke Newington, Baron Beust, Miss Mary Morgan, Mrs. Haliburton, Charles Gibson, Barbara. Mr. Winter, gardener to Mrs. Harvey, Shanklin, was a very close second; the Princess of Wales in his stand being selected as the premier bloom. Mr. Hicks, gardener to Mr. Harrington, Cowes, was third. In the corresponding class for Japanese Mr. R. Tolley, gardener to Lady Oglander, received premier honours with J. Délaux, Criterion, Stanstead White, Mrs. C. Wheeler, Madame Baco, Baronne de Prailly, Avalanche, Gloriosum, Baronne de Prailly, Val d'Andorre, Ralph Brocklebank, Madame Paul Dutour, M. J. Pigny, Mons. Elliott, George Daniels, Madame C. Audiguier, Mrs. H. Cannell, Mrs. Beale, Belle Paule, Marguerite Marrouch, George Daniels, Japonais, Madame Baco, and Mrs. F. Jameson. Mr. Miller, gardener to Mrs. Brooke, was placed second for a very fine collection, and Mr. Winter third. There were seven collections staged, all running each other very close.

For twelve incurved or reflexed Mr. Wilkings was placed first for a stand consisting of Emily Dale, Queen of England, Yellow Perfection, Lord Alcester, Empress Eugénie, Empress of India, Lord Wolseley, Jeanne d'Arc, Miss Mary Morgan, Norman Davis, Princess Teck, and Barbara. Mr. R. Solby and Mr. Winter were placed second and third respectively, all exhibiting good collections. For twelve Japs Messrs. Hicks, Wilkins, and Winter were placed in the order of their names. The first prize stand were comprised of good examples of Etoile de Lyon, Madame Baco, Sunflower, Edwin Molyneux, Duchess of Albany, Mons. Bernet, Lady Lawrence, Mr. G. Drover, Avalanche, Mons. Bernard, George Daniels, Mr. H. Cannell. This collection furnished the premier bloom of Japanese—a well-built flower of Sunflower.

The most successful exhibitor in the amateur classes was Mr. Wheeler, who was able to secure premier honours in both classes for twelve incurved and twelve Japanese. His stand of Japanese consisted of good examples of Thunberg, Val d'Andorre, M. J. Pigny, Etoile de Lyon, Madame Baco, Avalanche, Madame C. Audiguier, Avalanche, Belle Paule, Gloriosum, Lady Lawrence, and Thunberg; and the best of his incurves were Lord Wolseley, Queen of England, Prince Alfred, Jeanne d'Arc, Lord Alcester, and Barbara; Messrs. Cooper, Sanders, and Mathews dividing the other awards. Mr. Jacobs secured first place in almost every class set apart for cottagers. His blooms were large, massive, and bright throughout; evidently he has mastered the cultivation of the flower, his premier blooms of Thunberg and Empress of India being all that could be desired.

Miscellaneous exhibits were numerously contributed, and a box of Pitmaston Duchess Pears were the admiration of all. We are unable to give further details of this interesting and excellent-managed Exhibition.

## CHESHUNT.

THE Chrysanthemum Show at Cheshunt is steadily advancing in quality and importance, the one held last week being superior in all respects to those of preceding years. Mr. R. Ewing and Mr. George Paul take considerable interest in the Society, and it is mainly due to their efforts, aided by the Secretary (Mr. Archer) and the Committee, that such satisfactory progress has to be recorded. The hall devoted to the Show is not a large one, and scarcely admits of much extension of

the classes; but it is conveniently situated, and that is an important matter.

In the cut bloom classes the competition was very good, and the exhibits excellent. The principal class was that for twenty-four blooms, twelve incurved and twelve Japanese, not more than two blooms of any one variety. Mr. Cox, gardener to J. Trotter, Esq., was first, showing substantial blooms of the following incurved:—Alfred Salter (two), Lord Alcester (two), Golden Empress of India (two), Queen of England, Violet Tomlin (two), Miss Haggas, and Princess of Wales. The Japanese were also fine, comprising Etoile de Lyon (two), Avalanche (two), Japonais (two), Beauty of Castlewood (two), not distinguishable from Mrs. Wheeler; Violet Rose, Sunflower, M. Bernard, and Stanstead White. Mr. Bettesworth, gardener to R. Ewing, Esq., was a close second with bright Japanese and solid clean incurved.

With twelve incurved and twelve Japanese, Mr. Cox was also first, being followed in each class by Mr. Collins. In the premier stands the following varieties were represented:—Incurved: Alfred Salter, Miss Haggas, Princess Beatrice, Lord Alcester, Princess of Wales, Lord Wolseley, Golden Empress of India, Violet Tomlin, Princess Teck, Empress of India, Queen of England, and Hero of Stoke Newington. The Japanese were Etoile de Lyon, Stanstead White, Sunflower, Avalanche, Carew Underwood, Stanstead Surprise, W. G. Drover, Mrs. Wheeler, Mrs. Cannell, M. Bernard, Japonais, and Marguerite Marrouch. In several other classes Messrs. Cox, Walters, Turk, Gilbert, and Searles showed well, and secured prizes. Mr. Rowdon, gardener to J. Walton, Esq., had the best groups, and Mr. Bettesworth the best six dishes of Apples, excellent fruits. Messrs. G. Paul & Son, Cheshunt, contributed a group of graceful Bamboos, and Mr. Ewing had some handsome Chrysanthemum blooms not for competition, Avalanche being uncommonly fine.

## THE ECCLES, PATRICROFT, PENDLETON, AND DISTRICT.

THIS Society held their fourth annual Exhibition in the Town Hall, Eccles, and it may be considered one of the best in that part of the kingdom. The principal object is to encourage the growth of the Chrysanthemum amongst the amateurs, and in this they have so far been very successful. The schedule comprised fifty classes arranged in three sections, twenty being open to all, seventeen to amateurs from any part, and the remaining thirteen are devoted to the amateurs in the district.

The Exhibition was a very representative one, and the amateurs have shown well, and in one instance even took the lead over the professional growers. The Hall presented a splendid appearance. Large Palms, Crotons, &c., lent by Mrs. Thos. Agnew, Eccles, were placed in front of the orchestra and in the hall, and other small decorative plants lent by Oliver Heywood, Esq., J.P., Stewart Garnett, Esq., J.P., and Wm. Agnew, Esq., J.P., added materially to the effect of the Show. There was a good competition in most of the classes.

Cut blooms were numerous and of an excellent quality. For twenty-four blooms, half incurved and half Japanese, Mr. Chas. Smith, gardener to D. Wilson, Esq., Claughton, Birkenhead, was first with capital blooms, and received in addition a silver medal of the National Chrysanthemum Society and their certificate of merit; Mr. J. Walker, Stockport, being second. For twelve blooms, incurved, the same exhibitor was again first, and Mr. John Cragg, gardener to A. Henry, Esq., Fallowfield, was a good second. In the following class for twelve Japanese the winners were the same as in the preceding one. For twelve blooms, half incurved and half Japanese, the first honour was again taken by Mr. Chas. Smith, gardener to P. Wilson, Esq., and Mr. J. Walker was second. The first prize in a stand of twelve mixed blooms, incurved, Japanese, reflexed, and Anemone, went to Mr. J. Walker, Mr. A. Henry being second. In the class for six Anemone centered blooms an amateur, Mr. H. Huber, was awarded the first prize, and Mr. J. Walker second. In the open amateur class for twelve blooms, half incurved and half Japanese, Mr. T. Smethurst received the first prize, together with a silver medal of the National Chrysanthemum Society, and their certificate of merit. The first prize in the collection of eighteen blooms staged for effect was won by Mr. A. B. Wimpary, and in the other classes Mr. T. Smethurst, Mr. H. Huber, and Mr. W. Crawshaw took the lead. The classes open to amateurs residing in the district were all well competed for. For twelve blooms, six incurved and six Japanese, Mr. H. Huber received the first prize, and also the bronze Centenary medal of the National Chrysanthemum Society, and in the other classes in this section the same exhibitor was the principal prize-winner, Mr. R. Johnson also winning some first prizes in this section.

Chrysanthemums in pots were of a very good quality. Those in the open classes were all that could be desired, whilst those shown in the amateur sections were highly praiseworthy. For a group of plants, any varieties, arranged for effect, space not to exceed 9 feet by 6 feet, six groups were contributed. Mr. Towe, gardener to Mrs. H. Winterbottom, was placed first with grand examples of culture. Mr. T. Belshaw, gardener to G. H. Leigh, Esq., was second with even better plants, but through some defective arrangement of his group. For six incurved only a second prize was awarded to Messrs. T. Belshaw & Sons; and for six Japanese the same exhibitor was first; and Mr. John Barlow, gardener to T. G. Groves, Esq., second. For three Pompons G. H. Leigh, Esq., was placed first; and J. J. Thompson, Esq., second. In the open amateur section Mr. Thomas Morton and Mr. A. B. Wimpary took the lead; and in the amateur section for the district Mr. H. Huber was first in all the three classes. In the open section, for a group of

miscellaneous plants arranged for effect, space not to exceed 7 feet by 5 feet, Mrs. Thomas Agnew (Mr. Elkin, gardener) was well first with the most tastefully arranged group, Mrs. H. Winterbottom being placed second; and J. J. Thompson, Esq., third. For table plants Mrs. Thos. Agnew was again first. Mrs. H. Winterbottom took the lead for Roman Hyacinths; and J. J. Thompson, Esq., and H. H. Howarth, M.P., for Primulas. In the open amateur section Mr. H. Huber was awarded the first prize in the classes for six table plants—six foliage plants and four Primulas.

Miscellaneous exhibits were not so numerous as in former years owing to the want of space. Messrs. W. Clibran & Son, Altrincham, staged several large stands of cut blooms of Chrysanthemums. Messrs. Dickson & Robinson, Manchester, contributed a stand of very choice Cyclamens, Erica hyemalis, small Palms, Ferns, and Selaginellas.

#### DERBY.

THE above Society is amalgamated with the Midland Railway Horticultural Society, and held this year their sixth Exhibition of Chrysanthemums, and floral arrangements, in the spacious Drill Hall, Derby. It was a grand success in a financial point of view, for no less than 2500 visitors attended the Show on the opening day, and there was evidently no falling off on the second, for the building was packed with visitors. The Exhibition has far outdistanced former efforts, cut blooms being in many cases especially good. The most noticeable were the twelve incurved and twelve Japanese in the open class, staged by Mr. Goodacre, gardener to Lord Harrington, which secured him the coveted trophy he so well won last year, the property now becoming his own, he having won it twice consecutively. Mr. Evans, gardener Chaddeston Hall, was second, and Mr. Stopps, gardener to F. Alton, Esq., Borrowash Manor House, third, both showing substantial blooms. Mr. F. Bancroft won the challenge cup in the members' class for the second time, which consequently becomes his own, also securing the prize for the best bloom in the members' classes with a fine Etoile de Lyon. The other classes for cut blooms were well filled, the principal for six incurved and six Japanese, which was well won by Mr. Stopps, while Mr. Evans, Mr. F. Bancroft, Mr. H. Bancroft, F. W. Meakin, Mr. J. T. Smith, J. Bryan were successful in obtaining several prizes. The grouping has much improved since my last visit, the first prize falling to Mr. Smith, gardener to A. Cox, Esq., Mill Hill. Second, Mr. Dickman, gardener to Mr. E. McInnes, Osmaston Road. Third, Mr. Potter, gardener to J. Williams, Esq. Table decorations.—The prizes fell principally to Mr. Barlas, Mr. Evans, and Mr. Clark, while Mr. Adams was first with a bouquet, Mr. Potter being a good second. Specimen plants call for no comment, but hopes are entertained of these plants being better represented next year. The arrangements reflect much credit upon the Secretary, Mr. Bell, and a good working Committee.—J. P.

#### WALTON AND WEYBRIDGE.

THE sixteenth annual Show of this flourishing Society was held at the Public Hall, Weybridge, on the above date, and under the management of Mr. Masters, Secretary, and a hardworking Committee, a beautiful and interesting Exhibition was the result. The Hall was crowded with visitors nearly the whole afternoon and evening, and it was plainly evident that the Chrysanthemum is more popular than ever in this district.

The schedule contained thirty-six classes, nearly every one of which was well filled. The first is for six plants dwarf trained, and Mr. F. Cawte, gardener to Preston Thomas, Esq., Weybridge, gained first honours with a very bright even collection; very good indeed was a plant of John Salter. Second, Mr. Reed, gardener to E. Pettit, Esq., Oatlands Park. Three plants.—First, Mr. Millican, gardener to H. Cobbett, Esq., Walton. Second, Mr. Felgate, gardener to the Duchess of Wellington, Hersham. Three standards.—First, Mr. Millican. Second, Mr. Cawte. Third, Mr. Reed. Two pyramids.—First, Mr. Reed. Second, Mr. Millican. Third, Mr. Cawte. Pompon varieties were well shown by the same three exhibitors, Mr. Cawte being first with beautiful bright specimens.

Cut blooms were numerous and good, the Japanese varieties being especially fine. For twenty-four distinct (open class), twelve incurved and twelve Japanese, first, Mr. Carpenter, gardener to Major Collis Browne, Byfleet, with a very heavy stand, arranged thus:—Incurved: Empress of India, Violet Tomlin, Lord Alcester, Princess of Wales, Mr. Brunlees, Mrs. Heale, Golden Queen, Golden Empress, Princess Teck, Miss M. A. Haggas, Nil Desperandum, and Mrs. Shipman. Japanese: Condor, Baronne de Prailly, Mrs. F. Jameson, Avalanche, R. Brocklebank, E. Molyneux, Stanstead White, W. W. Coles, Album Fimbriatum, Etoile de Lyon, Sunflower, and Mons. Bernard. Second, Mr. Felgate; third, Mr. Sutton, gardener to J. S. Sassoon, Esq., Walton. Twenty-four incurved, first, Mr. J. Thorne, gardener to A. E. Flood, Esq., Walton, with a very clean stand of medium-sized solid flowers, arranged as follows, reading from left to right:—Lord Alcester, Queen of England, Bronze Queen, Jeanne d'Arc, Alfred Salter, Empress Eugénie, Golden Empress, Empress of India, Ada Spaulding, Mrs. S. Coleman, Beauty, Miss M. A. Haggas, Princess Teck, Cherub, Mrs. Heale, Barbara, Violet Tomlin, Mrs. Shipman, Mrs. N. Davis, Sir S. Carey, Princess of Wales, Mr. Bunn, Hero of Stoke Newington, and Eve. Second, Mr. Millican; third, Mr. Quarterman, gardener to E. Smith, Esq., Cobham. Twelve ditto, first, F. Hopkins, gardener to J. Wodderspoon, Esq., Walton; second, Mr. Felgate; third, Mr. Cawte.

Twenty-four, Japanese, first, Mr. Caryer, gardener to A. Meissner,

Esq., Weybridge, with a very bright stand; some of his best were Etoile de Lyon, Marsa, Charlie Sharman, Japonais, Mrs. F. Jameson, and Avalanche. Second, Mr. Felgate; third, Mr. Sutton. Twelve ditto, first, F. Hopkins; second, Mr. Cawte; third, Mr. Millican. Twelve Anemones, first, Mr. Millican; second, Mr. Reed. Pompons were well shown in several classes. Twelve blooms distinct, open only to gardeners who had not previously shown. First, Mr. Field, gardener to Captain Terry, Hersham; second, Mr. Packham, gardener to A. Hall, Esq., Walton; third, Mr. Pasker, gardener to F. W. Wigan, Esq., Walton. For six incurved (one variety), first, Mr. Thorne, with Lord Alcester; second, Mr. Felgate, with Golden Empress; third, Mr. Reed, with Empress of India. Six Japanese ditto, first, F. Hopkins, with Thunberg; second, Mr. Felgate, with Etoile de Lyon (these took first at Kingston); third, Mr. Sutton, with H. Cannell.

Special prizes were offered for a group of Chrysanthemums, which brought good competition. First, F. Hopkins; second, Mr. Reed; third, Mr. Cawte. Table ornaments and bouquets made a good display, and were much admired. Amateurs and cottagers also exhibited remarkably well, and it is not too much to say the Show under notice was one of the best the Society has ever held.

#### LINDFIELD.

THIS mid-Sussex Society held its sixth annual Show this year, and for the general quality of the exhibits compared well with many larger societies. The Assembly Room was gay with groups, plants, and blooms, whilst there was a good show of fruit, vegetables, &c., in an adjoining room. There were five large groups, and four in the amateur class. Mr. Crosley, gardener to H. M. Cumberlege, Esq., took premier place and bronze medal in the larger class, C. Wheeler being placed first in the smaller section. For eighteen Japanese Mr. J. Voss, gardener to W. Savill, Esq., was first with a stand of uniform excellence. The competition in this class was very keen, and all the blooms were of high quality; Mr. J. Hodges was second; Mr. T. Venn third. For twelve Japanese Mr. S. Horscroft, gardener to T. Potter, Esq., Ardingly, took first place with really good blooms; Mr. Voss and Mr. Venn being respectively second and third.

The first position for eighteen incurved was taken by Mr. T. Venn, gardener to W. Sturdy, Esq., who staged a very neat collection. Mr. Venn was again the winner in the class for twelve incurved, besides being awarded a certificate for the best incurved bloom in the Show (Lord Wolseley), and winning a special prize for the best bloom of Miss M. A. Haggas. Mr. Voss won a special prize for best bloom of Violet Tomlin, and also took first place for twelve reflexed and Anemone. Mr. J. Hodges, gardener to S. C. Gibbons, Esq., was awarded a certificate for the premier Jap, Mrs. J. Wright (a perfect bloom), and besides running very closely in the Japanese class was most successful in the fruit and vegetable divisions, being first for Grapes, Apples, Tomatoes, Potatoes, &c.

Mr. Townshend, gardener to E. Arbour, Esq., was first for table plants and second for Primulas, also second for an effective group. Mr. P. Marsh, gardener to G. C. Hawes, Esq., was first for standards, besides taking second prizes for small group, specimen plants, &c. In the cottager section the display of vegetables was excellent. There was a good attendance on both days, and the Show was generally admitted to have been the best on record.

#### FALMOUTH.

THE fifth annual Exhibition, held under the auspices of the Royal Cornwall Polytechnic Society on the above dates, afforded ample proof that there is no decline in the activity of Chrysanthemum growers in this neighbourhood.

Plants in all classes were exceptionally good, the Judges experiencing considerable difficulty in deciding between the first and second prize groups. Although larger cut blooms have been staged at former shows, the quality of those now exhibited was especially good. Some blooms of new varieties, sent by Mr. Robert Owen, Maidenhead, were much admired. The display of fruit was very satisfactory, including a fine collection of Apples from Mr. J. Watkins, Hereford. These created much interest, the colour and size being superior to those shown by local exhibitors. Amateurs showed considerable improvement both in plants and cut blooms. For groups the first prize was awarded to Mr. W. Ruse, gardener to G. P. Bull, Esq., Marlborough, Falmouth; second, to Mr. J. Downing, gardener to Mrs. Waters, Gyllyngdune; third to Mr. B. Gill, gardener to W. H. Lean, Esq., Ardyn Villa. These exhibitors, together with Mr. W. Jenkin, gardener to Howard Fox, Esq., Rosehill, secured most of the prizes for specimen plants.

*Cut Blooms.*—Twelve incurved.—First prize to Mr. G. Pappin, Flushing, for blooms of Lord Alcester, Prince Alfred, Empress of India, Lord Wolseley, Barbara, Princess of Teck, Baron Beust, Mrs. Norman Davis, Lord Eversley, Nil Desperandum, and Pink Venus. The second prize was awarded to Mr. E. King Nicholls, gardener to C. Gray, Esq., Penryn. Twelve Japanese.—First to Mr. G. Pappin for neat blooms of Mrs. F. Thompson, Peter the Great, Fair Maid of Guernsey, Flamme de Punch, Etoile de Lyon, Avalanche, Comte de Germiny, Mdle. Lacroix, Madame C. Audiguier, Mrs. J. Wright, Sunflower, and Sarah Owen. Second prize to Mr. S. Smith, gardener to Miss Fox, Penjerick. Six large flowered Anemone blooms.—First, Mr. G. Pappin, with Fleur de Marie, Prince of Anemones, Sunflower, Empress, Gluck, and Lady Margaret. Second prize, Miss Hockin, Little Falmouth.

A special feature of this year's Show was a class to illustrate the

climate of the West of England, prizes being offered for collections of cut flowers or foliage of any trees, shrubs, or plants grown in the open air, which brought together a magnificent collection of flowers, foliage, &c., of exotic plants, together with fine specimens of Citrons, Almonds, &c., the whole being grown and ripened in the open air in and near Falmouth. It is doubtful if such a collection of subjects growing out of doors could be shown in any other town in England.

Special attention is just now being given to fruit culture in the district, and during the Show a most valuable paper on "Renovating Orchards," by Mr. J. Wright, was read by the Hon. Secretary, Mr. J. P. Cregoe. This paper was specially written for this occasion by the kind request of Mr. Lewis Castle, Hon. Secretary of "The British Fruit Growers' Association." A large number of persons mostly interested in fruit culture were present, and the opinion freely expressed was that if the various practical suggestions in the paper are carried out great good must result to the long neglected orchards, not only in Cornwall but in other counties.

It is much to be regretted that almost constant rain interfered with the success of the Show financially.—VISITOR.

#### CUCKFIELD.

THIS Society held their fifth annual Show in the Talbot Hotel Assembly Rooms on Tuesday and Wednesday, the 18th and 19th inst., and was on the whole as successful as on former occasions. There was, unfortunately, a falling off in the number of groups, which has always been a good feature of this Show, only three being staged. The group shown by Mr. Geo. Stringer, gardener to R. A. Bevan, Esq., to which the premier award was given, was a fine group in every respect. One feature in it was much admired, and is worth noting by those growing for this purpose. It was a row of fine dwarf plants of the rose coloured variety La Frisure, all round, just inside a row of Fern, which made an excellent finish to the whole. Mr. J. Mitchell, gardener to Mrs. Maberly, Myttons, was second with a group in his usual neat style; and Mr. R. Fairbairn, gardener to Mrs. Lister, The Grange, Warninglid, was third with well grown plants and best quality bloom, but was, as is too often the case, deficient in finish. Specimen plants were not more numerous than on former occasions, but they were excellent quality. Messrs. Geo. Stringer, Mitchell, and Fairbairn being the successful exhibitors. Mr. Stringer was first for six Solanums with good plants. Mr. Mitchell occupied the premier position amongst seven competitors for six Primulas, Mr. R. Inglis being first for six Cyclamens.

Undoubtedly the best feature of the Show was in the two classes for twelve blooms each of Japanese and incurved, open to the county of Sussex. There were seven entries in this for the former and four for the latter. For twelve incurved Mr. T. Venn, gardener to W. Sturdy, Esq., Paxhill, Lindfield, was first with good, even, fair sized blooms. They were—Back row: Princess of Teck, Golden Empress, Lord Alcester, Miss M. A. Haggas. Middle row: Violet Tomlin, Guernsey Nugget, Lord Wolseley, Mrs. Heale. Front row: Barbara, Hero of Stoke Newington, Lady Dorothy, and Empress Eugénie. Mr. J. Voss, gardener to W. Savill, Esq., The Finches, Lindfield; Mr. S. Horscroft, gardener to T. Potter, Esq., Hapstead House, Ardingley; and Mr. R. Inglis followed in the order named.

The Japanese were of very high quality, and the winning stands were all so good that it required some knowledge of various sorts to arrive at a just decision as to their respective merits. Mr. J. Hodges, gardener to S. C. Gibbons, Esq., Great Walestead, Lindfield, was placed first with:—Back row: Etoile de Lyon, Madame Baco, Gloriosum, Volunteer. Middle row: Mrs. H. Cannell, Mons. Bernard, Pelican, Madame C. Audiguier. Front row: Mons. Barat, Boule d'Or, Jeanne Délaux, and Thunberg. Messrs. J. Voss, T. Venn, and S. Horscroft followed in succession. There was nothing in the local classes for cut blooms to call for special notice except it is the fact that Mr. J. Lingly, gardener to T. W. Best, Esq., Harvest Hill, had much the best of it, being placed first in all three classes—Japanese, incurved, and reflexed, with neat fresh blooms.

*Fruit.*—There were good entries in most of the fruit classes. For two dishes of dessert Pears Mr. Geo. Stringer was first with splendid samples of Pitmaston Duchess and Beurré Diel, and the same exhibitor was successful with equally fine stewing Pears—Uvedale's St. Germain and Catillac. Mr. Lingly had the best six dishes of Apples amongst eight entries; they were Waltham Seedling, Warner's King (both very fine), Alexander, Emperor Alexander, Kerry Pippin, and American Mother. Messrs. W. Manton, J. Mitchell, and Geo. Stringer were placed in the order named for a tray of vegetables, and, as usual, it was a good class.

Amongst exhibits not for competition Mr. J. Hodges showed six very fine blooms of Etoile de Lyon cut from two plants, two of them being pure white (crown buds), while the other four were bright pink (terminal buds), and illustrate the difference peculiar to this variety in producing what, to the uninitiated, would seem two distinct flowers on the same plant; splendid samples of culture, a very interesting exhibit. Messrs. J. Cheal & Sons exhibited over fifty dishes of Apples and Pears, many of them fine in size and of better colour than they are generally met with this season. Mr. Bunny of Danny Park, and Mr. Prentice of Paddockhurst, officiated as Judges, and Mr. Umpleby superintended the arrangements with his usual ability. Major Maberley shows unflinching interest as President of the Society, while Mr. J. Tugwell, sen., ably discharges the duties of Hon. Secretary.

#### ALVERSTOKE AND GOSPORT.

THE third Exhibition held by this Society afforded abundant proof that there is great advance in the activity of Chrysanthemum growing in the above neighbourhood, for a more satisfactory display could not possibly have been desired. The arrangements were well carried out by a small working Committee, consisting of the Hon. Secretary, Mr. J. H. Spencer; and Messrs. T. Naish, S. Collins, Babb, Miller, Burt, and Mitchell. The Thorngate Hall, a spacious, lofty, and beautifully decorated building, was filled with specimen plants, groups and cut flowers, while the fruit and vegetables were staged in the Friendly Societies' Hall adjoining. The schedule comprised fifty-three classes.

Groups were an especial feature, nine being staged for competition. In the class for a group in a space of 30 square feet, Mr. Gale, gardener to G. Cooke, Esq., Langton House, Gosport, was first with a well arranged group, comprising incurved, Japanese, and reflexed varieties of good quality. Mr. Hawkins, gardener to E. Laphorn, Esq., Fairthorne, Gosport, was second with a good arrangement, with smaller though fresh flowers. W. & J. T. Legg, Bury Road Nurseries, third; Mr. Davis, gardener to Mrs. Churcher, fourth. In the class for a group in 20 feet space, Mr. T. Smith was awarded first honours with a good arrangement, his flowers being heavy and fresh. Mr. T. Watch was second with a better arranged group, but his front plants were very weak. Mr. A. Dance, gardener to Mrs. Wharton, was third. The class for six specimen plants made a good display, filling one side of the hall. Mr. Hawkins was first with easy trained and well flowered specimens of Mdle. Lacroix, Val d'Andorre, Florence Percy, Peter the Great, Fair Maid of Guernsey, and Maiden's Blush. Mr. E. Foot was second with smaller, but fresh neat plants, Margot and Chevalier Damage being especially good. Mr. F. Limburn, gardener to Mrs. Lane, Bury Hall, third. For six specimen plants of Pompons Mr. Hawkins was again first with plants from 3 to 4 feet high and as much through, easy trained and beautifully flowered. Mr. Gale second; Mr. Foot third. Especially noteworthy were the plants showed by cottagers. For the class for four plants grown by cottagers without glass Mr. J. Webb was awarded the first prize for good plants, carrying fine flowers, one of the plants being Alfred Salter, having four very fine flowers, one of which would have secured the prize for the premier incurved bloom in the Show had the exhibitor pulled out one or two decayed florets which it contained.

*Cut Blooms.*—The principal class was for twenty-four blooms, half incurved and the remainder Japanese, distinct. Mr. J. Agate, Havant, was awarded first honours, with fresh, solid blooms of the following:—Incurved: Emily Dale Improved, Golden Empress, Lord Alcester, John Lambert, Miss M. A. Haggas, Violet Tomlin, Mrs. A. Coleman, Princess of Wales, Ada Spaulding, Barbara, Mrs. Heale, Lord Wolseley. Japanese: W. G. Drover, Mr. Cannell, Etoile de Lyon, Mrs. C. H. Wheeler, Mrs. H. Cannell, Geo. Maclure, Edwin Molyneux, Criterion, Ralph Brocklebank, Mrs. C. A. Carrière, Stanstead White, Anatole Cordonnier. Mr. Gale was second with good Japanese, but the incurved lacked freshness and finish. Mr. Limburn was third. In the class for eighteen Japanese Mr. Gale was first with a good stand, in which were fine blooms of G. F. Moseman, Etoile de Lyon, Japonais, and Belle Paule. Mr. Limburn was second, and Mr. Watch third. For twelve Japanese Mr. Hawkins was first with a fresh even stand; Criterion, Etoile de Lyon, Edwin Molyneux, Duchess of Albany, and Mons. Freeman were especially good. For eighteen incurved Mr. Gale was first, and Mr. Limburn second. For twelve incurved Mr. Didymus, gardener to Capt. H. G. Giles, R.N., was first, Mr. Watch second, Mr. Foot third. Mr. Limburn took leading honours in the class for twelve reflexed, Cullingfordi being grand. Mr. Hawkins second, Mr. Didymus third. Mr. Gale was first in the class for twelve Japanese Anemones, Mr. Foote second. For twelve Japanese and large Anemones Mr. Hawkins was first with fine blooms of Empress, Nelson, Souvenir de Madame Blandinieres, Dame B'anche, Margouline, Mrs. Pethers, and Geo. Hawkins, a fine yellow sport from Geo. Sands. Pompons were a strong class, seven staging. Mr. Hawkins was well ahead with fine bunches, "three flowers to a bunch," of Rubrum Perfectum, Comte de Morny, Sunset, Prince of Orange, Black Douglas, and Mdle. Marthe.

Among the cottagers' exhibits were some fine boxes of flowers from Mr. H. Lee and Gunner Holmes, R.A., the former taking the lead for six incurved, six reflexed, six Anemones, and six Pompons, all being good fresh solid blooms. From his stand of incurves was selected the premier bloom of the Show, Gunner Holmes taking first for six Japanese, Edwin Molyneux being grand, the finest yet seen in this part of the country, and was deservedly awarded the prize for the premier bloom in the Show.

The special prizes were numerous; the most interesting was a class for the best representative collection of cut blooms of Chrysanthemums of all sections. The first prize, which was given by the President (the Hon. and Rev. Canon Brodrick) was won by Mr. Hawkins with a finely arranged collection. His Japanese, incurved, reflexed, Anemones, singles, Pompons, and Anemone Pompons were especially good. The second prize, given by E. Laphorn, Esq., was won by Mr. Gale; third prize, given by A. S. Blake, Esq., being taken by Mr. Foot. A cup, offered by Miss E. Legg of the North Cross Street Seed Stores, for the best six varieties of vegetables was taken by Mr. Hawkins; the same exhibitor taking the prize offered by Mr. W. Colchester with a plant of Fair Maid of Guernsey, about 7 feet high and 4 feet through, carrying hundreds of pure white flowers. Vegetables were well shown, Mr. Hawkins securing the first place for nine distinct varieties with good leading kinds; W. & J. F. Legg second; Mr. Davis third; Mr. Limburn fourth. Apples and Pears were well shown, Mr. Gale, Mr. Hawkins,

and Messrs. Legg winning for Apples respectively; Mr. Limburn, Mr. Hawkins, and Mr. Foot taking the prizes for Pears in the order of their names. Mr. Hawkins was first for black Grapes, Mr. J. Groom being first for white, the last-named exhibitor showing some fine Solanums and Primulas. Bouquets were well shown, there being six staged, Mr. Hawkins winning easily with a handsome light arrangement; Mr. Gale second, Mr. Davis third, Mr. Foot fourth.

#### CHELMSFORD AND ESSEX.

A VERY successful Show was held in the Corn Exchange, a spacious, lofty light building with glass roof well adapted for the occasion. The groups, always good here (the cutting back system being very successfully practised in the neighbourhood), were exceptionally so on this occasion, and formed the chief centre of attraction, the silver medal of the N.C.S. being added to the money prize. Mr. S. Pragnell, gardener to H. C. Wells, Esq., C.C., Broomfield Lodge, Chelmsford, was first, closely followed by Messrs. Saltmarsh & Sons of The Nurseries, Chelmsford; third, Mr. Brazier, gardener to W. Gray, Esq., Chelmsford; fourth, Mr. J. Burrell, gardener to W. W. Duffield, Esq., Brownings, Chelmsford. The two leading groups in this class were said to have rivalled those of the N.C.S., having more massive deeper blooms from back to front. In a class for small groups an amateur, Mr. G. J. Bollingbroke was first; Mr. W. Harris, gardener to Philip Marriage, Esq., Broomfield Mills, second; Mr. H. Bishop, Langly's Park, Waltham, third; and fourth Mr. C. J. Simpson, St. John's Nursery, Chelmsford. Cut blooms were good, especially the Japanese. For twenty-four incurred Messrs. Saltmarsh & Sons were first, Mr. Pragnell second. The sharpest contest in the Show was for twenty-four Japanese, Messrs. Saltmarsh and Sons winning by a few points; Mr. Pragnell second; and Mr. W. Dance, gardener to Mrs. Lowe, Gosfield Hall, third. In a class for twelve incurred Mr. Dance was first, Mr. T. Brazier second, Mr. C. J. Simpson third. Twelve Japanese.—First, Mr. C. J. Simpson; second, Mr. T. Brazier; third, Mr. W. Harris. In the six classes Mr. Bollingbroke, Mr. Seward, Mr. W. Harris, Mr. E. Spurge, Mr. Witham, and Mr. Stevens, gardener to E. Jex, Esq., Springfield, were the winners. In the reflexed class Mr. Pragnell was first, Messrs. Saltmarsh & Sons second, Mr. W. Dance third. For large Anemones Messrs. Saltmarsh & Sons first, Mr. Pragnell second, Mr. Brazier third. For twelve varieties Pompons, three spikes of each, Mr. Pragnell was first, Mr. Brazier second, Messrs. Saltmarsh & Sons third. Messrs. Saltmarsh & Sons had the best incurred bloom in the Show with a fine bloom of Princess of Wales, whilst Mr. Pragnell took similar honours in the Japanese with a fine deep bloom of Avalanche, which the latter was awarded a certificate of the N.C.S.

The plant classes were well filled, and were very good indeed. For four incurred Mr. Dance was first; Mr. Brazier, second; Mr. Burrell, third. Four Japanese, first, Mr. Burrell; second, Mr. Dance; third, T. Brazier. Four Pompons, which were extremely well done, Mr. Dance was first; Mr. Burrell, second; Mr. Brazier, third. For single specimen, incurred, first, Mr. Burrell; second, Mr. W. Harris, with a novelty in a plant of Mrs. Dixon, trained heart shape; third, Mr. Brazier. Single specimen, Japanese, first, Mr. Brazier; second, Mr. Dance; third, Mr. Burrell. For single Pompons, Mr. Dance was first; Mr. Burrell, second; Mr. Brazier, third.

In a class for six table plants, Mr. Pragnell was first; Messrs. Saltmarsh & Sons, second; Mr. Stevens, third. There was a good competition in the vegetable classes, Mr. Pragnell taking first with a fine collection; Mr. Henry Bishop, Langly's Park, second; Mr. J. Burrell, third.

In the special prize classes, one for twelve Chrysanthemum blooms, four Japanese, four incurred, four Anemones, was well contested, Mr. Pragnell being first; Mr. Brazier, second; Mr. C. J. Simpson, third. The fruit classes were not quite so well represented as usual. Mr. Green, Harold Court, Brentwood, exhibited some fine Gros Colman Grapes; Messrs. E. Searle and Mr. Pragnell some excellent Alicante, taking prizes in the order named. Messrs. Saltmarsh & Sons exhibited a fine collection of Apples and Pears not for competition, whilst the Essex Bee Association offered several prizes for honey, which were well contested.

Messrs. Saltmarsh & Sons had the best stand of bloom in the Show with their twenty-four Japanese, and were awarded the bronze medal of the N.C.S. Mr. Dance won the Centenary bronze medal with his four incurred trained plants. Mr. Burrell was awarded a bronze medal of N.C.S. for his four Japanese plants, and Mr. Brazier a certificate of N.C.S. for his single specimen Japanese plant.

#### TUNBRIDGE WELLS.

THE fourteenth Exhibition of Chrysanthemums and fruit was held in the Royal Sussex Assembly Rooms, and must be recorded as one of the finest ever held under the auspices of this Society. There was a great falling off in the plant classes, but this was more than made up by the quantity and quality of the cut blooms staged. Two silver cups were again offered for competition in the plant classes, and it is to be regretted the competition for them was very weak. Let us hope the Committee will see the folly in offering two of the most valuable prizes for plants and ignoring the most attractive feature—the cut blooms. The first cup offered for a group of plants, Japanese, Pompons, or Anemone, effect to be the leading feature, brought one exhibitor in Mr. J. Snoker, gardener to Mrs. Hall, Brathay House, Broadwater Down, who was awarded the cup for a splendid group of well-grown plants. The second cup for a group shown in a space of 12 feet by 6 feet brought three exhibitors. Mr. Hemsley, gardener to S. R. Brewer-

ton, Esq., 42, Broadwater Down, was deservedly awarded the prize for a well arranged group, the quality of flowers being also good. Mr. Scammell, gardener to C. Reily, Esq., The Priory, Nevill Park, having to be content with second honours this year with a very creditable group. Mr. E. Luff, gardener to G. Holt-Mason, Esq., Castleton, Tunbridge Wells, third.

The centre of attraction was confined to the cut blooms, and it is surprising that such fine examples were forthcoming in this direction, the prizes being totally insignificant compared with the plant classes. In the class for twenty-four incurred two only competed. Mr. W. Wallis, a new exhibitor, gardener to J. Mews, Esq., Hartwell, Hartfield, was awarded first honours with a fine even stand, but several blooms had very faulty centres. The varieties were—In the back row: Alfred Lyre, Empress of India, Princess of Wales, Miss Haggas (good), Violet Tomlin, Mrs. Heale, Lord Wolseley, Golden Queen of England. Middle row: Mrs. W. Shipman, Isabella Bott, Jardin des Plantes, Lady Hardinge, Queen of England, Barbara, Golden Empress, Sir Stafford Cary. Front row: White Venus, Prince of Wales, Lady Dorothy, Duchess of Manchester, Eve, Cherub, Lord Eversley, Mr. Brunlees. Mr. J. Snow, gardener to C. and A. Murietta, Esqs., Wadhurst Park, was placed second with a good even stand of solid blooms, especially fine Mrs. Heale and Miss Haggas.

The class for twenty-four Japanese brought several fine collections. Mr. Wallis was again successful with heavy bright blooms of the following—Back row: Mrs. J. Wright, Sunflower, Stanstead Surprise, Etoile de Lyon, Gloriosum, Madame Baco, Duchess of Albany. Middle row: Madame C. Audiguier, M. J. M. Pigny, Le Sceptre Toulousain, Marsa, Avalanche, Sarah Owen, Mons. Bernard, George Daniels. Front row: Mrs. F. Jameson, Pink Mdle. Lacroix, Florence Percy, Ralph Brocklebank, J. Delaux, Mrs. A. Hardy, grand; Madame J. Laing, and Soleil Levant. Mr. C. Davis, The Gardens, Hall Place, Leigh, was placed second. The front row in this stand was very weak indeed. Mr. Snow, gardener Wadhurst Park, was placed third with a stand not many points behind the prize collection. For twelve incurred Mr. J. Legg, gardener to Rev. E. Boardman, Groombridge, came to the fore with even, clean, and solid blooms. Mr. Snow a good second. Mr. Avis, gardener to Hon. P. Petre, Faircrouch, Wadhurst, third. For six incurred Mr. Legg was again first, Mr. Wallis second, and Mr. Snow third. In the class for six Japanese the competition was also keen. Mr. Snow was placed first; Mr. Scammell, gardener to C. Reily, Esq., second; Mr. W. Avis third.

The show of fruit was remarkably fine, Mr. Bridger, gardener to Lord de Lisle, Penshurst, was the principal exhibitor. Mr. Johnstone, gardener to Captain Green, Bayham Abbey, exhibited in grand style, Mr. Bridger having to take second to him in several classes. The Secretary and Committee are to be congratulated upon the advance made.

#### REIGATE.

THE second Exhibition of this Society was held in the Public Hall, Reigate, which was filled to an uncomfortable degree, despite the fact that another room was devoted to overflow exhibits. Of course, when it is remembered that Reigate is a good district the crowded state of the Show was not surprising. In the cut flower classes competition was most keen. In the leading class for thirty-six Japanese Mr. C. J. Salter, gardener, Woodhatch Lodge, was first with fine examples of Sunflower, Marsa, L'Adorable, Japonais, Sarah Owen, and Madame Baco; the remainder (all good) were E. Molyneux, Ada Spaulding, Fimbriatum, Mr. H. Cannell, Yokohama Beauty, Mons. Astorg, John Thorp (a weak flower), Grandiflorum, Belle Paule, Blanche Neige, Mons. Bernard, Maiden's Blush, Madame C. Audiguier, Mrs. J. M. J. Pigny, Mrs. Wheeler, Charles Wagstaff, Moonlight, Madame John Laing, Avalanche, Jeanne Délaux, Charlie Sharman, Gloriosum, Amy Furze, Lady Lawrence, Dr. John Tanner, Stanstead White, Mdle. Lacroix, Etoile de Lyon, Volunteer, and Boule d'Or. Mr. J. Brown, the Hon. Sec., Great Doods, Reigate, was second with similar but rather rougher and smaller blooms.

For twenty-four Japs Mr. C. J. Goldsmith, gardener, High Trees, Redhill, was first with fine flowers of Mrs. J. Wright, Album Fimbriatum, Carew Underwood, Belle Paule, Duchess of Albany, Etoile de Lyon, Album, Elaine, and Edwin Molyneux. Mr. H. Bailey, The Briars, Reigate, was a close second. For twelve Japs Mr. W. Slowgrove, Gatton Lodge, Reigate, was awarded the first place; he had fine examples of Thunberg, Jeanne Délaux, Marsa, Boule d'Or, Meg Merrilies, Madame J. Laing, Val d'Andorre, Gloriosum, Avalanche, Edwin Molyneux, Comte de Germiny, and Stanstead White. Second Mr. J. R. Cotton, gardener to E. Bell, Esq., Wray Park, Reigate. Third Mr. J. Port, Sheybrook, Reigate. Mr. Port took first for six Japs; Mr. Peters, Danecroft Lodge, second. For six Japanese, one variety, Mr. Hayter, gardener to the Marchioness of Anglesey, The Priory, Reigate, was first with Sunflower; second Mr. Brown with Avalanche; third Mr. Cotton with Mdle. Lacroix. Six incurred, one variety, first Mr. Salter with Empress of India; second Mr. Hayter with Lord Alcester, also second for twelve incurred distinct, Mr. C. Goldsmith being first. For twenty-four incurred, distinct (twelve reflexed in eight varieties, and twelve Pompons three blooms each) Mr. Salter was first in each case with superb flowers.

In a large class for six varieties, any kind, Mr. Slowgrove was placed first; he had Etoile de Lyon, Boule d'Or, Maiden's Blush, Gloriosum, Val d'Andorre and Golden Dragon. Mr. Tickner, gardener to J. Watney, Esq., Shermanbury, Reigate, was a good second. Third, Mr. Cotton, who, however, was first for six blooms of incurred. Second, Mr. Peters and third Mr. S. J. Crofts, gardener, The Wilderness, Reigate. Plant.

department.—For six of any kind Mr. Tickner was first with six *Dracænas*. Six *Cyclamens*.—First, Mr. Hayter. Mr. Tickner had the best six table plants. Second, Mr. Brown, with six *Celosias*. Third, Mr. Hayter. Six *Chrysanthemums* in 32's.—First, Mr. W. Hamilton, Beechwood Gardens, Reigate. Second, Mr. Brown. Third, Mr. Hayter. Six *Primulas* from seeds supplied by J. Peed & Sons.—Mr. Cotton was awarded first prize. For a group of miscellaneous plants arranged for effect, 50 feet super.—First, R. V. Smith, gardener, Margery Hall, Reigate. Second, Mr. Hayter. Third, Mr. Hamilton. These groups were all much too crowded. In the corresponding class for 30 feet Mrs. Tickner had a light and effective group. For two specimen *Chrysanthemums*, and four ditto, trained, Mr. J. Reeves, gardener, Lochinvar, Reigate, secured first honours with large specimens.

The class for a group of *Chrysanthemums*, 50 feet super, was well filled, there being five entries forward. The first prize was awarded to Mr. C. J. Goldsmith, who had a charming group, dwarf and neatly arranged. Mr. Brown was second, but his group was not so even, moreover, it lacked finish. Mr. H. Bailey, The Briars, was a good third. In a similar class for groups of 30 feet.—First, Mr. Peters. Second, Mr. Tickner. Third, Mr. Port. Commended, Mr. Parfit, South Park. Mr. Walls, Earlswood Nurseries, Red Hill, had a bright and varied group of cut flowers arranged in somewhat novel fashion, a kind of panelled carpet; it seemed to be admired and attracted a good deal of attention. Messrs. Cheal & Sons, Lowfield Nurseries, Crawley, had forward a representative collection of Apples and Pears; they had grand samples of Warner's King, Prince Albert, Lord Derby, Golden Noble, Beauty of Kent, Wellington, and Sandringham—Uvedale's St. Germain and Beurré Clairgeau Pears. This firm also exhibited their patent flower supports filled with *Chrysanthemums*, for which purpose they seemed admirably suited.

#### CHELTENHAM.

A FINE Exhibition was held in the Winter Gardens on the 12th and 13th inst., the competition being very keen in almost every class. The Winter Gardens are admirably adapted for holding a large show, and probably a finer display was never held in the Gardens than on the above occasions. The prizes given for six plants did not bring out anything of special merit either in the Japanese or incurved classes, and the same remarks are applicable to the four plant classes; Mr. E. Pates, G. Holloway, Esq., M.P., Mr. J. Pilgrim, and Mrs. Lingwood taking the chief honours. The groups were very effective, plants and blooms proving high cultural skill. In the open class Mr. C. Roberts, Gloucester, was first, and Mr. J. Pilgrim, Cheltenham, was a good second; amongst amateurs Colonel Rogers was awarded first place; T. W. Butt, Esq., second.

For forty-eight cut blooms, distinct, twenty-four incurved and twenty-four Japanese, prizes of £10, £5, £3, £2, were given, for which there was keen competition. W. M. Baker, Esq. (gardener, Mr. J. Aplin), was a splendid first, with blooms that would be very difficult to equal. The varieties were—Back row: Stanstead Surprise, Boule d'Or, E. Molyneux, Etoile de Lyon, Val d'Andorre, Comtesse de Beauregard, Meg Merrilies, Yellow Dragon. Middle row: Comte de Germiny, Madame Baco, R. Brocklebank, Japonais, Sunflower, Avalanche, Carew Underwood, M. Brunt. Front row: Belle Paulc, Mrs. Alpheus Hardy, fine; C. Charman, Mr. H. Cannell, Mons. J. Laing, Sarah Owen, Mons. Freeman, Mrs. F. Jameson. Incurved, back row: Lord Wolseley, Lord Alcester, John Salter, Empress of India, Queen of England, Miss M. A. Haggas, Prince Alfred, Princess of Wales. Middle row: Jeanne d'Arc, Violet Tomlin, Mrs. Heale, C. Gibson, Golden Empress, Barbara, Princess of Teck, sport from Lord Alcester (finest incurved in the Show). Front row: Mabel Ward, Mrs. Nash, Cherub, Lady Slade, Empress Eugénie, Refulgence, Angelina, and Eve. T. P. W. Butt, Esq., was second; J. R. Greatorex, Esq., third; Mr. C. Roberts, fourth. For eighteen incurved blooms, T. P. W. Butt, Esq., was first; having Guernsey Nugget, Queen of England, Prince Alfred, Jeanne d'Arc, Lord Alcester, Mrs. Heale, Princess Beatrice, Lord Wolseley, Miss Haggas, Lady Hardinge, Violet Tomlin, Lady Dorothy, &c. Canon Coventry, second; Lord Sudeley, third. For eighteen Japanese blooms, T. P. W. Butt, Esq., was again first, with fine well built flowers. Lieut.-Colonel Rogers, second; Canon Coventry, third. For twelve incurved, Lieut.-Colonel Rogers was first; G. Holloway, Esq., second; Captain Tickell, third. For buttonholes and sprays, E. Smith & Son were awarded principal places.

For unlimited collection of culinary Apples, A. J. Skinner, Esq., was first; Mr. H. Moorman second; Mr. A. Cook third. For dessert, unlimited number of dishes, Mr. H. Moorman was first, A. J. Skinner, Esq., second; C. Lee-Campbell, Esq., third. For three varieties of black Grapes C. Lee-Campbell, Esq., was first with fine Gros Colman, Lady Downe's, and Alicante; and the same exhibitor was also first for three bunches of any black with Gros Colman, remarkable for large size of bunch and berry and perfect finish. A. J. Skinner, Esq., was second with Alicante; Lord Sudeley third with Gros Colman. For three bunches of white Mrs. Southwood was first with Bowood Muscat; C. Lee-Campbell, Esq., second, with Muscat of Alexandria. For nine dishes of vegetables, twelve specimens of each, A. J. Skinner, Esq., was first, Mr. A. Cook, second, both putting up in high-class style. *Primulas*, *Solanums*, *Epiphyllums*, and *Eupatoriums* were well shown, and contributed much to the attractiveness of the Show. Great credit is due to the energetic Secretary, Mr. G. Tovey, Westbourne Villa, for working up the Exhibition to its present position.

Mr. J. Aplin, gardener to W. Meath Baker, Esq., Hasfield Court, Gloucester, has fixed a grand sport from Lord Alcester, which will

prove, when known more, to be in great request. It is quite distinct, in colour approaching a beautiful mauve, perfect in shape, and very large; in fact, it was unquestionably the finest incurved in the Cheltenham Show. Mr. Aplin said he propagated a dozen plants from the sport last winter, and they have all come true. It is superior to its parent in width of floret, size of bloom, and of uncommon colour, which should make its future secure.

#### MONMOUTH.

THE Monmouth *Chrysanthemum* Society celebrated their annual Show recently, and although a young society, and established mainly through the exertions of the worthy Secretary, Mr. G. Tucker, an enthusiast in matters horticultural, especially in connection with the *Chrysanthemum*, it is now firmly established, and in much favour with the local public, and well deserves to rank as one of the best provincial exhibitions. Several groups of *Chrysanthemums* were in competition in the three classes devoted to them, some of a very high order of merit. The cut blooms were also good, but the staging was rather too high to show them off to advantage.

*Groups*.—In class 1, for a group in which quality and general effect were to be the leading features, and a silver cup, value £5 5s., offered as the first prize, three competitors entered, Mr. Bannerman, the President of the Society, coming first with a group of first-class quality, both Japanese and incurved being well represented, although this exhibit was rather roughly finished in front. Mr. Tucker was a good second, his flowers being generally rather smaller, but not showing large pots in the front. Third, Mr. Hughes. In class 2, for a group covering 36 square feet, the competition was stronger, six competing. Mrs. Parker was first, Col. Boothby second, Col. Gould third. Specimen plants were not very good. In the class for four, Mr. Bannerman was first, Mr. John Cloud second.

*Cut Blooms*.—The schedule of this Society specifies that all flowers shall be shown as grown; any exhibitor staging blooms artificially dressed shall be disqualified. The leading exhibits were very good, and if not really "dressed" had no doubt received some assistance while the blooms were in course of development. For twenty-four incurved, not less than eighteen varieties, Mr. Aplin, Hasfield Court, Gloucester, was a good first with Queen of England, Miss Haggas (two), Princess of Wales (two), Empress of India (two), Princess Teck, Violet Tomlin, Golden Empress, Lord Wolseley, Eve, Antonelli, Jeanne d'Arc, Lord Alcester, Refulgence, Mrs. Dixon, Barbara, Mrs. Nash, Baron Beust, G. Glenny, Cherub, and Lady Hardinge. Second Mr. E. C. Currie.

For a similar number of Japanese the competition was very keen, nine lots being in competition. Mr. Bannerman was first, just beating Mr. Aplin by two points; his flowers were Avalanche (two), Mr. Cannell (two), Madame Audiguier (two), M. J. Pigny (two), Frédéric Marrouch, Carew Underwood, Ralph Brocklebank (two), M. H. Elliott, Sarah Owen, Stanstead White, Sunflower (two), Mrs. J. Wright, J. Délaux, Hiver Fleuri, Gloriosum, Madame Baco, Peter the Great, and W. Robinson. Mr. Aplin had more colour in his stand, which also included a good bloom of Mrs. A. Hardy. Third Mr. Brook. For twelve incurved Mr. Tucker was first, Mr. F. C. Williams second; and for the same number of Japanese first Mr. Tonsett, second Mr. H. Kemeys-Tynte. Numerous classes were provided for miscellaneous plants, table plants, fruit, and vegetables, the competition for the leading position in most instances being keenly contested. In the fruit classes Apples made a good display.

*Not for Competition*.—Mr. Coomber, Hendre, Monmouth, contributed a handsome group of plants, among which *Calanthes* figured conspicuously; he also staged some of the best Japanese and incurved blooms in the Show, the latter being noticeable for their breadth and depth of flower, and in competition with others would have been an easy first in either of the classes. We may suggest that it would add more interest, especially to strangers, if the exhibitor's address and gardener's name were added to the prize cards.

#### BIRKENHEAD AND WIRRAL.

LAST Thursday the above Society held their fourth Exhibition of *Chrysanthemums* and fruit in the Birkenhead Town Hall, and judging from the exhibitors and the quality of cut blooms and hardy fruit (which could not be excelled in any part of the kingdom), the Birkenhead Show is likely to become a dangerous rival to the Liverpool Show, and although only starting with a small balance in the bank owing to the very wet weather experienced last year, it is most gratifying to state that the Society had this time a crowded attendance, and if only more classes are thrown open they need not fear for its ultimate success. At the dinner Mr. Jamieson, speaking as one of the Judges of fruit, said it had been a most difficult task owing to the excellent quality throughout, and Mr. Kipps, on behalf of the *Chrysanthemum*, said he believed if anything the incurved blooms were a little better than those he saw at Birmingham the previous day, while the Japanese were about equal. With such an excellent Secretary and Committee the Society is sure to increase in every respect, as it deserves to do.

For twenty-four incurved blooms (open) there was a close battle, Mr. G. Burden, gardener to G. Cockburn, Esq., Lingdale Lodge, Oxtun, securing first honours with the following. Back row: Queen of England (two), Lord Alcester (two), Alfred Salter, Empress of India, Golden Empress, Princess of Wales. Second row: John Salter (two), Princess of Wales, Violet Tomlin, Empress of India, Mrs. Heale, Emily Dale Improved, Miss M. A. Haggas. Front row: Miss M. A. Haggas, Refulgence, Prince Alfred, Lady Hardinge, Mrs. Coleman, very fine

Princess Beatrice, Jardin des Plantes, and Jeanne d'Arc. Second, Mr. J. Jellicoe, gardener to F. H. Gossage, Esq., Camp Hill, Woolton. Third, Mr. William Littlemore. For the same number of Japanese Mr. G. Burden was again first, his varieties being—Back row: Etoile de Lyon, Japonais, Avalanche, E. Molyneux, La Triomphante, Boule d'Or, Mrs. Laing, Stanstead White. Second row: T. Stephenson, Mons. Bernard, Hamlet, Val d'Andorre, Mrs. F. Jamson, M. J. M. Pigny, Jeanne Delaux, Criterion. Front row: Marsa, excellent; Sarah Owen, Marguerite Marrouch, Puritan, Sunflower, Val d'Andorre, Madame Louise Leroy, and C. Wheeler. A close second, Mr. J. Jellicoe; third, Mr. J. Watson, gardener to T. S. Hannay, Esq. For twelve incurved blooms (open), Mr. T. Leadbetter, gardener to T. B. Hall, Esq., was first; Mr. C. Osborne, gardener to H. J. Robinson, Esq., Aymestry Court, Woolton, second; and Mr. J. Watson third. In the corresponding number of Japanese, Mr. C. Osborne was first with splendid blooms; second, Mr. W. Broadey, gardener to W. H. Jones, Esq., Hooton, who had capital blooms; third, Mr. T. Leadbetter.

In the local classes for eighteen incurved Mr. T. Ranson, gardener to H. R. Rodger, Esq., was a good first. Second, Mr. G. Burden. Third, Mr. W. Broadey. For eighteen Japanese Mr. G. Burden was placed first, Mr. T. Ranson second, and Mr. J. Watson third. For twelve incurved, first, Mr. J. Watson. Second, Mr. C. Smith, gardener to D. Wilson, Esq., Claughton. Third, Mr. W. H. Jones. Twelve Japanese, first, Mr. T. Leadbetter. Second, Mr. C. Smith. Third, Mr. G. Lyon, gardener to J. H. Kenion, Esq., Rock Ferry. Six incurved, first, Mr. J. Hay, gardener to J. D. Irvén, Esq. Second, Mr. T. Smith, gardener to T. L. Telling, Esq., Oxton. Third, Mr. S. Bell, gardener to R. L. Greenshields, Esq. In the class for six incurved and six Japanese for those who have never won a prize there was a keen competition, Mr. J. Watson being first. Second, Mr. J. Taylor, gardener to R. Reed, Esq.

In the fruit classes the competition was very strong. Grapes were of very fair quality, whilst Apples and Pears were really superb. For a collection of six dishes (Pines excluded) Mr. M. Quirk, gardener to W. Porter, Esq., Thingwall Hall, Cheshire, was placed first with a good bunch of Alicante and Muscat of Alexandria of good colour, Thompson's and Beurré Boussoch Pears, Orange Pearmain and Col. Vaughan Apples. Second, Mr. W. Hannagan, gardener to R. C. Naylor, Esq., Hooton Hall. Equal third, Mr. J. Barker, gardener to J. W. Raynes, Esq., Rock Ferry, and Mr. R. Brownhill, gardener to G. Fowler, Esq. For two bunches Black Alicante Mr. J. Barker was an excellent first; Mr. T. Ferguson, gardener to Mrs. Patterson, Rock Ferry, second; Mr. T. Grindley, gardener to E. Billington, Esq., third. For two bunches of black Grapes, any other variety, Mr. T. Ferguson first with well coloured bunches of Barbarossa; second, Mr. R. Brownhill, with Gros Colman; third, Mr. T. Eaton, gardener to J. Parrington, Esq., Roby Mount, Roby, with Lady Downe's. For two bunches white Grapes, any variety, Mr. M. Quirk was well first; R. Hobson, Esq., Bromborough, second; Mr. T. Winkworth, gardener to R. Brocklebank, Esq., Childwall, and Mr. J. Barker, equal third. The class for four dishes of Pears, first to Mr. W. Hannagan, with grand examples of Pitmaston Duchess, Doyenné du Comice, Beurré Diel, and Glou Morceau; second, Mr. C. Worker, gardener to Mrs. Blomfield, who had enormous Pitmastons; third, Mr. C. Taylor, gardener to Rev. Canon Robin, Woodchurch. For one dish ripe fruit, first, Mr. C. Worker, with Doyenné du Comice; second Mr. Hannagan, with same variety; third, Mr. A. Brown, gardener to G. Webster, Esq., Upton. For six dishes culinary Apples Mr. W. Hannagan was first with splendid fruit of Peasgood's Nonesuch, Warner's King, Mère de Ménage, Gloria Mundi, Alfriston, and Emperor Alexander; second, Mr. A. Williams, Bodenham, Leominster; third, Mr. J. Davis, Bunhill, Bodenham, Leominster. One dish of culinary Apples brought out thirteen or fourteen exhibitors. First, Mr. T. Williams, with Warner's King; second, Mr. C. Worker; third, Mr. J. Davis, with same variety. For six dishes dessert Apples, Mr. J. Davis was first with beautiful coloured fruit of the following:—Blenheim Pippin, Summer Queening, Ribston Pippin, Princess Pippin, Cox's, and Court Pendû Plat; second, Mr. Hannagan; third, Mr. J. Hyde, Bodenham. For one dish, Mr. C. Worker first with Ribston; second, Mr. A. Brown, with same variety; third, Mr. J. Bounds, gardener to A. L. Jones, Esq., with King of Pippins. Four dishes brought a good number of competitors. First, Mr. A. Brown, with Cox's Orange, Blenheim, Ribston and King of the Pippins; second, Mr. C. Worker; third, Mr. T. Grindley. For six Cyclamens, first, Mr. J. Watson; second, Mr. S. E. Haines, gardener to McGregor Laird, Esq.; third, Mr. A. Price, gardener to F. Jevons, Esq., Claughton. Mr. Austin Houghton, the Secretary, is to be congratulated on the excellent show. In the evening a concert was given, and the hall was crowded.

#### PEMBROKE.

THOUGH so far removed from Chrysanthemum centres geographically, Pembroke can boast of a Show that, in the matter of quality of exhibits, rivals many of our best provincial fixtures. Both cut blooms and plants were highly meritorious, and for the district, the entries, too, were numerous. A very noticeable and commendable feature of the Society is the provision made for cottagers and small amateurs, and the response amply justifies the provision. Nowhere has it been my lot to see such splendid exhibits staged by *bonâ-fide* artisans as at this Show. The specimen plants and groups put up by these worthy sons of toil would have held their own very creditably if staged in the open classes in competition with some famous growers. This is a very healthy sign; may other societies follow this noble example! Additional interest was attached to the present Show, the N.C.S. having been induced to offer

Centenary silver and bronze medals and certificates for specimen blooms and plants.

For three plants, incurved or reflexed: First, Mr. French, gardener to Col. Suarin, Ovierton, with White and Peach Christine and Cloth of Gold. Three Japanese: First, Mr. French; second, Mr. Weaver, gardener to Col. Lambton, Brownslade, the former with Avalanche and Bertie Rendatler, very fine, but closely followed by Mr. Weaver. Group, 8 feet by 5 feet: Mr. French was again a splendid first, his Molyneux and Avalanche being grand, and the plants throughout even and beautifully foliaged. Mr. Weaver came second with a group that at an ordinary show would have had an excellent chance, his plants being only less excellent than the former. Single specimen, incurved or reflexed: Mr. Dumble, gardener to Sir Chas. Philips, Bart., Picton Castle, was first with George Glenny; Mr. French second, and Mr. T. F. Stephens third. For single specimen Japanese, Mr. French, with a grand plant of Avalanche, was first, his plant carrying about forty blooms of good size, the same plant gaining him the N.C.S. Centenary silver medal. Mr. J. T. Stephens (an amateur) took second with a capital dwarf plant of Val d'Andorre, and Mr. Dumble third with Avalanche. Single specimen Pompon: Mr. French first.

Twenty-four cut blooms: Mr. Dumble was placed first with exceedingly fine blooms, his best being Golden Empress, Empress of India, Mrs. Heale, Miss Haggas, Princess Teck, and Queen of England (incurved), and Condor, Etoile de Lyon, Madame C. Audiguier, Fair Maid of Guernsey, Sunflower, Florence Percy, Boule d'Or, Belle Paule, Val d'Andorre, and Avalanche (Japanese); Mr. French running in a very good second, his incurved smaller and less even. The best incurved in this lot were Golden Empress, White Venus, and Prince Alfred; and best Japanese, Florence Percy, Meg Merrilies, E. Molyneux, Condor, Etoile de Lyon, Comte de Germiny, and Avalanche. Third, Mr. W. Treseder, nurseryman, Cardiff. Twelve cut blooms, incurved: Mr. Dumble took honours with Princess Teck, Lord Alcester, Miss Haggas, &c., and twelve Japanese he stood first again with Condor, Jeanne Delaux, Sunflower, Belle Paule, &c. Mr. Treseder second with M. Lacroix, Madame Paule Dutour, Comtesse de Beauregarde, &c. Mr. French third, and Mr. Weaver extra third. Six large flowering Anemones: Mr. French first, Mr. Dumble second, and Mr. D. Owen third. The Society's silver medal for group was won by Mr. French with the best specimen mentioned. The N.C.S. silver Centenary medal for the best specimen plant, also won by Mr. French, with the Avalanche mentioned above, and the certificate of the N.C.S. for best bloom was won by Mr. Dumble for a splendid bloom of Avalanche in his first prize stands. In the corresponding classes for amateurs the principal exhibitors and prizetakers were Mr. G. T. Stephens, Mr. F. J. Skyrme, Mr. F. J. Gay, Mr. T. Croft, Mr. R. Williams, Mr. D. Owen, and Mrs. Rowe, Mr. T. Croft winning the Society's silver medal for group with a highly meritorious exhibit, Mr. J. T. Stephens gaining the N.C.S. silver medal for specimen plant with a good William Robinson, and the N.C.S. certificate for best bloom with an excellent Edwin Molyneux.

The cottagers' plants and blooms were exceedingly fine. Mr. J. Wogan in this section winning N.C.S. Centenary bronze medal for single specimen with Peter the Great, and Mr. B. Bryant winning a bronze medal given by Mr. Rowe for single specimen with Golden George Glenny. (Open to cottagers that had not won prizes at previous shows). Messrs. Thomson & Sons' prize to the exhibitor winning largest number of first prizes in Chrysanthemum classes went to Mr. French, as did also the special prize N.C.S. bronze Centenary medal for best bloom of Mrs. Alpheus Hardy. The competition for this, however, was not keen, though the variety is widely distributed in the district.

Fruit and vegetable classes were well filled, the amateurs here again holding their own well. The English Fruit and Rose Company, Hereford, had a good collection of Apples not for competition, Mr. W. Treseder of Cardiff floral arrangements, and Messrs W. Clibran & Son of Altrincham some stands of Chrysanthemums, which included Annie Clibran, Thos. Stephenson, and Violet Tomlin. Certificates of merit were awarded to each.

#### DISS.—NOVEMBER 18TH.

THE annual Chrysanthemum Exhibition, which is held in connection with the Diss Horticultural Society, was held at the Corn Hall on Tuesday last week, and was an unqualified success. The cut blooms were of excellent quality, while the plants, classes, and groups were not only well filled but of good quality, and tastefully arranged.

*Cut Blooms.*—The premier class was for thirty-six blooms Japanese, not less than twenty-four varieties or more than two blooms of one variety, the first prize of which was deservedly awarded to the Rev. l'age Roberts, Scole, for the following collection:—Avalanche, Ralph Brocklebank, Edwin Molyneux, Meg Merrilies, Yellow Dragon, very fine; La Triomphante, M. J. Pigny, Gloriosum, Mons. Tarin, Avalanche, Ralph Brocklebank, M. J. Pigny, Sunflower, La Triomphante, Lady Lawrence, Madame Baco, Fair Maid of Guernsey, Marguerite Marrouch, Mr. J. Laing, Edwin Molyneux, Mlle. Lacroix, Soleil Levant, Triomphe de la rue des Châlets, Marsa, Madame Baco, Sarah Owen, Triomphe du Nord, Sunflower, Mr. J. Laing, Meg Merrilies, Yellow Dragon, Madame C. Audiguier, Triomphe du Nord, Mons. Freeman, Mrs. J. Wright, and Sarah Owen. Mr. Alfred Bishop, Westley Hall, Bury St. Edmunds, followed closely for second honours, his best blooms being Barrone de Prailly, Mr. H. Cannell, Gloriosum, and Triomphe de la rue des Châlets. The Rev. H. S. Hawkins, Beyton Rectory, was a very creditable third. Boule d'Or and Mr. H. Cannell were very fine.

In the class for twenty-four Japanese, not less than eighteen varieties, Mr. R. C. Notcutt, Anglesea Road, Ipswich, wrested the premier honour from the Rev. F. Page Roberts, who was nevertheless a very good second, and Mr. Bishop third. The first prize collection comprised good blooms of Triomphe de la Châlets, Mdle. Lacroix, Carew Underwood, Etoile de Lyon, Japonais, George Daniels, Lady Lawrence, Etoile de Lyon, Gloriosum, Lady Lawrence, George Daniels, Stanstead Surprise, Mrs. J. Wright, Charlie Sharman, Gloriosum, Mr. H. Cannell, Mrs. H. Cannell, Florence Percy, Mr. H. Cannell, Madame J. Laing, Thomas Stevenson, Mons. Bernard, Sarah Owen. For twelve Japanese, distinct, Mr. F. J. Smith-Palgrave was placed first with a fine stand of Sarah Owen, Mad. Baco, Mr. H. Cannell, Etoile de Lyon, Mad. Baco, Ralph Brocklebank, Japonais, Grandiflorum, Mad. C. Audiguier, Mrs. J. Wright, Comtesse de Beauregard, and Triomphe de la rue des Châlets. Messrs. Notcutt and Bolton shared the other prizes in order of their names. There were several collections of six Japanese staged, and Mr. Smith was awarded the first place for a grand stand, the Rev. Hugh Berners, Harkstead Rectory, running him very close indeed for second honours. In reflexed the Rev. Hugh Berners was a good first with two Cullingfordi, two Golden Christine (very fine), two Dr. Sharp, two White Christine, two Chevalier Domage, two Putney George. Mr. Notcutt was placed second, his blooms being somewhat past, but he had fine flowers of Golden Christine and Cloth of Gold. A very elegant and pretty stand of single blooms was staged by the Rev. Page Roberts, to whom the first award was made; Admiral Symonds, Aurora, Mary Anderson, Paul Clifford, Jane, and Effie were particularly attractive. For six Japanese, one variety, the Rev. H. S. Hawkins was placed first with large and massive blooms of Thunberg, but suffered in appearance by being shown flat on a Rose box. The Rev. Page Roberts was a good second with Avalanche, Mr. Bishop exhibiting six good blooms of Baronne de Prailly. Some very large flowers of Golden Empress took first honours in the class for six incurved, one variety. For twelve incurved, distinct, the Rev. Page Roberts exhibited a very neat and fresh collection, which obtained for him the first prize, and consisted of Lord Alcester, good; Queen of England, John Salter, Empress of India, Jeanne d'Arc, fine; Lady Hardinge, very good; Miss Haggas, Prince Alfred, Violet Tomlin, White Globe, Baron Beust, and Princess of Wales. Mr. A. Bishop was awarded second honours, and the Rev. H. S. Hawkins third.

*Plants.*—For a collection of six, Mr. Smith was a very good first with profusely bloomed plants of Madame J. Laing, Peter the Great, Triomphe du Nord, M. J. Pigny, Fernand Feral, and Golden Empress. Mr. Bolton, Shrimphill, was placed second, and J. Tudor Frere, Esq., third, and in the other classes of plants the same exhibitors shared the honours. Several good groups of miscellaneous plants were arranged around the sides of the hall, the best coming from Tudor Frere, Esq., a very bright arrangement indeed. F. Taylor, Esq., M.P., obtained the second award; an extra prize being awarded to Mr. Bolton, whose collection evinced taste in arrangement, but wanting in finish and colour. Several pretty arrangements of Chrysanthemums and Ferns suitable for centre of table were exhibited. Miss Frere, Roydon, was first; Miss Smith, second; and for a similar arrangement, including foliage and berries, the first was awarded to Miss Savoury, Palgrave. During the day there were a large attendance, most of the *elite* of the neighbourhood being present. The arrangements were well carried by the Rev. Page Roberts, the indefatigable Hon. Secretary.

#### CARDIFF.—NOVEMBER 18TH AND 19TH.

THE Park Hall is an excellent place to hold a Chrysanthemum Show in, being roomy, and what is a decided advantage, plenty of light is available, which is a great gain. This cannot be said of all sites chosen for autumn exhibitions, many having a dark heavy aspect, which is all against the appearance of the flowers in dull weather. Cut blooms made by far the most important feature of the Show, although groups of Chrysanthemums were strongly represented. Specimen plants were in quality a long way below what are generally seen at almost any provincial exhibition, by far too many sticks being visible, the plants having been allowed to grow excessively tall.

*Cut Blooms.*—For twenty-four distinct kinds, irrespective of any section, there were five competitors, the best, a medium-sized even lot, coming from Mr. J. Horne, gardener to J. T. Masters, Esq., Cardiff, who staged half of them incurved and the remainder Japanese, the varieties being as follows—Incurved: Violet Tomlin, Queen of England, Lord Alcester, Prince Alfred, Princess Teck, C. Gibson, Empress Eugénie, Miss Haggas, Mr. Brunlees, Princess Beatrice, Mr. Bunn, Mrs. Heale. Japanese: Boule d'Or, Madame Baco, Mrs. Cannell, Carew Underwood, M. Brunet, Jeanne Délaux, Duchess of Albany, Bertha Flight, Mr. H. Cannell, Belle Paule, Charlie Sharman, and Sunflower. Mr. F. Case second, who staged mainly Japanese varieties; Mr. S. T. Wright, gardener to J. Lee Campbell, Esq., Glewston Court, Gloucester, third. For twelve incurved, distinct: First, Mr. N. Ryder, gardener to H. W. Thompson, Esq., Cardiff, with medium-sized neat blooms of Hero of Stoke Newington, Mr. Brunlees, Mabel Ward, Golden Empress, and Nil Desperandum as the best. Mr. W. Treseder, Cardiff, second; third, Mr. H. Rex, gardener to C. Waldron, Esq., Cardiff. For twelve Japanese, Mr. Horne was first with good blooms of the following—Ralph Brocklebank, Stanstead Surprise, Mrs. Cannell, Duchess of Albany, E. Molyneux, Avalanche, Sarah Owen, Madame C. Audiguier, Florence Percy, Sunflower, Charlie Sharman, and Mdle. Lacroix. Second, Mr. Treseder; Mr. S. Clark, gardener to Col. Hill, Cardiff, third; very close in a strong competition. Amateurs and cottagers staged strongly in the classes set apart for them, and made a good display.

Groups of Chrysanthemums, to occupy a space of 60 square feet, were staged by five competitors, the best coming from Mr. F. Case, the plants carrying good blooms neatly arranged. Mr. Treseder second. Mr. J. Julian, gardener to J. Gume, Esq., Cardiff, third. Specimen Chrysanthemums were best shown by Mr. H. W. Thompson. A capital specimen of Golden Christine was staged by Mr. G. Hawkins, gardener to Col. Tuberville, Cardiff, in the class for one incurved or reflexed, which had sixty fully developed blooms; a grand plant. Madame de Sevin, most freely flowered and loosely trained, won first honours for specimen Japanese for Mr. Hawkins, also bouquets and wreaths were well shown, Messrs. Perkins, Coventry, winning easily in both classes.

Fruit made a good display, the best lot of five dishes coming from Mr. S. T. Wright, Gros Colman, Muscat of Alexandria Grapes, and Beurré Diel Pears being the best. Mr. Hawkins second. For two bunches of black Grapes Mr. Wright led with Gros Colman; Mr. Case second with the same sort. Mr. Hawkins was first for the same number of white bunches with Muscat of Alexandria. Mr. G. Hawkins staged the best Pears, and Mr. Wright the best Apples, both having good examples in their different classes. Vegetables were a strong feature. For six varieties Mr. W. Moore, gardener to G. M. Treherne, Esq., was first, Mr. Hancock second, and Mr. Pugsby, gardener to General Lee, Dynas, third.

#### BRISTOL.—NOVEMBER 19TH AND 20TH.

WHAT proved to be one of, if not the very best displays ever made by this old Society was arranged in the Colston Hall, a noble building admirably adapted for the purpose. Although ostensibly a Chrysanthemum Show, nearly everything else in the way of flowers, fruit, and vegetables were equally well represented. The Committee is largely composed of practical gardeners, Mr. Wilfred Jones being the Secretary, and all are to be congratulated with the great success, pecuniarily and otherwise, that attended their efforts.

In the specimen plant classes there was a want of freshness only too apparent in many instances, and this is not to be wondered at considering the lateness of the fixture and the unfavourable state of the weather, so far as the lasting properties of the flowers were concerned. The entries were fairly numerous, and the principal prizewinners were Messrs. T. W. Gibson, J. Leech, T. M. Miller, and H. St. Vincent Ames. Messrs. J. Dole and F. Baskerville were the prizewinners, in the order named, for groups of Chrysanthemums to occupy a space 12 feet by 7 feet, but most of the plants shown were past their best. There were also classes for ornamental-foliaged plants, table plants, Ferns, Poinsettias, Primulas, ornamented fruited plants, Mignonette, Bouvardias, Zonal Pelargoniums, and Orchids, in all of which the competition was close and good. The principal prizewinners were Messrs. A. W. Summers, G. White, J. Dole, S. W. Gibson, J. Boddam Castle, R. Cripps, W. Cooper, D. R. Bain, C. D. Cave, J. West, J. Walls, and H. Laves. Groups of miscellaneous plants to occupy a space 10 feet by 5 feet were of their usual excellence, and in this class Mr. W. K. Wait was first, Mr. J. B. Brain second, and Messrs. James Garaway & Co. third.

Cut blooms were well and largely shown, there being eight entries in the class for forty-eight, to consist of equal numbers of Japanese and incurved, not less than eighteen to be distinct, and not more than two blooms of any one variety, and for which the first prize was £10, the second £6, and the third £4. After a very careful scrutiny the first prize was awarded to Mr. Cooper, gardener to C. L. Collard, Esq., Taunton; Mr. J. Aplin, gardener to W. Meath-Baker, Esq., Gloucester, who was only eight points behind, taking second place; Mr. Runnacles, Sherborne, being a good third, while an extra prize was awarded to Mr. J. Austin, Witley, who also had a beautiful lot of blooms. The varieties shown in the premier stands consisted of—Incurved—back row: Golden Empress of India, Empress of India (two), Lord Wolseley (two), Lord Alcester (two), Alfred Salter. Middle row: Lady Carey, Princess of Teck, Miss M. A. Haggas, Queen of England (two), Mr. Howe, Mrs. W. Shipman, and Hero of Stoke Newington. Front row: Mrs. Heale, Mrs. N. Davis, Eve, Barbara (two), Violet Tomlin, Lady Dorothy, and Lord Everslev. Japanese—back row—Etoile de Lyon (two), Avalanche, Boule d'Or, E. Molyneux, Japonais, Stanstead White, and Sunflower. Middle row: W. W. Coles, R. Brocklebank, Baronne de Prailly, M. J. Pigny, Thunberg, Madame J. Laing, J. Délaux, and Meg Merrilies. Front row: Mrs. C. Wheeler, Madame Baco, Sarah Owen, A. H. Neve, Marsa, Album Fimbriatum, Mrs. J. Clarke, and Thomas Gartledge. Mr. Aplin was well first with twenty-four blooms of incurved varieties, Mr. Runnacles being second, and Mr. Carpenter third. In the corresponding class for Japanese varieties the competition was very keen. Mr. Cooper was first, Mr. Aplin a close second, and Mr. G. Runnacles third. These and the other growers mentioned were the principal prizewinners in the other classes for cut blooms. A special prize of 10s. was offered for a single bloom of the Japanese Mrs. Alpheus Hardy, and for this three competed. Mr. Aplin had a grand bloom, and was easily first.

Vases, bouquets, and wreaths are always a feature at the Bristol shows, and they were both numerous and excellent on this occasion. Messrs. Meakins, C. Winstone, and E. T. Hill were the most successful with vases, and also with baskets of autumn foliage and berries, all of which were very beautiful. Hand bouquets were especially good, and it is worthy of note that a local florist, Mr. C. Winstone, succeeded in beating Messrs. Perkins & Sons, who were second, Messrs. Garaway and Co. being a creditable third. Wreaths of white flowers again were very lovely, and with these Messrs. Perkins & Sons were first, Mr. C. Winstone second, and Messrs. Garaway & Co. third.

Fruit was exceedingly plentiful, and considerably above average merit. There were no less than eight classes for Grapes, and in every

instance the competition was most keen. Mr. Stevens, gardener to E. D. Cave, Esq., was first for Black Hamburgh and also for Muscat of Alexandria, the latter being particularly good. So, also, were the first prize bunches of Alicante staged by Mr. R. Cripps; Gros Colman and Alnwick Seedling by Mr. W. Nash, gardener to the Duke of Beaufort; Lady Downe's by Mr. J. Gibson, gardener to Lord Cowley; and Mrs. Pince by Mr. W. G. Pragnell, gardener to J. K. D. Wingfield Digby, Esq., who each fully merited the first prize awarded to them in the respective classes. Mr. J. Austin had a first prize for a handsome Smooth Cayenne Pine. Pears, again, were very numerous and exceptionally good throughout. Mr. W. Bannister was first for both six varieties and four varieties, the examples of Marie Louise, Maréchal de la Cour, and Pitmaston Duchess shown by him being remarkably fine. Mr. W. G. Pragnell was a close second in both classes. Messrs. Bannister, Pragnell, Virgo, and Runnacles were most successful with Apples. Mr. W. Nash was well first for an excellent collection of six dishes of fruit; and Mr. G. Pymm, gardener to Mrs. Goldsmith, a creditable second. Vegetables were also well shown, the first prize collection of eight varieties, grown and very effectively arranged by Mr. Bannister, being worthy of special mention.

#### SWANSEA.—NOVEMBER 19TH AND 20TH.

THE Swansea and District Chrysanthemum Society held their first autumn Exhibition in the Drill Hall on the dates named, and for a first attempt must be considered satisfactory. No doubt by experience a better system of placing the prize cards on the exhibits will be adopted. In the present case it was late in the afternoon before this was accomplished. The site is an excellent one, but will probably be found too small a building to place the exhibits if the competitors increase, as no doubt they will if the present prize list is maintained, as no doubt it will be, or even increased. Much interest appears to be taken in the growth of Chrysanthemums in this district under unfavourable circumstances, such as the want of fresh air, caused by the number of furnaces in the adjoining neighbourhood. Mr. Roberts, Honorary Secretary, worked hard to render the affair a success. Our report cannot be otherwise than a meagre one for the cause named.

Groups of Chrysanthemums were staged by five competitors, the space being a large one—64 feet—and on the whole were creditable. Especially meritorious was the first prize one if we except the front, which required a little more finish. Specimen plants were very well staged in a few instances, while others were simply of the ordinary tall growth, showing too many stakes. Bouquets and wreaths were a capital show; those from Mr. T. Barron, florist, Swansea, who secured first prizes in each class, were especially noteworthy, white Lilac being largely used in the wreath, which added considerably to its beauty. Table plants, Primulas, and Cyclamens were staged in numbers. Vegetables were a strong feature, and on the whole of excellent quality.

Fruit was good in quality, if small in quantity, a remarkably fine dish of Vicomtesse Hericart de Thury Strawberry being exhibited in the first prize stand for a collection of fruit.

Cut blooms were the principal feature of the Show. Good prizes were offered in all the classes; it was surprising not to find more competitors in consequence. For forty-eight distinct varieties, half incurved and the remainder Japanese, there were but two entries. Mr. Ireland, gardener to Sir Hussey Vivian, Singleton, Swansea, was an easy first, with medium-sized, neat blooms, creditably staged.

Messrs. Clibran & Sons had, "not for competition," four dozen blooms of leading new and older varieties, Mr. T. Barron dwarf plants of Chrysanthemums, and Messrs. W. Wood & Sons, Wood Green, London, a stand of their horticultural sundries.

#### TIVERTON.—NOVEMBER 20TH.

THIS fixture was decidedly late for a south-western district; but only in a few instances was there a want of freshness apparent, and a really good all-round display was made, there being quite as many exhibits as the Drill Hall would hold. Great interest appears to be taken in the Society by many of the leading inhabitants of the town and locality, and the arrangements made by the Committee and very efficient and courteous Honorary Secretary, Mr. R. P. Cosway, gave general satisfaction.

In the plant classes the greatest prominence was given to the groups, and with these there was good competition. The best out of five occupying a semicircle with an external radius of not more than 6 feet was shown by Madame las Casas, this comprising very healthy plants, carrying fresh large blooms in good variety. The Rev. G. Hadow was second, the blooms in this case being more numerous but smaller, and the foliage poor. Colonel Greatwood was third. With smaller groups Mr. Lane was a good first, Mr. G. H. Spring second, and Mr. Martin third. No formally trained plants were shown, the prizes being won in various classes by well grown and freely flowered conservatory plants. The principal prizewinners were the Rev. T. U. Cross and Colonel Greatwood. Groups of Zonal Pelargoniums were novel and very effective. Mr. G. J. Barnes, gardener to T. C. Daniel, Esq., was well first in this class, the Rev. T. U. Cross second, and Major Carelton third. Messrs. Tottle, Taunton, G. J. Barnes, J. A. Pleass, and W. H. Dunsford were successful in the plant classes.

Cut blooms were fairly numerous, the competition being good in every class. Prizes of £4, £2 and £1 were offered for thirty-six Chrysanthemums, eighteen incurved and eighteen Japanese, not more than two of each, and there were five to be staged. The Judges, however, had no difficulty in awarding premier position to Mr. G. J. Barnes, who

had a fine fresh lot of blooms, consisting of the following varieties—Incurved: Lord Alcester, Hero of Stoke Newington, Novelty, Lord Wolseley, Lady Hardinge, Bronze Jardin des Plantes, C. Gibson, Lady Dorothy, Lord Eversley, Golden Empress, Princess of Teck, Alfred Salter, and Barbara. Japanese: Etoile de Lyon, E. Molyneux, Meg Merrilies, Val d'Andorre, Lady Lawrence, Sunflower, Golden Dragon (very fine), Mrs. W. E. Clark (good), Stanstead White, Boule d'Or (extra good) L'Automne, and Ralph Brocklebank. Mr. W. Dolling, gardener to Mrs. Wild, was second, and Mr. T. Knapman, third. Mr. G. J. Barnes was first for eighteen blooms of Japanese varieties, his stands comprising very fine fresh blooms of Baronne de Prailly, Etoile de Lyon, Meg Merrilies, Ralph Brocklebank, Angele Amiel, Lady Lawrence, Moonlight, Gloriosum, Stanstead White, Mrs. W. E. Clarke, and Golden Dragon. Mr. W. H. Fowler, Taunton, who exhibited so successfully at the Aquarium, was a good second, his best being Etoile de Lyon, Meg Merrilies, Carew Underwood, Pelican, Mrs. H. Cannell, Avalanche, Sarah Owen, Moonlight, Ralph Brocklebank and L'Or du Japon. The best twelve Japanese varieties were shown by Mr. S. Tottle, Sir John Walrond, Bart., being second; and with six varieties Mrs. North-Row was first and Madame de las Casas second. Mr. G. J. Barnes was easily first for eighteen blooms of incurved varieties, the best of these being Lord Alcester, Hero of Stoke Newington, G. Gibson, Lord Eversley, Mrs. N. Davis, Mrs. Heale, Novelty, Lady Dorothy and Princess of Teck; Mr. W. Dolling was second. Mr. S. Tottle had a first for twelve incurved varieties, and with six ditto Mrs. North-Row was first and Col. Greatwood second. The best six blooms of reflexed varieties were shown by Mr. J. Lloyd, gardener to Vincent Stuckey, Esq., Langport, Mr. S. Tottle being second, while the prizewinners with Anemone flowered varieties were Messrs. T. Knapman and Dolling. A class for twelve mixed varieties was novel and attracted good competition, Mrs. North-Row was first and Madame de las Casas second.

Twenty-nine classes were provided for Apples and Pears, and nearly all of them there was good competition, consequently a fine Show was made. The principal prizewinners were Lady Duckworth, Sir J. Walrond, and Messrs. Lloyd, W. C. Sim, S. Tottle, T. Knapman, G. J. Barnes, G. Babbage, and Mrs. Lane. In addition there were also extensive displays of Apples and Pears by Messrs. R. Veitch & Son, Exeter; C. T. Sclater, Exeter; and Jarman & Co., Chard. The first and last named added to the effectiveness of their exhibits by good backgrounds of plants and cut blooms.

#### FRUIT FORCING.

FIGS.—*Early Forced Trees in Pots.*—These require a light, properly ventilated, well heated structure. They are the better of a bed of leaves, in which the pots must not be plunged, but pedestals of loose bricks erected in the pit, and on these the pots should be stood. The pit being filled with leaves will generate a moist genial heat, highly favouring vegetation, but the fermenting materials must not be brought up too high or pressed very firmly about the pots or it is probable the Figs will be too highly excited by the heat. By placing the leaves loosely around the pots a gentle warmth of 65° may be had, and by adding more leaves a regular temperature should be assured. This is very important; the trees must not be hurried by too much bottom heat, but as the fermenting material settles more should be added and pressed firm, being very careful not to allow the heat about the pots to exceed 65° and 70° at their base. Maintain a temperature of 50° artificially until the buds are swelling freely, when the temperature may be increased to 55° at night, 60° by day by artificial means, admitting a little air at that, and allowing an advance to 70° to 75° from sun heat, closing at 65°. With the moisture constantly being given out by the fermenting materials there is less need of syringing. A sprinkling of the trees and house in the morning and early afternoon will be sufficient in bright weather; morning sprinkling will only be needed in dull weather.

*Young Trees Intended for Early Forcing.*—It is practically useless attempting very early forcing trees that have not been prepared for the process. Young trees, therefore, intended for early forcing in pots another season should be shaken out and repotted, starting them into growth shortly or at once, so that they may make the necessary growth and complete it early, so as to have time to rest before being forced for fruiting. For general purposes no Fig is equal to Brown Turkey; for very early Early Violet is worth place, and as a companion white to Brown Turkey, White Marseilles. Both are very free fruiting and require liberal treatment.

*Early Forced Planted-out Figs.*—It is necessary that the roots be confined to inside borders, and it is well if these are limited to areas considerably less in extent of surface than the trellises. To have ripe Figs in May the house must now be closed, but where the earliest Figs are had from trees in pots starting of the trees planted in borders may be deferred until the new year, so as to have fruit ripe early in June and afford a succession to the pot trees. If the trees planted out be now

started they will afford a closer succession, and there is nothing so fatal to a first crop as bringing the trees on too rapidly. Water in a tepid state should be applied to the roots at frequent intervals until the soil is thoroughly moistened, introducing thoroughly sweetened leaves and stable litter in ridge form into the house to produce a moist genial condition of the atmosphere, and to induce gentle steady excitement, as well as to economise fire heat. Commence with a temperature of 50° at night, 55° by day, and 65° from sun heat, syringing the trees and every available surface with water slightly in advance of the temperature of the house in the morning and early afternoon unless the weather be dull and cold, when the morning syringing only should be practised. Admit air moderately whenever the weather is mild, closing the house with sun heat at 65°, or if it exceed that with full ventilation close the ventilators when the sun heat begins to decline.

#### PLANT HOUSES.

*Hydrangeas*.—Varieties of *H. hortensis* that were rooted early, and were thoroughly matured before the approach of frost, have lost their foliage. These may be placed into 4½-inch pots as opportunity offers, and stood in a cool house ready for starting into growth. One crock at the base of each pot will be ample, and the compost may consist of loam, one-seventh of manure, sand, and a little leaf mould. The soil in which Cucumbers and Melons have been grown with the addition of leaf mould and sand will grow them well. Those rooted later and having plump buds with fresh foliage attached should be kept until the foliage ripens off naturally where the temperature will not fall below 45°. Any of the plants that have not their buds thoroughly developed should be placed on a shelf close to the glass where the temperature can be kept 5° higher.

*Hydrangea paniculata grandiflora*.—Those who have well developed plants may lift and place them into 5 and 6-inch pots, according to their size. Prune these close back, and place them in cold frames. Plants that have been in pots throughout the year may also be pruned back and top-dressed with rich material or placed into slightly larger pots.

*Spiraea japonica*.—Lift and repot the number of plants required for forcing. After potting plunge the pots of those not to be started forthwith in ashes. They will be better outside, and force more readily than if placed in frames. Any clumps that have not bold flowering crowns should be placed aside and cut into two or three according to their size and replanted again for another season. Plants that flowered well outside last year will be in capital condition for dividing. The secret of success in growing *Spiraeas* that will flower as freely as imported plants is to plant only those that have small or moderate crowns—that is, crowns that will not flower; in one season they will develop into strong flowering crowns. Plants that flower profusely outside are useless for forcing, because a number of crowns spring from the base and they have not sufficient time to develop the same season. Select a sunny position. The sooner next season's stock are planted the better. If clumps for 5-inch pots only are grown they should be planted 1 foot apart each way, if larger allow 6 inches more between the rows.

*Dielytra spectabilis*.—For years we have not bought these, but relied on home-grown plants. Lift established plants, and divide them according to the size pots in which they are to be forced. Pieces with small weak crowns should be planted for next year's supply of plants. Divide these into two batches, and plant the smallest closer together so that they can be grown for two years before forcing them. Once a stock is obtained the best plan is to lay in those that have been forced for division in autumn for the following season's supply of plants. One good plant will often make two, or suitable ones for larger pots if planted without being divided. In this case they should be planted, after being hardened, where they are to stand the two seasons. Place those that are potted into cold frames for a short time, and then introduce them into Peach houses or vineries that are just started. Few plants are so easily forced as *Dielytras*. They naturally start early into growth, and being of a light graceful habit of growth are telling in any arrangement. The white form of this old favourite is well worth growing.

*French Pelargoniums*.—These are frequently ruined by too close or confined an atmosphere. Where houses are not specially devoted to them, which is seldom the case in private gardening establishments, the general stock will be at home on the shelves of vineries and Peach houses, close to the glass and fully exposed to light. All that they need is protection from frost; as long as the temperature does not fall below 35° they will be safe. The liberal ventilation at this season that these structures receive suits them admirably. Growth is slow, but it is strong and sturdy. Old plants subjected to this treatment that were cut back in August will be ready for pinching in February and their final shift. Cuttings rooted from these plants will now be growing freely and ready for 5-inch pots; they should have the same treatment. Use for a compost fibry loam, one-seventh of manure and sand; pot firmly. Pinch any shoots that need it on these young plants. Earlier plants will be rooting freely in 5-inch pots. A little artificial manure may be applied to the surface of these every three weeks. Do not pinch the shoots again if the plants are required to flower early. Give them the same liberal ventilation, and keep the temperature for these from falling below 40°. In whatever stage of growth the plants are, be careful not to give them too much water; on the other hand, do not allow them to become dust dry. The syringe is not needed; these plants are better without it. Aphides will not give much trouble if this treatment is followed.

## THE BEE-KEEPER.

### RESULTS OF HIVES.

I PROMISED to give "A Lanarkshire Bee-keeper" the result of my hives. But thinking it may interest others have forwarded it to you. I have three hives, two being the Lanarkshire square hive, the other on the standard principle, containing eleven bars, each 12½ by 8½ inside measurement. One of the Lanarkshire hives were made up last autumn by driving two skeps, uniting the bees, and giving them a pure Carniolian queen I obtained from Neighbour & Sons, and fed up with 20 lbs. of sugar, besides four bars I took from the other hive of the same kind. They swarmed June 16th, also a cast on July 1st, that I threw back when hived. It was my intention to have destroyed all queen cells except two a few days after the first swarm; but my time being taken up with haymaking bees had to take their chance. At the end of the season they had from 10 lbs. to 15 lbs. of stores. I feed with 20 lbs. of sugar, and expect better results next year, as they have a young queen at their head. They had two boxes, but did not work much in the lowest one; therefore I did not give them the third till the end of August, when feeding for winter.

The other two hives were equal as regards stores in the autumn of 1889; but the spring of this year the Lanarkshire hive was very short of stores, only about 5 lbs. I was surprised at the time, but now see where I was wrong. I had not used any outside covering, and, as explained in this Journal (No. 539, October 23rd), being single-cased hives, the temperature was always varying with the temperature outside, therefore consuming more food. I fed with 6 lbs. of sugar, and left them to themselves. At the end of the season I took 33 lbs. in sections, and 18 lbs. after being run from the lowest box containing the oldest combs. There was still left over 20 lbs. in the two other boxes. I gave them the third box with fresh combs, and feed with 20 lbs. of sugar for winter. The other (standard) hive was well up for stores, therefore had no feeding. I took 30 lbs. in sections and 5 lbs. of run honey; there remained in hive between 8 lbs. and 10 lbs. These I also feed with 20 lbs. of sugar, and likewise prepared for winter.

I have three neighbours, each about a quarter of a mile from here, that are bee-keepers in a small way like myself, they having the standard hive. One said he has very little honey indeed. Another took 20 lbs. in sections from two hives. The third person has just his hives. One in the above hive has been neglected in this way. The young lady in 1889 opened the hive to take off some sections; on drawing one the bees appeared, the lady in her fright pulled down the lid and departed. At the end of the season of 1889 the hive was visited by an outdoor servant, he found the bees very strong, working as much from under the lid as at the entrance of the hive. It happened when the lid was pulled down it rested on some of the coverings used in wrapping up the sections. This man got stung so much that he would have no more to do with them, so the bees were left to their own course till October, 1890, when they were sold, the bees destroyed. On opening the hive, comb was built from roof to floor, the quantity of honey being 38 lbs. I was surprised on hearing the quantity of honey this hive had, as I thought it would have been much more than 38 lbs., considering it was honey from two seasons.—R. A. C., *Sevenoaks*.

## TO CORRESPONDENTS

\* \* \* All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

**Maggots in Soil** (*H. J. W.*).—What you send are maggots, not caterpillars, and in their present stage cannot be named. It is not in the least unlikely they have been conveyed in the manure; but as you say lime kills them they will do no harm, and the application will otherwise improve the soil, and be of benefit to the plants.

**Potash for Cleansing** (*Somerset*).—We do not find the article to which you refer; possibly you have not given a correct reference.

However, carbonate of potash, commonly called pearlash, is usually used for cleansing purposes, and it is a little surprising your chemist did not know it.

**American Blight** (*F. N. and J. S.*).—We not only consider it a wasteful, but a dangerous practice, dressing trees with pure petroleum for the destruction of this pest, for we have known the application to kill trees as well as insects. The mixture recommended on page 392, our issue of October 30th, is safe, and also effectual, if properly used.

**Chrysanthemum Sport** (*H. C. B.*).—The bloom received is very loose, and we scarcely suppose that the variety will be of material value when better grown, as it appears to be more like a reversion to the Queen of England than anything else. You had better, however, try it another year, as there is the possibility of its developing qualities that are not apparent in the specimen before us.

**Weeds in Lawn** (*C. T.*).—We have known lawns greatly improved and Daisies killed by applications of lawn sand, but it will not kill deep rooted plants, such as Plantains and Dandelions, but a drop or two of oil of vitriol placed exactly in the centre of each will. The method of application has been often and recently described. Your lawn is no doubt poor, and a free dressing of soot and wood ashes might do it much good. We have known an old lawn dug up, the land cleaned, grass seeds sown, and a firm, close, new lawn formed in eight weeks, the work commencing in March.

**Trimming Baskets of Chrysanthemums at Exhibitions with Ribbons and Silk Scarves** (*J. R. N.*).—It is usual to allow a full license to ladies' exhibits in these matters, in which it must be admitted they make a very interesting and diversified display. Of course in adjudicating, these trimmings must be made quite secondary to the flowers and their arrangement. Where there are better flowers and better taste in arrangement it would not be wise to withhold a prize because the exhibit was displayed in rich shades of satin and silk. Some people besides the ladies like these displays, but it would be well if such exhibits were "trimmed with natural sprays and leaves" only, or at least confined to the floral arrangement. The basket proper might be trimmed in any way the exhibitor saw fit.

**Old Rubbish-heap Soil for Levelling Lawn** (*Subscriber*).—You could not have anything better than the *débris* of the rubbish heap reduced to mould passed through a half-inch sieve for dressing the lawn. It will be better for filling up the inequalities in the surface than decomposed manure, and sufficiently invigorate the grass. Spread it evenly on the surface, allow it to lie a few days, and then make level with the back of a wooden or hay rake, by which the inequalities of surface will be removed. If deep the hollow places must have the turf raised and soil placed under, as the grass must not be deeply buried; but small inequalities are readily filled in the manner indicated. It should be done now—the sooner the better, and must not be deferred beyond February.

**Plum and Other Fruit Tree Stocks** (*J. B.*).—The Muscle or Mussel stock is raised from stones of the Plum of that name, sown now or earlier in drills 2 inches deep and 1 inch asunder, the drills 9 to 12 inches apart. The stones are not usually in commerce, but stocks may be had of most the large fruit growing nurserymen. We, however, have a rule, for obvious reasons, not to recommend dealers. The stocks or suckers for that purpose from Victoria Plums will answer, but they are not so good as those raised from seed, which are less liable to throw up suckers. The English Broad-leaved Paradise stock is raised from layers, and is grown extensively. Quince stocks are also raised from layers, and may be had of any large grower of fruit trees for sale. The Angers Quince is perhaps best, but the Portugal is largely used.

**Crassane Pear Growths Thorny** (*B. D. K.*).—It is not unusual for some Pear trees in their young state to have long thorny spurs, some of them, as in your case, very sharp. They are more disposed to produce the thorny growths on the free or Pear stock than on the Quince, for they bear earlier and produce fruitful growths on the Quince sooner than on the Pear stock, but they have the thorns on both stocks when young and extra vigorous. It is not likely the tree is on the White Thorn, as nurserymen very rarely use it as a stock, but it may be on the wild Pear, which is very spiny, and on that account makes a good hedge plant, particularly near the sea. In that case even the thorny character of the stock would not be imparted to the scion or graft, which retains its characteristics on any stock, therefore the spines are due to the variety—a tendency to produce thorny growths when young and vigorous. It is easy to distinguish the stock on which the tree is worked, as there is a considerable difference between a Pear and a Quince in their barks. The tree will outgrow the thorny spurs as it gains fruitfulness.

**Dracæna Leaves Withering** (*T. L.*).—If the soil is suitable, and no mistake made in watering, the cause of the evil must be ascribed to the temperature or atmosphere of the house. It may be too cold at times, giving a check to the movement of the sap, or too dry occasionally, if not always, causing an excess of evaporation, or an escape of moisture in greater ratio than supplied by the roots. It is quite certain the leaves are in some way deprived of the support that is requisite for their health. Possibly when you obtained the plants they had been grown in a higher temperature and moister atmosphere than your house affords, and they therefore received a check at the outset from which they have never recovered. The injury would not be apparent for some time. You had better remove all the injured leaves, and it might be desirable to notch the tops and place damp moss or moist soil round

them to induce the emission of roots and so establish dwarf young plants with healthy leaves down to the soil.

**Mildew and Insects on Vines** (*Ancient Subscriber*).—The greater part of what, at the first glance, looks like mildew on the leaves, is sulphur. This has evidently been applied freely to both the under and upper surfaces, and has killed most of the mildew, which was not, however very prevalent, and what little remains now is the result of the natural decay of the foliage, and will do no appreciable harm. Only on one leaf could we find traces of mealy bug, but on closely examining the berries we discovered a number of the unwelcome insects clustering round the base of the footstalks, and crowding under the part that connects with the fruit. It is easy enough to deal with the insects on the foliage, for all the leaves that are as far advanced in maturity as those sent, or which are nearly ready for falling, can be removed by the hand (leaving the stalks for a time) and burned. When the leaves are nearly ready to fall they have done their work, and are of no further use to the Vines, and when there are insects on them it is obviously better to remove them in the manner suggested than to let them remain to be scattered all over the house. Dealing with those on the fruit is a different and more difficult matter. Several of them are not very apparent, but a good magnifier reveals their presence. We advise you to make an experiment on a few berries or bunches, and we shall be glad if you will inform us of the result. Procure some methylated spirit, and apply it with a very small brush or feather, working it under the fissure that you will find at the top of the berries, for it is there where the insects are ensconced. The spirit will destroy all those to which it is thoroughly applied, and possibly may not injure the skins of the berries nor impair their quality. This is what we should like you to ascertain. After the Vines are pruned they must be thoroughly washed with an insecticide, also every part of the house and everything in it. Also, if the Vines are planted inside, the surface of the border must be removed, all dry parts made thoroughly moist, and fresh soil added. It is only by rigid cleanliness and constant watchfulness that this dread enemy of Vines can be extirpated. Its attack in your case is not half so bad as many we know, and you ought to be able to conquer the foe. If prompt and energetic measures are not taken, it will spread rapidly another year.

**Names of Fruits** (*J. Rimmery*).—1, Nouveau Poiteau; 2, Bishop's Thumb; 3, Knight's Monarch; 4, Burr Knot. (*A. C. McIntosh*).—1, Ribston Pippin, fine specimen; 2, Rhode Island Greening; 3, Josephine de Malines; 4, Beurré d'Arenberg; 5, Swan's Egg. (*Armagh*).—1, Golden Noble; 2, Maltster; 3, Pomeroy; 4, Dumelow's Seedling; 5, Mère de Ménage; 6, Not known.

**Names of Plants** (*J. B. S.*).—*Cotoneaster frigida*. Thanks for the excellent specimens. (*W. G.*).—Your variety of *Chrysanthemum* is practically the same as Sarah Owen, also a sport from Mrs. John Laing. (*A. G.*).—*Corydalis lutea*. (*A. E. C.*).—We fail to see any resemblance to the variety Mr. Freeman in the sport sent; it is something like M. Elliott.

### A DAIRY FACTORY.

DURING the past ten years many efforts of a novel character have been made for the improvement and development of the resources of agriculture, especially by landlords whose interests are bound up in the land, and who have striven to do something to ameliorate the condition of farmer and labourer by enabling both classes to help themselves. Some failures there have been, and much so-called success has proved a very doubtful blessing indeed, but in the guise of dairy factories there can be no doubt that real assistance has been given to all who have been able to turn the special advantages which they offer to full account. Attention has already been called by us to Lord Hampden's factory at Glynde, in Sussex, and in this paper an account of what is known as the Harleston Dairy Association will be given in sufficient detail to convey a clear idea of the cost of the establishment of such a factory upon a commercial footing as a going concern, and the apparatus required for such a purpose.

The chief objection to such undertakings is the heavy preliminary outlay that is usually incurred about the building, as the outlay is so heavy that anything like interest upon the capital invested in it, to say nothing of profits, is impossible for a considerable time. At Harleston this difficulty has been avoided by turning an old building to account for the purpose, so that the entire outlay upon the building, fittings, steam engine, and dairy utensils did not exceed £600, which is not an excessive amount upon a factory which ensures a ready market and prompt payment for all or any of the milk of the neighbouring farmers. It does more than this, for though the purchase of shares is quite optional, yet all who supply milk to the factory are invited to become shareholders if they become convinced that the business is likely to prove sound and profitable.

The butter made is of such uniform excellence that it has met with a ready sale at 1s. 4d. and 1s. 5d. per lb., the demand for it far exceeding the supply, so that there is no probability of too much milk being taken to the factory. There is a difficulty, however, and that is in the disposal of the separated milk, which is perfectly fresh and wholesome, and is offered for sale in Northampton at a nominal price, the object being not to make a profit, but rather to cover expenses upon this part of the business. Separated milk not sold has been used for pigs, and there can be no doubt that a porker trade might be built up in connection with the factory, which under good management should prove profitable. Provision would have to be made for breeding, as it would never answer to purchase pigs; home-bred pigs of the small white breed being altogether best, and there is always a ready market for them at weights ranging from 50 lbs. to 70 lbs. It is also obvious that a bacon factory might be added in due course, in which case a larger breed of pigs, such as middle whites, would be required of an average of about 300 lbs.

The separation of milk as it is brought to the dairy renders a large building unnecessary, and milk pans are dispensed with altogether. The new milk is weighed as it is received, the weight being printed by the weighing machine, by which the "churns" are elevated to an upper floor, where the milk is emptied into a galvanised cistern, whence it flows by a pipe down into a Victoria separator driven by a steam engine, which also drives the barrel churn and the Danish butter worker. The milk passes from the separator through another pipe and a refrigerator into another cistern, whence it is drawn for use or sale.

The factory is arranged in three parts, distinct from each other, yet so connected as to be easy of access and perfectly convenient. There are the engine house with only an outer entrance, so that

steam and dust are quite shut off from the other parts; the dairy, with separator, churn, and butter worker, and an upper floor for milk cisterns, and the milk room, with an outer door for the receipt and despatch of milk, so that traffic through the dairy is quite avoided. There are inner doors opening into the dairy and storeroom from the milk room. The fittings of the storeroom consist of light iron racks on the walls to hold small slates, each just large enough to contain 15 lbs. of butter, so it will be seen that the working plant is a very simple affair. A Victoria milk-testing machine is worthy of attention, from its simplicity and certainty. It consists of a horizontal disc with some grooves in the upper side sufficiently deep to contain a small bottle of milk in each one. The bottles lie in the slots with the corked ends pointing to the centre, they are kept in position by a metal cap fastened to the disc, which is made to revolve with such rapidity by the turning of a handle connected with multiplying wheels, that the cream is forced to the inner end of the bottles, and the quality of the milk is seen at a glance. The principle is that of centrifugal force acting upon the milk, very much as it does in the cream separator and the instantaneous butter maker.

### WORK ON THE HOME FARM.

A full flow of milk is difficult to maintain, as the cows are withdrawn altogether from the pasture, and much care is requisite to ensure that it is perfectly sweet, wholesome, and free from all taint from the food and water given to the cows, from unclean hands of milkers, dirty utensils, or foul odours in or near cowhouse or dairy. Really good butter depends so very much upon all these points having sufficient attention that we cannot urge upon home farmers too often the importance of close personal attention to every detail of management. The cows are now snugly housed in comfortable yards with deep open lodges, a closed cowhouse for milking them in, and enough loose boxes for down calving and delicate cows. We always try to have at least one cow calving every month from the present time onwards into spring, as this imparts freshness to the milk as nothing else can do. The dietary consists of the best meadow hay in the racks, a gallon of bran, and a few Carrots at each milking, and a moderate allowance of Cabbages once daily. All lodges are cleaned out thoroughly every morning, after the milking, while the cows are at the hay-racks, as then they settle down quietly upon the fresh clean litter for some time.

Calves are all in snug quarters for winter, and especial care will be taken to prevent any tendency to a falling off in condition. There can be no doubt that a warm, yet well ventilated building, quite free from draughts, and kept thoroughly clean and well littered, is conducive both to the health and condition of calves. The food must be nourishing, yet not of an abnormally forcing nature, for many a fine "bunch" of lusty young beasts has been lost from black-leg caused by over-feeding. By all means induce calves to take solid food as early as possible, but milk and porridge are never out of place during the first twelve months of their existence. Some minced roots mixed with chaff and meal, and slightly salted, is good for them, and there can be no doubt that variety of food answers best. If closer attention were given to this important point we should not see calves and store beasts becoming so much trouble with itch towards spring as we so often do, and care should always be taken that they have access to rock salt.

### REMARKS.

16th.—Overcast and gloomy morning; drizzle in afternoon; fair evening.  
 17th.—Fog, rather dense till 10 A.M., then slight, and bright sunshine from 11.30 A.M. to 3.30 P.M.; foggy again in evening.  
 18th.—Overcast and mild, with frequent drizzle.  
 19th.—Mild and dull.  
 20th.—Mild and dull, with occasional drizzle.  
 21st.—Fair, but sunless morning; drizzle and showers from 4 to 8 P.M.; bright night.  
 22nd.—Bright from sunrise to 11 A.M., then generally cloudy with spots of rain, and wet from 7 to 9 P.M.  
 A mild damp week, but with high barometer and small rainfall.—G. J. SYMONS.

## EXHIBITION SCHEDULES.

EVERY season's experience reveals imperfections in schedules of prizes for products invited for exhibition. The stipulations and conditions for the guidance of competitors and judges cannot be made too clear, and they should only be capable of one interpretation. At more than one Chrysanthemum show this year different views have been entertained in respect to what was or was not allowable under the schedule. This ought not to be. Committees of societies ought to have a clear conception of what they require exhibitors to do, and state this in terms which cannot be mistaken. It is not often that ambiguities arise in the cut bloom classes, nor with specimen plants; but they are too common in connection with groups arranged for effect. The object of these is presumably to afford the best and most tasteful examples of the association of plants, so as to produce the most pleasing and satisfying results. In the first place, the object in view cannot be attained by ill-grown examples with leafless stems, sickly leaves, and inferior blooms, for it is not in the power of man to so hide the defects of such plants that the group in its entirety is meritorious. In most schedules there are some such words as these—"Quality and effect to be the leading features in awarding the prizes." Obviously they must; but some, if not most, judges interpret the stipulation as meaning that quality of blooms is regarded as of primary importance by the Committee, and consequently taste in arrangement has been practically ignored, the chief awards having been made to a flat surface of handsome blooms, as if hoisted on sticks in boldly obtrusive and not over-clean pots, sometimes stacked on each other. There is no display of taste whatever in such arrangements, yet because the word "quality" stands first in the committee's instructions these conglomerations of pots, sticks, and stems, with "exhibition blooms" from 4 to 7 or 8 feet above them, are placed before groups of infinitely greater decorative value, simply because the blooms, though good, would not "count" so well, though the foliage and general taste displayed in the formation of the groups may be distinctly superior. It is a question for committees to consider whether the dual features "quality and effect" are not more confusing than otherwise to both judges and exhibitors, and whether the simple formula "the best and most effectively arranged group," or the "best group arranged for effect," of what is required, would not be better for all concerned. A group cannot present a good effect if the plants bear inferior or stale blooms, nor can it if pots, stems, and stakes are as conspicuous as flowers.

Competition in group classes has become so keen that perhaps more exhibitors than the public are aware of exercise considerable latitude in their arrangements. Some plants are taken out of their pots and some are laid on their sides, if thereby the general "effect" is enhanced. They know that the same methods are resorted to by the leading floral decorators in the embellishment of halls and mansions on festive occasions, and conclude they are justified in following the example. The consequence of this is that disquietude is caused and protests talked about if not formally lodged in time when prizes are adjudged to those groups. If it is the desire of authorities of shows that the plants of which groups are composed be shown in the pots in which they are grown it is easy to say so, then if exhibitors transgress they do so at their peril; otherwise

"custom" is in their favour and may give to them the benefit of any doubt which exists in the absence of explicit stipulations.

Another question now arises, and an important one in the judging of groups of plants arranged for effect. It can scarcely be expected that the adjudicators can disarrange the groups to search for possible contraventions. If they did this there would be, and not unnaturally, such an outcry from exhibitors that would very soon put an end to that method of exhibiting; while, without breaking into the groups on the first day, it is impossible that certain peculiarities can be discovered. This is particularly the case when plants have been cut down and their stems pressed in wet soil, or when flowers have been affixed where they never grew. That some exhibitors think it right to do such evidently wrong things is indisputable; but except there is a spy in the camp who is cognisant of the circumstances and reveals them, prizes may be adjudged to those groups, because the blooms are as upright and the foliage as fresh at the moment of inspection as if they were growing, but before the day is over, or the next day, the blooms hang down their heads as if ashamed of their position, and the leaves seem as if endeavouring to shrink into the pots below. The stipulated time for admitting protests has passed, yet the prizes have been awarded and exposed to the public, and officials are in a dilemma.

What is the remedy for this unfortunate state of things? It must be practicable to be useful. It is not practicable for judges to spoil groups in searching for what may or may not exist in them. They assume, in the absence of apparent discrepancies, that they are in accordance with the schedule, and determine their relative merits as presented at the time, not as they will appear the next day. Seeing, then, that it may not be till some time after the judging that the exact state of things can be ascertained, it seems to us that the best way in which officials of shows can protect both themselves and exhibitors who conform with the schedule is to insert a proviso to the effect that if anything is discovered before the close of the show in contravention with the stipulations, that the prizes will be withheld. This would prevent unfair liberties being taken, or if it did not, the penalty imposed on the first delinquent would have the desired effect. But such a proviso should not go beyond the groups, as the judges should incur the full responsibility in adjudicating on all that is fully presented to them in the ordinary exercise of their duties, otherwise confusion would soon rule supreme throughout the classes.

Now we turn to the exhibition of fruit, and in connection therewith all schedules are not so clear as they should be. In September next a great International Exhibition is to be held by the Royal Caledonian Horticultural Society in Edinburgh. "Great," indeed, it is sure to be, and good, as we know from past experience of the work of the Society and the indications in the schedule before us. This has not been sent officially, but by a correspondent who is in doubt on certain of the stipulations, and we are asked to examine those classes and state our views thereon.

In section I., which is termed class, good prizes are offered for Pine Apples, and handsome amounts for Grapes; but on turning to section II. (Grapes) we find that competitors in the preceding section are excluded. This we can quite understand as applied to Grapes, but why exhibitors of Pines in one section should be debarred from showing Grapes in the other is not so clear. The exclusion is perhaps not intended, and if not it would be as easy to make the matter clear as to leave it in doubt.

Section III., which our correspondent describes as perhaps the most important in the schedule, makes provision for collections of fruit containing (a) twelve dishes of any sorts, (b) twelve dishes excluding Pines and Bananas, (c) twelve dishes exclusive of Grapes and Pines, and not more than two dishes of one variety. "Why two dishes of one variety?" we are asked, but are not able to answer the question, and refer inquirers to the Committee. There

are three other classes in this section, the aggregate value of the prizes amounting to upwards of £113, truly a liberal provision.

Referring to the twelve dishes of fruit grown in an orchard house, our correspondent regards the conditions of this prize as correctly drawn, but the collection of eighteen dishes of hardy fruit, not more than two dishes distinct varieties of each kind, grown in the open air in Scotland, he regards as vague, and thinks it should be made clear whether such fruits as Grapes, Figs, Peaches, Nectarines, and Apricots, that require the protection of a wall or other structure to bring them to perfection in most parts of Great Britain and Ireland, are admissible as hardy fruits. The same remarks apply to the eighteen dishes of hardy fruit grown in the open air in England. As there is a wide difference of opinion on this point among some leading exhibitors it seems desirable that the conditions should be made very explicit.

Handsome prizes are offered for single dishes of Figs, Peaches, Nectarines, Apricots, and the like, but class 67 for twelve Plums, three sorts, four of each, together with classes 69 and 70, appear to our correspondent as "somewhat strangely drawn." Class 67 consists of three dishes, four of each sort, the prizes offered being £2, £1, and 10s., whilst in class 69 the collection of Plums to consist of six each of the following:—Jefferson, Coe's Golden Drop, Lawson's Golden Gage, Kirke's Seedling (?), Early Prolific, and Transparent Gage, the same prizes are only offered. We offer no opinion on this, but may remark that Kirke's Seedling is a misnomer, for Kirke did not raise the Plum referred to. It is also pointed out to us that it seems hard on exhibitors to compel them to include such varieties as Coe's Golden Drop and Early Prolific in a collection, on the ground that it is almost impossible to have these two varieties in perfection together when grown out of doors, one being a July and the other a September and October Plum.

Numerous varieties of Pears are invited, amongst others Winter Nelis, Glou Morceau, Easter Beurré, and Beurré Rance. As these varieties must be grown out of doors, it is impossible to have them much more than half developed by the second week in September, and why not invite such fine varieties of autumn Pears as Clapp's Favourite, Pitmaston Duchess, and Doyenné du Comice? The same remarks apply to Apples Court of Wick, Duke of Devonshire, Wellington, and Northern Greening being invited, and which will not be at maturity until months after the show, to the exclusion of other varieties that are in season at the time. Excellent prizes are offered for plants, cut flowers, and vegetables.

Some of the points referred to in the schedule appear to require some reconsideration with the object of making it clear to exhibitors, and enabling them to do their best in making the Exhibition what we hope it will be—a brilliant success.

### KEEPING GRAPES.

THE practice of keeping back Vines in spring and employing fires freely during October to ripen their fruit is nearly obsolete, and rightly so, because it is the reverse of economical, and the fruit keeps badly afterwards. Some late varieties, however, need to be started into growth earlier than others. For instance, Gros Colman, which takes a long season to bring it to perfection. Perhaps the best flavoured Gros Colman I have ever tasted was ripened in the temperature of a Muscat house. The Muscat of Alexandria was used as a stock, but in spite of this the variety appears to finish better under comparatively cool treatment. If the crop is too heavy, and hurried from the time the Grapes commence colouring, they are seldom black, but if the crop is moderate, and abundance of air is admitted day and night, there is no difficulty in colouring them. It would be wise to start Gros Colman a month earlier than is necessary for Lady Downe's and Alicante.

I am not in favour of having fruit ripe too soon that has to be kept some months on the Vines and in bottles. If thoroughly ripened by the end of September under cool airy treatment the fruit will keep well, but I would prefer having fruit ripe by the end of August rather than in October, and it would certainly keep better. This is not the only advantage gained by assisting them in spring, instead of when the days are short and the sun has but little power to solidify the wood. This is accomplished by

starting the Vines early enough instead of having to ripen the wood by the unnatural process when light and natural heat are at a discount.

After the fruit is ripe the treatment the Vines receive is often the reverse of what it should be. Instead of trying to keep the temperature at 55° to 60° as is too frequently done, until the Grapes are cut, say at the close of the year, the temperature should be gradually decreased until the Vines can have cool treatment. More Grapes decay through the use of fire heat after they are ripe than is the case if it is not used. Fire heat tends largely to shrivel the berries and dry the borders, so that recourse to watering is necessary, which by the opposite treatment would not be required. If one Grape more than another dislikes fire heat after it is ripe it is Alwick Seedling. If the structure in which it is grown is freely ventilated and kept cool the Grapes will hang in good condition for six weeks or two months longer than where the orthodox system of firing is practised. Closed ventilators and fire heat create atmospheric conditions that are highly favourable to decay in the berries. It should never be employed after the fruit is ripe when the ventilators are closed, except to keep out frost, and even then it is preferable to leave the ventilators open a little at the base and top, and have recourse to extra warmth in the pipes.

The only advantage fire heat affords in the keeping of Grapes is to expel damp, and this as far as possible should be used early in the day when the ventilators can be opened. Any moisture that may have become deposited on the berries through a low night temperature will do no harm, provided it is evaporated early in the day without fail.

Perhaps the most critical period for keeping Grapes is from the time the foliage commences fading until it falls. The period when this takes place varies considerably according to the time the fruit is ripe and the condition of the roots. Vines in healthy vigorous condition, with their roots in outside borders, and the fruit ripe by the end of September, will retain their foliage until near the close of the year, while under many other conditions the foliage will be off before the end of November. If the Grapes are preserved in good condition until the foliage has fallen naturally, there need be no difficulty in keeping them afterwards. A cool dry room should be selected for them after they are cut from the Vines. It is important that the room be liberally ventilated, for the whole secret of keeping Grapes in good condition depends upon a free circulation of air. If a uniform temperature can be maintained, that is, if the room is so situated that the temperature varies little, all the better. But the temperature had better vary considerably by the influence of external conditions than be kept uniform by fire heat. It is not only necessary to employ fire heat judiciously while the fruit is hanging on the Vines but also after they are cut and the stems placed in bottles of water.

The bottles to be used should, as far as practicable, be of clear glass, so that it can be seen at a glance whether the end of the stem is in the water or not. With many of the stems of the bunches this care is not necessary, but with others the case is different, and they need examining frequently. The best plan is to hang all with short stems together, so that they can be attended to whenever they need it. It is important to keep the stem well in the water. The bottles should slope gently so that the bunches hang perfectly clear. If the bunches are heavy shouldered do not allow the shoulders to press on the remaining portion of the bunch, but suspend them the same as when growing upon the Vines. If the berries press upon each other they are certain to decay however carefully they may be attended to. When they are in the bottles the bunches should be looked over once a week, so that any berries which decay do not remain to affect those surrounding them. Many bunches are spoiled in appearance by inattention to details of this nature. It is unnecessary to seal the ends of the shoots or even to place charcoal in the water. The necks of the bottles need not be stopped. The room should be cool and ventilated liberally. If fire heat is used the water from the bottles is evaporated, and causes a moist atmosphere that quickly ends in the destruction of the berries. Close the door and windows, light a fire, and moisture will soon be expelled when the door is opened. This state of things is avoided by using no heat, except the doors and windows can be thrown open at the same time. As long as frost can be kept out of the room we strongly urge the use of no artificial heat. Those who try this plan will find that their fruit will keep much better than is the case when used more or less frequently. Rather than employ fire heat prepare straw shutters for blocking up the windows during severe weather. If these are thick and kept dry they prevent the temperature of the room falling considerably; they should be removed daily and dried unless the weather is of such a nature that it is necessary to keep them up.

No room is suitable for this purpose in which a thorough circula-

tion of air cannot be maintained. For years we have kept Grapes well in a room behind a north wall with a door and window to the north, the circulation of air being maintained by the fireplace in the south-west corner. Years ago, when we kept a steady fire during dull bad weather, the Grapes kept badly. When we discontinued its use and threw open the door and window whenever the weather was anything like favourable we found no difficulty.

The closing weeks of August and September were all that Grape growers could desire, and the fruit should have been well ripened under the most favourable conditions, and therefore may be expected to keep well after being bottled if ordinary care is exercised.—WM. BARDNEY.

## RENOVATING ORCHARDS.

[A Paper by Mr. JOHN WRIGHT, read on behalf of the British Fruit Growers' Association, at a meeting of the Falmouth Horticultural Society, November 12th, 1890.]

(Continued from page 440.)

SEVERAL instances of success resulting from grafting profitless trees could be given, but two will suffice. Mr. Robert Garrod of Ipswich planted a number of fruit trees some years ago in good soil. In the course of time some of them instead of growing and bearing commenced cankering, and were soon worthless. By simply cutting back the branches of these, and grafting them with varieties that flourished, he made the useless trees useful, and they have since borne profitable crops, and the stems are free from canker. In this case there was sufficient nutriment in the soil, but the paralysed roots of the stunted trees could not imbibe it, but the free growth of the grafts caused an extension of root action, and sufficient nutriment was appropriated for the continuance of healthy growth and the support of good crops of fine fruit. I am at liberty to mention Mr. Garrod's name, because it has appeared in the public press, but I am not free to mention the name of the owner of some Apple trees in inferior varieties and of stunted growth. They did not afford him £5 worth of fruit a year. He was advised to cut them down and insert a number of scions on each of the hardy and strong growing Bramley's Seedling. They commenced bearing in three years, and the seventh after grafting yielded considerably more than £100 worth of fruit. Nothing was done to the roots. How, then, is the improvement to be accounted for? In this way. The stunted trees had roots, but they were of necessity weak, and did not extend far from the stems. They had impoverished the ground within the small occupied radius, but the strong variety established on the weak imparted strength to the roots, and these pushed beyond the impoverished radius into fresh feeding ground, and practically virgin soil. When endeavour is made to improve fruit trees by grafting, much stronger growing varieties should be chosen than those which are cut down for the reception of the scions, because of the increased power that is thus imparted to the roots, for the character of the roots is changed by grafting as certainly as are the tops of the trees.

The process of grafting cannot be made clear to the uninitiated without illustrations, but these, with concise details, are given in the essay which I wrote for the Fruiterers' Company, and which can be had by post for 1s. 3d. from 171, Fleet Street, London. I have the less hesitation in mentioning this, as I derive no advantage whatever from its sale.

I wish to make it quite clear that when old trees are renovated by grafting alone, it is because there is soil that can be reached by stronger roots which has not been deprived of its fertility. Where the whole surrounding ground is impoverished, grafting is not of much permanent value. Strong growing and rooting sorts will live where the weaker fail, just as active animals with good teeth have an advantage over others that are afflicted with the foot-and-mouth disease in getting the best share of the pasture; but where the food is scant it is soon devoured. And thus it is that we see grafted trees grow very well for a few years only, then collapse. They succumb because they have emptied the larder, for the earth is the great larder of Nature, and it is the duty of cultivators to keep it replenished with the food that is needed by the crops. The soil itself is not food, but only the medium for containing it, as a sponge contains water. We use the water and leave the sponge, and fruit trees draw the food out of the earth and leave the soil. There are not many exhausted fruit trees that cannot be improved by enriching the soil or placing in it the fruit-growing constituents which have been drawn out, and especially when the trees are also judiciously pruned and cleaned from insects, moss, and other parasitic encrustations.

The quickest method of storing food in the earth for immediate appropriation by trees is in the form of liquid manure, such as the drainage from stables and manure heaps, or the contents of cesspools—sewage. After much experience I am justified in recommending the application of liquid manure to debilitated fruit trees

in the winter under certain prescribed conditions. It may be applied usefully in the summer also if the soil is moist, not on the surface only but 3 feet or more below it, otherwise a minimum of benefit will accrue from a maximum outlay in material and labour. On this subject I cannot do better than reproduce what I wrote in the *Journal of Horticulture* a little more than a year ago. Those who have read it I ask to read it again and find all the fault they can with it. They had better do this before making full trials of the method indicated, because they will not have such a good chance afterwards. Here is the article that was founded on long practice. The simple plan advocated has since been tried by others and not found wanting:—

"Some time ago a correspondent said he failed to see how liquid manure given to fruit trees in the winter could be of any benefit, as the roots were then in a dormant state. In the first place they are not in a dormant state after the leaves fall, though they do not imbibe nutriment from the soil to anything like the same extent as in summer; and in the second place they do not imbibe what they need either in summer or at any other time when the food for which they are hungering and thirsting is not in the soil. That is the condition of thousands of trees in summer and winter. They have been planted for years or generations, and manure may or may not have been placed round their stems from time to time. Be that as it may, the roots have deprived the soil of all that was good for the trees, and gone further and deeper in search of more—seeking, but finding not that which is necessary for their sustenance. They have lived but not prospered, and never can prosper until the impoverished food store (the earth) is replenished—supplied with matter which is essential to their health.

"Unquestionably this may be given with great advantage in summer if obstacles do not forbid its application then, and in no other way can it be so quickly effective as in a liquid state. At no period are the roots of fruit trees of all kinds so active as early in September, and at no period can so much nutriment be imbibed from the soil in a given time when the earth is in a fit state for its reception. It is not in a fit state when it is dry, and I have no hesitation in saying that the best of liquid manure that can be procured does immeasurably less good applied in summer, when the soil, in which the roots are situated or trying to move, is dry, than in winter, when it is moist—not waterlogged, but moist enough for absorption, while at the same time permitting of free percolation, for where water passes through the soil air follows, and there can then be no stagnation. The earth, then, to be in the best condition for the reception of liquid manure, must be moist, yet sufficiently drained naturally or artificially.

"During the summer months the earth may appear moist, and is moist, it may be, to a foot or so in depth, even under and near long planted, large, yet enfeebled trees; but below the moist layer in which there are few or no roots, we find on digging that the earth is as dry as powder, and it is in this dry under stratum that the chief of the roots are established. This should be thoroughly moistened with clear water, then, and not till then, following with liquid manure. But it is often most difficult, and may be impracticable, to make the impoverished soil moist during the summer season of the year, in which the roots of starving trees are established; and beyond question the autumn rains and winter snows do the important work more effectively and cost nothing. Then is the time to empty cesspools and pour the contents into the ground; of course, when the surface is moderately dry. At that season of the year the liquid can be given of twice the strength it would be safe to apply it when the roots are in an active state; in fact, it is not easy, I suspect, to give it too strong in winter. Some of the virtues may pass away, but the bulk will be retained by the moist soil, and be imbibed by the roots to the certain benefit of the trees.

"I have used thousands of gallons of the contents of cesspools that could only be emptied in winter, with the most striking benefit to all kinds of fruit trees and bushes which only needed sustenance to render them bearers of excellent fruit; as I gained courage from experience the liquid was less and less diluted, and the stronger it was the more marked was the effect beneficially on the trees. If the soil is moist in summer liquid manure may be given with advantage to fruit trees that obviously need support; but the very strong may need to be somewhat diluted. It is worse than useless applying it to dry soil, as it drains down, leaving little of its virtues behind, and may in passing do injury to some of the roots; but apart from that the practice is wasteful, and therefore should be avoided.

"When travelling in Lincolnshire in August last year I had the pleasure of calling on a clergyman, who is also an ardent gardener. I had known the old espalier and other trees in his garden for years. Many of them had the appearance of being worn out, and most persons of an improving turn of mind, with the means of carrying out their ideas, would have destroyed the old trees and

planted young. Some were planted, but the old were retained and nourished. I was somewhat astonished to see the change they had undergone since the previous year, thick deep green leaves in place of the pale and thin; stout short jointed, well-fed wood in place of the weak; large fruit in place of the small, clean and rosy in place of the speckled and sickly hued. This rapid renovation had been effected by liquid manure given strong and plentifully in the winter.

"I had exactly similar experience in years gone by, and in the same village. Whether the vicar came to hear of this I know not, or whether he remembered something he had read on the subject, or whether it was a question of wasting the sewage or not, and so he ventured to try it on the old trees, not minding much if he killed them, I am not able to say, but the fact remains he did pour the strong stuff into the ground when it was naturally wet in winter and the trees leafless, then when the spring came and the summer advanced the sturdy shoots and thick dark leaves, the bold buds, and good fruit told plainly that the food in solution given in winter when the trees were resting was not lost, but retained and appropriated. In no other way could the enfeebled trees have been improved so quickly, decidedly, and cheaply.

"It is nearly thirty years since some cesspools on the premises of a gentleman could only be emptied in the winter. The contents were applied to old trees in an orchard, completely saturating the ground, and there was no mistaking the effect of the application. It was then used in the garden, being given to trees of various kinds near the walls and in the open that appeared to need extra support, also to Gooseberries, Currants, Strawberry beds, and Raspberry plantations, with the most satisfactory results; indeed, for seven years they had no manure beyond the sewage, and this was only given in winter. The owner of the trees and bushes, and all else who knew them, were satisfied that they became much more healthy and grew far better crops of fruit after being thus treated than they had ever done before, and canker wounds healed freely in some apparently worn out Apple trees that were invigorated in the manner described. To be effectual the application must be thorough, surface dribblings being of little use."

It may be thought, and is thought by some cultivators, that liquid manure applied in winter passes through the soil into the drains. This is not so when the soil is moist and not too sandy for fruit trees. The liquid is not lost, but filtered, that which is least wanted, then (almost pure water), passing away, that which is most wanted—the virtues of the liquid—being retained for the support of the trees. This anyone can prove by experimenting with a large flower potful of moderately firm moist soil.

In order to aid the penetration of the liquid quite down to the roots of trees holes made with a crowbar are useful, particularly on sloping ground, filling them over and over again. These food receptacles should not be close to the stem only, for the most active feeding roots are at a distance from it about equal to the spread of the branches. The deeper and wider and more numerous these conduits are the better, especially when they are afterwards filled, as they should be, with a rich compost rammed firmly. A mixture of loam, wood ashes, and leaf mould in equal parts, well incorporating with each bushel 3 or 4 lbs. of superphosphate of lime, used in the manner suggested will soon be taken possession of by a mass of fibrous roots, and the trees will be improved accordingly. I have seen some striking results follow that practice in the renovation of both fruit and ornamental trees on grass.

(To be continued.)

## AURICULAS.

ONE peculiarity of Auriculas is that they are interesting all the year round. At present they should be in the quarters where they are to flower next April. Growers who have only frames should see that they are thoroughly watertight, for a drip in the heart of a plant is fatal. During heavy rains the sashes should be kept close, enough ventilation being provided for by openings in the sides, or by having the frame raised some inches from the ground. In Scotland most of the growers have now houses specially erected for their Auriculas, and thus the plants can be under their observation during even the storms of winter. This is undoubtedly the best way of keeping the plants safe, for with frames much damage may be done before it can be discovered, as for many weeks sometimes they cannot be opened. Even with a house and all proper attention it is found that some plants will go wrong, and occasionally a loss has to be borne. The door of the Auricula house should be of wire netting, as close in the mesh as to exclude birds, and the upper half should be made to hold a glass sash, removeable at pleasure, which during winter protects the plants from draughts and driving rains. The plants require little water from this time to the commencement of growth about the beginning of

February, but they must never be allowed to become dust dry. A practised eye knows by the look of the soil where water is needed. The plants have gone to rest, and the chief attention they require is keeping them clear of green fly and yellow leaves. In a collection of any size, yellow leaves will be found every day, and they should at once be removed. Where the plants can be carefully observed, as in a house, every one is a study. Some will soon assume the appearance of a close cone like a pencil point; others maintain more or less expansion in their foliage all the time they are at rest, and some stems appear longer than others, owing to the thickness of the base of the leaf, which leaves a larger space empty when it is taken off.

Every Auricula grower knows that there are some plants that will not grow or bloom satisfactorily with him, whatever they may do with others. In my own experience I have never been able to make anything of Douglas's Conservative. Every season it has broken up into a number of small plants, and I have never had a plant of any size to show its real merits. The best plant and the best bloom of it I saw with Mr. B. Simonite at Sheffield the year it came out. The experience of some of the Scotch growers is the same as mine. There must be something inherently delicate in Campbell's Duke of Argyle, judging from its scarcity. This season I had a fine plant and a good bloom, but shortly after being repotted the stem above and below the soil decayed simultaneously, to my great grief, as there is little chance of replacing it. Simonite's Mrs. Douglas is another which breaks up with me. It is a desirable variety owing to its colour, which makes it conspicuous in a collection. Kay's Alexander Meiklejohn, as good a grey-edge as we have, is not a satisfactory grower. The leaves do not expand properly, and I have seldom seen it without a stunted look, and with the foliage "nirly," as the Scotch phrase it. With me it is not a ready breeder. It is the opinion of my Auricula-growing friends that Reid's Acme is losing strength, and is not so robust a grower as it used to be. I did not observe any difference in my plants last year, but now that my attention has been called to the matter I will watch Acme in future. On the other hand, it is pleasing to see at the proper season the robust and sturdy growth of Lightbody's Sir John Moore, Woodhead's Mrs. Dodwell and George Rudd, Campbell's Lord of Lorne, Turner's Colonel Champneys, Downing's Catherine, Horner's Heroine, and others. My excuse for mentioning these things is that points in the experience of others are always interesting and useful. — JOHN MORRIS, Dundee.

## PEARS ON WALLS.

I GIVE a select list of varieties of Pears, as grown at Kenward. I will speak of the south wall first: "Winter Nelis, Pitmaston Duchess, Williams' Bon Chrétien, Marie Louise, Glou Morceau, Doyenné Boussoch, Beurré Rance, Brown Beurré, Beurré Diel, Beurré Superfin, Chaumontel. On west walls: Gansel's Bergamot, Jargonelle, Marie Louise, Pitmaston Duchess, Williams' Bon Chrétien, Van Mons Léon Leclerc, Beurré Superfin, Winter Nelis. On east walls: Flemish Beauty, Madame Treyve, Doyenné Boussoch, Catillac, Bellissime d'Hiver, Uvedale's St. Germain, Williams' Bon Chrétien. On north walls: Swan's Egg, Marie Louise, Uvedale's St. Germain, Jargonelle.

The west wall I consider the best for Pears, but Glou Morceau does very well on the south wall, also Marie Louise, Chaumontel, Beurré Rance, Doyenné Boussoch, and Doyenné du Comice. Many more could be added. Winter Nelis does best with us on the south wall, double grafted upon Brown Beurré, or properly speaking, budded. I find Pitmaston Duchess does not set a sufficient number of fruits for a half crop. I am about to double work this upon Winter Nelis, and Winter Nelis upon Pitmaston Duchess.

The natural soil at Kenward is good for Pears, when the roots are prevented passing into the subsoil, which is more or less clay. In planting I use tiles, to prevent the roots getting into the subsoil, placing the tiles at the bottom of the hole made for planting, one tile overlapping the other, as on a building. This I find prevents coarse roots, and further, the roots are under the entire management of the cultivator. I have found all the fruit trees planted in this way free from strong breastwood in summer, and the wood ripens much better in autumn. All our fruit trees except Apples are planted upon clay tiles, and have been for many years, whether against walls or in the open quarters, and I have no cause to alter my system of planting upon tiles. Of course if very dry weather occurs the fruit trees are watered occasionally, according to the crop upon the trees. We have many other varieties of Pears in the open quarters, as pyramids and bush trees. Remarks upon these I must reserve for a future paper.

I need not say much about insects, but one or two may be mentioned. The slug worm is a small, black, slimy caterpillar, that occasionally does considerable mischief to the foliage of the Pear

tree by consuming the parenchyma of the leaves. The most effectual remedy is dusting with tobacco powder over the insects; this will soon make them roll off and die. Green caterpillars are very troublesome; these should be hand-picked, and also the maggots in the spring shoots. The worst pests I have to deal with are the wasps. These do great damage to our wall and other fruits. We find their nests if possible, and destroy them, but it is difficult to find every nest, otherwise we should soon cease to be troubled with them. We do our part, having taken and destroyed 233 queen wasps in the spring, and 113 nests up to the 27th of August, 1890; all these within flying distance of the fruit garden. The largest nest taken was 38 inches round, and contained thousands of live wasps, besides maggots just ready to hatch. The wasp is most destructive to ripe fruit, but they also attack green fruit. Last season we had a quantity of green Pears damaged by the wasp, even such hard Pears as Beurré Rance, upon a south wall, was much damaged by these insects, as late in the season as October. We destroyed over eighty nests last year, and I was in hopes we had thinned them for another year. My belief is that a very severe winter is Nature's way of keeping down all insects. A stranger walking round our fruit garden would not think we had troubled to take a nest. I have not mentioned gathering and storing the Pear, for most cultivators use the conveniences at hand, and I might leave this question also for a future paper.—J. SMITH, *Yalding*.

### CATERPILLARS AND FRUIT TREES, 1890.

FROM some districts of the midlands and the north of England serious complaints reached us last summer of the mischief caterpillars had caused to fruit trees, notably the caterpillar of the winter moth (*Cheimatobia brumata*), and in some places that of the mottled umber (*Hybernia defoliaria*) was nearly as abundant. Other destructive species often accompanied these two, but in less numbers generally. Taking England as a whole, however, I think we shall find that, considering the prevalence of the plague of caterpillars in 1889, the following season did not show anything like the abundance of them that some growers feared. True, there was a yield of fruit far below the average, but this could hardly be charged upon caterpillars, large or small, certainly not in our district of North Kent. Most of the fruit growers I know attribute the scarcity of fruit to the cold nights and rough winds that occurred just about the time of blossoming; and with regard to the Plum, the knowing ones foretold that a bad year would come after the four or five years, when the yield in most kinds was good, or even abundant.

Still, we had our caterpillars, quite as numerous as anybody desired, if not more so, and to prevent their progeny troubling us next year various precautions must be taken. The discovery that by the aid of the male insects the females of the winter moth can manage to get above an adhesive band or smear placed round the trees about the end of the year proves that what was supposed to be the best method of prevention cannot be absolutely depended upon. Yet for all that, this should always be done where the species has shown itself abundant in the summer, care being taken to lay on this composition before the emergence of moths, for though the period varies in different localities, if left till December is much advanced it is likely to be too late. This circlet also serves as an obstacle to the upward progress of the wingless females of the mottled umber, and to any other winter moth of similar habit. Some alarm has been occasioned by the mottled umber caterpillar, which has been looked upon as a new foe to fruit trees. This is a somewhat conspicuous one, larger than that of the winter moth, red-brown on the back, the sides yellow, grey, and white. Owing to its not spinning a web it can be easily shaken from the trees. I do not think it is more abundant than it used to be, but instead of feeding chiefly on the Elm, Lime, and other timber trees, it appears to have visited our orchards of late; but in Kent the species occurs only sparingly, though plentiful in adjacent counties. It must be borne in mind that this insect emerges earlier than the winter moth, and the eggs in an average year would be laid by the middle of November. The young caterpillars hatch out some time in April, as do those of the winter moth and allied species. Evidently during last spring many thousands of all these were destroyed by keen winds that followed a sudden burst of warmth, by which they had been brought into life too rapidly for themselves, but quite to the advantage of the horticulturist.

It is a matter of easy observation that the caterpillars which get on best in any ungenial spring are either those able to protect themselves by silken webs, or those naturally provided with a coating of hairs. Some have both safeguards, the brown tail for instance (*Liparis chrysorrhæa*), a caterpillar regarded in the reign of George III. as the leading foe of fruit trees, but which is now

less common, and found usually on the Hawthorn and Sloe. So, too, is it with the lackey (*Bombyx neustria*), which I never remember before so abundant on the Apple. Through June and July the caterpillars were to be noticed wandering about in all directions near gardens and orchards, for they are soon dislodged from the boughs on which they feed, and move hither and thither anxiously till they can regain their position. It is not at that season they do most harm to the trees, but in May, while the foliage is young. At the beginning of that month the new brood appears from the eggs laid in August, and they form colonies varying in number from fifty to thrice as many, each party constructing a general web, under which they shelter themselves in rainy weather, also after dark. During the day they scatter, going in little parties, sometimes several feet off, but seldom failing to reach their home at the time needful. In France for many years it has been customary to take precautions against the spread of the species by obliging owners of orchards to cut off and burn the twigs or branches having their webs. Hitherto it has not seemed needful in England, but may be if it continues to increase as it has of late. Through the winter months search should be made for the eggs, placed in circlets about the shoots; they can be easily removed without cutting the wood. Some of our country folks have a superstitious dislike of the adult caterpillar, perhaps because its head, with its two eye-like spots, looks peculiar, especially when it sways from side to side, in doubt as to which way it shall crawl. The lackey is rarely found on the Pear or Plum.

The small ermine moth (*Yponomeuta padella*) was noticeable upon both Apple and Plum in the summer of this year, but it was not particularly abundant. I think it now and then infests the Cherry, or if not, there is another species of the family does, alike in its web-weaving ways. The webs made by the caterpillars of this ermine are even more annoying than those of the lackey moth, and their secretions appear to have a poisonous effect on the trees in addition to the injury done to the leaves and buds. Sometimes also they are to be caught in the act of gnawing the epidermis of the twigs. It is upon the twigs the patches of eggs are laid, covered by the mothers with a smooth gum, which protects them from the weather, and also unfortunately makes them difficult to detect. Now is the time to look for these and remove them, but the gardener will probably be surprised to find under the gummy coating, not eggs; there will be moving objects, in fact tiny caterpillars. It is a curious circumstance that they hatch in the autumn, and remain without eating till the first warm days of spring, when they start off in search of food, and begin active life by burying themselves under the surface of the swelling buds solitarily, or it may be in twos or threes. Having grown to some extent they next unite to construct webs, which are their abodes till they come out as moths. These are tolerably conspicuous in July, though not large, owing to their tints of black and white. They are sluggish, therefore it is easy to capture them by spreading under the trees nets or cloths, into which they may be shaken. Some of our Pear trees in North Kent had their buds damaged by the caterpillars of *Tortrix angustiorana*, well known as an enemy of the Peach and Apricot. But still more marked injury to the Pear, Plum, and Cherry this year was caused by the hosts of aphides that appeared upon the trees in May and June, the species being chiefly *A. Mali*, *Pruni*, and *Mahaleb*. In many instances the growers found it impossible to grapple with the pest, and some trees became some sickly that they had to be cut down. During the autumn the slug-worms of the *Selandria* group were numerous on some Pear and Cherry trees.—ENTOMOLOGIST.

AT a recent meeting at Astwood Bank, Worcestershire, Mr. J. Hiam referred to the winter moth, the life history of which he explained. He exhibited live specimens of the male and female moth. He found that the egg laying began in the middle of October, and was now at its height. The first male moth he saw on the 22nd October and the first female four days later.

He judged from the state of his trees that the visitation of winter moths was as severe this autumn as ever, or rather more so. He found, however, that efforts to cope with the pest were becoming far more general; it was a rare thing now to see a tree without grease bands, whereas formerly it was a rare thing to see the trees with them. Still he found there was a great deal of prejudice to encounter. From his observations he concluded that fruit growers would have to be ready with the Paris green and London purple next spring. Mr. Hiam's bottles were covered with paper perforated with minute holes. Through these holes the female moths had thrust many of their eggs, showing in what minute crevices it was the habit of the moth to lay her eggs in on the trees. He had also some true specimens of the grub, which are a mere speck when first hatched. This little creature commences at once to eat at the centre of the bud, and does the damage weeks before its presence is noted. He produced a grease band from one

of his trees, and showed that not a moth had passed beyond it, as the grease was good. Mr. Hiam thought that many failures result from the use of bad grease, and strongly advocates its being placed on bands of greased paper. He considered it would not act effectually if placed on the bark, and in proof of this referred to his band. This was made to cover two-thirds of the circumference of a particular tree, the other third being greased on the tree. On the grease on the paper he took fifty-three male and eighty-five female moths, and on the grease on the tree only two males and two females. This clearly showed that the bark absorbed the grease and rendered it comparatively useless. He next explained the beneficial effects of syringing with Paris green and London purple, but counselled great care in their use.

The syringing not only had a beneficial effect on the crops of the year, but sensibly mitigated the attack of the pests in the following season, as the caterpillars being killed did not go down to the earth to come up in the autumn as moths. In proof of this he gave statistics of the moths found on trees syringed and not syringed. No. 1 was a standard orchard Apple tree, 20 inches in circumference, sprayed with Paris green after blooming. On Saturday week he found on the grease band of that tree fourteen male and three female moths. No. 2 was an Apple tree, 36 inches in circumference, and was syringed. From that he took twenty-one male and three female moths. No. 3 was 21 inches, and on the band were twenty-two males and four females. No. 4 was 30 inches, and had eight males and six females. The total number of moths caught on the greased bands of the four trees on Saturday week was sixty-five males and sixteen females. No. 5 tree was not sprayed with Paris green. It was 57 inches in circumference. On the grease band were 103 males and 138 females. No. 6, 34 inches, not syringed, eighty-five males, eighty-two females. No. 7 was the tree which was greased partly on the bark and partly on paper, so that all the moths were not caught. About a fourth of the tree was syringed. On it were fifty-five males and eighty-seven females. The total number of moths on the trees not sprayed with Paris green was 243 males and 307 females. He calculated roughly that the moths captured would represent 3000 caterpillars on the four syringed trees, and 60,000 on the other three.—(*Evesham Standard*.)

#### SEASONABLE NOTES ON VINES.

THE following hints will probably be useful to beginners in Grape culture who are expected to have a supply of fruit at different periods of the year. The earliest Vines were started in November. Whether in pots or planted out, they will need to have the temperature increased to 60° at night in mild weather, 55° in severe weather, gradually increasing it so as to have it 60° at night when the Vines are in leaf, 65° by day in severe weather, and 70° to 75° in mild weather with moderate ventilation. The evaporation troughs need not be charged with liquid manure if there are fermenting materials in the house, but if not the troughs should be filled and kept so with the drainings of the dungyard or stables, cowbyres, &c., but avoid the drainings of piggeries. Failing the materials named, employ 1 lb. guano in 20 gallons of water, which is also useful for watering Vines in pots, the water being applied at the temperature of the house. Tie up the Vines in position as soon as the growth has well commenced, and before the shoots are so long as to be liable to be damaged in the process. Sprinkle the house two or three times a day in clear weather, avoiding a close atmosphere on the one hand, and a dry one on the other. Disbudding should not be practised until the fruit shows in the points of the shoots.

When a supply of ripe Grapes is required in May, the Vines must be started without delay, nothing favours satisfactory starting more than a good bed of leaves and sweetened stable litter placed on the floor of the house and turned daily. The outside border should have the needful protection from cold rains and snow, two-thirds of leaves to one of stable litter affording a less violent and more lasting heat than dung. Provided the borders were covered with bracken, straw, or litter in early autumn so as to throw off the rain, the temperature will be considerably warmer than that of exposed borders, and in their case covering with fermenting materials may be dispensed with, but a covering of fresh leaves, so as to raise gentle warmth, is preferable, especially to those entirely outside. The inside borders should be brought into a thoroughly moist condition by applying water, and in the case of weakly Vines liquid manure at 90°. Start with a night temperature of 50° in severe weather, 55° in mild weather, and 65° by day, except the weather be severe, when 55° will suffice, not exceeding those figures until growth commences. Maintain a moist atmosphere by syringing occasionally, but excessive moisture excites the emission of aerial roots from the rods. Depress the rods of young Vines to the horizontal line, or below it, to insure the regular breaking of the eyes.

Vines in midseason houses from which the Grapes have been cut should be pruned, indeed there must be no delay in this work after the leaves are down. Any Grapes still hanging may be cut, placed in bottles of clear rain water with a piece of charcoal in each. The Grapes

often keep better that way than on the Vines, as the temperature of a Grape-room is more equable than can be commanded in a vinery. Keeping Grapes hanging after they are matured and the leaves fallen may not prejudicially affect the Vines unless prolonged to a late period, yet the greater amount of young wood keeps the sap more or less in circulation, and there is a certain amount of waste going on which cannot take place when the Vines are pruned. Prune, therefore, directly the leaves are fallen, cut any thin-skinned Grapes, as they do not require the maturing so necessary for such varieties as Gos Colman, and thick-skinned varieties generally. In pruning adhere to the system that has proved satisfactory. If the Vines are in good condition they will give sufficiently large bunches if pruned to a couple of buds, good useful Grapes, so essential for keeping the table supplied with fresh fruit daily. But if larger bunches are wanted, or the Vines, from weakness or other causes do not afford them so large as required, leave more growth, only be careful to select sound, round, well developed buds on firm well ripened wood. Large bunches are invariably defective in the finish of medium sized bunches. Aim, therefore, at finish. Vines that afford well finished examples when pruned to one bud will give a larger bunch and of equal finish from the second bud. If the soil be rich, plentiful and loose, the chances are the shoots or canes will be gross, long-jointed, having large thin textured leaves, the buds large, pointed, or if laterals are encouraged flat, and these may give the sensational bunches, which justly have their merits calculated by weight. If, on the other hand, the roots are in a firm but favourable rooting medium, causing an increase of root ramifications, then the wood will be stout and short-jointed, the leaves thick and leathery, and the buds at their base will be round, plump, and well matured. It is, of course, assumed the foliage has full exposure to light for the solidification of the growth as made, and that cultural requirements are granted in full measure. Let the Vines be dressed, the house thoroughly cleansed, and everything placed in order, so that there need be no hurry later on. Keep the house as cool as possible, to insure complete rest.

In late houses take every precaution possible against damp. Leaky roofs are a prolific cause of decay in Grapes; a single drop of water getting inside a bunch of Grapes is sufficient to spoil it. Though the decay may only be a berry it soon spreads and spoils the whole bunch, especially when the faulty berry is in the interior of the bunch, so that it escapes detection until the mischief is done. Remove all leaves as they become ripe, affording only sufficient fire heat to maintain a temperature of 40° to 45°, and close the house in damp weather, seeking to insure a dry, cool, and equable temperature. Muscat of Alexandria should have a temperature of 50°, a gentle warmth in the pipes constantly so as to prevent the deposition of moisture on the berries, but when the weather is cold and sharp allow the temperature to fall 5° or 10°, being careful not to allow the temperature to be much accelerated by sun heat or natural warmth without a free admission of air.—PRACTITIONER.

#### ORCHIDS AT ST. ALBANS.

MESSRS. F. SANDER & Co.'s great establishment at St. Albans seems to become more astonishing every year, not only in extent and numbers of plants, but also in the remarkable healthy condition distinguishing so varied a collection of Orchids. Cattleyas of all sections that were only imported six months ago are now fine vigorous plants, throwing up strong and abundant sheaths, and promising a rich display of flowers next year. House after house of *Odontoglossum crispum* and *vexillarium*, with all the other chief favourites in that genus, present similar results of good treatment. *Cœlogynes* and *Cymbidiums*, *Lælias*, *Dendrobiums*, *Masdevallias*, *Angræcums*, *Cypripediums*, and with many others that cannot be mentioned now, are all that the most critical could desire. Of the *Angræcums* one of the most attractive and free-flowering is *A. Sanderianum* (fig. 65), which succeeds especially well at St. Albans, producing its long racemes of creamy white flowers in profusion. Grown in small baskets suspended from the roof of a house with a temperature of 55° to 60° it seems to be thoroughly at home.

#### HYBRID CYPRIPEDIUMS.

*Cypripediums* are just now one of the special features, and the attention which has been given for some years to hybridising and seed saving is beginning to produce satisfactory results. For instance, there are three or four hybrids in flower that possess extremely distinct characters, and must be considered as most valuable additions to the list of cultivated *Cypripediums*. One of these is an exquisitely beautiful hybrid from *C. superbians* (Veitchi) and *C. hirsutissimum*, which shows a remarkable combination of the characters distinguishing those species. It has a somewhat heart-shaped dorsal sepal, 1½ inch wide by 1¼ deep

suffused with a soft delicate purple tint, with a few slightly deeper purple streaks, and faint green veins underlying the purple suffusion. There are also some dark dots at the base running into the veins. The tip is pale green, the margin has a number of white downy hairs, and the inner surface is also covered with a slight tomentum. The lower sepals are small and greenish. The petals are  $2\frac{3}{4}$  inches long by five-eighths inch broad at the widest part near the points. They are slightly deflexed, partaking somewhat of the *C. hirsutissimum* character, but very distinct in colour, soft purple, green at the base, with fine dark spots at the base, and dark marginal hairs. The lip is suggestive of *C. superbium* in shape and colouring, but is a distinct shade, and is dotted and

rounded, margined with white, rich dark crimson, with chocolate spots. The petals are very dark, with three dark dots on the upper margin, the lower half at the base being of a peculiar transparent green with a few dots; the lip is very dark, and the whole surface of the flower has a polished shining appearance that in a bright light is very effective. It is undoubtedly a grand acquisition. Another hybrid from *C. purpuratum* and *C. Spicerianum* is also very promising, but the flower is not quite expanded.

#### SEASONABLE HINTS.

THE pseudo-bulbs of *Dendrobium Brymerianum* have attained a length of 18 inches in baskets suspended beneath the roof. The

FIG. 65.—ANGRÆCUM SANDERIANUM.

suffused with purple. The leaves are long and narrow, regularly and prettily marbled on light green. The great charm of the hybrid is in the peculiarly soft and pleasing purple tinting, which is quite unique.

A more pretentious beauty is a hybrid from *C. calophyllum*, crossed with *C. ænanthum superbum*, and therefore possessing a most interesting parentage, both the forms named being themselves hybrids, *C. calophyllum* from *C. barbatum* and *C. venustum*, and *C. ænanthum superbum* from *C. insigne Maulei* and *C. Harrisianum*. *C. ænanthum superbum* is generally regarded as one of the finest hybrids ever produced; but some may probably consider the newcomer as, in some respects, an improvement upon that in richness of colouring and general appearance. The dorsal sepal is broad,

growths are firm, and only sufficient water should be given to keep the foliage fresh and their pseudo-bulbs plump. Make every attempt to ripen them thoroughly by placing them in a temperature  $5^{\circ}$  lower than the one in which they have been grown, where the atmosphere is dry and the plants can be fully exposed to light. The flower buds will soon appear if they are not already visible near the top of ripened pseudo-bulbs. The current season's growths must be well ripened and the plants allowed to enjoy a lengthened season of rest after flowering. Next season's flowers and good growth largely depend upon a thorough and complete season of rest. Dendrobiums frequently degenerate through being kept in heat and consequently in a growing condition more or less throughout the year.

## LÆLIA ANCEPS.

The earliest of these will be ready for unfolding their beautiful flowers. Place them while in flower in a temperature of 50° where the atmosphere can be kept moderately dry; the flowers will last in good condition much longer than if retained in the Orchid house where a fair amount of moisture is necessary. Plants that have flower spikes advancing and are not wanted in flower for some time will be safe if placed in a temperature of 50°. Be careful not to give them too much water while being retarded, or injury to the roots may result.

## LÆLIA AUTUMNALIS.

When grown under the same conditions as *L. anceps* this usually flowers about the same time, and like that can be retarded for some weeks. The flowers do not last more than half the time that those of *Lælia anceps* do, but it is nevertheless well worth growing in quantity. Both flower freely during the months of November, December and January, according to the temperature in which they are grown. Very frequently where different houses are not set apart solely for Orchids *Lælias* often have to be grown in a warmer temperature than is really desirable. Both these adapt themselves to ordinary stove treatment well. The most suitable place for them, however, is the *Cattleya* house, where these plants are not kept too warm during the winter months.

## PLEIONES.

The young growths of these commence springing up from the base directly the flowers fade, and should be repotted at once. If neglected in this stage it will tell seriously against them next autumn. When under good treatment they should have made bold pseudo-bulbs, and flower freely. These plants are easily grown, requiring a good rest from the time the foliage commences to fade by keeping them dry. From the time the flowers show, water should be given in small quantities, and gradually increased as growth extends. In potting remove the whole of the old compost, liberally drain the pots or pans, cover the drainage with a little moss, and employ a compost of fibry loam two parts, the other part being composed of leaf mould and sand. A little charcoal broken up fine may be added, and one-seventh of decayed cow manure that has been stacked for six months, and passed through a fine sieve. These dwarf deciduous Orchids require a stronger and richer soil than many growers are disposed to give them. A compost that suits *Calanthes* will do for these plants, which deserve more attention than they receive.

## MASDEVALLIA TOVARENSIS.

To keep this in good condition throughout the winter the temperature in which it is grown should not fall below 50° in the morning. It will not bear being kept as cold as other *Masdevallias*. In a temperature that ranges from 50° to 55° it is producing its flower spikes freely. Where it is possible to use the flowers without cutting off the spikes it is wise to do so, for they will flower a second time. Do not allow this or any of the *Masdevallias* to suffer by want of water. The temperature for others should not fall below 45° in the morning, or else their foliage are liable to become spotted and disfigure the plants for a long time. Spotting is the result of a low temperature and too moist an atmosphere.—ORCHID GROWER.

## MUSCAT GRAPES AT SHOWS.

At the recent Liverpool autumn Exhibition, in the class for four bunches of Grapes, to be distinct varieties, an exhibitor was placed first with a stand including Muscat of Alexandria and Bowood Muscat. Now, I consider that Bowood Muscat so closely resembles Muscat of Alexandria as not to be permissible as a distinct variety. A great many growers, I know, maintain that it is. I, for one, do not think so. The only difference that I can see is that the Bowood Muscat under good cultivation produces its berries somewhat more round, and that the bunches assume a more clustering shape, but under different methods of cultivation, combined with favourable local conditions, Muscat of Alexandria and Bowood Muscat can be grown to so closely resemble each other, that I do not think the most expert judges can be so certain as to proclaim them distinct varieties; therefore, when the difference is so trifling I do not consider there is enough margin left to acknowledge them as distinct in a class for Grapes.

This is a matter of great importance to exhibitors, hence my appeal to your columns. The exhibitor in question wrote to the Liverpool Committee, I believe, on the subject, before he entered the Grapes, which proves it a doubtful point as far as he is concerned, and received their sanction to exhibit them as distinct, so the responsibility in this case rests with the Committee. But is this to be generally recognised at exhibitions? I do not think that it should; if so, I am firmly of opinion that it will give rise to much dissatisfaction. I write this for

publication in the pages of your valuable paper in the hope that some correspondents will give their opinion.—INQUIRER.

EVENTS OF THE WEEK.—The Fruit, Floral, and Orchid Committees of the Royal Horticultural Society will meet on Tuesday next, December 9th, in the Drill Hall, James Street, Westminster, and as the last gathering of the year it is expected, if the weather is favourable, that there will be a good number of exhibits and a full attendance of the members. The same evening, at 6 P.M., a meeting of the Horticultural Club will be held in the Hotel Windsor, when a paper will be read on Rose stocks.

— THE LATE MR. SHIRLEY HIBBERD, F.R.H.S.—The many paragraphs, not only in the gardening papers but also in several London newspapers, testify to how deep and widespread is the feeling of loss sustained by the comparatively early death of Mr. Shirley Hibberd. A letter, with several influential names attached to it, has been forwarded to the Royal Horticultural Society, requesting the President and Council to take the initiation in promoting some public memorial of our late friend's life and work. Mr. Shirley Hibberd's services to horticulture have been so many and varied, and his devotion to the interests of our Society has been so enthusiastic and thorough, that the President and Council gladly accept the suggestion, and have desired me to announce that a public meeting will be held in the Society's office, 117, Victoria Street, Westminster, on Tuesday, December 9th, at 1 o'clock, to consider the question of raising a suitable memorial to the late Mr. Shirley Hibberd. I shall feel greatly obliged if you will kindly assist me in making this known as widely as possible.—W. WILKS, M.A., *Vicar of Shirley, Croydon, Secretary Royal Horticultural Society.*

— THE WEATHER IN THE METROPOLITAN DISTRICT has been extremely wintry during the past week, the keen winds of Tuesday and Wednesday being followed by heavy snow, varying from 3 to 4 inches near London, but further out up to 18 or 20 inches. Low temperatures were also experienced, 15° to 20° being registered in exposed positions. A partial thaw occurred on Sunday and Monday, succeeded by frosts and fogs.

— THE WEATHER IN THE NORTH.—Three days of very wintry weather have been experienced in Scotland in the latter half of last week. Snow has fallen over the country generally. In South Perthshire dense hoar frost took the place of snow. On the morning of the 27th ult. 14° of frost were registered, 10° and 8° following. Thaw followed on Saturday night, and on Monday morning the thermometer stood at 50°, with a soft S.W. wind.—B. D.

— FROST IN HAMPSHIRE.—The weather here during the last few days has been exceptionally severe. On the 27th ult. we registered 10° frost, on the same day a thin covering of snow fell. On Friday, 28th, early in the morning we had 14° frost, and at 3 P.M. the thermometer stood at 15°, or 17° frost, and gradually until at 2 A.M. on Saturday morning it registered 9° on the scale, or 23° frost, which is the most severe we have experienced for the last twelve years. On Sunday the wind veered from the north-east to S.S.E., a rapid thaw setting in, but which lasted only a few hours, when light frosts again occurred with the wind in the same direction. I never saw frost penetrate so deep in the soil in such a short time as during the three days of last week. Some soil which had been recently moved was frozen to a depth of 18 inches. Such sudden weather as that experienced ought to prove the necessity of attending promptly to the mulching of all newly planted fruit trees or shrubs, instead of delaying for a few days, until a more convenient opportunity is available.—E. MOLYNEUX.

— LETTUCES.—I grow Lettuces for market largely, and try many varieties. The best summer Cabbage Lettuce I have ever grown is Yates' Champion, for which I was awarded a certificate by the Nottinghamshire Horticultural and Botanical Society in 1889; and the best winter Cabbage Lettuce is Lee's Immense Hardy Green, from which I am cutting now. I should like to know what varieties other gardeners have found satisfactory.—J. B., *Nottingham.*

— GARDENERS' ORPHAN FUND.—At the Committee meeting of this Charity held on Friday night last, Mr. William Marshall in the chair, it was unanimously resolved that the Committee place on record their deep sense of the great loss sustained by the deaths of Mr. James McIntosh and Mr. Shirley Hibberd, Vice-Presidents of the Fund, and warm supporters of the same.

— THE following additions were announced to the FUND since the previous meeting. From the Chiswick Gardeners' Improvement Society as the result of a concert, £20; from Mr. J. Smith, Mentmore (concert), £10; from Mr. Proctor, nurseryman, Chesterfield, the result of work done by his invalid wife, £5; from Mr. W. Bates (Twickenham Chrysanthemum Show), £1 15s. 6d.; from Mr. J. A. Vallance (Bristol Chrysanthemum Show), £1 5s. 3d.; from Mr. G. W. Cummins (flower stall at the Croydon Chrysanthemum Show), £7 14s.; and from the collecting box in Mr. Smee's garden during the week it was open to the public for inspecting the Chrysanthemums, £4 2s. 6d. These seem appropriate methods of assisting the Fund, not only in an easy, but, in most cases, an enjoyable manner to the contributors, whose united mites amount to a substantial sum for an excellent object, in this instance the sums named being adequate for the support of a child for upwards of three years.

— THE DEAL MEMORIAL.—It was announced that the sum collected as a memorial tribute to the first esteemed Chairman of the FUND, the late Mr. George Deal, amounted to £302 2s. 6d. In accordance with a generous undertaking made by Mr. H. J. Veitch and Mr. N. Sherwood at the last annual dinner, those gentlemen sent cheques, increasing the total to £554 2s. 6d., which will enable the seven unsuccessful candidates at the last election to become beneficiaries of the Charity, as will be explained at the special general meeting which is to be held at 6 P.M. on Tuesday next, 9th inst., at the Cannon Street Hotel, for the purpose of making slight alterations in the rules. All subscribers are invited to attend the meeting.

— PRESENTATION TO MR. GEORGE LAING PAUL.—On the occasion of the son of Mr. George Paul, Old Nurseries, Cheshunt, attaining his majority on Friday last, the workmen in the nurseries were entertained at supper by Mr. Paul and his son in the Public Hall at Cheshunt. The senior foreman, Mr. George Gater, in proposing the health of the young master, surprised him with the gift of a handsome marble clock, on the part of himself and fellow workers. This gift was not the less appreciated in being presented by Mr. Gater, who has been an active worker in the firm for upwards of forty-two years, having been apprenticed to the great grandfather of Mr. George Laing Paul. The supper was enjoyed by 110 persons, and was a pleasant gathering of employers and employed, between whom the utmost cordiality exists, which makes life agreeable for all. We ask the acceptance of our best wishes by Mr. G. L. Paul for a bright and successful career.

— "HAZELL'S ANNUAL."—A copy of the sixth issue of this general year book of reference has been sent to us. Its 700 closely packed pages contain information on those subjects of current interest in which the majority of readers desire information. A liberal share of space is devoted to biographies of eminent persons. The labour movement is adequately discussed, and there is a great quantity of tabular matter on various subjects, the whole forming a condensed cyclopædia of technical and popular information, and altogether the work is a valuable production.

— THE TOTAL RAINFALL AT CUCKFIELD, Mid-Sussex, for the past month was 2.94 inches, being 0.73 below the average. The heaviest fall was 0.50 inch (snow) on the 26th. Rain fell on twenty days. The highest temperature was 57° on the 23rd, the lowest 7° on 29th. Remarkably mild up to 23rd, the temperature rising above 50° on eighteen days out of the number. Last week equally remarkable for its severity. Heavy fall of snow on 25th and 26th. Below is the readings for the last five days:—26th, max. 30°, min. 27°; 27th, max. 29°, min. 22°; 28th, max. 24°, min. 17°; 29th, max. 32°, min. 7°; 30th, max. 34°, min. 20°.—R. P.

— CARDIFF HORTICULTURAL SOCIETY. — The first annual dinner of this Society took place at the Queen's Hotel, Cardiff, last week under the presidency of Mr. James Lewis. The company, which numbered over forty, included the principal growers and amateurs of the district—viz., Messrs. A. Pettigrew (Castle Gardens), W. Treseder, S. Treseder, T. Clarke, R. Crossling, T. Malpas, Bishop, the members of the Committee, and others. In responding to the toast, "Success to the Society," the Chairman gave a brief outline of the origin of the

Society, which sprung from the ashes of the old Glamorgan Society. He stated the last Show was a success in every way, and a substantial balance would be carried forward to next year, which it was intended to make still more successful. The schedule would be very much enlarged and a strong committee appointed at the general meeting in December to carry out the programme, and if all worked with a will the Society would take its place as the leading show in the municipality. The next show (two days) will have to be held rather early in August in consequence of the visit of the British Association, which is timed for August 19th to 26th, and the date fixed in all probability will be the 12th and 13th.

— B. S. WILLIAMS' MEMORIAL FUND.—It being intended to close the above at an early date, subscribers who have not yet sent in their donations are requested to do so without further loss of time to Mr. Harry J. Veitch, Hon. Treasurer, 544, King's Road, Chelsea, S.W., or to either of the Hon. Secs., Mr. John A. Laing, The Nurseries, Forest Hill, S.E., and Mr. A. Outram, 7, Moore Park Road, Fulham, S.W.

— SECOND CROPS OF FRUIT.—After nearly a week's frost and snow we may fairly expect that we have heard the last about the mildness of the season and ripe Strawberries and Raspberries; but there is one case I will mention, that I gathered ripe Jargonelle Pears from a second flowering on the 14th of November. A similar circumstance I cannot call to mind. Second crops of Plums have come under my notice, surpassing in quantity the first crop, and although they did not ripen they sold at 12s. per pot.—J. HIAM, *Astwood Bank*.

— CHRYSANTHEMUM SHOW FIXTURES FOR 1891.—No horticultural societies are so prompt and early in fixing their dates as those devoted to the Chrysanthemum. Scarcely have the shows for one year concluded when the fixtures for the next year are announced, and in the case of the larger exhibitions this is very desirable, as it enables other societies to avoid as far as possible the dates selected. Already we hear of the following fixtures:—The National Society has decided to hold their annual Chrysanthemum Show on Tuesday and Wednesday, November 10th and 11th, at the Royal Aquarium, Westminster. The Kingston-on-Thames Society has chosen the same dates, and the experience of the present year proved that neither Show suffers in consequence, in fact it is probably a mutual advantage. The Northampton Society takes Wednesday and Thursday, November 11th and 12th. We shall be glad to announce other dates as soon as the Committees have decided upon them, for the reason stated above.

— ADDITIONAL NOTES ON SYRINGING.—Since my notes on syringing appeared in the Journal I have seen an ingenious mode of applying insecticides to plants which have become affected with vermin that cannot fail to be of the utmost service to plant growers. All insecticides that are really so must from their nature be expensive, and the waste which is caused by the use of the ordinary syringe in applying them has been a sore point with many in these days of economy. Besides this the difficulty of syringing plants without injuring the roots has necessitated their being laid on their sides in some cases to the no small detriment of the plants operated upon. The inventor of the "Stott Patent Sprayer," which is the name of the article referred to, has obviated these defects by a simple and effective contrivance which much resembles an ordinary garden engine nozzle with a check end attached. This check end causes the fluid to ascend in a fine spray through a small opening, which from its construction can easily be applied to the under side of the leaves where insects generally commence operations.—M. D.

— PROGRESS IN CHRYSANTHEMUMS.—In opening the Hornsey Chrysanthemum Society H. R. Williams, Esq., a gentleman of great influence and usefulness in the locality, and whose name is also prominent in the fruit world, said he did not know what state of perfection the Chrysanthemum was likely to reach, but when he compared the specimens exhibited that day with those he remembered seeing in his father's garden years and years ago, he could not help wondering at the marvellous progress that had been made. When all the other flowers were dead and forgotten the Chrysanthemum blossomed with freshness and grew to cheer them in the dark and sombre wintry days. The cultivation of the beautiful flower refined their taste and improved their minds, and he felt a better man for having come to the Show. In formally declaring the Exhibition open he wished it every success. He opened one at Highgate last week. Highgate used to be the hamlet and Hornsey the village. But now there was little village sentimentality about it, and Hornsey had grown to become one of the best and most important of all residential suburbs of London. Mr. Williams' gardener took many

prizes. Colonel Bird moved a vote of thanks to the Judges, President, and exhibitors. He thought that they should all bear in mind the fact that it was to the gardeners who had reared up the plants so tenderly that their thanks were in a great measure due.

— GRAPE GROWING AND GRAPE KEEPING.—In reference to Mr. Westcott's remarks, page 446, I have concluded that he has never given the prescription referred to a fair trial, but has used it in a rough state, which accounts for his statement that such a compound could not possibly enter into the crannies where mealy bug and other insects generally lodge. Had the mixture been run through a fine sieve and properly painted on the Vines, and not have been merely smudged on, as Mr. Westcott is pleased to term it, his experience would have been quite different. At present I am having the vineries painted, but as I do not syringe the canes I have no fear of the houses being disfigured; and supposing I did syringe, I would not go at it with all my strength, but would simply send a light spray with just sufficient force to reach the Vines, and in this case there would be no fear of the house getting bespattered. It is a mystery to me why Mr. Westcott wants to syringe with such force. My experience is that to syringe in this manner is very injurious. The method I have advocated for destroying insects on Vines is most economical and effective. I am well aware of the properties of certain insecticides, but to saturate a cane thoroughly with any of them so as to destroy mealy bug, &c., will prove injurious, to clear all the bark off will also do harm, and to solely depend on sponging throughout the year is a long and tedious method, which generally fails, especially when there is a press of work. Experience has taught me how effective my practice of destroying insects is, and I mean to keep to it till one is proved to be better, which Mr. Westcott has failed to do.—S. SCOTT.

## IRON.

### ITS USE IN CONNECTION WITH FRUIT CULTURE AND DISEASES.

IRON is present in igneous rocks, in volcanic as peroxide 5.17 per cent, plutonic as peroxide in Cornish grey granite 1.97, protoxide 1.04, up to 15.76 peroxide in Swedish trap. These rocks weather down into very much the same kind of soil. The rocks are termed felstones, felspar; greenstones, diorite, gabbro, diabase, dolerites, all having a greenish colour; and greystones, felsites, trachytes, and lavas. Felspar is among the most important rock forming minerals, occurring abundantly in granites (Peterhead)—iron peroxide 1.49, iron protoxide 0.43, and the characteristics are the potash felspar and soda felspar, also lime felspar. In potash felspar the potash varies from 4 to 16 per cent., and the soda rises from nothing to 10 per cent. In soda felspar the soda rises to 12 per cent., lime taking the place of potash. In the lime felspar lime rises from 6 to 20 per cent., and soda from 1 to 8 per cent. The felspars occur in all traps—Swedish, as just stated containing iron peroxide 15.76. Greenstone or whinstone is a mixture of hornblende and felspar, and syenite has felspar for its most abundant ingredient—iron peroxide 2.57, iron protoxide 5.75; diorite—iron peroxide 9.27; greystones—felsite contains iron protoxide 2.69; trachyte—iron peroxide 5.17; lavas—iron peroxide 5.69, iron protoxide 5.13. Iron, therefore, is abundant in the igneous rocks. They are naturally digested in carbonic acid water, which removes the alkali and disintegrates the mineral-producing clay—sedimentary or mechanically formed soils—viz., argillaceous or clayey, and arenaceous or sandy, which are termed aqueous rocks through deposition in water; stratified, yet granular in texture.

Besides the mechanically or sedimentary formed aqueous rocks just mentioned there are of the same order chemically, and organically formed rocks—viz., calcareous, silicious, phosphatic, carbonaceous, and ferruginous. There are also metamorphic rocks, or those the original character of which has been altered by new chemical combinations; limestone, for instance, converted into marble, sandstone into quartz, clay into slate, slate into schist, &c., approximating to the character of igneous rock, and in all we find iron, except in Carrara marble and Italian dolomite—viz., Welsh slates contain iron protoxide 7.83, and Cornish slates iron protoxide 5.14, and iron peroxide 13.39 per cent.

This matter may seem foreign to our subject, but it is of primary importance that we understand how rock originated, what it is composed of, and what kind of soil it will break down into when exposed to the atmosphere. Geologists tell us that four-fifths of the earth's crust consist probably of felspar and quartz. Felspars are double silicates of alumina and potash, or soda, or lime; quartz is oxide of silicon or silica, best seen pure in sea sand; micas are silicates of alumina, potash, or magnesia, with oxide of iron; hornblende contains silicates of magnesia, lime, and protoxide of iron, alumina being replaced by iron oxides and magnesia

We have given enough to show that soil is due to the decay of igneous rocks, and as iron enters into their composition it follows iron must form an ingredient of most soils. Felspar, it has also been stated, is the most abundant of all minerals, that its decomposition is due to carbonic acid gas (carbonic dioxide) in water; the lime, potash, or soda they contain is converted into a soluble carbonate, the silica set free remaining impalpable, which with the silicate of alumina forms an unctuous, plastic, yet mealy powder, chemically termed hydrated silicate of alumina, and geologically kaolin, its composition—silica 46.4, alumina 39.7, water 13.9; but the per-centages vary, and lime, magnesia, potash, soda, and iron-peroxide may or may not be present; mineral silicates resulting of the disintegration of hornblende containing iron protoxide 18.75, therefore besides kaolin or clay igneous rocks furnish lime, magnesia, peroxide of iron through oxidation of protoxide, and a hydrated silicate of protoxide is a product of the alteration, hence the abundance of iron silicate in sedimentary strata, and it is the presence of iron that gives the colours green and brown to clays. White clays are derived from serpentine, and often contain 33 per cent. of magnesia. Red clays contain iron peroxide 6.84, protoxide 0.32. They are of the coal measures and other strata, probably derived from similar rocks to basalt clays, which contain from 9.17 to 14.87 protoxide. In the change from the rock to the soil there is a loss of lime one-fifth, soda one-third, very little potash; but great gain of alumina, and iron oxides one-fourth. Ultimately the greatest losses is in potash and soda, then lime and magnesia, next silica and iron.

Iron is the basis of most rock pigments—they are red, brown, yellow, green, according to oxidation and hydration. Silicious cement forms sandstones, sand cemented by lime forms Kentish rag; if felspars intersperse millstone grit results, or if clay and sand get together we have new red sandstone. Sand particles cemented by peroxide of iron form red, yellow, or brown ferruginous sandstone, the upper greensand are green through silicate of iron, and the pudding stones of Hertfordshire are held together by calcareous, argillaceous, silicious, or ferruginous cement. Brick-earth, also brown or reddish loam, enclose calcareous concretions; gravel is an aggregation of rocky fragments embedded in finer material, cemented into solid rock it is conglomerate, and shingle is rounded rock fragments. Sandstones are not very irony, 0.25 is a minimum as in chalk flint; red sandstone contains peroxide 1.30; carboniferous a little in combination with alumina; also magnesian in similar combination.

Alumina is the basis of all clays; they are plastic combined with water, and harden when exposed to heat. If they are burnt water enters into no chemical combination when absorbed, but if charred, clays retain their chemical properties. Dark bluish-grey colour denotes oxide or sulphide of iron, often organic carbonaceous matter, and all clays emit an earthy smell when breathed upon. Clays are more or less calcareous; cement stones arise in some, or clayey matter separated by lime, and clay ironstone occurs in segregated masses in rocks or shales. Finely divided and intimate mixture of clay and sand constitute brick-earth or clay mixed with fine sand, the latter in such proportion as to allow water to percolate the mass freely and prevent its cementing together, and is a good example of loam. The light brown colour of many loams is due to peroxide of iron. Blue clay contains iron protoxides, 4.17; cretaceous, 6.7; white (carboniferous), 2.95; red (carboniferous) iron peroxide, 6.84; protoxide, 0.32; marls contain iron along with alumina, chalk marl, 3.04; clay marl, 11.92; sandy marl, 3.8; while new red contains 25.38 per cent. of alumina and iron oxide.

Limestones contain varied amounts of iron. Chalk with flints contain iron and alumina, 0.42; Portland limestone, 2.0; Kimmeridge, 8.2; oolite, 1.20; magnesian limestone, 1.8; Silurian limestone, nil; red chalk (Norfolk), 6.4. Argillaceous (clay) limestones owe their bluish grey colour to bisulphide of iron, which exposed to the influences of air and rain, is oxidised into the sulphate (ferrous sulphate), and in the change effected by the sulphuric acid uniting with the alkaline bases (alumina, lime, magnesia, &c.), the protoxide becomes hydrated peroxide of iron. The dark colour of rich cultivated lands is due to their being furnished with abundance of organic matter. Minerals present having a basis of iron-protoxide impart a bright deep green colour to rocks. Decomposition sets in on exposure, silica is set free, the iron taking up water and additional oxygen converted into a hydrated peroxide, consequently the rock loses its green colour, passes to yellowish brown as seen in the soils of the upper and lower greensand.

Argillaceous beds contain concretions of iron pyrites, become oxidised on exposure into sulphate, then pass into brown hydrated oxide. To that and the decomposition of another small portion of iron sulphide is due the change in the London, Kimmeridge, and Oxford clays from dark bluish grey at varying depths to a light burnt umber brown near the surface.

Soils owe their bleached appearance, as in the New Forest, to loss of peroxide of iron. The organic matter from the peat or Heather reduces the peroxide of iron to a protoxide; the free carbonic acid converts it into a carbonate. This salt being soluble is removed by the same surface waters, leaving the upper part of the gravel colourless, sometimes quite white. Sand in peat is white or yellowish; sands underlying peat are often bleached; the same occurs in alluvial deposits long exposed; iron sinks. The facts are iron is washed out of sands, out of limestone, out of vegetable soils or peats, causing it to accumulate in subsoils or in bogs.

The Thames, from the oolite and chalk of Berkshire, Gloucestershire, and Oxfordshire, derives half a million tons of matter in a year, two-thirds of which is carbonate of lime, which is carried out to sea, for river sediment contains little or no carbonate of lime, but consists of silica, alumina, and peroxide of iron, &c. In the silt of the Nile there is peroxide of iron, 20-21. Soils are liable to lose in proportion to their porosity and the presence of acids, freely diffusible as hydrochloric, nitric, and sulphuric—the last in a much less degree; the former combined with soda, the second with lime, forming chloride and nitrate respectively, and sulphates result of the third. Soda and lime are diffusible bases, and sulphates are in measure only less diffusible. The greater the percolation of water through a soil the sooner the matters are washed away, but ammonia, phosphoric acid, and potash are held, for fertile soils have corresponding retentive power. Iron being in sulphate form passes away with other substances, and the soil shows a poor percentage of iron. Some gravelly soils, even on the new red sandstone as in Cannock Chase, are mere waste; but the Hastings beds where interstratified with clay, the clay and calcareous weathering down together, a productive soil results, for the lime attacks the iron in the alumina where it has been held; yet where silicious soil contains nodules of iron a poor soil result. The soluble iron is washed out. Millstone grit is a poor gravelly soil; there is no iron of consequence where it is drained, but where the subsoil is clay iron obtains in the pan. How does it get there except by washing? If the lower greensand has a silicious soil mingled with silicate of iron it is barren and wet. It wants drainage and lime; in fact, where it becomes calcareous, as near Hythe, it is productive, yielding good crops of Hops. Indeed, the Hythe beds are the most important of the lower greensand strata, largest, most fertile, and most valuable in product. In Kent it is limestony (Kentish rag) and this mixed, as it often is, with brick earth is highly fertile. Woburn sands are of lower greensand age; so sterile in places as to grow little besides Scotch Fir, but at Sandy the sand gets an admixture of alluvial soil (we shall presently see what iron has to do with alluvial deposits) resulting in market gardens of extraordinary productiveness.

Upper greensand, where it is an admixture of chalk marl, is perhaps the richest soil and easiest cultivated. Its fertility is due to coprolites providing a supply of phosphorus. Marl we have seen is rich in iron. Where the soil of the upper greensand is very light the remedy is Gault clay—iron gone out—bring it in!

Chalk in its upper layers is white, bleached, iron washed out, the little resulting of animal debris; but the lower chalk is dingy, owing to the presence of iron, a mixture of the two causes good crops to issue. Chalky loams mingled with flints usually are excellent soil, indeed lime is inseparable from the cultivation of fruit, the Romans using it as a manure for fruit trees, acting, as it does, most beneficially in liberating potash from insoluble compounds, and hastening nitrification.—G. ABBEY.

(To be continued.)

## BERBERISES.

(Concluded from page 365.)

THE deciduous species are best raised from layers, and the evergreens by suckers, with a portion of root attached to each when taken from the parent. Layering may be done any time whilst the plants are at rest, but about this there are many opinions. Some will insist that it ought to be done when the sap is descending, for then a callosity is sure to be formed; but others uphold that it is best done before the sap rises, for the plant emits fibres more rapidly then than at any other period, and a tongued branch is more likely to callus at that time than when the plant is all but at rest.

find spring the best time for layering and getting plants of any kind to root quickly; but in the case of the Berberry it is immaterial what time they be layered, if tongued like a Carnation to facilitate the process, and pegged securely under the surface, leaving the slit open, and allowed to remain attached to the parent plant for twelve months from the date of the operation. The layers then may be detached from it, taken up with as much soil as will adhere to the fibres without falling off, and planted either

in beds to gather strength, or at once into the places where they are to remain.

Division is simply taking up an old plant and slipping the side shoots off with as much root adhering to them as possible, or digging round an established plant, and so opening a trench, and then taking off the suckers without disfiguring the parent or checking its growth so much as lifting would. These suckers are planted in lines, three in a 4-foot bed, and the plants about a foot apart in the line, more or less according to their size, from whence after a couple of years' growth they are transplanted to their final quarters.

After planting, deciduous Berberries require very little management. The shrubbery should have the weeds kept under, never allowing them to seed, and be slightly hoed and raked over at least twice during the summer, besides any weeding that may be required, and a general clearance of decayed wood and leaves after all the latter are fallen. When hard frost prevails a couple of inches of decayed leaves or other vegetable matter thrown on the surface will materially increase the health of the shrubs; and however much the flower beds may require a little of this vegetable earth I would not forget to let the shrubs have the decayed remains of the leaves taken from them the year before. I object to digging amongst shrubs at any time, especially when the roots nearly occupy the whole of the ground, and are close to the surface. The surface roots of shrubs are of as much moment to their well-being as those of a Vine are to successful Grape growing. Transplant a tree every year, and it becomes a dwarf; and shrubs in like manner, robbed of their roots annually by surface digging, become stunted. Pruning must be limited to cutting out irregular growths and such as overlap each other, as well as any dead wood that may be found. Should any shrub become unsightly it may be cut down; but if the plant be very old it would be better to stub it up and plant a young one, having first renewed the soil.

EVERGREEN SPECIES.—These are suitable for beds and groups on lawns. In either case the ground should be dug deeply, and a liberal amount of leaf mould or well rotted stable manure added, and if the turf has to be removed it should be turned in. Turf, however, makes such a good compost for plants, pot Vines, Pines, &c., that few gardeners can resist the temptation to rob the intended occupant of the bed of its due share of decayed vegetable matter by taking the turf away to the compost heap. Turf is so difficult to come at in most places that we can hardly insist on its being dug into the new bed; but still, every barrowful of turf taken away is equal to a barrowful of dung, or two of decayed leaves; therefore, for every barrowful of turf removed the same quantity of vegetable matter should be returned to the bed.

Where the ground is of a clayey nature the soil should be taken out 18 inches or 2 feet deep, and its place filled with a compost formed of two-thirds rich loam and the remainder leaf mould with a sprinkling of river sand. In digging this hole or bed another point must be taken into consideration: Can the water escape readily through the bottom of the bed, so as to prevent stagnant water lodging? If not, a drain must be cut to take away the water that will filter to the bottom, and where, unless there be a drain to carry it off, it will very soon cause the shrubs to assume a sickly appearance. Without drains in clay soils beds dug out a couple of feet deep are little short of a swamp during the greater part of the year, and the last plant to put in such beds is the Berberry, for, like the Sikkim and Bhotan Rhododendrons, they are all natives of the hills, where the rainfall is large, but the substratum of the soil of such a nature that no water can lodge so as to become stagnant.

Evergreen Berberries are better planted in early spring, but any time from the middle of October until April will answer; and even they may be removed in summer immediately after flowering, when it is possible to take up with a ball, and water freely for some time after planting. They may be planted in groups on lawns without any preparation of the soil, but then, unless the soil suits them, they will do anything but thrive.

Whether in groups or in beds they need little pruning, which should be confined to cutting in straggling growths, and such as are weak and old. The beds should be kept clear of weeds and leaves, and raked roughly occasionally to prevent moss forming on the surface. A dressing of leaf mould will tend to increase their vigour, and if it be pointed-in with a fork the bed will have a neat appearance during winter. The leaf mould may be applied any time in the autumn.

Some of the evergreen varieties make handsome pot plants; in fact, all the evergreens are useful grown in that way, either to ornament the conservatory in spring, or to plunge in the flower beds in winter, where their evergreen character is more beautiful than red brick, no matter how fine the tracery, and their rich yellow flowers impart a charm in spring.

The Mahonia or Berberis aquifolia is second to the Laurel only in usefulness, and yields to no evergreen undershrub in the beauty

of the flowers in early summer, and its beautiful purple berries in winter; these are produced in far greater abundance than those of the common Berberry, and make quite as good a preserve. Planted in woods it affords one of the best, if not the very best, cover for game. On a lawn it makes a good bed or group, and in shrubberies and by woodland walks it is quite at home. The treatment recommended for evergreen Berberries suits it, but it will thrive in nearly all soils and situations without any trouble beyond planting.—G.

AMATEUR ROSE GROWERS.—IN MEMORIAM REV. H. T. FRERE.

"AN Exhibitor" says: "It cannot be denied that the schedules of the National and many of the provincial and affiliated Societies, as at present constituted, are a monopoly, inasmuch as there is every facility and encouragement provided for the larger growers, but none for the smaller." I feel constrained to write once more to say that I deny this; it seems to me utterly at variance with the plain facts. He says, also: "The schedules are framed in such a manner as to obstruct the smaller growers." Would anyone believe, on reading this, that at the National Show not only are there very many restrictions and divisions as to who may and who may not show in every class, but also that there is an actual class with four prizes "for those who have never won a prize at a National Show?" Here, at all events, there must be four entirely new names every year.

But I should not have ventured to write again on this subject this week (hoping that "J. B." and "An Exhibitor" are preparing to bring forward their views at the coming general meeting of the N.R.S.) had not the latter made an astonishing quotation from "The Rosarian's Year Book for 1890." I hope anyone who has read his letter will turn to the Year Book, page 16, and read the whole of the passage in question. It seems to me the plainest statement of how "the young ones are either timid or wanting in energy, and will not believe that Rose showing, like everything else, must have a beginning." (The part in italics is omitted by "An Exhibitor.") The passage goes on to narrate one instance (with the facts of which I am well acquainted) of the many that can be shown where it was simply "pluck, and not protection" that were required to raise a small grower in four years into the first rank.

I feel sure that, if it had been possible, the Rev. H. T. Frere, the author of the capital article in the "Year Book" thus quoted, would have written to protest against his well-known sentiments being thus distorted. But, alas! the same post that brought me the Journal this morning gave me also the sad notice of his death after a short illness; and it is left to his old friend and rival of many years' standing to declare that "Pluck, not Protection," was certainly his motto, and to assert that in the passage in question it was "the timidity and want of energy in the young ones" (which were certainly no failings of his) to which he ascribed the lack of new names among the winners at exhibitions. I am very glad he wrote that paper; a very good one it is, as I had the pleasure of telling him at the time. I have just read it through again two or three times, and have found the whole a strangely faithful memorial of the man as I knew him, and the first and last paragraphs especially touching in the light of that sad note this morning.

Mr. Frere, as his article in the "Year Book" testifies, was a veteran at Rose showing, and good to the last, as was seen by his winning the principal prize at Norwich this year; but he never could be persuaded to exhibit in London or away from the eastern counties, though well qualified to do so. An excellent winner, and a still better loser, it would astonish me much to learn that he ever made an enemy at Rose shows. But as a rosarian, horticulturist, and botanist, he ranked far above the ordinary exhibitor; he was perfectly qualified to judge anything at a flower show; and I always used to go round the tents with him, if possible, in order to take notice of what he pointed out (especially in herbaceous and wild flowers) as "good." Of his other attainments and qualities this is not the place to speak; and as a man and a Christian I would prefer to let his own paper in the "Year Book" speak for him, especially in the closing sentence which he adopts and endorses from the lips of an aged parishioner, "The reason why I love my flowers is that God Almighty made them so beautiful."—W. R. RAILLEM

## NOTES ON EARLY ENGLISH HORTICULTURE.

(Continued from page 291.)

A LARGE number of exotic plants were brought into England during the reign of George II., that is, between 1727 and 1760. This is attributed chiefly to the stimulus given to research by the demand for new or rare species at the Chelsea Botanic Garden, where Miller was then curator, and in frequent correspondence with florists in all parts of Europe, being also in communication with travellers into nearly every part of the globe. It is reckoned

that in the above period we received upwards of 1700 new plants, more, indeed, than were introduced during the whole of the seventeenth century. Miller's exertions were seconded by several well known men, chiefly resident in or near London, who rank amongst the fathers of modern horticulture, most of them proprietors of nurseries, and who got their information not so much from books as from observation and practice. Some of them, at a time when travelling was a serious matter, braved the perils of land and water that they might see exotics growing in their natural soil, and be the means of bringing with their own hands into Britain plants suitable for garden or greenhouse. We find it is an historical fact that horticulture was advanced in our land much more by the exertions of men of small incomes than by those who had ample means at their command. Amongst the few noblemen of the reign of George II. who gave time and money to it, honourable mention must be given to Lord Petre, who died in 1742 at the early age of twenty-nine. At his residence in Essex (Ingatstone) he had houses and stoves, which contained specimens of most of the tropical plants then known. He had the first samples of the Camellia, a single red variety, but his plants died. The Duke of Chandos was one of the encouragers of gardening at this period, and it is supposed that Dr. Blackwell, afterwards of Chelsea, assisted him in planning the grounds of Canons, once so celebrated.

The wife of this unhappy doctor (who went to Sweden, got involved in a plot there and was executed) was more fortunate than her husband, and did good service to horticulture. Living in Paradise Row the pair were frequent visitors to the Apothecaries' Garden, and Mrs. Blackwell, who was skilled in drawing, obtained specimens of exotics there, drew them upon copper, and coloured them; to the plates were appended descriptions in several languages. This Herbal, as she called it, was published in 1739, with 500 figures, and much commended by gardeners and naturalists. One of the friends of Miller, so many years in charge of that garden, was Robert Furber, founder of the Kensington Nursery, and who owned extensive orchards in that district. He prepared a folio of twelve plates, delineating the fruits of the year, and also a small book with remarks on the culture of fruits and flowers, also a brief list of plants for sale, one of the first of the kind; this appeared in 1733. Christopher Gray, of the Fulham Nursery, a receiver of numerous novelties, brought out his catalogue of trees and shrubs in 1740, and the long famous firm of Dickson & Co., nurserymen of Edinburgh, had their first list out a few years later.

It seems odd to us that at Mile End, in Georgian days, were nurseries renowned for their choice exotics, two leading growers being Clements and Gordon. But the place was then a semi-rural suburb, with only scattered houses, and it was a great resort of the citizens on summer evenings. Geraniums and Heaths, also other species now of universal cultivation, had not arrived in Britain. The Camellia did not flower here till 1739, and Mignonette was unknown till 1752. Of the Rose many new varieties had been obtained, but in popularity Carnations and Gillyflowers were its rivals, and the Magnolia was a great favourite, being commonly planted against dwelling houses. To Aronias, Lilies, and Tulips much space was allotted in the gardens of those who liked display, and a writer in the "Connoisseur" cites, as a proof of the taste for Auriculas, that a Mr. Redmond of Islington could get half a guinea each for his new sorts. Horticulture was advanced in this reign by a man who, as a doctor and poet, was made a butt of by the wits of that day—Sir John Hill, who wrote articles upon a variety of popular subjects, and was honoured by the patronage of Lord Bute. That he had an extensive knowledge of botany and gardening is certain, hence by his books and personal influence he helped to diffuse a taste for ornamental plants. He also made our gardeners acquainted with the Linnean system of classification. At Bayswater he had a garden where he cultivated native and foreign species, kept bees also; here he prepared his "Waterdock essence" and "balsam of honey," which he sold with quackish zeal, inconsistent with his character as a man of science. One of his schemes was a sensible one, the formation of botanic gardens in towns, where the plants should all be duly labelled, and lectures given from time to time on the habits and structure of the different groups and orders. His most pretentious work was a system of botany, which ran to twenty-six volumes, and next to this in importance was his "Gardeners' New Kalender," published in 1755. He also published "Eden: A Complete Body of Gardening," a few years later; both had coloured plates. Two of his small works excited a good deal of attention; one of these was a suggestion for raising trees from their leaves, the other was on the methods of producing double and proliferous flowers. One of the accusations brought against him was that he used to visit gardens and then conceal specimens of plants to carry away. His widow issued at Edinburgh in 1779 an account of his life and writings.

Mr. Ord's garden at Parson's Green, which was laid out towards the middle of this century, though not very large, was an object of

interest to all the London gardeners, as being supposed to exhibit all recent improvements. It was remarkable for its trees, containing fine examples of the deciduous Cypress, Willow-leaved Oak, Turkey Hazel, Red Cedar, and a Lombardy Poplar, supposed in 1838 to be the tallest about London. Here also was a curious Moss Rose, which had been layered and made to extend over a space of 47 feet. At Walham Green, adjacent, lived Rocque, an eminent florist, and who made a special study of the grasses suitable for lawns and meadows. His father had a vineyard somewhere at the west of London, and produced wines which Switzer declares were quite equal to the French vintage. Rocque the younger used to sell his mixed Grasses in turf at so much the square foot for gardeners to propagate from. He translated from the Dutch a treatise on the Hyacinth and its cultivation, published in 1755. A notable impulse

Miller commends as yielding the finest fruit in the world. Warner of Rotherhithe produced a new Hamburgh Grape which he named the Gibraltar, and Miller, at Chelsea, gave name to a red Muscadine: he also raised a Black Burgundy of a new kind, from seed.— J. R. S. C.

#### LOCHNAW CASTLE.

DURING a brief sojourn in the North a short time ago, I paid a visit to the neighbourhood of Stranraer, the principal town of Wigtonshire, near which is situated Lord Stair's beautiful domain of Castle Kennedy. The town stands at the head of Loch Ryan, an almost land-locked piece of water, which affords welcome shelter to many storm-tossed vessels. I started one day for a drive along the southern shore of the Loch, the

FIG. 66.—LOCHNAW CASTLE.

to the cultivation of vegetables was given in Scotland by the failure of the corn crops in 1742, and for a while it seemed as if that part of Britain would surpass the southern division. Lord Kames also led the gentry to relinquish the old and absurd methods of planting shrubs and trees, which the Scotch followed long after they had been dropped in England. He escaped the jocular abuse directed against Lord Townsend, or Turnip Townsend, as he was called, to whom we probably owe it that this vegetable is as popular as it is at this moment. The Turnips described by Miller in his book were only three, none very good, but Townsend obtained from Hanover some excellent samples of seeds, which he distributed freely, grew Turnips largely himself, and removed a prejudice that existed against the plant. But few additions seem to have been made to our vegetables during this reign. Amongst our fruits, Biggs' Nonesuch and Dredge's White Lily are Apples attributed to this period, and a cider kind called the Canfroone. Harrison's Heart Cherry, brought from India, was planted at Kensington in the Royal Garden, and Fairchild produced a small red Nectarine bearing his name, the Newington Early, grown first in Surrey, which

scenery of which is picturesque at all times, but especially so in autumn, when the varying tints of the woods, harvest, pasture fields, and Heather, form a beautiful frame to the blue waters of the Loch. After proceeding four or five miles, I found our vehicle making an ascent along a public road bordered on both sides by plantations, formed to a great extent of the choicest varieties of Conifers. I was charmed with the rich verdure and luxuriance of the trees, which were 30 or 40 feet high, also with the arrangement and style of planting, and it was easy to recognise in it the handiwork of a skilled and enthusiastic arboriculturist. On inquiring from our driver I found the estate was that of Sir Andrew Agnew, Bart., of Lochnaw, who owns an extensive tract of land in this part of the country. I made a call on the gardener, to whom I was personally a stranger, but I was received by him with cheerful courtesy, and shown over the place as far as the time at my disposal permitted. It pleased me much to inspect the beautiful gardens and grounds, and to make the acquaintance of Mr. Scott, the gardener, who in this secluded region has been carrying on his work with taste and skill, and with a devotion which bespeaks genuine interest in his profession. The climate of Lochnaw is very mild, being almost surrounded on two sides by the sea. Fuchsias and many rare and tender exotic plants grow to the size of small trees, which could not

withstand the severest of the winters farther south, with the exception of favourable situations in Cornwall, Devon, and South Wales.

The grounds, which are very extensive, are finely wooded with trees, both native and exotic, amongst which are large numbers of *Abies Douglasi*, *Cryptomeria elegans* and *japonica*, *Cedrus atlantica*, *Deodara*, and *Libani*, *Cupressus Lawsoniana* in a variety of forms, *Thuia gigantea*, *Picea nobilis* and *Nordmanniana*, several varieties of *Retinospora*, *Sequoia sempervirens*, *Wellingtonia gigantea*, &c. From the lodge nearest to Stranraer a carriage drive of about a mile in length, nearly in a straight line, leads up to the castle. The road is neatly kept, and it is bordered on each side by fine trees of *Araucaria imbricata* 30 feet high. They stand well back from the drive, and are planted at the distance of 40 feet apart, with a broad verge of well-kept grass in front of them. There are many fine drives and walks through the grounds, to some of which the public are allowed free access. The castle itself stands at the head of a loch about 50 or 60 acres in extent, well stocked with large trout, some of which, I was told, weighed 9 lbs., but the average weight is 5 lbs. and 6 lbs. The mansion has a handsome and dignified appearance. Its oldest part is a square battlemented tower, five storeys high, in the Border style of architecture; bears date 1462; the modern portion is built of bluish whinstone, with wings attached, well harmonising with the old. Above the door of the modern building are carved the words, "For every house is builded by some man; but he that built all things is God." The view from the castle across the loch is very picturesque. Immediately adjoining the castle is the flower garden, which is situated on the margin of the loch. It is tastefully laid out in grass, the principal feature being a geometrical design in the centre, planted with the best kinds of bedding plants.

As we learn from a memorial stone of grey granite, which has been erected at one end of it, the flower garden was designed by Lady Louise Agnew, who died in 1888. She was a daughter of the Earl of Gainsborough, and was married to Sir Andrew before his accession to the property in 1849. The design of the flower garden was altered several times by herself, but it has not been changed in any way since her death.

The kitchen garden is 4 acres in extent, and lies to the west of the castle. It is enclosed by high walls, and divided by a central wall running north and south. The walls are covered with fruit trees, and the garden was well cropped with vegetables, but the crops of Apples, Pears, and Plums were very poor this season. The fruit, forcing, and plant houses are all in the kitchen garden. There are three lean-to vineries and a Peach house in one range, good substantial buildings, 16 feet wide, and 14 feet high; a span-roofed greenhouse and Melon house, besides a number of brick pits heated and unheated, and cool frames. The vineries contained good crops of late Grapes; the Peaches were all gathered, but the trees looked clean and healthy, and promised well for a good crop next year.

I regret that time did not permit of my taking notes when visiting this delightful place, and reporting it more fully. In conclusion, I might say Sir Andrew Agnew resides chiefly on his estate, and is much respected by his dependents, and throughout the district.—A. PETTIGREW, *Cardiff*.

#### CHRYSANTHEMUM JOHN LAMBERT.

AS this new incurved Chrysanthemum has been awarded a first-class certificate by the National Society at the Aquarium Show, and named after myself, I think it only fair to me and all other readers of your interesting paper, to know it was John Lambert that was shown in my first prize stand, and not Golden Queen of England as reported in your paper at the Birmingham Show. You kindly mentioned it in your report of the Leicester Show as extra good. It was the same sort as shown at Birmingham. If you will correct this in your next you will oblige—JOHN LAMBERT.

#### SELECTIONS OF CHRYSANTHEMUMS.

WITH pleasure I give the selections requested by "West Riding, Yorks." A comparison with the lists I gave in the Journal only four years since reveals some startling facts in the Japanese section, as of forty-eight varieties then named but seven are included in the present selection of twenty, which proves what a change has occurred since then, owing to the numerous additions made to this family annually. Belle Paule has deteriorated in a great measure; blooms are generally now found, when staged at all, in the front row, and with very few exceptions nearly white, though some show a few faint lines of purple. For this reason and the extreme height which it grows I have omitted it from the present selection. Apart from the better quality of the blooms of the more recent introductions, the improvement manifest in their habit is a great consideration. Exhibition blooms can be cut from plants which are only 4 feet high, pot included, whereas I have seen Madame C. Audiguier, for instance, reach 13 feet. I have refrained from adding several new sorts which I think will take a high position

when they become better known. I have placed *Avalanche* at the head of the list, a position which I think it richly merits, as I regard this variety as being the most useful for all purposes in cultivation. I know no other that will produce so many first class blooms from the same number of plants. The habit of growth is all that could be desired. The variety which I think will take a high position is *W. W. Coles*, which I note obtained the highest award at the Hull Exhibition. I saw this variety last year before it was exhibited, and was much impressed with its appearance.

The revolution in the varieties of incurved is not nearly so great, neither do the varieties appear to become any the worse for keeping, as the old varieties can be seen in as good condition now as they were many years since. During the same space of time five splendid additions have been added to the list of incurved varieties, which are distinct gains. Many of the old varieties still stand near the head of the poll. The "Queen" family is still unrivalled, as proved by the fact that one of its sports (*Lord Alcester*) takes more honours as premier bloom in the incurved section than all other varieties together. In the present day it is surprising that some exhibitors still grow *Guernsey Nugget* and *Lady Talfourd* when so many superior varieties are available. Additions have been made to all the other sections, but not in a marked degree as compared with the Japanese family. The additions to the reflexed section are the least numerous; one or two are good, which I have not added to so small a selection, as they perhaps would not be preferable to existing varieties. The Anemone class is much improved in brightness of colouring as well as in the points of excellence in this section. The main feature in this respect is the very full centres or discs which characterise this section in point of merit. Such sorts as *Miss Annie Lowe*, *Mrs. Judge Benedict*, and *W. G. Drover* are distinct gains to this section, and which much assist in making it justly popular with cultivators and the public alike.

*Twenty Japanese*.—*Avalanche*, white; *Edwin Molyneux*, crimson, gold reverse; *Sunflower*, yellow; *Etoile de Lyon*, lilac rose; *W. W. Coles*, bright red, bronzed gold; *Mr. A. H. Neve*, silvery blush; *Boule d'Or*, gold and bronze; *Val d'Andorre*, chestnut red, shaded orange; *Stanstead*, white; *Jeanne Délaux*, dark velvety brown; *Mdlle. Lacroix*, white; *Puritan*, white, faint blush at the base; *Criterion*, golden amber; *Gloriosum*, dull yellow; *W. H. Lincoln*, light yellow; *Mrs. Alpheus Hardy*, white, hirsute florets; *Madame C. Audiguier*, mauve; *Madame J. Laing*, white, flamed rose; *Thunberg*, golden yellow; and *Mons. Bernard*, purple violet.

*Twenty Incurved*.—*Lord Alcester*, pale primrose; *Empress of India*, white; *Queen of England*, blush; *Golden Empress*, pale yellow; *Golden Queen of England*, bronze yellow; *Alfred Salter*, lilac pink; *John Doughty*, rosy fawn; *Princess of Wales*, blush, tinted rose; *Mrs. Heale*, creamy white; *Mrs. Coleman*, golden bronze; *Miss M. A. Haggas*, golden yellow; *Violet Tomlin*, purple violet; *Princess of Teck*, blush white; *Hero of Stoke Newington*, rosy pink; *Mrs. Norman Davis*, golden yellow; *Nil Desperandum*, dark orange red; *Empress Eugénie*, rosy lilac; *Lord Wolseley*, bronze red; *Jardin des Plantes*, rich golden yellow; *Jeanne d'Arc*, blush white, tipped rose.

*Eight Reflexed*.—*Cullingfordi*, brilliant crimson; *Cloth of Gold*, light yellow; *Golden Christine*, light fawn yellow; *King of Crimson*, rich dark crimson; *Mrs. Forsythe*, white; *Pink Christine*, pink; *Peach Christine*, peach or blush; *Putney George*, brilliant crimson.

*Eight Large-flowered Anemones*.—*Lady Margaret*, white; *Miss Annie Lowe*, bright yellow guard florets, paler centre; *Gluck*, golden yellow; *Fleur de Marie*, white; *Mrs. Judge Benedict*, rose tinted guard florets, sulphur yellow disc; *W. G. Drover*, purple crimson; *Empress*, lilac; *J. Thorpe, jun.*, orange yellow.

*Eight Pompons*.—*Golden Mdlle. Marthe*, golden yellow; *Mdlle. Marthe*, white; *Black Douglas*, dark crimson; *Mdlle. Elise Dordan*, lilac pink; *President*, dark rosy crimson; *Prince of Orange*, light orange amber; *Marabout*, white fringed; *Nelly Rainford*, buff yellow.—E. M.

#### CHRYSANTHEMUMS FOR EXHIBITION.

By MR. CHARLES GIBSON.

(Continued from page 444.)

##### TAKING THE BUD.

THIS is a mystery to a beginner, and requires a good deal of judgment in the experienced. It is difficult to specify exact dates, because varieties differ so much and localities also. Light or clay soils, hill and vale, as well as the part of the country the exhibitor resides in, all affect the time and manner of taking the bud for a given date. Seasons too vary, so that the course one season might have to be altered the next. During the present season many buds showed early in July. These were run on to terminals, were taken the second week in August, and have given fine blooms, where another season, with the terminals later, they would be useless for exhibition. The other buds were taken earlier than usual, but the cool weather we had in August kept them in check, and the blooms are somewhat later than usual. As a rule I commence taking the bud the second week in August, and have generally finished the first week in September. The finest blooms for exhibition are generally obtained from crown buds taken the third week in August, but in the case of *Boule d'Or* the crown buds can be taken at the end of July, because they require so long a time to expand properly. Terminals run on after the first week in August do not attain exhibition size, consequently may as well be taken for early blooms. Although some of them may be too early for exhibition, a few good blooms are always acceptable for other purposes.

A few additional words will, I hope, enable those unacquainted with the subject to understand what "taking the bud" really means. If the plants have been grown as advised they will be from 18 inches to 3 feet in height at the end of May, according to the varieties. At the end of May and early in June they will be making their first "break," that is, at the top of the plant a bud is formed which stops that growth, and three shoots form. These start away together and make a long or short growth according to the varieties. When the growth of these shoots is completed by the formation of another bud it has to be decided whether this bud shall be reserved, or the plant be allowed to make another growth. This demands an acquaintance with the peculiarities of the varieties. If it is decided to reserve the bud the three shoots around the flower bud are removed as soon as it can be done with safety, leaving only the flower bud. This is called "taking the crown bud." If it is decided that taking this crown bud would be too early or likely to cause deformed flowers, the flower bud is removed with two of the shoots, and the best shoot allowed to make another growth. At the apex of this other buds are formed, the best is preserved, the others are all carefully removed, and this is called "taking the terminal bud." I have found the buds of most incurved varieties to come from the plants not stopped. In the natural break the shoots start evenly together, but the condition of the wood as to firmness influences the artificial break. I once stopped half my plants of incurved varieties to try the system, but the result was so convincing it was never repeated.

Varieties run on to the terminal bud in a sunny position are Barbara, Refulgence, Mabel Ward, Eve, and the Teck family of the incurved, and Grandiflorum of the Japanese. Other terminals, taken in a position not quite so hot, are Comte de Germiny, Stanstead Surprise, M. Lacroix, Étoile de Lyon, Lady Lawrence, Carew Underwood, and Baronne de Prailly of the Japanese, and Jeanne d'Arc incurved. L'Adorable and M. Tarin making short breaks have been taken on the third break. Japanese stand stopping much better than incurved. Before we had better varieties Elaine, Bertie Rendatler, and Thunberg were obtained by stopping in April. Edwin Molyneux and Mrs. F. Jameson amongst the newer varieties have come well from plants that have been stopped. In these cases early blooms lose their freshness, and terminals lack size and substance, but by stopping them they are obtained the right time for exhibition.

#### HOUSING THE PLANTS.

Attend to this in good time, removing under cover the earliest as soon as they show their florets, and following up the others every alternate day until the stock is housed. Large numbers of early blooms damp through the large buds becoming saturated before being housed. The first week in October is the time most of the plants are housed, unless the weather is threatening, when they are housed at once, so as not to be taken by surprise.

#### KEEPING THE BLOOMS.

This is sure to engage the attention of exhibitors. I have tried various ways, but have found no plan better than allowing them to remain on the plant. The early ones are placed in one house, or at the end of a house by themselves, the temperature cool and the house airy, with enough warmth in the pipes to evaporate undue moisture. When the blooms are nearly developed a piece of tiffany is fixed over the glass to prevent the cold and moist air injuriously affecting them by night and the sun injuring them by day. Blooms kept in this manner have often surprised me in the length of time they have kept for exhibition.

#### DAMPING.

The early buds are most subject to "damping." Heavy winds and rains battering the large buds before they are housed is often the cause. Continued foggy weather and too much artificial manure cause the lower florets to decay quickly. Low night temperature with much moisture followed by bright sunny days cause hundreds of blooms to be lost in a few hours. The best preventive is to have a small fire constantly, except on sunny days, with ventilation more or less at all times except during heavy fog. Where the temperature is not allowed to fluctuate too much, the blooms keep much cleaner and preserve their freshness for a long time. Some varieties are more subject to damp than others, and should be accorded the driest position in the house. Empress of India, Queen of England, Lady Hardinge, Mrs. W. Shipman, Mlle. Lacroix, Fernand Feral, and Madame C. Audiguier are with me the most subject to damp. Prince Alfred and Lord Wolseley should also be placed in as dry a position as possible, being early to bloom, and likely to go quickly at the lower part of the bloom.

#### INSECTS AND DISEASES.

Numerous insects attack the plants in various stages of their growth, but they can be generally overcome with timely attention. They are subject to green fly in all stages of their growth, but these are readily destroyed by dusting with tobacco powder. Immediately the plants are housed they should be well fumigated to destroy any aphides secreting themselves around the buds. Blooms stand fumigation so well I have never found any injury arise from it. A maggot attacks the plants in May. It is readily detected by the manner in which it webs the top leaves of the plant together. They should be searched for occasionally and destroyed. Earwigs are troublesome, especially among the blooms. They should be trapped through the summer by bean stalks cut in length and placed among the plants or inverted pots with a little dry moss. The cuckoo spit insect has been unusually prevalent this season, and destroyed many buds; it nips the stem and causes the bloom to heel

over and cease swelling. The only plan I know is to catch them, which is sometimes a troublesome matter, as they are so lively, but their numbers are reduced. When mildew attacks the plants sulphur should be applied, and this immediately arrests it.

#### PREPARING FOR THE SHOWS.

Where it is intended to exhibit the schedules of the societies must be carefully read and noted, otherwise mistakes readily occur through not meeting the conditions, and lead to disqualification. It is not desirable to send the entries until nearly the time for closing, because many losses of the blooms may occur from various causes, and the exhibitor may be unable to compete in the classes he intended. No more classes should be entered than the exhibitor has every reason to believe he can compete in. I knew one exhibitor who used to enter very early and in more classes than he could fill, and boast of his number of entries. All this entails work on the secretaries to no purpose, and leads the society into additional expense in providing accommodation. Managers of exhibitions should fix their close of entries as late as is consistent with the proper working of the show. Exhibitors are anxious to enter certain classes and are keeping their blooms for it, when perhaps a change to wet and foggy weather ruins a number of the blooms, and if no margin for losses has been allowed for, nothing can be done but cancel some of the entries. Where this does occur it should become more the general rule to give notice to the secretaries the day before the show; or perhaps a clause in the regulations to the effect that a fine would be imposed if notice was not sent would mend matters in the entry for competition.

The Chrysanthemum has given those with an inventive turn of mind scope for using their abilities in discovering aids to the best manner of setting up for exhibition. Many forms of cups and tubes have been brought out to assist the exhibitor to raise his blooms and set them up to best advantage. Holders for tickets with the names of the blooms at the back of the stands seem to be on their trial now. The large varieties of Japanese blooms leave no space for the name to be seen on the board, and unless they are in a conspicuous position the names have to be passed, or the blooms have to be pushed on one side every time we wish to find the name, injuring the blooms and also the effect, as well as taking up a great deal of time, when in a crowded exhibition others are perhaps waiting to get near. Tickets fixed in front of the stands are too low down, and are liable to be unfixed by visitors rubbing against them.

The various requisites for exhibiting should be examined and in readiness. A support from a board, or leaky tubes, or an insufficiency of them, may cause much delay at the last moment. The best way to reach the exhibition, times of trains, &c., should be fixed beforehand, so that when the time arrives for setting up the blooms the whole attention can be given to it, and not divided by matters that should have been seen to before. As a rule the blooms are prepared the day before the exhibition, commencing with the incurved because they take the longest time to prepare. Incurved blooms vary in the length of time they require; if clean and well grown they take a much shorter time than many people imagine. Some seasons the Queen family come with scaly centres, and then they are rougher and take more care. When cutting look carefully over each variety, cut only those that are required, and select solid deep blooms, broad florets and fresh. Two pairs of tweezers are required, one long pair to remove any damaged florets, and deformed ones at the base low down amongst the florets, as if these are not removed it prevents the others going into proper position, leaving hollows and losing the symmetrical proportion which adds so much to the beauty of an incurved bloom. With the short pair arrange the florets in as regular a manner as possible, commencing at the centre of the bloom. Take pains to do it well, as they are much admired, and some that profess to dislike the method must inwardly prefer their appearance.

Japanese blooms are cut in the afternoon of the day before the exhibition. The colours are arranged by day, so that they have the same light as when judged. If arranged in the evening some colours look different. Take Sunflower for instance, which loses its effect at night. Select fresh, large, well-coloured blooms with their centres well up, and as many of the true Japanese as possible when in their best condition; I mean such varieties as Boule d'Or, the Dragon type, Meg Merrilies, Ralph Brocklebank, Stanstead White, &c. Varieties in all classes should be shown in their true character, and distinct where distinctness is required by the schedule. Sports are especially liable to vary, and should only be shown in their true form. Where there is a doubtful bloom it should be left out and a safe one substituted, and not run the risk of being disqualified. In arranging the stands the large blooms should be placed in the back row, the medium in the middle row, and the smaller ones in front; each row should be made level at their top by raising the low one or lowering the high one. All should be well set up from the boards, as they gain much in effect by this method.

An early start should be made on the morning of the exhibition, so that time is given to see that the blooms have travelled safely, and everything ready for the judges at the appointed time. It is the duty of exhibition managers, exhibitors, and judges to be punctual. It is most to the interest of the exhibitors themselves, so that the judges may have the full time allotted to them at their disposal. If shorn of a quarter of the time through the unpunctuality of one or two exhibitors, and there is a large competition, with the prospect of the opening exhibition close at hand, it means hurried work, and hurried work at judging, as at other work, is seldom satisfactory.

## THE CHRYSANTHEMUM IN ART.

By Mr. G. C. HAITE, F.L.S., Bedford Park, W.

It has very properly been thought that so important a celebration as the centenary of the introduction of the Chrysanthemum would be incomplete without some reference to its position in the art expression of the country whence it came, a country remarkable for many qualities, but chiefly for the charm of its decorative arts and skilled handiwork; and would also be incomplete without some recognition of its introduction in the ornament of our own manufactures. Although the introduction of the flower may be considered recent, it has of late years become a favourite and prominent *motif* with our art workers; so much so that it must of necessity be associated with the great art revival of the latter part of the Victorian era.

The Committee of the National Chrysanthemum Society in asking me, as a practical worker in applied ornament, to talk to you on this phase of a most fascinating subject, paid me a great compliment, and, as the task was by no means an uncongenial one, I ventured to accept the honour, and shall endeavour to keep the few remarks I propose making as comprehensive and clear as the time at my disposal will allow. I need, therefore, offer no apology for the subject of my address or for its introduction here; I can only regret that it was not undertaken by someone more competent than myself.

It must be clearly understood that my remarks upon the art aspect and adaptation of the Chrysanthemum will be confined exclusively to that branch of art known as the applied or decorative; inasmuch as the selection of this flower for purposes of imitative painting can offer little, if any, food for reflection, seeing that its beauty and variety of form—combined with its richness of colour, would alone be sufficient to recommend it for such purposes. But a flower, or growth, must possess something more than an abstract beauty to take a foremost place in the ornament and history of a people. A flower may be beautiful in itself, and lack the qualities necessary for the purposes of applied art. As an example of this we may take the cultivated Rose, beautiful enough to satisfy the most fastidious taste, and absolutely unequalled in its exquisite colour, range, and subtleness of perfume, and yet can we call to mind a single instance in which it has been successfully treated as a decorative *motif*? On the contrary, it is painful to reflect that the only claim it could possibly advance to artistic utility—save the mark!—would be its frequent recurrence in the crochet and wool-worked table-mats and antimacassars of the last generation; now, let us hope things, I had almost said sins, of the past. The Rose will, of necessity, be associated with the darkest age in the art history of this country. Again, the Dahlia has been developed and cultivated to its full pitch of perfection, possibly, but has left no record, at least of a creditable kind, upon our every-day art. The Tulip was at one period more than popular. It became a fashionable craze—in some cases almost criminal in its consequences—riding foremost in the gilded chariot of fashion, and yet, as regards the influence upon taste and art, we meet with it chiefly in gaudy chintzes or abominable specimens of naturalistic wood-carving.

I might give further instances of a like nature, but these will suffice to justify the assertion that a flower may be beautiful in itself, but yet totally unfit for the purposes of applied art. Something more than culture and development, something more than the caprice of fashion, something more even than abstract beauty, gratifying though it be to sight and smell, is necessary for a growth to be exalted and to live for all time as a characteristic feature in a nation's ornament. The Lotus, the Iris, the Tudor Rose, the Ivy, and the Chrysanthemum not least, illustrate and prove this. Without prejudice I think I am justified in saying that in only too many instances, although the selection of a plant for cultivation has resulted in finer flower heads and more luxuriant growth to the gain of our gardens—all this has only been obtained by the elimination of those very points and characteristics which made it acceptable to the artistic eye, and possible artistic adaptation. But this has not been so in the culture and wonderful development of the Chrysanthemum. Never, perhaps, in the history of the world—certainly there is no parallel in our own memories—has art been so indebted to the florist as she is to-day for the development of this wonderful flower.

It must be confessed that the florists and chief growers possessed, and it is said still possess, a strong predilection for the type known as "incurved." That is a form which, viewing the flower from its artistic aspect, does not commend itself to artists, while the definition of its ball-like form restricts its use. But to their credit be it said the growers have been equally devoted and enthusiastic in their culture of the reflexed, the Anemone-flowered, the Pompon, and, as they are called, the dishevelled Japanese varieties. The last is the dearest to the artistic nature, and is evidently alike the favourite of the ornamentist at home and in far Japan.

As I shall have occasion to use the words conventional and conventionalism somewhat frequently, this may be a not altogether unfitting opportunity to attempt some clear definition of this much-abused, because misunderstood, term. To many, not only of the general public, but also to our art workers, it is understood to simply mean the flattening out of an object. South Kensington is supposed to have originated and propagated this idea. Certainly the development is responsible for a multitude of drawings in which this definition has been practically shown. It may also claim the honour of instituting the exact turnover, and the sub-division of the circle, the result of which is a lifeless and irritating repetition of aimless form, conventional indeed, but not in the sense desired. This convenient word is, moreover, relied upon by many as an excuse for want of truth, consequent upon

superficial observation. As I understand the real meaning of the word, conventionalism is the principle of selection, the discerning and adapting of the most salient characteristics of a flower, so that in the best conventionalised ornament the growth may never be an outrage upon Nature, but rather a clearer delineation of the same. This playful rendering of a spray of Chrysanthemums is designed to suggest a stork on the wing, and demonstrates how possible it is to realise the true growth and characteristics of Nature for a definite purpose, and further that conventional treatment does not necessarily restrict invention or fancy. The effect is so natural that we can discern but little difference at the first glance from a drawing of the actual bird. Indeed, we can quite imagine a spray of the flower growing by a freak of Nature in this manner. I am aware that this question of Nature in art is but a small factor, inasmuch as a growth may be conventionalised, as in much of the Chinese work, beyond recognition. Yet it by no means follows that it is not a good ornament, and fit for the purpose, but it at least lacks that interest which association always gives, and therefore I take it there is a distinct loss. But for a plant that is to appeal to as such to be delineated false in growth, and excused on the plea of conventionalism, is nothing less than an outrage on the principles of art and our common sense.

It is important to observe that the flower and foliage growths have stamped a nation's ornament with individuality and character for all time, are invariably conventional in treatment. We have no instance of a naturalistic treatment possessed of sufficient vitality to live, much less to form a vowel in the grammar of decorative art. The Lotus of Egypt in its conventional rendering alone would serve to prove the high civilisation and antiquity of Egypt, and to this day it stands the finest instance of conventionalism known, and yet in no way does it outrage true growth. The Lily of France, in its conventional treatment, is destined to immortality as the Fleur de Lis, is a rendering of the Iris, while the selection and use of the Tudor Rose of England stamps the best period of our own art, although it existed in its adopted form long before that date. And with the true instincts of an artistic people, we find the Chrysanthemum is rendered by the Japanese more or less conventionally, according to the purpose or material for which it is selected. Everyone knows that the Chrysanthemum is the imperial badge of Japan, but it may not be generally known that it shares this honour with the Paulownia imperialis, a growth equally capable of conventional expression and recalling in its form our purple Foxglove.

We find the simplest expression and severest form of the Chrysanthemum—as we might expect—in its adaptation to heraldry, as the imperial badge, in which it is shown as a simple rosette or Daisy composed of sixteen petals. Even in the later adaptation of the flower for postage stamps this simple and severe form was adopted. We may rest assured that its selection for this important function was not mere haphazard, prompted by personal caprice, or even some incident connected with the flower, but rather because it had within itself possibilities of a simple and satisfactory conventional treatment. The conventional rendering of an object is not due to either tradition or what is called taste, it but is the outcome of necessity, and simply means that the material to be decorated delineated the *motif* and method of treatment. Returning to its use as a badge. The reason for this simple expression is at once apparent first, that it might be clearly seen, and from a distance, without possibility of confusion, and equally important that it might be capable of execution upon and in every kind of material. Hence we see it in the hardest alloy for weapons and armour; carved in metal and crystal; beaten in high and low relief in brass; carved in wood and ivory; woven in fabric of dress and banner, and raised in lacquer, simple but unmistakable. But apart from being the badge of the Royal House of Japan, the flower is evidently dear to the people for its beauty alone. It appeals to them in its general adaptability for the ornamentation of their domestic surroundings, while it is by no means uncommon, I gather from one of those delightful letters from Sir Edwin Arnold, which appear from time to time, to find the Japs naming their daughters after these favourite flowers, O-Kiku-Sau, the Hon. Miss Chrysanthemum, in much the same way that we call our girls Rose, Violet, Lily, &c.

The Chrysanthemum is the leading, if not the most characteristic, feature in the ornament of this nation, who have taught us so much, and who are destined to still further revolutionise many of the ideas connected with applied ornament of the Western world—a nation whose history is so interwoven with the adaptation of this beautiful flower that I venture to say Japan is better known to the multitude to-day by the flower of her choice than by her civilisation of thousands of years, or by the character and history of her patient and talented people. As I have before said, we find it used in every imaginable way, from the severest possible form, as shown in the Imperial Badge, to the naturalistic paintings on silk or paper or the fanciful expression of form. It would be nothing short of a calamity to lose the varied expression of this flower, while it would be difficult to imagine the art of Japan without it. It stamps the native work with individuality, and in conjunction with the Bamboo serves to typify this art.

It is not possible to more than briefly allude to the extensive use made of the flower by designers and ornamentists in our own decorations and manufactures. Attention should be directed to the matter, inasmuch as I am compelled to admit that the flower is often either misapplied or adapted without sufficient simplification. As pointed out, Nature has done much of the designer's work, and we are too apt to rely upon this fact, utilising the flower as it is, instead of making it consistent with our requirements. As an instance, we not infrequently see in repoussé, pointed-petalled blossoms, selected for high relief and

attempts to render shapeless outlines, a method of expression suitable only for imitative painting. In woven fabrics, too, we see the flower over-burdened with petals and necessarily confused in form. The same attempts at naturalism are to be found in wood carving, wall-papers, &c. We should do well to study the methods of Japanese adaptation, not necessarily to copy, but for the principles involved, and we should more conscientiously study the flower itself, and not accept as accomplished that which Nature has still reserved for us to do, in the doing of which we invest the growth with a human interest. These conditions pre-suppose no arbitrary restrictions, inasmuch as the probabilities of variety are practically endless. The flower as such is perfect. It is left for the genius of man to make it equally so for his defined purpose. For the very reason that it is so decorative in itself we should resist the desire for imitative realism. The Japanese, to their credit and glory as an artistic nation, never fall into this mistake. If they use the flower as a *motif* for chasing in hard metals, as steel, alloys, iron, &c., they select blooms simple and defined in form. On the other hand, in chasing in soft metal—gold or silver—or carving in soft woods, they choose blooms, the beauties of which are better displayed in a more modelled form. In metal work the treatment may be convex or concave.

In their paintings we at once perceive that they allow themselves a wider selection, almost every kind and variety of flower finding recognition with greater latitude in treatment. Foreshortening, interlacing, and intricate arrangements are indulged in, and what may be termed an intermediate course is taken in their pottery and fabrics. Having taken a general though hasty view of the subject it may be profitable to ask ourselves why this flower over and above its claim to beauty, was and is so readily selected as a decorative *motif*? The fact of it being the Imperial Badge of a distant and still almost unknown people can have had with us, at least, little influence, however much it may have affected the Japs themselves. It rests its claim for admiration and selection upon a beauty of form as remarkable as it is varied upon a wide colour range, and a growth strong yet graceful, and a foliage no less beautiful than the blossom.

Many a flower has been grown in obedience to the demands of the fashion of the day, and their contributions to the art would have been of a negative nature. But in the flower we have met to honour we find it not only adapted to a variety of treatments consistent with the principles of applied ornament, but that, too, with little, and in many cases no alteration. Nature, indeed, seems to have been so enamoured of her production that she was half tempted to turn artist. Finally, we may all concede that we owe it a deep debt of gratitude, for it has made bright a period of our year that heretofore had been dull and flowerless. No longer can the poet sing—

“No warmth, no cheerfulness, no healthful ease,  
No comfortable feel in any member;  
No shade or shine, no butterflies, no bees,  
No fruits, no flowers, no leaves, no birds—  
November!”

### LETTUCES.

I OBSERVED (page 470) a note by “B.,” in which he seems to impugn my veracity in regard to Blond Blockhead Lettuce which I received from MM. Vilmorin of Paris. I am always exceedingly careful in any statements I venture to make, and enclose for your satisfaction page 20 of MM. Vilmorin’s wholesale catalogue for the current year, in which you will find both Blond Blockhead and Brown Blockhead quoted. So much for the catalogue. As to the seed, I herewith enclose the original packet with some of the seed, which I shall be greatly favoured by your forwarding to “B.” for his satisfaction, and to enable him to try this first-class Lettuce. I am afraid “B.” thought I was the only blockhead in the matter; but although I am painfully conscious of my imperfections I do not like that regrettable fact to be hinted at by others. I quite agree with “B.” in his appreciation of Hick’s Hardy Cos, which I always sow every autumn for spring cutting, but have never tried it for summer work. Tom Thumb I have never grown. To follow in the lines of “B.,” let me add that I received for trial from MM. Vilmorin a long Turnip like an enormous Radish, which was called Extra Early something, but I have unfortunately lost the seed packet. I sowed it in spring, and it produced good quality roots in less time and far superior to Early Milan, which unfortunately goes off so quickly. I do not think Vertus was the name, for that is familiar to me, but I think it had a name with which I was not acquainted.—H. S. EASTY.

[The enclosures have been forwarded to our correspondent as requested.]

### CHRYSANTHEMUM SHOWS.

#### BERKHAMPSTEAD.

THE above Society held their third annual Exhibition in the Town Hall, and though the building has been considerably enlarged since the last show, it was none too large to accommodate the whole of the exhibits, which were brought together in large numbers. The day was fine, and the Hall was crowded with visitors during the afternoon and evening. In the class for twenty-four incurved, distinct, Mr. C. Brown, gardener to R. Henby, Esq., Abbots Langley, was first with a fresh even stand of blooms. For twenty-four Japanese, Mr. G. Sturman of Watford, an amateur grower, who promises to make a formidable competitor,

was easily first with a magnificent stand. Among his best blooms were Etoile de Lyon, E. Molyneux, Sunflower, Boule d’Or, Avalanche, Carew Underwood, very fine; Fimbriatum, Volunteer, a grand bloom, finely coloured; M. Bernard, and Mrs. Beale. Mr. C. Brown was second with a good stand also, among which was one of the finest blooms of Madame C. Audiguier staged this season. For twelve incurved, distinct, Mr. R. B. Lowe, gardener to the Earl Brownlow, was first with good blooms. Mr. Neave, gardener to C. Van Raalte, Esq., was second. For twelve Japanese, distinct, Mr. Neave was first with a fine stand, having a very fine bloom of Golden Dragon. Mr. H. Folkes, gardener to T. F. Halsey, Esq., M.P., was second; T. Kirby, gardener to E. Mawley, Esq., was third.

Miscellaneous groups are always well done here, and Mr. Lowe was well first with a very finely arranged one. Mr. G. Hillier, gardener to H. H. Cooper, Esq., was second with a good group also. The groups of Chrysanthemums, on a space not exceeding 40 feet, made a fine display. Mr. A. B. Higgins, gardener to Mr. A. G. Lucas, was deservedly first with a similar group to the one he had at Watford the Tuesday previous, but better arranged. This consisted of some very fine plants, both of Japanese and incurves. Very fine indeed was Mrs. Alpheus Hardy. Mr. W. Lush, gardener to Mrs. Lionel Lucas, was second; equal third, Mr. H. H. Cooper and Mrs. Bedford, all very good. In the members’ class, Mr. W. F. Exler, gardener to Mrs. Oxenham, was first (with blooms somewhat rough) for twenty-four incurves. For twenty-four Japanese, Mr. F. E. Hicks, gardener to Mr. E. J. Pearson, was first with fine blooms. Second, Mr. Kirby; third, Mr. Lowe. Mr. Folkes, Mr. Kirby, and Mr. Bone, gardener to Lord Chesham, were successful in smaller classes.

Table plants, Primulas, and Cyclamens made a good show. Double Primulas, shown by Mr. C. Sims, gardener to T. Gooch, Esq., were splendidly done. Fruit and vegetables were very largely staged, the Grapes were particularly good. For black Grapes Mr. Folkes was first, and for white Grapes Mr. E. J. Pearson, gardener to the Hon. A. Talbot, headed the list. Mr. C. Brown was the most successful with vegetables, showing a fine clean lot. Several very fine honorary exhibits were sent. Mr. Beard, gardener to Mrs. Valpy, Champneys, sent a magnificent group, occupying one end of the large hall. This contained some very choice plants, and was well arranged. Mr. Beard is one of the leading members of the Committee, and very much credit is due to him for lending such a helping hand to the Society. He also staged a large collection of vegetables, and about six dozen cut Chrysanthemums, among them some fine exhibition blooms. Messrs. Lane & Son sent a fine collection of Apples.

Mr. Holloway, the hardworking and painstaking Secretary, with the Committee, are to be congratulated on such a very successful exhibition.

#### BOLTON.

THE fourth Exhibition took place in the Town Hall, and proved the most successful yet attempted and attracted large numbers of visitors. The Hall, which is one of the finest in the north of England, being crowded, the miscellaneous groups, three in number, being very nicely arranged. Mr. J. Pountain, gardener to Thos Wilkinson, Esq., taking first place; Mr. E. Cockburn, gardener to W. Slater, Esq., second; Mr. Geo. Pearson, gardener to John Heywood, Esq., third. For the group of Chrysanthemums there were four entries and all good, making a very fine show, Mr. J. Wainwright, gardener to E. Cross, Esq., J.P., C.C., being first, Mr. J. Pountain second, Mr. George Pawson third, and Mr. James Taylor, gardener to Mrs. Chas. Taylor, last.

Specimen Chrysanthemum plants were in grand form, those shown by Mr. R. Smith, gardener to Col. Omerod, being especially fine, taking first in six incurved and six Japanese, other exhibitors being Mr. J. Hicks, gardener to Mrs. Haslam, and Mr. J. Pountain.

Cut flowers were well represented. For thirty-six, eighteen incurved and eighteen Japanese, Mr. Joshua Kirkman, gardener to John Stanning, Esq., being first with a grand stand; the eighteen, nine incurved nine Japanese, being taken by Mr. Chas. Jones, gardener to Mrs. Shaw, Mr. J. Wainwright, and Mr. George Corbett, gardener to Arthur Knowles, Esq., coming close behind. Mr. Jones also secured first for twelve incurved, twelve Japanese taken by Mr. Corbett, and twelve miscellaneous by Mr. Wainwright. The amateur classes were well represented, and showed a marked improvement on former years.

#### HINCKLEY.

THIS, the third annual Exhibition, was in many respects a commendable one. St. George’s Hall, Hinckley, the room in which the Show was held, is a very suitable one for such a purpose; sufficiently large, lofty, well lighted, and well fitted, with a raised orchestra at the farther end from the door. The greater portion of the centre of the room, as well as the orchestra, were occupied by groups of miscellaneous plants stove and greenhouse, and Chrysanthemums, not for competition. Across the front of the orchestra were three very respectable groups of Chrysanthemums in competition for the prizes offered.

On a table down the right hand side of the room looking from the orchestra were the cut blooms, and a collection of hardy fruits; and on the opposite side of the room, on another similar table, a number of very good collections of vegetables in trays of six varieties, single dishes, &c. The Committee have this season, for the first time, offered a silver challenge cup value £5 5s., together with three of the N.C.S. medals, and a Centenary medal; but for all this they were disappointed in receiving but a very poor entry list to all the cut flower classes, these

classes unfortunately proving the weakest point in the Show, instead of being, as was hoped they would be, the strongest. The challenge cup was offered for twenty-four blooms, twelve incurved and twelve Japanese—eighteen varieties; but in this class there was only one competitor, he being an amateur grower with very small flowers, especially in his incurved.

It was believed that the fact of the cup having to be won three consecutive times to become the property of the winner, and the money prize with it 10s., being too small, accounted for the lack of entries. A strong effort will be made by the Committee to render this class more attractive next season.

The exhibitors of miscellaneous groups not for competition, were: J. Smith, Esq., Bond Street; Lieut.-Colonel Davis, J.P., Highfield House, Hinckley; M. Foxwell, Esq., Manor House, and B. Hurst & Sons, the Nurseries, Burbage, near Hinckley. The winner of the challenge cup, John Burchall, was also winner of the first prize for group of Chrysanthemums, staging a neat group, lacking diversity of colours.

The Committee and Hon. Sec. are very energetic and hard workers, and will doubtless, as they have affiliated their Society with the N.C.S., soon succeed in their endeavours to make their Show one of the best in the county of Leicester.—W. K.W.

#### MANCHESTER.

THE annual Exhibition of Chrysanthemums by the above Society was held in the Town Hall, and was in every respect an excellent Show, and is considered to be the best autumn display that has been brought together by this Society.

The principal attraction, or as one visitor puts it, "the great sensations," were arranged upon a continuous table running through the centre of the entire length of the spacious hall, while a table across one end under the orchestra contained a magnificent bank of Carnation Miss Joliffe, exhibited by Mr. J. Jennings, gardener to Leopold de Rothschild, Esq., Leighton Buzzard. These were in themselves a centre of attraction, and were deservedly awarded a special prize. A similar award was also made to Samuel Barlow, Esq., of Stakehill, Castleton, for his splendid collection of about 100 dishes of Apples and Pears, grown in his gardens at Llandudno, and many of which were exhibited recently at the Guildhall, London. Among other exhibits that received special recognition we noticed a stand of a very pretty new seedling Croton, Mrs. Usher, from the gardens of R. E. Warburton, Esq., Arley Hall. Among nurserymen's exhibits, Messrs. Dickson & Robson of Old Millgate, Manchester, had a tastefully arranged bank of Palms, Ericas, Cyclamen, &c., edged with small pots of a pretty and most useful Selaginella Emiliana. Messrs. Dickson, Brown, Tait also put up a beautiful table of fresh healthy plants of similar varieties edged with Maidenhair Ferns; Messrs. Clibran & Sons, Sale, collection of miscellaneous Chrysanthemum blooms, some dozens of well finished blooms of Etoile de Lyon were much admired; while the Home for Flowers was represented by a table of splendid trusses of popular winter-flowering Zonal Pelargoniums of all shades, the whites being specially noticed; Agnes, Sir Percival, and Swanley White were some of the best.

Apples and Pears were largely exhibited by the following firms:—Richard Smith & Co., Worcester; Messrs. Caldwell & Sons, Knutsford; Clibran & Sons, Manchester.

*Cut Blooms* were superior in a few classes to any exhibits of former years. The principal class for forty-eight blooms in thirty-six varieties was secured by Mr. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, with well finished flowers. Among his best were Lord Alcester, Golden Empress, John Lambert, Empress of India, Miss M. Haggas, Alfred Salter, &c. Japanese.—Ralph Brocklebank, Mrs. Wheeler, Jeanne Délaux, Avalanche, and Meg Merrilies. We failed to find the second prize stand in the above class. For twenty-four Japanese there was good competition, and some remarkably well finished blooms of good depth. First prize, Mr. Kirkman, gardener to J. Stanning, Esq., Broadfield, Leyland, Preston, a new exhibitor, and one who is certain to be heard of again, judging from the excellence of his blooms, both in Japanese and incurved. Mr. Kirkman has been a successful exhibitor for several years at Chorley and Bolton, and with the advanced position of his blooms at Manchester we hope to hear of him among the best growers of the day. His best were Etoile de Lyon, E. Molyneux, Golden Dragon, M. J. Pigny, Carew Underwood, Criterion, Avalanche, Pelican, Ralph Brocklebank, and Baronne de Prailly, all excellent. Second prize, J. Tomkinson, Esq., Wellington Hall, Tarporely. Third, J. Lamb, Esq., Renwood House, Bowden. Equal third, A. Heine, Esq.

For twenty-four incurved A. Heine, Esq., Fallowfield, won first honours with a good stand of blooms, his best being Prince of Wales, Alfred Salter, Queen of England, Empress of India, Golden Empress, Miss Tomlin, Jeanne d'Arc, &c. Second, J. Tomkinson, Esq., with a nice lot. Lord Alcester, Miss V. Tomlin, Empress of India, Golden Empress, Mrs. Haggas, Jeanne d'Arc. For twelve Japanese Mr. Kirkman was ahead of his competitors with similar blooms to those in his twenty-four stand. Second, J. Tomkinson, Esq. Third, A. Heine, Esq. For twelve incurved Mr. Kirkman took first honours, with splendid flowers of the usual kinds. Second, A. Heine, Esq. For thirty-six miscellaneous blooms there was close competition. First prize fell to T. F. Waters, Esq., Bonney Villa, Withington. Second, S. T. Whitehead, Esq., Burton Close, Bakewell. Equal third, Earl of Harrington, and J. Lamb, Esq., Renwood House. For three hand bouquets Mr. John Mossley, nurseryman, Halliwell. One hand.—First, Mr. John Mossley.

Second, James Brown, Esq., Longfield, Heaton, Mersey. Third, Miss Lord, Oakleigh.

For nine large flowered Chrysanthemums in pots. First, W. Leak, Esq., Demesne Road, Mosside. For six Pompons in pots. First, R. Hardwick, Esq. Second, S. Bles, Esq. For six Japanese in pots. First, M. S. Bles, Esq., Broughton Park. Second, R. Hardwick, Esq., Ashton-on-Mersey. Third, C. Chorlton, Esq.

There appears to be entire absence of gardeners' names upon the prize cards. Surely this is scarcely just to those who toil many hours for weeks previous to a Show, to the sacrifice of rest much needed, and possibly travel a long journey at night in order to be early on the morning of the Show, and after the awards are made surprised to find their names are not associated with a hard-earned honour. If this is, as I believe it to be, an exception to the general rule, I think the authorities need a reminder.—P.

#### YORK.

THIS Show was considered by those who have seen previous ones held in this Cathedral city to be the best of the whole series since the commencement in 1880. It was a remarkably fine display in every department, and keen competition was the invariable rule. Held, as it is, in the capacious building of the Exhibition, the exhibits were seen to the very best advantage, with plenty of space for the company present to view the products with comfort. The plant classes were well filled in nearly every case, and many good examples were not in the awards at all. The best groups were arranged in circles, in which manner they were seen from several points with equally good effect. That from Mr. McIntosh, gardener to J. T. Hingston, Esq., Clifton, York, was placed first, winning the cup and cash prize; from summit to base it was a good arrangement. The second prize went to a group somewhat after the same style. For a semicircular group Mr. Everard, gardener to Mrs. Gutch, Holgate Lodge, York, was first, taking also the N.C.S. Centenary medal. Mr. Everard also showed well in the plant classes, being placed first for four incurved plants with Pink Perfection, Prince Alfred, Lord Wolseley, and Jardin des Plantes. First also for two plants of Japanese with Val d'Andorre and Mdle. Lacroix, and first for a specimen with Edwin Molyneux. Mr. Smith, Norwood Nursery, Beverley, was first for four Japanese with plants profusely flowered of Val d'Andorre, Madame de Sevin, Mdle. Lacroix, and Dr. Macary. He also took first for four well-grown Pompons. Mr. Veat, gardener to Miss Steward, won first for reflexed varieties, showing the forms of Christine in good condition. Table plants were present in large numbers, and suited in most cases for the purposes intended.

The cut bloom classes excited a great deal of interest, some very fine examples being staged. In the premier class for thirty-six, equal of incurved and Japanese, in twenty-four varieties, Mr. Folkard, gardener to Sir James Walker, Bart., was placed first, taking the special prize of plate and money prize also. His blooms were.—Incurved, back row: Empress of India, A. Salter, Lord Alcester, Queen of England, Golden Empress, Empress of India. Middle row: Violet Tomlin, Mrs. Heale, Princess of Wales, Miss Haggas, Violet Tomlin, Princess of Wales. Front row: Lady Hardinge, Jardin des Plantes, Mrs. Heale, Cherub, Princess Teck, Miss Haggas. Japanese, back row: Etoile de Lyon, Boule d'Or, Avalanche, Boule d'Or, Edwin Molyneux, Etoile de Lyon. Middle row: Mrs. J. Laing, Stanstead White, Edwin Molyneux, Mrs. J. Laing, Condor, Madame Baco. Front row: Condor, Puritan, Coronet, Avalanche, Jeanne d'Arc, Sunflower. The Japanese in this lot were very bright, and the incurved of superior finish. Mr. Goodacre, gardener to Earl of Harrington, Elvaston, Derby, took the second prize. Mr. Folkard was also a good first for twenty-four blooms, equal numbers of Japanese and incurved, showing many superior blooms in both stands, winning also for twelve incurved blooms. For twelve Japanese, Mr. Short, gardener to A. Pease, Esq., M.P., Darlington, was placed first in a close competition; a bloom of Mrs. E. J. Clarke in this stand was very fine. With twelve Anemone flowered Mr. Midgley, gardener to J. H. Mason, Esq., Bingley, was to the front with an even stand of flowers. The best were Fabian de Mediana, Sabine, J. Marty, Lady Margaret, Minnie Chate, and Madame R. Owen—a good class. For reflexed blooms Mr. Short again won with capital flowers of Cullingfordi, Chevalier Domage, Peach Christine, Irene, King of Crimson, and Dr. Sharpe. The class for six Japanese blooms, one variety, was well filled, Avalanche being awarded both first and second prizes, the best coming from Mr. Finlay, gardener to Mrs. Proud, Darlington. Etoile de Lyon was also staged in good condition.

Bouquets were present in numbers, those of Chrysanthemums only being most conspicuous. The best came from Mr. Battensby, Blaydon-on-Tyne. Mixed cut flowers were shown well, especially so those from Mr. Letts, gardener to Earl of Zetland, Aske Hall; Lapagerias, Ixoras, Dipladenias, and several Orchids would in this lot have been hard to beat. For an epergne arrangement the first again went to Mr. Battensby, whose choice of flower was good, but too many were used at the base.

Mr. Letts showed a most superior set of half a dozen bunches of Grapes, winning the special prize in the form of a silver cup, also the cash prize with it. Barbarossa, very fine, Alicante and Muscat, both good, were the three sorts. Those from Mr. Goodacre took the second prize; these bunches had, some at least, been shown before and did not therefore compare so favourably with the first prize exhibit. Mr. Dawes, gardener to the Hon. Mrs. Ingram, Temple Newsham, Leeds, was a good first for two bunches of any black kind. Pears were exhibited best by

Mr. Hare, gardener to R. H. C. Neville, Esq., Grantham, who had Van Mons Léon Leclerc, Beurré Diel, Beurré Superfin, and Doyenné du Comice in good condition, and by Mr. Cuckney, gardener to Sir R. J. Musgrave, Bart., Eden Hall, Cumberland; Glou Morceau, Marie Louise, Louise Bonne, Josephine de Malines, Passe Colmar and Nouveau Poiteau were the best in this lot, both collections took the first prizes in their respective classes. Vegetables were provided for by several classes for collections and for single dishes, the produce staged being of superior quality. Miscellaneous collections of Apples from Messrs. Backhouse and Son, York Nurseries, who staged nearly eighty dishes, and from Mr. Watkins of Hereford, whose fruit was remarkably well coloured.

Mr. Lazenby, the courteous Secretary, and his Committee deserve a word of praise for their successful labours on this and former occasions.

#### SALISBURY.

THE Wilts Horticultural Society held its annual Exhibition of Chrysanthemums, fruits, and flowers in the County Hall, and it was one of the best Shows of the kind held by the Society, and the Committee, of which the Mayor of the City is Chairman, and its able and courteous Hon. Secretary (Mr. W. H. Williams), are to be congratulated upon the smooth and highly satisfactory manner in which the details of the Show were arranged and carried out. Three years ago through the influence and energy of Dr. Coates, Salisbury, four challenge cups were subscribed to and offered, together with a small money prize, to be competed for, the conditions being that the cup should be won three years in succession before becoming the property of any competitor. The trophies having been won the two previous years by the same exhibitors great interest was therefore evinced by the citizens of Salisbury and exhibitors generally as to the chances of cups changing hands or becoming the final property of the holders of them during the two past years, which, except in one instance, is what happened.

*Groups.*—Two classes were provided for groups of Chrysanthemums arranged for effect and one for miscellaneous plants in a semicircular space of 10 feet in diameter by 6 feet in the open classes; 8 feet by 5 feet in the amateurs' class. Four good groups were arranged in competition for the 10-guinea challenge cup. First, Mr. Frank Pearce, High Street, Salisbury, his plants being furnished with healthy foliage down to the pots, and the flowers large, fresh, and well selected, and intermixed as regards colour, the whole being edged by small plants of Ferns. Mr. L. Brown, Portland House, Salisbury (who won the cup the two previous years) was second; and Mr. A. Robey, gardener to Captain Greenwood, Harnham Cliff, Salisbury, was an excellent third. Although this was an open class Mr. Robey was the only gardener showing in it. Dr. Coates was easily first for a tastefully arranged group of miscellaneous plants set in a groundwork of Maidenhair Fern (*Adiantum cuneatum*) and *Selaginella* of the *Wildenovi* type, the outer circle consisting of *Panicum variegatum* and *Isolepis gracilis* arranged alternately. The dot plants consisted of Palms, Crotons, *Lælia anceps*, *Oncidium tigrinum*, *O. crispum*, *O. Forbesi*, *Cattleya Bowringiana*, *C. marginata*, *Odontoglossum crispum*, &c.

In the class confined to amateurs Mr. Chas. Haskins, Poultry Cross, Salisbury, was a capital first, thereby winning the 5-guinea cup three years in succession. His plants were well grown, and the blooms large, solid, and beautifully fresh. Mr. Witham Pearce, New Street, Salisbury, was a creditable second. There were only two entries in this class also. Four classes were devoted to specimen plants of the Chrysanthemum, but, excepting in the class for trained specimens, nothing worthy of note was staged. Mr. Kains, Winchester, was first for a trained specimen, staging a well trained profusely flowered plant of *Bertha Flight*; Mr. H. Pearce and Mr. L. Brown following in that order with good exhibits.

*Cut Blooms.*—These were shown well in the open classes. Three stands of twenty-four blooms each were staged in competition for the ten guinea challenge cup, which was easily won for the third time by Mr. H. W. Ward, gardener to the Earl of Radnor, Longford Castle, Salisbury, who staged *Boule d'Or* (two), *Avalanche* (two), *Triomphe de la Rue des Châlets*, *Japonais*, *Fernand Feral*, and *Meg Merrilies* in the back row; *Lord Alcester* (two), *Bronze Queen*, *Empress of India* (two), *Miss M. A. Haggas*, *Cherub* (two) in the middle row; *Barbara*, *Eve* (two), *Charles Gibson*, *Mrs. Heale*, *Alfred Salter*, *Empress Eugénie*, and *Hero of Stoke Newington* in the front row, all being substantial, fresh, well-matched blooms. Mr. Mann, gardener, Leighton House, Westbury, was second, his best blooms being *Etoile de Lyon* and *Edwin Molyneux*. Mr. Gill, gardener to Earl Nelson, Trafalgar Park, Salisbury, was a creditable third. Several good stands of a dozen blooms of incurved of not less than eight varieties were staged. Mr. Neville, gardener to Mr. Flight, Twyford, Winchester, was first, showing fine blooms of *Princess of Wales* (three), *Lord Alcester*, *Lady Dorothy*, *John Salter*, *Empress Eugénie*, *Violet Tomlin*, *Mrs. Coleman*, *Hero of Stoke Newington*, and *Nil Desperandum*. Mr. Inglefield, gardener to Sir John Kelk, Bart., Tedworth House, Marlborough, was a good second, his blooms of *Golden Empress* being exceptionally fine. Mr. W. Robinson, gardener to Lord Justice Lopes, Westbury, was a close third. In the corresponding class for a like number of Japanese, Mr. W. Robinson was first with finely coloured fresh blooms (back row) of *Edwin Molyneux* (two), *Condor*, *Etoile de Lyon*. Middle row: *Boule d'Or* (two), *Etoile de Lyon*, *Condor*. Front row: *Mons. Bernard*, *Sunflower*, *Sarah Owen*, and *Mdlle. Lacroix*. Mr. Neville was a good second, and Mr. Inglefield a close third. Mr. Neville had the best stand of reflexed, staging large fresh blooms of *Cullingfordi*, *Cloth of Gold*, *Golden Christine* (two), *White Christine*

(three), *Pink Christine*, *Peach Christine*, *King of the Crimson*, &c. Mr. W. Robinson and Mr. Ward being second and third in that order. Mr. Neville was again to the front for a stand of Anemones, with a very fine lot of blooms, *Jeanne Marty* (two), *Fabian de Mediana*, *Empress*, *Ratapoil*, *Miss Annie Lowe*, *Lady Margaret*, *Minnic Chatc*, *Souvenir de L'Ardenne*, &c. Mr. Tucker, gardener to Major W. P. Clarke, Bellfield, Trowbridge, was second, and Mr. W. Robinson was third, all staging good all-round blooms. All the above classes were well filled.

*Amateurs.*—Mr. Chaloner Shenton, Winchester, won the 5-guinea cup for the third time with a stand of eighteen blooms of not less than twelve varieties, staging *Etoile de Lyon* (four), *Boule d'Or* (two), *Prince Alfred*, *Barbara*, *Jeanne d'Arc*, *Lord Wolseley*, *Prince of Wales*, *Peach Christine* (two), &c. Mr. W. Follen, Codford, near Warminster, was second, and Mr. Botten, Basingstoke, third. The last named exhibitor was first for twelve blooms, not less than six varieties, showing, among others, good *Etoile de Lyon*, *Edwin Molyneux*, *C. Audiguier*. Mr. M. S. Melliuch, Exeter, was second, and Mr. John Kaines, Winchester, third.

The ladies' classes were well represented by the Misses Agnes Flight; Lovibond, 2, St. Anne Street, Salisbury; Mattie Brown, Salisbury; Mathews, Avonbourne, Salisbury; all staging artistic arrangements.

*Fruit.*—This made a fairly good display. Three collections of six kinds were staged by Messrs. Ward, Warden (Clarendon Park, Salisbury), and Evans, Melchet Court, Romsey, and to whom the prizes were awarded in that order. The Longford fruit consisted of well-coloured *Gros Guillaume* and *Muscat of Alexandria* Grapes, *Queen Pine*, *Longford Gem Melon*, *Glou Morceau Pear*, and *Court Pendu Plat Apples*. Grapes.—Mr. Warden was first in the any other black than *Alicante* with shapely well-coloured bunches of *Gros Colman*; Mr. Chalk, Westwood, Salisbury, being second with good *Lady Downe's*. Mr. Chalk was also first for *Alicante* and *Muscat of Alexandria* with good exhibits, being closely followed in each case by Mr. Ward, who was first in the any other white class with well-coloured bunches of *Trebbiano*.

Out of seventeen competitors with dessert Apples put up in excellent condition Mr. J. Hall, gardener to S. Montagu, Esq., M.P., Porterwood, near Southampton, was first, showing bright clean even fruits of *Harvey's Golden Russet*, *King of the Pippins*, and *Cox's Orange Pippin*; Mr. Pinkney, Mulford Hill, Salisbury, being a good second, showing *Sturmer Pippin*, *Cox's Orange Pippin*, and *Mother Apple*. Mr. Hall was also first for culinary Apples with fine fruits of *Warner's King*, *Alfristor*, and *Flower of Kent*; Mr. Fred Smith, The Palace Gardens, Salisbury, being a capital second, staging large, clear, even, well-coloured fruits of *Warner's King*, *New Hawthornden*, and *Emperor Alexander*. Mr. R. West, gardener to Fitzwigram, Esq., Downton, was first for Pears, showing fine fruits of *Van Mons Léon Leclerc*, *Beurré Bosc*, and *Doyenné du Comice*; Mr. Hill, Exeter, being second with *Beurré Diel*, *Chaumontel*, and *Huyshe's Victoria*.

*Non-competing Exhibits*—Messrs. Keynes, Williams, & Co., the well-known nurserymen of Salisbury, decorated the orchestra with a variety of foliage and flowering plants, a large specimen Orange tree heavily laden with golden fruit giving a finishing touch to the arrangement, which produced a fine effect when the County Hall was lighted up in the evening. Mr. Curry contributed a good though quiet effect in an arrangement of Ferns and *Selaginellas*; and Mr. Wilts, Southampton, staged two specimen plants of Chrysanthemums, which were greatly admired, as also were the examples of *Uvedale's St. Germain*, *Pitmaston Duchesse*, and other Pears staged by Messrs. Warden, Curry, and Hall.

#### WOKINGHAM.

THE Exhibition of this Society was held in the Drill Hall, and was a great advance on former years. Cut blooms were remarkably good, and competition keen in the leading classes. The arrangements were well carried out by the Hon. Sec., Mr. J. Bedford, and a hardworking Committee. In the class for twelve incurved, distinct, Mr. Lanc, gardener to Miss J. D. Smith, King's Ride, Ascot, was first with an even lot of blooms, very fresh. Back row: *Empress of India*, *Hero of Stoke Newington*, *Lord Alcester*, *Golden Empress*. Second row: *Mrs. Norman Davis*, grand; *Princess of Wales*, *Miss M. A. Haggas*, *John Salter*. Front row: *Lady Dorothy*, *Barbara*, *Princess Teck*, *Cherub*. A very close second was Mr. Allen, gardener to Sir G. Russell, Swallowfield Park. Mr. Allen's blooms were large, but not so fresh as the first prize lot. His stand contained a good *Princess of Wales*, *Lady Dorothy*, and *Lord Alcester*. Third, Mr. Trinder, gardener to Sir H. Mildmay, Bart., Dogmersfield Park. For twelve Japanese, distinct, Mr. Lane was again first with heavy flowers of good colour. Back row: Mr. H. Cannell, *Etoile de Lyon*, *Mrs. H. Cannell*, *Mrs. Wheeler*. Second row: *M. E. A. Carriere*, *Sunflower*, *Mons. Benard*, very fine; *Thunberg*. Front row: *Triomphe de la rue des Châlets*; *A. H. Neve*, good; *Puritan*, *Belle Paule*. Mr. H. Godfrey, gardener to Mrs. Rothery, Ribsden Hill, Bagshot, was second, with blooms but a point or so behind the first, *Stanstead White*, *Thunberg*, *Sunflower*, and *Lady Lawrence*, good, were his best blooms. Mr. Allen was third with heavy flowers, but several lacked freshness. For six reflexed Mr. Allen turned the tables, being first with a bright, even lot of flowers, consisting of *Cloth of Gold*, *Putney George*, *White Christine*, *Golden Christine*, *Peach Christine*, and *Phidias*. Mr. Godfrey was second, with good flowers. Third, Mr. Poppel, gardener to Sir A. E. C. Stephney, Bart., Wood End, Ascot. For twelve large flowered, any variety, Mr. Trinder was first with good Japanese and incurved. Second, Mr. Allen; third, Mr. Lane.

Groups were fairly well represented, and showed improvement. Mr. D. Wilks, gardener to B. E. Cammell, Esq., Folly Court, Wokingham, was first, with an even arrangement; the plants well clothed with foliage. Second, Mr. Bungay, gardener to Sir W. Moreshed, Forest Lodge, Binfield. Third, Mr. Woodgate, gardener to Colonel Harvey, Ambarrow, Sandhurst. Vegetables were well shown for Messrs. Sutton's prizes. Mr. Lane being first. Second, Mr. Bungay. Third, Mr. Hughes, gardener to H. F. de Paravicini, Esq., Heathfield, Bracknell. Some grand Grapes were staged by Mr. Ashman, gardener to C. D. Crews, Esq., Biljngbear Park, Wokingham, who was the only exhibitor. Mr. Ashman was also first for a collection of fruit.

Cottagers' vegetables were very fine, the first prize collection of six varieties being as good as those in the gardeners' class. It is hoped that the Show was well attended, as it certainly deserved to be.

#### TWICKENHAM.

THE Twickenham Chrysanthemum Show has become of considerable importance in the district, and has taken a place amongst the most interesting of those held around London. The date was this year, however, somewhat against its success, as several large shows had been held in its neighbourhood a week before, and these had attracted some of the best exhibitors of blooms. The Committee had, however, good reason to be satisfied with the results of their efforts, towards which Mr. J. J. G. Pugh (the Hon. Secretary), Mr. Bates, Mr. Freshwater, and others had done so much.

The chief winners can only be noted, and it may be said that the groups arranged for effect were the chief features in the plant classes. These were arranged near the sides of the hall, each in a space of 50 square feet, a belt of Ferns or decorative plants not exceeding 1 foot wide being allowed. The prizes were won by Mr. R. Mitchell, gardener to W. Cunard, Esq., Orleans House, Twickenham; Mr. J. Parsons, gardener to T. Twining, Esq., Perryn House, Twickenham; Mr. A. H. Rickwood, gardener to Dowager Lady Freake, Fulwell Park, Twickenham; Mr. W. Fitzwater, gardener to H. Labouchere, Esq., M.P., Pope's Villa, Twickenham; and Mr. J. Waldie, gardener to J. Bigwood, Esq., M.P., The Lawn, Twickenham, in the order named. Mr. J. Sallows, gardener to Miss Vaughan, Minden Rose, Twickenham also gained a first prize for four trained specimens, capitally grown examples, in his usual style.

The cut blooms were fairly good, especially those from Teddington, which secured nearly all the more important prizes. The following were the successful competitors:—Mr. E. Coombes, gardener to W. Furze, Esq., Roselands, Teddington; Mr. C. J. Waite, gardener to the Hon. W. P. Talbot, Esq., Esher; Mr. J. Parsons; Mr. W. Davies, gardener to J. P. Chappell, Esq., Weir Bank, Teddington; and Mr. C. Garrod, gardener to J. R. Tindale, Esq., Orford Lodge, Twickenham.

Fruit and vegetables, with cottagers' produce, were also well shown, and occupied several rows in the upper part of the Hall.

#### RUGBY.

THE Rugby Society is making steady progress. Each year some improvement is manifest in the Show, and this season was no exception to the rule, for cut blooms, plants, and groups presented a decided advance. The Committee is a practical one, and the members are fortunate in possessing a most industrious and capable Secretary in Mr. W. Bryant. In the class for thirty-six blooms, eighteen incurved and eighteen Japanese, there was a capital competition, Mr. William Fineh, gardener to J. Marriott, Esq., Queen's Road, Coventry, securing first honours with neat well finished bright blooms of the following varieties. Incurved: Jeanne d'Arc, Miss Haggas, Mrs. Heale, Lord Alcester, Hereward, Jardin des Plantes, Empress of India, Empress Eugénie, Princess Beatrice, John Lambert, Princess of Wales, Mrs. Davis, Golden Empress, Violet Tomlin, Hero of Stoke Newington, Lord Wolseley Guernsey Nugget, and Princess of Wales. The Japanese were Madame C. Audiguier, Madame Baco, Gloriosum, Ralph Brocklebank, Avalanche, Sarah Owen, Belle Paule, Mr. Cannell, Etoile de Lyon, Mrs. Cannell, Mrs. Wright, Jeanne Délaux, Boule d'Or, W. G. Drover, Golden Dragon, and three others. The second place was taken by Mr. Harman, gardener to the Right Hon. Earl of Denbigh, Newnham Paddox, Lutterworth, who had creditable blooms, a little too far advanced, otherwise they would have taken higher rank. Messrs. Plowman and Sons, Market Harborough, were third. With both twelve incurved and twelve Japanese Mr. Harman was easily first, being followed by Messrs. Finch and Perkins for the second place; and Messrs. Plowman and Sons for the third. His incurved were Queen of England, Golden Empress, Barbara, Empress of India, Princess of Wales, Mrs. Heale, Alfred Salter, Emily Dale, Miss M. A. Haggas, Lord Alcester, Lord Wolseley, and Jardin des Plantes. The Japanese were Etoile de Lyon, Avalanche, Sunflower, Fair Maid of Guernsey, Madame J. Laing, Madame C. Audiguier, E. Molyneux, Comte de Germiny, Stanstead White, Thunberg, Moonlight, and another. Remaining cut bloom classes were well filled, and the quality generally good.

The chief feature in the plant classes was that for a group arranged for effect, in which Mr. Parker of Rugby won first honours for one of the best groups shown this year at any exhibition, both in the quality of the plants and blooms and the style of arrangement. Other exhibits also showed well, and there were numerous plants. Vegetables were largely shown, and fruit was also represented, together with bouquets, baskets, and miscellaneous plants.

#### FRUIT FORCING.

PEACHES AND NECTARINES.—*Earliest House.*—There must not be any further delay in putting on the roof lights and closing the house for the fruit to be ripe in May. By what is known as "hard forcing" the very early varieties may be had earlier. Alexander and Waterloo as grown here are not materially different, but in America Alexander, which originated in Illinois State, is "most widely grown as best early variety. Fruit medium to large; greenish white, nearly covered with deep red; flesh firm, juicy and sweet, bears transportation well, pit (stone) partly free." Waterloo originated in New York State, and is described as "medium to large, round, pale green, marbled with red; flesh adhering partly to pit, greenish white, juicy, vinous. Not largely grown." These are very much "mixed" in this country, but there is no question that Alexander as first sent out by Mr. Rivers is the better variety. Early Beatrice closely follows Alexander in ripening, and though smaller is still handsomer, indeed a very pretty fruit of good quality. This, like Alexander and Waterloo, adheres partially to the stone, and it is singular the three varieties were originated at about the same time. Early Rivers is undoubtedly the finest quality early Peach, fruit large and beautiful, pale straw with a blush cheek, very juicy and sweet. Its flesh is very melting and does not bear carriage well, and is a freestone. Well grown it is the most delicious of early Peaches. Hale's Early originated in Ohio, U.S.A., is "medium to large, nearly round; skin greenish, mostly covered and mottled with red when ripe; flesh white, melting, juicy, rich and sweet, freestone." The descriptions are American, which we give, as there is some confusion as regards early Peaches in gardens. Our estimate of the varieties is Alexander, Hale's Early, and Royal George or Stirling Castle as the three best Peaches for early forcing in order of succession, Alexander ripening a month to six weeks in advance of Royal George in the same house, therefore this must be kept in view in starting the trees. It will only be necessary to exclude frost and admit air freely at 50° until the buds commence swelling, when it will be necessary to maintain a temperature of 40° to 45° at night and 50° to 55° by day, admitting air moderately at the latter figure, allowing the temperature to rise to 65° from sun heat, syringing the trees and every available surface morning and afternoon until the bloom buds are showing colour, after which the syringing may be discontinued, but sprinkling the house, walls, and paths may be continued as before. There must be no attempt at a close atmosphere, but allow a little air at the top of the house to lessen the condensation of moisture by the glass. The inside border will require to be supplied with water slightly in advance of the mean temperature of the atmosphere, maintaining the soil in a thoroughly moist state. Borders outside require to have a covering of leaves with a little stable litter to keep the leaves from blowing about, and lights or shutters to throw off the wet are an advantage.

*Houses to Afford Ripe Fruit in Late May or Early June.*—These should have the lights put on not later than the middle of next month, therefore have any repairs or painting attended to. When the lights are put on no fire heat should be applied except to exclude frost, and the trees not swelling the buds freely the heat may be turned on in the morning if the weather be severe to raise the temperature to 50°, which must not be exceeded in the daytime, syringing the trees in the morning and early afternoon, only using fire heat at night to exclude frost. Admit air at 50° freely whenever the weather admits, as Peaches delight in a well sweetened atmosphere.

*Succession Houses.*—Proceed with the pruning, thoroughly cleansing the glass and woodwork, whitewashing the walls, dressing the trees with an insecticide. Secure the trees to the trellis, top-dress the borders, and keep the houses cool by ventilating abundantly in mild weather. If the roof lights are moveable by all means remove them, or if off let them remain so until the time arrives for starting the trees. No frost will injure the wood if ripe, and if not thoroughly matured in wood and buds satisfactory crops are not obtainable.

PINES.—Young stock suffer irreparable injury from being kept too close and warm, particularly at this season, the plants being drawn and weakly. Well ventilated span or three-quarter span-roofed pits or small houses properly ventilated and heated are the most suitable for Pine growing. A temperature of 65° at night should not be exceeded, but a mean between that and 55° at night, which, with 65° in the daytime, will keep young stock gently progressing, admitting a little air at the top of the structure at 65°, leaving it on all day, but not to lower the temperature below that point, and when the sun raises the temperature to 75° a free circulation of air should be allowed. Keep the bottom heat steady at 80°, avoiding anything approaching to a damp atmosphere, moderate humidity will suffice. Apply water only when the plants become dry, and then give weak liquid manure. Keep the glass clean, the plants near to it, and allow them plenty of room.

Suckers ready for starting now may be kept until March, and if there is likely to be a scarcity of suckers any recently potted may be retained in 5-inch pots, affording a light position in a moist pit with a slight bottom heat, and a temperature of 55° at night, keeping them

rather dry at the roots. In the fruiting department  $65^{\circ}$  will be ample at night,  $5^{\circ}$  lower in the morning in cold weather,  $70^{\circ}$  to  $75^{\circ}$  by day. Take every opportunity of collecting leaves whilst dry, Oak and Beech being the best, and whenever a favourable opportunity offers push forward whatever may be necessary in the renewing or augmenting the fermenting beds.

**CHERRY HOUSE.**—Attention must be given without delay to pruning the trees. Those full grown and regularly stopped during growth will require very little pruning. Shoots not wanted for extension or filling vacant space should be cut back to about an inch from their base or the current year's growth, and the worn-out spurs as well as the decayed may be removed. The terminal shoots in the case of young trees not full-sized must not be shortened unless the extremity of the trellis is reached, and the central shoots of young trees will require to be cut back as may be necessary to originate shoots for filling up the space regularly, care being taken to always prune to a wood bud. Fan training is the most eligible system, particularly suited to the Cherry, as it admits of replacing any branch that may fall a prey to gumming. The house should have a thorough cleansing, the trees being washed with soapy water, 4 ozs. softsoap to a gallon of water, and then dressed with a composition formed of half a pound softsoap to half a gallon of water, half a gallon of tobacco juice, with four parts flowers of sulphur and one part of slaked lime, applying with a brush, being careful not to injure the buds. The lights may be placed on, but the house must be thoroughly ventilated until the time arrives for starting the trees, but it is better if the lights are left off.

**CUCUMBERS.**—Winter fruited are generally too precocious, and unless the plants are extra strong two-thirds at least of the fruit showing should be removed. Remove also the male flowers and tendrils, with any superfluous shoots and bad leaves, but do not stop the growing points too much for the next few weeks, affording water moderately—a supply twice a week will suffice. Plants growing in pots or boxes will require water oftener, with liquid manure occasionally. A night temperature of  $65^{\circ}$  to  $70^{\circ}$ , falling to  $60^{\circ}$  in severe weather,  $70^{\circ}$  to  $75^{\circ}$  by day, advancing to  $80^{\circ}$  or  $85^{\circ}$  with sun will be suitable. The roots will require moderate earthing from time to time, taking care that the soil has been previously warmed, press it firmly, but not hard. The bottom heat should be kept steady at about  $80^{\circ}$ . Atmospheric moisture will require to be kept up, but it must be moderate, damping only on bright mornings or early in the afternoon. A night covering over the roof lights of mats, canvas, or frigi domo is highly advantageous, but it must not remain on by day to the exclusion of light, every ray of which the plants must have. Remove old foliage and exhausted growths from the autumn fruited, avoiding overcrowding, and especially overcropping. Fertilise the flowers during a continuance of dull weather, and keep water from the young fruit.

**STRAWBERRIES IN POTS.**—Examine the drainage of pots being introduced to houses for forcing, making sure that it is clear. Remove the loose surface soil, applying a dressing of dried cow dung or horse droppings rubbed fine, adding a twelfth part of steamed bone dust or other approved fertiliser well incorporated, then watering with a rose watering pot, so as to bring it into a moist state, for if placed on dry it will be washed off in watering the plants. The plants may then be placed in position after removing any dead leaves, making sure that there is no deficiency of water at the roots, for the old leaves will not show a deficiency of water until the soil is very much too dry for healthy root action, therefore rap the pots, a practised hand will tell by the sound which plants are needing water. La Grosse Sucrée and Vicomtesse Hericart de Thury are excellent varieties. Noble and Auguste Nicaise may also be introduced, but they should be brought on very gradually.

**PLUMS.**—These are not often forced. They, however, are amenable to the same treatment as Cherries. In pruning, all last year's growth will need shortening; superfluous shoots may be removed, avoiding having the shoots too thickly placed. Dishes of Plums grown under glass are always welcome at dessert. Early Favourite, Denniston's Superb, De Montfort, Green Gage, Jefferson, Transparent Gage, Kirke's and Coe's Golden Drop are excellent sorts and come in succession. The fan system of training is the best, for Plums are liable to lose the branches. It is necessary that they have the roots restricted to a border of good soil not too extensive, for in wide, deep borders the trees grow too luxuriantly. Trees three or four years trained to walls are the most suitable for planting in houses. Strong loam, preferably marly, is the most suitable soil. Add a sixth of road scrapings and a similar proportion of old mortar rubbish to clayey loam. If the soil be light, add a fourth of clayey marl. A 2-foot depth of border and 1 foot of drainage, secured by a layer of old mortar rubbish, will suit Plums well, feeding the roots by the surface. The house must be light and well ventilated.

#### KITCHEN GARDEN.

**FORCING RHUBARB.**—Fortunately our Apple supply is a most abundant one this season, but in many cases it is not, and the demand for fruit or produce to make tarts in the kitchen will induce many to force as much Rhubarb as possible. Strong, healthy roots only should be used, and the whole clump must be introduced without cutting it in any way. Until January the roots cannot be forced freely in the ground, and the best way is to lift them, and if they can be placed in the corner of a Cucumber or Melon pit, where there are pipes to give a bottom heat of  $85^{\circ}$ , and an air temperature of  $65^{\circ}$  or  $70^{\circ}$ , growth will soon appear. We also force a few roots over a flue near the boiler, and have had much good Rhubarb from under the stage in a miscel-

laneous plant-forcing pit. Wherever there is a warm corner a Rhubarb root or two may be introduced, and in all cases the crowns should be covered with a little straw or a layer of leaves. The most acceptable forced Rhubarb is always produced in the dark, and the light should be screened from it as much as possible.

**FORCING SEAKALE.**—Like Rhubarb this takes from three to five weeks to be ready for use after being introduced to heat. We place a number of roots in 12-inch pots, the crowns only being above the soil. The pots are closely covered and plunged in bottom heat if possible. We also make up a good hotbed in a dark shed, and plunge some of the pots there. The growth is not so rapid as in a heated house, but much good Kale is produced.

**MUSTARD AND CRESS.**—As the supply of Lettuce, Endive, Cucumbers, and other salads decreases the demand for Mustard and Cress will increase, and they are more easily produced than any other salading. They may be cut in a week or little more after the seed has been sown, and a quantity can be prepared at a short notice. A thin layer of soil is placed in the bottom of some cutting boxes, it is levelled and firmed, and the seed is sown on the surface without covering. Those boxes are then placed in a warm house or any odd corner, and the supply is always certain.

**CHICORY.**—In this we have another useful winter salad. The seed is sown in May, the plants thinned or transplanted to 8 inches or 10 inches apart, and allowed to grow into strong thick roots. We lift and pot these like the Seakale; then they are plunged in a little bottom heat in a dark atmosphere, and they soon form a large head of pale cream-coloured leaves, which are excellent for salads. If half a dozen potfuls of roots are introduced to heat occasionally during the winter a salad will always be obtainable.

**REFUSE HEAPS.**—It does not matter what the size of the garden may be, there is always an accumulation of refuse in it, and this is a good time for making up heaps to decay, and a manure will be formed that will be found most valuable when the time comes for planting Potatoes and other root crops. To prepare it more rapidly it should be turned over once a month or so, and if a quantity of soot be mixed in it will improve the mass greatly.

## THE BEE-KEEPER.

### APIARIAN NOTES.

SINCE November 1st the weather has been changeable—from fine to stormy, with heavy rains. The 13th was a field day for the bees, pollen from three different sources being carried in freely, and in large pellets. Many late-bred bees availed the opportunity of airing themselves, and most hives had their complement. The more opportunities bees have of airing themselves the healthier they are, but unless the temperature is near  $50^{\circ}$  and the air calm it would be as well they had two months' repose. We have known them sixteen weeks closely confined to their hives without suffering. The heavy rainfalls, with the highly saturated condition of the ground, is against outdoor labour being proceeded with, and a week or two of dry weather would be welcomed alike by gardener and farmer.

#### MANIPULATING BEES.

Beginners have sometimes too great a desire to manipulate, and very often at a time the most injudicious for the good of the bees and their own safety. The mildest tempered bees can be provoked to sting by untimely and injudicious meddling! Some varieties of bees are more spiteful than others, but none of the varieties can be bred to be harmless. During a honey glut with a little caution supers may be added or removed, the hive opened, and combs examined with impunity. The same may be done with bees heavily fed. But to attempt the opening of hives at a time when the bees have neither been fed nor getting honey they are apt to be furious, and sometimes keep enraged and spiteful for long after, or, in other words, a perfectly peaceable colony of bees may be turned into perfect furies by injudicious and careless handling.

Some writers go so far as to say that there are naturally more vicious bees or colonies than others, and pretend to breed by selection mild tempered bees! I do not agree with that theory. The temper of bees is in a great measure affected by the treatment they receive from their owner, and by his manner and movements amongst them. It is a natural thing for bees to sting in defence of their property, and in defiance to their enemies when in front of their hives, or in their direct flight; and to say bees can be bred so as to be harmless is a sophistical mode of reasoning. Bees have a strong resentment to both men and dogs. From the moment they

are let loose at the Heather bees get frantic, and continue spiteful until the end, unless it may be during a glut of honey, but even then the outgoing bees are to be dreaded. The safest place for the bee-keeper to be when attacked is to creep as close to the side of a hive, with his face turned towards the entrance, and in a crouching position. In that way I have often escaped the fury of the bees and a severe stinging. Sheep move about the hives unconcerned, and are never attacked by bees, and this year a horse depastured amongst my hives, and was never stung, but I was always apprehensive of danger. Some odours have a great influence in raising the anger of bees, and some persons or horses will be attacked when others are unmolested. The dye from some garments, too, rouses the bees to fury and places the wearer in danger.

In addition to being careful not to rouse the bees to anger from the above the beginner should also be very careful by his movements in the apiary, being calm and never in a fighting attitude; and although advised never to interfere with his hives unless when absolutely necessary to do so, the beginner should make himself as familiar with his bees as possible by standing closely to them, drawing his hand frequently, but gently, across the front of the hive and handling it frequently. These movements go a great way to having mild tempered bees, and have the effect of putting them in the best of humour when manipulation takes place.

I never use smoke for quieting bees, as it cannot but be injurious to both bees and honey. Carbolic acid, first used by me as a quieter, and first announced in this Journal, is the safest and best; a little smeared at the entrance first, then as the covers are gradually removed, the top bars are also smeared so as not to smear the bees. They retreat at once from it, and a hum is got up that indicates other business than stinging. A feather with a little on it drives the bees to and from the places wanted.

If that is carefully gone about the beginner, instead of being disgusted at the first, as many are, gains confidence, and his love for the honey gatherers increases, and if at any time thereafter a colony gets enraged he knows how to pacify the most irascible, and he will also learn that bees cannot by any care or selection of breeding become as innocent as lambs, but by careful handling and a proper and judicious demeanour the bee-keeper may work amongst them and be unharmed.

#### ENEMIES.

Be watchful against the inroads of mice, and be sure the top of the covering of the hive is freely aired and that the roof is watertight. If through late feeding damp is engendered inside it will be advisable to transfer bees and comb into a clean, dry hive. If the floor is non-ventilating and damp it should be removed, substituting a dry one.—A LANARKSHIRE BEE-KEEPER.

## TO CORRESPONDENTS

All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

**The Two Oldest Fruits (West Riding).**—Your request for the "names of the two most ancient fruits" appears rather a curious one. We must refer you to Bible history, and you will perhaps there find that of existing fruits the Apple and the Fig are as old as any.

**Pears Shrivelling (Lankhills).**—The shrivelled specimens sent have all the appearance of having been gathered before they were sufficiently matured to be removed from the tree, and the necessary maturity is not infrequently retarded by the roots of trees of late varieties penetrating ungenial soil from which little nutriment can be derived that is requisite for perfecting the fruit.

**Treatment of Impatiens Hawkeri (B. S. G.).**—As the plants are coming into flower give them as light a position in the stove as possible, where they will not be subjected to too much moisture on their foliage from the syringe. Keep young plants in 2 or 3-inch pots close to the glass in a temperature of 60°. When ready the points may be removed to induce them to branch. Under this treatment they will grow strongly and make grand plants for early spring flowering if placed when ready into 5 and 6-inch pots. Use for a compost loam, one-seventh of manure, and a little sand. Press the soil firmly into the pots. This will prevent a soft rapid growth, which results from loose potting, and the use of leaf mould amongst the soil. I. Sultani may also be allowed to come into flower. Pinch later plants for succession, and place sturdy seedlings now in 2-inch into 4-inch pots. If these are grown close to the glass and not too warm they will be very useful when the bulk of the winter flowering plants are over.

**Banksia integrifolia (A. M. E.).**—Your plant is one of the Banksias, and bears the above name. Some time ago we gave an illustration of the plant, and as the number is now out of print, we reproduce

FIG. 67.—BANKSIA INTEGRIFOLIA (reduced).

it with the description. The Banksias are a peculiar genus of plants, the species forming which contribute largely to the native vegetation of New South Wales and other districts in the great Australian continent. These plants with their relatives the Proteas were at one time much grown in large establishments in England, but of late years they have been almost lost, and are now seldom seen except in botanic gardens. Some are perhaps more strange than beautiful, but there are several which are by no means devoid of attractions, and would add to the interest of many gardens. Of these the Australian Honeysuckle (*Banksia integrifolia*) is especially noteworthy as a free-growing and floriferous plant, which recommendations are not possessed by all its allies. The popular name appears somewhat far-fetched, as are many other popular names; but it does not refer to the habit of the plant as might be supposed, but to the quantity of nectar secreted in the flowers. *Banksia integrifolia* is a shrubby plant, usually of moderate size in cultivation, but attaining much greater dimensions in its native land, where some of its near relatives rise to a height of 50 feet. The flowers are yellowish in a cylindrical head at the ends of the branches. The leaves are narrow and undivided, dark green, and firm in texture. The plant succeeds in light turfy loam and peat, and requires only the temperature of a greenhouse or conservatory, supplying water carefully when not in flower.

**Fruitless Trees (Yew).**—When we hear that Apple, Pear, and Plum trees are "clothed with short-jointed wood and spurs, yet bear no fruit," we always wish to know if they produce blossom, as if they do, as is usual with trees that form spurs freely, the absence of fruit may be the result of frost or inclement weather in spring, which prevents the

setting of the hoped for crops. If you will inform us on this point as soon as possible we will endeavour to publish your letter, which is of a readable nature, with a reply that will not do any harm if it does no good. We fear the situation is not very favourable, and it may be the varieties are not the best adapted for it. We presume you do not know their names. You have nothing to lose by not planting for another week or two provided the roots of those in the outhouse do not get dry, as they will not if sufficiently covered with damp soil. Three years ago a tradesman ordered a number of trees, some of which he planted immediately on arrival during the first week in December, but frost and snow occurring he was advised to leave the others in the bundles as they arrived from the nursery in a cold shed. He allowed them to remain there for two months, then planted and pruned them one fine day, when the ground was dry on the surface. All these trees grew and have borne fruit, but all the others that he planted in December when the ground was wet (he forgot to prune them) died. We saw all the trees the following year, therefore can vouch for the facts of the case.

**Forcing Lilies of the Valley (J. T.).**—Any particular kind of soil is not material in the early forcing of these flowers, thousands of them being raised by packing the crowns or clumps in pots or boxes of cocoa-nut fibre refuse, and forced in pits having bottom heat of 85° to 90°, and top heat ranging from 70° to 80°. The crowns are either covered 2 or 3 inches deep with fibre, or otherwise kept dark and constantly moist. When forced into flower early or before Christmas the crowns are of little or no further use. For spring flowering the crowns or clumps may be firmly potted now in a mixture of loam, leaf mould, and sand, the former preponderating, and buried in fibre or ashes in a frame like Hyacinths. The requisite number of pots can then be withdrawn at intervals and placed in a warm house so as to maintain a prolonged supply of flowers. If the pots can be plunged in a warm bed growth will be accelerated, and it is well to cover the crowns an inch or two deep with fibre or leaves. They will grow very well in a temperature ranging between 55° and 70°, or even less, but the lower the temperature the slower is the growth, and usually the sturdier the plants. If good foliage is developed, and this is well supported and matured under the full influence of light and air, late-forced plants will flower again another year.

**Vines Failing (A. S.).**—We are very sorry that after such an earnest attempt has been made to grow good Vines the result is so unsatisfactory. The roots are in a very peculiar state and suggestive of the presence of phylloxera, but we failed after a most careful examination to find any of the insects or eggs. We know the soil is not suitable, but we are scarcely satisfied that it alone is the cause of the failure. The compost is far too unctuous and rich—too full of nitrogeous matter, and too destitute of mineral, also too retentive of moisture. When pressed it is like putty, and the reverse of tempting to the roots of Vines. It is only by an effort that they have penetrated it, and it is evident they could not remain healthy in it. We do not quite comprehend the condition of the Vines when they were planted in May. They may have been raised from eyes early in the same year and planted in a growing state, and thus received a check at the outset; or they may have been last year's canes, which would then have grown freely, and in this case, if the canes were of considerable length and the roots disentangled to any material extent, a check would inevitably follow, and a vigorous summer's growth could not be expected even if the soil were more favourable for early and free root action than is the mixture before us. When planting canes are left too long the root power is apt to be frittered away over a number of shoots which push from the cane, whereas were it concentrated in one or two as low down as convenient, that is where they can receive full light, strong summer growth follows, and without this there cannot be strong healthy roots. In your case, though a good foundation was made with concrete and adequate drainage, the border was made very much too large, and the soil far too rich. It would have been better without any manure, except on the surface. Then a check may have been received as suggested, even if the roots were free from parasitical insects, and we cannot say they were. The action that has been taken now of narrowing the borders to 4½ feet, and cutting down the Vines, also all the decayed roots, we consider right, but instead of adding more manure a large addition of lime rubbish, wood ashes, and coarse sand would have been much more beneficial. We doubt if fresh roots would start freely in such a wet rich medium. If the Vines were ours we should take them up, pot or place them in a free gritty compost, and keep them cool until spring, then plant them when growth commences. In the meantime we should spread lime rubbish 4 inches thick on the surface, or failing this chalk, which we think is plentiful in your district; also some newly slacked lime, say nearly half an inch thick, as well as all the wood ashes you can obtain, and some coarse sand, well incorporating these additions with the soil. The sooner this is done the better, and a month before planting we should have the border turned over again. At present some of the loam is nearly saturated, and as the border is inside the twice turning would sweeten the mass and render it infinitely more suitable for Vines than the border is now. All requisite manurial ingredients can be given on the surface, and we should mulch over the roots after planting, but not with a rich close manure, like a plaster. But we have another suggestion to make that may or may not be acceptable, and indeed may or may not be necessary, for we do not know the actual condition of the present Vines; therefore our suggestion shall be made for consideration only—namely, the advisability of procuring fresh and good planting canes. These well managed would make strong growth, and those now in possession may do. That is for you to consider and

determine. If fresh Vines are decided on they should be ordered at once, cut back on arrival to good eyes as low down as possible, so that when planted growth can start under the full influence of light. It would be advisable to dress the ends with styptic or knotting, to make sure against bleeding, and the Vines should be kept quite cool through the winter, and planted when they make an inch or two of growth in the spring. We regret the misfortune, which, however, is not the first by many of the same kind, nor will it be the last. It is the result of overzeal, an evident desire and earnest effort to win success, and we trust the gardener who has made this endeavour will still be rewarded with a fine house of Grapes.

**Names of Fruits.**—The names and addresses of senders of fruit to be named must in all cases be enclosed with the specimens, whether letters referring to the fruit are sent by post or not. The names are not necessarily required for publication, initials sufficing for that. Only six specimens can be named at once, and any beyond that number cannot be preserved.—(A. G.).—1, Doyenné Boussoch; 2, Dunmore.

**Names of Plants.**—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (F. P.).—1, Colletia horrida; 2, Colletia cruciata. The others were not in suitable condition for determination. (S. T.).—1, Adiantum farleyense; 2, Adiantum macrophyllum; 3, Asplenium bulbiferum. (W. W.).—1, Selaginella Kraussiana; 2, Selaginella Martensi.

## SWINE.

THE first farrow of pigs of a young sow is not usually so numerous as those which follow it, yet many closely approach the average of ten pigs. Three well-bred Suffolk sows have had their first farrows during the last four or five weeks, and they amount to a total of twenty-six pigs, two sows having each had eight, and the other ten pigs. The first farrow will soon be weaned, and though the sow is somewhat low in flesh she is by no means down to the bag of bones level, or anything like it. Judicious breeding and feeding both tell in her. She has suckled her pigs thoroughly well, and now takes rank among our most valuable sows. The pigs are sturdy, thriving, and healthy. They have had a low shallow trough outside the sows' sty, in which they have had milk thickened with meal regularly, milk alone being given at first for a few days, the meal being added gradually.

Each of these sows has its own sty, of a uniform size of 8 feet square, with front courts a little larger. Stys and courts are made quite clean every morning, while the first meal is being consumed, clean dry litter tending wonderfully to render the sows quiet and contented. At this season of the year all pigs revel in abundance of dry litter into which they can burrow for warmth, and all should have plenty except farrowing sows, for whom only a moderate quantity of short litter is best, just enough for a bed and no more. The sows should not be disturbed at the farrowing, but it is always desirable that the stockman should be near in case of any emergency, as, for instance, in a case where pigs only a few hours old were attacked by rats, and one of them killed, or where the sow is very restless, and it may become necessary to remove the pigs for a short time. This can easily be managed by giving the sow a warm mash, and while she is eating it everything possible should be done to make her comfortable, and she will soon settle down quietly with her pigs. Care and attention tell in this as in most things, and while in the majority of cases the sows are best left to themselves, yet occasions are certain to arise when help may usefully be given.

After the pigs are withdrawn from the sow she ought by no means to be turned out in a yard to subsist upon a daily Mangold or two, and what water she requires. By all means let her have some Mangolds and Turnips, but she ought also to have a little corn or buttermilk slightly thickened with coarse middlings for the due promotion of health and strength, and the recovery of condition lost in suckling her pigs. In a breeding sow we require neither fatness nor leanness, but a mean between the two extremes if we would have a healthy and abundant progeny.

Young pigs require no costly buildings or separate piggeries. A well littered open hovel or lodge, with a yard in front of it, and perhaps a division or two to separate bacon hogs from porkers, is all that is really requisite, but they must be kept clean and well fed, and then there need be no fear of infectious disease among them. Never let it be forgotten that in nine cases out of ten swine fever comes to a farm in newly purchased animals or strange sows. Let it be an inflexible rule to keep all strange pigs or new purchases apart from the home stock till it is seen that they are quite sound and free from disease of any kind. Such precaution is a very simple matter, but it is often neglected; disease makes its appearance, losses follow, another case of swine fever is reported, and, strange to say, its origin is generally regarded as a mystery. If a little common sense were brought to bear upon this matter, and due precaution taken, there would soon be an end of contagious disease among pigs. Why should they be kept in a filthy state more than any other animal? From mere custom the surround-

ings of pigs are suffered to become repulsive, yet a well kept piggery is really an attractive sight to all who care to see good practice in farming.

The question is sometimes raised whether it is best for farmers in a small way to keep breeding sows or purchase young pigs at about two months old. There is so much in favour of breeding one's own pigs that we do not hesitate to vote for the sows, provided they are well bred, and are not kept on when they become so big as to be unwieldy. Then they should always be fattened and sold, not killed for home consumption, as the pork is coarse and somewhat hard. There is always a market for fat sows, and we have sold them at all prices, from £4 up to £10 apiece, precisely according to size and quality.

## WORK ON THE HOME FARM.

A fine and exceptionally mild period in November proved most favourable to all crops. With us sowing began early, seed germination followed quickly, and the plant came full and vigorous. Whether taken collectively or separately the crops are alike good. Wheat and Winter Beans are both very good. The Wheat passed through the first of its five stages—that of germination—so well that the second stage of rooting is sufficiently advanced to give the plant a wonderfully vigorous appearance. The importance of free root action in the Wheat crop cannot be over-estimated, for it continues slowly throughout winter steadily taking up nutriment from the soil, which contributes so much to the third stage of straw and ear development, and tends as much as anything, perhaps more than anything, to a final result far above the average. There can be no doubt, too, that early sowing and vigorous root action both tell favourably upon the fourth stage of flowering and full corn in the ear, as well as upon the final stage of maturity which is much accelerated. Of course nothing we can say now can affect the Wheat sowing for good or evil this season, but a useful lesson for future guidance may best be enforced while special attention is being given to the condition of winter crops.

Rye is wonderfully vigorous, so are Winter Oats and Barley. Tares and Trifolium are equally good, and layers both of Clover and mixed seeds are remarkably luxuriant. Cattle Cabbage, even when planted late, are a full and heavy crop, roots are abundant and the silage stacks are much more bulky than the hay stacks. On the whole the outlook is satisfactory, there is an ample store of winter food and fair promise already for another season.

More work than usual has been done on the land this autumn, and now that is at an end we are turning to corn threshing in real earnest. The best malting Barleys are being threshed and brought on the market as fast as possible, the price for really bright samples being so much above market quotations as to render it quite worth while running them through the corn screen a second time. Prices range from 29s. 5d. up to 46s. per quarter, the higher sum being sufficiently remarkable to have special mention. It points to a profit so good as to enforce the importance of good culture and pure samples better than anything we can say, and shows that Barley growing is not only still profitable but is likely to continue so.

\* Thermometer covered by a fresh fall of snow.

## REMARKS.

- 23rd.—Rain in small hours; windy and overcast day, with occasional spots of rain.  
 24th.—Wet in small hours, and heavy rain at 3 A.M.; almost cloudless from sunrise to 9.30 A.M.; wet from 10 to 11 A.M.; then fine again, and clear cold night.  
 25th.—Generally bright in morning; overcast, with spots of rain, in afternoon; bright night.  
 26th.—A sprinkling of snow on ground; alternate spells of bright sunshine and slight sprinkles of snow; clear cold night.  
 27th.—Bright early; frequent slight sprinkles of snow in morning; bright afternoon and evening.  
 28th.—Snow believed to have commenced between 2 and 3 A.M.; fell incessantly till 3.30 P.M., and just a sprinkle at night, covering the ground to a depth of nearly 2 inches.  
 29th.—Overcast, with occasional flakes of snow in morning; fair afternoon; bright night.  
 Very sharp frost in the latter part of the week, which has brought the mean much below the average. The minimum on the 29th, 29.5°, is the lowest recorded in November since 1858.—G. J. SYMONS.

**M**AINTAINING the requisite amount of heat for the well-being of plants, also of such fruits and vegetables that need it, is one of the most important duties of gardeners, as well as of amateurs who derive pleasure from indulging in gardening under glass. These are increasing every year, and scarcely any villa is now regarded as complete without a conservatory. The public appreciation of glazed structures is so decided that speculative builders find it advantageous to invest in these adjuncts to homes for rendering them more tempting to tenants and purchasers, and it is well known that the trade in portable greenhouses for amateurs has increased enormously during recent years. It is gratifying to know that this is so, because homes are made pleasanter and families happier through a real interest being taken in the cultivation of plants and flowers under glass in winter, and Grapes, Tomatoes, or Cucumbers in summer. No doubt, difficulties are encountered in the pursuit in question; but these more often than not have given zest to endeavour, and first failures have not infrequently pointed the way to future success.

A chief difficulty that many have to contend with is that of heating; and these are not amateurs alone, but several gardeners. Much more is often expected from the provision afforded than can possibly be accomplished. The heating arrangements in many gardens are seriously defective. Perhaps the most apparent faults are those arising from motives of economy in unduly limiting, not so much the power of boilers, as the piping by and from which the heat is to be diffused. It is not in the least uncommon to find boilers capable of heating twice the extent of piping provided, and which is necessary for heating the structures satisfactorily and economically. When the requisite heat cannot be afforded without "keeping the water boiling," the piping is inadequate. Not only are very highly heated surfaces inimical to plants, but involve a much greater expenditure in fuel than suffices to heat a greater length of pipes moderately; or, in other words, a small outlay in providing additional piping where it is needed would reduce the consumption of fuel to a material extent, and thus in the end a distinct saving would be effected. For maintaining the requisite temperatures in glass structures in a manner the most beneficial to vegetation the pipes ought not to be hotter than can be borne by the hand for a few minutes, as a rule. Occasions may arise when it may be necessary to have them hotter for a short time, but undoubtedly the greater the overheating as a system the less healthy will be the plants, and the greater their liability to be attacked by insects. It is, therefore, decidedly false economy to unduly limit the extent of pipes for the purpose for which they are provided.

The most effectively heated houses are those in which the required temperature is maintained the most easily, or by an apparatus that is well master of its work when properly attended to. A gentle fire that can do what is wanted without being disturbed for ten or twelve hours will not consume half so much fuel as will a "roaring" fire in half the time, and which cannot be safely left for more than two or three hours in severe weather without the temperature falling below the safe minimum. There cannot be two opinions as to the former method being the easier, while it is decidedly the cheaper, as well as indisputably the more reliable. In the one case the owner or manager can rest comfortably after he

has done his duty, and in the assurance that all will be right; but in the other he cannot divest himself of anxiety, for he is conscious that, with practically no margin for contingencies, something may happen when he is helpless to prevent, and which may have serious results.

Some heating arrangements are faulty through the ill-setting of boilers and arrangement of pipes. The fire cannot act too directly for heating the water, nor can this flow out of the boiler too freely and along the pipes too smoothly. In not a few instances the water is obstructed in its very first movement by the infinitely too small connecting pipe from the boiler and through masonry to the larger pipes in the house. Even if those connections are clear they are insufficient, but in scores of cases they are half choked with fur. What is referred to as the "stuggish action of boilers" has been traced over and over again to the defect in question, and there are no doubt numbers of boilers at this moment "throttled" in the manner indicated, while the cause of the difficulty in heating is not suspected.

Not a few boilers that are good in themselves, and with little or nothing the matter with the connections or arrangements, do not perform their work as they ought, because the parts exposed to the fire, also the bars and flues thereto pertaining, are not kept clean. This work is usually entrusted to young men, and these vary in the management of fires and stokeholes. Some are careless and slovenly in their work, others the reverse; and further, it may be said that some men who have been long out of their teens do not appear to fully comprehend the importance of removing every obstruction of the nature suggested, and neither do the requisite work themselves nor see that others do it. Discoveries of delinquencies in these matters have often been made which have led to sayings and doings not of a pleasant nature. The truth of this is known to dozens of gardeners, old and young, who will read these lines, and if their publication will induce all who are responsible for heating to look closely into the conditions of stokeholes and boiler surroundings it is almost certain that something will be found open to improvement, unless (which is better) the stokers are on the alert, have the first inspection, and promptly make good any defects in past management. A disorderly stokehole is generally the index to something worse—namely, the general careless habits of the man in charge. A person who conscientiously does work well that is out of sight soon gains, as he deserves, a character for trustworthiness that is bound to stand him in good stead in after life.

A great deal depends in the management of fires on maintaining a suitable temperature in garden structures. A thoughtful man, who looks ahead and forms a reasonably good forecast of the weather a few hours in advance, and who commences action in good time, will accomplish the object in view far more easily, and with less fuel, than will another who allows himself to be taken by surprise by a (to him) unexpected fall in temperature, and then makes violent attempts to "raise the glass," that ought not to have fallen so low. Amateurs, especially the comparatively inexperienced, are prone to err in not starting the fires soon enough in the afternoons of bright days. The temperature in the house may register 50° or more, therefore all is thought to be right though the pipes are cold and the sky cloudless. They, therefore, wait for a little while, and perhaps in half an hour the cold has increased by from 5° to 10°. They then rush to wood, coals, and petroleum, but do all they will they cannot arrest the downward movement as indicated by the thermometer, and the danger point is reached in spite of all their efforts. They simply allow the cold to steal a march on them and prove the master, whereas by earlier action they might easily have kept it in subjection, and without difficulty prevented the temperature falling below the prescribed minimum, always provided the heating medium was equal to its work. And not only is early action in the daytime, in anticipation of a cold night, necessary to be master of the position, but early attention

in the morning is equally important. Great has been the injury done to plants, and during forcing operations, by a chill more or less severe a little before daybreak, when the cold is often the greatest, and fires have burnt down or become clogged, and the pipes have lost heat accordingly. However carefully the fires may be attended to at night, and they cannot be attended to too carefully, the work is only half done, and can only be complete and satisfactory when resumed before the dawn of day during the winter and spring months.—EXPERIENTIA DOCET.

### RENOVATING ORCHARDS.

[A Paper by Mr. JOHN WRIGHT, read on behalf of the British Fruit Growers' Association, at a meeting of the Falmouth Horticultural Society, November 12th, 1890.]

(Concluded from page 486.)

ONE of the most remarkable instances of improving fruit trees not on grass that has come under my notice was in the garden of Mr. Edmund Tonks, a gentleman of great scientific attainments and practical skill in Warwickshire. He planted an extensive collection some years ago, but the trees appeared to become old prematurely, growth practically ceased, the stems were as if devoured by canker, and the fruit was worthless. The soil was heavy, and, as was subsequently found out, poor, or in other words, contained little of the manurial essentials for maintaining healthy growth. Having ascertained what the soil lacked, and what Apples needed, the necessary ingredients were obtained and applied. These were superphosphate of lime twelve parts (or lbs.), nitrate of potash (saltpetre), ten; chloride of sodium (common salt), four; sulphate of magnesia, two; sulphate of iron, one; and sulphate of lime (gypsum), eight. These were well mixed in the proportions named, and applied to the soil yearly at the rate of quarter of a pound to the square yard. Improvement was soon manifest, and when I saw the trees at least 10,000 canker wounds were healed, and not one could be found in which the disease was active, yet nothing had been applied to the branches. In that case canker was the result of starvation, and with proper food the trees were restored to health and usefulness. The above may be said to be a complete manure for Apples, but as the majority of soils are not lacking in all the essentials, what may be called simpler applications usually do great good. The liquid manures above alluded to contain most of what is required, and in their absence a mixture of six parts (or pounds) of superphosphate of lime, three of muriate of potash, and two of sulphate of ammonia, applied at the above rate will generally improve enfeebled trees, as also will guano guaranteed to contain not less than 8 per cent. of ammonia, and 20 per cent. of phosphates. All chemical manures used as top-dressings should be applied not later than February; sprinkled on the land in late spring or summer they do little good, as they are apt to remain undissolved for a very long time, and therefore cannot be taken up by the roots. If used in solution they act quickly. For enfeebled fruit trees a pound of guano may be dissolved in 10 gallons of water, or the same quantity of the "simple mixture" above mentioned, either of which, applied in winter, will be bound to do good if it reach the roots. It may be mentioned that the strength named is twice what suffices for general garden crops other than trees. A peck of poultry or pigeon manure dissolved in 20 gallons of water is also excellent for debilitated trees. A farmer of my acquaintance gives a water-cartful of stable drainage to a favourite Apple tree every year when it is swelling its blossom buds, and it seldom fails to reward him with £5 or £6 worth of fruit, "leaving a profit," he said, "greater than he could obtain from an acre of Wheat." If he applied the liquid earlier it would do just as much good, possibly more, but given much later would be much less effectual. The tree is on grass, and the variety Gascoigne's Scarlet Seedling.

Something must be said on pruning in the renovation of enfeebled orchard trees. The interior of many trees is just a thicket of useless growths, fruit being produced on what is termed the "outside" of the trees only, where the leaves are exposed to the light and air; indeed, it cannot be produced under any other conditions. The aim, then, of the improver should be to invigorate those outside growths, which, perhaps, do not extend more than an inch or two a year. They must not be shortened nor materially thinned out, but the pruning must be confined to the removal of the useless shoots and small branches that start from the larger or "arms" of the tree, and push upwards in their endeavour to reach the light. They bear nothing but leaves, and it is not in the power of man to make them do anything else; but what they do is this: they divert the sap from the fruit-bearing parts, and to that extent deprive them of the support they need for making them stronger and more productive. The crowd of growths in the centres of old

trees where no sun and little light can reach may be likened to robbers, and should be cleared out. Shortening them will not suffice, but may make matters worse; they should be cut or sawn off close to the large branches from which they spring, and the wounds pared smooth with a sharp instrument. The sap will then flow direct to the fruitful parts, and these will be strengthened accordingly. If the soil is enriched the growths will be still further strengthened, and may be trusted to find themselves room on the outsides of trees; at least when these stand, as they should, distinctly apart from each other.

It will be seen that the method of renovation advocated resolves itself into this—giving the famine-stricken trees the food they so urgently need, and clearing the way for its distribution through the stems to the spur and fruit-bearing parts that are exposed to the direct action of light and air; but in removing the obstructive growths from the interior of trees, what may be termed a small matter of very great importance, must not be overlooked, or the trees will soon be choked worse than ever. In the spring following the pruning, which cannot be done too soon, clusters of young shoots may push from the main stems from which the useless parts have been cut. Obviously if these are allowed to extend they first divert the sap from where it is required for fruit production, and subsequently and soon fill up the trees with another horde of robbers. Nothing is more easy than to prevent this, and nothing more certain than that it has not been prevented in the case of thousands of trees, and the pruning has consequently been proclaimed as having done no good. Of course it has not under the circumstances, but that is the direct result of either thoughtlessness or negligence. What ought to be done is this—when the young spring growths referred to are an inch or two long an active man should rub every one of them out by the socket, going over the tree two or three times if needed. Cutting them off is of no use. The work is quickly done, and is absolutely necessary if the pruning is to be effectual.

Cleansing old and neglected fruit trees is a necessary operation in their regeneration. Not the stems alone, but the branchlets and fruiting spurs may be thickly covered with moss and lichens. The incrustations should be scraped from accessible parts, and then lime-washed, and where the scraping cannot be done, as in the most important parts—among and around the fruiting spurs, these should be thickly dusted with freshly slaked lime on a still day when every tree is dripping with wet, such as after a mist or fog. It is easily and quickly done. Send a man with a scuttle of lime on his arm up a ladder that reaches well above the tree. Let him dash the lime about in all directions, under and over the branches, sparing it not, yet letting every handful "tell," and if he does his work well the trees when dry will be as white as if covered with hoar frost, and the moss will vanish, leaving the wood perfectly clean. Nor should the lime that falls on the ground be considered as wasted. It will do great good. There can be no really healthy trees without lime in the soil, and there is seldom any in that of old orchards, except on the limestone formation, and often not enough there in the upper layer of soil, for it has either been washed down by the rains or extracted by the trees during their long occupation of the ground. The application of lime in the manner advised is unquestionably highly beneficial to moss-laden fruit trees.

Insects when present must be extirpated. One of the worst of these is the woolly aphis or American blight, which often crowds into every crevice, punctures the bark, and does incalculable injury. It may be destroyed with a solution made by dissolving two or three ounces of soft soap and a walnut-sized lump of soda in a gallon of boiling water, and while hot stirring in violently half a gill of petroleum, such as is burned in lamps. It should be brushed well into insect-filled crevices, stirring the mixture as the work proceeds, and some may be syringed with advantage all over the trees. Fruit trees syringed every winter with this mixture are usually kept free from moss and insects on the stems, though some may attack the leaves in summer. Pure petroleum has been advised for fruit trees, and though in some cases it may not have done harm, in others it has proved fatal to the trees. It is wasteful and foolish to resort to dangerously strong remedies when weaker and quite safe applications are effectual.

The subject of renovating fruit trees is a great one, and unquestionably important. It cannot be usefully treated in a few words; therefore, at the risk of being tedious, I have felt it undesirable to skim over the surface, and have endeavoured to describe in plain language methods which have proved successful in accomplishing the object in view. But while many old orchards may be, and should be, greatly improved, I am convinced that the fruit of the future that will command attention in our markets will be the produce of vigorous young trees not planted in or on the sites of old plantations either of fruit or of forest trees, but in fertile soil (not in damp valleys), such as is capable of growing first-class crops

of Wheat, Clover, and Potatoes. Let all who have old orchards make the best of them by all means, but also let all who can do so plant young trees.

### THE GLADIOLUS—HYBRIDS OF GANDAVENSIS.

THOSE who grow this most beautiful autumnal flower have carefully harvested the corms, and are eagerly scanning the catalogues of the raisers as to what new varieties may be added to their list; those who have not grown them have taken notes of some that they have seen on the exhibition table in order that they may commence their cultivation. It may therefore be an appropriate time to say something about them, and the more especially because some statements have been made which I think are not borne out by facts. It is sometimes said that when persons grow large quantities of any flower they must know more about them than those who grow only a few. I do not believe this to be the case. I am quite sure that many amateurs know more about the peculiarities of the different varieties than those who grow ten times the number, because amateurs watch each plant, and thus it may be that the grower of a few hundred Gladioli may know more about them than does the grower of thousands.

Gladiolus *gandavensis* is itself a hybrid supposed by some to be a cross between *G. psittacinus* and *cardinalis*, and by Dean Herbert to be a cross between *psittacinus* and *oppositiflorus*. I think the latter to be more correct, as it would account for the white flowers we get; but this is not conclusive, as we know what strange vagaries in colour we witness in many flowers. We have, for instance, in the Shirley Poppies colours of which we can find no trace in the wild Poppy from whence they originated. Whatever the parentage of this variety may be it has, under the hands of one or two cultivators, attained to great beauty, and no one can see a good stand of these set up but must be struck with their great beauty and variety of colour. Mr. Baker, who is a most accurate observer and writer, says that *G. gandavensis* was raised by Dean Herbert and sent to Van Houtte, who could not flower it; that it was sent by him to the Cape, where it flowered; and thence was sent home to Ghent and sent out by Van Houtte as *gandavensis*; but surely in this case Dean Herbert would hardly have written hesitatingly of its parentage, nor do I see why there should have been any difficulty in flowering so hardy and free-flowering a bulb. The cultivation and improvement of the plant was taken up very energetically about forty-five years ago by M. Souchet, who was *jardinier en chef* at the Palace of Fontainebleau. He retired from his office, and then, notwithstanding his miserable health, devoted himself entirely to their culture. I can look back with remembrances of special pleasure to my intercourse with the dear old man. At his death the culture was carried on by his nephew and successor, M. Souillard, associated with M. Brunelet. A few years later the late Mr. John Standish of Bagshot entered very enthusiastically, as he always did into everything he undertook, into their hybridisation; and long before Mr. Kelway came to the front his flowers obtained a certain reputation. Of course Mrs. Standish, Samuel Weymouth, and other flowers which at that time were thought most of would now, like the French ones of the same date, be considered utterly useless. The strides which have been made in this flower are very wonderful. In such varieties as Mont Blanc and Enchanteresse we have flowers three times the size of some of the older varieties, while in form, length of spike, and closeness of flowers there is nothing much to be desired that we have not obtained. It has been stated lately that the French do not admire such close spikes as we do, and that consequently the French spikes are less compact than the English. This is an utter mistake. Of course all are not equally well set; but take such flowers as Grande Rouge, Caméleon, Cervantes, Ovide, and indeed most of those which we exhibit are set so perfectly close as to overlap one another, while in length of spike they even exceed any English raised seedlings I have seen (except Mr. Burrell's), eighteen expanded blooms having been exhibited of some varieties. Mr. Burrell showed a spike of his seedling Snowdon, a grand white flower, at Sandy with twenty expanded blooms on it.

Coincident with this improvement in the flower itself has been that in its cultivation. Mr. Standish used to argue that it was best to make the soil as poor as possible, and when too rich even to burn it; but this is now an exploded notion, and the experience of most growers is that a good strong loamy soil is that which suits them best. This is the soil which Mr. Lindsell has, and which made me say to him when I urged him to grow them, "I know if you do you must beat me; your soil is so good." I believe the same of my friend Mr. Fowler of Claremont, near Taunton, and the sample I saw of his flowers the first year of cultivation at Taunton makes me think I, at any rate, shall have to take a back seat; in fact, a soil which will grow Strawberries and Roses well will grow the Gladiolus.

The time for planting them is about the beginning of March, but at any time during that month or April when the weather is favourable will do. I do not think that it makes much difference as to the time of flowering, whether it is a month earlier or later. There are some early forms, such as Shakespeare, which will bloom at the end of July, no matter whether you plant in March or April: while there are others, such as Matador, which will not bloom till the end of September, no matter how early they may be planted. The best plan is to trench the ground in the autumn where they are to be planted, leaving it up in lumps to let the frost penetrate it and sweeten it, all manure being dug in at this time. When the ground is ready for planting beds should be made 4 feet wide, to contain four rows of corms, which should be planted in rows 12 inches apart, and about half that distance apart in the rows. About 4 inches is a good depth for them, and here let me allude to a practice which is now generally practised, but which I heard condemned by an eminent authority—viz., that of cutting the corms in two before planting. If the outer skin be taken off when the corm is dug up there will be seen two if not more eyes, two at any rate. Now if the corm be divided so that each part has one of these eyes in it, you will have two plants instead of one. If the corm is left entire it is possible there may be two spikes, but very often if one is a little in advance of the other it will absorb the entire strength of the corm, so that the second shoot does not push at all. It was stated lately that this was wrong, and that it was not possible to obtain good blooms on corms if so treated. With regard to the former I can only say that all the spikes exhibited by Mr. Lindsell and myself were from cut corms. Nay, more than that, I am prepared to say that I and my friend are prepared to challenge any one amateur or professional to show eighteen blooms from cut corms against those from uncut ones, and that as to the corms produced I showed one at the meeting of the Horticultural Club, taken at random from some I had already lifted, which was between 9 and 10 inches in circumference, large enough for anything.

In planting I place some coarse road grit and charcoal about the corm. I do not like sand for pads, as it is called in East Kent, and I think it expresses very well the effect of sand—it gets close and soddened; and I do not believe, either for these or Lilies, that it is desirable to use it in this way. Of course, mixed with the soil it is useful, but not immediately about the corm. After they are planted very little care is necessary for some time, save keeping the beds clear of weeds. I believe that the Gladiolus likes a wet and moist summer better than a dry one, provided a dry autumn follows; the autumns at Fontainebleau are drier than ours, and the dryness of the autumns in Cambridgeshire gives Mr. Burrell a great advantage. When the plants are about a foot high and begin to show the spike each plant ought to be staked, and it is very necessary, as the spikes are apt to come crooked if it is not attended to in time. This is a troublesome affair where a large quantity is grown, and yet it cannot be dispensed with; it is possible, too, that the stake may have to be shifted afterwards, for it must be at the back of the flower, otherwise the blooms will be separated instead of being kept close together, and will also be rubbed: the stakes are to be about 5 feet in length, so as to let the whole spike be tied. When the spikes begin to develop is the time when artificial manure is to be applied if used at all. I have never done so, but others have used it with, they tell me, good results. My friend Mr. Lindsell employs muriate of potash. Mr. Kelway has a special preparation which he sells for the purpose. At this time, too, mulching must be done, if done at all; the action of fresh manure when it comes into contact with the corms is, we know, injurious, but I am not aware that when applied in mulching, allowing the fertilising salts to be washed down, it will do any harm. Its utility or otherwise would, I fancy, depend very much on the season. Should it be a wet season I very much question its utility, but if a dry one it will prevent evaporation, and secure a certain amount of moisture about the plants which I believe they like. On the whole, as far as my personal feeling and experience are concerned, I prefer to do without mulching.—D., Deal.

(To be continued.)

### IRON.

ITS USE IN CONNECTION WITH FRUIT CULTURE AND DISEASES.

(Continued from page 493.)

SOIL fertility rests principally on admixtures. Sand to keep it warm, and open it to air and moisture; clay to keep it moist, holding, and conserving; lime doubly benefiting as a food directly, and a liberator of other food; humus, to afford aliment and maintain a supply of carbonic acid. Alluvial soils are generally fertile through an admixture of minerals derived from various rocks. All silts

contain iron, even pond and ditch scourings. They are sweetened by lime.

Trap rocks by decay produce clay soil, containing iron 6.84, fertile—in fact, decomposing trap is a mineral fertiliser. Old red sandstone soil in Herefordshire contains “cornstones” embedded in marl, decomposing into a soil of great fertility—reddish through a large per-centage of oxide of iron. Apple and Pear trees have given Herefordshire cider and perry a world-wide fame.

New red sandstone seems to form a soil specially suited to Apples; they like red soil. Note the fact, the trias of Devonshire and Gloucestershire rival Herefordshire by its cider. Apple trees thrive on the middle lias of Somerset. Even a county (Rutland) takes its name from red land; that on the middle lias is very fertile. Stilton and double Gloucester cheese result from the rich pastures of the lias clays. Cheddar is produced by cows browsing on the pastures of the alluvium lias clay. Where fertility is there the soil is red—oxide of iron; but malm (firesione) is a calcareous sandstone of the upper greensand upholding the rich land of Farnham. Alluvial soils consist of well mixed detritus worn from various formations, and warping for the sake of the fertilising deposit is practised. Some rivers leave a deposit containing 15.65 peroxide of iron. In Lincolnshire and Yorkshire rich meadows and pastures are produced by warping. The Ouse, Derwent, Trent, Humber, Thames, and Severn have produced alluvial soils—all rich. Brick earths are “wash”—detritus worn from hills rolled down to produce rich soil in plains. Drifts are generally fertile; the boulder clay of Holderness, Yorkshire, is syenitic; Norfolk boulder clay is schist, iron borne on the bosom of ice-drifts from Sweden and higher latitudes.

There are a few facts about iron in soils not, perhaps, generally known. They are mainly gleaned from a very handy book of 176 pages, entitled “Soils and their Properties,” by Dr. W. Fream, and afford the best answer possible to the dictum, “iron is a source of injury in soils,” as is often asserted. In no case is it a cause of mischief where there is intelligent culture. It strikes Apple trees down with canker in light soils, and uproots them through canker in wet. If there is anything in facts they go to show that fruit trees are stricken in light soils through poverty—want of iron to grip ammonia; in wet soils through iron failing to get ammoniated for lack of air. In any case iron is not an enemy to, but a friend of the cultivator. Dr. Griffiths, in “Manures and their Uses,” page 99, states that on the German moorlands Thomas’ phosphate has proved equal to superphosphates. That is a clinching argument in favour of iron, but it is set down to economy—“a cheaper source of phosphoric acid.” Thomas’ phosphate contains ferrous oxide 14.66, and ferric oxide 8.64 = 23.30 iron. Peat soil contains when fertile 6.30 to 9.03, and 10.30 per cent.; sterile 0.46, 0.63, and 0.78. Moorland has all its iron washed out, hence the value of Thomas’ phosphate, but this phosphate contains lime. Fertile peat contains 1 to 5 per cent., unfertile 0.13, 0.32, 0.55, Thomas’ phosphate 41 to 47 per cent. Is the benefit, then, to be attributed to the iron? According to the German savants, the English agreeing, the phosphoric acid in Thomas’ phosphate is half as valuable as that contained in superphosphate of lime, yet it gave “equal, if not better results than superphosphate on the German moorlands.” Superphosphate ought not to contain iron oxide, but Dr. Voelcker found 4.64 in adulterated bonemeal. Clearly iron made Thomas’ phosphate equal to superphosphate on the German moorlands. On loam over clay I found no benefit from the iron in Thomas’ phosphate at 8 to 10 cwt. to the acre. A good handful, it may be stated in passing, per square yard improved the colour of Vine and Peach foliage; iron evidently is useful in forming chlorophyll, as will be shown presently.

All barren soils are deficient of iron. Sandy with a pan caused by shallow culture contain ferric oxide 2.00, humus being low 1.50, which makes just all the difference, for a black sandy mould had very little more iron, 2.13, but nearly 10 per cent. humus, and over 10 per cent. alumina, therefore it was fertile because alumina holds ammonia and iron, both ammoniating that substance. The barren had more sand, no more than a trace of potash, a half per cent. of alumina, nothing wherewith to grasp ammonia, the iron being in nodules, and wanting lime; indeed, there is no such thing as barrenness where iron exists along with lime, alumina each from 3 to 5 per cent., potash equal to 2 per cent., and phosphoric acid not under 0.25, and sulphuric acid not less than 0.10 to the extent of 4 to 6 per cent. It is injurious because it wants something to render it useful; in fact, it requires work. If none be granted it may act deleteriously. M. Ville declares that using nothing but farmyard manure exhausts the soil, but the Rothamsted investigators on this point state that where “there is a liberal use of animal manures, an accumulation of nitrogenous and mineral matter takes place in the soil.” This is conclusive, and light soils require animal manures more than heavy, for the simple reason that they lose more through

washing. Another reason is they last longer. M. Ville, however, states that only nitrogen, potash, lime, and phosphoric acid need be added to any soil in the form of manure. It seems that fertility of soils depends largely, if not entirely, on nitrification, and this on organic matter. Of course there is the organic remains of previous crops, and in the case of fruit trees their annual fibres to work on, else where does the organic matter originate where no manure is applied? Ammonia results from nitrification, is oxidised, becoming nitric acid, this unites with potash, soda, and lime, forming nitrates, and these are soluble, and become plant foods. There is something more, organic matter wherever it ferments is converted into carbonic and other organic acids, these are neutralised by lime, potash, &c., rendering some plant foods active and conserving others. Iron is a conservator of ammonia, it fixes ammonium carbonate. The stench from piggeries is notorious, and manure heaps are not always particularly sweet. Iron sulphate saves the waste of ammonia from manure by fixing it, the heap being watered with a solution of it, say 1 lb. to 20 gallons of water. Iron, therefore, is useful, a double sulphate of ammonium and iron is formed, the stench is taken away, the manure remains.

Road scrapings have virtue—iron, especially where whinstone is used or slag. All fruit trees like it along with lime; that, and silica, and iron help them to form stouter cell walls, to form flinty bark, to resist their fungoid enemies. English coprolites contain iron oxide and alumina 4.87 to 5.39 iron oxide, foreign 2.82 to 13.14 or more of iron oxide and alumina. They are best raw, especially for light soils.

Iron is present in all fertile soils, in all natural waters, and in all plants. Peroxide of iron and alumina, according to Liebig, form solid compounds with ammonia, and the precipitates obtained by the addition of ammonia to salts of alumina or iron are true salts, in which the ammonia is contained as a base. In fact, “all rust of iron contains a certain amount of ammonia” (Vauquelin), and Chevalier found ammonia a constituent of all minerals containing iron. “Soils, therefore, containing oxides of iron and burned clay must absorb ammonia” (Liebig). They further prevent, by their chemical properties, the escape of the ammonia once absorbed; but the ammonia absorbed by ferruginous oxides is separated by every shower of rain, and conveyed in solution to the soil. That gives iron some credit; but it is only half-hearted, for if iron forms compounds with ammonia it must liberate (render insoluble substances soluble) plant food. Ammoniated iron is as useful as ammoniated guanos, and better on soils derived from limestone and chalk rocks, for these set ammonia free, so that it volatilises into the air. Sulphate of iron, as before stated, prevents the escape of ammonia.

Soot contains oxides of iron and alumina 15.69 per cent. (Dr. Voelcker). How it beautifies sickly Wheat plants, puts green into Peas! Dr. Sachs says iron is indispensable to the green matter (chlorophyll) in leaves. “Iron sulphate,” Dr. Griffiths tells us, “destroys Peronospora infestans (the Potato fungus).” Prince Salm-Hortsmar tested the value of iron on Oats, “sickly and almost colourless” without it. “Knop, in 1859,” states Dr. Griffiths, “experimenting upon hybrids the most favourable to plant growth, recognised the necessity of adding phosphate of iron, or of sprinkling the roots of plants upon which he operated with this salt, and from his experiments drew the conclusion that these four bases—lime, potash, magnesia, and iron oxide—were indispensable to plants.”

Soils poor in iron oxide and lime appear most benefited by iron sulphate with an addition of lime, and on land on which, it is alleged, iron causes Apple trees to canker—viz., light, sandy loam, well drained—iron sulphate brought nearly 2 tons more of Potatoes per acre than land manured with farmyard manure and night soil mixed. The manure produced 5.02 tons, a dressing of three-quarters of a hundredweight iron sulphate per acre 6.76 tons, a gain in value of £3 2s. 3d. for an expenditure of less than £1.

Copperas or iron sulphate has long been known as an agent in the destruction of fungoid germs. Cereals are steeped in it before sowing to get rid of smut, ergot (*Claviceps purpurea*)—indeed, it is an antiseptic of the first order. It effectually destroys ergot in grass seeds, and there foster ergot through farmers allowing grass seeds to mature, for where grass is cut in flower there is no ergot, and a dressing of iron sulphate destroys fungoid germs in grass lands, and kills moss. Iron sulphate combats the Potato disease (*Peronospora infestans*), also the fungus on the tubercles of the Pea and Bean. Clover and Vetch roots—indeed, on all the pod bearers. Nodular outgrowths on Turnips are due to a fungus (*Plasmodiophora Brassicæ*), for which no remedies are so good as lime where the soil is not calcareous, and iron sulphate where it is, or both where there is a deficiency of soil constituents.

Now, I would ask space for a little inquiry into some disease I have occasionally of late years had to contend with in Cucumbers and Melons. The late Mr. R. Fish, in the *Journal of Horticulture*,

vol. xvi. new series, page 111, writes:—"Some fungi, if their mycelium occupy the soil, seem to do little injury to crops, but others seem to tolerate no rivals. We lately mentioned that some Cucumbers that bore heavily about Christmas seemed all at once to have lost their vigour, which they generally do when fruited hard before the turn of the day; but in taking them out we found another evil, half an inch or so beneath the surface of the soil and for a depth of 2 or 3 inches the bed was a mass of thready spawn, and this we have no doubt was the result of using leaf mould as a component part of a rich top dressing. As far as this spawn extended the roots were unhealthy. We believe that thousands of fruit trees, Vines, &c., have suffered by an excess of kindness through using half-decayed leaves in the compost of the borders. Mildew—mark the term—on the roots becomes then more dangerous than mildew on the twigs and leaves. Quicklime is a great enemy to all the fungus tribe that we have come in contact with, but a fiery heat seems to be the most successful opponent. A mild gentle heat, such as the heat of a Mushroom bed, seems most to promote their extension. Heaps collected from old shrubberies and woodlands are much more liable to fungus than the fresh-fallen leaves of the present season, though even they and their change in leaf mould are to be watched. A good heat in a hotbed will make them safe for the crops accelerated and safe afterwards." This is a very remarkable statement—a combination of practice with science, for there is not only a cause but a remedy suggested; but it was advanced before iron was broached in this country as a remedy for fungoid diseases. The Cucumbers failed because of the softness of their tissues—the lack of mineral matter to harden their epidermis, whereby they are able to withstand their fungoid enemies. There is the leaf mould, the manure, and the soil itself—turf. Now, turf usually contains little mineral matter of the order resisting fungoid germs; indeed, so poor is it in sand that a sixth is added for pot plants, and a goodly amount of grit, road scrapings, or old mortar rubbish for fruit trees, also for Cucumbers and Melons; and sometimes wood ashes, the mineral remains of plants. These admixtures are most salutary—indeed, they are essential. Practice has proved their value.

The disease in Melons and Cucumber stems and in their fruits is of a fungoid nature, partaking of the character of ferments, and comes in with organic matter, or a defect of inorganic, it may be phosphoric acid and sulphuric acid to energise the protoplasmic forces or of silica, lime and iron to strengthen their cell walls and epidermal tissues. But phosphorus, sulphur, iron, potash, lime, magnesia, soda, silica, chlorine are no use in those forms, and only as they are made available as food of plants. Even iron pyrites are of no good, they cannot, however, resist acids, and organic acids are Nature's mineral solvents. These cause the iron to give some of its store for the plant in a form it takes in by its root hairs. Dr. Griffiths states that iron sulphate acts on the "microparasitic cellulose" caused by the "fungus which produces nodular outgrowth upon the roots of the Cucumber, but not the cellulose of the plants," and goes on to say, "the spores of the fungus, which are extremely small, are found in the soils, where Cucumbers have grown, in the autumn and early winter, having been liberated by the rotting of the root nodules. These spores retain their vitality for months, and are capable of attacking the new seedlings planted in such soil. The spores are easily disseminated by such agencies as air, soils and streams. The Cucumber root fungus is completely destroyed by iron sulphate."—(Manures and their uses, pages 141 and 142).—G. ABBEY.

(To be continued.)

## A GARDENING TOUR IN IRELAND.

DURING the past two months a rapid succession of fruit conferences and exhibitions, with the multitude of Chrysanthemum shows only just concluded, has kept me so closely occupied that the execution of a promise made some time ago to friends and readers of this Journal has been considerably delayed. When I returned from my journey in Ireland a brief résumé was given in these pages of general impressions, and this was followed later on at the Crystal Palace Conference by a condensed review of the aspects and prospects of fruit culture in the Sister Isle. Now, however, a little more leisure will permit a detailed reference to what I found a very enjoyable and interesting tour, and several reminders from correspondents both here and on the other side of the Irish Sea have prompted me to relate more fully the particulars of the journey, the routes taken, and the gardens visited. The fact is that much could be written concerning Irish gardens, for in the first place most of those of any note are very picturesquely situated, and the climate, as I have previously remarked, is admirably adapted to the growth of trees and shrubs, so that the most important features in parks or extensive gardens are nearly

always strongly marked there. Secondly, whatever may be said respecting farming or the general culture of the land, gardening is in the great majority of cases well carried out in private establishments. Of course there have been the same difficulties to contend with there as here—namely, the decrease of proprietors' incomes has led to reduction in garden staffs and expenditure in many cases, and the gardener's skill has in consequence been often seriously taxed to meet the altered circumstances. A resolute and able man does not, however, readily submit to be overcome by difficulties such as these, and the result is that both in keeping and productiveness gardens in Ireland will bear comparison with those in England or Scotland, where the labour and expenditure correspond in some degree. This opinion is not founded upon a partial survey of any one district, but upon evidence afforded by establishments visited from the north of Antrim to Cork in the south. Not only is this the case, but the enthusiasm and interest in gardening matters amongst the experienced practitioners is equally as great as here, though it is not fostered by so many opportunities of meeting in friendly competition as Great Britain. The amateur cultivators, too, are not so numerous in proportion as here, but there are indications of an advance in this direction, and considerable aid is being afforded by gentlemen in different districts who are fully conscious how much can be effected by increased attention to horticulture. In no part of the United Kingdom could more good be accomplished by the extension of horticultural skill and practice into the domain of the farmer than in Ireland, and wherever this fact has been grasped a material improvement is evident. To some of these matters I shall have occasion to refer again, and in the meantime I will describe the route adopted and the first calls by the way.

Several modes of reaching Ireland were suggested by friends, and that especially recommended where a long sea voyage is not objected to was via Milford Haven and Waterford or Cork. The date fixed, however, for the meeting at Leicester rendered it difficult and inconvenient to proceed that way. The other alternatives were by Holyhead to Dublin—the usual route—or via Stranraer and Larne to Belfast. As it was decided to commence explorations in the north of Ireland and journey south so as to avoid as far as possible travelling twice over the same ground, the Stranraer route was adopted as the most convenient, and as regards time this was also most suitable, as it enabled us to leave Leicester shortly before 10 p.m., and reach Ireland next morning in time for a clear day's work. There, however, the advantage ended, for it was one of the most uncomfortable journeys I have ever endured. The train accommodation was bad, though it is rare that fault can be found with the Midland Company in this respect. It necessitated two changes with all the inconvenience of removing luggage, &c., and beyond that for a great portion of the distance we had unpleasant travelling companions. Some satisfaction was, however, found in the fact that after leaving Dumfries the sun rose in a clear sky and revealed some much more pleasing scenery in Kirkcubright and Wigtownshire than I had expected to see. This was really enjoyable, and helped to compensate for other disadvantages, though it is not a route I would recommend to anyone who wishes to proceed direct to Ireland, as a portion of a tour through the lake district it would be a different matter. The short sea trip from Stranraer to Larne is a great recommendation to some travellers, and on a clear day with a brisk fresh breeze, as on the day I crossed it, is as delightful a passage as could be desired, the Scottish coast scenery being good, an extensive view of the fine Antrim coast is also obtained, with a distant glimpse of the peculiar Ailsa Craig, which rises from the sea like a column to the height of over 1000 feet.

Having landed at Larne, it is optional to proceed direct to the north by train, or to visit Belfast first: the latter course was adopted, and after a brief stay the journey was resumed soon after 11 a.m. to the north of Antrim, Coleraine and the Giant's Causeway being the destinations. This afforded the first opportunity of a general view of the land cultivation and crops, and a very favourable impression it created, for a large portion of the country passed through would rank with the best cultivated land in Ireland, and would, in fact, compare favourably with many districts in England. The prevailing crops are of course very different, and it seems at first as if all the country is entirely under grass, or, as it was at the time of my visit, under hay. That a large space is so occupied is shown by the agricultural returns, for in Antrim alone, out of a total cultivated area of 245,000 acres, over 100,000 acres are devoted to hay, either as permanent pasture or rotation. How well the climate and the land suit the grass is proved by the large return, and judging by the amount of hay in the fields in large conical mounds, it would be thought that the weight per acre would be nearly double what is seen in England. I am informed, however, that the average is about 2½ tons per acre.

Another very striking feature to a stranger is the Flax crop,

and as in August it was just turning yellow, and in some cases being pulled, it was conspicuous in all directions. Antrim is one of the greatest centres of Flax culture in the United Kingdom. In only two other counties in Ireland is a greater acreage appropriated by this crop—namely, Down and Tyrone—and though there has been a decrease in the culture of Flax for the whole of Ireland, Antrim shows the only increase for the past two years, about 16,000 acres being now occupied. Comparatively little Flax is now grown in England, and it is only in York, Lincoln, Cambridge, Somerset, and Dorset where the total runs into hundreds of acres, and in many of these districts it is decreasing. In Antrim and the province of Ulster generally it is said to pay a fair return upon labour and capital, with due attention to details, although it tests the land rather severely.

Potatoes had a better appearance in this district than in any other part of Ireland that I visited, partly, perhaps, because the rainfall is less, but principally because a better system of culture is adopted, though even here the "lazy bed" method was carried out in several places. Still, generally, more space was afforded between the rows, and, as I afterwards learned, more care was adopted in obtaining and selecting the seed tubers. In some parts of Antrim, and especially in the neighbourhood of Coleraine, poultry keeping is developing into an important industry, something on the plan adopted in France. Numbers of cottagers are now engaged in this, and the eggs are bought by agents of firms in Scotland and shipped direct to Glasgow. I met one worthy Glasgow merchant travelling with his wife and daughters, who assured me that the greater part of his business was transacted in this way, and that some thousands of pounds were directed to a comparatively small district in the north of Ireland every year for eggs and fowls.

The culture of small fruits for jam is also being tried in several places, Gooseberries especially being found to succeed, and where the fruit can be supplied direct to the jam manufacturers, of which there are several in Belfast, the return pays fairly well; but the disposal of fresh fruit is said to be difficult, and the carriage is rather costly. There can be no question about the Gooseberries succeeding, for examples were seen in many different gardens and situations, some exceedingly exposed, but in all they were alike satisfactory in health and productiveness. Respecting the orchards, or what were once worthy of that name, something will be said later on.

#### THE GIANT'S CAUSEWAY.

At Coleraine, one of the chief whisky centres, it is necessary to change for Portrush and the Giant's Causeway, and perhaps it will be a pardonable offence if I change the subject of these notes for a short time to give a brief description of a wonderful natural phenomenon a little outside gardening matters. A horticulturist's education is not complete without some knowledge of geology, and on many a winter's night in past years with fellow students and workers have I journeyed to London to attend lectures on that peculiarly fascinating science. Scores of others have similarly paid attention to the subject, therefore I know there are many to whom a little reminder of their geological studies will not be unwelcome, particularly as that to be introduced is familiar, by name at least, to all.

From Coleraine it is a short run by train to Portrush, and from thence an "Electric Tramway" is advertised to convey the traveller five or six miles by road to the Giant's Causeway. This electric tramway has recently been written about as much as the Causeway itself. The guide books refer to it in glowing terms as a wonder of the age. It is widely advertised in the time tables and newspapers all over Ireland. It was, therefore, with some disappointment that on the occasion of my visit an unromantic steam tram had temporarily taken its place, which lumbered along the road in a shaky and cumbrous fashion, affording a distressing discord with the surroundings, and altogether too suggestive of the steam rollers of our great cities to be agreeable. I did have the satisfaction of being returned to Portrush after my visit by means of the electric power, but even then some of the gearing gave way, causing a stoppage on the road. But on the outward journey defects of conveyances were soon forgotten in viewing the delightful prospect afforded as the road began to ascend the cliffs. The day was a grand one, the sky and sea were brilliantly blue, such as we see represented in Italian landscapes, or as Miss North depicted in so many of her tropical views, and it was difficult to imagine that we were really in the land of bogs and fogs, and not on the shores of the Mediterranean. Far away in the distance was the Scottish coast and the Heather-clad mountains. Presently we looked down upon the town of Portrush nestling in its snug little bay, and then the road wound along the edge of a precipitous cliff at a great elevation, with the sea rushing below into scores of wonderful caverns and strange rocky recesses, arched or perforated

by the action of the waves during long periods of time. A writer has described the Irish scenery as like the Irish melodies, "Sweet, wild, and almost sad," and this is true of some districts and under some conditions, but it does not apply to the view from this romantic cliff road on such a day as that when I was there, but it could be imagined how different it would appear on a stormy day in winter. Even the remarkable ruins of Dunluce Castle, perched on the verge of the cliff like a portion of the rock itself, had quite a cheerful aspect in the bright sun, and though all the wildness was there the sadness was undoubtedly absent.

The road now left the cliff, and turning inland rapidly descended until Bushmills (another whisky producing town) was reached, and the view became of quite an ordinary character. There was nothing to indicate the proximity of any natural wonder, and when the tramcar stopped in the yard of the Causeway Hotel it seemed as if all the picturesque scenery had been left behind. The cliffs looked from the land side more like our rounded chalk downs in Sussex and Kent, and the Giant's Causeway did not reveal its presence by anything of a startling character. Visitors are soon surrounded by guides very much in the way described by Thackeray, but now there are two rival hotels instead of one, and the contest for every passenger that arrives would be amusing in the extreme were it not bewildering to the unfortunate stranger who has gained no previous knowledge of the respective establishments. Having selected a guide, however, who proved an exceedingly well-informed man, and quite a geological authority, his only defect being an excess of energy and almost superhuman strength, combined with an evident desire to accomplish his task with the greatest possible speed. The result of this was that the individuals who committed themselves to his charge were led, or rather dragged, over rocks along the face of the cliffs into a wild bay, bundled unceremoniously over slippery ledges, and into dark and fearsome caves and caverns, until he was almost entreated to pause. Still the Causeway had not been seen, this was only the prelude; another ascent was made to the neighbourhood of the hotels, and then a winding path gradually descending along the face of the cliff towards the shore was taken, and in about ten minutes our guide said, "There, that is the Causeway," pointing to a low and rocky portion of the coast in the distance. Then it began to dawn upon us that all the writers and guide-book compilers, even our geological friends, must have been in league to create a deceptive sensation, for anything of a more ordinary character when first seen could not be imagined. A nearer acquaintance with the phenomenon, however, soon reveals its remarkable character, and the visitor feels amply repaid for his journey. To describe the effect adequately is impossible, but to give an idea of it has been attempted. "It looks," said Thackeray in his "Irish Sketch Book," "like the beginning of the world somehow; the sea looks older than in other places, the hills and rocks strange, and formed differently from other rocks and hills—as those vast dubious monsters were formed who possessed the earth before man. The hill-tops are shattered into a thousand cragged fantastical shapes; the water comes swelling into scores of little strange creeks, or goes off with a leap, roaring into those mysterious caves yonder, which penetrate who knows how far into our common world. The savage rocksides are painted of a hundred colours. Does the sun ever shine here? When the world was moulded and fashioned out of formless chaos, this must have been the bit over, a remnant of chaos." Of course everyone knows that the Giant's Causeway is composed of basalt, the produce of extinct volcanoes long prior to the age of man, and judging by the effects there were, indeed, troublous times in Ireland in those days. This basalt, poured out in a liquid form, cooled gradually, and crystallised, as it were, into a wonderful series of polygonal columns, of which it is said there are over 40,000, extending from the cliffs to the sea, there dipping down and passing, some suppose, to Staffa and Fingal's Cave in the Hebrides, where a similar structure is reproduced. The regular form of these columns, which vary in height from a few inches to 20 feet or more, is very striking. The pentagons and hexagons predominate, but some of other shapes are pointed out, and one amongst the 40,000 is triangular. They are also in nearly equal segments, the ends being concave and convex, so that they fit like an elaborate piece of masonry. For a good portion of the space they form an irregular kind of floor, but in other parts they are piled up to a considerable height, assuming numberless forms, which in many cases have received fanciful names. Altogether, the Causeway may be taken as one of those natural peculiarities that must arrest the attention even of the thoughtless, and it is a place in which a student could wander and meditate for days.

There is not, however, much "gardening" in this disquisition, but something has to be yet related, for a garden was found on the top of a cliff, fully exposed to the north, within reach of the sea spray, and yet where fruit, vegetables, and flowers were cultivated with as much success as in many more favourable situations.

But a description of this must be reserved for my next letter, as this has already exceeded the limits.—LEWIS CASTLE.

(To be continued.)

CYPRIPEDIUM HYBRIDUM CASTLEANUM.

MR. R. A. ROLFE of Kew is responsible for the above name which has been bestowed upon a hybrid that has recently flowered in Messrs. Sander & Co.'s nursery at St. Albans, and was shown at the Royal Horticultural Society's meeting on Tuesday last. An experienced Orchid grower says, "It is one of the most distinct and delicately coloured hybrids I have ever seen, and there would be no fear of seedling *Cypripediums* becoming too common if they were all as well marked as this." The following description indicates the chief characters fairly well, but it is difficult to convey an accurate idea of the peculiar colouring in a verbal description.

It is a hybrid from *C. superbiens* (Veitchi) and *C. hirsutissimum*, and shows a remarkable combination of the characters distinguishing those species. It has a somewhat heart-shaped dorsal sepal,  $1\frac{1}{4}$  inch wide by  $1\frac{3}{4}$  deep, suffused with a soft delicate bluish purple tint, with a few slightly deeper purple streaks, and faint green veins underlying the purple suffusion. There are also some dark dots at the base running into the veins. The tip is pale green, the margin has a number of white downy hairs, and the inner surface is also covered with a slight tomentum. The lower sepals are small and greenish. The petals are  $2\frac{3}{4}$  inches long by five-eighths inch broad at the widest part near the points. They are slightly deflexed, partaking somewhat of the *C. hirsutissimum* character, but very distinct in colour, soft purple, green at the base, with fine dark spots at the base, and dark marginal hairs. The lip is suggestive of *C. superbiens* in shape and colouring, but is a distinct shade, and is dotted and suffused with purple. The leaves are long and narrow, regularly and prettily marbled on light green. The great charm of the flower is in the peculiarly soft and pleasing bluish purple tinting, which is quite unique.

CYPRIPEDIUM HYBRIDUM POLLETTIANUM.

This was also from Messrs. F. Sander & Co.'s nursery, and the same authority is responsible for the name. It is a hybrid from *C. calophyllum* crossed with *C. cœnanthum superbum*, and therefore possessing a most interesting parentage, both the forms named being themselves hybrids, *C. calophyllum* from *C. barbatum* and *C. venustum*, and *C. cœnanthum superbum* from *C. insigne Maulei* and *C. Harrisianum*. *C. cœnanthum superbum* is generally regarded as one of the finest hybrids ever produced; but some may probably consider the new comer as, in some respects, an improvement upon that in richness of colouring and general appearance. The dorsal sepal is broad, rounded, margined with white, rich dark crimson, with chocolate spots. The petals are very dark, with three dark dots on the upper margin, the lower half at the base being of a peculiar transparent green with a few dots; the lip is very dark, and the whole surface of the flower has a polished shining appearance that in a bright light is very effective. It is undoubtedly a grand acquisition.

CYPRIPEDIUM HYBRIDUM MAYNARDI.

A beautiful hybrid between *C. purpuratum* and *C. Spicerianum*, the flowers taking the general form of the latter parent, but evidently influenced by other in a material degree. The dorsal sepal is rounded in outline, but the lower part is reflexed and white, with a deep crimson central vein, and a few lighter ones; the base green. The petals are short, greenish at the base, dotted with purple, purplish towards the tip, edged white, the margin undulated. The lip is dark purplish, with a purple staminode. The leaves are about  $1\frac{1}{2}$  inch broad and 5 to 6 inches long, faintly marbled with dark green on a lighter ground. This is from the same establishment as the preceding, and we understand bears the name of a hybridist who has been working assiduously amongst the Orchids for some years.

CYMBIDIUM TRACYANUM.

An exceedingly vigorous plant of a new *Cymbidium* created a little sensation at the R.H.S. meeting on Tuesday, the size of the flowers, length of spike, and general bold characters at once commanding attention. Doubts were freely expressed, however, with regard to its being a true species. One experienced orchidist

considered it as "a form of *C. longifolium*," another dubbed it as "merely a fine *C. giganteum*," a third authority fancied he could discover "a nearer relationship to *C. Hookerianum* in the form, size, and markings of the lip." It is quite plain from these different opinions that the plant was not a readily recognised form of any well known type, and it was admittedly distinct if only as a variety, while it was unquestionably handsome. In the growth and foliage with the smooth stem or leaf bases it resembles *C. longifolium* or *giganteum*, but the flowers are of great size, 5 inches or more in diameter, with broad sepals and petals evenly and strongly veined or spotted in lines of a reddish tint on a yellow ground. The lip is long and broad, pale yellow spotted with red. The raceme was about 4 feet long, bearing numerous flowers. It was shown by Mr. H. A. Tracy, Amyard Park Road, Twickenham.

EPIPHRONITIS VEITCHI.

MANY handsome and peculiar hybrid Orchids have been raised by Messrs. J. Veitch & Sons at Chelsea, and the one here figured, though it cannot be compared with their imposing *Cattleyas* and choice *Cypripediums*, yet possesses a considerable share of interest. The characters of *Epidendrum radicans* and *Sophronitis grandiflora* seem so different to a casual examination that without some intimate knowledge of their botanical relationship it would not be thought likely they would cross readily. A cross was, however, effected between these two plants, and the result was the hybrid

FIG. 63.—EPIPHRONITIS VEITCHI.

which has received the singularly appropriate compound name *Epiphronitis Veitchi*. The plant was shown at the Royal Horticultural Society's meeting on June 24th this year, when it was certificated by the Orchid Committee, and attracted much notice owing to its curious parentage. The *Sophronitis* is said to be the seed parent, but in habit, growth, and leaves the hybrid resembles the *Epidendrum*, except that it appears to be dwarfer and not so strong. The flowers are about the same size of the *Epidendrum*, but have taken more of the colour of the *Sophronitis*, being much darker and richer than the first named. The sepals and petals are also broader and more rounded, the lip four-lobed, but not cut or serrated at the margin like the *Epidendrum*; it is also yellow in the centre, with a few dark spots. The woodcut (fig. 68) was prepared from a drawing taken of the flowers on the day the plant was shown by Messrs. Veitch & Sons.

The *Epidendrum*s are not popular Orchids, if we except *E. vitellinum* and its variety *majus*, but it is strange that more experiments have not been undertaken in this large family. At present very little has been done, and the *Epiphronitis* is the first result of any consequence that has come to my knowledge.—L. CASTLE.

A NIGHT AT CHILWELL.

WE sometimes read of a day being spent here, a week there, and of a journey of so many miles after this, that or the other, of which interesting details are recorded, but not often have we any narration in the Journal of a "night" spent anywhere, so the heading of these notes will at least be fresh if the matter happen to be commonplace or stale. The heading is further strictly accurate, for my sojourn at Chilwell embraced about fourteen hours of darkness, and only four or five of

daylight, and something of what I heard during the long night, and saw during the too short morning, may possess a small measure of interest to some readers.

"Come and see us on your way from Leicester to Hull," was the invitation of Mr. A. H. Pearson. It was of no use my telling him I had about enough of Chrysanthemums, for he only rejoined, "Oh! bother the mums, come and see me;" and therefore it came to pass that on a dark night in November I found my host awaiting me at Beeston Station, and ten minutes afterwards I was established in his cosy home. This, as I found in the morning, is a substantial and commodious farmhouse sort of building, upwards of 200 years old, surrounded by green fields, a little distance from the family home at the nursery.

"Ah," said my host on our arrival overnight, "this is my brother Charles, I think you have seen him before; he is the 'floral partner,' you know." Yes, I thought I had seen him before, and did know he had something to do with Chrysanthemums, Zonal Pelargoniums, Orchids, Eucharises, Roses, and various other plants that are grown, and grown well, in the several fine structures under his control. All these, he said, I was to see in the morning. "Stop a bit," observed A. H., "you are not going to spend all the time among the old mums; why they are damping like steam," and went on to intimate there were old orchards and new nurseries of young trees worth seeing, and must be seen, also Siberian Elms that were going off fast through an advertisement in the Journal. "Siberian Elms, what are they, and what are they like?" was my inquiring observation. "As to what they are like you will see in the morning; but where the stock came from we do not know. We only know that the original trees were planted by my grandfather, and no other trees have made the growth that they have, and we know of no others that grow so freely in good or poor soil. Our soil is good, and if you want to see trees in poor soil, or almost no soil, look at the avenues of them in Nottingham Park." It so happened I had seen these, admired the trees, wondered what variety of Elm they represented, and now in the night's conversation discovered they were known as "Siberians."

Another thing I got to know—namely, that there is only one Chilwell in the world, at least that is recognised by postal authorities, and that a letter simply addressed to the "Nurseries, Chilwell," is sure to find its way to Messrs. Pearson, no matter where it may be posted. This is a very old family, for there have been Pearsons at Chilwell for centuries, and the business has been long established. For years, or perhaps generations, what may be termed a good quiet local trade was done, but the late Mr. John Pearson, one of the finest men of his time in the horticultural ranks, saw there was a world for his wares beyond his locality, and he determined to reach it. He half frightened some of his timid contemporaries by advertising, but made and left his business great, and his sons intend to keep it growing. They appear to inherit their mother's cool judgment and their father's spirit of enterprise. So does the elder brother, Mr. Henry Pearson. Entering into a good local business at Beeston, he, like his father, was determined to extend the trade in the same way, and now, as Foster and Pearson, it is known not only all over the kingdom, but far beyond its limits. This fine business has been built up by the energy of one man, and the good work he has done, and who is now its head in the prime of life.

The mention of the mother of the present family reminds that she is a suffering invalid, a kind, good lady, and her daughters are like her in doing what they can for the poor and afflicted, and they do much more than can be mentioned here. To their house the distressed instinctively turn for advice. A case occurred at the time of my visit that is sad, yet in one respect a little amusing, and I came to know about it in this way:—As the evening went on, said C. to A. ("C" standing for Chrysanthemum Pearson, if you like, and "A" for Apple Pearson): "I must be off. I don't intend going to bed much before daylight if I sit up for a week till I catch that scoundrel and give him a good 'lacing;' so you be across early to attend to things, as I may not be about in the morning." "All right," quoth A., "off you go." And then he told me the story. A drinking, lazy hanger-on in the village not only starved his poor wife but beat her, and she in her trouble went to the Nursery and was taken in the house to live for a while and make herself useful. Some time about one o'clock the previous morning the scoundrel, seeing a light in the sick room of Mrs. Pearson, dashed a whole brick through the window. Feeling sure the dastardly trick would be repeated a policeman was set to watch on one side of the house, Mr. C. taking the other. About the same time in the morning of my visit the fellow entered the gate, and just as he was raising his hand to dash another brick into the room he was felled to the ground by the policeman, who was hiding in the bushes conveniently near. The next thing was to take him to the station; but as he refused to rise from the ground he was dragged through the mud, leaving a trail as if made by a bag of Potatoes. This method of progression, however, did not suit Mr. C., who, as he said, "didn't see the fun of dragging a log like that a mile through the mire," so concluded he would either "make the fellow walk or make him sore," and commenced "lacing." "I had a good stick," he went on to say, "and didn't let him have it. I laced him just as well as I could, and kept on till he was glad to get up and walk away with his captor. Poor beggar, he must be sore! But didn't it serve him right? He might have killed my mother." As the "lacing" was the result of the man's own stubbornness we thought it richly served him right, and he had a worse night than I had at Chilwell.

My evening was indeed a most pleasant one, and, well, rather long, as Mr. A. H. is a very good talker, and knows as well as most persons do what he is talking about, especially when his mind turns on Apples. It

was the planting season. "And how are the trees going?" I asked. "Going," was the reply, "We never had anything like it. Luckily I foresaw what was coming, and kept increasing the stock more and more; but have only just managed to keep ahead of the orders, but I have planted three more fields, and hope to meet all comers in future." "How much land have you, Mr. Pearson?" "Oh, about 300 acres, but only about half under orchards and nursery stock. The rest we farm, and change about, as there is nothing like fresh soil for trees and shrubs. You can manure as you like, but fresh ground is the thing for firm clean-growth, as you can see for yourself in the morning." I began to think I had a good deal to see in "the morning," and very little time for seeing it. And so it proved. It was a race and a rush through the houses, and over miles of ground, for the fields are widely scattered. In noting briefly what was seen it will be convenient to begin at the beginning—at home; and from Mr. A. H. Pearson's house to the main road which leads to the nurseries we pass along the avenue of Elms.

The trees were planted about thirty-three years ago, "Siberians" at uniform and wide distances, with other sorts between them, but these others are all gone, the Siberians overgrew them, and now occupy all the space. This is apparently a very free-growing variety of the Wyeh Elm (*Ulmus montana*), but is taller, and makes a fine tree much sooner. One of the stems, though not measured, was no doubt 8 or 9 feet in circumference, perhaps more. As an avenue, park, or shelter tree for orchards (but distant from them) this Elm must be one of the best, and it thrives as well in towns as any other of the genus, and better than most in exposed positions and near the sea.

Passing along to the nursery we glance at a very large and substantial building—the seed and bulb warehouse, root store, and what not. "That," remarked Mr. A. H., "came out of Tulips. My great-grandfather was like some others in his time, mad on them, and with the proceeds of his sales erected the building." It is conceivable that if all the florists' Tulips now in England were sold they would not realise as much as did that collection, for the prices have fallen, though there are not wanting signs that those splendid flowers are steadily regaining some of their lost popularity.

Now we are in the nursery, with its large and numerous glass structures, apparently as good as they were thirty years ago, and all well filled. We pass down a range of Orchid houses, through a stove, into a large vinery, with banks of Maidenhair Fern on each side the central path; rush through the Stephanotis and Eucharis house, see the finest stock that is to be seen of the fine old plant *Ardisia erenulata* that retains its clusters of red fruits for a year; peep down the pot Vine house and Maréchal Niel Rose house, resembling avenues of strong growth and canes; glance through Zonal Pelargonium house, which was brilliant with the best and newest varieties; pause at a houseful of the most beautiful of hardy variegated plants, *Yucca filamentosa variegata*, which they know how to increase at Chilwell, and enter the great Chrysanthemum house. There we have to "go slow," for with two Pearsons in front and their good man Pithers behind there is no escape. You have to see everything, and hear something, too. "Now, look here, isn't this a beauty! I call it a real good thing," says C. "I don't care a bit for it," answers A. "Oh," retorts C., "You go on and talk about Apples." But there were some "good things" in the Chrysanthemum house, and another house, a vinery, 100 or more feet long, was filled with good Apples. A pair of happy brothers are these, one among the flowers and the other among the fruit, and both may be proud of their produce.

The Chrysanthemums were splendidly grown though the "damp fiend" was among them; but he is to be conquered another year with more hot-water pipes and shading. Trained specimen plants at one end of the house "fit for Birmingham," the centre occupied with single-stemmed plants bearing blooms, not a few of which were equal to any that have been seen in any stands, cut-back plants in front of them, models in their way for grouping, and sides filled with great floriferous bushes innocent of manipulation in disbudding. Cartloads of flowers could be cut from these and others reserved for that purpose, and which have to be grown to meet the great demands of the "lace hands" in Nottingham. Such is the general character of the Chrysanthemum Show at Chilwell. For particulars there is not much room, but a few of the newer varieties of proved worth or promising merit may be referred to. Among the incurved all the Queen family were extra fine, notably, perhaps, John Lambert, which in its true form is distinct, being smoother and paler than Golden Queen; but all the "Lamberts" one sees are not as they should be, and either the wrong one has been grown under that name or the right one gone wrong. Also in superior form were Mrs. Coleman, C. Gibson, Lady Dorothy, and all the Princess of Wales family, Refulgence, and White Venus.

In the Japanese section perhaps Eynsford White had no superior in the collection, and Puritan, white, more or less tinted, stood out boldly. W. W. Coles was in brilliant garb; W. H. Lincoln, yellow, in the form of Stanstead White, was conspicuous; and Tacoma, G. Atkinson, Lilian B. Bird, Zillah, Mrs. W. S. Sargeant, Kioto, and others of the newer sorts were giving much satisfaction. For decorative purposes *Massalia* will spread, it is of the character of William Holmes, but brighter.

Among Anemones Gladys Spaulding is of dwarf habit, and had eight to ten exhibition blooms on a plant, better than where only two or three were allowed, as these were coarser. Mrs. Judge Benedict, M. Pankoucke, Mrs. Robert Owen, and Thorpe, jun., were noticeable, among others, that were good in this section, single varieties grown in a manner not often equalled, and some of the bushes must have contained two or three thousand flowers. Two of the favourites, which everybody wants who sees them, are Mrs. A. H. Bates, pure white, and

Marguerite, silvery white, a Chilwell seedling. Dozens of others must be passed, and they will continue in beauty till Christmas. Altogether the collection is large and choice, most of the varieties being represented in their best form, and as Mr. George Bolas says in a letter before me, "it is a treat to see them, and to go round with Pithers, who freely tells how the plants are managed."

We have yet the fruit and trees to see. As before mentioned the fruit Show was in a vinery, and extensive and excellent was the display, nearly all the best varieties of Apples and many of Pears being admirably represented. In the midlands some of the more popular Apples would not be recognised from their names alone by southern growers. For instance, the midland name for Devonshire Quarrenden is Waterloo Pippin; Court Pendû Plat is Woolaton Pippin; King of the Pippins is Pike's Pearmain; Duchess of Oldenburg is The Russian; Fearn's Pippin is Clifton Nonesuch; and Queen Caroline is Spencer's Favourite. The latter, however, Mr. Pearson says is the true name, as this beautiful Apple was raised by a Mr. Spencer in Nottinghamshire. Conspicuous in the "Apple show" is Newton Wonder, of the character of Dumelow's Seedling but larger, better in colour, and decidedly sweeter. This variety has been certificated by the Royal Horticultural Society, and is probably a coming Apple for the million. New Bess Pool was very fine and wholly distinct from the old, and the huge healthy symmetrical trees in the orchard suggest that this variety would make grand specimens for parks. Bright were the dishes of Lord Lennox, a small scarlet Apple of which large heaps may be seen in midland and northern markets. It is not a Cox's Orange Pippin or anything of that kind in flavour, but finds favour with the multitude, and the tree is one of the best of growers. The new Northern Greening is a Chilwell favourite, and the fruits are remarkable for symmetry and weight. Of Bramley's Seedling, too, there were fine dishes, as indeed there were of scores of others. But Mr. Pearson, like many others, is firm in the belief that by far too many varieties are grown. Therefore he has excluded scores from his catalogue, and his short selections are very good.

Still, we have to see the trees, which involves a drive of some miles—at least it would to see them all, and only an hour or two at disposal. Off we go with a dash and a splash down dirty lanes and over hummocky fields, for Mr. A. H. seems to go the nearest way with his trap, the same as when he has a day of hunting. A "spill," I thought, must be my fate that day, and the only little comfort I had in shaky moments was in contemplating the softness of the ground. However, we reached the "new fields" safely, and the sight was worth the jolting. Open to all the winds that blow are these nursery fields of fruit trees. The soil is a free, yellowish, generous loam, and bastard trenched 2 feet deep. Either two or three fields, or upwards of 20 acres, were occupied with trees in various stages from stocks up to two and three years old, and another was in preparation. They are surrounded with a broad grass glade, and cross roads of grass for driving. The lands or stretches are set out with exactitude and uniform in size, so that it is easy for the owner and his men to tell the number of trees in each. Healthy and hardy the trees grow in this good soil and air, and not a speck of mildew was to be seen, even on the "breaks" of Roses. When we see such an extension of tree raising as this, and remember others of the same kind elsewhere, there is no room left for doubt that fruit culture has commenced in earnest at last, and that a revolution in hardy fruit production has fairly set in in this country. Will it continue? It is bound to do so, because thinking persons know very well that if they do not plant young trees they will have no chance in the markets, as in a very few years' time the produce of the old and exhausted will not be "looked at" there; also the better the samples that are placed before the public the greater will be the demand, for the supply of high-class produce will create it, as is the case with other commodities. Business people do not wait to be asked to produce what is wanted, but provide what is good, and in that way tempt, indeed, so to say, compel purchasers. So it will be with fruit, and just in proportion as it is good in appearance and quality will the consumption increase, and the best can only be had from young trees planted in generous soil.

We go on to the old nursery of 10 acres within walls, but nearly all cleared. It is now to rest for a time, and only trees will be grown against the walls in the immediate future. Next we drive through the old orchards with fattening cattle grazing under the trees, and the herbage shows they keep the land fertile. It is here we see the huge and symmetrical proportions of both the old and new Bess Pool Apples, the latter the finer and more regular bearer, and just the tree for park scenery. Suggestive for the same purpose are gigantic trees of the "Beurré Grey" Pear, the foliage of which changes to crimson and gold in the autumn. Our next turn is homewards, and we glance at the collection of trees for avenues and parks—Elms, Limes, and most other trees, thinly planted and cared for, and stop to look at the plantation of variegated Yuccas which grow uninjured from year to year, and their like is not to be elsewhere seen. On to the station we pass the "glass nursery," and find the road lined with carriages, gigs, wagonettes and omnibuses which have brought loads of people to see the Chrysanthemums. I now think I have said enough, and after this tormentingly long narration cannot hope that Mr. A. H. Pearson will ever again ask me to spend a "night at Chilwell."—A WANDERER.

#### EDINBURGH INTERNATIONAL EXHIBITION.

THIS Show is sure to be such an important one that any defects of whatever nature are certain to cause a large amount of dissatisfaction and disappointment. It may truly be said of the ordinary autumn

Shows held in Edinburgh, Thither the tribes go up, and the "Internationals" seem to gather together alike from "little Wales," Ireland, England, and auld Scotland cultivators of every denomination—fruit grower, florist, and vegetableman. It does not require one to have much of the spirit of the seer to prophesy that the Exhibition of next autumn will eclipse any yet held in the capital of Scotland. I do not so particularly refer to the fruit, which will doubtless be in advance, as to other sections. The chief plant prizes ought, and surely will, draw not only contributions from Glasgow, but probably from Newcastle, Yorkshire, and perhaps further south. There will be some dozens of collections of vegetables, and of the hundreds of single dishes it would be hazardous to make a guess how many. Cut flowers are less generously provided for, but the entries are sure also to be large and good.

The remarks made on the fruit classes last week are not totally uncalled for, though it is only fair to note that the point of view occupied by the compilers of the schedule and by the writer are necessarily somewhat different; at the same time it must be conceded that "haste" is palpable on every page. It would appear as if the Committee entrusted with the getting out of the prize list had been working against time, and no revision made of the proof sheets. It is only charitable to hope so.

Referring to Class 1 and Class 2 I certainly understand it to absolutely reserve the latter class to gardeners and amateurs whose means are limited, and who would not feel warranted in entering the lists against those whose means of producing Grapes in quantity are, if not unlimited, yet of the most ample kind; however, the necessity of such a class is at the present day not very obvious. The wording of the collections is at one with several other items—as for instance No. 7, which is perfectly explicit; No. 8, which is vague; and No. 9, which is explicit in the superlative degree.

As to the collection of hardy fruit, I do not think any objection can be taken to the wording, nor can I see any difficulty in assuming the meaning to be any kind of fruit, such as Figs, Peaches, and Apricots. These are all grown in the "open air," though a wall is required. In Scotland mostly all Pears are grown as wall fruit, and a very large number of Apples are similarly cultivated. The great majority of Plums and Cherries in the same way have the benefit of a wall. These are all shown at the ordinary autumn exhibitions in the class for a collection of hardy fruit grown in the open air. With regard to the collection of Plums, though it will be impossible for cultivators in the south of England to show on the same day Coe's Golden Drop and Early Prolific, or White Magnum Bonum and Early Orleans, the majority of northern cultivators will not experience much difficulty in doing so. The reason for these collections, as well as for the dishes of late half-grown Pears and Apples, appears to be the outcome of a wish on the part of the "Caledonian" to popularise the particular sorts which received the greatest number of votes at the Apple Congress in 1885, and the Plum Congress in 1889. You will notice they are all good, Court of Wick Apple being the only one to which exception can be taken. At the same time it might have been perhaps as well if the Executive had dispensed with the late, and substituted some of the newer and better early varieties, many of which will find their way into the collections of Pears and Apples.

I now pass on to points which are not touched upon by your correspondent, who seems to have paid attention alone to the fruit classes. But what can anybody make of No. 128, "Table of Plants, 20 feet by 5 feet?" There it stands in all its bald uncertainty. Now in 1889, the first prize for a table of plants was awarded to a table which for effect should have been third, and in 1890 the second prize was awarded to an arrangement which for quality should have been first. The judgment in each case was correct, on the assumption that the Judges in 1889 had quality mainly in view, and that in 1890 quality occupied quite a secondary place. As further examples of indefiniteness, we have "Eight Foliage Plants, in pots not exceeding 10 inches," "Six Orchids, in bloom," "Three ditto," and not a single word as to the necessity, or otherwise, of distinctness in species or variety; while we have "Four Caladiums, distinct," "Two Crotons, of sorts," "Four Palms, sorts." In the cut flower section the same indefiniteness prevails. Thus we find "Twelve Cut Roses, sorts," "Twelve Fancy Pansies, distinct var.," "Six Spikes Phloxes, named." These are only a few examples.

Then there is a rule (No. 5) to the effect that "Undue dressing will disqualify." Surely such a rule is without meaning. It is a perfectly well understood fact that the exhibitor of whatever kind of flower will "dress" it so as to present it in its most attractive form. A large amount of the success in growing and exhibiting certain flowers is attended by the judicious dressing to which they are subjected. And so with vegetables, the best "dressed" and most effectively arranged collections have a very great advantage over those less judiciously handled, and in some degree the same remark applies to fruit.

While writing I may be allowed to make a suggestion that the names of the Judges should be communicated to the gardening public some time before the Show. There are judges who have a preference to well finished Muscats, others whose sympathies lean to the side of black Grapes. With some the inclusion of fine Grapes and Pine Apples in a collection covers all deficiencies in the remaining dishes. We have vegetable judges who look upon a collection of vegetables with eyes obscured by the surpassing excellencies of a dish of Leeks or of Onions, while a couple of dishes of rough Apples in a collection, if they are big enough, forms the *pons asinorum* of some hardy fruitists. Nor is it any uncommon occurrence to find the legitimate single dish varieties set

aside and prizes bestowed to other altogether different varieties. Then exhibitors of florist flowers ought to be assured that whoever are appointed to adjudicate upon these are up to their business. The classes for Dahlias, for Gladioli, and for Roses are sure to be well filled and keenly contested. It is surely not too much to expect that none of these are left to the tender mercies of those who may be expert with one flower and with little knowledge of the others. I am afraid I have unduly encroached on your good nature, but I can assure you I have tried to condense my remarks.—AN INTENDING EXHIBITOR.

EVENTS OF THE WEEK.—Horticultural gatherings are becoming less frequent now, and after such an exceptionally busy day as Tuesday last it might be expected that the business to be transacted before Christmas was nearly concluded. The General Committee of the National Chrysanthemum Society will meet at Anderton's Hotel on Monday, December 18th, at 7 P.M.; and on Wednesday, the 17th inst., the floral fête and bazaar, for the benefit of the Holmes Memorial Fund, will be held in the Royal Aquarium, Westminster.

— SHIRLEY HIBBERD MEMORIAL.—In response to the invitation from the Council of the Royal Horticultural Society a largely attended meeting was held in the Lindley Library, Victoria Street, on Tuesday last, at 1 P.M., Sir Trevor Lawrence, Bart., M.P., in the chair. After some introductory remarks by the Chairman, Dr. M. T. Masters referred to the valuable services rendered to horticulture by the late Mr. Shirley Hibberd, and proposed the following resolution, which was seconded by the Rev. H. H. D'Ombraïn, and carried unanimously:—"That in the opinion of this meeting it is desirable to establish a memorial commemorative of the disinterested labour of the late Shirley Hibberd, and as affording some expression of our gratitude to him and of our respect for his memory." Some discussion followed as to the form the memorial should assume, the general feeling being in favour of a portrait of Mr. Hibberd to be placed in the Lindley Library. It was, however, resolved to entrust the arrangements for collecting the fund and a consideration of the various suggestions to a committee comprising the Rev. W. Wilks, with Messrs. J. Douglas and G. Paul as representing the Council, and Dr. Masters with Messrs. Marshall, Collingridge, and Dean on behalf of the Fellows.

— GARDENERS' ROYAL BENEVOLENT INSTITUTION.—We are pleased to hear of another purchase of £300 Consols, making a total of £25,000 standing on in the names of the Trustees, thus giving good security to those gardeners who have subscribed to the Institution in case distress should overtake them. We are also glad to hear that Baron Schröder, Vice-President, has promised to preside at the fifty-second annual meeting of the members, to be held at Simpson's, Strand, on Thursday, 15th January, next at three o'clock, and that N. N. Sherwood, Esq., is to take the chair at the friendly dinner to be held after the election the same day at six o'clock.

— THE WEATHER.—Since the severe frosts at the end of last month, by which much damage was caused to shrubs and outdoor plants, there has not been anything unusual to record. Moderate frosts, dull days, with occasional fogs have prevailed in the neighbourhood of London, and a slight scattering of snow early in this week.

— SEVERE FROST IN SURREY.—The weather here on the 28th ult. was phenomenal with regard to the severe frost. We registered at four o'clock on the above date 24° frost Fahr., and at six o'clock the mercury showed 6° below zero. After that time it gradually rose above zero. In the Rev. W. Wilks' garden at Shirley, two miles from here, the thermometer registered 2° below zero; at Warlingham, four miles, 5½° below, and at Riverhead, near Sevenoaks, 1° below zero. The shrubs here are turned quite black, the Aucubas especially seem ruined. I may mention our thermometer registered the above at 6 inches from the ground. Enclosed herewith are a few leaves of shrubs and Ivy to show the result.—R. H. COPPIN, *Addington, Croydon*. [The temperatures recorded are extremely low, but the thermometer is too near the ground. The leaves sent are blackened, and evidently the injury is severe.]

— LONDON FOGS AND PLANT LIFE.—It is stated that the Royal Society has granted £100 towards the expenses of a report upon this subject now being prepared by the Royal Horticultural Society.

— GARDENING APPOINTMENTS.—We have received an intimation of an appointment to a garden in Cornwall, which will be inserted if our informant sends us his name and address, not for publication.

— THE EDINBURGH CHRYSANTHEMUM SHOW.—This, we are pleased to learn, was this year a financial success. The visitors during the three days numbered 35,000, Lieutenant Dan Godfrey and his band proving a great attraction. From £120 to £150 is the expected surplus. Nearly £300 for music and over £100 for fitting up the Show building are large items in expenditure, but no doubt it pays in Edinburgh.

— DUTCH CODLIN APPLE.—Mr. A. Harding writes from near Peterborough: "This has been the worst Apple year in this neighbourhood that has been known for many years. We had a very light crop. In a few old orchards in this village the produce from perhaps a hundred trees was only a few bushels. My best tree was Dutch Codlin; it had five bushels of good clean fruit, although an old, half worn out looking tree. I believe in manuring orchards, even if they are on grass."

— FRUIT ROOM.—I shall be obliged if any of your experienced readers will answer the following questions through your valuable *Journal of Horticulture*:—Is a dark, dry, underground chamber with a thorough draught better for keeping fruit than a room in a dwelling house having full daylight, a higher temperature, but no through draught? 2, Are shelves for laying Apples, &c., on, separately and singly, trellised or solid shelves, or barrels and casks, better for keeping? 3, Should Apples have the oily exudation wiped off them at any time during their "captivity"?—H. S.

— HAYWARDS HEATH HORTICULTURAL SOCIETY.—A highly satisfactory balance-sheet was submitted to the members of the above Society at their annual general meeting held at Mr. Wilmot's school-room last Friday evening. Notwithstanding that the receipts at the gates were more than £10 below the amount taken at their first show last year, owing to the weather, the creditable balance of £23 14s. 5d. remains in the Treasurer's hands. Total receipts, £206 7s. 9d.; and £116 16s. was paid in prizes.

— REPORT OF WEATHER DURING NOVEMBER 1890.—The weather during the past month was very mild until towards the end, when some sharp frosts and slight falls of snow were experienced. The sharpest frost was on the morning of November 29th, when 16° were registered. Rain fell upon seventeen days against six days of November, 1889, the maximum in any twenty-four hours being 0.52 on the 23rd. Minimum 0.01 on the 10th. Total amount during the month 2.66 against 0.87 of November 1889.—E. WALLIS, *The Gardens, Hamels Park, Buntingford, Herts*.

— ROYAL CALEDONIAN HORTICULTURAL SOCIETY.—At the annual meeting of the Royal Caledonian Horticultural Society, held in Edinburgh the other day, it was stated that £142 had been added to the funds during the year with subscriptions, and £200 it was proposed to save next year. The fund for the International amounts to about £700, the proceeds from that meeting being expected to make up the £1223 offered in prizes. Asked what about expenses, Mr. Young, the Assistant Secretary, humorously remarked they would save by drinking lemonade next year.

— CHISWICK GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION, SESSION 1890-91.—Mrs. S. A. Lee, Chiswick, has, with the object of encouraging original research and observation, again very kindly offered a sum of £15 10s. to be distributed in prizes for essays on horticultural subjects from members of the Association. Class 1, for the best essays on "Horticulture, its Influence on the Masses." First prize, £2; second, £1 10s.; third, £1 2s. 6d.; fourth, 12s. 6d. The competition in this class will take place, under supervision, in the Council room of the Royal Horticultural Society, on the evenings of February 20th and 21st, 1891, between the hours of seven and ten. Class 2, for the best essays on any horticultural subject at the discretion of the competitors. First prize, £2; second, £1 10s.; third, £1 2s. 6d.; fourth, 12s. 6d. Class 3, for the best essays on any horticultural subject at the discretion of the competitors (members under twenty-three years of age). First prize, Nicholson's "Dictionary of Gardening," four volumes, value £3; second, £1; third, 12s. 6d.; fourth, 7s. 6d. If preferred by the winners books on gardening subjects to the value of the second, third, and fourth prizes will be selected.

— PORTSMOUTH HORTICULTURAL SOCIETY.—The Summer Show of the above Society is announced to be held in the Victoria Park, Portsea, on July 8th, 9th, and 10th, and the Chrysanthemum Show in the large Drill Hall on November 4th, 5th, and 6th, 1891.

— WEATHER IN THE NORTH, December 1st to 8th.—A dull, cheerless week, with little frost and less sunshine. The thermometer has on several nights been at 32°, and 3° of frost were registered on morning of the 4th. Ploughing has been pushed forward in the district.—B. D., *S. Perthshire*.

— THE WEATHER.—The temperature on the 30th of November was exceptionally low. A Negretti and Zambra's self-registering thermometer 4 feet from the ground registered 17°, and at ten o'clock, A.M. it indicated 12°, and during the day was very low. A *Maréchal Niel* Rose against the mansion very severely injured, also a white *Banksian* Rose, both on a south aspect wall. The heavy fall of snow protected Savoys, Cabbages, &c.; but Broccolis have suffered much.—J. GADD, *Belhus, Purfleet*.

— A DWARF TROPEOLUM.—Seeing that Mr. Molyneux has so readily responded to "*West Riding, Yorks*," I shall be exceedingly glad if he will be good enough, through the *Journal of Horticulture*, to favour me with the name of the above. I had the privilege last year of inspecting the well-kept gardens at Swanmore Park, and there saw this dwarf *Tropæolum* growing for the first time. It seems as though I have not lost sight of it yet; the habit was so dwarf, foliage dark, and flowers such a bright scarlet. Excepting the colour it seemed to remind me of tufts of *Lobelia*.—WM. SPENCER, *Southport*.

— FRUIT CULTURE.—On Thursday evening, the 4th inst., Mr. W. Roupell, F.R.H.S., addressed the members of the Streatham Hill and Tulse Hill Institution upon this subject. The lecture, which was of a comprehensive character, was illustrated with some fine specimens of the best varieties of Apples, some of which had been previously exhibited at the Fruiterers' Show in the Guildhall. Reference was made to the useful work that was being done by the British Fruit Growers' Association; and some samples of preserved fruit from Lord Sudeley's fruit farms in Gloucestershire were shown and commended.

— THE WEATHER LAST MONTH.—November was dull and wet, and remarkable for the heavy fall of snow on the 25th (night) and two following days. It was 12 inches deep from 11 P.M. on the 27th until noon on the 28th. Rain and snow were recorded on all the days during the month except the 6th. The greatest daily fall was 0.71 inch on the 23rd, and the total for the month 3.90 inches. The barometer was very changeable. Highest reading, 30.45 at 9 A.M. on the 20th, lowest 28.90 at 7 A.M. on the 7th; average height for the month, 29.82. Highest shade temperature, 59° on the 23rd, lowest 11° on the 30th; lowest on grass, 14° on the 30th. Mean temperature of the month, 41.41°. The wind was in a westerly direction on twenty-four days. We had only eight bright days. The garden spring ran 9 gallons per minute on the 30th.—W. H. DIVERS, *Ketton Hall Gardens, Stamford*.

— LETTUCES.—I by no means intended to say anything against the veracity of Mr. Easty. My only difficulty was as to the variety of Lettuce he referred to in his note. I must explain that for some seasons Messrs. Vilmorin have favoured me with a copy of their retail catalogue (in French), and in that there is nothing which I could conceive as likely to be *Blond Blockhead* save the *Laitue Blonde Géante*, the description coming very near to that given. There is a *Grosse Brune Têtue*, which no doubt is the *Brown Blockhead*. Save the name! I shall hope to try both of these next year, and thank your correspondent for the seeds so kindly forwarded.—B. [Our friends across the channel have somewhat different ideas of nomenclature from those which we possess, and their names must not be taken too literally. For instance, "*Grosse blonde paresseuse*" does not exactly mean "large white lazy" Lettuce, as it might be literally translated, and similarly "*Grosse brune têtue*" can hardly be read as "large brown Blockhead." "*Têtue*" is probably in allusion to the firmness of the head, and possibly Messrs. Vilmorin in looking up their English dictionary, and finding the word given as meaning "headstrong," "obstinate," or "stubborn," confused the meanings, and considered a firm or solid head might be expressed by "blockhead." This seems the most likely explanation of the selection of so ridiculous a name.—ED.]

— GRAPE GROWING AND GRAPE KEEPING.—I must admit (see page 446) that Mr. Scott has in a novel and unmistakable way disposed of one of my objections to the use of his compound for the destruction

of insects on Vines by his dispensing with the use of the syringe. But with all due respect to Mr. Scott's experience respecting the exterminating properties of his compound I have failed to discover them; but whether the cause, as Mr. Scott suggests, has been from improperly mixing or unskilful application, is a matter of little interest or importance, as I find preventives much preferable to cures. But should Mr. Scott continue to abolish the use of the syringe, which is equally as mysterious to me as my vigorous use of it appears to him, the use of insecticides of some kind will, no doubt, be as indispensable in the future as in the past, and since Mr. Scott is perfectly satisfied with past results, any further intrusion from me would I fear appear unseemly.—RICHARD WESTCOTT.

— SUMMARY OF METEOROLOGICAL OBSERVATIONS AT HODSOCK PRIORY, WORKSOP, NOTTS, FOR NOVEMBER, 56 feet above mean sea level. Mean temperature of month, 41.0°. Maximum on the 20th, 58.6°; minimum on the 30th, 14.7°. Maximum in the sun on the 1st, 95.2°; minimum on the grass on the 30th, 8.2°. Mean temperature of the air, 40.1°. Nights below 32°, in shade twelve, on grass twenty-one. Total duration of sunshine, fifty-one hours, or 20 per cent. of possible duration. We had eight sunless days. Total rainfall, 3.23 inches. Rain fell on twenty-one days. Average velocity of wind, 9.9 miles per hour. Velocity exceeded 400 miles on five days, and fell short of 100 miles on five days. Approximate averages for November:—Mean temperature, 41.7°. Sunshine, fifty hours. Rainfall, 2.04 inches. Rather a wet month, and mild up to the last week, when we had an unusually heavy fall of snow (11 inches deep), and a few days of very cold weather, the frost on the 30th being sharper than has been recorded here in any November in any of the last fifteen years.—JOSEPH MALLENDER.

— BIRMINGHAM GARDENERS' ASSOCIATION.—Occasionally an evening is set apart for the exhibition of plants, flowers, and fruit or vegetables of interest, especially new and rare objects, and at the last meeting, Mr. Hughes, the Secretary, read a paper on the Federation of Gardeners' Associations, and several interesting exhibits were sent. Messrs. Cutbush & Son, Highgate Nurseries, London, sent some plants in berry of some of the newer forms of *Pernettyas*, showing what striking and pretty decorative plants they are. Mr. R. Owen, Maidenhead, sent cut blooms of several new American *Chrysanthemums* and seedlings, amongst them *Ada Spaulding*, *Mrs. S. Coleman*, and *Madame Edouard Veltón*, all fine incurved varieties. In Japanese varieties *Advance* is truly an advance, and of a new and beautiful colour, and others are very promising. Mr. Cryer, the gardener at Berrow Court, Birmingham, contributed several plants of well grown *Cyclamens*, and Mr. Burberry, the Orchid grower at Highbury, sent cut flowers of some very fine varieties of *Cypripedium insigne*, also good specimens of *Odontoglossum Pescatorei* and *Sophronis grandiflora*.

— ABOUT sixty members and friends of the KENT COUNTY CHRYSANTHEMUM SOCIETY sat down to dinner at the Bridge House Hotel on Wednesday, 3rd December. The President, J. W. Prior, Esq., occupied the chair, and Messrs. Stevens and Davis the vice chairs. Both the room and the tables were tastefully decorated for the occasion by Messrs. Laing & Sons and Mr. Chard. The toast "The President and Vice-Presidents" was given by Mr. Stevens, and most suitably responded to by the President. Mr. D. B. Crane, in a neat little speech, gave "The Executive," to which Mr. Needs, Hon. Secretary, replied, stating the progress the Society had made in its three seasons. The first year they had only 900 cut blooms, the second year 1800, and this, the third, upwards of 2000; they took nearly £90 in gate money, and hoped to have a balance of nearly £40 to carry forward for next season. "Kindred Societies" was next given by Mr. Needs, and E. C. Jukes, Esq., Vice-Chairman of the National, spoke with his accustomed freeness, urging such a good society to become affiliated with the National. Mr. Birdseye gave "The Exhibitors," and the Chairman then presented the 15-guinea cup to Mr. Blackburne. Mr. J. A. Laing and Mr. Chard also suitably replied. Other toasts followed with excellent songs and recitations by Messrs. O'Neil, Monk, Searle, Crane, Birdseye and others. A hearty vote of thanks was also given to Mr. Norman Davis as donor of a silver cup and for the great interest and attention he has devoted to the Society from its commencement.

— SHREWSBURY CHRYSANTHEMUM SHOW.—We are pleased to see this wealthy Society has once more held a fruit and Chrysanthemum Show, none of this kind having been held there for several years. It was a fine display of cut blooms, fairly good prizes being offered in the open classes for twenty-four distinct Japanese. The prizetakers were Colonel Wingfield, Onslow (gardener, Mr. Lambert), first; second, France Hay-

hurst, Esq. (gardener, Mr. Bremmell); third, Mrs. Foster, Moor Park, Ludlow (gardener, Mr. Haggart); extra, the Duke of Sutherland, Trentham (gardener, Mr. Blair). For twenty-four incurved blooms—First, Colonel Wingfield; second, Mr. Greatrix, Mytton Hall (gardener, Mr. Townsend); third, Mrs. Foster. In the classes for twelve incurved and twelve Japanese the same exhibitors were also successful. The amateurs showed very well in all classes provided for them. Certificates of merit were awarded to Messrs. Jones & Sons, Pritchard & Sons, Mr. Eckford, and Mr. Myers; Mr. Murrell of Shrewsbury, Messrs. Smith of Worcester, and Mr. Harrison of Millington's Hospital. Fruit was not first class this season, but fair collections were shown from Attingham, Lord Berwick's (Mr. Pearson); from Acton Regnald, Sir Vincent Corbet, Bart. (Mr. Hawkesford); from Berwick, J. Watson, Esq., M.P. (Mr. Gant); and Colonel Wingfield of Oaslow. Specimen plants were but poorly represented, growers in the county not knowing of the Show in time. The Show was well attended by the public, and we hope to see it continued another year.—G. W.

### EXHIBITION SCHEDULES.

IN the course of your remarks in the Journal of the 4th inst. on the question of disqualifying exhibitors of groups after the public have been admitted in cases where an exhibitor has, to adopt your own mild term, "peculiarities" in his group, you suggest a proviso that "if anything in contravention of the stipulations is discovered before the close of the Show the prizes will be withheld. Now, in the rules of a certain well-known Society I find the following:—"Any person exhibiting flowers or plants belonging to another and entering them as his or her own, or exercising any artifice to deceive the Judges, or otherwise attempting to gain prizes by unfair means, shall forfeit all claims to such prizes as may have been awarded to him or her, and the Committee reserve to themselves the power to refuse future entries from such exhibitor." This seems to meet the point you raise exactly, and you will observe that it says "shall" forfeit, not "may" forfeit, so that even the Committee cannot condone a wilfully wrong act.

It would certainly be absurd to suppose that Judges are to dive into groups to discover they know not what, something on the principle of "turn round three times, catch whom you can." Not only would exhibitors object, but also the public, who would not care to pay for admission to see the wrecks after the storm.

On one point in your article I must disagree with you. You say such a proviso as you suggest should only apply to groups, but what about flowers neatly "grafted" on to specimen plants, or nice compact centres deftly placed in large loose blooms? Would a Judge undertake the responsibility of discovering these "peculiarities?" I trow not. The symptoms of a wasting decline would probably not be apparent until the second day, and the adjudicator would certainly not be able when judging to discover with that pencil point of his whether every bloom was without guile.

Many a Society has been brought to the dust by allowing laxity in the observance of their rules, especially as regards honesty in exhibiting, for if Committees are not strict on this point it is unjust to those exhibitors who do show fairly, who thereupon get disgusted and cease showing at all.—ALTER EGO.

[There is a good deal of force in the remarks of our correspondent, and we do not in the least object to his slight disagreement with one of our propositions. Notwithstanding the stringency of general rules it is quite customary to insert special conditions or provisos to certain clauses, if only for guarding against the possibility of the stipulations in the rules being overlooked, and we think the practice good. In respect to judging blooms we think in the first place a sufficient number of Judges should be provided, and sufficient time allowed them for a critical examination of the whole of the exhibits, and then they should be expected to discover faults of whatever kind, and if they overlook any of a flagrant nature these Judges should be superseded another year. We think the practices suggested by our correspondent are about obsolete, and, at least in the case of cut blooms, are discoverable at the time the awards are made. We are convinced that in nine cases out of ten when mistakes are made they are the result of Judges having to "rush through" several classes in order that the work can be completed by the appointed time for the public admittance. If, as is usual, a stipulated time is announced for the entering of protests in the classes in question sufficient provision is made to practically ensure justice being done without relieving Judges of the responsibility that we are of opinion should rightly attach to them. Our remarks applied to exhibitions generally, and were not confined, except where stated, to any particular show.]

### GARDENERS' ORPHAN FUND.

A SPECIAL general meeting was held on Tuesday evening last, at the Cannon Street Hotel, London, for the purpose of making some slight yet important alterations in the rules. William Marshall, Esq., Chairman of the Executive Committee, was called on to preside. The agenda paper, he said, contained four resolutions, three of which he should ask Messrs. B. Wynne, J. Wright, and R. Dean to propose, one being reserved for himself.

The resolution moved by Mr. Wynne, and seconded by Mr. J. Wills,

was as follows:—"That in the opinion of this meeting it is desirable, in the best interests of the Gardeners' Orphan Fund, that the date of commencement of the financial year should be altered from July 1st to January 1st, and that the annual general meeting should be held in February instead of July."

Mr. Wynne explained that this was simply a reversion to first principles, a return to the original proposition of the Committee, but at an important general meeting was departed from on the motion of the late Mr. Shirley Hibberd, for reasons which appeared forcible at the time; and although the Committee was doubtful about the wisdom of the change, did not feel justified in causing the least dissension, therefore acquiesced. It caused much confusion and involved a large amount of secretarial work, which on the score of economy and good management it was desirable to avoid.

Mr. Wright next moved and Mr. Roupell seconded, "That in order to carry the previous resolution into effect the following alteration in the rules be and are hereby made:—1, In Rule 3, last line, substitute "31st of December" for "30th of June." 2, In Rule 9, fourth line, substitute "December" for "June." 3, In Rule 10, second line, substitute "February" for "July."

Mr. Wright said that as all knew there was truth in the axiom, "Great results from little causes spring," therefore he hoped and believed that great and good results would follow the small alteration of the four words indicated, in the rules. This was necessary for setting the machinery in motion, that would work more smoothly by the change; and the time was opportune for making this change, since all the unsuccessful candidates at the last election were now placed upon the Fund, which now supports thirty-seven children, at an annual outlay of £481.

Mr. R. Dean then moved, and Mr. Walker seconded, "That the sum of £554 13s., the amount required to enable the Committee to grant the benefits of the Fund to the seven unsuccessful candidates at the last election, as a memorial to the late Mr. George Deal, having been collected and received by the Treasurer, this Meeting endorses the action of the Executive Committee in placing on the Fund Alfred Henry Budd, Winifred Jones, Sidney Alfred Offer, Arthur Henry Rowland, Mary Grieve, Evan Evans Kinch, Francis Thomas Pragnell, as and from the 1st of January next."

Mr. Dean remarked that in no other way could the memory of their late Chairman be so appropriately perpetuated as in the form suggested. The tribute was a substantial one, and provides means of livelihood to seven children, and he was sure that a dissentient voice would not be heard against the resolution which he had pleasure in moving.

The Chairman next moved, and Mr. Assbee seconded, "That the hearty thanks of this meeting be accorded to the subscribers to the 'George Deal Memorial Fund,' and especially to Mr. N. N. Sherwood and Mr. H. J. Veitch, through whose generosity a worthy memorial of the late Chairman of the Committee has been raised, and applied in a manner that he, in life, would have most approved of."

It was quite unnecessary, he said, for him to say anything in favour of what he now placed before the meeting with great pleasure, and the undoubted approval of all present.

All the resolutions were passed unanimously, and the meeting closed with a vote of thanks to the Chairman, proposed by Mr. A. F. Barron.

### TREE AND SHRUB GROUPS.

GOOD work, correct practice, leading to successful combinations, and results entirely satisfactory, depends very much upon the study of faults and the full recognition of their cause. A faultless clump is a pleasant sight throughout the year. In the full glory of summer foliage it is of course at its best, but it has also special attractions at other seasons; of spring greenery, of autumnal leaf tints, of form in winter, when each tree invites inspection and comparison with the others. Nor is the clump devoid of colour then, for the rich greenery and warmth of evergreens is there, and there is also much beauty in the varied subdued tones of the bark of deciduous growth.

To obtain all this the trees must be well chosen and well placed, sufficiently far apart for full development; that is why the planting of permanent trees first and the temporary trees afterwards is advised. In the hands of an expert the position of each tree would be first of all marked upon a plan, and then the planting of the whole of the trees may be done together with certainty and despatch. In the hands of a tyro the work often becomes very costly from the wasteful use of valuable trees. An instance of this well known to me may be mentioned, where some miles of belts and many clumps have been planted so thickly with choice deciduous and evergreen trees in an uniform manner throughout, that thousands of valuable young trees will have to be sacrificed eventually, simply because there was no well considered plan at the outset. The planting was done by the owner of the estate, who was fond of and who knew trees fairly well, but who was quite ignorant of tasteful arrangement, and therefore had plenty of the choicest trees planted everywhere. With subsequent attention to thinning the result may prove tolerably satisfactory, but it would have been much more so, and far less costly, had the work been

placed in the hands of a competent planter. The outlay for trees would have been infinitely less, the nurses or temporary trees would have been Larch, growing into money by the time thinning became necessary, instead of more costly trees good for nothing at the thinning but faggot wood.

Small clumps may often be seen where only a single tree was required, and the effect of the foliage is very similar to that of one

appearance in the earlier stages of growth, and with age the Cedar will assume the typical form, becoming more round headed and more effective, for the appearance of a large specimen of the silvery Atlantica is very striking, affording a fine contrast to the Purple Beech. To this eventually will be conjoined the ruddy hue of the bark of the Scotch Fir, and its picturesque effect as the tapering form departs with its lower branches. Near it the Silver Birch

FIG. 69.—1. WHITE BIRCH; 2. LIME (*TILIA MISSISSIPIENSIS*); 3. SCOTCH FIR; 4. PURPLE BEECH; 5. *CEDRUS ATLANTICA GLAUCA*; 6. *ACACIA DECAISNEANA*; X X. COMMON ASH.

tree if the trees are all of the same kind; but however well such clumps are placed they never please the eye like a fine specimen, as at best they are just a formal mass of foliage, all sense of dignity and grace being lost in the absurdity of an effect of a many-legged tree.

Fig. 69 represents a small group, one of several in course of being planted in a park. The two Ash trees were in a hedgerow which has been cut down and grubbed, the trees being retained to form part of the group as shown. Without giving actual portraits of the trees the outlines are sufficiently characteristic of their

will be in fine contrast, and with the Lime and Acacia will combine to form an attractive and telling group. Farther up the line of the old hedgerow there are five Ash trees, also retained to form a bolder group with a Cedar of Lebanon, Turkey Oak, Scarlet Oak, two *Pinus austriaca*, Tulip Tree, common Lime, Horse Chestnut, Fern-leaved Beech, Purple-leaved Maple, Scotch Fir, and the Aucuba-leaved Ash. This will become a very fine group as the trees gain size, and it may be fairly given as an example for the clump for all seasons of the year, the characteristics of which are explained at the beginning of this paper. The turf sweeps gently

upwards from a lake between these two groups, onwards to a bold semicircle of timber in the distance, forming one of several vistas visible from a common centre.

Mixed groups are not to be planted exclusively. One vista commands a picturesque building on a hillside. Near the building there will be a group of Scotch Firs, and lower down the slopes of the hill a group of Elms; at other points groups of Oaks, and others of *Pinus austriaca*, will impart character and dignity in due course. The Elms and Oaks will be planted far enough apart to ensure full development and really fine timber. The Scotch Firs will be so arranged as eventually to form picturesque groups such as artists love rather than with a view to very fine specimens.—EDWARD LUCKHURST, *Warrens, Harold Wood, Romford.*

## THE ORIGIN OF THE FLORIST'S CHRYSANTHEMUM.

[A paper by the late Mr. Shirley Hibberd, read at the Centenary Conference of the National Chrysanthemum Society, November 11th, 1890.]

THE origin of the flower that commands our homage at this season and is the subject of this Centenary festival is a matter of some importance both to botanists and horticulturists, and cannot be without interest to those who find amusement in speculating on the beginning of things, and the histories of the favourites of the garden. It may appear to the casual observer of what is now passing as a question easily disposed of, for do we not read in the books that the Chrysanthemum was introduced to this country 100 years ago, certainly; and has been known in Europe 200 years probably; and that China has the honour of having made it as a garden flower from one of the wildings of her own woods? Many questions may be disposed of in this easy way for those who are content with the dust that may be swept from the surface of a subject, but in this solemn assembly, making serious business of all that pertains to the history of the golden flower, there must be an endeavour made to brush away the superficial dust in order to explore what lies beneath.

There is, then, be it observed, a strong *primâ facie* case for a plural origin of the various groups of flowers that are brought into the purview by the generic term Chrysanthemum. The Chusan Daisy appears far removed from the noble Queen of England or the fantastic Spiderkry, the latest of the grotesque forms of the flower that Japan has given us. We have Liliputians, Pompons, reflexed, and incurved, Japanese of several distinctive characters, and single flowers that in some particulars of growth and proportion stand apart from the other groups. When I said the other day, in discoursing on the Dahlia, that it is the most variable of all known flowers, I had not forgotten the flower that is now before us, but I was less sensible than I ought to have been of the immense range of its variations both in form, and size, and colour. But when I look seriously at the matter I perceive many visible connecting links between the several groups, and these are to be traced only by a careful diagnosis, which shall distinguish between actual differences and mere modifications and variations. An elastic cord may be 1 foot long and 1 inch thick, and in that form of great strength, but when stretched a touch might snap it; yet it is the same cord, and if we are careful not to break it will return to its original proportions and qualities, and so prove its identity. I would submit the Chrysanthemum to some such test, but the moment I contemplate doing so a difficulty arises that appears insuperable. We may stretch the flower as we stretched the cord, and in fact we have stretched it in every way imaginable, but we cannot restore it to its pristine form. We know something of analysis in this business, but nothing of synthesis; we have no record of any floral favourite that has been much modified by man being actually bred back to its original form of a wild flower. I remember at the first Primula Conference Mr. Lynch of the Cambridge Botanic Gardens undertook to breed back the Auricula to the wild form out of which it originated, and all that can be said further on the subject is that the promise made years ago remains unfulfilled, and I will venture to say will so remain for ever and ever. The experimental test must be useful in this inquiry, but it cannot be final. There remains for us only the inductive method, and in aid of that we have a body of facts of the highest interest and value.

It will be proper to begin with a few elementary particulars for the advantage of friends here who have not given any special attention to the structure of the flower and the general character of the plant. The Chrysanthemum is a compound or composite flower, and may be roughly described as a cluster of distinct flowers fused together, and fixed on one centre or receptacle. We find in a typical flower of any of the higher classes of indigenous plants a calyx of green leaves, a corolla of coloured petals, male organs or stamens crowned with anthers that diffuse a fertilising pollen, and

female organs or pistils crowned with sensitive stigmas that receive the pollen, and by the stimulus thus communicated to the ovary at the bases of the styles or stems of the pistils, the growth of fertile seed is promoted, and the proper work of the flower is thus completed. If you take a flower of a wild Rose you will easily discover all these parts, and they combine to represent what I will call unity, for the one flower is one flower, and all its parts relate to one centre, and the use of every part is in some way to contribute to the production of the scarlet hiep or berry in which the seeds are formed. In the flower of a single Chrysanthemum the corresponding organs are all to be found, but modified in form and arrangement. The characters that first strike us are the corolla, as we may call it, that forms the boundary, and the stamens and pistils that form the golden disk. When we remove one of the supposed petals we find it to be tubular at the base, and enclosing an imperfect pistil, which is often a mere thread without stigmas. Now we know that this is not a petal, but a kind of imperfect flower, and we call it a ligulate or strap-shaped floret. Analysing the disk by cutting the flower through vertically, we find on the receptacle a closely arranged set of tubes or narrow cups that terminate above in teeth and below in corresponding ovaries. In each of these tubes are stamens in a bundle, and through the bundle or fascies rises the pistil crowned with two horns that are veritable stigmas. Now we learn the meaning of the arrangement. Each tube is a complete flower, the tube itself being the corolla, and the stamens and pistils within rendering it properly hermaphrodite and capable of seed production, which the strap-shaped organs of the margin are not, for the pistils there are mere signs, and apparently accomplish nothing. We term the strap-shaped outer adornments florets of the ray, and the tubular flowers within florets of the disk. The golden colour of the disk is the result in the first instance of the pollen produced by the syngenesious or coherent anthers, which perfect and disperse the pollen some days in advance of the protrusion of the stigmas, and when these are ready to receive pollen advantageously the pollen of the florets to which they belong is all dispersed and gone, and consequently we may regard it as a rule of life with the Chrysanthemum that although the stigmas may receive pollen from florets of the same disk, they cannot receive it from the same floret, and will be very likely, indeed, to receive it from the stamens of another flower. The word "flower" I use for convenience solely; the proper term is capitulum, because a so-called flower consists, as already explained, of many florets united in one head.

When we reflect on the number of wild flowers that are fertilised by pollen from other flowers on other plants of their own kind, and that many of them are proterandrous or produce their pollen in advance of their stigmas, it seems a marvel that they should remain constant to a certain typical form, as many appear to do for centuries, although exposed to the chances of cross fertilisation. Variations do indeed occur, as every botanist knows full well, and yet the constancy of what we call species presents a problem of tremendous import for the philosopher. Many plants associate in groups which flower simultaneously and so favour a settled heredity, and thus the circumstances of place and time contribute to the constancy I am hypothesising. And another cause contributes to it, for varieties have a more slender tenure of existence than settled types, and we speak of the survival of the fittest to express our faith in the practice by Nature of a process of selection, death being the agency for the removal of variations that are not wanted. Thus creation and continuance are both kept in check, and types survive variations, except in some peculiar cases, in which they become established to behave themselves as species.

But when man steps in the case is altered. Anything that differs from the accustomed type will suit his taste even if it be useless and ugly. A peloric Snapdragon, or a wheat-ear Carnation, or a green Rose, or a Chrysanthemum in which the florets of the ray have usurped the place of florets of the disk, and so produces what we call a "double" flower, will afford great delight. His first business will be to keep this new creation, whereas, perhaps if he had left it alone, death would have swallowed it as a thing unfit. This keeping of the curiosities is the beginning of floriculture. A variation fires a new enthusiasm; the variety is cherished, and though unable to propagate itself by reason of its barrenness, the florist finds means to multiply it, and he takes the hint it offers and labours to obtain other variations, and so by degrees becomes the master of Nature within certain limits which, indeed, are very narrow, and as compared with the great scheme of Nature the work of the florist is but trifling. But as an amusement, floriculture must have the highest place amongst what may be termed elegant pursuits, for its aim is the creation and preservation of floral beauty, and its work will be of incalculable value to the philosopher if he will but remove the scales of prejudice from his eyes and see what he can learn from it. We talk of heredity, and the causes and consequences of variation, and sometimes imagine the botanists know all about it. The truth is, they know very little about it;

the key to such knowledge is in the florist's hands as regards the subjects of his attention, for he possesses records of their variations, and their life histories are to him familiar, and the habit of observation is not only forced upon him as essential to his success, but it grows by what it feeds upon, and every day reveals to him something that is concealed from the botanist, unless he happens to be also a florist, which he seldom is, and perhaps never can be.

Now let us look into this subject of variation. The ligulate florets are, as regards actual and direct contribution to the formation of seed, useless. But Nature is frugal, and all things have or have had uses to justify their being. That the ray florets were once upon a time fertile female flowers is probable, but if it be asked of what use are they now it may be answered that they doubtless serve to attract insects to the flowers that the pollen may be usefully removed and scattered. Now what do we see as the result of the multiplication of these ray florets at the expense of the disc florets? We see nothing else but this, that the doubling of the flower renders it infertile, and from the moment it acquires this new character it is actually dependent on man for its continuance. When man ceases to preserve the double Chrysanthemums they will absolutely perish, unless, indeed, neglect should quickly replace the inner ligulate florets with tubular florets, in which case they would save themselves by returning to a single form, and even that would be equivalent to destruction, for it is the continuance of the double flower we are considering. If you pull to pieces a double flower of any kind, whether incurved or reflexed, Pompon or Jap, if it has no yellow disk, it will be found destitute of pollen and absolutely incapable of seed production. One reason, therefore, that the raising of seedling Chrysanthemums is a matter of difficulty is that the flowers have become sterile, and therefore to obtain seed from them is impossible. I am well aware, of course, that seed is obtained not only by accident, but by method, and there is what may be called a science of seed production in this field of floriculture. But I am striving to get at the beginning of things, and must be allowed to set forth both generalities, and I repeat that the tendency of all improvement of the Chrysanthemum is to render the flower incapable of reproduction, and therefore its entire care as a garden flower is in the hands of man.

(To be continued.)

THE NATIONAL ROSE SOCIETY.

THE annual general meeting of the above Society was held in the Horticultural Club room on Monday, December 9th, at 3 P.M., Dr. Robert Hogg in the chair. There was a good attendance of members, amongst those present being the following:—The Revs F. R. Burnside, A. Foster-Melliard, F. H. Gall, J. H. Pemberton, W. Wilks, H. B. Biron, and H. H. D'Ombrain (Hon. Sec.), with Messrs. H. J. Pearson, H. Appleby, J. Bateman, R. Bloxham, B. R. Cant, F. Cant, C. E. Cant, W. J. Jefferies, E. B. Lindsell, G. Paul, J. D. Pawle, A. Prince, G. Prince, H. Wallis, W. H. Williams, O. G. Orpen, W. F. Cooling, J. Burrell, R. E. West, G. Mount, F. T. Strange, S. G. Rumsey, W. Rumsey, A. Slaughter and E. Mawley (Hon. Sec.).

The proceedings were commenced by Mr. Mawley reading the notice calling the meeting. The minutes of last annual general meeting were then taken as read, and Messrs. Jefferies and Bateman were appointed scrutineers of the ballot. Following this Mr. Mawley read the appended report, and Mr. J. D. Pawle the financial statement.

REPORT OF THE COMMITTEE FOR THE YEAR 1890.

DURING the past year the Society has been enabled, thanks in a great measure to the liberal donations of some of its members, to inaugurate a special exhibition of Tea Roses. This, the first show of the kind, was held at Westminster early in the season, in conjunction with the Royal Horticultural Society, and was generally acknowledged to be the finest display of this refined and popular class of Roses ever seen in London. At the Metropolitan Exhibition, which was again held at the Crystal Palace, Roses were more numerous than in any year since 1885. There were fewer exceptionally fine blooms than on some previous occasions, but the average size and quality of the flowers staged was remarkably good. In one respect this Show stands out as unique, in that nearly the whole of the blooms retained their freshness throughout the entire day. At this exhibition the Society's new challenge trophy for Tea and Noisette Roses was for the first time competed for. The Birmingham Show also proved a great success, being the largest and finest the Society has yet held in the provinces. In many of the classes the competition was singularly keen.

The first Supplement to the Catalogue of Exhibition and Garden Roses being out of print, an entirely new edition was prepared and

issued to members early in the summer. This supplement contains select lists and descriptions of those varieties which have been introduced since the original Catalogue appeared in 1884. Copies of the Royal Horticultural Society's Report on the National Rose Conference held at Chiswick in 1889 were also distributed.

The Committee wish again to direct the attention of their affiliated, and also of other Rose societies, to the question of Rose show fixtures. In some few cases during the past season the clashing of dates may possibly have been unavoidable, but in others it might, no doubt, have easily been prevented. If only all the Rose societies in the same neighbourhood would communicate with each other early in the year and come to some mutual arrangement, much of the present suicidal clashing of fixtures would, in the opinion of the Committee, entirely disappear. They would also point out that there is generally such a run on certain particular days, that some of the best dates are often altogether overlooked.

There are at the present time 497 members on the Society's books, while the number of affiliated societies is now thirty-one. Both these numbers are higher than in any previous year.

During the last year the Society has experienced several severe losses amongst its members, two of its Vice-Presidents—Mr. James McIntosh, who has from its very beginning been its most liberal supporter, and Mr. Shirley Hibberd, who, by his pen and active co-operation has done much to further its interest; while in the Countess of Rosebery the Society loses one of its recently appointed Vice-Patronesses.

FINANCIAL STATEMENT.

Considering the extra expenses incurred in holding a third Show, in printing the new supplement to the Catalogue, and in supplying members with reports of the Rose Conference, the financial position of the Society must be regarded as very satisfactory. The total expenditure was £692 15s. 7d., while the receipts, including the balance from last year, amounted to £738 0s. 3d., thus leaving £45 4s. 8d. to be carried forward to 1891.

ARRANGEMENTS FOR 1891.

The Committee have entered into the following arrangements for the coming year, which they trust will meet with the approval of the members generally. An early Show of Tea Roses will be again held at Westminster in conjunction with the Royal Horticultural Society on Tuesday, June 23rd, the Metropolitan Exhibition at the Crystal Palace on Saturday, July 4th, and the Provincial Show at Hereford on Thursday, July 16th. Although the idea of establishing a National Rose Society originated at Hereford fifteen years ago, this will be the first time that the Society has ever held a Show there.

MEMBERS' PRIVILEGES.

Subscribers of £1 will, as usual, be entitled to two private view tickets to the Society's Exhibitions at the Crystal Palace and Hereford, and four transferable tickets admitting at the same time as the general public; while subscribers of 10s. are entitled to one private view and two transferable tickets. Each member will also be entitled to a ticket of admission to the early Exhibition of Tea Roses. New members will receive a copy of the Society's illustrated catalogue of exhibition and garden Roses, together with one of the new supplement. Members alone are allowed to compete at the Society's Exhibitions.

In conclusion the Committee desire to express their best thanks to their local secretaries, also to all those who, by gifts of special prizes or in other ways, have contributed to maintain the Society in its present satisfactory position.

Audited with Vouchers and found correct—  
 J. D. PAWLE } *Hon. Auditors.*  
 F. T. WOLLASTON }

The adoption of the report and financial statement was moved by Dr. Hogg, who observed that he had every reason to be satisfied with the condition and progress of the Society. The Rev. A. Foster Melliard seconded the resolution, which was carried unanimously. Other resolutions followed, expressing the thanks of the Society to the Horticultural

Club for the use of their room during the year; also to the officers and other members of the Committee for their services in 1890. It was also resolved, on the motion of the Rev. J. Pemberton, seconded by Mr. B. R. Cant, "That the first part of bye-law 7 be altered so as to read, 'The General Committee meet twice annually—in January to elect the Executive Committee, and consider the schedules for the year; and in November to make arrangements for the general meeting of the Society.'"

A more important matter was next reached in the agenda when Mr. E. B. Lindsell rose to propose "That the following Roses be added to regulation 6:—Alfred Colomb, Marshal P. Wilder, Wilhelm Koelle, Duc de Rohan, Mrs. Jowitt, Grand Mogul, Jean Soupert, Lady M. Fitzwilliam, Lady Alice, Madame A. Lavallée, Marie Baumann, together with the following note:—N.B.—In bracketing Roses together foliage and habit of growth are not taken into consideration." The Rev. H. B. Biron seconded the motion, but in a rather doubtful tone, and some discussion followed. Several members raised objections to Alfred Colomb being identified with Marshal P. Wilder or Wilhelm Koelle. Others considered that though a difference was sometimes seen, the distinction was too slight or not sufficiently constant to permit their being staged together, and this seemed to be the general feeling; at least when the motion was put from the chair it was carried by a large majority.

Another matter of considerable importance, and which occasioned more discussion than any other part of the business, was the following, proposed by Mr. G. Paul:—"That having regard to the inutility of the addition made last year to Regulation 8 against dressing Roses, the words, 'Dressing Roses so as to alter their character is prohibited,' be omitted, and the Regulation stand as prior to its alteration." Mr. Paul remarked that it would seem somewhat strange for him to be the first to propose the alteration of a rule he had been instrumental in forming last year, but he was convinced from personal experience and general report that it had been inoperative. Both judges and exhibitors had practically ignored the rule, and it placed conscientious exhibitors at a greater disadvantage than before, as they were deterred from manipulating their flowers in any way, while others of a less sensitive disposition paid no regard to the matter. He entirely disapproved of dressing Roses in any form, but he felt it was useless to make a law that only led to law breaking. The Rev. Foster-Melliar expressed surprise at Mr. Paul's motion, because he thought the rule had been beneficial, and that excessive dressing so to alter the character of the blooms had been to a large extent stopped. He thought the rule should remain as it was, an opinion in which Mr. Jefferies and others concurred. The Rev. D'Ombraïn considered it desirable to try the rule for a long time before discarding it. Mr. Paul then said that there was an instruction to the Judges to the effect that an over-dressed bloom should be regarded as a bad bloom, and he asked if any judges present could say that they had acted upon this instruction. Several in reply to this stated that they had done so, and further expressed the opinion that there had been less excessive "dressing of bloom" during the past year than before. Mr. Paul said he was glad to hear this, and he hoped the discussion would be the means of leading to a more stringent enforcement of the regulation. He, however, adhered to his motion, which, being seconded and put to meeting, was negated by a large majority.

It was then declared that as the result of the ballot the names in the appended list had been duly returned, and the meeting closed with a hearty vote of thanks to the Chairman.

COMMITTEE AND OFFICERS, 1891.—President: The Very Rev. The Dean of Rochester, D.D. Vice-Presidents: His Grace the Duke of Portland, Sir Joseph R. Bailey, Bart., M.P., Michael Biddulph, M.P., James Rankin, M.P., the Mayor of Hereford, R. N. G. Baker, Rev. J. M. Fuller, T. B. Haywood, Dr. Robert Hogg. Hon. Treasurer: Thomas Burt Haywood. Hon. Secretaries: Rev. H. Honeywood D'Ombraïn, Edward Mawley. General Committee: H. Appleby, J. Bateman, Rev. H. A. Berners, R. Bloxham, G. Bunyard, Rev. F. R. Burnside, J. Burrell, B. R. Cant, F. Cant, Rev. A. Cheales, Captain Christy, W. F. Cooling, G. Dickson, Rev. A. Foster-Melliar, W. H. Fowler, Rev. F. H. Gall, T. W. Girdlestone, C. J. Grahame, W. J. Grant, R. Harkness, C. F. Hore, W. J. Jefferies, R. L. Knight, E. B. Lindsell, J. Boyes, Rev. F. Page-Roberts, G. Paul, J. D. Pawle, Rev. J. H. Pemberton, A. Prince, D. Prior, W. Rumsey, A. Slaughter, A. Turner, H. Wallis, R. E. West, E. Wilkins, Rev. W. Wilks, W. H. Williams, F. T. Wollaston. Hon. Auditors: J. D. Pawle and F. T. Wollaston. Dr. M. T. Masters was also elected a Vice-President.

#### LOCAL ROSE EXHIBITIONS.

I REALLY did not intend continuing further correspondence on this subject, but I feel bound to answer Mr. Raillem by referring once more to the statement I made at page 380, line twenty-one, also the statement made by "J. B.," at page 420, line forty-four, and the schedule of the Gloucester Show, and others I could mention, but space does not permit. If these are not monopolies, I do not know what are. Mr. Raillem quotes the N.R.S. schedule with its divisions and restrictions, and suggests it cannot be improved. Take for instance division F, which I suppose is allotted for the smaller growers. Will he tell me whether there are any restrictions that would prevent Mr. Lindsell or Mr. Pemberton from showing in any of the classes in that division if they thought well? If so, I confess my search has been in vain.

With regard to the passage I quoted from the "Rosarians' Year Book," in my opinion it was quite in accordance with the Rev. H. T. Frere's

views. There is no doubt in my mind that his object was for encouraging the smaller growers. He says in that paragraph, at page 16, "We want more exhibitors; we old ones must beat up for recruits, and give advice and counsel." He also says, "We ring changes of the prize-list on too small a peal year after year, A, B, C, D, &c., never E or F" (this sentence refers to provincial shows), and which Mr. Raillem omits to mention. The interpretation I put upon that is that there ought to be additional classes, and for whom? Undoubtedly the small growers, as already there are sufficient for the larger ones. Again, Mr. Raillem quotes the passage, "Where great difficulty was experienced in persuading a neighbour to show at an exhibition, and upon his taking a first prize started him off," &c. Mr. Raillem attributes that to pluck. I do not see much pluck in a man who wants politely driving to do anything. No, it was the encouragement he received which enabled him to win the prize. Pluck is all very well, but something else is required with it—a head with something in it, also a pocket with something in it.

In conclusion, permit me, although not personally known to him in life, to pay my humble tribute of sorrow for the loss we must feel by the death of the Rev. H. T. Frere.—AN EXHIBITOR.

### ROYAL HORTICULTURAL SOCIETY.

DECEMBER 9TH.

THE last meeting of the Committees for the present year was held in the Drill Hall, James Street, on Tuesday, when there was a good attendance of members at each of the three tables. Exhibits are never very numerous at this time of year, especially when the weather is unfavourable, but on the occasion under notice they were perhaps rather above the average of corresponding dates. Orchids in particular were well represented, some very valuable novelties being shown, and these furnished both interest and colour. The duties of the Floral Committee were much lighter than usual, two collections of Primulas and Zonal Pelargoniums composing the greater portion of the exhibits in this department. Fruit and vegetables included excellent market Grapes, fine Onions, and a quantity of preserved fruits.

FRUIT COMMITTEE.—Present: R. D. Blackmore, Esq., in the chair; and Messrs. John Lee, P. Crowley, Harrison Weir, C. Ross, J. Willard, J. Denning, W. Warren, J. T. Saltmarsh, A. H. Pearson, H. Balderson, G. Wythes, F. Q. Lane, T. F. Rivers, J. Cheal, and J. Wright.

Two bunches of a black Grape named Scarborough Seedling were sent by the Liverpool Horticultural Company. The variety is said to be a cross between the Black Hamburg and Gros Colman, but no award was made on the ground that it was considered to be too much like the last-named variety to be regarded as distinct, and on being compared with samples of Gros Colman in the room, as grown at Worthing for market, no difference was perceptible either in appearance or quality. Bunches of *Lady Hutt Grape* were sent by Mr. Miles, gardener to Lady Hutt, Appley Towers, the result of a cross between Gros Colman (seed parent) and Black Alicante. Berries round, white, about the size of the Black Hamburg, and extremely juicy and rich in quality. They were quite firm and the stalk green, indicating its keeping properties, and it will not improbably prove to be a first-rate white Christmas Grape. A first-class certificate was unanimously awarded.

Mr. Ross, Walford Park Gardens, sent two Pine Apples, Smooth Cayenne, weighing respectively 7 lbs. 4 ozs. and 6 lbs. 12 ozs., and a cultural commendation was promptly recorded. Mr. Ross also sent three seedling Apples, but as they were not equal to existing varieties no award was made. Varieties of Apples are already much too numerous, and a seedling has to afford evidence of distinct superiority to merit official recognition. However, a seedling of much promise was sent by Mr. J. T. Saltmarsh, and named Chelmsford Wonder. It was raised by a cottager in Essex, is said to keep till March, the tree being a good bearer. The fruits were almost as large and symmetrical as fine specimens of Peasgood's Noncuch, firm, heavy, and agreeably sub-acid. The Committee were so favourably impressed with this Apple that a desire was expressed to see it again in February or March, and to test it then in a cooked state. Mr. T. Dixon, Grove Road, Leighton Buzzard, sent a dish of Cox's Orange Pippin from a tree trained against a wall and grown in sandy soil. They were richly coloured, but wanting in flavour (vote of thanks). Mr. Sidney Ford sent dishes of King of the Pippins Apple, and a vote of thanks was accorded.

Mr. James O'Brien, Harrow-on-the-Hill, sent fruits of Jamaica Oranges, heavy, with a thin pale rind, very juicy and good (vote of thanks). Mr. G. Wythes sent a gigantic specimen of the Spanish Cardoon, and a cultural commendation was awarded. He also sent plants of Victoria Spinach and Beet, and the varieties were recommended to be grown at Chiswick. Onions of enormous size were exhibited by Mr. Deverill, and a cultural commendation unanimously awarded. A bronze medal was recommended for twelve baskets of Grapes for market, sent by Mr. W. Hazell, Worthing, and vote of thanks awarded to Mr. Beach for a fine collection of bottled fruit and jams, a silver medal having been adjudged for Mr. Beach's produce on a recent occasion.

FLORAL COMMITTEE.—Present: W. Marshall, Esq., in the chair; and Messrs. E. Mawley, H. Turner, G. Paul, T. Baines, W. H. Williams, B. Wynne, H. Herbst, R. Dean, H. B. May, F. Ross, W. C. Leach, C. Jefferies, H. Cannell, C. Noble, and the Rev. H. H. D'Ombraïn.

The most conspicuous of the exhibits before this Committee were:

the brilliant Zonal Pelargoniums from Messrs. H. Cannell & Sons' Swanley, and a better example of the value of these plants for winter flowering could not have been afforded. Several good varieties were represented by fine trusses or clusters of bright scarlet, crimson, and salmon flowers; but of two varieties stands were shown of a dozen or more trusses each. These were F. V. Neulans, scarlet, with a white centre; and Souvenir de Mirande, soft salmon, with a white centre, both single and very effective. A group of bright crimson and gold graceful Celosia "plumes" were also sent from Swanley. A silver Flora medal was awarded for the collection. A group of double Primulas came from Mr. H. B. May, Edmonton, very neat, compact, and well flowered (silver Banksian medal). Messrs. Pitcher & Manda, Hextable, sent a plant of Mrs. Alpheus Hardy, with small imperfect flowers, but why it was shown was not evident, as it was not calculated to enhance the general appreciation of the variety. Mr. A. Waterer, Knap Hill, contributed a group of Piceas for comparison with "*Picea pungens argentea*," for which a first-class certificate was awarded; and specimens of injured Aucuba and other leaves were shown by Philip Crawley, Esq., Waddon House, Croydon, where it was said the temperature had fallen on the 28th ult. to 1°, or 31° of frost, the thermometer being 4 feet from the ground. Messrs. G. Coppin & Sons, Addington, sent similar specimens; and a patent tree pruner, which was commended.

ORCHID COMMITTEE.—Present: H. J. Veitch, Esq., in the chair; Dr. M. T. Masters, and Messrs. Sidney Courtauld, James Douglas, Lewis Castle, De B. Crawshay, H. M. Pollett, H. Ballantine, J. Dominy, E. Hill, F. Sander, and J. O'Brien.

So many good novelties were exhibited at this meeting that four first-class certificates and three awards of merit, besides a cultural commendation, were granted by the above Committee. But the light was so bad that none of the flowers could be seen to advantage or in their true character. G. N. Pepper, Esq., Milford Hill, Salisbury, sent a very large *Lælia* anceps, with about two dozen long spikes of fine brightly coloured flowers; as a decorative plant it was one of the most attractive shown. T. A. Gledstanes, Esq., Manor House, Gunnersbury (gardener, Mr. Denison), had a large plant of the peculiar *Cœlogyne barbata*, the sepals and petals white, the lip heavily fringed with brown.

Messrs. J. Veitch & Sons, Chelsea, exhibited a group of beautiful hybrid *Cypripediums*, amongst which were *C. Medea* from *C. hirsutissimum* and *C. Spicerianum*, clearly showing the characters of both parents in combination, the dorsal sepal partaking of the *C. Spicerianum* shape and colouring, the petals like *C. hirsutissimum*, but modified by the effect of the other species. *C. Niobe*, which was figured in this Journal page 527, Dec. 19th, 1889, is a charming hybrid between *C. Fairrianum* and *C. Spicerianum*, and on this occasion several seedling variations from the same cross, differing both in size and colour of the flowers, such as *C. Lceanum* or *C. Lceanum superbum* does. Another hybrid *Cypripedium* named H. Ballantine, from *C. Fairrianum* and *C. purpuratum*, the dorsal sepal rounded, broad, and heavily veined with crimson, the petals tipped with crimson.

A most interesting group of hybrid *Cypripediums* was exhibited by Messrs. F. Sander & Co., St. Albans, and the plants were tastefully arranged with small Ferns. Very handsome was *C. Pollettianum*, from *C. calophyllum* and *C. cananthum superbum*. *C. Castlemanum* was even more distinct, but less showy, from *C. hirsutissimum* and *C. superbiens*, the prevailing colour a soft bluish purple. *C. Maynardi* is a beautiful hybrid from *C. purpuratum* and *C. Spicerianum*, all of which are described fully in our Orchid column (page 513). It is evident that we may now look for many more hybrid Orchids from St. Albans, as the numberless seedlings raised are just reaching flowering size, and fresh novelties will be frequent. Besides those already named the following were shown at the meeting:—*Selenipedium Weidlichianum*.—A free flowering hybrid, from *C. Hartwegi* and *C. Schlimi*. The lip bright rose; the petals twisted, edged, and tipped with rose; the dorsal sepal lighter, and the lower sepals broad and white. The leaves are long, narrow, green, and flower stem tall, branching, with a number of flowers. *Cypripedium Alcides*.—A hybrid from *C. insigne* and *C. hirsutissimum*, with greenish sepals and purple tinted lip. *Cypripedium Orpheus*.—From *C. venustum* and *C. callosum*, the dorsal sepal veined with purple and green; the petals deflexed, purple at the tip; the lip dark polished purple. *C. insigne longisepalum* is a peculiar importation from Northern India, with light greenish flowers; the dorsal sepal very long.

#### CERTIFICATED PLANTS.

*Cypripedium Pollettianum* and *Maynardi* and *Cattleya O'Brieniana* (F. Sander & Co.).—All these have already been described.

*Cymbidium Tracyanum* (Mr. H. A. Tracy).—This is also described in our Orchid column.

*Lælia Gouldiana* (T. Statter, Esq., Stand Hall, Whitfield, near Manchester; gardener, Mr. R. Johnston).—An excellent plant was shown of this fine *Lælia* with bright rosy crimson flowers, very freely produced, the plant of capital habit.

*Cypripedium Osborni* (Mr. T. Osborn, Grove Gardens, Teddington).—This a hybrid from *C. Harrisianum superbum* and *C. Spicerianum*, remarkable for the great size of the flowers, the dorsal sepal being extremely broad, white, with a crimson central bar and a few streaks, polished petals, and a purplish crimson lip of considerable size.

*Lælia Tresederiana* (T. Statter, Esq.).—A hybrid from *Cattleya crispa superba* and *C. Loddigesii*, with small, neat, light flowers, the sepals and petals pure white, the lip having an undulated margin of a

bright crimson purple colour, and a white base. In form it was rather more suggestive of *C. crispa* than the other species.

*Pinus pungens argentea* (Mr. A. Waterer, Knap Hill).—Though shown as *Picea pungens*, this would seem to be a variety of *Pinus pungens*, an American species from the Alleghany Mountains, where its popular name is "the Table Mountain Pine." The variety shown is distinguished by a fine silvery glaucous colour, very bright and uniform.

#### CUNILA MARIANA.

THE term Dittany is applied to several different plants. For example, the *Dictamnus Fraxinella* is so named, as also are two species of *Origanum*, while *Cunila Mariana* is known in North America as the common Dittany. Possibly these names have arisen from some fancied resemblance between the plants so designated; but to say the least the similarity of the *Cunila* to the *Dictamnus* is by no means strongly

FIG. 70.—CUNILA MARIANA.

marked. *Cunila Mariana*, of which an illustration is given in fig. 70, is a tufted dwarf hardy perennial plant included in the Mint family, and related to the *Monardas* and *Salvias*, though differing materially in general appearance. The plant rarely exceeds a foot in height, and produces its small rosy purple two-lipped flowers in great profusion, in dense corymbose or cymose clusters. According to Gray this *Cunila* is found in the dry hills south of New York; in England it thrives in any ordinary soil not too wet, and flowers in late summer.

#### THE AIGBURTH NURSERY.

INDOOR plants are remarkably well grown in the Aigburth Nursery belonging to Messrs. R. P. Ker & Sons. Great changes have taken place and improvements have been effected since Mr. Ranger took charge as manager. The outside collections have been extended and improved, but the glass arrangements have considerably increased. *Cyclamens* have become a prominent feature; several houses are devoted to them, the plants ranging in size from the ordinary trade size to those in 7-inch pots 15 or 16 inches across. Who would trouble to keep old plants when they can be grown to this size from seed in about twelve months?

Palms are grown in various sizes by thousands from tiny seedlings to large specimens. The large Vine house built a few years ago is filled with Palms, principally *Kentias*. Perhaps *K. Belmoreana* is the most beautiful of all; there are several distinct forms, as may be naturally expected, from seedlings. One plant is very conspicuous for the dark almost black colour of its foliage and the drooping habit of its leaves. *Pelargoniums* are well grown; *Roses*, *Azaleas*, *Dracænas*, *Camellias*,

greenhouse Rhododendrons, and a host of others; also white Amaryllises are a new feature, and are being grown by thousands.

The Crotons are in superb condition, and Mr. Ranger finds some difficulty in keeping a stock of medium-sized plants. Several well known varieties have been raised, Aigburth Gem being one of the last, and it is indeed a gem; there is another to follow soon, and in its present condition it may be briefly described as a miniature form of Warreni, with a greater percentage of yellow in its corkscrew-like foliage.—W. B.

#### CHRYSANTHEMUM MRS. ALPHEUS HARDY.

POSSIBLY in one year more interest has been centred in this novelty than in any other Chrysanthemum, and probably for the first season no variety has given more disappointment. Numerous remarks and complaints have necessarily been made respecting its future prospects as an exhibition flower of the first rank. I have seen this season four blooms all in prominent winning collections, which go a long way to prove it can be made a good exhibition flower. At any rate I would advise those who may have met with disappointment to take courage by this fact, and if any of your readers contemplate its extermination from their collections in future not to be so hasty, but give it yet another trial if only to prove what has been the most popular opinion, that being driven in heat so rapidly in order to produce sufficient stock to meet the public demand its constitution has necessarily been weakened thereby for a time.

It may not be amiss for me to repeat for what it is worth, the remark of at least two good growers who have been the fortunate producers of large creditable specimens. At the Kent County Show Mr. Blick exhibited a remarkably fine built flower, and he told me that that was the only one he was able to cut fit to exhibit from ten plants grown by him. On the other hand Messrs. Drover told me that they only grew two plants, and had been able to exhibit two flowers, one in their winning collection staged at Portsmouth, and the other the magnificent bloom found in the Centenary class at the National; they were further of an opinion that the bloom staged by them at Portsmouth was the finer bloom of the two. Numerous readers of the Journal will, I am sure, carry with them throughout the forthcoming year pleasant remembrances of the Aquarium Mrs. Alpheus Hardy as being a really good and attractive flower. The third bloom which it was my privilege to admire was exhibited at the Crystal Palace, and grown by Mr. Alpin, gardener to W. Meath Baker, Esq., Gloucester, and the fourth by the small band of Lambeth amateurs. I am quite ready to admit that if only five good flowers of this noted novelty has been exhibited this season it is but a small percentage for the number of plants grown; but spare it yet another year, and bear in mind that when produced it is a most striking and telling variety in a collection of twenty-four distinct.—J. W. MOORMAN.

#### ANNIE CLIBRAN.

FROM all I can learn this deserves to be more widely known and grown. This almost goes without saying when it is noted that it is a sport from the well known and popular Mdle. Lacroix. I am reminded to draw your attention to it by receiving the subjoined reference in a letter this morning from an extensive grower:—"I regret you did not see my blooms of Miss Annie Clibran, which I had for the first time this season from the extensive Altrincham (Manchester) firm of that name when judging at our local Show. It is the pink form (sport) of Mdle. Lacroix, and with me promises to make a fine exhibition flower, especially when required early. If cut down, say in May, it makes an admirable specimen, and might be utilised for groups."

#### OUTDOOR CHRYSANTHEMUMS AND THE WEATHER.

After the unusually severe frosts on the nights of November 27th and 28th outdoor Chrysanthemums, even protected by walls and attached canvas framework screens, as mine are, had their beauty sadly marred, and it is doubtful if any further blooms will expand. The foliage was all limp and parboiled looking; and this is not strange remembering we had 14° of frost, or 18° Fahr., on the night of the 28th, a very unusual result in the south of Ireland, and some years not registered at all. Last year I sent you a bouquet of outdoor Chrysanthemums, beautiful bright and fresh, to grace your Christmas table, but there is no chance of being able to do so this. Curiously enough, although there has been a severe snowstorm in Dublin and northwards, there has been none except on mountain peaks in Munster.—W. J. MURPHY, Clonmel.

#### CHRYSANTHEMUMS RECENTLY INTRODUCED.

NEW varieties of the Chrysanthemum are being sent out annually in such large numbers, especially the Japanese, that it is impossible for any private grower with only limited means of growing and housing them properly, as well as his general collection, to be able to grow many that have not been thoroughly tested. I generally have a few novelties each year, and will here give my opinion of those that I consider worthy of cultivation for exhibition blooms, and shall be glad if other growers

will do the same with regard to varieties they may have grown during the last season—*i.e.*, giving the height of plant, time the cuttings were received, whether strong or weak variety, and whether crown or terminal buds were taken. If this be done we shall be bestowing a great benefit upon each other, as much valuable time may be saved.

For instance, the first year that grand variety, Edwin Molyneux, came out many growers, myself included, took the terminal bud, as the crown appeared in our opinion too early, with the result that we had to be content with what might be fairly termed a very fine single variety.

MRS. E. W. CLARK.—An enormous incurved Japanese variety, the colour silvery purple. It is a strong grower, of dwarf sturdy habit, height 3 feet, and crown buds are best. The blooms last a long time after being fully expanded, in fact a bloom of this variety I showed on November 4th withstood all the journeys, and was still in good condition, and was shown on the 11th.

ROBERT CRAWFORD (Japanese) has large spreading florets, colour pleasing silvery lilac, strong grower, height 3 feet; crown buds. A grand variety.

LÉON FRAICHE (Japanese), outer florets incurving, colour fleshy pink, rather strong grower, height 4 feet, crown buds; a promising exhibition variety. The above were all received, rooted, on March 1st.

WILLIE (incurved), sport from Captivation, colour yellowish bronze, a strong grower, but unlike its parent does not grow nearly so high; it only attained the height of 3 feet with me, and the florets came much broader, and should it keep this character it will make a good front row flower. If not the last variety that obtained a certificate for and in the name of our late lamented secretary, it was certainly the last incurved variety.

MRS. S. COLEMAN (incurved), sport from Princess of Wales, has been sufficiently seen to be known to most exhibitors, but as shown by exhibitors it is certainly too much like Miss Haggas, only the lower florets showing very slightly the bronze which it is supposed and really does possess when in its true character. I shall not be surprised to see a good stand disqualified at any time should this variety be shown in its pale form in the same stand as Miss Haggas.—JOHN DOUGHTY, Angley Park Gardens.

[Mr. Doughty's suggestions as to notes on varieties in the form he adopts is a valuable one, and we hope other correspondents will follow with similar hints.]

#### DRESSING CHRYSANTHEMUM BLOOMS.

THIS important subject to growers and exhibitors was treated upon on Friday evening, November 7th, at the fortnightly meeting of the Walkley (Sheffield) Floral and Horticultural Society, in an address by Mr. Thomas Howe, a Sheffield workman, who for some years has taken great interest in the dressing of blooms, and has become an adept in the art. This year he is cultivating extensively for the purposes of exhibition. His remarks, which were confined exclusively to the incurved section, were received with great pleasure by his hearers, and he was complimented on the practical advice he gave.

He said in the course of his address that it required a great amount of practice, close attention, a steady mind, a good nerve, and a steady hand to accomplish the object of dressing a bloom perfectly. But while these qualities were essential on the part of the dresser something was required equally important on the part of the grower. It was impossible for a badly grown bloom to be dressed to perfection, though much is done to improve such, and the popular idea is that much more can be done, which is a great mistake. The cultivator who grows good flowers renders the work of dressing easier, and the results are far greater, because there is good ground to work upon.

In commencing to dress a flower he advocated that the centre should not be removed at random, but left in a great many cases until the finish, when the portion not needed could easily be removed. He laid great weight upon the importance of every grower for exhibition dressing his own flowers so that he could watch their development, and from the time when they are about one-third grown look out for any misplaced or deformed florets, and remove them at once, leaving the centre until a few days before the exhibition in the case of such varieties as Golden Beverley. He recommended Mrs. G. Rundle and G. Glenny as good varieties for beginners to commence with, because there is plenty of material in these flower to work upon, though they are naturally small. The worst varieties to dress were the Queen and the Empress family as they were long in the florets. The varieties with narrow florets, such as Princess Beatrice, Princess of Wales, and Hero of Stoke Newington, did not take half the time to dress.

Varieties such as Barbara, Golden Beverley, which have short-spurred florets, can only be dealt with by removing faulty plants and bad centres, and arranging the perfect florets as regularly as possible. It required some observation and attention to ascertain the best methods to follow in the treatment of the various varieties. No particular rules could be laid down as to how all varieties should be dressed, nor what sort of instrument should be used in every case. He had seen tweezers used which were too broad and gripped the florets too tightly. This caused injury to the tender skin of some, and in some varieties, particularly dark ones, this bruising was visible by a rusty appearance. Tools as fine as possible, he thought, must be used, and the greatest care be taken to learn the readiest and best means of using them.

#### DISQUALIFICATIONS IN CHRYSANTHEMUM CLASSES.

I DO not remember a season when so many instances of disqualification have taken place amongst exhibitors of cut blooms as has been the

case in the season just past, and amongst growers and exhibitors with a good deal of experience. In all cases that came under my notice it was due to the exhibitor not being careful in the selection of the blooms, and not from any intention to deceive the judges. When true stocks of any particular variety are cultivated there should be no difficulty in avoiding the unpleasant experience of disqualification, except through carelessness on the part of the exhibitor, or it may be just at the last moment a duplicate creeps in, unseen of course, and in the hurry of staging is overlooked. Nowadays, when there is such a great number of distinct varieties to choose from, it is highly injudicious to grow others about which there is any doubt. Where two, or even three, named varieties are found in any section that are so nearly alike in appearance that a difficulty arises in pointing out a distinction, it is much the best plan to choose the one most promising, discarding the remainder, and by employing one name only the risk of disqualification is an impossibility in the case of doubtful varieties, of which there is the greatest danger in the Golden Queen of England section of the Queen family now. Disqualifications this season have all taken place in the incurved section, strange to say. Such varieties as Jeanne d'Arc, Lord Alcester, Queen of England, Alfred Salter, Princess of Wales, and Mrs. Heale have been the transgressors. Perhaps the last two have been productive in years past of more disqualifications than any others. In this exhibitors have themselves to blame entirely, either in staging the blooms so nearly alike, or in mixing their stocks. When both are staged in true character there is a discernible difference. I also know that it is possible to cut from one plant blooms very different in colour, owing, of course, to the variation in the times when the buds from which the blooms developed were "taken." If set too early, say before the middle of August, very little colour will be found in those of Princess of Wales by the time the flowers are fully developed. Even though such blooms are taken from the true stock of Princess of Wales, an exhibitor is to blame for staging them so much out of character. If he does not run a risk of being disqualified he loses points in the quality of the flower, because experienced adjudicators do not allow the same points of merit to such blooms as I have described, therefore it behoves a competitor to stage blooms in accordance with the distinctions.

For the benefit of those who do not know the difference between them I will describe them both. Princess of Wales is the parent variety, being raised or sent out by Davis in 1864. The diameter of good blooms measure 5 inches; although some have been staged larger, this is a good average size. The form is quite of the best, incurving thoroughly towards the centre, which in well-developed blooms is high and somewhat pointed. The florets are narrow and pointed also slightly. The colour is blush, with distinct rose stripes down each floret, which gives it definition. Mrs. Heale is a sport from the above, which originated in 1867. The colour is creamy white, without a semblance of colour except that which the lower florets quickly assume with age or the base florets which become pink. The form of the bloom is similar to its parent, except that it causes a larger "shoulder," a term which will be understood by growers, but for those not initiated I will say it is the part of the bloom which is situated about half way between the base of the flower and the centre. This form is more pronounced in Mrs. Heale than in its parent, and so it is in the case of Miss M. A. Haggas, which is a sport from Mrs. Heale. In the case of Violet Tomlin, which sported from the Princess in 1888, this shoulder is less pronounced, taking after the form of the original type more clearly.

Exhibitors should aim at staging all varieties in their true character, especially having regard to the colour of each. By so doing they increase the value of the stand, lessen the risk of disqualification, which is always an unpleasant duty for the judges to perform, but which they are compelled to do in fairness to other exhibitors, whose position in the lists is improved through the error committed by an opponent, but who does not always see the faulty blooms with the same eyes as the judges.—E. MOLYNEUX.

#### CUT-BACK CHRYSANTHEMUMS.

ONE of the great objections to the majority of Chrysanthemums when grown with exhibition blooms, especially among amateurs, is the height to which they grow. Many amateurs with small houses would probably have to open the top ventilators to accommodate the plants.

Why should not societies encourage the system of cutting plants back by offering prizes for them? The third prize group at the recent Hull Show consisted, I believe, entirely of cut-backs, most of them with flowers which would have done credit to the cut bloom section, and the somewhat unusual spectacle was witnessed of the exhibitor having to raise the plants at the back of the group several feet. I have not the least hesitation in saying if these plants had been shown among the specimens they would have been a revelation to most of the visitors and have created considerable interest. Up to the present the cutting-back system has, I believe, only been adopted for grouping purposes except in isolated instances. As committees are now arranging their schedules for next year I recommend the foregoing suggestion to their consideration.—R. FALCONER JAMESON, *Hessle, Hull.*

#### THE QUEEN FAMILY.

ON page 476 of your paper there is another instance of the difficulties that are likely to arise with regard to the sports in the Queen family. At Cheltenham in the first prize stand for forty-eight distinct varieties, half Japanese and the remainder incurved, there was a bloom called sport from Lord Alcester; being myself an exhibitor at the same

place, and in the same class, I had the opportunity of seeing the said bloom, and had my attention called to it by two or three good growers of the Chrysanthemum. One of them directly said, "Why you have a bloom in your stand exactly like it," which I could see when I looked over the first prize stand. To make sure there was no error in the remarks myself and others made, the bloom was taken from my stand not only once, but three or four times, and put side by side with the sport, and the remark was "exactly the same," in colour, width of flower, and build, but I will not say in size; of the two mine was a little the smaller, but in every other particular the same as if they grew on the same plant. The bloom shown by me was a late bud of Emily Dale. Another instance, take a terminal bud or a late bud of Golden Queen of England, you have the exact form and colour as in the sport; and therefore I fail to see how it can be distinct.—R. C. T.

#### HARDY FRUIT GARDEN.

**PRUNING OPERATIONS.**—It is advisable for several reasons to push forward with the work of pruning and nailing, as not till this is done is it possible to properly complete the manuring and digging necessary near to the trees and bushes. If delayed till the spring the chances are it will not be well done, so much other work requiring to be attended to. Much of the nailing might also be completed by midwinter, this being proceeded with whenever the weather is sufficiently mild and dry; other work being found for the assistants to do in very cold weather.

**PEARS.**—These might well be first taken in hand, and when all are pruned and nailed much progress will have been made. All the leading branches should, where possible, be laid in to their full length, this applying to all methods of training wall trees. Left unpruned the young wood will break evenly next summer, and in many instances form fruit buds at most of the joints. Top them lightly and they will break at the ends only, the rest of the shoot being quite naked. If it is necessary to prune leading shoots, either for want of head room or for the purpose of procuring more branches, then shorten them to about one-third of their length, and a good even break will result. All lateral growth to be spurred back to within one inch or three joints of their starting point. Left to a greater length long, ugly spurs are soon formed, whereas they are most serviceable when kept closer to the main branches, therefore the walls too. Where the old spurs are somewhat crowded, and, it may be, of a greater length than desirable, it is advisable to thin these gradually, a few being sawn off every pruning season to within one inch, or rather less, of the main branch. Most of the short stumps will break afresh, and in the course of time all the clusters of spurs will be close to the main branches.

**INFORMALLY TRAINED TREES.**—The majority of wall trees of Pears are either trained horizontally or some form of cordon training is adopted. There are some varieties that do not answer well under this treatment, foremost among these being the Jargonel'e, while the Doyenné du Comice, Josephine de Malines, Beurré d'Amanlis, and Williams' Bon Chrétien also succeed remarkably informally trained. Where there is much head room, this including the ends of dwelling houses, stables, and outhouses, what are termed fan-shaped trees might well be planted, these being allowed to spread in all directions, and fresh branches laid in according as there is room for them. Thus treated they soon attain a great size, productiveness usually accompanying this comparatively unrestricted growth. It is the most simple of all methods of training. These and any other strong wall trees ought now to be very securely fastened to the walls. Ordinary shreds are not strong enough, and strips of leather, buckskin, strong cords, or other somewhat similar material should be substituted; such will last two or three seasons. A close look out ought to be kept for too tight shreds and nails in close contact with the branches, these often doing much harm before they are discovered.

**PROTECTING FIGS.**—In many districts Figs, no matter where grown, are far from being hardy. Sometimes only the points of young shoots are injured by frosts, and occasionally the trees are killed down to near the ground. In the former case the loss of a crop is inevitable, next season's fruit being produced from the points of sturdy, well-ripened shoots formed this year, the young Figs at the present time being only just visible. When the trees are badly injured it often requires several seasons before they again attain a productive state, the soft sappy shoots thrown up by cut down old trees rarely fruiting, and in addition are the most liable to be damaged by a moderately severe frost only. Where, therefore, Figs have previously been injured by frosts, and it would appear that only the south coast districts are exempt, some steps should be taken to protect the trees. If spread out considerably the branches may be unfastened and brought well up together, and these, as well as the more compact trees, can be then covered either by mats, branches of Spruce Fir or Pine trees, straw mats, or strong canvas. They will pay for the trouble taken with them, Figs being far more valuable and popular than many seem to be aware. The pruning to be deferred till the trees are uncovered in the spring.

**FRUIT BUSHES AND BIRDS.**—Already bullfinches have commenced destroying fruit buds, those on Red Currants being the first to suffer. Either the birds must be destroyed or the trees protected in some way, or the chances are a great failure with small fruits may happen next season. Permanent wire net-covered structures are the most economical in the long run, these protecting first the buds and then the ripe fruit from birds. Now is a good time to set about covering in a fruit quarter, and if the uprights are made of oak and the rafters of pitch-pine, all being duly coated with black varnish, this will remain sound for many years. Only  $\frac{3}{4}$ -inch mesh galvanised wire netting should be used, small birds finding their way through a coarser mesh, and some provision should also be made for opening the ends when it is desirable to let in those birds that prey on caterpillars. Black thread somewhat thickly strung among the branches has a deterrent effect on birds; so also does a coating of limewash, this being mixed rather thin, and freely syringed over the main branches after the pruning has been completed. If one application is not enough it should be repeated till the bushes are thoroughly whitened, more also being syringed over them after much wet weather. In the case of Gooseberry bushes the good old plan of bringing all the branches well up together in the form of a pyramid, and keeping them there with the aid of tar-twine, never fails. It is a somewhat rough job, but two pairs of willing hands wearing leather gloves can do it easily enough. The birds cannot penetrate this dense mass of prickly branches, and these should not be opened out and pruned till the buds are out of danger.

#### FRUIT FORCING.

**PEACHES AND NECTARINES.**—*Earliest Forced House.*—Up to the buds swelling and advancing for flowering the atmosphere may be kept rather close and moist, but not by any means warm. After the buds show colour syringing should be discontinued, the trees being given plenty of time to develop a strong flower, perfect in all its parts, therefore the flowers must be brought forward gently and steadily. Admit a little air constantly, about an inch by the top ventilators, and at and above  $50^{\circ}$  it should be increased correspondingly with the temperature, but not allowing the heat to fall below  $50^{\circ}$  in the daytime, maintaining that by artificial means, allowing an advance to  $65^{\circ}$  with sun heat and full ventilation, closing for the day at  $55^{\circ}$ . Though syringing the trees is not advisable after the anthers show, a moderate amount of air moisture is essential to health. This can readily be secured by damping available surfaces, as borders and paths, in the morning and early afternoon. Avoid a moist, close, stagnant atmosphere with a high temperature at night. In frosty weather  $40^{\circ}$  to  $45^{\circ}$ , and  $50^{\circ}$  in mild weather, is ample. Let there be no mistake in respect of moisture in the inside borders. If necessary supply tepid water or liquid manure, making sure that the soil is thoroughly moistened through to the drainage. Surface waterings are little better than waste of time. Weakly blossoms are the result of imperfect nourishment, very often through the trees being kept in a dripping atmosphere whilst they have not sufficient moisture at the roots. Superabundant blossoms are a source of weakness, therefore remove those under or on the back of the trellis where they are too redundant, drawing the hand contrary way of the growth. This materially assists the swelling and strengthens the remaining flowers.

*Second Early Forced House.*—In many, in fact most cases, this will be the first. It is that from which fruit is to be gathered in late May or early June, where such varieties as Hale's Early, Early York, Early Alfred, &c., are grown; but where Alexander, Waterloo, and Early Beatrice are cultivated the fruit will ripen a fortnight to three weeks in advance of the first named. These matters must have consideration in starting the trees. Although fire heat is not to be applied until the new year the house must be closed at once, just excluding frost, and ventilating abundantly at  $50^{\circ}$ . Sprinkle the trees morning and afternoon, allowing time for them to become fairly dry before night. Trees are greatly weakened by keeping them constantly dripping with moisture, especially at night. Soak inside borders with tepid water or liquid manure, and protect those outside with dry leaves or bracken and a little long litter, allowing a slope to the front, so as to throw off cold rains and snow. Some tarpaulin or spare lights are an advantage, but avoid using fermenting materials, as they cause wood growth too early in the tree for satisfactory progress in the fruit.

*Succession Houses.*—Let no opportunity pass of attending to pruning, cleansing the house and trees. It not only improves appearances, but is better for the trees, through the longer and more complete rest assured. Ventilate to the fullest possible extent in all but very severe weather. It is better, however, to remove the roof lights, exposing the trees to the elements for the winter, but trees that have not well ripened wood must not be exposed, for the unripe growths retain sap and are liable to have those vessels ruptured in severe weather. This is the cause of unfruitfulness in many trees. Bloom buds, however, fall from an opposite cause—over-excitement, premature and over-development, with a deficiency of nutrition or lack of water at the roots. Late houses, also unheated, are best unroofed in winter; the trees seem to like our mists, drizzling rains, and the continued rains moisten the soil down to the drainage, the soil being enriched. Exposure ensures complete rest, the flowers attain to finer development than attends trees that are kept constantly evaporating from the young wood through the time they are at rest by fixed roofs. It also retards the flowering, which is of great importance in the case of late houses, and unheated or wall cases.

**PINES.**—Ripe fruit is generally in greatest demand in May and June, and the plants for that purpose not now showing fruit will need to have

the tendency to growth checked, which causes the plants to concentrate the strength on reproduction. Select, therefore, from the plants started last March, and having made a good sturdy growth, such as show the best indications of starting into fruit growth when subjected to a higher temperature both at the roots and in the atmosphere. Those only that have completed a sturdy growth, formed a stout base, and are now at rest, are any use for this purpose. If the plants can be accommodated in a house by themselves it will be an advantage, but failing such they should be placed in a light position in the fruiting house. Such as are not likely to throw fruit at once should be kept cool and rather dry for a month or six weeks, after which they will generally throw up fruit when subjected to a brisk temperature at the roots and atmosphere. It is not desirable to start more plants now than can be helped, as the fruit will come up more readily a month hence, and be much stronger. Necessity often causes recourse to expedients in small places that are not needed in larger. Cultivators with few plants have difficulty in maintaining an unbroken supply of fruit; their tens or twenties are not as good for successional purposes as the hundreds of the larger grower. But judgment and the acquirement of considerably more skill often enable the grower with limited means to maintain a better successional supply of ripe Pine Apples throughout the year.

#### PLANT HOUSES.

*French and Fancy Pelargoniums.*—Young plants in  $2\frac{1}{2}$  and 3-inch pots that are well rooted should be placed into 5-inch pots. If the watering is carefully attended to one crock at the base will be ample. Use for a compost good fibry loam, one-seventh of decayed manure and sand. If the manure has not been properly prepared by being stacked under cover for some time dispense with it and use artificial manure instead. Do not use leaf mould, which encourages soft growth, and pot firmly to insure sturdy growth. Pinch the points out of the shoots, and place the plants where they can have abundance of air.

*Zonal Varieties.*—These rooted in 3-inch pots at the end of August or early the following month will be ready for 5-inch pots. If they have been pinched the shoots may be allowed to extend until they flower. For the present keep them on a shelf close to the glass where the temperature does not fall below  $45^{\circ}$ . Admit air freely on all favourable occasions. Bushy plants of the Vesuvius type that have flowered, if kept cool and dry, will flower freely again if introduced into a temperature of  $55^{\circ}$  early in January. Keep those that have grown tall rather dry, so that they can be cut back soon after the new year, and cuttings may be inserted where stock is needed.

*Petunias.*—Young bushy plants in small pots may be placed into 4-inch pots. For these plants add one-third of leaf mould to the compost advised for Pelargoniums. Pinch the points of any shoots that need it, and place the plants close to the glass where the temperature does not fall below  $40^{\circ}$ .

*Mignonette.*—Mignonette for spring flowering must have abundance of air. It has a tendency to grow quickly and weakly at this season of the year if the houses or frames are kept close. This must be avoided, or puny spikes of bloom in spring will result. Standards or pyramids that have flowered should be pinched out and placed in some airy position where they are free from frost. Under these conditions they will break again strongly into growth and flower profusely a few months hence. Do not practise feeding, it does more harm than good at this season of the year. When the days lengthen and growth is more rapid it will be beneficial. Soot water acts quickly and imparts a fine dark hue to the foliage. Artificial manure applied to the surface of the soil encourages the roots to the surface and keeps them active, which is the secret of growing good Mignonette.

*Lilium eximium.*—Bulbs of this Lilium imported from Japan are generally to hand this month. This is a useful Lilium for pot culture, and with us it has given greater satisfaction than the popular L. Harrisii for late flowering. The bulbs potted last year averaged seven flowers each, and did not exceed 20 inches in height. The bulbs should be placed singly into 5-inch pots in a compost of loam, leaf mould, one-seventh of manure, and sand. The bulbs should be just covered and the pots stood in a cool vinery or Peach house. Cover the pots 1 inch deep with cocoa-nut fibre refuse or other similar material, and leave until their growths are just visible. If the soil is in a proper state of moisture, and the plunging material is kept moist, no water will be needed until they are ready for removal. When taken from the ashes place them in a cool airy structure close to the glass on a base of ashes or other moisture-holding material. When they commence growing watch for aphides, and directly they appear fumigate with tobacco. When 8 or 9 inches high the plants will have abundance of roots, and artificial manure may be applied once a fortnight to the surface of the soil.

*Calceolarias.*—Watch for slugs, as they quickly injure these plants. The earliest should be placed into 5-inch pots. Use for a compost fibry loam, leaf mould, and old Mushroom bed refuse and sand. Be careful to place the plants on a moist base where they can enjoy abundance of air. If placed on dry shelves over hot-water pipes that have to be heated to keep out frost the plants will do no good. It is too dry for them, and they soon become a prey to aphides. Repot plants as they need more root room, and place those still in boxes into 3-inch pots.

*Primulas.*—Late seedlings that are now in  $2\frac{1}{2}$ -inch pots may be placed into 4-inch pots, and kept perfectly cool. They will grow strong, and towards the end of April flower profusely. These plants are also good for seed bearing, and will often produce double the quantity of seed that plants raised earlier in the year will afford.

*Libonias.*—If given greenhouse treatment only these plants in-

variably cast a considerable quantity of their foliage. To do them well they should occupy a light position in a low house, or on a shelf close to the glass, where the temperature ranges about 50° at night. These plants are easily grown, and deserve more attention for decorative purposes.

## THE BEE-KEEPER.

### APIARIAN NOTES.

#### BEES ENTERING SUPERS.

WHAT is the best method of inducing bees to enter supers? or what is the reason my bees will not enter their supers? These and similar questions are frequently sent, not only by beginners, but by bee-keepers of some experience. Various reasons may be assigned, such as being too late in placing them on; the same result may arise from being too early. In both cases the bees will swarm; in the former because they were crowded in the hive, and the worker cells filled with eggs, larvæ, or pupæ, and as honey becomes plentiful the newly vacated cells of the hatching bees are filled with it. Whenever a queen is in any way restricted in performing her maternal duties the bees naturally raise royal cells, and when once these are begun no effort of the bee-keeper short of excising these cells and giving more breeding space will prevent swarms issuing. Even this has not always the desired effect, but a young queen with the same provisions will prevent it, at least for a time.

In the latter case the interior of the hive is cooled, much in the same way as when the brood is spread the cluster of bees is contracted, and outlying eggs and brood are extracted, and the space above and at the side of the bees is filled with honey, and bees do not travel over sealed honey freely, and swarming ensues, but in an inferior or impoverished form. On account of the egg-eating the swarm is generally much smaller than it would otherwise have been.

Bees also refuse to enter supers if breeding has been stopped through a stress of weather, the hive being much in the same condition as when supers are placed on too early. To induce bees to enter supers satisfactorily and at the right time they should be placed on at the right time, when honey is beginning to flow, and the bees almost on the eve of crowding out, and to prevent any attempt at swarming ample breeding space must be maintained. The Lanarkshire hives permit an internal examination of any division without removing one or the other, and although it is inadvisable to open up hives when bees are at active work, it is sometimes advisable to do so.

The bee-keeper and the beginner should not only study the bees, but the weather. The bees must be strong, the weather fine, and the flowers yielding honey, before supers are placed on, but then not a moment should be lost until that is done, and in such a way as to give the bees neither labour in propolisising chinks nor in reducing the temperature of the hive.

#### SWARMING.

The beginner is never long in discovering the vagaries of bees when swarming. Nor is it possible to give here all the instructions necessary to hive bees under every form they assume, or from any position they may take. One thing, however, is certain, the best way is to get the bees into their permanent hive at once. With the majority of modern frame hives this can only be done satisfactorily in a few instances, while many a swarm has been lost or much trouble given by a second hiving, owing to shaking the bees into them from another receptacle, which is obviated no doubt by waiting till near dusk, but necessitating the loss of a day's working, being the most important, too, to any swarm of bees.

The hiving box described some years since obviates the risk of bees taking a second flight, and secures the first day's work, which

may be augmented by giving the bees a frame or two of built-out comb. I have had swarms increase in weight from 5 to 10 lbs. the day on which they swarmed when provided with combs.

The same kind of box may be used for single-cased hives. Bee-keepers should have several pairs of steps and ladders (the former are very handy when there are good fences to cross), which prevents their destruction or the necessity of having to creep through them. Before the population increased to the extent it is there were more tall trees in our neighbourhood, and good hedges often of dense growth. Where bees often hived in such inaccessible places great difficulty arose in getting the bees out and into their permanent hive, smoke and tobacco juice being the only agents in those days employed in the dislodgment of bees from the thickets.

Gooseberry bushes and a few scraggy trees and hedges are the principal places to which our bees betake themselves for their temporary hiving place. When a swarm issues I seldom allow it to settle, but at once proceed to get the bees to take to their permanent hive (which is lighter than double-cased ones) or to the hiving box, and I seldom fail. Whenever the bees begin to cluster I either place the hive or box above them or catch them in a bellglass, tumbling them into the hive or upon the alighting board, when, with the full doorway, they as a rule commence "fanning" and enter the hive, when the others with the queen follow. After a little experience beginners will soon learn the advantage of placing bees into their permanent hive at first, and without bother. Bees very often swarm upon a twig, and all the bee-keeper has to do is to detach it from the branch with a sharp knife, and placing it upon the ground with the hive over it; the bees ascend in a few minutes. But the greatest difficulties arise when the bees take to places that a hive or box can neither be placed over nor under them. When the bee-keeper observes them taking to such places he should prevent their settling by smearing the place with crude carbolic acid. A few feathers tied to a light rod of sufficient length to reach the place saturated with the acid is all that is necessary to drive them from their would-be retreat, and a little smeared on the part will prevent their returning, and is almost certain to cause them to settle in a more convenient place.

If at any time a swarm settles on a tree too high to reach from the ground or by the aid of an ordinary ladder, I use my hiving apparatus, upwards of thirty years old. It consists of a light wooden box, but may be made of cloth upon a frame of wire, the lighter the better, and a series of poles each about 4 feet 6 in length, and are held together by long tin ferrets, and may be extended to a great height.

One of the poles, which (the upper one) has a revolving arm and a pulley on the top back and front, which when a cord is passed over them, which reaches from the bottom at whatever the length of the poles may be, and suspends the hive at the top under the front pulley.

To secure the swarm hoist the hive until it can be set right above the cluster and the bees soon creep into it. To hasten their doing so apply the rod with the carbolicised feathers to the bottom of the cluster, and you will be delighted with the simple but effectual plan. When once the bees are mostly up slacken the cord and let the hive down by its own weight, then transfer to their permanent hive without delay.

There is still another way the hiver may be applied. It sometimes happens that it is unsuitable to hive the bees in the manner described, and they have to be shaken into the box. An arrangement in the shape of two hooks near the top of the rod on which the hive is hung; a small cord passes through a staple and is fastened to the light lid of the box, and is raised or lowered by the operator on the ground, who, if the bees are favourably suspended by a lateral movement of the hiver on the cluster, most of the bees with their queen will fall into it, and in a moment on slacking the cord the lid drops without killing a bee. If an assistant is present, and near the cluster, he can arrange the cord so that they may be let down gently, as stated above.

The above hive, the oldest of its kind, is perhaps also the best, and is a very superior appliance to the still older plan of sticking a pitchfork into a straw hive and holding it over a swarm; very pretty to see as a picture, but a very tiresome and inconvenient plan when put into practice. Even when the bees have been placed into the hive they have to be lowered to the ground at an angle, and when the pitchfork is removed it so jars the bees as to cause many of the bees to take wing; whereas with the hive, when not suitable to lower by the cord, the poles are easily disjoined until the hive is reached.—A LANARKSHIRE BEE-KEEPER.

### BEEES IN THE NORTH.

As regards East Yorkshire the outlook is very discouraging. In many places bees have died through neglect during the summer, and failing to feed them for the winter. Some bee-keepers who started here a few years ago in high spirits and followed their hobby with enthusiasm are now disgusted with their little friends. When visiting a friend some time ago I passed by a garden where I had often seen a row of bee hives, of which the owner seemed to take great care; but things had changed, many of the hives were standing in a corner of the garden empty, the bees having died, and the hives were for sale. Another bee-keeper, who was regarded as an authority, told me seven standard frames for any hives were sufficient where sections are wanted. To-day that gentleman has not a living bee, and others will soon be in the same condition. The cause is found in neglect, small hives, old queens, and insufficient supplies of food. It is very different in apiaries where bees are located in deep hives with young queens and plenty of food. "A Lanarkshire Bee-keeper" from time to time has condemned small hives, and they cannot be too strongly condemned, as where from seven to nine bars and a crate of twenty-one sections compose the hive little is obtained, and swarming is the rule. My best results this season were obtained from twenty standard bars on the tiering principle; not only did they give a little surplus, but required no feeding in so bad a season. The advice given in this Journal by "A Lanarkshire Bee-keeper" on tiering hives I have found sound, and those about to give up bee-keeping on account of its unprofitableness should try the tiering plan. I have made a Lanarkshire hive from instructions given in this Journal, and I am pleased with its arrangements. It is a cheap hive, easy to move about; the only defect is there is in so many bars when you want to catch the queen and prune out queen cells, but that may soon be overcome; however, this with ventilating floors shall be my plan in the future. Will "A. L. B. K." please say what kind of supers he uses for his hives?—HOWDENSHERE BEE-KEEPER.

All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

**Book (J. B.).**—The work you require is published by Messrs. Blackwood & Sons, Edinburgh, and can be obtained through a local bookseller.

**Pruning Marechal Niel Rose (John Marsh).**—Questions on this and all gardening subjects sent by regular subscribers to this Journal are most willingly answered through its columns.

**Fruitless Trees (Yew).**—Your letter has arrived too late for enabling us to do what we intended this week. You have no doubt done what is right under the circumstances. Too deep planting is undoubtedly one of the best preventives of health and fruitfulness in trees.

**Scabious in Pots (E. T. H.).**—You had better not disturb the seedlings at the present time, as in pots plunged in the ground the plants will make little or no growth for some time. It would be advisable to afford them some protection in very severe weather. The right time for transplanting them will be when early spring growth commences, and they may possibly need a little protection afterwards.

**Roses for Market (Rose).**—We can name you six H.P. varieties if you wish, but you will be wise in growing several plants of one variety only for the markets that you name. The variety most in demand in the bud state in those markets is Général Jacqueminot, and if you succeed in producing expanding buds early you will be able to realise good prices. Pinks and other colours do not sell so well as do good reds, and amongst these we know of no variety so suitable for the purpose as the one named.

**Destroying Mealy Bug and Scale. (Inquirer).**—Methylated spirits will destroy mealy bug, as we stated on page 281 last week. You are not the only gardener who has found too strong applications of petroleum injurious to Vines and Peach trees. A mixture is recommended on page 392 of our issue of October 30th, which if thoroughly applied will destroy scale and other insects. The hotter it is used the better, but neither scale nor mealy bug can be exterminated by one application of anything.

**Iris foetidissima—The Roast-Beef Plant. (J. W., Worcester-shire).**—Your plant is a native of England, and is found wild in many districts. It is much grown now for its capsules or bright red seeds, which are employed for decorative purposes in the autumn with good effect. The peculiar title "Roast Beef Plant" has been applied to it because the leaves when bruised give out an odour which is thought to resemble roast beef mixed with garlic. It is easily cultivated in ordinary garden soil provided the situation be neither excessively wet nor dry. Two other species of Iris are also regarded by some as natives of England—i.e., Iris pseudacorus and I. tuberosa, but the latter is excluded by some authorities.

**Forcing Lilac (E. M., Notts).**—White Lilac is obtained early in the year by placing well budded shrubs or bushes dug from the ground in a warm dark place, such as a well heated shed or Mushroom house. Shrubs of the common pink Lilac are usually the most plentiful, and the flowers come white when they expand in darkness. A temperature between 60° and 80° is suitable; the higher it is the sooner the flowers appear, and we have known them quickly obtained in a temperature of 90°. The shrubs must be syringed occasionally till the growth starts, and the roots be kept very moist. In addition to the heat from hot-water pipes, some persons have heaps of sweet fermenting materials, consisting of leaves mainly, in the Lilac shed, turning them occasionally, for the diffusion of heat and moisture, but an excess of moisture must be averted or the flowers will suffer. If you have not any shrubs that you can dig up you must apply to nurseries for them. White Lilac can be forced in glass structures, when small shrubs of the White variety are obtained and potted. The best of these are grown in France, and imported and sold by English nurserymen.

**Stocks for Fruit Trees (J. B. & Son).**—You call yourselves "gardeners," but ask the most extraordinary questions we have received from members of the craft. You first ask "If shoots cut off any free-growing Apple trees are layers of Paradise stocks?" No; those shoots would not be layers at all, but cuttings of Apple trees. If you want to raise Paradise stocks you must purchase trees of the Paradise Apple, and when established bend down the shoots, notch, and peg them into the ground as layers to emit roots. Next you ask, "If we get shoots off any free-growing Pear tree, and lay them in to strike root, what sort of stocks would they be called?" They would be called Pear stocks raised from cuttings, not layers. But that is not the way to raise Pear stocks, and if you try the plan you will find far more of the cuttings die than grow. Pear stocks are raised from pips or seeds, and Quince stocks, for grafting Pears on, from layers and cuttings. Your last question is a curiosity. "Shoots from Plum tree roots budded, wouldn't they be the same as the Plum tree was worked on?" If the buds grow that are inserted in the suckers of Plum trees the fruit that follows will be the same as that of the tree from which the buds, not the suckers, were taken. If the buds inserted fail, and the suckers grow and bear fruit, this may or may not be the same as that of the tree from which they were taken. If it was raised from a sucker the variety would be the same; but if the tree itself grew from inserted buds the suckers would not produce fruit the same as the tree did. We think you have a good deal to learn on a subject which "gardeners" are expected to understand, and the above small elementary lesson, we hope, may be of service.

**Early Bulbs (J. C.).**—You should have no difficulty, as if the Roman Hyacinths were potted early they will advance rapidly in gentle warmth, and a succession may be maintained by introducing a pan, box, or a few pots once a fortnight according to the demand. The earliest Dutch varieties are Homcrus, single red, and La Tour d'Auvergne, double white. These, if potted when advised, will have been removed from the plunging material and have become green in a cold frame. A few of both may be introduced into a temperature of 50° until they display signs of starting. Nothing is gained by placing them into brisk heat to force into bloom. No treatment is more certain to ruin them, for they are unduly forced out, and commence expanding their bells at the top of the spike instead of the base. They should be started gradually until they are growing, and then given a temperature of 60°, in which they will unfold their spikes in good condition. Early Tulips, such as scarlet Duc Van Thol and white Pottebakker, will also be ready for starting

These should have the same treatment as the Hyacinths until it is certain they have commenced growth, when they can be forced in brisk heat. When once growing Tulips will stand more heat than Hyacinths. We have frequently forced them into bloom in a close propagating frame where the night temperature of the house does not fall below 65°. This course is not advised, but when the blooms are required it may be safely practised.

**Grubs in Soil (W. R.).**—The grubs are a species of *Julus* or small millipede. They are most common in wet soil that contains much decaying animal matter. Perhaps your land needs draining. We should work in a liberal quantity of lime, placing lumps in heaps of a bushel on every 20 or 30 square yards, covering with soil dug from round them, and when the lumps swell and fall, spread the lime, and dig it into the land. When planting, surround the bulbs with wood ashes, the more the better, with a little soot mixed among them. Carrot baits inserted in the beds would still be useful, not, however, leaving them to rot in the ground. Surely the insertion of these would not be a formidable task, nor examining them at intervals afterwards. Affected bulbs, with tubers of Begonias and corms of Cyclamens attacked by the pest, should be well washed with a solution of softsoap, 3 ozs. of this being dissolved in a gallon of soft boiling water, stirring well in at the same time a wineglassful of petroleum. The solution should be used hotter than your hand can be borne in it, holding the tubers in a pair of padded pincers, and applying the solution with an old spoke brush, scrubbing it well in; in fact the tubers may be dipped in the solution for a few moments, water of a temperature of 180° not injuring them. They will endure more heat than their enemies, as you may prove by experiment. We should burn, or rather scorch, the soil used in potting, and thus destroy all animal life, then moisten the compost before using, as it never answers to pot anything in dust-dry soil. The scorching will improve the soil, as you may possibly have seen in the richer green of crops growing on ground where there has been a fire over those in the surrounding land.

**Names of Fruits.**—The names and addresses of senders of fruit to be named must in all cases be enclosed with the specimens, whether letters referring to the fruit are sent by post or not. The names are not necessarily required for publication, initials sufficing for that. Only six specimens can be named at once, and any beyond that number cannot be preserved. (*B. & Co.*).—*Maréchal de Cour*. (*A. O.*).—*Beurré Diel*, small.

**Names of Plants.**—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (*J. W., Worcestershire*).—The seeds you send are those of *Iris foetidissima*. See reply above. (*T., Middlesex*).—1, *Masdevallia tovarensis*; 2, *Masdevallia Lindenii*; 3, *Odontoglossum crispum*; 4, *Ondidium ornithorhynchum*. (*J. J. C.*).—1, *Lomaria gibba*; 2, *Nephrolepis davallioides*; 3, *Onoclea sensibilis*. (*W.*).—It is apparently a portion of a leaf of one of the *Kentias*, perhaps *Kentia Forsteriana*. (*A. B. D.*).—*Hemanthus albilifolius*.

CATTLE.

SURELY there is something radically wrong in cattle management, when we are told with all due gravity that cattle bought in spring have paid nothing for their summer's grass? Why buy at all if a loss is so probable? Again and again are we told of losses upon purchased cattle, and we do wonder at the folly of those who thus persist in spending their strength for nought. That, certainly, is not the way to make farming answer. If cattle must be bought, then we say buy right, feed right, sell right; aye, and it can be done too. We happen to know two large farmers in the eastern counties, from both of whom we have recently seen reports of the year's results, and we are bound to say that while one is crying out about the failure of spring-bought cattle to afford anything like a profit for the summer's grass, the other quietly admits that he is entirely satisfied with results from his purchased beasts. But then, you know, he bought right, and the other certainly did not do so. Eye and hand should always tell one clearly if the price asked for store cattle is right; if it is not, and no profit appears possible upon the transaction, why proceed any further with it?

The general answer to all this is found in the fluctuations of markets, and store beasts are frequently bought at high rates upon the chance of a profit being realised upon them as fat beasts. We may be told that one must risk something in business, and we agree, but in common prudence one should take all possible precaution to minimise that risk. If we go into an open market for store cattle we know that every dealer will puff his goods, and we ought also to know that the beasts which he offers contains several inferior. The "bunch" is made up for sale, and will not be separated easily; but it may be done, especially if trade is slow, as the dealers know full well that every time they have to remove the beasts from one market to another something is knocked off their profits.

The reason why purchased cattle are seldom if ever equal to home-bred beasts is obvious enough. The former have passed

through the trying alternations of scarcity and plenty, have been worried and knocked about in transit; the latter, thoroughly well bred to begin with, have known no break in the peace and plenty of their placid existence; well fed, well sheltered, and cared for in every way they have never lost the sleek condition of infancy, but have gone steadily on, gaining at least 1 lb. in weight daily, and we do not wonder at such phenomenal results as that of a shorthorn calf bred by Mr. Pearce of Market Drayton, who sent it to the butcher at eighteen weeks old, and it weighed when dressed, without head and feet,  $37\frac{1}{2}$  stone, or about 2 lbs. a day of dressed meat from birth. This calf must have been exceptionally well bred, for it had nothing but the cow's milk till within three weeks of its being killed, when a little meal was given it daily. This was of recent occurrence, and as an example may be considered a little beside the mark. If so, let us take a steer of twenty months that has been well done from its birth; now, we are well within bounds to put the increase of weight at 1 lb. a day, or half that of Mr. Pearce's calf, and this at twenty months gives us a prime beast weighing something over 600 lbs.; but if we say 600 lbs. at  $7\frac{1}{2}$  d., the present market price, we have a total value of £18 15s., and experience has shown that the value of the beast would really amount to at least £20, for the old Sussex standard of excellence (£1 a month) is still a very safe one to apply to choice home-bred beasts. Of course they run for at least several months with the cow and have all the milk, and particular attention is given to induce them to take other food as early as possible, and they are not turned out on pasture in spring till the herbage is so abundant that are soon satisfied. In point of fact they are never on short commons at any period of their existence, and one never hears complaints of the markets from the owners of such beasts.

There can be no good reason why those sleek 20-pounders should not be the rule, and not the exception. Only the reckless purchase of dear store beasts must cease, so too must the equally reckless mismanagement of cattle. If they have insufficient food, or that which is not sufficiently nourishing; if they are exposed to inelement weather, or are kept in a state of filth and discomfort; if they are crowded together in a yard without the separation of younger from the older animals, they will lose money very much in proportion to the degree of mismanagement. Very good is it, we know, to turn out so many beasts to graze in spring upon marsh or other rich pasture, and to have them come off in October straight to the butcher. But to do this well they must leave the yards in spring fairly forward in condition, and the man who buys a lot of lean kine in spring and complains in autumn that they have not paid for the summer's grass has only himself to blame. Such beasts never have answered well, and never will, for by autumn they have about reached the condition in which they ought to have been in spring at turning out time.

#### WORK ON THE HOME FARM.

The cold snap at the end of November should have induced everyone to look more closely than usual to the comfort of their live stock. The fall of snow was heavy generally, and we hear of as much as 2 feet of snow in East Kent. Thursday was the coldest November day we have had for many years, and it was with regret that we saw a lot of cattle being foddered with hay upon the snow out on the open pasture in the Midlands on that day. No shelter had they but the hedges, and the hay was really only just so much fuel to sustain vital heat in their sorely tried bodies.

Ewes forward in lamb have constant attention now, and are kept as quiet as possible. A frequent look round is desirable in case any of them become east, or rolling over upon their backs, as they are then unable to rise, and struggle till they are exhausted and die. They are now having some Pea straw in racks, and some of the chaffed winter Oat straw, of which we always have an abundant store at this season of the year. Feed upon pasture generally is running short, but we have a considerable extent of pasture reserved for the ewes that is full of feed, and we shall bring them upon this now shortly in readiness for the lambing in January. We are using no corn or cake for the ewes, as they are in excellent condition and will require none till after the lambing, when a moderate quantity is good both for the ewe and the lamb she suckles. Ewes having to make out upon poor pasture now become very poor, the lambs come weakly, and results are never satisfactory. No Turnips are given to ewes now, and they are kept altogether away from folds upon arable land, as the risk of injury from the strain made upon the system

if the land becomes at all wet and muddy is too great. We hold over the roots till after the lambing, when Mangolds are at once given freely upon the pasture, and late Swedes are left out upon the land specially for the ewes in folds, and we generally obtain excellent crops of Barley afterwards. A lot of crones or overage ewes drafted from the breeding flock are now in folds upon some poor pasture, which will be left so richly stored with fertility that a full crop of grass next season is a certainty. We commend this method of pasture renovation as having answered well with us upon poor thin land on a hill farm. Such folding in winter upon low lying pasture or heavy land would probably not answer, but it is quite certain to do so upon light land.

#### SEEDS AND ROOT STANDS AT THE AGRICULTURAL HALL.

THE annual Show of the Smithfield Club was opened at the Agricultural Hall, Islington, on Monday, December 8th, and proved a very satisfactory display. The entries in all the chief classes for cattle, sheep, and pigs are very numerous; the galleries are, as usual, together with a considerable space on the ground floor, packed with all kinds of agricultural machinery, from steam ploughs to butter churns.

With the exhibits of the large seed firms we are, however, chiefly concerned here, and therefore append a few particulars respecting them, taking them in the order they were visited. Messrs. Sutton & Sons, Reading, have an extensive and handsome stand, upon which the upper part is devoted to semicircular kinds of fine Swedes and Mangolds, the lower portion being elegantly panelled, and shows a series of photographs of the Reading establishment. There also are samples of the Grasses and other seeds, with new and approved varieties of Potatoes especially tested for their disease-resisting qualities. The more important of the roots are in Swedes, Crimson King and Champion, both very handsome, while of the Mangolds, Crimson Tankard, Golden Tankard, and Mammoth Long Red are equally good.

Closely following the above, Messrs. J. Carter & Co., High Holborn, have an extremely attractive exhibit occupying considerable space. The roots, which constitute one of the chief features, are arranged in substantial mounds, fine clean even samples of Elephant, Green Globe, and Prizewinner Swedes, together with Golden Tankard, Golden Intermediate, and Warden Prize Mangolds. Besides these there is an interesting series of the new hybrid Wheats raised by this firm, which are well worth attention for their fine quality. Potatoes all various, select vegetables, Sugar Beet, and samples of the principal farm and garden seeds, together with Grasses in mixture and otherwise, serve to furnish a very interesting stand.

Upon the opposite side of the gallery, in their customary position, Messrs. E. Webb & Sons, Wordsley, Stourbridge, have a tasteful and effective display of their leading specialities in roots and seeds. Of the former there are admirable specimens of the following Swedes—Purple Top Mammoth, Imperial, a fine purple variety; New Invincible, and Giant. Adjoining these we find such well-known Mangolds as Mammoth Long Red, Yellow Flesh, Tankard, and Champion Yellow Flesh, all good samples. Amongst the grains, Challenge White Wheat and Oats, Kinver Chevalier Barley, and Prolific Black Tartarian Oats are noticeable, together with Potatoes, Peas, and other vegetables in abundance.

Again passing round the gallery to near the stairs we find Messrs. Harrison & Sons, Leicester, have a well furnished stand, comprising very creditable roots and seeds. Swedes are well represented by Defiance, Normanton Globe, Green Barrel, Perfection, and Red Heart. Of Mangolds there are Giant Long Red and Golden Tankard, while Carrots, Onions, Beet, Parsnips, and Potatoes are well represented by select varieties.

Messrs. Oakshott & Millard, Reading; King of Coggeshall; and Raynbird, Caldecott, & Co., Bawtree, also have effective stands of roots and seeds. Messrs. Dieksons of Chester show a collection of Apples, and the English Fruit and Rose Company, Hereford, have an excellent collection of about fifty varieties of Apples.

#### REMARKS.

- 30th.—A little fog in the morning; sunshine in the middle of the day; fair evening.  
 1st.—Sunshine through slight fog in morning; dense fog from 1 to 2 P.M., and rather dense nearly all afternoon; clear night.  
 2nd.—Slight fog early, dark as night for a few minutes about 9.15 A.M., foggy morning fair afternoon, and fog again in evening.  
 3rd.—Overcast and slightly foggy.  
 4th.—Almost continuous rain or drizzle till 5 P.M.; overcast evening.  
 5th.—Overcast but dry. 6th.—Overcast and dry.  
 A cold but generally dry week.—G. J. SYMONS.

MEMORIALS AND  
TESTIMONIALS.

THE year now drawing near its termination will be remembered as a fatal one amongst horticulturists. Many excellent men have been called away, and all who knew, and especially who worked or associated with them, mourn their loss sincerely. The esteem in which they were held is testified to in the most practical manner by the movements that followed to perpetuate their memories befittingly. Large sums of money have been collected for this purpose, and the amounts have probably been enhanced because they either were, or it is understood will be, applied to charitable purposes, or to the advantage of the bereaved. Happily appeals for funds when so invested, and by which the names of departed friends are kept in remembrance, are never made to deaf ears or hardened hearts in the gardening community. The larger the sums then raised the greater is the general satisfaction, not because the dead are more honoured by a few large sums than by a greater number of small offerings, but because the larger the aggregate amount collected the greater or more extended the benefits to the living who need relief or assistance. But even when memorial funds are applied in the manner indicated there is no mistaking the feeling which largely prevails that individual gifts of large sums and duly published, have two distinct tendencies, neither of which is by any means generally approved—namely (1) inducing persons to give sums which they can perhaps ill spare, yet who object to be “seen” contributing, by comparison, ridiculously small amounts; or (2) declining to contribute anything. It is not in the least necessary to pass any opinion on such decisions, they are in accordance with human nature, and it is with this we have to deal. It is not to be supposed, however, that generous contributors do not give willingly and freely. In some cases we are convinced that they would prefer not to have their offerings published to the world, and we know of those amongst us who do much good by stealth, for we have been made the medium of conveyance of substantial assistance in cases of need on the condition that the names of the donors should not be disclosed.

The subject under notice is referred to now because of communications which have been received that it would serve no good purpose to publish, and of expressions that are so frequent as to have become common property, that the methods of memorialising do not by any means meet with common approbation. Our own action, and that of our contemporaries, is objected to in publishing printed lists of contributions time after time. In most cases we believe this has been done gratuitously to assist charities, and we suspect would be repeated were occasion to arise. Then what is referred to as “begging and touting” is a practice that is strongly condemned on the allegation that money so obtained is not the true way of representing the esteem in which friends are held. There is this to be said on that view of the case—namely, it is not conceivable that any person whose memory is thus honoured could, if living, approve of any such thing; and more, there cannot be a doubt that most persons now striving to do their duty would very much prefer silence after their decease to strained action of that kind in raising money to memorialise their names. We are sorry to hear the vulgar term “touting” so frequently in connection with memorial or testimonial movements of late, with which the practice indicated cannot be otherwise than incongruous. It is right that

the proposals be placed fully and fairly before the public, and then persons should be left to make their offerings; but the persistency with which applications are made for some object or other is undoubtedly creating a revulsion of feeling against that which is good in itself—doing honour to the living or the dead who have, by their lives and conduct, merited public recognition. Zeal is an admirable quality, but requires to be tempered by discretion for producing the most satisfactory results. “We live in testimonial days,” observes one of our correspondents; “and it appears as if some of the movers in these matters consider that the result is not a success if the amount collected is not greater than all previous amounts of the same nature. Large amounts were not collected, were not thought necessary, when such men as Loudon, Lindley, Berkeley, and Rivers died; but they are not the less remembered on that account. Their works are their greatest memorials, and the portraits of such of those men as were subscribed for were considered as affording sufficient evidence of the esteem in which they were held by their friends and associates.”

This brings to mind the latest case, that of the late Mr. Shirley Hibberd. Active, industrious, ever ready to help in any good cause, something should be done, and will be done, apart from his own works, to keep him in remembrance; and so far as we can ascertain, after taking some pains to test current opinion, this is overwhelmingly in favour of a portrait to be placed with those of Lindley, Veitch, Rivers, and others in the Lindley library. Recognising to the full Hibberd’s services in horticulture, he cannot, under the most generous estimate, be regarded as a greater man than they. One of those portraits was obtained by subscriptions among the Council of the Royal Horticultural Society; and the other (Mr. Rivers) by general offerings of those who had pleasure in sending them when they learned of the project in view. The cost of the portrait was, we think, about £40 or £50, and the surplus, which was similar in amount, was given to the Gardeners’ Royal Benevolent Institution. Will not something of the same kind meet every reasonable claim that can be advanced for our late friend? But as our charitable institutions are not weak and ill supported at the present time, could not the surplus be given to his child? This would be the most graceful of all tributes to his memory, and one which would touch him the most deeply if he could know it was done. It was with feelings of gladness that all who attended the meeting last week heard this child was provided for, but the provision cannot be so great that an addition would be a superfluity; and as coming from her father’s friends it would be to her something very near akin to a father’s love, and in time so felt—a token that he was loved in life by those who knew him best, and in this meet form remembered.

For perpetuating Mr. Hibberd’s memory in some such manner as suggested his friends, high and low, rich and poor, would, we believe, give their offerings gladly, and much more willingly than towards raising a large fund for sending young gardeners abroad for completing their education, or disbursing among professional lecturers at home on scientific subjects connected with horticulture. Granted that those projects are good in themselves, they would not only involve the sinking of a considerable amount of money, but besides they are not in harmony with the mind or habits of the man whose name they would commemorate. Shirley Hibberd was not a learned savant, but emphatically a popular teacher on gardening, and delighted in garden experiments; and having this in view, another suggestion made at the meeting for establishing a Hibberd Fund for conducting experiments at Chiswick would be more in consonance with his tastes, also appropriate, as he was a member of the Garden Committee; and if the surplus from a portrait should be large possibly something might be done to keep his memory green at Chiswick, as well as for his child. These are practical matters, and Mr. Hibberd was a practical man, a man of the people too, and the greater the number of small sums

of even 2s. 6d. or 5s., more or less, from professional and amateur gardeners not rich in this world's goods, but who would give their mites heartily, the greater would he, if living, appreciate the result apart from the sum collected. But the hewers of wood and the drawers of water in gardening must never forget that it is as easy for some to give pounds as it is for others to give pence, and that large sums may be, and are, given as freely, cheerfully, and with the same purity of motive as are the mites of the masses. This appears to be a case in which all should join—in which there should be less of pressing for money than seems to have become customary, but that each should give just what he feels he would like to give and no more, quite regardless of the contributions of others, who may be either better or worse off than himself. This we are sure must be the wish of the Committee, and we believe the small amount representing the day's wage of a gardener would if sent be as much appreciated as would a sum equal to a gardener's quarterly salary given by a person of wealth.

What appears desirable in providing testimonials or memorials in the gardening community for or in remembrance of men of national repute is a greater number of subscribers of small or moderate amounts. At present a comparative few support these movements. It is not the amount subscribed by a few, giving because somebody else gives, and giving as much as he, that constitutes the essence of memorial tributes to the memory of the dead, or as testimonials to the worth of the living, but the number of persons who gladly and spontaneously cast their offerings into the treasury, or in other words the number of givers rather than the amount subscribed, reveals the truest measure of genuine public sympathy with all movements such as those under consideration, and which are now being somewhat frequently discussed by various persons who are interested in them. We should like to see a very long list of subscribers to the Hibberd Memorial Fund.

### LETTUCES.

THIS vegetable was referred to by "J. B., Nottingham," in "Notes and Gleanings" on December 4th, also by Mr. H. S. Easty, and as the former says he would like the experience of others I gladly give mine. As most gardeners have to keep up a supply for salading purposes as long as possible the subject is of some importance. Although Endive, Chicory, Witloof, Dandelion, and Sorrel (when blanched) are reckoned as salad plants, Lettuces, as a rule, are always preferred to those plants. Although large numbers are planted here during the year the varieties are very limited. Several I have tried are not equal, from an all-round point of view, to some of the old standard varieties; nevertheless, any new variety, or old one either, with a good reputation will always be acceptable, particularly a well hearted one, either Cos or Cabbage, for use from the end of November to the end of March. Between those dates I find the most difficult time to obtain a good supply of well hearted Lettuce from outdoors. If the weather is favourable—that is, not above 10° of frost, and not too much wet or damp—a supply may be kept; but I have found 15° of frost damages full-grown Lettuce considerably; also, too much wet weather, with slight frosts, decays good hearted plants, and Lettuces without hearts are not much appreciated.

I have dug them up with good balls of earth in November, and placed them in unheated frames, and with all the care taken they have damped considerably. I have also covered them with straw, mats, and Pea haulm in the open ground, but the damp was too much for them to keep well after Christmas. The Pea haulm was the best of the three coverings; it is cleaner and lighter, but a fall of 12 inches of snow makes it bad for them. The best of all coverings for salad plants, such as Lettuce and Endive outdoors, is about 18 inches thick of bracken Fern (*Pteris aquilina*). It is clean and very light, and that thickness will keep out much frost. It is not, however, every gardener that lives within easy reach of a good supply of bracken, and I am one not lucky in that way; but I know that some are within easy reach of acres of this most useful covering, and to such it would be of great benefit, not only for Lettuces, but also for cold frames, Roses, and half-tender plants. The bracken should be cut in autumn before it is too dry and withered.

It must be understood that Lettuces to be well protected should have completed their growth, or made sufficient heart to fit them for the salad bowl before the end of November, as it is next to

impossible to secure much growth in December and January. In October and November also look out on all possible occasions when the plants are dry and tie them up, as it very much improves their eating qualities, whether the kind of Lettuce is self-folding or not. I had a very good supply of well-hearted Bath or Brown Cos through the month of December a few years ago by digging them up with good balls of earth attached, about a hundred plants that had been tied up when in a very dry condition in the middle of November. They were planted or laid in on the back border of a cold vinery, watering the earth about the roots as the planting proceeded, being careful not to let a drop fall on the foliage. The house being kept cool and dry, and the plants lifted with large balls of earth, they proved to be the most useful Lettuces I ever had through the month of December. If left on the border in the kitchen garden where they had been growing, the chances are that they would have been all spoilt with frost and damp, unless, as previously stated, I had a good supply of bracken. I hope that any gardeners who have a good supply of Lettuces through the three or four worst months of the year will give the benefit of their experience to the numerous readers of the Journal, with the best methods of culture and protection.

This matter is of considerable importance, as many families require salad daily in winter as well as the summer months, and it is not every gardener who can have a number of frost proof frames. The Broad-leaved Batavian Endive, well blanched, is the best substitute I know for Lettuce, but the latter is generally inquired after most. I should say that those having brick frames, with a flow and return hot-water pipe, in which early Potatoes are grown, with Melons for succession, would be suitable in which to sow Lettuce for use in December and January, after the Melons are cut in August. The hot-water pipes would dispel damp and promote a healthy growth. Any remarks from cultivators so situated I feel sure will be acceptable.

To maintain a supply of well hearted Lettuces from April to the end of November is easy enough, provided too much frost does not come before the date last named. For the earliest supply I sow thinly in beds about mid-August the two following, Hicks' Hardy White and Bath or Brown Cos. At the same time a good breadth of Lee's Immense Hardy Cabbage Lettuce, the sort mentioned by "J. B., Nottingham," is sown thinly in drills a foot apart, the plants to be thinned to 6 inches apart when large enough to handle. This sowing of Cabbage Lettuce, if the winter is not too severe, comes in at a most useful time to cut, before the Cos varieties are ready. Another sowing of the Cabbage variety is made at the beginning of September, thinning also to 6 inches apart when large enough. Last year this sowing proved the more useful of the two; a large number of the August sown plants were destroyed by frost and wet, as being more advanced in growth. I suppose their condition was such that they could not withstand the weather so well. Early in March a number of clean 6-inch pots were placed over the best plants, leaving the crock hole open, and in that way we had tender hearted Lettuce for use until the unprotected and tied Cos were ready the succeeding month.

One of the best summer Lettuces I find is All the Year Round, and although reputed hardy by some, I find it is not so, at all events in this district (midlands). Last year I sowed it in rows side by side with Lee's Immense Hardy Green at both sowings above stated, but 16° of frost completely destroyed it, while the last-named sort escaped almost uninjured.

I may state that both these sowings of Cabbage Lettuce were in open quarters. My opinion is that, provided the soil is of a moderately light texture and well drained, that plants are as hardy in the open quarters as near a south wall; at all events, that has been my experience. It is the full glare of the sun catching the plants so quickly on a south border after a night's frost that does the mischief. Some of the best Lettuces I have ever seen are grown by the London market gardeners, and, as a rule, they have no walls or south borders, but all open quarters. Two plantings are made from the mid-August sowings of the two Cos Lettuces named above. One planting is made in October of the strongest plants on well manured ground (for the Lettuce delights in a rich larder) in rows a foot apart, and about the same distance asunder in the rows. I usually plant about the same quantity of Hicks' as of the Brown Cos, but there is not much difference in their degree of hardiness. This planting, if all is well, is fit for use in May. Another planting is made from the same seed beds some time between the middle of February and middle of March, the weather and state of the land being the guide for this planting. These will follow those that were planted in October, and are fit for use in June. Both these forms of Cos Lettuce must be tied when three parts grown and perfectly dry. I find the best time for tying is late in the afternoon when the sun is off them, or has lost its power considerably, as if tied in the middle of the day when the

sun is powerful, as it often is in May, the results to the hearts of Lettuce are as bad as if tied when wet.

Throughout the summer I only grow two kinds—All the Year Round for a Cabbage, and Paris White Cos for an upright self-hearting Lettuce. Both these I have known and grown for many years, and if good strains of these two old favourites can be obtained they will not fail to give satisfaction from the end of May till October, if properly cultivated. The produce is all that can be desired for summer and early autumn use. The first sowing of Paris Cos for early summer use is made in a warm spot near a south wall from the middle to the end of February. The seeds are scattered thinly, so as to have the young plants as strong and sturdy as possible, and when large enough, and in favourable weather in April, to plant out in well prepared land in rows 15 inches apart, and 12 inches from plant to plant in the rows. If the weather is hot and dry at the time a few waterings may be necessary till the young plants are established. Showery weather is suitable, but the best results are not obtained if the soil is too wet at planting time. This bed will be fit to cut in June, and will succeed the autumn-sown Cos. Another sowing of Paris Cos should be made in the open in March, again in April, and at intervals of a fortnight from that time till the middle of July, planting out sufficient from these sowings when large enough to maintain a good supply throughout the summer. It is important not to plant closer than the distances named, as without sufficient air circulating about them the leaves are apt to become twisted, and do not self-fold well enough. I have seen them planted 12 inches by 9, and even closer, and have done the same myself; but the produce from such was not to be compared with those that had more room. If taken in a marketable sense, good solid Lettuce will generally sell at a profitable price; but small, twisted, light-weighting samples will scarcely sell at all, so that it is better to have one good one than six of poor quality. Also, if wider apart they do not bolt or seed so quickly.

It is also important that the Lettuce beds be not made under trees, also that the ground be hoed frequently, not only to destroy weeds, but to aerate the soil. It prevents excessive evaporation, but most persons who have had a few years' practical experience with kitchen gardening know the benefit of frequently hoeing between crops, even if there are no weeds to destroy. The Paris Cos is a good variety to maintain a supply till the end of September, after which time I prefer the Bath or Brown Cos. Of this, make two sowings, one the beginning of July, the other in the middle of the same month, and from these two sowings some good plants may be expected for October, November, and December. These must be planted the same distance as the Paris Cos, and when dry enough and large enough tied up. This variety, as far as my own eating is concerned, and I know it is the same as many others of the gardening craft, is one of the best in existence. There is a self-folding Brown Cos, but with me it has never come so fine; if a good strain can be had it is very useful for autumn and winter use.

Many people, and especially ladies, prefer good Cabbage to Cos Lettuce, and if only one sort is wanted for summer and autumn use All the Year Round will be found a good one. I never transplant Cabbage Lettuce, for seed is cheap, and an ounce will go a long way if sown thinly. If sown at all thick it is not only a waste of seed, but it makes more work to thin them, besides helping to spoil the crop. A good distance apart for this Lettuce to stand is a foot apart each way. Make the first sowing towards the end of February, again in March and April, from then every fortnight till the 1st of August, and a good supply of Cabbage Lettuce for some months will be the result. The first and last sowings may be on a south or west border, the others in the open. A very good position for Lettuce in June and July is on every alternate Celery ridge; the other ridge is best not planted, as the Celery can be watered and attended to with greater facility. Another good position is where the main crop of Scarlet Runners are sown. In March a quarter is cleared of old Cabbage stumps or autumn Broccoli. It is then well manured and dug up. In April marks are made 5 feet apart for the sowing of the Beans about the 1st of May. At the same time (in April) two rows of Paris Cos are planted down the centre between the 5-foot spaces, not less than a foot apart from the first sowing made in February. These will be half grown by the time the Beans are up, and fully grown and cleared off before the rows shade them much. I have had some large, well-hearted Lettuce from this planting.

If the summer should prove to be a dry one, a very good plan is to sow the Paris Cos thinly, and single out the plants immediately they are large enough to handle, but for all sowings and plantings an open position, plenty of manure, and digging a good spit deep at least with frequent hoeings, are essential to success. If these conditions are followed out the water pot will not be required much after planting. When waterings have to be resorted to, and the

water happens to be much colder than the soil, the plants wither very much in the succeeding hot sunshine. Manure well, and a Lettuce grows quickly, and the quicker it grows the more succulent its nature, a very essential point for one of the first of salad plants.

A few words should be said as to cutting Lettuce. As most gardeners are aware all vegetables in hot summer weather are best cut early in the day before the sun has much power, and although the dews are not so heavy as in autumn there is a certain dampness in the plants before breakfast time that makes them appear when cut very fresh and crisp. This particularly applies to Lettuce. Market gardeners do not cut, but generally pull the plants up by the roots, as their produce is often not retailed for a day or two after, and sometimes more, and when pulled does not wither so soon as when cut. It is advisable to cut all Lettuce for midday use before breakfast, and for night use as late as possible in the evening. When cut in the hot sunshine in the middle of the day they have a withered, dry, and tough appearance, and their taste correspondingly so. This refers mainly to the months of May, June, July, and August. If many are cut at once cover them with Rhubarb leaves till wanted.—A. HARDING.

## HARDY FLOWER NOTES.

WITH the last month of the dying year we can expect but little brightness in the flower garden; even if there were nothing of interest we might, however, say with Shakespeare—

“No man inveigh against the withered flower,  
But chide rough winter that the flower hath kill'd;  
Not that devour'd, but that which doth devour,  
Is worthy blame.”

Grim winter, with his icy breath, has yet left us something to admire. It may be there is but little flower, but there is at least the foliage of many evergreen plants to study and enjoy. On a wall, it is true, we have the old Monthly Rose in flower; the little creamy white *Crocus ochroleucus* is in bloom in the border, some late *Chrysanthemums* are in flower outside, and about the usual number of spring flowers have anticipated their usual period; but after all it is to the foliage that we have to look for something to interest and to yield pleasure.

Among the many plants which thus present themselves to our observation the Saxifrages are perhaps the most interesting; they present so much variety of colour and of shading that in a good collection there is always much to study; bright greens, silvery greys, and glaucous greens present themselves in almost endless variety. I have a short walk leading from my house to the garden gate; this walk, until within the last few years, was edged with Box, and proved very unsatisfactory. The Box has been removed, the border edged with rough stones, behind which were planted Saxifrages, Sedums, Silenes, and other alpine plants; these are now fairly established and the stones almost covered, and the plants form irregular hillocks, which come partly over the walk, and by their irregularity of outline deprive the straight walk of the formality which so largely characterised it in former years. This edging is always of interest. In spring, summer, and autumn there is always something in bloom, and even now (December 9th) it is bright and attractive. For obvious reasons the choicest of the Saxifrages are not grown in this position, but such kinds as *S. pectinata*, *S. pyramidalis*, *S. intermedia*, and *S. rosularis* among the incrustated, and *S. hypnoides*, *S. Wallacei*, *S. Kingi*, *S. tenuifolia*, *S. lanceolata*, and *S. muscoides atro-purpurea*, with others of the mossy section, flourish and increase, and are at this season, especially when the weather is fine, of great value. These Saxifrages are far too much neglected in the arrangement of the garden for winter and, unlike many of the shrubs which are so frequently used for this purpose, they may be permanent occupants of the flower garden. I am glad to think that I am not called upon to say which section of the Saxifrages is best suited for this purpose. Almost all are worthy of a place, and I feel sure that they should enter more largely into our gardens.

There are also a few variegated leaved members of the genus which are especially worthy of mention. I must confess to having become a comparatively recent convert to the use of variegated leaved plants. Even yet there are some I care little for, but I have been forced to the conclusion that the careful use of these forms will add much to the beauty and interest of the garden. I would, therefore, speak briefly of three Saxifrages which should be obtained where possible. The first is unfortunately somewhat expensive—a circumstance which is perhaps a recommendation to some—but is well worth growing. It is *S. Guthriana variegata*, a very neat compact variety of the *Umbrosa* section, beautifully variegated, with creamy yellow and green. The next is the varie-

gated form of *S. umbrosa*, the London Pride. This is a cheap plant, and it is surprising that it is so seldom seen. It is beautifully blotched with white, and a large rosette forms a very pretty object. To see the London Pride in perfection a rosette should be planted singly, with plenty of room to develop in, and in rich soil. Thus grown it will attain dimensions which will surprise most of those who see it. The only other variegated Saxifrage I know of, but which I have not seen but hope to add to my collection in spring, is *S. hypnoides argenteo-variegata*, one of the mossy section. This variety is described as having the foliage elegantly margined white. Although I have not seen this, I feel sure, from the reputation of the firms sending it out, that it will be a valuable addition. It will probably require some attention to keep the stronger green shoots from choking the variegated.

One could say much about some of the beautiful encrusted Saxifrages, but space will not permit at this time, and I must pass on to speak of other plants. While on the subject of variegated plants the Arabises must not be forgotten. Of the three varieties I know—*A. albida variegata*, *A. lucida variegata*, and *A. procurrens variegata*—I must confess to preferring the first, especially where it is desired for hanging over stones. The variegated form of *lucida* is duller in colour and more formal in outline, while the other, when in good condition, is much brighter and clearer in colour, and has to my mind a great attraction from what one may be pardoned for calling an "unstudied" habit of growth. It should, however, be grown in an open place, and any tendency to revert to the original colour should be prevented by pinching off the green shoots as they appear. A large plant belonging to a neighbour who kindly gave me my first plant has now reverted entirely to the original green colour, while mine are as fine as ever. I have not yet been able to appreciate the variegated Alyssum, *A. saxatile variegatum*, or the Aubrietia, *A. purpurea variegata*, but this appreciation may come in time.

Very valuable are some of the Euonymuses, such as *E. radicans argenteo-marginatus* and *E. r. aureo-marginatus*. The Aucuba-leaved Daisy is not very satisfactory with me, but is attractive where it does well. Some of the silvery leaved plants which are pretty in summer, present few attractions in winter. *Antennaria tomentosa* may be named as one of these. This cannot be said of *Santolina incana*, a dwarf shrubby plant, which is very conspicuous at this season. It will be found better to raise a stock of this every two years, as the older plants often become a little unsightly. It grows very readily from cuttings.

Glaucous-leaved plants are very useful at this time. Old plants of Carnations look well where they stand from year to year, but the Pinks are much finer for winter decoration. The old white variety is as good as any of the garden forms, but the neatest are some of the Alpine Pinks. One plant I have which crowns a projecting knoll of rockwork, built to check a current of wind, is particularly fine. It is nearly 2½ feet across, and is a hillock of spiny glaucous foliage. It is greatly admired, and time after time do I stop to enjoy its beauty. *Asphodelus luteus* will also be found very attractive, with its grass-like glaucous green leaves.

But my pen could run on long enough without exhausting the subject or dealing adequately with the many plants which lend brightness to the scene. To-morrow when I again look out many will silently reproach me for forgetting them. Ericas, Sempervivums, Sedums, Thymes, Cotoneasters, Aubrietias, and others are mute yet eloquent witnesses to the truth that the lover of hardy plants can enjoy in gloomy December a feast of beauty, which is none the less welcome when accompanied by the knowledge that many bulbs are beginning to peep above the soil, and are thus preparing to yield him that pleasure which they can so well bestow.

But while looking forward hopefully to the time when—

"Fair handed Spring unbosoms every grace,"

let us not forget the graces of winter—the brilliant mounds of green, of grey, and of parti-colour, which brighten our gardens and are the "silver lining" of the cloud which the short days inevitably lay upon us.—S. ARNOTT.

## ONIONS.

I ADDED several new varieties to my usual stock of Onion seed at sowing time, and amongst them I found Laxton's Concord superior to his Sandy Prize, but by no means so true. It will require selection, but the most globular type is certainly a handsome heavy Onion, and superior to any kind I have hitherto tried. I have selected a few, and shall save the seed, and after a year or two no doubt shall have a good and level stock. My practice is always to save the deepest in flesh, for I prefer that to great cir-

cumference, and by thus saving the thickest I have now obtained a stock of Rousham Park, which is considerably heavier than the usual sample. This is a flat Onion certainly, but large, thick, and heavy, and only second to a careful selection that I have made of Improved Anglo-Spanish, which is globular. These two Onions are my sheet anchor, but I shall certainly grow the seed from my selected Concord. Sandy Prize grew large, but it is a flat Onion, and I have discarded flat Onions with the above exception. Southport Globe, which I received from New York, did not satisfy me, and I shall not grow it again. The large flat Onions that are the pride of the exhibitor are of little household use, and, as a rule, are bad keepers to boot, a medium-sized, thick, heavy, close-grained bulb being what is required by the cook, and these will not begin to grow in such a hurry as the monsters. When Onions are exhibited I think weight ought to be stated, and weight ought to be the principal point in determining their position. It is so at some places, but at others circumference seems the acme of perfection, and weightier but less imposing looking bulbs are passed by.

My practice when I lived elsewhere, where the soil was extremely light and gravelly, was to sow seed the first week in February, weather permitting, and I found I did not succeed if I failed to sow during that month. I attempted the same plan two years in succession here on my heavy soil, but failed to get a plant each time, although I had used burnt earth both to mix with the soil and to cover the seed. The middle of March I find quite early enough, and although they seem to grow slowly for a long time they pull up wonderfully in July.

It is sometimes hard work to ripen the bulbs in showery autumns, but where the practice of a cottager hereabouts can be followed there will not be much difficulty. He has driven hooks in rows all up the south side of his cottage, and after pulling his crop, and tying them in bunches, he hangs them on the hooks, where they never fail to ripen.—H. S. EASTY.

## DRACÆNA LINDENI.

THIS is one of the most useful foliage plants that has been introduced during recent years. It lasts a considerable time in rooms without injury, and will bear the temperature and conditions of the conservatory from April until October, or longer if the temperature of that structure does not fall below 50°. Although it will bear for a long time shady positions in rooms and in the conservatory, it does much better and lasts longer where a fairly light position can be accorded it. Highly coloured specimens are handsome, but poorly coloured ones are ordinary in appearance, and in this condition the plant has not much to recommend it. Success in having the plants a good colour or the reverse depends solely upon the treatment they receive. Many have been unsuccessful in this respect through growing the plant in too warm a temperature. In a close stove the plant either becomes green or a sickly yellow, and is destitute of those beautiful markings which render it so conspicuous. Plants that are in this condition will, if removed to a lower temperature, soon develop coloured leaves. An intermediate temperature appears to suit it best, although it does not grow so rapidly as under stove treatment. This does not matter materially as long as well coloured examples can be produced, for if once they are developed they last a considerable time, and in light sunny positions in rooms we have known them grow and improve. Plants that were taken into the dwelling house in June are still there, and will last for some months longer in a presentable condition, when they will be cut up for stock.

This *Dracæna* does not require to be fully exposed to the sun, but it is by no means particular to the amount of shade. The temperature appears to be the main factor of importance, whether the foliage colours or not. Even if heavily shaded in a moderately low temperature it colours well. We have this season discovered that it is at home even in a late vinery where the foliage was moderately thin and air was admitted liberally. To develop fine specimens they should never have insufficient root room from the time heads or cuttings are rooted. Pot them from time to time, until they are placed into 10-inch pots, if large well developed plants are needed. This size is none too large, although the plant can effectively be used for decoration in any size down to 2-inch pots. We have found it succeed admirably when potted firmly in a compost of fibry loam, sand, and one-seventh of decayed manure.

It has been said that this *Dracæna* can be propagated too slowly to be used for general purposes of decoration, and this is true if one system, and a general one, only is practised. After taking off the head, which sometimes flowers after the plants have been root-bound and checked to wait for side shoots, which are produced one by one at intervals of time, is too slow. A quicker way is to cut up the stem into lengths of about 3 inches, and insert them singly

in small pots with sand at the base, and plunge them in bottom heat. These soon break into growth, and when large enough the young should be taken off and re-rooted. By this means numbers are produced in little more time than one or two would be secured from the stem when allowed to break from the top in a natural manner. Plants of this nature when they bear conservatory treatment during the summer are invaluable in assisting to change the character of that structure.—O. A.

ODONTOGLOSSUM URO-SKINNERI.

THE "Orchid Album," published by Messrs. B. S. Williams, Upper Holloway, has now reached part 105, including 420 coloured plates of the best and most interesting Orchids in cultivation, forming quite an Orchid library. In the present number plates and descriptions are devoted to *Odontoglossum Uro-Skinneri*, the beautiful hybrids *Cypripediums Marshallianum* and *œnanthum superbum*, and the showy *Dendrobium chrysotis*, with its heavily fringed lip like *D. Brymerianum*.

The illustration of *Odontoglossum Uro-Skinneri* represents an uncommonly fine variety, the sepals and petals heavily barred with brown on a green ground; the lip heart shaped, with an undulated margin, bright rose with white streaks. The raceme is a long one, and most effective. The following particulars are extracted from the notice accompanying the plate.

"The typical species was found by Mr. George Ure Skinner, whose name it commemorates, near the village of Santa Catarina, in the district of Solola, which is nearly a hundred miles distant from the City of Guatemala; but the plant here figured is a much finer variety than the one taken for illustration by Mr. Bateman in his monograph of the genus *Odontoglossum*; indeed, we cannot but think that the appellation of *splendens* is really deserved by this variety. It would seem that the plant first flowered in the establishment of Messrs. Veitch & Sons of Chelsea about the year 1859, and some discussion took place about its being a hybrid; but Mr. Skinner was strongly opposed to this theory, and he writes thus:—'I may be allowed to satisfy you that this is no hybrid; it is a very distinct species, which I found growing on rocks near the village of Santa Catarina;' and he further adds, 'it proves a very bad plant to get over alive, but in several attempts a few survived. We suspect, however, that in the days when Mr. Skinner wrote these lines the means of transit were much slower than at the present time, and the style of packing was not so well understood as it is to-day; there is consequently far less risk than formerly in the transit to England. We wish someone would put this to the test now in the case of *Odontoglossum Uro-Skinneri*, as the plant is becoming somewhat scarce in cultivation. It is a noble large-growing kind, and we have seen it growing luxuriantly in the collection of H. J. Buchan, Esq., Wilton House, Southampton. Here, too, we saw the first seedling *Odontoglossums* which had been raised in this country; they had been obtained from this species without any efforts at hybridisation, and were growing and doing well.

"The grand variety here figured was grown in the fine collection of E. Salt, Esq., Ferniehurst, Shipley, Leeds, and is another fine record to add to the many superb varieties which have flowered in that establishment, and we are much indebted to him for the opportunity of figuring it in the pages of the 'Album.' It blooms in the autumn months, and lasts a long time in full beauty.

"*Odontoglossum Uro-Skinneri* is a bold-growing evergreen plant, making large flat pseudo-bulbs, which spring from a creeping rhizome. The leaves are ovate-lanceolate, firm, and of good substance; the ground colour of the sepals and petals is very variable;

indeed, this has been noted from the time of its first introduction. Mr. Skinner said of it 'that it varied in almost every plant;' but although during the past thirty years we have seen many plants in flower, not one to approach the beauty of the one here figured has appeared. The colouring of the sepals and petals is for the most part of a pale green, marked over the surface with brown blotches, or of a dull brown, mottled more or less with green, and the lip white, dotted all over with blue or pale rose with white markings, and not the rich rose and chestnut brown of this illustration. The present plant is evidently a near ally of *O. biconense*, but Mr. Skinner points out the difference in the two species. He says, '*O. biconense* has oblong narrow bulbs and leaves, and no rhizome, but massed and always terrestrial, half buried in mossy banks.' Our present plant has large and flat bulbs, and a running rhizome; but we think that the conditions under which Mr. Skinner found it—*ie*, on rocks—are too often lost sight of by our Orchid growers. We have frequently observed this plant to be very much over-potted, and in consequence thriving indifferently, therefore bear in mind our advice and do not overburden the roots with soil, which is the great stumblingblock, especially to young amateur growers. Drain the pots carefully and well, and use for soil about half good peat fibre, from which all the fine mould has been well shaken, and some chopped sphagnum moss; mix the whole together with some medium-sized nodules of charcoal, and in potting add here and there a slight dash of sharp gritty silver sand, pressing the whole down very firmly. At this the dull season of the year water sparingly, but keep the plant moist, and at the turn of the season, when the days lengthen and the sun brightens, more may be given,

FIG. 71.—CYMBIDIUM TRACYANUM.

until in the summer season it may be treated in the same manner as the beautiful *O. crispum* (Alexandræ), which we all love so well."

CYMBIDIUM TRACYANUM.

At the meeting of the Royal Horticultural Society on December 9th Mr. H. A. Tracy of Amyard Park Road, Twickenham, exhibited a vigorous and handsome *Cymbidium*, for which the Orchid Committee awarded a first class certificate. Doubts were freely expressed, however, with regard to its being a true species. One experienced orchidist considered it as "a form of *C. longifolium*," another dubbed it as "merely a fine *C. giganteum*," a third authority fancied he could discover "a nearer relationship to *C. Hookerianum* in the form, size, and markings of the lip." It is quite plain from these different opinions that the plant was not a readily recognised form of any well known type, and it was admittedly distinct if only as a variety, while it was unquestionably handsome. In the growth and foliage with the smooth stem or leaf bases it resembles *C. longifolium* or *giganteum*, but the flowers are of great size, 5 inches or more in diameter, with broad sepals and petals evenly and strongly veined or spotted in lines of a

reddish tint on a yellow ground. The lip is long and broad, pale yellow spotted with red. The raceme was about 4 feet long, bearing numerous flowers.

### MAKING USELESS PEAR TREES USEFUL.

I READ with much interest your leading article in the Journal of November 17th on the above subject, and it is a very important one to which unfortunately far too little attention is paid generally. The failure in obtaining crops of fruit on many Pear trees will remain until far more attention is paid to the adaptability of sorts to situations, and the prevention of too free a growth. With too many persons an idea prevails that any varieties of Pear trees, purchased at sales by auction, and whether there or from nurseries, at the cheapest possible price, are suitable, and that it is only to plant to procure fruit.

In the favourable districts of England many Pears produce good crops of fruit, when it is almost impossible to get crops in the smoky districts of large manufacturing centres; and in these last named places where gardening is so difficult under the many existing disadvantages, there is frequently a great desire to battle with these difficulties, and to secure good crops of fruit. Much valuable information is to be gleaned from the article referred to, and it will be well if amateurs who wish to grow fruit well will study what is recommended by Mr. Smith.

The immediate neighbourhood of Birmingham is pretty well known as not being one of the best for gardening generally, and the Edgbaston district has a very large number of excellent gardening establishments, with an immense area of glass throughout those gardens, and Birmingham holds its own as a plant growing district, and high class cultivation is the rule. But our springs and autumns are often sunless and moist, and outdoor fruit crops of Apples, Pears, Plums, Cherries, Damsons, Filberts, &c., are most uncertain, from the non-enjoyment of a clearer atmosphere and other necessary adjuncts to successful outdoor gardening. When at the Botanic Gardens towards the end of November Mr. Latham, the Curator, showed me some excellent examples of two varieties of Pears—Beurré Diel and Doyenné du Comice, grown by F. M. Mole, Esq., in his garden in the Westfield Road, Edgbaston, within a mile and a half of the centre of Birmingham. In a correspondence since with that gentleman I found that his views as to the treatment of Pear trees was very much in unison with Mr. Smith's. I have since had an opportunity of inspecting his garden, and he has kindly given me his views in writing, which I have pleasure in giving below. Fruit growing in the immediate district of this great city is, as I have already said, most difficult, that is, to secure crops of really good fruit. Mr. Mole has made a study of the matter, and is a follower of the teaching of Mr. Rivers, Mr. J. Wright, and other safe authorities, but he acts also from his own, in some cases dearly bought experience, from buying in sorts which have been recommended, and after seasons of waiting have had to be rooted out, as too uncertain in cropping, or worthless. His garden all round is a marked example of first-class culture, and his Pear trees, especially on the walls, show they have received great attention. They are well trained, not overcrowded with spurs, but make clean good growth.

Mr. Mole pays particular attention to the summer pruning of the trees, removing what wood is not required, and laying in any new wood he wishes to retain. He always makes a point of thinning out his fruit as early as it can be done with safety, so as to secure a moderate crop of fine fruit rather than a larger quantity of inferior size and quality, and in removing any foliage which may cover the fruit to ensure full exposure to the sun. As flowers are grown on the borders, a little artificial manure is given when the border is forked over for planting out in June. If any trees grow too luxuriantly Mr. Mole adopts root-pruning, also the greatest care is taken in training the trees and thinning out flower buds when a heavy bloom is showing, and his treatment clearly shows that with good attention, and adopting proper methods, good fruit can be obtained even under very adverse circumstances.

The following are Mr. Mole's observations which I have referred to.—

"After twenty years' experience my opinion is that it is useless to attempt growing Pears in this neighbourhood on pyramids. A good bloom may be had occasionally, but this, as a rule, is destroyed by frost or ungenial weather, and even when a few Pears do set the chances are that the season will not be good enough to ripen them. If you have a sheltered garden and wish to try pyramid Pears, then Williams' Bon Chrétien is the only one worth planting, and under favourable circumstances the fruit from this, when you get it, will be very good.

"A south wall is the best, and for this I should recommend Beurré Diel and Doyenné du Comice. The former is an excellent

bearer, grows large fruit, and is a very good eating Pear. The latter is superior, the finest Pear I have grown, but it is much more shy in bearing than Beurré Diel. Durondeau succeeds, and Marie Louise I should also have. The latter will do, though not quite so well, on an east or west wall, and on such walls you can also plant Souvenir du Congrès and Jargonelle. Those named are ample and better than more, unless it is wished to grow a variety for experiment as I have done, and I could give a long list of Pears I have tried and thrown away after years of perseverance with them; good varieties, no doubt, in some parts, but useless here.

"I should have the Pear trees upright trained, as in No. 4 sketch in Rivers' catalogue, as by these you could cover the wall quicker, and as you can grow four trees where you would put one horizontal trained, there is a better chance of having fruit. Single cordons are also recommended, but I have not tried them; they, perhaps, have the advantage of being easier to manage.

"As to Apples for cooking these will do well as pyramids or bushes, and Lord Suffield, Ecklinville Seedling, and Cellini are what I should recommend, three sorts being ample. There may be many others equally good, but the above I know succeed. For dessert I must say the same as for trying Pears on pyramids. You may grow them to look at if you like, and this may satisfy some, but they are not, as a rule, worth anything for eating, being deficient in richness and flavour, therefore, I say, keep your pyramids for kitchen Apples. If a portion of a south wall can be given up two dessert Apples might be tried—American Mother and Cox's Orange Pippin (upright trained or single cordons), both excellent Apples for dessert when they come to perfection, which they probably would on a south wall.

"I need hardly say that success cannot be expected without giving care and regular attention to the trees in training, summer and autumn pruning, syringing, careful examination for destructive insects, and root-pruning when this is desirable. But it is a very pleasurable occupation, and one not difficult to acquire a knowledge of to anyone taking a personal interest in such matters, and looking after the trees themselves. My knowledge was gained in the first instance by reading 'Rivers' Miniature Fruit Garden.'—W. D.

### THE ORIGIN OF THE FLORIST'S CHRYSANTHEMUM.

[A Paper by the late Mr. Shirley Hibberd, read at the Centenary Conference of the National Chrysanthemum Society, November 11th, 1890.]

(Continued from page 521.)

IN our observations of garden favourites we learn that variation is subject to laws of which we know at least something, though it is but little considering the vastness of the subject. One thing we know, that the great law of like begetting like holds good here as in the rest of creation. Yet even in the most extravagant departure from types the law is illustrated, for when we can trace new forms to their parentage we find they represent their origin fairly enough, though perhaps in a way we could never have predicted. When the waggish soldiers at Scutari grafted the tails of rats on the snouts of other rats, and so got up a new species which they called the truncated or proboscis rat, they were not much more extravagant than the florists, only less honest, for the thing was a cheat, but a florist's flower, however far removed from its natural prototype, is a reality of Nature, and like the truncated rat when examined, reveals its origin. You see the variations of the Chrysanthemum are accomplishments of Nature in the first instance, but they represent the taste, fancy, or fanaticism—call it what you will—of man, because he takes pains to divert Nature from her wonted course, and as regards results will keep and perpetuate only what pleases him; and one consequence of this is that with all our wide range and great number of varieties, we do not possess all the materials needful to the inquiries before us, for in fact man would be sure to destroy the best evidences, which would be the varieties differing but little from the original types, and probably he would preserve nothing until he had obtained some very great remove between which and the type the connecting links were lost.

We have to make the best of the case as it stands. It may be said at starting that as regards form the flower presents fewer difficulties than as regard size and colour. The ray florets are drawn out to an extravagant length in the Spiderkry and the disk is contracted proportionately. It is the parallel of our elastic cord that served for an illustration of identity. The foundation of every group was imported. But the European cultivators have enlarged the groups and greatly improved the forms, and I use the term "improved" in full consciousness of all that it implies. But please observe how the florists have been working with Nature, and I may say under her dictation, without exactly knowing it. The incurved flower when perfect is absolutely sterile. In a cold climate this is possible, for cold causes the florets to curve inward, and suppresses

the organs of reproduction, so that ligulate and incurving florets are alone produced, and to expect seeds from such perfect florets is as vain as to look for lunar caustic in moonbeams. But warmth causes the florets to reflect or to curve outwards, and it favours the retention in the centre of the flower or capitule of a few tubular florets, and thus while in a warm climate it is impossible to grow the incurved varieties to perfection, the Japanese varieties attain to fine proportions, and to secure seed it is not only possible but easy. I know that seed can be produced, and has often been produced in this country, but you must permit me to deal with this subject in this broad manner or my story will have no end, unless, indeed, it makes an end of me. But observe that in the British Islands and the north of France, Belgium, and Holland, the incurved *Chrysanthemums* are well grown, and have much beauty, but in the south of France, and generally in the United States, the summers are too hot for them, and the more fantastic kinds that refuse to incurve with geometrical precision are the favourites, and the production of seed presents no special difficulty. Thus the favourites of the several countries have been determined by Nature much more than by man. A man may have longings for something he can obtain, but the regard that comes of familiarity is impossible. The longing for a rarity is very different to the love of a homely toy, and our intense admiration of the incurved flowers is in great part the consequence of the fact that our circumstances enable us to grow it to a high perfection.

The variations of colour are of great importance. There are but two colours in our flower, yellow and purple. Of white I say nothing, for it is simply the absence of colour; of yellow I will say that the *Chrysanthemum* attains to perfection of colour in yellow only, for in such a flower as *Jardin des Plantes* we have the purest yellow, and the colour is such as the artist would regard as perfect impasto, or a French florist might say "well ground in." You will say we have red, crimson, lilac, mauve, and so forth. I say these are all variations of purple, or they are mixtures caused by the intrusion of yellow, as in the colours we call orange, chestnut, and golden bronze. Upon the blue tone that is the basis of purple disappearing, the yellow steps in, and then we have brown, or bronze, in place of purple, but equally an impure secondary or tertiary colour, often very beautiful, and more so by association with its own green leaves. These do more for colours than we know of until the leaves are removed, and the flowers are put in bunches of one colour to look like Cauliflowers that have been dipped in a dye vat, and then are very gay, though destitute of beauty. And this purple, be it observed, is not well ground in. It is, in fact, not properly skin deep, and is rather a discolouration than a proper colour, for it belongs to the upper face of the florets, which on the under side are white, which causes the silvery turn-over of the incurved, and the curious gleamings of light in other varieties that show the under sides of their florets. I like the manner in which Mr. Norman Davis, in his paper on "Sports" read last year, speaks of these colours as "reflective." When a good distinctive term like this is proposed I make it a rule to adopt it, to prevent the manufacture of another, and the evils of collision that may ensue. He calls the purple tones reflective because they are not properly integral, and you may illustrate this by comparing the florets of a yellow variety with those of any other colour. There is no white underside in the yellow flower; the colour is integral, and it is the only colour that is so; all the others are superficial or reflective, and they illustrate the law of compensation in colours, for the purple is the complementary of yellow, and just the variation a yellow flower should aim at to keep within the limits of chromatic respectability. The law that appears to govern sports is one that affords direct hints of the origin of the *Chrysanthemum*. Mr. Norman Davis, arguing from the white basis of the rose and purple flowers, and the frequent occurrence of white flowers both in seedlings and sports, expresses his belief that the flower was originally white, and the supposition illustrates a remark by Mr. Burbidge, in his paper read last year at Chiswick, that our favourite is a kind of glorified Ox-eye Daisy endeavouring to become a tree. Madame Desgrange may be taken as an example of many instances. The original is white, and when immature it has a yellowish centre. If carefully examined it will be seen that this colour is akin to the green tint that occasionally appears in the centre of Lord of the Isles and other varieties while the flowers are young and disappears as they open out. But, however we may explain the yellow tint in the centre of Madame Desgrange, it certainly gives a hint of a kind of desire in the flower to become yellow, and this desire is gratified in *G. Wermig*. In like manner Lady Selborne has given a yellow sport; Beverley, Empress of India, Queen of England, Mrs. G. Rundle, White Globe, White Trevenna, White Cedo, and Snowdrop—to mention only a few out of many—have in like manner sported from white or blush to yellow; but there is, on the other hand, no instance of a decided

sport of a yellow to a white. Yellow flowers give deeper toned and bronzy sports, as, for example, Golden Annie Salter becomes Orange Annie Salter, the pure Yellow *Jardin* sports to Bronze *Jardin*; the white grounds are capable of anything known in the way of sports, for although we know of no sport from white to marone or chestnut, yet as the crimson is a reflective colour on a yellow ground, the white may first produce a yellow, and that may evolve the tone of red required for the chestnut. That sports have occurred most frequently in the incurved group is a fact demanding consideration. Is it because these are the farthest removed in form and constitution from the original type? or is it that, having been the most carefully cultivated and the most closely observed during a run of fifty or more years, the minutest variations of these have obtained skilled attention, while sports in other branches of the family have often passed unheeded to oblivion, in some cases not having been seen at all, and in many not cared for? It is impossible to answer these questions, but they are pertinent to the business before us, for the incurved flowers are in the most helpless condition of any of their family through complete sterilisation, and as they cast the burden of increasing their mere number on the cultivator, they take to a sportive habit to make amends for incapacity to vary through the agency of seeds? I offer these suggestions in all seriousness, for while we do not allow that plants possess volition, we are bound to assume that they possess it when endeavouring to sum up in brief the collective result of a complication of influences and circumstances. When we say that a garden flower casts upon its owner the charge of perpetuating it, that is like stating in the concrete that as cultivation renders it less fertile and less hardy, it must cease to exist as a subject for the florist unless assisted by the art that has shaped its form in a manner antagonistic to its welfare.

Passing from the comparatively trivial characters derived from colour, let us look a little closer into the plant. The small wiry *Liliputians* differ by many degrees from the large incurved varieties, and these again from the Japanese. The smaller kinds have thin much-cut leaves and small flower-heads of a chaffy texture, the florets very closely set, and the capitules as round as buttons. Seedlings of these produce a large proportion of yellow flowers, and often we find amongst them copies of the wild *Chrysanthemum indicum* so nearly identical with specimens obtained from China and India that cultivation appears scarcely to have changed it. The speculative cultivator must often have asked himself the question, Is it possible to obtain from any of these a proper incurved or Japanese variety? and after taxing his memory for the results of his own observations, and of reports current on the origination of well-known varieties, he would give a negative reply and dismiss the matter with the epithet, "impossible." But this *Chrysanthemum indicum* is the reputed parent of all our varieties, and there has been some robust faith shown in its pliability, or perhaps the declaration having been made at hazard has been accepted by one part of mankind for lack of a better explanation, and by another part in accordance with the schoolboy doctrine, that whatever is seen in print must be true.

But we have not been without witness to an explanation, possibly better. In 1792 Ramatuelle, in "Journal d'Histoire Naturelle," vol. ii., page 240, described the old purple *Kiku*, that was afterwards figured in the "Botanical Magazine," declared it to be distinct from the Linnæan *C. indicum*, and named it *Chrysanthemum morifolium*, the Mulberry-leaved *Chrysanthemum*—a quite appropriate name, for the leaf, especially as figured in B. M. 327, bears a striking resemblance in general outline to the leaf of the white Mulberry. At the Chiswick Conference Mr. W. B. Hemsley, F.R.S., directed attention to this point, and illustrated it by specimens recently collected by Dr. Henry in Central China. There is a slender form of the plant named *gracile*, and Mr. Hemsley named the plant obtained by Dr. Henry *vestitum*. He has since cancelled *vestitum*, and has assigned *gracile* a place as a slender variety of *C. morifolium*. This slender plant is found in North-west China, and its characters appear prominently in what we know as Chinese *Chrysanthemums*, more particularly those of the incurved and reflexed groups. The typical *C. morifolium* appears to show itself plainly in the Japanese group, the leaves of which are thicker and more downy, and the involucre bracts are often clothed with a fine pubescence. Maximowicz describes a plant as *morifolium* that cannot be accepted as such, and in respect of which there is not enough known to enable us to speculate upon it. But it appears that Dr. Henry has found the true *morifolium*, and that it answers admirably for a place in our charmed circle. The plant is robust, with thick leathery leaves, very variable in shape and degree of cutting, and clothed with a grey tomentum.

The case then stands thus as the result of the inquiry, that *Liliputians* and *Pompons* are garden forms of *Chrysanthemum indicum*, while the whole of the larger kinds (reflexed, incurved) and Japanese are garden forms of *Chrysanthemum sinense* (syn.

*C. morifolium*), the first two groups being descended from the variety *gracile*, the third from the true *sinense*, the most robust of all.

It must be observed here that the flower has certainly been cultivated in China three thousand years, and probably five thousand years, and we are absolutely without record of the manner in which the Chinese obtained it, but the actual vegetation of to-day in that country suggests the explanations that have been offered. Now, it must be admitted that the two reputed species, *indicum* and *sinense*, though for botanical purposes distinct, are so nearly related that the speculative mind is inevitably carried back to the time when one species became two through the influence of circumstances. The weaker *indicum* may have produced in travelling south the stronger *sinense*, but it is more likely that the stronger *sinense* in travelling north degenerated to *indicum*, and that a yellow flowered form proved itself the most capable of withstanding unfavourable influences; that, in fact, we have here a striking example of the survival of the fittest. Another separation gives us the *sinense* in a weaker form, bearing the name *gracile*, and thus we have three possible parental forms to generate the three great families—the Pompons, the incurved, and the Japanese, and they thus stand in proper order as to relative vigour and the magnitude of their several parts.

This view of the case establishes the unity afar off, of the three forms now known as occurring wild in China. We are to regard them as three forms of a species that as such no longer exists, having split up into these three sub-species or varieties. Call them what you will, the botanist must begin somewhere, and if he insists on calling them species, there is no reason in the world why we, who view things so differently should dispute with him. But even now the matter is not absolutely settled, for I am bound to return to the primary proposition and speak to that before I conclude.

You propose to me to declare the origin of the Florists' Chrysanthemum. Now the Pompon forms are not florists' Chrysanthemums. The Japanese are perhaps, the incurved certainly are, and for present purposes I declare this group to be Chrysanthemum *sinense*. If you ask in what, as regards origin, the incurved differ from the Japanese, I answer, The first are from the slender plant that is found in north-western China, and the Japanese represent the stouter plant that is found in the warmer zone. Here, then, in the original geography of the species we seem to have an explanation of the reason why our best reflexed and incurved varieties are so well adapted for cultivation in this country and in northern Europe generally, while the Japanese are more at home in the south, and with us are less hardy than the others. The first and hardiest group represent the north-western *gracile* form of *C. sinense*; the more vigorous and less hardy Japanese represent the true *morifolium* or Central China form of *C. sinense*; and thus we establish our florists' Chrysanthemum as of pure descent, its innumerable varieties being of its own making, and all of them being descendants of a white-rayed flower capable of sporting to yellow, and by reflective sports producing all shades of colour while avoiding the two primaries, pure red and true blue. That we shall ever have these colours is quite unlikely, and if the theory of the flower now presented is a sound one, it may be said in a word that to hope for red or blue is but a forlorn hope, and may with advantage be abandoned.

### BRIGHTNESS IN WINTER.

Now that Chrysanthemums, which so well relieve the gloom of November and early December, are practically over, what are their most varied, bright, and lively successors in the floral world? Are they not Zonal Pelargoniums? We know what is the answer of at least one who has done so much to improve and popularise these flowers—namely, "Come and See." I have for the first time been to see Mr. Cannell's Zonal Pelargoniums in winter, and they have placed me in a rather difficult position. If I were to fully and faithfully record my impressions they would be suggestive of exaggeration, whereas I know how incapable I am of representing the collection fairly, and doing justice to the claims of the several varieties now at the zenith of their beauty. It may be that many gardens have been overdone with the bright masses of Pelargoniums in summer, when relief from their fiery glare is refreshing, but in winter the case is different. "Warm" colours then are instinctively sought for, and they are provided in Zonal Pelargoniums. But all the varieties are not dazzling, for there are whites and neutral tints which in themselves are charming, and which enhance by contrast the brilliancy of glossy scarlets, glowing crimsons, and rich magentas, with which they are associated.

Until seeing the Swanley collection on a sharp winter's day, with snow covering the ground a foot deep, and driving in wild eddies everywhere giving one the shivers, I had no idea that the

plants in question were capable of such development in the dull season of the year. When stepping from the snow into one of the Pelargonium houses it was a veritable transformation scene. We have startling and dazzling changes in Christmas pantomimes, but not one has been produced to equal that just mentioned, and it was somewhat of a pity one of the great "spectacular" artists was not there that day to take a lesson from Mr. Cannell. The winter was forgotten in a moment, the shivers vanished, and all was warmth and beauty, more gladdening than could be produced by flowers on a summer's day.

Winter is the time for appreciating the full beauty of Zonal Pelargoniums without a doubt when revealed as at Swanley. But for producing such an effect as is there displayed three conditions are requisite—namely, good varieties, good culture, and good houses. A combination of these three "goods" gives a grand result. Good varieties consist of stout sturdy growers, which when justice is done to them throw up flower stalks like pipe stems, and bear heads of bloom like Hydrangeas. Good culture consists in growing the plants generously throughout their career in the fullest light when under glass in spring, and in the open air through the summer, giving nourishing stimulants judiciously for the production of thick leaves, which store flower-forming matter in the stems, and keeping it there by the suppression of buds till the time arrives for placing the plants under glass in the autumn. Good houses are those in which there is the least obstruction to light, every ray of which is needed in winter, and in which a temperature of from 50° to 55° or 60° can be easily maintained in severe weather.

It may be assumed that practically all gardeners can grow the plants, as can many amateurs, while the inexperienced who desire to do so can soon learn, as there is neither difficulty nor mystery in the matter, and they can mostly contrive to secure plants; but all who grow them do not succeed in producing the grand winter display that was expected. The varieties are then blamed, or perhaps writers are for overpraising them; but the fault is not there, for the sufficient reason that the best are so good that they cannot be overpraised. When the plants are well grown through the summer on the lines suggested and fail to flower satisfactorily in winter the misfortune is directly traceable to an insufficiency of light or warmth, or both, for continuing the growth steadily and sturdily. When the conditions are such as to insure this flowers are bound to follow. The plants have been trying to flower for months, but were prevented by the removal of the buds; but at last they are afforded a fair chance—are given the reins, so to say—and burst out into a blaze of beauty. That is their condition at Swanley in three large houses, which anyone who can do so may "go and see."

Where conveniences are not afforded for flowering Zonal Pelargoniums in winter the best varieties are now so fine, distinct, and many of them novel in colour, that they are worthy of being grown anywhere and everywhere for flowering under glass in spring or at any time. They are far too good for growing outdoors, are easy to manage, and seldom troubled with insects. But which are the best varieties some readers may be wanting to know. I can tell which I think are some of them. Of the brand new ones to "come out" in the spring the following compelled admiration; they are all single—Lady Brooke, delicate pink and white; Mr. Robert Cannell, the deepest salmon; Lord Rosebery, crimson, white eye, very fine; Maud of Wales, purple pink, fine form, one of the largest flowers yet seen; Lord Salisbury, a grand variety, magenta, purple shaded; Brilliantissima, crimson scarlet, very bright; Sunray, orange, the largest of its colour; and Hercules, scarlet, extra large pips. The following singles are in commerce and now flowering splendidly:—Beauty of Kent, mottled salmon; Cannell's Favourite, light magenta, large white eye; Parker's Favourite, reddish scarlet, very large truss, extra fine for winter; Mrs. Wildsmith, the largest rose pink in flower and truss; Winkfield Gem, rosy scarlet, very distinct and attractive; King of the Purples, very large trusses and distinct in colour; H. Cannell, jun., deep crimson, very dwarf and free; Swanley Single White, the purest white; Souvenir de Mirande, quite a novelty in Zonals, shrimp pink, bluish white at the base of the top petals; N. V. Noulans, of the same type as the preceding variety but deeper in colour, very distinct and effective; Stella Massey, blush white, and as the ladies say, "sweetly pretty;" Mrs. Norman, mottled salmon, enormous truss; Launcelot, one of the best scarlets, grand trusses, very free.

As a few of the finest and new double Zonals the following may be named:—Turtle's Surprise, a sport from F. V. Raspail, but much freer in flowering, habit like West Brighton Gem; Californie, orange shaded, very distinct; Silver Queen, the best white yet produced; Beauté Poitevene, semi-double, but very large flowers of a salmon shade; Sombre Horizon, the finest deep crimson; Salamander, light shaded purple, fine trusses; Tendresse, delicate pink, a great favourite; Nydia, mottled salmon,

deep centre, very dwarf; M. Bruant, scarlet semi-double, a very fine winter variety; and Girome, very deep purple pink.

I am vain enough to think the above is the best selection of Zonal Pelargoniums that has been published in the Journal, and if I had all the varieties flowering in my greenhouse as they flower at Swanley I might be compelled to express my admiration as Mr. Cannell did his, when he gave them a parting glance as if loth to leave them. "Ah! beautiful, indeed; beautiful, beautiful, beautiful!"—FLORA.

#### JUDGING ROSES.

I BEG to enclose copy of a card which I have prepared, and would suggest that it be used in judging Roses and Chrysanthemums, &c., in close contests and keen competitions for valuable prizes. The judging is sometimes very unsatisfactory that something of this kind is much needed. The plan will probably be open for discussion. I hope you may bring it before your readers, so that exhibitors can give their opinion regarding it.

The advantages of the card are:—1, Exhibitors would at once see their exact position, and find out their weak and strong points, which would often save a deal of trouble and bad feeling amongst exhibitors and judges. 2, Young exhibitors would see what to aim at in selecting flowers for exhibition, and it would also teach them how to judge correctly. 3, A better idea of the show would be conveyed in the newspaper reports to those who cannot attend by having the number of points given to each exhibit. One season's show could be correctly compared with the other, and see exactly what progress was being made by referring to number of points given.—WM. R. COCKER.

[The card for thirty-six blooms is designed as follows:—There are three rows of squares of twelve each, with three end squares for the total of each row. There is another square for the extra points given for arrangement and superior staging, with a fourth for the grand total. Then there is a space for the judge's signature under the statement, "We hereby declare having judged these Roses carefully and to the best of our ability;" and a space for the secretary's signature completes the card, which measures 9½ inches long by 6½ inches wide. At the National Rose Society's meeting recently the subject was introduced, and one member said he would like to know what would be the size of a card for seventy-two Roses.]

#### LOCAL ROSE EXHIBITIONS.

THE readers of the Journal must be very tired of this correspondence, and for my part this will be my last letter on the subject. "An Exhibitor" refers me to two passages in his and "J. B.'s" former letters. With regard to his own reference, I have examined the N.R.S. Birmingham schedule, the names of the prizewinners as recorded in the Journal, and my own recollection, and do not understand to what he alludes. "J. B.'s" contention was, I think, fully answered. The Gloucester schedule shows perhaps rather more of a leaning to free trade in Division C than that of most other provincial shows; I have no doubt the Committee of that Society are well able to defend it. I did not, I think, suggest that the N.R.S. schedule "could not be improved;" but "An Exhibitor" gives an instance—"Will I tell him whether there are any restrictions that would prevent Mr. Lindsell or Mr. Pemberton from showing in any of the classes of the F division if they thought well?" I should rather think there are. I do not say it is rendered impossible for them, any more than it is impossible for the heir to a peerage and large estates to renounce them and set up in business as a chimney sweep; but there certainly are restrictions to dissuade him, and it has not been found necessary hitherto to pass a law to prevent it, for the sake of the sweeps.

As to the quotation from the "Rosarian's Year Book," "An Exhibitor" says I "omitted to mention" a passage. On the contrary I begged those who are interested in this correspondence to "read the whole." I wish I could get him to understand. Undoubtedly the late Mr. Frere's object in the passage in question was "to encourage the small growers;" but to do this, by trying to get them to raise their own standard, not by holding out any hopes of the standard being lowered for their benefit. The "neighbour" mentioned in the little anecdote in question is, in my opinion, one of the best judges and exhibitors in England, though his soil is so very bad that he never could do much with H.P.'s. He was encouraged by Mr. Frere, and by the accident of winning an extra prize for a single exceptional Marie Rady, exactly in the way in which I am now trying to encourage "An Exhibitor" to show more pluck and independence. Surely it is not supposed that he had extra classes arranged for him, or that his energy and determination would have been unavailing if it had not been for that one flower?

It is true he had, and still has, I believe, "a head with something in it;" but I cannot fail to credit "An Exhibitor" also with this

endowment. Let him also have his heart in the right place, and with patience and perseverance (but not without them) he may confidently look forward to having a "pocket with something in it" as well.—W. R. RAILLEM.

#### VEGETABLES IN AND OUT OF SEASON.

VEGETABLES in season, no doubt, most readers of the Journal are concerned in, but this may not be true of those not in season, for the reason that only under exceptional circumstances and conditions are they produced, so that it does not become a question involving more than a casual interest. In gardens fully equipped, both as regards labour and appliances, it is possible to have vegetables that are not considered seasonable throughout the autumn, winter, and spring months, and in establishments where such are provided it not infrequently becomes a matter of course proceeding rather than the opposite, and the luxury held in much less high esteem by the great and affluent families than by others of more moderate wealth where such are presented.

Those that might be considered in one, though not in a general sense unseasonable, would include French Beans, new Potatoes, forced Asparagus, Turnips, Carrots, Cauliflowers, and Seakale. It is admittedly a very pleasant experience to be favoured with an indefinite supply of such at almost any time, and their production should, and do generally, merit appreciation. French Beans are foremost among the autumn forced vegetables, and their growth, where a large supply is required, entails a considerable amount of labour, and it is the general rule in large gardens for these to be ready for use in pots by the time the outdoor supply is cut off by frost. Such work as concerning the garden might be greatly minimised by salting down selected surplus pods during the summer. These certainly are not popular in the kitchen, as they require much time in passing them through several courses of clear water so as to free them from the salt, and they are also from their flaccid character more difficult to prepare for cooking—hence their objection with the cook.

Young tender Carrots are easy enough to procure at almost any time where frame accommodation is plentiful, which in winter and early spring provide a choice and delicate dish; and the same remark applies with some truth to Potatoes, although these are not so commonly grown for an autumn and early winter supply as Carrots, or Beans. Seakale and Asparagus demand, perhaps, more general attention than any I have enumerated, and are always greatly prized in winter and spring. The old method of forcing Seakale by means of pots and stable manure is not so generally practised as formerly, because the present system of growing a fresh stock of crowns from their thong-like roots annually provides a superior sample, and is less laborious in attendant cultural requirements. The forcing of Asparagus requires a good deal more time and space than Seakale, and a thorough system of procedure must necessarily be observed and practised. Only by an annual sowing or planting in spring can a yearly demand be met with strong roots suitable for forcing. Under good culture two or three seasons are required to bring up to this desirable stage of development, and cases are not uncommon where the ordinary or outdoor supply thwarts the intentions or ambitions of many intelligent men holding responsible positions, although now that culture from seed is more generally adopted obstacles of bygone days are yearly becoming less. Dang beds are requisitioned by some for the forced supply of this popular vegetable; but greater ease and certainty is secured by modern water-heated structures, because proper temperatures are better and more under the control of the attendant than manure-heated bodies usually are.

Turnips lose much of their bolting tendency when sown under glass in spring. If it were not so they would be scarcely worth the trouble such work entails, and where frame accommodation is plentiful Turnips ready for use may be had almost by the time it is safe to sow outdoors. With similar convenience the autumn outdoor sowing and winter treatment of Cauliflowers may be altogether dispensed with; the late varieties of Broccoli now in cultivation making it a more simple matter to supply Cauliflowers without the occasion of any approach to a prolonged interval by an early spring sowing to be planted either outdoors or under frame protection absolutely. Collections of vegetables form an interesting, important, and sometimes imposing feature at many of the autumn Chrysanthemum shows; when even at this early date, forced vegetables go a long way in deciding their respective merits, sometimes perhaps to the exclusion of more useful because seasonable displays. Seakale and Asparagus, too, are valuable adjuncts to the early winter list, but I am inclined to agree with the many expressions of competitive and non-competitive individuals I have often met as to the undesirability of such labour creating produce figuring prominently in early November exhibits, because it would be few who would appreciate such at the table at so early

a date. Moreover, if it were so, a large store would be required to meet an uninterrupted succession, and instances are not too common where the labour allowed in gardens provides sufficient margin for so early a start in the forcing of vegetables, more particularly Asparagus. The man of small conveniences is strictly handicapped in public competition when he has to meet these unseasonable products in the first and second weeks of November. Some such restrictions as pertain to fruit collections where Pine Apples are excluded are needed in this case. These supply a chance to the fruit exhibitor very similar to that of Asparagus or Seakale to the vegetable competitor in early November, and a fair and equitable basis for fruit growers as supplied in the exclusion of specified species in the schedule stipulations of many societies should be meted out in a similar manner in vegetable contests.

Everyone connected with gardening pursuits must agree that to produce creditable samples of the two kinds at the date I have pointed out requires energy and foresight on the part of the grower, and must necessarily bring with it high commendation; but while admitting this, the fact remains the same, that only the man in possession of convenience and time can supply these edibles thus early, and abundant material from which to make a representative collection can be had without resort to these at autumn exhibitions or at the table. To supply an enforced demand for home use would in many cases meet with a reasonable objection; unless, of course, the desirable convenience and time were freely provided, and even then there is some doubt of their being ready at such an early time with certainty, because the ripening of the foliage and crowns depend largely on the nature of the season. However, with due encouragement there are but few men who will not strive to meet all wishes in the matter of forced garden productions, especially for special events or festivities.—W. S.

WINTERLY WEATHER of a severe character has prevailed in the London district during the greater part of the past week. On Saturday a dense fog pervaded the suburbs, and later in the evening this partially cleared, and a rapid fall in the temperature ensued, several records from low districts showing 20° below freezing point. On Sunday the trees and shrubs were loaded with a beautiful hoar frost, which lasted throughout the day, the temperature standing at about 16° until night, when it fell a few degrees lower. On Monday there was a rise in the temperature with snow, but frost continued both on Monday and Tuesday. In localities further south the frost appears to have been more severe. A gardener at Rehill, Surrey, informs us that every morning for a week the thermometer registered 20° of frost, and wonders if any other gardener can remember a week of greater severity. Mr. Molyneux, writing from Hampshire, says that Aucubas, *Ligustrum japonicum*, and Myrtles look as if parboiled, but on the same wall as the Myrtles *Coronilla glauca* appears uninjured. We suspect this plant is more hardy than many persons suppose.

— GARDENERS' ORPHAN FUND.—I beg that you will allow me through the columns of the Journal, to call the attention of gardeners in Chertsey and the surrounding district to a grand evening concert to be given in the Constitutional Hall, Chertsey, on January 22nd, in aid of the Gardeners' Orphan Fund? I should be glad of any help in the way of decorating the hall or in the sale of tickets, or making the concert known. The well-known singer to gardeners, Miss Mary Belval, and other popular vocalists in the district, have promised to assist. All that is wanted is the hearty co-operation of those interested in horticulture. May a good balance be secured for the Fund.—A. J. BROWN, *Hon. Local Sec., School of Handicraft, Chertsey, Surrey.*

— THE following are the arrangements of the ROYAL BOTANIC SOCIETY for Shows and meetings at Regent's Park in 1891:—Spring Exhibitions: Wednesdays, March 18th and April 22nd. Summer Exhibitions: Wednesdays, May 13th and June 17th. Evening Fête: Wednesday, July 8th, 8 to 12 P.M. Promenades: Wednesdays in May, June, and July, commencing May 6th; Exhibition and Fête days excepted. General Meetings, for election of new Fellows, scientific

discussions, &c., Saturdays, at 3.45 P.M. January 10th, 24th; February 7th, 21st; March 7th, 21st; April 11th, 25th; May 9th, 23rd; June 13th, 27th; July 11th, 25th; November 14th, 28th; December 12th. Anniversary, Monday, August 10th, at 1 P.M.

— HORTICULTURAL CLUB.—There was a large attendance of members and their friends at the Club rooms, Hotel Windsor, Victoria Street, Westminster, on Tuesday evening. The chair was occupied by Mr. John Lee, and there were present the Rev. W. Wilks, the Rev. F. R. Burnside, Rev. F. H. Gall, Messrs. Girdlestone, H. J. Pearson, A. H. Pearson, George Mount, Wallis, Jeffries, H. Turner, E. B. Lindsell, Geo. Paul, G. Paul, jun., T. Francis Rivers, W. H. Williams, &c. In the evening a discussion took place on the subject of Rose Stocks, which was opened by Mr. T. W. Girdlestone with an exhaustive paper, in which he gave an account of some experiments he had made, and stated that he believed the Polyantha would be one of the most useful stocks of the future. An instructive discussion, in which Messrs. Rivers, G. Paul, and others took part, and a pleasant and profitable evening was brought to a close with a vote of thanks to Mr. Girdlestone for his excellent lecture.

— A DWARF TROPEOLUM.—The variety we grew here last year, and so favourably noticed by your correspondent in last issue of the Journal, was sent to me by a friend in the neighbourhood of Liverpool, who, I understood to say, selected it from some seedlings. From what these originated I am unable to say. It is indeed an exceptionally free flowering, dwarf variety; the colour is a remarkably bright scarlet, which was intensified by the position in which our plants were growing last year in the garden, in front of a long row of a dwarf white *Ageratum*, and being in a sunny spot had all in its favour to produce splendid results. I know of no plant so dwarf that can produce such a mass of colour for so long a season as this *Tropeolum*.—E. MOLYNEUX.

— FRENCH LETTUCES.—In reply to an inquiry published in the *Journal of Horticulture* of the 27th ult., page 470, I beg to say that "blonde géante" is the French name for the Blond Blockhead Lettuce. That Lettuce is one of the best varieties introduced for many years; its head is very large, a little depressed, firm, and a good keeper; the outer leaves are large and ample, finely curled and undulated at the edges, spreading on the ground. In general appearance it resembles very much the well known Neapolitan Lettuce, but differs entirely from it by the colour, which is much lighter, and is a pleasing white instead of a very pale whitish green. It is, in fact, a fine and excellent summer Lettuce, which is very much in favour now with the Parisian market gardeners. We have had 12° Cent. (22° Fahr.) of frost on December 15th, and the Seine presents a very curious appearance with its floating ice. The steamboats do not run.—E. SCHAETTEL, *Paris.*

— THE NATIONAL PINK SOCIETY (MIDLAND SECTION).—The following is the substance of a letter received from Mr. Chas. F. Thurstan, Hon Secretary *pro tem.*, Penn Fields, Wolverhampton:—"Following the successful exhibitions of florists' laced Pinks held this year at the Aquarium for the southern section, and the Botanical Gardens, Manchester, for the northern, it was suggested that a Midland Show should be held in connection with the Wolverhampton Floral Fête, July 14th, 15th, and 16th, 1891; and this having been taken up negotiations were opened with Mr. Green, the President of the Wolverhampton Horticultural Committee, with the result that he has consented to find the necessary tent space for exhibiting the Pinks, and also to recommend his Committee to contribute towards the prize money."

— A CORRESPONDENT in Florida writes as follows to the American Cultivator:—"The Loquat (*Photinia japonica* or *Eriobotrya japonica*), a half-hardy evergreen tree, growing to a height of about 20 feet, and belonging to the Rose family, is cultivated in Florida and California to a considerable extent. The white fragrant blossoms are disposed in terminal corymbs, below which spread the thick, leathery, shining, lanceolate leaves. The subsequent fruit, growing in Grape-like clusters, is ovoid in shape, as large as a medium sized Plum with a thick skin of a dull pinkish colour. The flavour varies, in some instances being too acid to be eaten with any degree of pleasure, but is more often sub-acid, or sweet and agreeably palatable. The blossoms appear chiefly during November and December, and the fruit ripens from February until May. Most of the stock used for planting here is seedling, although some of the choicest stock has been budded on the "Giant," an imported variety. The tree has been cultivated for many years in the gardens of Southern cities, but the seed from which most of the stock in this

State has multiplied came from St. Augustine. There are several variations in shape, habit and flavour, and careful selection will undoubtedly greatly improve the value of the fruit, especially if increased culture opens a northern market. The carrying capacity of the fruit is better than that of Cherries and Peaches, and its uses more varied. A few bunches with their shining green leaves are a very ornamental addition to a dish of dessert fruit. Besides being delicious eaten raw they make a jelly and sauce more piquant than Currants and Cranberries, and pies that recall and vanquish the memory of Cherry, Apple and Peach combined. The chief drawbacks to their culture are depredations of crows and mocking birds."

— WELLS (SOMERSET) CHRYSANTHEMUM SHOW.—In case you may like to insert it in your Journal, our 1891 Show is fixed for Tuesday and Wednesday, the 3rd and 4th November next.—ALBION G. ANDREWS, *Hon. Sec., St. Cuthbert's Lodge, Wells.*

— THE BRIGHTON AND HOVE CHRYSANTHEMUM SOCIETY.—We are informed by the Secretary, Mr. Mark Longhurst, that the recent Show was a great success. 9494 persons paid for admission at the doors, the receipts being over £324. This Show is an exceedingly well managed one in every respect, and both the Secretary and Committee are to be congratulated on the result.

— THE COLD WAVE OF DECEMBER 13TH AND 14TH.—A cold wave passed over us here during the end of last week and the beginning of this. On Saturday afternoon, between three and four o'clock, a thick, dark, low-lying column of smoke-like vapour, and not very wide, for it was clear on the north, south, and east, came up from the west, looking, as it might be, smoke from a heavy fire somewhere. The wind was east at the time, but it gradually came on and spread. It was so thick that we could not see the boles of the trees in the park, nor half their heads, but their tops were clearly visible. It passed on and away into the valleys, and remained so during the evening. Here and the higher parts of the town of Nottingham the fog and darkness was only ordinary, but in the lower parts of the town the fog was almost unpenetrable, and traffic became dangerous, and in some cases stopped.

— THE thermometer gradually went down, at 10.30 P.M. there being 16° of frost. The centre of intensity appears to have been from about midnight to 8 A.M. on Sunday morning, when 20° was registered. It rose very slowly to 9½° about 2 o'clock P.M., when it again began to decline, and at 10.30 P.M. there was 17° of frost. At 6 A.M., Monday, there was 12°, the ground being covered with a thin sheet of ice, showing that there must have been a slight shower in the night, and the wind was south-west and west. Now, at 2.30 P.M., the thermometer stands at 33°, 1° above freezing, and a little sleet is falling. Whether the wave will pass away without a downfall of snow we cannot yet tell. The barometer is declining, and downfall of some kind will undoubtedly come.—N. H. POWNALL, *Notts.*

— LIVERPOOL HORTICULTURAL ASSOCIATION.—Last Saturday a good attendance of members met together at the William Brown Street Museum to hear a paper by Mr. H. Ranger of Messrs. Ker's, Aigburth, entitled "Plant Culture under Glass and Insect Pests." Mr. White, the Chairman of the Association, presided. Mr. Ranger dealt with his subject in a very practical manner, dwelling chiefly on the importance of keeping plants clean, and the insects plants are most subject to, also the different remedies for their successful eradication. Many remedies were put forward, but Mr. Ranger placed confidence in paraffin for bug, fumigation for thrips, and sulphur for red spider and mildew, each to be used in proper proportions. Fir tree oil was also mentioned most approvingly. Those who entered prominently into the discussion after the reading of the paper were Mr. Tunnington, who had found beneficial results from the use of Campbell's fumigating insecticide, and Messrs. Bennett and Cox. The proceedings terminated in the usual manner.

— BEGONIAS INSIGNIS AND NITIDA.—What useful Begonias these are, either for a greenhouse or stove. The former is excellently adapted for pots, its bright green leaves and pretty pink flowers render it particularly striking at this season of the year. We take cuttings of this as early as possible in the new year, and they strike freely in any sandy soil, and, if placed in a warm propagating case, they will be rooted in about a fortnight's time. A compost of three parts loam, with good leaf mould, sand and charcoal added, suits them admirably, and we put three plants into a 5-inch pot. They are then placed in a warm, moist atmosphere, and the points of the shoots taken out when they have reached a height of 6 or 8 inches. At the beginning of April they are

placed into pots 3 inches larger, using the same material for potting, and are staked neatly out. As the weather becomes warmer we move them into frames, where they remain during the summer months. With this treatment they readily respond to the warmth of the greenhouse when placed indoors again, and a wealth of bloom is assured. Not only are the plants most ornamental, but the flowers come in when they are highly valued. In vases where the flowers are allowed to droop over the edges this Begonia is delightful in its effect, and is most pleasing by gas-light.

— BEGONIA NITIDA may be treated in a similar manner if grown in pots, but it is when planted out that it displays itself to the best advantage. Many who have vineries are often puzzled what to clothe the back walls with. In some establishments there is no need to cover them, but to others a wall 6 or 7 feet high is a great objection. Of course many more plants can be brought forward as suitable for such positions, but as the one under notice has answered our expectations so well I thought a note, for the benefit of those who have not tried this Begonia, might not be out of place. A few years ago we had planted on the back wall of our early vinery a double Hibiscus which covered the wall. True it answered the description as a covering, but it rarely flowered, and was oftener covered with green and white fly, which no fumigating or syringing would thoroughly exterminate. It was rooted out and the border remade. Two old plants of this Begonia which were getting rather too large were knocked out of the pots and transferred to the border and the growths tied to the wires. The plants soon began to revel in the new soil, and at the present time completely cover the wall. They are in flower, more or less, all the year round, and the flowers are most valuable. Apart from the flowers, the large glaucous leaves are at all times an ornament in themselves.—R. P. R.

— ON Wednesday, December 12th, the members of the EAST ANGLIAN HORTICULTURAL CLUB held their monthly meeting at the City Arms, Norwich, the President, Mr. Morris, of Witton, occupying the chair. The business of electing a Chairman, Vice-Chairman, and eight Committeemen was first proceeded with, and in the case of the two former they were re-elected for the ensuing year. The former Secretary having left the city recently it was necessary to choose another in his place. The Chairman (Mr. Morris) proposed, and Mr. Ives, The Gardens, Rackheath Park, seconded, that Mr. Upstone, although a stranger to them and Norwich, should be elected Secretary. He believed he had had some experience in the working of a society such as this, and so would be very helpful. Carried unanimously. Mr. George Daniels then read the first of a series of papers on "Ancient and Modern," which was full of exceedingly interesting notes, and had evidently been compiled with a great amount of thought and research. The same gentleman was also unanimously re-elected Hon. Treasurer. It may be remembered that the newly appointed Hon. Secretary until recently represented the firm of Messrs. Peed & Sons, of Norwood. He is now with Messrs. Daniels Bros., and resides in Norwich.

— THE BIRMINGHAM GARDENERS' ASSOCIATION.—At a fortnightly meeting on the 15th inst., a very interesting paper on "Evergreen Shrubs, &c., for Autumn and Winter Decoration" was read by Mr. Petch, formerly the head gardener at Manley Hall, Manchester, and for many years one of the travellers for Messrs. Rd. Smith & Co., Worcester. Much useful information was given, especially in lists of the most prominent kinds of golden and silver variegated shrubs and Conifers, as well as the better class of evergreen shrubs. Amongst berried plants Mr. Petch noticed the best varieties of Aucubas, Pernetyas, now several bright coloured varieties, Skimmias, Cratægus, Pyracantha Lelandi, and Vaccinium vitis-idaea. Low-growing shrubs most suitable for window boxes and small beds were mentioned. Hardy herbaceous plants were fully noticed, especially the evergreen trailing kinds for carpet work, silver coloured forms being also named and described with treatment most suitable to them.

— A CHRYSANTHEMUM SOCIETY FOR CIRENCESTER.—A well attended meeting to consider the advisability of instituting a Chrysanthemum Society for Cirencester, was, says the *Wilts and Gloucestershire Standard*, recently held at the Fleece Hotel. The meeting was the outcome of correspondence on the subject that has recently appeared in our columns, though the idea had been previously entertained by a few gentlemen interested in floriculture. Mr. Rawlins was voted to the chair, and amongst those present were Messrs. C. Mackinnon, H. L. Cooke, C. Smith, W. Griffiths, S. F. Hamper, Jesse Smith, A. Tranter, H. F. Sare, W. H. Cole, Job Saunders, G. Dash, C. Bennett, T. Gardner, A. Wall, T. Arnold, O. Orpett, D. Elkins, &c.

The Chairman having briefly opened the proceedings, it was proposed by Mr. Hamper, and seconded by Mr. Jesse Smith, that a Society be formed for the encouragement of the growth of the Chrysanthemum in Cirencester, and the motion was unanimously carried. It was also decided, on the motion of Mr. Cole, seconded by Mr. Gardner, that the Society be entitled "The Cirencester Chrysanthemum Society." It was unanimously agreed to ask Earl Bathurst to become President. Mr. Rawlins was elected Treasurer, and Mr. Sare Secretary. It was resolved that the membership of the Society be confined to subscribers of half a guinea and upwards. It was decided that a Committee of nine be appointed to act with the President, Treasurer, and Secretary, to carry out the rules of the Society, and the following were elected:—Messrs. E. C. Sewell, H. L. Cooke, W. J. Jefferies, G. H. Harmer, S. F. Hamper, E. Darby, T. Arnold, O. Orpelt, and D. Elkins. It was decided that the Committee should meet and draw up rules, and have a general meeting in January, and it was also agreed that the Committee should have power to add to their number.

— THE ALMANACK SEASON. — Messrs. Foster & Pearson send us from Beeston the usual useful series of twelve monthly sheets for 1891. The dates are very clear, and each sheet contains reminders on subjects in which gardeners are interested. These sheets are well adapted for hanging in seed rooms, offices, or other positions that may be convenient for reference.

— THE BIRMINGHAM CHRYSANTHEMUM SOCIETY. — The customary annual dinner of the Society took place on the 10th inst. at the Colonnade Hotel, and the large dining-room was well filled. Mr. W. B. Latham, Curator of the Botanical Gardens and Chairman of the Committee, was in the chair. The toast of "Success to the Society" was proposed by Mr. R. Parker, The Gardens, Impney, who alluded in terms of praise to the liberal prizes offered by the Society, and to exhibitors, and said that this year he had not been an exhibitor as he was desirous of trying his strength at the Exhibition of the National Society at the Royal Aquarium, and that next year he hoped to be again an exhibitor at Birmingham. Mr. Lambert, The Gardens, Onslow Hall, Shrewsbury, the winner of the £20 prize at the late Show for 48 blooms, replied to the toast of "The Successful Exhibitors," and alluded in very favourable terms to the excellent exhibits generally at the recent Show. The local nursery and seed trade was well represented, amongst them Mr. H. Pope, the founder of Messrs. Pope & Sons' Nursery and Seed Business, and in excellent health and spirits.

— FLORAL DECORATIONS.—The *American Garden and Forest* gives the following account of their elaborate floral decorations:—"On the occasion of a ball recently given in the club house at Tuxedo Park the decoration of the ball-room was entrusted to an expert, who, nevertheless, is not a florist—Miss Stearns, of the Associated Artists of 115, East Twenty-third Street. The result proved that something might be done in the way of floral decoration which would lack the conventionality that so often marks such arrangements without falling into the heterogeneousness of amateur attempts. The room is very large and circular in shape, with fourteen windows alternating with fourteen columns which sustain the cornice. On one side is a stage where the musicians were to sit. This was decorated in harmony with the pretty woodland scene which formed the background, high Palms flanking the side, while a row of lower Palms, mingled with Chrysanthemums, bordered the stage, and trailing Ivy fell over the front. Chrysanthemums were also intermixed with the taller Palms, in three shades of pink, making a charming effect as the electric light shone up over them from the foot-lights. This scheme was continued around the room by banking the window recesses with Hemlock boughs and great sprays of white Chrysanthemums, the dark green foliage being carried up into the coves of the domed ceiling. The columns were covered with autumn foliage, Oak leaves of a dark reddish bronze colour forming the base, and being shaded gradually up into terra-cotta tones and finally into the yellow of Maple foliage. On this background Chrysanthemums were arranged, likewise in graded colours, beginning below with dark red blossoms and shading up to the capitals, which were encircled by masses of golden Grandiflorums. To obviate, however, an undue contrast between these red and yellow pillars and the pink and green of the stage, the two columns adjoining these were differently treated, being wound with Hemlock foliage interspersed with white Chrysanthemums—the same scheme of colour chosen for the window recesses. The total effect of the beautiful room thus adorned was at once dignified and festal, and—an essential consideration in such cases—it made an excellent background for the gay dresses which filled it."

— ROYALTY AT READING.—The famous Berkshire town was *en fête* last Monday, on the occasion of H.R.H. the Prince of Wales installing the Duke of Clarence and Avondale Grand Master of the Freemasons in the county of Berks. They were accompanied by the Duke of Connaught. The town was gaily decorated, the bells pealed continuously, and the streets were thronged with people who desired to do honour to the popular Prince and the other members of the Royal Family who were present on the occasion. No other building in the town being large enough for the banquet Messrs. Sutton & Sons were requested to grant the use of one of their agricultural seed stores for the occasion. This was transformed into a handsome banqueting hall, and easily accommodated the six hundred Masons who sat down. The room and lengthy approaches thereto were beautifully adorned with plants and flowers, a thousand plants each of Primulas and Cyclamens being conspicuous by their colours and floriferousness. In the corridors the plants were arranged on mossy banks, and the tables were also attractively furnished. In front of the Royal Princes a number of crimson and white Cyclamens, Vulcan and Sutton's White, were arranged in panels—a veritable flower garden of the masonic colours. The Royal visitors were received by the founder of the firm, Mr. Martin Hope Sutton, and the present senior partner, Mr. Martin John Sutton, and conducted to the banquet. Visitors not being Masons, including the Mayor of the town, were entertained to luncheon in the Lecture Hall. Before his departure the Prince of Wales sent for Mr. Martin J. Sutton, and specially thanked him for the completeness of the arrangements which were so successfully carried out. On the following day the employés of the firm, with their wives, to the number of six hundred, were entertained in the building in honour of the event.

#### GOODRICH COURT.

THE Wye valley is famous for its beautiful scenery, and situated on a lofty eminence commanding some of the most lovely views stands Goodrich Court, the seat of H. C. Moffatt, Esq. The engraving, fig. 72 shows the eastern aspect of the Court, from which the lawns slope down in terraces toward the river Wye, presenting views of the surrounding country that would be difficult to excel. At one corner of the Court on this side are two very fine Cedars of Lebanon, and other fine trees are Cupressus Lawsoniana, Pinus excelsa, &c. The next terrace is bordered on the north side by an extensive bank of St. John's Wort, and on the south by choice Conifers, amongst which are conspicuous Cedrus atlantica, Picea Nordmanniana, P. magnifica, P. nobilis, P. pinsapo, Abies in variety, and many other well-grown and shapely trees. On the lowest terrace good views are obtained of Goodrich Castle, which was so well defended against Cromwell's soldiers; the old castle in ruins surrounded by trees, the Wye sweeping down in the valley, and extensive woods for a background form a lovely picture that no pen could do justice to. The north side of the Court presents a splendid view of the Wye valley towards Ross, and on clear days the Malvern hills are visible in the far distance. The western side has not the advantage of water, like the eastern and northern aspects, to improve the scenery; but it has charms all its own of hills and vales, with the Welsh mountains appearing prominently in the background. On the south side the stables were formerly located, but new stables have been erected a distance away, on the best principles, and the old ones are now being pulled down and a new wing added, and when complete the southern side of the Court will no doubt be as attractive as any of the others.

The lawns cover an area of nearly seven acres, on which are judiciously dotted some fine Golden Yews and other choice evergreen and deciduous trees. Leaving the Court by a drive through the park we come to the old gardens, which are being removed to a better and more commodious site, of which more anon. Many of the houses have been removed, but a few vineries and Peach houses remain for the present, in which are well grown Vines and Peach trees from which superior fruit is obtained. At the time of visiting Mr. Spencer, who has had charge here for many years, all the houses in the old gardens, with one exception, were filled with a truly magnificent collection of Chrysanthemums consisting of all the very best varieties, that would do credit to the cultivator on any exhibition table. So far Mr. Spencer has not thought of exhibiting, but it is hoped he will do so at no distant date. It would be useless to name any variety or varieties as being conspicuous, for all were good, any kind at all inferior being rigorously excluded; the result is consequently all that could be desired. In another house is a fine collection of stove plants, consisting of great plants of Anthuriums, Alocasias, and Marantas, which were being divided into smaller pieces as they had become too large for the houses. Ferns are very large and healthy, comprising all the most choice and useful kinds. A few of the most noteworthy are Adiantum farleyense, Asplenium, Pteris, Davallia, Nephrolepis, and many others. The side stages are filled with useful table plants, chiefly Crotons, Aralias, Pandanus, Asparagus, Dracenas, and Palms.

The new gardens are about a quarter of a mile away from the old site, and are admirably planned. The walled kitchen garden covers about four acres, and is approaching completion. Most of the ground

is cropped with the usual supply required for a gentleman's establishment. Deserving of special mention is a large quarter of Carrots, fine roots and heavy crop, untouched by disease or insects so prevalent amongst Carrots this year. A fine quarter of Autumn Giant Cauliflower was conspicuous by its sturdy habit and large firm heads. Passing into the houses, the Vines in a range in four divisions give promise of satisfactory results. The wood is splendid, and the buds large and prominent. Some good bunches of Muscat of Alexandria were hanging in the department devoted to them, and in the latest division large bunches of Alicante and Mrs. Pearson were noticed. The latter Grape is highly spoken of by Mr. Spencer as a high-class, late-keeping white Grape, and is strongly recommended for extended cultivation.

Several divisions are occupied by Pines, and there can be no question of this delicious fruit being well grown at Goodrich, more especially Queens, which are extra good; suckers, succession, and fruiting plants are models of health and high cultivation. At the back Melons and Cucumbers were producing good crops, and suspended over the path-

being formed of the newest varieties. The old and very useful *C. insigne* is strongly to the fore, most of the plants being of good size and finely flowered, and of several excellent types. *C. Spicerianum* is perhaps better grown than any other, most of the spikes having two flowers, and some have three. This is an unusual occurrence, and speaks volumes as to the system of management. Many other worthy objects must be omitted owing to want of space. A large Peach house was just ready for planting, and several other houses were in course of erection, all on the best and most improved systems. A house just completed was being filled with *Eucharis* and *Pancratium fragrans*, with *Stephanotis* trained on the roof. Well situated about the middle of the houses is the stokehole, in which is fixed a "Red Rose boiler," and Mr. Spencer speaks in high terms of its efficiency. A long and commodious range of shedding runs each way from the stokehole and coal-shed, comprising of Mushroom house, mess rooms, tool sheds, root and potting sheds, fruit rooms, and potting shed, office, &c. The lobby is admirably designed for the comfort of the young men, and is conveniently situated;

FIG. 72.—GOODRICH COURT.

ways are healthy plants of *Saccolabium*, some of which are throwing out strong spikes of bloom. A few *Dendrobiums* requiring strong heat are also hanging in one of the divisions, and have in every case made fine growths.

A large Orchid house next claims attention. It is divided into two compartments with a central stage and side stages round. Under each stage are tanks of water, and no doubt the humid atmosphere thus caused partly accounts for the rude health of the plants. *Laelias* are represented by magnificent pieces 2 or more feet through, with a dozen or two of flower spathes. *Cattleyas* are in great force, consisting of all the best varieties, and show the skill of a master hand. *Cymbidium eburneum* was throwing up two spikes from each pseudo-bulb, *Zygotetulum Mackayi* was flowering profusely, *Oncidium*s were flowering freely in a few cases, *Cœlogyne cristata*, the Chatsworth variety, and *C. cristata* Lemoni were promising a wealth of bloom from large vigorous plants. *Anthuriums*, more especially Ward's variety, evidently thoroughly enjoy their treatment, plant and foliage being very large and healthy. *Cypripedium*s have not occupied much of Mr. Spencer's attention till somewhat recently, but a choice collection is rapidly

in fact the arrangements throughout are of the best order, and speak well for the liberality of Mr. Moffat and his consideration for his men. With many thanks to Mr. and Mrs. Spencer for the kindness and hospitality I must conclude my record of a very pleasant and enjoyable visit.—VISITOR.

#### FLORAL DECORATIONS AT THE ROYAL AQUARIUM.

WILL you kindly permit me space in your valuable paper to make one or two suggestions for improvement in the arrangement of the schedules in the class for bouquets, wreaths, &c., at future Shows at the Aquarium, those existing at present being most unsatisfactory to exhibitors? An instance at the recent Show goes far to prove this. It distinctly states in the schedule that in this class all exhibits for table decoration were to be restricted to a table space not exceeding 36 square feet. Now, one exhibitor in this class far exceeded this space, having a raised background covering a space equally as large as his table, and so making 72 feet in all. My argument is this: If such background is to be used (and I admit it is a great improvement, as it undoubtedly

sets off the table) then let it be specified in the schedule whether that background is to be dressed or not. As the schedule was worded one would conclude everything was to be exhibited on the table in a space of 36 square feet. I do not for one moment wish to question the merit of this exhibitor's display, but were not others in this class placed at a disadvantage? and would they not have been enabled to have competed more fairly if conceded a similar space?—GEORGE NEWMAN, F.N.C.S.

### ROYAL HORTICULTURAL SOCIETY.

SCIENTIFIC COMMITTEE, December 9th.—Present: Dr. Masters, in the chair; Mr. McLachlan, Mr. Michael, Rev. C. Wolley Dod, Professor Church, Dr. Scott, Dr. Oliver, and Mr. Blandford, Hon. Secretary.

*Diseased Grapes.*—Grapes received from Mr. Barron were exhibited, attacked with fungoid disease. Dr. Masters pointed out that the disease has been described by Mr. Worthington Smith, and called attention to its resemblance to and possible connection with "scald," a much commoner complaint in which no fungoid growth has been described.

*Soil for Alpine Plants.*—The Rev. C. Wolley Dod showed samples of burnt clay, which he had found the best soil for Alpine plants. It prevented the growth of Hepaticæ, and was soft and friable, and far superior to broken brick. The cost of burning was about a shilling a ton. Professor Church undertook to determine the chemical composition of the earth used.

*Effects of Frost.*—Dr. Masters showed leaves of Aucuba blackened and killed by exposure to a temperature of  $-2^{\circ}$  Fahr. on the night of November 28th at Croydon. This exceptional temperature was independently confirmed. The Aucuba is among the hardiest evergreens. The variegated leaves appear to suffer most from frost.

*Abnormal Development of Bulbs.*—Dr. Masters showed bulbs, probably of Freesia, which had sent up a premature development of the shoots in an upward direction, bearing secondary bulbs on its sides. It appeared to be a converse phenomenon to what occurs in the case of bulbs, which send down "droppers," and may possibly be due to too deep planting.

*Banksian Rose in Fruit.*—Dr. Masters also showed a Banksian Rose which had been cross-fertilised by another species. The carpels were developed, but not the hypanthus (the "hip"), so that the same condition was found as in the carpels of Potentilla or Geum. This species has not been previously known to fruit in this country.

*Hybrid Orchids.*—Dr. Masters showed two hybrids between *Cypripedium Chantini* and *C. Spicerianum*, whose parents were of inverse sex.

*Study of Plant Pathology.*—Dr. Masters read a letter he had received from Dr. Sorauer of Vienna, inviting him to join the Internationale Phyto-Pathologische Commission for the study of plant diseases. This Commission has arisen out of the recent Exhibition of Forestry in Vienna. He thought that the invitation might fitly be extended to other investigators of such matters. After some discussion, Mr. Michael moved, "That it be suggested to Dr. Sorauer that the Internationale Phyto-Pathologische Commission place itself in communication with the Chairman of the Scientific Committee of the Royal Horticultural Society with a view to an arrangement for the exchange of information and assistance between the two Societies."

This was seconded by Professor Church and carried.

*Fog Investigation.*—Dr. Oliver proposed to present an *interim* report at Easter. This was agreed to.

### VEGETABLES FROM NOVEMBER TO MAY.

[Prize essay read by Mr. Atkins, foreman in The Gardens, at Kelton, Aigburth, before the members of the Liverpool Horticultural Association.]

To secure a constant supply of vegetables from one acre of garden during the winter and spring months, from November to May, requires considerable forethought and careful management. The varieties and quantity that can be grown of course depend on the facilities at command. For instance, where means are afforded for the production of Asparagus, French Beans, Mushrooms, and Seakale, these may be had in almost constant use during the time named, and will increase both the variety and quantity; but a good general supply may be obtained by growing a quantity of Brassica, Celery, and root vegetables.

I consider April and May the worst months for vegetables, as the winter stock is nearly exhausted, and the summer stock is hardly ready for use. For these months I should recommend a good supply of late Seakale, Broccoli, Spinach, and spring Cabbages. I have endeavoured to arrange in alphabetical order the vegetables, natural and forced, including common salads in general use during winter and spring. Cauliflowers I have not mentioned, as they can only be depended upon during the early part of November, being insufficiently hardy to stand very severe weather, and in our northern latitude the autumn sown plants are rarely ready for use before June.

With regard to the vegetables which are most profitable for a

garden of one statute acre, I should recommend that nearly half an acre be planted with Potatoes, the remaining ground to be filled with Broccoli, Brussels Sprouts, Cabbage, Carrots, Celery, Parsnips, Onions, and Salsafy.

**ARTICHOKES (JERUSALEM).**—A most useful vegetable for winter use. To insure a good crop trench a piece of ground in autumn, and give a dressing of manure. In March plant good tubers in rows 22 inches apart and 18 inches between the tubers. They will be ready for use in November, and may be taken up as required. All the remaining tubers may be lifted early in March; those that are wanted for stock replanted, and the others stored in a cool shed.

**ASPARAGUS.**—To obtain this vegetable from November onwards forcing must be resorted to. Make up a good hotbed, and cover it with about 4 inches of soil; place the crowns close together, and cover them with 2 inches of fine soil. A little air should be given at all times, except the outside temperature is below freezing point. A steady temperature of  $60^{\circ}$  will be sufficient. A succession of hotbeds will be necessary to keep up a regular supply until the outside beds are ready for use.

**BEEF.**—To secure good roots of this important and largely used winter salad choose an open situation and a light sandy soil. In autumn trench the ground to a depth of 2 feet; dig it in spring, and break the soil up rather fine. Sow the seed in April or May in drills 2 inches deep and 9 inches apart. The seeds grow more quickly if steeped in water previous to sowing, afterwards allowing them to become dry enough to separate from each other. When the plants are large enough thin them to 6 inches apart, and in dull weather fill any blanks that may occur. Lift the roots before hard frosts come, cut off the leaves to within an inch of the crown, place the roots in a cool shed, and cover them with sand or ashes.

**BEANS (FRENCH).**—French Beans for bearing during the winter and spring months require to be grown in a house specially adapted for forcing purposes. A temperature of  $60^{\circ}$  to  $70^{\circ}$ , with plenty of moisture and light, is essential to successful results. Successional sowing should be made from the beginning of September until March, using a compost of good loam with a little well rotted manure. The most useful sized pots are 8-inch; six beans should be sown in each pot and covered with about 2 inches of soil. The first sowing may be placed in a cool house until started and brought into heat when required, but the later sowings should be placed directly in the forcing house. Give air on every favourable opportunity, and keep the plants free from insects. Liquid manure will be found very beneficial when the pots are full of roots and the plants are bearing freely.

**BROCCOLI.**—This vegetable follows the autumn Cauliflower, and is invaluable for winter and spring use. It succeeds best in a deep, rich, loamy soil. Prepare the ground in autumn by trenching and manuring. Sow on a warm border from March till May, and prick off the seedlings when they are large enough. Choose dull showery weather for the permanent planting, which should be done in June or July. Allow a distance of 2 to 3 feet between the rows, and an equal distance between the plants. The heads of the plants must be bent northwards before frost sets in, and in so doing care must be taken to disturb the roots as little as possible.

**BRUSSELS SPROUTS.**—This is one of the most productive and delicious of our winter vegetables. To secure it in good form it should be grown in deep, rich soil, which must be trenched 2 feet deep and heavily manured in winter. In February and March sow the seed in boxes or pans of light soil and place them in a cool house. When the plants are large enough prick them into cold frames or prepared beds on a warm border. In May or June transplant in rows 2 to 3 feet apart, leaving a space of 18 to 24 inches between the plants. Plant with good balls of roots and give a good watering that they may receive as little check as possible. Keep them clear from weeds and earth up as soon as large enough.

**CABBAGES.**—To ensure a supply of good Cabbages for the winter and spring months it is necessary that they be planted on good, well manured ground. Select a somewhat sheltered situation for the winter and earliest spring crop, which should not be planted too soon in autumn, as the plants are more liable to run to seed. For a spring supply sow from the end of July to the middle of August in beds of light soil, afterwards covering the beds with netting to protect the seeds from the ravages of birds. Transplant when large enough in lines 18 inches to 2 feet apart, and the same between the plants. To provide a supply during the winter sow Colewort Cabbages from the middle of June to the end of July, and transplant when large to 1 foot apart.

**CARROTS.**—Carrots require to be grown in soil of a good depth and of a light sandy nature. Ground that has been manured

for a previous crop will suit them best, as fresh manure tends to make the roots forked. The ground must be free from wireworms and injurious insects. I have seen ground intended for Carrots given a heavy watering with salt water in winter, and judging from the following crops it proved highly beneficial to the growth of the Carrots, and also acted as a preventive of maggot.

For the main crop sow in March or April in shallow drills 9 inches apart. The seed requires to be well rubbed between the hands before it is sown, otherwise it cannot be distributed equally, the seeds being apt to cling together if not well rubbed. Thin to 2 inches apart, and when they have gained a useful size every other one may be drawn for use, leaving the main crop 4 or 5 inches asunder. The main crop will be ready to lift early in November. The tops should be cut off close to the crown, and the roots stored in sand or ashes in a dry place. Early Carrots are often in demand, and may be obtained by sowing on a mild hotbed in early spring. Stable litter, with plenty of leaves mixed with it, may be prepared and placed into a frame; this should be trodden firmly, and allowed to remain a few days before sowing. Eight inches of soil should be spread over the manure, the seeds sown broadcast and watered in. Air should be given on every favourable opportunity when the plants appear, or they will soon be drawn.

**CELERY.**—The best and most open situation in the kitchen garden must be selected for the cultivation of this vegetable, with the best farmyard manure dug into the trenches before planting. Sow the seeds in February in pans of light soil and placed in a moderate heat. As soon as the plants are large enough they may be pricked off into frames or deep boxes, using a compost of two parts loam, one part leaf mould, and one part good decayed manure. Frames are best for this purpose as allowing a greater depth of soil than boxes, consequently the plants are not so liable to "bolt." When boxes are used a good layer of manure over the crocks will be found advantageous in sustaining moisture at the roots. Harden the plants gradually and place them out in June in trenches which have been previously well manured. The trenches should be 15 inches wide and 12 inches deep; the plants are best placed in angles 9 inches apart. During the whole growing period never allow the plants to suffer from want of water; frequent supplies of liquid manure will be found beneficial when they are in the trenches.

Earthing may be commenced in September, and continued by stages, first tying the plants round with matting to keep the soil from the hearts and taking all laterals and dead leaves from the base. A sprinkling of lime among the plants when earthing up will be found efficacious in destroying slugs; it also adds materially to the flavour. Cover the ridges with dry straw or litter when frost sets in.

(To be continued.)

### PHYLLOCACTUS.

As attention is being especially drawn to these plants, and Messrs. J. Veitch & Sons of Chelsea have a series of choice hybrids, some of which have been certificated, for distribution next year, I have been desired to reproduce a chapter that was written on this subject some years ago. The issue of the Journal in which the notes first appeared has been long out of print, and my little work on "Cactaceous Plants," in which they were embodied, is also out of print; consequently with some emendations and additions I again give the article referring to the Phyllocactus in response to the wishes of several who are interested in the plants.

The most valuable genera in the whole Cactus family, considered from a horticulturist's standpoint, are undoubtedly the Phyllocactus and the Epiphyllum, and they are the only two which can be said to have partially escaped the modern neglect of the Cactæ as garden plants. These are still established favourites in many places, but they are comparative strangers to numbers of cultivators who might advantageously include them in their collections. Profuse in flowering, with large showy blooms, most variously coloured, from the richest crimsons and brightest scarlets to the most delicate rose and blush tints, they are unexcelled in beauty by any of the ordinary plants grown for decoration. So far from being fastidious or requiring any particular routine of culture, they are often treated with utmost carelessness, stored in "out-of-the-way" corners, and left in a measure to take care of themselves; yet do they repay their ungenerous hosts with abundance of glorious flowers, and then only are they brought into sight, to be again consigned to the old quarters when the flowering season is over. Like every other plant that is easily grown the Phyllocactuses and their allies respond most promptly to liberal treatment, and well as they may seem to be under the careless system, they are incomparably superior where their moderate requirements are studied and provided for. It is sometimes said that the flowering period is so short that they are scarcely worth the space they occupy for so many months, but assertions such as these have been formed upon limited experience. Phyllocactuses may be had in flower for three or four months in the year by having a dozen or

two plants in different stages, and with the Epiphyllums the flowering season can be prolonged for at least six months out of the twelve in an almost unbroken succession. Outside the ordinary decorative plants, such as Pelargoniums, &c., there are very few which possess so many recommendations as these, and it is to be hoped that their merits will become more widely recognised.

The genus Phyllocactus as now constituted includes thirteen species, natives of tropical America, Mexico, and Brazil, and are chiefly distinguished by their flattened leaf-like branches, with a prominent midrib, and by the large many-petalled flowers being produced from the notches in the edge of the stem or branches. These characters suffice in a broad sense to separate them from *Cereus* and *Epiphyllum*, their near neighbours. They are also epiphytal in habit, but this character is shared by several other Cactæ, and is therefore only useful as a cultural guide. In gardens, and even amongst botanists, there has been much confusion respecting these plants, some of the species having been referred to *Cereus*, some to *Epiphyllum*, and most of the older forms appear in works under the title *Cactus*. The principal confusion has, however, been between the *Epiphyllums* and the *Phyllocactus*; for even now, although the distinction has been clearly pointed out by recent writers, the two names are frequently employed in current literature as synonymous.

**Culture.**—The most important item in the culture is the soil, and this is easily provided. A light turfy loam should form the basis of the compost, and to this may be added one-third of leaf soil, old dried cow manure, and sand, well mixed together and employed in a rather dry state. The pots must be well drained, as the plants do not require a great depth of soil, and any approach to stagnation about the roots is the surest means of causing failure. When plants have attained a good size and the pots are filled with roots an annual top-dressing of soil and manure will be sufficient without repotting them, and is even preferable, as the plants appear to flower more profusely when retained for some years in the same pots. It is, however, occasionally necessary to turn the plants out to see that the drainage is in proper condition. As regards temperature, Phyllocactuses are by no means particular; they will succeed in an unheated house or frame, in a greenhouse or in a window, and in all these positions the majority will flower freely, but the best results are obtained by having them in a warm greenhouse, what is termed an intermediate house, during their growing period. After the growth has been completed they can be placed in cooler and more airy quarters, or a similar result can be obtained by keeping the frame closed while growth is advancing and ventilating freely afterwards.

**Propagation.**—They are readily increased by means of cuttings, which, if inserted in sandy soil in moderate heat and kept rather dry for a week or two, only slightly syringing them, will form roots, and can be placed singly in 60-size pots. Seeds are produced freely, and these may be sown in pans of light soil, placed in a dry part of the stove or in a warm house until they germinate, when a light position must be afforded the plants until they are large enough to be potted singly.

### SELECT SPECIES.

**P. ACKERMANNI, Haworth.**—One of the most handsome and best known forms in cultivation, remarkable alike for the large size, rich colour, and profusion of its flowers. It has been regarded by some writers as a hybrid, and is mentioned as such by Herbert, but upon what evidence does not appear. Lindley, on the other hand, gives a full account of the plant, and states that it was brought from Mexico by Mr. George Ackerman, in whose honour it was named by Haworth, the original stem having first flowered in Mr. Tate's nursery in June, 1829. A somewhat peculiar circumstance is, however, mentioned by the same authority—namely, that a seedling raised by Mr. Smith, gardener to Lord Liverpool, Coombe Wood, was flowered at the same time, and proved so similar in its characters that they could only be distinguished by a close examination. Whatever it be there can be no question respecting its beauty, and that is sufficient to recommend it to the attention of the readers of these notes. The flowers are 6 to 8 inches in diameter, with rich crimson shining petals, the outer ones lighter in colour. The stems are flat and crenated or notched, bearing the flowers on these depressions. Several varieties and hybrids have been raised from *P. Ackermanni* by crossing it with species of *Cereus*, especially *C. speciosissimus*, which has yielded a race of handsome forms differing in the colour and size of the flowers, but chiefly shades of crimson or red. It is also said that *P. Ackermanni* has been successfully crossed with *Cereus flagelliformis* in France, the plants resulting differing greatly from both parents, but I have never had an opportunity of seeing these forms. A beautiful hybrid between *P. Ackermanni* and *P. crenatus* has been raised and flowered in this country, in which the inner petals were of a soft pale rosy tint and the outer a deep crimson, affording a pretty contrast. One valuable character of this species and its varieties is that they may be had in flower from May to August or even longer than that with a good stock of plants brought forward a few at a time.

**P. ANGULIGER, Lemaire.**—An extremely distinct plant, easily recognised by the deeply angled stems 2 to 3 inches in diameter, which are indented on the margin somewhat like a large saw with the teeth turned upwards, forming blunt triangular lobes. The flowers, which are 3 to 5 inches in diameter, the petals white, the sepals narrow, orange or yellowish, and spreading, open during the day, and continue expanded for a considerable time, giving out a powerful fragrance. It was found by Hartweg during his travels in the west of Mexico growing upon trees

in a forest where Oaks predominated, and specimens were by him sent to the Royal Horticultural Society.

*P. BIFORMIS* (*Disocactus biformis*, Lindley).—Though not equal in attractions to other Phyllocactuses, this is an interesting plant, forming in appearance a link between those species and the Epiphyllums, but it is not likely to become of much garden value, and will only be grown to make a collection complete. The plant was introduced to England from Honduras at the same time (1839) and by the same persons as *P. crenatus*, and was described as a *Cereus*, but was subsequently constituted a genus by Lindley under the name *Disocactus*, and by Salm Dyck under the slightly different title of *Disisocactus*. The selection of these names was doubly unfortunate, first because there is a genus termed *Disocactus* quite distinct from this, and secondly because the plant does not possess sufficient characters to separate it from *Phyllocactus*, to which it is now referred by botanists. Plants in cultivation are usually rather small, but they will attain the height of 3 feet, branching freely and forming a rather graceful fleshy shrub. The branches are narrow, flattened and leaf-like, reddish on the margin, and bear the flowers at the points. The petals are narrow, 2 to 3 inches long, and partially combined into a kind of tube of a pale rosy pink colour. The flowers, however, do not last long, and are followed by bright red fruits about half an inch long, which, being produced abundantly, have a rather pretty effect.—L. CASTLE.

(To be continued.)

#### LARGE ANEMONE CLASSES.

IT is evident by the experience of the past exhibition season the present classification of the large Anemone section has caused much dissatisfaction, and not a little confusion amongst exhibitors. In many cases disappointments through disqualifications have been the result with the affiliated societies where the exhibits were judged according to the classification in the National Society's catalogue.

When the Japanese Anemones were first introduced to the public they were exhibited in juxtaposition with the large Anemones in their respective classes. The introduction was to such fine varieties as *Mdlle. Cahrol* and *Fabian de Mediana*, so distinct in their character and fantastic in the arrangement of the centre and guard florets that many growers rightly thought that they were quite out of place exhibited in the same class as the more formal florist's Anemones. They at once took the public taste, and many looked hopefully forward to the time when the same strides of improvement would be developed in them as in the other Japanese section, both in colour and size. The time might soon come when prizes could well be offered for stands of twelve, eighteen, or twenty-four distinct varieties, as the case might be, and which would form a very great attraction at an exhibition.

But this hope has not yet been realised, and the prophesied improvements of the Japanese character have not taken place, but quite the reverse. The stock of *Mdlle. Cahrol* and *Fabian de Mediana* seems to have deteriorated, for we seldom see such good blooms of them now as we used to see, and most of the varieties that have been subsequently introduced are so inbred with the formal type, that it is now very difficult to draw the line or explain the difference between them.

It is only a few years since some blooms of the old variety *Emperor* were exhibited at the Crystal Palace in a stand of large flowering Anemones, from which the Japanese type was excluded; being flowers from early buds they had developed an irregularity in the guard florets as is common with that variety, which gave it somewhat a Japanese character, and the stand was disqualified. This caused an outburst of indignation among those that had for a long time exhibited that same variety in the florist Anemone class. This and another variety, *Acquisition*, will develop the same irregular character in the blooms from an early bud. But although with these two varieties the guard or ray florets sometimes show an irregularity the cushion of centre florets retain the true character, a point of very great consideration and distinction in the Anemone classes. For instance, contrast the smooth, honeycomb like florets of a *Fleur de Marie* or *Prince of Anemones* with the rough-toothed florets of a *Mrs. Pethers* or *Lady Margaret*. Although the two latter varieties have splendid guard florets and are large, well built flowers, the ragged centre florets detract from their merit as a florist Anemone, and is a slight development of the character we should look for in a Japanese Anemone, of which I take *Fabian de Mediana* to be a good type.

Some of the more recent introductions of the so called Japanese Anemones are as smooth in their centre florets and as regular in their guard florets as many of the other section. *Mons. Charles Lehocqz* and *Nelson* are very smooth flowers, although perhaps they have not the depth of guard petals as some of the others. *Mons. Pankoucke*, *Sahine*, and *Minnie Chaté* are hybrids that have as much of the one

character as the other. *Ratapoil* and *James Weston* come a little nearer to what we would like to see in the Japanese section, but take them altogether is a very unsatisfactory class, and I would strongly advise societies when comparing their schedules for next season to allow all the large Anemones to be shown together, and make no distinction between them.

This would prevent a recurrence of what we have witnessed this season at the last Crystal Palace Exhibition. Some good stands of blooms of large Anemones were judged, and awarded prizes, and ultimately disqualified when found to contain blooms of *M. Pankoucke* and *M. Chas. Lehocqz*, both classed as Japanese. At Gosport a fine stand of twelve large Anemones was disqualified through containing two fine blooms of the variety *Nelson*. This also is classed as a Japanese Anemone in the National Chrysanthemum Catalogue, and, the Gosport Society being affiliated with the National, the flowers were to be judged as therein classified. The exhibitor was undoubtedly to blame for not referring to the recognised guide, but as he had exhibited the same varieties and won prizes at two exhibitions just previous he thought he was acting right. Another instance, my brother writes me from Chertsey that he was disqualified at Egham, and the same varieties took first prize at Staines. There are two or three of the many instances that have taken place this season through the confusion of many varieties that have been introduced, certificated, and classed as Japanese Anemones, and ultimately not developing sufficient of that character as is generally understood from the original type, to distinguish them from many of the other section.

If prizes were in future offered for twelve, eighteen, or twenty-four large Anemones, distinct varieties, without any definition as to section, but let them all be shown together, the advantage to the exhibitor and to the Society would be mutual, and it would avoid any unpleasantness caused by confusion of the sections, which is bound to result in misunderstanding and disqualification.—C. ORCHARD, *Bembridge, I.W.*

#### CHRYSANTHEMUMS AT CARDIFF CASTLE.

Some of the finest hush plants that I have ever seen were in the gardens at Cardiff Castle this year. Large hushy plants freely flowered are much appreciated for decoration in the Castle beside the large quantities of bloom needed in a cut state for the vases, therefore Mr. Pettigrew finds this system of growing the plants the best for his purpose. What impressed me most were the small pots in which such large plants were growing. Many in 9-inch pots were 4 feet high, nearly as much in diameter, and masses of flowers, making charming specimens. They were arranged in a large span-roof greenhouse, which afforded abundance of light and air to the plants, a decided point in their favour in assisting a free development of the flowers. The plants were well clothed with foliage, showing that they had received the necessary attention to watering during the summer, also with suitable stimulants to obtain so much luxuriance without grossness of either foliage or stems. The plants generally had been topped twice, once when 4 inches high, and again when the shoots resulting from the first topping had extended about 6 inches in length. Afterwards all growth was allowed to remain and all buds to develop flowers. Each plant, therefore, was furnished with from six to ten branches, which threw out many small side growths, which terminated at the point in numerous flowers. Japanese varieties were the most in favour on account of their graceful character and the general brightness of their flowers. Conspicuous amongst many were such as *Madame de Sevin*, *Mdlle. Louise Leroy*, *Fair Maid of Guernsey*, *Florence Percy*, *Madame Baco*, *Mdlle. Lacroix*, *Mrs. J. Wright*, &c.—E. MOLYNEUX.

#### JAPANESE CHRYSANTHEMUM W. H. LINCOLN.

MESSRS J. LAING & SONS of Forest Hill have given special attention in the past season to new varieties of Chrysanthemums, both imported and home-raised seedlings and sports. It is well known that the Messrs. Laing have been very successful in raising new varieties, for several could be named that have originated in the Stanstead Park Nurseries which now take a foremost place on the exhibition table. That represented in the engraving (fig. 73), *W. H. Lincoln*, is, however, of American origin, though it is likely to become a great favourite, as the colour is a very rich shade of yellow, somewhat like *Jardin des Plantes*, and not too common amongst Japanese Chrysanthemums. The engraving is from a reduced drawing, and represents the bloom about half its full size, as it forms a very handsome flower when developed, the florets twisting and slightly incurving irregularly. One strong recommendation is that the plant is of dwarf habit, about 3 feet high. A first class certificate was awarded for it at the meeting of the National Society on October 15th of the present year.

#### REVISING JUDGES' AWARDS.

RELATIVE to the competency of judges discovering faults in cut-blooms, we have to remember that sometimes all the blooms staged have not been grown by the exhibitors of them. Some have been acquired as gifts, and even less questionable means are not unknown, therefore it is necessary on this ground, if on no other, that there should be power of disqualification any time before the prize money is paid.—ALTER EGO.

[Certainly there should on the grounds indicated; but this is not a question of judging blooms, but of discovering men, if there are any left, who indulge in such practices.]

CHRYSANTHEMUM JOHN LAMBERT.

IN Mr. Molyneux's answer to "West Riding, Yorks," page 496, he gives Golden Queen of England as one of the best in his incurves, and

ever seen. I think the same, and shall stick to it for that variety; it incurves so well and is such a deep colour." This was written on November 11th, 1889. Can his opinion be altered so soon, and after the variety appearing in so many first class shows this season in the

FIG. 73.—CHRYSANTHEMUM W. H. LINCOLN.

includes it in his list of the best twenty. May I ask him if he means the old variety of this, or is it the sport he grew for me and is now named and certificated as John Lambert? He wrote me as follows:—"Good judges say that it is the best Golden Queen of England they had

first prize stands, not only shown by the raiser, but by several other good growers as well? I notice in one report of a show in your paper this and Emily Dale Improved were shown as distinct in the first prize stand.—JOHN LAMBERT.

## FRUIT FORCING.

**FIGS.—Earliest Forced Trees in Pots.**—Early Figs are best secured from trees in pots, as a slight warmth at the roots is highly beneficial, but even this has its disadvantages, as when the heat at the roots is 70° or more during the early stages of growth that is forced too rapidly, therefore see that the heat at the base of the pots is not more than that until the leaves are unfolding, when the temperature may be 75°, or even 80° at the base of the pots. The temperature of the house should be gradually increased to 60° at night, 65° by day by artificial means in severe weather, 5° more in mild weather, and 70° to 75° with sun heat and moderate ventilation, closing at 75°; but be careful not to bring on the trees too rapidly, especially in dull weather, as foliage produced under such conditions is not of stout texture, but thin, and liable to scorch under bright sun and to invite red spider. Water in a tepid state must be applied to the roots as required, and the trees and house must be syringed morning and afternoon, so as to have the foliage dry before nightfall, damping the house later in the day if the atmosphere has become dry.

**VINES.—Early Forced Vines in Pots.**—Fermenting materials in the pits must have attention, and if the pots are placed on pillars frequent additions of fresh material should be made as the heat declines. The heat about the pots must not exceed 70° to 75°, and the temperature of the house must be raised gradually after the buds commence swelling from 55°, so as to have it about 60° to 65° by the time they are coming into leaf, allowing an advance of 5° to 10° by day, carefully admitting a little air at 70°, and close early. Disbud as soon as the bunches can be detected, reserving the most promising. Stop the laterals about two joints beyond the bunches. The laterals proper, or those on the growth of the current year, should be removed up to the bunches, and those beyond allowed to extend as the space permits without crowding, it being essential that the foliage retained have full exposure to light and air, and no more than that encouraged. Usually a couple or three joints of extension in the laterals are sufficient for fruiting Vines in pots, the crop preventing much further extension. Where fermenting materials are employed the necessity for the application of moisture will not be so great as where the heat is obtained solely from hot water pipes. Evaporation troughs should be filled with liquid manure or guano water, 1 lb. of guano to twenty gallons of water, which may be employed for damping the floors after closing the house, or early in the afternoon.

**Early Forced Houses.**—The buds of Vines started last month now showing signs of swelling, the inside borders should have another good watering at the roots, applying it at a temperature of 80° to 90°, old Vines being accelerated in root activity and in the early swelling of their crop by watering at the beginning of their growths with tepid liquid manure. Avoid making the soil sodden by needless waterings, outside borders will not require watering. Raise the temperature 2° to 3° in the course of a few days, not exceeding 60° to 65° by artificial means until the Vines are in leaf. In quick forcing (which is not generally satisfactory), and where the Vines are thoroughly established and have had a long rest, growth may be induced by a brisk moist heat of 70° to 75°, continuing it until the Vines have fairly started growing, when the temperature should be allowed to fall to 60° to 65°, with 5° to 10° rise in the daytime, it being important whilst the foliage is being made that a moderate temperature be employed, in order to secure short-jointed wood and stout, well-developed foliage. Young Vines that have not been forced will need to be brought down into a horizontal position to insure their breaking regularly. Some well-fermented short stable manure and leaves placed in ridges on the inside border will afford a genial moisture and warmth, and lessen the necessity for frequent syringing. Keep material on outside border replenished with fresh material as may be required.

**CHERRY HOUSE.**—To have Cherries ripe in April the trees must now be started. Be sparing of fire heat at the commencement, not employing it unless absolutely necessary to maintain the temperature at from 35° to 40° at night and 40° to 45° by day, ventilating when the temperature is about 50° to 55°. Close the house at 50°. Syringe the trees and available surfaces early on fine afternoons, so as to admit of the buds becoming dry before nightfall. The border will be sufficiently moist through the removal of the roof-lights, if not it must have water to bring it into a thoroughly moist state. Trees in pots if at all dry will require repeated supplies of water to secure the thorough moisture of the soil to the base of the pots.

**STRAWBERRIES IN POTS.**—When the crowns commence swelling, and the trusses of bloom appear, the temperature may be advanced a few degrees by day. A temperature of 50° to 55° at night is sufficiently high for the present. Syringing the plants gently in the early part of fine days will be advantageous. Examine the plants daily, and apply water to all those which require it. Keep a sharp look out for aphides, and if any appear fumigate the house on two consecutive evenings, or

at this time of year it may be practised in the evening and early the following morning. It is absolutely essential that the plants be perfectly free of aphides before the flowers expand, as they are very susceptible of injury from fluctuations in heat and moisture, therefore in fumigating take care to deliver the smoke cool.

More plants should be placed in frames or in a house from which frost is excluded, so that they will be fit to draft into houses as required, but they must not be kept dry, and the pots must be plunged if there is danger from frost, as it is absolutely essential that the roots be kept from damage of any kind. Remove the decayed leaves, loosen the surface soil, and top-dress with horse droppings rubbed through a sieve. The drainage should be attended to, and if necessary rectified, and the pots washed. The plants may be introduced during the next three weeks to a Peach or to a Strawberry house if one be available. La Grosse Sucrée, Vicomtesse Hericart de Thury, Noble, Auguste Nicaise, Sir Harry, and President are suitable varieties. Sir Joseph Paxton in some places is very liable to mildew, but where it succeeds it is one of the best forcing varieties started at the new year and afterwards. Plants for introducing later on will be quite safe in their quarters out of doors plunged in ashes to the rim, and a light covering may be given of dry fern or litter in severe weather, removing it in mild weather.

## KITCHEN GARDEN.

**SOWING PEAS.**—All who own gardens are anxious to have Peas ready for gathering at the earliest possible date in spring. We have found that October and November sowings give early plants, but these plants are often checked, and by March more backward than they were in December. The December sown Peas are of a different stamp. Sown about the middle of the month the plants appear in January, are a few inches high in February, and by March they are in fine order to advance with the improving weather. These Peas will bear sooner than any that can be raised in spring, except under glass. South borders well exposed to the sun should be chosen for sowing Peas in December. They should have moderately rich and very firm soil, and the rows should be 8 feet apart, as when one row shades the other podding will be retarded many days. Only the earliest round-seeded sorts should be sown in winter. We have formed trenches, and sown in these thinking they would afford shelter, but the young plants suffered more from the damp confined in these than they did by the greatest exposure. We do not sow any of the early dwarf Peas at this time, but prefer those which are not less than 3 feet in height.

**BROAD BEANS.**—The above remarks also apply to these, but the very long podded sorts are useless for sowing as a first crop. They do best in a somewhat stiff, but not a wet soil, and the seed should be sown a little thicker now than in summer.

**MUSHROOMS.**—The severe weather is retarding the cool beds, but it has not caused them to cease bearing, not even in an open shed, where the temperature is only a few degrees more than in the open, but all beds in a heated house should have a thick coating of litter in cold and frosty weather. This not only increases the temperature in the bed, but prevents the surface from drying, which is very important. All beds should be so covered whether they have come into bearing or not. Continue to collect material and form beds as fast as possible, as the demand for Mushrooms is now unlimited, and a profusion of them will cause a scarcity of other vegetables to be less felt.

**FROST AND VEGETABLES.**—Our thermometer registered 10°, 13°, and 15° on three successive nights. This has caused green vegetables to shrink very much. Fortunately we had cut and stored all the Broccoli that showed heads amongst the foliage, and we have as many of them in a shed as will last over Christmas. This is a great advantage. Endive and Lettuce are destroyed in the open, but those in frames which were covered with mats are sound. Winter Spinach has suffered, but although the plants appear much injured, they will produce a bountiful supply in April and May. The tops of Celery have suffered a good deal, but the part under the soil is quite sound. To prevent the frost from injuring this crop a quantity of straw, hay, or bracken should be thrown lightly over the top of the ridge, and this may be removed when the weather is mild.

**ROOTS FOR PRESENT USE.**—Parsnips, Salsafy, and Jerusalem Artichokes may now be used. We do not send many of them to the kitchen so long as there is a good variety of other vegetables, but prefer to keep them in reserve for times of scarcity. Unfortunately the Parsnips are very much rusted on the crowns this season. This we attribute to the excessive dampness of the soil, and we have no cure for it. The decayed parts are cut off before the roots are sent into the kitchen. The Salsafy always remain sound during the winter, and is most useful. We dig up a quantity of roots when frost is anticipated, but allow the bulk to remain in the ground, and dig them as required. The Jerusalem Artichokes are treated in the same way, and they too are most useful, as they are extremely hardy, and never diseased, while they can be used in a variety of ways in the kitchen. This is a winter vegetable deserving of more extended culture, and should be grown in all small gardens.

**TURNIPS.**—We have had to supply some cooks that objected to Swedish Turnips, but fortunately our present one does not, and there is no difficulty in keeping up a supply in the hardest of weather. White and yellow Turnips that have attained a large size do not keep so well during frost as small bulbs, and all that have attained a good size would be better pulled up and stored in a cool shed. Chirk Castle, the best of

all white-fleshed winter Turnips, does not require this treatment, as the bulbs naturally bury themselves so deep in the soil that they are never injured by frost.

**FORCING ASPARAGUS.**—We place our first roots in on November 15th, and cut the first dish on November 29th. We find the roots force very freely and yield heavily. It is a much valued vegetable at all times, more especially at midwinter, and the dates given show that it can be produced in a fortnight or thereabouts; that in question was forced in a bed of a Cucumber pit with a bottom heat of 80° and a top temperature of 65° to 70°. All who can command these temperatures will readily secure Asparagus; strong fully matured crowns only should be forced. A few leaves may be placed under them with the roots packed close together, and a layer of soil to the depth of 3 inches on the top. We have forced the roots on ordinary hotbeds, but not so quickly or successfully as in the pits, particularly at midwinter. The roots are of no further use after being forced and should be thrown away. Two dozen good roots will give several dishes, and for maintaining a constant supply the requisite number of roots should be put in every fortnight.

#### PLANT HOUSES.

*Selaginella Kraussiana.*—Where these are appreciated for the margins of groups and other decorative purposes some 3 to 5-inch pots may now be made up. The pots should be filled a little above the rim with any light compost in which leaf soil forms nearly one half, small pieces pricked evenly over the surface. The smaller the pieces and the closer they are dibbled in the better they succeed, and the sooner they cover the surface. If the moss is taken from a cool house it will commence growing freely in a vinery or Peach house that is kept about 50°. The moist atmosphere of the former will suit the best. Other small growing varieties may be treated the same.

*Panicum variegatum.*—Cuttings of these may be inserted thickly together in 3-inch pots and placed in handlights in a warm house. They will soon be rooted and ready for decorative purposes early in the season. Few plants form a neater or more effective margin to a house of Palms or other foliage plants than these; a few plants dotted here and there are not particularly pleasing, but a good row adds materially to the appearance of the structure.

*Gardenias.*—Young plants that were rooted in thumb pots some time ago should be placed at once into 3-inch pots. They will continue to grow slowly, and will be ready for 5-inch pots early in the season. Keep the young plants in a temperature of 60° to 65°. Pinch the points out of the shoots to induce them to branch.

*Veronica Andersoni variegata.*—For large conservatories where flowering plants do not do well this will be found a useful plant during the winter months. Soft growing shoots will root freely now if inserted in sandy soil and placed in handlights in a heated structure. In one season they will grow into nice bushy plants if potted on, as they need root room and their shoots are pinched occasionally. They are also very effective grown as small standards with legs about 18 inches high. They grow into decorative plants quicker than *Euonymus latifolia variegata*, and are nearly as effective amongst other plants.

*Libonias.*—Where good plants of these are appreciated 1 foot high and as much through them, cuttings should be rooted early. If one or two plants are cut over now and placed into heat they will soon produce good cuttings, which should be inserted and rooted at once. If potted on as they need root room, and the shoots pinched occasionally until the plants are placed into 5 and 6-inch pots, they will be fine bushes by autumn, and if well ripened they will flower profusely.

*Solanums.*—To do these well cuttings should be rooted early. To obtain these, introduce a plant or two that has not berried well into heat to induce growth. Soft-growing ends should be taken off and inserted into sandy soil and potted singly as soon as they are rooted. The shoots should be pinched from time to time, and the plants repotted until they are placed into 5 or 6-inch. Grow them inside in an intermediate temperature until May, then gradually harden and place them in frames.

*Cyperus distans.*—Plants raised from seed sown some time ago and pricked off into boxes may be placed into 3-inch pots. Grow them on in a temperature of 50°, if kept too warm they draw up weakly. Plants that have flowered may, if wanted, be cut over and placed in heat, they will soon throw up again from the base and be useful for groups. They never make such good plants as those raised from seed. Seed may be sown on the surface of a pan of fine soil and placed in heat. If well watered and covered with a square of glass germination will soon take place. If the seeds are covered with soil they are a long time before they germinate, and often fail to do so if buried too deep, unless they are brought again to the surface.

*Grevillea robusta.*—Plants that have become damaged may be cut close back to the surface of the soil. If placed in a temperature of 50° they will soon break again into growth, and make good plants long before those raised from seed. They can be grown on with two or three shoots if preferred to those with a single stem. The latter are best for most purposes, and if the roots are carefully reduced after they have broken into growth and the plants repotted, they will grow rapidly after they are once started. Plants of *Aralia Sieboldi* that have become bare may be subjected to the same treatment, while the head may be taken off where the wood is soft, and re-rooted under a bellglass in heat.

# THE BEE-KEEPER.

## APIARIAN NOTES.

### THE WEATHER.

FEW if any dead bees lie about, unlike 1889, after the first spell of frost, when at some hives a few were carried out. Being all well covered and provided with stores there will be no apprehension that any will either succumb to the cold or from want, although the weather may become severe. Snow being the greatest enemy when the temperature rises above freezing, attention must be paid to closing the entrances and lowering the ventilators. So long as the temperature keeps under 30° they will be left undisturbed.

### SECTION CRATES.

For some years I have been using a contrivance for sections that pleases me so well that may now be given to the public. It possesses all the advantages claimed for the working of sections. They can be removed *en masse* from the case when full, and as they can be pressed firmly and closely together by blocks propolis is reduced to the minimum, and as these blocks are easily slackened the removal of the sections become easy. By placing the crate containing them upon a loose board a little less in size than the inside crate upon a box of the same dimensions the crate is pushed downward telescope fashion, and sections are left upon the top ready to be examined, and removed to a place of safety. The device is simply a piece of tin the exact length of the inside of the crate, and about 1 $\frac{7}{8}$  inches broad; both edges are folded a quarter of an inch, and then again doubled; this gives extra strength, and the right distance between top of the hive and the bottom of the section. A strip of tin about an inch deeper than the crate is soldered to the under side of the bearer, allowing half an inch for that purpose, and the other half inch is turned at right angles at the other end to form an "ear" for resting upon the top edge of the crate, which should be sunk at each rest the thickness of the tin, so that the upper edge is level. These end pieces should also have their edges turned.

The crate is simply an outer rim of the desired size, and about three-eighths of an inch deeper than the section. It will be observed these rests suit any size of section, and from one to any number can be wrought upon any hive, as in one compartment, and the tins are cheap, and can be made by anyone. If a small staple be driven underneath the rest at the bottom and side of crate it will keep them in place, and will not interfere with the easy removal of sections.

### SHELTER FOR HIVES.

The bee-keeper and the beginner should, as in other matters, have the stand and shelter prepared beforehand, that is before swarms appear. There are many forms of cases and houses for bee hives already described which may be left to the choice of the individual. The following is not an expensive shelter, and is lasting, and is meant for three or four hives. Four scantlings for corner posts, 2 feet 3 inches by 3 inches by 3 inches. For the front from say 7 feet to 8 feet long is a suitable size for three or four hives, and from 2 feet 6 inches to 3 feet wide, which the bee-keeper may determine for himself, and which must be the length of the scantlings, 3 inches by 1 $\frac{1}{2}$  inch. The top scantling or the wall plate should be half checked, so that it may be flush on the top, the roof to have a slight hang to the back, it being of corrugated galvanised iron. Two scantlings, 2 inches by 2 inches, are all the framing required. These are held to the iron by screws, is hinged to the wall plate, and rests upon the posts at the back, and held down by a hook and eye. When a square frame has been formed by nailing two scantlings on the ends of two posts it is finished, unless the bee-keeper has a mind to put in struts and diagonals. Now nail the top plate of the ends as described to the front, but

the under one may be nailed on the under side without checking. After this put in the back posts. When completed will form two right angles, or a front and two ends.

To fasten this place in charred and tarred posts in the ground at each end, inside of upper corner parts of frame, bore holes in the under plate, and nail firm to the posts in the ground, the back ones being the lowest for drip, if this is done accurately will bring end portions right which may be strutted or not. Having the posts in the ground separate from the framework, and kept back from the corner, enables the bee-keeper to renew these posts easily when required without interfering with the framework, which lasts longer than ground parts do.

Sheets of plain galvanised iron held by a few round-headed screws are all the fastenings required. I have omitted to say the bottom of the shelter should not be lower than will show 3 inches of hive from top of landing-board. It will be seen that the shelter is simply a small shed open at bottom, and without a back. Doors may be added, but all I recommend is a curtain of some cheap material.

It depends greatly where these shelters are situated as to the uses they may be put to. They may be as high again as advised above. Near fruit plantations newly gathered fruit may be packed and temporarily stored beneath them, and being portable may be moved about to shelter workers from rain. If ground is valuable flowers or fruit bushes may be trained, and handy for gardeners to shelter Chrysanthemums for a frosty night when a pressure of work is on.

If fruit is to be grown on them get a few iron studs about 3 inches long, having a hole in one end and the other pointed to drive into the angles, and stretch wires across or wire netting to train Currant or Gooseberry bushes to. The roof being almost flat will be handy at times to dry herbs. The structure, although not ornamental, is neat enough for shrubberies or even the flower garden. Its utility recommends it.—A LANARKSHIRE BEE-KEEPER.

#### TRADE CATALOGUE RECEIVED.

G. Shrewsbury, 36, Gray's Inn Road, London.—*Price List of Hot-Water Apparatus.*

R. Owen, Maidenhead.—*Catalogue of Chrysanthemums.*

H. & F. Sharpe, Wisbech.—*List of Seed Potatoes.*

Foster & Pearson, Beeston, Notts.—*Catalogue of Horticultural Buildings and Heating Apparatus.*

Sutton & Sons, Reading.—*Amateurs' Guide in Horticulture, highly Illustrated.*

James Veitch & Sons, Royal Exotic Nursery, King's Road, Chelsea.—*Illustrated Seed Catalogue for 1891.*

All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

**Carpet Bedding Plans.**—If you desire designs for copying you will find several in the "Parks and Gardens of London," published at this office, post free for 2s. 11d. There are also some good ones in a small manual prepared by Mr. A. Graham, Hampton Court Gardens,

Kingston-on-Thames; but we do not know whether he has any copies left or not. If you wish to learn geometrical drawing you will find lessons in Cassell's "Popular Educator," which you can obtain through a bookseller.

**Gardenias in Winter (W. R. S.).**—If the plants are swelling their flower buds they must not be kept in a lower temperature than 65°. Be careful not to give too much water, this will bring about deformity of the flower buds. If carefully supplied with water the same temperature as the house, and artificial manure is applied in small quantities to the surface of the soil at intervals of two or three weeks, the roots will continue active, and the flower buds develop naturally. Those that are first showing their flower buds and intended for spring flowering will do very well in a temperature 5° lower, provided they are not kept too wet at their roots. Young plants in 2-inch pots intended for growing on early in the year should be placed in the first-named temperature so that they can be kept slowly advancing. Pinch out the points of the plants to prevent their running up tall. Keep these plants close to the glass, but be careful that the soil does not become dry about their roots.

**Growing Chrysanthemums (Mum).**—Nine-tenths of the blooms that win prizes at exhibitions are produced by plants that are not topped at any time, though many growers top some of their plants once in spring, with the object of retarding the formation of the buds of varieties which are apt to show too soon. As you intend "making your first start" as an exhibitor next year you can scarcely expect to defeat experienced men in a forty-eight class, and if you succeed in doing so you will deserve much credit for the achievement. Most persons commence by showing in the smaller classes; still, if you produce sufficient first-class blooms for the larger by all means enter in those classes if you wish to do so. Manures have different effects in different soils, and no one kind can be said to be the best for all. You should read attentively Mr. Molyneux's and Mr. Iggulden's works on Chrysanthemum culture, both of which can be had from our office, the former for 1s. 2d., the latter for 9d., post free. The foregoing reply was in type awaiting publication when your second letter arrived. You can ask as many questions as you like, and answers will be readily given as soon as practicable. We answer all that we receive, but we cannot help letters being occasionally lost in the post; these accidents, however, seldom occur when the addresses are sufficiently full, and plain for delivery.

**Rose Climbing Devoniensis (J. J. T.).**—The following description of the Rose you name was given by W. R. Raillem in this Journal early in the current year. It gives the exact information you require. "(Pavitt, 1858).—I have not noticed the-climbing sports of the H.P.'s, as they seem to me to be of little practical value, since the blooms are generally inferior to the type, and better pillar and wall Roses are to be found among the Noisettes, Gloire de Dijon, Ayrshire, Evergreen, or Banksias. Some nine or ten are catalogued, and oddly enough they are mostly sports of varieties which have quite a short growth naturally. This Tea Rose, however, "out-herods Herod" in differing from the Devoniensis type, which (as we have seen) is of quite moderate growth, but the climbing variety is the strongest, most untidy, and irregular grower we have. Growing is its strong point, and it sometimes nearly omits the flowering part of the business altogether. A strong long shoot of the Gloire de Dijon or Noisette races, if laid in well and uninjured by frost, will bloom freely all up the rod. But not so Climbing Devoniensis. Away it goes again (if well treated on a south wall) from the top bud of last year's shoot, and its sole endeavour seems to be to get to the top of the wall as quickly as possible, and as a plant to look as bare at the base, ugly, and lopsided as it can. The great pithy, thorny, flowerless shoots are very susceptible to frost, and are not handsome at any time. But I have seen it show better manners, growing moderately and blooming freely throughout the summer on a south wall, where no attention was paid to it; and I believe this desirable state of affairs was attained by simple starvation, but the buds were small, and only useful as passable buttonholes."

**Mixed Laburnum (A. E.).**—Your designation of the tree leads us to suppose that you refer to a Laburnum bearing both yellow and purple flowers. We have seen many of such trees, the variety being known as Cytisus Adami. In all probability this was originally produced upwards of fifty years ago in budding Cytisus purpureus on the common Laburnum. In this process it is supposed that a cell of the one species became divided and united to a cell of the other, and the result has been a plant producing not only flowers of each species separately, but others partaking of the characters of both. There are other instances in the vegetable kingdom in which a similar union of cells is believed to have taken place, but Cytisus Adami is the best known and best established. Mr. Fish has added the following interesting notes on the subject:—"The changes produced on the Laburnum when grafted are sometimes wonderful and wholly unaccountable. We have rarely seen the common or Scotch Laburnum sport into other varieties. We recollect of only one instance in which flowers of purpurascens appeared. But if you graft either of the Laburnums with Cytisus purpureus or Cytisus supinus, the vagaries which sometimes take place are astonishing. A small standard of Cytisus alpinus was grafted with Cytisus purpureus, and on the same branch will sometimes be found small pieces of yellow and purple, and at the very point strong shoots of the Cytisus alpinus, the 'blood' of the stock finding its way through the more weakly growth of the scion. What is remarkable is, that grafting or budding with one variety will frequently, as the plant grows, present you with three or four varieties."

**Utilising Houses and Pits (Market).**—The unheated greenhouse may be profitably used for growing Grapes, Chasselas Vibert, Foster's White Seedling, Black Hamburg, Black Prince, and Trentham Black are suitable varieties; and in winter the house would form an admirable place for Mushrooms on the cool system in no way interfering with the resting of the Vines, the Mushroom being quite safe with efficient protection. As there is a bed in the centre and at the sides this arrangement may be inconvenient, therefore it may be used for Strawberries in pots, which will come in fully a fortnight to three weeks in advance of fruit from outdoor plants. Noble is a profitable variety to grow. The Strawberries could be followed by Tomatoes, having the plants raised in other structures, so as to be strong for planting out in May. In winter the house could be utilised for Christmas Roses (*Helleborus niger* and its varieties), also Marie Louise Violets, both being over by the time of introducing Strawberries. There is another purpose to which the house could be put—viz., Peaches, but that would preclude the house being used in winter for other purposes. Dagmar, Crimson Galande, Stirling Castle, Dymond, Prince of Wales, and Sea Eagle are excellent varieties for a cool house and market, being good in colour or size and pack well. Of course, the house could be used for Cucumbers in summer and Mushrooms in winter. You will find "Mushrooms for the Million" useful if you embark in their culture. The other house is not heated sufficiently for the growth of Cucumbers in winter or even in spring, but it might be used for them or Tomatoes in summer, one being about as profitable as the other; and in winter it would answer admirably for Mushrooms, which well grown are decidedly profitable. You may also grow Chrysanthemums, good blooms of late white varieties being remunerative. Another plan is to grow Grapes of the late keeping varieties, but that would preclude anything else; and an alternative plan is to grow midseason Grapes, utilising the house in autumn for Chrysanthemums. No. 1 pit is suitable for Cucumbers and No. 2 pit for Tomatoes, which may be followed in the autumn by Mushrooms or Violets. The disease in the Cucumbers and Tomatoes is identical. Add a good handful of superphosphate of lime to every bushel of your turfy loam, and if obtainable about a fourth of clay marl, dried, pounded, and mixed with the soil. These additions may not save your plants from the disease, but they will render their tissues firmer and less liable to attack and severe injury.

**The Costard Apple (M., Hants).**—This Apple is described in the "Fruit Manual" as follows:—"The large oblong five-ribbed and five-sided Apple, with a green skin and sometimes a brownish tinge on the side next the sun, an open eye and short stalk, is no doubt synonymous with the Catshead, and this accounts for George Lindley saying they are the same variety. But there are two other varieties of Costard which are undoubtedly distinct, and these are the Herefordshire or Dadnor Costard and the Gloucestershire Costard, which will be found described under these names. The Costard is one of our oldest English Apples. It is mentioned under the name of 'Poma Costard' in the fruiterers' bills of Edward I. in 1292, at which time it was sold for a shilling a hundred. The true Costard is now rarely to be met with, but at an early period it must have been very extensively grown, for the retailers of it were called Costardmongers, an appellation now transformed into costermongers. It is mentioned by William Lawson in 1597, who, in his quaint style, says, 'Of your Apple trees you shall finde difference in growth. A good pipping will grow large, and a Costard tree: stead them on the north side of your other Apples, thus being placed, the least will give sunne to the rest, and the greatest will shroud their fellows.' Modern authors make the Costard synonymous with the Catshead, chiefly, I think, on the authority of Mr. George Lindley, who has it so in the "Guide to the Orchard;" but this is evidently an error. All the early authors who mention both varieties regard them as distinct. Parkinson describes two varieties of Costard—the 'Gray' and the 'Greene.' Of the former he says, 'It is a good great Apple, somewhat whitish on the outside, and abideth the winter. The Green Costard is like the other, but greener on the outside continually.' Ray describes both the Catshead and Costard as distinct, and Leonard Meager enumerates three varieties of Costard in his list—the white, grey, and red. Some etymologists, and Dr. Johnson among the number, consider this name to be derived from *Cost*, a head; but what similarity there is between this Apple and a head, more than in any other variety, must puzzle anyone to discover. Is it not more probable that it is derived from *Costatus* (*Anglice*, costate, or ribbed), on account of the prominent ribs or angles on its sides? I think this a much more likely derivation."

**Names of Fruits.**—The names and addresses of senders of fruit to be named must in all cases be enclosed with the specimens, whether letters referring to the fruit are sent by post or not. The names are not necessarily required for publication, initials sufficing for that. Only six specimens can be named at once, and any beyond that number cannot be preserved. (A. B.).—1, *Nec plus Meuris*; 2, Not known, and worthless; 3, *Jersey Gratioli*. The Apple is not in a condition to be named, indeed none of the fruit display the true character of the varieties. (E. Price).—Pears: 1, *Chaumontel*; 2, *Josephine de Malines*. Apples: 1, *Flower of Kent*; 2, *New Hawthornden*; 3, *D'Arcy Spice*.

**Names of Plants.**—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at once,

and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (G. P.).—1, *Selaginella Martensi*; 2, *Selaginella caulescens*. We cannot undertake to name *Croton* and *Dracaena* leaves. (D. E.).—It is a neat little flower of the *Odontoglossum maculatum* type. It is worth preserving, for as the plant becomes stronger the flowers may improve.

COVENT GARDEN MARKET.—DECEMBER 17TH.

No alteration in prices. Business somewhat better. Hothouse goods in fair supply.

BUTTER MAKING.

We were pleasantly reminded that we had written nothing on this subject for some time by an able address before the Northamptonshire Chamber of Agriculture given recently by Mr. T. Nuttall of Beeby, Leicester, the well known veteran lecturer on dairy farming. The address was so practical and the teaching so incisive and clear, that the chief points may be usefully recounted here for the benefit of our readers.

At the outset it was insisted upon that the rule of thumb system must be abolished in dairy farming, and every practical detail mastered and reduced to a sound system which would render failure practically impossible and raise the quality of our dairy produce to the highest standard of excellence. That British dairy

produce is very far below this was shown by the fact that at the present time foreign cheese and butter realised 25s. per cwt. more than home produce in our markets. The dealers assert positively that no dependance can be placed upon English butter, for it is never two weeks alike and its keeping qualities are very low. With us the fault is a want of thoroughness or a clinging to rule of thumb, and slowness to obtain that thorough dairy education which is now possible. As the County Council meeting at Leicester saw their way to voting £300 for agricultural education there can be no reason why similar aid should not be forthcoming generally, and it will be if asked for.

Turning to cows, it was well laid down that the milk of each cow should be subject to a frequent test, as it is quite certain very many cows are not worth the food they eat. If a cow does not give more than 500 gallons she is not worth keeping. We put it plainly to home farmers. Do you apply any sort of test as to the quantity or quality of milk of individual cows? Hardly ever do we see a herd of cows without inferior animals greatly predominating, and yet they cost just as much to keep as the good ones. Only a few hours before sitting down to write this paper we watched a herd of Leicestershire cows being foddered out on an open pasture, with a bitter east wind blowing fine hard snow across the pasture; a small quantity of hay was thrown about the pasture out of a cart, each cow not getting more than a few handfuls, as the farmer wished to compel them to eat down the old fog left upon the pasture, and remember this foddering at midday had to suffice for the whole twenty-four hours. Well, the cost of food was reduced to a minimum there, and we suspect the returns were very much in proportion to it. The owner of the herd milks twenty-five of them, and he would certainly find it more profitable to reduce the number of his cows by half, to adopt a more liberal dietary, and an altogether more humane method of treatment.

The importance of cleanliness in every way was fully entered into by Mr. Nuttall, and he also laid stress upon the kindly treatment and thorough milking of the cows, the last of the milk in the udder always being the richest. He recommends the use of glass test tubes in all dairies; but for large dairies we strongly advise the use of the Victoria milk tester which we recently described, as being altogether more reliable and sure. In describing his own process he explained that he allowed the cream to ripen for about thirty-six hours, and put 1 lb. of salt to every 10 lbs. of cream. That quantity of cream which unripened would yield 8 lbs. of butter would, if properly ripened, yield 9 lbs. It was impossible to get rid of the caseine until the cream had time to ripen, and butter will never keep well if the caseine is not got rid of. He explained that this use of salt in the cream did nothing but good and did not affect the freshness of the butter, as all the salt was taken away in the buttermilk and caseine. To keep butter well not only must the whole of the caseine be removed from it, but no salt be put into it. This refers more especially to butter not intended to be used at once, or in a few days after it is made. It is put down in pans or jars, and salt water placed over it and changed once a fortnight. When the butter is taken out for use salting is done by using a brine consisting of 2 lbs. of salt to a gallon of water.

Much stress was laid upon the churning. The churn should be cleansed first with cold, then with hot, water the day before using using salt for the scouring instead of soda, which ought never to be used for a churn. The butter should be churned at 54°, and then allowed to rise to 65°. The churn should not be turned at a great speed, thirty-five times per minute being a safe rate of speed. If the churn was without dashes it might be turned forty-five or fifty times per minute. Mr. Nuttall asserted that he had butter made twelve months since, and it was as good now as it was when he put it down, as it had no caseine in it, and nothing could attack pure butter fat.

The sum and substance of the lecture was really systematic

practice based upon the teachings of science. The entire work of butter making is purely mechanical, and strict attention has only to be given to the necessary points and to thorough cleanliness to ensure butter of uniform excellence. Where this is not striven for in the right way it is far better not to attempt butter making at all, but rather to dispose of the milk to a factory or dealer, and so avoid the certain loss of attempting to sell inferior butter. We do not advise such a course, but would rather urge upon every dairy farmer the importance of better practice, and of being satisfied with nothing short of butter of the highest quality always.

#### WORK ON THE HOME FARM.

Now that the cows are settled down in the yards for the winter especial attention must be given to keeping up the quality of the dairy produce for the house, that being an especial test of good management for the next two or three months. With nothing but "stale" cows the difficulty is much increased, but with a cow calving every fortnight it becomes comparatively an easy matter to have plenty of good butter. We avoid artificial colouring altogether, and always regard with a suspicious eye fresh butter in midwinter with the rich golden colour of midsummer butter. The latter is natural, the former is artificial, and does not please the eye for that reason. Butter pure and unsophisticated at this season of the year is of pale colour even from Jerseys, but is nevertheless very palatable. With plenty of the best hay as the chief thing, and some bran, Carrots, and Cattle Cabbage, pure water, and access to rock salt, there can be no taint in the milk from the food. See that no cow with a morbid appetite has access to foul stable litter, of which it may partake greedily, and so spoil its own milk and that of any other cow mixed with it. Next to careful feeding and cleaning of cow houses comes cleanliness in milking. Clean hands are just as important as clean pails, and we not only take care to provide the milkers with means of washing in the cow-house, but see that they use them. It requires a little time to get men into habits of thorough cleanliness, but once acquired the habit of washing before milking clings to them.

Calves are now taken altogether from the cow after the first day, and are fed with milk from a stale cow, as the fresh cow's milk cannot be spared. The calves have very snug quarters in a separate compartment, with good light and ventilation, but quite closed. Older calves are also kept altogether, shut in for the winter, and are well fed upon a mixed dietary of chaff, crushed oats, bran, and a little of the compound Waterloo round cake with milk, according to the age of the calves. Such a dieting is ample, and care is taken not to overdo it. Our aim is to promote free growth and lusty condition without forcing the young stock on so fast as to incur any risk of loss from black leg. We find our care well repaid by the healthy, thriving condition of the stock, and very rare indeed is it that any sickness or loss occurs among them. Where young stock have not such care, and are left out on pasture exposed to the weather, with just a bit of hay once a day, how frequently during winter does one hear of another stirk being bad, and then of its speedy death. The wonder is how invariably this goes on every winter on Midland pastures, without any effort at a radical change in winter management.

#### OUR LETTER BOX.

**Roots for Exhibition (H. R. W.).**—We have received your letter. The requisite information cannot very well be compressed into the form of a brief reply. Rich deep soil with liquid manure and heavy manurial mulchings in summer are the chief essentials to success. The subject shall have further attention.

#### REMARKS.

7th.—Fair, with a little sun in afternoon.  
8th.—A sprinkle of snow early; fair day.  
9th.—Overcast day; misty evening.  
10th.—Fog early; sun shining through slight fog from 10 A.M. till 3 P.M.; fog again in evening.  
11th.—Fog till about 11 A.M., then clear, but slightly foggy all day.  
12th.—Slight fog early; bright sunshine from 11 A.M.; fair afternoon and evening.  
13th.—Fog early; bright sunshine from 11 A.M.; clear evening and night.  
A very cold week, temperature quite 12° below the average. No rain or snow.  
— G. J. SYMONS.

PERHAPS in no better way can an adequate idea of the enormous population and great extent of London be formed than by visits paid to the principal markets at times when the demands and supplies are specially large. Every season possesses particular characters, but it is doubtful if at any period the general supplies are so remarkable as in Christmas week. The spring months and during the London season are distinguished by greater abundance of flowers; the early summer gives wonderful quantities of soft fruits, especially Strawberries, followed later by the Cherries and other stone fruits; while in the vegetables we have Peas contributing for some weeks a special feature of much interest. These are, as it were, only episodes in the market history of the year. At Christmas there is a concentration of supplies, the home productions being largely increased by the importations from other countries, for that great inducement—the best prices—are then obtainable for all seasonable produce of good quality. So it is that no better time can be selected for a visit to a representative market, not only in the metropolis, but in any of our chief provincial towns, where these emporiums have developed considerably in recent years.

Covent Garden Market is rightly regarded as one of the best and most characteristic establishments of its kind to be seen in Great Britain, for there can be found at any season the choicest productions of the vegetable kingdom employed by man for food or ornament. Thousands of tourists in London every year include this market in the "sights" of the city; but they usually visit it during the day or evening, when comparatively little remains to indicate the business transacted. They may, it is true, find some of the auctioneers, who dispose of imported flowers or fruits, busy and noisy amidst a crowd of eager bidders. They can also see huge piles of baskets, boxes, and other packages, that give some idea of what has been or is to be done. Possibly they may visit the spacious new fruit market, and observe barrels of American Apples by the thousand, or cases of Pine Apples almost as numerous; but if their visits are later than 9 A.M. the great plant and flower market will be closed, and the practical, or what may be termed the principal business of the general market is closed. To gain anything like an approximate idea of Covent Garden it must be visited at early morning, and on several occasions at different seasons, and then those who are interested in the work of the world will find ample to astonish, to interest, and to instruct.

Few except those immediately concerned have any accurate knowledge of the manner in which business is conducted in Covent Garden. Many fancy that to hold a stall, stand, or shop in this market is a kind of hereditary privilege, and that outsiders are rigorously excluded; but this is far from being the fact, as whenever there is space anyone can claim the right to sell in accordance with the rules, and on payment of the dues or tolls. There are, however, something like 600 persons who have shops, stalls, or stands, either temporarily or for longer periods, and these, with their assistants and others, must bring up the total, exclusive of buyers, to about 2000 persons who are on every market morning actively engaged in the business. It is not generally known, too, what a broad distinction is made between growers who are also sellers and those who only sell what they have purchased from the

producers. The growers are given precedence as regards the choice of situation and application for space, while the others, termed "higglers," have in a great measure to take their chance, and that is usually an outside position. Then also as to the collection of market dues. In the case of shops and stalls or stands a rent is paid daily or for longer terms according to arrangement. Upon a large quantity of the produce brought in for quick morning sale, however, tolls are charged at the rate of  $\frac{1}{2}$ d. to  $1\frac{1}{2}$ d. per barrel, basket, package, or in whatever form the particular fruit or vegetables are sent in, for it is to these that this method specially applies. For instance, a barrel of Onions or a barrel of American Apples and a basket of Watercress contribute the same amounts to the income of the Duke of Bedford—namely, 1d. each.

But the main object of these notes is to point out some of the leading features of the Christmas market, and first to be considered is the fruit, which in all respects constitutes one of the most important parts of the business. Apples, of course, take first rank, and here we learn that English Apples are very scarce, and long prices are required for good samples of choice fruit. To compensate for this deficiency American Apples have been sent by hundreds of barrels, as, though the crops in the United States were not so good as usual, the prices here paid well. It is said that some of the dealers in foreign fruit have had a most profitable season, and 42s. per barrel is mentioned as the rate obtained for Newtown Pippins. Pears from English gardens are still more scarce than the Apples, but from France and the Channel Islands come plenty of fine fruits, especially baking or stewing Pears.

Pine Apples constitute a trade in themselves, both to growers and the dealers. Shiploads of these, with Oranges, are sent from St. Michaels, where the cultivation of these fruits is now an important industry. Handsome fruits are sold for a few shillings which not many years ago would have brought at least four times the sum. Some home-grown Pine Apples still find a place in the markets, but only the best fruits for special occasions. In the large Floral Hall, a new fruit market, at times we have seen astonishing displays of imported Pine Apples—hundreds of cases, opened and arranged along the floor, in preparation for auction sales, presenting a spectacle such as could probably not be seen elsewhere.

Grapes are in demand at Christmas, and here our own growers have a chance of competing with advantage. A high authority in the market says, "The Grape business is only in its infancy," and this piece of information will come as a welcome surprise to those who are familiar with the enormous quantities produced at Worthing, in the north and east of London, besides the great establishment at Clovenfords. It indicates that the demand is still greater than the supply, but as the latter is increased the prices go down, and then it becomes a question whether the cost of production, carriage, and sale can be covered. There is good indication that late Grapes pay better than early ones, because the cultivators for market are concentrating their attention chiefly upon the former. At the present time the major portion of the supplies consist of Alicante and Gros Colman, with Muscat of Alexandria and Lady Downe's in smaller quantities. Of the two first named neatly packed baskets are sent and sold by thousands during the busy season at fairly remunerative prices. In addition to these, however, we find the Spanish Almerian and Sweetwater Grapes in liberal supply, the former of which arrive packed in barrels and the others in boxes, furnishing abundance of good fruit that can be sold at moderate rates, and though not equal in quality to the home-grown Grapes they are very useful.

Oranges have already been noted as coming in quantities from the Azores; large consignments are also received from Spain and Portugal. Nuts constitute an essentially Christmas feature, and are obtained from many widely separated countries. From the West Indies and South America come Cocoa-nuts and Brazils in plenty; small nuts, including Barcelonas and Almonds, being

secured chiefly from Spain, the Azores, and the South of Europe generally. Tropical fruits of several kinds—such as Custard Apples, Prickly Pears, &c.—are represented by small supplies; but Bananas are imported in large quantities from the Canary Islands, West Indies, and Florida.

From the above it will be seen that fruit constitutes a large proportion of the seasonable supplies, but there is another great character of the Christmas week that cannot be overlooked—namely, the Mistletoe, Holly, and evergreens for decorative purposes. The trade transacted in Mistletoe in the course of a few days is astonishing, and we are informed that no less than 2000 crates have been received at Covent Garden for Christmas use. These crates are lightly but strongly made, about 4 feet wide and deep, and in them the Mistletoe is closely packed, each crate probably containing sufficient for supplying at least 100 homes with ample material for enjoyment during the season of festivity. If this be a fair estimate Covent Garden alone must furnish 200,000 homes with the interesting parasitical plant then in such great demand amongst young people. The Holly is also received in large quantities, but there is no means of gauging the actual number of loads or bundles. A visit paid a few days before December 25th to the extensive outside enclosures near Market Square gives the best idea, for then the Holly with miscellaneous evergreen shrubs is seen piled up in great mounds such as would be thought could never be cleared. Yet they all disappear, and good Holly is always in great request. This year the Holly is particularly well “berried,” and is selling well; last year there was but little of value, and much difference is found in the relative quantities of Holly and Mistletoe sold. When the former is good there is less demand for the latter, and *vice versa*. The Mistletoe is nearly all obtained from France, especially Normandy; but the Holly is all English. The common Firs known as Christmas trees are disposed by waggonloads, the trees ranging from diminutive specimens 20 inches high to giants of 20 feet, that are provided for special fêtes.

Flowers are necessarily in demand, but their prices are so high that they do not come within the reach of the multitude. A florist with only a small window to furnish assures us that he cannot obtain sufficient for his purpose at a less expenditure than £10 per morning, and at first glance some would be inclined to think the flowers were worth as many shillings, certainly at some seasons a much better display could be had for the last named sum. While the mild weather lasted flowers were unusually cheap, in fact there was a difficulty in selling them; now it is quite different, and it is surprising how great a change was effected in a few weeks. Chrysanthemums are the most abundant, but they have a dull and faded appearance in most cases. Violets come next in quantity, then of forced plants Roman Hyacinths, Lilies of the Valley, Lilac, and Richardia spathes, the last realising from 12s. to 18s. per dozen first hand. There are also a few boxes of Zonal Pelargoniums, Bouvardias, Roses (chiefly imported), Carnations, Eucharis and Tuberoses.

Plants in pots are chiefly Palms, Ferns, and others possessing foliage attractions, and useful for grouping, but there are some examples of early Tulips, Roman Hyacinths, and Lilies of the Valley, pots of these mixed having a pretty effect, and seem to be most in demand. Small shrubs in pots are also numerous. Of vegetables there is nothing special to note, the hardy Kale and other greens are the principal, but good Brussels Sprouts are in demand. Seakale is also selling well, and is being sent in more freely.

Such are the leading characteristics of Covent Garden in the present week, and they may be taken as an example on a larger scale of other metropolitan and provincial markets. In some respects the weather has been exceedingly unfavourable to the producers, but a measure of compensation will be derived from the higher prices obtained. The greatest disadvantage probably is found in the fact that many intending purchasers are deterred from undertaking expeditions with that object in view, and in this

way severe, and especially snowy weather, a few days before Christmas makes an enormous difference to business, both of wholesale and retail dealers.

### GOOD WISHES.

As I am writing at the close of the year, and near Christmas, perhaps, as an old reader—a reader of over forty years—I may be permitted to send my greeting to all who are interested in the *Journal of Horticulture*—Editor and staff, writers and readers, one and all, and hope that they may have a peaceful and soberly merry Christmas, and a bright and prosperous New Year. We that are getting on in life naturally look back on past days, and are disposed to think that those days were the best, and that our Journal now, the dear old *Cottage Gardener* of the past, was then the best in the world. I rejoice to see that it still goes “Upwards and Onwards.” This *nom de plume* was the signature of him who is now, I think, your oldest writer, Mr. R. Fenn of Sulhamstead. He, I know, has a leaning for past ways, and a lingering love for past days and past writers; still, equally with myself, I know that he rejoices in the progress of our Journal on the lines of his old signature, and rejoices specially in the vigour, the freshness, the ingenuity, and the high intelligence of the present day writers on our paper. “The older order changeth, yielding place to new,” but the world’s work is done. The lamp of gardening knowledge is taken out of older and quieter hands, and is carried forward with youthful impetuosity, with perhaps a higher educational intelligence, but not with more practically directed energy than we their fathers carried it. Go on, then, ye young and strong men and conquer, and none will rejoice more than we who belong to an older and passing away generation.—N. H. POWNALL, *Lenton Hall Gardens*.

[It is very pleasant to be kept in remembrance by old friends, and we assure our genial correspondent that Editor and staff appreciate and reciprocate their kindly greetings. It is but natural for those who have passed the meridian of life to think that the past days were the best days. We all look back longingly to the time when our “hearts were young,” and because young, more impressionable to passing events than they can be in after years. But though the old hearts cannot be so blithe as the young, they are not less constant, and not less sympathetic with past and present workers in a common cause—gardening. This is demonstrated not by the above letter only, but by the veteran alluded to in it, and whose “lamp” still shines on another page of the present issue. It is not the less welcome, even though it may make more clear certain shortcomings of which all men must be conscious who strive to do their best under the high-pressure system of working in these latter days. Both these time-honoured friends, and others who have laboured long and zealously, have done yeoman’s service in working and teaching, and thus in training successors for carrying on the work they love and will do to the end. While we rejoice in the energy and ability of their successors, we are not less proud of the pioneers. The world’s work is not yet done in gardening, nor are all its old workers, as is evident by the vivacity they display when impelled, now and then, to enter the literary arena. They can brighten the pages of the *Journal* yet, and impart to it freshness by their facile pens. We are thankful, as they are, that this is so, and trust we may live and love together to exchange mutual greetings at the close of another year. And now, to readers and writers, old and young, and everywhere, we re-echo the words of Mr. Pownall—for we can find no better to convey the expression of our strong hope and sincere wish that “one and all may have a peaceful and soberly Merry Christmas, and a bright and prosperous New Year.”]

### FLOWER CULTURE FOR PROFIT.

#### HELLEBORES.

HELLEBORUS NIGER MAXIMUS is by far the best of the Christmas Roses—the name by which one section of Hellebores is most familiar—and a good stock of this variety may be said to pay better than any other plants or flowers that can be grown. This, at first sight, might be considered a rather strong assertion, but it can be proved by facts and figures. At a very trifling cost or outlay in the way of manure, labour, and temporary protection we were able last season to gather from four span-roofed frames flowers that sold for upwards of £6, and probably nearly as many were used for the home and town house decoration. It must, however, in all fairness be added that it has taken at least six years to work up our stock of the plants to this pitch, the start having been made with about one dozen strong clumps. Much the best prices are

obtained just before Christmas and for about one week afterwards. We are very well satisfied with 1s. per dozen blooms at this the commencement of the season, the prices then gradually dropping to about 4d. per dozen for fresh blooms. In all probability our average per strong clump this winter will be 100 blooms, and it will thus be seen I am not far wrong in attaching so much value to the breadth of plants under my charge.

Most gardeners are fully alive to the usefulness of these plants, though only a comparatively few have as yet succeeded in growing them successfully. Failures are not so much due to any inherent fastidiousness of the plants, but rather to either a bad start being made or an excess of zeal on the part of the cultivator. What I call making a bad start is the too common practice of purchasing cheap plants, and which are principally obtained from Austria and northern Italy. These are simply "collected" plants, obtained from where they were growing in a wild state, and not only is the variety inferior, but the plants are almost irrecoverably injured by long exposure to the air before they reach this country. Last winter I saw a large breadth of imported plants in a nursery that had lost nearly all their leaves by an ordinarily severe frost, and though most of them are producing a few flowers this season they are yet a poor weakly lot, and scarcely worth garden room. Nor are the plants grown in Holland to be depended upon, and those who are anxious to make a good start should purchase, as soon as they can have them, strong home-grown clumps from English nurserymen. The flowers of the Easter variety do not equal the Eucharis in purity of colour, but are a good substitute for the same, and far more serviceable.

Where so many err is in constantly lifting, shifting, and dividing their clumps. Large growers of these flowers for market certainly take great liberties with their plants, a great breadth being annually cleared of their leaves, lifted, and planted thickly under glass, so as to have abundance of flowers for Christmas; but they have several large batches of various ages always coming on, and can afford to rest or split up any plants previously overworked or roughly used. Private growers with a small stock of plants must run no risks, but ought rather to arrange their plants in such a manner as to do away with the necessity for moving them for several years. What Hellebores require and should have, if possible, is a deep and fairly rich root run, a moderately rich leamy soil best suiting them, though I have known them do well in what is termed a brashy soil. A hot and dry soil or position will not do. Wherever planted they ought to be arranged in groups or patches, with a view to covering these with frames or handlights, as unless thus covered the flowers are of little market value, the colour and, strange to relate, durability of the flowers gathered from non-covered plants being faulty. We find span-roofed frames 9 feet long and 4 feet wide with hinged lights very serviceable. This season the flowers are very late, but if there are plenty of buds half or three parts expanded at Christmas we shall be very well pleased, as these if gathered and placed in pans of water in strong heat, such as a plant stove, will open well in a few hours. Farther cultural notes must be deferred.—M. H.

### CHRISTMAS EVERGREENS.

As the festive season approaches not only are eating and drinking commodities in great demand, but also all kinds of evergreens. The British public has always bedecked their homes with these, from humblest cottager to the wealthy, and it is no unusual sight to see the working classes on Christmas Eve, or just before, carrying home a small Spruce Fir as a Christmas tree for the children and a small bunch of evergreens, that both together, perhaps cost the modest sum of sixpence. It is also surprising to see the large number of crates of Mistletoe disposed of and we wonder whence it all comes. I am told that the greater part of the Mistletoe that finds its way to our large markets comes from France and other European countries. Be that as it may, it is certain there is not sufficient in these islands to meet the enormous demand for it.

It has been the custom for many years for the butchers, bakers, grocers, and all purveyors of useful commodities to decorate their shops, especially at this time of year, and show off their wares to the best advantage; and it is surprising that year by year each one tries to vie with his neighbours to have the best "show," and to improve on the last year's display; and the streets will be thick with people admiring and criticising, and giving their opinion on the tradespeople who have the best display, that where a plentiful supply of evergreens are forthcoming these are bought up to help in this Christmas decoration. The fashion has also gone to the church decorators, and the ladies who so willingly give their time, zeal, and ingenuity for beautifying the house of God deserve great

praise for the pains they take in the arrangement of the different kinds of evergreens. Texts in windows, panels of reading desks and pulpits, neatly edged with foliage and berries. Green moss also is used with effect. One advantage of evergreens at this season of the year is that they last fresh so long after being cut. Some hanging wreaths that were made last January with small pieces of variegated Box did not look bad at the end of March. Sashcord was used as a foundation with small string for tying on. I also saw some long wreaths made with large leaves of the Irish Ivy tied very closely that did duty in a barn for a meeting in October, and from some cause or other were not taken down. The March following another meeting of a different character took place in the same barn, and the Ivy wreaths were still left up, and by candlelight they looked but little altered. The almost total darkness and stillness perhaps had something to do with their keeping so well. The evergreens used for church decorations, as a rule, keep well the five or six weeks they are allowed to remain.

Foremost amongst the Christmas evergreens stands the Holly. No bunch or bundle is complete without it, and is eagerly sought after the fortnight preceding the 25th of December. I usually have cut the quantity I think will be required about the first week in December. It is laid in heaps and Laurel boughs placed over it to protect it from birds, for if left till the month is far advanced the chances are the birds take the greater part of it. With us they usually begin before November is out, stripping tree by tree till all are gone. Nor is it all safe when cut even from birds, for if field mice are at all abundant they will find them out and strip the berries off, I suppose for the sake of the small kernels inside the stones. A few years ago we had a particularly fine-berried tree that I wished to keep for home use; this was cut earlier than usual because of the birds, and covered over well with Laurel boughs. This heap was not looked at till wanted in the week preceding Christmas, and judge of my surprise when it was uncovered not a berry was left upon any of the branches, but all or nearly so lay upon the ground. It was evident that field mice had stripped them, and the ground in the vicinity was honeycombed with their runs. A good cutting of Laurel boughs are now put underneath the Holly as well as above it, as a little prevention from the depredations of these little rodents.

The small-leaved Ivy is one of the best plants for decoration, either for summer or winter, long loose trails from 3 to 6 feet long particularly useful in a variety of ways for rooms, halls, passages, churches, or near cornices, or wherever a hook or nail can be put. It is not of so much use if taken from a wall or building, but should be taken from woods and half-wild shrubberies, where it is found growing in its own wild way, climbing up the trunks of trees and shrubs, and then hanging down in long graceful trails, sometimes 12 feet in length. The stone pillars in a church I have seen decorated with it, not just a few pieces round the top, but commencing at the bottom of the pillar, and training it in an irregular, but still tending in an upright direction, varying the branches and laterals from 3 to 12 inches apart, making it appear as if the Ivy had grown there. Very small tacks appear to have been used here and there to fix it in position, also a few circles of small string round the pillars.

The leaves of *Berberis Aquifolium* make very good edgings for text boards, so also small sprays of Lobb's Thuja (*Thuja gigantea*), fixed with small tacks. The foliage of this last-named plant can be used in a variety of ways that suggest themselves to the art of the decorator. It is good for making small wreaths from 2 to 3 inches in thickness, with thick string for a foundation. The foliage lasts well, it is elegant and graceful, and small pieces a few inches in length, if cut right, lie flat, and can be used for making edgings or letters on a light ground, such as calico or canvas. If on a board, very small tacks can be pierced through the stems, but if only on canvas or bunting, small pins answer very well, or better still, a needle and thread. A very neat and lasting plant is the small Periwinkle, *Vinca minor*, and its variegated variety. Sprays of from 12 to 30 inches in length are good for hanging down from lamps and chandeliers, or other things where something small and light is required. *Lonicera aurea reticulata* is pretty, but will not last so long as the *Vinca*.

Among the other evergreens used for Christmas decorations are the Laurel, Aucuba, Box, Yew, and berried Ivy. *Cupressus macrocarpa*, *C. Lawsoni*, *Abies Douglasi*, *A. Nordmanniana*, and *Thuja gigantea*, when plentiful are also good, but no attempt should be made to disfigure such trees by cutting the ends of the branches off. It often happens that where branches hang over walks or over shrubs the bottom branches want sawing off at the trunk, and it is the foliage from these that can be utilised, and now is a very good time to saw them off where wanted. Box, Yew, and Laurel should be cut as not to disfigure the plants. Small boughs of the *Aucuba japonica* are good for filling up grates and fireplaces built up and laid lightly on each other. One of the best

things sought after is the variegated Holly, but it should be cut with a sparing hand, for it takes a lifetime to grow a fair sized tree. Leaves of this and the berries I have seen made into wreaths and crosses at cemeteries as tributes to departed relatives and friends, lasting and looking fresh for a long time; the leaves as an edging all round, with a centre of 2 or 3 inches (according to size) of berries stuck in with pins or threaded with a needle. Variegated Box is pretty, but unless it thrives well and there is abundance of it, should also be cut sparingly.—A. HARDING.

## A GARDENING TOUR IN IRELAND.

(Continued from page 513.)

THE concluding sentences of my last letter referred to a garden visited on the north coast of Antrim, which occupied an extremely exposed position, and to that a few words will be devoted in the present communication. When gardening is successfully carried out under the greatest difficulties we may expect to find something of special interest. I have had opportunities of visiting many exposed gardens in Great Britain along the east, west, and south coasts, and have often been astonished at the results produced under most unfavourable circumstances. Upon one occasion I journeyed to the late Mr. Percival's residence at Southport, Lancashire, to see his large collections of Orchids there in fine healthy condition; yet the houses were within a short distance of the sea, and the prevailing powerful westerly or south-westerly winds swept into them laden with salt whenever the ventilators were open, as they were very freely and generally. Along the Northumberland and Durham coasts also there are several gardens quite near the stormy North Sea, as, for instance, Earl Grey's garden at Howick Hall, Lesbury, where Mr. David Inglis has for so many years produced such excellent cultural results, but there is more protection from the winds than at Southport, though the cold is greater in the winter and early spring. At Sunderland and in the neighbourhood several gardens are still more exposed, with comparatively little protection, notably at Seaham Hall, one of the Marquis of Londonderry's estates, which is under the management of one of the oldest Journal subscribers and readers, Mr. R. Draper. There also gardening is carried out under adverse circumstances, and with no small measure of success. These are only a few examples of exposed gardens that occur to me on the moment, and where I have been particularly impressed with the disadvantages overcome, but many others could be named in England, Scotland, and Wales occupying equally unfavourable positions. In all such even a moderate degree of success depends upon the judgment and care exercised on the part of the gardeners, who must be essentially experimental at first, as it is only by experience that it can be ascertained what plants will form the best protection and what others can be grown, either indoors or out, sufficiently well to pay for the labour expended upon them. There is a surprising difference in the adaptability of plants to particular situations, both as regards exposure to cold, to wind, and to the sea breezes, and the same remark applies to fruit trees with equal force. Because a certain plant, shrub, tree, or variety of fruit is found satisfactory on the west coast it does not by any means follow that the same will give as good results on the east. Some plants possess a much greater elasticity of constitution than others, and to find these will naturally require continual trials for several years with close observation of their behaviour in various positions. The record of an exposed garden kept by a practical and well informed man can thus be rendered both interesting and useful, as it serves for a guide to others who are in similar difficulties.

Attention to the matter is especially necessary, because the most picturesque situations that can be selected for gentlemen's country or seaside residences are usually the most exposed and the least fitted for gardening in a general way. One of the first considerations in such a place is to provide something as shelter from wind, either walls, fences, hedges, or plantations, and here it may be noted that the matter is of considerable importance, as if well done at first much after trouble and expense will be spared. A short time since a cultivator engaged in flower production in the Scilly Isles was discussing this subject with me, and he expressed himself somewhat as follows—"In our Isles the wind is our greatest enemy, and causes our plants and flowers more damage than anything else. Many different plans have been tried to obviate this, and a good proportion have failed absolutely. Some went to the expense of erecting walls, but these, if anything, seemed to aggravate the mischief, for the wind bounced over them and descended upon the plants with redoubled force. I tried them myself, but was soon glad to remove them notwithstanding the expense. Closed fences are similarly useless, but partially open ones were better, and best of all were strong well planted hedges. They broke the force of the wind, which filtered through them as it were, and so satisfactory

did they prove that I have extended them round, and as divisions, on the whole of my land." This applies, of course, to an exceptional situation, but there are many places where a similar result would be obtained, and in nurseries occupying exposed positions, and in others for the protection of tender plants, the value of hedges for shelter has been abundantly proved. For a garden of any extent something more is required, and a plantation belt of the hardier Conifers becomes a necessity. But this long preamble is only intended to lead up to a short description of the garden at

### RANKERRY HOUSE.

When Lord Macnaghton selected this site near Bushmills for the present spacious mansion he undoubtedly paid more regard to the attractions of the coast scenery than to the fitness of the place for the development of a satisfactory garden. Many in fact would have despaired of ever producing anything of the kind. A large measure of success has, however, attended the efforts of the gardener (Mr. E. Duffin) to render it not only useful but ornamental as well. The house stands on an elevated portion of the cliff overlooking Blackrock Bay, and commands an extensive prospect along the coast to Portrush, with the Donegal coast in the distance, and on a bright sunny morning, like that when I was there, it was delightful in the extreme. The garden is a short distance farther in from the sea, but near enough for the spray to reach it on stormy days, and Mr. Duffin says that sometimes he "could go round after a storm and gather the salt from the trees and shrubs in large quantities by running his hand up the branches." This, it can be readily imagined, must be a serious trial for many plants, and it is with the wind the worst enemy that has to be contended against. Somewhat over an acre is enclosed within stout walls, as at this elevation these are found absolutely essential for the protection of glass houses and fruit trees; but within this enclosure hedges of Hawthorn and Elder, 3 or 4 feet high, are employed as sectional divisions and for additional protection. The land slopes rather steeply to the south, and therefore is well exposed to the influence of the sun; the atmosphere is generally clearer and the rainfall less than farther inland, so that certain advantages are employed of which the best possible use is made in the production of fruits, vegetables, and flowers.

The natural soil was not well suited for plant growth, and a large portion had to be made up by soil brought from a distance. This was thoroughly done, however, and by the judicious application of fertilisers since it has been gradually brought into good condition. The results are seen in the vegetable crops, Cauliflowers especially succeeding admirably. Peas also give good returns, Duke of Albany, Telephone, and Ne Plus Ultra being the favourites. Of other general kitchen garden crops are secured in good quantity and quality, so that when Lord Macnaghton and family are in London supplies are sent from Rankerry, and preferred to what could be obtained much nearer at hand. A very careful system of cropping has to be adopted, and considerable foresight is needed to maintain a due succession, as it is not at all uncommon for several sowings to be lost. Some idea of the success achieved can be formed from the fact that a succession of Cauliflowers and Broccoli has been maintained for the past four years with only one week break each season.

Amongst the fruits Strawberries are particularly successful, a bountiful crop of fine fruits being obtained from such varieties as Vicomtesse Hericart de Thury, Dr. Hogg, President, Duke of Edinburgh, and James Veitch. In several parts of the garden rows of compact sturdy plants showed how well these useful fruits can be grown when due attention is given them. They reminded me of those in the Royal Strawberry Gardens near Virginia Water, where Mr. Sharp has been so successful, and wherever healthy Strawberry plants are grown without an undue luxuriance of foliage the crops of fruit are usually the most satisfactory. Currants of various kinds thrive, and bear satisfactorily trained to wooden trellises, Lee's Prolific Black being a great favourite, and a profitable variety to cultivate where quantities of fine fruit are required. Red and White Currants are also included, and with Raspberries and Gooseberries give fair returns, though some little trouble has been needed to establish them. Upon the walls and in any sheltered places Apples, Pears, and Plums are being tried, and some have proved satisfactory, while as regards others the record is not yet complete, and further results have yet to determine which shall be grown and which discarded. As an example of the difference in experience with certain varieties, two days before in Leicester I heard a practical fruit cultivator condemn the Apple Lord Suffield as "utterly useless" for that district; yet here, at Rankerry, in the extreme north of Ireland, it gave perfect satisfaction together with Lane's Prince Albert, Potts' Seedling, Warner's King, Stirling Castle, and Ecklinville.

One of the special features of Rankerry gardens, however, is a

lean-to unheated orchard and Peach house range at the upper part, where highly satisfactory crops of useful fruits are obtained, Apples, Pears, Plums, Peaches, and Nectarines. Though of considerable length the houses are low and narrow, yet the returns, judging by what I saw, would yield a very substantial profit on labour and outlay. The trees are planted out nearly in front of the house, but some are on the back wall, and all were equally prosperous. The Peach house is 130 feet long, in two sections, and a grand crop was obtained this year, the supply extending from the middle of August to the middle of October, without artificial means, though it is intended to introduce a little assistance in this respect. Fine evenly trained trees in good health, yet not too vigorous, were observed of Elruge, Lord Napier, Pineapple, and Violette Hâtive Nectarines, and Royal George, Grosse Mignonne, Walburton's Admirable, and Noblesse Peaches. There also under glass Vines, Melons, and Tomatoes are extensively grown, without any apparent ill results from proximity to the sea.

Besides the ordinary decorative plants under glass, Roses and Carnations are a feature out of doors with miscellaneous bedding plants, Lobelias succeeding admirably, serve to render the marginal borders gay, and in August the appearance was especially bright. The garden was altogether, owing to its situation, an astonishing one, and with so many difficulties to contend with, Mr. Duffin deserves much credit for the success achieved.—L. CASTLE.

(To be continued.)

BLINDS FOR COVERING THE ROOF.

NOT only are blinds beneficial for shading during the summer, but they prove invaluable during cold severe weather. Those of a heavier nature are necessary for winter, and will keep the temperature of the house several degrees warmer than when the glass is fully exposed. The greatest difference is observable, however, during cold winds. From an economical point of view there is, perhaps, not much to be said in favour of blinds, but for the benefit of the plants they cannot be too strongly advocated. By their use the overheating of the hot-water pipes to maintain the desired temperature is often prevented.

ODONTOGLOSSUM HOUSE.

In some structures where these are grown they are so saturated with moisture that when severe weather sets in and warmth in the pipes is necessary, the plants and the woodwork are never dry, water hangs upon them for days. This must and can largely be prevented by leaving the ventilators open a little at the top. This necessitates the supply of more heat in the pipes, but the moisture that is evaporated has a ready means of escape, and the foliage of the plants will be found dry in the morning instead of dripping with water. As long as the moisture can be evaporated once during the day no harm results, but when it is allowed to hang about the plants several days in succession decay soon commences.

PHALÆNOPSIS.

During severe weather these should not be suspended very near the glass, or serious injury may result. They will be perfectly safe if they are 18 inches below the glass. Even at this distance if blinds are not used a few mats tacked over the roof outside where the plants are suspended will secure them against injury.

CATTELEYA HOUSE.

In cold severe weather the temperature of this structure may be allowed to fall to 55°, in fact it will be better for the plants than if the temperature is 5° higher. Considerably less harm results from a slightly lower temperature than is the case of overheating the pipes to maintain the requisite temperature. Less moisture will be needed during the time the temperature is lower, or else the foliage of the plants may become spotted. A low temperature with a saturated atmosphere is a certain cause of spotting. Be careful that plants standing near hot-water pipes are not allowed to shrivel. Plants that are unduly dried by this means should be removed.

CYPRIPEDIUM INSIGNE.

Where this plant has been pushed on for some years in heat and is now past flowering, stand the plants in a cool house for a time

where they can enjoy a season of rest. If introduced at once into a vinery or Peach house they will flower another season too early to be of much service. They are not needed before November, and we have found them doubly useful where they unfold their flowers after the middle of December. Give the plants a month's rest and then start them into growth where they can have a temperature of 50°.—ORCHID GROWER.

MASDEVALLIA SCHROEDERIANA.

THERE are not too many novelties amongst the more attractive Masdevallias, and though we have plenty of curiosities, yet something more is required to brighten collections. A welcome addition is *M. Schroederiana* (fig. 74), which was sent by Baron Schröder

FIG. 74.—MASDEVALLIA SCHROEDERIANA.

from his great collection at The Dell on July 8th this year, and when exhibited before the Orchid Committee of the Royal Horticultural Society a first-class certificate was awarded. The flowers are of good size, the three outer divisions nearly equal in size, but the two lower are rather the larger, edged with deep purple, and white in the centre. The sepaline "tails" are very long, recurved, and yellow, giving the flower a very distinct appearance. This may be expected to be utilised by the hybridisers, and ought to yield some novel results if it will cross readily with other allied species.

WALL PEARS.

WITH regard to "Useless Pear Trees Made Useful" (*Journal of Horticulture*, November 27th), I herewith send a few specimen Pears from the trees made useful. First to come under notice is *Beurré Rance*. This tree is probably over thirty years old, with seven tiers of branches 40 feet long. Before this tree was root-pruned and fresh soil given ten years ago, the tree never bore any

fruit worth gathering, but since the root-pruning operation we have had excellent crops of good clean fruit, similar to the specimen sent. I had one crop weighed which was 112 lbs. weight of fruit, giving an average per Pear of 12 ozs.; every one of the Pears was sound and fit for use.

Winter Nelis comes next. The specimen sent is a fair size fruit of this sort; we have had fruit larger. The tree is upon a west wall, is about twenty years old, planted upon tiles. We have good crops of fruit, and when well grown it is of good flavour. We have four trees of this variety, which give us a long season of dessert fruit, planted in different aspects and gathered at different times. We often have this variety in use five and six weeks.

Glou Morceau follows. The tree is on south wall and about twenty-five years old, and bears well every year. The fruit is very useful, coming in at Christmas every year, and a most excellent Pear for market purposes. Our tree is in good health and looks well. The Catillac Pear sent is from a tree in open quarters, but a very fair specimen.

I may say in passing I had a Marie Louise Pear tree removed from a north wall to a south wall a few years ago. This tree has given excellent crops of fruit since, except the first year after removal. This year we had twenty-two dozens of clean Pears. Again we have an old tree (against a building on a wall 14 feet high) of old Brown Beurré, which never fails to crop; we had eighteen dozens of good fruit this year.

The paper I read at Brighton, and which you have kindly referred to, gave my system of cultivation, and I have no hesitation in saying that old Pear trees on walls can be made useful and to bear good crops of fruit by a similar system of cultivation to the one I advocate. The trees could be cut back and grafted with known varieties to succeed in the district. If grafting is decided upon root-pruning will not probably be required for some time afterwards, and perhaps not at all.—ROBERT SMITH, *Yalding, Kent.*

[The specimens sent are very fine and fully bear out all that Mr. Smith says respecting his practice.]

#### REVIEW OF THE PAST SEASON.

THERE are no doubt many enthusiastic cultivators of this flower who have no opportunity of comparing their own produce with that of many others at the leading exhibitions, therefore have not the means of knowing whether the season just past has been as favourable as others have been to the development of Chrysanthemums. The horticultural press, and especially the *Journal of Horticulture*, devotes a considerable space "in the season" to reports of the numerous exhibitions, and has thus earned the thanks of an army of workers for disseminating so much information. The practice of recording the names of varieties in first prize stands is of great service to cultivators, many of whom go carefully through the reports at the end of the season and revise their lists for next year's display; and readers who do not require such information readily forbear for a short space for the benefit of others, and then find all they desire on general subjects.

In spite of many drawbacks to which the plants were exposed during their progress since last December, it would be very wrong to say this has not been a good season. Taken altogether Chrysanthemums never have been more satisfactory than during the season of 1890.

It is wonderful to note the great change that has taken place in the competitive ranks. Where there were half a dozen exhibitors then, six or seven years ago, in any particular class, and that number then was considered to be a large one, three times as many are now to be found struggling for the premier honour. This, I take it, is a most remarkable advance, yet some would have us believe that Chrysanthemums have had their day, and so on. When twenty exhibitors enter for one class, and eighteen out of that number "turn up" to compete in a difficult class, such as was the case at the Birmingham Show, it speaks volumes for the spirit of emulation that exists. The class referred to was for twenty-four incurved and the same number of Japanese blooms, all to be distinct. This is a far more difficult class to fill than where the same number of blooms can be staged in thirty-six varieties only, and there is more credit due to a man who can win in such a great variety class than there is in duplicated classes, for it is in the "timing" of the blooms of so many that are distinct where several growers fail. There are two reasons which account for the increased number of competitors in the "difficult" classes—namely, a great increase in superior varieties and much larger prizes than formerly.

Not only in these large classes has the competition increased, but in the "twelves" and "sixes" in the cut bloom department the same is

noticeable. It is a very common occurrence to find twelve entries in these classes, and occasionally half as many more. It is in the classes devoted to Japanese blooms that the great increase in competitions at shows is the most marked. It has been said, and I think with some truth, that the stands of incurved blooms, taken as a whole, do not compare so favourably in the manner in which they are "set up;" they do not possess as much neatness and smoothness of floret as they should. I do not mean to say there are no stands of the present day to compare so favourably with those of the past; but what I mean is, there is a more general roughness throughout, even in spite of the improvement which is manifest in the extended list of varieties. There is too much striving for size of bloom at the expense of solidity and evenness of outline, which are the most important items to study in the presentation of perfect examples of incurved blooms. I suspect the chief cause of this defect lies in the fact of growers endeavouring to make their plants "look well" during the growing season; they overdo it by gorging them to such an extent with stimulants that it is not possible to mature the wood in such a manner as to produce such examples as is possible to obtain from perfectly matured plants.

Depend upon it if growers would pay more attention to maturing the wood of the plants and less to making the leaves so gross they would have more cause for satisfaction when November comes round in 1891. The Centenary Show at the Aquarium bore evidence of the justness of my remarks, as many stands of blooms were but indifferently "set up," and by cultivators who surprised many persons that I have since met, and who visited the late Show for the first time with the object of "picking up a wrinkle" or two; but as far as the manner in which many of the blooms were staged they were much disappointed, and did not fail to say so.

The prizes offered by the proprietor of the *Journal of Horticulture*, which were for the object of encouraging symmetry of bloom rather than size, and merit in staging the blooms, was productive of good. The winning stand especially was meritorious in the quality of the specimens staged, and deserved all the praise it received.

In staging the Japanese blooms there has been a tendency to place them too low. There is just a certain height at which they look their best, but lifted up too much they have a gaunt appearance; but "flopped" down close on the boards they look lost and quite out of character. The offering of the Veitch Memorial medals for both incurved and Japanese blooms to be staged with not less than 8 inches of stem and foliage, afforded test cases for future schedule makers who are wishful to improve the present method by dispensing with the ugly green boards and show cups. The Japanese did not look amiss. The results in this case were worth repeating, but the same cannot be said of the incurved blooms. Even these did not look so ridiculous as some very fine blooms I saw at an exhibition later. They were dressed in the ordinary manner, supported in tubes, but elevated at least 8 inches above the boards in the back row, and as they were minus their foliage they had the appearance of mops upon poles.

It would be a difficult task to devise means to revolutionise the present system of staging cut blooms for competition. Especially in the incurved section is this difficulty felt to be serious, so that the blooms could be represented in the same high state of cultivation as at the present moment.

A few words about the quality of the blooms staged. I do not think Japanese varieties have ever been better than those seen at some exhibitions. Particularly rich and bright has been the colours, and with improved kinds the stands have had a more massive appearance, the tendency nowadays being for varieties which have full centres, semi-drooping florets or incurved ones, rather than those which are remarkable for their breadth than anything else. Meg Merrilies is a type of this, and which is not so popular as was the case some two years since even. Such varieties as Avalanche, Mr. A. H. Neve, W. W. Coles, and Etoile de Lyon, or Mrs. C. Wheeler being more preferred. Certainly they give a more massive appearance to a stand.

In the incurved section the "Queen" family has exhibited a general falling off in the quality of the blooms, but there has been an increase in merit in middle and front row blooms. In no case have I seen the "Queens" well represented. If they were wide at one place they lacked depth and solidity, and in many instances exhibited a great want of freshness, which is most detrimental to their appearance. Of all the families of Chrysanthemums the "Queen" prefers a hotter and drier summer than we have had this year. The wood needs more maturing than any other family or kind to present the varieties in first-rate condition. Gross immature growth may give size in diameter, but fails to produce depth of bloom, solidity, and smoothness of petal, and these are the points which the Queen family, without exception, has lacked as far as my experience has gone. In many instances it has been impossible to find the premier bloom amongst this type of flower, recourse has had to be taken in selecting Princess of Wales for that honour. This could not be so if Lord Alcester was himself, I venture to say. This variety since it was introduced has taken more premier awards than all other sorts put together.

The Queen family has given trouble to cultivators all through the season. Many complaints were heard during the summer of the persistent manner in which buds formed at the point of growth much more often than was required or good for the plant's future. It would have been strange indeed if these discrepancies in the growth of the plants could be made without any adverse result when the time came to produce the blooms. The commencement of the trouble dates as far back as last December, when suitable cuttings were difficult to obtain.

The bulk of those to be had were weak, and not at all like what cultivators prefer. The next adverse circumstance which occurred to prevent regular and steady growth, which is much to be preferred, occurred during the latter half of the month of May, when the bulk of the plants were in the pots preparatory to transferring them to the largest pots. The small pots were crowded with roots. The weather at that time was exceptionally hot for the time of the year; on six successive days did the thermometer register 80° and over in the shade. No matter how much attention the plants received, it was difficult to keep them in a progressive state without feeling the effects of the extreme heat, which would conduce to premature bud formation instead of a free growth which is so desirable at all stages, especially at that period of their existence. The remedy in such an instance would be to provide shade for the pots until the plants can be placed into those in which they are to flower. Then followed an exceptionally cold, damp, and sunless summer, July being most remarkable in that respect. The consequence was the growth was "soft," and not of the character to produce firm blooms. September and October were two of the finest months of the whole year, and did much to restore the lost wants to the plants. A great change came over many collections of plants, which at one time appeared like being in anything but good order to produce good blooms. The great power the sun had did wonders in ripening the wood and maturing the leaves, quickly making the latter assume autumn tints. The past season of growth and flowering of the plants should prove conclusively that the Japanese section does not require the wood maturing nearly as much as do the incurved, and more especially the "Queen" family. While Japanese new varieties have been seen in goodly numbers it is remarkable how few first class varieties have been added to the incurved section.

#### CHRYSANTHEMUM GOLDEN QUEEN OF ENGLAND *v.* JOHN LAMBERT.

FOR the information of Mr. J. Lambert I may say that when I wrote my reply to "West Riding," giving a selection of Chrysanthemums, I meant Golden Queen of England, as there stated and described. I have not yet seen a "John Lambert" which could be included in a stand of blooms in which Golden Queen of England was also staged, the whole to be distinct; therefore had I named John Lambert in preference to Golden Queen of England I consider I should have been misleading "West Riding," as he would have thought I regarded the two names as being distinct, which I certainly do not. This was not my aim in obliging the correspondent in question. Until Mr. J. Lambert has sufficient confidence in the distinctness from Golden Queen of England of his presumed new variety to exhibit it in the same stand as the Golden Queen, where all are required by the conditions of the schedule to be distinct varieties, I consider he has no right to attempt to influence others to do what he does not appear to have the courage to do himself. It cannot be said he has not had the opportunity of doing so during the last exhibition season. He competed largely and met with great success, upon which I congratulate him. To add names to varieties merely for the sake of doing so is not calculated to benefit those who do not know the distinction, but who simply follow the instructions and advice of others.—E. MOLYNEUX.

#### CHRYSANTHEMUM MRS. ALPHEUS HARDY.

I SHOULD like to write a few words of encouragement to those who have been disappointed with the above variety, as having grown about one dozen plants this season I have had the pleasure of exhibiting six very fair blooms. One was shown at the Crystal Palace; this was the smallest, and I think I was the only exhibitor that had a bloom at the Palace. One was shown at Cheltenham, one at Monmouth, and three at Bristol; one of these at Bristol was, according to Mr. W. Drover, the second best bloom yet shown in England. As your readers might suppose, those blooms caused at each place no little attraction amongst the visitors and all connected with these Exhibitions. Besides these I have been able to cut nine other blooms, samples of which were shown at the N.C.S. floral meeting on December 10th. I have many more small blooms coming on plants which were stopped late and not disbudded; these I can see will be very useful for cutting for vases, &c. Now I think this ought to encourage all growers, but they must not look too much on the sunny side, for they cannot grow it like the Queen family. My advice is to all who have the room to grow eight or a dozen plants, to use different size pots and various soils, and stop a plant or two. My best blooms have been taken from plants grown in 7-inch pots, rather light soil, with a sprinkling of powdered oyster-shells and a little charcoal. I advise all to give Mrs. Alpheus Hardy another trial.—JOHN APLIN.

#### SPORT FROM LORD ALCESTER.

I SEE in the Journal that a correspondent who signs himself "R. C. T.," page 525, says he had a bloom of Emily Dale staged at the late Cheltenham Show which was the same as the above. Having to hurry away to Monmouth with another box of forty-eight blooms I had very little time to look over the blooms shown at Cheltenham. I have Emily Dale but not Golden Queen of England, as no exhibitor ought to grow the two, nor have I John Lambert, which I was told at the Crystal Palace was the nearest approach to this sport. As regards Emily Dale I have grown it for years, and have taken buds at various times; but I never had a bloom of it but what was rather flat, whereas this sport is a very deep bloom. It was much admired at Bristol and Monmouth. I might say here that it made its appearance as a root sport about the middle of last February. Your correspondent and all

other exhibitors can rest assured that this will cause no confusion in the Queen family. I have declined to part with the stock although I have had several tempting offers; but I have placed two cuttings in the hands of a very able Chrysanthemum grower, who will be able to let us know next season if it is distinct from Emily Dale and other varieties of the Golden Queen family.—JOHN APLIN, *The Gardens, Hasfield Court, Gloucester.*

#### MR. W. DROVER.

IN another column we publish a review of the Chrysanthemum year, but it would be incomplete without reference to the winner of the greatest prize ever offered—the historic centennial—and Mr. W. Drover seems fully entitled to be included amongst the Chrysanthemum men of the time by the publication of his portrait in the *Journal of Horticulture*. It will be remembered that the class provided by the N.C.S. was for cut blooms of forty-eight distinct varieties—twenty-four incurved and twenty-four Japanese—and that Mr. Drover won the first prize (£25) easily by the great superiority of his incurved blooms. He was also similarly successful in the contest for the first prize offered by the proprietor of this Journal for eighteen incurved blooms, excluding

FIG. 75.—MR. W. DROVER.

the Queen family, which brought together some of the most interesting stands of incurved blooms in the Exhibition.

#### DERBY CHRYSANTHEMUM ASSOCIATION.

THE annual dinner of the Derby Chrysanthemum Association took place at the Victoria Restaurant, Victoria Street, Derby, on Saturday evening, December 13th, when the following members were present—Messrs. W. Allen, J. E. Barnesby, F. Bancroft, H. Bancroft, W. Boyes, G. Fayser, W. Fowkes, E. Letchford, F. Radford, Jarvis, W. E. Bates, J. Chandler, Lane, Woodward, Beach, J. B. Chapman, Adams, and H. J. Bell, the Hon. Secretary. The gentlemen's gardeners were represented by Messrs. Goodacre (Elvaston Castle), Barlas (Willersley Castle), Stopps, Borrowash, Evans, Spondon, Smith (gardener to Arthur Cox, Esq., Mill Hill), Potter (gardener to James Williams, Esq.). In the unavoidable absence of the Chairman, Geo. Sutherland, Esq., the chair was occupied by Mr. W. E. Bates, whilst the Hon. Secretary filled the vice-chair. After the usual loyal toasts had been honoured, Mr. Boyes proposed the health of Mr. Bell, the Hon. Secretary, and referred to the admirable manner he had performed his arduous duties during the past season, the success of the Association being due to his untiring efforts. Mr. Goodacre, the winner of the 10-guinea Challenge Derby China Vase, in rising to second the proposition, complimented the Association on its present satisfactory state, and characterised the recent Show at Derby as the prettiest one held in the Midland counties without exception. The proposition was carried with acclamation. Mr. Bell, in returning thanks, said it was a pleasure to him to be engaged in the work of the Association, and acknowledged the assistance rendered him by the Committee.

Mr. Hudson (one of the visitors) in proposing the toast of the evening, "Success to the Derby Chrysanthemum Association," referred in eulogistic terms to the courtesy extended by the Hon. Secretary, and

congratulated the Association on the good state of affairs. This was seconded by Mr. Barnes, and carried with loud applause. Mr. John Banks Chapman, an enthusiastic grower of the "Golden Flower," related in a humorous speech his first season's experience as a Chrysanthemum exhibitor. The remainder of the evening was spent in a convivial manner, a paper by Mr. Charles Gibson (one of the Judges) on "The Growth of Chrysanthemums," being reserved for a future occasion.

#### CERTIFICATED CHRYSANTHEMUMS, 1859 TO 1890.

IN the following list, which I commenced compiling for my "Chrysanthemum Annual" several years since, the names are given of the Chrysanthemums certificated by the Royal Horticultural Society, the National Chrysanthemum Society, and of some of the leading exhibitions like Kingston, the Crystal Palace, &c. The names of persons indicate those to whom the certificates were awarded. The Floral Committee of the Royal Horticultural Society commenced its duties in 1859; but though the Floral Committee of the National Chrysanthemum Society was only instituted recently, the novelties submitted to the latter body, and honoured by certificates, have been comparatively much more numerous. Many varieties have been certificated at local shows, of which no record could be obtained. It has been thought preferable to give the full alphabetical list first, and follow with general comments and descriptions. This course has therefore been adopted, and will be convenient in regard to the fact that many of the varieties certificated a quarter of a century ago are now out of cultivation. I shall be glad to receive any historical or other notes concerning the varieties named in the list as it appears, to be incorporated in the subsequent comments.—LEWIS CASTLE.

*Abbreviations.*—R.H.S. = Royal Horticultural Society; N.C.S. = National Chrysanthemum Society.

(To be continued.)

TO CONTRIBUTORS.—In consequence of our having to prepare for press earlier than usual this week several communications arrived too late for insertion, and the publication of many interesting articles must of necessity be postponed.

— THE WEATHER.—Snow, fogs, and frosts have, alternately and combined, constituted the weather of the past week in the London district, and very rarely do we experience such a severe and continuous spell of winter before Christmas. Snow fell to the depth of 4 or 5 inches, and still remains; the partial thaw on Sunday morning having dissipated but little. The temperature rose then to about 36°; towards evening the atmosphere became more clear, and in several places the frost registered was 16°. On Monday this was followed by a very dense fog, which continued the whole day. Intense frost prevailed over England on the same day, the thermometer falling to a minimum of 4° at Cambridge, 7° at Loughborough, 8° at Hillington, 9° at Oxford, and 14° in London. But in the outlying districts the temperature fell rapidly in the evening to 10° at 6 P.M. After this it rose slowly, and on Tuesday morning the thermometer stood at 26° with less fog.

— “B. D., *South Perthshire*,” writes as follows—“December 8th to 22nd. During the last fortnight intensely cold damp weather, with occasional slight frosts, has been followed by snow and frosts of from 10° to 17° during the last three days. There is every appearance of more snow on morning of 22nd. “May ’90’s Xmas canty run, Wi’ routh o’ luck in ’91.”

— A CORRESPONDENT in Hampshire also writes:—“We have had a succession of severe wintry weather. On Monday we registered 18° of frost, 14° on Thursday, and on Saturday the thermometer registered 13° again. Most of the day the thermometer stood at 27°, or 5° frost. About 2 P.M. a thin blue mist pervaded the sky, which deepened into a fog-like appearance, giving the atmosphere a peculiar appearance. Directly afterwards rain began to fall lightly, which owing to the lowness of the temperature froze as it fell, giving the trees on the north-east side a glassy appearance, which crackled in the wind which was blowing at the time. This lasted for four hours, having the effect of making the roads where the snow had been cleared a sheet of ice, most difficult to walk upon. At no time during the last ten days has the thermometer risen above 34°. On the 19th (Friday) a depth of 6 inches of snow fell, measured on the level, which is the heaviest fall of snow at one time that we have experienced here since January 18th, 1881. Fortunately no wind accompanied the snow, which prevented drifting.”

— MESSRS. WM. PAUL & SON of Waltham Cross inform us that at the sale of the late MR. HENRY BENNETT’S ROSES last week they acquired the property of the new Tea-scented variety “Lady Henry Grosvenor,” together with a large quantity of the unnamed seedlings, Tea-scented and Hybrid Tea-scented. The only other named seedling (“Captain Hayward,” H.P.) was also sold at the same time, its destination, as stated at the sale, being the United States.

— DINNER TO MESSRS. SUTTON & SONS’ EMPLOYEES AT READING.—From the dinner, which we stated in our last issue was given by the above firm to their workpeople in honour of the Prince of Wales’ visit, a telegram was sent by Mr. Martin J. Sutton, informing Sir Henry Ponsonby at Windsor Castle that the health of Her Majesty had been enthusiastically drunk, and the gathering was shortly informed in reply that the telegram had been read by the Queen with very much pleasure.

— CARTER’S PROVIDENT SICK FUND.—The fifth annual meeting of this Society has just been held at the warehouses of Messrs. James

Carter & Co., Queen’s seedsmen, High Holborn. The chair was taken by Mr. Sharman. The statement of affairs presented to the meeting showed that, although the past year (owing to the epidemic of influenza during the winter) had been one of the worst the Society has experienced, after meeting all engagements and making provision for one or two exceptional cases, the Society has been able to close its books with a very substantial balance in hand. Considering the smallness of the subscription and considerable benefits paid to its members the result must be considered gratifying. All the officers were re-elected.

— VEITCH MEMORIAL PRIZES.—At a meeting of the Veitch Memorial Trustees held on Tuesday last, Dr. Maxwell T. Masters in the chair, the following distribution of medals was decided upon. Three to the Edinburgh International Exhibition—namely, one for the most meritorious dish of fruit in the Show; one for the most meritorious Orchid, stove, or greenhouse plant selected from the exhibits, and one for the most meritorious and interesting hybrid plant or fruit, the result of a cross between two species, not between two varieties of one species. One medal is given for the most meritorious Orchid, stove, or greenhouse plant in the York Gala Exhibition; one for the most meritorious collection of fresh cones, with foliage, of hardy Conifers on the occasion of the Royal Horticultural Society’s Conifer Congress to be held at Chiswick; and one for twelve dishes of vegetables, distinct, at the Crystal Palace Autumn Show.

— GISHURSTINE.—We have received from Price’s Patent Candle Company samples of this well known and approved dressing for boots in wet and snowy weather. A correspondent who has been using the dubbing of late, desires to state that he has found it highly satisfactory in keeping his feet “dry and warm when trudging through the snow.”

— PRAISING PEAS.—We have received letters from three gardeners in different districts, not only praising the same Pea, but praising it in identical terms. Under the circumstances we are bound to express our regret that gardeners in good positions should be the mediums of distributing matter of this nature. Such a practice could not be otherwise than most objectionable to their employers if made known, and compromising to the firm in whose interest the paragraph is written and distributed.

— AT A recent meeting of the BRITISH FRUIT GROWERS’ ASSOCIATION arrangements were made to hold Conferences on Fruit during 1891 at the following places:—Dublin in August in conjunction with the Royal Horticultural Society of Ireland; at Cardiff, also in August, on the occasion of the Cardiff Horticultural Society’s Show; at Edinburgh, on one of the days of the International Exhibition in September; and at the Crystal Palace, Sydenham in the same month. The dates and programme will be announced later, and invitations from several other important centres are under consideration. Committee meetings will be held in the Horticultural Club room, Hotel Windsor, Victoria Street, S.W. at 5 P.M. on Thursdays, January 8th, February 5th, March 5th, April 2nd, May 7th, June 4th, July 2nd, August 6th, September 3rd, October 1st, November 24th, and December 17th. Suggestions and offers of assistance at the Conferences named above should be sent to the Hon. Sec., Mr. Lewis Castle, Hotham House, Merton, Surrey.

— FRUIT GROWING is not being recommended to the small holders of land in vain, says a daily paper. One of the striking features of the Agricultural Returns for 1890, issued yesterday, is the increased acreage devoted to orchards, market gardens, and the culture of small fruit. It seems that in the growth of small fruit alone, that is, Strawberries, Gooseberries, Currants, &c., there are 4300 more acres employed this year than last, and there were never so many acres of orchards in the country since records began to be kept. In 1873 there were not 150,000 acres of orchard in Great Britain. Now there are 202,305. On the other hand, there is a continued decline in the Hop area, which was the subject of a Parliamentary Committee’s investigation last session. The surface employed for Hop growing—54,555 acres—has never been reported so low as it is in the returns of this year.

— THE Directors of the Royal Aquarium, Westminster, have arranged for the following EXHIBITIONS AND FLORAL FETES DURING 1891:—First Spring Exhibition, March 11th and 12th; second Spring Exhibition, April 29th and 30th; Early Summer Exhibition, May 20th and 21st; Grand Summer Show and Fête, June 24th and 25th; Early Autumn Show of the National Chrysanthemum Society, September 9th and 10th; Great Autumn Fruit Show, October 14th, 15th, and 16th; Great Annual Exhibition of the National Chrysanthemum Society, November 10th, 11th, and 12th. 1892.—Mid-Winter Exhibition of the National Chrysanthemum Society, January 5th and 6th.

— THE SHIRLEY HIBBERD MEMORIAL.—At a meeting of the Committee appointed by the Royal Horticultural Society to consider the best means of perpetuating the memory of the late Mr. Shirley Hibberd, and held on the 19th inst. in the Lindley Library, it was unanimously decided to secure a portrait of the eminent horticulturist, to be placed in the hands of the Trustees of the Lindley Library, on behalf of the Royal Horticultural Society. It was further decided that the surplus remaining after the expenses connected with the preparation of the portrait have been defrayed, shall be invested in the names of trustees, to be hereafter appointed, for the benefit of Mr. Hibberd's orphan daughter. The Committee appointed to carry out the scheme is composed of the following gentlemen:—Rev. W. Wilks, Secretary to the Royal Horticultural Society; George Paul and James Douglas, representing the Council of the Society; and Messrs. W. H. Collingridge, W. Marshall, R. Dean, and Dr. Masters, representing the Fellows. Many subscriptions have already been promised, and others are solicited, which may be paid to any member of the Committee, or to Dr. Masters, Chairman of the Committee, at the Royal Horticultural Society, 117, Victoria Street, Westminster.

— THE ESSEX FIELD CLUB.—A special meeting and the 120th ordinary meeting will be held in the Loughton Public Hall on Tuesday evening, December 30th, 1890, at 8 o'clock, when the Secretary will submit to the members, on behalf of the Council, the following modifications of subscription to the Club:—That the subscriptions shall remain as before—viz., 10s. 6d. per annum—but that each member wishing to receive the "Essex Naturalist" shall subscribe a further sum of 4s. 6d. in advance in each year towards the expenses of publication, postages, &c. That the life membership be £8 8s. In accordance with Rule 6, the Council and officers for 1891 will be nominated preparatory to the tenth annual general meeting. 1, "Exhibitions and Remarks Thereon." 2, "Ezekiel George Varenne," by Prof. G. S. Boulger, F.L.S., F.G.S. 3, "Note on Hydrobia Jenkinsi," by Edgar A. Smith, F.L.S. President of the Conchological Society.

— HARDY FRUIT.—What is and what is not hardy fruit is a question often discussed at horticultural exhibitions. "An Intending Exhibitor" (see page 515) in criticising the prize schedule issued by the Royal Caledonian Horticultural Society, asserts that "In Scotland nearly all Pears are grown as wall fruit, and a very large number of Apples are similarly cultivated. The great majority of Plums and Cherries in the same way have the benefit of a wall." Such being the case he sees no reason why Figs, Peaches, and Apricots when grown in the open air should not be considered hardy fruits. Apples, Cherries, Pears, and Plums, Gooseberries and Currants, are improved in quality by being grown against a wall. The case is quite different when applied to Peaches, Nectarines, Figs, and Apricots, and if "An Intending Exhibitor" is in the habit of attending the Edinburgh autumn shows he will know that for a collection of these so-called hardy fruits it is useless for a competitor attempting to win a prize unless he can stage two dishes of Figs, Peaches, Nectarines, and Apricots. It is well known all these are grown against walls, some heated with flues, and some by protected glass copings, yet we are asked to believe they are grown in the open air. As these semi-hardy kinds are well represented in the other collections it would be better to have none but really hardy sorts in collections of hardy fruits. This is done in several societies, and is known to be satisfactory to all.—J. M.

— FAVERSHAM CHRYSANTHEMUM ASSOCIATION.—The annual general meeting of the members was held at the Royal William last week, when Mr. F. T. Hart, Chairman of the Committee, presided over a large attendance. The Hon. Secretary, Mr. C. Stidolph, presented the annual balance sheet, which showed an income of £168 8s. 3d., being £62 9s. 4d. balance brought forward, £53 10s. 6d. subscriptions, £51 2s. 8d. realised by the recent Show, and £1 5s. 9d. bank interest. The expenditure amounted to £119 5s. 9d., of which the principal item was £71 13s. for prizes, and thus there remained in hand a balance of £49 2s. 10d. The rules of the Association were revised and confirmed, a proposal that membership should be confined to the postal district instead of the union district being negatived. Mr. L. Jackson was re-elected Treasurer, and Mr. C. Stidolph Hon. Secretary, both being warmly thanked for their past services. The Committee were re-elected, except that Messrs. G. F. Scott, G. T. Anderson, E. Mannoch, and G. W. Woolley were appointed in the place of some members who did not seek re-election. The Hon. Secretary drew attention to the movement that is on foot to commemorate the valuable services rendered by the late Mr. William Holmes, Secretary of the National Chrysanthemum Society, by raising a fund, a portion of which is to be set aside for

assisting the technical education in landscape gardening of the late Mr. Holmes's eldest son.

— THE GARDENERS' ORPHAN FUND.—The usual monthly meeting of the Committee took place at the Horticultural Club on the 18th inst., Mr. William Roupell in the chair. The minutes having been read, the Hon. Secretary made a report as to the proceedings of the recent special general meeting of members. The balance at the bank was stated to be £584 10s. 11d. The following special receipts were announced:—Bournemouth and District Gardeners' Mutual Improvement Association Concert, £15 10s. 6d.; Mr. J. Smith, Mentmore, box at Chrysanthemum Show, 10s.; Mr. J. C. Mundell, M. or Park, box, £1 12s.; Mr. Miller, Margate, box, 9s. 1d.; Mr. Chapman, Yeominster, box, 16s.; Mr. Scott, Bradford, box, £1 2s.; Messrs. H. Cannell and Sons, Swarley, box, £1 10s.; Mr. Johnstone, Tamworth, box, £1 10s.; Mr. C. Sutton, Sevenoaks, box, 10s. 6d. The guardians of the children recently placed upon the Fund were appointed—in all cases the mother. A cheque for the quarter's allowance to the thirty-seven children now enjoying the benefit of the Fund, amounting to £120 5s., was drawn, and several other accounts were paid. A vote of thanks to the Chairman closed the proceedings.

— SPENCER'S FAVOURITE OR QUEEN CAROLINE APPLE.—I enjoyed reading "Wanderer's" "A Night at Chilwell" very much indeed. I only take exception to one statement of "Wanderer's" host, and my very good neighbour, Mr. A. H. Pearson, as to the right name for Spencer's Favourite Apple. Some time ago in order to try to find out something of the origin of Domino App'le (you, Mr. Editor, asked me to do so), I spent an evening in the reference department of our Nottingham Free Library examining volumes of "The Midland Florist." I did not find what I wanted as to Domino, but I found the following note as to the origin of Spencer's Favourite Apple:—"Brown's Queen Caroline, syn. Spencer's Favourite, was raised by Mr. Timothy Brown, nurseryman of Measham, three miles from Ashby-de-la-Zouch. It came into bearing, and was named Queen Caroline when that unfortunate Queen's name was before the public in the Law Courts. It came into the hands of Mr. John Spencer of Adbolton, near Nottingham, in the following manner:—A lot of stocks were worked in the nursery of Mr. Wm. Hood of Ashby-de-la-Zouch with grafts from the original tree. Mr. Spencer got his trees from this source. About Birmingham this Apple is sent out as Brown's Seedling."—(*The Midland Florist*, 1850.) I may be wrong, but this explanation seems conclusive. Spencer is dead, and he has left none, I believe, to carry on the family name in the gardening world. I may say that I worked the substance of this information into my notes with the Apples I sent to the Apple Congress in 1883, and which is printed in "British Apples," page 84.—N. H. POWNALL, *Lenton Hall Gardens, Nottingham.*

— LIVERPOOL HORTICULTURAL ASSOCIATION.—The fourth annual dinner in connection with the above Association was held last Saturday evening. The Hon. Treasurer, Fletcher Rogers, Esq., presided, and there were about 150 persons present. Following the loyal toasts, "The Liverpool Horticultural Association" was proposed by the Hon. Treasurer, who said that it gave him great pleasure to be able to announce that they had been materially helped by the subscription list, and had now a handsome balance to the good. Mr. White, the Chairman of the Association responded, and said that he must congratulate the Committee and members as well on the success of the summer Show, which would compare favourably with any held since the formation. He also stated that the autumn Show was no exception. Not only were the exhibits of the highest quality in every respect, but the attendance was larger than on any previous occasion. "The Horticultural Trade" was responded to by Mr. Davies of Wavertree, and Mr. R. W. Ker, Aigburth Nursery. Mr. Davies spoke of the kindly feeling which existed between gardeners and members of the trade, and also of the pleasure it gave the trade to help forward the work of the Association. Mr. R. W. Ker echoed Mr. Davies's remarks, and paid a graceful tribute to the memory of the late Mr. B. S. Williams, Mr. H. Low, Mr. W. Holmes, and Mr. Shirley Hibberd. He also pleaded for the assistance of their excellent Hon. Treasurer in trying to secure a challenge cup for the Chrysanthemum Show, and went on to say that he and his brother had decided to give a silver challenge cup, value £10 10s. with £10 10s. cash each year, until finally won, for thirty-six cut blooms Chrysanthemums—viz., twelve Japanese, twelve incurved, and twelve reflexed, open to all within a radius of Liverpool Exchange, to be won twice consecutively, or three times in all, subject to conditions of the Liverpool Horticultural Association. This generous offer of Messrs. Ker was greeted with loud applause. Mr. Rogers responded to the toast

of "The Hon. Treasurer and Chairman," saying how pleased he was at the kindly reception he had always had from the members, and that he was fully convinced the Association had entered upon another term of prosperity. With regard to Mr. Ker's suggestion, &c., a challenge cup, he gave the members every reason to believe that no effort would be spared on his part to carry it to a successful issue.—R. P. R.

— MANCHESTER ROYAL BOTANICAL SOCIETY.—The following are the dates upon which the meetings of this Society will be held in 1891:—First Spring Flower Show, Town Hall, 17th of March; second ditto, at Town Hall, 28th of April; annual Whitsuntide Exhibition opens at the Gardens, May 15th; Rose Show at the Gardens, July 18th. Exhibition of Hardy Fruits and Congress at the Town Hall, 13th, 14th, 15th, and 16th of October.

— FRUIT ROOM.—Your correspondent "H. S." asks for information respecting a fruit room. In reply to his questions I should say—1, That a dark, dry, underground chamber would be preferable to a room in a dwelling-house having full daylight, always provided the above description is correct, as a damp underground room would probably cause mould and make the Apples taste fusty. There should be a sufficiency of ventilation, but too much draught would be an objection, as it would cause the temperature to vary too much. 2, In the cool underground room perhaps trellised shelves would be a slight advantage, but as they are usually covered with sheets of paper it would not make much difference. I do not see how barrels or casks would be of service in this room, but in a very light and dry room they certainly might be useful for storing late varieties, which sometimes shrivel instead of ripening when too much exposed to light and warm air. 3, There is

FIG. 76.—AN EFFECTIVE GROUP OF PLANTS. (See page 564)

— ENCLOSED is a bloom of SINGLE CAMELLIA grown here. I should like your verdict with regard to its merits. Some blooms were sent to a nurseryman and condemned as being worthless. My opinion of it is different. I consider it to be a good variety. The plant from which the enclosed bloom were cut is planted out, and has always been very floriferous until this season. It made a strong growth, but set few flower buds. A trench about 18 inches wide has been taken out 2 feet from the stem and filled in with peat, the compost before being mostly loam. Strong growths have been cut back to two-year-old wood, and the plant is again ready for commencing another season's growth.—D. [Single Camellias are coming into favour with many amateurs, and they certainly admit of being employed in many forms of floral decorations for which the "double" varieties are unsuited. As a "single" Camellia your variety is well worth cultivation, but from a florist's or trade point of view the opinion expressed would no doubt be correct, as the demand at present is not large enough to render them very profitable, while there are so many of the symmetrical double Camellias to be had.]

nothing, except bruising, which tends to hasten the decay of Apples more than wiping off the oily exudation. I have seen Apples exposed for exhibition, part of which have been wiped and others left in their natural state, and the wiped fruits have been perfectly rotten before the others showed a trace of decay.—A. H. PEARSON, *Chilwell*.

— THE HULL AND EAST RIDING CHRYSANTHEMUM SOCIETY'S Exhibition for 1891 is fixed, Mr. Harland informs us, for Wednesday and Thursday, November 18th and 19th.

— THERE was a large attendance of members at the fourteenth annual general meeting of the KINGSTON AND SURBITON CHRYSANTHEMUM SOCIETY, held at the Kingston Hotel on Wednesday evening, December 16th, W. Furze, Esq., in the chair. The Secretary read the balance sheet, which showed, after paying £156 in prizes, a balance in hand of £60. Hearty votes of thanks were then passed to the President, G. C. Sherrard, Esq., J.P., the Vice-President and lady patronesses, also to the Hon. Treasurer, Mr. J. Drewett, and Hon.

Secretary, Mr. Geo. Woodgate, all of whom were unanimously re-elected. On the election for fifteen members to form the Committee six new members found places thereon.—G. W.

— PRESENTATION AT SHREWSBURY.—Recently Mr. R. Milner, who for twelve years was gardener at Sundorne Castle, was presented with an illuminated address (and a silver sugar basin and cream jug for Mrs. Milner). The presentation was made at the offices of Messrs. Adnitt and Naunton, Secretaries of the well-known Shrewsbury Show. The Rev. J. W. Dodson presided, and there were present Messrs. Jeffries, Bowler, Lambert, &c. In making the presentation, the Rev. Chairman referred in the highest terms to the great interest Mr. Milner took in all matters relative to horticulture, always willing to give sound practical advice when required, and he was sure that he would be only expressing the sentiments of the numerous subscribers to the presents, when he spoke of the regret he felt at Mr. Milner's leaving the neighbourhood, and he begged of the acceptance of the presents as a slight token of the high esteem in which he and Mrs. Milner were held during their twelve years' residence at Sundorne, and wishing Mr. and Mrs. Milner continued happiness and future prosperity. Mr. Milner returned thanks for the valuable presents and address, which, he said, he and his wife valued very highly, and they leave the neighbourhood of Shrewsbury with many pleasant memories. Mr. Milner was appointed gardener to Miss Talbot at Penrice Castle, near Swansea, some few months ago, and we understand that many improvements are being carried out in the old gardens under his supervision.

### GROUPING PLANTS.

GROUPING plants effectively has become an important part of the duties of many gardeners, both in the arrangement of conservatories and the embellishment of rooms on festive occasions. The managers of flower shows encourage the tasteful association of plants both in the summer and autumn. At many November shows all plants, besides Chrysanthemums, are excluded from the groups, but in others ornamental foliaged plants are admissible. In the former case several groups are pleasingly arranged and well finished, but the majority are composed of a smooth face of colour with a good display of pots and stakes. At Hull the groups must be margined and interspersed with foliage plants, and thus afford very good lessons in effective arrangement. The illustration (fig. 76) represents the first prize group there, much reduced from a photograph. It was arranged by Mr. G. Wilson, gardener to J. Reckitt, Esq., some of the chief plants employed being mentioned in the report (November 27th, page 467). They were in the brightest and best of condition, and disposed so as to as far as possible display their individual beauty. The group combined richness of colour with elegance in leafage, and was admirably finished throughout. Beautiful associations of plants of the same free nature are provided at the Brighton shows.

### OBSERVATIONS ON PRUNING.

PERHAPS to no other branch of gardening is there attached so much of apparent mystery for the amateur as the subject of pruning. When the magician's wand in the shape of a pruning knife wielded by the cunning hand of a gardener has passed over the object of amputation, it is only necessary to await the result. But while disinclined to agree with this assertion in its entirety, there can be no doubt that the art of pruning is most beneficial in its results. Since the day when our great progenitor was placed in the garden to keep and dress it the fluctuations of pruning betwixt extension and spur systems have been continuous in their action and varied in their methods. Nor is strange that it should be so when we consider the numerous genera that are thus operated upon, and the many soils and situations in which they are grown. Peaches have been subjected to the spur system, but it may be safely said that the practice was not continued for any lengthened period, yet the examples are many in which fruit trees have been rendered more productive by a partial freedom from this method. It was a very old writer who remarked when treating on this subject, "Yet have not any that I know described to us (except in general words) what or which are those superfluous boughs which we must take away; and that is the most needful point to be known in lopping."\* But with all due respect for his endeavours to clear away this darkness it must be admitted that the shadow of uncertainty hangs over his teachings like the difficulty of a physician in writing a prescription without seeing the patient. It

\* Evelyn's "Silvia," page 211, fourth edition.

is impossible that there can be other than general directions on such a subject, but those instructions ought to be sufficient to any who will but mix them with his powers of his observation and knowledge of the genera and locality.

But there is one part of a plant to which a general rule of pruning might be applied, which although it does not lie at the root of the matter is yet very near it, being in short the stem. Much has been written about root-pruning and branch-pruning so as to get an even balance betwixt the two extremities of a tree, whereas the medium through which this balancing is conducted is in many instances completely ignored, or at least but little attended to. On the treatment, and consequently the condition of the stem, depends in a great measure the future usefulness of a tree. Where the practice of keeping it closely trained until the desired height has been attained has been followed it is rarely that the bole swells proportionately with the other portion of the tree, and consequently the nourishment for its support is not conveyed so freely as through a more open channel. Fruit trees with hard contracted stems rarely produce a satisfactory crop, and though doubtless there are remedies for this defect the complaint might have been prevented if more freedom had been given to lateral growths. Were more notice taken of the early treatment of the stem it is not improbable that less discussions would afterwards be heard about pruning. It is not to be inferred from this that stem pruning alone is necessary for the proper management of a tree, but I believe it would go a long way towards mitigating some of the evils of which so much is heard. If instead of cutting or rubbing away all stem shoots under the erroneous impression that by doing so more nourishment is imparted to the head, some of them were left and kept at breathing distances apart until the tree attained a fair size, gratifying results would in all probability accrue from the change of treatment. It is difficult to determine the time when the final denudation should take place; age alone is not to be judged, as some grow more freely than others, but when the stem is clean and elastic, bearing a suitable proportion to its top, the operation if desired might be accomplished.

Some growers are very tardy in doing this in either forest or fruit trees, as the bark soon heals over if the shoots are cut clean and close. The Vine is as susceptible as most fruits to differences of treatment, and when a certain amount of freedom is given to bottom growths, not for the purpose of fruit, as plenty of that can be had from above them, but as it were to aid and assist the stem to satisfactorily perform its proper functions, much future benefit is derived. The stem swells, preventing the unnatural practice of tying it down, and so avoiding the sometimes baneful results of the system. It may be observed that suckers are less prevalent where there is a proportionate equality betwixt the stem and the top, and more plentiful where the former is contracted, as if the sap, after finding only a stifled outlet in the proper direction of its course, spent its strength in another channel.—M. D.

### HARDY FLOWERING SHRUBS.

My object is not to write of these generally, but to draw attention to a few plants that are not planted in beds and borders outside to the extent that they deserve to be. Those selected are frequently associated with other plants for forcing, to be employed in the conservatory and for cutting purposes early in the season. They are equally ornamental when grouped with Rhododendrons, Azalea pontica, Ghent varieties, and other American plants in various positions in the pleasure ground and rock garden. The first of these is *Deutzia gracilis*, which is equally as valuable outside as for forcing purposes. It is perfectly hardy, and in a sunny open spot is very beautiful in the rock garden, and few plants are more effective when placed towards the front of clumps of American plants. Wherever planted it should be given room to develop itself, and not placed where stronger growing plants will eventually overcrowd it. When planted outside the best plan is to allow the plant to grow naturally, and not cut it back annually, as we are in the habit of doing when it is grown for forcing purposes. However beautiful large bushes of *D. crenata* and its double form *flore-pleno*, may be, they cannot surpass the dwarf growing *D. gracilis*, which is suitable for many positions where the others would be out of place.

*Azalea amœna* is perfectly hardy, and deserves to be planted outside more frequently than we see it. In many gardens it is only known as a greenhouse plant and used annually for forcing. It is valuable inside and equally effective outside. Being of dwarf growth it is well adapted for rockeries, and few plants are more conspicuous when in bloom. An open sunny spot should be selected where its roots can be surrounded with plenty of soil which has a tendency to be moist. It will soon succumb if planted in shallow soil that will dry up after a few days of bright

sunshine. This *Deutzia* looks well if planted just behind a large stone where its branches can hang naturally over the top, which it will do when well established. It keeps fairly dwarf outside, and throws up suckers freely from the base. Near the margin of beds of *Rhododendrons* and deciduous *Azaleas* it is at home, and also flourishes in the same soil, and no peat preparations need be made. It grows freely in good soil (where lime does not abound) that has been enriched with manure or leaf mould.

The old *Azalea indica* is also hardy, and this we have only recently discovered. A fairly large plant has been on the north side of a *Rhododendron* clump for some years. It grows freely and flowers profusely, and is therefore effective in such positions. It needs no special preparation, and is evidently at home under the same conditions as *Rhododendrons*. Have other varieties of Indian *Azaleas* been tried outside, and with what success?

*Rhododendron præcox* and *Early Gem* are very useful for outside planting, and both look well in the rock garden and also in the front of beds of American plants. In too many gardens these are used solely for forcing purposes, and for ornamental purposes outside are either overlooked or ignored. This is to be regretted, for they flower early when there are few other things; and although they are sometimes caught by frost they are nevertheless worth growing in sheltered positions.—W. B.

### STRAWBERRY CULTIVATION.

STRAWBERRY cultivation in many instances in the north does not receive the attention it deserves; the plants are often allowed to go wild, and I have witnessed as many as twenty individuals in one field of Strawberries during the spring upon their knees spudding the weeds, which one individual during the summer with a Dutch hoe would have killed in a few hours. This and growing crops between the rows of Strawberries so as to overgrow the latter is the opposite of economically occupying the ground or of profitable Strawberry culture.

"Why do you not grow Strawberries to have a full crop from the plants within one year of planting?" was a question I put to an author of a horticultural work and a grower of Strawberries. "It cannot be done," was the reply. "I have tried it, and have always failed." Without ocular demonstration I could not argue my point; but the other day the same person visited me. I took him to a small plantation of Strawberries, one part planted in September, 1889, and good plants, and the other planted at the end of July and beginning of August of the present year; by no means so early as they might have been, nor so well grown. I asked him to examine the two and say whether the 1889 or the 1890 plants were likely to be the more fruitful, but the only answer was, "He could not without seeing have believed it." Many are of the same opinion, while others do not give Strawberry plants the care they are entitled to. Gathering the runners at the end of the season, then dressing, exposing them it may be for days to a dry withering wind, or allowing plants to be overgrown with weeds or vegetables, then having to wait one or two years for a full crop, is far from profitable.

My method has been given before, but is none the worse for being retold. The ground intended for Strawberries should either be naturally rich or enriched before planting, and at all times kept free from weeds. Lea, if rich, produces heavy crops of Strawberries, and it is better to have but half a crop of vegetables from ground intended for Strawberries, with a full crop of the latter within a year, than to keep a plantation of Strawberries for years without getting one full crop in any year. When I have decided upon a piece of ground previous to planting Strawberries, I grow a row of Onions or Eschallots in the centre of where the Strawberry plants are intended to be; early Turnips or Beet, or any narrow growing plant will do.

I encourage runners from fruiting plants of the previous year, that all flowers are carefully nipped out as well, the weakest runners taken away as they appear; pieces of turf are chopped up and placed so that the runners will strike into them. Whenever they are well rooted, and plenty of them, the plants are separated, lifted, and planted immediately, in July, the earlier the better. They will grow vigorously without a check, and remain in a green and growing condition all winter, and by the following July a full crop of large Strawberries will be the reward of the cultivator. If the day is hot when planting, place the Strawberries in a shallow plate in which is a little water and grass.

Never allow a runner to grow from plants for next year's fruiting, and whenever the fruit is gathered dig the year-old plants down, and plant the ground with suitable vegetables. The mother plants that showed fruit blossoms and were allowed to bear

plants may be trimmed, and manured will bear a good crop late in the season or the following year.

If the above method is carried out thoroughly there will not only be more fruit but more vegetables taken from the ground in the same space of time than from any other method, and the ground will be less impoverished than by growing old Strawberry plants for a succession of years. I have sometimes grown Strawberries successfully by planting one row of plants at 16 inches apart in the row, then bosoming these plants on both sides with plants the same distance, leaving a space of 32 inches from centre to centre of the outer rows. This allows more plants, and the wide space is ample to permit gathering the fruit and keeping down weeds.—W. T.

### GLADIOLI.

(Continued from page 509.)

THE enjoyment of the blooming season is not, as in the case of many flowers, of short duration. In such a splendid autumn as we had this year good spikes of bloom continued until the middle of November; and at the meeting of the Horticultural Club on November 9th, Mr. Lindsell exhibited some remarkably good spikes; and when to this length of the flowering season we add that no flower is more durable in a cut state, we can see what claims it has on all those who love a garden.

The taking up, harvesting and keeping the corms during the resting season is one of the most important points connected with their culture, and here, as in other points, there is some difference of opinion. I am not now dealing with those who grow them by the acre, but with the amateurs who grow only a moderately sized collection. The grower for sale has a good many things to do at the time, and he may be well satisfied to take up his corms when and how he can; but the amateur can bide his own time. I think, therefore, that the advice to get them up as soon as they have done flowering is not sound; they are not then matured and are apt to shrivel up very much in the drying off; on the contrary, I think that it is much better to leave them some considerable time in the ground after that—in fact not to begin taking them up until late on in November or early in December unless the foliage becomes yellow, when it may be best to lift them. I find it better to begin with some of the earlier flowering sorts first, such as *Amalthee*, *Shakespeare*, &c. The best place to dry them off is, I think, a cool vinery where they have the advantage of the shade of the Vines, and where a little fire heat may be put on. If necessary, I lay some out on the ground, and when they are dry cut them off the stalks quite close to the corm. In some cases where I have only a few of a sort I tie them in a bundle and hang them up to rods of galvanised iron which remain in the house, leaving the string about a foot in length for that purpose.

The keeping of the corms during the winter is a rather important matter. Some advocate paper bags, but I think this is a very bad plan. If the bases of the corms come into contact they are sure to damage root growth, and this is injurious to the future well-being of the corms. They can be laid on low shelves, in which case the base should be uppermost, or, which I think is the best plan of all, they should be placed on an open trellis frame, with trays of the same kind, so that there is no contact, and there is a free current of air round them. When they are dry, and before I place them on the trays, I always write the name of the variety on the corm itself, so that if by any chance they become misplaced there is no fear of an error, and one always likes to keep things true to name.

I now come to a point on which there has been more difference of opinion than on any other matter connected with the culture of the *Gladiolus*. I mean the losses which everyone who has tried their growth experiences. This has been assigned by some to degeneration, by others to exhaustion, and by others (myself included) to disease; but from whatever cause it is experienced more or less by every grower. A few years ago I submitted some corms to the consideration of Mr. Worthington G. Smith, who examined them most carefully, and proved them to be affected by a disease similar to that which in some seasons attends the corms in Holland. Mr. Burrell says we must calculate on a loss of 10 per cent., and I wish I could get off with this. I met a nurseryman some little time ago, who said, "I am sick of them; during the last ten years I have spent £50 on them, and I have not a corm left!" I have seen nearly every grower who has taken up their culture giving them up, and it would be folly to conceal the fact that in some soils considerable loss must be counted on. That it is a disease I have not the smallest doubt, and its ravages are sometimes very distressing; for instance, this year I never had finer looking beds. I cut, as the exhibitions showed, some very grand spikes, but some of these very corms when I lifted them were utterly worthless. Mr. Lindsell tells me he has not lost 5 per cent., and when I

came to examine the question of soils I found that his is a good stiff loam, while mine is a light garden soil with a good deal of humus in it, and as a consequence I have always to deplore a considerable loss. I have this year found that I have lost quite as many in proportion of the French imported and my own home grown roots; and I believe, as I have said, that it is a matter of soil exclusively. Let me, however, add that the small cormlets which cluster round the corms are generally sound, and that they can be easily propagated in this way, and the price of many exhibition varieties is now so low that losses may be very easily replaced. As I have often said they do not exceed those for Hyacinths, and we never expect to get anything from them after the first year; but the *Gladiolus* will last for many years, and where the corms are lost through disease they can be, as I have said, easily replaced.—D., Deal.

## LONDON PARKS, COMMONS, AND OPEN SPACES.

DURING the past few years so rapid have additions been made to our open spaces that a brief account of all those other than "Royal Parks" may be found useful, and not altogether devoid of interest.

In order to make my list as simple as possible I propose dealing with the enclosed parks first in the order with which they were acquired for public use, and now under the control of the London County Council. In the year of 1857 the late Metropolitan Board of Works considerably directed their attention to providing public places of recreation for the inhabitants of our vast metropolis in districts in which such places did not already exist, and in that year caused a bill to be passed through Parliament named the "Finsbury Park Act," empowering them to provide a park situated in the parishes of Islington and Hornsey. Though Finsbury Park is a long distance from Finsbury it was at that time within the parliamentary division of Finsbury, hence the adoption of its name. Finsbury Park is 115 acres in extent, and was first opened for public use August, 1869. It lies high, and a good distance away from the smoky and manufacturing parts of our great city. There is no important point to note in the landscape work, but from the purity of the atmosphere vegetation thrives well. The summer bedding arrangements are always highly attractive, and worthy of a long journey to see. Amongst other trees Planes, Hollies, and a large and varied collection of Coniferæ are fast developing into promising specimens. A grand display of Chrysanthemums is annually made and thrown open during the season free to all. There is also a large lake furnished with small pleasure boats, and there are twenty-two courts set apart for lawn tennis. Several pitches are always at command for cricket throughout the season, and spaces are set apart for football during the winter months. A gymnasium is also provided, and the place is yearly growing in beauty and public favour.

In 1864 the Metropolitan Board of Works obtained from Parliament power to form a park in the parish of Rotherhithe for the inhabitants of the south-eastern district of London, to be called Southwark Park, and which was dedicated for public use June, 1869. Its size is 63 acres, somewhat flat, and completely surrounded by numerous factories and other works. It is in the midst of a large working population, and all the trees and shrubs clearly exhibit signs of the unfavourable conditions under which they exist. A very large space is devoted to cricket and football. Lawn tennis courts are provided, and there is a gymnasium and an ornamental lake well stocked with fancy varieties of waterfowl. The summer bedding arrangements are well maintained, and there is annually a Chrysanthemum exhibition, for which purpose a large house has been built, and thousands of persons every season enjoy the feast provided for them with so much care and forethought.

The two parks above named are decided acquisitions, and would appear for a time to have satisfied London; but to the praise and credit of the late Metropolitan Board of Works be it said, that steadily but surely, and almost yearly, they secured for public use for ever some common or open space that would otherwise have been claimed by that monster of bricks and mortar, the speculative builder. Such places will form the subject of a subsequent paper. I will, therefore, pass at once to the year of 1887, when three of the most important of our London places of public resort were transferred from the Commissioners of Her Majesty's Works and Public Buildings to the late Metropolitan Board of Works under the powers of "The London Parks and Works Act, 1887." By it was transferred in that year to the late Board, and from them to the Council, the management and control of Victoria Park, Battersea Park, Kennington Park, Bethnal Green Museum Garden, Westminster Bridge, and the Grosvenor Embankment, all of which had previously from its formation been maintained by the State,

Parliament having voted annually the money required. Thus in one autumn was the maintenance of 463 acres added to the rates of the metropolis.

Victoria Park now consists of an area of 244 acres, and was purchased by the Crown by virtue of an Act of Parliament passed in 1842. But although 290 acres was the extent then purchased, there was only 220 acres reserved for recreation grounds, the remaining 70 acres were intended for building purposes. The population had increased so rapidly that in the year of 1872 there was a great outcry made by the people against the Government with regard to the sale of this surplus land. Deputations waited upon the Chancellor of the Exchequer, Mr. Lowe, but he refused to sacrifice the revenue to be derived from the sale of the ground. The Victoria Park Preservation Society, and other bodies, next prevailed on the Metropolitan Board of Works to purchase an area of 24 acres from the Commissioners of Woods and Forests for the sum of £24,450, which they did, and handed it over to the Commissioners of Her Majesty's Works and Public Buildings to be added to the park—a gracious act on the part of the Metropolitan Board of Works.

From a gardening point Victoria Park possesses many attractions. The spring bedding display of Hyacinths and Tulips are scarcely surpassed in any other London park, while the carpet, sub-tropical, and other summer bedding arrangements are annually carried out in the most masterly style, which all interested should not fail to see and compare notes. A large quantity of Chrysanthemums are grown here, and as in others of the Council's parks are open to public view, and we also believe that the Palm house is open to those interested at all reasonable times. There is a large lake much used for bathing, a gymnasium, and an abundance of space assigned to all for outdoor sports. It has been reported that fully 150,000 persons frequent this park in a single day. The fields and green lanes which existed in 1842, and then surrounded the enclosure, has given place to a dense mass of streets and alleys, now teeming with a hard-working, industrious population. A magnificent structural fountain was generously erected by the Baroness Burdett-Coutts, and near here on Sundays in the summer will be found a gathering of the masses that would astonish many strangers.—J. W. MOORMAN.

(To be continued.)

## VEGETABLES FROM NOVEMBER TO MAY.

[Prize essay read by Mr. Atkins, foreman in The Gardens, at Kelton, Aigburth, before the members of the Liverpool Horticultural Association.]

(Continued from page 545.)

**ENDIVE.**—As Endive comes into use when few other salading vegetables are to be had it should receive every attention, with a view to supplying well-blanching heads during the winter and spring months. For the main crop sow in June or July, and the end of August for a crop to stand over the winter. The seed may be sown in drills 9 inches apart, the plants thinned when large enough to 9-inch distances, and any blank spaces filled up. The plants should be protected with mats in severe weather, and damp should always be guarded against. They may be blanched by tying up the leaves with matting or covering with flower pots. The blanching process takes about a fortnight, and as they will not keep long in this condition a small quantity must be done at frequent intervals.

**KALE.**—This vegetable comes in very useful when hard frost has rendered Cabbages unfit for use. Sow early in April, and again in May for a succession, and plant out from June to the end of August in rows 2 feet apart. When the tops are cut off the stems should not be destroyed, as they will soon break again and form successional crops.

**LEEKS.**—Leeks form an excellent vegetable for winter use, and are also valuable as a potherb. Sow in February or March on a warm border, and transplant in June in heavily manured ground. They will be fit for use throughout the winter and spring months. Any not used before April should be lifted and their roots laid in loose soil to prevent their running to seed.

**LETTUCES.**—To obtain a supply of Lettuces during the winter months, sow the hardy varieties in September and October in cool frames, and thin out when large enough to 2 inches apart. They should be kept as dry as possible, and air admitted freely in fine weather. Frost must be excluded by covering the frame with dry litter, which should be removed on every favourable occasion. For early spring use sow in a warm frame in January and February, and transplant when large enough on a warm border or in cool frames.

**MUSHROOMS.**—The cultivation of Mushrooms is an important work in gardens, a constant supply being generally expected where the means of cultivation are at command. The principal material

required is horse droppings, which should be collected as dry and free from straw as possible. Spread this out thinly in a dry place as collected until enough has been placed together to form a bed. Then throw the material into a heap and turn frequently to allow all the rank steam to escape. When they are thoroughly prepared make it up into a bed, which may be of any form or size, according to the means at the disposal of the cultivator. In forming the beds the manure should be trodden down as firmly as possible. Holes must be made in the bed about 1 foot apart, and reaching nearly to the bottom to prevent heating too violently. The beds must be left for a few days before spawning, as the vitality of the spawn may be destroyed if they become overheated. The spawn must be placed in a warm moist temperature a few days before being inserted, as this insures a safer and quicker growth. A safe temperature at which spawning may be done is 80° to 85°. Break the spawn up in pieces 2 or 3 inches square, and insert it about 1 inch deep and 6 inches apart. The bed may then be covered with 2 inches of rather heavy loam, beaten down firmly and sprinkled with tepid water.

**ONIONS.**—Onions succeed best in a rich loamy soil and an open situation. The ground should be trenched and heavily manured in autumn, and left as rough as possible through the winter. It should be prepared in spring by a slight digging, levelling and treading firm. For main crop sow as early as possible in March, and for spring use sow the Tripoli varieties in August, and transplant as early in the following year as the weather will permit. Sow thinly in drills 9 inches apart, cover the seed lightly, and tread or beat the surface firm. Thin out the young Onions gradually when large enough until they are from 4 to 6 inches apart. Onions form the best bulbs on firm ground, therefore the rows should not be hoed between but kept free from weeds by hand. A slight sprinkling of soot in showery weather will be beneficial to the bulbs, and prevent the attack of the maggot. When the tops show signs of decay the Onions may be lifted, and exposed to the sun until thoroughly dry, they may then be tied up in bunches and hung in a cool shed.

**PARSNIP.**—This very nutritious root is easily cultivated, and when grown on good ground yields a bulky return. The ground intended for Parsnips should be trenched and manured in autumn. A deep sandy soil is most suitable, as the roots can have a free downward course; a stiff soil almost invariably produces forked roots. The seed may be sown in March in shallow drills 9 inches apart. When the seedlings are 2 inches high they should be thinned to 6-inch distances, and the ground always kept well hoed between the rows to kill weeds and benefit the plants. The roots may be lifted and stored away in autumn or dug up as required for use.

**POTATO.**—The Potato is perhaps the most useful and essential of all winter vegetables, its value as an article of food being specially recognised by the labouring classes. The sets required to produce the main crop should be planted in April; a suitable distance for strong growing varieties is 2 or 2½ feet between the rows and 8 or 9 inches between the sets, which should be placed at a uniform depth of from 4 to 6 inches. The sets may be planted in trenches cut with a spade or in holes made with a dibber. Trenches are to be preferred, as a more uniform depth can be secured, although the work will not be done so quickly.

When trenches are used a sufficient width of ground is prepared for one row, a line is laid, and the ground cut out to the depth required. Arrange the sets in the bottom of the trench, fill in, and prepare another space in the same manner. Farmyard manure suits them best, and may either be dug in at trenching time or spread in the trenches at the time of planting, beneath or above the sets. When the tops have risen 6 inches they should be earthed up, and if the soil be at all heavy the spaces between the rows should be first broken up with a heavy hoe or mattock, taking care not to go too near the roots. Lift the crop when the foliage has turned yellow, being left in the open air a few hours to dry, and stored away in a dry dark shed or Potato pit.

New Potatoes may be had in early spring by planting on hot-beds in deep pits. A quantity of stable litter and leaves should be prepared and put into a pit, and trodden down rather firmly. Place 9 inches of rather light soil over the manure, and plant the sets 12 inches apart and 3 inches deep. Dwarf compact sorts only must be grown under glass, and as soon as the weather allows after the plants are up pull off the sashes during the best part of the day.

**SALSIFY.**—This vegetable is in every respect, except in qualities, very much like the Parsnip, requiring the same treatment as to sowing in drills, thinning, hoeing among during summer, and taking

up and storing in October or November. It requires an open situation and a deep rich light soil, but the latter should not be newly manured, as it tends to the production of forked roots.

**SAVOY.**—Savoys succeed well in deeply dug and well manured ground. Sow in April in seed beds, and transplant in July in lines 18 inches apart, and an equal distance between the plants. The flavour will be much improved by exposure to frost before cutting.

**SEAKALE.**—This vegetable, being one of the easiest to force, is very extensively used. The main object in the culture of Seakale is to grow plants on to secure large crowns. To raise plants for forcing the best plan is to take cuttings from the roots, which may be obtained when crowns are being lifted for forcing. The strongest roots must be selected, and they are cut about 4 inches long, the crown end cut straight across and the other end cut on an angle that they may be easily known at planting time. The cuttings should be buried in sandy soil during winter, and in March or April taken up and planted in deep rich soil. Various methods may be adopted for forcing, but the most common mode is to lift the crowns, place them in large pots and stand them in a temperature of 55° to 60°, turning an empty flower pot over the crowns to exclude light. Another simple method is to place large pots made for the purpose over the crowns and cover the pots with stable litter. As the spring season advances Seakale may be obtained by placing pots over the crowns and filling the pots with ashes.

**SPINACH.**—The Prickly or winter Spinach should be sown in a sheltered situation about the middle of August, in drills 15 inches apart. The first sowing of the summer variety may be made in February on a warm border, and to maintain a supply a sowing must be made about every fortnight until April.

**TURNIPS.**—Turnips may be had in use during the winter months by sowing the hardy varieties in August. The seed is best sown in drills 9 inches apart, and when the plants are large enough they may be thinned to about 6 inches apart. A supply may be obtained in spring by sowing broadcast in a cool frame in February. Plenty of air must be given to ensure a sturdy growth, and when the plants are strong enough the frame may be removed. Another sowing may be made in March on a warm border for a succession.

---

## CARNATION SOUVENIR DE LA MALMAISON.

PLANTS raised by cuttings or layering at the end of July or the beginning of August should have 3-inch pots well filled with active roots. These plants seldom do well if confined too long in small pots. If placed at once into 6-inch pots the roots will work freely amongst the new soil and start vigorously into growth early in the season. Carnations do well in a compost of three parts fibry loam to one of leaf mould; one-seventh of decayed manure being added, with a liberal quantity of coarse sand. The soil must be in an intermediate state for moisture and pressed firmly into the pots. Plunge the pots to the rim in ashes in a cold frame, and admit air abundantly during favourable weather. For some time after potting no water will be needed, and roots will form with greater freedom without it. During severe weather frost may be kept from the plants if practicable by placing litter round the sides of the frame, and mats or the same material over the top. Light should not be excluded from the plants more than is necessary. The pink and scarlet forms of this Carnation may be given the same treatment. The old, white, and crimson Cloves (W. P. Milner and others)—in fact, any free-flowering border varieties—will give satisfaction if grown on the same principle.

Directly growth is visible aphides will appear, and these must be destroyed at once or they will soon ruin the plants. Care must also be taken to prevent the plants suffering through an insufficient supply of water. Soot water in a clear state is beneficial after the plants have made a quantity of roots, but strong stimulants should not be given.—N. G.

---

## WANDERINGS.

A CORRESPONDENT who believes himself, as he says, to be "typical," has written a letter to the Editor asking for "more wanderings," and the Editor has handed it to me. This indicates that I have been in close contact with an important personage, for it is not everyone who can gain access to a controller of the press. I have been told if Editors gave audiences to all who sought them their lives would be one long interview, and they would have no time at their disposal for producing what the public need. They, therefore, best serve the public by locking themselves up. It will be seen that our Editor did not apply to the wrong man on the present occasion—at least for mental wanderings,

for here I am in the thick of them. But I must return to my "typical" friend. It is not altogether mental wanderings that he wants, for he says (meaning himself and other "types," I presume) "we don't always want feeding with Chrysanthemums nor with heavy dishes of the 'best soil.' We don't want to know how we are to do this that or the other when we can't do it, or after we have done it, and then have to wait nearly another year before we can do it again; but we want a mixed menu—something solid and something light, for you know the old story of all work and no play and its gloomy results. Perhaps it is because we brothers of the spade work so hard that we have got into a dull way of expressing ourselves. We all seem to think on the same lines and plod on in the same groove. We want to straighten our backs now and then, and not for ever have our noses to the grindstone. We don't want to be continually telling each other what we are doing as if we were so many clever Jack Horners, but we want to know what is going on just outside the circle of hard routine, and thus spend a pleasant few minutes of free reading after a hard day's toil; so please give us a few more wanderings, not forgetting the episodes and occurrences that are met with even if they are not strictly 'gardensque.'"

That is the letter before me, and I am inclined to think if it had been addressed to me I should have sent it back to the author with a request for a "type" of what he really does want, for he is evidently my equal in wandering. Perhaps he will do so yet; I hope so, and I will do what I can to lead him on if he will follow me over the ocean. He need not be afraid of my exploring for his identity. If I did I should not get it. I once had a rather curious experience of difficulty of getting a name from an editor. It happened many years ago, but as I am invited to "wander," I shall neither be bound by limits of time nor space.

An article once appeared in a certain newspaper which a certain gentleman did not like. As he was a personal friend of the conductor he was, on calling, invited into his presence, where I also happened to be making a few arrangements with the view to possible eventualities. "Ah, good morning, my dear fellow, what a capital article that was in which I am honoured with prominence. Of course I cannot agree with everything in it, but the writer has put the case well from his point of view, and I am sure I should enjoy his friendship, if I do not already. You couldn't get me an introduction, could you?" "Oh yes I could," replied the Editor, and the interviewer rubbed his hands gleefully; "that is to say if I have permission. I will write and ask for it if you like." Checkmated decidedly, and then followed irateness, with first a "demand" and then a threat of an action. "Very well," was the calm response. "Mr. So-and-so is my lawyer, so it is useless our discussing the subject further." There was an interchange of professional letters, but the coveted "introduction" was never brought about; the writer's name was not obtained by the Editor's friend, and it certainly never will be, for he is dead, and that ends the matter. But the principle lives, and I am satisfied it is useless attempting to draw an editor, therefore my typical prompter can remain in obscurity just as long as he likes.

Now we are off. After reading about "foreign parts," a very dear friend, whom I will call Joan, asked if I would take her to the Continent. "Certainly; I will take you anywhere, from the Isle of Man to the Rocky Mountains—where is it to be?" It did not appear to be westwards, but eastwards, that the thoughts were trending, for the answer came, "I want to see Antwerp Cathedral, and I should like to see Mr. Van Geert and Mr. Everaerts; then that beautiful park I have been reading about at Brussels; and I should like to visit Ghent and see the Van Houttes; go up the Rhine and see the old castles; then round into Holland, and"—but that was enough for me, so I mildly suggested we had better first get to Antwerp and then go—well, according to the weather. It is now a case of Darby and Joan packing up, watching the wind, and trying to snatch a fine day and calm sea to speed us on our journey. It is a long time ago now, but that is of no consequence; we waited till the wind ceased blowing, and on the morning of the last day of August we hove in sight of the famous cathedral. It must be understood I did not go to Belgium in search of materials on which to write; and only a little can be remembered out of the much that was seen and enjoyed, but we do not forget the journey.

The route to select was a matter of serious discussion. One train started from London at 10 A.M., but that was too early, so we determined to go at midday, but missed the Thames steamer, and there was then nothing for it but to run down to Harwich and cross in the night. The steamers are large and fine, garnished with plants and flowers, and lighted with electricity. The night was clear, and water only broken by small ripples, from which the moonlight glinted, making a track like shimmering gold. The deck was pleasant, but after midnight we went below—Joan in charge of the stewardess, Darby looking after himself, which he has been trying to do under various circumstances for about half a century with more or less of success. He was fairly successful that night—at least for a time after, as the hymn-like song says,

"He laid him down in peace to sleep,  
Rocked in the cradle of the deep."

But he had a rough awakening—a short but sharp shaking, as if being sent up like a shuttlecock, and on coming down again hit and knocked sideways, then caught once more and sent spinning, but before he got anywhere definitely had another great thump upwards, and so on for an hour or so. It was very different from digging. You know where you are when you are at spade work, but you are never in the

same place for two seconds and never know where you are going next when you are made the sport of the Storm King, even if he is not in his most violent mood. Poor Joan was, however, more cruelly treated. A night-long attack of *mal de mer* in its worst form was her sad fate, and the stewardess, after being specially "tipped" to give her special attention, slept like a top through it all, neither storm, silver, nor sickness disturbing her sweet slumbers. It is as well to tell the truth in these matters, and it is true that there was no tipping on the return journey; and thus we learn wisdom by experience.

We landed on a Sunday morning, and Sundays over there differ somewhat from Sundays at home. The crowds in the streets; the processions with their banners and their bands; the brisk trade in shops, cafés, and estaminets or taverns, with the overflow outside them, where men, women, and children quaff their bock from the tables across the pathway—all this is a little strange to a first visitor who has not been "brought up" to such customs as there prevail. But the crowd is not rough. The country folk, we were told, work hard and live hard all the week, then dress for a day's enjoyment in the towns on Sunday. Many come in dog-carts, but they are different from ours, for dogs draw carts there, sometimes three abreast, and sometimes running tandem; and perhaps if the Belgian peasants were told that our dog carts were made for dogs to ride in they would think us a very peculiar people. "But surely," we can imagine some of our good friends saying, "you did not spend your Sunday in that way?" No, we did not—at least, not exactly, for we kept out of the dog carts, and we did go to the cathedral service. High mass there is an imposing ceremonial. The magnificent paintings around you, the huge building filled with glorious music, and the great bell booming in unison; the genuflexions of the priests half hidden in clouds of incense, and the evident devotion of the good Catholics to their service, was altogether something to be remembered. Apart from the paintings the cathedral does not startle by its interior beauty, but the tower, rising from the ground to a height of 402 feet, is superb by its architectural elegance, justifying its comparison by the first Napoleon with a piece of Mechlin lace.

We pass from the service into the Place Verte, once the churchyard, and now a large square of trees, with plenty of space for promenading between them, and find an open air concert in full swing, the cathedral congregation increasing the audience materially. From church direct to concerts appears to be quite the correct thing. The people seem to think they are none the worse for having been to church first, and appear to know very well that in our country many persons attend concerts regularly who never go to church. However, we did not linger at the concert, but went to the Plantin Museum, because nobody in Belgium seems to go home on a fine Sunday till he can help it. This museum contains a marvellous collection of everything in connection with printing, arranged in the ancient mansion of the Plantin-Moretus family, who carried on their famous business in the building for nearly three centuries. It was acquired with the ancient furniture, family portraits, tapestries, and stock-in-trade by the Corporation of Antwerp, and is free to visitors. Taking it all in all its equal is probably not to be found; and the systematic arrangement of its wonderful contents by Mr. Max Roosas, the accomplished director, is a triumph of patience and persevering work. Mr. Roosas, it may be added, is a son-in-law of Mr. Van Geert, and world-famed as a linguist and archaeologist. A drive down the boulevards followed, and now you have what is regarded as a very proper way of spending Sunday in Antwerp, with perhaps a turn into the Zoological Gardens at night, to sip coffee and listen to the music under a canopy of foliage. There sit thousands round the little tables, and feel more comfortable outside than in so long as the weather remains agreeable.

The next day, September 1st, will be remembered in Antwerp as the date of the introduction of omnibuses similar to those in London, and the new vehicles laden with passengers on the top caused quite a flutter of excitement. People flocked out of their houses to see them, and the drivers and conductors were tempted by innkeepers to "take something," perhaps as an inducement to establish stopping places on the way. The 'buses did a great trade from the first, and so keen were passengers for outside seats that they would not go inside, even when it rained, so long as there was room on the top. Trams have long been established, and the cars though plain are convenient. They are not enclosed in summer, but plain benches are arranged across a platform, about 18 inches above the ground, with a foot-board a little lower, running along the outside, on and off which passengers step all along the line—at least, those who are used to it, and they appear to be the majority. But if the Antwerpians were behind us with omnibuses, they lead us in some other respects; for instance, in public telephones, and by payment of a trifle anybody may talk with anybody else with whom he is put in communication in any part of this large, prosperous, and highly interesting ancient and modern city.

What strikes a stranger whose linguistic attainments is limited to his mother tongue is not the language he hears only, but which he sees displayed on signs and buildings. If a tradesman has wall enough he will tell you a good deal in Dutch or Flemish of what he is, does, makes, or sells; and you could almost fancy that long words are chosen as if to impress with the extent of the business, especially when it is obviously small. Something of the same kind is perhaps not unknown in other countries, including our own, for small people are apt to try and make themselves look greater than they are. But to these rows of Dutch letters that puzzle you so; the guide, who speaks English and Flemish too, will tell you there is not much

difference between them, and that if you look a few times at the Dutch method of arranging the alphabeticals you will soon evolve English out of them. There is something in that, no doubt, but all the same the one-language man finds some rather awkward words to deal with. As puzzles are in season at Christmas time I will set two for young British gardeners who are ignorant of Dutch to render into English without any assistance from dictionaries or otherwise, but simply by "looking at them a few times." One of these I managed to interpret because it is easy, but the other beat me. Here are the word puzzles:—

Indeniewepellicaan.  
Gebreveteerde suikerbakkerij.

To the foreman or journeyman gardener, who puzzles out the English of both, subject to the above conditions, I will send a prize; and if more than one succeeds he whose letter is first opened must have priority; if all fail I must give a little lesson in languages another day, for I have not quite done with Belgium. Replies may be sent to 171, Fleet Street, addressed to—WANDERER.

### PEACH TREES UNDER GLASS.

GROWING Peaches under glass is one of the most important duties of many gardeners. No time should be lost in pushing to completion the work of pruning, washing, and tying to the trellises both Peach and Nectarine trees, afterwards giving attention to the borders in the manner set forth below. In pruning thin the shoots well, cutting back the old wood which bore fruit this season to a good healthy shoot of this year's growth, retaining those shoots which are situate lowest down on the old wood, and which are best furnished with fruit buds and sufficient in number to cover the trellis at about 5 inches apart. Shorten back weak growths to a wood bud, and any extra strong shoots of the current year's growth that can be dispensed with cut clean away, so as to divert the flow of sap into the weaker shoots, and thereby promote a balance of growth in the individual trees. This is an object that should never be lost sight of in the pruning any kind of tree. This done wash the glass and woodwork, and limewash the other parts. A few handfuls of sulphur stirred into the lime before using it is useful in making it distasteful to insects. Unless quite free from insects the trees should be washed with a solution consisting of 4 ozs. softsoap dissolved in one gallon of warm water, with two handfuls of sulphur well mixed. This should be applied to every part of them with a soft brush without doing damage to the buds. Should scale exist on the trees it will be necessary to add a wineglassful of petroleum to the above solution and sufficient clay to give it the consistency of paint. When dry, the branches are ready to be tied to the trellis, allowing, as already stated, a space of about 5 inches between shoots. This will admit of one young growth of next year's making being tied in between each pair of branchlets. Do not tie the shoots too tightly to the wires, otherwise growth will be impaired.

The borders next claim attention. Point over the surface down to the roots with a fork, removing the loose soil, and adding a mixture composed of three parts good fibry loam and one of lime rubble and wood ashes, following this with a coating 2 inches thick of horse droppings or short manure, and finishing with a good soaking of tepid water. If ripe Peaches are required towards the end of next May or early in June the house should be kept close the middle or third week in this month, and the trees be syringed two or three times a day with water at a temperature of about 75°, and only use the heating apparatus to prevent the temperature in the house falling below 40° at night and 45° in the daytime. Admit fresh air to the house every favourable opportunity that presents itself. When the trees come into flower a drier and more airy atmosphere should be maintained, and to secure a good set the flowers should have a camel's-hair pencil or some other soft substance passed over them every day at about 11 o'clock. The probability is that during the time the syringe is withheld from the trees while the crop of fruit is being set that aphides will effect a lodgment on them. Therefore as soon as the fruit is set the house should be fumigated lightly a couple of evenings in succession to dislodge this pest, after which a free and well directed use being made of the syringe and tepid water morning and afternoon on bright days, together with judicious supplies of clear water and tepid liquid manure being given alternately at the roots, will be the means of keeping the trees free from the attack of aphids and red spider.

Disbudding the trees should be done by degrees, so as not to subject them to any check, which if done all at one time would follow the operation, and in the carrying out of which the formation of the trees for next year must not be lost sight of, as the necessary number of side buds should be left as low down on the old wood as they appear to balance the growth of the tree for another year. In thinning the fruit on healthy vigorous trees leave a space of about 4½ inches between the fruits at the first thinning, removing every other fruit a week or ten days later, and before the stoning process has been completed, as with such trees there need be no apprehension of the fruit dropping during that otherwise critical period. But in the case of trees the opposite of those indicated it will be wise to defer finally thinning the fruit until the stoning process is completed. After this the night temperature should range from 55° to 60°, with 10° higher by day of fire heat, increasing by 10° with sun heat, until the fruit begins colouring, when a more airy and dry atmosphere should be preserved so as to give colour and flavour to the fruits. In determining the number of fruit to be

left on each tree the size and condition of the latter must be taken into consideration, the best shaped and placed fruits being retained as a matter of course.—H. W. WARD, *Longford Castle*.

### CLARKIAS.

SPRIGHTLY and charming flowers are Clarkias, and the improvement by selection that has been established in these hardy annuals of late years is very considerable. They are highly attractive in gardens during the summer from seed sown in spring, and the spikes when cut are suitable for furnishing vases gracefully. Our best displays of these flowers are usually towards the end of May and in June, from seed sown in the open in September. If sown sooner the plants grow too

FIG. 77.—CLARKIA MORNING GLORY.

tall before winter. At present those which were sturdy are safe under the snow. We are reminded of Clarkias now by an illustration of a new variety in Carter's "Vade Mecum" for 1891, and named Morning Glory. Flowers were sent to us in August, and were distinct in form from any we had seen, and very attractive. How far their peculiarity is fixed we have obviously not had time for testing; but it is well portrayed in the figure, with which we are favoured by the Holborn firm.

### AS OF A DREAM.

"THE error is not contradicted about my jams. Why don't you write and contradict it?" Thus was I addressed some time ago at home. "Oh, well, I do not think it signifies." "But it *do* signify," was the quick response. "You have for the last thirty years wanted to take up my jams along with your home-made wines, and now the Royal Horticultural Society have invited me to do so, I feel quite jealous to find my exhibits reported in my favourite paper as having been shown by Mr. Roupell, who only took one jar of an exceptional kind." "Oh, well, I am quite sure Mr. Roupell does not want to be burdened with your forty extra pots; besides, the pages of the horticultural journals are so filled up about Chrysanthemums just now that they could not find room to give heed to our necessities of life; so good-night, my

dear. The subject might be entertained about Christmas time;" and now I want an excuse to wish our Editors a Happy New Year, and to let them know that I am still in the land of the living, I will propose to do so—as of a dream.

December 16th.—“It is nearly Christmas time, and you have not done what you proposed.” Oh, ah!—well, it is a longish dream, but sometimes if one dreams but an instant one's whole life appears shown over again. At any rate, the Black Currant jam “dog-in-the-blanket” that Alice made for dinner to-day was palpable, and as I have got a day or two's respite from those plaguey parish valuation lists I will at once relate a trifle about our late comical enterprises. I was not successful in an entreaty to bring up my wife's jams to the Fruiterers' Guildhall Show along with a collection of my seedling Potatoes—these latter not necessarily for competition, but as giving an opportunity to a large gathering of the public as showing special suitability for culture, and quality, at the present day. I saw we could not show in rule, according to the schedule, so I tried to win over the Secretary in this way: “I feel myself in a great measure a city man, having bent the printers' backs there periodically since 1852 on practical horticultural subjects, and beginning in connection with the old *Cottage Gardener*; plus I was apprenticed to the watchmaking in Knightsbridge, when the site of Belgrave Square was a receptacle for the débris of London, and I have eaten Cherries from the trees on the site where I afterwards sat as a member of the Royal Horticultural Society's Fruit Committee.” I fear I bothered Mr. Eagleton; but he let me down in an agreeable manner by “regretting that Potatoes were not within the scope of the Fruiterers' Exhibition” (the Pomme de Terre?), “and he feared he must confine me to exhibits as specified in the schedule.” Thus the glory of the world passeth away! Not quite; for the Royal Horticultural Society was now making a departure, and had made up its mind for a jam show. Now our universal friend must be appealed to, because the schedule laid it down that “all jams, fruit, and jellies should be in clear glass jars, quart and pint bottles,” which was simply kicking the ground from under us country people, who had their preserves already made, and stored away in any convenient teacups (handleless), or glasses and jars, as they promiscuously “come to hand” in country cottages. Mr. Barron's answer was just what we expected, “We shall be very pleased to receive Mrs. Fenn's interesting contribution in the style that Mrs. Fenn will present it; kindly let us know as to space desired both by yourself and your wife.” Thus the Royal Horticultural Society had the first initiative after all in presenting to the public a complete selection of Apples, jams, &c., from a cottage homestead, and, as expressed by a label, to be appropriate for a small holder to grow—plus, in showing the utilisation of surplus fruits into jams, jellies, syrups, and beverages as human food.

You have got it in your archives in Fleet Street, in print, how I planted my first orchard, about 1836, at Stanton Lacey, near Ludlow. In 1852 and onwards I have mentioned many anecdotes of Mr. Thos. Andrew Knight, of Downton Castle, almost the next parish to Stanton Lacey, Bromfield intervening. Mr. Knight would hob-nob with anyone fond of horticulture. When in London he usually stayed with his daughter, Mrs. Walpole, in Upper Wimpole Street, and on my first visit to the R.H.S. Chiswick fêtes I rode on Mr. Walpole's carriage, which conveyed Mr. Knight thither as President in 1835, or it may have been 1836. Mr. Knight had a great objection to sleeping upstairs in London. His bedroom was the back dining-room on the first floor.

When I read of your visits to Downton and its neighbourhood, I have wished that I could have been with you; we would have gone and seen the rectory orchard, by the banks of the river Corve; the plantations and trees in the churchyard, nearly all of which I had a hand in planting, and which I should expect are now at their best as timber. And again, when you are visiting Nowton in Suffolk you would little suppose how I was at the planting of many of those trees you have so often, to my great pleasure, told us recently about. Why, I remember a greater part of the site of those trees as a common. My relatives lived as tenants under Mr. Oakes, and I was born at Rushbrook, the hall of which you must have seen upon the hill; and your old pages will tell how, as a child, I planted a young Ash tree against the cottage wall where I was born, and how it was kept sacred there till there arose the danger of its pulling the house down. I mention these things as a dream, but also as an assurance to your readers that I am not a novice in what I am about to advise them, at least that is those of cottage folk, to plant. Why I had for the matter of that planted my first garden and orchard, and was partaking of the jams and fruits thereof, when Mr. Gladstone was a good Conservative. But his airing of his jam theory has given the subject a thousandfold more impulse than a simple individual like myself could do, even by example, and precept, and writing, “how to do” these things nearly all my life.

This (my present home) is the third place I have, so to say, made and planted, and seen grow up. Everything here is in full practical working that is now so thoroughly being thrashed as to what “ought” to be done. I have seen, too, nearly the whole of the horticultural world grow up from boys into manhood, and many—too many of them—are gone over to the majority, and now, when I attend the horticultural meetings, I am scarcely known, at least so it seems to me. Perhaps it is a dream.

The Berks County Council had ordered a restamping of the weights and machines. So on the 10th of October we lifted the case containing our exhibits into my cart with the above, and drove direct to the South-Western Station at Reading, ordering my man to the county inspector with his portion. Then with anxiety about the missus's jams, by

keeping a sharp eye on the porter to see that the case was kept “this side up,” I arrived in London during one of the densest fogs the metropolis could inflict. I self piloted through the fog the next morning, and “Big Ben” boomed the hour of seven as I arrived at the Drill Hall, but to find the trestles and tables just arrived from Chiswick. It would be “quite an hour” before my staging space could be occupied, and quite that period I surmised before the coffee shops transacted business. Drill Hall, not inviting; in the streets, a suffocating fog; pleasant; but breakfast most desirable; voyage of discovery for the same. “Soldier's Home” I read on a new building; “Cup of Tea half-penny, Slice of Bread and Butter, half-penny,” with other reasonable prices. Enter:—I found chairs on the tops of tables, and men, old soldiers apparently (with buckets of water washing the floor), who civilly inclined to make way. Pray do not disturb yourselves, I merely want a cup of tea; and making up to the counter I inquired of the bar occupant, who was polishing some resplendent urns, “Is it too soon for a cup of tea?” “We have none ready, sir, but I can make you a pot of tea. Anything to eat with it?” Oh, yes thanks, some bread and butter, and would a slice of bacon be too inconvenient?” “I can cook you a rasher, but you will have to wait ten minutes,” and he looked apologetically at the wet floor. I instinctively said, “The outlook in the street is far worse, and here comes the morning's papers for me to take a first peep.” For civility and a know what to do I commend the Soldier's Home to all waifs and strays from the country in a thick London fog in the early morning. So to the Drill Hall, where my superfluous were ready by the time that I was for staging, and I gained the compliment of being “the first ready.” But scant reports were given me and I seemed wounded in the house of my friends.—ROBT. FENN.

(To be continued.)

#### FRUIT FORCING.

**PINES.**—Preparations for producing ripe fruit during the months of May and June must not be further delayed. Black Jamaica, Smooth-leaved Cayenne, and Charlotte Rothschild, which failed to show fruit during October and November, will not now throw up in time to ripen at the period in question, therefore attention must be directed to those that attain perfection in less time, such as the Queen, Enville, and Providence. Choose at once those plants which have an enlarged base, with a tendency to open at the centre, signs of the fruit being shortly visible, placing them in a light house or pit, affording a brisk bottom heat of 85° to 90°, a top heat of 60° to 65° at night, 70° to 75° by day, and 10° more when the external conditions are favourable. A genial atmosphere should be maintained, but not be produced by steam resulting from syringing the hot water pipes, as syringing the plants once or twice a week is ample, and then very lightly, on fine afternoons damping the house. See that the soil is in proper condition as to moisture, using tepid water with a dash of guano or some approved fertiliser in it, applying it copiously about every ten days.

**PEACHES AND NECTARINES.**—*Earliest House.*—Less moisture is needed at this time of year than in spring, when the days are longer and more sunny. Cease, therefore, syringing the trees when the flowers show the anthers; but a moist atmosphere tends to weaken them, and should be guarded against by a little ventilation constantly, avoiding syringing the trees after the flowers show colour. A moderate moisture, however, must be maintained by damping the floor on bright mornings and early in the afternoon of fine days. The temperature may be maintained at 55° by day and 50° at night, but in sharp weather 50° by day and 40° to 45° at night is safer than the higher temperature. In fact, low but safe night temperatures invigorate, and are advantageous rather than otherwise. Inside borders must be kept moist, affording if necessary a thorough supply of water at a temperature slightly in advance of that of the house. Avoid, however, making the soil sodden by needless waterings, and particularly by dribbles that make the soil soapy whilst below it is dry.

*Second Early House.*—Anything required in the way of repairs, &c., must be attended to at once, and the trees must have their final dressing, if one be necessary, and be tied to the trellis. The house must then be closed, merely employing fire heat to exclude frost. This will accelerate the activity of the sap and the gentle advance of the buds, so that fire heat can be safely used at the beginning of the new year in houses that are to afford ripe fruit at the close of May or early in June. Besides, when the trees are brought on too rapidly they are apt to cast their buds, especially those of the early large flowered varieties. Alexander, Amsden's June, and Waterloo differ very little, and have large flowers, so also have Hale's Early, Early Grosse Mignonne, Early Alfred, and Early York, with Early Beatrice and Early Rivers. Varieties with large flowers do not bear forcing nearly so well as those with small flowers, which is due to premature development of the buds, but there are

exceptions. Yet as a rule the small-flowered varieties are better adapted for early forcing than the large-flowered for another reason—viz., that large flowers are often deficient of pollen whilst the other varieties afford pollen abundantly. Early Albert is one of the surest of early forcing Peaches, not liable to cast its buds like the large-flowered sorts. Early Louise, Dagmar, and Crimson Galande, all raised by the late Mr. Thos. Rivers, have small flowers, and precede Royal George or Stirling Castle in ripening, and with those no fault is to be found, except Early Louise, the fruits of which are liable to crack at the stone. Its constitutional vigour may have something to do with that, and when care is taken not to overfeed, it is the very best flavoured of all early Peaches, except Early Rivers, which also cracks at the stone, and its flowers being large do not afford sufficient pollen. All the large-flowered Peaches require to be brought on very gently; in fact, they should never be started until the new year, and every care even then must be taken, by timely removal of the roof lights, to prevent over-maturing of the buds. In Nectarines the surest and best are those with small flowers. Lord Napier and Hunt's Tawny are exceptions, but in these there is a tendency to blindness when the trees are subjected to very early forcing in consecutive years, yet not more so than in Elruge, but Rivers' Elruge (happily rarely seen) is apt to have blind buds. Perhaps the best Nectarine, having the good properties of Royal George Peach—viz., being equally good as a forcer as for cool culture, is Dryden. It has small flowers, and though of the Elruge type, is a decided advance on that esteemed variety. The fruit, however, is larger and better coloured, the tree having a better constitution. Stanwick Elruge, also, has small flowers and sets splendidly. The Orange Nectarines, of which Pine Apple is the chief, are not very early forcers; but Victoria, like Royal George Peach, is good everywhere, everything in size, colour, and quality of fruit, with certainty of crop that everyone desires. It, however, is late, following Royal George Peach, both of which seem to enjoy the generous treatment accorded fruit trees grown under glass. Damp the trees in the morning and early afternoon of bright days, and to accelerate the swelling of the buds turn on the heat by day, but it must not exceed 50°, and is better left alone until the house has been closed at least a fortnight. Protect the border outside with a little dry fern or litter, but avoid heavy coverings of leaves or stable manure.

*Succession Houses.*—Push forward pruning and dressing trees after loosening them from the trellis, cutting out any weak attenuated wood, thinning where crowded, leaving space between the current bearing wood for training in that intended to displace it. Thoroughly cleanse the house, dress the trees with an insecticide, secure the trees to the trellis, leaving space in the ligature for the swelling of the shoots, tight tying being prolific of gum. Remove the surface soil down to the roots without disturbing them, affording a surface dressing of good loam with a handful of bonemeal to every bushel of loam, and a similar proportion of wood ashes, or half the quantity of kainit, not covering the roots more than 2 to 3 inches deep. If inside borders are at all dry soak thoroughly with water or liquid manure if vigour in the trees is wanted, and keep the house as much ventilated as possible, or if the lights are off let them stay until the time arrives for starting, or the buds advancing necessitate protection.

*FIGS IN UNHEATED HOUSES.*—Unloosen the trees from the trellis or wall, have the branches tied together in convenient bundles, and cover them with a single thickness of mat, and then some dry straw or fern a few inches thick, securing with tarred string, mulching over the roots with some short dry littery material to a depth of at least 6 inches, thereby securing the safety of the roots, whilst covering the branches with straw or other material will not only insure them against frost, but tend to a more complete state of rest. If the trees are in an unsatisfactory state, arising from too rich, loose, and over-extended border, they should be given a chance of fruiting. Where the soil is too rich apply a dressing of quicklime and road scrapings in equal parts an inch or two thick, and mix it with the surface soil as deeply as the roots will allow without disturbing them much, and after resting a time and when in good order tread it firmly. If the trees make long-jointed wood it is best to lift them carefully and replant, making the soil firmer, using old mortar rubbish to the extent of a fourth and of road scrapings a sixth, mix together well and make it firm, curtailing the rooting area to at least half the width the trees cover of trellis. If the soil, however, be light and sandy, add a fourth of clay marl, dried, pounded, and thoroughly incorporated with the soil, which will tend to encourage shorter-jointed wood, improving the texture of the foliage, and increasing its power of elaboration, whereby the size and quality of the fruit is improved.

*CUCUMBERS.*—The weather has necessitated sharp firing, and there has been little sun, which is sure to result in weak growth. Light is very important for these plants in winter, therefore keep the glass clean both inside and out. Employ a covering of mats or other protective material over the lights at night, and have a mat over the doorway, so as to prevent the rush inwards of cold air when the door is opened, and avoid needless entries. Do not apply strong liquid manure too freely, but keep the roots active by judicious earthing, or surface dressings of rich, sweet, warm lumpy loam, sprinkling some horse manure over the surface, and if more vigour is wanted use a little superphosphate, to which has been added two-thirds of kainit. Avoid overcropping the plants, not allowing the fruit to hang too long. They keep fresh several days after being cut if the heels are inserted in saucers of water in moderate heat. Remove superfluous and ill-shaped fruits as they appear. Red spider must be kept under by sponging the leaves carefully, or they may be syringed with a solution of softsoap, 2 ozs. to the gallon of water, but care must be taken not to damage the

leaves. If mildew appear, flowers of sulphur must be applied to the affected parts, and a little brushed on the hot-water pipes mixed with skim milk, reducing the atmospheric moisture. Aphides, whether green or black, succumb to dusting with tobacco powder or fumigation on two or three successive evenings, taking care not to dry the atmosphere, and to deliver the smoke cool. Avoid the common practice of putting cinders in fumigators, they give off sulphurous fumes and destroy vegetation, and take care not to give too much.

Where Cucumbers or Melons are obtained from frames or pits heated by fermenting materials, some fresh Oak or Beech leaves should be thrown together, with one-third of stable litter, and, if necessary, be moistened so as to induce fermentation. The heap must be turned when warmed through, turning the outside to the inside, thoroughly incorporating the materials, alike to induce a genial state of warmth and to sweeten them.

## THE BEE-KEEPER.

### APIARIAN NOTES.

#### SUPERS FOR LANARKSHIRE HIVES.

"A HOWDENSHERE BEE-KEEPER" wishes to know what kind of supers I use. It is rather difficult to answer the question definitely, so many sorts have been used, and are still in use by me. For the last forty years I have had nothing but divisible-supers, or those having little or no attachment to anything but the top bar, and perfectly straight. The first decade of these four I secured straightness by splitting the top bar and inserting guide-comb after removing the greater part of the side walls, then tightening the bar by two brass screws. Our hives then were mostly of the same sort as I now use, but minus the end or vertical pieces of the frames, a few octagons, and several of my first frame hives. The octagon supers were of the ordinary type as are usually sent out, and a per-centage of them with the rim in one piece, while in others I had them similarly made, but were small, four forming the complete super or cover. I have still the pattern of these beside me. If the supers are to be sold the bee-keeper should study what is likely to be easiest disposed of at the greatest remuneration. The full sized super gives the bee-keeper the greatest quantity of honey with the least outlay, and are sent to the market at less cost than sections are, with less chance of being damaged, and I have yet to be convinced that they are less saleable than sections, whilst their beauty is greater.

I also use a few sections, working them in the rims of ordinary supers. The rabbets intended for the bars hold a slip of wood for tightening them on end, and use tin frames suspended to sides of super for the sections to rest on. This is the best arrangement for sections I ever tried; a description of these has been in the hands of the Editor for some time, which may appear soon. I also use full sized supers, with and without end pieces, on bars. I prefer them without them.

Small supers are employed of different sizes, holding from 2 to 6 lbs. each. I prefer those holding about 5 lbs.; they are about 7 inches square by 4¼ inches deep, being my standard for depth, the sides and top bars are one-eighth of an inch thick, and fronts and backs five-sixteenths, the rabbet for the top bar being about one-eighth deep and on. At first I had these as well as the hives dovetailed, or rather morticed or tenoned, because a true dovetail is wider on the in than on the outside, but I abandoned that, finding nailing superior both in firmness and for hives more lasting. The many joints in inside dovetailed work cause early decay.

Half sized supers and divisible supers I have also used, constructed so that one or any number of bars may be employed. I never nail the bars of large supers, but have always in readiness two light pieces of wood to screw to the top of super at the ends of the bars. I have omitted to say that all supers less in size than the outside of hive have an outer case to slip over them. This arrangement is absolutely necessary where the hives have to be moved about, and where all the divisions are clamped together.

with hinges or strong hooping there is little fear of bees escaping or supers being shifted or twisted.

I have other kinds of supers than those described, but I think unnecessary to detail them at present, the amplified statement being perhaps more than your correspondent desired, but which I hope may not be without its usefulness.

#### VENTILATING FLOORS.

I am glad to observe that your correspondent has succeeded in making a cheap hive with its ventilating floor. I trust he does not follow the advice given in a contemporary, re-making stands for hives, to nail the rim, plain joint at the corners. Such a slip shop method of putting together any stand is not commendable. A very little pressure out of the perpendicular soon causes it to collapse. It is in the neat and proper checking and nailing at the corners that gives strength to all stands or supports.

Since I communicated my intention a few weeks ago of making a few stands without feet in lieu of all my prize hives I had disposed of, I have now accomplished the work, but as I departed from my intention of keeping them without feet a brief description may not be unacceptable. The sides of the stands are 5 inches deep; the length of the feet is 8 inches by  $2\frac{1}{2}$  by  $1\frac{1}{2}$  inch. These are squared across 3 inches from one end, and a gauge set at five-eighths is run upon the face, and are then ripped to the cross mark, where it is cut in. The 3 inches form the feet proper, the sawn portion being nailed to the sides of the hive, and at their extremity, gives the stand a good grip of the ground, and reduces the oscillation to a minimum when in transit. The feet should be made from larch or red pine. They are much cheaper than iron, and are easily made by any amateur. The alteration in the bottom or false floor gives me great satisfaction. It is so easily opened or shut, and is always in place, yet it can be removed, cleaned, and replaced in a few seconds. It must be observed that these sizes of the feet should not be departed from. If the projections are more than five-eighths they might be the means of preventing an extra row of hives on the conveyances when taking them to the Heather. —A LANARKSHIRE BEE-KEEPER.

#### TRADE CATALOGUES RECEIVED.

Cooper, Taber & Co., 90, Southwark Street, S.E.—*Catalogue of Seeds, 1890-91.*

John Laing & Sons, Forest Hill, S.E.—*Catalogue of Flower and Vegetable Seeds.*

Webbs, Wordsley, Stourbridge.—*Spring Catalogue, 1891 (illustrated with coloured plates).*

\* \* \* All correspondence should be directed either to "THE EDITOR" or to "THE PUBLISHER." Letters addressed to Dr. Hogg or members of the staff often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post, and we do not undertake to return rejected communications.

**Planting Vines (A. A. B.).**—Your letter cannot be answered this week, but you have nothing to lose by waiting.

**Dwarf Japanese Plants (Inquirer).**—We hope to give the information you require in an early issue of this Journal.

**Cineraria Leaves Curling (E. N.).**—The position the plants occupy is not suitable for them. The dry air rising from the highly heated hot-water pipes is exactly what these pipes do not like. If you cannot find a cooler place for them cover the stage with slates or anything else suitable for retaining a layer of cocoa-nut fibre refuse, sweet ashes, or fine gravel, and if this is kept damp the plants will thrive much better than on the dry open latticework stage. A temperature of  $45^{\circ}$  from fire heat is quite sufficient.

**Artichokes and Parsnips (Graves).**—You may tell your master from us that both his Artichokes and Parsnips are perfectly safe in the ground under the snow. It is convenient to have some taken up before the winter and stored where they can be readily obtained as wanted in severe weather, but if kept too warm and dry they will not be so good in quality as those left in the ground. We should let the crops remain where they are till the snow vanishes and the ground is in suitable condition for digging, when the roots can be taken out.

**Missing Parcels (A. E. Coleman).**—We have not been able to trace the missing parcel. If the box was substantial and the address made secure, it ought to have been delivered. We receive during the year several smashed boxes from which most or all the contents have escaped, also direction labels which have become detached from the parcels in transit. Two of such labels have reached us during the last month, but we have no means of knowing who were the senders. We shall be glad to receive a bloom of your sport on the first convenient opportunity, and to express an opinion thereon.

**Propagating Chrysanthemums (Cork).**—Some of the finest of plants and blooms have been grown both from sturdy suckers taken with a few roots bristling from them, and by striking the tops of strong suckers. It is more a question of selection of either, and of the means and methods in raising and growing the plants, than anything else on which success hinges. The excessive and prolonged flagging of cuttings, and which, in consequence, have scarcely strength to produce roots, though very common, cannot be regarded as a good commencement in Chrysanthemum culture. You had better, perhaps, try both the methods to which you allude, and thus ascertain which is the most applicable in your particular case.

**Tomato Roots and Stems Cankered (R. G. M.).**—The soil would be improved by the dressing you propose giving of quicklime, applying it at the rate of 3 lbs. per square yard, and mixing it thoroughly with a foot in depth of soil. The soot would be better applied afterwards, or before putting in the loam, sprinkling it on the surface and pointing in lightly. A peck per square rod ( $30\frac{1}{2}$  square yards) is a proper quantity to use. It would be an advantage to add a little superphosphate of lime and kainit to the loam used for planting in, say a good handful to a bushel of the loam. Superphosphate and kainit may also be used as a surface dressing, taking two-thirds the former to one-third the latter, and applying at the rate of 4 ozs. per square yard.

**Cox's Orange Pippin Apple (M. B.).**—We are not aware that this delicious Apple is extensively grown in the United States or Canada for importation into this country. It is evident that the supply is not equal to the demand, or such high prices would not be obtained for, as you say, "inferior samples." We have seen hundreds of trees of Cox's Orange Pippin laden with fruit this season in one particular district, and where the crop had been thinned the samples were as good as any imported, but where thinning had not been resorted to the produce was of a decidedly trashy character, and the trees exhausted by their load of inferior fruit. In a few years' time the supply of home grown Cox's Orange Pippin Apples will be both larger and better than it is now, and we think you will not have long to wait for obtaining good samples at a reasonable price. Many trees have been planted during recent years, and ten times more fruit will be placed in the market next year than has been the case this, if 1891 proves what we hope it will be, a good Apple year. You can procure the small work to which you refer from a bookseller. It is published by Bell & Sons, Covent Garden, price 2s. 6d.

**"Campanilla canariensis" (J. T. S.).**—The plant which you say has been sent under the above name is perhaps *Canarina campanulata*, a relative of the Campanulas, and has been also named *Campanula canariensis*. It was figured in the "Botanical Magazine" in 1799, and thus described:—"The flowers of this plant so strongly resemble those of the Campanula that it is no wonder the older botanists regarded it as such; Linnaeus himself did so at first and Miller also, and even now it may perhaps be doubted whether it ought to be made a distinct genus of, since it is found to differ principally in number of its parts of fructification. It is a native of the Canary Islands, whence its name, was cultivated in the Royal Garden, Hampton Court, as long since as the year 1696, and is a tender herbaceous plant, to be found in most of our greenhouses. Its stem rises to the height of 6 or more feet; its flowers, produced singly from the fork of the stalk, are large and showy. They begin to open at the commencement of winter and continue to blow till March. Is propagated by parting of its roots, which must be done with caution, for, as the root is fleshy, if they are broken or wounded the milky juice will flow out plentifully, so that if these are planted before the wounds are skinned over it occasions their rotting. The best time for transplanting and parting of their roots is in July, soon after the stalks are decayed. The soil should be a light sandy loam, mixed with a fourth part of screened lime rubbish."

**Pears for Cordons (J. V.).**—The question for you to decide is this—Whether with so many trees you could dispose of the produce quickly and to advantage? If you have any doubt of this, the safer course would be to plant at the least half a dozen varieties. Late Pears realise the best prices, but autumn Pears often produce the best crops. Then, again, all varieties do not succeed equally well in all places. Now we understand your case more fully, we suggest as likely to answer your purpose Williams' Bon Chrétien, Louise Bonne of Jersey, Maréchal de Cour, Pitmaston Duchess, Doyenné du Comice, and Josephine de Malines. For affording a succession in three varieties, which was what we understood you to require, the three previously named answer well. Beurré d'Amanlis is an excellent grower and bearer, but from some soils the fruit is occasionally a little coarse and gritty, yet, generally speaking, it is a very useful Pear. If you were planting for home use you would require at the least thrice the number of varieties to insure a continuous supply. You must remember that Pears cannot, like Apples, be kept for any considerable time after they are ready for use, and a loss not infrequently ensues when the whole of the fruit cannot be promptly disposed of. You would probably not err by growing a dozen or two trees each of Glou Morçeau and Bergamotte Esperen.

**Screen for Garden (W. T. S.).**—Your question appears almost exactly similar to one we have previously answered. As you cannot spare much room for the screen a neat hedge would be suitable. We should plant two upright-growing Conifers, such as Cupressus Lawsoniana, at the ends of the flower border, and they would mask the extension of the border in the kitchen garden, and have an ornamental appearance from the house. A hedge could then be taken across either on the kitchen garden side of the path next the lawn tennis ground, or at the other end nearer the fowl run, the former plan we should think preferable. We should raise a mound on which to plant the hedge, which on the path side next the lawn could be faced with rockwork and planted so as to be ornamental. The entrance to the kitchen garden could be by the two side paths, forming another behind the hedge to reach the central walk. The question of forming the hedge is very much a question of cost. The Japanese Privet is cheap, quick growing, and neat; but Conifers have a more feathery appearance, and good sized plants to begin with, say of the Cupressus named, would cost much more than similar plants of the Privet. A cheap method of forming a screen in summer is to sow a row of Sweet Peas, Scarlet Runner Beans, or Sunflowers, but a permanent evergreen screen would be the more satisfactory.

**Managing Fruit Trees (Yew).**—Under the circumstances it is scarcely necessary to publish your letter, but we shall be glad to insert an account of your experience at some future time. There was no wonder at the trees being unsatisfactory. Twisting the roots into small holes made in the subsoil is a method of planting that no gardener would adopt except under compulsion, and we know of two instances where the owners of trees insisted on that practice being carried out, one of them on the ground that the sun would not dry the roots, the other to make the trees stand firm without stakes. If you have planted your trees in accordance with the instructions given in the Essay they are planted correctly. You had better not prune them at present, but in spring remove any ill-placed or weak branches, leaving the more promising and best disposed a foot or more apart, and if the spurs are much crowded on these thin some of them out so that you can lay your hand between those remaining. Some of the branches, if they extend unduly may be shortened, and the whole of them should have a small wood bud, not a large blossom bud, at the end for continuing the growth; therefore if blossom buds cluster at the ends of the branches, as is not uncommon with stunted trees, cut them back to wood buds, even if this somewhat interferes with the symmetry of the trees. Should blossom buds be very numerous in the spring it will be advantageous to remove some of them before expansion, leaving one or two on each spur; these will then be strengthened accordingly, and if the fruit sets there will be ample for a crop next year. There is still the contingency of frost destroying the blossoms if protection cannot be devised for their preservation. We trust you may be able to effect your wish in having at least "one fruit" from each tree.

**Names of Fruits.**—The names and addresses of senders of fruit to be named must in all cases be enclosed with the specimens, whether letters referring to the fruit are sent by post or not. The names are not necessarily required for publication, initials sufficing for that. Only six specimens can be named at once, and any beyond that number cannot be preserved. (J. G.).—Pear Comte de Lamy, Apple Cockle's Pippin. (D. S.).—1, Braddick's Nonpareil; 2, Court Pendû Plat; 3, Wyken Pippin; 4, Northern Greening. (G. L.).—The Pear is Bergamotte Esperen.

**Names of Plants.**—We only undertake to name species of plants, not varieties that have originated from seed and termed florists' flowers. Flowering specimens are necessary of flowering plants, and Fern fronds should bear spores. Specimens should arrive in a fresh state in firm boxes. Slightly damp moss, soft green grass or leaves form the best packing, dry wool the worst. Not more than six specimens can be named at once, and the numbers should be visible without untying the ligatures, it being often difficult to separate them when the paper is damp. (J. T. S.).—Your Campanilla canariensis is probably Canarina campanulata, respecting which see reply on preceding page. (R. B.).—1, Erica hyemalis; 2, A good variety of Epiphyllum truncatum; 3, Aralia Sieboldi. (W. W.).—1, Adiantum trapeziforme; 2, Asplenium bulbiferum; 3, Lomaria gibba; 4, Davallia Mooreana.

COVENT GARDEN MARKET.—DECEMBER 24TH.

No alteration in prices. Business somewhat better. Hothouse goods in fair supply.

CHRISTMAS NOTES.

No great change have we to record this Christmas in the agricultural situation, but the fact of the superior quality of the cattle at the great Christmas market at Smithfield, and of the fat beasts at the Smithfield Club Show at Islington is sufficiently remarkable to have special mention made of it. That there is a decided improvement in the quality of imported beasts as well as home-bred stock is certain; but at the great Christmas market Scots still held the lead which they have taken so long, and though decided efforts were made to force up prices there was no proportionate general advance.

The fat stock show season is one of the best we have had. At the Birmingham Show there were fifteen beasts each weighing 1 ton and upwards, live weight, the heaviest beast being a Hereford weighing 21 cwt. 3 qrs. 9 lbs., its age being three years ten months,

the others comprising Welsh, polled Scotch, Sussex, and Short-horns. The whole of these abnormally heavy beasts were over three years, having evidently been kept for show rather than profit, and not one of them can be taken as an example for ordinary practice. This keeping of "over-yearred" beasts is a mistake, and the Committee of the Birmingham Show marked their sense of it this year by offering only one prize for beasts over three years. Mere prizewinning ought certainly not to be the end and aim of competitors in such shows, and early maturity must be kept to the fore.

At the Agricultural Hall, Islington, the Judges were so pleased with the eight Devons in the class for young steers that they were commended *en bloc*. The age of the first prize beast was 584 days, and its average gain in weight per day since birth was 1 lb. 14 ozs. In the same class for Herefords the best beast was 611 days old, with an average gain in weight per day of 2 lbs. 2½ ozs.; but this average was beaten by Her Majesty the Queen's young Shorthorn, 577 days old, with an average daily increase of 2 lbs. 6½ ozs. The champion beast of the Show was the Queen's Shorthorn heifer Princess Josephine II., which was sold to Mr. John Jones of Llandudno for the marvellous price of £160. Her live weight was 16 cwt. 2 qrs., and the price given equals 1s. 9d. per lb. live weight, but sinking the offal it brings the price up at dead weight to 3s. per lb. Her record is so remarkable that we give it in full. At the Birmingham Show she gained first-class prize, £15; best Shorthorn, £50; Elkington cup, £105; total £170. At Islington first-class prize, £20; best Shorthorn, £25; best cow or heifer, £50; Horley's prize, £5; champion plate, £105; total £205; or won in prizes £375, sold for £160, total £585.

Sheep were more numerous than usual, and were remarkable for general excellence, the champion prizes going to Lincolns among Long-wools and to Hampshire Downs for Short-wools; and in these two breeds lambs under twelve months gave the highest daily average in weight increase, that of the Lincolns being 12½ ozs. and of the Hampshire Downs 12 ozs., the best lamb of that breed belonging to Mr. W. Newton, being the heaviest lamb in the show. It was 314 old and weighed 236 lbs., thus well maintaining the pre-eminence of this breed for early maturity.

The entries of pigs were also more numerous than usual, the Berkshires taking chief honours, and Tamworths were much better shown than they were last year. Middle Whites were well represented, and we do not know a more useful class; some of those shown were perfect pictures, over which a fancier would linger with delight. Surely it was one of those enthusiastic persons that penned the following lines:—

"I would like to be a pig, is my incessant, heart-felt sigh—  
And to wallow, wallow, wallow in a warm and cosy sty;  
To feel myself upon the straw so comfortably stout;  
To exercise activity by the twiddling of my snout;  
To open for a moment an appreciative eye.  
Oh! might I be a pig like this, how sweet to live and die!  
Such is the contemplative life—reposing, peaceful, still;  
Enjoying with tranquillity the sweet unworked-for swill;  
The future all so rosy, and the present all a "cram,"  
Secure of a most useful immortality in ham,  
For eating is elysium, and sweet it were to me  
To think the more that I could eat more useful I would be."

The arrival at the Deptford Cattle Market of 422 prime Christmas bullocks from the United States of America is a new feature, as these cattle averaged 1900 lbs. live weight, or nearly 18 cwt., and were well bred. The fact is significant, and should not be overlooked by our home breeders of cattle. All that is possible in the way of improved breeding and the development of early maturity should be done, for that is the only way to meet foreign competition.

The attention of dairy farmers is called to Mr. T. Nuttall's assertion that the complete removal of buttermilk and casein in

churning and butter working ensures the removal of all unpleasant flavour of Turnips or other food from the butter. It is also claimed for the American simplex churn that it does this perfectly, the process of butter making being by the novel plan of allowing a stream of air to ascend through the cream. The introducers of this churn offer to purchase cream from any description of feed, so confident are they in efficiency of the churn in getting rid of all impurity from the butter. We hope shortly to see this novelty at work, and to report upon it, for if all is true that is said about it it should prove a real boon, and cause really palatable butter to be far more common than it now is.

#### WORK ON THE HOME FARM.

Advantage has been taken of the frosty weather to clear away an accumulation of manure from the pig yards to heaps at convenient points for the root crops of next season. The manure is placed upon a bed of road sidings about a foot in depth, and when the heap is finished it is at once covered with a coating of several inches of soil. It will be turned over once, and the soil well mixed with it next March, just before it is used. Of course the temptation to cart straight from the yard out upon the land now while the surface is frozen is great, but the loss of fertility from the manure is so great when thus exposed that we altogether prefer the heaps or mixens made as the manure can be had and left till spring.

Some large heaps of clay burnt some months ago are now being carted and spread upon heavy land that is being drained in readiness for the steam cultivator, which will be set to work immediately after the drains are finished. The land is very heavy, and the drains are only 15 feet apart and 20 inches deep; this close draining, with plenty of ballast worked well down to the subsoil, should get rid of the superfluous water. That drains alone will not do so we have long been convinced, and we recently had additional proof in some tree stations from which the soil—a tenacious clay—had been taken out to a depth of 2 feet only 6 feet from a drain, yet when the holes became full of rain water the drain had absolutely no effect upon them, and each hole had to be connected with it by means of a short branch drain. Some old drains are also being examined and all outfalls cleared of obstructions. It is always advisable to set the eyes or ends of main drains in brickwork, especially when they are in the sides of a pond or ditch where cattle go to drink, for if the pipes are set in a wall of turf sods, as is so often done, the turf soon gets trampled down and the pipes closed. This poaching of the margins of ponds by cattle renders them so unsightly that we always like to harden them with gravel for a width of 2 yards from the edge of the water. This is not unsightly, for the grass gradually spreads among and conceals the gravel, and the pond sides are always firm. The common plan of having a narrow drinking place to a cattle pond is decidedly wrong; the sides of the pond should have no high banks, but should slope gently down to the water, which is then accessible from all sides.

The lambing folds are now being made on the south side of a dense belt of trees, the enclosure being formed by a double line of hurdles with straw between them, and there are plenty of cribs around the inner sides with roofs of thatched hurdles.

#### REMARKS.

14th.—Brilliant throughout.

15th.—Snow from 9 to 10.30 A.M., and ice needles at intervals all day. High fog all afternoon, and at times darkness like night.

16th.—Overcast, but free from fog.

17th.—Overcast morning; slight snow all afternoon; fair evening.

18th.—Overcast and gloomy all day; intensely dark from 9.30 to 11 A.M.

19th.—Snow commenced in small hours, and by 9 A.M. was 2.3 inches deep; another inch had fallen by 0.30 P.M., and occasionally a few crystals fell in afternoon; fair evening.

20th.—Occasional snow in morning, and an almost continual fall in afternoon and evening.

A week of extremely sharp frost, unequalled since January, 1881. G. J. SYMONS.
